DICTIONARY

OF

ARTS, SCIENCES, AND MISCELLANEOUS

LITERATURE;

ENLARGED AND IMPROVED.

THE SIXTH EDITION.

Illustrated with nearly six hundred Engravings.

VOL. I.

INDOEI DISCANT; AMENT MEMINISSE PERITI.

EDINBURGH:
PRINTED FOR ARCHIBALD CONSTABLE AND COMPANY;
AND HURST, ROBINSON, AND COMPANY, 90, CHEAPSIDE,
LONDON.

1823.
The importance of a work so constructed as to exhibit a comprehensive and accurate view of every branch and portion of human knowledge, and human art, must be too apparent to require any illustration. Such is the intention of the Encyclopædia Britannica; and the publication of five extensive editions of a work devoted to such objects, at once affords a proof of its eminent utility, and of the favourable opinion of the public as to the ability with which it has been executed.

The great superiority of the plan of this work has contributed in no small degree both to its usefulness and popularity. A very few words will serve to explain the principles, and to evince the pre-eminence of the method which its compilers have pursued in treating the various branches of the arts and sciences.

In all former attempts, the alphabet, in place of being employed in the humble function of an index to the matter contained in the work, was made supreme arbiter of the whole arrangement; and the different sciences, instead of being made the subjects of distinct and connected discussion, were cut down into detached parts, out of which no general view of any one science or art could possibly be formed. In this view, the alphabet, far from conducing to clearness, became an instrument of disorder; and its only use appeared to be, to save the trouble of a more commodious or philosophical arrangement. These obvious defects in all the most popular Dictionaries of arts and sciences were clearly observed by Mr. Chambers, himself the compiler of a well-known work of this kind; and, in speaking of the labours of his predecessors, he particularly censures the uninsructive method of their performances. "Former lexicographers (he observes) scarce attempted any thing like structure in their works; they seem not to have been aware that a dictionary is in some measure capable of the advantages of a continued discourse; and hence it is, that we see nothing like a whole in what they
have done.” For the purpose of remedying this defect in his own work, he informs his readers, that “his view was to consider the several matters, not only in themselves, but relatively, or as they respect each other; both to treat them as so many wholes, and as so many parts of some greater whole; and to point out their connection with each other, and with that whole, by reference: so that by a course of references from generals to particulars, from premises to conclusions, from cause to effect, and vice versa, a communication might be opened between the several parts of the work, and the detached articles be in some measure replaced in the natural order of science, out of which the alphabetical order had removed them.” And in order to exhibit a view of the bearings and relations of the various articles scattered through his Dictionary, he has prefixed to it a tabular analysis illustrative of their mutual connections and dependencies.

But although it must be admitted, that this table is elaborately and skilfully constructed, and that the arrangement of the Cyclopaedia of Mr Chambers is much preferable to that of any former work of the kind, it is still indisputably liable to many of those very objections for which this author censures his predecessors. Even if his original plan had been carried into effect with complete success, and all the articles in different parts of his work had been so managed, as when reunited, to have made so many complete systems, the number of references was still so great, that no reader could possibly have submitted to the trouble of combining them. (A).

Of this inconvenience the original compilers of the Encyclopædia Britannica were fully aware; and they resolved, in the conduct of their work, to adopt such a plan as should completely free it from this objection. They were as fully convinced as their predecessors of the utility of a separate explanation of every technical term, and of the necessity also of noticing, in detail, many topics which it would be proper more fully to illustrate in a general account of the respective sciences to which they belonged. But without such general treatises, combining in

---

(A) Thus, from Meteorology we are referred to Air and the Atmosphere; including, 1st, The history of its contents, Æther, Fire, Vapour, Exhalation, &c.; 2d, Meteors formed therein; as Cloud, Rain, &c. Shower, Drop, Snow, Hail, Dew, Damp, &c. Rainbow, Parhelion, Halo, Thunder, Waterspout, Winds, Monsoon, Hurricane, and the like. And as every word printed in capitals is the title of an article treated separately in the Cyclopaedia, we must turn backwards and forwards through more than twenty-four references before we come at the detached topics, which we are directed to unite into a system of Meteorology. The number of articles which must be united in the same manner to constitute the Compiler's system of Metaphysics is upwards of forty-eight; and those which are referred to Theology above three hundred!
in one view all the related parts of a subject, they deemed it impossible to convey any thing like complete or philosophical information. They accordingly endeavoured, in so far as their limits would permit, to exhibit a clear and satisfactory account of the several arts and sciences under their proper denominations, and to explain, at the same time, the subordinate articles, under their technical terms. These articles may be divided into three kinds. The first consists of such as, not depending very closely on particular systems, admit of a complete explanation under their proper names; the second, of such as require to be considered in the general account of the sciences with which they are connected, and also under their own denominations; and the third, of such as belong to a great whole, from which they cannot be separated, so as to be explained in detail. Articles of the first kind admit, of course, of no references; those of the second sort, being only partially explained under their own denominations, the reader is referred for more complete information to the article where the subject is more fully illustrated; and in articles of the third description, no attempt is made to explain them, except in connection with the subjects to which they severally belong, and to which the reader is always therefore referred.

Such is the plan of arrangement adopted in the first, and followed, with some improvements in the detail, throughout every edition of the *Encyclopædia Britannica*; and there appears to be no other, by which the great objects of such a work could be so conveniently and completely attained. Indeed, it seems to be now pretty generally admitted, in this country at least, that the best form which can be given of this kind of Dictionary, is that in which the several arts and sciences are digested into treatises, and the various subordinate and detached parts of knowledge explained in the order of the alphabet.

In the first edition of the *Encyclopædia Britannica*, its compilers seem to have intended little more than to furnish a general Dictionary of Arts and Sciences; but in the succeeding edition, they took a wider range, so as to include the great departments of Geography, History, Biography, and General Literature. In this way, the work was converted into a Pandect and Repository of universal knowledge; and from three volumes, the form in which it first appeared, has been gradually extended to a size more commensurate to the magnitude and variety of its objects.

Of the first and second editions of this work, and the twelve first volumes of the third, it is understood, that Mr Colin Macfarquhar, one of its original proprietors and projectors, was the principal editor. Owing to his death, the remaining six volumes of the third edition were edited by the Reverend Dr Gleig. This gentleman was peculiarly fortunate, in being honoured with the co-operation
operation of the late Professor John Robison, whose contributions to the latter volumes of that edition were numerous, and tended essentially to enhance the character and utility of the undertaking. The fourth edition was wholly edited by Dr James Miller, under whose superintendence, and with the assistance of several able contributors, the work received a large addition of new articles and treatises in all its departments.

To enumerate all the contributors to a work which has undergone so many changes, and of the compilation of which in its successive stages no record has been preserved, is now beyond any means of information which either the publishers or any others possess. But they can still afford this satisfaction in regard to almost all the more valuable treatises which it contains.

The article Agriculture, which, it seems probable, was originally compiled by the late Mr James Tytler, was re-arranged and improved for the fourth edition by Robert Forsyth, Esq. advocate. The treatise on Anatomy, originally drawn up by Mr Andrew Fyfe of the University of Edinburgh, was revised by Dr Millar. Acoustics, Aerostation, and Gunnery, were compiled by Mr Tytler. The new discoveries in Acoustics and Aerostation were added by Dr Millar. Astronomy, compiled also by Mr Tytler for the third edition, from materials furnished by Mr Jones of London, was more scientifically arranged, with the addition of the later discoveries, for the fourth. Blind was furnished by Dr Blacklock and Dr Moyes. Education, Religion, and Society, were composed by Mr Robert Heron. The lives of Johnson and Mary Queen of Scots, with Instinct, Love, Metaphysics, Miracle, the history of Ethics under Moral Philosophy, Oath, Passion, Plastic Nature, Polytheism, Prayer, Slavery, and Supper of the Lord, were contributed by Dr Gleig; Grammar and Theology by the Reverend James Bruce and Dr Gleig; and Motion by Dr Gleig and Mr Tytler. Medicine, originally written by Dr Duncan, senior, of the University of Edinburgh, was revised by him for the fourth edition. The article Music was partly drawn up by Dr Blacklock, and revised for the fourth edition by George Sandy, Esq. The historical part of this article, originally written by William Maxwell Morrison, Esq. advocate, was revised and continued down to the publication of the fourth edition, by the same gentleman, who also furnished the treatise on Physiognomy. Mysteries, Mythology, and Philology, were drawn up by the late Dr Doig of the grammar school of Stirling. Navigation, Parallax, Pendulum, Projection of the Sphere, and Ship-Building, were furnished by the late Dr Mackay of Aberdeen. Optics, which was drawn up by Mr Jones, and revised for the third edition by the late Professor Robison, was subjected to another revision for the fourth edition by Dr Brewster. Percussion, Perspective, Philosophy, Physics, Pneumatics, Precession
Preface.

Precession of the Equinoxes, Projectiles, Pumps, Quantity, Resistance of Fluids, River, Roof, Rope-making, Rotation, Seamanship, Signals, Simson (Robert, life of), Smoke-jack, Specific Gravity, Spirituous Liquors, Statics, Steam and Steam Engine, Stove (the addition to this article in the fourth edition by Dr Millar), Strength of Materials, Telescope, Tide, Articulating Trumpet, Variation of the Compass, and Water-Works, were contributed by Professor Robison. Predestination and Providence were furnished by Mr Forsyth; the History of the French Revolution by the same gentleman and Dr Gleig; and the Continuation in the fourth edition by Dr Millar.

All the preceding articles were written for editions prior to the fourth, in which they only received the improvements or additions which have been respectively specified. The following articles and treatises were contributed, for the first time, to the fourth edition:

Algebra, Conic Sections, Fluxions, Geometry, Logarithms (description of), Mensuration, Porism, Series, and Trigonometry, by Mr Wallace, one of the mathematical professors in the Royal Military College at Sandhurst. Hydrodynamics, Free-Masonry, History of Mathematics, and Mechanics, by Dr Brewster of Edinburgh. Ichthyology, Meteorolite, Ophiology, and Ornithology, by Mr Muirhead, professor of natural history in the university of Glasgow. Africa, Asia, and Europe, with the continuation of the history of America, and of Britain, by Robert Forsyth, Esq. advocate. Electricity, Farriery, Geography, Geology (part of), Magnetism, Mammalia, Man, Materia Medica, Physiology, Prescriptions (extemporaneous), Russia, Science (amusements of), Scotland (geographical and statistical parts), Spain, War (introduction), and Zoophytes, by Dr Kirby of Edinburgh. Continuation of the history of India, by the late Dr William Tennant. Life and philosophy of Boscovich, by Dr Poole of Edinburgh. Entomology, by Mr James Williamson of Edinburgh. Midwifery, by Dr Hamilton, junior, professor of midwifery, Edinburgh. Surgery, by James Wardrop, Esq. surgeon, London. Vegetable Physiology, by Mr Lyall, surgeon, Paisley. Political Economy and Taxation, by Mr Hugh Murray of Edinburgh. Cetology, Chemistry, Conchology, Crystallization, Dyeing, Erpetology, Furnace, Galvanism, Geology (part of), Mineralogy, Ores (analysis and reduction of), Stones (analysis of), and the continuation of Galvanism under the word Zinc, by Dr Millar.

The favourable reception of the fourth edition encouraged the then proprietor to proceed with a reprint, which had advanced to the sixth volume, before the copyright was acquired by the present publishers. They were thereby precluded from making any material alterations on the present or fifth edition; but as the work
work, after it became their property, was subjected to a revision by the former editor (Dr Millar), many errors and inaccuracies have been corrected; and the improvement of the plates has given it a decided superiority in this capital department over every former edition. The Supplement volumes, with which it is to be followed, will enrich its stock of miscellaneous information with a large accession of interesting articles; and, presenting a view of the arts and sciences in their latest state of improvement at home and abroad, will thus render the Encyclopædia Britannica the most complete repertory of universal knowledge that has yet been given to the public.

Edinburgh, 1st December, 1817.

THE SIXTH EDITION.

In bringing out a New Edition of the Encyclopædia Britannica, the Publishers deem it unnecessary either to enlarge on the utility of such works in general, or to dwell on the peculiar merits of that with which they are more immediately concerned, whose established reputation precludes the necessity of any formal eulogium. The plan of the Work having been described, and the history of its progress detailed, in the Preface to the Fifth Edition, which is now reprinted and subjoined, it is only necessary here to give an account of the alterations and improvements introduced into the present Edition.

In correcting and revising this Edition, it was necessary to keep in view the additional matter contained in the Supplement, now in course of publication. Scientific articles, relating to subjects upon which there are new treatises in that work, have received few alterations; but others, which seemed to require it, have been revised by gentlemen acquainted with the respective subjects. The Historical articles have been extended, so as to embrace an outline of all the recent memorable public transactions in both hemispheres. Most of the Geographical articles have been carefully revised, and some of them altogether rewritten. This department will be found to contain, besides several entirely new articles, a great body of additional statistical details, derived from the census of 1811 and other sources; and all the great changes introduced by the Congress of Vienna in 1815, and subsequent diplomatic arrangements, have been attended to, under the heads to which they refer. But what will be found to give a peculiar value to the present Edition, the titles of all the articles (hitherto published) in the Supplement, have been inserted at their proper places in the Alphabetical order, while numerous references of a more general kind have been introduced.

Edinburgh, January 1822.
Encyclopaedia Britannica.

A.

A, THE first letter of the alphabet, in all the known languages of the world, that of Ethiopia excepted, in which it is the 13th. It has deservedly the first place in the alphabet, on account of its simplicity, very little more being necessary to its pronunciation than opening the mouth.

In the English language, A is the mark of three different sounds, termed, by our grammarians, the broad, the open, and the slender A. The first resembles that of the German A, is found in several monosyllables, as wall, salt, &c. and is pronounced as au in cause. It is probable that the Saxons expressed only this broad sound of the letter, as it is still commonly retained in the northern districts of England, and universally throughout Scotland; as, task for talk, waak for walk or wake.—The open A resembles that of the Italians in adagio, and is the same with that of a in father, rather, &c. The slender sound is peculiar to the English language, and resembles the sound of the French diphthong au in pape, or their a masculine, or perhaps it is a middle sound between them. This is exemplified in place, waste, &c. also in toleration, justification, and all other words ending with ation.

A is sometimes added after words in burlesque poetry; in which case it only makes an additional syllable without any alteration of the sense, as the interjection O very often does in our ballads. It is also sometimes redundant, as in the words arise, awake, &c. which are not different in signification from rise, wake, &c.

It is sometimes a word, either noun or interjection; in which last case, it is commonly an expression of grief, and joined with the aspirate, as ah! When a noun, it is only with respect to itself; as great A, little a, &c.

A is very frequently used as an article; in which case it has no plural signification, and is used to denote the number one, as a house, a field, &c. When placed as an article before any of the vowels, y and w only excepted, it is joined with the letter r; as an island, an orator, &c.—In the three following cases it is a preposition: 1. When it goes before a participle, or noun derived from a participle; as, I am a doing this or that. 2. When used before local surnames; as Cornelius a Lapide, Thomas a Kempis, &c. 3. When it is used in composition; as, a foot, a sleep, &c. In some instances it denotes the proportion of one thing to another; as, so much a week, a man, a head, &c.

A, among the ancients, was a numeral letter, and signified 500; and when a dash was added on the top A, 5000.

A, in the Julian calendar, is the first of the seven dominical letters. It had been in use among the Romans long before the establishment of Christianity, as the first of the eight mundinales literae; in imitation whereof it was that the dominical letters were first introduced.

A is also an abbreviation used with different intentions. Hence, Asserat A, negat E, verum generaliter ambar.

Thus, in the first figure, a syllogism consisting of three universal affirmative propositions, is said to be in Bär-ba; the A thrice repeated, denoting so many of the propositions to be universal, &c. See BARBARA.

A, among the Romans, was used in giving votes or suffrages.—When a new law was proposed, each voter had two wooden ballots put into his hand; the one marked with a capital A, signifying antiquo, q. d. antiquum volo; and the other with U. R. for uti rogas. Such as were against the law, cast the first into the urn; signifying I refuse it, I antick it; or, I like the ancient law, and desire no innovation.

A, in the trials of criminal causes, also denoted absolution: Whence Cicero, pro Milone, calls A, litera salutatissimæ, a saving letter. Three ballots were distributed to each judge, marked with the letters, A for absulvo, I acquiti; C for condemnno, I condemn; and N. L. for non liquet, It is not clear. From the number of each cast into the urn, the pretor pronounced the prisoner's fate. If they were equal in number, he was absolved.

A, in the ancient inscriptions of marbles, &c. occasionally stands for Augustus, agar, aint, &c. When double it denotes Augusti; when triple aureum, argen-tum, as; and sometimes its meaning can only be known by the rest of the inscription. Isidore adds, that when it occurs after the word miles, (soldier), it denotes him young. On the reverse of ancient medals, it denotes that they were struck by the city of Argos, sometimes by that of Athens; but on coins of modern date, it is the mark of Paris.

A, as an abbreviation, is also often found in modern writers: as A. D. for anno Domini; A. M. artium magister, master of arts; anno mundi, &c.
AAR

A, the letter a, with a line above it, thus ā, is used in medical precriptions for ana, of each; sometimes it is written thus, āā: e.g. B. Mel. Succar. et Mann. ā, vel āā. T. i.e. Take of honey, sugar, and manna, of each, one ounce.

A, put to bills of exchange, is in England an abbreviation of accepted, and in France for accepte. It is likewise usual among merchants to mark their sets of books with the letters A, B, C, &c. instead of the numbers 1, 2, 3, &c.

A.A.A. The chemical abbreviation for Almagama, or Almagamation.

A.A., the name of several rivers in Germany and Swiss Rhind.

AACH, little town of Germany, in the circle of Suabia, near the source of the river Aach, and almost equally distant from the Danube and the lake Constance. It belongs to the house of Austria. E. Long. 9. 9. N. Lat. 47° 55'.

AACHUS, a little town of Germany, in the circle of Westphalia and bishopric of Munster. It is the capital of Aachus, a small district; has a good castle; and lies north-east of Coesfeld. E. Long. 7. 1. N. Lat. 52° 10'.

AAM, or HAM, a liquid measure in common use among the Dutch, containing 128 measures called minges, each weighing nearly 36 ounces avoirdupois; whence the Aam contains 288 English, and 148½ pints Paris measure.

AAR, the name of two rivers, one in Switzerland, and another in Westphalia in Germany. It is also the name of a small island in the Baltic.

AARRASSUS, in Ancient Geography, a town of Pisidia, in the Hither Asia, thought to be the Annassus of Ptolemy.

AARON, high-priest of the Jews, and brother to Moses, was by the father's side great grandson, and by the mother's grandson of Levi. By God's command he met Moses at the foot of Mount Horeb, and they went together into Egypt to deliver the children of Israel; he had a great share in all that Moses did for their deliverance. The Scriptures call him the prophet of Moses, and he acted in that capacity after the Israelites had passed over the Red Sea. He ascended Mount Sinaï with two of his sons, Nadab and Abihu, and seventy elders of the people; but neither he nor they went higher than half way, from whence they saw the glory of God; only Moses and Joshua went to the top, where they stayed forty days. During their absence, Aaron, overcome by the people's eager entreaties, set up the golden calf, which the Israelites worshipped by his consent. This calf has given rise to various conjectures. Some rabbies maintain that he did not make the golden calf, but only threw the gold into the fire, to get rid of the importunities of the people; and that certain magicians who mingled with the Israelites at their departure from Egypt, cast this gold into the figure of a calf. According to some authors, the fear of falling a sacrifice to the resentment of the people, by giving a refusal, made Aaron comply with their desire: and they allege also that he hoped to studie their request, by demanding of the women to contribute their ear rings, imagining they would rather choose to remain without a visible deity, than be deprived of their personal ornaments. This affair of the golden calf happened in the third month after the Israelites came out of Egypt. In the first month of the following year, Aaron was appointed by God high-priest; which office he executed during the time that the children of Israel continued in the wilderness. He died in the fortieth year after the departure from Egypt, upon Mount Hor, being then 123 years old; A. M. 2522, of the Julian period 3262, before the Christian era 1452.

AARON, the Carite, a learned Jew who flourished about the year 1299. He left many works on the Old Testament, among which there is one entitled, “A Commentary on the Pentateuch,” which has been much valued. It was written in Hebrew, and printed in folio with a Latin translation, at Jenae, in 1710.

AARON, another Carite Jew, who lived in the 15th century, wrote a concise Hebrew grammar, entitled Chelil Sophi, “The Perfection of Beauty,” which was printed at Constantinople in 1531.

AARON and JULIUS, Saints, were brothers who suffered martyrdom together, during the persecution under the emperor Dioclesian, in the year 303, about the same time with St. Alban the first martyr of Britain. We are not told what their British names were, it being usual with the Christian Britons, at the time of baptism, to take new names from the Greek, Latin, or Hebrew. Nor have we any certainty as to the particulars of their death; only that they suffered the most cruel torments. Two churches were dedicated to the brothers, in which their bodies were interred, at Caerleon, the ancient metropolis of Wales.

AARON, or Harun, At Raschid, a celebrated caliph, or Mahometan sovereign of the Saracen empire; whose history is given under the article BAGAD.

AARSENS, FRANCIS, Lord of Somedlyck and Spuyck, was one of the grandees, or nobles of the United Provinces, who contended for the government of the United Provinces could ever boast of. His father, Cornelius Aarsens, was register to the States; and being acquainted with Mr. Plessis Morny, at the court of William prince of Orange, he prevailed upon him to take his son under him, with whom he continued some years. John Olden Barneveld, who presided over the affairs of Holland and all the United Provinces, sent him afterwards agent into France, where he learned to negotiate under those profound politicians Henry IV. Villeroj, Silleri, Rosme, Jaonin, &c. and he acquitted himself in such a manner as to obtain their approbation. Soon after, he was invested with the character of ambassador, and was the first who was recognized as such by the French court; at which time Henry IV. declared, that he should take precedence next to the Venetian minister. He resided in France 15 years; during which time he received great marks of esteem from the king, who created him a knight and baron; and for this reason he was received among the nobles of Holland. However, he became at length so odious to the French court, that they desired to have him recalled. He was afterwards deputed to Venice, and to several German and Italian princes, upon occasion of the troubles in Bohemia. He was the first of three extraordinary ambassadors sent to England in 1620, and the second in 1641; in which latter embassy he was accompanied by the lord of Brerode as first ambassador, and Heemvelt as third, to negotiate the marriage of Prince William, son of the Prince of Orange, with a daughter.
daughter of Charles I. He was likewise ambassador extraordinary at the French court in 1624, at the beginning of Cardinal Richelieu's administration, who had a high opinion of him. The memoirs which he has left, of the negotiations in which he was engaged, show him to have been one of the ablest men of his time, and worthy of the confidence and trust reposed in him by his country. But his character is not altogether without stain. His enmity to the remonstrants was bitter and unrelenting; and he is supposed to have greatly encouraged the violent measures pursued by Prince Maurice against the venerable Barneveldt, and to have been the principal adviser for assembling the famous and persecuting synod of Dordrecht. He died at a very advanced age; and his son, who survived him, was reputed the wealthiest man in Holland.

AASAR, in Ancient Geography, a town of Palestine, in the tribe of Judah, situated between Azotos and Ascalon. In Jerome's time it was a hamlet.

Abu, the eleventh month of the civil year of the Hebrews, and the fifth of their ecclesiastical year, which begins with the month Nissan. It answers to the moon of July; that is, to part of our month of the same name, and to the beginning of August: it consists of thirty days. The Jews fast on the first of this month, in memory of Aaron's death; and on the ninth, because on that day both the temple of Solomon, and that erected after the captivity, were burnt; the former by the Chaldeans, and the latter by the Romans. The same day is also remarkable among that people for the publication of Adrinus's edict, wherein they were forbidden to continue in Judea, or even to look back when at a distance from Jerusalem, in order to lament the desolation of that city. The 18th of the same month is also a fast among the Jews; because the lamp in the sanctuary was that night extinguished, in the time of Ahaz.

Ab, in the Syriac calendar, is the name of the last summer month. The first day of this month they called Simonia, the fast of the virgin, because the eastern Christians fasted from that day to the fifteenth, which was therefore called Patna-Miriam, the cessation of the fast of the virgin.

ABA (or rather ABE) Hanifah or Hanfa, surnamed Al-Nooma, was the son of Thabet, and born at Coufah in the 80th year of the Hegira. This is the most celebrated doctor of the orthodox Mussulmans, and his sect is held in greatest esteem among the four which they indifferently follow. Notwithstanding this, he was not very well esteemed during his life; insomuch that the caliph Almanor caused him to be imprisoned at Bagdad, for having refused to subscribe to the opinion of absolute predestination, which the Mussulmans call Cadha. But afterwards Abou Joseph, who was the sovereign judge or chancellor of the empire under the caliph Hadi, brought his doctrine into such credit, that it became a prevailing opinion. That to be a good Mussulman was to be a Hanife. He died in the 250th year of the Hegira, in the prison of Bagdad: and it was not till 335 years after his death, that Melick Schah, a sultan of the Seljucidan race, erected to his memory a magnificent monument in the same city, and a college for his followers, in the 485th year of the Hegira, and Anno Christi 1092. The most eminent successors of this doctor were Ahmed Benali, Al Giassas, and Al Razi who was the master of Nasiri; and there is a mosque particularly appropriated to them in the temple of Mecca.

ABA, Abas, Abos, or Abus, in Ancient Geography, the name of a mountain of Greater Armenia, situated between the mountains Niphasos and Nibonis. According to Strabo, the Euphrates and Araxes rose from this mountain; the former running eastward, and the latter westward.

ABA. See ABE.

ABA, Albon, or Ovon, a king of Hungary. He married the sister of Stephen I. and was elected king on the deposition of Peter in 1021. The emperor Henry III. preparing to reinstate Peter on the throne, ABA made an incursion into his dominions, and returned loaded with booty; but was next year obliged to make restitution, by paying a large sum, in order to prevent a threatened invasion from the emperor. He indulged in great familiarity with the lower class of the people, on account of which, and his neglect of his order, he became universally odious to the nobility. The fugitive nobles, aided by the emperor, excited a revolt against him. After a bloody battle, ABA was put to flight; and was murdered by his own soldiers in 1044, having reigned three years.

ABAA, a river in Thessaly, supposed by some to be the Peneus of the ancients.

ABAC/E/NA, in Ancient Geography, a town of Media, and another of Caria in the Hither Asia.

ABAC/ENUM, in Ancient Geography, a town of Sicily, whose ruins are supposed to be those lying near Trippi, a citadel on a high and steep mountain not far from Messina. The inhabitants were called Abaco vini.

ABACH, a market town of Germany, in Lower Bavaria, seated on the Danube, 12 miles S. W. of Ratisbon. It is remarkable for Roman antiquities, and for springs of mineral waters which are said to be good for various distempers. E. Long. 11. 15. 56. N. Lat. 48. 53.

ABACINAR/E, or A/BACIN/E/NAR/E, in writers of the middle age, a cruel species of punishment, consisting in the blinding of the criminal, by holding a red-hot hazon or bowl of metal before his eyes.

ABACK (a sea term), the situation of the sails when the surfaces are flattened against the masts by the force of the wind. The sails are said to be taken aback when they are brought into this situation, either by a sudden change of the wind, or by an alteration in the ship's course. They are laid aback, to effect an immediate retreat, without turning to the right or left; or, in the sea phrase, to give the ship stern-way, in order to avoid some danger discovered before her in a narrow channel, or when she has advanced beyond her station in the line of battle, or otherwise. The sails are placed in this position by slackening their lee braces, and hauling in the weather ones; so that the whole effort of the wind is exerted on the fore part of their surface, which readily pushes the ship astern, unless she is restrained by some countering force. It is also usual to spread some sail aback near the stern, as the mizen top-sail, when a ship rides with a single anchor in a sound, in order to prevent her from approaching it so as to entangle the flukes of it with her slackened cable, and thereby loosen it from the ground.
ABACOT, the name of an ancient cap of state worn by the kings of England, the upper part whereof was in the form of a double crown.

ABACTORS, or ABACTORES, a name given to those who drive away, or rather steal, cattle by hawks, or great numbers at once; and are therefore very properly distinguished from purors or thieves.

ABACUS, among the ancients, was a kind of cup-board or buffet. Livy, describing the luxury into which the Romans degenerated after the conquest of Asia, says they had their abaci, beds, &c. plated over with gold.

ABACUS, among the ancient mathematicians, signified a table covered with dust, on which they drew their diagrams; the word in this sense being derived from the Phœnician abok, dust.

ABACUS, or ABACUSCUS, in Architecturc, signifies the superior part or member of the capital of a column, and serves as a kind of crowning to both. Vitruvius tells us the abacus was originally intended to represent a square tile laid over an urn, or rather over a basket. See Architecture, No. 15.—The form of the abacus is not the same in all orders: In the Tuscan, Doric, and Ionic, it is generally square; but in the Corinthian and Composite, its four sides are arched inwards, and embattled in the middle with some ornament, as a rose or other flower. Scammonzz uses abacus for a concave moulding on the capital of the Tuscan pedestal; and Palladio calls the plinth above the echinus, or boulitin, in the Tuscan and Doric orders, by the same name.

ABACUS is also the name of an ancient instrument for facilitating operations in arithmetic. It is variously contrived. That chiefly used in Europe is made by drawing any number of parallel lines at the distance of two diameters of one of the counters used in the calculation. A counter placed on the lower line, signifies 1: on the 2d, 10; on the 3d, 100; on the 4th, 1000, &c. In the intermediate spaces, the same counters are estimated at one half of the value of the line immediately superior, viz.: between the 1st and 2d, 5; between the 2d and 3d, 50, &c. See Plate I. fig. 1, where the same number, 1802 for example, is represented under both divisions by different dispositions of the counters. A farther illustration of this mode of notation is given in fig. 2.

National debt, according to Mr Ad-dington, 1st Feb. 1823, L 400,709,832
According to Mr Tierney, - 457,150,081
According to Mr Morgan, - 528,418,628
New sinking fund, - 3,275,143
Old sinking fund, - 2,534,187

ABACUS is also used by modern writers for a table of numbers ready cast up, to expedite the operations of arithmetic. In this sense we have Abaci of addition, of multiplication, of division. This instrument for computation is, under some variations, in use with most nations, as the Greeks, Romans, Germans, French, Chinese, &c.

Grecian ABACUS, was an oblong frame, over which were stretched several brass wires, strung with little ivory balls, like the beads of a necklace; by the various arrangements of which all kinds of computations were easily made.

Roman ABACUS was a little varied from the Grecian, having pins sliding in grooves, instead of strings or wires and beads.

Chinese ABACUS, or Shwan-fan, like the Grecian, consists of several series of beads strung on brass wires, stretched from the top to the bottom of the instrument, and divided in the middle by a cross piece from side to side. In the upper space every string has two beads, which are each counted for 5; and in the lower space every string has five beads, of different values, the first being counted as 1, the second as 10, the third as 100, and so on, as with us.

ABACUS Pythagoricus, the common multiplication table, so called from its being invented by Pythagoras.

ABACUS Logisticus, is a right angled triangle, whose sides, forming the right angle, contain the numbers from 1 to 60; and its area, the faets of each two of the numbers perpendicularly opposite. This is also called a canon of sexagesimal.

ABACUS et Palmula, in the Ancient Music, denote the machinery, whereby the strings of polylectra, or instruments of many strings, were stricken with a plectrum made of quills.

ABACUS Harmonicus, is used by Kircher for the structure and disposition of the keys of a musical instrument, whether to be touched with the hands or the feet.

ABACUS Major, in metallurgic operations, the name of a trough used in the mines, wherein the one is wash-

ABADDON, is the name which St John in the Revelation gives to the king of the locusts, the angel of the bottomless pit. The inspired writer says, this angel is Hebrew, and in Greek signifies Abaddon, i.e. a destroyer. That angel is thought to be Satan or the devil; but Mr le Clerc thinks with Dr Hammond, that by the locusts which came out of the abyss, may be understood the zealots and robbers, who miserably afflicted the land of Judea, and laid it in a manner waste, before Jerusalem was taken by the Romans; and that Abaddon, the king of the locusts, may be John of Gischala, who having treacherously left that town a little before it was surrendered to Titus, came to Jerusalem, where he soon headed part of the zealots, who acknowledged him as their king, whilst the rest would not submit to him. This subdivision of the zealot party brought a thousand calamities on the Jews.

ABADIR, a title which the Carthaginians gave to gods of the first order. In the Roman mythology, it is the name of a stone which Saturn swallowed, by the contrivance of his wife Ops, believing it to be his newborn son Jupiter; hence it became the object of religious worship.

ABE, or ABA, in Ancient Geography, a town of Phocis in Greece, near Helicon; famous for an oracle of Apollo older than that at Delphi, and for a rich temple which was plundered and burnt by the Persians.

ABAFT, a sea term, signifying the hinder part of a ship, or all those parts both within and without which lie towards the stern, in opposition a fore: which see.—Abaft, is also used as a preposition, and signifies further aft, or nearer the stern: as, the harribage stands abaft the mainmast, i.e. behind it, or nearer the stern.

ABAISSED, abaise, in Heraldry, an epithet applied to the wings of eagles, &c. when the tip looks downwards.
ABA

ABA [5] ABA

Abanias, downwards to the point of the shield, or when the wings are shot; the natural way of bearing them being extended.

ABAKA KHAN, the eighth emperor of the Moguls, a wise and good prince, ascended the throne in 1264. He reigned 17 years, and his by some authors said to have been a Christian. It may be admitted, indeed, that he joined with the Christians in keeping the feast of Easter, in the city Hamadan, a short time before his death. But this is no proof of his Christianity; it being common, in times of brotherly love, for Christians and Mahometans to join in keeping the same feasts, when each would compliment the other with doing honour to his solemnity.

ABAKANSKOI, a town of Siberia, which was founded by Peter the Great in 1707. It is provided with a garrison, to protect the hunters who are employed in catching martens and foxes on account of their fur, which are here an important article of commerce. It is situated in E. Long. 94° 5' N. Lat. 53° 32'.

ABALAK, a small town of Siberia, two miles from Tobolsk, in E. Long. 64° 10' N. Lat. 57° 1'. Abalak is famous as the resort of many pilgrims who visit an image of the virgin Mary, which is annually carried in procession to Tobolsk.

ABALIENATION, in law, the act of transferring one man's property to another.

ABALLABA, the ancient name of Appleby, a town in Westmoreland, remarkable only for its antiquity, having been a Roman station. W. Long. 1° 40'; N. Lat. 55° 48'.

ABALUS, in Ancient Geography; supposed by the ancients to be an island in the German ocean, called by Timaeus Basilia, and by Xenophon Lampanusculum; but now the peninsula of Scandinavia. Here, according to Pliny, some imagined that amber dropped from the trees.

ABANA, or AMARA, in Ancient Geography, a river of Phoenicia, which, rising from Mount Hermon, washed the mouth and coast of Damascus, and falls into the Phoenician sea to the north of Tripolis, called Chryseolechos by the Greeks.

ABANGA. See Ady.

ABANO, a town of the Paduano, in the republic of Venice, famous among the ancients for its hot baths.

ABANTES, a people who came originally from Thrace, and settled in Phocaea, a country of Greece, where they built a town which they called Aba, after the name of Abas their leader; and if we may credit some ancient authors, the Abantes went afterwards into the island Euboea, now called Negropont: others say the Abantes of Euboea came from Athens. The Abantes were a very warlike people, closing with their enemies, and fighting hand to hand.

ABANTIAS, or ABANTIS, in Ancient Geography, a name of the island Euboea in the Egean sea, extending along the coast of Greece, from the promontory Sinium in Attica to Thessaly, and separated from Boeotia by a narrow strait called Euripus. From its length the island was formerly called Morus; afterwards Abantis or Abantia, from the Abantes, a people originally of Thrace, called by Homer ἀβαντής Εὐβοια, from wearing their hair long behind, having in a battle experienced the inconvenience of wearing long hair before. From cutting their hair before, they were called Caretes.

ABAPTISTON, in Surgery, the perforating part of the instrument called a Trepan. This instrument, which is mentioned by Galen, Fabricius ab Aquapendente, and others, was a conical saw with a circular edge. Modern practitioners, however, prefer the cylindrical form; and various contrivances have been recommended to obviate the danger that may arise from want of dexterity, or from rashness, in performing the operation of trepanning. A new instrument has been lately invented and delineated for this purpose, by Mr. Rodman, surgeon in Paisley. This instrument is so contrived, that it can be fitted to cut any thickness of bone without danger of injuring the brain; and as no pivot or centre pin is necessary, the dreadul accidents which have sometimes happened by not removing it, when the instrument in common use is employed, are completely avoided. (Philos. Mag. April 1802.)

ABARA, a town in the Gulf of Armenia, under the dominion of the Turks; it is often the residence of the archbishop of Naksivan. E. Long. 46° 25' N. Lat. 39° 45'.

ABARANER, a town of Asia, in the Greater Armenia, belonging to the Turks: it is seated on the river Alingenia. E. Long. 46° 30'; N. Lat. 39° 50'.

ABARCA, an ancient kind of shoe used in Spain for passing the mountains with. It was made of raw hides, and bound with cords, which secured the feet of travellers against the snow.

ABARIM, high mountains of steep ascent, separating the country of the Ammonites and Moabites from the land of Canaan, where Moses died. According to Josephus, they stood opposite to the territory of Jericho, and were the last station but one of the Israelites coming from Egypt. Nebio and Pisgah were parts of these mountains.

ABARIS, the Hyperborean, a celebrated sage of antiquity, whose history and travels have been the subject of much learned discussion. Such as number of fabulous stories, were told of him, by Herodotus him - Jamblichi, self seems to scruple to relate them. He tells us on the contrary, that this barbarian was said to have travelled with an arrow, and to have taken no sustenance: but this does not acquaint us with the marvellous properties which were attributed to that arrow; nor that it had been given him by the Hyperborean Apollo. With regard to the occasion of his leaving his native country, Harpocrates tells us, that the whole earth, being visited with a deadly plague, Apollo, upon being consulted, gave no other answer, than that the Athenians should offer prayers in behalf of all other nations; upon which, several countries deputed ambassadors to Athens, among whom was Abaris the Hyperborean. In this journey, he renewed the alliance between his countrymen and the inhabitants of the island of Delos. It appears that he also went to Lacedemon; since according to some writers, he there built a temple consecrated to Proserpine the Salutary. Lib. ill. p. 94. It is asserted, that he was capable of foretelling earthquakes, driving away plagues, laying storms, &c. Porphyry wrote several books, as Suidas informs us, viz., in Vida Pythag. Apollonius's arrival in the country of the Hyperboreans; &c. Under the navigations of the river Hebrus; Orphoeus, or the God of Orpheus; a collection of oracles, &c. A Casa.

Himerius
ABA [6]

so Diarthrosis, and Decrartication, to distinguish it from that sort of articulation which admits of a very obscure motion, and is called Synarthrosis.

ABA, a weight used in Persia for weighing pearls. It is one-eighth less than the European carat.

ABA, in heathen mythology, was the son of Hypo-
thoon and Meganira, who entertained Ceres, and offered a sacrifice to that goddess; but Abas ridiculing the ceremony, and giving her opprobrious language, she sprinkled him with a certain mixture she held in her cup, on which he became a newt or water lizard.

ABAS, Schah, the Great, was third son of Codaben-
di, 7th king of Persia of the race of the Sophis. Succeed-
ning to his father in 1595, at the age of 18, he found the
affairs of Persia at a low of occasion by the
conquests of the Turks and Tartars. He regained sev-
eral of the provinces they had seized; but death put
a stop to his victories in 1629, after a reign of 44 years.
He was the greatest prince who had reigned in Persia
for many ages; and it was he who made Isphahan the
metropolis of Persia. His memory is held in the high-
est veneration among the Persians.

ABAS, Schah, his grandson, 9th king of Persia of
the race of the Sophis, succeeded his father Sesi at 13
years of age. He was but 18 when he made himself
master of the city of Candahar, which had surrendered
in his father's reign to the great Mogul, and all the
province about it; and he preserved it afterwards ag-
ainst this Indian emperor, though he besieged it more
than once with an army of 300,000 men. He was a
very merciful prince, and openly protected the Chris-
tians. He had formed a design of extending the limits
of his kingdom toward the north, and had for that ef-
fect levied a powerful army; but death put a stop to all
his great designs, at 37 years of age, A.D. 1665.

ABASCIA, or ARBASSIA, the northern district of
the western division of Georgia in Asia; situated on the
coast of the Black sea, and tributary to the Turks.
The inhabitants are poor, thievish, and treacherous,
so that there is no trading with them without the ut-
most caution. They trade in furs, buck and tyger skins,
linen yarn, boxwood, and bees wax: but their prin-
cipal traffic consists in the sale of their own children
to the Turks, and to one another. They are destitute of
many necessaries of life, and have nothing among them
that can be called a town; though we find Anacopia,
Dandar, and Czvorki, mentioned in the maps. They
have the name of Christians; but have nothing left
but the name, any more than the Mingrelians their
northern neighbours. The men are robust and active,
and the women are fair and beautiful; on which ac-
count the Turks have a great value for the female
slaves which they purchase from among them. Their
customs are much the same as those of the Mingre-
lia; see E. Long: from 39° to 43°. N. lat. from
33° to 45°.

ABASCUS, a river of Asiatic Sarmatia, which, ris-
ing from Mount Caucasus, falls into the Euxine, be-
tween Pitius to the east, and Nosios to the west.

ABASITIS, in Ancient Geography, a tract of As-
iat Mysia, in which was situated the city of Ancryn.

ABASSA, THE GREATER and THE SMALLER, two
districts in the vicinity of the Caucasian mountains.
The latter, according to Pallas, is inhabited by six tribes
who were formerly Christians, but the nobles now pro-

ABUSUS, a river of Asiatic Sarmatia, which, ris-
ing from Mount Caucasus, falls into the Euxine, be-

ABASITIS, in Ancient Geography, a tract of As-
iat Mysia, in which was situated the city of Ancryn.

ABASSA, THE GREATER and THE SMALLER, two
districts in the vicinity of the Caucasian mountains.
The latter, according to Pallas, is inhabited by six tribes
who were formerly Christians, but the nobles now pro-

ABUSUS, a river of Asiatic Sarmatia, which, ris-
ing from Mount Caucasus, falls into the Euxine, be-
tween Pitius to the east, and Nosios to the west.
fest the Mahometan religion. In manners, dress, mode of
life, and, in some degree, in language, they resemble
the Circassians. They practise agriculture, but chiefly
depend on pasturage for their subsistence. They are
celebrated for a fine breed of large horses. They are
frequently harassed and plundered by the Circassian
princes.

ABASSI, or ABASSIS, a silver coin current in Per-
sia, equivalent in value to a French livre, or tenpence
halfpenny sterling. It took its name from Schah Ab-
bas II. king of Persia, under whom it was struck.

ABASSUS, in Ancient Geography, a town of the
Greater Phrygia, on the confines of the Tolostobagi,
a people of Galatia in Asia.

ABATAMENTUM, in Law, is an entry to lands
by interposition, i.e. when a person dies seized, and
another who has no right enters before the heir.

To ABATE, (from the French abattre, to pull
down, overthrow, demolish, batter down, or destroy),
a term used by the writers of the English common law
both in an active and neutral sense; as, To abate a
castle, is to beat it down. To abate a writ, is, by some
exception, to defeat or overthrow it. A stranger abat-
teth; that is, entereth upon a house or land void by
the death of him that last possessed it, before the heir
takes possession, and so keepeth him out: wherefore, as he
that putteth out him in possession is said to disseize, so
he that stepeth in between the former possessor and his
heir is said to abate. In the nearer signification thus;
The writ of the defendant shall abate; that is, shall
be disabled, frustrated, or overthrown. The appeal
abated by covin; that is, the accusation is defeated by
decree.

ABATE, in the manage, implies the performing any
downward motion properly. Thus a horse is said to
abate or take down his curves, when he puts both his
hind legs to the ground at once, and observes the same
exactness in all the times.

ABATEMENT, in commerce, a term used for
a prohibition of trade to all French merchants in the
ports of the Levant who will not stand to their bargains,
or refuse to pay their debts. It is a sentence of the
French consul, which must be taken off before they can
sue any person for the payment of their debts.

ABATEMENT, in Heraldry, an accidental figure
supposed to have been added to coats of arms, in order
to denote some dishonourable demeanour or stain, where-
by the dignity of coat armour was rendered of less es-
teein. See Heraldry.

ABATEMENT, in Law. See To ABATE.

ABATEMENT, in the customs, an allowance made
upon the duty of goods, when the quantum damaged is
determined by the judgment of two merchants upon oath,
and ascertained by a certificate from the surveyor and
land waits.

ABATUS, an ancient term for a officer of the
stables.

ABATIS, or ABATTIS, in military affairs, a kind
of retrenchment made of felled trees. In sudden emer-
gencies, the trees are merely laid lengthwise beside
each other, with the branches pointed outwards to
prevent the approach of the enemy, while the trunks
serve as a breastwork to the defendants. When the
abatis is employed for the defence of a pass or entrance,
the boughs of the trees are stripped of their leaves and
pointed, the trunks are planted in the ground, and the
branches interwoven with each other.

ABATON, a building at Rhodes, erected as a
fence to the trophy of Artemisia, queen of Halicarnas-
sus, Coos, &c. raised in memory of her victory over
the Rhodians; or rather to conceal the disgrace of the
Rhodians from the eyes of the world: for to efface or
destroy the trophy was with them a point of religion.

ABATER, in Law, a term applied to a person who
enters to a house or lands void by the death of the last
possessor, before the true heir.

ABATOS, in Ancient Geography; an island in the
lake Moeris, formerly famous for its papyrus. It was
the burial place of Osiris.

ABAUZIT, FIRMIN, a learned Frenchman, was
born at Uzes, in Languedoc, in November 1679. His
father died when he was but two years of age. In conse-
queness of the revocation of the edict of Nantes, in
the time of Louis XIV., to avoid the rigours of persecution
to which the Protestants of France were exposed, young
Abauzit's mother, who was a Protestant, not without
difficulty, escaped with her son to Geneva, where he
remained secure from danger, and enjoyed the benefit
of education. From his 10th to his 15th year, his time
was wholly devoted to literature; and having made
great progress in languages, he studied mathematics,
physics and theology. In the year 1698, he travelled
into Holland, where he became acquainted with the
learned Bayle, with Basnage and Jurieu. Thence he
passed over to England, and was introduced to Sir
Isaac Newton, who entertained a very high opinion of
his merit. For this philosopher afterwards sent him his
Commercium Epistolicum, accompanied with a very ho-
nourable testimony. "You are well worthy, says
Newton, to judge between Leibnitz and me." The
reputation of Abauzit reached the ears of King Wil-
liam, who encouraged him by a very handsome offer
to settle in England; which he declined, and returned
to Geneva. In 1715 he entered into the society form-
ed for the purpose of translating the New Testament
into the French language, and contributed valuable
assistance to this work. The chair of philosophy in
the university was offered to him by that body in 1723,
which he refused on account of his health and diffidence
of his talents. But in 1727 he accepted of the office
of librarian to the city, the duties of which were nei-
ther burdensome, nor subjected him to any particular
restraint.

Abauzit, who was deeply conversant in physical and
mathematical knowledge, was one of the first who em-
braced the grand truths which the sublime discoveries
of Newton exhibited to the world. He defended the
doctrines of that philosopher against Father Castel;
and discovered an error in the Principia, which was
corrected by Newton in the second edition of his work.
He was a perfect master of many languages; he un-
derstood history so exactly, that he remembered the
names of the principal characters and the dates of the
events; his knowledge of physics was deep and exten-
sive, and he was well acquainted with medals and an-
cient manuscripts. The different sciences which he
had studied, were so well digested and arranged in his
retentive mind, that he could at once bring together
all that he ever knew on any subject. A remarkable
instance of this occurred in a conversation with
Rousseau.
ABBA

Rousseau on the music of the ancients, while the latter was employed in compiling his Dictionary of Music. He had been at great pains in giving an accurate account of ancient music. But how much was he surprised to find that Abaizit could give him a full and clear history of all that he had with much labour collected; and the more so, when he was informed that 30 years had elapsed since his inquiries led him to consider that subject. It was probably in consequence of this incident that Rousseau addressed to Abaizit one of the finest panegyrics which he ever wrote.

A very fine compliment is said to have been paid to Abaizit by Voltaire. A stranger having addressed the poet in a flattering manner, by saying he had come to Geneva to see a great man, Voltaire asked him, whether he had seen Abaizit?

This excellent man having enjoyed that stium cum dignitate, so much talked of, and so eagerly sought after, but rarely obtained, having thus lived universally respected to the great age of 87 years, died in the year 1787, lamented by the republic, and regretted by the learned.

Abaizit was a sincere Christian; his piety was pure and unaffected; his benevolence was extensive. Liberal in his opinions, he was indulgent and forbearing to those whose sentiments and opinions were different from his own. Simple and easy in his manners, every thing about him, his house, his person, and his way of life, discovered a strong aversion to show and luxury. He carefully avoided the officious observances of ceremony, and anxiously withdrew from the insomne praise of finery. His conversation, free from pedantry and ostentation, instructive and entertaining, was always heard with eagerness, and listened to with attention.

The writings which Abaizit left behind him are chiefly on religious subjects. He wrote an "Essay on the Apocalypse," in which he endeavoured to show, that the predictions in that book were to be applied to the destruction of Jerusalem. This work was translated into English; to which a refutation was added, which satisfied Abaizit so much that he was mistaken in his views, that he ordered an edition then ready for publication in Holland to be stopped. His other works are, "Reflections on the Eucharist; On Idolatry; On the Mysteries of Religion; Paraphrases and Explanations of sundry parts of Scripture; Seven Critical and Antiquarian Pieces; and various Letters."

ABAVO, in Boiay, a synonyme of the ADAMSONIA.

ABBA, a term among clothiers applied to the yarn of a weaver's warp. They say also Abb-tool in the same sense.

ABBA, in Ancient Geography, a town of Africa Propria, near Carthage.

ABBA, in the Syriac and Chaldee languages, literally signifies a father; and figuratively, a superior, reputed as a father in respect of age, dignity, or affection. It is more particularly used in the Syriac, Coptic, and Ethiopic churches, as a title given to the bishops. The bishops themselves bestow the title of Abba more eminently on the bishop of Alexandria; which occasioned the people to give him the title of Baba, or Papa, that is Grandfather; a title which he bore before the bishop of Rome. It is a Jewish title of honour given to certain rabbins called Tanaim; and it is also particularly used, by some writers of the middle age, for the superior of a monastery, usually called Abbot.

ABBADIE, JAMES, an eminent Protestant divine, born at Nay in Bern in 1654; first educated there under the famous John la Placette, and afterwards at the university of Sedan. From whence he went into Holland and Germany, and was minister in the French church of Berlin. He left that place in 1692; came to England; was some time minister in the French church in the Savoy, London; and was made dean of Killalo in Ireland. He was strongly attached to the cause of King William, as appears in his elaborate defence of the Revolution, and his history of the assassination-plot. He had great natural abilities, which he improved by true and useful learning. He was a most zealous defender of the primitive doctrine of the Protestants, as appears by his writings; and that strong nervous eloquence for which he was so remarkable, enabled him to enforce the doctrines of his profession from the pulpit with great spirit and energy. He possessed uncommon powers of memory. It is said that he composed his works without committing any part to writing, till they were wanted for the press. He died in London in 1727, after his return from a tour in Holland. He published several works in French that were much esteemed; the principal of which are, A Treatise on the Truth of the Christian religion; The Art of Knowing one's Self; A Defence of the British Nation; the Duty of Jesus Christ essential to the Christian Religion; The History of the last Conspiration in England, written by order of King William III.; and The Triumph of Providence and Religion, or the opening the Seven Seals by the Son of God.

ABBAS, son of Abdalmotallah, and Mahomet's uncle, opposed his nephew with all his power, regarding him as an impostor and traitor to his country; but in the second year of the Hegira, being overcome and made a prisoner at the battle of Beder in 623, a great ransom being demanded for him, he represented to Mahomet, that his paying it would reduce him to beggary, which would bring dishonour on the family. Mahomet, who knew that he had concealed large sums of money, said to him, "Where are the purses of gold that you gave your mother to keep when you left Mecca? Abbas, who thought this transaction secret, was much surprised, and conceiving that his nephew was really a profligate, embraced his religion. He became one of his principal captains; and saved his life when in imminent danger at the battle of Hidaj, against the Huns, soon after the reduction of Mecca. But besides being a great commander, Abbas was one of the first doctors of Islamism, the whole of whose science consisted in being able to repeat and explain the Koran, and to preserve in their memory certain apocryphal histories. He is said to have read lectures on every chapter of the Koran, as his nephew pretended to receive them from heaven. He died in 652, and his memory is held in the highest veneration among the Musulmans to this day.

Abul-ABBAS, surnamed Saffih, one of his grandsons, was proclaimed caliph a century after his death; and in him began the dynasty of the ABBASSIDES, who possessed the caliphate for 524 years. There were 37 caliphs of this race who succeeded one another without interruption.
ABBESS, in a monastic sense, the same with Abbots.

AAbbey, in a modern sense, the denomination of a class of persons which has been popular in France. They were not in orders; but having received the ceremony of tonsure, were entitled to enjoy certain privileges in the church. The dress of abbesses was that of academics or professed scholars. In colleges they were the instructors of youth, and were employed as tutors in private families. Many of them have risen to a distinguished rank in the state, while others have been no less eminent in science and literature.

ABBESS, the superior of an abbey or convent of nuns. The abbess has the same rights and authority over her nuns that the abbots regular have over their monks. The sex indeed does not allow her to perform the spiritual functions annexed to the priesthood, with which the abbots is usually invested; but there are instances of some abbesses who have a right, or rather a privilege, in commission a priest to act for them. They have even a kind of episcopal jurisdiction, as well as some abbots who are exempted from the visitation of their diocesans.

Martene, in his treatise on the rights of the church, observes, that some abbesses have formerly confessed their nuns. But he adds, that their excessive curiosity carried them such lengths, that there arose a necessity of checking it. However, St Basil, in his Rule, allows the abbess to be present with the priest at the confession of her nuns.

ABBEVILLE, a considerable city of France, in the department of the Somme. The river Somme divides it into two parts. It has a collegiate church and twelve parish churches, the most considerable of which are St George's and St Giles's; and it is the seat of two tribunals. It is a fortified town; the walls are flanked with bastions, and surrounded by large ditches. Never having been taken, from this circumstance it is sometimes called the Maiden Town; and hence too, its motto, Semper fidelis. The number of the inhabitants in 1800 amounted to 18,578. The situation in the midst of a fertile valley is pleasant and healthy. It is famous for its woollen manufacture, established in 1665 under the auspices of Colbert. The stuffs manufactured here are said to equal in fabric and quality the finest in Europe. There is also a manufactory of fire arms, and a considerable trade in grain, lint, and hemp. It is about 11 miles east of the British channel, and ships may come from thence by the river Somme to the middle of the town.

E. Long. 1. 50. N. Lat. 50. 7.

ABBEY, a monastery, or religious house, governed by a superior under the title of abbot or abbess.

Abbeys differ only from priories, that the former are under the direction of an abbot, and the others of a prior; for abbot and prior (we mean a prior conventual) are much the same thing, differing in little.

Fauchet observes, that, in the early days of the French monarchy, dukes and counts were called abbots, and duchies and counties abbey. Even some of their kings are mentioned in history under the title of abbots. Philip I, Louis VI, and afterwards the duke of Orleans, are called abbots of the monastery of St Aignan. The dukes of Aquitaine were called abbots of the monastery of St Hilary at Poitiers; and the earls of Anjou, of St Aubin, &c.

VOL. I. Part I.

Monasteries were at first established as religious houses, to which persons retired from the bustle of the world to spend their time in solitude and devotion. But they soon degenerated from their original institution, and obtained large privileges, exemptions, and riches. They prevailed greatly in Britain before the Reformation, particularly in England; and as they increased in riches, so the state became poor: for the lands which these regulars possessed were in mortua manu, i.e. could never revert to the lords who gave them. This inconvenience gave rise to the statutes against gifts in mortmaine, which prohibited donations to these religious houses; and Lord Coke tells us, that several lords, at their creation, had a clause in their grant, that the donor might give or sell his land to whom he would, (exceptis viris religiosis et Judaeis) excepting monks and Jews.

These places were wholly abolished in England at the time of the Reformation; Henry VIII. having first appointed visitors to inquire into the lives of the monks and nuns, which were found in some places to be extremely irregular, the abbots, perceiving their dissolution unavoidable, were induced to resign their houses to the king, who by that means became invested with the abbey lands: these were afterwards granted to different persons, whose descendants enjoy them at this day: they were then valued at 2,853,000l. per annum, an immense sum in those days.

Though the suppression of religious houses, even considered in a political light only, was a great national benefit, it must be owned, that at the time they flourished, they were not entirely useless. Abbots or monasteries were then the repositories, as well as the seminaries, of learning; many valuable books and national records, as well as private history, having been preserved in their libraries, the only places in which they could have been safely lodged in those turbulent times. Many of those, which had escaped the ravages of the Danes, were destroyed with more than Gothic barbarity at the dissolution of the abbeys. These ravages are pithecally lamented by John Bale, in his declaration upon Leland's Journal 1549. "Covetousness," says he, "was at that time so busy about private commodity, that public wealth, in that most necessary and of respect, was not anywhere regarded. A number of them which purchased these superstitious mansions, reserved of the library books, some to serve their jakes, some to scour the candlesticks, and some to rub their boots; some they sold to the grocer and soap seller; and some they sent over sea to the bookbinders, not in small numbers, but in whole ships full; yea, the universities of this realm are not clear of so detestable a fact. I know a merchant that bought the contents of two noble libraries for 42s. price, a shame it is to be spoken! This stuff hath he occupied instead of gray paper, by the space of more than these ten years, and yet he hath store enough for as many years to come. I shall judge this to be true, and utter it with heaviness, that neither the Britons under the Romans and Saxons, nor yet the English people under the Danes and Normans, had ever such damage of their learned monuments as we have seen in our time."

In these days every abbey had at least one person whose office it was to instruct youth; and the historians of this country are chiefly beholden to the monks
for the knowledge they have of former national events. In these houses also the arts of painting, architecture, and printing, were cultivated. They were hospitals for the sick and poor, and afforded entertainment to travellers at a time when there were no inns. In them the nobility and gentry who were heirs to their founders could provide for a certain number of ancient and faithful servants, by procuring them arbitrations, or stated allowances of meat, drink, and clothes. They were likewise a asylum for aged, and indigent persons of good family. The neighbouring places were also greatly benefited by the fairs procured for them, and by their exemption from forest laws; add to which, that the monastic estates were generally let at very easy rents, the fines given at renewals included.

ABBEYBOYLE, a town of Ireland, in the county of Roscommon, and province of Connaught. W. Long. 8. 32. N. Lat. 53. 54. It is remarkable for an old abbey.

ABBEYHOLM, a town in Cumberland, so called from an abbey built there by David king of Scots. It stands on an arm of the sea. W. Long. 3. 18. N. Lat. 54. 57.

ABBOT, or ABBAt, the superior of a monastery of monks erected into an abbey or priory. The name Abbott is originally Hebrew, where it signifies father. The Jews call father, in their language, Ab; whence the Chaldeans and Syrians formed Abb; thence the Greeks Accas, which the Latins retained; and hence our Abb, the French Abbé, etc. St Mark and St Paul use the Syriac Abb in their Greek, by reason it was then commonly known in the synagoguees and the primitive assemblies of the Christians; adding to it, by way of interpretation, the word father, Accas et pater. "Abba, father!" q. d. Abba, that is to say, Father. But the name Ab, or Abba, which at first was a term of tenderness and affection in the Hebrew and Chaldean, became at length a title of dignity and honour: The Jewish doctors affected it; and one of their most ancient books, containing the sayings or apophtegms of divers of them, is entitled Pirke Aboth or Avoth; i. e. Chapters of the Fathers. It was in allusion to this affectation, that Jesus Christ forbade his disciples to call any man their father on earth; which word St Jerome turns against the superiors of the monasteries of his time, for assuming the titles of Abbots, or Fathers.

The name Abbot, then, appears as old as the institution of monks itself. The governors of the primitive monasteries assumed indifferently the titles Abbotts, and Archimandrites. They were really distinguished from the clergy; though frequently confounded with them, because a degree above laymen.

In those early days, the abbots were subject to the bishops and the ordinary pastors. Their monasteries being remote from cities, built in the farthest solitudes, they had no share in ecclesiastical affairs. They went on Sundays to the parish church with the rest of the people; or, if they were too remote, a priest was sent them to administer the sacraments; till at length they were allowed to have priests of their own body. The abbots, or archimandrites himself was usually the priest; but his function extended no farther than to the spiritual assistance of his monastery; and he remained still in obedience to the bishop. There being among the abbots several persons of learning, they made a vigorous opposition to the rising heresies of those times; which first occasioned the bishops to call them out of their deserts, and fix them about the suburbs of cities, and at length in the cities themselves; from which era their degeneracy is to be dated. The abbots then threw off their former plainness and simplicity, assumed the rank of prelates, aspiring at being independent of the bishops, and grasped at so much power, that severe laws were made against them by the councils of Chalcedon. Many of them, however, carried the point of dependency, obtained the appellation of lord, and were distinguished by other badges of the episcopate, particularly the mitre.

Hence arose new distinctions between the abbots. Those were termed mitred abbots, who were privileged to wear the mitre, and exercise episcopal authority within their respective precincts, being exempted from the jurisdiction of the bishop. Others were called croisved abbots, from their bearing the crozier or pastoral staff. Others were styled episcopal or universal abbots, in imitation of the patriarch of Constantinople: while others were termed cardinal abbots, from their superiority over all other abbots. In Britain, the mitred abbots were lords of parliament; and called abbots-sovereign, and abbots-general, to distinguish them from the other abbots. And as there were lords-abbots, so there were also lords-priors, who had exempt jurisdiction, and were likewise lords of parliament. Some reckoned 26 of these lords-abbots and priors who sat in parliament. Sir Edward Coke says, that there were 27 parliamentary abbots and two priors. In the parliament 20 Rich. II. there were but 25 abbots and two priors: but in the summons to parliament anno 4 Ed. III. more are named.

In Roman Catholic countries, the principal distinctions observed between abbots are those of regular and commendatory. The former take the vow and wear the habit of their order; whereas the latter are seculars who have received tonsure, but are obliged by their bulls to take orders when of proper age. Anciently the ceremony of creating an abbot consisted in clothing him with the habit called cucnas, or cowl; putting the pastoral staff into his hand, and the shoes called pedales on his feet: but at present, it is only a simple benediction, improperly called, by some, consecration.

ABBOT is also a title given to others beside the superiors of monasteries: thus bishops whose sees were formerly abbey, are called abbots. Among the Germans, the chief magistrates of the republic formerly bore the title of abbot of the people. It was likewise usual, about the time of Charlemagne, for several lords to assume the title of count-abbots, abba-comites; because the superintendency of certain abbays was committed to them.

ABBOT, George, archbishop of Canterbury, was born October 29, 1562, at Guildford in Surrey. He was the son of Maurice Abbot a cloth-worker. He studied at Oxford, and in 1592 was chosen principal of University college. In 1599, he was installed dean of Winchester: the year following, he was chosen vice-chancellor of the university of Oxford, and a second time in 1603. In 1604, the translation of the Bible now in use was begun by the direction of King James: and
Abbot

...and Dr Abbot was the second of eight divines of Oxford, to whom the care of translating the whole New Testament (excepting the Epistles) was committed. The year following, he was a third time vice-chancellor. In 1628, he went to Scotland with George Hume earl of Dunbar, to assist in establishing an union between the churches of Scotland and England; and in this business he conducted himself with so much address and prudence, that it laid the foundation of all his future preferment. King James ever after paid great deference to his advice and counsel; and upon the death of Dr Overton bishop of Litchfield and Coventry, he named Dr Abbot for his successor, who was accordingly constituted bishop of those two united sees in December 1659. About a month afterwards he was translated to the see of London, and on the second of November following was raised to the archiepiscopal see.

It is not however improbable, that his extravagant adulation of his royal master, in which he went as far as any other court-chaplain could do, contributed not a little to his rapid preferment. In the preface to a pamphlet which he published, the following specimen of ridiculous flattery occurs: Speaking of the king he says, "whose life hath been so immaculate and unspotted, &c. that even malice itself, which leaves nothing unsearched, could never find true blemish in it, nor cast probable aspersions on it."—Zealous as a David; learned and wise, the Solomons of our age; religious as Josias; careful of spreading Christ's faith as Constantine the Great; just as Moses; undaunted in all his ways as a Jehosaphat and Hezekiah; full of clemency as another Thaddeus."—If Mr Walpole had seen this passage, he certainly would not have said, that "honest Abbot could not flatter."

His great zeal for the Protestant religion made him a strenuous promoter of the match between the Elector Palatine and the Princess Elizabeth; which was accordingly concluded and solemnized the 14th of February 1612, the archbishop performing the ceremony on a stage erected in the royal chapel. In the following year happened the famous case of divorce between the lady Frances Howard, daughter of the earl of Suffolk, and Robert earl of Essex; which has been considered as one of the greatest blemishes of King James's reign. The part which the archbishop took in the business, added much to the reputation he had already acquired for incorruptible integrity. It was referred by the king to a court of delegates, whose opinion the king and court wished and expected to be favourable to the divorce. But the archbishop, unsawed by royal authority, with inflexible firmness resisted it, and published his reasons for persisting in his opinion, to which the king, disappointed in his views, thought fit to reply: Sentence was given in the lady's favour. In 1618, the king published a declaration, which he ordered to be read in all churches, permitting sports and pastimes on the Lord's day: this gave great uneasiness to the archbishop; who, happening to be at Croydon on the day it was ordered to be read, had the courage to forbid it.

Being now in a declining state of health, the archbishop used in the summer to go to Hampshire for the sake of recreation; and being invited by Lord Zouch to hunt in his park at Bramshill, he met there with the greatest misfortune that ever befell him; for he accidentally killed the game-keeper by an arrow from a cross-bow which he shot at one of the deer. This fatal accident threw him into a deep melancholy; and he ever afterwards kept a monthly fast on Tuesday, the day on which it happened; and he settled an annuity of 20l. on the widow*. Advantage was taken of this misfortune, to lessen him in the king's favour; Church but his majesty said, "An angel might have miscarried in this sort." His enemies alleging that he had incurred an irregularity, and was thereby incapacitated for performing the offices of a primate; the king directed a commission to ten persons to inquire into this matter.

The result, however, was not satisfactory to his Grace's enemies; it being declared, that, as the murder was involuntary, he had forfeited his archiepiscopal character. The archbishop after this seldom assisted at the council, being chiefly hindered by his infirmities; but in the king's last illness he was sent for, and constantly attended till his majesty expired on the 27th of March 1622. He performed the ceremony of the coronation of King Charles I. though very infirm and distressed with the gout. He was never greatly in this king's favour; and the duke of Buckingham being his declared enemy, watched an opportunity of making him feel the weight of his displeasure. This he at last accomplished, upon the archbishop's refusing to license a sermon, preached by Dr Sibthorp, to justify a loan which the king had demanded, and pregnant with principles which tended to overthrow the constitution. The archbishop was immediately after suspended from all his functions as primate; and they were exercised by certain bishops commissioned by the king, of whom Laud, the archbishop's enemy, and afterwards his successor, was one: while the only cause assigned for this procedure was, That the archbishop could not at that time personally attend those services which were otherwise proper for his cognizance and direction. He did not, however, remain long in this situation; for a parliament being absolutely necessary, his Grace was sent for, and restored to his authority and jurisdiction. But not proving friendly to certain rigorous measures adopted by the prevailing church party, headed by Laud, whose power and interest at court were now very considerable, his presence became unwelcome there; so that, upon the birth of the prince of Wales, afterwards Charles II. Laud had the honour to baptize him, as dean of the chapel. The archbishop being worn out with cares and infirmities, died at Croydon, the 5th of August 1633, aged 71 years; and was buried at Guildford, the place of his nativity, where he had endowed an hospital with lands to the amount of 300l. per annum. A stately monument was erected over the grave, with his effigy in his robes. He proved himself, in most circumstances of his life, to be a man of great moderation to all parties; and was desirous that the clergy should gain the respect of the laity by the sanctity and purity of their manners, rather than claim it as due to their function. His opinions and principles, however, have been drawn upon him many severe reflections; particularly, from the earl of Clarendon. But Dr Welwood has done more justice --- memoirs, to his merit and abilities. He wrote several tracts of his own, upon p. 38. B 2
this town was founded by a Norman lady, about the year 1026. Edward the Confessor and William the
Conqueror were considerable benefactors to it.

Abbots-Langley, a village in Herts, four miles from St Alban's, famous as the birth-place of Pope
Adrian IV.

Abbreviation of Adjudications, in Scots Law,
an abstract or abridgment of a decree of adjudication,
which is recorded in a register kept for that purpose.

Abbreviation, or Abbreviature, a con
traction of a word or passage, made by dropping
some of the letters, or by substituting certain marks or
characters in their place. A late philosophical writer
on grammar, divides the parts of speech into words which
are necessary for the communication of thought, as the
noun and verb, and abbreviations which are employed
for the sake of dispatch. The latter, strictly speaking,
are also parts of speech, because they are all useful in
language, and each has a different manner of signification.

Mr Tooke, however, seems to allow that rank
only to the necessary words, and to consider all others
as merely substitutes of the first sort, under the title of
abbreviations. They are employed in language in
three ways; in terms, in sorts of words, and in construc-
tion. Mr Locke in his Essay treats of the first
class; numerous authors have written on the last; and
for the second class of abbreviations, see Divisions of
Purify. Lawyers, physicians, &c. use many abbrevi-
ations, for the sake of expedition. But the Rabbins
are the most remarkable for this practice, so that their
writings are unintelligible without the Hebrew abbrevi-
utures. The Jewish authors and copyists do not con-
tent themselves with abbreviating words like the Greeks
and Latin, by retrenching some of the letters or syllables;
they frequently take away all but the initial let-
ters. They even take the initials of several succeeding
words, join them together, and, adding vowels to them,
make a sort of barbarous words, representative of all
those which they have thus abridged. Thus, Rabbi
Moses ben Maimon, in their abbreviate is Rambam, &c.

The following Abbreviations are of most frequent
occurrence in the Writings and Inscriptions of the
Romans.

A

PR.
Abbreviation of fractions, in Arithmetic and Algebra, is the reducing them to lower terms.

ABBREVIATOR, in a general sense, a person who abridges any large book into a narrower compass.

ABBREVIATORS, a college of 72 persons in the chancery of Rome, who draw up the pope's briefs, and reduce petitions, when granted by him, into proper form for being converted into bulls.

ABB'S (Sr) HEAD, a promontory of land in the southern extremity of the Frith of Forth, in Scotland, 10 miles north of Berwick, and nearly the same distance
from King Cinyras, lived in obscurity, and subsisted by cultivating a garden, while Strato was in possession of the crown of Sidon. Alexander the Great having deposited Strato, inquired whether any of the race of Cinyras was living, that he might set him on the throne. It was generally thought that the whole race was extinct: but at last Abdalonymus was thought of, and mentioned to Alexander; who immediately ordered some of his soldiers to fetch him. They found the good man at work, happy in his poverty, and entirely a stranger to the noise of arms, with which all Asia was at that time disturbed; and they could scarcely persuade him they were in earnest. Alexander was convinced of his high descent by the dignity of his person; but was desirous of learning from him in what manner he bore his poverty. I wish,” said Abdalonymus. “I may bear my new condition as well: these hands have supplied my necessities: I have had nothing, and I have wanted nothing.”

This answer pleased Alexander so much, that he not only bestowed on him all that belonged to Strato, but augmented his dominions, and gave him a large present out of the Persian spoils.

ABDALS, in the eastern countries, a kind of saints supposed to be inspired to a degree of madness. The word is perhaps derived from the Arabic, Abdollah, the servant of God. The Persians call them devaeh khoda, similar to the Latin way of speaking of prophets and sibyls, q. d. furentes deo, raging with the god. Hurried on by excess of zeal, especially in the Indies, they often run about the streets, and kill all they meet who are of a different religion. The English sailors call this running a muck, from the name of the instrument, a sort of poniard, which they employ on those desperate occasions. If they are killed, as it commonly happens before they have done much mischief, they reckon it highly meritorious; and are esteemed, by the vulgar, martyrs for their faith.

ABDARA, or ABERA, in Ancient Geography, a town of Bética in Spain, a Phoenician colony; now Adra, to the west of Almeira in the kingdom of Granada.

ABDERA, in Ancient Geography, a maritime town of Thrace, not far from the mouth of the river Nessus, on the east side. The foundation, according to Herodotus, was attempted to be laid by Timesius the Clazomenian; but he was forced by the Thracians to quit the design. The Teians undertook it and succeeded, and settled in this place, in order to avoid the insults and oppression of the Persians.—Several singularities are told of Abdera. * Plin. lib. xxx. c. 3.

The grass of the country round it was of such quality, that the horses which fed on it were seized with madness. In the reign of Cassander king of Macedon, this city was so infested with frogs and rats, that the inhabitants were forced for a time to quit it.—The Abderites, or Aberitani, were very much derided for their want of wit and judgment: yet their city has given birth to several eminent persons; as Protagoras, Democritus, Anaxarchus, Hecataeus the historian, Nicocetus the poet, and many others, who were mentioned among the illustrious men.—In the reign of Lysimachus, Abdera was afflicted for some months with a most extraordinary disease: this was a burning fever, whose crisis was always on the seventh day, and then it left them; but it so distracted their imaginations, that they fancied themselves players. After this, they were ever aus titulus repeating verses from some tragedy, and particularly from
from the Andromeda of Euripides, as if they had been upon the stage; so that many of these pale meagre actors were pouring forth their tragic exclamations in every street. This delirium continued till the winter following; which was a very cold one, and therefore fitter to remove it. Lucian, who has described this disease, endeavours to account for it in this manner: Archelaus, an excellent player, acted the Andromeda of Euripides before the Abderites, in the height of a very hot summer. Several had a fever at their coming out of the theatre; and as their imaginations were full of the tragedy, the delirium which the fever raised perpetually represented Andromeda, Perseus, Medusa, &c. and the several dramatic incidents, and called up the ideas of those objects, and the pleasure of the representation, so strongly, that they could not forbear imitating Archelaus's action and declamation: And from these the fever spread to others by infection.

ABDERAHMA, a Saracen viceroy in Spain, who revolted and formed an independent principality at Cordova. He had several successors of the same name.

A viceroy and captain-general of this name led the Saracens and their followers into France, ravaging the country wherever they came. At length he was met at Tours by Charles Martel, who had received reinforcements of Germans and Gepidæ; and after many skirmishes, the Saracen army, in a general action, was totally routed, and Abderahma was killed with 370,000 Moors. This great event, which first broke the power of the Saracens, and taught the Europeans that they were not invincible, happened about the year 732 of the Christian era, and of the Hégira 114.

ABDEST, a Persian word, properly signifying the water placed in a basin for washing the hands; but is used to imply the legal purifications practised by the Mahometans before prayer, entering the mosque, or reading the Alcoran.

ABDIAS OF BABYLON, one of the boldest legendar writers, who boasted that he had seen Christ, that he was one of the 70 disciples, had been eye-witness of the actions and prayers of several of the apostles at their deaths, and had followed into Persia St Simon and St Jude, who he said, made him the first bishop of Babylon. His book, entitled Historia Cerimonia Apostolica, was published by Wolfgang Lazius, at Basle, 1551; and has passed through several editions in other places.

ABDUCTION, the action whereby a magistrate, or person in office, renounces and gives up the same before the term of service is expired.

This word is frequently confounded with renunciation; but differs from it: for abduction is done purely and simply, whereas resignation is in favour of some third person. In this sense, Dioclesian is said to have abducted the crown; Philip IV. of Spain resigned it. It is said to be a renunciation, quitting, and relinquishing, so as to have nothing further to do with a thing; or the doing of such actions as are inconsistent with the holding of it. On King James's leaving the kingdom, and abdicating the government, the lords proposed that the word desposition should be employed; but the commons thought that it was not sufficiently comprehensive. Among the Roman writers it is more particularly used for the act whereby a father discard-
To a dignified politeness, and condescending freedom, this prince is said to have added a manifest liberality in the patronage of science and of art; and of this fact, indeed, we have a laudable instance in the pension which he granted to Abdollatiiph, and which amounted to 30 dinars per month. After the death of the sultan, this sum was raised by his sons to 100 dinars, till the ambition of their uncle forced them from the throne of Egypt and of Syria; and thus was our traveller compelled to resort again to Damascus, after a short abode at Jerusalem: where his lectures, and his treatises were equally the objects of general admiration.

In the capital of Syria, his pursuits were of the same nature, and attended with similar success. His practice as a physician was extensive. To the students in the college of Al Aziz, he freely communicated the ample stores of his cultivated mind; and in the works which he composed on the principles of medicine, he displayed that depth of research and that felicity of illustration, which are the rare effects of genius combined with diligence, judgment, and erudition.

Such is the testimony given to the exertions of our author; and it is added that they were rewarded at Damascus not with fame alone, but also with riches. Yet neither the applause of the wise nor the patronage of the wealthy had power to detain him, when other scenes or other society promised to gratify his curiosity, or to increase his knowledge. On this account probably, he left Damascus, and, after having visited Aleppo, resided several years in Greece. With the same view he travelled through Syria, Armenia, and Asia Minor, still adding to the number of his works; many of which he dedicated to the princes whose courts he visited, or whose subjects he laboured to instruct.

After having thus enriched his own mind, and contributed so successfully to the improvement of others, sentiments of devotion induced him to undertake a pilgrimage to Mecca. In the mean time, however, he seems to have experienced the full force of that desire, which in the native of Switzerland has often been known to supersede every other,—the desire of once more beholding the place which gave him birth. He wished also to present the fruits of his travels, and of his studies, to the caliph Al Mostanser Billah. He therefore eagerly journeyed towards Bagdad, which, after so long an absence, he no doubt beheld with emotions of tender exultation: but scarcely had he reached it when he was suddenly taken ill, and died in his 63d year, A.D. 1223. Of 150 treatises which he composed on various subjects of medicine, natural philosophy and polite literature, only one, entitled Historiae Egyptiae Compendium, has survived the ravages of time. This manuscript, the only one which has been discovered, was brought to Europe by the celebrated orientalist Pococke, and is now preserved in the Bodleian Library. Dr White of Oxford published an edition of the original Arabic, with an elegant Latin version in 1480. See Abdallatif, Supplement.

ABDOMEN, in Anatomy, is that part of the trunk of the body which lies between the thorax and the bottom of the pelvis. See Anatomy.

ABDOMINALIS, or ABDOMINATE FISHES, constitute the Fourth Order of the Fourth Class of Animals, in the Linnaean system. See Ichthyology.

ABDUCTION, in Logic, a kind of argumentation, by the Greeks called apogege, wherein the greater extreme is evidently contained in the medium, but the medium not so evidently in the lesser extreme as not to require some farther medium or proof to make it appear. It is called abduction, because, from the conclusion, it draws us on to prove the proposition assumed. Thus, in the syllogism, "All whom God absolves are free from sin; but God absolves all who are in Christ; therefore all who are in Christ are free from sin,"—the major is evident; but the minor, or assumption, is not so evident without some other proposition to prove it, as, "God received full satisfaction for sin by the sufferings of Jesus Christ."

ABDUCTOR, or ABDUCENT, in Anatomy, a name given to several of the muscles, on account of their serving to withdraw, open, or pull back the parts to which they belong.

ABEL, second son of Adam and Eve, was a shepherd. He offered to God some of the firstlings of his flock, at the same time that his brother Cain offered the fruits of the earth. God was pleased with Abel's oblation, but displeased with Cain's; which so exasperated the latter, that he rose up against his brother and killed him. These are the only circumstances Moses relates of him; though, were we to take notice of the several particulars to which curiosity has given birth on this occasion, they would run to a very great length. But this will not be expected. It is remarkable, that the Greek churches, who celebrate the feasts of every other patriarch and prophet, have not done the same honour to Abel. His name is not to be found in any catalogue of saints or martyrs till the 10th century; nor even in the new Roman martyrology. However he is prayed to, with some other saints, in several Roman litanies said for persons who lie at the point of death.

ABEL-Keramim, or Vinumum, beyond Jordan, in the country of the Ammonites, where Jephthah defeated them, seven miles distant from Philadelphia; abounding in vines, and hence the name. It was also called Abola.

ABEL-Melahah, the country of the prophet Elias, situated on this side Jordan, between the valley of Jezreel and the village Bethmoea, in the plains of Jordan, where the Midianites were defeated by Gideon. Judges vii. 22.

ABEL Mizraim, (called also the Threshing-floor of Atad), signifying the lamentation of the Egyptians; in allusion to the mourning for Jacob, Gen. i. 3, 10, 11. Supposed to be near Hebron.

ABEL-Musch, or Abelmusch, in Botany, the trivial name of a species of the HIBISCUS.

ABEL-Sattim, or Sittim, a town in the plains of Moab, to the north-east of the Dead sea, not far from Jordan, where the Israelites committed fornication with the daughters of Moab: So called, probably, from the great number of sittim trees there.

ABELARD, Peter, an eminent scholastic philosopher of France, the son of Berenger, of noble descent, was born at Palais near Nantes in Bretagne, in the year 1079. Abelard had received from nature a vigorous and active mind; but it was his lot to live at a period, when logic, metaphysics, and polemic theology,
Having spent some time in visiting the schools of several provinces, after the example of the ancient philosophers who travelled in search of wisdom, in the twentieth year of his age he fixed his residence in the university of Paris, then the first seat of learning in Europe. The master, William de Champeaux, was at that time in high repute for his knowledge of philosophy, and his skill in the dialectic art; to him he committed the direction of his studies, and was at first contented with receiving instruction from so eminent a preceptor. De Champeaux was proud of the talents of his pupil, and admitted him to his friendship. But the aspiring youth ventured to contradict the opinions of his master, and in the public school held disputations with him, in which he was frequently victorious. The jealousy of the master and the vanity of the pupil naturally occasioned a speedy separation.

Elated by success, and confident of his own powers, Abelard, without hesitation, at the age of twenty-two, opened a public school of his own. "I was young indeed," says he; "but confident of myself, my ambition had no bounds: I aspired to the dignity of a professor, and only waited till I could fix on a proper place to open my lectures." Melun, a town ten leagues from Paris, where the court frequently resided, was the place which he chose for this bold display of his talents. But it was not without considerable difficulty that Abelard executed his plan; for De Champeaux, who regarded him as a rival, openly employed all his interest against him. Abelard at length prevailed, his school was opened, and his lectures were attended by crowds and admiring audiences. Emboldened by this success, and perhaps stimulated by unworthy resentment, Abelard resolved to maintain an open contest with his master, and for this purpose removed his school to Corbeil near Paris. The disputants frequently met in each other's schools; and the contest was supported on each side with great spirit, amidst crowds of their respective scholars. The young champion was in the end victorious, and his antagonist was obliged to retire.

Constant application and violent exertions had now so far impaired Abelard's health, that it was become necessary for him to interrupt his labours; and, with the advice of his physician, he withdrew to his native country. Two years afterwards, he returned to Corbeil, and found that De Champeaux had taken the monastic habit among the regular canons in the convent of St Victor; but that he still continued to teach rhetoric and logic, and to hold public disputations in theology. Returning to the charge, he renewed the contest, and his opponent was obliged to acknowledge himself defeated; and the scholars of De Champeaux deserted him, and went over in crowds to Abelard. Even the new professor, who had taken the former school of De Champeaux, voluntarily surrendered the chair to the young philosopher, and requested to be enrolled among his disciples. A triumph so complete, while it gratified the vanity of Abelard, could not fail to provoke the resentment of his old master, who had influence to obtain the appointment of a new professor, and drive Abelard back to Melun. De Champeaux's motive for this violent proceeding was soon perceived; even his friends were ashamed of his conduct; and he retired from the covent into the country. When Abelard was informed of the flight of his adversary, he returned towards Paris, and took a new station at the abbey on Mount St Genevieve. His rival, the new professor, was unequal to the contest, and was soon deserted by his pupils, who flocked to the lectures of Abelard. De Champeaux too returning to his monastery, renewed the struggle; but so unsuccessfully, that Abelard was again victorious.

During a short absence, in which Abelard visited his native place, De Champeaux was preferred to the see of Chalons. The long and singular contest between these philosophers terminated; and Abelard, perhaps for want of a rival to stimulate his exertions, or possibly through envy of the good fortune of his rival, determined to exchange the study and profession of philosophy for that of theology. He therefore quitted his school at St Genevieve, and removed to Laon, to become a scholar of Anselm. From this celebrated master he entertained high expectations; but they were soon disappointed. On attending his lectures, he found that, though he possessed uncommon fluency of language, he left his auditors without instruction. "You would have thought," says Abelard, "he was kindling a fire, when instantly the whole house was filled with smoke, in which not a single spark was visible: he was a tree covered with a thick foliage, which pleased the distant eye; but on a nearer inspection, there was no fruit to be found: I went up to this tree in full expectation, but I saw that it was the fig-tree which the Lord had cursed." (Hist. Colog. s. a.). Abelard gradually retired from these unprofitable lectures, but without offering offence either to the veteran professor, or his scholars. In conversation one of them asked him, what he thought of the study of the Scriptures? Abelard replied, that he thought the explanation of them a task of no great difficulty; and, to prove his assertion, he undertook to give a comment, the next day, upon any part of the Scriptures they should mention. They fixed upon the beginning of the prophecy of Ezekiel; and the next morning he explained the passage in a theological lecture, which was heard with admiration. For several successive days, the lectures were at the request of the audience continued; the whole town pressed to hear them; and the name of Abelard was echoed through the streets of Laon. Anselm, jealous of the rising fame of this young theologian, prohibited his lectures, under the pretence that so young a lecturer might fall into mistakes, which would
A B E

would bring discredit upon his master. Abelard, whose ambition required a wider field than that of
Laon, obeyed the prohibition, and withdrew. He re-
turned to Paris, whither the fame of his theological
talents had arrived before him, and opened his school
with his lectures on the prophecies of Ezekiel. His au-
ditors were delighted; his school was crowded with
scholars; and he united in his lectures the sciences of
theology and philosophy with so much success, that
multitudes repaired to his school from various parts of
France, from Spain, Italy, Germany, Flanders, and
Great Britain.

Hitherto Abelard has appeared with high distinc-
tion, as an able disputant, and a popular preacher:
we must now view him under a different character,
and, when nearly arrived at the sober age of forty,
see him, on a sudden, exchanging the school of philo-
sophy for the bower of pleasure, and even disgracing
himself, as will too plainly appear in the sequel, by
forming and executing a deliberate plan for the seduc-
tion of female innocence. It happened that there was
at this time, resident in Paris, Heloise, the niece of
Fulbert, one of the canons of the cathedral church, a
lady about eighteen years of age, of great personal
beauty, and highly celebrated for her literary attain-
ments. Abelard, whose vanity had been satiated with
fame, and the vigour of whose mind was now conser-
vated by repose, found himself inclined to listen to the
voice of passion. He beheld with ardent admiration
the lovely Heloise, and confident that his personal
attractions were still irresistible, he determined to cap-
vitate her affections. Fulbert, who doubtless thought
himself honoured by the visits of so eminent a scholar
and philosopher, received him into his house as a learn-
ed friend. He was soon afterwards prevailed upon,
by a handsome payment which Abelard offered for his
board, to admit him into his family; and, apprehen-
sing no hazard from a man of Abelard's age and pro-
fession, confidentially requested him to undertake the
instruction of Heloise. Abelard accepted the trust,
but, as it seems, without any other intention than to
betray it. The hours of instruction were employed in
other lessons than those of learning and philosoph-
y; and to such a master as Abelard, it was not surprising
that Heloise was an apt scholar. Fulbert's respectful
opinion of the philosopher, and his partiality for his
niece, long concealed from him an amour, which was
become the subject of general conversation. At length
the discovery burst upon him like a clap of thunder.
Upon discovering her pregnancy, it was thought ne-
necessary for her to quit her uncle's house, and Abelard
conveyed her to Bretagne, where his sister was pre-
pared to receive them. Here Heloise was delivered of
a son, to whom they gave the whimsical name of Astro-
labus. Abelard, upon the birth of the child, pro-
posed to Fulbert to marry his niece, provided the mar-
rriage might be kept secret: Fulbert consented, and
Abelard returned to Bretagne to fulfil his engagement.
Heloise, partly out of regard to the honour of Abe-
lard, whose profession bound him to celibacy, and
partly from a romantic notion that love like hers ought
not to submit to ordinary restraints, at first gave Abe-
lard a peremptory refusal. He, however, at last pre-
vailed, and they were privately married at Paris. He-
loise from this time met with severe treatment from
her uncle, which furnished Abelard with a plea for
removing her from his house, and placing her in the
abbey of Benedictine nuns, in which she had been
educated. Fulbert concluded, perhaps not without
reason, that Abelard had taken this step, in order to
rid himself of an incumbrance which obstructed his fu-
ture prospects. Deep resentment took possession of his
soul, and he meditated revenge. He employed seve-
reral ruffians to enter his chamber by night, and inflict
upon his person a disgraceful and cruel mutilation.
The deed was perpetrated; the ruffians were taken,
and suffered, according to the Lex Talionis, the pun-
ishment they had inflicted; and Fulbert, for his sa-
vage revenge, was deprived of his benefice, and his
goods were confiscated. Unable to support his moti-
vating reflections, Abelard resolved to retire to a con-
vent. At the same time he formed the selfish resolu-
tion, that, since Heloise could no longer be his, she
should never be another's, and ungenerously demanded
from her a promise to devote herself to religion; and
even insisted upon her taking the holy vow before him;
suspecting, as it seems, that if he first engaged himself,
she might violate her promise, and return to the world;
a circumstance, with which she afterwards tender-
dly reproached him: "In that one instance, I con-
fess, your mistrust of me tore my heart; Abelard, I
blushed for you." Heloise submitted to the harsh in-
junction, professed herself in the abbey of Argenteuil,
and receiving the religious habit, exclaimed in the
words of Cornelia:

O maxime conjus!
O thalamis indigne meis! hoc juris habebat
In tantum fortuna capit? cur impia nupsit,
Si minorem factura fuit? nunc accipe penas,
Sed quas sponte tuam.

"Ah! my once greatest lord! Ah! cruel hour!
Is thy victorious head in Fortune's power!
Since miseries my benevolent love pursues,
Why did I wed thee, only to undo?
But see, to death my willing neck I bow;
Atone the angry gods by one kind blow." ROWE

A few days after Heloise had taken her vows, Abe-
lard assumed the monastic habit in the abbey of St De-
ny, determined as it seems to forget, in hope of being
forgotten by the world. However, his admirers and
scholars in Paris were unwilling that the world should
lose the benefit of his labours, and sent deputies to en-
treat him to return to his school. After some delib-
ervation, he again yielded to the call of ambition; and
at a small village in the country, he resumed his les-
tures, and soon found himself surrounded with a nu-
merous train of scholars. The revival of his popularity
renewed the jealousy of other professors, who took the
first opportunity of bringing him under ecclesiastical
censure. A treatise which he published at this time,
etituled, "The Theology of Abelard," was supposed
to contain some heretical tenets. A synod was called at
Soissons in the year 1121; the work was condemned
to be burnt, and Abelard was commanded to throw it
into the flames. After being involved in other con-
traversies, new charges were brought against him, and
he fled to the convent of St Ayoul at Provins in Cham-
pagne, the prior of which was his intimate friend.
The place of his retreat was soon discovered, and
threats.

[ 22 ]

Abelard.

threats and persuasions were in vain employed to recall him: at last he obtained permission to retire to some solitary retreat, on condition that he should never again become a member of a convent.

The spot which he chose was a vale in the forest of Champagne, near Nogent upon the Seine. Here Abelard, in 1122, erected a small oratory, which he dedicated to the Trinity, and which he afterwards enlarged, and consecrated to the Third Person, the Comforter, or Paraclete. Here he was soon discovered, and followed by a train of scholars. A rustic college arose in the forest, and the number of his pupils soon increased to six hundred. Jealousy again provoked the exertions of his enemies, and he was meditating his escape, when, through the interest of the duke of Bretagne, and with the consent of the abbot of St Denys, he was elected superior of the monastery of St Gildas, in the diocese of Vannes, where, though not without frequent and grievous vexations, he remained several years.

About this time, Roger the abbot of St Denys, on the plea of an ancient right, obtained a grant for annexing the convent of Argenteuil, of which Heloise was now prioress, to St Denys, and the nuns, who were accused of irregular practices, were dispersed. Abelard, informed of the distressed situation of Heloise, invited her, with her companions, eight in number, to take possession of the Paraclete.

It was during Abelard's residence at St Gildas, that the interesting correspondence passed between him and Heloise, which is still extant. The letters of Heloise, in this correspondence, abound with proofs of genius, learning, and taste, which might have graced a better age. It is in these letters that Mr Pope has formed his "Epistle from Eloisa to Abelard:" a piece which is entitled to the highest praise for its poetical merit, but which deviates in many particulars from the genuine character and story of Heloise, and culpably violates moral propriety. Here, too, Abelard probably wrote his "Theology," which again subjected him to persecution. His opinions were pronounced heretical by a council; and although he appealed to Rome, the judgment of the council was confirmed by the pope; and he was sentenced, unheard, to perpetual silence and imprisonment. By the interposition of some friends, however, and by a submissive apology, he obtained his pardon, with permission to end his days in the monastery of Cluni.

At Cluni he was retired, studious, and devout. The monks of the convent importuned him to resume the business of instruction. In a few occasional efforts he complied with their solicitation; and his lectures were heard with undiminished applause. But his health and spirits were much enfeebled, and gradually declined till he died in the 63rd year of his age, A. D. 1142. His body was sent to Heloise to be interred in the convent of the Paraclete. Heloise survived her husband 21 years, a pattern of conjugal affection and monastic virtue; and was buried in the same grave, as appears by the following epitaph:

Hic
Sub eodem marmore, jacent
Hujus Monasterii
Conditor, Petrus Abelardus,
getting children, but of adopting two of different sexes.

ABELLA, anciently a town of Campania, near the river Clanius. The inhabitants were called Abellani, and said to have been a colony of Chalcidians. The nux Avellana, called also Prunus avellana, or the hazel nut, takes its name from this town, according to Macrobius. 

New Acclaves.

ABELLINUM, anciently a town of the Hirpini, a people of Apulia; distant about a mile from the river Sabatto, between Beneventum and Salernum. Pliny calls the inhabitants Abellinenses, with the epithet Protoli, to distinguish them from the Abellinenses Marsi. 

New Acclines. E. Long. 15. 20. N. Lat. 41. 0.

ABEN EZRA, ABRAHAM, a celebrated rabbi, born at Toledo in Spain, called by the Jews, The wise, great, and admirable Doctor, was a very able interpreter of the Holy Scriptures; and was well skilled in grammar, poetry, philosophy, astronomy, and medicine. He was also a perfect master of the Arabic. His principal work is, "Commentaries on the Old Testament," which is much esteemed: these are printed in Bompert's and Buxtorf's Hebrew Bibles. His style is clear, elegant, concise, and much like that of the Holy Scriptures: he almost always adheres to the literal sense, and everywhere gives proofs of his genius and good sense; he, however, advances some erroneous sentiments. The greatest of all his books is entitled "Jesu Mora," which is a theological work, intended as an exhortation to the study of the Talmud. He also wrote Elegantiæ Grammaticæe, printed in octavo at Venice in 1548. He died in 1774, aged 75.

ABEN MELPER, a learned rabbi, who wrote a commentary on the Old Testament in Hebrew, entitled, "The Perfection of Beauty." This rabbin generally follows the grammatical sense and the opinions of Kimchi. The best edition is that of Holland.

ABENAS, a town of France, in the department of Ardeche; and upon a river of the same name, at the foot of the Cevennes. E. Long. 4. 20. N. Lat. 44. 37.

ABENEL-GAUBY, a fixed star of the second or third magnitude, in the south scale of the constellation Libra.

ABENSBERG, a small town of Germany, in the kingdom of Bavaria, and in the government of Münich. It is seated on the river Abentz, near the Danube. E. Long. 11. 38. N. Lat. 48. 45.

ABERAVON, a borough town of Glamorganshire in Wales, governed by a portreeve. It has a market, which is now discontinued. The vicarage is discharged, and is worth 45l. clear yearly value. It is seated at the mouth of the river Avon, 194 miles west of London. W. Long. 3. 35. N. Lat. 51. 40.

ABERRBROTHICK, or ABERBETH, one of the royal boroughs of Scotland, situated in the county of Angus, about 40 miles N. N. E. of Edinburgh, in W. Long. 2. 29. and N. Lat. 56. 36. It is seated on the discharge of the little river Brothie into the sea, as the name imports, Aber in the British implying such a situation. It is a small but flourishing place, well built, and still increasing. The town has been in an improving state for the last forty years, and the number of inhabitants greatly augmented; which is owing to the introduction of manufactures. The population in 1801 was above 7000. The inhabitants consist chiefly of weavers of coarse brown linens, and some sail-cloth; others are employed in making white and coloured threads; the remainder are either engaged in the shipping of the place, or in the necessary and common mechanic trades. The brown linens, or osnaburges, were manufactured here before any encouragement was given by government, or the linen company erected at Edinburgh. It appears from the books of the stamp-office in this town, that seven or eight hundred thousand yards are annually made in the place, and a small district round. Besides this export and that of thread, much barley and some wheat is sent abroad. The foreign imports are flax, flax-seed, and timber, from the Baltic. The coasting trade consists of coals from Borrowstounness, and lime from Lord Elgin's kilns in Fife. At this place, in default of a natural harbour, a tolerable artificial one of piers has been formed, where, at spring tides, which rise here fifteen feet, ships of two hundred tons can come, and of eighty at neap tides; but they must lie dry at low water. This port is of great antiquity: there is an agreement yet extant between the abbot and the burglers of Aberbrothick, in 1194, concerning the making of the harbour. Both parties were bound to contribute their proportions; but the largest fell to the share of the former, for which he was to receive an annual tax payable out of every rod of land lying within the borough. The glory of this place was the abbey, whose very ruins give some idea of its former magnificence. It was founded by William the Lion in 1178, and dedicated to our celebrated primate Thomas à Becket. The abbot was buried there; but there are no remains of his tomb, or any other, excepting that of a monk of the name of Alexander Nicol. The monks were of the Tyronesian order; and were first brought from Kelso, whose abbey declared those of this place, on the first institution, to be free from his jurisdiction. The last abbot was the famous Cardinal Beaton, at the same time archbishop of St Andrew's, and, before his death, as great and absolute here as Wolsey was in England. King John, the English monarch, granted this monastery most uncommon privileges; for, by charter under the great seal, he exempted it à teminis et consuetudine in every part of England, except London. At Aberbrothick is a chalybeate water, similar to those of Peterhead and Glandye.

ABERCONWAY, or CONWAY, in Caernarvonshire, North Wales; so called from its situation at the mouth of the river Conway. It is a handsome town, pleasantly situated on the side of a hill, and has many conveniences for trade; notwithstanding which it is the poorest town in the county. It was built by Edward I. and had not only walls, but a strong castle, which is now in ruins. Here is an inscription on the tomb of one Nicholas Hocks, importing that he was the one-and-fortieth child of his father, and had twenty-seven children himself. It is 229 miles from London. W. Long. 3. 47. N. Lat. 53. 20.

ABERCRUMBIE, THE HONOURABLE ALEXANDER (Lord Abercromby), a judge in the courts of session and justiciary in Scotland, was the youngest son of George Abercromby, of Tulibody, Esq., of a respectable family in Clackmannanshire, and was born on the 12th October 1745. Mr Abercromby was early destined for the profession of the law, and with this view.
view he was educated at the university of Edinburgh, where he passed through the requisite course of languages, philosophy, and law, and was admitted advocate in the year 1766: but neither during the time of his education, or for some years after he entered his professional career, did he give much promise of those eminent abilities and that assiduous application which afterwards distinguished him as a pleader and a judge. The vivacity of his disposition, and the sprightliness of his manners, led him to prefer the gayer amusements of life, and the society of men of fashion and pleasure, to the arduous prosecution of philosophical studies, and to the less inviting and more barren paths of legal disquisitions. When, however, either during his academical course, or the first years of his practice at the bar, occasions required the exertion of his talents, the quickness of his perception, and the acuteness and strength of his understanding, enabled him to display such powers of attention and application to business as are seldom acquired but by regular and uniform habits of industry, and by the force of constant application. But, to attain that distinction and eminence to which he aspired, and to secure that independence which the patrimony of a younger son of a family, more respectable than opulent, could not afford him, he found it necessary to withdraw from those scenes of amusement and pleasure, and to seclude himself from that society which his gaiety and agreeable manners had enlivened and entertained, and to think seriously of applying to the labours of his profession. With much credit to himself, and with undiminished vigour of mind, he threw off the character of the man of fashion, and devoting his time and talents to the toilsome detail of business as a lawyer, by his successful efforts he soon gave solid proofs of the distinguished abilities which he possessed. About this time, he was engaged as counsel in a cause in which public curiosity and opinion were much interested and divided. This cause, which was of a very intricate nature, afforded an opportunity of making a more eminent display of his professional talents. By a speech which he delivered on this occasion, conspicuous for accurate discrimination, strength of argument, and impressive eloquence, he gave a favourable presage of his future celebrity. The marks of approbation which he now received probably taught him to appreciate those talents which had hitherto remained concealed or unemployed, and encouraged him to call them forth into exertion.

In 1780, Mr Abercromby resigned the office of sheriff depute of Stirlingshire, which he had held for several years, and accepted of that of depute-advocate, with the hope of extending his employment in the line of his profession. In this step he was not disappointed; for his reputation and business rapidly increased, and soon raised him to the first rank of lawyers at the Scotch bar. In the midst of the laborious duties of his profession, Mr Abercromby did not entirely preclude himself from indulging in the elegant amusements of polite literature. He was one of that society who set foot two periodical papers, the Mirror and Lounger, published at Edinburgh; the former in 1779, and the latter in 1783. To the Mirror he contributed ten papers, and to the Lounger nine. The names of the authors have been published in the late editions of these works, which renders it unnecessary to point out those papers of which Mr Abercromby was the author.

In May 1792, he was appointed one of the judges of the court of session, and in December following he was called to a seat in the court of justiciary. Lord Abercromby continued to discharge the arduous duties of these important offices till summer 1795, when he was seized with a pectoral complaint, of which he died on the 17th November the same year, at Exmouth in Devonshire, where he had gone for the recovery of his health.

As a lawyer, Lord Abercromby had acquired great reputation. His papers on law-cases were distinguished for precision and perspicuity. His speeches were elegant, animated, and eloquent. With the most pathetic feeling he pleaded the cause of the unfortunate; while he could assume the severe tone of virtuous indignation in rebuking injustice and oppression. With such qualifications, added to the strictest attention and punctuality, he could not fail to become an able and respectable judge. In this high station, his deportment was grave, dignified, and decided. His elocution was solemn and deliberate; and his opinions, delivered in this manner, had an impressive effect. Avoiding a detail of circumstances, and never arguing the cause as a lawyer, he pronounced with brevity and precision the opinion of a judge drawn from its striking and prominent features. His only writings are the papers in the periodical publications already alluded to. They are marked by an easy turn of expression, manly and virtuous sentiments, and, when the subject required it, by delicate irony or unaffected tenderness. (Phil. Trans. Edin.).

Abercromby, Sir Ralph, knight of the Bath, and a lieutenant-general in the British army, an elder brother of the preceding, was born in the year 1738. Being destined for the army, he obtained, in May 1756, a cornet's commission in the 2d dragoon guards; and rose, April 24. 1762, to the rank of a captain in the 3d regiment of horse. Ascending through the intermediate gradations of rank, he was appointed, November 3. 1781, to the colonelcy of the 103d infantry. September 28. 1787, he was promoted to the rank of major-general. November 5. 1795, he obtained the command of the 7th regiment of dragoons. Having been nearly 40 years in the army, having served with honour in two wars, and being esteemed one of the ablest, coolest, and most intrepid officers in the whole British forces, he was employed on the continent under his royal highness the duke of York, in the commencement of the present war. In the action on the heights of Cateau, he commanded the advanced guard; and was wounded at Nimieu. He conducted the march of the guards from Deventer to Oudenaaal, in the retreat of the British out of Holland, in the winter of 1794-5. In August 1795, he was appointed to succeed Sir Charles Grey, as commander in chief of the British forces in the West Indies. March 24. 1796, Grenada was suddenly attacked and taken by a detachment of the army under his orders. He afterwards obtained possession of the settlements of Demarara and Issequibo, in South America. St Lucia was next taken by more difficult exertions, in which the ability of this eminent commander was signalized displayed.
played. St. Vincent's was, by the middle of June, added to the British conquests. Trinidad, in February 1797, shared the same fate. He returned the same year to Europe, and, in reward for such important services, was invested with the red ribbon, appointed to the command of the regiment of Scots Greys, entrusted with the governments of the Isle of Wight, Fort George, and Fort Augustus, and raised to the high military rank of lieutenant-general. He held, for a time, the chief command of the forces in Ireland. In that command, he laboured to maintain the discipline of the army, to suppress the rising rebellion, and to protect the people from military oppression, with a care worthy alike of the great general and the enlightened and beneficent statesman. From that station he was called to the chief command of the forces in Scotland. His conduct in this distinguished appointment gave universal satisfaction. When the great enterprise against Holland was resolved upon, Sir Ralph Abercromby was called again to command, under his royal highness the duke of York. The difficulties of the ground, the inclemency of the season, delays, though inconvenient, yet unavoidable, the disorderly movements of the Russians, and the timid duplicity of the Dutch, disappointed our hopes of that expedition. But, by the Dutch, the French, the British, it was confessed, that even victory, the most decisive, could not have more conspicuously proved the talents of this illustrious officer. His country applauded the choice, when he was sent with an army to dispossess the French of Egypt. His experience in Holland and Flanders, and in the climate of the West Indies particularly, fitted him for this new command. He accomplished some of the first duties of a general, in carrying his army in health, in spirits, and with the requisite intelligence and supplies, to the destined scene of action. The landing, the first dispositions, the attacks, and the courage opposed to attack, the spirit with which his army appears to have been by confidence in their leaders imbued, that extraordinary superiority which the British infantry under his command evinced to that which was thought the bravest and best disciplined infantry in the world, demonstrate that all the best qualities of the greatest commanders were in Sir Ralph Abercromby united—that they were all summoned forth into activity in the glorious achievements amid which he fell. In his private character he was modest, disinterested, benevolent, and honourable. General Lord Hutchinson, who succeeded him in the command, in the dispatches with the account of his death, has given a fine eulogium on his character as a soldier, and strongly expressive of the high estimation in which he was held by the army. We have sustained an irreparable loss in the person of our never sufficiently to be lamented commander in chief, Sir Ralph Abercromby, who was mortally wounded in the action, and died on the 28th of March. I believe he was wounded early, but he concealed his situation from those about him, and continued in the field, giving his orders with that coolness and perspicacity which had ever marked his character, till long after the action was over, when he fainted through weakness and loss of blood. Were it permitted for a soldier to regret any one who has fallen in the service of his country, I might be excused for lamenting him more than any other person; but it is some consolation to those who tenderly loved him, that, as his life was honourable, so was his death glorious. His memory will be recorded in the annals of his country—will be sacred to every British soldier—and embalmed in the recollection of a grateful posterity. His remains were conveyed on board Admiral Lord Keith's flag ship to Malta, attended by Colonel Sir John Dyer, and were interred in the commandery of the grand master, with the highest military honours.

A monument to his memory, to be erected in St Paul's church, London, at the public expense, was voted by the house of commons. His widow has been created a peeress, and a pension of 2000l. a year for her and three lives settled on the family. (Gent. Mag.).

ABERDEEN, the name of two cities in Scotland, called the Old and New Town, situated on the German ocean, in W. Long. 2°. 8' and N. Lat. 57° 8'.

ABERDEEN, Old, is a place of great antiquity. According to tradition, it was of note in the reign of Gregory, who conferred on it some privileges about the year 893. In 1204, Malcolm II. founded a bishopric at a place called Mortlich in Banffshire, in memory of a signal victory which he there gained over the Danes; which bishopric was translated to Old Aberdeen by David I.; and in 1163, the then bishop of Aberdeen obtained a new charter from Malcolm IV. There is extant a charter of Alexander II. by which, in 1217, the king grants to Aberdeen the same privileges he had granted to his town of Perth.

The Old Town lies about a mile to the north of the New, at the mouth of the river Don, over which is a fine Gothic bridge, of a single arch, greatly admired, which rests on a rock on each side. This arch, said to have been built by a bishop of Aberdeen about the year 1290, is 67 feet wide at the bottom, and 34½ feet high above the surface of the river, which at ebb tide is here 19 feet deep. The Old Town was formerly the seat of the bishop, and had a large cathedral commonly called St Machar's. This very antique spires, and one aisle, which is used as a church, are now the only remains of it. The bishopric was founded in the time of David I. as above mentioned. The cathedral had anciently two rows of stone pillars across the church, and three turrets; the steeple, which was the largest of these turrets, rested upon an arch, supported by four pillars. In this cathedral there was a fine library; but about the year 1560, it was almost totally destroyed. But the capital building is the King's College on the south side of the town, which is a large and stately fabric. It is built in form of a square, with cloisters on the south side. The chapel is very ruinous within; but there still remains some wood work of exquisite workmanship. This was preserved by the spirit of the principal at the time of the Reformation, who armed his people and checked the blind zeal of the barons of the Mearns; who, after stripping the cathedral of its roof, and robbing it of the bells, were going to violate this seat of learning. They shipped their sacks of booty, with an intention of exposing it to sale in Holland: but the vessel had scarcely gone out of port, when it perished in a storm with all its ill-gained lading. The steeple is vaulted with a double cross arch; above which is an imperial crown, supported by eight stone pillars, and closed with a globe and two gilded D crosses.
Aberdeen crosses. In the year 1631 this steeple was thrown down by a storm, but was soon after rebuilt in a more stately form. This college was founded in 1494, by William Elphinston bishop of this place, lord chancellor of Scotland in the reign of James III. and lord privy seal in that of James IV. But James IV. claimed the patronage of it, and it has since been called the King's College. The number of students in 1816-17 was 187. This college, and the Marischal College in the New Town, form one university, called the University of King Charles. The library is large, but not remarkable for many curiosities. Hector Boethius was the first principal of the college; and sent for from Paris for that purpose, on an annual salary of forty merks Scots, at thirteen pence each. The square tower on the side of the college was built by contributions from General Monk and the officers under him then quartered at Aberdeen, for the reception of students of which about a hundred attend the college, many of whom lodge in it.

Aberdeen, New, is the capital of the shire of Aberdeen. For extent, trade, and beauty, it greatly exceeds any town in the north of Scotland. It is built on a hill or rising ground, and lies on a small bay formed by the Dee, deep enough for a ship of 200 tons, and above two miles in circumference.—The buildings (which are of granite from the neighbouring quarries) are generally four stories high; and have for the most part, gardens behind them, which give it a beautiful appearance. On the high street is a large church which formerly belonged to the Franciscans. This church was begun by Bishop William Elphinston; and finished by Gavin Dunbar, bishop of Aberdeen, about the 1502. Bishop Dunbar is said likewise to have built the bridge over the Dee, which consists of seven arches. In the middle of Castle street is an octagon building, with nest halls of the kings of Scotland from James I. to James VII. The town-house has a large square, and in the centre the grammar school is a low but neat building. Gordon's hospital is handsome; in front is a good statue of the founder: it maintains forty boys, who are apprenticed at proper ages. The infirmary is a large plain building, and sends out between eight and nine hundred cured patients annually. But the chief public building in the New Town is the Marischal College, founded by George Keith earl Marischal, in the year 1593; but since greatly augmented with additional buildings. In both the Marischal and King's college the languages, mathematics, natural philosophy, divinity, &c. are taught. The number of students in the session of 1816-17 was 212, besides 105 students of divinity, alternately attending each university. The convents in Aberdeen were, one of Mathurines or of the order of the Trinity, founded by William the Lion, who died in 1214; another of Dominicans, by Alexander II.; a third of Observantines, a building of great length in the middle of the city, founded by the citizens; and Mr. Richard Vans, S.C.; and a fourth of Carmelites, or White Friars, founded by Philip de Arbutnot in 1540.

Aberdeen, including the Old Town, is supposed to contain 25,000 inhabitants. Its trade is considerable, but might be greatly extended by an attention to the white fisheries.

The harbour was long a great detriment to its trade, and occasioned the loss of many lives and much property. A stranger could never depend upon finding it as he left it; while vessels lay at anchor in the road till the tide should make, they have often been wrecked by storms which suddenly arose. It was very narrow at the mouth, having the easterly rocky point of the Grampian mountains on the south, and a flat blowing sand on the north, extending along the coast for many miles. By the easterly and north-easterly storms the sand was driven in a long ridge across the harbour's mouth, and formed what was called the bar. Upon this bar the depth of water at low tide was sometimes not above three feet. Clearing away the sand, though but a partial and temporary remedy, was a matter of great expense to the community. If it was cleared one week so as to have five or six feet of water at ebb, a fresh storm the next week undid all that had been done. The town at last came to the resolution of erecting a strong pier on the north side of the harbour. This pier is 1200 feet in length, and gradually increases in thickness and height as it approaches to the sea, where the head or rounding is 60 feet diameter at the base, and the perpendicular elevation is 38 feet. The whole is built of granite, which is very durable stone: many of the outside stones are above three tons weight, with hewn beds. It was built under the direction of Mr. Smeaton; and other extensive improvements have since been executed, the whole of which have cost about 120,000l. About 150 vessels belong to the port of Aberdeen, whose aggregate burden amounts to 17,135 tons. The principal exports are grain, fish, thread, hosiery, cotton and linen goods.

Aberdeen, like most of the other royal burghs of Scotland, has long been encumbered by its debts. In 1789, the town debt was something less than 12,000l., but from various causes it had increased so rapidly since that period, that in 1815 it amounted to 232,743l. The whole of the town debt being insufficient to discharge the interest of this debt, the town was under the necessity in February 1817 of declaring the burgh insolvent; and in consequence of this step all the burgh property, feu-duities, and funds, were made over to trustees. The magistrates then in office, in an address to their successors, published 19th September 1817, ascribed the embarrassed state of the burgh chiefly to the secrecy and concealment fostered by the system of self-election, and to the want of some control on the part of the citizens over the town's affairs. The election that followed not having been regularly conducted, was challenged by the burgesses, and set aside by the Court of Session. It was now expected that the magistracy would be restored by a poll election—the mode sanctioned by precedent in such cases; but the Privy Council issued a warrant in August 1818, directing the persons who had been in office previous to the irregular election, to meet and elect a new set of magistrates. This measure appeared to be an infringement on the rights of the burgesses, but because it recalled those very men to office by whose mismanagement the affairs of the city had been brought to a state of insolvency, and most of whom had denounced the system as gerrinious. The committee of the House of Commons which sat in 1819 on the subject of burgh reform,
The Boilers or Bullers of Buchan, arrest the attention of all strangers, by their stupendous craggy precipices.

The soil, in so extensive a district, is as various as can be well supposed. The state of agriculture in the interior parishes of the county is very rude; but the example of many patriotic proprietors is producing wonders even in the most barren soils. Prejudices in husbandry, when deeply rooted, are with difficulty overcome; but even these are yielding to a more regular and modern system. A navigable canal, extending 18 miles, from the harbour of Aberdeen to Inverury, was opened in 1807. It is 23 feet wide, by 3 feet 9 inches deep; and is raised to the height of 169 feet above low water mark by 17 locks. The principal rivers of Aberdeen are, the Dee and Don, the Ythan, the Ugie, and the Cruden. The Deveron also forms its boundary with Banffshire for many miles. All the rivers have been long celebrated for the excellence of the salmon with which they abound. The rents of the fisheries are estimated at 2480l. per annum, and the produce at upwards of 10,000l. Besides the fisheries of the rivers, the sea coast of Aberdeen abounds with all kinds of excellent fish; and a number of fishing vessels are fitted out from the sea ports of the county, particularly Peterhead and Fraserburgh. Under the article of fisheries, we may mention the celebrated pearl fishing in the river Ythan. In this river some pearls have been found, which sold singly so high as 2l. and 3l. With regard to mineralogy, little wealth of that description has hitherto been found in this county. The granite quarries are the most valuable articles. From those in the neighbourhood of Aberdeen, 12,000 tons and upwards are annually exported to London, the value of which may be estimated at about 8400l. There are several quarries in the parish of Aberdoar, which yield excellent millstones. There is a quarry of blue slate wrought in the parish of Culesalmond, and a vein of manganese in the neighbourhood of Old Aberdeen. The county abounds with limestone; but, from the want of coal, it cannot be wrought to much advantage, except near a sea port. In Old Machar and Old Deer parishes, about 55,000 bolls of lime are annually burnt, valued at 2750l. Some kelp is made on the coast, the value of which must be considerable. Plumbago, amethysts, emeralds, agates, asbestos, talc, mica, schistus, and other curious minerals, are found in many parts of the county. The principal manufacture carried on in the county, is the knitting of stockings and hose, in which all the women, and most of the old men and boys, are employed the greater part of the year. The other manufactures are too trifling to deserve particular notice. Aberdeen-shire contains three royal boroughs; ABERDEEN, TORE, and INVERURY; and several large and handsome towns; as Peterhead, Fraserburgh, Huntly, and Old Meldrum. It is divided into 83 parishes.

The following account of the population of Aberdeen-shire, at two different periods, is taken from the Statist. Hist. of Scotland.

Population in 1811 - 135,075

Total, 116,836 - 122,921

See ABERDEENSHIRE, SUPPLEMENT.

ABERDOUR, a small town in Fifeshire, Scotland, on the frith of Forth, about ten miles north-west of Edinburgh. In old times it belonged to the Viponts; in 1126 it was transferred to the Mortimers by marriage, and afterwards to the Douglasses. William, lord of Liddesdale, surnamed the Flower of Chivalry, in the reign of David II. by charter conveyed it to James Douglas, ancestor of the present noble owner the earl of Morton. The monks of Inchcolm had a grant for a burial place here from Allan de Mortimer, in the reign of Alexander III. The nuns, usually styled the Poor Clares, had a convent at this place.

ABERFORD, a market town in the west riding of Yorkshire, stands in a bottom; and is about a mile in length, and pretty well built. It is near a Roman road, which is raised very high, and not far from the river Cock; between which and the town there is the foundation of an old castle still visible. It is 181 miles north-by-west from London. W. Long. 2. 45. N. Lat. 55. 52.

ABERGAVENNY, a large, populous, and flourishing town in Monmouthshire, seated at the confluence of the rivers Usk and Gavenny. It has a fine bridge over the Usk, consisting of fifteen arches; and being a great thoroughfare from the west part of Wales to Bath, Bristol, Gloucester, and other places, is well furnished with accommodation for travellers. It is surrounded with a wall, and had once a castle. It carries on a considerable trade in flannels, which are brought hither for sale from the other parts of the county. It is 142 miles distant from London. W. Long. 3. N. Lat. 51. 47. Abergavenny appears to have been the Gibbonium of Antoninus, and the town of Usk his Burrium. Population 2815 in 1811.

ABERNEITHY, JOHN, an eminent dissenting minister, was the son of Mr John Abernethy, a dissenting minister in Coleraine, and was born there on the 19th of October 1680. When about nine years of age he was separated from his parents, his father being obliged
Abernethy, to attend some public affairs in London; and his
Irish rebels, retiring to Derry, a relation who had him
under his care, having no opportunity of conveying
him to her, carried him to Scotland; and thus he
escaped the hardships and dangers of the siege of Derry,
in which Mrs Abernethy lost all her other children.
He afterwards studied at the university of Glasgow,
where he remained till he took the degree of master of
arts; and, in 1705, he was chosen minister of a dis-
senting congregation at Antrim, in which situation he
continued above 20 years. About the time of the Ban-
gorion controversy (for which see Hoadley), a dis-
sension arose among his brethren in the ministry at
Belfast, on the subject of subscription to the Westmin-
ster Confession of Faith. In this controversy he became
a leader on the negative side, and incurred the censure
of a general synod. The agitation of parties began to
be also felt among the members of his congregation.
Many of them deserted him; which induced him to
accept of an invitation to settle in Dublin, where his
preaching was much admired. Here he continued for
ten years, respected and esteemed. But his labours
were terminated by a sudden attack of the gout in the
head, to which he had been subject; and he died in
December 1740, in the 60th year of his age. His
writings, as was his character, are distinguished for
candour, liberality, and manly sentiment. He published
a volume of sermons on the Divine Attributes; after
his death a second volume was published by his friends;
and these were succeeded by four other volumes on
different subjects: all of which have been greatly ad-
mired.
Abernethy, a small town in Strathberry, a district
of Perthshire in Scotland, situated on the river Tay, a
little above the mouth of the Erne. It is said to have
been the seat of the Pictish kings; and was afterwards
the see of an archbishop, which was afterwards trans-
ferr ed to St Andrew's. In the churchyard of Aber-
ethy, there is a tower of singular construction. It is
of a circular form, is 74 feet in height, and 48 feet in
circumference. The tower at Brechin is the only one
of a similar structure in Scotland. The researches of
the antiquarian have hitherto failed in discovering the
uses of these insulated buildings. It has been sup-
posed that they are of Pictish origin, and that they
were intended as places of confinement for religious
devotees in performing penance, and hence they have
been denominated towers of repentance. Population
1635 in 1811.
ABERRATION, in Astronomy, an apparent
motion of the celestial bodies, produced by the progressive
motion of light, and the earth's annual motion in her
orbit.
This effect may be explained and familiarized by the
motion of a line parallel to itself, much after the
manner that the composition and resolution of forces are
explained.
M. de Maupertuis, in his "Elements of Geography,"
gives a familiar and ingenious idea of the aberration,
in this manner: "It is thus," says he, "concerning
the direction in which a gun must be pointed to strike
a bird in its flight; instead of pointing it straight to
the bird, the fowler will point a little before it, in the
path of its flight, and that so much the more as the
flight of the bird is more rapid, with respect to the
flight of the shot." In this way of considering the
matter, the flight of the bird represents the motion of
the earth, and the flight of the shot represents the mo-
tion of the ray of light.
Mr. Clairaut too, in the Mem. de l'Acad. des Sciences
for the year 1746, illustrates this effect in a familiar
way, by supposing drops of rain to fall rapidly and
quickly after each other from a cloud, under which a
person moves with a very narrow tube; in which case,
it is evident that the tube must have a certain inclina-
tion, in order that a drop which enters at the top, may
fall freely through the axis of the tube, without touch-
ing the sides of it; which inclination must be more or
less according to the velocity of the droppings in respect
to that of the tube; then the angle made by the di-
rection of the tube and of the falling drops, is the ab-
eration arising from the combination of those two mo-
tions.
This discovery, which is one of the brightest that
have been made in the present age, we owe to the ac-
curacy and ingenuity of the late Dr. Bradley, astron-
omer royal; to which he was occasionally led by the
result of some observations which he had made with a
view to determine the annual parallax of the fixed stars,
or that which arises from the motion of the earth in its
annual orbit about the sun.
The annual motion of the earth about the sun had
been much doubted, and warmly contested. The de-
defenders of that motion, among other proofs of the rea-
ality of it, conceived the idea of adding an incon-
testable one from the annual parallax of the fixed stars,
if the stars should be within such a distance, or if in-
struments and observations could be made with such ac-
curacy, as to render that parallax sensible. And with
this view various attempts have been made. Before the
observations of M. Picard, made in 1672, it was the
general opinion, that the stars did not change their po-

tion during the course of a year. Tycho Brab and Riccioli fancied that they had assured themselves of it
from their observations; and from hence they concluded
that the earth did not move round the sun, and that
there was no annual parallax in the fixed stars. M. Pi-
card, in the account of his Voyage d'Ouralisbourg, made
in 1672, says that the pole star, at different times of
the year, has certain variations, which he had observed
for about 10 years, and which amounted to about 40°
a year: from whence some, who favoured the annual
motion of the earth, were led to conclude that these va-

tiations were the effect of the parallax of the earth's
orbit. But it was impossible to explain it by that pa-
rallass; because this motion was in a manner contrary
what ought to follow only from the motion of the earth in her orbit.
In 1674 Dr. Hook published an account of observa-
tions which he said he had made in 1665, and by
which he had found that the star of Dracoon was 2°
more northerly in July than in October: observations
which, for the present, seemed to favour the opinion of
the earth's motion, although it be now known that
there could not be any truth or accuracy in them.
Flemsteed having observed the pole star with his
mural quadrant, in 1680 and the following years, found
that its declination was 40° less in July than in De-
cember; which observations, although very just, were
yet
Aberration yet, however, improper for proving the annual parallax; and he recommended the making of an instrument of 25 or 20 feet radius, to be firmly fixed on a strong foundation, for deciding a doubt which was otherwise not soon likely to be brought to a conclusion.

In this state of uncertainty and doubt, then, Dr. Bradley, in conjunction with Mr. Samuel Molinex, in the year 1725, formed the project of verifying, by a series of new observations, those which Dr. Hook had communicated to the public almost 50 years before. And as it was his attempt that chiefly gave rise to this, so it was his method in making the observations, in some measure, that they followed; for they made choice of the same star, and their instrument was constructed upon nearly the same principles: but had it not greatly exceeded the former in exactness, they might still have continued in great uncertainty as to the parallax of the fixed stars. For this, and many other convenient and useful astronomical instruments, philosophers are indebted to the ingenuity and accuracy of Mr. Graham.

The success of the experiment evidently depending so much on the accuracy of the instrument, this became a leading object of consideration. Mr. Molinex's apparatus then having been completed, and fitted for observing, about the end of November 1725, on the third day of December following, the bright star in the head of Draco, marked by Bayer, was for the first time observed, as it passed near the zenith, and its situation carefully taken with the instrument. The like observations were made on the fifth, seventh, and twelfth days of the same month; and there appearing no material difference in the place of the star, a farther repetition of them, at that season, seemed needless, it being a time of the year in which no sensible alteration of parallax, in this star, could soon be expected. It was therefore curiosity that chiefly urged Dr. Bradley, who was then at Kew, where the instrument was fixed, to prepare for observing the star again on the 17th of the same month; when, having adjusted the instrument as usual, he perceived that it passed a little more southerly this day than it had done before. Not suspecting any other cause of this appearance, it was ascribed to the uncertainty of the observations, and that either this, or the foregoing, was not so exact as had been supposed. For which reason they proposed to repeat the observation again, to determine from what cause this difference might proceed: and upon doing it, on the 20th of December, the doctor found that the star passed still more southerly than at the preceding observation. This sensible alteration surprised them the more, as it was the contrary way from what it would have been, had it proceeded from an annual parallax of the star. But being now pretty well satisfied, that it could not be entirely owing to the want of accuracy in the observations, and having no notion of any thing else that could cause such an apparent motion as this in the star; they began to suspect that some change in the materials or fabric of the instrument itself might have occasioned it. Under these uncertainties they remained for some time; but being at length fully convinced, by several trials, of the great exactness of the instrument; and finding, by the gradual increase of the star's distance from the pole, that there must be some regular cause that produced it; they took care to examine very nicely, at the time of each observation, how much the variation was; till about the beginning of March 1726, the star was found to be 20' more southerly than at the time of the first observation: it now indeed seemed to have arrived at its utmost limit southward, as in several trials, made about this time, no sensible difference was observed in its situation. By the middle of April it appeared to be returning back again towards the north; and about the beginning of June, it passed at the same distance from the zenith, as it had done in December, when it was first observed.

From the quick alteration in the declination of the star at this time, increasing about one second in three days, it was conjectured that it would now proceed northward, as it had before gone southward, of its present situation; and it happened accordingly; for the star continued to move northward till September following, when it again became stationary; being then near 20' more northerly than in June, and upwards of 30' more northerly than it had been in March. From September the star again returned towards the south, till, in December, it arrived at the same situation in which it had been observed twelve months before, allowing for the difference of declination on account of the precession of the equinox.

This was a sufficient proof that the instrument had not been the cause of this apparent motion of the star; and yet it seemed difficult to devise one that should be adequate to such an unusual effect. A nutation of the earth's axis was one of the first things that offered itself on this occasion; but it was soon found to be insufficient; for though it might have accounted for the change of declination in $\gamma$ Draconis, yet it would not at the same time accord with the phenomena observed in the other stars, particularly in a small one almost opposite in right ascension to $\gamma$ Draconis, and at about the same distance from the north pole of the equator: for though this star seemed to move the same way, as a nutation of the earth's axis would have made it; yet changing its declination but about half as much as $\gamma$ Draconis in the same time, as appeared on comparing the observations of both made on the same days, at different seasons of the year, this plainly proved that the apparent motion of the star was not occasioned by a real nutation; for had this been the case, the alteration in both stars would have been nearly equal.

The great regularity of the observations left no room to doubt, but that there was some uniform cause by which this unexpected motion was produced, and which did not depend on the uncertainty or variety of the seasons of the year. Upon comparing the observations with each other, it was discovered that, in both the stars above mentioned, the apparent difference of declination from the maxima, was always nearly proportional to the versed sine of the sun's distance from the equinoctial points. This was an inducement to think that the cause, whatever it was, had some relation to the sun's situation with respect to those points. But not being able to frame any hypothesis, sufficient to account for all the phenomena, and being very desirous to search a little farther into this matter, Dr. Bradley began to think of erecting an instrument for himself at Wanstead; that, having it always at hand, he might with the more ease and certainty inquire into the laws of this new motion. The consideration likewise of
Aberration being able, by another instrument, to confirm the truth of the observations hitherto made with that of Mr Molineux, was no small inducement to the undertaking; but the chief of all was, the opportunity he should thereby have of trying in what manner other stars should be affected by the same cause, whatever it might be. For Mr Molineux's instrument being originally designed for observing γ Draconis, to try whether it had any sensible parallax, it was so contrived, as to be capable of but little alteration in its direction; not above seven or eight minutes of a degree: and there being but few stars, within half that distance from the zenith of Kew, bright enough to be well observed, he could not, with his instrument, thoroughly examine how this cause affected stars that were differently situated, with respect to the equinoctial and solstitial points of the ecliptic.

These considerations determined him; and by the contrivance and direction of the same ingenious person, Mr Graham, his instrument was fixed up the 15th of August 1727. As he had no convenient place where he could make use of so long a telescope as Mr Molineux's, he contented himself with one of but little more than half the length, namely of 12 feet and a half, the other being 24 feet, and a half long; judging from the experience he had already had, that this radius would be long enough to adjust the instrument to a sufficient degree of exactness: and he had no reason afterwards to change his opinion; for by all his trials he was very well satisfied, that when it was carefully rectified, its situation might be securely depended on to half a second. As the place where his instrument was hung, in some measure determined its radius; so did it also the length of the arc or limb, on which the divisions were made, to adjust it: for the arc could not conveniently be extended farther, than to reach to about 62 degrees on each side of the zenith. This however was sufficient, as it gave him an opportunity of making choice of several stars, very different both in magnitude and situation; there being more than two hundred, inserted in the British Catalogue, that might be observed with it. He needed not indeed to have extended the limb so far, but that he was willing to take in Copella, the only star of the first magnitude that came so near his zenith.

His instrument being fixed, he immediately began to observe such stars as he judged most proper to give him any light into the cause of the motion already mentioned. There was a sufficient variety of small ones, and not less than twelve that he could observe through all seasons of the year, as they were bright enough to be seen in the day time, when nearest the sun. He had not been long observing, before he perceived that the motion they had before entertained, that the stars were farthest north and south, when the sun was near the equinoxes, was only true of those stars which are near the solstitial colure. And after continuing his observations a few months, he discovered what he then apprehended to be a general law observed by all the stars, namely, that each of them became stationary, or was farthest north or south, when it passed over his zenith at six of the clock, either in the evening or morning. He perceived also that whatever situation the stars were in, with respect to the cardinal points of the ecliptic, the apparent motion of every one of them tended the same way, when they passed his instrument about the same hour of the day or night; for they all moved southward when they passed in the day, and northward when in the night; so that each of them was farthest north when it came in the evening about six of the clock, and farthest south when it came about six in the morning.

Though he afterwards discovered that the maxima, in most of these stars, do not happen exactly when they pass at those hours; yet not being able at that time to prove the contrary, and supposing that they did, he endeavoured to find out what proportion the greatest alterations of declination, in different stars, bore to each other; it being very evident that they did not all change their inclination equally. It has been before noticed, that it appeared from Mr Molineux's observations, that γ Draconis changed its declination above twice as much as the before-mentioned small star that was nearly opposite to it; but examining the matter more nicely, he found that the greatest change in the declination of these stars, was in the size of the latitude of each star respectively. This led him to suspect that there might be the like proportion between the maxima of other stars, but finding that the observations of some of them would not perfectly correspond with such an hypothesis, and not knowing whether the small difference he met with might not be owing to the uncertainty and error of the observations, he deferred the farther examination into the truth of this hypothesis, till he should be furnished with a series of observations made in all parts of the year; which would enable him not only to determine what errors the observations might be liable to, or how far they might safely be depended on; but also to judge, whether there had been any sensible change in the parts of the instrument itself.

When the year was completed, he began to examine and compare his observations; and having satisfied himself as to the general laws of the phenomena, he then endeavoured to find out the cause of them. He was already convinced that the apparent motion of the stars was not owing to a nutation of the earth's axis. The next that occurred to him, was an alteration in the direction of the plumb-line, by which the instrument was constantly corrected; but this, upon trial, proved insufficient. Then he considered what refraction might do; but here also he met with no satisfaction. At last, through an amazing sagacity, he conjectured that all the phenomena hitherto mentioned, proceeded from the progressive motion of light, and the earth's annual motion in her orbit: for he perceived, that if light were propagated in time, the apparent place of a fixed object would not be the same when the eye is at rest, as when it is moving in any other direction but that of the line passing through the object and the eye; and that when the eye is moving in different directions, the apparent place of the object would be different. (Hutton's Math. Dict.).

Aberration, in Optics, the deviation or dispersion of the rays of light, when reflected by a speculum, or refracted by a lens, which prevents them from meeting or uniting in the same point, called the geometrical focus, but are spread over a small space, and produce a confusion of images. There are two species of aberration distinguished by their different causes; the
Aberration is equal to the geocentric motion of the planet, the space it appears to move as seen from the earth, during the time that light employs in passing from the planet to the earth. Thus, in the sun, the aberration in longitude is constantly 20°, that being the space moved by the sun, or, which is the same thing, by the earth, in the time of 8' 7'', which is the time in which light passes from the sun to the earth. In like manner, knowing the distance of any planet from the earth, by proportion it will be, as the distance of the sun is to the distance of the planet, so is 8' 7'' to the time of light passing from the planet to the earth: then computing the planet's geocentric motion in this time, that will be the aberration of the planet whether it be in longitude, latitude, right ascension, or declination. (Hutton's Math. Dict.)

ABERYSTWITH, a market-town of Cardiganshire, in Wales, seated on the Ridal, near its confluence with the Ithwch, where it falls into the sea. It is a rich town, and has a great trade in lead, and a considerable fishery of whiting, cod, and herrings. It was formerly surrounded with walls, and fortified with a castle: but both are now in ruins. Its distance from London is 203 miles W. N. W. W. Long. 4° 20'. N. Lat. 52° 17'. Population 2264 in 1811.

ABESTA, or AVESTA, the name of one of the sacred books of the Persian magi, which they ascribe to their great founder Zarosater. The Abesta is a commentary on two others of their religious books called Zend and Paswend; the three together including the whole system of the Ignoic or worshipping of fire.

ABETTOE, a law term implying one who encourages another to the performance of some criminal action, of whom is art or part in the performance itself. Treason is the only crime in whichabetors are excluded by law, every individual concerned being considered as a principal. It is the same with art-and-part in the Scots law.

ABEX, a country of Higher Ethiopia, in Africa, bordering on the Red sea, by which it is bounded on the east. It has Nubia or Senaar on the north; Senaar and Abyssinia on the west; and Abyssinia on the south. Its principal towns are Saquaem and Arkeko. It is subject to the Turks, and has the name of the beglerbeglik of Habeleth. It is about five hundred miles in length and one hundred in breadth; in a mountainous country, sandy, barren, and unhealthy, much infested with wild beasts; and the forests abound with ebony trees.

ABEYANCE, in Law, the expectancy of an estate. Thus if land be leased to one person for life, with reversion to another for years, the remainder for years is in abeyance till the death of the lessee.

ABGAR, or ABGARUS, a name given to several of the kings of Edessa in Syria. The most celebrated of them was one who, it is said, was contemporary with Jesus Christ; and who having a distemper in his feet, and hearing of Jesus' miraculous cures, requested him by letter to come and cure him. Eusebius, who believed that this letter was genuine, and also an answer
A B I

a tribute; which they exacted, not with a view to live in affluence, but merely to enjoy the necessaries of life. They never took arms but to obligue those to make good a promise to them by whom it had been broken. They paid tribute to none of the neighbouring states. They deemed themselves exempt from such an imposition; for they relied on their strength and courage, and consequently thought themselves able to repel any invasion. The Abians, we are told, were a people of great integrity. This honourable eulogium is given them by Homer. (Strabo).

ABIAH, high priest of the Jews, son to Abimelech, who had borne the same office, and received David into his house. This so enraged Saul, who hated David, that he put Abimelech to death, and 81 priests; Abiathar alone escaped the massacre. He afterwards was high priest; and often gave King David testimonies of his fidelity, particularly during Absalom’s conspiracy, at which time Abiathar followed David, and bore away the ark. But after this, conspiring with Adonijah, in order to raise him to the throne of King David his father; this so exasperated Solomon against him, that he divested him of the priesthood, and banished him, A. M. 3021, before Christ 1014.

ABIB, signifying an ear of corn, a name given by the Jews to the first month of their ecclesiastical year, afterwards called Nisan. It commenced at the vernal equinox; and according to the course of the moon, by which their months were regulated, answered to the latter part of our March and beginning of April.

ABIDING by Writings, in Scots Law: When a person founds upon a writing alleged to be false, he may be obliged to declare judicially, whether he will stand or abide by it as a true deed.

ABIES, the Fir-tree. See Pinus, Botany Index.

ABIGEAT, an old law term, denoting the crime of stealing cattle by drows or herds. This crime was severely punished; the delinquent being often condemned to the mines, banishment, and sometimes capital.

ABIHU, brother to Nadab, and son to Aaron. The two former had the happiness to ascend Mount Sinai with their father, and there to behold the glory of God: but afterward putting strange fire into their censors, instead of the sacred fire commanded by God, fire rushing upon them killed them. Though all the people bewailed this terrible catastrophe, Moses forbade Aaron and his two sons Eleazar and Ithamar to join in the lamentation.

ABIS CYTHAX, taken by Strabo to denote the European Sarmate, bordering on the Thracians and Bastarnae: They were commended by Curtius for their love of justice, and by Ammianus for their contempt of other things.

ABIMELECH, king of Gerar, a country of the Philistines, was contemporary with Abraham. This patriarch and his family being there, his wife Sarah, though 90 years of age, was not safe in it; for Abimelech carried her off, and was so enamoured of her, that he resolved to marry her. Abraham did not declare himself Sarah’s husband; but gave out she was his sister. But the king being warned in a dream, that she was married to a prophet, and that he should die

VOL. I. PART L

if he did not restore her to Abraham, the king obeyed; Abimelech at the same time reproving Abraham for his disingenuity; who thereupon, among other excuses, said he was really his sister, being born of the same father, though of a different mother. Abimelech afterwards gave considerable presents to Abraham; and a covenant, that of Beersheba, was entered into between them, A. M. 2107. After the death of Abraham, there being a famine in the neighbouring countries, Isaac his son also withdrew into Gerar, which was then likewise governed by a king called Abimelech, probably the successor of the former. Here Rebekah’s beauty forced her husband to employ Abraham’s artifice. Abimelech discovering that they were nearly related, chid Isaac for calling his wife his sister; and at the same time forbade all his subjects, upon pain of death, to do the least injury to Isaac or Rebekah. Isaac’s prosperity lost him the king’s friendship, and he was desired to go from among them. He obeyed; but Abimelech afterwards entered into a covenant with him, A. M. 2200.

ABIMELECH, the natural son of Gideon, by his concubine. His violent acts and death are recorded in Judges, chap. ix. A. M. 2769.

ABINGDON, a market-town in Berkshire, situated on a branch of the Thames, derives its name from an ancient abbey. The streets, which are well paved, terminate in a spacious area, in which the market is held; and in the centre of this area is the market-house, which is supported on lofty pillars, with a large hall of freestone above, in which the summer assizes for the county are held, and other public business done, the Lent assizes being held at Reading. It has two churches; one dedicated to St Nicholas, and the other to Helena: the latter is adorned with a spire, and both are said to have been erected by the abbots of Abingdon. Here are also two hospitals, one for six, and the other for thirteen poor men, and as many poor women; a free school; and a charity school. The town was incorporated by Queen Mary. It sends two members to parliament, who are chosen by the inhabitants at large not receiving alms. Its great manufactures are sail-cloth, sacking, and especially malt, large quantities of which are sent by water to London. It is seven miles south of Oxford, 47 east of Gloucester, and 55 west of London. This town is supposed by Bishop Gibson to be the place called, in the Saxon annals, Cleveshoo. W. Long. 1. 12. N. Lat. 51. 42. Population 481 in 1811.

ABINTESTATE, in Civil Law, is applied to a person who inherits the right of one who died intestate or without making a will. See INTESTATE.

ABIPONIANS, a tribe of American Indians, who formerly inhabited the district of Chaks in Paraguay; but the hostilities of the Spaniards have now obliged them to remove southwest into the territory lying between Santa Fe and St Jago. The only account we have of them is that published by M. Debrizhoffer in 1785. This gentleman, who lived seven years in their country, informs us that they are not numerous, the whole nation not much exceeding 3000; for which he assigns as a reason an unnatural custom among their women of sometimes destroying their own children, from motives of jealousy lest their husbands should take other mates during the long time they give suck, which
Abiponians is not less than two years. They are naturally white, but, by exposure to the air and smoke, become of a brown colour. They are a strong and hardy race of people; which our author attributes to their marrying so late, an Abiponian seldom or never thinking of marriage till 30 years of age. They are greatly celebrated on account of their chastity and other virtues; though, according to our author, they have no knowledge of a Deity. They make frequent incursions into the territories of the Spaniards, mounted on the horses which run wild in those parts. They have a kind of order of chivalry for their warriors; and are so formidable, that 100 of their enemies will fly before ten of these horsemen. The hatred which these savages, whose manners, though rude and uncultivated, are in many respects pure and virtuous, bear to the Spaniards, is invincible. These pretended Christians," says our author, "who are the scum of the Spanish nation, practise every kind of fraud and villany among these poor barbarians; and their corrupt and vicious morals are so adapted to prejudice the Abiponians against the Christian religion, that the Jesuit missionaries have, by a severe law, prohibited any Spaniard from coming, without a formal permission, into any of their colonies."

—From his account of the success of the Jesuits in converting them to Christianity, however, it does not appear that they have been able to do more than bribe them to a compliance with the ceremonies of the Popish superstition; so that in general they are quite ignorant and uncivilized; a most striking instance of which is, that in counting they can go no further than three; and all the art of the Jesuits to teach them the simplest use and expression of numbers has proved unsuccessful.

Abiram, a sedition Levite, who, in concert with Korah and Dathan, rebelled against Moses and Aaron, is said to have shared with them in the government of the people; when Moses ordering them to come with their censers before the altar of the Lord, the earth suddenly opened under their feet, and swallowed up them and their tents; and at the same instant fire came from heaven, and consumed 250 of their followers. Numb. chap. xvi.

Abishai, son of Zeruiah, and brother to Joab, was one of the celebrated warriors who flourished in the reign of David: he killed with his own hand 300 men, with no other weapons but his lance; and slew a Philistine giant, the iron of whose spear weighed 300 shekels. 1 Sam. chap. xxvi. 2 Sam. chap. xxviii.

Abjuiration, in our ancient customs, implied an oath, taken by a person guilty of felony, and who had fled to a place of sanctuary, whereby he solemnly engaged to leave the kingdom for ever.

Abjuration is now used to signify the renouncing, disclaiming, and denying upon oath, the Pretender to have any kind of right to the crown of these kingdoms.

Abjuration of Heresy, the solemn renunciation of any doctrine as false and wicked.

Ablactation, or weaning a child from the breast. See Weaning.

Ablassation, among the ancient gardeners, the same with what is now called grafting by approach, is a method of engrafting, by which the scion of one tree being for some time united to the stock of another, is afterwards cut off, and, as it were, weaned from the parent tree.

ABLA, a country of Great Tartary, the inhabitants of which are called Bucharas or Bucharan. See Ablat.

Ablacuation, an old term in Gardening, signifies the operation of removing the earth, and burning the roots of trees in winter; to expose them more freely to the air, rain, snows, &c.

Ablancourt. See Perrot.

Ablative, in Grammar, the sixth case of Latin nouns. The word is formed from *a* *ferrre*, "to take away." Priscian also calls it the comparative case; as serving among the Latins, for comparing, as well as taking away.

The ablative is opposite to the dative; the first expressing the action of taking away, and the latter that of giving.

In English, French, &c. there is no precise mark whereby to distinguish the ablative from other cases; and we only use the term in analogy to the Latin. Thus, in the two phrases, *the magnitude of the city*, *he spoke much of the city*; we say, that of the city in the first is genitive, and in the latter ablative; because it would be so, if the two phrases were expressed in Latin.

The question concerning the Greek ablative has been the subject of a famous literary war between two great grammarians, Frischiuni and Cronius; the former maintaining, and the latter opposing, the reality of it. The dispute still subsists among their respective followers. The chief reason alleged by the former is, that the Roman writers often joined Greek words with the Latin prepositions which govern ablative cases, as well as with nouns of the same case. To which their opponents answer, that the Latins anciently had no ablative themselves; but instead thereof, made use, like the Greeks, of the dative case; till at length they formed an ablative, governed by prepositions, which were not put before the dative: that, at first, the two cases had always the same termination, as they still have in many instances: but that this was afterwards changed in certain words. It is no wonder then, that the Latins sometimes join prepositions which govern an ablative case, or nouns in the ablative case, with Greek datives, since they were originally the same; and that the Greek dative has the same effect as the Latin ablative.

Ablative Absolute, in Grammar, is a phrase detached or independent of the other parts of a sentence or discourse. In the Latin language it is frequent, and it has been adopted by the moderns.

Ablay, in Geography, a country of Great Tartary, governed by a Calmuck chief, but subject to Russia, to obtain its protection. It lies east of the river Irtish, and extends 500 leagues along the northern borders of Siberia, from E. Long. 72° to 85° N. Lat. from 51° to 54°.

ABLE, or ABKE, Thomas, chaplain to Queen Catherine, consort to Henry VIII. distinguished himself by his zeal in opposing the proceedings against that unfortunate princess for a divorce. For this purpose he wrote a piece, entitled "Tractatus de Non discoendae Henrieti et Catharinae matrimonio," i. e. "A Treatise proving that the marriage of King Henry and Queen Catherine ought not to be dissolved." But the title of the book, according to Bishop Tavener, was...
ABN

Invidia Vetus. He took the degree of bachelor of arts at Oxford on the 4th of July 1533, and that of master of arts on the 27th of July 1536. In 1534 he fell under a prosecution for being concerned in the affair of Elizabeth Barton, called the Holy Maid of Kent. This was an infamous impostor, sborned by the monks to use strange gesticulations, exhibit fictitious miracles, and to feign the gift of prophecy; and so well did she act her part, that she drew some persons of respectability to her interest: but being detected, she was condemned and executed, after discovering the names of her principal accomplices and instigators. On her account Able was charged with misprision of treason, by stat. 25 Hen. VIII.; and being also one of those who denied the king’s supremacy over the church, he was apprehended and imprisoned; during which time his confinement was so rigorous, that the keeper of Newgate was committed to Marshalsea prison for suffering him to go out upon bail. He was afterwards hanged, drawn, and quartered, at Smithfield in 1540. Boucquier gives him the character of a very learned man; and tells us, that he used to teach the queen music and the learned languages.

ABLECTI, in Roman antiquity, a select body of soldiers chosen from among those called EXTRAORDINARI.

ABLEGMINA, in Roman antiquity, those choice parts of the entrails of victims which were offered in sacrifice to the gods. They were sprinkled with flour, and burnt upon the altar; the priests pouring some wine on them.

ABLEOE, in Geography, a town of Little Tartary, which lies between the river Dnieper and the Black sea. E. Long. 33° 15′. N. Lat. 46° 20′.

ABLUMENTS, in Medicine, the same with diluents or diluents.

ABLUTION, in a general sense, signifies the washing or purifying something with water.

ABLUTION, in a religious sense, a ceremony in use among the ancients, and still practised in several parts of the world: it consists in washing the body, which was always done before sacrificing, or even entering their houses. Abusions appear to be as old as any ceremonies, and external worship itself. Moses enjoined them; the heathens adopted them; and Mahomet and his followers have continued them: thus they have got footing among most nations, and make a considerable part of most established religions. The Egyptian priests had their diurnal and nocturnal ablutions; the Grecians their sprinklings; the Romans their lustrations and lavations; the Jews their washing of hands and feet, beside their baptisms. The ancient Christians had their ablutions before communion; which the Roman church still retain before their mass, sometimes after. The Syrians, Copts, &c. have their solemn washings on Good Friday: the Turks their greater and lesser ablutions; their Ghash and Wodoo, their Aman, Taharat, &c.

ABNER, the son of Ner, father-in-law to Saul, and general of all his forces, served him on all occasions with fidelity and courage. After the death of that prince, Abner set Ishbosheth Saul’s son, on the throne. A war breaking out between the tribe of Judah, who had elected David king, and Israel, Abner marched against that prince with the flower of his troops, but was defeated. Abner afterward, being disgusted, went over to David, and induced the chief of the army and the elders of Israel to declare for him. He was received by David with every mark of affection, which gave offence to Joab, by whom he was insidiously put to death. A. M. 2956.

ABNOBA, now ABENOW, in Geography, a long range of mountains in Germany, extending from the Rhine to the Neckar, and having different names according to the different countries through which they stretch. About the river Maine they are called the Oden or Oetenwald; between Hesse and Franconia, the Spessart; and about the duchy of Wurttemberg, where the Danube takes its rise, they receive the name of Baar.

ABO, a maritime town of Finland, situated on the promontory formed by the gulfs of Finland and Bothnia, 120 miles north-east from Stockholm, in E. Long. 22° 7′ and N. Lat. 60° 58′. It belonged formerly to Sweden, but was transferred to Russia with the province of Finland in 1809. It is built on both sides of the river Auraajoki, which have a communication by a wooden bridge. The streets and lanes of Abo amount to 102; the number of houses to 1100, which in 1780 contained above 2000 families. In 1791 the number of inhabitants was 11,500.

A Gymnasium was established at Abo by Gustavus Adolphus in 1626, which was converted by Queen Christina, in 1640, into an academy or university, in which are now taught anatomy, natural history, chemistry, and economics. The library founded by Queen Christina consists of above 10,000 volumes, besides manuscripts, ancient coins, medals, &c. The school of anatomy is in considerable repute; and enjoys, it is said, one very extraordinary privilege. By a particular regulation, all persons who hold lands or pensions from the crown are bound to leave their bodies to be dissected for the instruction of the students.

The trade of Abo is considerable. The exports consist of iron, copper, pitch, tar, deals, &c. The imports are tobacco, coffee, sugar, wine, salt, grain, hemp, and spiceries. In Abo are manufactured silk ribbands, fustian, sail-cloth, leather, tiles, watches and clocks, paper, sugar, and tobacco. The plantations of tobacco in this neighbourhood produce not less than 152,000 cwt. annually. (Acerbi’s Travels).

ABO-HUS, or ABO-SLOT, a very ancient castle in Finland, situated at the mouth of the river Aura, was the residence of Duke John, and the prison of King Eric in the 16th century. It is at present employed as a magazine for corn and gunpowder, and as a prison for state offenders.

ABOARD, the inside of a ship. Hence any person who enters a ship is said to go aboard; but when an enemy enters in the time of battle, he is said to board; a phrase which always implies hostility. To fall aboard of, is to strike or encounter another ship when one or both are in motion, or to be driven upon a ship by the force of the wind or current. - Aboard-main-tack, the order to draw the main-tack, i.e. the lower-corner of the main-sail, down to the chess-tree.

ABOASAR, in Geography, a village in Lower Egypt, supposed to be the ancient Busiris.

ABOCCIS, in Ancient Geography, the Abuncis of Potlonya, a town of Ethiopia, situated on the western side of the Nile near the great cataract.

E 2

ABOCRO,
ABOCRO, or ABORREL, in Geography, a town near the river Ankarol or Cobre, on the African Gold coast. It gives name to a republican province.

ABOLA, in Geography, a division of the Agow, in Abyssinia, is a narrow valley, through which runs a river of the same name, whose waters receive many tributary streams from the lofty, rugged, and woody mountains that form the valley. In none of the rivers are any fish found, which Bruce ascribes to their being dried up in the summer, and great rapidity in winter.

ABOLITION, implies the act of annulling, destroying, making void, or reducing to nothing. In our law, it signifies the repealing any law or statute. The leave given by a prince or judge to a criminal accused to desist from farther prosecution of the accused, is in the most appropriate sense denominated abolition.

Abolition is particularly used among civilians, for remitting the punishment of a crime. It is, in this sense, a kind of amnesty; the punishment, not the infamy, is taken off.

Abolition, in the Roman law, is the annulling a prosecution, or legal accusation; and in this sense, it is different from amnesty; for, in the former, the accusation might be renewed by the same prosecutor, but in the latter, it was extinguished for ever. Within 30 days after a public abolition, the same accuser, with the prince's license, was allowed to renew the charge; after a private abolition, another accuser might renew it, but the same could not. Abolation was also used for expunging a person's name from the public list of the accused, hung up in the treasury. It was either public, as that under Augustus, when a man or name which had long hung up, were expunged at once; or private, when it was done at the motion of one of the parties. Abolition of debts, according to the doctrine of the Thedosian code, was sometimes granted to those who were indebted to the fiscus. A medal of the emperor Adrian represents that prince with a sceptre in his left hand, and a lighted torch in his right, with which he sets fire to several papers in presence of the people, who testify their joy and gratitude by lifting up their hands towards heaven. The legend on the medal is, Reliquia vetera N. i. summis abolita.

Abolla, in antiquity, a warm kind of garment, lined or doubled, worn by the Greeks and Romans, chiefly out of the city, in following the camp.—Critics and antiquaries are greatly divided as to the form, use, kinds, &c. of this garment. Papias makes it a species of the toga, or gown; but Nonnus, and most others, suppose it to be a species of the pallium, or cloak. The abolla seems rather to have stood opposed to the toga, which was a garment of peace, as the abolla was of war; at least Varro and Martial place them in this opposite light. There seem to have been different kinds of abolla, appropriated to different characters and occasions. Even kings appear to have used the abolla: Caligula was offended with King Ptolemy for appearing at the shows in a purple abolla, the splendour of which drew the eyes of the spectators from the emperor to himself.

Abomasus, Abomasum, or Abosmus, names of the fourth stomach of ruminating animals. It is in the abomasus of calves and lambs that the runnet or earring is formed where milk is curdled. See Anatomy, Part II.

ABOMINATION, a term used in Scripture with regard to the Hebrews, who, being shepherds, are said to have been an abomination to the Egyptians, because they sacrificed the sacred animals of that people, as oxen, goats, sheep, &c. which the Egyptians esteemed as abominations, or things unlawful. The term is also applied in the sacred writings to idolatry and idols, because the worship of idols is itself an abominable thing, and at the same time ceremonies observed by idolaters were always attended with licentiousness and other odious and abominable actions. The abomination of desolation, foretold by the prophet Daniel, is supposed to imply the statue of Jupiter Olympus, which Antiochus Epiphanes caused to be placed in the temple of Jerusalem. And the abomination of desolation, mentioned by the Evangelists, signifies the ensign of the Romans, during the last siege of Jerusalem by Titus, on which the figures of their gods and emperors were embroidered, and placed upon the temple after it was taken.

Abon, Abona, or Abonis, in Ancient Geography, a town and river of Albion. The town, according to Camden, is Abingdon; and the river, Abon or Avon. But by Antonine's Itinerary, the distance is nine miles from the Venta Silurum, or Caerwent; others, therefore, take the town to be Porchut, at the mouth of the river Avon, near Bristol. Abon or Avon, in the Celtic language, denotes a river.

Aboras, in Ancient Geography, by Xenophon called Araxes, a river of Mesopotamia, which flows into the Euphrates at Circesium. In the negotiation between Dioclesian and Narses, near the end of the third century, it was fixed as the boundary between the Roman and Persian empire.

Aborigines, in history. ( Dionysius of Halicarnassus, Livy, Virgil) original, a proper name, given to a certain people in Italy, who inhabited the ancient Latium, or country now called Campagna di Roma. In this sense the Aborigines are distinguished from the Janigene, who, according to the false Berosus, inhabited the country before them; from the Siculi, whom they expelled; from the Grecians, from whom they descended; from the Latins, whose name they assumed after their union with Eneas and the Trojans; lastly, from the Ausonii, Voleci, Oenotri, &c. neighbouring nations in other parts of the country. Whence this people came by the appellation is much disputed. St Jerome says, they were so called, as being absque origine, the primitive planters of the country after the flood: Dionysius of Halicarnassus accounts for the name, as denoting them the founders of the race of inhabitants of that country: others think them so called as being originally Arcadians, who claimed to be earth-born, and not descended from any people. Aurelius Victor suggests another opinion, viz. that they were called Aborigines, q. d. Aberriges, from agg. "from," and errare, "to wander"; as having been before a wandering people. Pausanias rather thinks they were thus called ews eges, "from mountains; which opinion seems confirmed by Virgil, who, speaking of Saturn, the legislator of this people, says,

Is genus indoctile ac dispersum montibus altis
Compositum, legesse odiit.——

The Aborigines were either the original inhabitants of the country, settled there by Janus, as some imagine;
Aborigines, gone; or by Saturn, or Cham, or others; not long
after the dispersion, or even, as some think, before it:
Or, they were a colony sent from some other nation;
who expelling the Siculi, the ancient inhabitants, set-
tled in their place. About this mother nation there
is great dispute. Some maintain it to be the Arca-
drians, parties of whom were brought into Italy at dif-
f erent times; the first under the conduct of Oenotrius,
son of Lycaon, 450 years before the Trojan war; a
second from Thessaly; a third under Evander, 60
years before the Trojan war; besides another under
Hercules; and another of Lacedemonians, who fled
from the severe discipline of Lycurgus: all these uni-
ting, are said to have formed the nation or kingdom
of the Aborigines. Others will have them of barba-
rian rather than Grecian origin, and to have come
from Scythia; others from Gaul. Lastly, Others will
have them to be Cannibals, expelled by Joshua.
The term Aborigines, though so famous in antiqui-
ety, is used in modern geography only occasionally
as an appellative. It is given to the primitive inhabi-
tants of a country, in contradistinction to colonies, or
new races of people.

Abortion, in Midwifery, the premature exclu-
sion of a fetus. See Midwifery.
The practice of procuring abortions was prohibited
by the ancient Greek legislators Solon and Lycurgus.
Whether or not it was permitted among the Romans,
has been much disputed. It is certain the practice,
which was by them called viscerae sivm inferre, was
frequent enough; but whether there was any penalty
on it before the emperors Severus and Antonine, is
the question. Noth maintains the negative; and fur-
ther, that those princes only made it criminal in one
particular case, viz. of a married woman's practising
it out of resentment against her husband, in order to
defraud him of the comfort of children: this was or-
dered to be punished by a temporary exile. The foun-
dation on which this practice is said to have been al-
 lowed, was, that the fetus, while in utero, was regar-
ded as part of the mother, ranked as one of her own
viscera, over which she had the same power as over the
rest: besides, that it was not reputed as a man, homo;
nor to be alive, otherwise than as a vegetable: con-
sequently, that the crime amounted to little more than
that of plucking unripe fruit from the trees. Zeneca
represents it as a peculiar glory of Helvia, that she had
never, like other women, whose chief study is their
beauty and shape, destroyed the fetus in her womb.
The primitive fathers, Athenagoras, Tertullian, Mi-
nutius Felix, Augustin, &c. declaimed loudly against
the practice as a virtual murder. Several councils have
condemned it. Yet we are told that the modern Ro-
mish ecclesiastical laws allow of dispensations for it.
Egan mentions the rates at which a dispensation for
it may be had.

The practice of artificial abortion is chiefly in the
hands of women and nurses, rarely in that of physi-
cians; who, in some countries, are not admitted to the
profession without shunning it. Hippocrates, in the
oath he would have enjoined on all physicians, includes
their not giving the pessus abortivus, though elsewhere
he gives the formal process whereby he himself pro-
cured in a young woman a miscarriage. It may, how-
ever, be observed, that often all the powers of art
prove ineffectual, and no less often do the attempts
prove the means of punishment by their fatal conse-
quences. See Abortion, Supplement.

Abortion, among gardeners, signifies such fruits
as are produced too early, and never arrive at matu-
rity.

Abortive, is, in general, applied to whatever
comes before its legitimate time, or to any design which
miscarries.

Abortive Corn, a distemper of corn mentioned by
M. Tillet, and suspected to be occasioned by insects:
It appears long before harvest, and may be known by
a deformity of the stalk, the leaves, the ear, and even
the grain.

Abortive Velum, is made of the skin of an abortive
calf.

Abortites, or Abodrites, in History, the name of a
people bordering on Bulgaria, in that part of Dacia contiguous to the Danube. The country of
the Abodrites, now called Heckdenburg, was a part
of the ancient Vandalia.

Aboukir, a small town of Egypt, situated in
the desert between Alexandria and Rosetta. It is the
ancient Canopus, and is situated, according to Mr Sa-
vary, six leagues from Pharos. Pliny says, from the
 testimonies of antiquity, that it was formerly an island:
and its local appearance makes this credible. The town
is built upon a rock, which forms a handsome road for
shipping, and was out of the reach of inundations.
In the bay of Aboukir, a signal victory was obtained
in 1798 by the English fleet over the French fleet.
The town was taken from the Turks, after a vigorous
defence, by the French in 1799, and retaken by the
English in 1801.

Abouleda, a celebrated Arabian writer. See
Supplement.

About, the situation of a ship immediately after
she has tacked, or changed her course by going about
and standing on the other tack. About ship! the or-
der to the ship's crew for tacking.

Aboutige, a town of Upper Egypt, in Africa,
near the Nile, where they made the best opium in all
the Levant. It was formerly a large, but now is a
mean place. N. Lat. 26° 10.

Abra, a silver coin struck in Poland, and worth
about one shilling sterling. It is current in several
parts of Germany, at Constantinope, Astracan, Smyrne,
and Grand Cairo.

Abrabanel, Abrabanel, or Ahravanel,
Isaac, a celebrated rabbi, descended from King David,
and born at Lisbon A.D. 1437. He became coun-
sellor to Alphonso V. king of Portugal, and afterwards
to Ferdinand the Catholic; but in 1492 was obliged
to leave Spain with the other Jews. In short, after re-
siding at Naples, Corfu, and several other cities, he
died at Venice in 1508, aged 71. Abrabanel passed
for one of the most learned of the rabbis; and the Jews
gave him the names of the Sage, the Prince, and the
Great Politician. We have a commentary of his on
all the Old Testament, which is pretty scarce; he there
principally adheres to the literal sense; and his style is
clear, but a little diffuse. His other works are, A
Treatise on the Creation of the World; in which he re-
utes Aristotle, who imagined that the world was
ternal: A Treatise on the Explication of the Prophe-
...
ABRAM.

Abram, the father and stock whence the faithful sprung, was the son of Terah. He was descended from Noah by Shem, from whom he was nine degrees removed. Some fix his birth in the 130th year of Terah's age, but others place it in his father's 70th year. It is highly probable he was born in the city of Ur, in Chaldea, which he and his father left when they went to Canaan, where they remained till the death of Terah; after which, Abraham resumed his first design of going to Palestine. The Scriptures mention the several pieces he stopped at in Canaan; his journey into Egypt, where his wife was carried off from him; his going into Gerar, where Sarah was again taken from him, but restored, as before; the victory he obtained over the four kings who had plundered Sodom; his compliance with his wife, who insisted that he should make use of their maid Hagar in order to raise up children; the covenant God made with him, sealed with the ceremony of circumcision; his obedience to the command of God, who ordered him to offer up his only son as a sacrifice, and how this bloody act was prevented; his marriage with Keturah; his death at the age of 175 years; and his internment in the cave of Machpelah, near the body of Sarah his first wife. It would be of little use to dwell long upon these particulars, since they are so well known. But tradition has supplied numberless others, the mention of one or two of which may not be unacceptable.

Many extraordinary particulars have been told relating to his conversion from idolatry. It is a pretty general opinion, that he sucked in the poison with his milk; that his father made statues, and taught that they were to be worshipped as gods. Some Jewish authors relate, that Abraham followed the same trade with Terah for a considerable time. Maimonides says, that he was bred up in the religion of the Saracens, who acknowledged no deity but the stars; that his reflections on the nature of the planets, his admiration of their motions, beauty and order, made him conclude the universe must be a being superior to the mankind of the universe, a being who created and governed it; however, according to an old tradition, he did not renounce Paganism till the 50th year of his age. It is related, that his father, being gone a journey, left him to sell the statues in his absence; and that a man, who pretended to be a purchaser, asked him how old he was: Abraham answered, Fifty."—"Wretch that thou art (said the other), for adoring at such an age a being which is but a day old!" Those words greatly confounded Abraham. Some time afterwards, a woman brought him some flour, that he might give it as an offering to the idols; but Abraham, instead of doing so, took up a hatchet and broke them all to pieces, excepting the largest, into the hand of which he put the weapon. Terah, at his return, asked whence came all this havoc? Abraham made answer, that the statues had had a great contest which should eat first of the oblation; but which (said he), the god you see there, being the stoutest, bowed the others to pieces with that hatchet." Terah told him this was bantering; for those idols had not the sense to act in this manner. Abraham recited these words upon his father against the worshipping of such gods. Terah, stung with this raillery, delivered up his son to the cognizance of Ninrood, the sovereign of the country; who exibited Abraham to worship the fire; and, upon his refusal, commanded him to be thrown into the midst of the flames: "Now let your God (said he) come and deliver you." But (adds the tradition) Abraham escaped from the flames unhurt.—This tradition is not of modern date, since it is told by St Jerome; who seems to credit it in general, but disbelieves that part of it which makes Terah so cruel as to be the informer against his own son. Perhaps it is the ambiguity of the word Ur n7. might have given rise to the fiction altogether. Such as lay stress on the following of a lowing words which God says to Abraham (Gen. xiv: 17, and it is also significant in 2 Thess. ii. 7.), I am the Lord that brought thee out of Ur of the Chaldees, imagine that he saved him from a great peril. Lat. version alteration, since he employed the very same words in the Exod. ix. beginning of the dialogue to denote the deliverance has it thus: qui eligens cum deigne Chaldea.

Abraham is said to have been well skilled in many sciences, and to have wrote several books. Josephus tells us that he taught the Egyptians arithmetic and geometry; and according to Eusebius and Artemon, he instructed the Phenicians, as well as the Egyptians, in astronomy. A work which treats of the creation has been long ascribed to him: it is mentioned in the Talmud, and the rabbis Chanina and Hoschias used to read it on the eve before the Sabbath. In the first ages of Christianity, according to St Epiphanius, a heretical sect, called Sethianians, dispersed a piece which had the title of Abraham's Revelation. Origen mentions also a treatise supposed to be written by this patriarch. All the several works which Abraham composed in the plains of Mamre, are said to be contained in the library of the monastery of the Holy Cross on Mount Amaria in Ethiopia. The book on which the creation was printed at Paris in 1552, and translated into Latin by Postel: Bittangel, a converted Jew, and professor at Konigsegg, gave also a Latin translation of it, with remarks, in 1642.

ABRAM Ben Chavi, a Spanish rabbi, in the 12th century, who professed astrology, and assumed the character of a prophet. He pretended to predict the coming of the Messiah, which was to happen in the year 1358; but fortunately he died in 1302, fifty-five years before the time when the prediction was to be fulfilled.
to have come from Egypt; whence they are of some use for explaining the antiquities of that country. Sometimes they have no other inscription beside the word: but others have the names of saints, angels, or Jehovah himself annexed; though most usually the name of the Basiliadon god. Sometimes there is a representation of Isis sitting on a lotus, or Apis surrounded with stars; sometimes monstrous compositions of animals, obscene images, Phalli and Ithyphalli. The graving is rarely good, but the word on the reverse is sometimes said to be in a more modern style than the other. The characters are usually Greek, Hebrew, Coptic, or Hetrurian, and sometimes of a mongrel kind, invented, as it would seem, to render their meaning the more inscrutable. It is disputed whether the Veronica of Montreuil, or the granite obelisk mentioned by Gori, be Abrasax.

ABREST (a sea term), side by side, or opposite to; a situation in which two or more ships lie, with their sides parallel to each other, and their heads equally advanced. This term more particularly regards the line of battle at sea, where on the different occasions of attack, retreat, or pursuit, the several squadrons or divisions of a fleet are obliged to vary their dispositions, and yet maintain a proper regularity by sailing in right or curved lines. When the line is formed abreast, the whole squadron advances uniformly, the ships being equally distant from and parallel to each other, so that the length of each ship forms a right angle with the extent of the squadron or line abreast. The commander in chief is always stationed in the centre, and the second and third in command in the centres of their respective squadrons. —Abrace, within the ship, implies on a line with the beam, or by the side of any object aboard; as, the frigate sprung a leak abreast of the main hatchway, i.e. on the same line with the main hatchway, crossing the ship's length at right angles, in opposition to abreast of the hatchway.

ABRETENE, or ABRETINE, in Ancient Geography, a district of Mycia, in Asia. Hence the epitaph Abretenus given to Jupiter (Sterbo); whose priest was Cleon, formerly at the head of a gang of robbers; and who received many and great favours at the hand of Antony, but afterwards went over to Augustus. The people were called Abretiani; inhabiting the country between Ancysa of Phrygia and the river Rhynndacus.

ABRIDGEMENT, in Literature, a term signifying the reduction of a book into a smaller compass. The art of conveying much sentiment in few words, is the happiest talent an author can be possessed of. This talent is peculiarly necessary in the present state of literature; for many writers have acquired the dexterity of spreading a few trivial thoughts over several hundred pages. When an author hits upon a thought that pleases him, he is apt to dwell upon it, to view it in different lights, to force it in improperly, or upon the slightest relations. Though this may be pleasant to the writer, it tires and vexes the reader. There is another great source of diffusion in composition. It is a capital object with an author, whatever be the subject, to give vent to all his best thoughts. When he finds a proper place for way of them, he is peculiarly happy. But rather than sacrifice a thought he is fond of, he forces it in by way of digression, or superfluous illustration.
In Dr. Campbell's Dissertation on Miracles, the author's principal aim is to show the fallacy of Mr. Hume's argument; which he has done most successfully by another single argument, as follows:

"The evidence arising from human testimony is not solely derived from experience: on the contrary, testimony hath a natural influence on belief antecedent to experience. The early and unlimited assent given to testimony by children gradually contracts as they advance in life: it is, therefore, more consonant to truth to say, that our diffidence in testimony is the result of experience, than that our faith in it has this foundation. Besides, the uniformity of experience, in favour of any fact, is not a proof against its being reversed in a particular instance. The evidence arising from the single testimony of a man of known veracity will go farther to establish a belief in its being actually reversed: If his testimony be confirmed by a few others of the same character, we cannot withhold our assent to the truth of it. Now, though the operations of nature are governed by uniform laws, and though we have not the testimony of our senses in favour of any violation of them; still, in particular instances we have the testimony of thousands of our fellow-creatures, and those too men of strict integrity, awed by no motives of ambition or interest, and governed by the principles of common sense, That they were actually eye witnesses of these violations, the constitution of our nature obliges us to believe them."

These two examples contain the substance of about 100 pages.—Making private abridgments of this kind has many advantages: It engages us to read with accuracy and attention; it fixes the subject in our minds; and, if we should happen to forget, instead of rereading the books again, by glancing a few lines, we are not only in possession of the chief arguments, but recall in a good measure the author's method and manner.

Abridging is peculiarly useful in taking the substance of what is delivered by professors. It is possible even with the assistance of shorthand, to take down, verbatim, what is said by a public speaker. Besides, although it were practicable, such a talent would be of little use. Every public speaker has circumlocutions, redundancies, lumber which deserve not to be copied. All that is really useful may be comprehended in a short compass. If the plan of the discourse, and arguments employed in support of the different branches, be taken down, you have the whole. These you may afterwards extend in the form of a discourse dressed in your own language. This would not only be a more rational employment, but would likewise be an excellent method of improving young men in composition; an object too little attended to in all our universities.

"The mode of reducing, says the author of the Curiosities of Literature, what the ancients had written in bulky volumes, practised in preceding centuries, came into general use about the fifth. As the number of students and readers diminished, authors neglected literature, and were diagnosticated with composition; for to write is seldom done, but when the writer entertains the hope of finding readers. Instead of original authors, there suddenly arose numbers of abridgers. These men, amidst the prevailing disgust for
for literature, imagined they should gratify the public by introducing a mode of reading works in a few hours, which otherwise could not be done in many months; and, observing that the bulky volumes of the ancients lay buried in dust, without any one condescending to examine them, the disagreeable necessity inspired them with an invention that might bring those works and themselves into public notice, by the care they took of renovating them. This they imagined to effect by forming abridgments of these ponderous volumes.

All these Abridgers, however, did not follow the same mode. Some contented themselves with making a mere abridgment of their authors, by employing their own expressions, or by inconsiderable alterations. Others composed these abridgments in drawing them from various authors; but from whose works they only took what appeared to them most worthy of observation, and dressed them in their own style. Others, again, having before them several authors who wrote on the same subject, took passage from each, united them, and thus formed a new work. They executed their design by digesting in common places, and under various titles, the most valuable parts they could collect, from the best authors they read. To these last ingenious scholars, we owe the rescue of many valuable fragments of antiquity. They happily preserved the best maxims, the characters of persons, descriptions, and any other subjects which they found interesting in their studies.

There have been learned men who have censured these Abridgers, as the cause of our having lost so many excellent entire works of the ancients; for posterity becoming less studious, was satisfied with these extracts, and neglected to preserve the originals, whose voluminous size was less attractive. Others on the contrary say, that these Abridgers have not been so prejudicial to literature, as some have imagined; and that had it not been for their care, which snatched many a perishable fragment from that shipwreck of letters, which the barbarians occasioned, we should perhaps have had no works of the ancients remaining.

Abridgers, Compilers, and even Translators, in the present fastidious age, are alike regarded with contempt; yet to form their works with skill requires an exertion of judgment, and frequently of taste, of which their contemporaries appear to have no conception. It is the great misfortune of such literary labours, that even when performed with ability, the learned will not be found to want them, and the unlearned have not discernment to appreciate them.

ABRINCATARUM OPPIDUM, in Ancient Geography, the town of the Abrincates or Abrincatui; now Avranches, in France, situated on an eminence in the south-west of Normandy, near the borders of Brittany, on the English channel. W. Long. 1. 10. N. Lat. 48. 40.

ABROGATION, the act of abolishing a law, by authority of the maker; in which sense the word is synonymous with abolition, repealing, and revocation.

Abrogation stands opposed to rogation: it is distinguished from derogation, which implies the taking away only some part of a law; from subrogation, which denotes the adding a clause to it; from obrogation, which implies the limiting or restraining it; from dispensation, which only sets it aside in a particular instance; and from antiquation, which is the refusing to pass a law.

ABROKANI, or MALLEMOLLI, a kind of muslin, or clear, white, fine cotton cloth, brought from the East Indies, particularly from Bengal; being in length 16 French ells and 3 quarters, and in breadth 5 eights.

ABROLHOS, in Geography, dangerous shoals or banks of sand, about 20 leagues from the coast of Brazil. S. Lat. 18. 22. W. Long. 38. 45.

ABROMA, in Botany. See BOTANY INDEX.

ABROTANUM, in Botany. See ARTEMISIA, BOTANY INDEX.

ABRONUM, in Ancient Geography, a town and harbour on the Mediterranean, in the district of Syrtis Parva in Africa; one of the three cities that formed Tripoly.

ABRUG-BANTA, in Geography, a populous town of Transylvania, in the district of Weissenburg. It is situated in a country which abounds with mines of gold and silver, and is the residence of the mine office, and chief of the metal towns. E. Long. 23. 24. N. Lat. 46. 50.

ABRUS, in Botany; the trivial name of the GLYCINE.

ABRUZZO, a province of Naples. The river Pescara divides it into two parts; one of which is called Ulterior, of which Aquila is the capital; and the other Citerior, whose capital is Chieti. Besides the Apennines, there are two considerable mountains, the one called Monte Cavallo, and the other Monte Majello; the top of which last is always covered with snow. Abruzzo is a cold country; but the rigour of the climate is not so great as to prevent the country from producing in abundance every thing requisite for the support of life. Vegetables, fruits, animals, and numberless other articles, of sustenance, not only furnish ample provision for the use of the natives, but also allow of exportation. It produces so much wheat, that many thousands of quarters are annually shipped off. Much Turkey wheat is sent out, and the province of Teramo sells a great deal of rice little inferior in quality to that of Lombardy. Oil is a plentiful commodity, and wines are made for exportation on many parts of the coast; but wool has always been, and still is, their staple commodity: the flocks, after passing the whole summer in the fine pastures of the mountains, are driven for the winter into the warm plains of Puglia, and a few spots near their own coast, where the snow does not lie. There are no manufactures of woollens in the province, except two small ones of coarse cloth. The greatest part of the wool is exported unwrought. No silk is made here, though mulberry trees would grow well in the low grounds.

Formerly the territory of Aquila furnished Italy almost exclusively with saffron; but since the culture of that plant has been so much followed in Lombardy, it has fallen to nothing in Abruzzo. In the maritime tracts of country the cultivation of liquorice has been increased of late years, but foreigners export the roots in their natural state; in the province of Teramo there is a manufacture of pottery ware, for which there is a great demand in Germany, by the way of Trieste, as it is remarkably hard and fine; but even this is going
ABR to decay, by being abandoned entirely to the ig- 

ABSA 

ABSAgnorance of common workmen. It is not to be expected 
that any improvements will be made in arts and manu- 
factures, where the encouragement and attention of su-

ABSApeers is wanting, and no pains taken to render the 
commodity more marketable, or to open better channels 
of sale for it. The only advantages these provinces 

ABSAenjoy, are the gift of benevolent nature; but she has 
still greater presents in store for them, and waits only 
for the helping hand of government to produce them. 
This whole coast, one hundred miles in length, is ut-

ABSAterly destitute of sea ports; and the only spots where 
the produce can be embarked are dangerous inac-

ABSAcent roads, at the mouths of rivers, and along a lee-

ABSAshore; the difficulty of procuring shipping, and of lead-

ABSAing the goods, frequently causes great quantities of 

ABSAthem to rot on hand; which damps industry, and pre-

ABSAvents all improvements in agriculture. The husband-

ABSAman is a poor dispirited wretch, and wretchedness pro-

ABSAduces emigration: the uneven surface of the country 
ococcations it to be inhabited by retail, if the expres-

ABSAsion may be used, rather than in large masses; for there is 

ABSA not a city that contains ten thousand people, and few 
of them exceed three thousand. Villages, castles, and 
fecundatory estates are to be met with in abundance; 

ABSA but the numbers of their inhabitants are to be reckoned 

ABSAby hundreds, not thousands; in a word, the political 

ABSAand social system of the province shows no signs of the 
vigour which nature so remarkably displays here in all 
her operations.

ABSA

ABSA

The antiquity and the naturalist may travel here 

ABSwith exquisite pleasure and profit; the former will find 
treasures of inscriptions, and inedited monuments, be-

ABSAlonging to the warlike nations that once covered the 
ABSAface of the country; the natural philosopher will have 

ABSAa noble field for observation in the stupendous moun-

ABSAtains that rise on all sides. Monte-corno and Majello 

ABSAare among the most interesting. The first is like an aged 

ABSAMonument of nature, bald, and horribly broken on 

ABSAevery aspect; from various appearances, it is evident 

ABSAthat its boulders contain many valuable veins of metallic 

ABSAore; but the great difficulty of access renders the search 

ABSAof them almost impracticable. Majello has other merits, 

ABSAand of a gayer kind—nature has clothed its declivities 

ABSAand elevated fields with an infinite variety of plants.

ABSA

The character of the inhabitants varies a little among 

ABSAthemselves, according to situation and climate, but es-

ABSAentially from the disposition of the natives of the more 

ABSA southern provinces. This proceeds from a difference of 

ABSOriuon: for the Lombards, who were barbarians, but not 

ABSAcrue; poor, but hospitable; endowed with plain honest 

ABSAsense, though possessed of little aveness or subtlety; re-

ABSAmained peaceable proprietors of these mountainous regions, 

ABSAtil the Normans, who were ac-

ABSAustomed to a similar climate, came and dispossessed 

ABSAthem. The Greeks who retained almost every other 

ABSANpart of the kingdom under their dominion, never had 

ABSAany sway here. For this reason the Abruzzesi still 

ABSAbear a great resemblance to their northern proglomers 

ABSA儿女: to this day one may trace in them the same 

ABSAgoodness of heart, but great indolence and re-

ABSApugnacious to lively exertions; a fault that proceeds 

ABSArather from a want of active virtue, than a disposition to 

ABSAwickedness. Hence it comes, that in these provinces, 

ABSAwhere the proximity of the frontier almost ensures in-
munity, fewer atrocious and inhuman deeds are heard 

ABSAthan in other parts of the realm. Remnants of an-

ABScient northern customs existed here so late as the be-

ABSAginning of this century, and, among the mountaineers, 

ABSAvery evident traces of the Frank and Teutonic lan-

ABSAguages may be discovered.

abo
ABSORption.

Absolute numbers, but 2 is not, as being joined with the letter x.

ABSOlution, in Civil Law, is a sentence whereby the party accused is declared innocent of the crime laid to his charge. Among the Romans, the ordinary method of pronouncing judgment was this: after the cause had been pleaded on both sides, the precew used the word absolvere, q. d. they have said what they had to say; then three ballots were distributed to each judge, marked as mentioned under the article A; and as the majority fell of either mark, the accused was absolved or condemned, &c. If he were absolved, the prætor dismissed him with viatetur non fessice, or viatetur fessice.

ABSOlution, in the Canons Law, is a juridical act, whereby the priest declares the sins of such as are penitent remitted. The Romanists hold absolution a part of the sacrament of penance; the council of Trent, sess. xiv. cap. iii. and that of Florence, in the decree ad Armenos, declare the form or essence of the sacrament to lie in the words of absolution, I absolve thee of thy sins. The formula of absolution, in the Roman church, is absolute: in the Greek church, it is deprecatory; and in the churches of the reformed, declarative.

ABSOlution is chiefly used among Protestants for a sentence by which a person who stands excommunicated is released or freed from that punishment.

ABSORBENT, in general, any thing possessing the faculty of absorbing, or swallowing up another.

ABSORBENT Medicines, testaceous powders, or substances into which calcareous earth enters, as chalk, crabs eyes, &c. which are taken inwardly, for drying up or absorbing any acid or redundant humours in the stomach or intestines. They are likewise applied externally to ulcers or sores with the same intention.

ABSORBENTS or ABsORBIng Vessels, in Anatomy, a name given promiscuously to the lactic vessels, lymphatics, and inhalant arteries, a minute kind of vessels found in animal bodies, which imbibe fluids that come in contact with them. On account of their moistness and transparency, they escape observation in ordinary dissection. They have, however, been detected in every tribe of animals, and, in the animals which have been examined, in every part of the body. Those which open into the stomach and intestines, and convey the chyle, which is a milky fluid, from these organs to the blood, have received the name of lacteals, or lactic vessels; and those which open on the external surface, and the surface of all the cavities of the body, have been denominated lymphatics, from the lymph or colourless fluid which they contain. See Anatomy.

ABSORBING, the swallowing up, sucking up, or imbibing any thing: thus black bodies are said to absorb the rays of light; luxuriant branches, to absorb, or waste the nutritious juices which should feed the fruit of trees, &c.

ABSORPTION, in the animal economy, is the function of the absorbent vessels, or that power by which they take up and propel substances. This power has been ascribed to the operation of different causes, according to the theories which physiologists have proposed. Some attribute it to capillary attraction, others to the pressure of the atmosphere, and others to
The Roman ladies, in the first ages of the republic, were all enjoined to be abstemious; and that it might appear, by their breath, whether or no they kept up to the injunction, it was one of the laws of the Roman civility, that they should kiss their friends and relations whenever they accosted them.

ABSTEMIUS, LAURENTIUS, a native of Macerata, professor of belles lettres in Urbino, and librarian of Duke Guido Ubaldio, under the pontificate of Alexander VI. He wrote, 1. Notes on most difficult passages of ancient authors. 2. Heptamythum. A collection of a hundred fabulous &c. which have been often printed with those of Apollodorus, Pheorus, Gaius, Avienus, &c. and a preface to the edition of Aurelius Victor published at Venice in 1505.

ABSTERGENT MEDICINES, those employed for resolving obstructions, concretions, &c. such as soap, &c.

ABSTINENCE, in a general sense, the act or habit of refraining from something to which there is a strong propensity. Among the Jews, various kinds of abstinence were ordained by their law. The Pythagoreans, when initiated, were enjoined to abstain from animal food, except the remains of sacrifices; and to drink nothing but water, unless in the evening, when they were permitted to take a small portion of wine. Among the primitive Christians, some denied themselves the use of such meats as were prohibited by that law, others regarded this abstinence with contempt; of which St Paul gives his opinion, Rom. xiv. 1—5. The council of Jerusalem, which was held by the apostles, enjoined the Christian converts to abstain from meats strangled, from blood, from fornication, and from idolatry. Abstinence, as prescribed by the gospel, is intended to mortify and restrain the passions, to humble our vicious natures, and by that means raise our minds to a due sense of devotion. But there is another sort of abstinence, which may be called ritual, and consists in abstaining from particular meats at certain times and seasons. It was the spiritual monarchy of the western world which first introduced this ritual abstinence; the rules of which were called rogations; but grossly abused from the true nature and design of fasting. In England, abstinence from flesh has been enjoined by statute since the Reformation, particularly on Fridays and Saturdays, on vigils, and on all commonly called fish days. The like injunctions were renewed under Queen Elizabeth: but at the same time it was declared, that this was done not out of motives of religion, as if there were any difference in meats; but in favour of the consumption of fish, and to multiply the number of fishermen and mariners, as well as to spare the stock of sheep. The great fast, says St Augustin, is to abstain from sin.

Abstinence is more particularly used for a spare diet, or a slender parsimonious use of food. Physicians relate wonders of the effects of abstinence in the cure of many disorders, and protracting the term of life. The noble Venetian Cornaro, after all imaginable means had proved vain, so that his life was anticipated of at 40, recovered, and lived to near 100, by the mere effect of abstinence; as he himself gives the account. It is indeed surprising to what a great age the primitive Christians of the east, who retired from the persecutions into the deserts of Arabia and Egypt, lived,
Abstinence, indeed, healthful and cheerful, on a very little food. Cassian assures us, that the common rate for 24 hours was 12 ounces of bread, and pure water: with such a frugal fare St Anthony lived 105 years; James the Hermit, 104; Arsenius, tutor of the emperor Arcadius, 120; St Epiphanius, 115; Simeon the Stylite, 112; and Romuald, 120. Indeed, we can match these instances of longevity at home. Buchanan informs us, that one Laurence arrived at the great age of 140 by force of temperance and labour; and Spottwood mentions one Kentigern, afterwards called St Mongoth or Mongie, who lived to 185 by the same means. Abstinence, however, is to be recommended only as it means a proper regimen; for in general it must have bad consequences when observed without some regard to constitution, age, strength, &c. According to Dr Cheyne, most of the chronic diseases, the infirmities of old age, and the short lives of Englishmen, are owing to repletion; and may be either cured, prevented, or remedied by abstinence; but then the kinds of abstinence which ought to be observed, either in sickness or health, are to be deduced from the laws of diet and regimen.

Among the inferior animals, we see extraordinary instances of long abstinence. The serpent kind, in particular, bear abstinence to a wonderful degree. We have seen rattlesnakes which had lived many months without any food; yet still retained their vigour and fierceness. Dr Shaw speaks of a couple of cerastes (a sort of Egyptian serpents), which had been kept five years in a bottle close corked, without any sort of food, unless a small quantity of sand in which they coiled themselves up in the bottom of the vessel may be reckoned as such; yet when he saw them, they had newly cast their skins, and were as brisk and lively as if just taken. But it is natural for divers species to pass four, five, or six months every year, without either eating or drinking. Accordingly, the tortoise, bear, dormouse, serpent, &c. are observed regularly to retire, at those seasons, to their respective cells, and hide themselves, some in the caverns of rocks or ruins; others dig holes under ground; others get into woods, and lay themselves up in the clefs of trees; others bury themselves under water, &c. And these animals are found as flat and fleshy, after some months abstinence, as before. Sir G. Ent weighed his tortoise several years successively, at its going to earth in October, and coming out again in March; and found, that of four pounds four ounces, it only used to lose about one ounce. Indeed we have instances of men passing several months as strictly abstinent as other creatures. In particular, the records of the Tower mention a Scotchman imprisoned for felony, and strictly watched in that fortress for six weeks, during which time he did not take the least sustenance: and on this account he obtained his pardon. Numberless instances of extraordinary abstinence, particularly from morbid causes, are to be found in the different periodical Memoirs, Transactions, Ephemerales, &c. It is to be added, that, in most instances of extraordinary human abstinence, related by naturalists, there were said to have been apparent marks of a texture of blood and humour, much like that of the animals above mentioned. Though it is no improbable opinion, that the air itself may furnish something for nutrition, it is certain, there are sub-

stances of all kinds, animal, vegetable, &c. floating in the atmosphere, which must be continually taken in by respiration; and that an animal body may be nourished thereby, is evident in the instance of vipers; which if taken when first brought forth, and kept from every thing but air, will yet grow very considerably in a few days. So the eggs of lizards are observed to increase in bulk, after they are produced, and in like manner the eggs or spawn of fishes grow and are nourished with the water. And hence, say some, it is that cooks, turnspit dogs, &c. though they eat but little, yet are usually fat. See Fasting. See also Dietetics. Supplement.

ABSTINENTS, or ABSTINENTES, a set of heretics that appeared in France and Spain about the end of the third century. They are supposed to have borrowed part of their opinions from the Gnostics and Marcionians, because they opposed marriage, condemned the use of flesh meat, and placed the Holy Ghost in the class of created beings. We have, however, no certain account of their peculiar tenets.

ABSTRACT, in a general sense, any thing separated from something else.

Abstract idea, in Metaphysics; is a partial idea of a complex object, limited to one or more of the component parts or properties, laying aside or abstracting from the rest. Thus, in viewing an object with the eye, or recollecting it in the mind, we can easily abstract from some of its parts or properties, and attach ourselves to others: we can attend to the redness of a cherry, without regard to its figure, taste, or consistence. See Abstraction.

Abstract Mathematics, otherwise called Pure Mathematics, is that which treats of magnitude or quantity, absolutely and generally considered, without restriction to any species of particular magnitude; such as Arithmetic and Geometry. In this sense, abstract mathematics is opposed to mixed mathematics; wherein simple and abstract properties, and the relations of quantities primitively considered in pure mathematics, are applied to sensible objects, and by that means become intermixed with physical considerations: such are Hydrostatics, Optics, Navigation, &c.

Abstract Numbers, are assemblages of units, considered in themselves, without denoting any particular and determinate things. Thus six is an abstract number, when not applied to any thing; but if we say 6 feet, 6 becomes a concrete number. See the article Number.

Abstract Terms, words that are used to express abstract ideas. Thus beauty, ugliness, whiteness, roundness, life, death, are abstract terms.

Abstract, in Literature, a compendious view of any large work; shorter and more superficial than an abridgement.

Abstraction, in general, the act of abstracting, or the state of being abstracted.

Abstraction, in Metaphysics, the operation of the mind when occupied by abstract ideas. A large oak fixes our attention, and abstracts us from the shrubs that surround it. In the same manner, a beautiful woman in a crowd, abstracts our thoughts, and engrosses our attention solely to herself. These are examples of real abstraction: when these, or any others of a similar kind, are recalled to the mind after the objects themselves.
ABTHANES, in History, a title of honour used by Abthanes, the ancient inhabitants of Scotland, who called their nobles thanes, which in the old Saxon signifies king’s ministers; and of these the higher rank were styled abthanes, and those of the lower underthanes.

ABUBEKER, or Abu-Beck, the first caliph, the immediate successor of Mahomet, and one of his first converts. His original name was Abduleasa, signifying, servant of the candle or temple, which, after his conversion to Mahometanism, was changed to Abdulah, servant of God; and on the marriage of the prophet with his daughter Ayesha, he received the appellation of Abu-Beck, Father of the virgin. Illustrations by his family, and possessed of immense wealth, his influence and example were powerful means of propagating the faith he had adopted, and in gaining converts to the new religion. Abu-beker was a sound believer, and although he lived in the greatest familiarity with Mahomet, he had always the highest veneration for his character. He vouchèd for the truth of his revelations after his nightly visits to heaven, and thus obtained the appellation of the faithful. He was employed in every mission of trust or importance, was the constant friend of the prophet, and when he was forced to fly from Mecca, was his only companion. But notwithstanding his blind devotion to Mahometanism, his moderation and prudence were conspicuous in checking the fanatical zeal of the disciples of the new religion, on the death of Mahomet. This event threatened destruction to the doctrines of Islamism. Its followers could not doubt that it had taken place, and they were afraid to believe it. In this uncertainty and fluctuation of belief, Omar drew his sword, and threatened to cut in pieces all who dared to assert that the prophet was dead. Abu-beker, with more coolness and wisdom, addressed the people. Is it, says he, Mahomet whom you adore, or the God whom he has revealed to you? Know that this God is alone immortal, and that all those whom he has created are subject to death. Appalled and reconciled by this speech, they elected him successor to Mahomet, and he assumed the modest title of caliph, which has continued with all his successors. Ali, the son-in-law of the prophet, regarding the elevation of Abu-beker as a violation of his legal rights to the succession, refused at first to recognise the appointment, till he was forced by threats into compliance and submission. His partisans, however, still considered him as the legitimate successor, and their opinion has prevailed among many Mussulmans, who believe that the sovereign authority, both spiritual and temporal, remains with his descendants.

The first part of the reign of Abu-beker was unsettled and turbulent. Many of his subjects returned to idolatry, some embraced Christianity, new impostors arose. Seduced by the example of Mahomet, they were dazzled with the hope of power and distinction, and were thus led on to destruction. He alone was received as the true prophet, all others were false. Abu-beker, with the assistance of Caled, an able general, soon reduced to submission and obedience, or punished with death, all those who disputed or resisted his authority. Tranquillity being established at home, he sent out his armies, under the same general, to propagate the Mahometan faith in Syria, which, after a bloody battle, was compelled to submit to a new power, and to adopt a new religion. Damascus was afterwards besieged;
and on the very day that it surrendered and opened its gates to his victorious arms, Abu Bekr expired in the 13th year of the Hegira.

The public conduct of this caliph was marked by prudence, equity, and moderation. Mild and simple in his manners, frugal in his fare, he discovered great indifference to riches and honours. Such was his liberality to the poor and to his soldiers, that he bestowed on them the whole of his revenue. The treasury being on this account quite exhausted at his death, made Omar say, "that he had left a difficult example for his successors to follow." A short time before his death, he dictated his will in the following words: "This is the will of Abu Bekr, which he dictated at the moment of his departure from this world: At this moment when the infidel shall believe, when the impious shall no longer doubt, and liars shall speak truth, I name Omar for my successor. Musulmans, hear his voice, and obey his commands. If he rule justly, he will confirm the good opinions which I have conceived of him; but if he deviate from the paths of equity, he must render an account before the tribunal of the sovereign judge. My thoughts are upright, but I cannot see into futurity. In a word, they who do evil, shall not always escape with impunity." Abu Bekr collected and digested the revelations of Mahomet, which had hitherto been preserved in detached fragments, or in the memories of the believers; and to this the Arabs gave the appellation Almasnaf, or the Book. The first copy was deposited in the hands of Hafes, the daughter of Omar and the widow of Mahomet.

ABUCCO, Abocco, or Abachi, a weight used in the kingdom of Pegu. One abocco contains 12½ teccalizes; two abocces make a gir or agire; two giris, half a hias; and a hias weighs an hundred teccalizes; that is, two pounds five ounces the heavy weight, or three pounds nine ounces the light weight of Venice.

ABUKESAO, in commerce, the same with ASLAN.

ABULFARAGIUS, Gregory, son of Aaron a physician, born in 1226, in the city of Malatia, near the source of the Euphrates in Armenia. He followed the profession of his father; and practised with great success: but he acquired a higher reputation by the study of the Greek, Syrian, and Arabic languages, as well as by his knowledge of philosophy and divinity; and he wrote a history which does great honour to his memory. It is written in Arabic, and divided into dynasties. It consists of ten parts, being an epitome of universal history from the creation of the world to his own time. The parts of it relating to the Saracens, Tartar Moguls, and the conquests of Jenghiz Khan, are esteemed the most valuable. He professed Christianity, and was bishop of Aleppo, and is supposed to have belonged to the sect of the Jacobites. His contemporaries speak of him in a strain of most extravagant panegyric. He is styled the king of the learned, the pattern of his times, the phœnix of the age, and the crown of the virtuous. Dr Pococke published his history with a Latin translation in 1663.

ABULFAZEL, an eastern writer of eminence. See SUPPLEMENT.

ABUNA, the title given to the archbishop or metropolitan of Abyssinia.

ABUNDANT NUMBER, in Arithmetick, is a number, the sum of whose aliquot parts is greater than the number itself. Thus the aliquot parts of 12, being 1, 2, 3, 4, and 6, they make, when added together, 16. An abundant number is opposed to a deficient number, or that which is greater than all its aliquot parts taken together; as 14, whose aliquot parts are 1, 2, and 7, which makes no more than 10: and to a perfect number, or one to which its aliquot parts are equal, as 6, whose aliquot parts are 1, 2, and 3.

ABUNDANTIA, a heathen divinity, represented in ancient monuments under the figure of a woman with a pleasing aspect, crowned with garlands of flowers, pouring all sorts of fruits out of a horn which she holds in her right hand, and scattering grain with her left, taken promiscuously from a sheaf of corn. On a medal of Trajan she is represented with two corncobs.

ABUSAIID ABN ALIAPUTH, sultan of the Moguls, succeeded his father, anno 777 of the Hegira. He was the last monarch of the race of Jenghiz Khan, who held the undivided empire of the Moguls; for after his death, which happened the same year that Tamerlane was born, it became a scene of blood and desolation, and was broken into separate sovereignties.

ABUS, in Ancient Geography, a river of Britain, formed by the confluence of the Ure, the Derwent, Trent, &c. falling into the German Sea, between Yorkshire and Lincolnshire, and forming the mouth of the Humber.

ABUSE, an irregular use of a thing, or the introducing something contrary to the true intention thereof. In grammar, to apply a word abusively, or in an abusive sense, is to misapply or pervert its meaning. — A permutation of benefices, without the consent of the bishop, is termed abusive, and consequently null.

ABUT-W-TEMAN, an Arabian poet. See Supplement.

ABUTILON, in Botany, the trivial name of several species of the sida. See SIDA, BOTANY INDEX.

ABYDOS, in Ancient Geography, an ancient town built by the Milesians, in Asia, on the Hellespont, where it is scarce a mile over, opposite to Bosporus on the European side. Now both are called the Dardanellas. Abydos lay midway between Lampsacus and Ilium, famous for Xerxes's bridge, (Homer's Virgil;) and for the loves of Leander and Hero, (Museus, Ovid;) celebrated also for its oysters (Ennios, Virgil.) The inhabitants were a soft effeminate people, given much to distraction; hence the proverb, Ne temere Abydoni calcare, when we would caution against danger. (Stephanus.)

ABYDOS, in Ancient Geography, an inland town of Egypt, between Pтолemais and Diospolis Parva, towards Syene; famous for the palace of Memnon and the temple of Osiris. A colony of Milesians; (Stephanus.) It was the only one in the country into which the singers and dancers were forbidden to enter.

The city, reduced to a village under the empire of Augustus, now presents to our view only a heap of ruins without inhabitants; but to the west of these ruins is still found the celebrated tomb of Osymandes. The entrance is under a portico 60 feet high, and supported by two rows of massive columns. The immovable solidity of the edifice, the huge masses which compose it, the hieroglyphics it is loaded with, stamp it a work of the ancient Egyptians. Beyond it is a temple 300 feet long and 143 wide. Upon entering the temple we meet with an immense hall, the roof of which.
which is supported by 28 columns 60 feet high, and 19 in circumference at the base. They are 12 feet distant from each other. The enormous stones that form that ceiling, perfectly joined and incrusted, as it were, one in the other, offer to the eye nothing but one solid platform of marble 126 feet long and 26 wide. The walls are covered with hieroglyphics. One sees there a multitude of animals, birds, and human figures with pointed caps on their heads, and a piece of stuff hanging down behind, dressed in loose robes that come down only to the waist. The sculpture, however, is clumsy; the forms of the body, the attitudes and proportions of the members, ill observed. Amongst these we may distinguish some women suckling their children, and men presenting offerings to them. Here also we meet with the divinities of India. Monsieur Chevalier, formerly governor of Chandernagore, who resided 20 years in that country, carefully visited this monument on his return from Bengal. He remarked here the gods Jaggrenate, Gones, and Vecknou or Wiannow, such as they are represented in the temples of Hindostan.

A great gate opens at the bottom of the first hall, which leads to an apartment 46 feet long by 22 wide. Six square pillars support the roof of it; and at the angles are the doors of four other chambers, but so choked up with rubbish that they cannot now be entered. The last hall, 64 feet long by 24 wide, has stairs by which one descends into the subterraneous apartments of this grand edifice. The Arabs, in searching for treasure, have piled up heaps of earth and rubbish. In the part we are able to penetrate, sculpture and hieroglyphics are discoverable as in the upper story. The natives say that they correspond exactly with those above ground, and that the columns are as deep in the earth as their height above the surface. It would be dangerous to go far into those vaults; for the air of them is so loaded with a mephitic vapour, that a candle can scarce be kept burning in them. Six lions heads, placed on the two sides of the temple, serve as spouts to carry off the water. You mount to the top by a staircase of a very singular structure. It is built with stones incrustated in the wall, and projecting six feet out; so that being supported only at one end, they appear to be suspended in the air. The walls, the roof, and the columns of this edifice, have suffered nothing from the injuries of time; and did not the hieroglyphics, by being corroded in some places, mark its antiquity, it would appear to have been newly-built. The solidity is such, that unless people make a point of destroying it, the building must last a great number of ages. Except the colossal figures, whose heads serve as an ornament to the capitals of the columns, and which are sculptured in relief, the rest of the hieroglyphics which cover the inside are carved in stone. To the left of this great building we meet with another much smaller, at the bottom of which is a sort of altar. This was probably the sanctuary of the temple of Osiris.

ABYLA (Ptolemy, Mela); one of Hercules's pillars, on the African side, called by the Spaniards Sierra de los Monos, opposite to Calpe in Spain, the other pillar; supposed to have been formerly joined, but separated by Hercules, and thus to have given entrance to the sea now called the Mediterranean; the limits of the Nabours of Hercules (Pliny).

ABYSS, in a general sense, denotes something profound, and, as it were, bottomless. The word is originally Greek, ἀβυσσός; compounded of the privative ἄ, and βυσσός, q. d. without a bottom.

ABYSS, in a more particular sense, denotes a deep mass or fund of waters. In this sense, the word is particularly used in the Septuagint, for the water which God created at the beginning with the earth, which encompassed it round, and which our translators render by deep. Thus it is that darkness is said to have been on the face of the abyss.

ABYSS is also used for an immense cavern in the earth, in which God is supposed to have collected all those waters on the third day; which, in our version, is rendered the sea, and elsewhere the great deep. Dr Woodward, in his Natural History of the Earth, asserts, that there is a mighty collection of waters enclosed in the bowels of the earth, constituting a huge orb in the interior or central parts of it; and over the surface of this water he supposes the terrestrial strata to be expanded. This, according to him, is what Moses calls the great deep, and what most authors render the great abyss. The water of this vast abyss, he alleges, communicates with that of the ocean, by means of certain hiatuses or channels passing between it and the bottom of the ocean; and this and the abyss he supposes to have one common centre, around which the water of both is placed; but so, that the ordinary surface of the abyss is not level with that of the ocean, nor at so great a distance from the centre as the other, it being for the most part restrained and depressed by the strata of earth lying upon it; but wherever these strata are broken, or so lax and porous that water can pervade them, there the water of the abyss ascends; fills up all the clefts and fissures into which it can get admissiveness; and saturates all the interstices and pores of the earth, stone, or other matter, all around the globe, quite up to the level of the ocean.

The existence of an abyss or receptacle of subterraneous waters, is controverted by Camerarius; and the Desert, defended by Dr Woodward chiefly by two arguments: 1. The first drawn from the vast quantity of water which covered the earth, in the time of the deluge; the second, from the consideration of earthquakes, which he endeavours to show are occasioned by the violence of the waters in this abyss. A great part of the terrestrial globe has been frequently shaken at the same moment, which argues, according to him, that the waters, which were the occasion thereof, were coextensive with that part of the globe. There are even instances of universal earthquakes, which (says he) show, that the whole abyss must have been agitated; for so general an effect must have been produced by as general a literature, cause, and that cause can be nothing but the subterraneous abyss.

To this abyss also has been attributed the origin of springs and rivers; the level maintained in the surfaces of different seas; and their not overflowing their banks. To the effluvia emitted from it, some even attribute all the diversities of weather and change in our atmosphere. Bay, and other authors, ancient as well as modern, suppose a communication between 1777, the Caspian sea and the ocean by means of a subterraneous abyss; and to this they attribute it that the Caspian does not overflow, notwithstanding the great number of large rivers it receives, of which Kempfer reports.
ABYSSINIA.

Abyssinian. A BYSSINIA, ABASSIA, or UPPER ETHIOPIA, in Geography, an empire of Africa within the torrid zone, which is comprehended between the 9th and 16th degrees N. Lat. and the 30th and 40th degrees of E. Long. By some writers of antiquity the title of Ethio-

pians was given to all nations whose complexion was black; hence we find the Arabians, as well as many other Asiatics, sometimes falling under this denomination; besides a number of Africans whose country lay at a distance from Ethiopia properly so called. Thus the Africans in general were divided into the western or Hesperian Ethiopians, and those above Egypt situated to the east; the latter being much more generally known than the former, by reason of the commerce they carried on with the Egyptians.

From this account we may easily understand why there should be such a seeming disagreement among ancient authors concerning the situation of the empire of Ethiopia, and likewise why it should pass under such a variety of names. Sometimes, for example, it was named Índia, and the inhabitants Índians; an appella-
tion likewise applied to many other distant nations. It was also denominated Atlantis and Ethiopia, and in the most remote periods of antiquity Cepheania; but more usually Æthiopia, a word somewhat resembling Abassia or Abyssinia, its modern names. On the other hand, we find Persia, Chaldea, Assyria, &c. styled Ethiopia by some writers: and all the countries extending along the coasts of the Red sea were promiscuously denominated India and Ethiopia. By the Jews the empire of Ethiopia was styled Ejchd and Lodim.

Notwithstanding this diversity of appellations, and vast diffusion of territory ascribed to the Ethiopians, there was one country to which the title was thought more properly to belong than to any of the rest; and which was therefore called Ethio-

pias Propria. This was bounded on the north by Egypt, extending all the way to the lesser cataract of the Nile, and an island named Elephantine; on the west it had Libya Interior; on the east the Red sea, and on the south unknown parts of Africa; though these boundaries cannot be fixed with any kind of precision.

In this country the ancients distinguished a great variety of different nations, to whom they gave names either from some personal circumstance, or from their manner of living. The principal of these were, 1. The Blemmyes, seated near the borders of Egypt: and who, probably from the shortness of their necks, were said to have no heads, but eyes, mouths, &c. in their breasts. Their form must have been very extraordinary, if we believe Vopiscus, who gives an account of some of the captives of this nation brought to Rome. 2. The Nabatae, inhabiting the banks of the Nile near the island Elephantine already mentioned, said to have been removed thither by Osiris to repress the incursions of the Blemmyes. 3. The Troglodytes, by some writers said to belong to Egypt, and described as little superior to brutes. 4. The Nubians, of whom little more is known than their name. 5. The Pigmees, by some supposed to be a tribe of Troglodytes; but by others placed on the African coast of the Red sea. 6. The Aulites or Abalites, of whom we know nothing more than that they were situated near the Abalitic gulf. 7. The Strutheriopaghi, so called from their feeding upon ostriches, were situated to the south of the Momones. 8. The Acrophagi, 9. Chealonopaghi; 10. Ichthypaghi; 11. Gynamogli; 12. Elephantopaghi; 13. Rhode-

opaghi; 14. Sputamopaghi; 15. Hybopaghi; and, 16. Ophipaghi: all of whom had their names from the food they made use of, viz. locusts, tortoises, fish, bitches, milk, elephants, roots, fruits or seeds, and serpents. 17. The Hylogenae, neighbours to the Ele-

phantopaghi, and who were so savage that they had no houses, nor any other places to sleep in but the tops of trees. 18. The Pamphagi, who used almost every thing indiscriminately for food. 19. The Agri-

opaghi, who lived on the flesh of wild beasts. 20. The Anthropopaghi, or man-eaters, are now supposed to have been the Caffres, and not any inhabitants of Proper Ethiopia. 21. The Hippopaghi, or horse-eaters, who lay to the northward of Libya Incognita. 22. The Macrobii, a powerful nation, remarkable for their longevity; some of them attaining the age of 120 years. 23. The Sambr, situated near the city of Tenespis in Nubia upon the Nile; of whom it is reported that all the quadrupeds they had, not excepting even the ele-

phants, were destitute of ears. 24. The Ascheae, a people inhabiting the mountainous parts, and continually employed in hunting elephants. Besides these, there were a number of other nations or tribes, of
Abyssinia.

Abyssinia, whom we scarce know any thing but the names; as the Gapachi, Ptoempanne, Cadapum, Pechini, Catrades, &c.

First settlement.

In a country inhabited by such a variety of nations, all in a state of extreme barbarism, it is rather to be wondered that we have any history at all, than that it is not more distinct. It has already been observed, that the Jews, from the authority of the sacred writers no doubt, bestowed the name of Cush upon the empire of Ethiopia; and it is generally agreed that Cush was the great progenitor of the inhabitants. In some passages of Scripture, however, it would seem that Cush was an appellation bestowed upon the whole peninsula of Arabia, or at least the greater part of it. In others, the word seems to denominate the country watered by the Araxes, the seat of the ancient Scythis or Cushites; and sometimes the country adjacent to Egypt on the coast of the Red sea.

A number of authors are of opinion, that Ethiopia received its first inhabitants from the country lying to the east of the Red sea. According to them, the descendants of Cush, having settled in Arabia, gradually migrated to the south-eastern extremity of that country; whence, by an easy passage across the straits of Babelmandel, they transported themselves to the African side, and entered the country properly called Ethiopia: a migration which, according to Eusebius, took place during the residence of the Israelites in Egypt; but, in the opinion of Sossinus, after they had taken possession of Canaan, and were governed by judges.

Mr Bruce makes mention of a tradition among the Abyssinians, which, they say, has existed among them from time immemorial, that very soon after the Flood, Cush the grandson of Noah, with his family, passed through Aithbara, then without inhabitants, till they came to the ridge of mountains which separates that country from the high lands of Abyssinia. Here, still terrified with the thoughts of the deluge, and apprehensive of a return of the same calamity, they chose to dwell in caves made in the sides of these mountains, rather than trust themselves in the plains of Aithbara; and our author is of opinion, that the tropical rains, which they could not fail to meet with in their journey southward, and which would appear like the return of the deluge, might induce them to take up their habitations in these high places. Be this as it will, he informs us that it is an undoubted fact, that here the Cushites, with unparalled industry, and with instruments utterly unknown to us, formed to themselves commodious, yet wonderful habitations in the heart of mountains of granite and marble, which remain entire in great numbers to this day, and promise to do so till the consummation of all things.

The Cushites having once established themselves among these mountains, continued to form habitations of the like kind in all the neighbouring ones; and thus following the different chains (for they never chose to descend into the low country), spread the arts and sciences, which they cultivated, quite across the African continent from the eastern to the western oceans. According to the traditions above mentioned, they built the city of Axum early in the days of Abraham.

Description. Though now an unconsiderable village, was once of the city of Axum.

lounging to a magnificent temple, originally 110 feet in length, and having two wings on each side: a double porch; and an ascent of 12 steps. Behind this stand several obelisks of different sizes, with the remains of several others which have been destroyed by the Turks. There is also a great square stone with an inscription, but so much effaced that nothing can be discovered excepting some Greek and Latin letters, and the word Basilius. Mr Bruce mentions some “prodigious fragments of colossal statues of the dog-star” still to be seen at this place; and “Sire (adobe), which, in the language of the Trigoditres, and in that of the low country of Meero, exactly corresponding to it, signifies a dog, instructs us in the reason why this province was called Sire, and the large river which bounds it Siris.”

Soon after building the city of Axum, the Cushites founded that of Meero, the capital of a large island or peninsula formed by the Nile, much mentioned by ancient historians, and where, according to Herodotus, they pursued the study of astronomy in very early ages with great success. Mr Bruce gives two reasons for Meero why their building this city in the low country, after having built Axum in the mountainous part of Abyssinia.

1. They had discovered some inconveniences in their caves both in Siris and the country below it, arising from the tropical rains in which they were now involved, and which prevented them from making the celestial observations to which they were so much addicted.

2. It is probable that they built this city farther from the mountains than they could have wished, in order to avoid the fly with which the southern parts were infested.

This animal, according to Mr Bruce, who has given a figure of it, is the most troublesome to quadrupeds that can be imagined. He informs us, that it infests those places within the tropical rains where the soil is black and leamy, and no other place whatever. It is named zimbo (by whom we are not informed), and has not been described by any other naturalist. It is of a size somewhat larger than a bee, thicker in proportion, and having broader wings, placed separate like those of a fly, and quite considerable, or without any spot. The head is large, with a sharp upper jaw; at the end of which is a strong pointed hair about a quarter of an inch long; and the lower jaw has two of these hairs: all of which together make a resistance to the finger equal to that of a strong cat's bristle. One or all of these hairs are used as weapons of offence to the cattle; but what purpose they answer to the animal itself, our author does not say. So intolerable, however, are its attacks to the cattle, that they no sooner hear its buzzing, than they forsake their food, and run about till they fall down with fright, fatigue, and hunger. Even the camel, though defended by a thick and strong skin with long hair, cannot resist the punctures of this insect; which seem to be poisonous, as they produce large purulent swellings on the body, head, and legs, which at last terminate in death. To avoid this dreadful enemy, the cattle must all be removed as quick as possible to the sandy parts of Athbara, where they stay as long as the rains last, and where this dreadful enemy never ventures to follow them. The elephant and rhinoceros, who, on account of the quantity of food they require, cannot remove to these barren places, roll themselves in the mud, which when dry, coasts them over so hard, that
 Abyssinia.

that they are enabled to resist the punctures of the insect; though even on these some tubercles are generally to be met with, which our author attributes to this cause. Mr. Bruce is of opinion, that this is the fly mentioned by Isaiah, chap. vii. 18, 19. "And it shall come to pass, that in that day the Lord shall his for the fly that is in the utmost part of the rivers of Egypt; and they shall come and shall rest all of them in the desolate valleys, and in the holes of the rocks, and upon all thorns, and upon all busses." That is (says Mr. Bruce,) they shall cut off from the cattle their usual retreat to the desert, by taking possession of these places, and meeting them there, where ordinarily they never come, and which therefore are the refuge of the cattle.

Meroe, which lay in N. Lat. 16°, the exact limit of the tropical rains, was without the bounds assigned by nature to these destructive insects; and consequently a place of refuge for the cattle. Mr. Bruce, on his return through the desert, saw at Gerri, in this latitude, ruins, supposed to be those of Meroe, and caves in the mountains immediately above them; for he is of opinion, that they did not abandon their caverns immediately after they began to build cities. As a proof of this, he mentions that Thebes, in Upper Egypt, was built by a colony of Ethiopians; and that near the ruins of that city, a vast number of caves are to be seen even up to the top of a mountain in the neighbourhood: all of which are inhabited at this day. By degrees, however, they began to exchange these subterraneous habitations for the cities they built above ground; and thus became farmers, artificers, &c. though originally their sole employment had been commerce.

On this subject Mr. Bruce has given a very curious dissertation; though how far the application of it to the Ethiopians may be just, we cannot pretend to determine. He begins with observing, that the magnificence of the Indians and Egyptians has been celebrated from the most remote antiquity, without any account of the sources from whence all this wealth was derived: and indeed it must be owned, that in all histories of these people, there is a strange deficiency in this respect. The kings, we are to suppose, derived their splendour and magnificence from their subjects; but we are quite at a loss to know whence their subjects had it: and this seems the more strange, that in no period of their history are they ever represented in a poor or mean situation. Nor is this difficulty confined to these nations alone. Palestine, a country producing neither silver nor gold, is represented by the sacred writers as abounding in the early ages with both these metals in a much greater proportion than the most powerful European states can boast of, notwithstanding the vast supplies derived from the lately discovered continent of America. The Assyrian empire, in the time of Semiramis, was so noted for its wealth, that M. Montesquieu supposes it to have been obtained by the conquest of some more ancient and richer nation; the spice of which enriched the Assyrians, as those of the latter afterwards did the Medes. This, however, Mr. Bruce very justly observes, will not remove the difficulty, because we are equally at a loss to know whence the wealth was derived to that former nation; and it is very unusual to find an empire or kingdom of any extent enriched by conquest. The kingdom of Macedon, for instance, though Alexander the Great overran and plundered in a very short time the richest empire in the world, could never vie with the wealth of Tyre and Sidon. These last were commercial cities; and our author justly considers commerce as the only source from whence the wealth of a large kingdom ever was or could be derived. The riches of Semiramis, therefore, were accumulated by the East India trade centering for some time in her capital. While this was suffered to remain undisturbed, the empire flourished; but by an absurd expedition against India itself, in order to become mistress at once of all the wealth it contained, she lost that which she really possessed; and her empire was soon after entirely ruined. To the same source he attributes the riches of the ancient Egyptians; and it is of opinion, that Sesostris opened up to Egypt the commerce with India by sea; though other authors speak of that monarch in very different terms. As the luxuries of India have somehow or other become the objects of desire to every nation in the world, this easily accounts for the wealth for which Egypt has in all ages been so much celebrated, as well as for that with which other countries abounded; while they served as a medium for transmitting those luxuries to other nations, and especially for the riches of those which naturally produced the Indian commodities so much sought after. This was the case particularly with Arabia, some of the productions of which were very much coveted by the western nations; and being, besides, the medium of communication between the East Indies and western nations, it is easy to see why the Arabian merchants soon became possessed of immense wealth.

Besides the territories already mentioned, the Cushites had extended themselves along the mountains which run parallel to the Red sea on the African side; which country, according to Mr. Bruce, has "in all times been called Saba, or Asaba, both which signify South; an epithet given from its lying to the southward of the Arabian gulf, and which in ancient times was one of the richest and most important countries in the world." By that acquisition (says our author,) they enjoyed all the perfumes and aromatics in the east; myrrh, and frankincense, and cassia; all which grew spontaneously in that stripe of ground from the bay of Bilur west of Azab to Cape Gardafui, and then southward up in the Indian ocean, to near the coast of Melinda, where there is cinnamon, but of an inferior kind." As the Cushites or Troglydotes advanced still farther south, they met not only with mountains, in which they might excavate proper habitations, but likewise with great quantities of gold and silver furnished by the mines of Sofala, which, our author says, furnished "large quantities of both metals in their pure and unmixed state, lying in globules without any alloy or any necessity of preparation or separation." In other parts of his work, he labours to prove Sofala to have been the Ophir mentioned in Scripture.

Thus the Ethiopians, for some time after their settlement, according to Mr. Bruce, must have been a first a civilization of the first importance in the world. The northern colonies from Meroe to Thebes built cities, learned and made improvements in architecture; cultivated people, commerce, agriculture, and the arts; not forgetting
ABYSSINIA.

The science of astronomy, for which they had an excellent opportunity by reason of the clearness of the sky in the Thebaid. Their brethren farther to the south, or those who inhabited Ethiopia properly so called, were confined for six months to their caves by reason of the tropical rains, whence they were naturally led to pursuits of another kind. "Letters," at least one kind of them, and arithmetical characters (we are told), were invented by this middle part of the Cushites; while trade and astronomy, the natural history of the winds and seasons, were what necessarily employed that part of the colony established at Sofala most to the southward.

While the Cushites were thus employed at home in collecting gold, gathering and preparing spices, &c., these commodities were sent abroad into other countries by another set of people, named Shepherds, who acted as carriers to them, and who afterwards proved so formidable to the Egyptians. These differed in their appearance from the Ethiopians, having long hair, and the features of Europeans; and were of a very dark complexion, though not at all like the black-moors or negroes. They lived in the plain country in huts or moveable habitations, attending their cattle, and wandering up and down as various circumstances required. By acting as carriers to the Cushites, they became a great and powerful people, possessing vast numbers of cattle, as well as a very considerable extent of territory. They possessed a strip of land along the Indian ocean; and to the northward of that another along the Red sea: but their principal habitation was the flat part of Africa between the northern tropic and the mountains of Abyssinia, which country is now called Beja. This reaches from Mau shal along the coast to Suakim; then turns westward, and continues in that direction, having the Nile on the south, the tropic of Cancer on the north, with the deserts of Selima and Libya on the west. The next district belonging to these people was Meroe, now called Athbara, lying between the rivers Nile and Astaboras. A third district, now called Derkin, is a small plain lying between the river Mareb on the east, and Athbara on the west. But the most noble and warriorlike of all the Shepherds were those who possessed the mountains of Habash, reaching from the neighbourhood of Mausah to Suakim: which district is still inhabited by them.

These Shepherds, according to our author, were distinguished by several different appellations, which may be supposed to denote different degrees of rank among them. Those called simply Shepherds, our author supposes to have been the common sort who attended the flocks. Another set were called Hycos or Agos, signifying "armed shepherds," who are supposed to have been the soldiers. A third were named Agag, supposed to be the chiefs or nobles of these armed shepherds; whence the title of king of kings, according to Mr Bruce, is derived; and he supposes Agag killed by Samuel to have been an Arabian shepherd.

The building of Carthage augmented the power of the Shepherds to a considerable degree, by reason of the vast quantity of carriage naturally belonging to a place of such extensive commerce, and which fell into the hands of the Lehabin, Lubim, or Libyan peasants. An immense multitude of camels, in the early ages, answered the purpose of navigation: and thus Abyssinia we find that commerce was carried on by the Ishmaelites as early as the days of Joseph, from the southern extremity of the Arabian peninsula. These Shep

Reason of

herds, however, though generally the friends and allies of the Egyptians, who were also Cushites, sometimes proved very bitter enemies to them, as is related in the Shep

hers and

egyptian.

The reason of this may be deduced from the great opposition between their manners and customs. The Egyptians worshipped black cattle, which the Shepherds killed and used as food; the latter worshipped the heavenly bodies, while the Egyptians were the grossest idolaters, and worshipped idols of all kinds that can be imagined. Hence a mere difference in religion might occasion many bloody quarrels; though, if the above account can be depended upon as authentic, it is natural to imagine that the mutual connection of interests should have cemented their friendship, whatever difference there might happen to be in opinions of any kind.

Besides the Cushites and Shepherds, however, we find many nations inhabiting this country, that are various nations inhabiting this country, who are fairer than either the Cushites, or the Shepherds, and which, though they have each a particular name, are all known by the general title of Habesh; which may be translated by the Latin word convexus, signifying a number of distinct people meeting accidentally in one place; and which our author maintains against Scaliger, Ludolf, and a number of others, to be a very just translation, and quite consonant to the history of the country.

The most authentic ancient history of this country, First settle according to Mr Bruce, is the chronicle of Azum; which the character of which, among the modern Abyssinians, Ethiopians, according stands next to the sacred writings themselves; and to the A byssinian authority we have on the subject. According to this history, book, there was an interval of 5500 years between the creation of the world and the birth of Christ; 1008 years before which last event the empire of A byssinia or Ethiopia received its first inhabitants.

Two hundred years after its settlement, it was destroyed by a flood that it received the name of Curby laid Midra, or a country laid waste; "or (says our author) waste by a flood, as it is called in Scripture, a land which the waters or deluge, floods had spoiled." (Isaiah xviii. 2). The peopling of the country was finished about 1400 years before Christ, by the settlement of a great number of people, speaking different languages, who sat down peaceably in the high lands of Tigre, in the neighbourhood of the Shepherds, with whom they were in friendship.

These people, according to tradition, came from Palestine; and our author is inclined to believe the whole of the relation to be true, as the time coincides with the expulsion of the Canaanitish nations by Joshua, which happened about 1490 B. C. Ten years before which the Canaanitish nations by Joshua, which happened about 1490 B. C. Ten years before which there had been, according to Pausanias, a flood in Ethiopia which occasioned prodigies and confusion. Ethiopia, he thinks, would afford the most ready asylum for the fugitive Canaanites, as they must have long had a commercial intercourse with that country; and he supports the opinion likewise from what Procopius mentions of two pillars extant in his time, on the coast.
Abyssinia.

coast of Mauritania, with the following inscription in the Phoenician language: "We are Canaanites, flying from the face of Joshua the son of Nun, the robber." The authenticity of these inscriptions, however, is much disputed, and therefore it cannot go a great way in establishing any historical point. The first and most considerable of the colonies above mentioned settled in the province of Ambara; the second in Damot, one of the southern provinces; the third in another province called Lestia, or Teherats-Agou, from Tehera their principal habitation; and a fourth in the territory of Gulat.

Our author goes on to prove, that the Ethiopians in ancient times were not only the most learned people in the world, but that they spoke the original language, and were the inventors of writing. In what manner they came to degenerate from this character, and into their present state of barbarity, cannot be known; this being a phenomenon equally unaccountable with the degeneracy of the Egyptians. According to some authors, the Ethiopians were conquered by Moses; of which transaction we have the following account. Before the time of that legislator, the Ethiopians possessed the country of Thebais in Egypt: but, not content with this, they made an irruption into Lower Egypt, and penetrated as far as Memphis; where, having defeated the Egyptians, they threatened the kingdom with total destruction. The Egyptians, by the advice of their oracles, put Moses at the head of their forces; who immediately prepared for invading the enemy's country. The Ethiopians imagined that he would march along the banks of the Nile; but Moses chose rather to pass through some of the interior countries, though greatly infested with serpents, and where consequently his march must be attended with much danger. To preserve his men, he constructed a number of casks or panniers of the Egyptian reed papyrus, which he filled with the birds named Ibis, celebrated for their antipathy to serpents. As soon as he approached the tract abounding with these reptiles, a sufficient number of the birds were let out, who presently cleared the way for the army by destroying the serpents. Thus the Ethiopians were surprised in their own country, where they had dreaded no invasion; their forces, being defeated in the field, were at last shut up in the capital Meroe, a city almost impregnable, by being surrounded with three rivers, the Nile,Astapus, and Astaboras. The daughter of the Ethiopian monarch, however, having an opportunity of seeing Moses from the walls, fell in love with him, and offered to deliver up the city, provided he would swear to marry her. With this requisition the Jewish legislator complied; but treated the inhabitants with great severity, plundering the city, and putting many of the inhabitants to death. After this he ravaged the whole country, dismantling all the places of strength; and having thus rendered the Ethiopians incapable of attempting any thing against other nations for a considerable time, he returned in triumph to Egypt, after an absence of ten years.

From the time of Moses to that of Solomon, there is a chasm in the Ethiopian history. After this, however, we are furnished with some kind of regular accounts. The history commences with the queen of Sheba, who came to visit the Jewish monarch, and whom the Abyssinians suppose to have been sovereign of Ethiopia Propria; but Mr Bruce is of opinion that she was only sovereign of that territory on the eastern coast of Africa named Saba, which he says ought to be her title instead of Sheba. In favour of this opinion, he likewise urges that it was customary for the Sabaeans, or inhabitants of the African district named Saba, to be governed by women; whereas those who inhabited the opposite side of the Arabian gulf, and who were named Sabean Arabs or Homerites, were not only governed by kings, but would not allow their sovereigns to go abroad anywhere under pain of being stoned to death. The Abyssinians, as has been already hinted, claimed her for their sovereign; and he informs us, that having received an account from Tamerin an Ethiopian merchant, of the surprising wisdom and wealth of Solomon, she undertook the journey mentioned in Scripture, to ascertain the truth of the report. In this she was attended by a great many of her nobility, carrying along with her also magnificent presents for the monarch she intended to visit. According to the Abyssinian historians, she was a Pagan at the time this journey was undertaken; but being struck with admiration at the sight of Solomon's grandeur, and the wisdom he displayed, she became a convert to the true religion. Another part of her history, by no means inconsistent with the character of Solomon, is, that she returned in a state of pregnancy; and within a year was delivered of a son, named David by Solomon; but by his mother Menelik, Meneloch, or Menelcheck; that is, another self. When he grew up he was sent to be educated at the court of his father Solomon; where having staid some time, he was accompanied home by many doctors of the law, and other Israelites of distinction, particularly Azariah the son of Zadoc the high-priest. By these the Jewish religion was established in Abyssinia, where it continued till the introduction of Christianity. Thus the princess we speak of is named Makeda, Bundes, or Budke, by the Abyssinians. By her Solomon's son is styled The Queen of the South, and is said to have come from the utmost parts of the earth, or of the habitable world. Hence the compilers of the Universal History have inferred, that the princess styled The Queen of Sheba in Scripture was really sovereign of Ethiopia. "Ethiopia (say they) is more to the south of Judea than the territory or kingdom of Saba in Arabia Felix; consequently has a better claim than that country for the dominions of the princess whom our Saviour calls The Queen of the South. Ethiopia is styled the remotest part of the habitable world by Herodotus and Strabo; and therefore better agrees with what our Saviour has said of the queen of Sheba, that she came from the uttermost parts of the earth, than Arabia. Nor can it be deemed a sufficient reply to this argument, that Arabia Felix was the uttermost part of the earth in respect to Judea, since it was bounded by the Red sea: for that not only Egypt, but even Ethiopia, regions beyond that sea, were known to and had a communication with the Jews, both before and in our Saviour's time, is indisputably clear. Lastly, From what has been suggested, it appears no improbable conjecture, that Judaism was not only known, at least in a part of Ethiopia,
Ethiopia, but nearly related to the established religion there, at the beginning of the apostolic age, it not much earlier. After all, these two opinions, so contrary in appearance, may be made consistent without great difficulty; since it is agreed, that Arabia and Ethiopia have anciently borne the same name, been included during certain intervals in one empire, and governed by one prince. Part of the Arabs and Ethiopians had the same origin, and very considerable numbers of the Abysseni transported themselves from Arabia Felix into Ethiopia; a circumstance which sufficiently proves the intercourse that formerly subsisted between the Cushites or Ethiopians of Asia and Africa.

The Abyssinian historians farther inform us, that the young prince Menilek was appointed and crowned king in the temple of Jerusalem, before he returned to his own country; that Azariah was constituted high-priest; that he brought with him a Hebrew transcript of the law; and though this book is now lost, having been burnt along with the church of Azum, the office is still continued in the line of Azariah, whose successors are styled Nebrius, high priests, or keepers of the church in that city; both church and state being modelled exactly after that of Jerusalem. Makeda continued to enjoy the sovereignty for 40 years; and the last act of her reign was to settle the succession to the throne. By this act the crown was declared hereditary in the family of Solomon for ever; it was also determined, that after her no woman should be entitled to wear the crown or act as sovereign of the country; but that the sovereignty should descend to the most distant heirs male, rather than to the females, however near; which two articles were to be considered as fundamental laws of the empire, not to be abolished. Lastly, That the male heirs of the royal family should always be sent prisoners to a high mountain, where they were to be confined till they should be called to the throne, or as long as they lived. This custom, according to Mr Bruce, was peculiar to Abyssinia; the neighbouring Shepherds being accustomed to have women for their sovereigns, which prevailed in the last century, and perhaps does so at present.

Makeda having established these laws in such a manner as not to be revocable, died in the year 986 B.C. The transactions of her son Menelik after his accession are not pointed out, farther than that he removed his capital to Tigre. His reign can by no means be accounted prosperous; since in his time the empire was invaded by Shishak or Sesak the king of Egypt, who plundered the temple of Jerusalem under Rehoboam.

The like fate attended a rich temple which had been built at Saba the capital of the Ethiopian empire, and which might very probably occasion the removal of the imperial seat to Tigre, as already mentioned. It is indeed pretty plain from Scripture, that Ethiopia, or great part of it, was subject to this monarch; as the Ethiopians or Cushites, mentioned in his army which invaded Jedia, are joined with the Libum or Libyans, and must therefore be accounted inhabitants of Ethiopia Proper. This is indeed no small confirmation of the opinion of Sir Isaac Newton, who agrees with Josephus in supposing Shishak to have been the celebrated 'Sesostris of profane historians. Thus far we are certain, that in the passage of Scripture just now alluded to, the sacred historian indirectly ascribes the sovereignty of Ethiopia to Shishak; and we do not find it anywhere hinted that another Egyptian monarch was possessed of this sovereignty. Herodotus also plainly tells us, that Sesostris was master of Ethiopia, and that no other Egyptian but himself ever possessed that empire.

During the reign of Shishak, we know no particulars concerning the Ethiopians; but after his death, kings of Egypt against the Libyans, who had taken an opportunity of invading the country during the civil war which took place on the death of that great conqueror. In about ten years afterwards, however, according to the same author, they became aggressors; drowned the successor of Shishak in the Nile, and seized on the whole kingdom; at which time Libya also fell into their hands. In the time of the king of Judah, we find the combined host of the Ethiopians and Libum or Libyans, making an attack on the territories of that prince, to the number of more than a million. The Defeat of this army is considered as the first piece of history just mentioned; it is not easy to conceive how the two should combine in such a manner, unless Zerah was master of both. The total overthrow which the allied army received from the king of Judah, gave the inhabitants of Lower Egypt an opportunity of revolting; who being sustained by an army of 20,000 auxiliaries from Phenicia and Palestine, obliged Memnon, supposed to be the same with Amenophis, to retire to Memphis. Soon after this he was forced to leave Egypt altogether, and to retire into Ethiopia; but in about 13 years he returned with his son Ramses at the head of a powerful army, and obliged the Canaanitish forces to retire out of Lower Egypt; a transaction denominated by the Egyptian writers the second expulsion of the Shepherds.

Sir Isaac Newton is of opinion, that the Egyptian 'Menes, princes Menes, Memnon, and Amenophis, were the same person; and that by him Memphis was either originally built or first fortified, in order to prevent the Egyptians from entering Ethiopia. He is also supposed to have been the son of Zerah, and to have died at a very advanced age about 90 years after the decease of Solomon. Thus, according to Sir Isaac Newton's chronology, the most remarkable transactions of antiquity will be brought lower by ages than by the usually received computations. According to this, the Argonautic expedition happened in the time of Amenophis; though some Greek writers inform us, that the same prince assisted Preem king of Troy with a body of forces. He was succeeded by Ramses, already mentioned, who built the northern portico of the temple of Vulcan at Memphis. The next was Moeris; who adorned Memphis, and made it the capital of his empire, about two generations after the Trojan war. Cheops, Cephrenus, and Mycerinus, succeeded in order to Moeris; the last being succeeded by his sister Niitcri. In the reign of Aschis her successor, both Ethiopia and Assyria revolted from Egypt; which, being now divided into several small kingdoms, was quickly subdued by Sabacon or So, the emperor of Ethiopia. This monarch, soon after his accession to the throne of Egypt, allied himself with Hoohea king of Israel; by which means the latter was induced to revolt.
ABYSSINIA.

Abissinia, revolt from the Assyrians; and in consequence of this, an end was put to the kingdom of Israel by Shalmaneser king of Assyria, in the 24th year of the era of Nabonassar, and 727 before the commencement of the Christian era. According to Herodotus, this monarch voluntarily resigned the crown of Egypt after he had enjoyed it 50 years; but Africanus relates, that after a reign of eight years, he died in Egypt, in the ninth year of Hezekiah king of Judah. His successor Sethon, supposed to be the Sevechus of Manetho, advanced to Pelusium with a powerful army against Sennacherib king of Assyria; when the bowstrings of the Assyrians were gnawed in pieces by a great number of rats and mice, and thus they were easily defeated with great slaughter by the Egyptians. Hence Herodotus informs us, that the statue of Sethon which he saw in Egypt had a mouse in its hand. Sir Isaac Newton, however, explains the whole in an allegorical manner. As the mouse among the Egyptians was a symbol of destruction, he conjectures, that the Assyrians were on this occasion overthrown with great slaughter; and that Sethon, in conjunction with Terhakah, either king of the Arabian Cushites, or a relation of Sethon, and his viceroy in Ethiopia Proper, surprised and defeated Sennacherib betwixt Libnah and Pelusium, making as great slaughter among his troops as if their shield-straps and bowstrings had been destroyed by mice.

In the 78th year of the era of Nabonassar, the empire of Ethiopia was subdued by Esarhaddon king of Assyria; who held it three years, committing enormous cruelties both in that country and in Egypt. After his death the Ethiopians shook off the yoke, and maintained their independency till the time of Cyrus the Great, the first king of Persia; who, according to the Greek historian Xenophon, seems to have also been sovereign of Ethiopia. After his death they revolted, and his son Cambyses unsuccessfully attempted to reduce them. Herodotus informs us, that before he undertook this expedition, he sent some of the Ichthyophagi ambassadors to the king of the Macrobii or long-lived Ethiopians, under pretense of soliciting his friendship, but in reality to observe the strength of the country. Of this the Ethiopian prince was aware, and told the ambassadors that he knew their design, reproached Cambyses with his injustice and ambition, and gave them his bow; telling them at the same time, that the Persians might think of invading Ethiopia when they could easily bend it; and in the mean time, that their master ought to thank the gods who had never inspired the Ethiopians with a desire of extending their territories by conquest. Cambyses had sent by the ambassadors a rich purple robe, gold bracelets, a box of precious ointment, a vessel full of palm wine, and other things, which he imagined would be acceptable to the Ethiopian monarch. But all these, excepting the wine, were despised. This, he owned, was superior to any liquor produced in Ethiopia; and he did not scruple to intimate, that the Persians, short-lived as they were, owed most of their days to the use of this excellent liquor. Being informed by the ambassadors that a considerable part of the food made use of by the Persians was bread, he said that it was no wonder to find people who lived on dung unable to attain the longevity of the Macrobii Ethiopians. In short, the whole of his answer was so contemptuous and disgusting, that Cambyses was filled with the greatest indignation; in consequence of which, he instantly began his march without taking time to make the necessary preparations, or even to procure provisions of any kind for his army. Thus a famine ensued among them; which at last became so grievous, that the soldiers were obliged to eat one another; and Cambyses himself, finding his life in great danger, was obliged to give orders for marching back again; which was not accomplished without the loss of a great number of men. Another army which he sent on an expedition against Ammonia, in order to destroy the celebrated oracle of Jupiter Ammon, perished entirely in the deserts, being overwhelmed with the vast clouds of sand frequently raised there by the wind.

At this time, it is doubtful whether Cambyses would Ethiopia at have accomplished his purpose even if he had found it this time practicable to march into the heart of Ethiopia. This empire had but a short time before received a very considerable accession of strength by the desertion of 240,000 Egyptians who had been posted by Psammetichus in different places on the frontiers. These not having been relieved for three years, had gone over at once to the emperor of Ethiopia, who placed them in a country disaffected to him; ordering them to expel the inhabitants, and take possession of their lands. Not-We are told, indeed, that the Persian monarch, not Ethiopia withstanding this, however, Sir Isaac Newton hints, supposed by that Cambyses conquered Ethiopia, about the 23rd or 24th year of the era of Nabonassar; but his opinion on this respect does not appear to be well founded. We are told, indeed, that the Persian monarch, not by Cambyses notwithstanding the misfortunes he met with in the expedi-tion above mentioned, did really make himself master of some of the Ethiopian provinces which bordered on Egypt; and that these, together with the Trogodites, sent him an annual present of cirmox (shiny gold), 200 bundles of ebony, five Ethiopian boys, and 20 elephants teeth of the largest size; but it appears improbable to the last degree, that even though Cambyses had employed the whole of his reign in the attempt, he could have conquered the vast regions of Ethiopia Proper, Sennar, and Abassia, which were all included in the Ethiopia of the ancients.

When Xerxes invaded Greece, we find his army, according to Herodotus, was partly composed of Ethiopians, of whom Herodotus mentions two distinct races of people. One of these inhabited the Asiatic coast, and differed from the Indians only in their hair and language. Their arms were the same with those of India; they wore helmets made of the skins of horses, the ears and manes of which served them for tufts and plumes of feathers; their shields being made of the skins of cranes. The hair of the Asiatic Ethiopians was long, but that of the western tribes was frizzled. The latter were also differently armed, having darts lighted at one end and covered with leather. We are not informed particularly from what nations these troops were brought, nor whether they were natural subjects of the king of Persia, or only auxiliaries; of consequence we can conclude nothing certain concerning the dominion of the Persian monarchs at this time over Ethiopia, further than that they might possess some of the provinces next to Egypt; while the main

Digitized by Google
body of the empire being in a state of independence, and unconnected with other parts of the world, is not taken notice of by the historians of those times.

Though Alexander the Great had a desire to know the source of the Nile, but did not suffer himself to be diverted by this curiosity from pursuing the expedition into Persia. Ptolemy Euergetes, however, appears to have carried this curiosity to such an extremity as to invade Ethiopia for no other purpose. It is not surprising that the particulars of this expedition are not recorded by any historian, as it appears by an inscription that he penetrated to the farthest parts of the empire, and conquered the most powerful nations in it. Of this we have the following account, which is looked upon by the best historians to be authentic. It was copied on the spot (being the western entrance to Aduale, one of the cities of Ethiopia) by Cosmas Egyptianus, or, as some call him, Cosmas Indicopleustes, in the time of the emperor Justin I. by order of Elesbaan king of the Axumites, and of which the following account is given by the person who copied it. "Here (says he), facing the road to Axuma, stood a chair of white marble, consisting of a square base, a small thin column at each angle of this base, with a larger wreathed one in the middle, a seat or throne upon these, a back and two sides. Behind this chair there was a large stone three cubits high, which had sustained considerable injury from time. This stone and chair contained an inscription to the following purpose: 'Ptolemy Euergetes penetrated to the farthest parts of Ethiopia. He subdued Gaza, Agame, Signe, Ava, Tiamo or Tziamo, Gambels, Zingabene, Angabe, Tiaoma, Athagsa, Cala, Semene, Lasene, Zas, Gabala, Atalinu, Bega, the Tangaita, Anine, Metine, Sesca, Rauso. Solate, the territory of Rauso, and several other kingdoms. Among the nations he reduced, were some inhabiting mountains always covered with a deep snow; and others seated upon the ridges of hills, from whence issued boiling steams, and craggy precipices, which therefore seemed inaccessible. Having finally, after all these conquests, assembled his whole army at Aduale, he sacrificed to Mars, Neptune, and Jupiter; for his great success, he dedicated this chair or throne to Mars.'"

From the time of this conqueror to that of the emperor Augustus, we meet with nothing of any consequence relating to Ethiopia Proper. The Roman forces having about this time been drawn out of Egypt, in order to invade Arabia, Candace queen of Ethiopia, or perhaps rather of the island or peninsula of Erythia, took the opportunity of their absence to make an irruption, with a numerous army, into the province of Thebais. At there was at that time no force to oppose her; she met for some time with great success; but hearing at last that Petronius, governor of Egypt, was in full march to attack her, she retired into her own dominions. Petronius pursued her as far as Pselcha, where with 10,000 men he gained an easy victory over 30,000 undisciplined Ethiopian savages, armed only with poles, hatchets, and other clumsy or insignificant weapons of a similar nature. This victory was soon followed by the reduction of several fortresses; however, as the Roman soldiers were excessively incommoded by the heat of the climate, Petronius, notwithstanding his success, was obliged at last to retire. Soon after, Candace sent ambassadors to Augustus himself with such magnificent presents, that the emperor is said to have been thereby induced to grant her a peace on her own terms. From this time the Romans returned to their former wars of Ethiopia. Augustus was complimented on the great glory he had acquired; and that he had, by reducing a country till that time unknown even to the Romans, finished the conquest of Africa. No material alteration, however, took place in the affairs of Meroe, in consequence of this conquest, whether real or pretended. Pliny informs us that it had been governed by queens, who bore the title of Candace, for several generations before that time; and so it continued to be afterwards, as we learn from Scripture, where we are informed that, in the reign of Tiberius, the sovereign of Ethiopia was still named Candace. Some indeed are of opinion that the Candace mentioned in the Acts of the Apostles was the same with her who had been conquered by Augustus; but this seems by no means probable, as the interval of time is by far too long to be allowed for the reign of a single princess.

From an anecdote of the debauched emperor Heligabalus who was accustomed to confine his favourites, by way of diversion, with old Ethiopian women, we may learn that some intercourse took place between the two peoples, and probably that the Ethiopians owned some kind of subjection to the Romans. The Blemmyes, a gang of monstrous banditti, who inhabited the frontiers of Thebais, were vanquished by the emperor Probus: but, towards the close of the third century, we find them again become so powerful, that in conjunction with another nation called Nobatae, who inhabited the banks of the Nile near Upper Egypt, they committed such depredations in the Roman territories, that Dicogens was obliged to assign lands to the latter, and to pay both of them a considerable sum annually, to desist from their former practices. These expedients did not answer the purpose; the savages continued their depredations till the time of the emperor Justinian, who treated them with more severity, and obliged them to remain at peace. We are told by Procopius, that before the time of Dicogens, the Roman territories extended so far into Ethiopia, that their boundaries were not 23 days journey from the capital, so that probably the whole empire had been in a state of dependence on them.

From the time of this emperor to that of their conversion to Christianity, we find nothing remarkable in the history of the Ethiopians. Three hundred and twenty-seven years are counted from the time of our Saviour to that of Abereh and Atzehba, one from Abra and Asba, who enjoyed the kingdom when the gospel was preached in Ethiopia by Frumentius. This Ethiopian man was a kinsman and companion of a philosopher named Meropius, a native of Tyre; who having travelled all over India, died on an island of the Red Sea. After his death Frumentius, with another named Eutetes, who had also been his companion, were brought before the king of Ethiopia, to whom that island was subject. He took them into his service; making the one his treasurer and the other his butler. On the death of this prince, the queen conceived such a favour for them, that she refused to allow them to depart out of the kingdom; but committed the management of
Abyssinia.

Aby

sia.

her affairs entirely to Frumentius, who made use of his influence to diffuse the Christian religion throughout the country, and at last was appointed bishop of Axum. It is said, however, that the court and principal people, if not the nation in general, relapsed into idolatry, which continued to prevail till the year 521, when they were again converted by their king Adad or Aidog.

The two princes Abra and Asba, who reigned jointly in Ethiopia in the time of Frumentius, lived in such harmony together, that their friendship became almost proverbial. After being converted to Christianity, they adhered strictly to the orthodox doctrine, refusing to admit an Arian bishop into their country. In the time of the emperor Constantius, however, this heresy was introduced, and greatly favoured by that monarch; and an attempt was made to depose Frumentius on account of his refusal to embrace it.

The reign of these princes is remarkable for an expedition into Arabia Felix, called by the Mohammedan writers the war of the elephant, and which was undertaken on the following occasion: The temple of Mecca, situated nearly in the middle of the Arabian peninsula, had been held in the greatest veneration for near 1400 years; probably from the notion entertained by the people in the neighbourhood, that Adam pitched his tent on that spot. Here also was a black stone supposed to possess extraordinary sanctity, as being that on which Jacob laid his head when he had the vision of angels. The most probable account of the real origin of this temple, according to Mr Bruce, is, that it was built by Moses, and that he himself was worshipped there under the name of Osiris.

On account of the veneration in which this tower and idol were held by the Arabs, Mr Bruce supposes that the thought was first suggested of making it the emporium of the trade between India and Africa; but Abra, in order to divert it into another channel, built a very large temple near the Indian ocean in the country of the Homerites; and, to encourage the resort of people to this new temple, he bestowed upon it all the privileges of the former which stood in the city of Mecca. The tribe of Arabs named Koreish, in whose country Mecca stood, being exceedingly alarmed at the thoughts of having their temple deserted, entered the new one in the night; burnt all that could be consumed, and besmeared the remains with human excrements. Abra, provoked at this sacrilege, assembled a considerable army, with which he invested Mecca, himself appearing on a white elephant, from whence the war took its name already mentioned. The termination of the war, according to the Arabian historians, was miraculous. A vast number of birds named Ababil came from the sea, having faces like lions; each carrying in its claws a small stone about the size of a pea, which they let fall upon the Ethiopian army in such numbers, that every one of them was destroyed. At this time it is said that the smallpox first made its appearance; and the more probable account of the destruction of the Ethiopian army is, that they perished by this distemper.

The war of the elephant is supposed to have terminated in the manner above mentioned about the year 360; from which time to that of Elephas, named also Caleb, and probably the same with the Adad or A.

†
Abysinia.

of one of their kings formed a design of overturning the Ethiopian government, and setting aside the family of Solomon, who had hitherto continued to enjoy the sovereignty. This design was facilitated by several circumstances. The empire had been weakened by an unsuccessful war, famine, and plague; the throne was possessed by an infant; and the absurd custom of confining the whole royal family on a rock named Dama, gave her an opportunity of cutting them all off at once by surprising that place. Fortunately, however, the king himself escaped the general catastrophe, and was conveyed by some of the nobility of Amhara to the province of Xosa or Shoar; by which means the line of Solomon was preserved, and afterwards restored, though not till after a very considerable interval.

Judith having by this massacre established her own power, assumed the imperial dignity, though in direct opposition to an established and fundamental law of the empire already mentioned, that no woman should enjoy the sovereign authority. The people, however, seem to have submitted quietly to her government, as she sat on the throne for 40 years, and afterwards transmitted the sovereignty to her posterity; five of whom reigned successively in this country. We are not furnished with any particulars concerning their reigns: farther than that, during them, the people were greatly oppressed. By some means, of which historians have not given any account, another revolution took place; and a new set of usurpers, related to the family of Solomon, but not their direct lineal descendants, succeeded to the throne. These were Christians, and governed with much greater lenity than the Jewish sovereigns had done; but still, being usurpers, none of their transactions are recorded in the Abyssinian annals, excepting those of Lalibala, who was accounted a saint.

He lived in the end of the 12th or beginning of the 13th century, and proved a great prince. At that time the Christians in Egypt were grievously persecuted, and several of the Saracens, who had a particular hatred to masons, builders, and stone cutters; looking upon them as the chief promoters of idolatry by the ornaments they put upon their works. These were joyfully received by Lalibala; who, by affording them an asylum in his dominions, soon collected a great number. They were employed by him in hewing churches out of the solid rock, after the example of the ancient Troglodytic habitations; and many works of this kind remain in the country to this day. He undertook, however, a still more difficult and arduous task; no less than that of lessening the stream of the Nile, and thus starving the whole kingdom of Egypt, now in the hands of his enemies, and who persecuted those of his religion. From the account given by Mr Bruce of this project, it appears that there really is a possibility in nature of accomplishing it; not indeed by turning the course of the Nile itself, but by diverting that of many of its branches, which are the means of conveying into it the water supplied by the tropical rains, and by which it overflows its banks annually. We are likewise assured by the same author, that Lalibala succeeded in his enterprise so far as to divert the course of two large rivers from the Nile, and that they have ever since flowed into the Indian ocean. He next proceeded to carry a level towards a lake named Zagwe, into which many rivers, whose streams contribute to Abysinia, increase that of the Nile, empty themselves; and had this been accomplished, there is no doubt that the loss of so much water would have been very sensibly felt by the Egyptians. According to most historians, this enterprising monarch was prevented by death from putting his design in execution; though Mr Bruce informs us of a written account at Shoa, in which it was asserted, that he was dissuaded from it by certain monks, who told him, that by sending down such a quantity of water to the eastern and dry parts of Africa, these countries would soon become so fertile and populous that they would rival the empire of Ethiopia, or at least withdraw their allegiance from it entirely. The remains of these works were seen by the Portuguese ambassador in 1522.

This new revolution.

At all this time the princes of the line of Solomon had been obliged to content themselves with the sovereignty of the province of Xosa or Shoar, without making any attempt to regain their former dignity; but they were unexpectedly restored without bloodshed or disturbance by Nascueto Leeb the grandson of Lalibala. This prince, who was of a gentle and pacific disposition, was persuaded by a monk named Tecla Haimonait, much celebrated for his sanctity, to resign the crown, to which, though he received it from his father, he could not pretend any absolute right. In consequence of the mediation of this monk, therefore, it was agreed that Nascueto should give up the empire to Icon Amlac the lineal descendant of Solomon, who then possessed the sovereignty of Shoar. In consequence of this a portion of lands should be irrevocably and irremediably assigned to him and his heirs; and he should likewise be allowed some marks of sovereignty as a testimony of his former grandeur. In this treaty, however, the good monk did not forget his own interest. He had founded a famous monastery in Shoar, and was primate of the whole empire under the title of Abuna. He now insisted that one third of the kingdom should be absolutely ceded to himself for the maintenance of his own dignity, and the support of the clergy, convents, &c. throughout the country; he also insisted that no native Abyssinian should ever enjoy the same dignity with himself, even though he should have been chosen and ordained at Cairo, as was the custom with the Abyssinian prelates.

These extraordinary terms were complied with, and Icon Amlac raised to the throne of Ethiopia. He did not, however, remove the seat of government from the province of Shoar; but continued at Tegulat the capital of that province during the whole of his lifetime, which continued 15 years after his accession to the throne. We are ignorant of the transactions of his reign, as well as that of several of his successors: five of whom ascended the throne in as many years. From this quick succession Mr Bruce is of opinion, that a civil war had taken place among the candidates for the throne; but the Abyssinian annals make no mention of this; neither have we any particular account of the transactions of the empire till the time of Amda Sion, who began to reign in 1312. He was the son of We-Reign of dem Araad, the youngest brother of Icon Amlac, Amda Sion, and succeeded to the throne on the death of his father. He professed the Christian religion; but his practice seems uncertain.
seems to have been very opposite to its precepts. He began his reign with living publicly with a concubine of his father's; and quickly after committed incest with his two sisters. On this he was first exorted to repentance, and then excommunicated, by Honorius, a monk greatly celebrated for his sanctity, and who has since been canonized. The prince, enraged at this indignity, caused the saint to be severely whipped through every street of his capital. That night the town was by some unknown means set on fire and reduced to ashes: the clergy persuaded the people, that the blood of Honorius had turned to fire as it dropped on the ground, and thus occasioned the catastrophe; but the king suspecting that the monks themselves had been the incendiaries, banished or imprisoned them all, so that their hopes of exciting an insurrection were disappointed; and being dispersed into those provinces where the inhabitants were mostly Jews or Pagans, they were now obliged to apply to what was certainly more incumbent upon them, viz. the diffusion of the knowledge of the gospel.

While the king was thus occupied with the monks, one of the factors, who had been entrusted with some of his commercial interests, was assassinated by the Moors in the province of Ifat; on which, without making the least complaint or expostulation, he assembled his troops, and with seven horsemen (A) fell upon the nearest Mahometan settlements, massacring all he met without exception. Putting himself then at the head of his army, he proceeded in the most rapid career of desolation, laying waste the whole country with fire and sword, and carrying off an immense booty.

For some time the Moors were so surprised, that they did not think of making opposition; but at last they took up arms, and attempted to surprise the Abyssinian monarch in his camp, hearing that he had sent out most of his army in detachments. With this view they approached the camp in the night time, expecting to have found the king and his few soldiers immersed in sleep. Unexpectedly, however, he had been joined by a considerable part of his army, whom he drew up in battle array to receive his enemies. An engagement ensued, in which the king behaved with great valor, killed the Moorish general with his own hand, and gained a complete victory. He then commanded such of his soldiers as could not find houses ready built, to build huts for themselves, and a large tract of land to be plowed and sown, as if he meant to stay in the country of the enemy during the rainy season.

The Mahometans now perceiving that they were in danger of being totally exterminated, willingly submitted to the terms he pleased to impose upon them; while the monarch conciliated the affections of his people by dividing among them the vast plunder he had acquired in this expedition.

The Moors no sooner found themselves freed from any apprehensions of immediate danger, than they prepared for a new revolt. The king having intelligence of their designs, secretly prepared to subdue them before they could have time to bring their matters to a sufficient bearing. The Moors, however, being better prepared than he expected, began hostilities by surprising and plundering some villages belonging to the Christians, and destroying their churches. A most formidable combination had taken place; and as the consequence of allowing the confederate rebels to join their forces might have been very dangerous, the king used his utmost endeavours to prevent it. This design was in some measure facilitated by the superintendence of Amino king of Hazas, one of the principal rebels. This man, by the advice of a conjurer in whom he put great confidence, instead of marching his troops to the assistance of his allies, remained at home with them, where he was defeated and taken prisoner by a detachment of the king's army. The governor of Ambarara was next despatched against Saber eddin the revolted governor of Fatigar, with orders to lay waste the country, and use every method to force him to a battle, if he should be disinclined to venture it himself. These orders were punctually executed; Saber eddin another was compelled to stand an engagement, in which he was defeated; the victors plundered his house, and took his wife and children prisoners. But in the mean time intelligence was received of a new revolt among the Falasha, who had assembled a great army, and threatened to become very formidable; their chief keeping a close correspondence with Saber eddin, as well as with the king of Adel. These, however, shared the same fate with the rest, being entirely defeated by the FalsaTzaga Christos another Abyssinian general, who soon after joined the king with his whole army. This proved fatal to the rebel cause: Saber eddin, no longer able to support himself against the royal forces, was obliged to surrender at discretion, and all the rest were quickly reduced; so that the king was at leisure to march against the kings of Adel and Mara, who having now united their forces, resolved to give him battle. At this juncture this the Abyssinian monarch was so exasperated, that against Adel, he determined to take the most ample vengeance on his Mara, &c. enemies. In the presence of his whole army, therefore, and a monk of uncommon sanctity dressed in the same habit in which he usually performed divine service, the king made a long speech against the Mahometans. He recounted the many victories which they had committed; and of which the kings of Adel and His speech Mara had been principal promoters. He enumerated in many examples of murder, sacrilege, &c. of which they had been guilty; setting forth also that they had carried off great numbers of Christians into slavery, and that the view of making slaves was now a great motive with them for making war. He disclaimed every idea of commencing hostilities from any avaricious motive; as a proof of which, he denied that he would accept of any part of the plunder for his own use; concluding with a declaration, that he was now about to swear on the holy eucharist, that, "though

(A) On this Mr. Bruce remarks, that "it has been imagined the number should be increased to 70; but there would be little difference in the rashness of the action. The word in the Abyssinian annals which he translates is seven; but if we increase the number at all, it ought more probably to be seven hundred than seventy.
but 20 of his army should join him, he would not
turn his back upon Adel or Mara, till he had either
forced them to tribute and submission, or entirely ex-
tirpted them and annihilated their religion. After
this speech, he took the oath in the presence of the
whole army; who not only applauded him with loud
shouts, but protested that they looked upon themselves
to be all bound by the oath he had taken. As he had
mentioned in his speech that the plunder had been pur-
chased by the lives of their Christian brethren, they
determined to show their abhorrence at keeping any
of it on these terms. Taking lighted torches in their
hands, therefore, they set fire to the whole plunder
that had been amassed since the beginning of the war;
and having thus reduced themselves to a state of po-
verty, they prepared to show their Christianity by
thirsting, not after the wealth, but the blood of their
enemies.

Notwithstanding the enthusiasm of the whole army
on this occasion, the expedition was attended with
great difficulties. These arose principally from super-
stition; and, as on the one hand, the Abyssinians
were by this principle laid under considerable disadvantages,
their adversaries on the other enjoyed equal advantages
from no better cause. The Abyssinians, according
to Mr Bruce, are very credulous with respect to genii
or spirits which go about doing mischief in the dark.
Hence they are afraid of travelling, but especially of
fighting, in the night-time; because they imagine that
the world is then entirely given up to these beings, who
are put out of humour by the motions of men, or of
any other terrestrial creature. In the night-time there-
fore an Abyssinian dreads not even throw a little water
out of a bason, lest it shall fall upon some spirit and
provoke it to vengeance. The Moors, on the other
hand, though equally fearful, secure themselves against
these invisible enemies by means no less ridiculous
than the fears themselves. A verse of the Koran, sewed
up in leather, and worn round their neck or arm, is suf-
icient to defy the power of the most mischievous spirit.
Under such powerful protection, therefore, they laugh
at the terrors of the Abyssinians, and are on all occa-
sions ready to attack them in the night-time, and even
prefer that season rather than any other for coming to
an engagement. Sensible of this advantage, and en-
couraged by the little loss which attended even a de-
feat in these nocturnal encounters, they determined on
the present occasion to avoid any pitched battles, and
to content themselves with harassing the king's army
with continual skirmishes of this kind. Thus, though
the Abyssinian monarch had always the advantage, his
troops soon began to complain; and, on the com-
 mencement of the rainy season, insisted on being allow-
et to return. This was by no means agreeable to a
prince of such a martial disposition as Amda Sion. He
therefore told them, that, if they were afraid of rains,
he would conduct them to a country where there were
none; meaning Adel, which, though likewise within
the limits of the tropical rains, has them at another
season than that in which they fall in Abyssinia. Thus
he persuaded his army again to set forward; but was
so grievously harassed by the nocturnal attacks of the
Moors, that he was once more in danger of being de-
serted; and when by his eloquence he had found
means to dissipate the apprehensions of the soldiers, he
was seized with a violent fever which threatened his
life. The soldiers now expected that they were soon
to return; but while they indulged themselves in the
the king is seized
carelessness which usually attends an expectation of
this kind, they accidentally received intelligence that
the Moors, having assembled an army of 40,000 men, few
were in full march to attack them, and at a very small
distance. The king was now free from fever, but so
weak that he faintted on attempting to put himself in
readiness for going out to battle. Still, however, his
resolution continued firm and unalterable; having re-
covered from his faint, washed and refreshed himself,
he made a speech to his soldiers filled with the most
enthusiastic expressions of confidence in the justice and
goodness of the cause in which he was engaged, and in
the continuance of the divine favour and protection.
"As it never was my opinion (said he), that it was
my own strength and valour, or their want of it, which
has so often been the cause of preserving me from their
hands; so I do not fear at present that my accidental
weakness will give them any advantage over me, as
long as I trust in God's power as much as I have ever
done." By this speech the drooping spirits of the A-
byssinians were revived; and they only begged that
their monarch would now trust to the valor of his
troops, and not expose his person to such danger as he
had usually done. He promised to comply with their
request; but matters were soon thrown into confusion
by a report that the Moors had poisoned the wells and
disheartened all the running water in the front of the
army. The poisoned wells, however, were easily avoid-
ed; and a priest of vast sanctity was dispatched a day's
journey before the army to disenchant the waters by
his blessings; which, having the advantage of the good
qualities of the element itself on their side, were doubt-
less more powerful than the spells of the infidels. Not
content with this, the king caused a river to be conse-
crated by the name of Jordan; but while his men were
employed in bathing themselves in this holy water, the
Fits-Auris, an officer who had been dispatched with
a party of men who always go before the Abyssinian
armies, was attacked and driven back on the main bo-
dy by a detachment of the enemy, who had along with
them a number of women provided with drugs to poi-
son and spells to enchant the waters. A dreadful pan-
nic now seized the whole army. Unmindful of the
promises made to their king, they not only refused to
keep up the strain of the engagement, but for the most part resolved to leave the
camp, and return homewards without delay. The
king, sensible that all was lost if this pernicious scheme
should be adopted, did his utmost to encourage and
persuade them to return to their duty; but perceiving
that nothing was to be gained by reasoning with men
so much terrified, he only requested that such as could
not be induced to fight, would not leave their places,
but stand quiet spectators of the battle. Even this
had very little effect: so that, ending the enemy now the fight
ready to make an attack, he ordered his master of the with a very
home with only five others, to attack the left wing of the
enemy; while he, with a small party of his ser-
 vants, made an attack on the right. This desperate
action was attended with success. The king, notwith-
standing the weakness he yet laboured under, killed
with his own hand two of the commanding officers
of the enemy's right wing; while his son dispatched another
side.
ABYSSINIA.

There was considerable rank belonging to the left. This had such an effect upon the whole Moorish army that they began evidently to lose courage; while the Abyssinians, ashamed of their conduct, now rushed furiously on to rescue their prince from danger. The battle continued for some time with great obstinacy; but at last the centre and left wing of the Moors were entirely defeated. The right wing, composed principally of Arabsians, retired in a body; but not knowing the country, they entered a deep valley surrounded by perpendicular rocks entirely covered with wood. The Abyssinians, imagining they had nothing more to do, began to strip and mangle the bodies of the killed and wounded; but the king, perceiving that the Arabsians had brought themselves into a situation from whence they never could be extricated, obliged his soldiers to desist from this barbarous employment, and even killed two of them who disobeyed his orders. The army was then divided into two parts, one of which surrounded the devoted Arabsians, while the other was sent a day’s journey after the remainder of the Moors. Both parties proved equally successful. The king, with part of his division, attacked the Arabsians in front, while the rest rolled great stones down from the tops of the rocks upon them. By this they were thrown into such confusion, that being neither able to fly nor resist, they were all killed to a man. The fate of the Moors was little better. The other division of the Abyssinian army found them lying round a large pool of water, which they lapped like as many dogs. In this helpless situation there was nothing requisite but to order them to be slaughtered; and this cruel order was punctually executed. The soldiers imagining they should now discharge their vow to heaven, wares themselves with slaughter; till at last, being almost satiated with blood, they made a few prisoners, among whom was Malch king of Marsa, with his queen; the former of whom was hanged by order of Amda Sion, and the latter cut in pieces, and her body given to the dogs by the soldiers.

Amda Sion parries his advantage.

This signal victory was gained in the end of July 1316; but as the rains at that season set in with violence, most of the army now again insisted on their returning home without delay. The king and principal officers, however, were of opinion, that the advantages so dearly purchased ought by all means to be pursued till they had either reduced the Mahometans to submission, or at least deprived them of all power to make attacks on the empire with any prospect of success. This opinion being adopted, the king sent back the baggage, women, and others who could be of no use to the army; retaining only the veteran soldiers, who were able to encounter more than six times the number of such enemies as he could expect to meet with.

Advancing farther into the Mahometan territories, he took up his residence in a large town called Zeyla; from whence he, that very night, sent out a detachment to surprise a large village in the neighbourhood named Toraca. This was executed with success; the men were massacred, and the women kept to witness the places of those who had been sent away. Continuing still to advance, he detached parties to lay waste the countries all round; and in this expedition he had the good fortune to cut off two of the principal authors of the conspiracy against him. He then proceeded to invade Talab and Abalge in the territories of the king of Adel. That monarch, now rendered desperate by the view of approaching ruin, had assembled all the troops he could raise, in order to make one last effort against the enemy; but conducted himself with much less prudence than he ought to have done when contending with such an experienced and vigilant adversary. Amda Sion, confident of success, took no less care how to prevent the enemy from escaping than how to gain the victory. For this purpose he dispatched parties of horse to lie in wait in all those avenues by which he supposed that the Moors might attempt to make their escape; after which, falling furiously on the Adelians himself, and being well supported by his troops, he gained a complete victory; the king of Adel, the king with great numbers of his men, being killed on the spot, and almost all the rest by the parties of horse cut off and killed, whom the Abyssinian monarch had posted in ambush to intercept them.

As the loss of this battle rendered the affairs of the Adelians quite desperate, the three young princes, sons of the late king, with their uncle, waited upon Amda Sion with rich presents, which they laid at his feet in the most humble manner, putting their foreheads in the dust, and intreating his pardon; professing their submission and readiness to obey his commands, provided that he would spare the remainder of their country and property. To this the king made a very favourable reply, reproaching them with indignities done to himself; but especially with the sacrifice they had committed in burning churches and murdering priests, destroying also defenceless people in villages, merely because they imagined that he could not protect them. To punish these and other crimes, he said, he was now in the heart of their country; and he was determined never to turn his back upon Adel while he had ten men capable of drawing their swords; for which reason he commanded them to return and expect the approach of his army.

By this fierce speech the brother and two eldest children of the king of Adel were so disheartened, that they could not speak; but the youngest son made a very spirited speech, in which he attempted to soften the king by complimenting his valour, and showing that it was unworthy of his character to push the war against a people who were already conquered and defenceless. All the answer he could obtain, however, was that unless the queen with the rest of the royal family, and the principal people of the nation, would come by to-morrow evening and surrender themselves as the princes had done, he would lay waste the territory of Adel, from the place where he sat to the Indian ocean. On this the princes earnestly requested their mother to submit without reserve to the clemency of the Abyssinian monarch, and to wait upon him next morning; but she was prevented from this by some of the war nobility who had formerly advised the war, and who continue justly suspected danger to themselves if they should be obliged to submit unconditionally to the conqueror. They resolved, therefore, not to wait for a battle; and the better to ensure success, they bound themselves by an oath to stand by each other to the last extremity. At the same time they dispatched messengers to the princes, requesting them to make their escape with all manner of expedition, and to head the army themselves; all
Abyssinia.

all of whom were determined to conquer or die as soon as the royal family should be out of the enemy's hands. By this conduct the Abyssinian monarch was so much irritated, that he divided his army into three parts; two of which were arranged to enter the territory of the enemy by different routes, and to exterminate both man and beast wherever they came; while he himself, with the third, took the straight road to the place where the new Adelian army was encamped. Here he found a number of infantry drawn up and ready to engage him; but, besides these, there was a multitude of old men, women, and even children, all armed with such weapons as they could procure. Surprised at this sight, he ordered a party of horse to disperse them; but this was found impossible; so that he was obliged to call in the detachments he had sent out, with orders to fall upon the enemy by the nearest way they could advance. The engagement was for a long time very doubtful; and in opposition to Anda Sion appeared the young king of Wypo, who everywhere encouraged his troops, and made the most obstinate resistance. The Abyssinian monarch having observed him, sheathed his sword, and arming himself with a bow, chose the broadest arrow he could find, and took so just an aim, that he shot the young prince through the side of the neck, and his head inclining to one shoulder he soon fell down dead. On this the spirit of the Adelians entirely forsook them, and they betook themselves to flight; but unluckily falling in with two Abyssinian detachments coming to the king's relief, they were so completely destroyed, that only three of them are said to have made their escape. On the side of the Abyssins, however, the victory was dearly purchased; many of the principal officers being killed, and scarcely one of the cavalry escaping without a wound.

The Moorish army entirely cut off.

Dreadful devastations.

The royal family not confined as formerly.

Reign of Saif Arnaad.

By this conduct the Abyssinian monarch was so much irritated, that he divided his army into three parts; two of which were arranged to enter the territory of the enemy by different routes, and to exterminate both man and beast wherever they came; while he himself, with the third, took the straight road to the place where the new Adelian army was encamped. Here he found a large number of infantry drawn up and ready to engage him; but, besides these, there was a multitude of old men, women, and even children, all armed with such weapons as they could procure. Surprised at this sight, he ordered a party of horse to disperse them; but this was found impossible; so that he was obliged to call in the detachments he had sent out, with orders to fall upon the enemy by the nearest way they could advance. The engagement was for a long time very doubtful; and in opposition to Anda Sion appeared the young king of Wypo, who everywhere encouraged his troops, and made the most obstinate resistance. The Abyssinian monarch having observed him, sheathed his sword, and arming himself with a bow, chose the broadest arrow he could find, and took so just an aim, that he shot the young prince through the side of the neck, and his head inclining to one shoulder he soon fell down dead. On this the spirit of the Adelians entirely forsook them, and they betook themselves to flight; but unluckily falling in with two Abyssinian detachments coming to the king's relief, they were so completely destroyed, that only three of them are said to have made their escape. On the side of the Abyssins, however, the victory was dearly purchased; many of the principal officers being killed, and scarcely one of the cavalry escaping without a wound.

The remainder of this expedition consisted only in the destruction and burning of towns and villages, and massacres of helpless people, on pretence of retaliating the injuries committed by the Mahometans against the Christians. At last, weary of conquest and of carnage, this victorious monarch, who had suffered a deal in any battle, returned in triumph to his capital, where he ended his days after a reign of 30 years. In his time we find that the royal family were not confined, as had been the usual practice from the time of the queen of Sheba to the massacre by Judith; for Saif Arnaad, the son and successor of Anda Sion, distinguished himself in one of the battles in which his father was engaged.

Though the new prince, as appears from what has been just now observed, was by no means destitute of military talents, the Abyssinian empire enjoyed a profound peace during his reign. The only remarkable transaction was the relief given by him to the Coptic patriarch, whom the sultan of Egypt had thrown into prison. At this time a great trade was carried on through the desert by caravans between Cairo and Abyssinia, as well as from Cairo to Suakim on the Red sea; but the Ethiopic monarch having seized the merchants from Cairo, and sent parties of horse to intercept the caravans in their passage, the sultan was soon content to release the patriarch, whom he had imprisoned only with a view to extort money.

In the reign of Theodore, who held the crown of Ethiopia from the year 1409 to 1412, we find an infringement made on the treaty between Icon Ammac and the Abuna Tecla-Haimanout formerly mentioned. By that treaty the Abuna was to have a full third of the whole empire for the support of his own dignity and that of the church; but Theodore, justly considering this as an unreasonable acquisition, reduced it very considerably, though he still allowed a very ample revenue out of every province of the empire; and even this has been considered by several of his successors as too large, and consequently has been frequently abridged by them. The annals of this prince's reign are very defective, and Mr Bruce supposes that they have been mutilated by the ecclesiastics; which, considering what we have just now related of his reducing their revenues, is by no means improbable. By his subjects he was in celebration—a saint, to that to this day the people as such a saint, that he is is celebrated. The Annals of Abyssinian during which period war is to cease, and happiness to be universally diffused.

From the time of Theodore to that of Zar Jacob, who began his reign in 1434, the Abyssinian annals furnish us with little or nothing of any consequence. The Zar Jacob character of this prince is represented as by no means in- ferior to that of Theodore, or indeed of any monarch qual Sola- son. that ever sat on the throne of Ethiopia, or any other kingdom in the world. He is, in short, set forth as another Solomon, and a model of what sovereigns ought to be; though, from some particulars of his reign, his character should seem to be rather exaggerated. The first remarkable transaction of this great monarch was his sending an embassy to the council of Florence. The ambassadors were certain the council of Florence, who in that assembly adhered to the opinions of the Greek church; and the embassy itself was judged to be of such consequence as to be the subject of a picture in the Vatican. This prince obtained also a conveit at Rome from the pope for the use of the Abyssinians; which is still preserved, though very seldom visited by those for whom it was designed. He seemed to have been very desirous of keeping up a correspondence with the Europeans as the Asiatics; and in his time we first read of a dispute in Abyssinia with the Frang! or Franks on the subject of religion. This was carried on in presence of the king between one Aba George and a Ve-the church etian painter, Francisco de Branco Lone, in which of Rome, the former confuted and even convinced his antagonist; but from this time we find a party formed for the church of Rome, and which probably took its rise from the embassy to the council of Florence.

The prince of whom we now treat was the first who introduced persecution on a religious account into his dominions; and for this reason, most probably, he is so highly commended by the ecclesiastics. The state of religion in Abyssinia was now indeed very corrupt. The Greek profession had been originally established from the church of Alexandria; but in the low provinces bordering on the coast of Adel, the Mahometan superstition prevailed. Many of that persuasion had also dispersed themselves through the towns and villages in the internal parts of the empire, while in not a few places the grossest idolatry still took place; such as the worship of the heavenly bodies, the wind, trees, cows, serpents, &c. All this had hitherto passed unnoticed; but in the reign of Zar Jacob, some fami-
ABYSSINIA.

lies being accused of worshipping the cow and serpent, were brought before the king, who pronounced sentence of death upon them. Their execution was followed by a royal proclamation, that whoever did not carry on his right hand an amulet with these words upon it, "I renounce the devil for Christ our Lord," should not only forfeit his personal estate, but be liable to corporeal punishment. The spirit of persecution thus began, quickly diffused itself, and an inquisitor was appointed to search for criminals. This was one Amda Sion, the king's chief confidant, who pretended to all that absurd and sanguine devotion common to religious hypocrites. In this he was flattered with uncommon parade and attendance, the usual rewards of people of that stamp; for he never appeared abroad but with a great number of soldiers, trumpets, drums, and other ensigns of military dignity waiting upon him. He kept also a number of spies, who brought him intelligence of those who were secretly guilty of any idolatrous or treasonable practices; after which, proceeding with his attendants to the house of the delinquent, he caused the family first supply himself and his party with refreshments, and then ordered the unhappy wretches to be put to death in his presence. Among those who suffered in this barbarous manner were the two sons-in-law of the king himself, who had been accused by their wives, the one of adultery, and the other of incest; on which slight ground they were both put to death in their own houses, in such a manner as deservedly threw an odium on the king. His conduct was afterwards so severely condemned by a certain clergyman from Jerusalem, that a reformation seems to have been produced; and no mention is afterwards made of the inquisitor or persecution during this reign.

The affair of the kingdom regulated.

Murder of the king's son-in-law.

The attention of the king was now called off from religion to the state of his affairs in the different provinces of the kingdom. As the Moorish provinces were very rich, by reason of the extensive trade they carried on, and frequently employed their wealth in exciting rebellion, it became necessary that the sovereign himself should examine into the circumstances and dispositions of the several governors; which was likewise proper on another account, that he might assign to each the sum to be paid. On this occasion he divided the empire more distinctly, and increased the number of governments considerably; which being done, he set about repairing the churches throughout the country, which had fallen into decay, or been destroyed in the war with the Mahometans. So zealous was he in this respect, that having heard of the destruction of the church of the Virgin in Alexandria by fire, he instantly built another in Ethiopia, to repair the loss which Christianity might have suffered.

The last public transaction of this prince's reign was the quashing of a rebellion which some of his governors had entered into; but whatever glory he might acquire from this or any other exploit, his behaviour with regard to his domestic affairs must certainly place him in a very disadvantageous light. In the decline of the king's life, the mother of the heir apparent conceived such an extreme desire to behold her son in possession of the throne, that she began to form schemes for obliging his father to take him into partnership with him in the government. These being discovered, her husband cruelly caused her to be whipped to death: Abyssinia.

and finding that his son afterwards performed certain solemnities at her grave in token of regard for her, he caused him to be loaded with irons and banished to the top of a mountain; where he would probably have been put to death, had not the monks interfered. These having invented prophecies, dreams, and revelations, that none but the young prince Boda Mariam was to possess the throne, the old king submitted to the decrees of Heaven, and relented in his severity.

On the accession of the new king in 1468, the old royal law for imprisoning all the royal family was revived, and a mountain named Graben chosen for the purpose. A gaol was fixed. Having thus secured himself from any danger of a rival in case he should undertake a foreign expedition, he proclaimed a pardon to all those who had been banished during the former reign, and thus ingratiated himself with his people: after which he began to prepare for war. At this the neighbouring princes, particularly the king of Adel, being alarmed, sent ambassadors requesting the continuance of peace. The Abyssinian monarch told them, that his design was to destroy the Dobas; a race of shepherds very wealthy, but extremely barbarous, professing the Pagan religion, and greatly resembling the Gallas. The reason of his commencing hostilities against them was, that they made continual inroads into his country, and committed the greatest cruelties; on which account he determined not to make war as with a common enemy, but to exterminate and destroy them as a nuisance. The king of Adel was no sooner possessed of this piece of intelligence, than he communicated it to the Dobas; desiring them to send their women and children, with their most valuable effects, into his country, till the invasion should be over. This proposal was readily em Braced; but Boda having got notice of it, seized an massacred avenue through which they must necessarily pass, and massacred every one of the company. After this, entering their country, he committed such devastations, that they were glad to submit, and even to renounce their religion in order to free themselves from such a dreadful enemy. The king then turned his arms against Adel, where he was attended with his usual success; a most complete victory being gained over the Moors by the Abyssinian general: but while the king himself was advancing towards that country, with a full resolution to reduce it to the most absolute state of misery, he was seized with a pain in his bowels, which occasioned his death.

The discovery of the kingdom of Ethiopia or Abyssinia by the Europeans took place about this time. It has already been observed, that some intercourse by means of individuals had been carried on betwixt this country and Italy; but the knowledge conveyed to Europeans in this manner was very imperfect and obscure. Even the situation of the country had been of Abyssinia by the forgotten; and though some confused notions were entertained of a distant Christian prince who was likewise a priest, Marco Paulo, the famous Venetian traveller, affirms that he had met with him in Tartary; and it was universally agreed, that his name was Johannes John. Prosetier, Praetie Janni, or Prestier John. When the Portuguese began to extend their discoveries along the coast of Africa, more certain intelligence concerning this prince was obtained. Be moy, one of the kings of
the Jalooses, a nation on the western coast of Africa, had assured the Portuguese navigators of the existence of such a prince so strongly, that the king determined to send ambassadors to him; and the discovery was of the greater consequence, that a passage to the East Indies was now attempted both by land and sea. The ambassadors were named Peter Covilhan and Alphonso de Paiva. These were sent to Alexandria in Egypt, from whence they were to set out on their journey; the intent of which was, to explore the sources of the Indian trade, the principal markets for the spice, &c. but above all, to discover whether it was possible to arrive at the East Indies by sailing round the continent of Africa.

In the prosecution of this scheme our two travellers went from Alexandria to Cairo; from thence to Suez at the bottom of the Red sea; from Suez they took their route to Aden, a wealthy and commercial city beyond the straits of Babel Mandel. Covilhan now set sail for India, and De Paiva for Sumaken. The latter lost his life without making any discovery; but Covilhan passed over to Calicut and Coen. From thence he returned to the continent of Africa, visiting the gold mines of Sofala, and passing from thence to Aden and Cairo; at which place he was informed of the death of his companion. In this city he was met by two Jews with letters from the king of Abyssinia. One of these Jews was sent back with letters to the Abyssinian monarch: but with the other he proceeded to the island of Ormus in the Persian gulf. Here they separated; the Jew returning home, and Covilhan repassing the straits of Babel Mandel, whence he proceeded to Aden, and afterwards entered the Abyssinian dominions.

The reigning prince at this time was named Alexander; and when Covilhan arrived, he was employed in levying contributions upon his rebellious subjects. He met with a kind reception; and was conveyed to the capital, where he was promoted to the highest posts of honour, but never allowed to return to Europe again. The intelligence, however, which he transmitted to the court of Portugal proved of much importance. He not only described all the ports of India he had seen, with the situation and wealth of Sofala, but advised the king to prosecute the discovery of the passage round Africa with the utmost diligence; affirming, that the cape at the southern extremity of the continent was well known in India; and accompanying the whole with a chart which he had obtained from a Moor, and which showed exactly the situation of the cape and neighbouring countries.

Covilhan arrived in Ethiopia about the year 1493; and the prince to whom he addressed himself was Alexander, the son of Boda Mariam, a prince endued with many good qualities, and no less versed in military affairs than any of his predecessors. His reign was disturbed by plots and rebellions, which at last proved fatal to him. From his early years he manifested a great desire to make war on the king of Adel, who seems to have been the natural rival of the Ethiopian princes. But the Adelian monarch, having now become sensible that he was not able to cope with such powerful adversaries, took the most effectual way of securing himself; viz. by gaining over a party at the court of Abyssinia. In this he had now succeeded so well, that when Alexander was about to invade Adel, Alexander Za Saluce the prime minister, with many of the principal nobility, were in the interest of his adversary. He is described by Not being apprized of this treachery; however, Alexander his prime minister intrusted this minister with the command of a great part of his forces; and with these the latter aban- doned him in the heat of an engagement. Alexander his army in battle, but and the few troops that remained with him, however, were so far from being disheartened by this treachery, that they seemed to be inspired with fresh courage. The king having killed the standard-bearer of the enemy, and thus become master of the green ensign of Mahomet, the enemy began to give way; and on his killing the king of Adel's son, immediately after, they quitted the field altogether. The victory was not by any means complete; neither was Alexander in a situation to pursue the advantage he had gained. Having therefore challenged the Moors to a second engagement, which they declined, he returned with a design to punish his perfidious minister Za Saluce, who had endeavoured to excite the governors of all the provinces to revolt as he went along. The traitor, however, Alexander had laid his plots too well; so that his sovereign was murdered in two days after his arrival in the capital. Za Saluce did not enjoy the rewards he expected from his treachery: for having attempted to excite a revolt in the province of Amhara, he was attacked by the nobility there; and his troops deserting him, he was taken prisoner without any resistance, his eyes were put out, and himself exposed on an ass, to the curses and derision of the people.

Alexander was succeeded by an infant son, who Reigned only seven months; after which his younger Nao, brother Naol was chosen king by the unanimous voice of the people. He proved a wise and virtuous prince; but the late misfortunes, together with the corruption introduced at court by the Mahometans, had so unhinged the government, that it became very difficult to know how to manage matters. Judging very properly, however, that one of the most effectual methods of quieting the minds of the people would be an offer of a general pardon; he not only proclaimed this, but likewise, "That any person who should abjure another with being a party in the misfortunes of past times, or say that he had been privy to this or that conspiracy, had received bribes from the Moors, &c. should be put to death without delay." On his enter-Maffudi, fusing government, he found it necessary to prepare against an enemy whom we have not heretofore men- tioned, viz. Maffudi, prince of a district named Arer, which lay in the neighbourhood of Adel. This chief-tain being a man of a very enterprising and martial disposition, and a most violent enthusiast in the Mahome- tan cause, had made a vow to spend 40 days annually in some part of the Abyssinian dominions during the time of Lent. For this purpose he kept a small body of veteran troops, with whom he fell sometimes on one part, and sometimes on another of the frontiers, putting to death without mercy such as made resistance, and carrying off for slaves those who made none. For 30 years he continued this practice; beginning exactly on the first day of Lent, and proceeding gradually up the country as the term advanced. His progress was greatly facilitated by the superstition of the people themselves, who kept that fast with such rigour as almost
Abyssinia. most entirely to exhaust their strength; so that Maffudi having never met with any opposition, was always sure of success, and thus came to be reckoned invincible. On the present occasion, however, he experienced a prodigious reverse of fortune. Naad having enjoined his soldiers to live in the same full and free manner during the fast as at any other time, and having set the example himself, marched out against his enemy; who, being ignorant of the precaution he had taken, advanced with his usual confidence of success. The Abyssinian monarch, still pretending fear, as if on account of the weakness of his men, pitched his camp in very strong ground, but left some passages open to it, that the enemy might make an attack. This was done contrary to the advice of their leader; and the consequence was, that almost every one of them was cut off. On this the king of Adel sent ambassadors to solicit a continuance of the peace with himself; which was granted, upon condition that he restored all the slaves whom Maffudi had carried off in his last year’s expedition; with which the Mahometan chief thought proper to comply rather than engage in such a dangerous war.

Naad having thus freed his country from the danger of any foreign invasion, applied himself to the cultivation of the arts of peace, and reforming the manners of his subjects, in which he spent the remainder of his days. He died in 1508, after a reign of 13 years; and was succeeded by his son David III., a child of 11 years of age. Though the affairs of the empire were at present in such a state as required a very prudent and active administration, the empress Helena, widow of Buda Marim, had interest enough to get the crown settled on the infant just mentioned. This proceeded partly from her desire of engrossing all the power into her own hands, and partly from a wish to keep peace with Adel her native country. These ends could not be accomplished but by keeping a minor on the throne of Abyssinia; which was therefore her constant object as long as she lived. But though this might not have been attended with any very bad consequence had the two nations been left to decide the quarrel by themselves, the face of affairs was now quite changed by the interference of the Turks. That people having now conquered almost the whole of Arabia to the Indian ocean, being likewise on the point of reducing Egypt, and having a great advantage over their adversaries in using fire-arms, now projected the conquest of India also. In this indeed they were always disappointed by the superior valour of the Portuguese; but as this conquest remained a favourite object with them, they did not abandon their attempts. In the countries which they had conquered, they exacted such enormous contributions from the merchants, that vast numbers of them fled to the African side of the Red sea, and settled on the coast of Adel. The Turks, surfeited with the increase of trade in this country, in which they themselves had occasioned, resolved to share in the profits. For this purpose they took possession of Zeyla, a small island in the Red sea, directly opposite to the coast of Adel; and erected a custom-house in it, where they oppressed and ruined the trade as in other places. Thus both Adel and Abyssinia were threatened with a most formidable enemy, which it would have been utterly out of their power to have resisted, had not the desire of possessing India constantly prevented the Turks from directing their strength against these countries.

Helena was sensible enough of the dangerous situation of the empire, but preferred the gratification of her ambition to the good of her country; however, that she might preserve herself from the attacks of such a formidable enemy, it was now thought proper to enter into an alliance with the Portuguese. The ambassador from Portugal, Peter Covilcan, was denied the liberty of returning to his own country, as he had been already related; and as, for some time past, it had not been obvious how he could be of much use, he had begun to fall into oblivion. The present emergency, however, recovered his importance. The empress was sensible of the necessity she lay under of having some person who understood both the Abyssinian and Portuguese languages before she could open any correspondence with that nation, and who might likewise inform her of the names of the persons to whom her letters ought to be addressed. By him she was now instructed in everything necessary to the success of her embassy. The message was committed to one Matthew, an Armenian merchant, with whom a young Abyssinian was joined; but the latter died by the way. The letters they carried were by Mr. Bruce supposed to have been partly the work of Covilcan and partly of the less experienced Abyssinian confidants of the empress. They began with telling the king, that Matthew would give him information of her whole purpose, and that he might depend on the truth of what he said; but in the latter part the whole secret of the embassy was disclosed, and a force sufficient to destroy the Turkish power was expressly solicited. Among the other particular of this embassy also it is said, that a third part of Abyssinia was offered in case her requisitions were complied with; but this, as well as the embassy itself was always denied by David when he came of age.

Matthew, though raised from the rank of merchant to that of an ambassador, could not, it seems, act according to his new dignity in such a manner as to screen himself from the most mortifying and dangerous imputations. Having arrived at Dabul in the East Indies, he was seized as a spy, but relieved by Albuquerque the viceroy of Goa; and that not out of any regard to his character as ambassador, but because he himself had a design upon Abyssinia. This viceroy used his utmost endeavours to induce Matthew to deliver his commission to him; but the ambassador constantly refused to show any letter he had, except to the king of Portugal in person, and in his own kingdom. This put him out of favour with the viceroy; while his attendants, displeased at the mean appearance of the man, insisted sometimes that he was a spy from the sultan, at others that he was a cook, an impostor, or a menial servant. Matthew, however, perceiving that he was now out of danger, maintained that his person was sacred, and insisted on being treated as the representative of a sovereign. He left the viceroy, bishop, and clergy know, that he had with him a piece of the wood of the true cross, sent as a present to the king of Portugal: and he required them, under pain of sacrifice, to pay respect to the bearer of such a precious relic, and to celebrate its arrival as a festival. This was instantly complied with, and a solemn procession instituted; but very little regard
Abyssinia.

Abyssinian guards appeared to have been paid to this ambassador either in his temporal or spiritual character, as he could not obtain leave to depart for Portugal till 1513, which was three years after he arrived in India. In his passage he was extremely ill-treated by the shipmasters with whom he sailed: but of this they soon had cause to repent; as on their arrival at Lisbon they were all put in irons, and would probably have died in confinement, had not Matthew made intercession for them with the king.

In the mean time, Maffudi having recovered from the defeat given him by Naad, and formed alliances with the Turks in Arabia, had renewed his depredations on the Abyssinian territories with more success than ever. Such a number of slaves had been, by his assiduity, sent to Mecca, that he was honoured with a green silk standard (an emblem of the true Mahometan faith), with a tent of black velvet embroidered with gold, and he was likewise made Sheykh of Zeyla; so that, as this island was properly the key to the Abyssinian empire, he could neither be rewarded with greater honour nor profit. This happened when David had attained the age of 16; and in consequence of such surprising success the king of Adel, never a hearty friend to Abyssinia, determined to break the peace with that empire and make an alliance with Maffudi. Having taken this resolution, the two princes invaded Abyssinia with their joint forces, and in one year carried off 19,000 Christian slaves, so that a general terror was spread over the whole empire. David, already impatient of the injuries his people had sustained, determined to raise an army, and to head it in person as his ancestors had done, contrary to the advice of the empress, who considering only his youth and inexperience in military affairs, wished him to have employed some of his veteran officers. A very powerful army was raised, and ample supplies of all kinds were procured. With one part of his forces the emperor took the road to Ausa the capital of Adel; sending the other under the command of an officer named the Betwudet, to meet the Moorish army, which was then ravaging part of Abyssinia. It was natural to be imagined, that the Moors, on hearing that an army was marching to destroy the capital of their country, would abandon the thoughts of conquest or plunder to preserve it. In doing this, David knew that they had certain defiles to pass before they could reach Adel. He ordered the Betwudet therefore to allow them to enter these defiles; and before they could get through, he himself, with the main body of the army, marched to attack them at the other end. Thus the Moors were completely hemmed in by a superior army: but besides this unfavourable situation, they were farther dispirited by Maffudi. That hero came, on the morning of the engagement, to the king of Adel, informing him that his own time was now come; that he had been certainly told by a prophet, long ago, that if this year (1516) he should fight the king of Abyssinia in person, he should lose his life. He was assured that the Abyssinian monarch was then present, having seen the scarlet tent which was used only by the sovereign of that country; and therefore advised the king of Adel to make the best of his way over the least steep part of the mountain before the engagement began. The Adelian monarch, who had at any rate no great inclination to fight, was not inspired with courage by this speech: he therefore followed the advice given him; and, with a few of his friends, passed the mountain, leaving his troops to their fate. The Moors, in the mean time, being abandoned by one leader, and having another devoted to destruction, showed an uncommon backwardness to engage, which was taken notice of by their enemies. Maffudi, however, as soon as he supposed the king of Adel to be out of danger, sent a trumpet to the Abyssinian camp, with a challenge to any man of quality in the army to fight him; on condition that the party of the victorious champion should be accounted conquerors, and that the armies should immediately separate without further bloodshed. The challenge was instantly accepted by a monk named Gabriel Andreas; who, in the reign of Buda Mariam, had been condemned to lose the tip of his tongue for speaking slightly of the king's proclamation of amnesty. Maffudi showed no reluctance to present himself; but received such a stroke from his antagonist with a two-handed sword as almost cut his body in two, and he immediately fell down dead. Andreas cut off his head; and throwing it at the king's feet, cried out, "There is the Goliath of the infidels." This became the signal for a general engagement, notwithstanding the terms stipulated by Maffudi before the combat. The Moors were quickly repulsed by the king's troops, and driven back through the defiles. At the other end they were met and defeated by the Betwudet (8), who drove them back to the king's forces; so that at last being forced to fly to the mountains, they were all slaughtered by the peasants, or perished with hunger and thirst.

The same day that this victory was gained over the Zeyla Moors by David, being in the month of July 1516, the island of Zeyla in the Red sea was taken and the Portuguese town burnt by the Portuguese fleet under Lopez Suarez de Alberguiera. The Abyssinian ambassador, Matthew, in the mean time, had been received with the greatest marks of esteem in Portugal. The utmost attention was paid to his embassy; he was lodged in the most splendid manner; and his maintenance was suitable to his lodging. The king prepared an embassy for his part, and sent home Matthew on board the Indian fleet commanded by Lopez. The ambassador ordered for Abyssinia was one Edward Galvan, a man who had filled many state departments with the utmost applause; but who by reason of his age, being now 86, was certainly very unfit for such a distant and perilous voyage. He died accordingly on the island of Camaran in the Red sea, where Suarez had imprudently landed, and passed the winter in the utmost distress for want of provisions of every kind. This admiral was succeeded by Lopez de Seguerya; who sailed hence to the island of Goa in the East Indies, where he fitted out a strong fleet; after which he returned to the Red sea, and landed on the island of Masuah, hav-
ABYSSINIA.

During all this time, not a single word had passed relating to the affairs of the two nations; so that it is difficult to imagine what might have been the design of the Abyssinian emperor. At last, having resolved to send an embassy to Portugal, he allowed Roderigo an ambassador to depart, but detained two of his people; appointing Zaga Zuab, an Abyssinian monk, his ambassador to Portugal.

This long intercourse betwixt two such distant nations, however, could not but greatly alarm the Mahometan powers, who were natural enemies to both. Scarcely had the Turkish sultan, having been constantly defeated by the Portuguese in the east, and alarmed at the thoughts of having a fleet of that nation in the Red Sea, where they might greatly annoy his settlements on the coast of Arabia, determined to carry his arms to the African side; while the king of Adel, having strengthened himself by alliances with the Turkish officers in Arabia, was now become a much more formidable enemy than before. This was soon experimentally felt, for the empire of Adelians in which the Abyssinian monarch was overthrown with the loss of almost all his grand officers and principal nobility, besides a vast number of private men. The victory was principally owing to the assistance given by the Turks; for the army was commanded by Mahomet surnamed Gragné, i.e. left-handed, governor of Zryla, which had now received a Turkish garrison. This man, having conquered Abyssinia greatly at heart, resolved, as soon as possible, to effect something decisive; and therefore having sent to Mecca all the prisoners taken in his late expedition, he obtained in return a considerable number of janizaries, with a train of portable artillery. Thus the fortune of the war was entirely decided in favour of the Adelians and Turks; the emperor was defeated in every battle, and frequently hunted from place to place like a wild beast. The Moors, finding at last no necessity for keeping up an army, overran the whole empire in small parties, everywhere plundering and burning the towns and villages, and carried off the people as slaves.

This destructive war continued till the year 1537; when Gragné sent a message to the emperor, exhorting him not to fight any longer against God, but to make peace while it was in his power, and give him his daughter in marriage: on which condition he would withdraw his army; but otherwise he would reduce his empire to such a state that it should be capable of producing nothing but grass. David, however, still refused to submit; replying, that he put his confidence in God, who at present only chastised him and his people for their sins; but that Gragné himself, being an infidel, and enemy to the true religion, could not fail of coming in a short time to a miserable end. This unsuccessful negotiation was followed by several encounters, in which the emperor was constantly defeated; in one of which his eldest son was killed, and in another his youngest was taken prisoner; so that he now seemed entirely destitute, being obliged to wander on foot, and all alone, hiding himself throughout the day among the bushes on the moun-

ABYSSINIA.

Abyssinia. prised both to friends and enemies. Many of his veteran soldiers, compassionating the distresses of their sovereign, sought him out in his biding places; so that he once more found himself at the head of a small army, with which he gained some advantages that served to keep up his own spirits and those of his adherents. His greatest enemy was Ammer, one of Grane's officers, who headed the rebellious Abyssinians, and who had formed a scheme of assassinating the king; but, instead of accomplishing his purpose, he himself was assassinated in 1538 by a common soldier, on what account we are not informed.

By the death of Ammer and the small successes which David himself had obtained, the affairs of Abyssinia seemed to revive; but still there was no probability of their being ever brought to a fortunate issue. An embassy to Portugal was therefore thought of in good earnest, as the mischievous effects of slighting the proffered friendship of that power were now sufficiently apparent. One of the attendants of Rodrigo, named John Bermudes, who had been detained in Abyssinia, was chosen for this purpose; and to his temporal character of ambassador was added that of Abuna, primate or patriarch. John, who was not a clergyman originally, had received all the inferior ecclesiastical orders at once, that the supreme one might be thus conferred upon him; but happening to be a great bigot to the papish religion, he would not accept of his new dignity but with a proviso, that his ordination should be approved by the pope. This was indirectly submitting the church of Abyssinia to that of Rome; to which David would never have agreed, had it not been for the desperate situation of his affairs at that time. John was therefore allowed to do as he thought proper: when passing through Arabia and Egypt to Italy, he had his ordination confirmed by the pope; after which he set out on the business of his embassy. On his arrival at Lisbon, he was acknowledged by the king as patriarch of Alexandria, Abyssinia, and of the sea; for this last title had also been conferred upon him by his Holiness. Entering then upon the purpose of his embassy, he began by putting Zaga Zaabi in irons for having wasted so much time, and done nothing effectual since he had left Abyssinia. Then he represented to the king the distresses of the Abyssinians in such a strong light, and insisted so violently for relief to them, that an order was very soon procured for 400 musketeers to be sent by Don Garcia de Noremb to their relief. To accelerate the progress of the intended succours, John himself proposed to sail in the same fleet with Don Garcia; but his voyage was delayed for a whole year by sickness, occasioned, as he supposed, by poison given him by Zaga Zaabi, the monk whom he had imprisoned, and who had been set at liberty by the king. After his recovery, however, he set out for the East, and, by the death of Don Garcia, which happened in the mean time, occasioned another delay; but at last it was resolved, that Don Stephen de Gama, who had succeeded to Don Garcia, should undertake an expedition to the Red sea, in order to burn some Turkish galleys which then lay at Suez. But intelligence having in the mean time been received of the intended voyage, these vessels had withdrawn themselves. Anchoring then in the port of Masab, Don Stephen sent over to Arkeeko on the continent to procure fresh water and other provisions; but the Turks and Moors being now entirely masters of that coast, the goods he had sent in The succour exchange were seized without any thing being given and taken in return. A message was brought back, importing the town of the that the king of Adel was now master of all Ethiopia Arkeeko. and consequently, that no trade could be carried on without his leave; but if Don Stephen would make peace with him, the goods should be restored, a plentiful supply of water and all kinds of provisions granted, and amends likewise made for 60 Portuguese who had been killed at Zeyla. These had run away from the fleet on its first arrival in the Red sea, and landed on the coast of Adel, where they could procure no water; of which the barbarians took advantage to decoy them up the country; where, having persuaded them to lay down their arms, they murdered them all. To this Don Stephen returned a smooth answer, sent more goods, obtained provisions, and promised to come ashore as soon as a Mahometan festival, which the savages were then celebrating, should be over. This treaty was carried on with equal bad faith on both sides; but Don Stephen had now the advantage by obtaining the provisions he stood in need of. These were no sooner brought on board, than he strictly forbade all intercourse with the land; and choosing out 600 men, he attacked the town of Arkeeko, killed the governor, and sent his head to the Abyssinian court; massacring at the same time all the people in the town he met with.

During this long interval, a considerable change Affairs of had taken place in the Abyssinian affairs. We have Abyssinia already seen that David had been reduced to great distress; but afterwards met with some little successes, which seemed to indicate an approaching change of fortune. In these, however, he was not disappointed. A Mahometan chief called Vicor Maged made a sudden attack upon the rock Geshen, where the royal family were kept; and finding it entirely unguarded, ascended without opposition, and put every person to the sword. This last disaster seems to have been too great Death of for the resolution even of this heroic prince, as he died accession of the same year, 1540. He was succeeded by his son Claudius to David, and, though then about 18 years of age, the empire, was endowed with all the great qualities necessary for managing the affairs of the empire in such a dreadful crisis, and had made considerable progress before the arrival of the Portuguese.

On his accession, the Moors, despising his youth, in A powerful instantly formed a league among themselves to crush him league at once; but, like almost all others too confident against the victory, they neglected to take the proper precautions against a surprise. This was not unobserved by Claudius, who, falling upon one party which lay next to him, gave them a total defeat. The king pursued the Moors through the whole day of engagement, the ensuing night, and part of the following day; putting to flight both without mercy every one who fell into his hands. This excessive ardour very much damped the spirits of his enemies, and at the same time inspired his own party with the most sanguine hopes of success; whence he soon appeared at the head of such an army as convinced his enemies that he was by no means to be despised. They now found it necessary to desist from the practice they had so long continued, of plundering and ravaging
ravaging the country; to call in their scattered parties, unite their troops, and spend the rainy season in such parts of Abyssinia as they had conquered, without returning into Adel, as had hitherto been usual with them. They now came to a resolution to force the king to a general engagement, in which they hoped to prove victorious by dint of numbers. For this purpose all the rebel chiefs in Abyssinia were called in, and a formidable army collected. They waited only for one very experienced chief named Jonathan; after whose junction they determined to attack the royal army without delay. But Claudius took his posts at all times with such judgment, that any attempt upon his

Jonathan a camp would have been almost desperate: and getting intelligence where Jonathan lay with his forces, he marched out in the night time, came upon him quite unprepared, defeated and killed him, sending his head to the rest of the confederacy by a prisoner, the only one he had spared out of all those who were taken. By the same messenger a defiance was sent to the Moors, and many opprobrious epithets were bestowed upon them; but though the armies approached one another, and continued for several days under arms, the Moors were so much intimidated that they would by no means venture an engagement.

By this victory the spirits of the Abyssinians were so much elevated, that they clenched in from all parts to join their prince; and even many of the Mahometans, having experienced the lenity of the Christian government, chose rather to submit to Claudius than to the Turks and Adelians. The king, however, was in danger of being assassinated by one Ammer, a treacherous governor; who knowing that he had retired to some distance from his army to celebrate the festival of Easter, attempted to surprise him when almost destitute of attendants; but Claudius having timely notice of his designs, laid an ambush for him with a considerable part of his army which he headed in prison. The rebel, not being equally well informed, fell into the snare, was defeated, and almost his whole army cut off on the 25th of April 1541.

Succinct was the situation of affairs when the Portuguese arrived. The head of the governor of Arkeko had been received by the queen, who regarded it as a happy instance of the valour of her allies, and as a presage of future victories. The Portuguese admiral, Don Stephen de Gama, lost no time in employing the men allowed by the king to assist the Abyssinians. These were in number 450; but as the officers who commanded them were all noblemen of the first rank, the army was considerably increased by the number of their servants. The supreme command was given to Don Christopher de Gama the admiral’s youngest brother. Almost every man on board, however, was ambitious to share in the glory of this enterprise; and great complaints were made by those who were not allowed to go: and hence, Mr Bruce informs us, the bay in the island of Mauah, where the admiral’s galley rode, had the name of Bahia dos Agravoado; the bay of the injured, not of the sick, as has been erroneously supposed.

This gallant army instantly set forward by the most easy road through the Abyssinian territories, in order to join the emperor. Still, however, the way was so rugged, that the carriages of their artillery gave way, and they were therefore obliged to construct new ones as they went along, splitting the barrels of old muskets to furnish them with iron, which was extremely scarce in Abyssinia. In this journey the general was met by the empress, attended with her two sisters and a great many others of both sexes, whom he saluted with empress. drums beating and colours flying, accompanied by a general discharge of the fire-arms, to their great confusion and terror. Her majesty, whose person was entirely covered, indulged the Portuguese general with a view of her face; and after a mutual exchange of civilities, the queen returned with 100 musketeers appointed by him as her guard. After eight days march, through a very rugged country, Don Christopher received a defiance in very insulting terms from Gragné the Mahometan general, which was returned in the same style. An engagement took place on the 25th of Battle between the Portuguese and the Moors, though greatly superior in horse, had already felt so much of the Portuguese valour, that he did not choose to venture a second battle.

As the season was now far advanced, the Portuguese put themselves into winter-quarters; while Gragné remained in their neighbourhood, in hopes of forcing them to a battle before they could be joined by the king, who advanced for the purpose as fast as possible. This being the case, it was to the last degree imprudent in Don Christopher to think of venturing an engagement without previously forming a junction with his royal ally; especially as Gragné had now doubled the number of his horse, increased his train of artillery, and otherwise received considerable reinforcements. Unfortunately, however, the Portuguese Don Christopher suffered himself to be hurried away by the impetuosity of his own temper; and paying regard to the defiances and reproaches of a barbarian whom he ought to have despised, was induced, contrary to all advice that could be given, to venture an engagement at a vast disadvantage. Yet when the armies encountered each other, the superiority of the Portuguese was so great, that victory seemed likely to be decided in their favour. On this Gragné ordered some artillery to be pointed against the Abyssinian allies. These entirely unaccustomed to fire-arms, fled almost at the first discharge. Gragné, well knowing that it was his interest to destroy the Portuguese, who were only 400 in number, ordered no pursuit against the Abyssinians, but fell with his whole force upon the Europeans. Even yet his success was doubtful, till Don Christopher, exposing himself too much, was singled out and shot through the arm. This produced such confusion, that Is wounded a total defeat, with the loss of the camp, ensued; when and defeat the barbarians, according to custom, put to death all the wounded, and began to abuse the women, who had all retired into the tent of the general. This being observed by a noble Abyssinian lady married to one of the Portuguese, she set fire to some barrels of gunpowder which happened to be in the tent, and thus perished along with her ravishers.

Don Christopher, who by his rashness had occasioned this disaster, obstinately refused to fly, till he was put into a litter by force, and set off along with the queen and patriarch, who happened to be present. The two latter had set off before the battle; but Don Christopher
ABYSSINIA.

Claudius, being now freed from all apprehension of foreign enemies, began to turn his thoughts towards the reparation of the damages occasioned by such a long war, and the settlement of religious affairs. We have already mentioned, that John Bermudes was appointed by the Pope, as he said, patriarch of Alexandria, Abyssinia, and of the sea. This, however, is said by others to have been a falsehood; that John was originally ordained by the old patriarch of Abyssinia; and that the Pope did no more than give his sanction to this ordination, without adding any new one of his own. But whether this was so or not, certain it is, that John, who was very insolent in his behaviour, and of a turbulent disposition, now began to insist that Claudius should not only embrace the doctrines of the church of Rome, but establish that religion throughout the empire, which he said his father David had engaged to do; and which, considering the extreme distress in which he was involved, it is very probable that he did. Claudius, however, was of a different opinion, and re-asserted his determination to alter the religion of the country; upon which betwixt the emperor and the Patriarch a contention began, which was not ended but by the total expulsion of the Catholics, and the cutting off all intercourse between the Portuguese and Abyssinians intermarried, and attended religious worship promiscuously in each other's churches; so that the two nations might have continued to live in harmony, had it not been for the misbehaviour of Bermudes. Claudius, perceiving the violence and overbearing disposition of the man, took every opportunity of showing his attachment to the Alexandrian or Greek church; denying that he had made any promise of submitting to the see of Rome. On this Bermudes told him that he was accused and excommunicated; the king in return called him a Nestorian heretic; to which Bermudes replied by calling him a liar, and threatened to return to India, and carry all the Portuguese along with him. To this insolent speech Claudius answered, that he wished indeed that Bermudes would return to India; but that he would not allow the Portuguese, nor any person, to leave his territories without permission.

Thus matters seemed likely to come to an open rupture; and there can be no doubt that the worst extremities would have followed, had not the emperor been restrained by the fear of the Portuguese valour on the one hand if he should attempt any thing against them, and the hopes of further advantages should he retain them in his service. For these reasons he bore with patience the insults of the patriarch; attempting to gain the rest of the Portuguese over to his side. He succeeded perfectly with their commander Arius Dias, The Portuguese who privately renounced the church of Rome, and was received into that of Abyssinia by the name of Marcus or Marcos; in consequence of which, the emperor, looking upon him as a naturalized subject, sent him a grand religion, and with the Abyssinian arms to be used instead of those of Portugal. This, however, was not delivered; for a Portuguese named James Brito, meeting the page who carried it, took it from him and killed him with his sword. The apostasy of Arius is said to have been owing to the great honours which had been conferred upon him unexpectedly, and cut him in pieces with all
ABYSSINIA.

Bermudes persuaded to withdraw to India. According to Mr Bruce he repaired to Dobarwa, where he remained two years quite neglected and forlorn, saying mass to no more than ten Portuguese who had settled there after the defeat of Don Christopher. He then went to Masuah; and the wind soon becoming favourable, he embarked in a Portuguese vessel, carrying with him the ten persons to whom he had officiated as priest. From Goa he returned to Portugal, and continued there till his death. On the other hand, the Portuguese writers inform us, that he was narrowly watched by order of the emperor; and that Gaspar de Suza, the Portuguese commander, had orders to put him to death if he should attempt to make his escape. Bermudes, however, being determined at all events, to make his escape, pretended to be ill of the gout, and that a change of air was necessary for his recovery; for which reason he went to the town above mentioned, where there was a monastery. On this pretence he was allowed to cross the kingdom of Tigré, accompanied by eight faithful servants, with whom he reached Dobarwa unsuspected. Here he remained concealed in a monastery for two years before he could find an opportunity of getting to the island of Masuah, from whence he proceeded to Goa.

The emperor was scarce freed from this troublesome difficulty, when he was in danger of being involved in new difficulties by the intrusion of others into his dominions. Ignatius Loyola, founder of the order of the Jesuits, was at that time at Rome; and so much attached to the cause of the pope, that he proposed to go in person to Abyssinia, in order to make a thorough conversion of both prince and people. His holiness, however, who, from what he had already seen of Ignatius, conceived that he might be of greater use to him by staying in Europe, sent in his stead Núñez de Baretto, one of the society of Jesuits, whom he invested with the dignity of patriarch, and honoured with a letter to Claudius. With these commissions, and a number of priests, Baretto sailed for Goa in the East Indies; by which, however distant, the only passage to Abyssinia was at that time. On his arrival at that place he was informed that the Abyssinian monarch had had such a steady aversion to the church of Rome, that there was no probability of his meeting with a favourable reception. For this reason it was judged more proper to send some clergyman of inferior dignity, with proper credentials, as ambassadors to the emperor from the government of India, without running the risk of having any affront put upon the patriarch. These were Oviedo bishop of Hierapolis, Carneyro bishop of Nice, and several others, who arrived safely at Masuah in the year 1538. Claudius, on hearing of their arrival, was greatly pleased, as supposing that a new supply of Portuguese soldiers was arrived. Finding, however, that they were only priests, he was very much mortified, but still resolved to give them a civil reception. But a more important consideration, and which concerned the welfare of the empire in the highest degree, now claimed his attention. This was the appointment of a successor to the throne, Claudius himself having no son. A project Prince Menas was therefore set on foot for ransom. Prince Menas, the emperor's youngest brother, who had been deemed the prisoner by the Moors in the time of David, and his captivity thereto detained in captivity on a high mountain in Adel.
This was not likely to be accomplished; for the Moors would not willingly part with one who they knew was their mortal enemy, that he might be raised to the sovereignty of a great empire. By detaining him prisoner also, they might reasonably hope for disputes concerning the succession to the Abyssinian throne; which would enable them to attack the empire with advantage. In these circumstances, it is probable that Claudius would have found great difficulty in procuring his brother’s liberty, had it not been that the son of the famous Cragné had been taken in that battle in which his father was killed, and in like manner confined on a mountain in Abyssinia. A proposal was then made to his mother, who had escaped into Athbara, that her son should have his liberty, provided the king’s brother should be restored. This was accepted; and by means of the bashaw of Masuah, an exchange was made. Four thousand ounces of gold were given for the ransom of Menas, which were divided between the Moors and the bashaw of Masuah; while on his part Claudius set at liberty Ali Gerad the son of Cragné without any farther demand.

According to Bermudes’s account of these times, the widow of Cragné was taken prisoner at the battle in which her husband was killed, and was afterwards married to Arier Dias. In this case we must suppose her to have been the same with the queen of Adel, mentioned as his consort by other historians: but Mr. Bruce treats this account as a mere fable; and informs us, that by an order of Nur the son of Mungid, murderer of the royal family as already related, she made her escape into Athbara. On that occasion Nur fell in love with her; but she refused to marry any man unless he brought her the head of Claudius, who had killed her former husband. To attain his wishes, therefore, Nur, now governor of Zeyla, undertook the task; and when Claudius marched towards Adel, sent him a challenge to fight; telling him that there was yet a particular instrument for shedding the blood of the Abyssinian princes, and desiring him to be prepared, as he was very soon to set out to attack him. The emperor did not decline the combat, but is said to have been advised against this expedition by all his friends. This advice seems to have proceeded from a number of prophecies, probably trumped up by the clergy, that he should be unfortunate, and lose his life in the campaign. These prophecies ought no doubt to have had weight with him, as they most certainly indicated a spirit of disaffection among his troops; and the event accordingly evinced that it was so. The Abyssinians fled almost on the first fire, leaving the king in the midst of his enemies, attended only by 18 Portuguese and 20 horsemen of Abyssinia, who continued faithful to the last. All these were killed after the most desperate resistance; the king himself receiving upwards of 20 wounds before he fell. His head was cut off, and brought by Nur to his mistress, who hung it up on a tree before her door. Here it remained for three years, when it was at last bought by an Armenian merchant, who buried it at Antioch in the sepulchre of a saint of the same name. Nur gained on this occasion a very complete victory; the king and most of the principal nobility being killed, a great number made prisoners, and the camp taken with an immense booty. On his return to Adel, he refused to accept of any congratulations, or to allow rejoicings to be made for Abyssinia.

This fatal engagement took place on the 22d of March 1559; and as the succession had been already settled, Menas ascended the throne without any opposition. On his accession he found his affairs in great reign of confusion, and he had still to contend with foreign and domestic enemies. The first of these was Rada, the king of the Jews, who had a territory in the empire of Abyssinia, the capital of which was on a rock named Sima. The cause of this quarrel is not known, but the event was unfortunate; the king being obliged to abandon the enterprise, after having bestowed a considerable time upon it. This was followed by an attempt to assassinate him, which had very near taken place; and this again by a conspiracy among his principal nobles headed by Isaac the Baharnagash. He had been a very faithful servant of the late emperor Claudius; but ill used by Menas, who was of a very haughty and morose disposition. In attempting to suppress this rebellion, the first attempts of the emperor were likewise ineffectual, his forces being attacked by surprise and entirely defeated. Soon after this, Isaac proclaimed Tascar, the nephew of Menas, who was then at liberty, king of Abyssinia; hoping thereby to strengthen his cause, and enable him to cope with the emperor, who was assembling a powerful army against him. This expedient did not answer the purpose. His army was entirely defeated by Menas; Tascar taken prisoner, seated, and thrown headlong from the top of a precipice; and Isaac himself escaped with great difficulty to the confines of his own government in the neighborhood of Masuah. Here he entered into an alliance with the Turkish bashaw of Masuah; whose friendship he gained by putting him in possession of the town of Dobawra, Allies with with the flat country adjacent, which abounds with the Turks and Portuguese, and the key to the province of Tigrè and the high lands of Abyssinia. Besides this, Isaac strengthened himself also by an alliance with the Portuguese; which, had their number been at all considerable, must have been very formidable. Their inclination to desert their former protector and ally the emperor, proceeded entirely from the shameful behaviour of their priests, who never would be satisfied without enslaving the emperor as well as his subjects to the tyranny of Rome. We have already seen that Bermudes had proceeded so far on this subject, that he narrowly escaped with his life. His successor Oviedo (for the patriarch Nunnez died by the perch way) fared still worse. On his introduction to the emperor Claudius, he informed him, that the pope and king of Portugal now expected no less than an immediate fulfilment of his engagements of submission to the see of Rome. This requisition was made with such an air of insolence, that the prince could scarce conceal his resentment; but restraining his passion, he promised to consider of it, and to call meetings of the learned in these matters to debate the point. This was a very fruitless task; and therefore Oviedo thought proper to quit the court towards the end of December 1558; leaving behind him an insolent letter addressed to the Portuguese.
Abyssinia.

Portuguese and such converts as they had made; in which he exhorited them not to converse with schismatics, and the Abyssinians to forsake their errors. Being now debarred from access to the emperor, he began to entertain the people with seditious discourses; which practice he continued during the remaining part of the reign of Claudius and the beginning of that of Menas. The latter, perceiving the pernicious tendency of his discourses, positively commanded him to desist; which the patriarch refusing, the emperor fell upon him with his own hands, beat him severely, tore his clothes and beard, and took his chalice from him that he might be disabled from saying mass: after which he banished him, with Francis Lopez another of his associates, to a barren mountain, where they remained seven months in great misery. Not content with this, he issued many severe edicts against the Portuguese; prohibited them from intermarrying with the Abyssinians; and such of the Abyssinian women as were already married to Portuguese husbands, he commanded not to accompany them to their churches. His next step was to call Oviedo again into his presence, and command him, under pain of death, instantly to leave his dominions. The insolent and foolish priest refused obedience to this express command: he declared that he would obey God rather than man; and presenting his bare neck to the emperor, desired him to strike and put an end to his life at once. Menas drew his sword, but was prevented by the queen and officers who stood near him from giving the fatal stroke. A second beating and banishment to the mountain succeeded; and in the latter part of the sentence all the Portuguese priests as well as others were included. The Portuguese, however, determined not to submit to such an indignity; and therefore, to a man, joined Isaac; who, in expectation of more auxiliaries from India, professed a great desire of embracing the Romish religion. The king was very apprehensive, and not without reason, of the arrival of more Portuguese; but it appears that Oviedo had not sufficient interest to procure the supply he promised. An engagement, therefore, took place without them, in which Menas was again victorious; though the battle was not so decisive as to put an end to the rebellion.

The emperor died a short time after his victory, and was succeeded in 1563 by his son Sertza Dengbel, then only 12 years of age. The beginning of his reign was disturbed by new rebellions, which, however, were happily suppressed. Isaac, with his allies the bashaw and the Portuguese, seems to have remained for some time unmolested; and in the year 1569, a kind of accommodation took place. It is by no means easy to say how the Portuguese were again received into favour after such flagrant treachery and rebellion. Mr Bruce only simply tells us that "Oviedo and the Portuguese did not appear at court." This indeed is not to be wondered at, as they had been so lately at open war with the emperor. Other accounts say, that after the last battle with Isaac, "their name became so odious to all the Abyssinians, especially to their monarchs, that they would never suffer any of them to be in their army from that time." Some of these accounts say also, that Menas was defeated and killed in another battle; others, that he was driven to some high mountains, where he wandered about till death put an end to his misery. Accounts of this kind, however, are by Mr Bruce treated as mere falsehoods, and expressly contradictory to the annals of those times. All we can say upon the subject therefore is, that after the defeat of Isaac, the Portuguese, not excepting Oviedo himself, remained in Abyssinia, where they were more favourably dealt with by the new emperor than they had been by his father; though he was no friend to their religion, as supposing it to be destructive of monarchy and all civil government. It is probable also, that the various disturbances which happened, together with his own tender age during the beginning of his reign, would prevent him from paying that attention to them which he would otherwise have done. The Galla, a very barbarous nation, and who have at last greatly reduced the power of the Ethiopian monarchs, made frequent inroads during this reign; and in the year 1576, a league was formed by Mahomet king of the bashaw Adel, with Isaac and the Turkish bashaw, who had either continued their hostilities or renewed them about Adel; this time. The emperor, however, marched with such expedition, that he did not allow them time to join their forces; and attacking them separately, gained a complete victory over them all. Almost the whole Galla were defeated.

Moors, who also entered Adel with a design to make a full end of his enemies on the east, he received information that the Galla had invaded his dominions on the west. Traversing the whole breadth of the empire therefore with the utmost expedition, he came up with these enemies, who were afraid to encounter him. On this he turned his army against the Falasha, obliging them to deliver up their king, whom he banished to a mountain. Then, invading the country of the Galla and Falasha, he ravaged it for four years successively, protecting at the same time the kingdom of Narea from the inroads of these barbarians.

While Sertza Dengbel employed himself in repelling the incursions of Galla, one Cadward Bashaw, a Turkish officer of great valour and experience, who had been invested with the office of bashaw of Musuah, began to make inroads into the province of Tigre. Tigre invaded by Cadward Bashaw.

The emperor hastened to oppose him; but in his passage committed great devastations in the country of the Falasha, in order to provoke them to descend from their mountains and come to an engagement. These Falasha profess the Jewish religion, and were then governed by a king named Gezehem. This monarch, provoked by the ravages and destruction he beheld, desisted with vast numbers of his subjects, in order to revenge it; but was killed and his army utterly defeated by the Abyssinians, on the 9th of January 1594. The victorious Sertza then hastened to encounter the bashaw; who, confident of the superiority of his own troops, not only waited for him patiently, but gave him every advantage he could desire. A very desperate battle ensued; the event of which was doubtful, till Robel, commander of part of the king's household troops, who were armed with pikes, attacked that part of the Turkish horse where he saw the bashaw, and killed the officer who carried the standard. In doing this he broke his pike; but though then destitute of any other weapon than a short crooked knife which the Abyssinians always carry in their girdles, he instantly pushed up to the bashaw, and with it wounded him mortally.
Abyssinia.

Death of the emperor.

Tally in the throat. This unexpected event instantly decided the victory; the Turkish horse betook themselves to flight, and the rest of the army soon followed their example. A dreadful slaughter ensued among the Moors, who were pursued to the island Masnab; and many were driven into the deserts, where they perished with thirst. After this, marching back to the western part of his territories, the emperor proceeded to Naress, destroying the Cala as he went along. His last expedition was towards Damot to chastise some rebels there. Before he set out, a priest of great sanctity and talent for divination, is said to have warned him not to undertake the war; but his advice was rejected with contempt: on which he requested him only not to eat the fish taken out of a certain river; but this advice was also neglected, and the fish being really of a poisonous nature, the king died in consequence of eating them.

On the death of Sertza Dengbel a dispute ensued about the succession. In the beginning of his sickness the late king had named for his successor his son Jacob, a boy of only seven years of age; but finding death approaching, he named his nephew Za Dengbel, as being come to the years of manhood, and more fit for the government of such a numerous and turbulent people. This last resolution proved highly disgraceful to the queen and some of the principal nobility, who wished for a minority, during which they might engross the power into their own hands. In conjunction with her two sons-in-law, Kesla Wahad and Ras Athanasius, therefore, the empress determined to raise Jacob to the throne, notwithstanding the final determination of the late king above mentioned. This was put in execution immediately after the death of Sertza Dengbel; Jacob was raised to the throne, and Za Dengbel confined in an island of the lake Demera or Tzana. An attempt was likewise made to seize Socinios, natural son to Facilitas grandson of the unfortunate David, who had likewise a claim to the throne; for his not being born of a lawful marriage was no objection in Abyssinia. Socinios, however, no sooner saw the fate of his cousin Za Dengbel, than he withdrew himself from the power of his enemies; and Za Dengbel himself, after being a short time confined in the island above mentioned, found means to escape, and took refuge among the inaccessible mountains of Gojam.

Thus disappointed in their attempts on the princes, the empress, with her two sons-in-law, were obliged to pretend loyalty to Jacob, whom they governed till he was 17 years of age. The young king then, perceiving that his tutors were taking some steps to prolong their dominion over him, took the government into his own hands, and banished one Za Selasse, whom they had employed in the execution of their projects, to the kingdom of Naress. The conspirators, alarmed at this bold exertion of royal prerogative, determined instantly to depose Jacob, and raise Za Dengbel, whom they had banished, to the throne. This, however, was now a matter of some difficulty, as he had concealed himself so effectually among the mountains of Gojam, that he could scarce be found out. His retreat being at last discovered, Ras Athanasius took an opportunity of in-ulting Jacob, even while sitting on the throne; called him an obstinate, stubborn, and foolish boy; declared him degraded from the imperial dignity, and that Za Dengbel was coming to supplant him. Jacob Abyssinia, perceiving, by the insolence of this speech, that he was entirely in the power of his enemies, left his palace in the night, in order to fly to the mountains of Sanaan, where his mother’s relations were, from whom he expected protection. He got to the borders of that country, but was there discovered, seized, and brought back to his rival, who was now seated on the throne. Za Dengbel, however, with a clemency not very usual in Abyssinia, did not either put him to death, or mutilate him in such a manner as to render him incapable of afterwards enjoying the kingdom; but contented himself with banishing him for life to Naress.

Za Dengbel was no sooner settled on the throne, than he unluckily behaved in such a manner as to alienate the affections of his people from him entirely. Decline of This was occasioned by his attachment to the church of the Romish religion in Abyssinia. Rome. Ever since the time that the Portuguese had joined Isaac the Bahrangaash, the entrance into Abyssinia had been shut up by the Turks, so that no new missionaries could have access; and all those who came with Oviedo being dead, the Romish religion had languished for want of preachers to support it. The last of those died in 1565; and all the rest having been dead some time before, little could be expected from the labours of a single person. Next year Melchior Sylvanus, a vicar of the church at Goa, sent on a mission to Abyssinia; being supposed to be a proper person for this work, on account of his language and complexion which might muzzle the vigilance of the Turks. He entered without being suspected; but the great defeat given the Turks by Sertza Dengbel, already mentioned, had reduced their power so much, that less danger now attended this expedition than formerly, and other missionaries quickly followed.

The most learned, as well as best qualified for the undertaking in every respect, was Peter Paes, who restored to the undertaking in every respect, was Peter Paes, who restores to this country in the year 1600; and on his taking upon him the whole charge of the mission, Sylvanus returned to India. The new missionary did not at first affect to intrude himself on the emperor; but taking up his residence at the convent of Fremona in the province of Tigré, he first applied to the study of the learned language of the Abyssinians called Gers, and in which their books are usually written. In this he made such progress as quickly to surpass the natives themselves; after which he set up a school, where the children of the Portuguese and Abyssinians were taught promiscuously. The progress made by his scholars was so great, that he was spoken of at court, and recommended in the warmest terms to the emperor Jacob before his deposition. On this he was sent for, and appeared before the court in 1604; where, to the great dissatisfaction of the Abyssinian monks, he received such honours as are usually bestowed on men of the first quality. Next day, in a dispute before the king, two of his scholars, whom he had brought along with him, fairly vanquished the best theologians that could be found to oppose them. Mass was then said in the Romish manner; and this was followed by a sermon, which in the purity and elegance of its diction (whatever the substance might be) excelled any thing that had ever been composed in the Abyssinian language.

Though Paes had been called to court by Jacob, yet Za Dengbel was on the throne before he arrived, and
The news of Za Denghel's death were received with such general indignation throughout the Abyssinian empire, that the rebels did not name any successor. As it seemed natural to think, however, that Jacob, who now be re-elected, was eager to dispatch Za Selasse to acquaint him of his good fortune; but during this interval Socinios appeared, not as a candidate, but as claiming to be already in possession of the empire, and ready to sup.

Port his rights by force of arms. His first step was to let Ras Athanasius know his pretensions to the throne, and desire his assistance with his army, promising to reward him as soon as it should be in his power. Without waiting for any answer, he advanced so rapidly, that Athanasius had scarce time to consider what he should reply, when a second message was sent, importing that Socinios was in the neighbourhood, and ordering preparations to be made for receiving him as his sovereign. This expeditious mode of action so much confounded Athanasius, that he complied with the requisitions, saluting him king, and joining his troops to his. Thus successful in his first attempt, Socinios made a similar one on Za Selasse. In this, however, he was disappointed. Za Selasse having first sent an equivocal answer, marched against him with his whole army; while Socinios, happening to fall sick, and putting little confidence in Athanasius, withdrew to the mountains of Amhara. Athanasius like, he is obvious, not knowing to whom he should attach himself, desired to withdraw his forces, and stood neuter.

Za Selasse had refused to join Socinios, in expectation that Jacob would make his appearance, whom he rather wished to enjoy the crown than Socinios; as under the former he might hope to engross all the power to himself. For a long time, however, no answer was returned to his messages; his troops became impatient; so that fearing lest a mutiny or general desertion should take place, he dispatched a messenger to Socinios, acknowledging him for emperor. But scarce was this done, when a messenger arrived from Jacob, informing him that he was then in Dembea, and promising Za Selasse great honours if he would acknowledge him for his sovereign. With these terms the traitor instantly complied, and his example was followed by Athanasius; while Socinios, not as yet able to resist all his enemies, retired again to Amhara. This, however, he was not long of accomplishing. Jacob was by no means possessed of equal military skill; and though Za Selasse was an experienced officer, yet his extreme perversity, pride, and obstinacy, rendered it very dangerous to have any concern with him. This appeared remarkably in the present case. His pride was such in the first place would not allow him to join his forces with those of Jacob, lest the latter, who was inferior in defeat of military skill, should have a share in the victory he was to gain. Then, intoxicated with his opinion of himself, he neglected to behave with the caution necessary in the neighbourhood of such an experienced general as Socinios, which gave the latter an opportunity of cutting off almost his whole army. Being now obliged to fly with a few attendants to Jacob's camp, he met with an indifferent reception on account of his defeat; for which reason he made proposals to join Socinios. The latter accepted his offer, though he could put no confidence in one who had been guilty of such complicated treachery; only he thought it would be an advantage...
Before any thing of importance could be done in Abyssinia, the king was called forth to suppress a rebellion which had already taken place. An impostor had appeared, who called himself Jacob the late king, and pretended to have escaped from the battle; but so much wounded in the face that he kept one side of it constantly covered to conceal the defacement. He made his appearance among the mountains of Habab near Masauah; and being joined by great numbers of people, Sela Christos, brother to the king, and governor of Tigre, marched against him. The impostor's troops, though numerous, fled at the first onset; but he escaped to the mountains, where it was very difficult to follow him. This, however, was attempted; and a great many of the posts he had taken were stormed like as many forts; but still the impostor himself, though driven from place to place, found means to make his retreat to the country lying between the mountains of Habab and the territory of the Baharnagh. Thither he was pursued by Sela Christos; but that general, finding the rebellion likely to spread through the whole province of Tigre, thought proper now to acquaint his brother Socinios with the state of affairs, and to desire his assistance. The king, though at that time he had sent away most of his troops in an expedition against the Shangalla and Gongas, who dwelt on the north-west of Abyssinia, set out immediately with such troops as he could collect. These were but few in number; his cavalry, particularly, amounting to no more than 350, besides a small reinforcement brought by his brother Emanu Christos, governor of Amlara. As he proceeded, he was informed that a party of Galla were lodged on a hill at no great distance from him. Determining to cut them off, he surrounded the hill where they were posted; but having caused his cavalry to advance before, and pass a deep ravine, they were almost entirely destroyed, while the rest of the army were seized with such a panic that they refused to stir. In this extreme danger, the Galla passed the ravine to attack them; but the king having advanced singly, and killed the first of them, his troops, ashamed of their cowardice, rushed forward on the enemy, and gained a complete victory, The Galla which obliged the savages to leave the province they infested at that time.

The misfortune of the cavalry on this occasion quickly occasioned a report that the king had been defeated; of which the impostor Jacob did not fail to take advantage; and descending from his mountains, committed great devastations in the low country. But the imposture attended by a great multitude, who likewise Jacob fought with more obstinacy than formerly, he was again defeated by Sela Christos with a force greatly inferior. But before any thing effectual could be done for his reduction, the Galla made a dreadful inroad into the southern provinces, murdering all who fell into their hands, and burning and destroying towns, churches, and villages, in the most dreadful manner. The king bore those excesses for some time with patience, till at last he drew them into such a disadvantageous situation, that being surrounded by his forces, and inferior in number as well as in valour, they were all cut off. An army of to a man, with the loss of only 400 on the part of Galla cut off. Coronation of the king underwent the ceremony of coronation. He then marched ed.
ABYSSINIA.

Abyssinia. ed against the impostor Jacob; but the latter was too sensible of the superiority of his rival to face him in the field. He therefore retired again to his mountains, while the king left the suppression of the rebellion to an experienced officer named Amsala Christos; who employed two young men, who had been outlawed for murder, to assassinate the impostor. This being done, it was found that the pretended Jacob was not another than a herdman among those mountains to which he so constantly fled for refuge; and that he had neither wound nor scar on his face, but had kept one half of it covered to conceal the little resemblance he bore to Jacob whom he personated.

The king being now freed from this rebellion, began again to turn his thoughts towards religion. His first step was to make a handsome present to the Jesuits; but he soon showed his inexpérience in religious matters, by attempting to reconcile the two contending parties in his empire. Before he could see the folly of this attempt, however, his attention was called by a most dangerous rebellion, which was begun by one Melchizedec, a servant of the late Sertza Denghel, but a man of great experience in war. He was first opposed by Sanuda, a brave officer; but being totally destitute of troops, he was obliged to apply to the attendants of the king of Sennaar, who had been deposed by his subjects, and was at that time in Abyssinia. These readily joined him; and a bloody battle ensued, in which Sanuda was so totally defeated, that he alone had the good fortune to escape, and that grievously wounded, his men being all killed on the spot. On this misfortune Socinios sent his brother Emanna Christos with a considerable force to reduce the rebels. Melchizedec finding himself opposed by such an able general, exerted himself to the utmost, in order to raise a force sufficient to resist him; and in this he succeeded so well, that his army soon struck terror into all the neighbouring country, notwithstanding the presence and known valour of the king's brother. A prince of the blood-royal, named Arzo, was likewise found and proclaimed king, in order to give some sanction to the rebels; soon after which they boldly marched to meet the royal army. The engagement took place on the 9th of March 1611, and was fought with great obstinacy on both sides; the advantage even appeared for some time on that of the rebels; till Emanna Christos, perceiving that all was at stake, pushed desperately forward to the place where Melchizedec himself was. The latter seeing no probability of avoiding a single combat, which he did not choose to try, instantly turned his horse and fled; and the rest of the army soon followed his example. Melchizedec, however, did not much avail himself of this cowardice; for he was closely pursued by the peasants, taken prisoner, and executed as a traitor, together with several of his principal officers. The fate of Prince Arzo, whom, to support their cause, the rebels had proclaimed king, is not known.

This victory, so far from extinguishing the spirit of rebellion, seemed to have inflamed it beyond all bounds: for news were now received that the whole country round the head of the Nile to the province of Tigre had revolted; so that there was necessity for the immediate presence of the emperor himself; and even this was insufficient, as the rebels were dispersed over such a large tract of territory. His two brothers, Emana and Sela Christos, were therefore both employed against different rebel chiefs, while the king marched against those who were most formidable. The cruel principle on which this war was carried on seems to have been very cruel, viz. that of killing all the men, and carrying off the women and children for slaves. This was rigidly executed, first upon the inhabitants of a mountainous district named Gusman on the Nile; though, at the intercession of the missionary Peter Paez, the women and children, instead of being sold for slaves, were given to the Jesuits to be educated in the Catholic religion. The Gonga and Agwas were next attacked with equal success, and still greater cruelty; one of their tribes named Zalabasso, being almost entirely exterminated: but this, instead of having any good effect, seemed to multiply the rebels still more. The Agwas and Gallu invaded the provinces in the neighbourhood; and another impostor, whose true name was Amdo, appeared as a competitor for the crown. This last rebel proved much more formidable than any of the rest. He was indeed surprised before he had time to collect any forces; but Gideon, king of the Jews of Samen, having killed the guards who watched him, set the impostor at liberty, and supported his cause. Thus he soon collected a very formidable army, with which he defeated and killed an officer named Abram, who opposed him with a considerable force. This brought Socinios himself against him, who instantly attacked the Jewish monarch Gideon, as being the principal support of his cause. War with the country of the Jews was naturally strong, and very full of fortified places, the reduction of it was evidently a very difficult task. The first place attacked was a fortress named Masraba; which, though very strongly fortified and garrisoned, was soon taken by storm, and every one in it put to the sword without distinction. Hotchi and Amba Za Hancasse, two other strong fortresses, shared the same fate. A fourth, named Senga, was no less strong than any of the former, was also taken; Gideon himself narrowly escaping with his life in the attack. Discouraged therefore by so many misfortunes, and apprehending the total ruin of his country, this prince at last was content to sue for peace, which was granted on condition that Amdo should be delivered up. This traitor was condemned to a punishment very unusual among Christians, viz. that of being crucified; but in nailing him to the cross, his death cries and groans so much affected the king, that he ordered him to be taken down and beheaded.

The war was now resumed against the Gongas and Guba; whom the king annually invaded for the purpose of making slaves. In this expedition his officers not only executed their commission against these numerous enemies, but likewise carried off a great number of cattle from the Agwas, who were then at peace with the emperor. This conduct was very much disapproved by Socinios, who obliged them to make restitution of what they had taken away; and the doing them justice in this particular, had more effect in reducing the rest of these people to obedience, than all the cruelties which had been committed since the beginning of the war.

In 1616, the emperor set out on an expedition against the Gallu; but this was laid aside on the death of
Abyssinia.

of his eldest son, for whom he entertained a great affection. It was succeeded by a very cruel order against the Jews, whom Socinians now determined to exterminate without any apparent occasion. His commands, however, were executed with the utmost punctuality, so that very few escaped; and among the rest perished their prince Gideon lately mentioned. He was supposed to be immensely rich, and to have concealed his riches, which have been sought for in vain by the Abyssinians from that time to the present. The children of the murdered Jews were sold for slaves; and such of the profession as were scattered through the empire, bad orders to renounce their religion and be baptized, under pain of death. Thus almost the whole Jewish religion was extinguished at once, as most of them chose rather to embrace Christianity than suffer death. In token of the sincerity of their conversion, they were all ordered to plough and harrow on the Sabbath day.

Successful expedition against the Galla.

After this massacre, the expedition against the Galla was resumed, and carried on with the usual cruelty: while the Galla never once appeared to prevent the desolation of their country. Next year, however, a new association was made among these savages, and the empire invaded by them in two different parts at once. One of their armies was cut off to a man before they had time to begin their ravages; while the other fled on the first approach of the royal army, leaving their wives, children, and baggage, to the mercy of the enemy. Thus the king was left for a short time at rest from rebellions or foreign invasions; and this interval he determined to make use of in making war on his neighbour the king of Sennaar, from whom he had formerly received an affront. In this expedition he was assisted by one Wed Ageeb, a prince of the Arabs, who lived on the frontiers of Abyssinia. The allies proceeded with their usual cruelty, killing all the men, and selling the women and children for slaves. Vast numbers of cattle were carried off; and the victorious armies returned with an immense booty. The next expedition was against Fatima queen of the Shephards, otherwise called queen of the Greeks, who resided on the north-east of Athbara. In this also the king proved successful, though less blood was shed than usual: but it was not long before this extraordinary success meet with a severe check by the entire loss of an Abyssinian army; the favourite son of the emperor himself being killed in the engagement, with some of the best officers in the empire.

All this time Peter Paez had applied himself with the utmost assiduity to the conversion of the Abyssinians to the Catholic faith; and in this undertaking he had been attended with wonderful success. He was indeed singularly qualified for an undertaking of this kind among a rude and barbarous people: for besides an uncommon share of learning, he possessed an eminent degree of skill in the mechanical arts; by which he was enabled to teach the Abyssinians how to build houses of stone and lime, which they had never known before. In these he was first mason, carpenter, smith, and architect himself; and thus, to the astonishment of the whole empire, he built some churches and a palace for the king. His universal genius prepared the people for the reception of his opinions; while the barbarous ignorance and savage manners of his antagonists tended to prejudice every one against their tenets, though ever so just in themselves. Sela Christos, the king's brother, is said to have been converted by only reading the Abyssinian books with attention; in which, it seems, the ignorance of the priests had been displayed in an extraordinary manner. We have already seen how well the emperor himself was disposed towards the Romish church; and his example was followed by many of the principal people of the kingdom. At last the Abyssinian patriarch, named Simon, made a complaint that irregularities in religion had been committed, and disputes held on matters of faith, without calling him, or permission granted him, to support the clergy in these controversies. As Socinians had no high opinion of this priest's learning or eloquence, he did not imagine that any harm could ensue to the cause from granting what he wanted. A public dispute was accordingly appointed; in which Simon's inferiority was so apparent, that Socinians now publicly declared his belief in the two natures of Christ.

While the conversion was in this prosperous way, letters arrived from the pope and king of Spain, from the but without any promise of the temporal assistance pope and of which had been solicited; though they assured him of an ally superior, the Holy Spirit himself, provided the emperor continued firm in his resolutions of embracing the Catholic faith. Socinians would probably have been as well satisfied with an account of a reinforcement of soldiers; but as matters stood, he was obliged to becontent, and resolved to submit in form to the pope, renouncing for ever his connexion with the Greek church. As it was improper, however, to send letters on a subject of such importance by a common messenger, proper persons were to be appointed who might occasionally assume the character of ambassadors, and act accordingly. This being resolved on, the next thing was to determine the way by which the ambassadors were to reach Europe. The usual track by Measaub was now shut up on account of the rebellion which existed in the neighbouring provinces; so that the more eligible way seemed to be through Nares and the provinces to the southward, by which they might reach Melinda, and from thence embark for Goa.

The ambassadors were chosen by lot; which falling first on Antonio Fernandez, he named Fecur Egzie for Europe. As his companion; and, all things being settled, they set out for Goa in the beginning of March 1613. It seems surprising that the Abyssinian monarch should have sent ambassadors on such a dangerous expedition through barbarous countries, without being accompanied by a proper guard. This, however, seems undoubtedly to have been the case; as we hear of no other attendants than ten Portuguese, whom Fecur Egzie took with him, six of whom were to go no farther than Nares, but the other four were to proceed to India: forty men armed with shields and javelins were also granted, but this force was much too small to answer any useful purpose. Sela Christos indeed furnished them with guides from the barbarous nations in the neighbourhood of Nares, taking hostages for the security of the travellers; but the insufficiency of these precautions soon appeared. Our account of travellers had proceeded but two days journey into the their journey:

country.
ABYSSINIA.

Abysinian. country of the Gonga, when they were treated in such a hostile manner, that one of the Portuguese was obliged to return with Fernandez to complain of the treatment of the savages. On this information Sida Christos instantly dispatched three officers, with a proper number of troops, to chastise them; by which means the ambassadors got safe to Mene, the name of some miserable villages, on a ford of the Nile. Here they crossed the river on skins blown up, and next day entered the country of the Pagan Gallu; and soon after, though without great difficulty, they reached the kingdom of Narea, the most southerly province of the Abyssinian empire, but quite surrounded by the Galla. Here they were received with great kindness by the commanding officer of the first fortified place they came to; but on being introduced to the king himself, they met with a very different reception. This was owing to the insinuations of an Abyssinian monk, that they were to bring Portuguese soldiers that way into Abyssinia; which would be destructive to his kingdom. On calling a council, it was resolved to send them into the kingdom of Bali; so that they would be obliged to pass through a much more difficult and dangerous road than what was first intended. Having thus, as he supposed, provided against the danger which threatened his kingdom, he made them a present of 50 pieces of gold, recommending them at the same time to the ambassador from the sovereign of Ginjero, through which they went next to pass.

On leaving Narea, they received a convoy of 80 soldiers to conduct them safely to their next stage; after which they passed four days through countries totally laid waste by the Galla, and where they were obliged to hide themselves for fear of meeting with these savages. Proceeding still through woods and vast chains of mountains, they came to the river Zebee, more properly Kibbe, from its white colour resembling melted butter, as the word imports. Fernandez describes this river as larger than the Nile, and vastly more rapid. They passed it by a kind of bridge, but certainly a most tremendous one. The channel of the river is full of rocks; and betwixt every two of these a single tree was laid, so elastic that it would bend with the weight of one person; while the vast height of the precipice, and the sight of the roasting current below, was sufficient to strike the boldest with terror. At a small distance from this bridge was a ford, through which it was necessary that their horses should pass; which being accomplished without any accident, though with difficulty and danger, they entered the territory of Ginjero. Here they were hospitably received by the sovereign, and after a mutual exchange of presents proceeded to Sanjara, the capital of another small kingdom named Combat, which was at this time governed by a Moor named Amelmad. During the time of their residence here, one Mangner, a schematical Abyssinian, arrived, who insinuated to the king that the recommendations they had brought along with them were false. This reduced them to the necessity of staying there till messengers could be sent to Socinios to know whether it was so or not; which occasioned a delay of three months. At last orders were brought to send them off immediately. This favourable answer procured the dismissal of the ambassadors with presents; while the malicious Mangner was detained prisoner. He escaped, however, and overtook them in the next kingdom, named Alaba, Abyssinia; which was governed by a Moor named Alko. Here he accused them of a design to overturn the Mahometan religion altogether: which so exasperated the barbarian, that he threatened them all with death; and actually put them in prison, where some of the Portuguese died. At last, after holding a council, in which The ambassadors gave their voice for putting them to death, it was resolved that they should be sent back to Amelmad; return, which was accordingly done, and from his dominions they returned to Abyssinia. This ended this memorable embassy, by which the pope was deprived of any authentic documents which might show that any Abyssinian emperor had ever voluntarily submitted to him; and there can be no doubt that this miscarriage, more than any thing else, prevented the establishment of Popery in this country.

Socinios had now gone so far in favour of the Catholic party, that he began to share in some measure of rebellions on account of the welcome of Za Denghel; numberless conspiracies being formed against him, which it was undoubtedly owing only to the altered situation of affairs by the preaching and assiduity of Peter Paez, that he was able to withstand. The conspirators were at this time supported, not only by the Abuna, but by Emmata Christos himself, the king's brother, whom we have frequently had occasion to mention. Their first step was the very same which had been so successfully taken by Za Selasso in the time of Za Denghel, viz. to pronounce sentence of excommunication on the emperor. He was at that time absent on an expedition against the Agors; but excommunication immediately on hearing what was transacted in his absence; informing the Abuna, that if he did not recall the excommunication without delay, he should pay the forfeit. This spirited declaration had the effect, that the anathema was annulled, and the sentence, conspiracy dissolved for that time. It was next resolved that a double attempt should be made between Emmata Christos the king's brother, and the emperor's son-in-law, and Keafa Wahad master of the household, to assassinate the king in his palace. To accomplish this purpose it was concerted that they should desire an audience; that Julius should enter first, and present a petition of such a nature as would probably be refused: on this he was to begin an altercation, and during the continuance of it the other two assassins were to come up, and stab their sovereign before he had time to put himself in a posture of defence. Happily for Socinios, however, he was informed of his danger by a page just before Julius made his appearance; on which, instead of refusing the petition, he granted it immediately; and that there was no room for dispute. He then got up to walk; which was scarce done Emmata Christos also came; on which Socinios invited them all to the terrace to walk with him. This prevented their falling upon him at that moment; and as they supposed they would have still a better opportunity on the terrace, they readily consented. But Socinios having opened a private door, at which he entered first, drew it quickly after him; and as this door had a spring-lock made by Peter Paez, which shut it in the inside, but could not be opened from without, the conspirators were disappointed. Being also sensible that their design had been discovered, they were obliged for some time to keep at a distance, but did not for that reason abandon their wicked projects.
The rebellious spirit of the conspirators continues.

It is deserted by its associates.

Excommunicated on a second occasion.

Rashness and death of Julius.

Emana Christos taken, but pardoned.

Their next scheme was to be put in execution when the king was absent on an expedition against the people of Sennaar, who had made a violent irruption into the Abyssinian territories. The object now was not the assassination of the emperor, but of his brother Sela Christos; because the emperor had taken the government of Gojam from Emana Christos, who was a Schismatic, to give it to Sela Christos, who was a violent Catholic. The enterprise was begun by Julius; who issued a proclamation, that all those who believed two natures in Christ should leave the province of Tigré, where he was governor; and that such as were true friends to the Alexandrian faith should repair to his standard to fight for it. He then ordered the goods of all the Catholics in Tigré to be confiscated; and marched without delay into Gojam, in hopes to surprise Sela Christos. But here the whole scheme was baffled by the vigilance and activity of the emperor; for he having received information of what was going forward, returned into that province before the conspirators had received certain intelligence of his having left it. This so much damped the ardour of Emana Christos and Kella Wahad, that they stood aloof without attacking any thing till Julius should try his fortune. That rebel was at first very much disconcerted; but soon recovering his courage, advanced to the place where the Nile issues out of the lake of Dembea, where he met with the Abuna. Being confirmed by that priest in his wicked designs, he resolved, by his advice, to fall upon the king before he could be joined by Sela Christos, Simon himself (the Abuna) offering to share his fortune: and to confirm all, a new and solemn excommunication was pronounced against the king and all his adherents. Socinios, alarmed at these proceedings, sent a message to Sela Christos, desiring him to come to his assistance as fast as possible. In the mean time he himself advanced to meet Julius; but chose his posts so judiciously, that he could not be forced to an engagement without great disadvantage on the part of the enemy. Notwithstanding this, Julius pitched his camp close to that of the king, with a design to force him to a battle at all events. This rash action was followed by one still worse. Simon had persuaded him, that as soon as the royal army should leave him, they would abandon the standard of the emperor to join his. On this, without farther consideration, he rushed into the camp of Socinios with a very few attendants, and reached the emperor's tent. There he was known by the guards, and instantly dispatched with all his followers; the whole army betook themselves to fight after his death, and were pursuaded with great slaughter by the royalists. The plunder of the camp was immense, Julius having brought all his riches, which he had amassed by a long course of extortion, into the field along with him; and all of these were distributed among the soldiers. A vast number of cattle were likewise taken, which Socinios distributed among the priests, judges, and lay-officers. By this complete victory the whole scheme of the conspirators was overthrown. Emana Christos having no forces capable of coping with his brother, and unwilling, as we have said, to assist Julius openly, had retired to a high mountain named Mecha Ambo, in the territory of Gojam. Here he was invested by Af Christos, an experienced general, whom Sela Christos had left governor when he joined the emperor. Emana, who was likewise an expert commander, would have made a vigorous defence; but unfortunately the mountain was so destitute of water, that in three days he was delivered up by his own men, to save themselves from perishing with thirst. On being brought to the king, he was tried in a full assembly of judges, and condemned to death; but the king pardoned and sent him to Amhara.

This terrible conspiracy had beenoccasioned by the dispute concerning the Sabbath-day; the Abyssinian church insisting on the observance of the seventh day of the week as a Sabbath, and the Romish church on the observance of the first day. Another rebellion was one Jonael, who had been concerned in rebellion by the expedition formerly mentioned, in which the A. Jonael, gows cattle were driven away, and afterwards restored by the king. It is more than probable that his resentment on this account contributed much to increase his zeal on the present occasion; but whatever was the real cause, religion was the sole pretence. He began with a most insolent and anonymous letter to the king; in which the arguments of the Alexandrians for the observance of the Jewish Sabbath were stated, and the contrary doctrine condemned with the utmost virulence of expression. The king himself was reviled in the most opprobrious manner, compared to another Dioclesian, the Jesuits said to be relations of Pontius Pilate, and all of them devoted to hell without redemption. By this stupid performance the king was so much offended, that he added a clause to the former proclamation, commanding that "all out-door work, such as plowing and sowing, should be publicly followed by the husbandmen on the Saturday, under penalty of paying a web of cotton cloth for the first omission, the value of the cloth to be 5s.; the second offence to be punished by a confiscation of moveables, and the offence not to be pardoned for seven years." To this Socinios added a speech from the throne in vindication of himself, concerning the part he had taken in religious matters; and to show that he was in earnest, caused the tongue of a hawk to be cut out for denying the two natures of Christ, and one of his generals to be whipt for observing the Jewish Sabbath.

In the mean time Jonael having collected what forces he could, openly declared against his sovereign; but not daring to meet him in the field, he retired into the country of the Galla, on hearing that Socinios was approaching him with an army. On this the king entered their territories, and laid them waste; which created a dissension among the savages themselves; one party being for affording him protection, the other for delivering him up. This being made known to him, he sent a few presents to the faithless barba- dered rians of Jonael's party; who returned his kindness by sending him the head of the rebel, though but a short time before they had fought with their brethren for his rescue.

A more formidable enemy than Jonael, however, still remained. The province of Damot was one of rebellion, the most disaffected to Socinios in the whole empire; and to this place the greatest part of the religious fa-
ABYSSINIA.

Abyssinia. natives in other provinces had retired. They now mustered up an army of more than 12,000 men, among whom were 400 monks, all of them armed with shields, lances, and swords; inspired, besides, with such a degree of religious enthusiasm, that they expected to be rendered invulnerable by all terrestrial weapons, and that armies of angels would fight in their cause. Against these Sela Christos was dispatched with about 7000 excellent soldiers; and as the general himself was a zealous Roman Catholic, as well as most of his men, we need not doubt that both parties imagined themselves sure of the protection of heaven, and consequently that the encounter would be very violent. The two armies met on the 16th of October 1620; but Sela Christos was unwilling to destroy the infatuated people, who he knew would be unable to resist his veteran troops. He therefore first showed them his superiority in some skirmishes; and then sent a pathetic message, offering a general pardon if they would lay down their arms. The messengers, however, were not allowed to approach, so that an engagement became unavoidable. The numbers of the rebels, as Sela Christos had foreseen, availed very little against the discipline of the veterans he commanded. The 400 monks made a most obstinate resistance; and did not yield till after 180 of them had been killed on the spot.

Sociinos, having once more vanquished his enemies, now determined to show his attachment to the church of Rome more openly. Having therefore sent for Peter Paez, he told him his final resolution to embrace the Catholic religion in its full extent; after which he renounced the Alexandrian church in the most explicit manner. His renunciation was followed by a proclamation vindicating his conduct; in which, besides the arguments used for the pope’s supremacy, &c. he insisted much on the bad lives of the clergy of the opposite party, and for which it appeared that there was in reality too much foundation. This was the last work of the excellent missionary Peter Paez, who died of a fever immediately after his leaving the king. The example of the sovereign, however, had very little effect upon his subjects. The proclamation was followed by a new rebellion in Ambara. Unluckily the enemies of his brother Sela Christos had persuaded Sociinos to deprive him of his government; and there was no other in the kingdom who could be intrusted with such an important commission; so that the king soon found himself under a necessity of replacing and committing to him the charge of the war against the rebels. In this he was attended with his usual success: for the rebel chief, finding himself unable to contend with his enemy, repaired for assistance to the Galla; who no sooner had him in their power, than they killed him on the first offering of the imperial general, mangling his body in such a manner that scarce a bit of it remained to be sent to his antagonist.

In the mean time news of the revolution in religious matters which had taken place in Abyssinia, arrived in Europe. Though the embassy to the pope and king of Spain could not pass, as has already been related, yet frequent accounts had been otherwise transmitted; which produced such an effect, that a new set of missionaries, with a patriarch (Alphonso Mendes) at their head, were sent to Abyssinia. They arrived at Gorgora, the seat of royal residence, in the beginning of the year 1626; and at the very first audience of the emperor, it was agreed that he should take an oath of submission to the pope. The ceremony was performed with all the splendour that could be contrived: the oath of submission then preached a sermon on the pope’s supremacy in the Portuguese language, intermixed with the Latin quotations; which is reported to have greatly pleased the emperor, confirmed the faith of the emperor and his brother, though neither of them understood a word of the languages in which it was preached. An answer to this unintelligible discourse was made in the Amharic language, which was equally unintelligible to the patriarch and his attendants; and to this the patriarch added a few words of a reply equally ill understood. At the conclusion of the dispute, an oath of the pope’s supremacy was taken by the emperor himself on his knees, then by the princes, and afterwards by all present, according to their different stations. Sela Christos, not Violent with taking the oath, drew his sword, and conduct of Sela Christos, in words not easily understood, denounced vengeance on “those who fell from their duty:” and he likewise added to the oath of supremacy another to the emperor and Facilidas the prince royal; but if the latter should fail in the defence of the Catholic faith, he swore to be his greatest enemy: nor would he be satisfied without imposing this clause upon all the officers, whether civil or military, then present.

This violent conduct of Sela Christos procured him and of the emperor’s number of enemies, and at last was the occasion of his destruction; but that of the king and patriarch set the whole empire in a flame. An extension of jurisdiction was first pronounced upon all who did not keep the oath: a proclamation was next issued, that all priests should previously embrace the Catholic religion under pain of death; and that every one, under the same penalty, should observe Lent and Easter, according to the rules of the Roman church. The patriarch proceeded in the same style; reordering the clergy, consecrating the churches over again, re-baptizing the people, even such as were full grown, abrogating circumcision, polygamy, and divorce (for these had been allowed by the Alexandrian church), and reducing the movable feasts entirely to the rules of the church of Rome.

Though polygamy and divorce are no doubt inconsistent with the pure doctrines of the gospel, yet it was very improper to meddle with these practices at once in such a violent manner. Besides the confusion that this would naturally occasion in private families, these practices gave occasion to many questions in law, which it belonged to the civil judges to decide; but now these were all subjected to the authority of the patriarch: and from some other steps taken by this prelate, it appeared that he intended to encroach much farther upon the civil authority. One of these related to the church lands; which in Ethiopia are granted by the king, and resumed at his pleasure; others being granted in their place, so that neither priests nor monks have any property in them. On the present occasion, an Abyssinian nobleman had possessed some lands belonging to a Catholic monk; for which he was excommunicated, and the king decided to commit to this new tribunal, he was instantly condemned to restore the lands; but refusing this also, the patriarch was at length compelled to give them up, and the king decided to commit to his successor.
ABYSSINIA.

Abyssinia. arch took an opportunity, as he was attending the emperor at church, to pronounce sentence of excommunication against him, giving him over at once, soul and body to the devil.—On hearing this terrible sentence pronounced, the nobleman fainted away, and was with difficulty recovered. On the intercession of the emperor, however, the curse was taken off; but the incident produced a very disagreeable effect on the minds of the people, who from that day began to entertain a greater aversion than ever to the Roman Catholics and their priests. This aversion was greatly increased by the absurd conduct of the patriarch, in ordering the body of an Abyssinian saint to be taken up, and thrown out of the grave in an ignominious manner, because it had been buried under the altar of a church, which he imagined was thus defiled. In all other respects, the patriarch behaved in such an insolent and overbearing manner, that the effect of his oppression soon began to be universally felt, and the Catholic religion began very quickly to decline.—The first stroke given to it was the alteration of the liturgy; which was done at the desire of the emperor. Ever since the establishment of the Catholic religion, the Latin mass book, &c. had been made use of according to the practice of the church of Rome; but as it seemed very unreasonable to impose this at once upon the Ethiopians, Socinios ordered the patriarch to make such alterations in the old Abyssinian liturgies as he thought proper, that the people might thus have an opportunity of paying their devotions in a language they understood. The patriarch, not being able to assign any solid reason to the contrary, was obliged to comply; but no sooner was this done than the people made use of their old liturgies entirely, without the least regard to the innovations of the patriarch. In the midst of the confusion which daily took place from these causes, the Gallia made a dreadful invasion, and cut off one of the emperor's generals with his whole army; nor were all the abilities of Sela Christos, who had so often distinguished himself, sufficient to retrieve matters; so that the savages, after having ravaged the country for some time at pleasure, returned home loaded with booty. This misfortune was followed by the revolt of Tesca Georgis, the king's son-in-law, who not only made religion the pretext for taking up arms, but insulted the Catholics in the most outrageous manner; collecting their religious trinkets into a heap, and then publicly setting fire to them. After this he called before him his own chaplain, named Abba Jacob, who was a Catholic, stripped him of his pontificals, and killed him with his own hand. A reconciliation with Socinios was now impossible; so that he had no resource but in arms. In this however, he was equally unsuccessful with the other rebels in this reign; being defeated, taken prisoner, and put to death, along with his sister Abderra, notwithstanding the intercession of a Catholic missionary for him, and that of the queen and ladies of the court for his sister.

As the reasons given by the king for refusing such powerful intercession were purely religious, the people became more and more averse to a profession so extremely oppressive and sanguinary as that of Rome seemed to be. A revolt of the Agows quickly followed; not that religion had really any share in their determinations, but that they were exasperated by the Abyssinian slavery and oppression to which they saw themselves subjected. They now therefore set up Melcha Christos, a prince of the royal blood, as a pretender to the crown; and soon put on such a formidable appearance, that the king himself thought proper to march against them with an army of 50,000 fighting men, which with the servants and other attendants amounted to more than 80,000. Melcha Christos retired with his troops to the craggy mountains of the country; and being imprudently followed by the emperor, rolled down such quantities of stones from the precipices, that Socinios was obliged to retreat with great precipitation, after having lost almost one half of his army.

On this defeat the emperor found himself obliged to The rebels apply to Sela Christos, whom he had again disgraced defeated and deprived of his government. He succeeded in giv. Sela Christos. Locsa Mar. a time entirely broke their power; but this success was quickly followed by the revolt of Locsa Mariam, a revolt and near relation of the king. He also was defeated, and death. obliged to retire to a mountain so steep, that though he ascended it in safety, he was dashed in pieces with many of his followers in attempting to descend; the rest, who escaped this danger, being killed by their pursuers. Still, however, the rebel Melcha Christos several times was unsubdued; against whom Prince Facildas, the heir-apparent to the throne, was sent, having under his banner a nobleman of most distinguished character named Keba Christos. The latter was defeated and killed, without its being in the power of Facildas to do any thing towards the suppression of the rebellion. This misfortune was followed by the death of Fecur Erzie, formerly ambassador with Antonio Fernandes to the pope, but now lieutenant-general to Sela Christos. He was cut off with a small body of troops by the Gallia; and from many misfortunes befalling the imperial troops, the power of Melcha Christos was augmented to such a degree, that he now began to act as a king, and appointed a deputy-governor to one of the provinces. His opinion of his own importance grew. However, he had almost proved his ruin; for the new governor having appointed a great festival on Saturday, in opposition to the royal edict, he was attacked by a party of the king's troops, and entirely routed with the loss of 2000 of his men. This defeat Prince Facil. was avenged by an overthrow given to Prince Facildas himself; the blame of which was laid upon Sela defeated. Christos. The latter, as we have often had occasion to observe, was not only a most valiant commander, but a rigid Catholic; and these two qualities might naturally have been thought to secure him in favour with the emperor. His violent conduct in regard to the Catholic religion, however, had raised him so much university enemies, that accusations were perpetually brought against him; and one disgrace constantly followed another, notwithstanding all his services. The present accusation was brought by one Lesana Christos, whom Sela Christos had formerly condemned to death. For this offence he had received a pardon from Socinios; and he now revenged himself upon his former judge by accusing him to his sovereign. Sela Christos was not unmindful of his conduct; and therefore, as soon as he had him in his power, put him to death without regarding the pardon he had received. The emperor on
ABYSSINIA.

Deprived of the government of Gojam, which he gave to Serca Christos, who has supposed to be a dependent on Prince Facilidas, and was besides cousin to the emperor himself. The new governor, on his entering upon office, promised solemnly to support the Catholic religion; but no sooner did he arrive in Gojam than he solicited Prince Facilidas to rebel against his father, and re-establish the Alexandrian faith. This was not the only instance in which he showed his disobedience. He had received the charge of a caravan which came annually from Narea; but instead of acting properly in this respect, he employed himself in driving off the cattle of the Agosa and Damota, who expected no harm, and were consequently quite unprepared. Such numbers of them were carried off on this occasion, that 300,000 are said to have been sent to the Abyssinian market. Socinios, when informed of such an atrocious robbery, ordered him to restore the cattle, and to surrender himself prisoner; but instead of complying with this order, he again solicited Facilidas to revolt against his father. For this he was sharply reproved; but now determined to make the world believe that the prince had entered into his schemes, he sent a public message to him in which he was desired to come and take possession of the kingdom. Facilidas imprisoned the person who brought this treasonable message, and soon after sent him to Socinios; but Serca Christos still persisted in his mad attempts. He now proposed to abolish the Romish religion throughout the kingdom; and with that view attacked a convent which Sela Christos had built in Gojam: but the fathers having been furnished with some fire-arms, made so good a defence, that he was obliged to give over the enterprise. He then took the last step to complete his folly, by openly revolting against the emperor, and setting up a prince of the royal-blood in opposition to him, whom he had found living in obscurity among his mother’s relations. To cut off all possibility of reconciliation with the emperor, he renewed the sacrilegious practices of Georgis, and put to death a priest for refusing to deny the two natures of Christ. Thus he procured a multitude of enthusiasts to join him; but when the affair came to a decision, and Prince Facilidas with a well-disciplined army was sent against him, it then became evident how little the fanaticism of a tumultuous rabble availed against the skill of a regular army. The rebels fought, however, with great obstinacy till most of them were killed, their commander being obliged to take refuge on a mountain; from whence, being unable to make his escape, he at last came down and surrendered at discretion. We need not doubt of his fate; but notwithstanding the execution of this rebel, another still remained. This was Melcha Christos, against whom the emperor next prepared to march. He now found, however, the bad consequences of having acted so violently in favour of the Catholic religion. His army was so disaffected, that he could scarcely put any confidence in them. For this reason he issued a proclamation, that such as chose to observe the Wednesday as a fast instead of Saturday, had liberty to do so. This and some other indulgences being reported to the patriarch, the latter sharply reproved him as committing an encroachment on the priesthood; and put him in mind of the punishment of leprosy inflicted upon Uzziah for assuming the priest’s office. Thus an altercation commenced; and it was evident, from the behaviour of Socinios, that his extreme favour for the Romish religion began to decline. After this he set out for the country of Lasta, where Melcha Christos was, and the entrance to which was guarded by very high and rugged mountains. Among these the rebels had strongly fortified themselves: but were driven from four posts by the king’s troops, so that the latter imagined a complete victory had been gained. Assembling themselves, however, on the top of another high mountain, the rebels watched their opportunity; and descending the next upon them, cut off great numbers, and obliged the emperor to retreat. Another campaign was therefore necessary; but now the army lost all patience. They were become weary of making war on their countrymen, and after slaughtering them in the field, seeing the intervals between the campaigns filled up with numerous executions of those who had escaped the sword. A deputation was therefore sent to the soldiers by Prince Facilidas, who, though he had never declared his sentiments openly, was strongly suspected of being no friend to the Catholics. The Alexandrian purport of the deputation was, that they did not mean faith to say that the Romish profession was a bad one, but it was such as they could not understand; and consequently there could be no merit on their part in professing it. They were ready, however, to lay down their lives for the public good, provided their ancient religion was restored; but this was a point they would not give up, and without which they would neither concern themselves in the quarrel, nor even wish success to the emperor’s arms. With regard to the Romish religion, they added this declaration, perhaps the strongest possible mark of aversion, that they did not wish to know anything about it. Socinios, therefore, according to the Abyssinian accounts, promised to restore the Alexandrian faith, on condition that he returned victorious from Lasta. The army then readily agreed to follow him wherever he pleased; while the rebels, having left their fortresses in Lasta, probably from a confidence in their own strength, boldly marched towards the royal army. In the engagement, however, they did not show their usual acracy, and were soon defeated with the loss of 8000 men. Many Melcha of their best officers were killed on the spot, and Melcha Christos himself escaped only by the swiftness of his horse.

By this victory the power of the rebels was broken; but it was not attended with the same satisfaction to the people with which other victories were wont to be accompanied. On viewing the field of battle along with Facilidas next day, the prince is said to have made a pathetic speech to his father; in which he told him, speech of which the bodies of the men he saw dead on the field of Prince Facilidas battle were neither those of Pagans nor Mahometans, but of his own Christian subjects; and that victories of this kind were like driving a sword into one’s own entrails. "How many men (says he) have you slaughtered? how many more have you yet to kill? We are become a proverb even to the Pagans and Moors for carrying on this war; and for apostatizing, as they say, from the faith of our ancestors." The king did not make any reply at that time; but the effects of the prince's
Abyssinia.

The prince's words were soon apparent. The patriarch took the first opportunity of upbraiding him with his ingratitude to the Catholics, and deserting the religion whose professors had by their prayers obtained such a signal victory. To this Socinios replied in general, that he had done every thing in his power to establish the Catholic religion, for which he had shed the blood of thousands, and had still as much more to shed; but that he should consider of the matter, and acquaint him with his final resolution. This was by no means favourable; for next day, in his absence, he sanctioned the many rebellions which had been excited on account of religion; and concluded with telling him, that though the faith of Rome was not a bad one, yet the people of Abyssinia did not understand it. For this reason he was determined to grant a toleration, by allowing such as professed the Catholic faith to do so in peace, and such as rather chose that of Alexandria to do the same. The patriarch replied, that he had no objection to grant this indulgence to such as had not yet embraced the Catholic faith; but those who had done so could not be permitted to renounce it without a grievous sin. Thus a new system of persecution would have commenced: but the emperor, understanding well the purport of his discourse, replied, that if this was the case he was no longer master of his own kingdom; and immediately afterwards issued a proclamation, wherein he declared the Alexandrian faith restored, with the altar for the sacred, liturgy, and every other thing belonging to it; at the same time, that being now old and infirm, he himself resigned the crown and empire to Facilidas.

This remarkable proclamation was made on the 14th of June 1633; after which Socinios took no farther care of public affairs; nor did he long survive this transaction. He died on the 4th of September this year, and with him fell all the hopes of the Jesuits. Facilidas, as has been rightly conjectured, was an inveterate enemy to the Catholic faith. As soon therefore as he had obtained the government, even before he took upon himself the title of the king, the Catholics were everywhere displaced from offices of trust and honour; but as soon as he found himself established on the throne, a letter was sent to the patriarch, informing him, that as the Alexandrian faith was now restored, it became indispensable necessary for him to leave the kingdom, especially as the new Abuna was on the way, and only deferred his journey till the Roman priests should be out of the country. For this reason he commanded the patriarch, with all his brethren, to leave their convents throughout the empire, and retire to Fremona in the kingdom of Tigré, there to wait his further pleasure. The patriarch attempted to soften him by many concessions, but in vain; on the 9th of March 1633 he was ordered with the rest of the fathers, to proceed immediately for Fremona. This they were obliged to comply with; but the emperor, understanding that they were about to establish themselves, and to solicit succours from Spain to accomplish their purposes by force, he sent orders to the patriarch, instantly to deliver up all the gunpowder they had at that place, and to prepare, without delay, to set out for Masuah. Still the infuriated and obstinate priest determined not to comply with the emperor's orders. At last he thought proper to deliver up the gunpowder; but resolved to leave his companions behind him, and to disperse them as much as possible through the empire, in case he himself should be obliged to embark at Masuah; which, however, he did not by any means intend. For this purpose he applied to the Baharna, the gush, named John Abay, then in rebellion against the emperor, who carried them all off from Fremona in the night-time, under a guard of soldiers, and lodged them safely in a strong fortress named Adicotta. Here the patriarch imagined that he might remain in safety till he should be able to send a message to the emperor. In this, however, he was deceived. John conveyed them from place to place, through many unwholesome situations, till their strength as well as their patience was exhausted. At last, on receiving a present of gold, he allowed them to return to their old habitation Adicotta. Facilidas, then, being determined at all events to get rid of such troublesome guests, endeavoured to prevail upon John by bribes to deliver them into his hands. John was too delicate to comply with this request, which he supposed would be a violation of hospitality; but he consented, on receiving a proper compensation, to sell them to the Turks. Two were left behind in Abyssinia, in hopes of soon sharing the crown of martyrdom; and this indeed Facilidas did not delay to put them in possession of, being both ordered for execution as soon as he got them into his power. Not content with this, and being perpetually apprehensive of fresh invasions from Europe, he entered into a treaty with the Turkish bashaw to keep the ports of Masuah and Suskem shut against them; by which their entrance into Abyssinia would be effectually prevented.

During these transactions, the emperor took the most effectual methods otherwise to eradicate the Roman religion, by cutting off the principal persons who professed it, or obliging them to renounce their profession. The principal of these was his uncle Sela Christos, who had deserved so well of the late emperor Socinios, and of the whole empire in general. His excessive bigotry in religious matters proved the cause of his destruction, as has formerly been hinted. When it was proposed to him to renounce his faith, he absolutely refused to do so, either to avoid the greatest punishment the king could inflict, or to obtain the greatest gift he had in his power to bestow. On this he was banished to an unhealthy district among the mountains of S amen; but as even here he kept up a correspondence with the Jesuits, and wished to facilitate the introduction of more Portuguese from India, he was sentenced to be hanged on a cedar tree.

The expulsion of the present race of missionaries did not entirely discourage the Europeans from attempting to introduce a fresh mission into Abyssinia. The obstinate, haughty, and rebellious spirit of the Jesuits was universally condemned, and regarded as the cause of the extreme aversion showed by the emperor and the whole empire against the doctrines they professed. It was therefore hoped, and not without some appearance of reason, that the point might still be gained, provided the mission were undertaken by others less violent and insidious in their behaviour. After the execution of those who remained in Abyssinia, six Capuchins, the reformed order of St Francis, were sent with permission from the Grand Signior to facilitate their passage.
Abyssinia.

The rebels chose his son for their leader. The emperor's army perishes with cold.

Princes of the blood again imprisoned on a mountain.

Facilidas defeated by the Agows and Shangalla.

The rebels choose his son for their leader. The emperor's army perishes with cold.

Abyssinia.

Four of them murdered, and the other two return.

Three others murdered by order of Facilidas.

Melcha Christos still continues in rebellion.

Is defeated and killed.

The rebels choose his son for their leader. The emperor's army perishes with cold.

The rebel army numbered 30,000.
ABYSSINIA.

A grandson of Socinius, who had fled to the Galla when Facilidas first banished the princes to Wechne, was proclaimed king. A multitude of savages immediately flocked to his standard, so that he was soon at the head of a very formidable army, while the Agows and other malefactors were ready to join him as soon as he should repass the Nile. The king, however, entirely disconcerted the scheme by his activity; for, advancing with the utmost celerity, he reached the banks of the Nile before the Galla on the other side were ready to join their allies on this side of it. The Agows were so confounded at his presence, that they allowed him to pass the river unmolested. The Galla were equally surprised at seeing the war transferred into their own country; and, with their usual fickleness, deserted the prince whose cause they had pretended to espouse. A few remained faithful, but were utterly defeated by the forces of Yasous; the unhappy prince himself, whose name was Isaac, being taken prisoner, and put to death in the presence of his rival. After this, many great exploits were performed against the rebellious Agows, Galla, and other savages: but which, as they produced no other consequence than that of establishing the emperor’s character for personal valour and military skill, we shall here pass over; only remarking, that, in the opinion of his subjects, one of his campaigns was the most glorious ever recorded in the annals of Abyssinia. The most memorable events in the present reign regarded religion, and a renewal of the correspondence between Europe and Abyssinia; of which we have a particular account from Mr. Bruce to the following purpose. About the end of the 17th century, a number of Franciscans from Italy settled at Cairo in Egypt, and were maintained at the expense of the fathers in Palestine, though pretending to be independent of their superior, the guardian of Jerusalem. The latter, displeased at this method of proceeding, offered to supply the mission to Egypt entirely at the expense of Palestine, and likewise to furnish from thence missionaries capable of instructing the people in the Christian religion. This proposal meeting with a favourable reception at Rome, a new set of missionaries from Jerusalem, called by our author Capuchins, appeared at Cairo; from whence the Franciscans were banished, only two of them being allowed to remain in that city. The others returned to Rome; where, finding that they could not re-establish themselves by fair means, they had recourse to artifice and fiction. It was now pretended, that, on the expulsion of the Jesuits from Abyssinia, a great number of Catholic Christians had fled into the neighbouring countries of Nubia and Sennaar, where they found themselves so grievously oppressed by the Mahometans, that, without some spiritual assistance, they would be under the necessity of renouncing their religion. This story being confirmed by the two Franciscans who remained at Cairo, the cause of these supposed Christians was eagerly espoused by the religious in Italy, and a new mission set on foot at the expense of the pope for their relief, which continues to this day under the title of the Ethiopic mission. The missionaries had it also in charge to penetrate if possible into Abyssinia; and to keep up, as far as was in their power, the Catholic faith, until a better opportunity should offer of making an attempt to convert the whole Abyssinian empire. For this purpose a convent was procured for them at Achmim in Upper Egypt; and permission was granted, notwithstanding their former banishment, to settle two of their order at Cairo independent of the fathers of Palestine.

While these transactions passed in Italy and Egypt, Louis XIV. of France was in the height of his glory. He had attempted to rival the ancient Greeks and Romans in the magnificence of his works; but his conduct with regard to religion, his persecution of the Protestants, and revocation of the edict of Nantes, had stigmatized him throughout the greatest part of Europe as a bloody and merciless tyrant. To wipe off this stain, the Jesuits, his great spiritual directors, formed a scheme of inducing the emperor of Abyssinia to send an embassy to France; after which they hoped that they might get themselves replaced in the Ethiopian mission, to the exclusion of the Franciscans. The king, whose pride was very much flattered by the proposal, readily embraced it; but the pope’s consent was still necessary. His holiness was by no means pleased with this intrusion of a temporal prince into spiritual affairs; nevertheless he did not choose to enter into any contest; but that he might undo with one hand what he did with the other, he appointed six Jesuits, of whom Verseau, the ambassador of Louis to himself was one, to be missionaries to Abyssinia, but the superior of the Franciscans to be his legate a latere at that court; providing him with suitable presents for the emperor and principal nobility.

The Jesuits now finding themselves in danger of being supplanted by the Franciscans, applied to the pope to know which of the two orders should make the first attempt to enter Abyssinia; but received no other answer than that those who were most expert should do so. Verseau, probably dispossessed at the conduct of the pope, went to a convent in Syria, of which he was superior, without making any attempt to enter Ethiopia: therefore the mission remained in the hands of two persons of opposite professions, a Jesuit and a Franciscan; the name of the latter being Paschal, an Italian; and of the former Brevedent, a Frenchman. The latter was accounted a man of learning and probity, zealous in the cause of his religion, but by no means imprudent or rash in his attempts to promote it.

In the mean time an unforeseen accident procured Yasous full admittance to the missionaries into Abyssinia more sick, and readily than could have been expected in the present situation of affairs. Yasous and his son had both been attacked by a scabrous disorder which threatened to turn to a leprosy; on which one Hagi Ali, a Mahometan factor at Cairo, received orders to bring with him an European physician on his return to Abyssinia. It happened that this man had formerly been acquainted with Friar Paschal, who had administered some medicines to him. He now proposed that Paschal should accompany him to Abyssinia in the character of a chaplain and physician; and that Friar Anthony, another of his own order, should go with him as his companion. But this scheme was frustrated by Maillet the French consul, who had the charge of the whole from Louis XIV. and wished that the Jesuits alone should have the conduct of the mission. For this purpose he represented...
ABYSSINIA.

Abyssinia. to Hagi Ali, that Friar Paschal understood nothing of medicine; but he promised to furnish him with another, whose skill was extolled above all those of ancient or modern times. Hagi Ali, who knew nothing of the matter, readily agreed to Maillet's proposal; and Charles Pocnet, a Frenchman, who had been bred a chemist and apothecary, was appointed to the office of physician, with Father Brevedent to attend him as his servant. Thus the scheme of the Franciscans was for the present overthrown: but unluckily Maillet employed one Ibrahim Hanna, a Syrian, to write letters to the Abyssinian monarch and some of his principal nobility, which he desired him to submit to the inspection of one Francis, a Capuchin or monk of the Holy Land, and consequently an enemy to the Franciscans. Ibrahim, not being acquainted with the monk he mentioned, and thinking any other would answer as well, carried the letters to one of the same name, but of the Franciscan order. Thus the whole secret was divulged at once; and the Franciscans, with the malevolence essential to such religious miscreants, resolved on the destruction of Pocnet and his attendants. At present, however, their sanguinary intentions were defeated; Pocnet set out immediately after he had received his commission, and arrived safe at Gondar the capital of Abyssinia, with his attendant Father Brevedent, on the 21st of July 1699. Brevedent died on the 9th of August; but Pocnet lived to execute his commission, by making a full cure of his royal patient. On the 2d of May 1700, he set out on his return for Europe, and arrived at Masuah without any bad accident.

It has been already observed that the main end of this undertaking was to procure an embassy from Abyssinia to the French monarch; and this end also was gained. An ambassador was procured, but unluckily not such as M. Maillet, the chief manager of the whole project desired. This man, intoxicated with absurd notions of nobility and distinctions of rank, could not make allowance for the difference between the appearance of an ambassador from a barbarous monarch, however powerful, and one from the sovereignty of a civilized and polite nation. The ambassador sent by Yasous, therefore, having been originally no other than a cook, could not be agreeable to a man of such a disposition. The presents sent by the Abyssinian monarch, indeed, had they arrived, would have probably conciliated matters. These were, an elephant, some Abyssinian young women, &c. but unluckily the elephant died, and the ambassador was robbed of all the rest by a Turkish bashaw. Maillet, therefore naturally proud, imperious, and coketous, thought proper to call in question the authenticity of Morat the ambassador's mission, to call Pocnet himself a liar, and not to allow the former to proceed to France. The transactions on this occasion are set forth at length by Mr. Bruce greatly to the disgrace of Maillet; but as details of this kind would swell the present article beyond due bounds, we must refer the curious reader to the work just mentioned.

Thus the scheme of procuring an embassy from Abyssinia having proved abortive, the next project of the Jesuits was to get an embassy sent from France, whose object was to be the cementing a perpetual peace between the two nations, and to establish a lasting and commercial intercourse; though, whatever friendship Abyssinia or good-will might take place, it was evident that there was not a single article that could be exchanged between them, nor was there any ready communication between the two countries either by sea or land. The person pitched upon as ambassador M. de was M. de Roule, vice-consul at Damietta. He is Roule sent ambassador from France. characterised by Mr Bruce as a young man of some merit, who had a considerable degree of ambition, and a moderate skill in the common languages spoken in the east: but absolutely ignorant of that of the country to which he was going, and, what was worse, of the customs and prejudices of the nations through which he was to pass. Like most of his countrymen he had a violent predilection for the dress, carriage, and manners of France, and a hearty contempt for those of all other nations: this he had not address enough to disguise; and this endangered his life. Besides these disadvantages, he had the misfortune to be under the displeasure of all those of his own nation who resided at Cairo; so that the merchants were very much averse to his embassy; and, as the Franciscans and Capuchins were his mortal enemies, he had not a single friend in the world except Maillet and the Jesuits. Unluckily the consul misled him in one of the most material articles, and which was undoubtedly of the utmost consequence to him in the accomplishment of his purpose, viz. the presents necessary to be taken with him for the barbarous people through whose country he was to pass. Brocades, satins, and trinkets of various kinds, according to Mr Bruce, were the proper wares; but, instead of this, he had taken along with him mirrors of various kinds, with the pictures of the king and queen of France, wearing crowns upon their heads. The former of these subjected him to the imputation of being a magician; while the latter, if shewn to a Mahometan, would bring upon him the charge of idolatry. The worst misfortune of all was the malice and treachery of the Franciscans, who had already prejudiced against him the people of the caravan with whom he was to go, the governors of the provinces through which his road lay, and the brutal and barbarous inhabitants of Sennar who lie in the way between Egypt and Abyssinia. The consequence of all this was, that he was murdered at the last-mentioned place with all his retinue. The Franciscan friars, who had preceded him to Sennar, left it before his arrival, and returned immediately after. There cannot therefore be the least doubt that they were the authors of his murder; though the bigotted disposition of Louis XIV. prevented all inquiry into the matter; so that the particular steps they took to accomplish their designs were never published to the world.

The assassination of De Roule was preceded by that of Yasous emperor of Abyssinia, who fell by a conspiracy of his wife and son, occasioned by a fit of jealousy in the former. He was succeeded by his son Tecla Haimanout who had conspired against him. Before his death, he had dispatched a message to the king of Sennar, requiring him to afford M. de Roule protection at his court, and a safe conduct from it; but when the messenger was within three days journey of the capital of that kingdom, he received news of the assassination of Yasous. On this he returned.
Abyssinia.

The new emperor intends to revenge his death.

The letters of protection renewed by Tecla Haimanout the reigning prince. This was readily done: but before the messenger could reach Sennaar, he was informed that De Roule was already assassinated; on which he returned with still greater haste than before. The Abyssinian monarch, provoked at such a scandalous violation of the law of nations, declared his intention of commencing hostilities against the king of Sennaar; and for this purpose assembled his army. But this was scarcely done, before he was informed that a rival, named Amda Sion, had been set up against him by the friends of his father Yasous, and had been for some time privately collecting troops to surprise him before he could be ready to make any opposition. It was therefore necessary to employ the army destined against Sennaar to reduce this rebel to obedience; and scarcely was this done, when the emperor himself was assassinated; so that all thoughts of revenging the death of M. de Roule were laid aside.

Reign of Theophilus.

Tecla Haimanout perished in 1706, and was succeeded by his uncle Tiffili, or Theophilus; whose first care was to apprehend all those suspected to have been concerned in the death of his predecessor. Tiffili, the murderers of Yasous, whom Tecla Haimanout had instigated, imagined themselves secure, and came to court without any fear of danger: but no sooner did Theophilus get them into his power, than he caused them all to be put to death without exception; the queen herself being publicly hanged on a tree. Not satisfied with avenging the death of Yasous by the execution of his murderers, he did the same with those of Tecla Haimanout; putting to death all who were immediately in his own power, and commanding the governors of the provinces to do the same with those whom they could find within their jurisdiction. One of these, named Tigi, who had formerly been Betwudet, having escaped into the country of the Galla, raised a very considerable army, with which he invaded Abyssinia, where he committed the most dreadful cruelties. Theophilus engaged him on the 28th of March 1709; when, with a force greatly inferior, he gained a complete victory. A number of the Galla fled to a church, hoping to be protected by the sanctity of the place; but the emperor telling his soldiers that it was defiled by those who were in it, commanded it to be set on fire, so that every one perished. Tigi, with his two sons, were taken prisoners, and put to death. The king himself did not long survive his victory; falling sick of a fever, of which he died in Sept. 1709.

Execution of the queen and other regicides.

After the death of Theophilus, the line of Solomon by the queen of Sheba was superseded a second time, and a stranger of the name of Oustas seated on the Abyssinian throne. The extreme severity of Theophilus in punishing the murderers of both Yasous and Tecla Haimanout gave occasion to this; for as both princes had been assassinated in consequence of conspiracies formed by the principal people of the nation, the number of conspirators was so great, that the parties concerned had interest sufficient to influence the election of the new monarch, even in this most capital respect, of his not being a descendant of Solomon. Excepting this single defect, he was in every respect worthy of the kingdom, and was already the highest subject in it. Oustas scarce was he seated on the throne, however, when a dangerous conspiracy was formed against him by the very persons by whom he had been placed upon it. Oustas baffled their designs, by seizing the principal conspirators before they had time to bring their schemes to a bearing: and several people of the first rank were condemned to lose their noses, or to be put to death. After this the emperor undertook an expedition against the Shangalla, according to the barbarous custom of the Abyssinian monarchs, who hunt these poor people merely for the sake of making slaves; slaughtering the men without mercy, as well as many of the women, and carrying off only the boys and girls into captivity. In this he met with perfect success; and was about to attempt the conquest of the whole country, when he was called back by the news that his prime minister Tafa Christos was dead. While the emperor remained in his capital at Gondar, he was taken suddenly ill; which he imputed at first to witchcraft, and therefore used some antidotes; among which the smoking of the palace with gunpowder was one. But this was done so carelessly by the servants, that the whole building was consumed; an accident looked upon by the people in general as a very bad omen, especially as the king's complaint increased every day. At last the principal officers came to pay him a visit of condolence, as they pretended; but in reality to observe the nature of his distemper, and to consult whether or not it was likely to continue till they could fall upon means to deprive him of the government. Oustas understood their intentions, and therefore summoned all his strength to assume for a moment the appearance of health; so that the officers found him as usual engaged in business. Being thus disconcerted, it became necessary to make some apology for a visit so extraordinary and formal; for which they were at first somewhat at a loss; on recollection, however, they told him, that hearing he had been sick, which they happily found was not the case, they had come to make a proposal concerning the succession; professing a desire that he would quiet the minds of his own family, and of the people in general, by appointing his son Fasil successor to the throne after his decease. Oustas Oustas de- conferred them an equivocal answer; but the disposal of, and concerning Fasil happening to be overheard by the sol-David pro- viers, a violent mutiny ensued, and all the officers who diers, had come to visit Oustas were killed. Part of the town was set on fire in the confusion; and at last a proclamation was made, that David son of Yasous was king of Abyssinia. The prince was then sent for from the mountain, and arriving at Gondar, was crowned on the 30th of January 1714. The distemper of Oustas, in the mean time continuing to increase, he died on the 10th of February the same year.

The new emperor was a rigid Alexandrian in principle; but Oustas had been so far favourable to the David. Catholics as to entertain some of their priests, though in a private manner. As it was the custom, however, to call a convocation of the clergy on the accession of every new emperor, the monks and others insisted upon one being called on the present occasion; the more especially that a new Abuna was come from Egypt, and the leity shown to the Catholics by Oustas had excited the jealousy of the Abyssinian clergy in the highest
ABYSSINIA.

This assembly proved fatal to three Romish priests, whom Oustas had protected and supported for some time. They were brought before the king and Abyssinian clergy; who shortly asked them, whether they believed that the council of Chalcedon was to be accepted as a rule of faith, and that Pope Leo lawfully presided in it? To both these questions they answered in the affirmative: on which, without farther trial, they were condemned to be stoned; and the sentence was instantly put in execution by the furious and ignorant multitude, only one person in the whole assembly exclaiming against it as unjust. The priests being thus gratified in one instance, insisted that Abba Gregorius, who had acted as interpreter to the three just mentioned, should also be put to death; but this was prevented by David, who, found, upon inquiry, that he had only done so in obedience to the express commands of Oustas his sovereign.

Here we must take notice, that though the faith of Abyssinian is always said to be the same with that of Alexandria, it is not for that reason to be imagined that the clergy are all of the same mind. On the contrary, many different parties exist among them, who hate one another no less than all of them do the church of Rome. The principal of these in the time we speak of were the monks of Debra Libanos and those of St Eustathius, to which last the emperor himself belonged. On the arrival of a new abuna, it is customary to interrogate him before the emperor and assembly of the clergy, which of the two opinions he adheres to. The emperor at present, not thinking his presence necessary, sent the betwadet, with the principal persons of both parties, to hear the profession of the new abuna, which was afterwards to be proclaimed to the people. The latter, probably not willing to contend with either party, gave an equivocal answer. But with this the king himself was dissatisfied; and therefore, without consulting the abuna farther, he caused it to be proclaimed, that the new abuna's profession was the same with that of the monks of St Eustathius. This was highly resented by the monks of Debra Libanos, who instantly ran to the king, and from him received a profession directly contrary to what had been proclaimed by the king's order. Notified of this, they continued their tumult, disregarding the imminent danger they were in of falling under the king's displeasure. One of their number was so inflamed as to cry out, that he saw a cherub with a flaming sword guarding the door of the house where they were. Unluckily, however, they continued their assembly so long, and behaved in such a seditious manner, that the emperor sent against them a body of Pagan Gallia; who fell upon them sword in hand, killed upwards of 100 of the ringleaders, and then lying ost into the street, destroyed indiscriminately every one they met.

The massacre continued till the next day at noon, when a stop was put to it by the king's proclamation. The vast quantity of bloody so wantonly shed, however, could not but occasion great discontent throughout the capital, and the bad effects of it soon appeared. The king was universally hated, and numberless conspiracies were talked of; but before any pretender to the crown appeared, David himself fell sick, the cause of which was found to be poison. The perpetrators of this crime being known, were instantly put to death; Abyssinia, but nothing could save the life of the emperor, who died the 9th of March 1719, in great agony.

David was succeeded by his brother Baculla; who reign of in the beginning of his reign proved very severe and cruel, cutting off almost all the nobility who could be supposed to have had any share in the conspiracies and seditions of former reigns. In the latter part of it he became much more mild, and was beloved by his subjects. He was succeeded in 1729 by his son Yasouf, who continued long under the regency of his mother; and as soon as he took the management of affairs upon himself, was disturbed with continual seditions and rebellions. In one of these the city of Gondar was made a field of battle, and was so frequently set on fire, as to be almost entirely reduced to ruins. Having at last succeeded in reducing all his Cultivates enemies to obedience, he encouraged and promoted the arts of peace, repairing and ornamenting his palaces, in which he employed some Greek artists. For this he renounced the diversion of hunting, and the barbarous expeditions against the Shangalla; but this way of life is so Approved so disagreeable to his turbulent subjects, that by his severe satire was published against him, under the title, of "The expeditions of Yasouf the Little," Indignant at the treatment he received in this country, he determined on an expedition against the kingdom of Sennar; and having made the necessary preparations, invaded it with a formidable army, without the least pretence of provocation, or making any declaration of war. As he proceeded to to the country of the enemy, he allowed his soldiers everywhere to exercise the greatest cruelties, to destroy every living creature with the sword, and every thing combustible with fire. Some of the Arabs joined him as he went along; many more fled from his presence; and a body of them tried to oppose him. These last were utterly defeated; and Yasouf without delay prepared to march to Sennar the capital of the kingdom. As he still went on, the king Baady, being assisted by a division Hamis prince of a territory named Dar Foor, surprised of his army on a division of his army so unexpectedly, that they were cut off all; and the number of 18,000, Yasouf, however, still continued his destructive progress; though he gave over all thoughts of reducing the capital, or subduing the kingdom. He returned triumphant to Gondar, making a great show of the plunder he had acquired; though the dejected countenances of many of his army showed that they were by no means pleased with expeditions of this kind. The king himself was supposed to behold the distress of his subjects on this occasion with a malicious pleasure, on account of their impatience and turbulence in times of peace, and their forcing him into a war when he had no inclination for it. In a short time, however, the people were perfectly comforted for the loss of their brethren. In the religious action they had lost all those holy relics re-utensils, which it is usual in Abyssinia to carry into the field of battle in order to ensure victory. Among these there was a picture of the crown of thorns, which was put upon our Saviour's head; some pieces of the true cross upon which he suffered; a crucifix which had spoken on many occasions; with many other sacred relics of equal value. Soon after the battle all these were redeemed by the priests at an extravagant rate; no less than 8000 ounces of gold having been given...
for the speaking crucifix; and for the rest, we are to
suppose a proportional price had been paid. On the ar-
raival of this trumpery at Gondar, the greatest rejoicings
were made, and Yassou was astonished at the people
having so soon forgot the loss of their countrymen and
relations.

Soon after these transactions the abuna died; but
though it was customary for the Abyssinian monarchs
to advance the money necessary to bring a new one
from Alexandria, Yassou found himself obliged to lay
a tax upon the churches for defraying it at this time,
having spent all his ready money in repairing and orna-
menting his palaces. Three priests, consigned to the
emperor for the care of the abuna in Egypt for the new
priest, were insulted and mobbed.

A stated tribute for the passage of the abuna was
now exhausted; but the rapacious scheriff put one of their number in prison;
where he continued for a twelvemonth till the
money arrived: and from this time these extortions were
changed into a stated tribute; 75 ounces of gold
being granted for leave of passage to Cairo for the abuna; 90 ounces to the schie-
rieff, and as many to the abuna, for allowing the abuna
to pass from Cairo: an agreement which subsisted to this
day. Several other insults of this kind being received
from the abune, Yassou at last discovered that there
was a strict alliance between them, the governor of
Tigré, and the Baharnagash; any one of whom, had he
thought proper, could have crushed this pitiful prince
with the smallest effort. On this the emperor deter-
mained to march against him in person; but was pre-
vented by a rebellion which had been purposely excited
in the country of Azab and that of the Dobas. The
rebels were easily overthrown: but thus the expulsion
against the abune was delayed for a year; during which
interval the emperor sent for Michael to Gondar. This
order was positively refused, and a war ensued.
Michael, unable to contend with the emperor in the open
field took to an high mountain, the usual refuge of
Abyssinian rebels. Here also his bad fortune pursued
him; all his posts were taken by storm excepting one,
which, it was evident, would likewise have been carried,
though not without a very great expence of men. Here
Michael requested a capitulation; and to ensure favour-
able terms, he desired to put into the hands of Yassou
a great quantity of treasure, which would otherwise be
degraded among the common soldiery. This being
done, Michael descended with a stone upon his head,
as confessing himself guilty of a capital crime, with a
design to make submission to the emperor. This was
prevented for one day by a violent storm of wind and
rain; from which moment the Abyssinians believe he
began converse with the devil: but Mr Bruce informs
us, that he has often heard him say it was Michael the
archangel who was his correspondent.

Yassou was firmly determined to put this rebel to
Yassou in death, notwithstanding the quantity of gold he had re-
obliged to receive; neverthelesse a promise was extorted from him
by Michael; but contrary to his own in-
clitigation. The execution of the sentence, however, was prevented by
the intercession of all the officers of any consideration in the
court or army. Such universal solicitation
could not be withstood: Michael was pardoned; but
with these remarkable words, that the emperor washed
his hands of all the innocent blood which Michael
should shed before he brought about the destruction of his country, which he knew he had been long medita-
ing.

Michael continued for some time in prison; but was set at
afterwards set at liberty, and even restored to his go-
verment at Tigré. No sooner was he reinstated than
raised to the highest honours.

The emperor determined to punish the
abune of
Masua, but is pre-
vented.

pay tribute.

Death of
Yassou.
ABYSSINIA.

On the death of Yasous, his son Ios was by the Galla princess just mentioned succeeded to the throne without any opposition. The discontent which had taken place in the former reign about the power assumed by the relations of the old queen, now began to show itself more openly; and it was complained that a relationship to her was the only way to preferment, by which means the old families, whose merit had often saved the state, were totally excluded from every share of favour.

On the accession of the young king, a party of Galla horse, said to be about 1,200 in number, were sent as the portion of his mother; and these were quickly followed by a number of private persons from motives of curiosity, or hopes of preferment, who were emboldened by the number of 600 into a troop of infantry, the command of which was given to Woosheka. The great favour in which these people were at first soon induced many others to make their appearance. Two of the king’s uncles were sent for by his express desire; and they brought along with them a troop of 1,000 horse. By the time they arrived the queen was dead; but her two brothers, named Brulhe and Lubo, finding that she was justly preferred in her, determined to make a party at court. This was easily effected; every thing was governed by Gallas; even the court itself divided to speak their language; while the Abyssinians were at the last degree mortified by seeing their inveterate enemies thus establishing a dominion over them in the heart of their own country. At last the king thought proper to appoint his uncle Lubo to the government of Ambara; but this produced such excessive discontent, that he was soon forced to retry his nomination lest a civil war should ensue. While the empire was thus divided into two parties, Suhol Michael came to Gondar in a very splendid manner, on an application from the exiled prince of Sennar to be restored to his kingdom. This prince, when conducted into the presence of the emperor, prostrated himself before him, owned himself his vassal, and was put in possession of the government of Ras el Fel under the condition, with a large revenue, where he agreed to stay till all the disputes between the king and his uncle, should subsist. This salutary advice, however, he had not prudence to comply with; but suffering himself to be decoyed from his asylum in Atbara, was taken prisoner and murdered.

In the mean time the Abyssinian prime minister, Welde de l'Oul, died. He had hitherto moderated the fury of the opposite parties by his wise and prudent conduct; but no sooner was he taken out of the way, than a most dreadful scene of confusion and civil war took place, which raged with the utmost violence while Mr. Bruce was in Abyssinia, and seemed not likely to come to any termination when he left it. The whole empire was divided into two great factions: at the head of the one was the old queen, mother of Yasous; and at the head of the other, Ios himself the emperor, with his Galla relations. Matters were first brought to a crisis by the imprudence of the emperor himself in bestowing the government of Begemder upon Brulhe one of his Galla uncles. The government of this province had been lately resigned into the hands of the queen by an old officer named Ayo; and it was supposed that his son named Mariam Barea, universally allowed to be one of the most accomplished noblemen of the kingdom, was to succeed him in this government. This opinion was farther confirmed by the marriage of Mariam himself with Ozoro Esther, a daughter of the old queen by her second husband. Unfortunately a quarrel had happened between Kasmati Ayo, the old governor of Begemder, and Subul Michael, a little before the resignation of the former, and continued undecided till Mariam took the office upon him. The occasion was quite trifling; nevertheless, as Mariam had refused to submit to the decision of the judges, whom he stigmatized as partial and unjust, insisting that the king should either decide the affair in person, or that it should be referred to the decision of the sword, he thus fell under the imputation of being a disobedient and rebellious subject. In consequence of this, Ios looked upon him ever afterwards with an evil eye; and deprived him, by proclamation, of the government of Begemder, giving it to his own Galla uncle of Brulhe, of whom we have already made so much mention.

This unexpected promotion threw the whole empire into a ferment. As Begemder was a frontier province bordering on the country of the Galla, there was not the least doubt, that, immediately on the accession of Brulhe to his new office, it would be overrun by that race of barbarians, remarkable for their savage manners almost beyond all the other nations in Africa. This was the more dangerous, as there was not above a day’s journey betwixt the frontiers of Begemder and Gondar, the capital of the whole empire. Mariam Barea himself, who had a high sense of honour, was particularly hurt at the manner in which he was deprived of his dignity, and condemned with his family to be subject to a race of Pagans, whom he had often defeated in battle, and obliged to acknowledge him as their superior. All remonstrance, however, was vain. Brulhe, under the sanction of the imperial command, advanced with an army to take possession of his new dignity: but so exceedingly averse were the Abyssinians to follow him in this expedition, that the army disbanded itself several times after it had been collected; and it took up almost a year before he could proceed from the place where his camp was at the last Tzans or Demeba, to the frontiers of Begemder, though scarce a day’s journey distant. Mariam Barea is reported to have beheld his operations with great contempt, employing his time in the dispatch of ordinary business, and endeavouring to reconcile himself to the king, but without success. As his last effort, he sent a remonstrance to the emperor; in which, among many protestations of duty and obedience, he reminded him, that, in his investiture into the office of governor of Begemder, he had sworn not to allow any of the Galla to enter his province; that, should he deviate from the observance of this oath, the safety of the princes in Wechne would be endangered; they would constantly be liable to the invasions of the Pagans, and probably be extirpated, as had already happened at two different times; and he begged of the emperor, if he was determined to deprive him of his government, to bestow it rather upon some Abyssinian nobleman; in which case he promised to retire, and live in private with his old father. He had, however, formed a resolution, which he thought it his duty to submit to the emperor, that if his man-
Abyssinia.

Abbyssinia should think proper to come, at the head of a Galla army, to invade his province, he would retire to the farthest extremity of it, till he was stopped by the country of the Galla themselves; and so far from molesting the royal army, he might be assured, that though his own men might be straitened, every kind of provision should be left for his majesty. But if an army of Galla, commanded by one of that nation, should enter the province, he would fight them at the well of Pernay, on the frontiers, before one of them should drink there, or advance the length of a pike into the province.

This remonstrance had no effect upon the emperor. He returned a scoffing answer, announcing the speedy arrival of Brulhe, whom he thought sure of victory: but, at the same time, to show that he did not put his confidence entirely in his prowess, he created Suhul Michael governor of Samen, which lay next to Tigré in the way to Begemder, so that no obstruction might lie in the way of that officer's march to Gondar, in case there should be any occasion for him. Mariam, provoked at the manner in which he was undervalued in the king's message, gave an ironical reply, in which he alluded to the name of Brulhe, in the Abyssinian language signifying a kind of bottle; this he told him would be broken on the rocks of Begemder, if sent into that country.

On receiving this last message from Mariam, the king instantly ordered the army to be put in motion; but the Abyssinians had unanimously determined not to act offensively against their countrymen. Brulhe therefore was left to decide the affair with his Galla. Mariam kept exactly to his word in the declaration he had made to the king, not stirring out of his province, nor allowing the least attempt to be made to harass his enemy, till they were drawn up at the well above mentioned, where he met them with his army. The Galla, unsupported by the Abyssinian troops, were utterly unable to bear the shock of Mariam's army, and therefore soon betook themselves to flight; but a part of them, who were surrounded by the cavalry, fought valiantly till they were all cut to pieces. Mariam had given the most express orders to take Brulhe alive; or, if that could not be done, to allow him to make his escape. One of his servants, however, observing him in the field, pushed up through the enemy to the place where he was, and running him twice through with a lance, left him dead on the spot.

Mariam Barea was no sooner informed of the death of his rival, than he cried out in great emotion, that Suhul Michael, with the whole army from Tigré, would attack him before autumn. In this he was not deceived. Joas instantly dispatched an express for Michael, ordering his attendance, and investing him with the dignity of Ras, by which he became possessed of unlimited power both civil and military. Michael himself had for a long time seen that matters would come to this crisis at last, and had provided for it accordingly. He now set out with an army of 26,000 men, all of them the best soldiers in the empire, and 10,000 of them armed with matchlocks; all this traversed the country wherever they came, but he encumbered his army by nothing useless; allowing his men to carry along with them neither women, tents, beasts of burden, nor even provisions.

The subsistence of his troops was abundantly provided by the miserable inhabitants of the provinces through which he passed; and not satisfied with this, he insisted on a contribution in money from all the districts within a day's march of those places where he was; the least delay was followed by the slaughter of the inhabitants and destruction of their houses. Towns, villages, and buildings of every kind, were set on fire as he passed along; these people fled from all quarters to the capital for refuge, as from the face of the most invertebrate enemy; and Joas himself was now sensible of his having been in the wrong to invest him with such unlimited power. On his arrival at the capital, Michael took possession of all the avenues, as if at Gondar he meant to besiege it; so that an universal consternation ensued. Instead of offering any hostility, however, he waited with the utmost respect on the emperor, proceeding immediately from the royal presence to his own house, where he sat in judgment, as the nature of his office required him to do. No sooner had he taken upon him this new office, however, than justice in his execution was in such a rigorous and impartial manner as made the boldest offenders tremble. Some parties of his own soldiers, presuming upon the license that had hitherto been granted them, entered Gondar, and began to plunder as they had done in other places; but, on the very first complaint, their commander caused 12 of them to be apprehended and hanged. Their execution was followed by 50 others in different quarters of the city; after which he gave the charge of the capital to three officers who were to preside over three quarters, himself taking care of the fourth. Two civil judges were appointed to assist each officer in a district, two were left in the king's house, and four of them held a court of judicature in his own. Thus the inhabitants (finding that instead of bloodshed among massacre, they were to expect nothing but strict equity and moderation, became reconciled to Michael the day after his arrival, and lamented only that he had not come sooner to relieve them from the anarchy and confusion in which they had been held so long. To so great a degree of perfection indeed did he bring his legislation, that a very short time after he entered the city, a loaf of bread, a bottle of water, and an ounce of gold, were exposed in the market-place on the head of a drum night and day for some time, without any one offering to take them away. This was the more remarkable, as there was then a scarcity of provisions, and Michael himself would allow but a very scanty supply of water to be carried into the city; thereby giving the inhabitants to understand, that if he should set fire to it as he had done to other places, it would not be in their power to quench the flames.

The capital being thus secured in perfect obedience, Michael next prepared to set out on his expedition against Mariam Barea. Sensible, however, that the Mariam destruction of this worthy nobleman would be attended with a great degree of odium, he was resolved that none of it, or at least as little as possible, should fall upon himself. For this purpose, he insisted that the emperor should make himself appear to be the sole cause of all this, and carry all his soldiers along with him. Thus he had an opportunity of throwing the whole blame upon Joas and representing himself as no more than a passive instrument in the affair. He also took every occasion of praising
praising his antagonist for his virtues, and censoring the
emperor for attempting to cut off such an excellent of-

cer.

In the mean time Mariam Barea keeping exactly to
the terms of the last remonstrance he had sent to Ioas,
retired before him to the extremity of the province.
Ioas and Michael advanced furiously, burning-and de-
stroying everything as they went along. An engage-
ment at last ensued at a place called Nefas Musa,
on the extreme borders of Begemder, when Mariam
could not retreat without going out of the province.

As the royal army was more than twice the number of
the other, and commanded by an officer of superior
skill, victory was not long of being decided in its fa-
vour. Mariam with 12 of his officers, took refuge
in the country of the Galla; but were immediately
delivered up by that faithless people. He was put
to death by Lubo the brother of Brulbe, who is said
with his own hands to have cut his throat as a sheep
is commonly killed in this country, and afterwards to
have disfigured the body in a shocking manner. The
head was cut off, and carried to Michael's tent, who
would not allow it to be uncovered in his presence.
It was afterwards sent to the family of Brulhe in
the country of the Galla, to shew them what attention
had been given to revenge his death; and this displeas-
ed the Abyssinians even more than any thing that
had yet happened since the beginning of the contest.

The 12 officers, who were taken along with him,
sought protection in the tent of Ras Michael, to which
they were suffered to escape by Wooshaka their keeper.
Lubo, however, intimated likewise to have sacri-
ficed them as he had done Mariam, and therefore sent
Wooshaka to demand them: but no sooner had he un-
folded his errand, than Michael, in a rage, called to his
attendants to cut him pieces before the tent door;
which would certainly have been done, had he not fled
with the utmost precipitation.

The scandalous ascendency, which the Galla always
manifested over the king, had greatly displeased Mi-
ichael, and he expressed himself so freely on the sub-
ject, that a coolness took place between them. An-
other officer named Waraguna Fasil, a Galla by
birth, had incensed himself into the king's favour,
and greatly distinguished himself at the battle of
Nefas Musa. It was no wonder, therefore, that he
soon became a rival to Michael; and this rivalship
was greatly augmented by the following circumstance.
Near the field of battle at Nefas Musa was a house
of Mariam Barea, where Ozoro Esther his widow now
was. Being surrounded by pleasant and verdant me-
dows, Fasil encamped there for the sake of his cav-

Abyssinia.

noy. No other design was at that time apparent; how-
ever his presence greatly alarmed the princess. She
had along with her at that time a nobleman named
Ayto Aylo, who had been at the battle of Sennuar; but
had there been terrified to such a degree, that he reso-
ved to renounce the world ever after and turn monk.
In this character he was now with Ozoro Esther: and
though he refused to be concerned in any military af-
airs, he was still consulted by both parties as a kind
of oracle. In the present emergency, therefore, he told
the princess that there was only one way by which she
could secure herself from the cruelty of the Galla, and
becoming a prey to one or other of the murderers of
her husband; and that was by immediately espousing
Ras Michael. Ozoro was perfectly sensible of the
propriety of the advice, and therefore set out next
morning in company with Aylo to Michael's tent.
Here she threw herself at his feet on the ground; and
refusing to rise, Aylo explained her errand, informing
the Ras that she intended to bestow herself upon him
in marriage, as being the only person not guilty of her
former husband's death capable of affording her pro-
tection in her present situation. Michael saw clearly
the advantages attending such a match; and therefore,
having caused the army to be drawn up in order of
battle, as if for a review, he sent for a priest, and was Esther
married to the princess in the sight of all his men. The
ceremony was followed by the loud acclamations of the
whole army; and Ioas was soon informed of the rea-
son. He expressed his displeasure at the match, how-
ever, in such unequivocal terms, that a mutual hatred
from that moment commenced. This was soon made
public by a very trifling accident. One day while the
army was marching, Michael being much incommoded
by the sun, which affected his eyes, threw a white hand-
kercchief over his head to keep off the heat. This
was instantly told the king, who took it as an affront
offered to himself; for in Abyssinia it is unlawful to
cover the head on any occasion whatever in presence of
the emperor, or even within sight of the palace where
he lodges. Ioas was no sooner informed of the suppos-
ed affront, than he sent to the Ras to know upon what
account he presumed to cover his head in his presence;
but though the covering was instantly taken off, it was
thought that no atonement could ever be made for such
a grievous offence. Soon after this a quarrel happen-
ing between Fasil and a person named Gusko, likewise a
man of great consequence, complaint was made to the
Ras, who, as civil judge, summoned both parties before
him. Fasil absolutely refused to obey any such jurisdic-
tion; and the affair being laid before the other judges, it
was given in favour of Michael, and Fasil declared to be
in rebellion. This was followed by a proclamation de-
claring him of his government of Damot, and every
other public office he held. Fasil, however, had no
mind to submit to this disgrace; and therefore, after
holding a long conference with the king, departed
with his army, encamping on the high road betwixt
Damot and Gondar, where he intercepted the provi-sions
coming from the southward to the capital. This was
followed by an attempt to assassinate the Ras. A shot
was fired from one of the windows of the palace intoat Michael
the house where he sat in judgment; the distance be-
ing so small, that he could easily be seen from the pa-
lace window. The ball, however, missed

Michael, but killed a dwarf who was standing before
him fanning the flies from his face. As it was evident
that this shot must have been fired with the knowledge
of the king, it was rightly judged to be the commence-
ment of hostilities. Ioas instantly removed to a dis-
"ance, but sent Wooshaka with orders to the Ras to
return to Tigre without seeing his face; declaring, at
the same time his own uncle Lubo governor of Begem-
der and Ambara. Michael could scarcely be prevailed
upon to see Wooshaka, and told him that he should
certainly be put to death the next time he appeared
in his presence. Next day Ioas sent a message to the Ras
by four judges, commanding him to return to Tigre
without
Abyssinia.

without the least delay, under pain of his highest displeasure. Michael returned a formal answer, concluding, that he expected the king himself to be ready to march against Fasil to-morrow. To this an absolute refusal was given: on which Michael issued a proclamation, commanding all the Galla to leave the capital next day under pain of death: in case of disobedience they were declared outlaws, and liable to be killed by the first that met them if they were found 24 hours after the proclamation in the capital, or to the same penalty if they were found in the kingdom after ten days. An engagement took place a short time after, in which Fasil was totally defeated, and obliged to retire into Damot. In this engagement some of the king's black horse were taken. These were all slaves, and subject to no other commands but those of his majesty himself. Their appearance clearly showed that they must have been sent by the king to fight against the Ras. All of them were therefore brought before the latter, and interrogated by whose orders they had come to the battle. Two refused to give any answer, and had their throats cut in presence of their companions. A third plainly told him that they had been sent by the king; who had likewise ordered an Armenian to fire out of the palace window at Ras Michael. On this the prisoners were dismissed; but assassins instantly dispatched to put an end to the king's life; which they accomplished, and buried him in a church dedicated to St Raphael.

On the death of Ioas, Michael, now absolute master of Abyssinia, set up for emperor Hannes, brother to the late king Bacufu, an old man who had resided almost all his lifetime on the mountains of Wechne, and being entirely unaccustomed with the affairs of the world, was on this account probably supported by Michael to be the more proper for his purposes. Hannes had been maimed by the loss of his hand, on purpose to incapacitate him for the throne; but this objection was laughed at by the Ras. He found him, however, possessed of a quality much more inimical to his own purposes; and that was, an absolute aversion at meddling with the affairs of government: so that he could not by any means be induced to take the field against Fasil. Michael therefore was obliged to set out by himself; but thinking it improper to leave a king of any kind behind him in the capital, he had the old man poisoned before his departure; putting his son Tecla Haimanot in his place.

The young emperor, according to Mr Bruce's account, was of a fair complexion, less tunny than a Neapolitan or Portuguese, owing to his having been born in the mountain. He was endowed with many princely accomplishments; and so much attached to Michael, that he called him Father from the time of his accession, waiting upon him when indisposed with the affection of a son. There being now no objection, therefore, Michael marched against Fasil without delay, and entirely defeated him on the 3d of December 1769. On this occasion Wooncheka was taken prisoner, and afterwards fled alive, notwithstanding the intercession of some of Michael's officers for him; his skin being afterwards formed into a bottle. This piece of cruelty was attributed to Ozoro Esther; whom Mr Bruce represents as the most humane and merciful of women; though he is obliged to allow, that on the present occasion, as well as on every other which regarded her former husband, she entirely forgot her Abyssinian character. The night on which this miserable victim was destroyed, she appeared in the king's tent dressed like a bride; and in a little time returned in triumph to Gondar.

Soon after these transactions Mr Bruce entered A-

Mr Bruce's byssinias. He arrived at Masnach when there was only a report of Hannes's being ill, and Mr Bruce was supposed to be his physician, though in truth that emperor was already dead. Here he was ill-treated by the naybe, with a design to extort money, and afterwards probably to put him to death, as was his custom with other strangers. He escaped the danger, however, by the protection of Achmet, nephew and heir apparent to the naybe, and by his own prudent and resolute behaviour; threatening his adversaries with the arrival of a British man of war in case of any injury; showing the Grand Signor's protection; making use of the name of Ras Michael, now so formidable, and to whom he had obtained a recommendation, &c. After many variations and delays, he was at last allowed to depart; and a guide, by name Saloom, was sent along with him. This man was brother-in-law to the naybe, and a profess- ed Christian; but a traitor in his heart, and who wished to do every thing in his power to hurt our traveller. He was furnished with another guide, however, by his friend Achmet, to inform him where to pitch his tent, and other necessary particulars.

On the 15th of November 1769 Mr Bruce left Ar-

Ar- Sets out keeko, on the eastern coast of Africa, and proceeded from Ar-

Southwards for Gondar the capital of Abyssinia. Af-

After an hour's journey, he pitched his tent near a pit full of rain water, where he remained all night; and in the evening a messenger arrived from the naybe, who took away the guide Saloom. Next day the latter returned in company with Achmet the naybe's nephew already mentioned. The latter caused him de- posit in his hands Saloom's full hire, as though he had gone the whole length he had promised. Four of the men were commanded to go back to Ar-

Ar-keeko, and others put in their place: after which Achmet told Mr Bruce that he was not to take the road through Dobawa, though near, because it belonged to the naybe; but that Saloom knew another by a place called Dixan, which belonged to himself, and where he could insure him of a good reception. In this journey, he told him, that he would be obliged to cross the mountain of Taranta, the highest in Abyssinia; but the fatigue of this would be more than recompensed by the assurance of safety and the curiosity of the place. Taking leave of Achmet in a very friendly manner, therefore, Mr Bruce with his company finally set out on their journey the evening of the 16th. For the short space they had travelled, the account of ground was covered with grass broader in the leaf than the country ours, but in a little time the soil became hard, dry, through gravely, and full of scacia or Egyptian thorn. Next day (the 19th) they changed their course from south to west; and soon arrived at a range of mountains standing so close to one another, that there was no passage between them excepting what was worn by torrents of water; the bed of one of which consequently now became their road. In the evening they pitched their tent at some distance from this torrent, which had scarcely any water in it when they left it; but all the afternoon there had been an appearance of rain, with much
much thunder and lightning, at a distance. On a sudden they heard a noise among the mountains louder than thunder; and instantly saw the torrent, swelled immensely by the distant rains, now running like a rapid river, and the foremost part of it advancing in its bed in a body of water about the height of a man. Having run for some time in this violent manner, the current, no longer supplied by the rains, began to diminish, and by the next morning was quite gone. Among these mountains the nights are cold even in summer.

On the 18th the journey was resumed in the bed of the torrent, which now scarcely had any water: though the stones were rendered very slippery by the quantity of rain which had fallen. Leaving this disagreeable road, they came to a fine rivulet; which being the first clear water they had seen from the time Mr Bruce left Syria, was exceedingly agreeable. They proceeded along the banks of this river for some time; and soon as leaving it, they came to another of the same kind; but next day were obliged to resume their course in the bed of a torrent. The mountains in this part of the world are excessively rugged and full of precipices, entirely destitute of soil, and covered with loose stones of a black colour. On the side of the torrent in which they marched, however, there grew very large sycamore trees, some of them little less than 7½ feet in diameter. Their branches afforded shelter to an infinite number of birds; many of them without song; but others having notes very different from the European kinds, and peculiar to the continent of Africa. Most of those which had very beautiful colours were of the jay, or magpie kind. The trees were loaded with figs; but they came to nothing, by reason of the ignorance of the savages, who knew not the process of carification. The streams of water themselves, which at this season were found so delightful, run only after October; they appear on the other side of the mountains when the summer rains in Abyssinia are ceasing; at other times no water is to be met with, excepting what is contained in stagnant pools.

On the 20th of November they began to ascend the high mountain of Taranta. Their road was now exceedingly rugged and uneven, intersected with monstrous gullies and holes made by the torrents, as well as by huge fragments of rocks which had tumbled down. It was with the utmost difficulty that they could carry the astronomical instruments up the hill; in which work Mr Bruce himself, and one of his attendants named Yasine, a Moor, bore a principal share. The only misfortune they met with was, that their ass being unloaded, and committed to the care of a single person, refused to ascend this barren mountain; and in spite of all that their drivers could do, set off at a brisk trot for the fertile plains below. Luckily, however, they were afterwards recovered by four Moors sent after them, and the journey resumed without any material interruption. The beasts were now become much more tractable, having been seen and pursued by the hyenas with which that mountain abounds. The under part of the mountain produces in great plenty the tree called kolquall, which was here observed in greater perfection than in any other place throughout the whole journey. The middle part produced olives which carried no fruit; and the upper part was covered with the oxeedras or Virginia cedar, called arse in the language of the country. On the top is a small village Of the vil-

named Halai, inhabited by poor shepherds, who keep large Halai, the flocks of the rich people of the town of Dixan be-
inhabited of the mountains.

On the top was a small village named Halai, inhabited by poor shepherds, who keep large flocks of the rich people of the town of Dixan. The men have a girdle of coarse cotton cloth, swathed six times round their middle; and they carry along with them two lances, and a shield made of bulls hides. Besides these weapons, they have in their girdles a crooked knife with a blade about 16 inches in length, and fastened in breadth at the lower part. There is here great cattle, &c., plenty of cattle of all kinds; the cows generally of a milk white, with dewlaps hanging down to their knees; their horns wide like those of the Lincolnshire cattle; and their hair like silk. The sheep are all black, both here and throughout the province of Tigré; having hair upon them instead of wool, like the rest of the sheep within the tropics; but remarkable for its lustre and softness, without any bristly quality. On the top of the mountain is a plain, which, at the time our author was there, they had sown with wheat. The air seemed exceedingly cold, though the barometer was not below 59° in the evening. On the west side, the cedars, which on other parts are very beautiful, degenerate into small shrubs and bushes.

The road down this mountain was for some time Town of nothing inferior in ruggedness to what they had met Dixan described with in ascending it; but as they approached Dixan, it became considerably better. This is the first town on the Abyssinian side of Taranta. It is seated on the top of a hill of a form exactly conical, surrounded by a deep valley like a ditch; and no access to it but by a path which winds round the hill. The inhabitants were formerly exterminated by Michael Ras; and the succeeding race, in Mr Bruce’s time, were of a very indigent character, being, as he says, composed of the worst people from the territories of the Baharnagash and the province of Tigré, on both of which it borders. Here he was in danger from the treachery of Saloomo, who wished to have decoyed him into the power of some assassins. Finding that this could not be done, he surrounded Mr Bruce and his retinue with a body of armed men; but they were dispersed by the authority of Hagi Abedalcarder, the friend of Achmet, who had received orders to provide for the safety of the travellers. The only trade carried on here is that of buying and selling slaves; who are stolen from Abyssinia, chiefly by the priests, and sent into Arabia and India.

The next stage was from Dixan to Adowa, capital of the province of Tigré. Leaving Dixan on the 25th Adowa, on the 25th of November, they pitched their tent the first night capital of under a large spreading tree called daroo, which Mr Bruce says was one of the finest he saw in Abyssinia, being about 7½ feet in diameter. They had been joined by some Moors driving 20 loaded asses and two bulls, which in that country are likewise used as beasts of burden.
ABYSSINIA.

Burden. Here, our author says, he recovered a tranquility of mind which he had not enjoyed since his arrival at Masauh; but they were now entirely without the dominions of the naybe, and entered into those of the emperor. Saloono attended them for some way, and seemed disposed to proceed; but one of the company, who belonged to the Abyssinian monarch, having made a mark in the ground with his knife, told him, that if he proceeded one step beyond that, he would kill him hand and foot, and leave him to be devoured by wild beasts.

The country becomes more fertile as he passes along.

Being now in a great measure delivered from their fears and embarrassments, the company proceeded on their journey with pleasure, through a much better country than they had hitherto passed. In some places it was covered with wild oats, wood, high bent grass, &c., but in not a few places rocky and uneven. Great flocks of a bird as large as a turkey, called in the Amharic language, erkoom, were seen in some places. A large animal of the goat kind, called aseon, was found dead and newly killed by a lion. It was about the size of a large ass, and afforded a plentiful repent. Numbers of kolmell trees were also seen; and the sides of the river Habesh were adorned with a beautiful tree of the same name with the stream. There were in this place also many flowers of various kinds, particularly jessamine. The mountains of Adown, which they came in sight of on the 5th of December, are totally unlike any thing to be met with in Europe; their sides being all perpendicular rocks, like steeples or obelisks of many different forms.

Adowna, though the capital of an extensive province or kingdom, does not contain above 300 houses; but occupies nevertheless a large space, by reason of the insensures of a tree called cossauy, which surround each of the houses. It stands on the declivity of a hill, situated on the west side of a small plain surrounded by mountains. It is watered by three rivulets which never become dry even in the greatest heats. A manufactory is carried on here of a kind of coarse cotton cloth which passes for money throughout all Abyssinia. The houses are built of rough stone cemented with mud; lime being only used in the construction of those at Gondar, and even there it is very bad.

Our traveller was very hospitably entertained at Adowna, by one Janni, with whom he resided during his stay there. Leaving it on the 17th of December, he visited the ruins of Axum, once the capital of the empire. Here are 40 obelisks, but without any hieroglyphics. A large one still remains, but the two largest are fallen. There is also a curious obelisk, of which he gives a figure, with other antiquities which our limits will not allow us to enlarge upon. The town has at present about 600 houses, and carries on manufacories of the coarse cotton cloth already mentioned. It is watered by a small stream which flows all the year, and it is received into a fine bason 150 feet square, where it is collected for the use of the neighbouring gardens. Its latitude was found by Mr. Bruce to be 14° 6′ 56″ north.

On the 20th of January 1770, our traveller set out from Axum. The road was at first smooth and pleasant, but afterwards very difficult; being composed of stones raised one above another, the remains of a magnificent causeway, as he conjectures. As they passed farther on, however, the air was everywhere perfumed by a vast number of flowers of different kinds, particularly jessamine. One species of this, named agass, was found in such plenty, that almost all the adjacent hills were covered by it; the whole country had the most beautiful appearance; the weather was exquisitely fine, and the temperature of the air agreeable. In this fine country, however, Mr. Bruce had the first opportunity of beholding the horror barbarity of the Abyssinians, in cutting off pieces of flesh from the bodies of living animals, and devouring them raw; but notwithstanding this extreme cruelty, they have the utmost horror and religious aversion at pork of every kind; insomuch that Mr. Bruce durst not venture to taste the flesh of a wild boar, just after having assisted in the destruction of five or six.

During the remaining part of the journey from Adowna to Siré, the country continued equally beautiful, and the variety of flowers and trees greatly augmented; but as a report was propagated that Ras Michael had been defeated by Fasili, they now met with some insults. These, however, were but trifling; and on the 2nd in the evening they arrived safely at Siré, situated in N. Lat. 14° 6′ 35″.

This town is still larger than Axum; but the houses Siré are built of no better materials than clay, and covered with thatch; the roofs being in the form of cones, which indeed is the shape of all those in Abyssinia. It stands on the brink of a very steep and narrow valley, through which the road is almost impassable. It is famous for a manufactury of cotton cloth, which, as we have already observed, passes for money throughout the whole empire. At some times, however, beads, needles, amber, and incense, will pass in the same way. The country in the neighbourhood is extremely fine; but the inhabitants are subject, by reason of the low situation, to putrid fevers. On leaving it on the 24th, our travellers passed through a vast plain, where they could discern no hills as far as the eye could reach, excepting some few detached ones standing on the plain, covered with high grass, which the inhabitants were then burning. The country to the northward is flat and open. In the way to Gondar, however, lies that ridge of mountains called Somon; of which one named Lamo-moon is the most remarkable, and by some supposed to be the highest in Abyssinia. Betwixt Siré and those mountains the river Tacazze runs, which, next to the Nile, is the largest in Abyssinia. Mr. Bruce informs us that it carries near one third of the water which falls on the whole empire; and when passing it, he saw the marks of its stream, the preceding year, 18 feet perpendicular above the bottom; nor could it be ascertained whether this was the highest point to which it had reached. It has its source in the district of Ango, rising from three sources like the Nile, in a flat country, about 300 miles to the E. of Gondar. It is extremely pleasant; being shaded with tall lofty trees, the water extremely clear, and the banks adorned with the most fragrant flowers. At the ford where they crossed, this river was fully 200 yards broad, and about three feet deep; being stony and well covered with bottom of pebbles. At the very edge of the water the banks were covered with tamarisks, behind which grew tall and stately trees, that never lose their leaves. It abounds with fish; and is inhabited by crocodiles and hippopotami;
Abyssinia.

Abysinia, hippopotami; the former of which frequently carry off people who attempt to cross the river upon blow-up skins. The neighbouring woods are full of lions and hyaenas. The Tacazze is marked by Mr Bruce in his map as a branch of the Astaboras, which falls into the Nile. The latitude of the ford was found to be 13° 42' 45''.

This river was passed on the 26th of January; after which our travellers entered into the country of Sament; the governor of which, Ayto Tesfios, had never acknowledged the authority of Ras Michael, nor any of the emperors set up by him since the death of Iona. The country therefore was hostile; but the uncertainty of the event of the war, and the well-known severity of Michael's disposition, preserved our traveller and his company from any insult, excepting a feeble and unsuccessful attempt to extort money. Here Mr Bruce observes that the people were more flat nosed than any he had hitherto seen in Abyssinia. The path among the mountains was for the most part exceedingly dangerous, having a precipice of vast height close by it which way soever you turn. The mountains appeared of very extraordinary shapes; some being like cones; others high and pointed, like columns, pyramids, or obelisks. In one place a village was observed in such a dangerous situation, that scarce the distance of a yard intervened between the houses and the dreadful precipice. Below it is a plain of about a mile square, covered with citron and lemon trees. A river named Mai-Lumi rises above this village, and falls into the wood, where it divides into two; one branch surrounding the north and the other the south part of the plain; then falling down a rock on each side, they unite; and having run about a quarter of a mile farther, the stream is precipitated in a cataract 150 feet high. The lions and hyenas were very numerous among these mountains, and devoured one of the best mules our travellers had. The hyenas were so bold, that they stalked about as familiarly as dogs, and were not intimidated by the discharge of fire arms. Their voracity was such, that they ate the bodies of those of their own species which our travellers had killed in their own defence.

On the 7th of February they began to ascend Lamalmon by a winding path scarcely two feet broad, on the brink of a dreadful precipice, and frequently intersected by the beds of torrents, which produced vast irregular chasms in it. After an ascent of two hours, attended with incredible toil, up this narrow path, they came to a small plain named Kedus or St Michael, from a church of that name situated there. This plain is situated at the foot of a steep cliff, terminating the western side of the mountain, which is as perpendicular as a wall, with a few trees on the top. Two streams of water fall down this cliff into a wood at the bottom; and as they continue all the year round, the plain is thus preserved in continual verdure. The air is extremely wholesome and pleasant. On ascending to the very top of the mountain, where they arrived on the 9th of February, our travellers were surprised to find, that though from below it had the appearance of being sharp pointed, it was in reality, a large plain, full of springs, which are the sources of most rivers in this part of Abyssinia. These springs boil out of the earth, sending forth such quantities of water as are sufficient to turn a mill. A perpetual verdure prevails; and it is entirely owing to indolence in the husbandman if he has not three harvests annually. Lamalmon stands on the north-west part of the mountains of Samen; but though higher than the mountains of Tigré, our author is of opinion that it is considerably inferior to those which are situated on the south-east. The plain on the top is altogether impregnable to an army, both by reason of its situation and the plenty of provisions it affords for the maintenance of its inhabitants; even the streams on the top are full of fish. Here the mercury in the barometer stood at 20° 7 inches.

During the time our travellers remained at Lamalmon, a servant of Ras Michael arrived to conduct them safely to the capital, bringing a certain account of the victory over Fasil; so that now the difficulties and dangers of their journey were over. The country appeared better cultivated as they approached the capital; and they saw several plantations of sugar canes which they grow from the seed. In some places, however, particularly in Woggora, great damage is done by swarms of ants, rats, and mice, which destroy the fruits of the earth. Mr Bruce had already experienced the mischief arising from a small species of ant, whose bite was not only more painful than the sting of a scorpion, but which issued out of the ground in such numbers as to cut in pieces the carpets and everything made of soft materials to which they could have access.

When Mr Bruce approached the capital, he was dressed like a Moor; and this dress he was advised to keep, until he should receive some protection from government; his greatest, indeed his only, danger arising from the priests, who were alarmed at hearing of the approach of a Frank to the capital. This was the more necessary, as the emperor and Michael Ras were both out of town. For this reason also he took up his residence in the Moorish town at Gondar; which is very large, containing not fewer than 3000 houses. The only inconvenience he underwent here was the not being allowed to eat any flesh: for we have already taken notice of a law made by one of the emperors, that none of his subjects should eat flesh but such as had been killed by Christians: and a deviation from this would have been accounted equal to a renunciation of Christianity itself. Here he remained till the 1st of February; when Ayto Aylo waited upon him, and addressed him in the character of physician, which he had assumed. By this nobleman he was carried to the Mr Bruce palace of Koscan, and introduced to the old queen. His advice was required for one of the royal family who was ill of the smallpox; but a saint had already undertaken his cure. The event, however, proved unfortunate; the patient died, and the saint lost his reputation. Our limits will not allow us to give any particular account of the steps by which Mr Bruce arrived at the high degree of reputation which he enjoyed in Abyssinia. In general, his success in the practice of medicine, his skill in horsemanship, and the use of fire-arms, which by his own account must have been very extraordinary; his prudence in evading religious disputes; as well as his personal intrepidity, and presence of mind, is properly which never once failed him, even in the greatest and emergencies; all conspired to render him agreeable to people of every denomination. By the king he was promoted to the government of Ras-el-Feel, was his
ABYSSINIA.

constant attendant on all occasions, and was with him in several military expeditions; but never met with any opportunity of distinguishing his personal valour, though he had the command of a body of horse at one of the battles fought at a place named Serbrazos. Thus honoured and employed, he had an ample opportunity of exploring the sources and cataracts of the Nile, as well as the geography and natural products of the whole country; obtaining also leave at last to return home. We cannot, however, praise the benevolence of his spirit at his departure. It has already been observed, that he was in some danger from the priests on his first arrival, on account of their suspecting him to be a Jesuit; for that is the meaning which they affix to the word Frank or European. As he constantly attended the established worship of the country, however, and carefully avoided all disputes on the subject of religion, he became at last not only unsuspected, but very intimate with many of the principal ecclesiastics. From one of these, named Tenso Christos, he asked a benediction immediately before he departed; which piece of unexpected humility so affected the priest, that it brought tears in his eyes. The benediction was conveyed in the simple form, "God bless you." A troop of inferior priests who attended would needs bless him also; and probably were pleased at having it in their power to bestow a benediction publicly on a man of such consequence: but to the blessings of these poor monks Mr. Bruce replied in English, "Lord send you all a halter, as he did Abba Salama!" This Abba Salama had an ecclesiastical greatness of consequence; but of a very dissolute life, and at last hanged for his crimes. The monks imagined he had been recommending them to their patriarch Abba Salama, and with great devotion answered "Amen.

The history of the war after Mr. Bruce's arrival is related at great length in his work. The king Tecla Haimanout still kept his ground, and was at last acknowledged by almost the whole empire, though success did not always attend his arms. An usurper, named Scimioz, was reduced and made a servant in the king's kitchen, but was afterwards hanged for theft. Ras Michael, notwithstanding all his skill in military affairs, was not able to get the better of Fasli; and his excessive cruelty, avarice, and ambition disgusted every one. An attempt was even made to assassinate him; and his spiritual friend (Michael the archangel, according to his own report, or the devil, according to that of the Abyssinians) at last forsook him; so that he was carried off prisoner by a party of the rebels. After this misfortune he was much dejected, imputing it to the want of the spiritual assistance just mentioned, and which it seems had withdrawn itself some time before. His wife Ozoro Esther, whom Mr. Bruce characterizes as the handsomest woman he ever saw, was in great favour with the king at the time our traveller left Abyssinia. As the king himself was a handsome young man, there is no improbability in supposing with Mr. Bruce, that "they were not insensible to each other's merits;" and as she was sometimes honoured with a private audience, where Michael himself "bore no part in the conversation," we shall conclude our history of this singular empire by a conjecture, that soon after Mr. Bruce's departure, Michael either died by course of nature, he being then very old, or was cut off by his enemies; on which Tecla Haimanout, having fully settled the affairs of his empire, became possessed of the beautiful Ozoro Father, and commenced his reign with great glory.

With regard to the geographical description of ancient Ethiopia, little can be said; as not even the boundaries of the empire itself, much less those of the particular districts which composed it, were known. The ancient writers, however, agreed that it was very mountainous: but they mention no mountains of any consequence excepting Garbata and Elephas, whose situation is not well ascertained, though it is generally supposed that they answer to the mountains of Tigre. The most noted cities were Axum, Napata, Premis or Premnis, Melis, Mondus, Abalis, Msylion, Caloe, Opone, &c. The nations which inhabited ancient Ethiopia have already been enumerated; and it is not to be supposed that all, or indeed any two of them, would agree in many respects. The ancient historians, however, give the following information. They had many laws which were very different from those of other nations; especially their laws relating to the election of kings. The priests chose the most reputable men of their body, and drew a large circle around them, which they were not to pass. A priest entered the circle, running and jumping like an Eginon or satyr. He of those that were enclosed in the circle who first caught hold of the priest, was immediately declared king; and all the people paid him homage, as a person intrusted with the government of the nation by Divine Providence. The new-elected king immediately began to live in the manner which was prescribed to him by the laws. In all things he exactly followed the customs of the country; he paid a most rigid attention to the rules established from the origin of the nation, in dispensing rewards and punishments. The king could not order a subject to be put to death, though he had been capitaly convicted in a court of justice, but he sent an officer to him, who showed him the signal of death. The criminal then shut himself up in his house, and was his own executioner. It was not permitted him to fly to a neighbouring country, and substitute banishment for death; a relaxation of the rigour of the law, with which criminals were indulged in Greece.

We have the following extraordinary information with regard to the death of many of their kings: The priests of Meroë, who had acquired great power there, when they thought proper dispatched a courier to the king to order him to die. The courier was commissioned to tell him, that it was the will of the gods, and that it would be the most heinous of crimes to oppose an order which came from them. Their first kings obeyed these groundless despotical sentences, though they were only constrained to such obedience by their own superstition. Ergameses, who reigned in the time of Ptolemy the second, and who was instructed in the philosophy of the Greeks, was the first who had the courage to shake off this iniquitous and accursed yoke. He led an army against Meroë, where, in more ancient times, was the Ethiopian temple of gold; when he put all the priests to the sword, and instituted a new worship.

The friends of the king had imposed on themselves a very singular law, which was in force in the time of Diodorus Siculus. When their sovereign had lost the use of his legs, he was driven with all the majesty of his station, by the means of sedan chairs, to the palace of his son, or to some other residence. The royal bed was placed before the door of the building, and his majesty was placed on it, and carried to the palace of his son; and this was repeated so often, that the carriage continued for several years in the same situation.
use of any part of his body, by malady, or by any other accident, they inflicted the same infirmity on themselves; deeming it, for instance, shameful to walk straight after a lame king. They thought it absurd not to share with him corporeal inconveniences; since we are bound by the ties of mere friendship to partake the misfortunes and prosperity of our friends. It was even customary among them to die with their kings, which they thought a glorious testimony of their constant loyalty. Hence the subjects of an Ethiopian king were very attentive to his and their common preservation; and therefore it was extremely difficult and dangerous to form a conspiracy against him.

The Ethiopians had very particular ceremonies in their funerals. According to Ctesias, after having salted the bodies, they put them into a hollow statue of gold which resembled the deceased; and that statue was placed in a niche in a pillar which they set up for that purpose. But it was only the remains of the richest Ethiopians that were thus honoured. The bodies of the next class were contained in silver statues; and the poor were enshrined in statues of earthenware.

Herodotus informs us, that the nearest relations of the dead kept the body a year in their houses, and offered sacrifices and first fruits during that time to their deceased friend; and at the end of the year, they fixed the niche in a place set apart for the purpose near their town.

The Ethiopians made use of bows and arrows, darts, lances, and several other weapons, in their wars, which they managed with great strength and dexterity. Circumcision was a rite observed amongst them, as well as among the Egyptians, from very early antiquity; though which of these nations first received it, cannot certainly be known. The Ethiopian soldiers tied their arrows round their heads, the feathered part of which touched their foreheads, temples, &c. and the other projected out like so many rays, which formed a kind of crown. These arrows were extremely short, pointed with sharp stones instead of iron, and dipped in the venom of serpents, or some other poisonous poison, so much that all the wounds given by them were attended with immediate death. The bows from which they shot these arrows were four cubits long; and required so much strength to manage them, that no other nation could make use of them. The Ethiopians retreated fighting, in the same manner as the Parthians; discharging volleys of arrows with such dexterity and address, whilst they were retreating full speed, that they terribly galled the enemy. Their lances or darts were of an immense size, which may be deemed a farther proof of their vast bodily strength.

Thus far chiefly with regard to the Ethiopians who lived in the capital, and who inhabited the island of Meroë, and that part of Ethiopia which was adjacent to Egypt.

There were many other Ethiopian nations, some of which cultivated the tracts on each side of the Nile, and the islands in the middle of it; others inhabited the provinces bordering on Arabia; and others lived more towards the centre of Africa. All these people, and among the rest those who were born on the banks of the river, had flat noses, black skins, and woolly hair. They had a very savage and ferocious appearance; they were more brutal in their customs than in their nature. They were of a dry, cold temperament; their nails in length resembled claws: they were ignorant of the arts which polish the mind: their language was hardly articulate; their voices were shrill and piercing. As they did not endeavour to render life more commodious and agreeable, their manners and customs were very different from those of other nations.

When they went to battle, some were armed with bucklers of ox hides, with little javelins in their hands; others carried crooked darts; others used the bow; and others fought with clubs. They took their wives with them to war, whom they obliged to enter upon military service at a certain age. The women wore rings of copper at their lips.

Some of these people went without clothing. Sometimes they threw about them what they happened to find, to shelter themselves from the burning rays of the sun. With regard to their food, some lived upon a certain fruit, which grew spontaneously in marshy places; some ate the tender shoots of trees, which were defended by the large branches from the heat of the sun, and others sowed Indian corn and lotos. Some of them lived only on the roots of reeds. Many spent a great part of their time in shooting birds; and as they were excellent archers, their bows supplied them with plenty. But the greater part of this people were sustained by the flesh of their flocks.

The people who inhabited the country above Meroë made remarkable distinctions among their gods. Some, they said, were of an eternal and incorruptible nature, as the sun, the moon, and the universe; others having been born among men, had acquired divine honours by their virtue, and by the good which they had done to mankind. They worshipped Isis, Pan, and particularly Jupiter and Hercules, from whom they supposed they had received most benefits. But some Ethiopians believed that there were no gods; and when the sun rose, they fled into their marshes, executing him as their cruellest enemy.

These Ethiopians differed likewise from other nations in the honours which they paid to their dead. Some threw their bodies into the river, thinking that the most honourable sepulchre. Others kept them in their houses in niches: thinking that their children would be stimulated to virtuous deeds by the sight of their ancestors; and that grown people, by the same objects, would retain their parents in their memory. Others put their dead bodies into coffins of earthenware, and buried them near their temples. To swear with the hand laid upon a corpse, was their most sacred and inviolable oath.

The savage Ethiopians of some districts gave their crown to him who of all their nation was best made. Their reason for that preference was, that the two first gifts of heaven were monarchy and a fine person. In other territories, they conferred the sovereignty on the most vigilant shepherd; for he, they alleged, would be the most careful guardian of his subjects. Others chose the richest man for their king; for he, they thought, would have it most in his power to do good to his subjects. Others, again, chose the strongest; esteeming those most worthy of the first dignity who were ablest to defend them in battle.

The Jesuit missionaries were the first who gave any account of information to the Europeans concerning this country; the mission...
and indeed, excepting them and the late accounts by Mr. Bruce, we have no other source of information concerning it. Louis XIV. of France appointed six Jesuits to this mission, and furnished them with suitable presents for the emperor and the principal nobility. The admission of these missionaries was facilitated by a dangerous scurvy disease, which had attacked Yasous and his son, and for which they wished to have the advice of an European physician. Maillet, the French consul at Cairo, wishing the Jesuits to have the honour of the mission, disappointed the views of Friars Paschal and Anthony, two Franciscans, who were first thought of, and recommended Charles Pontet, a Frenchman, who had been bred a chemist and apothecary, and Father Brevedent as his servant, to Hagi Ali, a Mahometan factor at Cairo, for the desired purpose. The Franciscans attempted the destruction of Pontet and his attendants; but Pontet arrived safe at Gondar on the 21st of July, 1690, and having perfectly cured his royal patient, set out on the 26 of May, 1700, on his return for Europe, and arrived in safety at Masauah. Brevedent died at Gondar soon after their arrival. An embassy on the part of the Abyssinian monarch was defeated by the interference of Maillet; but the Jesuits concerted another mission from France, and the person appointed as ambassador was M. de Roule, vice-consul at Damietta. This mission was very improperly conducted; the merchants at Cairo opposed it; the Franciscans obstructed it, and it terminated in the murder of the ambassador in the province of Senassar.

The missionaries confirm what is said by the ancients, that Abyssinia is a very mountainous country. The provinces of Begender, Gojam, Wałęka, Shoa, &c. according to them, are only one continued chain of mountains. Many of them were said to be of such enormous height, that the Alps and Pyrenees are but mole-hills in comparison of them. Those called *Aorm* were said to be of this kind; but Mr. Bruce informs us, that these accounts are greatly exaggerated. Brevedent, according to him, and even frequently in the plains, there are many steep and raggy rocks to be met with of various and whimsical shapes; some of them so smooth, that men and oxen are raised to the top by means of engines. The tops of these rocks are covered with woods and meadows, full of springs and streams of water; of which Mr. Bruce has given us an account in his description of Lamalmon. The most remarkable of these, according to the authors we are now speaking of, is that called *Ambo Geshen*, mentioned in the course of this article as one of the mountains used for a prison to the princes of the blood. Its top is described as only half a league in breadth, though it is said that it would require near half a day to go round it.

Modern Ethiopia, or Abyssinia, as it is now called, is divided, according to Mr. Bruce, into two parts, named *Tigré* and *Ambara*; though this rather denotes a difference in the language than the territory of the people. The most easterly province properly so called is Masauah. It is of considerable length, but no great breadth; running parallel to the Indian ocean and Red sea, in a zone of about 40 miles broad, as far as the island Masauah. The territories of the Baharnagash include this province as well as the districts of Azab and Habab. In the former are mines of fossil salt, which substance in Abyssinia passes current instead of money. For this purpose the mineral is cut into square solid pieces about a foot in length. Here also is a kind of mint from which great profits are derived. The Habab is likewise called the land of the *Agaws* or Shepherds; who speak the language called *Geez*, and have had the use of letters from the most early ages. This province was formerly taken by the Turks, when the rebellious Baharnagash Isaaq called them to his assistance against the emperor Menas. From that time the office fell into disuse, and the Baharnagash at present has much less power than formerly. The province of Masauah is now governed by a Mahometan prince or officer called a *majebe*.

Tigré is bounded on the east by the territories of the Baharnagash, of which the river Mareb is the boundary on the east, and the Taczaze on the west. It is about 200 miles long from north to south, and 120 broad from west to east. All the merchandise sent across the Red sea to Abyssinia, or from Abyssinia across the Red sea, must pass through this province, so that the governor has his choice of it as it goes along. Thus the province itself is very wealthy; and as the Abyssinian fire-arms are brought from Arabia, the governors of Tigré, by purchasing quantities of them, may easily render themselves very powerful. No arms of this kind can be sent to any person without his permission; nor can any one buy till the governor has first had an offer.

Siré was some time ago united to Tigré, on account of the misconduct of its governor; but was disjoined from it at the time Mr. Bruce was in Abyssinia, with the consent of Ras Michael, who bestowed the government of it upon his son. It is about 25 miles long, and as much in breadth. Its western boundary is the Taczaze.

Samien is a very mountainous province lying to the westward of the river Taczaze, about 80 miles long, and in some places 30 broad, though in most it is much narrower. It is mostly inhabited by Jews.

Begender lies to the north-east of Tigré. It is about 180 miles long and 60 broad; bounded by the river Nile on the west. It comprehends the mountainous country of Lasta; and there are now several small governments dismembered from it. The inhabitants are fierce and barbarous, but reckoned the best soldiers in Abyssinia; and it is said that this province with Lasta can furnish 45,000 horsemen. It abounds with iron mines, which in Abyssinia would be very valuable if properly managed. It is also well stored with beautiful cattle. Near the south end it is cut into vast gullies, seemingly by floods, of which we have no account. This province is reckoned the great barrier against the incursions of the Galla; and though they have often endeavoured to make a settlement in it, they have never yet found it practicable. Several of their tribes have been cut off in the attempt.

Next to Begender is the province of Amhara, in length about 120 miles, and somewhat more than 40 broad. It is very mountainous; and the men are reckoned the handsomest in all Abyssinia. In this province is the mountain or rock Geshen, formerly the residence of the royal family. This province is parallel to Begender on the south; being separated from it by the river Bashilo. On the west it is bounded by the Nile. The river Geshen is another boundary.

Walaka
ABYSSINIA.

Abyxina. Walaka lies between the rivers Geshaa and Samba. It is a low unwholesome province, having Upper Shoa to the southward. It was in this province that the only surviving prince of the family of Solomon was preserved after the massacre by Judith, formerly mentioned; and on this account great privileges were conferred upon the inhabitants, which in some degree continue to this day. The governor is considered as an ally, rather than a subject, of the emperor of Abyssinia; and to preserve his independence, he has allowed the Gallor to surround his province entirely, yielding up to them the territory of Walaka above mentioned. Trusting to the value of his own people, he is under no apprehension of his barbarous neighbours the Gallor. This province is also remarkable for the monastery of Debra Libanos, where the famous saint Tecla Haimanout, the founder of the power of the clergy, was bred.

Gojam is remarkable for having in it some of the sources of the Nile. It is bounded on the north by the high mountains of Amid Amid, on the south by the river Nile, on the west by another river named Guli, and on the east by the river Temeci; on the north-east it has the kingdom of Damot. It is about 60 miles long from north to south, and somewhat more than 20 in breadth from east to west. It is very populous, but the men are accounted the worst soldiers in Abyssinia. There is great plenty of very beautiful cattle.

Beyond the mountains of Amid Amid on the east lies the country of the Agowa; on the west it has Bué, Umbarma, and the country of the Gonas; on the south, those of Damot and Gafat; and Dingleber on the south.

Dembea occupies all the space along the lake of the same name, from Dingleber below the mountains bounding Guesque and Kinya. Mr Bruce is of opinion that the lake has formerly overflowed the whole of it; and the decrease of this lake he brings as an instance of the decrease of large pools throughout the world.

To the south of Dembea is the country of Kuara, bordering on that of the Shangalla, the Macrobi of the ancients. The neighbouring countries, inhabited by Pagan savages, produce gold, which is introduced into plenty in this province. None is produced in the province itself, nor indeed does Mr Bruce mention any part of Abyssinia where gold is naturally found. In the lower part of this country is a colony of Pagan blacks named Goujari; derived, according to our author, from the black slaves who came into the country with the Arabs after the invasion of Mahomet. These deserting their masters, formed the colony we speak of; but it is now more increased by vagabonds from other parts than by the multiplication of the inhabitants themselves. The governor of this country is one of the great officers of state: he has kettle-drums of silver, which he is allowed to beat through the streets of Gondar; a privilege of none but himself. This privilege was conferred upon the first governor by David II. who conquered the country.

The frontier countries of Narea, Ras-el-Feeh, Tchelga, &c. are wholly inhabited by Mahometans, and the government of them is usually given to strangers. The country is very hot, unwholesome, and covered with thick woods. The people are fugitives from all nations, but excellent horsemen; making use of no other weapon but the broadsword, with which, however inadequate we might suppose the weapon to be, they will attack the elephant or rhinoceros.

According to Mr Bruce the empire of Abyssinia is bounded on the south by a vast chain of mountains, extending with very little interruption from 34° to 44° E. Long. and between 8° and 20° N. Lat. In more prosperous times it extended beyond these southward, particularly into the kingdom of Adel; but the mountains just mentioned are undoubtedly to be reckoned its natural boundaries on this side. On the east and north-east it has the Red sea, and on the south-east the kingdom of Adel. On the west and north its boundaries are less distinctly marked; having on both these quarters the barbarous kingdom of Sennaar, whose limits will no doubt frequently vary according to the fortunes of war between the two princes. From Arkeeko, situated near the foot of the basaltic mountains, in about 15° 30' N. Lat. it extends to near 7° N. Lat. where the mountains of Caffa, the most southerly province of Abyssinia, terminate. Along the coast of the Red sea lie the territories inhabited by the Hazorta Shibo, the district of Engana Shibo, and the kingdom of Duncali, including the territory of Azab and the salt pits already mentioned. To the westward of these is the province or kingdom of Tigré, including the country of the Dobas, part of the kingdom of Bali, and that of Dawaro. Still farther west are those of Siré, Lasta, Amhara, the greatest part of Bali, and part of Fatigar, which last reaches beyond the mountains. Proceeding still in the same direction, we come to Tcherkin, Tchelga, Abargale, Saloo, Begemeder, Shoa, and Ifat; reckoning always from north to south; Tcherkin, for instance, being to the northward of Tchelga, &c. Shoa extends a considerable way to the westward; so that, besides Ifat, it has to the south of it also the kingdoms of Hade and Cambut; the latter extending beyond the southern ridge of mountains. To the westward are Ras-el-Feeh, Dembea, Gojam, and Damot; and beyond these are the kingdoms of Bembba, Bizamo, Gooderoo, and Guerra; those of Narea or Enarea and Caffa occupying the south-west corner of the empire.

The climate of Abyssinia, though, like other parts of the torrid zone, it was formerly thought to be uninhabitable, is not only tolerable, but in general temperate and healthy. In this respect, however, the uneven surface of the country exposes different situations to the effects of heat and cold, of dryness and moisture, and of a free circulation or a stagnation of the atmosphere, in very various degrees. On the mountains, and in the higher parts of the country, the sky is clear and serene, the air is cool and refreshing, and the people are healthy and sprightly; whilst those who live in some of the valleys, in the vicinity of marshes, and in sand deserts, suffer the pernicious influence of excessive heat, and of a moist, stagnant, and suffocating air; so that the climate depends upon soil and situation as much almost as upon the latitude. Mr Bruce observes, that on the highest mountain of the ridge called Lamalmon, the thermometer stood at 32° in the depth of winter, the wind being north-west; clear and cold, but attended only with hoar frost. This, he adds, vanished into dew after
after a quarter of an hour's sun; nor did he ever see any sign of congelation of water upon the top of the highest mountains. The barometer stood at 19° 9' at noon of the same day, and the thermometer was at 78°. He observed hail to lie for three hours in the forenoon on the mountains of Amid Amid. The range of the barometer and thermometer, according to Mr Bruce's register kept at Gondar from February 19, 1770, to May 31, 1771, will appear from the following table.

The rainy season commences in April or the beginning of May, when the sun becomes vertical, and ends in September. The rains generally cease about the 8th of September; a sickly season follows till they begin again, about the 20th of October; they then continue constant, but moderate till the 8th of November. All epidemic diseases cease with the end of these rains. In order to avoid the inconveniences that attend the overflowing of their rivers during this season, as well as on account of the greater salubrity of elevated situations, the Abyssinians have built many of their towns and villages on the mountains. Their houses are generally very mean, consisting only of one story, and constructed with straw and laths, earth and lime; though there are some of stone and better materials. It is a mistaken notion, however, that they live in tents, and not in houses. In a climate like that of Abyssinia, subject to scorching weather for six months, and to deuges of rain, storms of wind, thunder and lightning, and hurricanes, such as are unknown in Europe, for the other six, it is not probable that they should choose to live in houses, after having known how to build such cities as Axum. In many of the towns and villages, the houses are separated by hedges, which being always green, and intermixed with flowers and fruit trees at certain distances, afford an agreeable prospect, and contribute also to their salubrity.

The inhabitants of Abyssinia are subject to violent fevers, which commonly prove fatal on the third day. Those who survive to the fifth day often recover, merely by drinking cold water, and by repeatedly throwing cold water upon them in their beds. The bark is the most effectual remedy; which in critical cases, says Bruce, should be frequently repeated in small doses, and perfect abstinence observed, unless from copious draughts of cold water. Another common disease in Abyssinia, is the tertian fever, which is in no respect different from our tertian, and is successfully treated in the same manner. All fevers terminate in intermitents, and if they continue long in dysenteries, which are always tedious, and very frequently mortal. Bark and ipecacuahba, in small quantities, water, and fruit not ever ripe, have been found the most effectual remedies. The dysentery, commencing with a constant diarrhoea, is seldom cured, if it begins with the rainy season; otherwise small doses of ipecacuanha either remove it, or change it into an intermittent fever, which yields to the bark. Another endemic disease is called hanzer, the hogs or the swine, and is a swelling of the glands of the throat, and under the arms, which by ineffectual attempts for producing suppuration, and opening the tumours, becomes a running sore, and resembles the evil. In connection with this disorder, we may mention those swellings to which the whole body is subject, but more particularly the arms, thighs, and legs, sometimes accompanied with ulcers in the nose and mouth, which deface the smoothness of the skin, and which on this account are much dreaded by the Abyssinians. The two last diseases sometimes yield to mercurials; but the last is speedily and completely cured by antimonials. Another complaint afflicts those who are in the habit of drinking stagnant water. It is called fereiti, or the worm of Pharoah, and appears in all parts of the body, but most frequently in the legs and arms. It is a worm with a small black head and a hooked beak, of a whitish colour, and a white body of a silky texture, resembling a small tendon. The native seize it by the head, and wind it gently round a piece of silk, or a bird's feather, and thus by degrees they extract it without any inconvenience, or permanent scar. Mr Bruce suffered much from this complaint, and the breaking of the worm in the operation of extracting it. The most terrible of all the diseases of this climate is the elephantiasis. The cica, mercury, and tar-water, were unsuccessfully tried in this complaint; the greatest benefit was derived from whey made of cows milk. To the alternation of scorching heat and chilling cold, thin clothing, the use of stagnant putrid water for four months, and other such causes, these diseases may be partly, if not wholly ascribed. The smallpox was introduced into Abyssinia at the time of the siege of Mecca, about the year 336, and the Abyssinian army was the first victim to it.

The great difference of climate, owing to the vast extent and variety of elevation in different parts of this empire, is very perceptible in its soil and productions. The mountains in many places are not only barren, but altogether inaccessible, except by those who make it their constant practice to climb amongst them, and even by them they cannot be ascended without great difficulty and danger. The shapes of these mountains, as we have already had occasion to observe, are very strange and fantastical: exceedingly different from those of Europe; some resembling towers and steeples, while others are like a board or slate set up on end; the base being so narrow, and the whole mountain so high and thin, that it seems wonderful how it can stand. In the valleys, however, and flat parts of the country, the soil is excessively fruitful, though in the warmest places grain cannot be brought to perfection. Wine is also made only in one or two places, but the greatest profusion of fruits of all kinds is to be collected in every where, as well as many vegetables not to be found in other countries. There is a vast variety of flowers, which adorn the banks of the rivers in such a manner as to make them resemble fine gardens. Among these species of rose is met with, which grow upon trees, and is much superior in fragrance to those which grow on bushes. Senna, cardamom, ginger, and cotton,
ABYSSINIA.

1. The papyrus, the ancient material for paper, which our author supposes to have been a native of Ethiopia, and not of Egypt as has been supposed. 2. Balassan, balsam, or balsam plant; a tree growing to the height of 14 or 15 feet, and used for fuel along with other trees in the country. It grows on the coast of the Red Sea, among the myrrh trees behind Azab, all the way to Babelmandel. This is the tree producing the balm of Gilead mentioned in Scripture. 3. The sausa, myrrh, and opoponax trees. These grow likewise along the coast of the Red Sea. The sausa or opopal-pasum is used in manufactures; and, according to our author, resembles gum dragont, probably tragacanth. The tree which produces it grows to a great size, and has a beautiful flower, scarce admitting of description without a drawing. 4. The erget, a species of the mimosa, is of two kinds: one called erget y'dimmo, or the bloody erget, from the pink colour of its filaments; the other erget el krone, or the horned erget, with a flower resembling the acacia vera or Egyptian thorn. These were both found on the banks of a river named Amo, near the great lake Dambaa. 5. Ennete, an herbaceous plant, growing in Narea, in swampy places; but is supposed to grow equally well in any other part of the empire, where there is heat and moisture sufficient. It forms a great part of the vegetable food of the Abyssinians. It produces a kind of fig, but these are not eatable. When used for food, it is to be cut immediately above the small detached roots, or perhaps a foot or two higher, according to the age of the plant. The green is to be stripped from the upper part till it becomes white; and when soft, it affords an excellent food when eaten with milk or butter. 6. Kolquall, a kind of tree, only the lower part of which is woody, the upper part being herbaceous and succulent. The flowers are of a beautiful golden colour, and the fruit turns to a deep crimson; so that the trees make a very beautiful appearance. The whole plant is full of a very acrid and caustic milk. 7. Rack is a large tree, growing not only in Abyssinia but in many places of Arabia Felix. Its wood is so hard and bitter, that no worm will touch it; for which reason it is used by the Arabs for constructing their boats. It grows, like the mangrove, among the salt-water of the sea, or about salt springs. 8. Gir-gir, or Geshe-el-sabe, a kind of grass found about Ras-el-Feel, growing to the height of about three feet four inches. 9. The kantua, a very noxious species of thorn, much more troublesome than any with which we are acquainted, and growing to the height of eight or more feet. The fruits have a spore much like the flowers of mimosa. 10. The gagedi is a short tree only about nine feet high, a native of Lamalmon. The flowers, which are yellow, and very beautiful, turn towards the sun like those of the helianthus. 11. The wansey, a tree common throughout all Abyssinia, flowers exactly on the first day the rains cease. It grows to the height of 18 or 20 feet; having a thick bark and close heavy wood; the first part of which is white, but the rest of a dark colour. The flowers are of a beautiful white colour; but it does not appear to possess any other remarkable property, though it is held in great estimation by the Abyssinians, and is even worshipped by the Galla. 12. The farak, or Bauhinia acuminate, grows in the country immediately adjacent to the sources of the Nile, being found by Mr Bruce scarce 400 yards distant from the fountain. 13. Kuara, is a beautiful tree, growing in the south and south-west parts of Abyssinia. It has a fruit like a bean, of a red colour, which in the early ages was made use of as a weight for gold and diamonds; and hence Mr Bruce is of opinion that the name of the imaginary weight carat is derived. 14. The walkula, grows in the hottest parts of Ethiopia. It is a flowering tree, with beautiful white blossoms, which do not appear till towards the middle of January. The flaxinia is called nolnne, and are accounted pernicious to bees. The wood is very heavy. 15. The wooginoos, or Bricea antisyneretica, is common throughout the whole empire, but principally on the sides of the valleys. It is a sovereign remedy against the dysentery, a very common and fatal disease in hot countries. Mr Bruce had experimental proof of its antisyneretic virtue. 16. Casso, or Banksia antisyneretica, is a very beautiful and useful tree, being a strong anthelmintic, and used as such by the Abyssinians. Every person there, whether male or female, is troubled with that kind of worm called ascariides; a great number of which are evacuated every month, and the evacuation is promoted by an infusion of this plant. While taking this medicine, the patients sequestrate themselves from all their acquaintance, and keep close at home. It is said that the want of this medicine in other countries is the reason why the Abyssinians do not go out of their own country; or, if they do, that they are short-lived. Teff, is a kind of grain sown generally throughout Abyssinia, and is used in making the bread commonly made use of by the inhabitants. They have indeed plenty of wheat, and are as skilful in forming it into bread as the Europeans; but this is only made use of by people of the first rank; however, the teff is sometimes of such an excellent quality, that the bread made from it is held in equal estimation with the finest wheat. From the bread made of this grain a sourish liquor called bouza is prepared, which is used for common drink like our small beer. A liquor of the same kind, but of inferior quality, is made from barley cakes. Some have been of opinion, that the use of teff occasions the worms above mentioned; but this is controverted by Mr Bruce. Nook, a plant not to be distinguished from our marigold, either in shape, size, or foliage, is also sown very generally over the country, and furnishes all Abyssinia with oil for the kitchen and other uses.

Abyssinia abounds with a vast variety of quadrupeds both wild and tame. Immense numbers of cattle every morning present themselves, some of them are the most beautiful in the world. Some have monstrous horns, said to be capable of holding 10 quarts each; but this, as our author informs us, is a disease which proves fatal to them. Buffaloes are here met with in great numbers, and are very fierce and intractable; but there are no such animals as carnivorous bulls, which have been said to exist in this and other internal parts of Africa. Antelopes and other wild animals are met with in great numbers in the uncultivated parts; feeding chiefly on the leaves of trees. They abound most of all, however, in those parts which have been once cultivated,
ABYSSINIA.

Abyssinia, cultivated, but since desolated by the calamities of war; and where wild oats abound in such quantities as to hide them from pursuit. Hyenas, lions, foxes, jackals, wild boars, &c. are also found, as well as the elephant, rhinoceros, camelopard, and others of the larger and more uncommon kinds. Great havoc is made in the cultivated fields by multitudes of baboons, apes, rats, and mice. There is plenty of bares; but these being reckoned unclean, as well as wild boars, are not used as food. The rivers abound with crocodiles and hippopotami, at least the Nile, and those large streams which flow into it; but a great number have water in them only during the rainy season, and these have neither fish nor any animal that feeds upon them.

The number of birds in this country is immense; nor are those of the carnivorous kind at all deficient. Great numbers of eagles, vultures, hawks, and others of that kind are met with, and come punctually every year after the tropical rains have ceased. They feed first upon the shell fish which are met with in great quantities on the edges of the deserts, where they had lived in the salt springs; but, being forced from their natural habitations when these springs were swelled by the rains, are afterwards left to perish on dry land. When these fail, their next resource is from the carcasses of the large animals, such as the elephant and rhinoceros, which are killed in the flat country by the hunters. Their next supply is the multitude of rats and field mice which infest the country after harvest. The vast slaughter of cattle made by the Abyssinian armies, the multitude of persons killed whose bodies are allowed to rot on the field of battle, &c. furnish them also with another resource. These supplies, however, all fail at the beginning of the rainy season, when the hunters and armies return home, and the vast quantity of water which continually overflows the ground renders it impossible for them to find any other food.

There are other birds which feed upon insects, and multitudes which live on grain or seeds of various kinds; all of which are amply supplied by the immense quantity of fruits and berries which grow in Abyssinia, and are ripe at all seasons of the year. A very remarkable particular concerning this is, that the trees which bear fruit all the year round do not carry it always in the same place. The west side is that which blossoms first, and where of consequence the fruit first comes to perfection; the south side succeeds, and goes through the same process: after which, the north blossoms in like manner; and last of all is the east side, which produces flowers and fruit towards the beginning of the rainy season. All the trees of Abyssinia are ever-green; and their leaves are of a thick, leathery consistence, and highly varnished, to enable them to resist the violent rains which fall during a certain season. The graminious birds have likewise this advantage, that the rains do not fall at the same time all over the country. It is intersected by a chain of mountains that divide the seasons also; so that they have but a short way to fly in order to become birds of passage, and supply themselves with such food as is necessary for them beyond the mountains. All the pigeons, of which there are many species, are birds of passage, excepting one kind. The owls are extremely large and beautiful, but few in number. There is a great variety of swallows, several kinds of which are unknown in Europe; but, says our author, "those that are common in Europe appear in passage at the very season when they take their flight from thence. We saw the greatest part of them in the island of Mau- suah, where they lighted and tarried two days, and then proceeded with moon-light nights to the south-west." The large birds which reside constantly among the mountains of Samen and Taranta have all their feathers tubular, the hollow part being filled with a kind of yellow dust which issues out in great abundance on hunting them. This was particularly observed by Mr Bruce in a species of eagle, which he calls the golden eagle; and the dust being viewed through a microscope with a very strong magnifying power, appeared like fine feathers. The crow is spotted white and black, almost in equal proportions. The raven has his feathers intermixed with brown, the tip of his beak white, and a figure like a cup or chalice of white feathers upon his head. Our author saw no sparrows, magpies, nor bats; neither are there many water-fowl, especially of the web-footed kind: but there are vast numbers of storks, which cover the plains in May, when the rains become constant. There are no geese, excepting one species called the golden goose or goose of the Nile, which is common all over Africa; but there are snipes in all the marshes.

Our author describes very few fishes; though he says that an account of these, and other marine productions of the Red sea, which he has painted and collected, would occupy many large volumes, and the engraving cost a sum which he could not by any means afford. Among others, he mentioned the torpedo and the benny, which latter is good food, and grows to a large size; that from which he took the drawing was about 32 pounds weight. Its whole body is covered with beautiful scales resembling silver spangles. Locusts and a species of ants are extremely troublesome and pernicious in Abyssinia, but the fly by the natives called tootsetlya is most destructive to cattle.

Mr Bruce gives a particular description of a kind of Fowser-lizard, and of the cerastes or horned serpent; but de- pents in A- byssinia. nies that serpents are numerous in Abyssinia, as almost all authors have supposed, and as we should be led naturally to suspect. He vouches also for the power that some persons have of enchanting serpents and scorpions, which in some is natural, in others communicated artificially by certain medicines. He prevailed upon those who knew the secret to prepare him by these means as they had done others; but, notwithstanding this assistance, he acknowledges, that when it came to the trial his heart always failed him.

The crown is hereditary in the line of Solomon, but it depends on the minister to choose the particular person who is to enjoy it; and it is always his inclination to have the government in his own hands, he never fails to choose an infant, who is seldom suffered to live after he is crowned, before the years of maturitv. Thus per- the earth is warms and commotions take place, insomuch that of evil the ravenous birds, as has been observed, find one great supply of food in the slaughter made by the Abyssinians of one another. All authors indeed agree that the devastations committed by the armies of this country are by their excessive; insomuch, that after a long encampment is removed,
Abyssinia.

The measure of the distance is such as to be seen all around the place where it was but bare earth. When an army marches through the country, says Mr Bruce, "an inconceivable number of birds and beasts of prey, especially the former, follow it from the first day of its march to its return; increasing always in proportion the more it advances into the country. An army there leaves nothing living behind, not even the vestige of a habitation; but fire and the sword reduce every thing to a wilderness and solitude. The beasts and birds unmolested have the country to themselves, and increase beyond all possible conception. The slovenly manners of this savage people, who, after a battle, bury neither friends nor enemies; the quantity of beasts of burden that die perpetually under the load of baggage, and variety of mismanagement; the quantity of offal, and half-eaten carcasses of cows, goats, and sheep, which they consume in their march for sustenance; all furnish a stock of carrion sufficient to occasion contagious distempers, were there not so prodigious a number of voracious attendants who consume them almost before putrefaction. There is no giving the reader any idea of their number, unless by comparing them to the sand of the sea. While the army is in motion, they are a black canopy which extends over it for leagues. When encamped, the ground is discoloured with them beyond the sight of the eye; and all the trees are loaded with them."

The prodigious number of criminals executed for high treason, whose bodies are cut in pieces and thrown about the streets, invite the hyenas to the capital, in the same manner that the carrion of the camp invites the birds of prey to follow it. The method of keeping off these voracious animals is certainly very curious. "An officer (says Mr Bruce) called Serack Maasaery, with a long whip cracking and making a noise worse than 20 French posts, roars at the door of the palace before the dawn of day. This chases away the hyenas and other wild beasts; this too is the signal for the king's rising, who sits in judgment every morning fasting; and after that, about eight o'clock, he goes to breakfast."

From these and other circumstances we should be apt to imagine that the Abyssinians, instead of becoming more civilized, were daily improving in barbarity. The king is anointed at his election with plain oil of olives; "which (says Mr Bruce) being poured upon the crown of his head, he rubs into his long hair indecently enough with both his hands, pretty much as his soldiers do with theirs when they get access to plenty of butter." In former times, however, matters seem to have been conducted with more decency. Socinios, the greatest monarch that ever sat on the Abyssinian throne, was crowned, after having gained a great victory over the Galla, in a very different manner, and with the ceremony which we are told were among the ancient kings of Tigre. At that time he had with him an army of about 30,000 men; and was besides attended by all the great officers dressed in the gayest manner, as well as by the ladies of the first quality in the empire. The king himself, dressed in crimson damask, with a great chain of gold about his neck, his head bare, and mounted on a horse richly caparisoned, advanced at the head of his nobility, passed the outer court, and came to the paved way before the church. Here he was met by a number of young girls, daughters of the ambares or supreme judges, together with many noble virgins standing on the right and left of the court. Two of the noblest of these held on their hands a crimson cord of silk, somewhat thicker than common whip cord, stretched across from one company to another, as if to shut up the road by which the king was approaching the church. When this cord was prepared and drawn tight about breast-high by the girls, the king entered; advancing moderately quick, and showing his skill in horsemanship as he went along. Being stopped by the tension of the string, the damsels asked, Who he was? To this he answered, "I am your king, the king of Ethiopia." But they replied, "You shall not pass; you are not our king." He then retired some paces, and again presented himself. The question was again put, "Who he was?" To which he answered, "I am your king, the king of Israel." But the same reply was still given by the girls. The third time, on being asked, "Who he was?" he answered, "I am your king, the king of Sion:" and drawing his sword, he cut the cord asunder. The damsels then cried out, "It is a truth, you are our king; truly you are the king of Sion." On this they began to sing Hallelujah, and were joined by the whole army and the rest of the king's attendants. Amidst these acclamations the king advanced to the foot of the stair of the church, dismounted, and sat down upon a stone; which, in Mr Bruce's opinion, was plainly an altar of Anubis or the Dog-star. After the king, came a number of priests in proper order. The king was first anointed, then crowned, and accompanied half up the steps by the singing priests. He stopped at a hole made on purpose in one of the steps, where he was fumigated with myrrh, aloes, and cassia; after which divine service was celebrated; and he returned to the camp, where 14 days were spent in feasting and rejoicing.

Ceremonies of this kind are now given over on account of the expense. Our author was informed by Tecla Haimanout, that when he was obliged to retire into Tigre from his enemies, Ras Michael had some thoughts of having him crowned in contempt of his enemies; but by the most moderate calculations that could be made, it would have cost 20,000 ounces of gold, about 8,000 sterling; on which all thoughts of it were laid aside.

The Abyssinians compute time by the solar year. Mode of computing five days and a quarter, and thus they complete the year. The five days are added to the month of August, and to every fourth year they add a sixth day. They begin their year with the 29th or 30th of August, i.e. the kalends of September; the 29th of August being the first of their month Mascaram. The common epoch which the Abyssinians use is from the creation of the world, and the reckoning 5502 years from the creation to the birth of Christ, rejecting the odd eight years of the Greeks, who make this period 538 years. They have also many other epochs, such as from the council of Nice and Ephesus. In their ecclesiastical computations they make use of the golden number and epact. The first use of epacts amongst them was not earlier, according to Scaliger, than the time of Dioclesian; but Mr Bruce observes, that this is contrary to the positive evidence of Abyssinian history, which says expressly, that the epact was invented by Calmetius.
Demetrius of Alexandria. This Demetrius was the 12th patriarch of Alexandria, and elected about the 190th year of Christ, or in the reign of Severus, and consequently long before the time of Dioscorus. The Abyssinians have another mode of computing time, that is peculiar to themselves. They read the whole of the evangelists, in order, every year, in their churches, and when they speak of an event, they write or say, it happened in the days of Matthew; that is, in the first quarter of the year, whilst they were reading the gospel of St Matthew in their churches. They compute the time of the day in a very arbitrary manner. The twilight being very short, is selected for the beginning of their day; this they call Naggé, which comprehends the duration of twilight. Most expresses the moment when the evening twilight begins. Mid-day is called Kator, which signifies culmination. All the other parts of time they describe, in conversation, by pointing at the place of the heavens where the sun was, when the event, which they are describing, happened.

With regard to the manners of the Abyssinians, they are represented by Mr Bruce as barbarously savage. Their continual warfare inures them to blood from their infancy; so that even children would not have the least scruple at killing another, or grown up persons, if they were able. Many shocking instances of hardness of heart are related by our author in Tecla Haimanout himself, though otherwise an accomplished prince. Their cruelty displays itself abundantly in the punishments inflicted upon criminals, one of which is trying alive, as has been already related of Woosheka. Cutting in pieces with a sabre is another; and this is performed, not by executioners, whose employment is reckoned disgraceful as in this country, but by officers and people of quality. So little is this thought of in Gondar, the capital of the empire, that Mr Bruce happening to pass by an officer employed in this work, who had three men to dispatch, the officer called to him to stop till he had killed them all, as he wanted to speak to him upon a matter of consequence. Stoning to death is a capital punishment likewise common in this country; and usually inflicted on Roman Catholics if they happen to be found, or upon other heretics in religion.

Manners of the Abyssinians.

It is not to be supposed that people who regard the lives of one another so little, will show much compassion to the brute creation. In this respect, however, the Abyssinians are cruel and savage beyond all people on the face of the earth. There are many instances of people eating raw fish or flesh, and we call them barbarous that do so; but what name shall we give to those who cut off pieces of flesh from animals while still living, and eat it not only raw but still quivering with life? He informs us, that when at no great distance from Axum, the capital of Tigré, he fell in with three soldiers "driving a cow. They halted at a brook, threw down the beast, and one of them cut a pretty large collar of flesh from its buttock; after which they drove the cow gently on as before." In another place he tells us, that the flesh was taken from the upper part of the buttock; that the skin was flapped over the wound, fastened with a skewer, and a cataplasm of clay put over all. But it may be asked, how could the animal travel after those muscles were cut which are necessary to its motions? In his description of their feasts there is more consistency; for there the animal is tied so that it cannot move; after stripping off the skin, the flesh of the buttocks is cut off in solid square pieces, without bones or much effusion of blood; and the prodigious noise the animal makes is a signal for the company to sit down to table. The flesh is then cut smaller, laid on pieces of bread, powdered with pepper and salt, and eaten. All this time the animal bleeds but little: but when the large arteries are cut and it expires, the flesh becomes tough; and the wretches who have the rest to eat, gnaw it from the bones like dogs!

The truth of Mr Bruce's account of these horrible barbarities, as well as of many other parts of his narrative, has been questioned. Later testimony proves, that the practice of cutting flesh from living animals for eating does exist in the country; but it does not seem to be common; nor does it appear that public feasts are conducted with such circumstances of monstrous cruelty. In a few other particulars, later travellers have qualified Mr Bruce's statements. But they at the same time bear testimony to the accuracy of his description of the country and its inhabitants, and to his knowledge of its history, and thus give additional authority to all that is important in his work.

Under the article Abyssinia, in the Supplement, an account is given of the new information furnished by Mr Salt's two journeys, and of the controversy regarding Bruce's accuracy.

ABYSSINIAN, in Ecclesiastical History, is the name of a sect in the Christian church, established in the empire of Abyssinia. The Abyssinians are a branch of the Copts or Jacobites; with whom they agree in admitting but one nature in Jesus Christ, and rejecting the council of Chalcedon: whence they are also called Eutychians or Monophysites, and stand opposed to the Melchites. They are only distinguished from the Copts, and other sects of Jacobites, by some peculiar national usages. The Abyssinian sect or church is governed by a bishop or metropolitan styled Abuna, sent them by the Coptic patriarch of Alexandria residing at Cairo, who is the only person that ordains priests.

The next dignity is that of Komos, or Hegumenos, who is a kind of arch presbyter. They have canons also, and monks: the former of whom marry; the latter, at their admission, vow celibacy, but with a reservation: these, it is said, make a promise aloud, before their superiors, to keep chastity; but add in a low voice, as you keep it. The emperor has a kind of supremacy in ecclesiastical matters. He alone takes cognizance of all ecclesiastical causes, except some smaller ones reserved to the judges; and confers all benefits, except that of Abuna.

There are two classes of monks among the Abyssinians; those of Debra Libanos, and those of St Eustathius. The

A C A

The latter are grossly ignorant. Their head is the superior of the convent of Mahabur Selassie, in the north-west part of Abyssinia, near Kuara and the Shangalla, towards Senasa and the river Dender. The chief of the former is the Ithugeh, who is ordained in the following manner. Two chief priests hold a white cloth or veil over his head, a third repeats a prayer, and then they lay their hands on his head, and join together in singing psalms. In turbulent times this Ithugeh has more extensive influence than even the Abuna.—

The monks do not live in convents, but in separate houses round their church; and each cultivates for himself a portion of the land which is assigned them as their property. The churches are built on eminences, in the vicinity of running water, for the advantage of purifications and ablutions, according to the Levitical law, and are surrounded with rows of Virginia cedar. They are circular buildings with conical summits and thatched roofs, and encompassed on the outside with pillars of cedar, to which the roof projecting eight feet beyond the wall is fixed, and forms an agreeable walk in the hot or rainy season. The internal partition and arrangement of the church, is that prescribed by the Mosaic law; and many of the ceremonies and observances in their mode of worship, are obviously derived from the ceremonial rites of the Jewish religion.

The Abyssinians have at different times expressed an inclination to be reconciled to the see of Rome; but rather out of interest of state than any other motive. The emperor David, or the queen regent on his behalf, wrote a letter on this head to Pope Clement VII., full of submission, and demanding a patriarchy from Rome to be instructed by: which being compiled with, he publicly abjured the doctrine of Eutychius and Dioscorus in 1626, and allowed the supremacy of the pope. Under the emperor Sultan Seghed all was undone again; the Roman missionaries settled there, had their churches taken from them, and their new converts banished or put to death. The congregation de propaganda have made several attempts to revive the mission, but to little purpose. The doctrines and ritual of this sectary form a strange compound of Judaism, Christianity, and superstition. They practice circumcision, and are said to extend the practice to the females as well as males: They observe both Saturday and Sunday as Sabbaths: they eat no meats prohibited by the law of Moses: women are obliged to the legal purifications; and brothers marry their brothers wives, &c. On the other hand, they celebrate the epiphany with peculiar festivity, in memory of Christ's baptism; when they plunge and sport in ponds and rivers; which has occasioned some to affirm that they were baptized anew every year. Among the saints days is one consecrated to Pilate and his wife; because Pilate washed his hands before he pronounced sentence on Christ, and his wife desired him to have nothing to do with the blood of that just person. They have four lenten: the great one commences ten days earlier than ours, and is observed with much severity, many abstaining therein even from fish, because St. Paul says there is one kind of flesh of men, and another of fishes. They allow of divorce, which is easily granted among them, and by the civil judge; and, nor their civil laws prohibit polygamy itself. They have at least as many miracles and legends of saints as the Roman church; which proved no small embarrassment to the Jesuit missionaries, to whom they produced so many miracles, wrought by their saints, in proof of their religion, and those so well circumstanciated and attested, that the Jesuits were obliged to deny miracles to be any evidence of a true religion; and in proof herof, to allege the same arguments against the Abyssinians which Protestants in Europe allege against Papists. They pray for the dead, and invoke saints and angels; have so great a veneration for the virgin, that they charged the Jesuits with not rendering her honour enough. They venerate images in painting; but abhor all those in relievo, except the cross. They hold that the soul of man is not created; because, say they, God finished all his works on the sixth day. They admit the apocryphal books, and the canons of the apostles, as well as the apostolical constitutions, for genuine. Their liturgy is given by Alvarez, and in English by Pagit; and their calendar by Ludolph.

A C A, A C E, or A C O N, in Ancient Geography, a town of Phoenicia, on the Mediterranean; afterwards called Ptolemais; now Acre. See ACRE.

ACACALOTL, the Brazilian name of a bird called by some corvus aquaticus, or the water raven: properly, the pelicanus carbo, or corvorum. See Ornithology Index.

ACACIA, EGYPTIAN THORN, or BINDING BEAN TREE, in Botany, a species of mimosa, according to Linneus; though other botanists make it a distinct genus. See MIMOSA, Botany Index.

The flowers of a species of the acacia are used by the Chinese in making that yellow which we see bears washing in their silks and stuffs, and appears with so much elegance in their painting on paper. The method is this:

They gather the flowers before they are fully open; these they put in a clean earthen vessel over a gentle heat, and stir them continually about as they do the tea leaves, till they become dryish and of a yellow colour; then to half a pound of the flowers they add three spoonfuls of fair water, and after that a little more, till there is just enough to hold the flowers incorporated together; they boil this for some time, and the juice of the flowers mixing with the water, it becomes thick and yellow; they then take it from the fire, and strain it through a piece of coarse silk. To the liquor they add half an ounce of common alum, and an ounce of calcined oyster shells reduced to a fine powder. All is then well mixed together; and this is the fine lasting yellow they have so long used.

The dyers of large pieces use the flowers and seeds of the acacia for dyeing three different sorts of yellow. They roast the flowers, as before observed; and then mix the seeds with them, which must be gathered for this purpose when full ripe: by different admixture of these, they give the different shades of colour, only for the deepest of all they add a small quantity of Brazil wood.

Mr. Geoffrey attributes the origin of bezoor to the seeds of this plant; which being browsed by certain animals, and vivifying the stomach by their great sourness and astringency, cause a condensation of the juices, till at length they become coated over with a stony matter, which we call BEZOAR.

False
ACACIA [ 108 ]

ACACIA, See ROBINIA, BOTANY INDEX.

Three-thorned ACACIA, or Honey-buckst. See GLE-ACACIA, BOTANY INDEX.

ACACIA, in the Materia Medica, the inspissated juice of the unripe fruit of the Mimosa Nilotica.

The juice is brought to us from Egypt, in roundish masses, wrap up in thin bladders. It is outwardly of a deep brown colour, inclining to black; inwardly of a reddish or yellowish brown; of a firm consistence, but not very dry. It soon softens in the mouth, and discovers a rough, not disagreeable taste, which is followed by a sweetish relish. This inspissated juice entirely dissolves in watery liquors; but is scarce sensibly acted on by rectified spirit.

ACACIA is a mild astringent medicine. The Egyptians give it in spitting of blood, in the quantity of a drachm, dissolved in any convenient liquor; and repeat this dose occasionally: they likewise employ it in collyria for strengthening the eyes, and in gargariums for quinseyes. Among us, it is little otherwise used than as an ingredient in mithridate and theriac, and is rarely met with in the shops. What is usually sold for the Egyptian acacia, is the inspissated juice of unripe sloes; this is harder, heavier, of a darker colour, and somewhat sharper taste, than the true sort. See the next article.

GERMAN ACACIA, the juice of unripe sloes inspissated nearly to dryness over a gentle fire, care being taken to prevent its burning. It is moderately astringent, similar to the Egyptian acacia, for which it has been commonly substituted in the shops. It is given in fluxes, and other disorders where styptic medicines are indicated, from a scruple to a drachm.

ACACIA, among antiquaries, something resembling a roll or bag, seen on medals, as in the hands of several consuls and emperors. Some take it to represent a handkerchief rolled up, where-with they made signals at the games; others a roll of petitions or memorials; and some, a purple bag full of earth, to remind them of their mortality.

ACACIANS, in ecclesiastical history, the name of several sects of heretics; some of which maintained, that the Son was only a similar, not the same, substance with the Father; and others, that he was not only a distinct but a dissimilar substance. Two of these sects had their denominations from Acacius bishop of Cæsarea, who lived in the fourth century, and changed his opinions, so as, at different times, to be head of both. Another was named from Acacius patriarch of Constantinople, who lived in the close of the fifth century.

ACACIUS, surnamed Luscus, because he was blind of one eye, was bishop of Cæsarea in Palestine, and succeeded the famous Eusebius: he had a great share in the banishment of Pope Liberius, and bringing Felix to the see of Rome. He gave name to a sect, and died about the year 365. He wrote the life of Eusebius, which is lost, and several other works.

ACACIUS, Saint, bishop of Amida in Mesopotamia, in 420, was distinguished by his piety and charity. He sold the plate belonging to his church, to redeem seven thousand Persian slaves who were perishing with hunger. He gave each of them some money and sent them home. Versunia their king was so affected with this noble instance of benevolence, that he desired to see the bishop; and this interview procured a peace between that prince and Theodosius I.

There have been several other eminent persons of the same name; particularly, a martyr under the emperor Decius: a patriarch of Antioc, who succeeded Basil in 458, and died in 459: a bishop of Mileturn in the fifth century: a famous rhetorician in the reign of the emperor Julian: and, a patriarch of Constantinople in the fifth century: who was ambitious to draw the whole power and authority of Rome by degrees to Constantinople, for which he was excommunicated by Pope Felix II. He in his turn passed sentence of excommunication against the pope. Still, however, he held his patriarchate till his death in 458.

ACAD, or AChAD, in Ancien Geography, the town in which Nimrod reigned, called Archad by the Seventy; situated in Babylonia, to the eastward of the Tigris.

ACADEMICIAN, or ACADEMIST, a member of an academy. See ACADEMY in the modern sense.

ACADEMICS, or ACADEMISTS, a denomination given to the cultivators of a species of philosophy originally derived from Socrates, and afterwards illustrated and enforced by Plato, who taught in a grove near Athens, consecrated to the memory of Academus, an Athenian hero; from which circumstance this philosophy received the name of Academic. Before the days of Plato, philosophy had in a great measure fallen into contempt. The contradictory systems and hypotheses which had successively been urged upon the world were become so numerous, that, from a view of this inconstancy and uncertainty of human opinions, many were led to conclude, that truth lay beyond the reach of our comprehension. Absolute and universal scepticism was the natural consequence of this conclusion. In order to remedy this abuse of philosophy and of the human faculties, Plato laid hold of the principles of the academical philosophy; and, in his Phædo, reasons in the following manner: "If we are unable to discover truth (says he), it must be owing to two circumstances: either there is no truth in the nature of things; or the mind, from a defect in its powers, is not able to apprehend it. Upon the latter supposition, all the uncertainty and fluctuation in the opinions and judgments of mankind admit of an easy solution: Let us therefore be modest, and ascribe our errors to the real weakness of our own minds, and not to the nature of things themselves. Truth is often difficult of access: in order to come at it, we must proceed with reason and deliberation, carefully examining every step; and, after all our labour, we will frequently find our greatest efforts disappointed, and be obliged to confess our ignorance and weakness."

Labour and caution in their researches, in opposition to rash and hasty decisions, were the distinguishing characteristics of the disciples of the ancient academy. A philosopher, possessed of these principles, will be slow in his progress; but will seldom fall into errors, or have occasion to alter his opinion after it is once formed. Vanity and precipitation are the great sources of scepticism: hurried on by these, instead of attending to the cool and deliberate principles recommended by the academy, several of our modern philosophers have plunged themselves into an absurd and ridiculous kind of scepticism. They pretend to discredit subjects that
Academies are plain, simple, and easily comprehended; but give peremptory and decisive judgments upon things that evidently exceed the limits of our capacity. Of these, Berkeley and Hume are the most considerable. Berkeley denied the existence of every thing, excepting his own ideas. Mr. Hume has gone a step further, and questioned even the existence of ideas; but at the same time has not hesitated to give determined opinions with regard to eternity, providence, and a future state, miraculous interpositions of the Deity, &c. subjects far above the reach of our faculties. In his essay on the academical or sceptical philosophy, he has confounded two very opposite species of philosophy. After the days of Plato, indeed, the principles of the first academy were grossly corrupted by Arcesilas, Carneades, &c. This might lead Mr. Hume into the notion that the academical and sceptical philosophy were synonymous terms. But no principles can be of a more opposite nature than those which were inculcated by the old academy of Socrates and Plato, and the sceptical notions which were propagated by Arcesilas, Carneades, and the other disciples of the succeeding academies.

ACADEMY, in antiquity, a garden, villa, or grove, situated within a mile of Athens, where Plato and his followers held their philosophical conferences. It took its name from one Academus, or Academus, who was the original owner of it, and made it a kind of gymnasium. He lived in the time of Theseus; and, after his death, it retained his name, and was consecrated to his memory. Simon embellished it with fountains, trees, and walks; but Sylla, during the siege of Athens, employed these very trees in making battering engines against the city. Cicero toobad his villa, or place of retirement, near Pozzuoli, which he also named an academy, where he composed his Academical Questions, and his book De Natura Deorum.

ACADEMY, among the moderns, is most commonly used to signify a society of learned men, established for the improvement of any art or science, and generally under the protection of a prince. Ptolemy Soter, for the encouragement and improvement of the liberal arts in his dominions, founded an academy at Alexandria, and provided it with a collection of books, which was the foundation of the Alexandrian library. Theodosius the younger established an academy at Constantinople, and appointed professors of every science, with the view of making it a rival institution to that at Rome; which, with the other literary seminaries, had been destroyed by the Goths about the end of the fourth and the beginning of the fifth centuries.

The first academy we read of was established by Charlemagne, at the instigation of Alcuin. It was composed of the chief wits of the court, the emperor himself being a member. In their academical conferences, every person was to give an account of what ancient authors he had read; and each even assumed the name of some ancient author who pleased him most; or some celebrated person of antiquity. Alcuin, from whose letters we learn those particulars, took that of Flaccus, the surname of Horace: a young lord, named Augilbert, took that of Homer: Adelard, bishop of Corbie, was called Augustine: Riculf, bishop of Mentz, was Dametas; and the king himself, David.

This shows the mistake of some modern writers, who relate, that it was in conformity with the genius of the learned men of those times, who were great admirers of Roman names, that Alcuin took the name of Flaccus Albinus.

Most nations have now their academies; but Italy has the greatest number. Many flourishing academies existed in France before the revolution. Most of them were established by Louis XIV. We have but few in Britain; and those of chiefest note go by a different name, viz. Society.

In giving an account of the principal academies, it seems most proper to arrange them according to their subjects.

I. Medical Academies, as that of the Nature Curiosi in Germany; that founded at Palermo in 1645; another at Venice in 1701, which meets weekly in a hall near the grand hospital; another at Geneva in 1715, in the house of M. le Clerc. The colleges of physicians at London and Edinburgh, are also, by some, ranked in the number of academies.

The Academy of Nature Curiosi, called also the Leopoldine Academy, was founded in 1652 by Jo. Laur. Bauschius, a physician; who, in imitation of the English, published an invitation to all physicians to communicate their extraordinary cases; and, meeting with success, was elected president. Their works were at first published separately; but in 1670 a new scheme was laid for publishing a volume of observations every year. The first volume appeared in 1684, under the title of Ephemerides, and the work has been continued with some interruptions and variations of the title, &c.

In 1687, the emperor Leopold took the society under his protection, granting the members several privileges, particularly that their presidents should be counts palatine of the holy Roman empire. This academy has no fixed residence, or regular assemblies; instead of these, there is a kind of bureau, or office, first established at Breslau, and afterwards removed to Nuremberg, where letters, observations, &c. from correspondents or members are taken in. The academy consists of a president, two adjucnts or secretaries, and colleagues or members without restriction. The colleagues, at their admission, oblige themselves to two things; first, to choose some subject out of the animal, vegetable, or mineral kingdom, for discussion, provided it had not been treated of by any colleague before; the second, to apply themselves to furnish materials for the Annual Ephemerides. Each member to bear a symbol of the academy; viz. a gold ring; whereon, instead of a stone, is a book open, and on the face thereof, an eye; on the other side, the motto of the academy, Nam quam otiosus.

II. Chirurgical Academies; as that instituted some years ago, by public authority, at Paris: the members of which were not only to publish their own and correspondents observations and improvements; but to give an account of all that is published on surgery, and to compose a complete history of the art, by their extracts from all the authors ancient and modern who have written on it. A question in surgery was annually proposed by the academy, and a gold medal of 200 livres value was given to the successful competitor. Academy of Surgery at Vienna, was instituted some years ago by the present emperor, under the direction of
Academia of the celebrated Brambilla. In this there were at first only two professors; and to their charge the instruction of 130 young men was committed, 30 of whom had formerly been surgeons in the army. But of late the number both of the teachers and pupils has been considerably increased. Gabrielli has been appointed to teach pathology and practice; Bonaccinghi, anatomy, physiology, and surgery; Pisci, medical and phthisical surgery; Hunzowski, surgical operations, midwifery, and the chirurgia forensis; and Pieri, chemistry and botany. To these also has been added, Beindel as prosector and extraordinary professor of anatomy and surgery. Besides this, the emporor, with his usual liberality, has provided a large and splendid edifice in Vienna, which affords habitations both for the teachers, the students, pregnant women, patients for clinical lectures, and servants. He has also purchased for the use of this academy a medical library, which is open every day; a complete set of surgical instruments; an apparatus for experiments in natural philosophy; a collection of natural history; a number of anatomical and pathological preparations; a collection of preparations in wax brought from Florence; and a variety of other useful articles. Adjoining to the building also there is a good botanical garden.

Among other parts of this institution, three prize medals, each of the value of 40 florins, are to be annually bestowed on those students who return the best answer to questions proposed the year before. These prizes are not entirely founded by the emperor, but are in part owing to the liberality of Brendelli, the protocbirurgus at Vienna.

III. Ecclesiastical Academies: as that at Bologna in Italy, instituted in 1687, employed in the examination of the doctrine, discipline, and history, of each age of the church.

IV. Cosmographical Academies: as that at Venice, called the Argonauti. This was instituted at the solicitation of F. Coronelli, for the improvement of geographical knowledge. Its design was to publish exact maps, both celestial and terrestrial, as well particular as general, together with geographical, historical, and astronomical descriptions. Each member, in order to defray the expense of such a publication, was to subscribe a proportional sum, for which they were to receive one or more copies of each piece published. For this end three societies are settled; one under F. Moro, provincial of the Minorites in Hungary; another under the Abbe Laurence an Ruy Bayanne au Marais; the third under F. Baldigiani, Jesus professor of mathematics in the Roman college. The devices of this academy is the terrestrial globe, with the maps of the world; and at its expense all the globes, maps, and geographical writings of F. Coronelli have been published.

V. Academies of Sciences:—These comprehend such as are erected for improving natural and mathematical knowledge. They are otherwise called Philosophical and Physical academies.

The first of these was instituted at Naples, about the year 1560, in the house of Baptista Perti. It was called the Academy Secretorum Naturaet; and was succeeded by the Academy of Lyncei, founded at Rome by Prince Frederic Cesi, towards the end of that century. Several of the members of this academy rendered it famous by their discoveries; among these was the celebrated Galileo. Several other academies were instituted about that time, which contributed greatly to the advancement of the sciences; but none of them comparable to that of the Lyncei.

Some years after the death of Torricelli, the Academy del Cimento made its appearance, under the protection of Prince Leopold, afterwards Cardinal de Medici. Redi was one of its chief members: and the studies pursued by the rest may be collected from those curious experiments published in 1667, by their secretary Count Lawrence Maglotti, under the title of Saggi di Naturali Esperienze; a copy of which was presented to the Royal Society, translated into English by Mr Waller, and published at London in 1670.

The Academy degli Inquiriti, afterwards incorporated into that of Della Tracia in the same city, followed the example of that of Del Cimento. Some excellent discourses on physical and mathematical subjects, by Geminiano Montanari, one of the chief members, were published in 1667, under the title of Pensieri Fisico-Matematici.

The Academy of Rossano, in the kingdom of Naples, was originally an academy of belles lettres, founded in 1540, and transformed into an academy of sciences in 1693, at the solicitation of the learned abbot Don Giacinto Gimma; who being made president, under the title of Promotor General thereof, gave them a new set of regulations. He divided the academicians into the following classes: Grammarians, Rhetoricians, Poets, Historians, Philosophers, Physicians, Mathematicians, Lawyers, and Divines, with a class apart for cardinals and persons of quality. To be admitted a member, a man must have some degree in the faculty. The members are not allowed to take the title of Academiists in the beginning of their books, without a written permission from their president, which is not granted till the work has been examined by the censors of the academy; and the permission is the greatest honour the academy can confer, as they thereby adopt the work, and are answerable for it against all criticisms that may be made upon it. To this law the president or promoter himself is subject; and no academist is allowed to publish any thing against the writings of another without leave from the society.

Several other academies of Sciences have been founded in Italy; but, for want of being supported by princes, did not continue long. The loss of them, however, was abundantly repaired by the institution of others still subsisting; such as, the Academy of Filomorosi at Verona; of Ricciopi at Padua, where a learned discourse on the origin of springs was delivered by Sig. Vallisneri, first professor of physic in the university of that city, and which was afterwards printed. To the Academy of the Muti de Reggio, at Modena, the same Sig. Vallisneri presented an excellent discourse on the scale of created beings, since inserted in his history of the generation of man and animals, printed at Venice in the year 1721.

F. Marsenne is said to have given the first idea of a philosophical academy in France, towards the beginning of the 17th century, by the conferences of naturalists and mathematicians occasionally held at his lodgings; at which Gassendi, Des Cartes, Hobbes, Roberval, Pascal, Blondel, and others assisted. F. Merse
Academies were proposed to each certain problems to examine, or certain experiments to be made. Those private assemblies were succeeded by more public ones, formed by Mr Montmort, and Mr Thevenot the celebrated traveller. The French example animated several Englishmen of distinction and learning to erect a kind of philosophical academy at Oxford, towards the close of Oliver Cromwell's administration; which, after the Restoration, was erected into a Royal Society. See Society. The English example, in its turn, animated the French. Louis XIV. in 1666, assisted by the counsels of M. Colbert, founded an academy of sciences at Paris, with a sufficient revenue to defray the charge of experiments, and salaries to the members.

Royal Society of Sciences. After the peace of the Pyrenees, Louis XIV. being desirous of establishing the arts, sciences, and literature, upon a solid foundation, directed M. Colbert to form a society of men of known abilities and experience in the different branches, who should meet together under the king's protection, and communicate their respective discoveries. Accordingly M. Colbert, having conferred with those who were at that time most celebrated for their learning, resolved to form a society of such persons as were conversant in natural philosophy and mathematics, to join to them other persons skilled in history and other branches of erudition, along with those who were entirely engaged in what are called the Belles Lettres, grammar, eloquence, and poetry. The geometricians and natural philosophers were ordered to meet on Tuesdays and Saturdays, in a great hall of the king's library, where the books of mathematics and natural philosophy were contained; the learned in history to assemble on Mondays and Thursdays, in the hall where the books of history were contained; and the class of belles lettres to assemble on Wednesdays and Fridays. All the different classes were likewise ordered to meet together upon the first Thursday of every month; and, by their respective secretaries, make a report of the proceedings of the foregoing month.

In a short time, however, the classes of history, belles lettres, &c. were united to the French Academy, which was originally instituted for the improvement and refining the French language: so that the Royal Academy contained only two classes, viz. that of natural philosophy and mathematics.

In the 1696, the king, by proclamation dated the 26th of January, gave this academy a new form, and put it upon a more respectable footing. It was now to be composed of four kinds of members, viz. honorary, pensionary, associates and electors. These last were a kind of pupils, or scholars, one of whom was attached to each of the pensionaries. The first class to contain ten persons, and of the rest twenty. The honorary academicians were to be inhabitants of France; the pensionaries all to reside at Paris; and the associates allowed to be foreigners; and the electors all to live at Paris. The officers to be, a president named by the king, out of the class of honorary academicians; and a secretary and treasurer to be perpetual. Of the pensionaries, three to be geometricians, three astronomers, three mechanics, three anatomists, three chemists, three botanists, and the remaining two to be secretary and treasurer. Of the twelve associates, two to apply themselves to geometry, two to botany, and two to chemistry. The electives to apply themselves to the same kind of science with the pensionaries they were attached to; and not to speak, except when called by the president. No regular or religious to be admitted, except into the class of honorary academicians; nor any person to be admitted either for associate or pensionary, unless known by some considerable printed work, some machine, or other discovery. The assemblies were held on Wednesdays and Saturdays, unless either of them happened to be a holiday, and then the assembly was held on the preceding day. To encourage the members to pursue their labours, the king engaged not only to pay the ordinary pensions, but even to give extraordinary gratifications according to the merit of their respective performances; furnishing withal the expense of the experiments and other inquiries necessary to be made. If any member gave in a bill of charges of experiments he had made, or desired the printing of any book, and brought in the charges of graving, the money was immediately paid by the king, upon the president's allowing and signing the bill. So if an anatomist required live tortoises, for instance, for making experiments about the heart, &c. as many as he pleased were brought him at the king's charge.

Their motto was Invenit et perfectit.

In the year 1716, the duke of Orleans, than regent, made an alteration in their constitution; augmenting the number of honoraries, and of associates capable of being foreigners, to 12; admitting regulars among such associates; and suppressing the class of electives, as it appeared to be attended with some inconveniences, particularly that of making too great an inequality among the academicians, and being productive of some misunderstandings and animosities among the members.

At the same time he created other two classes; one consisting of 12 adjuncts, who, as well as the associates, were allowed a deliberative voice in matters relative to science; and the other six free associates, who were not attached to any particular science, nor obliged to pursue any particular work.

Since its re-establishment in 1669, this academy has been very exact in publishing, every year, a volume containing either the works of its own members, or such memoirs as have been composed and read to the academy during the course of that year. To each volume is prefixed the history of the academy, or an extract of the memoirs, and, in general, of whatever has been read or said in the academy; at the end of the history, are the eulogiums upon such academicians as have died that year. M. Rouille de Meslay, counsellor to the parliament of Paris, founded two prizes, one of 2500, and the other of 2000 livres, which were alternately distributed by the parliament every year: the subject for the first must relate to physical astronomy, and those for the latter to navigation and commerce.

Notwithstanding the advantages which the members of this academy enjoyed over others, in having their expenses defrayed, and even being paid for their time and attendance, they had fallen under some imputations, particularly that of plagiarism, or borrowing their neighbours inventions; but with what justice we do not say. This academy was suppressed and abolished by the convention in 1793; and other institutions have been established. See Institute.

The French had also considerable academies in most of
of their great cities: as, at Montpelier a royal academy of sciences on the like footing as that of Paris, being as it were a counterpart thereof; at Toulouse, an academy under the denomination of Lunatists; others at Niemes, Arles, Lyons, Dijon, Bourdeaux, &c.

The Royal Academy of Sciences at Berlin was founded in 1700, by Frederic II. king of Prussia, on the model of that of England; excepting that, besides natural knowledge, it likewise comprehends the belles lettres. In 1710, it was ordained that the president shall be one of the counsellors of state, and nominated by the king. The members were divided into four classes: the first for prosecuting physics, medicine, and chemistry; the second for mathematics, astronomy, and mechanics; the third for the German language and the history of the country; the fourth for oriental learning, particularly as it may concern the propagation of the Gospel among infidels. Each class to elect a director for themselves, who shall hold his post for life. The members of any of the classes have free admission into the assemblies of any of the rest.

The great promoter of this institution was the celebrated Mr Leibnitz, who accordingly was made the first director. The first volume of their transactions was published in 1710, under the title of Miscellanea Berolinensis; and though they received but few marks of the royal favour for some time, they continued to publish new volumes in 1723, 1727, 1734, and 1740. At last, however, Frederic III. the late king of Prussia, gave new vigour to this academy, by inviting to Berlin such foreigners as were most distinguished for their merit in literature, and encouraged the subjects to prosecute the study and cultivation of the sciences by giving ample rewards; and thinking that the academy, which till that time had had no minister or opulent nobleman for its president, would find an advantage in having a man of letters at its head, he conferred that honour on M. Maupertuis. At the same time he gave a new regulation to the academy, and took upon himself the title of its protector.

The academists hold two public assemblies annually; one in January, on the late king's birth day; and the other in May, on the day of his accession to the throne. At the latter of these is given, as a prize, a gold medal of 50 ducats value: the subject for this prize is successively natural philosophy, mathematics, metaphysics, and erudition.

The Imperial Academy of Sciences at Petersburgh was projected by Czar Peter the Great. That great monarch having, during his travels, observed the advantage of public societies for the encouragement and promotion of literature, formed the design of founding an academy of sciences at St Petersburgh. By the advice of Wolf and Leibnitz, whom he consulted on this occasion, the society was regulated, and several learned foreigners were invited to become members. Peter himself drew the plan, and signed it on the 10th of February 1724; but was prevented, by the suddenness of his death, from carrying it into execution. His deace, however, did not prevent its completion: for on the 21st of December 1725, Catharine I. established it according to Peter's plan; and on the 27th of the same month the society was first assembled. On the 1st of August 1726, Catharine honoured the meeting with her presence, when Professor Bullinger, a German naturalist of great eminence, pronounced an oration upon the advances made by the loadstone and needle for the discovery of the longitude.

The empress settled a fund of 4982l. per annum for the support of the academy; and fifteen members all eminent for their learning and talents, were admitted and pensioned, under the title of Professors in the various branches of literature and science. The most distinguished of these professors were Nicholas and Daniel Bernoulli, the two De Lisles, Bullinger, and Wolf.

During the short reign of Peter II. the salaries of the members were discontinued, and the academy was utterly neglected by the court; but it was again patronized by the empress Anne, who even added a seminary for the education of youth, under the superintendence of the professors. Both institutions flourished for some time under the direction of Baron Korf; but upon his death, towards the latter end of Anne's reign, an ignorant person being appointed president, many of the most able members quitted Russia. At the accession of Elizabeth, new life and vigour were again restored to the academy: the original plan was enlarged and improved; some of the most learned foreigners were again drawn to Petersburgh; and, what was considered as a good omen for the literature of Russia, two natives, Lomonosoff and Romovski, men of genius and abilities, who had prosecuted their studies in foreign universities, were enrolled among its members. The annual income was increased to 10,650l. and soon afterwards the new institution took place.

The late empress Catharine II. with her usual zeal for promoting the diffusion of knowledge, took this useful society under her more immediate protection. She altered the court of directors greatly to the advantage of the whole body; corrected many of its abuses, and infused a new vigour and spirit into their researches. By her majesty's particular recommendation the most ingenious foreigners visited the various provinces of her vast dominions; and as the fund of the academy was not sufficient to supply the whole expense of these several expeditions, the empress bestowed a largess of 2000l. which she renewed as occasion required.

The purpose and intent of these travels will appear from the instructions given by the academy to several persons who were engaged in them. They were ordered to pursue their inquiries upon the different sorts of earths and waters; upon the best methods of cultivating the barren and desert spots; upon the local disorders incident to animals, and the most efficacious means of relieving them; upon the breeding of cattle, and particularly of sheep; on the rearing of bees and silk worms; on the different places and objects for fishing and hunting; on minerals; on the arts and trades, and on forming a Flora Russica, or collection of indigenous plants; they were particularly instructed to rectify the longitude and latitude of the principal towns; to make astronomical, geographical, and meteorological observations; to trace the course of the rivers; to take the most exact charts; and to be very distinct and accurate in remarking and describing the manners and customs of the different people, their dresses, languages, antiquities, traditions, history, religion;
and, in a word, to gain every information which might tend to illustrate the real state of the whole Russian empire.

In consequence of these expeditions, perhaps no country can boast, within the space of so few years, such a number of excellent publications on its internal state, on its natural productions, on its topography, geography, and history, on the manners, customs, and languages of the different people, as have issued from the press of this academy.

The first transactions of this society were published in 1728, and entitled Commentarii Academiae Scientiarum Imperialis Petropolitanae ad ann. 1726, with a dedication to Peter II. The publication was continued under this form until the year 1747, when its transactions were called Novi Commentarii Academici, &c. In 1777 the academy again changed the title into Acta Academiae Scientiarum Imperialis Petropolitanae, and likewise made some alteration in the arrangement and plan of the work. The papers, which had been hitherto published in the Latin tongue, are now written either in that language or French; and a preface is added, styled Partie Historique, which contains an account of its proceedings, meetings, admission of new members, and other remarkable occurrences.

Of the Commentaries, 14 volumes were published: the first of the New Commentaries made its appearance in 1750, and the twentieth in 1776. Under the new title of Acta Academica, several volumes have been given to the public, and two are printed every year. These transactions abound with ingenious and elaborate disquisitions upon various parts of science and natural history, and which reflect the greatest honour upon their authors; and it may not be an exaggeration to assert, that no society in Europe has more distinguished itself for the excellence of its publications, and particularly in the more abstruse parts of the pure and mixed mathematics.

The academy is still composed, as at first, of fifteen professors, besides the president and director. Each of these professors has a house and an annual stipend from 200l. to 600l. Beside the professors, there are four adjutants, who are pensioned, and who are present at the sittings of the society, and succeed to the first vacancies. The direction of the academy is at present consigned to the princess Dashkof.

The building and apparatus of this academy are extraordinary. There is a fine library, consisting of 36,000 curious books and manuscripts. There is an extensive museum, in which the various branches of natural history, &c. are distributed in different apartments: it is extremely rich in native productions, having been considerably augmented with a variety of specimens collected by Pallas, Gmelin, Guldenstaedt, and other learned professors, during their late expeditions through the Russian empire. The stuffed animals and birds occupy one apartment. The chamber of rarities, the cabinet of coins, &c. contain innumerable articles of the highest curiosity and value. The society has this modest motto, Paulatim.

The Academy of Sciences at Bologna, called the Institute of Bologna, was founded by Count Marsiglio in 1712, for the cultivating of physics, mathematics, medicine, chemistry, and natural history. Its history is written by M. de Limiers, from memoirs furnished by the founder himself.

The Academy of Sciences at Stockholm, or Royal Swedish Academy, owes its institution to six persons of distinguished learning, amongst whom was the celebrated Linnaeus: they originally met on the 2d of June 1739; formed a private society, in which some dissertations were read; and in the latter end of the same year their first publication made its appearance. As the meetings continued and the members increased, the society attracted the notice of the king, and was, on the 31st of March 1741, incorporated under the name of the Royal Swedish Academy. Not receiving any pension from the crown, it is only under the protection of the king, being directed, like our Royal Society, by its own members. It has now a large fund, which has chiefly arisen from legacies and other donations; but a professor of experimental philosophy, and two secretaries, are still the only persons who receive any salaries. Each of the members resident at Stockholm becomes president by rotation, and continues in office during three months. There are two species of members, native and foreign: the election of the former is held in April, and of the latter in July: no money is paid at the time of admission. The dissertations read at each meeting are collected and published four times in the year; they are written in the Swedish language, and printed in octavo; and the annual publications make a volume. The first 40 volumes, which were finished in 1779, are called the Old Transactions; for in the following year the title was changed into that of New Transactions. The king is sometimes present at the ordinary meetings, and particularly at the annual assembly in April for the election of members. Any person who sends a treatise which is thought worthy of being printed, receives the Transactions for that quarter gratis, and a silver medal, which is not esteemed for its value, being worth only three shillings, but for its rarity and the honour conveyed by it. All the papers relating to agriculture are published separately under the title of Oeconomica Acta. Annual premiums, in money and gold medals, principally for the encouragement of agriculture and inland trade, are also distributed by the academy. The fund for these prizes is supplied from private donations.

The Royal Academy of Sciences at Copenhagen owes its institution to the zeal of six literati, whom Christian VI. in 1742, ordered to arrange his cabinet of medals. The count of Holstein was the first president; and the six persons who first formed the design, were John Gram, Joachim Frederic Rasmus, Christian Louis Scheid, Mark Woldickey, Eric Pontopidan, and Bernard Moelmann. These persons occasionally meeting for that purpose, extended their designs; associated with them others who were eminent in several branches of science; and forming a kind of literary society, employed themselves in searching into and explaining the history and antiquities of their country. The count of Holstein warmly patronised this society, and recommended it so strongly to Christian VI. that, in 1743, his Danish majesty took it under his protection, called it the Royal Academy of Sciences, endowed it with a fund, and ordered the members to join to their former pursuits, natural history, physics, and mathe-
Academies. In consequence of the royal favor, the members engaged with fresh zeal in their pursuits; and the academy has published 15 volumes in the Danish language, some of which have been translated into Latin.

The American Academy of Sciences was established in 1782, by the council and house of representatives in the province of Massachusetts's Bay, for promoting the knowledge of the antiquities of America, and of the natural history of the country; for determining the uses to which its various natural productions might be applied; for encouraging medicinal discoveries, mathematical disquisitions, philosophical inquiries and experiments, astronomical, meteorological, and geographical observations, and improvements in agriculture, manufactures, and commerce; and, in short, for cultivating every art and science which may tend to advance the interest, honour, dignity, and happiness of a free, independent, and virtuous people. The members of this academy are never to be more than 200, nor less than 40.

Royal Irish Academy arose out of a society established at Dublin, about the year 1782, and consisting of a number of gentlemen, most of whom belonged to the university. They held weekly meetings, and alternately read essays on various subjects. The members of this society afterwards formed a more extensive plan, and admitting only such names as might add dignity to their new institution, became the founders of the Royal Irish Academy, which professes to unite the advancement of science with the history of mankind and polite literature. The first volume of their transactions for 1787 appeared in 1788, and seven volumes have been since published. A society was formed in Dublin, similar to the Royal Society in London, as early as the year 1683; but the distracted state of the country was unpropitious to the cultivation of philosophy and literature. The plan was resumed about the beginning of the present century, and the earl of Pembroke, then lord lieutenant, was president of a philosophical society established in Dublin college. In the year 1740, there was instituted a Physico-historical Society; of which two volumes of minutes are extant:

VI. Academies or Schools of Arts; as that at Petersburg, which was established by the empress Elizabeth, at the suggestion of Count Shuvalof, and annexed to the Academy of Sciences: the fund was 4000l. per annum, and the foundation for 40 scholars. The late empress formed it into a separate institution, enlarged the annual revenue to 12,000l. and augmented the number of scholars to 300; she also constructed, for the use and accommodation of the members, a large circular building, which fronts the Neva. The scholars are admitted at the age of six, and continue until they have attained the age of 18; they are clothed, fed, and lodged, at the expense of the crown. They are all instructed in reading and writing, arithmetic, the French and German languages, and drawing. At the age of 14 they are at liberty to choose any of the following arts, divided into four classes: 1. Painting in all its branches, of history, portraits, battles, and landscapes; architecture; mosaic; enamelling, &c. 2. Engraving on copperplates, seal-cutting, &c. 3. Carving on wood, ivory, and amber. 4. Watch-making, turning, instrument-making, casting statues in bronze and other metals, imitating gems and medals in paste and other compositions, gilding, and varnishing. Prizes are annually distributed to those who excel in any particular art; and from those who have obtained four prizes, twelve are selected, who are sent abroad at the charge of the empress. A certain sum is paid to defray their travelling expenses; and when they are settled in any town, they receive an annual salary of 6cl. which is continued during four years. There is a small assortment of paintings for the use of the scholars; and those who have made great progress are permitted to copy the pictures in the empress's collection. For the purpose of design, there are models in plaster of the best antique statues in Italy, all done at Rome, of the same size with the originals, which the artists of the academy were employed to cast in bronze.

The Royal Academy of Arts in London, was instituted for the encouragement of Designing, Painting, Sculpture, &c. &c. in the year 1768. This academy is under the immediate patronage of the king, and under the direction of 40 artists of the first rank in their several professions. It furnishes, in winter, living models of different characters to draw after; and in summer, models of the same kind to paint after. Nine of the ablest academicians are annually elected out of the 40, whose business is to attend by rotation, to set the figures, to examine the performance of the students, and to give them necessary instructions. There are likewise four professors, of Painting, of Architecture, of Anatomy, and of Perspective, who annually read public lectures on the subjects of their several departments; besides a president, a council, and other officers. The admission to this academy is free to all students properly qualified to reap advantage from the studies cultivated in it; and there is an annual exhibition of paintings, sculptures, and designs, open to all artists of distinguished merit.

The Academy of Painting and Sculpture at Paris. This took its rise from the disputes that happened between the master painters and sculptors in that capital; in consequence of which, M. le Brun, Sarazin, Corneille, and others of the king's painters, formed a design of instituting a particular academy; and, having presented a petition to the king, obtained an arrêt dated January 20, 1648. In the beginning of 1655, they obtained from Cardinal Mazarin a brevet, and letters patent, which were registered in parliament; in gratitude for which favour, they chose the cardinal for their protector, and the chancellor for their vice protector. In 1663, by means of M. Colbert, they obtained a pension of 4000 livres. The academy consisted of a protector; a vice protector; a director; a chanceller; four rectors; adjuncts to the rectors; a treasurer; four professors, one of which was professor of anatomy, and another of geometry; several adjuncts and counsellors, a historiographer, a secretary, and two subsecretaries.

The Academy of Painting held a public assembly every day for two hours in the afternoon, to which the painters resorted either to design or to paint, and where the sculptors modelled after a naked person. There were 12 professors, each of whom kept the school for a month; and there were 12 adjuncts to supply them in case of need. The professor upon duty placed the naked man as
VII. Academies of Law; as that famous one at Bologna.
VIII. Academies of History; as the Royal Academy of Portuguese History at Lisbon. This academy was instituted by King John V. in 1720. It consists of a director, four censors, a secretary, and 50 members; to each of whom is assigned some part of the ecclesiastical or civil history of the nation, which he is to treat either in Latin or Portuguese. In the church-history of each diocese, the prelates, synods, councils, churches, monasteries, academies, persons illustrious for sanctity or learning, places famous for miracles or relics, must be distinctly related in twelve chapters. The civil history comprises the transactions of the kingdom from the government of the Romans down to the present time. The members who reside in the country are obliged to make collections and extracts out of all the registers, &c. where they live. Their meetings to be once in fifteen days.

A medal was struck by this academy in honour of their prince: the front of which was his efigy, with the inscription Johannes V. Lustianorum Rex; and, on the reverse, the same prince is represented standing, and raising History almost prostrate before him, with the legend, Historia Resurgete. Underneath are the following words in abbreviature: REGIA ACAD. HISORIA LUSITAN. INSTITUTA VI. IDUS Decembris MDCCXX.

Academy of Swabian History at Tubingen was lately established by some learned men, for publishing the best historical writings, the lives of the chief historians, and compiling new memoirs on the several points and periods thereof.

IX. Academies of Antiquities; as that at Cortona in Italy, and at Upsal in Sweden. The first is designed for the study of Hetrurian antiquities; the other for illustrating the northern languages, and the antiquities of Sweden, in which notable discoveries have been made by it. The head of the Hetrurian academy is called Lucemon, by which the ancient governors of the country were distinguished. One of their laws is to give audience to poets only one day in the year; another is to fix their sessions, and impose a tax of a dissertation on each member in his turn.

The Academy of Medals and Inscriptions at Paris was set on foot by M. Colbert, under the patronage of Louis XIV, in 1663, for the study and explanation of ancient monuments, and perpetuating great and memorable events, especially those of the French monarchy, by coins, relieves, inscriptions, &c. The number of members at first was confined to four or five, chosen out of those of the French academy; who met in the library of M. Colbert, from whom they received his majesty's orders. The days of their meetings were not determined; but generally they met on Wednesdays, especially in the winter season; but, in 1691, the king having given the inspection of this academy to M. de Pontchartrain comptroller general, &c. he fixed their meetings on Tuesdays and Saturdays.

By a new regulation, dated the 16th of July 1701 the academy was composed of ten honorary members; ten associates; each of whom had two declarative voices, ten pensionaries; and ten eleves, or pupils. They then...
Academies met every Tuesday and Wednesday, in one of the halls of the Louvre; and had two public meetings yearly, one the day after Martinmas, and the other the 16th after Easter. The class of eleven was suppressed, and united to the associates. The king nominated their president and vice-president yearly; but their secretary and treasurer were perpetual. The rest were chosen by the members themselves, agreeably to the constitutions on that behalf given them.

One of the first undertakings of this academy was to compose, by means of medals, a connected history of the principal events of Louis XIV’s reign; but in this design they met with great difficulties, and of consequence it was interrupted for many years; but at length it was completed down to the advancement of the duke of Anjou to the crown of Spain.

In this celebrated work, the establishment of the academy itself was not forgotten. The medal on this subject represents Mercury sitting, and writing with an antique stylus on a table of brass; he leans with his left hand on an urn full of medals, and at his feet are several others placed upon cards; the legend, Re- turn to septem fides; and on the exergue, Academis regia inscriptionem et numismatum, instituita MDC.LXIII. signifying that the Royal Academy of Medals and Inscriptions, founded in 1663, ought to give to future ages a faithful testimony of all great actions. Besides this work, we have several volumes of their memoirs; and their history written and continued by their secretaries.

X. Academies of Belles Lettres, are those wherein eloquence and poetry are chiefly cultivated. These are very numerous in Italy, and were not uncommon in France.

The Academy of Umidii at Florence has contributed greatly to the progress of the sciences, by the excellent Italian translations given, by some of its members, of the ancient Greek and Latin historians. Their chief attention is to the Italian poetry, at the same time that they have applied themselves to the polishing of their language, which produced the Academy della Crusca.

The Academy of Humorists, Umoristi, had its origin at Rome from the marriage of Lorenzo Marcini, a Roman gentleman, at which several persons of rank were guests; and, being carnival time, to give the ladies some diversion, they took themselves to the reciting of verses, sonnets, speeches, first extempore, and afterwards premeditated; which gave them the denomination of Belli Humori. After some experience, coming more and more into the taste of these exercises, they resolved to form an academy of belles lettres; and changed the title of Belli Humori for that of Humoristi: choosing for their device a cloud, which, after being formed of exhalations from the salt waters of the ocean, returns in a gentle sweet shower; with this motto from Lucretius, Redit aegmine duci.

In 1650, the Academy of Arcadi was established at Rome for reviving the study of poetry and of the belles lettres. Besides most of the politer wits of both sexes in Italy, this academy comprehends many princes, cardinals, and other ecclesiastics; and, to avoid disputes about pre-eminence, all appear masked after the manner of Arcadian shepherds. Within ten years from its first establishment, the number of Academists amounted to six hundred. They hold assemblies seven times a year, in a mead or grove, or in the gardens of some noblemen of distinction. Six of these meetings are employed in the recitation of poems and verses of the Arcadi residing at Rome; who read their own compositions; except ladies and cardinals, who are allowed to employ others. The seventh meeting is set apart for the compositions of foreign or absent members.

This academy is governed by a custos, who represents the whole society, and is chosen every four years, with a power of electing 12 others yearly for his assistance. Under these are two sub-custodes, one vicar or pro-custos, and four deputies or superintendents, annually chosen. The laws of the society are immutable, and bear a near resemblance to the ancient model.

There are five modes of electing members. The first is by acclamation. This is used when sovereign princes, cardinals, and ambassadors of kings, desire to be admitted; and the votes are then given vis vis. The second is called representation; this was introduced in favour of ladies and academical colonies, where the votes are taken privately. The third, surrogation; whereby new members are substituted in the room of those dead or expelled. The last, destination; whereby, when there is no vacancy of members, persons of poetical merit have the title of Arcadi conferred upon them till such time as a vacancy shall happen. All the members of this body, at their admission, assume new pastoral names, in imitation of the shepherds of Arcadia. The academy has several colonies of Arcadi in different cities of Italy, who are all regulated after the same manner.

XI. Academies of Languages; called by some, Grammatical Academies: as, The Academy della Crusca at Florence, famous for its vocabulary of the Italian tongue, was formed in 1582, but scarce heard of before the year 1584, when it became noted for a dispute between Tasso and several of its members. Many authors confound this with the Florentine academy. The discourses which Torricelli, the celebrated disciple of Galileo, delivered in the assemblies, concerning levity, the wind, the power of percussion, mathematics, and military architecture, are a proof that these academies applied themselves to things as well as words.

The Academy of Fructiferi had its rise in 1617 at an assembly of several princes and nobility of the country, who met with a design to refine and perfect the German tongue. It flourished long under the direction of princes of the empire, who were always chosen presidents. In 1668, the number of members rose to upwards of 900. It was prior in time to the French academy, which only appeared in 1629, and was not established into an academy before the year 1635. Its history is written in the German tongue by George Neumarch.

The French Academy, which had its rise from a meeting of men of letters in the house of M. Conrat, in 1629. In 1635, it was erected into an academy, by Cardinal Richelieu,
Richelieu, for refining and ascertaining the French language and style. The number of its members was limited to 40; out of whom a director, chancellor, and secretary, were to be chosen: the two former held their posts for two months, the latter was perpetual. The members of this academy enjoyed several privileges and immunities, among which was that of not being obliged to answer before any court but that of the king’s household. They met three times a week in the Louvre; at breaking up, 40 silver medals were distributed among them, having on one side the king of France’s head, and on the reverse, Protecteur de l’Académie, with laurel, and this motto, A l’Immortalité. By this distribution, the attendance of the Academists was secured: those who were present received the surplus otherwise intended for the absent. To elect or expel a member, at least 18 were required; nor could any be chosen unless he petitioned for it: by this expedient, the affront of refusal from a member suspected was avoided. Religious were not admitted: nor could any nobleman, or person of distinction, be admitted on another footing than as a man of letters. None were to be expelled, except for base and dishonest practices; and there were but two instances of such expulsions, the first of M. Granier for refusing to return a deposit, the other of the Abbé Foretiere for plagiarism. The design of this academy was to give not only rules, but examples, of good writing. They began with making speeches on subjects taken at pleasure, about 20 of which were printed. They met with great opposition from the parliament at their first institution; it being two years before the patents granted by the king could be registered. They have been severely satirized, and their style has been ridiculed as enervating instead of refining the French language. They are also charged with having surfeited the world by flattery, and having exhausted all the topics of panegyric in praise of their founder; it being a duty incumbent on every member, as his admission was made a speech in praise of the king, the cardinal, the chancellor Seguier, and the person in whose place he is elected. The most remarkable work of this academy is a dictionary of the French tongue; which, after 50 years spent in settling the words and phrases to be used in writing, was last published in 1694.

The foundation of an academy similar to the above has been proposed at Petersburgh by the learned Princess Dashkof: it is to consist of 60 members. The plan was approved by the late empress, who gave a fund for its support and establishment.

The Royal Spanish Academy at Madrid held its first meeting in July 1713, in the palace of its founder, the Duke d’Escalona. It consisted at first of eight academists, including the duke; to which number 14 others were afterwards added, the founder being chosen president or director. In 1714, the king granted them his confirmation and protection. Their device is a crucible in the midst of the fire, with this motto, Limpia, Faga, y de Espéndor; “It purifies, fixes, and gives brightness.” The number of members is limited to 24; the duke d’Escalona to be director for life, but his successors chosen yearly, and the secretary to be perpetual. Their object, as marked out by the royal declaration, was to cultivate and improve the national language: they were to begin with choosing carefully such words and phrases as have been used by the best Spanish writers; noting the low, barbarous, or obsolete ones; and composing a dictionary wherein these may be distinguished from the former.

XII. Academies of Politics; as that at Paris, which consisted of six persons, who met at the Louvre, in the chamber where the papers relating to foreign affairs were lodged. This academy proved of little service, as the kings of France were unwilling to trust any but their ministers with the inspection of foreign affairs. For a further account of similar establishments, see the article Society in this work, and the article Academy in the Supplement.

Academy is also a term for schools and other seminaries of learning among the Jews, where their rabbins and doctors instructed their youth in the Hebrew language, and explained to them the Talmud and the secrets of the Cabala. Those of Tiberias and Babylon have been the most noted.

The Romans had a kind of military academies, established in all the cities of Italy, under the name of Campi Martis. Here the youth were admitted to be trained for war at the public expense. The Greeks, beside academies of this kind, had military professors called Tactici, who taught all the higher offices of war, &c. &c.

Academy is often used with us to denote a kind of collegiate seminary, where youth are instructed in arts and sciences. There is one at Portsmouth for teaching navigation, drawing, &c. which was founded by George L in 1722; another at Woolwich, for fortification, gunnery, &c. established by George II. in 1741.—An account of these two institutions, and of the Royal Military College at Marlow, will be found under the article Academy, in the Supplement.

The nonconformist ministers, &c. are bred up in private academies; as not approving the common university education. There are several academies of this description in different parts of England.

Academy is likewise a name given to a riding-school where young gentlemen are taught to ride the great horse, &c. and the ground allotted is usually called the Manege.

Academy Figure, a drawing of a naked man or woman, taken from the life; which is usually done on paper with red or black chalk, and sometimes with pastils or crayons.

Acadie, or Acady, in Geography, a name formerly given to Nova Scotia, or New Scotland, in America. See Nova Scotia.

Acæna, in antiquity, a Grecian measure of length, being a ten-feet rod, used in measuring their lands.

Acen, in Botany. See Botany Index.

ACAJOU, or Cashew-nut Tree. See Anacardium, Botany Index.

ACALANDRUS, a river falling into the bay of Tarentum, not far from the Metapontum (Pliny, Strabo); now called Fiume de Roseto.

Acaleptic, in ancient prosody, a complete verse.

Acalypha, the Three-seeded Mercury. See Botany Index.

Acalzike, a town and fortress of Asiatic Tartary, situated in N. Lat. 41° 30'. E. Long. 44° 14'.

ACAMANTIS.
ACAMANTIS, the ancient name of the island of Cyprus, taken from one of its promontories situated to the west, and called Acamas. Teos in Ionia was also called thus from Acamas the founder.

ACAMAS, ACAMANTIS, in Ancient Geography, the west promontory of the island of Cyprus, from whence it took its ancient name; now Cape Pissavos, or Epianion, where formerly was a town of the same name, now a village called Cruso. 

ACAMAS, son of Theseus, followed the rest of the Grecian princes to the siege of Troy; and was depoited, with Diomedes, to the Trojans, in order to get Helen restored. Laced, priest's daughter, fell in love with him, stole a night with him, and had a son by him called Munitus. He was one of the heroes who concealed themselves in the wooden horse. One of the tribes of Athens was called Acamantides from him, by the appointment of the oracle; and he founded a city in Phrygia Major, called Acamantium. Homer mentions two other heroes of this name; one a Thracian prince who came to succour Priam, another a son of Antenor.

ACANGIS, that is, Ravagers or Adventurers; a name which the Turks give their hostas or light troops, who are generally sent out in detachments to procure intelligence, harass the enemy, or ravage the country.

ACANTHA, in Botany, the prickle of any plant; in Zoology, a term for the spine or prickly fins of fishes.

ACANTHABOLUS, in Surgery, an instrument for pulling thorns, or the like, out of the skin.

ACANTHINE, any thing resembling or belonging to the herb acanthis. Acanthine garments, among the ancients, are said to be made of the down of thistles; others think they were garments embroidered in imitation of the acanthus.

ACANTHOPTERGYCIOUS FISHES, a term used by Linnaeus and others for those fishes whose back fins are hard, osseous, and prickly.

ACANTHOS, ACANTHUS, a town of Egypt, near Memphis, (Pliny;) now Bissalta. Also a maritime town of Macedonia, to the west of Mount Athos; a colony of Andriotes, (Thessalides, Ptolemy;) now Erissos; near which was shown Xerxes's ditch of seven stadia, in order to separate Mount Athos from the continent, and convey his ships, without doubling Athos, into the Singitic bay. Acanthos is also a town of Epirus.

ACANTHUS, Bear's Breech, in Botany. See BOTANY INDEX.

ACANTHUS, in Architecture, an ornament representing the leaves of the acanthus, used in the capitals of the Corinthian and Composite orders.

ACAPALA, or ACAFULA, a town in the province of Chiapa, in New Spain, which is situated on Tabasco river, about five leagues north-west from Chiapa.

ACAPAM, a town of Asia on the Euxine sea.

ACAPULCO, a considerable town and port in Mexico, on a bay of the South sea, distant from the city of Mexico south-east 210 miles. It has a remarkably fine harbour, from whence a ship annually sails to Manilla in the Philippine islands in Asia; and another returns annually from thence with all the treasures of the East Indies, such as diamonds, rubies, sapphires, and other precious stones; the rich carpets of Persia; the camphire of Borneo; the benzoin and ivory of Pegu and Cambodiah; the silks, muslins, and calicoes, of the Mogul's country; the gold dust, tea, china ware, silk, and cabinets, of China and Japan; besides cinnamon, cloves, mace, nutmegs, and pepper; insomuch that this single ship contains more riches than many whole fleets. The goods brought to Acapulco are carried to the city of Mexico by mules and pack horses; and from thence to Vera Cruz on the North sea, in order to be shipped for Europe. Acapulco is but a small place, containing about 4000 inhabitants, mostly people of colour; which are increased to 5000 by the resort of strangers to the annual fair, held when the Manila galleon arrives. A wretched fort, with 31 pieces of cannon, defends the harbour. It is equally extensive, safe, and commodious. The basin which constitutes this harbour is surrounded by lofty mountains, which are so dry, that they are even destitute of water. The air here is hot, heavy, and unwholesome; to which none can habituate themselves except certain negroes that are born under a similar climate, or some mulattoes. Upon the arrival of the galleons, traders flock here from all the provinces of Mexico, to exchange European toys, with their own cochineal and silver, for spices, muslin, printed linens, silk, perfumes, and the gold works of Asia. The value of the precious metals exported in the galleon, amounts in general to about 200,000l. or 350,000l.; the value of the goods to about 300,000l. or 400,000l.; according to Humboldt. W. Long. 99. 46. N. Lat. 16. 50.

ACARAI, a town of Paraguay in South America, built by the Jesuits in 1624. W. Long. 51. 5. S. Lat. 26.

ACARANA, a small American fish, called by our sailors the old wife. See LABRUS, ICHTHYLOGY INDEX.

ACARI, PORT, in Geography, lies on the coast of Peru, in S. Lat. 15. 50. W. Long. 54. 40.

ACARNANIA, the first country of Free Greece, or Greece Proper, bounded on the west by the Saimus Ambracius, and separated from Aetolia by the river Acheles on the east, and by the Saimus Ambracius from Epirus. The people were called Acaimanes, denoting persons unshorn; other Etolians, to the east of the Acheles, being called Caretes (Homer) from being shorn. According to Lucian, they were noted for effeminacy and incontinence; hence the proverb Porcellus Acanantius. This country was famous for an excellent breed of horses; so that Acanantis eques was a proverbial saying for a thing excellent in its kind. It is now called il Cornia and il Despotato.

ACARON, or ACCARON, a town of Palestine, called Ekron in Scripture. It was the boundary of the Philistines to the north; stood at some distance from the sea, near Bethshemesh; and was famous for the idol of Baalzebub.

ACARUS, the Tick or Mite. See ENTOMOLOGY INDEX.

ACASTUS, in classic history, the son of Pelias, king of Theessaly, and one of the most famous hunters of the time, married Hippolita, who falling desperately in love with Pelus her son-in-law, and he refusing to gratify
ACATELLIC, a term in ancient poetry for such verses as have all their feet or syllables, in contradistinction to those that have a syllable too few. The first verse of the two following from Horace is acatalectic or complete, the last is catalectic or deficient.

Solviue actae hymen, grata vice veris et Favoni: 
Trabuntque siccas machinas carinas——

ACATALEPSY, signifies the impossibility of comprehending something. The distinguishing tenet of the Pyrrhonians was their asserting an absolute catalepsy in regard to everything.

ACATERY, or ACCATERY, anciently an officer of the king's household, designed for a check between the clerks of the kitchen and the purveyors.

ACATHARSIA, in Medicine, an impurity of the blood or humour.

ACATHISTUS, the name of a solemn hymn or vigil, anciently sung in the Greek church on the Saturday of the fifth week of Lent, in honour of the Virgin, for having thrice delivered Constantinople from the invasions of the barbarous nations. It was denominated anchor, i.e. without sitting; because, in the celebration of the praises of the virgin, the people stood all night singing.

ACATIUM, in Ancient Navigation, a kind of boat or pinnace used for military purposes. The acatiyum was a species of those vessels called naves acturiae, i.e. such as were wrought with oars. It was sometimes made use of in battle. Strabo describes it as a privateer or pirate sloop, and Suidas, as a fishing vessel.

ACALUS, in Botany, a term applied to certain plants, the flowers of which have no pedicle or stalk to support them, but rest immediately on the ground, such as the carline thistle, &c.

ACCA, SAINT, bishop of Haghastalti, or Hezham, in Northumberland, succeeded Wilfrid in that see in 709. He ornamented his cathedral in a most magnificent manner; furnished it with plate and holy vestments; and erected a noble library, consisting chiefly of ecclesiastical learning, and a large collection of the lives of the saints, which he was at great pains to procure. He was accounted a very able divine, and was famous for his skill in church music. He wrote several books: particularly, Passiones Sanctorum, The Sufferings of the Saints: Pro illustrandis Scripturis, ad Bedam, For explaining the Scriptures, addressed to Bede. He died in 740, having enjoyed the see of Hexham 31 years, under Egbert king of the Northumbrians.

ACALIA, in Roman antiquity, solemn festivals held in honour of Acca Laurentia, Romulus's nurse: they were otherwise called Laurentalia.

ACCAPITARE, in Law, the act of becoming vassal of a lord, or of yielding him homage and obedience.

Hence

ACCAPITUM signifies the money paid by a vassal upon his admission to a feud.

ACCAPITUM, in our Ancient Law, was used also to express the relief due to the chief lord. See RELIEF.

ACCEDES AD CURIAM, in English Law, a writ lying where a man has received, or fears, false judg-

men in an inferior court. It lies also for justice delayed, and is a species of the writ RECORDARE.

ACCELERATION, in Mechanics, the increase of velocity in a moving body. Accelerated motion is that which continually receives fresh accessions of velocity. Acceleration stands directly opposed to retardation, which denotes a diminution of velocity.

ACCELERATION is chiefly used, in Physics, in respect of falling bodies, i.e. of heavy bodies tending towards the centre of the earth by the force of gravity. That natural bodies are accelerated in their descent, is evident from various considerations, both a priori and posteriori. Thus, we actually find, that the greater height a body falls from, the greater impression it makes, and the more vehemently does it strike the subject plane, or other obstacle.

Various were the systems and opinions which philosophers produced to account for this acceleration. But the immediate cause of acceleration is now sufficiently obvious: the principle of gravitation, which determines the body to descend, determining it to be accelerated by a necessary consequence.

Suppose a body let fall from on high: the primary cause of its beginning to descend is doubtless the power of gravity; but when once the descent is commenced, that state becomes in some measure natural to the body; so that if left to itself, it would persevere in it for ever, though the first cause should cease as we see in a stone cast with the hand, which continues to move after it is left by the cause that gave it motion. But, beside the propensity to descend impressed by the first cause, and which of itself were sufficient to continue the same degree of motion, once begun, in infinitum; there is a constant accession of subsequent efforts of the same principle, gravity, which continues to act on the body already in motion, in the same manner as if it were at rest. Here, then, being a double cause of motion; and both acting in the same direction, viz. directly towards the centre of the earth; the motion they jointly produce must necessarily be greater than that of any one of them. And the velocity thus increased having the same cause of increase still persisting, the descent must necessarily be continually accelerated.

The motion of a body ascending, or impelled upwards, is diminished or retarded from the same principle of gravity acting in a contrary direction, in the same manner as a falling body is accelerated; See Retardation.

A body thus projected upwards, rises till it has lost all its motion: which it does in the same time that a body falling would have acquired a velocity equal to that wherewith the body was thrown up. Hence the same body thrown up, will rise to the same height from which falling it would have acquired the velocity wherewith it was thrown up; and hence the heights which bodies thrown up with different velocities do ascend to, are to one another as the squares of these velocities.

ACCELERATION of Bodies on Inclined Planes. The same general law obtains here as in bodies falling perpendicularly: the effect of the plane is to make the motion slower; but the inclination being everywhere equal, the retardation arising therefrom will proceed equally in all parts, at the beginning and the ending of the motion. See Mechanics.
ACCELERATION of the Motion of Pendulums.—The motion of pendulous bodies is accelerated in their descent; but in a less ratio than that of bodies falling perpendicularly. See MECHANICS and PENDULUM.

ACCELERATION of the Motion of Projectiles. See PROJECTILES.

ACCELERATION is also applied in the ancient astronomy, in respect of the fixed stars. This acceleration was the difference between the revolution of the primary mobile and the solar revolution; which was computed at 3 minutes and 56 seconds.

ACCELERATION of the Moon, a term used to express the increase of the moon's mean motion from the sun, compared with the diurnal motion of the earth; so that it is now a little swifter than it was formerly. Dr Halley was the first who made this discovery; and he was led to it by comparing the ancient eclipses observed at Babylon with those observed by Albatennius in the ninth century, and some of his own time. He was not able to ascertain the quantity of this acceleration, because the longitudes of Bagdad, Alexandria, and Aleppo, where the observations were made, had not been accurately determined. But since his time, the longitude of Alexandria has been ascertained by Chazelles; and Babylon, according to Ptolemy's account, lies 50° east from Alexandria. From these data, Mr Dusthorn compared several ancient and modern eclipses, with the calculations of them, by his own tables, and thereby verified Dr Halley's opinion; for he found that the same tables represent the moon's place more backward than her true place in ancient eclipses, and more forward than her true place in later eclipses, and thence justly inferred that her motion in ancient times was slower, in later times quicker, than the tables give it. But he did not content himself with merely ascertaining the fact; he proceeded to determine the quantity of the acceleration; and by means of the most ancient eclipse of which any authentic account remains, observed at Babylon in the year before Christ 721, he concluded, that the observed beginning of this eclipse was not above an hour and three quarters before the beginning by the tables; and therefore the moon's true place could precede her place by computation but little more than 50° of a degree at that time. Admitting the acceleration to be uniform, and the aggregate of it as the square of the time, it will be at the rate of about 10° in 100 years.

Dr Long attributes the acceleration above described to one or more of these causes: either, 1. The annual and diurnal motion of the earth continuing the same, the moon is really carried round the earth with a greater velocity than heretofore; or, 2. The diurnal motion of the earth, and the periodical revolution of the moon, continuing the same, the annual motion of the earth round the sun is a little retarded; which makes the sun's apparent motion in the ecliptic a little slower than formerly; and, consequently, the moon, in passing from any conjunction with the sun, spends less time before she again overtakes the sun, and forms a subsequent conjunction: in both these cases, the motion of the moon from the sun is really accelerated, and the syzydical month actually shortened. Or, 3. The annual motion of the earth, and the periodical revolution of the moon continuing the same, the rotation of the earth round its axis is a little retarded: in this case, days, hours, minutes, seconds, &c. by which all periods of time must be measured, are of a longer duration; and consequently the synodical month will appear to be shortened, though it really contains the same quantity of absolute time as it always did. If the quantity of matter in the body of the sun be lessened by the particles of light continually streaming from it, the motion of the earth round the sun may become slower: if the earth increases in bulk, the motion of the moon round the earth may be quickened thereby. See ASTRONOMY.

ACCELERATION of a Planet. A planet is said to be accelerated in its motion when the real diurnal motion exceeds the mean diurnal motion. On the other hand, a planet is said to be retarded in its motion when the mean motion exceeds the real diurnal motion. This inequality arises from the change in the distance of the planet from the sun, which is continually varying; the planet moving always quicker in its orbit when nearer the sun, and slower when farther off.

ACCELERATOR, in Anatomy, the name of two muscles of the penis, which serve for ejecting the urine or semen. See Anatomy, Table of the Muscles.

ACCIDENTES, a lower order of ministers in the Roman church, whose office is to light and trim the candles.

ACCENDONES, in Roman antiquity, a kind of gladiators, whose office was to excite and animate the combatants during the engagement. The orthography of the word is contested: the first edition of Tertullian, by Rhenanus, has it accedones; an ancient manuscript, accendones. Aquinas adheres to the former, Pitsicus to the latter. The origin of the word, supposing it accendones, is from accendo, I kindle; supposing it accedones, from accedo, I accede, am added to. The former places their distinguishing character in enlivening the combat by their exhortations and suggestions: the latter supposes them to be much the same with what among us are called seconds, among the Italians, patroni; excepting that these latter only stand by to see the laws of the sword duly observed, without intermeddling to give advice or instruction.

ACCENSI, in the Roman armies, certain supernumerary soldiers, designed to supply the places of those who should be killed or anywise disabled. They were thus denominated, quia accensibus, or ad canem adjicebantur. Vegetius calls them supernumerarii legionum. Cato calls them ferentarii, in regard they furnished those engaged in battle with weapons, drink, &c. Though Nonnus suggests another reason of that appellation, viz. because they fought with stones, slings and weapons quae feruntur, such as are thrown, not carried in the hand. They were sometimes also called velitae, and velati, because they fought clothed, but not in armour: sometimes adscriptitii, and adscriptivii; sometimes dorarii. The accensi, Livy observes, were placed at the rear of the army, because no great matter was expected from them; they were taken out of the fifth class of citizens.

ACENSI, in antiquity, denotes an inferior order of officers, appointed to attend the Roman magistrates, somewhat in the manner of ushers, serjeants or tipstaves among us. They were thus called from accire, to send for; one part of their office being to call assemblies of
of the people, summon parties to appear and answer before the judges, &c.

ACCENS was also an appellation given to a kind of adjutants, appointed by the tribune to assist each century and decurion. In which sense accentus is synonymous with optio. In an ancient inscription, given by Torre, we meet with ACCENSUS EQUITUM ROMANORUM; an office nowhere else heard of. That author suspects it for a corruption; and instead thereof reads, A CENSIBUS.

ACCENSION, the action of setting a body on fire; thus the ascension of tinder is effected by striking fire with flint and steel.

ACCENT, in reading or speaking, an inflexion of the voice, which gives to each syllable of a word its due pitch in respect of height or lowness. See Reading. The word is originally Latin, accentus; a compound of ad, to, and cane, to sing. Accentus, quasi adcentus, or justa cæstus. In this sense, accent is synonymous with the Greek τόνος; the Latin tenor, or tenor; and the Hebrew דב, gustus, taste.—For the doctrine of Accents, in Composition, see Poetry, Part III.

Accent, among grammarians, is a certain mark or character placed over a syllable to direct the stress of its pronunciation. We generally reckon three grammatical accents in ordinary use, all borrowed from the Greeks, viz. the acute accent (\(^\ddot{\circ}\)), which shows when the tone of the voice is to be raised. The grave accent (\(\acute{\circ}\)), when the note or tone of the voice is to be depressed. The circumflex accent (\(\circ\circ\)), is composed of both the acute and the grave, and points out a kind of undulation of the voice. The Latins have made the same use of these three accents.

The Hebrews have a grammatical, a rhetorical, and musical accent: though the first and last seem, in effect, to be the same; both being comprised under the general name of tonic accents, because they give the proper tones to syllables; as the rhetorical accents are said to be euphonic, because they tend to make the pronunciation more sweet and agreeable. There are four euphonic accents, and 21 tonic; of which some are placed above, and others below the syllables; the Hebrew accents serving not only to regulate the risings and fallings of the voice, but also to distinguish the sections, periods, and members of periods, in a discourse; and to answer the same purposes with the points in other languages. Their accents are divided into emperors, kings, dukes, &c. each bearing a title answerable to the importance of the distinction it makes. Their emperor rules over a whole phrase, and terminates the sense completely; answering to our point. Their king answers to our colon; and their duke to our comma. The king, however, occasionally becomes a duke, and the duke a king, as the phrases are more or less short. It must be noted, by the way, that the management and combination of these accents differ in Hebrew poetry from what they are in prose. The use of the tonic or grammatical accents has been much controverted; some holding that they distinguish the sense; while others maintain that they are only intended to regulate the music, or singing; alleging that the Jews sing, rather than read, the Scriptures in their synagogues. Be this, however, as it will, it is certain the ancient Hebrews were not acquainted with these accents. The opinion which prevails amongst the learned is, that they were invented about the sixth century, by the Jewish doctors of the school of Tiberias, called the Massorets.

As to the Greek accents, now seen both in manuscripts and printed books, there has been no less dispute about their antiquity and use than about those of the Hebrews. Isaac Vossius endeavours to prove them of modern invention; asserting, that anciently they had nothing of this kind, but only a few notes in their poetry, which were invented by Aristophanes the grammarian, about the time of Ptolemy Philopater; and that these were of musical, rather than grammatical use, serving as aids in the singing of their poems, and very different from those introduced afterwards. He also shows from several ancient grammarians, that the manner of writing the Greek accents in these days was quite different from that which appears in our books. The author of La Methode Greque, p. 546, observes, that the right pronunciation of the Greek language being natural to the Greeks, it was needless for them to mark it by accents in their writings; so that, according to all appearance, they only began to make use of them about the time, when the Romans, wishing to learn the Greek tongue, sent their children to study at Athens, thinking thereby to fix the pronunciation, and to facilitate it to strangers; which happened, as the same author observes, a little before Cicero's time. Wetstein, Greek professor at Basil, in a learned dissertation, endeavours to prove the Greek accents of an older standing. He owns that they were not always formed in the same manner by the ancients; but thinks that difference owing to the different pronunciation which obtained in the different parts of Greece. He brings several reasons, a priori, for the use of accents, even in the earliest days: as that they then wrote all in capital letters equidistant from each other, without any distinction either of words or phrases, which without accents could scarce be intelligible; and that accents were necessary to distinguish ambiguous words, and to point out their proper meaning; which he concludes from a passage in Homer, mentioned by Aristotle in his Politics, chap. v. Accordingly, he observes, that the Syrians, who have tonic, but no distinctive accents, have yet invented certain points, placed either below or above the words, to show their mood, tense, person, or sense.

Mr Browne of Trinity College, Dublin, has entered more deeply into this investigation; and as he had an opportunity of conversing with the crew of a Greek ship from Patras, a town situated not far distant from the ancient Corinth, which had been driven by stress of weather into the port of Dingle in Ireland, the result of his inquiries was, that the practice of the modern Greeks is different from any of the theories that have been delivered in books. It is true, he observes, they have not two pronunciations for prose and verse, and in both they read by accent, but they make accent the cause of quantity; they make it govern and controul quantity; they make the syllable long on which the acute accent falls, and they allow the acute accent to change the real quantity. They always read poetry as well as prose by accent. Whether any inference can hence be drawn as to the pronunciation of the ancients, I must leave, after what I have premised above, to men of more learning, but I think it at least so probable as to make it worth while to mention the
instances which occurred in proof of this assertion more particularly. Of the two first persons whom I met, one, the steward of the ship, an inhabitant of the island of Cephalonia, had had a school education: he read Euripides, and translated some easier passages without much difficulty. By a stay in this country of near two years, he was able to speak English very tolerably, as could the captain and several of the crew; and almost all of them spoke English fluently. The companion, however, of the steward could speak only modern Greek, in which I could discover that he was giving a description of the distress in which the ship had been, and though not able to understand the context, I could plainly distinguish many words, such as ἀνάγκη—εὐκρίνεια, and among the rest the sound of ἀργύρους pronounced short; this awoke my curiosity, which was still more heightened when I observed that he said ἀναγκαίως long, with the same attention to the alteration of the accent with the variety of case, which a boy would be taught to pay at a school in England. Watching therefore more closely, and asking the other to read some ancient Greek, I found that they both uniformly pronounced according to accent, without any attention to long or short syllables where accent came in the way; and on their departure, one of them having bade me good day, by saying καλάμες, to which I answered καλάμες, he with strong marks of reprobatio set me right, and repeated καλάμες; and with like censure did the captain upon another occasion observe upon my saying So- cletes instead of Socrates.

"I now had a strong wish to know whether they observed the distinction in this respect usually between verse and prose, but from the little scholarship of the two men with whom I had conversed, from the ignorance of a third whom I afterwards met, (who however read Lucian with ease, though he did not seem ever to have heard of the book), and on account of my imperfect mode of conversing with them all, I had little hopes of satisfaction on the point, nor was I clear that they perfectly knew the difference between verse and prose. At length having met with the commander of the ship, and his clerk Athanasius καὶ μήμης, and finding that the latter had been a schoolmaster in the Morea, and had here learnt to speak English fluently, I put the question to them in the presence of a very learned college friend, and at another time, to avoid any error, with the aid of a gentleman who is perfectly master of the Italian language. Both the Greeks repeatedly assured us that verse as well as prose was read by accent, and not by quantity, and exemplified it by reading several lines of Homer, with whose name they seemed perfectly well acquainted.

"I shall give an instance or two of their mode of reading:

*ἐφ οὐ πάντως τιναλμεθανειασεναεοιηνον*,
*Tσο ἀμετωμάτως προερχομαι ἀχίλλειον*,
*ἐν ἑνὶ ἕρτοι νοιντελατοπετομένοις ἐν ἑνὶ λαυτώπαις."

They made the i in ἀνίω, πατέρα, and γάρ long.

But when they read,

*καθι μελ, ἁγίατις, ἐσκε ομήρωσκεοι*,
they made the second syllable of the first word καθι short, notwithstanding the acute accent: on my asking why, they desired me to look back on the circumflex on the first syllable, and said it thence necessarily followed; for it is impossible to pronounce the first syllable with the great length which the circumflex denotes, and not to shorten the second. The testimony of the schoolmaster might be vitiated, but what could be stronger, than that of these ignorant mariners as to the vulgar common practice of modern Greece; and it is remarkable that this confirms the opinion of Bishop Horsey, that the tones of words in connexion are not always the same with the tones of solitary words, though in those of more than one syllable the accentual marks do not change their position. I must here add that these men confirmed an observation which I have heard made, that we are much mistaken in our idea of the supposed lofty sound of παλαιάραισις ἱσορροπο, that the borderers on the coast of the Archipelago take their ideas from the gentle laving of the shore by a summer wave, and not from the roaring of a winter ocean, and they accordingly pronounced it Polypbárrwos thálasseis.

"I own that the observations made by me on the pronunciation of these modern Greeks brought a perfectly new train of ideas into my mind. I propose them, with humility, for the consideration of the learned; but they have made a strong impression upon me, and approached, when compared with other admitted facts, nearly to conviction. In short, I am strongly inclined to believe, that what the famous treatise so often mentioned on the prosodies of the Greek and Latin languages mentions as the peculiarity of the English, that we always prolong the sound of the syllable on which the acute accent falls, is true, and has been true of every nation upon earth. We know it is true of the modern Italians—they read Latin in that respect just as we do, and say, *Arma virūmque cōns, in nōxīt fert animus,* as much as we. And when we find the modern Greeks following the same practice, surely we have some cause to suppose that the ancients did the same. In the English language, indeed, quantity is not affected, because accent and quantity always agree. Bishop Horsey endeavoured to prove that they did so in Greek, but this is on the bold supposition that the accent doth not fall where the mark is placed. The objection to this hypothesis, which seems to have been admitted by all writers, and considered as decisive by some as to prose, by all as to verse, is that such a mode of pronunciation or reading must destroy metre, or rhythm. From this position, however universal, or however it may have been taken for granted, I totally dissent. That it will oppose the metre or quantity I readily agree, but that it will destroy the rhythm, by which, whatever learned descriptions there may have been of its meaning, I understand nothing more than the melody or smooth flowing of the verses, or their harmony if you please, if harmony the properly syllabled, successive and not synchronous sounds. On the contrary, nothing can be more disagreeable or unmelodious than the reading verse by quantity, or scanning of it, as it is vulgarly called. Let us try the line so often quoted—

*Armi virūmque cōns, Trōje qui prūmis ab orīs,*

instead of

*Armi virūmque cōnī, Trōje qui prūmis ab orīs.*

"No
No man ever defined rhythmos better than Plato, ordinem quendam qui in motibus cernitur; the motion or measure of the verse may be exact, and yet the order, arrangement, and disposition of the letters and syllables, such as to be grating and unmelodious to the ear. In like manner, the feet of the verse may be exact, but the stress laid upon particular syllables of it which follows the quantity may totally destroy the melody: in short, the radical error seems to be the confusion of quantity with melody, and the supposition that whatever is at war with quantity and metre must be at war with melody.

"It will be asked then what is the use of metre or measure in verse, if we are not to read by it; and here is the grand difficulty, and I own with candour I cannot answer it with perfect satisfaction to my own mind: to those indeed who say we are to read by accent in prose, it may be equally asked what is the use of long or short syllables in prose, if we are not to attend to them when accent comes in the way: but to those who think otherwise, I can only answer, that in the first place accent doth not always interfere, and then quantity is our guide, and accent often agrees with quantity. Secondly, metre determines the number of feet or measures in each verse, and thereby produces a general analogy and harmony through the whole: and it is to be observed, that, as I apprehend, accent doth not change the number of feet, though it doth the nature or species of them. Thus when we read

Arma virumque cæro, Tróiaque qui primus ab oris,
we do not make more feet than when we scan the line, nor employ more time than in pronouncing the next line in which the accent happens to accord with the quantity, viz.

talianam fato profugus, Lavinaque venit.

Thirdly, the poet in measuring his verse certainly must be confined to some certain number and order of long and short syllables, in order to produce a concordance through the whole, and even to regulate the position of accent, which though not subdued by quantity will certainly have some relation to it, euphoniam gratiam; but surely the length or shortness of a syllable cannot determine where emphasis shall be placed—that must depend on the meaning and the thought; and it would be most absurd for the poet to say to the reader, you shall not rest upon this emphatic and significative word because its syllables are short, and wherever there is a rest, there must be length and intonation." (Irish Trans. vol. vii.)

The use of accents, to prevent ambiguities, is most remarkably perceived in some eastern languages, particularly the Siamese and Chinese. Among the people of China, every word, or (which is the same thing) syllable, admits of five accents, as spoken more acutely or resonantly; and thus stands for many different things. The same sound ya, according to the accent affixed to it, signifies God, a wall, excellent, stupidity, and a goose. The Chinese have but 330 spoken words in their language; but these being multiplied by the different accents or tones, which affect the vowels, furnish a language tolerably copious. By means hereof, their 330 simple sounds come to denote 1650 things; but this being hardly sufficient, they are increased further by aspirates added to each word to double the number.

The Chinese only reckon four accents: for which the missionaries use the following marks, ō, ó, a, ū; to which they have added a fifth, thus ă. They make a kind of modulation; wherein, prolonging the duration of the sound of the vowel, they vary the tone, raising and sinking it by a certain pitch of voice: so that their talking is a sort of music or singing. Attempts have been made to determine the quantity of the rise or fall on each accent by means of musical notes; but this is hard to effect, as being different in different persons. Hence the great difficulty of the language to foreigners; they are forced to sing most scrupulously: if they deviate ever so little from the accent, they say quite a different thing from what was intended. Thus, meaning to compliment the person you are talking with the title Sir, you call him a beast with the same word, only a little varied in the tone. Magalhon makes the language the easier to learn on this account. The Siamese are also observed to sing rather than to talk. Their alphabet begins with six characters, all only equivalent to a K, but differently accented. For though in the pronunciation the accents are naturally on the vowels, yet they have some to diversify such of their consonants as are in other respects the same.

Accent, in Music, is a certain enforcement of particular sounds, whether by the voice or instruments, generally used at the beginning of bars.

Acceptance, in Law, a person's agreeing to offers made in bargaining, by which the bargain is concluded.

Acceptance, in the church of Rome, is put for receiving the pope's constitutions.

Acceptance, in Commerce, is the subscribing, signing, and making one's self debtor for the sum contained in a bill of exchange or other obligation.

Acceptation, in Grammar, the sense or meaning in which any word is taken.

Accepter, or Accepter, the person who accepts a bill of exchange, &c.

Acceptation, among civilians, an acquittance or discharge given by the creditor to the debtor without the payment of any value.

Accessible, something that may be approached, or that access may be had to. Thus we say, Such a place is accessible on one side, &c.

Accession, in Law, is a method of acquiring property, by which, in things that have a close connection or dependance upon one another, the property of the principal thing draws after it the property of the accessory: Thus, the owner of a can becomes likewise the owner of the calf. It sometimes likewise signifies consent or acquiescence.

Accession, among physicians, is used for a paroxysm of a disease; among politicians, it signifies a prince's succeeding to the government upon the death of his predecessor.

Accessory, or Accessory, something that succeeds, or is added to another more considerable thing; in which sense the word stands opposed to principal.

Accessory, or Accessory, in Common Law, is chiefly used for a person guilty of a felonious offence, not principally, but by participation: as by advice, command, or concealment.

There are two kinds of accessories: before the fact,
Accessory and after it. The first is he who commands, or procures another to commit felony, and is not present himself; for if he be present he is a principal. The second is he who receives, assists, or comforts any man that has done murder or felony, whereof he has knowledge. A man may also be accessory to an accessory, by aiding, receiving, &c. an accessory in felony.

An accessory in felony shall have judgment of life and member, as well as the principal who did the felony; but not till the principal be first attained, and convict, or outlawed thereon. Where the principal is pardoned without attainer, the accessory cannot be arraigned; it being a maxim in law, Ubi non est principalis, non potest esse accessorius: but if the principal be pardoned, or have his clergy after attainer, the accessory shall be arraigned; 4 and 5 W. et M. cap. 4.

And by stat. 1 Anne, cap. 9, it is enacted, that where the principal is convicted of felony, or stands mute, or challenges above 50 of the jury, it shall be lawful to proceed against the accessory in the same manner as if the principal had been attainted; and notwithstanding such principal shall be admitted to his clergy, pardoned, or delivered before attainer. In some cases also, if the principal cannot be taken, then the accessory may be prosecuted for a misdemeanour, and punished by fine, imprisonment, &c. In the lowest and highest offences there are no accessories, but all are principals: as in riots, routs, forcible entries, and other trespasses, which are the lowest offences. So also in the highest offence, which is, according to the English law, high treason, there are no accessories.

Accessories, in petty treason, murder, and in felonies of several kinds, are not to have their clergy. There can be no accessory before the fact in manslaughter: because that is sudden and unpremedised.

Accessory Nerves, in Anatomy, a pair of nerves, which arising from the medulla in the vertebrae of the neck, ascend, and enter the skull, and pass out of it again with the par vagus, wrapped up in the same common integument, and after quitting them, are distributed into the muscles of the neck and shoulders. See Anatomy.

Accessory, among painters, an epithet given to such parts of a history-piece as serve chiefly for ornament, and might have been wholly left out: such as vases, arms, &c.

ACCI, in Ancient Geography, a town of Tarraconensis, formerly called Acti; supposed to be Guadice, to the east of the city of Granada in Spain, at the foot of a mountain near the source of the rivulet Guadalantin; now greatly decayed. It is the Colonie Accitana Gemella, and was of some repute among the Roman colonies. The people were called Gemellenses, because the colony consisted of colonists from the third and sixth legions.

ACCI, DONATOMI, a native of Florence, was born in 1428, and was famous for his learning and the honourable employments which he held. He wrote, a Latin translation of some of Plutarch's Lives; Commentaries on Aristotle's Ethics and Politics; and the Lives of Hannibal, of Scipio, and of Charlemagne. He was sent by France, by the Florentines, to solicit aid from Louis XI. against Pope Sixtus IV., but on his journey died at Milan in 1478; his body was carried to Florence, and buried in the church of the Carthusians at the public expense. The small fortune he left his children is a proof of his probity and disinterestedness. His daughters, like those of Aristides, were portioned by his fellow-citizens, as an acknowledgement of his services. His funeral oration was spoken by Christopher Landini; and an elegant epitaph, by Politian, was inscribed on his tomb.

ACCIDENT, in a general sense, denotes any casual event.

ACCIDENT, among Logicians, is used in a threefold sense. 1. Whatever does not essentially belong to a thing; as the clothes a man wears, or the money in his pocket. 2. Such properties in any subject as are not essential to it; thus whiteness in paper is an accidental quality. 3. In opposition to substance, all qualities whatever are called accidents; as sweetness, softness, &c.

ACCIDENT, in Grammar, implies a property attached to a word, without entering into its essential definition; for every word, notwithstanding its signification, will be either primitive, derivative, simple, or compound, which are the accidents of words. A word is said to be primitive, when it is taken from no other word in the language in which it is used; thus heaven, king, good, are primitive words. It is said to be derivative, when it is taken from some other word; thus heavenly, kingdom, goodness, &c. are derivatives. A simple word is easily distinguished from a compound: thus just, justice, are simple words; unjust, injustice, are compound: res is a simple word, as well as publica; but respublica is a compound. Besides accidents which are common to all sorts of words, each particular species has its accidents: thus the accidents of the noun substantive are the gender, declension, and number; and the adjective has another accident, namely the comparison. See the articles Grammar and Language.

ACCIDENT, in Heraldry, an additional point or mark in a coat of arms, which may be either omitted or retained without altering the essence of the armour; such as abatement, difference, and tincture.

ACCIDENTAL, in a general sense, implies something that happens by accident, or that is not essential to its subject.

ACCIDENTAL, in Philosophy, is applied to that effect which flows from some cause intervening by accident, without being subject, or at least without any appearance of being subject, to general laws or regular returns. In this sense, accident is opposed to constant and principal. Thus the sun's place is, with respect to the earth, the constant and principal cause of the heat in summer, and the cold in winter; whereas, winds, storms, and rains, are the accidental causes which often alter and modify the action of their principal cause.

ACCIDENTAL COLOURS, are those which depend upon the affections of the eye, in contradistinction to those which belong to light itself. The impressions made upon the eye by looking steadfastly on objects of a particular colour are various, according to the single colour or combination of colours in the object; and they continue for some time after the eye is withdrawn, and give a false colour to other objects. M. Buffon endeavoured to trace the connections which these accidental colours have with such as are natural, in a variety of instances. The subject has also been considered.
did not confine himself to dramatic writing; for he left other productions, particularly his annals, mentioned by Macrobius, Priscian, Festus, and Nonnus Marcellus. He has been censured for writing in too harsh a style, but in all other respects has been esteemed a very great poet. He was so much esteemed by the public, that a comedian was punished, for only mentioning his name on the stage. Cicero speaks with great derision of one Accius who had written a history; and, as our author had written annals, some insist that he is the person censured: but as Cicero himself, Horace, Quintilian, Ovid, and Paterculus, have spoken of our author with so much applause, we cannot think it is the same person whom the Roman orator censures with so much severity.

There was also in this age a pretty good orator of the same name, against whom Cicero defended Cluentius. He was born in Pisaurum, and perhaps was a relation of our poet.

Accius, a poet of the 16th century, to whom is attributed A Paraphrase of Aesop's Fables, on which Julius Scaliger bestows great encomiums.

ACCLAMATION, a confused noise or shout of joy, by which the public express their applause, esteem, or approbation.

Acclamations are of various kinds; ecclesiastical, military, nuptial, senatorial, synodical, scholastical, theatrical, &c. We meet with loud acclamations, musical and rhetorical acclamations; acclamations of joy and respect, and even of reproach and contumely. The former, wherein words of happy omen were used, were also called Laudations, et bona voto, or good wishes; the latter, Exercitationes et convictia. Suetonius furnishes an instance of this last kind in the Roman senate, on occasion of the decree for demolishing the statues of Domitian, when the fathers, as the historian represents it, could not refrain from contumelious acclamations of the deceased. The like were shown after the death of Commodus, where the acclamations run in the following strain: Hosti patria honores deirahantur, perrictas honores deirahantur; hostis statuta undique, perrictas statutaa undique, gladiatoris statuta undique, &c.—The formula, in acclamations, was repeated sometimes a greater, sometimes a lesser, number of times. Hence we find in Roman writers, acclamatum est qui quinquies, et sexies; five times, and twenty times; sometimes also sexages, and even octagies; sixty and eighty times.

Acclamations were not unknown on the theatres in the earliest ages of the Roman commonwealth; but they were at first then, and little other than confused shouts. Afterwards they became a sort of regular concerts. That mentioned by Phaedrus, letate incolumis Roma solvo princepe, which was made for Augustus, and proved the occasion of a pleasant mistake of a flute-player.
player called Princes, shows that musical acclamations were in use in that emperor's reign. Reverterentem ex provincia modulatis carminibus prosequentur, says Suetonius, who gives another instance in the time of Tiberius: a false report of Germanicus' death being spread through Rome, the people ran in crowds to the capital with torches and victims, singing, Salve Roma, Salve Patria, Salve est Germanicus—Nero, passionately fond of music, took special care to improve and perfect the music of acclamations. Charmed with the harmony with which the Alexandrians, who came to the games celebrated at Naples, had sung his praises, he brought several over to instruct a number of youth, chosen from among the knights and people, in the different kinds of acclamations practised at Alexandria. These continued in use as long as the reign of Theodorik. But the people did not always make a single chorus; sometimes there were two, who answered each other alternately: thus, when Nero played on the theatre, Burhus and Seneca, who were on either hand, giving the signal by clapping, 5000 soldiers called Augustali, began to chant his praise, which the spectators were obliged to repeat. The whole was conducted by a music-master called moeochoros or pau- sarius. The honour of acclamations was chiefly rendered to emperors, their children, and favourites; and to the magistrates who presided at the games. Persons of distinguished merit also sometimes received them, of which Quintilian gives us instances in Cato and Virgilius. The most usual forms were, Feliciter, Laudem victorius, Animos fecit. The actors themselves, and they who gained the prizes in the games of the circus, were not excluded the honour of acclamations.

To theatrical acclamations may be added those of the soldiery and the people in time of triumph. The victorious army accompanied their general to the capital; and among the verses they sung in his praises, frequently repeated Io TRiUMPHIS, which the people answered in the same strain. It was also in the way of acclamation, that the soldiers gave their general the title of Imperator, after some notable victory; a title which he only kept till the time of his triumph.

The acclamations of the senate were somewhat more serious than the popular ones; but arose from the same principles, viz. a desire of pleasing the prince or his favourites; and aimed likewise at the same end, either to express the general approbation and zeal of the company, or to congratulate him on his victories, or to make him new protestations of fidelity. These acclamations were usually given after a report made by some senator, to which the rest all expressed their consent by crying Omnem, Omnes; or else, Aequum est, Justum est. Sometimes they began with acclamations, and sometimes ended with them without other debates. It was after this manner that all the elections and proclamations of emperors, made by the senate, were conducted; something of which practice is still retained at modern elections of kings and emperors, where Præst Rex, and Long live the King, are customary forms of acclamation.

The Greeks borrowed the custom of receiving their emperors in the public places from the Romans. Luitpold relates, that at a procession where he was present, they sung to the emperor Nicephorus, παλαι τηκι πατερα, that is, Many years; which Codini expresses thus, by νε παλαι γαντεγαγοι, or by νε παλαι νεγαγοι, and the wish or salutation by πλησιν, πλησιν. And at dinner, the Greeks then present wished with a loud voice to the emperor and Barisan, Ut Dessemm cœps in duplïcït, as he translates the Greek. Plutarch mentions an acclamation so loud, upon occasion of Flaminius' restoring liberty to Greece, that the very birds fell from heaven with the shout. The Turks practise something like this on the sight of their emperors and grand viziers to this day.

For the acclamations with which authors, poets, &c. were received, who recited their works in public; it is to be observed, the assemblies for this purpose were held with great parade in the most solemn places, as the Capitol, temples, the Athenæum, and the houses of great men. Invitations were sent everywhere, in order to get the greater appearance. The chief care was, that the acclamations might be given with all the order and pomp possible. Men-of fortune who pretended to wit, kept able applauders in their service, and lent them to their friends. Others endeavoured to gain them by presents and treats. Philostratus mentions a young man named Vavus, who lent money to the men of letters, and forgave the interest to such as applauded his exercises. These acclamations were conducted much after the same manner as those in the theatre, both to the music and the accompaniments: they were to be suited both to the subject and to the person. There were particular ones for the philosophers, for orators, for historians, and for poets. It would be difficult to rehearse all the forms of them; one of the most usual was Sophas, which was to be repeated three times. Martial comprehends several other usual forms in this verse:

Graviter, Cité, Nequiter, Euge, Beati.

Neither the Greeks nor Romans were barren on this head. The names of gods and heroes were given those whom they would extoll. It was not enough to do it after each head of discourse, chiefly after the exordium; but the acclamations were renewed at every fine passage, frequently at every period.

The acclamations with which the spectators honoured the victories of the athletes, were a natural consequence of the impetuous motions which attended the gymnastic games. The cries and acclamations of the people, sometimes expressing their compassion and joy, sometimes their horror and disgust, are strongly painted by different poets and orators.

Acclamations made also a part of the ceremony of marriage. They were used for the omen's sake; being the Leta Omnia, sometimes spoken of before marriage in Roman writers.

Acclamations, at first practised in the theatre, and passing thence to the senate, &c., were in process of time received into the acts of councils, and the ordinary assemblies of the church. The people expressed their approbation of the preacher variously; the more usual forms were, Orthodox! Third Apostle, &c. These acclamations being sometimes carried to excess, and often misplaced, were frequently prohibited by the ancient doctors, and at length abrogated; though they appear to have been in some use about the time of St. Bernard.

Acclamation
ACCLAMATION MEDALS, among Antiquaries, such as represent the people expressing their joy in the posture of acclamation.

ACCLIVITY, the rise or ascent of a hill, in opposition to the declivity or descent of it. Some writers on fortification use it for the talus of a rampart.

ACCOLA, among the Romans, signified a person who lived near some place; in which sense, it differed from incola, the inhabitant of such a place.

ACCOLADE, a ceremony anciently used in the conferring of knighthood.

Antiquaries are not agreed wherein the accolade properly consisted. The generality suppose it to be the embrace, or kiss, which princes anciently gave the new knight, as a token of their affection: whence the word accolade; q.d. a clapping, or taking round the neck. Others will rather have it to be a blow on the chin of the neck, given on some occasion. The accolade is of some antiquity, in whichever of the two senses it be taken.

Greg. de Tours writes, that the kings of France, even of the first race, in conferring the girt shoulder belt, kissed the knights on the left cheek. For the accolé, or blow, John of Salisbury assures us, it was in use among the ancient Normans: by this it was that William the Conqueror conferred the honour of knighthood on his son Henry. At first it was given with the naked fist; but was afterwards changed into a blow with the flat of the sword on the shoulder of the knight.

ACCOLADE, sometimes synonymous with Accolade, which see.—It is also used in various senses in heraldry; sometimes it is applied to two things joined; at other times, to animals with crowns or collars about their necks, as the lion in the Ogilvy’s arms; and, lastly, to kens, batons, maces, swords, &c. placed saltierwise behind the shield.

ACCOLTI, BENEDICT, the younger, grandson of Benedict Accolti the elder, who flourished about the year 1376, was born at Arezzo in 1415. About the year 1450, he was appointed secretary to the republic of Florence, when he was greatly distinguished. He wrote “Four Books concerning the War which the Christians carried on against the infidels to recover Judea and the Holy Sepulchre.” This work was printed at Venice in 1532, and it is the ground-plot of Tasso’s Jerusalem Delivered. He wrote also an account of the “Excellent Personages of his Time,” in the form of dialogue. He died in 1466.

ACCOLTI, Benedict, was nephew, or according to some, grandson, of Peter Accolti, and was born at Florence in 1497. He was much distinguished for his knowledge of law, and a most retentive memory; and was such a master of the Latin language, that he obtained the flattering appellation of the Cicero of the Age. He enjoyed very high ecclesiastical honours: Leo X. bestowed on him the bishopric of Cadiz; Adrian the VI. gave him that of Cremona, and the archbishopric of Havana; and Clement VII. raised him to the rank of cardinal. At the request of Clement, he wrote a treatise in vindication of the pope’s right to the kingdom of Naples. He left several other works, and particularly some pieces of poetry. He died at Florence in 1549.

ACCOLTI, Francis, brother of the former, was born about the year 1418. He was professor of jurisprudence in several universities, and was styled the prince of lawyers. His understanding was vigorous, his knowledge was extensive, and his eloquence powerful; but he was so sordidly parsimonious that he amassed immense treasures. He died about the year 1470; and left behind him several works on law, and some translations of the works of Chrysostom.

ACCOLTI, Peter, the son of Benedict the younger, was born at Arezzo about the year 1455. He was a professor of law, and taught with great reputation. He was successively raised to several bishoprics, and at last to the rank of cardinal in 1511. He was created by Pope Leo X. prince of the state of Nepi. He wrote a comedy entitled “Virginia,” and some other poems which were much applauded by his contemporaries. He died at Rome in 1522.

ACCOMMODATION, the application of one thing, by analogy, to another; or the making two or more things agree with one another.

To know a thing by accommodation, is to know it by the idea of a similar thing referred thereto.

A prophecy of scripture is said to be fulfilled various ways; properly, as when a thing foretold comes to pass; and improperly, or by way of accommodation, when an event happens to any place or people, like what fell out some time before to another.—Thus, the words of Isaiah, spoken to those of his own time, are said to be fulfilled in those who lived in our Saviour’s; and are accommodated to them: “Ye hypocrites, well did Esaias prophesy of you,” &c. which same words St. Paul afterwards accommodates to the Jews of his time.

The primitive church accommodated multitudes of Jews, and even heathen ceremonies and practices, to Christian purposes; but the Jews had before done the same by the Gentiles: some will even have circumcised the tabernacle, brazen serpent, &c. to have been originally of Egyptian use, and only accommodated by Moses to the purposes of Judaism. * Spencer main. 1. Saurin. 2. D. O. T. tom. 1. concerns, that most of the rites of the old law were in imitation of those of the Gentiles, and particularly of the Egyptians; that God, in order to divert the children of Israel from the worship they paid to their false deities, consecrated the greatest part of the ceremonies performed by those idolaters, and had formed out of them a body of the ceremonial law; that he had indeed made some alterations therein, as barriers against idolatry; and that he thus accommodated his worship to the genius and occasions of his ancient people. To this condescension of God, according to Spencer, is owing the De legibus origin of the tabernacle, and particularly that of the Hebr. 3. 5 & 31 by later writers.

ACCOMPA NIMENT, something attending or added as a circumstance to another, either by way of ornament, or for the sake of symmetry.

ACCOMPANIMENT, ACCOMPAGNATO, ACCOMPAGNATURA, in Musica, denotes the instruments which accompany a voice, in order to sustain it, as well as to make the music more full. The accompaniment is used in recitative, as well as in song; on the stage, as well as in the choir, &c. The ancients had likewise their accompaniments in the theatre; they had even different kinds of instruments to accompany the chorus, from those which accompanied the actors in the recitation.
The accompaniment, among the moderns, is frequently a different part or melody from the song it accompanies. It is disputed whether it was so among the ancients. It is generally alleged, that their accompaniments went no farther than the playing in octave, or in antiphony to the voice. The Abbé Fréquier, from a passage in Plato, pretends to prove, that they had actual symmetry, or music in parts: but his arguments seem far from being conclusive.

Accompaniment, in Painting, denotes such objects as are added, either by way of ornament or fitness to the principal figures; as dogs, guns, game, &c. in a hunting piece.

Accompaniment, in Heraldry, any thing added to a shield by way of ornament; as the belt, mantling, supporter, &c. It is also applied to several bearings about a principal one; as a salier, bend, fess, chevron, &c.

Accomplishe, one that has a hand in a business; or is privy in the same design or crime with another. See Accessory.

By the law of Scotland, the accomplishe can only be prosecuted after the conviction of the principal offender, unless the accession of the accomplishe is immediate, in ipso acto, (so as in effect to render them co-principal.) By the general rule, the accomplies suffers the same punishment with the principal offender; yet if he be remarkably less guilty, justice will not permit equal punishment.

The council of Sens, and several other synodical statutes, expressly prohibit the revealing of accomplisces.

Accomplishment, the entire execution or fulfilling of any thing.

Accomplishment is principally used in speaking of events foretold by the Jewish prophets in the Old Testament, and fulfilled under the New. We say a literal accomplishment, a mystical or spiritual accomplishment, a single accomplishment, a double accomplishment, a Jewish accomplishment, a Christian, a beaten accomplishment. The same prophecy is sometimes fulfilled in all, or in several of those different ways. Thus, some of the prophecies of the Old Testament, the Jews find a literal accomplishment in their own history, about the time when the prophecy was given: the Christians find another in Christ, or the earliest days of the church; the heathens another, in some of their emperors; the Mahometans another, in their legislator, &c. There are two principal ways of accomplishing a prophecy, directly, and by accommodation. See Accommodation, and Prophecy.

Accomplishment, is also used for any mental or personal endowment.

Accords, in Painting, is the harmony that reigns among the lights and shades of a picture.

Accords, Stephen Tabourot, Sieur de Bea, advocate in the parliament of Dijon in France, and king's advocate in the bailiwick and chancery of that city, was born in 1549. He was a man of genius and learning; but too much addicted to trifles, as appears from his poem entitled "Les Bigarrures," printed at Paris in 1582. This was not his first production, for he had before printed some sonnets. His work entitled "Les Touches," was published at Paris in 1582; which is indeed a collection of witty poems, but worked up in a loose manner, according to the licentious taste of that age. His Bigarrures are written in the same strain. He was censured for this way of writing, which obliged him to publish an apology. The lordship of Accords is an imaginary sef, or title from the device of his ancestors, which was a drum, with the motto à tous accords, "chiming with all." He had sent a sonnet to a daughter of M. Begat, the great and learned president of Burgundy, who (says he) did me the honour to love me; and inasmuch (continues he), I had subscribed my sonnet with only my device à tous accords, this lady first nicknamed me, in her answer, Seigneur des Accords; by which title her father also called me several times. For this reason I chose this surname, not only in all my writings composed at that time, but even in these books." He died in 1595, in the 50th year of his age.

Accorso (in Latin Accorsonus), Francis, the elder, an eminent lawyer, was born at Bagnolo, near Florence, in 1182. He began the study of law at a late period of life; but such were his assiduity and proficiency, that he soon distinguished himself. He was appointed professor at Bologna, and became a very eminent teacher. He undertook the great work of uniting and arranging into one body the almost endless comments and remarks upon the Code, the Institutes, and Digests, which, he observed, only tended to involve the subjects in obscurity and contradiction. When he was employed in this work, it is said, that hearing of a similar one proposed and begun by Odofred, another lawyer of Bologna, he feigned indisposition, interrupted his public lectures, and shut himself up, till he had, with the utmost expedition, accomplished his design. His work, entitled "A Perpetual Commentary," was much esteemed. It was printed with the "Body of Law," published at Lyons in 1627. He died in 1650, and left very great riches. His son, the younger Francis Accorso, succeeded him in his professorship, and accompanied Edward I. to England, on his return from the crusade in 1297. (See Bing.)

Accorso, Marsigilo, a learned and ingenious critic, was a native of Aquila, in the kingdom of Naples, and lived about the beginning of the sixteenth century. To a perfect knowledge of Greek and Latin, he added an intimate acquaintance with several modern languages. Classical literature was much improved and promoted by his labours. In discovering and collating ancient manuscripts he displayed uncommon assiduity and diligence. His work, entitled "Distribus," printed at Rome, in folio, in 1524, is a singular monument of erudition and critical skill. He bestowed, it is said, unusual pains on Claudian, and made above seven hundred corrections in the works of that poet, from different manuscripts. Unfortunately the world has been deprived of the advantage of these criticisms; for they were never published. These corrections were made while he travelled on horseback during a tour through Germany, a circumstance which is strongly characteristic of his industry and assiduity. An edition of Aemilius Marcellinus, which he published at Augsburg in 1533, contains five books more than any former one. He was the first editor of the "Letters of Cassiodorus," with his "Treatise on the Soul." The affected use
ACCRATION, among civilians, the property acquired in a vague or unoccupied thing, by its adhering to or following another already occupied: thus, if a legacy be left to two persons, one of whom dies before the testator, the legacy devolves to the survivor by right of accretion.

ACROCHE, in Heraldry, denotes a thing's being hooked with another.

ACCRUBATION, a posture of the body, between sitting and lying. The word comes from the Latin accubare, compounded of ad, to, and cubo, I lie down.

ACCRUBATION, or Accubitus, was the table posture of the Greeks and Romans; whence we find the words particularly used for the lying, or rather (as we call it) sitting down to meat. The Greeks introduced this posture. The Romans, during the frugal ages of the republic, were strangers to it; but as luxury got footing, this posture came to be adopted, at least by the men; for as to women, it was reputed an indecency in them to lie down among the men: though, afterwards, this too was got over. Children did not lie down, nor servants, nor soldiers, nor persons of meaner condition. They took their meals sitting, as a posture less indulgent. The Roman manner of disposing themselves at table was this: A low round table was placed in the convaculum, or dining room, and, about this, usually three, sometimes only two, beds or couches; and according to their number, it was called bicipalium or tricipalium. These were covered with a sort of bedclothes, richer or plainer according to the quality of the person, and furnished with quilts and pillows, that the guests might lie the more commodiously. There were three persons on each bed; to the more, way esteemed sordid. In eating, they lay down on their left sides, with their heads resting on the pillows, or rather on their elbows. The first lay at the head of the bed, with his feet extended behind the back of the second; the second lay with the back of his head towards the navel of the first, only separated by a pillow, his feet behind the back of the third; and so of the third or fourth. The middle place was esteemed the most honourable. Before they came to table, they changed their clothes, putting on what they called exinatoria vestis, the dining garment; and pulled off their shoes, to prevent soiling the couch.

ACCBITOR, an ancient officer of the emperors of Constantinople, whose business was to lie near the emperor. He was the head of the youth of the bed-chamber, and had the cubicularius and procurator under him.

ACCRUATION, in a general sense, the act of heaping or amassing things together. Among lawyers, it is used in speaking of the concurrence of several titles to the same thing, or of several circumstances to the same proof.

ACCRUATION of Degrees, in a university, is the taking several of them together, or at shorter intervals than usual, or than is allowed by the rules of the university.

ACCRUSED, something that lies under a curse, or sentence of excommunication.

In the Jewish idiom, accursed and crucified were synonymous. Among them, every one was accounted accursed who died on a tree. This serves to explain the difficult passage in Rom. ix. 3, where the apostle

R

Paul
Paul wished himself accursed after the manner of Christ, i.e. crucified, if he could in any way save his countrymen. The proposition we here make use of, is used in the same sense, 2 Tim. i. 3: where it obviously signifies after the manner of.

ACCUSATION, the charging anyone with a criminal action, either in one's own name, or in that of the public. The word is compounded of ad, to, and causari to plead.

Writers on politics treat of the benefit and the inconveniences of public accusations. Various arguments are alleged, both for the encouragement and discouragement of accusations against great men. Nothing, according to Machiavel, tends more to the preservation of a state, than frequent accusations of persons trusted with the administration of public affairs. This, accordingly, was strictly observed by the Romans, in the instances of Camillus, accused of corruption by Manlius Capitolinus, &c. Accusations, however, in the judgment of the same author, are not more beneficial than calamities are pernicious; which is also confirmed by the practice of the Romans. Manlius not being able to make good his charge against Camillus, was cast into prison.

By the Roman law, there was no public accuser for public crimes; every private person, whether interested in the crime or not, might accuse, and prosecute the accused to punishment or absolution. Cato, the most innocent person of his age, had been accused 42 times, and as often absolved. But the accusation of private crimes was never received but from the mouths of those who were immediately interested in them: None (e.g.) but the husband could accuse his wife of adultery.

The ancient Roman lawyers distinguished between postulatio, delatio, and accusatio. For, first, leave was desired to bring a charge against one, which was called postulare: then he against whom the charge was laid was brought before the judge; which was called deferre, or nominis delatio: lastly, the charge was drawn up and presented; which was properly the accusatio. The accusation properly commenced, according to Paddus, when the reus or party charged, being interrogated, denied he was guilty of the crime, and subscribed his name to the delatio made by his opponent.

In the French law, none but the procureur general, or his deputies, can form an accusation, except for high treason and coining, where accusation is open to every body. In other crimes, private persons can only act the part of denouncers, and demand reparation for the offence, with damages.

In Britain, by Magna Charta, no man shall be imprisoned or condemned on any accusation, without trial by his peers, or the law; none shall be vexed with any accusation, but according to the law of the land; and no man may be molested by petition to the king, &c., unless it be by indictment or presentment of lawful men, or by process at common law. Promoters of suggestions, are to find surety to pursue them; and if they do not make them good, shall pay damages to the party accused, and also a fine to the king. No person is obliged to answer upon oath to a question whereby he may accuse himself of any crime.

ACCUSATIVE, in Latin Grammar, is the fourth case of nouns, and signifies the relation of the noun on which the action implied in the verb terminates; and hence, in such languages as have cases, these nouns have a particular termination, called accusative, as, Augustus visuit Antonium, Augustus vanquished Antony. Here Antonium is the noun on which the action implied in the word visuit terminates; and, therefore, must have the accusative termination. Ovid, speaking of the palace of the sun, says, Materiem superabat opus. The work surpassed the materials. Here materiem has the accusative termination; because it determines the action of the verb superabat. In the English language there are no cases, except the genitive; the relation of the noun being shown by the assistance of prepositions, as of, to, from, &c.

ACCUUSORUM COLONIA, in Ancient Geography, an inland town in the Cavares, in Gallia Narbonensis; now Grenoble, in Dauphine. See GRENoble.

ACE, among gamblers, a card or die marked only with one point.

ACELDAMA, in Scripture history, a place without the south wall of Jerusalem, beyond the brook of Siloam, was called the Potters field, because clay of which pots were made was dug out of it. It was afterwards bought with the money with which the high priests and rulers of the Jews purchased the blood of Jesus Christ, and hence it was called Acceldama, the field of blood.

ACELUM, or ACELIUM, in Ancient Geography, a town of the Venetian territory, now called Asolo, situated to the west of Treviso, at the source of the rivulet Musone. E. Long. 13°. N. Lat. 43°.

ACENTETUM, or ACANTHIZ, in Natural History, a name given by the Ancients to the purest and finest kind of rock crystal. They used the crystal in many ways; sometimes engraving on it, and sometimes forming it into vases and cups, which were held next in value to the vasa murrhina of those times. The crystal they obtained from the island of Cyprus was much esteemed; but often faulty in particular parts, having hairs, cracks, and foulnesses, which they called salta, in the middle of the large pieces. Pliny tells us, that when it was used for engraving on, the artist could conceal all these blemishes among the strokes of his work; but when it was to be formed into cups or precious vases, they always chose the acinetum which had no flaws or blemishes.

ACEPHALI, or ACEPHALITE, a term applied to several sects who refused to follow some noted leader. Thus the persons who refused to follow either John of Antioch, or St Cyril, in a dispute that happened in the council of Ephesus, were termed Acephali, without a head or leader. Such bishops, also, as were exempt from the jurisdiction and discipline of their patriarchs, were styled Acephali.

ACEPHALI, the levellers in the reign of King Henry I, who acknowledged no head or superior. They were reckoned so poor, that they had not a tenement by which they might acknowledge a superior lord.

ACEPHALOUS, or ACEPHALUS, in a general sense; without a head.

The term is more particularly used in speaking of certain nations, or people, represented by ancient naturalists and cosmographers, as well as by some modern travellers,
The real intention probably was to overcome any offensive smell that might arise about the corpse. The Chinese have still a custom like this: they erect an altar to the deceased in a room hung with mourning; and place an image of the dead person on the altar, to which every one that approaches it bows four times, and offers oblations and perfumes.

The acerra also signified a little pot wherein were put the incense and perfumes to be burnt on the altars of the gods and before the dead. It appears to have been the same with what was otherwise calledthuribulum, and pyxis.

We find mention of acerra in the ancient church. The Jews had also their acerra, in our version rendered censers; and the Romanists still retain them under the name of incense pots. In Roman writers, we frequently meet with plena acerra, a full acerra: to understand which, it is to be observed, that people were obliged to offer incense in proportion to their estate and condition; the rich in larger quantities, the poor only a few grains; the former poured out full acerra on the altar, the latter took out two or three bits with their fingers.

Acerra, a town of Italy, in the kingdom of Naples, and in the Terra di Lavoro; seated on the river Agno, seven miles north-east of Naples. E. Long. 14° 30'. N. Lat. 40° 55'.

Acerrae, in Ancient Geography, the name of a town on the Claniae, in Campania, not far from Naples; now Acerra. The name also of another town, now called la Girola, in the territory and to the south-east of Lodi, where the rivulet Serio falls into the Adda, to the west of Cremona and north of Placentia.

Aceneses, in Ancient Geography, a large and rapid river of Italy which Alexander passed in his expedition into that country. The kingdom of Perus, which was conquered by Alexander, lay between the Hydasipes and this river, which, uniting with the former and other considerable rivers, pours its waters into the Indus. According to Major Rennell, the modern Jenaub is the Acesines of the ancients.

Acesus, a bishop of Constantinople in the reign of Constantine, was a rigid adherent to the Novatian doctrines, according to which those whom persecutions had shaken from the faith, or who were guilty of any mortal sin after baptism, could not be admitted to the communion of the church, even after exhibiting the most convincing proofs of sincere repentance. Constantine, who was extremely displeased with the severity of this rigid sect, in discouraging and rejecting repentance, is said to have thus expressed himself: "Then, Acesius, make a ladder for yourself, and go up to heaven alone." (Gen. Buxg.)

Acescens, a word used to denote any thing which is turning sour, or which is slightly acid. It is only applied properly to the former of these two meanings. The second may be expressed by either of the two words, acidus or sub-acid.

Acetabulum, in antiquity, a measure used by the ancients, equal to one-eighth of our pint. It seems to have acquired its name from a vessel in which aceto or vinegar was brought to their tables, and which probably contained about this quantity.

Acetabulum, in Anatomy, a cavity in any bone for...
A public council was then held, in which affairs of
importance were discussed and determined. A register
was appointed to record the transactions of the coun-
cil. This assembly had two presidents, who were no-
minated alternately by the different towns. But in-
stead of two presidents, they soon elected but one. Many
neighbouring towns which adhered to the constitute-
tion of this republic, founded on equality, liberty, the
love of justice, and of the public good, were incorporat-
ed with the Achaeans, and admitted to the full enjoyment
of their laws and privileges.—The arms which the
Achaeans chiefly used were slings. They were trained
to the art from their infancy, by slinging from a great
distance, at a curcular mark of a moderate circumference.
By long practice they took so nice an aim, that they
were sure, not only to hit their enemies on the head,
but on any part of the face they chose. Their slings
were of a different kind from those of the Batarians,
whom they far surpass in dexterity.

ACHÆI, ACHAÉANS, the inhabitants of Achaja
Propria. In Livy, the people of Greece; for the most
part called Achivi, by the Roman poets. In Homer,
the general name for Grecians. See ACHAÉNS.

ACHÆORUM PORTUS, (Pliny;) now Porta Buon,
a harbour of the Chersonesus Taurica, on the Euxine:
Another in near Sigurae, and which the Xanthus, after
being joined by the Simois, falls.

ACHÆMÉNÉS, according to Herodotus, was
grandfather of Cambyses, and great-grandfather of
Cyrus the first, king of Persia. Most of the commen-
tators of Horace are of opinion, that the Achaemenes
whom that poet mentions, ode xii. of his 2d book, was
one of the Persian monarchs; but, if that were true,
he must have reigned before the Medes subdued the
Persians; for we do not hear of any king of that name
from the time that the Persians founded that great mo-
narchy, which is looked upon as the second universal
one. However this be, the epithet Achæmenis is
frequently given to the Persians, in the old Latin
poets.

ACHÆMENES, son of Darius I. king of Persia, and
brother of Xerxes, had the government of Egypt be-
stowed on him, after Xerxes had forced the Egyptians
to return to their allegiance. He some time after com-
manded the Egyptian fleet in the celebrated expedition
which proved so fatal to all Greece. The Egyptians
having again taken up arms after the death of Xerxes,
Achaemenes was sent into Egypt to suppress the rebel-
lion; but he was vanquished by Inarxus, chief of the rebels,
succoured by the Athenians.

ACHÆUS, cousin-german to Seleucus Ceraunus
and Antiochus the Great, kings of Syria, became a
very powerful monarch, and enjoyed the dominions he
had usurped for many years; but at last he was punish-
ed for his usurpations in a dreadful manner, in the
140th year of Rome, as related by Polybius.*

ACHAIA, a name taken for that part of Greece
cap. 56.

* Lib. viii.

which Ptolemy calls Hellas; the younger Pliny, Grec-
cia; now called Lacedaemon: bounded on the north by
Thesaly, the river Sperchius, the Sinus Malicus, and
Mount Óeta; on the west by the river Achelous; on
the east, turning a little to the north, it is washed by
the Archipelago, down to the promontory of Sonium;
on the south, joined to Peloponnesus, or the Morea, by
the isthmus of Corinth, five miles broad.
ACHAYA Propria, anciently a small district in the north of Peloponnesus, running westward along the bay of Corinth, and bounded on the west by the Ionian sea, on the south by Elis and Arcadia, and on the east by Sicily: inhabitants the Achaeans, properly so called; its metropolis Patrae. It is now called Romani Altic, in the Morea.

ACHAIA was also taken for all those countries that joined in the Achean league, reduced by the Romans to a province. Likewise for Peloponnesus.

ACHAIAN Presbyteri, or the Presbyters of Achain, were those who were present at the martyrdom of St. Andrew the apostle, A. D. 59; and are said to have written an epistle in relation to it. Bellarmine, and several other eminent writers in the church of Rome, allow it to be genuine; while Du Pin, and some others, expressly reject it.

ACHAIUS, son of Ethwio, was raised to the crown of Scotland, A. D. 788. The emperor Charlemagne sent an embassy to this prince, to request an alliance with him against the English, whose pirates so infested the seas, that the merchants could not carry on their trade. The alliance was concluded in France, upon conditions so advantageous to the Scots, that Achaius, to perpetuate the memory of it, added to the arms of Scotland a double field sowed with lilies. He died in 810.

ACHALALACTIL, a species of king's-fisher. See ALCEDO, Ornithology Index.

ACHAN, the son of Carmi, of the tribe of Judah, at the taking of Jericho, concealed two hundred shekels of silver, a Babylonish garment, and a wedge of gold, contrary to the express command of God. This sin proved fatal to the Israelites, who were repulsed at the siege of Ai. In this dreadful exigence, Joshua prostrated himself before the Lord, and begged that he would have mercy upon his people. Achan was discovered by casting lots, and he and his children were stoned to death. This expiation being made, Ai was taken by stratagem. Josh. vii. 8, 9.

ACHANE, an ancient Persian corn measure, containing 45 Attic medimni.

ACHARACA, anciently a town of Lydia, situated between Tralles and Nysa; in which were the temple of Pluto and the cave Charionum, where patients slept in order to obtain a cure.

ACHAT, in Law, implies a purchase or bargain. And hence probably purveyors were called achators, from their making bargains.

ACHATES, the companion of Aeneas, and his most faithful friend, celebrated in Virgil.

ACHATES, in Natural History, the same as Agate.

ACHATES, in Ancient Geography, a river of Sicily, now the Drillo; which runs from north to south, almost parallel with, and at no great distance from, the Gela; and rises in the north of the territory of Noto. It gave name to the achates, or agate, said to be first found there.

ACHZIB, or ACHZIB, in Ancient Geography, a town of Galilee, in the tribe of Asher, nine miles from Ptolemais.—Also a town in the more southern parts of the tribe of Judah.

ACHEEN, ACH, or ACHEN, a kingdom of Sumatra in the East Indies, situated in the north-western part of the island.

The capital is situated on a river which empties itself near the north-west point, or Acheen head, about two miles from the mouth. It lies in a wide valley, formed like an amphitheatre by two lofty ranges of hills. The river is not large, and by emptying itself in several channels is rendered very shallow at the bar. In the dry monsoon, it will not admit boats of any burthen, much less large vessels, which lie without, in the road formed by the islands off the point. Though no longer the great mart of eastern commodities, it still carries on a considerable trade with the natives of that part of the coast of Indostan called Telling, who supply it with the cotton goods of their country, and receive in return, gold dust, sapan wood, betel nut, patch-leaf, a little pepper, sulphur, camphire, and benzoin. The country is supplied with Bengal opium, and also with iron, and many other articles of merchandise, by the European traders.

Acheen is esteemed comparatively healthy, being most free from woods and swamps than most other portions of the island; and the fevers and dysenteries to which these are supposed to give occasion, are there said to be uncommon. The soil is light and fertile; and the products, besides those already enumerated as articles of export trade, and a variety of fine fruits, are chiefly rice and cotton. There is likewise some raw silk procured in the country, of very inferior quality. Gold dust is collected in the mountains near Acheen, but the greatest part is brought from the southern ports of Nalaboo and Soosoo. The sulphur is gathered from a volcanic mountain in the neighbourhood, which supplies their own consumption for the manufacture of gunpowder, and admits of a large exportation.

In their persons, the Achenese differ from the rest of the Sumatrans, being taller, stouter, and darker complexioned. They appear not to be a genuine people; but are thought, with great appearance of reason, to be a mixture of Bataas, Malays, and Moors from the west of India. In their dispositions they are more active and industrious than their neighbours; they possess more penetration and sagacity; have more general knowledge; and, as merchants, they deal upon a more extensive and liberal footing. Their religion is Mahometanism; and having a great number of mosques and priests, its forms and ceremonies are strictly observed.

The appearance of the town, and the nature of the buildings, are much the same as are found in the generality of Malay bazaars, excepting that the superior wealth of this place has occasioned a great number of public edifices, but without the smallest pretensions to magnificence. The king's palace, if it deserves the appellation, is a very rude and unworkie piece of architecture, designed to resist the force of an enemy, and surrounded for that purpose by strong walls, but without any regular plan, or view to the modern system of military attack. The houses in common are built of bamboo and rough timber, and raised some feet from the ground on account of the place being overflowed in the rainy season.

A considerable fabric of a thick species of cotton cloth, and of stuff for the short drawers worn both by Malays and Achenese, is established here, and supplies an extensive demand. They weave also very handsome silk pieces of a particular form, for that part of the dress which is called by the Malays cayen servong.
Achæen.

The Acheneæ are expert and bold navigators, and employ a variety of vessels, according to the voyages they undertake, and the purposes for which they design them. The river is covered with a multitude of fishing sampans or canoes, which go to sea with the morning breeze, and return in the afternoon, with the sea wind, fully laden.

Having no convenient coins, though most species of money will be taken here at a valuation, they commonly make their payments in gold dust, and for that purpose are all provided with scales or small steelyards. They carry their gold about them, wrapped up in pieces of bladder, and often purchase to so small an amount, as to make use of grains or seeds for weights.

The monarchy is hereditary; and the king usually maintains a guard of 100 sepoys about his palace.

According to Mr. Marsten, "the grand council of the nation consists of the king or sultan, four coloballongs, and eight of a lower degree, who sit on his right hand, and sixteen cafoorangs, who sit on his left. At the king's feet sits a woman, to whom he makes known his pleasure: by her it is communicated to an eunuch, who sits next to her; and by him to an officer named cafooreng gondong, who then proclaims it aloud to the assembly. There are also present two other officers, one of whom has the government of the bosar or market, and the other the superintending and carrying into execution the punishment of criminals. All matters relative to commerce and the customs of the port come under the jurisdiction of the shabandar, who performs the ceremony of giving the chesp or license for trade; which is done by lifting a golden-hafted cresser over the head of the merchant who arrives, and without which he dares not to land his goods. Presents, the value of which are become pretty regularly ascertained, are then sent to the king and his officers. If the stranger be in the city, not an ambassador, the royal elephants are sent down to carry him and his letters to the monarch's presence; these being first delivered into the hands of an eunuch, who places them in a silver dish, covered with rich silk, on the back of the largest elephant, which is provided with a machine (howser) for that purpose. Within about an hundred yards of an open hall, where the king sits, the cavalcade stops, and the ambassador disembark, and makes his obeisance by bending his body, and lifting his joined hands to his head. When he enters the palace, if an European, he is obliged to take off his shoes; and having made a second obeisance, is seated upon a carpet on the floor, where betel is brought to him. The throne was some years ago of ivory and tortoiseshell; and when the place was governed by queens, a curtain of gauze was hung before it, which did not obstruct the audience, but prevented any perfect view. The stranger, after some general discourse, is then conducted to a separate building, where he is entertained with the delicacies of the country by the officers of state, and in the evening returns in the manner he came, surrounded by a prodigious number of lights. On high days (oree ryeed) the king goes in great state, mounted on an elephant richly caparisoned, to the great mosque, preceded by his colobballongs, who are armed near the European manner."

The country under the immediate jurisdiction of Achæen, is divided into three districts, named Duo-poolo duo, Duo-poolo leemo, and Duo-poolo anam. Each district is governed by a pangleemo, and under him an imoom and four pangeechees to each mosque.

"Achæen has ever been remarkable for the severity with which crimes are punished by their laws: the same rigour still subsists, and there is no commutation admitted, as is regularly established in the southern countries. There is great reason, however, to conclude, that the poor alone experience the rod of justice; the nobles being secure from retribution in the number of their dependants. Petty theft is punished by suspending the criminal from a tree, with a gun or heavy weight tied to his feet, or by cutting off a finger, a hand, or leg, according to the nature of the theft. Many of these mutilated and wretched objects are daily to be seen in the streets. Robbery on the highway and house-breaking are punished by drowning, and afterwards exposing the body on a stake for a few days. If the robbery is committed upon an imoom or priest, the sacrilege is expiated by burning the criminal alive. A man who is convicted of adultery is seldom attempted to be screened by his friends, but is delivered up to the friends and relations of the injured husband. These take him to some large plain, and forming themselves in a circle, place him in the middle. A large weapon called a gadoobong, is then delivered to him by one of his family; and if he can force his way through those who surround him, and make his escape, he is not liable to further prosecution; but it commonly happens that he is instantly cut to pieces. In this case his relations bury him as they would a dead buffalo, refusing to admit the corpse into their house, or to perform any funeral rites." These discouragements to vice might seem to bespeak a moral and virtuous people: yet all travellers agree in representing the Acheneæ as one of the most dishonest and flagitious nations of the East.

Achæen was visited by the Portuguese in 1599. They made various attempts to establish themselves in the country, but were expelled with disgrace. The state is exposed to frequent convulsions, and in 1805 the prince was obliged to desert his capital. See SUMATRA.

ACHELOUS, in fabulous history, wrestled with Hercules, for no less a prize than Deianira, daughter of King Oeneus: but as Achelous had the power of assuming all shapes, the contest was long dubious: at last as he took that of a bull, Hercules tore off one of his horns; so that he was forced to submit, and to redeem it by giving the conqueror the horn of Amalthea, the same with the cornucopie or horn of plenty; which Hercules having filled with a variety of fruits, consecrated to Jupiter. Some explain this fable, by saying, that Achelous is a winding river of Greece, whose stream was so rapid, that it roared like a bull, and overflowed its banks; but Hercules, by bringing it into two channels, broke off one of the horns, and so restored plenty to the country. See the next article.

ACHELOUS, a river of Acrania; which rises in Mount Pindus, and, dividing Alpheus from Acrania, falls from north to south into the Sioux Chryseus. It was formerly called Thoas from its impetuousity, and king of rivers (Homer). The epithet Achelous is used for Aquæus, (Virgil); the ancients calling all water Achelous, especially in oaths, vows, and sacrifices, according to Ephorus: Now called Aspro Potamo. Rivers are by the ancient poets called Tauriformes, either
ACH or Achelous II

ACHICOLUM, is used to express the forinx, tholos, or sudatorium of the ancient baths: which was a hot room where they used to sweat. It is also called architholus.

ACHILLSEA, YARROW, MILFOIL, NOSEBLEED, or SNEEZEWORT. See BOTANY INDEX.

ACHILLEID, ACHILLES, a celebrated poem of Statius, in which that author proposed to deliver the whole life and exploits of Achilles; but being prevented by death, he has only treated of the infancy and education of his hero. See STATIUS.

ACHILLES, one of the greatest heroes of ancient Greece, was the son of Peleus and Thetis. He was a native of Pthia, in Thessaly. His mother, it is said, in order to consume every mortal part of his body, used to lay him every night under live coals, anointing him with ambrosia, which preserved every part from burning but one of his lips, owing to his having licked it. She dipped him also in the waters of the river Styx; by which his whole body became invulnerable, except that part of his heel by which she held him. But this opinion is not universal, nor is it a part of his character as drawn by Homer; for in the Iliad (B. xxi. 161.) he is actually wounded in the right arm, by the lance of Asteropeus, in the battle near the river Scamander. Thetis afterwards intrusted him to the care of the centaur Chiron, who, to give him the strength necessary for martial toil, fed him with honey and the marrow of lions and wild boars. To prevent his going to the siege of Troy, she disguised him in female apparel, and hid him among the maidens at the court of King Lycomedes; but Ulysses discovering him, persuaded him to follow the Greeks. Achilles distinguished himself by a number of heroic actions at the siege. Being disguised, however, with Agamemnon for the loss of Briseis, he retired from the camp. But returning to avenge the death of his friend Patroclus, he slew Hector, fastened his corpse to his chariot, and dragged it round the walls of Troy. At last Paris, the brother of Hector, wounded him in the heel with an arrow, while he was in the temple treating about his marriage with Philoxena, daughter of King Priam. Of this wound he died, and was interred on the promontory of Sigeum: and after Troy was taken, the Greeks sacrificed Philoxena on his tomb, in obedience to his desire, that he might enjoy her company in the Elysian fields. It is said, that Alexander, seeing this tomb, honoured it by placing a crown upon it; at the same time crying out, that "Achilles was happy in having, during his life, such a friend as Patroclus; and, after his death, a poet like Homer." Achilles is supposed to have died 1183 years before the Christian era.

ACHILLES TUTUS. See TATIUS.

ACHILLUS, in Anatomy, is a strong tendinous cord formed by the tendons of several muscles, and inserted into the os calcis. It has its name from the fatal wound Achilles is said to have received in that part from Paris the son of Priam.

ACHILLINI, ALEXANDER, born at Bologna, and doctor of philosophy in that university. He flourished in the 15th and 16th centuries, and by way of eminence was styled the Great Philosopher. He was a steadfast follower and accurate interpreter of Averroes upon Aristotel, but most admired for his acuteness and strength of arguing in private and public disputations.
He made a surprising quick progress in his studies, and was very early promoted to a professorship in the university; in which he acquitted himself with so much applause that his name became famous throughout all Italy. He continued at Bologna till the year 1506; when the university of Padua made choice of him to succeed Antonio Francatian in the first chair of philosophy, and his fame brought vast numbers of students to his lectures at Padua: but the war, wherein the republic of Venice was engaged against the league of Cambrai, putting a stop to the lectures of that university, he withdrew to his native country, where he was received with the same marks of honour and distinction as before, and again appointed professor of philosophy in Bologna. He spent the remainder of his life in this city, where he died, and was interred with great pomp in the church of St Martin the Great, which belongs to the Carmelite friars. Jovius, who knew Achillini, and heard his lectures, says, that he was a man of such exceeding simplicity, and so unacquainted with address and flattery, that he was a laughing stock to the pert and saucy young scholars, although esteemed on account of his learning. He wrote several pieces on philosophical subjects, which he published, and dedicated to John Bentivogli.

ACHILLINI, Claudius, grandson of the former, read lectures at Bologna, Ferrara, and Parma; where he was reputed a great philosopher, a learned divine, an excellent lawyer, an eloquent orator, a good mathematician, and an elegant poet. He accompanied Cardinal Ludovino, who went as legate into Piedmont; but being afterward neglected by this cardinal, when he became pope under the name of Gregory XV, he left Rome in disgust, and retired to Parma, where the duke appointed him professor of law, with a good salary. A canzone which he addressed to Louis XIII. on the birth of the dauphin, is said to have been rewarded by cardinal Richier, with a gold chain of the value of 1000 crowns. He published a volume of Latin letters, and another of Italian poems, which gained him great reputation. He died in 1640, aged 66.

ACHIOTTE, or ACHIOTEL, a foreign drug, used in dying and in the preparation of chocolate. It is the same with the substance more usually known by the name of ARNOTTO. See Bixa, Botany Index.

ACHIROPOETOS, a name given by ancient writers to certain miraculous pictures of Christ and the Virgin, supposed to have been made without hands. The most celebrated of these is the picture of Christ, preserved in the church of St John Lateran at Rome; said to have been begun by St Luke, but finished by the ministry of angels.

ACHMET, son of Seerim, an Arabian author, has left a book concerning the interpretation of dreams according to the doctrine of the Indians, Persians, and Egyptians, which was translated into Greek and Latin. The original is now lost. He lived about the 4th century.

ACHMET I, emperor of the Turks, the third son and successor of Mahomet III. ascended the throne before he reached the age of fifteen. During the period of his reign, the Turkish empire enjoyed at one time great prosperity, and at another was depressed with adversity. The Asiatic rebels, who took refuge in Persia, involved the two empires in a war, during which the Turks lost Bagdad, to recover which every effort proved unsuccessful. In his reign Transylvania and Hungary were the scenes of war between the Turks and Germans. In addition to the calamities and distresses of war abroad and internal tumults and broils, a pretender to his throne disturbed his repose, and made attempts on his life. He was much devoted to amusements; and spent his time chiefly in the harem and in the sports of the field. His seraglio consisted of 3000 women; and his hunting establishment was composed of 40,000 falconers, and an equal number of hunters, in different parts of his dominions. He expended great sums of money in building, and particularly on a magnificent mosque which he erected in the Hippodrome. Achmet was less cruel than some of his predecessors; but he was haughty and ambitious. He died in 1617 at the age of 29. His three sons successively ascended the throne after him. (Gen. Bign.)

ACHMET II, emperor of the Turks, son of Sultan Ibrahim, succeeded his brother Solymas in 1601. The administration of affairs during his reign was feeble and unsettled. The Ottoman territory was overrun by the imperialists; the Venetians seized the Morea, took the isle of Chios, and several places in Dalmatia; and the Arabs attacked and plundered a caravan of pilgrims, and even laid siege to Mecca. Though he never discovered the vigour and sagacity that are essentially requisite in the character of a sovereign, in private life he was mild, devout, and inoffensive. He was fond of poetry and music; and to those about his person, he was cheerful and amiable. He died in 1623 at the age of 50.

ACHMET III, emperor of the Turks, son of Mahomet IV. succeeded his brother Mustapha II. who was deposed in 1703. After he had settled the discontents of the empire, his great object was to amass wealth. With this view he debased the coin, and imposed new taxes. He received Charles XII. of Sweden, who took refuge in his dominions, after the battle of Pultowa in 1709, with great hospitality; and, influenced by the sultana mother, he declared war against the Czar Peter, Charles's formidable rival. Achmet recovered the Morea from the Venetians; but his expedition into Hungary was less fortunate, for his army was defeated by Prince Eugene at the battle of Peterwaradin in 1716. As the public measures of Achmet were influenced by ministers and favourites, the empire during his reign was frequently distracted by political struggles and revolutions. The discontent and sedition of his soldiers at last drove him from the throne. He was deposed in 1730, and succeeded by his nephew Mahomet V. He was confined in the same apartment which had been occupied by his successor previous to his elevation to the throne, and died of an apoplexy in 1736, at the age of 74. The intentions of this prince, it is said, were upright; but his talents were moderate, never discovering that vigour of mind and steadiness of action which are so necessary in the character of a sovereign. Excessive confidence in his vizzier diminished the splendour of his reign, and probably tended to shorten the period of it. (Gen. Bign.)

ACHMET GEDUC, a famous general under Mahomet II. and Bajazet II. in the 15th century. When Mahomet II. died, Bajazet and Zezan both claimed the throne: Achmet sided with the former, and by his bravery
bravery and conduct fixed the crown on his head. But Bajazet took away his life; shining virtue being always an unpardonable crime in the eyes of a tyrant.

ACHMETSCHEL, a town of the peninsula of the Crimea, the residence of the sultan Galga, who is eldest son of the khan of Tartary. F. Long. 52. 20. N. Lat. 45. 35.

ACHMIN, a large town of Upper Egypt, situated on the eastern bank of the Nile. One admires there (says Abulfeda, as quoted by M. Savary) a temple which is comparable to the most celebrated monuments of antiquity. It is constructed with stones of a surprising size, on which are sculptured innumerable figures. Though this town be fallen from its ancient splendour, it is still one of the most beautiful of Upper Egypt. According to M. Savary, an Arab prince commands there, and the police is well attended to. The streets are wide and clean, and commerce and agriculture flourish. It has a manufacture of cotton stuffs, and pottery, which are conveyed over all Egypt. It is the same that Herodotus calls Chemmis, and Strabo Panopolis, or the city of Pau, who was worshipped there. Herodotus says, that Perseus was a native of this city, and that his descendants had established festivals there in his honour. It has lost its ancient edifices, and much of its extent; the ruins of the temple, described by Abulfeda, being without its limits to the north. Nothing remains of it but some stones, of such magnitude that the Turks have not been able to move them. They are covered with hieroglyphics. On one of them are traced four concentric circles, in a square. The innermost of these contains a sun. The two succeeding ones, divided into 12 parts, contain one, 12 birds, the other, 12 animals, almost effaced, which appear to be the signs of the zodiac. The fourth has no divisions, and presents 12 human figures: which M. Savary imagines to represent the 12 gods, 12 months of the year, and 12 signs of the zodiac. The Egyptians, says Herodotus, knew the first 20 years of the month, the 12 months, and employed the names of the 12 gods. The four seasons occupy the angles of the square, on the side of which may be distinguished a globe with wings. M. Savary thinks it probable that this stone belonged to a temple dedicated to the sun, that the whole of these hieroglyphics mark his passage into the signs of the zodiac, and his course, whose revolution forms the year. The columns of this temple have been partly broken to make lime and millstones. Some of them have been transported into one of the mosques of Achmin, where they are placed without taste; others are heaped up in the squares of the town.

M. Savary tells us of a serpent which is worshipped here, and is the wonder of the country. "Upwards of a century ago (says he) a religious Turk called Suleik Haridi died here. He passed for a saint among the Mahometans; he raised a monument to him, covered with a cupola, at the foot of the mountain. The people flocked from all parts to offer up their prayers to him. One of the priests, profiting by their credulity, persuaded them that God had made the soul of Scheik Haridi pass into the body of a serpent. Many of these are found in the Thébas, which are harmless; and he had taught one to obey his voice. He appeared with his serpent, dazzled the vulgar by his surprising tricks, and pretended to cure all disorders.

ACHN, Some lucky instances of success, due to nature alone, and sometimes to the imagination of the patients, gave him great celebrity. He soon consigned his serpent Haridi to the tomb, producing him only to oblige princes and persons capable of giving him a handsome recompense. The successors of this priest, brought up in the same principles, found no difficulty in giving sanction to so advantageous an error. They added to the general persuasion of his virtue that of his immortality. They had the boldness even to make a public proof of it. The serpent was cut in pieces in presence of the emir, and placed for two hours under a vase. At the instant of lifting up the vase, the priests, no doubt, had the address to substitute one exactly resembling it. A miracle was proclaimed, and the immortal Haridi acquired a fresh degree of consideration. This knavery procures them great advantages. The people flock from all quarters to pray at this tomb; and if the serpent crawls out from under the stone, and approaches the supplicant, it is a sign that his malady will be cured. It may be imagined that he does not appear till an offering has been made proportioned to the quality and riches of the different persons. In extraordinary cases, where the sick persons cannot be cured without the presence of the serpent, a pure virgin must come to solicit him. To avoid inconveniences on this head, they take care to choose a very young girl indeed. She is decked out in her best clothes, and crowned with flowers. She puts herself in a praying attitude; and as the priests are inclined, the serpent comes out, makes circles round the young suppliant, and goes and reposes on her. The virgin, accompanied by a vast multitude, carries him in triumph amidst the general acclamation. No human reasoning would persuade these ignorant and credulous Egyptians that they are the dupes of a few impostors; they believe in the serpent Haridi as firmly as in the prophet." E. Long. 51. 55. N. Lat. 26. 20.

ACHONRY, a small town of Ireland, in the province of Connaught and county of Sligo, seated on the river Shannon.

ACHOR, a valley of Jericho, lying along the river Jordan, not far from Gilgal; so called from Achon, the trouble of Israel, being there stoned to death.

ACHOR, in Medicine, a species of HERBS.

ACHOR, in Mythology, the god of flies; to whom, according to Pliny, the inhabitants of Cyrene sacrificed, in order to obtain deliverance from the insects and the disorders occasioned by them.

ACHRADINA, in Ancient Geography, one of the four cities or divisions of Syracuse, and the strongest, largest, and most beautiful part of it; separated by a very strong wall from the outer town, Tycha and Neapolis. It was adorned with a very large forum, with beautiful porticoes, a most elegant prytaneum, a spacious senate-house, and a superb temple of Jupiter Olympus.

ACHRAS, or SAPOTA PLUM. See BOTANY INDEX.

ACHROMATIC, an epithet expressing want of colour. The word is Greek, being compounded of a privative, and ἄχρωμα, colour. This term was first introduced into astronomy by De la Lande.

ACHROMATIC TELESCOPES, are telescopes contrived to remedy the aberrations in colours. They were invent-
Achromatic by Mr John Dollond, optician, and have been since improved by his son and others. See ABBREVIATION.

A more particular account of the invention and construction of these instruments will be found under OPTICS.

ACHELING, a measure for liquids used in Germany. Thirty-two achelings make a hectar; four scellins or scellins make an achelting.

ACHYR, a strong town and castle of the Ukrain, subject to the Russians since 1667. It stands on the river Uorsko, near the frontiers of Russia, 127 miles west of Kiow. E. Long. 36. C. N. Lat. 49. 32.

ACHYRANTHEMIS, in Botany. See BOTANY Index.

ACICANTHERA, in Botany, the trivial name of a species of RHORIA.

ACICULÆ, the small pikes or prickles of the hedgehog, echinus marinus, &c.

ACIDALIS, VEGIS, would, in all probability, have been one of the greatest critics in these latter ages, had he lived longer to perfect those talents which nature had given him. He was born at Witstock, in Brandenburg; and having visited several academies in Germany, Italy, and other countries, where he was greatly esteemed, he afterwards took up his residence at Breslaw, the metropolis of Silesia. Here he remained a considerable time, in expectation of some employment; but nothing offering, he turned Roman Catholic, and was chosen rector of a school at Niessa. It is related, that about four months after, as he was following a procession of the host, he was seized with a sudden phrensy; and being carried home, expired in a very short time. But Thuanus tells us, that his excessive application to study was the occasion of his untimely death; and that his sitting up in the night composing his Conjectures on Plautus, brought upon him a distemper which carried him off three days, on the 23th of May 1595, being just turned of 29. He wrote a Commentary on Quintus Curtius; also, Notes on Tacitus, on the twelve Panegyrics; besides several letters and poems. His principal pieces are inserted in the Delicie of the German poets, and consist of epic verses, odes, and epigrams. A little work printed in 1595, under the title of Malvires non esse homines, "That women were not of the human species," was falsely ascribed to him. But the fact was, that Acidalius happening to meet with the manuscript, and thinking it very whimsical, transcribed it, and gave it to the bookseller, who printed it. The performance was highly censured, so that the bookseller being seized, he discovered the person who gave him the manuscript, and a terrible outcry was made against Acidalius. A story goes, that being one day to dine at a friend's house, there happened to be several ladies at table; who supposing him to be the author, were moved with so much indignation, that they threatened to throw their plates at his head. Acidalius, however, ingeniously diverted their wrath. In his opinion, he said, the author was a judicious person, the ladies being certainly more of the species of angels than of men.—Mr Baillet has given him a place among his Enfants Celebres; and says, that he wrote a comment upon Plautus when he was but 17 or 18 years old, and that he composed several Latin poems at the same age.

ACIDALUS, a fountain in Orchomenus, a city of Boetia, in which the Graces, who are sacred to Venus, bathed. Hence the epithet Acidalia, given to Venus, (Virgil.)

ACIDITY, that quality which renders bodies acid.

ACIDITON, in Botany, the trivial name of a species of ADELIA.

ACIDS, in Chemistry, a class of substances which are distinguished by the following properties.

1. When applied to the tongue, they excite that sensation which is called sour or acid.
2. They change the blue colours of vegetables to a red. The vegetable blues employed for this purpose are generally tincture of bitumin and syrup of violets or of radishes, which have obtained the name of reagents or tests. If these colours have been previously converted to a green by alkalies, the acids restore them again.
3. They unite with water in almost any proportion.
4. They combine with all the alkalies, and most of the metallic oxides and earths, and form with them those compounds which are called salts.

It must be remarked, however, that every acid does not possess all these properties; but all of them possess a sufficient number of them to distinguish them from other substances. And this is the only purpose which artificial definition is meant to answer.

The acids are by far the most important class of bodies in chemistry. It was by their means indeed, by studying their properties, and by employing them as instruments in the examination of other bodies, that men of science laid the foundation of chemistry, and brought it to that state in which we find it at present.

The nature and composition of acids, therefore, became a very important point of discussion, and occupied the attention of the most eminent cultivators of the science.

Paracelsus believed that there was only one acid principle in nature, which communicated taste and solubility to the bodies in which it was combined. Hecher embraced the same opinion; and added to it, that this acid principle was a compound of earth and water, which he considered as two elements. Stahl adopted the theory of Boccher, and endeavoured to prove that his acid principle is sulphuric acid; of which, according to him, all the other acids are mere compounds. But his proofs were only conjectures or vague experiments, from which nothing could be deduced. Nevertheless, his opinion, like every other which he advanced in chemistry, continued to have supporters for a long time, and was even countenanced by Macquer. At last its defects began to be perceived; Bergman and Scheele declared openly against it; and their discoveries, together with those of Lavoisier, demonstrated the falsehood of both parts of the theory, by showing that sulphuric acid does not exist in the other acids, and that it is not composed of water and earth, but of sulphur and oxygen.

The opinion, however, that acidity is owing to some principle common to all the salts, was not abandoned. Wallerius, Meyer, and Sage, had advanced different theories in succession about the nature of this principle, but as they were founded rather on conjecture and analogy than direct proof, they obtained but few advocates. At last M. Lavoisier, by a number of ingenious and accurate experiments, proved that several combustible
Acids. Combustible substances, when united with oxygen, form acids; that a great number of acids contain oxygen; and that when this principle is separated from them, they lose their acid properties. He concluded, therefore, that the acidifying principle is oxygen, and that acids are nothing else but combustible substances combined with oxygen, and differing from one another according to the nature of the combustible base.

This conclusion, as far as regards the greater number of acids, is certainly true. All the simple combustibles, except hydrogen, are convertible into acids; and these acids are composed of oxygen and the combustible body combined: this is the case also with four of the metals. It must not, however, be admitted without some limitation.

1. When it is said that oxygen is the acidifying principle, it is not meant surely to affirm that oxygen possesses the properties of an acid, which would be contrary to truth; all that can be meant is, that it enters as a component part into acids, or that acids contain it as an essential ingredient.

2. But, even in this sense, the assertion cannot be admitted: for it is not true that oxygen is an essential ingredient in all acids, or that no body possesses the property of an acid unless it contains oxygen. Sulphured hydrogen, for instance, possesses all the characters of an acid, yet it contains no oxygen.

3. When it is said that oxygen is the acidifying principle, it cannot be meant surely to affirm that the combination of oxygen with bodies produces in all cases an acid, or that whenever a body is combined with oxygen, the product is an acid; for the contrary is known to every chemist. Hydrogen, for instance, when combined with oxygen, forms not an acid, but water, and the greater number of metallic bodies form only oxides.

All that can be meant, then, when it is said that oxygen is the acidifying principle, is merely that it exists as a component part in the greater number of acids; and that many acids are formed by combustion, or by some equivalent process. The truth is, that the class of acids is altogether arbitrary, formed when the greater number of the bodies arranged under it were unknown, and before any precise notion of what ought to constitute the characteristic marks of an acid had been thought of. New bodies, when they were discovered, if they possessed any properties analogous to the known acids, were referred without scruple to the same class, how much soever they differed from them in other particulars. Hence we find, under the head of acids, bodies which have scarcely a single property in common, except that of combining with alkalis and earths.

What substances, for instance, can be more dissimilar than sulphuric, prussic, and uric acids? Hence the difficulty of assigning the general characters of the class of acids, and the disputes which have arisen about the propriety of classing certain bodies among acids. If we lay it down as an axiom that oxygen is the acidifying principle, we must either include among acids a great number of bodies which have not the smallest resemblance to those substances which are at present reckoned acids, or exclude from the class several bodies which have the properties of acids in perfection. The class of acids being perfectly arbitrary, there can not be such a thing as an acidifying principle in the most extensive sense of the word.

The acids at present known amount to about 30; and all of them, eight excepted, have been discovered within these last 40 years. They may be arranged under two general heads: 1. Acids composed of two ingredients. 2. Acids composed of more than two component parts. (Thomson's Chemistry.) See Chemistry.

ACIDULOUS, denotes a thing that is slightly acid: it is synonymous with the word sub-acid.

ACIDULÆ: Mineral waters that are brisk and sparkling without the action of heat are thus named; but if they are hot also, they are called Thermæ.

ACIDULATED, a name given to medicines that have an acid in their composition.

ACIDUM AEREUM, the same with fixed air; or, in modern chemistry, carbonic acid.

ACIDUM PINGUE, an imaginary acid, which some German chemists supposed to be contained in fire, and by combining with alkalies, lime, &c. to give them their caustic properties; an effect which is found certainly to depend on the loss of their carbonic acid.

ACILA, in Ancient Geography, a staple or mart town in Arabia Felix, on the Arabian gulf, from which, according to Pliny, the Scenite Sabac set sail for India. Now Ziden.

ACILISENÆ, in Ancient Geography, a district of the lesser Armenia towards the head of the Euphrates, having that river on the west, and on the south a river to which Xenophon and Pliny seem to have given the same name.

ACILIUS GLABRIO, Marcus, consul in the year of Rome 562, and 211 years before the Christian era, distinguished himself by his bravery and conduct in gaining a complete victory over Antiochus the Great, king of Syria, at the straits of Thermopylae in Thessaly, and on several other occasions. He built the temple of Pity at Rome, in consequence of a vow which he made before this battle. He is mentioned by Pliny, Valerius Maximus, and others.

ACINASIS, in Ancient Geography, a river of Asia, at the southern extremity of Colchis, which discharges itself into the Euxine sea, between the Bathylias and the Lys. It is mentioned by Arrian in his Periplus.

ACINIPPO, in Ancient Geography, a town of Bactica: its ruins, called Ronda la Vigna, are to be seen near Arunda, in the kingdom of Granada.

ACINODENDRUM, in Botany, the trivial name of a species of Melastoma.

ACINOS, in Botany, the trivial name of a species of Thymus. See Botany Index.

ACINUS, or ACINI, the small protuberances of mulberries, strawberries, &c. and by some applied to grapes. Generally it is used for those small grains growing in bunches, after the manner of grapes, as Siguufrum, &c.

ACIS, in Mythology, the son of Faunus and the nymph Simaethus, was a beautiful shepherd of Sicily, who being beloved by Galatea, Polyphemus the giant was so enraged, that he dashed out his brains against a rock; after which Galatea turned him into a river, which he was called by his name.

The Sicilian authors say, that Acis was a king of this
this part of the island, who was slain by Polyphemus, 

one of the giants of Ατά, in a fit of jealousy.

Acis, a river of Sicily, celebrated by the poets, running from a very cold spring, in the woody and shady foot of Mount Ατά, for the space of a mile eastward 

into the sea, along green and pleasant banks, with the 

speed of an arrow, from which it takes its name. Its 

waters are now impregnated with sulphureous vapours, 

though formerly they were celebrated for their sweet-

ness and salubrity, and were held sacred by the Sicilian 

shepherds:

Quique per Ατάνα τοις Acis petit aqua non fines, 

Et dulci gratam Nercida peruit unda. S. ITAL.

It is now called Il Fiume Fredda, Acis, Jaci, or Chi-

oci, according to the different Sicilian dialects: An-

tonine calls it Acis. It is also the name of a hamlet 

at the mouth of the Acis.

ACKERMANN, JOHN C. GOTTLIB, an eminent 

German medical writer. See SUPPLEMENT.

ACKNOWLEDGMENT, in a general sense, is a 

person's owning or confessing a thing; but more parti-

cularly, is the expression of gratitude for a favour.

ACKNOWLEDGMENT-Money, a certain sum paid by 

tenants, in several parts of England, on the death of 

their landlords, as an acknowledgment of their new lords.

ACLIDES, in Roman antiquity, a kind of missile 

weapon, with a thong affixed to it, by which it was 

drawn back. Most authors describe it as a sort of dart 

or javelin; but Scaliger makes it roundish or globular, 

and full of spikes, with a slender wooden stem to poise 

it by. Each warrior was furnished with two.

ACLOVA, in Botany, a barbarous name of a spe-

cies of Colutea. It is used by the natives of Guinea 

to cure the itch: They rub it on the body as we do 

groggins. See Colutea, BOTANY INDEX.

ACME, the top or height of any thing. It is usu-

ally applied to the maturity of an animal just before it 

begins to decline; and physicians have used it to ex-

press the utmost violence or crisis of a disease.

ACMELIA, in Botany, the trivial name of a spe-

cies of Spilanthus. See Botany INDEX.

ACMODAE, in Ancient Geography, seven islands 

in the British sea, supposed by some to be the Scillies islands, 

but by others those of Shetland near the Orkneys, on 

the northern coast of Scotland.

ACMONIA, and AGMONIA, in Peutinger's map, 

town of Phrygia Major, now in ruins. The inhabi-

tants are called Acmoneses by Cicero, and the city 

Civitas Acmens. Also a city of Dacia (Potaemy), 

on the Danube, near the ruins of Trajun's bridge, built 

by Severus, and called Severicum; distant 12 German 

miles from Temeswar, to the south-east.

ACNIDA, VIRGINIAN HEMP. See Botany Index.

ACNUA, in Roman antiquity, signified a certain 

measure of land, about an English rood, or fourth part 

of an acre.

ACO, in Geography, a town of Peru in South A-

merica. It is also the name of a river in Africa, which 

rises in the Abyssinian mountains, runs in a south-east 

course, and discharges itself into the Indian ocean.

ACOMETE, or ACMETTE, in church history, or, 

Men who lived without sleep; a set of monks who 

shanted the divine service night and day in their places 

of worship. They divided themselves into three bo-

dies, who alternately succeeded one another, so that 

the service in their churches was never interrupted.

This practice they founded upon the precept, Pray with-

out ceasing. They flourished in the east about the mid-

dle of the 5th century. There are a kind of acometi 

still subsisting in the Roman church, viz. the religious 

of the holy sacrament, who keep up a perpetual adora-

tion, some one or other of them praying before the 

holy sacrament day and night.

ACOLA, in Ancient Geography, a town in Medis, 

on the borders of the Hyrcanian sea.

ACOLOTHUS, or ACOLOTHSTS, in antiquity, was 
an appellation given to those persons who were steady 

and immovable in their resolutions; and hence the 

Stoics, because they would not forsake their principles, 

nor alter their resolutions, acquired the title of acolo-

thi. The word is Greek, and compounded of a priva-

tive, and kathé, way; as never turning from the original 

course.

ACOLUTHUS, among the ancient Christians, implied 
a peculiar order of the inferior clergy in the Latin 

church, for they were unknown to the Greeks for above 

400 years. They were next to the subdeacon; and 

we learn from the fourth council of Carthage, that the 

archdeacon, at their ordination, put into their hands a 

candlestick with a taper, giving them thereby to under-

stand that they were appointed to light the candles of 

the church; as also an empty pitchet, to imply that 

they were to furnish wine for the eucharist. Some 

think they had another office, that of attending the 

bishop wherever he went. The word is Greek, and 

compounded of a privative, and kathé, to hinder or 

disturb.

ACOLYTHIA, in the Greek church, denotes the 

office or order of divine service; or the prayers, cer-

emonies, hymns, &c. whereof the Greek service is 

composed.

ACOMA, a town of New Mexico, seated on a hill, 

with a strong castle. To reach the town, you walk up 

go steps cut out of the rock. It is the capital of that 

province, and was taken by the Spaniards in 1599.

W. Long. 104. 15. Lat. 35. o.

ACOMINATUS, NICETAS, was secretary to A-

lexius Commnenus and to Isaacus Angelus successively: 

he wrote a history from the death of Alexius Commenus 

in 1118, where Zonaras ended his, to the year 1203, 

which has gone through many editions, and has been 

much applauded by the best critics.

ACONCROBA, in Botany, the indigenous name of 

a plant which grows wild in Guinea, and is in great 

esteem among the natives for its virtues in the small-

pox. They give an infusion of it in wine. The leaves 

of this plant are opaque, and as stiff as those of the 

phiylea: they grow in pairs, and stand on short foot-

stalks; they are small at each end, and broad in the 

middle; and the largest of them are about three inches 

in length, and an inch and a quarter in breadth in the 

middle. Like those of our bay, they are of a dusky 

colour on the upper side, and of a pale green under-

neath.

ACONITE. See ACONITUM, Botany Index.

WINTER ACONITE. See Helleborus, Botany Index.

ACONITI, in antiquity, an appellation given to 

some of the Athletes, but differently interpreted: 

Mercurialis understands it of those who only anointed 

their
their bodies with oil, but did not smear themselves over with dust, as was the usual practice.

ACONITUM, Aconite, Wolfsbane, or Monkshood. See Botany Index.

ACONTIAS, in Zoology, an obsolete name of the anguis jaculus, or dart-snake, belonging to the order of amphibius serpentes. See ANGUPS.

ACONTIUM, aconitus, in Grecian antiquity, a kind of dart or javelin, resembling the Roman pilum.

ACONITIUS, a young man of the island Cea, who having gone to Delos, to see the sacred rites which were performed there by a crowd of virgins in the temple of Diana, fell desperately in love with Cydippe; but not daring to ask her in marriage, on account of the meanness of his birth, insidiously threw down at her feet an apple, on which were inscribed these words, Me tibi nupturam, (felix est omen,) Acanti, Juro, quam colimus, numina magna Deae. Or according to others, Juro tibi sacra per mystica sacra Diante, Me tibi venturam comitem, sponsamque futuram. The virgin taking upon the apple, inadvertently read the words, and thus apparently bound herself by a promise; for by law, every thing uttered in that temple was held to be ratified. When her father, a little after, ignorant of what had happened, betrothed her to another man, she was suddenly seized with a fever. Whereupon Aconitus sent her a letter, (expressed by Ovid, Ep. 20.) to persuade her that her fever was caused by Diana for not having fulfilled the promise which she had made to him in the temple of that goddess. Cydippe therefore resolved to comply with the wishes of Aconius, even against the inclination of her father. Her answer is the subject of Ovid's 21st epistle. (Adam's Clas. Biog.)

ACONTIUS, James, a philosopher, civilian, and divine, born at Trent in the 16th century. He embraced the reformed religion; and coming into England in the reign of Queen Elizabeth, he was favourably received and much honoured by that princess, which he acknowledges in a book dedicated to her. This work is his celebrated Collection of the Strategems of Satan, which has been so often translated, and passed through so many editions.

ACORN, the fruit of the oak tree. See QUERCUS, Botany Index.

ACORN, in sea language, a little ornamental piece of wood, fashioned like a cone, and fixed on the uppermost point of the spindle, above the vane, on the masthead. It is used to keep the vane from being blown off from the spindle in a whirlwind, or when the ship leans much to one side under sail.

ACORUS, Calamus aromaticus, Sweet Flag, or Sweet Rush. See Botany Index.

ACORUS, in the Materia Medica, a name sometimes given to the great galangal. See KEMPERIA.

ACORUS, in Natural History, blue coral. The true sort is very scarce; some, however, is fished on the coasts of Africa, particularly from Rio del Be to the river of the Camarones. This coral is part of the merchandise which the Dutch trade for with the Camarones: that of the kingdom of Benin is also very much esteemed. It grows in form of a tree on a rocky bottom.

ACOSTA, Joseph D', a celebrated Spanish writer. See Supplement.

ACOSTA, Uriel, a Portuguese, born at Oporto towards the close of the 16th century. He was educated in the Roman religion, which his father also professed, though descended from one of those Jewish families who had been in a manner forced to receive baptism. Uriel had a liberal education. He was instructed in several sciences; and at last he studied law. He had by nature a good temper and mild disposition; and religion had made so deep an impression on his mind, that he ardently desired to conform to all the precepts of the church, to avoid eternal death, which he dreaded. He applied with great assiduity to reading the Scriptures and other religious books, carefully consulting also the creed of the confessors; but the more he studied, the more difficulties occurred, which perplexed him at length to such a degree, that, being unable to solve them, he fell into the most terrible agonies of mind. He thought it impossible to fulfil his duty with regard to the conditions required for absolution; so that he despair of salvation, if he could find no other means of attaining it; and it proved difficult to abandon a religion in which he had been bred up from his infancy, and which had been deeply rooted in his mind. However he began to inquire, whether several particulars mentioned about the other life were agreeable to reason; and, upon inquiry and deliberation, he imagined that reason suggested many arguments against them. Acosta was about two and twenty, when he was thus perplexed with doubts: and the result of his reflections was, that he could not be saved by the religion which he had imbibed in his infancy. Nevertheless he prosecuted his studies in the law; and at the age of five and twenty, was made treasurer in a collegiate church. Being naturally of a religious disposition, and now made uneasy by the popish doctrines, he began to study Moses and the prophets; where he thought he found more satisfaction than in the gospel, and at length became convinced that Judaism was the true religion: and, as he could not profess it in Portugal, he resolved to leave the country. He accordingly resigned his place, and embarked for Amsterdam with his mother and brothers; whom he had ventured to instruct in the principles of the Jewish religion, even when in Portugal. Soon after their arrival in Amsterdam, they became members of the synagogue; were circumcised according to custom; and he changed his name of Gabriel for that of Uriel. A little time was sufficient to shew him, that the Jews did neither in their rites nor morals conform to the law of Moses, of which he could not but declare his disapprobation: but the chiefs of the synagogue gave him to understand, that he must exactly observe their tenets and customs; and that he would be excommunicated, if he deviated in the least from them. This threat, however, had no effect; for he thought it would be a most mean behaviour in him, who had left the sweets of his native country purely for liberty of conscience, to submit to a set of Habbis without any proper jurisdiction; and that it would shew both want of courage and piety, if he should stifle his sentiments on this occasion. He therefore persisted in his invectives, and in consequence was excommunicated: the effect of which was such, that his own brothers durst not speak to him, nor salute him when they met him in the streets. Finding himself thus situated, he wrote a book in his justification; wherein he endeavours to shew, that the rites and traditions
Acosta.
ditions of the Pharisees are contrary to the writings of
Moses, and soon after adopted the opinion of the Sad-
ducees: for he had worked himself up to a belief, that
the rewards and punishments of the old law relate only
to this life; and this, because Moses nowhere men-
tions the joys of heaven, or the torments of hell. His
adversaries were overjoyed at his embracing this tenet;
foreseeing, that it would tend greatly to justify, in
the sight of Christians, the proceedings of the synagogues
against him. Before his book was printed, there
appeared a piece upon the immortality of the soul, writ-
ten by a physician, who omitted nothing he could sug-
gest to make Acosta pass for an atheist. The very
children were encouraged to insult him in the streets,
and to batter his house with stones; all which however
did not prevent him from writing a treatise against the
physician, wherein he endeavoured to confute the doc-
trine of the soul's immortality. The Jews now made
application to the magistrates of Amsterdam; and in-
formed against him, as one who wanted to undermine
the foundation of both Jewish and Christian religions.
He was thrown into prison, but bailed out within a
week or ten days after; however all the copies of his
works were seized, and he himself fined in 300 florins.
Nevertheless, he proceeded still farther in his scepti-
cism. He now began to examine, whether the law of
Moses came from God; and he supposed he had at
length found reasons to convince him, that it was only
a political invention. Yet, instead of drawing this in-
fERENCE from thence, "I ought not to return to the
Jewish communion," he thus argued with himself,
Why should I continue all my life cut off from the
communion, exposed to so many inconveniences, espe-
cially as I am in a country where I am a stranger, and
unacquainted with the language? Had I not better
play the ape among apes?" He accordingly return-
ed to the Jewish church, after he had been excommun-
icated 15 years; and, after having made a recantation
of what he had written, subscribed every thing as
they directed. A few days after, he was accused by
a nephew, who lived in his house, that he did not, as
to his eating and many other points, conform to the
laws of the synagogue. This accusation was attended
with very bad consequences; for a relation of Acosta,
who had got him reconciled to the synagogue, thought
he was in honour bound to persecute him with the ut-
most violence. The Rabbis and the rest of the Jews
were animated with the same spirit; especially, when
they found that Acosta had dissuaded two Christians,
who had come from London to Amsterdam, from turn-
ing Jews. He was summoned before the grand coun-
cil of the synagogue; when it was declared to him,
that he must again be excommunicated, if he did not
give such satisfaction as should be required. He found
the terms so hard, that he could not comply. The
Jews thereupon again expelled him from their commu-
nion; and he afterwards suffered various hardships and
great persecutions, even from his own relations. After
remaining seven years in a most wretched situation, he
at length declared he was willing to submit to the sen-
tence of the synagogue, having been told that he might
easily accommodate matters; for, that the judges, be-
ing satisfied with his submission, would soften the sev-
erture of the discipline. Acosta, however, was caught in
a snare; for they made him undergo the most rigorous
penance. These particulars relating to the life of
Acosta, are taken from his work, entitled, "Exemplar
Humane Vitae," published and refuted by Limborch.
It is supposed that he composed a few days before his
death, after having determined to lay violent hands
on himself. He executed this horrid resolution a little
after he had failed in his attempt to kill his principal
enemy; for the pistol, with which he intended to have
shot him as he passed his house, having missed fire, he
immediately shut the door, and shot himself with anoth-
er pistol. This happened at Amsterdam, but in what
year is not exactly known.

ACOSTAN, a mountainous island in the north seas
between Asia and America, observed by Captain Cook.
ACOUSMATIC, sometimes also called Acous-
tric, in Grecian antiquity, such of the disciples of Pytha-
goras as had not completed their five years probation.
ACOUSTIC, in general, denotes any thing that
relates to the ear, the sense of hearing, or the doctrine
of sounds.

ACOUSTIC Duct, in Anatomy, the same with meatus
auditorius, or the external passage of the ear. See An-
atomy.

ACOUSTIC Instrument, or auricular tube. See Aco-
ustics.

ACOUSTIC Vessels, in the ancient theatres, were a
kind of vessels made of brass, shaped in the bell fashion,
which being of all tones within the pitch of the voice,
or even of instruments, rendered the sound more au-
dible, so that the actors could be heard through all parts
of theatres which were even 400 feet in diameter.

ACOUSTIC Disciples, among the ancient Pythagoreans,
those more commonly called Acousmatici.

ACOUSTICS,

Acoustics, or the Science of Sound, is that science which instructs us in the
nature of sound. It is divided by some writers in-
to Diacoustics, which explains the properties of those
sounds that come directly from the sonorous body to the
ear; and Catacoustics, which treats of reflected sounds:
but such distinctions do not appear to be of any real
utility.

Sound is a term of which it would be preposterous
to offer any definition, as it may almost be said to ex-
press a simple idea: But when we consider it as a sen-
sation, and still more when we consider it as a per-
ception, it may not be improper to give a descrip-
tion of it; because this must involve certain relations
of external things, and certain trains of events in the
material world, which make it a proper object of phi-
losophical discussion. Sound is that primary infor-
mation which we get of external things by means of
the sense of hearing. This, however, does not explain it;
for were we in like manner to describe our sense of
hearing, we should find ourselves obliged to say, that it
is the faculty by which we perceive sound. Languages
are not the invention of philosophers; and we must not expect
A C O U S T I C S.

Preliminary

Our methods of expressing the information given by our different senses are not similar, as a philosopher, cautiously contriving language, would make them. We have no word to express the primary or generic object of our sense of seeing; for we believe, that even the vulgar consider light as the medium, but not the object. This is certainly the case (how justly we do not say) with the philosopher. On the other hand, the words smell, sound, and perhaps taste, are conceived by most persons as expressing the immediate objects of the senses of smelling, hearing, and tasting. Smell and sound are hastily conceived as separate existences, and as mediums of information and of intercourse with the odorous and sounding bodies; and it is only the very cautious philosopher who distinguishes between the smell which he feels and the perfume which fills the room. Those of the ancients, therefore, who taught that sounds were beings wafted through the air, and felt by our ears, should not, even at this day, be considered as awkward observers of nature. It has required the long, patient, and sagacious consideration of the most penetrating geniuses, from Zeno the Stoic to Sir Isaac Newton, to discover that what we call sound, the immediate external object of the sense of hearing, is nothing but a particular agitation of the parts of surrounding bodies, acting by mechanical impulse on our organs; and that it is not any separate being, nor even a specific quality inherent in any particular thing, by which it can affect the organ, as we suppose with respect to a perfume, but merely a mode of existence competent to every atom of matter. And thus the description which we proposed to give of sound must be a description of that state of external contiguous matter which is the cause of sound. It is not therefore prelatory to any theory or set of doctrines on this subject: but on the contrary, is the sum or result of them all.

To discover this state of the external body by which, without any farther intermedium of substance or of operation, it affects our sensitive faculties, must be considered as a great step in science. It will show us at least one way by which mind and body may be connected. It is supposed that we have attained this knowledge with respect to sound. Our success, therefore, is a very pleasing gratification to the philosophic mind. It is still more important in another view: it has encouraged us to make similar attempts in other cases, and has supplied us with a fact to which an ingenious mind can easily fancy something analogous in many abstract operations of nature, and thus it enables us to give some sort of explanation of them. Accordingly this use has been most liberally made of the mechanical theory of sound; and there is now scarcely any phenomenon, either of matter or mind, that has not been explained in a manner somewhat similar. But we are sorry to say that these explanations have done no credit to philosophy. They are, for the most part, strongly marked with that precipitate and self-conceited impatience which has always characterised the investigations conducted solely by ingenious fancy. The consequences of this procedure have been no less fatal to the progress of true knowledge in modern times than in the schools of ancient Greece: and the ethical philosophers of this age, like the followers of Aristotle of old, have filled ponderous volumes with nonsense and error. It is strange, however, that this should be the effect of a great and successful step in philosophy: But the fault is in the philosophers, not in the science. Nothing can be more certain than the account which Newton has given of the propagation of a certain class of undulations in an elastic fluid. But this procedure of nature cannot be seen with distinctness and precision by any but well-informed mathematicians. They alone can rest with unshaken confidence on the conclusions legitimately deduced from the Newtonian theorems; and even they can insure success only by treading with the most scrupulous caution the steps of this patient philosopher. But few have done this; and we may venture to say, that not one in ten of those who employ the Newtonian doctrines of elastic undulations for the explanation of other phenomena have taken the trouble, or indeed were able, to go through the steps of the fundamental proposition (Prin. II. 35. &c.) But the general results are so plain, and admit of such impression illustration, that they draw the assent of the most careless reader; and all imagine that they understand the explanation, and perceive the whole procedure of nature. Emboldened therefore by this successful step in philosophy, they, without hesitation, fancy similar intermediums in other cases; and as air has been found to be a vehicle for sound, they have supposed that something which they call ether, somehow resembling air, is the vehicle of vision. Others have proceeded farther, and have held that ether, or another something like air, is the vehicle of sensation in general, from the organ to the brain: nay, we have got a great volume called A THEORY OF MAN, where all our sensations, emotions, affections, thoughts, and purposes or volitions, are said to be so many vibrations of another something equally unseen, gratuitous, and incompetent; and to crown all, this exalted doctrine, when logically prosecuted, must terminate in the discovery of those vibrations which pervade all others, and which constitute what we have been accustomed to venerate by the name DEITY. Such must be the termination of this philosophy; and a truly philosophical dissertation on the attributes of the Divine Being can be nothing else than an accurate description of these vibrations!

This is not a needless and declamatory rhapsody. If the explanation of sound can be legitimately transferred to those other classes of phenomena, these are certain results; and if so, all the discoveries made by Newton are but the gimmerings of the morning, when compared with this meridian splendour. But if, on the other hand, sound logic forbids us to make this transference of explanation, we must continue to believe, for a little while longer, that mind is something different from vibrating matter, and that no kind of oscillations will constitute infinite wisdom.

It is of immense importance therefore to understand thoroughly this doctrine of sound, that we may see clearly and precisely in what it consists, what are the phenomena of sound that are fully explained, what are the data and the assumptions on which the explanations proceed, and what is the precise mechanical fact in which it terminates. For this, or a fact perfectly similar, must terminate every explanation which we derive from this by analogy, however perfect the analogy may be. This previous knowledge must be completely possessed
ACOUSTICS.

Preliminary Observations.

Sensed by every person who pretends to explain other phenomena in a similar manner. Then, and not till then, he is able to say what classes of phenomena will admit of the explanation: and, when all this is done, his explanation is still an hypothesis, till he is able to prove, from other indisputable sources, the existence and agency of the same thing analogous to the elastic fluid, from which all is borrowed.

At present therefore, we shall content ourselves with giving a short history of the speculations of philosophers on the nature of sound, tracing out the steps by which we have arrived at the knowledge which we have of it. We apprehend this to be of great importance; because it shows us what kind of evidence we have for its truth, and the paths which we must shun if we wish to proceed farther: and we trust that the progress which we have made will appear to be so real, and the object to be attained so alluring to a truly philosophical mind, that men of genius will be incited to exert their utmost efforts to pass the present boundaries of our real progress.

In the infancy of philosophy, sound was held to be a separate existence, something which would be, although no hearing animal existed. This was conceived as wafted through the air to our organ of hearing, which it was supposed to affect in a manner resembling that in which our nostrils are affected when they give us the sensation of smell. It was one of the Platonic species, fitted for exciting the intellectual species, which is the immediate object of the soul's contemplation.

Yet, even in those early years of science, there were some, and, in particular, the celebrated founder of the Stoic school, who held that sound, that is, the cause of sound, was only the particular motion of external gross matter; propagated to the ear, and there producing that agitation of the organ by which the sound is immediate.

Zeno's opinion. * B. vii. § 158.

Zeno, as quoted by Diogenes Laertius, says, "Hearing is produced by the air which intervenes between the thing sounding and the ear. The air is agitated in a spherical form, and moves off in waves; and falls on the ear, in the same manner as the water in a cistern undulates in circles when a stone has been thrown into it." The ancients were not remarkable for precision, either of conception or argument, in their discussions, and they were contented with a general and vague view of things. Some followed the Platonic notions, and many the opinion of Zeno, but without any further attempts to give a distinct conception of the explanation, or to compare it with experiment.

Air the vehicle of sound produced by the air-pump.

But in later times, during the ardent researches in the last century into the phenomena of nature, this became an interesting subject of inquiry. The invention of the air-pump gave the first opportunity of deciding by experiment whether the elastic undulations of air were the causes of sound: and the trial fully established this point: for a bell rung in vacuo gave no sound, and one rung in condensed air gave a very loud one. It was therefore received as a doctrine in general physics, that air was the vehicle of sound.

The celebrated Galileo, the parent of mathematical philosophy, discovered the nature of that connexion between the lengths of musical chords and the notes which they produced, which had been observed by Pythagoras, or learned by him in his travels in the east, and which he made the foundation of a refined and beautiful science, the theory of music. Galileo showed, that the real connexion subsisted between the tones and the vibrations of these chords, and that their different degrees of acuteness corresponded to the different frequency of their vibrations. The very elementary and familiar demonstration which he gave of this connexion did not satisfy the curious mathematicians of that inquisitive age; and the mechanical theory of musical chords was prosecuted to a great degree of refinement. In the course of this investigation, it appeared that the chord vibrated in a manner precisely similar to a pendulum vibrating in a cycloid. It must therefore agitate the air contiguous to it in the same manner; and thus there is a particular kind of agitation which the air can receive and maintain, which is very interesting.

Sir Isaia Newton took up this question as worthy of Newton's notice; and endeavoured to ascertain with mathematical precision the mechanism of this particular class of undulations, and gave us the fundamental theorems concerning the undulations of elastic fluids, which make the 47th, &c. propositions of Book II. of the Principles of Natural Philosophy. They have been (perhaps hastily) considered as giving the fundamental doctrines concerning the propagation of sound. A variety of corresponding facts are narrated in the article PNEUMATICS, to show that such undulations actually obtain in the air of our atmosphere, and are accompanied by a set of phenomena of sound which precisely correspond to all the mechanical circumstances of these undulations.

In the mean time, the anatomists and physiologists were busily employed in examining the structure of our anato- organs of hearing. Impressed with the validity of this doctrine of aerial undulations being the cause of sound, their researches were always directed with a view to discover those circumstances in the structure of the ear which rendered it an organ susceptible of agitations from this cause; and they discovered many which appeared as contrivances for making it a drum, on which the aerial undulations from without must make very forcible impulses, so as to produce very sonorous undulations in the air contained in it. These therefore they considered as the immediate objects of sensation, or the immediate causes of sound.

But some anatomists saw that this would not be a full account of the matter: for after a drum is agitated, it has done all that it can do; it has produced a noise. But a farther process goes on in the ear: there is behind the membrane, which is the head of this drum, a curious mechanism, which communicates the agitations of the membrane (the only thing acted on by the undulating air) to another chamber of most singular construction, where the auditory nerve is greatly expanded. They conceive, therefore, that the organ called the structure drum does not act as a drum, but in some other way. In the ear, it seemed bad logic to suppose it acts as a drum merely by producing a noise. This is in no respect different from the noise produced out of the ear; and if it is to be heard as a noise, we must have another ear by which it may be heard, and this ear must be another such drum; and this must have another, and so on for ever. It is like the inaccurate notion that vision is the contemplation of the picture on the retina. These anatomists attended therefore to the structure. Here they observed
ACOUSTICS.

Preliminary Observations.

observed a prodigious unfolding of the auditory nerve of the ear, which is curiously distributed through every part of this cavity, lining its sides, hung across it like a curtain, and sending off fibres in every direction, so as to leave hardly a point of it unoccupied. They thought the machinery contained in the drum peculiarly fitted for producing undulations of the air contained in this labyrinth, and that by these agitations of the air the contiguous fibres of the auditory nerve are impelled, and that thus we get the sensation of sound.

The cavity intervening between the external ear and this inner chamber appeared to these anatomists to have no other use than to allow a very free motion to the stapes or little piston that is employed to agitate the air in the labyrinth. This piston condenses on a very small surface the impulse which it receives from a much larger surface, strained by the malleus on the entry of the tympanum, on purpose to receive the gentle agitations of the external air in the outer canal. This membranous surface could not be agitated, unless completely detached from every thing round it; therefore all animals which have this mechanism have it in a cavity containing only air. But they held, that nature had even taken precautions to prevent this cavity from acting as a drum, by making it of such an irregular rambling form; for it is by no means a cavity of a symmetrical shape, like a vessel, but rather resembles the rambling holes and blebs which are often seen in a piece of bread, scattered through the substance of the cranium, and communicating with each other by small passages. The whole of these cavernose are lined with a softish membrane, which still further unifies this cavity for producing sound. This reasoning is specious, but not very conclusive. We might even assert, that this anfractuous form, with narrow passages, is well fitted for producing noise. If we place the ear close to the small hole in the side of a military drum, we shall hear the smallest tap of the drumstick like a violent blow. The lining of the cavernose is nervous, and may therefore be strongly affected in the numerous narrow passages between the cells.

While these speculations were going on with respect to the ear of the breathing animals, observations were occasionally made on other animals, such as reptiles, serpents, and fishes, which give undoubted indications of hearing; and many very familiar facts were observed or recollected, where sounds are communicated through or by means of solid bodies, or by water: therefore, without inquiring how or by what kind of mechanism it is brought about, it became a very general belief among physiologists, that all fishes, and perhaps all animals, hear, and that water in particular is a vehicle of sound. Many experiments are mentioned by Kircher and others on the communication of sound through solid bodies, such as masts, yards, and other long beams of dry fir, with similar results. Dr Monro has published a particular account of very curious experiments on the propagation of sound through water in his Dissertation on the Physiology of Fishes; so that it now appears that air by no means the only vehicle of sound.

Water discovered in the internal ear.

In 1760 Cotuni published his important discovery, that the labyrinth or instern cavity of the ear in animals is completely filled with water. This, after some contest, has been completely demonstrated (see in Vol. I. Part L.

† particular Meckel Junior de Labyrinthe Auris Contenuis, Argentor. 1777), and it seems now to be admitted by all.

This being the case, our notions of the immediate cause of sound must undergo a great revolution, and a new research must be made into the way in which the nerve is affected: for it is not enough that we substitute the undulations of water for those of air in the labyrinth. The well-informed mechanician will see at once, that the vivacity of the agitations of the nerve the force of which will be greatly increased by this substitution; for if the undulation be perfectly elastic through the whole extent of the undulatory agitation which it receives, its effect will be greater in proportion to its specific gravity; and this is confirmed by an experiment very easily made. Immerse a table-bell in water contained in a large thin glass vessel. Strike it with a hammer. The sound will be heard as if the bell had been immediately struck on the sides of the vessel. The filling of the labyrinth of the ear with water is therefore an additional mark of the wisdom of the Great Artist. But this is not enough for informing us concerning the ultimate mechanical event in the process of hearing. The manner in which the nerve is exposed to these undulations must be totally different from what was formerly imagined. The filaments and membranes, which have been described by former anatomists, must have been found by them in a state quite unlike to their situation and condition in the living animal. Accordingly the most eminent anatomists of Europe seem at present in great uncertainty as to the state of the nerve, and are keenly occupied in observations to this purpose. The descriptions given by Monro, Scarpa, Camper, Comparetti, and others, are full of most curious discoveries, which make almost a total change in our notions of this subject, and will, we hope, be productive of most valuable information.

Scarpa has discovered that the solid cavity called the Scarpa's labyrinth contains a threefold expansion of the auditory nerve. One part of it, the cochlea, contains it in a fibrous substance, ramified in a most symmetrical manner in the through the whole of the zona molle of the lamina spiralis; while it anastomoses with another production of it diffused over the general lining of that cavity. An other department of the nerve, also in a fibrous state, is spread over the external surface of a membranaceous bag, which nearly fills that part of the vestibule into which the semicircular canals open, and also that orifice which receives the impressions of the stapes. This bag sends off tubular membranaceous ducts, which, in like manner, nearly fill these semicircular canals. A third department of the nerve is spread over the external surface of another membranaceous bag, which lies between the one just now mentioned and the cochlea, but having no communication with either, almost completely filling the remainder of the vestibule. Thus the vestibule and canal seem only a case for protecting this sensitive membranaceous vessel, which is almost, but not altogether, in contact with the osseous case, being separated by a delicate and almost fluid cellular substance. The fibrous expansion of the nerve is not indiscriminately diffused over the surface of these sacculi, but evidently directed to certain foci, where the fibres are constipated. And this is the last appearance of the fibrous state of the nerve; for when the inside of these sacculi is inspected, no fibres appear, but a pulp (judged to be nervous from
A C O U S T I C S.

what it is commonly supposed. Under this head animal voices might be particularly considered, and the elements of human speech properly ascertained.

When the production of continued sounds is once shown to be a thing regulated by principle, it may be systematically treated, and this principle may be considered as combined with every mechanical state of body that may be pointed out. This will suggest to us methods of producing sound which have not yet been thought of, and may therefore give us sounds with which we are unacquainted. Such an acquisition is not to be despised nor rejected. The bountiful Author of our being and of all our faculties has made him an object of most enchanting relish to the human mind. The Greeks, the most cultivated people who have ever figured on the stage of life, enjoyed the pleasures of music with rapture. Even the poor negro, after toiling a whole day beneath a tropical sun, will go ten miles in the dark to dance all night to the simple music of the balafone, and return without sleep to his next day’s toil. The penetrating eye of the anatomist has discovered in the human larynx an apparatus evidently contrived for tempering the great movements of the glottis, so as to enable us to produce the intended note with the utmost precision. There is no doubt therefore that the consummate Artist has not thought it unworthy of his attention. We sought therefore to receive with thankfulness this present from our Maker—this laborum dulce lenitem; and it is surely worthy the attention of the philosopher to add to this innocent elegance of life.

CHAP. I. Different Theories of Sound.

Most sounds, we all know, are conveyed to us on the vehemence of the air. In whatever manner they either existed or float upon it, or are propelled forward in it, certain it is, that, without the vehicle of this or some other fluid, we should have no sounds at all. Let the air be exhausted from a receiver, and a bell shall emit no sound when rung in the void; for, as the air continues to grow less dense, the sound dies away in proportion, so that at last its strongest vibrations are almost totally silent.

Thus air is a vehicle for sound. However, we must air not that, with some philosophers assert, that it is the only one vehicle; that, if there were no air, we should have no sounds whatsoever: for it is found by experiment, that sounds are conveyed through water with the same facility with which they move through air. A bell rung in water returns a tone as distinct as if rung in air. This was observed by Derham, who also remarked that the tone came a quarter deeper. It appears, from the experiments of naturalists, that fishes have a strong perception of sounds, even at the bottom of deep rivers. From hence, it would seem not to be very material in the propagation of sounds, whether the fluid which conveys them be elastic or otherwise. Water, which, of all substances that we know, has the least elasticity, yet serves to carry them forward; and if we make allowance for the difference of its density, perhaps the sounds move in it with a proportionate rapidity to what they are found to do in the elastic fluid of air. But though air and water are both vehicles of sound, yet neither of them according to some philosophers seems to
to be so by itself, but only as it contains an exceedingly
subtle fluid capable of penetrating the most solid bod-
dies. Hence, by the medium of that fluid, sounds can
be propagated through wood, or metals, even more
readily than through the open air. By the same means,
deaf people may be made sensible of sounds if they hold
a piece of metal in the mouth, one end of which is ap-
plied to the sounding body. And as it is certain, that
air cannot penetrate metals, the medium of sound, say
they, must be of a more subtle nature; and thus the
electrical fluid will naturally occur as the proper one.
But why then is sound no longer heard in an exhausted
receiver, if the air is not the fluid by which it is con-
veyed, seeing the electrical matter cannot be excluded?
The reply to this is obvious: The electrical fluid is so
exceedingly subtle, and pervades solid bodies with so
much ease, that any motion of a solid body in a quan-
tity of electric matter by itself, can never excite a de-
gree of agitation in it sufficient for producing a sound;
but if the electric fluid is entangled among the parti-
cles of air, water, wood, metal, &c. whatever affects
their particles will also affect this fluid, and produce
an audible noise. In the experiment of the air-pump,
it is alleged there may be an ambiguity, as the gra-
dual exhausting of the air creates an increasing dif-
ference of pressure on the outside, and may occasion in
the glass a difficulty of vibrating, so as to render it less
fit to communicate to the air without the vibrations that
strike it from within. From this cause the diminution
of sound in an exhausted receiver may be supposed to
proceed, as well as from the diminution of the air. But
if any internal agitation of its parts should happen to the
electrical fluid, exceeding loud noises might be prop-
gated through it, as has been the case when large
meteors have kindled at a great distance from the earth.
It is also difficult, they suppose, to account for the amaz-
ing velocity of sound, upon the supposition that it is
propagated by means of air alone; for nothing is more
certain, than that the strongest and most violent gale
is, in its course, inert and sluggish, compared with the motion
of sound.

One thing, however, is certain, that whether the fluid
which conveys the note be elastic, or nonelastic, what-
soever sound we hear is produced by a stroke, which the
sounding body makes against the fluid, whether air or
water. The fluid being struck upon, carries the im-
pression forward to the ear, and there produces the sen-
sation. Philosophers are so far agreed, that they all
is, and how allow that sound is nothing more than the impres-
sion made by an elastic body upon the air or water, and
this impression carried along by either fluid to the or-
gan of hearing. But the manner in which this con-
voyance is made, is still disputed: Whether the sound
is diffused into the air, in circle beyond circle, like
the waves of water when we disturb the smoothness of
its surface by dropping in a stone; or whether it tra-
vels along, like rays diffused from a centre, somewhat
in the swift manner that electricity runs along a rod of
iron; these are the questions which have divided the
learned.

Newton's theory. Newton was of the first opinion. He has explained
the progression of sound by an undulatory, or rather a
vibratinal, motion in the parts of the air. If we have
an exact idea of the crawling of some insects, we shall
have a tolerable notion of the progression of sound upon
this hypothesis. This insect, for instance, in its motion,
first carries its contractions from the hinder part, in or-
der to throw its fore part to the proper distance, then
it carries its contractions from the fore part to the hini-
ser to bring that forward. Something similar to this
is the motion of the air when struck upon by a sound-
ing proper. To be a little more precise, suppose ABC,
Plate I. fig. 1. the striking of a harpsichord screwed to
a proper pitch, and drawn out of the right line by the
finger at B. We shall have occasion elsewhere to ob-
serve, that such a string would, if let go, vibrate to E;
and from E to D, and back again; that it would con-
tinue thus to vibrate like a pendulum, for ever, if not
externally resisted, and, like a pendulum, all its little
vibrations would be performed in equal times, the last
and the first being equally long in performing; also
that, like a pendulum, its greatest swiftness would al-
ways be when it arrived at E, the middle part of its
motion. Now then, if this string be supposed to be
from the finger at B, it is obvious, that whatever be
its own motion, such also will be the motion of the
parts of air that fly before it. Its motion, as is obvious,
is first uniformly accelerated forward from B to E,
then retarded as it goes from E to D, accelerated back
again as it returns from D to E, and retarded from E
to B. This motion being therefore successively pro-
duced through a range of elastic air, it must happen,
that the parts of one range of air will be sent forward
with accelerated motion, and then with a retarded
motion. This accelerated motion reaching the remotest
end of the first range will be communicated to a second
range, whilst the nearest parts of the first range being
retarded in their motion, and falling back with the re-
cession of the string, retire first with an accelerated,
then with a retarded motion, and the remotest parts
will soon follow. In the mean time, while the parts of
the first range are thus falling back, the parts of the
second range are going forward with an accelerated
motion. Thus there will be an alternate condensation
and relaxation of the air, during the time of one vibra-
tion; and as the air going forward strikes any opposing
body with greater force than upon retiring, so each of
these accelerated progressions has been called by New-
ton a pulse of sound.

Thus will the air be driven forward in the direction
of the string. But now we must observe, that these
pulses will move every way; for all motion impressed
upon fluids in any direction whatsoever, operates all
around in a sphere: so that sounds will be driven in all
directions, backwards, forwards, upwards, downwards,
and on every side. They will go on succeeding each
other, one on the outside of the other, like circles in
disturbed water; or rather, they will lie one without
the other, in concentric shells, shell above shell, as we
see in the coats of an onion.

All who have remarked the tone of a bell, while its
sounds are decaying away, must have an idea of the
pulses of sound, which, according to Newton, are form-
bred by the air's alternate progression and recession.
And it must be observed, that as each of these pulses is
formed by a single vibration of the string, they must
be equal to each other; for the vibrations of the string
are known to be so.

Again, As to the velocity with which sounds travel,
Different theories of sound.

The thickness of the parts of the air, and the distance of these parts from each other. From hence he goes on to prove, that each little part moves backward and forward like a pendulum; and from hence he proceeds to demonstrate, that if the atmosphere were of the same density everywhere as at the surface of the earth, in such a case, a pendulum, that reached from its highest surface down to the surface of the earth, would by its vibrations discover to us the proportion of the velocity with which sound would travel. The velocity of which each pulse would move, he shows, would be as much greater than the velocity of such a pendulum swinging with one complete vibration, as the circumference of a circle is greater than the diameter. From hence he calculates, that the motion of sound will be 979 feet in one second. But this not being consonant to experience, he takes in another consideration, which destroys entirely the rigour of his former demonstration, namely, vapours in the air; and then finds the motion of sound to be 1142 feet in one second, or near 13 miles in a minute; a proportion which experience had established nearly before.

This much will serve to give an obscure idea of a theory which has met with numerous opposers. Even John Bernoulli, Newton's greatest disciple, modestly owns that he did not pretend to understand this part of the Principia. He attempted therefore to give a more perspicuous demonstration of his own, that might confirm and illustrate the Newtonian theory. The subject seemed to reject elucidation; his theory is obviously wrong, as d'Alembert has proved in his Theory of Fluids.

The objections.

Various have been the objections that have been made to the Newtonian system of sounds. It is urged, that this theory can only agree with the motion of sound in an elastic fluid, whereas sounds are known to move forward through water that is not elastic. To explain their progress therefore through water, a second theory must be formed; so that two theories must be made to explain a similar effect; which is contrary to the simplicity of true philosophy, for it is contrary to the simplicity of nature. It is further urged, that this slow vermicular motion but ill represents the velocity with which sounds travel, as we know by experience that it is almost 13 miles in a minute. In short, it is urged, that such undulations as have been described, when coming from several sonorous bodies at once, would cross, obstruct, and confound each other; so that, if they were conveyed to the ear by this means, we should hear nothing but a medley of discord and broken articulations. But this is equally with the rest contradictory to experience, since we hear the fullest concert, not only without confusion, but with the highest pleasure. These objections, whether well founded or not, have given rise to another theory: which we shall likewise lay before the reader; though it too appears liable to objections, which shall be afterwards mentioned.

Another theory.

Every sound may be considered as driven off from the sounding body in straight lines, and impressed upon the air in one direction only: but whatever impression is made upon a fluid in one direction, is diffused upon its surface into all directions: so that the sound first driven directly forward soon fills up a wide sphere, and is heard on every side. Thus, as it is impressed, it instantaneously travels forward with a very swift motion, resembling the velocity with which we know electricity flies from one end of a line to another.

Now, as to the pulses, or close shakes as the musicians express it, which a sounding body is known to make, each pulse (say the supporters of this theory) is itself a distinct and perfect sound, and the interval between every two pulses is profoundly silent. Continuity of sound from the same body is only a deception of the hearing; for as each distinct sound succeeds at very small intervals, the organ has no time to transmit its images with equal swiftness to the mind, and the interval is thus lost to sense: just as in seeing a flaming torch, whirled rapidly round, it appears as a ring of fire. In this manner a beaten drum, at some small distance, presents us with the idea of continuing sound. When children run with their sticks along a rail, a continuing sound is thus represented, though it need scarce be observed that the stroke against each rail is perfectly distinct and insulated.

According to this theory, therefore, the pulses are nothing more than distinct sounds repeated by the same body, the first stroke or vibration being ever the loudest, and travelling farther than those that follow; while each succeeding vibration gives a new sound, but with diminished force, till at last the pulses decay away totally, as the force decays that gives them existence. All bodies whatsoever that are struck return more or less a sound: but some, wanting elasticity, give back no repetition of the sound; the noise is at once produced and dies: while other bodies, however, there are, which being more elastic and capable of vibration, give back a sound, and repeat the same several times successively. These last are said to have a tone; the others are not allowed to have any.

This tone of the elastic string, or bell, is notwithstanding nothing more than a similar sound of what the former bodies produced, but with the difference of being many times repeated, while their note is but single. So that, if we would give the former bodies a tone, it will be necessary to make them repeat their sound, by repeating our blows swiftly upon them. This will effectually give them a tone; and even an unmusical instrument has often had a fine effect by its tone in our concerts.

Let us now go on then to suppose, that by swift and equally continued strokes we give any nonelastic body its tone; it is very obvious, that no alterations will be made in this tone by the quickness of the strokes, though repeated ever so fast. These will only render the tone more equal and continuous, but make no alteration in the tone it gives. On the contrary, if we make an alteration in the force of each blow, a different tone will then undoubtedly be excited. The difference will be small, it must be confessed; for the tones of these inflexible bodies are capable but of small variation; however, there will certainly be a difference. The table on which we write, for instance, will return a different sound when struck with a club, from what it did when struck only with a switch. Thus nonelastic bodies return a difference of tone, not in proportion to the swiftness with which their sound is repeated, but in proportion to the greatness of the blow which produced it; for in two equal nonelastic bodies, that body produced
ACOUSTICS.

Different Theories of Sound.

Chapter I.

We now then come to a critical question, What is it that produces the difference of tone in two elastic sounding bells or strings? or, what makes one deep and the other shrill? This question has always been hitherto answered by saying, that the depth or height of the note proceeded from the slowness or swiftness of the times of the vibrations. The slowest vibrations, it has been said, are qualified for producing the deepest tones, while the swiftest vibrations produce the highest tones. In this case, an effect has been given for a cause. It is in fact the force with which the sounding string strikes the air when struck upon, that makes the true distinction in the tones of sound. It is this force, with greater or less impressions, resembling the greater or less force of the blows upon a nonelastic body, which produces correspondent affections of sound. The greatest forces produce the deepest sounds; the high notes are the effect of small efforts. In the same manner a bell, wide at the mouth, gives a grave sound; but if it be very massy within, that will render it still graver; but if massy, wide, and long or high, that will make the tone deepest of all.

Thus, then, will elastic bodies give the deepest sound in proportion to the force with which they strike the air: but if we should attempt to increase their force by giving them a stronger blow, this will be in vain; they will still return the same tone; for such is their formation, that they are sonorous only because they are elastic, and the force of this elasticity is not increased by our strength, as the greatness of a pendulum’s vibrations will not be increased by falling from a greater height.

Now as to the frequency with which elastic strings vibrate the deepest tones, it has been found, that the longest strings have the widest vibrations, and consequently go backward and forward slower; while, on the contrary, the shortest strings vibrate the quickest, or come and go in the shortest intervals. From hence those who have treated of sounds have asserted, as was said before, that the tone of the string depended upon the length or the shortness of the vibrations. This, however, is not the case. One and the same string, when struck, must always, like the same pendulum, return precisely similar vibrations: but it is well known, that one and the same string, when struck upon, does not always return precisely the same tone: so that in this case the vibrations follow one rule, and the tone another. The vibrations must be invariably the same in the same string, which does not return the same tone invariably, as is well known to musicians in general. In the violin, for instance, they can easily alter the tone of the string an octave or eight notes higher, by a softer method of drawing the bow; and some are known thus to bring out the most charming airs imaginable. These peculiar tones are by the English fiddlers called flote-notes. The only reason, it has been alleged, that can be assigned for the same string thus returning different tones, must certainly be the different force of its strokes upon the air. In one case, it has double the tone of the other: because upon the soft touches of the bow, only half its elasticity is put into vibration.

This being understood (continue the authors of this theory), we shall be able clearly to account for many things relating to sounds that have hitherto been inexplicable. Thus, for instance, if it be asked, When two strings are stretched together of equal lengths, tensions, and thickness, how does it happen, that one of them being struck, and made to vibrate throughout, the other shall vibrate throughout also? The answer is obvious: The force that the string struck receives is communicated to the air, and the air communicates the same to the similar string; which therefore receives all the force of the former; and the force being equal, the vibrations must be so too. Again: Put the question, If one string be but half the length of the other, and be struck, how will the vibrations be? The answer is, The longest string will receive all the force of the string half as long as itself, and therefore it will vibrate in proportion, that is, through half its length. In the same manner, if the longest string were three times as long as the other, it would only vibrate in a third of its length; or if four times, in a fourth of its length. In short, whatever force the smaller string impresses upon the air, the air will impress a similar force upon the longer string, and partially excite its vibrations.

From hence also we may account for the cause of those Eolian charming melancholy gradations of sound in the Eolian Lyre. lyre, Plate I. fig. 2.; an instrument (says Sir John Hawkins lately obtruded upon the public as a new invention, though described above a century ago by Kircher. Vide Kircher’s Musurgia lib. III. This instrument is easily made, being nothing more than a long narrow box of thin deal, about 30 inches long, 5 inches broad, and 1½ inches deep, with a circle in the middle of the upper side or belly about ¼ inch diameter pierced with small holes. On this side are seven, ten, or (according to Kircher) fifteen or more strings of very fine gut, stretched over bridges at each end, like the bridge of a fiddle, and screwed up or relaxed with screw-pins (a). The strings are all tuned to one and the same note; and the instrument is placed in some current of air, where the wind can brush over its strings with freedom. A window with the sash just raised to give the air admission will answer this purpose exactly. Now when the entering air blows upon these strings with different degrees of force, there will be excited different tones of sound; sometimes the blast brings out all the tones in full concert; sometimes it sinks them to the softest murmurs; it feels for every tone, and by its gradations of strength solicits those gradations of sound which art has taken different methods to produce.

It remains, in the last place, to consider (by this theory) the loudness and lowness, or, as the musicians speak, the strength and softness of sound. In vibrating elastic strings, the loudness of the tone is in proportion to the deepness of the note; that is, in two strings, all things in other circumstances alike, the deepest tone will be loudest. In musical instruments upon a different principle, as in the violin, it is otherwise;

(n) The figure represents the instrument with ten chords; of which some direct only eight to be tuned, unisons, and the two outermost octaves below them. But this seems to be not material.
A C O U S T I C S.

Chap. I.

The nature of musical sounds illustrated according to the same theory.

The mind takes in comparison, all harmony depends. The variety of sounds is infinite: but because the ear cannot compare two sounds so as readily to distinguish their discriminations when they exceed the proportion of one and seven, musicians have been content to confine all harmony within that compass, and allowed but seven notes in musical composition.

Let us now suppose a stringed instrument fitted up in the order mentioned above. For instance: Let the first string be twice as long as the second; let the third string be three times shorter than the first; let the fourth be four times, the fifth string five times, and the sixth six times as short as the first. Such an instrument would probably give us a representation of the lyre as it came first from the hand of the inventor. This instrument will give us all the seven notes following each other, in the order in which any two of them will accord together most pleasingly; but yet it will be a very inconvenient and a very disagreeable instrument: inconvenient, for in a compass of seven strings only, the first must be seven times as long as the last; and disagreeable, because this first string will be seven times as loud also: so that when the tones are to be played in a different order, loud and soft sounds would be intermixed with most disgusting alternations.

In order to improve the first instrument, therefore, succeeding musicians very judiciously threw in all the other strings between the two first, or, in other words, between the two octaves, giving to each, however, the same proportion to what it would have had in the first natural instrument. This made the instrument more portable, and the sounds more even and pleasing. They therefore disposed the sounds between the octave in their natural order, and gave each its own proportional dimensions. Of these sounds, where the proportion between any two of them is most obvious, the concord between them will be most pleasing. Thus octaves, which are as two to one, have a most harmonious effect; the fourth and fifth also sound sweetly together, and they will be found, upon calculation, to bear the same proportion to each other that octaves do. Let it not be supposed (says M. Sauvage), that the musical scale is merely an arbitrary combination of sounds; it is made up from the consonance and differences of the parts which compose it. Those who have often heard a fourth and fifth accord together, will be naturally led to discover their difference at once; and the mind unites itself to their beauties.”

Let us then cease to assign the coincidences of vibrations as the cause of harmony, since these coincidences in two strings vibrating at different intervals, must at best be but fortuitous; whereas concord is always pleasing. The true cause why concord is pleasing, must arise from our power, in such a case, of measuring most easily the differences of the tones. In proportion as the note can be measured with its fundamental tone by large and obvious distinctions, then the concord is most pleasing; on the contrary, when the ear measures the discriminations of two tones by very small parts, or cannot measure them at all, it loses the beauty of their resemblance: the whole is discord and pain (c).

(c) It is certain, that in proportion to the simplicity of relations in sound, the ear is pleased with its combinations; but this is not to be admitted as the cause why musicians have confined all harmony to an octave.
ACOUSTICS.

But there is another property in the vibration of a musical string not yet taken notice of, and which is alleged to confirm the foregoing theory. If we strike the string of a harpsichord, or any other elastic sounding chord whatever, it returns a continuing sound. This till of late was considered as one simple uniform tone; but all musicians now confess, that instead of one tone it actually returns four tones, and that constantly. The notes are, beside the fundamental tone, an octave above, a twelfth above, and a seventeenth. One of the bass notes of a harpsichord has been dissected in this manner by Basevan, and the actual existence of these tones proved beyond a possibility of being controverted. In fact, the experiment is easily tried; for if we smartly strike one of the lower keys of a harpsichord, and then take the finger briskly away, a tolerable ear will be able to distinguish, that, after the fundamental tone has ceased, three other shorter tones will be distinctly heard; first the octave above, then the twelfth, and lastly the seventeenth: the octave above is in general almost mixed with the fundamental tone, so as not to be easily perceived, except by an ear long habituated to the minute discriminations of sounds. So that we may observe, that the smallest tone is heard last, and the deepest and largest one first: the two others in order.

In the whole theory of sounds, nothing has given greater room for speculation, conjecture, and disappointment, than this amazing property in elastic strings. The whole string is universally acknowledged to be in vibration in all its parts, yet this single vibration returns no less than four different sounds. They who account for the tones of strings by the number of their vibrations, are here at the greatest loss. Daniel Bernoulli supposes that a vibrating string divides itself into a number of narrow, each of which has a peculiar vibration; and though they all swing together in the common vibration, yet each vibrates within itself. This opinion, which was supported, as most geometrical speculations are, with the parade of demonstration, was only born soon after to die. Others have ascribed this to an elastic difference in the parts of the air, each of which, at different intervals, thus received different impressions from the string, in proportion to their elasticity. This is absurd. If we allow the difference of tone to proceed from the force, and not the frequency, of the vibrations, this difficulty will admit of an easy solution. These sounds, though they seem to exist together in the string, actually follow each other in succession: while the vibration has greatest force, the fundamental tone is brought forward: the force of the vibration decaying, the octave is produced, but almost wholly instantaneously; so this succeeds, with diminished force, the twelfth; and, lastly, the seventeenth is heard to vibrate with great distinctness, while the three other tones are always silent. These sounds, thus excited, are all of them the harmonic tones, whose differences from the fundamental tone are, as was said, strong and distinct. On the other hand, the discordant tones cannot be heard. Their differences being but very small, they are overpowered, and in a manner drowned in the tones of superior difference; yet not always neither; for Daniel Bernoulli has been able, from the same stroke, to make the same string bring out its harmonic and its discordant tones also (d). So that from hence we may justly infer, that every note whatsoever is only a succession of tones; and that those are most distinctly heard, whose differences are most easily perceivable.

To this theory, however, though it has a plausible appearance, there are strong and indeed insuperable objections. The very fundamental principle of it is false. No body whatever, whether elastic or nonelastic, yields a greater sound by being struck with a larger instrument, unless either the sounding body, or that part of it which emits the sound, is largest. In this case, the largest bodies always return the gravest sounds.

In speaking of elastic and nonelastic bodies in a musical sense, we are not to push the distinction so far as when we speak of them philosophically. A body is musically elastic, all of whose parts are thrown into vibrations so as to emit a sound when only part of their surface is struck. Of this kind are bells, musical strings, and all bodies whatever that are considerably hollow. Musical nonelastics are such bodies as emit a sound only from that particular place which is struck: thus, a table, a plate of iron nailed on wood, a bell sunk in the earth, are all of them nonelastics in a musical sense, though not philosophically so. When a solid body, such as a log of wood, is struck with a switch, only that part of it emits a sound which comes in contact with the switch; the note is acute and loud, but would be no less so though the adjacent parts of the log were removed. If, instead of the switch, a heavier or larger instrument is made use of, a larger portion of its surface then returns a sound, and the note is consequently more grave; but it would not be so if the large instrument was struck with a sharp edge, or a surface only equal to that of the small one.

In sounds of this kind, where there is only a single thwack, without any repetition, the immediate cause of the gravity or acuteness seems to be the quantity of air displaced by the sounding body; a large quantity of air displaced produces a grave sound, and a smaller quantity a more acute one, the force wherewith the air is displaced signifying very little. What we here advance is confirmed by some experiments made by Dr Priestley, concerning the musical tone of electrical discharges. The passage being curious, and not very long, we shall here transcribe it.

"As the cause of my experiments has required a great variety of electrical explosions, I could not help observing a great variety in the musical tone made by the reports. This excited my curiosity to attempt to reduce this variation to some measure. Accordingly, by

Discriminated sounds, whose vibrations either never coincide, or at least very rarely, do not, only cease to please, But violently grate the ear. Harmony and discord, therefore, are neither discriminated by the judgment of hearers, nor the institution of musicians, but by their own-essential and immutable nature.

ACOUSTICS.

Of Musical Sounds.

Of Musical Sounds.

By the help of a couple of spinets, and two persons who had good ears for music, I endeavoured to ascertain the tone of some electrical discharges; and observed that every discharge made several strings, particularly those that were chords to one another, to vibrate; but one note was always predominant, and sounded after the rest. As every explosion was repeated several times, and three of us separately took the same note, there remained no doubt but that the tone we fixed upon was at least very near the true one. The result was as follows:

"A jar containing half a square foot of coated glass founded F sharp, concert pitch. Another jar of a different form, but equal surface, sounded the same.

"A jar of three square feet sounded C below F sharp. A battery consisting of sixty-four jars, each containing half a square foot, sounded F below the C.

"The same battery, in conjunction with another of thirty-one jars, sounded C sharp. So that a greater quantity of coated glass always gave a deeper note.

"Differences in the degree of a charge in the same jar made little or no difference in the tone of the explosion; if any, a higher charge gave rather a deeper note."

These experiments shew us how much the gravity or acuteness of sounds depends on the quantity of air put in agitation by the sounding body. We know that the noise of the electric explosion, arises from the return of the air into the vacuum produced by the electric flash. The larger the vacuum, the deeper was the note: for the same reason, the discharge of a musket produces a more acute note than that of a cannon; and thunder is deeper than either.

Besides this, however, other circumstances concur to produce different degrees of gravity or acuteness in sounds. The sound of a table struck upon with a piece of wood, will not be the same with that produced from a plate of iron struck by the same piece of wood, even if the blows should be exactly equal, and the iron perfectly kept from vibrating. Here the sounds are generally said to differ in their degrees of acuteness, according to the specific gravities or densities of the substances which emit them. Thus gold, which is the most dense of all metals, returns a much graver sound than silver; and metalline wires, which are more dense than thers, return a proportionably graver sound. But neither does this appear to be a general rule in which we can put confidence. Bell-metal is denser than copper, but by no means appears to yield a graver sound: on the contrary, it seems very probable, that copper will give a graver sound than bell-metal, if both are struck upon in their non-elastic state; and we can by no means think that a bell of pure tin, the least dense of all the metals, will give a more acute sound than one of bell-metal, which is greatly more dense. In some bodies hardness seems to have a considerable effect. Glass, which is considerably harder than any metal, gives a more acute sound; bell-metal is harder than gold, lead, or tin, and therefore sounds much more acutely: though bow far this holds with regard to other substances, there is not a sufficient number of experiments for us to judge.

In bodies musically elastic, the whole substance vibrates with the slightest stroke, and therefore they always give the same note whether they are struck with a large or with a small instrument; so that, striking a part of the surface of any body musically elastic is equivalent in it, to striking the whole surface of a non-elastic one. If the whole surface of a table was struck with another table, the note produced would be neither more nor less acute whatever force was employed; because the whole surface would then yield a sound, and no force could increase the surface: the sound would indeed be louder in proportion to the force employed, but the gravity would remain the same. In like manner, when a bell or musical string is struck, the whole substance vibrates, and a greater stroke cannot increase the substance. Hence we see the fallacy of what is said concerning the Pythagorean anvils. An anvil is a body musically elastic, and no difference in the tone can be perceived whether it is struck with a large or with a small hammer; because either of them are sufficient to make the whole substance vibrate, provided nothing but the anvil is struck upon: smills, however, do not strike their anvils, but red hot-iron laid upon their anvils; and thus the vibrations of the anvil are stopped, so that it becomes a non-elastic body, and the differences of tone in the strokes of different hammers proceed only from the surface of the large hammers covering the whole surface of the iron, or at least a greater part of it than the small ones. If the small hammer is sufficient to cover the whole surface of the iron as well as the large one, the note produced will be the same whether the large or the small hammer is used.

Lastly, the argument for the preceding theory, grounded on the production of what are called flute-notes on the violin, is built on a false foundation; for the bow being lightly drawn on an open string, produces no flute-notes, but only the harmonies of the note to which the string is tuned. The flute-notes are produced by a particular motion of the bow, quick and near the bridge, and by fingering very gently. By this management the same sounds are produced, though at certain intervals only, as if the vibrations were transferred to the space between the end of the finger-board and the finger, instead of that between the finger and the bridge. Why this small part of the string should vibrate in such a case, and not that which is under the immediate action of the bow, we must own ourselves ignorant; nor dare we affirm that the vibrations really are transferred in this manner, only the same sounds are produced as if they were.

Though these objections seem sufficiently to overturn the foregoing theory, with regard to acute sounds being the effects of weak strokes, and grave ones of stronger impulses, we cannot admit that longer or shorter vibrations are the occasions of gravity or acuteness in sound. A musical sound, however lengthened, either by a string or bell, is only a repetition of a single one, whose duration by itself is but for a moment, and is therefore termed inappreciable, like the smack of a whip, or the explosion of an electrical battery. The continuation of the sound is nothing more than a repetition of this instantaneous inappreciable noise after the manner of an echo, and it is only this echo that makes the sound agreeable. For this reason, music is much more agreeable when played in a large hall where the sound is reverberated, than in a small room where there is no such reverberation. For the same reason, the sound of a string is more agreeable when put on a hol-
A C O U S T I C S.

by experiment; and it is found that they describe 1070 Paris feet, or 1142 London feet in a second, whether the sound be loud or low, grave or acute.

5 Prob. To determine the latitude of a pulse. Divide the space which the pulse describes in a given time (4) by the number of vibrations performed in the same time by the sounding body, (Cor. 1. Prop. 24. Smith’s Harmonics), the quotient is the latitude.

M. Sauveur, by some experiments on organ pipes, found that a body, which gives the gravest harmonic sound, vibrates 12 times and a half in a second, and that the shrillest sounding body vibrates 91,100 times in a second. At a medium, let us take the body which gives what Sauveur calls his fixed sound: it performs 100 vibrations in a second, and in the same time the pulses describe 1070 Parisian feet; therefore the space described by the pulses whilst the body vibrates once, that is, the latitude, or interval of the pulse, will be 10.7 feet.

6 Prob. To find the proportion which the greatest space, through which the particles of the air vibrate, bears to the radius of a circle, whose perimeter is equal to the latitude of the pulse.

During the first half of the progress of the elastic fibre, or sounding body, it is continually getting nearer to the next particle; and during the latter half of its progress, that particle is getting farther from the fibre, and these portions of time are equal (Helsham) therefore we may conclude, that at the end of the progress of the fibre, the first particle of air will be nearly as far distant from the fibre as when it began to move, and in the same manner we may infer, that all the particles vibrate through spaces nearly equal to that run over by the fibre.

Now M. Sauveur (Acad. Science. ann. 1700, p. 141.) has found by experiment, that the middle point of a chord which produces his fixed sound, and whose diameter is 7 of a line, runs over in its smallest sensible vibrations 7 of a line, and in its greatest vibration 72 times that space; that is, 72 × 7 of a line, or 4 lines, that is, 7 of an inch.

The latitude of the pulses of this fixed sound is 10.7 feet (5); and since the circumference of a circle is to its radius as 710 is to 113, the greatest space described by the particles will be to the radius of a circle, whose periphery is equal to the latitude of the pulse as 74 of an inch is to 1.7029 feet, or 20.4348 inches, that is, as 2 to 61.3044.

If the length of the string be increased or diminished in any proportion, ceteris paribus, the greatest space described by its middle point will vary in the same proportion. For the inflecting force is to the tending force as the distance of the string from the middle point of vibration to half the length of the string (see Helsham and Martin); and therefore the inflecting and tending forces being given, the string will vibrate through spaces proportioned to its length; but the latitude of the pulse is inversely as the number of vibrations performed by the string in a given time (5), that is, directly as the time of one vibration, or directly as the length of the string (Prop. 24. Cor. 7. Smith’s Harmonics); therefore the greatest space through which the middle point of the string vibrates will vary in the direct ratio of the latitude of the pulse, or of the radius of a circle whose circumference is equal to...
ACOUSTICS.

Chap. II.

If the particles of the aerial pulses, during any part of their vibration, be successively agitated, according to the law of a cycloidal pendulum, the comparative elastic forces, arising from their mutual action, by which they will afterwards be agitated, will be such as will cause the particles to continue that motion, according to the same law, to the end of their vibration.

Let $AB$, $BC$, $CD$, &c. fig. 3, denote the equal distances of the successive pulses; $ABC$ the direction of the motion of the pulses propagated from $A$ towards $B$; $E$, $F$, $G$, three physical points of the quiescent medium, situated in the right line $AC$ at equal distances from each other; $E_p$, $F_p$, $G_p$, the very small equal spaces through which these particles vibrate; $s$, $\phi$, $\gamma$, any intermediate places of these points. Draw the right line $PS$, fig. 4, equal to $E_p$, bisect it in $O$, and from the centre $O$ with the radius $OP$ describe the circle $SPIA$. Let the whole time of the vibration of a particle and its parts be denoted by the circumference of this circle and its proportional parts. And since the particles are supposed to be first agitated according to the law of a cycloidal pendulum, if at any time $PH$ or $PHSA$, the perpendicular $HL$ or $H_p$, be let fall on $PS$, and if $E_p$ be taken equal to $PL$ or $P_L$, the particle $E$ shall be found in $s$. Thus will the particle $E$ perform its vibrations according to the law of a cycloidal pendulum. Prop. 52. B. I. Principis.

Let us suppose now, that the particles have been successively agitated, according to this law, for a certain time, by any cause whatsoever, and let us examine what will be the comparative elastic forces arising from their mutual action, by which they will afterwards continue to be agitated.

In the circumference $PHSA$ take the equal arches $HI$, $IK$ in the same ratio to the whole circumference which the equal right lines $EF$, $FG$, have to $BC$ the whole interval of the pulses; and let fall the perpendiculars $HL$, $IM$, $KN$. Since the points $E$, $F$, $G$ are successively agitated in the same manner, and perform their entire vibrations of progress and regress while the pulse is propagated from $B$ to $C$, if $PH$ be the time from the beginning of the motion of $E$, $PI$ will be the time from the beginning of the motion of $F$, and $PK$ the time from the beginning of the motion of $G$; and therefore $E_p$, $F_p$, $G_p$ will be respectively equal to $PL$, $PM$, $PN$ in the progress of the particles. Whence $s_p$ or $EF + FP - E_p$ is equal to $EF - LM$. But $s_p$ is the expansion of $EF$ in the place $s_p$, and therefore this expansion is to its mean expansion as $EF - LM$ to $EF$. But $LM$ is to $IH$ as $IM$ is to $OP$; and $IH$ is to $EF$ as the circumference $PHSA$ is to $BC$; that is, as $OP$ is to $V$, if $V$ be the radius of a circle whose circumference is in $BC$; therefore, as above, $LM$ is to $EF$ as $IM$ is to $V$; and therefore the expansion of $EF$ in the place $s_p$ is to its mean expansion as $V - IM$ is to $V$; and the elastic force existing between the physical points $E$ and $F$ is to the mean elastic force as $V - IM$ is to $V$ (Cotes Pneum. Lect. 9.) By the same argument, the elastic force existing between the physical points $F$ and $G$ is to the mean elastic force as $IM - KN$ is to $V$; and the difference between these forces is to the mean elastic force as $IM - KN$ is to $V$; that is, as $IM - KN$ is to $V$; or as $IM - KN$ is to $V$; if only (upon account of the very narrow limits of the vibration) we suppose $IM$ and $KN$ to be indefinitely less than $V$. Wherefore since $V$ is given, the difference of the forces is as $IM - KN$, or as $HI - IM$ (because $KH$ is bisected in $I$); that is, (because $HI - IM$ is to $IH$ as $OM$ is to $OI$ or $OP$, and $IH$ and $OP$ are given quantities) as $OM$; that is, if $EF$ be bisected in $O$ as $OP$.

In the same manner it may be shown, that if $PHSA$ be the time from the beginning of the motion of $E$, $PHSA$ will be the time from the beginning of the motion of $F$, and $PHSA$ the time from the beginning of the motion of $G$; and that the expansion of $EF$ in the place $s_p$ is to its mean expansion as $EF + FP - E_p$, or as $EF + IM$ is to $EF$, or as $V + s$ is to $V$ in its regress: and its elastic force to the mean elastic force as $V + s$ is to $V$; and that the difference of the elastic forces existing between $E$ and $F$, and between $F$ and $G$ is to the mean elastic force as $kn - ism$ is to $V$; that is, directly as $\phi p$.

But this difference of the elastic forces, existing between $E$ and $F$, and between $F$ and $G$, is the comparative elastic force by which the physical point $\phi$ is agitated: and therefore the comparative accelerating force, by which every physical point in the medium will continue to be agitated both in progress and regress, will be directly as its distance from the middle point of its vibration; and consequently will be such as will cause the particles to continue their motion undisturbed, according to the law of a cycloidal pendulum. Prop. 38. 1. 1. Newton. Principis.

Newton rejects the quantity $V \times IM + KN + IM \times KN$, on supposition that $IM$ and $KN$ are indefinitely less than $V$. Now, although this may be a reasonable hypothesis, yet, that this quantity may be safely rejected, will, I think, appear in a more satisfactory manner from the following considerations derived from experiment: $PS$, in its greatest possible state, is to $V$ as $1$ is to $61,3044$ (6); and therefore $IM$, or $KN$, in its greatest possible state, (that is, when the vibrations of the body are as great as possible, and the particle in the middle point of its vibration) is to $V$ as $1$ is to $122.6$. Hence $V = 15030.76 \times V \times IM + KN = 245.2$ and $IM \times KN = 1;$ therefore $V = V \times IM + KN + IM \times KN = 15030.76 \times 1014736.56; that is, as $61$ is to $60$ nearly.

Hence it appears, that the greatest possible error in the accelerating force, in the middle point, is the greatest part of the whole. In other points it is much less; and in the extreme points the error entirely vanishes.

We should also observe, that the ordinary sounds we hear are not produced by the greatest possible vibrations of which the sounding body is capable; and that in general $IM$ and $KN$ are nearly evanescent with respect
ACOUSTICS.

Chap. II.

Propagation of Sound.

respect to V. And very probably the disagreeable sensations we feel in very loud sounds, arise not only from IM or KN being a sensible proportion to V, by which means the cycloidal law of the pulses may be in some measure disturbed, but also from the very law of the motion of the sounding body itself being disturbed. For the proof of this law's being observed by an elastic fibre is founded on the hypothesis that the space, through which it vibrates, is indefinitely little with respect to the length of the string. See Smith's Harmonies, p. 237. Halsham, p. 270.

8. If a particle of the medium be agitated according to the law of a cycloidal pendulum, the comparative elastic force, acting on the adjacent particle, from the instant in which it begins to move, will be such as will cause it to continue its motion according to the same law.

For let us suppose, that three particles of the medium had continued to move for times denoted by the arches PK, Pi, PI, PHI, the comparative elastic force, acting on the second during the time of its motion, would have been denoted by H, = IM, that is, would have been directly as MO (7). And if this time be diminished till I becomes coincident with P, that is, if you take the particles in that state when the second is just beginning to move, and before the third particle has yet been set in motion; then the point M will fall on P, and MO become PO; that is, the comparative elastic force of the second particle, at the instant in which it begins to move, will be to the force with which it is agitated in any other moment of time, before the subsequent particle has yet been set in motion, directly as its distance from the middle point of vibration. Now this comparative elastic force, with which the second particle is agitated in the very moment in which it begins to move, arises from the preceding particle's approaching it according to the law of a pendulum; and therefore, if the preceding particle approaches it in this manner, the force by which it will be agitated, in the very moment it begins to move, will be exactly such as should take place in order to move it according to the law of a pendulum. It therefore sets out according to that law, and consequently the subsequent elastic forces generated in every successive moment, will also continue to be of the just magnitude which should take place, in order to produce such a motion.

9. The pulses of the air are propagated from sounding bodies, according to the law of a cycloidal pendulum. The point E, fig. 3, of any elastic fibre producing a sound, may be considered as a particle of air vibrating according to the law of a pendulum (1). This point E will therefore move according to this law for a certain time, denoted by the arch IH, fig. 4, before the second particle begins to move; for sound is propagated in time through the successive particles of air (4). Now from that instant, the comparative elastic force which agitates F, is (8) directly as its distance from the middle point of vibration. F therefore sets out with a motion according to the law of a pendulum; and therefore the comparative elastic force by which it will be agitated until G begins to move, will continue that law (8). Consequently F will approach G in the same manner as E approached F, and the comparative elastic force of G, from the instant in which it begins to move, will be directly as its distance from the middle point of vibration; and so on in succession. Therefore all the particles of air in the pulses successively set out from their proper places according to the law of a pendulum, and therefore (7) will finish their entire vibrations according to the same law.

"Cor. 1. The number of pulses propagated is the same with the number of vibrations of the tremulous body, nor is it multiplied in their progress; because the little physical line sy, fig. 3, as soon as it returns to its proper place, will be quiescent: for its velocity, which is denoted by the sine IM, then vanishes, and its density becomes the same with that of the ambient medium. This line, therefore, will no longer move, unless it be again driven forwards by the impulse of the sounding body, or of the pulses propagated from it.

"Cor. 2. In the extreme points of the little space through which the particle vibrates, the expansion of the air is in its natural state; for the expansion of the physical line is to its natural expansion as V = IM is to V; but IM is then equal to nothing. In the middle point of the progress the condensation is greatest: for IM is then greatest, and consequently the expansion V = IM least. In the middle of the regress, the rarefaction is greatest, for im, and consequently V + im is then greatest.

"10. To find the velocity of the pulses, the density and elastic force of the medium being given.

"This is the 49th Prop. B. II. Newton, in which he shows, that whilst a pendulum, whose length is equal to the height of the homogeneous atmosphere, vibrates once forwards and backwards, the pulses will describe a space equal to the periphery of a circle described with that altitude as its radius.

"Cor. 1. Hence, shows, that the velocity of the pulses is equal to that which a heavy body would acquire in falling down half the altitude of that homogeneous atmosphere; and therefore, that all pulses move equally fast, whatever be the magnitude of PS, or the time of its being described; that is, whether the tone be loud or low, grave or acute. See Halles de Sonis, § 49.

"Cor. 2. And also, that the velocity of the pulses is in a ratio compounded of the direct subduplicate ratio of the elastic force of the medium, and the inverse subduplicate of its density. Hence sounds move somewhat faster in summer than in winter. See Halles de Sonis, p. 141.

"11. The strength of a tone is as the moment of the particles of air. The moment of these particles (the medium being given) is as their velocity; and the velocity of these particles is as the velocity of the string which sets them in motion (9). The velocities of two different strings are equal when the spaces which they describe in their vibrations are to each other as the times of these vibrations: therefore, two different tones are of equal strength, when the spaces, through which the strings producing them vibrate, are directly as the times of their vibration.

"12. Let the strength of the tones of the two strings AB, CD, which differ in tension only (fig. 5: S) be equal. Quere the ratio of the impressing forces F and F? From the hypothesis of the equality of the strength of the tones, it follows (11), that the space U2
ACOUSTICS.

Chap. IV.

A gun is discharged at a distance, we see the fire long before we hear the sound. If then we know the distance of the place, and know the time of the interval between our first seeing the fire and then hearing the report, this will shew us exactly the time the sound has been travelling to us. For instance, if the gun is discharged a mile off, the moment the flash is seen, you take a watch and count the seconds till you hear the sound; the number of seconds is the time the sound has been travelling a mile. Again, by the above axiom, we are enabled to find the distance between objects that would be otherwise immeasurable. For example, suppose you see the flash of a gun in the night calculated at sea, and tell seven seconds before you hear the report, it follows therefore that the distance is seven times 1142 feet, that is, 24 yards more than a mile and a half. In like manner, if you observe the number of seconds between the lightning and the report of the thunder, you know the distance of the cloud from whence it proceeds.

But according to another philosopher, Dr Thomas Young, the velocity of sound is not quite so great. "It has been demonstrated, he observes, by M. de la Grange and others, that any impression whatever communicated to one particle of an elastic fluid, will be transmitted through that fluid with an uniform velocity, depending on the constitution of the fluid, without reference to any supposed laws of the continuation of that impression. Their theorem for ascertaining this velocity is the same as Newton has deduced from the hypothesis of a particular law of continuation: but it must be confessed, that the result differs somewhat too widely from experiment, to give us full confidence in the perfection of the theory. Corrected by the experiments of various observers, the velocity of any impression transmitted by the common air, may, at an average, be reckoned 1150 feet in a second." (Phil. Trans. vol. xc, p. 116.)

Derkson has proved by experiment, that all sounds whatever travel at the same rate. The sound of a gun at the same rate.

The striking of a hammer, are equally swift in their motions; the softest whisper flies as swiftly, as far as it goes, as the loudest thunder.

To these axioms we may add the following:

Smooth and clear sounds proceed from bodies that are homogeneous, and of an uniform figure; and harsh or obtuse sounds, from such as are of a mixed matter and irregular figure.

The velocity of sounds is to that of a brisk wind as fifty to one.

The strength of sounds is greatest in cold and dense air, and least in that which is warm and rarefied. Ever point against which the pulses of sound strike, becomes a centre from which a new series of pulses are propagated in every direction.

Sound describes equal spaces in equal times.

CHAP. III. Of the Velocity, &c. of Sound. Axioms.

Velocity of sound.

By the experiments of some philosophers it has been proved, that sound travels at about the rate of 1142 feet in a second, or near 13 miles in a minute; nor do any obstacles hinder its progress, a contrary wind only a small matter diminishing its velocity. The method of calculating its progress is easily made known. When
Chap. IV.  

ACOUSTICS.

The form of a whispering gallery must be that of a concave hemisphere (\(\gamma\)) as ABC, fig. 8.; and if a low sound or whisper be uttered at A, the vibrations expanding themselves every way will impinge on the points DDD, &c. and from thence be reflected to EEE, and from thence to the points F and G, till at last they all meet in C, where, as we have said, the sound will be the most distinctly heard.

The augmentation of sound by means of speaking-trumpets, is usually illustrated in the following manner: Let ABC, fig. 9. be the tube, BD the axis, and B the mouth-piece for conveying the voice to the tube. Then it is evident when a person speaks at B in the trumpet, the whole force of his voice is spent upon the air contained in the tube, which will be agitated through its whole length, and, by various reflections from the side of the tube to the axis, the air along the middle part of the tube will be greatly condensed, and its momentum proportionally increased, so that when it comes to agitate the air at the orifice of the tube AC, its force will be as much greater than what it would have been without the tube, as the surface of a sphere, whose radius is equal to the length of the tube, is greater than the surface of the segment of such a sphere whose base is the orifice of the tube. For a person speaking at B, without the tube, will have the force of his voice spent in exciting concentric superficies of air all round the point B; and when those superficies or pulses of air are diffused as far as D every way, it is plain the force of the voice will there be diffused through the whole superficies of a sphere whose radius is BD; but in the trumpet it will be so confined, that at its exit it will be diffused through so much of that spherical surface of air as corresponds to the orifice of the tube. But since the force is given, its intensity will be always inversely as the number of particles it has to move; and therefore in the tube it will be to that without, as the superficies of such a sphere to the area of the large end of the tube nearly.

But it is obvious, Dr. M. Young observes, that the confinement of the voice can have little effect in increasing the strength of the sound, as this strength depends on the velocity with which the particles move. Were this reasoning conclusive, the voice should issue through the smallest possible orifice; cylindrical tubes would be preferable to any that increased in diameter; and the less the diameter, the greater would be the effect of the instrument; because the plate or mass of air to be moved, would, in that case, be less, and consequently the effect of the voice the greater; all which is contradicted by experience.

"The cause of the increase of sound in these tubes must therefore be derived from some other principles: and among these we shall probably find, that what the ingenious Kircher has suggested in his Phaenogoria is the most deserving of our attention. He tells us, that the augmentation of the sound depends on its reflection from the tremulous sides of the tube; which reflections, conspiring in propagating the pulses in the same direction, must increase its intensity." Newton also seems to have considered this as the principal cause, in the scholium of Prop. 50. B. II. Princip. when he says, "we hence see why sounds are so much increased in stentorophonic tubes, for every reciprocal motion is, in each return, increased by the generating cause.

"Farther, When we speak in the open air, the effect on the tympanum of a distant auditor is produced merely by a single pulse. But when we use a tube, all the pulses propagates from the mouth, except those in the direction of the axis, strike against the sides of the tube, and every point of impulse becoming a new centre, from whence the pulses are propagated in all directions, a pulse will arrive at the ear from each of those points; thus, by the use of a tube, a greater number of pulses are propagated to the ear, and consequently the sound increased. The confinement too of the voice may have a little effect, though not such as is ascribed to it by some; for the condensed pulses produced by the naked voice, freely expand every way; but in tubes, the lateral expansion being diminished, the direct expansion will be increased, and consequently the velocity of the particles, and the intensity of the sound. The substance also of the tube has its effect; for it is found by experiment, that the more elastic the substance of the tube, and consequently the more susceptible it is of these tremulous motions, the stronger is the sound.

"If the tube be laid on any nonelastic substance, it deadens the sound, because it prevents the vibratory motion of the parts. The sound is increased in speaking-trumpets, if the tube be suspended in the air; because the agitations are then carried on without interruption. These tubes should increase in diameter from the mouth-piece, because the parts vibrating in directions perpendicular to the surface will conspire in impelling forward the particles of air, and consequently, by increasing their velocity, will increase the intensity of the sound: and the surface also increasing, the number of points of impulse and of new propagation will increase proportionally. The several causes, therefore, of the increase of sound in these tubes, Dr. Young concludes to be, 1. The diminution of the lateral, and consequently the increase of the direct, expansion and velocity of the included air. 2. The increase of the number of pulses, by increasing the points of new propagation. 3. The reflections of the pulses from the tremulous sides of the tube, which impel the particles of air forward, and thus increase their velocity." (Enquiry into the principal Phenomena of Sound, p. 56.)

An echo is a reflection of sound striking against some object, as an image is reflected in a glass: but it has been disputed what are the proper qualities in a body for thus reflecting sounds. It is in general known, that caverns, grottoes, mountains, and ruined buildings, return this reflection of sound. We have heard of a very extraordinary echo, at a ruined fortress near Louvain, in Flanders. If a person sung, he only heard his own voice, without any repetition: on the contrary, those who stood at some distance heard the echo but not the voice; but then they heard it with surprising variations, sometimes louder, sometimes softer, now more near,

(e) A cylindric or elliptic arch will answer still better than one that is circular.
near, then more distant. There is an account in the memoirs of the French Academy, of a similar echo near Rouen.

It has been already observed that every point against which the pulses of sound strike becomes the centre of a new series of pulses, and sound describes equal distances in equal times; therefore, when any sound is propagated from a centre, and its pulses strike against a variety of obstacles, if the sum of the right lines drawn from that point to each of the obstacles, and from each obstacle to a second point, be equal, then will the latter be a point in which an echo will be heard. Thus let A fig. 10, be the point from which the sound is propagated in all directions, and let the pulses strike against the obstacles C, D, E, F, G, H, I, &c. each of these points becomes a new centre of pulses by the first principle, and therefore from each of them one series of pulses will pass through the point B. Now if the several sums of the right lines $AC + CB$, $AD + DC$, $AE + EB$, $AG + GB$, $AH + HB$, $AI + IB$, &c. be all equal to each other, it is obvious that the pulses propagated from A to these points, and again from these points to B, will all arrive at B at the same instant, according to the second principle; and therefore, if the hearer be in that point, his ear will at the same instant be struck by all these pulses. Now it appears from experiment (see Muschenbroek, vol. ii. p. 210), that the ear of an exercised musician can only distinguish such sounds as follow one another at the rate of 9 or 10 in a second, or any slower rate: and therefore, for a distinct perception of the direct and reflected sound, there should intervene the interval of 4th of a second; but in this time sound describes $\frac{1}{12}$ or 127 feet nearly. And therefore, unless the sum of the lines drawn from each of the obstacles to the points A and B exceeds the interval AB by 127 feet, no echo will be heard at B. Since the several sums of the lines drawn from the obstacles to the points A and B are of the same magnitude, it appears that the curve passing through all the points C, D, E, F, G, H, I, &c. will be an ellipse, (Prop. 14. b. ii. Hyd. Con.) Hence all the points of the obstacles which produce an echo, must lie in the surface of the oblong spheroid, generated by the revolution of this ellipse round its major axis.

As there may be several spheroids of different magnitudes, so there may be several different echoes of the same original sound. And as there may happen to be a greater number of reflecting points in the surface of an exterior spheroid than in that of an interior, a second or a third echo may be much more powerful than the first, provided that the superior number of reflecting points, that is, the superior number of reflected pulses propagated to the hearer, be more than sufficient to compensate for the decay of sound which arises from its being propagated through a greater space. This is finely illustrated in the celebrated echoes at the lake of Killarney in Kerry, where the first return of the sound is much inferior in strength to those which immediately succeed it.

From what has been laid down it appears, that for the most powerful echo, the sounding body should be in one focus of the ellipse which is the section of the echoing spheroid, and the hearer in the other. However, an echo may be heard in other situations, though not so favourably; as such a number of reflected pulses may arrive at the same time at the ear as may be sufficient to excite a distinct perception. Thus a person often hears the echo of his own voice; but for this purpose he should stand at least 63 or 64 feet from the reflecting obstacle, according to what has been said before. At the common rate of speaking, we pronounce not above three syllables and a half, that is, seven half syllables in a second; therefore, that the echo may return just as soon as three syllables are expressed, twice the distance of the speaker from the reflecting object must be equal to 1000 feet: for as sound describes 1144 feet in a second, the length of that space, that is, 1000 feet nearly, will be described while six half or three whole syllables are pronounced; that is, the speaker must stand near 500 feet from the obstacle. And in general, the distance of the speaker from the echoing surface, for any number of syllables, must be equal to the seventh part of the product of 1144 feet multiplied by that number.

In churches we never hear a distinct echo of the voice, but a confused sound when the speaker utters his words too rapidly; because the greatest difference of distance between the direct and reflected courses of such a number of pulses as would produce a distinct sound, is never in any church equal to 127 feet, the limit of echoes.

But though the first reflected pulses may produce no echo, both on account of their being too few in number, and too rapid in their return to the ear; yet it is evident, that the reflecting surface may be so formed, as that the pulses which come to the ear after two reflections or more, may, after having described 127 feet or more, arrive at the ear in sufficient numbers, and also so nearly at the same instant, as to produce an echo, though the distance of the reflecting surface from the ear be less than the limit of echoes. This is confirmed by a singular echo in a grotto on the banks of the little brook called the Dinan, about two miles from Castlecomber, in the county of Kilkenny. As you enter the cave, and continue speaking loud, no return of the voice is perceived; but on your arriving at a certain point, which is not above 14 or 15 feet from the reflecting surface, a very distinct echo is heard. Now this echo cannot arise from the first course of pulses that are reflected to the ear, because the breadth of the cave is so small, that they would return too quickly to produce a distinct sensation from that of the original sound; it therefore is produced by those pulses, which, after having been reflected several times from one side of the grotto to the other, and having run over a greater space than 127 feet, arrive at the ear in considerable numbers, and not more distant from each other, in point of time, than the ninth part of a second.

To what has been said of reflected sounds, we shall add an extract on the same subject from the ingenious paper which we have already quoted.

M. de la Grange has also demonstrated, that all impressions are reflected by an obstacle terminating an elastic fluid, with the same velocity with which they arrived at that obstacle. When the walls of a passage,
or of an unfurnished room, are smooth and perfectly parallel, any explosion, or a stamping with the foot, communicates an impression to the air, which is reflected from one wall to the other, and from the second again towards the ear, nearly in the same direction with the primitive impulse: this takes place as frequently in a second, as double the breadth of the passage is contained in 1130 feet; and the ear receives a perception of a musical sound, thus determined in its pitch by the breadth of the passage. On making the experiment, the result will be found accurately to agree with this explanation. If the sound is predetermined, and the frequency of vibrations such as that each pulse, when doubly reflected, may coincide with the subsequent impulse proceeding directly from the sounding body, the intensity of the sound will be much increased by the reflection; and also, in a less degree, if the reflected pulse coincides with the next but one, the next but two, or more, of the direct pulses. The appropriate notes of a room may readily be discovered by singing the scale in it; and they will be found to depend on the proportion of its length or breadth to 1130 feet. The sound of the stopped diapason pipes of an organ is produced in a manner somewhat similar to the note from an explosion in a passage; and that of its red pipes to the resonance of the voice in a room: the length of the pipe in one case determining the sound; in the other, increasing its strength. The frequency of the vibrations does not at all immediately depend on the diameter of the pipe. It must be confessed, that much remains to be done in explaining the precise manner in which the vibration of the air in an organ pipe is generated. M. Daniel Bernoulli has solved several difficult problems relating to the subject; yet some of his assumptions are not only gratuitous, but contrary to matter of fact." (Phil. Trans. or. ed. p. 118.)

We shall now close this article with describing a few inventions founded on some of the preceding principles, which may perhaps amuse and not be altogether uninstrustive to a number of our readers.

Amusing Experiments and Contrivances.

I. Place a concave mirror of about two feet diameter as AB, fig. 11, in a perpendicular direction. The focus of this mirror may be at 15 or 18 inches distance from its surface. At the distance of about five or six feet let there be a partition, in which there is an opening EF, equal to the size of the mirror; against this opening must be placed a picture, painted in water colours, or a thin cloth, that the sound may easily pass through it (c).

Behind the partition, at the distance of two or three feet, place another mirror GH, of the same size as the former, and let it be diametrically opposite to it (h).

At the point C let there be placed the figure of a man seated on a pedestal, and let his ear be placed exactly in the focus of the first mirror: his lower jaw must be made to open by a wire, and shut by a spring; and there may be another wire to move the eyes: these wires must pass through the figure, go under the floor, and come up behind the partition.

Let a person, properly instructed, be placed behind the partition near the mirror. You then propose to any one to speak softly to the statue, by putting his mouth to the ear of it, assuring him that it will answer instantly. You then give the signal to the person behind the partition, who, by placing his ear to the focus I, of the mirror GH, will hear distinctly what the other said; and, moving the jaw and eyes of the statue by the wires, will return an answer directly, which will in like manner be distinctly heard by the first speaker.

This experiment appears to be taken from the Century of Inventions of the Marquis of Worcester; whose designs, at the time they were published, were treated with ridicule and neglect as being impracticable, but are now known to be generally, if not universally, practicable. The words of the marquis are these: "How to make a brazen or stone head in the midst of a great field or garden, so artificial and natural, that though a man speak ever so softly, and even whisper into the ear thereof, it will presently open its mouth, and resolve the question in French, Latin, Welsh, Irish, or English, in good terms, uttering it out of its mouth, and then shut it until the next question be asked."—The two following, of a similar nature, appear to have been inventions of Kircher, by means of which (as he informs us) he used to "utter feigned and ludicrous consultations, with a view to show the fallacy and impiety and imposure of ancient oracles.

II. Let there be two heads of plaster of Paris, placed on pedestals, on the opposite sides of a room. There must be a tin tube of an inch diameter, that must pass from the ear of one head through the pedestal, under the floor, and up to the mouth of the other. Observe that the end of the tube which is next the ear of the one head, should be considerably larger than that end which comes to the mouth of the other. Let the whole be so disposed that there may not be the least suspicion of a communication.

Now, when a person speaks quite low, into the ear of the bust, the sound is reverberated through the length of the tube, and will be distinctly heard by any one who shall place his ear to the mouth of the other. It is not necessary that the tube should come to the lips of the bust.—If there be two tubes, one going to the ear, and the other to the mouth of each head, two persons may converse together by applying their mouth and ear reciprocally to the mouth and ear of the busts; and at the same time other persons that stand in the middle of the chamber, between the heads, will not hear any part of their conversation.

III. Place a bust on a pedestal in the corner of a room, lar head.

(c) The most effectually to conceal the cause of this illusion, the mirror AB may be fixed in the wainscot, and a gaunt or any other thin covering thrown over it, as that will not in the least prevent the sound from being reflected. An experiment of this kind may be performed in a field or garden, between two hedges, in one of which the mirror AB may be placed, and in the other an opening artfully contrived.

(h) Both the mirrors here used may be of tin or gilt pasteboard, this experiment not requiring such accuracy.
room, and let there be two tubes, as in the foregoing amusement, one of which must go from the mouth and the other from the ear of the bust, through the pedestal and the floor, to an under apartment. There may be likewise wires that go from the under jaw and the eyes of the bust, by which they may be easily moved.

A person being placed in the under room, and at a signal given applying his ear to one of the tubes, will hear any question that is asked, and immediately reply; moving at the same time, by means of the wires, the mouth and the eyes of the bust, as if the reply came from it.

IV. In a large case, such as is used for dials and spring clocks, the front of which, or at least the lower part of it, must be of glass, covered on the inside with gauze, let there be placed a barrel organ, which, when wound up, is prevented from playing, by a catch that takes a toothed wheel at the end of the barrel. To one end of this catch there must be joined a wire, at the end of which there is a flat circle of cork, of the same dimension with the inside of a glass tube, in which it is to rise and fall. This tube must communicate with a reservoir that goes across the front part of the bottom of the case, which is to be filled with spirits, such as is used in thermometers, but not coloured, that it may be the better concealed by the gauze.

This case being placed in the sun, the spirits will be rarefied by the heat; and rising in the tube, will lift up the catch or trigger, and set the organ in play: which will continue to do as long as it is kept in the sun; for the spirits cannot run out of the tube, that part of the catch to which the circle is fixed being prevented from rising beyond a certain point by a check placed over it.

When the machine is placed against the side of a room on which the sun shines strong, it may constantly remain in the same place, if you enclose it in a second case, made of thick wood, and placed at a little distance from the other. When you want it to perform, it will be only necessary to throw open the door of the outer case, and expose it to the sun.

But if the machine be movable, it will perform in all seasons by being placed before the fire; and in winter it will move readily stop when removed into the cold.

A machine of this sort is said to have been invented by Cornelius Dreble, in the last century. What the construction of that was, we know not; it might very likely be more complex, but could scarcely answer the intention more readily.

V. Under the keys of a common harpsichord let there be fixed a barrel, something like that in a chamber organ, with stops or pins corresponding to the tunes you would have it play. These stops must be moveable, so that the tunes may be varied at pleasure. From each of the keys let there go a wire perpendicular down:

the ends of these wires must be turned up for about one-fourth of an inch. Behind these wires let there be an iron bar, to prevent them from going too far back. Now, as the barrel turns round, its pins take the ends of the wires, which pull down the keys, and play the harpsichord. The barrel and wires are to be all enclosed in a case.

In the chimney of the same room where the harpsichord stands, or at least in one adjacent, there must be a smoke jack, from whence comes down a wire, or cord, that, passing behind the wainscot adjoining the chimney, goes under the floor, and up one of the legs of the harpsichord, into the case, and round a small wheel fixed on the axis of that first mentioned. There should be pulleys at different distances, behind the wainscot and under the floor, to facilitate the motion of the cord.

This machinery may be applied to any other keyed instrument as well as to chimes, and to many other purposes where a regular continued motion is required.

An instrument of this sort may be considered as a perpetual motion, according to the vulgar acceptation of the term; for it will never cease going till the fire be extinguished, or some parts of the machinery be worn out.

VI. At the top of a summer-house, or other building, a vertical let there be fixed a vase AB, fig. 12, on which is the symphony pinion C, that takes the toothed wheel D, fixed on the axis EF, which at its other end carries the wheel G, that takes the pinion H. All these wheels and pinions are to be between the roof and the ceiling of the building. The pinion H is fixed to the perpendicular axis IK, which goes down very near the wall of the room, and may be covered after the same manner as are bell-wires. At the lower end of the axis IK there is a small pinion L, that takes the wheel M, fixed on the axis of the great wheel NO. In this wheel there must be placed a number of stops, corresponding to the tunes it is to play. These stops are to be moveable, that the tunes may be altered at pleasure. Against this wheel there must hang 12 small bells, answering to the notes of the gamut. Therefore, as the wheel turns round, the stops striking against the bells play the several tunes. There should be a fly to the great wheel, to regulate its motion when the wind is strong. The wheel NO, and the bells are to be enclosed in a case.

There may be several sets of bells, one of which may answer to the tenor, another to the treble, and a third to the bass, or they may play different tunes, according to the size of the wheel. Instead of bells, glasses may be here used, so disposed as to move freely at the stroke of the stops. This machinery may likewise be applied to a barrel-organ; and to many other uses.

A view of the more recent facts and speculations relating to this difficult branch of science will be found under the article Acoustics in the Supplement.

---

ACQUA PENDENT E, a pretty large town of Acquapendente, in the territory of the church, and patriomy of St Peter, with a bishop's see. It is seated on a mountain, near the river Paglia, ten miles W. of Orvieto, and 57 N. by W. of Rome. It takes its name from a fall

Fig. 12.
ACQUARIUM, a small town of Italy, in Frigana, a district of Modena, which is remarkable for its medicinal waters. It is 18 miles south-west of the city of Modena. E. Long. 10° 45'. N. Lat. 44° 24'.

ACQUEST, or ACQUISIT, in Law, signifies goods got by purchase or donation. See CONQUEST.

ACQUI, a town of Italy, in the duchy of Montferrat, with a bishop's see and commodious baths. It was taken by the Spaniards in 1745, and retaken by the Piedmontese in 1746; but after this it was taken again and dismantled by the French, who afterwards forsook it. It is seated on the river Bormia, 25 miles north-west of Genoa, and 30 south of Casal. E. Long. 8° 19'. N. Lat. 44° 4'.

ACQUISITION, in general, denotes the obtaining or procuring something. Among lawyers, it is used for the right or title to an estate got by purchase or donation.

ACQUITTAL, a discharge, deliverance, or setting of a person free from the guilt or suspicion of an offence.

ACQUITTANCE, a release or discharge in writing for a sum of money, witnessing that the party has paid the said sum.—No man is obliged to pay a sum of money if the demandant refuses to give an acquittance, which is a full discharge, and bars all actions, &c. An acquittance given by a servant for a sum of money received for the use of his master, shall be a good discharge for that sum, provided the servant used to receive his master's rents, debts, &c.

ACRA, a town of Africa, on the coast of Guinea, where the English, Dutch, and Danes, have strong forts, and each fort has its particular village. W. Long. o°. 2'. N. Lat. 5° 0'.

ACRA, in Ancient Geography, one of the hills of Jerusalem, on which stood the lower town, which was the old Jerusalem; to which was afterwards added Zion, or the city of David. Probably called Acre, from the fortress which Antiochus built there in order to annoy the temple, and which Simon Maccabees took and razed to the ground.

ACRA Japygia, in Ancient Geography, called Salentina by Ptolemy; now Capo di San Maria di Leva: A promontory in the kingdom of Naples, to the south-east of Otranto, where formerly was a town, now lying in ruins, on the Ionian sea, over against the Montes Acerocerianum of Epirus.

ACRÆ, in Ancient Geography, a town of Sicily, whose inhabitants were called Acrenæ. It stood to the south of Syracuse, at the distance of 24 miles, near the place now called the monastery of Santa Maria d'Arcia, on an eminence, as appears from Silius Italicus. The Syracusans were the founders of it, according to Thucydides, 70 years after the building of Syracuse, or 66 years before Christ. Hence the epithet Acreus.

ACRAGAS, or AGRAGAS, in Ancient Geography, so called by the Greeks, and sometimes by the Romans, but more generally Agrigentum by the latter; a town of Sicily. In Greek medals the inhabitants are called AKITANTINOI, and Agrigentine by Cicero. The town stood upon a mountain, at the confluence of the Acracas and Hypsa, near the port called Eryx by Ptolemy, but Euromos, or the Dock, by Strabo; and in Vol. I. Part I. the time of the latter, scarce a trace of all that side remained. In the year before Christ 584, the people of Gela built Acragas, 128 years after building their own city. It took its name from the river running by it; and being but two miles from the sea, enjoyed the conveniences of a sea port. It was a place of great strength, standing on the top of a very steep rock, and washed on the south side by the river Acracas, now called Piume di Gergenti, and on the south-west by the Hypsa, with a citadel to the south-east, externally surrounded by a deep gulf, which made it inaccessible but on the side next the town. It was famous for the tyrant Phalaris and his brazen bull. The Agrigentines were a people luxurious in their tables, and magnificent in their dwellings; of whom Empedocles, in Diogenes Laërtius, says, that they lived to-day as if they were to die to-morrow, and built as if they were to live for ever. The country round the city was laid out in vine and olive yards, in the produce of which they carried on a great and profitable commerce with Carthage. E. Long. 13° 30'. N. Lat. 37° 20'.

ACRAMAR, or VAN, in Geography, a town and lake of the greater Armenia in Asia. The town, which is large, populous, and commercial, is the capital of the government of Van, is situated at the foot of the mountains of Diarbekir, and is said to have been built by Semiramis. The lake abounds with fish. There are two islands in it which are inhabited by religious Armenians. E. Long. 42° 50'. N. Lat. 38° 2'.

ACRASIA, among physicians, implies the predominancy of one quality above another, either with regard to artificial mixtures, or the humours of the human body. The word is Greek, and compounded of a privative, and σαρκαμος, to mix; s. d. not mixed in a just proportion.

ACRATUS, in Ancient Geography, a town of Asia Minor in Lydia. Some imperial Greek medals of this city still exist, which were struck under the pretors in honour of Severus, and several other emperors.

ACRATH, in Ancient Geography, a place in Mauritania Tingitana, now supposed to be Veles de Gomara: A fortified town in the kingdom of Fez, with a citadel and commodious harbour on the Mediterranean, scarce a mile distant from Penon de Velez, a Spanish fort. W. Long. 5°. N. Lat. 34° 45'.

ACRE, or ACRA, in Geography, a sea-port town in Syria. It was formerly called Ptolemais, from one of the Ptolemies; and Acra on account of its fortifications; whence the knights of St John of Jerusalem called it St John d'Acre. This city was successively under the dominion of the Romans and the Moors; and was famous in the time of the crusades, and underwent several sieges both by the Christians and Saracens. It is situated at the north angle of a bay, which extends in a semicircle of three leagues, as far as the point of Carmel.

During the crusades, the possession of this town was long disputed by the Christians and Saracens. In 1192, it was taken from the latter by Richard L. of England and Philip of France, after a siege of two years, and the slaughter of 100,000 Christians, besides a greater number who perished by shipwreck or disease, who gave it to the knights of St John of Jerusalem. They kept possession of it 100 years, when it was retaken by the Saracens, and almost entirely destroyed. This event
The event is rendered memorable by an act of singular resolution with which it was accompanied. A number of beautiful young nuns, terrified at the prospect of being exposed to the brutal lust of the infidels, determined to avoid the violation of their chastity, by rendering themselves objects of aversion. With this view they cut off their noses and mangled their faces. The Saracens, inflamed with resentment at a spectacle which prevented the gratification of their appetites, immediately put them all to the sword. After the expulsion of the crusaders, it remained almost deserted till about the year 1270, when it was fortified by Daker, an Arabian sheik, who maintained his independence against the Ottoman power, till the year 1775, when he was basely assassinated by the emissaries of that government at the age of 86 years. He was adored by his people, whom his prudence and valour had through life projected against the tyranny and oppression of the pacha. More lately the works erected by Djezzar, within the last ten years, have rendered it one of the principal towns upon the coast. The mosque of this pacha is boasted as a masterpiece of eastern taste. The bazar, or covered market, is not inferior even to those of Aleppo; and its public fountain surpasses in elegance those of Damascus, though the water is of a very indifferent quality. The pacha has derived the more honour from these works, as he was himself both the engineer and architect: he formed the plans, drew the designs, and superintended the execution.

The port of Acre is one of the best situated on the coast, as it is sheltered from the north and north-west winds by the town itself; but it is greatly choked up since the time of Fakr-el-Din. Djezzar contented himself with making a landing place for boats. The fortifications, though more frequently repaired than any other in all Syria, are of no importance: there are only a few wretched low towers near the port, on which cannon are mounted; and these rusty iron pieces are so bad, that some of them burst every time they are fired. Its defence on the land side is merely a garden wall without any ditch.

In the year 1799 Acre was again the scene of war, when it was bravely defended by our gallant countryman Sir Sidney Smith, against the military skill and extraordinary exertions of Bonaparte, and some of his ablest generals. The pacha Djezzar was preparing to evacuate the place, and make good his retreat with his women and treasure, when Sir Sidney with his squadron anchored in the road of Caifa. The fortifications were repaired under the direction of a skilful engineer, which, with the assistance of the English marines, encouraged and animated the pacha to hold out. After the French had renewed and varied the attack, and been as often repulsed with great slaughter, Bonaparte, despairing of success, raised the siege on the 20th of May, the 1st day after breaking ground.

Corn and cotton form the basis of the commerce of Acre, which is becoming more flourishing every day. Of late, the pacha, by an abuse common throughout all the Turkish empire, has monopolized all the trade in his own hands, no cotton can be sold but to him, and from him every purchase must be made. In vain have the European merchants claimed the privileges granted them by the sultan; Djezzar replied, that he was the sultan in his country, and continued his monopoly. The merchants were generally French, and they had six houses at Acre, with a consul. The condition of the inhabitants has been much improved since the death of Djezzar, his successor Suleiman being a mild and pacific man.

That part of the bay of Acre in which ships anchor with the greatest security lies to the north of Mount Carmel, below the village of Haifa (commonly called Coiffa). The bottom is good holding ground, and does not chase the cable, but the harbour is open to the north-west wind, which blows violently along all this coast. Mount Carmel, which commands it to the south, is a flattened cone, and very rocky; it is about 1000 feet high. We still find among the brambles wild vines and olive trees, which prove that industry has formerly been employed even in this ungrateful soil: on the summit is a chapel dedicated to the prophet Elias, which affords an extensive prospect over the sea and land. It is 20 miles south of Tyre, and 37 north of Jerusalem. E. Long. 39. 25. N. Lat. 32. 40.

Acre, in the Mogul’s dominions, the same with lack, and signifies the sum of 100,000 rupees; the rupee is of the value of the French crown of three livres, or 30 sols of Holland; 120 lacks of rupees make a corron in Hindostan, or 10,000,000 rupees: the pound sterling is about eight rupees; according to which proportion, a lack of rupees amounts to 12,500l. sterling.

Acre, the universal measure of land in Britain. The word (formed from the Saxon acher, or the German aker, a field), did not originally signify a determinate quantity of land, but any open ground, especially a wide campaig; and in this antique sense it seems to be preserved in the names of places, as Castleacre, West-acre, &c. An acre in England contains four square rods, a rod 40 perches or poles of 16. feet each by statute. Yet this measure does not prevail in all parts of England, as the length of the pole varies in different counties, and is called customary measure, the difference running from the 16. feet to 28. The acre is also divided into 10 square chains, of 22 yards each, that is, 4840 square yards. An acre in Scotland contains four square roods; one square rood is 40 square falls; one square fall, 36 square ells; one square ell, nine square feet and 73 square inches; one square foot, 144 square inches. The Scots acre is also divided into 10 square chains; the measuring chain should be 24 ells in length, divided into 100 links, each link 8,755 inches; and so one square chain will contain 10,000 square links. The English statute acre is about three roods and six falls standard measure of Scotland.

The French acre, arpent, contains 3/4 English acre, or 54,450 square English feet, whereof the English acre contains only 43,560.—The Strasbourg acre is about half an English acre.—The Welsh acre contains commonly two English ones.—The Irish acre is equal to one acre two roods and 19 perches.±, English.

Acre-Fight, an old sort of duel fought by English and Scottish combatants, between the frontiers of their kingdoms, with sword and lance: it was also called camp-fight, and the combatants champions, from the open field being the stage of trial.

Acre-Tax, a tax laid on land at so much per acre. In some places this is also called acre-shot. Impositions on lands in the great level are to be raised by a proportionable

Acridophaga.

ACRIBEIA, a term purely Greek, literally denoting an exquisite or delicate accuracy; sometimes used in our language, for want of a word of equal significa-

tion.

ACRID, a name for any thing that is of a sharp or pungent taste. See MATERIA MEDICA.

ACRIDOPHAGI, in Ancient Geography, an Ethi-
opian people, represented as inhabiting near the des-
ts, and to have fed on locusts. This latter circum-
stance their name imports; the word being com-
ounded of the Greek aṣias, locust, and ἐφαγιν, to eat. We have the following account of them by Diodorus Siculus. Their stature was lower than that of other men; they were meagre, and extremely black. In the spring, high west winds drove from the desert to their quarter locusts of an extraordinary size, and remarkable for the squalid colour of their wings. So great was the number of these insects, that they were the only sustenance of the barbarians, who took them in the fol-
lowing manner: At the distance of some stadia from their habitations there was a wide and deep valley. They filled this valley with wood and wild herbs, with which their country abounded. When the cloud of locusts appeared, which was driven on by the wind, they set fire to the fuel which they had collected. The smoke which arose from this immense fire was so thick, that the locusts in crossing the valley, were stifled by it, and fell in heaps on the ground. The passage of the locusts being thus intercepted for many days, they made a large provision of those insects. As their coun-
try produced great quantities of salt, they salted them, to render them more palatable, and to make them keep till the next season. This peculiar supply was their sole food: they had neither herds nor flocks. They were unacquainted with fishing; for they lived at a dis-
tance from the sea. They were very active, and ran with great swiftness. But their life was not of long duration; it exceeded not forty years. The close of their life was extremely miserable; for in their old age, winged lice of different, but all of ugly forms, bred in their bodies. This malady, which began in the breast and belly, soon spread through the whole frame. The patient at first felt an itching; and the agreeable sensation produced by his scratching of him-
self, preceded a most deplorable calamity. For when those lice, which had bred in his body, forced their way out, they caused effusions of corrupt blood, with excoriating pains in the skin. The unhappy man, with lamentable cries, was industrious himself to make passages for them with his nails. In short these lice issued forth successively from the wounds made by the hands of the patient, as from a vessel full of holes, and in such numbers that it was impossible to exterminate them.—Whether this extraordinary and dreadful dis-
temper was occasioned by the food of the inhabitants of this country, or by a pestilential quality of their climate, it is difficult to determine. Indeed, as to the credibility of the whole account, we must leave the reader to judge.

But though the circumstances of these people should be deemed fabulous, yet may the acridophagia be true. It is well known, that to this day the inhabitants of Ethiopia, Arabia, &c. frequently use locusts for food.

The reader will not be displeased if we lay before him the result of Dr Hasselquist's inquiries as to this particular, who travelled in Syria and Egypt so late as the year 1752. This ingenuous gentleman, who travelled with a view to improve natural history, informs us, that he asked Franks, and many other people who had lived long in these countries, whether they had ever heard that the inhabitants of Arabia, Ethiopia, &c. used locusts as food? They answered that they had. He likewise asked the same question of Armenians, Copts, and Syrians, who lived in Arabia, and had travelled in Syria, and near the Red sea; some of whom said they heard of such a practice, and others that they had often seen the people eat these insects. He at last obtained complete satisfaction on this head from a learned sheik at Cairo, who had lived six years in Mecca. This gentleman told him, in presence of M. le Grand the principal French interpreter at Cairo, and others, that a famine frequently rages at Mecca when there is a scarcity of corn in Egypt, which obliges the inhabitants to live upon coarser food than ordinary: That when corn is scarce, the Arabs grind the locusts in hand mills, or stone mortars, and bake them into cakes, and use these cakes instead of bread: That he has frequently seen locusts used by the Arabsians, even when there was no scarcity of corn; but then they boil them, stew them with butter, and make them into a kind of fricassees; which he says is disagreeably
tasted, for he had sometimes tasted these locust fricassees out of curiosity.

A later traveller, Dr Sparman, informs us * * * Foyage to "That locusts sometimes afford a high treat to the capr,
more unpolished and remote hordes of the Hottentots; when, as sometimes happens, after an interval of 8, 10, or 20 years, they make their appearance in incredible numbers. At these times they come from the north, migrating to the southward, and do not suffer themselves to be impeded by any obstacles, but fly boldly on, and are drowned in the sea whenever they come to it. The females of this race of insects, which are most apt to migrate, and are chiefly eaten, are said not to be able to fly; partly by reason of the shortness of their wings, and partly on account of their being heavy and distended with eggs; and shortly after they have lain these in the sand, they are said to die. It is partic-

ularly of these that the Hottentots make a brown coffee-coloured soup, which at the same time acquires from the eggs a fat and greasy appearance. The Hot-
tentots are highly rejoiced at the arrival of these loc-

huts, though they are sure to destroy every bit of ver-
dure on the ground: but the Hottentots make them-
selves ample amends for this loss, by falling foul on the animals themselves, eating them in such quantities as in the space of a few days to get visibly fatter and in better condition than before."

The Abbé Poiret, also, in his Memoir on the Insects of Barbary and Numidia, informs us, "That the Moors make locusts a part of their food; that they go to hunt them; fry them in oil and butter; and sell them publicly at Tunis, at Bonne," &c.

From these accounts, we may see the folly of that dispute among the divines about the nature of St John's food in the wilderness: some maintaining the original word to signify the fruits of certain trees; others, a kind of
ACR

with arms and legs extended, in imitation of flying; and running, dancing, and leaping, on a rope stretched horizontally.

ACROBATICA, or ACROBATICUM, from άρρομπος, high, and διάκρητος, or διάκριμα, I go; an ancient engine whereby people were raised aloft, that they might see more conveniently about them. The acrobatica among the Greeks amounted to the same with what they call escensoriam among the Latins. Authors are divided as to the use of this engine. Turnebus and Barbarus take it to have been of the military kind, raised by besiegers, high enough to overlook the walls, and discover the state of things on the other side. Baldus rather supposes it a kind of moveable scaffold, or cradle, contrived for raising painters, plasterers, and other workmen, to the tops of houses, trees, &c. Some suspect that it might have been used for both purposes; which is the opinion of Vitruvius and Aquinas.

ACROCERANIA, or MONTES CERANIIH, in Ancient Geography, mountains running out into the sea (so called from their being often thunderstruck), separating the Ionian sea from the Adriatic; where Ilyria ends and Epirus begins: now called Monti della Chiana.

ACROCHERISMUS, among the Greeks, a sort of gymnastic exercise, in which the two combatants contended with their hands and fingers only, without closing or engaging the other parts of the body.

ACROCORSITHUS, in Ancient Geography, a high and steep hill, hanging over the city of Corinth, which was taken within the walls, as an acropolis, or citadel. On its top stood a temple of Venus; and lower down issued the fountain Prine.

ACROMION, in Anatomy, the upper part of the scapula or shoulder blade. See Anatomy.

ACROMONOCRATICUM, in Poetry, a kind of poem, wherein every subsequent verse begins with the letter wherewith the immediately preceding one terminated.

ACRON, a celebrated physician of Agrigentum, in Sicily, who lived about the middle of the fifth century before Christ. He first thought of lighting large fires, and purifying the air with perfumes, to put a stop to the pestilence that ravaged Athens, and which was attended with success. He wrote two treatises, according to Suidas, in the Doric dialect; the one on physic, and the other on abstinence or diet.

ACRON, in Geography, a territory on the Gold coast of Guinea, in Africa, bordering on the Fantanese country. The Dutch have a fort here called Fort Patience; and under it is a village, inhabited only by fishermen. The other inhabitants are addicted to husbandry, and sell their corn to other countries. There is plenty of game, which is very commodious for the Dutch factory. The people are very ignorant, and go naked like the rest of the negroes. This is called Little Acrón; for Great Acrón is farther inland, and is a kind of a republic.

ACRONICAL, ACRONYCAL, or ACRONICAL, in Astronomy, is a term applied to the rising of a star, when the sun is set in the evening; but has been promiscuously used to express a star's rising at sunset, or setting at sunrise.

ACRONIUS LACUS (Mela); a small lake formed by the Rhine, soon after its rise out of the Alps, and after
after passing the greater lake at Constance, called Ve
netus, and now the Bodensee, or lake of Constance.

ACROPOLIS, in Ancient Geography, the citadel,
and one of the divisions of Athens; called Polis, because
constituting the first and original city; and the Upper
Polis, to distinguish it from the lower, which was
afterwards built round it in a large open plain. the Acro-
polis standing on a rock or eminence in the heart of
this plain; and hence its name: To the north it had
a wall built by the Pelasgi, and therefore called Pela-
sic; and to the south a wall, by Cimon the son of Miltiades,
out of the Persian spoils, many ages after the building
of the north wall. It had nine gates, and was there-
fore called Eseopylon; yet but one principal gate or
entrance, the ascent to which was by a flight of steps
of white marble, built in a magnificent manner by Pe-
riceus, (Plutarch).

ACROPOLITAN, George, one of the writers in
the Byzantine history, was born at Constantinople, in
the year 1220, and educated at the court of the em-
peror John Ducas at Nice. He was employed in the
most important affairs of the empire; being sent am-
bassador to Larissa, to establish a peace with Michael
of Epirus; and was constituted judge to try Michael
Commens, who was suspected of engaging in a con-
spiracy. Theodosius Lascaris, the son of John, whom
he had taught logic, appointed him governor of all the
western provinces in his empire. In 1255, he was taken
prisoner in a war with Michael Angelus; but gaining
his liberty in 1260, by means of the emperor Palai-
ologus, he was sent by him ambassador to Constantin
prince of Bulgaria; and was employed in several other
negotiations. He wrote, A Continuation of the Greek
History, from the taking of Constantinople by the
Latins till it was recovered by Michael Palaeologus in
1261, which makes part of the Byzantine history; A Trea-
ise concerning Faith, Virtue, and the Soul; An Exposi-
tion of the Sermons of St Gregory Nazianzen, and
other pieces. Gregory Cyprian, patriarch of Con-
stantinople, in his encomium upon him, prefixed to
Acropolita's history, is perhaps somewhat extravagant
in his praise, when he says he was equal to Aristotle
in philosophy, and to Plato in the knowledge of divine
things and Attic eloquence.

ACROSPIRE, a vulgar term for what botanists call
the plumes.

ACROSPIRED, in malt-making, is the grain's
shooting both at the root and blade end.

ACROSTIC, in Poetry, a kind of poetical com-
position, disposed in such a manner, that the initial let-
ters of the verses form the name of some person, king-
dom, place, motto, &c. The word is compounded of
the Greek aster, extremity, and oter, verse. The
acrostic is considered by the critics as a species of false
wit, and is therefore very little regarded by the
moderns.

ACROSTICHUM, Rustyback, Wall-rue, or
Fox-Fern. See Botany Index.

ACROSTOLIUM, in ancient naval architecture,
the extreme part of the ornament used on the prows
of ships, which was sometimes in the shape of a buckler,
belt, animal, &c. but more frequently circular, or
spiral. It was usual to bear them from the prows of
vanquished vessels, and fix them to the conquerors, as a
signal of victory. They were frequently represented
on the reverse of ancient medals.

ACROTELETIC, among ecclesiatric writers, an
apellation given to any thing added to the end of a
psalm, as the Gloria Patri, or Doxology.

ACROTHERIA, in Geography, a small town in
the island of Santorin. N. Lat. 36° 25'. E. Long. 26° 1.'

ACROTHERIA, in Architecture, small pedestals,
usually without bases, anciently placed at the middle
or two extremes of pediments or frontispieces, serving
to support the statues, &c. It also signifies the figures
placed as ornaments on the tops of churches, and the
sharp pinnacles that stand in ranges about flat buildings
with rails and balusters.

Among ancient physicians, it signified the larger ex-
tremities of the body, as the head, hands, and feet.
It has also been used for the tips of the fingers, and some-
times for the eminences or processes of bones.

ACROTMYMON, from aster, extreme, and thymos,
thyme. A sort of wart described by Celsus as hard and
rough, with a narrow basis and broad top; the top is
of the colour of thyme; it easily splits and bleeds.
This tumour is also called thymus.

ACT, in general, denotes the exertion of power;
and differs from power, as the effect from the cause.

Act, in Logic, is particularly understood of an op-
eration of the human mind. Thus to discern and exa-
mine, are acts of the understanding; to judge and af-
firm, are acts of the will. There are voluntary and
spontaneous acts; the former are produced by the
operation of the soul, the latter without its privy or
participation.

Act, in the universities, signifies a thesis maintained
in public by a candidate for a degree; or to show the
capacity and proficiency of a student. The candidates
for a degree of bachelor and master of arts are to hold
philosophical acts; and those for bachelor of divinity,
thetical acts, &c. At Oxford, the time when ma-
ters or doctors complete their degrees, is also called the
act; which is held with great solemnity. At Can-
bidge, they call it the commencement.

Act of Faith, Auto da Fe, in the Romish-church,
is a solemn day held by the inquisition, for the pun-
ishment of heretics, and the absolution of the innocent
accused. They usually contrive the Auto to fall on a
some great festival, that the execution may pass with
the more awe and regard; at least it is always on a
Sunday.

The Auto da Fe may be called the last act of the
inquisitorial tragedy; it is a kind of gaol-delivery, ap-
pointed as oft as a competent number of prisoners in
the inquisition are convicted of heresy, either by their
own voluntary or extorted confession, or on the evi-
dence of certain witnesses. The process is thus: In the
morning they are brought into a great hall, where
they have certain habits put on, which they are to wear
in the procession. The procession is led up by Domic-
ian friars; after which come the penitents, some with
san-benitcos, and some without, according to the na-
ture of their crimes; being all in black coats without,
sleeves, and barefooted, with a wax candle in their
hands. These are followed by the penitents who have
narrowly escaped being burnt, who over their black
coats have flames painted with their points turned down-
wars.
AC T [166] AC T

Act. wards, Zuego revolto. Next come the negative and relapsed, who are to be burnt, having flames on their habits pointing upwards. After these come such as profess doctrines contrary to the faith of Rome, who, besides flames pointing upwards, have their picture painted on their breasts, with dogs, serpents, and devils, all open-mouthed, about it. Each prisoner is attended with a familiar of the inquisition; and those to be burnt have also a Jesuit on each hand, who are continually preaching to them to abjure. After the prisoners come a troop of familiars on horseback; and after them the inquisitors, and other officers of the court, on mules; last of all, the inquisitor-general on a white horse, led by two men with black hats and green hat-bands. A scaffold is erected in the Terriero de Pazo, big enough for two or three thousand people; at one end of which are the prisoners, at the other the inquisitors. After a sermon made up of encomiums of the inquisition, and invectives against heretics, a priest ascends a desk near the middle of the scaffold, and, having taken the absorption of the penitents, recites the final sentence of those who are to be put to death; and delivers them to the secular arm, earnestly beseeching at the same time the secular power not to touch their blood, or put their lives in danger. The prisoners being thus in the hands of the civil magistrate, are presently loaded with chains, and carried first to the secular gaol, and from thence in an hour or two brought before the civil judge; who, after asking in what religion they intend to die, pronounces sentence, on such as declare they die in the communion of the church of Rome, that they shall be first strangled, and then burnt to ashes; on such as die in any other faith, that they be burnt alive. Both are immediately carried to the Ribera, the place of execution; where there are as many stakes set up as there are prisoners to be burnt, with a quantity of dry furze about them. The stakes of the professed, that is, such as persist in their heresy, are about four yards high, having a small board towards the top for the prisoner to be seated on. The negative and relapsed being first strangled and burnt, the professed mount their stakes by a ladder; and the Jesuits, after several repeated exhortations to be reconciled to the church, part with them, telling them they leave them to the devil, who is standing at their elbow to receive their souls, and carry them with him into the flames of hell. On this a great shout is raised; and the cry is, Let the dogs be made; which is done by thrusting flaming furzes fastened to long poles against their faces, till their faces are burnt to a coal, which is accompanied with the loudest acclamations of joy. At last, fire is set to the furze at the bottom of the stake, over which the professed are chained so high, that the top of the flame seldom reaches higher than the seat they sit on; so that they rather seem roasted than burnt. There cannot be a more lamentable spectacle; the sufferers continually cry out, while they are able, Misericordia per amor de Dios, "Pity for the love of God!" yet it is beheld by all sexes and ages with transports of joy and satisfaction.

Act. in dramatic poetry, signifies a certain division or part of a play, designed to give some respect to the actors and spectators. The Romans were the first who divided their theatrical pieces into acts; for no such divisions appear in the works of the first dra- matic poets. Their pieces indeed consisted of several parts or divisions, which they called protasis, epiteles, catastrophe, and catastrophe; but these divisions were not marked by any real interruptions in the theatre. Nor does Aristotle mention any thing of acts in his Art of Poetry. But, in the time of Horace, all regular and finished pieces were divided into five acts.

Neve minor, nee si quintum productor actus Fabulae, que posci vult, et spectata reponit.

If you would have your play deserve success,
Give it five acts complete, nor more nor less.

FRANCIS.

The first act, according to some critics, besides introducing upon the stage the principal characters of the play, ought to propose the argument or subject of the piece; the second, to exhibit this to the audience, by carrying the fable into execution; the third, to raise obstacles and difficulties; the fourth, to remove these, or raise new ones in the attempt; and the fifth, to conclude the piece, by introducing some accident that may unravel the whole affair. This division, however, is not essentially necessary; but may be varied according to the humour of the author, or the nature of the subject. See Poetry.

Act of Grace. See Grace.

Act, among lawyers, is an instrument in writing for declaring or justifying the truth of any thing. In which sense, records, decrees, sentences, reports, certificates, &c. are called acts.

Acts also denote the deliberations and resolutions of an assembly, senate, or convention; as acts of parliament, &c. Likewise matters of fact transmitted to posterity in certain authentic books and memoirs.

Acta Consistorii, the edicts or declarations of the council of state of the emperor. These edicts were generally expressed in such terms as these: "the august emperors, Diocletian and Maximin, in council declared, that the children of decurions should not be exposed to wild beasts in the amphitheatre."

The senate and soldiers often swore, either through abjunct flattery or by compulsion, upon the edicts of the emperor, as we do upon the Bible. And the name of Apidius Merula was erased by Nero out of the register of senators, because he refused to swear upon the edicts of the emperor Augustus.

Acta Diurna, was a sort of Roman gazette, containing an authorized narrative of the transactions worthy of notice which happened at Rome. Petronius has given us a specimen of the acta diurna in his account of Trimalchii; and as it may not perhaps be unentertaining to see how exactly a Roman newspaper runs in the style of an English one, the following is an article or two out of it:

"On the 26th of July, 35 boys and 40 girls were born at Trimalchii's estate at Cuma.

"At the same time a slave was put to death for uttering disrespectful words against his lord." The same day a fire broke out in Pompey's gardens, which began in the night, in the steward's apartment.

Acta Populi, among the Romans, were journals or registers of the daily occurrences; as assemblies, trials, executions, buildings, births, marriages, deaths, &c. of
of illustrious persons, and the like. These were otherwise called Acta Publica and Acta Diurna, or simply Acta. The Acta differed from Annals, in that only the greater and more important matters were in the latter, and those of less note were in the former. Their origin is attributed to Julius Caesar, who first ordered the keeping and making public the acts of the people. Some trace them higher, to Servius Tullius; who, to discover the number of persons born, dead, and alive, ordered that the names of those born, upon a birth, should be put into a book, and that of those dying, into that of Venus Lutitis; the like was also done upon assuming the toga virilis, &c. Under Marcus Antoninus, this was carried further: persons were obliged to notify the births of their children, with their names and surnames, the day, consul, and whether legitimate or spurious, to the prefects of the Aerearium Saturni, to be entered in the public acts; though before this time the births of persons of quality appear thus to have been registered.

Acta Senatus, among the Romans, were minutes of what passed and was debated in the senate house. These were also called Commentarii, and by a Greek name ιστορία. They had their origin in the consulship of Julius Caesar, who ordered them both to be kept and published. The keeping them was continued under Augustus, but the publication was abrogated. Afterwards all writings, relating to the decrees or sentences of the judges, or what passed and was done before them, or by their authority, in any cause, were also called by the name Acta: In which sense we read of civil acts, criminal acts, intervenient acts; acta civitatis, acta criminalis, interveniente, &c.

Public Acts. The knowledge of public acts forms part of a peculiar science, called the Diplomatic, of great importance to a historian, statesman, chronicler, and even critic. The preservation of them was the first occasion of erecting libraries. The style of acts is generally barbarous Latin. Authors are divided as to the rules of judging of their genuineness, and even whether there be any certain rules at all. E. Germain will have the greater part of the acts of former ages to be spurious. Fontanini asserts, that the number of forged acts now extant, is very small. It is certain there were severe punishments inflicted on the forgers and falsifiers of acts. The chief of the English acts, or public records, are published by Rymer, under the title of Federis, and continued by Saunders; an extract whereof has been given in French by Rapin, and translated into English under the title of Acta Regni. Great commendations have been given this work: also some exceptions made to it; as that there are many spurious acts, as well as errors, in it; some have even charged it with falsifications. The public acts of France fell into the hands of the English after the battle of Poictiers, and are commonly said to have been carried by them out of the country. But the tradition is not supported by any sufficient testimony.

Acts of the Apostles, one of the sacred books of the New Testament, containing the history of the infant church, during the space of 29 or 30 years from the ascension of our Lord to the year of Christ 63. It was written by St. Luke; and addressed to Theophilus, the person to whom the evangelist had before dedicated his Gospel. We here find the accomplishment of several of the promises made by our Saviour: his ascension; the descent of the Holy Ghost; the first preaching of the apostles, and the miracles whereby their doctrines were confirmed; an admirable picture of the manners of the primitive Christians; and, in short, every thing that passed in the church till the dispersion of the apostles, who separated themselves in order to propagate the gospel throughout the world. From the period of that separation, St. Luke quits the history of the other apostles, who were then at too great a distance from him, and confines himself more particularly to that of St. Paul, who had chosen him for the companion of his labours. He follows that apostle in all his missions, and even to Rome itself; for it appears that the Acts were published in the second year of St. Paul’s residence in that city, or the 36th year of the Christian era, and in the 9th or 10th year of Nero’s reign. The style of this work, which was originally composed in Greek, is much purer than that of the other canonical writers; and it is observable that St. Luke, who was much better acquainted with the Greek than with the Hebrew language, always, in his quotations from the Old Testament, makes use of the Septuagint version. The council of Laodicea places the Acts of the Apostles among the canonical books, and all the churches have acknowledged it as such without any controversy.

There were several spurious Acts of the Apostles; particularly, 1. Acts, supposed to be written by Abudias, 2. Acts, supposed to have been written by Apelles, and 3. Acts, supposed to have been written by the apostles themselves when they were upon their journey into Persia. 2. The Acts of St. Peter; this book came originally from the school of the Ebionites. 3. The Acts of St. Paul; which is entirely lost. Eusebius, who had seen it, pronounces it of no authority. 4. The Acts of St John the Evangelist; a book made use of by the Encratites, Manichæans, and Priscillians. 5. The Acts of St. Thomas; received by the Manichæans, Encratites, and Apocryphists. 6. The Acts of St. Thomas the Apostle; received particularly by the Manichaeans. 7. The Acts of St. Philip. This book the Geostics made use of. 8. The Acts of St. Matthias. Some have imagined that the Jews for a long time had concealed the original Acts of the life and death of St. Matthias written in Hebrew; and that a monk of the abbey of St. Matthias at Treves, having got them out of their hands, procured them to be translated into Latin, and published them; but the critics will not allow them to be authentic.

Acts of Pilate; a relation sent by Pilate to the emperor Tiberius, concerning Jesus Christ, his death, resurrection, ascension, and the crimes of which he was convicted before him. It was a custom among the Romans, that the prœconsuls and governors of provinces should draw up acts, or memoriae, of what happened in the course of their government, and send them to the Emperor and Senate. The genuine acts of Pilate were sent by him to Tiberius, who reported them to the senate; but they were rejected by that assembly, because not immediately addressed to them: as is testified by Tertullian, in his Apol. cap. 5. and 20. 21. The heretics forged acts in imitation of them: in the reign of the emperor Maximin, the Gentiles, to throw an odium on the Christian name, spread about spurious Acts of Pilate: which the emperor, by a solemn edict, ordered:...
ordered to be sent into all the provinces of the empire, and enjoined the schoolmasters to teach and explain them to their scholars, and make them learn them by heart. These acts, both the genuine and the spurious, are lost. There is indeed extant, in the Pseu-do-Hege-sippus, a letter from Philo to the emperor Claudius, concerning Jesus Christ; but it discovers itself at first sight not to be authentic.

ACT of Parliament is a positive law, consisting of two parts, the words of the act, and its true sense and meaning; which being joined, make the law. The words of acts of parliament should be taken in a lawful sense. Cases of the same nature are within the intention, though without the letter, of the act: and some acts extend by equity to things not mentioned therein. See PARLIAMENT.

ACTÆA, were meadows of remarkable verdure and luxuriy near the sea-shore, where the Romans used to indulge themselves to a great degree in softness and delicacy of living. The word is used in this sense by Cicero and Virgil; but Vossius thinks it can only be used in speaking of Sicily, as these two authors did. See BOTANY INDEX.

ACTÆON, in fabulous history, the son of Aristæus and Autonoe: a great hunter. He was transformed by Diana into a stag, because he looked on her while bathing; and was devoured by his own dogs. The effects of impertinent curiosity and expensive pleasures seem to be the moral of the fable.

ACTANIA, an island, according to Pliny, in the North sea. It lies to the west of Holstein and Ditmersch, not far from the mouth of the Eyder and Elbe, and is now called Heyligland.

ACTE. See SAMBUSUS.

ACTIAN GAMES, in Roman antiquity, were solemn games instituted by Augustus, in memory of his victory over Mark Antony at Actium, held every fifth year, and celebrated in honour of Apollo, since called Actius. Hence Actian Years, an era commencing from the battle of Actium, called the Era of Augustus.

Virgil insinuates them to have been instituted by ANneas; from that passage, En. III. v. 280.

Actique Illiacis celebramus litora ludis. En. III. 280.

But this he only does by way of compliment to Augustus: attributing that to the hero from whom he descended, which was done by the emperor himself; as is observed by Servius.

ACTINIA, in Zoology, a genus belonging to the order of Vermes mollusca, called Animal Flowers, and Sea Anemones. See VERMES.

ACTINOLITE, in Mineralogy. See MINERALOGY INDEX.

ACTIO, in Roman antiquities, an action at law in a court of justice. The formalities used by the Romans, in judicial actions, were these: If the difference failed to be made up by friends, the injured person proceeded in jure reum vocare, to summon the offending party to the court, who was obliged to go, or give bond for his appearance.

The offending party might be summoned into court sive voce, by the plaintiff himself meeting the defendant, declaring his intention to him, and commanding him to go before the magistrate and make his defence. If he would not go willingly, he might drag and force him along, unless he gave security for his appearance on some appointed day. If he failed to appear on the day agreed on, then the plaintiff, whenever he met him, might take him along with him by force, calling any by-standers to bear witness, by asking them veni antestori? the by-standers upon this turned their ear toward him in token of their consent: To this Horace alludes in his satire against the impertinent, Lib. i. Sat. 9. See this further explained under the article ANTENARI.

Both parties being met before the pretor, or other supreme magistrate presiding in the court, the plaintiff proposed the action to the defendant, in which he designed to prosecute him. This they termed edere actionem; and was commonly performed by writing it in a tablet, and offering it to the defendant, that he might see whether he had better stand the suit or compound.

In the next place came the postulatio actionis, or the plaintiff's petition to the pretor, for leave to prosecute the defendant in such an action. The petition was granted by writing at the bottom of it actionem do, or refused by writing in the same manner actionem non do.

The petition being granted, the plaintiff vadabatur reum, i.e. obliged him to give sureties for his appearance on such a day in the court; and this was all that was done in public, before the day fixed upon for the trial.

In the mean time, the difference was often made up, either transactio, by letting the cause fall as dubious; or pactio, by composition for damages amongst friends.

On the day appointed for hearing, the pretor ordered the several bills to be read, and the parties summoned by an accensus, or beadle. See ACCESNI.

Upon the nonappearance of either party, the defaulter lost his cause: if they both appeared, they were said se stetisse; and then the plaintiff proceeded item sive actionem intendere, i.e. to prefer his suit, which was done in a set form of words, varying according to the difference of the actions. After this the plaintiff desired judgment of the pretor, that is, to be allowed a judez or arbitrer, else the recuperatores or centumviri. These he requested for the hearing and deciding the business: but none of them could be desired but by the consent of both parties.

The pretor having assigned them their judges, defined and determined the number of witnesses to be admitted, to hinder the protracting of the suit; and then the parties proceeded to give their caution, that the judgment, whatever it was, should stand and be performed on both sides. The judges took a solemn oath to be impartial: and the parties took the juramentum columnnis. Then the trial began with the assistance of witnesses, writings, &c. which was called disceptio causa.

ACTION, in a general sense, implies nearly the same thing with ACT.—Grammarians, however, observe some distinction between action and act; the former being generally restricted to the common or ordinary transactions, whereas the latter is used to express those which are remarkable. Thus, we say it is a good action
A C T  [ 169 ]

the orator, or the accommodation of his countenance, voice, and gesture, to the subject of which he is treating. See ORATORY.

ACTION, in a theatrical sense. See DECLAMATION.

ACTION for the Pulpit. See DECLAMATION.

ACTION, in Painting and Sculpture, is the attitude or position of the several parts of the face, body, and limbs, of such figures as are represented, and whereby they seem to be really actuated by passions. Thus we say, the action of such a figure finely expresses the passions with which it is agitated; we also use the same expression with regard to animals.

ACTION, in Physiology, is applied to the functions of the body, whether vital, animal, or natural.

The vital functions, or actions, are those which are absolutely necessary to life, and without which there is no life: as the action of the heart, lungs, and arteries. On the action and reaction of the solids and fluids on each other, depend the vital functions. The pulse and respiration are the external signs of life. Vital diseases are all those which hinder the influx of the venous blood into the cavities of the heart, and the expulsion of the arterial blood from the same. The natural functions are those which are instrumental in repairing the several losses which the body sustains; for life is destructive of itself, its very offices occasioning a perpetual waste.

The manducation of food, the deglutition and digestion thereof, also the separation and distribution of the chyle and excrementitious parts, &c. are under the head of natural functions, as by these our aliment is converted into our nature. They are necessary to the continuance of our bodies. The animal functions are those which we perform at will, as muscular motion, and all the voluntary actions of the body: they are those which constitute the senses of touch, taste, smell, sight, hearing, perception, reasoning, imagination, memory, judgement, affections of the mind. Without any or all of them, a man may live, but not so comfortably as with them.

ACTION, in Commerce, is a term used abroad for a certain part or share of a public company's capital stock. Thus, if a company has 400,000 livres capital stock, this may be divided into 400 actions, each consisting of 1000 livres. Hence a man is said to have two, four, &c. actions, according as he has the property of two, four, &c. 1000 livres capital stock. The transferring of actions abroad is performed much in the same manner as stocks are with us. See STOCKS.

ACTION, in Law, is a demand made before a judge for obtaining what we are legally entitled to demand, and is more commonly known by the name of law-suit or process. See SUIT.

ACTIONARY, or ACTIONIST, a proprietor of stock in a trading company.

ACTIONS, among merchants, sometimes signify moveable effects; and we say the merchant's creditors have seized on all his actions, when we mean that they have taken possession of all his active debts.

ACTIVE, denotes something that communicates action or motion to another; in which acceptance it stands opposed to passive.

ACTIVE, in Grammar, is applied to such words as express action; and is therefore opposed to passive. The active performs the action, as the passive receives it.

Y Thus
Thus we say, a verb active, a conjugation active, &c., or an active participle.

Active Verbs, are such as do not only signify doing, or acting, but have also nouns following them, to be the subject of the action or impression: Thus, To love, to teach, are verbs active; because we can say, To love a thing, to teach a man. Neuter verbs also denote an action, but are distinguished from active verbs: in that they cannot have a noun following them: such are, To sleep, to go, &c. Some grammarians, however, make three kinds of active verbs: the transitive, where the action passes into a subject different from the agent; the reflexive, where the action returns upon the agent; and reciprocal, where the action returns mutually upon the two agents who produced it.

Active Power, in Metaphysics, the power of executing any work or labour; in contradistinction to speculative powers*, or the powers of seeing, hearing, remembering, judging, reasoning, &c.

The exertion of active power we call action; and as every action produces some change, so every change must be caused by some effect, or by the cessation of some exertion of power. That which produces a change by the exertion of its power we call the cause of that change; and the change produced, the effect of that cause. See Metaphysics.

Active Principles, in Chemistry, such as are supposed to act without any assistance from others; as mercury, sulphur, &c.

Activity, in general, denotes the power of acting, or the active faculty. See Active.

Sphere of Activity, the whole space in which the virtue, power, or influence, of any object is exerted.

Actium, in Ancient Geography, a town situated on the coast of Aacarnania, in itself inconsiderable, but famous for a temple of Apollo, a safe harbour, and an adjoining promontory of the same name, in the mouth of the Sinus Ambracius, over against Nicopolis, on the other side of the bay: it afterwards became more famous on account of Augustus's victory over Antony and Cleopatra; and for quinquennial games instituted there, called Actia or Ludi Actiaci. Hence the epithet Actius, given to Apollo (Virgil). Actia acra, a computation of time from the battle of Actium. The promontory is now called Capo di Figalo. The medals of Actium were silver, gold and bronze; and the ordinary type is a flying pegasus.

Actius, in mythology, a surname of Apollo, from Actium, where he was worshipped.

Acton, a town near London, where is a well that affords a purging water, which is noted for the pungency of its salt. This water is whitish; to the taste it is sweetish, with a mixture of the same bitter which is in the Epsom water. The salt of this water is not quite so soft as that of Epsom; and is more calcareous than it, having more of the salt of lime: for a quantity of the Acton water being boiled high, and mixed with a solution of sublimates in pure water, threw down a yellow sediment. The salt of the Acton water is more nitrous than that of Epsom; it strikes a deep red, or purple, with the tincture of logwood in brandy, as is usual with nitrous salts; it does not precipitate silver out of the spirit of nitre, as common salt does: 1 lb. of this water yields 40 grains of salt.

Actor, in general, signifies a person who acts or performs something.

Actor, among civilians, the proctor or advocate in civil courts or causes; as, Actor ecclesiæ has been sometimes used for the advocate of the church; actor dominicus for the lord's attorney; actor villæ, the steward or head bailiff of a village.

Actor, in the drama, is a person who represents some part or character in the theatre. The drama consisted originally of nothing more than a simple chorus, who sung hymns in honour of Dæmus; so that the primitive actors were only singers and musicians. Thespis was the first that, in order to ease this uniformed chorus, introduced a declaimer, who repeated some heroic or comic adventur. Aeschylus, finding a single person tiresome, attempted to introduce a second, and changed the ancient recitals into dialogues. He also dressed his actors in a more majestic manner, and introduced the cymbals or buskins. Sophocles added a third, in order to represent the various incidents in a more natural manner: and here the Greeks stopped, at least we do not find any of their tragedies above three persons in the same scene. Perhaps they looked upon it as a rule of the dramatic poem never to admit more than three speakers at a time on the stage; a rule which Horace has expressed in the following verse:

Nec quarta logis persona labaret.

This, however, did not prevent their increasing the number of actors in comedy. Before the opening of a play, they named their actors in full theatre, together with the parts they were to perform. The ancient actors were masked, and obliged to raise their voice extremely, in order to make themselves heard by the innumerable crowd of people who filled the amphitheatre: they were accompanied with a player on the flute, who played a prelude, gave them the tone, and played while they declaimed. Horace speaks of a kind of secondary actors in his time, whose business was to imitate the first; and lessen themselves, to become better foils to their principals.

The moderns have introduced an infinite number of actors upon the stage. This heightens the trouble and distress that should reign there, and makes a diversity, in which the spectator is sure to be interested.

Actors were highly honoured at Athens. At Rome they were despised, and not only denied all rank among the citizens, but even when any citizen appeared upon the stage, he was expelled his tribe, and deprived of the right of suffrage by censors. Cicero, indeed, esteems the talents of Roscius: but he values his virtues still more; virtues which distinguished him so remarkably above all others of his profession, that they seemed to have excluded him from the theatre. The French have, in this respect, adopted the ideas of the Romans; and the English those of the Greeks.

Actor, the name of several persons in fabulous history. One Actor among the Aurunci is described by Virgil as a hero of the first rank. En. xii.

Actorum tabule, in antiquity, were tables instituted by Servius Tullius, in which the births of children were registered. They were kept in the treasury of Saturn.

Actress
ACTRESS, in a general sense, a female who acts or performs something.

ACTRESS, in the Drama, a female performer. Women actors were unknown to the ancients, among whom men always performed the female character; and hence one reason for the use of masks among them.

Actresses are said not to have been introduced on the English stage till after the restoration of King Charles II. who has been charged with contributing to the corrupting of our manners by importing this usage from abroad. But this can be but partly true; for the queen of James I. acted a part in a pastoral; and Prunus, in his Histriomastix, speaks of women actors in his time as prostitutes; which was one occasion of the severe prosecution brought against him for that book.

There are some very agreeable and beautiful talents, of which the possession commands a certain sort of admiration; but of which the exercise for the sake of gain is considered, whether from reason or prejudice, as a sort of public prostitution. The pecuniary recompense, therefore, of those who exercise them in this manner, must be sufficient, not only to pay for the time, labour, and expence of acquiring the talents, but for the discredit which attends the employment of them as the means of subsistence. The exorbitant rewards of players, opera-singers, opera-dancers, &c. are founded upon those two principles; the rarity and beauty of the talents, and the discredit of employing them in this manner. It seems absurd at first sight that we should despise their persons, and yet reward their talents with the most profuse liberality. While we do the one, however, we must of necessity do the other. Should the public opinion or prejudice ever alter with regard to such occupations, their pecuniary recompense would quickly diminish. More people would apply to them, and the competition would quickly reduce the price of their labour. Such talents, though far from being common, are by no means so rare as is imagined. Many people possess them in great perfection, who disdain to make use of them; and many more are capable of acquiring them, if any thing could be made honorably by them.

ACTUAL, something that is real and effective, or that exists truly and absolutely. Thus philosophers use the terms actual heat, actual cold, &c. in opposition to virtual or potential. Hence, among physicians, a red hot iron, or fire, is called an actual cauterity; in distinction from cauterities, or cauteries, that have the power of producing the same effect upon the animal solids as actual fire, and are called potential cauteries. Boiling water is actually hot; brandy, producing heat in the body, is potentially hot, though of itself cold.

Actual Sin, that which is committed by the person himself; in opposition to original sin, or that which he contracted from being a child of Adam.

ACTUARIOE NAVES, a kind of long and light ships among the Romans, thus denominated, because they were so designed for swiftness and expedition. They correspond to what the French call brigantines.

ACTUARIO, a celebrated Greek physician of the 13th century, and the first Greek author who has treated of mild purgatives, such as cassia, manna, senna, &c. He is the first also who mentioned distilled waters.

His works were printed in one volume folio, by Henry Actuarius Stephens in 1567.

ACTUARIUS, or ACTARIUS, a notary or officer appointed to write the acts or proceedings of a court, or the like. In the Eastern empire, the actuarii were properly officers, who kept the military accounts, received the corn from the suspetores or storekeepers, and delivered it to the soldiers.

ACTUATE, to bring into act, or put a thing in action. Thus an agent is said, by the schoolmen, to actuate a power, when it produces an act in a subject. Thus the mind may be said to actuate the body; and thus a medicine is said by some ancient physicians to be actuated or brought into action, when by means of the vital heat it is made to produce its effect.

ACTUS, in Ancient Architecture, a measure in length equal to 120 Roman feet. In Ancient Agriculture the word signified the length of one furrow, or the distance a plough goes before it turns.

Actus Minimus was a quantity of land 120 feet in length, and four in breadth.

Actus Major, or Actus Quadratus, a piece of ground in a square form, whose side was equal to 120 feet, equal to half the jugerum.

Actus Intervicinalis, a space of ground four feet in breadth, left between the lands as a path or way.

ACUANITES, in Ecclesiastical History, the same with those called more frequently Manichees. They took the name from Acua, a disciple of Thomas one of the twelve apostles.

ACULEATE, or Aculeati, a term applied to any plant or animal armed with prickles.

ACULEI, the prickles of animals or of plants.

ACULER, in the Manege, is used for the motion of a horse, when, in working upon volts, he does not go far enough forward at every time or motion, so that his shoulders embrace or take in too little ground, and his croupe comes too near the centre of the volt. Horses are naturally inclined to this fault in making demi-volts.

ACUMINA, in Antiquity, a kind of military omen, most generally supposed to have been taken from the points or edges of darts, swords, or other weapons.

ACUNA, CHRISTOPHER DE, a Spanish Jesuit, born at Burgos. He was admitted into the society in 1612, being then but 15 years of age. After having devoted some years to study, he went to America, where he assisted in making conquests in Chili and Peru. In 1640 he returned to Spain, and gave the king an account how far he had succeeded in the commission he had received to make discoveries on the river of the Amazons; and the year following he published a description of this river at Madrid. Acuna was sent to Rome, as procurator of his province. He returned to Spain with the title of Qualificador of the Inquisition; but soon after embarked again for the West Indies, and was at Lima in 1675, when Father Southwell published at Rome the Bibliothecque of the Jesuit writers. Acuna's work is entitled, Novo descubrimiento del gran rio de las Amazonas; i.e. "A new discovery of the great river of the Amazons." He was 10 months together upon this river, having had instructions to inquire into every thing with the greatest exactness, that his majesty might thereby be enabled to render the navigation more easy and commodious. He
went aboard a ship at Quito with Peter Texiera, who had already been so far up the river, and was therefore thought a proper person to accompany him in this expedition. They embarked in February 1639, but did not arrive at Para till the December following. It is thought that the revolution of Portugal, by which the Spaniards lost all Brazil, and the colony of Para at the mouth of the river of the Amazons, were the cause that the relation of this Jesuit was suppressed; for, as it could not be of any advantage to the Spaniards, they were afraid it might prove of great service to the Portuguese. The copies of this work became extremely scarce, so that the publishers of the French translation at Paris asserted, that there was not one copy of the original extant, excepting one in the possession of the translator, and perhaps that in the Vatican library. M. de Comberville was the author of this translation: it was published after his death, with a long dissertation. An account of the original may be seen in the Paris Journal, in that of Leipsic, and in Cheverau’s History of the World.

ACUPUNCTURE, the name of a surgical operation among the Chinese and Japanese, which is performed by pricking the part affected with a silver needle. They employ this operation in headaches, larchgories, convulsions, colics, &c.

*ACUS*, in *Ichthyology*, the trivial name of a species of syngnathus. See *SYNGNATHUS*.

ACUSIO COLONIA, now ANCONA, according to Holstenius, between Orange and Valence, near Montelimart, on the banks of the Rhone.

ACUTE, an adjective applied to such things as terminate in a sharp point or edge. And in this sense it stands opposed to obtuse.

ACUTE Angle, in Geometry, is that which is less than a right angle, or which does not subtend 90 degrees.

ACUTE-angled Triangle, is a triangle whose three angles are all acute.

ACUTE-angled Cone, is, according to the ancients, a right cone, whose axis makes an acute angle with its side.

ACUTE, in *Music*, is applied to a sound or tone that is sharp or high in comparison of some other tone. In this sense, acutae stands opposed to grave.

ACUTE Accent. See Accent.

ACUTE Diseases, such as come suddenly to a crisis. This term is used for all diseases which do not fall under the head of chronic diseases.

ACUTATOR, in writers of the barbarous ages, denotes a person that whets or grinds cutting instruments; called also in ancient glossaries acutor, asserveras, samariusia, cohatrius, &c. In the ancient armies there were acutators, a kind of smiths, retained for whetting or keeping the arms sharp.

AD, a Latin preposition, originally signifying to, and frequently used in composition both with and without the *du*, to express the relation of one thing to another.

AD Bestias, in antiquity, is the punishment of criminals condemned to be thrown to wild beasts.

AD Hominem, in *Logic*, a kind of argument drawn from the principles or prejudices of those with whom we argue.

AD Ludos, in antiquity, a sentence upon criminals among the Romans, whereby they were condemned to entertain the people by fighting either with wild beasts or with one another, and thus executing justice upon themselves.

AD METALLA, in antiquity, the punishment of such criminals as were condemned to the mines, among the Romans; and therefore called Metallica.

AD VETEREM, a term chiefly used in speaking of the duties or customs paid for certain goods: The duties on some articles are paid by the number, weight, measure, tale, &c.; and others are paid ad veterem, that is, according to their value.

ADAGE, a proverb, or short sentence, containing some wise observation or popular saying. Erasmus has made a very large and valuable collection of the Greek and Roman adages; and Mr Ray has done the same with regard to the English. We have also Kelly’s Collection of Scots Proverbs.

ADAGIO, in *Music*. Adversatively, it signifies softly, leisurely: and is used to denote the slowest of all times. Used substantively, it signifies a slow movement. Sometimes this word is repeated, as adagio, adagio, to denote a still greater retardation in the time of the music.

ADALIDES, in the Spanish policy, are officers of justice, for matters touching the military forces. In the laws of King Alphonso, the adalides are spoken of as officers appointed to guide and direct the marching of the forces in time of war. Lopez represents them as a sort of judges, who take cognizance of the differences rising upon excursions, the distribution of plunder, &c.

ADAM, the first of the human race, was formed by the Almighty on the sixth day of the creation. His body was made of the dust of the earth: after which, God animated or gave it life, and Adam then became a rational creature. His heavenly Parent did not leave his offspring in a destitute state to shift for himself; but planted a garden, in which he caused to grow not only every tree that was proper for producing food, but likewise such as were agreeable to the eye, or merely ornamental. In this garden were assembled all the brute creation; and, by their Maker, caused to pass before Adam, who gave all of them names, which were judged proper by the Deity himself.—In this review Adam found none for a companion to himself. This solitary state was seen by the Deity to be attended with some degree of unhappiness; and therefore he threw Adam into a deep sleep, in which condition he took a rib from his side, and healing up the wound formed a woman of the rib he had taken out. On Adam’s awaking, the woman was brought to him; and he immediately knew her to be one of his own species, called her his bone and his flesh, giving her the name of Eve because she was taken out of man.

The first pair being thus created, God gave them authority over the inferior creation, commanding them to subdue the earth, also to increase and multiply and fill it. They were informed of the proper food for the beasts and for them; the grass, or green herbs, being appointed for beasts; and fruits, or seeds, for man. Their proper employment also was assigned them: namely, to dress the garden, and to keep it.

Though Adam was thus highly favoured and instructed by his Maker, there was a single tree, which grew
in the middle of the garden, of the fruit of which they were not allowed to eat; being told that they should surely die in the day they ate of it. This tree was named the Tree of the Knowledge of Good and Evil. This prohibition, however, they soon broke through. The woman having entered into conversation with the Serpent, was by him persuaded, that by eating of the tree she should become as wise as God himself: and accordingly, being invited by the beauty of the fruit, and its desirable property of inquiring wisdom, she plucked and ate; giving her husband of it at the same time, who did likewise eat.

Before this transgression of the divine command, Adam and his wife had no occasion for clothes, neither had they any sense of shame; but immediately on eating the forbidden fruit, they were ashamed of being naked, and made aprons of fig leaves for themselves. On hearing the voice of God in the garden, they were terrified, and hid themselves: but being questioned by the Deity, they confessed what they had done, and received sentence accordingly; the man being condemned to labour; the woman to subjection to her husband, and to pain in child-bearing. They were then driven out of the garden, and their access to it prevented by a terrible apparition. They had clothes given them by the Deity made of the skins of beasts. In this state Adam had several children; the names of only three of whom we are acquainted with, viz. Cain, Abel, and Seth. He died at the age of 930 years.

These are all the particulars concerning Adam's life, that we have on divine authority: but a vast multitude of others are added by the Jews, Mahometans, and Papists; all of which must be at best conjectural; most of them, indeed, appear downright falsehoods or absurdities. The curiosity of our readers, it is presumed, will be sufficiently gratified by the few which are here subjoined.

According to the Talmudists, when Adam was created, his body was of immense magnitude. When he sinned, his stature was reduced to a hundred ells, according to some; to nine hundred cubits, according to others; who think this was done at the request of the angels, who were afraid of so gigantic a creature.

In the island of Ceylon is a mountain, called the Peak or mountain of Adam, from its being, according to the tradition of the country, the residence of our first parents. Here the print of his footsteps, above two palms in length, are still pointed out.

Many reverence have been formed concerning the personal beauty of Adam. That he was a handsome well-shaped man is probable; but some writers, not content with this, affirm, that God, intending to create man, clothed Himself with a perfectly beautiful human body, making this his model in the formation of the body of Adam.

Nor has the imagination been less indulgent concerning the formation of the human species male and female.—It would be endless to recount all the fancies that have been written on this subject; but as Madame Bourignon has made a considerable figure in the religious, or rather superstitious, world, we cannot help inserting some of her opinions concerning the first man, which are peculiarly marvellous. According to the revelations of this lady, Adam before his fall possessed in himself the principles of both sexes, and the virtue or power of producing his like, without the concurrent assistance of woman. The division into two sexes she imagined was the consequence of man's sin; and now, she observes, mankind are become so many monsters in nature, being much less perfect in this respect than plants or trees, which are capable of producing their like alone, and without pain or misery. She even imagined, that being in an ecstasy, she saw the figure of Adam before he fell, with the manner how, by himself, he was capable of procuring other men. "God," says she, "represented to my mind the beauty of the first world, and the manner how he had drawn it from the chaos: every thing was bright, transparent and darted forth life and ineffable glory. The body of Adam was purer and more transparent than crystal, and vastly fleet; through his body were seen vessels and rivulets of light, which penetrated from the inward to the outward parts, through all his pores. In some vessels ran fluids of all kinds and colours, vastly bright, and quite diaphanous. The most ravishing harmony arose from every motion; and nothing resisted, or could annoy him. His stature was taller than the present race of men; his hair was short, curled, and of a colour inclining to black; his upper lip covered with short hair; and instead of the bestial parts which modesty will not allow us to name, he was fashioned as our bodies will be in the life eternal, which I know not whether I dare reveal. In that region his nose was formed after the manner of a face, which diffused the most delicious fragrancy and perfumes, whence also men were to issue, all whose principles were inherent in him: there being in his belly a vessel, where little eggs were formed; and a second vessel filled with a fluid which impregnated those eggs; and when man heated himself in the love of God, the desire he had that other creatures should exist beside himself, to praise and love God, caused the fluid above mentioned (by means of the fire of the love of God,) to drop on one or more of these eggs, with inexpressible delight; which being thus impregnated, issued, some time after, out of man by this canal, in the shape of an egg; i.e. the whence a perfect man was hatched by insensible descent. Woman was formed by taking out of Adam's side the vessels that contained the eggs; which she still possesses, as is discovered by anatomists.

Many others have believed that Adam at his first creation was both male and female: others, that he had two bodies joined together at the shoulders, and their faces looking opposite ways like those of Janus. Hence, say these, when God created Eve, he had no more to do than to separate the two bodies from one another. Of all others, however, the opinion of Paracelsus seems the most ridiculous. Negabat primos pa- dragynes, renrente ante lapum habuisse partes generationis hominis ne- cessarius; credebat postea accessisse, ut strumam gutturis, Vomorum de Philosophos.

Extravagant things are asserted concerning Adam's knowledge. It is very probable that he was instructed by the Deity how to accomplish the work appointed him, viz. to dress the garden, and keep it from being destroyed by the brute creatures; and it is also probable that he had likewise every piece of knowledge communicated to him that was either necessary or pleasing: but that he was acquainted with geometry, mathematics, rhetoric, poetry, painting, sculpture, &c. is too ridiculous to be credited by any sober person. Some rabbi,
rabbis, indeed, have contented themselves with equaling Adam's knowledge to that of Moses and Solomon; while others, again, have maintained that he excelled the angels themselves. Several Christians seem to be little behind these Jews in the degree of knowledge they ascribe to Adam, nothing being hid from him, according to them, except contingent events relating to futurity. One writer indeed (Pinedo) excepts politics; but a Carthusian friar, having exhausted in favour of Aristotle, every image and comparison he could think of, at last asserted that Aristotle's knowledge was as extensive as that of Adam. In consequence of this surprising knowledge with which Adam was endowed, he is supposed to have been a considerable author. The Jews pretend that he wrote a book on the creation, and another on the Deity. Some rabbis ascribe the 92d psalm to Adam; and in some manuscripts the Chaldee title of this psalm expressly declares that this is the song of praise which the first man repeated for the Sabbath day.

Various conjectures have been formed concerning the place where man was first created, and where the garden of Eden was situated; but none of these have any solid foundation. The Jews tell us, that Eden was separated from the rest of the world by the ocean; and that Adam, being banished therefrom, walked across the sea, which he found every way fordable, by reason of his enormous stature. The Arabian imagined paradise to have been in the air; and that our first parents were thrown down from it on their transgression, as Vulcan is said to have been thrown down headlong from heaven by Jupiter.

Strange stories are told concerning Adam's children. That he had none in the state of innocence, is certain from Scripture; but that his marriage with Eve was not consummated till after the fall, cannot be proved from thence. Some imagine, that, for many years after the fall, Adam denied himself the conubial joys by way of penance; others, that he cohabited with another woman, whose name was LILITH. The Mahometans tell us, that our first parents having been thrown headlong from the celestial paradise, Adam fell upon the isle of Serendib, or Ceylon, in the East Indies; and Eve on Iddaa, a port of the Red sea, not far from Mecca. After a separation of upwards of 200 years, they met in Ceylon, where they multiplied: according to some Eve had twenty, according to others only eight, deliveries; bringing forth at each time twins, a male and a female, who afterwards married.

The rabbins imagine that Eve brought forth Cain and Abel at a birth; that Adam wept for Abel a hundred years in the valley of tears near Hebron, during which time he did not cohabit with his wife; and that this separation would probably have continued longer, had it not been forbid by the angel Gabriel. The inhabitants of Ceylon affirm, that the salt lake on the mountain of Colombo consists wholly of the tears which Eve for one hundred years together shed because of Abel's death.

Some of the Arabians tell us, that Adam was buried near Mecca on Mount Abukobeis; others, that Noah, having laid his body in the ark, caused it to be carried after the deluge to Jerusalem by Melchisedech the son of Shem: of this opinion are the eastern Christians; but the Persians affirm that he was interred in the isle of Serendib, where his corpse was guarded by lions at the time the giants warred upon one another. Some are of opinion that he was buried at Jerusalem, on the place where Christ suffered, that so his bones might be sprinkled with the Saviour's blood.

Adam, Alexander, late rector of the high school of Edinburgh, and author of several useful works. See Supplement.

Adam, Melchior, lived in the 17th century. He was born in the territory of Grotkaw in Silesia, and educated in the college of Breege, where the dukes of that name, to the utmost of their power, encouraged learning and the reformed religion as professed by Calvin. Here he became a firm Protestant; and was enabled to pursue his studies by the liberality of a person of quality, who had left several exhibitions for young students. He was appointed rector of a college at Heidelberg, where he published his first volume of illustrious men in the year 1615. This volume, which consisted of philosophers, poets, writers on polite literature, and historians, &c. was followed by three others: that which treated of divines was printed in 1619; that of the lawyers came next; and, finally, that of the physicians: the two last were published in 1620. All the learned men, whose lives were contained in these four volumes, lived in the 16th, or beginning of the 17th century, and are either Germans or Flemings; but he published in 1618 the lives of twenty divines of other countries in a separate volume. All his divines are Protestants. The Lutherans were not pleased with him, for they thought him partial; and will not allow his work to be a proper standard of the learning of Germany. He was the author of several other works besides his lives. His industry as a biographer is commended by Bayle, who acknowledges his obligations to his labours. He died in 1622.

Adam, Robert, an eminent architect, was born at Edinburgh in the year 1728. He was the second son of William Adam, Esq. of Maryburgh, in the county of Fife, who has also left some respectable specimens of his genius and abilities as an architect in Hope-town house, and the Royal Infirmary of Edinburgh, which were erected from designs executed by him. And it was perhaps owing to the fortunate circumstance of his father's example that young Adam first directed his attention to those studies, in the prosecution of which he afterwards rose to such distinguished celebrity. He received his education at the university of Edinburgh, where he had an opportunity of improving and enlarging his mind, by the conversation and acquaintance of some of the first literary characters of the age, who were then rising into reputation, or have since established their fame as historians and philosophers. Among these were Mr Hume, Dr Robertson, Dr Smith, and Dr Ferguson, who were the friends and companions of the father, and who continued through life their friendship and attachment to the son.

In the year 1754 Mr Adam travelled to the continent, with a view to extend his knowledge and improve his taste in architecture, and resided in Italy for three years. Here he surveyed and studied those noble specimens of ancient grandeur which the magnificent public edifices of the Romans, even in ruins, still exhibit. But he saw with regret, that the public buildings, constructed with more durable materials and greater
Adam, who has done full justice to these superb vestiges by his elegant drawings and engravings. In general, however, the coarseness of the work, and the bad taste of the age are equal to the magnificence of the buildings. For all this, I do not mean to detract from the merit of the august remains of Dioclesian’s palace. I count them among the most respectable monuments of antiquity now extant.” And the historian of the Decline and Fall of the Roman Empire, in consequence of this observation, after having expressed a high commendation of the work, has thrown out a suspicion of the accuracy of the representations and descriptions.

“For the account of Dioclesian’s palace, says Mr Gibbon, we are indebted to an ingenious artist of our own time and country, whom a very liberal curiosity had carried into the heart of Dalmatia. But there is room to suspect that the elegance of his designs and engravings has somewhat flattened the objects which it was their purpose to represent. We are informed by a more recent and very judicious traveller, that the awful ruins of Spalatro are not less expressive of the decline of the arts, than of the greatness of the Roman empire in the time of Dioclesian.” Mr Gibbon’s criticism is scarcely supported by the observation of the Abbé Fortis; and what the latter has advanced on this subject is not perfectly consistent with itself: for while he censures the coarseness of the work and the bad taste of the age, he bestows something like indirect praise, when he adds that, he means not to detract from the merit of the august remains of this edifice, and regards it as one of the most respectable monuments of antiquity now extant. The apparent coarseness of the work is probably owing to the effects of the weather, which have destroyed the smooth polish of the chisel which it originally received; and Mr Adam allows, that, previous to this period of the Roman empire, the arts had visibly declined, but at the same time contends, that the buildings erected in the reign of Dioclesian, exhibit convincing proofs of the stile and manner of a purer age. But of this, the admirer of this elegant art may judge for himself, by consulting the engravings and descriptions, the accuracy and truthfulness of which there seems to be no reason to doubt.

In the year 1768 Mr Adam obtained a seat in parliament. He was chosen to represent the county of Kinross; and about the same time he resigned his office of architect to the king. But he continued his professional career with increasing reputation; and about the year 1773, in conjunction with his brother James, who also rose to considerable eminence as an architect, he published another splendid work, consisting of plans and elevations of public and private buildings which were erected from their designs. Among these are Lord Mansfield’s house at Caenwood, Luton house in Bedfordshire belonging to Lord Bute, the new Gateway of the Admiralty Office, the Register Office at Edinburgh, &c. which are universally admired as precious monuments of elegant design and correct taste. The Adelphi buildings at London, which are also striking examples of the inventive genius of the Messrs Adam, proved an unsuccessful speculation. The wealth and power of a nation were perhaps only equal to so extensive an undertaking: it was too great to be attempted by private citizens.

The buildings which have been more lately erected from
from the designs of Mr. Adam, afford additional proofs of the unlimited extent of his invention, and the amazing fertility of his genius. Those parts of the new University of Edinburgh which have been completed, and the Infirmary at Glasgow, need only be mentioned in proof of our remark. The latter edifice we have often beheld and contemplated with those feelings of admiration, elevated to a kind of rapturous enthusiasm, which the rare union of perfect symmetry and elegant disposition of parts combined with inexpressible beauty and lightness into one whole seldom fails to inspire.

We have also seen and admired elegant designs executed by Mr. Adam, which were intended for the South Bridge and South Bridge Street of Edinburgh, and if they had been adopted, would have added much to the decoration of that quarter of the town; but being considered unsuitable to the taste or economy of the times, they were rejected.

Strange incongruities appear in buildings which have been erected from designs by Mr. Adam. But of these it must be observed, that they have been altered and mutilated in the execution, according to the capricious fancy and vulgar taste of the owners; and it is well known that a slight deviation changes the character and mars the effect of the general design. A lady of rank was furnished by Mr. Adam with a design of a house, which, after being executed, he was astonished to find out of all proportion. On inquiring the cause, he was informed that the pediment which he had designed would not admit a piece of rude sculpture which represented the arms of the family, and by the date which it bore incontestably proved its antiquity. It was therefore absolutely necessary to enlarge the dimensions of the pediment, to receive this ancient badge of family honour, and sacrifice the beauty and proportion of the whole building. We have seen a large public edifice which was also designed by Mr. Adam; but when it was erected, the length was curtailed of the space of two windows, while the other parts remained according to the original plan. It now presents a heavy unsightly pile, instead of that elegance of proportion and correctness of style which the faithful execution of Mr. Adam's design would have probably exhibited.

To the last period of his life, Mr. Adam displayed an increasing vigour of genius and refinement of taste; for, in the space of one year preceding his death, he designed eight great public works, besides twenty-five private buildings, so various in their style, and beautiful in their composition, that they have been allowed by the best judges, sufficient of themselves to establish his fame unrivalled as an artist. The present improved taste, which now pretty generally prevails in our public and private edifices, undoubtedly owes much to the elegant and correct style introduced by Mr. Adam. His fertile genius was not confined merely to the external decoration of buildings; it displayed itself with equal effect in the internal arrangement and disposition of the apartments, and in the varied, elegant, and beautiful ornaments of chimney pieces and ceilings. But not only did he introduce a total change in the architecture of the country, the manufactures also which are in any way connected with decoration, experienced a considerable degree of improvement by the exercise of his inventive powers. His talents extended beyond the line of his own profession; he displayed in his numerous drawings in landscape, a luxuriance of composition, and an effect of light and shadow which have rarely been equalled.

He died on the 3d of March 1792, by the bursting of a blood-vessel, in the 64th year of his age, and was buried in Westminster Abbey. His funeral was attended by a select number of friends, some of them of distinguished rank, who esteemed him while living, and who wished to express this last mark of regard. The many elegant buildings, public and private, erected in various parts of the kingdom, from the designs of Mr. Adam, will remain lasting monuments of his taste and genius; and the natural suavity of his manners, joined to the excellence of his moral character, secured to him the affectionate regard of his friends, and the esteem of all who enjoyed his acquaintance.

James Adam, whom we have already mentioned as associated with his brother in many of his labours, died on the 20th October 1794.

ADAM'S Apple, a name given to a species of Citrus. See Botany Index.

ADAM'S Bridge, or Rama's Bridge, in Geography, a ridge of sands and rocks, extending across the north end of Manara gulf, from the island of that name on the north-west coast of Ceylon, to Ramnecote or Ramankoil island, off Raman point.

ADAM'S Needle. See Yucca, Botany Index.

ADAM'S Peak, a high mountain of the East Indies, in the island of Ceylon, on the top of which it is believed the first man was created. It is in the form of a sugar loaf, and terminates in a circular plain about 200 paces in diameter. The summit is covered with trees, and has a deep lake which supplies the principal rivers of the island. The mountain is seen at the distance of twenty leagues from sea. It is situated in N. Lat. 5° 55' E. Long. 80° 39'. See Adam.

ADAM or ADOM, a town in the Persea, or on the other side of the Jordan, over against Jericho, where the Jordan began to be dried up on the passage of the Israelites, (Joshua.)

ADAMA, or ADMAH, one of the towns that were involved in the destruction of Sodom; (Moses.)

ADAMANT, a name sometimes given to the diamond. (See Diamond.) It is likewise applied to the scorice of gold, the magnet, &c.

ADAMARA, in Geography, a district of Abyssinia, near the province of Waldubba, containing several considerable villages, that are inhabited by Mahometans; who by their number and strength contribute to the safety of the monks in that part of the country. It is so called from Adama, which in the Amharic dialect signifies pleasant, the name of an adjacent mountain. The river Anzo runs in a contiguous valley. (Bruce's Travels, 4to, vol. iii. p. 179.)

ADAMIC EARTH, a name given to common red clay, alluding to that species of earth of which the first man is supposed to have been made.

ADAM OCCUM, in Anatomy, a protuberance in the fore part of the throat, formed by the os hyoidei. It is thought to be so called upon a strange conceit, that a piece of the forbidden apple, which Adam ate, stuck by the way and occasioned it.

ADAMITES,
ADAMITES, or ADAMIANs, in ecclesiastical history, were a branch of the Basilidians and Carcopatians.

Ephraim tells us, that they were called Adamites from their pretending to be re-established in the state of innocence, and to be such as Adam was at the moment of his creation, whence they ought to imitate him in his nakedness. They rejected marriage; maintaining, that the conjugal union would never have taken place upon earth had sin been unknown.

This obscure and ridiculous sect did not at first last long; but it was revived, with additional absurdities, in the twelfth century, by one Tundamus, since known by the name of Tanchelin, who propagated his errors at Antwerp, in the reign of the emperor Henry V. He maintained, that there ought to be no distinction between priests and laymen, and that fornication and adultery were meritorious actions. Tanchelin had a great number of followers, and was constantly attended by 3000 of these profligates in arms. His sect did not however continue long after his death; but another appeared under the name of Turlupins, in Savoy and Dauphiny, where they committed the most brutal actions in open day.

About the beginning of the fifteenth century, one Picard, a native of Flanders, spread these errors in Germany and Bohemia, particularly in the army of the famous Ziska, notwithstanding the severe discipline he maintained. Picard pretended that he was sent into the world as a new Adam, to re-establish the law of nature; and which, according to him, consisted in exposing every part of the body, and having all the women in common. This sect found also some partisans in Poland, Holland, and England: they assembled in the night, and it is asserted, that one of the fundamental maxims of their society was contained in the following verse:

Juro, per jura, secretum prode re noli.

ADAMS, in Geography, a township of Berkshire county, in the state of Massachusetts in North America. It is 140 miles north-west of Boston, and contains 2040 inhabitants. In the northern part of this district, a stream called Hudson's brook, has worn a channel through a stratum of white marble, and over the channel the rocks form a fine natural bridge, which is 12 or 15 feet long, 10 feet broad, and more than 60 feet above the water.

ADAMSHIDE, a district of the circle of Rastenburg, belonging to the king of Prussia, which, with Dombroisk, was bought, in 1737, for 42,000 dollars.

ADAMSON, PATRICK, a Scottish prelate, archbishop of St Andrew's, was born in the year 1543 in the town of Perth, where he received the rudiments of his education; and afterwards studied philosophy, and took his degree of master of arts at the university of St Andrew's. In the year 1566, he set out for Paris, as tutor to a young gentleman. In the month of June of the same year, Mary queen of Scots being delivered of a son, afterwards James VI. of Scotland and I. of England, Mr Adamson wrote a Latin poem on the occasion. In this poem he gave the prince the title of king in France and England, and this proof of his loyalty involved him in difficulties; for the French court was offended, and ordered him to be arrested; and he was confined for six months. He was released only through the intercession of Queen Mary, and some of the principal nobility, who interested themselves in his behalf. As soon as he recovered his liberty, he retired with his pupil to Bourges. He was in this city during the massacre at Paris; and the same persecuting spirit prevailing among the Catholics at Bourges as at the metropolis, he lived concealed for seven months in a public house, the master of which, upwards of 70 years of age, was thrown from the top thereof, and had his brains dashed out, for his charity to heretics. Whilst Mr Adamson lay thus in his sepulchre, as he called it, he wrote his Latin poetical version of the book of Job, and his tragedy of Herod in the same language. In the year 1573, he returned to Scotland; and, having entered into holy orders, became minister of Paisley. In the year 1575, he was appointed one of the commissioners, by the general assembly, to settle the jurisdiction and policy of the church; and the following year he was named, with Mr David Lindsay, to report their proceedings to the earl of Morton, then regent. About this time the earl appointed him one of his chaplains; and, on the death of Bishop Douglas, promoted him to the archiepiscopal see of St Andrew's, a dignity which brought upon him great trouble and uneasiness: for now the glamour of the Presbyterian party rose very high against him, and many inconsistent absurd stories were propagated concerning him. Soon after his promotion, he published his catechism in Latin verse, a work highly approved even by his enemies; but, nevertheless, they still continued to persecute him with great violence. In 1578, he submitted himself to the general assembly, which procured him peace but for a very little time; for the following year, fresh accusations were brought against him. In the year 1582, being attacked with a grievous disease, in which the physicians could give him no relief, he happened to take a simple medicine from an old woman, which did him service. The woman whose name was Alison Frascone, was the upon charged with witchcraft, and committed to prison, but escaped out of her confinement; however, about four years afterwards, she was again found and burnt for a witch. In 1583, King James came to St Andrew's; and the archbishop, being much recovered, preached before him, and disputed with Mr Andrew Melvil, in presence of his majesty, with great reputation; which drew upon him fresh calumny and persecution. The king, however, was so well pleased with him, that he sent him ambassador to Queen Elizabeth, at whose court he resided for some years. His conduct, during his embassy, has been variously reported by different authors. Two things he principally laboured, viz. the recommending the king his master to the nobility and gentry of England, and the procuring some support for the episcopal party in Scotland. His eloquent preaching drew after him such crowds of people, and raised in their minds such a high idea of the young king his master, that Queen Elizabeth forbade him to enter the pulpit during his stay in her dominions. In 1584, he was recalled, and sat in the parliament held in August at Edinburgh. The Presbyterian party was still very violent against the archbishop. A provincial synod was held at St Andrew's in April 1586: the archbishop
bishop was here accused and excommunicated; he appealed to the king and the states, but this availed him little; for the mob being excited against him, he durst scarcely appear in public. At the next general assembly, a paper being produced, containing the archbishop's submission, he was absolved from the excommunication. In 1538, fresh accusations were brought against him. The year following he published the Lamentations of the prophet Jeremiah in Latin verse; which he dedicated to the king, complaining of his hard usage. In the latter end of the same year, he published a translation of the Apocalypse in Latin verse; and a copy of Latin verses, addressed also to his majesty, deploiring his distress. The king, however, was not moved by his application; for the revenue of his see was granted to the duke of Lennox; so that the prelate and his family were literally reduced to the want of bread. During the remaining part of his unfortunate life he was supported by charitable contributions, and he died in 1551. The character of this prelate has been variously represented, according to the sentiments of religion and politics which prevailed. But there is little doubt that he encouraged and supported, under the authority of the king, oppressive and injurious measures. Bigotted and timid, he wanted that firmness and intrepidity, which promise steadiness and uniformity of conduct in the conspicuous characters of turbulent times. His learning was unquestioned; and he acquired great reputation as a popular preacher. In his adversity he submitted with pious resignation to his hard fate. The panegyric of the editor of his works, Mr Wilson, is extravagant and absurd. He says, that "he was a miracle of nature, and rather seemed to be the immediate production of God Almighty, than born of a woman."

ADAMUS. The philosopher's stone is so called by alchemists; they say it is an animal, and that it has carried its invisible Egg in its body, since the moment they were united by the Creator.

ADANA, in Geography, a town of Asia Minor, in Natalia, and in the province of Caucasia. It is situated on the river Choques; on the banks of which stands a small and strong castle built on a rock. It has a great number of beautiful fountains brought from the river by means of water-works. Over the river there is a stately bridge of fifteen arches, which leads to the water-works. The climate is pleasant and healthy, and the winter mild and serene: but the summer is so hot as to oblige the principal inhabitants to retire to the neighbouring mountains, where they spend six months among shady trees and grotoes, in a most delicious manner. The adjacent country is rich and fertile, and produces melons, cucumbers, pomegranates, pulse, and herbs of all sorts, all the year round; besides corn, wine, and fruits in their proper season. It is 30 miles north-east of Tarsus, on the road to Aleppo. E. Long. 36. 12. N. Lat. 38. 10.

ADANSON, Michael, a celebrated naturalist, was born at Aix in Provence in the year 1787. He was sent to Paris in early life, and devoted his studies with great assiduity to medicine, botany, and astronomy, and was a pupil of the celebrated Remusat. He went to Senegal in the year 1749, where he remained six years examining the natural productions of that country. He presented the fruits of his discoveries in geography and natural history to the Royal Academy; and in consequence of these communications he was appointed one of their corresponding members. In the year 1759, on the death of Remusat he was elected a member in his place; and about the same time he was admitted an honorary member of the Royal Society of London. Having spent six years in Senegal, he returned to Paris, where he published a work entitled Histoire Naturelle du Senegal, in 4to; and in 1765 his Familles des Plantes, 3 tois 8vo. In the year 1775 he presented to the academy the plan of a natural history, which he did not live to execute. He died on the 3d of August 1806. See Adamson, M. Supplement.

ADASONIA, Ethiopian Sour-gourd, Monkeys'-bread, or African Calabash-tree. See Botany Index.

ADAR, the name of a Hebrew month, answering to the end of February and beginning of March, the 12th of their sacred, and 6th of their civil year. On the 7th day of it, the Jews keep a fast for the death of Moses; on the 13th, they have the feast of Esther; and on the 14th, they celebrate the feast of Purim, for their deliverance from Haman's conspiracy. As the lunar year which the Jews followed in their calculations, is shorter than the solar by about 11 days, which at the end of three years make a month, they then intercalate a 13th month, which they call也没人能， or the second Adar.

ADARCE, a kind of medicinal salts found on reeds and other vegetables, and applied by the ancients as a remedy in several cutaneous diseases.

ADARCON, in Jewish antiquity, a gold coin mentioned in Scripture, worth about ½s. sterling.

ADARME, in Commerce, a small weight in Spain, which is also used at Buenos Ayres, and in all Spanish America. It is the 16th part of an ounce, which at Paris is called the demi-gras. But the Spanish ounce is seven per cent. lighter than that of Paris. Stephens renders it in English by a drachme.

ADATAES, ADATTS, or ADATVS, in Commerce, a muslin or cotton cloth, very fine and clear, of which the piece is ten French ells long, and three quarters broad. It comes from the East Indies; and the finest is made in Bengal.

ACCORDABILIS DEXTRAR, in old law books, signify money paid by the vassal to his lord, upon the selling or exchanging of a feud.

ACGRECENTES, among the Romans, denoted a kind of soldiery, entered in the army, but not yet put on duty; from these the standing forces were recruited. See Ancilii.

ADDA, in Geography, a river of Switzerland and Italy, which rises in Mount Brunico, in the county of the Grisons, and, passing through the Valtellina, traverses the lake Canso and the Milanese, and falls into the Po near Cremona.

ADEPHAGIA, in Medicine, a term used by some physicians, for glutony, or a voracious appetite.

ADDER, in Zoology, a name for the Viper. See Culebra.

Adder-Bite, or Adder's-bite. See Libellula. See Adder, the English name for a species of Scincus.

Water Adder, a name given to the Culebra Natrix.
ADDER-stung, is used in respect of cattle, when stung by any kind of poisonous reptiles, as adders, scorpions, &c. or bit by a hedgehog or shrew. For the cure of such bites, some use an ointment made of dragon's blood, with a little barley meal, and the whites of eggs.

ADDER-wort, or Snakeweed. See Polygonum.

ADDEXTRORES, in the court of Rome, the pope's mitre-bearers, so called according to Dunciag, because they walk at the pope's right hand when he rides to visit the churches.

ADDICE, or Adze, a kind of crooked axe used by shipwrights, carpenters, cooperers, &c.

ADDICTI, in antiquity, a kind of slaves, among the Romans, adjudged to serve some creditor whom they could not otherwise satisfy, and whose slaves they became till they could pay or work out the debt.

ADDITION, among the Romans, was the making over goods to another, either by sale or by legal sentence; the goods so delivered were called bona addicta. Debts were sometimes delivered over in the manner, and thence called servis addictis.

ADICTIO IN DIEM, among the Romans, the adjudging a thing to a person for a certain price, unless by such a day the owner, or some other, give more for it.

ADDISON, Lancelot, son of Lancelot Addison, a clergyman, was born in the parish of Crosby-Ravensworth in Westmoreland, in the year 1632. He was educated at Queen's College, Oxford; and at the restoration of King Charles II. accepted of the chaplainship of the garrison of Dunkirk; but that fortress being delivered up to the French in 1662, he returned to England, and was soon after made chaplain to the garrison of Tangier; where he continued seven years, and was greatly esteemed. In 1670, he returned to England, and was made chaplain in ordinary to the king; but his chaplainship of Tangier being taken from him on account of his absence, he found himself straitened in his circumstances, when he seasonably obtained the rectory of Milton in Wiltshire, worth about £260 per annum. He afterwards became a prebendary of Sarum; took his degree of doctor of divinity at Oxford; and in 1683 was made dean of Litchfield, and the next year archdeacon of Coventry. His life was exemplary; his conversation pleasing, and greatly instructive; and his behaviour as a gentleman, a clergyman, and a neighbour, did honour to the place of his residence. He wrote, 1. A Short Narrative of the Revolutions of the Kingdoms of Fex and Morocco: 2. The present history of the Jews: 3. A Discourse on Catechising: 4. A Modest Plea for the Clergy: 5. An Introduction to the Sacrament: 6. The first State of Mahometism; and several other pieces. This worthy divine died on the 20th of April 1703, and left three sons: Joseph, the subject of the next article; Gulston, who died while governor of Fort St George; Lancelot, master of arts, and fellow of Magdalen college in Oxford: and one daughter, first married to Dr Sarte, prebendary of Westminster, and afterwards to Daniel Comber, Esq.

ADDISON, Joseph, the son of the preceding Dean Addison, was born at Milton, near Ambresbury, in Wiltshire, on the 12th of May 1672; and not being thought likely to live, was baptized the same day. He received the first rudiments of his education at the place of his nativity under the reverend Mr Naish; but was soon removed to Salisbury under the care of Mr Taylor; and from thence to the Charter-house, where his acquaintance with Sir Richard Steele commenced. About the age of fifteen, he was entered at Queen's college, Oxford, where he applied very closely to the study of classical learning, in which he made a surprising proficiency.

In the year 1687, Dr Lancaster, dean of Magdalen college, having by chance seen a Latin poem of Mr Addison's, was so pleased with it, that he immediately got him elected into that house, where he took up his degrees of bachelor and master of arts. His Latin pieces in the course of a few years, were exceedingly admired in both universities; nor were they less esteemed abroad, particularly by the celebrated Boileau, who is reported to have said, that he would not have written against Perrault, had he before seen such excellent pieces by a modern hand. He published nothing in English before the twenty-second year of his age; when there appeared a short copy of verses written by him, and addressed to Mr Dryden, which procured him great reputation from the best judges. This was soon followed by a translation of the Fourth Georgic of Virgil (omitting the story of Aristaeus), much commended by Mr Dryden. He wrote also the Essay on the Georgics, prefixed to Mr Dryden's translation. There are several other pieces written by him about this time; amongst the rest, one dated the third of April 1694, addressed to H. S. that is, Dr Sacheverel, who became afterwards so famous, and with whom Mr Addison lived once in the greatest friendship; but their intimacy was some time after broken off by their disagreement in political principles. In the year 1695 he wrote a poem to King William on one of his campaigns, addressed to Sir John Somers, lord-keeper of the great seal. This gentleman received it with great pleasure, took the author into the number of his friends, and bestowed on him many marks of his favour.

Mr Addison had been closely pressed, while at the university, to enter into holy orders; and had once resolved upon it: but his great modesty, his natural diffidence, and an uncommon degree of sense of the importance of the sacred function, made him afterwards alter his resolution; and having expressed an inclination to travel, he was encouraged thereto by his patron above-mentioned, who by his interest procured him from the crown a pension of 300l. per annum to support him in his travels. He accordingly made a tour to Italy in the year 1699; and in 1701, he wrote a poetical epistle from Italy to the earl of Halifax, which has been universally esteemed as a most excellent performance. It was translated into Italian verse by the abbot Antonio Maria Salvini, Greek professor at Florence. In the year 1705, he published an account of his travels, dedicated to Lord Somers; which, though at first but indifferently received, yet in a little time met with its deserved applause.

In the year 1702, he was about to return to England, when he received advice of his being appointed to attend Prince Eugene, who then commanded for the emperor in Italy; but the death of King William happening soon after, put an end to this affair as well as his pension; and he remained for a considerable time unemployed.
Addison. employed. But an unexpected incident at once raised him, and gave him an opportunity of exerting his fine talents to advantage: for in the year 1704, the lord treasurer Godolphin happened to complain to Lord Halifax, that the duke of Marlborough's victory at Blenheim had not been celebrated in verse in the manner it deserved; and, intimidated, that he would take it kindly if his lordship, who was the known patron of the poet, would name a gentleman capable of doing justice to so elevated a subject. Lord Halifax replied, somewhat hastily, that he did know such a person, but would not mention him; adding, that long had he seen with indignation, men of no merit maintained in luxury at the public expense, whilst those of real worth and modesty were suffered to languish in obscurity. The treasurer answered very coolly, that he was sorry there should be occasion for such an observation, but that he would do his endeavour to wipe off such reproaches for the future; and he engaged his honour, that whoever his lordship named, as a person capable of celebrating this victory, should meet with a suitable recompense. Lord Halifax thereupon named Mr. Addison; insisting, however, that the treasurer himself should send to him; which he promised. Accordingly he prevailed on Mr. Boyle (afterwards Lord Carlton), then chancellor of the exchequer, to make the proposal to Mr. Addison; which he did in so polite a manner, that our author readily undertook the task. The lord-treasurer had a sight of the piece, when it was carried no farther than the celebrated simile of the angel; and was so pleased with it, that he immediately appointed Mr. Addison a commissioner of appeals, vacant by the promotion of Mr. Locke, chosen one of the lords commissioners for trade. The Campaign is addressed to the duke of Marlborough; it gives a short view of the military transactions in 1704, and contains a noble description of the two great actions at Schellenberg and Blenheim. In 1705, he attended Lord Halifax to Hanover; and the ensuing year was appointed under-secretary to Sir Charles Hedges, secretary of state; in which office he acquitted himself so well, that the earl of Sunderland, who succeeded Sir Charles in December, continued Mr. Addison in his employment.

A taste for operas beginning at this time to prevail in England, and many persons having solicited Mr. Addison to write one, he complied with their request, and composed his Rosamond. This, however, whether from the defect of the music, or from the prejudices in favour of the Italian taste, did not succeed upon the stage; but the poetry of it has been, and always will be justly admired. About this time, Sir Richard Steele composed his comedy of the Tender Husband, to which Mr. Addison wrote a prologue. Sir Richard surprised him with a dedication of this play, and acquainted the public, that he was indebted to him for some of the most excellent strokes in the performance. The marquis of Wharton, being appointed lord lieutenant of Ireland in 1705, took Mr. Addison with him as his secretary. Her Majesty highly approved of his records of Ireland, and as a farther mark of her favour, considerably augmented the salary annexed to that place. Whilst he was in this kingdom, the Tatler was first published; and he discovered his friend Sir Richard Steele to be the author, by an observation on Virgil, which he had communicated to him. He afterwards assisted considerably in carrying on this paper, which the author acknowledges. The Tatler being laid down, the Spectator was set on foot, and Mr. Addison furnished great part of the most admired papers. The Spectator made its first appearance in March 1711, and was brought to a conclusion in September 1712.

His celebrated Cato appeared in 1713. He formed the design of a tragedy upon this subject when he was very young, and wrote it when on his travels; he reviewed it in England, without any intention of bringing it on the stage; but his friends being persuaded it would serve the cause of liberty, he was prevailed on by their solicitations, and it was accordingly exhibited on the theatre, with a prologue by Mr. Pope, and an epilogue by Dr. Garth. It was received with the most uncommon applause, having run thirty-five nights without interruption. The Whigs applauded every line in which liberty was mentioned, as a satire on the Tories; and the Tories echoed every clap, to shew that the satire was unfelt. When it was printed, notice was given that the queen would be pleased if it was dedicated to her;* but as he had designed that compliment elsewhere, he found himself obliged, " says Tickell," by his duty on the one hand, and his honour on the other, to send it into the world without any dedication." It was no less esteemed abroad, having been translated into French, Italian, and German; and it was acted at Leghorn, and several other places, with vast applause. The Jesuits of St. Omer made a Latin version of it, and the students acted it with great magnificence.

About this time another paper called the Guardian, was published by Steele, to which Addison was a principal contributor. It was a continuation of the Spectator, and was distinguished by the same elegance and the same variety; but, in consequence of Steele's propensity to politics, was abruptly discontinued in order to write the Englishman.

The papers of Addison are marked in the Spectator by one of the letters in the name of Clio, and in the Guardian by a Hand. Many of these papers were written with powers truly comic, with nice discrimination of characters, and accurate observation of natural or accidental deviations from propriety: but it was not supposed that he had tried a comedy on the stage, till Steele, after his death, declared him the author of "The Drummer." This, however, he did not know to be true by any cogent testimony: for when Addison put the play into his hands, he only told him it was the work of a gentleman in the company; when it was received, as is confessed, with cold disapprobation, he was probably less willing to claim it. Tickell omitted it in his collection; but the testimony of Steele, and the total silence of any other claimant, has determined the public to assign it to Addison, and it is now printed with his other poetry. Steele carried "The Drummer" to the playhouse, and afterwards to the press, and sold the copy for 50 guineas. To Steele's union may be traced the profit supplied by the play itself, of which the characters are such as Addison would have delineated; and the tendency such as Addison would have promoted.

It is said that Mr. Addison intended to have composed an English dictionary upon the plan of the Italian (Delia.)
Addison, (Della Crusca); but, upon the death of the queen, being appointed secretary to the lords justices, he had not leisure to carry on such a work. When the earl of Sunderland was appointed lord lieutenant of Ireland, Mr. Addison was again made secretary for the affairs of that kingdom: and, upon the earl's being removed from the lieutenancy, he was chosen one of the lords of trade.

Not long afterwards an attempt was made to revive the Spectator, at a time indeed by no means favourable to literature, when the accession of a new family to the throne filled the nation with anxiety, discord, and confusion; and either the turbulence of the times or the satiety of the readers put a stop to the publication, after an experiment of 82 numbers, which were afterwards collected into an eighth volume, perhaps more valuable than any of those that went before it: Addison produced more than a fourth part.

In 1715, he began the Freeholder, a political paper, which was much admired, and proved of great use at that juncture. He published also, about this time, verses to Sir Godfrey Kauller upon the king's picture, and some to the princess of Wales with the treaty of Cato.

Before the arrival of King George he was made secretary to the regency, and was required by his office to send notice to Hanover that the queen was dead, and that the throne was vacant. To do this would not have been difficult to any man but Addison, who was so overwhelmed with the greatness of the event, and so distracted by choice of expression, that the lords, who could not wait for the niceties of criticism, called Mr. Southwells, a clerk in the house, and ordered him to despatch the message. Southwell readily told what was necessary in the common style of business, and valued himself upon having done what was too hard for Addison.

In 1716, he married the countess dowager of Warwick, whom he had solicited by a very long and anxious courtship. He is said to have first known her by becoming tutor to her son. The marriage, if uncontradicted report can be credited, made no addition to his happiness; it neither found them nor made them equal. She always remembered her own rank, and thought herself entitled to treat with very little ceremony the tutor of her son. It is certain that Addison has left behind him no encouragement for ambitious love. The year after, 1717, he rose to his highest elevation, being made secretary of state; but is represented as having proved unequal to the duties of his place. In the house of commons he could not speak, and therefore was useless to the defence of the government. In the office he could not issue an order without losing his time in quest of fine expressions. At last, finding by experience his own inability for public business, he was forced to solicit his dismissal, with a pension of £500 a year. Such was the account of those who were inclined to detract from his abilities; but by others his relinquishment was attributed to declining health, and the necessity of recess and quiet.

In his retirement, he applied himself to a religious work, which he had begun long before; part of which, scarce finished, has been printed in his works. He intended also to have given an English paraphrase of some of David's Psalms. But his ailments increased, and cut short his designs. He had for some time been oppressed by an asthmatic disorder, which was now aggravated by a dropy, and he prepared to die conformably to his precepts and professions. He sent, as Pope relates, a message by the earl of Warwick to Mr Gay, desiring to see him; Gay, who had not visited him for some time before, obeyed the summons, and found himself received with great kindness. The purpose for which the interview had been solicited was then discovered: Addison told him, that he had injured him; but that, if he recovered, he would recompense him. What the injury was he did not explain, nor did Gay ever know: but supposed that some preferment designed for him had by Addison's intervention been withheld. Another deathbed interview, of a more solemn nature, is recorded: Lord Warwick was a young man of very irregular life, and perhaps of loose opinions. Addison, for whom he did not want respect, had very diligently endeavoured to reclaim him; but his arguments and expostulations had no effect: One experiment, however, remained to be tried. When he found his life near its end, he directed the young lord to be called; and when he desired, with great tenderness, to hear his last injunctions, tolled him, "I have sent for thee that you may see how a Christian can die." What effect this awful scene had on the earl's behaviour is not known: he died himself in a short time. Having given directions to Mr. Tickell for the publication of his works, and dedicated them on his deathbed to his friend Mr. Craggs, he died June 17, 1719, at Holland-house, leaving only one child, a daughter, by his marriage.

Addison's course of life before his marriage has been detailed by Pope. He had in the house with him Budgell, and perhaps Philips. His chief companions were Steele, Budgell, Philips, Carey, Davenant, and Colonel Brett. With one or other of these he always breakfasted. He studied all morning; then dined at a tavern, and went afterwards to Button's. From the coffeehouse he went again to the tavern, where he often sat late and drank too much wine.

Dr. Johnson, in delineating the character of Addison, observes with Tickell, that he employed wit on the side of virtue and religion. He not only made the proper use of wit himself, but taught it to others; and from his time it has been generally subservient to the cause of reason and truth. He has dissipated the prejudice that had long connected gaiety with vice, and easiness of manners with laxity of principles. He has restored virtue to its dignity, and taught innocence not to be ashamed. This is an elevation of literary character, "above all Greek, above all Roman fame," No greater felicity can genius attain than that of having purified intellectual pleasure, separated mirth from indecency, and wit from licentiousness; of having taught a succession of writers to bring elegance and gaiety to the aid of goodness; and, to use expressions yet more awful, of having "turned many to righteousness." As a describer of life and manners, he must be allowed to stand perhaps the first of the first rank. His humour, which as Steele observes, is peculiar to himself, is so happily diffused as to give the grace of novelty to domestic scenes and daily occurrences. He never "outsteps the modesty of nature," nor raises merriment or wonder by the violation of truth.
Addison.

Addison.

truth. His figures neither divert by distortion, nor amaze by aggravation. He copies life with so much fidelity, that he can hardly be said to invent; yet his exhibitions have an air so much original, that it is difficult to suppose them not merely the product of imagination. As a teacher of wisdom he may be confidently followed. His religion has nothing in it enthusiastic or superstitious; he appears neither weakly credulous nor wantonly sceptical; his morality is neither dangerously lax nor impractically rigid. All the enchantment of fancy and all the cogency of argument are employed to recommend to the reader his real interest, the care of pleasing the Author of his being. Truth is shown sometimes as the phantom of a vision, sometimes appears half-veiled in an allegory; sometimes attracts regard in the robes of fancy, and sometimes steps forth in the confidence of reason. She wears a thousand dresses, and in all is pleasing.

The doctor, however, has related the following anecdote, which every admirer of Addison, every man of feeling, must be reluctant to believe. "Steele (says the doctor), whose imprudence of generosity, or vanity of profusion, kept him always incurably necessitous, upon some pressing exigence, in an evil hour, borrowed a hundred pounds of his friend, probably without much purpose of repayment; but Addison, who seems to have had other notions of a hundred pounds, grew impatient of delay, and reclaimed his loan by an execution. Steele felt, with great sensibility, the obduracy of his creditor; but with emotions of sorrow rather than of anger." It is much to be wished, says Dr Kippis, that Dr Johnson had produced his authority for this narration. It is very possible, that it may be only a story the doctor had somewhere heard in conversation, and which is entirely groundless; "and this I am the rather inclined to believe, as I have been assured, by one of the most respectable characters in the kingdom, that the fact hath no foundation in truth." Mr Potter, in a late publication, hath informed us, that he is told by the best authority that the story is an absolute falsehood.

Mr Tyers, in "A Historical Essay on Mr Addison," printed, but not published, has mentioned some facts concerning him, with which we were not before acquainted. These are, That he was laid out for dead as soon as he was born: that, when he addressed his verses on the English poets to Henry Sacheverell, he courted that gentleman's sister; that, whenever Jacob Tonson came to him for the Spectator, Bayle's French Historical and Critical Dictionary lay always open before him: that, upon his return to England, after his travels, he discharged some old debts he had contracted at Oxford, with the generosity of good interest: that he was put into plentiful circumstances by the death of a brother in the East Indies: that, having received encouragement from a married lady, of whose he had been formerly enamoured, he had the integrity to resist the temptation: that he refused a gratification of a three hundred pounds bank-note, and afterwards of a diamond-ring of the same value, from a Major Dunbar, whom he had endeavoured to serve in Ireland by his interest with Lord Sunderland: and that his daughter by Lady Warwick died a few years ago unmarried, residing at Bilton near Rugby, and possessing an income of more than twelve hundred a-year.

The following letter, which probably relates to the case of Major Dunbar, reflects great honour on Mr Addison's integrity. "June 26, 1715,—Sir, I find there is a very strong opposition formed against you; but I shall wait on my lord lieutenant this morning, and lay your case before him as advantageously as I can, if he is not engaged in other company. I am afraid what you say of his grace does not portend you any good. And now, Sir, believe me, when I assure you I never did, nor ever will, on any pretence whatsoever, take more than the stated and customary fees of my office. I might keep the contrary practice concealed from the world, were I capable of it, but I could not from myself; and I hope I shall always fear the reproaches of my own heart more than those of all mankind. In the mean time, if I can serve a gentleman of merit, and such a character as you bear in the world, the satisfaction I meet with on such an occasion is always a sufficient, and the only reward to, Sir, your most obedient, humble servant, J. ADDISON."—

The anecdote which follows was told by the late Dr Birch. Addison and Mr Temple Stanyan were very intimate. In the familiar conversations which passed between them, they were accustomed freely to dispute each other's opinions. Upon some occasion, Mr Addison lent Stanyan five hundred pounds. After this, Mr Stanyan behaved with a timid reserve, deference, and respect; not conversing with the same freedom as formerly, or canvassing his friend's sentiments. This gave great uneasiness to Mr Addison. One day they happened to fall upon a subject, on which Mr Stanyan had always been used strenuously to oppose his opinion, but, even upon this occasion, he gave way to what his friend advanced, without interposing his own view of the matter. This hurt Mr Addison so much, that he said to Mr Stanyan, "Either contradict me, or pay me the money."

In Tickell's edition of Mr Addison's works there are several pieces hitherto unmentioned, viz. The Dissertation on Medals; which, though not published till after his death, yet he had collected the materials, and began to put them in order, at Vienna, in 1702. A pamphlet, entitled, The present State of the War, and the Necessity of an Augmentation, considered. The late Trial and Conviction of Count Tariff. The Whig Examiner came out on the 14th of September 1716; there were five of these papers attributed to Mr Addison, and they are the severest pieces he ever wrote. He is said also to have been the author of a performance entitled Dissertatio de insignioribus Romanorum Poetis, and of a Discourse on Ancient and Modern Learning.

ADDITIONAL, something added to another. Thus physicians call the ingredients added to a medicine already compounded, adventitious.

ADDITION, is the joining together or uniting two or more things, or augmenting a thing by the accession of others thereto.

ADDITION, in Arithmetic, Algebra, &c. See these articles.

ADDITION, in Music, a dot marked on the right side of a note, signifying that it is to be founded or lengthened.
ADONIAN, a small place in the Val di Demona in the
the kingdom of Sicily. E. Long. 15° 25'. N. Lat. 38° 5'.
Anciently Adranum, at the foot of Mount Gibeal.
The ruined walls of this ancient city still exhibit an air of its former grandeur.

ADES, or HADES, denotes the invisible state. In the heathen mythology, it comprehends all those regions that lie beyond the river Styx, viz. Erebos, Tartaros, and Elysium. See HELL.

ADESNNARIANS, Adesnariarins, in church history, a sect of Christians who hold the real presence of Christ's body in the eucharist, though not by way of transubstantiation. They differ considerably as to this presence; some holding that the body of Christ is in the bread; others, that it is about the bread; and others that it is under the bread.

ADFIATION, a Gothic custom, whereby the children of a former marriage are put upon the same footing with those of the second. This is also called unio prolio, and still retained in some parts of Germany, though Heinecians observes that this is not adoption.

AD FINES, (Antonine), a town of Swizerland, supposed to be the modern Fium, in the north of the district of Targow, on the rivulet Thur, not far from the borders of Swabia, about half way between Constance and Frechenfeld. So called, because when Cecina, general of the emperor Vitellius, with the auxiliary Thietins, defeated the Helveti, the former extended their borders thus far, their territory ending here; and in the time of the Romans, it was the last town in this quarter, and of some repute.

ADHA, a festival which the Mahometans celebrate on the 12th day of the month Dhoulebeggett, which is the 26th and last of their year. This month being particularly destined for the ceremonies which the pilgrims observe at Mecca, it takes its name from thence, for the word signifies the month of Pilgrimage. On that day they sacrifice with great solemnity, at Mecca, and nowhere else, a sheep, which is called by the same name as the festival itself. The Turks commonly call the festival the Great Bairam, to distinguish it from the lesser, which ends their fast, and which the Christians of the Levant call the Easter of the Turks. The Mahometans celebrate this festival, out of the city of Mecca, in a neighbouring valley; and sometimes they sacrifice there a camel. See BAIRAM.

ADHATODA, in Botany. See Justicea, Botany Index.

ACTION of ADHERENCE, in Scots Law; an action competent to a husband or wife, to compel either party to adhere, in case of desertion.

ADHESION, in a general sense, implies the sticking or adhering of bodies together.

ADHESION, in Philosophy. See Cohesion in this work, and Adhesion in the Supplement.

ADHESION, in Anatomy, a term for one part sticking to another, which in a natural state are separate. For the most part, if any of those parts in the thorax or belly lie in contact, and inflame, they grow together.

ADHIL, in Astronomy, a star of the sixth magnitude, upon the garment of Andromeda, under the last star in her foot.

ADHOA, in ancient customs, denotes what we otherwise call relief. In which sense we sometimes also find the word written adhova, adhoamentum, and adhoamentum.

ADJANUM, Maiden-hair; in Botany. See Botany Index.

ADPHORISTS, in church history, a name importing lukewarmness, given, in the 16th century, to the moderate Lutherans, who embraced the opinion of Melanchthon, whose disposition was much more pacific than that of Luther.

ADAZZIO, Adazzio, or Aiaccio, in Geography, a handsome town and castle of Corsica in the Mediterranean, with a bishop's see, and a good harbour. It is populous and fertile in wine. It is 27 miles south-west of Corte. E. Long. 41° 54'. N. Lat. 38° 5'.

ADJECTIVE, in Grammar, a kind of noun joined with a substantive, either expressed or implied, to denote its qualities or incidents. See Grammar.

ADIGE, a river in Italy, which taking its rise south of the lake Giace among the Alps, runs south by Trent, then east by Verona in the territory of Venice, and falls into the gulf of Venice, north of the mouth of the Po.

ADJOURNMENT, the putting off of a court or other meeting, till another day. There is a difference between the adjournment and the prorogation of the parliament; the former not only being for a shorter time, but also done by the house itself; whereas the latter is an act of royal authority.

ADIPOCIRE, derived from adeps, fat, and cere, wax, denotes a substance which has been lately examined by chemists. It is formed by a certain change which the soft parts of animal bodies undergo, when kept for some time in running water, or when a great number of dead bodies are heaped together in the same place. Great quantities of this substance were found on removing the animal matters from the burial ground of the Innocents at Paris in the year 1787. In this burial ground, 1200 or 1500 bodies were thrown together into the same pit, and being decomposed, were converted into this substance. It has some of the properties of wax or spermacet. See Chemistry Index.

ADIPOSE, a term used by anatomists for any cell, membrane, &c. that is remarkable for its fatness.

ADIRBEITSAN, in Geography, a province of Persia, in Asia, and part of the ancient Media. It is bounded on the north by the province of Schirvan, on the south by Irac-Agemi and Kurdistan, on the east by Ghilan and the Caspian sea, and on the west by Turcomania. E. Long. 42° to 48°. N. Lat. 36° to 39°.

ADIT, in a general sense, the passage to, or entrance of, any thing.

ADIT of a Mine, the hole, or aperture, whereby it is entered and dug, and by which the water and ores are carried away. The term amounts to the same with curriculus or drift, and is distinguished from air-shaft. The adit is usually made on the side of a hill, towards the bottom thereof, about four, five, or six feet high, and eight wide, in form of an arch; sometimes cut in the rock, and sometimes supported with timber, so conducted as that the sole or bottom of the adit may answer to the bottom of the shaft, only somewhat lower, that the water may have a sufficient current to pass away without the use of the pump. Damps and the impurity of the air are the great impediments against driving
driving adits above 20 or 30 fathoms, by reason of the necessity, in this case, of letting down air-shafts from the day to meet the adit, which are often very expensive, both on account of the great depth of mines, and the hardness of the mineral strata to be cut through. The best remedy against this is that practised in the coal mines near Liège, where they work their adits without air-shafts; the manner of which is described by Sir James Moray. (Phil. Trans. vol. 1, p. 79.)

Adit of a Mine is sometimes used for the air-shaft itself, being a hole driven perpendicularly from the surface of the earth into some part of the mine, to give entrance to the air. To draw off the standing water in winter, in deep mines, they drive up an adit, or air-shaft, upon which the air disengages itself from the water, when it begins to run with such violence as produces a noise equal to the bursting of a cannon, dashes every thing in the way against the sides of the mine, and loosens the very rocks at a distance. (Ibid.)

ADJUDICATION, implies the act of adjudging, or determining, a cause in favour of some person.

ADJUDICATION, in Scots Law, the name of that action by which a creditor attaches the heritable estate of his debtor, or his debtor's heir, in order to appropriate it to himself, either in payment or security of his debt; or that action by which the holder of an heritable right, labouring under any defect in point of form, may supply that defect.

ADJUNCT, among philosophers, signifies something added to another, without being any necessary part of it. Thus water absorbed by cloth or a sponge, is an adjunct, but no necessary part of either of these substances.

ADJUNCT, in Metaphysics, some quality belonging to either the body or mind, whether natural or acquired. Thus thinking is an adjunct of the mind, and growth an adjunct of the body.

ADJUNCT, in Music, a word which is employed to denominate the connexion or relation between the principal mode and the modes of its next-fifths, which, from the intervals that constitute the relation between them and it, are called its adjuncts.

ADJUNCT is also used to signify a colleague, or some person associated with another as an assistant.

ADJUNCT Gods, or ADJUNCTS of the Gods, among the Romans, were a kind of inferior deities, added as assistants to the principal ones, to ease them in their functions. Thus, to Mars was added Bellona and Nemesis; to Neptune, Salacia; to Vulcan, the Cabiri; to the Good Genius, the Lares; to the Evil, the Lemures, &c.

ADJUNCTS, in Rhetoric and Grammar, signify certain words or things added to others, to amplify or augment the force of the discourse.

ADJUNCTS, or ADJUNCTS, in the Royal Academy of Sciences at Paris, denoted a class of members, attached to the pursuit of particular sciences. The class of Adjuncts was created in 1716, in lieu of the Eleves: they were twelve in number; two for geometry, two for mechanics, two for astronomy, two for anatomy, two for chemistry, and two for botany. The Eleves not taken into this establishment were admitted on the footing of supernumerary Adjuncts.

ADJUTANT, in the military art, is an officer whose business it is to assist the major. Each battalion

of foot and regiment of horse has an adjutant, who receives the orders every night from the brigade-major: which, after carrying them to the colonel, he delivers out to the serjeants. When detachments are to be made, he gives the number to be furnished by each company or troop, and assigns the hour and place of rendezvous. He also places the guards; receives and distributes the ammunition to the companies, &c.; and, by the major's orders, regulates the prices of bread, beer, and other provisions. The word is sometimes used by the French for an 'aid-du-camp.'

ADJUTANTS-general, among the Jesuits, a select number of fathers, who resided with the general of the order, each of whom had a province or country assigned him, as England, Holland, &c. and their business was to inform the father-general of state occurrences in such countries. To this end they had their correspondents delegated, emissaries, visitors, regents, provincials, &c.

ADJUTORIUM, a term used by physicians for any medicine in a prescription but the capital one.

ADLE-EGGS, such as have not received an impregnation from the semen of the cock.

ADLEGEON, in the public law of the German empire, a right claimed by the states of the empire of adjoining plenipotentiaries, in public treaties and negotiations, to those of the emperor, for the transacting of matters which relate to the empire in general. In which sense adlegation differs from legation, which is the right of sending ambassadors on a person's own account—Several princes and states of the empire enjoy the right of legation, which have not that of adlegation, and vice versa. The bishops, for instance, have the right of adlegation in the treaties which concern the common interest, but no right of legation for their own private affairs. The like had the duke of Mantua.—The emperor allows the princes of Germany the privilege of legation, but disputes that of adlegation. They challenge it as belonging to them jure regni, which they enjoy in common with the emperor himself.

ADLOCUTION, ADLOCUTIO, in Antiquity, is chiefly understood of speeches made by Roman generals to their armies, to encourage them before a battle. We frequently find those adlocutions expressed on medals by the abbreviation ADLOCUT. COH.—The general is sometimes represented as seated on a tribunal, often on a bank or mound of turf, with the cohorts ranged orderly round him, in manipuli and turmae. The usual formula in adlocutions was, Fortis es set ac fidatis.

ADMANUENSES, in ancient law books, denote persons who swore by laying their hands on the book.

—In which sense, admanuenses amount to the same with laymen; and stand opposed to clerks, who were forbid to swear on the book, their word being reputed as their oath; whence they were also denominated fide digni.

ADMEASUREMENT, ADMEASURATIO, in Law, a writ which lies for the bringing those to reason, or mediocrity, who usurp more of any thing than their share. This writ lies in two cases; termed,

ADMEASUREMENT of Dower, ADMEASURATIO dottis, where the widow of the deceased holds more from the heir, or his guardian, on account of her dower, than of right belongs to her.

A a
ADMIRAL, a great officer or magistrate, who has
the government of a navy, and the hearing of all mar-
time causes.

Authors are divided with regard to the origin and
denomination of this important officer, whom we find
established in most kingdoms that border on the sea.
But the most probable opinion is that of Sir Henry
Spelman, who thinks, that both the name and dignity
were derived from the Saracens, and, by reason of the
holy wars, brought amongst us; for admiral, in the
Arabian language, signifies a prince, or chief ruler,
and was the ordinary title of the governors of cities,
provinces, &c. and therefore they called the com-
mmander of the navy by that name, as a name of dignity
and honour. And indeed there are no instances of
admirals in this part of Europe before the year 1584,
when Philip of France, who had attended St Lewis in
the wars against the Saracens, created an admiral. Du
Cange assures us, that the Sicilians were the first, and
the Genoese the next, who gave the denomination of
admiral to the commanders of their naval armaments;
and that they took it from the Saracen or Arabic emir,
a general name for every commanding officer. As for
the exact time when the word was introduced among
us, it is uncertain; some think it was in the reign of
Edward I. Sir Henry Spelman is of opinion that it
was first used in the reign of Henry III. because nei-
ther the laws of Oleron, made in 1266, nor Bracton,
who wrote about that time, make any mention of it;
and that the term admiral was not used in a charter in
the eighth of Henry III. where he granted this office
to Richard de Lacy, by these words Maritimam Angli
cus; but in the 50th year of the same reign, not only
the historians, but the charters themselves, very fre-
quently used the word admiral.

Anciently there were generally three or four admi-
rals appointed in the English seas, all of them holding
the office durante bene placito; and each of them having
particular limits under their charge and government;
as admirals of the fleet of ships, from the mouth of the
Thames, northward, southward, or westward. Besides
these, there were admirals of the Cinque Ports, as in the
reign of Edward III. when one William Latimer was
styled admiralis quinque portuum: and we sometimes
find that one person has been admiral of the fleets to
the southward, northward, and westward: but the title of
admiralis Anglice was not frequent till the reign of
Henry IV. when the king's brother had that title given
him, which in all commissions afterwards was granted
to the succeeding admirals. It may be observed, that
there was a title above that of admiral of England,
which was, locum tenens regis super mare, the king's
lieutenant general of the sea; this title we find men-
tioned in the reign of Richard II. Before the use of
the word admiral was known, the title of custos maris
was made use of. See ADMIRAL, SUPPLEMENT.

Lord High ADMIRAL of England, in some ancient rec-
cords called capitamus maritimus, an officer of great
antiquity and trust, as appears by the laws of Oleron, to
denominated from the place at which they were made by
Richard I. The first title of admiral of England, ex-
pressly
for executing jurisdiction within their respective limits. Their decrees, however, are not final, an appeal lying to the court of admiralty in London.

Admiral is also an appellation given to the most considerable ship of a fleet of merchantmen, or of the vessels employed in the cod fishery of Newfoundland. This last has the privilege of choosing what place he pleases on the shore to dry his fish; gives proper orders, and appoints the fishing places to those who come after him; and as long as the fishing season continues, he carries a flag on his mainmast.

Admiral, in Conchology, the English name of a species of the voluta, a shell-fish belonging to the order of vermes testaceae. See Conchology Index.

Admiralty properly signifies the office of lord high admiral, whether discharged by one single person, or by joint commissioners called lords of the admiralty.

Court of Admiralty, is a sovereign court, held by the lord high admiral, or lords of the admiralty, where cognizance is taken in all maritime affairs, whether civil or criminal.—All crimes committed on the high seas, or on great rivers below the first bridge next the sea, are cognizable in this court only, and before which they must be tried by judge and jury. But in civil cases the mode is different, the decisions being all made according to the civil law. From the sentences of the admiralty judge an appeal always lay, in ordinary course, to the king in chancery, as may be collected from statute 25 Hen. VIII. c. 19. which directs the appeal from the archbishop's courts to be determined by persons named in the king's commission, "like as in case of appeal from the admiralty court." And by statute 8 Eliz. c. 5. it is enacted, that upon an appeal made to the chancery, the sentence definitive of the delegates appointed by commission shall be final.

Appeals from the vice-admiralty courts in America, and our other plantations and settlements, may be brought before the courts of admiralty in England, as being a branch of the admiralty's jurisdiction, though they may also be brought before the king in council. But in case of prize vessels, taken in time of war, in any part of the world, and condemned in any courts of admiralty, the appeal lies to certain commissioners of appeals consisting chiefly of the privy council. And this by virtue of divers treaties with foreign nations, by which particular courts are established in all the maritime countries of Europe for the decision of this question. Whether lawful prize or not? for this being a question between subjects of different states, it belongs entirely to the law of nations, and not to the municipal laws of either country. See a more full account of the various courts of admiralty, and of their powers and practices, under the article Admiralty in the Supplement.

Admiralty Bay, in Geography, a spacious bay with good anchorage on the west coast of Cook's straits, in the southern island of New Zealand. S. Lat. 40° 37'. E. Long. 174° 54'.

There is a bay of the same name on the northwest coast of America, in N. Lat. 59° 31'. W. Long. 140° 18'.

Admiralty Inlet, the entrance to the supposed straits of Juan de Fuca, on the west coast of New Georgia,
In N. Lat. 48° 30', W. Long. 124° 15'. It was visited by Captain Vancouver in 1792, who found the soil on the shores rich and fertile, well watered, and clothed with luxuriant vegetation.

**Admiralty Islands**, lie in about 2° 18' S. Lat. and 146° 44' E. Long. There are between 20 and 30 islands said to be scattered about here, one of which alone would make a large kingdom. Captain Carteret, who first discovered them, was prevented from touching at them, although their appearance was very inviting, on account of the condition of his ship, and of his being entirely unprovided with the articles of barter which suit an Indian trade. He describes them as clothed with a beautiful verdure of woods, lofty and luxuriant, interspersed with spots that have been cleared for plantations, groves of cocoa nut trees, and houses of the natives, who seem to be very numerous. The largest of these islands is 18 leagues long in the direction of east and west. The discoverer thinks it highly probable that these islands produce several valuable articles of trade, particularly spices, as they lie in the same climate and latitude as the Moluccas.

**Admiration**, in ethics, is that passion of the mind which is excited by the contemplation of superior and rare excellence, as superior or uncommon wisdom, ingenuity, or benevolence.

**Admonition**, in ecclesiastical affairs, a part of discipline much used in the ancient church. It was the first act, or step, towards the punishment or expulsion of delinquents. In cases of private offences, it was performed, according to the evangelical rule, privately: in case of public offence, openly, before the church. If either of those sufficed for the recovery of the fallen person, all further proceedings in the way of censure ceased: if they did not, recourse was had to excommunication.

**Admonitio Fustium**, a military punishment among the Romans, not unlike our whipping, but it was performed with vine branches.

**Admortalization**, in the feudal customs, the reduction of the property of lands or tenements to mortmain. See Mortmain.

**Adnata**, in Anatomy, one of the coats of the eye, which is also called conjunctiva and albuginea.

**Adnata** is also used for any hair, wool, or the like, which grows upon animals or vegetables.

**Adnata**, or Adnascentia, among gardeners, denote those offsets, which by a new germination under the earth, proceed from the lily, narcissus, hyacinth, and other flowers, and afterwards become true roots.

**Adnoun**, is used by some grammarians to express what we more usually call an adjective. — The word is formed by way of analogy to adverbs; in regard adjectives have much the same office and relation to nouns that adverbs have to verbs. Bishop Wilkins uses the word adnomen in another sense, viz. for what we otherwise call a preposition.

**Adolescence**, the state of growing youth; or that period of a person's age, commencing from his infancy, and terminating at his full stature or manhood. The word is formed of the Latin *adolescere*; "to grow." — The state of adolescence lasts so long as the fibres continue to grow, either in magnitude or firmness. The fibres being arrived at the degree of firmness and tension sufficient to sustain the parts, no longer yield or give way to the efforts of the nutritious matter to extend them; so that their farther accretion is stopped, from the very law of their nutrition. Adolescence is commonly computed to be between 15 and 25, or even 30 years of age; though in different constitutions its terms are very different. — The Romans usually reckoned it from 12 to 25 in boys; and to 21 in girls, &c. And yet, among their writers, *juvenis* and *adolescens* are frequently used indifferently for any person under 45 years. ADOLESCENT, or ODOLAM, in Ancient Geography, a town in the tribe of Judah, to the east of Eleutheropolis. David is said to have hid himself in a cave near this town. (Bible).

**ADOM**, in Geography, a state or principality of the Gold coast, in Africa. It is a populous, rich, and fertile country, abounding with corn and fruits.

**ADON**, a populous village in the province of Stuhlweissenberg, belonging to Hungary. It lies in a fruitful country, towards the river Danube. E. Long. 19° 20'. N. Lat. 47° 30'.

**ADONAI**, one of the names of the Supreme Being in the Scriptures. The proper meaning of the word is *my lord*, in the plural number; as *Adoni* is my lord, in the singular. The Jews, who either out of respect, or superstition, do not pronounce the name of Jehovah, read Adonai, in the room of it, as often as they meet with Jehovah in the Hebrew text. But the ancient Jews were not so scrupulous; nor is there any law which forbids them to pronounce the name of God, (Calmet).

**ADONIA**, in antiquity, solemn feasts in honour of Venus, and in memory of her beloved Adonis. The Adonias were observed with great solemnity by most nations; Greeks, Phoenicians, Lyceans, Syrians, Egyptians, &c. From Syria, they are supposed to have passed into India. The prophet Ezekiel is understood to speak of them. They were still observed at Alexandria in the time of St. Cyril; and at Antioch in that of Julian the Apostate, who happened to enter that city during the solemnity, which was taken for an ill omen. The Adonia lasted two days: on the first of which certain images of Venus and Adonis were carried, with all the pomp and ceremonies practised at funerals: the women wept, tore their hair, beat their breasts, &c. imitating the cries and lamentations of Venus for the death of her paramour. This lamentation they called *Adoniasargos*. The Syrians were not contented with weeping, but subjected themselves to severe discipline, shaved their heads, &c. Among the Egyptians, the queen herself used to carry the image of Adonis in procession. St. Cyril mentions an extraordinary ceremony practised by the Alexandrians: A letter was written to the women of Byblis, to inform them that Adonis was found again: this letter was thrown into the temple, which (it was pretended) did not fail punctually to convey it to Byblis in seven days; upon the receipt of which, the Byblian women ceased their mourning, sung his praises, and made rejoicing as if he were raised to life again: Or rather, according to Meursius, the two offices of mourning and rejoicing made two distinct feasts, which were held at different times of the year, the one six months after the other, Adonis being supposed to pass half the year with Proserpine, and half with Venus.

—The Egyptian Adonia are said to have been held in memory...
ADO

memory of the death of Osiris; by others of his sickness and recovery. Bishop Patrick dates their origin from the slaughter of the first born under Moses.

ADONIDES, in Botany, a name given to botanists who described or made catalogues of plants cultivated in any particular place.

ADONUS, son of Cynaras king of Cyprus, the darling of the goddess Venus: being killed by a wild boar, in the Italian woods, he was turned into a flower of a blood-colour, supposed to be the anemone. Venus was inconsolable; and no grief was ever more celebrated than this, most nations having perpetuated the memory of it by a train of anniversary ceremonies. Among Shakespeare’s poems, is a long one on the subject of Venus’s affection for Adonis.

The text of the Vulgate in Ezekiel viii. 14, says, that this prophet saw women sitting in the temple, and weeping for Adonis: but according to the reading of the Hebrew text, they are said to weep for Thammuz, or the hidden one. Among the Egyptians, Adonis was adored under the name of Osiris the husband of Isis. But he was sometimes called by the name of Ammuz, or Thammuz, the concealed, to denote probably his death or burial. The Hebrews, in derision, call him sometimes the dead, Psal. cxi. 28. and Lev. xix. 28. because they wept for him, and represented him as one dead in his coffin; and at other times, they call him the image of jealousy, Ezek. viii. 3, 5. because he was the object of the god Mars’s jealousy. The Syrians, Phenicians, and Cyprians, called him Adonis; and F. Calmet is of opinion, that the Ammonites and Moabites gave him the name of Baal-peor. See Baal-peor.

ADONIS, Adonis, in Ancient Geography, a river of Phoenicia, rising on Mount Lebanon, and falling into the sea, after a north-west course, at Byblus; famous in fable, as a beautiful shepherd youth (Virgil); son of Cynaras, king of the Cyprians, loved by Venus, slain by a boar, and turned into a river. Theocritus laments him dead in an idyllion, or rather ode, as did the women yearly, when in flood time, the river rolled down a red earth, which tinged its waters, deemed to be his wound bleeding afresh. In the Phenician language Adan signifies a willow, and Adon lord, with the same radical letters. Hence, ίαθος Adon, Saligus, and Κυρίς or Κυρῆς Adonis for Κυρίως. Adonis horti, are gardens beautifully arranged, but more adapted for pleasure than profit.

Adonis, Bird’s eye, or Pheasant’s eye, in Botany. See Botany Index.

ADONISTS, a sect or party among divines and critics, who maintain, that the Hebrew points ordinarily annexed to the consounds of the word Jehovah, are not the natural points belonging to that word, nor express the true pronunciation of it; but are the vowel points, belonging to the words Adonia and Elohim, applied to the consounds of the ineffable name Jehovah, to warn the readers, that instead of the word Jehovah, which the Jews were forbidden to pronounce, and the true pronunciation of which had been long unknown to them, they are always to read Adonai. They are opposed to Jehovists: of whom the principal are Drusius, Capillus, Buxtorf, Alting, and Reland, who has published a collection of their writings on this subject.

ADOPTIANI, in church history, a sect of ancient heretics, followers of Felix of Urgel, and Eiphon of Toledo, who, towards the end of the eighth century, advanced the notion, that Jesus Christ, in his human nature, is the Son of God, not by nature, but by adoption.

ADOPTION, an act by which any one takes another into his family, owns him for his son, and appoints him for his heir.

The custom of adoption was very common among the ancient Greeks and Romans; yet it was not practised, but for certain causes expressed in the laws, and with certain formalities usual in such cases. It was a sort of imitation of nature, intended for the comfort of those who had no children: wherefore he that was to adopt was to have no children of his own, and to be past the age of getting any; nor were eunuchs allowed to adopt, as being under an actual impotency of begetting children; neither was it lawful for a young man to adopt an elder, because that would have been contrary to the order of nature; nay, it was even required that the person who adopted should be eighteen years older than his adopted son, that there might at least appear a probability of his being the natural father.

Among the Greeks it was called μητροπή, filiation. It was allowed to such as had no issue of their own; excepting those who were not ἱπποκράτεις, their own masters, i.e. slaves, women, madmen, infants, or persons under twenty years of age; who being incapable of making wills, or managing their own estates, were not allowed to adopt heirs to them. Forereigners being incapable of inheriting at Athens, if such were adopted, it was necessary first to make them free of the city. The ceremony of adoption being over, the adopted had his name enrolled in the tribe and ward of his new father; for which entry a peculiar time was allotted, viz. the festival Πασχαλία. To prevent rash and inconsiderate adoptions, the Lacedemonians had a law, that adoptions should be transected, or at least confirmed, in the presence of their kings. The children adopted were invested with all the privileges, and obliged to perform all the duties, of natural children; and being thus provided for in another family, ceased to have any claim of inheritance, or kindred, in the family which they had left, unless they first renounced their adoption; which, by the laws of Solon, they were not allowed to do, unless they had first begotten children, to bear the name of the person who had adopted them: thus providing against the ruin of families, which would otherwise have been extinguished by the desertion of those who had been adopted to preserve them. If the children adopted happened to die without children, the inheritance could not be alienated from the family into which they had been adopted, but returned to the relations of the subject who should seem, that by the Athenian law, a person, after having adopted another, was not allowed to marry without permission from the magistrate: in effect, there are instances of persons, who being ill used by their adoptive children, petitioned for such leave. However this be, it is certain some men married after they had adopted sons: in which case, if they begat legitimate children, their estates were equally shared between the begotten and adopted.

The Romans had two forms of adoption; one be-
ADOPTION [I50]

ADOPTION. Fore the prætor; the other at an assembly of the people, in the times of the commonwealth, and afterwards by a rescript of the emperor. In the former, the natural father addressed himself to the prætor, declaring that he emancipated his son, resigned all his authority over him, and consented he should be translated into the family of the adopter. The latter was practised, where the party to be adopted was already free; and this was called adrogation. The person adopted changed all his names; assuming the prename, name, and surname, of the persons who adopted him.

Besides the formalities prescribed by the Roman law, various other methods have taken place; which have given denominations to different species of adoption, among the Gothic nations, in different ages. As,

ADOPTION by arms, was when a prince made a present of arms to a person, in consideration of his merit and valour. Thus it was that the king of the Hueri was adopted by Theodoric; Athalaric by the emperor Justinian; and Covros, nephew of the king of Persia, by the emperor Justin. The obligation here laid on the adoptive son was, to protect and defend the father from injuries, affronts, &c. And hence, according to Selden, the ceremony of dubbing knights took its origin as well as name.

ADOPTION by baptism, is that spiritual affinity which is contracted by god-fathers and god-children in the ceremony of baptism. This kind of adoption was introduced into the Greek church, and came afterwards into use among the ancient Franks, as appears by the Capitularies of Charlemagne.

In reality, the god-father was so far considered as adoptive father, that his god-children were supposed to be entitled to a share in the inheritance of his estate.

ADOPTION by hair, was performed by cutting off the hair of a person, and giving it to the adoptive father. It was thus that Pope John VIII. adopted Bosom king of Arles; which, perhaps, is the only instance in history of adoption, in the order of the ecclesiastics; a law that professes to imitate nature, not daring to give children to those in whom it would be thought a crime to beget any.

ADOPTION by marriage, is the taking the children of a wife or husband, by a former marriage, into the condition of proper or natural children; and admitting them to inherit on the same footing with those of the present marriage. This is a practice peculiar to the Germans: among whom, it is more particularly known by the name of cinkindschaff; among their writers in Latin, by that of union prolation, or union of issues. But the more accurate writers observe, that this is no adoption. See ADFAELATION.

ADOPTION by testament, that performed by appointing a person heir by will, on condition of his assuming the name, arms, &c. of the adopter. Of which kind we meet with several instances in the Roman history.

Among the Turks, the ceremony of adoption is performed by obliging the person adopted to pass through the skirt of the adopter. Hence, among that people, to adopt is expressed by the phrase, to draw another through my skirt. It is said, that something like this has also been observed among the Hebrews; where the prophet Elijah adopted Elisha for his son and successor, and communicated to him the gift of prophecy, by letting fall his cloak or mantle on him. But adoption, properly so called, does not appear to have been practised among the ancient Jews: Moses says nothing of it in his laws; and Jacob's adoption of his two grandsons, Ephraim and Manasseh, is not so properly an adoption, as a kind of substitution, whereby those two sons of Joseph were allotted an equal portion in Israel with his own sons.

ADOPTION is also used, in Theology, for a federal act of God's free grace; whereby those who are regenerated by faith, are admitted into his household, and entitled to a share in the inheritance of the kingdom of heaven.

ADOPTION is sometimes also used, in speaking of the ancient clergy, who had a custom of taking a maid or widow into their houses, under the denomination of an adoptive or spiritual sister or niece.

ADOPTION is also used in speaking of the admission of persons into certain hospitals, particularly that of Lycon, the administrators whereof have all the power and rights of parents over the children admitted.

ADOPTION is also used for the reception of a new academy into the body of an old one.—Thus The French academy of Marseilles was adopted by that of Paris: on which account, we find a volume of speeches extant, made by several members of the academy of Marseilles, deputed to return thanks to that of Paris for the honour.

In a similar sense, adoption is also applied by the Greeks, to the admitting a monk, or brother, into a monastic community; sometimes called spiritual adoption.

ADOPTIVE, denotes a person or thing adopted by another. Adoptive children, among the Romans, were on the same footing with natural ones; and accordingly were either to be instituted heirs, or expressly disinherited, otherwise the testament was null. The emperor Adrian preferred adoptive children to natural ones; because we choose the former, but are obliged to take the latter at random.

M. Menage has published a book of eulogies, or verses addressed to him; which he calls Liber Adoptivus, an adoptive book; and adds it to his other works.—Heinsius, and Furstenburg of Munster, have likewise published adoptive books.

In ecclesiastical writers we find adoptive women, or sisters, (adoptive feminae or sorores), used for those handmaids of the ancient clergy, otherwise called sub-intruders.

ADOPTIVE GREEKS, are those which a person enjoys by the gift or concession of another, and to which he was not otherwise entitled. They stand contradistinguished from arms of alliance. We sometimes meet with adoptive heir, by way of opposition to natural heir; and adoptive gods, by way of contradistinction to domestic ones. The Romans, notwithstanding the number of their domestic, had their adoptive gods, taken chiefly from the Egyptians: such were Isis, Osiris, Anubis, Apis, Harpocrates, and Canopus.

ADORATION, the act of rendering divine honours; or of addressing a being, as supposing it a god. The word is compounded of ad, "to," and oris, "mouth;" and literally signifies to apply the hand
Adoration to the mouth; *Manum ad os admovere, q. d., *to kiss the hand;* this being, in the eastern countries, one of the great marks of respect and submission.—The Romans practised adoration at sacrifices, and other solemnities; in passing by temples, altars, groves, &c. at the sight of statues, images, or the like, whether of stone or wood, wherein any thing of divinity was supposed to reside. Usually there were images of the gods placed at the gates of cities, for those who went in or out, to pay their respects to.—The ceremony of adoration among the ancient Romans was thus: The devotee having his head covered, applied his right hand to his lips, the fore finger resting on his thumb, which was erect, and thus bowing his head, turned himself round from left to right. The kiss thus given was called *osculum labraturn;* for ordinarily they were afraid to touch the images of their gods themselves with their profane lips. Sometimes, however, they would kiss their feet, or even knees, it being held an incivility to touch their mouths; so that the affair passed at some distance. Saturn, however, and Hercules, were adored with the head bare; whence the worship of the last was called *institutionum peregrinum,* and *ritus Graecanus,* as departing from the customary Roman method, which was to sacrifice and adore with the face veiled, and the clothes drawn up to the ears, to prevent any interruption in the ceremony by the sight of unlucky objects.—The Jewish manner of adoration was by prostration, bowing, and kneeling.—The Christians adopted the Grecian rather than the Roman method, and adored always uncovered. The ordinary posture of the ancient Christians was kneeling, but on Sundays standing: and they had a peculiar regard to the east, to which point they ordinarily directed their prayers.

Adoration is more particularly used for the act of praying or preferring our requests or thanksgivings to Almighty God.

Adoration is also used for certain extraordinary civil honors or respects which resemble those paid to the Deity, yet are given to men.

The Persian manner of adoration, introduced by Cyrus, was by bending the knee, and falling on the face at the prince's feet, striking the earth with the forehead, and kissing the ground. This ceremony, which the Greeks called *necromantei,* Conan refused to perform to Artaxerxes, and Callisthenes to Alexander the Great, as deeming it impious and unlawful.

The adoration performed to the Roman and Grecian emperors consisted in bowing or kneeling at the prince's feet, lying hold of his purple robe, and presently withdrawing the hand and clapping it to the lips. Some attribute the origin of this practice to Constantius. It was only persons of some rank or dignity that were entitled to the honour. Bare kneeling before the emperor to deliver a petition, was also called adoration.

The practice of adoration may be said to be still subsisting in England, in the ceremony of kissing the king's or queen's hand, and in serving them at table, both being performed kneeling.

Adoration is more particularly used for kissing one's hand in presence of another, as a token of reverence. The Jews adored by kissing their hands and bowing down their heads; whence, in their language, *kissing* is properly used for adoration.

Adoration is also used among Roman writers for a high species of applause given to persons who had spoken or performed well in public. See *Acclimation*). We meet with adoration paid to orators, actors, musicians, &c. The method of expressing it was, by rising, putting both hands to their mouth, and then retaining them towards the person intended to be honoured.

Adoration is also used in the court of Rome, for the ceremony of kissing the pope's feet.—The introduction of adoration among the Romans is ascribed to the low flattery of Vitellius, who, upon the return of C. Caesar from Syria, would not approach him otherwise than with his head covered, turning himself round, and then falling on his face. Heliogabalus restored the practice, and Alexander Severus again prohibited it. Dioclesian redemed it; and it was, in some measure, continued under the succeeding princes, even after the establishment of Christianity, as Constantine, Constantius, &c. It is particularly said of Dioclesian, that he had gems fastened to his shoes, that divine honours might be more willingly paid him, by kissing his feet. The like usage was afterwards adopted by the popes, and is observed to this day. These prelates, finding a vehement disposition in the people to fall down before them and kiss their feet, procured crucifixes to be fastened on their slippers; by which stratagem, the adoration intended for the pope's person is supposed to be transferred to Christ. Divers acts of this adoration we find offered even by princes to the pope.

Adoration is also used for a method of electing a pope. The election of popes is performed two ways; by adoration and by scrutiny. In election by adoration, the cardinals rush hastily, as if agitated by some spirit, to the adoration of some one among them, to proclaim him pope. When the election is carried by scrutiny, they do not adore the new pope till he is placed on the altar.

Barbarous adoration is a term used, in the laws of King Canute, for that performed after the manner of the heathens who adored idols. The Romish church is charged with the adoration of saints, martyrs, images, crucifixes, relics, the virgin, and the host; all which by Protestants are generally aggravated into idolatry, on a supposition, that the honour thus paid to them is absolute and supreme, called by way of distinction *Latrinium,* which is due only to God. The Roman Catholics, on the contrary, explain them, as only a relative or subordinate worship, called *Dulia* and *Hyperdulia,* which terminates ultimately in God alone. But may not the same be said of the idol worship of the heathens? The Phoenicians adored the winds, on account of the terrible effects produced by them; the same was adopted by most of the other nations, Persians, Greeks, Romans, &c. The Persians chiefly paid their adorations to the sun and fire; some say also to rivers, the wind, &c. The motive of adoring the sun was the benefits they received from that glorious luminary, which of all creatures has doubtless the best pretensions to such homage.

Adorea, in Roman antiquity, a word used in different senses; sometimes for all manner of grain, sometimes for a kind of cakes made of fine flour, and offered in sacrifice; and finally for a dole or distribution of corn, as a reward for some service; whence by metonymy it is put for praise or rewards in general.

Adosulation,
ADOSCULATION, a term used by Dr. Grew, to imply a kind of impregnation, without intromission; and in this manner he supposes the impregnation of plants is effected by the falling of the farina succundans on the pistil.

ADOSSEE', in Heraldry, signifies two figures or bearings being placed back to back.

ADOUX, the name of a river of France, which rises in the mountains of Bigorre, in the department of the Upper Pyrenees, and running north by Tarbes through Gascony, afterwards turns east, and passing by Dax, falls into the bay of Biscay, below Bayonne.

ADOWA, the capital of Tigré in Abyssinia, is situated on the declivity of a hill on the west side of a small plain, which is surrounded on every side by mountains. The name, signifying pass or passage, is characteristic of its situation; for the only road from the Red sea to Gondar passes by Adowa. The town consists of 300 houses, is the residence of the governor, and has a manufactury of coarse cotton cloth which circulates in Abyssinia as the medium of exchange in place of money. N. Lat. 14. 7. E. Long. 38. 50.

ADOUX, TUBEROUS MOSCHATEL, HOLLOW-ROOT, or INGLORIOUS, in Botany. See Botany Index.

AD FONDUS OMNium, among physicians, an abbreviation in their prescriptions, signifying that the last-mentioned ingredient is to weigh as much as all the rest together.

Ad Quod Damnum, in the English Law, a writ directed to the sheriff, commanding him to inquire into the damage which may arise from granting certain privileges to a place, as a fair, a market, or the like.

ADRACHNE, in Botany, a species of the strawberry tree. See ARBUTUS, Botany Index.

ADRAMMELICH, one of the gods of the inhabitants of Sepharvaim, who were settled in the country of Samar, in the room of those Israelites who were carried beyond the Euphrates. The Sepharvaites made their children pass through the fire, in honour of this idol and another called Anamelech. It is supposed, that Adrammelich meant the sun, and Anamelech the moon: the first signifies the magnificent king; the second the gentle king.

ADRAMYTTIUM, in Ancient Geography, now Andramitis, a town of Mysia Major, at the foot of Mount Ida, an Athenian colony, with a harbour and dock near the Caicus. ADRAMYTTIUM, the epithet; as, ADRAMYTTIUM Sinus, a part of the Egean sea, on the coast of Mysia; ADRAMIETTUM Conventus, sessions or assizes, the eighth in order of the nine Conventus Juridici of the province of Asia.

ADRANA, a river of Germany (Polybius); now the Eder, rising on the borders of the country of Nassau, to the north-east of, and not far from Dillenburg, running through the landgraviate of Hesse, the county of Waldeck, by Fritzlar, and then again through the landgraviate, and, together with the Fulda, falling into the Weser, to the south of, and not far from Cassel.

ADRAMNUM, or HADRANUM, in Ancient Geography, now ADerno, which see.
winter, and was initiated in the mysteries of Eleusinian Ceres. He went from thence to Sicily, chiefly to view Mount Ætna, contemplate its phenomena, and enjoy the beautiful and extensive prospect afforded from its top. He returned to Rome the beginning of the year 129; and, according to some, he went again, the same year, to Africa; and, after his return from thence, to the east. He was in Egypt in the year 132, revisited Syria the year following, returned to Athens in 134, and to Rome in 135. The persecution against the Christians was very violent under his reign; but it was at length suspended, in consequence of the remonstrances of Quadratus bishop of Athens, and Aristides, two Christian philosophers, who presented the emperor with some books in favour of the Christian religion. He conquered the Jews: and, by way of insult, erected a temple to Jupiter on Calvary, and placed a statue of Adonis in the manger of Bethlehem; he caused also the images of swine to be engrafted on the gates of Jerusalem. At last he was seized with a dropsy, which vexed him to such a degree, that he became almost raving mad. A great number of physicians were sent for, and to the multitude of them he ascribed his death. He died at Baiae in the 63rd year of his age, having reigned 21 years. The Latin verses he addressed to his soul, which he composed a short time before his death, in a strain of tender levity, have been much criticised, and have been the subject of numerous translations and imitations.

Animula vagula, blandula,
Hospes, comitesque corporis,
Quae nunc abbis in loca
Fatisula, rigida, nudula,
Nec, ut soleas, dasis jocos 2

Ah! fleeting spirit! wandering fire,
That long hast warm’d my tender breast,
Must thou no more this frame inspire?
No more a pleasing cheerful guest?
Whither, whither art thou flying?
To what dark undiscover’d shore?
Thou seem’st at all trembling, shivering, dying,
And wit and humour are no more!

Some fragments of his Latin poetry are still extant, and there are Greek verses of his in the Anthology. He also wrote the history of his own life; to which, however, he did not choose to put his name; but that

---

(A) This work, though called by the Roman historians murus, which signifies a wall of stone, was only composed of earth covered with green turf. It was carried on from the Solway frith, a little west of the village of Burgh on the Sands, in as direct a line as possible, to the river Tyne on the east, at the place where the town of Newcastle now stands; so that it must have been above 60 English, and near 70 Roman miles in length. It consisted of four parts: 1. The principal agger, mound of earth or rampart, on the brink of the ditch. 2. The ditch on the north side of the rampart. 3. Another rampart on the south side of the principal one, about five paces distant from it. 4. A large rampart on the north side of the ditch.—This last was probably the military way to the line of forts on this work: it was so to those formerly built by Agricola: and if it did not serve the same purpose in this, there must have been no military way attending it. The south rampart might serve for an inner defence in case the enemy should beat them from any part of the principal rampart, or it might be designed to protect the soldiers from any sudden attack of the provincial Britons. For many ages, this work hath been in so ruinous a condition, that it is impossible to discover its original dimensions with certainty. From their appearance, it seems probable that the principal rampart was at least 10 or 12 feet high.
of Phlegon, one of his freed-men, a very learned person, was prefixed to it. He had great wit and a retentive memory, and he distinguished himself in the various branches of literature and science. In his natural disposition he was suspicious, envious, cruel, and lascivious. In his character there was a strange composition of virtues and vices. He was affable, courteous, and liberal; but he was capricious and unsteady in his attachments, and violent in his resentment. Thus he was distrusted by his friends, and dreaded by his enemies. Antoninus his successor obtained his apotheosis; and prevented the rescission of his acts, which the senate once intended.

ADRIAN I. Pope, ascended the papal throne, A.D. 772. He was the son of Theodore, a Roman nobleman, and possessed considerable talents for business. He maintained a steady attachment to Charlemagne, which provoked Desiderius, a king of the Lombards, to invade the state of Bavenna, and to threaten Rome itself. Charlemagne rewarded his attachment, by marching with a great army to his aid; and having gained memorable advantages, he despatched the pope at Rome, and expressed his piety, by the humiliating ceremony of kissing each of the steps, as he ascended to the church of St. Peter. The affairs of the church now claimed Adrian's particular attention: for Irene, who, in 780, assumed the regency at Constantinople, during the minority of her son Constantine, wishing to restore the worship of images, applied to Adrian for his concurrence. The pontiff readily acquiesced in her proposal for calling a council, and commissioned two legates to attend it. The first council, however, was dispersed by an insurrection of the citizens; but at the next meeting in the city of Nice, in 787, which was protected by a military force, a decree was passed for restoring the worship of images. Adrian approved the decree, but in the western church it was deemed heretical and dangerous. Charlemagne condemned the innovation, and the French and English clergy occurred in opposing it. A treatise, containing 120 heads of refutation, was circulated, as the work of Charlemagne, under the title of "The Caroline Books," in opposition to the decree of the council. This work was presented to the pope by the king's ambassador, and the pope wrote a letter to Charlemagne by way of reply. The king, and also the Calicican and English churches, retained their sentiments; and, in 794, a council was held at Frankfort on the Maine, consisting of about 300 western bishops, by which every kind of image-worship was condemned. Adrian did not live to see a termination of this contest; for after a pontificate of nearly twenty-four years, he died in 795. Adrian seems to have directed his chief attention to the embellishment of the churches, and the improvement of the city of Rome; and he was probably possessed by Charlemagne, out of the plunder of his conquests, with ample means for this purpose.

ADRIAN II. Pope, succeeded Nicholas I. A.D. 867. Having twice refused the dignity, he accepted it in the 76th year of his age, being the united choice of the clergy, nobility, and people. The contest for power between the Greek and Latin churches had been very violent some years before his accession to the papal chair.

Adrian, during this contest with the eastern patriarch, was extending his authority over the kings and princes of the west. He employed his whole interest to induce Charles the Bald, who had taken possession of the kingdom of Lorraine, and who had been crowned at Rheims by the archbishop Hincmar, to relinquish it in favour of the emperor; and he even sent legates to the king, after having attempted to engage Hincmar, the clergy, and the nobility, to desert him, ordering him to surrender to the emperor's right. The king was invincible; and the pope was obliged to give up the contest. He also further interfered in the concerns of princes, by taking Charles's rebellious son Carloman, and the younger Hincmar, bishop of Luon, under the protection of the Roman see. He proceeded in this business with such vigour, that he was under no peril of retiring without gaining his point. Death terminated his ambitious projects and his life of inquietude, A.D. 872, after a pontificate of five years.

ADRIAN IV. Pope, the only Englishman who ever had the honour of sitting in the papal chair. His name was Nicholas Brekepere; and he was born at Langley, near St. Alban's, in Hertfordshire. His father having left his family, and taken the habit of the monastery of St. Alban's, Nicholas was ordered to submit to the lowest offices in that house for daily support. After some time, he desired to take the habit in that monastery, but was rejected by the abbot Richard. Upon this he resolved to try his fortune in another community, and accordingly went to Paris; where, though in very poor circumstances, he applied himself to his studies with great assiduity, and made a wonderful proficiency. But having still a strong inclination to a religious life, he left Paris, and removed to Provence, where he became a regular clerk in the monastery of St. Rufus. He was not immediately allowed to take the habit; but passed some time, by way of trial, in recommending himself to the monks by a strict attention to all their commands. This behaviour, together with the beauty of his person, and prudent conversation, rendered him so acceptable to those religious, that after some time they entreated him to take the habit of the canonical order. Here he distinguished himself so much by his learning and strict observance of the monastic discipline, that upon the death of the abbot, he was chosen superior of that house; and we are told that he rebuilt the convent. Pope Eugenius III. being apprised of the great merit of Nicholas, and thinking he might be serviceable to the church on a higher station, created him cardinal-bishop of Albano in 1346. In 1348, his holiness sent him legate to Denmark and Norway; where, by his fervent preaching.
ing and diligent instructions, he converted those barbarous nations to the Christian faith, and erected Upsal into an archiepiscopal see. When he returned to Rome, he was received by the pope and cardinals with great marks of honour; and Pope Anastasius, who succeeded Eugenius, happening to die at this time, Nicholas was unanimously chosen to the holy see, in November 1154, and he took the name of Adrian. When the news of his promotion reached England, King Henry II. sent Robert abbot of St Alban's, and three bishops, to Rome, to congratulate him on his election; upon which occasion Adrian granted very considerable privileges to the monastery of St Alban's, particularly an exemption from all episcopal jurisdiction, excepting to the see of Rome. Adrian, in the beginning of his pontificate, boldly withstand the attempts of the Roman people to recover their ancient liberty under the consuls, and obliged those magistrates to abdicate their authority, and leave the government of the city to the pope. In 1155, he drove the heretic Arnaud of Bresse, and his followers, out of Rome. The same year he excommunicated William king of Sicily, who ravaged the territories of the church, and absolved that prince's subjects from their allegiance. About the same time, Frederick king of the Romans, having entered Italy with a powerful army, Adrian met him near Sutrium, and concluded a peace with him. At this interview, Frederick consented to hold the pope's stirrup whilst he mounted on horseback. After which, his holiness conducted that prince to Rome, and in St Peter's church placed the imperial crown on his head, to the great mortification of the Roman people, who assembled in a tumultuous manner, and killed several of the Imperialists. The next year a reconciliation was brought about between the pope and the Sicilian king, that prince taking an oath to do nothing farther to the prejudice of the church, and Adrian granting him the title of King of the Two Sicilies. He built and fortified several castles, and left the papal dominions in a more flourishing condition than he found them. But notwithstanding all his success, he was extremely sensible of the disquiétudes attending so high a station; and declared to his countryman John of Salisbury, that all the former hardships of his life were mere amusement to the misfortunes of the popedom; that he looked upon St Peter's chair to be the most uneasy seat in the world; and that his crown seemed to be clapped burning on his head. He died September 1. 1159, in the fourth year and tenth month of his pontificate; and was buried in St Peter's church, near the tomb of his predecessor Eugenius. There are extant several letters, and some homilies, written by Pope Adrian.

ADRIAN V. Pope, a Genoese, whose name was Otto boni Frisoni, succeeded Innocent V. A. D. 1276. He was by his uncle Innocent IV. created cardinal deacon of St Adrian, and in 1254 sent by him to England, to settle the disputes between Henry III. and his barons. He was employed again for the same purpose, by Clement III. when he issued a sentence of excommunication against the king's enemies. When he was congratulated on his accession to the papal chair, he said, "I wish you had found me a healthy cardinal, rather than a dying pope." After his election he went to Viterbo to meet the emperor Rodolphus, for the purpose of opposing the usurpation of Charles, king of the Two Sicilies; but died soon after his arrival, having enjoyed his dignity only thirty-eight days. He zealously encouraged the crusade to the Holy Land, and upon his election sent a large sum to Constantinople towards building galleys.

ADRIAN, cardinal priest, of the title of St Chrysogonus, was a native of Corneto in Tuscany. Innocent VIII. sent him nuncio into Scotland and into France; and after he had been clerk and treasurer of the apostolic chamber, Pope Alexander VI. whose secretary he had been, honoured him with the cardinal's hat. His life was a continued scene of odd alterations. He narrowly escaped death the day Alexander VI. poisoned himself by mistake. Afterward he drew upon himself the hatred of Julius II. so that he was obliged to go and hide himself in the mountains of Trent. Having been recalled by Leo X. he was so ungrateful, that he engaged in a conspiracy against him. The pope pardoned his fault; but not caring to trust this, made his escape, and it could never be known exactly what was become of him. He was one of the first who effectually reformed the Latin style. He studied Cicero with great success, and made many excellent observations on the propriety of the Latin tongue. The treatise he composed De Sermonem Latino, is a proof of this. He had begun a Latin translation of the Old Testament. He wrote De Vera Philosophia: This treatise was printed at Cologne, 1548.

ADRIAN VI. Pope, was born at Utrecht in 1459. His father was not able to maintain him at school, but he got a place at Louvain, in a college in which a certain number of scholars were maintained gratis. It is reported that he used to read in the night time by the light of the lamps in the churches or streets. He made a considerable progress in all the sciences; led an exemplary life; and there never was a man less intruding and forward than he was. He took his degree of doctor of divinity at Louvain; was soon after made canon of St Peter's, and professor of divinity at Utrecht, and then dean of St Peter's and vice-chancellor of the university. He was obliged to leave an academical life, to be tutor to the archduke Charles. This young prince made no great progress under him: however, never was a tutor more considerably rewarded; for it was by Charles V.'s credit he was raised to the papal throne. Leo X. had given him the cardinal's hat in 1517. After this pope's death, several cabals in the conclave ended in the election of Adrian, with which the people of Rome were very much displeased. He would not change his name, and in every thing he showed a great dislike for all ostentation and sensual pleasures, though such an aversion had been long ago out of date. He was very partial to Charles V. and did not enjoy much tranquillity under the triple crown. He lamented much the wicked morals of the clergy, and wished to establish a reformation of manners among them. He died September 14. 1523.

ADRIANI, JOANNI BATTISTA, was born of a patrician family of Florence in 1511. He wrote a History of his own Times in Italian; which is a continuation of Guicciardini, beginning at the year 1536; to which Thuanus acknowledges himself greatly indebted: besides which, he composed six funeral ora-
ADRIANISTS, in ecclesiastical history, a sect of heretics divided into two branches, the first were disciples of Simon Magus, and flourished about the year 34. Theodoret is the only person who has preserved their name and memory; but he gives us no account of their origin. Probably this sect, and the six others which sprung from the Simonians, took their name from the particular disciples of Simon. The second were the followers of Adrian Hamstead the anabaptist; and held some particular errors concerning Christ.

ADRIANOPELE, a city of Turkey in Europe, in the province of Romania, and the see of an archbishop under the patriarch of Constantinople. It is about seven or eight miles in circumference, including the old city and some gardens. The houses are low, mostly built of mud and clay, and some of brick; and the streets are exceedingly dirty. The walls and towers are in a great measure fallen to decay. However, there is a beautiful bazar, or market, half a mile long, called Ali Basha. It is a vast arched building, with six gates, and 365 well furnished shops, kept by Turks, Armenians, and Jews, who pay five crowns a-month for each shop. The number of inhabitants of all nations and religions may be about 100,000; but it is dear living here, because the provisions are brought from distant places. The air is wholesome, and the country very pleasant in the summer time, on account of the river and streams that run near and about the city; the chief of which is the Mariza. These promote and preserve the verdure of the gardens, meadows, and fields, for a considerable part of the year. In the winter there is plenty of game. Near the principal bazar there is another, about a mile in length, covered with boards, with holes on each side to let in the light. It is full of good shops, which contain all kinds of commodities. Sultan Selim’s mosque stands on the side of a hill, in the midst of the city; and hence this magnificent structure may be seen on all sides. Everything made of gold and silver, jewels, pistols, scissors, &c. are sold in another part of the city, called by travellers the bissestein, though it differs little from a bazar. This contains about 200 shops, and is covered like the former: but the covering is supported by two rows of large pillars. The grand vizier’s palace is nothing more than a convenient house, after the Turkish manner of building. The emperor’s seraglio is a regular structure, in a plain near the river Tungia. It is two miles in compass, and has seven gates, besides those of the gardens, which are several miles in circumference. The city is governed by a mullah cadi, who has an absolute authority both in civil and criminal matters. In the time of the plague, or war, the grand signor sometimes resides here. The Turks took this city from the Greeks in 1362, and made it the capital of empire, till Mahomet II. took Constantinople in 1453. E. Long. 26. 27. N. Lat. 41. 41.

ADRIANUM (or ADRIATICUM) MARE, in Ancien Geography, now the gulf of Venice, a large bay in the Mediterranean, between Dalmatia, Scyavonia, Greece, and Italy. It is called by the Greeks ADRIATICA. ADR

ADRIA by the Romans, (as Arbiter ADRI

ADRIANUS, Note, Hor.) Cicero calls it Hadrianae Mare; Virgil has Hadriaticas Undas. It is commonly called More ADRIATICUM without an aspiration; but whether it ought to have one, is a dispute: if the appellation is from Hadria, the town of the Piceni, it must be written Hadriaticum, because the emperor’s name, who thence derives his origin, is on coins and stones Hadriana; but if from the town in the territory of Venice, as the more ancient, and of which that of the Piceni is a colony, this will justify the common appellation ADRIATICUM.

ADROGATION, in Roman antiquities, a species of adoption, whereby a person who was capable of choosing for himself was admitted by another into the relation of a son. The word is compounded of ad, “to,” and rogare, “to ask;” on account of a question put in the ceremony of it, Whether the adopter would take such a person for his son? and another to the adoptive, Whether he consented to become such a person’s son?

ABSIDELLA, in antiquity, the table at which the flamens sat during the sacrifices.

ADSTRICITION, among physicians, a term used to denote the rigidity of any part.

ADUACA, or ATUACA, anciently a large and famous city of the Tungri; now a small and inconsiderable village, called Tongeren, in the bishopric of Liege, to the north-west of the city of Liege, in the territory of Haspengow, on the rivulet Jeker, that soon after falls into the Maese. E. Long. 5. 52. N. Lat. 50. 54.

ADVANCE, in the mercantile style, denotes money paid before goods are delivered, work done, or business performed.

ADVANCED, in a general sense, denotes something posted or situated before another. Thus, Advanced Ditch, in Fortification, is that which surrounds the glacis or esplanade of a place.

Advanced Guard, or Vanguard, in the art of war, the first line or division of an army, ranged or marching in order of battle; or, it is that part which is next the enemy, and marches first towards them.

Advanced Guard, is more particularly used for a small party of horse stationed before the main guard.

ADVANCER, among sportmen, one of the starts or branches of a buck’s attire, between the back antler and the palm.

ADUAR, in the Arabian and Moorish customs, a kind of ambulatory village, consisting of tents, which these people remove from one place to another, as suits their convenience.

ADVENT, in the calendar, properly signifies the approach of the feast of the nativity. It includes four Sundays, which begins on St Andrew’s day or on the Sunday before or after it. During advent, and to the end of the octaves of epiphany, the solemnizing of marriage is forbidden without a special license. It is appointed to employ the thoughts of Christians on the first advent or coming of Christ in the flesh, and his second advent or coming to judge the world. The primitive Christians practised great austerity during this season.

AD VENTREM INSPICIENDUM, in Law, a writ by which a woman is to be searched whether she be with child.
ADVENTURE, in a general sense, some extraordinary or accidental event. It also denotes a hazardous or difficult undertaking.

Bill of Adventure, among merchants, a writing signed by a merchant, testifying the goods mentioned in it to be shipped on board a certain vessel belonging to another person, who is to run all hazards; the merchant only obliging himself to account to him for the produce.

Adventure Bay, in Van Diemen's land. "There is a beautiful sandy beach, about two miles long, at the bottom of Adventure bay, formed to all appearance by the particles which the sea washes from a fine white sandstone. This beach is very well adapted for hauling a seine. Behind it is a plain, with a broadish lake, out of which we caught, by angling, some eels and trout. The parts adjoining the bay are mostly hilly, and are an entire forest of tall trees, rendered almost impassable by a beech of fern, shrubs, &c. The soil on the flat land, and on the lower part of the hills, is sandy, or consists of a yellowish earth, and in some parts of a reddish clay; but further up the hills, it is of a gray tough cast. This country, upon the whole, bears many marks of being very dry, and the heat appears to be great. No mineral bodies, nor stones of any other kind than the white sandstone, were observed by us; nor could we find any vegetables that afforded subsistence for man. The forest trees are all of one kind, and generally quite straight: they bear clusters of small white flowers. The principal plants observed, are wood-sorrel, milkwort, cudweed, bell-flower, gladiolus, samphire, and several kinds of fern; the only quadruped, a species of opossum, about twice the size of a large rat. The kangaroo, found further northward in New Holland, may also be supposed to inhabit here; as some of the inhabitants had pieces of the skin of that animal.

"The principal sorts of birds in the woods are brown hawks or eagles, crows, large pigeons, yellowish parakeets, and a species which they called motacilla cyanop, from the beautiful azure colour of its head and neck. On the shore were several gulls, black oyster-catchers, or sea pies, and plovers of a stone colour.

"The inhabitants seemed mild and cheerful, with little of that wild appearance that savages in general have. They are almost totally devoid of personal activity or genius, and are nearly upon a par with the wretched natives of Terra del Fuego. They display, however, some contrivance in their methods of cutting their arms and bodies in lines of different directions, raised above the surface of the skin. Their indifferently for presents, their general inattention and want of curiosity, were very remarkable, and testified no acuteness of understanding. Their complexion is a dull black, which they sometimes heighten by smutting their bodies, as was supposed, from their leaving a mark behind on any clean substance. Their hair is perfectly woolly, and is cleft with grease and red ochre, like that of the Hottentots. Their noses are broad and full, and the lower part of the face projects considerably. Their eyes are of a moderate size; and though they are not very quick or piercing, they give the countenance a frank, cheerful, and pleasing cast.

Their teeth are not very white, nor well set, and their mouths are too wide: they wear their beards long, and clothed with paint. They are, upon the whole, well proportioned, though their belly is rather protruberant. Their favourite attitude is to stand with one side forward, and one hand grasping, across the back, the opposite arm, which on this occasion hangs down by the side that projects."

Cook's Voyages.

ADVENTURER, in a general sense, denotes one who hazards something.

ADVENTURERS, is particularly used for an ancient company of merchants and traders, erected for the discovery of lands, territories, trades, &c. unknown. The society of adventurers had its rise in Burgundy, and its first establishment from John duke of Brabant in 1248, being known by the name of The brotherhood of St Thomas à Becket. It was afterwards translated into England, and successively confirmed by Edward III and IV. Richard III. Henry IV. V. VI. and VII. who gave it the appellation of Merchant Adventurers.

ADVERB, in Grammar, a particle joined to a verb, adjective, or participle, to explain their manner of acting or suffering; or to mark some circumstance or quality signified by them. The word is formed from the preposition ad, "to," and verbum, "a verb;" and signifies literally a word joined to a verb, to show how, when, or where, one is, does, or suffers; as, the boy paints neatly, writes ill; the house stands there, &c. See Grammar.

ADVERSARIA, among the ancients, a book of accounts, not unlike our journals, or day-books. It is more particularly used for a kind of common-place book. See Common-place Book.

ADVERSATIVE, in Grammar, a word expressing some difference between what goes before and what follows it. Thus, in the phrase, he is an honest man, but a great enthusiast, the word but is an adversative conjunction.

ADVERSATOR, in antiquity, a servant who attended the rich in returning from supper, to give them notice of any obstacles in the way, at which they might be apt to stumble.

ADVERTISEMENT, in a general sense, denotes any information given to persons interested in an affair; and is more particularly used for a brief account of an affair inserted in the public papers, for the information of all concerned.

ADULA, in Ancient Geography, a mountain in Rhaetia, or the country of the Orisons, part of the Alps, in which are the fountains of the Rhine: now St Gothsard.

ADULE, or ADULUS, in Ancient Geography, a town of Egypt built by fugitive slaves, distant from its port on the Red sea 20 stadia. Pliny calls the inhabitants Aduliti. The epithet is either Adulites; as, Monumentum Adulitanum, on the pompous inscription of the statue of Ptolemy Euergetes, published by Leo Alatius, at Rome in 1631, and to be found in Spon and Thevenot: or Adulicius; or Adulicus: or Adulicus Sinus, a part of the Red sea.

ADULT, an appellation given to anything that is arrived at maturity: Thus we say an adult person, an adult plant, &c. Among civilians, it denotes a youth between 14 and 25 years of age.
ADULTERER, a man who commits adultery.

ADULTRESS, a woman guilty of ADULTERY.

ADULTERINE, a man who commits adultery; a woman who is married, and, without being married with another; or being married, with another man; or being unmarried, with a man that is married. According to the latter, she is not an adulteress, if she be not herself in the married state, though she converses with a man that is. The crime, in this case, was more properly called *stuprum than adulterium.* Hence, among the Romans the word adulterinum, "adulteress," differed from pellex, which denoted a single woman who cohabited with a married man; and pellex differed from concubina, which signified her who had only intercourse with an unmarried man. The former was reputed infamous, and the other innocent.

ADULTERATION, the act of debasing, by an improper mixture, something that was pure and genuine. The word is Latin, formed from the verb adulterare, "to corrupt," by mingling something foreign to any substance. We have laws against the adulteration of coffee, tea, tobacco, snuff, wine, beer, brandy, wax, hairpowder, &c.

ADULTERATION of coin, properly imports the making or casting of a wrong metal, or with too base or too much alloy.

Adulterations of coins are effected divers ways: as, by forging another stamp or inscription; by mixing impure metals with the gold or silver; most properly, by making use of a wrong metal, or an undue alloy, or too great an admixture of the baser metals with gold or silver. Counterfeiting the stamp, or clipping and lessening the weight, do not so properly come under the denomination of adulterating. Evelyn gives rules and methods both of adulterating and detecting adulterated metals, &c.—Adulterating is somewhat less extensive than debasing, which includes diminishing, clipping, &c.

To adulterate or debase the current coin, is a capital crime in all nations. The ancients punished it with great severity: among the Egyptians both hands were cut off: and by the civil law, the offender was thrown to wild beasts. The emperor Tiberius enacted, that counterfeiting the coin should be capital; and under Constantine it was made treason, as it is also among us. The adulterating of gems is a curious art, and the methods of detecting it no less useful. Nichols Lapid. p. 18.

ADULTERINE, in the Civil Law, is particularly applied to a child issued from an adulterous amour or commerce. Adulterine children are more odious than the illegitimate offspring of single persons. The Roman law even refuses them the title of natural children; as if nature disowned them. Adulterine children are not easily disposed of for admission to orders. Those are not deemed adulterines, who are begetten of a woman openly married, through ignorance of a former wife being alive. By a decree of the parliament of Adulterine, Paris, adulterine children are declared not legitimated. ADULTERY, by the subsequent marriage of the parties, even though a papal dispensation be had for such marriage, wherein is a clause of legitimation.

ADULTERINE Marriages, in St Augustine's sense, denote second marriages, contracted after a divorce. ADULTERY, an unlawful commerce between one married person and another, or between a married and unmarried person.

Punishments have been annexed to adultery in most ages and nations, though of different degrees of severity. In many it has been capital: in others venial, and attended only with slight pecuniary multas. Some of the penalties are serious, and even cruel; others of a jocose and humorous kind. Even contrary things have been enacted as punishments for adultery. By some laws, the criminals are forbidden marrying together, in case they became single; by others, they are forbidden to marry any besides each other; by some, they are incapacitated from ever committing the like crime again; by others, they are glutted with it till it becomes downright nauseous.

Among the rich Greeks, adulterers were allowed to redeem themselves by a pecuniary fine; the woman's father, in such cases, returned the dowry he had received from her husband, which some think was refunded by the adulterer. Another punishment among those people, was putting out the eyes of adulterers.

The Athenians had an extraordinary way of punishing adulterers, called *μακρογένες συνμετέχεις,* practiced at least on the poorer sort who were not able to pay the fines. This was an awkward sort of empalement, performed by thrusting one of the largest radishes up the anus of the adulterer, or, if defect thereof, a fish with a large head, called *mugil,* "mullet." Alcæus is said to have died this way, though it is doubted whether the punishment was reputed mortal. Juvenal and Catullus speak of this custom as received also among the Romans, though not authorized by an express law as it was among the Greeks.

There are various conjectures concerning the ancient punishment of adultery among the Romans. Some will have it to have been made capital by a law of Romulus, and again by the twelve tables. Others, that it was first made capital by Augustus; and others, not before the emperor Constantine. The truth is, the punishment in the early days was very various, much being left to the discretion of the husband and parents of the adulterous wife, who exercised it differently, rather with the silence and countenance of the magistrate than any formal authority from him. Thus we are told, the wife's father was allowed to kill both parties, when caught in the fact, provided he did it immediately, killed both together, and as it were with one blow. The same power ordinarily was not indulged the husband, except the crime were committed with some mean or infamous person; though, in other cases, if his rage carried him to put them to death, he was not punished as a murderer. On many occasions, however, revenge was not carried so far; but mutilating, castrating, cutting off the ears, noses, &c. served the turn. The punishment allotted by the lex Victor, was not, as many have imagined, death; but rather banishment, or deportation, being interdicted fire and water; though...
Octavius appears, in several instances, to have gone beyond his own law, and to have put adulterers to death. Under Macrinus, many were burnt at a stake. Constantine first by law made the crime capital. Under Constantius and Conants, adulterers were burnt, or sewed in sacks and thrown into the sea. Under Leo and Marcian, the penalty was abated to perpetual banishment, or cutting off the nose. Under Justinian, a farther mitigation was granted, at least in favour of the wife, who was only to be scourged, lose her dowry, and be shut up in a monastery; after two years, the husband was at liberty to take her back again; if he refused, she was shaven, and made a nun for life: But it still remained death in the husband. The reason alleged for this difference is, that the woman is the weaker vessel. Theodora declaims against the empress Theodora, who is supposed to have been the cause of this law, as well as of others procured in favour of that sex from the emperor.

Under Theodosius, women convicted of this crime were punished after a very singular manner, viz. by a public constipation; being locked up in a narrow cell, and forced to admit to their embraces all the men that would offer themselves. To this end, the gallants were to dress themselves on purpose, having several little belts fastened to their clothes, the tinkling of which gave notice to those without of every motion. This custom was again abolished by the same prince.

By the Jewish law, adultery was punished by death in both parties, where they were both married, or only the woman. The Jews had a particular method of trying, or rather purging, an adulteress, or a woman suspected of the crime, by making her drink the bitter waters of jealousy; which, if she were guilty, made her swell.

Amongst the Mingrelians, according to Chardin, adultery is punished with the forfeit of a hog, which is usually eaten in good friendship between the gallant, the adulterer, and the cuckold. In some parts of the Indies, it is said any man's wife is permitted to prostitute herself to him who will give an elephant for the use of her; and it is reputed no small glory to her to have been rated so high. Adultery is said to be so frequent in Ceylon, that not a woman but practices it, notwithstanding its being punishable with death. Among the Japanese, and divers other nations, adultery is only penal in the woman. Among the Aisyrians, the crime of the husband is said to be only punishable on the innocent wife. In the Marian islands, on the contrary, the woman is not punishable for adultery; but if the man go astray he pays severely: the wife and her relations waste his lands, turn him out of his house, &c. Among the Chinese, there is reason to conclude that adultery is not capital; for it is said that fond parents will make a contract with their daughters future husbands to allow them the indulgence of a gallant.

In Spain, they punished adultery in men by cutting off that part which had been the instrument of the crime. In Poland, before Christianity was established, they punished adultery and fornication in a very particular manner: the criminal they carried to the market-place and there fastened him by the testicles with a nail; laying a razor within his reach, and leaving him under a necessity, either of doing justice upon himself, or of perishing in that condition.

The Saxons formerly burnt the adulteress, and over her ashes erected a gibbet, whereas the adulterer was hanged. In this kingdom, likewise, adultery, by the ancient laws, was severely punished. King Edmund ordered adultery to be punished in the same manner as homicide; and Canute the Dane ordered that a man who committed adultery should be banished, and that the woman should have her nose and ears cut off. In the time of Henry I. it was punished with the loss of eyes and genitals.

In Britain, adultery is reckoned a spiritual offence, that is, cognizable by the spiritual courts, where it is punished by fine and penance. The common law takes no farther notice of it, than to allow the party grieved an action and damages. This practice is often cen- sured by foreigners, as making too light of a crime, the bad consequences of which, public as well as private, are so great. It has been answered, that perhaps this penalty, by civil action, is more wisely calculated to prevent the frequency of the offence, which ought to be the end of all laws, than a severer punishment. He that by a judgement of law is, according to circumstances, stripped of great part of his fortune, thrown into prison till he can pay it, or forced to fly his country, will, no doubt, in most cases, own that his pays dearly for his amusement.

As to the moral turpitude of this offence, some have vainly endeavoured to deny or explain it away by various arguments, and even by an appeal to Scripture. On the part of the man who solicits the chastity of a married woman, it certainly includes the crime of seduction, and is attended with mischief still more complicated and extensive: It creates a new sufferer, the injured husband, upon whose simplicity and affection is inflicted a wound the most painful and incurable that human nature knows. The infidelity of the woman is aggravated by cruelty to her children, who are generally involved in their parents shame, and always made unhappy by their quarrel.

It has been argued, that these consequences ought less to be attributed to the crime than to the discovery. But, in the first place, the crime could not be discovered unless it were committed, and the commission is never secure from discovery. Secondly, If adulterous connexions were allowable whenever the parties could hope to escape detection, which is the conclusion to which this argument leads, the husband would be left no other security for his wife's chastity, than in her want of opportunity or temptation; which would probably deter most men from marrying; or render marriage a state of continual jealousy and alarm to the husband, which would end in the slavery and confinement of the wife.

The marriage vow is "witnessed before God," and accompanied with circumstances of solemnity and religion which approach to the nature of an oath. The married offender, therefore, incurs a crime little short of perjury, and the seduction of a married woman is little less than subornation of perjury: — and this guilt is independent of the discovery.

At the usual apology for adultery is the prior transgression of the other party; and so far indeed as the bad effects of adultery are anticipated by the conduct of the husband or wife who offends first, the guilt of the second offender is extenuated. But this can never amount
ADULTERY

Adultery amounts to a justification; unless it could be shown that the obligation of the marriage vow depends upon the condition of reciprocal fidelity; a construction which appears founded on no text in expediency, nor in the terms of the vow, nor in the design of the legislator which prescribed the marriage rite. The way of considering the offence upon the footing of provocation and retaliation, is a childish trifling with words.

"Thou shalt not commit adultery," was an interdict delivered by God himself; yet Scripture has been adduced as giving countenance to the crime. As Christ told the woman taken in adultery, "Neither do I condemn thee," we must believe, it is said, that he deemed her conduct either not criminal, or at least not a crime of the heinous nature we represent it to be. But from a more attentive examination of the case, it will be evident that nothing can be concluded from it favourable to such an opinion. The transaction is thus related: "Early in the morning Jesus came again into the temple, and all the people came unto him; and he sat down and taught them. And the scribes and Pharisees brought unto him a woman taken in adultery, when they had set her in the midst, saying unto him, Master, this woman was taken in adultery. In the law, Moses commanded us that such should be stoned: but what sayest thou? This they said, tempting him, that they might have to accuse him. But Jesus stooped down, and with his finger wrote on the ground, as though he would have been answered. But when they continued asking him, he lifted up himself, and said unto them, He that is without sin among you, let him first cast a stone at her; and again he stooped down and wrote on the ground: and they which heard it, being convicted of their own conscience, went out one by one. And Jesus was left alone, and the woman standing in the midst. When Jesus had lifted up himself, and saw none but the woman, he said unto her, Woman, where are those thine accusers? Hath no man condemned thee? She said, No man, Lord: and Jesus said unto her, Neither do I condemn thee; go and sin no more."

"This they said, tempting him, that they might have to accuse him; that is, to draw him into an exercise of judicial authority, that they might have to accuse him before the Roman governor of usurping or intermeddling with the civil government.

"This was their design; and Christ's behaviour throughout the whole affair proceeded from a knowledge of this design, and a determination to defeat it. He gives them at first a cold and sullen reception, well suited to the insidious intention with which they came: he stooped down, and with his finger wrote on the ground as though he heard them not. When they continued asking him, when they teased him to speak, he dismissed them with a rebye, which the importunate malice of their errand, as well as the secret character of many of them, desired: 'he that is without sin (that is, this sin) among you, let him first cast a stone at her.' This had its effect. Stung with the reproach, and disappointed of their aim, they stole away one by one, and left Jesus and the woman alone. And then follows the conversation, which is the part of the narrative most material to our present subject. 'Jesus saith unto her, Woman, where are those thine accusers? Hath no man condemned thee?' She said, No man, Lord. And Jesus said unto her, 'Neither do I condemn thee; go and sin no more.' Now, when Christ asked the woman, 'Hath no man condemned thee?' he certainly spoke, and was understood by the woman to speak, of a legal and judicial condemnation; otherwise her answer, 'No man, Lord,' was not true. In every other sense of condemnation, as blame, censure, reproof, private judgment, and the like, many had condemned her; all those, indeed, who brought her to Jesus. If then a judicial sentence was what Christ meant by condemning in the question, the common use of language requires us to suppose that he meant the same in his reply 'Neither do I condemn thee.' i.e. I pretend to no judicial character or authority over thee; it is no office or business of mine to pronounce or execute the sentence of the law. When Christ adds, 'Go and sin no more,' he in effect tells her that she had sinned already; but as to the degree or quality of the sin, or Christ's opinion concerning it, nothing is declared, or can be inferred, either way."

It has been controverted, whether adultery may be lawfully committed in war, with the enemies wives? The answer is in the negative, and the authorized practice of civilized nations is agreeable to this. It has also been a famous question, whether it be lawful for a woman to commit adultery with the consent of her husband, and for the procuring some good to him? St Austin apparently allows of it; at least does not condemn it.

De Sermon. Dom. in Deut. vii. 1. It has likewise been a dispute, whether it be lawful for one of the parties married to commit adultery with the consent of the other, for the sake of having children? Of which we have instances in Abraham, who had four children. On this account, conversed with Hagar; and likewise lib. xvi. among the Greeks and Romans. Tolman, a German professor, has a dissertation on the husband's right to alienate his wife's body to another's use.

It is much disputed, whether adultery dissolves the bond of matrimony, and is a sufficient cause of divorce, so that the parties may marry again. This was allowed in the ancient church, and is still continued in the Greek, as well as the Lutheran and Calvinist churches. Romanists, however, disallow of it, and the council of Trent even anathematized those who maintain it; though the canon of anathematization was mitigated in deference to the republic of Venice, in some of whose dominions, as Zant, Cephalonia, &c. the contrary usage obtains. The ecclesiastical courts in England so far agree with the Papists, that they only grant a divorce à mensas et thoro, in case of adultery; so that a complete divorce to enable the parties to marry again, cannot be had without an act of parliament.

ADULTERY is also used in ancient customs, for the punishment or fine imposed for that offence, or the privilege of prosecuting for it. In which sense adulterium amounts to the same with what the Saxons call legevutia.

ADULTERY is sometimes used in a more extensive sense, for any species of impurity or crime against the virtue of chastity; and in this sense divines understand the seventh commandment.

ADULTERY
Consistorial Advocates; officers of the consistory at Advocate.

Rome who plead in all oppositions to the disposal of benefits in that court: they are ten in number.

Collective Advocates, those chosen by the abbot, bishop, or chapter; a particular license being had from the king or prince for that purpose. The elections were originally made in the presence of the count of the province.

Feudal Advocates. These were of the military kind, who, to make them more zealous for the interest of the church, had lands granted them in fee, which they held of the church, and did homage, and took an oath of fidelity to the bishop or abbot. These were to lead the vassals of the church to war, not only in private quarrels of the church itself, but in military expeditions for the king’s service, in which they were the standard-bearers of their churches.

Fiscal Advocate, fisci advocatus, in Roman antiquity, an officer of state under the Roman emperors, who pleaded in all causes wherein the fiscus, or private treasury, was concerned.

Juridical Advocates, in the middle age, were those who from attending causes in the court of the comtes, or count of the province, became judges themselves, and held courts of their vassals thrice a year, under the name of the tria plétia generalis. In consideration of this further service, they had a particular allowance of one-third part of all fines, or mules, imposed on defaulters, &c. besides a proportion of diet for themselves and servants.

Matricular Advocates, were the advocates of the mother or cathedral churches.

Military Advocates, those appointed for the defence of the church, rather by arms and authority than by pleading and eloquence. These were introduced in the times of confusion, when every person was obliged to maintain his own property by force; bishops and abbots not being permitted to bear arms, and the scholastic or gown advocate being equally unacquainted with them, recourse was had to knights, noblemen, soldiers, or even to princes.

Nominative Advocates, those appointed by a king or pope. Sometimes the churches petitioned kings, &c. to appoint them an advocate: at other times this was done of their own accord. By some regulations, no person was capable of being elected advocate, unless he had an estate in land in the same county.

Regular Advocates, those duly formed and qualified for their profession, by a proper course of study, the requisite oath, subscription, license, &c.

Subordinate Advocates, those appointed by other superior ones, acting under them, and accountable to them. There are various reasons for the creation of these subordinate advocates; as, the superior quality of the principal advocate, his being detained in war, or being involved in other affairs; but chiefly the too great distance of some of the church lands, and their lying in the dominions of foreign princes.

Supreme Sovereign Advocates, were those who had the authority in chief; but acted by deputies or subordinate advocates. These were called also principal, greater, and sometimes general advocates. Such in many cases were kings, &c. when either they had been chosen advocates, or became such by being founders or endowers of churches. Princes had also
ADVOCATES, in the English courts, are more generally called counsel. See COUNSEL.

Faculty of ADVOCATES, in Scotland, a respectable body of lawyers, who plead in all causes before the courts of session, justiciary, and exchequer. They are also entitled to plead in the house of peers, and other supreme courts in England.

In the year 1660, the faculty founded a library upon a very extensive plan, suggested by that learned and eminent lawyer Sir George Mackenzie of Rosehaugh, advocate to King Charles II. and King James VII. who enriched it with many valuable books. It has been daily increasing since that time, and now contains not only the best collection of law books in Europe, but a very large and select collection of books in all subjects. Besides, this library contains a great number of original manuscripts, and a vast variety of Jewish, Grecian, Roman, Scots, and English coins and medals.

A candidate for the office of an advocate undergoes three several trials: The first is in Latin, upon the civil law and Greek and Roman antiquities; the second, in English, upon the municipal law of Scotland; and, in the third, he is obliged to defend a Latin thesis, which is impugned by three members of the faculty. Immediately before putting on the gown, the candidate makes a short Latin speech to the lords, and then takes the oaths to the government and de fide.

The faculty at present consists of above 200 members. As an advocate or lawyer is esteemed the gentle profession in Scotland, many gentlemen of fortune take the degree of advocate, without having any intention of practising at the bar. This circumstance greatly increases their number, gives dignity to the profession, and enriches their library and public fund. It is from this respectable body that all vacancies on the bench are generally supplied.

Lord ADVOCATE, or King's ADVOCATE, one of the eight great officers of state in Scotland, who sat in parliament without election. He is the principal crown lawyer in Scotland. His business is to act as a public prosecutor, and to plead in all causes that concern the crown; but particularly in such as are of a criminal nature. The office of king's advocate is not very ancient: it seems to have been established about the beginning of the 16th century. Originally he had no power to prosecute crimes without the concurrence of a private party; but, in the year 1597, he was empowered to prosecute crimes at his own instance. He has the privilege of pleading in court with his hat on. This privilege was first granted to Sir Thomas Hope; who having three sons lords of session, it was thought indecent that the father should plead uncovered before the sons, who as judges sat covered.

BILL OF ADVOCATION, in Scots Law, a writing drawn up in the form of a petition; whereby a party, in an action before an inferior court, applies to the supreme court, or court of session, for calling the action from the inferior court before itself.

Letters of ADVOCATION, in Scots Law, the decree or warrant of the court of session upon cognizance of the facts set forth in the bill, drawn up in the form of a summons, and passing under the signet, discharging the inferior judge and all others from further procedure in the cause, and advocating it to itself.

ADVOWEE, in ancient customs and law books, denotes the advocate of a church, religious house, or the like. There were advowees of cathedrals, abbeys, monasteries, &c. Thus, Harlequin and the title of advowee of St Peter's; King Hugh, of St Riquier; and Boulton mentions some letters of Pope Nicholas, by which he constituted King Edward the Confessor, and his successors, advowees of the monastery at Westminster, and of all the churches in England. These advowees were the guardians, protectors, and administrators of the temporal concerns of the churches, &c. and under their authority were passed all contracts which related to them. It appears also, from the most ancient charters, that the donations made to churches were conferred on the persons of the advowees. They always pleaded the causes of the churches in court, and distributed justice for them, in the places under their jurisdiction. They also commanded the forces furnished by their monasteries, &c. for the war; and even were their champions, and sometimes maintained duels for them.

This office is said to have been first introduced in the fourth century, in the time of Stilicho; though the Benedictines do not fix its origin before the eighth century. By degrees, men of the first rank were brought into it, as it was found necessary either to defend with arms or to protect with power and authority. In some monasteries they were only called conservatores; but these, without the name, had all the functions of advowees. There were also sometimes several sub-advowees, or sub-advocates, in each monastery, who officiated instead of the advowees themselves; which, however, proved the ruin of monasteries; those inferior officers running into great abuses.

Hence also, husbands, tutors, and every person in general, who took upon him the defence of another, were denominated advowees, or advocates. Hence several cities had their advowees; which were established long after the ecclesiastical ones, and doubtless from their example. Thus we read in history of the advowees of Augsburg, of Arras, &c.

The vidamens assumed the quality of advowees; and hence it is, that several historians of the eighth century confound the two functions together. Hence also it is, that several secular lords in Germany bear mitres for their crests, as having anciently been advowees of the great churches.

Spelman distinguishes two kinds of ecclesiastical advowees.—The one, of causes or processes, advocati causarum; the other, of territory or lands, advocati soli.

The former were nominated by the king, and were usually lawyers, who undertook to plead the causes of the monasteries. The other, which still subsists, and are sometimes called by their primitive name, advowees, though more usually patrons, were hereditary; as being the founders and endowers of churches, &c. or their heirs.

Women were sometimes advowees, advocatissae. And, in effect, the canon law mentions some who had this title, and who had the same right of presentation, &c. in their churches which the advowees themselves had. In
ADU

AED

In a stat. 25 Edw. III. we meet with *advowee para-
mount* for the highest patron; that is, the king.

*ADVOSON*, or *ADVOWSEN*, in *Common Law*, signifies a right to present to a vacant benefice. *Ad-
voxon* is so called, because the right of presenting to
the church was first gained by such as were founders,
benefactors, or maintainers of the church.

Though the nomination of fit persons to officiate in
every diocese was originally in the bishop, yet they
were content to let the founders of churches have the
nomination of the persons to the churches so founded,
reserving to themselves a right to judge of the fitness
of the persons nominated.

*Advowsions* formerly were most of them appendant
to manors, and the patrons were parochial barons:
the lordship of the manor and patronage of the church
were seldom in different hands, until *advowsions* were
given to religious houses. But of late times the lord-
ship of the manor and *advowson* of the church have
been divided.

*Advowsions are presentative, collative, or donative:
*presentative*, where the patron presents or offers his
clerk to the bishop of the diocese, to be instituted in
his church; *collative*, where the benefice is given by
the bishop, as original patron thereof, or by means of a
right he has acquired by lapse; *donative*, as where the
king or other patron does, by a single donation in writ-
ing, put the clerk into possession, without presentation,
institution, or induction.

Sometimes, anciently, the patron had the sole nomi-
nation of the prelate, abbot, or prior; either by inves-
titure (*i.e.* delivery of a pastoral staff), or by direct
presentation to the diocesan; and if a free election was
left to the religious, yet a *conge d’elire*, or license of
election, was first to be obtained of the patron, and the
person elected was confirmed by him. If the founder’s
family became extinct, the patronage of the convent
went to the lord of the manor. Unless the several col-
leges in the universities be restrained in the number of
*advowsions* they may receive, it is argued they will in
time acquire such a stock as to frustrate the design of
their foundation (which is the education of youth), by
creating too quick a succession of fellows; so that
there will not be in the colleges a sufficient number of
persons of competent age, knowledge, and experience,
to instruct and form the minds of the youth. In some
colleges the number of *advowsions* is said to be already
two-thirds, or more, of the number of fellows.
It is objected, on the other side, that the succession of
fellows may be too slow as well as too quick; whereby
persons well qualified may be detained so long in col-
leges as not to have strength or activity enough left for
the discharge of parochial functions.

Colleges holding more *advowsions* in number than a
moiety of the fellows, are not capable of purchasing
more. Grants of *advowsions* by Papists are void.
9 Geo. II. c. 36. § 5. 11 Geo. II. c. 17. § 5.

*Advowsions* are temporal inheritances and lay fees;
they may be granted by deed or will, and are assets in
the hands of heirs or executors. Presentations to *ad-
voxon* for money, or other reward, are void. 1 Eliz.
cap. 6.

In Scotland, this right is called *patronage*. See *Pa-
tronage*.

*ADUST*, *ADUSTUS*, among physicians, &c. is ap-
p lied to such humours as by long heat become of a hot
and fiery nature. Such is choler supposed to be. Me-
lanchohy is usually considered as black and adust bile.
Blood is said to be adust, when, by reason of some ex-
traordinary heat, its more subtle parts are all evaporat-
ed, leaving the grosser, with all the impurities therein,
half torrified.

*ADY*, in *Natural History*, a name given to the palm
of the island of St Thomas. It is a tall tree with a
thick, bare, upright stem, growing single on its root,
of a thin light timber, and full of juice. The head of
this tree shoots into a vast number of branches, which
being cut off, or an incision being made therein, afford
a great quantity of sweet juice, which fermenting sup-
plies the place of wine among the Indians. The fruit
of this tree is called by the Portuguese *carvoces* and
*corisco*; and by the black natives, *abanga*. This
fruit is of the size and shape of a lemon; and contains
a kernel, which is good to eat. The fruit itself is eaten
roasted, and the raw kernels are often mixed with man-
dioc meal. These kernels are supposed very cordial.
An oil is also prepared from this fruit, which answers
the purpose of oil or butter. This oil is also used for
anointing stiff and contracted parts of the body.

*ADYNA*, in *Medicine*, of a privative, and
*diminuere* strength, want of power, debility, or weakness,
from sickness.

*ADYNALAE*, the second class of Dr Cullen’s no-
sological arrangement, which includes those diseases in
which the involuntary motions, whether vital or natural,
are diminished.

*ADYNAMON*, among ancient physicians, a kind of
weak factitious wine, prepared from must boiled
down with water; to be given to patients to whom
genuine wine might be hurtful.

*ADYTUM*, in *Pagan antiquity*, the most retired
and sacred place of temples, into which none but the
priests were allowed to enter. The *Sanctum Sanct-
orum* of the temple of Solomon was of the nature of
the pagan *ady tum*, none but the high priest being
admitted into it, and he but once a-year.

*ADZE*, or *ADDS*, a cutting tool of the axe kind;
having its blade made thin and arching, and its edge
at right angles to the handle; chiefly used for taking
off thin chips of timber or boards, and for paring away
certain irregularities which the axe cannot come at.
The adze is used by carpenters, but more by coopers,
as being convenient for cutting the hollow sides of
boards, &c. It is ground from a base on its inside
to its outer edge; so that, when it is blunt, they cannot
conveniently grind it without taking its helve out of the
eye.

*AE*, or *Æ*, a diphthong compounded of *A* and *E*.
Authors *æ* by no means agreed as to the use of the
*æ* in English words. Some, out of regard to etymo-
logy, insist on its being retained in all words, particu-
larly technical ones, borrowed from the Greek and
Latin; while others, from a consideration that it is no
proper diphthong in our language, its sound being no
other than that of the simple *e* contend that it ought
to be entirely disused; and, in fact, the simple *e* has
of late been adopted instead of the Roman *æ*, as in the
word *equator*, &c.

*ÆCEA*, in *Grecian antiquity*, solemn festivals and
games celebrated at *Ægina*, in honour of *Æacus*.

*Æacus*, the son of Jupiter by *Ægina*. When
the
the isle of Ægina was depopulated by a plague, his father, in compassion to his grief, changed all the ants upon it into men and women, who were called Myrmidones, from μυρμήνης, an ant. The foundation of the temple is said to be that, when the country had been depopulated by pirates, who forced the few that remained to take shelter in caves, Æacus encouraged them to come out, and by commerce and industry recover what they had lost. His character for justice was such, that, in a time of universal drought, he was summoned by the Delphic oracle to intercede for Greece, and his prayer was answered. See the article ÆGINA. The Pagans also imagined that Æacus, on account of his impartial justice, was chosen by Pluto one of the three judges of the dead; and that it was his province to judge the Europeans.

Æ budæ, a name anciently given to the Western islands of Scotland.

Æ Bu r a , in Ancient Geography, a town of Spain, in Extremadura, on the river Guadiana, to the west of Merida; now called Talavera. W. Long. 7. 15. N. Lat. 38. 40.

Æchmalotarcha, in Jewish antiquity, a title given to the principal leader or governor of the Hebrew captives residing in Chaldea, Assyria, and the neighbouring countries. This magistrate was called by the Jews, rosh-galath, i.e. the chief of the captivity: but the above term, of like import in the Greek, is that used by Origen and others who wrote in the Greek tongue.

The Jewish writers assure us, that the achmalotarchae were only to be chosen out of the tribe of Judah. The eastern Jews had their princes of the captivity, as the western Jews their patriarchs. The Jews are still said to have an achmalotarcha at Babylon, but without the authority of the ancient ones. (Busnagie Hist. Jews, and Prudence's Connection).

Æcidium, in Botany. See Botany Index.

Æclusanum, in Ancient Geography, a town of the Hirpini in Italy, at the foot of the Apenines, to the east of Abellinum, contracted Eclanum, situated between Beneventum and Tarantum. The inhabitants are called Eculani by Pliny; and Eclanenses, in an ancient inscription (Gruter). The town is now called Fricceto, (Cluverius), 43 miles east of Naples. E. Long. 15. 38. N. Lat. 41. 15.

Ædes, in Roman antiquity, besides its more ordinary significance of a house, likewise signified an inferior kind of temple, consecrated to some deity.

Ædicula, a term used to denote the inner part of the temple, where the altar and statue of the deity stood.

Æditate, the office of ædile, sometimes called ædilitia. See the next article.

Ædile (aeedilis), in Roman antiquity, a magistrate whose chief business was to superintend buildings of all kinds, both public and especially public ones, as temples, aqueducts, bridges, &c. To the ædiles likewise belonged the care of the highways, public places, weights and measures, &c. They also fixed the prices of provisions, took cognizance of debauches, punished lewd women, and such persons as frequented gaming houses. The custody of the plebeians, or orders of the people, was likewise committed to them. They had the inspection of comedies and other pieces of wit; and were obliged to exhibit magnificent games to the people, at their own expense, whereby many of them were ruined. To them also belonged the custody of the plebeians, and the censure and examination of books. They had the power, on certain occasions, of issuing edicts; and, by degrees, they procured to themselves a considerable jurisdiction, the cognizance of various causes, &c. This office ruined numbers by its expensiveness; so that, in Augustus's time, even many senators declined it on that account.

All these functions which rendered the ædiles so considerable belonged at first to the ædiles of the people, ædiles plebei, or minores: these were only two in number, and were first created in the same year as the tribunes; for the tribunes, finding themselves oppressed with the multiplicity of affairs, demanded of the senate to have officers, to whom they might intrust matters of less importance; and accordingly two ædiles were created; and hence it was that the ædiles were elected every year at the same assembly as the tribunes. But these plebeian ædiles having refused, on a signal occasion, to treat the people with shows, as pleading themselves unable to support the expense thereof, the patricians made an offer to do it, provided they would admit them to the honours of the ædilitate. On this occasion there were two new ædiles created, of the number of the patricians, in the year of Rome 388; they were called ædiles curules, or majores; as having a right to sit on a curule chair, enriched with ivory, when they gave audience; whereas the plebeian ædiles only sat on benches. Besides that the curule ædiles shared all the ordinary functions with the plebeian, their chief employ was, to procure the celebration of the grand Roman games, and to exhibit comedies, shows of gladiators, &c. to the people; and they were also appointed judges in all cases relating to the selling or exchanging estates.

To ease these four first ædiles, Caesar created a new kind, called ædiles ceraeales, as being deputed chiefly to take care of the corn, which was called domum Ceres; for the Heathens honoured Ceres as the goddess who presided over corn, and attributed to her the invention of agriculture. These ædiles ceraeales were also taken out of the order of patricians. In the municipal cities there were ædiles, and with the same authority as at Rome.

We also read of an ædilis alimentarius, expressed in abbreviation by Ædil. ol. im. whose business seems to have been to provide diet for those who were maintained at the public charge, though others assign him a different office. In an ancient inscription we also meet with ædile of the camp, ædilis castrorum.

Æditium Edictum, among the Romans, was that whereby a remedy was given to a buyer in case a vicious or unsound beast, or slave, was sold to him. It was called ædilitium, because the preventing of frauds in sales and contracts belonged especially to the curule ædiles.

Æditus, in Roman antiquity, an officer belonging to the temple, who had the charge of the offerings, treasure, and sacred utensils. The female deities had a female officer of this kind called Æditia.

Ægagropila, a ball composed of hair, generated in the stomach of the chamniis goat, which is similar to those found in cows, hogs, &c. There is another
AEGEAN sea, in Ancient Geography, now the Archipelago, a part of the Mediterranean, separating Europe from Asia; washing, on the one hand, Greece and Macedonia; on the other, Caria and Ionia. The origin of the name is greatly disputed. Festus advances three opinions: one, that it is so called from the many islands therein, at a distance appearing like so many goats: another, because Aegea queen of the Amazons perished in it: a third opinion is, because Aegeas, the father of Theseus, threw himself headlong into it.

AEGEUS, in fabulous history, was king of Athens, and the father of Theseus. The Athenians having basely killed the son of Minos king of Crete, for carrying away the prize from them, Minos made war upon the Athenians; and being victorious, imposed this severe condition on Aegaeus, that he should annually send into Crete seven of the noblest of the Athenian youths, chosen by lot, to be devoured by the Minotaur. On the fourth year of this tribute, the choice fell on Theseus; or, as others say, he himself entreated to be sent. The king, at his son's departure, gave orders, that as the ship sailed with black sails, it should return with the same in case he perished; but, if he became victorious, he should change them into white. When Theseus returned to Crete, after killing the Minotaur, and forgot to change the sails in token of his victory, according to the agreement with his father; the latter, who watched the return of the vessel, supposing by the black sails that his son was dead, cast himself headlong into the sea, which afterwards obtained the name of the Aegaeon sea. The Athenians decreed Aegaeus divine honours; and sacrificed to him as a marine deity, the adopted son of Neptune.

AEGIAS, among physicians, a white speck on the pupil of the eye, which occasions a diminution of sight.

AEGIDA, (Pliny;) now Capo d'Istria, the principal town on the north of the territory of Istri, situated in a little island, joined to the land by a bridge. In an inscription, (Gruter,) it is called Egidis Inula. E. Long. 14° 20'. N. Lat. 45° 50'. It was afterwards called Justinopolis, after the emperor Justinus.

AEGILOPS, the name of a tumour in the great angle of the eye; either with, or without, an inflammation. The word is compounded of aeg, goat, and aye, eye; as goats are supposed extremely liable to this distemper.

Authors frequently use the words aegilops, anchilops, and fistula lacrymalis, promiscuously; but the more accurate, after Egineta, make a difference. The tumour, before it becomes ulcerous, is properly called anchilops; and, after it is got into the lacrimal passages, and has rendered the os lacrymale carious, fistula lacrymalis.

If the aegilops be accompanied with an inflammation, it is supposed to take its rise from the abundance of blood which a plethoric habit discharges on the corner of the eye. If it be without an inflammation, it is supposed to proceed from a viscus pituitous humour, thrown upon this part.

The method of cure is the same as that of the opthalmia. But before it has reached the lacrimal passages, it is managed like other ulcers. If the aegilops be neglected, it bursts, and degenerates into a fistula, which eats into the bone.

AEGILOPS, in Botany. See Botany Index.

AEGIMURUS, in Ancient Geography, an island in the bay of Carthage, about 30 miles distant from that city, (Livy;) now the Goulet: This island being afterwards sunk in the sea, two of its rocks remained above water, which were called Arce, and mentioned by Virgil, because the Romans and Carthaginians entered into an agreement or league to limit their respective boundaries by these rocks.

AEGINA, in fabulous history, the daughter of Aegus, king of Boeotia, was beloved by Jupiter, who debauched her in the similitude of a lambent flame, and then carried her from Epidaurus to a desert island called Oenone, which afterwards obtained her own name.

AEGINA, in Ancient Geography, an island in the Saronic bay, or bay of Engia, 20 miles distant from the Pireus, formerly yeying with Athens for naval power, and at the sea-fight of Salamis disputing the palm of victory with the Athenians. It was the country and kingdom of Aeacus, who called it Aegina from his mother's name, it being before called Oenopia, (Ovid.) The inhabitants were called Eginetani, and Eginenses. The Greeks had a common temple dedicated to Jupiter and Aegina. The Eginetans applied to commerce; and were the first who coined money called Noemum Aegumus; hence Egineticae as, formerly in great repute. The inhabitants were called Myrmidones, or a nation of ants, from their great application to agriculture. See AEACUS.

The island was surrounded by Attica, the territory of Megara, and the Peloponnesus, each distant about 100 stadia, or 12 miles and a half. In circumference it was reckoned 180 stadia, or 22 miles and a half. It lies in the Sinus Saronicus, called also from this island the Gulf of Eginia.

It is now called Aegina or Agina, the g soft and the i short. The temple above mentioned is situated upon the summit of a mountain called Panhellenium, at some distance from the shore. The Eginetans affirmed it was erected by AEACUS; in whose time Greece being terribly oppressed by drought, the Delphic oracle was consulted; and the response was, That Jupiter must be rendered propitious by AEACUS. The cities entreated him to be their mediator: He sacrificed and prayed to Jupiter Panhellenius, and procured rain.

The temple was of the Doric order, and had six columns in front. Twenty-one of the exterior columns are yet standing, with two in the front of the pronaos and of the posticum, and five of the number which formed the ranges of the cell. The entablature, except the
the architrave, is fallen. The stone is of a light brownish colour, much eaten in many places, and indicating a very great age. Some of the columns have been injured by boring to their centres for the metal. In several, the junction of the parts is so exact, that each seems to consist of one piece. This ruin Mr Chandler considers as scarcely to be paralleled in its claim to a remote antiquity. The situation on a lonely mountain, at a distance from the sea, has preserved it from total demolition, amid all the changes and accidents of numerous centuries.

Near the shore is a barrow, raised, it is related, for Phocus upon the following occasion. Telamon and Peleus, sons of Eacus, challenged their half brother Phocus to contend in the Pentathlon. In throwing the stone, which served as a quoit, Peleus hit Phocus, who was killed; when both of them fell. Afterwards Telamon sent a herald to assert his innocence. Eacus would not suffer him to land, or to apologize, except from the vessel; or, if he chose rather, from a heap cast up in the water. Telamon, entering the private port by night, raised a barrow, as a token, it is likely, of a pious regard for the deceased. He was afterwards condemned, as not free from guilt; and sailed away again to Salamis. The barrow in the second century, when seen by Pausanias, was surrounded with a fence, and had on it a rough stone. The terror of some dreadful judgment to be inflicted from heaven had preserved it entire and unaltered to his time; and in a country depopulated and neglected, it may still endure for many ages.

The soil of this island is, as described by Strabo, very stony, especially the bottoms, but in some places not unfertile in grain. Besides corn, it produces olives, grapes, and almonds; and abounds in pigeons and partridges. It has been related, that the Eginetians annually wage war with the feathered race, carefully collecting or breaking their eggs, to prevent their multiplying, and in consequence a yearly famine. They have no hares, foxes, or wolves. The rivers in summer are all dry. The waivode or governor farms the revenue of the Grand Signior for 12 purses, or 6000 piastres. About half this sum is repaid yearly by the car-ratch-money, or poll tax.

Aegina, the capital of the above island. Its site has long been forsaken. Instead of the temples mentioned by Pausanias, there are 13 lonely churches, all very mean; and two Doric columns supporting their architrave. These stand by the sea-side toward the low cape; and, it has been supposed, are a remnant of a temple of Venus, which was situated by the port principally frequented. The theatre, which is recorded as worth seeing, resembled that of the Epidaurians both in size and workmanship. It was not far from the private port; the stadium, which, like that at Priene, was constructed with only one side, being joined to it behind, and each structure mutually sustaining and propping the other. The walls belonging to the ports and arsenal were of excellent masonry, and may be traced to a considerable extent, above, or nearly even with the water. At the entrance of the mole, on the left, is a small chapel of St Nicholas; and opposite, a square tower with steps before it, detached from which a bridge was laid across, to be removed on any alarm. This structure, which is mean, was erected by the Venetians, while at war with the Turks in 1693.

Ægineta, Paulus, a celebrated surgeon of the island of Ægina, from whence he derived his name. According to Mr Le Clerc's calculation, he lived in the fourth century; but Abulpharagius the Arabian, who is allowed to give the best account of those times, places him with more probability in the seventh. His knowledge in surgery was very great, and his works are deservedly famous. Fabricius ab Aquapendente has thought fit to transcribe him in a great variety of places. Indeed the doctrine of Paulus Ægineta, together with that of Celsus and Albucasis, make up the whole text of this author. He is the first writer who takes notice of the cathartic quality of rhubarb; and, according to Dr Milward, is the first in all antiquity who deserves the title of man-midwife.

Æginhard, the celebrated secretary and supposed son-in-law of Charlemagne. He is said to have been carried through the snow on the shoulders of the affectionate and ingenious Imma, to prevent his being tracked from her apartments by the emperor her father: a story which the elegant pen of Addison has copied and embellished from an old German Chronicle, and inserted in the 3d volume of the Spectator.—This happy lover (supposing the story to be true) seems to have possessed a heart not onworthy of so enchanting a mistress, and to have returned her affection with the most faithful attachment; for there is a letter of Æginhard's still extant, lamenting the death of his wife, which is written in the tenderest strain of connubial affliction; it does, not, however, express that this lady was the affecitionate princess; and indeed some late critics have proved that Imma was not the daughter of Charlemagne.—But to return to our historian: He was a native of Germany, and educated by the munificence of his imperial master, of which he has left the most grateful testimony in his preface to the life of that monarch. Æginhard, after the loss of his lamented wife, is supposed to have passed the remainder of his days in religious retirement, and to have died soon after the year 840. His life of Charlemagne, his annals from 741 to 889, and his letters, are all inserted in the 2d volume of Duchesne's Scriptores Francorum. There is an improved edition of this valuable historian, with the annotations of Hermann Schmincke, in 4to, 1711.

Ægipan, in Heathen Mythology, a denomination given to the god Pan, because he was represented with the horns, legs, feet, &c. of a goat.

Ægiphila, Goat-friend, in Botany. See Botany Index.

Ægis, in the Ancient Mythology, a name given to the shield or buckler of Jupiter and Pallas. The goat Amalthea, which had suckled Jove, being dead, that god is said to have covered his buckler with the skin; whence the appellation ægis, from ægí, ægís, she-goat. Jupiter, afterwards restored the animal to life, covered it with a new skin, and placed it among the stars. He made a present of his buckler to Minerva: whence that goddess's buckler is also called ægis.

Minerva having killed the Gorgon Medusa, nailed her head in the middle of the ægis, which henceforth had
had the faculty of converting logs into stone all those who
looked upon it; as Medusa herself had done during her
life.

Others suppose the segis not to have been a buckler,
but a cuirass, or breastplate; and it is certain the se-
gis of Pallas, described by Virgil, “En. lib. vii. ver. 435,”
must have been a cuirass; since that poet says expres-
sively, that Medusa’s head was on the breast of the
goddess. But the segis of Jupiter, mentioned a little
higher, ver. 354, seems to have been a buckler: the
words

Cum sape migrantem
Ægida concertet dextra,

are descriptive of a buckler; but not at all of a cuirass
or breastplate.

Servius makes the same distinction on the two pas-
sages of Virgil; for on verse 354, he takes the segis
for the buckler of Jupiter, made, as above mentioned,
of the skin of the goat Amalthea; and on verse 435,
he describes the segis as the armour which covers the
breast, and which in speaking of men is called cui-
rass, and segis in speaking of the gods. Many authors
have overlooked these distinctions for want of going to
the sources.

ÆGISITHUS, in ancient history, was the son of
Thyestes by his own daughter Pelopia, who, to con-
ceal her shame, exposed him in the woods; some say
he was taken up by a shepherd, and suckled by a goat,
whence he was called Ægisithus. He seduced Clytem-
nestra the wife of Agamemnon, and lived with her
during the siege of Troy. Afterwards with her assistance
he slew her husband, and reigned seven years in My-
ene. He was, together with Clytemnestra, slain by
Orestes. Pompey used to call Julius Caesar Ægisithus,
on account of his having seduced his wife Matia, whom
he afterwards put away, though he had three children
by her.

ÆGITHALUS, in Ancient Geography, a pro-
monitory and citadel of Sicily, between Drepanum
and the Emporium Ægistanum; afterwards called Acel-
lus; corruptly written Ægitharos, in Ptolemy; situated
near Mount Erys, and now called Capo di Santo Teodo.

ÆGIUM, in Ancient Geography, a town of Achaeia
Propria, five miles from the place where Helice stood,
and famous for the council of the Acheans, which usu-
ally met there on account either of the dignity or com-
motions situation of the place. It was also famous for
the worship of Omophorion Zeus, Conventional Jupiter,
and of Panachaean Ceres. The territory of Ægium was
watered by two rivers, viz. the Phoenix and Megani-
tes. The epithet is Ægenaes. There is a coin in the
cabinet of the king of Prussia, with the inscription ÀTΓ, and
the figure of a tortoise, which is the symbol of Pe-
loponnesus, and leaves no doubt as to the place where
it was struck.

ÆGOBOLIUM, in antiquity, the sacrifice of a
goat offered to Cybele. The ægobolium was an ex-
piatory sacrifice, which bore a near resemblance to the
taurolium and criobolium, and seems to have been
sometimes joined with them.

ÆGOPODIUM, SMALL WILD ANGELICA, GOAT-
wort, Goatsfoot. See Botany Index.
again, and offered battle; retiring in the evening according to custom with more insulting airs than the days before. Lysander, as usual, detached some galleys to observe them, with orders to return with the utmost diligence when they saw the Athenians landed, and to put up a brazen buckler at each ship's head as soon as they reached the middle of the channel. He in the mean time ran through the whole line in his galley, exhorting the pilots and officers to hold the seamen and soldiers in readiness to row and fight on the first signal.

As soon as the bucklers were put up in the ships heads, and the admiral galley had given the signal by the sound of trumpet, the whole fleet set forward in good order. The land army at the same time made all possible haste to the top of the promontory to see the battle. The strait that separates the two continents in this place is about fifteen stadia, or three quarters of a league in breadth; which space was presently cleared through the activity and diligence of the rowers. Conon, the Athenian general was the first who perceived from shore, that fleet advance in good order to attack him; upon which he immediately cried out for the troops to embark. In the height of sorrow and trouble, some he called by their names, some he conjured, and others he forced to go on board their galleys; but all his endeavours and emotions were ineffectual, the soldiers being dispersed on all sides. For they were no sooner come on shore, than some ran to thebutlers, some to walk in the country, some to sleep in their tents, and others had begun to dress their suppers. This proceeded from the want of vigilance and experience in their generals, who, not suspecting the least danger, indulged themselves in taking their repose, and gave their soldiers the same liberty.

The enemy had already fallen on with loud cries and a great noise of their oars, when Conon, disengaging himself with nine galleys, of which number was the sacred ship called the Paralian, stood away for Cyprus, where he took refuge with Evagoras. The Peloponnesians, falling upon the rest of the fleet, took immediately the galleys which were empty, and disabled and destroyed such as began to fill with men. The soldiers, who ran without order or arms to their relief, were either killed in their endeavour to get on board, or flying on shore were cut to pieces by the enemy, who landed in pursuit of them. Lysander took 8000 prisoners, with all the generals, and the whole fleet. After having plundered the camp, and fastened the enemy's galleys to the stems of his own, he returned to Lampasacus amidst the sound of flutes and songs of triumph. It was his glory to have achieved one of the greatest military exploits recorded in history with little or no loss, and to have terminated a war in the small space of an hour, which had already lasted 27 years, and which perhaps, without him, had been of much longer continuance.

ÆGYPT. See EGYPT.

ÆGYPTIACUM, in Pharmacy, the name of several detergent ointments; as black, red, white, simple, and compound.

ÆGYPTILLA, in Natural History, the name of a stone described by the ancients, and said, by some authors, to have the remarkable quality of giving water the colour and taste of wine. This seems a very imaginary virtue, as are indeed too many of those in former ages attributed to stones. The descriptions left us of this remarkable fossil tell us, that it was variegated with, or composed of, veins of black and white, or black and bluish, with sometimes a plate or vein of whitish red. The authors of these accounts seem to have understood by this name the several stones of the onyx, sardonyx, and cameo kind; all which we have at present common among us, but none of which possesses any such strange properties.

ÆGYPTIUS, in fabulous history, was the son of Belus, and brother of Danaus. See BELIDES.

ÆINAUTÆE, in antiquity, navum, always mariners, a denomination given to the senators of Miletus, because they held their deliberations on board a ship, and never returned to land till matters had been agreed on.

ÆLFRIC, an eminent ecclesiastic of the 10th century, was the son of an earl of Kent, and a monk of the Benedictine order in the monastery of Abingdon. In 963, he was settled in the cathedral of Winchester, under Athelwold the bishop, and undertook the instruction of the youth of the diocese, for which purpose he compiled a Latin Saxon vocabulary, and some Latin colloquies. He also translated from the Latin into Saxon many of the historical books of the Old Testament. While he resided at Winchester he drew up Canons, which are a kind of charge to be delivered by the bishops to their clergy. He was afterwards abbot of St Alban's, bishop of Wilton, and, finally, in 994, translated to the see of Canterbury. Here he had a hard struggle for some years in bravely defending his diocese against the incursions of the Danes. He died in 1005, and was buried at Abingdon; but his remains were removed to Canterbury in the reign of Canute. Ælfric is held up as one of the most distinguished prelates of the Saxon church. His learning, for the times, was considerable, his morals were pure, and his religious sentiments were untainted with many of the corruptions of the age in which he lived. Besides the works already mentioned, he translated two volumes of Homilies from the Latin Fathers.

ÆLFRIC, surnamed Ætu, pupil of the former, was promoted to the archbishopric of York in 1033, and died in 1051.

ÆLFRIC, an abbot of Malmesbury in 974, was created bishop of Crediton in 974, and died in 981.

ÆLIA Capitolina, a name given to the city built by the emperor Adrian, A.D. 134, near the spot where the ancient Jerusalem stood, which he found in ruins when he visited the eastern parts of the Roman empire. A Roman colony was settled here, and a temple, in place of that of Jerusalem, was dedicated to Jupiter Capitolinus. Hence the name is derived, to which he prefixed that of his own family.

ÆLIAN, Claudius, born at Prænesta in Italy. He taught rhetoric at Rome, according to Perizouius, under the emperor Alexander Severus. He was surnamed Mæthypetus, Honey-mouth, on account of the sweetness of his style in his discourses and writings. To this excellence the poet alludes:

Q jocunda, Covine, solitudo, Carruad magis, essendique gratum, Facunli muti munus Æliani. MARTIAL.
AEN

He was likewise honoured with the title of Sophist, an appellation in his days given only to men of learning and wisdom. He loved retirement, and devoted himself to study. He greatly admired and studied Plato, Aristotle, Isocrates, Plutarch, Homer, Anacreon, Archilochus, &c. and, though a Roman, gives the preference to the writers of the Greek nation. His two most celebrated works are, his Various History, and History of Animals. He composed likewise a book on Providence, mentioned by Eustathius; and another on Divine Appearances, or The Declarations of Providence. There have been several editions of his Various History.

ÆLIUS FONS, in Ancient Geography, one of the fortresses near the wall or rampart, or, in the words of the Notitia, through the line of the hither wall; built, as is thought, by Adrian: now named Portland, in Northumberland, between Newcastle and Morpeth. (Camden.)

ÆLIUS FONS, now il Ponte St Angelo, a stone bridge at Rome, over the Tiber, which leads to the Burgo and Vatican from the city, along Adrian’s mole, built by the emperor Adrian.

ÆLFRED. See Alfred.

ÆLURUS, in Egyptian Mythology, the deity or god of cats; represented sometimes like a cat, and sometimes like a man with a cat’s head. The Egyptians had so superstitious a regard for this animal, that the killing it, whether by accident or design, was punished with death; and Diodorus relates, that, in the time of extreme famine, they chose rather to eat one another that touch these sacred animals.

ÆM, the, or Aem, a liquid measure used in most parts of Germany; but different in different towns: the sem commonly contains 20 verists, or 80 masses; that of Heidelberg is equal to 48 masses; and that of Wurtemberg to 160 masses. See Aem.

ÆMILIIUS PAULUS, the son of Æmilius Paulus, who was killed at the battle of Cannae. He was twice consul. In his first consulate he triumphed over the Ligurians, and in the second subdued Persicus king of Macedon, and reduced that country to a Roman province, on which he obtained the surname of Macedonicus. He returned to Rome loaded with glory, and triumphed for three days. He died 168 years before Christ.

ÆMILIIUS, Paulus, a celebrated historian, born at Verona, who obtained such reputation in Italy, that he was invited into France by the cardinal of Bourbon, in the reign of Louis XII. in order to write the history of the kings of France in Latin, and was presented to a canonry in the cathedral of Paris. He was near 30 years in writing that history, which has been greatly admired, and died in Paris on the 5th of May 1529.

ÆMOBOLIUM, in antiquity, the blood of a bull or ram offered in the sacrifices, called taurobolia and ericobolio: in which sense the word occurs in ancient inscriptions.

ÆNARIA, in Ancient Geography, an island in the bay of Cumæ, or over-against Cumæ in Italy, (Pliny.) It is also called Inarina (Virgil); and now Ischia; scarce three miles distant from the coast, and the promontory Misenum to the west; 20 miles in compass; called Pithecusae by the Greeks. It is one of the Oenotrides, and fenced round by very high rocks, so as to

Æneas, in fabulous history, a famous Trojan prince, the son of Anchises and Venus. At the destruction of Troy, he bore his aged father on his back, and saved him from the Greeks; but being too solicitous about his son and household gods, lost his wife Creusa in the escape. Landing in Africa, he was kindly received by Queen Dido: but quitting her coast, he arrived in Italy, where he married Lavinia, the daughter of King Latinus, and defeated Turnus, to whom she had been contracted. After the death of his father-in-law, he was made king of the Latins, over whom he reigned three years: but joining with the Aborigines, he was slain in a battle again the Tuscans. Virgil has rendered the name of this prince immortal, by making him the hero of his poem. See ÆNEID.

Æneas Sylvius, Pope. See PIUS II.

ÆNEATORES, in antiquity, the musicians in an army, including those that played trumpets, horns, &c.

The word is formed from Æneus, on account of the brazen instruments used by them.

ÆNEID, the name of Virgil’s celebrated epic poem. Blair’s Lectures.

The subject of the Æneid, which is the establishment of Æneas in Italy, is extremely happy. Nothing could be more interesting to the Romans than to look back to their origin from so famous a hero. While the object was splendid itself, the traditionary history of his country opened interesting fields to the poet; and he could glance at all the future great exploits of the Romans, in its ancient and fabulous state.

As to the unity of action, it is perfectly well preserved in the Æneid. The aspect of Æneas, by the order of the gods, is constantly kept in view. The episodes are linked properly with the main subject. The nodus, or intrigue of the poem, is happily managed. The wrath of Juno, who opposes Æneas, gives rise to all his difficulties, and connects the human with the celestial operations throughout the whole poem.

One great imperfection of the Æneid, however, is, that there are almost no marked characters in it. Achates, Cephalus, Gog, and other Trojan heroes who accompanied Æneas into Italy, are insipid figures. Even Æneas himself is without interest. The character of Dido is the best supported in the whole Æneid.

The principal excellency of Virgil is tenderness. His soul was full of sensibility. He must have felt himself all the affecting circumstances in the scenes he describes; and he knew how to touch the heart by a single stroke. In an epic poem this merit is the next to sublimity. The second book of the Æneid is one of the greatest masterpieces that genius was executed. The death of old Priam, and the family-pieces of Æneas, Anchises, and Creusa, are as tender as can be conceived.

In the fourth book, the unhappy passion and death of Dido are admirable. The episodes of Pallas and Evander, of Nisus and Euryalus, of Lausus and Memnon, are all superlatively fine.

In his battles Virgil is far inferior to Homer. But in the important episode, the descent into hell, he has outdone Homer by many degrees. There is nothing in antiquity to equal the sixth book of the Æneid.

ÆNGINA, one of the islands of the Archipelago.
ENIGMA denotes any dark saying, wherein some unknown thing is concealed under obscure language. The word is Greek, ἔνιγμα, formed of ἀνῆγμα, obscure insinuate, to hint a thing darkly, and ὄνομα, an obscure speech or discourse. The popular name is riddle; from the Belge raeden, or the Saxon raethan, to interpret. F. Bouhours, in the memoirs of Trevoix, defines an enigma, a discourse or painting, including some hidden meaning, which is proposed to be guessed.

Painted Enigmas are representations of the works of nature or art, concealed under human figures, drawn from history or fable.

A verbal Enigma, is a witty, artful, and abstruse description of any thing. In a general sense, every dark saying, every difficult question, every parable, may pass for an enigma. Hence obscure laws are called Enigmata Juris. The alchemists are great dealers in the enigmatical language, their processes for the philosopher's stone being generally wrapped up in riddles: e.g. Fae ex mare et femina circulum, inde quadrangulum hine triangulum, fac circulum, et habebis lapidem philosophorum. F. Menestrier has attempted to reduce the composition and resolution of enigmas to a kind of art, with fixed rules and principles, which he calls the philosophy of enigmatical images.

The subject of an Enigma, or the thing to be concealed and made a mystery of, he justly observes, ought not to be such in itself; but, on the contrary, common, obvious, and easy to be conceived. It is to be taken, either from nature, as the heaven or stars; or from art, as painting, the compass, a mirror, or the like.

The form of Enigmas consists in the words, which, whether they be in prose or verse, contain either some description, a question, or a prosopopoeia. The last kind are the most pleasing, inasmuch as they give life and action to things which otherwise have them not. To make an enigma, therefore, two things are to be pitched on which bear some resemblance to each other, as the sun and a monarch; or a ship and a house; and on this resemblance is to be raised a superstructure of contrarieties to amuse and perplex. It is easier to find great subjects for enigmas in figures than in words, inasmuch as painting attracts the eyes and excites the attention to discover the sense. The subjects of enigmas in painting are to be taken either from history or fable: the composition here is a kind of metamorphosis, wherein, e.g. human figures are changed into trees, and rivers into metals. It is essential to enigmas, that the history or fable, under which they are presented, be known to every body: otherwise it will be two enigmas instead of one; the first of the history or fable, the second of the sense in which it is to be taken. Another essential rule of the enigma is, that it only admits of one sense. Every enigma which is susceptible of different interpretations, all equally natural, is so far imperfect. What gives a kind of erudition to an enigma, is the invention of figures in situations, gestures, colours, &c., authorised by passages of the poets, the customs of artists in statues, baso reliefos, inscriptions, and medals. In foreign colleges, the Explication of Enigmas makes a considerable exercise; and that one of the most difficult and amusing, where wit and penetration have the largest field. By explaining an enigma, and the finding a motto corresponding to the action and persons represented in a picture, taken either from history or mythology. The great art of this exercise consists in the choice of a motto, which either by itself, or the circumstances of time, place, person who speaks, or those before whom he is speaking, may divert the spectators, and furnish occasion for strokes of wit; also in showing to advantage the conformities between the figure and thing figured, giving ingenious turns to the reasons employed to support what is advanced, and in artfully introducing pieces of poetry to illustrate the subject and awaken the attention of the audience.

As to the solution of enigmas, it may be observed, that those expressed by figures are more difficult to explain than those consisting of words, by reason images may signify more things than words can; so that to fix them to a particular sense, we must apply every situation, symbol, &c. and without omitting a circumstance. As there are few persons in history, or mythology, but have some particular character of vice or virtue, we are, before all things, to attend to this character, in order to divine what the figure of a person represented in a painting signifies, and to find what agreement this may have with the subject whereof we would explain it. Thus, if Proteus be represented in a picture, it may be taken to denote inconstancy, and applied either to a physical or moral subject, whose character is to be changeable, e.g. an almanack, which expresses the weather, the seasons, heat, cold, storms, and the like. The colours of figures may also help to unriddle what they mean: white, for instance, is a mark of innocence, red of modesty, green of hope, black of sorrow, &c. When figures are accompanied with symbols, they are less precarious; these being, as it were, the soul of enigmas, and the key that opens the mystery of them. Of all the kinds of symbols which may be met with in those who have treated professedly on the subject, the only true enigmatical are those of Pythagoras, which, under dark proverbs, hold forth lessons of morality; as when he says Statuam ne transfiliis, to signify, Do no injustice.

But it must be added, that we meet with some enigmas in history, complicated to a degree which much transcends all rules, and has given great perplexity to the interpreters of them. Such is that celebrated ancient one, Elia Latia Crispis, about which many of the learned have puzzled their heads. There are two exemplars of it: one found 145 years ago, on a marble near Bologna: the other in an ancient MS. written in Gothic letters at Milan. It is controverted between the two cities, which is to be reputed the more authentic.

The Bononian Enigma.

D. M.

Elia Latia Crispis,
Inc vir, inc mulier,
Inc androgyna,
Inc pudica, inc juvenis,
Inc
Nona; on the Adriatic, by which it is for the greater part surrounded; over against the island GISIA, from which it is distant four miles to the west. E. Long. 16°. N. Lat. 28°.

ÆONUS, in Ancient Geography, now the ION, a river of Germany, which, rising in the country of the Grisons, out of the Alps, in the district called Gotteshaus-punt, runs through the Grisons, the county of Tyrol, the duchy of Bavaria, and through Passau into the Danube.

ÆONUS, ÆNOS, or ÆNUM, in Ancient Geography, a town of Thrace, situated on the eastmost mouth of the Hebrus, which has two mouths; and said to be built by the Cumeans. It was a free town, in which stood the tomb of Polydorus, (Pliny); ÆNUS is the epithet. Here the brother of Cato Uticensis died, and was honoured with a monument of marble in the forum of the Ænii, (Plutarch); called ÆNEI, (Stephanus). Livy says that the town was otherwise called Abythus. Now Eno.

ÆNITIOLOGIUS, in Poetry, a verse of two dactyls and three trochees; as Praelatio dira placent truci juveniae.

ÆOLLÆ INSULÆ, now Isoli Lipari, in Ancient Geography, seven islands, situated between Sicily and Italy; so called from Æolus, who reigned there about the time of the Trojan war. The Greeks call them HEPHAESTIADÆ and the Romans VULCANÆ, from their fiery eruptions. They are also called LIPARÆRUM INSULÆ, from their principal island Lipara. Dionysius Periegetes calls them ΠΑΛΙἈΡΑ, because circumnavigable.

ÆOLIC, in a general sense, denotes something belonging to Æolus.

ÆOLIC, or ÆOLIAN, in Grammar, denotes one of the five dialects of the Greek tongue. It was first used in Boetius; whence it passed into Æolus, and was that which Sappho and Alcestis wrote in. The Æolic dialect generally throws out the aspirate or sharp spirit, and agrees in so many things with the DORIC dialect, that the two are usually confounded together.

The Æolic digamma is a name given to the letter F, which the Æolians used to prefix to words beginning with suffixes, as ÆON, for ON; also to insert between vowels, as ÆON, for ON.

ÆOLIC Verse, in Prosody, a verse consisting of an iambus, or spondee; then of two anapests, separated by a long syllable; and, lastly, of another syllable. Such as O stellifer conditor orbis. This is otherwise called ευθυγραμμικός verse and, from the chief poets who used it, Archilochian and Pindaric.

ÆOLIPILE, in Hydrodynamica, is a hollow ball of metal, generally used in courses of experimental philosophy, in order to demonstrate the possibility of converting water into an elastic steam or vapour by heat. The instrument, therefore, consists of a slender neck, or pipe, having a narrow orifice inserted into the ball by means of a shouldered screw. This pipe being taken out, the ball is filled almost full of water, and the pipe being again screwed in, the ball is placed on a pan of kindled charcoal, where it is well heated, and there issues from the orifice a vapour, with prodigious violence and great noise, which continues till all the included water is discharged. The stronger the fire is, the more elastic and violent will be the steam; but care must be taken that the small orifice of the pipe be not,
ÆOLIS, or ÆOLIA, in Ancient Geography, a country of the Hither Asia, settled by colonies of Æolian Greeks. Taken at large, it comprehends all Troas, and the coast of the Hellespont to the Propontis, because in those parts there were several Æolian colonies: more strictly, it is situated between Troas to the north, and Ionia to the south. The people are called Æolites or Æoli.

ÆOLIAN MARE, in Ancient Geography, a part of the Ægean sea, washing Æolis; called also Mystrum, from Mystrae. Now called Golfo di Smyrna. Æolus, in heathen mythology, the god of the winds, was said to be the son of Jupiter by Acasta, or Sigeia, the daughter of Hippotas: or, according to others, the son of Hippotus by Menecles, daughter of Hyllus, king of Lipara. He dwelt in the island Strongyle, now called Strombolo, one of the seven islands called Æolian from their being under the dominion of Æolus. Others say, that his residence was at Rhesium, in Italy; and others again place him in the island Lipara. He is represented as having authority over the winds, which he held enchaîned in a vast cavern, to prevent their continuing the devastations they had been guilty of before they were put under his direction. Mythologists explain the original of these fables, by saying, that he was a wise and good prince; and, being skilled in astronomy, was able, by the flux and reflux of the tides, and the nature of the volcano in the island Strongyle, to foretell storms and tempests.

Harp of Æolus, or the Æolian lyre. See Acoustics.

ÆON, a Greek word, properly signifying the age or duration of anything.

ÆON, among the followers of Plato, was used to signify any virtue, attribute, or perfection: hence they represented the deity as an assemblage of all possible Æons; and called him pleroma, a Greek term signifying fulness. The Valentinians, who, in the first ages of the church, blended the conceits of the Jewish cabalists, the Platonists, and the Chaldean philosophers, with the simplicity of the Christian doctrine, invented a kind of Theogony, or Genealogy of Gods (not unlike that of Hesiod), whom they called by several glorious names, and all by the general appellation of Æons: among which they reckoned Zeus, Life; Λόγος, Word; Μορφή, Only begotten; Παράδειγμα, Fulness; and many other divine powers and emanations, amounting in number to thirty; which they fancied to be successively derived from one another; and all from one self-originated deity, named Bythos, i. e. profound or unutterable; whom they called likewise, The most high and ineffable Father. See VALENTINIANS.
the Christian era began at the epoch of the birth of Jesus Christ. See Chronology, where the different Eras, &c. are enumerated and explained.

ÆRARIIUM, the treasury or place where the public money was deposited amongst the Romans.

Ærarium sanctius contained the moneys arising from the twentieth part of all legacies: this was kept for the extreme necessities of the state.

Ærarium Privatum was the emperor's privy purse, or the place where the money arising from his private patrimony was deposited.

Ærarium Viceimperatorum, the place where the money arising from the taxes levied from foreign countries was laid up, so called because it most commonly consisted of a twentieth part of the produce.

Ærarium Illyricum, or Iunonis Luciae, was where the moneys were deposited which parents paid for the birth of each child.

There are several other treasuries mentioned in history, as the ærarium Juventutis, Veneris, &c. The temple of Saturn was the public treasury of Rome, either because Saturn first taught the Italians to coin money, or, which is most likely, because this temple was the strongest and most secure, and therefore the fittest, place for that purpose.

Ærarium differs from fæcus, as the first contained the public money, the second that of the prince. The two are, however, sometimes indiscriminately used for each other.

ÆRATUS, a name given by the Romans to a degraded citizen, who had been struck off the list of his countrymen. Such persons were so called, because they were liable to all the taxes (Æra), without enjoying any of its privileges.

The ærarii were incapable of making a will, of inheriting, of voting in assemblies, of enjoying any post of honour or profit; in effect, were only subject to the burdens, without the benefits of society; yet they retained their freedom, and were not reduced to the condition of slaves. To be made an ærarius was a punishment inflicted for some offence, and reputed one degree more severe than to be expelled a tribe, tribus moveri.

ÆRATUS was also an officer instituted by Alexander Severus, for the distribution of the money given in largesses to the soldiery or people.

ÆRATUS was also used for a person employed in coined or working brass.

These are sometimes called ærarii fusores; at other times, ærarius is distinguished from fusor; the former answering to what we now call coppersmiths, the latter to founders.

ÆRATUS was likewise applied to a soldier who receives pay.

ÆRIA, or EXRIA, in Ancient Geography, the ancient name of Egypt. The scholiast on Apollonius Rhodius, says, that not only Thessaly, but Egypt, was called Ægea by the Greeks, which Eusebius also confirms: and hence Apollinaris, in his translation of the 114th Psalm, uses it for Egypt. Hesychius applies this name to Ethiopia.

AERIAL, in a general sense, denotes something partaking of the nature of air; thus aerial substances, aerial particles, &c.

AERIAL Perspective. See Perspective and Painting.

AERIANS, in church history, a branch of Arians, who, to the doctrines of that sect, added some peculiar dogmas of their own; as, that there is no difference between bishops and priests; a doctrine maintained by many modern divines, particularly of the presbyterian and reformed churches. The sect received its denomination from Aærius an Armenian priest of the fourth century. He founded his doctrine chiefly upon some passages in St Paul; and, among others, upon that in 1 Tim. iv. 14, where the apostle exhorts him not to neglect the gift he had received by the laying on of the hands of the Presbytery. Here, observes Aærius, is no mention of bishops: on the contrary, Timothy evidently received his ordination from the presbyters or priests.—Epiphanius zealously maintains the superiority of bishops against the Arians. The word presbytery, used by the apostle, he observes, includes both bishops and priests; the whole senate or assembly of the ecclesiastics of the place.

Flosum æreis, among alchemists, small scales procured from copper melted by a strong heat; it is sometimes used for ærigo or verdigris.

AEROGRAPHY, from æros, air, and γραφειν, to describe; a description of the air or atmosphere, its limits, dimensions, properties, &c. This amounts to the same with aerogy, unless we suppose the latter to enter into the rationale, and the former to confine itself to a description of the more obvious affections thereof. See Meteorology.

AEROMANCY, a species of divination performed by means of air, wind, &c. See Divination.

AEROMETRY, the science of measuring the air. It comprehends not only the doctrine of the air itself, considered as a fluid body, but also its pressure, elasticity, rarefaction, and condensation. But the term is at present not much in use, this branch of natural philosophy being more frequently called Pneumatics. See Pneumatics.

AERONAUT, a person who navigates or floats in the air by means of an air balloon. See Aerostation.

AERONAUTICA, from æros, and ναυτική, derived from ναύς, ship; the art of sailing in a vessel or machine through the atmosphere, sustained as a ship in the sea. See Aerostation.

AEROPHYLACEA, a term used by naturalists for caverns or reservoirs of air, supposed to exist in the bowels of the earth. Kircher speaks much of aerophylacea, or huge caverns replete with air, disposed under ground; from whence, through numerous occult passages, that element is conveyed either to subterraneous receptacles of water, which, according to him, are hereby raised into springs or rivers, or into the funds of subterraneous fire, which are hereby fed and kept alive for the restoration of metals, minerals, and the like.
The only person who brought his scheme of flying Bishop to any kind of rational principle was the Jesuit Francis Lana's Lana, contemporary with Bishop Wilkins. His method scheme was similar to Friar Bacon's. He was acquainted with the real weight of the atmosphere, and, justly concluded, that if a globular vessel were exhausted of air, it would weigh less than before; and considering that the solid contents of vessels increased in much greater proportion than their surfaces; he supposed that a metallic vessel might be made so large, that, when emptied of its air, it would be able not only to raise itself in the atmosphere, but to carry up passengers along with it: and he made a number of calculations necessary for putting the project in execution. But though the theory was here unexceptionable, the means proposed were certainly insufficient to accomplish the end: for a vessel of copper, made so thin as was necessary to make it float in the atmosphere, would be utterly unable to resist the external pressure; which being demonstrated by those skilled in mechanics, no attempt was made on that principle.

In the year 1709, however, as we are informed by Strange a letter published in France in 1784, a Portuguese proposal for a waterman, Friar Gusman, applied to the king for encouragement to his invention of a flying machine. The mean scheme on which his was constructed, if indeed it had any principle, seems to have been that of the paper kite. The machine was constructed in a form of a bird, and contained several tubes through which the wind was to pass, in order to fill a kind of sails, which were to elevate it; and when the wind was deficient, the same effect was to be performed by means of bellows concealed within the body of the machine. The ascent was also to be promoted by the electric attraction of pieces of amber placed in the top, and by two spheres enclosing magnets in the same situation.

These childish inventions show the low state of science at that time in Portugal, especially as the king, in order to encourage him to farther exertions in such an useful invention, granted him the first vacant place in his college of Barcelos or Santarem, with the first professorship in the university of Coimbra, and an annual pension of 600,000 reis during his life. Of this De Gusman, it is also related, that, in the year 1736, he made a wicker basket of about seven or eight feet diameter, and covered with paper, which raised itself about 200 feet in the air, and the effect was generally attributed to witchcraft.

In the year 1766, Mr Henry Cavendish ascertained the possibility the weight and other properties of inflammable air, determining it to be at least seven times lighter than the common air. Soon after which it occurred to Dr Black, that perhaps a thin bag filled with inflammable air might be buoyed up by the common atmosphere, and he thought of having the allantois of a calf prepared for this purpose; but his other avocations prevented him from prosecuting the experiment. The same thought occurred some years afterwards to Mr Cavalo; and he has the honour of being the first who made experiments.
AEROSTATION.

Experiments on the subject. He first tried bladders; but the thinnest of these, however well scraped and prepared, were found too heavy. He then tried Chinese paper; but that proved so permeable, that the vapour passed through it like water through a sieve. His experiments, therefore, made in the year 1782, proceeded no farther than blowing up soap bubbles with inflammable air, which ascended rapidly to the ceiling, and broke against it.

But while the discovery of the art of aerostation seemed thus on the point of being made in Britain, it was all at once announced in France, and that from a quarter whence nothing of the kind was to have been expected. Two brothers, Stephen and John Montgolfier, natives of Annanoy, and masters of a considerable paper manufactury there, had turned their thoughts towards this project as early as the middle of the year 1782. The idea was first suggested by the natural ascent of the smoke and clouds in the atmosphere; and their design was to form an artificial cloud, by enclosing the smoke in a bag, and making it carry up the covering along with it. Towards the middle of November the experiment was made at Avignon with a fine silk bag of a parallelepiped shape. By applying burning paper to the lower aperture, the air was rarefied, and the bag ascended in the atmosphere, and struck rapidly against the ceiling. On repeating the experiment in the open air, it rose to the height of about 70 feet.

An experiment on a more enlarged scale was next projected; and a new machine, containing about 650 cubic feet was made, which broke the cords that confined it, and rose to the height of about 600 feet. Another of 33 feet in diameter rose about 1000 feet high, and fell to the ground three quarters of a mile from the place where it ascended. A public exhibition was next made on the 5th of June 1783, at Annanoy, where a vast number of spectators assembled. An immense bag of linen, lined with paper, and containing upwards of 23,000 cubic feet, was found to have a power of lifting about 500 pounds, including its own weight. The operation was begun by burning chopped straw and wool under the aperture of the machine, which immediately began to swell; and after being set at liberty ascended into the atmosphere. In 21 minutes it had ascended 6000 feet; and when its force was exhausted, it fell to the ground at the distance of 7668 feet from the place from whence it set out.

Soon after this, one of the brothers arrived at Paris, where he was invited by the Academy of Sciences to repeat his experiments at their expense. In consequence of this invitation, he constructed, in a garden in the faubourg of St Germain, a large balloon of an elliptical form. In a preliminary experiment, this machine lifted up from the ground eight persons who held it, and would have carried them all off if more had not quickly come to their assistance. Next day the experiment was repeated in presence of the members of the academy; the machine was filled by the combustion of 50 pounds of straw made up in small bundles, upon which about 12 pounds of chopped wool were thrown at intervals. The usual success attended this exhibition: the machine soon swelled; endeavoured to ascend; and immediately after sustained itself in the air, together with the charge of between 400 and 500 pounds weight. It was evident that it would have ascended to a great height; but as it was designed to repeated the experiment before the king and royal family at Versailles, the cords by which it was tied down were not cut. But in consequence of a violent rain and wind which happened at this time, the machine was so far damaged, that it became necessary to prepare a new one for the time that it had been determined to honour the experiment with the royal presence; and such expedition was used, that this vast machine, of near 60 feet in height and 43 in diameter, was made, painted with water colours both within and without, and finely decorated, in no more than four days and four nights. Along with this machine was sent up a Some animal wicker cage, containing a sheep, a cock, and a duck, which were the first animals ever sent through the atmosphere. The full success of the experiment was prevented by a violent gust of wind which tore the cloth in two places near the top before it ascended; however, it rose to the height of 1440 feet; and after remaining in the air about eighty minutes, fell to the ground at the distance of 12,200 feet from the place of its setting out. The animals were not in the least hurt.

The great power of these aerostatic machines, and M. Pilatre de Rozier their very gradual descent in falling to the ground, had originally showed that they were capable of transporting people through the air with all imaginable safety, and this was further confirmed by the experiment already mentioned. As M. Montgolfier, therefore, proposed to make a new aerostatic machine of a firmer and better construction than the former, M. Pilatre de Rozier offered himself to be the first aerial adventurer.

This new machine was constructed in a garden in the faubourg of St Antoine. It was of an oval shape, about 48 feet in diameter, and 74 in height, elegantly painted on the outside with the signs of the zodiac, cyphers of the king's name, and other ornaments. A proper gallery, grate, &c. were appended in the manner afterwards described; so that it was easy for the person who ascended to supply the fire with fuel, and thus keep up the machine as long as he pleased. The weight of the whole apparatus was upwards of 1600 pounds. The experiment was performed on the 15th of October 1783. M. Pilatre having placed himself in the gallery, the machine was inflated, and permitted to ascend to the height of 84 feet, where he kept it aloft for about four minutes and a half: after which he descended very gently: and such was its tendency to ascend, that it rebounded to a considerable height after touching the ground. Two days after, he repeated the experiment with the same success as before; but the wind being strong, the machine did not sustain itself so well as formerly. On repeating the experiment in calmer weather, he ascended to the height of 210 feet. His next ascent was 262 feet; and in the descent, a gust of wind having blown the machine over some large trees of an adjoining garden, M. Pilatre suddenly extricated himself from such dangerous a situation, by throwing some straw and chopped wool on the fire, which raised him at once to a sufficient height. On descending again, he once more raised himself to a proper height by throwing straw on the fire. Some time after, he ascended in company with M. Giroud...
M. Girond de Villeto to the height of 330 feet; hovering over Paris at least nine minutes in sight of all the inhabitants, and the machine keeping all the while perfectly steady.

These experiments had shown, that the aërostatic machines might be raised or lowered at the pleasure of the person who commanded; they had likewise discovered, that the keeping them fast with ropes was no advantage; but, on the contrary, that this was attended with inconvenience and hazard. On the 21st of November 1783, therefore, M. Pilatre determined to undertake an aerial voyage in which the machine should be fully set at liberty. Every thing being got in readiness, the balloon was filled in a few minutes; and M. Pilatre placed himself in the gallery, counterpoised by the marquis d’Arlandes, who occupied the other side. It was intended to make some preliminary experiments on the ascending power of the machine; but the violence of the wind prevented this from being done, and even damaged the balloon essentially; so that it would have been entirely destroyed had not timely assistance been given. The extraordinary exertions of the workmen, however, repaired it again in two hours, and the adventurers set out. They met with no inconvenience during their voyage, which lasted about 25 minutes; during which time they had passed over a space of above five miles.

From the account given by the marquis d’Arlandes, it appears that they met with several different currents of air; the effect of which was, to give a very sensible shock to the machine, and the direction of the motion seemed to be from the upper part downwards. It appears also that they were in some danger of having the balloon burnt altogether; as the marquis observed several round holes made by the fire in the lower part of it, which alarmed him considerably, and indeed not without reason. However, the progress of the fire was easily stopped by the application of a wet sponge, and all appearance of danger ceased in a very short time.

This voyage of M. Pilatre and the marquis d’Arlandes may be said to conclude the history of those aërostatic machines which are elevated by means of fire; for though many other attempts have been made upon the same principle, most of them have either proved unsuccessful or were of little consequence. They have therefore given place to the other kind filled with inflammable air (hydrogen gas); which, by reason of its smaller specific gravity, is both more manageable and capable of performing voyages of greater length, as it does not require to be supplied with fuel like the others. This was invented a very short time after the discovery had been made by M. Montgolfier. This gentleman had indeed designed to keep his method in some degree a secret from the world; but as it could not be concealed, that a bag filled with any kind of fluid lighter than the common atmosphere would rise in it, inflammable air was naturally thought of as a proper succedaneum for the rarefied air of M. Montgolfier. The first experiment was made by two brothers Messrs. Robert, and M. Charles a professor of experimental philosophy. The bag which contained the gas was composed of lattice, varnished over with a solution of the elastic gum called casvinchow; and that with which they made their first essay was only about 13 English feet in diameter. Many difficulties occurred in filling it with the inflammable air, chiefly owing to their ignorance of the proper apparatus; insomuch that, after a whole day’s labour from nine in the morning, they had got the balloon only one-third part full. Next morning they were surprised to find that it had fully inflated of itself during the night; but, upon inquiry, it was found, in what manner a balloon partly filled with inflammable air, had mixed itself with the inflammable air; ad may inferring a compound still lighter than the common atmosphere, but not sufficiently light to answer the purposes of aërostation. Thus they were obliged to renew their operation; and, by six o’clock in the evening of next day, they found the machine considerably lighter than the common air; and, in an hour after, it made a considerable effort to ascend. The public exhibition, however, had been announced only for the third day after; so that the balloon was allowed to remain in an inflated state for a whole day; during which time it had lost a power of ascent equal to about three pounds, being one-seventh part of the whole. When power in it was at last set at liberty, after having been well filled with inflammable air, it was 35 pounds lighter than an equal bulk of common air. It remained in the atmosphere only three quarters of an hour, during which it had traversed 25 miles. Its sudden descent was supposed to have been owing to a rupture which had taken place when it ascended into the higher regions of the atmosphere.

The success of this experiment, and the aerial voyage, first made by Messrs. Rozier and Arlandes, naturally suggested the idea of undertaking something of the same kind with a balloon filled with inflammable air, and

The machine used on this occasion was formed of gores bents of silk, covered over with a varnish made of casvinchow, of a spherical figure, and measuring 27 feet in diameter. A net was spread over the upper hemisphere, and was fastened to a hoop which passed round in the middle of the balloon. To this a sort of car, or rather boat was suspended by ropes, in such a manner as to hang a few feet below the lower part of the balloon; and, in order to prevent the bursting of the machine, a valve was placed in it; by opening of which, some of the inflammable air might be occasionally let out. A long silken pipe communicated with the balloon, by means of which it was filled. The boat was made of basket work, covered with painted linen, and beautifully ornamented; being 8 feet long, 4 broad, and 3 deep; its weight 130 pounds. At this time, however, as at the former, they met with great difficulties in filling the machine with inflammable air; owing to their ignorance of the most proper apparatus. But at last, all obstacles being removed, the two adventurers took their seats at three quarters after one in the afternoon of the first of December 1783. Persons skilled in mathematics were conveniently stationed with proper instruments to calculate the height, velocity, &c. of the balloon. The weight of the whole apparatus, including that of the two adventurers, was found to be 604 pounds, and the power of ascent when they set out was 20 pounds; so that the whole difference between the weight of the balloon and its equal bulk of common air was 634 pounds. But the weight of common atmosphere displaced by the inflammable gas was
History.

Specific gravity of the inflammable air in this first voyage.

was calculated to be 771 pounds, so that there remains 14.7 for the weight of the latter; and this calculation makes it only 52 times lighter than common air.

At the time the balloon left the ground, the thermometer stood at 50° of Fahrenheit's scale; and the quicksilver in the barometer at 30.18 inches; and, by means of the power of ascent with which they left the ground, the balloon rose till the mercury fell to 27 inches, from which they calculated their height to be about 600 yards. By throwing out ballast occasionally as they found the machine descending by the escape of some of the inflammable air, they found it practicable to keep at pretty near the same distance from the earth during the rest of their voyage; the quicksilver fluctuating between 27 and 27.55 inches, and the thermometer between 53° and 57°, the whole time. They continued in the air for the space of an hour and three quarters, when they alighted at a distance of 27 miles from Paris: having suffered no inconvenience during their voyage, nor experienced any contrary currents of air, as had been felt by Mess. Pitêtre and Arlandes. As the balloon still retained a great deal of its inflating, M. Charles determined to take another voyage by himself. M. Robert accordingly got out of the boat, which was thus lightened by 150 pounds, and of consequence the aerostatic machine now had nearly as much power of ascent. Thus he was carried up with such velocity, that in twenty minutes he was almost 9000 feet high, and entirely out of sight of terrestrial objects. At the moment of his parting with the ground, the globe had been rather flaccid; but it soon began to swell, and the inflammable air escaped from it in great quantity through the silken tube. He also frequently drew the valve that it might be more freely emitted, and the balloon effectually prevented from bursting. The inflammable gas being considerably warmer than the external air, diffused itself all round, and was felt like a warm atmosphere; but in ten minutes the thermometer indicated a variation of temperature as great as that between the balloon of spring and the ordinary cold of winter. His fingers were benumbed by the cold, and he felt a violent pain in his right ear and jaw, which was ascribed to the dilatation of the air in these organs, as well as to the external cold. The beauty of the prospect which he now enjoyed, however, made amends for these inconveniences. At his departure the sun was set on the valleys; but the height to which M. Charles was got in the atmosphere, rendered him again visible, though only for a short time. He saw, for a few seconds, vapours rising from the valleys and rivers. The clouds seemed to ascend from the earth, and collect one upon the other, still preserving their usual form; only their colour was gray and monotonous for want of sufficient light in the atmosphere. By the light of the moon, he perceived that the machine was turning round with him in the air; and he observed that there were contrary currents which brought him back again. He observed also, with surprise, the effects of the wind, and that the streamers of his banners pointed upwards; which, he says, could not be the effect either of his ascent or descent, as he was moving horizontally at the time. At last, recollecting his promise of returning to his friends in half an hour, he pulled the valve, and accelerated his descent. When within 200 feet of the earth, he threw out two or three pounds of ballast, which rendered the balloon again stationary; but, in a little time afterwards, he gently alighted in a field about three miles distant from the place whence he set out; though, by making allowance for all the turnings and windings of the voyage, he supposes that he had gone through nine miles at least. By the calculations of M. de Ménifer, he rose at this time not less than 10,500 feet high; a height somewhat greater than that of Mount Etna. A small balloon, which had been sent off before the two brothers set out on their voyage, took a direction opposite to that of the large one, having met with an opposite current of air, probably at a much greater height.

The subsequent aerial voyages differ so little from Attempts that just now related, that any particular description of to guide them seems to be superfluous. It had occurred to Mess. Charles, however, in his last flight, that there might be a possibility of directing the machine in the atmosphere; and this was soon attempted by M. Jean Pierre Blanchard, a gentleman who had, for several years, amused himself with stationary flights, and by mechanical means, though he had never succeeded in the undertaking. As soon as the discovery of the aerostatic machines was announced, however, he resolved to add the wings of his former machine to a balloon, and made no doubt that it would then be in his power to direct himself through the air at pleasure. In his first attempt he was frustrated by the impetuosity of a young gentleman, who insisted, right or wrong, on ascending along with him. In the scuffle which ensued on this occasion, the wings and other apparatus were entirely destroyed; so that M. Blanchard was obliged to commit himself to the direction of the wind; and in another attempt it was found, that all the strength he could apply to the wings was scarce sufficient to counteract the impression of the wind in any degree. In his voyage, he found his balloon, at a certain period, acted upon by two contrary winds; but, on throwing out four pounds of ballast, he ascended to a place where he met with the same current, and was able to stay put from the earth. His account of the sensations he felt during this voyage, was somewhat different from that of M. Charles; having, in one part of it, found the atmosphere very warm, in another cold; and having once found himself very hungry, and at another time almost overcome by a propensity to sleep. The height to which he arose, as measured by several observations with mathematical instruments, was thought to be very little less than 10,000 feet; and he remained in the atmosphere an hour and a quarter.

The attempts of M. Blanchard to direct his machine Voyage of through the atmosphere, were repeated in the month of Mess. Morveau and Bertrand, at Dijon, who raised themselves with an inflammable air balloon to the height, as it was thought, of 13,000 feet; passing through a space of 18 miles in an hour and 25 minutes. M. Morveau had prepared a kind of oars for directing the machine through the air; but they were damaged by a gust of wind, so that only two of them remained serviceable; by working these, however, they were able to produce a sensible effect on the motion of the machine. In a third aerial voy-
AEROSTATION.

The success of Messrs Charles and Robert in their former experiments, encouraged them soon to repeat them, with the addition of some machinery to direct their course. Having enlarged their former balloon to the size of an oblong spheroid 45½ feet long and 27½ in diameter, they made it to float with its longest part parallel to the wind and with the shape of an umbrella without the handle, to the top of which a stick was fastened parallel to the aperture of the umbrella. Five of these were disposed round the boat, which was near 17 feet in length. The balloon was filled in three hours, and, with the addition of 450 pounds of ballast, remained in aquilibrrio with the atmosphere. About noon, on the 19th of September 1784, they began to ascend very gently in consequence of the wind. On putting out 24 pounds of ballast, but were soon obliged to throw out eight pounds more, in order to avoid running against some trees. Thus they rose to the height of 1400 feet, when they perceived some thunder clouds near the horizon. On this they ascended and descended, to avoid the danger, as the wind blew directly towards the threatening clouds; but, from the height of 600 feet to that of 4200 above the surface of the earth, the current was quite uniform and in one direction. During their voyage they lost one of their oars; but found, that by means of those which remained, they could ascend. The wind, however, was so violent that it seemed that they had not been seen through the thunder clouds; as, after a few minutes, they heard a loud clap of thunder; and three minutes after, another much louder; at which time the thermometer sunk from 77 to 59 degrees. This sudden cold, occasioned by the approach of the clouds, condensed the inflammable air so that the balloon descended very low, and they were obliged to throw out 40 pounds of ballast; yet on examining the heat of the air within the balloon, they found it to be 104°, when that of the external atmosphere was only 63°. When they had got so high that the mercury in the barometer stood only at 23.94 inches, they found themselves becalmed; so that the machine did not go even at the rate of two feet in a second, though it had before gone at the rate of 24 feet in a second. On this they determined to try the effect of their oars to the utmost; and, by working them for 35 minutes, and marking the shadow of the balloon on the ground, they found that, in that time, they had described the segment of an ellipse whose longest diameter was 6000 feet. After having travelled about 150 miles, they descended, only on account of the approach of night, having still 200 pounds of ballast left.

Their conclusion, with regard to the effect of their wings, is as follows: "Those experiments show, that far from going against the wind, as is said by some persons to be possible in a certain manner, and some aeronauts pretend to have actually done, we only obtained, by means of two oars, a deviation of 22 degrees: it is certain, however, that if we could have used our four oars, we might have deviated about 40 degrees from the direction of the wind; and as our machine would have been capable of carrying seven persons, it would have been easy for five persons to have gone, and to have put in action eight oars, by means of which a deviation of about 80 degrees would have been obtained."

We have already observed (say they), that if we did not deviate more than 22 degrees, it was because the wind carried us at the rate of 24 miles an hour; and it is natural to judge, that if the wind had been twice as strong as it was, we should not have deviated more than one-half of what we actually did; and on the contrary, if the wind had been only half as strong, our deviation would have been proportionally greater."

Having thus related all that has been done with re—Centriva- gandum to the conducting of aerostatic machines through the atmosphere, we shall now relate the attempts that have been made to lessen their expense, by falling upon some contrivance to ascend without throwing out ball—last, and to descend without losing any of the inflammable air. The first attempt of this kind was made by the duke de Chartres; who, on the 18th of July the duke de Chartres, ascended with the two brothers, Roberts, and a fourth person, from the park of St Cloud. The balloon was of an oblong form, made to ascend with its longest diameter horizontally, and measured 53 feet in length and 24 in breadth. It contained within it a smaller balloon filled with common air; by blowing into which with a pair of bellows, and thus throwing into a considerable quantity of common air, it was supposed that the machine would become lighter. The ascent and descent, especially, as by the inflation of the internal bag, the inflammable air in the external one would be condensed into a smaller space, and thus become specifically heavier. The voyage, however, was attended with such circumstances as rendered it impossible to know what would have been the event of the scheme. The power of ascent with which they set out, seems to have been very great; as, in three minutes after parting with the ground, they were lost in the clouds, and involved in such a dense vapour that they could see neither the dark clouds on sky nor the earth. In this situation they seemed to be attacked by a whirlwind, which, besides turning the balloon three times round from right to left, shocked a whirlwind, and beat it so about, that they were rendered incapable of using any of the means proposed for directing their course, and the silk stuff of which the helm had been composed was even torn away. No scene can be conceived more terrible than that in which they were now involved. An immense ocean of shapeless clouds rolled one upon another below them, and seemed to prevent any return to the earth, which still continued invisible, while the agitation of the balloon became greater every moment. In this extremity they cut the cords which held the interior balloon, and of consequence it fell down upon the aperture of the tube that came from the large balloon into the boat, and stopped it up. They were then driven upwards by a gust of wind from below, which carried them to the top of that stormy vapour in which they had been involved. They now saw the sun without a cloud; but the heat of his rays, with the diminished density of the atmosphere, had such an effect on the inflammable air, that the balloon seemed every
every moment ready to burst. To prevent this, they introduced a stick through the tube, in order to push away the inner balloon from its aperture; but the expansion of the inflammable air pushed it so close, that all attempts of this kind proved ineffectual. It was now, however, become absolutely necessary to give vent to a very considerable quantity of the inflammable air; for which purpose the duke de Chartres himself bored two holes in the balloon, which tore open for the length of seven or eight feet. On this they descended with great rapidity; and would have fallen into a lake, had they not hastily thrown out 52 pounds of ballast, which enabled them just to reach the water's edge.

The success of the scheme for raising or lowering aerostatic machines by means of bags filled with common air being thus rendered dubious, another method was thought of. This was to put a small aerostatic machine with rarefied air under an inflammable air balloon, but at such a distance that the inflammable air of the latter might be perfectly out of the reach of the fire used for inflating the former; and thus, by increasing or diminishing the fire in the small machine, the absolute weight of the whole would be considerably diminished or augmented. The scheme was unhappily put in execution by the celebrated M. Pilatre de Rozier, and another gentleman named M. Romaine. Their inflammable air balloon was about 37 feet in diameter, and the power of the rarefied air one was equivalent to about 60 pounds. They ascended without any appearance of danger or sinister accident; but had not been long in the atmosphere when the inflammable air balloon was seen to swell very considerably, at the same time that the aeronauts were observed, by means of telescopes, very anxious to get down, and busied in pulling the valve and opening the appendages to the balloon, in order to facilitate the escape of as much inflammable air as possible. A short time after this the whole machine was on fire, when they had then attained the height of about three quarters of a mile from the ground. No explosion was heard; and the silk which composed the air balloon continued expanded, and seemed to resist the atmosphere for about a minute; after which it collapsed, and the remains of the apparatus descended along with the two unfortunate travellers so rapidly, that both of them were killed. M. Pilatre seemed to have been dead before he came to the ground; but M. Romaine was alive when some persons came up to the place where he lay, though he expired immediately after.

These are the most remarkable attempts that have been made to improve the science of aërostation; though a great number of other expeditions through the atmosphere have taken place. But of all the voyages which had been hitherto projected or put in execution, the most daring was that of M. Blanchard and Dr Jeffries across the straits of Dover, which separate Britain from France. This took place on the 7th of January 1785, being a clear frosty morning with a wind, barely perceptible, at N. N. W. The operation of filling the balloon began at 10 o'clock, and, at three quarters after 12, every thing was ready for their departure. At one o'clock M. Blanchard desired the boat to be pushed off, which now stood only two feet distant from that precipice so finely described by Shakespear in his tragedy of King Lear. As the balloon was scarcely sufficient to carry two, they were obliged to throw out all their ballast except three bags of 10 pounds each; when at last rose gently; though making very little way on account of there being so little wind. At a quarter after one o'clock, the barometer, which on the cliff stood at 297.7 inches, was now fallen to 273.4, and the weather proved fine and warm. They had now a most beautiful prospect of the south coast of England, and were able to count 37 villages up to it. After passing over several vessels, they found that the balloon, at 30 minutes after one, was descending, on which they threw out a third of a half of ballast; but as they saw that it still descended, and with much greater velocity than before, they now threw out all the ballast. This still proving ineffectual, they next threw out a parcel of books they carried along with them, which made the balloon ascend, when they were about midway between France and England. At a quarter past two, finding themselves again descending, they threw away the remainder of their books, and, ten minutes after, they had a most enchanting view of the French coast. Still, however, the machine descended; and as they had now no more ballast, they were obliged to throw away their provisions, the wings of their boat, and every thing they could possibly spare. “We threw away (says Dr Jeffries) our only bottle, which, in its descent cast out a steam like smoke, with a rushing noise; and when it struck the water, we heard and felt the shock very perceptibly on our car and balloon.” All this proving insufficient to stop the descent of the balloon, they next threw out their anchors and chains, and at last stripped off their clothes, fastening themselves to certain slings, and intending to cut away the boat as their last resource. They had now the satisfaction, however, to find that they were rising; and as they passed over the high lands between Cape Blanc and Caled the machine rose very fast, and carried them to a greater height than they had been at any former part of their voyage. They descended safely among some trees in the forest of Guinnes, where there was just opening enough to admit them.

It would be tedious as well as unnecessary to recount all the other aerial voyages that have been performed in our own or other countries: It appeared sufficient for the purpose of this article to notice those which were most remarkable and interesting; and therefore an account of the ingenious Mr Baldwin’s excursion from Chester, alluded to above, must not be omitted in our enumeration.

On the 8th of September 1785, at forty minutes past p.m., Mr Baldwin ascended from Chester in Mr. Lunnard’s balloon. After traversing in a variety of different directions, he first alighted, at 28 minutes after three, about twelve miles from Chester, in the neighbourhood of Froodeham, then reascending and pursuing his excursion, he finally landed at Rixton moor, five miles N. N. E. of Wavington, and 25 miles from Chester. Mr Baldwin has published his Observations and remarks made during his voyage, and taken from minutes. Our limits will not admit of relating many of his observations; but the few following are some of the most important and curious. “The sensation of ascending is compared to that of a strong pressure from the bottom of the ear upwards against the
the soles of his feet. At the distance of what appeared to him seven miles from the earth, though by the barometer scarcely a mile and a half, he had a grand and most enchanting view of the city of Chester and its adjacent places below. The river Dee appeared of a red colour; the city very diminutive; and the town entirely blue. The whole appeared a perfect plain, the highest building having no apparent height, but reduced all to the same level; and the whole terrestrial prospect appeared like a coloured map. Just after his first ascent, being in a well watered and maritime part of the country, he observed a remarkable and regular tendency of the balloon towards the sea; but shortly after rising into another current of air, he escaped the danger: this upper current, he says, was visible to him at the time of his ascent, by a lofty sound stratum of clouds flying in a safe direction. The perspective appearance of things to him was very remarkable. The lowest bed of vapour that first appeared as cloud was pure white, in detached fleeces, increasing as they rose: they presently coalesced, and formed, as he expresses it, a sea of cotton, tufting here and there by the action of the air. In the undisturbed part of the clouds, the whole became an extended white floor of cloud, the upper surface being smooth and even. Above this white floor he observed, at great and unequal distances, a vast assemblage of thunder clouds, each parcel consisting of whole acres in the densest form: he compares their form and appearance to the smoke of pieces of ordnance, which had consolidated as it were into masses of snow, and penetrated through the upper surface or white floor of common clouds, there remaining visible and at rest. Some clouds had motions in slow and various directions, forming an appearance truly stupendous and majestic. He endeavours to convey some idea of the scene by a figure; and from this fig. 1. Plate II. is copied. A represents a circular view he had from the car of the balloon, himself being over the centre of the view, looking down on the white floor of clouds, and seeing the city of Chester through an opening, which discovered the landscape below, limited by surrounding vapour to less than two miles in diameter. The breadth of the outer margin defines his apparent height in the balloon (viz. 4 miles) above the white floor of clouds. Mr Baldwin also gives a curious description of his tracing the shadow of the balloon over tops of volumes of clouds. At first it was small, in size and shape like an egg; but soon increased to the magnitude of the sun's disc, still growing larger, and attended with a most captivating appearance of an iris encircling the whole shadow at some distance round it, the colours of which were remarkably brilliant. The regions did not feel colder, but rather warmer than below. The sun was hottest to him when the balloon was stationary. The discharge of cannon, when the balloon was at a considerable height, was distinctly heard by the aeronaut; and a discharge from the same piece, when at the height of thirty yards, so disturbed him as to oblige him for safety to lay hold firmly of the cords of the balloon. At a considerable height he poured down a pint bottle full of water; and as the air did not oppose a resistance sufficient to break the steam into small particles, it mostly fell down in large drops. In the course of the balloon's track it was found much affected by the wind (a circumstance observed in former aerial voyages). At one time the direction of the balloon kept continually over the water, going directly towards the sea, so much as to endanger the aeronaut; the mouth of the balloon was opened, and in two minutes he descended into an under current blowing from the sea: he kept descending, and landed at Bellair farm in Rinsley, 12 miles from Chester. Here he lightened his car by 31 pounds, and instantly reascending, was carried into the interior part of the country, performing a number of different manoeuvres. At his greatest altitude he found his respiration free and easy. Several bladders which he had along with him cracked and expanded very considerably. Clouds and land, as before, appeared on the same level. By way of experiment, he tried the upper valve two or three times, the neck of the balloon being closed; and remarked, that the escape of the gas was attended with a growing noise like millstones, but not near so loud. Again, round the shadow of the balloon, on the clouds he observed the iris. A variety of other circumstances and appearances he met with, is fancifully described; and at 33 minutes past three he finally landed.

The following is an account of an establishment formed in France during the late war for the improvement of aerial navigation:

"The aerostatic institute, founded by the committee of public safety, and enveloped in the most profound secrecy at Meudon, to which also was added a camp for the exercise of the artillers, is even yet looked upon as a secret arrangement of the republic, respecting which the greatest precautions are taken; the doors being shut against the public and all foreigners.

It was impossible to have selected a more convenient spot for the establishment of the aeronautic institute than the royal lodge of Meudon. From its elevated site on a mountain, it commands a beautiful and extensive prospect over a plain covered with villages and cultivated fields, intersected by the Seine, and terminated by the city of Paris.

The perfection and the rational application of aeronautics are the objects of the labours of this establishment, to which the celebrated natural philosopher Guyton Morveau has in particular rendered the most important services. But the institution stood in need of such a director as Conté, for whom Guyton Morveau has procured the appointment. With a love of the science Conté unites a penetrating genius for research and invention, accompanied by indefatigable assiduity.

The corps of aeronauts, intended to serve in the employments of the republic, and consisting of fifty courageous youths, is trained at the school of Meudon: it is there that the balloons are prepared which are sent off to the armies; and every day in summer the pupils are employed, at one time in performing their exercises, at another in making researches, in natural philosophy, with a balloon which is kept constantly filled for the purpose.

The improvement in the preparation of the balloon, the discovery of a new mode of filling it with inflammable air from the substance of water (hydrogen gas), discovered by Lavoisier, the invention of a new telegraph, connected with the balloon, are the principal advances which have been made in aerostatics at Meudon under the direction of Conté.

The
History.

The old lodge of Monton serves as a manufactory for the preparation of the balloons, and all of the apparatus necessary to accompany them to the armies. The new lodge is appropriated to the institute, and to the accommodation of the pupils, and of the director and his family. There were prepared the *Entreprenu* for the army of the north, by means of which the hostile army was reconnoitered at the battle of Fleurs; the *Cléeste* for the army of the Sambre and Meuse; the *Hercule* and the *Intrepide* for the army of the Rhine and Moselle.

The silk for the balloons is manufactured at Lyons, and is very thick and strong; and Conté has rendered them much more durable by the precaution of only varnishing the outer surface. The varnish is of an excellent quality; it sufficiently hardens the outside, and does not make the silk stick together when the balloon is folded. Moreover, experience has proved that the inner coat of varnish cannot resist the operation of filling the balloon, that it is corroded by the gas, and that this friction renders the silk flabby.

The filling of the balloon with hydrogen gas is the result of the discoveries made by the great Lavoisier, and has for its basis his important experiment of the decomposition of water. The gas is prepared by the following simple and inexpensive process.

Six or more hollow iron cylinders are set in brick work, beside and over each other, in a furnace which may be constructed in twelve hours; and both ends of each cylinder are made to project from the furnace. The openings of these cylinders are stopped with strong iron covers, through which metal tubes are let in. The tube at one end serves for pouring water, previously heated, into the cylinders when red hot; that on the opposite side is destined to conduct the air which first presents itself, through a reservoir filled with a caustic liquor, and to convey it into the balloon. The cylinders are partly filled with coarse iron filings, which the excess weight of the furnace, kept up by coal during the whole time of the operation, reduces to a state of extincence. At this stage of the process, the valve of one of the tubes of each cylinder is opened, and a small quantity of boiling water is gently poured into the heated cylinder. As soon as the vapour of the water touches the heated iron, the two substances which compose the water are separated: the one (the oxygen) attaches itself to the iron, which it calcines, and which after the operation, is found partly crystallized, after the manner of volcanic productions: the other of the component substances of the water (the hydrogen) combines with a quantity of the igneous substance termed caloricus, and becomes inflammable air (hydrogen gas), which continues in a permanent state of elastic fluidity, and weighs seven or eight times less than the atmospheric air.

As the water contains a small portion of the substance of carbone (carbonique) which would render the air in the balloon heavy, the air, as it first rushes out of the cylinders, is made to pass through a reservoir of water impregnated with a caustic alkali. This fluid attracts to itself all the carbone, and nothing rises into the balloon but very pure and inflammable air.

During the operation, it has sometimes happened that the cylinders, heated to extincence, melted. To guard against this accident, the projecting end of the cylinder is furnished with a pyrometer, and a scale, which, by means of an iron rod, indicates the degrees of rarefaction of the air. A particular point on the scale announces the moment when the cylinders are heated in the degree nearest to fusion: when such is the case, the fire is immediately diminished. The operation of filling a balloon of thirty feet diameter employs one-third of a day.

The exercising balloon at Monton is of a spherical form, and thirty-two feet in diameter. Its upper half is covered with a linen case to keep off the rain from the balloon and its netting. This netting, woven with strong cords, embraces the upper part of the balloon, and is destined to support the car for the reception of the aeronauts. The balloon, kept constantly full and ready for ascent, and exposed in the open air in all weathers, preserves its buoyant station in the atmosphere, being fastened on the great terrace of the lodge. When the weather is favourable, the aeronautic exercises are begun. The balloon is set free from its fastenings, and elevated to a certain height; then the car is made fast to the cords which hang down from the net: the whole of this is done in five minutes. A colonel then mounts the car with one of the pupils, and the balloon rises to the height, generally, of from a hundred and sixty to two hundred and forty yards. The pupils separate into divisions, for the purpose of holding the balloon in the air, suffering it to mount, and drawing it down, by means of three principal ropes fastened to the net, and ramified with several others: in these manoeuvres they employ the aid of a capstern. When the balloon has been newly filled, it has yet suffered no evaporation, and still retains all its force, it requires the strength of twenty persons to hold it; and in that state it will bear eight hundred weight. After a space of two months, though much evaporated, it is still capable of bearing two persons with their instruments, and even a considerable ballast, of the same height in the air: but then ten persons are sufficient to hold it.

The car is constructed of a light lattice work of Form of the wood, lined with prepared leather, and hangs about sixteen feet beneath the balloon: it affords convenient room for two persons seated opposite each other, with the necessary instruments for making observations.

The balloon ascends as often in the day as is requisite for the succession of observations which are to be made; but these ascents take place only in calm and serene weather. Whenever any unforeseen accident occurs, the aerial machine is hauled down in five minutes. In strong gusts of wind which suddenly arise, the aeronauts are always exposed to some danger: the balloon, held by the ropes, cannot rise freely; and its vibrations and fluctuations resemble those of a paper kite which has not yet reached a certain degree of altitude. This spectacle, nevertheless, is more terrifying to the spectator than to the aeronaut, who, seated in his car, which its own weight preserves in a perpendicular position under the balloon, is but slightly affected by its desultory motion. No instance of any unfortunate accident has yet occurred at Monton.

All fear, all idea of danger, vanishes on examining the solidity of the whole apparatus, the precautionary measures adopted with the most prudent foresight and the utmost security, and especially when we are more particularly
particular acquaintance with the cool unassuming steadiness of Conté, the director of the whole.

When the return of peace shall allow more leisure, and shall favour the employment of this apparatus in other experiments than those immediately connected with the military service, we may expect to derive from it the most important and diversified advantages to natural science. The experiments will then be conducted under the direction of a committee of naturalists from the national institute, with a view of making discoveries in natural philosophy, meteorology, and other branches. When the labours of the aerostatic institute shall have accomplished ends so important to the arts, and so great general utility, there will be printed a particular account of the establishment, and of the course of experiments pursued: at present, these matters are kept from the knowledge of the public.

The most recent invention of Conté, admirable for its simplicity and precision, is the aerostatic telegraph. It consists of eight cylinders of varnished black silk, stretched on hoops, and resembling those little pocket lanterns of crimped paper, which draw out and fold down again on themselves. These eight moveable cylinders, each three feet in diameter, and of a proportionate length, are suspended from the bottom of the car, connected together with cords, and hanging one above another, at the distance of four feet. By means of cords passing through the bottom of the car, the aeronautic observers direct those cylinders, give them different positions at will, and thus carry on their telegraphic correspondence from the regions of the air.

Conté has further applied his thoughts to the invention of a similar aerostatic telegraph, which, without the assistance of a great balloon, or an aerial correspondent, should be managed by a person standing on the ground, by means of cords; the apparatus being suspended to a small balloon, of only twelve feet diameter.

Ascent of a balloon at the battle of Fleurus. Conté, captain of the aeronautic corps, was the man who ascended with the Entreprendant balloon on the 26th of June, 1794, and who conducted the wonderful and important service of reconnoitring the hostile armies at the battle of Fleurus, accompanied by an adjutant and a general. He ascended twice on that day, to observe, from an elevation of four hundred and forty yards, the position and manoeuvres of the enemy. On each occasion he remained four hours in the air, and, by means of preconcerted signals with flags, carried on a correspondence with General Jourdan, the commander of the French army.

His intended ascent had been made known to the enemy, who, at the moment when the balloon began to take its flight, opened the fire of a battery against the aeronauts. The first volley was directed too low: one ball, nevertheless, passed between the balloon and the car, and so near to the former, that Conté imagined it had struck it. When the subsequent discharges were made, the balloon had already reached such a degree of altitude, as to be beyond the reach of cannon shot, and the aeronauts saw the balls flying beneath the car. Arrived at their intended height, the observers, remote from danger, and undisputed, viewed all the evolutions of their enemies, and, from the peaceful regions of the air, commanded a distinct and comprehensive prospect of two formidable armies engaged in the work of death. (Month. Mag. vol. vi. p. 337.)

On the 28th of June 1802, M. Garnerin, a French aeronaut, in company with an English gentleman, as a voyage was conducted in a balloon of 20 feet diameter from Ranelagh Gardens to a distance of near 60 miles from London. They passed over London, rose to the height of 10,000 feet, and landed in three quarters of an hour. The temperature of the air when they ascended to the clouds was 15 degrees lower than on the surface of the earth; but when they rose above the clouds, it became sensibly milder. The rapidity of M. Garnerin's voyage is unequalled in the history of aerostation.

The frequency of aerial voyages, accompanied with the use of aerostation, particularly details of thrilling and uninteresting circumstances, and apparently made with a view to promote the interests of particular persons, regardless of any advancement in knowledge, had sunk the science of aerostation so low in the opinion of most people, that before we give an account of the most proper methods of constructing these machines, it is necessary to premise something concerning the uses to which they may possibly be applied. These, according to Mr Cavallo, are the following:

"The small balloons, especially those made of paper, and raised by means of spirit of wine, may serve to explore the direction of the winds in the upper regions of the atmosphere, particularly when there is a calm below; they may serve for signals in various circumstances, in which no other means can be used; and letters or other small things may be easily sent by them, as for instance from ships that cannot safely land on account of storms, from besieged places, islands, or the like. The larger aerostatic machines may answer all the above mentioned purposes in a better manner; and they may, besides, be used as a help to a person who wants to ascend a mountain, a precipice, or to cross a river; and perhaps one of these machines tied to a boat by a long rope, may be, in some cases, a better sort of sail than any that is used at present. The largest sort of machines, which can take up one or more men, may evidently be subervient to various economical and philosophical purposes. Their conveying people from one place to place with great swiftness, and without trouble, may be of essential use, even if the art of guiding them in a direction different from that of the wind should never be discovered. By means of those machines the shapes of certain seas and lands may be better ascertained; men may ascend to the tops of mountains they never visited before; they may be carried over marshy and dangerous grounds; they may by that means come out of a besieged place, or an island; and they may, in hot climates, ascend to a cold region of the atmosphere, either to refresh themselves, or to observe the ice, which is never seen below; and, in short, they may be thus taken to several places, to which human art hitherto knew of no conveyance.

"The philosophical use, to which these machines may be subervient, are numerous indeed: and it may be sufficient to say, that hardly any thing which passes in the atmosphere is known with precision, and that principally for want of a method of ascending into it. The formation of rain, of thunder storms, of vapours, hail,
AEROSTATION.

heat into it, or enclosing a quantity of gas specifically lighter than the common atmosphere in a certain space; both will ascend, and for the same reason. A cubic foot of air, by the most accurate experiments, has been found to weigh about 0.0014 grains, and to be expanded by every degree of heat, marked on Fahrenheit's thermoscope, about 0.57th part of the whole. By heating a quantity of air, therefore, to 500 degrees of Fahrenheit, we shall just double its bulk when the thermometer stands at 50 in the upper air, and in the same proportion we shall diminish its weight; and if such a quantity of hot air be enclosed in a bag, that the excess of the weight of the bag is more than the weight of the air contained in it, both the bag and air will rise into the atmosphere, and continue to do so until they arrive at a place where the external air is naturally so much rarer that the weight becomes equal: and here the whole will float.

The power of hot air in raising weights, or rather that by which it is itself impelled upwards, may be shown in the following manner: Roll up a sheet of paper into a conical form, and, by thrusting a pin into it near the apex, prevent it from unrolling. Fasten it then, by its apex, under one of the scales of a balance by means of a thread, and, having properly counterpoised it by weights, put it into the opposite scale; apply the flame of a candle underneath, you will instantly perceive the cone to arise, and it will not be brought into equilibrium with the other but by a much greater weight than those who have never seen the experiment would believe. If we try this experiment with more accuracy, by getting proper receptacles made which contain determinate quantities of air, we shall find that the power of the heat depends much more on the capacity of the bag which contains it than could well be supposed. Thus, let a cubical receptacle be made of a small wooden frame covered with paper, capable of containing one foot of air, and let the power of a candle be tried with this as above directed for the paper cone. It will then be found that a certain weight may be raised; but a much greater one will be raised by having a receptacle of the same kind which contains two cubic feet; a still greater by one of three feet; a yet greater by one of four feet, &c. and this even though the very same candle be made use of; nor is it known to what extent even the power of this small flame might be carried.

From these experiments it appears, that in the aerostatic machines constructed on Montgolfier's plan; a red-hot iron under one of the scales of a balance, by which the latter is instantly made to ascend; for as soon as the red-hot iron is brought under the scale, the hot air being lighter than that which is colder, ascends, and strikes the bottom, which is thus impelled upwards, and the opposite scale descends, as if a weight had been put into it.

Upon this simple principle depends the whole theory of aerostation; for it is the same thing whether we render the air lighter by introducing a quantity of

Principles of aerostation.

Experiments showing the impulse of heated air.
be near an ounce. Let its capacity be increased 16 times; and the tendency to arise will be equivalent to a pound, though this may be done without making the machine 16 times heavier than before. It is certain, however, that all aerostatic machines have a tendency to produce or preserve heat within them, which would by no means be imagined by those who have not made the experiment. When Messrs. Charles and Roberts made their longest aerial voyage of 150 miles, they had the curiosity to try the temperature of the air within their balloon, in comparison with that of the external atmosphere; and at this time they found, that when the external atmosphere was 63°, the thermometer within the balloon stood at 104°. Such a difference of temperature must have given a machine of the magnitude which carried them a considerable ascending power independent of any other cause, as it amounted to 41 grains on every cubic foot; and therefore in a machine containing 50,000 such feet would have been almost 200 pounds. Hence we may easily account for what happened at Dijon, and is recorded by M. M. D'Universel. He says the balloon, intended to be filled with inflammable air, being completed was, by way of trial, filled with common air, and in that state exposed to the atmosphere. Now it was observed, and indeed a similar observation had been made before, that the air within the balloon was much hotter than the circumambient air; the thermometer in the former stood at 120°; whereas in the latter, even when the sun shone upon it, the thermometer stood at 84°. This showed a considerable degree of rarefaction within the balloon; and consequently it was suspected, that by means of this rarefaction alone, especially if it were to increase a little, the balloon might ascend. On the 30th of May, about noon, the wind being rather strong, agitated the balloon so that two men were employed to take care of it; but, notwithstanding all their endeavours, it escaped from its confinement; and, lifting up about 65 pounds weight of cords, equatorial circle, &c. rose many feet high, and passing over some houses, went to the distance of 250 yards, where at length it was properly secured.

This difference between the external and internal heat being so very considerable, must have a great influence upon aerostatic machines, and will undoubtedly influence those filled with inflammable air as well as the other kind. Nor is it unlikely, that the short time which many aerial voyagers have been able to continue in the atmosphere may have been owing to the want of a method of preserving this internal heat. It may naturally be supposed, and indeed it has always been found, that balloons, in passing through the higher regions of the atmosphere, acquire a very considerable quantity of moisture, not only from the rain or snow they sometimes meet with, but even from the dew and vapour which condenses upon them. On this an evaporation will instantly take place; and, as it is the property of this operation to produce a very violent cold, the internal heat of the balloon must be soon exhausted in such a manner as to make it become specifically heavier than the common atmosphere, and consequently descend in a much shorter time than it would have done by the mere loss of air. To this, in all probability, we are to ascribe the descent of the balloon which carried Messrs. Blanchard and Jeffries; and which seemed so extraordinary to many people, that Great Britain were obliged to have recourse to an imaginary agency of attraction in the waters of the ocean, in order to solve M. Blanchard's balloon. This supposition is rejected by Mr. Cavallo; who explains the matter, by remarking, that sound acoustical experiments, in two former voyages made with the same machine, counted it could not long support two men in the atmosphere; so that we had no occasion to wonder at its weakness on this occasion. "As for its rising higher (says he), just when it got over the land, that may be easily accounted for. In the first place, the two travellers threw out their clothes just about that time; secondly, in consequence of the wind's then increasing, the balloon travelled at a much greater rate than it had done whilst over the sea; which increase of velocity lessened its tendency to descend: besides which, the vicissitudes of heat and cold may produce a very considerable effect; for if we suppose, that the air over the land was colder than that over the sea, the balloon coming into the latter from the former, continued to be hotter than the circumambient air for some time after; and consequently, it was comparatively much lighter when in the former than when in the hotter air over the sea; hence it floated easier in the former than in the latter case."

It seems indeed very probable, that there was something uncommon in the case of M. Blanchard's balloon while passing over the sea; for, as it rose higher after reaching the land than in any former period of the voyage, and likewise carried them to a distance over land more than half of that which they had passed over water, we can scarce avoid supposing, that it had a tendency to descend when over the water more than when over land, independent of any loss of air. Now, it does not appear that the air over the sea is at all warmer than that above land; on the contrary, there is every reason to believe, that the superior reflective power of the land renders the atmosphere above it warmer than the sea can do: but it is very natural to suppose, that the air above the sea is more moist than that above land; and consequently, by letting fall its moisture upon the balloon, must have occasioned an operation that would deprive the machinery of its internal heat, which it would partly recover after it entered the warmer and drier atmosphere over land.

We shall now proceed to the construction of aerostatic machines; of which the smaller are only portion of amusement, or some slight experiments, and are very easily made. As in all of them, however, it is of the utmost consequence to have the weight as little as possible, the shape becomes an object of great consideration. For this purpose a spherical figure has been made of their thermally demonstrated to be the best, as capable of containing a greater quantity under a smaller surface than any other. Thus a perfect sphere contains less surface in proportion to its solidity than a spheroid; a spheroid less than a cylindrical; the latter less than a cube; and a cube still less than a parallelepiped. In all cases, therefore, where we can fill the whole capacity of the balloon with air equally light, the spherical figure is undoubtedly to be preferred; and this holds good with regard to all inflammable air balloons, whether their size be great or small; but in the rarest air ones, where the under part must necessarily be much colder than the upper, the globular shape seems not so proper.
proper. An inverted cote, or truncated pyramid, with the smaller part undermost, seems then to be most proper, as it allows the heated air (which has a great tendency to expand as well as to ascend) to collect in the wide part at the top, while the useless surface, in the lower part, and which, in any other figure, would contain only the colder and heavier air, is thus thrown aside. In fact it has been found, that aerostatic machines, raised by means of rarefied air, when made of the shape of a paralleloped, or even one deviating still more from the shape of a globe, have answered the purpose as well as they could have been supposed to do, had ever so much care been taken in forming them exactly to that shape. The very first, machine made by M. Montgolfier was in form of a paralleloped; and though it contained only 40 cubic feet, showed a very considerable power of ascent. A very large one, 74 feet high, which M. Montgolfier had designed to exhibit before the royal family, had the middle part of it prismatic for about the height of 25 feet; its top was a pyramid of 29 feet; and its lower part was a truncated cone near 20 feet. It weighed 1000 pounds; and, notwithstanding its shape, in a very short time manifested a power of ascent equal to 500 pounds.

Another aerostatic machine of a small size, but of the figure of a paralleloped, being suffered to ascend with 30 sheets of oiled paper fixed in a wire frame, and set on fire, rose to a great height, and in 22 minutes could not be seen. It seems therefore, that, with regard to the shape, of these machines, it is by no means necessary to adhere rigidly to that of a sphere; but that any oblong form answers very well.

Materials. For experimental purposes, both the inflammable and rarefied air balloons may be made of paper; the former being made of that kind called thin post, varnished over with linseed oil; the latter either of that or any other kind, without varnish. In order to avoid the danger of burning, however, it has been proposed to impregnate the paper of which these small and rarefied air balloons are made with a solution of sal ammoniac, alum, or some other salt: but this does not seem to be necessary. Those filled with inflammable air have been made of gold-beaters skin or peeled bladders; but the cheaper material of paper is undoubtedly preferable.

For aerostatic machines of a larger size, the material universally employed is varnished silk; and for those of the rarefied air kind, linen painted over with some size colour, or lined with paper. The best varnish for an inflammable air balloon is that made with birdlime, and recommended by M. Faujas de Saint Fond, in a treatise published on the subject. The following is his method of preparing it: "Take one pound of birdlime, put it into a new proper earthen pot that can resist the fire, and let it boil gently for about an hour, viz. till it cease to crackle; or, which is the same thing, till it is so far boiled, as that a drop of it being let fall upon the fire will burn; then pour upon it a pound of spirit of turpentine, stirring it at the same time with a wooden spatula, and keeping the pot at a good distance from the flame, lest the vapour of this essential oil should take fire. After this, let it boil for about six minutes longer; and then pour upon the whole three pounds of boiling oil of nuts, linseed, or poppy, rendered drying by means of litharge; stir it well, let it boil for a quarter of an hour longer, and the varnish is made. After it has rested for 24 hours, and the sediment has gone to the bottom, decant it into another pot; and when you want to use it, warm, and apply it with a flat brush upon the silk stuff, whilst that is kept well stretched. One coat of it may be sufficient; but if two are necessary, it will be proper to give one on each side of the silk, and to let them dry in the open air while the silk remains extended."

Mr Cavallo gives the following method of preparing this varnish, which he prefers to that of M. de Stilo's method: "In order to render linseed oil drying, boil it with two ounces of saccharum saturni and three ounces of litharge, for every pint of oil, till the oil has dissolved them, which will be accomplished in half an hour; then put a pound of birdlime and half a pint of the drying oil into a pot (iron or copper pots are the safest for this purpose), the capacity of which may be equal to about one gallon, and let it boil very gently over a slow charcoal fire till the birdlime ceases to crackle, which will be in about half or three quarters of an hour; then pour upon it two pints and a half more of drying oil, and let it boil for one hour longer, stirring it very frequently with an iron or wooden spatula. As the varnish, whilst boiling, and especially when it is nearly done, swells very much, care should be had to remove, in those cases, the pot from the fire, and to replace it when the varnish subsides, otherwise it will boil over. Whilst the stuff is boiling, the operator should, from time to time, examine whether the varnish has boiled enough; which is thus known:—Take some of it upon the blade of a knife, and then, after rubbing the blade of another knife upon it, separate the knives; and when, on this separation, the varnish begins to form threads between the two, you may conclude that it is done; and, without losing time, it must be removed from the fire. When it is almost, though not quite cold, add about an equal quantity of spirit of turpentine; mix it well together, and let it rest till the next day; when, having warmed it a little, strain and bottle it. If it is too thick, add some more spirit of turpentine. When this varnish is laid upon the silk, the stuff should be made perfectly dry, and stretched; so that the varnish, which ought to be used lukewarm, may fill up the pores of the stuff. The varnish should be laid once very thin upon one side of the stuff; and, about 12 hours after, two other coats of it should be laid on, one on each side; and, 24 hours after, the silk may be used, though, in cold weather, it may be left to dry some time longer."

Much has been said in France of their elastic gum varnish, and its composition kept a secret; but Mr Baldwin, after many expensive trials, declares to the world what he considers as the secret; and it is merely this: "Take any quantity of caschouche, as two ounces avoidance cloth; cut it into small bits with a pair of scissors; put a strong iron ladle (like that used by plumbers) over a common pitcher or other fire. The fire must be gentle, glowing, and without smoke. When the ladle is hot, much below a red heat, put a single bit into the ladle. If black smoke issues, it will presently flame and disappear, or it will evaporate without flame: the ladle is then too hot. When the ladle is less hot, put in a second bit, which will produce
duce a white smoke. This white smoke will continue during the operation, and evaporate the caoutchouc; therefore no time is to be lost; but little bits are to be put in, a few at a time, till the whole are melted. It should be continually and gently stirred with an iron or brass spoon. Two pounds of one quart of the best drying oil (or of raw linseed oil, which together with a few drops of neat's foot oil, has stood a month, or not so long, on a lump of quicksilver, to make it more or less drying), is to be put into the melted caoutchouc, and stirred till hot, and the whole poured into a glazed vessel through a coarse gauze or fine sieve. When settled and clear, which will be in a few minutes, it will be fit for use either hot or cold. Mr Baldwin is not at liberty, he observes, to publish the art of laying on the varnish; but says, that it consists in making so instant motion in the varnish, which would create minute bubbles; that therefore brushes are improper. M. Blanchard’s method of making elastic gum varnish for the silk of a balloon, is the following. Dissolve elastic gum (caoutchouc) cut small, in five times its weight of spirit of turpentine, by keeping them some days together; then boil one ounce of this solution in eight ounces of drying linseed oil for a few minutes; lastly, strain it. It must be used warm. The pieces of silk for the balloon must be cut out of a proper size, according to the dimensions, after the varnish is sufficiently dry. They may be joined by laying about half an inch of the edge of one piece over the edge of the other, and sewing them by a double stitching. M. Blanchard uses expeditiously the following method: He lays about half an inch of the edge of one piece flat over the edge of the other, and passes a hot iron over it; in doing which a piece of paper ought to be laid both under and over the silk. The joining may be rendered more secure by running it with a silk thread, and stitching a ribbon over it. The ribbons laid over seams may be stuck with common glue, provided the varnish of the silk is properly dried. When the glue is quite dry, the ribbons should be varnished over, to prevent their being unglued by the rain.

The best method of cutting the pieces of silk that are to form a balloon, is to describe a pattern of wood or stiff card paper, and then to cut the silk upon it. As the edges of such a pattern are not perfect circles, they cannot be described by a pair of compasses; but the best method of drawing them is as follows. First, Draw on a flat surface two right lines AE and BC, fig. 2, perpendicular to each other. Secondly, Find the circumference answering to the given diameter of the balloon in feet and decimals of a foot; and make AD and DE each equal to a quarter of the circumference, so that the whole length AE of the pattern may be equal to half the circumference. Thirdly, Divide AD into 18 equal parts; and to the points of division apply the lines FG, HI, KL, &c. parallel to each other, and perpendicular to AD. Fourthly, Divide the whole circumference in twice the given number of pieces, and make DC and BB each equal to the quotient of this division; so that the whole, BC, is equal to the greatest breadth of one of these pieces. Fifthly, Multiply the above-mentioned quotient by the decimals annexed to FG, viz. 0.99519, and then the product express the length of FG; again, multiply the same length of DE by the decimals annexed to HI, and the product expresses the length of HI; and, in short, the product arising from the multiplication of the length of DC by the decimals annexed to each of the parallel lines, gives the length of that line. Lastly, Having found the lengths of all these lines, draw by hand a curve line passing through all the extremities of the said lines, and that is the edge of one quarter of the pattern. The other quarters may be easily described, by applying to them a piece of paper cut according to that already found. Suppose, for example, that the diameter of the balloon to be constructed is 20 feet, and that it is required to make it of 12 pieces; then, in order to draw the pattern for those pieces, find the circumference of the balloon, which is 62.85 feet, and dividing it by four, the quotient is 15.7 feet; make therefore AD equal to 15.7 feet, and DE likewise of the same length. Divide the circumference 62.85 by 24, which is double the number of pieces that are to form the balloon, and the quotient, 2.618 feet, is the length of DC and likewise of BD; so that BC is equal to 5.236 feet. Then having divided the line AD into 18 equal parts, and having drawn the parallel lines from those points of division, find the length of each of those lines by multiplying 2.618 by the decimals annexed to that line. Thus, 2.618 multiplied by 0.99519, gives 2.608 feet for the length of FG; and again, multiplying 2.618 by 0.99519, gives 2.578 feet for the length of HI; and so on the rest. In cutting the pieces after such a pattern, care should be taken to leave them about three quarters of an inch all round larger than the pattern, which will be taken up by the seams.

To the upper part of the balloon there should be adapted, and well fitted in, a valve, opening inwards; to which should be fastened a string passing through a hole made in a small piece of round wood fixed in the lowest part of the balloon opposite to the valve, and the end of this string fastened in the car below, so that the aeronaut may open the valve when occasion requires. The action of this valve may be understood from fig. 3. A round brass plate AB has a round hole CD, about two or three inches diameter, covered on both sides with strong smooth leather. On the inside there is a shutter E, also of brass, covered with leather, which is to close the hole CD; being about two inches larger in diameter than the hole. It is fastened to the leather of the plate AB; and by a spring, which need not be very strong, it is kept against the hole. The elasticity of the gas itself will help to keep it shut. To this shutter the string is fastened, by which it is occasionally opened for the escape of gas. A small string or other security should be fixed to the shutter and the plate, so as not to admit the shutter to be opened beyond a certain safe distance. To the lower part of the balloon two pipes should be fixed, made of the same stuff as the envelope; 6 inches diameter for a balloon of 30 feet, and proportionately larger for balloons of a greater capacity. They must be long enough for the car. For balloons of 18 feet and less diameter, one neck or pipe will be sufficient. These pipes are the apertures through which the inflammable gas is introduced into the balloon.

The car or boat is best made of wicker work, covered with leather, and well painted or varnished over; and the proper method of suspending it, is by ropes proceeding.
Practice.

AEROSTATION.

ceeding from the net which goes over the balloon. This net should be formed to the shape of the balloon, and fall down to the middle of it, with various cords proceeding from it to the circumference of a circle about two feet below the balloon; and from that circle other ropes should go to the edge of the boat. This circle may be made of wood, or of several pieces of slender cane bound together. The meshes of the net may be small at top, against which part of the balloon the inflammable air exerts the greatest force; and increase in size as they recede from the top. A hoop has sometimes been applied around the middle of the balloon to fasten the net. This, though not absolutely necessary, is best made of pieces of cane bound together, and covered with leather.

With regard to the rarefied air machines, Mr Cavalo recommends first to soak the cloth in a solution of sal-ammoniac and common size, using one pound of each to every gallon of water; and when the cloth is quite dry, to paint it over in the inside with some earthly colour, and strong size or glue. When this paint has dried perfectly, it will then be proper to varnish it with oily varnish, which might dry before it could penetrate quite through the cloth. Simply drying linseed oil will answer the purpose as well as any, provided it be not very fluid.

It now only remains to give some account of the method by which aerostatic machines may be filled with their proper gas, in order to give them their power of ascending into the atmosphere; and here we are enabled to determine with much greater precision concerning the inflammable air balloons than the others. With regard to them, a primary consideration is, the most proper method of procuring the inflammable air. It may be obtained in various ways, as will be shown under the article Chemistry. But the most advantageous methods are, by applying acids to certain metals; by exposing animal, vegetable, and some mineral substances, in a close vessel to a strong fire; or by transmitting the vapour of certain fluids through red-hot tubes.

1. In the first of these methods, iron, zinc, and sulphuric acid are the materials most generally used. The sulphuric acid must be diluted with five or six parts of water. Iron may be expected to yield in the common way 1700 times its own bulk of gas; or one cubic foot of inflammable air to be produced by 41/2 ounces of iron, the like weight of sulphuric acid, and 22 1/2 ounces of water. Six ounces of zinc, an equal weight of sulphuric acid, and 30 ounces of water, are necessary for producing the same quantity of gas. It is more proper to use the turnings or chippings of great pieces of iron, as of cannon, &c. than the filings of that metal, because the heat attending the effervescence will be diminished; and the diluted acid will pass more readily through the interstices of the turnings when they are heaped together, than through the filings, which stick closer to one another. The weight of the inflammable air thus obtained by means of sulphuric acid, is in the common way of procuring it, generally one-seventh part of the weight of common air; but with the necessary precautions for philosophical experiments, less than one-tenth of the weight of common air. Two other sorts of elastic fluids are sometimes generated with the inflammable air. These may be separated from it by passing the inflammable air through water in which quicklime has been dissolved. The water will absorb these fluids, cool the inflammable air, and prevent its over-heating the balloon when introduced into it.

Fig. 4. of Plate II. represents an apparatus described by Mr Cavalo as proper for filling balloons of the size of two or three feet in diameter with inflammable air, after passing it through water.—A is the bottle with the ingredients: BCD a tube fastened in the neck of B, and passing through C, the cork of the other bottle, in which there is another hole made to receive the tube on which the balloon is tied. Thus it is plain, that the inflammable air coming out of the tube D will pass first through the water of the bottle E and then into the balloon. Two small casks may be used instead of the bottles A and E.

2. Inflammable air may be obtained at a much cheaper rate by the action of fire on various substances; but the gas which these yield is not so light as that produced by the effervescence of acids and metals. The substances proper to be used in this way are, pitcoal, asphaltum, amber, rock-oil, and other minerals; wood, and especially oak, camphor-oil, spirits of wine, ether, and animal substances, which yield air in different degrees, and of various specific gravities: but pitcoal is the preferable substance. A pound of this exposed to a red heat, yields about three cubic feet of inflammable air, which, whether it be passed through water or not, weighs about one-fourth of the weight of common air.

Dr Priestley found, as we have elsewhere noticed, that animal or vegetable substances will yield six or seven times more inflammable air when the fire is suddenly increased than when it is gently raised, though it be afterwards made very strong. Mr Cavalo observes, that the various substances above enumerated generally yield all their inflammable air in about one hour's time. The general method is, to enclose the substances in iron or earthen vessels, and thus expose them to a strong fire sufficiently to make the vessels red-hot; the inflammable air proceeding from the aperture of the vessel is received into a tube or refrigeratory, and, passing through the tube or worm, is at last collected in a balloon or other vessel. A gun-barrel has often been used for essays of this kind. The substance is put into it so as to fill six or eight inches of its lowest part, the remainder filled with dry sand: a tube, adapted to the mouth of the barrel, is brought into a basin of water under an inverted receiver; and the part of the barrel containing the substance being put into the fire and made red-hot, the inflammable air is collected in the inverted receiver. As the gun-barrel cannot serve for producing a large quantity of inflammable air, Mr Cavalo recommends, as the most advantageous shape, the following contrivance: Let the vessel be made of clay, or rather of iron, in the shape of a Florence flask, somewhat larger, and whose neck is longer and larger (See ABC, Fig. 5). Put the substance to be used into this vessel, so as to fill about four-fifths or less of its cavity AB. If the substance is of such a nature as to swell much by the action of the fire, let a tube of brass, or first a brass and then a leaden tube, to the neck C of the vessel; and let the end D of the tube be shaped as in the figure, so that going into the water of a tube HI, it may terminate under a sort of inverted ves-

Practice.

Sel EF, to the upper aperture of which the balloon G is adapted. Things thus prepared, if the parts A B C of the vessel are put into the fire, and made red hot, the inflammable air produced will come out of the tube CD, and passing through the water will at last enter into the balloon G. Previous to the operation, as a considerable quantity of common air remains in the inverted vessel EF, which is in like manner to expel, the vessel EF should have a stop-cock K, through which the common air may be sucked out, and the water ascend as high as the stop-cock. The dimensions of such an apparatus Mr Cavallo gives thus: Diameter of largest part of the vessel ABC seven inches, length of whole vessel 16 inches; diameter of its aperture one inch, diameter of the cavity of the tube CD three-fourths of an inch; lower aperture of the vessel EF six inches, least height of the vessel EF 24 inches; its aperture F about two inches. The aperture of the vessel EF should be at least one foot below the surface of the water in HI. Care must be taken that the fire used in this process be at a sufficient distance, otherwise it may happen to fire the inflammable air which may escape out of the vessel EF.

3. The last method of obtaining inflammable air was discovered by M. Lavoisier, and also by Dr Priestley. M. Lavoisier made the steam of boiling water pass through the barrel of a gun, kept red hot by burning coals. Dr Priestley uses, instead of the gun-barrel, a tube of red-hot brass, upon which the steam of water has no effect, and which he fills with the pieces of iron which are separated in the boring of cannon. By this method he obtains an inflammable air, the specific gravity of which is that of common air as 1 to 12. In this method, not yet indeed reduced to general practice, a tube about three quarters of an inch in diameter, and about three feet long, is filled with iron turnings; then the neck of a retort, or of close boiler, is luted to one of its ends, and the worm of a refrigeratory is adapted to its other extremity. The middle part of the tube is then surrounded with burning coals, so as to keep about one foot in length of it red hot, and a fire is always made under the retort or boiler sufficient to make the water boil with vehemence. In this process a considerable quantity of inflammable air comes off out of the worm of the refrigeratory. It is said that iron yields one-half more air by this means than by the action of sulphuric acid.

For filling large balloons, a greater quantity is necessary; and the only materials that can, with any certainty of success, be employed for producing the proper gas, are, sulphuric acid, and iron filings or turnings. It has indeed been recommended to use zinc instead of iron filings, because white vitriol, the salt produced by the union of the sulphuric acid and zinc, is much more valuable than the green sort produced by the union of the same acid with iron. But though this is undoubtedly the case, it will as certainly be found, upon trial, that the superior price of the zinc will be more than an equivalent for all the advantage that can be derived from the additional price of the white vitriol.

For a balloon of 3 feet diameter, Mr Cavallo recommends 3000 pounds of iron turnings, as much sulphuric acid, and 19,500 pounds of water. These proportions, however, appear too great with respect to the acid and metal, and too little with respect to the water. Sulphuric acid will not exert its power upon iron unless it be diluted with five or six times its quantity of water, in which case, a much smaller quantity of both acid and metal will serve. Mr Lunardi, who Mr Lunardi, from the number of his voyages had certainly much more practical knowledge in aeronautics, filled his balloon thus.

at Edinburgh and Glasgow with about 2000 pounds of iron (the boric of cannon procured from Carron), as much sulphuric acid, and 12,000 pounds of water. The iron was placed in his vessels in layers, with straw between them, in order to increase the surface. His apparatus was not materially different from that of Mr Cavallo, fig. 6, where AA are two tubes, about three feet in diameter and nearly two feet deep, inverted in large tube BB filled with water. In the bottom of each of the inverted tubes a hole is made, and a tube E of tin adapted, which is about seven inches in diameter, and seven or eight long. To these tubes the silken ones of the balloon are to be tied. Round each of the tube B, five, six, or more strong casks are placed; in the top of each two holes are made, and to one of these holes a tin tube is adapted, and so shaped, that, passing over the edge of the tube B, and through the water, it may terminate with its aperture under the inverted tube A. The other hole of these casks serves for the introduction of materials, and is stopped with a wooden plug. When the balloon is to be filled, put the net over it, and let it be suspended as shown by CDF; and having expelled all the common air from it, let the silken tube be fastened round the tin ones EE; and the materials being put into the casks, the inflammable air, passing into the balloon, will soon distend, and render it capable of supporting itself; after which the rope GH may be slipped off. As the balloon continues to be filled, the net is adjusted properly round it; the cords that surround it are fastened to the hoop MN; then the boat IK being placed between the two sets of casks, is fastened to the hoop MN, and every thing that is required to be sent up, as ballast, instruments, &c. is placed in it. At last when the balloon is little more than three quarters full, the silken tubes are separated from the tin ones of the inverted tubes, and their extremities being tied up, are placed in the boat. Lastly, The aeronauts being seated in the boat, the lateral ropes are slipped off, and the machine is abandoned to the air. (See Blanchard's Balloon, Plate III.)

This apparatus was at last reduced by Mr Lunardi to its utmost simplicity, by using only two large casks, and suffering the vapour to go into the balloon without passing through water. Thus his balloon was filled in less than half an hour, when, before, it had required two hours at least. The sinking of his casks in the ground was also an additional convenience, as it created no confusion, and rendered the materials much more easily conveyed into them.

With regard to the rarefied air balloons, the method of filling them is as follows. A scaffold ABCD, fig. 7, rarefied air balloons.

The breadth of which is at least two-thirds of the diameter of the machine, is elevated about six or eight feet above the ground. From the middle of it descends a well E, rising about two or three feet above it, and reaching to the ground, furnished with a door or two, through which the fire in the well is supplied with fuel. The well should be constructed of brick or of plastered wood.
wood, and its diameter should be somewhat less than that of the machine. On each side of the scaffold are erected two masts HI, KI, each of which has a pulley at the top, and rendered firm by means of ropes KG, KP, HP, HG. The machine to be filled is to be placed on the scaffold, with its neck round the aperture of the well. The rope passing over the pulleys of the two masts, serves, by pulling its two ends, to lift the balloon about 15 feet or more above the scaffold; and the rest of the machine is represented by the dotted lines in the figure MNO. The machine is kept steady, and held down, whilst filling, by ropes passing through loops or holes about its equator; and the ropes may easily be disengaged from the machine, by slipping them through the loops when it is able to sustain itself. The proper combustibles to be lighted in the well, are those which burn quick and clear, rather than such as produce much smoke; because it is hot air, not hot smoke, that is required to be introduced into the machine. Small wood and straw have been found to be very fit for this purpose. Mr Cavallo observes, as the result of many experiments with small machines, that spirit of wine is upon the whole the best combustible; but its price may prevent its being used for large machines. As the current of hot air ascends, the machine will soon dilate, and lift itself above the scaffold and gallery which was covered by it. The passengers, fuel, instruments, &c. are then placed in the gallery. When the machine makes efforts to ascend, its aperture must be brought, by means of the ropes annexed to it, towards the side of the well a little above the scaffold; the fire place is then suspended in it, the fire lighted in the grate, and the lateral ropes being slipped off, the machine is abandoned to the air. (See Montgolfier's balloon, Plate III.) It has been determined by accurate experiments, that only one-third of the common air can be expelled from these large machines: and therefore the ascending power of the rarefied air in them can be estimated as only equal to half an ounce avoirdupois for every cubic foot.

The conduct of balloons, when constructed, filled, and actually ascending in the atmosphere, is an object of great importance in the practice of aeronautics. The method generally used for elevating or lowering the balloons with rarefied air, has been the increase or diminution of the fire: and this is entirely at the command of the aeronaut, as long as he has any fuel in the gallery. The inflammable air balloons have been generally raised or lowered by diminishing the weight in the boat, or by letting out some of the gas through the valve; but the alternate escape of the air in descending, and discharge of the ballast for ascending, will by degrees render the machine incapable of floating; for in the air it is impossible to supply the loss of ballast, and very difficult to supply that of inflammable air. These balloons will also rise or fall by means of the rarefaction or condensation of the enclosed air, occasioned by heat and cold. It has been proposed to aid a balloon in its alternate motion of ascent and descent, by annexing to it a vessel of common air, which might be condensed for lowering the machine, and rarified again, by expelling part of it, for raising the machine: But a vessel adapted to this purpose must be very strong; and, after all, the assistance afforded by it would not be very considerable. M. Meunier, in order to attain this end, proposes to enclose one balloon filled with common air in another filled with inflammable air: as the balloon ascends, the inflammable air is diluted, and of course compresses the internal balloon containing the common air: and by diminishing its quantity, lessens its weight. If it should be necessary to supply this loss, he says it may be easily done by a pair of bellows fixed in the gallery. Others have proposed to annex a small machine with rarefied air to an inflammable air balloon by ropes, at such a distance that the fire of the former might not affect the inflammable air of the latter: the whole apparatus, thus combined, of balloons formed on the two principles of heated and inflammable air, might be raised or lowered by merely increasing or diminishing the fire in the lower balloon.

Wings or oars are the only means of this sort that have been used with some success: and, as Mr Cavallo observes, they seem to be capable of considerable improvement; although great effects are not to be expected from them, when the machine goes at a great rate. The best methods of moving those wings are by the human strength applied similarly to the oars of a waterman. They may be made in general of silk stretched between wires, tubes, or sticks; and when used, must be turned edgewise when they are moved in the direction in which the machine is intended to be impelled, but flat in the opposite direction. Fig. 8. is the representation of one of Mr Blanchard's wings. Fig. 9. is one of those used by Mr Lunardi, which consists of many silk shutters or valves, ABCD, DECF, &c. every one of which opens on one side only, viz. AD opens upon the line AB, DECF opens upon the line DC, &c. In consequence of this construction, this sort of oars does not need being turned edgewise. Fig. 10. represents one of the wings used by the brothers Roberts in the aerial voyage of the 19th September 1784; and fig. 11. represents one of the wings constructed by Count Zambecarri, which consists of a piece of silk stretched between two thin tubes set at an angle; but these wings are so contrived as to turn edgewise by themselves when they go on one direction. Other contrivances have been made to direct aeronautic engines, but they have mostly been invented to effect a power upon them as upon a ship. It appears, however, that they can have no effect when a machine is only moved by the wind alone, because the circumambient air is at rest in respect to the machine. The case is quite different with a vessel at sea, because the water on which it floats stands still whilst the vessel goes on; but it must be time and experience that can realize the expectations suggested by these contrivances.

A view of the principles of this science, and of the more recent aerial voyages, is given under the article AERONAUTICS in the SUPPLEMENT.
AESCHINES, a celebrated Grecian orator, was born at Athens 327 years before the Christian era. According to his own account, he was of distinguished birth; according to that of Demostenes, he was the son of a courtesan, and a humble performer in a company of comedians. But whatever was the true history of his birth and early life, his talents, which were considerable, procured him great applause, and enabled him to be a formidable rival to Demostenes himself. The two orators, inspired probably with mutual jealousy and animosity, became at last the strenuous leaders of opposing parties. AESCHINES was accused by Demostenes of having received money as a bribe, when he was employed on an embassy to Philip of Macedon. He indirectly retaliated the charge by bringing an accusation against Ctesiphon the friend of Demostenes for having moved a decree, contrary to the laws, to confer on Demostenes a golden crown, as a mark of public approbation. A numerous assembly of judges and citizens met to hear and decide the question; each orator employed all his powers of eloquence; but Demostenes, with superior talents, and with justice on his side, was victorious; and AESCHINES was sent into exile. The resentment of Demostenes was now softened into generous kindness; for when AESCHINES was going into banishment, he requested him to accept of a sum of money; which made him exclaim, “How do I regret leaving a country where I have found an enemy so generous, that I must despair of ever meeting with a friend who shall be like him!”

AESCHINES opened a school of eloquence at Rhodes, which was the place of his exile, and he commenced his lectures by reading to his audience the two orations which had been the cause of his banishment. His own oration received great praise; but that of Demostenes was heard with boundless applause. In so trying a moment, when vanity must be supposed to have been deeply wounded, with a noble generosity of sentiment, he said, “What would you have thought if you had heard him thunder out the words himself.”

AESCHINES afterwards removed to Samos, where he died, in the 75th year of his age, Three of his orations only are extant. His eloquence is not without energy,
AESCHYLUS, the tragic poet, was born at Athens. The time of his birth is not exactly ascertained; some suppose that it was in the 6th, others in the 7th Olympiad; but according to Stanley, who follows the Arundelian marbles, he was born in the 63d Olympiad. He was the son of Euphorion, and brother to Cynegirus and Aminias, who distinguished themselves in the battle of Marathon, and the sea-fight of Salamis, at which engagements Aeschylus was likewise present. In this last action, according to Diodorus Siculus, Aminias, the youngest of the three brothers, commanded a squadron of ships, and fought with so much conduct and bravery, that he sunk the admiral of the Persian fleet, and signalized himself above all the Athenians. To this brother our poet was, upon a particular occasion, obliged for saving his life: Aelian relates, that Aeschylus being charged by the Athenians with certain blasphemous expressions in some of his pieces, was accused of impiety, and condemned to be stoned to death: They were just going to put the sentence in execution, when Aminias, with a happy presence of mind, throwing aside his cloak, showed his arm without a hand, which he had lost at the battle of Salamis in defence of his country. This sight made such an impression on the judges, that, touched with the remembrance of his valour, and with the friendship he showed for his brother, they pardoned Aeschylus. Our poet, however, resented the indignity of this prosecution, and resolved to leave a place where his life had been in danger. He became more determined in this resolution when he found his pieces less pleasing to the Athenians than those of Sophocles, though a much younger writer. Some affirm, that Aeschylus never set down to compose but when he had drank liberally. He wrote a great number of tragedies, of which there are but seven remaining: and notwithstanding the sharp censures of some critics, he must be allowed to have been the father of the tragic art. In the time of Thespis, there was no public theatre to act upon; the strollers driving about from place to place in a cart. Aeschylus furnished his actors with masks, and dressed them suitably to their characters. He likewise introduced the buskin, to make them appear more like heroes. - The ancients gave Aeschylus also the praise of having been the first who removed murders and shocking sights from the eyes of the spectators. He is said likewise to have lessened the number of the chorus. M. Le Fevre has observed, that Aeschylus never represented women in love in his tragedies; which, he says, was not suited to his genius; but, in representing a woman transported with fury, he was incomparable. Longinus says, that Aeschylus has a noble boldness of expression; and that his imagination is lofty and heroic. It must be owned, however, that he affected pompous words, and that his sense is too often obscured by figures: this gave Sallustius occasion to say, that he was more difficult to be understood than the Scripture itself. But notwithstanding these imperfections, this poet was held in great veneration by the Athenians, who made a public decree that his tragedies should be played after his death. He was killed in the 69th year of his age, by an eagle letting fall a tortoise upon his head as he was walking in the fields. He had the honour of a pompous funeral from the Sicilians, who buried him near the river Gela; and the tragedians of the country performed plays and theatrical exercises at his tomb. The best edition of his plays is that of London, 1663, folio, with a Latin translation and a learned commentary by Thomas Stanley.

ÆSCYHNUMENÉ, BASTARD SENSITIVE PLANT, in Botany. See BOTANY Index.

ÆSCELAPIUS, in the heathen mythology, the god of physic, was the son of Apollo and the nymph Coronis. He was educated by the centaur Chiron, who taught him physic; by which means Æsculapius cured the most desperate diseases. But Jupiter, enraged at his restoring to life Hippolitus, who had been torn in pieces by his own horses, killed him with a thunderbolt. According to Cicero, there were three deities of this name: the first, the son of Apollo, worshipped in Arcadia, who invented the probe, and bandages for wounds; the second, the brother of Mercury, killed by lightning; and the third, the son of Arisippus and Arinoe, who first taught the art of tooth-drawing and purging. At Epidaurus, Æsculapius's statue was of gold and ivory, with a long beard, his head surrounded with rays, holding in one hand a knotty stick, and the other entwined with a serpent; he was seated on a throne of the same materials as his statue, and had a dog lying at his feet. The Romans crowned him with laurel, to represent his descent from Apollo; and the Phliasians represented him as beardless. The cock, the raven, and the goat, were sacred to this deity. His chief temples were at Pergamus, Smyrna, Trica a city in Ionia, and the isle of Coos; in all which votive tablets were hung up, showing the diseases cured by his assistance. But his most famous shrine was at Epidaurus; where, every five years, games were instituted to him, nine days after the Isthmian games at Corinth.

ÆSCLUS, the Horse-chestnut, in Botany. See BOTANY Index.

ÆSOP, the Phrygian, lived in the time of Solon, about the 50th Olympiad, under the reign of Cæsarius the last king of Lydus. As to genius and abilities, he was greatly indebted to nature; but in other respects was not so fortunate, being born a slave and extremely deformed. St Jerome, speaking of him, says he was unfortunate in his birth, condition in life, and death; knotting thereby at his deformity, servile state, and tragical end. His great genius, however, enabled him to support his misfortunes; and in order to alleviate the hardships of servitude, he composed those entertaining and instructive fables which have acquired him so much reputation. He is generally supposed to have been the inventor of that kind of writing; but this is contested by several, particularly Quintilian, who seems to think that Hesiod was the first author of fables. Æsop, however, certainly improved this art to a very great degree; and hence it is that he has been accounted the author of this sort of productions:

Æsopus auctor quam materiam reperit,
Hanc ego polivi versus senaris.

Phæd. Mins is the task, in easy verse,
The tales of Æsop to rehearse.

The.
The first master whom Aesop served, was one Carmus Demarchus, an inhabitant of Athens; and there, in all probability, he acquired his purity in the Greek tongue. After him he had several masters; and at length came under a philosopher named Idmon or Iadmon, who enfranchised him. After he had recovered his liberty, he soon acquired a great reputation amongst the Greeks; so that, according to Meziric, the report of his wisdom having reached Croesus, he sent to enquire after him, and engaged him in his service. He travelled through Greece, according to the same author; whether for his own pleasure, or upon the affairs of Croesus, is uncertain; and passing by Athens soon after Pisistratus had usurped the sovereign power, and finding that the Athenians bore the yoke very impatiently, he told them the fable of the frogs who petitioned Jupiter for a king. The images made use of by Aesop are certainly very happy inventions to instruct mankind; they possess all that is necessary to perfect a precept, having a mixture of the useful with the agreeable. "Aesop the fabulist (says Aulus Gellius) was deservedly esteemed wise, since he did not, after the manner of the philosophers, rigidly and imperiously dictate such things as were proper to be advised and persuaded; but framing entertaining and agreeable apologues, he thereby charms and captivates the human mind."—Aesop was put to death at Delphi. Plutarch tells us, that he came there with a great quantity of gold and silver, being ordered by Croesus to offer a sacrifice to Apollo, and to give a considerable sum to each inhabitant: but a quarrel arising between him and the Delphians, he sent back the money to Croesus; for he thought those for whom the prince designed it, had rendered themselves unworthy of it. The inhabitants of Delphi brought an accusation of sacrilege against him; and pretending they had convicted him, threw him headlong from a rock. For this cruelty and injustice, we are told they were visited with famine and pestilence; and consulting the oracle, they received for answer, that the god designed this as a punishment for their treatment of Aesop: they endeavoured to make an atonement, by raising a pyramid to his honour. Aesop, Clesius, a celebrated actor, who flourished about the 670th year of Rome. He and Roscius were cotemporaries, and the best performers who ever appeared upon the Roman stage; the former excelling in tragedy, the latter in comedy. Cicero put himself under their direction to perfect his action. Aesop lived in a most expensive manner, and at one entertainment is said to have had a dish which cost above eight hundred pounds; this dish, we are told, was filled with singing and speaking birds, some of which cost near 50l. The delight which Aesop took in this sort of birds proceeded, as Mr Bayle observes, from the expence. He did not make a dish of them because they could speak, according to the refinement of Pliny upon this circumstance, this motive being only by accident; but because of their extraordinary price. If there had been any birds that could not speak, and yet more scarce and dear than these, he would have procured such for his table. Aesop's son was no less luxurious than his father, for he dissolved pearls for his guests to swallow. Some speak of this as a common practice of his; but others mention his falling into this excess only on a particular day, when he was treating his friends. How race * speaks only of one pearl of great value, which he dissolved in vinegar, and drank. Aesop, notwithstanding his expences, is said to have died worth above 160,000. When he was upon the stage, he entered into his part to such a degree, as sometimes to be seized with a perfect ecstasy: Plutarch mentions it as reported of him, that whilst he was representing Atreus deliberating how he should revenge himself on Thyestes, he was so transported beyond himself in the heat of action, that with his truncheon he smote one of the servants crossing the stage, and laid him dead on the spot. Estimation capitis, a term met with in old law books for a fine anciently ordained to be paid for offences committed against persons of quality, according to their several degrees. Estival, in a general sense, denotes something connected with, or belonging to, summer. Hence, estival sign, estival solstice, &c. Estuaria, in Geography, denotes an arm of the sea, which runs a good way within land. Such is the Bristol channel, and many of the friths of Scotland. Estuaries, in ancient baths, were secret passages from the hypocaustum into the chambers. Estuary, among physicians, a vapour bath, or any other instrument for conveying heat to the body. Esymnium, in antiquity, a monument erected to the memory of the heroes by Esymnus the Megarean. He, consulting the oracle in what manner the Megareans might be most happily governed, was answered, If they held consultation with the more numerous: whom he taking for the dead, built the said monument, and a senate-house that took within its compass the monument; imagining, that thus the dead would assist at their consultations. (Pausanias.) Aeth, or Ath, a strong little town in the Austrian Netherlands and province of Hainaut, situated on the river Dender, about twenty miles south-west of Brussels. Athalia, or Iulia, in Ancient Geography, now Elba; an island on the coast of Etruria, in compass an hundred miles, abounding in iron. It was so called from avela, smoke, which issued from the shops of Vulcan. Aethelstan, see Athelstan. Aether, is usually understood of a thin, subtle matter, or medium, much finer and rarer than air; which commencing from the limits of our atmosphere, possesses the whole heavenly space. The word is Greek, α&omicron;θερ, supposed to be formed from the verb ἀ&omicron;θω, "to burn, to flame;" some of the ancients, particularly Anaxagoras, supposing it to be of the nature of fire. The philosophers cannot conceive that the largest part of the creation should be perfectly void; and therefore they fill it with a species of matter under the denomination of ether. But they vary extremely as to the nature and character of this aether. Some conceive it as a body sui generis, appointed only to fill up the vacuities between the heavenly bodies; and therefore confined to the regions above our atmosphere. Others suppose it of so subtle and penetrating a nature, as to pervade the air and other bodies, and possess the pores and intervals thereof. Others deny the existence of any such specific matter; and think the air itself, by that immense tenuity and expansion it is found capable of...
light upon this subject, and rendered it extremely probable that the aether so often talked of is no other than the electric fluid, or solar light, which diffuses itself throughout the whole system of nature.

AETHER, in Chemistry, a light, volatile, and very inflammable liquid, produced by distillation of acids with rectified spirit of wine. See Chemistry Index.  
AETHERAL, AETHERUS, something that belongs to, or partakes of, the nature of AETHER. Thus we say, the aetheral space, aetheral regions, &c.

Some of the ancients divided the universe, with respect to the matter contained therein, into elementary and aetheral matter. Under the aetheral world was included all that space above the uppermost element, viz. fire. This they supposed to be perfectly homogeneous, incorruptible, unchangeable, &c. The Chaldees placed an aetheral world between the empyreum and the region of the fixed stars. Besides which, they sometimes also speak of a second aetheral world, meaning by it the starry orb; and a third aetheral world, by which is meant the planetary region.

ÆTHIÓPIA. See ETHIOPIA and ABYSSINIA. ÆTHIÓPS, Mineral, Martial, and Antimonial. See Chemistry Index.  
ÆTHUSA, FOOL’S PARSLEY, in Botany. See Botany Index.

AEÍTANS, in church history, a branch of Arians, who maintained that the Son and Holy Ghost are in all things dissimilar to the Father. See AETIUS.

ÆTIOLÓGY, is that part of pathology which is employed in exploring the causes of diseases.

ÆTION, a celebrated painter, who has left us an excellent picture of Roxana and Alexander, which he exhibited at the Olympic games; it represents a magnificent chamber, where Roxana is sitting on a bed of most splendid appearance, which is rendered still more brilliant by her beauty. She looks downwards, in a kind of confusion, being aware of the presence of Alexander standing before her. A number of little Cupids flatter about, some holding up the curtain, as if to show Roxana to the prince, whilst others are busied in undressing the lady; some pull Alexander by the cloak, who appears like a young bashful bridegroom, and present him to his mistress: he lays his crown at her feet, being accompanied by Ebphesion, who holds a torch in his hand, and leans upon a youth, who represents Hymen. Several other little Cupids are represented playing with his arms; some carry his lance, stooping under so heavy a weight; others bear along his buckler, upon which one of them is seated, whom the rest carry in triumph; another lies in ambush in his armour, waiting to frighten the rest as they pass by. This picture gained Aetion so much reputation, that the president of the games gave him his daughter in marriage.  
ÆTITES, or EAGLE-STONE, in Natural History, a flinty or crusted stone, hollow within, and containing a nucleus, which, on shaking, rattles within. It was formerly in repute for several extraordinary magical as well as medical powers; such as preventing abortion, discovering thieves, and other ridiculous properties. The word is formed from aetos, “eagle,” the popular tradition being, that it is found in the eagle’s nest, whither it is supposed to be carried while the female...
male site, to prevent her eggs from being rotten. It is
found in several parts; near Trevoux in France, one
can scarcely dig a few feet, without finding consider-
sable strata or beds of the coarser or ferruginous kind. They
are originally soft, and of the colour of yellow ochre.
But the finest and most valued of all the eagle-stones,
are accidental states of one or other of our common
pebbles.

AETIUS, one of the most zealous defenders of
arianism, was born in Syria, and flourished about the
year 336. After being servant to a grammarian, of
whom he learned grammar and logic, he was ordained
deacon, and at length bishop, by Eudoxus patriarch of
Constantinople. Actius was banished into Phrygia
on account of his religious opinions; but was recalled from
exile on the accession of Julian, and was much esteemed
by that emperor. He died, it is supposed, at Con-
stantinople, about the year 366. St Epiphanius has
preserved 47 of his propositions against the Trinity.
His followers were called AETIANS.

AETIUS, a famous physician, born at Amida in
Mesopotamia, and the author of a work entitled Tetra-
biblos, which is a collection from the writings of those
physicians who went before him. He lived, according
to Dr Freind, at the end of the fifth or the beginning
of the sixth century.

AETIUS, governor of Gallia Narbonensis in the reign
of Valentinian III, forced the Franks who were passing
into Gaul to repass the Rhine. He defeated the Goths;
and routed Attila king of the Huns, who invaded Gaul
with an army of 700,000 men. But the emperor,
jealous of the merit of this great man, killed him in
454, with his own hand, under the pretense that he
had permitted the invasion of the Huns, after Attila's
defeat.

ÆTNA, (in the Itineraries Ethana, supposed from
æt, "to burn," according to Bochart, from athuna,
a furnace, or ætuna, darkness), now Monte Gibello:
a volcano or burning mountain of Sicily, situated in
N. Lat. 38°. E. Long. 15°.

This mountain, famous from the remotest antiquity,
both for its bulk and terrible eruptions, stands in
the eastern part of the island, in a very extensive plain,
called Vul di Demoni, from the notion of its being inhab-
ted by devils, who torment the spirits of the damned in
the bowels of this volcano.

Concerning the dimensions of Mount Ætna, we can
scarcely extract any thing consistent, even from the
accounts of the latest and most ingenious travellers. Pin-
dar, who lived about 455 years before Christ, calls it
the Pillar of Heaven, on account of its great height.
All modern writers likewise agree, that this mountain
is very high, and very large; but differ much both
as to its height and magnitude: some making it no
less than twelve miles high, others eight, others six,
some four; while Mr Brydone, and Sir William Ham-
ilton, who lately ascended to its highest summit,
reduce its height to little more than two miles; nay
by some it is reduced to 10,036 feet, somewhat less
than two miles. No less remarkable are the differ-
ences concerning its circumference: some making it
only 60 miles round, others 100; and Signior Recupe-
ro, from whom Mr Brydone had his information in
this respect, affirms it to be no less than 183 miles in
circuit.

We are sorry to retract from the merit of Mr Bry-
done, or to involve in obscurity what he has been at
so much pains to elucidate; but every person who com-
pares the account of Mount Ætna in different circum-
stances, given by Signior Recupero, and to which Mr Bry-
done seems to have assented, with its apparent cir-
cumference on the map prefixed to that gentleman's tour through
Sicily and Malta, must at once be struck with the pro-
digious disparity. Indeed, it is plain, that in the map,
the geographer has not left room for any such moun-
tain: nor can we help thinking, that, by comparing
the distances of some of the Sicilian towns from one
another, Signior Recupero's dimensions will be found
enormously exaggerated.—Certain it is, that where the
geographer has placed Catania, which stands at the
foot of Mount Ætna, on one side, there is no more than 28
miles from the most distant point of the river Alcan-
tara, which forms the boundary on the opposite side;
so that a circle, whose radius is 14 or 15 miles, must
compact as much space as we can possibly think is
occupied by the basis of Mount Ætna. Thus we shall
reduce the circumference of this famous mountain to
between 80 and 90 miles; and even when we do so, it
is perhaps too great.

But if we be embarrassed with the circumference of
Ætna, we are much more so with the accounts relating
to its height; and one circumstance, particularly, cre-
ares almost insurmountable difficulties. It is agreed
upon by all travellers, and among the rest by Sir William
Hamilton, that, from Catania, where the ascent first
begins, to the summit, is not less than 30 miles. The
descent on the other side we have no account of; but
whatever supposition we make, the height of the moun-
tain must be prodigious. If we suppose it likewise to
be 30 miles, and that Mount Ætna can be represented by
an equilateral triangle, each of whose sides is 30 miles,
we will have an amazing elevation indeed, no less than
26 miles perpendicular! Such a height being beyond
all credibility, we must contract the sides of our tri-
angle, in proportion to its basis. We shall begin with
allowing ten miles for the difference between a straight
line from Catania to the summit, and the length of
the road, occasioned by the inequalities of the moun-
tain; and supposing the descent on the other side to be
somewhat shorter, we may call it 15 miles. Mount
Ætna will now be represented by a scalene triangle,
whose base is 30 miles, its longest side 20, and its
shortest 15; from which proportions we will still find
its height to be betwixt eight and nine miles.—This
is Dimensions
still incredible, and when all the various relations con-
cerning the height of Ætna are compared, we hope it
will not be thought presumptuous in us to give it as
our opinion, that the true dimensions of this mountain
are as yet unknown. The following measures are given
by different authors.

Height above the surface of the sea, 10,326 feet.
One hundred and eighty miles circumference at the
cross-track.—Faujas de S St Fond, in his Volcans du Vivars.
Height 12,000 feet.—Brydone. Tour to Sicily.
Height 2500 toises.—La Plâtrière, said as from Re-
cupero.
Height 1950 toises.—Diameter 30 miles.—Mentelle
Geogr. comp.

Others make its height only 2200 toises, and its su-
face only 300 square miles.

Concerning
Concerning the products and general appearance of this volcano, authors are much better agreed. The journey from Catania to its summit has been lately described by several travellers, M. D'Orville, Mr Brydone, Sir William Hamilton, M. Houel, and the abbé Spallanzani. "They all agree, that this single mountain affords an epitome of the different climates throughout the whole world: towards the foot, it is extremely hot; farther up, more temperate; and grows gradually more and more cold the higher we ascend. At the very top, it is perpetually covered with snow: at the whole island is supplied with that article, so necessary in a hot climate, and without which the natives say Sicily could not be inhabited. So great is the demand for this commodity, that the bishop's revenues, which are considerable, arise from the sale of Mount Ætna's snow; and he is said to draw 1000l. a-year from one small portion lying on the north side of the mountain. Great quantities of snow and ice are likewise exported to Malta and Italy, making a considerable branch of commerce. On the north side of this snowy region, Mr Brydone was assured that there are several small lakes which never thaw; and that the snow, mixed with the ashes and salt of the mountain are accumulated to a vast depth. The quantity of salts contained in this mountain, he, with great probability, conjectures to be one reason of the preservation of its snows; for salt increases the coldness of snow to a surprising degree.

In the middle of the snowy region stands the great crater, or mouth of Ætna; from which, though contrary to the usual method of travellers, we shall begin our particular account of this mountain. Sir William Hamilton describes the crater as a little mountain, about a quarter of a mile perpendicular, and very steep, situated in the middle of a gently inclining plain, of about nine miles in circumference. It is entirely formed of stones and ashes; and, as was informed by several people of Catania, had been thrown up about 25 or 30 years before the time (1769) he visited Mount Ætna. Before this mountain was thrown up, there was only a prodigious large chasm, or gulf, in the middle of the above-mentioned plain; and it has been remarked, that about once in 100 years the top of Ætna falls in; which undoubtedly must be the case at certain periods, or the mountain behaved continually to increase in height. As this little mountain, though emitting smoke from every pore, appeared solid and firm, Sir William Hamilton and his companions went up to the very top. In the middle is a hollow, about two miles and a half in circumference, according to Sir William Hamilton; three miles and a half, according to Mr Brydone; and three or four, according to M. D'Orville. The inside is crusted over with salts and sulphur of different colours. It goes shewing down from the top, like an inverted cone; the depth, in Sir W. Hamilton's opinion, nearly corresponding to the height of the little mountain. From many places of this space issue volumes of sulphureous smoke, which being much heavier than the circumambient air, instead of ascending in it, roll down the side of the mountain, till, coming to a more dense atmosphere, it shoots off horizontally, and forms a large track in the air, according to the direction of the wind; which, happily for our travellers, carried it exactly to the side opposite to which they were placed. In the middle of this funnel is the tremendous and unfathomable gulf, so much celebrated, in all ages, both as the terror of this life, and the place of punishment in the next. From this gulf continually issue terrible and confused noises, which in eruptions are increased to such a degree as to be heard at a prodigious distance. Its diameter is probably very different at different times: for Sir W. Hamilton observed, by the wind clearing away the smoke from time to time, that the inverted hollow cone was contracted almost to a point; while M. D'Orville and Mr Brydone found the opening very large. Both Mr Brydone and Sir W. Hamilton found the crater too hot to descend into it; but M. D'Orville was bolder: and accordingly he and his fellow traveller, fastened to ropes which two or three men held at a distance for fear of accidents, descended as near as possible to the brink of the gulf; but the small flames and smoke which issued from it on every side, and a greenish sulphur, and punice stones, quite black, which covered the margin, would not permit them to come so near as to have a full view. They only saw distinctly, in the middle, a mass of matter which rose in the shape of a cone, to the height of above 60 feet, and which towards the base, as far as their sight could reach, might be 600 or 800 feet. While they were observing this substance, some motion was perceived on the north side, opposite to that whereon they stood; and immediately the mountain began to send forth smoke and ashes. This eruption was preceded by a sensible increase of its internal roarings; which, however, did not continue; but after a moment's dilatation, as if to give it vent, the volcano resumed its former tranquillity; but as it was by no means proper to make a long stay in such a place, our travellers immediately returned to their attendants.

On the summit of Mount Ætna, Sir W. Hamilton observes, that he was sensible of a difficulty in respiration from the too great subtility of the air, independent of what arose from the sulphurous smoke of the mountain. Mr Brydone takes no notice of this; which probably rose from the air being in a more rarefied state at the time of Sir W. Hamilton's observation than of Mr Brydone's; the barometer, as observed by the former, standing at 18 inches and 10 lines, by the latter at 19 inches 6½ lines.

In these high regions there is generally a very violent wind, which, as all our travellers found it constantly blowing from the south, is perhaps most frequently directed from that point. Here Mr Brydone's thermometer fell to 27°.

The top of Ætna being above the common region Splendid of vapour, the heavens appear with exceeding great of the stars splendour.—Mr Brydone and his company observed, as seen from the top of the starry ascending in the night, that the number of stars Ætna seemed to be indefinitely increased, and the light of each of them appeared brighter than usual; the whiteness of the milky-way was like a pure flame which shot across the heavens; and, with the naked eye, they could observe clusters of stars that were invisible from below. Had Jupiter been visible, he is of opinion that some of his satellites might have been discovered with the naked eye, or at least with a very small pocket glass. He likewise took notice of several of those meteors called falling stars; which appeared as much elevated as when viewed from the plain; a proof, according to Mr Brydone.
The woody region descends eight or nine miles below the Regione deserta, but differs greatly in the temperature of its climate. Sir W. Hamilton observed a gradual decrease of the vegetation as he advanced; the under part being covered with large timber trees, which grew gradually less as he approached the third region, and at last degenerated into the small plants of the northern climates. He also observed quantities of juniper and tamar; and was informed by his guide, that later in the season (he visited Etna in June) there are a great many curious plants, and in some places rhubarb and saffron in great plenty. In Carrera's history of Catania, there is a list of all the plants and herbs of Etna.

This region is extolled by Mr. Brydone as one of the most delightful spots on earth. He lodged for a night in a large cave near the middle, formed by one of the most ancient lavas. It is called La Speolana del Capriole, or the goats cavern; because it is frequented by those animals, which take refuge there in bad weather. Here his rest was disturbed by a mountain thrown up in the eruption 1756. It discharged great quantities of smoke, and made several explosions like heavy cannon fired at a distance; but they could observe no appearance of fire.

This gentleman likewise visited the eastern side of the Regione sylvosa, intending to have ascended that way to the summit, and descended again on the south side to Catania; but found it impracticable. On this Eruption side, part of the woody region was destroyed in 1755 by a torrent of boiling water, which issued from the great crater. Its traces were still very visible, about a mile and a half broad, and in some places more. The soil was then only beginning to recover its vegetative power, which it seems this torrent had destroyed for 14 years. Near this place are some beautiful woods of cork, and evergreen oak, growing absolutely out of the lava, the soil having hardly filled the crevices; and not far off, our traveller observed several little mountains that seemed to have been formed by a late eruption. Each of these had a regular cup, or crater, on the top; and, in some, the middle gulf, or voragine, as the Sicilians call it, was still open. Into these gulls Mr. Brydone tumbled down stones, and heard the noise for a long time after. All the fields round, to a considerable distance, were covered with large burnt stones discharged from these little volcanoes.

The woody region, especially the east side, called Oregus-Carpinetis, abounds with very large chestnut trees; the chesnut most remarkable of which has been called, from its size, Castagna de Cento Cavalli; or chestnut tree of a hundred horses. Mr. Brydone was greatly disappointed at the sight of this tree, as it is only a bush of five large ones growing together; but his guides assured him, that all these five were once united into one stem; and Signior Recupero told him, that he himself had been at the expense of carrying up peasants with tools to dig round it, and found all the stems united below ground in one root. The circumference, as measured by Mess. Brydone and Glover who accompanied him, amounted to 204 feet. Here the barometer stood at 26 inches 5 lines and a half, indicating an elevation of near 4000 feet.

The Piedmontes district is covered with towns, vil. Regione lages culta.
lages, monasteries, &c. and is well peopled, notwithstanding the danger of such a situation; but the fertility of the soil tempts people to inhabit that country; and their superstitious confidence in the saints, with the propensity mankind have to despise danger which they do not see, render them as secure there as in any other place. Here, Sir William Hamilton observes, they keep their vines low, contrary to the custom of those who inhabit Mount Vesuvius; and they produce a sort of wine, but not in such abundance; here also many terrible eruptions have burst forth; particularly one in 1699. At the foot of the mountain raised by that eruption, is a hole, through which Sir William Hamilton descended, by means of a rope, into several subterraneous caverns, branching out, and extending much farther than he chose to venture; the cold there was excessive, and a violent wind extinguished some of the torches. Many other caverns are known in this and the other regions of Ætna; particularly one near this place, called La Spelone della Palumba, (from the wild pigeons building their nests there). Here Mr. Brydone was told that some people had lost their senses, from having advanced too far, imagining they saw devils and damned spirits.

River Acis. In this region the river Acis, so much celebrated by the poets, in the fable of Acis and Galatea, takes its rise. It bursts out of the earth at once in a large stream, runs with great rapidity, and about a mile from its source throws itself into the sea. Its water is remarkably clear; and so extremely cold, that it is reckoned dangerous to drink it: it is said, however, to have a poisonous quality, from being impregnated with vitriol; in consequence of which cattle have been killed by it. It never freezes, but is said often to contract a greater degree of cold than ice.

Houel's observations. The following additional particulars relating to the eruptions, magnitude, scenery, and products of this celebrated volcano, are chiefly collected from the Voyage Pittoresque of M. Houel, who appears to have surveyed it with greater accuracy than any former traveller.

The form of Mount Ætna is that of a cone, very broad at the base, which is more than 40 miles in circumference. From the bottom you ascend ten leagues before reaching its summit on the south side; and on any of the other sides, the way being not so straight, would be considerably longer. Ætna is entirely composed of substances that have been discharged from the volcano in its various explosions.

It appears from the quantities of marine bodies deposited all over the under part of Ætna, that it must have been once covered by the sea to at least one half of its present height. The whole island of Sicily, and the greatest part of Mount Ætna, have been, in our author's opinion, formed under water. But the period when the eruptions from this volcano first commenced, the manner in which the sea subsided, and the precise time at which it fell so low as its present level on the shores of Sicily, are facts concerning which we have no certain knowledge.

The general principle, however, Mr. Houel thinks may be regarded as undeniable. When this mountain stood half under water, the currents of the ocean would gradually accumulate upon it large masses, both of its own productions, such as shells, and bones of fishes, and of various other matters, which would be intermixed with the volcanic matters discharged from the focus of the burning mount. In a long series of ages these strata of heterogeneous matters would naturally become so considerable, as to form the enormous mass of mountains with which the volcano is now surrounded. The currents of the ocean might often convey the volcanic matters to a considerable distance from the volcanic focus. And there are mountains at no small distance from Ætna, which seem to have been produced in this manner. Those of Caricintini, at the distance of 15 leagues, consist chiefly of a mixture of pozzolana with calcareous matters. At Lintini, and in places around it, there are distinct beds of pozzolana, scorice, and real lava, as well as others in which all these matters are blended together in a mass of calcareous matter. At Palazzolo, about 24 miles from the city of Syracuse, the sides of the hills having been cut by the streams which run down them, in many places to a considerable depth, display huge masses of lava, and extensive beds of pozzolana. In the neighbourhood of Noto there are also volcanic productions to be found.

At Pachino, where the island of Sicily forms an angle, there is a range of hills extending for several miles, which consist all of pozzolana.

The province of Val di Noto is more homogeneous in the matters of which its soil consists, than the two other dales of Sicily. These, in every hill which they contain, exhibit a vast variety of different matters. So amazing, indeed, is that variety, that they may be considered as exhibiting a collection of specimens of all the different materials which enter into the composition of the globe. In those two dales few volcanic productions have been yet observed. But it is not to be inferred for this reason that they contain but few. They may be hereafter discovered in great plenty. In the volcano of water at Maccalubbe, between Aragona and Girgenti; in the baths of Castellamare, near Alcamo and Segeste; in the baths of Termini; in the isles of Lipari; in the hot waters of Ali, between Messina and Taormina, by the lake in the valley of Caltagirone; in all these places, which comprehend the whole circumference of Sicily, the influence of the volcano of Ætna is, in some measure, felt. Nay, it would even seem, that in these places there are so many volcanic craters. All of these are so disposed as to show that they existed prior not only to the volcanic matters, but to the other substances intermixed with them.

The waters of the sea have, in former times, risen much higher than at present. But how they receded, or whether they are to continue stationary at their present height, we know not. For more than 2000 years, during which Sicily has been inhabited, and has had cities and harbours, the sea has not been observed either to recede or encroach in any considerable degree.

When the sea subsided from Mount Ætna, the mountain must have been covered over with such matters as the sea usually deposits; consequently with calcareous matters. A part of those matters would be indurated by the action of the atmosphere, while the rest would be carried down by the rain waters, and again conveyed into the ocean. The torrents of rain...
water which pour down the sides of Mount Etna have furrowed its sides, by cutting out for themselves channels; and they have removed from its summit, and are still removing to a further distance, all the extraneous bodies upon it. In many places, they flow at present over a channel of lava, having cut through all the matters which lay above it: still, however, there remain in many places both calcareous matter and other marine productions, which show that this volcano has been once covered by the waters of the ocean. But these are daily wasting away; not only the rains, but men likewise, who carry them off as materials for lime and for building, conspire to deface them.

No fewer than 77 cities, towns, and villages, are scattered over the sides of Etna. They are most numerous on the south side, where the temperature of the air is milder than on the north. Reckoning those cities, towns, and villages, one with another, to contain each 1200 or 1500 souls, the whole number of the inhabitants of Mount Etna will then be 92,400, or 115,500. But it is certainly much more considerable.

Plate IV. fig. 1. exhibits a view of the north-east side of the mountain, taken at sea. The lower part presents to the eye very extensive plains entirely covered with lava of different thickness, on which vegetation has not yet made any progress. The nearer the shore the more barren is the ground; while the fertility of the soil increases as we advance farther inwards. The mountain is everywhere full of vast excavations; which our author considers as a proof, that instead of increasing in bulk it is actually in a state of decay and diminution. The vast torrents of lava, which overspread the sides of it from time to time, he considers as insufficient to repair the waste occasioned by rains, rivulets, and torrents flowing from the summit. Unless the eruptions, therefore, become more frequent than they have been for some time past, he supposes that, by degrees, the height of the mountain must be reduced to that of the surrounding beds of lava. He had not an opportunity of measuring the altitude of Etna himself; but he observes, that it had been done by the celebrated M. de Saussure, who found the elevation to be 10,032 feet. This was done on the 5th of June 1773, at 20 minutes after seven in the morning. The height of the barometer on the most elevated part at the brink of the crater was 18 inches $1\frac{1}{2}$ lines; which, by the necessary corrections, is reduced to 18 inches $1\frac{3}{4}$ lines. At the same time the mercury at Catania, placed only one foot above the level of the sea, stood at 28 inches $2\frac{1}{2}$ lines; which must be reduced to 28 inches $1\frac{1}{2}$ lines, on account of the necessary correction for the thermometer.

Mountains of calcareous matter.

From Giana our author had an opportunity of contemplating the vast number of calcareous mounts scattered over that part of Etna; which (he says) "are nothing more than fragments, the slender remains of those enormous masses which have been deposited all around the base of Mount Etna; and are a very curious monument of the revolutions which this mountain has undergone." They are of a true calcareous nature; and the inhabitants are accustomed to supply themselves with limestone from them. They also use stones of which these mounts are composed for the purposes of building; as the lava is so hard that it cannot be cut without the greatest difficulty, and they have no other stone in these parts.

Leaving this place, our author travelled over several extensive plains of lava, covered on each side of the way with stunted trees, but without any cultivation: the lava being of that kind which is very unfavourable to the growth of vegetables. Arriving at St Leonardo, he observed the course of the eruption of water which happened in 1755.

This water took its course down the west side of the particular mountain: and the channel which it cut for itself is account of the eruption of water in 1755.

The eruption of water was still less frequent than that of lava or half vitrified solid matters, ashes, &c. though that of water, and even mixed with the shells of marine animals (though we are not told whether it was salt or not), has sometimes been observed in other volcanoes, particularly Vesuvius. The eruption we now speak of happened in the month of February 1755. It was preceded by an exceedingly thick black smoke issuing from the crater, intermixed with flashes of fire. This smoke gradually became thicker, and the bursts of flame more frequent. Earthquakes and subterraneous thunder convulsed the mountain, and struck the inhabitants of the adjacent parts with the utmost terror. On Sunday the second of March, the mountain was seen to emit a huge column of smoke, exceedingly dense and black, with a dreadful noise in the bowls of the earth, accompanied also with violent flashes of lightning. From time to time there were loud cracks, like the explosions of cannon; the mountain appeared to shake from its foundations; the air on that side next Mascali became very dark, and loud peals of thunder were heard. These seemed to issue from two caverns, considerably below the summit, on the side of the mountain, and were accompanied with violent blasts of wind like a tempest.

These terrible phenomena continued and increased; Etna seemed ready to swallow up at once all those materials which it had been for so many years disgorging, or rather about to sink at once into the bowls of the earth from whence it appeared to have been elevated. The prospect was far beyond any idea that can be given by description of this tremendous scene. The inhabitants were alarmed beyond measure; the sight of the flames driven by the winds against the sides of the mountain, the shocks of the earthquake, and the fall of rocks, struck the imagination with a horror not to be conceived. During this dreadful commotion, an immense torrent of water was emitted from the highest crater of the mountain. The whole summit of Etna was at that time covered with a thick coating of snow. Through this the boiling water directed its course eastward; and, in its passage, met with frightful precipices. Over these it dashed with the utmost violence, adding its tremendous roaring to the complicated horrors of this awful scene. The snow, melting instantaneously as the boiling torrent advanced, increased its destructive power by augmenting its quantity, while the mischievous effects of the heat were scarce diminished, by reason of the immense quantity of boiling liquid which continued to pour from the summit of the mountain.

This boiling torrent having dashed its awful cataclysms from one chain of rocks to another, at length
reached the cultivated plains, which it overflowed for a number of miles. Here it divided itself into several branches, forming as many deep and rapid rivers; which, after several other subdivisions, discharged themselves into the sea.

Though the mountain continued to discharge water in this manner only for half an hour, the ravages of it were very terrible. Not only those of common inundations, such as tearing up trees, hurrying along rocks and large stones, took place here, but the still more dreadful effects of boiling water were felt. Every cultivated spot was laid waste, and every thing touched by it was destroyed. Even those who were placed beyond the reach of the torrent, beheld with inexpressible horror the destruction occasioned by it; and though the alarming noises which had so long issued from the mountain now ceased in a great measure, the shocks of earthquakes and the violent smoke which continued to issue from the mountains, showed that the danger was not over. Two new openings were now observed, and two torrents of lava began to make their way through the snow.

On the 7th of March a dreadful noise was again heard in the bowels of the mountain, and a new column of very thick and black smoke began to issue from it. A horrid explosion of small stones succeeded; some of which were carried as far as the hills of Mascali, and great quantities of black sand to Messina, and even quite over the strait to Reggio in Calabria. On the shifting of the wind to the northward this sand reached as far as the plains of Agosta. Two days after the mountain opened again, and a new torrent of lava was discharged; which, however, advanced very slowly towards the plain, moving only at the rate of a mile in a day. It continued to flow in this manner for six days, when every thing appeared so quiet, that the Canon Recupero set out to view the changes which had taken place.

That gentlemen’s design was to trace the course of the dreadful torrent of water above mentioned. This he was very easily enabled to do by the ravages it had made; and, by following the channel it had cut all the way from the sea to the summit of the volcano, he found that this immense quantity of water had issued from the very bowels of the mountain. After issuing from the crater, and increasing its stream by passing through and melting the snow which lay immediately below the summit, it destroyed in an instant a fine and extensive forest of fir-trees. All of these were torn up by the violence of the current, though many were no less than 24 or 30 inches in diameter. He observed that the great stream had, in its descent, divided itself into four branches; and these had again subdivided themselves into several smaller ones, easily distinguishable by the quantity of sand they had deposited. Afterwards reuniting their streams, they formed many islands, and rivers 900 feet in breadth, and of a depth which could not easily be determined. Proceeding farther down, and still forcing its way among the beds of old lava, the channel of the waters was widened to 1,500 feet, until it was again contracted in the valleys as before. Every object which stood in the way of this tremendous torrent was moved from its place. Enormous rocks were not only hurried down, but several of them moved to more elevated situations than those they formerly occupied. Whole hills of lava had been removed and broken to pieces, and their fragments scattered along the course of the river, and the valleys were filled up by vast quantities of sand which the waters had deposited. Our author observed, that even at the time he visited the mountain, about ten years after the eruption, the whole side of it still bore the marks of this deluge.

On M. Houel’s arrival at Jaci Catena, he inquired for the physician of the place; it being customary for strangers to do so who want to learn anything concerning the curiosities of the country, as the physicians there are generally those who have any pretensions to literature. By this guide he was shown a well which they call Holy Water. There is a flight of steps from the surface of the ground to that of the water. This well itself is 20 feet wide and 40 feet deep. It is supplied by three different springs, each of which is said to have a peculiar taste. The physician informed our author, that one of them resembled milk in its taste; another tasted like soap; and the third had the taste of common water; but our author, after tasting each of them, could not find any remarkable difference.

In his way to La Trizza, our author discovered some very ancient baths with stoves. They had been built here on account of a spring of warm sulphureous water, supposed to be excellent for the cure of cutaneous disorders; and for which purpose they are still made use of. They are now called the Springs of St. Venera, of whom there is an image here. The fountain from which they flow is on a level with the surface of the ground. The water tastes very disagreeably of sulphur; and deposes a quantity of white impalpable powder, adhering to herbs and stones over which it passes. This substance our author calls the cream of sulphur; though it is probably a selenitic substance formed by the decomposition of the sulphur, and the union of its acid with some calcareous matter which held it in solution before.

From this place our author proceeded to the sea-port Balsatico of Trizza, a small place, which with the adjacent country contains only about 300 inhabitants. Off the shore of this place is a basaltic rock, which seems to be the only remains of a much larger one destroyed by the action of the air. All round are long ranges of basaltic rocks of various species, of which there are many. The rocks of the Cyclops stand round the small harbor of La Trizza; and from this view we perceive the number of rocks of very different heights. All of them appear more or less above water, though some are so low that they cannot be seen without approaching very near; and this circumstance renders the harbor inaccessible to vessels of any considerable burden, at the same time that, by reason of the depth of the sea, it is impossible either to cut or unite them by a mole. The principal of these rocks is the extremity of an island, one half of which is composed of lava placed on a basaltic base; over this is a crust of pozzolana, combined with a kind of white calcareous matter of a pretty hard and compact consistence; and which, by the action of the air, assumes the appearance of soft, spongy porous wood. On this subject our author observes, that "the rock at some former period, had become so hard as to split, and the clefts were then filled up with
with a very hard matter which was porous on all sides like scoriz. That matter afterwards split also; leaving large interstices, which in their turn have been filled up with a kind of compound yellow matter. The island appears to have been formerly inhabited, but is at present destitute both of inhabitants and of culture, only the people of La Trizza feed a few goats upon it."

To the southward of the harbour of La Trizza we observe several fragments of basaltes, both in the form of needles, and in that of prismatic columns of a very regular form, and which may be easily separated from one another. From the position in which these fragments are disposed, it appears that the mass to which they belong must have suffered some very violent shock; otherwise such huge rocks could never have been broken, overturned, and scattered in directions so very different from their original positions. In one of these ruins there are some parts harder than the rest, which withstand the action of the air, while the intervening spaces yield to it, and appear to be thus destroyed. In some others this effect is much more remarkable; because the columns happen to be much farther advanced towards a state of dissolution, the parts of which consist being already disjoined; and in each of those which project we perceive a fissure: which shows that each of these parts may be divided into two. "They are indeed (says our author) actually divided, and display a convexity issuing from a concavity, like a pile of hats placed one upon another, when they are removed one by one; which is a very curious singularity."

Continuing his journey still southward, our author arrived at the promontory of the Castel d'Acì. This is the most singularly curious of all that are in the neighbourhood of Ætna. The ancient mass of it is enclosed between two bodies of lava of a more modern origin. These compose the rocks on which Castel d'Acì is situated, and which lie under the soil of the adjacent country. Beyond that city are the immense plains of the lower part of Ætna. These gradually rise till they reach the summit, which is hid among the clouds. The promontory is almost entirely composed of basaltes, the interstices of which are filled up with a yellowish matter, which seems to be a clay nearly of the same nature with that formerly taken notice of in the island of La Trizza. It also covers the mass of basaltes, and has produced both the superior and anterior parts of the promontory. Here the author saw a number of women employed in washing webs of cloth in the sea; and takes notice of the dexterous method they have of lifting it up in folds, and packing it on their heads in bundles, without receiving any assistance. At the foot of this promontory are many curious basaltic rocks. All along the eastern side of Mount Ætna the soil is broken, but filled with beautiful varieties of basaltes, highly worthy of observation. Indeed, according to our author's opinion, there is no volcano in Europe so rich as Ætna in basaltes, nor where so many curious figures of it are to be seen.

M. Houel having spent some more time in visiting the basaltic columns around the foot of the mountain, set out from Acì to visit the famous chestnut tree for an hundred horses which we have already mentioned. In his way thither he passed through the villages of Forza, Mangano, St Leonardo, St Matteo, and La Macchia. The landscapes of each of these places by itself are extremely beautiful; but the country between them is a frightful wild desert, presenting to the eye nothing but extensive plains of black lava, which at a distance have the appearance of vast quantities of pitch. The roads became rougher as they advanced; but the adjoining fields assumed a more pleasing aspect. The reason of this is, that the torrents of lava (by which the plains are rendered unfit for vegetation for a great number of years) have rolled rapidly down the more steep sides of the mountain without destroying the fertility of the soil.

Travelling through very difficult roads, and often incombued with dangerous precipices, our author at last arrived at the celebrated chestnut tree, which was the chief object of this journey. He observes, that, Great num-}
A E T [ 241 ]

“...when a new crater (says our author) is formed on Mount Etna, it is always in consequence of some shock that is powerful enough to break the arches of its caverns. Doubtless it is inconceivable that there should be any agent endowed with such force; but when such a fracture is once made, it is necessarily very large, and the surface of the ground above cannot but be broken in several different places at considerable distances from one another. The matter which is discharged always issues from the principal opening and those adjoining to it. None of these mouths, however, continue open, excepting that which is directly in the line in which the matter is discharged; the lava soon choking up those which are in a more oblique direction.”

Our author went down one of these openings with torches; but could not reach the bottom, and was obliged to return on account of the extreme cold. The descent was extremely difficult, and became more so in proportion as he advanced. This crater is of an oval form, and the opening through which he descended was in one extremity; but he was tempted to think that the crater which rises above it had been formed of matter discharged by another mouth: or perhaps it might have had a more central opening, through which the stones, sand, &c. which form the crater were discharged.

Four of the mouths of this mount appear to be composed of a reddish pozzolana, which has procured it the name of the Red Mountain; but when we ascend the pyramids, or rather funnels which they form, we find them composed of different-coloured layers of sand. Some of these are of a bluish-gray colour, others of a fine yellow, and some of a kind of green formed by a mixture of gray and yellow, while others are of red colour. A great number of small crystals, black schoerels, and granites are found among them, as well as pieces of scoria, which had been discharged by the volcano in the form of a thick and glutinous matter. All these mouths have internally the form of a funnel, and their shape is nearly that of a mutilated cone or round pyramid. This is the natural and unavoidable consequence of the perpendicular fall of the pulverized matter which the volcano discharges from the orifice at the bottom. The sides of the craters are not all of one height; the parts to the east and west being considerably higher than the intermediate summits, because the currents of the ashes passed alternately from east to west, and fell upon those sides in greater quantities than on the others; which circumstance has given to the volcano the appearance of having two summits.

M. Houel, having finished his observations on Monte Cvento di Rosso, returned to the convent of Nicolosi, which is described now only a house for the entertainment of travellers. The Benedectines of Catania, to whom it belongs, visit this place only when in an ill state of health, as the purity of the air renders it very salutary to the human constitution. A solitary brother, however, resides here to take care of the house, and to superintend the cultivation of the neighbouring plains. Those fathers once possessed an extensive and very fertile tract of land in this neighbourhood; but the eruptions of Etna have rendered it totally incapable of cultivation. This house stands at a very considerable height, being no less than 2496 feet above the level of the sea. Set-
having now got above the region of the trees, they entered the third, which our author denominates the region of snow and sterility. The wind became more brisk and keen as they advanced, so that they could scarce keep their hats upon their heads; and our author lost his, though tied on with a handkerchief. Here they were frequently obliged to cross considerable streams of water formed by the melting of the snow. In general the surface was sufficiently hard to bear them; but our author’s mule once sunk up to her belly, and was not extricated without great difficulty. Having at last overcome all difficulties, they arrived Plain on at the large plain on the summit of Aetna, and in the summit midst of which is the crater of the volcano. It is entirely composed of lava, cinders, ice, and snow; and has been styled, ironically as our author thinks, Monte Fumante. Here the wind continued to blow with excessive violence; and our author informs us, that in order to have any notion of its keeness, we must be accustomed to feel it on some very elevated station, as it is impossible to judge from what we feel at inferior altitudes. They took shelter behind a lump of lava, the only one which appeared in the whole plain, and, which our author says, would seem designed expressly for the shelter of travellers. Here they lay, wrapped up in their cloaks, for an hour: but as soon as it was day, that they could distinguish the place where the sun was to rise, they got up and advanced towards the ruins of the building known by the name of the Philosopher’s Tower. The wind still blew so violently, that after an effort of four minutes they fell down exhausted: but the extreme cold obliging them again to get up, they made a second attempt; and after several intermissions of this kind, at last accomplished their design. They were surprised, however, to find nothing but the corner of a wall not more than two feet high, consisting of two rows of unpolished stones; great part of it having been probably buried by the sand and other matters discharged by the mountain. Here, being sheltered from the wind, and the day advancing, they began to enjoy the glorious prospect which every moment became more extensive. At the rising of the sun, the horizon was serene, without a single cloud. The coast of Calabria (says our author) was as yet indistinguishable from the adjoining sea; but in a short time a fiery radiance began to appear from behind the Italian hills, which bounded the eastern part of the prospect. The fleecy clouds, which generally appear early in the morning, were tinged with purple; the atmosphere became strongly illuminated, and reflecting the rays of the rising sun, appeared filled with a bright effulgence of
of flame. The immense elevation of the summit of Ætna made it catch the first rays of the sun's light, whose vast splendour, while it dazzled the eyes, diffused a most
cherishing and enlivening heat, reviving the spirits, and
difusing a pleasant sensation throughout the soul. But though the heavens were thus enlightened, the sea still retained its dark azure, and the fields and for-
rests did not yet reflect the rays of the sun. The grad-
ual rising of this luminary, however, soon diffused
his light over the hills which lie below the peak of Ætna.
This last stood like an island in the midst of the
ocean, with luminous points every moment multiplying
around, and spreading over a wider extent with the
greatest rapidity. It was as if the universe had been
observed suddenly springing from the night of non-
existence. The tall forests, the lofty trees and exten-
sive plains of Ætna, now presented themselves to view.
Its base, the vast tracts of level ground which lie adja-
cent, the cities of Sicily, its parched shores, with the
ashing waves and vast expanse of the ocean, gradual-
ly presented themselves, while some fleeting vapours,
which moved swiftly before the wind, sometimes veiled
part of this vast and magnificent prospect. In a short
time every thing was displayed so distinctly, that they
could plainly recognize all those places with which they
were before acquainted. On the south were seen the
hills of Camerata and Trapani; on the north, the
mounts Pelegrino and Termini, with the celebrated
Enna, once crowned with the temples of Ceres and
Proserpine. Among these mountains were seen a great
many rivers running down, and appearing like as
many lines of glittering silver winding through a variety
of rich and fertile fields, washing the walls of 28 cities,
while their banks were otherwise filled with villages,
hamlets &c. rising among the ruins of the most illus-
triuous republics of antiquity. On the south and north
were observed the rivers which bound by their course
the vast base of Mount Ætna, and afford a delightful
prospect to the eye; while at a much greater distance
were seen the islands of Lipari, Alicudi, Felicucco,
Parinacia, and Stromboli.

Having enjoyed for some time the beauty of this
magnificent prospect, our author set about making
a draught of the place from which the view was taken;
and at length accomplished it, notwithstanding the
great impediments he met with from the wind.
Among the objects which he delineated on this occasion,
the Philosopher's Tower was one. It seems, he says,
not to be very ancient; neither the materials of which
it consists, nor the mode of architecture, bearing any
resemblance to those of the Greeks and Romans. The
surrounding plains seem to consist entirely of a black
sand intermixed with pieces of scoria, which have been
formerly thrown out by the volcano. Beyond that
plain, which rises gently, appears a cone, the summit
of which is the volcanic crater. When viewed from
the south side, on which they stood, this crater seems
to consist of a number of small hills. Into these it was
broken by the emission of the boiling torrent in the
year 1755. When discharged from the crater, these
waters spread towards the right, and at the distance
of a mile eastward fell in a cascade from a prodigious
height.

The violence of the wind beginning now to abate a
little, the travellers set out for the very summit, in or-
der to take a view of the great crater; in which journey
(our author says) it would be difficult to make people,
who have never engaged in such enterprises, compre-
end all the obstacles they had to encounter. This
cone (the little mountain mentioned by Sir William
Hamilton) is composed of ashes, sand, and pozzolana,
thrown up at different times by the volcano. The ma-
terials are so loose, that the adventurous traveller sinks
about mid-leg at every step, and is in constant terror
of being swallowed up. At last, when the summit is
reached, the sulphurous exhalations, which are con-
tinually emitted from the pores of the mountain, threat-
en suffocation, and irritate the fauces and larynx in such
a manner as to produce a very troublesome and inces-
tant cough. The looseness of the soil, which gives
way under the feet, obliges the traveller, every now
and then, to throw himself flat on his belly, that so he
may be in less danger of sinking. In this posture our
author viewed the wide unfathomable gulf in the
middle of the crater; but could discover nothing ex-
cept a cloud of smoke, which issued from a number of
small apertures scattered all around, and accompanied
with a kind of noise. Another and more dreadful
sound, however, issues from the bowels of the volcano
and which, according to our author, "strikes the heart
with terror, so that all the strength of reason is neces-
sary to prevent the observer from flying with precipi-
tation from such a dreadful place." Several travel-
ners who had visited this cone before him, were so ter-
ified by these dreadful sounds, that they fled with the
utmost haste till they arrived at the foot of the
mountain.

Our author compares these sounds to a discharge of
cannon in the wide abyss; the noise of which is re-
queited throughout all the caverns, and produces a
sound perhaps the most alarming that can be imagi-
daed; and during the short space in which he listened,
several of these discharges were heard to follow one another
almost uninterruptedly.

This dreadful noise, our author, with very great pro-
bability, supposes to be occasioned by the explosions of
the internal fire, or, as he calls it, the focus of the
volcano, which, striking against the sides of these
imme-
cense caverns, the sounds produced are re-echoed
through their cavities, and probably multiplied in an
extraordinary manner; so that what would be only a
slight explosion in the open air, occasions a sound more
tremendous than the loudest thunder. To such as are
convinced of this, and have sufficient courage to resist
the first impressions which these sounds must unavoid-
ably occasion, they will in a short time not only appear
exceedingly sublime, but by their variety, even somewhat
agreeable. "They enable us (says our author) to form
some conception of the space through which they must
pass before they reach the ear, width of the vast extent
and width of the hollows of the mountain."

Having for some time contemplated this awful spec-
tacle, our author wished to measure the crater by walk-
ing round it, but found this impossible. On the north
side the surface is hard and smooth, the ashes having
been so far dissolved by the moisture deposited by the
smoke as to cement into one uniform mass. This is
sometimes dissolved even into a fluid state, in such a
A E T

manner as to run down the sides of the cone; so that, after several attempts, he was at last obliged to abandon his design.

Fig. 2. exhibits a view of the crater of Ætna taken on the brink of the east side. The fore ground (a) of the figure is one division of the crater; beyond it are two eminences b and c, higher than that on which some human figures are represented. All the three form a triangle nearly equilateral; but, when viewed from any considerable distance, only two of them can be seen; for which reason the Sicilians have termed the mountain bicornis, or double-horned.

The smoke, as represented in the figure, issues from all quarters, either from chinks or holes scattered over the whole crater. But the situation of the principal mouth is in the midst of the three eminences. Its diameter, when our author visited this mountain, was only about 60 feet, and so filled with smoke, that nothing remarkable could be discovered. From the height d, the rock situated on the left side of the print, and on which the human figures are represented, all the way to the rock e on the right, the distance is no more than 900 feet. Our author observed, that the cone is not exactly in the middle of the plain, but is situated more towards the north than the south. He did not attempt to cross the central valley f, on account of the looseness of the ground, and that there was no object apparently worthy of the risk he must run in so doing. At the nearest view he took, it was only observed that there was snow lying in several parts of it, though the heat which otherwise prevailed seemed to be very intense.

The smoke which issues from the crater of Ætna is generally carried in a direction from south to north; and, as it brings along with it a considerable quantity of water, the latter, condensed by the cold winds, runs down the side of the mountain in plentiful streams, and often leaves pretty permanent marks of its course. In this manner he accounts for the great eruption of water in 1755, which he supposes to have been occasioned only by an unusual quantity of water falling into the burning focus of the mountain, there rarefied into steam, and afterwards condensed by the coldness of the atmosphere.

Like other travellers to Mount Ætna, this gentleman found the wind blowing from the south, and he is of opinion, that a south wind blows here more frequently than any other, as he did not observe any channels cut by the water on any other side than the north. He had several opportunities of making this observation, having frequently visited the top of Ætna, and always paid attention to the crater. The sand on the east and west sides was always loose, while that on the north was compacted into a solid body. The three summits were of a later date than the rest of the crater, having been probably thrown up by some eruption which had burst it asunder. The black spots on the fore ground represent a number of hillocks about the size of mole-hills, from which a sulphureous vapour constantly issues, and by which the adjacent ground is tinged of an ochre colour. This vapour issues from the crevices with a kind of hollow whistling noise; which, with the volcanic thunder, smoke, and noxious smell, render it very disagreeable to stay here even for a few moments.

The smoke is represented in the figure precisely as it appeared on the day that he ascended, which was very warm. But it does not always rise in this manner; for when the cold is very intense, it collects into a body, and thickens around the edge of the crater: on which occasion it is condensed into water, which diffuses itself around the edge of the crater, and mixing with the cold produced by a south wind, produces very often their clothes insufficient to protect them; and it is remarkable that such intense cold is always produced by a south wind. The day that our author took his draught, the wind blew faintly from the north.

The base of Mount Ætna, according to M. Houel's Account of observations, consists of alternate layers of lava and marline, subterraneous substances, which have been deposited successively at the foot of Mount Ætna upon another. These alternate layers extend to an unknown depth. They must needs go as far down as the level of the stratum of lava which was discharged by the volcano at its first origin. The last deposited by the sea is a range of calcareous mountains of a considerable height, and which are placed on a basis of lava. Beneath that layer of lava is another of sea pebbles, which are well known to be rounded by their attrition against one another by the motion of the waves. This layer is of a considerable depth, and lies upon a yellowish rock, consisting of a species of indurated sand. The river Simeto flows over this rock, which it has cut away considerably. That part which is at present the bed of the river is much higher than the base of Ætna that is on a level with the sea; and the least thing occurs to suggest an idea of what has been the primary base of the volcano. The marine substances, already taken notice of, lie nearly in a horizontal direction, more or less so according to the nature of the surface on which they have been deposited.

Ætna abounds very much with springs, fountains, and even rivers of considerable magnitude. Our author has computed, that if all the water flowing down springs on the sides of this mountain were collected, it would fill the channel of a river 36 feet broad and 6 in depth. Many of the springs afford fine salt; some are very pure, and others are impregnated with noxious substances; while others are remarkable for their use in dyeing particular colours.

"It is worthy of notice (says our author), that the streams of water, some of them more copious, others such a large quantity, are seen to issue at all different degrees of height, from the base to the summit of the mountain."

"Even in summer, when very little rain falls for three or four months, or when perhaps for that space there is no rain at all, and for three of which, at least, there is not an ounce of snow melted; even then a great number of rivulets continue to flow down the sides of Ætna; and at the same time a number of streams, external and subterraneous, each of them several feet wide, are, according to the accounts of the country people, plentifully supplied with water."

As the trifling quantity of snow which is melted here even in the midst of summer, and the still smaller quantity discharged by the clouds, would be totally insufficient to supply those streams, and must be all absorbed by the earth for the support of vegetation, those streams must proceed from some other cause, whose effects are more copious and permanent.
This cause is the evaporation of those aqueous particles which arise from the constant ebullition at the bottom of the volcanic focus. These issuing out at the great crater, and at innumerable chips in the sides of the mountain, are soon condensed by the cold of that elevated region of the atmosphere, and, percolating through the earth, give birth to those numerous streams in question.

"A volcano, according to my idea, cannot subsist without water; nor can water occupy a place in any volcanic focus without being changed into vapour. But before that water can make its appearance, except in the form of smoke, it must have filled the whole volcanic cavern, and must have been forcibly pressed by the action of the fire against its sides; it must next have condensed, and assumed the form of water; in which state it must have penetrated through the inclined layers of sand and pozzolana which intervene between the different strata of lava; for these strata lie one above another, and are full of chips, in such a manner as to present to the eye an appearance pretty much resembling that of the inside of a tiled roof."

It has been a question, Whether the eruptions of Mount Ætna were more frequent in ancient than in modern times? At first, it seems impossible to give a precise answer to such a question; but when we consider, that the matter in the volcanic focus was then greater in quantity than at present, in proportion to the space which it occupied; that the cavities were then sooner filled with vapour; and that the centre of the focus was then less remote, we will not hesitate to pronounce, that in earlier times the eruptions were more frequent as well as more copious.

The first symptom of an approaching eruption is an increase of the smoke in fair weather; after some time, a puff of black smoke is frequently seen to shoot up in the midst of the white, to a considerable height. These puffs are attended with considerable explosions: for while Vesuvius was in this state, Sir William Hamilton went up to its top, which was covered with snow; and perceiving a little hillock of sulphur, about six feet high, which had been lately thrown up, and burnt with a blue flame on the top, he was examining this phenomenon, when suddenly a violent report was heard, a column of black smoke shot up with violence, and was followed by a reddish flame. Immediately a shower of stones fell; upon which he thought proper to retire. Phenomena of this kind, in all probability, precede the eruptions of Ætna in a much greater degree. The smoke at length appears wholly black in the daytime, and in the night has the appearance of flame; showers of ashes are sent forth, earthquakes are produced, the mountain discharges volleys of red-hot stones to a great height in the air. The force by which these stones are projected, as well as their magnitude, seems to be in proportion to the bulk of the mountain. Signior Recupero assured Mr. Braidone, that he had seen immensely large ones thrown perpendicularly upwards to the height of 7000 feet, as he calculated from the time they took to arrive at the earth after beginning to descend from their greatest elevation. The largest stone, or rather rock, that was ever known to be emitted by Vesuvius, was 12 feet long and 4½ in circumference. This was thrown a quarter of a mile; but much larger ones have been thrown out by Mount Ætna, almost in the proportion in which the latter exceeds Vesuvius in bulk. Along with these terrible symptoms, the smoke that issues from the crater is sometimes in a highly electrified state. In this case, the small ashes which are continually emitted from the crater, are attracted by the smoke, and rise with it to a great height, forming a vast, black, and to appearance dense, column; from this column continual flashes of forked or zig-zag lightning issues, sometimes attended with thunder, and sometimes not, but equally powerful with ordinary and lightning. This phenomenon was observed by Sir Isaac Newton, while observing the smoke.

When these dreadful appearances have continued sometimes four or five months, the lava begins to make its appearance. This is a stream of melted mineral matters, which in Vesuvius commonly boils over the top, but very seldom does so in Ætna; owing to the great weight of the lava, which long before it can be raised to the vast height of Mount Ætna, bursts out through some weak place in its side. Upon the appearance of the lava, the violent eruptions of the mountain generally, though not always, cease; for if this burning matter gets not sufficient vent, the comotions increase to a prodigious degree. In the night-time the lava appears like a stream of fire, accompanied with flame; but in the day-time it has no such appearance: its progress is marked by a white smoke, which by the reflection of the red-hot matter in the night assumes the appearance of flame.

We shall close this article with an enumeration of all the different eruptions from Mount Ætna which are found upon record.

1. The first mentioned in history, is that of which List of Diodorus Siculus speaks, but without fixing the period at which it happened. That eruption, says he, obliged the Sicani, who then inhabited Sicily, to forsake the rock, and retire to the western part of the island. A long time after that, the Sicilians, a people of Italy, migrated into Sicily, and took up their abode in that part of the island which had been left desert by the Sicani.

2. The second eruption known to have issued from this volcano, is the first of the three mentioned by Thucydides; of none of which he fixes the date, mentioning only in general, that from the arrival of the first Greek colonies that settled in Sicily (which was in the 11th Olympiad, and corresponds to the 734th year before the Christian era, to the 88th Olympiad, or the year 425 before Christ, Ætna at three different times discharged torrents of fire. This second eruption happened, according to Eusebius, in the days of Phalaris, in the 65th year before the Christian era. The assertion of Eusebius is confirmed by a letter from that tyrant to the citizens of Catania, and the answer of the Catamians (if, after Bentley's Dissertations against their authenticity, any credit be due to the Epistles of Phalaris). But Diodorus gives both these pieces.

3. The third, which is the second of the three mentioned by Thucydides, happened in the 65th Olympiad.
pias, in the 477th year before the Christian era, when
Xanthippus was archon at Athens. It was in this same
year the Athenians gained their boasted victory over
Xerxes’s general Mardonius near Platea. Both the
erection of the volcano and the victory of the Athe-
nians are commemorated in an ancient inscription on
a marble table which still remains. An ancient me-
dal exhibits a representation of an astonishing deed to
which that eruption gave occasion. Two heroic youths
boldly ventured into the midst of the flames to save
the Citizens: their names, which well deserved to be
transmitted to future ages, were Amphimnous and
Anapius. The citizens of Catania rewarded so noble
a deed with a temple and divine honours. Seneca,
Silius Italicus, Valerius Maximus, and other ancient
authors, mention the heroism of the youths with just
applause.

4. The fourth eruption, the third and last of these
mentioned by Thucydides, broke out in the 80th O-
lympiad, in the 425th year before the Christian era.
It laid waste the territory of Catania.

5. The fifth is mentioned by Julius Obsequens and
Orosius, who date it in the consuls of Sergius Ful-
nius Flaccus and Quintus Calpurnius Piso, nearly 133
years before the Christian era. It was considerable;
but no peculiar facts are related concerning it.

6. In the consuls of Lucius Amilius Lepidus and
Lucius Aurelius Orestes, in the 135th year before the
Christian era, Sicily suffered from a violent earthquake.
Such a deluge of fire streamed from Ætna as to render
the adjoining sea into which it poured absolutely hot.
Orosius says, that a prodigious quantity of fishes were
destroyed by it. Julius Obsequens relates, that the
inhabitants of the isles of Lipari ate such a number of
those fishes, as to suffer, in consequence of it, by a dis-
temper which proved very generally mortal.

7. Four years after the last mentioned, the city of
Catania was desolated by another eruption, not less
violent. Orosius relates, that the roofs of the houses
were broken down by the burning ashes which fell
upon them. It was so dreadfully ravaged, that the
Romans found it necessary to grant the inhabitants an
exemption from all taxes for the space of ten years, to
enable them to repair it.

8. A short time before the death of Caesar, in the
43d year before Jesus Christ, there was an eruption
from Mount Ætna. Livy mentions it. It was not
distinguished by any thing extraordinary. It was after-
wards considered as an omen of the death of Caesar.

9. Suetonius, in the life of Caligula, mentions an
eruption from Mount Ætna which happened in the 40th
year after the Christian era. The emperor fled on the
very night on which it happened, from Messina, where
he at that time happened to be.

10. Carrera relates, that in the year 253, there was
an eruption from Mount Ætna.

11. He speaks of another in the year 420; which
is also mentioned by Photius.

12. In the reign of Charlemagne, in the year 812,
there was an eruption from Ætna. Geoffrey of Viter-
bo mentions it in his Chronicle.

13. In the year 1269, on the 4th February, about
day-break, there was an earthquake in Sicily, which
was felt as far as Reggio, on the opposite side of the
strait. Catania was reduced by it to ruins; and in
that city more than 15,000 souls perished. The bi-
shop, with 44 monks of the order of St. Benedict, were
buried under the ruins of the roof of the church of St
Agatha. Many castles in the territories of Catania
and Syracuse were overturned; new rivers burst forth,
and ancient rivers disappeared. The ridge of the
mountain was observed to sink in on the side next
Taormina. The spring of Arethusa, so famous for the
purity and sweetness of its waters, then became muddy
and brackish. The fountain of Aja, which rises from
the village of Saraceni, ceased to flow for two hours;
at the end of which the water gushed out more copi-
ously than before. Its waters assumed a blood colour,
and retained it for about an hour. At Messina, the
sea, without any considerable agitation, retired a good
way within its ordinary limits; but soon after re-
turning, it rose beyond them, advanced to the walls of
the city, and entered the streets through the gates.
A number of people who had fled to the shore for
safety were swallowed up by the waves. Ludowico
Aurelio relates, that the vines, corn, and trees of all,
sorts, were burnt up, and the fields covered over with
such a quantity of stones as rendered them unfit for cul-
tivation.

14. Twelve years after this, in the year 1281, a
dreadful eruption issued from Ætna on the east side.
Streams of fire ran down the declivity of the moun-
tain, and encircled the church of St. Stephen, but with-
out burning it.

Nicholas Speciale, who relates, though he did not see,
this event, was witness to another conflagration on
Ætna 45 years after this, in the year 1329, on the 23d
of June, of which he has given a description.

15. On that day, says he, about the hour of ves-
per, Ætna was strongly convulsed, and uttered dread-
ful noises; not only the inhabitants of the mountain,
but all Sicily, were struck with consternation and
alarm. On a sudden, a terrible blaze of fire issued
from the southern summit, and spread over the rocks
of Mazzara, which are always covered with snow.
Together with the fire, there appeared a great deal of
smoke. After sunset, the flames and the stones that
issued out with them were seen to touch the clouds.
The fire making way for itself with the most furious
impetuosity, burnt up or reduced to ruins all those
structures which the piety of former times had consec-
rated to the Deity. The earth yawning, swallowed
up a great many springs and rivulets. Many of the
rocks on the shore of Mascali were shaken and dashed
into the sea. A succession of these calamities con-
 tinued till the 15th of July, when the bowls of Ætna
were again heard to rebel. The conflagration of
Mazzara still went on without abatement. The earth
opened near the church of St. John, called II Papa-
secca; on the south side fire issued from the gap with
great violence; to add to the horrors of the day, the
sun was obscured from morning to evening with clouds
of smoke and ashes, as entirely as in an eclipse. Ni-
colas Speciale went towards the new-opened crater, to
observe the fire and the burning stones which were
issuing from the volcano. The earth rebelled and
tottered under his feet; and he saw red-hot stones issue
time successively in a very short space from the
crater, with a thundering noise, the like of which, he
says, he had never before heard.
In a few days after this, all the adjacent fields were burnt up by a shower of fire and sulphureous ashes; and both birds and quadrupeds being thus left destitute of food, died in great numbers. A great quantity of fishes likewise died in the rivers and the contiguous parts of the sea. "I cannot think (says he) that either Babylon or Sodom was destroyed with such awful severity."—The north winds, which blew at the time, carried the ashes as far as Malta. Many persons of both sexes died of terror.

16. Scarce had four years elapsed after this terrible event, when Aetna made a new explosion, and discharged volleys of stones, causing the neighbouring fields to tremble. This happened in the year 1333.

17. Forty-eight years after this, on the 25th of August 1381, an eruption from Aetna spread its ravages over the confines of the territory of Catania, and burnt up the olive yards in the neighbourhood of that city.

18. In the year 1444, 63 years after the last eruption, a torrent of lava issued from Aetna and ran towards Catania. The mountain shook; and the shocks were so violent, that several huge masses of rock were broken from its summit, and hurled into the abyss with a tremendous noise.

19. After this Aetna was scarce at rest for 18 months or two years. On Sunday the 25th of September 1446, about an hour after sunset, an eruption issued from the place called La Pietra di Massarra. This eruption was soon over.

20. In the following year, 1447, on the 21st of September, there was another, with a good deal of fire; but this eruption was likewise of short duration.

21. Aetna now ceased to emit fire, and that for a considerable time. The neighbouring inhabitants not only ascended to the summit of the mountain, but even, if we may credit accounts, went down into the fiery gulf, and believed the volcanic matter to be now exhausted: But on the 25th of April 1536, near a century from the slight eruption in 1447, a strong wind arose from the west, and a thick cloud, reddish in the middle, appeared over the summit of the mountain. At the very same instant a large body of fire issued from the abyss, and fell with the noise and rapidity of a torrent along the eastern side of the mountain, breaking down the rocks, and destroying the flocks and every other animal that was exposed to its fury. From the same crater, on the summit of the mountain, there issued at the same time a stream of fire more terrible than the other, and held its course towards the west. It ran over Bronte, Arzuns, and Castelli. It consisted entirely of sulphur and bitumen. On the same day the church of St Leon, which stood in a wood, was first demolished by the shocks of the earthquake, and its ruins after that consumed by the fire. Many chasms were opened in the sides of the mountain; and from those issued fire and burning stones, which darted up into the air with a noise like that produced by a smart discharge of artillery. Francis Negro de Piazza, a celebrated physician, who lived at Lentini, wishing to have a nearer view of the eruptions, and to make some observations which he thought might be of consequence, was carried off and burnt to ashes by a volley of the burning stones. This conflagration of Aetna lasted some weeks.

22. In less than a year, on the 17th of April 1537, the river Simeto swelled so amazingly as to overflow the adjacent plains, and carry off the country people and their cattle and other animals. At the same time, the country around Paterno, the neighbouring castles, and more than 500 houses, were destroyed by the ravages of the river; and most of the wood was torn up by the roots by violent blasts of wind. These ravages of the elements were followed by Aetna, which on the 11th of the following month was rent in several places, disclosing fiery guls, and pouring out a deluge of fire in more terrible torrents than those of the preceding year. They directed their course towards the monastery of St Nicholas d'Arena; destroyed the gardens and vineyards; and proceeding onwards towards Nicolosi, burnt Montpellici and Fallica, and destroyed the vineyards and most of the inhabitants. When the conflagration ceased, the summit of the mountain sunk inward with such a noise, that all the people in the island believed the last day arrived, and prepared for their end by extreme unction. These dreadful disturbances continued through the whole year, more especially in the months of July and August, during which all Sicily was in mourning. The smoke, the noise, and the shocks of the earthquake, affected the whole island; and if Pilots may be believed, who relates this event, many of the Sicilians were struck deaf by the noise. Many structures were demolished; and among others the castle of Corleone, though more than 25 leagues distant from the volcano.

23. During the succeeding 30 years there was no disturbance of this nature. At the end of that space, Sicily was alarmed by a new eruption from the mountain. Aetna discharged new streams of fire, and covered the adjacent country with volcanic ashes, which entirely ruined the hopes of the husbandman.

24. In the year 1579, Aetna renewed its ravages; but no particular account of the damage which it did upon this occasion has been transmitted to us.

25. Twenty-five years had elapsed, when Aetna, in the month of June 1603, flamed with new fury. Peter Carrera affirms that it continued to emit flames for the space of 33 years, till 1636, without interruption, but not always with the same violence. In 1607, the streams of lava which flowed from it destroyed the woods and vineyards on the west side of the mountain. In 1609, they turned their course towards Aderno, and destroyed a part of the forest del Pino, and a part of the wood called la Sciumbrita, with many vineyards in the district Costerna. These torrents of lava continued to flow for three months. In the year 1614, a new effort of the subterraneous fire opened another crater, from which fire was discharged on Randazzo, in the district called d'Piro. The fire continued to flame for 10 or 12 years longer.

26. The same Peter Carrera relates, that a dreadful conflagration happened in the year 1664, of which he himself was witness. It happened on the 13th of December, and lasted without interruption, but with different degrees of violence, till the end of May 1678. But in 1669 the inhabitants of Nicolosi were obliged to
to forsake their houses, which tumbled down soon after they left them. The crater on the summit of Etna had not at this time a threatening aspect, and everything there continued quiet till the 25th of March; but on the 8th of that month, an hour before night, the air was observed to become dark over the village la Pedara and all that neighbourhood; and the inhabitants of that country thought that an almost total eclipse was taking place. Soon after sunset, frequent shocks of earthquakes began to be felt; these were at first weak, but continued till day-break to become more and more terrible. Nicolosi was more affected than any other tract of country on that side of Etna; about noon every house was thrown to the ground; and the inhabitants fled in consternation, invoking the protection of heaven. On the 10th of March a chasm several miles in length, and five or six feet wide, opened in the side of the mountain; from which about two hours before day, there arose a bright light, and a very strong sulphurous exhalation was diffused through the atmosphere.

About 11 in the forenoon of the same day, after dreadful shocks of earthquake, a crater was opened in the hill called des Noissettes, from which there issued huge volumes of smoke, not accompanied with fire, ashes, or stones, but with loud and frequent claps of thunder, displaying all the different phenomena with which thunder is at different times attended. And what was very remarkable, the chasm was formed on the south side, between the top and the bottom of the mountain. On the same day another chasm was formed two miles lower, from which issued a great deal of smoke, accompanied with a dreadful noise and earthquake. Towards the evening of the same day, four other chasms were opened towards the south, in the same direction, accompanied during their formation with the same phenomena, and extending all the way to the hill called la Pusara.

About twelve paces beyond that, another of the same kind was formed. On the succeeding night, a black smoke, involving a quantity of stones, issued from this last chasm; it discharged at the same time flakes of a dark earth-coloured spagyry matter, which became hard after they fell. There issued from the same gulf a stream of lava, which held its course into a lake called la Hardia, six miles from Montpellieri, and on its way thither destroyed many dwelling houses and other buildings in the neighbouring villages.

On the next day, March 12th, this stream of fire directed its course towards the tract of country called Malpaso, which is inhabited by 800 people: in the space of 20 hours it was entirely depopulated and laid waste. The lava then took a new direction, in which it destroyed some other villages.

The mount of Montpellieri was next destroyed with all the inhabitants upon it.

On the 23rd of the same month, the stream of fire was in some places two miles broad. It now attacked the large village of Mazzalucia; and on the same day a vast gulf was formed, from which were discharged sand or ashes, which produced a hill with two summits, two miles in circumference, and 150 paces high. It was observed to consist of yellow, white, black, gray, red, and green stones.

The new mount of Nicolosi continued to emit ashes for the space of three months; and the quantity discharged was so great as to cover all the adjoining tract of country for the space of 15 miles; some of these ashes were conveyed by the winds as far as Messina and Calabria; and a north wind arising, covered all the southern country about Agosta, Lentini, and even beyond that, in the same manner.

While at that height on Nicolosi so many extraordinary appearances were passing, the highest crater on the summit of Etna, still preserved its usual tranquillity.

On the 25th of March, about one in the morning, the whole mountain, even to the most elevated peak, was agitated by a most violent earthquake. The highest crater of Etna, which was one of the loftiest parts of the mountain, then sunk into the volcanic focus; and in the place which it had occupied, there now appeared nothing but a wide gulf more than a mile in extent, from which there issued enormous masses of smoke, ashes, and stones. At that period, according to the historian of this event, the famous block of lava on Mount Frumento was discharged from the volcanic focus.

In a short time after, the torrent of fire, which still continued to flow, directed its course towards Catania with redoubled noise, and accompanied with a much greater quantity of ashes and burning stones than before. For several months many most alarming shocks of earthquakes were felt; and the city was threatened with destruction by the torrent of fire. In vain they attempted to turn or divert its course; the lava rose over the walls, and entered by an angle near the Benedictine convent on the 11th of June following. This awful event is related by Francis Monaco, Charles Mancius, Vincent Auria, and Thomas Theodeschi.

A description of the lava issuing from Mount Etna in 1669 was sent to the court of England by Lord Winchelsea, who at that time happened to be at Catania in his way home from an embassy to Constantinople. Sir W. Hamilton gives the following extract of it. "When it was night, it went upon two towers in divers places; and I could plainly see, at ten miles distance, as we judged, the fire began to run from the mountain in a direct line, the flame to ascend as high as and as big as one of the greatest steeples in your Majesty's kingdoms, and to throw up great stones into the air; I could discern the river of fire to descend the mountain, of a terrible fiery or red colour, and stones of a paler red to swim thereon, and to be some as big as an ordinary table. We could see this fire to move in several other places, and all the country covered with fire, ascending with great flames in many places, smoking like a violent furnace of iron melted, making a noise with the great pieces that fell, especially those that fell into the sea. A cavalier of Malta, who lives there, and attended me, told me, that the river was as liquid, where it issues out of the mountain, as water, and came out like a torrent with great violence, and is five or six fathom deep, and as broad, and that no stones sink therein."
forth as the water doth at the head of some great river; and having run in a full body for a stone’s cast or more, began to crust or curdle, becoming, when cold, those hard porous stones which the people call scarrì. These, though cold in comparison of what first issues from the mountain, yet retained so much heat as to resemble huge tanks of sea-coal strongly ignited, and came tumbling over one another, bearing down or burning whatever was in their way. In this manner the lava proceeded slowly on till it came to the sea, when a most extraordinary conflict ensued between the two adverse elements. The noise was vastly more dreadful than the loudest thunder, being heard through the whole country to an immense distance; the water seemed to retire and diminish before the lava, while clouds of vapour darkened the sun. The whole fish on the coast were destroyed, the colour of the sea itself was changed, and the transparency of its waters lost for many months.

While this lava was issuing in such prodigious quantity, the merchants, whose account is recorded in the Philosophical Transactions, attempted to go up to the mouth itself; but dare not come nearer than a furlong, lest they should have been overwhelmed by a vast pillar of ashes, which to their apprehension exceeded twice the bigness of St Paul’s steeple in London, and went up into the air to a far greater height; at the mouth itself was a continual noise, like the beating of great waves of the sea against rocks, or like distant thunder, which was sometimes so violent as to be heard 60, or even 100 miles off; to which distance also part of the ashes was carried. Some time after, having gone up, they found the mouth from whence this terrible deluge issued to be only a hole about 10 feet diameter. This is also confirmed by Mr Brydone; and is probably the same through which Sir William Hamilton descended into the subterraneean caverns already mentioned.

27. Some years after this conflagration, a new burning gulf opened in the month of December 1682 on the summit of the mountain, and spread its lava over the hill of Mazarrà.

28. On the 24th of May 1686, about twelvemonth in the evening, a new eruption burst out from the summit of the mountain on the side contiguous to the hill del Bue. Such a quantity of inflamed matter was thrown out as consumed woods, vineyards, and crops of grain, for four leagues round. It stopped its course in a large valley near the castle of Mascali. Several people from the neighbourhood had ascended a hill between the wood of Catania and the confines of Cirrìa, to observe the progress of the lava: but the hill, on a sudden, sunk inwards, and they were buried alive.

29. Ætna was now long quiet; for no less a space of time indeed than one half of the present age. In the year 1755 its eruptions were renewed. It opened near Mount Lepa, and emitted as usual fire and smoke; after which it remained quiet only for eight years.

30. In the year 1769, there was an eruption which continued three months, but with intervals. Ætna was at first heard to rebell. Flames and clouds of smoke were seen to issue out, sometimes silver-coloured, and at other times, when the rays of the sun fell upon them, of a purple radiance: at length they were carried off by the winds, and raised, as they were driven before them, a shower of fire all the way to Catania and beyond it. An eruption soon burst out; the principal torrent divided into two branches, one of which ran towards the east, and fell into a deep and extensive valley.

The flames which issued from this new crater afforded a noble spectacle. A pyramid of fire was seen to rise to a prodigious height in the air, like a beautiful artificial fire-work, with a constant and formidable battery, which shook the earth under those who were spectators of the scene. Torrents of melted matter running down the sides of the mountain, diffused a light bright as day through the darkness of night.

At sounding the burning lava was observed to have run round some oaks that were still standing unburnt. Their leaves were all withered. Some birds had fallen from their branches, and been burnt to death. Some people cast wood upon the lava, and it was immediately burnt. This lava continued hot, and exhaled smoke for two years. For five years after this, no snow appeared on the summit of Ætna.

31. In the year 1764 a new crater was opened at a great distance from Mount Ætna.

32. In the year 1766 another was opened at the grotto of Paterno: fire, smoke, and an inconsiderable torrent of lava issued out of it.

33. On the 27th of January 1790 a new opening was formed two miles under the last-mentioned crater. On the 28th of February, and the 14th March, the earthquake was renewed on the north side, and accompanied with terrible noises.

Between the 6th of April and the 7th of May the convulsions were again renewed, accompanied with noise as before; a quantity of pumice stones and fine sand was discharged from it.

On the 18th of May the shocks were renewed: on the 23rd a new crater was formed on the side of Mount Frumenti on the summit of Ætna; and from it a torrent of lava discharged, which spread through the valley of Laudunza. It was 200 paces in breadth. Two other chinks were opened in the mountain near Paterno, and very near one another. The lava issuing from them proceeded, in the space of seven days, six miles; on the 25th it had run nine miles.

A new crater was likewise opened on the 25th; from which a quantity of red-hot stones continued to issue for half an hour, and fell at a very great distance: there proceeded likewise from it a stream of lava; which, in the same space of time, ran over a tract of country two miles in extent.

Several parts of those streams of lava were observed to be cold on the surface, and formed into solid masses, but melted again by a new stream of burning lava, which however did not melt the old lava.

34. The last eruption happened in 1787. From the 1st Account of the 10th of July, there were signs of its approach, the late. On the 11th, after a little calm, there was a subterraneous noise, like the sound of a drum in a close place, and it was followed by a copious burst of black smoke. It was then calm till the 15th, when the same phenomena occurred. On the 17th, the subterraneous noise was heard again: the smoke was more abundant, slight shocks of an earthquake followed, and the lava flowed from behind one of the two little mountains which form
the double head of Ætna. On the 18th, while the spectators were in anxious expectation of a more severe eruption, all was quiet, and continued so more than 12 hours: soon after they perceived some new shocks, accompanied with much noise, and the mountain threw out a thick smoke, which, as the wind was westerly, soon darkened the eastern horizon: two hours afterwards a shower of fine black brilliant sand descended: on the east side it was a storm of stones; and, at the foot of the mountain, a deluge of flashes of fire, of scoria and lava.

These appearances continued the whole day; at the setting of the sun the scene changed. A number of conical flames rose from the volcano; one on the north, another on the south, were very conspicuous, and rose and fell alternately. At three in the morning, the mountain appeared cleft, and the summit seemed a burning mass. The cones of light which arose from the crater were of an immense extent, particularly the two just mentioned. The two heads seemed to be cut away: and at their separation was a cone of flame, seemingly composed of many lesser cones. The flame seemed of the height of the mountain placed upon it; it was probably two miles high, on a base of a mile and a half in diameter. This cone was still covered with a very thick smoke, in which there appeared very brilliant flashes of lightning, a phenomenon which Ætna had not before afforded. At times, sounds like those from the explosion of a large cannon were heard seemingly at a less distance than the mountain. From the cone, as from a fountain, a jet of many flaming volcanic matters was thrown, which were carried to the distance of six or seven miles: from the base of the cone a thick smoke arose, which, for a moment obscured some parts of the flame, at the time when the rivers of lava broke out. This beautiful appearance continued three quarters of an hour. It began the next night with more force; but continued only half an hour. In the intervals, however, Ætna continued to throw out flames, smoke, ignited stones, and showers of sand. From the 20th to the 22nd, the appearances gradually ceased. The streams of lava was carried towards Bronte and the plain of Lago.

After the eruption, the top of the mountain on the western side was found covered with hardened lava, scoria, and stones. The travellers were annoyed by smoke, by showers of sand, mephitic vapours, and excessive heat. They saw that the lava which came from the western point divided into two branches, one of which was directed towards Libeccio; the other, as we have already said, towards the plain of Lago. The lava on the western head of the mountain, had from its various shapes been evidently in a state of fusion; from one of the spiracula, the odour was strongly that of liver of sulphur. The thermometer, in descending, was at 40 degrees of Fahrenheit's scale; while near the lava, in the plain of Lago, it was 140 degrees. The lava extended two miles; its width was from 13/4 to 21 feet, and its depth 13/4 feet.

These are the most remarkable circumstances we have been able to collect, that might serve to give an adequate idea of this famous mountain. Many things, however, concerning the extent, antiquity, &c. of the lavas, remain to be discussed, as well as the opinions of philosophers concerning the origin of the internal fire which produces so much mischief; but the consideration of these belongs to the general article Volcano, to which the reader is referred.

Ætolia, Ætoliae, a name given by some authors to the land annexed which is found on the surface and sides of the openings of Ætna, and other burning mountains, after their eruptions; and sometimes on the surface of the ferruginous matter which they throw out. This salt makes a very various appearance in many cases: it is sometimes found in large and thick cakes; sometimes only in form of a thin powder, scattered over the surface of the earth and stones. Some of this salt is yellow, some white, and some greenish.

Ætolarcha, in Grecian antiquity, the principal magistrate or governor of the Ætolians.

Ætolia, a country of ancient Greece, comprehending all that tract now called the Despotat, or Little Greece. It was parted on the east by the river Evanaus, now the Ethika, from the Locrenses Oxolus; on the west, from Acarnania, by the Acheolus: on the north, it bordered on the country of the Dorians and part of Phocis; and, on the south, extended to the bay of Corinth.

The Ætolians were a restless and turbulent people; seldom at peace among themselves, and ever at war with their neighbours; utter strangers to all sense of friendship or principles of honour; ready to betray their friends upon the least prospect of reaping any advantage from their treachery: in short, they were looked upon by the other states of Greece no otherwise than as outlaws and public robbers. On the other hand, they were bold and enterprising in war; inured to labour and hardships; undaunted in the greatest dangers; jealous defenders of their liberties, for which they were, on all occasions, willing to venture their lives, and sacrifice all that was most dear to them. They distinguished themselves above all the other nations of Greece, in opposing the ambitious designs of the Macedonian princes; who, after having reduced most of the other states, were forced to grant them a peace upon very honourable terms. The constitution of the Ætolian republic was copied from that of the Achaean, and with a view to form, as it were, a counter alliance; for the Ætolians bore an irreconcilable hatred to the Acheans, and had conceived no small jealousy at the growing power of that state. The Clemensian war, and that of the allies, called the social war, were kindled by the Ætolians in the heart of Peloponnesus, with no other view but to humble their antagonists the Achaean. In the latter, they held out, with the assistance only of the Eleans and Lacedemonians for the space of three years, against the united forces of Achaia and Macedon; but were obliged at last to purchase a peace, by yielding up to Philip all Acarnania. As they parted with this province much against their will, they watched all opportunities of wresting it again out of the Macedonian's hand; for which reason they entered into an alliance with Rome against him, and proved of great service to the Romans in their war with him; but growing insolent upon account of their services, they made war upon the Romans themselves. By that warlike nation they were overcome, and granted a peace on the following severe terms: 1. The majesty of the Roman people
people shall be revered in all Ætolia. 2. Ætolia shall not suffer the armies of such as are at war with Rome to pass through her territories, and the enemies of Rome shall be likewise the enemies of Ætolia. 3. She shall, in the space of 100 days, put into the hands of the magistrates of Corcyra all the prisoners and deserters she has, whether of the Romans or their allies, except such as have been taken twice, or during her alliance with Rome. 4. The Ætolians shall pay down in ready money, to the Roman general in Ætolia, 200 Euboic talents, of the same value as the Athenian talents, and engage to pay 50 talents more within the six years following. 5. They shall put into the hands of the consul 40 such hostages as he shall choose; none of whom shall be under 12, or above 40 years of age: the prætor, the general of the horse, and such as have been already hostages at Rome, are excepted out of this number. 6. Ætolia shall renounce all pretensions to the cities and territories which the Romans have conquered, though these cities and territories had formerly belonged to the Ætolians. 7. The city of Oenis, and its district, shall be subject to the Acarnanians.

After the conquest of Macedon by Æmilius Paulus, they were reduced to a much more severe condition; for not only those among them who had openly declared for Perseus, but such as were only suspected to have favoured him in their hearts, were sent to Rome, in order to clear themselves before the senate. There they were detained, and never afterwards suffered to return into their native country. Five hundred and fifty of the chief men of the nation were barbarously assassinated by the partisans of Rome, for no other crime but that of being suspected to wish well to Perseus. The Ætolians appeared before Æmilius Paulus in mourning habits, and made loud complaints of such inhuman treatment; but could obtain no redress: nay, ten commissioners who had been sent by the senate to settle the affairs of Greece, enacted a decree, declaring that those who were killed had suffered justly, since it appeared to them that they had favoured the Macedonian party. From this time those only were raised to the chief honours and employments in the Ætolian republic who were known to prefer the interest of Rome to that of their country; and as these alone were counted among at Rome, all the magistrates of Ætolia were the creatures and mere tools of the Roman senate. In this state of servile subjection they continued till the destruction of Corinth, and the dissolution of the Achæan league; when Ætolia, with the other free states of Greece, was reduced to a Roman province, commonly called the province of Achæa. Nevertheless, each state and city was governed by its own laws, under the superintendency of the prætor whom Rome sent annually into Achæia. The whole nation paid a certain tribute, and the rich were forbidden to possess lands anywhere but in their own country.

In this state, with little alteration, Ætolia continued under the emperors, till the reign of Constantine the Great, who, in his new partition of the provinces of the empire, divided the western parts of Greece from the rest, calling them New Epirus, and subjecting the whole country to the praefectus praetorio for Illyricum. Under the successors of Constantine, Greece was parcelled out into several principalities, especially after the taking of Constantinople by the Western princes.

At that time, Theodorus Angelus, a noble Grecian, of the imperial family, seized on Ætolia and Epirus. The former was left to Michael his son, who maintained it against Michael Paleologus, the first emperor of the Greeks, after the expulsion of the Latins. Charles, the last prince of this family, dying in 1450 without lawful issue, bequeathed Ætolia to his brother's son, named also Charles; and Acarnania to his natural sons Memnon, Turnus, and Hercules. But, great disputes arising about this division, Amurath II., after the reduction of Thessalonica, laid hold of so favourable an opportunity, and drove them all out in 1432. The Mahometans were afterwards dispossessed of this country by the famous prince of Epirus, George Castriot, commonly called Scanderbeg; who, with a small army, opposed the whole power of the Ottoman empire, and defeated these barbarians in 22 pitched battles. That hero, at his death, left great part of Ætolia to the Venetians; but, they not being able to make head against such a mighty power, the whole country was soon reduced by Mohammed II., whose successors hold it to this day.

AFTER, Domitius, a famous orator, born at Naumes, flourished under Tiberius, and the three succeeding emperors. Quintilian makes frequent mention of him, and commends his pleadings. But he disgraced his talents, by turning informer against some of the most distinguished personages in Rome. Quintilian, in his youth, cultivated the friendship of Domitius very assiduously. He tells us that his pleadings abounded with pleasant stories, and that there were public collections of his witty sayings, some of which he quotes. He also mentions two books of his "On Witnesses." Domitius was once in great danger from an inscriptions he put upon a statue erected by him in honour of Caligula, wherein he declared that this prince was a second time consul at the age of 27. This he intended as an encomium, but Caligula taking it as a sarcasm upon his youth, and his infringement of the laws, raised a process against him, and pleaded himself in person. Domitius, instead of making a defence, repeated part of the emperor's speech with the highest marks of admiration; after which he fell upon his knees, and, begging pardon, declared, that he dreaded more the eloquence of Caligula than his imperial power. This piece of flattery succeeded so well, that the emperor not only pardoned, but also raised him to the consulsship. After he died in the reign of Nero, A. D. 59.

AFFA, a weight used on the Gold Coast of Guineu. It is equal to an ounce, and the half of it is called eggbea. Most of the blacks on the Gold Coast give these names to these weights.

AFFECTION, in a general sense, implies an attribute inseparable from its subject. Thus magnitude, figure, weight, &c. are affections of all bodies; and love, fear, hatred, &c. are affections of the mind.

AFFECTION, signifying a settled bent of mind towards a particular being or thing, occupies a middle space between disposition on the one hand, and passion on the other. It is distinguishable from Disposition, which being a branch of one's nature, originally, must exist before there can be an opportunity to exert it upon any particular object; whereas Affection can never be original.

AFFIRMATION, in Logic, the asserting the truth of any proposition.

AFFIRMATION, in Law, denotes an indulgence allowed to the people called Quakers: who, in cases where an oath is required from others, may make a solemn affirmation that what they say is true; and if they make a false affirmation, they are subject to the penalties of perjury. But this relates only to oaths taken to the government, and on civil occasions; for Quakers are not permitted to give their testimony in any criminal case, &c.

AFFIRMATIVE, in Grammar. Authors distinguish affirmative particles such as, yes.—The term affirmative is sometimes used substantively. Thus we say, the affirmative is the more probable side of the question: there were so many votes, or voices, for the affirmative.

AFFIX, in Grammar, a particle added at the close of a word, either to diversify its form or alter its signification. We meet with affixes in the Saxon, the German, and other northern languages; but more especially in the Hebrew, and other oriental tongues. The Hebrew affixes are single syllables, frequently single letters, subjoined to nouns and verbs; and contribute not a little to the brevity of that language. The oriental languages are much the same as to the radicals, and differ chiefly from each other as to affixes and prefixes.

AFFLIATUS, literally denotes a blast of wind, breath, or vapour, striking with force against another body. The word is Latin, formed from ad, "to," and flaire, "to blow." Naturalists sometimes speak of the afflatus of serpents. Tully uses the word figuratively, for a divine inspiration; in which sense, he ascribes all great and eminent accomplishments to a divine afflatus. The Pythian priestess being placed on a tripod or perforated stool, over a holy cave, received the divine afflatus, as a late author expresses it, in her belly; and being thus inspired, fell into agitations, like a phrenetic; during which she pronounced, in hollow groans and broken sentences, the will of the deity. This afflatus is supposed, by some, to have been a subterraneous fume, or exhalation, wherewith the priestess was literally inspired. Accordingly, it had the effects of a real physical disease; the paroxysm of which was so vehement, that Plutarch observes it sometimes proved mortal. Van Dale supposes the pretended enthusiasm of the Pythia to have arisen from the fumes of aromatic plants.

AFFLICTION is not itself, in propriety of medical speech, a disease, but it is the cause of many: for whatever excites envy, anger, or hatred, produces diseases from tense fibres; as whatever excites fear, grief, joy, or delight, begets diseases from relaxation.

AFFORAGE, in the French customs, a duty paid to the lord of a district, for permission to sell wine, or other liquors, within his seigniory. Afforage is also used for the rate or price of provisions laid and fixed by the provost or sheriffs of Paris.

AFFORESTING, AFFORESTATIO, the turning ground into forest. The Conqueror, and his successors, continued afforesting the lands of the subject for many afforesting reigns; till the grievance became so notorious, that the people of all degrees and denominations were brought to sue for relief; which was at length obtained, and commissions were granted to survey and perambulate the forest, and separate all the new afforested lands, and reconvert them to the uses of their proprietors, under the name and quality of purifico or pourrable land.

AFFRAY, or AFFRayment, in Law, formerly signified the crime of affrighting other persons, by appearing in unusual armour, brandishing a weapon, &c.; but at present, affray denotes a skirmish or fight between two or more.

AFFRONTEE, in Heraldry, an appellation given to animals facing one another on an escutcheon, a kind of bearing which is otherwise called confronter, and stands opposed to adossee.

AFFUSION, the act of pouring some fluid substance on another body. Dr. Grew gives several experiments of the luctation arising from the affusion of divers menstruums on all sorts of bodies. Divines and church historians speak of baptism by affusion; which amounts to much the same with what we now call sprinkling.

AFGHANS, in History, a people who inhabit a province in the northern parts of India, between the 30th and 35th degrees of latitude. Its length from north to south may be estimated at 300 miles, and its breadth at 300. Cabul and Candahar are the two principal divisions of the country; but many of the contiguous provinces have also been occasionally subject to their princes. It is probable that not one-fifth part of the country is under a state of permanent cultivation. Most of the genuine Afghan tribes are migratory; and dwell in tents, and subsist on the produce of their flocks. In the south, the country of the Afghans is a barren desert of sand: to the north of Cabul it is a savage and mountainous region. The central part, through which the rivers Cow and Cabul flow, is fertile. The population probably does not exceed three millions of all descriptions. The armies of the state are composed of a diversity of nations; but the best troops are drawn from the Afghan districts. Cavalry constitute their chief military strength; a serviceable horse in this country costing only about six pounds sterling. A corps of infantry, armed with matchlocks, composes also a part of the Afghan armies.

The Afghans have been sometimes described as Tatars; but they bear no resemblance to this people, either in person or language. They are hardy and robust; and being addicted to a state of predatory warfare, have a fixed contempt for the occupations of civilized life. Bread, of wheat and barley, milk, butter, and cheese, compose their usual diet. Throughout Hindostan they are represented as ferocious, sanguinary, and treacherous; but their courage and military habits make them be sought after as soldiers by the native powers.

They boast of being descended of Saul the first king of Israel, and that their great ancestor was raised from the rank of a shepherd, not on account of his princely qualities, but because his stature was exactly equal to the length of a rod which the angel Gabriel had given to the prophet Samuel as the measure of the stature of him whom God had destined to fill the throne of Israel.
AFRICA, (derived according to Bochart from a Punic word signifying ears of corn), was represented by the ancients as one of the three great divisions or continents of which they believed the world to consist.

By them it was called Libya. Since the discovery of America, it has been considered by the moderns as one of the four quarters of the globe.

Excepting at its north-east corner, called the Isthmus of Suez, which is a neck of land, about sixty miles over, that unites it to Asia, Africa is entirely surrounded by water. On the north it is bounded by the Mediterranean sea, which divides it from Europe. Its whole western coast is washed by the waters of the Atlantic ocean, by which it is divided from America; and on the east, the Red sea and the Indian ocean separate it from Asia. From the Mediterranean sea on the north, to the Cape of Good Hope, which constitutes its southern extremity, is no less than 4,500 miles. Its broadest part, from Cape Verde, in the Atlantic ocean, to Cape Guarda-fui, near the straits of Babel-Mandel, at the mouth of the Red sea, is 3,500 miles from west to east. In shape it somewhat resembles a triangle, of which the Mediterranean sea and the Atlantic ocean form two sides, while the third side consists of the Red sea and the Indian ocean.

The greater part of this vast peninsula has in all ages remained unknown to the other inhabitants of the world. The general aspect however of its situation, represents it as well situated for maintaining a commercial intercourse with the other quarters of the globe. It stands as it were in the centre between Europe, Asia, and America; and therefore has a much nearer communication with each of them than they can have with one another. It is opposite to Europe, on its northern boundary, the Mediterranean sea, for almost 1,000 miles in a line from east to west; the distance seldom 100 miles, never 100 leagues. It is opposite to Asia the whole length of the Red sea; the distance sometimes only 15 miles, seldom 50 leagues. Its coast, for about 2,000 miles, lies opposite to America, at the distance of from 50 to 700 leagues, including the islands; whereas America is nowhere nearer to Europe than 1,000 leagues, and excepting at its north-west corner, where it is yet little known, is not nearer to Asia than 2,500 leagues.

The knowledge of the ancients concerning Africa seems to have been, in a great degree, limited to the countries adjoining to the Mediterranean or to the Red sea. The ideas, however, which Herodotus entertained of this great continent are by no means incorrect upon the whole; and it has been reserved for our own times to verify a part of the description which he has given of the interior of Africa. Previous to his time, the whole sea coast of this continent had been explored by the conductors of an expedition fitted out by Necho, one of the kings of Egypt. It is to be observed that this Necho took Sidon, and reduced Phoenicia and Palestine. He must therefore have possessed considerable maritime power: Nor was he less powerful by land; for he marched through Palestine and Syria to attack the Assyrians near the Euphrates, and, in his way, defeated and slew Josiah the king of Judah, who opposed his march at Megiddo (2 Kings xxxiii. 29.) Having defeated the Assyrians (or Babylonians) he placed a strong garrison in Carchemish, a fortified city on the Euphrates which he had taken; and, in his return, he took possession of Jerusalem, called Cadytis by Herodotus. This enterprising prince employed a body of Phoenician mariners to circumnavigate Africa, an undertaking which they accomplished with success. The following is the short narrative given by Herodotus of this remarkable transaction:

Circumnavigation of Africa. Except in that particular part which is contiguous to Herodotus's account of Asia, the whole of Africa is surrounded by the sea. The first person who has proved this, was, as far as we are able to judge, Necho king of Egypt. When he had desisted from his attempt to join by a canal the Nile with the Arabian gulf, he dispatched some vessels, under the conduct of Phoenicians, with directions to pass by the Columns of Hercules, and, after penetrating the Northern ocean, to return to Egypt. These Phoenicians, taking their course from the Red sea, entered into

AFRICA.

Sir William Jones seems to have had no doubt but the Afghans are descendants of Israel. "We learn (says he) from Ezedra, that the ten tribes, after a wandering journey, came to a country called Ararath, where we may suppose they settled; now the Afghans are said by the best Persian historians to be descended from the Jews. They have traditions among themselves of such a descent; and it is even asserted, that their families are distinguished by the names of Jewish tribes, although since their conversion to Islam, they studiously conceal their origin from all whom they admit not to their secrets. The Puntho language, of which I have seen a dictionary, has a manifest resemblance to the Chaldæan; and a considerable district under their dominion is called Hazareth or Hazaret, which might easily have been changed into the word used by Ezedra.

AFRANIIUS, Lucius, a Latin comic poet, who lived about a century before Christ. He wrote comedies in imitation of Menander; and is commended by Tully and Quintillian for his acute genius and fluent style. Some fragments of his works only are now extant.
AFRICA.

Africa. into the Southern ocean. On the approach of autumn they landed at Libya, and planted some corn in the place where they happened to find themselves: when this was ripe, and they had cut it down, they again departed. Having thus consumed two years, in the third they passed the Columns of Hercules, and returned to Egypt. The relation may obtain attention from others, but to me it seems incredible; for they affirmed that, having sailed round Africa, they had the sun on their right hand. Thus was Africa for the first time known."

Many of the most eminent of the ancient historians and geographers regarded this account of the circumnavigation of Africa as altogether fabulous, chiefly in consequence of the story concerning the appearance assumed by the great celestial bodies in the course of the voyage, which was then unintelligible, from the imperfect state of the science of astronomy. But the very circumstances which, among the ancients, excited a doubt about the existence or success of such a voyage, must now be regarded as affording the most satisfactory internal evidence of the veracity of the ancient Phoenician navigators.

The Carthaginians were the rivals of the Egyptians in commerce, and must undoubtedly have explored a great part of the coast of Africa; but, according to the usual cautious and monopolizing spirit of commercial states, it is probable that they concealed their discoveries from other nations. As almost no monuments of their literature now exist, we are deprived of the means of investigating the full extent of their geographical knowledge. One important document has, however, reached our times, which demonstrates the enterprising spirit of that people. This is, an apparently abridged journal of a voyage to the western coast of Africa, undertaken by Hanno the Carthaginian, about 30 or 40 years after the expedition above mentioned under Necho king of Egypt. Herodotus does not seem to have been informed of this undertaking of Hanno; nor does Pliny appear to have seen the journal of the voyage, though he is no stranger to its contents. Hanno is said to have deposited, at his return, the journal of his voyage in the temple of Saturn, which may perhaps account for the means of its preservation. It begins by stating, that "it was decreed by the Carthaginians that Hanno should undertake a voyage beyond the Pillars of Hercules, and found Libyphoenician cities. He sailed, accordingly, with 60 ships of 50 oars each, and a body of men and women to the number of 30,000, and provisions and other necessaries." From the extent of this plan of colonization, or rather of establishing permanent garrisons, upon the western coasts of Africa, it is evident that these coasts must, in some measure, have been previously examined. Major Rennel, who has investigated the subject with great accuracy, with a reference to the journal of the voyage, is of opinion that the Carthaginian or Libyphoenician cities founded by Hanno, were all situated to the south of the strait of Gibraltar, and to the northward of the river Senegal; and that all of them, excepting one at Cerné, now called Arguin, were placed to the north of Cape Bodajor. To the southward of Cerné, Hanno during his voyage made two expeditions; but it does not appear that he made any attempt to fix an establishment beyond the limits now mentioned. On his first expedition, he seems to have sailed into the river Sene-
AFRICA.

The Nasamones, according to Herodotus, were the most powerful of the Nomadic tribes upon this coast. They bordered upon the greater Syritis, now called the gulf of Sort. He says, that during the summer season they leave their cattle on the coast, and go up into the country to gather dates at a place called Aureola, which will be afterwards noticed. The Nasamones are said to have seized upon the territories of the Pyylli. These were a people who possessed the reputation of being able tocharm serpents, and to cure the wounds occasioned by their stings. Cato is said by Plutarch to have carried some of the Pyylli with him for that purpose, in his memorable march round the greater Syritis. It is certain, that in modern times, in Egypt, Abyssinia, and India, certain persons are believed to possess the power of completely subduing serpents of the most venomous kinds, so as to have them entirely under their command. They are said to seize on them with their naked hands, without apprehension of mischief, and this not only on serpents they have already been accustomed to, but on such as they never saw before.

Beyond the Nasamones to the southward, Herodotus mentions the Garamantes, whom he represents as a numerous nation, situated ten journeys from Aureola, between the Nasamones and the Macae. The Macae appear to have been the next tribe upon the coast after the Nasamones. The present towns of Messara and Lebida are situated within the territory that belonged to them. The Gindanes, Lotophagi, and Machytes, in the order here mentioned, occupied the remainder of the space between the Macae and the lake Tritonitis, or gulf of Kabes; for Herodotus appears to have understood by the lake Tritonitis, either the gulf alone, or the gulf and an adjoining lake collectively, which in his time very probably had a communication, though they are now separated by a neck of land, and the lake receives the name of Lowdesh. It is to be observed, that the Lotophagi derived their name from the fruit of a tree or shrub called the lotus, upon which they subsisted, supposed to be the rhinus lotos of Linneus. It is not only found in this territory, but also upon the whole northern coast of Africa, and on many spots of the desert, and even in the country of the Negroes. To the westward of the lake Tritonitis, Herodotus mentions the Aues, the Moryses, the Zorreres, and the Zygantes; which last appear to have been the inhabitants of the province that contained the city of Carthage: of the territories of this last state Herodotus gives no description, though he says, that he is able to name all the nations that inhabit the country as far as the Atlantes, beyond which he knows nothing. Some other positions in the north of Africa that were known in the times of Herodotus, will be afterwards mentioned.

With regard to the interior of Africa, the knowledge of Herodotus was very indistinct. He mentions Ethiopia in a way that in some measure corresponds with Nubia, and Abyssinia: "Ethiopia, (says he), "which is the extremity of the habitable world, is contiguous to Arabia on the south-west. In produces gold in great quantities, elephants with their prodigious teeth, trees and shrubs of every kind, as well as ebony. Its inhabitants are also remarkable for their size, their beauty, and their length of life." To Ethiopia, however, he gives a wide extent, so as to inclu
AFRICA.

The States of Barbary, which acknowledged rather a nominal than a real dependence upon the Turkish empire.

The rest of Africa was forgotten till the fifteenth century, when the discovery of the mariners compass enabled the Europeans to extend their maritime enterprises to all the quarters of the globe, with a facility that was formerly unknown. In these enterprises the discoveries Portuguese took the lead. They had never sailed along the coast of Africa, beyond Cape Negro, in 27° north latitude, till A.D. 1412, when they ventured 160 miles farther, to Cape Bojador, whose rocky cliffs stretching out to a considerable distance into the Atlantic ocean, intimidated them from advancing farther. In 1419, when attempting to double this cape, they discovered the Madeira islands. Afterwards in 1433, they passed Cape Bojador, penetrated between the islands, the tropics, and discovered the river Senegal and the Cape de Verde islands situated between 14° and 18° Cape de north latitude. In 1471, they crossed the equator, Verde isles and were astonished to find that the torrid zone contained fertile and populous regions, instead of being burnt up by perpetual heat as had been formerly believed. In 1484, the Portuguese navigators, now became ambitious of the reputation of discoverers of new countries, penetrated 1500 miles beyond the equator; of the Cape and two years thereafter Bartholomew de Diaz disco- of Good the Cape of Good Hope. In 1497, this cape, Hope, being the southern extremity of Africa, was passed by Vasquez de Gama.

At this time the European nations were fast emerging from barbarism. The feudal aristocracies, by which they had been kept in a state of perpetual anarchy, were gradually subdued by different princes, and a few powerful states or monarchies were raised upon their ruins. These states enjoying greater domestic tranquillity, were become capable of directing the energy and superior intelligence, which began to prevail in the European character, to enterprises requiring united and successive efforts. The discoveries of the Portuguese, by pointing out a very fertile region in the centre of Africa, in which gold and ivory could be obtained in exchange for the manufactures of Europe, and in which settlements could be easily formed, would in all probability have directed to this quarter the whole activity of the most enterprising of the European states, had not other events diverted them to different quarters. The events now alluded to, where the discovery of A- merica by Columbus in 1492, and the easy communication with the East Indies, opened up by the discovery of the passage round the Cape of Good Hope, as it were in Africa.

Hence it has happened, that during these three centuries Africa has been much neglected; and, in the most enterprising period of the history of the world, the European nations, though the most enterprising of mankind, have left in a great measure unexplored this immense continent, though situated in their vicinity, and abounding in valuable productions. A few factories for the purpose of procuring slaves have been established by the English, French, and Spaniards, upon the western coast, to the north of the equator. From thence to the tropic of Capricorn, the Portuguese have a few settlements, upon the east and the west coast, for the same purpose; and the Dutch settlement at the Cape of Good Hope,
AFRICA.

AFRICA. Hope, is the only establishment at all worthy of the name of an European colony, retaining the language and somewhat of the manners of the parent state.

What is known of the interior of Africa is chiefly the result of the efforts of particular travellers, who have penetrated into different quarters of that great continent, impelled by the ambition of extending the limits of human knowledge; or it is the fruit of the exertions of a private society of persons of rank in England, instituted in 1788, bearing the name of the African Association, who have employed at their expense, various individuals to enter Africa at different points, and to proceed by such routes as have been thought most likely to lead to important discoveries.

We shall now give a concise account of the great continent of Africa, as far as a knowledge of it has been obtained from these different sources. In the statement now to be given, however, we shall avoid taking any farther notice of that fertile stripe of territory on the north of Africa, which borders upon the Mediterranean sea, or upon the Atlantic ocean, southward to the mountains of Atlas, constituting the states of Egypt, Tripoli, Tunis, Algiers, Fez, and Morocco. Neither shall we take any notice of the country of Abyssinia at the head of the Nile, or of the Dutch settlement of the Cape of Good Hope, as each of these will be separately discussed under their proper names.

Africa, to the south of the states on the Mediterranean and of Morocco, consists of two great divisions, the Sahara, or great desert, which is the country of the Moors or Arabs; and Nigritia, Negroland, or the country of the negroes or Ethiopians. The limits of these two divisions, though not in all cases accurately defined, depend on the soil and climate, and appear to have remained permanent from the days of Herodotus.

The Sahara, or great desert, extends from the south of Morocco, and of the states on the Mediterraneans, commonly called the Barbary States, to the rivers Senegal and Niger, or to a line drawn across the continent of Africa, from Cape Verd to the Red sea. Beyond the Sahara or desert, to the southward, is the country of the negroes.

The Sahara presents a surface equal in extent to nearly one half of Europe. It is upwards of 800 miles in breadth from north to south, and more than double that extent in length, from the Atlantic ocean on the west, to the frontiers of Abyssinia on the east. Its general description is that of a vast wilderness of lifeless sand, parched by the intolerable heat of an almost vertical sun. Its chief varieties consist of immense plains covered with naked pebbles, or of barren rocks towering towards an unclouded and burning sky. The sterility of the soil is rather marked than alleviated by some scattered plants, and by the verdure of a few valleys in which water either stagnates or springs up.

The general description, however, of the great African wilderness, is by no means to be understood as universal or without exception. The desert is here and there intersected with spots of astonishing fertility, which are crowded with inhabitants. Everything in the climate of Africa is in extremes. No cold is indeed experienced in that vast continent; but barrenness and fertility of soil border upon each other with a degree of suddenness, of which, in the temperate cli-
Libyan desert on the south. As the ancient Persians worshipped one supreme deity whom they represented by the sun, and as they had a regular and well disciplined priesthood, they were taught to regard with indignation the idolatry of the Greeks. Hence the Persian monarch Cambyses sent an army against the Ammonians, with orders to burn the temple from whence the oracles of Jupiter were delivered. The expedition was unsuccessful, the army having been overwhelmed with sand, or left by their guides to perish in the desert; so that no remnant of them ever returned.

The position of the Oasis of Ammon has lately been ascertained by our countryman Mr. Brown, who travelled into that quarter with a view to its discovery. It appears to correspond with the modern Siwah, in 29° 12’ N. Lat. and 26° 18’ E. Long. As a building of such antiquity must be an object of great curiosity, we shall transcribe Mr. Brown’s description of the small part of the temple that remains, the rest having been destroyed by the modern inhabitants of the country to build their houses and garden walls.

It is a single apartment,” says Mr. Brown, “built of many stones of the same kind as those of which the pyramids consist, and covered originally with six large and solid blocks that reach from one wall to the other. The length I found 32 feet in the clear, the height about 28, the width 15. A gate situated at one extremity forms the principal entrance, and two doors also near that extremity open opposite to each other. The other end is quite ruined; but, judging from circumstances, it may be imagined that the building has never been much larger than it now is. There is no appearance of any other edifice having been attached to it, and the less so, as there are remains of sculpture on the exterior of the walls. In the interior are three rows of emblematical figures, apparently designed to represent a procession; and the space between them is filled with hieroglyphic characters, properly so called. The soft is also adorned in the same manner; but one of the stones which formed it is fallen within, and breaks the connection. The other five remain entire. The sculpture is sufficiently distinguishable; and even the colours in some places remain.”

Mr. Horne, a native of Germany, a traveller employed by the African Association, has still more recently visited Siwah, on his way from Cairo to Fezzan along with a caravan, in which he travelled under the character of a Mahometan merchant. He seems to think that the total circumference of the ruins of the ancient temple of Jupiter Ammon may be several hundred yards, though in many places the outward wall has been entirely carried away. He seems to have measured the outside of the same building whose inside appears to have been measured by Mr. Brown, and accordingly describes the length as from 30 to 36 feet, the width 24, and the height 27; but he was interrupted in taking his measurements by the jealousy of the natives. He also describes the ceiling as formed of vast blocks of stone of four feet in breadth, and three feet in depth, which extend across the whole building; and this roof seems to have preserved this part of the fabric entire, as the present barbarous inhabitants dare not attempt to demolish the walls, lest they themselves should be overwhelmed by the fall of the stones which form the roof. One of these stones of the roof has fallen in, and is broken; but the people (says Mr. Horne) have not been able to remove the large fragments fallen from the roof, which their ancestors were enabled to bring from the quarry, and to raise entire to the summit of the edifice: such are the vicissitudes of art, of knowledge, and of human powers and means, as well as of human happiness and fortunes.

The fertile part of the territory of Siwah appears to be about 18 miles in circumference, containing 60 small villages besides Siwah the capital. It is an independent state, acknowledging the Grand Seigneur as lord paramount, but paying no tribute. It affords abundance of vegetable productions, with corn and oil; and is copiously supplied with water from springs and small streams, but none of them flow beyond its territory. They are either evaporated on approaching the surrounding desert, or, if they reach it, are lost in the sterile sand. Its government is vested in about 32 wealthy citizens, who assume the title of scheik, or chief. Justice is administered according to ancient usage and traditional notions of equity. Delays which are paid in dates, constitute the punishment. The dress of the men consists of a white cotton shirt and breeches, and a large piece of calico cloth striped white and blue, manufactured at Cairo, which is worn over the left shoulder, and is called melaye. On their heads they wear a cap of red worsted or cotton, which is the distinction of a Mussulman, no Jew or Christian being permitted to use it. The women of Siwah wear wide blue shifts, usually of cotton, which reach to the ankles, and a melaye, above described, which they wrap round their head, and which falls over the body like a cloak. They plait their hair into three tresses one above the other, and fasten little bells to the lowest. They wear ear-rings and necklaces of glass beads. Those of the higher class wear round their necks a solid ring of silver thicker than the collar usually worn by criminals in some parts of the continent of Europe. There are many catacombs in the neighbourhood of Siwah, which formed the burying places of the ancient inhabitants, which show great labour and neatness of work.

The same traveller, Mr. Horne, on his way towards Fezzan, passed through Augila, an island of oasis in the desert, that was well known in the days of Agathocles. It is situated in 35° 3’ N. Lat. and 22° 46’ E. Long. The territory contains three towns, Augila the capital, Mojabara, and Meledia. Many of the inhabitants engage in the caravan trade. Those who do so, very frequently have three houses, one at Cairo, one in the territory of Augila, and a third in Fezzan, with a wife and family establishment at each. The country is level, and the soil sandy, but being well watered it is tolerably fertile. After a march of 16 days from Augila, Mr. Horne reached Temsus, in the territory of the important oasis Fezzan, of which we shall now give some account upon the authority of the journal which he has very recently transmitted to Europe.

Fezzan, the country of the ancient Garamantes of Herodotus, called by Pliny *Phoasania Regio*, is well Fezzan, wards of 1100 miles west from Grand Cairo, and consists of an extensive plain amidst a surrounding wildness of sand and of naked rocks.

The greatest length of the cultivated part of Fezzan

AFRICA.

Africa is about 300 English miles from north to south, and its greatest breadth from east to west is 200 miles. It contains 101 towns and villages, of which Mourzouk is the capital, situated according to Renouf, in 25' 48' N. Lat. and 15' 57' E. Long. The principal towns to the northward of the capital are Sochina, Sibha, Hun, and Wadou; Gatron to the south; and Quila to the east. The climate is never temperate. During summer the heat is intense, and the south wind is scarcely supportable even by the natives. A penetrating north wind prevails during winter, which drives to the fire even the natives of a northern country. Tempests of wind are frequent, which whirl up the sand and dust so as to give a tinge of yellow to the atmosphere. Rain falls seldom, and in small quantities. There is no river, nor even a rivulet deserving notice, throughout the whole country. The soil is what in Europe would be called a light sand, containing calcareous rock or earth, and sometimes a bottom of clay.

Dress of the sultan, on days of ceremony, consists of the Tripolitan dress, over which he wears a large white embroidered shirt, made after the fashion of the Negroes. His turban extends a full yard from the front to the hinder part, and is two-thirds of a yard in breadth. His revenue consists of assessments on all cultivated lands, and of arbitrary requisitions, which are collected by his slaves in an oppressive manner, if they are not bribed. He also derives an income from duties on foreign trade, from certain territorial domains, and from salt pools in the interior lakes. The present sultan has added to his treasuries by predatory expeditions against the weaker tribes in the neighborhood of his country. The chief booty upon these occasions consists of men and women, who are sold as slaves. The princes of the royal family are supported from certain territories allotted to them, together with a weekly distribution of corn from the sultan’s store, and occasional exactions from the people.

The clergy and the cadi or chief judge, are supported by the produce of certain woods and gardens; and they possess great authority with the people. The dignity of cadi is hereditary in a certain family; but the sultan, upon every vacancy, appoints to the office that individual of the family who can best read and write, accomplishments which here seem to be somewhat unusual, and therefore much valued.

The population of Fezzan amounts to about 70,000 or 75,000 souls. In the southern districts they have mixed with the natives of the desert, whom they resemble; but the original Fezzanians are a people of ordinary stature, of a deep brown complexion, with short black hair and regular features. They possess little energy character either of mind or body. Almost their only food consists of dates, or of a kind of farinaceous pap, with no butcher’s meat. The men who can afford it are much addicted.
African habits and amusements. Dancing.

In Fezzan there are a great number of loose women, and also of singing girls whose song is Sudanic, that is derived from the country of the Negroes. Their musical instrument is called rababé; it is an excavated hemisphere, made from a shell of the gourd kind, and covered with leather; to this a long handle is fixed, on which is stretched a string of horse hairs longitudinally, closed and compact as one cord, about the thickness of a quill. This is played with a bow.

Diseases. Various sorts of venereal disorders prevail in Fezzan; but it is worthy of remark, that, for the cure of all the species, they only use salts and the fruit handal (colocynthis) as powerful cathartics; the sores, if any, are at the same time washed with a solution of soda: and these remedies seldom fail. Other maladies prevalent there are the ague and hemorrhoids, for neither of which have they any other remedy than amulets, consisting of certain sentences of the Koran written on a slip of paper, which the patient wears about his neck, and in bad cases is made to swallow. It is said, however, that their knowledge of surgery is sufficient to enable them to cure a simple fracture.

The empire of Cassina. South from Fezzan a variety of other islands are scattered, which have been united by conquest under one chief, and receive the name of the empire of Cassina or Kasseena. The territories of this empire, therefore, consist of a considerable quantity of land of amazing fertility, interspersed with arid wastes, where the rays of the sun, reflected from the sand or the rocks, produce the most intense and suffocating heat. Cassina, the capital, is situated in N. Lat. 16° 20' W. Long. 11° 45'. Agades, which is an island, or province as it may be called, of the empire of Cassina, sends annually a caravan of 1000 camels to certain salt lakes in the desert, at a place called Dombo; and the salt is distributed among the other islands or provinces of this empire.

A similar empire, as travellers are pleased to call it, consisting of a number of fertile spots of this immense desert, is called Bornou. Mathan, the capital, is situated in N. Lat. 24° 32' E. Long. 22° 37'. It is surrounded by a ditch, and a wall 14 feet in height. The king is said to be more powerful than the emperor of Morocco. His dominions extend beyond the desert into the fertile country of the Negroes, of which he possesses a large portion. He is elected by three of the principal chiefs; but the choice is restricted to the royal family. The military force of the state consists of cavalry armed with the sabre, the pike, and the bow. Fire arms are not unknown, but they are too difficult to be procured.

Besides these, there is a variety of other districts in this desert, of which some slight intelligence has been obtained; such as Gadamis, north-west from Fezzan, about N. Lat. 50° south-east from which another island, called Théb, at the distance of about 400 miles. On the south-east of Fezzan is Thébe, at the distance of 200 miles; eastward of which, and 600 miles from the Nile, is Bardara. Zegzeg and Kur are in the same vicinity. Further to the south is Bergoo and Darfoo.

This last lies to the southward of the general latitude of the great desert. It has of late years been made known by Mr. Brown, the first discoverer of the Oasis of Ammon. He penetrated into Darfoo in 1792, and remained there a considerable time. Its chief town, Cobbe, is situated in 14° 11' N. Lat. and 28° 8' E. Long. and the country contains about 200,000 inhabitants, consisting of native tribes of a deep black complexion and woolly hair, though with features different from those of the Negroes, and of Arabs of various tribes. The wild animals are, the lion, the leopard, the hyena, the wolf, and the wild buffalo. The domestic animals are, the camel, the sheep, the goat, and borred cattle. Considerable quantities of grain of different sorts are reared, and, as the country is within the tropics, after the periodical rains the fertility is very sudden and great. The people are very barbarous. The practice of polygamy is extolled, but the intercourse of the sexes is totally destitute of delicacy or decency. The most severe labours of the field are left to the women; and the houses, which are of clay covered with thin boards, are chiefly built by them. Salt is the general medium of commerce at Darfoo, as gold dust is in many other places of Africa.

This territory is governed by a chief, who calls himself Sultan of self sultan, and assumes the most extravagant titles. Darfoo. He appears in public on a splendid throne, while an officer proclaims, see the buffalo, the offspring of from extraordinary buffalo, the bull of bulls, the elephant of superioraary titles.

May God preserve thy life! 0 master, may God assist, and render thee victorious!"

These islands of the African desert are too little known to render valuable any attempt at a more minute description of them. They all resemble each other in the fertility of their soil and the barbarous state of their inhabitants, who are Mahometans, unless where they approach the country of the Negroes. Though they maintain towards each other the maxims of apparent hospitality, yet a Christian is everywhere odious; and they account it meritorious to persecute or enslave him. Their language is chiefly a dialect of the Arabic, and their literature is in a great measure confined to reading the Koran. Their only intercourse with other nations is carried on by the caravans which periodically traverse these immense deserts: and the smaller islands, that are neglected by the caravans, are sometimes absolutely forgotten by the rest of the world for many years; and their inhabitants, left to themselves and to their native ignorance, at last ima-
A FRICA.

The Sahara, or great wilderness, does not on its western boundary at once attain its utmost degree of barrenness. Immediately to the south of Morocco and of the mountains called "Atlas" is a considerable extent of terrains inhabited by a tribe called the "Mouselinens." In their manners, they differ considerably from the Moors on the coasts of the Mediterranean, and also from the Moors or Arabs of the desert. Their civil government is republican, as they choose new chiefs every year, who are accountable to the aged men of the community. It is probable, however, that order is preserved among them chiefly by the influence of their priests, who are greatly respected; and the influence of the high priest amounts almost to despotic power. The people are chiefly engaged in a sort of pastoral life, to which agriculture is occasionally united. They have also villages in which various tradesmen reside, chiefly weavers, shoemakers, smiths, and potter, who have no cattle: But some opulent persons residing in the towns have flocks and herds of cows, horses, camels, sheep, and goats, besides poultry, kept by slaves at a distance in the country. The soil possesses considerable fertility, and produces the necessaries of life with little cultivation. The plains abound with dates, figs, and almond trees; and grapes are cultivated. Oil, wax, and tobacco, are also produced, and sold in the villages. Their agriculture is very rude. The chiefs of families, or small tribes, choose the ground most fit for cultivation. Its surface is slightly turned over with a kind of paddle, for the plough is unknown; and then the seed is sown upon it. The spot is then deserted by the inhabitants, who wander in all directions with their cattle, and do not return till harvest, when the corn is cut down and threshed. Magazines are then formed, consisting of holes in the earth, into which the corn is put. Planks are laid over it, which are covered with a layer of earth, made level with the soil, to prevent it being discovered by enemies. These magazines belong to every chief of a family or tribe, in proportion to the number of men he employed in the common labour.

The Mouselinens are almost constantly engaged in war against the emperor of Morocco. They are extremely jealous of their independence and freedom; and their country is the retreat of all the discontented Moors. No sooner does the emperor of Morocco take the field against them, than the whole inhabitants of the country districts mount their horses; and, while a part of them escort the women and slaves, and cattle, to places of safety, or even into the desert if they are close pressed, the rest of them occupy the passes of the mountains, and meet the enemy. During peace, parties of them often undertake to escort caravans, by which means there is preserved among them a considerable military spirit. In other respects they bear a great resemblance to the ancient Arabs. They permit polygamy, but their women are not so much secluded from society as among the Moors on the seacoast. Their children are brought up with care; and are not considered as men till they exhibit some proofs of their courage. Jews are permitted to live among them in their villages, but they are not allowed to cultivate the earth, or to carry arms. Christians are much hated; but a Christian slave is better treated than among the other Arabs, because the avarice of the Mouselinens is greater than their fanaticism. As their slaves constitute their riches, they treat them tolerably well from a principle of prudence.

The south of the country of the Mouselinens, upon the coast of the Atlantic, is the rendering tribe of Wadelims; to the south of whom are the "Abassas: And next to these are the "Travers:" who border with the country of the Negroes. Eastward along the northern frontier of the Negroes lie the Moorish states of Jaffr, Ludamar, and others. With the exception of these small states, it is to be observed, that the great desert, or Sahara, reaching from the Atlantic ocean to the frontiers of Abyssinia, and from the vicinity of the Mediterranean to the country of the Negroes, is possessed by two great Moorish nations called the "Tuarick," and the "Tibbo." Of these the Tuarick is the most powerful: It consists of the whole desert and Tibbo westward from the meridian of Fezzan. The desert, of Sahara, eastward from the same meridian, belongs to the Tibbo. The manners and character of the whole of these tribes, whether great or small, is nearly or altogether similar. The desert which they inhabit is parched and uncultivated. Many places of it have the appearance of being capable of cultivation, as shrubs grow in various situations; and palms, or dates, rise at distant intervals. But the flying sand is the great obstacle to cultivation, by rendering the result of it uncertain. The sand drifts with every gale, and is at times accumulated into high mountains, which disappear as the winds blow. Thus it is shifted about with every change of the blast, excepting when the air is entirely stagnant. When the sand shower becomes formidable, the Moors are obliged to load their camels, turn their backs to the gale, and hasten away, to avoid being buried alive.

As water is very scarce in the desert, the Arabs or Moors form large holes for reservoirs to collect the rain water, which, though it soon becomes putrid and disgusting, is the only drink of man or beast. From the scarcity of water, they have few horned cattle; and their flocks consist chiefly of sheep, goats, and camels, animals which are patient of thirst. None but the wealthiest Arabs, who possess numerous herds, are able to maintain horses, as it is often necessary to give them milk to drink instead of water. The urine of the camels is carefully preserved to wash the vessels used to contain food; and the Arabs are frequently under the necessity of drinking it, mixed with milk, for the purpose of allaying their thirst. As their riches consist of their herds and flocks, they attend them with the greatest care. If a beast be sick, it is attended with more anxiety than a man; but if it seem likely to die, they kill and eat it. If it die before its blood be shed, it is accounted unclean, and is never eaten.

The Sahara, or desert, abounds in antelopes, wild animals of boars, leopards, apes, and serpents. The Arabs or the desert. Moors are expert hunters, and, as the leopard's skin is an article of commerce, that animal, from being frequently attacked, learns to keep at a distance from their habitations. Hunting the ostrich is a favourite amusement. It is undertaken by about twenty horsemen who
A F R I C A.

who advance in a line against the wind, at the interval of a quarter of a league behind each other. As soon as the foremost perceives an ostrich, he rushes upon it. The ostrich cannot fly; but with the assistance of its wings, it runs in the direction of the wind, and though it may avoid a few of the Arabs successively, cannot escape the whole number. In their bivouacs, the Moors or Arabs lodge by families in tents covered with a cloth of camels hair, which the women spin and weave. The furniture of the tent consists of two large sacks of leather, in which they keep their clothes and pieces of old iron, a few goat skins for holding milk and water, two large stones for grinding their barley, a mattress of osier which serves for a bed, a carpet for a covering, a small kettle and some wooden dishes, with pack saddles for their camels. They often associate to convey salt, which abounds in the desert, into the country of the Negroes; for which, in return, they bring back provisions and blue cotton cloth and slaves. They also associate for war and for hunting; and in most cases, where the property acquired consists of goods which can be packed up into parcels, they divide it into shares, which they cover up, and fix upon a woman, a child, or a stranger, who knows nothing of the contents of the various parcels, to distribute them by hazard to the different associates of the enterprise.

Artificers. The only artificers among the Moors of the desert, are smiths, or a kind of tinkers, who go among them from the country of the Monselemiines to mend their broken vessels, or repair their arms, and are paid in skins, goats and camels hair, or ostrich feathers, according to agreement. All of them are more attentive to their arms than to their dress; the latter of which often consists only of a long blanket which they wrap round them, with a cloak of camels hair, and most frequently of goats skins. They wear loose frocks or shirts, however, of blue cotton cloth, if they can procure them from the Negroes, by whom this cloth is manufactured. Their arms consist of daggers and clubs, with sabres and muskets if they can obtain them. To this general description of poverty, however, some of the Moors of the great inland nation or tribe of Tuarick form an exception, in that part of the desert which borders upon Fezzan, where they have an opportunity of acquiring wealth by engaging in the caravan trade. Mr Horneman saw at Fezzan many individuals of the Hagara, one of the tribes of the Tuarick, and describes them thus: "The Hagara are yellowish, like the Arabs; near Soudan, there are tribes entirely black. The clothing of this nation consists of wide dark blue breeches, a short narrow shirt of the same colour, with wide sleeves, which they bring together and tie on the back of their neck, so that their arms are at liberty. They wind a black cloth round their head in such a manner, that at a distance it appears like a helmet, for their eyes only are seen. Being Mahometan, they cut off their hair, but leave some on the top of the head, round which those who wear no cap contrive to fold their black cloth, so that it appears like a tuft on their helmet. Round their waist they wear a girdle of a dark colour. From several cords which fall from their shoulders hangs a Koran in a leather pouch, and a row of small leather bags containing amulets. They always carry in their hands a small lance neatly worked, about five feet long. Above the left elbow, on the upper part of the arm, they wear their national badge, a thick black or dark-coloured ring of horn or stone. Their upper dress is a Soudanian (Negro) shirt, over which a long sword hangs from the shoulder. The travelling merchants of this nation carry fire arms, though others use only the sword, the lance, and the knife, which they carry on their left arm; but the handle is finely worked; for they have the art of giving to copper as bright a colour as the English artists, and this art they keep very secret. They carry on a commerce between Soudan, (i.e. Nigritia), Fezzan and Gadamis. Their caravans give life to Mournzouk, which without them is a desert; for they, like the Soudanians (Negroes) love company, song, and music. The Tuarick are not all Mahometans. In the neighbourhood of Soudan and Tomboutoo live the Tagama, who are white, and of the Pagan religion."

Hospitality is the most remarkable virtue of the Moors, or Arabs of the desert. The chief of a horde is by custom bound or entitled to entertain all strangers; but every tent contributes to his stock of provisions. When a stranger reaches an Arab horde, the first person who perceives him points out the tent of the chief. If the master is not present, the wife or the slave comes forth to meet him, and brings him milk to drink. His camels are then unloaded, and his effects ranged around him. His arms are deposited near those of the master of the tent. The Arab, who in the field is a rapacious plunderer, in his tent is generous and hospitable; and the person of an enemy is inviolable, though he should have killed the near kinsman of his master. All this, however, is chiefly to be applied to persons of their own religion; for towards Christians and Jews, their fanaticism renders them extremely intolerant. A Jew, more especially, if discovered, can scarcely escape alive from among them.

Polygamy is allowed among the Arabs of the desert, as among other Mahometans; but it is very effectually restrained by the poverty of the people. Divorce is permitted at the will of either party; but if a male child is born, the marriage becomes indissoluble. In the education of children force is never employed. The priests, who are the teachers, instruct them to read the Arabic characters and sentences of the Koran; but if the child become weary of the school, he quits it or returns to it at pleasure, without being reproached.

Property descends by inheritance in equal shares to both male children; but the females have no share, and are obliged to reside with their eldest brother. The chief of the horde becomes the guardian of the children who are left orphans. Property is ill secured by their customs. If a thief is caught in the fact he may be punished; but if he escape with his booty, it cannot afterwards be claimed.

The abstinence and hardships which the Moors of the desert are frequently under the necessity of encountering, and their habits of predatory war against passing caravans, or hostile tribes, bestow upon them an evident superiority over the more peaceful tribes of Negroes who inhabit the fertile regions of the south. They possess also the knowledge of writing, and of the Arabic language, which inspires them with no small confidence of the importance of their own character and
and accomplishments. Hence, they assume a haughtiness of gait, and a ferocity of aspect, which distinguishes them no less than their complexion from the Negroses in their neighbourhood. Such is the presumption resulting from these sentiments, that though a small party of Negroes would never risk themselves in the desert, one or two Moors will travel with impunity through all Africa, and plunder the Negroes by whom they have been entertained.

As the equator passes almost through the centre of Africa, by far the largest portion of that great continent is situated within the torrid zone, and is possessed by the Ethiopians and Negroes, who are called by the Arabs Biled al Soudan, or Biled al Abiad, the land of blacks, or the land of whites. In all countries within the tropics, excessive rains fall twice every year about the time of the vernal and of the autumnal equinoxes. At these periods every river is swollen into a mighty flood, and if the country be level it is completely inundated. From this circumstance, along with the heat of the climate, arises the extreme fertility of the middle regions of the globe.

Though the Sahara, or great African desert, extends a few degrees beyond the tropic of Cancer, yet its boundaries begin to be ill defined; fertile spots become more frequent: and at last, in the latitude of the Cape of Verd isles, and in the neighbourhood of the first rivers, the Senegal and the Niger, the gum forests mark the commencement of the land of the Negroes. About 600 miles from the western coast, in the mountains of Kong, the river Senegal takes its rise, and flows westward into the Atlantic ocean. The same mountains are the source of the great river of the Ethiopians, the Niger, the knowledge of which, from the time of Herodotus, has been lost by the European nations, and has only been recently restored in consequence of the intrepid and persevering exertions of our countryman Mungo Park, who had been employed by the African Association to endeavour to discover whether its existence ought to be regarded as a reality or as an error of the ancient geographers. It runs eastward; but its termination, as will be afterwards noticed, is still unknown.

To the south of these rivers, all Africa belongs to various nations of Negroes, among whom considerable varieties of appearance and of character exist. In general, however, they are distinguished by short woolly hair, flat noses, thick lips, and black complexion, while their intellectual powers have been supposed by some to be inferior to those of the civilized European or Asiatic nations. Some modern writers, however, such as Bruce and Volney, are of opinion, that the elements of the arts and sciences came originally from Upper Egypt to Abyssinia, and the Egyptians appear to have described to the Ethiopians the commencement of civilization among mankind. "The Thebans (says Diodorus) consider themselves as the most ancient people on the earth; and assert that with them originated philosophy and the science of the stars. Their situation, it is true, is infinitely favourable to astronomical observation, and they have a more accurate division of time into months and years than other nations." The same opinion he attributes to the Ethiopians. "The Ethiopians conceive themselves to be of greater antiquity than any other nation; and it is probable that, born under the sun's path, its warmth may have ripened them sooner than other men. They suppose themselves also to be the inventors of divine worship, of festivals, of solemn assemblies, of sacrifices, and every other religious practice. They affirm that the Egyptians are one of their colonies; and that the Delta, which was formerly sea, became land by the conglomeration of the earth of the higher country, which was washed down by the Nile. They have, like the Egyptians, two species of letters, hieroglyphics and the alphabet; but among the Egyptians, the first was known only to the priests, and by them transmitted from father to son, whereas both species are common among the Ethiopians." The Ethiopians (says Lane) were the first who invented the science of the stars, and gave names to the planets, not at random and without meaning, but descriptive of the qualities which they conceived them to possess; and it was from them that this art passed in an imperfect state to the Egyptians.

But though the antiquity of the civilization of Egypt cannot be disputed, there is little reason to believe that the middle regions of Africa ever exhibited the human character in a higher state of cultivation than it now possesses there. In all ages its inhabitants were engaged in the barbarous practice of selling each other into slavery to distant nations. No remains of ancient magnificence are to be found in their country, nor any instruments of art which mark the genius of an improved people. Even the plough is still unknown, and the ingenuity of man is only exerted to supply his most simple wants.

A great part of the country of the Negroes receives ancient among Europeans the name of Guinea, a term as old as the time of Ptolemy, who applies it to the maritime districts, though this name is said to be utterly unknown to the natives of the country themselves, excepting where they have learned it from European traders. It would appear, however, that they have originated from one of the central states or empires of Africa, upon the banks of the Niger, which though once possessed of great power, has now fallen into decay, and is lost in the empire of Tombeutoo, and some neighbouring states.

The middle regions of Africa bring to maturity all the tropical productions or fruits in their utmost perfection and abundance. With the slightest cultivation, rice, maize, millet, sugar, cotton, indigo, &c. are raised, along with some fruits peculiar to itself, among which may be mentioned the shea-tree, from which the vegetable butter is prepared, which forms a principal article of commerce in all the interior districts. The shea-tree is said to resemble the American oak; the butter is prepared from the kernel of the fruit. This vegetable kernel resembles a Spanish olive, and is enclosed in a sweet pulp under a thin green rind. It is dried in the sun, and then boiled in water. Travellers tell us that the butter produced from it is white, firm, and better flavoured than that of milk. If this account of it be correct, which we have no reason to doubt, measures ought certainly to be taken for conveying this tree to the European settlements in the West Indies, and for cultivating it there, as it would undoubtedly be very valuable when reared in the vicinity of the bread-fruit tree, which has lately been brought from Otaheite.
AFRICA.

Various species of wild beasts inhabit this country, as lions, leopards, hyenas, elephants, buffaloes, wild boars, rhinoceroses, with great variety of the species of deer, and various kinds of monkeys. Innumerable species of snakes are also to be found here; one of the most remarkable of which, called the cobra, is of a pale green colour with black spots, about a foot in length, and as thick as a man’s finger. It possesses the power of expelling a subtle vapour into the eyes of any animal that approaches within the distance of two or three feet, so as to occasion extreme pain for several days, and even incurable blindness. Another species of snake, said to be found also in Ceylon, grows here to the enormous size of 50 feet in length; the colour of the back is dark grey, with lines of a dusky yellow: part of the belly is of a lighter colour and spotted; it lurks, in moist situations, wreathed into curls, which include a space of about five feet diameter, and give it at a distance some resemblance to the mouth of a well. Over these curls or rings it rears its head and part of its body, and remains immovable till some animal approach within its reach, when it darts upon it; and, if the animal is large, twists its body round it, and with an immense force crushes all its bones; and having lubricated it with saliva, swallows it entire. All having devoured in this manner a large animal, the snake remains as if lifeless for many days during the process of digestion, and in this situation may be easily destroyed. The cobra is also found in this country, along with an immense variety of reptiles. Of these, ants are the most formidable and destructive to man. They differ in size, from an inch in length to a minuteness that is almost imperceptible to the naked eye. They sometimes burst from their nests in such innumerable myriads as to destroy every thing on the surface of the earth, and to oblige the natives to desert their habitations. They often extinguish fires by their numbers, and form bridges of their own dead bodies over shallow waters which impede their progress. One species forms swarms like bees, and erects round pyramids of clay which becomes extremely hard. These pyramids are usually eight or ten feet high. Their interior consists of galleries suited to the size of the animal, interwoven like a labyrinth, having a small opening as a door or entry to the dwelling. Monstrous spiders also exist in this country, a single thread of whose web, it is said, will support a weight of several ounces.

The natives of this country have too little art or industry to take much advantage of the metals with which the earth is supposed in many places to abound. In some situations, however, they produce iron of a tolerable quality; but gold is the chief object of their search. It does not appear, however, that they have ever wrought the mines of which they have discovered to any depth, and it is chiefly procured from the sands of the rivers or of torrents after violent rains. It is then collected in some districts in considerable quantities, and forms an important article of commerce. Women chiefly engage in this employment, and an individual may collect in general during the dry season, as much as is equal to the value of two slaves. The gold obtained is either used in commerce or wrought into ornaments for the women. The standard of value is called menkallii, which is equal in value to about 10s.

In general, however, it may be remarked, with regard to all the natural productions of this continent, whether animal, vegetable, or mineral, that they still remain in great obscurity, and present a vast field for the investigation of the natural historian.

The general character of the Negroes, who are the inhabitants of these fertile regions, is that of extreme of the Neolithic. It is said, that they will dance for almost 24 hours together; and they do not suffer their gaiety to be disturbed by events, which, in other countries, are productive of much unhappiness. They do not appear to want the feelings of humanity, nor are they more destitute of sagacity than other men and women of an equal degree of education; but the general fertility of their country, which supplies them with food in consequence of the exertion of a very slight degree of industry, and the little occasion they have for clothing amidst the heat of their climate, produces an indolent and general habit of seeking present pleasure, and of banishing from their minds all care for the future.

The kind of government that exists among the Negro nations is by no means uniform. In many districts the country is governed by an immense multitude of independent petty chiefs, who are engaged in frequent wars with each other. In other places the talents of individual chieftains have been able to reduce considerable tracts of territory under their dominion. In such cases, in consequence of the internal tranquility produced by the extension of the prince’s power, flourishing towns have grown up. Thus upon the Niger stands the town of Sego, the capital of Bambara, Town of which was visited by Mungo Park, and which lies in Sego. N. Lat. 14° 10′, and W. Long. 2° 20′, containing about 30,000 inhabitants. Two hundred miles below this upon the same river stands Tombuctoo, the great Tombo-centre of the commerce of Fezzan, Cairo, and the countries on the north of Africa, with the land of the Negroes. Farther down the same river stands Foussa, Foussa, which is understood to be a city of still greater extent. Many of the Negro towns are fortified with ditchs and walls, built like the houses of the natives of clay and stone. The trenches are sometimes flanked with square towers like a regular fortification, and the walls are very high.

Domestic slavery prevails in a very great degree among all the Negro states. As the tropical rains sometimes fail or are deficient in quantity, the scorching heat of the sun burns up the face of the country, and produces a most frightful barrenness. On these occasions it is not uncommon for parents to sell their children, and even themselves, for bread. A freeman may also lose his liberty by being taken prisoner in war, or on account of the real or supposed crimes of murder and sorcery. He also forfeits it in consequence of insolvency. From these causes domestic slavery prevails to such a degree, that in many places three-fourths of the natives are slaves. These slaves, however, form in some measure a part of the community; and, by the custom of the country, the master cannot sell one who is born his slave, without accusing him of a crime, a circumstance, which, in consequence, of
of the slave trade, at times gives rise to much dissension, and to wars which resemble, in some measure, the sanguinary contests which existed in various countries in Europe, during the feudal times, between the villains and their lords. Thus, in 1735, a general insurrection took place in many districts on the western coast: the slaves attacked their masters, massacred great numbers of them, set fire to the ripe rice, blockaded the towns, and obliged them to see for peace.

Few arts have been brought to much perfection by the Negroes, because the division of labour has been little known among them. The same individual spins, weaves, sews, hunts, fishes; forms baskets, fishing-tackle, instruments of agriculture; makes soap, dyes cloth with indigo, and makes canoes. In all these, the neatness of the work excites the astonishment of strangers who know the diversity of occupations in which the same individuals engage, and the imperfection of the tools with which they labour. They are not strangers, however, to that ordinary division of labour, to which nature herself seems to have given rise in consequence of the distinction of the sexes. The women spin, and the men weave the cotton cloth of which their dresses are composed. The cotton is prepared for this purpose by rolling it with an iron spindle upon a smooth stone or board. The thread is well twisted though coarse, but the loom is so narrow that the web is only about four inches broad. The women dye this cloth with the leaves of indigo, pounded fresh, and mixed with a strong alkaline lea, formed by the lixivation of wood ashes. The colour thus produced is a rich and dourable blue with a purple gloss.

The workers in metals, and the manufacturers of leather, appear to be almost the only instances of what may be called a separate profession existing among the Negroes. The manufacturers of leather separate the hair by steeping the hides in a mixture of wood ashes and water, and use the pounded leaves of a tree called guo, as we do the oak bark, for the purpose of tanning. They dye the skins of sheep and goats red with powdered millet stalks, and yellow with a root which abounds in their country. The manufacturers of iron stoves also distinguish some of the interior districts; but it is generally hard and brittle. They form their weapons and tools of it, however, with considerable ingenuity. In smelting gold they use fixed alkaline salt, obtained by washing with water the ashes of burned corn stalks, and evaporating the ley to dryness. It must also be remarked, that, in the interior of the country, Mungo Park found a negro who manufactured gunpowder from nitre collected from the reservoirs of water frequented by the cattle, and sulphur supplied by the Moors, who obtain it from the Mediterranean. He pounded the ingredients in a wooden mortar, and granulated it; but the grains were unequal, and the strength of the gunpowder was very inferior to that of Europe.

The only necessary of life in which the country of the Negroes appears to be extremely deficient is salt, which is the more wanted among them in consequence of their subsisting chiefly upon vegetable food. A child cries for a piece of salt as for a great delicacy; and it is a proverbial expression of a man's riches, to say, that he eats salt to his food. This important article they receive from the great desert by caravans of trading Moors. They also receive arms, hardware, glass, and trinkets of all sorts, on the western coast from the Europeans, and, in the interior, from the caravans of Cairo, Fezzan, and Morocco. For these they give in return, gold, ivory and slaves. With regard to the ivory, the Negroes cannot comprehend for what reason it is so much valued by strangers. It is in vain to tell them that ships are built, and long voyages undertaken, to procure it to make handles for knives. They are satisfied that a piece of wood might serve the purpose as well, and imagine that it is applied to some important use which is concealed from the Negroes, lest they should raise the price of it. The trade of the Negroes is conducted by barter; and to Medium of adjusting the value of their different articles of commerce, they appeal to a nominal standard, consisting of a certain quantity of any commodity for which there is a great demand. Thus on the Gambia, that quantity of ivory or of gold-dust which is estimated as equal in value to a bar of iron, is denominated a bar of ivory, or a bar of gold-dust.

A marvellous story has, in all ages, been told of a singular strange mode of conducting commerce that exists among peoples in Africa. They live in the wildest trading mountainous districts: they are said to engage annually in trade, but at the same time to exclude themselves from all personal intercourse with the traders who visit them: They traffic chiefly in gold-dust, which they bring to particular places, and there leave it upon the approach of the traders, who deposit quantities of goods which they are willing to give for the gold-dust, and thereafter retire. The natives then approach, and carry off the goods, or the gold dust, according as they think fit to accept or reject the bargain. From the days of Herodotus down to our own times, this story has been repeated by various writers, and in particular by Wad-trom, upon the authority of the chevalier de la Touch, vice-governor of Goree, in 1788, who is said to have visited the districts inhabited by these invisible traders.

The knowledge of the Negroes with regard to all knowledge speculative subjects, is extremely limited. Their notions of geography and astronomy, like those of other extremely little developed nations, are altogether confined to what is mingled earth as a vast plain, the boundaries of which are covered with clouds and darkness. The sea is a great river of salt water; beyond which is the land of the white people; and at a still greater distance, is the land to which the slaves are carried, which is inhabited by giants, who are cannibals. Eclipses are ascribed to enchantment, or to the interposition of a great cat, which puts its paw between the moon and the earth. They divide the year by moons, and calculate the years by the number of rainy seasons. They religious seem to believe in one God, who has power over all things; but their religious opinions are extremely undefined, so that it is in vain to expect to find among them any system of belief that is either universally received, or even consistently adhered to by the same individuals. In general they seem to think, that the god of the blacks or Negroes is different from the god of the whites: When they are pleased with their own condition and their country, they represent their supreme deity as a good being, and the white deity as a kind of devil, who sends the white people to make slaves of the
the Negroes: But when they are in ill humour, they complain of their black deity as mischievous and cruel; while they say that the white deity gives his people the Europeans brandy and fine clothes, and other good things which are denied to the Negroes. Their notions of a future state are of the same fluctuating nature. They have a confused idea that the existence of the human mind does not terminate with this life; and they seem to venerate the spirits of the dead, regarding them as protectors, and placing victuals at the graves of their ancestors upon stated occasions. In general, however, they regard death with great horror; and in Whidah it was a law, that no person, on pain of death, should mention it in presence of the king. Some of them have a notion of a future state as connected with rewards and punishments of their conduct in this life. They imagine that the deceased are conveyed to a mighty river in the interior regions of Africa, where God judges of their past lives, and particularly of the regularity with which they have celebrated the new moons, which among the Negroes are kept as festivals; and of the fidelity with which they have adhered to their oaths. If the judgment is in their favour, they are gently wafted over the great river to a happy country, resembling in description the paradise of Mahomet, where they enjoy plenty of all those things which they were accustomed to value in this world: But if the judgment is unfavourable, they are plunged into the river, and never heard of more. They also believe, like the vulgar of most other countries, that the ghosts of persons who have been guilty of great and unpunished crimes, find no rest after death, but haunt or wander about those places in which their crimes were committed. The Asiatic doctrine of the transmigration of the souls of men after death into the bodies of other animals, is also entertained by some of them.

The opinions of the Negroes concerning the creation of man are not more fixed or definite than their ideas of his future existence. In general, they ascribe his original creation to the deity; but some of them pretend that he emerged, they know not how, from the caves and holes of the earth, or was produced by a monstrous spider. A curious fiction upon this subject is also said to prevail in some of the Negro states:—That God originally created both black men and white men; that he meant to bestow one gift upon each of them, gold or wisdom; that he gave the black men their choice, and that they preferred gold, and left wisdom or ingenuity to the whites; that God was offended with them on account of this improper choice, and ordained them to be slaves for ever to the white men.

They also believe in a divine providence, which sends rain to give fertility to the earth and the trees, and to wash down gold from the mountains. Accordingly, they pray fervently to God to give them those things upon which they set the greatest value, such as rice and yams, and gold, and slaves, and health, and activity. At the same time, from their inaccuracy of thinking upon this subject, they readily say, when conversed with, that it is not God but the earth that gives them rice; that their cattle produce young without the assistance of God; and that, if they did not labour for themselves, they might starve before God would help them.

From this loose and inaccurate mode of reasoning, the religion of the Negroes sits very light upon them. They seem to have a sort of priests, who perform some ceremonies at the new moons, and on certain occasions, such as, at marriages, or on giving names to young children; but these priests having no settled system of doctrine, and not being united into a disciplined body, possess very little influence. Hence it is extremely easy to induce the Negroes to adopt any religion by any more intelligent people. Accordingly, the Moors have made many converts among them; and some of the most considerable Negro states upon the northern frontier, that is, upon the Senegal and the Niger, are Mahometan.

But though the Negroes have little speculative religion, they have much superstition, as appears from the great use which they make of what are called fetiches, or charms termed obi by the Africans in our West-Indian islands. The fetiche consists of any natural object, with which chance has brought into the fancy of a Negro. One selects the tooth of a dog, of a tiger, or of a cat, or the bone of a bird; while another fixes upon the head of a goat, or a monkey, or parrot, or even upon a piece of red or yellow wood, or a thorn branch. The fetiche, thus chosen, becomes to its owner a kind of divinity, which he worships, and from which he expects assistance on all occasions. In honour of his fetiche, it is common for a Negro to deprive himself of some pleasure, by abstaining from a particular kind of meat or drink. Thus one man eats no goats flesh, another tastes no beef, and a third no brandy or palm wine. By a continual attention to his fetiche, a Negro so far imposes upon himself, as to represent it to his imagination as an intelligent being, or ruling power, inspecting his actions, rewarding his virtues, and punishing his crimes. Hence he covers it up carefully whenever he performs any action that he accounts improper. The importance or value of a fetiche is always estimated according to the success of its owner, and the remarkable prosperity of an individual brings his fetiche so much into fashion, as to induce others to adopt it. On the contrary, when a Negro suffers any great misfortunes, he infallibly attributes it to the weakness of his fetiche, which he relinquishes, and adopts another that he hopes will prove more powerful. A fortunate fetiche is usually adopted by the whole family of its possessor, to which it becomes an object of reverence, or a guardian like the household gods, diti lare, and penates, of the ancient Romans. Sometimes a whole tribe or a large district has its fetiche, which is regarded as a kind of palladium upon which the safety of their country depends. Thus at Accra the national fetiche was a lake, which the people accounted sacred. This lake was converted into a salt pit by the Portuguese, and the natives regarded this profanation as the cause of the conquest of their country by a neighbouring tribe called the Agroundoons. Thus also at Whidah, although the people believe in one supreme god, they worship as their national fetiche a kind of serpent of monstrous size, which they call the grandfather of the snakes. They say that it formerly deserted some other country, on account of its wickedness, and came to them, bringing good fortune and prosperity along with it. From this account of the fetiches of the Negroes, the intelligent reader will naturally remark, that even idolatry itself remains in an imperfect
imperfect state among the people; and he will observe the difference between the polished superstition of ancient Greece and Rome, and the vulgar and unadorned credulity of these rude and artless tribes. In the vicinity of their settlements, the Mambos have prevailed, and a singular custom of the Negroes, to adopt as fetishes or charms, certain sentences of the Koran, which they write out and sell to them, under the name of spectres. Mungo Park, when travelling among them, sometimes sold spectres, which usually consisted of the Lord's prayer.

Among the Negroes some singular customs prevail, which are not unworthy of notice, on account of their having some similarity to certain practices that have subsisted among other nations. Persons accused of any crime, more especially of poisoning, are frequently required to prove their innocence, by drinking what is called the red water. This is a poisonous liquor formed from the roots of certain plants, and the bark of trees, of a very narcotic quality. The accused is placed on a high chair, and strip of his clothes, having only a quantity of plantain leaves wrapped round his waist. He then, in the presence of the whole village, eats a little rice, and drinks a quart of the red water, which is extremely apt to find the accused person guilty. If he escape unharmed, however, and without vomiting, he is judged innocent. Much dancing and singing takes place on account of his escape, and he is allowed to demand that some punishment be inflicted on his accusers on account of the defamation. Among the superstitious customs of the Negroes, may be mentioned the practice of circumcision, which is universal among them. It is not regarded as a religious rite, but as a kind of charm for preventing barrenness. It is not performed till the age of puberty.

In several Negro states certain secret societies or fraternities exist, which possess great political influence, and in some places absolute power. One of these societies, called the society of the Bell, is appropriated to men, to the exclusion of women. It supports itself by the use of mystical symbols, a pretense to the knowledge of important secrets, and by abstraction to an imaginary being, called the Bell, who is said to be capable of changing his form at pleasure. This society monopolizes the public offices, and excludes all others. The young men are initiated into it by a noviciate which lasts some years. A space is marked out of eight or nine miles in circumference in a fertile spot, in which huts are built, and provisions raised. The young men resort thither, and are taught by instructors pitched upon by the society, to fight, to fish, to hunt, and to sing certain songs peculiar to the fraternity; they also receive new names as a mark of their new birth, and certain scars are imprinted on their bodies, with heated instruments of iron, to point them out as belonging to the fraternity. On returning home after their initiation, they are received with great ceremony by their relations, as persons now introduced into public life.

There is a kind of counterpart of this association, though of less political importance, called the society of the Nago or Sandi, which is confined to females. In a remote wood, which men are prohibited to approach, a number of huts are constructed, and the young marriageable girls are conducted thither during the night. They remain in this solitude, under the care of certain matrons, during four months, and are taught a variety of religious customs and superstitions. When their noviciate is expired, they return by night to their villages, where they are received by all the women both old and young, who, according to their number and the number of the instruments, till daybreak. If any one should approach this procession, he would suffer death, or be compelled to redeem himself by a very heavy fine.

There is a third kind of society, which is much more strange and universal than those now mentioned, and seems to exist in all the Negro states. This society does not appear to have any special name, but it conducts the mysteries of a strange imaginary being, called Mumbo Jumbo. As the practice of polygamy exists very universally among the Negroes, they often find great difficulty in preserving the peace of their families amidst a variety of rival wives. When the husband finds his authority altogether contemned, he has recourse to the assistance of Mumbo Jumbo. The dress of this strange minister of justice usually hangs upon a tree in a forest in the neighbourhood of every Negro village. It is made of bark, and forms a figure of about eight or ten feet high, with a tuft of straw on his head. When Mumbo is about to appear, the women make a approach in the evening by dismal screams from the adjacent woods, and as soon as it is dark they enter the village, and proceed immediately to the public place, where all the inhabitants both male and female are obliged to assemble at its call; for this phantom has absolute power. Nobody must appear covered in its presence, and every person is bound implicitly to execute its commands. As the women know that the visit is intended against some of them, they can have no great relish for the solemnity, but they dare not refuse to attend. The ceremony commences with songs and dances. These continue till midnight, when Mumbo Jumbo fixes upon the individual on whose account he comes. She is immediately seized by his command, stripped naked, tied to a post, and scourged with Mumbo's rod, to the great entertainment of the whole assembly, and especially of the rest of the women, who are often laziest in their dervish and censure of the ceremonies. The society then exclaims, that this mysterious personage make use of a peculiar or cant language, which is not understood by the uninstructed. They pretend that Mumbo Jumbo is a wild man, or some strange being that knows every body's thoughts. They bind themselves by oaths never to reveal their secrets to a woman or boy. The fraternity is so powerful, that when one of the Negro kings was weak enough to reveal the secret of Mumbo Jumbo's character to a favourite wife, who communicated it to the other females of the household, he and his whole family were immediately assassinated, in the presence, and by the command of Mumbo Jumbo; and nobody dared to dispute the propriety of their punishment.

Like all rude nations, the different tribes of Negroes are implicit believers in witchcraft and magic, sorcery, and in the existence of various kinds of sorcerers. These sorcerers they regard with the utmost terror and abhorrence. They believe that some of them have power to control the seasons, and to prevent the rice from arriving at maturity. Others of them are supposed to
A F R I C A.

suck the blood of men and beasts, and to occasion all kinds of diseases. When they suspect a person to have died in consequence of sorcery, they interrogate the corpse, which they believe gives answers in the affirmative, by forcibly compelling forward the persons who bear it, and in the negative by a rolling motion. If an answer is given in the affirmative, they inquire concerning the murderer, beginning with the relations of the deceased, and naming the suspected persons. When the guilty person is named, they say that the corpse impels the bearers forward; and upon the authority of this evidence, the person accused is seized and sold into slavery, and sometimes his whole family. It is evident that a trial of this kind may be so managed, as on all occasions to secure the condemnation of the accused person. Accordingly, in proportion to the demand for slaves, accusations of sorcery are more frequently brought forward against their subjects by the Negro chiefs. These accusations, however, are sometimes also brought against persons of importance, who cannot be sold on account of their rank, or against aged persons, whom nobody will purchase. In these cases, the person convicted is compelled to dig his own grave; and being placed at the foot of it, one from behind strikes him a violent blow upon the back of the head or neck, which causes him to fall upon his face into the grave. Some loose earth is then thrown upon him; a stake of hard wood is driven through his body, and the grave is filled up.

Tenacious of their customs.

Of these and all their other customs, the Negroes are extremely tenacious; and this tenacity of their customs, down to the minutest trifles, forms the principal obstacle to their civilization or improvement. Thus it is the custom to cut the rice six or eight inches below the ear, by two or three stalks at a time, according as they can be grasped between the thumb of the right hand and a knife, which is held in the same hand. The stalks are leisurely transferred to the left hand, and when it is almost full, they are tied like a nosegay and put into a basket. A negro chief who had seen the English mode of reaping, said, that it would cost an African his life, should he attempt to introduce it into his country, as he would be accused of intending to overturn the ancient customs, and would be compelled to drink the red water. By means of their customs, also, property is rendered less valuable than in other countries, which operates as a discouragement to industry. Their agriculture is carried on in concert by the inhabitants of every district, who share in common the products of their harvest. Hence the idea of exclusive property is rendered very vague, while the unlimited exercise of the law or custom of hospitality, renders the possession of it uncertain; as the industrious are forced to share their wealth with the indolent. Beggars are not reckoned disgraceful; and if a person has been negligent in providing the necessaries of life, he has only to discover where provisions are to be found, and he must obtain a share; for if he enter a house during a repast, the master, by custom, cannot avoid inviting him to partake. As domestic slavery, however, and the traffic in slaves, constitutes a most profitable branch of the African customs, it is not wonderful that their chiefs adhere to them with peculiar obstinacy.

With regard to the private or domestic economy of the Negroes, it may be observed, that their houses consist usually of a circular wall, built of mud, or of clay and stone, about four feet high, with a conical roof of bamboos, covered or thatched with hay. As houses of this structure cannot well be divided into separate apartments; where there is a plurality of wives, each has a hut appropriated to herself, and the whole huts belonging to a family are surrounded by a fence of bamboos formed into a kind of wicker work. A number of these enclosures, with intermediate passages or streets, which have no regular arrangement, form a town or village. The furniture of their houses usually consists of a bed, formed of a frame of canes, covered with a bullock's skin or with a mat, and of one or two wooden stools, and a few wooden dishes and pots for dressing food. The dress of both sexes is formed of cotton cloth; that of the men usually consists of a loose shirt or frock with wide sleeves, together with drawers or trousers, which reach to the middle of the leg. Some of the Negroes add to these a cap and sandals. The dress of the women consists of two pieces of cloth, each of which is about six feet long, and three feet broad. The one is wrapped round the waist and hangs down to the ankles, and the other is negligently thrown over the shoulders.

The state of the women, as among other barbarous State of nations, is by no means favourable. It is in general accounted altogether unnecessary for a lover to make proposals to his intended bride. She is considered as the property of her father, from whom he purchases her, and to whom he generally pays a price equal to the value of about two slaves. When he has agreed with the parents, therefore, with whom he eats a few nuts to ratify the contract, the proposed bride must give her consent, or remain for ever unmarried; for if she is given to another, the lover is entitled to seize her for a slave. On the day of marriage the bride is conducted with great ceremony to the house of the bridegroom, who must furnish abundance of liquor and refreshments to her attendants. On approaching the house, the bride is covered all over with a robe of white cotton, and is carried on the back of a woman to the house of her husband. She is then placed amidst a circle of matrons, who give her many instructions about her future life. The day is concluded with dances, songs, and feasting, and the validity of the marriage is confirmed by exhibiting tokens of virginity according to the Mosaic law.

A man is allowed to have as many wives as he can afford to purchase, and they are treated in a great measure as slaves, being in general compelled to take the whole charge of the agriculture abroad, as well as of the preparation of food for the family at home. When the husbands, however, are contented with one or two wives, instances of conjugal infidelity are uncommon; but when they have a greater number, they are often under the necessity of overlooking the accidental gallantries of their wives, in consequence of the impossibility of subjecting them to rigid confinement in the simple state of society in which they live. The Negro women suckle their children till they are able to walk, and sometimes till they are three years old, and during that period have no connection with their husbands.

After this account of the Negroes in general, we shall
AFRICA.

shall proceed to take notice of some of the more remarkable tribes into which they are divided, and with which we have been made acquainted by the latest travellers. Of these the tribe of MANDINGOES is the most important. They derive their name from a district in the interior of Africa, called Manding. This territory is situated in the most elevated northern tract of the country of the Negroes, near the sources of the rivers Senegal and Gambia, which flow into the Atlantic on the west, and of the Niger, which proceeds towards the east. Kamaliah, which is one of its towns, and was visited by Mr. Park, lies in 12° 46' N. Lat. Though Manding is in so high a level, and abounds in gold, it is not mountainous or barren. The tribe that has issued from it, and assumes the name of Mandingoes, forms by far the most numerous race of Negroes through the whole western quarter of the continent of Africa. Their territories intermingling in various situations with the possessions of other states, and, they, even form the bulk of the population where other tribes enjoy the sovereign power. Their language is by far the most universally understood of all the Negro tongues, and it appears to be more polished than any other. The Mandingoes are a tall slender race, of a colour moderately black. Their eyes are remarkably small, and they wear their beards. They are more industrious, and engage more extensively in commerce than other Negroes, so that they are frequently employed as agents in making bargains by persons of other tribes. In the character of travelling merchants, and instructors of youth, they have insinuated themselves into all the Negro countries, where they are distinguished by wearing more regularly than others a red or white cotton cap, and sandals. Some of them who have learned to read and write Arabic, and who profess Mahometanism, erect schools in the Pagans' villages, and instruct the youth gratis. They assume a great appearance of sanctity, abstain from strong liquors, and pretend to the power of counteracting magic. Thus they acquire a most extensive influence, and few affairs of importance are transacted without their advice. In almost every district, troops of Mandingo merchants are to be met with; and as their intellectual powers are more developed than those of other Negroes, they have been able to extend their language, as a kind of learned tongue, second only to the Arabic, along the Senegal and the Niger.

In most of the Mandingo towns there are two public buildings; a mosque for public prayers, and what is called the bentang, which is a large stage formed of interwoven bamboo erected under a spreading tree. At the bentang all public affairs are transacted, and idle persons assembled to smoke tobacco, and hear news. In every village there is a magistrate, who preserves public order, levies the duties on merchants, and presides at the palavers or courts held by the old men, where justice is administered. At these courts civil questions between parties are debated. In the Pagan states the decisions are pronounced according to the customs of their fathers; but where Mahometanism is more generally received, which is usually the case among the Mandingoes, the Koran is the rule of judgement, or the Shuria, which contains a digest of Mahometan laws both civil and criminal. Certain Mahometan Negroes, who make the laws of the prophet their particular study, are frequently retained in causes, as professional pleaders, and they are said to exhibit great dexterity in perplexing the judges.

The Pagan Mandingoes believe in one God, the Religious creator of all things; but they consider him as of a nature too much exalted above human affairs, to give much attention to their prayers. They address him, however, at the new moons, and imagine every new moon to be a new creation. They fancy that certain subordinate spirits rule the world, and that these spirits are influenced by enchantments and fetiches. They believe in a future state, but most of them admit that they know nothing about it. Their funerals consist of a tumultuous procession, in which they make dismal howlings; and after burying the body beside some large tree, the solemnity terminates in a revel of drinking, and at last of dancing and singing.

Next to the Mandingoes, the Foulahs are the most numerous race of Negroes on the western quarter of the continent of Africa. Their original country is called Fouladdo. It is a small state, situated near the sources of the Senegal and the Niger. From hence they have emigrated in powerful clans, and have acquired extensive territories, especially along these rivers, and along the Gambia. The Foulahs also possess the sovereignty of various isolated tracts southward, towards Sierra Leonne. Besides the fixed settlements in which they enjoy the sovereignty, they have introduced themselves in many places along the banks of the Gambia, and to the southward along what is called the gulf of Guinea, to a great distance, into the greater part of the Negro states, in the character of shepherds and cultivators of the ground. They obtain admission by paying a tax or rent to the chief of the territory for whatever lands they occupy, and emigrate at pleasure. In consequence of this mode of life, the sovereignty frequently fluctuates in the small states, between them and the Mandingoes, and other tribes, according to the proportion of the population, which often alters, from the emigrations of the Foulahs.

The features of the Foulahs are very different from those of the other Negroes. They have a Roman nose, a thin face, and small features, with long glossy soft hair, so as to resemble in a great degree the East Indian lascar. Their complexion is by no means of the permanent jetty colour of the other Negroes, but varies with the districts they inhabit, approaching to yellow in the vicinity of the Moors, and deepening into a moderate black towards the equator. Their stature is of the middle size, their form graceful, and their air insinuating. Their women are well shaped, and have regular features; but neither men nor women are so robust in their make as the other Negroes. Hence, they are accounted by the Negroes an intermediate race between themselves and the Moors; but the Foulahs consider themselves as superior to the Negroes, and class themselves among white nations. Their natural disposition is mild and humane, and they are Character extremely hospitable where the Mahometan religion has not taught them to treat infidels with reserve. They support with great care the aged and infirm of their own tribe, and frequently relieve the necessities of persons of other tribes. There are few instances of one Foulah being insulted by another, and they never sell their countrymen for slaves; on the contrary, if a
The Foulahs have the misfortune to be enslaved, his whole clan or village contributes to pay his ransom.

The Foulahs engage more extensively than the other Negroes in the raising of corn, and the breeding of cattle, but especially in the latter occupation. Hence the Mandingoos frequently entrust their cattle to the care of the Foulahs. They render them tractable by familiarity; feed them by day in the woods and open meadows, and secure them by night in folds, which they fence very strongly. Not satisfied with this precaution, the herdsmen, whose huts are erected in the middle of the fold, keep fires during the night burning around the folds, for the protection of the cattle against wild beasts, and to show that they are in a state of preparation against robbers. From the necessity of guarding their cattle they become intrepid hunters, and kill lions, tigers, elephants, and other wild beasts, with poisoned arrows, or with muskets which they purchase from the whites upon the coast. To poison their arrows, they boil the leaves of a particular shrub in water, and dip in the black juice a cotton thread, which they fasten round the barbs of the arrow.

From the milk of their cattle the Foulahs make considerable quantities of butter; but like all the Negro nations, they are entirely ignorant of the art of preserving milk by making it into cheese. This art is probably prevented from being introduced by the heat of the climate, and by the extreme scarcity of salt, which can be obtained in no other way but by purchasing it from the sea coast, or from caravans of trading Arabs, who bring it on the backs of camels from the great desert. They entertain a singular superstition, that to boil the milk of a cow prevents her from having any more. Hence, they will sell no milk to any person whom they have once discovered to have boiled it.

Like the other Negro tribes, the Foulahs are excessively fond of dancing. They have also a strong passion for music, and their chiefs account a practical skill in it a most respectable accomplishment. Their national airs have a peculiar character, and are tender and pleasing.

Though the Foulahs do not enslave each other, they do not hesitate to make war upon the neighbouring tribes for the purpose of obtaining slaves, chiefly with a view of selling them to Europeans upon the coast for fire-arms and gunpowder. Such at least is the account of the matter, which was obtained in 1794 by Messrs. Watt and Winterburn, who visited Fouta-Jallon, an extensive Foulah kingdom in the interior of Sierra Leone. This kingdom extends about 500 miles from east to west, and 200 from north to south. Temboo, the capital, contains 7,000 inhabitants. The power of their king is in a great measure arbitrary. On an emergency, he can bring to the field 10,000 cavalry. The markets and all kinds of trade are regulated by him and his officers. The soil is in many places extremely fertile, producing rice and maize, which are cultivated by the women, and carried to market by the men. In general, however, the ground is dry and stony, but affords pasture for all kinds of cattle. Their women dig a species of iron stone from mines of considerable depth. The ore is afterwards manufactured into a very malleable metal. In this kingdom of Fouta-Jallon there are schools in every town; and the majority of the people can read. The Mahometan religion is professed, but the mild character of the Foulahs prevents them from exhibiting that aspect of intolerance towards strangers which characterizes the professors of this religion in other countries.

On the western coast, a great part of the district between the rivers Senegal and Gambia, or, as it is often called, Senegambie, is inhabited by a nation called the Joloffs, which differs considerably from the other tribes of the Negroes. Their stature is tall and robust, and, though their complexion is of the deepest black, their noses are not so much depressed, nor their lips so protuberant, as those of the Mandingoos. They excel their neighbours in the manufacture and dyeing of cotton cloth, which they form into a finer thread and a broader web. They use their tees with the same dexterity as their fingers in many operations. Hence when they perceive a pair of scissors, a knife, or a toy which they covet, they turn their backs upon it, and, having engaged the owner in conversation, they seize it artfully with their toes, and throw it into a pochec which they wear behind. In this way, strangers trading in their towns are amazed to find their goods vanishing before their eyes, while they cannot perceive the thief. The Joloffs are very warlike, and equal the Moors in the management of horses; but, as they are divided into a number of petty states, which are continually engaged in war with each other, they have little power as a nation. In the succession to their leaders or chiefs, they follow the female line as the surest; and therefore, the eldest son of the eldest sister of the chief is preferred.

On the coast to the south of the river Gambia, there exists a rude but industrious tribe, called the Feloops, who have little intercourse with their neighbours. They possess considerable energy of character, and have resisted successfully the attacks of the Mandingoos, even when assisted by the Portuguese. They are very faithful in friendship, and their enmity is equally permanent, as they transmit their family feuds from generation to generation. When a man is killed in a quarrel, his eldest son procures his sandals, which he wears on the anniversary of the murder of his father, till he can revenge his death. In those parts of their country in which the Europeans have committed any ravages, they give no quarter to a white man. They sell to the Europeans, however, rice, goats, poultry, wax, and honey.

Besides these, a variety of tribes inhabit the same coast, and are known to Europeans under the appellation of Naltoo, Bisars, Bissagos, Balantes, Papés, and Bembons, of whom it is unnecessary to take particular notice, as they appear to be distinguished by no peculiarity from the other Negro tribes.

Proceeding eastward in the country between the Sambaok, Senegal and the Gambia is Bombaok, a region of considerable extent. The natives were originally termed Malinké; but, by intermingling with the Mandingoos, they have gradually so much assimilated to that people, as to lose the character of a distinct tribe. The country is mountainous, but is unwholesome and full of minerals. It abounds in mines of gold, silver, mines of copper, tin, and iron, but is neither well suited for gold, nor agriculture nor for pastureage. The working of the mines is regulated by the caprice or the wants of the chiefs.
AFRICA.

The chiefs of the different districts. The miners are indolent and unskilful: They never penetrate beyond 10 feet in depth, though the quantity of gold increases with the depth of the mine. They regard gold as a capricious and malevolent being, who delights in deluding the miners; on which account they never attempt to recover a vein when it disappears. The government of Bambouk fluctuates, like that of many of the Negro states, between monarchy and anistocracy, and the power of the king or supreme chief is extremely limited.

The frontiers of the Negro kingdoms usually consist of a wild or desert tract. Thus the kingdom of Wooll, which is on the north-west of Bambouk, is separated on its eastern boundary, by a wilderness filled with wild beasts, from the kingdom of Bondou, which lies to the north of Bambouk. Fattecondi is the capital of Bondou, at which the king resides. The king caused Major Houghton, an English traveller employed by the African Association, to be plundered; and he begged from Mr Mungo Park his blue coat, which that traveller was under the necessity of giving him, to avoid bad usage. His revenues, however, are considerable. His authority is firmly established, and his power is formidable to his neighbours. He was so well pleased with obtaining Mr Park's blue coat, adorned as it was with yellow buttons, that, on the following day he presented it to him somewhat more than half an ounce of gold, exempted his baggage from examination by the tax-gatherers, and allowed him to pay a visit to the women of his seraglio. The country at large is covered with wood, and, as it is in an elevated situation, and consequently somewhat less exposed than elsewhere to the burning heat of the climate, it is abundantly fertile. The frontier town of the kingdom eastward is called Jong. It contains 2000 inhabitants, is surrounded by a high wall with holes for muskets, and is in 14° 25' N. Lat. and 9° 12' W. Long.

To the north-east of Bondou is the Mandingo kingdom of Kasson, in which this peculiar custom or superstition prevails, that no woman is allowed to eat an egg. Koonakary, the capital, lies in N. Lat. 14° 31', about 394 geographical miles east of Jong. To the south-east of Kasson is the kingdom of Kaarta, which is bordered on the east by Bambouk, between which and Kaarta there are very frequent wars; a circumstance which renders travelling through these and other Negro states not a little difficult. The people are industrious: The cultivation of corn is carried on to a great extent, especially in Bambouk. They are Mahometans, without the intolerant fanaticism of that religion; and accordingly they are hospitable to strangers, though of a different faith. The neighbourhood of the Moors, however, renders the country unsafe; and, to guard against their incursions, the Negroes, when employed in agriculture, are under the necessity of carrying their arms to the field.

Sego, the capital of Bambouk, lies in N. Lat. 14° 10', and W. Long. 2° 26'; and contains about 30,000 inhabitants. It was here that Mungo Park at last beheld the long-sought majestic river Niger, glittering to the morning sun, as broad as the Thames at Westminster, and flowing slowly from west to east. The river is here called the Joliba by the natives. From the times of the Nasamonian explorers prior to the days of Herodotus, during 2300 years, no certain intelligence concerning this river had been obtained by the European nations, and its very existence had been doubted by the most intelligent writers. Mr Park is the only European traveller who since that period can boast of having reached it. Sego consists of four distinct towns; two of which are on the north and two on the southern part of the Niger. They are surrounded by high mud walls. The houses are of a square form; they are built of clay, and have flat roofs. The streets are narrow; and, as the Moors form a considerable proportion of the inhabitants, their mosques appear in every quarter. The language, however, is a dialect of the Mandingo. The authority of the Negro king of Bambouk is not a little restrained here by the influence of the Moors; and, to avoid giving offence to their intolerant spirit, he was under the necessity of sending Mr Park immediately out of the city to a village in the neighbourhood. The weather was stormy, but some negro women conducted him into a hut, gave him food, and thereupon began to their accustomed labour of spinning cotton. During their work they amused themselves with a song, composed upon the occasion, which one of them sung to a plaintive air. The translation of the song is in these terms: "The wind roared and the rains fell; the poor white man, faint and weary, came and sat under our tree. He has no mother to bring him milk, no wife to grind his corn. Chorus. Let us pity the white man, no mother has be;" &c.

The current money of this place consists of cowries, a kind of shells (cyprea moneta Lin.) which are also employed in the same way in Bengal. A man and his horse can subsist during 24 hours upon the provisions that 100 of them will purchase. The king of Bambouk presented Mr Park with 5000 cowries, and desired him to leave the neighbourhood of his capital, that he might not be destroyed by the Moors. This traveller persevered in advancing eastward down the river to another town called Silla, situated in N. Lat. 14° 48', Silla and W. Long. 1° 24', about 1090 British miles east of Cape Verdi. This formed the utmost limit to which he was able to advance, and therefore remains the boundary of our certain knowledge of the countries in that direction. He learned, however, that Silla stands within 200 miles of the city of Tombuctoo, which is upon the same river, and had long been an object of search of the Portuguese, the French, and English. He was informed, that the country is very populous in that direction. He was also told, that about two days' journey below Silla, where he stopped, there is a larger town than Sego, called Jenée, which stands on a small island in the Niger; and that two days journey below Jenée, the river expands into a large lake called Dibbie, from which the water issues in two large branches, insulating a fertile and swampy country called Ginbala; and that the two great branches of the river reunite at Kabra, which is one day's journey to the south of the city of Tombuctoo, of which it is the port. The government of Tombuctoo is said to be in the hands of the Moors; and that place is the principal emporium of the Moorish commerce in Africa. Below Tombuctoo, to the eastward, in the Niger city of Housa, the capital of a great kingdom, and possessed of extensive commerce. The Niger passes to the south of Housa at the distance of two days journey; but Mr Park...
AFRICA.

Africa. Park could learn nothing further concerning its course, as the traders who arrive at Tombuctoo and Houssa from the coast can say nothing more of it, than that it runs towards the rising of the sun to the end of the world. Any farther intelligence that has hitherto been obtained, concerning Soudan or Nigeritia to the eastward of the route of Mr Park, is extremely uncertain, being merely the result of inquiries made by Mr Horneman among the merchants of Fezzan during his residence there. In the present imperfect state of our knowledge, however, this information is entitled to attention. He observes, that "the Houssa are certainly Negroes, but not quite black; they are the most intelligent people in the interior of Africa; they are distinguished from their neighbours by an interesting countenance; their nose is small and not flattened; and their features are not so disagreeable as those of the Negroes, and they have an extraordinary inclination for pleasure, dancing, and singing. Their character is benevolent and mild. Industry and art, and the cultivation of the natural productions of the land, prevail in their country; and in this respect they excel the Fezzanians, who get the greatest part of their clothes and household implements from the Soudanians. They can dye in this country any colours but scarlet. The culture of their land is as perfect as that of the Europeans, although the same manner of doing it is very troublesome. In short, says Mr Horneman, we have very unjust ideas of this people, not only with respect to their cultivation and natural abilities, but also of their strength and the extent of their possessions, which are by no means so inconsiderable as they have been represented. Their music is imperfect, compared to the European; but the Housanian women have skill enough to affect their husbands thereby even to weeping, and to inflame their courage to the greatest fury against their enemies. The public singers are called Kadanka."

Bornou. The same traveller informs us, that to the eastward of Houssa are situated the dominions of the sultan of Bornou. The people are blacker than the Housanians, and completely Negroes. They are strong, patient, labour, and phlegmatic. Their food is a paste made of flour and flesh, and their liquor is an intoxicating but nourishing kind of beer. Their best natural production is copper. The low country of Wangara is said to be subject to Bornou. It is periodically overflowed by the Niger; but the course of that river farther eastward is not known. Mr Horneman was informed that it had at least a periodical communication with the longer branch of the Nile, called the Bahr Abiad or White river, which rises in the mountains Al Komri, or mountains of the Moon, about the seventh degree of N. Lat. To the eastward of Wangara, at the distance of about six degrees of longitude, is the country of Darfoor already mentioned; beyond which lies Kordofan, another barbarous state; and still farther to the eastward is the country of Abyssinia, in which the shorter branch of the Nile, the Bahr Azzac or Blue river, takes its rise, which was visited and traced to its source by our countryman Mr Bruce. That traveller considered the Bahr Azzac as the Nile, whereas in truth it is only one of its tributary streams.

The belt or stripe of territory of which we have hitherto taken notice is situated between the 10th and 17th degrees of N. Lat. To the southward of this line the interior of Africa is still unknown, as it has hitherto been visited by no European traveller. We only know that it contains various nations or tribes of Negroes, of different characters and degrees of civilization. It may be observed, however, that to the south of Tombuctoo and Houssa lies the kingdom of Gago, near a ridge of mountains which run from west to east, and give rise to many streams that flow northward into the Niger. It produces much gold, and the people are warlike. Their armies are composed of cavalry; and no warrior is permitted to take an enemy prisoner before he has obtained, by the mutilation of persons whom he has slain, an hundred bloody trophies, similar to those which, in the Jewish history, David is said to have won from the Philistines and presented to King Saul as the price of his daughter Michal (1 Samuel xviii. 25.) In Gago, when the general takes the field he spreads a buffalo's hide upon the ground; and pitching a spear at each side, he causes the soldiers to march over it till a hole be worn through the hide, when the army is understood to be sufficiently numerous. The king is absolute; but, when they are offended with his conduct, his subjects sometimes rebel and send him a present of parrot eggs, with a message, importing that "his subjects, considering that he must be fatigued with the trouble of government, are of opinion that it is time for him to indulge in a little sleep." If the rebellion appear too formidable to be resisted, his majesty takes the hint, and desires his women to strangle him; upon which he is immediately succeeded by his son.

To the south of Gago, and near to the gulf of Guinea, Dahomy is the kingdom of Dahomy. The capital, called Abo- my, stands in N. Lat. 7° 57'. The country is fertile and cultivated, bearing every kind of grain, as well as indigo, cotton, and sugar. The character of the people is strongly marked, and some of their customs are singular. In their wars they are bold, and even ferocious; but towards strangers they are hospitable, without any mixture of rudeness. Their king possesses absolute power in the most complete sense of the word. All children, whether male or female, are considered as his property. They are early separated from their parents, and receive a sort of public education, with a view to destroy from their minds all family connections. The king's dwelling occupies a space about a mile square. It consists of a multitude of huts formed of mud walls with bamboo roofs; and the whole is enclosed by a mud wall of 20 feet in height. The entrance of the king's apartment is paved with human skulls, and the side walls are ornamented with the jaw bones of men. On the thatched roofs numerous human skulls are ranged on wooden stakes; and he declares war by announcing that his house wants thatch. He has commonly about 3000 females immured in this dwelling; and about 500 are appropriated to each of the principal officers. When a man wants a wife he must purchase her from the king or some of these officers. He must first lay down the price, which is 20,000 cowries; and must then be contented with the wife that is allotted to him. At his succession the king proclaims that he knows nobody, and is not inclined to make any new acquaintance; that he will administer justice rigorously and impartially, but will listen to no representations against his will; and that he will receive no presents except from his officers, who approach him
AFRICA.

with the most subject submission. His whole subjects acknowledge themselves his slaves, and admit his right to the absolute disposal of their property and persons. Their character is nevertheless active and intrepid; and they sacrifice themselves in war without hesitation, in obedience to his commands. Thus the Dahomans appear to form a sort of exception to the general mildness of the Negro character.

In addition to what has been here stated concerning the black inhabitants of the southern regions of Africa, it may be remarked, that a French traveller, Vaillant, proceeding northward from the Cape of Good Hope, has made repeated efforts to investigate the character and state of the natives in that quarter. He has extended his researches into what is called the country of the Caffirs, far beyond the limits that had been reached by any other traveller, and has given us the names of various African tribes, under the appellation of Gues-siquas, Nimiquas, Koraquas, Kahobiquas, and Houzou-anas. These tribes differ considerably in their features and make of body from the general Negro race, which we have already described. In their moral and intellectual character, however, they are not a little inferior: Their wants are extremely few, and are supplied by their flocks and herds without the necessity of agriculture; and their lives pass away in a routine of listless inactivity, or of simple and uninteresting occupations, the detail of which would afford little amusement or instruction.

We have already mentioned, that the European nations, during these three last centuries, have established small settlements or garrisons upon different parts of the Negro coast, chiefly for the purpose of obtaining slaves by trading with the natives. The number of people that are annually exported from that country, in consequence of this trade, by Europeans or Moors, is very great. The Europeans have frequently carried from the west coast above 100,000 slaves a year; and the caravans of Egypt and Fezzan carry off about 20,000 annually. The very great extent to which this traffic is carried on the western coast undoubtedly gives rise to many abuses among the native states in that neighbourhood, and is productive of frequent wars among them. Unfortunately, the nations of Europe have hitherto made few efforts to compensate these evils by any attempts to introduce their arts, their civilization, or their science, among the natives. Till lately, the Portuguese were the only nation that attempted the improvement of the Negroes. They did not confine themselves to garrisons or trading factories, but formed considerable colonies on the coasts. They attempted to instruct the natives in the better cultivation of their soil; and introduced their own religion among them. It is even said, that in Losango, Congo, Angola, and Benguela, they have been so sedulous in the conversion of the Negroes, that they have made them better Christians than themselves. It is worthy of notice, as a fact of some importance in natural history, that such of the descendants of the Portuguese in these climates as have adopted the manners of the Negroes, and their modes of life, are hardly to be distinguished in colour from the darkest Negroes. From the weakness of the parent state, the Portuguese settlements, in many places, are greatly decayed; and their efforts for the civilization of the natives have not been sufficiently extensive or persevering; still, however, they are said to carry on the slave-trade with more mildness and humanity than other nations. The slaves are catechised and baptized before they are shipped; which tends to diminish the terrors attending transportation. The slave-ships of the Portuguese are never crowded, and they are chiefly navigated by black mariners.

In 1779, a Swedish society formed the project of settling a European colony on the western coast of Africa, with the view of disseminating the general principles of civilization. This project was, at a later period, eagerly pressed by Charles Berns Wadstrom, a native of that country, but without success. Afterwards the Danes established a small colony with the same view, near the mouth of the river Volta, under the superintendence of Doctor Isert. In the mean time, the university of Cambridge in England, in 1785, proposed, as the subject of a prize-essay, a question concerning the lawfulness of the slavery and commerce of the human species. The prize was won by Mr. J. Clarkson; and the question began to attract public notice: Vast numbers of pamphlets were written; and in a few years the whole nation interested itself in the subject, and the slave-trade became an object of popular indignation. Some legislative attempts were made towards its abolition, which were probably frustrated by the convulsive state into which Europe was plunged by the French revolution. In the mean time, as early as 1783, Doctor H. Smeathman had proposed a specific plan for the colonization of Africa. This plan was not immediately attended to; but in the year 1787, after the subject had assumed a greater degree of importance, an attempt was made to carry it into execution, by sending about four hundred blacks and sixty whites, chiefly people of abandoned characters, collected about London, to Sierra Leone. In consequence of the kind of persons chosen as colonists, this first attempt did not succeed. But in July 1791, a Sierra Leone Company, which had contributed money for the purpose of making a settlement with a view to the instruction and civilization of the Africans, were incorporated by act of parliament under the name of the Sierra Leone Company. At the termination of the American war, many black loyalists had been conveyed to Nova Scotia, which they disliked, in consequence of the sterility of the lands allotted to them, and the severity of the climate. The new Sierra Leone Company made proposals to these blacks to form a settlement upon the coast of Africa, to which they were to be conveyed at the expense of the Company. The proposal was accepted by 1200 blacks, who arrived at Sierra Leone in March 1792. After experiencing considerable difficulties, the colony began to enjoy tolerable prosperity, and received ambassadors from the neighbouring Negro states; but on the 28th September 1794 a French squadron suddenly plundered and destroyed the colonial town. This squadron had been fitted out for the purpose of disturbing the trade of the English slave-factories on the coast, and is said to have been instigated by an American slave captain, who had taken some offence at the governor, to make the attack now mentioned. The damage was repaired. The settlement has since been visited by various missionaries from different religious sects in Britain, with
AFRICA.

AFRICA. See Company in this work, and AFRICAN COMPANY in the Supplement.

AFRICAN Association. See Association.

AFRICAN Institution. See Supplement.

AFRICANUS, JULIUS, an excellent historian of the third century, the author of a chronicle which was greatly esteemed, and in which he reckons 5500 years from the creation of the world to Julius Caesar. This work, of which we have now no more than what is to be found in Eusebius, ended at the 221st year of the vulgar era. Africanus also wrote a letter to Origen on the history of Susanna, which he reckoned supposititious: and we have still a letter of his to Aristides, in which he reconciles the seeming contradictions in the two genealogies of Christ recorded by St Matthew and St Luke.

AFLSAGERS, persons appointed by the burgomasters of Amsterdam to preside over the public sales made in that city. They must always have a clerk of the secretary’s office with them, to take an account of the sale. They correspond to our brokers, or auctioneers.

AFT, in the sea language, the same with ABBAT.

AFTERBIRTH, in Midwifery, signifies the membranes which surround the infant in the womb, generally called the secondures. See Midwifery.

AFTERMATH, in Husbandry, signifies the grass which springs or grows up after mowing.

AFTERNOON, the latter half of the artificial day, or that space between noon and night.

AFTER-PAINS, in Midwifery, excessive pains felt in the groin, loins, &c. after the woman is delivered.

AFTER-SWARMs, in the management of bees, are those which leave the hive some time after the first has swarmed. See Bee.

AFWESTAD, a large copper-work belonging to the crown of Sweden, which lies on the Dala, in the province of Dalmaria, in Sweden. It looks like a town, and has its own church. Here they make copper plates; and have a mint for small silver coin, as well as a royal post-house. E. Long. 14. 10. N. Lat. 58. 10.

AGA, in the Turkish language, signifies a great lord or commander. Hence the aga of the janizaries is the commander in chief of that corps; as the general of horse is denominated spechialer aga. The aga of janizaries is an officer of great importance. He is the only person who is allowed to appear before the Grand Signior without his arms across his breast in the posture of a slave. Eunuchs at Constantinople are in possession of most of the principal posts of the seraglio: The title aga is given to them all, whether in employment or out. This title is also given to all rich men without employ, and especially to wealthy landholders.

We find also agas in other countries. The chief officers under the khan of Tartary are called by this name. And among the Algerines, we read of agas chosen from among the boluk bashis (the first rank of military officers), and sent to govern in the chief towns and garrisons of that state. The aga of Algiers is the president of the divan, or senate. For some years, the aga was the supreme officer; and governed the state in place of the bashaw, whose power dwindled to a shadow. But the soldiery rising against the boluk bashis, or agas, massacred most of them, and transferred the sovereign power to the caliph, with the title of Dey or King.

AGADES, a kingdom and city of Negroiland in Africa. It lies nearly under the tropic of Cancer, between Gobor and Cano. The town stands on a river that falls into the Niger; it is walled, and the king’s palace is in the midst of it. The king has a retinue, who serve as a guard. The inhabitants are not so black as other Negroes, and consist of merchants and artificers. Those that inhabit the fields are shepherds or herdsmen, whose cottages are made of boughs, and are carried about from place to place on the backs of oxen. They are fixed on the spot of ground where they intend to feed their cattle. The houses in the city are stately, and built after the Barbary fashion. This kingdom was, and may be still, tributary to the king of Tombuctoo. It is well watered; and there is great plenty of grass, cattle, senna, and manna. The prevailing religion is the Mahometan, but it is not rigidly practised.

AGALLOCHUM, a very fragrant medicinal wood brought from the East Indies. See ExeDeraria, Botauy Index.

AGALMATA, in antiquity, a term originally used to signify any kind of ornaments in a temple; but afterwards for the statues only, which were most conspicuous.

AGAMEMNON, the son of Atreus by Euryclea, was captain general of the Trojan expedition. It was foretold to him by Cassandra, that his wife Clytemnestra would be his death; yet he returned to her; and accordingly was slain by Agamemnon, who had gained upon his wife in his absence, and by her means got the government into his own hands.

AGAN, in Geography, one of the Ladrones islands. The circumnavigator, Magellan, was assassinated here in the year 1525.

AGANIPPE, in antiquity, a fountain of Bceotia, at Mount Helicon, on the borders between Phocis and Bceotia, sacred to the Muses, and running into the river Peneius; (Pliny, Pausanius.) Ovid seems to make
AIGA

Aganeipe and Hippocrates the same. Serenus more truly distinguishes them, and ascribes the blending them to poetical license.

AGANIPPIDES, in ancient poetry, a designation given to the Muses, from a fountain of Mount Helicon, called Aganeipe.

AGAPE, in ecclesiastical history, the love-feast, or feast of charity, in use among the primitive Christians; when a liberal contribution was made by the rich to feed the poor. The word is Greek, and signifies love. St Chrysostom gives the following account of this feast, which he derives from the apostolic practice. He says, "The first Christians had all things in common, as we read in the Acts of the Apostles; but when that equality of possessions ceased, as it did even in the Apostles' time, the agape, or love-feast, was substituted in the room of it. Upon certain days, after partaking of the Lord's supper, they met at a common feast; the rich bringing provisions, and the poor who had nothing being invited." It was always attended with receiving the holy sacrament; but there is some difference between the ancient and modern interpreters as to the circumstance of time, viz. whether this feast was held before or after the communion. St Chrysostom is of the latter opinion; the learned Dr Cave of the former.—These love-feasts, during the three first centuries, were held in the church without scandal or offence; but, in after times, the heathens began to tax them with impunity. This gave occasion to a reformation of these agapes. The kiss of charity, with which the ceremony used to end, was no longer given between different sexes; and it was expressly forbidden to have any beds or couches, for the conveniency of those who should be disposed to eat more at their ease. Notwithstanding these precautions, the abuses committed in them became so notorious, that the holding of them (in churches at least) was solemnly condemned, at the council of Carthage, in the year 307.

AGAPETÆ, in ecclesiastical history, a name given to certain virgins and widows, who, in the ancient church associated themselves with, and attended on, ecclesiastics, out of a motive of piety and charity.

In the primitive days there were women instituted deaconesses; who, devoting themselves to the service of the church, took up their abode with the ministers, and assisted them in their offices. In the fervour of the primitive piety, there was nothing scandalous in these societies; but they afterwards degenerated into libertinism; insomuch, that St Jerome asks, with indignation, unde agapatæ ternis in ecclesiis introiit? This gave occasion for councils to suppress them.—St Athanasius mentions a priest, named Leonius, who, to remove all occasion of suspicion, offered to mutilate himself, to preserve his beloved companion.

AGARD, ARTHUR, a learned English antiquarian, born at Totton in Derbyshire in the year 1540. His fondness for English antiquities induced him to make many large collections; and his office as deputy chamberlain of the exchequer, which he held 45 years, gave him great opportunities of acquiring skill in that study; and composed a work purposely to explain it, under the title of Tractatus de usu et obscurioribus verbis libri de Domestacy: he also compiled a book for the service of his successors in office, which he deposited with the officers of the king's receipt, as a proper index for succeeding officers. All the rest of his collections, containing at least twenty volumes, he bequeathed to Sir Robert Cotton; and died in 1615.

AGARIC, FEMALE. See Boletus, Botany Index.

AGARIC Mineral, a marly earth resembling the vegetable of that name in colour and texture. It is found in the fissures of rocks, and on the roofs of caverns; and is sometimes used as an astringent in fluxes, hemorrhages, &c.

AGARICUS, MUSHROOM. See Agaricus, Botany Index.

AGATE, or achat, (among the Greeks and Latins, Agar, and Achates, from a river in Sicily, on the banks of which it was first found), a very extensive genus of the semipellucid gems.

These stones are variegated with veins and clouds, but have no zones like those of the onyx. They are composed of crystal debased by a large quantity of earth, and not formed, either by repeated incrustations round a central nucleus, or made up of plates laid evenly on one another; but are merely the effect of one simple concretion, and variegated only by the disposition given by the fluid they were formed in to their differently coloured veins or matters.

Agates are arranged according to the different colours of their ground. Of those with a white ground there are three species. (1.) The dendrochelae, mocoa stone, or arborecent agate. This seems to be the same with what some authors call the achatem with rosemary in the middle, and others achatem with little branches of black leaves. (2.) The dull milky-looking agate. This, though greatly inferior to the former, is yet a very beautiful stone. It is common on the shores of rivers in the East Indies, and also in Germany and some other parts of Europe. Our lapidaries cut it into counters for card-playing, and other toys of small value. (3.) The lead-coloured agate, called the phasochlates by the ancients. Of the agates with a reddish ground there are four species. (1.) An impure one of a flesh-coloured white, which is but of little beauty in comparison with other agates. The admixture of flesh-colour is but very slight; and it is often found without any aloids, veins, or other variegations; but sometimes it is prettily veined or variegated with spots of irregular figures, having fimbriated edges. It is found in Germany, Italy, and some other parts of Europe; and is wrought into toys of small value, and often into the German guidentine. It has been sometimes found with evident specimens of the perfect mosses bedded deep in it. (2.) That of a pure blood colour, called harnachates, or the bloody agate, by the ancients. (3.) The clouded and spotted agate, of a pale flesh colour, called by the ancients the cornelium achatem or sardochates. (4.) The red-lead coloured one, variegated with yellow, called the coral agate, or coralla-achates, by the ancients.

Of the agates with a yellowish ground there are only two known species; the one of the colour of yellow wax, called caravaches by the ancients; the other a
very elegant stone, of a yellow ground, variegated with white, black, and green, called the leonina, and leoni-
teres, by the ancients.

Lastly, Of the agates with a greenish ground, there is only one known species, called by the ancients jas-
pachates.

Of all these species there are a great many varieties; some of them having upon them natural representations of men and different kinds of animals. These representations are not confined to the agates whose ground is of any particular colour, but are occasionally found on all the different species. Velshins had in his custody a flesh-coloured agate, on one side of which appeared a half moon in great perfection, represented by a milky semicircle; on the other side, the phases of vesper, or the evening star: whence he denominated it an aphroditian agate. An agate is mentioned by Kir-
cher *, on which was the representation of a heroine armed; and in one in the church of St Mark in Venice has the representation of a king's head adorned with a diadem. On another, in the museum of the prince of Gonzag, was represented the body of a man with all his clothes in a running posture. A still curious one is mentioned by De Boot †, wherein appears a circle struck in brown, as exactly as if done with a pair of compasses, and in the middle of the circle the exact figure of a bishop with a mitre on: but inverting the stone a little, another figure appears; and if it is turned yet further, two others appear, the one of a man, and the other of a woman. But the most celebrated agate of this kind is that of Pyrrhus, wherein were represent-
ed the nine Muses, with their proper attributes, and Apollo in the middle playing on the harp ‡. In the emperor's cabinet is an oriental agate of a surprising bigness, being fashioned into a cup, whose diameter is an ell, abating two inches. In the cavity is found delineated in black specks, ΨΧΙΣΤΟΡ s. XXX. Other agates have also been found, representing the numbers 4191, 1912; whence they were called arithmetical agates, as those representing men or women have ob-
tained the name of anthropomorphous.

Great medicinal qualities were formerly attributed to the agate, such as resisting poisons, especially those of the viper, scorpion, and spider; but they are now very jealously rejected from medicinal practice. The oriental ones are all said to be brought from the river Gymbay. A mine of agates was some time discovered in Transylvania, of divers colours; and some of a large size, weighing several pounds.

Agates may be stained artificially with solution of silver in spirit of nitre, and afterwards exposing the part to the sun; and though these artificial colours disappear on laying the stone for a night in aquafortis, yet a knowledge of the practicability of thus staining agates, must render these curious figures above men-
tioned strongly suspected of being the work not of na-
ture but of art. Some account for these phenomena from natural causes. Thus Kircher, who had seen a stone of this kind in which were depicted the four letters usually inscribed on crucifixes, I. N. R. I. ap-
prehends that some real crucifix had been buried un-
der ground, among stones and other rubbish, where the inscription happening to be parted from the cross, and to be received among a soft mould or clay susceptible of the impression of the letters, came afterwards to be

petrified. In the same manner he supposes the agate of Pyrrhus to have been formed. Others resolve much of the wonder into fancy, and suppose those stones formed in the same manner with the camaeius or Flo-

Agate.

petrified. In the same manner he supposes the agate

petrified. In the same manner he supposes the agate

of Pyrrhus to have been formed. Others resolve much

of the wonder into fancy, and suppose those stones

formed in the same manner with the camaeius or Flo-

romei.

The agate is used for making cups, rings, seals, handles for knives and forks, bills for swords and hangers, beads to pray with, smelling boxes, patch-

boxen, &c. being cut or sawed with no great difficul-

ty. At Paris none have a right to sell them com-

modity except the wholesale mercers and goldsmiths.
The sword cutlers are allowed to sell it, but only when

made into handles for couteaux de chasse, and ready set

in. The cutlers have the same privilege for their knives

and forks.

Considerable quantities of these stones are still found

near the river Achates in Sicily. There are found in

some of these the surprising representations above men-
tioned, or others similar to them. By a dexterous ma-

nagement of these natural stains, medals have been pro-

duced, which seem masterpieces of nature: for this stone

bears the graver well; and as pieces of all magnitudes

are found, they make all sorts of work of it. The high

altar of the cathedral of Messina is all over encrusted

with it. The lapidaries pretend that the Indian agates

are finer than the Sicilian; but Father Labat informs us, that in the same quarries, and even in the same

block, there are found pieces much finer than others, and

crude fine pieces are sold for Indian agates in order to

eachuse their prices.

Agate, among antiquaries, denotes a stone of this kind

engraved by art. In this sense, agates make a

species of antique gems; in the workmanship whereof

we find eminent proofs of the great skill and dexterity of the sculptors. Several agates of exquisite beauty are

preserved in the cabinets of the curious; but the facts

or histories represented on these antique agates, however

well executed, are now become so obscure, and their

explications so difficult, that several diverting mistakes

and disputes have arisen among those who undertook to
give their true meaning.

The great agate of the apotheosis of Augustus, in the

treasury of the holy chapel, when sent from Con-

stantinople to St Lewis, passed for a triumph of Joseph.

An agate, which was in the French king's cabinet, had

been kept 700 years with great devotion, in the Bene-
dictine abbey of St Evre at Toul, where it passed for

St John the Evangelist carried away by an eagle, and
crowned by an angel; but the Heathenism of it having

been lately detected, the religious would no longer give

it a place among their relics, but presented it in 1684
to the king. The antiquaries found it to be the apo-
theosis of Germanicus. In like manner the triumph of

Joseph was found to be a representation of Germa-
nicus and Agrippina, under the figures of Ceres and

Triptolemus. Another was preserved, from time im-

memorial, in one of the most ancient churches of

France, where it had passed for a representation of pas-

sion and the fall of man; there being found on it two

figures representing Adam and Eve, with a tree, a ser-
pent, and a Hebrew inscription round it, taken from

the third chapter of Genesis, " The woman saw that
the tree was good," &c. The French academicians,
instead of our first parents, found Jupiter and Minerva

represented by the two figures: the inscription was of
AGATE is also the name of an instrument used by gold-wire drawers; so called from the agate in the middle of it, which forms its principal part.

AGATHIAS, or, as he calls himself in his epigrams, AGATHIUS, distinguished by the title of Ἀσκολεστικός, a Greek historian in the 6th century under Justinian. He was born at Myrina, a colony of the ancient Ἀθηναίοι, in Asia the Less, at the mouth of the river Phrygus. He was an advocate at Smyrna.

AGATHOCLES, the famous tyrant of Sicily, was the son of a potter at Reggio. He was a thief, a common soldier, a centurion, a general, and a pirate, all in regular succession. He defeated the Carthaginians several times in Sicily, and was once defeated himself. He first made himself tyrant of Syracuse, and then of all Sicily; after which he vanquished the Carthaginians in both in Sicily and Africa. But after having ill success, and being in arrears with his soldiers, they mutinied, forced him to fly his camp, and cut the throats of his children, whom he left behind. Recovering himself again, he relieved Corfu, besieged by Cassander; burnt the Macedonian fleet; returned to Sicily; murdered the wives and children of those who had murdered his: afterwards meeting with the soldiers themselves, he put them all to the sword; and, ravaging the sea-coast of Italy, took the city of Hipponius.

AGATHYRNAS, or AGATHYRNIUM, AGATHYRSA, or AGATHYSYN, in Ancient Geography, a town of Sicily; now St. Verone; as old as the war of Troy, being built by Agathyrnas, son of Ἀθηναίος, on an eminence. The pretentious name is Agathyrnasus; or, according to the Roman idiom, Agathyrnensis.

AGE, in the most general sense of the word, signifies the duration of any being, from its first coming into existence to the time of speaking of it, if it still continues; or to its destruction, if it has ceased to exist some time before we happen to mention it.

Among the ancient poets, this word was used for the space of 30 years; in which sense, age amounts to much the same with generation. Thus, Nestor is said to have lived three ages when he was 90 years old. By Ancient Greek historians, the time elapsed since the beginning of the world is divided into three periods, which they called ages. The first reaches from the creation to the deluge which happened in Greece during the reign of Ogyges; this they called the obscure or uncertain age, because the history of mankind is altogether uncertain during that period. The second they call the fabulous or heroic age, because it is the period in which the fabulous exploits of their gods and heroes are said to have been performed. It began with the Egyptian deluge, and continued to the first Olympiad, where the third or historical age commenced.

This division, however, must be observed, holds good only with regard to the Greeks and Romans, who had no histories earlier than the first Olympiad; the Jews, Egyptians, Phcenicians, and Chaldæes, not to mention the Indians and Chinese, who pretend to much higher antiquity, are not included in it.

The interval since the first formation of man has been divided by the poets into four ages, distinguished by the epithets of golden, silver, bronzes, and iron. During the golden age, Saturn reigned in heaven, and justice and innocence in this lower world. The earth then yielded her productions without culture; men held all things in common, and lived in perfect friendship. This period is supposed to have lasted till the expulsion of Saturn from his kingdom. The silver age commenced when men began to deviate from the paths of virtue; and, in consequence of this deviation, their lives became less happy. The bronze age commenced on a farther deviation; and the iron age took place in consequence of one still greater. A late author, however, reflecting on the barbarism of the first ages, will have the order which the poets assign to the four ages inverted; the first being a time of rudeness and ignorance, more properly denominated an iron than a golden age. When cities and states were founded, the silver age commenced; and since arts and sciences, navigation and commerce, have been cultivated, the golden age has taken place.
In some ancient northern monuments, the rocky or story age corresponds to the braven age of the Greeks. It is called rocky, on account of Noah’s ark, which rested on Mount Ararat; whence men were said to be descended or sprung from mountains: or from Deucalion and Pyrrha restoring the race of mankind, by throwing stones over their heads. The northern poets also style the fourth age of the world the ashes age, from a Gothic king Madenis, or Mannus, who on account of his great strength was said to be made of ash, or because in his time people began to make use of weapons made of that wood.

Among the Jews, the duration of the world is also divided into three ages. 1. The seculum inane, or void age, was the space of time from the creation to Moses. 2. The present age, denotes all the space of time from Moses to the coming of the Messiah; and 3. The age to come, denotes the time from the coming of the Messiah to the end of the world.

Various other divisions of the duration of the world into ages have been made by historians.—The Sibylline oracles, wrote according to some, by Jews acquainted with the prophecies of the Old Testament, divide the duration of the world into ten ages; and according to Josephus, each age contained six hundred years. It appears, by Virgil’s fourth eclogue, and other testimonies, that the age of Augustus was reputed the end of those ten ages, consequently as the period of the world’s duration.

By some, the space of time commencing from Constantine, and ending with the taking of Constantinople by the Turks in the 15th century, is called the middle age; but others choose rather to date the middle age from the division of the empire made by Theodosius at the close of the 4th century, and extend it to the time of the emperor Maximilian I. in the beginning of the 16th century, when the empire was first divided into circles.—The middle is by some denoted the barbarous age, and the latter part of it the lowest age. Some divide it into the non-academical and academical ages. The first includes the space of time from the 6th to the 9th century, during which schools or academies were lost in Europe. The second from the 9th century, when schools were restored, and universities established, chiefly by the care of Charlemagne.

The several ages of the world may be reduced to three grand epochs, viz. the age of the law of nature, called by the Jews the void age, from Adam to Moses; the age of the Jewish law, from Moses to Christ; and the age of grace, from Christ to the present year.

Age is also frequently used in the same sense with century, to denominate a duration of 100 years. Age likewise signifies a certain period of the duration of human life; by some divided into four stages, namely, infancy, youth, manhood, and old age; the first extending to the 15th year, the second to the 25th, the third to the 50th, and the fourth to the end of life; by others divided into infancy, childhood, youth, manhood, and old age.

Age, in Law, signifies a certain period of life, when persons of both sexes are enabled to do certain acts. Thus, one at twelve years of age ought to take the oaths of allegiance to the king in a leaf; at fourteen he may marry, choose his guardian, and claim his lands held in soccage. Twenty-one is called full age, a man or woman being then capable of acting for themselves, of managing their affairs, making contracts, disposing of their estates, and the like.

Age of a Horse. See Horse.

Age of Trees. These after a certain age waste. An oak at a hundred years old ceases to grow. The usual rule for judging of the age of wood, is by the number of circles which appear in the substance of a trunk or stock cut perpendicularly, each circle being supposed the growth of a year; though some reject this method as precarious, alleging, that a simple circle is sometimes the produce of several years; besides that, after a certain age, no new circles are formed.

Age-Prior, in Law, is when an action being brought against a person under age, for lands descended to him, he, by motion or petition, shows the matter to the court, praying the action may be stayed till his full age, which the court generally agrees to.

Agelnoth, Egelnoth, or Athelnoth, in Latin Archimatus, archbishop of Canterbury, in the reign of Canute the Great, succeeded Livingus in that see in the year 1020. This prelate, surnamed the Good, was son of Earl Agilmer, and at the time of his election, dean of Canterbury. After his promotion he went to Rome, and received his pall from Pope Benedict VIII. In his way thither, as he passed through Pavia, he purchased, for an hundred talents of silver and one of gold, St. Augustin’s arm, which was kept there as a relic; and sent it over to England as a present to Leofric earl of Coventry. Upon his return, he is said to have raised the see of Canterbury to its former lustre. He was much in favour with King Cnut, and employed his interest with that monarch to good purposes. It was by his advice the king sent over large sums of money for the support of the foreign churches; and Malmesbury observes that this prince was prompted to acts of piety, and restrained from excesses, by the regard he had for the archbishop. Agelnoth, after he had sat 17 years in the see of Canterbury, departed this life on the 20th of October 1038, and was succeeded by Eadwine, King Harold’s chaplain. This archbishop was an author, having written, 1. A Panegyric on the blessed Virgin Mary. 2. A Letter to Earl Leofric concerning St. Augustin. 3. Letters to several persons.

Agema, in Macedonian antiquity, was a body of soldiers, not unlike the Roman legion.

Ageomolans, Agianomolans, or Azamolans, in the Turkish Polity, are children purchased from the Tartars, or raised every third year, by way of tribute, from the Christians tolerated in the Turkish empire. These, after being circumcised and instructed in the religion and language of their tyrannical masters, are taught the exercises of war, till they are of a proper age for carrying arms; and from this corps the janizaries are recruited. With regard to those who are thought unfit for the army, they are employed in the lowest offices of the seraglio. Their appointments also are very small, not exceeding seven aspers and a half per day, which amount to about threepence-halfpenny of our money.

Agen, a city of France, on the river Garonne, the capital of Agenois, in the province of Guiene, now the department of the Lot and Garonne, and the see of a bishop. The gates and old walls, which are yet remaining,
remaining show that this city is very ancient, and that its former circuit was not so great as the present. The palace, wherein the presidial holds his sessions at this day, was heretofore called the castle of Montravel, and is seated without the walls of the old city, and on the side of the fosse. There are likewise the ruins of another castle, called La Sagne, which was without the walls, close by a brook. Though the situation of Agen is convenient for trade and commerce, but very little open, is a disadvantage of this advantage. Its population was 10,824 by the last enumeration. It is seated on the bank of the river Garonne, in a pleasant country; but is itself a very mean and disagreeable place, the houses being ill-built, and the streets narrow, crooked, and dirty. E. Long. o. 35. N. Lat. 44. 12.

AGENDA, among philosophers and divines, signifies the duties which a man lies under an obligation to perform: thus we meet with the agenda of a Christian, or the duties he ought to perform; in opposition to the credenda, or things he is to believe.

AGENDA, among merchants, a term sometimes used for a memorandum-book, in which is set down all the business to be transacted during the day, either at home or abroad.

AGENDA, among ecclesiastical writers, denotes the service or office of the church. We meet with agenda matutina et vesperita, "the morning and evening prayers;" agenda diei, "the office of the day," whether feast or fast; agenda mortuorum, called also simply agenda, "the service of the dead."

AGENDA is also applied to certain church-books, compiled by public authority, prescribings the order and manner to be observed by the ministers and people in the principal ceremonies and devotions of the church. In which sense agenda amounts to the same with what is otherwise called ritual, liturgy, acolastia, missal, formulory, directory, &c.

AGENHINE, in our old writers, signifies a guest that has lodged at an inn for three nights, after which time he was accounted one of the family; and if he offended the king's peace, his host was answerable for him. It is also written Hogenhine and Hogenhyne.

AGENOIS, in Geography, a country of France, in the department of the Garonne, formerly the province of Guienne. It contains about one hundred and twenty square leagues; is fertile and healthy; and, according to Caesar, was inhabited by the Nitiobriges. It constituted part of the kingdom of Aquitania; was held by the counts of Toulouse, and successively by the English and French.

AGENORIA, in mythology, the goddess of courage and industry, as Fortuna was of indolence.

AGENT, in a general sense, denotes any active power or cause. Agents are either natural or moral. Natural agents are such inanimate bodies as have a power to act upon other bodies in a certain and determinate manner; as gravity, fire, &c. Moral agents, on the contrary, are rational creatures, capable of regulating their actions by a certain rule.

AGENT, is also used to denote a person intrusted with the management of an affair, whether belonging to a society, company, or private person.

Agentes in rebus, one of the ranks of officers in the court of the Constantinopolitan emperors, whose business was to collect and convey the corn both for the army and household; to carry letters and messages from court to all parts of the empire; to regulate couriers and their vehicles; to make frequent journeys and expeditions through the provinces, in order to inspect any motions, disturbances, or machinations tending that way, and to give early notice thereof to the emperor.

There were various orders or degrees of agentes in rebus; as tribuni, primicerii, senatores, duces, ciri, circiterae, equites, tyranno, &c. through which they rose gradatim. Their chief, who resided at Constantinople, was designated princeps; which was a post of great dignity, being reckoned on a level with that of procesus. They were settled in every part of the empire; and are also said to have served as interpreters.

AGER, in Roman antiquity, a certain portion of land allowed to each citizen. See AGRARIAN LAW.

AGER PECINU, or Picenum, in Ancient Geography, a territory of Italy to the south-east of Umbris, reaching from the Apennines to the Adriatic. The people are called Picentes (Cicero, Livy,) distinct from the Picentini on the Tuscian sea, though called by Greek writers Piscenses. This name is said to be derived from the bird picus, under whose conduct they removed from the Sabines, of whom they were a colony.

AGERATUM, Bastard Hemp-Agrimony, in Botany. See Botany Index.

AGESILAUS, king of the Lacedaemonians, the son of Archidamus, was raised to the throne in opposition to the superior claim of his nephew Leotychides. As soon as he came to the throne, he advised the Lacedaemonians to anticipate the king of Persia, who was making great preparations for war, and to attack him in his own dominions. He was himself chosen for this expedition; and gained so many advantages over the enemy, that if the league which the Athenians and the Thessals formed against the Lacedaemonians had not obliged him to return home, he would have carried his victorious arms into the very heart of the Persian empire. He gave up, however, all these triumphs readily, to come to the succour of his country, which he happily relieved by his victory over the allies in Boeotia. He obtained another near Corinth; but to his great mortification, the Thessals afterward gained several over the Lacedaemonians. These misfortunes at first raised a clamour against him. He had been sick during the first advantages which the enemy gained; but as soon as he was able to act in person, his valour and prudence prevented the Thessals from reaping the advantages of their victories; so that it was generally believed, had he been in health at the beginning, the Lacedaemonians would have sustained no losses, and that all would have been lost had it not been for his assistance. It cannot be denied but he loved war more than the interest of his country required; for if he could have lived in peace, he had saved the Lacedaemonians several losses, and they would not have been engaged in many enterprises which in the end contributed much to weaken their power. He died in the third
third year of the 104th Olympiad, being the 84th year of his age, and 41st of his reign, and was succeeded by his son Archidamus. Agesilaus would never suffer any picture or sculpture to be made of him, and prohibited it also by his will: this he is supposed to have done from a consciousness of his own deformity; for he was of a short stature, and lame of one foot, so that strangers used to despise him at the first sight. His fame went before him into Egypt, and there they had formed the highest ideas of Agesilaus. When he landed in that country, the people ran in crowds to see him: but great was their surprise when they saw an ill-dressed, slovenly, mean-looking little fellow, lying upon the grass; they could not forbear laughing, and applied to him the fable of the mountain in labour. He was, however, the first to jest upon his own person; and such was the gaiety of his temper, and the strength with which he bore the roughest exercises, that these qualities made amends for his corporeal defects. He was remarkable for plainness and frugality in his dress and mode of life. “This (says Cornelius Nepos) is especially to be admired in Agesilaus: when very great presents were sent him by kings, governors, and states, he never brought any of them to his own house; he changed nothing of the diet, nothing of the apparel of the Lacedaemonians. He was contented with the same house in which Euripidhes, the founder of his family, had lived: and whoever entered there, could see no sign of debauchery, none of luxury; but on the contrary, many of moderation and abstinence; for it was furnished in such a manner, that it differed in nothing from that of any poor or private person.” Upon his arrival in Egypt, all kinds of provisions were sent to him; but he chose only the most common, leaving the perfumes, the confections, and all that was esteemed most delicious, to his servants. Agesilaus was extremely fond of his children, and would often amuse himself by joining in their diversions: one day when he was surprised riding upon a stick with them, he said to a person who had seen him in this posture, “Forbear talking of it till you are a father.”

APPLE, or AGGONA, a British settlement on the Gold coast of Guinea. It is situated under the meridian of London, in 6 degrees of N. Lat.

AGGER, in the ancient military art, a work of fortification, used both for the defence and the attack of towns, camps, &c. In which sense it is the same with what was otherwise called valleum, and in later times aggustum; and among the moderns lines, sometimes, cavaliers, terrasses, &c. The agger was usually a bank, or elevation of earth or other matter, bound and supported with timber; having sometimes turrets on the top, wherein the workmen, engineers, and soldiery, were placed. It was also accompanied with a ditch, which served as its chief defence. The usual materials of which it was made were earth, boughs, fascines, stakes, and even trunks of trees, ropes, &c. variously crossed, and interwoven somewhat in the figure of stars; whence they were called stelati axes. When these were wanting, stones, bricks, tiles, supplied the office: on some occasions arms, utensils, pack-saddles, were thrown in to fill it up. We even read of aggers formed of the carcasses of the slain; sometimes of dead bones mixed with lime; and even with the heads of slaughtered citizens. For want of due binding, or so-

AGGERHUYS, a city of Norway, capital of the province of the same name, subject to Denmark, and situated in E. Long. 28. 35. N. Lat. 59. 30.

AGGERS-HERRED, a district of Christiansand, and a diocese of Norway. It consists of three judicial places: namely, Ascher, West Barn, and Agger.

AGGLUTINANTS, in Pharmacy, a general name for all medicines of a glutinous or viscid nature; which, by adhering to the solids, were supposed to contribute to repair their loss.

AGGULATION, in a general sense, denotes the joining two or more things together, by means of proper glue or cement.

AGGULATION, among physicians, implies the action of uniting the parts of a body, separated by a wound, cut, &c. It is also applied to the action of such internal medicines as are supposed to be of an agglutinating quality.

AGGREGATE, in a general sense, denotes the sum of several things added together, or the collection of them into one whole. Thus a house is an aggregate of stones, wood, mortar, &c. It differs from mixed or compound; for, in the latter, the union is more intimate than between the parts of an aggregate.

AGGREGATE, in Botany, is a term used to express those flowers which are composed of parts or florets, so united, by means either of the receptacle or calyx, that
AGGREGATION, in physics, a species of union, whereby several things which have no natural dependence or connexion with one another are collected together, so as in some sense to constitute one. Thus, a heap of sand, or a mass of ruins, are bodies by aggregation.

Agher, a town of Ireland, situated in the southern part of Ulster, not far from Clogher.

Aghrim, a town of Ireland, in the county of Wicklow, and province of Leinster, situated about 31 miles south-west of Wicklow.

Aghrim, in Galway; a small village, distant about 32 miles from Dublin, and rendered memorable by a decisive battle fought there, and at Kilcoommedou-hill, the 12th of July 1691, between General Ginkel and Monseur St Ruth, the commanders under King William III. and James II.; when St Ruth, the general of the Irish army, with 7000 of his men, was slain; but of the English only 500. The victory was the more considerable, as the English army consisted of no more than 18,000 men; whereas the Irish were composed at 20,000 foot, and 5000 horse and dragoons. They lost likewise nine pieces of brass cannon; all their ammunition, tents, and baggage; and most of their small arms, which they threw away to expedite their flight; with 11 standards, and 52 pair of colours.

AgiaDES, in the Turkish armies, a kind of pioneers employed in fortifying camps, smoothing of roads, and the like offices.

Agility, an aptitude of the several parts of the body to motion. The improving of agility was one of the chief objects of the institution of games and exercises. The athlete made particular profession of the science of cultivating and improving agility. Agility of body is often peculiar to some people; yet it seems less owing to any thing peculiar in their frame and structure than to practice.

Aigncourt, a village of the French Netherlands, situated in E. Long. 2° 10'. Lat. 50° 35'. famous on account of the victory obtained by Henry V. of England over the French, in 1415.

The army of Henry, after landing in France, was by various accidents reduced to 10,000 men, of whom not a few were sick, or slowly recovering from sickness;—they had to traverse a long tract of country, inhabited by exasperated enemies, from whom they were to procure provisions, lodging, guides, intelligence, and every thing they wanted;—that country was defended by many strong towns, intersected by deep rivers, and guarded by an army of 100,000 or (according to some contemporary writers) 140,000 men.

Henry, undaunted by all these dangers and difficulties, departed from Harfleur, marching his army in three lines, with bodies of cavalry on the wings. He proceeded by very easy journeys, that he might not fatigue his troops, or discourage them by the appearance of a flight; observing the strictest discipline, and paying generously for every thing he received; which induced the country people to bring provisions to his camp, in spite of all the commands they had received to the contrary. To keep his men in spirits, and from repining, the king fared as ill as the meanest soldier, always appearing with a cheerful countenance, and addressing them in the most friendly and encouraging language. They arrived at the village of Aigncourt in the county of St Pol, on the evening of October 24th; and there beheld the whole French army, at a small distance, directly in their route. The king took an attentive view of it from an eminence: and being fully convinced that it was impossible to proceed any further on his way to Calais without a battle, and equally impossible to return to Harfleur with so great an army in his rear, resolved to hazard an action next morning, as the only means of preserving himself and his little army from destruction.

The English army lodged that night in the villages of Aigncourt, Maisonnelle, and some others; where they met with better accommodation than they had been accustomed to for some time past, and spent part of their time in mutual exhortations to fight bravely in the approaching battle. The king, overhearing some of the nobles expressing a wish, that the many brave men who were idle in England were present to assist them, is said to have cried out—"No! I would not have one man more;—if we are defeated, we are too many—if it shall please God to give us the victory, as I trust he will, the smaller our number the greater our glory." The moon happening to shine very bright, Henry, with some of his best officers, carefully examined the ground, and pitched upon a field of battle, admirably calculated to preserve a small army from being surrounded by a great one. It was a gentle declivity from the village of Aigncourt, of sufficient extent for his small army, defended on either side by hedges, trees, and brush-wood. Having placed guards and kindled fires on all sides, the king and his army betook themselves to rest; except such as were of a more serious turn of mind, who, considering that as the last night of their lives, spent it in devotion.

The French exulting in their numbers, confident of victory, and abounding in provisions, spent the night in noisy festivity, and in forming fanciful schemes about the disposal of their prisoners and their booty. It was in general resolved to put all the English to the sword, except the king and the chief nobility, who were to be taken prisoners for the sake of their ransom.

On the morning of Friday the memorable 25th of October, A.D. 1415, the day of Crispin and Crispianus, the English and French armies were ranged in order of battle, each in three lines, with bodies of cavalry on each wing. The constable d'Albert, who commanded the French army, fell into the snare that was laid for him, by drawing up his army in the narrow plain between the two woods. This deprived him, in a great measure, of the advantage he should have derived from the prodigious superiority of his numbers; obliged him to make his lines unnecessarily deep, about 30 men in file; to crowd his troops, particularly his cavalry, so close together, that they could hardly move or use their arms; and, in a word, was the chief cause of all the disasters that followed. The French, it is said, had a considerable number of cannon of different sizes in the field; but we do not hear that they did any execution, probably for want of room. The first line of the French army, which consisted of 8000 men at arms...
A G I

Agincourt at arms on foot mixed with 4000 archers, with 500 men-at-arms mounted on each wing, was commanded by the constable d'Albert, the duke of Orleans and Bourbon, and many other nobles; the duke of Alençon, Brabant, and Bar, &c., conducted the second line; and the earls of Marl, Damartine, Fauconberg, &c., were at the head of the third line. The king of England employed various arts to supply his defect of numbers. He placed 200 of his best archers in ambush, in a low meadow, on the flank of the first line of the French. His own first line consisted wholly of archers, man in file; each of whom, besides his bow and arrows, had a battle-axe, a sword, and a stake pointed with iron at both ends, which he fixed before him in the ground, the point inclining outward, to protect him from cavalry. This was a new invention, and had a happy effect. That he might not be encumbered, he dismissed all his prisoners, on their word of honour to surrender themselves at Caen, if he obtained the victory; and lodged all his baggage in the village of Agincourt, in his rear, under a slender guard. The command of the first line was, at his earnest request, committed to Edward duke of York, assisted by the lords Beaumont, Wilsby, and Fanshawe; the second was conducted by the king, with his youngest brother Humphry duke of Gloucester, the earls of Oxford, Marshal, and Suffolk; and the third was led by the duke of Exeter, the king's uncle. The lines being formed, the king, in shining armour, with a crown of gold adorned with precious stones on his helmet, mounted on a fine white horse, rode along them, and addressed each corps with a cheerful countenance and animating speeches. To inflame their resentment against their enemies, he told them, that the French had determined to cut off three fingers of the right hand of every prisoner; and to rouse their love of honour, he declared, that every soldier in that army who behaved well, would from henceforth be deemed a gentleman, and entitled to bear coat armour.

When the two armies were drawn up in this manner, they stood a considerable time gazing at one another in solemn silence. But the king, dreading that the French would discover the danger of their situation and decline a battle, commanded the charge to be sounded, about ten o'clock in the morning. At that instant, the first line of the English kneeled down, and kissed the ground; and then starting up, discharged a flight of arrows, which did great execution among the crowded ranks of the French. Immediately after, upon a signal being given, the archers in ambuscade arose, and discharged their arrows on the flank of the French line, and threw it into some disorder. The battle now became general, and raged with uncommon fury. The English archers, having expended all their arrows, threw away their bows, and, rushing forward, made dreadful havoc with their swords and battle-axes. The first line of the enemy was, by these means, defeated; its leaders being either killed or taken prisoners. The second line, conducted by the duke d'Albert, who had made a vow either to kill or take the king of England, or to perish in the attempt, now advanced to the charge, and was encountered by the second line of the English, conducted by the king. This conflict was more close and furious than the former. The duke of Gloucester, wounded and unhorsed, was protected by his royal brother till he was carried Agincourt off the field. The duke d'Albert forced his way to the king, and assaulted him with great fury; but that prince brought him to the ground, where he was instantly dispatched. Discouraged by this disaster, the second line made no more resistance; and the third fled without striking a blow; yielding a complete and glorious victory to the English, after a violent struggle of three hours duration.

The king did not permit his men to pursue the fugitives to a great distance, but encouraged them to take as many prisoners as they could on or near the field; in which they were so successful, that, in a little time, his captives were more numerous than his soldiers. A great proportion of these prisoners were men of rank and fortune; for many of the French noblesse being on foot, and loaded with their heavy armour, could not make their escape. Among these were the dukes of Orleans and Bourbon, the marshal Bouicaut, the counts d'Eu, Vendome, Richemont, and Harcourt; and 7000 barons, knights, and gentlemen. The French left dead on the field of battle, the constable d'Albert, the three dukes of Alençon, Brabant, and Bar, the archbishop of Sens, one marshal, 13 earls, 92 barons, 1500 knights, and a far greater number of gentlemen, besides several thousands of common soldiers. Even the French historians acknowledge, that the loss of the English was inconsiderable: those of our own cotemporary writers who make it the greatest, affirm, that it did not exceed 300, and that the duke of York and the earl of Suffolk were the only great men who fell on that side in this memorable action.

AGIO, in commerce, is a term chiefly used in Holland, and at Venice, to signify the difference between the value of bank stock and the current coin. The agio in Holland is generally three or four per cent., and at Rome it is from 15 to 25 per cent.; but at Venice the agio is fixed at 20 per cent.

AGIOYSYMFANDRUM, a wooden instrument used by the Greek and other churches under the dominion of the Turks, to call together assemblies of the people. The agiosympandrum was introduced in the place of bells, which the Turks prohibited their Christian subjects the use of, lest they should make them subservient to sedition.

AGIS, king of Lacedemon, was descended from Agesilus II. in a right line. He projected the reformation of his kingdom, by the restoring of the laws of Lycurgus: but he fell under the weight of an enterprise that could not but be disagreeable to all those who had great possessions, and had been long accustomed to the sweets of a voluptuous life. Agis being in the flower of his age, and having a very refined desire of glory, practised the ancient discipline first in his own person: his clothes and his table were according to the manners of former times; which is so much the more to be admired, because Agesilaus his mother and Archidamus his grandmother had brought him up voluptuously. When he sounded the people's minds, he found the younger sort opposed his project less than those who had enjoyed a relaxation of discipline several years. The greatest difficulty was expected to arise from the women. They had at that time more credit than ever; for their power is never greater than when luxury is in fashion. Agesilus's mother did not at all relish
relish the proposed reformation. She must have lost her riches, which gave her a share in a thousand sorts of intrigues; so she opposed the design at once, and treated it as a chimera. But her brother Agesilaus, whom Agis had engaged, knew how to manage her in such a manner, that she promised to second the enterprise. She endeavoured to gain the women: but instead of suffering themselves to be persuaded, they applied to Leonidas the other king of Laconeon, and humbly besought him to frustrate the designs of his colleague. Leonidas durst not oppose it openly, for fear of irritating the people; to whom the reformation was agreeable, because they found their account in it. He contented himself with countermine it by intrigues, and sowing suspicions as if Agis had aspired to tyranny, by pulling down the rich and raising the poor. Agis did not fail to propose his new laws to the senate, relating to the discharge of debts, and a new division of the lands. Leonidas, being supported by the rich, opposed this project so strongly, that there was one voice more against it than for it. He paid dear for his success in this affair. Lysander, one of the Ephori, who had been the grand promoter of the reformation; called him to account; alleged the celestial signs; and put to death Cleombrotus, a prince of the royal blood and son-in-law to Leonidas, to make sure of the kingdom. Leonidas being frightened at this, took refuge in a temple; whither his daughter, the wife of Cleombrotus, followed him. He was summoned; and because he did not appear, he was degraded of his dignity, which was conferred on Cleombrotus. He obtained leave to retire to the city. The new Ephori had Lysander and Mandroclidas tried for innovation; these persuaded the two kings to unite and turn out these Ephori. The thing was brought about; but not without a great uproar in the city. Agesilaus, one of the Ephori that succeeded those that were just turned out, would have caused Leonidas to be killed on the way to Tegae, if Agis had not sent him a strong guard. The reformation might then have been established, if Agesilaus had not found means to evade the good intentions of the two kings. Whilst this was transacting, the Achaeans asked assistance; which was given them, and Agis had the command of the troops. He acquired a good deal of reputation in this campaign. At his return, he found his affairs so embroiled by the ill conduct of Agesilaus, that it was impossible for him to maintain himself. Leonidas was recalled to Laconemon: Agis retired into one temple and Cleomenes into another. The wife of the latter behaved herself in such a manner that she became the admiration of every body. Leonidas was contented with banishing his son-in-law; after which he applied himself entirely to the ruin of Agis. One of the Ephori, who had no mind to return what Agesistara had lent him, was the principal instrument of the misfortune of this family. Agis never went out of his sanctuary but to bathe. One day, as he was returning from thence to the temple, he was seized by that Euphorus and carried to prison. Then he was brought to his trial and condemned to death, and delivered to the executioner. His mother and grandmother used all the interdict and importunity imaginable, that, as he was king of Laconemon, he might at least be permitted to plead his case before the people. But they were apprehensive lest his words would make too great an impression, and therefore they ordered him to be strangled that very hour. The Ephorus who was in debt to Agesistara, permitted that princess to go into the prison, where she received like to Agis's grandmother; but he gave orders to strangle them one after another. Agesistara died in a manner that was extremely to her honour. The wife of Agis, who was a princess of great fortune and prudence, and one of the finest ladies in Greece, was forced away from her apartment by King Leonidas, and obliged to marry his son, who was then very young, and hardly fit for marriage.

AGISTMENT, AGISTAGE, or AGISTATION, in Law, the taking in other people's cattle to graze at so much per week. The term is peculiarly used for the taking cattle to feed in the king's forests, as well as for the profits arising from that practice. — It is also used, in a metaphorical sense, for any tax, burden, or charge; thus, the tax levied for repairing the banks of Romney-marsh was called agistamentum.

AGISTOR, or AGISTATOR, an officer belonging to forests, who has the care of cattle taken in to be grazed, and levies the moneys due on that account. They are generally called quest-takers or gift-takers, and are created by letters-patent. Each royal forest has four agistors.

AGISYMBHA, in Ancient Geography, a district of Libya Interior, according to Agathemerus, situated to the south-east of the Æthiopes Anthropophagi; the parallel passing through which, at 16° to the south of the equator, was the utmost extent of the knowledge of the ancients to the south (Ptolemy).

AGITATION, the act of shaking a body, or tossing it backwards and forwards.

AGITATION, in Physics, is often used for an intestine commotion of the parts of a natural body. Fermentation and effervescence are attended with a brisk agitation of the particles.

AGITATION is one of the chief causes or instruments of mixtion: by the agitation of the parts of the blood and chyle, in their continual circulation, sanguification is in a good measure effected. Butter is made out of milk by the same means: in which operation, a separation is made of the oleous parts from the serous, and a conjuction of the oleous together. Digestion itself is only supposed to be an insensible kind of agitation.

AGITATION is reputed one of the symptoms of inspiration. Petit informs us, that in the last century, a Petit de a vapour, of an extraordinary kind, which put all the people into trembling and agitations, and unless they got away betimes, set them a dancing, with strange contortions and gesticulations. This seems to verify what has been related of the temple of Delph.

AGITATION is also used in Medicine for a species of exercise popularly called swinging. Maurice prince of Orange found this method a relief against the severe pains of the goyt and stone. Bartholine mentions fits of the toothach, deafness, &c. removed by vehement agitations of the body.

AGITATOR, in antiquity, a term sometimes used for a charioteer, especially those who drove in the circus at the curule games.
AGITATORS, in the English history, certain officers set up in the army in 1647, to take care of its interests.

_—Cromwell joined the agitators, only with a view to serve his own ends; which being once accomplished, he found means to get them abolished._

AGLAIA, the name of the youngest of the three Graces, espoused to Vulcan.

AGLIONBY, John, an English divine, chaplain in ordinary to King James I. was born in Cumberland, and admitted a student at Oxford in 1583. He was a man of universal learning, and had a very considerable hand in the translation of the New Testament appointed by King James I. in 1604. He died in 1659.

AGMEN, in antiquity, properly denotes a Roman army in march: in which sense, it stands contradistinguished as _actio_, which denoted the army in battle array; though, on some occasions, we find the two words used indifferently for each other. The Roman armies, in their marches, were divided into _primatum agmen_, answering to our van-guard; _medium agmen_, our main-guard; and _postremum agmen_, the rear-guard.

The order of their march was thus: After the first signal with the trumpets, &c. the tents were taken down, and the baggage packed up; at the second signal, the baggage was to be loaded on the horses and carriages; and, at the third signal, they were to begin their march. First came the _extraordinarii_; then the auxiliaries of the first wing, with their baggage; these were followed by the legions. The cavalry marched either on each side or behind.

AGNATE, in Low, any male relation by the father's side.

AGNEL, an ancient French gold coin, first struck under the reign of St. Louis, worth about twelve sous six deniers. The agnel is also called sometimes _mouton d'or_, and _agneau d’or_. The denomination is supposed to have arisen from the figure of a lamb (_agnus_) or sheep, struck on one side.

AGNES, Saint, in Geography, one of the Scilly isles, on the west of England, which is of small extent, but well cultivated, and fertile in corn and grass. On the most elevated part of the island stands the lighthouse, built of stone, which is 11 feet high. The whole inhabitants consist of about 50 families. It is situated in N. Lat. 49° 56'. W. Long. 6° 46'.

AGNESI, Maria Gaetana, an Italian lady celebrated for her skill in mathematics. See Supplement.

AGNO, a river of Naples, which taking its rise in the mountains of Terra di Lavora, falls into the Mediterranean, about seven miles north of Pozzuoli.

AGNOETÆ (from _agnus_, to be ignorant of), in church history, a sect of ancient heretics, who maintained that Christ, considered as to his human nature, was ignorant of certain things, and particularly of the time of the day of judgment. Eulogius, patriarch of Alexandria, ascribes this heresy to certain solitary in the neighbourhood of Jerusalem, who built their opinion upon the text Mark xii. 32. "Of that day and how knoweth no man, no not the angels who are in heaven, neither the Son, but only the Father only."—The same phrase was made use of by the Arians; and hence the orthodox divines of those days were induced to give various explications thereof. Some allege, that our Saviour here had no regard to his divine nature, but only spoke of his human. Others understand it thus, That the knowledge of the day of judgment does not concern our Saviour considered in his quality of Messiah, but God only; which is the most natural solution.

AGNOMEN, in Roman antiquity, a kind of fourth or honorary name, given to a person on account of some extraordinary action, virtue, or other accomplishment. Thus the agnomem _Africanus_ was bestowed upon Publius Cornelius Scipio, on account of his great achievements in Africa.—The agnomem was the third in order of the three Roman names: thus, in Marcus Tullius Cicero, Marcus is the praenomen, Tullius the nomen, and Cicero the agnomem.

AGNUS, or LAMB, in Zoology, the young of the ovis or sheep. See OVIS.

AGNUS CASTUS, in Botany, the trivial name of a species of the vitiæ. See VITEX, BOTANY INDEX. The Greeks call it _agnos_, chaste; to which has since been added the reduplicative _castus_, q. d. chaste, chaste. It was famous among the ancients as a specific for the preservation of chastity. The Athenian ladies, who made profession of chastity, lay upon leaves of _agnus castus_ during the feasts of Ceres.—From the time of Dioscorides the seeds of _agnus castus_ have been much celebrated for their antiaprodiasie virtue. Modern writers ascribe to them an opposite effect; but they are seldom used in practice.

AGNUS DEI, in the church of Rome, a cake of wax stamped with the figure of a lamb supporting the banner of the cross. These being consecrated by the pope with great solemnity, and distributed among the people, are supposed to have great virtues; as, to preserve those who carry them worthily, and with faith, from all manner of accidents; to expel evil spirits, &c. The name literally signifies _Lamb of God_; this being supposed an image or representation of the Lamb of God who took away the sins of the world. They cover it up with a piece of stuff cut in form of a heart, and carry it very devoutly in their processions.—The Roman priests and religious derive considerable pecuniary advantage from selling these _Agnus Dei's_ to some, and presenting them to others. The pope provides a regular supply, by consecrating once in seven years: they are distributed by the master of the wardrobe, and received by the cardinals and other prelates, with great reverence, in their caps and mitres.—This ceremony they pretend to derive from an ancient custom of the church, wherein part of the paschal taper consecrated on Holy Thursday was distributed among the people, to perfume their houses, fields, &c. in order to drive away devils, and to preserve them from storms and tempests. The _Agnus Dei_ is forbidden to be brought into England under pain of incurring a _procunium_; 13 Eliz. cap. 2.

_Agnus Dei_ is also a popular name for that part of the mass wherein the priest, striking his breast three times, rehearsest, with a loud voice, a prayer beginning with the words _Agnus Dei_.—It is said to have been first brought into the missal by Pope Sergius I.

AGOGE, among ancient musicians, a species of modulation, wherein the notes proceed by continuous degrees.

AGON, among the ancients, implied any dispute or content, whether it had regard to bodily exercises or the accomplishments of the mind; and therefore poets, musicians,
muscians, painters, &c. had their agonies, as well as the
athletes. Games of this kind were celebrated at most
of the heathen festivals with great solemnity, either an-
nually, or at certain periods of years. Among the lat-
ter were celebrated at Athens, the agon gymnasticus, the
agon Nemean instituted by the Argives in the 53d O-
lympiad, and the agon Olympic instituted by Hercules
430 years before the first Olympiad.—The Romans al-
so, in imitation of the Greeks, instituted contests of the
kind. The emperor Aurelian established one under the
name of agon solis, the contest of the sun; Diocol-
esian another, which he called agon capitolinum, which
was celebrated every fourth year, after the manner of the
Olympic games. Hence the years, instead of Iustro,
are sometimes numbered by agonies.

Ago also signifies one of the ministers employed
in the heathen sacrifices, and whose business it was to strike the victim. The name is supposed to have been derived from hence, that standing ready to give the stroke, he asked, Agon? or Agone? Shall I strike.

AGONALES, an epitet given to the Sali.

AGONALIA, in Roman antiquity, festivities cele-
brated in honour of Jove or the god Agonius, whom
the Romans invoked before undertaking any affair of
importance.

AGONALIS CIRCUS, now La Piazza Novana, a
long, large, beautiful street in the heart of Rome, adorn-
ed with fountains, and the obelisk of Caracalla, still re-
taining the form of that circus. The reason of the name
Agonalis is either unknown or doubtful. Ovid seems
to derive it from the agonies, or solemn games, there
celebrated; and seems to have been the Ludus Apollinarens,
or Acticci, instituted by Augustus; whence the circus
was called Apollinaris; also Alexandrinus, from the
emperor Alexander Severus, who either enclosed or re-
paired it.

AGONISMA, in antiquity, denotes the prize given
on the victor in any combat or dispute.

AGONISTARCHA, from agon, "combat," and
agone, "chief," in antiquity, seems to have been the
same with agonothetsa; though some suggest a dif-
fERENCE, making it the office of the former to preside at
and direct the private exercises of the athlete, which
they went through by way of practice, before they made
their appearance on the public theatres or amphithe-
CITIC, in church history, a name given by
Donatus to such of his disciples as he sent to fairs, mar-
ket, and other public places, to propagate his doctrine;
for which reason they were also called Circuitores, Cir-
celliones, Coprutos, Coropites, and at Rome Montemnes.
They were called Agonistici, from the Greek agon,
"combat," in regard they were sent as it were to fight
and subdue the people to their opinions.

AGONIUM, in Roman antiquity, was used for the
day on which the res sacrarum sacrificed a victim, as
well as for the place where the games were celebrated,
other names being agon and agonotheta.

AGONOTHETA, or AGONOTHETES, in Grecian
antiquity, was the president or superintendent of the sac-
cred games; who not only directed the expense attend-
ing them, but inspected the manners and discipline of
the athletes, and adjudged the prizes to the victors.

AGONY, any extreme pain. It is also used for
the pangs of death. Much of the terror of death con-
sists in the pangs and convulsions wherewith the agony
seems attended; though we have reason to believe that
the pain in such cases is ordinarily not extremely acute;
a course of pain and sickness having usually stupefied
and indisposed the nerves for any quick sensations.
However, various means have been thought of for mi-
tigating the agony of death. Lord Bacon considers
this as part of the province of a physician; and that
not only where such a mitigation may tend to a reco-
very, but also when, there being no further hope of a reco-
very, it can only tend to make the passage out of life
more calm and easy.
Complacency in death, which
Augustus so much desired, is certainly no small part of
happiness. Accordingly, the author last cited ranks
euthanasia, or the art of dying easily, among the deside-
rata of science; and does not even seem to disapprove
of the course Epicurus took for that end.

Hinc stygias ebris aquae.

Opium has been applied for this purpose, with the
ap-
plause of some, but the condemnation of more.

AGONYCLITAE, or AGONYCLITES, in church
history, a sect of Christians, in the 7th century, who
prayed always standing, as thinking it unlawful to kneel.

AGORÆUS, in heathen antiquity, an appellation
given to such deities as had statues in the market-
places; particularly Mercury, whose statue was to be
seen in almost every public place.

AGONANOMUS, in Grecian antiquity, a magi-
strate of Athens, who had the regulation of weights and
measures, the prices of provisions, &c.—The ago-
nonomi, at Athens, were ten in number, five belonging
to the city, and as many to the Piraeus; though others
make them 15 in all, of whom they assign 10 to the ci-
ty. To these a certain toll or tribute was paid by all
who brought any thing to sell in the market.

AGOUTI, or Aguti. See Mus.

AGRA, a large city in Hindostan on the river Jum-
na, and capital of a province of the same name. The
houses consist of several stories, and the streets are so
narrow as scarcely to admit a palanquin. The greatest
part of it is now a heap of ruins, and nearly unin-
lived. On the opposite side of the river are several
handsome tombs. The Tajo Mahal, perhaps the most
superb mausoleum in the world, is situated about three
miles below the city, and is constructed of white mar-
brick inlaid with precious stones. It was built by
the emperor Shah Jehan between the years 1631 and 1640,
for the cemetery of his wife, and is said to have cost
750,000l. sterling. Agra was taken from the Moguls
in 1784 by Madajee Sindia the Mahatta chief, and
remained in the hands of his successor till 1803, when
it was captured by the British army under Lord Lake.
E. Long. 76. 56. N. Lat. 27. 12.

AGHARIAN LAWS, among the Romans, those
relating to the division and distribution of lands; of
which there were a great number; but that called the
Agrarian Law, by way of eminence, was published by
Sporius Cassius, about the year of Rome 268, for di-
viding the conquered lands equally among all the citi-
ezns, and limiting the number of acres which each
citizen might enjoy. —The Roman lands were of sev-
eral kinds; some conquered from the enemies, and not
yet brought to the public account; others brought in-
and Bodetria discharge themselves; and here he built
fortresses to shut up the nations yet unconquered. In
his fifth, he marched beyond the friths; where he
made some new acquisitions, and fixed garrisons on
the western coasts, over against Ireland. In his sixth
campaign he passed the river Bodetria; ordering his
fleet, the first which the Romans ever had in those
parts, to row along the coasts, and take a view of the
northern parts. In the following spring, the Britons
raised an army of 30,000 men; and the command was
given to Galgacus, who, according to Tacitus, made
an excellent speech to his countrymen on this occasion.
Agricola likewise addressed his men in very strong and
elegant terms. The Romans gained the victory, and
10,000 of the Britons are said to have been killed.
This happened in the reign of the emperor Domitian;
who, growing jealous of the glory of Agricola, recall-
ed him, under pretence of making him governor of
Syria. Agricola died soon after; and his death is sus-
ppected to have been occasioned by poison given him
by that emperor. Tacitus the historian married his
daughter, wrote his life, and laments his death in the
most pathetic manner.

Agricola, George, a German physician, famous
for his skill in metals. He was born at Glauchau, in
Mimna, the 24th of March 1494. The discoveries
which he made in the mountains of Bohemia, gave him
so great a desire of examining accurately into every
thing relating to metals, that though he had engaged
in the practice of physic at Joachimstal by advice of
his friends, he still prosecuted his study of fossils with
great assiduity; and at length removed to Chemnitz,
where he entirely devoted himself to this study. He
spent in pursuit of it the pension he had of Mauritio
duke of Saxony, and part of his own estate; so that he
reaped more reputation than profit from his labours. He
wrote several pieces upon this and other subjects; and
died at Chemnitz, the 21st of November 1555, a very
firm Papist. In his younger years he seemed not averse
to the Protestant doctrine; and he highly disapproved
of the scandalous traffic of indulgences, and several
other things in the church of Rome. The following
lines of his were posted up in the streets of Zwickau,
in the year 1519:

Si nos ejecta sulbit, cista tu nummo,
Hec minimum infelix tu mihi, pauper, eris:
Si nos, Christe, tua servatos morte edisti,
Tum nihil infelix tu mihi, pauper, eris.

If wealth alone salvation can procure,
How sad a state for ever waits the poor!
But if thou, Christ, our only Saviour be,
Thy merits still may bless ev'n poverty!

In the latter part of his life, however, he had attacked
the Protestant religion: which rendered him so odious
to the Lutherans, that they suffered his body to remain
unburied for five days together; so that it was obliged
to be removed from Chemnitz to Zeitz, where it was
interred in the principal church.

Agricola, John, a Saxon divine, born at Eisleben
in 1492. He went as chaplain to Count Mansfeld,
when that nobleman attended the elector of Saxony to
the diet at Spire in 1526, and that of Augsburg in 1530.
He was of a restless, ambitious temper, railed and
wrote...
Agriculture, wrote against Melanchthon, and gave Count Mansfeld occasion to reproach him severely. He obtained a professorship at Wittemberg, where he taught particular doctrines, and became founder of the sect of Antinomians; which occasioned warm disputes between him and Luther, who had before been his very good friend. But though he was never able to recover the favour either of the elector of Saxony or of Luther, he received some consolation from the fame he acquired at Berlin: where he became preacher at court; and was chosen in 1548, in conjunction with Julius Phleg and Michael Helligus, to compose the famous Interim, which made so much noise in the world. He died at Berlin in 1566.

AGRICULTURE.

Definition.

Agriculture, in general, or in the abstract, may be defined to be, The art of making the earth to produce in large quantities, and in the greatest perfection of which their nature is capable, those vegetables which are necessary to the subsistence, or useful for the accommodation of mankind. Agriculture differs from gardening in this respect, that the gardener is chiefly occupied in rearing small quantities of the nicer and more delicate vegetables, which are rather valued as objects of luxury than as articles of food; whereas the agriculturist labours upon a larger scale, with a view to supply himself and his countrymen with the necessaries of life.

In civilized societies, agriculture, or the cultivation of the soil, becomes a separate business or employment; and agriculturists, or the persons engaged in agriculture, receive the appellation of farmers or husbandmen.

To enable the agriculturist or husbandman to conduct his business with success, it is necessary that he should confine his attention to the mere cultivation of the soil, or the rearing of vegetables. The vegetables which are capable of affording a comfortable subsistence to the human constitution are few in number; and it has been found by experience, that they cannot be profitably sown and reared year after year upon the same spot of ground. Hence it becomes necessary at times to rear upon it grasses or other vegetables which are unfit for affording nourishment to man. But although men cannot eat grass, they may, nevertheless, contrive to obtain subsistence from it in an indirect manner. They may give it to cattle, whose ordinary and natural food it is; and having thus, as it were, converted the grass into the flesh of animals, they can devour these animals; and in this way, obtain a richer and more stimulating food than any vegetable production can possibly afford. It is therefore a part of the business of the husbandman to rear and to feed those animals which are used as food in the society of which he is a member, that he may be enabled at all times to derive profit from the portion of territory that he cultivate. It is also necessary towards conducting his operations with success, that he should rear and feed other animals, not as a source of human subsistence, but for the sake of the services which they are capable of affording; for it has pleased the beneficent Contriver of this world, to place upon it beings of a subordinate nature, capable of assisting mankind in their labours, without being degraded by the state of servitude in which they are placed. To the cultivators of the soil, these animals, from their strength and patience of labour, are particularly useful, and even absolutely necessary in our cold and barren climates. They must therefore be fed and lodged with the greatest care.

Hence the employment of the husbandman is of the greatest importance. Extensive nature, requiring much foresight, and a considerable knowledge of the relations that subsist between the most important objects in nature—the soil, the seasons, the animals, and the plants, so far as they are connected with the subsistence of mankind. It is by bringing to perfection this art that man becomes truly the lord of the universe. He subdues by his operations every part of the surface of the earth, and acquires over the animals which inhabit it, a solid right of dominion or of property, in consequence of having reared, and afforded them subsistence by his skill and his labour. He uses them indeed as food; but before he can do so, he must first bestow upon them subsistence, attend to their multiplication, and to their health and welfare. As they possess no foresight, the purpose to which they are destined is to them no evil.

It is only in proportion to the degree in which this important art of agriculture has flourished, that nations have been, or ever can be, permanently prosperous. Every improvement that is made in it is a moral benefit conferred upon mankind; for by increasing the quantity of human food, or facilitating the production of it, one of two things must always happen: Either the number of our species will be increased, that is to say, a greater multitude of rational and intelligent beings will exist in the creation; or a greater number of those who already exist, will find leisure for the improvement of their intellectual characters by studying and carrying to perfection the sciences and arts. Thus, the strength of nations is increased in proportion to the degree in which their soil is skilfully cultivated, and their independence is secured by finding upon the spot which they inhabit all that is necessary for their subsistence.

It is a fortunate circumstance, that the art of husbandry is a natural endowment, men, by the exercise of which all others, and all times indispensable to human existence, is in every respect conducive to the welfare of those engaged in it. The practice of it bestows health upon the body; and by the variety of occupations which it affords, it also bestows a considerable degree of reflection upon the minds of the lowest persons occupied in it; while, at the same time, it prevents their acquiring that spirit of artifice and cunning, which in all countries is apt to degrade the character of those engaged in the inferior branches of commercial employment. Nor does it fail, in all ranks and conditions of life, to produce a more candid and liberal character than any other employment.
History.

Agriculture.

No British husbandman has ever refused or even hesitated to allow to be communicated to the public every branch of his art, and every improvement which he and his forefathers may have made in it; whereas, in all the branches of manufacture or of commerce, every transaction, as far as possible, is covered with a mysterious veil of secrecy, and every improvement, as far as possible, is concealed by its inventor, and sometimes undoubtedly perishes with him.

The antiquity of this art is undoubtedly beyond that of all others; for we are informed by Scripture, that Adam was sent from the garden of Eden, to till the ground; and, this being the case, he certainly must have known how to do so. — It would be ridiculous, however, to imagine that he was acquainted with all the methods of plowing, harrowing, fallowing, &c. which are now made use of; and it would be equally so to suppose, that he used such clumsy and unartful instruments as wooden hoes, born of oxen, &c. to dig the ground, which were afterwards employed for this purpose by certain savages; but as we know nothing of the particular circumstances in which he was situated, we can know as little concerning his method of agriculture.

The prodigious length of life which the antediluvians enjoyed, must have been very favourable to the advancement of arts and sciences, especially agriculture, to which it behoved them to apply themselves in a particular manner, in order to procure their subsistence. It is probable, therefore, that even in the antediluvian world, arts and sciences had made great progress, nay, might be farther advanced in some respects than they are at present. Of this, however, we can form no judgment, as there are no histories of those times, and the Scripture gives us very slight hints concerning them.

No doubt, by the terrible catastrophe of the flood, which overwhelmed the whole world, many sciences would be entirely lost, and agriculture would suffer; as it was impossible that Noah or his children could put in practice, or perhaps know, all the different methods of cultivating the ground that were formerly used. The common methods, however, we cannot but suppose to have been known to him and his children, and by them transmitted to their posterity; so that as long as mankind continued in one body without being dispersed into different nations, the arts, agriculture especially, would necessarily advance; and that they did so, is evident from the undertaking of the tower of Babel. It is from the dispersion of mankind consequent upon the confusion of tongues, that we must date the origin of savage nations. In all societies where different arts are cultivated, there are some persons who have a kind of general knowledge of most of those practiced through the whole society, while others are in a manner ignorant of every one of them. If we suppose a few people of understanding to separate from the rest, and become the founders of a nation, it will probably be a civilized one, and the arts will begin to flourish from its very origin; but, if a nation is founded by others whose intellects are in a manner callous to every human science (and of this kind there are many in the most learned countries), the little knowledge or memory of art that was among the original founders will be lost, and such a people will continue in a state of barbarism for many ages, unless the arts be brought to them from other nations.

From this, or similar causes, all nations of equal antiquity have not been equally savage, nor is there any solid reason for concluding that all nations were originally unskilled in agriculture; though, as we know not the original instruments of husbandry used by mankind when living in one society, we cannot fix the date of the improvements in this art. Different nations have always been in a different state of civilization; and agriculture, as well as other arts, has always been in different degrees of improvement among different nations at the same time.

From the earliest accounts of the eastern nations, we have reason to think, that agriculture has at all times been understood by them in considerable perfection; seeing they were always supplied not only with the necessary, but the greatest luxuries of life.

As soon as the descendants of Abraham were settled in Palestine, they generally became husbandmen, from the chiefs of the tribe of Judah to the lowest branch of the family of Benjamin. High rank or birth did not at that time make any distinction, for agriculture was considered as the most honourable of all employments; witness the illustrious examples of Gideon, Saul, and David.

The Chaldeans, who inhabited the country where agriculture had its birth, carried that valuable art to a degree of excellence unknown in former times. They cultivated their lands with great assiduity, and seem to have found out some means of restoring fertility to an exhausted soil, by having plentiful harvests in succession; on which account they were not obliged, as their predecessors had been, to change their situations, in order to obtain a sufficiency for themselves and their numerous flocks and herds.

The Egyptians, who from the natural fertility of their country by the overflowing of the Nile, raised every year vast quantities of corn, were so sensible of the blessings resulting from agriculture, that they ascribed the invention of that art to Osiris. They also regarded Isis, their second deity, as the discoverer of the use of wheat and barley, which before grew wild in the fields, and were not applied by that people to the purposes of food. Their superstitious gratitude was carried so far, as to worship those animals which were employed in tillage, and even the produce of their lands, as leeks, onions, &c.

The divine honours paid to Bacchus in India were derived from the same source, he being considered in that country as the inventor of planting vineyards, and the other arts attendant upon agriculture.

It is also related of the ancient Persians, on the most respectable authority, that their kings laid aside their grandeur once every month to eat with husbandmen. This is a striking instance of the high estimation in which they held agriculture; for at that time arts were practiced among those people in great perfection, particularly those of weaving, needle-work, and embroidery. The precepts of their religion taught by their ancient magi, or priests, included the practice of agriculture. The saint among them was obliged to work out his salvation by pursuing all the labours of agriculture: And it was a maxim of the Zendavesta, that he who sows the ground with care and diligence, acquires a greater degree...
degree of religious merit, than he could have gained by the repetition of ten thousand prayers.

The Phoenicians, so well known in Scripture by the name of Philistines, were also remarkable for their attention to and skill in agriculture. But finding themselves too much disturbed and confined by the incursions and conquests of the Israelites, they spread themselves throughout the greatest part of the Mediterranean islands, and carried with them their knowledge in the arts of cultivation.

Mago, a famous general of the Carthaginians, is said to have written no less than 28 books on the subject; which Columella tells us were translated into Latin by the express order of the Roman senate. We are informed by the ancient writers, that Ceres was born in Sicily, where she first invented the arts of tillage and of sowing corn. For this essential service, she was, agreeably to the superstition of those ages, deified and worshipped as the goddess of plenty. The truth of this is, that, in the time of Ceres, the island, through her endeavours and the industry of the people, became very fruitful in corn; and agriculture was there esteemed so honourable an employment, that even their kings did not disdain to practise it with their own hands.

But time, which at first gave birth to arts, often caused them to be forgotten when they were removed from the place of their origin. The descendants of Noah, who settled in Europe, doubtless carried their knowledge of agriculture with them into the regions which they successively occupied. But those who took possession of Greece were such an uncivilized race, that they fed on roots, herbs, and acorns, after the manner of beasts. Pelasgus had taught them the culture of the oak, and the use of acorns as food; for which service, we are told, divine honours were paid him by the people.

The Athenians, who were the first people that acquired any tincture of politeness, taught the use of corn to the rest of the Greeks. They also instructed them how to cultivate the ground, and to prepare it for the reception of the seed. This art, we are told, was taught them by Triptolemus. The Greeks soon perceived that bread was more wholesome, and its taste more delicate, than that of acorns and the wild roots of the fields; accordingly they thanked the gods for such an unexpected and beneficial present, and honoured their benefactor.

As the arts of cultivation increased, and the blessings they afforded became generally experienced, the people soon preferred them to whatever the ravages of conquest, and the cruel depredations of savage life, could procure. And accordingly we find, that the Athenian kings, thinking it more glorious to govern a small state wisely, than to aggrandize themselves, and enlarge the extent of their dominions by foreign conquest, withdrew their subjects from war, and mostly employed them in cultivating the earth. Thus, by continued application, they brought agriculture to a considerable degree of perfection, and soon reduced it to an art.

Hesiod was the first we know of among the Greeks who wrote on this interesting subject. According to the custom of the oriental authors, he wrote in poetry, and embellished his poem with luxuriant description and sublime imagery. He calls his poem Works and Days, because agriculture requires exact observations on times and seasons.

Xenophon has also, in his Oeconomica, remarked, that agriculture is the nursing mother of the arts. For, says he, "where agriculture succeeds prosperously, there the arts thrive; but where the earth necessarily lies uncultivated, there the other arts are destroyed."

Other eminent Greek writers upon agriculture were, Democritus of Abdera, Socrates, Archytas Tarentius, Aristotle, and Theophrastus, from whom the art received considerable improvement.

The ancient Romans esteemed agriculture so honourable an employment, that the most illustrious senators of the empire, in the intervals of public concerns, applied themselves to this profession; and such was the simplicity of those ages, that they assumed no appearance of magnificence and splendour, or of majesty, but when they appeared in public. At their return from the toils of war, the taking of cities, and the subduing of hostile nations, their greatest generals were impatient till they were again employed in the arts of cultivation.

Regulus, when in Africa, requested of the senate to be recalled, lest his farm might suffer, for want of proper cultivation, in his absence, and the senate wrote him for answer, that it should be taken care of at the public expense, while he continued to lead their armies.

Cato the censor, after having governed extensive provinces, and subdued many warlike nations, did not think it below his dignity to write a Treatise on Agriculture. This work (as we are told by Servius) he dedicated to his own son, it being the first Latin treatise written on this important subject; and it has been handed down to us in all its purity, in the manner that Cato wrote it.

Varro composed a treatise on the same subject, and on a more regular plan. This work is embellished with all the Greek and Latin erudition of that learned author, who died 28 years before the commencement of the Christian era. Virgil, who lived about the same time, has, in his Georgics, adorned this subject with the language of the Muses, and finely illustrated the precepts and rules of husbandry left by Hesiod, Mago, and Varro.

Columella, who flourished in the reign of the emperor Claudius, wrote 12 books on husbandry, replete with important instruction.

From this period to that of the reign of Constantine Pogonatus, husbandry continued in a declining state; but that wise emperor caused a large collection of the most useful precepts relating to agriculture to be extracted from the best writers, and published them under the title of Gropomices. It has been asserted, that he made this collection with his own hand; and the truth of the assertion is not improbable, as it is well known that after he had conquered the Saracens and Arabians, he not only practised and encouraged, but studied the arts of peace, fixing his principal attention on agriculture as their best foundation.

After the death of Constantine, however, the increasing attention of the people to commerce, and the ignorance and gross superstition of the ages which succeeded, seem to have rendered agriculture an almost neglected.
History.

AGRICULTURE.

The eruptions of the northern nations soon abolished any improved system. These innumerable and enterprising barbarians, who overran all Europe, were originally shepherds or hunters, like the present Tartars and the savages of America. They contented themselves with possessing, without labour or trouble, those vast countries rendered deserts by their own ravages, cultivating only a very small spot near their habitations; and in this trifling husbandry only the meanest slaves were employed: so that the art itself, which formerly was thought worthy of the study of kings, was now looked upon as mean and ignoble; a prejudice which is scarcely effaced at present, or at least but very lately.—During this period, therefore, we find no vestiges of anything tolerably written on the subject. No new attempts were made to revive it, or to improve it, till the year 1478, when Crescenzi published an excellent performance on the subject at Florence. This roused the slumbering attention of his countrymen, several of whom soon followed his example. Among these Tatti, Stephano Augustino Gallo, Sansovino, Lauro, and Tarello, deserve particular notice.

From the fall of the Roman empire, till the revival of learning in the fifteenth century, little is known of the state of agriculture in any part of Europe; and even that little must be gleaned from the incidental notices of historians, who were too much occupied in recording the achievements of war, with the rude policy and intestine broils of their respective countries, to give much attention to the peaceful, and at that time degraded, labours of the husbandman. The policy of the feudal system, the distribution of society which it occasioned, and the perpetual dissensions and petty hostilities which it engendered, furnish the best evidence of the low state of an art which can flourish only under the protection of law, and be carried on with success only by the energy of free men. But, during this long interval, the population of Europe was divided into two great classes, of which by far the larger one was composed of bondmen, without property, or the power of acquiring it, and small tenants, very little superior to bondmen; and the other class, consisting chiefly of the great barons and their retainers, was more frequently employed in laying waste the fields of their rivals than in improving their own. The superstition of the times, which destined a large portion of the country to the support of the church, and which, in some measure, secured it from predatory incursions, was the principal source of what little skill and industry were then displayed in the cultivation of the soil. "If we consider the ancient state of Europe," says Mr Hume, (A) "we shall find that the far greater part of the society were everywhere bereaved of their personal liberty, and lived entirely at the will of their masters. Every one that was not noble was a slave; the peasants were sold along with the land; the few inhabitants of cities were not in a better condition; even the gentry themselves were subjected to a long train of subordination under the greater barons, or chief vassals of the crown, who, though seemingly placed in a high state of splendour, yet, having but a slender protection from law, were exposed to every tempest of the state, and, by the precarious condition in which they lived, paid dearly for the power of oppressing and tyrannizing over their inferiors.—The villains were entirely occupied in the cultivation of their master's land, and paid their rents either in corn and cattle, and other produce of the farm, or in servile offices, which they performed about the baron's family, and upon farms which he retained in his own possession. In proportion as agriculture improved, and money increased, it was found that these services, though extremely burdensome to the villain, were of little advantage to the master; and that the produce of a large estate could be much more conveniently disposed of by the peasants themselves, who raised it, than by the landlord or his bailiff, who were formerly accustomed to receive it. A commutation was, therefore, made of rents for services, and of money-rents for those in kind; and as men in a subsequent age discovered, that farms were better cultivated where the farmer enjoyed security in his possession, the practice of granting leases to the peasant began to prevail, which entirely broke the bonds of servitude, already much relaxed from the former practices. The latest laws which we find in England, for enforcing or regulating this species of servitude, were enacted in the reign of Henry VII. And though the antient statutes on this subject remain still unrepelled by Parliament, it appears, that before the end of Elizabeth, the distinction between villain and free-man, was totally, though insensibly, abolished; and that no person remained in the state, to whom the former laws could be applied."

But, long before the fifteenth century, it is certain that there was a class of tenans, holding on leases for lives, or for a term of years, and paying a rent in land produce, in services, or in money. Whether they gradually sprang up from the class of bondmen, according to Lord Kames, (b) or existed from the earliest period of the feudal constitution, according to other writers, (c) their number cannot be supposed to have been considerable during the middle ages. The stock which these tenants employed in cultivation, commonly belonged to the proprietor, who received a proportion of the produce as rent;—a system, which still exists in France, where such tenants are called metayers, and some vestiges of which may yet be traced in the steel-bow of the law of Scotland. Leases of the 13th century still remain; (d) and both the laws and chartuaries, (e) clearly prove the existence in Scotland, of a class of cultivators, distinct from the serfs or bondmen. Yet the condition of these tenants seems to have been very different from that of the tenants of the present day; and the lease approached nearer in its form to a feu-charter, than to the mutual agreement now in use. It was of the nature of a beneficary grant by the proprietor, under certain conditions, and for a limited period: the consent of the tenant seems never to have been doubted. In the

the common expression, granting a lease, we have retained an idea of the original character of the deed even to the present time.

The corn crops cultivated during this period seem to have been of the same species, though all of them probably much inferior in quality to what they are in the present day. Wheat, the most valuable grain, must have borne a small proportion, at least in Britain, to that of other crops; the remarkable fluctuation of price; its extreme scarcity, indicated by the extraordinary rate at which it was sometimes sold; as well as the preparatory cultivation required, may convince us, that its consumption was confined to the higher orders, and that its growth was by no means extensive. Rape and oats furnished the bread and drink of the great body of the people of Europe. Cultivated herbage and roots were then unknown in the agriculture of Britain. It was not till the end of the reign of Henry VIII. that any salads, carrots, or other edible roots, were produced in England. The little of these vegetables that was used, was formerly imported from Holland and Flanders. Queen Catherine, when she wanted a salad, was obliged to despatch a messenger thither on purpose (f).

The ignorance and insecurity of those ages, which necessarily confined the cultivation of corn to a comparatively small portion of country, left all the rest of it in a state of nature, to be depastured by the inferior animals, then only occasionally subjected to the care and control of man. Cultivators were crowded together in miserable hamlets; the ground contiguous was kept continually under tillage, and beyond that, wastes and woodlands of much greater extent were appropriated to the maintenance of their flocks and herds, which pastured indiscriminately with little attention from their owners.

The low price of butcher meat, though it was then the food of the common people, when compared with the price of corn, has been justly noticed by several writers, as a decisive proof of the small progress of civilization and industry.

At what time agriculture was introduced into Britain is uncertain. When Julius Caesar first invaded this island, it was not wholly unknown. That conqueror was of opinion, that agriculture was first introduced by some of those colonies from Gaul which had settled in the southern parts of Britain, about 100 years before the Roman invasion. (f)

It is not to be expected that we can now be acquainted with many of the practices of these ancient husbandmen. It appears, however, that they were not acquainted with the art of manuring, particularly marl, which we have on the authority of Pliny, who tells us, that it was peculiar to the people of Gaul and of Britain; that its effects continued 80 years; and that no man was ever known to marl his field twice, &c.—It is highly probable, too, that lime was at this time also used as a manure in Britain, it being certainly made use of in Gaul for this purpose at the time of Julius Caesar's invasion.

The establishment of the Romans in Britain produced great improvements in agriculture, insomuch that prodigious quantities of corn were annually exported from the island; but when the Roman power began to decline, this, like all the other arts, declined also, and was almost totally destroyed by the departure of that people. The unhappy Britons were now exposed to frequent incursions of the Scots and Picts, who destroyed the fruits of their labours, and interrupted them in the exercise of their art. After the arrival of the Saxons in the year 449, they were involved in such long wars, and underwent so many calamities, that the husbandmen gradually lost much of their skill, and were at last driven from those parts of their country which were most proper for cultivation.

After the Britons retired into Wales, though it appears from the laws made relative to this art, that agriculture was thought worthy of the attention of the legislature, yet their instruments appear to have been very unartful. It was enacted that no man should undertake to guide a plough who could not make one; and that the driver should make the ropes of twisted willows, with which it was drawn. It was usual for six or eight persons to form themselves into a society for fitting out one of these ploughs, providing it with oxen and every thing necessary for ploughing; and many minute and curious laws were made for the regulation of such societies. If any person laid dung on a field without the consent of the proprietor, he was by law allowed the use of that land for one year. If the dung was carried out in a cart in great abundance, he was to have the use of the land for three years. Whoe'er cut down a wood, and converted the ground into arable, with the consent of the owner, was to have the use of it for five years. If any one folded his cattle, for one year, upon a piece of ground belonging to another, with the owner's consent, he was allowed the use of that field for five years.

Thus, though the Britons had in a great measure lost the knowledge of agriculture, they appear to have been very assiduous in giving encouragement to such as would attempt a revival of it; but among the Anglo-Saxons, things were not at present in so good a state. These restless and haughty warriors, having contracted a distaste and contempt for agriculture, were at pains to enact laws to prevent its being followed by any other than women and slaves. When they first arrived in Britain, they had no occasion for this art, being supplied by the natives with all the necessaries of life. After the commencement of hostilities, the Saxons subsisted chiefly by plunder; but having driven out or extirpated most of the ancient Britons, and divided their lands among themselves, they found themselves in danger of starving, there being now no enemy to plunder; and therefore they were obliged to apply to agriculture.

The Saxon princes and great men, who, in the division of the lands, had received the greatest shares, are said to have subdivided their estates, into two parts, which were called the in-lands and the out-lands. The in-lands were those which lay most contiguous to the mansion-house of their owner, which he kept in his own

(f) Hume's History of England, chap. 23.
own possession, and cultivated by his slaves, under the
direction of a bailiff, for the purpose of raising pro-
visions for the family. The out-lands were those at a
greater distance from the house, and were let to the
corns, or farmers of those times, at very moderate
rents. By the laws of Ina king of the West Saxons,
who reigned in the end of the seventh and begin-
ing of the eighth century, a farm consisting of ten hides,
or plough-lands, was to pay the following rent: "Ten
casks of honey; three hundred loaves of bread; twelve
casks of strong ale; thirty casks of small ale; two
oxen; ten wethers; ten geese; twenty hens; ten
cheeses; one cask of butter; five salmon; twenty pounds
of flour; and one hundred eels." From this low
rent, the imperfection of agriculture at that time is
easily discoverable; but it is still more so from the low
prices at which land was then sold. In the ancient
history of the church of Ely, published by Dr. Gale,
there are accounts of many purchases of lands by Ædell-
woald, the founder of that church, and by other
benefactors, in the reign of Edgar the Peaceable, in the
tenth century. By a comparison of these accounts it
appears, that the ordinary price of an acre of the best
land in that part of England, in those times, was no
more than 16 Saxon pennies, or about four shillings of
our money: a very trifling price, even in comparison
with that of other commodities at the same time; for,
by comparing other accounts, it appears, that four sheep
were then equal in value to an acre of the best land,
and one horse of the same value with three acres.
The frequent and despicable famines which afflicted Eng-
lund about this time, are further instances of the wretched
state of agriculture.
In 1043, a quarter of wheat sold for 60 Saxon pennies (15 of our shillings), at that
time equal in value to seven or eight pounds of our mo-
neny now.

The invasion of the Normans in 1066, contributed very
much to the improvement of agriculture; for, by
that event, many thousands of husbandmen from Flan-
ders, France, and Normandy, settled in Britain, ob-
tained estates or farms, and cultivated them after the
manner of their country. The implements of husband-
ry, used at this time, were of the same kind with those
employed at present; but some of them were less per-
fect in their construction. The plough, for example,
had but one stilt or handle, which the ploughman
guided with one hand, having in his other hand an in-
strument which served both for cleaning and mending
the plough, as well as for breaking the clods. The
Norman plough had two wheels; and in the light soil of
Normandy, was commonly drawn by one or two
oxen; but, in England, a greater number was often
necessary. In Wales, the person who conducted the
oxen in the plough walked backwards. Their carts, har-
nows, scythes, sickles, and scythes, from the figures
of them still remaining, appear to have been nearly of
the same construction with those that are now used. In
Wales they did not use a sickle for reaping their corns,
but an instrument like the blade of a knife, with a
wooden handle at each end.—Their chief manure, next
to dung, seems still to have been marl. Summer-fal-
lowing of lands designed for wheat, and ploughing them
several times, appear to have been frequent practices of
the English farmers in this period.

Of the state of agriculture in England, we may
obtain a nearer view, by shortly adverting to some of
the laws from the Conquest, down to the beginning of
the reign of Henry VII. in 1485, when the feudal
system, which had been gradually falling into decay,
was almost dissolved in that country.

One of the earliest and greatest grievances, was
the levying of purveyance. This originally com-
prised the necessary provisions, carriages, &c. which
the nearest farmers were obliged to furnish to the king's
armies at the current prices; and to his houses and
castles in time of war. It was called the great purvey-
ance, and the officers who collected these necessaries
were called purveyors. The smaller purveyance
included the necessary provisions and carriages for the
king's household, when living at home, or travelling
through the kingdom, which the tenants on the king's
demesne lands were obliged to furnish gratis; and the
practice came to be adopted by the barons and great
men, in every tour which they thought proper to make
in the country. These exactions were so grievous, and
levied in so licentious a manner, that the farmers,
when they heard of the court's approach, often deserted
their houses, as if the country had been invaded by an
enemy. "Purveyance," says Dirom, "was, perhaps,
for many centuries, the chief obstruction to the agricul-
ture and improvement of Great Britain. Many laws
were made for the reformation and regulation of pur-
veyance, but without effect; and the practice continued
down to so late a period as the reign of James the First."

The home trade in corn and other products was
restricted, by acts against forestallers in 1360, and at se-
veral subsequent periods. For many years after the Con-
quest, the greater part of the trade of England was car-
ried on in markets and fairs; and a very considerable
part of the revenue of the crown arose from the duties
payable to the king upon the goods brought to them for
sale. The barons had also tolls at the fairs within their
respective jurisdictions. When farmers and merchants
were bringing their corn and other necessaries to be sold
there, they were sometimes met on the way by persons
who purchased their commodities in order to retail
them at a higher price. Thus, the king and the lord
of the manor, lost the several duties payable to them;
and the price, it was thought, was at the same time
raised to the inhabitants. Such were the original for-
estallers, who were subjected by several statutes to se-
vere penalties. This crime of forestalling, and the
kindred ones of regrating and ingrossing, were care-
fully defined, and the different degrees of punishment
specified, in a new statute in 1552, to be afterwards
noticed. An early law of 1266, for regulating the sa-
size of bread and ale, furnishes a clear proof of the
little intercourse that must have subsisted at that time
between town and country. "Brewers in cities," says
the statute, "may well afford to sell two gallons of
beer or ale for a penny, and out of cities three or four
gallons for a penny."

(c) Inquiry into the Corn Laws.
Several laws were made in the 14th and 15th centuries, permitting the exportation of grain, when the price of wheat did not exceed six shillings and eight pence a quarter; and in 1463 importation was prohibited when the price was lower. The last statute, however, was little attended to, and foreign grain was admitted as before; while the state of the country, and the restrictions on internal commerce, scarcely permitted any advantage to be derived from the acts allowing exportation.

In the elaborate work of Mr. Chalmers already referred to, a great many valuable notices are collected regarding the husbandry of Scotland during these ages. It is evident from his researches, that the progress of cultivation, in the 13th century, had been greater than we should have expected from the turbulence of the times, and the comparatively rude and uncivilized state of society. Purveyance, and other obstructions to improvement, were nearly the same in Scotland as in England; the laws regarding the corn trade appear in some instances to have been copied from those of England; and in the northern, as in the southern part of the island, the clergy were by far the most skilful and industrious husbandmen.

Yet it is difficult to reconcile the idea of any considerable improvement, particularly in so far as regards the extensive cultivation of wheat, (which Mr. Chalmers infers from the authorities he quotes), with an act passed in 1426, which ordained that when wheat was sold at least a firkin (little more than a Winchester bushel) of wheat, and half a firkin of peas, with a proportion of beans; or with the state of the districts where wheat is said to have been extensively grown, only a few years ago.

By statute 1449, the tenant was for the first time secured in possession during the term of his lease, against a purchaser of the land; and in 1469, he was protected from having his property carried off for the landlord's debts, beyond the amount of rent actually due; a statute which proves his miserable condition before that time.

Soon after the beginning of the 16th century, agriculture partook of the general improvement which followed the invention of the art of printing, the revival of literature, and the more settled authority of government; and, instead of the occasional notices of historians, we can now refer to regular treatises, written by men who engaged eagerly in this neglected, and hitherto degraded, occupation. We shall therefore give a short account of the principal works, as well as of the laws and general policy of Britain in regard to agriculture, from the early part of the 16th century to the Revolution in 1688, when a new era commenced in the legislation of corn, and soon after in the practice of the cultivator.

The first, and by far the best of our early works, is The Book of Husbandry, printed in 1544, commonly ascribed to Fitzherbert, a Judge of the Common Pleas in the reign of Henry VIII. This was followed, in 1539, by The Book of Surveying and Improvements, by the same author. In the former treatise we have a clear and minute description of the rural practices of that period; and from the latter may be learned a good deal of the economy of the feudal system in its decline. The Book of Husbandry has scarcely been excelled by any later production, in as far as concerns the subjects of which it treats; for at that time, cultivated herbage and edible roots were still unknown in England. The author writes from his own experience of more than forty years; and, if we except his biblical allusions, and one or two vestiges of the superstition of the Roman writers about the influence of the moon, there is very little of this valuable work that should be omitted, and not a great deal that need be added, in so far as regards the culture of corn, in a manual of husbandry adapted even to the present time. Fitzherbert touches on almost every department of the art; and, in about a hundred octavo pages, has contrived to condense more practical information, than will be found scattered through as many volumes of later times; and yet he is minute even to an extreme on points of real utility. There is no reason to say, with Mr. Harte, that he had revived the husbandry of the Romans; he merely describes the practices of the age in which he lived; and from his commentary on the old statute extens a manerii, in his Book of Surveying, in which he does not allude to any recent improvements, it is probable that the management which he details had been long established. But it may surprise some of the agriculturists of the present day to be told, that, after the lapse of almost three centuries, Fitzherbert's practice, in some material branches, has not been improved upon; and that in several districts abuses still exist, which were as clearly pointed out by him at that early period, as by any writer of the present age.

The Book of Husbandry begins with the plough, and other instruments, which are concisely and particularly described; and then about a third part of it is occupied with the several operations, as they succeed one another throughout the year. Among other things in this part of the work, the following deserve notice. "Somme (ploughs) wyl tourn the sheld brestith at every landes ende, and plowe all one way," the same kind of plough that is now found so useful on hilly grounds. Of wheel ploughs, he observes, that "they be good on even grounde that lyeth lyghte" and on such lands they are still most commonly employed. Cart wheels were sometimes bound with iron, of which he greatly approves. On the much agitated question about the employment of horses or oxen in labour, the most important arguments are distinctly stated. "In somme places," he says, "a horse plough is better," and in others an oxen plough, to which, upon the whole, he gives the preference; and to this, considering the practices of that period, they were probably entitled. Beans and peas seem to have been common crops. He mentions the different kinds of wheat, barley, and oats; and, after describing the method of barrowing "all maner of cornes," we find the roller employed. "They use to role thayr barley grounde after a shawre of rayne, to make the ground even to move." Under the article "To Fabowe," he observes, "the greater cloves (cloads), the better wheate, for the cloves keppe the wheate warme all wynter; and at March they will melte, and breake and fall in many small peces, the whiche is a newe dongynge and refreshynge of the corne." This is agreeable to the present practice, founded on the very same reasons. "In May, the shepe folde is to set out;" but Fitzherbert does not much approve of folding, and points out its disadvan-
The author then points out the great advantages of enclosures; recommends "quyecketonye, dychyne, and hed-greyng," and gives particular directions about the sittes, and the method of training a hedge, as well as concerning the planting and management of trees. We have here a short information "for a yonge gentylman that intendeth to thrye:" and "a prolong for the wyues occupation," in some instances rather too homely for the present time. Among other things, she is to "make her husband and herself some clothes;" and "she maye haue the lockes of the shape ethyrer to make blankettes and couerlettes, or bothe." This is not so much amiss; but what follows will bring our learned judge into disrepute, even with our most industrious housewives. "It is a wyues occupation, to wyne all maner of corneys, to make male, to wase and wrynge, to make leeye, sheere corne, and, in time of need, to help her husbande to fyl the macke wyne or drown carne, drye the ploughge, to loode leye, corne, and suche other. And to go or ride to the market, to sel butter, chese, mylke, eggs, chekyne, capons, hennes, pyggges, gee, and all maner of corneys." The rest of the book contains some useful advices about diligence and economy; and concludes, after the manner of the age, with many pious exhortations.

Such is Fitzherbert's Book of Husbandry, and such was the state of agriculture in England in the early part of the 16th century, and probably for a long time before; for he nowhere speaks of the practices which he describes or recommends as of recent introduction.

The Book of Surveyinge adds considerably to our knowledge of the rural economy of that age. "Four maner of commens" are described; several kinds of mills for corn, and other purposes, and also "querines goo with hand:" different orders of tenants, down to the "boundmen,"" who, in some places continue as yet;"—and many tymes, by colour thereof, there be many freemen taken as boundmen, and their lands and goods is taken from them." Lime and marl are mentioned as common manures; and the former was sometimes spread on the surface to destroy heath. Both drainage and irrigation are noticed; though the latter but slightly. And the work concludes with an inquiry, "Howe to make a township that is worth XX. marke a yere, worth XX. li. a year:" from which we shall give a specimen of the author's manner, as well as of the economy of the age.

"It is undoubted that to every townshyppe that standeth in tillage in the playne countrey, there be errable landes to plowe, and sawe, and leysse to tye or tedi thyer horses and mares upon, and common pasture to kepe, and pasture thyer catell, beastes, and shepe upon. And also they have medowe grounde to get theyr hey uppon. Than to let it be known how many acres of errable lande every man hath in tillage, and of the same acres in every field to change with his neighbours, and to leyde them togather, and to make bym one seuerall close in every fele, for his errable landes and his leysse in every fele, to leyde them togethier in one fele, and to make one seuerall close for them all. And also another seuerall close for his portion of his common pastoure, and also his portion of his medowe in a seuerall close by itselfe, and al kept in seueral both in wynter and somer; and every cottage shall have his portion assigned bym accordyng to his rent, and than shall nat the ryche man ouerpresse the
poore man with his cattell, and evry man may eate his owne close at his pleasure. Undoubted, that hay and strawe that will find one beest in the house, will find two beestes in the close, and better they shall lyeke. For these beestis in the house have short heare and thyne, and towards March they will pille and be bare. And therefore they may nat abyde in the fylde before the heerdmen in winter tymes for colde. And those that lie in a close under a hedge have long heare and thicke, and they will never pille nor be bare, and by this reason the husbande maye kepe tywe and many cattell as he did before.

"This is the cause of this approwgment. Nowe every husbande bathe size seuerall closes, whereof iii. be for corn, the fourth for his leyse, the fyfte for his commen pastures, and the sixte for his haye; and in wytter time there is but one occupied with corn, and than hath the husbande other fyue to occupy tylle lente come, and that he hath his falowe felde, his ley felde, and his pasture felde al sommer. And when he hath mooned his medowe, than he hath his medowe grounde, soo that if he hath any wayke castell that wold be amended, or dyuers manner of castell, he may put them in any close he will, the which is a grete adventage; and if all shulde lye commen, then wolde the edych of the cornes felde the and the aftermath of all the meadowes be eaten in X. or XII. dayes. And the rych men that hath moche castell, wold have the advauntage, and the poore man can have no helpe nor reliefe in wytter, when he hath moste neste; and if an acre of land be the size pens or it be enclosed, it will be worth VIII. pens when it is enclosed, by reason of the com-postyng and dongyng of the castell that shall go and lye upon it both day and night; and if any of his three closes that he hath for his corn be worn or bare, than he may breke and plowe up his close that he hadde for his layse, or the close that he hadde for his common pasture, or bothe, and sowe them with corn, and let the other lye for a time, and so shall he have alway resist grounde, the which will bear moche corne with lytel dunge; and also he shall have a grete profyte of the wod in the hedges when it is grown, and not only these profitys and adventages before said, but he shall save moche more than at these; for by reason of these closes, he shall save meste, drinke, and wages of a shepherde, the wages of the heerdman, and the wages of the swine heerd, the which may fortune to be as chargeable as all his holle rent, and also his corne shall be better saued from eatings or distroyeng with castell. For dour ye nat but heerdmen with their castell, shepherdes with their shepe and tieng of horses and mares, distroyeth much cornne, the which the hedges wold save. Paradicurere some men would say, that this should be against the common weale, because the shepherdes, heerdmen, and swynshepherdes, shuld than be put out of wages. To that it may be answered, though these occupations be not used, there be as many newe occupations that were not used before. As gettyng of quickesettes, diching, beddig, and plashing, the which the same men may use and occupye."

The next author who writes professedly on agricult-

ure is Tusser, whose Five Hundred Points of Husbandry was published in 1562, and has been recommended by Lord Molesworth to be taught in schools.[2] The edition of 1604 is the one we make use of here, in which the Book of Husbandry consists of 118 pages, and then follows the Points of Housewifery, occupying 42 pages more. It is written in verse. Amidst a vast heap of rubbish, there are some useful notices concerning the state of agriculture in different parts of England. Hops, which had been introduced in the early part of the 16th century, and on the culture of which a treatise was published in 1574 by Reynold Scott, are mentioned as a well known crop. Buckwheat was sown after barley. It seems to have been the practice then, in some places, to "geld filicias" as well as colts. Hemp and flax are mentioned as common crops. Enclosures must have been numerous in several counties; and there is a very good "comparison between champion (open fields) country, and several" which Blythe afterwards transcribed into his Improver Improved. Carrots, cabbages, turnips, and rape, are mentioned among the herbs and roots for the kitchen. There is nothing to be found in Tusser about serfs, or bondmen, as in Fitzherbert's works. This author's division of the crop is rather curious, though probably quite inaccurate, if he means that the whole rent might be paid by a tenth of the corn. But this, perhaps, is not his meaning.

"One part cast forth for rent due out of hand.
One other part for seed to sow thy land.
Another part lease parson for his tith.
Another part for harvest, sickle and sith.
One part for ploughwrite, cartwrite, knacker and smith.
One part to uphold thy teemes that draw therewith.
Another part for servant and workman's wages hate.
One part likewise for fibellie daie by daie.
One part thy wife for needful things doth crave.
Thyself and thy child the last part would have?"

The next writer is Barnaby Googe, whose Whole Art of Husbandry was printed in 1578, and again by Markham in 1614. The first edition is merely a translation of a German work; and very little is said of English husbandry in the second, though Markham made some trifling interpolations, in order, as it is alleged, to adapt the German husbandry to the English climate. It is, for the most part, made up of gleanings from all the ancient writers of Greece and Rome, whose absurdities are faithfully retained; with here and there some description of the practices of the age, in which there is little of novelty or importance. Googe mentions a number of English writers who lived about the time of Fitzherbert, whose works have not been preserved.

For more than 50 years after this, or till near the middle of the 17th century, there are no systematic works on husbandry, though several treatises on particular departments of it. From these it is evident, that all the different operations of the farmer were performed with more care and correctness than formerly; that
that the fallows were better worked; the fields kept freer of weeds, and much more attention paid to
manures of every kind. A few of the writers of this pe-
tiod deserve to be shortly noticed.

Sir Hugh Plat, in his *Jewel House of Art and Na-
ture*, printed in 1594, (which Weston in his Cat
logue erroneously gives to Gabriel Platteres), makes some use-
ful observations on manures, but chiefly collected from
other writers. His censure of the practice of leaving
farm dung lying scattered about is among the most va-

able.

Sir John Norden’s *Surveyor’s Dialogue*, printed in
1627, and reprinted with additions in 1618, is a work of
considerable merit. The first three books of it re-
late to the rights of the Lord of the Manor, and the
various tenures by which landed property was then held,
with the obligations which they imposed: Among others,
we find the singular custom, so humorously described
in the Spectator, about the incontinent widow riding up
on a ram. In the fifth book, there are a good many judi-
cious observations on the “different natures of grounds,
how they may be employed, how they may be bettered,
reformed and amended.” The famous meadows near
Salisbury are mentioned; and when cattle have fed
their fill, hogs, it is pretended, “are made fat with
the remnant, namely with the roots and sapce of the
grasse.” So many extravagant assertions have been
made about these meadows by several of our early
writers, that we ought to receive their statements with
some degree of scepticism, wherever they seem to ap-
proach the marvellous. “Clover grasse, or the grasse
honey suckle,” (white clover), is directed to be sown
with other hay seeds. “Carrot roots” were then rais-
ed in several parts of England, and sometimes by
farmers. London street and stable dung was carried to
a distance by water; though it appears from later writ-
iers to have been got almost for the trouble of removing.
And leases of twenty-one years are recommended for
persons of small capital, as better than employing it in
purchasing land;—an opinion that prevails very gene-

rally among our present farmers.

Bees seem to have been great favourites with these
early writers; and among others, there is a treatise by
Butler, a gentleman of Oxford, called the *Feminine
Monarchie*, or the *History of Bees*, printed in 1609,
full of all manner of quaintness and pedantry.

We shall pass over Markham, Mascall, Gabriel
Platteres, and several other authors of this period, the
best part of their writings being preserved by Blythre
and Hartlib, of whom we shall say a little immediately.
In Sir Richard Weston’s *Discourse on the Husbandry
of Brabant and Flanders*, published by Hartlib in 1643,
we may mark the dawn of the vast improvements which
have since been effected in Britain. This gentleman
was ambassador from England to the elector palatine
and king of Bohemia in 1619, and had the merit of be-
ing the first who introduced the great *clover*, as it was
then called, into English agriculture about 1643, and
probably turnips also. His directions for the cultura-
tion of clover are better than was to be expected. It
thrives best, he says, when you sow it on the worst and
barest heath ground is in England. The ground is to be pared and burnt;
unstacked lime must be added to the same. The ground
is next to be well ploughed and harrowed; and about

Vol. I. Part I.
AGRICULTURE.

Dr. Beattie's Annotations, with the writer of the Legacy's answers; both of them ingenious, and sometimes instructive. But this cannot be said of Gabriel Platter's Mercurius Latifrons, also added to this edition, which is a most extravagant production. There are also several communications from Hartlib's different correspondents; of which the most interesting are those on the early cultivation, and great value of clover. Hartlib himself does not appear much in this collection. But he seems to have been a very useful person in editing the works of others, and as a collector of miscellaneous information on rural subjects. It is strange that neither Blyth nor Hartlib, nor any of Hartlib's correspondents, had ever heard of Fitzherbert's works.

Among the other writers previous to the revolution, we shall only mention Ray the botanist and Evelyn, both men of great talents and research, whose works are still in high estimation. A new edition of Evelyn's Sylva and Terra was published in 1777 by Dr. Hunter, with large notes and elegant engravings, and reprinted in 1812.

Some of the works of the sixteenth and seventeenth centuries are now very scarce, and most of them little known to agriculturists of the present day. In almost all of them there is much that is now useless, and not a little trifling and foolish; yet the labour of perusal is not altogether fruitless. He who wishes to view the condition of the great body of the people during this period, as well as the cultivator who still obstinately resists every new practice, may, each of them, be gratified and instructed, in tracing the gradual progress of improvement, both in enjoyment, and in useful industry. The preceding review commences with a period of feudal anarchy and despotism, and comes down to the time when the exertions of individual interest were protected and encouraged by the firm administration of equal laws; when the prosperity of Great Britain was no longer retarded by internal commotions, nor endangered by hostile invasion.

The laws of this period, in so far as they relate to agriculture and rural economy, display a similar progress in improvement.

From the beginning of the reign of Henry VII. to the end of Elizabeth's, a number of statutes were made for the encouragement of tillage, though probably to little purpose. The great grievance of those days, was the practice of laying arable land to pasture, and suffering the farm-houses to fall to ruin. "Where, in some towns," says the statute, 4th Henry VII. (1488), "two hundred persons were occupied and lived of their lawful labours, now there are occupied two or three herdsmen, and the residue fall into idleness," therefore it is ordained, that houses which, within three years, have been let for farm, with twenty acres of land, lying in tillage or husbandry, shall be upheld, under the penalty of half the profits to be forfeited to the king or the lord of the fee. Almost a century afterwards, the practice had become still more alarming; and in 1534, a new act was tried, apparently with as little success. "Some have 24,000 sheep, some 20,000, some 10,000, some 6000, some 4000, and some more and some less;" and yet it was alleged the price of wool had nearly doubled, "sheep being come to a few persons hands." A penalty was therefore imposed on all who kept above 2000 sheep; and no person was to take in farm more than two tenements of husbandry. By the 39th Elizabeth (1597), arable land made pasture since the 1st Elizabeth, shall be again converted into tillage, and what is arable shall not be converted into pasture.

Many laws were enacted during this period against vagabonds, as they were called; and persons who could not find employment seem to have been sometimes confounded with those who really preferred idleness and plunder. The dissolution of the feudal system, and the suppression of the monasteries, necessarily deprived a great part of the rural population of the means of support. They could not be employed in cultivating the soil; for there was no middle class of farmers possessed of capital to be vested in improvements; and what little disposable capital was in the hands of great proprietors, could not, in these rude times, be so advantageously embarked in the expensive and precarious labours of growing corn, as in pastureage, which required much less skill and superintendence. Besides, there was a constant demand for wool on the Continent; while the corn market was not only confined by laws against exportation, but fettered by restrictions on the internal trade. In this state of things, it would have been wiser to have encouraged manufactures, as furnishing the natural outlet to the surplus of the agricultural population, than to have interfered with private interest, under pretence of encouraging husbandry. But, instead of this, the interest of the labouring classes, who were, in some instances, prohibited from going to great cities and becoming artificers, as well as of the proprietors in the management of their estates, were to be sacrificed to the most mistaken views of national policy. The laws regarding the wages of labour, and the price of provisions, are a further proof of the ignorance of the age in matters of political economy, particularly in regard to the proper subjects of legislation.

By the statute 1552, it is declared, that any person that shall buy merchandise, victual, &c. coming to market; or make any bargain for buying the same, before they shall be in the market ready to be sold; or shall make any motion for enhancing the price; or dissuade any person from coming to market; or forbear to bring
Agriculture.

any of the things to market, &c. shall be deemed a forestaller. Any person who buys and sells again in the same market, or within four miles thereof, shall be reputed a regrater. Any person buying corn growing in the fields, or any other corn, with intent to sell again, shall be reputed an unlawful ingrosser. It was also declared, that no person shall sell cattle within five weeks after he bought them. Licenses, indeed, were to be granted in certain cases, and particularly when the price of wheat was at or under six shillings and eighteen pence a quarter, and other kinds of grain in that proportion.

The laws regarding the exportation and importation of corn, during this period, could have had little effect in encouraging agriculture, though, towards the latter part of it, they gradually approached that system which was finally established at and soon after the Revolution. From the time of the above mentioned statute against forestallers, which effectually prevented exportation, as well as the freedom of the home trade, when corn was above the price therein specified, down to 1688, there are at least twelve separate enactments on this subject; and some of them are so nearly the same, that it is probable they were not very carefully observed. The price at which wheat was allowed to be exported, was raised from 6s. 8d. a quarter, the price fixed by the 1st and 2d of Philip and Mary (1553), to 10s. in 1623; to 20s. in 1593; to 26s. 8d. in 1624; to 32s. in 1623; to 40s. in 1660; to 48s. in 1663; and at last, in 1670, exportation was permitted without limitation. Certain duties, however, were payable, which in some cases seem to have amounted to a prohibition, and until 1660 importation was not restrained even in years of plenty and cheapness. In permitting exportation, the object appears to have been revenue rather than the encouragement of production.

The first statute for levying tolls at turnpikes, to make or repair roads in England, passed in 1663.

Of the state of agriculture in Scotland in the 17th, and the greater part of the 18th centuries, very little is known; no professed treatise on the subject appeared till after the Revolution. The south-eastern counties were the earliest improved, and yet, in 1660, their condition seems to have been very wretched. Ray, who made a tour along the eastern coast in that year, says "We observed little or no fallow grounds in Scotland; some ley ground we saw which they manured with sea wreck. The men seemed to be very lazy, and may be frequently observed to plough in their cloaks. It is the fashion of them to wear cloaks when they go abroad, but especially on Sundays. They have neither good bread, cheese, nor drink. They cannot make them, nor will they learn. Their butter is very indifferent, and one would wonder how they could contrive to make it so bad. They use much potage made of coalwort, which they call kail, sometimes broth of decocted barley. The ordinary country houses are pitiful cofts, built of stone, and covered with turfs, having in them but one room, many of them with no chimneys, the windows very small holes, and not glazed. The ground in the valleys and plains bears very good corn, but especially bears barley or bigge, and oats, but rarely wheat and rye (1)."

It is probable that no great change had taken place in Scotland, from the end of the fifteenth century, except that tenants gradually became possessed of a little stock of their own, instead of having their farms stocked by the landlord. "The minority of James V., the the reign of Mary Stewart, the infancy of her son, and the civil wars of her grandson Charles I., were all periods of lasting waste. The very laws which were made during successive reigns, for protecting the tillers of the soil from spoil, are the best proofs of the deplorable state of the husbandman (k)."

Yet in the 17th century were those laws made, which paved the way for the present improved system of agriculture in Scotland. By statute 1633, landholders were enabled to have their tithes valued, and to buy them either at 9 or at 5 years purchase, according to the nature of the property. The statute 1685 conferring on landlords a power to entail their estates, was indeed of a very different tendency, in regard to its effects on agriculture. But the two acts in 1695, for the division of commons, and separation of intermixed properties, have facilitated in an eminent degree the progress of improvement.

From the Revolution to the accession of his present Majesty, the progress of agriculture was by no means so considerable as we should be led to imagine from the great exportation of corn. It is the opinion of well-informed writers (l), that very little improvement had taken place, either in the cultivation of the soil, or in the management of live stock, from the Restoration down to the middle of last century. Even clover and turnips, the great support of the present improved system of agriculture, were confined to a few districts, and, at the latter period, were scarcely cultivated at all by common farmers in the northern part of the island. Of the writers of this period, therefore, we shall notice only such as describe some improvement in the modes of culture, or some extension of the practices that were formerly little known.

La Houghton's Collections on Husbandry and Trade, a periodical work begun in 1681, we have the first notices of sheep being fed on the ground with turnips. "Some in Essex have their fallow after turnips, which feed their sheep in winter, by which means their turnips are scooped, and so made capable to hold dew and rain water, which, by corrupting, imbibe the nitre of the air, and when the shell breaks, it runs about and fertilizes. By feeding the sheep, the land is dunged as if it had been folded, and those turnips, though few or none be carried off for human use, are a very excellent improvement; nay, some reckon it so, though they only plough the turnips in, without feeding (m)." This was written in February 1694: but ten years before, Worlidge, one of his correspondents, observes, "Sheepfatten very well on turnips, which prove an excellent nourishment for them in hard winters, when fodder is scarce; for they will not only eat the greens, but feed on

---

Comber on National Subsistence, p. 161.
on the roots in the ground, and scoop them hollow even to the very skin."—"Ten acres," he adds, "sown with clover, turnips, &c. will feed as many sheep as one hundred acres thereof would before have done (n)."

At this time potatoes were beginning to attract notice. "The potato," says Houghton, "is a bacciferous herb, with excellent roots, bearing winged leaves, and a bell flower." "This I have been informed," says Houghton, "was brought first out of Virginia by Sir Walter Raleigh; and he stopping at Ireland, some was planted there, where it thrived very well, and to good purpose; for in their succeeding wars, when all the corn above ground was destroyed, this supported them; for the soldiers, unless they had dug up all the ground where they grew, and almost sifted it, could not extricate them. From thence they were brought to Lancashire, where they are very numerous, and now they begin to spread all the kingdom over. They are a pleasant food boiled or roasted, and eaten with butter and sugar. There is a sort brought from Spain, that are of a longer form, and are more luscious than ours; they are much set by, and sold for sixpence or eigthepence the pound (o)."

The next writer is Mortimer, whose Whole Art of Husbandry was published in 1706, and has since run through several editions. It is a regular systematic work of considerable merit; and it does not appear that much improvement has been made in the practices he describes, in many parts of Britain. From the third edition of Harthill's Legacy, we learn that clover was cut green, and given to cattle; and it appears that this practice of sowing, as it is now called, had become very common about the beginning of last century, wherever clover was cultivated. By-grass was now sown along with it. Turnips were hand-hoed, and extensively employed in feeding sheep and cattle, in the same manner as at present.

The first considerable improvement in the practice of that period, was introduced by Jethro Tull, a gentleman of Berkshire, who began to drill wheat and other crops, about the year 1701, and whose Horse-hoeing Husbandry was published in 1731. In giving a short account of the innovations of this eccentric writer, it is not meant to enter into any discussion of their merits. It will not detract much from his reputation to admit, that, like most other men who leave the beaten path, he was sometimes misled by inexperience, and sometimes deceived by a too sanguine imagination. Had Tull confined his recommendation of the drill husbandry, to leguminous and bulbous-rooted plants generally, and to the cereal, only in particular circumstances; and had he, without puzzling himself about the food of plants, been contented with pointing out the great advantage of pulverizing the soil in most cases, and extirpating weeds in every case, he would certainly have deserved a high rank among the benefactors of his country. A knowledge of his doctrines and practice, however, will serve as a necessary introduction to the present approved modes of culture.

Tull's theory is promulgated with great confidence; and in the controversy which he thought proper to maintain in support of it, he scrupled not to employ ridicule as well as reasoning. Besides the Roman writers de rustica, Virgil in particular, whom he treats with high disdain, he is almost equally severe on Dr Woodward, Bradley, and other writers of his own time.

As the distance between his rows appeared much greater than was necessary for the range of the roots of the plants, Tull begins by showing, that these roots extend much farther than is commonly believed; and then proceeds to inquire into the nature of their food. After examining several hypotheses, he decides this to be fine particles of earth. The chief, and almost the only use of dung, he thinks, is to divide the earth; to dissolve "the terrestrial matter which affords nutrient to the mouths of vegetable roots"; and this can be done more completely by tillage. It is therefore necessary, not only to pulverize the soil by repeated ploughings before it be seeded; but as it becomes gradually more and more compressed afterwards, recourse must be had to tillage, while the plants are growing, and this is hoeing; which also destroys the seeds that would deprive the plants of their nourishment.

The leading features of Tull's husbandry, is his practice of laying the land into narrow ridges of five or six feet, and upon the middle of these, drilling one, two, or three rows; distant from one another about seven inches when there were three; and ten inches when only two. The distance of the plants on one ridge, from those on the contiguous one, he called an interval; the distance between the rows on the same ridge a space, or partition: the former was stirred repeatedly by the horse-hoe, the latter by the hand-hoe.

The extraordinary attention this ingenious person gave to his mode of culture, is perhaps without a parallel. "I formerly was at much pains," he says, "and at some charge, in improving my drills, for planting the rows at very near distances; and had brought them to such perfection, that one horse would draw a drill with eleven shares, making the rows at three inches and a half distance from one another; and, at the same time, sow in them three very different sorts of seeds, which did not mix; and these too at different depths. As the barley-rows were seven inches asunder, the barley lay four inches deep. A little more than three inches above that, in the same channels, was clover; betwixt every two of these rows was a row of St Foin, covered half an inch deep."

"I had a good crop of barley the first year; the next year two crops of broad clover, where that was sown; and where hop-clover was sown, a mixed crop of that and St Foin; but I am since, by experience, so fully convinced of the folly of these, or any other mixed crops, and more especially of narrow spaces, that I have demolished these instruments (in their full perfection) as a vain curiosity, the drift and use of them being contrary to the true principles and practice of horse-hoeing (r)."

In the culture of wheat, he began with ridges six feet broad, or eleven on a breadth of 66 feet; but on this he afterwards had fourteen ridges. After trying different numbers of rows on a ridge, he at last preferred two, with an intervening space of about ten inches. He allowed only three pecks of seed for an acre. The first

(n) Houghton's Collections, Vol. IV. p. 142—144.
(r) Horse-Hoeing Husbandry, p. 62. Lond. 1762.
first hoeing was performed by turning a furrow from the row, as soon as the plant had put forth four or five leaves; so that it was done before, or at the beginning of winter. The next hoeing was in spring, by which the earth was returned to the plants. The subsequent operations depended upon the circumstances and condition of the land, and the state of the weather. The next year’s crop of wheat was sown upon the intervals which had been unoccupied the former year; but this he does not seem to think was a matter of much consequence. “My field,” he observes, “whereon is now the thirteenth crop of wheat, has shown that the rows may successfully stand upon any part of the ground. The ridges of this field were, for the twelfth crop, changed from six feet to four feet six inches. In order for this alteration, the ridges were ploughed down, and then the next ridges were laid out the same way as the former, but one foot six inches narrower, and the double rows drilled on their tops; whereby, of consequence, there must be some rows standing on every part of the ground, both on the former partitions, and on every part of the intervals. Notwithstanding this, there was no manner of difference in the goodness of the rows; and the whole field was in every part of it equal, and the best, I believe, that ever grew on it. It is now the thirteenth crop, likely to be good, though the land was not ploughed crossways (q).

It follows from this singular management, that Tull thought a succession of crops of different species altogether unnecessary; and he labours hard to prove against Dr Woodward, that the advantages of such a change, under his plan of tillage, were quite chimerical; though he seems to admit the benefit of a change of the seed itself. But the best method of determining the question would have been, to have stated the amount of his crops per acre, and the quality of the grain, instead of resting the superiority of his management on the alleged saving of expense, when compared with the common broad-cast husbandry.

On the culture of turnip, both his principles and his practice are much more correct. The ridges were of the same breadth as for wheat; but only one row was drilled on each. His management, while the crop was growing, differs very little from the present practice. When drilled on the level, it is impossible, he observes, to hoe-plough them so well as when they are planted upon ridges. But the seed was deposited at different depths, the half about four inches deep, and the other half exactly over that, at the depth of half an inch. “Thus planted, let the weather be never so dry, the deepest seed will come up; but if it raineth immediately after planting, the shallow will come up first. We also make it come up at four times, by mixing our seed, half new and half old, the new coming up a day quicker than the old. These four comings up give it so many chances for escaping the fly; it being often seen, that the seed sown over night will be destroyed by the fly, when that sown the next morning will escape, and vice versa: Or you may hoe-plough them when the fly is like to devour them; this will bury the greatest part of those enemies: Or else you may drill in another row without new-ploughing the land.”

Drilling, and horse and hand-hoeing, seem to have been in use before the publication of Tull’s book. “Hoeing,” he says, “may be divided into deep, which is our horse-hoeing; and shallow, which is the English hand-hoeing; and also the shallow horse-hoeing used in some places between rows, where the intervals are very narrow, as sixteen or eighteen inches.—This is but an imitation of the hand-hoe, or a succetanum to it, and can neither supply the use of dung, nor of fallow, and may be properly called scratch-hoeing.” But in his mode of forming ridges, his practice seems to have been original; his implements display much ingenuity; and his claim to the title of Father of the present horse-hoeing husbandry of Great Britain seems indisputable. A translation of Tull’s book was undertaken at one and the same time in France, by three different persons of consideration, without the privy of each other.—Two of them afterwards put their papers into the hands of the third, M. Du Hamel du Mangeur, of the Royal Academy of Sciences at Paris, who published a treatise on husbandry, on the principles of Mr Tull, a few years after. But Tull seems to have had very few followers in England for more than thirty years. The present method of drilling and horse-hoeing turnips, was not introduced into Northumberland till about the year 1780 (r); and it was then borrowed from Scotland, the farmers of which had the merit of first adopting Tull’s management in the culture of this root about 1762, and from whom it has since made its way, but slowly, in the southern part of the island.

Among the English writers of this period, may be mentioned Bradley, Lawrence, Hales, Miller, Ellis, Smith, Hill, Hitt, Lisle, and Home. Most of their works went through several editions in a few years— at once a proof of the estimation in which they were held, and of the direction of the public mind towards an investigation of the principles and practice of agriculture.

Of the progress of the art in Scotland, till towards the end of the 17th century, we are almost entirely ignorant. The first work, written by Donaldson, was printed in 1697, under the title of Husbandry Anatomised; or, An Inquiry Into the Present Manner of Tending and Manuring the Ground in Scotland. It appears from this treatise, that the state of the art was not more advanced at that time in North Britain, than it had been in England in the time of Fitzherbert. Farms were divided into infield and outfield; corn crops followed one another, without the intervention of fallow, cultivated herbage or turnips, though something is said about following the outfield; enclosures were very rare; the tenantry had not begun to emerge from a state of great poverty and depression; and the wages of labour, compared with the price of corn, were much lower than at present; though that price, at least in ordinary years, must appear extremely moderate in our times. Leases for a term of years, however, were not uncommon; but the want of capital rendered it impossible for the tenantry to attempt any spirited improvements.

Donaldson first points out the common management of

AGRICULTURE.

History.

of that period, which he shows to have been very unproductive; and afterwards recommends what he thinks would be a more profitable course. Of the "dale ground (he says), that is, such lands as are partly hills and partly valleys, of which sorts may be comprehended the greatest part of arable ground in this kingdom, I shall suppose a farmer to have a lease or tuck of three score acres, at three hundred marks of rent per annum (16l. 13s. 4d. sterling). Perhaps some, who are not acquainted with rural affairs, may think this cheap; but those who are the possessors thereof think otherwise, and find difficulty enough to get the same paid, according to their present way of manuring thereof. But that I may proceed to the comparison, I shall show how commonly this farm room is managed. It is commonly divided into two parts, viz. one-third croft, and two-thirds outfield, as it is termed. The croft is usually divided into three parts; to wit, one-third barley, which is always dunged—that year barley is sown thereon; another third oats; and the last third pease. The outside field is divided into two parts; to wit, the half oats, and the other half grass, two years successively. The product, which may be supposed to be on each acre of croft, four bolls (three Winchester quarters); and that of the outfield, three (two and one-fourth quarters): the quota is seven score bolls, which we shall also reckon at five pounds (8s. 4d.) per boll, cheap year and dear year, one with another. This in all is worth 700l. (£8l. 6s. 8d. sterling).

Then let us see what profit he can make of his cattle. According to the division of his lands, there is twenty acres of grass, which cannot be expected to be very good, because it gets not leave to lie above two years, and therefore cannot be well soarded. However, usually, besides four horses, which are kept for ploughing the said land, ten or twelve nolt are also kept upon a farm room of the above-mentioned bounds: but, in respect of the badness of the grass, as said is, little profit is had of them. Perhaps two or three stone of butter is the most can be made of the milk of his kine the whole summer; and not above two heifers brought up each year. As to what profit may be made by bringing up young horses, I shall say nothing, supposing he keeps his stock good by those of his own up-bringing. The whole product, then, of his cattle, cannot be reckoned above fifty meers (2l. 1s. 6d.). For in respect his beasts are in a manner half starved, they are generally small; so that scarce may a heffer be sold at above twelve pounds (1l. sterling). The whole product of this farm room, therefore, exceeds not the value of 733l. (£6l. 1s. 8d. sterling), or thereabout.

The labourers employed on this farm, were two men and one woman, besides a herd in summer, and other servants in harvest.

Donaldson then proceeds to point out a different mode of management, which he calculates to be more profitable; but no notice is taken of either clover or turnips, as crops to be raised in his new course, though they are incidentally noticed in other parts of the work.

"I also recommend potatoes, as a very profitable root for husbandmen and others that have numerous families. And because there is a peculiar way of planting this root, not commonly known in this country, I shall here shew what way it is ordinarily planted or set. The ground must be dry; and so much the better it is, if it have a good sward of grass. The beds or riggs are made about eight feet broad, good store of dung being laid upon your ground; horse or sheep dung is the most proper manure for them. Throw each potato or sett (for they were sometimes cut into sets) into a knot of dung, and afterwards dig earth out of the furrows, and cover them all over, about some three or four inches deep; the furrows left between your riggs must be about two feet broad, and little less will they be in depth, before your potatoes be covered. You need not plant this root in your garden; they are commonly set in the fields, and wildest of ground, for enriching of it." As to their consumption, they were sometimes "boiled and broken, and stirred with butter and new milk; also roasted, and eaten with butter; yea, some make bread of them, by mixing them with oat or barley-meal; others parboil them, and bake them with apples, after the manner of tarts."

There is a good deal in this little treatise about sheep, and other branches of husbandry; and if the writer was well informed, as in most instances he appears to have been, his account of prices, of wages, and generally of the practices of that period, is very interesting.

The next work on the husbandry of Scotland, is, The Country Man's Rudiments, or An Advice to the Farmers in East Lothian, how to labour and improve their grounds, said to have been written by Lord Belhaven, about the time of the Union, and reprinted in 1723. In this we have a deplorable picture of the state of agriculture, in what is now the most highly improved county in Scotland. His Lordship begins with a very high encomium on his own performance. "I dare be bold to say, there was never such a good easy method of husbandry as this, so succeed, extensive, and methodical in all its parts, published before." And he bespeaks the favour of those to whom he addresses himself, by adding, "neither shall I affright you with hedging, ditching, marling, chalking, paring and burning, draining, watering and such like, which are all very good improvements indeed, and very agreeable with the soil and situation of East Lothian; but I know ye cannot bear as yet such a crowd of improvements, this being only intended to initiate you in the true method and principles of husbandry." The farm rooms in East Lothian, as in other districts, were divided into infield and outfield, the former of which got all the dung. "The infield, where wheat is sown, is generally divided by the tenant into four divisions or breaks, as they call them, viz. one of wheat, one of barley, one of pease, and one of oats; so that the wheat is sowed after the pease, the barley after the wheat, and the oats after the barley. The outfield land is ordinarily made use of promiscuously for feeding of their cows, horse, sheep, and oxen: 'tis also dunged by their sheep, who lay in earthen folds; and sometimes when they have much of it, they fauch or follow a part of it yearly." Under this management, the produce seems to have been three times the former amount, says his Lordship, "if in East Lothian, they did not leave a higher stubble than in other places of the kingdom, their grounds would be in a much worse condition than at present they are, though bad enough.—A good crop of corn makes a good stubble, and a good stubble is the equallest.
equallest making that is." Among the advantages of enclosures, he observes, "you will gain much more labour from your servants, a great part of whose time was taken up in gathering thistles, and other garbage, for their horses to feed upon in their stables; and thereby the great trampling and pulling up, and other destruction of the corns, while they are yet tender, will be prevented." Potatoes and turnips are recommended to be sown in the yard (kitchen garden). Clover does not seem to have been known. Rents were paid in corn; and, for the largest farm, which he thinks should employ no more than two ploughs, the rent was "about six chalders of victual, when the ground is very good, and four in that which is not so good. But I am most fully convinced they should take long leases or tacks, that they may not be straitened with time in the improvement of their rooms; and this is profitable both for master and tenant."

Such was the state of the husbandry of Scotland in the early part of last century. The first attempts at improvement cannot be traced farther back than 1723, when a number of landholders formed themselves into a Society of Improvers in the knowledge of Agriculture in Scotland. The Earl of Stair, one of their most active members, is said to have been the first who cultivated turnips in that country. The Select Transactions of this Society were collected and published in 1743, by Mr. Maxwell, who took a large part in its proceedings. It is evident from this book, that the Society had exerted itself in a very laudable manner, and apparently with considerable success, in introducing cultivated herbage and turnips, as well as in improving on the former methods of culture. But there is reason to believe, that the influence of the example of its members, did not extend to the common tenantry, who are always unwilling to adopt the practices of those who are placed in a higher rank, and supposed to cultivate land for pleasure, rather than profit. Though this Society, the earliest probably in the united kingdom, soon counted upwards of three hundred members, it existed little more than twenty years. Maxwell delivered lectures on agriculture for one or two sessions at Edinburgh, which, from the specimen he has left, ought to have been encouraged.

In the introductory paper in Maxwell's Collection, we are told, "that the practice of draining, enclosing, summer-fallowing, sowing flax, hemp, rape, turnip, and grass seeds; planting cabbages after, and potatoes with, the plough, in fields of great extent, is introduced; and that, according to the general opinion, more corn grows now yearly where it was never known to grow before, these twenty years last past, than perhaps a sixth of all that the kingdom was in use to produce, at any time before."

"In this work, we find the first notice of a threshing machine; it was invented by Mr. Michael Menzies, advocate, and be obtained a patent for it. Upon a representation made to the Society, that it was to be seen going in several places, they appointed two of their number to inspect it; and in their report they say, that one man would be sufficient to manage a machine which would do the work of six. One of the machines was "moved by a great water wheel and triddles;" and another, "by a little wheel of three feet diameter, moved by a small quantity of water." This machine, the Society recommended to all gentlemen and farmers.

The next work is by the same Mr. Maxwell, printed in 1757, and entitled the Practical Husbandman: being a collection of miscellaneous papers on Husbandry, &c. In this book, the greater part of the Select Transactions is republished, with a number of new papers, among which, an Essay on the Husbandry of Scotland, with a proposal for the improvement of it, is the most valuable. In this he lays it down as a rule, that it is bad husbandry to take two crops of grain successively, which marks a considerable progress in the knowledge of modern husbandry; though he adds, that in Scotland, the best husbandmen after a fallow take a crop of wheat; after the wheat, peas; then barley, and then oats; and after that they fallow again. The want of enclosures was still matter of complaint. The ground continued to be cropped so long as it produced two seeds: the best farmers were contented with four seeds, which was more than the general produce.

The first act of parliament for collecting tolls on the highway in Scotland, was passed in 1753, for repairing the road from Dunglass bridge to Haddington. In ten years after, several acts followed for the counties of Edinburgh and Lanark, and for making the roads between Edinburgh and Glasgow. The benefit which agriculture has derived from good roads, it would not be easy to estimate. The want of them was one great cause of the slow progress of the art in former times. The Revolution in 1688 was the epoch of that system of Corn Laws, to which very great influence has been ascribed, both on the agriculture and general prosperity of the country. In 1670, exportation was permitted, whatever the price might be; and importation was virtually prohibited, by a duty of 10s. per quarter, when wheat did not exceed 53s. 4d.; of 8s. when above that, and not exceeding 85s.; and, when above 85s., the duty of 5s. 4d., imposed by the act 1663, continued to be payable. Still, however, as there was a duty payable on exportation; and as importation, from some defect in the law respecting the mode of ascertaining the prices at which the different duties were exigible, still continued at the low duty, the system by which exportation was encouraged, and importation in ordinary cases prohibited, was not completely established till 1688 and 1700. In the former of these years, a bounty of 5s. a quarter was given on exportation, when the price of wheat did not exceed 48s.; and in the latter, the duties on exportation were wholly repealed. Under these laws, not only was the excess of exports very considerable, but the prices of grain, down to 1765, were much lower than during an equal number of years preceding 1688. This is not the place to inquire how far these laws had an influence in producing this phenomenon; but the facts themselves are indisputable. Yet the mere circumstance of large exportations of grain does by no means prove the prosperity of agriculture; far less is its cheapness in the home markets any evidence of the comfortable subsistence of the lower orders. Corn seems to have been raised in such abundance, not merely because the market was extended by means of the bounty, but because there was little demand for other products of the soil, which have, since that time, withdrawn a large portion of the best arable land from the growth of corn. And the price
price was low, because neither the number nor wealth of the consumers had increased in a proportion corresponding to the supply. Before the accession of his present Majesty, the number of acts for enclosure was only two hundred and forty-four—a clear proof that agricultural improvements proceeded much more slowly than they have done since. And it cannot be disputed, that, owing to the imperfect culture of that period, when ameliorating crops did not enter largely into the courses of management, any given extent of land did not produce so much corn, as under the improved rotations of modern husbandry.

The exportation of wool was prohibited in 1647, in 1663, and in 1688; and the prohibition strictly enforced by subsequent statutes. The effect of this on its price, and the state of the wool trade, from the earliest period to the middle of last century, are distinctly exhibited by the learned and laborious author of Memoirs on Wool, printed in 1747.

The gradual advance in the price of land produced, soon after the year 1762, occasioned by the increase of population, and of wealth derived from manufactures and commerce, has given a more powerful stimulus to rural industry, augmented agricultural capital in a greater degree, and called forth a more skilful and enterprising race of cultivators, than all the laws for regulating the corn trade could ever have effected. Most of the inventions for increasing produce and economizing labour, have either been introduced, or improved and greatly extended since that time; and by means of both, the free surplus has been vastly increased for the supply of the general consumption. The passing of more than 3000 bills of enclosure, in the present reign, is a proof how much more rapidly the cultivation of new land has proceeded than in the former period; and the garden-like appearance of the country, as well as the striking improvement in the condition of all classes of the rural population, display, in the most decided manner, the skill and the success with which this great branch of national industry is now followed throughout the greater part of Britain.

In a view of the progress of husbandry, any considerable improvements in the species of crops cultivated, and the order in which they succeed one another, in agricultural machinery, and in the kinds and varieties of live stock, are entitled to hold a very prominent place. But our limits do not permit us to do more, than just to notice a few of the most important. Besides that they are too recent, and, in general, too well known to require any particular description, all the most valuable discoveries, and the most beneficial practices of this period, have been explained with sufficient minuteness in the numerous agricultural works that have lately issued from the press; and most of them in the pages of this journal.

The swing plough, improved by Small, the thrashing machine, brought to perfection by Meikle, and the reaping machine, now in a very promising state, by far the most important inventions in agricultural machinery, must be already well known to our readers.

The great line of distinction between the present and the former courses of cropping, consists in the alternation of what are called exhausting and ameliorating crops. The best cultivators rarely take two corn crops in succession; but a culmiferous crop is almost universally succeeded, in all well cultivated districts, by a leguminous crop, or one of herbage, cut or pastured, or turnips, cabbages, rape, &c.; or when the soil is unsuited to turnips, by a summer fallow, recurring at as distant an interval as the state of the soil, in regard to cleanliness will permit. In common language, a green or a pulse crop, or a plain fallow, is interspersed between every two white corn crops. These green crops not only preserve the fertility of the soil, but, when sown in rows, as most of them usually are, they afford an opportunity of exterminating weeds, by the use of the horse and hand hoe; and even when sown broadcast, by their complete possession of the ground, if it is properly prepared, the growth of weeds is effectually checked. In other respects, these intermediate crops are of the utmost importance in every good course of management. Whether they be eaten on the ground, or carried to the farm-houses and straw-yards, much valuable manure is obtained from their consumption; and on sandy or gravelly soils, when only a part of a turnip crop is eaten by sheep on the ground, the greatest defect of such land is removed by their treading; and, in many cases, rendered capable of producing as valuable a crop of wheat as soils of a closer texture. It is for these reasons, that by the cultivation of clover and turnips in particular, in regular alternation with corn, the soil is so much enriched, as to yield as much corn on one half of any given extent of land, as the whole did under the old course of successive crops of corn; and, unless upon strong clays, an unproductive fallow is wholly dispensed with.

But these crops are not less valuable in another point of view. Before the introduction of clover and turnips, there was nothing for the maintenance of live stock, but natural herbage in summer, with the addition of coarse hay and straw in winter; and in the northern parts of the island in particular, where the winters are long and severe, it was seldom possible to do more, for about half the year, than preserve cattle and sheep from starving. Even in the most favourable situations, very little butcher's meat could be brought to market from December to June, unless at an expense which the great body of consumers were quite unable to reimburse. The more early maturity of cattle and sheep, and the regular supply of the market throughout the year, are therefore chiefly owing to turnips and clover; as well as the vast increase in the number of the live stock kept on arable land, and the great degree of perfection to which some breeds have been brought, by the skilful experiments of several eminent agriculturists.

Among these, the first place is unquestionably due to Mr Robert Bakewell of Dishley, in Leicestershire. By his skilful selection at first, and constant care afterwards to breed from the best animals, without any regard to their consanguinity, he at last obtained a variety of sheep, which, for early maturity, and the property of returning a great produce of mutton for the food they consume, as well as for the small proportion which the weight of the offal bears to that of the four quarters, are altogether unequalled either in this or any other country. The Dishley or New Leicester sheep, and their crosses, are now spread over the principal corn districts of Britain; and, from their quiet domesticated habits, are probably still the most profitable
profitable of all the varieties of sheep, on farms where the rearing and fattening of live stock are combined with the best courses of tillage crops.

The practice of Mr. Bakewell and his followers, furnishes an instance of the benefits of a division of labour in a department of business where it was little to be expected. Their males were let out every year to breeders from all parts of England; and thus, by judiciously crossing the old races, all the valuable properties of the Dishley variety descended, after three or four generations, to their posterity. By no other means could this new breed have spread so rapidly, nor have been made to accommodate itself so easily to a change of climate and pasture. Another recommendation of this plan was, that the ram-hirer had a choice among a number of males, of somewhat different properties, and in a more or less advanced stage of improvement, from which it was his business to select such as suited his particular object. These were reared by experienced men, who gave their principal attention to this branch alone; and having the best females as well as males, they were able to furnish the necessary supply of young males in the greatest variety, to those farmers whose time was occupied with other pursuits. The prices at which Mr. Bakewell’s rams were hired, appear enormous. In 1789, he received twelve hundred guineas for the hire of three bred at one birth; two thousand for seven; and, for his whole letting, at least three thousand guineas.

Merino sheep were first brought into England in 1788, when his Majesty procured a small flock by way of Portugal. In 1791, another flock was imported from Spain. In 1824, when his Majesty’s annual sales commenced, this race began to attract much notice. Dr. Parry of Bath has crossed the Ryeland or Herefordshire sheep with the Merinos, and brought the wool of the fourth generation to a degree of fineness not excelled by that of the pure Merino itself; while the carcase, in which is the great defect of most Merinos, has been much improved. Lord Sommerville, and many other gentlemen, have done themselves much honour by establishing this race, so necessary to the prosperity of our woollen manufactures, and in removing its defects by their judicious management.

One of the most valuable plants, introduced into cultivation since 1765, is the rutabaga or Swedish turnip, which in some degree supplies the great desideratum of late spring food for live-stock, after the common turnip is generally much damaged, and sometimes almost wholly destroyed, by the severity and changes of the weather. The Scotch yellow turnip is for the same reason a most useful variety, coming in between the white turnips and the Swedish, in some situations supplying the place of the latter, and yielding generally a larger produce.

A variety of oats, called the potato oat, was accidentally discovered in Cumberland in 1788. It comes early, and gives a large produce both in grain and in meal, on good soils. It has spread over all the north of England and south of Scotland, and is now almost the only kind sown on many of the best farms. But it has already begun to degenerate. A great many varieties of summer wheat have been introduced of late, but they are only partially cultivated.

In 1765, the corn laws established in the end of the 17th century began to be repealed, and export prohibited, and importation permitted, without of duties, by annual acts, during the seven years. A new system was established in 1777 in Portugal, when the price of wheat was above 48s. per quarter, at the low duty of 6d. Exportation was prohibited when the price was 44s.; and below that, the former bounty of 5s. per quarter continued to be payable.

By the act 1791, the bounty on exportation, when the price was under 44s. per quarter, remained unaltered; but exportation was permitted till the price was 46s. Importation was virtually prohibited by high duties when the price was below 50s., and permitted on payment of a duty of 6d. when at or above 54s.

In 1804, the corn laws were altered a third time, and the bounty on exportation was paid till the price of wheat was 48s. per quarter; and at 54s. exportation was prohibited. The high duty of 24s. 3d. was payable on importation till the price was 63s.; above 63s., and under 66s., a duty of 2s. 6d.; and above 66s., the low duty of 6d. By an act in 1805, importation into any part of Britain is to be regulated by the aggregate average price of the twelve maritime districts of England. Importation was never stooped under the law of 1804, till February 1815.

During the last twenty-two years, about 60 millions of pounds sterling have been paid for foreign grain. In bad seasons, the prices have been enhanced to a most alarming degree, notwithstanding large bounties have been paid on importation. The average price of every successive period of ten years, since 1765, has risen considerably; and since 1795, the price has been seldom less than double the average of the first 60 years of the last century.

The corn laws, after much discussion in Parliament, a very general opposition on the part of the manufacturing and commercial classes, with a great number of publications on both sides, have recently undergone another change, which will probably be not more lasting than those that have preceded it. By the 54th of the king, ch. 69. (17th June 1814) the exportation of corn, meal, malt and flour, from any part of the united kingdom, is permitted at all times, without payment of any duty, or receiving any bounty; and by the 55th, ch. 26. (23rd March 1815) importation is altogether prohibited (except for the warehouse, from whence it may be taken out for sale, when the prices are such as would permit importation) till the price of wheat is 80s.; rye, pease and beans, 53s.; barley, bear or bigg, 40s.; and oats 27s. per quarter. Above these prices, these different kinds of corn are admitted, without payment of any duty whatever. From the British colonies in America, corn may be imports for home-consumption, without payment of any duty, when the prices are at or above—wheat, 67s.; rye, pease, and beans, 44s.; barley, bear or bigg, 33s.; and oats, 22s. per quarter. Almost all the restrictions of the inland corn trade, were removed by the act 1772; and the more just views of the present age have given freedom to the trade, in point of fact, though some of the old laws against forestalling, &c. are still unrepealed. Yet it is not many years since punishments were inflicted for these imaginary crimes.

The agriculture of Scotland has been greatly benefi-
ed by an act in 1770, which relaxed the rigour of strict entails, and extended the powers of proprietors, in so far as regards the improvement of their estates, and the granting of leases.

There is nothing that shows more clearly the rapid progress of agriculture in Britain, than the great number of societies that have been lately formed, one or more in almost every county, for the diffusion of knowledge, and the encouragement of correct operations and beneficial discoveries. We have already noticed the society of improvers, established in Scotland in 1723. Besides those respectable associations, which have for their object the encouragement of arts, manufacturers, and commerce, generally, several large institutions have been formed, whose chief purpose is the improvement of agriculture. Among these, the Bath and West of England Society, established in 1777, and the Highland Society of Scotland, in 1784, hold a conspicuous rank; and the establishment of the Board of Agriculture, in 1793, ought to form a new era in the history of the agriculture and rural economy of Britain. The reports of the different counties, many of them surveyed a second time, and now reprinted, according to an uniform plan, have been followed by the General Report of the Agricultural State and Political Circumstances of Scotland; and a similar work for England is understood to be in the contemplation of the Board.

A great many excellent works on agriculture and relative subjects, have been published since 1760; and, among these, several periodical ones have been very favourably received, and widely circulated. But as they are comparatively recent, and the best of them well known, it is unnecessary to give any particular account, either of their merits or defects.

Within the last six years, the agriculture of Britain has experienced a shock, from which it cannot recover for a much longer period. In that time, the loss of capital, owing to the extraordinary depression of almost all sorts of land produce, cannot have been less than one year's rental of the whole island. The replies sent to the circular letter of the Board of Agriculture, regarding the agricultural state of the kingdom, in February, March, and April last, furnish a body of evidence which cannot be controverted, and exhibit a picture of widely spread ruin among the agricultural classes, and of distress among all that immediately depend upon them, to which there is probably no parallel. This is not the place to inquire into the causes of this melancholy reverse; but it will not readily be ascribed, by those who are best acquainted with the subject, either to the uncommon fertility of the seasons, or a too extensive cultivation.

About the year 1600, France made some considerable efforts to revive the arts of husbandry, as appears from several large works, particularly Les Moyens de devenir Riche; and the Cosmolite, by Bernard de Palissy, a poor potter, who seems to have been placed by fortune in a station for which nature never intended him; Le Theatre d'Agriculture, by Defrères; and L'Agriculture et Maison Rustique, by Messrs. Etienne, Liebault, &c.

Nearly in the same period, the skilful practice of husbandry became more prevalent among the people and the Flemings than the publishing of books on the subject. Their intention seemed to be that of carrying on a private lucrative employment, without instructing their neighbours. Whoever therefore became desirous of copying their method of agriculture, was obliged to visit that country, and make his own remarks on their practice.

The principal idea they had of husbandry was, by keeping the lands clean and in fine tillage, to make a farm resemble a garden as nearly as possible.

Such an excellent principle, at first setting out, led them of course to undertake the culture of small farms only, which they kept free from weeds, continually turning the ground, and manuring it plentifully and judiciously. When they had by this method brought the soil to a proper degree of cleanliness, health, and sweetness, they chiefly cultivated the more delicate grasses, as the surest means of obtaining a certain profit upon a small estate, without the expense of keeping many draught horses and servants. A few years experience was sufficient to convince them that ten acres of the best vegetables for feeding cattle, properly cultivated, would maintain a larger stock of grazing cattle than forty acres of common farm grass was on lands badly cultivated. They also found, that the best vegetables for this purpose were lucerne, stainton, trefoil of most kinds, field turnips, &c.

The grand political secret of their husbandry, therefore, consisted in letting farms on improvement. They are said also to have discovered nine sorts of manure; but what they all were, we are not particularly informed. We find, however, that marl was one of them; the use and virtues of which appear also to have been well known in this kingdom two hundred years ago, although it was afterwards much neglected. They were the first people among the moderns who ploughed in green crops for the sake of fertilizing the soil; and who confined their sheep at night in large sheds built on purpose, the floors of which were covered with sand or virgin earth, &c. which the shepherd carted away each morning to the compost dunghill.

After the peace of Aix-la-Chapelle, most of the nations of Europe, by a sort of tacit consent, applied themselves to the study of agriculture, and continued to do so, more or less, amidst the universal confusion that succeeded.

The French found, by repeated experience, that they could never maintain a long war, or procure a tolerable peace, unless they could raise corn enough to support themselves in such a manner as not to be obliged to submit to harsh terms on the one hand, or to perish by famine on the other. This occasioned the king to give public encouragement to agriculture; and even to be present at the making of several experiments. The great, and the rich of various ranks and stations, followed his example; and even the ladies were candidates for a share of fame in this public-spirited and commendable undertaking.

During the hurry and distresses of France in the war of 1750, considerable attention was paid to agriculture. Prize questions were annually proposed in their rural academies, particularly those of Lyons and Bourdeaux; and many judicious observations were made by the Society for improving agriculture in Britain.

After the conclusion of that war in 1763, matters were carried on there with great vigour. The University of Amiens made various proposals for the advancement.
History.

AGRICULTURE.

The advancement of husbandry; and the marquis de Tourbillon (a writer who proceeded chiefly on experience) had the principal direction of a geological society established at Tours.

The society at Rouen also deserves notice; nor did the king and his ministers think it unworthy their attention. There soon existed about fifteen societies in France, established by royal approbation, for the promoting of agriculture; and these had twenty co-operating societies belonging to them.

About this time vigorous exertions began to be made in Russia to introduce the most approved system of husbandry which had taken place in other parts of Europe. The late empress sent several gentlemen into Britain and other countries to study agriculture, and gave it all possible encouragement in her own dominions.

The art of agriculture has also been for many years publicly taught in the Swedish, Danish, and German universities, where the professors may render effectual service to their respective countries, if they understand the practical as well as the speculative part, and can converse with as much advantage with the farmer as with Virgil and Columella.

Even Italy has not been totally inactive. The Neapolitans of this age have condescended to recur to the first rudiments of revived husbandry, and begun to study anew the Agricultural System of Crescenzo, first published in 1478. The people of Bergamo have pursued the same plan, and given a new edition of the Ricordo d’Agriculture de Tarello, first published in 1577. The duchy of Tuscany has imbibed the same spirit of improvement. A private gentleman, above 40 years since, left his whole fortune to endow an academy of agriculture. The first ecclesiastic in the duchy was president of this society, and many of the chief nobility were members.

His Sardinian majesty also sent persons to learn the different modes of practice in foreign countries; and made some spirited attempts to establish a better method of agriculture among his subjects.

In Poland also M. de Bielski, grand marshal of the crown, made many successful attempts to introduce the new husbandry among his countrymen; and procured the best instruments for that purpose from France, England, and other parts of Europe.

The Hollanderz are the only people now in Europe who seem to look upon agriculture with indifference. Except the single collateral instance of draining their fens and morasses, they have scarcely paid any attention to it; and even this seems to have proceeded more from the motive of self-preservation, than any love of, or disposition to, husbandry.

In the year 1759, a few ingenious and public-spirited men at Berne in Switzerland established a society for the advancement of agriculture and rural economics. In that society were many men of great weight in the republic, and most of them persons of a true cast for making improvements in husbandry, being enabled to join the practice with the theory.

Nor must we here omit to mention, that the justly celebrated Linnaeus and his disciples have performed great things in the north of Europe, particularly in discovering new kinds of profitable and well-tasted food for cattle. About the same time, Sweden bestowed successful labours on a soil which had before been looked upon as cold, barren, and incapable of melioration. Of this the Stockholm Memoirs will be a lasting monument.

Denmark, and many of the courts in Germany, followed the same example. Woollen manufactures were encouraged, and his Danish majesty sent three persons into Arabia Felix to make remarks, and bring over such plants and trees as would be useful in husbandry, building, and rural affairs.

The duchy of Wirtemburg, also, a country by no means unfertile, but even friendly to corn and pastureage, has contributed its assistance towards the improvement of agriculture, having more than 50 years since published 14 economical relations at Stuttgart.

Neither must we forget the very assiduous attention of the learned in Leipsic and Hanover to this important object. During the rage and devastation of a long war, they cultivated the arts of peace; witness the Journal d’Agriculture printed at Leipsic, and the Recueil d’Hanover printed in that city.

Even Spain, constitutionally and habitually inactive on such occasions, in spite of all their natural indolence, and the prejudices of bigotry, invited Linnaeus, with the offer of a large pension, to superintend a college founded for the purpose of making new inquiries into the history of nature and the art of agriculture.

Among the Japanese, agriculture is in great repute; and among the Chinese it is distinguished and encouraged by the court beyond all other sciences. The emperor of China yearly, at the beginning of spring, goes to plough in person, attended by all the princes and grandees of the empire. The ceremony is performed with great solemnity; and is accompanied with a sacrifice, which the emperor, as high-priest, offers to Chang-Ti, to ensure a plentiful crop in favour of his people.

But, without any improper partiality to our own country, we are fully justified in asserting, that Britain alone exceeds all modern nations in husbandry; and from the spirit which for the last twenty years has animated many of our nobility and gentry, to become the liberal patrons of improvement, there is reason to hope that this most useful of arts will in a few years, be carried to a greater pitch of perfection than it has ever yet attained in any age or country.—The Royal Society, the Bath Society, and the Society of Arts, &c. in particular, have been signally useful in this respect; and the other associations, which are now established in many parts of the kingdom, co-operate with them in forwarding their laudable design.

It is not, however, to the exertion of public societies, excellent and honourable as they are, that all our modern improvements in agriculture owe their origin. To the natural genius of the people have been added the theory and practice of all nations in ancient and modern times. This accumulated mass of knowledge has been arranged, divided, and subdivided; and after passing the test of practical experiments, the essential and most valuable parts of it have been preserved, improved, and amply diffused in the works of Lord Kames, Mr Young, Stillingsleet, Dr Hunter, Anderson, Dickson, Ellis, Randal, Lisle, Marshall, Mortimer, Duhamel, Bradley, Kent, Mills, and a few other writers upon this.
AGRICULTURE.

History.

The board of agriculture.

We also remark with much satisfaction, that the British government has of late years thought fit to render the improvement of agriculture an object of public attention and encouragement, by the institution of a Board of Agriculture. About the year 1790, Sir John Sinclair, Bart. invited the clergy of the church of Scotland to transmit to him descriptions of the state of their different parishes, with a view to the publication of what is called a Statistical Account of Scotland. The whole members of this body having readily complied with his request, a work in 20 volumes octavo was compiled from the materials afforded by them, containing an account of the agriculture, manufactures, and population of the country. The same gentleman, about that period, was also active in obtaining the institution of a private society, called The British Wool Society, which was very successful in calling the attention of the public to the improvement of that important article of national growth and manufacture. By these patriotic exertions, having acquired a considerable share of popularity, he was encouraged on 15th May 1793, to make a motion in the house of commons, of which he was a member, for an address to the crown, recommending the institution of a board of agriculture. The chancellor of the exchequer, Mr Pitt, on perceiving that the proposal was acceptable to the majority of the house, gave it a decided support, and on the 17th May, to which the debate had been adjourned, the motion was carried for an address to his majesty to institute such a board, at an expense not exceeding 3000l. In consequence of this application, a charter passed the great seal, incorporating the members of administration for the time, with the archbishops of Canterbury and York, and all their successors in office, together with certain other noblemen and gentlemen, into a board or society, by the name of the Board of Society for the encouragement of Agriculture and internal improvement, under the patronage of the crown, with power to the members to elect office-bearers and successors to themselves: and in the mean time Sir John Sinclair was appointed to be the first president, to continue in office till 25th March following; Sir John Cail, Bart. was appointed to be the first treasurer, and Arthur Young, Esq. so well known for his agricultural publications, was appointed secretary.

The regular sittings of the board did not commence till 23d January 1794, since which time it has continued to exert a very considerable degree of activity in establishing an extensive foreign correspondence, and in procuring and publishing every kind of useful domestic agricultural intelligence, some specimens of which we shall afterwards have occasion to notice. This board, soon after its institution, also employed persons of known reputation to prepare agricultural surveys of every county in the island of Great Britain. Many of these surveys have been published, and form treatises upon this important art, which, for extent of intelligence and ability of execution, have not been exceeded in any age or country. The board has also obtained parliamentary rewards to some individuals for important discoveries, and has offered premiums for essays or treatises upon subjects connected with the purpose of its institution, which have produced a great variety of valuable and ingenious disquisitions.

THEORY OF AGRICULTURE.

IN an art that is so necessary to mankind, and that has been so universally practised, it might perhaps be expected, that the principles upon which its operations depend, would have been by this time completely and accurately investigated, and consequently that a correct theory of agriculture could easily be exhibited. This, however, is by no means the case; and it is not a little singular, that, in this most useful of all arts, the theory should still be more defective than in almost any science with which we are acquainted. It is fortunate, however, for the human race, that in most cases, or at least in all important arts, they succeed better in practice than in speculation. During many ages, various artists were accustomed to extract the most ordinary, but most useful metals, from the state of ore or earth in which nature produces them, and to reduce them back from their metallic form and lustre, to a state of ore or earth again. These artists were unacquainted with the principles upon which the success of their operations depended; and it is only within these few years that some ingenious chemists have successfully investigated the nature of these processes, and have explained what they have called the oxydation and disoxydation of metals. The same thing has happened in agriculture. Men have often cultivated the ground well, while they have speculated ill concerning the mode of doing so. Various reasons render it still more difficult to form a complete theory of agriculture, than of chemistry, difficulty in mechanics, or other arts. In agriculture, an experiment cannot be made in an instant, or even in an hour, it or in a day or two. A whole season must pass away before a single experiment can be performed, and after all, as in other arts, the inquirer after truth may be misled by some unobserved circumstances. Some fact, quite foreign to the experiment itself, arising out of the peculiar state of the soil, or of the trains of seasons, may produce plentiful crops for a year or two, though, in ordinary circumstances, no such effect would follow: and the ingenious contriver of the experiment, who thought he had made an important discovery, may afterwards derive from it only disappointment and mortification. But human life is too short to admit a very great variety of agricultural experiments to be performed by the same individual. After a few seasons, he must leave his place to be occupied by a new inquirer, possessed of a different character and of different views. Unfortunately, till of late years, it was not usual for husbandmen to publish, and thus to immortalize and diffuse over whole nations, the result of their private experience and reflections. Scattered over the face of great countries, and having little intercourse with foreigners, or even with each other, they knew little of what was done by men engaged in the same profession, though at no great distance. In this way, the benefit of
Theory.

A R G U T U R E.

Vegetables of local discoveries was not communicated to the world at large, nor an opportunity afforded of eradicating local prejudices and erroneous practices. As the state of this valuable profession is now rapidly altering in these respects, there is little doubt that we are fast approaching towards a period at which it will be possible to exhibit a clear and correct theory of agriculture, or to arrange under a few simple heads the rules or principles upon which the practice of the art depends.

What we are now to offer, is not to be considered as perfect, nor even as possessing any near approximation towards a perfect theory of the husbandman's art; but merely, such a general statement of its principles as results from the degree of information hitherto collected upon the subject.

A theory, or general view of the principles of agriculture seems necessarily to resolve itself into the two following investigations: 1st. To inquire, among the great variety of vegetables that exist in nature, what particular plants ought to be regarded as most worthy of cultivation; and 2dly. To consider the best mode of cultivating with success the plants thus selected.

With regard to the first of these divisions of the subject, or the vegetables that ought to be chosen as most valuable and worthy of cultivation, it may be observed, that the value of a plant is of two kinds, absolute, or relative: The absolute value of a plant depends upon its fitness to afford subsistence to the human species, whereas its relative value consists of the tendency which the cultivation of it will have to enrich a particular husbandman, or class of husbandmen, either because their lands are well adapted for its growth, or because there is a ready market for it in the vicinity, where it bears a high price.

Concerning the absolute value of plants, or their tendency to afford subsistence to mankind, it is to be observed, that some plants are directly useful or valuable, because they are immediately consumed as food by man, such as wheat, oats, or potatoes; whereas mankind derive subsistence from another class of plants, only in an indirect manner, by giving them to cattle, and afterwards eating the flesh of these cattle, as happens with regard to grass and straw of all kinds.

SECT. I. Of Vegetables to be cultivated as Food for Man.

Some vegetables afford subsistence to the human species by means of the fruit that grows upon them, which hangs, and is brought to maturity in the air, at the summit of their stems. Other vegetables derive their value from producing roots, which come to maturity in the bosom of the soil, and are dug from thence to be consumed by mankind.

Of fruit-bearing vegetables, those called trees, which rise aloft with a strong trunk, are the most permanent and remarkable. It is said that a spot of ground, occupied by some kinds of trees, such as elms or oaks, is capable of producing a very great portion of food, useful for the support of the human species. One advantage attending the cultivation of such vegetables, would be that, after the trees are planted, and secured by fences for a few years against animals, they would for ever after, or at least for many years, continue to grow and flourish without care or labour. It does not appear, however, that in any nation of ancient or modern times, vegetables of fruit-bearing trees have been reared with a view to afford subsistence to the community. For this two reasons may be assigned. In the first place, a considerable number of years must elapse, before such plants could arrive at maturity, and fulfill the purpose of their ripening at their destination. Of whatever use therefore they might be, they are destroyed in the war.

What it ought to contain.

The value of vegetables is absolute and relative.

They are useful directly and indirectly.

Vegetables with the gluten, or glue, that is prepared from animal bodies. In other respects, however, it does not appear that wheat is more valuable than some other kinds of grain; by means of long boiling, a given weight of barley, or even of oats, will render a quantity of water as thick or full of moulage as can be done by the same weight of wheat.

After wheat, oats have in our country been considered as of very great importance. It is a hardy and beautiful plant; grows with little cultivation, and is particularly well suited for lands newly brought in from a state of nature, upon which it was always used as the first crop, till the introduction of the turnip husbandry. The meal of it is usually very coarsely grind, and mixed with a considerable quantity of the inner covering of the grain. Hence it has always a considerable degree of roughness, and is harsh, and unsuited to very delicate constitutions; but this very harshness, from its stimulant effect, producing a feeling of warmth in the stomach, renders it more grateful to persons much exposed to the open air, and accustomed to hard labour, who account it a hearty kind of food. Essentially, and in its intrinsic qualities, this grain differs little from some other.

Barley is chiefly valued in consequence of the facility with which it produces a great quantity of saccharine matter by the process of vegetation or malting, which fits it for the preparation of vinous or spirituous liquors. Pease are also sometimes used when grinded into meal as an article of human food; but on account of their viscid and indigestible quality, they can never become valuable in that point of view, unless to persons engaged in the open air, in the most active and severe kinds of labour.

In other respects, however, it does not appear that there is much difference in point of quality or wholesomeness between the various kinds of grain cultivated in different countries. They are all capable of affording nourishment to the human constitution, and of preserving it in health and vigour: When grinded into meal, they require little further preparation, and are easily made into bread, or otherwise prepared for immediate consumption, by being mixed according to the fancy or taste of different nations, with a small quantity of water, or any other liquid.

Of the roots which are used to afford subsistence to man, the potato has hitherto been the principal. The rest, consisting chiefly of carrots, turnips, and parsnips, are never used as a sole nutrient, being rather adopted for the purpose of giving variety and relish to other food, and chiefly to butchers meat. The potato, however, is in some measure an exception to this general rule. It contains a large quantity of starch, which does not seem inferior to the starch prepared from wheat, so far at least as that ingredient is to be regarded as contributing to the nourishing qualities of the grain. Its taste resembles, more nearly than any other root, the taste of bread; and accordingly it is daily beginning to be more extensively used, and to form a larger portion of the food of the poor. The celebrated Dr Adam Smith long since remarked its tendency to produce a strong and handsome race of people, as demonstrated by its effect upon the common people of Ireland, who have for a considerable length of time in a great measure subsisted upon it.

It is to be observed concerning all the roots now mentioned, that a crop of them always contains a much larger quantity of human food than a crop of any kind of grain upon the same extent of ground. A Scots acre of good land, which will not produce more than they produce; 2800 pounds weight of oatmeal, will easily produce once more 20,000 pounds weight of potatoes, and will sometimes food than in favourable seasons produce 30,000 or 35,000 pounds weight of that valuable root.

Potatoes, however, and all the other roots, have bi-Their de-Their de-Their de-therto possessed these radical defects: The carriage of feet on them is extremely expensive, in consequence of their food, weight, arising from the vast quantity of moisture they contain. Hence they can only be cultivated in abundant dance in the vicinity of great towns, or where they are meant to be consumed upon the farm as the food of cattle.

Roots are also incapable of long preservation. In the winter they are destroyed by frost, and in summer for long by heat, which causes them to vegetate or to corrupt; preservation, both of which changes render them unfit to be used as food.

These roots are also much more bulky than grain in its bulky proportion to the quantity of nourishment contained in the same. Hence they are rendered less fit to be consumed much by persons engaged in sedentary professions. Such persons accordingly seldom fail to find them injurious to the stomach, by their bulkiness, and their tendency to injure the powers of digestion, by producing flatulencies and other unpleasant consequences.

On the whole, the difference between these succulent and the grain of corn plants seems to amount to this, that, although they are both formed of similar substances, the potato being analogous to wheat, and the carrot and parsnip to rye, or rather to barley after it has been converted into malt, yet, as the roots are formed in the basement of the soil, and are of a loose and watery texture, their formation requires from nature a slighter effort than the bringing to perfection the small grains which are produced in the air at the top of corn plants. She therefore compensates by an abundant crop the diminished quality of her work.

Hence it has appeared an important problem in econ-How they nomics, to devise a plan by which the succulent roots may be of vegetables may be deprived of their superficially rendered moisture, that thus human art may perform for them in value equal in what nature has not accomplished; and that they may be rendered completely equal in value to grain in point of quality, while in quantity they are so superior. With this view different processes have been adopted.

Potatoes have been grated down in their raw state, and repeatedly washed with water: the result of which starch operation is, that the starch contained in them is obtained with great labour; but the rest of the root is lost; and this operation cannot be applied to other kinds of roots with success. Another mode of accomplishing the object was devised a few years ago by M. Grenel, and published in the Journal of the Lyceum of Arts of Paris. It is performed in this manner: The pota-granulating toes must first be boiled by the heat of the steam of boiling water, without touching the water itself. They are then stripped of their skin, and allowed to cool, and made use of in the following way:—A white iron tube of two inches diameter, and eight inches in length, open at the one end and close at the other, is every-
Theory.

Vegetables, where perforated with small holes, and a round piece of wood is prepared, which easily goes into the tube, but which at the same time fills it. Things being thus in readiness, a quantity of the potatoes, boiled as already mentioned, is put into the tube till it is full. They are then forcibly rammed down with the round piece of wood or piston; the consequence of which operation is, that they are forced through the little holes in the sides of the tube, and come out in the shape of worms. They are received upon linen cloths, covered with unsizzled paper, and dried in the heat of the sun, or in a warm room. The small pieces must be stirred from time to time; and it is said, that in less than 12 hours, the preparation dries so as to be capable of being preserved.

The defect of this process evidently is, that it is a petty operation, which can only proceed slowly, and upon a diminutive scale. It is therefore unlikely to be adopted in the great operations of an extensive agriculture, as a mode of preparing or preserving human food.

At the beginning of the present year 1802, another process for accomplishing this important object was contrived by Robert Forsyth, Esq., advocate. Of this process, which has been communicated to the Board of Agriculture, we are authorized to give the following account:

The whole difficulty of discovering a process, with the view to render succulent roots as easily preserved and transported, and therefore in every respect as valuable as grain, seems to arise from our not having the command of such a degree of steady and vigorous, but moderate heat, as will deprive them of their moisture, while at the same time they are prevented from being burnt or scorched in the way that coffee-beans are treated before being ground. This requisite degree of heat may be obtained in a very cheap and easy manner, by making use of the steam of boiling water, which never can burn any vegetable substance. Upon this principle, Mr Forsyth's process is founded, and is conducted in the following manner:

1st. Let a quantity of potatoes, or carrots, or parsnips, &c. be washed, and then cut or chopped into very small pieces.

2dly. Lay them upon a metallic plate, and dry them with the heat of steam transmitted through the metal. They are then in a state analogous to grain, and seem capable of being preserved for any length of time.

3dly. Reduce them into flour or meal, by grinding in any mill, or with any instrument capable of grinding grain.

The meal or flour thus prepared has no tendency to attract moisture from the atmosphere, and may be preserved during any length of time, if closely pressed or packed. Without this precaution, Mr Forsyth has preserved it for six months, when it had been coarsely ground in a coffee mill.

The drying process is not tedious. As potatoes contain a great quantity of starch or gummy matter, the pieces of them, while drying, are apt to adhere to each other; they must therefore be frequently turned or stirred during that part of the operation. When dry, they are almost as hard as barley, and taste somewhat like the skin of a roasted potato.

Carrots and parsnips contain less gummy matter. They require less attention while drying, and do not need to be grated. A small vessel in which water is kept boiling by a lamp, C, with three wicks.

B, a small round vessel, in which water is kept boiling by a lamp, C, with three wicks.

D, a tube, by which the steam passes into E, which contains the drying vessel A, and is closely soldered all round to the bottom of it.

F, a tube, by which the water formed by the condensed steam flows from the steam vessel, F, back into the boiler B, entering at the bottom of the boiler.

G, a crooked tube, by which the superfluous steam escapes into the open air. It is crooked, that it may retard the passage of the steam when the vessel is at work, which forces it to deposit more of its heat on the bottom of the drying vessel A.

H, a tube by which the boiler B is filled with hot water.

I, a tube passing through the centre of the boiler, and serving as a chimney to the lamp C. It does not communicate with the water in the boiler.

K shows the figure of the cover of the drying vessel A. The cover has a groove or gutter L, passing round its lower edge. The vapour which rises from the roots when drying, condenses on touching the cover, and flows down to the gutter, from which it escapes in the state of water, by a hole left for that purpose at each corner. The cover is only used for the neatness requisite in making experiments.

The whole is supported by four moveable feet, attached to the corners of the drying vessel A, but not appearing in the figure. Every part of it is made of white iron or tinned plate.

Instead of the lamp C, a small iron pan filled with pieces of burning charcoal, was sometimes used to keep the water boiling, and a still more convenient plan was at times adopted during the winter season. It consisted of resting the bottom of the boiler B upon the front of the grate of the chamber, while a fire was burning, the rest of the instrument being at the same time supported by a rope attached to the back of a chair, to a nail or peg in the wall for hanging a picture, or to any other convenient support. When used in this last manner, however, the instrument has this defect.
defect, that the water in the tube H boils over at times into the fire, which might be avoided, by placing the tube on the opposite side of the boiler.

Upon the above contrivance, it may be remarked that a kiln formed of a large metallic plate, heated by the steam of boiling water, may prove valuable in many processes. In particular, it will probably be found useful for drying malt, with a view to prevent the ale formed of it from having a brown colour. It may also, perhaps, be used with success for drying wheat that is intended to be sown, to prevent the future crop from suffering by mildew, as will be afterwards mentioned; and it affords a ready and cheap mode of drying not only roots, but all vegetable productions, without burning them, or altering their taste or other essential properties.

Sect. II. Of the most proper kinds of Vegetables to be raised for the purposes of feeding Cattle.

Though this must be an article of the utmost consequence to every farmer, we do not find that it has been much considered. Mr. Anderson seems to have been the first writer on agriculture who has properly attended to this subject; and what he hath written upon it, is rather a catalogue of desiderata than any thing else: and indeed the desiderata on this subject are so many and so great, that we must acknowledge ourselves very unable to fill them up. To attain to a competent knowledge in this respect, the following things must be taken into consideration. (1.) The wholesomeness of the food for cattle, with regard to health and strength, or fitness. (2.) The quantity that any extent of ground is capable of yielding. (3.) The quantity necessary to feed the different kinds of cattle. (4.) The labour of cultivation; and (5.) The soil they require to bring them to perfection, and the effect they have upon it.

With regard to the wholesomeness, it is plain, that as the natural food of wild cattle is the green succulent plants they meet with all the year round, food of this kind, could it be had, must be preferable to hay; and accordingly we find that cattle will always prefer succulent vegetables where they can get them. To find plants of this kind, and having proper qualities in other respects, we must search among those which continue green all the year round, or come to their greatest perfection in the winter time. Of these, cabbages bid fair for holding the first place; both as being very succulent, and a very large quantity of them growing upon a small space of ground. In Mr. Young's Six Months Tour, we have an account of the produce of cabbages in many different places, and on a variety of soils. The produce by Mr. Crow at Keplin, on a clay soil, was, on an average of six years, 35 tons per acre; by Mr. Smelt at the Lenses, on a sandy gravel, 18 tons per acre; by Mr. Beroop at Danby, on an average of six years, 37 tons per acre: and the general average of all the accounts given by Mr. Young, is 36 tons per acre.

Cabbages, however, have the great inconvenience of sometimes imparting a disagreeable flavour to the milk of cows fed with them, and even to the flesh of other cattle. This, it is said, may be prevented by carefully picking off the decayed and withered leaves:

...and very probably this is the case: for no vegetable grewes more to putrefaction than this; and therefore particular care ought to be taken to pull off all the leaves that have any symptoms of decay. Dr. Priestley found that air was rendered noxious by a cabbage leaf, air rendered remaining in it for one night, though the leaf did not show any symptom of putrefaction. For milk cows, by them, probably, the cabbages might be rendered more proper food by boiling them.

The culture of the turnip-rooted cabbage has lately been much practised, and greatly recommended, particularly for the purpose of a late spring seed; and seems indeed to be an important article in the farming economy, as will be shown in its proper place.

Turnips likewise produce very bulky crops; the average weight of an English acre being from 20 to 25 tons, and that of a very full crop as high as 30 tons and upwards.

Carrots are found to be an excellent food for cattle of all kinds, and are greatly relished by them. In a rich land, according to Mr. Young's account, the produce of this root was 200 bushels per acre. In a finer soil, it was 640 bushels per acre. It is probable, indeed, that carrots will make a more wholesome food for cattle than either cabbages or turnips, as they are strongly antisepic; insomuch as to be used in poultices for correcting the sanies of cancers. It is probably owing to this, that the milk of cows fed on carrots is never found to have any bad taste. Six horses kept on them through the winter without oats, performed their work as usual, and looked equally well. This may be looked upon as a proof of their salubrity as a food; and it certainly can be no detriment to a farmer, to be so much versant in medical matters as to know the impropriety of giving putrescent food to his cattle. It is well known what a prodigious difference there is in the health of the human species when fed on putrid meats, in comparison of what they enjoy when supplied with food of a contrary nature; and why may there not be a difference in the health of beasts, as well as of men, when in similar circumstances?—It is also very probable, that as carrots are more solid than cabbages or turnips, they go much farther in feeding cattle than either of them.

Potatoes likewise appear to be a very palatable food for all kinds of cattle; and not only oxen, hogs, &c. are easily fed by them, but even poultry. According to a correspondent of the Bath Society*, "roasting pork is never so moist and delicate as when fed with potatoes, and killed from the barn doors without any agricultural confinement. For bacon and hams, two bushels of potatoes meal should be well incorporated with four bushels of boiled potatoes, which quantity will fat a hog of twelve stone, (fourteen pounds to the stone)."

Buck-wheat (Polygonum fagopyrum) has been lately recommended as an useful article in the present as well as other respects. It has been chiefly applied to the feeding of hogs, and esteemed equal in value to barley; it is much more easily ground than barley, as a mallow-mill will grind it completely. Horses are very fond of the grain; poultry of all sorts are speedily fattened by it; and the blossom of the plant affords food for bees at a very opportune season of the year, when the meadows and trees are mostly stripped of their flowers. Probably the grain may hereafter be even found a material article...
AGRICULTURE.

in distillation, should a sufficient quantity be raised with that view. From the success of some experiments detailed in the Bath Society Papers, and for which a premium was bestowed, it has been inferred that this article ought in numerous cases to supersede the practice of summer-fallowing.

Whins have lately been recommended as a very proper food for cattle, especially horses; and are recommended by Mr. Anderson in a particular manner. They have this advantage, that they require no culture, and grow on the worst soil; but they are troublesome to cut, and require to be bruised in a mill constructed for the purpose; neither is the ground at all molested by letting whins grow upon it for any length of time. Notwithstanding these disadvantages, however, as whins continue green all the year round, and when bruised will afford an excellent succulent food, which seems possessed of strongly invigorating qualities, they may be looked upon as the cheapest winter food that can possibly be given to cattle. According to the calculations of Mr. Eddison of Gateford, a single acre, well cropped with whins, will winter six horses: at three or four years growth, the whole crop should be taken, cut close to the ground, and carried to the mill; in which the whins are to be bruised, and then given to the horses. Four acres ought to be planted, that one may be used each year, at the proper age to be cut; and he reckons the labour of one man sufficient for providing food to this number of horses. He says, they all prefer the whins to hay, or even to corn.

The herb called burnet hath likewise been recommended as proper food for cattle, on account of its being an evergreen; and further recommended, by growing almost as fast in winter as in summer. Of this herb, however, we have very various accounts. In a letter addressed by Sir James Caldwell, F. R. S. to the Dublin Society, the culture of this plant is strongly recommended, on the authority of one Bartholomew Rocque, farmer at Willyam-Green, a village about three miles south-west of London.

What gave occasion to the recommendation of this plant, was, that about the year 1760, Mr. Wych, chairman of the committee of Agriculture of the London Society for the encouragement of arts, manufactures, and commerce, came to Rocque (who was become very eminent by the premiums he had received from the society), and told him, he had been thinking, that as there are many animals which subsist wholly upon the fruits of the earth, there must certainly be some plant or herb fit for them that naturally vegetates in winter; otherwise we must believe the Creator, infinitely wise and good, to have made creatures without providing for their subsistence; and that if there had been no such plants or herbs, many species of animals would have perished before we took them out of the hands of nature, and provided for them dry meat at a season, when, indigenous plants having been indiscriminately excluded, under the name of weeds, from cultivated fields and places set apart for natural grass, green or fresh meat was no longer to be found.

Rocque allowed the force of this reasoning; but said, the knowledge of a grass, or artificial pasture, that would vegetate in winter, and produce green fodder for cattle, was lost; at least, that he knew of no such plant. Mr. Wych, however, knowing how very great advantage would be of discovering a green fodder for winter and early in the spring, wrote to Bern, and also to some considerable places in Sweden, stating the same argument, and asking the same question. His answers to these letters were the same that had been given by Rocque. They owned there must be such plant, but declared they did not know it.

Mr. Wych then applied again to Rocque; and desired him to search for the plant so much desired, and so certainly existing. Rocque set about this search with great assiduity; and finding that a pimpernel, called burnet, was of very speedy growth, and grew nearly as fast in winter as in summer, he took a handful of it and carried it into his stable, where there were five horses; every one of which ate of it with the greatest eagerness, snatching it even without first smelling it. Upon the success of this experiment he went to London, and bought all the burnet seed he could get, amounting to no more than eight pounds, it having been only used in salads; and he paid for it at the rate of 4s. a pound. Six of the eight pounds of seed be sowed upon half an acre of ground, in March, in the year 1761, with a quarter of a peck of spring wheat, both by hand. The seed being very bad, it came up but thin. However, he sowed the other two pounds in the beginning of June, upon about six rood of ground: this be mowed in the beginning of August; and at Michaelmas be planted off the plants on about 20 rood of ground, giving each plant a foot every way, and taking care not to bury the heart. These plants bore two crops of seed the year following; the first about the middle of June, the second about the middle of September; but the June crop was the best. The year after it grew very rank, and produced two crops of seed, both very good. As it ought not to be cut after September, he let it stand till the next year; when it sheltered itself, and grew very well during all the winter, except when there was a hard frost; and even during the frost it continued green, though it was not perceived to grow. In the March following it covered the ground very well, and was fit to receive cattle.

If the winter is not remarkably severe, the burnet, though cut in September, will be 18 inches long in March; and it may be fed from the beginning of February till May: if the cattle are taken off in May, there will be a good crop of seed in the beginning of July. Five weeks after the cattle are taken off, it may be removed, if that is preferred to its standing for seed. It grows at the rate of an inch a-day, and is made into hay like other grass. It may be mown three times in one summer, and should be cut just before it begins to flower. Six rood of ground has produced 1100 pounds at the first cutting of the third year after it was sowed; and, in autumn 1763, Rocque sold no less than 300 bushels of the seed.

According to Rocque, the soil in which burnet flourishes best, is a dry gravel; the longest drought never hurts it: and Sir James Caldwell asserts, that he saw a very vigorous and exuberant plant of this kind, growing from between two bricks in a wall in Rocque's ground, without any communication with the soil; for he had cut away all the fibres of the root that had stretched downward, and penetrated the earth long before.

Burnet was found equally fit for feeding cows, sheep, and

†
and horses; but the sheep must not be suffered to crop it too close. Though no seed was left among the hay, yet it proved nourishing food; and Rucque kept a horse upon nothing else, who, at the time of writing the account, was in good heart, and looked well. He affirmed also, that it cured horses of the distemper called the grease, and that by its means he cured one which was thought incurable; but says, it is only the first crop which has this effect.

This is the substance of Sir James Caldwell’s letter to the Dublin Society, at least so to what regards the culture of burnet; and it might reasonably be expected, that a plant, whose use was recommended to the public with so much parade, would soon have come into universal esteem. We were surprised, therefore, on looking into Mr. Miller’s Dictionary, to find the following words, under the article Poterium:—"This plant has of late been recommended by persons of little skill, to be sown as a winter pasturage for cattle: but whoever will give themselves the trouble to examine the grounds where it naturally grows, will find the plants left uneaten by the cattle, when the grass about them has been cropped to the roots; besides, in wet winters, and in strong land, the plants are of short duration, and therefore very unfit for that purpose; nor is the produce sufficient to tempt any person of skill to engage in its culture; therefore I wish these persons to make trial of it in small quantities, before they embark largely in these new schemes."—Mr. Anderson, too, in his Essays on Agriculture, mentions the produce of burnet being so small, as not to be worth cultivating.

Upon the authority of Mr. Rucque, likewise, the white beet is recommended as a most excellent food for cows; that it vegetates during the whole winter, consequently is very forward in the spring; and that the most profitable way of feeding cows is to sow this herb, and give it to them green all the summer. It grew in Rucque’s garden, during a very great drought, no less than four feet high, from the 30th of May to the 3d of July; which is no more than one month and four days. In summer it grows more than an inch a day; and is best sown in March: a bushel is enough for an acre, and will not cost more than ten shillings. It thrives best in a rich, deep, light soil: the stalks are very thick and succulent; the cows should therefore eat them green.

Another species of beet (Beta cicla), the Mangel Wurzel, or Root of Scarcity, as it has been called, has been lately extolled as food both for man and cattle; but, after all, seems only to deserve attention in the latter view. It is a biennial plant; the root is large and fleshy, sometimes a foot in diameter. It rises above the ground several inches, is thickest at the top, tapering gradually downward. The roots are of various colours, white, yellow, and red; but these last are always of a much paler colour than beetroot. It is good fodder for cows, and does not communicate any taste to the milk. It produces great abundance of leaves in summer, which may be cut three or four times without injuring the plant. The leaves are more palatable to cattle than most other garden plants, and are found to be very wholesome. The farmers in those parts of Germany where it is chiefly cultivated, we are told, prefer this species of beet, for feeding cattle, to cabbage, principally because they are not so liable to be hurt by worms or insects; but they think they are not so nourishing as turnips, potatoes, or carrots, and that cattle are not nearly so soon fattened by this root as by carrots, parsnips, or cabbages. It has even been asserted that this root affords less nourishment than any of those that have been commonly employed for feeding cattle. This does not correspond with the promptness accounts with which the public has been entertained. Upon the whole, however, it is a plant that seems to deserve the attention of our farmers; as on some soils, and in particular circumstances, it may prove a very useful article for the above purposes.

In Mr. Anderson’s Essays, we find it recommended to make trial of some kinds of grasses, which probably ease grass would not only answer for fresh fodder during the winter, but might also be cut for hay in summer. This is particularly the case with that species called sheep’s fescue grass. "I had," says he, a small patch of this grass in winter 1773; which, having been cut in the month of August or September preceding, was saved from that period, and had advanced before winter to the length of five or six inches; forming the closest pile that could be imagined. And although we had about six weeks of very intense frost, with snow, and about other six weeks, immediately succeeding that, of exceeding keen frost every night, with frequent thaws in the day time, without any snow, during which time almost every green thing was destroyed; yet this little patch continued all along to retain as fine a verdure as any meadow in the month of May; hardly a point of leaf having been injured by the uncommon severity of the weather. And as this grass begins to vegetate very early in the spring, I leave the reader to judge what might be the value of a field of grass of this kind in these circumstances."

Of another kind of grass, called purple fescue, Mr. Purple for Anderson gives the following character: "It retains its verdure much better than rye-grass during the winter season; but it had more of its points killed by the weather than the former. It likewise rises in the spring, at least as early as rye-grass."

This ingenious farmer has also made experiments on the culture of these and several other kinds of grasses; which being very well worthy of attention, we shall here insert.

1. Purple fescue grass. "Although this grass is very often found in old pastures, yet, as it has but few flower-stalks, and as it is greedily eaten by all domestic animals, these are seldom suffered to appear; so that it usually remains there unperceived. But it seems to be better able to endure the peculiar serinity of the dung of dogs than almost any other plant; and is therefore often to be met with in dog holes, as I call the little holes by roadside where dogs usually piss and dung; and as it is allowed to grow there unperturbed, the farmer may have an opportunity of examining the plant, and becoming acquainted with its appearance."

"The leaves are long and small, and appear to be roundish, something like a wire; but, upon examination, they are found not to be tubulated like a reed or rush; the sides of the leaf being only folded together from the middle rib, exactly like the strong bent-grass on the sea shore. The flower-stalk is small, and branches out in the head, a little resembling the wild
wild oat; only the grains are much smaller, and the ear does not spread full open, but lies bending a little to one side. The stalks are often spotted with reddish freckles, and the tops of the roots are usually tinged with the same colour; from whence it has probably obtained its distinctive name of festuca rubra, or red (purple) fescue.

"It is often to be met with in old garden walks; and, as its leaves advance very quickly after cutting, it may usually be discovered above the other grasses, about a week or fortnight after the walks are cut. Nor do they seem to advance only at one season, and then stop and decay, like the rye-grass; but continue to advance during the whole of the summer, even where they are not cut; so that they sometimes attain a very great length. Last season (1774), I measured a leaf of this grass, that sprung up in a neglected corner, which was four feet and four inches in length, although not thicker than a small wire. It is unnecessary to add, that these leaves naturally trail upon the ground, unless where they meet with some accidental support; and that if any quantity of it is suffered to grow for a whole season, without being eaten down or cut, the roots of the leaves are almost rotted, by the overshadowing of the tops of the other leaves, before the end of the season.

"This is the appearance and condition of the plant in its native situation: as it is seldom that it is discovered but in pretty old pastures, and as in that state it carries only a very few seed-stalks, it was with some difficulty that I could collect a small handful of the seed, which I carefully sowed in a small patch of garden mould, to try if it could be easily cultivated. It came up as quickly as any other kind of grass, but was at first as small as hair: the leaves, however, advanced space; and were, before autumn, when the grain with which they had been sown was cut down, about 16 or 18 inches in length; but having been sown very thin, it was necessary to pick out some other kinds of grass that came up amongst it, lest it might have been choked by them. Early next spring it advanced with precocious vigour, and the tufts that were formed from every seed became exceeding large; so that it quickly filled the whole ground. But now the leaves were almost as broad as those of common rye-grass, and the two sides only inclined a little towards one another from the mid-rib, without any appearance of roundness. In due time a great many seed-stalks sprung out, which attained very nearly to the height of four feet, and produced seeds in abundance; which may be as easily saved as those of common rye-grass.

"The prodigious difference between this plant in its native and cultivated state amazed me; but it was with a good deal of satisfaction that I found there would be no difficulty in procuring seeds from it, which I had much doubted of at first. It would seem, that nature hath endowed this plant with a strong generative power during its youth, which it gradually loses as it advances in age (for the difference perceived in this case could not be attributed to the richness of the soil); and that, on the contrary, when it was old, the leaves advanced with an additional vigour, in proportion to the declining strength of the flower-stalks; for the leaves of the young plants seldom exceed two feet, whereas numbers of the old leaves were near four feet in length.

"From these peculiarities in the growth of this plant, it would seem to promise to be of great use to the farmer; as he could reap from a field of it, for the first two or three years, as great a weight of hay as he could obtain from any of the culmi-ferous grasses (those bearing a long jointed stalk; and, if he meant afterwards to pasture it, he would suffer no inconveniences from the flower-stalks; and the succulent leaves that continue to vegetate during the whole summer, would at all times furnish his cattle with abundance of wholesome food. It has also been remarked, that this grass rises as early in the spring as rye-grass; and continues green for the greatest part of winter, which the other does not. It is moreover an abiding plant, as it seems never to wear out of the ground where it has once been established. On all which accounts, it appears to me highly to merit the attention of the farmer; and well deserves to have its several qualities, and the culture that best agrees with it, ascertained by accurate experiments.

2. Sheep's fescue grass, or festuca ovina, is much more praised by the Swedish naturalists for its singular value as a pasture-grass for sheep: this animal being represented as fonder of it than of any other grass, and fattening upon it more quickly than on any other kind of food whatever. And indeed, the general appearance of the plant, and its peculiar manner of growth, seems very much to favour the accounts that have been given of it.

"This plant is of the same family with the former, and agrees with it in several respects; although they may be easily distinguished from one another. Its leaves, like the former, in its natural state, are always rounded, but much smaller; being little bigger than large horse hairs, or swine-bristles, and seldom exceed six or seven inches in length. But these spring out of the root in tufts, so close upon one another, that they resemble, in this respect, a close hair brush more than anything else I know: so that it would seem naturally adapted to form that short thick pile of grass in which sheep are known chiefly to delight. Its flower-stalks are numerous, and sometimes attain the height of two feet; but are more usually about 12 or 15 inches high.

"Upon gathering the seeds of this plant, and sowing them as the former, it was found that they sprung up as quickly as any other kind of grass; but the leaves were at first no bigger than a human hair. From each side springs up one or two of these hair-like filaments, that in a short time send out new offsets, so as quickly to form a sort of tuft, which grows larger and larger, till it at length attains a very large size, or till all the intervals are closed up, and then it forms the closest pile of grass that it is possible to imagine. In April and May it pushed forth an innumerable quantity of flower-stalks, that afforded an immense quantity of hay; it being so close throughout, that the scythe could scarcely penetrate it. This was allowed to stand till the seeds ripened; but the bottoms of the stalks were quite blanched, and almost rotten for want of air before that time.

"This was the appearance that it made the first year after
Agriculture

Food for Cattle.

after it was sowed: but I have reason to think, that, after a few years, it likewise produces fewer seed-stalks, and a greater quantity of leaves, than at first. But however that may be, it is certain, that if these are eaten down in the spring, it does not, like ryegrass, persist in a continued tendency to run to seed: but is at once determined to push forth a quantity of leaves without almost any stalks at all: and as all domestic animals, but more especially sheep, are extremely fond of this grass, if they have liberty to pasture where it grows, they bite it so close as never to suffer almost a single seed-stalk to escape them; so that the botanist will often search in vain for it, when he is treading upon it with his feet. The best way to discover it in any pasture, is to search for it in winter, when the tufts of it may be easily distinguished from every other kind of grass, by their extraordinary closeness, and the deep green colour of the leaves.

What soil most proper.

"It seems to grow in almost any soil; although it is imagined that it would flourish best in a light sandy soil, as it can evidently live with less moisture than almost any other kind of grass; being often seen to remain in the sods that have been employed in coping for stone dykes, after all the other grasses that grew in them have disappeared. It is likewise found in poor barren soils, where hardly any other plant can be made to grow at all: and on the surface of dry worn-out peat moss, where no moisture remains sufficient to support any other plant whatever: but in neither of these situations does it thrive; as it is there only a weak and unsightly plant, very unlike what it is when it has the good fortune to be established upon a good soil; although it is seldom met with in that last state than in the former.

"I will not here repeat what has been already said about the particular property that this plant possesses of continuing all winter; nor point out the benefits that the farmer may reap from this valuable quality. He need not, however, expect to find any verdure in winter on such plants as grow upon the loose mossy soil above mentioned; for, as the frost in winter always hoes up the surface of this soil, the roots of the plants are so lacerated thereby, as to make it, for some time in the spring, to all appearance dead. Nor will he often perceive much verdure in winter upon those plants that grow upon poor hungry soils, which cannot afford abundant nourishment to keep them in a proper state of vegetation at all times: but such plants as grow on earthen dykes, which usually begin to vegetate with vigour when the autumnal rains come on, for the most part retain their verdure at that season almost as well as if they were in good garden-mound.

"I have been very particular in regard to this plant; because, in as far as my observations have yet gone, it promises on many accounts to make a most valuable acquisition to the farmer, and therefore justly demands a very particular share of his attention."

The holcus lanatus, or creeping soft-grass of Hudson. — This is considered by our author as one of the most valuable kinds of meadow-grasses; its pile being exceedingly close, soft, and succulent. It delights much in moisture, and is seldom found on dry ground, unless the soil is exceeding rich. It is often found on those patches near springs, over which the water frequently flows; and may be known by the uncommon softness and succulence of the blade, the lively light green colour of the leaves, and the matted intertexture of its roots. But notwithstanding the softness of its first leaves, when the seed-stalks advance, they are rough to the touch, so that the plant then assumes a very different appearance from what we would have expected. The ear is branched out into a great number of fine ramifications somewhat like the oat, but much smaller. This kind of grass, however, would not be easily cultivated, on account of a kind of soft membrane that makes the seeds adhere to the stalk, and to one another after they are separated from it; as if they were intermingled with cobweb, so that it is difficult to get them separated from the stalk, or to spread readily by sowing. It spreads, however, so fast by its running roots, that a small quantity sown very thin, would be sufficient to stock a large field in a short time.

These are the kinds of grasses, properly so called, which have not as yet been cultivated, that Mr Anderson thinks the most likely to be of value; but, besides these, he recommends the following of the pea-tribe.

1. Milk-vetch, liquorice-vetch, or milkwort. This milk plant, in some respects, very much resembles the common white clover: from the top of the root a great number of shoots come out in the spring, spreading along the surface of the ground, every way around it; from which arise a great many clusters of bright yellow flowers, exactly resembling those of the common broom. These are succeeded by hard round pods, filled with small kidney-shaped seeds. From a supposed resemblance of a cluster of those pods to the fingers of an open hand, the plant has been sometimes called ladle-fingers. By others it is called rowcows, from a fancied resemblance of the pods to the toes of a bird. Others, from the appearance of the blossom, and the part where the plant is found, have called it sick, improperly fell-broom. It is found plentifully almost everywhere in old grass fields; but as every species of domestic animals eat it, almost in preference to any other plant, it is seldom allowed to come to the flower in pasture grounds, unless where they have been accidentally saved from the cattle for some time; so that it is only about the borders of corn fields, or the sides of inclosures to which cattle have not access, that we have an opportunity of observing it. As it has been imagined that the cows which feed on the pastures, where this plant abounds, yield a quantity of rich milk, the plant has, from that circumstance, obtained its most proper English name of milk-vetch.

One of the greatest recommendations of this plant is, that it grows in poor barren ground, where almost no other plant can live. It has been observed in ground so poor, that even heath, or ling (Erica communes), would scarcely grow; and under very obdurate clays, where no other plant could be made to vegetate; insomuch that the surface remained entirely uncovered, unless where a plant of this kind chanced to be established: yet, even in these unfavourable circumstances, it flourished with an uncommon degree of luxuriance, and yielded as tender and succulent, though not such abundant shoots, as if reared in the richest manured fields. In dry barren sands, also, where almost no other plant could be made to live, it has been found to send out such a number of healthy shoots all round, as to cover the earth with the closest and most beautiful carpet that can be desired.
Theory.

Agriculture.

The stalks of the milk-vetch are weak and slender, so that they spread upon the surface of the ground, unless they are supported by some other vegetable. In ordinary soils they do not grow to a great length, nor produce many flowers; but in richer fields the stalks grow to a much greater length, branch out a good deal, but carry few or no flowers or seeds. From these qualities our author did not attempt at first to cultivate it with any other view than that of pasture; and, with this intention, sowed it with his ordinary hay seeds, expecting no material benefit from it till he desisted from cutting his field. In this, however, he was agreeably disappointed; the milk-vetch growing the first season as tall as his great clover, and forming exceeding fine hay; being scarce distinguishable from lucerne, but by the slenderness of the stalk, and proportional smallness of the leaf.

Another recommendation to this plant is, that it is perennial. It is several years after it is sowed before it attains to its full perfection; but, once established, it probably remains for a great number of years in full vigour, and produces annually a great quantity of fodder. In autumn 1773, Mr. Anderson cut the stalk from an old plant that grew on a very indifferent soil; and, after having thoroughly dried it, he found that it weighed 14 ounces and a half.

The stalks of this plant die down entirely in winter, and do not come up in the spring till the same time that clover begins to advance; nor does it advance very fast, even in summer, when once cut down or eaten over; so that it seems much inferior to the above-mentioned grasses; but it might be of use to cover the worst parts of a farm, on which no other vegetable could thrive.

2. The common yellow vetchling (Lathyrus pratensis) is an everlasting care, grows with great luxuriance in stiff clay soils, and continues to yield annually a great weight of fodder, of the very best quality, for any length of time. This is equally fit for pasture or hay; and grows with equal vigour in the end of summer as in the beginning of it; so would admit being pastured upon in the spring, till the middle, or even the end of May, without endangering the loss of the crop of hay. This is an advantage which no other plant except clover possesses; but clover is equally unfit for early pasture or for hay. Sainfoin is the only plant whose qualities approach to it in this respect, and the yellow vetching will grow in such soils as are utterly unfit for producing sainfoin. It is also a perennial plant, and increases so fast by its running roots, that a small quantity of the seed would produce a sufficient number of plants to fill a whole field in a very short time. If a small patch of good ground is sowed with the seeds of this plant in rows, about a foot distance from one another, and the intervals kept clear of weeds, the rest of the field will spread so much as to fill up the whole patch next year; when the stalks may be cut for green fodder or hay. And if that patch were dug over in the spring following, and the roots taken out; it would furnish a great quantity of plants, which might be planted at two or three feet distance from one another, where they would probably overspread the whole field in a short time.

3. The common blue tare seems more likely than the former to produce a more flourishing kind of hay, as it abounds much more in seeds; but as the stalks come up more thinly from the root, and branch more above, it does not appear to be so well adapted for a pasture grass as the other. The leaves of this plant are much smaller, and more divided, than those of the other; the stalks are likewise smaller, and grow to a much greater length. Though it produces a great quantity of seeds, yet the small birds are so fond of them, that, unless the field were carefully guarded, few of them would be allowed to ripen.

Our author gives the preference to this plant beyond vetch all others of the same tribe for pasture. The roots of it spread on every side a little below the surface of the ground, from which, in the spring, many stems arise quite close by one another; and as they have a broad tufted top covered with many leaves, it forms as close a pile as could be desired. It grows very quickly after being cut or cropped, but does not arrive at any great height; so that it seems more proper for pasturage than making hay; although, upon a good soil, it will grow sufficiently high for that purpose; but the stalks grow so close upon one another, that there is great danger of having it rolled at the root, if the season should prove damp. It seems to thrive best in a clayey soil.

Besides these, there are a variety of others of the same everlasting class, which he thinks might be useful to the farmer. The common garden everlasting pea, cultivated as a flowering plant, he conjectures, would yield a prodigious weight of hay upon an acre; as it grows to the height of ten or twelve feet, having very strong stalks, that could support themselves without rotting till they attained a great height.

One other plant, hitherto unnoticed, is recommended by our author to the attention of the farmer; it is the *common yarrow* (*Achillea millefolium*), or *hundred-leaved grass*. Concerning this plant, he remarks, that in almost every fine old pasture, a great proportion of the growing vegetables with which the field is covered consists of it; but the animals which feed there are so fond of the yarrow, as never to allow one seed-stalk of it to come to perfection. Hence these seed-stalks are never found but in neglected corners, or by the sides of roads; and are so disagreeable to cattle, that they are never tasted; and thus it has been erroneously thought that the whole plant was refused by them. The leaves of this plant have a great tendency to grow very thick upon one another, and are therefore peculiarly adapted for pasturage. It arrives at its greatest perfection in rich fields that are naturally fit for producing a large and succulent crop of grass. It grows also upon clays; and is among the first plants that strike root in any barren clay that has been lately dug from any considerable depth; so that this plant, and thistles, are usually the first that appear on the banks of deep ditches formed in a clayey soil. All animals delight to eat it; but, from the dry aromatic taste it possesses, it would seem peculiarly favourable to the constitution of sheep. It seems altogether unfit for hay.

Besides these plants, which are natives of our own country, there are others which, though natives of a foreign climate, are found to thrive very well in Britain; and have been raised with such success by individuals, as highly to merit the attention of every farmer. Among these the first place is claimed by lucerne.
This is the plant called *medica* by the ancients, because it came originally from Media, and on the culture of which they bestowed such great care and pains. It hath a perennial root, and annual stalks, which, in a good soil, rise to three feet, or sometimes more, in height; its leaves grow at a joint like those of clover; the flowers, which appear in June, are purple; and its pods are of a screw-like shape, containing seeds which ripen in September. All sorts of domestic cattle are fond of this plant, especially when allowed to eat it green, and black cattle may be fed very well with the hay made from it; but an excess of this food is said to be very dangerous.

Lucerne has the property of growing very quickly after it is cut down, insomuch that Mr. Rocque has mowed it five times in a season, and Mr. Anderson affirms he has cut it no less than six times. It is, however, not very easily cultivated; in consequence of which it sometimes does not succeed.

Another grass was brought from Virginia, where it is a native, and sown by Rocque in 1763. This grass is called timothy, from its being brought from New-York to Carolina by one Timothy Hanson. It grows best in a wet soil; but will thrive in almost any. If it is sown in August, it will be fit for cutting in the latter end of May or beginning of June. Horses are very fond of it, and will leave lucerne to eat it. It is also preferred by black cattle and sheep; for a square piece of land having been divided into four equal parts, and one part sowed with lucerne, another with saffoin, a third with clover, and the fourth with timothy, some horses, black cattle, and sheep, were turned into it, when the plants were all in a condition for pasturage; and the timothy was eaten quite bare, before the clover, lucerne, or saffoin, was touched.

One valuable property of this grass is, that its roots are so strong and interwoven with one another, that they render the wettrest and softest land, on which a horse could not find footing, firm enough to bear the heaviest cart. With the view of improving boggy lands, therefore, so as to prevent their being peasted with the feet of cattle, Mr. Anderson recommends the cultivation of this kind of grass, from which he has little expectation in other respects.

On this subject, of the kind of plants most proper to be raised for feeding cattle, one general question ought not to pass unnoticed concerning the propriety of feeding them upon roots and plants cultivated by the aid of the plough, or upon leaving them to derive their subsistence from lands allowed to remain continually in pasture. The advantages of the latter practice are set forth by Thomas Davis, Esq. of Longfleet, in the following words. "Experience sufficiently evinces the extreme difficulty of persuading tenants that they get more (generally speaking) by feeding their lands, than by ploughing them; yet it requires very few arguments to convince a landlord, that, in cold wet land especially, the less ploughed land you have, the less you put it in the tenant's power to ruin your estate. That a tenant of 60l. per annum on a dairy farm will get money, while a corn farm of the same size will starve its occupier (though perhaps the former gives 15s. per acre for his land, and the latter only 10s.), is self-evident. The plough is a friend of every body's, though its advantages are very far from being particularly and local-
Theory.

AGRICULTURE.

and though potatoes are found to prosper in a sandy, or even a moosy soil, it would be in vain to expect them to produce an equally valuable crop upon a stiff clay, in which the roots cannot swell or expand to a proper size. In forming a plan of agriculture, therefore, the husbandman must not overlook the peculiar nature of the soil that has fallen to his lot, or its physical relation to the nature of certain vegetables, as he can only hope for success by adapting the one of these to the other.

The husbandman must also have a special regard to the state of the market to which his commodities are to be brought. It is in vain for him to cultivate large quantities of roots, such as potatoes or carrots, at a distance from great towns, which alone can afford a market for them, unless he intend to consume them upon his own farm by feeding cattle. In a part of the country, however, in which great breweries are established, if his soil is fit for the purpose, he may safely venture to rear large quantities of barley; as he cannot in such a situation be at any time destitute of a market. Hence we can perceive, that it is the state of the market which must at all times regulate the enterprises of the agriculturist, and the kind of crops which he is to bring forward. Thus also we see the mode in which agriculture may be most successfully encouraged by a nation. Let an abundant market be provided for the produce of the soil, and that produce will infallibly be augmented. In this way, it is evident that the consumption of grain, by means of distilleries or breweries, is highly favourable to the production of it in great quantities. They are even favourable to the existence of plenty, or of abundance of bread for the use of the people. In good seasons, by affording a ready market, they give activity to the husbandman, and in bad seasons their operations can be arrested by law, and the superfluous quantity of grain which was meant to be consumed by them, can be converted into human food. Thus they operate in some measure like a great public granary, in which provisions should be kept against an accidental scarcity.

It may sometimes happen, that by the character of the age in which he lives, and the state of the market which it produces, a husbandman may find himself most profitably employed, when rearing a kind of food which is by no means the most advantageous to the population of his country. This takes place, when he is employed in preparing butchers meat instead of bread; that is, when he finds it more profitable to rear upon his lands vegetables which can only be consumed by cattle, and thus contribute only in an indirect manner to the sustenance of the human species, than to cultivate those vegetable productions which are suited to the human stomach, and which therefore directly and immediately afford subsistence to man. According to Archdeacon Hislop's Comparative Statement, lately published, the weight of food from an acre of arable land, on the average of three years, a fallow year being included, is nine and a half times greater than from an acre of feeding stock; and according to the calculations of the Rev. Dr Walker, at Collingston, professor of natural history at Edinburgh, a Scots acre of land in pasture, fed with sheep, produces only 120 pounds weight of meat, whereas the same land will yield 280 pounds of oatmeal, or above ten times as much. Let it even be supposed, then, that one pound of mutton contains in itself as much substantial nourishment for the human constitution, as two pounds weight of oatmeal; still it will follow that lands cultivated for the production of oats, will support a population five times greater in number, than can be supported by the same land when used for the pasture of sheep; and, where one million of people are found to exist upon a territory occupied in the one way, between five and six millions of people might exist upon the same land if it were cultivated for raising grain, and if the inhabitants would consent to use it as their food. Were any contrivance adopted, of the nature of these already mentioned, for converting the succulent roots of potatoes, carrots, &c. into dry meal or flour; the same proportional difference of population would continue to exist, between nations in which that kind of flour should be consumed as human food, and in which it should be used for feeding cattle. For a man can always commit an enormous waste of food; who, instead of eating grain himself, gives it to an inferior animal, in the expectation of afterwards receiving an equivalent, by devouring the flesh of that animal.

With these general considerations, however, the practical agriculturist, or husbandman, may have nothing to do. To succeed in his profession, he must accommodate himself to the public taste, or to the state of the market around him; and must consider what commodity, whether grain or butchers meat, will there bring the best reward for his labour. He may even find the state of the market affected by other circumstances, than the pure taste of the public for butchers meat, in preference to vegetable food; although that must always be of great importance among a luxurious people. Conquering nations, who extend their political dominion over distant regions, never fail to draw to their native country a very great portion of the wealth of the vanquished states. The victorious nation never fails, in such cases, to contain a great number of wealthy individuals, whose revenue is not derived from the cultivation of their own soil, or from any branch of manufacture or of commercial industry carried on by them upon it; but which consists of money drawn from the remote provinces of the empire, in consequence of estates possessed, or fortunes acquired there, in the service of government. The result of such circumstances naturally is, that those wealthy individuals not only live at home in a luxurious manner, and increase to an immense extent the consumption of butchers meat by themselves and their numerous retinues; but for the sake of ostentation, and as the only means of employing their wealth, they maintain great numbers of carriages and of riding horses. To support such establishments, they themselves not only convert large tracts of territory from arable into pasture lands; but even the whole husbandmen of the country are induced to do the same, to derive a profit from supplying them with butchers meat, and with food for their pleasure horses. In the mean time, the grain that may be wanted for the consumption of the people, whether rich or poor, being a commodity which is easily preserved and transported, must be bought from foreign nations, by a portion of the
Profit from superfluous wealth of the state; and thus a rich and prosperous people may come to depend upon foreigners for a morsel of bread; and when these foreign nations happen to experience an unfortunate season, this wealthy people may suffer all the horrors of famine upon a fertile soil, and in the midst of overflowing treasures.

Such was the state of Italy under the ancient Romans. Every part of it was adorned with the parks and villas and gardens of the nobles, who derived their revenues from the remote parts of the empire. This seat of dominion exhibited a picture of boundless splendour and magnificence. But the soil was entirely occupied in the service of ostentation or of luxury: and Italy, one of the most fertile corn countries in Europe, depended for grain upon Egypt, and the western provinces of Africa that border upon the Mediterranean. Such also, though perhaps in an inferior degree, seems to be the present state of Great Britain. It has acquired vast and fertile and populous provinces, within the torrid zone in the east, from which individuals are annually transporting home immense treasures obtained in the public service. In the west, also, within the same torrid zone, by a great expense of treasure and of human lives, the cultivation of certain valuable commodities has been established; and from estates situated there, individuals residing at home now derive great revenues. The principles which regulate human affairs are unalterable; and in every age the same causes are attended with the same consequences. What occurred in ancient Italy, took place among us so soon as the possession of distant territories had leisure to display its natural effects. Britain formerly not only produced a abundance of grain for the support of its own inhabitants, but it possessed a considerable surplus for exportation. After the acquisition of foreign possessions, this surplus produce gradually ceased to exist; and it appears from documents, which the legislature has acknowledged to afford authentic and complete evidence of the truth of the fact, that, for twenty years past, notwithstanding all our agricultural improvements, and the waste lands that have been brought under the plough, the produce of grain is annually becoming more and more unequal to the consumption; and this decrease appears in some measure to keep pace with the increasing value of our distant possessions. In the mean time we are annually coming under the necessity of purchasing larger and larger supplies of grain, from the foreign states of Europe or of North America; and thus these nations, without undergoing the imputation of usurpation, and without encountering the hazard of an unfriendly climate, have been enabled, through the medium of our luxury, to obtain a share of the riches of Hindostan, and of the profits of our West India cultivation. In the mean time their agriculture is encouraged, while we are made to depend upon them for the necessaries of life. After all, it appears unreasonable, and would perhaps be improper, to regret a state of affairs, which is the result of national aggrandisement, and of the superiority and successful enterprise of our countrymen! Still, however, it is obviously to be wished, that, so far as agriculture is concerned, we could be restored to the state of independence which our ancestors enjoyed, when they were able, from their own soil, to supply themselves with the necessaries of life: such a state is sometimes necessary to the independent existence of a community, and is at all times conducive to its welfare. It can only how-ever be produced by means of agriculture. There Principles of Cultivation.

Ye generous Britons, venerate the Plough, And o'er your hills and long withdrawing vales, Let autumn spread her treasures to the sun; So with superior boon may your rich soil, Exuberant, nature's better blessings pour O'er every land, the naked nations clothe, And be th' exhaustless granary of a world! THOMSON.

Sect. IV. General Principles of Cultivation.

It is not our intention here to enter into a minute disquisition, concerning the nature of vegetables, or the different substances with which they may be connected, in their growth or in their decay. Such investigations, in a proper arrangement of the sciences, ought to be left to chemistry; but even that science, so far as vegetable substances are concerned, is still in such a state of imperfection, that a detail of the experiments and opinions of philosophical chemists, concerning vegetables, would as yet afford but a very trifling portion of useful information to the husbandman. We shall therefore content ourselves with here stating such general remarks, as appear necessarily connected with the important art of which we are now treating.

A vegetable is not to be regarded merely as a piece of matter, or as a mixture of certain material substances. It is an organized being, possessed of life, which it derived from another similar organized being that existed previous to itself; and this former organized and living being derived its constitution from a parent stem, which grow out, of a still older plant, up to an antiquity of which we have no knowledge. A vegetable, in this manner, not only has a birth, but it also has a growth, which is supported by food that it takes in and conveys by peculiar organs to the particular parts for which it is destined. When it has arrived at maturity, or reached the perfection of its form and constitution, a vegetable like an animal begins to decay, and finally dies, and, by a process of putrefaction, is converted into a kind of earth.

To the life of vegetables, in the same manner as to the life of animals, the presence of atmospheric air is necessary. They also require a certain moderate degree of heat; without which their growth cannot proceed, although a great degree of it is utterly fatal even to their texture. That they require moisture, is equally obvious; as appears from the ordinary effect of rain, or of the continued want of it, upon fields and plants. They require likewise to be inserted in the earth, or in some way connected with a collection of its particles; for although some plants, particularly the bulbous-rooted kinds, vegetate in pure water and air alone, it appears that they acquire little addition of solid substance, and that neither they, nor any of the other larger plants, reach perfection, or produce seed, unless planted in the earth, or supplied with a portion of it.

As all soils are by no means equally adapted for sup-porting vegetables, or bringing them to maturity, it is necessary for the husbandman to attend to their nature, and the modes in which they may be altered or ameliorated for his use. Independent of these hard concretions, which obtain the name of stones or rocks, it
To understand this subject correctly, it is necessary to consider the nature and origin of this fertile mould. It is evident that one of these original substances which form a part of the great mass of the solid globe of the earth, but appears to be the result of the operations of Nature and of the destruction of living and organized beings, is garden mould. Mr. Headrick, in an essay which he will afterwards have occasion to mention, suddenly thrown up from the sea or from the bowels of the earth, the first plants of which nature would place upon it would be the various species of lichens, and such as can subsist wholly upon what they imbibe from the air, without needing a soil in which to push their roots. These plants serve which the double purpose of clothing the rocks, and thus preventing the fine particles that are dissolved by air and moisture from being washed away, and, from their growth and dissolution, of accumulating vegetable soil for the sustenance of more succulent plants. The rock is thus gradually made to acquire such a depth of soil, that it becomes able to sustain not only grasses and shrubs, but may become a receptacle for the oak itself. The progress here stated is correct; but some circumstances must be added to it, to render it practically useful to the husbandman. It is to be observed that, animal substances, after they have ceased to form a part of a living body, have a tendency to proceed rapidly into a state of putrefactive fermentation, by which the greatest part of their mass is rendered volatile. When animal substances are mingled with vegetables, they speedily communicate their own fermentation or putrefaction to the vegetables, which by means of it are decomposed, fall to pieces, and are transformed into that kind of black earth, which we have called garden mould, and which forms the most fertile of all soils for the production of vegetables. It is by this process then, that is, by the fermentation of vegetable by means of animal substance, that the surface of this globe has been fertilized, or a black and rich mould produced upon it, as we daily see taking place in a variety of situations. No sooner do the small lichens or mosses cover the face of the naked rock, or gravel, or clay, than a variety of species of small animals appear, and feed upon them. The plants and animals die in succession, their substances mingle and give rise to the putrefaction already mentioned, which is productive of a small portion of soil. A new race of plants of greater strength and bulk rises upon the ruins of the first, and supports larger animals, all destined in their turn to perish and to increase the quantity of fertile soil. More valuable grasses soon supplant the original small and coarse vegetables, and the spot assumes the appearance of a rich verdure. New species of animals also begin to inhabit it: snails and worms abound; and by their remains contribute to the dissolution of the roots of plants, which everywhere penetrate the new soil, and to the decomposition of the stems which periodically fall down. When the soil has acquired sufficient depth, it is sheltered by shrubs; and, lastly, by forest trees, under the shade of which the larger animals exist. The trees shed their leaves every season, and every season consequently gives an additional layer or stratum of fertile mould to the soil: and thus while the forest endures, the fertility of
Agriculture.

The leaves, and there undergo some change by the action of the air: for the leaves of vegetables appear to perform the same office similar to that which is accomplished in animals by the organ called the lungs. From the leaves the sap, thus changed, descends to every part of the plant, and contributes to its growth by becoming a part of its substance. It would seem, however, that the liquors which circulate in plants, not only undergo a change at the leaves, but also at their first entrance by the vessels of the roots; for if several different kinds of trees are inducted upon the same common stock, each of them is able to derive the sap peculiar to itself from the sap of the common stock. Thus also the chemists have informed us, that vinegar, called by them the acetic acid, is found variously combined in the ascending sap of various trees; but it has never yet been discovered, that vinegar exists in any perceptible quantity in vegetable mould. That substance, therefore, must be formed by the root, by bringing together the ingredients of that acid which it finds and selects in the earth.

When any plant, whether great or small, is put into a close vessel, and strongly heated, allowing only the smoke to escape, the residue is in all cases of the same nature, and is called charcoal, or by the chemists carbon. Of this carbonaceous matter a considerable quantity is always found in rich garden mould, derived with no doubt from the remains of vegetable substances of which that mould was originally formed. This carbonaceous matter, however, or charcoal, being insoluble in water, cannot in its ordinary state enter into the vessels of growing vegetables; but, as it is rendered soluble by a variety of combinations, it is no doubt found out in such a state by the fibres of growing roots, and conveyed upwards in the juice. But as all vegetable mould, and the charcoal or carbonaceous matter which it contains, is the result of the ruins of vegetation, and as the lichens or vegetables of the coarsest and simplest kind, which originally grew upon the naked stone, have no other nourishment than water and atmospheric air, it is probable, that out of these materials they are capable of forming the charcoal, which constitutes the basis of their form, and of the constitution of every other vegetable. It is true, that the chemists still regard carbon or charcoal as a simple and uncompounded substance; and they have not found it in water, nor in atmospheric air, unless in the most minute degree, resulting probably from the combustion of fires and the breathing of animals in inhabited countries. But although chemists have not hitherto been able to find charcoal in the three simple substances, oxygen, hydrogen, and azote, of which atmospheric air and water are composed, it seems evident, that the mighty Chemist who contrived this world, and the constitution of vegetables, finds no difficulty in forming it of those materials by means of their organization. Hence we rather think, that water and air must constitute the original food of the simplest and coarsest kind of plants; but if this idea be true, it is to be regarded as a fact that is more curious in speculation than useful in practice: for it is certain, that the more valuable and larger vegetables, which is the business of the husbandman to cultivate, cannot be reared to perfection without the aid of vegetable mould. Though they may possess, therefore, the power of deriving...
AGRICULTURE.

When ground has been long uncultivated, producing all the time plants, not succulent, but such as are very difficultly dissolved, and in a manner incapable of putrefaction; there the soil will be excessively barren, and yield very scanty crops, though cultivated with the greatest care. Of this kind are those lands covered with heath, which are found to be the most barren of any, and the most difficultly brought to yield good crops. In this case lime will be as serviceable as it was detrimental in the other: for by its septic qualities, it will continually reduce more and more of the soil to a putrid state; and thus there will be a constant succession of better and better crops, by the continued use of lime when the quantity first laid on has exerted all its force. By the continued use of this manure, the ground will be gradually brought nearer and nearer to the nature of garden mould; and, no doubt, by proper care, might be made as good as any: but it will be as great a mistake to imagine, that, by the use of lime, this kind of soil may be rendered perpetually fertile, as to think that the other was naturally so; for though lime enriches this soil, it does so not by adding vegetable food to it, but by preparing what it already contains; and when all is properly prepared, it must as certainly be exhausted as in the other case.

Here, then, we have examples of two kinds of poor soils, one of which is totally destroyed, the other greatly improved, by lime, and which therefore require very different manures; lime being more proper for the last than dung; while dung, being more proper to restore an exhausted soil than lime; ought only to be used for the first. Besides dunging land which has been exhausted by long cropping, it is of great service to let it lie fallow for some time; for this it owed its original fertility; and what gave the fertility originally, cannot fail to restore it in some degree.

By attending to the distinction between the reasons for the poverty of the two soils just now mentioned, we will always be able to judge with certainty in what cases lime is to be used, and when dung is proper. The mere poverty of a soil is not a criterion whereby we can judge, we must consider what hath made it poor. If it is naturally so, we may almost infallibly conclude, that it will become better by being manured with lime. If it is artificially poor, or exhausted by continual cropping, we may conclude that lime will entirely destroy it.

—We apprehend, that it is this natural kind of poverty only which Mr. Anderson says, in his Essays on Agriculture, may be remedied by lime; for we can scarcely think that experience would direct any person to put lime upon land already exhausted. His words are,

"Calcereous matters act as powerfully upon land that is naturally poor, as upon land that is more or less richly impregnated with those substances that tend to produce a luxuriant vegetation."

"Writers on agriculture have long been in the custom of dividing manures into two classes, viz. Enriching manures, or those that tended directly to render the soil more prolific, however sterile it may be; among the foremost of which was dung: Exciting manures, or those that were supposed to have a tendency to render the soil more prolific, merely by acting upon those exerting..."
AGRICULTURE.

Principles of Cultivation.

Riching manures that had been formerly in the soil, and giving them a new stimulus, so as to enable them to operate anew upon the soil which they had formerly fertilized. In which class of stimulating manures, lime was always allowed to hold the foremost place.

"In consequence of this theory, it would follow, that lime could only be of use as a manure when applied to rich soils; and, when applied to poor soils, would produce hardly any, or even perhaps hurtful, effects.

"I will frankly acknowledge, that I myself was so far imposed upon by the beauty of this theory, as to be hurried along with the general current of mankind, in the firm persuasion of the truth of this observation, and for many years did not sufficiently advert to those facts that were daily occurring to contradict this theory.

"I am now, however, firmly convinced, from repeated observations, that lime, and other calcareous manures, produce a much greater proportional improvement upon poor soils than such as are richer; and that lime alone, upon a poor soil, will, in many cases, produce a much greater and more lasting degree of fertility than dung."

Thus far Mr. Anderson's experience is exactly conformable to the theory we have laid down, and what ought to happen according to our principles. He mentions, however, some facts which seem very strongly to militate against it; and indeed he himself seems to proceed upon a theory altogether different.

Calcaneous matter alone (says he) is not capable of rearing plants to perfection;—mould is necessary to be mixed with it in certain proportions, before it can form a proper soil. It remains, however, to be determined, what is the due proportion of these ingredients for forming a proper soil.

"We know that neither chalk, nor marl, nor lime, can be made to nourish plants alone; and soils are sometimes found that abound with the two first of these to a faulty degree. But the proportion of calcaneous matter in these is so much larger than could ever be produced by art, where the soil was naturally destitute of these substances, that there seems to be no danger of erring on that side. Probably it would be much easier to correct the defects of these soils in which calcaneous matters superabound, by driving earth upon them as a manure, than is generally imagined; as a very small proportion of it sometimes affords a very perfect soil."

I shall illustrate my meaning by a few examples.

Near Sandside, in the county of Caithness, there is a very extensive plain on the sea coast, endowed with a most singular degree of fertility. In all seasons it produces a most luxuriant herbage, although it never got any manure since the creation; and has been from time immemorial subjected to the following course of crops.

1. Bear, after once ploughing from grass, usually a good crop.
2. Bear, after once ploughing, a better crop than the first.
3. Bear, after once ploughing, a crop equal to the first.
4. 5. and 6. Natural grass, as close and rich as could be imagined; might be cut, if the possessor so inclined, and would yield an extraordinary crop of hay each year.

"After this the same course of cropping is renewed. The soil that admits of this singular mode of farming, appears to be a pure incoherent sand, destitute of the smallest particle of vegetable mould; but, upon examination, it is found to consist almost entirely of broken shells: the fine mould here bears such a small proportion to the calcaneous matter, as to be scarce perceptible, and yet it forms the most fertile soil that ever I yet met with."

"I have seen many other links (downs) upon the sea shore, which produced the most luxuriant herbage, and the closest and sweetest pile of grass, where they consisted of shelvy sand; which, without doubt, derive their extraordinary fertility from that cause.

A very remarkable plain is found in the island of Jiz-eye, one of the Hebrides. It has been long employed as a common: so that it has never been disturbed by the plough, and affords annually the most luxuriant crop of herbage, consisting of white clover and other valuable pasture grass, that can be met with anywhere. The soil consists of a very pure shelvy sand.

"From these examples I think it is evident, that a very small proportion of vegetable mould is sufficient to render calcaneous matter a very rich soil. Perhaps, however, a larger proportion may be necessary when it is mixed with clay than with sand; as poor chalky soils seem to be of the nature of that composition."

To these examples brought by Mr. Anderson, we may add some of the same kind mentioned by Lord Kames. His lordship having endeavoured to establish the theory of water being the only food of plants, though he himself frequently deviates from that theory, yet thinks it possible, upon such a principle, to make a soil perpetually fertile.

"To recruit (says he), with vegetable food, a soil impoverished by cropping, has hitherto been held the only object of agriculture. But here opens a grander object, worthy to employ our keesnest industry, that of making a soil perpetually fertile. Such soils actually exist; and why should it be thought, that imitation here is above the reach of art? Many are the instances of nature being imitated with success. Let us not despair while any hope remains; for invention never was exercised upon a subject of greater utility. The attempt may suggest proper experiments: it may open new views; and if we fail in equalizing nature, may we not, however, hope to approach it. A soil perpetually fertile must be endowed with a power to retain moisture sufficient for its plants, and at the same time must be of a nature that does not hinder by moisture. Calcareous earth promises to answer both ends: it prevents a soil from being hardened by water; and it may probably also invigorate its retentive quality. A field that got a sufficient dose of clay marl, carried above 30 successive rich crops, without either dung or fallow. Doth not a soil so meliorated draw near to one perpetually fertile? Near the east side of Zife, the coast for a mile inward is covered with sea sand, a foot deep or so; which is extremely fertile, by a mixture of sea shells reduced to powder by attrition. The powdered shells, being the same with shell marl, make the sand retentive of moisture; and yet no quantity of moisture will unite the sand into a solid body. A soil so mixed seems to be
AGRICULTURE.

Lord Kames, indeed, mentions fields in Scotland, that, past memory, have carried successive crops of wheat, peas, barley, oats, without a fallow, and without manure; and particularises one on the river Carron, of nine or ten acres, which had carried 130 crops of oats without intermission and without manure: but as we are not acquainted with such fields, nor know any thing about their particular situation, we can form no judgment concerning them.

Besides the two kinds of soils above mentioned, there are others, the principal ingredient of which is clay or sandy soil. The first of these is apt to be hardened by the heat of the sun, so that the vegetables can scarce penetrate it in such a manner as to receive proper nourishment. The second, if it is not situated so as to receive a great deal of moisture, is very apt to be parched up in summer and the crop destroyed; nor has it sufficient adhesion to support plants that have few roots and grow high. From these opposite qualities, it is evident that these two soils would be a proper manure for one another: the clay would give a sufficient degree of firmness to the sand, and the sand would break the too great tenacity of the clay. According to Dr Home's experiments, however, sand is the worst manure for clay that can be used. He recommends marl most. To reduce clay ground as near as possible to the form of pure vegetable mould, it must first be pulverized. This is most effectually performed by ploughing and harrowing, but care must be taken not to plough it whilst too wet, otherwise it will concretbe into hard clots which can scarcely be broken. After it is pulverized, however, some means must be taken to keep it from concreting again into the same hard masses as before. According to Lord Kames, though clay, after pulverization, will concretbe into as hard a mass as before, if mixed with water; yet if mixed with dunghill juice, it will not concretbe any more. Lime also breaks its tenacity, and is very useful as a manure for this kind of soil.

The conclusion we wish the practical farmer to draw, is, that there is a certain limit to the fertility of the earth, both as to duration and to degree, at any particular time: that the nearer any soil approaches to the nature of pure garden mould, the nearer it is to the most perfect degree of fertility; but that there are no hopes of keeping it perpetually in such a state, or in any degree of approximation to it, but by constant and regular manuring with dung. Lime, chalk, marl, &c. may be proper to bring it near to this state, but are absolutely unfit to keep it continually so. They may indeed for several years produce large crops; but the more they increase the fertility for some years, the sooner will they bring on an absolute barrenness; while regular manuring with plenty of dung will always ensure the keeping up the soil in good condition. What we have said concerning the use of lime, &c. applies likewise to the practice of frequent ploughing, though, in a less degree. This tends to meliorate ground that is naturally poor, by giving an opportunity to the vegetable parts to putre the ground, and when that is done, it tends to exhaust, though not so much as lime. A judicious farmer will constantly try to keep his lands always in good condition, rather than to make them suddenly much better.
Sect. V. Of the different kinds of Vegetables proper to be raised with a view to the Melioration of Soil.

The methods of meliorating soils, which we have mentioned above, consisting of tedious and laborious operations that yield no return at first, it is natural for a farmer to wish for some method of meliorating his ground, and reaping crops at the same time. One very considerable step towards the melioration of ground is its pulverization. This is accomplished by repeated ploughings (s), as already mentioned; especially if performed in autumn, that the ground may be exposed to the winter's frost: but these ploughings yield no crop as long as the field is not sown. By planting in the field, however, those vegetables whose roots swell to a considerable bulk, the ground must constantly be acted upon by the swelling of their roots in all directions: and thus the growing of the crop itself may be equal, or superior in efficacy to several ploughings, at the same time that the farmer enjoys the benefit of it. The plant most remarkable for the swelling of its roots is the potato. They are not, however, equally proper for all soils. In clay they do not thrive, nor are palatable; but in hard gravelly or sandy soils, they grow to a large size, and are of an excellent quality. Turnips likewise contribute to meliorate the ground, by the swelling of their roots. In clay ground, peas and beans thrive exceedingly well, and therefore are proper in this kind of soil as a preparatory for other kinds of grain. These push their roots deep into the ground, and cover it with their leaves, so that the sun has not so much access as when it is covered with crops of grain. Wherever any of these kinds of vegetables are raised, it is observable, that more or less blackness is communicated to the soil: an evident sign of its melioration; this being the colour of the true vegetable mould, or loamy soil, as it is called.

Besides the above-mentioned plants, carrots, parsnips, cabbages, and all those vegetables which sink their roots deep in the ground, answer the same purpose of loosening and pulverizing the earth: but as they will not thrive on ground already well cultivated, they cannot be raised to any advantage for the purpose of meliorating a poor soil.

It has been customary in many places, particularly in England, to sow turnip, peas, buck-wheat, &c. and then to plough them down for manuring the land. This being similar to that operation of nature by which she renders the uncultivated soils so exceedingly fertile, cannot fail of being attended with singular advantages.

In addition to this, it may be proper to remark, that an idea has been entertained with regard to the succession of vegetables to each other, which ought not to be overlooked, as at some future period it may lead to important consequences. It has been supposed, that the roots of plants, or at least of some plants, possess a power of throwing out, as excrementitious, a parting weeds, of the substances which they have taken in, but which are no longer necessary for their subsistence or growth. It is undoubted, at least, that while by some plants the soil seems to be rendered altogether unfit for the to enrich production of certain others, it is rendered by different the soil, plants extremely well adapted to their growth. Thus, wheat succeeds uncommonly well after drilled beans; and these two vegetables have even been repeated for a great number of years in rotation, without any deficiency or failure of crop.

Sect. VI. Of destroying Weeds.

What we have already said regarding the cultivation of the soil, respects only the fitting it for producing all kinds of vegetables indiscriminately. Experience, however, shows, that the ground is naturally much more disposed to produce and nourish some kinds of vegetables than others; and those which the earth seems most to delight in, are commonly such as are of very little use to man; but if neglected, will increase to such a degree, as entirely to destroy the plants intended to be raised, or at least hinder them from coming to perfection, by depriving them of nourishment. The clearing the ground of weeds, therefore, is an article no less necessary in agriculture, than the disposing it to produce vegetables of any kind in plenty.

The weeds may be divided, according to the time Weeds di- of their duration, into annual, or such as spring from vied into a seed, and die the same year; and perennial, that is, annual and perennial, such as are propagated by the seeds, and last for a number of years. The first kind are the least noxious, and most easily destroyed. For this purpose it will be sufficient to let them spring up till near the time of ripening their seed, and then plough them down before it comes to maturity. It is also of service to de- stroy such weeds as grow in borders or neglected corners, and frequently scatter their seeds to a great dis- tance; such as the thistle, dandelion, rag-weed, &c. for these are sufficient to propagate their species through a deal of ground; as their seeds are carried about with the wind to very considerable distances. A farmer ought also to take care, that the small seeds of weeds, separated from corn in winnowing, be not sown again upon the ground; for this certainly happens when they are thrown upon a dunghill; because, being the natural offspring of the earth, they are not easily destroyed. The best method of preventing any mischief from this cause, would be to burn them.

Perennial weeds cannot be effectually destroyed, but by removing the roots from the ground, which is often weeds, how destroyed. a matter of some difficulty. Many of these roots strike so deep in the ground, that they can scarcely be got out. The only method that can be depended upon in this case, is frequent ploughing, to render the ground as tender as possible; and harrowing with a particular kind

(s) This, however, must be understood with some limitation; for it appears from experience, that many tight and thin soils receive detriment rather than advantage from frequent ploughings; particularly in summer, when the sun exhales the nutritive particles in great abundance.
Agriculture.

The thorn, or bramble, spreads its roots very wide; Diseases of
and at the same time sinks them deep in the earth.

Though cut in winter, it rises and comes to such perfe-
ction as to carry fruit in summer. It can only be
extirpated by ploughing up the ground and collect-
ing the roots.

One effectual plan, which, as will afterwards appear, is
practicable in many more situations than it has hi-
destroyed thereto been applied to, for destroying these and all
by flooding other woody shrubs and plants, together with a great
number of weeds, that are of no value upon pasture
grounds, consists of flooding the land, by directing
over it a stream of water. By means of such a device,
all whins and other shrubs are completely rolled and
destroyed.

Sect. VII. Of the Diseases of Plants.

As some of the most valuable kinds of vegetables are
liable to suffer much by diseases peculiar to them,
and medicinal means are of no effect, it is of much
importance to the husbandman to be well
versed in the nature of these diseases, and to adopt
a system for preventing their appearance. Hence it appears
most proper to introduce the consideration of them in this
place before we proceed to the practical part of the subject;
and as wheat is reckoned the most valuable
kind of grain, we shall begin with the diseases to
which it is exposed.

Wheat chiefly suffers from two diseases, the blight
and the mildew. Of the blight in wheat we shall which
give an account upon the authority of an essay by wheat is
Robert Somerville, Esq. surgeon, 1st Battalion 8th
Fencible Regiment, inserted in the communications to
the Board of Agriculture, giving a statement of the
nature and appearance of the blight which occasioned
the failure of the crop in 1795.—When the crop had Blight in
just shaken the flowers, and the grains were beginning to
form, most of them seemingly in a healthy manner,
it was observed that many of the blades and stalks
were rather of a dry green colour, and in two weeks
thereafter appeared upon them great numbers of
small red insects. As the season advanced, these
insects not only increased in size, but became more
numerous, and in almost every field the grain began to
manifest unequivocal symptoms of disease, which were
so formidable, that in many instances a total loss was
dreaded, and in not a few cases, one half of the crop
was actually destroyed. The minute symptoms of
the blight were these:

1st. In the very early stages of the disease, and before
the ear was affected, the blades and stalks were marked
with black and rusty spots. These spots seemed to be
occasioned by a glutinous substance deposited upon them,
easily soluble in water, and which could be readily
washed off by rubbing the stalks with a wet cloth.
Some spots, however, were white, and these seemed to
be owing to wounds or punctures made by vermin;
the leaf having, to a certain extent, in consequence of
these,
Diseases of these, withered and become white. As the season advanced, the black and rusty-coloured spots became larger and more numerous: and when the grain began to ripen, not only the blades but the straw were almost entirely coloured with black spots.

2d. After the crop had begun to shoot, and was in the ear, many of the heads were entirely empty. Where the stalk was green, and to appearance tolerably healthy, but the ear at the same time withered and without grain, the misfortune seemed to have arisen from an injury done to the neck of the ear, at the place of its junction with the stalk. There the outer rind was destroyed all round, which must have cut off the circulation between the ear and the stalk, as happens in trees that have had their bark destroyed all round.

3d. Many of the ears were entirely empty in the upper part, while the lower half was well filled. In these cases, the injury seemed owing to the ring being destroyed about the middle of the ear, at that place which separated the full from the empty part, and was similar to the injury done in the preceding case where the whole ear was destroyed.

4th. In very many cases the ears had a plump well-filled prickles and an empty husk alternately. In these the injury seemed owing to a wound inflicted at the bottom of the empty grains, where they are joined to the stalk, and which had taken place while they were in flower, preventing them from making any farther progress.

5th. Many ears, though not entirely empty, contained only small shrivelled grains, or what are called hungry pickles. These seemed to have escaped any accident till they had made some progress in filling, after which they became stationary and ripened prematurely. On examination they were found to be injured at the place where they were joined to the stalk, in the same manner, as was already mentioned, in the case of those that had empty heads or ears. Like these also the whole ear was in some cases ill filled. In others only half of it was in that state, and in a very great number the ears consisted of a well and ill filled grain alternately. Without a single exception, the whole of the ill filled or hungry grains, were wounded at the place of their insertion into the ear.

6th. A number of ears, though well filled, were opened over the husks found almost entirely covered with black and rusty spots, nearly resembling those already described, and like them also they were easily rubbed or washed off. The downy part of many of these grains, when examined carefully with a good glass, appeared to contain several small white transparent globules, resembling the eggs of insects.

7th. In many fields, especially such as had been followed and well manured for the wheat crop, a great number of plants were entirely withered from top to bottom. The decay in most of these cases, took place when the wheat was beginning to shoot. No injury was visible in these cases upon the blade or stalk, but on examining the roots, a worm was found at every one of them.

Lastly, As the crop began to whiten, the dark or rusty spots on the straw and ears became more numerous, and appeared more conspicuous. In place of put-ting on a white or yellow appearance, the whole crop looked as if it had been sprinkled with soot.

The whole of these symptoms appeared to arise from the attack of an insect, and from the injuries and depredation which it committed upon the plants. This insect, when first distinguishable by the eye, was of a red colour, and so soft as to be killed by the slightest pressure. As it increased in size the colour gradually changed to a dirty black, at which it became stationary. During its growth it lost its soft texture, and in proportion as its colour darkened it became hard, and as it was covered with a crust or shell upon the back. It is said to be not uncommon, and to be met with at all times, even in the best fields of wheat, though its numbers are infinitely increased in late wet seasons. From its eggs appearing to lodge upon the well-filled ears of the grain, it may be considered as in danger of being propagated to the succeeding crop. On this account our author hazards some conjectures upon the best means of preventing future danger from it. One of these consists of the use of lime mixed up with all manure, with a view to prevent insects from being generated in it. It is also suggested that the manure, by means of which slugs and worms are chiefly supposed to be produced, ought not to be plowed into the ground in autumn, but applied as a top-dressing in the spring, because it is understood that manure, exposed to the sun and air, has much less tendency to foster insects, than when it is covered up in the earth.

Another disease, which is much more destructive to wheat, and much more frequently met with, is the mildew, or black, or red mildew. It is of two kinds, the black and the red. In both cases it consists of a quantity of seemingly coarse powder attached to the grain in the ear, or loosely surrounding it; in consequence of which it is evidently prevented from filling or arriving at perfection. The black kind of mildew is by far the most frequent and the most pernicious. It is most generally known in England by the name of smut, and in Scotland by that of the black, both of which are sufficiently expressive. Concerning the cause of this disease various opinions have been entertained. Dr Home, in his Principles of Agriculture and Vegetation, ascribes it to an over luxuriance of growth. He is of opinion, that too great an abundance of juices in a vegetable will produce diseases similar to those occasioned by repulsion in animal bodies, viz. stagnations, corruptions, varices, carbuncles, &c. along with the too great luxuriance we have just now mentioned, which is expresses by "too great an abundance of water shoots." Hence he is induced to class the smut among diseases arising from this cause, it being a corruption happening most in rainy seasons and to weak grain. Like other contagious diseases, he tells us, the smut may be communicated from the infected to healthful grain. As a preventive he recommends steeping the seed in a strong pickle of sea salt. Besides the effect which this has upon the grain itself, it is useful for separating the good from the bad; the best seed falling to the bottom, and the faulty swimming on the top of the liquor.

Independent of this notion of an over luxuriancy of Opinions growth, it may be observed, that two opinions have concerned chiefly been supported by persons who have speculated the case of mildew. One opinion is, that the
Theor.

Diseases of plants.

pickles before it is sown, with a view to the destruction of such insects.

It is to be remarked, that in all countries a great variety of these pickles has been contrived, with a view to prevent the existence of smut in wheat, some of which we shall now mention. One of the most common is the salt pickle, consisting of a solution of common salt in water, of such strength as that an egg will swim in it. To the wheat, after it has been washed in this pickle, and the light grains removed, some new slaked lime is added, and carefully mixed with it with a wooden shovel, till it attain a sufficient degree of dryness, in which state it is committed to the earth. A pickle consisting of very stale urine has also been recommended to be used for washing wheat that is meant to be used as seed. It is attended with this disadvantage, however, that if the urine is too strong, and if any length of time is suffered to elapse, in consequence of rain or other accidents, before the grain is sown, its vegetable power is said to be greatly injured by the corrosive quality of the volatile alkali with which such urine abounds. This is more particularly the case when quicklime is added to the urine; as the alkali is then brought into a caustic state.

Another pickle has been proposed to the Board of Agriculture by an Italian physician, J. B. Scandella. It is prepared and used in the following manner:

Take of nitre, three pounds; alum, one pound; vitriol, six ounces; verdigris, three ounces; wood-ashes, well sifted, six pounds; boil the whole in a copper with five pails of water for an hour, then remove them from the fire, and pour them into a large vessel; then add sixteen pails of water, in which half a bushel of quicklime has been previously dissolved: mix the whole intimately, and allow them to stand till they are quite cold. In this steep two bushels and a half of wheat are to be plunged, and left for about six hours, stirring it up frequently with a wooden shovel, and skimming off what rises to the surface; the wheat is then to be withdrawn, and spread out till it is dry enough for sowing. The process is thus to be continued until the whole quantity of seed intended to be sown is pickled. The above steep is generally sufficient for preparing about twenty-four bushels of wheat.

Another pickle has been recommended, consisting of a decoction in water of Barbadoes aloe, tobacco, and hellebore powder. A committee of the Royal Society of Agriculture at Paris, in 1786, recommended the following pickle for the same purpose, contrived by M. Tillet:—Pour upon 50 pounds of wood-ashes, 900 pints of water; stir it well for three days, and then draw off. Wash the black wheat in so many clear waters as not at last to dirty it. Heat the lye, so as just to bear the hand in it; shake in the hot lye one pound of lime to every seven or eight pints of it. In the preparation dip the seed in baskets many times. For want of wood-ashes use potash, seven or eight pounds for 100 pints of water.

In addition to these it may be remarked, that a solution of arsenic in water is made use of in some counties of England, as a pickle in which they wash or steep the grain previous to its being sown, for the purpose of protecting the future crop against smut.

The most complete set of experiments, however, which
Diseases of which we have met with upon the subject, was made by Arthur Young, Esq. at present secretary to the Board of Agriculture. December 7, 1787, he sowed 14 beds with the same seed wheat as black with the smut as any he ever saw.

**No. 1. Sown dry, nothing done to it.**
1. Washed well in clear water.
2. Washed in lime-water.
3. Washed in lye of wood ashes.
4. Washed in an arsenic and salt mixture.
5. Steeped in lime-water four hours.
6. Ditto in the lye four hours.
7. Ditto in the arsenic four hours.
8. Ditto in lime-water 12 hours.
9. Ditto in the lye 12 hours.
10. Ditto in the arsenic 12 hours.
11. Ditto in lime-water 24 hours.
12. Ditto in the lye 24 hours.
13. Ditto in the arsenic 24 hours.

**RESULT.**

A proposal has also been made, to destroy by means of heat the insects which are supposed to propagate the disease called smut from the seed wheat to the future crop. The following directions for that purpose are extracted from the Agricultural Survey of the County of Clarkmannan, by J. F. Erskine, of Marr, Esq.:

"Let the wheat be laid upon the kiln, about three or four inches thick; the kiln to be heated middling strong with blind coal; the wheat to continue on the kiln for 24 hours, but turned frequently. After taking it off the kiln, it must be allowed 24 hours to cool; during which time it must be frequently turned; then put it through the fanners once or twice. After the wheat has lain a few hours on the kiln, and the fire begins to have effect, a great number of very small worms, formerly undiscovered by the eye, appear on the top of the grain, and are soon destroyed by the heat. These come from blacked wheat, or other corns, that could not be suspected to be indifferent; or may lie in or on good wheat; which worms continuing (when not thus killed), might consume the corn after it is thrown into the earth, thereby checking the growth entirely, or preventing it from having the strength it otherwise would have to bring forth a strong productive stalk. This practice is said to have been brought from Ireland, and is recommended as preferable to pickling. It might perhaps be performed with greater success by the use of a kiln heated by the steam of boiling water, in the way already mentioned, as such a kiln would instantly afford a fixed and known degree of heat, which could in no case be exceeded."

After all, however, both from the reason of the thing, and from the concurring opinion of the most experienced and intelligent farmers, we think ourselves authorized to say, that the husbandman will act imprudently if he place entire and complete confidence in any one of the remedies above mentioned. His safest and best plan for procuring crops of wheat free from smut is this: In the first place, he ought to procure seed from a situation in which the grain has risen absolutely free from this disease. He ought next to exert the greatest care in cleaning out, in the most anxious manner, his whole barns and their floors, and every place within doors into which his grain may come, and in which diseased grain has formerly been kept: with this view it may probably be necessary to whitewash the walls with a mixture of quicklime and water, which will prove an effectual remedy. After having adopted these precautions, it may still be necessary, with a view to secure a sound and full crop, to plunge the seed into a strong pickle of salt and water, with a view to float the lighter grains, which ought to be skimmed off and laid aside for poultry, to which they may be given after being washed in fresh water.

The want of nourishment in plants may be easily known by their decay; in which case, the only remedy is, to supply them with food, according to the methods we have already directed, or to remove from their neighbourhood such other plants as may draw off the nourishment from those we wish to cultivate.—In the Memoirs of the Academy of Sciences for 1798, Mr. Villeneuve mentions a disease, which he calls écorce, and to which attacks saffron in the spring. It is owing to another plant, a species of trefoil, fixing some violet-coloured threads, which are its roots, to the roots of the saffron, and sucking out its juice. This disease is prevented by digging a trench, which saves all the unaffected.

The bad qualities, and unequal distribution of the juices of plants, are the occasion of so few of these diseases to which vegetables in this country are subject, that we forbear to mention them at present. Most of the diseases of plants are owing to external accidents, particularly to the depredations of insects.—The insects by which the greatest devastations are committed in this country are, slugs, caterpillars, grubs, and flies. The slugs and caterpillars feed on the leaves and young shoots; by which means they often totally destroy the vegetable. Where the plants are of easy access, these insects destroy and devour may be destroyed by sprinkling the vegetable strewed by with lime-water; for quicklime is a mortal poison to creatures of this kind, and throws them into the greatest agonies the moment they are touched with it. On trees, however, wherever this method cannot so well be followed, fumigation is the most proper; and, for this purpose, nothing is better than the smoke of vegetables not perfectly dry. In some cases the eggs of these destroying creatures may be observed, and ought without doubt immediately to be taken away. On the fruit trees, as apples, pears, medlars, on some forest trees, the oak and draf maple especially, and the white and black thorn in hedges, a kind of little tufts are to be observed, resembling at first sight withered leaves twisted by a cobweb, about the uppermost twigs or branches.
The sweet smell of the turnip has been thought to attract the fly; upon which supposition, the remedy appeared to consist in overpowering that smell by one which is strong, fetid, and disagreeable. Hence it has been recommended that upon an acre of turnips sown in the usual way, a peck or more of dry soot be thrown after the ground is finished, and in an regular a way as he sows the seed.

Some time ago an insect, called the corn butterfly, committed such ravages while in its vermicular state, that it was called the corn bug, in France, that upwards of 200 parishes were ruined by it; and the ministry offered a reward to the discoverer of an effectual remedy against this destroying worm. The cure which was at last discovered was, to heat the corn in an oven so much as not to destroy its vegetative power, but sufficiently to destroy the small worms which made their nest in the substance of the grain, and at last ate out the substance so completely, that nothing could be got from the husk even by boiling it in water. It is certain, that enough insects can bear a great deal of cold; they are easily destroyed by a slight degree of heat; nor is the vegetative power of corn easily destroyed, even when kept for a long time in a pretty strong heat. This method must therefore be very effectual for destroying all kinds of insects with which grain is apt to be infected: but care must be taken not to apply too great a heat; and the adjusting of the precise degree necessary to destroy the insect, without hurting the corn, will be attended with some difficulty.

The curled disease in potatoes has long been a subject of investigation and experiment among farmers; disease in and the knowledge of its cause and cure seems yet to remain a desideratum. The Agricultural Society at Manchester, a few years ago, offered a premium for discovering by actual experiment the cause of the disease in question; and a great variety of letters were in consequence addressed to them upon the subject.—As these contain many interesting observations both on the disease itself, and the best methods hitherto adopted for preventing it, the following abstract of them may not improperly be introduced in this place.

I. According to the writer of the first letter, this various disease is caused by an insect produced by frost or bad methods of keeping before setting; and the newest kinds, such as prevention, have been raised within these nine or ten years, are most apt to curl, because they will not stand to be kept in winter and spring before setting, as the old kinds will. In autumn 1776, he got up a bed of potatoes to lay by in winter, leaving plenty in the ground as regular as possible; and, before the severity of winter came on, covered part of the bed with straw and pease-haum, and left the other part of the bed uncovered. That part of the bed which was covered was quite free from curled ones; but the uncovered part produced a great many curled, owing, as the writer says, to frost and severity of the weather.

II. This writer had about a quarter of an acre of potatoes, well manured with cow and horse dung, and took the greatest care in picking the fine smooth-skinned potatoes for sets; yet nine out of ten parts were curled. He attributes the cause of this disease to a white grub or insect, which he found near the root, about half an inch long, with eight or ten legs, its head brown and hard; as, upon examining a number of the curled roots, he
he found them all bitten, chiefly from the surface to
the root, which of course stopped the progress of the
sap, and threw the leaf into a curl. The uncured
roots were not bitten. He tried a few experiments as
follows:—First, he put root to the insects in the rows
for two days; and after that, he put time to them for
the same time, but they still kept lively; next he put
a little salt, which destroyed them in a few hours.
From which he infers, that if coarse salt were put into
the ground at the time the land is preparing for pota-
toes, it would effectually cure this distemper.

III. In this letter, the cause of the disease is attrib-
uted to the method of earthing the stems while in cul-
tivation; and the branch, striking root into the new
earthed-up soil, it is said, produces potatoes of such a
nature as the year following to cause the disease com-
plained of.

To prevent the disease, it is recommended to take
the sets from those potatoes that have not bred any
from the branch covered; or, otherwise, to dig the part
the sets are to be raised from.

IV. According to this writer, the disorder proceeds
from potatoes being in old-tilled or worn-out ground;
for though these potatoes may look tolerably well, yet
their sets will mostly, if not all, produce curled potatoes.

Hence he is convinced, that no sets ought to be used
from old-tilled or couch-grass land; and that in order
to have good sets, they should be procured from land
that was purposely fallowed for them; from fresh ley
land, where they are not curled; or from ley land that
was burnt last spring. He directs to plant them on
virgin mould, and the potatoes will have no curled ones
amongst them; and to keep them for winter, from any
other kind.

To avoid the uncertainty of getting good sets, he
recommends crabs to be gathered from potatoes grow-
ing this year on fresh land free from curl, and the next
spring to sow them on fresh ley land; and continue to
plant their sets on fresh ley land yearly, which he is
convinced will prevent the curl.

All the good potatoes he saw this year, either on
fresh ley land or on old-tilled land, were raised from
sets that grew upon fresh ley land last year; and where
he has seen curled potatoes, he found, upon inquiry,
the potato sets grew upon old-tilled and worn-out land
last year. He gives as a general reason for the disor-
der, that the land is oftener cropt than it had used to
be, much more corn being now raised than formerly.

V. In 1772, this writer planted some potatoes by
accident full nine inches deep: when taken up, many
of the plants were rotten, and a few curled. He kept
the whole produce for seed, and planted two acres with
it in 1773, not quite six inches deep. The crop was
amazingly great; and he did not observe any curled
plants among them. In 1774, many of these were
planted in different soils; yet they were so infected
with the curled disease, that not one in twenty escaped.
In 1775, the complaint of this disease became general.
In 1776, it occurred to him that the good crop of
1773 was owing to the accidental deep setting of
1772; and that the reason why the same seed became
curled in 1774, was their being set so near the surface
in 1773; and attributes the disease to the practice of
ebb setting. In 1777, he took some potatoes from a
crop that was curled the year before, and after cutting
the sets, left them in a dry room for a month. Half
were planted in ground dug fourteen days before; the
other half, having been steeped in a brine made of
whistler's ashes for two hours, were also planted on the
same land at the same time. The steeped ones came
up ten days before the others, and hardly any missed or
were curled. The unsteeped ones generally failed, and
those few that came up were mostly curled.

He therefore advised as a remedy. 1. That the pota-
toes intended for next year's sets be planted nine inches
deep. 2. That they remain in the ground as long as the
season will permit. 3. That these sets be well defended
from frost till the beginning of March. 4. That the
sets be cut a fortnight before planting. 5. That they
be steeped, as above, two hours in brine or lye. 6. That
the dung be put over the sets. And, 7. That fresh sets
be got every year from sandy soils near the coast, or on
the shore.

P.S. At planting, the hard dry sets should be cast
aside, for they will probably be curled. Curled potatoes
always proceed from sets which do not rot or putrify
in the ground.

VI. This writer had five drills of the old red pota-
toes, and four of the winter whites, growing at the same
time in the same field. The drills were prepared ex-
actly alike. Among the red not one was curled; the
winter whites were nearly all curled. He says he has
found by experience, that the red never curl.

VII. Two of the writer's neighbours had their sets
out of one heap of potatoes. They both set with the
plough, the one early, and the other late, in the season.
Most of those early set proved curled, and most of those
set late smooth; the latter on clay land.

A few roods of land were also planted with small
potatoes, which had lain spread on a chamber floor all
the winter and spring till the middle of May. They were
soft and withered: they proved smooth and a good crop.
Middle-sized potatoes, withered and soft, which had
been kept in a large dry cellar, and the sprouts of which
had been broken off three times, produced also a smooth
good crop.

Hence he was led to think superfluity of sap, occa-
sioned by the seed being unripe, might cause the disease.
To be satisfied in this, he asked the farmer whether he
had set any of the same potatoes this year, and what
was the nature of his land? He told him "he had
that they had been set on his farm fourteen years with-
out ever curling; that his soil was a poor whitish sand,
of little depth; that he let those he designed for keep-
ing grow till they were fully ripe."

Hence he concludes, the only sure way to prevent
the curl is, to let potatoes intended for seed stand till
they are fully ripe, and to keep them dry all winter.

VIII. This writer set a quantity of the red potatoes,
without having a curled one amongst them. His meth-
ond is, when the sets are cut, to pick out such as are
reddest in the inside. On digging them up at Mi-
Chaelmas, he mixes none of the curled seed among the
others. The curled are easily distinguished, by their
stalks withering two months before the rest of the
crop.

The cause of the curled disease he attributes to pota-
toes being of late years produced from seed instead of
roots as formerly. Such will not stand good more than
two or three years, use what method you please.
DIAGNOSIS OF SPRING HE SET THE OLD RED AND WHITE RUSETTS, AND HAD NOT A CURLED POTATO AMONGST THEM.

On the limestone land about Denbigh, in North Wales, they have no curled potatoes. If this be owing to the nature of that land, perhaps lime might prevent the disease.

IX. According to this writer, all sorts of grain wear out and turn wild if sown too long on the same land; the same will hold good in all sorts of pulse, pease, beans, and (as he conceives) potatoes. It generally happens, that those who have most curled potatoes plant very small sets.

Eleven years ago he bought a parcel of fresh sets, of the golden-dun kind, and has used them without change to the present year, without any being curled. This he principally attributes to his having always planted good large sets.

About four years since, he thought of changing his sets, as his potatoes were too smooth, too round, and much diminished in size. But the curl at that time beginning to be very alarming, he continued his sets till part of his crop missing last year, he was obliged to buy new sets this spring, which being small, were curled like other people's.

He allows, that the curl has frequently happened to persons who have used large potatoes for sets; for, as all roots are not equally affected, some curled ones may be mixed with the rest.

To prevent the evil, cut your sets from clear and middle-sized potatoes, gathered from places as clear of the curl as possible; preserve them as usual till spring. If any are harder, or grasher more in cutting than usual, cast them aside. He would also recommend the raising a fresh sort from the crab produced on the sorts least affected, which in Lancashire are the long-duns.

X. Set potatoes with the sprits broke off, and they will (says the writer of this letter) be curled ones; if set with the sprits on, they will not be curled. Again, take a potato which is a sprit, and cut a set off with two sights; break one sprit off, and let the other stay on, and set it; the former will be curled, and the latter will not.

When you have boiled your potatoes, take them out before they are sprit, and lay them dry until you have set or sown them, and you will have no curled potatoes.

XI. This writer was at the expense of procuring sets at 50 miles distance, and where this disease was not known. The first year's trial was successful; the year following he procured sets from the same place, but one-fifth of his crop was infected. By way of experiment, he planted sets from roots which had been infected the year before, and some of these produced healthy plants, free from all infection.

As every effect must have a cause, he supposed it might be some insect, which, living on the leaves, gave them that curled and sickly appearance, as is the case in the leaves of many shrubs and trees. But whether the insect is lodged in the old sets, and to be destroyed at the time of planting, or, proceeding from some external cause, can only be destroyed afterwards, he is not yet certain, although he has made the following experiments.

On a piece of ground that had not been dug for 20 years, he planted four rows of sets, which he knew to be perfectly clear; the drills were two feet distant; the disease of sets one foot distant in each drill. He then planted on the same ground four rows with sets from curled potatoes, at equal distances; in each row were about 20 sets.

Lot 1st, The curled sets.

No. 1. Without manure.
No. 2. In salt.
No. 3. In soot.
No. 4. In quicklime.

Lot 2d, The clear sets.

No. 1. Without manure.
No. 2. In salt.
No. 3. In soot.
No. 4. In quicklime.

Those planted in salt and soot in both lots were destroyed. In Lot 1st, No. 1 and 4 all curled. Lot 2d, No. 1 and 4 quite clear.

This experiment was made on a supposition that the insect lodged in the set, and must be destroyed on planting. But of that he is not fully satisfied. He repeated salt, soot, and quicklime, on the branches of several curled potatoes. Salt destroyed all he touched with it. Lime and soot had, he thought, a partial effect on the plants. After some time, they appeared almost as healthy as the rest. Thus, although he had done little towards the cure, he flatters himself he has pointed out the cause, the insects on the curled plants being not only very numerous, but visible to the naked eye.

XII. This writer ascribes the cause of the disease to the frost, and bad keeping-in winter and spring before setting. They are liable to be damaged by frost after they are set; but this may be prevented by covering. If it be asked, why frost did not injure them formerly? he answers, it is only the new kinds which are apt to curl. To this may be added, that less care is now taken of the seed than formerly. To prevent the latter, let them remain in the ground covered with baulm or litter till the time they are wanted for setting: and, in case no frost touches them afterwards, they will be free from the disease.

XIII. This writer says, the red potato was as generally planted as the winter white and the Lincolnshire kidney were now. The first, being a late potato, did not sprout so early as the others. The white sprout very early, and therefore should be first moved out of the place where they have been preserved in the winter. Instead of that, they are often let remain till their roots and sprouts are matted together. On separating them, these sprouts are generally rubbed off, and they are laid by till the ground is ready; during which interval they sprout a second time: but these second sprouts, being weak and languid, will shrink, sicken, and die; and the fruit at the roots will be small, hard, ill-shaped, and of a brown colour.

Now, if putting off the sprouts once or more, before the sets are put in the ground, be the cause (as he verily believes it is) of the curled disease, an easy remedy is at hand. When the potatoes intended for sets are dug up, lay them in a west aspect as dry as possible: in such a situation they will not sprout so soon. The best time for removing most sorts, is the first fine day after the 24th of February. Cut them into sets as soon as possible, and let them remain covered with dry sand till the ground is prepared, which should be a winter fallow. Lay the sets in without breaking off any of the sprouts, for the second will not
This accounts for one sprout out of three from the same set being curled. The two stems not curled rose from two later eyes, and were first sprouts. The sprout curled was a second, the first having been rubbed off.

XIV. This writer says, that last spring one of his neighbours cut and set, in the usual way of drilling, some loads of the largest potatoes he could procure; and more than half of them proved curled. Being a few sets short of the quantity wanted, he planted some very small potatoes which he had laid by for the pigs. These being fully ripe and solid, there was not a curled plant among them. He apprehends, the others being curled was owing to their not being fully ripe. A crop of potatoes, set this year in rows, on ground that had borne a crop of them last year, were mostly curled; but many plants came up from seed left in the ground last season, and there was not a curled one among them.

XV. Of late years, this writer says, great improvements have been made in setting potatoes and cutting the sets. The ground is dressed cleaner and dunged stronger. Many people, in drilling, wrap up the sets entirely in the dung; by which means, though their potatoes are larger, the disease seems to be increased. They also cut their sets out of the richest and largest potatoes, which is perhaps another cause of this evil. In cold countries, where they set their own seed, which has grown on poor land, with less dung, they have no curled plants. On the contrary, when they bought rich and large potatoes for seed, they have been curled in great quantities. He believes, the richness and largeness of the seed to be the cause of the evil; for he does not remember to have seen a curled stem which did not spring from a set of a large potato.

XVI. This writer apprehends the curled disease in potatoes to proceed from a defect in the planta seminalis, or seed plant; and from comparing curled ones with others, there appeared to be a want of, or inability in, the powers of expanding or unfolding the parts of the former; which from this defect, forms shrivelled, starved, curled stems. On examining some of the sets at the time of getting the crop, he found them hard and undecayed; so hard, indeed, that some of them would not be soft without long boiling. This led him to think, that some manures might have the same effect on them as tanners' oozes has on leather, and so harden them, that the embryo plant could not come forth with ease; but a closer examination taught him otherwise, and that they grow equally in all manures.

Some have thought that the fermentation is occasioned by too great quantities being heaped together; but the writer has seen an instance, wherein a single potato preserved by itself, when set, produced stems of the curled kind. He thinks the most consistent and rational opinion is, that the disease is occasioned by the potatoes being taken from the ground before the stamen, or miniature plant, is properly matured and ripened.

For let it be observed, that the potato, being a native of a warmer climate, has there more sun, and a longer continuance in the ground, than in its present exotic state, consequently it has not the same natural causes here to mature the seed plant as in its native state. We ought, therefore, to give all the opportunities our climate will admit for nature to complete her work, and fit the stamen for the next state of vegetation, especially in those intended for seed. But if the potato be taken up before the seed-plant be fully matured, or the air and sap vessels have acquired a proper degree of firmness or hardness, it must, when thus robbed of further nutrition, shrivel up; and when the vessels, in this immature state, come to set again in the second state of vegetation, they may produce plants which are curled.

If it be asked, why are they more common now than formerly? he answers, that before the present mode of setting them took place, people covered them, while in the ground, with straw, to protect them from frost.

If it be asked, why one set produces both curled and smooth stems? he answers, we suppose every eye to contain a planta seminalis; that all the embryos, or seed plants, contained in one potato, are nourished by one root; and that, as in ears of corn, some of these seed plants may be nourished before others.

One of his neighbours, last year, set two rows of potatoes, which proving all curled, he did not take them up; and this year there is not a curled one among them. Such potatoes, therefore, as are designed for seed, should be preserved as long in the ground as possible.

XVII. This writer advises such sets to be planted as grow in moss land; and, he says, there will not be a single curled one the first year. This is affirmed by the inhabitants of two townships, where they grow amazing quantities. A medical gentleman sowed last year two bushels of sets from one of the above places, and had not one curled; but on sowing them again this year, he had a few.

Notwithstanding there seems to be a diversity of opinions in the above writers, occasioned by the different appearances of their crops, and the seemingly contrary effects of the means used to prevent or cure the disease, we conceive that the following general propositions may be fairly drawn from the whole. 1. That some kinds of potatoes are (cassiteris paribus) much more liable to be affected by the disease than the rest; and that the old-red, the golden-dun, and the long-dun, are the most free from it. 2. That the disease is occasioned by one or more of the following causes, either singly or combined: 1st. By frost, either before or after the sets are planted: 2d. From planting sets out of large unripe potatoes: 3d. From planting too near the surface, and in old worn-out ground: 4th. From the first shoots of the sets being broken off before planting; by which means there is an incapacity in the planta seminalis to send forth others sufficiently vigorous to expand so fully as they ought. 5. That the most successful methods of preventing the disease, are cutting the sets from smooth middle-sized potatoes, that were fully ripe, and had been kept dry after they were taken out of the ground; and without rubbing off their first shoots, planting them pretty deep in fresh earth, with a mixture of quicklime, or on limestone land.

A correspondent of the Bath Society is convinced, that, whatever may be its cause, the fault itself is inherent...
Diseases of Plants.

I made a hot-bed in the following manner (which method I have used ever since): I laid horse dung, &c. (as is generally used in making hot-beds), about 18 inches thick; over which I spread a layer of fine rich mould about four or five inches thick: upon the top of this mould I laid, in different divisions, a certain number of potatoes of various sorts, some of my own growth, and others brought from different parts, and covered these lightly over with more mould; they soon came up. I then observed which was freest from the blight or curl; for if there were not more than one defective in forty or fifty, I concluded I might set of that sort with safety. This method I have now practised near twelve years, and never lost my crop, or any part thereof worth mentioning; whilst my neighbours, who followed the old method, were frequently disappointed in their crops; and to the best of my knowledge, all those of my neighbours who have of late been persuaded to take the trouble of using the same means as myself, have never failed of success to their utmost wishes in one instance; nor do I ever think it will fail, if duly attended to; the fault being some hidden cause in the seed unknown at present, and I believe incurable by any means, at least which have yet come to my knowledge. My reason for planting my hot-beds so soon is, that if the frost hinders the first experiment, or they all prove bad, I may have time to make a second or third, if necessary, with different sorts of seed, before the proper season arrives for planting in the fields and grounds appointed for the great and general crops.

In addition to the interesting information upon this subject, which has been obtained by means of these societies, various other speculations about the cause and cure of this disease have of late been introduced to the notice of the public. In particular it has been strongly urged, that the disease is almost always occasioned by insects. It is said, that on looking at the roots of such potatoes as grow up curled, it will usually be found, that the bearing plant is devoured and excavated by slugs, centipedes, or beetles. Sometimes also, though more rarely, the curl is supposed to arise from the leaves themselves being infected with minute animalculae. Hence, in rich soils in the neighbourhood of cities and well-manured gardens, the potatoes are most subject to the curl, because such insects as devour the seed abound most in these soils. The insects are thought to prefer one potato to another. They will hardly touch a yam. A potato from a late part of the country, which has been hardly ripened, the vermin do not seem to like; but a potato that has been somewhat sweetened or mellowed by the frost, is supposed to be greedily devoured by them.

An ingenious notion concerning the cause of the disease has been suggested from attending to the history of the plant in this country. The potato plant was introduced into the island of Great Britain from a mate much warmer than ours, as early as the reign of Queen Elizabeth; but it is a singular circumstance, that the curled disease did not make its appearance till within less than 40 years ago. Indeed, the disease is said to have first occurred in the year 1764, in the very district of Lancashire where potatoes had been first cultivated. It is also said, that the Surinam potato and some other kinds which have been more recently introduced into our climate, have never yet exhibited any symptom of the curl. It is farther said, that till within these 40 years the potato plant never brought its seeds to maturity in this country, though the roots were in full perfection; that the Surinam potato and others lately introduced do not as yet produce perfect seeds at the top of their stem; and that potatoes, which have been cultivated for a length of time in bleak and mountainous situations, are still in the same state, and do not bring their seeds to maturity. Hence it is endeavoured to be inferred, that there exists a connexion in the nature of the plant between this disease and the state of maturity to which the seed is brought. It is supposed, that the plant is unfit at once to afford mature and perfect seed at the summit of its stem, and also roots capable of propagating it in perfection. From these premises it is suggested, that to prevent the curl, it will be necessary to procure seed potatoes from mountainous situations into which the disease has not yet come, because the plant has never produced perfect fruit at the summit of its stem; or an attempt may be made to procure more perfect seed from the ordinary kind of potatoes, by destroying the flowers, which may have the effect to prevent the plant from being exhausted by bringing to maturity both fruit at its summit and roots at its bottom. Lastly, It has been supposed, upon these principles, that the disease may be prevented by rearing potatoes from the seed produced at the summit of the stem; the mode of practising which will afterwards be explained.

In the mean time, it may be observed, that the subject has been farther discussed, in a less speculative manner, by an anonymous correspondent of the Board of Agriculture *. This gentleman does not consider the curl as a specific disease, but as an accidental debility of those plants in which it occurs; that we are not, therefore, to seek for a cure or preventive in a change of seed alone, as many have all along done, but in complete attention to all that experience shows to be necessary to an accurate culture, and to their perfect growth. In this way alone, he thinks, there is reason to expect that this very useful article of human food may be cultivated with the same success as before its dreadful enemy the curl made such havoc in our crops, as of late years it certainly has done. He describes the disease as occurring, in Mid-Lothian, most frequently from the following causes: 1st. From planting potatoes on soils altogether unfit for them. Being unable to penetrate a stiff soil, potatoes require a light, pervious, or open mould. For a long period after potatoes first appeared in the country, this circumstance was carefully attended to. They were planted entirely with the spade, in the lightest spots upon every farm. Hence, the plants rose vigorous, and no curl was seen; but on farmers wishing to extend the culture of potatoes, they attempted to plant them on every soil, without regard to its nature or tendency to produce this crop. 2dly. Imperfect culture is described as a frequent cause of curling. A crop of potatoes is commonly strong, abundant, and free from curl, in proportion to the previous culture given to the soil, and the care taken to keep it clean after they are planted. Hence, it frequently happens, that while a farmer who cultivates this root in a negligent
Diseases of Plants.

Agriculture.

Theory.

of two months, those at 16 and 18 inches deep

found unchanged; while some of those at

depth of 12 and 14 inches, had put forth some feeble

germ not exceeding the length of an inch. Those

planted at 3 and 4 inches were evidently the strongest

during the whole season, and their roots largest. Hence,

to procure an early, abundant, and healthy crop, 3

inches appears to be the best depth for planting pota-
toes. 9thly, Whatever injures the new sets or the gerns

afterwards may produce curl; such as the trampling of

horses feet at the time of planting; their being par-
tially covered with stones or hard clods of earth; deep

harrowing, when the young shoots are advancing; and

grubs, snails, or insects attacking the gerns at first, or

the stems afterwards. Hence, 8thly. The curl was pro-
duced to an uncommon degree upon a field of stiff land,

by passing a roller over it, about a fortnight after plant-

ing. 9thly, The state of the weather when the crop

is young may produce the curl. Rain alone will not

do so, if it be not allowed to lodge; but a long con-

tinuance of dry weather, especially with cold winds,

when the shoots first appear, is apt to produce this
disease, and also hoar-frost in this early state of the
crop. Hence, it is thought that the three first weeks
of April answer best for planting potatoes in the south
of Scotland and north of England, as they do not, in
that case, appear till the middle or end of May. From
all these remarks it is concluded, that though with the
best management the curl can never be completely ba-
nished from our fields, yet with due attention to the
leading points above mentioned, it may be prevented
from being attended with any serious mischief.

As no information upon this interesting subject
ought to be overlooked, we think it necessary to state,
that the following plan for preventing the curl in po-
tatoes has very recently been laid before the public,
by an anonymous correspondent of the publishers of
the Farmer’s Magazine, who asserts, that he has adopt-
edit with complete success. It consists of using for
seed what are called potato beans. These beans are
dark brown excrescence, larger than a horse bean,
which grows near the ground, on the haulm or shaw,
generally, it is supposed, where it has been broken or
wounded. They are shaped like potatoes, and have a
number of eyes, from one of which grow two small
leaves. It is said, that eight or ten years ago, several
of these potato beans were planted merely to try if
they would grow, and that they produced a great num-
ber of common sized potatoes, but of a bad quality.
These potatoes, however, being cut and planted next
year, produced potatoes of an excellent quality, and in
great plenty. Since that time a number of beans have
always been planted sufficient to produce enough of
potatoes for next year’s seed. They are planted at the
same distance, and treated in every respect in the
same manner with common sets; and their produce is
equally plentiful. No other change of seed has ever
been necessary.

Sect. VIII. Of the Obstacles to Agricultural

Improvement.

Before proceeding to the practical part of the sub-
ject, it may be proper to take notice of some of the
moral and political circumstances which resist the pro-
gress of art.
Theory. AGRICULTURE.

Obstacles to Agriculture.

One of the first and most obvious obstacles to the improvement of this or of any other art, consists of the ignorance of its practitioners, or of its being carried on by persons of an illiterate and unintelligent character, who are unable to take a comprehensive view of the principles of their profession, or who have not sufficient curiosity to inquire after the best modes of practice, or understanding to discern the value of any new practices that are explained to them. It ought never to be forgotten, that the art of the husbandman is an intricate and extensive one, and that one of the chief circumstances which has hitherto prevented its improvement has arisen, as already mentioned, from the secluded situation of persons engaged in it. They are scattered over the face of the country, instead of being collected together like other artists in towns, so as to be enabled to derive aid from each other's experience. Fortunately this difficulty is passing away, in consequence of the diffusion of agricultural knowledge, by means of the great number of publications upon that subject which are gradually introducing themselves into the remotest corners of the country. Persons receiving a liberal education, particularly at the university of Edinburgh, have now also an easier opportunity than formerly of acquiring a knowledge of the principles of this art, in consequence of the establishment of a professorship of agriculture, which has been endowed by a private gentleman, Mr Pulteney. Even with all these advantages, men, and not are by the exertions of the Board of Agriculture, it can never be expected that this art can reach its ultimate degree of perfection, unless a considerable number of the persons engaged in it are men of intelligent characters and good education, who will call in the improvements which are making in other sciences, as well as in this art, in distant countries, to the assistance of their personal experience.

A second obstacle to agricultural improvement consists of the poverty of the husbandman, or of his want of capital, to enable him fully and completely to labour the soil, and provide materials for its amelioration. Complaints have often been made, with little reason, of the obstinacy of farmers, and of the tenacious manner in which they adhere to old practices, though demonstrated to be improper: But a poor man cannot afford to make experiments, or to hazard the loss of a crop for the chance of obtaining a more valuable one by some untried practice. In consequence of want of capital, large portions of territory remain in some parts of the country in a state of nature, and consequently unproductive, both to the occupier and to the proprietor. Both landlords and tenants, therefore, ought to know, that a man who engages in agriculture without a sufficient capital takes up a bad trade, in which something may be lost by both parties by the deterioration both of the soil and of the stock upon it, but from which neither the public nor themselves can derive profit.

A third obstacle to agricultural improvement sometimes arises from the possessor of the soil not having a sufficient interest in it. In barbarous nations, lands are often possessed by communities as an undivided property, without any individual member having an exclusive right to a particular spot. In such cases the worst kind of agriculture must always prevail, for the same reason that public affairs are always worse managed than the affairs of private persons, who find their industry stimulated not merely by a sense of duty, but by the influence of avarice, and of all the other selfish passions. Considerable portions of territory in England still remain withheld from the exertions of an improving agriculture by this state of property. But, even where the cultivator in the soil is exclusive, it may still be too limited. Where a landlord is prevented by an entail, or other family settlement, or by narrow prejudices and a short-sighted policy, from granting leases of a proper endurance, it is never likely that the soil can be well cultivated. Every outgoing farmer will endeavour, during the last years of his lease, to do as little for the land as possible, and to take from it all that he can possibly obtain. The first years of every new lease will therefore be spent by every new farmer in repairing the damage done by his predecessor. Scarcely, however, has he accomplished this object, when he himself, if his lease be short, must set about procuring indemnity for the money he has laid out in ameliorating the soil, by scourging it in his turn, or by taking from it as heavy crops as possible, and bybestowing upon it little or no expense.

Under the same head of a want of proper interest in the soil, may be enumerated the payment of tithes, of which in England every farmer so grievously complains. Whatever may be the cultivator in the soil, the lay-out in improvements, is not expended for himself; as the proprietor of the tithes is entitled to draw a share of the whole additional increase, and thus becomes a partner in the profits of the enterprise, without running any risk of loss by its failure. The odium of this tax, is said to induce great numbers of husbandmen to continue their lands in pasture, to the no small detriment of the public, from the comparative unproductiveness of human food, which attends that mode of occupying the soil. Fortunately, in Scotland this evil hath been removed by the wisdom of our forefathers, as every landlord possesses the privilege of obtaining his tithes to be fixed at a settled rate of payment for ever; and, in many cases, of having his lands altogether disburdened, upon payment of a very moderate price.

The progress of the art of agriculture in Europe was long retarded by the want of respectability which attended it, when engaged in as a profession or trade from which profit was to be derived. In the feudal times, the military profession was the only employment in which a layman of liberal education could respectably engage. Agriculture, the only art which is absolutely necessary to the existence of man, was regarded with contempt, and left in the hands of the meanest of the people. Even the most ordinary mechanics were considered as superior to persons whose employment it was; because the mechanic, residing in a town, and usually under the protection of the prince, was safe from the dominion and the insults of the petty chieftains that ruled in every part of the open country. The state of affairs is now greatly altered in this respect: More enlightened views, and a better state of society, have
have restored to the profession of agriculture the respectability which naturally belongs to it. It must be acknowledged, however, that the recent improvements which have taken place in the art, have contributed not a little to this change in the sentiments of mankind concerning the persons occupied in it. It is now found, that a man may become rich by agriculture, and that there are fewer better ways in which a prudent and industrious man can lay out a moderate capital. In a commercial age, the path that leads to wealth is always respected and accounted honourable, and accordingly it is now not unusual for the sons of British noblemen and gentlemen, of extensive fortunes, to become apprentices to farmers.

The last obstacle to agricultural improvements, of which we shall take notice, arises in some countries from the want of judicious legislation, or proper arrangements made by the public in its favour. The produce of the art of the husbandman, and the manners of which his lands have occasion, are all bulky commodities, which cannot be transported without labour and expense. Unless care is taken, therefore, to prepare and maintain good roads throughout the country, the profits of agriculture must always be subjected to such deductions as will greatly retard its prosperity. In the same manner, if the state, from any narrow policy, shall prevent the husbandman from bringing his goods to the best market, by exportation or otherwise, it is impossible that his art can flourish. In former times, nations were afraid to permit the exportation of grain, even in seasons of plenty, lest they should be left without food, not considering that the earliest mode of producing abundance of any commodity consists in offering, at all times, a good price for it. This error is now rectified in most nations; and at all events, in the present state of affairs, the British husbandman has no reason to complain, as the grain reared in this country is, even in the best seasons, understood to be inadequate to afford subsistence to its inhabitants.

PRACTICE OF AGRICULTURE.

THE practice of agriculture naturally divides itself into three parts: 1st, The cultivation of vegetable food for men and animals; 2dly, The cultivation of vegetables, such as flax and hemp, which are more properly articles of commerce; and, 3dly, The rearing and management of animals. To these we shall add, as connected with all the branches of agriculture, a short description of the most useful modes of fencing and enclosing lands for cattle and other objects of husbandry.

PART I. OF THE CULTIVATION OF VEGETABLE FOOD.

We shall consider this branch of the subject under four divisions. In the first we shall present to the reader a statement of the most useful instruments of agriculture: 2dly, We shall state the mode of preparing land for cropping, by removing the physical obstructions to agriculture, and reducing the soil into a proper state; 3dly, We shall explain the culture of particular plants, and the practices of husbandry connected with it; and, lastly, We shall state the principles and operations of the horsehoesing or drill husbandry.

SECT. I. Instruments of Husbandry.

The instruments employed in agriculture are various; as the plough, the harrow, the roller, &c. which are again diversified by various constructions adapted to particular uses.

1. OF PLOUGHS.

The plough is a machine for turning up the soil by the action of cattle, contrived to save the time, labour, and expense, which, without this instrument, must have been employed in digging the ground, and fitting it to receive all sorts of seed.

Amidst all the varieties which can occur in the manner of ploughing the ground, arising from difference of soil, local habits, and other causes, there is still a sameness in the task, which gives a certain uniformity to the chief parts of the instrument, and should therefore furnish principles for its construction. There is not, perhaps, any invention of man that more highly merits our utmost endeavours to bring it to perfection; but it has been too much neglected by those persons who study machines, and has been considered as a rude tool, unworthy of their attention. Any thing appears to them sufficient for the clumsy task of turning up the ground; and they cannot imagine that there can be any nicety in a business which is successfully performed by the ignorant peasant. Others acknowledge the value of the machine, and the difficulty of the subject; but they think that difficulty insuperable, because the operation is so complicated, and the resistances to be overcome so uncertain, or so little understood, that we cannot discover any unequivocal principle, and must look for improvement only from experience or chance.

But these opinions are ill founded. The difficulty is indeed great, and it is neither from the ignorant farmer nor the rude artist that we can expect improvement. It requires the serious consideration of the most accomplished mechanician; but from him we may expect improvement. We have many data; we know pretty distinctly what preparation will fit the ground and may be improved.

114

113

an instrument of the greatest value.
Agriculture.

It will therefore be very proper, under this article, to ascertain, if possible, what a plough in general ought to be, by describing distinctly its task. This will surely point out a general form, the chief features of which must be found under every variety that can arise from particular circumstances.

The plough performs its task, not by digging, but by being pulled along. We do not aim at immediately reducing the ground to that friable and uniform state into which we can bring it by the spade; but we wish to bring it into such a state that the ordinary operations of the season will complete the task.

For this purpose, a slice or sod must be cut off from the firm land. This must be shoved to one side, that the plough and the ploughman may proceed in their labour; and the sod must be turned over, so that the grass and stubble may be buried and rot, and that fresh soil may be brought to the surface; and all must be left in such a loose and open condition, that it may quickly crumble down by the influence of the weather, without baking into lumps, or retaining water. The first office is performed by the couter, which makes a perpendicular cut in the ground. The point of the couter follows this, and its edge gets under the sod, and lifts it up. While lifting it up, it also heels it over, away from the firm land. The mouldboard comes last, and pushes it aside, and gradually turns it over as far as is required.

The general form of the body of a plough is that of a wedge, or very blunt chissel, AFEDBC (fig. 1), having the lower corner D of its edge considerably more advanced than the upper corner B; the edge BD and the whole back AFDB is the same perpendicular plane; the bottom FDB approaches to a triangular form, acute at D, and square at F; the surface BCED is of a complicated shape, generally hollow, because the angle ABC is always greater than FDE: this consequence will be easily seen by the mathematician. The back is usually called the land side by the ploughman, and the base FDE is called the sole, and FE the heel, and BCED the mouldboard. Lastly, the angle AFE is generally square, or a right angle, so that the sole has level both as to length and breadth.

By comparing this form with attention, the reader will perceive that if this wedge is pulled or pushed along in the direction FD, keeping the edge BD always in the perpendicular cut which has been previously made by the couter, the point D will both raise the earth and shove it to one side and twist it over; and, when the point has advanced from F to D, the sod, which formerly rested on the triangle DFE, will be forced up along the surface BCED, the line DF rising into the position D/F, and the line EF into the position E/F. Had the bottom of this furrow been covered with a bit of cloth, this cloth would be lying on the mouldboard, in the position B/E; the slice, thus deranged from its former situation, will have a shape something like that represented in fig. 2.

In as much as the wedge raises the earth, the earth presses down the wedge; and as the wedge pushes the earth to the right hand, the earth presses the wedge to the left; and in this manner the plough is strongly pressed, both to the bottom of the furrow by its sole, and also to the firm land by its back or land side. In short, it is strongly squeezed into the angle formed between the perpendicular plane of the head DE (fig. 1) by the perpendicular plane a b D F and the horizontal plane FDE; and in this manner the furrow becomes a firm groove, directing the motion of the plough, and giving it a resisting support, by which it can perform all parts of its task.

We beg our readers to keep this circumstance constantly in mind. It evidently suggests a fundamental maxim in the construction, namely, to make the land mental side of the plough an exact plane, and to make the mouldboard of an equal slope, if not plane, at least straight from point to heel. The con- struction of Any projection would tear up the supporting planet, destroy the directing groove, and expend force in doing mischief.

This wedge is seldom made of one piece. To give it the necessary width for removing the earth would require a huge block of timber. It is therefore usually framed of several pieces, which we shall only mention in order to have the language of the art. Fig. 3 represents the land side of a plough, such as are made by James Small at Rosebank, near Ford, Mid Lothian. The base of it, CM, is a piece of hard wood, pointed before C to receive a hollow shoeing of iron CO, called the sock, and tapering a little towards the hinder end, M, called the heel. This piece is called the head of the plough. Into its fore part, just behind the sock, is mortised a sloping post, AL, called the breast, the front of which is worked sharp, forming the edge of the wedge. Nearer the heel there is mortised another piece, PQ, sloping far back, called the stilt, serving for a handle to the ploughman. The upper end of the breast is mortised into the long beam RH, which projects forward, almost horizontally, and is mortised behind into the stilt. To the fore end of the beam are the cattle attached. The whole of this side of the wedge is fashioned into one plain surface, and the intervals between the pieces are filled up with boards, and commonly covered with iron plates. The couter, WFE, is firmly fixed by its Shank, W, into the beam, rakes forward at an angle of 45° with the horizon, and has its point E about six inches before the point of the sock. It is brought into the same vertical plane with the land side of the plough, by giving it a knee outward immediately below the beam, and then kneeing it again downward. It is further supported on this side by an iron stay FF, which turns on a pin at F, passes through an eye-bolt I on the side of the beam, and has a nut screwed on it immediately above. When screwed to its proper slope, it is firmly wedged behind and before the shank.—Fig. 3 No. 2 represents the same plough viewed from above. ST is the right-hand or small stilt fixed to the inside of the mouldboard LV.

Fig. 4 represents the bottom of the wedge. CM is the head, covered at the point by the sock. Just behind the sock there is mortised into the side the head a smaller piece DE, called the furrow, making an angle of 15° with the land side of the head, and its outside edge is in the same straight line with the side of the sock. From the point to the heel of the head is about 33 inches, and the extreme breadth of the heel is about nine. The side of the wedge, called the furrow side, is formed by the mouldboard, which is either made of a block or plank of wood, or of a thick iron plate.
AGRICULTURE.

The sock drawn in this figure is called a spear sock, and is chiefly used in coarse or stony ground, which requires great force to break it up. Another form of the sock is represented in the next figure 4. No. 2. This is called a feather sock, and has a cutting edge CF on its furrow side, extending back about ten inches, and to the right hand or furrow side about six. The use of this is to cut the sod below, and detach it from the ground, as the coulter detaches it from the unploughed land. This is of great use when the ground is bound together by knotted roots, but it is evident that it cannot be used to advantage in very stony ground. It may reasonably be asked, why the feather is not much broader, so as to cut the whole breadth of the furrow? This is sometimes done. But we must recollect that the sod is not only to be pushed aside, but also to be turned over. If it were completely detached by the feather, and chanced at any time to break on the back of the sock, it would only be pushed aside; but by leaving a little of the sod uncut, it is held fast below while it is shoved aside above, which cannot fail to twist it round. As the wrest advances, it easily destroys the remaining connection, which in general is very slight and crumbling.

The breadth of the sole at the heel determines the width of the furrow. Nine inches will give enough room for a horse or man to walk in. A greater breadth is of no use, and it expends force in pushing the earth aside. It is a mistake to suppose that a broad sole gives more room for the turned slice to stand on; for whatever is the breadth of the furrow, the successive slices will be left at their former distances, because each is shoved aside at the same distance. When the breadth of a slice exceeds its depth, and it is turned on its side, it will now stand on a narrow base, but higher than before, and therefore will stand looser, which the farmers desire. On the other hand, when the depth considerably exceeds the breadth, the sods, now turned on their sides, must be squeezed home to the ploughed land, which breaks them and tosses them up, making rough work. In wet clay soil, this is also apt to knead them together. But all this is workmanship, and has no dependence on the width of the sole behind.

We have already said that the sole is generally level from the right to the heel. This was not the case formerly, but the wrest was considerably raised behind. It resulted from this form, that the furrow was always shallower on the right side, or there was left a low ridge of unstridled earth between the furrows. This circumstance alone was a bad practice; for one great aim of ploughing is the renewal of the superficial soil. In this way of ribbing the furrows, the sod tumbles over as soon as it is pushed to the top of the rib on the right of the rut made by the plough; the firmest parts of it fall undermost, and the rest crumbles above it, making the work appear neat; whereas it is extremely unequal, and what most needs the influence of the weather to crumble it down is sheltered from it. Add to these circumstances, that the hollow is a receptacle for water, with a surface which can retain it, having been consolidated by the pressure of the plough. For all these reasons, therefore, it seems advisable to form the furrow with a flat or level bottom, and therefore to keep the heel of the wrest as low as the heel of the head. For the same reason it is proper to hold the plough with the land side perpendicular, and not to bend it over to that side, as is frequently done, producing the same ribbed furrow as an ill-formed sole.

There is great variety of opinions about the length of the plough. If considered merely as a pointed instrument, or even as a cutting instrument acting obliquely on a given length of sod, there can be no doubt that it will be more powerful as it is longer: that is, it will require less force to pull it through the ground. But it must also show the earth aside, and if we double its length we cause it to act on twice as much earth at once; for when the plough has entered as far as the heel, the whole furrow side is acting together in pushing the earth to the side. Now it is found, that the force necessary for pushing a mass of earth horizontally along the rough ground is nearly equal to its weight. It would seem, therefore, that nothing is to be gained by making the base of the plough of a great length, except a greater facility in making the first penetration, and this is chiefly performed by the coulter and sock; and a great length renders the plough heavy and cumbersome; and, by causing it to act long on the sod, tends to knead and cake it.

Nothing very precise can be offered on this subject. Some sensible advantage is derived by making the plough taper, especially forward, where it acts as a boring and cutting instrument; and for this purpose it is convenient to give the coulter a slope of 45 degrees. This has also the advantage of throwing up the stones and roots, which it would otherwise drive before it through the firm ground.) And for the same reason, the edge of the feather has a great slope, it being 10 inches long and only six inches broad. But if we pursue this advantage too far, we expose ourselves to another risk. It is sometimes necessary to heel over the plough to the right, in order to get over some obstruction. In doing this, the coulter is necessarily raised for a moment, and the slanting cut now made by the feather becomes the directing groove for the plough. When the feather has a very long slope, this groove has force enough to guide the whole plough; and it is almost impossible for the ploughman to prevent it from running out of the ground to the land side (A). The feather, therefore, should not exceed ten or twelve inches in length.

But to return to the length of the plough, from which this observation has diverted us a little, we must add, that a long plough has a great advantage in the steadiness of its motion, having a much more extensive support both on the land side and below, and being therefore less affected by its inequalities. Accordingly, they are now made considerably longer than formerly; and 33 inches has been assumed as a proportion to 9 inches in breadth, in conformity to the most approved ploughs now in use.

We

(A) This is often felt with the excellent plough described by Mr Arbuthnot of Surry, in the Transactions of the Society for the Encouragement of Arts, &c. London.
Part I.

We come now to treat of the mouldboard. This is the most delicate part of the plough, and is to be seen in the greatest variety in the works of different artists, each of whom has a nostrum of great value in his own opinion. It is here indeed that the chief resistances are exerted and must be overcome; and a judicious form of this part of the plough may diminish them considerably, while it performs the work in the best manner. Without pretending to say that the different resistances are susceptible of an accurate determination, we can still draw sufficient inferences from published rules and mechanics to direct us to what would be nearly the best possible form for a mouldboard. The task to be performed is to raise, push aside, and turn over to a certain degree, a slice already cut off from the firm ground. As we cannot provide for every inequality of the cohesion or tenacity of the earth, our safest way is to consider it as uniform: the weight of it is always so. As we cannot provide for every proportion between the tenacity and the weight, we must take an average or medium proportion which is not far from that of equality. Conceiving the slice at first as only tenacious, and without weight, it is an easy problem to determine the form which shall give it the intended twist and removal with the smallest force. In like manner we can proceed with a slice that has weight without tenacity.

It is equally easy to combine both in any proportion; and it is easiest of all to make this combination on the supposition of equality of weight and cohesion. Supposing the slice like a brick, we know that it requires the greatest force to begin to raise it on one edge, and that strain becomes less as it rises, till its centre of gravity is perpendicularly above the supporting angle. It requires no force to raise it further; for on pushing it beyond this position, it would fall over of itself, unless witheld by the tenacity of what is not yet raised. But on considering the form or plan of the sock, we find that while the weight of the sod resists most strongly, there is less of it in this situation actually rising, and this nearly in the same proportion with the labour of raising it; and we see that after the sod has attained that position in which it is ready to fall over, it has reached the wider part of the wrest, and is now pushed aside, which requires nearly the same force as to raise it: and this continues to the end of the operation.
