Baley, Walter, the son of Henry Baley of Warrwell in Dorsetshire, was born at Potsham in the same county, and educated at Westminster school. From thence he was sent to Oxford; and, after two years probation, was admitted perpetual fellow of New College in the year 1550. Having taken his degrees in arts, he practised physic, and in 1558 was proctor of the university. About this time he obtained a prebend of Wells, which he resigned in 1579. In the year 1561 he was appointed queen's professor of physic, in 1563 proceeded doctor in that faculty, and afterwards became one of her majesty's physicians in ordinary. He was thought skilful in his profession, and had considerable practice. He died in 1592, aged 63; and was buried in the instaple chapel of New College. His works are: 1. A discourse of three kinds of paper in common use, 1588, 8vo. 2. Brief treatise of the preservation of the eye sight; first printed in the reign of Elizabeth, in 12mo; afterwards at Oxford in 1616 and 1654, 8vo. 3. Directions for health natural and artificial;
BALI, an island of Asia, in the East Indies, forming the north side of the straits of Java, through which the East India ships sometimes return from China to Europe: but the passage is commonly difficult on account of contrary winds. The island is now very populous, and abounds in rice and other productions peculiar to that climate. The inhabitants are Pagans, and very warlike. F. Long. ii. 15. 30. S. Lat. 9. 0.

BALIOL, or BAILIOL, Sir JOHN DE, founder of Bailioll-collegi in Oxford, was the son of Hugh Bailiol, of Bernard's castle, in the diocese of Durham; and was a person very eminent for his power and riches. During the contests and wars between King Henry III. and his barons, he firmly adhered to the king. In 1263, he began the foundation and endowment of Bailiol college, which was afterwards perfected by his widow. He died in the year 1269.

BALIOL, BALLIOL, or BOILLIO, John, the competitor with Robert Bruce for the crown of Scotland, was the great grandson of David earl of Huntingdon, third son of King David I. See SCOTLAND.

BALISORE, a sea port town of Asia, in the East Indies, to the north-west of the bay of Bengal. It is about four miles from the sea by land, but 20 by the river, seated in a very fruitful soil, producing rice, wheat, aromatic seeds, tobacco, &c. The inhabitants make several sorts of stuffs of cotton, silk, and a kind of grass. The place was given up to the English by the Nagore rajah at the peace in 1803. E. Long. 86. 50. N. Lat. 21. 30.

BALISTES. See Ichthyology Index.

BALIVO AMVENDO, in Law, was a writ for removing a bailiff from his office, for want of having sufficient land in his bailiwick to answer the king and his people, according to the statute of Westminster, 2 reg. Orig. 78.

BALK, among builders, is sometimes used for the summer beam of a house; sometimes for the pole and rafters, which support the roofs of barns, &c. and sometimes for the beams used in making sea-holds.

BALK, or Balkh, a province of Great Bukharia in Asia, about 360 miles long and 250 broad, situated to the south of the province of Samarkand, and to the east of Bukharia Proper. It is the least of the three provinces that make up what is called Great Bukharia; but being extremely fertile and well cultivated, the prince draws a great revenue from it. The country particularly abounds with silk, of which the inhabitants make pretty manufactures. The Uzbecks subject to the khan of Balkh are the most civilized of all the Tartars inhabiting Great Bukharia, owing probably to their commerce with the Persians: they are likewise more industrious, and more honest, than the rest; but in other respects have the same customs with the rest of the Tartars. The province is subdivided into several countries; the most remarkable of which are Khotzan or Katlan, Tokharestan, and Badagshan. It was formerly subject to Persia, but is now a dependency on the kingdom of Cabul.

BALK, the capital of the above-mentioned province, situated on the frontiers of Persia, in E. Long. 65. 20. N. Lat. 36. 45. It is probably the ancient Bactra, capital of the kingdom of Bactria; and is said by the Persians to have been founded by Kaymaraz, the first king of Persia, because he met his brother upon the spot where it stood, after he had been lost for a long time; balkhidon, or balghidien, in the Persian language, signifying to receive and embrace a friend. In the 27th year of the Hegira, of Christ 647, Balk was reduced by the Arabs, under the command of Abdullah Ebn Amer. It continued subject to Arab princes till the year of the Hegira 432, of Christ 1041; when it was reduced by Togrol Beg, the Tangrolipix of the Greeks, and prince of the Seljukian dynasty. It was taken by Yenghis Khan, A. D. 1221, who with his usual and unparalleled cruelty caused all the inhabitants to be brought without the walls, and massacred without mercy. In 1369, Sultan Hosein, the last of the race of Yenghis Khan, was driven from Balk by Tamerlane, whose successors were driven out by the Uzbeks in the 15th century. It was afterwards redeemed by Shah Ismael Sufi; but finally wrested out of his hands by the Uzbeck Tartars, between whom and the Persians it is the occasion of almost continual wars. It was not long since the residence of a Khan of Tartars. It is the most considerable city possessed in these parts by the Mahometan Tartars, is large, well built, and populous, the houses consisting for the most part of stone or brick. The fortifications consist of bulwarks of earth, fenced without with a strong wall, high enough to cover the soldiers employed in defence of those fortifications. As this place is the resort of all the business transacted between the Indies and Great Bukharia, trade flourishes extremely at Balk; especially as it has a fine river passing through its suburbs, which is of vast service to the town. This river falls into the Amu, in N. Lat. 38. 30. upon the confines of Great Bukharia and Kowarazm. The khan's palace, or castle, is a large edifice built after the oriental manner; and consists almost entirely of marble, of which there are fine quarries in the neighbourhood. The khan of Balk was obliged in 1739 to submit to the Persians under Khouli Kan; but since that time the country has been separated from Persia, and is now subject to the kingdom of Cabul.

BALE, in the fishery, persons placed on rocks and eminences at sea to spy the herring drives, and give notice to the fishermen, by waving boughs, what way they go, and where they may be found.

BALL, in a general sense, a spherical and round body, whether naturally so, or formed into that figure by art.

Ball, in the military art, comprehends all sorts of bullets for fire-arms, from the cannon to the pistol. Cannon-balls are of iron; musket-balls, pistol-balls, &c. are of lead. The experiment has been tried of iron balls for pistols and fuses; but they are justly rejected, not only on account of their lightness, which prevents them from flying straight, but because they are apt to furrow the barrel of the pistol, &c.

Ball of a Pendulum, the weight at the bottom. In shorter pendulums this is called the bob.

Ball, in Pyrotechnics, is also a composition of various
Balls.

Various combustible ingredients, serving to burn, smoke, give light, &c. In this sense we read of fire-balls, light-balls, smoke-balls, stink-balls, sky-balls, water-balls, land-balls.

Ball, among the Cornish miners, signifies a tin-mine.

Ball, among printers, a kind of wooden tunnel stuffed with wool, contained in a leather cover, which is nailed to the wood, with which the ink is applied on the forms to be wrought off. See PRINTING.

Horse-Balls, among farriers. Horses have a very nice taste; it is therefore proper to give the more disagreeable drugs in the form of balls, and to make drenches of the more palatable. Balls should be of an oval shape, not exceeding the size of a pullet's egg; and should be dipped in sweet oil to make them slip down the easier. Some horses have a straight gullet, which makes them very averse to a ball being thrust down their throats; such horses had better have drenches given them, or their medicines may be mixed with bran, or in their mashes. See FARRIER, passim.

Ball-Fein, in Mineralogy, a name given by the miners of Sussex to a sort of iron ore common there, and wrought to considerable advantage. It yields not any great quantity of metal, but what it has runs freely in the fire; it is usually found in loose masses, not in the form of a stratum, and is often covered with one or more crusts. It generally contains some sparkling particles; and is usually of a circular form in the perfect masses, thickest in the middle, and gradually thinner as it approaches the sides. The ores of Sussex are in general poor, but they require very little trouble in the working; so that a considerable profit is made annually from them.

Ball and Socket, an instrument made of brass, with a perpetual screw, so as to move horizontally, vertically, and obliquely; and is generally used for the managing of surveying or astronomical instruments.

Puff-Ball, the English name of the lycoperdon. See LYCOERDON, BOTANY INDEX.

Martial Balls, in Pharmacy, are a mixture of filings of iron and cream of tartar, used to prepare water or other liquids with iron dissolved by the tartaraceous acid. To make these balls, one part of filings of iron and two parts powdered cream of tartar are mixed well together, and put into an earthen or iron vessel with some water. This mixture is to be stirred from time to time, till it becomes almost dry; and then it is to receive more water, and to be stirred as before. This treatment is to be continued till it acquires, when nearly dry, somewhat of the consistence and tenacity of softened resin. Then it is to be rolled up in the form of a ball, which is generally kept tied up in a rag; and when intended to be used, it is to be infused in water, till it gives some colour to that liquid. The infusion of martial balls is tonic, vulnerary, discutient, and aperitive; and is employed both internally and externally. Iron being soluble in all acids, is attacked in this preparation by the tartaraceous acid, which reduces it to a kind of neutral salt not crystallizable. This salt would remain liquid, and would form a soluble martial tartar, called tartarised tincture of Mars. If proper proportions of filings of iron and cream of tartar be used, and treated long enough for an entire and complete combination, nothing would be obtained but a liquor or magnum, which could not be preserved in a solid form, but would be continually moist. Therefore, in the martial ball there is a good deal of the cream of tartar and filings of iron not combined together, by which its solidity is preserved.

Mercurial Balls, in Pharmacy, are an amalgam of mercury and tin, sufficiently solid to be moulded, and to preserve a given form. The method of making them is by adding mercury to melted tin, and pouring the fluid mass into a round hollow mould. These balls are employed to purify water, in which they are boiled; for which purpose travellers often carry some along with them. Nothing, however, can be more pernicious than such a practice, should the water contain any nitrous acid, which it very often does.

Balls of Silk-worms and Spiders, are little cases or cones of silk, wherein those insects deposit their eggs. Spiders are extremely tender of their balls, which they carry about with them, adhering to the papillae about their anus. Grew mentions balls or bags of a species of silk-worms in Virginia as big as hens eggs, and containing each four aurelias.

Zoologists speak of a sort of balls of hair covered over with a smooth shining coat or shell, found in the stomachs of oxen, cows, calves, horses, sheep, goats. See the article BEOZOR.

Balls of Fire, in Meteorology. See FIRE, BALLS OF.

Balls, in Electricity, are two pieces of cork, or pith of elder, nicely turned in a lattice to the size of a small pea, and suspended by fine linen threads; intended as electrometers, and of excellent use to discover small degrees of electricity, to observe the changes of it from positive to negative, and vice versa; and to estimate the force of a shock before the discharge, so that the operator should always be able to tell very nearly before the discharge, by knowing how high he has charged his jars, what the explosion will be.

Fire-Balls, are bags of canvas filled with gunpowder, sulphur, saltpetre, pitch, &c. to be thrown by the soldiers, or out of mortars, in order to fire the houses incommoding trenches, advanced posts, or the like.—The Greeks had divers kinds of fire-balls, or πυραμίδες; one kind called, more particularly, κεράτης, or κερατίδες, made of wood, sometimes a foot or even a cubit long; their heads being armed with spikes of iron, beneath which were hemp, pitch, and other combustibles, which being set on fire, they were cast among the enemy. The preparations of fire-balls, among the moderns, consist of several operations, viz. making the bag, preparing the composition, tying, and, lastly, dipping the ball. 1. The bags for this purpose are either oval or round. 2. The composition whereof with fire-balls are filled is various: To ten pounds of meal-gunpowder add two of saltpetre, one of sulphur, and one of coleophony; or to six pounds of gunpowder, add four of saltpetre, four of sulphur, one of powdered glass, half a pound of antimony, as much camphor, an ounce of sal-ammoniac, and four of common salt, all pulverised. Sometimes they even fill fire-balls with hand grenades. 3. For tying the fire-balls, they prepare two iron rings, one fitted round the aperture,
aperture, where the ball is to be lighted, the other
wear its base. A cord is tied to these rings in such a
manner, as that the several turns represent semicircles
of the sphere cutting the globe through the poles: over
the cords, extended according to the length of the ball,
others are tied, cutting the former at right angles, and
parallel to each other, making a knot at each intersection:
lastly, after putting in a leaden bullet, the rest of
the space is filled with tow or paper. 4. Thus com-
pleted, the fire-ball remains to be dipped in a composi-
tion of melted pitch four pounds, colophony two, and
linseed oil or oil of turpentine two; after dipping, they
cover it round with tow, and dip again, till it be
brought to the just diameter required.

Light-Balls, are such as diffuse an intense light
around; or they are balls which, being cast out of
the hand or a mortar, burn for some time, and illuminate
the adjacent parts. 1. Luminous or light-balls for the
hand are made of saltpetre, sulphur, brimstone, camphor,
and borax, all sprinkled with oil, and moulded into a mass with suet; and this is
wrapped up in tow, with a sheet of strong paper over it.
To fire it, they make a hole into it with a bodkin, in-
to which they put some priming, that will burn slow.
Its use is to be cast into any works they would discover
in the night-time. 2. For the larger light-balls, or
those to be thrown a greater distance, they melt
equal quantities of sulphur, turpentine, and pitch; and
therein dip an earthen or stone ball, of a diameter much
less than that of the mortar out of which the fire-
ball is to be cast: then rolling it in gunpowder, and
covering it round with gauze, they dip it again, and
repeat the rest till it come to fit the cavity of the
mortar; lastly, they sprinkle it round with
powder. This, being once kindled, will strongly il-
minate all around the place where it is thrown, and
give opportunity to examine the state and condition
thereof.

Smoke or Dark-Balls, those which fill the air with
smoke, and thus darken a place to prevent discoveries.
To prepare a darkening ball, make an oval or spheri-
cal bag; melt rosin over the coals, and add an equal
part of saltpetre not purified, also of sulphur, and a
fifth part of charcoal. The whole being well incorpo-
rated, put in tow first shred, and fill the bags with
this composition, and dip it after the same manner as a
fire-ball.

Stink-Balls, those which yield a great stench where
fired to annoy the enemy. Their preparation is thus:
Melt ten pounds of pitch, six of rosin, twenty of salt-
petre, eight of gunpowder, and four of colophony; to
these add two of charcoal, six of horse-hoofs cut
small, three of saffresta, one of stinking-saracen, and
any other offensive ingredients. The rest as in the former.

Sky-Balls, those cast on high out of mortars, and
which, when arrived at their height, bursting like roc-
kets, afford a spectacle of decoration. Sky-balls are
made of a wooden shell, filled with various composi-
tions, particularly that of the stars of rockets. These are
sometimes intermixed with crackers and other combus-
tibles, making rains of fire, &c.

Water-Balls, those which swim and burn a consi-
derable time in the water, and at length burst therein.
These are made in a wooden shell, the cavity of which

Vol. III. Part I.

is filled with refined saltpetre, sulphur, saw-dust boiled
in water of saltpetre, and dried; to which sometimes
other ingredients are added, as iron filings, Greek
pitch, amber dust, powdered glass, and camphor. The
ingredients are to be ground, mixed up, and moistened
with linseed oil, nut oil, olive oil, hempseed oil, or
petrol. At the bottom is placed an iron coffin, filled
with whole gunpowder, that the ball may at last burst
with a greater noise: and, lastly, the ball is by the ad-
dition of lead or otherwise, made of the same specific
gravity with water.

Land-Balls are those which, being thrown out of
a mortar, fall to the ground, burn, and burst there. The
ingredients are much the same as in the water-balls, on-
ly the specific gravity is not attended to.

Ballad, a kind of song, adapted to the capacity
of the lower class of people; who, being mightily taken
with this species of poetry, are thereby not a little in-
fluenced in the conduct of their lives. Hence we find,
that seditious and designing men never fail to spread
ballads among the people, with a view to gain them
over to their side.

Ballagh, a town of Ireland, in the county of
Sligo, and province of Connaught. W. Long. 9. 50.
N. Lat. 53. 48.

Ballan, or Ballon, a town of France, in the
department of Sarthe, seated on the river Orne. E.
Long. 0. 20. N. Lat. 48. 10.

Ballast, any heavy matter, as stone, gravel, iron,
&c. thrown into the hold of a ship, in order to make
her sink a proper depth in the water, that she may be
capable of carrying a sufficient quantity of sail without
oversetting.

There is often great difference in the proportion
of ballast required to prepare ships of equal burden for a
voyage; the quantity being always more or less accord-
ing to the sharpness or flatness of the ship's bottom,
which seamen call the floor.

The knowledge of ballasting a ship with propriety,
is certainly an article that deserves the attention of the
skilful mariner: for though it is known, that ships in
general will not carry a sufficient quantity of sail till
they are laden so deep that the surface of the water will
nearly glance on the extreme breadth amidships, yet
there is more than this general knowledge required;
since, if she has a great weight of heavy ballast, as lead,
iron, &c. in the bottom, it will place the centre of
gravity too low in the hold; and although this will en-
able her to carry a great sail, she will nevertheless sail
very heavily, and run the risk of being dismayed by
her violent rolling.

To ballast a ship, therefore, is the art of disposing
those materials so that she may be duly poised,
and maintain a proper equilibrium on the water, so as nei-
ther to be too stiff nor too crank, qualities equally per-
nicious: as in the first, although the ship may be fitted
to carry a great sail, yet her velocity will not be pro-
portionally increased; whilst her masts are more endan-
gered by her sudden jerks and excessive labouring: and
in the last, she will be incapable of carrying sail, with-
out the risk of oversetting.

Stiffness, in ballasting, is occasioned by disposing a
great quantity of heavy ballast, as lead, iron, &c. in
the bottom, which naturally places the centre of gravity
very near the keel; and that being the centre about
which the vibrations are made, the lower it is placed, the more violent will be the motion of rolling.

**Crankness**, on the other hand, is occasioned by having too little ballast, or by disposing the ship's laying so as to raise the centre of gravity too high, which also endangers the mast in carrying sail when it blows hard: for when the masts lose their perpendicularly height, they strain on the shrouds in the nature of a lever, which increases as the sine of their obliquity; and a ship that loses masts is in great danger of being lost.

The whole art of ballasting, therefore, consists in placing the centre of gravity to correspond with the trim and shape of the vessel, so as neither to be too high nor too low, neither too far forwards nor too far aft; and to lade the ship so deep, that the surface of the water may nearly rise to the extreme breadth, amidships; and thus she will be enabled to carry a good sail, incline but little, and ply well to the windward.

Ships are said to be in ballast when they have no other loading. Masters of vessels are obliged to declare the quantity of ballast they bear, and to unload it at certain places. They are prohibited unloading their ballast in havens, roads, &c. the neglect of which has ruined many excellent ports.—Ships and vessels taking in ballast in the river Thames are to pay so much a ton to Trinity-houses, Deptford; who shall employ ballastmen, and regulate them; and their lighters are to be marked, &c. on pain of 10l.

**Ballatoons**, large heavy luggage-boats used for carrying wood by the river from Astrakan and the Caspien sea to Moscow. These will carry from 100 to 200 tons, and have from 100 to 120 men employed to row and tow them along.

**Ballenden**, Sir John, a Scottish poet, in the reign of James V. of Scotland, was descended from an ancient family in that kingdom. His father, Mr. Thomas Ballenden of Auchinoul, was director to the chancery in the year 1540, and clerk register in 1541. Where our poet was educated, we are not informed; but from one of his poems we learn, that in his youth he had some employment at the court of King James V. and that he was in great favour with that prince. Having taken orders, and being created doctor of divinity at the Sorbonne, he was made canon of Ross, and archdeacon of Muray. He likewise obtained the place of clerk-register, but was afterwards deprived of that employment by the factions of the times; however, in the succeeding reign of Mary, he recovered that office, and was one of the lords of session. Being a zealous Papist, he, in conjunction with Dr. Laing, was extremely assiduous in retarding the progress of the reformation, till at last, finding the opposition too powerful, he quitted Scotland, and went to Rome, where he died in the year 1550. He is generally esteemed one of the best Scottish poets of that age. His works are: 1. The History and Chronicles of Scotland of Hector Boethius, translated by Mr. John Ballenden, Edinb. 1565. This is not a mere translation, Ballenden having corrected several mistakes of his author, and made large additions. It is in folio, and black letter. 2. Cosmography to the History of Scotland, with a poetical poem. 3. A Description of Albany. 4. Translation of Boethius's Description of Scotland. 5. Epistles to King James V. Balfour says he had seen these letters. 6. Several poems in Carmichael's collection of Scottish poems; besides many others in manuscript, in private libraries in Scotland. 7. Virtue and Force, a poem addressed to King James V.

**Ballat**, or **Balletto**, a kind of dramatic poem, representing some fabulous action or subject divided into several entries; wherein several persons appear, and recite things under the name of some deity, on other illustrious character.

**Ballet** is more particularly used for a kind of comical dance, consisting of a series of several airs of different kinds of movements, which together represent some subject or action. They are performed chiefly by masks representing sylvans, triptons, nymphs, shepherds, and the like; and consist of three parts, the entry, figure, and the retreat. The word is of Greek origin, formed from *ballein*, *jaceo*, to cast, throw, or toss; whence also in writers of the middle age, we find *ballattones*, *dancing*; and *ballata*, *to dance*.

**Balliage**, or **Bailiage**, in Commerce, a small duty paid to the city of London by aliens, and even denizens, for certain commodities exported by them.

**Ballion**, a town of Ireland in the county of Cavan, and province of Ulster. W. Long. 7. 43. N. Lat. 54. 6.

**Balliseannon**, a large town of Ireland in the county of Donegal, and Tyrconnel, with a good haven. W. Long. 8. 25. N. Lat. 54. 25.

**Ballesta**, a machine used by the ancients for shooting darts; it resembled in some measure our crossbow. The word is Latine, signifying a cross-bow; and is derived from the Greek *ballein*, to shoot, or throw.

Vegetius informs us, that the ballistae discharged darts with such rapidity and violence that nothing could resist their force; and Athenaeus adds, that *agitatarum* made one little more than two feet in length, which shot darts 500 paces.

In *Plato* LXXXIV. is represented the ballista used in sieges, according to the chevalier Valar; 2, 2, the base of the ballista; 3, 4, upright beams; 5, 6, transverse beams; 7, 7, the two capitals in the upper transverse beam, (the lower transverse beam has also two similar capitals, which cannot be seen in this transverse-figure); 9, 9, two crossarms or supports for strengthening the transverse beams; 10, 10, two arches of cords fastened to the capitals; 11, 11, two arms inserted between the two stands, or parts of the skains; 12, a cord fastened to the two arms; 13, darts which are shot by the ballista; 14, 14, curves in the upright beam, and in the concavity of which cushions are fastened, in order to break the force of the arms, which strikes against them with great force when the dart is discharged; 15, the asbor, or machine, in which a groove or canal perfectly straight is formed, and in which the darts are placed in order to their being shot by the ballista; 17, the nut of the trigger; 18, the roll or windlass, about which the cord is wound; 19, a hook, by which the cord is drawn towards the centre, and the ballista cocked; 20, a stage or table on which the asbor is in part sustained.

**Ballisteam**, or **Ballisterna**, in antiquity, a military song or dance used on occasions of victory. Vopiscus has preserved the *ballisterna* sung in honour of Aurelian, who, in the Saracen war, was said to have
B A L

have killed 48 of the enemy in one day with his own hand. Mille, mille, mille, mille, mille, mille, decollavit; unam homo mille, mille, mille, mille decollavit; mille, mille, mille, mille, mille, mille, mille.

Tusum vini habet nemo, quantum facit sanguinis. The same writer subjoins another popular song of the same kind: Mille Frances, mille Sermotes, semel acerrimius; mille, mille, mille, mille, mille, mille, Perras, quarimus. It took the denomination ballistern from the Greek balla, fuscio, or fuscio, to cast or toss, on account of the motions used in this dance, which was attended with great elevations and swingings of the hands. The ballistern were a kind of popular ballads, composed by poets of the lower class, without much regard to the laws of metre.

BALLISTIC PENDULUM, an ingenious machine invented by Benjamin Robbins for ascertaining the velocity of military projectiles, and consequently the force of fired gunpowder. It consists of a large block of wood, annexed to the end of a strong iron stem, having a cross steel axis at the other end, placed horizontally, about which the whole vibrates together like the pendulum of a clock. The machine being at rest, a piece of ordnance is pointed straight towards the wooden block, or ball of this pendulum, and then discharged: the consequence is this; the ball discharged from the gun strikes and enters the block, and causes the pendulum to vibrate more or less according to the velocity of the projectile, or the force of the blow and by observing the extent of the vibration, the force of that blow becomes known, or the greatest velocity with which the block is moved out of its place, and consequently the velocity of the projectile itself which struck the blow and urged the pendulum. Hutton's Mathematical Dict.

B A L L O N, or BALON, in a general sense, signifies any spherical hollow body, of whatever matter it be composed, or for whatever purposes it be designed. Thus, with chemists, balloon denotes a round short-necked vessel, used to receive what is distilled by means of fire; in architecture, a round globe on the top of a pillar; and among engineers, a kind of bomb made of pasteboard, and played off, in fire-works, either in the air or on the water, in imitation of a real balloon.

Air-BALLOON. See Aerostation.

Balloon also denotes a kind of game something resembling tennis. The balloon is played in the open field, with a great round ball of double leather blown up with wind, and thus driven to and fro with the strength of a man's arm, fortified with a brace of wood.

Ballon, or Balloon, is more particularly used among voyagers for the state-barges of Siam. The balloons are a kind of brigantine, managed with oars, of very odd figures, as serpents, sea-horses, &c. but by their sharpness and number of oars, of incredible swiftness. The balloons are said to be made of a single piece of timber, of uncommon length; they are raised high, and much decorated with carving at head and stern; some are gilt over, and carry 320 or even 500 rowers on each side. The oars are either plated over with silver, or gilt, or radiated with gold; and the dome or canopy in the middle, where the company is placed, is ornamented with some rich stuff, and furnished with a balustrade of ivory, or other costly matter, enriched with gilding. The edges of the balloon just touch the water, but the extremities rise with a sweep to a great height. Some are adorned with a variety of figures, made of pieces of mother-of-pearl inlaid: the richer sort, instead of a dome, carry a kind of steeple in the middle; so that, considering the slenderness of the vessel, which is usually 100 or 120 feet long, and scarce six broad, the height of the two ends, and of the steeple with the load of decorations, it is a kind of miracle they are not overtop.

Balloon, in the French paper trade, is a term for a quantity of paper, containing 24 reams.

Balloon, Ballon, or Ballot, in the French glass-trade, signifies a certain quantity of glass-plates, smaller or greater according to their quality. The balloon of white glass contains 25 bundles, of six plates per bundle; but the balloon of coloured glass is only of 12 bundles, and of three plates to a bundle.

Ballota, White Horkhound. See Botany Index.

Ballotade, in the manage, the leap of a horse between two pillars, or upon a straight line, made with justness of time, with the aid of the hand and the calves of the legs; and in such a manner, that when his fore-feet are in the air, he shows nothing but the shoes of his hinder feet without yerking out.

Balloting, a method of voting at elections, &c. by means of little balls usually of different colours, by the French called ballots; which are put into a box privately.

Balls, or Ballets, in Heraldry, a frequent bearing in coats of arms, usually denominated, according to their colour, bezantes, plates, hurts, &c.

Balluster, a small kind of pillar used for balustrades.

Ballustrade, a series or row of ballusters, joined by a rail; serving as well for a rest to the elbows as for a fence or enclosure to balconies, altars, staircases, &c. See Architecture, No. 74.

Balm. See Melissa, Botany Index.

Balm, or Balsam. See Balsam.

Balm of Gilead. See Supplement.

Balnaves, Henry, a Scottish Protestant divine, born in the shire of Fife, in the reign of James V. and educated at the university of St. Andrew's. He went afterwards to France in order to finish his studies; and returning to Scotland, was admitted into the family of the earl of Arran, who at that time governed the kingdom: but in the year 1542 the earl dismissed him for having embraced the Protestant religion. In 1564, he joined, says Mackenzie, the murderers of Cardinal Beaton; for which he was declared a traitor, and excommunicated. Whilst that party were besieged in the castle of St. Andrew's, they sent Balnaves to England, who returned with a considerable supply of provisions and money; but being at last obliged to surrender to the French, he was sent with the rest of the garrison to France. He returned to Scotland, about the year 1559; and having joined the Congregation, he was appointed one of the commissioners to treat with the duke of Norfolk on the part of Queen Elizabeth. In 1563 he was made one of the lords of session, and appointed by the general assembly, with other learned men, to revise the book of Discipline. Knox, his cotemporary, and fellow-labourer, gives him the character of a very learned and pious divine. He died
BALNEARIUS FUR, in antiquity, a kind of thief who practised stealing the clothes of persons in the baths; sometimes also called *fur balneorum*. The crime of those thieves was a kind of sacrilege; for the hot baths were sacred: hence they were more severely punished than common thieves who stole out of private houses. The latter were acquitted with paying double the value of the thing stolen; whereas the former were punished with death.

BALNEUM, a term used by chemists to signify a vessel filled with some matter, as sand, water, or the like, in which another is placed that requires a more gentle heat than the naked fire.

BALSA, an ancient town of Lusitania, in the *Ager Cuneus*; now *Tavira*, capital of Algarva.

BALSAM, or NATIVE BALSAM, an oily, resinous, liquid substance, flowing either spontaneously, or by means of incision, from certain plants. There are a great variety of balsams, generally denominated from the substances from which they are obtained; and which are explained under their names as they occur.

BALSAMICS. *Balsamica* is a Latin word which signifies mitigating. The term *balsamic* is a very lax one; it includes medicines of very different qualities, as emollients, detergents, restoratives, &c. but in medicines of all these kinds there seems to be this requisite, that they be soft, yielding, and adhesive, also that by their smallness they have a ready disposition to motion. Medicines of this tribe are generally required for complaints whose seat is in the visceras; and as they cannot be conveyed there but by the common road of the circulation, it follows, that no great effects can be expected from them but by their long continuation. Hoffman calls by the name of *balsamica* those medicines which are hot and acrid, also the natural balsams, gums, &c. by which the vital heat is increased.

BALSORA. See BASSORA.

BALTAGI, among the Turks, porters and hewers of wood, in the court of the grand signior; who also mount on horseback when the emperor rides out. Part of them also, who, for that purpose, must be castrated, keep watch at the gates of the first and second courts of the seraglio. The first are called *capigi*; and their commander *capigi paicha*.

BALTIC SEA, a great gulf surrounded by Sweden, Russia, Courland, Prussia, Pomerania, and Denmark. The king of Denmark levies a tax at Elsinore on every ship that enters the Baltic sea. It is remarkable that this sea neither ebb nor flows, and there is always a current sets through the Sound into the ocean. It is generally frozen over three or four months in the year. See BALTIC, Supplement.

BALTIMORA. See BOTANY Index.
kingdom of Dancali, about 14 hours journey west from Babel-Mandel. It is remarkable only for being the landing place of the Abyssinian patriarch Alphonsus Mendez, with his Jesuits and Portuguese, on April 3d 1724. The royal palace they found to consist of about half a dozen of tents, and a score of huts, fenced about with a horn hedge, and shaded by some wild kinds of trees. The hall of audience was only a large tent about a musket-shot from the rest. At the upper end was a kind of throne made of stones and clay, covered with a carpet, and two velvet cushions. At the other end was his majesty’s horse, with the saddle and other accoutrements hanging one side.

BALZAC, JOHN LEWIS GUEZ DE, born at Angouleme in 1595. Voltaire has allowed him all the merit of having given numbers and harmony to the French prose, but censures his style as somewhat bombastic. The critics of his own time gave him no little disquiet; and he gave them no little advantage over him by his sallies of vanity, and some particular propositions which were a little dangerous. M. Balzac, getting rid of these disputes by his moderation, settled at his country-seat; refined his style and genius; and got by his letters and other writings which he published from time to time, the reputation of being the first writer in France. He was at length drawn from his retirement by the hopes of making his fortune under Cardinal Richelieu, who had formerly curtailed his friendship: but in a few years he retired again, disgusted with the slavish dependence of a court life. All he obtained from the court was a pension of 2000 livres, with the titles of counsellor of state and historiographer of France. He died in 1654; and was buried in the hospital of Notre Dame des Anges, to which he bequeathed 12,000 livres. He left an estate of 100 francs per annum, for a gold medal to be bestowed every two years for the best discourse on some moral subject. Besides his letters he wrote a work called Oeuvres Diverses, i.e. on various subjects; The Prince; The Christian Socrates, &c. and many other pieces, all of which have been published in two vols folio.

BAMBA, a province of the kingdom of Congo in Africa.—It is situated between the rivers of Ambrosi and Lese; the last of which parts it from Pemba on the east, as the Ambrosi does from the province of Sogno on the north. Along the sea-coast it extends itself northward to the river Lelunda; and on the south to that of Danda, which parts it from the kingdom of Angola. The governors of this province bear the title of dukes, and are always some of the princes of the royal family. They are as despotic and arbitrary as if they were really kings, notwithstanding the care and pains their monarchs have taken to keep them within due bounds. The soil of this province is very fertile; and would produce all the necessaries of life in great plenty, were the inhabitants but industrious in its cultivation. The sea coasts produce a vast quantity of salt, which could be purified with little trouble, and would yield an extraordinary revenue if the duties were duly paid: but these the governors find means to sink mostly into their own coffers.—Here is also the fishery of the zimbis, or little sea-snailed, whose shell is the current coin not only in this and the neighbouring kingdoms, but also in the most distant parts of Africa. Here are also said to be mines of gold, silver, quicksilver, copper, tin, and iron; but none except the iron mines are allowed to be worked.

BAMBERG, a large handsome town of Franconia in Germany, and capital of a bishopric of the same name. It was formerly imperial, but is now subject to Bavaria. The country about it produces plenty of corn, fruits, and liquorice. It has an university, founded in 1525; and is situated at the confluence of the rivers Main and Regnitz. E. Long. 10° 15'. N. Lat. 50° 10'.

BAMBERG, a town of Bohemia, situated at the foot of a mountain. E. Long. 16° 50'. N. Lat. 49° 53'.

BAMBOCCIO, a celebrated painter of conversations, landscapes, cattle, &c. was born at Laer near Norden in 1613. His name was Peter Van Laer; but in Italy they gave him the name of Bambocco, on account of the uncommon shape of his body, the lower part being one-third longer than the upper, and his neck so short that it was buried between his shoulders. He had, however, an ample amends for the unseemliness of his limbs, in the superior beauties of his mind: he was endowed with an extensive genius; and, indeed, had an universal taste for every part of painting. He resided at Rome for sixteen years successively; every day studying to improve himself by those beautiful models which were continually open to his observation, and by the lovely scenery in the environs of that city. He was held in the highest esteem by all ranks of men, as well as by those of his own profession; not only on account of his extraordinary abilities, but also for the amiable qualities of his mind. He studied nature incessantly; observing with a curious exactness every effect of light on different objects, at different hours of the day; and whatsoever incident afforded pleasure to his imagination, his memory for ever perfectly retained. His style of painting is sweet and true; and his touch delicate, with great transparency of colouring. His figures are always of a small size, well proportioned, and correctly designed; and although his subjects are taken but from the lower kind of nature, such as plunderings, playing at bowls, inn, farriers shops, cattle, or conversations; yet whatever he painted was so excellently designed, so happily executed, and so highly finished, that his manner was adopted by many of the Italian painters of his time. His works are still universally admired; and he is justly ranked among the first class of the eminent masters. His hand was as quick as his imagination, so that he rarely made sketches or designs for any of his works; he only marked the subject with a crayon on the canvas, and finished it without more delay. His memory was amazing: for whatever objects he saw, if he considered them with any intention to insert them in his compositions, the idea of them was so strongly impressed on his mind, that he could represent them with as much truth as if they were placed before his eyes. Sanders observes, that although painters who are accustomed to a small size are frequently inaccurate in the disposition of the different parts of their subject, seeming content if the whole appears natural; yet Bamboccio was as minutely exact in having his figures, trees, grounds, and distances, determined with the utmost precision and perspective truth, as the best masters usually are in pictures of the largest size; which...
in one circumstance that causes the eye to be so agreeably deluded by the paintings of Bamboccio. In the latter part of his life, he was severely tormented with an asthmatic complaint, which he endured with much impatience; and it is reported, that as the disorder seemed to him insupportable, he threw himself into a canal to shorten his misery, and was drowned. His death happened in 1673.

BAMBOE, in Botany, the trivial name of a species of arundo. See ARUNDO, BOTANY INDEX.

BAMBOO-HABIT; a Chinese contrivance by which a person who cannot swim may easily keep himself above water. The following account of it is from a letter to the author of the Seaman's Preservation. "In the year 1730, I was passenger in a ship from Batavia to China, burden about 400 tons, called the Pride, Francisca Xavier commander, freighted by English, Chinese, and Portuguese. Near the coast of China we met one of those storms called a tuftoon (tau-fong), or a great wind, which carried away all our masts, bowsprit and rudder; and in our hold we had six feet of water, expecting every moment the ship would founder.—We consequently were consulting our preservation: the English and Portuguese stood in their shirts only, ready to be thrown off; but the Chinese merchants came upon deck, not in a cork-jacket, but I will call it a bamboo-habit, which had lain in their chests against such dangers; and it was thus constructed; four bamboos, two before and two behind their bodies, were placed horizontally, and projected about 28 inches. These were crossed on each side by two others, and the whole properly secured, leaving a space for their body; so that they had only to put it over their heads, and tie the same securely, which was done in two minutes, and we were satisfied they could not possibly sink." The shape is here subjoined.

BAMBOURGH, an unconsiderable village in Northumberland, on the sea coast, 14 miles north of Alnwick, was once a royal borough, and sent two members to parliament: it even gave name to a large tract extending southward, which was called Bamboorshire. It had also three religious foundations: a house of friars preachers founded by Henry III. a cell of canons regular of St Austin, and an hospital. Its very ancient castle stands on an almost perpendicular rock close to the sea, and accessible only on the south-east side, on a spot where, according to the monkish historians, there stood the castle or palace of the kings of Northumberland, built, as it is said, by King Ida, who began his reign about the year 559. Part of the present ruins are by some supposed to be the remains of King Ida's work. The ancient name of this place was, it is said, Bebbeborough; which name Camden, from the authority of Bede, imagines borrowed from Bebb, Ida's queen: but the author of the additions to that writer is of a contrary opinion, as in the Saxon copy it is called Cynicencber, or the "royal mansion." According to Florilegus, King Ida at first fenced it only with a wooden enclosure, but afterwards surrounded it with a wall. It is thus described by Roger Hoveden, who wrote in the year 1192: "Bebba is a very strong city, but not exceeding large; containing not more than two or three acres of ground. It has but one hollow entrance into it, which is admirably raised by steps. On the top of a hill stands a fair church; and in the western point is a well curiously adorned, and of sweet clean water." This castle was besieged anno 042 by Penda, the pagan king of the Mercians, who, as the story goes, attempted to burn it: for which purpose he laid vast quantities of wood under the walls, and set fire to them as soon as the wind was favourable; but no sooner was it kindled, than by the prayers of St Adrian, the wind changed and carried the flames into his camp, so that he was obliged to raise the siege. In 710, King Oserd, on the death of Alfred his father, took shelter in this castle with Britric his tutor or guardian; one Edulph having seized the crown, by whom, with his partizans, they were unsuccessfully besieged. Britric made so gallant a defence, that the siege was turned into a blockade, which gave the royal subjects time to arm in defence of their young king. On their marching hither to his relief, Edulph fled: but was followed, taken, and put to death by Britric, who thereby securely seated Os red on the throne, when this castle became his palace. In the reign of Egbert, Kedulph bishop of Lindisfarne was confined here 30 years, from 730 to 760. In 933, it was plundered and totally ruined by the Danes; but being of great importance in defending the northern parts against the continual incursions of the Scots, it was soon after repaired, and made a place of considerable strength. It is said to have been in good repair at the time of the Conquest, when it was probably put into the custody of some trusty Norman, and had in all likelihood some additions made to its works; and this is the more probable, as the present area, contained within its walls, measures upwards of 80 acres, instead of three, as when described by Hoveden. About the year 1005 it was in possession of Robert de Mowbray earl of Northumberland, who engaging in some treasonable practices against William Rufus, that king laid siege to it and obliged it to surrender. In the next reign it was entrusted by Henry 1. to Eustace Fitz-John, who was dispossessed of it and his other employments by King Stephen, that king being jealous of his attachment to Maud, daughter of Henry I. Irritated at this, Fitz-John delivered the castle of Alnwick to David king of Scotland, and brought to his aid all the forces he could raise; he was, however, afterwards reconciled to King Stephen, and held the manors of Burg and Knaresborough in Yorkshire, but never recovered the government of this castle.

In the 16th of Henry II., some great repairs seem to have been done here, as in Madox's history of the exchequer, under the article of Aremcentures, it appears one William, son of Waldef, was fined five marks for refusing his assistance in the king's works at Baenbourg castle.
castle. It's keep is supposed to have been the work of this reign.

Edward I summoned Balliol to meet him here 1265; and on his refusal invaded Scotland and took him prisoner. Edward II. sheltered Gaweston here 1310. It was taken by the Yorkists after the battle of Hexham. In the reign of Elizabeth, Sir John Forester, warden of the marches, was governor of it, and made a knight banneret after the battle of Musselburgh; and his grandson John obtained a grant of both castle and manor from James I. His descendant Thomas forfeited it in 1715; but his maternal uncle, Nathaniel Carew, bishop of Durham, purchased and bequeathed them to unconfined charitable uses. The ruins are still considerable; but many of them are now filled with sand, covered up by the winds which rage here with great violence, and carried to very distant places. The remains of a great hall are very singular; it has been warmed by two fire-places of a vast size, and from the top of every window ran a flue like that of a chimney, which reached the summit of the battlements. These caves seem designed as many superfluous chimney's to give vent to the smoke that the immense fires of those hospitable times filled the rooms with; for halls smoky, but filled with good cheer, were in those days thought no inconvenience. In the year 1757, the trustees for Lord Crew's charity began the repairs of the keep or great tower; the direction and management being committed to Sharp, Ashburnham of Durham, one of their number; who has made a most judicious and humane application of his lordship's generous bequest. The walls are from 9 to 12 feet thick. The upper parts of the building have been formed into granaries; whence, in times of scarcity, corn is sold to the indigent without any distinction at four shillings per bushel. A hall and some small apartments are reserved by the Doctor, who frequently resides here to see that this noble plan is properly executed. Among the variety of distressed who find relief from the judicious disposition of this charity, are the mariners escaping this dangerous coast, for whose benefit a constant watch is kept on the top of the tower; from whence signals are given to the fishermen of Holy Island when any ship is discovered in distress, these fishermen by their situation being able to put off their boats when none from the land can get over the breakers. The signals are so regulated as to point out the particular place where the distressed vessel lies. Besides which, in every great storm, two men on horseback patrol the adjacent coast from sunset to sunrise; who, in case of any shipwreck, are to give immediate notice at the castle. Premises are likewise paid for the earliest information of any such misfortune. By these means the lives of many seamen have been, and will be, preserved, who would otherwise have perished for want of timely assistance. Nor does this benevolent arrangement stop here. The shipwrecked mariner finds a hospitable reception in this castle; and is here maintained for a week or longer, as circumstances may require. Here, likewise, are store-houses for depositing the goods which may be saved; instruments and tackle for weighing and raising the sunk and stranded vessels; and, to complete the whole, at the expense of this fund, the last offices are decently performed to the bodies of such drowned sailors as are cast on shore.

BAMBUCK, a country of Africa, of which the following account is given by the Abbé Raynal, on the credit of a modern traveller whom he does not name. "In the interior part of Africa, under the 12th or 15th degree of north latitude, there is (says a modern traveller) a pretty large country, known by the name of Bambuck. It is not subject to a particular king; but governed by village lords, called fivers. These hereditary and independent chiefs are all obliged to unite for the defence of the state, when it is either attacked as a community, or only in one of its branches. The territory of this aristocratical state is dry and barren. It produces neither maize, rice, nor pulse. The insupportable heat is subject to, proceeds in part from its being surrounded by high mountains, which prevent the wind from refreshing the air. The climate is as unwholesome as it is disagreeable: vapours, which continually issue from the bowels of a soil replete with minerals, render this country unfit to live in, especially to strangers."

"It is gold that hath made this miserable country an object worthy of notice; gold, which in the eyes of the covetous man seems to compensate for all the evils of nature, though in reality it increases them all. This metal is so common in this country, that it is found almost indiscriminately everywhere. To obtain it, sometimes it is sufficient to scrape the surface of the earth, which is clayish, light, and mixed with sand. When the mine is rich, it is dug only to the depth of a few feet, and never deeper; though it has been observed, that the lower it was dug, the more gold the soil afforded. The miners are too indolent to pursue a toil which constantly becomes more tedious, and too ignorant to perceive the inconveniences it would be attended with. Their negligence and their folly are in this instance so extraordinary, that in washing the gold, in order to separate it from the earth, they only preserve the larger pieces; the light parts pass away with the water, which flows down an inclined place."

"The inhabitants of Bambuck do not work those mines at all times, nor are they at liberty to do it when they please. They are obliged to wait till private or public wants determine the farmers to grant this permission. When it is proclaimed, all who are able to avail themselves of this advantage meet at the appointed place. When their work is finished, a division is made. Half of the gold goes to the lord, and the remainder is equally distributed among the labourers. Those who want gold at any other time than that of the general digging, search for it in the beds of the rivers, where it is very common.

"The French and English have successively been desirous of appropriating to themselves those real or imaginary riches. Some thought they could reach this country by the Niger, others by the Saloum. Far from having succeeded in their attempts of becoming masters of this country, they have not yet ascertained its existence. The unsuccessfulness of past efforts hath redoubled the activity of sanguine minds; sensible and judicious merchants have chosen to limit themselves to commerce much more important, which is that of slaves."

BAM,
BAMFF, a shire of Scotland, comprehending part of Buchan, with the districts of Strathdevon, Boyne, Enzie, Strathaven, and Balvenie, extends 52 miles in length, with a breadth varying from 8 to 25, and has an area of 622 square miles. On the south and east it is bounded by Aberdeenshire; on the north it is watered by the German ocean; on the west it is bounded by the county of Elgin; and on the south west, it borders on Inverness-shire. The face of the country is agreeably diversified with hill and dale, not without woods, well watered with rivers, and exhibiting many seats and plantations. The air is pure and keen, the climate healthy, and the soil fertile, producing plentiful crops of corn. The district of Buchan, extending northwards from the river Ugie to the sea, and westward as far as Devron, comprehending a tract of 20 miles in length and nine in breadth, is more free from hills and mountains than any other district of the same extent in the kingdom of Scotland. It is inhabited chiefly by Lowlanders, and gives the title of earl to the family of Erskine; of which family, however, Erskine of Mar is the chief. The county of Bamff abounds with the necessaries and comforts of life. The pastures yield sheep, cattle, and horses; the arable lands produce plenty of corn; while the rivers and sea supply great quantities of fish. Various minerals have been found in different parts of the shire; and a piece of amber, as large as a horse, was once cast ashore on the beach. In the mountainous district of Balvenie on the western side of the shire, watered by the Spey, there is a noted rock, which produces lumps and whetstones sufficient to supply the whole island. Here are also veins of alum stone, and springs of alum water. Strathallan, another district to the north-east of Balvenie, abounds with such plenty of limestone, that the inhabitants use it as common stone in building their houses; and moreover burn a great quantity of it into lime, which they sell to good advantage in the village of Keith, on the river Devron. Along this whole coast, there are ancient Danish monuments, such as cairns, tumuli, and huge stones standing erect. In Strathaven, a hilly country, lying along the limpid river Aven, which falls into the Spey, we meet with Gordon castle, belonging to the duke of Gordon, the most princely edifice in the north of Scotland, environed with fine gardens and parks well stored with fallow deer. The valued rent is 79,200l. Scots; and in 1811 the real gross rent of lands was 79,396l. 3s. 4d. as ascertained by the property-tax returns.

The following is the population of the different parishes of this county at different periods:

Population in 1811, 36,668. See Banffshire, Supplement.

BAMFF, the capital of the shire of that name in Scotland, is pleasantly situated on the side of a hill, at the mouth of the river Devron. It has several streets, of which that with the town-house in it, adorned with a new spire, is very handsome. This place was erected into a burgh by virtue of a charter from Robert II. dated October 7, 1372, endowing it with the same privileges, and putting it on the same footing, with the burgh of Aberdeen; but tradition says it was founded in the reign of Malcolm Canmore. The number of inhabitants in 1811 was 2860. The harbour is very bad, as the entrance of the mouth of the Devron is very uncertain, being often stopped by the shifting of the sands, which are continually changing in great storms; the pier is therefore placed on the outside. Much salmon is exported from hence. About Troophead some kelp is made; and the adventurers pay the lord of the manor 50l. per annum for the liberty of collecting the materials. Near the town is a most magnificent seat lately built by the earl of Fife. It lies in a beautiful plain washed by the Devron, the lofty banks of which, clothed with wood on the opposite side, afford a delightful contrast to the soft vale beneath. W. Long. 2° 5'. N. Lat. 57° 40'.

BAMIYAN, a city of Asia, situated in the province of Zabulistan, 10 days journey from Balkh, and eight from Gazna. It is remarkable only for its dreadful catastrophe when taken by Jenghiz Khan in 1221. At that time the city belonged to Sultan Jalaluddin, the last of the famous Mahmud Gaznai's race. Jenghiz Khan was at that time about to attack Gazna, that prince's capital; but was stopped by the garrison of Bamiyan, which he had hoped would give him no trouble. In this, however, he was disappointed. The people had for a long time expected an attack; and had therefore ruined the country for five or six leagues round, while the peasants had carried away the stones, and every thing that could be of use to the besiegers, Accordingly,
Accordingly, Jenghiz Khan, having erected wooden towers, and planted his engines upon them, was in a short time obliged to give over his attacks till millstones and other materials could be brought from a great distance. The walls of the city were very strong, so that the engines of the Moguls made but little impression; and the garrison making frequent and furious sallies, cut off whole squadrons of their enemies, and frequently overthrew their towers and engines. This exceedingly chagrined Jenghiz Khan; who one day returning from a fruitless attack, and hearing of the defeat of one of his generals by Jalalodin, swore to be revenged on Ramiyan. This fury cost the life of one of his grandchildren; who exposing himself too much, to please his grandfather, was slain with an arrow. At last, however, by the numberless multitude of the Moguls, who continued the attacks without intermission, the city was taken, after its walls had been ruined in many places, and the bravest soldiers and officers of the garrison slain in its defence. The mother of the young prince who had been killed entering with the troops, and more deserving the name of a fiend than a woman, caused the throats of all the inhabitants to be cut, without exception. She even gave orders to rip up the bellies of all the women with child, that not an infant might be left alive. In short, to gratify the rage of this inhuman monster, the buildings were all levelled with the ground; the castle, and every living creature, destroyed; insomuch that the hardened Moguls themselves gave this place the name of Mauhali, which in their language signifies the unfortunate city. A strong castle has since been built out of its ruins.

BAMOTH-BAAL, in Ancient Geography, one of the towns of the tribe of Reuben, which seems also to have had a temple of Baal on an eminence; lying eastwards, and not far from the river Arnon, and the territory of Moab. Jerome calls it Banamoth, a city of the Amorites, beyond Jordan, in the possession of the sons of Reuben. Whether the same with that mentioned Num. xxxi. is doubtful, from the disagreement of interpreters; and yet we may admit it to be the place of encampment of the Israelites, and of Balaam’s first station, or where he had the first view of the rear of the people.

BAMPTON, a town of Devonshire, situated in a bottom surrounded with high hills, and containing 1332 inhabitants in 1811. W. Long. 4° 25'. N. Lat. 51° 5'.

BAN, or BANS. See BNN.

BAN, in commerce, a sort of fine smooth muslin, which the English import from the East Indies. The piece is almost a yard broad, and runs about 20 yards and a half.

BANANA TREE, a species of the musa or plantain. See MUSG, BOTANY INDEX.

BANARES, or BENARES, a town of Hindostan, greatly celebrated for its sanctity, and being the university of the Indian Bramins. It is seated on the north side of the river Ganges, and contains nearly 600,000 inhabitants. E. Long. 82° 30'. N. Lat. 26° 20'.

BANBURY, a town of Oxfordshire in England, situated on the river Charwell, in W. Long. 1° 20'. N. Lat. 52° 0'. It sends one member to parliament.

BANC, or BENCH, in Law, denotes a tribunal, or VOL. III. Part I. judgment-seat; hence king’s banc is the same with the court of king’s bench, and common banc with that of common pleas.

BANCI JUS, or the privilege of having a bench, was anciently only allowed to the king’s judges, qui summos administrant justitiam. Inferior courts, as courts-baron, hundred courts, &c. were not allowed that prerogative; and even at this day the hundred-court at Freibridge in Norfolk is held under an oak at Gey-wood; and that of Woolfill in Herefordshire, under an oak near Ashton in that county, called Hundred oak.

BANCA, an island of Asia in the East Indies, between Sumatra and Borneo; from the first of which it is separated only by a narrow channel. This island is famous on account of its tin mines. The prince of the island, who is also possessor of the territory of Palambang on the river of the same name in Sumatra, where he has his constant residence, had a contract with the Dutch, by whose troops his authority and independence are preserved, for the tin which he compels his subjects to deliver to him at a low price. Their profit, it is said, was not less than 150,000l. annually. In consequence of the perfection which the miners had arrived at in the reduction of the ore, the tin of this island was preferred to the tin from Europe at the Canton market. E. Long. 105° 10'. N. Lat. 13° 25'.

BANCALIS, a sea-port town on the east coast of the island of Sumatra, where the Dutch have a settlement. E. Long. 99° 7'. N. Lat. 1° 5'.

BANCK, Peter Vander, an engraver of considerable repute, was born at Paris, and received his instructions in the art from the celebrated Francois de Polly. He came over into England with Gaspar the painter, about the year 1674; and married the sister of a gentleman of estate in Hertfordshire, named Forster. He was a laborious artist: but the pay he received for his plates being by no means adequate to the time he bestowed upon them, he was reduced to want; and, retiring from business, sought an asylum in the house of his brother-in-law. He died at Bradfield, and was buried in the church there, in 1674; leaving his widow in possession of the chief part of his plates, which she disposed of to Brown, a printseller, to great advantage, and left an easy fortune.—His chief employment was engraving of portraits; and, according to Virtue’s account of this artist published by the Hon. Mr Walpole, he was the first in England who engraved them at a large scale. But even their novelty, it seems, added to their merit, could not sufficiently recommend them to support the artist. Like many of Polly’s disciples, his great merit, according to Mr Strutt, consists in the laboured neatness and management of the mechanical part of the art. Freedom, harmony, and chasteness of outline, are by no means the characteristic of his prints. However, though they cannot rank with the superior productions of Edelinck or Nanteuil, &c. they have their share of merit; and doubtless will be always esteemed in England, as preserving the best resemblance of so many eminent persons who were living at that time.

BANCO, an Italian word which signifies bank. It is commonly used to signify the bank of Venice.

BANCOCK, a town of the kingdom of Siam in Asia.
BAND, in a general sense, some small narrow ligament, where with any thing is bound, tied, or fastened.

Band of Soldiers, in military affairs, those who fight under the same flag or ensign.

Band of Pensioners, a company of 120 gentlemen, who receive a yearly allowance of 100l. for attending on his majesty on solemn occasions.

Band is also the denomination of a military order in Spain, instituted by Alphonse XI. King of Castile, for the younger sons of the nobility; who, before their admission, must serve 10 years at least, either in the army or at court; and are bound to take arms for the catholic faith against the infidels.

Band, in Surgery. See Bandage.

BANDA ISLANDS, the general name of five islands in the East Indies, belonging to the Dutch. Two of them are uncultivated, and almost entirely uninhabited; the other three claim the distinction of being the only islands in the world that produce the nutmeg.

If we except this valuable spice, the islands of Banda, like all the Moluccas, are barren to a dreadful degree. What they produce in superfluities they want in necessities. The land will not bring forth any kind of corn; and the pith of the sago serves the natives of the country instead of bread.

As this food is not sufficient for the Europeans who settle in the Moluccas, they are allowed to fetch provisions from Java, Macassar, or the extremely fertile island of Bali. The company itself carries some merchandise to Banda.

This is the only settlement in the East Indies that can be considered as an European colony; because it is the only one where the Europeans are proprietors of lands. The company finding that the inhabitants of Banda were savage, cruel, and treacherous, because they were impatient under their yoke, resolved to exterminate them. Their possessions were divided among the white people, who got slaves from some of the neighbouring islands to cultivate the lands. These white people are for the most part Creoles, or malecontents who have quitted the service of the country. In the small island of Rosering, there are likewise several banditti, whom the laws have branded with disgrace; and young men of abandoned principles, whose families wanted to get rid of them: so that Banda is called the Island of Correction. The climate is so unhealthy, that these unhappy men live but a short time. It is on account of the loss of so great a number of hands, that attempts have been made to transfer the culture of the nutmeg to Amboyna; and the company were likewise probably influenced by two other strong motives of interest, as their trade would be carried on with less expense and greater safety. But the experiments that have been made have proved unsuccessful, and matters remain in their former state.

BANDAGE, in Surgery, a fillet, roller, or swath, used in dressing and binding up wounds, restraining dangerous hemorrhages, and in joining fractured and displaced bones.

BANDALIER, or BANDELLER, in military affairs, a large leather belt, thrown over the right shoulder, and hanging under the left arm; worn by the ancient musketeers, both for the sustaining of their fire-arms, and for the carriage of their musket chargers, which being put up in little wooden cases, coated with leather, were hung, to the number of twelve, to each bandelier.

BANDELET, or BANDLET, in Architecture, any little band, or flat moulding, as that which crowns the Doric architrave.

BANDER CONGO, a small sea-port town in Asia, seated on the Persian gulf. E. Long. 54° 10'. N. Lat. 19° 0'.

BANDERET, a general, or one of the commanders in chief of the forces. This appellation is given to the principal commanders of the troops of the canton of Bern in Switzerland, where there are four banderets, who command all the forces of that canton.

BANDEROLL, a little flag, in form of a guidon, extended more in length than in breadth, used to be hung out on the masts of vessels, &c.

BANDITTI, from the Italian bandito; persons proscribed, or, as we call it, outlawed; sometimes denominated bannit or foris bannit. It is also a denomination given to highwaymen or robbers who infest the roads in troops, especially in Italy, France, and Sicily. Mr. Brydome, in his tour through Sicily, informs us, that in the eastern part, called Vel Demosi, from the devils that are supposed to inhabit Mount Etna, it has ever been found altogether impracticable to extirpate the banditti; there being numberless caverns and subterraneous passages round that mountain, where no troops could possibly pursue them: besides, they are known to be perfectly determined and resolute, never failing to take a dreadful revenge on all who have offended them. Hence the prince of Villa Franca has embraced it, not only as the safest, but likewise as the wisest and most political scheme, to become their declared patron and protector: and such of them as think proper to leave the mountains and forests, though perhaps only for a time, are sure to meet with good encouragement and a certain protection in his service, where they enjoy the most unbounded confidence, which, in no instance, they have ever yet been found to make an improper or a dishonest use of. They are clothed in the prince's livery, yellow and green, with silver lace; and wear likewise a badge of their honourable order, which entitles them to universal fear and respect from the people.

In some circumstances, these banditti are the most respectable people of the island, and have by much the highest and most romantic notions of what they call their point of honour. However criminal they may be with regard to society in general; yet with respect to one another, and to every person to whom they have once professed it, they have ever maintained the most unshaken fidelity. The magistrates have often been obliged to protect them, and pay them court, as they are known to be perfectly determined and desperate, and so extremely vindictive, that they will certainly put any person to death that has ever
gives them just cause of provocation. On the other hand, it never was known that any person who had put himself under their protection, and showed that he had confidence in them, had cause to repent of it, or was injured by any of them in the most trifling way; but, on the contrary, they will protect him from impositions of every kind, and scorn to go halves with the landlord, like most other conductors and travelling servants, and will defend him with their lives if there is occasion. Those of their number who have thus enlisted themselves in the service of society, are known and respected by the other banditti all over the island; and the persons of those they accompany are ever held sacred. For these reasons, most travellers choose to hire a couple of them from town to town; and may thus travel over the whole island in safety.

BANDORA, the capital of the island of Salset, on the west coast of the peninsula on this side the Ganges. It is separated from the island of Bombay by a narrow channel, and subject to the Portuguese. E. Long. 72° 35'. N. Lat. 19° 0'.

BANDORÉ, the name of a musical instrument with strings, resembling a lute, and said to be invented in the fourth year of Queen Elizabeth, by John Rose, a citizen of London.

BANDY-LEGs, from the French bander, 'to bend,' a distortion of the legs, when they turn either inward or outward on either side; arising from some defect in the birth, or imprudence in the nurse, endeavouring to make a child stand or walk before his legs were strong enough to sustain the weight of his body. See VALGUS.

BANE (from the Saxon bana, a murderer), signifies destruction or overthrow. Thus, "I will be the bane of such a man," is a common saying. So, when a person receives a mortal injury by any thing, we say, "it was his bane;" and he who is the cause of another man's death, is said to be le bane, i.e. a malefactor.

BANFF. See BANFF.

BANGHUR, a town of Ireland, in King's county in the province of Leinster, seated on the river Shannon. W. Long. 8° 5'. N. Lat. 53° 10'.

BANGLE EARS, an imperfection in a horse, remedied in the following manner. Place his ears in such a manner as you would have them stand; bind them with two little strings so fast that they cannot stir, and then clip away all the empty wrinkled skin close by the head.

BANGIUS, Thomas, a Danish divine, and an elegant Latin writer on the origin of languages and a variety of other subjects. He died in 1661.

BANGOR, an Episcopal city of Caernarvonshire in North Wales. In ancient times it was so considerable, that it was called Bangor the Great, and defended by a strong castle; but it is now a very mean place; the principal buildings being the cathedral, the bishop's palace, and free school. The see is of very great antiquity, and its founder unknown. The church is dedicated to St Daniel, who was bishop here about the year 516; but for near 500 years afterwards, there is no certainty of the names of his successors. Owen Glendower greatly defaced the cathedral church; but Bishop Dean repaired it again. This met a still more cruel ravager than Owen Glendower, in the person of Bishop Bulkeley; who not only alienated many of the lands belonging to it, but even sold the bells of the church. This diocese contains the whole of Caernarvonshire except three parishes, the shire of Anglesey, and part of the shires of Denbigh, Merioneth, and Montgomery; in which are 107 parishes, whereof 36 are appropriated. It has three archdeaconries, viz. Bangor, Anglesey, and Merioneth; of which the two first are commonly annexed to the bishopric for its better support. This see is valued in the king's books at £31. 16s. 4d. and is computed to be worth annually £200. The tenth of the clergy is £31. 14s. 3d. To the cathedral there belong a bishop, a dean, an archdeacon, a treasurer, and two prebendaries, endowed; a precentor, a chancellor, and three canons, not endowed; three vicars choral, an organist, lay-clerks, choristers, and two officers. W. Long. 4° 10'. N. Lat. 53° 20'.

BANGOR, a town of Ireland, in the county of Down and province of Ulster. It is seated on the south shore of the bay of Carrick Fergus, opposite to the town of that name; and has a considerable trade for soles, turbot, &c. W. Long. 6° 11'. N. Lat. 54° 42'.

BANGUE, a species of opium, in great use throughout the east, for drowning cares and inspiring joy. This by the Persians is called bang; by the Arabs, essrar, corruptly assoral, and asaroth; by the Turks, bengite, and vulgarly called mastack; by the European naturalists, bangue or bang. It is the leaf of a kind of wild hemp, growing in the countries of the Levant; it differs little, either as to leaf or seed, from our hemp, except in size. Some have mistaken it for a species of aetha.

There are divers manners of preparing it, in different countries. Olearius describes the method used in Persia. Mr Sale tells us, that, among the Arabs, the leaf is made into pills, or conserves. But the most distinct account is that given by Alexander Maurocordato, counsellor and physician of the Ottoman Porte, in a letter to Wedelius. According to this author, bangue is made of the leaves of wild hemp, dried in the shade, then ground to powder; put into a pot wherein butter has been kept; set in an oven till it begins to torrify; then taken out, and pulverized again; thus to be used occasionally, as much at a time as will lie on the point of a knife. Such is the Turkish bangue. The effects of this drug are, To confound the understanding; set the imagination loose; induce a kind of folly and forgetfulness, wherein all cares are lost, and joy and gaiety take place thereof. Banque, in reality, is a succedaneum to wine, and obtains in those countries where Mahometanism is established; which prohibiting the use of that liquor absolutely, the poor Musulmans are forced to have recourse to succedaneum, to rouse their spirits. The principal is opium and this bangue. As to the opinion among Europeans, that the Turks prepare themselves for battle by a dose of bangue, which rouses their courage, and drives them, with eagerness, to certain death; Dr Maurocordato assures us, that it is a popular error; the Turks think they are then going assuredly to receive the crown of martyrdom; and would not, for any consideration, lose the merit of it, which they would do, by eating the bangue, as being held unlawful by their apostle, among other things which intoxicate.

Z 2

BANIALUCII,
BANILECH, or Bagnaluch, a city of European Turkey, the capital of Bosnia, upon the frontiers of Dalmatia, near the river Setina. E. Long. 18° 20'. N. Lat. 44° 20'.

BANIAN-Tree. See Ficus, Botany Index.

BaniANS, a religious sect in the empire of the Mogul, who believe a metempsychosis; and will therefore eat no living creature, nor kill even noxious animals, but endeavour to release them when in the hands of others.—The name of Banian is used with some diversity, which has occasioned much confusion, and many mistakes. Sometimes it is taken in a less proper sense, and extended to all the idolaters of India, as contradistinguished from the Mahometans: in which sense, Banians includes the Bramins and other casts. Banians, in a more proper sense, is restrained to a peculiar cast, or tribe of Indians, whose office or profession is trade and merchandize: in which sense, Banians stand contradistinguished from Bramins, Cutters, and Wyzes, the three other casts into which the Indians are divided. The four casts are absolutely separate as to occupation, relation, marriage, &c. though all of the same religion; which is more properly denominated the religion of the Bramins, who make the ecclesiastical tribe, than of the Banians, who make the mercantile. The proper Banians are called, in the Shaster, or book of their law, by the name of Shuddery; under which are comprehended all who live after the manner of merchants, or that deal and transact for others, as brokers; exclusive of the mechanics or artificers, who make another cast, called Wyzes. These Banians have no peculiar sect or religion, unless it be, that two of the eight general precepts given by their legislator Brama to the Indian nation, are, on account of the profession of the Banians, supposed more immediately to relate to them, viz. those which enjoin veracity in their word and dealings, and avoiding all practices of circumvention in buying and selling. Some of the Banians, quitting their profession, and retiring from the world, commence religious, assume a peculiar habit, and devote themselves more immediately to God, under the denomination of Vertea. These, though, they do not hereby change their cast, are commonly reckoned as bramins of a more devout kind; much as monks in the Roman church, though frequently not in orders, are reputed as a more sacred order than the regular clergy. The name Banian imports as much, in the Bramin language (wherein their law is written), as a people innocent and harmless; void of all guile; so gentle, that they cannot endure to see either a fly or a worm injured; and who, when struck, will patiently bear it, without resisting or returning the blow.—Their mien and appearance is described by Lord*, in terms a little precise, but very significant: "A people presented themselves to my eyes clothed in linen garments, somewhat low descending; of a gesture and garb, as I may say, maidenly, and well nigh effeminate; of a countenance shy and somewhat estranged." Gemelli Careri divides the Banians into 72 tribes, all distinct, and not allowed to marry with each other. Lord assures us they are divided into 82 casts or tribes, correspondent to the casts or divisions of the Bramins or priests, under whose discipline they are as to religious matters; though the generality of the Banians choose to be under the direction of the two Bramin tribes, the Visnagranagers and Volsagranagers.

The Banians are the great factors, by whom most of the trade of India is managed; in this respect, comparable to the Jews and Armenians, and not behind either, in point of skill and experience, in whatever relates to commerce. Nothing is bought but by their mediation. They seem to claim a kind of jus divinum to the administration of the traffic of the nation, grounded on their sacred books, as the Bramins do that of religion. They are dispersed, for this purpose, through all parts of Asia, and abound in Persia, particularly at Isphahan and Gombroon, where many of them are extremely rich, yet not above acting as brokers, where a penny is to be got. The chief agents of the English, Dutch, and French East India Companies, are of this nation: they are faithful, and are generally trusted with the cash of those companies in their keeping. They act also as bankers, and can give bills of exchange for most cities in the East Indies. Their form of contract in buying and selling is remarkable; being done without words, in the profoundest silence, only by touching each other's fingers: the buyer loosing his paminor or girdle, spreads it on his knee, and both he and the seller having their hands underneath, by the intercourse of the fingers, mark the price of pounds, shillings, &c. demanded, offered, and at length agreed on. When the seller takes the buyer's whole hand, it denotes a thousand; and, as many times as he squeezed it, as many thousand pagods, or rupees, according to the species in question, are demanded; when he only takes the five fingers, it denotes five hundred; and when only one, one hundred: taking only half a finger, to the second joint, denotes fifty; the small end of the finger, to the first joint, stands for ten.

BANIE, ANTHONY, licentiate in law, member of the academy of inscriptions and belles lettres, an ecclesiastic of the diocese of Clermont in Auvergne; died in November 1741, aged 69. He is principally celebrated for his translation of the Metamorphoses of Ovid, with historical remarks and explanations; which was published in 1732, at Amsterdam, in folio, finely ornamented with copperplates, by Picart; and reprinted at Paris 1738, in two vols 4to: and for his Mythology, or Fables of the Ancients, explained by history; a work full of the most important information, which was translated into English, and printed at London in 1741, in 4 vols 8vo.

BANISHMENT, exile, among us is of two kinds: the one voluntary, and upon oath; the other by compulsion, for some offence or crime. The former, properly called abjuration, is now ceased; the latter is chiefly enjoined by judgment of parliament. Yet outlawing and transportation may also be considered as species of exile.

BANISTER, JOHN, a physician and surgeon in the reign of Queen Elizabeth, was educated at Oxford, where, says Anthony Wood, he studied Logicals for a time; but afterwards applied himself solely to physic and surgery. In 1573 he took the degree of bachelor of physic; and, obtaining a license from the university to practise, settled at Nottingham, where he lived many years in great repute, and wrote several medical treatises.
BANISTERIA. See Botany Index.

BANK, in Commerce, a common repository, where many persons agree to keep their money, to be always ready at their call or direction: or, certain societies or communities, who take the charge of other people's money, either to improve it, or to keep it secure.

The first institution of banks was in Italy, where the Lombard Jews kept benches in the market-places for the exchange of money and bills; and banco being the Italian name for bench, banks took their title from this word.

Banks are of two principal kinds. 1. One sort is either public, consisting of a company of moneyed men, who being duly established, and incorporated by the laws of their country, agree to deposite a considerable fund, or joint stock, to be employed for the use of the society, as in lending money upon good security, buying and selling bullion, discounting bills of exchange, &c.: or private, i.e. set up by private persons, or partnerships, who deal in the same way as the former upon their own single stock and credit.

The greatest bank of circulation in Europe is the Bank of England; its establishment, regulations, and importance, &c.

Bank of England; its establishment, regulations, and importance, &c.

The company was incorporated by parliament in the fifth and sixth years of King William and Queen Mary, by the name of The Governors and Company of the Bank of England: in consideration of the loan of 1,200,000l. granted to the government; for which the subscribers received almost 8 per cent. By this charter, the company are not to borrow under their common seal, unless by act of parliament; they are not to trade, or suffer any person in trust for them to trade, in any goods or merchandise; but they may deal in bills of exchange, in buying or selling bullion, and foreign gold and silver coin, &c.

By an act of parliament passed in the 8th and 9th years of William III. they were empowered to enlarge their capital stock to 2,201,171l. 10s. It was then also enacted, that bank-stock should be a personal, and not a real estate; that no contract either in word or writing for buying or selling bank-stock, should be good in law, unless registered in the books of the bank within 7 days, and the stock transferred in 14 days; and that it shall be felony, without benefit of clergy, to counterfeit the common seal of the bank, or any sealed bank-bill, or any bank-note, or to alter or erase such bills or notes. By another act passed in the 7th of Queen Anne, the company were empowered to augment their capital to 4,402,343l. and they then advanced 400,000l. more to the government; and in 1714, they advanced another loan of 1,500,000l.

In the third year of the reign of King George I. the interest of their capital stock was reduced to 5 per cent. when the bank agreed to deliver up as many exchequer bills as amounted to 2,000,000l. and to accept an annuity of 100,000l. and it was declared lawful for the bank to call from their members, in proportion to their interests in the capital stock, such sums of money as in a general court should be found necessary. If any member should neglect to pay his share of the moneys so called for, at the time appointed by notice in the London Gazette, and fixed upon the Royal Exchange, it should be lawful for the bank, not only to stop the dividend of such member, and to apply it towards payment of the money in question, but also to stop the transfers of the share of such defaulter, and to charge him with an interest of 5 per cent. per annum, for the money so omitted to be paid; and if the principal and interest should be three months unpaid, the bank should then have power to sell so much of the stock belonging to the defaulter as would satisfy the same. After this, the bank reduced the interest of the 2,000,000l. lent to the government, from 5 to 4 per cent. and purchased several other annuities, which were afterwards redeemed by the government, and the national debt due to the bank reduced to 1,600,000l.

But in 1742, the company engaged to supply the government with 1,600,000l. at 3 per cent. which is now called the 3 per cent. annuities; so that the government was now indebted to the company 3,200,000l. the one half carrying 4, and the other 3 per cent.

In the year 1745, the company agreed that the sum of 986,800l. due to them in the exchequer bills unsatisfied, on the duties for licenses to sell spirited liquors by retail, should be canceled, and in lieu thereof to accept of an annuity of 394,42l. the interest of that sum at 4 per cent. The company also agreed to advance the further sum of 1,000,000l. into the exchanger, upon the credit of the duties arising by the malt and land tax at 4 per cent. for exchequer bills to be issued for that purpose; in consideration of which, the company were enabled to augment their capital with 986,800l. the interest of which, as well as that of the other annuities, was reduced to 3½ per cent. till the 27th of December 1757, and from that time to carry only 3 per cent.

And in order to enable them to circulate the said exchequer bills, they established what is now called bank circulation. The nature of which may be understood from what follows.

The company of the bank are obliged to keep cash sufficient not only to answer the common, but also any extraordinary demand that may be made upon them; and whatever money they have by them, over and above the sum supposed necessary for these purposes, they employ in what may be called the trade of the company; that is to say, in discounting bills of exchange, in buying of gold and silver, and in government securities, &c. But when the bank entered into the above-mentioned contract, as they did not keep unemployed a larger sum of money than what they deemed necessary to answer their ordinary and extraordinary demands, they could not conveniently take out of their current cash so large a sum as a million, with which they were obliged to furnish the government, without either lessening that sum they employed in discounting, buying gold and silver, &c. (which would have been very disadvantageous to them), or inventing some method that should answer all the purposes of keeping the million in cash. The method which they chose, and which fully answers their end, was as follows:

They opened a subscription, which they renew annually, for a million of money; wherein the subscribers advance 10 per cent. and enter into a contract to pay the remainder, or any part thereof, whenever the bank shall call upon them, under penalty of forfeiting the 10 per cent. so advanced: in consideration of which, the bank pays the subscribers 4 per cent. interest for
In Scotland there are two public banks, both at Edinburgh. The one, called The Bank of Scotland, was established by act of parliament in 1695; the other, called The Royal Bank, by royal charter in 1727.

Within these 30 years there have also been erected private banking companies in almost every considerable town, and even in some villages. Hence the business of the country is almost entirely carried on by paper-currency, i.e., by the notes of those different banking companies; with which purchases and payments of all kinds are commonly made. Silver very seldom appears, except in the change of a twenty-shilling bank-note, and gold still seldomer. But though the conduct of all those different companies has not been unexceptionable, and has accordingly required an act of parliament to regulate it; the country, notwithstanding, has evidently derived great benefit from their trade. It has been asserted, that the trade of the city of Glasgow doubled in about 15 years after the first erection of the banks there; and that the trade of Scotland has more than quadrupled since the first erection of the two public banks at Edinburgh. Whether the trade, either of Scotland in general, or of the city of Glasgow in particular, has really increased in so great a proportion, during so short a period, we do not pretend to know. If either of them has increased in this proportion, it seems to be an effect too great to be accounted for by the sole operation of this cause. That the trade and industry of Scotland, however, have increased very considerably during this period, and that the banks have contributed a good deal to this increase, cannot be doubted.

The value of the silver money which circulated in Scotland before the Union in 1707, and which immediately after it was brought into the bank of Scotland, in order to be recoined, amounted to 411,171 l. 10s. 9d. sterling. No account has been got of the gold coin; but it appears from the ancient accounts of the mint of Scotland, that the value of the gold annually coined somewhat exceeded that of the silver. There were a good many people too upon this occasion, who, from a diffidence of repayment, did not bring their silver into the bank of Scotland; and there was, besides, some English coin, which was not called in. The whole value of the gold and silver, therefore, which circulated in Scotland before the Union, cannot be estimated at less than a million sterling. It seems to have constituted almost the whole circulation of that country; for though the circulation of the bank of Scotland, which had then no rival, was considerable, it seems to have made but a very small part of the whole. In the present times, the whole circulation of Scotland cannot be estimated at less than two millions, of which that part which consists of gold and silver most probably does not amount to half a million. But though the circulating gold and silver of Scotland have suffered so great a diminution during this period, its real riches and prosperity do not appear to have suffered any. Its agriculture, manufactures, and trade, on the contrary, the annual produce of its land and labour, have evidently been augmented.

It is chiefly by discounting bills of exchange, that Discount is, by advancing money upon them before they are due, that the greater part of banks and bankers issue their promissory notes. They deduct always upon whatever
ever sum they advance, the legal interest till the bill shall become due. The payment of the bill, when it becomes due, replaces to the bank the value of what had been advanced, together with a clear profit of the interest. The banker, who advances to the merchant whose bill he discounts not gold and silver, but his own promissory notes, has the advantage of being able to discount to a greater amount, by the whole value of his promissory notes, which he finds by experience are commonly in circulation. He is thereby enabled to make his clear gain of interest on so much larger a sum.

The commerce of Scotland, which at present is not very great, was still more inconsiderable when the two first banking companies were established; and those companies would have had but little trade, had they confined their business to the discounting of bills of exchange. They invented, therefore, another method of issuing their promissory notes, by granting what they called cash accounts; that is, by giving credit to the extent of a certain sum (2000l. or 3000l. for example), to any individual who could procure two persons of unquestioned credit and good landed estate to become surety for him, that whatever money should be advanced to him within the sum for which the credit had been given should be repaid upon demand, together with the legal interest. Credits of this kind are commonly granted by banks and bankers in all different parts of the world.

But the easy terms on which the Scots banking companies accept of repayment, are peculiar to them, and have perhaps been the principal cause, both of the great trade of those companies and of the benefit which the country has derived from it.

Whoever has a credit of this kind with one of those companies, and borrows 1000l. upon it, for example, may repay this sum piecemeal, by 20l. and 30l. at a time, the company discounting a proportional part of the interest of the great sum from the day on which each of those small sums is paid in, till the whole be in this manner repaid. All merchants, therefore, and almost all men of business, find it convenient to keep such cash-accounts with them; and are thereby interested to promote the trade of those companies, by readily receiving their notes in all payments, and by encouraging all those with whom they have any influence to do the same. The banks, when their customers apply to them for money, generally advance it to them in their own promissory notes. These the merchants pay away to the manufacturers for goods, the manufacturers to the farmers for materials and provisions, the farmers to their landlords for rent, the landlords repay them to the merchants for the conveniences and luxuries with which they supply them, and the merchants again return them to the banks in order to balance their cash-accounts, or to replace what they may have borrowed of them; and thus almost the whole money business of the country is transacted by means of them. Hence the great trade of those companies.

By means of those cash-accounts, every merchant can, without impropriety, carry on a greater trade than he otherwise could do. If there are two merchants, one in London, and the other in Edinburgh, who employ equal stocks in the same branch of trade, the Edinburgh merchant can, without impropriety, carry on a greater trade, and give employment to a greater number of people, than the London merchant. The London merchant must always keep by him a considerable sum of money, either in his own coffers, or in those of his banker (who gives him no interest for it), in order to answer the demands continually coming upon him for payment of the goods which he purchases upon credit. Let the ordinary amount of this sum be supposed 500l. The value of the goods in his warehouse must always be less by 500l. than it would have been, had he not been obliged to keep such a sum unemployed. Let us suppose that he generally disposes of his whole stock upon hand, or of goods to the value of his whole stock upon hand, once in the year. By being obliged to keep such a great sum unemployed, he must sell in a year 500l. worth less goods than he might otherwise have done. His annual profits must be less by all that he could have made by the sale of 500l. worth more goods; and the number of people employed in preparing his goods for the market, must be less by all those that 500l. more stock could have employed. The merchant in Edinburgh, on the other hand, keeps no money unemployed for answering such occasional demands. When they actually come upon him, he satisfies them from his cash-account with the bank, and gradually replaces the sum borrowed with the money or paper which comes in from the occasional sales of his goods. With the same stock, therefore, he can, without impropriety, have at all times in his warehouse a larger quantity of goods than the London merchant; and can thereby both make a greater profit himself, and give constant employment to a greater number of industrious people who prepare those goods for the market. Hence the great benefit which the country has derived from this trade.

The late multiplication of banking companies in both parts of the United Kingdom, an event by which many people have been much alarmed, instead of diminishing, increases the security of the public. It obliges all of them to be more circumspect in their conduct, and, by not extending their currency beyond its due proportion to their cash, to guard themselves against those malicious runs which the rivalry of so many competitors is always ready to bring upon them. It restrains the circulation of each particular company, within a narrower circle, and reduces their circulating notes to a smaller number. By dividing the whole circulation into a greater number of parts, the failure of any one company, an accident which, in the course of things, must sometimes happen, becomes of less consequence to the public. This free competition too obliges all bankers to be more liberal in their dealings with their customers, lest their rivals should carry them away. In general, if any branch of trade, or any division of labour, be advantageous to the public, the freer and more general the competition, it will always be the more so. See further, the article Paper-Money.

2. The other kind of banks consist of such as are in the Bank of England altogether on the public account, and are called banks of deposit. The Bank of England; the nature of which not being generally understood, the following particular explanation may not be unacceptable.

The currency of a great state, such as Britain, generally,
generally consists almost entirely of its own coin. Should this currency, therefore, be at any time worn, clipt, or otherwise degraded below its standard value, the state by a reformation of its coin can effectually re-establish its currency. But the currency of a small state, such as Genoa or Hamburg, can seldom consist altogether in its own coin, but must be made up, in a great measure, of the coins of all the neighbouring states with which its inhabitants have a continual intercourse. Such a state, therefore, by reforming its coin, will not always be able to reform its currency. If foreign bills of exchange are paid in this currency, the uncertain value of any sum, of what is in its own nature so uncertain, must render the exchange always very much against such a state, its currency being, in all foreign states, necessarily valued below even what it is worth. In order to remedy the inconvenience to which this disadvantageous exchange must have subjected their merchants, such small states, when they began to attend to the interest of trade, have frequently enacted, that foreign bills of exchange of a certain value should be paid, not in common currency, but by an order upon, or by a transfer in, the books of a certain bank, established upon the credit and under the protection of the state; this bank being always obliged to pay, in good and true money, exactly according to the standard of the state. The banks of Venice, Genoa, Amsterdam, Hamburg, and Nuremberg, seem to have been all originally established with this view, though some of them may have afterwards been made subservient to other purposes. The money of such banks, being better than the common currency of the country, necessarily bore an agio, which was greater or smaller, according as the currency was supposed to be more or less degraded below the standard of the state. The agio of the bank of Hamburg, for example, which is said to be commonly about 14 per cent. is the supposed difference between the good standard money of the state, and the clipt, worn, and diminished currency poured into it from all the neighbouring states.

Before 1609, the great quantity of clipt and worn foreign coin, which the extensive trade of Amsterdam brought from all parts of Europe, reduced the value of its currency about 9 per cent. below that of good money fresh from the mint. Such money no sooner appeared, than it was melted down or carried away, as it always is in such circumstances. The merchants, with plenty of currency, could not always find a sufficient quantity of good money to pay their bills of exchange; and the value of those bills, in spite of several regulations which were made to prevent it, became in a great measure uncertain. In order to remedy these inconveniences, a bank was established in 1609 under the guarantee of the city. The bank received both foreign coin, and the light and worn coin of the country, at its real and intrinsic value in the good standard money of the country, deducting only so much as was necessary for defraying the expense of coining, and other necessary expense of management. For the value which remained after this small deduction was made, it gave a credit in its books. This credit was called bank-money; which, as it represented money exactly according to the standard of the mint, was always of the same real value, and intrinsically worth more than current money. It was at the same time enacted, that all bills drawn upon or negotiated at Amsterdam of the value of 600 guilders and upwards should be paid in bank-money, which at once took away all uncertainty in the value of those bills. Every merchant, in consequence of this regulation, was obliged to keep an account with the bank in order to pay his foreign bills of exchange, which necessarily occasioned a certain demand for bank-money. Bank-money, over and above both its intrinsic superiority to currency, and the additional value which this demand necessarily gives it, has likewise some other advantages. It is secure from fire, robbery, and other accidents; the city of Amsterdam is bound for it; it can be paid away by a simple transfer, without the trouble of counting, or the risk of transporting it from one place to another. In consequence of these advantages, it seems from the beginning to have been an agio; and it is generally believed that all the money originally deposited in the bank was allowed to remain there, nobody caring to demand payment of a debt which he could sell for a premium in the market. Besides, this money could not be brought from these coffers, as it will appear by and by, without previously paying for the keeping.

Those deposits of coin, or which the bank was bound to restore in coin, constituted the original capital of the bank, or the whole value of what was represented by what is called bank-money. At present they are supposed to constitute but a very small part of it. In order to facilitate the trade in bullion, the bank has been for these many years in the practice of giving credit in its books upon deposits of gold and silver bullion. The credit is generally about 5 per cent. below the mint price of such bullion. The bank grants at the same time what is called a receipt or receipt, entitling the person who makes the deposit, or the bearer, to take out the bullion again at any time within six months, upon re-transferring to the bank a quantity of bank-money equal to that for which credit had been given in its books when the deposit was made, and upon paying 1⁄2 per cent. for the keeping if the deposit was in silver, and 1⁄4 per cent. if it was in gold; but at the same time declaring, that in default of such payment, and upon the expiration of this term, the deposit should belong to the bank at the price at which it had been received, or for which credit had been given in the transfer books. What is thus paid for the keeping of the deposit may be considered as a sort of warehouse-rent; and why this warehouse-rent should be so much dearer for gold than for silver, several different reasons have been assigned. The fineness of gold, it has been said, is more difficult to be ascertained than that of silver. Frauds are more easily practised, and occasion a greater loss in the more precious metal. Silver, besides, being the standard metal, the state, it has been said, wishes to encourage more the making of deposits of silver than those of gold.

Deposits of bullion are most commonly made when the price is somewhat lower than ordinary; and they are taken out again when it happens to rise. In Holland the market price of bullion is generally above the mint price, for the same reason that it was so in England before the late reformation of the gold coin. The difference is said to be commonly from about six to sixteen
Bank.

sixteen stivers upon the mark, or eight ounces of silver of eleven parts fine and one part alloy. The bank
price, or the credit which the bank gives for deposits of such silver (when made in foreign coin, of which the fineness is well known and ascertained, such as Mexico dollars), is 22 gilders the mark; the mint-price is about 23 gilders; and the market-price is from 23 gilders six stivers to 23 gilders 16 stivers, or from 2 to 3 per cent. above the mint-price. The proportion between the bank-price, the mint-price, and the market-price, of gold bullion, are nearly the same. A person can generally sell his receipt for the difference between the mint-price of bullion and the market-price. A receipt for bullion is almost always worth something, and it very seldom happens therefore that anybody suffers his receipt to expire, or allows his bullion to fall to the bank at the price at which it had been received, either by not taking it out before the end of the six months, or by neglecting to pay the ¼ or ½ per cent. in order to obtain an new receipt for another six months. This, however, though it seldom happens, is said to happen sometimes, and more frequently with regard to gold than with regard to silver, on account of the higher warehouse-rent which is paid for the keeping of the more precious metal.

The person who by making a deposit of bullion obtains both a bank-credit and a receipt, pays his bills of exchange as they become due with his bank-credit; and either sells or keeps his receipt, according as he judges that the price of bullion is likely to rise or to fall. The receipt and the bank-credit seldom keep long together, and there is no occasion that they should. The person who has a receipt, and who wants to take out bullion, finds always plenty of bank-credits, or bank-money, to buy at the ordinary price; and the person who has bank-money, and wants to take out bullion, finds receipts always in equal abundance.

The owners of bank-credits and the holders of receipts consider these two different kinds of creditors against the bank. The holder of a receipt cannot draw out the bullion for which it is granted, without re-assigning to the bank a sum of bank-money equal to the price at which the bullion had been received. If he has no bank-money of his own, he must purchase it of those who have it. The owner of bank-money cannot draw out bullion without producing to the bank the receipts for the quantity which he wants. If he has none of his own, he must buy them of those who have them. The holder of a receipt, when he purchases bank-money, purchases the power of taking out a quantity of bullion, of which the mint-price is 5 per cent. above the bank-price. The sum of 5 per cent. therefore, which he commonly pays for it, is paid not for an imaginary, but for a real value. The owner of bank-money, when he purchases a receipt, purchases the power of taking out a quantity of bullion, of which the market-price is commonly from 2 to 3 per cent. above the mint-price. The price which he pays for it, therefore, is paid likewise for a real value. The price of the receipt, and the price of the bank money, compound or make up between them the full value or price of the bullion.

Upon deposits of the coin current in the country, the bank grants receipts likewise as well as bank-credits; but those receipts are frequently of no value, and will bring no price in the market. Upon ducautos, for example, which in the currency pass for three guilders each, the bank gives a credit of three gilders only, or 5 per cent. below their current value. It grants a receipt likewise entitling the bearer to take out the number of ducautos deposited at any time within six months, upon paying ½ per cent. for the keeping. This receipt will frequently bring no price in the market. Three guilders bank-money generally sell in the market for three guilders three stivers, the full value of the ducautos if they were taken out of the bank; and before they can be taken out, ½ per cent. must be paid for the keeping, which would be mere loss to the holder of the receipt. If the agio of the bank, however, should at any time fall to 3 per cent. such receipts might bring some price in the market, and might sell for 1¼ per cent. But the agio of the bank being now generally about 5 per cent. such receipts are frequently allowed to expire, or, as they express it, to fall to the bank. The 5 per cent. which the bank gains, when deposits either of coin or bullion are allowed to fall to it, may be considered as the warehouse rent for the perpetual keeping of such deposits.

The sum of bank-money for which the receipts are expired must be very considerable. It must comprehend the whole original capital of the bank, which, it is generally supposed, has been allowed to remain there from the time it was first deposited, nobody caring either to renew his receipt or to take out his deposit, as, for the reasons already assigned, neither the one nor the other could be done without loss. But whatever may be the amount of this sum, the proportion which it bears to the whole mass of bank-money is supposed to be very small. The bank of Amsterdam has for these many years past been the great warehouse of Europe for bullion, for which the receipts are very seldom allowed to expire, or, as they express it, to fall to the bank. The far greater part of the bank-money, or of the credits upon the books of the bank, is supposed to have been created, for these many years past, by such deposits which the dealers in bullion are continually both making and withdrawing.

No demand can be made upon the bank but by means of a recipie or receipt. The smaller mass of bank-money, for which the receipts are expired, is mixed and confounded with the much greater mass for which they are still in force; so that, though there may be a considerable sum of bank-money for which there are no receipts, there is no specific sum or portion of it which may not at any time be demanded by one. The bank cannot be debtor to two persons for the same thing; and the owner of bank-money who has no receipt cannot demand payment of the bank till he buys one. In ordinary and quiet times, he can find no difficulty in getting one to buy at the market-price, which generally corresponds with the price at which he can sell the coin or bullion it entitles him to take out of the bank.

It might be otherwise during a public calamity; an invasion, for example, such as that of the French in 1672. The owners of bank-money being then all eager to draw it out of the bank, in order to have it in their own keeping, the demand for receipts might raise their price to an exorbitant height. The holders of them
Bank might form extravagant expectations, and instead of 2 or 3 per cent. demand half the bank-money for which credit had been given upon the deposits that the receipts had respectively been granted for. The enemy, informed of the constitution of the bank, might even buy them up in order to prevent the carrying away of the treasure. In such emergencies, the bank, it is supposed, would break through its ordinary rule of making payment only to the holders of receipts. The holders of receipts, who had no bank-money, must have received within 2 or 3 per cent. of the value of the deposit for which their respective receipts had been granted. The bank, therefore, it is said, would in this case make no scruple in paying, either with money or bullion, the full value of what the owners of bank-money who could get no receipts were credited for in its books; paying at the same time 2 or 3 per cent. to such holder of receipts as had no bank-money, that being the whole value which in this state of things could justly be supposed due to them.

Even in ordinary and quiet times it is the interest of the holders of receipts to depress the agio in order either to buy bank-money (and consequently the bullion which their receipts would then enable them to take out of the bank) so much cheaper, or to sell their receipts to those who have bank-money, and who want to take out bullion, so much dearer; the price of a receipt being generally equal to the difference between the market-price of bank-money and that of the coin or bullion for which the receipt had been granted. It is the interest of the owners of bank-money, on the contrary, to raise the agio, in order either to sell their bank money so much dearer, or to buy a receipt so much cheaper. To prevent the stock-jobbing tricks which those opposite interests might sometimes occasion, the bank has of late years come to a resolution to sell at all times bank-money for currency, at 5 per cent. agio, and to buy it again at 4 per cent. agio. In consequence of this resolution, the agio can never either rise above 5 or sink below 4 per cent. and the proportion between the market-price of the bank and that of current money is kept at all times very near to the proportion between their intrinsic values. Before this resolution was taken, the market-price of money used sometimes to rise so high as 9 per cent. agio, and sometimes to sink so low as par, according as opposite interests happened to influence the market.

The bank of Amsterdam professes to lend out no part of what is deposited with it, but, for every guilder for which it gives credit in its books, to keep in its repositories the value of a guilder either in money or bullion. That it keeps in its repositories all the money or bullion for which there are receipts in force, for which it is at all times liable to be called upon, and which, in reality, is continually going from it and returning to it again, cannot well be doubted. But whether it does so likewise with regard to that part of its capital for which the receipts are long ago expired, for which in ordinary and quiet times it cannot be called upon, and which in reality is very likely to remain with it for ever, or as long as the States of the United Provinces subsist, may appear perhaps more uncertain. At Amsterdam, however, no part of faith is better established, than that for every guilder circulated as bank-money, there is a correspondent guilder in gold and silver to be found in the treasure of the bank. The city is guaranteed that it should be so. The bank is under the direction of the four reigning burgomasters, who are changed every year. Each new set of burgomasters visits the treasure, compares it with the books, receives it upon oath and delivers it over, with the same awful solemnity, to the set which succeeds it; and in that sober and religious country oaths are not disregarded.

A rotation of this kind seems alone a sufficient security against any practices which cannot be avowed. Amidst all the revolutions which faction has ever occasioned in the government of Amsterdam, the prevailing party has at no time accused their predecessors of infidelity in the administration of the bank. No accusation could have affected more deeply the reputation and fortune of the disgraced party; and if such an accusation could have been supported, we may be assured that it would have been brought. In 1672, when the French king was at Utrecht, the bank of Amsterdam paid so readily as left no doubt of the fidelity with which it had observed its engagements. Some of the pieces which were then brought from its repositories appeared to have been scorched with the fire which happened in the town-house soon after the bank was established. Those pieces, therefore, must have lain there from that time.

What may be the amount of the treasure in the bank is a question which has long engaged the speculations of the curious. Nothing but conjecture can be offered concerning it. It is generally reckoned that there are about 3000 people who keep accounts with the bank; and allowing them to have, one with another, the value of 1500l. lying upon their respective accounts (a very large allowance), the whole quantity of bank-money, and consequently of treasure in the bank, will amount to 3,000,000l. or, at 11 gilders the pound sterling, 33,000,000 of gilders; a great sum, and sufficient to carry on a very extensive circulation, but vastly below the extravagant ideas which some people have formed of this treasure.

The city of Amsterdam derives a considerable revenue from the bank. Besides what may be called the house-rent above-mentioned, each person, upon first opening an account with the bank, pays a fee of 10 gilders, and for every new account, 3 gilders 3 stivers; for every transfer, 2 stivers; and if the transfer is for less than 300 gilders, 6 stivers; in order to discourage the multiplicity of small transactions. The person who neglects to balance his accounts twice in the year forfeits 25 gilders. The person who orders a transfer for more than is upon his accounts, is obliged to pay 3 per cent. for the sum overdrawn, and his order is set aside into the bargain. The bank is supposed, too, to make a considerable profit by the sale of the foreign coin or bullion which sometimes falls to it by the expiring of receipts, and which is always kept till it can be sold with advantage. It makes a profit likewise by selling bank-money at 5 per cent. agio, and buying it in at 4. These different emoluments amount to a good deal more than what is necessary for paying the salaries of officers, and defraying the expense of management. What is paid for the keeping of bullion upon receipts, is alone supposed to amount to a neat annual revenue of between 150,000 and 200,000 gilders. Public utility, however, and not revenue, was the original object of this
this institution. Its object was to relieve the merchants from the inconvenience of a disadvantageous exchange.

The revenue which has arisen from it was unforeseen.

See Banking, Supplement.

Bank for Savings, a class of institutions lately introduced with the view of encouraging habits of economy among the labouring classes. See the article in the Supplement.

Bank, in sea affaires, denotes an elevation of the ground or bottom of the sea, so as sometimes to surmount the surface of the water, or at least to leave the water so shallow as usually not to allow a vessel to remain aloft over it.—In this sense, bank amounts to much the same as flat, shoal, &c.

Banker, a person who traffics and negociates in money; who receives and remits money from place to place by commission from correspondents, or by means of bills or letters of exchange, &c.

The ancient bankers were called argentearii, and memuarii; by the Greeks, argyrophoi, ezalaphoi, and ag-

argyrophoi. Their chief business was to put out the money of private persons to interest; they had their boards and benches, for this purpose, in all the markets and public places, where they took in the money from some to lend it to others.

Banking, the making of banks to oppose the force of the sea, rivers, or the like, and secure the land from being overflowed thereby. With respect to the water which is to be kept out, this is called banking; with respect to the land, which is hereby to be defended, imbanking.

Banking is also applied to the keeping a bank, or the employment of a banker. Banking, in this sense, signifies the trading in money, or remitting it from place to place, by means of bills of exchange. This answers to what the French call faire la banque. In France, every body is allowed to bank, whether merchant or not; even foreigners are indulged in this kind of traffic. In Italy, banking does not derogate from nobility, especially in the republican states; whence it is, that most of the younger sons of great families engage in it. In reality, it was the nobility of Venice and Genoa, that, for a long time, were the chief bankers in the other countries of Europe.

Bankish, a province of the Mogul's dominions, in the north part of the Hither India, lying south-west of the province of Cassimere.

Bankrupt, (bancus ruptus), is so called, because, when the bank or stock is broken or exhausted, the owner is said to be a bankrupt. And this word bankrupt is derived from the French bancaroute, which signifies a breaking or failing in the world; bancar in French is as much as mensa in Latin, and route is the same as vestigium; and this term is said to have been taken originally from the Roman mensarius, which were set in public places; and when a trader was slipped away, with an intention to deceive his creditors, he left only some vestiges or signs of his table or shop behind him. But a bankrupt with us, from the several descriptions given of him in our statute-law, may be defined "a trader, who secretes himself, or does certain other acts tending to defraud his creditors." For the better understanding of this article, it will be proper to consider, 1. Who may become a bankrupt. 2. What acts make a bankrupt. 3. The proceedings on a commission of bankruptcy: and, 4. In what manner an estate in goods and chattels may be transferred by bankruptcy. But of these, the two last being treated under the article Commission of Bankruptcy, the two first only belong to this place.

1. A bankrupt was formerly considered merely in the light of a criminal or offender; and in this spirit we are told by Sir Edward Coke, that we have fetched as well the name, as the wickedness of bankrupts from foreign nations. But at present the laws of bankruptcy are considered as laws calculated for the benefit of trade, and founded on the principles of humanity as well as justice; and to that end they confer some privileges not only on the creditors, but also on the bankrupt or debtor himself. On the creditors, by compelling the bankrupt to give up all his effects to their use, without any fraudulent concealment: on the debtor, by exempting him from the rigour of the general law, whereby his person might be confined at the discretion of his creditor, though in reality he has nothing to satisfy the debt; whereas the law of bankrupts, taking into consideration the sudden and unavoidable accidents to which men in trade are liable, has given them the liberty of their persons, and some pecuniary emoluments, upon condition they surrender up their whole estate to be divided among their creditors.

In this respect our legislature seems to have attended to the example of the Roman law. We mean not the Blackett terrible law of the twelve tables, whereby the creditors might cut the debtor's body into pieces, and each of them take his proportional share: if indeed that law, de debito in parte secundo, in principle understood, was so butcherly a light; which many learned men have with reason doubted. Nor do we mean those less inhuman laws (if they may be called so, as their meaning is indisputably certain), of imprisoning the debtor's person in chains; subjecting him to stripes and hard labour, at the mercy of his rigid creditor; and sometimes selling him, his wife, and children, to perpetual foreign slavery trans Tiberim (A): an oppression which produced so many popular insurrections, and secessions to the mons sacer. But we mean the law of cession, introduced by the Christian emperors; whereby, if a debtor ceded, or yielded up all his fortune to his creditors, he was secured from being dragged to a gnoil, "omnia quoque corporali cruciatus semito." For, as the emperor justly observes, "in summum erat spoliatum fortunis suis in solidum damnari." Thus far was just and reasonable: but as the departing from one extreme is apt to produce its opposite, we find it afterwards enacted, that if the debtor by any unforeseen accident was reduced to low circumstances, and would swear that he had not sufficient left to pay his debts, he should not be compelled to cede or give up even that which

(A) In Pegu, and the adjacent countries in the East Indies, the creditor is entitled to dispose of the debtor himself, and likewise of his wife and children; insomuch that he may even violate with impunity the chastity of the debtor's wife; but then, by so doing, the debt is understood to be discharged.
Bankrupts, which he had in his possession; a law which, under a false notion of humanity, seems to be fertile of perjury, injustice, and absurdity.

The laws of England, more wisely, have steered in the middle between both extremes: providing at once against the inhumanity of the creditor, who is not suffered to confine an honest bankrupt after his effects are delivered up; and at the same time taking care that all his just debts shall be paid, so far as the effects will extend. But still they are cautious of encouraging prodigality and extravagance by this indulgence to debtors; and therefore they allow the benefit of the laws of bankruptcy to none but actual traders; since that set of men are, generally speaking, the only persons liable to accidental losses, and to an inability of paying their debts, without any fault of their own. If persons in other situations of life run in debt without the power of payment, they must take the consequence of their own indiscretion, even though they meet with sudden accidents that may reduce their fortunes: for the law holds it to be an unjustifiable practice, for any person but a trader to encumber himself with debts of any considerable value. If a gentleman, or one in a liberal profession, at the time of contracting his debts, has a sufficient fund to pay them, the delay of payment is a species of dishonesty, and a temporary injustice to his creditor: and if, at such a time, he has not sufficient fund, the dishonesty and injustice is the greater. He cannot therefore murmur, if he suffers the punishment which he has voluntarily drawn upon himself. But in mercantile transactions the case is far otherwise. Trade cannot be carried on without mutual credit on both sides; the contracting of debts is therefore here not only justifiable but necessary. And if, by accidental calamities, as by the loss of a ship in a tempest, the failure of brother-traders, or by the non-payment of persons out of trade, a merchant or trader becomes incapable of discharging his own debts, it is his misfortune and not his fault. To the misfortunes therefore of debtors, the law has given a compassionate remedy, but denied it to their faults; since, at the same time that it provides for the security of commerce, by enacting that every considerable trader may be declared a bankrupt, for the benefit of his creditors as well as himself, it has also, to discourage extravagance, declared that no one shall be capable of being made a bankrupt, but only a trader; nor capable of receiving the full benefit of the statutes, but only an industrious trader.

In the interpretation of the several statutes made concerning English bankrupts, it hath been held, that buying only, or selling only, will not qualify a man to be a bankrupt; but it must be both buying and selling, and also getting a livelihood by it: as, by exercising the calling of a merchant, a grocer, a merchant, or, in one general word, a chapman, who is one that buys and sells anything. But no handicraft occupation (where nothing is bought or sold, and therefore an extensive credit, for the stock in trade, is not necessary to be had) will make a man a regular bankrupt: as that of a husbandman, a gardener, and the like, who are paid for their work and labour. Also an innkeeper cannot, as such, be a bankrupt: for his gain or livelihood does not arise from buying and selling in the way of merchandise, but greatly from the use of his rooms and furniture, his attendance, and the

2. To learn what the acts of bankruptcy are which render a man a bankrupt, we must consult the several statutes, and the resolutions formed by the courts thereon. Among these may therefore be reckoned, 1. Departing from the realm, whereby a man withdraws himself from the jurisdiction and coercion of the law, with an intent to defraud his creditors. 2. Departing from his own house, with an intent to secrete himself and avoid his creditors. 3. Keeping in his own house, privately (except for just and necessary cause), so as not to be seen or spoken with by his creditors; which is likewise construed to be an intention to defraud his creditors, by avoiding the process of the law. 4. Procuring, or suffering himself willingly to be arrested, or outlawed, or imprisoned, without just and lawful cause; which is likewise deemed an attempt to defraud his creditors. 5. Procuring his money, goods, chattels, and effects, to be attached or sequestrated by any legal process; which is another plain and direct endeavour to disappoint his creditors of their security. 6. Making any fraudulent conveyance to a friend, or secret trustee, of his lands, tenements, goods, or chattels: which is an act of the same suspicious nature with the last. 7. Procuring any protection, not being himself privileged by parliament, in order to screen his person from arrest; which also is an endeavour to elude the justice of the law. 8. Endeavouring, or desiring, by any petition to the king, or bill exhibited in any of the king's courts against any creditors, to compel them to take less than their just debts; or to procrastinate the time of payment, originally contracted for; which are an acknowledgment of either his poverty or his knavery. 9. Lying in prison for two months, or more, upon arrest or other detention for debt, without finding bail, in order to obtain liberty. For the inability to procure bail argues a strong deficiency in his credit, owing either to his suspected poverty, or ill character; and his neglect to do it, if able, can arise only from a fraudulent intention; in either of which cases, it is high time for his creditors to look to themselves, and compel a distribution of his effects. 10. Escaping from prison after an arrest for a just debt of 100l. or upwards: for no man would break prison, that was able and desirous to procure bail: which brings it within the reason of the last case. 11. Neglecting to make satisfaction for any just debt to the amount of 100l. within two months after service of legal process, for such debt, upon any trader having privilege of parliament.

These are the several acts of bankruptcy expressly defined by the statutes relating to this article; which being
being so numerous, and the whole law of bankrupts
being an innovation on the common law, our courts
of justice have been tender of extending or multiplying
acts of bankruptcy by any construction or implication.
And therefore Sir John Holt held, that a man's re-
moving his goods privately to prevent their being sei-
zed in execution, was no act of bankruptcy. For the
statutes mention only fraudulent gifts to third persons,
and procuring them to be seized by sham process, in
order to defraud creditors; but this, though a pal-
ple fraud, yet, falling within neither of those cases,
cannot be adjudged an act of bankruptcy. So also it
has been determined expressly, that a banker's stop-
or refusing payment is no act of bankruptcy: for it is
not within the description of any of the statutes; and
there may be good reasons for his so doing, as suspicion
of forgery, and the like; and if, in consequence of
such refusal, he is arrested, and pots in bail, still it is
no act of bankruptcy; but if he goes to prison, and lies
there for months, then, and not before, is he become a
bankrupt.

As to the consequences resulting from the unhappy
situation of a bankrupt, see the article Commission of
Bankruptcy.

BANKS, John, a dramatic writer, was bred to
the law, and belonged to the society of Gray's Inn;
but this profession not suitting his natural disposition,
he quitted it for the service of the muses. Here, how-
ever, he found his rewards by no means adequate to
his deserts. His emoluments at the best were precu-
rious, and the various successes of his pieces too feel-
ingly convinced him of the error in his choice. This,
however, did not prevent him from pursuing with
cheerfulness the path he had taken; his thirst of fame,
and warmth of poetic enthusiasm, allying to his ima-
gination many disagreeable circumstances into which
indigence, the too frequent attendant on poetical pur-
suits, frequently threw him. His turn was entirely to
tragedy; his merit in which is of a peculiar kind.
For at the same time that his language must be con-
sidered to be extremely unpoetical, and his numbers
un-
couth and unharmonious; nay, even his characters ve-
ry far from being strongly marked or distinguished,
and his episodes extremely irregular; yet it is im-
possible to avoid being deeply affected at the repre-
sentation, and even at the reading, of his tragic pieces.
This is owing in the general to a happy choice of his
subjects; which are all borrowed from history, either
real or romantic; and indeed the most of them from
circumstances in the annals of our own country, which,
not only from their being familiar to our continual re-
collection, but even from their having some degree of
relation to ourselves, we are apt to receive with a kind
of partial prepossession, and a pre-determination to be
pleased. He has constantly chosen as the basis of his
plays such tales as were in themselves and their well-
known catastrophes most truly adapted to the purposes
of the drama. He has indeed but little varied from the
strictness of historical facts; but he seems to have
made it his constant rule to keep the scene perpetually
alive, and never suffer his characters to droop. His
verse is not poetry, but prose run mad. Yet will the
false gem sometimes approach so near in glitter to the
tru e one, at least in the eyes of all but real connoisseurs
(and how small a part of an audience are to be ranked
in this class it will need no ghost to inform us), that
bom t will frequently pass for the true sublime; and
where it is rendered the vehicle of incidents in them-
selves affecting, and in which the heart is apt to inte-
rest itself, it will perhaps be found to have a stronger
power on the human passions than even that property
to which it is in reality no more than a bare succeda-
nume. And from these principles it is that we must
account for Mr Banks's writings having in the gene-
ral drawn more tears from, and excited more terror in,
even judicious audiences, than those of much more cor-
correct and more truly poetical authors. The tragedies
he has left behind him are, 1. Albion Queens. 2. Cyrus
the Great. 3. Destruction of Troy. 4. Innocent Ur-
surper. 5. Island Queens. This is only the Albion
Queens altered. 6. Rival Kings. 7. Virtue Betray-
ed. 8. Unhappy Favourite. The Albion Queens
was rejected by the managers in 1684; but was acted by
Queen Anne's command in 1706, with great applause,
and has been several times revived. The Unhappy
Favourite continued till very lately a stock tragedy at
the theatres; but gives way at present to the later
tragedies from the same story, by Jones and Brooke.

Neither the time of the birth, nor that of the death,
of this author, are ascertained. His remains, how-
ever, lie interred in the church of St James's, West-
minster.

BANKS'S ISLAND, a small island in the South sea,
discovered by Captain Cook in 1770, in 8. Lat. 53
32. W. Long. 186. 30. It is of a circular figure, and
about 24 leagues in compass: it is sufficiently high to
be seen at the distance of 12 or 15 leagues; and the
land has a broken irregular surface, with the appear-
ance of barrenness rather than fertility. It is, however,
inhabited; as some straggling savages were observed
upon it.

BANKSIA. See Botany Index.

BANN, or Ban (from the Brit. ban, i. e. cl smoother); is
a proclamation or public notice; any public summons or edict, whereby a thing is commanded or forbidden. It is a word ordinary among the feudists; and there is both bannus and bannum, which signify two
several things.—The word bannus is particularly used in
England in publishing matrimonial contracts; which is
done in the church before marriage, to the end that
if any persons can speak against the intention of the
parties, either in respect of kindred; precontract, or
for other just cause, they may take their exception in
time before the marriage is consummated; and in the
canon law, Banne sunt proclamations sponsi et sponsae
in ecclesiis fieri solvi. But there may be a faculty or
license for the marriage, and then this ceremony is
omitted: and ministers are not to celebrate marriage
between any persons without a license, except the banns
have been first published three several times, upon pain of

The use of matrimonial banns is said to have been
first introduced in the Gallican church, though some-
thing like it obtained even in the primitive times; and
it is this that Tertullian is supposed to mean by trion-
dina promunidatio. The council of Lateran first ex-
tended, and made the usage general. By the ordi-
nance of Blois, no person could validly contract mar-
riage, without a preceding proclamation of three banns;
or could any person whatever be dispensed with, ex-
cept:
cept for the two last. But the French themselves have abated much of this severity; and only minors are now under an absolute necessity of submitting to the formality of banns. For majors, or those of age, after publication of the first banns, the two latter are easily bought off.

Banns is also used to denote proscription or banishment for a crime proved; because anciently published by sound of trumpet; or, as Vossius thinks, because those who did not appear at the above-mentioned summons, were punished by proscription. Hence to put a prince under the bann of the empire, is to declare him divested of all his dignities. The sentence only denotes an interdict of all intercourse, and offices of humanity, with the offender; the form of which seems taken from that of the Romans, who banished persons by forbidding them the use of fire and water. Sometimes also cities are put under the imperial bann; that is, stripped of their rights and privileges.

Bann also denotes a pecuniary mulct, or penalty, laid on a delinquent for offending against a bann.

Bann, or Bannus, a title anciently given to the governor or viceroy of Croatia, Dalmatia, and Scyria.

Episcopal Bann (Bannus Episcopalis), a mulct paid to the bishop by those guilty of sacrilege and other crimes.

Bann is also used for a solemn anathema, or excommunication attended with curses, &c. In this sense we read of papal banns, &c.

Bann, in military affairs, a proclamation made in the army by beat of drum, sound of trumpet, &c. requiring the strict observance of discipline, either for the declaring a new officer, or punishing an offender.

BANNER denotes either a square flag, or the principal standard belonging to a prince.

We find a multiplicity of opinions concerning the etymology of the word banner; some deriving it from the Latin bandum, "a band or flag;" others from the word banns, "to summons the vassals to appear in arms;" others again from the German ban, "a field or tene ment," because landed men alone were allowed a banner; and, finally, there are some who think it is a corruption of panniere, from pannus, "cloth," because banners were originally made of cloth.

The Banner of France, was the largest and richest of all the flags borne by the ancient kings in their great military expeditions. St Martin’s cap was in use 600 years as the banner of France; it was made of taffety, painted with the image of that saint, and laid one or two days on his tomb to prepare it for use. About the year 1100 came in a more pompous apparatus. The banner royal was fastened to the top of a mast, or some tall tree, planted on a scaffold; borne on a carriage drawn by oxen, covered with velvet housings, decorated with devices or cyphers of the prince reigning. At the foot of the tree was a priest, who said mass early every morning. Ten knights mounted guard on the scaffold night and day, and as many trumpets at the foot of the tree never ceased flourishing, to animate the troops. This cumbersome machine, the model of which was brought from Italy, continued in use about 130 years. Its post was in the centre of the army. And here it was that the chief feats were performed, to carry off and defend the royal banner; for there was no victory without it, nor was any army reputed vanquished till they had lost their banner.

BANNERET, an ancient order of knights, or feudal lords; who, possessing several large fiefs, led their vassals to battle under their own flag or banner, when summoned thereto by the king. The word seems formed from bann, "a square flag," or from band, which anciently denoted a flag.—Bannerets are also called in ancient writers milites excavatarii, and excavariorii bannarii, bannarii, banderini, &c.

Anciently there were two kinds of knights, great and little; the first whereof was called bannerets, the second bachelors; the first composed the upper, the second the middle, nobility.

The banneret was a dignity allowed to march under his own flag, whereas the bachelorius eques followed that of another. To be qualified for a banneret, one must be a gentleman of family, and must have a power to raise a certain number of armed men, with estate enough to subsist at least 28 or 30 men. This must have been very considerable in those days; because each man, besides his servant, had two horsemen to wait on him armed, the one with a cross-bow, the other with a bow and hatchet. As he was not allowed to be a baron who had not above 13 knights fees, so he was not admitted to be a banneret if he had less than 10.

Banneret, according to Spenman, was a middle order between a baron and a simple knight; called sometimes also vexillarius minor, to distinguish him from the greater, that is, from the baron, to whom alone properly belonged jus vexilli, or privilege of the square flag. Hence the banneret was also called bannertus, quasi baro minor; a word frequently used by English writers in the same sense as banneret was by the French, though neither of them occur before the time of Edward II.

Some will have bannerets to have originally been persons who had some portion of a barony assigned them; and enjoyed it under the title of bero proximus, and that with the same prerogatives as the baron himself. Some, again, find the origin of bannerets in France, others in Brittany, others in England. These last attribute the institution of bannerets to Conon, lieutenant of Maximus, who commanded the Roman legions in England under the empire of Gratian in 385. This general, say they, revolting, divided England into 40 cantons, and in these cantons distributed 40 knights; to whom he gave a power of assembling, on occasion, under their several banners, as many of the effective men as were found in their respective districts: whence they are called bannerets. However this be, it appears from Froussart, &c. that anciently such of the military men as were rich enough to raise and subsist a company of armed men, and had a right to do so, were called bannerets. Not, however, that these qualifications rendered them knights, but only bannerets; the appellation of knight being only added thereto, because they were simple knights before.

Bannerets were second to none but knights of the Garter. They were reputed the next degree below the nobility; and were allowed to bear arms with supporters, which none else may under the degree of a baron. In France, it is said, the dignity was hereditary; but in England it died with the person that
BAN

The order dwindled on the institution of banquets by King James I. and at length became extinct. The last person created banqueter was Sir John Smith, made so after Edgehill battle, for rescuing the standard of King Charles I.

The form of the banqueter's creation was this. On a day of battle, the candidate presented his flag to the king or general; who, cutting off the train or skirt thereof, and making it a square, returned it again, the proper banner of banqueters; who are hence sometimes called knights of the square flag. There seem to have been banqueters created either in a different manner, or by others than the sovereign; since King James, in the patents of baronets, gives them precedence to all knights banqueters, except such as are created by the king himself in the field; which implies, either that there are some of this order created out of the field, or by inferior persons. See Chivalry, Supplement.

Banquets is also the name of an officer or magistrate of Rome towards the close of the 14th century. — The people of that city, and throughout the territory of the church, during the disputes of the antipopes, the public government, where the whole power was lodged in the hands of a magistrate called senator, and twelve heads of quarters called banqueters, by reason of the banners which each raised in his district.

Bannock, a kind of oat-cake, baked in the embers, or on a stone placed before the fire. It is common in the northern parts of this kingdom. Bannockburn, a village in Scotland, near Stirling, celebrated as the place of a great battle between the Scots and English. See Supplement.

Bannum, in Law, signifies the utmost bounds of a manor or town.

Banquet, a feast or entertainment where people regale themselves with pleasant foods or fruits.

Banquet, in the manage, that small part of the branch of a bridge that is under the eye; which gathers and joins the extremities of the bit to the branch.

Banquet-Line, an imaginary line drawn, in making a bit, along the banquet, and prolonged up or down, to adjust the form and weakness of the branch, in order to make it stiff or easy.

Banquet, or Banquette, in Fortification, a little foot-bank, or elevation of earth, forming a path which runs along the inside of a parapet, upon which the musketeers get up, in order to discover the counter-scarp, or to fire on the enemy, in the most or in the covert-way.

Banqueting Room or House. See Saloon.

The ancient Romans supped in the atrium, or vestibule, of their houses; but, in after times, magnificent saloons, or banqueting-rooms, were built, for the more commodious and splendid entertainment of their guests. Lecullus had several of these, each distinguished by the name of some god; and there was a particular rate of expense appropriated to each. Plutarch relates with what magnificence he entertained Cicero and Pompey, who went with a design to surprise him, by only telling a slave who waited, that the cloth should be laid in the Apollo. The emperor Claudius, amongst others, had a splendid banqueting-room named Mercury. But every thing of this kind was outdone by the lustre of that celebrated banqueting-house of Nero, called Domus an-

BANTRY

BANSTICKLE. See Gasterosteus, Ichthyology Index.

Bantam, a town of the island of Java, in the East Indies, situated in E. Long. 105. 16. S. Lat. 6. 20. It is the capital of a kingdom of the same name, with a harbour and castle; but the harbour is now so choked up that it is inaccessible to vessels of any great burden. It is divided into two towns separated by a river, and one of them inhabited by Chinese. Bantam once enjoyed a flourishing trade. It was a great mart for pepper and other spices; but this trade, as well as the power of its sovereign, has fallen to decay. For its history, &c. see Java.

Bantam-work, a kind of painted or carved work, resembling that of Japan, only more gaudy.

There are two sorts of Bantam, as well as of Japan work. As, in the latter, some are flat, lying even with the black, and others high and embossed; so in Bantam-work, some are flat, and others carved into the wood, as we find in many large screens: with this difference, that the Japan artists work chiefly in gold and other metals; and those of Bantam generally in colours, with a small sprinkling of gold here and there: for the flat Bantam-work is done in colours, mixed with gum-water, proper for the thing designed to be imitated. For the carved, or in-cut kind, the method of performing it is thus described by an ingenious artist: First, the wood is to be primed with whiting and size, so often till the primer lie near a quarter of an inch thick; then it is to be water-plained, i.e. rubbed with a fine wet cloth, and some time after, rubbed very smooth, the blacks laid on, varnished up with a good body, and polished well, though with a gentle hand. This done, the design is to be traced out with vermilion and gum-water, exactly in the manner wherein it is intended to be cut; the figures, trees, building, &c. in their due proportion; then the gouge is applied, with other kind of proper shapes, differing according to the workman's fancy: with these he cuts deep or shallow, as is found convenient, but never deeper than the whiting lies, the wood being never to feel the edge of the instrument. Lines, or parts of the black, are still to be left for the draperies, and other outlines, and for the distinction of one thing from another; the rule being to cut where the white is, and leave the black untouched. The carving being finished, then take to the pencil, with which the colours are laid into the cut-work: after this, the gold is to be laid in those places which the design requires; for which purpose a strong thick gum-arabic water is taken and laid with a pencil on the work; and, while this remains wet, leaf-gold is cut with a sharp smooth-edged knife, in little pieces, shaped to the biggest and figure of the places where they are to be laid. These being taken up with a little cotton, they daub them with the same close to the gum water, which affords a rich lustre. The work thus finished, they clean up the black with oil, taking care not to touch the colours. The European workmen ordinarily use brass dust, which is less bright and beautiful.
BANTRY, a town of Ireland, in the county of Cork, and province of Munster. It is seated on a bay of the same name, in W. Long. 9. 15. N. Lat. 51. 30.

BAOBAB, the name given by Prosper Alpinus to the African calabash-tree, since called ADANSONIA. See ADANSONIÆ Index.

BAPTISM, in matters of religion, the ceremony of washing; or a sacrament, by which a person is initiated into the Christian church.—The word is formed from the Greek βάπτιζω, of πεπτίζω, to dip or wash. Baptism is known, in ecclesiastical writers, by divers other names and titles. Sometimes it is called palingenia, or lavet of regeneration; sometimes salute, or life and salvation; sometimes εἰκόνα, signaculum Domini, and signaculum fidei, or the seal of faith; sometimes absolutely mysterium, and sacramentum; sometimes the sacrament of faith; sometimes visitum, from its being administered to departing persons; sometimes sacerdotium laici, or the lay priesthood, because allowed, in cases of necessity, to be conferred by laymen: sometimes it is called the great circumcision, because it was imagined to succeed in the room of circumcision, and to be a seal of the Christian covenant, as that was the seal of the covenant made with Abraham: so, in regard that baptism had Christ for its author, and not man, it was anciently known by the name of Δείπνος καὶ πεπτίζω καὶ γεννάω, the gift of the Lord: sometimes it was simply called bapæa. Besides these, and a number of other additions, by way of eminence, because it was both a gratuitous and singular gift of Christ: in reference to the making men complete members of Christ's body, the church, it had the name of Τελειωσις, and Τέλος, the consecration and consummation; because it gave men the perfection of Christians, and a right to partake of the Τελειωμα, which was the Lord's Supper: it had also the name of μεταμορφωσις, and μεταμορφωμα, the initiation, because it was the admittance of men to all the sacred rites and mysteries of the Christian religion.

Baptism has been supposed by many learned authors to have had its origin from the Jewish church, in which, as they maintain, it was the practice long before Christ's time, to baptize proselytes or converts to their faith, as part of the ceremony of their admission: a practice which, according to some, obtains among them to this day; a person turning Jew, is first circumcised, and, when healed, is bathed, or baptized in water, in presence of their rabbins; after which he is reputed a good Jew. Others, however, insist that the Jewish proselyte baptism is not by far so ancient, and that John the Baptist was the first administrator of baptism among the Jews. Of this opinion were Dealingius, J. G. Carpzovius, Boernerus, Wersdorffus, Zelnerus, Owen, Knatchbull, Jennings, Gill, and others.

Grotius is of opinion, that the rite of baptism had its original from the time of the deluge; immediately after which, he thinks, it was instituted in memory of the world having been purged by water. Some learned men think it was added to circumcision, soon after the Samaritan schism, as a mark of distinction to the orthodox Jews. Spencer, who is fond of deriving the rites of the Jewish religion from the ceremonies of the Pagans, lays it down as a probable supposition, that the Jews received the baptism of proselytes from the neighbouring nations, who were wont to prepare candidates for the more sacred functions of their religion, by a solemn ablation; that by this affinity of sacred rites, they might draw the Gentiles to embrace their religion, and that the proselytes (in gaining of whom they were extremely diligent) might the more easily comply with the transition from Gentilism to Judaism. In confirmation of this opinion, he observes, first, that there is a civil precept for circumcision, God having enjoined only the rite of circumcision for the admission of strangers into the Jewish religion. Secondly, that, among foreign nations, the Egyptians, Persians, Greeks, Romans, and others, it was customary that those who were to be initiated into their mysteries, or sacred rites, should be first purified by dipping their whole body in water. That learned writer adds, as a farther confirmation of his opinion, that the cup of blessing likewise, added to the paschal supper, seems plainly to have been derived from a pagan original: for the Greeks, at their feasts, had one cup, called ωαρα μεταμορφωμα, the cup of the good demon or god, which they drank at the conclusion of their entertainment, when the table was removed. Since then, a rite of Gentile origin was added to one of the Jewish sacraments, viz. the passover, there can be no absurdity in supposing, that baptism, which was added to the other sacrament, namely circumcision, might be derived from the same source. In the last place, he observes, that Gentiles, in the institution of their baptism, paid a peculiar regard to those rites which were borrowed from the Gentiles: for rejecting circumcision and the paschal supper, he adopted into his religion baptism and the sacred cup; thus preparing the way for the conversion and reception of the Gentiles into his church.

The design of the Jewish baptism, if baptism be practised by them, is supposed to be, to import a regeneration, whereby the proselyte is rendered a new man, and of a slave becomes free. The effect of it is, to cancel all former relations; so that those who were before akin to the person, after the ceremony ceased to be so. It is to this ceremony Christ is supposed to have alluded, in his expression to Nicodemus, that it was necessary that he should be born again, in order to become his disciple.—The necessity of baptism to salvation is grounded on those two sayings of our Saviour; He that believeth, and is baptized, shall be saved; and Except a man be born of water and of the Spirit, he cannot enter into the kingdom of God. The ancients did not generally think the mere want of baptism, where the procuring it was impracticable, excluded men absolutely the effect from the hopes of eternal salvation. Some few of them, indeed, are pretty severe upon infants dying without baptism; and some others seem also, in general terms, to deny eternal life to adult persons dying without it: but when they interpret themselves, and speak more distinctly, they make some allowances, and except several cases, in which the want of baptism may be supplied by other means. Soch are, martyrdom, which commonly goes by the name of second baptism in men's own blood, in the writings of the ancients; because of the power and efficacy it was thought to have to save men by the invisible baptism of the Spirit, without the external element of water. Faith, and repentance, were also esteemed a supplement to the want of baptism, in such catechumens as died while they were piously preparing themselves for baptism.
BAP [377] BAP

communicating with the church, was thought to supply the want of baptism in persons who had been admitted to communion, on a presumption of their being duly baptized, though the contrary afterwards appeared. For infants dying without baptism, the case was thought more dangerous; as here, no personal faith, repentance, or the like, could be pleaded, to supply the defect, and wash away original sin: on this account, they who spoke most favourably of them, as Greg. Nazianzen, and Severus bishop of Antioch, only assigned them a middle state, neither in heaven nor hell. But the Latins, as St. Augustine, Fulgentius, Marius Mercator, &c. who never received the opinion of a middle state, concluded, as they could not be received into heaven, they must go to hell. Pelagius, and his followers, who denied original sin, asserted, that they might be admitted to eternal life, and salvation, though not to the kingdom of heaven; between which they distinguished. Where the fault was not on the side of the child, nor his parents, but of the minister, or where any unavoidable accident rendered baptism absolutely impossible, Hincmar, and others, make an exception, in holding the child saved without baptism.

Of the time, place, and subjects of baptism.

The receiving baptism is not limited to any time, or age of life. Some contend for its being administered like circumcision, precisely on the eighth day, as Greg. Nazianzen; and others would have it deferred till the child is three years of age, and able to hear the mystic words, and make answer thereto, though he do not understand them. In the canon law we find divers injunctions against deferring the baptism of infants beyond the 37th day, 30th day, and the 9th day; some of them under pecuniary forfeitures.

Salmasius, and Suicerus from him, deliver it as authentic history, that for the two first ages, no one received baptism, who was not first instructed in the faith and doctrine of Christ, so as to be able to answer for himself, that he believed; because of those words, 

*Ut Iesu Christi factum est baptismum*;

which, in effect, is to say, that no infant, for the first two ages, was ever admitted to Christian baptism. But, afterwards, they own, that paedobaptism came in, upon the opinion that baptism was necessary to salvation. But Vossius, Dr. Forbes, Dr. Hammond, Mr. Walker, and especially Mr. Wall, who has exactly considered the testimony and authority of almost every ancient writer that has said anything upon this subject, endeavour to evince, that infants were baptized even in the apostolical age. It is certain, Tertullian pleads strongly against giving baptism to infants; which shows, at least, that there was some such practice in his age, though he disapproved of it. It is certain, the ordinary subjects of this sacrament, in the first ages, were converts from Judaism and Gentilism, who, before they could be admitted to baptism, were obliged to spend some time in the state of catechumens, to qualify them to make their professions of faith, and a Christian life, in their own persons: for, without such personal professions, there was ordinarily no admission of them to the privilege of baptism. Those baptized in their sick-beds were called* clinicus*; and were held in some reproach, as not being reputed true Christians. Hence several censures, in councils and ecclesiastical writers, of clinic baptism. This clinic baptism was not sufficient to qualify the person, in case of recovery, for ordination. Some had their baptism put off by way of punishment, when they fell into gross and scandalous crimes, which were to be expiated by a longer course of discipline and repentance. This was sometimes 5, 10, 20 years or more; even all their lives to the hour of death, when their crimes were very flagrant.

In the earliest ages of the church, there was no stated time or place for the reception of baptism. Afterwards Easter, Whitsuntide, and Epiphany, became solemn seasons, out of which baptism was not administered, except in cases of necessity. The catechumens who were to receive it at these times, were called *competentes*: and to these it is that St. Cyril addresses his catechizes. In the apostolical age, and some time after, before churches and baptistries were generally erected, they baptized in any place where they had convenience; as John baptized in Jordan, and Philip baptized the eunuch in the wilderness, and Paul the jailor in his own house. But in after ages, baptistries were built adjoining to the church; and then rules were made, that baptism should ordinarily be administered nowhere but in these buildings. Justinian, in one of his novels, refers to ancient laws, appointing that none of the sacred mysteries of the church should be celebrated in private houses. Men might have private oratories for prayer in their own houses; but they were not to administer baptism or the eucharist in them, unless by a particular license from the bishop of the place. Such baptisms are frequently condemned in the ancient councils, under the name *enacturadum, baptisms in private conventicules*.

As to the attendant ceremonies and manner of baptism in the ancient church: The person to be baptized, if an adult, was first examined by the bishop or officiating priest, who put some questions to him; as, first, Whether he abjured the devil and all his works; secondly, Whether he gave a firm assent to all the articles of the Christian faith: to both which he answered in the affirmative. If the person to be baptized was an infant, these interrogatories were answered by his sponsors, or godfathers. Whether the use of sponsors was as old as the apostles days, is uncertain: perhaps it was not, since Justin Martyr, speaking of the method and form of baptism, says not a word of them.—After the questions and answers, followed exorcism; the manner and end of which was this: The minister laid his hands on the person's head, and breathed in his face, implying thereby the driving away or expelling of the devil from him, and preparing him for baptism, by which the good and holy spirit was to be conferred upon him. After exorcism, followed baptism itself: and first the minister, by prayer, consecrated the water for that use. Tertullian says, "any waters may be applied to that use: but then God must be first invoked; and then the Holy Ghost presently comes down from heaven, and moves upon them, and sanctifies them." The waters being consecrated, the person was baptized "in the name of the Father, and of the Son, and of the Holy Ghost!" by which "dedication of him to the blessed Trinity, the person, (says Clemens Alexandrinus) is delivered from the corrupt trinity, the devil, the world, and the flesh." In performing the ceremony of baptism, the usual custom (except in clinical cases, or
B A P

or where there was scarcity of water), was to immerse and dip the whole body. Thus St Barnabas, describing a baptized person, says, "We go down into the water full of sin and filth, but we ascend bearing fruit in our hearts." And this practice of immersing the whole body was so general, that we find no exceptions made in respect either to the tenderness of infants, or the bashfulness of the other sex, unless in case of sickness or other disability. But to prevent any indecency, men and women were baptized apart. To which end, either the baptisteries were divided into two apartments, one for the men, the other for the women, as Bingham has observed; or the men were baptized at one time and the women at another, as is shown by Vossius, from the Ordo Romanus, Gregory's Sacramentarium, &c. Add, that there was anciently an order of deaconesses, one part of whose business was to assist at the baptism of women. The precautions, however, rather indicate a scrupulous attention to delicacy, than imply any indecency in the circumstance of immersion itself. From the candidates being immersed, there is at least no reason to infer that they were naked: The present Baptists never baptize naked, though they always immerse. After immersion, followed theunction; by which (says St Cyril) was signified that they were now cut off from the wild olive, and were ingrafted into Christ, the true olive tree; or else to shew that they were now to be champions for the gospel, and were anointed thereto, as the old athletes were against their solemn games. With this anointing was joined the sign of the cross, made upon the forehead of the person baptized; which being done, he had a white garment given him, to denote his being washed from the defilements of sin, or in allusion to that of the apostle, "As many as are baptized in Christ have put on Christ." From this custom the feast of Pentecost, which was one of the annual seasons of baptism, came to be called Whitsunday, i.e. White-Sunday. This garment was afterwards laid up in the church, that it might be an evidence against such persons as violated or denied that faith which they had owned in baptism.—When the baptism was performed, the person baptized, according to Justin Martyr, "was received into the number of the faithful, who then sent up their public prayers to God, for all men, for themselves, and for those who had been baptized."

The ordinary ministers, who had the right of administering this sacrament, that is, of applying the water to the body, and pronouncing the formula, were presbyters or bishops; though on extraordinary occasions laymen were admitted to perform the same.

As to the present form of administering baptism, the church of Rome uses the following. When a child is to be baptized, the persons who bring it wait for the priest at the door of the church, who comes thither in his surplice and purple stole, attended by his clerks. He begins with questioning the godfathers, whether they promise, in the child's name, to live and die in the true catholic and apostolical faith, and what name they would give the child. Then follows an exhortation to the sponsors; after which the priest, calling the child by its name, asks it as follows: What dost thou demand of the church? The godfather answers, Eternal life. The priest goes on: If you are desirous of obtaining eternal life, keep God's commandments, thou shalt love the Lord thy God, &c. After which he breathes three times in the child's face, saying, Come out of this child, thou evil spirit, and make room for the Holy Ghost. This said, he makes the sign of the cross on the child's forehead and breast, saying, Receive the sign of the cross on thy forehead, and in thy heart. Then taking off his cap, he repeats a short prayer; and laying his hand gently on the child's head, repeats a second prayer: which ended, he blesses some salt; and putting a little of it into the child's mouth, pronounces these words, Receive the salt of wisdom. All this is performed at the church door. The priest, with the godfathers and godmothers, entering into the church, and advancing towards the font, repeat the apostles creed and the Lord's prayer. Being come to the font, the priest exercises the evil spirit again; and taking a little of his own spittle, with the thumb of his right hand, rubs it on the child's ears and nostrils, repeating, as he touches the right ear, the same word (Ephatha, be thou opened) which our Saviour made use of to the man born deaf and dumb. Lastly, they pull off its swaddling-clothes, or strip it below the shoulders, during which the priest prepares the oils, &c. The sponsors then hold the child directly over the font, observing to turn it due east and west: whereupon the priest asks the child, Whether he renounces the devil and all his works and the godfather having answered in the affirmative, the priest anoints the child between the shoulders in the form of a cross. Then taking some of the consecrated water, he pours part of it thrice on the child's head, at each perfusion calling on one of the Persons of the Holy Trinity. The priest concludes the ceremony of baptism with an exhortation.—The Romish church allows midwives, in cases of danger, to baptize a child before it comes entirely out of its mother's womb: where it is to be observed, that some part of the body of the child must appear before it can be baptized, and that it is baptized on the part which first appears: if it be the head, it is not necessary to rebaptize the child; but if only a foot or hand appears, it is necessary to repeat baptism. A stillborn child thus baptized may be buried in consecrated ground.

The Greek church differs from the Romish, as to the rite of baptism, chiefly in performing it by immersion, and plunging the infant all over in the water. The forms of administering baptism among us being too well known to require a particular description, we shall only mention one or two of the more material differences between the form, as it stood in the first liturgy of King Edward, and that in the English Common Prayer Book at present. First, the form of consecrating the water did not make a part of the office, in King Edward's liturgy, as it does in the present, because the water in the font was changed, and consecrated, but once a month. The form likewise itself was something different from that now used; and was introduced with a short prayer, that Jesus Christ, upon whom (when he was baptized) the Holy Ghost came down in the likeness of a dove, would send down the same Holy Spirit, to sanctify the fountain of baptism; which prayer was afterwards left out, at the second review.—By King Edward's first book, the minister is to dip the child in the water thrice; fist, dipping the right side; secondly, the left; the third time, dipping the face towards the foot. This triple immersion was a very ancient
ancient practice in the Christian church, and used in honour of the Holy Trinity; though some later writers say, it was done to represent the death, burial, and resurrection, of Christ, together with his three days continuance in the grave. Afterwards, the Arians making an ill use of it, by persuading the people that it was used to denote that the three Persons in the Trinity were three distinct substances, the orthodox left it off, and used only one single immersion.

By the first common-prayer of King Edward, after the child was baptized, the godfathers and godmothers were to lay their hands upon it, and the minister was to put on him the white vestment commonly called the *chrismum*, and to say, "Take this white vesture, as a token of the innocency, which, by God's grace, in this holy sacrament of baptism, is given unto thee; and for a sign, whereby thou art admitted, so long as thou livest, to give thyself to innocence of living, that after this transitory life thou mayest be partner of the life everlasting. Amen." As soon as he had pronounced these words, he was to anoint the infant on the head, saying, "Almighty God, the father of our Lord Jesus Christ, who hath regenerated thee by water and the Holy Ghost, and hath given unto thee remission of all thy sins; may be vouchsafe to anoint thee with the unction of his Holy Spirit, and bring thee to the inheritance of everlasting life. Amen." This was manifestly done in imitation of the practice of the primitive church.

The custom of sprinkling children, instead of dipping them in the font, which at first was allowed in case of the weakness or sickness of the infant, has so far prevailed, that immersion is at length quite excluded. What principally tended to confirm the practice of affusion or sprinkling, was, that several of our Protestant divines, flying into Germany and Switzerland during the bloody reign of Queen Mary, and returning home when Queen Elizabeth came to the crown, brought back with them a great zeal for the Protestant churches beyond sea, where they had been sheltered and received; and having observed, that at Geneva and some other places, baptism was administered by sprinkling, they thought they could not do the church of England a greater piece of service than by introducing a practice dictated by an oracle as an innovation, and which, together with the coldness of our northern climate, was what contributed to banish entirely the practice of dipping infants in the font.

Many different notions have been entertained concerning the effects of baptism, which it would be endless to enumerate. The Remonstrants and Socinians reduce baptism to a mere sign of divine grace. The Romanists, on the contrary, exalt its power; holding, that all sin is entirely taken away by it; that it absolutely confers the grace of justification, and consequently grace ex opere operato. Some also speak of an indelible character impressed on the soul by it, called character dominicus, and character regis: but this is held, by others, a mere chimera; for that the spiritual character, conferred in regeneration, may easily be effaced by mortal sins. Dodwell maintained, that it is by baptism the soul is made immortal; so that those who die without it will not rise again. It must be added, he restrains this effect to episcopal baptism alone. From the effects ordinarily ascribed to baptism, even by ancient writers, it should seem, that the ceremony is as much of heathen as Jewish origin; since Christians do not restrain the use of it, like the Jews, to the admission of new members into the church, but hold, with the heathens, a virtue in it for remitting and washing away sins. The Brahmins are still said to baptize with this latter view, at certain seasons, in the river Ganges; to the waters whereof they have annexed a cleansing or sanctifying quality; and hence it is that they flock from all parts, even of Tartary, driven by the expectation of their being eased of their load of sins. But, in this point, many Christians seem to have gone beyond the folly of the heathens. It was only the smaller sins of infancy which these latter held to be expiable by washing; for crimes of a blacker dye, they allowed no water could efface them, no purgation could discharge them. The Christian doctrine of a total remission of sins by baptism could not fail, therefore, to scandalize many among the heathens, and furnish them an occasion of satiriBing Christianity itself: "Whoever (says he) is guilty of rapes, murders, sacrilege, or any abominable crime, let him be washed with water, and he will become pure and holy."

In the ancient church, baptism was frequently conferred on Jews by violence; but the church itself never seems to have allowed of force on this occasion. By a canon of the fourth council of Toledo, it is expressly forbid to baptize any against their wills. That which looks most like force in this case, allowed by law, were two orders of Justinian; one of which appoints the heathens, and the other Samaritans, to be baptized, with their wives and children and servants, under pain of confiscation. By the ancient laws, baptism was not to be conferred on image-makers, stage-players, gladiators, *auriga* or public drivers, magicians, or even strolling beggars, till they quitted such professions. Slaves were not allowed the privilege of baptism without the testimony and consent of their masters; excepting the slaves of Jews, Heathens, and heretics; who were not only admitted to baptism, but in consequence thereof, had their freedom. Vossius has a learned and elaborate work De Baptismo, where in he accurately discusses all the questions concerning baptism according to the doctrine of the ancients.

Baptism by Fire, spoken of by St John the Baptist, has occasioned much conjecture. The generality of the fathers held, that believers, before they enter paradise, are to pass through a certain fire, which is to purify them from all pollutions remaining on them unexpiated. Others, with St Basil, understand it of the fire of hell; others, of that of tribulation and temptation. Others, with St Chrysostom, will have it denote an abundance of graces. Others suppose it to mean the descent of the Holy Ghost on the apostles, in form of fiery tongues. Lastly, others maintain, that the word *fire* here is an interpolation; and that we are only to read the text, *He that shall come after me will baptize you with the Holy Ghost*. In reality, it is not found in divers manuscript copies of St Matthew.

The ancient Syriac and Hermians, understanding the passage literally, maintained, that material fire was necessary in the administration of baptism. But we do not find how or what part of the body they applied it, or whether they were satisfied with obliging;
the person baptized to pass through the fire. Valenti-
nus rebaptized all who had received water-baptism, and
confessed on them the baptism of fire.

_Bis dociuit tingi, traductaque corporis flamma._
_TERTULL._ Carmin. contr. Marc. i. 1.

Heraclitus, cited by Clemens Alexandrinus, says, that
some applied a red-hot iron to the ears of the person
baptized, as if to impress some mark upon him.

_Baptism of the Dead_, a custom which anciently pre-
vailed among some people in Africa, of giving baptism
to the dead. The third council of Carthage speak of
it as a thing that ignorant Christians were fond of.
Gregory Nazianzen also takes notice of the same su-
perstitious opinion prevailing among some who delay-
ed to be baptized. In his address to this kind of men,
he asks, whether they stayed to be baptized after
death? Philastrius also notes it as the general error of
the Montanists or Cataphrygians, that they baptized
to-men after death. The practice seems to be grounded
on the same opinion, that when men had neglected to
receive baptism in their life-time, some compensation
might be made for this default by receiving it after
death.

_Baptism of the Dead_ was also a sort of vicarious
baptism, formerly in use, when a person dying without
baptism, another was baptized in his stead.

St. Chrysostom tells us, this was practised among the
Marcionites with a great deal of ridiculous ceremony;
which he thus describes: After any catechumen was
dead, they hid a living man under the bed of the de-
ceased; then coming to the dead man, they asked him
whether he would receive baptism; and he making no
answer, the other answered for him, and said, he would
be baptized in his stead: and so they baptized the liv-
ing for the dead.

Ephiphanius assures us, the like was also practised
among the Corinthians. This practice they pretended
to found on the Apostle’s authority; alleging that text
of St. Paul for it, ‘If the dead rise not at all, what shall
they do who are baptized for the dead?’ A text which
has given occasion to a great variety of different systems
and explanations. Vossius enumerates no less than nine
different opinions among learned divines concerning the
sense of the phrase, _being baptized for the dead_.

St. Ambrose and Walafrid Strabo seem clearly of
opinion, that the apostle had respect to such a custom
then in being; and several moderns have given into
the same opinion, as Baronius, Jos. Scaliger, Justellus,
and Grotius.

Several among the Roman Catholics, as Bellarmin,
Salmeron, Menochius, and a number of schoolmen, under-
it of the baptism of tears, and penance, and
prayers, which the living undergo for the dead; and
thus allege it as a proof of the belief of purgatory in
St. Paul’s days.

_Hypothetical Baptism_, that formerly administered in
certain doubtful cases, with this formula: _If thou art
baptized, I do not rebaptize; if thou art not, I baptize
thee in the name of the Father, &c._ This sort of bap-
tism, enjoined by some ancient constitutions of the Eng-
lish church, is now fallen into disuse.

_Solemn Baptism_, that conferred at stated seasons;
such, in the ancient church, were the _Pascual baptism_,
and that at Whitsuntide. This is sometimes also called
general baptism.

_Lay Baptism_, we find to have been permitted by
both the Common-prayer Books of King Edward and
that of Queen Elizabeth, when an infant is in imme-
diate danger of death, and a lawful minister cannot be
had. This was founded upon the mistaken notion of
the impossibility of salvation without the sacrament of
baptism: but afterwards, when they came to have clear
notions of the sacraments, it was unanimously
resolved in a convocation, held in the year 1575, that
even private baptism, in a case of necessity, was only
to be administered by a lawful minister.

_Baptism_ is also applied, abusively, to certain cer-
emonies used in giving names to things inseminate.

The ancients knew nothing of the custom of giving
baptism to inanimate things, as bells, ships, and the
like, by a superstitious consecration of them. The first
notice we have of this is in the Capitulars of Charles
the Great, where it is only mentioned to be censured:
but, afterwards, it crept into the Roman offices by de-

grees. Baronius carries its antiquity no higher than
the year 686, when the greatest bell of the church of
Lateran was christened by Pope John III. At last it
grew to that superstitious height, as to be thought pro-
per to be complained of in the _Centum Grovamina_ of
the German nation, drawn up in the public diet of the
empire held at Nuremberg anno 1581; where (after
having described the ceremony of baptizing a bell, with
godfathers, who make responses as in baptism, and give
it a name, and clothe it with a new garment as Christians
were used to be clothed, and all this to make it capable
of driving away tempests and devils) they conclude
against it, as not only a superstitious practice, but con-
trary to the Christian religion, and a mere seduction of
the simple people.

_Baptism_, in the sea language, a ceremony in long
voyages on board merchant ships, practised both on
persons and vessels who pass the tropic or line for the
first time. The baptizing the vessel is simple, and
consists only in washing them throughout with sea-
water; that of the passengers is more mysterious.
The oldest of the crew, that has passed the tropic or line,
comes with his face blacked, a grotesque cap on his
head, and some sea-book in his hand, followed by the
rest of the seamen dressed like himself, each having
some kitchen utensil in his hand, with drums beating;
he places himself on a seat on the deck, at the foot of
the mainmast. At the tribunal of this mock magis-
strate, each passenger, not yet initiated, swears he will
take care the same ceremony be observed, whenever he
is in the like circumstanes: Then, by giving a little
money by way of gratification, he is discharged with
a little sprinkling of water; otherwise he is heartily
drenched with streams of water poured upon him; and
the ship boys are enclosed in a cage, and ducked at dis-
cretion.—The seamen, on the baptizing a ship, pretend
to a right of cutting off the beak-head unless redeemed
by the captain.

_Baptismal_, something belonging to baptism; thus
we say baptismal vow, presents, &c.

_Baptismal Vow or Covenant_, a profession of obedi-
ence to the laws of Christ, which persons in the an-
cient church made before baptism. It was an indis-

BAPTISMAL

BAPTISM.

BAPTISMAL PRESENTS are in use in Germany, made by the sponsors to the infant, consisting of money, plate, or even sometimes fields of lands; which by the laws of the country are to be kept for the child till of age, the parents having only the trust, not the right, of disposing of them. An anonymous author has published a discourse express on this occasion, entitled, De pecunia lastrica.

BAPTIST, JOHN MONNOYER, a painter of flowers and fruit, was born at Lisse in 1633, and educated at Antwerp, where he perfected himself in the knowledge of his art, and in his first years was intended for a painter of history; but having soon observed that his genius more strongly inclined him to the painting of flowers, he applied his talents to those subjects, and in that style became one of the greatest masters. His pictures are not so exquisitely finished as those of Van Huysem, but his composition and colouring are in a bolder style. His flowers have generally a remarkable freedom and looseness, as well in the disposition as in the pencilling; together with a tone of colouring that is lively, admirable, and nature itself. The disposition of his objects is surprisingly elegant and beautiful; and in that respect his compositions are easily known, and as easily distinguished from the performances of others.

He died in 1699. He left a son, Anthony, who painted flowers in the same style and manner, and had great merit.

BAPTISTS, in ecclesiastical history, (from βάφτισμα, I baptize;) a denomination of Christians, distinguished from other Christians by their particular opinions respecting the mode and the subjects of baptism.

Instead of administering the ordinance by sprinkling or pouring water, they maintain that it ought to be administered only by immersion. Such, they insist, is the meaning of the word βάφτισμα; so that a command to baptize is a command to immerse. Thus it was understood by those who first administered it. John the Baptist, and the apostles of Christ, administered it in Jordan and other rivers and places where there was much water. Both the administrators and the subjects are described as going down into, and coming up again out of, the water; and the baptized are said to be buried in baptism, and to be raised again: which language could not, they say, be properly adopted on supposition of the ordinance being administered in any other manner than by immersion. Thus also, they affirm, it was in general administered in the primitive church. Thus it is now administered in the Russian and Greek church: and thus it is, at this day, directed to be administered in the church of England, to all who are thought capable of submitting to it in this manner.

With regard to the subjects of baptism, the Baptists say, that this ordinance ought not to be administered to children or infants at all, nor to grown up persons in general; but to adults only of a certain character and description. Our Saviour's commission to his apostles, by which Christian baptism was instituted, is to go and teach all nations, baptizing them: that is, say they, not to baptize all they meet with; but first to instruct them—to teach all nations, or to preach the gospel to every creature—and whoever receives it, him to baptize in the name of the Father, and of the Son, and of the Holy Ghost. To such persons, and to such only, baptism appears to have been administered by the apostles, and the immediate disciples of Christ. They are described as repenting of their sins, as believing in Christ, and as having gladly received the word. Without these qualifications, Peter acquaints those who were converted by his sermon, that he could not have admitted them to baptism. Philip holds the same language in his discourse with the eunuch; and Paul treats Lydia, the jailor, and others, in the same manner. Without these qualifications, Christians in general think it wrong to admit persons to the Lord's supper; and, for the same reasons, without these qualifications, at least a profession of them, the Baptists think it wrong to admit any to baptism. Wherefore they withhold it, not only from the impenitently vicious and profane, and from infidels who have no faith; but also from infants and children, who have no knowledge, and are incapable of every action civil and religious. They further insist, that all positive institutions depend entirely upon the will and declaration of the institutor: and therefore, that reasoning by analogy from abrogated Jewish rites is to be rejected, and the express commands of Christ respecting the mode and subjects of baptism ought to be our only rule.

The Baptists in England form one of the denominations of Protestant dissenters. They separate from the establishment for the same reasons as their brethren of the other denominations do; and from additional motives derived from their particular tenets respecting baptism. The constitution of their churches, and their modes of worship, are congregational or independent: in the exercise of which they are protected, in common with other dissenters, by the act of Toleration. Before this act, they were liable to pains and penalties as nonconformists, and often for their peculiar sentiments as Baptists. A proclamation was issued out against them, and some of them were burnt in Smithfield in 1538. They bore a considerable share in the persecutions of the last and of the preceding centuries; and, as it should seem, in those of some centuries before; for there were several among the Lollards and the followers of Wickliff, who disapproved of infant baptism. There were many of this persuasion among the Protestants and reformers abroad. In Holland, Germany, and the North, they went by the names of Anabaptists, and Mennonites; and in Piedmont and the south, they were found among the Albigenses and Waldenses. See the histories of the Reformation and the above articles in this Dictionary.

The Baptists subsist under two denominations, viz. the Particular or Calvinistical, and the General or Arminian. The former is by far the most numerous. Some of both denominations allow of mixed communion, viz. of persons who have been sprinkled in their infancy, and therefore unbaptized in the view of the Baptists; others disallow it; and some of them observe the seventh day of the week as the Sabbath, apprehending the law that enjoined it not to have been repealed by Christ or his apostles. But a difference of opinion respecting these
and other matters, is not peculiar to the Baptists: it is common to all Christians, and to all bodies of men who think and judge for themselves.

BAPTISTRY, in ecclesiastical writers, a place in which the ceremony of baptism is performed.

In the ancient church it was one of the exedrae or buildings distinct from the church itself: and consisted of a porch or anti-room where the persons to be baptized made their confession of faith, and an inner room where the ceremony of baptism was performed. Thus it continued till the sixth century, when the baptistries began to be taken into the church-porch, and afterwards into the church itself.

The ancient baptistries were commonly called *foro* or *phoistiria*, q.d. places of illumination; an appellation sometimes given to baptism. Or they might have the name for another reason, because they were the places of an illumination, or instruction, preceding baptism, for here the catechumens seem to have been trained up, and instructed in the first rudiments of the Christian faith.

Those baptistries were anciently very capacious: because, as Dr. Cave observes, the stated times of baptism returning but seldom, there were usually great multitudes to be baptized at the same time: and then the manner of baptizing, by immersion, or dipping under water, made it necessary to have a large font likewise. In *Fenantius Fortunatus*, it is called *aula baptismatis*, the large hall of baptism, which was indeed so capacious, that we sometimes read of councils meeting and sitting therein. This hall, or chapel, was always kept shut during Lent, and the door sealed up with the bishop's seal, not to be opened till Maundy Thursday.

The baptistery was always reputed a sacred place. In the Roman order, we find the ceremonies used in the consecration of the baptistries: they were to be built of a round figure, and distinguished with the image of St. John the Baptist; over the basin or font was a figure of a dove in gold or silver, to represent the Holy Ghost.

The name *baptistery* is sometimes also given to a kind of chapel in a large church, which served for the same office. It is an observation of some learned men, that anciently there was but one baptistery in a city, and that at the bishop's church; and that afterwards they were set up in parish churches, with the special allowance however of the bishop.

BAR, in a general sense, denotes a slender piece of wood or iron, for keeping things close together.

BAR, in courts of justice, an enclosure made with a strong partition of timber, where the counsel are placed to plead causes. It is also applied to the benches where the lawyers or advocates are seated, because anciently there was a bar to separate the pleaders from the attorneys and others. Hence our lawyers who are called to the bar, or licensed to plead, are termed barristers, an appellation equivalent to licentiate in other countries.

BAR, or BARR, (Latin barra, and in French barr), in a legal sense, is a plea or peremptory exception of a defendant, sufficient to destroy the plaintiff’s action. And it is divided into bar to common intendment, and bar special; bar temporary, and perpetual. Bar to a common intendment is an ordinary or general bar, which usually disablists the declaration of the plaintiff; bar special is that which is more than ordinary, and falls out upon some special circumstance of the fact as to the case in hand. Bar temporary is such a bar as is good for the present, but may afterwards fail; and bar perpetual is that which overthrows the action of the plaintiff for ever.

BAR, in Heraldry, an ordinary in form of the fess, but much less. See HERALDRY.

BAR, in the manege, the highest part of that place of a horse's mouth situated between the grinders and tusks, so that the part of the mouth which lies under and at the side of the bars retains the name of the gum. A horse with sensible bars has a fine light mouth, with an even and firm appui. See APPUI.

To BAR a VEN in Farriery, is an operation performed upon the veins of the legs of a horse and other parts, with intent to stop the malignant humour. It is done by opening the skin above it, disengaging it, and tying it both above and below, and striking between the two ligatures.

BAR, in Music, a stroke drawn perpendicularly across the lines of a piece of music, including between each two a certain quantity or measure of time, which is various as the time of the music is either triple or common. In common time, between each two bars is included the measure of four crotchets; in triple, three. The principal use of bars is to regulate the beating of time in a concert. The use of bars is not to be traced higher than the time when the English translation of Adrian le Roy's book on the Tablature was published, viz. the year 1574; and it was some time after that before the use of bars became general.

To come nearer to the point, Barnard's cathedral music, printed in 1641, is without bars; but bars are to be found throughout in the Ayres and Dialogues of Henry Lawes published in 1653; from whence it may be conjectured that we owe to Lawes this improvement.

BAR, in Hydrography, denotes a bank of sand, or other matter, whereby the mouth of a river is in a manner choked up.

The term bar is also used for a strong beam wherein the entrance of a harbour is secured: this is more commonly called boom.

BAR of a tavern or coffeehouse, the place where the waiters attend to answer the calls of the customers.

BAR, among printers, denotes a piece of iron with a wooden handle, whereby the screw of the press is turned in printing. See PRINTING.

BARS of Iron, are made of the metal of the sows and pigs as they come from the furnace. These pass through two forges, called the finery and the chaufery; where, undergoing five several heats, they are formed into bars.

BAR, a very strong city of Podolia in Poland, upon the river Kiow. E. Long. 28. 30. N. Lat. 50. 6.

BAR, formerly a duchy of France, now the department of Meuse, is bounded on the east by Lorraine, on the north by Luxembourg, on the west by Champagne, on the south by part of the same country, and by Franche Comte. It is crossed by the river Meuse from north to south, and watered by several other rivers, which render it very fertile. It was divided into four bailiages, viz. Bassilly, Bar, St Michael, and
and Clermont. The chief towns are Bar-le-duc, Clermont, St. Michael, Longuey, Pont à Mousson, and Stenay. In 1736, it was given to Stanislaus then king of Poland.

Bar-le-duc, the capital of the late duchy of Bar, in the department of Meuse, is seated on the declivity of a hill. It is divided into the higher and lower town: the lower is watered by the rivulet Orney, which abounds with excellent trouts. The wines are excellent, and not inferior to those of Champagne. E. Long. 5°. 30'. N. Lat. 48°. 35'.

Bar-le-Mont, a town of France, in the department of the North, situated on the river Sambre. E. Long. 3°. 40'. N. Lat. 50°. 10'.

Bar sur Aube, an ancient town of France, in the department of Aube, seated at the foot of a mountain. It is much celebrated for excellent wines. E. Long. 4°. 50'. N. Lat. 48°. 14'.

Bar sur Seine, a town of France, in the duchy of Burgundy, now in the department of Aube, seated between a mountain which covers it on the west, and the river Seine which runs on the east. E. Long. 4°. 30'. N. Lat. 48°. 5'.

Bar-Master, among miners, the person who keeps the gauge, or dish, for measuring the ore.

Bara, in Ancient Geography, a small island in the Adriatic, opposite to Brundusium: the Pharos of Mela also a frith or arm of the sea of Britannia Secunda (Ptolemy) supposed to be the Murray frith.

Bara, one of the Hebrides or Western islands of Scotland. It is a small rock, only a quarter of a mile in circumference, being part of a chain called the Long Island, the whole cluster appearing at low water as one island. Bara is altogether barren; but abounds with great numbers of sea-fowl such as solan geese, guillemotes, puffins, &c.

Bara, the name of a festival celebrated with much magnificence at Messina, and representing the assumption of the Virgin: The bara, though used as the general denomination of this festival, signifies most particularly a vast machine 50 feet high, at the top of which a young girl of 14, representing the Virgin, stands upon the hand of an image of Jesus Christ.

Round him turn vertically, in a circle, 12 little children which represent the seraphims; below them, in another circle, which turns horizontally, are 12 more representing the cherubims; below these a sun turns vertically, with a child at the extremity of each of the four principal radii of his circle, who ascend and descend with his rotation, yet still stand upright. Below the sun is the lowest circle, about seven feet from the ground, in which 12 boys turn horizontally without interruption; these are intended for the twelve apostles, who are supposed to surround the tomb of the Virgin at the moment when she ascends into heaven. This complication of superstitious whirligigs may have already nearly turned the stomachs of some of our readers, or at least rendered them squeamish. But think of the poor little cherubims, seraphims, and apostles, who are twirled about in this procession! for, says Mr Houel, some of them fall asleep, many of them vomit, and several do still worse; but these unseemly effusions are no drawback upon the edification of the people; and nothing is more common than to see fathers and mothers soliciting with ardour for their boys and girls the pious distinction of puking at the bara. This machine is not drawn by asses or mules, but by a multitude of robust monks.

Barabintzians, a tribe of Tartars, living on both sides of the river Iriz. They seem to derive their name from the Barabaitan desert, whose lakes supply them abundantly with fish, on which and their cattle they chiefly subsist. They have plenty of game and wild-fowl of every kind, particularly ducks and puffins. Most of them are heathens, but Mahometanism daily gains ground among them. Some of them pay tribute to the empress of Russia, and others to the Khan Taisha.

Baracoa, a town in the north-east part of the island of Cuba. W. Long. 74°. 30'. N. Lat. 20°. 25'.

Baralipton, among logicians, a term denoting the first indirect mode of the first figure of syllogism. A syllogism in baralipton, is when the two first propositions are general, and the third particular, the middle term being the subject in the first proposition and the predicate in the second. The following is of this kind.

BA. Every evil ought to be feared;
RA. Every violent passion is an evil;
LIP. Therefore something that ought to be feared is a violent passion.

Baralotus, in Church History, a sect of heretics at Bologna in Italy, who had all things in common, even their wives and children. Their facility in complying with all manner of debauchery made them get the name obedientes, "compliers."

Baranca de Malambo, a town of Terra Firma in America, with a bishop's see and a good haven. It is a place of great trade, and is seated on the river Magdaline. W. Long. 75°. 30'. N. Lat. 11°. 10'.

Barangi, officers among the Greeks of the lower empire. Cuias calls them in Latin protectores, and others give them the name of securigers. It was their business to keep the keys of the city gates, where the emperor resided.

Baranwahr, a town of Lower Hungary, in a county of the same name, taken by the emperor of Germany from the Turks in 1684. It is seated between Buda and Belgrade, in E. Long. 18°. 5'. N. Lat. 46°. 0'.

Barathrum, in antiquity, a deep dark pit at Athens, into which condemned persons were cast headlong. It had sharp spikes at the top, that no man might escape out; and others at the bottom, to pierce and torment such as were cast in. Its depth and capaciousness made it to be applied proverbially to a covetous person: to a glutton, called Barathro by the Romans (Lucretius, Horace); and Barathrum in the same sense (Horace); and for a common prostitute (Plautus).

Baratier, Philip, a most extraordinary instance of the early and rapid exertion of mental faculties. This surprising genius was the son of Francis Baratier, minister of the French church at Schwobach near Nuremberg, where he was born Jan. 10. 1721. The French was his mother tongue, together with some words of High Dutch; but by means of his father incessantly talking Latin to him, it became as familiar to him as the rest: so that, without knowing the rules of grammar, he at four years of age talked French to his mother,
Baratze, mother, Latin to his father, High Dutch to the maid
or neighbouring children; and all this without mixing
or confounding the respective languages. About the
middle of his fifth year he acquired Greek in like man-
er; so that in 15 months he perfectly understood all
the Greek books in the Old and New Testament,
which he readily translated into Latin. When he was
five years and eight months old, he entered upon He-
brew; and in three years time was so expert in the He-
brew text, that from a bible without points, he could
give the sense of the original in Latin or French, or
translate extempore the Latin or French versions into
Hebrew, almost for word; and had all the He-
brew psalms by heart. He composed at this time a
dictionary of rare and difficult Hebrew words, with
critical remarks and philological observations, in about
400 pages in 4to; and, about his tenth year, amused
himself for twelve months with the Rabbinical writ-
ers. With these he intermixed a knowledge of the
Chaldaic, Syriac, and Arabic; and acquired a taste
for divinity and ecclesiastical antiquity, by studying
the Greek fathers, and councils of the first four ages
of the church. In the midst of these occupations, a
pair of globes coming into his possession, he could in
8 or 10 days time resolve all the problems on them;
and in about three months, in Jan. 1735, devised his pro-
ject for the discovery of the longitude, which he com-
municated to the Royal Society at London and the
Royal Academy of Sciences at Berlin. In June 1731,
he was matriculated in the university of Altorf; and
at the close of the year 1732, he was presented by his
father at the meeting of the reformed churches of the
circle of Franconia; who, astonished at his wonderful
talents, admitted him to assist in the deliberations of
the synod; and to preserve the memory of so singular
an event, it was ordered to be registered in its acts.
In 1734, the margrave of Brandenburg Ansparc grant-
ed this young scholar the use of whatever books he
wanted from the Ansparc library, together with a
pension of 50 florins, which he enjoyed three years;
and his father receiving a call from the French church
at Stettin in Pomerania, young Baratze was, on the
journey, admitted master of arts, with universal ap-
plause, at the university of Hall: at Berlin he was ho-
noured with several conversations with the king of Prus-
sia, and was received into the Royal Academy. To-
wards the close of his life he acquired a taste for me-
dals, inscriptions, and antiquities; metaphysical inqui-
ries, and experimental philosophy, intervening occasion-
ally between these studies. He wrote several essays
and dissertations; made astronomical remarks, and la-
borious calculations; took great pains toward a history
of the heresies of the anti-trinitarians, and of the 30
years war in Germany; his last publication, which ap-
peared in 1740, was on the succession of the bishop of
Rome. The final work he engaged in, and for which
he had gathered large materials, was Inquiries concern-
ing the Egyptian Antiquities. But the substance of this
blazing meteor was now almost exhausted: he was al-
ways weak and sickly; and died October 1, 1740, aged
19 years 8 months and 16 days. He published 11 dif-
ferent pieces, and left 29 manuscripts on various sub-
jects, the contents of which may be seen in his life writ-
ten by M. Formey professor of philosophy at Berlin.

Baratz, (Turkish), letters-patent granted by
the Turkish emperors to the Greek patriarch, bishops,
&c. for the exercise of their ecclesiastical functions.
This Baratz gives the bishops full power and autho-

Barbadoes, different; being in some places sandy and light, in others rich, and in others spongy; but all of it is cultivated according to its proper nature, so that the island presents to the eye the most beautiful appearance that can be imagined. Oranges and lemons grow in Barbadoes in great plenty, and in their utmost perfection. The lemon juice here has a peculiar fragrancy. The citrons of Barbadoes afford the best drams and sweet-meats of any in the world, the Barbadoes ladies excelling in the art of preserving the rind of the citron fruit. The juice of the limes, or dwarf-lemons, is the most agreeable souring we know, and great quantities of it have of late been imported into Britain and Ireland. The pine apple is also a native of Barbadoes, and grows there to much greater perfection than it can be made to do in Europe by any artificial means. A vast number of different trees peculiar to the climate are also found to flourish in Barbadoes in great perfection; such as the aloe, mango, calabash, cedar, cypress, mastich, etc. He likewise are produced some sensitive plants, with a good deal of garden stuff, which is common in other places. In short, a native of the finest, the richest, and most diversified country in Europe, can hardly form an idea of the variety of delicious and at the same time nutritive vegetable productions with which this island abounds.

When Barbadoes was first discovered by the English, few or no quadrupeds were found upon it, except hogs, which had been left there by the Portuguese. For convenience of carriage to the sea side, some of the planters at first procured camels; which undoubtedly would in all respects have been preferable to horses for their sugar and other works; but the nature of the climate disagreeing with that animal, it was found impossible to preserve the breed. They then applied for horses to Old and New England: from the former they had those that were fit for show and draught; from the latter those that were proper for mounting their militia, and for the saddle. They had likewise some of an inferior breed from Curasasso, and other settlements. They are reported to have had their first breed of black cattle from Bonsvisia and the isle of Mayo; they now breed upon the island, and often do the work of horses. Their asses are very serviceable in carrying burdens to and from the plantations. The hogs of Barbadoes are finer eating than those of Britain, but the few sheep they have are not near so good. They likewise have goats, which when young are excellent food. Racoons and monkeys are also found here in great abundance. A variety of birds are produced in Barbadoes, of which the humming bird is the most remarkable. Wild fowl do not often frequent this island: but sometimes teal are found near their ponds. A bird which they call the man of war, is said to meet ships at 20 leagues from land, and their return is, to the inhabitants, a sure sign of the arrival of these ships. When the wind blows from the south and south-west, they have flocks of curlews, plovers, snipes, wild pigeons, and wild ducks. The wild pigeons are very fat and plentiful at such seasons, and rather larger than those of England. The tame pigeons, pellets, ducks, and poultry of all kinds, that are bred at Barbadoes, have also a fine flavour, and are accounted more delicious than those of Europe. Their rabbits are scarce; they have no hares; and if they have deer of any kind, they are kept as curiosities. Barbadoes.

The insects of Barbadoes are not venomous, nor do either their snakes or scorpions ever sting. The musktoes are troublesome, and bite, but are more tolerable in Barbadoes than on the continent. Various other insects are found on the island, some of which are troublesome, but in no greater degree than those that are produced by every warm summer in England. Barbadoes is well supplied with fish; and some caught in the sea surrounding it are almost peculiar to itself; such as the parrot-fish, smapers, grey cavallos, terumbs, and coney-fish. The mullets, lobsters, and crabs, caught here are excellent; and the green turtle is perhaps the greatest delicacy that ancient or modern luxury can boast of. At Barbadoes this delicious shellfish seldom sells for less than a shilling a pound, and often for more. There is found in this island a kind of land crab, which eats herbs wherever it can find them, and shelters itself in houses and hollows of trees. According to report, they are a shellfish of passage; for in March they travel to the sea in great numbers. See Cancer.

The inhabitants may be reduced to three classes; viz. the masters, the white servants, and the blacks. The former are either English, Scots, or Irish; but the great encouragement given by government to the peopling this and other West Indian islands, induced some Dutch, French, Portuguese, and Jews, to settle among them with their estates; by which, after a certain time, they acquire the rights of naturalization in Great Britain. The white servants, whether by covenant or purchase, lead more easy lives than the daylabourers in England; and when they come to be overseers, their wages and other allowances are considerable. As to the treatment of the negro slaves in this and the other islands, that falls to be spoken of under the articles Negro, Slave, West-Indies; which see. The manners of the white inhabitants, in general, are the same as in most polite towns and countries in Europe. The capital of the island is called Bridgetown; see that article.

As the history of this island furnishes no very remarkable events, the following short hints concerning it may suffice.

When the English, some time after the year 1625, first landed here, they found it the most savage and destitute place they had hitherto visited. It had not the least appearance of ever having been peopled even by savages. There was no kind of beasts of pasture or of prey, no fruit, no herb, no root fit for supporting the life of man. Yet as the climate was so good, and the soil appeared fertile, some gentlemen of small fortune in England resolved to become adventurers thither. The trees were so large, and of a wood so hard and stubborn, that it was with great difficulty they could clear as much ground as was necessary for their subsistence. By unremitting perseverance, however, they brought it to yield them a tolerable support; and they found that cotton and indigo agreed well with the soil; and that tobacco, which was beginning to come into repute in England, answered tolerably. These prospects, together with the storm between the king and parliament, where he was beginning to break out in England, induced many new adventurers to transport themselves into this island. And what is extremely

Barbados.

from the redness of his beard, was admiral, and Hay-Barbarossa.

radius the second in command: they called themselves Barbar.

the friends of the sea, and the enemies of all who sailed

upon it: and their names became terrible from the

strait of Dardanelles to those of Gibraltar. With such

a power they wanted an establishment; and the oppor-

tunity of settling themselves offered in 1516, by the

inconsiderate application of Eusebius king of Algiers to

them for assistance against the Spaniards. Aruch, leav-

ing his brother to command the fleet, carried 3000

men to Algiers, where he was received as their deli-

ver; and secretly murdering the prince he came to

aid, caused himself to be proclaimed king in his stead.

To this usurpation he added the conquest of Tremec-

cen; when his exploits and piracy induced the em-

peror Charles V. to furnish the marquis de Gomarez,

governor of Oran, with troops to suppress him; by

whom he was defeated and killed near Tremecen. His

brother Hayradin, known also by the name of Barba-

rossa, assumed the sceptre at Algiers with the same abil-

ities, and with better fortune; for the Spaniards, suf-

ficiently employed in Europe, giving him no distur-

bance, he regulated the interior police of his kingdom

with great prudence, carried on his naval operations

with vigour, and extended his conquests on the con-

tinent of Africa. He put his dominions under the pro-

tection of the Grand Signior, Solyman the Magnifi-

cent; and obtained the command of the Turkish fleet.

With so powerful a protector, he acquired the kingdom

of Tunis in a manner similar to that by which his bro-

ther gained Algiers. Since the time of the Barbarossas,

Algiers has been understood to be dependent on the

Porte; but this dependence is now little more than

merely nominal.

Barbarus, Francis, a noble Venetian, was a

man of great fame in the 15th century, not only for

learning, but likewise for a skilful address in the man-

agement of public affairs. He is author of a book De

Re Usoria, and some speeches.

Barbarus, Hermolaus, grandson of the preceding,

one of the most learned men in the 15th century. The

public employments he was intrusted with early, did not

prevent him from cultivating polite learning with great

application. As he was very skilful in the Greek, he

undertook the most difficult translations, and began with

a famous paraphrase upon Aristotle. He then attempt-

ed Dioscorides, whose text he corrected, gave a transla-

tion of him, and added a commentary. But of all his

works, there is none which has gained him so much re-

putation as that which he made upon Pliny; he cor-

rected in him above 5000 passages, and occasionally

restored 300 in Pomponius Mela. Pope Innocent VIII.

to whom he was ambassador, conferred the patriarchate

of Aquileia upon him. He was so imprudent as to ac-

cept of it without waiting for the consent of his supe-

riors; though he could not be ignorant that the repub-

clic of Venice had made laws to forbid all the ministers

they sent to the court of Rome to accept any benefice.

His superiors were inflexible; and not being able to

gain any thing upon them either by his flattery or his

father's interest, the father died of grief, and the son

soon followed him.

Barbarus, Daniel, of the same family with the

preceding, was patriarch of Aquileia, and famous for

his learning. He was ambassador from Venice to Eng-

land;
BAR

Barbarus; and was one of the fathers of the council of Trent, where he acted with great zeal for the interest of the pope. He wrote, a Commentary on Vitruvius. 2. Catena Graecorum Patrum in quinquaginta Psalmos Latiné Versa. 3. La Pratica della Perspectiva. He died in 1360, at 41 years of age.

BARBARY, a region of Africa, including the states of Algiers, Morocco, Tripoli, and Tunis; (see those articles). This country contains almost the whole of what the Romans possessed of the continent of Africa, excepting Egypt. It stretches itself in length from east to west, beginning at the southern limits of Egypt, to the straits of Gibraltar, full 35 degrees of longitude; and from thence to Santa Cruz, the utmost western edge of it, about six more, in all 41 degrees; so that the utmost length of Barbary from east to west is computed at above 750 German leagues. On the south, indeed, it is confined within much narrower bounds, extending no farther than from 27 to 35½ degrees of north latitude; so that its utmost breadth, from north to south, does not exceed 128 German miles. More particularly, Barbary begins on the west of the famed Mount Atlas, called by the Arabs Al Duascal, or Al Duascal, enclosing the ancient kingdoms of Suez and Dels, now provinces of Morocco; thence stretching north-eastward along the Atlantic to the pillars of Hercules at Cape Finisterre, then along the coast of the Mediterranean, it is at last bounded by the city of Alexandria in Egypt.

Concerning the origin of the name Barbary, there are many conjectures. According to some, the Romans, after they had conquered this large country, gave it that name out of contempt and dislike to the barbarous manners of the natives, according to their custom of calling all other people but themselves Barbarians. Marmol, on the contrary, derives the word Barbary from Berber, a name which the Arabs gave to its ancient inhabitants, and which they retain to this day in many parts of the country, especially along the great ridge of the mountains of Atlas; and which name was given them on account of the barrenness of their country. According to Leo Africanus, the name of Barbary was given by the Arabs on account of the strange language of the natives, which appeared to them more like a mumur or grumbling of some brute animals than articulate sounds. Others, however, derive it from the Arabic word bar, signifying a desert, twice repeated; which was given by one Ifric, or Africus, a king of Arabia, from whom the whole continent of Africa is pretended to have taken its name. According to them, this king being driven out of his own dominions, and closely pursued by his enemies, some of his retinue called out to him Bar, Bar; that is, To the desert, To the desert; from which the country was afterwards called Barbary.

Among the Romans this country was divided into the provinces of Mauritania, Africa Propria, &c. and they continued absolute masters of it from the time of Julius Caesar till the year of Christ 428. At that time Bonifacius the Roman governor of these provinces, having through the treachery of Èlius been forced to revolt, called in to his assistance Genseric king of the Vandals, who had been some time settled in Spain. The terms offered, according to Procopius, were, that Genseric should have two thirds, and Bonifacius one third, of Africa, provided they could maintain themselves against the Roman power; and to accomplish this they were to assist each other to the utmost.—This proposal was instantly complied with; and Genseric set sail from Spain in May 428, with an army of 80,000 men, according to some, or only 24,000 according to others, together with their wives, children, and all their effects. In the mean time, however, the empress Placidia having discovered the true cause of Bonifacius's revolt, wrote a most kind and obliging letter to him, in which she assured him of her favour and protection for the future, exhorting him to return to his duty, and exert his usual zeal for the welfare of the empire, by driving out the Barbarians whom the malice of his enemies had obliged him to call in for his own safety and preservation.

Bonifacius readily complied with this request, and Endeavoured the Vandals considerable sums if they would unhesitatingly retire out of Africa and return to Spain. But Genseric, already master of the greatest part of the country, would not return but returned a scoffing answer, and thus, falling unexpectedly on him, cut most of his men to pieces, and obliged Bonifacius himself to fly to Hippo, which place he invested in May 430. The siege lasted till the month of July the following year; when the Vandals were forced, by a famine that began to rage in their camp, to drop the enterprise, and retire. Soon after, Bonifacius having received two reinforcements, one from Rome, and the other under the conduct of the celebrated Aspar, from Constantinople, a resolution was taken by the Roman generals to offer the enemy a battle. The Vandals readily accepting the challenge, Romans and Vandals were engaged for several hours, until the Vandals being utterly defeated, a prodigious number of them taken, the king of the Vandals and the rest obliged to shelter themselves among the rocks and mountains. Aspar, who commanded the eastern troops, escaped with difficulty to Constantinople, and Bonifacius was recalled to Italy. Upon their departure, the Vandals overran all Africa, committing everywhere the most terrible ravages; which struck the inhabitants of Hippo with such terror, that they abandoned their city, which was first plundered, and then set on fire by the victorious enemy; so that Ciritha and Carthage were now the only strong places possessed by the Romans.

In 435, Genseric, probably being afraid of an attack by the united forces of the eastern and western empires, concluded a peace with the Romans, who yielded to him part of Numidia, the province of Proconsularis, and likewise Byzance; for which, according to Prosper, he was to pay a yearly tribute to the emperor of the east. Genseric delivered up his son Hunerici by way of hostage; but so great was the confidence which the Romans placed in this barbarian, that some time after they sent him back his son. Of this they soon had reason to repent; for in 439, the Romans being engaged in a war with the Goths in Gaul, Genseric laid hold of that opportunity to seize upon the so-called city of Carthage; by which he considerably enlarged his African dominions. Valentinian, the Roman emperor, however, maintained as long as he lived the two Mauritanias, with Tripolitana, Tingitana, and that part of Numidia where Ciritha stood.

On the taking of Carthage, Genseric made it the seat of his empire; and in 440 made a descent on the island...
were sufficient for expelling the Vandals, had they been much more powerful than they were; but the command being given to Basiliscus, a covetous and ambitious man, the fleet was utterly defeated through his treachery, and all the vast preparations came to nothing. By this last defeat the power of the Vandals in Africa was fully established, and Genseric made himself master of Sicily, as well as of all the other islands between Italy and Africa, without opposition from the western emperors, whose power was entirely taken away in the year 476.

Thus was the Vandalic monarchy in Barbary founded. Kingdomed by Genseric, between the years 428 and 468. If we of the Vandals founded. 13 himself an absolute barbarian in the strictest sense of the word, and an utter stranger to every useful art, he did not fail to show his own prowess by the destruction of all the monuments of Roman greatness which were so numerous in the country he had conquered. Accordingly, instead of improving his country, he laid it waste, by demolishing all the statically structures both public and private, and all other valuable and sumptuous works with which those proud conquerors had adorned this part of their dominions. So that, whatever monuments the Romans had been at such an immense expense to erect, in order to eternalize their own glory, the barbarous Vandals were now at no less pains to reduce into heaps of ruins. Besides this kind of devastations, Genseric made his dominions a scene of blood and slaughter, by persecuting the orthodox Christians; being himself, as well as most of his countrymen, a zealous Arian; and for this his long reign is chiefly remarkable. He died in 477, after a reign of 60 years: and was succeeded by his son Hunneric.

The new king proved yet a greater tyrant than his father, persecuting the orthodox with the utmost fury; bloody tyrant and, during his short reign of seven years and a half, destroyed more of them than Genseric had done in all his lifetime. He is said to have died in the same manner as the heresiarch Arians; before which time his flesh had been rotted upon his bones, and crawling with worms, so that he looked more like a dead carcass than a living man. Concerning his successors Gutamund, Thrasamund, and Hilderic, we find nothing remarkable, except that they sometimes persecuted, and sometimes were favourable to, the orthodox: and by his favour for them the last king was ruined. For, having unadvisedly published, in the beginning of his reign, a manifesto, wherein he repealed all the acts of his predecessors against the orthodox, a rebellion was the immediate consequence. At the head of the malcontents was Hilderic, one Gilimer, or Gildemar, a prince of the blood-royal, who by degrees became so powerful, as to depose Hilderic in the seventh year of his reign; after which he caused the unhappy monarch, with all his family, to be closely confined, and was himself crowned king of the Vandals at Carthage.

Gilimer proved a greater tyrant than any that had gone before him. He not only cruelly persecuted the orthodox, but horribly oppressed all the rest, so that he was held in universal abhorrence and detestation when the Greek emperor Justinian projected an invasion of Africa. This expedition of Justinian's is said to have
Barbaric masters of this country. The Vandal inhabitants were permitted to remain as they were, on condition of exchanging the heresy of Arianism for the orthodox faith. As for Gildimer, he fled with the utmost expedition to Medamund, a town situated on the top of the Pappuan mountain, and almost inaccessible by reason of its height and ruggedness. The siege of this place was committed to Pharas, an officer of great experience, who having shut up all avenues to the town, the unhappy Gildimer was reduced to the greatest straits for want of provisions. Pharas being soon apprised of the distress he was in, wrote him a most friendly and pathetic letter, earnestly exhorting him to put an end to the distress of himself and his friends by a surrender. This Gildimer declined; but at the same time concluded his answer with a most submissive request, that Pharas would so far pity his great distress as to send him a loaf of bread, a sponge, and a lute. This strange request greatly surprised Pharas; but at last it was explained by the messenger, who told him that the king had not tasted any baked bread since his arrival on that mountain, and earnestly longed to eat a morsel of it before he died: the sponge he wanted to allay a tumour that was fallen on one of his eyes; and the lute, on which he had learned to play, was to assist him in setting some elegiac verses he had composed on the subject of his misfortunes to a suitable tune. At this mornful report Pharas could not refrain from tears, and immediately despatched the messenger with the things he wanted.

Gildimer had spent near three winter months on the summit of this inhospitable mountain, his misery having still more against the thoughts of surrendering, when a melancholy scene in his own family at once reconciled him to it. This was a bloody struggle between two boys, one of them his sister's son, about a flat bit of dough, laid on the coals; which the one seized upon, burning hot as it was, and clapped it into his mouth; but the other by dint of blows forced it out, and ate it from him. This quarrel, which might have ended fatally had not Gildimer interposed, made so deep an impression upon him, that he immediately despatched a messenger to Pharas, acquainting him that he was willing to surrender himself and all his effects upon the conditions he had offered, as soon as he was assured that they were embraced by Belisarius. Pharas lost no time to get them ratified and sent back to him; after which he was conducted to Belisarius, who gave him a very kind reception. Gildimer was afterwards brought before Justinian in gold chains, whom he besought in the most submissive manner to spare his life. This was kindly readily granted by the emperor; who also allowed him a treated by.

Barbaric country was reduced by the Saracen, as we have already related under the article ARABIA. It continued subject to the caliphs of Arabia and Bagdad till the reigne of Harun al-Raschid, who having appointed Ibrahem.
bar

Brahim Ebn Aglab, governor of the western parts of his empire, that prefect took the opportunity, first of assuming greater powers to himself than had been granted by the caliph, and then erecting a principality altogether independent of the caliphs. The race of Aglab continued to enjoy their new principality peaceably till the year of the Hegira 297 or 298, during which time they made several descents on the island of Sicily, and conquered part of it. About this time, however, one Obelidallah rebelled against the house of Aglab, and assumed the title of caliph of Kairwan (the ancient Cyrene, and residence of the Aglabite princes). To give the greater weight to his pretensions, he also took the surname of Al Mohdi, or Al Mahedi, the director. According to some, also, he pretended to be descended in a right line from Ali Ebn Abu Taleb, and Fatima the daughter of Mahomet; for which reason, say they, the Arabs called him and his descendants Fatemites. He likewise encouraged himself and his followers by a traditional prophecy of Mahomet, that at the end of 300 years the sun should rise out of the west. Having at length driven the Aglabites into Egypt, where they became known by the name of Mogrebians, he extended his dominions in Africa and Sicily, making Kairwan the place of his residence.

In the 300th year of the Hegira, Habbassah, one of his generals, overthrew the caliph Al Mokhtader's forces in the neighbourhood of Barca, and made himself master of that city. After which he reduced Alexandria itself; and was making great progress in the conquest of the whole country, when Al Mokhtader despatched against him his two generals, Takin and Al Kasem, with an army of 100,000 men. Habbassah being informed that the caliph's troops were in motion, advanced at the head of his army to give them battle, and at last came up with them in an island called by the Arabs Ard Al Khamsin. Here he attacked them with incredible bravery, notwithstanding their force was much superior to his; but the approach of night obliged both generals to sound a retreat. The action therefore was by no means decisive, though extremely bloody, the caliph's generals having lost 20,000, and Habbassah 10,000. The latter, however, durst not renew the fight next morning; but stole off in the night, and returned home, so that Al Mokhtader in effect gained a victory. In the 302nd year of the Hegira, however, Habbassah returned, possessed himself of Alexandria a second time, defeated a body of the caliph's forces, and killed 7000 of them upon the spot. What further progress he made at that time we are not certainly told; but in the 307th year of the Hegira, Abu Kasem, son to the Fatemite caliph Al Mohdi, again entered Egypt with an army of 100,000 men. At first he met with extraordinary success, and overran a considerable part of that fine country. He made himself master of Alexandria, Al Tynum, Al Bakasa, and the isle of Al Asmaryn, penetrating even to Al Jizah, where the caliph's army under the command of Munes was posted in order to oppose him. In this country he found means to maintain himself till the 308th year of the Hegira. This year, however, he was entirely defeated by Munes, who made himself master of all his baggage, as well as of the plunder he had acquired; and this blow obliged him to fly to Kairwan with the shattered remains of his army, where he remained without making any further attempt on Egypt.

Al Mohdi reigned 24 years; and was succeeded by his son Abul Kasem above mentioned, who then took the surname Al Kayem Mohdi. During his reign we read of nothing remarkable, except the revolt of one Yezid Ebn Cond, a man of mean extraction, but who, having been raised to the dignity of chancellor, found means to raise such a strong party, that the caliph Yezid was obliged to shut himself up in the castle of Mobedia, of which Yezid, being then at the head of a powerful army, soon reduced the capital of Kairwan, the cities of Al Rakkada and Tunis, and several other fortresses. He was no less successful in defeating a considerable number of troops which Al Kayem had raised and sent against him; after which he closely besieged the caliph himself in the castle where he had shut himself up. The siege continued seven months; during which time the place was reduced to such straits, that the caliph must either have surrendered it or been starved, when death put an end to his anxiety in the 12th year of his reign, and the 334th of the Hegira.

Al Kayem was succeeded by his son Iahmael, who immediately took upon himself the title of Al Mansur caliph. This caliph thought proper to conceal the death of his father till he had made the preparations necessary for reducing the rebels. In this he was so successful that he obliged Yezid to raise the siege of Mobedia the same year; and in the following gave him two great overthrows, obliging him to shut himself up in the fortress of Kothama, or Cittana, where he besieged him in his turn. Yezid defended the place a long time with desperate bravery; but finding the garrison at last obliged to capitulate, he made shift to escape privately. Al Mansur immediately despatched a body of forces in pursuit of him; who overtook, and brought him back in fetters; but not till after a vigorous defence, in which Yezid received several dangerous wounds, of which he died in prison. After his death, Al Mansur caused his body to be flayed, and his skin stuffed and exposed to the public view. Of Al Mansur's exploits in Sicily an account is given under that article. Nothing farther remarkable happened in his African dominions; and he died after a reign of seven years and 16 days, in the 341st of the Hegira.

Al Mansur was succeeded by his son Abu Zammin Al Most Moosid, who assumed the surname of Al Most Ledimil Ledimil lah. He proved a very warlike prince, and maintained a bloody contest with Abdalrahman, caliph of Andalusia; for a particular account of which see the article Spain. In the 347th year of the Hegira, beginning March 23rd, 958, Al Moos sent a powerful army to the western extremity of Africa, under the command of Abul Hasan Jawhar, one of his slaves, whom he had advanced to the dignity of vizir. Jawhar first advanced to a city called Tchahur, which he besieged for some time ineffectually. From thence he marched to Fez, and made proper dispositions for attacking that city. But finding that Ahmed Ebn Beer, the emir of the place, was resolved to defend it to the last, he thought proper to abandon the enterprise. However, having traversed all the tract between that capital and the Atlantic ocean, he again sat down before Fez, and took it by storm the following year.

but
Barbar, Barbar. — The greatest achievement performed by this caliph was his conquest of Egypt, and the removal of the caliphate to that country. This conquest, though long projected, he did not attempt till the year of the Hegira 358. Having then made all necessary preparations for it, he committed the care of that expedition to a faithful and experienced general called Gugur, or Jaufur; but in the mean time, this enterprise did not divert Al Moez from the care of his other conquests, particularly those of Sicily and Sardinia: to the last of which he sailed in the year of the Hegira 361, continuing a whole year in it, and leaving the care of his African dominions to an experienced officer named Yusef Ben Zeirit. He sailed thence the following year for Tripoli in Barbary, where he had not staid long before he received the agreeable news that his general had made himself master of Alexandria. He lost no time, but immediately embarked for it, leaving the government of his old African dominions in the hands of his trusty servant Yusef above mentioned, and arriving safely at that port was received with all the demonstrations of joy. Here he began to lay the foundations of his new Egyptian dynasty, which was to put a final end to the old one of Kairawan it had continued about 65 years.

Al Moez preserved all his old dominions of Kairawan or Africa Proper. But the ambition or avarice of the governors whom he appointed suffered them to run quickly to a shameful decay; particularly the new and opulent metropolis of Mohedin, on which immense sums had been lavished, as well as labour and care, so as to render it not only one of the richest and stateliest, but one of the strongest, cities in the world. That we may truly say, that wealth and splendour of this once famed, though short-lived state, took their final leave of it with the departure of the caliph Al Moez, seeing the whole maritime tract from the Egyptian confines to the straits of Gibraltar hath since become the nest of the most odious piratical crew that can be imagined.

Under the article Algiers we have given a short account of the erection of a new kingdom in Barbary by Teysefen; which, however, is there no farther continued than is necessary for the proper understanding the history of that country. A general history might here be given of the whole country of Barbary, but as that would necessarily occasion repetitions under the articles Morocco, Tripoli, Tunis, &c. we must refer to those articles for the historical part, as well as for an account of the climate, inhabitants, &c.

Barbatelli, Bernardino, otherwise called Pochetti, a painter of history, fruit, animals, and flowers, was born at Florence in 1542. He was the disciple of Ridolfo Ghirlandaio at Florence; from whose school he went to Rome, and studied there with such uncommon assiduity, that he was frequently so abstracted, and so absolutely engrossed by the objects of his contemplations, as to forget the necessary refreshments of sleep and food. He was excellent for painting every species of animals, fruit, or flowers; and in those subjects not only imitated, but equalled nature. His touch was free, light and delicate, and the colouring of his objects inexpressibly true; and, beside his merit in this most usual style of painting, the historical subjects which he designed from sacred or profane authors were much esteemed and admired. He died in 1612.

Barbe, Barbe, or Barbe. See Barb.

Barbe, or Barbe, is an old word, denoting the armour of the horses of the ancient knights and soldiers, who were accounted at all points. It is said to have been an armour of iron and leather, wherewith the neck, breast, and shoulders of the horse were covered.

Barbo, St, a town of Biscay in Mexico, near which are rich silver mines. W. Long. 109° 55. N. Lat. 25° 0.

Barbed, in a general sense, bearded like a fish. Barbed and Crested, in Heraldry, an appellation given to the combs and gills of a cock, when particularized for being of a different tincture from the body.

A barred cross, is a cross the extremities whereof are like the barbed irons used for striking fish.

Barbel, in Ichthyology. See Cyprinus.

Barbelicot, an ancient sect of Gnostics, spoken of by Theodoret. Their doctrines were absurd, and their ceremonies too abominable to be repeated.

Barber, one who makes a trade of shaving or trimming the beards of other men for money. Anciently a lute or viol, or some such musical instrument, was part of the furniture of a barber's shop, which was used then to be frequented by persons above the ordinary level of the people, who resorted to the barber either for the cure of wounds, or to undergo some chirurgical operation, or as it was then called, to be trimmed, a word that signified either shaving or cutting and curling the hair; these, together with letting blood, were the ancient occupations of the barber-surgeon. As to the other important branch of surgery, the setting of fractured limbs, that was practised by another class of men called bone-setters, of whom there are hardly any now remaining. The musical instruments in his shop were for the entertainment of waiting customers; and answered the end of a newspaper, with which at this day those who wait for their turn at the barber's amuse themselves. For the origin of the barber's pole, see the article APPETITION.

Barberini, Francis, one of the most excellent poets of his age, was born at Barberino, in Tuscany, in the year 1524. As his mother was of Florence, he settled in that city; where his profession of the law, but especially the beauty of his poetry, raised him a very considerable character. The greatest part of his works are lost; but that which is entitled the Precepts of Love, which is a moral poem calculated to instruct those in their duty who have a regard for glory, virtue, and eternity, has had a better fate. It was published at Rome, adorned with beautiful figures, in 1640, by Frederic Ubaldini: he prefixed the author's life; and as there are in the poem many words which are grown obsolete, he added a glossary to explain them, which illustrates the sense by the authority of cotemporary poets.

Barberino, a town of Tuscany in Italy, situated:
BARBEZIEUH, a town of France, in the department of Charente. It had a manufactuary of linen cloth, and contained 2740 inhabitants in 1815. W. Long. c. 5. N. Lat. 45. 23.

BARBICAN, or BARBACAN. See BARBACAN.

BARBIERI, GIOVANNI FRANCESCO, otherwise called GUERCINO DE CENTO, an eminent historical painter, was born at Cento, a village not far from Bologna, in 1490. At first he was the disciple of Benedetto Gennari; but he afterwards studied for some time in the school of the Caracci, though he did not adopt the manner of that famous academy. He seemed to prefer the style of Caravaggio to that of Guido or Albano, imagining it impossible to imitate nature truly, without the assistance of strong lights and strong shadows; and from that principle, his light was admitted into his painting room from above. In effect, by the opposition of his strong lights and shadows, he gave such force to his pictures, that few, except those of Caravaggio, can stand near them, and not seem feeble in their effect: however, that manner is censured as not being like nature, because it makes objects appear as if they were seen by candle-light, or by the brightness of a sun-beam, which alone can justify the depth of his shadowing. The principal attention of Guercino seems to have been fixed on arriving at perfection in colouring; he saw the astonishing effects produced by the colouring of the celebrated Venetian masters; and observed, that notwithstanding any imperfections in regard to grace, correctness, or elegance, the works of these masters were the objects of universal admiration. From which observation, he seems to have devoted his whole study to excel in colouring; as if he were convinced, that few are qualified to discern the elevation of thought, which constitutes the excellence of a composition; few may be touched with the grandeur or beauty of the design, or perhaps have a capacity to examine even the correctness of any part of a painting; and yet every eye, and even every imperfect judge of a picture, may be sensibly affected by the force and beauty of the colouring. His taste of design was natural, easy, and often grand, but without any extraordinary share of elevation, correctness, or elegance. The airs of his heads often want dignity, and his local colours want truth. However, there is great union and harmony in his colours, although his canvases are not very fresh; and in all his works there is a powerful and expressive imitation of life, which will forever render them estimable. Towards the decline of his life, he observed that the clearer and brighter style of Guido and Albano had attracted the admiration of all Europe; and therefore he altered his manner, even against his own judgment. But he apologized for that conduct, by declaring, that in his former time he painted for fame, and to please the judicious; and he now painted to please the ignorant, and enrich himself. He died in 1666.—The most capital performances of Guercino, is the history of S. Petronilla, which is considered as one of the ornaments of St. Peter's at Rome.

BARBIERI, PAOLO ANTONIO, da Cento, painter of still life and animals, was the brother of Guercino, and born at Cento in 1596. He chose for his subjects fruits, flowers, insects, and animals; which he painted after nature with a lively tint of colour, great tenderness of pencil, and a strong character of truth and life. He died in 1640.

BARBITOS, or BARBITON, an ancient instrument of music, mounted with three, others say seven, strings; much used by Sappho and Alceus, whence it is also denominated LEUBOON.

BARBLES, or BARBS, in Farriery, the knots or superfluous flesh that grow up in the channels of a horse's mouth; that is, in the intervals that separate the bars, and lie under the tongue. These, which are also called barbes, obtain in black cattle as well as horses, and obstruct their eating. For the cure, they cast the beast, take out his tongue, and clip off the barbles with a pair of scissors, or cut them with a sharp knife; others choose to burn them off with a hot iron.

BARBOUR, JOHN, archdeacon of Aberdeen, was esteemed an excellent poet in the reign of David II. He wrote the history of Robert the Bruce, in a heroic poem, which is still extant, and which contains many facts and anecdotes omitted by other historians. The latest edition of this book is that of Glasgow, 8vo, printed in the year 1672. It is entitled, "The acts and life of the most victorious conqueror Robert Bruce king of Scotland; wherein also are contained the martial deeds of the valiant princes Edward Bruce, Sir James Douglase, Earl Thomas Randel, Walter Steward, and sundry others." In one passage, he calls it a romance; but that word was then of good reputation: everybody knows that the 'Ballad of ballads' has been innocently applied to true history, as well as the 'Ballad of ballads' to a sacred song.

BARBUDA, one of the British Caribbea islands, about 20 miles long and 12 broad. It is low land, but fruitful and pretty populous. The inhabitants employ themselves in husbandry, and find always a ready market for their corn and cattle in the sugar islands. Barbuda is the property of the Codrington family, who
have great numbers of negroes here as well as in Barbadoes. It lies in W. Long. 61. 3. N. Lat. 18. 5.

BARCA, a large country of Africa, lying on the coast of the Mediterranean sea, between the kingdoms of Egypt andTripoli, extending itself in length from east to west from the 30th to the 46th degree of east longitude, and in breadth from north to south about 30 leagues, as is generally supposed. It is for the most part, especially in the middle, a dry sandy desert: on which account the Arabs call it Sahart or Ceyart Barka, that is, the desert or road of whirlwinds or hurricanes. It labours almost everywhere under a great scarcity of water; and except in the neighbourhood of towns and villages, where the ground produces some small quantities of grain, such as millet and some maize, the rest is in a manner quite barren and uncultivated, or, to speak more properly, uncultivatable: and even of that small quantity which those few spots produce, the poor inhabitants are obliged to exchange some part with their indigent neighbours, for dates, sheep, and camels, which they stand in greater need of than they, by reason of their great scarcity of grass and other proper food; for want of which, those that are brought to them seldom thrive or live long. In this country stood the famed temple of Jupiter Ammon; and notwithstanding the pleasantness of the spot where it stood, this part of the country is said to have been the most dangerous of any, being surrounded with such quick and burning sands as are very detrimental to travellers; not only as they sink under their feet, but being light, and heated by the rays of the sun, are easily raised by every breath of wind; which, if it chance to be in their faces, almost burns their eyes out, and stifles them for want of breath; or, if veleament, often overwhelms whole caravans. Against this temple Cambyse, king of Persia despatched an army of 50,000 men. They set out from Thebes in Upper Egypt, and under the conduct of proper guides reached the city of Oasis seven days journey from that place: but what was their fate afterwards is uncertain; for they never returned either to Egypt or to their own country. The Ammonians informed Herodotus, that, after the army, had entered the sandy desert which lies beyond Oasis, a violent wind began to blow from the south at the time of their dinner, and raised the sand to such a degree, that the whole army was overwhelmed and buried alive.

Concerning the government or commerce of this country we know nothing certain. Most probably the maritime towns are under the protection of the Porre: but whether under the bashaw of Egypt or Tripoli, or whether they have formed themselves into independent states like those of Algiers and Tunis, we cannot say; only we are told that the inhabitants of the maritime towns are more civilized than those that dwell in the inland parts. The first profess Mahometanism, and have imbiber some notions of humanity and justice; whilst the latter, who have neither religion nor any sign of worship among them, are altogether savage and brutish. They are a sort of Arabs, and like them live entirely upon theft and plunder. By them this tract, which before was a continued desert, was first inhabited. At their first coming in, they settled themselves in one of the best places of the country; but as they multiplied, and had frequent wars with one another, the

strongest drove the weakest out of the best spots, and sent them to wander in the desert parts, where they live in the most miserable manner, their country hardly affording one single necessary of life. Hence it is that they are said to be the ugliest of all the Arabs: their bodies having scarcely any thing but skin and bone, their faces meagre, with fierce ravenous looks; their garb, which is commonly what they take from the passengers who go through those parts, tattered with long wearing; whilst the poorest of them have scarce a rag to cover their nakedness. They are most expert and resolute robbers, that being their chief employment and livelihood; but the travellers in these parts are so few, that the Barcons are often necessitated to make distant excursions into Numidia, Libya, and other southern countries. Those that fall into their hands are made to drink plenty of warm milk; then they hang them up by the feet, and shake them, in order to make them vomit up any money they think they have swallowed; after which, they strip them of all their clothes, even to the last rag: but with all this inhumanity, they commonly spare their life, which is more than the other African robbers do. Yet notwithstanding every artifice they can use, the Barcons are so poor, that they commonly let, pledge, or even sell their children to the Sicilians and others from whom they have their corn, especially before they set out on any long excursion.

BARCALON, an appellation given to the prime minister of the king of Siam. The barcalon has in his department every thing relating to commerce, both at home and abroad. He is likewise superintendent of the king's magazines.

BARCELONA, a handsome, rich, and strong city of Spain, in the province of Catalonia, of which it is the capital. This city was originally founded by Hamilcar Barca, and from him called Barchina. It was reduced by the Romans, and continued subject to them till the kingdom of Spain was overrun by the Goths and Vandals, and afterwards by the Saracens and Moors. In the beginning of the 9th century, Barcelona was in the hands of the Moors, and under the government of one Zade. This governor having more than once abused the clemency of Charlemagne, at last irritated Lewis king of Aquitain, and son to Charles, to such a degree, that he gave orders to his generals to invest the city, and not to rise from before it till they had put Zade into his hands. The Moor made most obstinate resistance, so that the siege lasted many months: at last, finding it impossible to preserve the city much longer, and being destitute of all hopes of relief, he determined, or rather was compelled by the inhabitants, to go to the Christian camp and implore the emperor's mercy; but here he was no sooner arrived than he was arrested and sent prisoner to Charlemagne, who condemned him to perpetual banishment. The people gaining nothing by this expedient, continued to hold out for six weeks longer, when the king of Aquitain himself took the command of the siege. To him they made a proposal, that if he would allow them to march out and go where they pleased, they would surrender the place. Lewis having agreed to this, made his public entry into Barcelona, where he formed a design of extending his father's dominions as far as the Ebro; but being recalled before he could put his design in execution,
Barcelona, he appointed one Bera count of Barcelona. The city continued subject to him and his successors, who still enjoyed the title of counts of Barcelona, from the year 802 to 1131; during which time we find nothing remarkable, except that the city was once taken by the Moors, but was soon afterwards recovered by the assistance of Lewis IV. king of France. In 1131 it was united to the crown of Aragon by the marriage of Don Raymond V. count of Barcelona with the daughter of Don Ramiro the monk, king of Aragon. In 1465 the Catalonians revolted against Don Joan II. king of Aragon, out of love to the queen, Donna Joanna; and consequence of which was, that Barcelona was besieged by that monarch in 1471. Various efforts were made by Lewis XI. of France and the duke of Lorraine in order to raise the siege, but without effect. Things at length were brought to the utmost extremity, when the king offered to pardon them all, without the smallest punishment either in person or property, provided they would submit: but these terms they rejected, chiefly through the influence of the count de Pailhers, who had been pardoned the year before. The army, on the other hand, was very earnest on being led on to the assault, in hopes of plunder. The king, however, wrote a letter to the citizens, dated the 6th of October, in terms as affectionate as if he had been writing to his children, bewailing the miseries they had brought on themselves, and concluding with a protestation that they, and not he, must be answerable for the consequences. Upon this, at the persuasion of a priest who had a reputation for sanctity, they sent deputies to the king, and made a capitulation on the 17th of the same month. In this the king acknowledged they had taken up arms on just motives; and forgave every body except Pailhers, who was, however, suffered to escape. On the 22d of October the king made his entry into the city, and confirmed all their ancient privileges.

In 1697, Barcelona was taken by the French, after a bloody siege of 52 days; and the loss of this city had a considerable effect in disposing the Spaniards to agree to the treaty of Ryswick. In Queen Anne's time it was taken by the allies under the earl of Peterborough. In 1808 it was surprised by a body of French troops under General Duquesne, and continued in their possession till 1814. It contains 10,200 houses, and 111,500 inhabitants, including the contiguous town of Barcelonetta.

Barcelona is situated by the sea-side, of a form between a square and an oval. It is surrounded with a good brick wall, round which is another, with 14 bastions, born-works, ramparts, and ditches; the ramparts are high, broad, and spacious, insomuch that 100 coaches may be seen every evening driving thereon for pleasure. The city is divided into two parts, the Old and the New, which are separated from each other by a wall and a large ditch; the streets are handsome, well paved with large stones, wide, and very clean. It is the residence of a viceroy, a bishop's see, has a fine university, a mint, a good port, and is adorned with handsome buildings. Here is a court of inquisition, which the inhabitants look upon as an advantage. The remarkable buildings are the cathedral, which is large, handsome, and adorned with two high towers, the church of the Virgin Mary, the palace of the bishop, that of the inquisition, and several religious houses: add to these the palace of the viceroy; the arsenal, which contains arms for 1000 men; the exchange, where the merchants meet; the tarsanas, where they build the galleys; and the palace where the nobility of the country meet, called La Casa de la Deputation.

This last is built with fine large freestone, and adorned with columns of marble: there is in it a large hall, with a girt ceiling and a handsome portico, wherein persons may either walk or sit; the hall is adorned with the portraits of all the counts of Barcelona. There are several fine squares, particularly that of St. Michael, into which all the great streets run. The street is wide, spacious, deep, and safe; defended on both sides by a great mole, and on the other sheltered from the west wind by two mountains that advance into the sea, and form a kind of promontory: the mole is 750 paces long, with a quay, at the end of which is a light-house and a small fort. One of the mountains, called Mount Joy, is very high, and rises in the middle of the plain near the city: it is covered with gardens, vineyards, groves of trees, and has a strong fort for the defence of the city. This mountain, being a rock, yields an inexhaustible quarry of fine hard freestone. Barcelona is a place of great trade, on account of the convenience of its harbour. Since the trade with Mexico has been thrown open, the commerce of this port has increased surprisingly. Before the late revolution its trade inward and outward was computed at 1,750,000l. Sterling. The number of vessels that entered the harbour in 1803, was 1333. The women are well shaped, and as handsome as any in Spain; they are brisk and lively in their conversation, and more free and unrestrained in their behaviour than in other parts of Spain. 

E. Long. 2. 5. N. Lat. 41. 26.

BARCELONETTE, a town of France, in the department of the Lower Alps, formerly in the government of Dauphiny, and capital of the valley of its own name. It belonged to the duke of Savoy, and was eued to France by the treaty of Utrecht in 1712.

E. Long. 6. 40. N. Lat. 44. 26.

BARCELOR, a town of Asia, in the East Indies, on the coast of Malabar. It is supposed to be the ancient Barace, and has a considerable trade in pepper.

E. Long. 74. 15. N. Lat. 13. 45.

BARCELOS, a town of Portugal, with the title of a duchy. It is seated on the river Cavado, over which there is a handsome bridge.

W. Long. 7. 0. N. Lat. 41. 20.

BARCINO, in Ancient Geography, a town of the Tarraconensia in Spain, and capital of the Laletani. Now BARCELONA. See that article.

BARCLAY, ALEXANDER, a learned monk in the reign of Henry VIII. Where he was born, though of no great importance, was nevertheless a matter of virulent contention among his former biographers. Bale, who was his contemporary, is of opinion he was born in Somersetshire. There is indeed a village of his name, and a numerous family, in that county. Pitcairn thinks he was born in Devonshire. Mackenzie is positive he was a Scotchman; but without proof, unless we admit as such his name Alexander. He was, however, educated in Oriel-college, Oxford. After leaving the university he went abroad, and continued some time in France, Italy, and Germany, where he acquired a competent knowledge of the languages of those countries, as appears from several translations of books, which
which he afterwards published. On his return to England, he was made chaplain to his patron the bishop of Tyne, who likewise appointed him a priest of St Mary, at the college of Ottery in Devonshire, founded by Grandison bishop of Exeter. After the death of his patron, he became a Benedictine monk of Ely. On the dissolution of that monastery, he first obtained the vicarage of St Matthew at Weyke in Somersetshire; and, in 1549, being then doctor of divinity, was presented to the vicarage of Much Bawde in Essex. In 1552, he was appointed rector of Allhallows, Lombard-street, which he lived to enjoy but a very short time. He died at Croydon in Surrey in June 1552. He is generally allowed to have improved the English language, and to have been one of the poliest writers of his time. He composed several original works; but was chiefly remarkable for his translations from the Latin, Italian, French, and German languages. His version from Sallust of the war of Jugurtha is accurate, and not without elegance. His lives of several saints, in heroic verse, are still unpublished. His Stultifera navis, or The ship of fools, is the most singular of his performances. It was printed by Richard Pynson at London, 1509, in folio; and contains a variety of wooden plates, which are worth the inspection of the curious.

BARCLAY, William, a learned civilian, was born in Aberdeen in the year 1541. He spent the early part of his life, and much of his fortune, at the court of Mary queen of Scots, from whose favour he had reason to expect preferment. In 1573 he went over to France, and at Bourges commenced student of civil law under the famous Cajetan. He continued some years in that seminary, where he took a doctor's degree; and was soon after appointed professor of civil law in the university of Pont à Mousson, then first founded by the duke of Lorraine. That prince afterwards made him counsellor of state and master of requests. Barclay, in the year 1581, married Ann de Maleville, a French lady, by whom he had a son, who became a celebrated author, and of whom the reader will find an account in the next article. This youth the Jesuits would gladly have received into their society. His father refused his consent, and for that reason these disciples of Jesus soon contrived to ruin him with the duke his patron. Barclay now embarked for Britain, where King James I. offered him a considerable preferment, provided he would become a member of the church of England: but not choosing to comply, he returned to France in 1604; and, soon after his arrival, was appointed professor of civil law in the university of Angers, where he died the year following, and was buried in the Franciscan church. He was esteemed a learned civilian; and wrote elaborately in defence of the divine right of kings, in answer to Buchanan and others. The titles of his works are, 1. De regno et regali potestate, &c. 2. Commentarius in tit. pandectarum de rebus creditis, et de jure-jurando. 3. De potestate papae, &c. 4. Primitia in vitam Agricolae.

BARCLAY, John, son of the former, was, as we have above mentioned, so great a favourite of the Jesuits, that they used all their efforts to engage him in their society. His father would not consent, and carried his son with him into England, who was already an author, for he had published "A Commentary upon Thebaeus of Statis" and a Latin poem on the coronation of King James, and the first part of Euphormio, 1603. He returned to France with his father, and after his father's death went to Paris, and soon after came back to London: he was there in 1606. He published "The History of the Gunpowder Plot," a pamphlet of six leaves, printed at Amsterdam. He published at London in 1610 "An Apology for the Euphormio," and his father's treatise De potestate papae. And at Paris, 1612, he published a book entitled Pietas, in answer to Cardinal Bellarmine, who had written against William Barclay's book concerning the power of the Pope. Two years after he published Icon Animorum. He was invited to Rome by Pope Paul V. and received a great deal of civility from Cardinal Bellarmine, though he had written against him. He died at Rome in 1621, while his Argenis was printing at Paris. This celebrated work has since gone through a great number of editions, and has been translated into most languages. M. de Piretsc, who had the care of the first edition, caused the effigies of the author to be placed before the book; and the following distich, written by Grotius, was put under it:

Gente Caledonia, Gallus natalibus, hit est, Romam Romano qui ducet ore loqui.

BARCLAY, Robert, one of the most eminent among the Quakers, the son of Colonel David Barclay, descended of the ancient family of Barcylus, was born at Edinburgh in 1648. He was educated under an uncle at Paris, where the Papists used all their efforts to draw him over to their religion. He joined the Quakers in 1669, and distinguished himself by his zeal and abilities in defence of their doctrines. In 1676 he published in Latin at Amsterdam his "Apology for the Quakers," which is the most celebrated of his works, and esteemed the standard of the doctrine of the Quakers. The Theses Theologicae, which were the foundation of this work, and address to the clergy of what sort soever, were published before the writing of the Apology, and printed in Latin, French, High-Dutch, Low Dutch, and English. The dedication of his Apology to King Charles II. is very remarkable for the uncommon frankness and simplicity with which it is written. Amongst many other extraordinary passages, we meet with the following: "There is no king in the world who can so experimentally testify of God's providence and goodness; neither is there any who rules so many free people, so many true Christians; which thing renders th' government more honourable, thyself more considerable, than the accession of many nations filled with slavish and superstitious souls. Thou hast tasted of prosperity and adversity; thou knowest what it is to be banished thy native country, to be over-ruled as well as to rule and sit upon the throne; and being oppressed, thou hast reason to know how hateful the oppressor is both to God and man: if, after all those warnings and admonitions, thou dost not turn unto the Lord with all thy heart, but forget him who remembered thee in thy distress, and give thyself up to follow lust and vanity, surely great will be thy condemnation."—He travelled with the famous Mr. William Penn through the greatest part of England,
Holland, and Germany, and was everywhere received with the highest respect; for though both his conversation and behaviour were suitable to his principles, yet there was such liveliness and spirit in his discourse, and such serenity and cheerfulness in his deportment, as rendered him extremely agreeable to all sorts of people. When he returned to his native country, he spent the remainder of his life in a quiet and retired manner. He died at his own house at Ury on the 3d of Oct. 1690, in the 42d year of his age.

BARCOCHEBAS, or rather BARCOCHAB, a Jewish impostor, whose real name was Akiba; but he took that of Barcochab, which signifies the Son of a Star; in allusion to the prophecy of Balaam, "There shall a star arise out of Jacob." He proclaimed himself the Messiah; and talking of nothing but wars, victories, and triumphs, made his countrymen rise against the Romans, by which means he was the author of innumerable disorders; he ravaged many places, took a great number of fortresses, and massacred an infinite multitude of people, particularly the Christians. The emperor sent troops to Rufus, governor of Judea, to suppress the sedition. Rufus in obedience exercised a thousand cruelties, but could not finish his attempt. The emperor was therefore obliged to send Julius Severus, the greatest general of that time; who attained his end without a direct battle: he fell on them separately; cut off their provisions; and at last the whole contest was reduced to the siege of Bitter, in the 18th year of Hadrian. The impostor perished there. This war cost the Romans a great deal of blood.

BARD, a word denoting one who was a poet by his genius and profession; and "who sung of the battles of heroes, or the heaving breasts of love." Ossian's Poems, i. 37.

The curiosity of man is great with respect to the transactions of his own species; and when such transactions are described in verse, accompanied with music, the performance is enchanting. An ear, a voice, skill in instrumental music, and, above all, a poetical genius, are requisite to excel in that complicated art. As natural talents are rare, the few that possessed them were highly esteemed; and hence the profession of a bard, which, besides natural talents, required more culture and exercise than any other known art. Bards were capital persons at every festival and at every solemnity. Their songs, which, by recording the achievements of kings and heroes, animated every hearer, must have been the entertainment of every warlike nation. We have Hesiod's authority, that in his time bards were as common as potters or joiners, and as liable to envy. Demodocus is mentioned by Homer as a celebrated bard; and Phemius, another bard, is introduced by him deprecating the wrath of Ulysses in the following words:

"O King! to mercy be thy soul inclin'd,
"And spare the poet's ever-gentle kind.
"A deed like this thy future fame would wrong,
"For dear to gods and men is sacred song.
"Self-taught I sing; by heav'n, and heav'n alone,
"The genuine seeds of poesy are sown;
"And (what the gods bestow) the lofty lay,
"To gods alone, and godlike worth, we pay.

Cicero reports, that at Roman festivals, anciently, the virtues and exploits of their great men were sung. The same custom prevailed in Peru and Mexico, as we learn from Garcilasso and other authors. We have for our authority Father Gobien, that even the inhabitants of the Marian islands have bards, who are greatly admired, because in their songs are celebrated the feats of their ancestors.

But in no part of the world did the profession of bard appear with such lustre as in Gaul, in Britain, and in Ireland. Wherever the Celt or Gaul is mentioned by ancient writers, we seldom fail to hear of their Druids and their bards; the institution of which two orders, was the capital distinction of their manners and policy. The Druids were their philosophers and priests; the bards, their poets and recorders of heroic actions: and both these orders of men seem to have subsisted among them, as chief members of the state, from time immemorial. The Celt possessed, from vol. i. every remote ages, a formed system of discipline and manners, which appears to have had a deep and lasting influence. Ammianus Marcellinus gives them this express testimony, that there flourished among them the study of the most laudable arts; introduced by the bards, whose office it was to sing in heroic verse the gallant actions of illustrious men; and by the Druids, who lived together in colleges or societies, after the Pythagorean manner, and philosophizing upon the highest subjects, asserted the immortality of the human soul. Though Julius Caesar, in his account of Gaul, does not expressly mention the bards; yet it is plain, that, under the title of Druids, he comprehends that whole college or order; of which the bards, who, it is probable, were the disciples of the Druids, undoubtedly made a part. It deserves remark, that, according to his account, the Druidical institution first took rise in Britain, and passed from thence into Gaul; so that they who aspired to be thorough masters of that learning were wont to resort to Britain. He adds too, that such as were to be initiated among the Druids, were obliged to commit to their memory a great number of verses, insomuch that some employed 20 years in this course of education; and that they did not think it lawful to record these poems in writing, but sacredly handed them down by tradition from race to race.

So strong was the attachment of the Celtic nations to their poetry and their bards, that amidst all the changes of their government and manners, even long after the order of the Druids was extinct, and the national religion altered, the bards continued to flourish; not as a set of strolling songsters, like the Greek Anabou or rhapodists, in Homer's time, but as an order of men highly respected in the state, and supported by a public establishment. We find them, according to the testimonies of Strabo and Diodorus, before the age of Augustus Cæsar; and we find them remaining under the same name, and exercising the same functions as of old, in Ireland, and in the north of Scotland, almost down to our own times. It is well known, that, in both
both these countries, every regulus or chief had his own bard, who was considered as an officer of rank in his court.

Of the honour in which the bards were held, many instances occur in Ossian's poems. On all important occasions, they were the ambassadors between contending chiefs; and their persons were held sacred. "Cairbor feared to stretch his sword to the bards, though his soul was dark. Loose the bards (said his brother Cathmor), they are the sons of other times. Their voice shall be heard in other ages, when the kings of Temora have failed."—The bards, as well as the druids, were exempted from taxes and military services, even in times of the greatest danger; and when they attended their patrons in the field, to record and celebrate their great actions, they had a guard assigned them for their protection. At all festivals and public assemblies they were seated near the person of the king or chieftain, and sometimes even above the greatest nobility and chief officers of the court. Nor was the profession of the bards less lucrative than it was honourable. For, besides the valuable presents which they occasionally received from their patrons when they gave them uncommon pleasure by their performances, they had estates in land allotted for their support. Nay, so great was the veneration which the princes of these times entertained for the persons of their poets, and so highly were they charmed and delighted with their tuneful strains, that they sometimes pardoned even their capital crimes for a song.

We may very reasonably suppose, that a profession that was at once so honourable and advantageous, and enjoyed so many flattering distinctions and desirable immunities, would not be deserted. It was indeed very much crowded; and the accounts which we have of the number of the bards in some countries, particularly in Ireland, are hardly credible. We often read, in the poems of Ossian, of a hundred bards belonging to one prince, singing and playing in concert for his entertainment. Every chief bard, who was called Allath Redam, or doctor in poetry, was allowed to have 30 bards of inferior note constantly about his person; and every bard of the second rank was allowed a retinue of 15 poetical disciples.

Though the ancient Britons of the southern parts of this island had originally the same taste and genius for poetry with those of the north, yet none of their poetical compositions of this period have been preserved. Nor have we any reason to be surprised at this. For after the provincial Britons had submitted quietly to the Roman government, yielded up their arms, and had lost their free and martial spirit, they could take little pleasure in hearing or repeating the songs of their bards in honour of the glorious achievements of their brave ancestors. The Romans, too, if they did not practise the same barbarous policy which was long after practised by Edward I. of putting the bards to death, would at least discourage them, and discontinue the repetition of their poems, for very obvious reasons. The sons of the song being thus persecuted by their conquerors, and neglected by their countrymen, either abandoned their country or their profession; and their songs being no longer heard, were soon forgotten.

It is probable that the ancient Britons, as well as many other nations of antiquity, had no idea of poems that were made only to be repeated, and not to be sung to the sound of musical instruments. In the first stages of society in all countries, the two sister arts of poetry and music seem to have been always united; every poet was a musician, and sung his own verses to the sound of some musical instrument. This, we are directly told by two writers of undoubted credit, was the case in Gaul, and consequently in Britain, in this period. "The bards (says Diodorus Siculus *) sung their poems to the sound of an instrument not unlike a lyre." "The bards (according to Ammianus Marcellinus †, as above hint) celebrated the brave actions of illustrious men, in heroic poems, which they sung to the sweet sounds of the lyre." This account of these Greek and Latin writers is confirmed by the general strain, and by many particular passages, of the poems of Ossian. "Beneath his own tree, at intervals, each bard sat down with his harp. They raised the song, and touched the string, each to the chief he loved."†

The invention of writing made a considerable change in the bard profession. It is now an agreed point, that no poetry is fit to be accompanied with music; but what is simple: a complicated thought or description requires the utmost attention, and leaves none for the music; or, if it divide the attention, it makes but a faint impression.$ The simple odes of Quinault See the bear away the palm from every thing of the kind composed by Boileau or Racine. But when a language, in its progress to maturity, is enriched with variety of phrases fit to express the most elevated thoughts, men of genius aspired to the higher strains of poetry, leaving music and song to the bards: which distinguished the profession of a poet from that of a bard. Homer, in a lax sense, may be termed a bard; for in that character he strolled from feast to feast. But he was not a bard in the original sense: he, indeed, recited his poems to crowded audiences; but his poems are too complex for music, and he probably did not sing them, nor accompany them with the lyre. The Trouvadores of Provence were bards in the original sense, and made a capital figure in the days of ignorance, when few could read, and fewer write. In later times, the songs of the bards were taken down in writing, which gave every one access to them without a bard; and the profession sunk by degrees into oblivion. Among the Highlanders of Scotland, reading and writing in their own tongue is not common even at present; and that circumstance supported long the bard profession among them, after being forgot among the neighbouring nations.

BARDANA, or BURDOCK. See ARCTIUM, BOTANY Index.

BARDARIOE, in antiquity, were a kind of ancient guard attending the Greek emperors, armed with rods, wherewith they kept off the people from crowding too near the prince when on horseback. Their captain, or commander, was denominated primivergus.—The word was probably formed from the bardae, or housings on their horses.

BARDAS, the brother of the empress Theodora, and uncle of the famous Photius, is said to have had no other good quality besides that of loving the sciences and polite literature, which he established in the Eastern
BAR

Eastern empire; for he was treacherous, cruel, and ambitious. In the year 856, he assassinated Theotistus, general of the emperor Michael's forces, and obtained his post. At length he caused the disgrace of the empress Theodora; and St Ignatius, patriarch of Constantinople, reproaching him for his vices, he had him deposed in 858, in order to make room for Photius. Bardas was assassinated by Basilius the Macedonian, in 866.

BARDED. in Heraldry, is used in speaking of a horse that is caparisoned. He bears sable, a cavaliere d'or, the horse baraded, argent.

BARDESANISTS, a sect of ancient heretics, thus denominated from their leader, Bardesanes, a Syrian of Edessa in Mesopotamia. Bardesanes, born in the middle of the second century, became eminent, after his conversion to Christianity, for his zeal against heretics; against whom, we are informed by St Jerome and Eusebius, he wrote a multitude of books: yet had he the misfortune to fall, himself, into the errors of Valentinus, to which he added some others of his own. He taught, that the actions of men depend altogether on fate, and that God himself is subject to necessity. His followers went further, and denied the resurrection of the body, and the incarnation and death of our Saviour; holding that these were only apparent or fantastical.

BARDEWICK, a town of Germany, in the circle of Lower Saxony and duchy of Lunenburg; formerly a very large place; but being ruined in 1189, by the duke of Saxony, has never yet recovered itself. It is seated on the river Ilmenau, in E. Long. 10. 6. N. Lat. 53. 40.

BARDS, a strong and rich town of Germany, in the duchy of Pomerania, with a castle and spacious harbour. It is subject to the Swedes; and is situated near the Baltic sea, in E. Long. 13. 20. N. Lat. 54. 23.

BARE, in a general sense, signifies not covered. Hence we say bare-headed, bare-footed, &c.

The Roman women, in times of public distress and mourning, went bare-headed, with their hair loose. Among both Greeks, Romans, and Barbarians, we find a feast called Nudipedia. The Abyssinians never enter their churches, nor the palaces of kings and great men, but bare-footed.

Bare-foott Carmelites and Augustines, are religious of the order of St Carmel and St Austin, who live under a strict observance, and go without shoes, like the Capuchins. There are also bare-foot fathers of mercy. Formerly there were bare-foot Dominicans, and even bare-foot nuns of the order of St Augustine.

BARETH, a town of Germany in Franconia, now subject to Bavaria, and containing 10,000 inhabitants. It was formerly the chief town of a margravate of the same name. E. Long. 11. 50. N. Lat. 50. 0.

BARENT, Ditric, an excellent painter, was born at Amsterdam, and was the son of a very industrious painter. He studied in Italy, and became the favourite disciple of Titian, with whom he lived a long time; but at length returned to Amsterdam, where he painted many extraordinary pieces. He died in 1582, aged 48.

BARFLEUR, a town of France, in Normandy, now the department of the Channel. It was ruined, and had its harbour filled up by the English in 1346. The cape of that name is 12 miles east of Cherbourg, and near it part of the French fleet was destroyed in 1692. W. Long. 1. 6. N. Lat. 49. 40.

BARGAIN and SAILE, a species of conveyance in the English law. It is a kind of a real contract, whereby the bargainer for some pecuniary consideration bargains and sells, that is, contracts to convey, the land of the bargaine; and becomes by such bargain a trustee for, or seized to the use of, the bargaine; and then the statute of uses completes the purchase: or, as it hath been well expressed, the bargain first vests the use, and then the statute vests the possession. But as it was foreseen that conveyances, thus made, would want all those benefits of notoriety which the old common-law assurances were calculated to give; to prevent therefore clandestine conveyances of freeholds, it was enacted in the same session of parliament, by statute 27 Hen. VIII. c. 16. that such bargains and sales should not endure to pass a freehold, unless the same be made by indenture, and enrolled within six months in one of the courts of Westminster-hall, or with the custos rotulorum of the county. Clandestine bargains and sales of chattel interests, or leases for years, were thought not worth regarding, as such interests were very precarious till about six years before; which also occasioned them to be overlooked in framing the statute of uses: and therefore such bargains and sales are not directed to be enrolled. But how impossible it is to foresee, and provide against, all the consequences of innovations! This omission has given rise to the species of conveyance by lease and release.

BARGE (Bargie, Dutch), a vessel or boat of state, furnished with elegant apartments, canopies, and cushions; equipped with a band of rowers, and decorated with flags and streamers: they are generally used for processions on the water, by noblemen, officers of state, or magistrates of great cities. Of this sort, too, we may naturally suppose the famous barge or galley of Cleopatra, which, according to Shakespeare,

Like a burnish'd throne,
Burnt on the water: the poop was beaten gold:
Purple her sails; and so perfum'd, that
The winds were love-sick with them: the oars were silver,
Which to the tune of flutes kept time, and made
The water which they beat to follow faster,
As amorous of their strokes.

At the helm
A seeming mermaid steer'd: the silken tackles
Swell'd with the touches of those flower-soft hands
That rarely form'd their office.

There are likewise other barges of a smaller kind, for the use of admirals and captains of ships of war. These are of a lighter frame, and may be easily hoisted into and out of the ships to which they occasionally belong. Barge is also the name of a flat-bottomed vessel of burden, for lading and discharging ships, and removing their cargoes from place to place in a harbour.

Barge Course, in Architecture, a beam mortised into another, to strengthen the building.

Barge Course, with bricklayers, a term used for
that part of the tiling which projects over without the
principal rafters, in all sorts of buildings where there
is either a gable or a kirkin-head.

BARMER, BARMER, or BAR MASTER,
in the royal mines, the steward or judge of the barmote.
The bar-master is to keep two great courts of barnote yearly;
and every week a small one, as occasion requires.

BARMOTE, or BARMOTE, a court which takes
conscience of causes and disputes between miners.—
By the custom of the mines, no person is to sue any
miner for ore-debt, or for ore, or for any ground in
variance, but only in the court of barnote, on penalty
of forfeiting the debt, and paying the charges at law.

BAI, a very handsome and rich town of Italy,
in the kingdom of Naples; the capital of Terra di Bari,
and an archbishop's see. It is well fortified, is seated
on the gulf of Venice, and had formerly a good har-
bour, but it was destroyed by the Venetians. E. Long. 40.
N. Lat. 42. 51.

BARI, or Terra di Bari, a territory of Italy,
in the kingdom of Naples, of which the above-mentioned
city is the capital. It is bounded on the north by the
Capitanata, on the north-west by the Ulterior
principal, on the south by the Basilicata, on the south-east
by the Terra de Otranto, and on the north-east by the
gulf of Venice. It has no considerable river except
the Ovano, which separates it from the Capitanata.
The soil is a sandy; and the soil produces plenty of
corn, fruit, and saffron: but there are a great many
serpents, and spiders called tarantulas. See ARANEA.
The principal towns are Bari, the capital, Frani, and
Drano, Bova, Bilonto, Conversano, Monopoli, Poligna-
no, Barletto, and Malsetto. The two first are archi-
piscopal, and all the rest episcopal.

BARILLA, or BARILLA, the name of a plant
cultivated in Spain for its ashes, from which the purest
kinds of mineral alkali or soda are obtained.

There are four plants, which, in the early part of
their growth, bear so strong a resemblance to each other
as would deceive any but the farmers and wise observers.
These four are, barilla, gazul (or, as some call it,
elgzmil), sosia, and salicornia, or salicr. They are
all burnt to ashes; but applied to different uses, as
being possessed of different qualities. Some of the
rogue farmers mix more or less of the three last with the
first; and it requires a complete knowledge of the
colour, taste, and smell of the ashes to be able to detect
their knavery.

Barilla is sown fresh every year. Its greatest height
above ground is four inches: each root pushes out a
vast number of little stalks, which again are subdivided
into smaller sprigs resembling samphire; and all together
form a large spreading tufted bush. The colour is
bright green; as the plant advances towards maturity,
this colour vanishes away till it comes at last to be a
dull green tinged with brown.

Gazul bears the greatest affinity to barilla, both in
quality and appearance: the principal difference con-
sists in its growing on a still drier saltier earth, con-
sequently it is impregnated with a stronger salt. It
does not rise above two inches out of the ground,
spreading out into little tufts. Its sprigs are much
flatter and more pulpy than those of barilla, and are
still more like samphire. It is sown but once in three,
four, or five years, according to the nature of the soil.

Sosia, when of the same size, has the same appear-
ance as gazul; but in time grows much larger, as its
natural soil is a strong salt marsh, where it is to be
found in large tufts of sprigs, treble the size of barilla,
and of a bright green colour, which it retains to the
last.

Salicorn has a stalk of a deep green colour inclining
to red, which last becomes by degrees the colour of
the whole plant. From the beginning it grows up-
right, and much resembles a bush of young rosemary.
Its natural soil is on the declivities of hills near the
salt marshes, or on the edges of the small drains or chan-
nels cut by the husbandmen for the purpose of watering
the fields; before it has acquired its full growth, it is
very like the barilla of those seasons in which the
ground has been damped before sowing. In those
years of manuring, barilla, contrary to its usual na-
ture, comes up with a tinge of red; and when burnt
falls far short of its wonted goodness, being bitter,
more impregnated with salts than it should be, and rais-
ing a blister if applied for a few minutes to the tongue.
Barilla contains less salt than the others: when burnt,
it runs into a mass resembling a spongy stone, with a
faint cast of blue.

Gazul, after burning, comes as near barilla in its
outward appearance as it does while growing in its ve-
tetable form; but if broken, the inside is of a deeper
and more glossy blue. Soza and salicorn are darker,
and almost black within, of a heavier consistence, with
very little or no sign of sponginess.

All these ashes contain a strong alkali; but barilla
the best and purest, though not in the greatest quan-
tity. Upon this principle, it is fittest for making glass
and bleaching linen; the others are used in making
soap. Each of them would whiten linen; but all;
except barilla, would burn it. A good crop of ba-
rella impoverishes the land to such a degree, that it can-
not bear good barilla a second time, being quite ex-
hausted. For this reason the rich farmers lay man-
ure upon the ground, and let it lie fallow for a sea-
son; at the end of which it is sown afresh without any
danger, as the weeds that have sprung up in the year
of rest have carried off all the pernicious effects of the
dung. A proper succession of crops is thus secured
by manuring and following the different parts of the
farm, each in their turn. The poorer tribe of cultivat-
cors cannot pursue the same method for want of capital;
and are therefore under the necessity of sowing their
lands immediately after manuring, which yields them a
profit just sufficient to afford a present scanty subsis-
tence, though the quality and price of their barilla be but
 trifling.

The method used in making barilla is the same as
that followed in Britain in burning kelp. The plant
as soon as ripe is plucked up and laid in heaps, then
set on fire. The salt juices run out below into a
hole made in the ground, where they run into a vitri-
ified lump, which is left about a fortnight to cool. An
acre may give about a ton.

BARING OF TREES, in Agriculture, the taking
away some of the earth about the roots, that the
winter-rain and snow-water may penetrate farther
Barking

Barjols, a town of Provence, now the department of Var, in France, containing 3025 inhabitants in 1815. E. Long. 5° 23'. N. Lat. 43° 35'.

Barium, in Ancient Geography, a town of Apulia, on the Adriatic; so called from the founders, who being expelled from the island Bara, built this town. It is now called Bar; see that article.

Bark, in the anatomy of plants, the exterior part of the wood corresponding to the skin of an animal. For its organization, texture, &c. see the article Plants.

As animals are furnished with a panniculus adiposus, usually replete with fat, which invests and covers all the fleshly parts, and screens them from external cold; plants are encompassed with a bark replete with fatty juices, by means whereof the cold is kept out, and in winter-time the spicule of ice prevented from fixing and freezing the juices in the vessels: whence it is, that some sort of trees remain evergreen the year round, by reason their barks contain more oil than can be spent and exhaled by the sun, &c.

The bark has its peculiar diseases, and is infested with insects peculiar to it. It appears from the experiments of M. Buffon, that trees stripped of their bark the whole length of their stems, die in about three or four years. But it is very remarkable, that trees thus stripped in the time of the sap, and suffered to die, afford timber heavier, more uniformly dense, stronger, and fitter for service, than if the trees had been cut down in their healthy state. Something of a like nature has been observed by Vitruvius and Evelyn.

The ancients wrote their books on bark, especially of the ash and lime tree, not on the exterior, but on the inner and finer bark called phyllyra.

There are a great many kinds of barks in use in the several arts. Some in agriculture, and in tanning leather, as the oak-bark; some in physic, as the quinquina or Jesuit's bark, mace, &c.; others in dyeing, as the bark of alder, and walnut-trees; others in spicery, as cinnamon, cassia lignea, &c.; and others for divers uses, as the bark of the cork tree, &c.

In the East Indies, they prepare the bark of a certain tree so as to spin like hemp. After it has been beaten and steeped in water, they extract long threads from it, which are something between silk and common thread; being neither so soft nor so glossy as silk, nor so rough and hard as hemp. They mix silk with it in some stuffs; and these are called nilvae, and cherequesmolles.

Of the bark of a species of mulberry-tree the Japanese make their paper. See Morus.

In the island of Oatihe, the natives make their cloth, which is of three kinds, of the bark of three different trees; the paper-mulberry above mentioned, the bread-fruit tree, and the cocoa tree. That made of the mulberry is the finest and whitest, and worn chiefly by the principal people. It is manufactured in the following manner. When the trees are of a proper size, they are drawn up, and stripped of their branches; after which, the roots and tops are cut off; the bark of these rods being then slit up longitudinally, is easily drawn off; and, when a proper quantity has been procured, it is carried down to some running water, in which it is deposited to soak, and secured from floating away by heavy stones: when it is supposed to be sufficiently softened, the women, servants go down to the brook, and stripping themselves, sit down in the water, to separate the inner bark from the green part on the outside: to do this, they place the under side upon a flat smooth board, and with a kind of shell scrape it very carefully, dipping it continually in the water till nothing remains but the fine fibres of the inner coat. Being thus prepared in the afternoon, they are spread out upon paper, not upon barks; they are placed in lengths of about 11 or 12 yards: one by the side of another, till they are about a foot broad, and two or three layers are also laid one upon the other: care is taken that the cloth shall be in all parts of an equal thickness, so that if the bark happens to be thinner in any one particular part of one layer than the rest, a piece that is somewhat thicker is picked out to be laid over in the next. In this state it remains till the morning, when great part of the water which it contained when it was laid out is either drained off or evaporated, and the several fibres adhere together, so that the whole may be raised from the ground in one piece. It is then taken away, and laid upon the smooth side of a long piece of wood prepared for the purpose, and beaten by the women servants. The instrument used for this purpose is a square wooden club, having each of its four sides or faces marked, lengthwise, with small grooves, or furrows, of different degrees of fineness; those on one side being of a width and depth sufficient to receive a small pack-thread, and the others finer in a regular gradation, so that the last are not more than equal to sewing silk. They beat it first with the coarsest side of this mallet, keeping time like our smiths; it spreads very fast under the strokes, chiefly however in the breadth, and the grooves in the mallet mark it with the appearance of threads; it is successively beaten with the other sides, last with the finest, and is then fit for use. Of this cloth there are several sorts, of different degrees of fineness, in proportion as it is more or less beaten. The other cloth also differs in proportion as it is beaten; but they differ from each other in consequence of the different materials of which they are made. The bark of the bread-fruit is not taken till the trees are considerably longer and thicker than those of the mulberry; the process afterwards is the same.—Of the bark, too, of a tree which they call poeval, they manufacture excellent matting; both a coarse sort which serves them to sleep upon, and a finer to wear in wet weather. Of the same bark they also make ropes and lines, from the thickness of an inch to the size of a small pack-thread.

Bark, or Jesuit's Bark, is a name given by way of eminence to the quinquina, or cinchona. See Cinchona.

Bark, in Navigation, a general name given to small ships; it is, however, peculiarly appropriated by seamen to those which carry three masts without a mizen top-sail. Our northern mariners, who are trained in the coal-trade, apply this distinction to a broad-sailed ship which carries no ornamental figure on the stern or prow.

Water-barks, are little vessels used in Holland for the carriage of fresh water to places where it is wanting.
Bark, as well as for the fetching sea-water to make salt of. They have a deck, and are filled with water up to the deck.

**Bark-Binding,** a distemper incident to trees; cured by splitting the bark, or cutting along the grain.

**Bark-Galling,** is when the trees are galled with thorns, &c. It is cured by binding clay on the galled places.

**Bark-Longue,** or Barka Longa, a small, low, sharp-built, but very long vessel, without a deck. It goes with sails and oars, and is very common in Spain.

**BARKHAMSTEAD,** or BERKSMITHSTEAD, a town of Hertfordshire in England, seems to have been the seat of a Roman town. It had formerly a strong castle, which has long since been demolished. Population 1963 in 1811. W. Long. 0. 35. N. Lat. 45. 49.

**BARKING,** a town of Essex, in England, with 2421 inhabitants, seated on the river Roding, not far from the Thames, in a very unwholesome air. It has been chiefly noted for a large monastery, now in ruins; there being nothing left standing but a small part of the walls and a gate-house. E. Long. 0. 13. N. Lat. 51. 32.

**Barking of Trees,** the peeling off the rind or bark. This must be done, in our climate, in the month of May, because at that time the sap of the tree separates the bark from the wood. It would be very difficult to perform it at any other time of the year, unless the season was extremely wet and rainy; for heat and dryness are a very great hindrance to it.

By the French laws, all dealers are forbid to bark their wood while growing, on the penalty of 500 livres. This law was the result of ignorance; it being now found that barking of trees, and letting them die, increases the strength of timber.

**BARKLEY,** a town of Gloucestershire in England, seated on a branch of the river Severn, with 616 inhabitants in 1811. It had formerly a nunnery, and has still the title of a barony. W. Long. 2. 30. N. Lat. 51. 49.

**BARKWAY,** a town of Hertfordshire in England, on the great road from London to York. W. Long. 0. 5. N. Lat. 52.

**BARLEUS,** Gaspar, professor of philosophy at Amsterdam, and one of the best Latin poets of the 17th century. There was scarce anything great that happened in the world, while he lived, but he made a pompous elegy upon it, when reasons of state were no obstacle to it. He was a great defender of Arminius; and showed his abilities in history by his relation of what passed in Brazil during the government of Count Maurice of Nassau, published in 1647. He died the year after.

**BARLERIA, Snap-Dragon. See Botany Index.**

**BARLETTA,** a handsome and strong town of Italy, in the kingdom of Naples, and in the Terra di Bari, with a bishop's see. It is situated on the gulf of Venice, in E. Long. 16. 32. N. Lat. 41. 50.

**BARLEY,** in Botany. See Hordeum, Botany and Agriculture Index.

The principal use of barley among us is for making beer; in order to which it is first malted. See the article *Beer.***

The Scandinavians, among whom malt liquors are little known, feed their horses with barley as we do with oats. In Scotland, barley is a common ingredient in Vol. III. Part II.

Broths; and the consumpt of it for that purpose is very considerable, barley-broth being a dish as frequent there as that of soup in France.

**Pearl Barley,** and French Barley; barley freed of the husk by a mill; the distinction between the two being, that the pearl barley is reduced to the size of small shot, all but the very heart of the grain being ground away.

**Barley-Water,** is a decoction of either of these, reputed soft and lubricating, of frequent use in physic. This well known decoction is a very useful drink in many disorders; and is recommended, with nitre, by some authors of reputation, in slow fevers.

**Barley-Corn** is used to denote a long measure, containing in length the third part of an inch, and in breadth the eighth. The French carpenters also use barley-corn, grain d'orge, as equivalent to a line, or the twelfth part of an inch.

**Barley-Corn (grain d'orge),** is also used in building for a little cavity between the mouldings of joiners work, served to separate or keep them severer; thus called because made of a kind of plane of the same name.

**BARLOW, William,** bishop of Chichester, descended of an ancient family in Wales, was born in the county of Essex. In his youth he favoured the Reformation; and travelled to Germany to be instructed by Luther, and other preachers of the new doctrine. How long he continued a Protestant is uncertain: but from his letter to King Henry VIII. quoted below, it appears that he wrote several books against the church of Rome. However, he was a regular canon in the Augustinian monastery of St. Osith in the county of Essex, and studied some time at Oxford with the brothers of that order, where he took the degree of doctor in divinity. He was then made prior of the convent at Bisham in Berkshire; and afterwards succeeded to the several priories of Blackmore, Tiptree, Leda, Bromhole, and Haverford-west. On the dissolution of abbeys, he resigned not only with a good grace, but persuaded several other abbots to follow his example. King Henry was so pleased with his royal obedience on this occasion, that he sent him, in 1533, on an embassy to Scotland; in the same year made him bishop of St. Asaph; in two months after, translated him to the see of St. David's, and in 1547 to that of Bath and Wells. During this time, our good bishop, as appears from the following epistle to the king, was, or pretended to be, a staunch Papist: it was written in 1533.

"Pray to God, who of his infinitly goodness and mercy inestimably hath brought me out of darkness into light, and from deadly ignorance into the quick knowledge of the truth. From which, through the fiend's instigation and false persuasion, I have greatly swerved. In so much that I have made certain bokes, and have suffered them to be emprinted, as the treatise of the *Buryall of the Mass,* &c. In these treatises I perceive and acknowledge myself grievously to have erred, namely against the blessed sacrament of the altar; disallowing the mass and denying purgatory, with slanderous imputing of the pope and my lord cardinal, and outrageous railing against the clergy, which I have forsaken and utterly renounced. (As a pardon William Barlow.)" However, when Edward VI. came to the crown, he was again a Protestant; and for
that reason, on Queen Mary's accession, was deprived of his bishopric, and sent prisoner to the Fleet, where he continued some time. At length he found means to escape, and immediately joined the other English Protestants in Germany. When Queen Elizabeth ascended the throne, our prelate was raised to the see of Chichester, and soon after made first prebendary of the collegiate church of Westminster. He died in 1568, and was buried in the cathedral of Chichester. He had five daughters, each of whom married a bishop. He wrote, 1. The Burial of the name. 2. The climbing up of Fryems and religious Persons, portrayed with Figures. 3. Christian Homilies. 4. A book upon Cosmography. 5. The godly and pious Institution of a Christian Man, commonly called the Bishop's Book; and several other works. He is said to be the translator of the Apocrypha as far as the book of Wisdom. His letters to M. Parker are in manuscript in Corpus Christi college, Cambridge, Misc. i. 445.

Barlow, William, a mathematician and divine, the son of the bishop of Chichester, was born in Pembroke whilst his father was bishop of St David's. In 1560, he was entered commoner of Balaie college in Oxford; and in 1564, took a degree in arts, which having completed by determination, he left the university and went to sea; but in what capacity is uncertain: however, he acquired considerable knowledge in the art of navigation. About the year 1573, he entered into orders, and became prebendary of Winchester and rector of Easton near that city. In 1588 he was made prebendary of Litchfield, which he exchanged for the place of treasurer of that church. Some years after, he was made chaplain to Prince Henry, the son of King James I.; and in 1614, archdeacon of Salisbury. He was the first writer on the nature and properties of the magnet. Barlow died in the year 1635, and was buried in the church at Easton. His works are, 1. "The Navigator's Supply, containing many things of principal importance belonging to navigation, and use of diverse instruments framed chiefly for that purpose." London, 1597, 4to. Dedicated to Robert earl of Essex. 2. "Magnetic Advertisements, or diverse, pertinent Observations and approved Experiments concerning the Nature and Properties of the Loadstone." London, 1616, 4to. 3. "A Brief Discovery of the idle Animadversions of Mark Ridley, M. D. upon a Treatise entitled Magnetic Advertisements." London, 1618, 4to.

Barlow, Thomas, born in 1607, was appointed fellow of Queen's college in Oxford in 1633; and two years after was chosen reader of metaphysics to the university. He was keeper of the Bodleian library, and in 1637 was chosen provost of Queen's college. After the restoration of King Charles II. he was nominated one of the commissioners for restoring the members unjustly expelled in 1648. He wrote at that time The Case of Toleration in Matters of Religion, to Mr. R. Boyle. In 1675, he was made bishop of Lincoln. After the popish plot, he published several tracts against the Roman catholic religion; in which he shows an uncommon extent of learning, and skill in polemical divinity. Nevertheless, when the duke of York was proclaimed king, he took all opportunities of expressing his affection toward him; but after the revolution he was readily voted that the king had abdicated his kingdom; and was very vigorous in excluding those of the clergy who refused the oaths, from their benefices.

Mr Granger observes, that "this learned prelate, whom nature designed for a scholar, and who acted in conformity with the bent of nature, was perhaps as great a master of the learned languages, and of the works of the celebrated authors who have written in those languages, as any man in his age. The greatest part of his writings, of which Mr Wood has given us a catalogue, are against Popery: and his conduct for some time, like that of other Calvinists, appeared to be in direct opposition to the church of Rome. But after James ascended the throne, he seemed to approach much nearer to Popery than he ever did before. He sent the king an address of thanks for his declaration for liberty of conscience, and is said to have written reasons for reading that declaration. His compliances were much the same after the revolution. His moderation, to call it by the softest name, was very great; indeed so great as to bring the firmness of his character in question. But casuistry reconciles seeming contradictions. He was, abstracted from this laxity of principles, a very great and worthy man." He died at Buckden, in Huntingdonshire, on the 8th of October 1694, in the 8th year of his age.

Barlow, Francis, an English painter, was born in Lincolnshire. On his coming to London, he was placed with one Sheppard, a limner; but his genius led him chiefly to drawing of birds, fish, and other animals. There are six books of animals from his drawings, and he painted some ceilings with birds for noblemen and gentlemen in the country. His etchings are numerous; his illustration of Emperor is his greatest work. He died in 1702. There is something pleasing in the composition and manner of this master, though neither is excellent. His drawing too is very indifferent; nor does he characterize any animal justly. His birds in general are better than his beasts.

Barlow, Joel, an American literary and political character. See Supplement.

BARM, the same with yest. See YEST.—Barm is said to have been first used by the Celts in the composition of bread. About the time of Agricola's entrance into Lancashire, a new sort of loaf had been introduced at Rome, which was formed only of water and flour, and much esteemed for its lightness: and it was called the water cake from its simple composition, and the Partian roll from its original inventors. But even this was not comparable to the French or Spanish bread for its lightness. The use of curmi, and the knowledge of brewing, had acquainted the Celts with an ingredient for their bread, which was much better calculated to render it light and pleasant than the leaven, the eggs, the milk, or the wine and honey, of other nations. This was the spume which arose on the surface of their curmi in fermentation, and which the Welsh denominate barm, and we barm. The Celts of Gaul, of Spain, and most probably therefore of South Britain, had long used it; and their bread was, in consequence of this, superior in lightness to that of any other nation in the world. See the articles Baking and Bread.

BARMAS, an East Indian people, who in 1511 possessed
BAR

possessed all the coast extending from Bengal to Pegu.

It appears also, that they were formerly masters of

Ava, the dominions of which extended as far as China;

and of consequence the Barmas were masters of most

of the northern parts of the peninsula beyond the Gan-

ga. Their dominions, however, were afterwards re-

duced to very narrow bounds, and their king became

tributary to the king of Pegu; but by degrees they not

only recovered their former empire, but conquered the

kingdoms of Pegu, Siam, and several others. By the

latest accounts, their kingdom extends from the pro-

vince of Yunnan in China, about 800 miles in length

from north to south, and 250 in breadth from east to

west. See Asia and Pegu.

BARN, in Husbandry, a covered place or house, with

air-holes in the sides, for laying up any sort of grain,

hay, or straw.

St BARNABAS'S DAY, a Christian festival, cele-

brated on the 11th of June.—St Barnabas was born in

Cyprus, and descended of the tribe of Levi, whose

Jewish ancestors are thought to have retired thither to

secure themselves from violence during the troublesome

times in Judea. His proper name was Joses; to which,

after his conversion to Christianity, the apostles added

that of Barnabas, signifying either the son of prophecy,

or the son of consolation; the first respecting his eminent

prophetic gifts, the other his great charity in selling

his estate for the comfort and relief of the poor Chris-

tians. He was educated at Jerusalem, under the great

Jewish doctor Gamaliel; which might probably lay

the foundation of that intimate friendship which was

afterwards contracted between this apostle and St Paul.

The time of his conversion is uncertain; but he is ge-

nerally esteemed one of the seventy disciples chosen by

our Saviour himself.

At Antioch, St Paul and St Barnabas had a con-

test, which ended in their separation; but what fol-

lowed it with respect to St Barnabas is not related in

the Acts of the Apostles. Some say, he went into Ita-

yy, and founded a church at Milan. At Salamis, we

are told, he suffered martyrdom; whether some Jews,

being come out of Syria, set upon him, as he was dis-

patching in the synagogue, and stoned him to death.

He was buried by his kinsman Mark, whom he had

taken with him, in a cave near that city. The re-

mains of his body are said to have been discovered in

the reign of the emperor Zeno, together with a copy

of St Matthew's gospel, written with his own hand,

and lying on his breast.

St BARNABAS'S Epistle, an apocryphal work ascribed

to St Barnabas, and frequently cited by St Clement

of Alexandria and Origen. It was first published in

Greek, from a copy of Father Hugh Menard, a Bene-

dictine monk. An ancient version of it was found in

a manuscript of the abbey of Ceebey, near a thousand

years old. Vossius published it, in the year 1656, to-

gether with the epistles of St Ignatius.

St BARNABAS'S Gospel, another apocryphal work,

ascribed to St Barnabas the apostle, wherein the his-

tory of Jesus Christ is related in a manner very differ-

ent from the account given us by the four Evangelists.

The Mahometans have this gospel in Arabic, and it

corresponds very well with those traditions which Ma-

homet followed in his Koran. It was, probably, a

fugery of some nominal Christians; and afterwards

altered and interpolated by the Mahometans, the better

Barnabas's serve their purpose.

BARNABITES, a religious order, founded in the

16th century by three Italian gentlemen, who had been

advised by a famous preacher of those days to read

carefully the epistles of St Paul. Hence they were

called clerks of St Paul; and Barnabites, because they

performed their first exercise in a church of St Barna-

bas at Milan. Their habit is black; and their office

to instruct, catechise, and serve in mission.

BARNACLE, a species of goose. See ANAS, OR-

NITHLOGY Index.

BARNACLES, in Farriery, an instrument com-
piled of two branches joined at one end with a hinge,

to put upon horses nesses when they will not stand quiet-

ly to be shod, blooded, or dressed.

BARNADESIA. See BOTANY Index.

BARNARD, or BERNARD, JOHN, the son of John

Barnard gent. was born at Castor in Lincolnshire, and

educated at Cambridge. After several preferments, he

was made a prebendary of the church of Lincoln. He

wrote Censorum Clerior, against scandalous ministers not

fit to be restored to church livings; the Life of Dr Hey-

lyn; and a few other works. He died at Newark,

August 17, 1683.

Barnard Castle, seated on the river Tees in the

county of Durham, is a town and barony belonging to

Vane earl of Darlington. It is indifferently large, and

has a manufactury of stockings. W. Long. 1. 45.

N. Lat. 54. 35.

BARNES, JOSHUA, professor of the Greek language

at Cambridge, in the beginning of the 18th century.

He was chosen queen's professor of Greek in 1695; a

language he wrote and spoke with the utmost facility.

His first publication was a whimsical tract, entitled

Geramia, or a New Discovery of the little sort of people

called Pygmies. After that appeared his Life of Ed-

ward III., in which he introduces his hero making

long and elaborate speeches. In the year 1700, when

he published many of his works, Mrs Mason, of Hem-

mingford, in Huntingdonshire, a widow lady of

between 40 and 50, with a jointure of 300l. per annum,

who had been for some time a great admirer of him,

came to Cambridge, and desired leave to settle 100l.

a-year upon him after her death; which he politely

refused, unless she would likewise condescend to make

him happy with her person, which was not very engag-

ing. The lady was too obliging to refuse any thing to

Joshua, for whom she said, "the sun stood still?" and

they were accordingly married. Mr Barnes wrote

several other books besides those above mentioned, par-

particularly, Sacred Poems; The Life of Oliver Cromwell,

the Tyrant; several dramatic pieces; a poetical Para-

phrase on the History of Esther, in Greek verse, with a

Latin translation, &c.: and he published editions of

Euripides, Anacreon, and Homer's Iliad and Odyssey,

with notes and a Latin translation. He wrote with

greater ease in Greek than even in English, and yet is

generally allowed not to have understood the delicacies

of that language. He was of such a humane disposition,

and so unacquainted with the world, that he gave his

only coat to a vagrant begging at his door. This ex-

cellent man died on the 3d of August 1712, in the 58th

year of his age.

BARNEVELDT, JOHN D'OLEDEN, the celebrated

3 E 2 Dutch
Barneveldt Dutch statesman, and one of the founders of the civil liberty of Holland. His patriotic zeal inducing him to limit the authority of Maurice prince of Orange the second stadtholder of Holland, the partizans of that prince falsely accused him of a design to deliver his country into the hands of the Spanish monarch. On this absurd charge he was tried by 26 commissaries deputed from the seven provinces, condemned, and beheaded in 1619. His sons William and René, with a view of revenging their father's death, formed a conspiracy against the stadtholder, which was discovered. William fled: but René was taken and condemned to die; which fatal circumstance has immortalized the memory of his mother, of whom the following anecdote is recorded. She solicited a pardon for René; upon which Maurice expressed his surprise that she should do that for her son which she had refused for her husband. To this remark, she replied with indignation, "I would not ask a pardon for my husband, because he was innocent. I solicit it for my son, because he is guilty."

Barnet, a town partly in Middlesex and partly in Hertfordshire. It is a great thoroughfare, and the market is very remarkable for hogs. Population 1799.

Barnsley, or Black Barnsley, a town of the west riding of Yorkshire, seated on the side of a hill, and five furlongs in length, and containing 5014 inhabitants in 1811.

Barnstable, a sea-port town of Devonshire, seated on the river Taw, over which there is a good bridge. It sends two members to parliament, and had 4019 inhabitants in 1811.

Baro, or Baron, Peter, professor of divinity in the university of Cambridge, in the 16th century, was born at Estampes in France, and educated in the university of Bourges, where he was admitted a licentiate in the law; but being of the Protestant religion, he was obliged to leave his native country to avoid persecution; and withdrawing into England, was kindly entertained by Lord Burleigh. He afterwards settled at Cambridge; and by the recommendation of his noble patron, was, in 1574, chosen Lady Margaret's professor there. For some years he quietly enjoyed his professorship; but there was at last raised a restless faction against him, by his opposing the doctrine of absolute predestination; which rendered his place so uneasy to him, that he chose to leave the university, and to settle in London.

Barocci, Frederic, a celebrated painter, was born at Urbino, where the genius of Raphael inspired him. In his early youth he travelled to Rome; where he painted several things in fresco. He then returned to Urbino; and giving himself up to intense study, acquired a great name in painting. His genius particularly led him to religious subjects. At his leisure hours, he etched a few prints from his own designs; which are highly finished, and executed with great softness and delicacy. The Sublataion is his capital performance in that way: of which we seldom meet with any impressions, but those taken from the retouched plate, which are very harsh. He died at Urbino in 1612, aged 84.

Baroch, or Broach, a town of Cambay, in Hindostan; it is walled round, and was formerly a place of great trade. It is now inhabited by weavers, and such mechanics as manufacture cotton cloth. Here they have the best cotton in the world, and the best bastas are manufactured in this place. It was taken possession of by the British in 1853, and is still retained by them. E. Long. 72° 5'. N. Lat. 22° 15'.

Barometers. Notwithstanding this clear proof of the pressure of the atmosphere, however, the assertion of a plenum left no means untied to solve the phenomena of the Torricellian experiment by some other hypothesis. The most ridiculous solution, and which at the same time gave the adverse party the greatest difficulty to overthrow, was that of Linus. He contended, that in the upper part of the tube, there is a film or rope of mercury, extended through the seeming vacancy; and that, by this rope, the rest of the mercury was suspended, and kept from falling into the basin. Even this so absurd hypothesis he pretended to confirm by the following experiments. Take, says he, a small tube, open at both ends, suppose about 20 inches long; fill this tube with mercury, stopping the lower orifice with your thumb: Then closing the upper end with your finger, and immersing the lower in stagnant mercury, you shall perceive, upon the removal of your thumb, a manifest suction of your finger into the tube; and the tube and mercury will both stick so close to it that you may carry them about the room. Therefore, says he, the internal cylinder of mercury in the tube is not held up by the preponderate air without; for if so, whence comes so strong a suction, and so firm an adhesion of the tube to the finger? - The same effect follows, though the tube be not quite filled with mercury; for if a little space of air is left at the top, after the tube is immersed in the stagnant mercury, there will be a considerable suction as before.

These experiments, which are themselves clear proofs of the pressure of the air, supported for some time the funicular hypothesis, as it was called, of Linus. But when it was discovered, that if the tube was carried to the top of a high mountain the mercury stood lower than on the plain, and that if removed into the vacuum of an air-pump it fell out altogether, the hypothesis of Linus was rejected by every body. - There are, however, two experiments which create a considerable difficulty. One is mentioned by Mr. Huygens, viz. that if a glass tube 7½ inches long, or perhaps longer, is filled with mercury well purged of its air, and then inverted, the whole will remain suspended; whereas, according to the Torricellian experiment, it ought to subside immediately to the height of 29 or 30 inches. It is true indeed, that, upon shaking the tube, the mercury presently subsides to that height; but why it should remain suspended at all, more than twice the height to which it can be raised by the pressure of the most dense atmosphere, seems not easily accounted for: and accordingly, in the Philosophical Transactions we find attempts to account for it by the pressure of a medium more subtle than the common air, and capable of pervading both the mercury and glass. We find there also another very surprising fact of the same kind mentioned; viz. that a pretty large tube under 29 inches in length, filled with mercury, and inverted into a basin of the same, will remain full, though there be a small hole in the top. This too, is there accounted for by the pressure of a medium more subtle than common air; but by no means in a satisfactory manner. Mr. Rowing, who mentions the phenomenon of the 7½ inch tube, accounts for it in the following manner. "The cause of this phenomenon seems to be, that by the great weight of so long a column of mercury, it was pressed into so close contact with the glass in pursuiting in, that by the mutual attraction of cohesion between the mercury and the glass, the whole column was sustained after the tube was inverted." - Here, however, we must observe, that this solution seems equally unsatisfactory with that of the subtle medium already mentioned; because it is only one end of the column which sustains so great a pressure from the weight of the mercury; and therefore, though five or six inches of the upper part of the tube, where the pressure had been strongest, might thus remain full of mercury, yet the rest ought to fall down. Besides, it is only the outside of the mercurial column that is in contact with the glass, and consequently these parts only ought to be attracted. Therefore, even granting the pressure to be equally violent, on the inversion of the tube, all the way from 29 to 7½ inches, yet the glass ought to be only as it were silvered over by a very thin film of mercury, while the middle parts of the column ought to fall out by reason of their fluidity.

The other experiment hinted at, is with regard to another siphon: which, though it belongs more properly to the experiment article Hydrostatics, yet seems necessary to be mentioned here. It is this: That a siphon, once set a running, will continue to do so though set under the receiver of an air-pump and the air exhausted in the most perfect manner; or if a siphon is filled, and then set under a receiver and the air exhausted, if by any contrivance the end of the lower leg is opened, it will immediately begin to run, and discharge the water of any vessel in which the other leg is placed, as though it was in the open air. The cause of this phenomenon, as well as the former, seems very difficult to be investigated. Some philosophers have attempted a solution on a principle similar to that of the funicular hypothesis of Linus above-mentioned; namely, that fluids in siphons seem as it were to form one continuous body; so that the heavier part descending, like a chain pulls the lighter after it. This might be deemed a sufficient explanation, if the siphon were only empty to the water it first contains in itself: but when we consider that the water in the vessel, inside of which much exceeds the quantity contained in the clear siphon, is likewise evacuated, this hypothesis cannot by no means be admitted; because this would be like the lighter part of a chain pulling the heavier after it.

Concerning the cause of these singular phenomena, we can only offer the following conjecture. The evacuation of a medium much more subtle than air, and of electricity, which pervades the vacuum of an air-pump with the utmost facility, is now sufficiently ascertained in the phenomena of electricity. It is also well known, that this fluid surrounds the whole earth to an indeterminate height. If, therefore, this fluid either is the power of gravity itself, or is acted upon by that power, it must necessarily press upon all terrestrial bodies in a manner similar to the pressure of the atmosphere. If then we could from any vessel entirely exclude this subtle fluid, and form an electrical vacuum, as well as we can do an aerial one by means of the air-pump, we would in that case see fluids as evidently raised by the pressure of the electric matter, as we now see them raised by that of the air. But though this cannot be done, we are assured that there are certain substances, of which glass is one, through which the electric manner cannot pass,
It was, however, some time after the Torricellian experiment had been made, and even after it had been universally agreed that the suspension of the mercury was owing to the weight of the atmosphere, before it was discovered that this pressure of the air was different at different times though the tube was kept in the same place. But the variations of altitude in the mercurial column were too obvious to remain long unobserved; and accordingly philosophers soon became careful enough to mark them. When this was done, it was impossible to avoid observing also, that the changes in the height of the mercury were accompanied, or very quickly succeeded, by changes in the weather. Hence the instrument obtained the name of the weather-glass, and was generally made use of with a view to the fore-knowledge of the weather. In this character, its principal phenomena are as follow:

1. The rising of the mercury presages, in general, its pleasant fair weather; and its falling, foul weather, as rain, snow, high winds, and storms.

2. In very hot weather, the falling of the mercury glass by Mr. Patrick foreshows thunder.

3. In winter, the rising presages frost; and in frosty weather, if the mercury falls three or four divisions, there will certainly follow a thaw. But in a continued frost, if the mercury rises, it will certainly snow.

4. When foul weather happens soon after the falling of the mercury, expect but little of it; and, on the contrary, expect but little fair weather when it proves fair shortly after the mercury has risen.

5. In foul weather, when the mercury rises much and high, and thus continues for two or three days before the foul weather is quite over, then expect a continuance of fair weather to follow.

6. In fair weather, when the mercury falls much and low, and thus continues for two or three days before the rain comes, then expect a great deal of wet, and probably high winds.

7. The unsettled motion of the mercury denotes uncertain and changeable weather.

8. You are not so strictly to observe the words engraved on the plates (though in general it will agree with them), as the mercury’s rising and falling. For if it stand at much rain, and then rises up to changeable, it presages fair weather; though not to continue so long as if the mercury had risen higher: and so, on the contrary, if the mercury stood at fair, and falls to changeable, it presages foul weather; though not so much of it as if it had sunk lower.

These are the observations of Mr. Patrick, on which Mr. Browning makes the following remarks: "From these observations it appears, that it is not so much the height of the mercury in the tube that indicates the weather, as the motion of it up and down: wherefore, in order to pass a right judgment of what weather is to be expected, we ought to know whether the mercury is actually rising or falling; to which end the following rules are of use."

"1. If the surface of the mercury is convex, standing higher in the middle of the tube than at the sides, it is generally a sign that the mercury is then rising.

"2. If the surface is concave, it is then sinking: and,

"3. If it is plain, the mercury is stationary; or rather, if it is a little convex: for mercury being put into
Barometer. A glass tube, especially a small one, will naturally have its surface a little convex, because the particles of mercury attract one another more forcibly than they are attracted by glass. Further,

"4. If the glass is small, shake the tube; and if the air is grown heavier, the mercury will rise about half the tenth of an inch higher than it stood before; if it is grown lighter, it will sink as much. This proceeds from the mercury's sticking to the sides of the tube, which prevents the free motion of it till it is disengaged by the shock; and therefore, when an observation is to be made with such a tube, it ought always to be shaken first; for sometimes the mercury will not vary of its own accord, till the weather it ought to have indicated is present.

Here we must observe, that the above-mentioned phenomena are peculiar to places lying at a considerable distance from the equator; for, in the torrid zone, the mercury in the barometer seldom either rises or falls much. In Jamaica, it is observed by Sir William Boeston, that the mercury in the morning constantly stood at one degree below changeable, and at noon sunk to one degree above rain; so that the whole scale of variation there was only 1/4° of an inch. At St Helena, too, where Dr Halley made his observations, he found the mercury to remain wholly stationary whatever weather happened. Of these phenomena, their causes, and why the barometer indicates an approaching change of weather, the Doctor gives us the following account:

Phenomena of the barometer solved by Dr Halley.

"1. In calm weather, when the air is inclined to rain, the mercury is commonly low.

"2. In serene, good, and settled weather, the mercury is generally high.

"3. Upon very great winds, though they be not accompanied with rain, the mercury sinks lowest of all. With relation to the point of compass the wind blows upon.

"4. Casteris paribus, the greatest heights of the mercury are found upon easterly, or north-easterly, winds.

"5. In calm frosty weather, the mercury generally stands high.

"6. After very great storms of wind, when the mercury has been very low, it generally rises again very fast.

"7. The more northerly places have greater alterations of the barometer than the more southerly.

"8. Within the tropics, and near them, those accounts we have had from others, and my own observations at St Helena, make very little or no variation of the height of the mercury in all weathers.

Hence I conceive, that the principal cause of the rise and fall of the mercury is from the variable winds which are found in the temperate zones, and whose great inconstancy here in England is notorious.

A second cause is, the uncertain exhalation and precipitation of the vapours lodging in the air, whereby it comes to be at one time much more crowded than at another, and consequently heavier; but this latter depends in a great measure upon the former. Now from these principles I shall endeavour to explicate the several phenomena of the barometer, taking them in the same order I have laid them down. Thus,

"4. The mercury's being lower inclines it to rain; because the air being light, the vapours are no longer supported thereby, being become specifically heavier than the medium wherein they floated; so that they descend towards the earth, and, in their fall, meeting with other aqueous particles, they incorporate together, and form little drops of rain: but the mercury's being at one time lower than another, is the effect of two contrary winds blowing from the place where the barometer stands; whereby the air of that place is carried both ways from it, and consequently the incumbent cylinder of air is diminished, and accordingly the mercury sinks: As, for instance, if in the German ocean it should blow a gale of westerly wind, and at the same time, an easterly wind in the Irish seas; or, if in France it should blow a northerly wind, and in Scotland a southerly; it must be granted, that that part of the atmosphere impendant over England would thereby be exhausted and attenuated, and the mercury would subside, and the vapours which before floated in these parts of the air of equal gravity with themselves sink to the earth.

"2. The greater height of the barometer is occasioned by two contrary winds blowing towards the place of observation, whereby the air of other places is brought thither and accumulated; so that the incumbent cylinder of air being increased both in weight and weight, the mercury pressed thereby must needs stand high, as long as the wind continues so to blow; and then the air being specifically heavier, the vapours are better kept suspended, so that they have no inclination to precipitate and fall down in drops, which is the reason of the serene good weather which attends the greater heights of the mercury.

"3. The mercury sinks the lowest of all by the very rapid motion of the air in storms of wind. For the tract or region of the earth's surface, wherein the winds rage, not extending all round the globe, that stagnant air which is left behind, as if these our three on the sides, cannot come so fast as to supply the evacuation made by so swift a current; so that the air must necessarily be attenuated when and where the said winds continue to blow, and that more or less according to their violence: add to which, that the horizontal motion of the air being so quick as it is, may in all probability take off some part of the perpendicular pressure thereof; and the great agitation of its particles is the reason why, the vapours are dissipated, and do not condense into drops so as to form rain, otherwise the natural consequence of the air's rarefaction.

"4. The mercury stands highest upon the easterly and north-easterly winds; because in the great Atlantic ocean, on this side the 35th degree of north latitude, the winds are almost always westerly or south-westerly; so that whenever here the wind comes up at east and north-east, it is sure to be checked by a contrary gale as soon as it reaches the ocean; wherefore, according to our second remark, the air must needs be heaped over this island, and consequently the mercury must stand high as often as these winds blow. This holds true in this country; but is not a general rule for others, where the winds are under different circumstances: and I have sometimes seen the mercury here as low as 29 inches upon an easterly wind; but then it blew exceedingly hard, and so comes to be accounted for by what was observed in the third remark.

"5. In calm frosty weather the mercury generally
Barometer stands high; because (as I conceive) it seldom freezes but when the winds come out of the northern and north-eastern quarters, or at least unless those winds blow at no great distance off. For the north parts of Germany, Denmark, Sweden, Norway, and all that tract from whence north-eastern winds come, are subject to almost continual frost all the winter: and thereby the lower air is very much condensed, and in that state is brought hitherward by those winds, and, being accumulated by the opposition of the upper air, and on the sea in the ocean, the mercury must needs be pressed to a more than ordinary height; and as a concurring cause, the shrinking of the lower parts of the air into lesser room by cold, must needs cause a descent of the upper parts of the atmosphere, to reduce the cavity made by this contraction to an equilibrium.

6. After great storms, when the mercury has been very low, it generally rises again very fast: I once observed it to rise one inch and a half in less than six hours after a long-continued storm of south-west wind. The reason is, because the air being very much rarefied by the great evacuations which such continued storms make thereof, the neighbouring air runs in the more swiftly to bring it to an equilibrium; as we see water runs the faster for having a greater declivity.

7. The variations are greater in the more northerly places, as at Stockholm greater than at Paris (compared by M. Paschal); because the northerly parts have usually greater storms of wind than the more southerly, whereby the mercury should sink lower in that extreme; and then the northerly winds bringing in the more dense and ponderous air from the neighbourhood of the pole, and that again being checked by a southerly wind at no great distance, and so heaped, must of necessity make the mercury in such case stand higher in the other extreme.

8. Lastly, This remark, that there is little or no variation near the equinoctial, does above all others confirm the hypothesis of the variable winds being the cause of these variations of the height of the mercury; for in the places above named there is always an easy gale of wind blowing nearly upon the same point, viz. E. N. E. at Barbadoes, and E. S. E. at St Helen, so that there being no contrary currents of air to exhaust or accumulate it, the atmosphere continues much in the same state: however, upon hurricanes, the most violent of storms, the mercury has been observed very low; but this is but once in two or three years, and it soon recovers its settled state, about 29\frac{3}{4} inches.

This theory has been controverted, and the principal objections are: That if the wind was the sole agent in raising or depressing the mercury, the alterations of its height in the barometer would be only relative or topical; there would still be the same quantity supported at several places taken collectively: thus what a tube at London lost, another at Paris, Pisa, or Zurich, &c. would gain. But the contrary is found to be the case; for, from all the observations hitherto made, the barometers in several distant parts of the globe rise and fall together. This is a very surprising fact; and deserves to be well examined. Again, setting aside all other objections, it is impossible, on Dr Halley's hypothesis, to explain the mercury's fall before, and rise after, rain. For suppose two contrary winds sweeping the air from over London: We know that few if any of the winds reach above a mile high; all therefore they can do will be to cut off a certain part of the column of air over London: if the consequence of this be the fall of the mercury, yet there is no apparent reason for the rains following it. The vapours indeed may be let lower; but it will only be till they come into an air of the same specific gravity with themselves; and then their effect will cease before.

Lastly, it is impossible, according to the laws of fluids, that the air above any place could be exhausted by the blowing of two contrary winds from it; for, suppose a north-east and south-west wind both blow from London at the same time, there will be two others at the same time blowing towards it from opposite points, viz. a north-west and south-east one, which will every moment restore the equilibrium, so that it can never be lost in any considerable degree at least.

Mr Leibnitz accounted for the sinking of the mercury before rain upon another principle, viz. That as of Mr Leibnitz, a body specifically lighter than a fluid, while it is suspended by it, adds more weight to that fluid than when, by being reduced in its bulk, it becomes specifically heavier, and descends; so the vapour, after it is reduced into the form of clouds, and descends, adds less weight to the air than before; and therefore the mercury falls. To which it is answered, 1. That when a body descends in a fluid, its motion in a very little time becomes uniform; or nearly so, a farther acceleration of it being prevented by the resistance of the fluid; and then, by the third law of nature, it forces the fluid downwards with a force equal to that whereby it tends to be farther accelerated, that is, with a force equal to its whole weight. 2. The mercury by its descent foretells rain a much longer time before it comes, than the vapour after it is condensed into clouds can be supposed to take up in falling.

3. Supposing that as many vapours as fall in rain during a whole year were at once to be condensed into clouds, and even quite cease to gravitate upon the air, its gravity would scarcely be diminished thereby so much as is equivalent to the descent of two inches of mercury in the barometer. Besides, in many places between the tropics, the rains fall at certain seasons in very great quantities, and yet the barometer shows there very little or no alteration in the weight of the atmosphere.

Another hypothesis somewhat similar to that of Leibnitz has been given: but as it is liable to the objections just now mentioned, especially the last, we found it not sufficient to bear to give any particular account of it; and shall attempt, upon other principles, to give a satisfactory solution of this phenomenon.

The necessary preliminaries to our hypothesis are:

1. That vapour is formed by an intimate union between the fire and that of water, by which the fire or heat is so totally enveloped, and its action so entirely suspended by the watery particles, that it not only loses its properties of giving light and of burning, but becomes incapable of affecting the most sensible thermometer; in which case, it is said by Dr Black, the author of this theory, to be in the latent state. For the proofs of this, see the articles EVAPORATION, COLD, CONCEALATION, &c. 2. If the atmosphere is affected...
Barometer. - Afflicted by any unusual degree of heat, it thence becomes incapable of supporting so long a column of mercury as before, for which reason that in the barometer sinks. This appears from the observations of Sir William Beechey already mentioned; and likewise from those of De Luc, which shall be afterwards taken notice of.

These axioms being established, it thence follows, that as vapour is formed by an union of fire with water, or if we please to call it an elective attraction between them, or solution of the water in the fire, it is impossible that the vapour can be condensed until this union, attraction, or solution, be at an end. The beginning of the condensation of the vapour then, or the first symptoms of an approaching rain, must be the separation of the fire which lies hid in the vapour. This may be at first slow and partial, or it may be sudden and violent: in the first case, the rain will come on slowly, and after a considerable interval; and in the other, it will be very quick, and in great quantity. But Dr Black hath proved, that when fire quells its latent state, however long it may have lain dormant and insensible, it always assumes its proper qualities again, and affects the thermometer as though it had never been absorbed. The consequence of this must be, that in proportion as the latent heat is discharged from the vapour, it must sensibly affect those parts of the atmosphere into which it is discharged; and in proportion to the heat communicated to these, they will become specifically lighter, and the mercury sink of course. Neither are we to imagine that the quantity of heat discharged by the vapour is inconsiderable; for Dr Black hath shown, that when any quantity of water, a pound for instance, is condensed from the vapour of a common still, as much heat is communicated to the head and refrigeratory as would have been sufficient to heat the pound of water red hot, could it have borne that degree of sensible heat.

The causes by which this separation between the fire and water is, or may be effected, come to be considered under the articles Rain, Condensation, Vapour, &c. Here we have only to observe, that as the separation may be gradual and slow, the barometer may indicate rain for a considerable time before it happens: or if the sensible heat communicated from the vapour to the atmosphere shall be absorbed by the colder parts, or by any unknown means carried off, or prevented from affecting the specific gravity of the air, the barometer will not be affected; and yet the water being deprived of the heat necessary to sustain it, must descend in rain; and thus it is found that the indications of the barometer do not always hold true. Hence also it appears, that though the specific gravity of the air is diminished, unless that diminution proceeds from a discharge of the latent heat contained in the vapours, no rain will follow; and thus the sinking of the barometer may prognosticate wind as well as rain, or sometimes nothing at all.

The difficulty, however, on this hypothesis, is to account for the barometer being stationary in all weather between the tropics; whereas it ought to move up and down there as well as here, only more suddenly, as the changes of weather there are more sudden than here. But it must be considered, that in these climates, during the daytime, the action of the sun's rays is so violent, that what is gained by the discharge of latent heat from the vapour, is lost by the interposition of the clouds between the sun and earth, or by the great evaporation which is constantly going on; and in the night, the cold of the atmosphere is so much increased, that it absorbs the heat as fast as the vapour discharges it, so that no sensible effect can be produced; for in warm climates, though the day is excessively hot, the night is observed to be vastly colder in proportion than it is with us. This, however, does not prevent the barometer from being affected by other causes, as well as with us; for Dr Halley observes, that in the time of hurricanes it sinks very low. The cause of this is most probably a great commotion in the electric fluid, by which the air is internally agitated, and its power of gravitation in part suspended.—A confirmation of the above hypothesis, however, is taken from the different heights at which the mercury arrives in different climates. The barometer range, for instance, at the latitude of 45° is the greatest of all; because here the evaporation and condensation of the vapours are both very considerable, at the same time that the latent heat discharged cannot be absorbed so suddenly as in the torrid zone, the difference between the length of the days and nights being greater, and consequently the nights warmer in summer and colder in winter. Farther to the northward the range is less, and in the latitude of 60° only two inches, by reason of the greater cold and length of the days and nights; whence the quantity of vapour condensed, or of latent heat expelled, becomes proportionably less.

Having thus given an account of the several phenomena of the barometer considered as a weather-glass, and likewise endeavoured to account for them in the most satisfactory manner, we now proceed to give a particular description of the barometers most commonly made use of, with various schemes for their improvement.

Fig. 1. represents the common barometer, such as Plate was invented by Torricelli, and such as we have already given a general description of. AB represents a tube of glass, a quarter of an inch in diameter, and 34 inches long, hermetically sealed at A. This tube being supposed to be filled with mercury, is then inserted into the basin CD: upon which the mercury in the tube falls down to GH, somewhat above 28 inches, while that in the basin rises to CF. The lowest station of the mercury in this country is found to be 28 inches, and the highest 31. From the surface of the mercury CF, therefore, 28 inches are to be measured on the tube AB, which suppose to reach to the point K. This point, therefore, is the lowest of the scale of variation, and in the common barometers is marked stormy. In like manner, the highest point of the scale of variation I, is placed 31 inches above EF; and is marked very dry on one side for the summer, and very hard frost on the other for the winter. The next half inch below is marked set fair on the one side, and set frost on the other. At 30 inches from CF is marked the word fair on one side, and frost on the other. Half an inch below that, is wrote the word changeable, which answers both for summer and winter. At 29 inches is rain on the one side, and snow on the other; and at 28½ are the words much rain on the one side, and much snow on the other. Each of these
Barometer. Long divisions are usually subdivided into 10, and there is a small sliding index fitted to the instrument, by which the ascent or descent of the mercury to any number of divisions is pointed out. Each of these tens is sometimes divided into ten more, or hundredths of an inch, by means of a sliding slip of brass with a vernier scale on it, which shall be hereafter described and explained. This kind of barometer is the most common, and perhaps the most useful and accurate, of any that has yet been invented, from the following circumstance, that the natural simplicity of its construction, in preference to others with greater described, does not admit of any kind of resistance to the free motion of the column of mercury in the tube. The scale of variation being only three inches, and it being naturally wished to discover more minute variations than can thus be perceived, several improvements have been thought of.

The improvement most generally adopted is the diagonal barometer represented fig. 2, in which the scale of variation, instead of three inches, may be made as many feet, by bending the tube so as to make the upper part of it the diagonal of a parallelogram, of which the shortest side is the three-inches scale of variation of the common barometer. This, however, has a very great inconvenience: for not only is the friction of the mercury upon the glass so much increased that the height doth not vary with every slight change of air; but the column of mercury is apt to break in the tube, and part of it to be left behind, upon any considerable descent.

Fig. 3 is the rectangular barometer; where AC represents a pretty wide cylinder of glass, from which proceeds the tube CDF bent into a right angle at D. Suppose now the cylinder AC to be four times longer than the tube CD, so that every inch of the cylinder from C to A should be equal in capacity to four inches of the tube CD. The whole being then filled with mercury, and inverted, the mercury will subside from A to B, at the same time that it cannot run out at the open orifice F, because the air presses in that way. If any alteration then happens in the weight of the air, suppose such as would be sufficient to raise the mercury an inch from B towards A, it is evident that this could not be done without the mercury in the horizontal leg retiring four inches from E towards D; and thus the scale of variation counted on the horizontal leg would be 12 inches. But the inconveniences of friction are much greater here than in the diagonal barometer; and besides, by the least accident, the mercury is apt to be driven out at the open orifice F.

The pendant barometer (fig. 4) consists of a single tube, suspended by a string fastened to the end A. This tube is of a conical or tapering figure, the end A being somewhat less than the end B. It is hermetically sealed at A, and filled with mercury: then will the mercury sink to its common station, and admit of a length of altitude CD, equal to that in the common barometers. But from the conical bore of the tube, the mercury will descend as the air grows lighter, till it reaches its lowest altitude, when the mercury will stand from the lower part of the tube B to E, so that BE will be equal to 28 inches: consequently the mercury will, in such a tube, move from A to E, or 32 inches, if the tube be five feet, or 60 inches; and therefore the scale AE is here above ten times greater than in the common barometer: but the fault of this barometer is, that the tubes being of a very small bore, the friction will be considerable, and prevent its moving freely; and if the tube is made of a wider bore, the mercury will be apt to fall out.

Fig. 5 is a invention of Mr Rowning, by which the scale of variation may be increased to any length, or even become infinite. ABC is a compound tube hermetically sealed at A, and open at C, empty from A to D, filled with mercury from thence to B, and from thence to E with water. Let BDH be a horizontal line; then it is plain, from the nature of the siphon, that all the compound fluid contained in the part from H to G, will be always in equilibrium with itself, be the weight of the air what it will, because the pressure at H and G must be equal. Whence it is evident that the column of mercury DH is in equilibrium with the column of water GE, and a column of air taken conjointly, and will therefore vary with the sum of the variations of these. That the variation in this barometer may be infinite, will appear from the following computation. Let the proportion between the bores of the tube AF and FC be such, that when HD, the difference of the legs wherein the mercury is contained, is augmented one inch, GE, the difference of the legs wherein the water is contained, shall be diminished 14; then, as much as the pressure of the mercury is augmented, that of the water will be diminished, and so the pressure of both taken together will remain as it was; and consequently, after it has begun to rise, it will have the same tendency to rise on, without ever coming to an equilibrium with the air.

Fig. 6 represents Dr Hook's wheel-barometer. Here ACDG is a glass tube, having a large round head at A, and turned up at the lower end F. Upon the surface of the mercury in the bent leg is an iron ball G, with a string going over a pulley CD. To the other end of the string is fastened a smaller ball H, which as the mercury rises in the leg FG, turns the index KL from N towards M, on the graduated circle MNOP; as it rises in the other leg, the index is carried the contrary way by the descent of the heavier ball G along with the mercury. The friction of this machine, however, unless it is made with very great accuracy, renders it useless.

Fig. 7 is another barometer, invented by Mr Rowning, in which also the scale may be infinite. ABCD is a cylindrical vessel, filled with a fluid to the height W, in which is immersed the barometer SP consisting of the following parts: The principal one is the glass tube TP (represented separately at tp), whose upper end T is hermetically sealed: this end does not appear to the eye, being received into the lower end of a tin pipe GH, which in its other end G receives a cylindrical rod or tube ST, and thus fixes it to the tube TP. This rod ST may be taken off, in order to put in its stead a larger or a lesser as occasion requires. It is a star at the top of the rod ST: and serves as an index by pointing to the graduated scale LA, which is fixed to the cover of the vessel ABCD. MN is a large cylindrical tube made of tin (represented separately at ms), which receives in its cavity the smaller part of the tube TP, and is well cemented to it at both ends, that none of the fluid may get in. The tube TP, with this apparatus,
Barometer apparatus, being filled with mercury, and plunged into the basin MP, which hangs by two or more wires upon the lower end of the tube MN, must be so poised as to float in the liquor contained in the vessel ABCD; and then the whole machine rises when the atmosphere becomes lighter, and vice versa. Let it now be supposed, that the fluid made use of is water; that the given variation in the weight of the atmosphere is such, that, by pressing upon the surface of the water at W, the surface of the mercury at X may be raised an inch higher (measuring from its surface at P) than before; and that the breadth of the cavity of the tube at X, and of the basin at P, are such, that by this ascent of the mercury, there may be a cubic inch of it in the cavity X more than before, and consequently in the basin a cubic inch less. Now, upon this supposition, there will be a cubic inch of water in the basin more than there was before; because the water will succeed the mercury, to fill up its place. Upon this account the whole machine will be rendered heavier than before by the weight of a cubic inch of water; and therefore will sink, according to the laws of hydrostatics, till a cubic inch of that part of the rod WS, which was above the surface of the water at W, comes under it. Then, if we suppose this rod so small, that a cubic inch of it shall be 14 inches in length, the whole machine will sink 14 inches lower into the fluid than before; and consequently the surface of the mercury in the basin will be pressed, more than it was before, by a column of water 14 inches high. But the pressure of 14 inches of water is equivalent to one of mercury; this additional pressure will make the mercury ascend at X as much as the supposed variation in the weight of the air did at first. This ascent will give room for a second cubic inch of water to enter the basin; the machine will therefore be again rendered so much heavier, and will subside 14 inches farther, and so on in infinitum. If the rod was so small that more than fourteen inches of it were required to make a cubic inch, the variation of this machine would be negative with respect to the common barometer; and instead of coming nearer to an equilibrium with the air by its ascent or descent, it would continually recede farther from it: but if less than 14 inches of rod were required to make a cubic inch, the scale of variation would be finite, and might be made in any proportion to the common one. Neither this nor the other infinite barometer have ever been tried, so that how far they would answer the purposes of a barometer is as yet unknown.

Fig. 8. represents another contrivance for enlarging the scale of the barometer to any size.—AB is the tube of a common barometer open at B and scaled at A, suspended at the end of the lever which moves on the fulcrum E.—CD is a fixed glass tube, which serves in place of the cistern. This last tube must be so wide as to allow the tube AB to play up and down within it.—AB being filled with mercury, is nearly counterbalanced by the long end of the lever. When the atmosphere becomes lighter, the mercury descends in the long tube, and the surface of the mercury rising in the cistern pushes up the tube AB, which at the same time becoming lighter, the lever preponderates, and points out the most minute variations. Here too the friction occasions inconveniences; but this may be in some measure remedied by a small shake of the apparatus at each inspection.

In the Philosophical Transactions, Mr Caswell gives the following account of a barometer, which has been commended as a very accurate one: "Let ABCD (fig. 9.) represent a bucket of water in which is the barometer eresoem, which consists of a body eras, and a tube esyo: the body and tube are both concave cylinders communicating with one another, and made of tin: the bottom of the tube, say, has a lead weight to sink it so that the top of the body may just swing even with the surface of the water by the addition of some grain weights on the top. The water, when the instrument is forced with its mouth downwards, gets up into the tube to the height y. There is added on the top a small concave cylinder, which I call the pipe, to distinguish it from the bottom small cylinder which I call the tube. This pipe is to sustain the instrument from sinking to the bottom: mad is a wire; ms, de, are two threads oblique to the surface of the water, which threads perform the office of diagonals: for that while the instrument sinks more or less by the attraction of the gravity of the air, there, where the surface of the water cuts the thread, is formed a small bubble; which bubble ascends up the thread, as the mercury in the common barometer ascends.

The dimensions of this instrument given there are, 21 inches for the circumference of the body, the altitude 4, each base having a convexity of 6 1/2 inches. The inner circumference of the tube is 3.14 inches, and its length 45; so that the whole body and tube will contain almost 1 1/2 quarts. The circumference of the pipe, that the machine may not go to the bottom on every small alteration of the gravity of the air, is 2.14 inches; according to which dimensions, he calculates that it will require 44 grains to sink the body to the bottom, allowing it only four inches to descend; at the same time that it is evident, that the fewer grains that are required to sink it to this depth, the more nice the barometer will be. He also calculates, that when the mercury in the common barometer, is 30 1/2 inches high, the body with a weight of 44 grains on its top will be kept in equilibrio with the water; but when the mercury stands at 28 inches, only 19 grains can be supported: and lastly, by computing the length of the diagonal threads, &c. he finds, that his instrument is 1200 times more exact than the common barometer. The following are his observations on the use of it.

1. While the mercury of the common barometer is Mr Cas.-often known to be stationary, 24 hours together, the well's ob.-servations of the new barometer is rarely found to stand still one minute.

2. Suppose the air's gravity increasing, and accordingly the bubble ascending; during the time that it ascends 20 inches, it will have many short descents of the quantity of half an inch, one, two, three, or more inches; each of which being over, it will ascend again. These retrogressions are frequent, and of all varieties in quantity and duration; so that there is no judging of the general course of the bubble by a single inspection, though you see it moving, but by waiting a little time.

3. A small blast of wind will make the bubble descend;
Barometer.

Barometer. descend; a blast that cannot be heard in a chamber of the town will sensibly force the bubble downward. The blasts of wind sensible abroad, cause many of the above-mentioned retrocessions or accelerations in the general course; as I found by carrying my barometer to a place where the wind was perceptible.

4. Clouds make the bubble descend. A small cloud approaching the zenith, works more than a great cloud near the horizon. In cloudy weather, the bubble descending, a break of the clouds (or clear place) approaching to the zenith, has made the bubble to ascend; and after that break had passed the zenith a considerable space, the bubble again descended.

5. All clouds (except one) hitherto by me observed, have made the bubble to descend. But the other day, the wind being north, and the course of the bubble descending, I saw to the windward a large thick cloud near the horizon, and the bubble still descended: but as the cloud drew near the zenith, it turned the way of the bubble, making it to ascend; and the bubble continued ascending till the cloud was all passed, after which it resumed its former descent. It was a cloud that yielded a cold shower of small hail.

These are the most remarkable contrivances for the improvement of the common barometer; the last, on account of its being so exceedingly sensible, and likewise easy of construction and portable, seems to deserve attention much more than the others, which are always the more inaccurate, and the less easily moved, according to the enlargement of their scale; whereas this is seemingly subject to no such inconvenience. It is evident, however, that none of these could be used at sea, on account of the unsteady motion of the ship: for which reason Dr. Hook thought of constructing a barometer upon other principles.

This contrivance was no other than two thermometers. The one was the common spirit-of-wine thermometer, which is affected only by the warmth of the air: the other, which acts by the expansion of a bubble of air included, is affected not only by the external warmth, but by the various weight of the atmosphere. Therefore, keeping the spirit thermometer as a standard, the excess of the ascent or descent of the other above it would point out the increase or decrease of the specific gravity of the atmosphere. This instrument is recommended by Dr. Halley, who speaks of it as follows: "It has been observed by some, that, in long keeping this instrument, the air included either finds means to escape, or deposits some vapours mixed with it, or else from some other cause becomes less elastic, whereby in process of time it gives the height of the mercury somewhat greater than it ought: but this, if it should happen in some of them, hinders not the usefulness thereof, for that it may at any time very easily be corrected by experiment; and the rising and falling thereof are the things chiefly remarkable in it, the just height being barely a curiosity.

I had one of these barometers with me in my late southern voyage, and it never failed to prognosticate and give early notice of all the bad weather we had, so that I depended thereon, and made provision accordingly; and from my own experience I conclude, that a more useful contrivance hath not for this long time been offered for the benefit of navigation."

Fig. 10. represents a kind of Chamber Barometer, or a complete instrument for observing in a fixed place, such as a room, &c. the changes in the atmosphere, by Mr. W. Jones, Optician, London; and consists of a barometer $d$, thermometer $a$, and hygrometer $e$, all in one mahogany frame. One advantage of this instrument is, that either the thermometer or hygrometer may be taken from the frame, and occasionally made use of in another place if required. The thermometer is separated by only unscrewing two screws $a$, and the hygrometer by unscrewing a brass pin at the back of the frame, not seen in this figure. The index of the hygrometer is at any time set, by only moving with your finger the brass wheel seen at $c$; the two sliding indexes of the barometer and thermometer are moved by a rack-work motion, set in action by the key $g$ placed in the holes $h$ and $i$. The divisions of the barometer plate $b$ are in tenths of an inch, from 28 to 31 inches; these again subdivided into hundredths by means of the vernier scale, placed oppositely on a sliding slip of brass similar to the common barometers, most of which are now made with this vernier. On this vernier are ten equal parts, or divisions; (see A, fig. 11. which for the sake of perspicuity is drawn larger). All of these together are called the vernier scale.
The screw at fig. 10, serves to press the mercury quite up into the tube, when required to be much moved or carried about, thereby rendering the barometer of the kind called portable. To the lower extremity of the tube (see fig. 14.) is cemented a wooden reservoir A, with a kind of leather bag at bottom, the whole containing the mercury, but not quite full: and though the external air cannot get into the bag to suspend the mercury in the tube, by pressing on its surface, as in the common one; yet it has the same effect by pressing on the outside of the bag; which being flexible yields to the pressure, and keeps the mercury suspended in the tube to its proper height. Through the under part of the frame passes the screw f, with a flat round plate at its end; by turning of this screw, the bag may be so compressed as to force the mercury up to the top of the tube, which keeps it steady, and hinders the tube from breaking by the mercury dashng against the top when carried about, which is otherwise apt to do.

A new kind of marine barometer has lately been invented by Mr Nairne. It differs from the common one in having the bore of the tube small for about two feet in its lower part; but above that height it is enlaraged to the common size. Through the small part of the instrument the mercury is prevented from ascending too hastily by the motion of the ship; and the motion of the mercury in the upper wide part is conseuently lessened. Much is found to depend on the proper suspension of this instrument; and Mr Nairne has since found, by experiment, the point from which it may be suspended so as not to be affected by the motion of the ship.

Another marine barometer has been invented by one Passameur, a French artist. It is only a common one having the middle of the tube twisted into a spiral consisting of two revolutions. By this contrivance, the impulses which the mercury receives from the motions of the ship are destroyed by being transmitted in contrary directions.

We must now speak of the barometer in its second character, namely, as an instrument for measuring accessible altitudes. This method was first proposed by M. Pascal; and succeeding philosophers have been at no small pains to ascertain the proportion between the sinking of the mercury and the height to which it is carried. For this purpose, however, a new improvement in the barometer became necessary, viz. the making of it easily portable from one place to another without danger of its being broken by the motion of the mercury in the tube; which was effected by the contrivance already mentioned.

Among the number of portable barometers we may perhaps reckon what Mr Boyle called his Statical Barometer. It consisted of a glass bubble, about the size of a large orange, and blown very thin, so as to weigh only 70 grains. This being counterpoised by brass weights in a pair of scales that would turn with the 20th part of a grain, was found to act as a barometer. The reason of this was, that the surface of the bubble was opposed to a vastly larger portion of air than that of the brass weight, and consequently liable to be affected by the various specific gravity of the atmosphere: thus, when the air became specifically light, the bubble descended, and vice versa; and thus, he says, he could have perceived variations of the atmospheric sphere no greater than would have been sufficient to raise or lower the mercury in the common barometer an eighth part of an inch.

To these we may add an account of a new and very method of singular barometer mentioned by M. Lazowski in his measuring tour through Switzerland. "A cure, short-sighted, of the air who nevertheless amused himself with brining at a mark, by the thought of stretching a wire in such a manner as to sound of draw the mark to him, in order to see how he had a wire aimed. He observed, that the wire sometimes sounded as if it had been oscillatory; and that this happened when a change was about to ensue in the atmosphere; so that he came to predict with considerable accuracy when there was to be rain or fine weather. On making further experiments, it was observed, that this wire was more exact, and its sounds more distinct, when extended in the plane of the meridian than in other positions. The sounds were more or less soft, and more or less continued, according to the changes of weather that were to follow; though the matter was not reduced to any accuracy, and probably is not capable of much. Fine weather, however, was said to be announce by the sounds of counter tenor, and rain by those of bass. M. Volta was said to have mounted 15 chords at Pavins, in order to bring this method to some perfection; but there are as yet no accounts of his success.

The portable barometer, as already observed, has difficulties long been in use for the mensuration of accessible altitudes; and, in small heights, was found to be more exact than a trigonometrical calculation, the mercury descending at the rate of about one inch for 500 feet of height to which it was carried; but, in great heights, the most unaccountable differences were found between the calculations of the most accurate observers; so that the same mountain would sometimes have been made thousands of feet higher by one person than another, may, by the same person at different times. All these anomalies M. de Luc of Geneva undertook to account for, and to remove; and in this undertaking he persisited with incredible patience for 20 years. The result of his labour is as follows.

The first cause of irregularity observed was a fault removed in the barometer itself. M. de Luc found, that two by M. de barometers, though perfectly alike in their appearance, did not correspond in their action. This was owing to air contained in the tube. The air was expelled by boiling the mercury in them; after which, the motions of both became perfectly consonant. That the tubes mercury may bear boiling, they must not be very thick, the bow boiled thickness of the glass not above half a line, and the tube, in the tubes, the diameter of the bore ought to be from two to three lines. The operation is performed in the following manner: A chaffing dish with burning coals is placed on a table; the tube hermetically sealed at one end, is inverted, and filled with mercury within two inches of the top; the tube is gradually brought near the fire, moving it obliquely up and down, that the whole length of it may be heated; and advancing it nearer and nearer, till it is actually in the flame, the globules of air begin to move visibly towards the top. The boiling at last commences; and it is easy to make it take place from one end to the other, by causing the several parts of the tube successively pass with rapidity through.
through the flame. By this operation the mercury is freed from all aerial particles, particularly those which line the inside of the tube, and which cannot easily be got clear of by any other method. When this last stream of air is discharged, the tube may be afterwards emptied, and filled even with cold mercury, when it will be found nearly as free of air as before. The mercury in the tube thus prepared by a determinate quantity of heat, will rise higher than those in the common sort, and the barometers will more nearly correspond with each other: whereas there will be a difference of six or eight lines in the ascent of mercury in the common barometers. Instruments of this kind rise uniformly in a heated room, whilst those of the common kind descend in different proportions. On cooling the room, the former descend uniformly, while the latter descend unequally, by reason of the unequal proportions of air in them.

The next cause of variation was a difference of temperature. To discover the effects of heat on the mercury, several barometers were chosen that for a long time had been perfectly consonant in their motions. One of these was placed in an apartment by itself, to mark the change in the external air, if any should happen. The rest were situated in another apartment, along with three thermometers, graduated according to the scale of M. de Réaumur, and exactly correspondent with one another. The point at which the mercury stood when the experiment began, was carefully noted, and also the precise height of the thermometers. The latter apartment then was gradually heated; and with so much uniformity, that the thermometers continued still to agree. When the heat had been augmented as much as possible, the altitudes both of the barometers and thermometers were again accurately marked, to ascertain the differences that corresponded to one another. This experiment was repeated several times with next to no variation; and from the barometer in the first apartment it appeared, that no sensible alteration had taken place in the external air. Hence M. de Luc found, that an increase of heat sufficient to raise the thermometer from the point of melting ice to that of boiling water, augments the height of the mercury in the barometer precisely six lines; and, therefore, dividing the distance between these two points on the thermometer into 96 equal parts, there will be \( \frac{1}{96} \) of a line to add to, or subtract from, the height of the mercury in the barometer, for every degree of variation of the thermometer so graduated. A scale of this kind, continued above boiling or below freezing water, accompanies his portable barometer and thermometer.—So accurate, he says, did long practice make him in barometrical sensations, that he could distinguish a variation of \( \frac{1}{16} \) of a line in the height of the mercury. He allows of no inclination of the tube, or other means to augment the scale, as all these methods diminish the accuracy of the instrument. Two observations are always required to measure the altitude of a mountain: one with a barometer left on the plain, and another on the summit; and both must be accompanied with a thermometer.

His portable barometer consists of two tubes, one above the other, the lower tube being set round, so that the lower end turns up for a short space parallel to the straight part. On this open end is fixed a cock; and on the upper side of this cock is placed another tube, of the same diameter with the former, eight inches in length, open at both ends, and communicating with the long tube, through the cock. When the barometer is carried from one place to another, it is inverted very slowly, to hinder any air getting in; the quicksilver retires into the long tube on which the key of the cock is turned; and to preserve the cock from too great pressure of the mercury, the barometer is conveyed about in this inverted posture. When an observation is to be made, the cock is first opened; the tube is then turned upright, very slowly, to prevent, as much as possible, all the vibration of the mercury, which disturbs the observation; and according to the weight of the atmosphere, the mercury falls in the longer branch, and rises up through the cock, into the shorter.

The whole of the cock is made of ivory, except the key. The extremities of the tubes are wrapped round with the membrane employed by the gold-beaters, done over with fish-glue, in order to fix them tight, the one in the lower, and the other in the upper, end of the perpendicular canal of the cock. The part of the key that moves within the cock is of cork, and the outward part or the handle is of ivory. The cock is fastened firmly to the ivory by means of a broad thin plate of steel, which cuts both the ivory and cork, lengthwise, through the centre, and reaches inward to the hole of the key. This plate also counteracts the flexibility of the cork, and makes it obey the motion of the handle, notwithstanding it is very considerably compressed by the ivory, to render it tight. That this compression may not abridge the diameter of the hole of the key, it is lined with a thin hollow ivory cylinder, of the same diameter with the tubes.

On the upper end of the shorter tube is fixed, in the intervals of observation, a kind of funnel, with a small hole in it, which is shut with an ivory stopple. The use of it is to keep the tube clean; to replace the mercury that may have made its way through the cock in consequence of any dilatation; and likewise to replace the mercury taken out of the shorter tube, after shutting the cock, on finishing an observation; because, when the mercury is left exposed to the air; it contracts a dark pellicle on its surface, that sullies both itself and the tube. The shorter tube should be wiped from time to time, by a little brush of sponge fixed on the end of a wire.

The barometer, thus constructed, is placed in a long box of fir, the two ends of which are lined on the inside with cushions of cotton covered with leather. This box may be carried on a man's back, like a quartermaster, either walking or riding; and should have a cover of wax-cloth to defend it against rain. It should be kept at some distance from the body of the man, and be protected from the sun by an umbrella, when near the place of observation, to prevent its being affected by any undue degree of heat. The barometer should, farther, be attended with a plummet, to determine the perpendicular position of it; and a tripod to support it firm in that position at the time of observation.

The scale of the barometer begins on the long tube, at a point on a level with the upper end of the shorter one;
Barometer and rise, in the natural order of the numbers, to 21 inches. Below the above point, the scale is transferred to the short tube; and descends on it, in the natural order of the numbers, to 7 inches. The whole length of the scale is 28 French inches; and since, as the mercury falls in the one tube, it must rise in the other, the total altitude will always be found by adding that part of the scale, which the mercury occupies in the long tube, to that part of it which the mercury does not occupy in the short one. In estimating, however, the total fall or rise on the long tube, every space must be reckoned twice; because, of barometers of this construction, only half the real variation appears in one of the branches.

Near the middle of the greater tube is placed the thermometer above mentioned, for ascertaining the corrections to be made on the altitude of the mercury in consequence of any change in the temperature of the air. It is placed about the middle of the barometer, that it may partake as much as possible of its mean heat. A ball is nearly of the same diameter with the tube of the barometer, that the dilations or contractions of the fluids they contain may more exactly correspond. The scale is divided into 96 parts, between the points of boiling water and melting ice; and the term of 0 is placed one-eighth part of this interval above the lower point; so that there are 12 degrees below, and 84 above it. The reason for placing 0 here is, that as 27 French inches are about the mean height of the barometer, so the 12th degree above freezing is nearly the mean altitude of the thermometer. Hence, by taking these two points, the one for the mean altitude, and the other for the mean heat, there will be fewer corrections necessary to reduce all observations to the same scale, than if any higher or lower points had been fixed upon.

If then the barometer remains at 27 inches, and the thermometer at 0, there are no corrections whatever to be made. But if, while the barometer continues at 27 inches, the thermometer shall rise any number of degrees above 0, so many sixteenths of a line must be subtracted from the 27 inches, to obtain the true height of the barometer produced by the weight of the atmosphere, and to reduce this observation to the state of the common temperature. If, on the other hand, the thermometer shall fall any number of degrees below 0, while the barometer still stands at 27 inches, so many sixteenths must be added to that height, to obtain the true altitude.

Nothing is more simple than these corrections, when the barometer is at or near 27 inches of height. If, however, it fall several inches below this point, as the portable barometer very frequently must, the dilatations will no longer keep pace with the degrees of heat, after the rate of \( \frac{1}{15} \) of a line for every degree of the thermometer; because the columns of mercury being shortened, the quantity of fluid to be dilated will be diminished. The truth is, the quantity of the dilatations for the same degree of heat is just as much diminished as the column is shortened. If, then, it shall still be found convenient to reckon the dilatations by sixteenths of a line, these sixteenths must be counted on a scale, of which the degrees shall be as much longer than the degrees of the first scale, as the shortened column of mercury is less than 27 inches, the height to which the length of the degrees of the first scale was adapted. For instance, let the mercury descend to 13\( \frac{1}{2} \) inches, half the mean column, and let the thermometer ascend 10 degrees above the mean heat; 10 sixteenths should be deducted from the mean column, for this temperature, according to the rule; but 10 sixteenths only, or 5 whole sixteenths, must be subtracted from the column of 13\( \frac{1}{2} \) inches, because the sum of its dilatations will be half that of the former, the quantities of fluid being to one another in that proportion.

It would cause considerable embarrassment if the sixteenths of correction were always to be subdivided into less fractions, proportional to every half inch of descent of the barometer; and the same end is obtained in a very easy manner, by reckoning the corrections on different scales of the same length, but of which the degrees are longer according as the columns of the barometer are shorter. For example, the degree of correction on the scale applicable to the column of 13\( \frac{1}{2} \) inches will be double in length what the same degrees are for the column of 27 inches; and of course the number of corrections will be reduced likewise one half, which we have seen by the rule they ought to be.

The author constructed, on a piece of vellum, scales with these properties, for no less than 23 columns of mercury, being all those between 18 inches and 29 inclusive, counting from half inch to half inch; within which extremes, every practical case will be comprehended. He wrapped this vellum on a small hollow cylinder, including a spring, like a spring-curtain, and fixed it on the right side of the thermometer. The vellum is made to pass from right to left, behind the tube of the thermometer, and to graze along its surface. The observer, to find the corrections to be made, pulls out the vellum till the scale corresponding to the observed altitude of the barometer comes to touch the thermometer, and on that scale he counts them. The vellum is then let go, and the screw gently fills it up.

The author having now, as he imagined, completely finished the instruments necessary for the accurate measurements on the mountain of Saleve, was chosen for the scene of these operations. This mountain is near 3000 French feet high. The height of it was twice measured by levelling, and the result of the measurements differed only 0 \( \frac{1}{2} \) inches; though there intervened six months between them, and the total altitude was so considerable. On this mountain were chosen no less than 15 different stations, rising after the rate of 200 feet, one above another, as nearly as
Barometer.

41 Strange anomalies of the barometer at different times of the day.

Little progress was made in this plan, when a phenomenon, altogether unexpected, presented itself. The barometer, being observed, at one of the stations, twice in one day, was found to stand higher in the latter observation than in the former. This alteration gave little surprise, because it was naturally imputed to a change of the weight of the atmosphere, which would affect the barometer on the plain in the same manner. But it produced a degree of astonishment, when on examining the state of the latter, it was found, instead of corresponding with the motions of the former, to have held an opposite course, and to have fallen while the other rose. This difference could not proceed from any inaccuracy in the observations, which had been taken with all imaginable care; and it was so considerable as to destroy all hopes of success, should the cause not be detected and compensated.

The experiment was repeated several times at intervals, that no material circumstance might escape notice. An observer on the mountain, and another on the plain, took their respective stations at the rising of the sun, and continued to mark an observation, every quarter of an hour, till it set. It was found, that the lower barometer gradually descended for the first three quarters of the day; after which it reascended, till in the evening it stood at nearly the same height as in the morning. While the higher barometer ascended for the first three-fourths of the day, and then descended, so as to regain likewise, about sunset, the altitude of the morning.

The following theory seems to account for this phenomenon. When the sun rises above the horizon of any place, his beams penetrate the whole of the section of the atmosphere of which that horizon is the base. They fall, however, very obliquely on the greater part of it, communicate a little heat to it, and consequently produce little dilatation of its air. As the sun advances, the rays become more direct, and the heat and rarefaction of course increase. But the greatest heat of the day is not felt even when the rays are most direct, and the sun is in the meridian. It increases while the place receives more rays than it loses, which it will do for a considerable time after mid-day; in like manner as the tide attains not its highest altitude till the moon has advanced a considerable way to the west of the meridian. The heat of the atmosphere is greatest at the surface of the earth, and seems not to ascend to any great distance above it. The dilatations, for this reason, of the air, produced by the sun, will be found chiefly, if not solely, near the earth. A motion must take place, in all directions, of the adjacent air, to allow the heated air to expand itself. The heated columns extending themselves vertically, will become longer, and at the same time specifically lighter, in consequence of the rarefaction of their inferior parts. The motion of air, till it rises into wind, is not rapid: these lengthened columns, therefore, will take some time to dissipate their summits among the adjacent less rarefied columns that are not so high; at least, they will not do this as fast as their length is increased by the rarefaction of their bases.

The reader, we presume, anticipates the application of this theory to the solution of the phenomenon in question. The barometer on the plain begins to fall a little after morning, because the column of air that supports it becomes specifically lighter on account of the rarefaction arising from the heat of the sun. It continues to fall for the first three quarters of the day; because, during that time, the heat, and consequently the rarefaction, are gradually increasing. It rises again after this period; because the cold, and of course the condensation, coming on, the specific gravity is augmented by the rushing in of the adjacent air. The equilibrium is restored, and the mercury returns to the altitude of the morning.

The barometer on the eminence rises after morning, and continues to do so for three-fourths of the day, for two reasons. The density of the columns of air is greatest near the earth, and decreases as the distance from it increases. The higher, for this reason, we ascend in the atmosphere, we meet with air specifically lighter. But by the rarefaction of the base of the column that supports the mercury of the barometer on the eminence, the denser parts of that column are raised higher than naturally they would be if left to the operation of their own gravity. On this account, the higher barometer is pressed with a weight, nearly as great as it would sustain, were it brought down, in the atmosphere, to the natural place of that denser air now raised above it by the prolongation of the base of the column. The other reason is, that as the rarefaction does not take place at any great distance from the earth, little change is produced in the specific gravity of the portion of the column that presses on the higher barometer, and the summit of that column dissipates itself more slowly than it increases. Thus, we see how this barometer must ascend during the first three-fourths of the day, and pursue a course the reverse of that on the plain. The condensation returning after this time, the denser air subdues, the equilibrium takes place, and the mercury descends to its first position.

This phenomenon prompted the idea of a second pair of thermometers, to measure the mean heat of the column of air intercepted between the barometers. These thermometers are extremely delicate and sensible. The tubes are the finest capillary, the glass very thin, and the diameters of the balls only three lines. The balls are insulated, or detached from the scales, which are fixed to the tubes only, by ligatures of fine brass-wire covered with silk. The air, by this contrivance, has free communication with the balls on all sides; and, if the direct rays of the sun be intercepted at some distance by a bit of paper, or even the leaf of a tree, the thermometers will quickly mark the true temperature of the air.

The reader, perhaps, will ask here, Could not this method have been gained by the first pair of thermometers? But we must request him to suspend his judgment till we have explained the theory of computing the altitudes from the descents of the mercury. He will
the fixed point. With this view, all the remaining ob-

servations were collected, and compared with the
different temperatures in which they were taken; and
from an attentive examination of these circumstances,
it was discovered, that for every 215 feet of height fur-
nished by the logarithms, one foot of correction must
be added or subtracted, for every degree of the ther-

mometer, according as it stood above or below the
term 0.

The scale of Reaumur did not conveniently express
this correction of 1 to 215. The author wished to adopt
the ratio of 1 to 1000, in forming a new scale for that
purpose; but the divisions would have been too small.
He employed, therefore, that of 1 to 186, because
by doubling the degree of the higher thermometer
above or below 0; or, which amounted nearly to the
same thing, by doubling the mean heat of the column
of air in taking the sum of the degrees of both ther-

mometers, there resulted the ratio of 1 to 1000. The
new scale, then, was divided by the following proportion:
As 215, the last term of the ratio found by Reaumur's
scale, is to 1000, the last term of the ratio to be applied
on the new scale: so is 80, the parts between the fixed
points of the first scale, to 186, the number of parts be-

tween the same points on the second. And as 80 is to
186; so is 184, the point on Reaumur's scale at which
the logarithms give the altitudes without correction, to
39, the point at which they give them on the new scale.
The term 0 is placed at this point, 39 at melting ice,
and 147 at that of boiling water. To reduce all obser-

vations to the same temperature by this scale, nothing
more is necessary than to multiply the heights found
from the logarithms by the sum of the degrees of both
thermometers above or below 0, and to divide the pro-
duct by 1000. The quotient must be added to, or sub-
tracted from, the logarithmic height, according as the
temperature is positive or negative.

As a specimen of the author's method, we shall now
present our readers with the result of his operations at
the 15 stations on Saleve. In one column are marked
the heights found by levelling, and opposite to them
the same heights found by the barometer; to the latter
are prefixed the number of observations of which they
are the mean.

</table>

From this table we presume the reader will be in-
clined to entertain the most favourable opinion of the
3 G
Barometer, abilities and industry of M. de Luc. Notwithstanding the
amazing pains, however, which he has taken to re-
move every inaccuracy in the barometer, it did not re-
main entirely free from error; nor in many instances
have the observations made by different persons exactly
corresponded. Considerable improvements have been
suggested by Colonel Roy and Sir George Shuck-
burgh, &c. (see Phil. Trans. vol. lxvi. and lxvii.)
and put in execution, with improvements, by Mr Rams-
den, and other ingenious instrument-makers in Lon-
don. The following is a description of a very portable
one constructed by Mr William Jones of Holborn, which,
from its principle, comprehends every advantage that
M. de Luc's instrument possesses; in many particulars
is exempted from the errors to which his is liable; and
is not subject to be deranged by carriage or other
motion.

Fig. 12, is a representation of the instrument as en-
closed in its mahogany case by means of three metallic
rings b b b. This case is in the form of a hollow cone
divided into three arms or legs from a to c, and is so
carved in the inside as to contain steadily the body of
the barometer: The arms, when separated, form three
firm legs or supports for the barometer when making
observations (see fig. 13.) The instrument is suspend-
ed at the part g of the case, by a kind of improved gimb-
als; and therefrom, with its own weight, is sufficient-
ly steady in exposed weather. In that part of the frame
where the barometer tube is seen (ae), there is a long
slit or opening made, so that the altitude of the mer-
cury may be seen against the light, and the vernier
piece a brought down to coincide with the edge of the
mercury to the greatest possible exactness. When the
instrument is placed on its support, the screw f is to be
let down in order that the mercury may subsist to its
proper height; and also a peg at p must be loosened, to
give admission to the action of the external air upon
the mercury contained in the box b. The adjustment
or mode of observing what is called the zero, or 0,
division of the column of mercury, is by the mercury
being seen in the transparent part of the box b: the
inside of which is a glass tube or reservoir for the
mercury, and an edge piece of metal fixed on the ex-
ternal part of the box. The mercury is to be brought
into contact with the edge by turning the screw f to-
wards the right or left as necessary. The vernier
piece at a determines the altitude of the column of
mercury, is to be brought down by the hand to a
near contact, and then accurately adjusted by turning
the screw h at top of the instrument. This barometer
has usually two different sorts of scales inserted on it:
that on the right at ae, is a scale of French inches
from 19 to 31, measured from the surface or zero of
the mercury in the box b below, divided into 12th parts
or lines, and each line subdivided by the vernier into
ten parts, so that the height of the column of mercury
may be ascertained to the 120th part of a French inch.
The scale which is on the other side, or left of observa-
tion, is of the same length; but divided into English
inches, each of which is subdivided into 20ths of an
inch, and the vernier subdivides each 20th into 25 parts;
so that the height of the mercury is hereby ascertained
to the 500th part of an English inch (viz. 20 × 25 =
500). But this vernier is figured double for the con-
venience of calculation, viz. the first five divisions are
marked 10, the 20 marked 40, and the 25 marked 50;
then each exact division is reckoned as the two thou-
sandth of an inch, which amounts to the same; for the

is the same in value as the 120th of an inch. A thermome-
ter is always attached to the barometer, and indeed is indis-

spensably necessary: it is fastened to the body at c, coun-
tersunk beneath the surface of the frame, which makes
it less liable to be broken: the degrees of the thermo-

eter are marked on two scales, one on each side, viz.
that of Fahrenheit and Reaumur, scales generally
known; the freezing point of the former being at 32,
and the latter at 0. On the right hand side of these
two scales there is a third, called a scale of correction;
it is placed oppositely to that of Fahrenheit, with the
words add and subtract: it serves as a necessary correc-
tion to the observed altitude of the mercury at any giv-

ten temperature of the air shown by the thermometer.
There are several other valuable pieces of mechanism
about the instrument that cannot clearly be represented
in the figure; but what has already been said, we pre-
sume, is sufficient for the reader's general information.
For the manner of making the necessary observations,
and calculating the necessary particulars deducible
therefrom, a full information may be obtained from M.
de Luc, Recherches sur les Modifications de l'Atmo-
sphere, and the Philos. Trans. vol. lxvii. and lxviii.
before cited.

It may be necessary to add here, that by very small
additional contrivances to this instrument, Mr Jones
renders it equally useful for making observations at sea,
with any marine barometer that has hitherto been in-
vented.

This article may not be improperly concluded by an
observation of Mr Magell, relative to a principal cau-
se of error in barometrical measurements. This be-
thought's hypothesis, states to be owing to the inattention of observers to the
correctness of the instrument. In barometrical
measurements, the mercury in barome-
ters were made. If two barometers were both at
30 inches high, and equally circumstanced in every
other respect, excepting only the specific gravity of the
quicksilver; so that one be filled with the first kind
of mercury, the other with the second kind:
I have tried, viz. whose specific gravity was = 13.62
and the other = 13.45. In this case, and in all proba-
bility many of this kind have often occurred, the error
must have been no less than 327 feet; because the
heights of the mercurial columns in each barometer must
be in the inverse ratio of their specific gravities: viz.
Now the logarithm of 30=4.77121
ditto of 30.379=4.82573
the difference is = 0.052
This difference shows, that there are 54.52 fathoms
between one place and another, or 327 feet, though in
reality both places are on the same level.

But if the specific gravity of the mercury, in the
two barometers, were as the two above alluded to of
Bergman and Foureroy; viz. one of 14.110, and the
other of 13.000, which may happen to be the case, as
the heaviest is commonly reputed the purest mercury;
on this supposition the error must have amounted to
355.76 toises or above 2134 feet and a half; because
13.000 : 14.110 :: 30 : 32.561, and the difference
between
BAR

Barometer
Baron.

between the logarithms of 30 and 32.561 is 355.76,
which converted into feet gives 2134.5.

A historical account of the invention and progressive improvement of the Barometer, and of its application to the mensuration of heights, will be found under the articles BAROMETER and BAROMETRICAL MEASUREMENTS in the Supplement.

BARON, a person who holds a barony. The origin and primary import of this term are much contested.
Menage derives it from the Latin baro, which we find used in the pure age of that language for vir, a stout or valiant man; whence, according to this author, it was, that those placed next the king in battles were called barones, as being the bravest men in the army; and as princes frequently rewarded the bravery and fidelity of those about them with fees, the word came to be used for any noble person who holds a fee immediately of the king. Isidore, and after him Camden, take the word in its original sense, to signify a mercenary soldier. Messeurs of the Port Royal derive it from ames, weight or authority. Cicero uses the word baro for a stupid brutal man; and the old Germans make mention of buffeting a baron, i.e. a villain; as the Italians use the word barone to signify a beggar. M. de Marco derives baron from the German baron, man, or freeman; others derive it from the old Gaulish, Celtic, and Hebrew languages; but the most probable opinion is, that it comes from the Spanish varo, a stout, noble person; whence wives used to call their husbands, and princes their tenants, barones. In the Salic law, as well as the laws of the Lombards, the word baron signifies a man in the general; and the old glossary of Philomenes translates baron by aem, aem.

BARON is more particularly used among us, for a lord or peer of the lowest class; or a degree of nobility next below that of a viscount, and above that of a knight or baronet. In ancient records the word baron included all the nobility of England, because regularly all noblemen were barons, though they had also a higher dignity. But it hath sometimes happened, that, when an ancient baron hath been raised to a new degree of peerage, in the course of a few generations the two titles have descended differently; one perhaps to the male descendants, the other to the heirs general; whereby the earldom or other superior title hath subsisted without a barony: and there are also modern instances where earls and viscounts have been created without annexing a barony to their other honours: so that now the rule doth not hold universally that all peers are barons.

The original and antiquity of barons has occasioned great inquiries among our English antiquarians. The most probable opinion is supposed to be, that they were the same with our present lords of manors; to which the name of court baron (which is the lord’s court, and incident to every manor) gives some countenance. It is said the original name of this dignity in England was comes, which by the Saxons was called comar, and by the Normans into baron. It may be collected from King John’s magna charta, that originally all lords of manors, or barons, had seats in the great council or parliament: but such is the deficiency of public records, that the first precept to be found is of no higher date than the 49th year of King Henry III.; which, although it was issued out in the king’s name, was neither by his authority nor by his direction: for, not only the king himself, but his son Prince Edward, and most of the nobility who stood loyal to him, were then prisoners in the hands of the rebellious barons; having been so made in the month of May preceding, at the battle of Lewes, and so continued until the memorable battle of Evesham, which happened in August the year following; when, by the happy escape of Prince Edward, he rescued the king and his adherents out of the hands of Simon Mountfort earl of Leicester. It cannot be doubted but that several parliaments were held by King Henry III. and King Edward I.; yet no record is to be found giving any account thereof (except the 4th of King Edward I.), until the 22d year of the reign of the last mentioned king.

Before the 49th of Henry III. the ancient parliaments consisted of the archbishops, bishops, abbots, earls, and barons. Of these barons there were two sorts: the greater barons, or the king’s chief tenants, who held of him in capite by barony; and the lesser barons, who held of the first military service in capite. The former had summons to parliament by several writs; and the latter (i.e. all those who were possessed of thirteen knights fees and a quarter) had a general summons from the sheriff in each county. Thus things continued till the 49th of Henry III. But then, instead of keeping to the old form, the prevailing powers thought fit to summon, not all, but only those of the greater barons who were of their party; and, instead of the lesser barons who came with large retinues, to send their precepts to the sheriff of each county, to cause two knights in every shire to be chosen, and one or two burgesses for each borough, to represent the body of the people residing in these counties and boroughs; which gave rise to the separation into two houses of parliament. By degrees the title came to be confined to the greater barons, or lords of parliament only; and there were no other barons among the peerage but such as were summoned by writ, in respect of the tenure of their lands or baronies, till Richard II. first made it a mere title of honour, by conferring it on divers persons by his letters patent. See further on this subject the article LAW.

When a baron is called up to the house of peers by writ of summons, the writ is in the king’s name, and he is directed to come to the parliament appointed to be held at a certain time and place, and there to treat and advise with his majesty, the prelates, and nobility, about the weighty affairs of the nation. The ceremony of the admission of a baron into the house of peers is thus: He is brought into the house between two barons, who conduct him up to the lord chancellor, his patent or writ of summons being carried by a king at arms, who presents it kneeling to the lord chancellor, who reads it, and then congratulates him on his becoming a member of the house of peers, and invests him with his parliamentary robe. The patent is delivered to the clerk of the commons, who administers the oaths to the new peer, who is then conducted to his seat on the barons bench. Some barons hold their seats by tenure. The first who was raised to this dignity by patent was John de Beauchamp of Holt Castle, created baron of Kidderminster in Worcestershire, to him and his heirs male, by King Richard II. in the 11th year of his reign. He invested
Baron. invested him with a mantle and cap. The coronation-
orbes of a baron are the same as an earl's, except that
he has only two rows of spots on each shoulder. In like
manner, his parliamentary robes have but two guards of
white fur, with rows of gold lace. In other respects
they are the same as other peers. King Charles II.
granted a coronet to the barons. It has six pearls, set
at equal distances on the chaplet. Its cap is the same
as a viscount's. His style is Right Honourable; and
he is styled by the king or queen, Right Trusty and
Well Beloved.

Barons by ancient tenure were those who held
certain territories of the king, who still reserved the
tenure in chief to himself. We also read of barons by
temporal tenure; who are, as such honours, castles,
manors, as heads of their barony, that is, by grand
seigneurty; by which tenure they were anciently sum-
moned to parliament. But at present a baron by ten-
ure is no lord of parliament, till he be called thither
by writ.

The barons by tenure after the Conquest, were di-
vided into majors and minores, and were summoned
accordingly to parliament; the majors or greater bar-
ons, by immediate writ from the king; the minores,
or lesser barons, by general writ from the high sheriff,
at the king's command.

Anciently they distinguished the greater barons from
the less, by attributing high, and even sovereign juris-
diction, to the former, and only inferior jurisdiction
over smaller matters to the latter.

Barons of the Exchequer, the four judges to whom
the administration of justice is committed, in causes
between the king and his subjects relating to matters
concerning the revenue. They were formerly barons
of the realm, but of late are generally persons learned
in the laws. Their office is also to look into the ac-
counts of the king, for which reason they have auditors
under them. See Exchequer.

Barons of the Cinque-ports are members of the
house of commons, elected by the five ports, two for
each port. See the article Cinque-ports.

Baron and Dame, in the English Law, a term used
for husband and wife, in relation to each other: and
they are deemed but one person; so that a wife cannot be
witness for or against her husband, nor he for or against
his wife, except in cases of high treason.

Baron and Dame, in Heraldry, is when the coats of
arms of a man and his wife are born par pale in the
same escutcheon, the man's being always on the dexter
side, and the woman's on the sinister; but here the
woman is supposed not an heiress, for then her coat
must be borne by the husband on an escutcheon of
pretence.

Baron, Robert, a dramatic author, who lived
during the reign of Charles I. and the protectorship
of Oliver Cromwell. He received the earlier parts of
his education at Cambridge, after which he became a
member of the honourable society of Gray's Inn. Du-
ing his residence at the university, he wrote a novel
called the Cyprian Academy, in which he introduced
the two first of the dramatic pieces mentioned below.
The third of them is a much more regular and perfect
play, and was probably written when the author had
attained a riper age. The names of them are, 1. Deo-
rum Dana, a masque. 2. Grinus and Hegia, a past-
ral. 3. Mirsa, a tragedy. Mr Baron had a great
intimacy with the celebrated Mr James Howell, the
great traveller, in whose collections of Letters there
is one to this gentleman, who was at that time at Paris.
To Mr Howell in particular, and to all the ladies and
gentlewomen in England in general, he has dedicated
his romance.

Baronet, a dignity or degree of honour next be-
neath a baron, and above a knight; having precedence
of all knights excepting those of the Garter, and being
the only knighthood that is hereditary.

The dignity of baronet is given by patent, and is
the lowest degree of honour that is hereditary. The
order was founded by King James I. at the suggestion
of Sir Robert Cotton, in 1611, when 200 baronets
were created at once; to which number it was intended
they should always be restrained: but it is now enlar-
ed at the king's pleasure, without limitation.

They had several considerable privileges given them,
with an habendam to them and their heirs male. They
were allowed to charge their coat with the arms of
Ulster, which are, in a field argent, a sinister hand,
gules; and that upon condition of their defending the
province of Ulster in Ireland against the rebels, who
then harassed it extremely: to which end they were
each to raise and keep up 30 soldiers at their own ex-
pense for three years together, or to pay into the ex-
chequer a sum sufficient to do it; which, at 8d. per
day per head, was 105l. So that, including fees, the
expense of this dignity may be about 1200l. ster-
ling. To be qualified for it, one must be a gentle-
man born, and have a clear estate of 1000l. per an-
num.

Baronets take place according to the dates of their
patents; by the terms of which no honour is to be
erected between barons and baronets. The title Sir is
granted them by a peculiar clause in their patents,
though they be not dubbed knights: but both a baro-
et, and his eldest son, being of full age, may claim
knighthood.—The first baronet who was created was
Sir Nicholas Bacon of Redgrave in Suffolk, whose
successor is therefore styled Primus Baronetorum
Anglic.

Baronets of Scotland, called also Baronets of Nova
Scotia. The order of knights baronets was also de-
signed to be established in Scotland in the year 1621,
by king James I. for the plantation and cultivation of
the province of Nova Scotia in America; but it was
not actually instituted till the year 1625 by his son
Charles I. when the first person dignified with this title
was Sir Robert Gordon of Gordonsstone, a younger son
of the earl of Sutherland. The king granted a cer-
tain portion of land in Acadia of New Scotland, to
each of them, which they were to hold of Sir William
Alexander (afterwards earl of Stirling), for their en-
couragement who should hazard their lives for the good
and increase of that plantation, with precedence to
them, and their heirs male for ever, before all knights
called equites aurati, and all lesser barons called lards,
and all other gentlemen, except Sir William Alexan-
der his majesty's lieutenant in Nova Scotia, his heirs,
their wives and children; that the title of Sir should
be prefixed to their Christian name, and Baronet added
to their surname; and that their own and their eldest
sons wives should enjoy the title of Lady, Madame, or
Dame.
good from bad music; she understands it perfectly well, and even composes; which makes her absolute mistress of what she sings, and gives her the most exact pronunciation and expression of the sense of her words. She does not pretend to beauty, neither is she disagreeable or a coquette. She sings with a bold and generous modesty, and an agreeable gravity; her voice reaches a large compass of notes, and is exact, loud, and harmonious; she softens and raises it without straining or making grimmaces. Her raptures and sighs are not lascivious; her looks have nothing coquettish in them, nor does she transgress a virgin modesty in her gestures. In passing from one key to another, she shows sometimes the divisions of the enharmonic and chromatic kind with so much art and sweetness, that every body is ravished with that fine and difficult method of singing. She has no need of any person to assist her with a theorbo or viol, one of which is necessary to make her singing complete; for she plays perfectly well herself on both these instruments. In short, I have had the good fortune to hear her sing several times above 30 different airs, with second and third stanzas composed by herself. I must not forget to tell you, that one day she did me the particular favour to sing with her mother and her sister. Her mother played upon the lute, her sister upon the harp, and herself upon the theorbo. This concert, composed of three fine voices, and of three different instruments, so powerfully transported my senses, and threw me into such raptures, that I forgot my mortality, and thought myself already among the angels enjoying the felicity of the blessed.

BARONIUS, CESAR, a pious and learned cardinal, was born at Sore in 1538. He studied at Rome, and put himself under the discipline of St Philip de Neri. In 1593, he was made general of the congregation of the Oratory by the resignation of the founder Philip de Neri. Pope Clement VIII. made him his confessor, and created him a cardinal in 1596. He was afterwards made librarian to the Vatican; and died in 1605, at 68 years of age. He wrote several works, the principal of which is his Annales Ecclesiastici, from A. D. 1 to 1108, in 12 vols folio; which has been abridged by several persons, particularly by Henry Spondeus, Bzovius, and Ludovico Arelio.

BARONY, BARONIA, or Baronagium, the lordship or fee of a baron, either temporal or spiritual: In which sense barony amounts to the same with what is otherwise called honour.

A barony may be considered as a lordship held by some service in chief of the king, coinciding with what is otherwise called grand serjeanty. Baronnies, in their first creation, moved from the king himself, the great lord of the whole realm, and could be holden immediately of no other lord. For example, the king enfeoffed a man of a great seigneurie in land, to hold to the person enfeoffed and his heirs, of the king and his heirs, by baronial service; to wit, by the service of 20, 40, 60 knights, or of such other number of knights, either more or fewer, as the king by his enfeoffment limited or appointed.—In the ages next after the Conquest, when a great lord was enfeoffed by the king of a large seigneurie, such seigneurie was called a barony, but more commonly an honour; as, the honour of Gloucestershire, the honour of Wallingford, the hon-
A barony, according to Bracton, is a right indivisible. Wherefore, if an inheritance be to be divided among coparceners, though some capital messages may be divided, yet if the capital message be the head of a county or barony, it may not be parcelled: and the reason is, lest by this division many of the rights of counties and baronies by degrees come to nothing, to the prejudice of the realm, which is said to be composed of counties and baronies.

BARRA, or BARRY, island of. See BARRY.

BARRA, in Commerce, a long measure used in Portugal and some parts of Spain, to measure woollen cloths, linen cloths, and sergees. There are three sorts: the barra of Valencia, 13 of which make 125 yards English measure; the barra of Castile, 7 of which make 64 yards; and the barra of Arragon, 3 of which make 25 yards English.

BARRABA, DESERT OF; a tract of land in Siberia, lying between the rivers Iritis and Oby, in the province of Tobolsk. It is uninhabited, but not though any deficiency of the soil; for that is excellent for tillage, and part of it might also be laid out in meadows and pastures. It is interspersed with a great number of lakes, which abound with a species of carp called by the neighbouring people karasusch; and the country produces great numbers of elk, deer, foxes, ermine, and squirrels. Between the Iritis and Oby are some rich copper mines; particularly on a mountain called Pictouna, from the picta or white fires that grow upon it. Every hundred weight of the ore found here yields 12 pounds of pure copper; and there is no occasion for digging deep in order to come at it. Most of these ores, besides being very rich in copper, yield a great deal of silver, which affords so much gold as makes rich returns for the trouble and expense of extracting it.

BARRACAN, in Commerce, a sort of stuff, not diapered, something like camblet, but of a coarser grain. It is used to make cloaks, surtouts, and such other garments, to keep off the rain. —The cities where the most barracans are made in France are Valenciennes, Lisle, Abbeville, Amiens, and Rouen. Those of Valenciennes are the most valued; they are all of wool, both the warp and the woof.

BARRACIDA, a species of pike. See ESAY, ICHEIOLOGY Index.

BARRACKS, or BARACKS, places for soldiers to lodge in, especially in garrisons.—Barracks, when damp, are greatly prejudicial to the health of the soldiers lodged in them; occasioning dysenteries, intermitting fevers, coughs, rheumatic pains, &c. For which reason, quarter-masters ought to be careful in examining every barracks offered by the magistrates of a place; rejecting all ground-flours in houses that have either been uninhabited, or have any signs of moisture.

BARRATOR, or BARRETOR, in Law, a person guilty of barretry. See BARRYTRY.

Lambert derives the word barretor from the Latin balatro, "a vile knave"; but the proper derivation is from the French barrateur, i.e. "a deceiver;" and this agrees with the description of a common barretor in my Lord Coke's report, viz., that he is a common mover and maintainer of suits in disturbance of the peace, and in taking and detaining the possession of houses and lands or goods by false inventions, &c. And therefore it was adjudged that the indictment against him ought to be in these words, viz.: That he is commis- nis malefactor, calumniator, et seminatore litium et dis cordiarum inter vicinos suos, et pacis regis perturbator, &c. And there it is said that a common barrat is the most dangerous oppressor in the law, for he oppresses the innocent by colour of law, which was made to protect them from oppression.

BARRATRY, in Law. See BARRYTRY.

BARRATRY, in a shipmaster, is his cheating the owners. If goods delivered on ship-board are embezzled, all the mariners ought to contribute to the satisfaction of the party that lost his goods, by the maritime law; and the cause is to be tried in the admiralty. In a case where a ship was insured against the barratry of the master, &c. and the jury found that the ship was lost by the fraud and negligence of the master, the court agreed, that the fraud was barratry, though not named in the covenant; but that negligence was not.

BARRAUX, a fortress of Dauphiny, belonging to France, now in the department of Isere. It stands in the valley of Gresivaudon, and was built by a duke of Savoy in 1397. The French took it in 1598, and have kept it ever since. It is seated on the river Isere, in E. Long. 5° 10'. Lat. 45° 50'.

BARRY, or BARRA, one of the Western isles, in the county of Inverness, Scotland; is eight miles in length, and four in breadth. The soil in general is thin and fit only for pasture, but in some places it produces corn and potatoes. The population amounted to 1669 in 1811. The inhabitants are chiefly employed in the cod and ling fishery, which is here very successful.
In the year 1787 they carried 30,000 ling to the Glasgow market. The fish is carried to market in the same boat in which it is taken, either by going round the mull of Cantyre, or drawing the boat by horses across the isthmus of Tarbat. There is a good harbour in the north-east side. Some cattle are reared in the island, and a little kelp is burned on the shore.

BARREL, in Commerce, a round vessel, extending more in length than in breadth, made of wood, in form of a little tun. It serves for holding several sorts of merchandise.

BARREL is also a measure of liquids. The English barrel, wine-measure, contains the eighth part of a tun, the fourth part of a pipe, and one half of a hogshead; that is to say, it contains 314½ gallons; a barrel, beer-measure, contains 36 gallons; and ale-measure 32 gallons. The barrel of beer, vinegar, or liquor preparing for vinegar, ought to contain 34 gallons, according to the standard of the ale quart.

BARREL also denotes a certain weight of several merchandises, which differ according to the several commodities. A barrel of Essex butter weighs 166 pounds; and of Suffolk butter, 236 pounds. The barrel of herrings ought to contain 32 gallons wine-measure, which amount to about 28 gallons old standard, containing about 1000 herrings. The barrel of salmon must contain 42 gallons; the barrel of eels the same. The barrel of soap must weigh 256 lb.

BARREL, in Mechanics, a term given by watchmakers to the cylinder about which the spring is wrapped; and by gunsmiths to the cylindrical tube of a gun, pistol, &c. through which the ball is discharged.

BARREL, in Anatomy, a pretty large cavity behind the tympanum of the ear, about four or five lines deep, and five or six wide.

Fire-Barrels. See Fire-Ship.

Thundering Barrels, in the military art, are filled with bombs, grenades, and other fire-works to be rolled down a breach.

BARRENNESS, the same with sterility. See Sterility.

BARRETRY, in Law, is the offence of frequently exciting and stirring up suits and quarrels between his majesty's subjects, either at law or otherwise. The punishment for this offence, in a common person, is by fine and imprisonment: but if the offender (as is too frequently the case) belongs to the profession of the law, a bareret is thus able as well as willing to do mischief ought also to be disabled from practising for the future. And indeed it is enacted by statute 12 Geo. 1. c. 29. that if any one, who hath been convicted of forgery, perjury, subornation of perjury, or common barretry, shall practise as an attorney, solicitor, or agent, in any suit; the court, upon complaint, shall examine it in a summary way; and, if proved, shall direct the offender to be transported for seven years. Hereunto also may be referred another offence, of equal malignity and audacity; that of suing another in the name of a fictitious plaintiff, either one not in being at all, or one who is ignorant of the suit. This offence, if committed in any of the king's superior courts, is left, as a high contempt, to be punished at their discretion: but in courts of a lower degree, where the crime is equally pernicious, but the authority of the judges not equally extensive, it is directed by statute 8 Eliz. c. 2. to be punished by six months imprisonment, and treble damages to the party injured.

BARRICADE, or Barricado, a military term for a fence formed in haste with vessels, baskets of earth, trees, palisades, or the like, to preserve an army from the shot or assault of the enemy. The most usual materials for barricades consist of pales or stakes, crossed with batoons, and shod with iron at the feet, usually set up in passages or breaches.

BARRICADE, in naval architecture, a strong wooden rail, supported by stanchions, extending across the foremost part of the quarter-deck. In a vessel of war the vacant spaces between the stanchions are commonly filled with rope-matts, cork, or pieces of old cable; and the upper part, which contains a double rope-netting above the rail, is stuffed with full hammocks to intercept the motion, and to prevent the execution of small-shot in the time of battle.

BARRIER, in Fortification, a kind of fence made at a passage, retrenchment, &c. to stop up the entry thereof. It is composed of great stakes, about four or five feet high, placed at the distance of eight or ten feet from one another, with transoms, or overthwart rafters, to stop either horse or foot, that would enter or rush in with violence: in the middle is a moveable bar of wood, that opens or shuts at pleasure. A barrier is commonly set up in a void space, between the citadel and the town, in half moons, &c.

BARRIERS, signifies that which the French call jau de barres, i.e. pales et estrains; a martial exercise of men armed and fighting together with short swords, within certain bars or rails which separate them from the spectators: it is now disused in this country.

BARRING A VEIN, in Fartry, an operation performed upon the veins of a horse's legs, and other parts of his body, with intent to stop the course, and lessen the quantity, of the malignant humours that prevail there.

BARRINGTON, JOHN SHUTE, Lord Viscount Barrington, a nobleman distinguished for theological learning, was the youngest son of Benjamin Shute, merchant, and was born in 1678. He received part of his education at the university of Utrecht; and, after returning to England, studied law in the Inner Temple. In 1701 he commenced writer in favour of the civil rights of Protestant dissenters, to which body he belonged. At the recommendation of Lord Sommers he was employed to engage the Presbyterians in Scotland to favour the union of the two kingdoms; and in 1708, for this service, was appointed to the place of commissioner of the customs. From this he was removed by the Tory ministry of Queen Anne; but his fortune was, in the mean time, improved by the bequest of two considerable estates; one of them left him by Francis Barrington of Tofts, Esq., whose name he assumed by act of parliament. Mr Barrington now stood at the head of the Dissenters. On the accession of George L he was returned member of parliament
Barrington, parliament for Berwick-upon-Tweed; and in 1720 the king raised him to the Irish Peerage, by the style of Viscount Barrington of Ardglass. He was unfortunately engaged as sub-governor in one of the bubbles of the time, the Harborough lottery, and underwent the disgrace of expulsion from the house of commons, in 1723; a censure which was thought greatly too severe, and altogether unmerited on his part. In 1725 he published his principal work, entitled Miscellanea Sacra, or a new method of considering so much of the History of the Apostles as is contained in Scripture, in an abstract of their history, an abstract of that abstract, and four critical essays; 2 vols. 8vo. This work traces the methods taken by the first preachers of the gospel for propagating Christianity, and explains the several gifts of the Spirit, by which they were enabled to discharge their office. It has always been reckoned a valuable and judicious defence of the Christian cause; and was reprinted with additions and corrections, in 3 vols. 8vo, 1770, by his son, afterwards bishop of Durham. In the same year he published "An Essay on the several Dispensations of God to Mankind, in the Order in which they lie in the Bible, &c." 8vo, 1725. He wrote various other tracts, chiefly on subjects relative to toleration in matters of religion. He died in 1734, in his 56th year, leaving several children, of whom five sons had the uncommon fortune of rising to high stations in the church, the law, the army, and the navy. Lord Barrington was a friend and disciple of Locke, and adopted his sentiments as to the right and advantage of free inquiry, and the value of civil and religious liberty. He contributed greatly to the rising spirit of liberal scriptural criticism among those who wished to render religion rational. He was a man of great moderation, and, though chiefly connected with the Dissenters, he occasionally frequented and communicated with the established church. Gen. Bing.

BARRINGTON, Daines, fourth son of Lord Viscount Barrington, distinguished as an antiquarian and naturalist, was educated for the profession of the law, and, after possessing various posts, was appointed a Welsh judge in 1757, and afterwards second justice of Chester. He never rose to much eminence at the bar, but he showed his knowledge of the law as an object of liberal study, by a valuable publication entitled "Observations on the Statutes, chiefly the more ancient, from Magna Charta to 21 James I. c. 27: with an Appendix, being a proposal for new-modelling the Statutes," 4to, 1766. This work has been quoted with great respect by many of our historians and constitutional antiquaries. In 1773 he published an edition of Orosius, with Alfred's Saxon version, and an English translation and notes of his own, which met with some severe animadversion from the critics. His "Tracts on the Probability of reaching the North Pole," 1775, 4to, were written in consequence of the northern voyage of discovery undertaken by Captain Phipps (now Lord Mulgrave). He accumulates in them a variety of evidence favourable to his own opinion of the practicability of attaining the object in which that voyage failed; but there is little probability that the attempt will be renewed. Mr Barrington's other writings, which are numerous, are chiefly to be found in the publications of the Royal and Antiquarian Societies, of both of which he was Barrington a long an assiduous member, and of the latter, vice-president. They relate to a variety of topics in natural history and antiquities, and show great industry and extent of research, though with an occasional leaning to singularity and paradox. Many of his tracts were collected by him in a 4to volume entitled, "Miscellanea on various Subjects," 1781. His "Experiments and Observations on the Singing of Birds," and his "Essay on the Language of Birds," were among the most curious and ingenious of his papers. These, and many others, prove that he was not only deeply conversant in books, but was a very attentive and sagacious observer of nature. In private life he was a man of worth and integrity, unambitious, and devoted to study and literary conversation. He resigned his office of justice of Chester in 1785, and afterwards lived in retirement in his chambers in King's-Bench-Walks, Inner-Temple, associating chiefly with his brother benchers, and amusing himself with superintending the improvements of the gardens. He died March 14, 1800, and was buried in the Temple church.

BARRINGTONIA, See BOTANY INDEX.

BARRISTER, is a counsel learner in the law, admitted to plead at the bar, and there to take upon him the protection and defence of clients. They are termed jurisconsulti; and in other countries called licentiani in jure: and anciently barristers at law were called apprentices of the law, in Latin apprentici juris mobiliores. The time before they ought to be called to the bar, by the ancient orders, was eight years, now reduced to five; and the exercises done by them (if they were not called ex gratia) were twelve grand moots performed in the inns of Chancery in the time of the grand readings, and 24 petty moots in the term times, before the readers of the respective inns: and a barrister newly called is to attend the six (or four) next long vacations the exercise of the house, viz. in Lent and Summer, and is thereupon for those three (or two) years styled a vacation barrister. Also they are called utter barristers, i.e. pleaders, to distinguish them from benchers, or those that have been readers, who are sometimes admitted to plead within the bar, as the king, queen, or prince's counsel are.

BARRITUS is a word of German original, adopted by the Romans to signify the general shout usually given by the soldiers of their armies on their first encounter, after the classicum or alarm. This custom, however, of setting up a general shout was not peculiar to the Romans, but prevailed among the Trojans according to Homer, amongst the Germans, the Gauls, Macedonians and Persians. See CLASSICUM.

BARROS, John, a celebrated Portuguese historian, born at Viseo in 1496. He was educated at the court of King Emanuel, among the princes of the blood, and made a great progress in Greek and Latin. The Infant John, to whom he attached himself; and became preceptor, having succeeded the king his father in 1521, Barros obtained a place in this prince's household; and in 1522, was made governor of St George del Mina, on the coast of Guinea. Three years after, the king having recalled him to court, made him treasurer of the Indies, and this post inspired him with the thought of writing this history, for which purpose
BAR

BARROW, ISAAC, an eminent mathematician and divine, was the son of Mr Thomas Barrow a linen draper in London, where he was born in 1630. He was at first placed at the Charter-house school for two or three years. There, however, his conduct gave but little hopes of success in the profession of a scholar; for he was extremely fond of fighting, and promoting it among his schoolfellows: but being removed from thence, his disposition took a happier turn; and having soon made great progress in learning, he was admitted a pensioner of Peter-house in Cambridge. He now applied himself with great diligence to the study of all parts of literature, especially to that of natural philosophy. He afterwards turned his thoughts to the profession of physic, and made considerable progress in anatomy, botany, and chemistry; after this he studied chronology, astronomy, and geometry. He then travelled into France and Italy, and in a voyage from Leghorn to Smyrna, gave a proof of his bravery; for the ship being attacked by an Algerine pirate, he remained upon deck, and with the greatest intrepidity fought, till the pirate, perceiving the stout resistance the ship made, sheered off and left her (A).

At Smyrna he met with a most kind reception from Mr Bretton the English consul, upon whose death he afterwards wrote a Latin elegy. From thence he proceeded to Constantinople, where he received the like civilities from Sir Thomas Bondich the English ambassador, and Sir Thomas Dawes, with whom he afterwards preserved an intimate friendship. At Constantinople he read over the works of St Chrysostom, once bishop of that see, whom he preferred to all the other fathers. When he had been in Turkey somewhat more than a year, he returned to Venice. From thence he came home in 1659, through Germany and Holland; and was episcopally ordained by Bishop Brownrig. In 1660, he was chosen to the Greek professorship at Cambridge. When he entered upon this province, he intended to have read upon the tragedies of Sophocles; but he altered his intention, and made choice of Aristotle's rhetoric. These lectures having been lent to a friend who never returned them, are irrecoverably lost. July the 16th 1662, he was elected professor of geometry in Gresham college, by the recommendation of Dr Wilkins, master of Trinity-college, and afterwards bishop of Chester. Upon the 20th of May 1663 he was elected a fellow of the Royal Society, in the first choice made by the council after their charter. The same year the executors of Mr Lucas having, according to his appointment, founded a mathematical school at Cambridge, they fixed upon Mr Barrow for the first professor; and though his two professorships were not inconsistent with each other, he chose to resign that of Gresham college, which he did May the 20th, 1664. In 1669 he resigned his mathematical chair to his learned friend Mr Isaac Newton, being now determined to give up the study of mathematics for that of divinity. Upon quitting his professorship, he was only a fellow of Trinity-college, till his uncle gave him a small sine-cure in Wales, and Dr Seth Ward bishop of Salisbury conferred upon him a prebend in his church. In the year 1670 he was created doctor in divinity by mandate; and, upon the promotion of Dr Pearson master of Trinity-college to the see of Chester, he was appointed to succeed him by the king's patent, bearing date the 13th of February 1672. When the king advanced him to this dignity, he was pleased to say, "he had given it to the best scholar in England." His majesty did not speak from report, but from his own knowledge: the doctor being then his chaplain, he was used often to converse with him, and in his humorous way, to call him an "unfair preacher," because he exhausted every subject, and left no room for others to come after him. In 1675 he was chosen vice-chancellor of the university. The doctor's works are very numerous, and such as do honour to the English nation. They are, 1. Euclid's Elements. 2. Euclid's Data. 3. Optical Lectures, read in the public school of Cambridge. 4. Thirteen Geometrical Lectures. 5. The Works of Archimedes, the four Books of Apollonius's Conic Sections, and Theodosius's Spheraies explained in a new Method. 6. A Lecture, in which Archimedes's Theorems of the Sphere and Cylinder are investigated and briefly demonstrated. 7. Mathematical Lectures, read in the public schools of the university of Cambridge: the above were all printed in Latin: and as to his English works, they are printed together in four volumes folio.—"The name of Dr Barrow (says the reverend and learned Mr Granger) will ever be illustrious.
lustrians for a strength of mind and compass of knowledge that did honour to his country. He was unvalued in mathematical learning, and especially in the sublime geometry; in which he has been excelled only by one man, and that man was his pupil, the great Sir Isaac Newton. The same genius that seemed to be born only to bring hidden truths to light, to rise to the heights or descend to the depths of science, would sometimes amuse itself in the flowery paths of poetry; and he composed verses both in Greek and Latin. He at length gave himself up entirely to divinity; and particularly to the most useful part of it, that which has a tendency to make men wiser and better. He has, in his excellent sermons on the Creed, solved every difficulty and removed every obstacle that opposed itself to our faith, and made divine revelation as clear as the demonstrations in his own Euclid. In his sermons he knew not how to leave off writing till he had exhausted his subject; and his admirable discourse on the duty and Reward of Bounty to the Poor, took him up three hours and a half in preaching. This excellent person, who was a bright example of Christian virtue, as well as a prodigy of learning, died on the 4th of May 1677, in the 47th year of his age; and was interred in Westminster abbey, where a monument, adorned with his bust, was soon after erected, by the contribution of his friends.

BARROWS, in Ancient Topography, artificial hillocks or mounts, met with in many parts of the world, intended as repositories for the dead, and formed either of stones heaped up, or of earth. For the former, more generally known by the name of *cairns*, see *cairns.*—Of the latter Dr Flott takes notice of two sorts in Oxfordshire: one placed on the military ways; the other in the fields, meadows, or woods; the first sort doubtless of Roman erection, the other more probably erected by the Britons or Danes. We have an examination of the barrows in Cornwall by Dr Williams, in the Phil. Trans. No. 458. From whose observations we find that they are composed of foreign or adventitious earth; that is, such as does not rise on the place, but is fetched from some distance.—Monuments of this kind are also very frequent in Scotland. On digging into the barrows, urns have been found in some of them, made of calcined earth, and containing burst bones and ashes; in others, stone chests containing bones entire; in others, bones neither lodged in chests nor deposited in urns. These tumuli are round, not greatly elevated, and generally at their bases surrounded with a fosse. They are of different sizes; in proportion, it is supposed, to the greatness, rank, and power, of the deceased person. The links or stans of Skail, in Sandwich, one of the Orkneys, abound in round barrows. Some are formed of earth alone, others of stone covered with earth. In the former was found a coffin, made of six flat stones. They are too short to receive a body at full length: the skeletons found in them lie with the knees pressed to the breast, and the legs doubled along the thighs. A bag, made of the lems doubled abroad at the feet of some of these skeletons, containing the bones, most probably, of another of the family. In one to be seen multitudes of small beetles; and as similar insects have been discovered in the bag which enclosed the sacred Ibis, we may suppose that the Egyptians, and the nation to whom these tumuli did belong, might have had the same superstition respecting them. On some of the corpses interred in this island, the mode of burning was observed. The ashes, deposited in an urn which was covered on the top with a flat stone, have been found in the cell of one of the barrows. This coffin or cell was placed on the ground, then covered with a heap of stones, and that again covered with earth and sods. Both barrow and contents evince them to be of a different age from the former. These tumuli were in the nature of family vaults: in them have been found two tiers of coffins. It is probable, that on the death of any one of the family, the tumulus was opened, and the body interred near its kindred bones.

Ancient Greece and Latinium concurred in the same practice with the natives of this island. Patroclus among the Greeks, and Hector among the Trojan, received but the same funeral honours with our Caledonian heroes; and the ashes of Deroenmus the Laurentine monarch had the same simple protection. The urn and pall of the Trojan warrior might perhaps be more superb than those of a British leader: the rising monument of each had the common materials from our mother earth.

The snowy bones his friends and brothers place,
With tears collected, in a golden vase.
The golden vase in purple walls they roll'd
Of softest texture and inwrought with gold.
Last o'er the urn the sacred earth they spread,
And rais'd a tomb, memorial of the dead.

*Pope's Homer's Iliad, xxiv. 1003.*

Or, as it is more strongly expressed by the same elegant translator, in the account of the funeral of Patroclus;

High in the midst they heap the swelling bed
Of rising earth, memorial of the dead.

Ib. xxii. 319.

The Grecian barrows, however, do not seem to have been all equally simple. The barrow of Alyattes, father of Croesus king of Lydia, is described by Herodotus as a most superb monument, inferior only to the works of the Egyptians and Babylonians. It was a vast mound of earth heaped on a base of large stones by three classes of the people; one of which was composed of girls who were prostitutes. Alyattes died, after a long reign, in the year 562 before the Christian era. Above a century intervened, but the historian relates, that to his time five stones (see *termis* or *stela*), on which letters were engraved, had remained on the top, recording what each class had performed; and from the measurement it had appeared, that the greater portion was done by the girls. Strabo likewise has mentioned it as a huge mound raised on a lofty basement by the multitude of the city. The circumstance was six stadia or three quarters of a mile; the height two plethra or two hundred feet; and the width thirteen plethra. It was customary among the Greeks to place on barrows either the image of some animal, or *stela*, commonly round pillars with inscriptions. The famous barrow of the Athenians in the plain of Marathon, described by Pausanias, is an instance of the latter usage. An ancient monument in Italy by the Appian-way, called without reason
Barrows, or similar tumuli, are also found in great numbers in America. These are of different sizes, according to Mr. Jefferson's account; some of them constructed of earth, and some of loose stones. That they were repositories of the dead has been obvious to all; but on what particular occasion constructed, was matter of doubt. Some have thought they covered the bones of those who have fallen in battles fought on the spot of interment. Some ascribed them to the custom said to prevail among the Indians, of collecting at certain periods the bones of all their dead, whereasover deposited at the time of death. Others again supposed them the general sepulchre for towns, conjectured to have been on or near these grounds; and this opinion was supported by the quality of the lands in which they are found (those constructed of earth being generally in the softest and most fertile meadow grounds on river sides), and by a tradition, said to be handed down from the aboriginal Indians, that when they settled in a town, the first person who died was placed erect, and earth put about him, so as to cover and support him, so that when another died, a narrow passage was dug to the first, the second reclined against him, and the cover of earth replaced, and so on. "There being one of these barrows in my neighbourhood (says Mr. Jefferson), I wished to satisfy myself whether any, and which of these opinions were just. For this purpose I determined to open and examine it thoroughly. It was situated on the low grounds of the Rivanna, about two miles above its principal fork, and opposite to some hills, on which had been an Indian town. It was of a spheroidal form, of about 40 feet diameter at the base, and had been of about 12 feet altitude, though now reduced by the plough to seven and a half, having been under cultivation about a dozen years. Before this it was covered with trees of 12 inches diameter, and round the base was an excavation of five feet depth and width, from whence the earth had been taken of which the hillock was formed. I first dug superficially in several parts of it, and came to collections of human bones, at different depths, from six inches to three feet below the surface. These were lying in the utmost confusion, some vertical, some horizontal, and directed to every point of the compass, entangled, and held together in clusters by the earth. Bones of the most distant parts were found together; as, for instance, the small bones of the foot in the hollow of a skull: many skulls would sometimes be in contact, lying on the face, on the side, on the back, top or bottom, so as to give the idea of bones emptied promiscuously from a bag or basket, and covered over with earth, without any attention to their order. The bones of which the greatest numbers remained, were skulls, jaw-bones, teeth, the bones of the arms, the thighs, legs, feet, and hands. A few ribs remained, some vertebræ of the neck and spine, without their processes, and one instance only of the bone which serves as a base to the vertebral column. The skulls were so tenier, that they generally fell to pieces on being touched. The other bones were stronger. There were some teeth which were judged to be smaller than those of an adult; a skull which, on a slight view, appeared to be that of an infant, but fell to pieces on being taken out, so as to prevent satisfactory examination; a rib, and a fragment of the under-jaw of a person about half-grown; another rib of an infant; and part of the jaw of a child, which had not yet cut its teeth. This last furnishing the most decisive proof of the burial of children here, I was particular in my attention to it. It was part of the right half of the under-jaw. The processes by which it was articulated to the temporal bones were entire; and the bone itself went to where it had been broken off, which, as nearly as I could judge, was about the place of the eye tooth. Its upper edge, wherein would have been the sockets of the teeth, were perfectly smooth. Measuring it with that of an adult, by placing their hinder processes together, its broken end extended to the penultimate molar of the adult. This bone was white, all the others of a sand colour. The bones of infants being soft, they probably decay sooner, which might be the cause so few were found here. I proceeded then to make a perpendicular cut through the body of the barrow, that I might examine its internal structure. This passed about three feet from its centre, was opened to the former surface of the earth, and was wide enough for a man to walk through and examine its sides. At the bottom, that is, on the level of the circumjacent plain, I found bones; above these a few stones, brought from a cliff a quarter of a mile off, and from the river one-eighth of a mile off; then a large interval of earth, then a stratum of bones, and so on. At one end of the section were four strata of bones plainly distinguishable; at the other, three; the strata in one part not ranging with those in another. The bones nearest the surface were least decayed. No holes were discovered in any of them, as if made with bullets, arrows, or other weapons. I conjectured that in this barrow might have been a thousand skeletons. Every one will readily seize the circumstances above related, which militate against the opinion that it covered the bones only of persons fallen in battle; and against the tradition also which would make it the common sepulchre of a town, in which the bodies were placed upright, and touching each other. Appearances certainly indicate that it has derived both origin and growth from the accumulation of bones, and deposition of them together; that the first collection had been deposited on the common surface of the earth, a few stones put over it, and then a covering of earth; that the second had been laid on this, had covered more or less of it in proportion to
the number of bones, and was then also covered with earth, and so on. The following are the particular circumstances which give it this aspect. 1. The number of bones. 2. Their confused position. 3. Their being in different strata. 4. The strata in one part having no correspondence with those in another. 5. The different states of decay in these strata, which seem to indicate a difference in the time of interment. 6. The existence of infant bones among them. But on whatever occasion they may have been made, they are of considerable notoriety among the Indians; for a party passing, about thirty years ago, through the part of the country where this barrow is, went through the woods directly to it, without any instructions or enquiry; and having stood about for some time, with expressions which were construed to be those of sorrow, they returned to the high road, which they had left about half a dozen miles to pay this visit, and pursued their journey. There is another barrow, much resembling this in the low grounds of the south branch of the Shenandoah, where it is crossed by the road leading from the Rockfish gap to Staunton. Both of these have, within these dozen years, been cleared of their trees and put under cultivation, are much reduced in their height, and spread in width, by the plough, and will probably disappear in time. There is another on a hill in the Blue ridge of mountains, a few miles north of Wood’s gap, which is made up of small stones thrown together. This has been opened and found to contain human bones as the others do. There are also many others in other parts of the country. 7.

Barrows, in the salt-works, are wicker cases, almost in the shape of a sugar-loaf, wherein the salt is put to drain.

Barrulet, in Heraldry, the fourth part of the bar, or the one half of the closet; an usual bearing in coat-armour.

Barry, in Heraldry, is when the field is divided bar-ways, that is, across from side to side, into several parts.

Barry, Girald, commonly called Giraldus Cambrensis, i.e. Girald of Wales, a historian and ecclesiastic in the reigns of Henry II. and Richard I. was born at the castle of Mainarper, near Pembroke, A. D. 1146. By his mother he was descended from the princes of South Wales; and his father, William Barry, was one of the chief men of that principality. Being a younger brother, and intended for the church, he was sent to St David’s, and educated in the family of his uncle, who was bishop of that see. He acknowledges, in his history of his own life and actions, that in his early youth he was too playful; but being severely reproached for it by his preceptors, he became a very hard student, and greatly excelled all his school-fellows in learning. When he was about 20 years of age, he was sent, A. D. 1166, for his further improvement, to the university of Paris; where he continued for three years, and became, according to his own account, a most excellent rhetorician; which rendered him very famous. On his return into Wales he entered into holy orders, and obtained several benefices both in England and Wales. Observing, with much concern, that his countrymen, the Welsh, were very backward in paying the tithes of wool and cheese, which he was afraid would involve them in eternal damnation, he applied to Richard archbishop of Canterbury, and was appointed his legate in Wales for rectifying that disorder, and for other purposes. He executed this commission with great spirit; excommunicating all, without distinction, who refused to save their souls by surrendering the tithes of their cheese and wool. Not satisfied with enriching, he also attempted to reform, the clergy; and dilated the archdeacon of Brecon to the archbishopric, for the unpardonable crime of matrimony; and the poor old man, refusing to put away his wife, was deprived of his archdeaconry; which was bestowed upon our zealous legate. In discharging the duties of this new office, he acted with great vigour, which involved him in many quarrels; but, if we may believe himself, he was always in the right, and always victorious. His uncle, the bishop of St David’s, dying A. D. 1176, he was elected his successor by the chapter: but this election having been made without the permission, and contrary to the inclination of Henry II., our author prudently declined to insist upon it, and went again to Paris to prosecute his studies, particularly in the civil and canon law, and theology. He speaks with great raptures of the prodigious fame he acquired by his eloquent declamations in the schools, and of the crowded audiences who attended them, who were at a loss to know whether the sweetness of his voice, the beauty of his language, or the irresistible force of his arguments, were most to be admired. Having spent about four years at Paris, he returned to St David’s; where he found every thing in confusion; and the bishop being expelled by the people, he was appointed administrator by the archbishop of Canterbury, and governed the diocese in that capacity to A. D. 1184, when the bishop was restored. About the same time he was called to court by Henry II. appointed one of his chaplains, and sent into Ireland A. D. 1185, with Prince John. By this prince he was offered the united bishoprics of Ferns and Leighlin, but declined them; and employed his time in collecting materials for his Topography of Ireland, and his History of the conquest of that island. Having finished his Topography, which consisted of three books, he published it at Oxford, A. D. 1187, in the following manner, in three days. On the first day he read the first book to a great concourse of people, and afterwards entertained all the poor of the town; on the second day he read the second book, and entertained all the doctors and chief scholars; and, on the third day, he read the third book, and entertained the young scholars, soldiers, and burgesses.  “A most glorious spectacle! (says he) which revived the ancient times of the poets, and of which no example had been seen in England.” He attended Baldwin archbishop of Canterbury, in his progress through Wales, A. D. 1186, in preaching a crusade for the recovery of the Holy Land; in which, he tells us, he was far more successful than the primate; and particularly, that the people were prodigiously affected with his Latin sermons, which they did not understand, melting into tears, and coming in crowds to take the cross. Although Henry II. was our author assures us, entertained the highest opinion of his virtues and abilities; yet he would never advance him to any higher dignity in the church, on account of his relation to the princes and great men of Wales. But on the accession of Richard I. (A. D. 1189), his projects of preferment became.
became better: for he was sent by that prince into Wales to preserve the peace of that country, and was even joined in commission with William Longchamp, bishop of Ely, as one of the regents of the kingdom. He did not, however, improve this favourable opportunity: refusing the bishopric of Bangor in A.D. 1190, and that of Landaff the year after, having fixed his heart on the see of St David's, the bishop of which was very old and infirm. In A.D. 1192, the state of public affairs, and the course of interest at court, became so unfavourable to our author's views, that he determined to retire. At first he resolved to return to Paris to prosecute his studies; but meeting with some difficulties in this, he went to Lincoln, where William de Monte read lectures in theology with great applause. Here he spent about six years in the study of divinity, and in composing several works. The see of St David's, which had long been the great object of his ambition, became vacant, A.D. 1198, and brought him again upon the stage. He was unanimously elected by the chapter; but met with so powerful an adversary in Hubert archbishop of Canterbury (who opposed his promotion with great violence), that it involved him in a litigation which lasted five years, cost him three journeys to Rome, at a great expense, and in which he was at last defeated, A.D. 1203. Soon after this he retired from the world, and spent the last 17 years of his life in a studious privacy, composing many books, of which we have a very correct catalogue in the Biographia Britannica. That Girald of Wales was a man of uncommon activity, genius, and learning, is undeniable; but these and his other good qualities were much tarnished by his insufferable vanity.

BARRY, James, an eminent British painter. See Supplement.

BARRY, in Heraldry, is when an escutcheon is divided bar-ways, that is, across from side to side, into an even number of partitions, consisting of two or more tinctures, interchangeably disposed; it is to be expressed in the blazon by the word barry, and the number of pieces must be specified; but if the divisions be odd, the field must be first named, and the number of bars expressed.

BARRY, Bendy, is when an escutcheon is divided evenly, bar and bend-ways, by lines drawn transverse and diagonal, interchangeably varying the tinctures of which it consists.

BARRY, Pile, is when a coat is divided by several lines drawn obliquely from side to side, where they form acute angles.

BARSA, in Ancient Geography, an island on the coast of France, in the English channel, (Itinerary): Basepool according to some; but according to others, Bardsley.

BARSALLI, a kingdom of Africa, bordering on the river Gambia, inhabited by a tribe of negroes called Jelfs. The government of this kingdom is a most despotic monarchy: all people being obliged to prostrate themselves on the earth when any of the royal family makes his appearance. In time of war, every soldier has his share of the booty, and the king but a certain proportion, which is moderate, considering that if he pleased he might keep the whole. The kingdom is divided into a number of provinces, over which governors called bumeyes are appointed by the king. These

bumeyes are absolute within their jurisdiction; but they seldom carry their prerogative so far as to incur the dislike of the people, which would quickly prove fatal to them. The Mahometan religion is profess'd by the king and his court; though little regard is paid to that part of the impostor's creed which forbids the use of wine; for the king cannot live without brandy, nor is he ever more devout than when he is drunk. When his majesty is in want of brandy or other necessaries, he sends to beg of the governor of Jamesfort that he will despatch a boat with the merchandise he has occasion for; and to purchase this he plunders the neighbouring towns, and seizes a certain number of his subjects, whom he sells for slaves to the Europeans in exchange for their commodities. This is his method of supplying himself if he happens to be at peace with his neighbours; for which reason the people are never so happy as when at war; and hence they pursue war with great vigour, and continue it with obstinacy.—The general dress of the people is a kind of loose calico surplice, that hangs down below the knee; which they sometimes plait about the waist in a very agreeable manner. They wear a great number of gold trinkets in their hair, ears, nose, and round their necks, arms, and legs; but the women especially are fond of these ornaments. The king of Barsalli, whom Moor saw in 1732, had a prodigious number of women: but when he went abroad he was seldom attended by more than two, who seemed to be dressed out in the whole finery and jewels of the seragli. He had likewise a number of brethren; but it was seldom that he deigned to speak to them: if ever he did them that honour, they were forced to treat him with the same respect as other subjects, and fall prostrate on the earth the moment they came into his presence, notwithstanding they were the presumptive heirs of the crown. It is indeed usual for the king's children to dispute the right of succession with his brethren, and the longest sword generally carries away the prize.

BARSANTI, FRANCISCO, an eminent musical performer and composer, was born at Lucca about the year 1650. He studied the civil law in the university of Padua; but, after a short stay there, chose music for his profession. Accordingly, he put himself under the tuition of some of the ablest masters in Italy; and having attained to a considerable degree of proficiency in the science of practical composition, took a resolution to settle in England, and came thither with Geminiani, who was also a Luccese, in the year 1714. He was a good performer on the hautboy, and also on the flute; in the former capacity he found employment in the opera band, and in the latter derived considerable advantages by teaching. He published, with a dedication to the earl of Burlington, six solos for a flute with a thorough-bass, and afterwards six solos for a German flute and a bass. He also made into sonatas, for two violins and a bass, the first six solos of Geminiani. He continued many years a performer at the opera house: at length reflecting that there was a prospect of advantage for one of his profession in Scotland, he went thither; and, with greater truth than the same is asserted of David Rizzio, may be said to have meliorated the music of this country, by collecting and making bases to a great number of the most popular Scots tunes. About the year 1750 Bar-
BARTAR, or Barter, is the exchanging of one commodity for another. The word comes from the Spanish barter, to deceive or circumvent in bargaining, perhaps because those who deal this way usually endeavour to overreach one another.

To transact properly, the price of one of the commodities and an equivalent quantity of the other, must be found either by practice or by the rule of three.

**Quest. 1.** How many pounds of cotton, at 9d. per lb., must be given in barter for 13 c. 3 Q. 14 lb. of pepper, at 1s. 16d. per c.?

**First.** Find the price or value of the commodity whose quantity is given as follows:

C. Q.

Ans. 1036lb. = 9 1

If the above question be wrought decimally, the operation may stand as follows:
Barthelemy. In this retreat, he dedicated his leisure hours to the study of Arabic. A young Maronite, who had been educated at Rome, afforded him his assistance, and enabled him not only to read, but even to speak it. On this, his new friend proposed to him to render all the services in his power to the Maronites, Armenians, and other Catholic Arabsians, who were but slightly acquainted with the language of the country in which they resided: in other words, he wished that he would announce the word of God to them in their native tongue, and accordingly presented him with some Arabic sermons, composed by a Jesuit, who belonged to the propagandists.

Barthelemy got one or two of them by heart, and pronounced them in a spacious hall belonging to the seminary, to the entire satisfaction of his oriental auditors.

His reputation now rose high, and he began to be considered as a youth of uncommon promise, when a trifling incident occurred which tended not a little to increase it. Ten or twelve of the principal merchants of Marseilles one day introduced a person to him who had implored their charity on the exchange, observing that he was by birth a Jew, and had been raised, on account of his great learning, to the dignity of a rabbin; but having perceived, in consequence of his studies, that the Christian was the true religion, he had become a convert. He at the same time added, that he was profoundly instructed in the oriental languages, and demanded to be put to the proof, by being confronted with some learned man.

Barthelemy, not then 21 years of age, was immediately pitched upon. It was in vain he assured them, that although he could read, he was unable to speak the languages in question; they pressed him to enter into conversation with the native of the east; and the stranger himself entreated that the conference might immediately commence.

The challenge was at length accepted, and the foreigner began the contest, from which Barthelemy retired with the character of a prodigy of eastern erudition.

Barthelemy having now finished his education at the seminary, retired to Aubagne, and spent some time in the bosom of his family, by all the members of which he was greatly beloved. He was accustomed, however, to repair frequently to Marseilles, on purpose to visit the academicians, and other learned men residing there. Among those to whom he attached himself in a particular manner, was a M. Cary, the possessor of a fine cabinet of medals and a valuable collection of books, which were quite analogous to the favourite subject of his pursuits and studies. They spent whole days together in conversing on literary subjects; after which, Barthelemy, as if insatiable of knowledge, would retire to the Minims, where Father Sigaloux, a correspondent of the academy of sciences, was employed in making astronomical observations. In these labours the young abbé became his associate, for he was ambitious of improving in every kind of knowledge.

But he began at length to perceive, that in order to render his studies profitable, it would be necessary to circumscribe them, as mediocrity of knowledge, the inevitable result of a diversity of applications, was but little preferable to ignorance itself. Occupied with these sentiments, he repaired entirely to literature. He was furnished with a letter to M. de Boze, keeper of the medals, and perpetual secretary of inscriptions and belles lettres. This learned man, so estimable in every point of view, received him with great politeness, and introduced him to the acquaintance of the most distinguished members of the three academies, who dined twice a week at his apartments. Mixing with society of this kind, Barthelemy became more deeply enamoured than ever with a love of letters, and a respect for those who cultivated them.

M. de Boze, in the mean time, carefully studied the character and disposition of the young man, and at length favoured him with his friendship, and even with his confidence; at least be conferred as much of these as was possible for a man of so much circumspection and reserve. As the increasing age, and declining health, of M. de Boze would not permit him to apply any longer with the intense investigation necessary for the completion of the cabinet of medals, he had entertained some thoughts of associating M. de Bastie, a learned antiquary belonging to the academy of inscriptions, as a partner in his labours. That gentleman lost the appointment, however, in consequence of an unlucky expression, and Barthelemy was selected a few months afterwards: this nomination was approved of by M. Bigon and the librarian, and Maurepas the minister of the department. From that moment the abbé dedicated both his days and nights to the study of those medals which his colleague had been prevented, by his infirmities, from arranging.

Amidst his multiplied occupations, Barthelemy began to enjoy a mode of life so conformable to his taste and his talents, when he beheld with affliction a new career present itself. In the course of his journey to the capital he had seen M. de Bausset, then a canon, at Aix. They were friends and countrymen; for M. de Bausset was born at Aubagne, where his family had been long established. As he was a young man of considerable expectations, he had promised that Barthelemy should become his vicar-general the moment he himself was decorated with the mitre. Such a flattering offer was not to be rejected; and as the canon was now nominated to the bishopric of Beziers, he did not fail to remind his old acquaintance of their mutual engagement. The sorrow of the medalist on this occasion was too great to be concealed: he was, however, too scrupulous an observer of his word to break his promise; but the prelate, who saw and felt for the embarrassment of Barthelemy, immediately desisted from his importunities.

On the death of M. de Boze, keeper of the cabinet of medals, in 1753, Barthelemy, who had been his colleague during seven years, of course expected to succeed him in that honourable situation. One person, however, started as a candidate; but notwithstanding the abbé, relying on the justice of his pretensions, took no step whatever to obtain the appointment, yet the zeal of his friends rendered all solicitations to his post unnecessary, for they were both numerous and powerful. M. de Maleherbes, whose unfortunate and tragical death all worthy men deplore; M. de Stainville,
Barthele-
ville, afterwards a duke and minister; and M. de Con-
taut, brother of the last Marshal de Biron, supported
his pretensions, and he was accordingly nominated suc-
cessor to his friend in 1753.

M. de Stainville, afterwards better known during his
administration by the title of duke de Choiseul,
in 1754 was appointed ambassador to Rome, Madame
de Stainville, a lady both young and beautiful, being
passionately attached to learning and learned men, con-
ceived a particular regard for the abbé, and it was
proposed that he should occupy a place in their car-
riage, on this occasion, and make the tour of Italy
along with them. Such a proposition could not fail
to be highly flattering; but he was obliged, from prin-
ciples of duty, to refrain for a time from complying
with their wishes. He set out soon after, however,
and arrived in November at Rome, where he and his
companion were received and treated in the kindest
manner by the French plenipotentiary, who lived in a
magnificent style. Pope Benedict XIV. who then
wore the tiara, being a learned man himself, did not
fail to distinguish Barthelemy by the most courteous
reception. But his stay at Rome was not long, for he
was desirous of visiting Naples, rendered particularly
interesting to an antiquary, at that period, by the re-
cent discoveries made in its neighbourhood. He and
his fellow-traveller were occupied during a whole
month in admiring the curiosities of that capital, and in study-
ing ancient literature; after which they took a journey
of 30 leagues, to behold the monuments of Grecian
architecture, still existing on the site of the ancient city
of Puteoli.

The spacious apartments of the palace of Portici,
containing the antiquities of Herculanum and Pompeii,
were still more interesting, and excited a far greater
degree of curiosity in the breasts of the French philoso-
phers. There they beheld an immense quantity of paint-
ings, statues, busts, vases, and utensils of every kind; ob-
jects peculiarly calculated to engage their attention and
excite their applause. It was not, however, without a
certain mixture of grief and surprise that they noticed
the four or five hundred manuscripts, saved from the
ruins of Herculanum, lying in the same forlorn state in
which they were discovered. Two or three only had
been unrolled, of which the learned Mazocchi has given
an explanation: as these contained nothing important,
the operation was abandoned.

But Barthelemy was not so easily discouraged, for
he unceasingly solicited, he almost condescended to in-
trigue, with a view to engage the possessors of these
treasures to turn them to the best advantage. He, at
length, perceived his labours about to be crowned with
success a few years afterwards, but he was finally dis-
appointed by the death of the marquis Caraccioli, the
minister of Naples, who had entered most cordially in
his views.

Another subject about this time also engaged the
attention of the abbé. He was exceedingly desirous
of presenting the learned men of France with a spe-
cimen of the ancient writing employed in the Greek
manuscripts. He accordingly addressed himself, on
this subject, to his friend Mazocchi, and also to M.
Paderno, who superintended the treasures of Portici:
both, however, replied that they were expressly enjoin-
ed not to communicate any thing. On this he solicited
permission to look, for a few minutes only, on a page of
a manuscript which had been cut from top to bottom
since its discovery. It contained 28 lines, and Barthe-
lemy read it over six different times with extreme at-
tention; after this he retired to a corner and trans-
cribed the precious fragment, on a piece of paper, from
memory. He then returned, and having made a men-
tal collation between the copy and the original he cor-
corrected two or three trifling errors that had escaped his
attention.

Having thus rendered himself master of a fac-simile
of the MS., which related to the persecution of the
Greek philosophers during the time of Pericles, he
transmitted the literary plunder in the course of that
very day to the academy of belles lettres, strictly en-
joining secrecy, however, that Mazocchi and Paderno
might escape all manner of blame.

M. de Stainville having been appointed ambassador
to the court of Vienna, in 1757, the abbé accompanied
his lady thither. On his arrival he found that his friend
and protector had made certain engagements with the
French ministry, on purpose to gratify his passion for
antiquities. In consequence of this he had left to visit
Greece and the sea-ports of the Mediterranean, at the
king's expense, where he was to amass new treasures,
and return with them to his native country by Marseilles.
But, notwithstanding all the attractions that this pro-
ject presented, his scrupulous attachment to his duty
prevailed over his passion for knowledge; as he deemed
it highly improper that the cabinet of medals should
be so long shut.

At length, towards the end of 1758, M. de Stainville,
now duke de Choiseul, was nominated minister for
foreign affairs in the room of the abbé de Bernis,
who had retired with a cardinal's hat. No sooner did
this event take place, than both he and his lady deter-
mind to provide for their friend. They accordingly
requested Barthelemy to state the sum that would make
him easy for life, and he instantly mentioned 6000
livres a year; blushing at the same time at the large-
ness of the demand.

As the purse of the nation was now open to the pa-
ton, he distributed his favours with a liberal hand;
and it must be owned that, on this occasion, an object
worthy of remuneration presented itself in the person of
the learned abbé. Accordingly, in 1759, he presented
him with a pension on the archbishopric of Alby:
in 1765 he conferred on him the treasurership of St
Martin de Tours, and in 1768 he made him secretary-
general to the Swiss guards. In addition to these the
abbé also enjoyed a pension of 5000 livres on the Mer-
cury. His income was now very large, but he employed
it nobly; for he distributed the surplus, which was
considerable, among indigent men of letters.

In 1771 M. de Choiseul was disgraced, being suc-
ceeded in his office by his enemy the duke d'Aiguillon,
and exiled to his estate at Chanteloupe. On this oc-
casion he was forsaken as usual by the courtiers, who
had basked in the sunshine of his favour; but he was
not deserted by the grateful antiquary, who instantly
repaired thither to pay his respects; nay, when the
king demanded the duke's resignation of the post of
colonel-general of the Swiss guards, the abbé, with a
spirit
Barthélemy, spirit that does honour to his memory, insisted on sending in his own resignation of the secretaryship; but the ex-minister interfered, and prevailed upon him not to deliver it up without an indemnification, which should be sanctioned by the great seal, and authorized by letters patent enregistered in parliament.

Barthélemy was now in possession of more than 1,200l. sterling per annum; of this he distributed between three and four hundred in the manner before related: the remainder was not dissipated in pomp and ostentation, but employed in such a manner as to enable him to enjoy philosophic ease. He also educated and established three nephews in life, one of whom has been successively ambassador and director; he at the same time supported the rest of his family in Provence, and selected a noble library, which he disposed of some years before his death.

After having thus possessed an ample income during more than twenty years, the abbé Barthélemy found himself, towards the latter end of his existence, reduced to live on a pittance calculated merely to furnish the indispensable necessaries of life, in consequence of the suppression of places and appointments that ensued immediately after the revolution. He was never heard, however, to complain; nay, he did not seem to perceive the change; and, while he was still permitted by his age and infirmities to walk from one end of Paris to the other, to pay his respects to Madame de Choiseul, he seemed to him as happy as before.

In 1788 appeared his celebrated work, entitled *Voyage du jeune Anacharsis en Grece, dans le milieu du quatrième siècle avant l'ére Christiane*. He had begun it in 1757, and, during an uninterrupted succession of 30 years, occupied his leisure hours in bringing it to maturity.

His hero, a young Scythian, descended from the famous philosopher Anacharsis, whose name he bears, is supposed to repair to Greece, for his instruction in his early youth, and, after making a tour of her republics, her colonies, and her islands, he returns to his native country and writes this book, in his old age, after the hero of Macedon had overturned the Persian empire. In the manner of modern travellers, he gives an account of the customs, government, and antiquities, of the country he has visited; a copious introduction supplies whatever may be wanting in respect to historical details; while various dissertations on the music of the Greeks, on the literature of the Athenians, and on the economy, pursuits, ruling passions, manners and customs, of all the surrounding states, afford ample gratification to the reader of taste.

In 1789 the author became a candidate for a chair in the French academy; and such was the reputation he had obtained by his labours, that this learned body became particularly anxious to enrol him among its members; he was accordingly elected by acclamation. The speech delivered by the Abbé on his inauguration has been equally celebrated for its simplicity and modesty.

In 1790 M. de St Priest, minister of the department of Paris, made him an offer of the place of librarian to the king, then vacant by the resignation of M. le Noir. This was, at that period, a very flattering proposal, but it was not accepted; for the Abbé imagined that it might interfere with his literary occupa-

Vol. III. Part II.
Barthelmy: accordingly at eleven o'clock at night he was awaked from his sleep, and conducted to the house of his fair friend.

But the attention of the government did not stop here: for in a few weeks afterwards, the place of national librarian being vacant by the death of Carrs, and the resignation of Chamfort, who had held it jointly, it was offered to the Abbé, with the most flattering marks of attention. His age and infirmities, however, afforded but too good a pretext for his refusal.

In 1794 his approaching dissolution was apparent to every one but himself, for his fainting fits became longer and more frequent; however, as he did not retain any remembrance of them, he occupied his time as usual; in other words, he devoted all his hours to friendship and literature.

He had now reached the 80th year of a life which had been entirely spent in a labours and incessant application to study, which had secretly weakened the springs of existence. The rigour of the winter of 1795, against which he had adopted no precautions, is supposed to have hastened the catastrophe; this did not occur, however, until the spring.

On the 25th of April he dined with Madame de Choiseul. In the course of the night he became so weak that he was unable to ring his bell; and in the morning, when his servant entered, he was found with his feet in the bed and his head on the floor, entirely deprived of sensation. After being replaced, his recollection returned, but he grew gradually worse, and he was carried off without experiencing any pain, April 30, 1795.

He retained full possession of all his senses until the very last moment. At one o'clock he read Horace as if nothing extraordinary had occurred; but his hands turning cold, in consequence of the approach of death, became unable to support the book, which fell to the ground. His head soon after was seen to incline on one side, he appeared to sleep, and it was believed by his nephew and his attendants that this was really the case; but it was soon discovered that his respiration had ceased, and that this learned man was no more.

Thus died, without any of the usual struggles that accompany death, John James Barthelmy, one of the greatest ornements of his age, regretted by all his relations as if he had been their common father, whose life presented an example, and whose works form a model for literary men. In person he was above the middle size, and, if we are to give credit to his admirers, his countenance displayed an air of antiquity wonderfully correspondent to his studies. His bust, carved by the chisel of Houdon, is allowed to be a masterpiece of art, and that able sculptor has contrived to infuse into the physiognomy a mixture of the mildness, simplicity, good-nature, and grandeur, so visible in the original.

BARTHEZ, Paul Joseph, an eminent French physician. See Supplement.

BARTHUS, Caspar, a very learned and copious writer, born at Custrin in Brandenburg, the 2ed of June 1576. Mr Baileit has inserted him in his Enfonde Celebrations, where he tells us, that at 12 years of age he translated David's Psalms into Latin verse of every measure, and published several Latin poems. Upon the death of his father (who was professor of civil law at Francfort, counsellor to the elector of Brandenburg, and his chancellor at Custrin), he was sent to Gotha, then to Eisenach, and afterwards, according to custom, went through all the different universities in Germany. When he had finished his studies, he travelled into Italy, France, Spain, and England. He studied the modern as well as ancient languages, and his translations from the Spanish and French show that he was not content with a superficial knowledge. Upon his return to Germany, he took up his residence at Leiпис, where he led a retired life, his passion for study having made him renounce all sort of employment. He wrote a vast number of books; the principal of which are, 1. His Adiversaria, a large volume in folio; the second and third volumes of which he left in manuscript. 2. A Translation of Aeneas Gazzau. 3. A large volume of Notes upon Claudian, in 4to. 4. Three large volumes upon Status &c. He died in Leipzig, in 1658, aged 71.

BARTHOLINUS Kaspar, a learned physician and anatomist in the 17th century, was born at Malmo, a town in the province of Schonen, which then belonged to Denmark. At three years of age he had such a quick capacity, that in 14 days he learned to read; and in his 13th year he composed Greek and Latin orations, and pronounced them in public. When he was about 18 he went to the university of Copenhagen, and afterwards studied at Rostock and Wittenberg. He next set out upon his travels; during which he neglected no opportunity of improving himself at the different universities to which he came, and everywhere receiving marks of respect. He was in 1613 chosen professor of physic in that university, which he enjoyed 11 years; when, falling into a dangerous illness, he made a vow, that if it should please God to restore him, he would solely apply himself to the study of divinity. He recovered, and kept his word; and soon after obtained the professorship of divinity, and the canonry of Roschild. He died on the 15th of July 1629, after having written several small works chiefly on metaphysics, logic, and rhetoric.

BARTHOLINUS Thomas, a celebrated physician, son of the former, was born at Copenhagen in 1616. After studying some years in his own country, he in 1637 went to Leyden, where he studied physic during three years. He then travelled into France, and resided two years at Paris and Montpelier, in order to improve himself under the famous physicians of those universities. Afterwards going to Italy, he continued three years at Padua; and at length went to Basil, where he obtained the degree of doctor of philosophy. Soon after, he returned to Copenhagen; where in 1647 he was appointed professor of the mathematics; and next year was nominated to the anatomical chair, an employment better suited to his genius and inclination; which he discharged with great assiduity for 13 years, and distinguished himself by making several discoveries with respect to the lacteal veins and lymphatic vessels. His close application, however, having rendered his constitution very infirm, he, in 1661, resigned his chair; but the king of Denmark allowed him the title of honorary professor. He devoted to a little estate he had purchased at Hagestedt, near Copenhagen, where he hoped to have spent the remainder of his days in peace and tranquillity; but his house being burnt in
BARTHOLOMEW, St., one of the Caribbean islands, belonging to the French, but ceded by them to Sweden in 1783. It is about 24 miles in compass, and has a good haven.

BARTHOLOMITES, a religious order founded at Genoa in the year 1307; but the monks leading very irregular lives, the order was suppressed by Pope Innocent X. in 1659, and their effects were confiscated.

In the church of the monastery of this order at Genoa is preserved the image which it is pretended Christ sent to King Abgarus. See ABGARUS.

BARTOLOCCI, JULIUS, a learned monk, and professor of Hebrew at Rome, was born at Celeno, in 1613; and distinguished himself by writing an excellent Hebrew and Latin catalogue of the Hebrew writers and writings, in 4 vol. folio, a continuation of which was performed by Imbonati his disciple. He died in 1687.

BARTOLOMEO, FRANCISCO, a celebrated painter, born at Savigliano, a village 10 miles from Florence, in the year 1469, while the disciple of Cosimo Rosselli, and who was much more beholden to the works of Leonardo da Vinci for his extraordinary skill in painting. He was well versed in the fundamentals of design. Raphael, after quitting the school of Perrigno, applied to this master; and under him studied the rules of perspective, with the art of managing and uniting his colours. In the year 1500, he turned Dominican friar; and some time after was sent by his superiors to the convent of St. Martin, in Florence. He painted both portraits and histories; but his scrupulous conscience would hardly ever suffer him to draw naked figures, though nobody offered them better. He died in 1517, aged 48.

BARTOLOMEO, Bartolo, a town of Lincolnshire, seated on the river Humber, where there is a considerable ferry to pass over into Yorkshire. Population 2204 in 1811. W. Long. 0. 10. N. Lat. 53. 40.

BARTOMIA, Painted Cup. See BOTANY INDEX.

BARCHE, THE PROPHET OF, one of the apocryphal books, subjoined to the canon of the Old Testament. Baruch was the son of Neriah, who was the disciple and amanuensis of the prophet Jeremiah. It has been reckoned part of Jeremiah's prophecy, and is often cited by the ancient fathers as such. Josephus tells us, Baruch was descended of a noble family; and it is said in the book itself, that he wrote this prophecy at Babylon; but at what time is uncertain. It is difficult to determine in what language this prophecy was originally written. There are extant three copies of it; one in Greek, the other two in Syriac; but which of these, or whether any one of them, be the original, is uncertain.

BARFLES, in church history, certain heretics, who held, that the Son of God had only a phantom of a body; that souls were created before the world, and that they lived all at one time.

BARFUTH, an ancient town of Turkey, in Syria, with a Christian church of the Nestorian persuasion. It is situated in a fine fertile soil, but is inconsiderable now to what it was formerly. E. Long. 34. 40. N. Lat. 33. 30.

BARUTH, an Indian measure, containing 17 gantans: It ought to weigh about three pounds and a half English avoirdupois.

BABYTONUM, in the Greek grammar, denotes a verb, which having no accent marked on the last syllable, a grave accent is to be understood. In Italian music, barytona answers to our common pitch of bass.

BAS, RELIEF. See BASSO-RELIEVO.

BAS, James Philip, a modern French engraver, by whom we have some excellent prints. His great force seems to lie in landscapes and small figures, which he executed in a superior manner. His style of engraving is extremely neat; but yet he proves the freedom of the etching, and harmonizes the whole with the graver and dry point. We have also a variety of pretty vignettes by this artist. He flourished about the middle of the present century; but we have no account of the time of his birth or death.

BASALTES, (from Basal, "iron," or Basalite, Name, de- diligenter examinato), in Natural History, a heavy, hard rivet, stone, chiefly black or green, consisting of prismatic crystals, the number of whose sides is uncertain. The English miners call it cockle; the German schleier. Its specific gravity is to that of water as 3030 or upwards to 1000. It frequently contains iron: and consists either of particles of an indeterminate figure, or of a sparry, striated, or fibrous texture. It has a flinty hardness, is insoluble by acids, and is fusible by fire.

The
The following is an analysis of some basaltes by Mr. Bergman; and as the resemblance of it to lava will be frequently mentioned in the succeeding part of this article, we shall here contrast this analysis with that of lava by the same author.

The most remarkable property of this substance is its figure, being never found in strata, like other marbles, but always standing up in the form of regular angular columns, composed of a number of joints, one placed upon, and nicely fitted to another, as if formed by the hands of a skilful workman. See Plate LXXV. fig. 15.

Basaltes was originally found in columns in Ethic Basaltes and fragments of it in the river Tomolus, and in the neighbourhood of Mount Ætna in Sicily. The lava of Hecla in Iceland, and of the volcano in the island of Bourbon. These are the only three active volcanoes in whose neighbourhood it is to be met with; but it is also found in the extincted volcanoes in Italy, and in the neighbourhood of Vesuvius.

In Ireland the basaltes rises far up the country, runs into the sea, crosses at the bottom, and rises again on the opposite land. In Staffa the whole end of the island is supported by natural ranges of pillars, mostly above 50 feet high, standing in natural colonnades, according as the bays and points of land have formed themselves, upon a firm basis of solid unformed rock. Above these, the stratum, which reaches to the soil or surface of the island, varies in thickness, as the island itself is formed into hills or valleys, each hill, which hangs over the valleys below, forming an ample pediment. Some of these, above 60 feet in thickness from the base to the point, are formed by the slope of the hill on each side, almost into the shape of those used in architecture.

The pillars of the Giant's Causeway have been very particularly described and examined. The most accurate account of them is to be met with in a work entitled "Letters concerning the northern coast of the county of Antrim," from which the following particulars relative to the present subject are extracted.

"1. The pillars of the Causeway are small, not very much exceeding 1 foot in breadth and 30 in length; account of the pillars sharply defined, neat in their articulation, with concave or convex terminations to each point. In many of the capes and islands they are of a larger size; more imperfect and irregular in their figure and articulation, having often flat terminations to their joints. At Fairhead they are of a gigantic magnitude, sometimes exceeding 5 feet in breadth and 100 in length; sometimes apparently destitute of joints altogether. Through many parts of the country, this species of stone is entirely rude and unformed, separating in loose blocks;
Basalts

"2. The pillars of the Giant's Causeway stand on the level of the beach; from whence they may be traced through all degrees of elevation to the summit of the highest grounds in the neighbourhood.

"3. At the Causeway, and in most other places, they stand perpendicular to the horizon. In some of the capes, and particularly near Bushet harbour, in the isle of Bagherly, they lie in an oblique position. At Doon point in the same island, and along the Balintoy shore, they form a variety of regular curves.

"4. The stone is black, close, and uniform; the varieties of colour are blue, reddish, and gray; and of all kinds of grain, from extreme fineness to the coarse granulated appearance of a stone which resembles imperfect granite, abounding in crystals of schoorl, chiefly black, though sometimes of various colours.

"5. Though the stone of the Giant's Causeway be in general compact and homogeneous; yet it is remarkable, that the upper joint of each pillar, where it can be ascertained with any certainty, is always rudely formed and cellular. The gross pillars also in the capes and mountains frequently abound in these air-holes through all their parts, which sometimes contain fine clay, and other apparently foreign bodies: and the irregular basaltes beginning where the pillars cease, or lying over them, is in general extremely honey-combed; containing in its cells crystals of zeolite, little morsels of fine brown clay, sometimes very pure steatite, and in a few instances bits of agate.

Sir Joseph Banks observes, that the bending pillars of Staffa differ considerably from those of the Giant's Causeway. In Staffa they lie down on their sides, each forming the segment of a circle; and in one place, a small mass of them very much resembles the ribs of a ship. Those of the Giant's Causeway which he saw, ran along the face of a high cliff, bent strangely in the middle, as if unable, at their first formation, while in a soft state, to support the mass of incumbent matter.

The rocks of the Cyclopes, in the neighbourhood of Ætna, exhibit very magnificent basaltic pillars. A general view of them is given on Plate LXXXVI. fig. 2. where, a, b, c, are the three principal rocks; c is the extremity of an island, one half of which is composed of lava, on a base of basaltes, of no uncommon nature; above which there is a crust of pozzolana, combined with a certain white calcareous matter, which is pretty hard and compact; and which, as it is composed by the action of the air, appears like a piece of knotty porous wood. That rock, at some former period, became so hard as to split; and the clefts were then filled up with a very hard and porous matter like searce. This matter afterwards acquiring new hardness, also split, leaving large interstices, which in their turn have been filled up with a species of compound yellow matter. The island was formerly inhabited; and there still remains a flight of steps leading from the shore to the ruins of some houses which appear to have been built in the rock.

The rock 8 has the straightest and most regular columns of any. It is represented distinctly in Plate LXXXVII. fig. 1. and likewise in a general view of c and d, with the foot of Ætna leading to Catania.

These basaltic columns, at first view, seem to resemble those of the Giant's Causeway, and others commonly met with: but on a nearer inspection, we find a remarkable difference; being assembled in groups of five or six about one, which serves as their common centre. They are of various sizes and forms; some square, others hexagonal, heptagonal, or octagonal. One half of this rock is composed of perpendiculat columns; the other of another species of basaltes disposed in inclined, and almost rectilinear, layers. These are in contact with the columns, and are as closely connected with them as they are with one another. The layers are longer at the base than towards the top of the rock. It is further to be remarked, that most of these layers are subdivided as they rise upwards; so that towards these upper extremities, one layer presents to the eye sometimes one, sometimes two, and sometimes three divisions. The fragments of basaltes taken off from these layers are of a rhomboidal figure, because the layers break obliquely.

These layers, though inclined towards the base, become almost perpendicular towards the upper part of the rock, where they appear united in a point, and overtop most of the visible and elevated parts of the prismatic columns. These columns terminate in such a manner as to form a kind of staircase. They appear even to rise under a species of clay with which they are covered at one extremity, till they reunite themselves with the point which is formed by the most elevated parts of the layers of basaltes beside them.

This extraneous matter with which these columns are covered, and of which the summit of this pyramidal consists, appears to be of the same species with the former, composing the upper part of the island already described.

The basaltes of that island has one particularity, viz. that it is full of small crystals of about the size of peas. These appear no less beautiful than rock-crystal; but they are much softer, and yield even to the action of the air. We see here large fragments of basaltes which were formerly full of crystals, but destroyed by time. They are now not unlike a sponge, from the great number of holes which appear all over the surface. Those pieces of basaltes which contain most of these crystals are not so hard as those which contain fewer of them.

The promontory of Castel d'Isci, which terminates on the basis of Ætna, is almost entirely composed of basaltes, but of a kind very different from the former. It consists of a great number of cylinders, from the diameter of six inches to that of twenty feet. Some of these are solid, others hollow like cannon: some extended in layers, others similar to carrots of tobacco consisting of a number of pieces squeezed together. Some of these cylinders are straight, others curved into a variety of forms. Some look like globes enclosed in the rocks; and in the fractures of these globes we perceive the strata of which they are composed.

Fig. 2. represents the basaltes at the foot of this promontory on the south side. The little mounts into which it appears to be collected, are sometimes only one French foot in diameter, sometimes six. They are composed of small prisms or needles, or of cubic trapezoids, and consist of a matter distinguished by the name of dirty lava. It is made up of pozzolana, consolidated.
In support of the volcanic origin of the basaltes it has been argued,

1. That it agrees almost entirely with lava in its elementary principles, in its grain, the species of the foreign bodies it includes, and all the diversities of its texture.

2. The iron of the basaltes is found to be in a metallic state, capable of acting on the magnetical needle, which is also the case with that found in compact lava.

3. The basaltes is fusible per se; a property which it has in common with lavas.

4. The basaltes is a foreign substance superinduced on the original limestone-soil of the country, in a state of softness capable of allowing the flints to penetrate considerably within its lower surface.

5. Those extensive beds of red ochre which abound among our basaltes are supposed to be an iron earth reduced to that state by the powerful action of heat; for such a change may be produced on iron in our common furnaces, provided there be a sufficient influx of fresh air; and the basaltes itself, in such circumstances, is easily reducible to an impure ochre. This is also found to take place in the living volcanoes, particularly within their craters; and is therefore supposed to afford a presumptive argument of the action of fire in the neighbourhood of basaltes.

6. Though zeolite is not yet proved to be the actual production of a volcano, yet its presence is always supposed to give countenance to this hypothesis; because zeolite is found in countries where the action of subterraneous fire is still visible, and where there is reason to believe that the whole soil has been ravaged by that principle. Thus it abounds in Iceland, where the flames of Hecla yet continue to blaze; and in the island of Bourbon, where there is still a volcano in force. It is therefore supposed to arise from the decomposition of the products of a volcano, where the fires have been long extinct.

7. Crystals of schorl appear in great plenty among many kinds of our basaltes; and these, though not absolutely limited to volcanic countries, yet being found in great abundance among the Italian lavas, in circumstances exactly corresponding to those of our basaltes, are thought to supply a good probable argument in the present case.

8. The peperino stone is thought to be undoubtedly of a volcanic origin. It has frequently the burnt and spongy appearance of many of the volcanic products; and that of the Giant's Causeway agrees exactly with the peperino of Iceland and Bourbon.

9. Pozzolane earth is met with among the basaltes of France; and there is very little reason to doubt that our basaltes, if pulverised, would agree with it in every respect; that is, it would produce a fine sharp powder, containing the same elementary parts, and probably agreeing with it in its valuable uses as a cement. This earth is also found in the Canary islands, which are thought to have other marks of fire; it is met with in all the volcanized parts of Italy, and is never found excepting where there are other evident marks of fire.

10. Pozzolane stone is universally allowed to be produced by fire, and indeed bears the resemblance of a cinder.
Basalt.

11. There are three living volcanoes, within whose neighborhood the basalt and most of its usual attendant fossils have been observed, viz. Etna in Sicily, Hecla in Iceland, and the island of Bourbon on the coast of Africa. To which it may be added, that it is found throughout all the volcanized parts of Italy, though not anywhere immediately in the neighborhood of Vesuvius. Sir William Hamilton, however, informs us, that in the year 1779 he "picked up some fragments of large and regular crystals of close-grained lava or basalt; the diameter of which, when the prisms are complete, might have been eight or nine inches." He observes, that Vesuvius does not exhibit any lavas regularly crystallized, and forming what are called Giants Causeways, except a lava that ran into the sea, near Torre del Greco, in the year 1631, which has a small degree of such an appearance. As the fragments of basalt which he found on this mountain, however, had been evidently thrown out of the crater in their proper form, he puts the question, "May not lavas be more ready to crystallize within the bowels of a volcano than after their emission? And may not many of the Giants Causeways already discovered be the nuclei of volcanic mountains, whose lighter and less solid parts may have been worn away by the hand of time?"

Mr. Faujas de St. Fond gives an example of basalt columns placed deep within the crater of an extinguished volcano.

12. It is well ascertained by experience, that there are vast beds of pyrites dispersed through the interior parts of the earth at all depths; and it is also a certain fact, that this compound substance may be decomposed by the accidental effusion of water, in such a manner as to become hot, and at last to burn with great fury. This accession of pyrites is by many supposed to be the true origin of the volcanic fire; and an argument for this is, that the present volcanoes do pour forth great quantities of the component parts of pyrites, particularly sulphur, iron, and clay. Now, among the superinduced substances of the county of Antrim, and the same may probably be said of every other volcanic country, it is certain that the quantity of iron and clay diffused through almost every species of fossil, amounts to more than one half of the whole material; so that two of the principal elements of the pyrites are still found there, reduced in many instances to a slag or scoria. The third principle; viz. the sulphur, cannot be expected to remain; because sulphur is totally consumed by combustion; and what might perhaps escape and be subdued would no doubt have since perished by decomposition, in consequence of being exposed to the air.

13. Another argument, which to Sir William Hamilton appears very convincing, is, that glass sometimes takes on the appearance of prisms, or crystallizes in cooling. He received some specimens of this kind from Mr. Parker of Fleet-street, who informed him that a quantity of his glass had been rendered unserviceable by taking such a form. Some of these were in laminae, which may be easily separated, and others resemble basaltic columns in miniature, having regular faces. "Many of the rocks of lava in the island of Ponza (says he) are, with respect to their configurations, strikingly like the specimens of Mr. Parker's glass above mentioned; none being very regularly formed basaltes, but all having a tendency towards it. Mr. Parker could not account for the accident that occasioned his glass to take the basaltic form; but I have remarked, both in Naples and Sicily, that such lavas as have run into the sea are either formed which run into regular basaltes, or have a great tendency towards such a form. The lavas of Mount Etna, which run into the sea near Jaci, are perfect basaltes; and a lava that ran into the sea from Vesuvius, near Torre del Greco in 1631, has an evident tendency to the basaltic form."

In opposition to these arguments it is urged, that in Arguments many of the countries where basaltes most abound, in opposition to the volcanic mountains. They assert, therefore, that the basaltes are a fossil, very extensively spread over the surface of the earth; and that, where it is found in the neighborhood of volcanic mountains, we ought to suppose these to be accidentally raised on a basaltic soil rather than to have created it. But the advocates for the volcanic system are not much embarrassed with this argument. According to them, the basaltes have been formed under the earth itself, and within the bowels of these great mountains; where it could never have been exposed to view until, by length of time or some violent shock of nature, the incumbent mass must have undergone a very considerable alteration, such as should go near to destroy every exterior volcanic feature. In support of this it may also be observed, that the monuments of Antrim do bear evident marks of some very violent convulsion, which has left them in their present situation; and that the island of Bagherry, and some of the Western isles of Scotland, do really appear like the surviving fragments of a country, great part of which might have been buried in the ocean. It is further added, that though the exterior volcanic character be in a great measure lost in the basaltic countries; yet this negative evidence can be of little weight, when we consider, that the few instances where the features have been preserved afford a sufficient answer to this objection. Thus the Montagne de la Coupe in France still bears the marks of its having been formerly a volcano: and this mountain is observed to stand on a base of basaltic pillars, not disposed in the tumul- tuary heap into which they must have been thrown by the furious action of a volcanic eruption, tearing up the natural soil of the country; but arranged in all the regularity of a Giant's Causeway, such as might be supposed to result from the crystallization of a bed of melted lava, where rest and a gradual refrigeration contributed to render the phenomenon so perfect as possible.

To these arguments stated by Mr. Hamilton we shall add another from Mr. Ferber; viz. That at the time he went from Rome to Ostia they were paving the road with a species of black lava. In some of the broken pieces he observed little empty holes, of the bigness of a walnut, incrusted all around their sides by white or amethystine, semi-pellucid, pointed, or truncated pyramidal crystallizations, entirely resembling the agate nodules or geodes, which are commonly filled with quartz crystallizations. There was no crack or fissure...
Basaltic in the ambient compact lava; the crystal sherds were pretty hard, and might rather be called quartz. Some fine brownish dust lay in the rest of the holes, as impalpable and light as ashes. He tells us also, that in the greatest part of the Paddy, Veronese, and Vicentine lavas, we meet with an infinite quantity of white polygonal shell crystallizations, whose figure is as regular, and still more polygonal, than the basaltes.

These may be considered as the principal arguments in favour of the volcanic theory of basaltes. On the other hand, the late celebrated Mr. Bergman expresses himself to the following purpose.

"Ten years ago it was a general opinion, that the surface of the earth, together with the mountains, had been produced by moisture. It is true that some declared fire to be the first original cause, but the greater number paid little attention to this opinion. Now, on the contrary, the opinion that subterraneous fire had been the principal agent gains ground daily; and every thing is supposed to have been melted, even to the granite. It is not improbable, that both the fire and water have contributed their share in this operation; though in such a proportion, that the force of the former extends much farther than the latter; and, on the contrary, that fire has only worked in some parts of the surface of the earth. It cannot be doubted that there has been some connection between the basaltic pillars and subterraneous fire; as they are found in places where the marks of fire are yet visible; and as they are even found mixed with lava, tephra, and other substances produced by fire.

"As far as we know, nature makes use of three methods to produce regular forms in the mineral kingdom. 1. That of crystallization or precipitation; 2. The crusting or settling of the external surface of a liquid mass while it is cooling; and 3. The bursting of a moist substance while it is drying.

"The first method is the most common; but to all appearance, nature has not made use of it in the present case. Crystals are seldom or never found in any quantity running in the same direction; but either inclining from one another, or, what is still more common, placed towards one another in sloping directions. They are also generally separated a little from one another when they are regular. The nature of the thing requires this, because the several particles of which the crystals are composed must have the liberty of obeying that power which affects their constitution. The basaltic columns, on the contrary, whose height is frequently from 30 to 40 feet, are placed parallel to one another in considerable numbers, and so close together that the point of a knife can hardly be introduced between them. Besides, in most places, each pillar is divided into several parts or joints, which seem to be placed on one another. And indeed it is not uncommon for crystals to be formed above one another in different layers, while the solvent has been visibly diminished at different times; but then the upper crystals never fit so exactly upon one another as to produce connected prisms of the same length or depth in all the strata taken together; but each stratum, separately taken, produces its own crystals.

"Precipitation, both in the wet and dry way, requires that the particles should be free enough to arrange themselves in a certain order; and as this is not practicable in a large melted mass, no crystallizations appear, excepting on its surface or in its cavities. Add to this, that the basaltes in a fresh fracture do not show a plain smooth surface under the microscope; but appear sometimes like grains of different magnitude, and at other times resemble fine rays running in different directions, which does not correspond with the internal structure of crystals.

"Hence the opinion of basaltes being formed by crystallization either in the wet or dry method must become less probable; but it must not be omitted, that the cracks exhibit a kind of crystallization, which at first sight resembles a heap of basaltes, but upon a closer examination a very great difference is to be found. The form of the spar is everywhere alike, but the basaltes differ from one another in size and the number of their sides. The former, when broken, consists of many small unequal cubes; but the basalt does not separate in regular parts, &c. &c.

"Nature's second method of producing regular forms is that of crusting the outer surface of a melted mass. By a sudden refrigeration, nature, to effect this purpose, makes use of polyhedral and irregular forms. If we suppose a considerable bed which is made fluid by fire, and spread over a plain, it evidently appears, that the surface must first of all lose the degree of heat requisite for melting, and begin to congeal. But the cold requisite for this purpose likewise contracts the uppermost congealed stratum into a narrower space; and consequently causes it to separate from the remaining liquid mass, as the side exposed to the air is already too stiff to give way. In this manner a stratum is produced, running in a parallel direction with the whole mass; others are still produced by the same cause in proportion as the refrigeration penetrates deeper. Hence we may very plainly see how a bed may be divided into strata. In the same manner the refrigeration advances on the sides; which consequently divides the strata into polyhedral pillars, which can hardly ever be exactly square, as the strongest refrigeration in the inner parts of the mass advances almost in a diagonal line from the corners. If we add to this, that a large mass cannot be equal through its composition, nor everywhere liquid in the same degree, it will be easy to discover the cause of several irregularities. If the depth of the bed be very considerable in proportion to its breadth, prismatic pillars without cross divisions will be formed at least lengthwise from the uppermost surface downwards.

"The third way is perfectly similar to the preceding in its effect; but it is different from it by the mass being soaked in water, and by the bursting of it asunder, being the effect of the contraction while it is drying. If we suppose such a bed to be spread over a level space, the drying advances in the same manner as the refrigeration in the former case. This separation into strata properly happens when a considerable quantity of clay enters into the whole composition, because the clay decreases more than any other kind of earth in drying.

"It is most probable, therefore, that the pillars have been produced out of the basaltic substance while it was yet soft, or at least not too hard to be softened by exhalations. If we therefore suppose a bed to be spread over a place where a volcano begins to work, this theory,
it is evident that a great quantity of the water always present on such occasions must be driven upwards in exhalations of vapours; which, it is well known, possess a penetrating softening power, by means of which they produce their first effect: but when they are increased to a sufficient quantity, they force this tough moist substance upwards: which then gradually falls, and during this time bursts in the manner above described.

The reasons for this supposition are as follows:
1. We do not find the internal substance of the basaltes melted or vitrified; which, however, soon happens by fusion; and for which only a very small degree of fire is requisite. It is of consequence very hard to explain how this substance could have been so fluid that no traces of bubbles appear in it; and yet, when broken, seem dull and uneven. Lava is seldom vitrified within; but the greater number of bubbles and pores which are found in the whole mass, are more than sufficient proofs, that it has not been perfectly melted to its smallest parts, but has only been brought to be near fluid. Secondly, the basaltes so much resemble the finer trapp, both in their grain and original composition, that they can hardly be distinguished in small fragments.

Mr. Kirwan is of opinion, that the basaltes owe their origin both to fire and water; they seem to have been at first a lava; but this, while immersed in water, was so diffused or dissolved in it with the assistance of heat, as to crystallize when cold, or coalesce into regular forms. That basaltes is not the effect of mere fusion to be concludes from comparing its form with its texture. Its form, if produced by fusion, ought to be the effect of having flowed very thin; but in that case its texture should be glassy: whereas it is merely earthy and devoid of cavities. Hence we may understand how it comes to pass that lava perfectly vitrified, and even water, have been found enclosed in basaltes.

Mr. Houlé, in his Voyage Pittoresque, is at considerable pains to account for the origin of the different species of basaltes he met with in the neighbourhood of Ætna. "Some modern writers (says he) attribute the configuration of the basaltes to the sudden cooling of the lava, in consequence of the effects produced upon it by the coldness of sea-water, when it reaches the sea in a state of fusion. They suppose that the shock, which it then receives, is the cause of those different configurations which this substance assumes; the most remarkable of which have been already mentioned. This assertion, however, seems to be ill founded. By considering the basaltic rock, the first of the Cyclops represented in the plate, we find that the pile is not in its original state, and that the series of columns is at present incomplete. It is very probable, that the species of clay found there, and which is extraneous to the basaltes, has by some means taken possession of its place; and it likewise appears, that not one of the basaltes here described is entire.

It seems, incredible, however, that a mass of matter reduced by fire to a state of liquefaction, and flowing into the sea, should be suddenly changed into regular figures by the shock of coming into contact with cold water; and that all the figures which are thus formed should be disposed in the same manner with regard to one another. For if we suppose that the water made its way into the cavity of the lava at the instant when it retreated backwards, then might the same quantity of water penetrate into the most remote parts of the mass; and by that means prolong the cavity which it had begun to form when it first entered the mass. The water then being lodged within this burning mass, and being in a state of dilatation, would have expelled whatever opposed it, and swelled the whole mass in such a manner as to form much larger interstices than those which appear between the basaltic columns; since these are everywhere in close contact with one another. Besides, how could the sudden cooling of the lava divide the upper part and sides of such an enormous mass as exactly as if they had been cast in a mould made on purpose?"

It remains also for those who adopt the hypothesis in question to explain how the shock occasioned by the cold water should make itself felt beyond a certain depth; since the very first moment it comes into contact with the liquid lava, it must cease to be cold; for the lava cannot but communicate to it a greater degree of heat than it communicates of cold in return, as the water is more easily penetrable by the burning lava than the mass of lava by the surrounding water. But farther, if at the first moment after the lava met the water it were cooled and contracted, the water would soon prevent, by the contraction of its whole surface, any continuation of the effect which it had first occasioned.

This seems to be the great difficulty: for how is it thus possible for the water to extend its influence to the centre of any very considerable mass? and even supposing it to act at the centre, how could it be able to fix the common centre of all the different columns?

Let us next consider what a degree of ebullition must take place in the water when it receives such a vast quantity of lava heated not only more intensely than common fire, but than red-hot iron! Though that mass, 100 fathoms in diameter, were to proceed from the bottom of the sea; or though it were immersed in it, the degree of ebullition would still be the same; and it is difficult to conceive what shock can be occasioned by a cold which does not exist, on a mass which burns, or causes to boil, whatever comes near it.

One peculiarity attending the basaltes is, that it remains fixed in the recess which it has once occupied. Another, not less essential, is its power of dividing itself in the midst of any one of its hardest parts, and to form two distinct pieces, one of which is always concave, and the other convex; a division which seems the most singular curiosity of the whole.

A third peculiarity might still be found in the interior part of these columns, if we were to meet with any that had suffered more by the lapse of time than those already described; but it is impossible for all this to be effected by water. How can water, which is everywhere the same, and which may be expected always to produce the same effects, produce such a variety on basaltes by mere contact?

The cause of all these varieties, therefore, seems to be this, that these lavas are originally composed of materials extremely different in their natures, and from which such a variety of effects naturally proceed.
BASES [442]

We see others extremely hard and compact, very finely grained, and containing likewise schoecl and zeolite crystals. Others are very hard and dense, which appear to be a mixture of small gray and white bodies; and of each of these colours many different shades, from light to darker, containing also zeolite crystals. Lastly, we find some consisting of a matter similar to clay, mixed with round black sand.

It may be objected, that the late eruptions of Aetna afford no basaltes, nor have they any divisions similar to those above mentioned. To this we may reply, that if they afford neither such basaltes, nor such regular divisions, the reason is, that neither their quantity, nor the ingredients of which they are composed, are such as are necessary for the production of basaltes: and for a proof of this we may refer to lavas of the most remote antiquity, which have no more resemblance to basaltes than those that are more modern.

Lastly, an argument, to which no plausible reply can be made, that the basaltes are not formed by seawater, is, that in the year 1669, the lava of Mount Aetna ran into the sea for two leagues and a half, without having the least appearance of being converted into basaltes.

BASAN, or BASHAN, in Ancient Geography, a territory beyond Jordan, mentioned in Scripture. By Josephus, Eusebius, and Jerome, it is called Batanae. On the entering of the Israelites into the land of Caanaan, the whole of the country beyond Jordan, from that of the Moabites, or Arabin, as far as Mount Hermon and Lebanon, was divided into two kingdoms, viz. that of Sihon king of the Amorites, and of Og king of Basan or Bashan; the former to the south, and the latter to the north. The kingdom of Sihon extended from the river Arnon and the country of Moab, to the river Jabok; which running in an oblique course from the east, was at the same time the boundary of the Ammonites, as appears from Num. xxii. 24, and Deut. ii. 37, and iii. 16. The kingdom of Sihon fell to the lot of the Reubenites and Gadites, and Basan to the half-tribe of Manasseh. To this was annexed a part of the hilly country of Gilead, and the district of Argob; yet so that Bashan continued to be the principal and greatest part: but, after the Babylonish captivity, Basan was subdivided; so that only a part was called Batanea or Basan, another Trachonitis, a third Auranitis or Iterae, and some part also Gaulonitis; but to settle the limits of each of these parts is a thing now impossible.—Bashan was a country famous for its pastures and breed of large cattle.

BASARTSCHIK, a considerable town of Romania, in Turkey in Europe. It is pretty well built, and hath clean and broad streets; has a great trade; and is situated on the river Meritz, in E. Long. 24° 30′ N. Lat. 41° 49′.

BASARUCO, in commerce, a small base coin in the East Indies, being made only of very bad tin. There are, however, two sorts of this coin, a good and a bad; the bad is one-sixth in value lower than the good.

BASE, in Geometry, the lowest side of the perimeter of a figure: Thus, the base of the triangle may be said of any of its sides, but more properly of the lowest, or that which is parallel to the horizon. In rectangu-
A bashaw is made with the solemnity of carrying a flag or banner before him, accompanied with music and songs, by the mirielen, an officer on purpose for the investiture of bashaws. Bashaw, used absolutely, denotes the prime vizier; the rest of the denomination being distinguished by the addition of the province, city, or the like, which they have the command of; as the bashaw of Egypt, of Palestine, &c. The bashaws are the emperor’s sponges. We find loud complaints among Christians of their avarice and extortion. As they buy their governments, every thing is venal with them. They live in their governments in a style of princely splendour and profusion. When glutted with wealth, the emperor frequently makes them present of a bow-string, and becomes heir to all their spoils.

Basil, St., the Great, one of the most learned and eloquent doctors of the church, was born at Cesarea, in Cappadocia, about the year 328; and went to finish his studies at Athens, where he contracted a strict friendship with St. Gregory Nazianzen. He returned to his native country in 355, where he taught rhetoric. Some time after, he travelled into Syria, Egypt, and Libya, to visit the monasteries of these countries; and the monastic life so much suited his disposition, that upon his return home he resolved to follow it, and he was the first institutor thereof in Pontus and Cappadocia. His reputation became so great, that, upon the death of Eusebius bishop of Cesarea, in 370, he was chosen his successor. It was with some difficulty that he accepted of this dignity; and no sooner was he raised to it, than the emperor Valens began to persecute him because he refused to embrace the doctrine of the Arians. Being at length let alone, he began to use his utmost endeavours to bring about a reunion betwixt the eastern and western churches, who were then much divided about some points of faith, and in regard to Melethius and Paulinus two bishops of Antiochia. But all his efforts were ineffectual, this dispute not being terminated till nine months after his death. Basil had a share in all the disputes which happened in his time in the east in regard to the doctrine of the church; and died the first of January, 379.

There have been several editions of his works in Greek and Latin. The best is that of Father Garnier, printed in Greek and Latin, in three volumes folio. St. Basil’s style is pure and elegant, his expressions are grand and sublime, and his thoughts noble and full of majesty. Erasmus places him among the greatest orators of antiquity.

Basil, a canton of Switzerland, which joined the confederacy in 1501. It is bounded on the south by the canton of Solothurn; on the north by part of the margrave of Baden-Durlach, and the territory of Rheinfelden; on the east by Frickthal; and on the west by part of Solothurn, the diocese of Basel, and the Sundgau; being upwards of 20 miles in length, and about 16 in breadth. It contains 270 square English miles, and had a population of 49,300 in 1815. It is entirely Protestant. The lower parts of it afford corn and wine, and pasture; but the mountains are barren. Here are many medicinal springs and baths, and the air is wholesome and temperate. Both men and women for the most part wear the French dress; but the language commonly spoken is the High Dutch, though the French is also much used. The government is aristocratic;
cratic; and its revenues arise chiefly from secularized abbeys, and impost on goods carried through the country, to and from France, Italy, and Germany. Besides the military establishment of the city of Basil, there are two provincial regiments, consisting each of ten companies, and a troop of dragoons. The places of most note are Basil the capital, Wallenburg, St Jacob, and Staats-Haus, &c.

Basil, the capital of the canton of that name, is the largest city in all Switzerland, and contains about 12,000 inhabitants. Its environs are exceedingly beautiful, consisting of a fine level tract of fields and meadows. The city is divided into two parts by the Rhine, over which there is a handsome bridge. It is thought by some to have risen on the ruins of the old Augusta Rauracorum. For its name of Basil it is indebted to Julian the Apostle, who would have it so called in honour of his mother Basilia. It is fortified with walls, moats, towers, and bastions, and contains several churches, besides the cathedral, which is an old Gothic structure; a commandery of the order of St John, and another of the Teutonic order; a public granary and arsenal; a stately townhouse, in which is an exquisite piece of the sufferings of Christ, by Holbein, and a statue of Munatius Plancus, a Roman general, who about 50 years before Christ, built the ancient city of Augusta Rauracorum; an university which was founded in 1459, and has a curious physic-garden, library, and museum; a gymnasium; a stately palace, belonging to the margrave of Baden-Durach; besides a chamber of curiosities, several hospitals, &c. In the arsenal is shown the armour in which Charles the Bald lost his life, with the furniture of his horse, and the kettle-drums and trumpets of his army. On the staircase of the council-house, is a picture of the last judgement, in which, though drawn before the Reformation, popes, cardinals, monks, and priests, are represented in the torments of hell. Over-against the French church, on a long covered wall, is painted the dance of death; where the king of terrors is represented as mixing with all ranks and ages, and complimenting them, in German verses, on their arrival at the grave. St Peter's square, planted with elm and lime trees, makes a pleasant walk; but a spot regularly planted with trees, close by the river, and near the minister, makes still a finer, as commanding a most beautiful and extensive prospect. The celebrated Erasmus died here in 1536, in the 70th year of his age, and was buried in the great church. He left his library and cabinet of rarities to one Amberbach, a learned lawyer of this city, of whose heirs they were purchased by the university. Besides this cabinet, there are several other curious private ones. The clocks of this city go an hour faster than elsewhere, except at Constance; a circumstance which some ascribe to the famous council held there, when it was thought the best expedient to bring the fathers early to the assembly, for the quicker despatch of business; but others say, that, in Basil, it was owing to an assault being defeated by that means. About 400 years ago, according to the story, the city was threatened with an assault by surprise. The enemy was to begin the attack when the large clock of the tower at one end of the bridge should strike one after midnight. The artist who had the care of the clock, being informed that this was the expected signal, caused the clock to be altered, and it struck two instead of one; so the enemy, thinking they were an hour too late, gave up the attempt; and in commemoration of this deliverance, all the clocks in Basil have ever since struck two at one o'clock, and so on. But this practice is said now to be abolished.

They show, by way of confirmation, a head, which is placed near to this patriotic clock, with the face turned to the road by which the enemy was to have entered. This same head lolls out its tongue every minute, in the most insulting manner possible. This was originally a piece of mechanical wit of the famous clockmaker's who saved the town. He framed it in decision of the enemy, whom he had so dexterously deceived. It has been repaired, renewed, and enabled to thrust out its tongue every minute for these four hundred years, by the care of the magistrates, who think so excellent a joke cannot be too often repeated. Trade still flourishes here, especially in silk, ribbons, and wines; and the police is under excellent regulations. Most of the offices are bestowed by lot among well qualified persons. No person, without the city, must wear lace of gold or silver. All young women are prohibited from wearing silks; and the nearest relations only are to be invited to a marriage-feast. For the government of the city there are several councils or colleges, and officers. Of the last, the two burgomasters, and two wardens of trades, are the chief. The great council is composed of the representatives of the several companies of the greater and lesser city. Basil was the see of a bishop till the Reformation; but though there is one that still bears the title, he has now no jurisdiction here, and lives at Fontenay, near the Upper Alsace. The two Buxtorfs, father and son, and the famous painter Holbein, were natives of this place. The council held here, in 1431, sat in the vestry of the cathedral.

Basil. See Ocumum, Botany Index.

Basil, among joiners, the sloping edge of a chisel, or of the iron of a plane, to work on soft wood: they usually make the basil 12 degrees, and for hard wood 18; it being remarked, that the more acute the basil is, the better the instrument cuts; and the more obtuse, the stronger, and fitter it is for service.

Basilicus, a title assumed by the emperors of Constantinople, exclusive of all other princes, to whom they give the title rex, "king." The same quality was afterwards given by them to the kings of Bulgaria, and to Charlemagne, from the successors of which last they endeavoured to wrest it back again.

The title basilicus has been since assumed by other kings, particularly the kings of England, Ego Edgar totius Anglie basilicus confirmus. Hence also the queen of England was entitled Basilia and Basiliacum.

Basilian monks, religious of the order of St Basil. That saint, having retired into a desert in the province of Pontus, founded a monastery for the convenience of himself and his numerous followers; and for the better regulation of this new society, he drew up in writing the orders and rules he would have them follow. This new order soon spread all over the east; nor was it long before it passed into the west. The rule of St Basil was approved by Pope Liberius, the same year.
church. In which sense, the name frequently occurs
in St Ambrose, St Austin, St Jerome, Sidonius Apollinaris,
and other writers of the fourth and fifth centuries.
It is thought that the name was thus applied,
from many of the ancient churches having been formed
of the Roman halls mentioned in the preceding article.
In reality, on the conversion of Constantine, many of
the ancient basilicas were given to the church, and
turned to another use, viz. for Christian assemblies to
meet in, as may be collected from that passage of Augus-
nius, where speaking to the emperor Gratian, he tells
him, the basilica, which heretofore were wont to be
filled with men of business, were now thronged with
votaries praying for his safety. By which he means
mean, that the Roman halls or courts were turned into
Christian churches: and hence, we conceive, the name
basilica came to be a general name for churches in after
ages.

BASILIC is chiefly applied, in modern times, to
churches of royal foundation; as those of St John de
Lateran, and St Peter of the Vatican at Rome, founded
by the emperor Constantine.

BASILICS were also little chapels built by the ancient
Franks over the tombs of their great men, so called,
as resembling the figure of the sacred basilicae, or church-
es. Persons of inferior condition had only tumba or
porticuli erected over them. By an article in the Sa-
lucy law, he that robbed a tumba or porticus, was to be
fined fifteen solidi; but he that robbed a basilica, thirty
solidi.

BASILICS, in literary history, a name supposed to
have been given by the emperor Leo to a collection of
laws in honour of his father Basilii Macedon, who be-
gan it in the year 867, and in the execution chiefly
made use of Sabbatius Protopatharius, who carried
the work as far as 40 books. Leo added 20 books
more, and published the work in 880. The whole, 30
years after, was corrected and improved by Constan-
tine Porphyrogenitus, son of Leo; whence many have
held him the author of the Basilica. Six books of the
Basilica were translated into Latin in 1557, by Gentian
Heretius. An edition of the Greek Basilics, with a
Latin version, has been since published at Paris, in
1647, by Anin. Fabrottis, in 7 volumes. There are
still wanting 19 books, which are supposed to be lost.
Fabrottis has endeavoured to supply in some measure
the defect from the synopsis of the Basilica, and the
glosses; of which several had been made under the suc-
ceeding emperors, and contained the whole Justinian
law, excepting the superfluities, in a new and more con-
sistent order, together with the later constitutions of
the emperors posterior to Justinian.

BASILICA, in Anatomy, the interior branch of
the axillary vein, running the whole length of the
arm.

BASILICATA, a territory of Italy, bounded on
the north by the Otranto, Bari, and Capitanata; on
the west by the Principato, and a small part of the
Tuscan sea; on the south by Calabria; and on the east
by the gulf of Taranto. It is watered by several ri-
vers: but as it is almost all occupied by the Apennine
mountains, it is neither very populous nor fertile; how-
ever it produces enough to maintain its inhabitants,
and has a small quantity of cotton. The principal
BASILICIA, a denomination given in the Greek empire to those who carried the emperor's orders and commands.

BASILICON, in Pharmacy, a name given to several compositions to be found in ancient medicinal writers. At present it is confined to three officinal ointments, distinguished by the epithets black, yellow, and green. See PHARMACY.

BASILIDJANS, ancient heretics, the followers of Basilides, an Egyptian, who lived near the beginning of the second century. He was educated in the Gnostic school, over which Simon Magus presided; with whom he agreed that Christ was a man in appearance, that his body was a phantom, and that he gave his form to Simon the Cyrenian, who was crucified in his stead. We learn from Eusebius, that this heresiarch wrote 24 books upon the gospel, and that he forged several prophets; to two of which he gave the names Barca and Barcop. We have still the fragment of a Basilidian gospel. His disciples supposed there were particular virtues in names: and taught with Pythagoras and Plato, that names were not formed by chance, but naturally signified something.—Basilides, to imitate Pythagoras, made his disciples keep silence for five years.

In general, the Basilidians held much the same opinions with the Valentinians, another branch of the Gnostic family. They asserted, that all the actions of men are necessary; that faith is a natural gift, to which men are forcibly determined, and should therefore be saved though their lives were ever so irregular. Tremendous others assure us, they acted consistently with their principles; committing all manner of villanies and impurities, in confidence of their natural election. They had a particular hierarchy of divine persons, or Æons. Under the name Abrasax, they are said to have worshiped the supreme God, from whom as a principle, all other things proceeded. There are several gems still subsisting, inscribed with the name Abrasax, which were used by the Basilidians as amulets against diseases and evil spirits. See ABRAAX and ABRAKAS.

BASILLIPUM, in Ancient Geography, a town of Bética in Spain; now Cantillana, a citadel of Andalusia, above Seville, on the Guadalquivir.

BASILICUS, in Zoology, the trivial name of a species of lacerta. See LACERTA, EREFOTOLOGY INDEX.

BASILISK, a fabulous kind of serpent, said to kill by its breath or sight only. Galen says, that it is of a colour inclining to yellow; and that it has three little eminences upon its head, speckled with whitish spots, which have the appearance of a sort of crown. Ælian says, that its poison is so penetrating, as to kill the largest serpents with its vapour only; and that if it but bite the end of any man's stick, it kills him. It drives away all other serpents by the noise of its hissing. Pliny says, it kills those who look upon it.—The generation of the basilisk is not less marvellous, being said to be produced from a cock's egg, brooded on by a serpent. These, and other things equally ridiculous, are related by Matthiolus, Galen, Dioscorides, Pliny, and Erasistratus. Hirschmayer and Vander Wiel have given the history of the basilisk, and detected the folly and imposture of the traditions concerning it.—In some apothecaries shops there are little dead serpents shown, which are said to be basilisks. But these seem rather to be a kind of small bird, almost like a cock, but without feathers: its head is lofty, its wings are almost like a bat's, its eyes large, and its neck is very short. As to those which are shown and sold at Venice, and in other places, they are nothing but little thornbacks artificially put into a form like that of a young cock, by stretching out their fins, and contriving them with a little head and hollow eyes; and this, Calmet says, he has in reality observed in a supposed basilisk, at an apothecary's shop at Paris, and in another at the Jesuits of Pont-a-Mousson.

BASILISK, in military affairs, a large piece of ordnance, thus denominated from its resemblance to the supposed serpent of that name. The basilisk throws an iron ball of 200 pounds weight. It was much talked of in the time of Solyman emperor of the Turks, in the wars of Hungary; but seems now out of use. Paulus Jovius relates the terrible slaughter made by a single ball from one of these basilisks in a Spanish ship; after penetrating the boards and planks in the ship's head, it killed above 30 men. Maffes speaks of basilisks made of brass, which were drawn each by 100 yoke of oxen.

—Modern writers also give the name basilisk to a much smaller and sizeable piece of ordnance, which the Dutch make 15 feet long, and the French only 10. It carries 48 pounds.

BASILIUS, surnamed the Macedonian emperor of the Greeks. He was a common soldier, and of an obscure family in Macedonia, and yet raised himself to the throne: for having pleased the emperor Michael by his address in the management of his horses, he became his first squerry, and then his great chamberlain. He at length assassinated the famous Bardas, and was associated to the empire in 840. He held the eighth general council at Constantinople; deposed the patriarch Photius, but in 858 restored him to the patriarchate; and declared against the popes, who refused to admit him into their communion. He was drenched by his enemies the Saracens, whom he frequently vanquished; and loved by his subjects, for his justice and clemency. He died in 886. Under his reign the Russians embraced Christianity, and the doctrine of the Greek church. He ought not to be confounded with Basilis the Younger, who succeeded Zemisoes in 975, and after a reign of 50 years died in 1025.

BASINGSTOKE, a corporation town of Hampshire in England, and a great thoroughfare on the western road. It is seated on a small brook, and had 2636 inhabitants in 1811. W. Long. 110. N. Lat. 51. 20.

BASIOGLOSSUS, a muscle arising from the base of the os hyoidei. See ANATOMY, Table of the Muscles.

BASIS, or BASE, in Geometry. See BASE.

BASIS, or Base, in Chemistry. Any body which is dissolved by another body, which it receives and fixes, and with which it forms a compound, may be called the basis of that compound. Thus, for example, the basis of neutral salts are the alkaline, earthy, and metallic matters which are saturated by the several acids, and form with them these neutral salts. In this sense it is that these neutral salts are called salts with earthy basis.
BAS

A basket I, by painted Britons wrought,
And now to Rome's imperial city brought.

See Basket-Making, Supplement.

Baskets of Earth, in the military art, in French corbeillers, are placed on the parapet of a trench, filled with earth. They are about a foot and a half high, about a foot and a half in diameter at the top, and 8 or ten inches at bottom; so that, being set together, there is a sort of embrasures left at their bottoms, through which the soldiers fire, without exposing themselves.

Basket-Fish, a species of sea-star. See Astéries.

Basket-Salt, that made from salt-springs; being purer, whiter, and composed of finer grains than the common brine-salt. See Salt.

Basking-Shark, or Sun-Fish of the Irish. See Squalus.

BASNAGE, James, a learned and accomplished author, and pastor of the Walloon church at the Hague, was born at Rouen in Normandy, August 8, 1613. He was the son of Henry Basnage, one of the ablest advocates in the parliament of Normandy. At 17 years of age, after he had made himself master of the Greek and Latin authors, as well as the English, Spanish and Italian languages, he went to Geneva, where he began his divinity studies under Mestreza, Turretin, and Tronchin; and finished them at Sedan, under the professors Jurieu and Le Blanc de Beaulieu. He then returned to Rouen, where he was received as minister, September 1676; in which capacity he remained till the year 1685, when the exercise of the Protestant religion being suppressed at Rouen, he obtained leave of the king to retire to Holland. He settled at Rotterdam, and was a minister pensionary there till 1691, when he was chosen pastor of the Walloon church of that city. In 1709 Pensionsary Hein- sius got him chosen one of the pastors of the Walloon church at the Hague, intending not only to employ him in religious but in state affairs. He was employed in a secret negotiation with Marshal d'Uxelles, plenipotentiary of France at the congress of Utrecht; and he executed it with so much success, that he was afterwards entrusted with several important commissions, all which he discharged in such a manner as to gain a great character for his abilities and address; a celebrated modern writer has therefore said of him, that he was fitter to be minister of state than of a parish. The Abbé du Bois, who was at the Hague in 1716, as ambassador plenipotentiary from his most Christian majesty, to negotiate a defensive alliance between France, England, and the States General, was ordered by the duke of Orleans, regent of France, to apply himself to M. Basnage, and to follow his advice; they accordingly acted in concert, and the alliance was concluded in January 1717. He kept an epistolary correspondence with several princes, noblemen of high rank, and ministers of state, both Catholic and Protestant, and with a great many learned men in France, Italy, Germany, and England. The Catholics esteemed him no less than the Protestants; and the works he wrote, which are mostly in French, spread his reputation almost all over Europe; among these are, 1. The History of the religion of the Reformed Churches. 2. Jewish Antiquities. 3. The History of the Old and New Testament;
BAS

Testament; and many others. He died September 22, 1723.

BASNAGNE, Henry, Sieur de Beauval, second son to Henry Basnagne, and brother to James mentioned in the last article. He applied himself to the study of the law, and was admitted advocate in the parliament of Rouen in the year 1679. He did not follow the bar immediately upon his admission; but went to Valencia, where he studied under M. de Marville. Upon his return from thence, he practised with great reputation till the year 1687, when the revocation of the edict of Nantes obliged him to fly to Holland, where he composed the greatest part of his works, and died there the 20th of March 1710. His chief work is Histoire des Ouvrages des Spoons. Rotterdam, 24 vol. in duodecimo. This work was begun in the month of September 1687, and continued till June 1709. When he arrived in Holland, Mr Bayle, through indisposition, had been obliged to drop his Nouvelles de la Republique des Lettres, which induced Mr Basnagne to undertake a work of the same kind under a different title.

BASON, in Hydraulics, a reservoir of water, used for various purposes: thus we say, The basin of a jet d'eau, the basin of a fountain, and likewise the basin of a port or harbour.

Basam, in Jewish antiquities, the laver of the tabernacle, made of the brass looking-glasses belonging to those devout women who watched and stood cinelins at the door of the tabernacle.

Bason, or Dish, among glass-grinders. These artificers use various kinds of basons, of copper, iron, &c., and of various forms, some deeper, others shallower, according to the focus of the glasses that are to be ground. In these basons it is that convex glasses are formed, as concave ones are formed on spheres or bowls.

Glasses are worked in basons two ways. In the first, the basin is fitted to the arbor or tree of a lathe, and the glass (fixed with cement to a handle of wood) is presented and held fast in the right hand within the basin, while the proper motion is given by the foot to the basin. In the other, the basin is fixed to a stand or block, and the glass with its wooden handle moved. The moveable basons are very small, seldom exceeding five or six inches in diameter; the others are larger, sometimes above ten feet diameter. After the glass has been ground in the basin, it is brought smoother with grease and emery; and polished first with tripoli, and finished with paper cemented to the bottom of the basin.

Bason, among batters, is a large round shell or case, ordinarily of iron, placed over a furnace; wherein the matter of the hat is moulded into form. The batters have also basons for the brims of hats, usually of lead, having an aperture in the middle, of a diameter sufficient for the largest block to go through.

Basques, a small territory of France, towards the Pyrenean mountains. It comprehends Labourd, Lower Navarre, and the district of Soule, which, with Bearn, form the department of the Lower Pyrenees.

Bass, the lowest in the four parts of music: of uncertain etymology; whether from the Greek word basos, "a foundation," or from the Italian adjective basso, signifying "low." Of all the parts it is the most important, and it is upon this that the chords proper to constitute a particular harmony are determined. Hence the maxim among musicians, that when the bass is properly formed, the harmony can scarcely be bad.

Basses are of different kinds. Of which in their order.

Thorough-bass is the harmony made by the bass-viol, or theorbo, continuing to play both while the voices sing and the other instruments perform their parts, and also filling up the intervals when any of the other parts stop. It is played by figures marked over the notes, on the organ, spinet, harpsichord, &c., and frequently simply and without figures on the bass-viol and bassoon.

Counter-bass is a second or double bass, where there are several in the same concert.

Bass-viol, a musical instrument of the like form with that of a violin, but much larger. It is struck with a bow as that is; has the same number of strings; and has eight stops, which are subdivided into semistops. Its sound is grave, and has a much nobler effect in a concert than that of the violin.

Bass, Isle of, a rock, about a mile in circumference, in the mouth of the Frith of Forth, at a small distance from the town of North Berwick in East Lothian. It is steep and inaccessible on all sides, except to the south-west; and even there it is with great difficulty that a single man can climb up with the help of a rope or ladder. It was formerly kept as a garrison. A party of King James's adherents surprised it at the Revolution, and it was the last place in the three kingdoms that submitted to the new government; upon which its fortifications were ordered to be neglected. In summer, this remarkable rock, which rises to a great height above the water, in form of a cone, is quite covered with sea-fowl which come hither to breed. The chief of these are the solan geese, which arrive in June, and retire in September. It also contains a small colony of warren for rabbits, and affords pasture for a few sheep.

The force of the tides has now almost worn a hole quite through this rock. W. Long. 2. 15. N. Lat. 56° 3'.

BASSAN, GIACOMO DE PONT, or Le Bassan, a celebrated Venetian painter, was born in 1529. His subjects generally were peasants and villagers, busy at their different rural occupations, according to the various seasons of the year; cattle, landscapes, and historical designs; and in all those subjects the figures were well designed, and the animals and landscapes have an agreeable resemblance of simple nature. His compositions cannot boast of much elegance or grandeur of taste, not even those which are historical; but they have abundance of force and truth. His local colours are very well observed, his carnations are fresh and brilliant, and the chiaroscuro and perspective well understood. His touch is free and spirited; and the distances in his landscapes are always true, if not sometimes too dark in the nearer parts. His works are spread all over Europe: many of them were purchased by Titian; and there are several in the French king's cabine, the royal palace, and the Hotel de Toulouse. They are more readily known than those of most other painters; from the similitude of characters and countenances in the figures and animals; from the taste in the buildings, utensils, and draperies; and, besides,
from a violet or purple tint that predominates in every one of his pictures. But the genuine pictures of his hand are not so easily ascertained; because he frequently repeated the same design, and his sons were mostly employed in copying the works of their father, which he sometimes retouched. As he lived to be very old, he finished a great number of pictures; yet, notwithstanding his application and years, the real pictures of Giacomo are not commonly met with. Many of those which are called originals by purchasers as well as dealers, being at best no more than copies by the sons of Bassan, who were far inferior to him; or perhaps by some painter of still meaner abilities. But the true pictures of Giacomo always bear a considerable price if they happen to be undamaged. He died in 1592, aged 82.—Francis and Leander, his sons, distinguished themselves in the same art; but inheriting a species of lunacy from their mother, both came to an untimely end.

BASSIN, or BASS, a town of the French Netherlands, in the county of Flanders, on the confines of Artois, remarkable on account of the many sieges it has sustained; but its fortifications are now demolished. It is seated on a canal which runs as far as Deule. E. Long. 3° 0'. N. Lat. 50° 53'.

Basse Terre, part of the island of St Christopher's, one of the Caribbee islands, formerly occupied by the French, but ceded to Great Britain by the treaty of Utrecht in 1713.

BASSET, or BASSETTE, a game with cards, said to have been invented by a noble Venetian, for which he was banished. It was first introduced in France by Signior Justiniani, ambassador of Venice, in 1674. Severe laws were made against it by Louis XIV. to elude which they disguised basset under the name of pour et contre, that is, "for and against," which occasioned new arrests and prohibitions of parliament. The parties concerned in it are, a dealer or banker; his assistant, who supervises the losing cards; and the punter, or any one who plays against the banker.

Besides these, there are other terms used in this game: 1. The fissa or face, which is the first card turned up by the tailleur belonging to the pack, by which he gains the value of half the money laid down on every card of that sort by the punters. 2. The couch, or first money which every punter puts on each card; each person that plays having a book of 13 several cards before him, on which he may lay his money, more or less, at discretion. 3. The paroli; which is, when a punter having won the first stake, and having a mind to pursue his good fortune, crooks the corner of his card, and lets his prize lie, aiming at a sept et le va. 4. The maitre; when having won the first stake, the punter is willing to venture more money on the same card. 5. The pay; when the punter having won the first stake, but it a shining, half crown, guinea, or whatever he laid down on his card, and not caring to hazard the paroli, leaves off, or goes the pay; in which case, if the card turns up wrong, he loses nothing, having won the couch before; whereas, if it turn right, he by this adventure wins double the money staked. 6. The alpiew; much the same with paroli, and used when a couch is won by turning up or crooking the corner of the winning card. 7. Sept et le va, the first great chance or prize, when the punter, having won the couch, makes a paroli, and goes on to a second chance; so that if his winning card turns up again, it comes to sept et le va, which is seven times
times as much as he laid down on his card. 8. Quinaise et le va is the next higher prize, when the punter having won the former, is resolved to push his fortune, and lay his money a second time on the same card by crooking another corner; in which case, if it comes up, he wins fifteen times the money he laid down.

9. Trent et le va is the next higher prize, when the punter, crooking the fourth corner of his winning card, if it turn up, wins 33 times the money he first staked.

10. Solvant et le va is the highest prize, and entitles the winner to 67 times his first money; which, if it were considerable, stands a chance to break the bank; but the bank stands many chances first of breaking the punter. This cannot be won but by the tailleur's dealing the cards over again.

The rules of the game of basset are as follow: 1. The banker holds a pack of 52 cards, and having shuffled them, he turns the whole pack at once, so as to discover the last card; after which he lays down all the cards by couples. 2. The punter has his book of 13 cards in his hand, from the king to the ace; out of these he takes one card, or more at pleasure, upon which he lays a stake. 3. The punter may, at his choice, either lay down his stake before the pack is turned, or immediately after it is turned, or after any number of couples are down. 4. Supposing the punter to lay down his stake after the pack is turned, and calling 1, 2, 3, 4, 5, &c. the places of those cards which follow the card in view, either immediately after the pack is turned, or after any number of couples are drawn. Then, 5. If the card upon which the punter has laid a stake comes out in any even place, except the first, he wins a stake equal to his own. 6. If the card upon which the punter has laid a stake comes out in any even place, except the second, he loses his stake. 7. If the card of the punter comes out in the first place, he neither wins nor loses, but takes his own stake again.

The game has been the object of mathematical calculations. M. de Moivre solves this problem; to estimate at basset the loss of the punter under any circumstances of cards remaining in the stock when he lays his stake, and of any number of times that his card is repeated in the stock. From this solution he has formed a table showing the several losses of the punter in whatever circumstances he may happen to be. From this table it appears, 1. That the fewer the cards are in the stock, the greater is the loss of the punter. 2. That the least loss of the punter, under the same circumstances of cards remaining in the stock, is when the card is but twice in it; the next greater when but three times; still greater when four times; and the greatest when but once. The gain of the banker upon all the money adventured at basset is 1.50. 3d. per cent.

Basset, Peter, a gentleman of good family, was chamberlain or gentleman of the privy chamber to King Henry V. a constant attendant on that brave prince, and an eye-witness of his most glorious actions both at home and abroad; all which he particularly described in a volume, entitled, The Acts of King Henry V., which remains in MS. in the college of heralds.

BASSETING, in the coal mines, denotes the rise of the vein of coal towards the surface of the earth, till it come within two or three feet of the surface itself. This is also called by the workmen cropping; and stands opposed to dipping, which is the descent of the vein to such a depth that it is rarely, if ever, followed to the end.

BASBIA. See BOTANY INDEX.

BASSOON, a musical instrument of the wind sort, blown with a reed, furnished with 11 holes, and used as a bass in a concert of hautboys, flutes, &c. To render this instrument more portable, it is divided into two parts, whence it is called a faggot. Its diameter at bottom is nine inches, and its holes are stopped like those of a large flute.

BASSOR, BASBORA, or Basrah, a city between Arabia and Persia, situated in the extremity of the deserts of Irak, a little to the west of the Tigris, in about 57° east longitude, and 30° north latitude. It was built by the command of the caliph Omar, in the 15th year of the Hegira, for the sake of carrying on more commodiously an extensive commerce between the Syrians, Arabsians, Persians, and Indians. It contains 50,000 or 60,000 inhabitants; and stands upon a thick stony soil, as the word basra imports, about a day and a half's journey from one of the mouths of the Tigris, where it empties itself into the Persian gulf, denominated likewise from this town the Bay of Bassor. The circumjacent tract is looked upon by the Arabs to be one of the most delightful spots in Asia, and even as one of the most beautiful gardens in the world; however, the hot winds that frequently blow there are very troublesome to travellers, and sometimes overwhelm them with sand driven by the force of these winds out of the neighbouring deserts. The city is inhabited by Jacobites, Nestorians, Jews, Mahometans, and Chaldean Christians, commonly called Christians of St John, which last are pretty numerous here.

The abbe Raynal values the merchandise annually brought to Bassora at 535,000l. of which the English furnish 175,000l. the Dutch 87,000l. and the Moors, Banians, Armenians, and Arabs, furnish the remainder. "The cargoes of these nations (says be) consist of rice, sugar; plain, striped, and flowered muslins from Bengal; spices from Ceylon and the Molucca islands; coarse white and blue cottons from Commandel; cardamom, pepper, sanders wood, from Malabar; gold and silver stuffs, turbans, shawls, indigo, from
from Surat; pearls from Baharen, and coffee from Mocha; iron, lead, and woollen cloth, from Europe. Other articles of less consequence are imported from different places. Some of these commodities are shipped on board small Arabian vessels; but the greater part is brought by European ships, which have the advantage of a considerable freight.

This merchandise is sold for ready money; and passes through the hands of the Greeks, Jews, and Armenians. The Banians are employed in changing the coin current at Bassora, for that which is of higher value in India.

The different commodities collected at Bassora are distributed into three channels. One half of them goes to Persia, whether they are conveyed by the caravans; there being no navigable river in the whole empire. The chief consumption is in the northern provinces, which have not been so much ravaged as those of the south. Both of them formerly made their payments in precious stones, which were become common by the plunder of India. They had afterwards recourse to copper utensils, which had been exceedingly multiplied from the great abundance of copper mines. At last they gave gold and silver in exchange, which had been concealed during a long scene of tyranny, and are continually dug out of the bowels of the earth. If they do not allow time for the trees that produce gum, and have been cut, to make fresh shoots; if they neglect to multiply the breed of goats which afford such fine wool, and if the silks, which are hardly sufficient to supply the few manufactures remaining in Persia, continue to be so scarce;—in a word, if this empire does not rise again from its ashes, the mines will be exhausted, and this source of commerce must be given up.

BASTARD, a natural child, or one begotten and born out of lawful wedlock.

The civil and canon laws do not allow a child to remain a bastard, if the parents afterwards intermarry; and herein they differ most materially from our law; which, though not so strict as to require that a child shall be begotten, yet makes it an indispensable condition that it shall be born, after lawful wedlock. And the reason of the law is surely much superior to that of the Roman, if we consider the principal end and design of establishing the contract of marriage, taken in a civil light; abstractedly from any religious views, which has nothing to do with the legitimacy or illegitimacy of the children. The main end and design of marriage, therefore, being to ascertain and fix upon some certain person, to whom the care, the protection, the maintenance, and the education of the children, should belong; this end is undoubtedly better answered by legitimating all issue born after wedlock, than by legitimating all issue of the same parties, even born before wedlock, so as wedlock afterwards ensues: 1. Because of the very great uncertainty there will generally be, in the proof that the issue was really begotten by the same man; whereas, by confining the proof to the birth, and not to the begetting, our law has rendered it perfectly certain, what child is legitimate, and who is to take care of the child. 2. Because, by the Roman law, a child may be continued a bastard, or made legitimate, at the option of the father and mother, by a marriage ex post facto; thereby opening a door to many frauds and partialities, which by our law are prevented. 3. Because by those laws a man may remain a bastard till 40 years of age, and then become legitimate by the subsequent marriage of his parents; whereas by the main end of marriage, the protection of infants, is totally frustrated. 4. Because this rule of the Roman law admits of no limitation as to the time, or number of bastards to be so legitimatized; but a dozen of them may, 20 years after their birth, by the subsequent marriage of their parents, be admitted to all the privileges of legitimate children. This is plainly an great discouragement to the matrimonial state; to which one main inducement is usually not only the desire of having children, but also the desire of procreating lawful heirs. Whereas, our constitution guards against this indelicacy, and, at the same time, gives sufficient allowance to the frailties of human nature. For if a child be begotten while the parents are single, and they will endeavour to make an early separation for the offence, by marrying within a few months after, our law is so indulgent as not to bastardize the child, if it be born, though not begotten, in lawful wedlock; for this is an incident that can happen but once; since all future children will be begotten, as well as born, within the rules of honour and civil society.

From what has been said it appears, that all children born before marriage are bastards by our law: and so it is of all children born so long after the death of the husband, that by the usual course of gestation, they could not be begotten by him. But this being a matter of some uncertainty, the law is not exact as to a few days. But if a man dies, and his widow soon after marries again, and a child is born within such a time as that by the course of nature it might have been the child of either husband: in this case he is said to be more than ordinarily legitimate; for he may, when he arrives to years of discretion, choose which of the fathers he pleases. To prevent this, among other inconveniences, the civil law ordained that no widow should marry infra annum luctus; a rule which obtained so early as the reign of Augustus, if not of Romulus; and the same constitution was probably handed down to our early ancestors from the Romans, during their stay in this island; for we find it established under the Saxon and Danish governments.

As bastards may be born before the coverture or marriage-state is begun, or after it is determined, so also children born during wedlock may in some circumstances be bastards. As if the husband be out of the kingdom of England (or as the law loosely phrases it, extra quatuor maria) for above nine months, so that no access to his wife can be presumed, her issue during that period shall be bastards. But generally during the coverture, access of the husband shall be presumed, unless the contrary shall be shown; which is such a negative as can only be proved by shewing him to be elsewhere; for the general rule is, presumption pro legitimatis. In a divorce à mensa et thoro, if the wife breeds children, they are bastards; for the law will presume the husband and wife conformable to the sentence of separation, unless access be proved: but in a voluntary separation by agreement, the law will suppose access, unless the negative be shown. So also, if there is an apparent impossibility of procreation on the part of the husband, as if he be only eight years old, or the like, there the issue of the wife shall be bastard. Likewise,
in case of divorce in the spiritual court at vinculo matrimonii, all the issue born during the coverture are bastards; because such divorce is always upon some cause that rendered the marriage unlawful and null from the beginning.

As to the duty of parents to their bastard children, by our law, it is principally that of maintenance. For though bastards are not looked upon as children to any civil purposes, yet the ties of nature, of which maintenance is one, are not so easily dissolved; and they hold indeed as to many other intentions; as particularly that a man shall not marry his bastard sister or daughter. The method in which the English law provides maintenance for them is as follows: When a woman is delivered, or declares herself with child, of a bastard, and will by oath before a justice of the peace charge any person having got her with child, the justice shall cause such person to be apprehended, and commit him till he gives security, either to maintain the child, or appear at the next quarter sessions to dispute and try the fact. But, if the woman dies, or is married, before delivery, or miscarries, or proves not to have been with child, the person shall be discharged; otherwise the sessions, or two justices out of sessions, upon original application to them, may take order for the keeping of the bastard, by charging the mother or the reputed father with the payment of money or other sustenance for that purpose. And if such putative father, or lewd mother, run away from the parish, the overseers, by direction of two justices, may seize their rent, goods, and chattels, in order to bring up the said bastard child. Yet such is the humanity of our laws, that no woman can be compulsively questioned concerning the father of her child till one month after her delivery; which indulgence is, however, very frequently a hardship upon parishes, by giving the parents opportunity to escape.

As to the rights and incapacities which appertain to a bastard: The former are very few, being only such as he can acquire; for he can inherit nothing, being looked upon as the son of nobody, and sometimes called filius nullius, sometimes filius populi. Yet he may gain a surname by reputation, though he has none by inheritance. All other children have their primary settlement in their father’s parish; but a bastard in the parish where born, for he hath no father. However, in case of fraud, as if a woman either be sent by order of justices, or comes to beg as a vagrant, to a parish which she does not belong to, and drops her bastard there, the bastard shall, in the first case, be settled in the parish from whence she was illegally removed; or in the latter case, in the mother’s own parish, if the mother be apprehended for her vagrancy. Bastards also, born in any licensed hospital for pregnant women, are settled in the parish to which the mothers belong. The incapacity of a bastard consists principally in this, that he cannot be heir to any one; for being nullius filius, he is therefore of kin to nobody, and has no ancestor from whom an inheritable blood can be derived: Therefore, if there be no other claimant upon an inheritance than such illegitimate child, it shall escheat to the lord. And as bastards cannot be heirs themselves, so neither can they have any heirs but those of their own bodies. For as all collateral kindred consists in being derived from the same common ancestor, and as a bastard has no legal ancestor, he can have no collateral kindred; and consequently can have no legal heirs, but such as claim by a lineal descent from himself. And therefore, if a bastard purchases land, and dies seized thereof without issue, and intestate, the land shall escheat to the lord of the fee. A bastard was also, in strictness, incapable of holy orders; and though that were dispensed with, yet he was utterly disqualified from holding any dignity in the church, but this doctrine seems now obsolete; and in all other respects there is no distinction between a bastard and another man. And really any other distinction but that of not inheriting, which civil policy renders necessary, would, with regard to the innocent offspring of his parent’s crimes, be odious, unjust, and cruel, to the last degree; and yet the civil law so boasted of for its equitable decisions, made bastards in some cases incapable even of a gift from their parents. A bastard may, lastly, be made legitimate, and capable of inheriting, by the transcendent power of an act of parliament, and not otherwise; as was done in the case of John of Gaunt’s bastard children, by a statute of Richard II.

As to the punishment for having bastard children: By the statute of 18 Eliz. c. 3. two justices may take order for the punishment of the mother and reputed father; but what that punishment shall be is not therein ascertained: though the contemporaneous exposition was, that a corporal punishment was intended. By statute 7 Jac. 1. c. 4. a specific punishment (viz. commitment to the house of correction) is inflicted on the woman only. But in both cases it seems that the penalty can only be inflicted, if the bastard becomes chargeable to the parish; for otherwise the very maintenance of the child is considered as a degree of punishment. By the last mentioned statute the justices may commit the mother to the house of correction, there to be punished and set on work for one year: and in case of a second offence, till she finds sureties never to offend again.

He that gets a bastard in the hundred of Middleton in Kent, forfeits all his goods and chattels to the king. If a bastard be got under the umbrage of a certain oak in Knollywood in Staffordshire, belonging to the manor of Terley castle, no punishment can be inflicted, nor can the lord nor the bishop take cognizance of it.

It is enacted by statute 21 Jac. 1. c. 27. that if any bastard woman be delivered of a child, which, if born alive, should by law be a bastard; and endeaours privately to conceal its death, by burying the child or the like; the mother so offending shall suffer death, as in the case of murder, unless she can prove by one witness at least that the child was actually born dead. This law, which savours pretty strongly of severity, in making the concealment of the death almost conclusive evidence of the child’s being murdered by the mother, is nevertheless to be also met with in the criminal codes of many other nations of Europe; as the Danes, the Swedes, and the French; but it has of late years been usual with us, upon trials for this offence, to require some sort of presumptive evidence that the child was born alive, before the other constrained presumption...
Bastard, therefore killed by its parent) is admitted to convict the prisoner.

Concerning bastards in Scotland, and the laws with regard to them, see Law.

Bastard, in respect of artillery, is applied to those pieces which are of an unusual or illegitimate make or proportion. These are of two kinds, long and short, according as the defect is on the redundant or defective side. The long bastards again, are either common or uncommon. To the common kind belong the double culverin extraordinary, half culverin extraordinary, quarter culverin extraordinary, falcon extraordinary, &c. The ordinary bastard culverin carries a ball of eight pounds.

Bastard is also an appellation given to a kind of faction or troop of banditti, who rose in Guinean about the beginning of the fourteenth century, and joining with some English parties, ravaged the country, and set fire to the towns. Mezeray supposes them to have consisted of the natural sons of the nobility of Guinean, who being excluded the right of inheriting from their fathers, put themselves at the head of robbers and plunderers to maintain themselves.

Bastard Flower-fence. See Adenanthera. The flowers of this plant bruised and steeped in milk are said to be gently anodyne; for which purpose they are often given in the West Indies to quiet very young children. The leaves are used instead of sena in Barbadoes and the Leeward Islands. In Jamaica, the plant is called sena.

Bastard Hemp. See Datisca, Botany Index. Bastard Rocket, Dyers-Weed, or Wild Wood. See Reseda, Botany Index.

Bastard Star-of-Bethlehem See Albuca, Botany Index.

Bastard-Scarlet is a name given to red dyed with bale madder, as coming nearest the bow-dye, or new scarlet.

Bastardy, is a defect of birth objected to one born out of wedlock. Eustathius will have bastards among the Greeks to have been in equal favour with legitimate children, as low as the Trojan war; but the course of antiquity seems against him. Potter and others show, that there never was a time when bastardy was not in disgrace.

In the time of William the Conqueror, however, bastardy seems not to have implied any reproach, if we may judge from the circumstance of that monarch himself not scrupling to assume the appellation of bastard. His epistle to Alan count of Bretagne begins, Ego Williulmus cognomento bastardus*.

Bastardy, in relation to its trial in law, is distinguished into general and special. General bastardy is a certificate from the bishop of the diocese, to the king's justices, after inquiry made, whether the party is a bastard or not, upon some question of inheritance. Bastardy special is a suit commenced in the king's courts against a person that calls another a bastard.

Arms of Bastardy should be cross'd with a bar, fillet, or traverse from the right to the left. They were not formerly allowed to carry the arms of their father, and therefore they invented arms for themselves; and this is still done by the natural sons of a king.
The officers of the staff took the charge of conveying
the letters of the prisoners to the police. They
were sent regularly at noon and at night: but if they desired
it, their letters were sent at any hour by express,
who were paid out of the money of those who were
confined. The answers were always addressed to the
major, who communicated them to the prisoner. If no
notice was taken of any request contained in the letter
of the prisoner, it was a refusal. The attendants whom
they appointed for those who were not allowed their own
servants, or who had none of their own, were commonly
invalid soldiers.

Sometimes a prisoner obtained permission of having
books, his watch, knife, and razors, and even paper
and ink. He might have asked to see the lieutenant
of the police when he came to the Bastile. This officer
commonly caused prisoners to be brought down some
days after their arrival. Sometimes he went to visit them
in their chambers.

When the lieutenant of the police saw a prisoner,
the conversation turned upon the cause of his confine-
ment. He sometimes asked for written and signed
declarations. In general, as much circumspicuousness was
necessary in these conferences as in the examination it-
self, since nothing that a person might have said or
written was forgotten.

When a prisoner wanted to transmit any thing to
the lieutenant of the police, it was always by means of the
major. Notes might have been sent to this officer
by the turnkeys. A person was never anticipated in
anything—he must have asked for everything; even
for permission to be shaved. This office was performed
by the surgeon; who also furnished sick or indisposed
prisoners with sugar, coffee, tea, chocolate, confec-
tions, and the necessary remedies.

The time of walking was an hour a day; sometimes
an hour in the morning and an hour in the evening, in
the great court.

A prisoner might have been interrogated a few days
after his entrance into the Bastile, but frequently this
was not done till after some weeks. Sometimes he was
previously informed of the day when this was to be
done; often he was only acquainted with it the mo-
moment he was brought down to the council-chamber.
This commission of interrogatory was executed by the
lieutenant of the police, a counsellor of state, a master
of requests, a counsellor or a commissioner of the Cha-
telet. When the lieutenant of the police did not him-
self interrogate, he usually came at the end of the ex-
amination.

The commissioners were purely passive beings. Fre-
cently they attempted to frighten a prisoner; they laid
snares for him, and employed the meanest artifices to
get a confession from him. They pretended proofs, ex-
hibited papers, without suffering him to read them: as-
serting that they were instruments of unavoidable con-
version. Their interrogatories were always vague.
They turned not only on the prisoner's words and
actions, but on his most secret thoughts, and on the
discourse and conduct of persons of his acquaintance,
whom it was wished to bring into question.

The examiners told a prisoner that his life was at

If the prisoner made the required confession, the
commissioners then told him, that they had no precise
authority for his enlargement, but that they had every
reason to expect it; that they were going to solicit it,
&c. The prisoner's confessions, far from being his
condition, gave occasion to new interrogatories, often
lengthened his confinement, drew in the persons with
whom he had connexions, and exposed himself to new
vexations.

Although there were rules for all occasions, yet every
thing was subject to exceptions arising from influence,
recommendations, protection, intrigue, &c. because the
first principle in this place was arbitrary will. Very
frequently, persons confined on the same account were
treated very differently, according as their recommenda-
tions were more or less considerable.

There was a library, founded by a foreign prisoner
who died in the Bastile in the beginning of the last
century. Some prisoners obtained leave to go to it; others,
to have the books carried to their chambers.

The falsest things were told the prisoners with an air
of sincerity and concern. "It is very unfortunate that
the king has been prejudiced against you. His ma-
jesty cannot hear your name mentioned without being
irritated. The affair for which you have lost your li-

erty is only a pretext—they had designs against you
before—you have powerful enemies." These discourses
were the etiquette of the place.

It would have been in vain for a prisoner to ask leave
to write to the king—he could never obtain it.

The perpetual and most insupportable torment of
this cruel and odious inquisition, were vague, indeter-
minate, false, or equivocal promises, inexhaustible and
constantly deceitful hopes of a speedy release, exhor-
tations to patience, and blind conjectures, of which
the lieutenant of the police and officers were very li-
vish.

To cover the odium of the barbarities exercised here,
and slacken the zeal of relations or patrons, the most
abundant and contradictory slanders against a prisoner
were frequently published. The true causes of impris-
onment, and real obstacles to release, were concealed.
These resources, which were infinitely varied, were in-
exhaustible.

When a prisoner who was known and protected had
entirely lost his health, and his life was thought in
danger, he was always sent out. The ministry did
not choose that persons well known should die in the
Bastile. If a prisoner did die there, he was interred
in the parish of St Paul, under the name of a domes-
tic;
and this falsity was written in the register of deaths, in order to deceive posterity. There was another register in which the true names of the deceased were entered; but it was made without great difficulty that extracts could be procured from it. The commissioners of the Bastille must have first been informed of the use the family intended to make of the extract.

In 1674, the baggage of Louis chevalier de Rohan, grand maître of France, having been taken and ransomed in a skirmish, some letters were found which caused a suspicion that he had treated with the English for the surrender of Havre de Grace. He was arrested and put into the Bastille. The Sieur de la Tuanderie, his agent, concealed himself. The proof was not sufficient. A commission was named to proceed against the accused for treason. La Tuanderie was discovered at Rouen: an attempt was made to arrest him; but he fired on the assailants, and obliged them to kill him on the spot. Persons attached to the chevalier de Rohan went every evening round the Bastille, crying through a speaking trumpet, “La Tuanderie is dead, and has said nothing;” but the chevalier did not hear them. The commissioners, not being able to get any thing from him, told him, “that the king knew all, that they had proofs, but only wished for his own confession, and that they were authorised to promise him pardon if he would declare the truth.” The chevalier, too credulous, confessed the whole. Then the perfidious commissioners changed their language. They said, “that with respect to the pardon, they could not answer for it: but that they had hopes of obtaining it, and would go and solicit it.” This they troubled themselves very little about; and condemned the criminal to lose his head. He was conducted on a platform to the scaffold, by means of a gallery raised to the height of the window of the armory in the arsenal, which looks towards the little square at the end of the Rue de la Tournelle. He was beheaded on November 27, 1674.

The Jesuits of the college of Clermont, in the Rue St. Jacques, Paris, having this same year (1674) invited the king (Louis XIV.) to honour with his presence a tragedy to be performed by their scholars, that prince accepted the invitation. These able courtiers took care to insert in the piece several strokes of flattery, with which the monarch, greedy of such incense, was greatly pleased. When the rector of the college was conducting the king home, a nobleman in the train applauded the success of the tragedy. Louis said, “Do you wonder at it? this is my college.” The Jesuits did not lose a word of this. The very same night they got engraved in large golden letters on black marble, Collège Lodoisci Magni, instead of the former inscription which was placed beneath the name of Jesus on the principal gate of the college (Collège Claramontanum Societatis Jesu); and in the morning the new inscription was put up in place of the old one. A young scholar of quality, aged 13, who was witness to the zeal of the reverend fathers, made the two following verses, which he posted up at night on the college gate:

Abestit hinc Jesum, posuitque insignia regis
Impia gens: altis non colit tilla Deum.

The Jesuits did not fail to cry out sacrilege: the young author was discovered, taken up, and put into the Bastille. The impecunious society caused him, as a matter of favour, to be condemned to perpetual imprisonment; and he was transferred to the citadel of the isle St. Marguerite. Several years after, he was brought back to the Bastille. In 1705 he had been a prisoner 31 years. Having become heir to all his family, who possessed great property, the Jesuit Riquelet, then confessor of the Bastille, demonstrated to his brethren on the necessity of restoring the prisoner to liberty. The golden shower which forced the tower of Danse had the same effect on the castle of the Bastille. The Jesuits made a merit with the prisoner of the protection they granted him; and this man of rank, whose family would have become extinct without the aid of the society, did not fail to give them extensive proofs of his gratitude.

Nowhere else on earth, perhaps, has human misery, by human means, been rendered so lasting, so complete, or so remediless. This the following case may suffice to evince; the particulars of which are translated from that elegant and energetic writer M. Mercier. The heinous offence which merited an imprisonment surpassing torture and rendering death a blessing, though for obvious reasons not specified by our author, is known from other sources to have consisted in some unguarded expressions implying disrespect concerning the late Gallic monarch Louis XV.

Upon the accession of Louis XVI. to the throne, the ministers then in office, moved by humanity, began their administration with an act of clemency and justice; they inspected the registers of the Bastille, and set many prisoners at liberty. Among those there was an old man who had groaned in confinement for 47 years between four thick and cold stone-walls. Hardened by adversity, which strengthens both the mind and the constitution, when they are not overpowered by it, he had resisted the horrors of his long imprisonment with an inscrutable and manly spirit. His locks white, thin, and scattered, had almost acquired the rigidity of iron; whilst his body, environed for so long a time by a coffin of stone, had borrowed from it a firm and compact habit. The narrow door of his tomb, turning upon its grating hinges, opened not as usual by halves; and an unknown voice announced his liberty, and made him depart. Believing this to be a dream, he hesitated; but at length rose up and walked forth with trembling steps, amazed at the space he traversed: The stairs of the prison, the halls, the court, seemed to him vast, immense, and almost without bounds. He stopped from time to time, and gazed around like a bewildered traveller: His vision was with difficulty reconciled to the clear light of day: He contemplated the heavens as a new object: His eyes remained fixed, and he could not even weep. Stupefied with the newly acquired power of changing his position, his limbs, like his tongue, refused, in spite of his efforts, to perform their office: at length he got through the formidable gate.

When he felt the motion of the carriage prepared to transport him to his former habitation, he screamed out, and uttered some inarticulate sounds; and as he could not bear this new movement, he was obliged to descend. Supported by a benevolent arm, he sought out the street where he had formerly resided: he found it, but no trace of his house remained; one of the publi
lic edifices occupied the spot where it had stood. He
now saw nothing that brought to his recollection, either
that particular quarter, the city itself, or the objects
with which he had formerly been acquainted. The
houses of his nearest neighbours, which were fresh in his
memory, had assumed a new appearance. In vain were
his looks directed to all the objects around him; he
could discover nothing of which he had the smallest re-
membrance. Terrified, he stopped and fetched a deep
sigh. To him, what did it import that the city was
peopled with living creatures? None of them were alive
to him; he was unknown to all the world, and he knew
nobody: And whilst he wept, he regretted his dunge-
on.

At the name of the Bastile, which he often pronounc-
ed and even claimed as an asylum, and the sight of his
clothes that marked a former age, the crowd gathered
round him: curiosity, blended with pity, excited their
attention. The most aged asked him many questions,
but had no remembrance of the circumstances he reca-
pitulated. At length accident brought in his way an
ancient domestic, now a superannuated porter, who,
confined to his lodge for 15 years, had barely sufficient
strength to open the gate:—Even he did not know the
master he had served; but informed him that grief and
misfortune had brought his wife to the grave 30 years
before, that his children were gone abroad to distant
climes, and that of all his relations and friends none
now remained. This recital was made with the indif-
ference which people discover for events long passed,
and almost forgot. The miserable man groaned, and
groaned alone. The crowd around, offering only un-
known features to his view, made him feel the excess of
his calamities even more than he would have done in the
dreadful solitude that he had left.

Overcome with sorrow, he presented himself before
the minister to whose humanity he owed that liberty
which was now a burden to him. Bowing down, he
said, "Restore me again to that prison from which
you have taken me: I cannot survive the loss of my
nearest relations; of my friends; and, in one word, of
a whole generation: Is it possible in the same moment
to be informed of this universal destruction, and not
to wish for death? This general mortality, which to
the rest of mankind comes slowly and by degrees, has
to me been instantaneous, the operation of a moment.
Whilst secluded from society, I lived with myself only;
but here I neither can live with myself nor with this
new race, to whom my anguish and despair appear only
as a dream. There is nothing terrible in dying; but it is
dreadful indeed to be the last." The minister
was melted; he caused the old domestic to attend this
unfortunate person, as only he could talk to him of his
family. This discourse was the single consolation that he
received: for he shunned all intercourse with a new
race, born since he had been exiled from the world;
and he passed his time in the midst of Paris in the same
solitude as he had done whilst confined in a dungeon for
almost half a century. But the chagrin and mortifica-
tion of meeting no person who could say to him, We
were formerly known to another, soon put an end to
his existence.

Such was the nature of this celebrated fortress.
Many of our readers will probably recollect that it was
attacked and taken by the Parisian mob on the 14th
July 1789. At that time only seven prisoners were
found in it, and it did not appear that any of them were
the victims of tyranny or wanton oppression.

BASTIMENTOS, the name of some small islands
near Terra Firma in South America, at the mouth of
the bay of Nombre de Dios.

BASTINADO. See BASTANDO.

BASTION, in the modern fortification, a huge mass
of earth, faced usually with sods, sometimes with brick,
and rarely with stone, standing out from a rampart
whereof it is a principal part, and is what, in the an-
cient fortification, was called a buttwark.

Solid Bastions, are those that have the void space
within them filled up entirely, and raised of an equal
height with the rampart.

Void and Hollow Bastions, are those that are only
surrounded with a rampart and parapet, having the
space within void and empty, where the ground is so
low, that, if the rampart be taken, no retrenchment
may be made in the centre, but what will lie under the fire
of the besieged.

Flat Bastion, is a bastion built in the middle of the
curtain, when it is too long to be defended by the ba-
ston at its extremes.

Cut Bastion, is that whose point is cut off, and in-
stead thereof has a re-entering angle, or an angle in-
wards, with two points outwards; and is used either
when without such a contrivance the angle would be
too acute, or when water or some other impediment
hinders the carrying on the bastion to its full extent.

Composed Bastion, is when two sides of the interior
polygon are very unequal, which makes the gorges also
unequal.

Deformed Bastion, is when the irregularity of the
lines and angles makes the bastion out of shape; as when
it wants one of its demigorges, one side of the interior
polygon being too short.

Demi-Bastion, is composed of one face only, and
but one flank, and a demigorge.

Double Bastion, is that which is raised on the place
of another bastion.

Regular Bastion, is that which has its true propor-
tion of faces, flanks, and gorges.

Bastion of France, a fortress on the coast of Bar-
bar, belonging to the French.

BASTITANI, in Ancient Geography, a people of
the province of Batetica in Spain. See BATICA.

BASTOGNE, a small town of the Netherlands,
in the duchy of Luxembourg. E. Long. 6. o. N. Lat.
50. 10.

BASTON, in Law, one of the servants to the war-
den of the Fleet-prison, who attended the king's courts
with a red staff, for taking into custody such as are com-
mitted by the court. He also attends on such prisoners
as are permitted to go at large by license.

BASTON, or Batton, in Architecture, a moulding in
the base of a column, called a Paethnic.

BASTON, Baton, or Bateau. This word is French,
and signifies a staff or cudgel: it should be spelt Baton;
but is, by most English writers, corruptly spelt as
above. It is only borne in English coats of arms, as
a badge of illegitimacy; but French heralds intro-
duce it in arms as a difference, or mark of consci-
quinity.

BASTON, Robert, a Carmelite monk, afterwards
prior
prior of the convent of that order at Scarborough, and also poet laureat and public orator at Oxford, flourished in the fourteenth century. King Edward I. in his expedition into Scotland in 1304, took Robert Bacon with him, in order to celebrate his victories over the Scots; but our poet being taken prisoner, was obliged to change his note, and sing the successes of Robert Bruce. He wrote several books in Latin, on the wars of Scotland, the Luxury of Priests, Synodical Sermons, &c., and also a volume of tragedies and comedies, in English. He died about the year 1310.

BASTONADO, BASTONADE, the punishment of beating or drubbing a criminal with a stick. The word is formed of the French baston, a "stick" or "staff." The bastonade was a punishment used both among the ancient Greeks, Romans and Jews, and still obtains among the Turks. The Romans called it fustigatio, fustium adminitio, or fustibus baud, which differed from the flagellatio, as the former was done with a stick, the latter with a rod or scourge. The fustigation was a lighter punishment, and inflicted on freemen; the flagellation a severe, and reserved for slaves. It was also called tympanum, because the patient here was beaten with sticks, like a drum.—The punishment is much in use in the east to this day. The method there practised is thus: the criminal being laid on his belly, his feet are raised, and tied to a stake, held fast by officers for the purpose; in which posture he is beaten with a cudgel on the soles of his feet, back, chin, &c. to the number of 100 or more blows.

BASTWICK, Dr. JOHN, born at Writtle in Essex, in 1559; practised physic at Colchester; but being a man of warm imagination, and a good Latin scholar, applied himself to writing books against popery. About the year 1633, he printed in Holland a Latin treatise, entitled Elenchi religiosi Pontificum, with Flagellum pontificis et episcoporum Latinum, in which the English prelates thinking themselves also aimed at, he was fined 1000l. in the high court commission, excommunicated, prohibited practising physic, his books ordered to be burnt, and himself to remain in prison until he had made a recantation. Instead of recanting, he wrote in prison, Apologia ad praesides Anglicos: and another book, called, The Liturgy; wherein he severely exclaimed against the proceedings of that court, and taxed the bishops with an inclination towards popery. Prynn and Burton coming under the lash of the star-chamber court at the same time, they were all censured as scandalous seditionists persons, condemned to a fine of 5000l. each, to be pilloried, to lose their cars, and to perpetual imprisonment in three remote parts of the kingdom. The parliament in 1640 reversed these proceedings; and ordered Dr Bastwick a reparation of 5000l. out of the estates of the commissioners and lords who had persecuted him, which the ensuing confusions prevented his receiving; however, his wife had, in 1644, an allowance ordered for her and her husband's maintenance. What became of him afterward is not known.

BAT, in Zoology. See Vespertilio, Mammalia Index.

BAT-Fowling, a method of catching birds in the night, by lighting some straw, or torches, near the piece where they are at roost; for upon beating them Vol. III. Part II.

up, they fly to the flame, where, being amazed, they are easily caught in nets or beat down with bushes fixed to the end of poles, &c.

BAT, Bate, or Bats, a small copper coin, mixed with a little silver, current in several cities of Germany: it is worth four crussers. It is also a coin in Switzerland, current at five livres, or 100 sols, French money.

BATABLE, or Destable Ground, that land which lay between Scotland and England, when the kingdoms were distinct, to which both nations pretended a right.

BATACALLA, a small kingdom on the coast of Malabar in the East Indies. It had a very large town of the same name; but there is nothing now left, except 12 or 12 small pagods covered with copper and stone. The country produces a good deal of pepper: the English formerly had a factory here; but were all massacred by the natives, because one of their bulldogs had killed a consecrated cow.

BATACALLA, a fortified town and castle on the east coast of the island of Ceylon in the East Indies. The Dutch drove away the Portuguese, and possessed themselves of part of the adjacent country. E. Long. 81° 3'. N. Lat. 7° 55'.

BATANISTS, or Batenites. See Batenites.

BATASEK, a town of Lower Hungary, seated on the Danube, in E. Long. 19° 50'. N. Lat. 46° 30'.

BATAVA (Castra understood), a citadel of Vindeция, so called from the Cohors Batava, in garrison under the commander in Rhedia: now Passau: being first called Batur, from the Batavi; then Bassau: and Passau: situated in Bavaria, at the confluence of the Danube, Inn, and Iils. See Passau.

BATAVIA, the capital of the Dutch settlements in the East Indies; a city of the kingdom of Bantam in the island of Java. See Java.

BATAVORUM INSULA, the island of the Batavians, in Ancient Geography. Of this island Tacitus gives the following description. "The Rhine flowing in one channel, or only broken by small islands, is divided, at its entering Batavis, as it were into two rivers. One continues its course through Germany, retaining the same name, and violent current, till it falls into the ocean. The other washing the coast of Gaul, with a broader and more gentle stream, is called by the inhabitants Vahalas; which name it soon changes for that of Mona, by the immense mouth of which river it discharges itself into the same ocean." According to Tacitus, therefore, the island of the Batavians was bounded by the ocean, the Rhine, and the Vahalas, now the Wale. Caesar extends it to the Mona, or Meuse; but Pliny agrees with Tacitus. However, this island was of greater extent in Tacitus's time than in Caesar's; Drusus, the father of Germanicus, having by a new canal conveyed the waters of the Rhine into the ocean a considerable way north of the former mouth of that river. The Batavi were a branch of the Catti, who in a domestic sedition, being expelled their country, occupied the extremity of the coast of Gaul, at that time uninhabited, together with this island situated among shoals. Their name Batavi they carried with them from Germany; there being some towns in the territory of the Catti called Buttenberg, and Batterhausen. The bravery of the Batavi, especially the 3 M

horse,
BATH [458]

BATAVURIA, horse, procured them not only great honour from the Romans, being called their brothers and friends; but an exception from taxes, being obliged only to furnish men and arms. The modern name of this island is Bata or Bataio.

BATAVURIA Oppidum, in Ancient Geography, a town in the island of the Batavi, mentioned by Tacitus, without any particular name; which has given rise to several surmises about it, some supposing it to be Ninoguen, but Cluvierus, Batavudurium or Bataurum, both without the island; which situation renders both these places inadmissible, since Tacitus places this nameless town within the island.

BATCHelor. See BACHELOR.

BATE, GEORGE, an eminent physician, born at Maid's Morton, near Buckingham, in the year 1608. In 1629 he obtained a license, and for some years practised in and about Oxford: his practice was chiefly amongst the Puritans, who at that time considered him as one of their party. In 1637, he took his degree of doctor in physic, and became very eminent in his profession, so that when King Charles kept his court at Oxford, he was his principal physician. When the king's affairs declined, Dr Bate removed to London, where he accommodated himself so well to the times, that he became physician to the Charter-house, fellow of the college of physicians, and afterwards principal physician to Oliver Cromwell. Upon the Restoration, he got into favour with the royal party, was made principal physician to the king, and fellow of the Royal Society; and this, we are told, was owing to a report raised on purpose by his friends, according to Mr Wood, that he gave the protector a dose which hastened his death. Dr Bate wrote in Latin an account of the late commotions in England, and some other pieces. He died at his house in Hatton-garden, and was buried at Kingston upon Thames in Surrey.—There was another George Bate, who wrote a work entitled, "The Lives, Actions, and Execution, of the prime Actors and principal Con- trivers of that horrid Murther of our late pious and sacred King Charles L"

BATENITES, a sect of apostates from Mahometanism, dispersed through the East, who professed the same abominable practices with the Ismaelians and Kar-matians. The word properly signifies esoterici, or people of inward or hidden light.

BATES, WILLIAM, D. D. an eminent Presbyterian divine, born in November 1625. He was admitted in Emmanuel college, Cambridge, and from thence removed to King's college in 1644. He was one of the commissioners, at the conference in the Savoy, for reviewing the public liturgy, and was concerned in drawing up the exceptions against the Common Prayer; however, soon after the Restoration, he was appointed chaplain to King Charles II. and became minister of St Dunstan's in the West, but was deprived of that benefice for nonconformity. Dr Bates bore a good and amiable character; and was honoured with the friendship of the lord keeper Bridgman, the lord chancellor Finch, the earl of Nottingham, and Archbishop Tillotson. He was also, at the Restoration, the deanery of Litchfield; which he refused. He published Select Lives of illustrious and pious persons, in Latin; and since his death, all his works, except his Select Lives, have been printed in one volume in folio. He died in July 1699, in the 74th year of his age.

BATH, a city of Somersetshire in England, seated in W. Long. 2. 30. N. Lat. 51. 27. All the different names that this city has borne in different ages and languages have been taken from its medicinal waters, as the aqua Sulis, or "hot waters," of Tolemy; the Aqua Solis, or "waters of the sun," of Antonius; the Caer Baden, and Caer Eunant, i.e. "the city of baths," and "the city of ointment," of the Britains; and the Ackmanchester, i.e. "the city of valetudinarians," of the Saxons. The baths consist of the King's bath, the Queen's bath, the Cross-bath, the Hot-bath, the Luper's bath, and the duke of Kingston's bath. This place was of old a resort only for cripples and diseased persons; but now it is more frequented by the sound for pleasure than by the sick for health. The waters are very pleasant to the taste; and impregnated with a vitriolic principle, yielding, upon evaporation, a little neutral salt, and a calcareous earth and iron. They are very efficacious in strengthening the bowels and stomach, in relaxing the relaxed fibres, and invigorating the circulation. In bilious complaints they are counted specific; and proved serviceable in most nervous, paralytic, rheumatic, and gouty complaints. At the King's bath is a handsome pump-room, where the gentlemen and ladies go in a morning to drink the waters; and there is a band of music that plays all the time. In the Cross-bath is a monument of marble, representing the descent of the Holy Ghost attended by angels, erected by the earl of Melfort (who was secretary of state for Scotland) when King James II. met his queen here. The King's bath is a large basin of 65 feet 10 inches by 40 feet 10 inches, containing 346 tons 2 hogsheads and 35 gallons of water when filled to its usual height. In the middle is a wooden building with nches and seats for the accommodation of the bathers. There are also iron rings all round for them to hold by; and guides, both male and female, to attend them in the bath. The person intending to bathe puts on, at his own lodgings, a bathing dress of brown canvas hired for the purpose; and is carried in a close chair, of a particular make, to one of the slips which open into the bath. There he descends by steps into the water, where he is attended by a guide. Having staid six or seven minutes in the bath, he ascends again into the slip, where he puts off his bathing-dress, and being wrapped in blankets, is carried home to bed, where he lies for some time to encourage perspiration. The King's bath is overlooked by the company in the pump-room; and adjoining to it are places furnished with pumps to pour the hot streams on any particular part of the body. The Queen's bath communicates with the King's, from which it is filled; therefore the water of it is not so hot, being at a greater distance from the source. As the heat is here more moderate, the bathers descend first into the Queen's bath, and advance gradually to the centre of the other. In the year 1755, the abbey-house or priory, belonging to the duke of Kingston, was taken down in order to erect a more commodious pile of building; and in digging for the foundation, the workmen discovered, about twenty feet below the surface of the earth, the remains of Roman baths and sudatories constructed up

2
Bath, on an elegant plan, with floors suspended on pillars, and surrounded with tubulated bricks, for the conveyance of heat and vapour. These were supplied by a spring of hot water, of the same properties and temperature as of the King's-bath; and the sewer was found still entire, that conveyed the waste water into the river. The duke, having cleared the spring and the sewer, has erected several convenient baths and sudatories on the spot, where invalids may be accommodated at all hours, by night as well as by day. The two seasons are the spring and fall; but those who take the waters purely for their health do not regard the seasons, but drink them all the year round. There are a number of genteel sedan chairs, which carry people to any distance, not exceeding half a mile, for sixpence. The company assemble in the afternoon alternately at two stately rooms, to converse together, or play at cards. At a very pretty new theatre near the parade, plays are acted every other night; and there are balls twice a-week; for which and the rooms, as books at the libraries, the gentry generally subscribe. The city is surrounded with hills on all sides, except a little opening to the east and west, through which the Avon runs. This river, which has been made navigable to Bristol by act of parliament, washes the city on the east and south sides, and there is an elegant bridge over it. This city hath formerly had a slight wall, of which some part still remains, as well as one or two of its gates; but almost all the new buildings, and much the greatest and finest part of the city, is without the walls, particularly the fine square called Queen's-square, in the middle of which is a small garden, with gravel walks, and an obelisk in the centre. But the greatest ornament at Bath is the circus: it is of circular form, consisting of houses built on an uniform plan, with three openings at equal distances to the south, east, and west, leading into as many streets. The fronts of the houses, which are all three stories high, are adorned with three rows of columns in pairs, of the Doric, Ionic, and Corinthian orders, the frize embellished with sculpture. The whole has an air of magnificence, which cannot fail to strike the most indifferent spectator. In the centre of the area is a reservoir, or basin, filled by two or three springs rising in the neighbouring hills; whence the streets in this district are supplied with water. On the south side of the town are the north and south parades, two noble walks, paved with hewn stone, raised upon arches, facing each an elegant row of houses on one side, and having a stone balustrade on the other. These, with the two streets that join them, were planned and executed by Mr Wood, an able architect, who likewise built the square and projected the circus. The two public rooms stand between the north parade and Orange-grove; which last is a square planted with trees, having in the middle a stone obelisk, inscribed in Latin to the late prince of Orange, who recovered his health in consequence of drinking the Bath waters, and gave his name to this part of the town. Several new streets and rows have of late years been built on the north side of Bath, in the neighbourhood of the square, such as Grey-street, Minsham-street, Edgar-row, Harlequin-row, Bladud's-buildings, King's-head-street, and Brook-street. Their advantages for building here are very great, having excellent freestone, limestone, and slate, in the neighbourhood. One sort of their lime is as white as snow. The guild-hall of Bath stands in the market-place, and is said to be built on a plan of Inigo Jones, which, however, exhibits nothing worthy of that great architect: besides, one end of it has been rebuilt in a different style. The hall is ornamented with some portraits of the late prince of Wales and other remarkable personages; but the greatest curiosity of the place is a Minerva's head in bronze, a real antique, dug up in Stall-street, in the year 1725. Bath boasts a noble infirmary, or general hospital, for the reception of the sick and lame from all parts of the three kingdoms. It extends 100 feet in front, and 90 in depth, being capable of receiving 150 patients. Here was anciently a monastery, of which the present cathedral was the church. It is a venerable pile: the principal front of which is adorned with angles ascending and descending. There are three other churches in Bath, and several chapels and meeting-houses. Besides the infirmary, there are several other hospitals, houses, and charity schools. The corporation consists of a mayor; eight aldermen, of whom two are justices of the peace; and 24 common-council men. The city is extremely well provided with stage coaches, post coaches, chaises, machines, and waggons. Bath is the general hospital of the nation, and a great number of invalids find benefit from the waters: but as the city lies in a bottom surrounded by very high hills, the air is constantly overcharged with damp; and indeed this place is more subject to rain than most other parts in England. The markets are remarkably well supplied with provisions of all kinds at reasonable rates, particularly fish and poultry. They also afford excellent mutton fed upon Lansdown, one of the highest hills that overlook the city. This down, remarkable for its pure air, extends about three miles; and at the extremity of it there is a stone monument, with an inscription, erected to the memory of Sir Beville Granville, who was here killed in a battle which he fought with the parliament's army in the reign of Charles I. Bath sends two members to parliament. The earliest mention of Bath was bestowed on William Pultney in the end of Sir Robert Walpole's administration, but is now extinct. The population varies of course considerably, but it is estimated on a mean at 38,000.

Bath is joined with Wells to form a bishopric, called the diocese of Bath and Wells. The bishop's seat is at Wells, whose cathedral church was built by Ina, king of the West Saxons in 704, and by him dedicated to St Andrew. Several other of the West Saxon kings endowed it, and it was erected into a bishopric in 905, during the reign of King Edward the Elder. The present church was begun by Robert the 18th bishop of this see, and completed by his immediate successor, John de Villula, the 16th bishop, having purchased the city of Bath for 500 merks of King Henry I, transferred his seat to that city in 1088. From this, disputes arose between the monks of Bath and the canons of Wells, about the election of a bishop; but they were at last compromised by Robert the 18th bishop, who decreed, that henceforward the bishop should be styled from both places, and that the precedence should be given to Bath; that in the vacancy of the see, the bishop should be elected by a certain number of delegates from both churches; and that he should be installed.

3 M a

stalled
to of this knighthood, Tria juncta in uno, wrought upon a circle gules, with a glory or rays issuing from the centre, and under it the laced of white silk here-fore worn by the knights of the Bath. They have red breeches and stockings, and have white hats, with a plume of white feathers thereon. The king allowed the chapel of King Henry VII. to be the chapel of the order, and ordered that each knight's banner, with plates of his arms and style, should be placed over their several stalls, in like manner as the knights of the Garter in St George's chapel in the castle of Wind-sor; and he allowed them supporters to their arms. His Royal Highness Prince William, second son to the prince of Wales, on this occasion, was made the first knight-compassion, and his grace the duke of Montague grand master of the order, the dean of Westmin-ster (for the time being) dean of the order; the other officers of which are, Bath king of arms, a genealo-gist, register and secretary, gentleman usher, and messenger.

Bath, Balneum, a convenient receptacle of water for persons to wash or plunge in, either for health or pleasure. —Baths are distinguished into hot and cold; and these again are either natural or artificial. The natural hot baths are formed of the water of hot springs, of which there are many in different parts of the world; especially in those countries where there are or have evidently been volcanoes. The artificial hot baths consist either of water or of some other fluid made hot by art. The cold bath consists of water, either fresh or salt, in its natural degree of heat; or it may be made colder by art, as by a mixture of nitr, sal-ammoniac, &c. The chief hot baths in our coun-try are those of Bath and Bristol, in Somersethire; and those others of Buxton and Matlock, in Derbyshire; which latter, however, are rather warm or tepid than hot. The use of these baths is found benefi-cial in diseases of the head, as palsy, &c. in cutic-u-lar diseases, as leprosy, &c. obstructions and consti-pations of the bowels, the scurvy and stone, and in most diseases of women and children. The baths have performed many cures, and are commonly used as a last remedy in obstinate chronic diseases; where they succeed well, if they agree with the constitution of the patient: but whether they will agree or not, cannot be known without trial.

As to the origin of those hot waters, of which the natural hot baths are formed, we are very much in the dark. All that can be affirmed with certainty is, that where there are volcanoes, there also are hot springs in great abundance; but how the heat of the volcano should be constantly communicated to the waters of a spring for many ages, during a great part of which the volcano itself has lain in a dormant state, seems almost beyond the reach of investigation. Another thing that creates a great difficulty is, that the fire of a volcano must certainly lie very deep in the earth, and most probably shifts from place to place; but the waters of a spring must always issue from a place situated lower than the origin of the spring itself. Besides, though we should suppose the water to come from the top of a volcano itself, and consequently boiling hot, it could not be supposed to percolate far through cold earth, without losing all the heat it ac-quired from the volcano. From some observations, howe-
however, it certainly does appear, that there are some spots on the earth which have a power of producing heat within themselves, independent of any thing foreign; and that water is so far from being able to destroy this power, that it seems rather to promote and continue it. We know that water has this effect upon a mixture of iron filings and sulphur; but whatever quantities of similar substances we may suppose to be contained in the earth, we must also suppose to be destroyed by one great conflagration soon after they have begun to act upon each other, so that by their means no lasting heat in waters could be produced. Dr. Stukeley indeed would solve this, and several other phenomena, by making the fire and smoke of volcanoes the effects of electricity: but here sufficient proof is wanting; for electricity, even in its most powerful state, is not very apt to set bodies on fire. The thought, however, deserves attention; for if electricity is capable of setting a volcano on fire, it is undoubtedly capable of producing solfataras where it meets with proper materials, and from them springs of any degree of heat.

The cold bath is found one of the most universal and innocent remedies yet discovered, though still its use is not to be adopted without precautions.

Baths in vapour, the fume or steam of some decoction is received upon the body to promote a perspiration. These are also by some called Bainha Laconica.

Vapour baths are, when the patient is not plunged into what is prepared for the bath, but only receives its steam upon those parts of his body which require it: as in some distempers of the fundament and womb, where the patient sits and receives the fumes of some proper fomentation, &c. To these may be added the bagnio; where people are made to sweat by the heat of a room, and pouring on of hot water; after which they generally go into a hot bath or bagnio.

A peculiar sort of vapour bath was much used by the ancient Mexicans, and is still in use among the present Indians their descendants. According to the abbe Clavigero, these baths are built of raw bricks, and their form is similar to that of ovens for baking bread: but with this difference, that the pavement of the bath is a little convex, and lower than the surface of the earth; whereas that of most ovens is plain, and a little elevated for the accommodation of the baker. The greatest diameter of a bath is about eight feet, and its greatest height six. The entrance, like the mouth of an oven, is wide enough to allow a man to creep easily in. In the place opposite to the entrance there is a furnace of stone or raw bricks, with its mouth outward to receive the fire, and a hole above it to carry off the smoke. The part which unites the furnace to the bath, and which is about two feet and a half square, is shut with a certain dry stone of a porous texture. In the upper part of the vault there is a airhole, like that to the furnace. This is the usual structure of the temazcalli; but there are others that are without vault or furnaces, mere little square chambers, yet well covered and defended from the air. When any person goes to bathe, he first lays a mat within the temazcalli, a pitcher of water, and a bunch of herbs or leaves of maize. He then causes a fire to be made in the furnace, which is kept burning until the stones which join the bath and furnace are quite hot. The person who is to use the bath enters commonly naked, and generally accompanied for the sake of convenience, or on account of infirmity, by one of his domestics. As soon as he enters, he shuts the entrance close, but leaves the air-hole at top for a little time open, to let out any smoke which may have been introduced through the chinks of the stone; when it is all out be likewise stops up the air-hole. He then throws water upon the hot stones, from which immediately arises a thick steam to the top of the temazcalli. While the sick person lies upon the mat, the domestic drives the vapour downwards, and gently beats the sick person, particularly on the ailing part, with the bunch of herbs which are dipped for a little while in the water of the pitcher, which has then become a little warm. The sick person falls immediately into a soft and copious sweat, which is increased or diminished at pleasure, according to the case requires. When the evacuation desired is obtained, the vapour is let off, the entrance is cleared, and the sick person clothes himself, or is transported on the mat to his chamber; as the entrance to the bath is usually within some chamber of his habitation. This sort of bath, called temazcalli by the natives, has been regularly used in several disorders, particularly in fevers occasioned by costiveness. The Indian women use it commonly after childbirth, and so those persons who have been stung or wounded by any poisonous animal. It is undoubtedly a powerful remedy for all those who have occasion to carry off gross humours; and certainly it would be most useful in Italy, where the rheumatism is so frequent and afflicting. When a very copious sweat is desired, the sick person is raised up and held in the vapour; as he sweats the more nearer he is to it. The temazcalli is so common, that in every place inhabited by the Indians there are many of them.

Buxus. Dry, are those made of ashes, salt, sand, shreds of leather, and the like. The ancients had diverse ways of sweating by a dry heat; as by the means of a hot sand, stove-rooms, or artificial bagnios, and certain natural hot steams of the earth, received under a proper arch, or hot-house, as we learn from Celsus. They had also another kind of bath by insolation, where the body was exposed to the sun for some time, in order to draw forth the superfluous moisture from the inward parts; and to this day it is a practice in some nations to bury the body over with horse-dung, especially in chronic diseases, to digest and breathe out the humour that causes the distemper. In New England they make a kind of stoves of turf, wherein the sick are shut up to bathe or sweat.

The same name is sometimes also given to another kind of bath, made of kindled coals, or burning spirit of wine; the patient being placed in a convenient close chair for the reception of the fume, which rises and provokes sweat in a plentiful manner: care is here taken to keep the head out, and to secure respiration. This bath has been found very effectual in removing old obstructions in the limbs; and venereal complaints, and will often complete a cure left unperformed by salivation.

Some authors speak of bloody baths, bainha sanguinolenta,
Bat, prepared especially of the blood of infants, anciently supposed to be a kind of specific for the leprosy.

Bat's Metalline, those made of water impregnated with the scorion of metals. The most common and useful of this kind are those prepared with the scorion of iron, which abound with the earthy, saline, and sulphureous substance of the metal; and these are of excellent service for strengthening and bracing up the part to which they are applied, and recovering weak and decayed limbs; stopping various kinds of bleeding; and restoring the mucosal and hemmoroidal flux where obstructed; insomuch that they may well be substituted for the natural iron baths.

Adjacent to the smelting huts where metals are run from their ore, are to be found large quantities of the slag of copper, antimony, and cobalt, which abound with sulphur, vitriolic salt, and an earthy principle, make serviceable baths for strengthening the lost tone of the fibres, and relaxing them when they are too stiff. These baths have likewise a detoxifier and cleansing virtue; so that with prudence, and due regard to circumstances, they may be used on many occasions. The way of making these artificial baths is, either to take the slags as they come hot from the furnace, and else to heat them afresh, and throw them into hot water; which is afterwards to be used either in the way of bath, or fomentation, occasionally. There are other artificial baths, prepared of alum and quicklime, by boiling them together in fine rain-water. Such baths are highly serviceable in paralytic disorders and weakness of the limbs.

The pepper bath, or pfeffer wasser, on the Alps, is one of the most celebrated in Europe, and has been the subject of particular treatises, besides what has been said of it occasionally by Scheuchzer and others. It was first discovered in the year 1240, and is of the periodical kind. The water breaks forth in a dreadful place, scarce accessible to the subsoil, or indeed to men, unless of the greatest boldness, and such as are not in the least subject to dizziness. These baths have this singularity above all others, that they commonly break forth in May, and that with a sort of impetuousity, bringing with them beech leaves, crabs or other wood-fruit; and that their course lasts in September or October. Scheuchzer professes himself of opinion, that these waters are not impregnated with any minerals, or, if they do contain any, that their virtues in curing distempers and preserving health do not proceed from them. They are exceedingly clear, destitute of colour, taste, or smell.

Baths, Balnea, in Architecture, denote large pompous buildings among the ancients, erected for the sake of bathing. Baths made a part of the ancient gymnasia, though they were frequented more for the sake of pleasure than health.

The most magnificent baths were those of Titus, Ptolemaeus, and Diocletian, of which there are some ruins still remaining. It is said that at Rome there were 856 public baths. Fabricius adds, that the excessive luxury of the Romans appeared in nothing more visible than in their baths. Seneca complains, that the baths of plebeians were filled from silver pumps; and that the freedmen trod on gems. Macrobius tells us of one Sergius Oratus, a voluntary, who had pendant baths hanging in the air.

According to Dion, Mucenas was the first who made a bath at Rome; yet there are instances of public baths prior to this; but they were of cold water, small, and poorly decorated. Agrippa, in his ediliate, built 160 places for bathing, where the citizens might be accommodated, either with hot or cold gratia. After this example, Nero, Vespasian, Titus, Domitian, Severus, Giordani, Aurelian, Maximian, Diocletian, and most of the emperors who studied to gain the affections of the people, erected baths laid with the richest marble, and wrought according to the rules of the most delicate architecture. The rich had baths at home, and frequently very magnificent ones, especially after the time that the practice of pillaging the provinces had begun; but they only used them on extraordinary occasions. The great men, and even emperors themselves, sometimes bathed in public with the rest of the people. Alexander Severus was the first who allowed the public baths to be opened in the night-time during the heats of summer.

The Greek baths were usually annexed to palestra or gymnasium, of which they were considered as a part. These baths consisted of seven different apartments, usually separated from each other, and intermixed with other buildings belonging to the other sorts of exercises. These were, 1st, The cold bath, frigida lavatio; 2dly, The eleothesium, or room where they were anointed with oil; 3dly, The frigidarium, or cooling room; 4thly, The propignium, or entrance of the hypocaustum or stove; 5thly, The vaulted room for sweating in, or vapour-bath, called concamerata sudatio, or tepidarium; 6thly, The laconicum, or dry stove; 7thly, The hot bath, called calidarium lavatio.

As for the baths separate from the palestra, they appear to have been usually double, one for men, the other for women; but so near, that the same furnace heated both. The middle part was possessed by a large basin that received water by several pipes, and was surrounded by a balustrade, behind which there was an area for the reception of those who waited to use the bath. They were vaulted over, and only received light from the top.

In the Roman baths, the first part that appeared was a large basin, called αλεξάνδρια in Greek, and natatio or piscina in Latin. In the middle was the hypocaustum, which had a row of four apartments on each side, called balnearia: these were the stove, the bath, cold bath, and tepidarium. The two stoves, called laconicum and tepidarium, were circular and joined together. Their floor was hollow and suspended, in order to receive the heat of a large furnace, which was communicated to the stoves through the vacuities of their floor. This furnace also heated another room called vasarium, in which were three large brazen vessels called millaria, respectively containing hot, warm, and cold water; which were so disposed, that the water might be made to pass by siphons and pipes out of one or other of them into the bath, in order to adjust its temperature. The description is given by Vitruvius. At three in the afternoon, which is what Pliny calls hora octava et nona, the Romans all repaired to the baths, either the public or the private ones: this
was called the bath hour, hora balnei, which in winter was at nine, in summer at eight. The public baths were all opened at the sound of a bell, and always at the same hour. Those who came too late, stood a chance for bathing in cold water.

They began with hot water; after which, as the pores were now opened, and might give room for too plentiful a perspiration, they thought it necessary for their health to close them again, either with the cold bath, or at least with a sprinkling of cold water. During the bath, the body was scraped with a kind of knives, or small strikels, such as are still found in the cabinets of the curious. After bathing succeededunction and perfuming, from which they went fresh to supper.

The Romans, when they found their stomachs overcharged with meat, went to the bath, as we learn from Juvenal, who inveighs against those who, having gorged themselves with eating, were forced to go into the baths to give themselves relief. They found also that a bath was good to refresh themselves after some considerable fatigue or travel, as Celsus tells us; which makes Plautus say, that all the baths in this world were not sufficient to remove the weariness he felt. After Pompey's time, the humour of bathing was carried to great excess, by which many were ruined, several having brought themselves to such a pitch, that they could not bear food without bathing first. The emperor Titus is said to have lost his life thereby. Hence Pliny inveighs severely against those physicians who held, that hot baths digested the food. The emperor Hadrian first laid a restraint on the immediate humour of bathing, by a public edict, prohibiting all persons to bathe before the eighth hour.

dius of Agrippa, (thermae Agrippinianae.) were built of brick, but painted in enamel: those of Nero, thermae Neronesianae, were not only furnished with fresh water, but even had the sea brought into them: those of Caracalla were adorned with 200 marble columns, and furnished with 1600 seats of the same matter. Lipsius assures us they were so large, that 1800 persons might conveniently bathe in them at the same time. But the baths of Dioclesian, thermae Dioclesianae, surpassed all the rest in magnificence. One hundred and forty thousand men were employed many years in building them.

Great part of these, as well as those of Caracalla, are still standing; and with the vast high arches, the beautiful and stately pillars, the extraordinary plenty of foreign marble, the curious vaulting of the roofs, the prodigious number of spacious apartments, and a thousand other ornaments, make one of the greatest curiosities of modern Rome.

Bath, in Chemistry. Several kinds of apparatus employed to transmit heat are called baths; but the substances most frequently used by chemists for this purpose are water and sand. When water is employed, it is called Baineum Maria, or water bath; which is very much used, very convenient for many operations, and may be employed successfully for all degrees of heat inferior to that of boiling water. As water, when exposed to fire in any vessel from which it can evaporate, does only receive a determinate degree of heat, which always remains the same when once it has arrived at the boiling heat, it follows, that by the water bath, a degree of heat always equal may be transmitted with certainty. Further, this degree of heat being incapable of burning, or of communicating an empyreumatic quality to matters susceptible of it, the water bath has also the advantage of not exposing substances to this inconvenience. When vessels in which distillations and digestions are made, are placed in sand, then a sand bath is formed. This intermediate substance of sand is very convenient, to moderate the too great activity of the naked fire, and to transmit any degree of heat, from the weakest to a red heat. As this bath is attended with less trouble, and requires less apparatus than the water bath, it is much used in laboratories. Nothing is requisite for the sand bath, but an earthen or iron vessel full of fine sand, which is fitted into a furnace, and capable of containing the cucurbits, retorts, matresses, or other vessels containing the matter to be operated upon.

Bath, in Metallurgy, is used to signify the fusion of metallic matter in certain operations. In refining or cupelling, for example, the metals are said to be in bath when they are melted. When gold is purified by antimony, this semi-metal, melted, is called by some the bath of gold; alchemists, who consider gold as the king of metals, call antimony the bath of the king only; because in fact gold only can resist the action of antimony.

Bath, in Hebrew antiquity, a measure of capacity, containing the tenth part of an omar, or seven gallons and four pints, as a measure for things liquid; or three pecks and three pints, as a measure for things dry.

Bath-Kol, the daughter of a voice. So the Jews call one of their oracles, which is frequently mentioned in their books, especially the Talmud; being a fantastical way of divination invented by the Jews themselves, though called by them a revelation from God's will, which he made to his chosen people, after all verbal prophecies had ceased in Israel. It was in fact a method of divination similar to the sortes Virgiliana of the Heathens. For as, with them, the first words they happened to dip into, in the works of that poet, were a kind of oracle whereby they predicted future events; so with the Jews, when they appealed to Bath-kol, the first words they heard from any man's mouth were looked upon as a voice from heaven, directing them in the matter they inquired about. The Christians were not quite free from this superstition, making the same use of the book of the Scriptures as the Pagans did of the works of Virgil. It was practised by Heraclitus, emperor of the east, in the beginning of the seventh century: for, being at war with Chosroes king of Persia, and in doubt, after a successful campaign, where to take up his winter quarters, he consulted the book of the scriptures in this way of divination, and was determined thereby. In France, it was the practice for several ages to use this kind of divination at the consecration of a bishop, in order to discover his life, manners, and future behaviour. This usage came into England with the Norman conquest; for we are told, that at the consecration of William, the second Norman bishop of the diocese of Norwich, the words which first occurred on dipping into the Bible were, Not this man, but Barabbas: soon after which, William died, and Herbert de Lozinge, chief sinner breaker to King William Rufus, succeeded him; at whose consecration the words at which the Bible opened were the same which
which Jesus spoke to Judas the traitor; Friend, wherefore art thou come? This circumstance so affected Herbert, that it brought him to a thorough repentance of his crime; in expiation of which he built the cathedral church of Norwich, the first stone of which he laid in the year 1096.

BATHA, BATH, or BACHIA, a town of Hungary, and capital of a county of the same name, seated on the Danube. - F. Long. 20. 40. N. Lat. 46. 40.

BATHING, the act of using or applying a bath; that is, of immersing the body, or part of it, in water or other fluid.

Bathing is a practice of great antiquity. The Greeks, as early as the heroic age, are said to have bathed themselves in the sea, in rivers, &c. We even find mention in Homer of hot baths in the Trojan times; but these seem to have been very rare, and only used on extraordinary occasions. Athenaeus speaks of hot baths as unusual even in his age. In reality, public baths appear to have been discouraged, and even prohibited, by the ancient Greeks, who were contented to wash themselves at home in a sort of bathing tubs. The method of bathing among the ancient Greeks was, by heating water in a large vessel with three feet, and thence pouring it on the head and shoulders of the person seated in a tub for that purpose, who, at coming out was anointed with oil.

The Romans were also long before they came into the use of baths; the very name of which, thermae, shows they borrowed it from the Greeks. As the ancient Romans were chiefly employed in agriculture, their custom was, every evening after work, to wash their arms and legs, that they might sit down to supper with more decency: for it is to be observed, the use of linen was then unknown; and the people of that age went with their arms and legs bare, and consequently exposed to dust and filth. But this was not all; for every ninth day, when they repaired to the city, either to the nundine or to attend at the assemblies of the people, they bathed all over in the Tiber, or some other river which happened to be nearest them. This seems to have been all the bathing known till the time of Pompey, when the custom began of bathing every day. See BATH.

The Celtic nations were not without the use of bathing: the ancient Germans bathed every day, in warm water in winter, and in summer in cold. In England, the famous bath in Somersetshire is said by some to have been in use 200 years before Christ. Of this, however, it must be owned, we have but very slender evidence; but Dr Musgrave makes it probable that it was a place of considerable resort in Geta's time; there being still the remains of a statue erected to that general, in gratitude for some benefactions he had conferred upon it.

Although bathing, among the ancients, made, as it were, a part of diet, and was used as familiarly as eating or sleep; yet it was in high esteem among their physicians for the cure of diseases, as appears from Strabo, Pliny, Hippocrates, and Oribasius; whence frequent exhortations to washing in the sea, and plunging into cold water. The first instance of cold bathing, as a medicine, is Melampus's bathing the daughters of the king of Argos; and the first instance of warm bathing is Medea's use of it, who was said to boil people alive, because Pelias king of Thessaly died boiling in a warm bath under her hands. The cold bath was used with success by Antonius Musa, physician to the emperor Augustus, for the recovery of that prince; but fell into neglect after the death of Marcellus, who was thought to have been destroyed by the improper use of it. It was again brought into request towards the close of the reign of Nero, by means of a physician of Marseilles named Charmis; but during the ignorance of the succeeding ages, the practice was again banished for a long time. Both hot and cold bathing are now prescribed in many cases by the physicians, though they are not agreed as to the manner in which they operate on the human body. See MEDICINE. Index.

Bathing among the Turks, as among the ancients, makes a part of diet and luxury; and in every town, and even village, there is a public bath. Indeed, the necessity of cleanliness, in a climate where one perspires so copiously, has rendered bathing indispensable; the comfort it produces preserves the use of it; and Mahomet, who knew its utility, has reduced it to a precept. Of these baths, and the manner of bathing, particularly at Cairo, the following account is given by M. Savary in his Letters on Egypt.

"The first apartment one finds in going to the bath, is a large hall, which rises in the form of a rotunda. It is open at the top, to give a free circulation to the air. A spacious estrade, or raised floor, covered with a carpet, and divided into compartments, goes round it, on which one lays one's clothes. In the middle of the building, a jet-d'eau spouts up from a basin, and agreeably entertains the eye. When you are undressed, you tie a napkin round your loins, take a pair of sandals, and enter into a narrow passage, where you begin to be sensible of the heat. The door shuts to; and at 20 paces off, you open a second, and go along a passage, which forms a right angle with the former. Here the heat increases. They who are afraid of suddenly exposing themselves to a stronger degree of it, stop in a marble hall, in the way to the bath properly so called. The bath is a spacious and vaulted apartment, paved and lined with marble, around which there are four closets. The vapour incessantly arising from a fountain and cistern of hot water, mixes itself with the burning perfumes. These, however, are never burnt except the persons who are in the bath desire it. They are mixed with the steam of the water, and produce a most agreeable effect.

"The bathers are not imprisoned here, as in Europe, in a sort of tub, where one is never at one's ease. Extended on a cloth spread out, the head supported by a small cushion, they stretch themselves freely in every posture, whilst they are wrapped up in a cloud of odoriferous vapours, which penetrate into all their pores. After reposing there some time, until there is a gentle moisture over the whole body, a servant comes, presses you gently, turns you over, and when the limbs are become supple and flexible he makes all the joints crack without any difficulty. He masses * and seems to knead away the flesh without making you feel the smallest pain. This operation finished, he puts on a stuff glove, and rubs you a long time. During this operation, he detached from the body of the patient, which is running through with sweat, a sort of small scales, and removes even the
Bathing.

the imperceptible dirt that stops the pores. The skin becomes soft and smooth like satin. He then conducts you into a closet, pours the lather of perfumed soap upon your head, and withdraws. The ancients did more honour to their guests, and treated them in a more voluptuous manner. Whilst Telemaechus was at the court of Nestor, the handsomest of the daughters of the king of Ithaca, led the son of Ulysses to the bath; washed him with her own hands; and, after anointing his body with precious oils, covered him with rich habiliments and a splendid cloak. Pisistratus and Telemaechus were not worse treated in the palace of Menelaus. "When they had admired its beauties, they were conducted to basins of marble, where a bath was prepared: Beautiful female slaves washed them; and, after anointing them with oil, covered them with rich tunics and superb pelisses.

The closet to which one is conducted is furnished with a cistern and two cocks; one for cold and the other for hot water. There you wash yourself. Soon after the servant returns with a deplorable pomatum, which in an instant makes the hair fall off the places it is applied to. Both men and women make general use of it in Egypt. It is composed of a mineral called res-mma; which is of a deep brown. The Egyptians burn it lightly, knead it with water, mixing it with half the quantity of slaked lime. This grayish paste applied to the hair, makes it fall off in two or three minutes, without giving the slightest pain.

"After being well washed and purified, you are wrapped up in hot linen, and follow the guide through the windings that lead to the outer apartment. This insensible transition from heat to cold prevents one from suffering any inconvenience from it. On arriving at the estrade, you find a bed prepared for you; and scarcely are you laid down before a child comes to press every part of your body with his delicate fingers, in order to dry you thoroughly. You change linen a second time, and the child gently grates the callousity of your feet with pumice stone. He then brings you a pipe and Mocha coffee.

"Coming out of a stove where one was surrounded by a hot and moist fog, where the sweat gathered from every limb, and transported into a spacious apartment open to the external air, the breast dilates, and one breathes with voluptuousness. Perfectly massed, and as it were regenerated, one experiences an universal comfort. The blood circulates with freedom; and one feels as if disengaged from an enormous weight, together with a suppleness and lightness to which one has been hitherto a stranger. A lively sensation of existence diffuses itself to the very extremities of the body. Whilst it is lost in delicate sensations, the soul, sympathizing with the delight, enjoys the most agreeable ideas. The imagination, wandering over the universe, which it embellishes, sees on every side the most enchanting pictures, everywhere the image of happiness. If life be nothing but the succession of our ideas, the rapidity with which they recur to the memory, the vigour with which the mind runs over the extended chain of them, would induce a belief that in the two hours of that delicious calm that succeeds the bath, one has lived a number of years."

Such are the baths, the use of which were so strong-

Vol. III. Part II.

ly recommended by the ancients, and which are still the delight of the Egyptians. It is by means of them that they prevent or dispel rheumatisms, catarrhs, and such cutaneous disorders as are produced by want of perspiration. Hence likewise they find a radical cure for that fatal evil which attacks the sources of generation, the remedy for which is so dangerous in Europe. By the same resource they get rid of that uncomfortable feeling so common to all nations who do not pay so much attention to the cleanliness of their bodies. M. Tournefort, indeed, who had used steam baths at Constantinople, where there is less refinement in them than at Cairo, is of opinion that they injure the breast. But, according to M. Savary, this is an error which further experience would have corrected. There are no people who make more frequent use of them than the Egyptians, and there is no country where there are fewer asthmatic people. The asthma is scarcely known there.

The women are passionately fond of these baths. They frequent them at least once a-week, and take with them slaves properly qualified for the purpose. More luxurious than the men, they use rose-water. It is there that female head-dressers form their long black hair into tresses, which they mix with precious essences instead of powder and pomatum. It is there that they blacken the edge of their eye-lids, and lengthen their eye-brows with coheb, a preparation of tin burnt with gall-nuts; it is there they stain the finger and toe-nails with the leaves of benné, a shrub common in Egypt, and which gives them a golden colour. The linen and clothing they make use of are passed through the sweet steam of the wood of aloes; and when the work of the toilet is at an end, they remain in the outer apartment, and pass the day in entertainments. Females entertain them with voluptuous songs and dances, or tell them tales of love.

The medical effects of bathing are considered under the article Bathing, in the Supplement.

BATHURST, Ralph, M. D. an eminent physician, poet, and divine, born in the year 1620. He studied divinity in Trinity college, Oxford; but the times of confusion coming on, he changed the course of his studies, and applied himself to physic. He took a doctor's degree in that faculty; in which he rose to such eminence, that he was in the time of the usurpation, appointed physician to the state. Upon the Restoration, he quitted his profession of physic; was elected a fellow of the Royal Society, and president of his college; and having entered into holy orders, he was made chaplain to the king, and afterwards dean of Wells. Soon after, he served the office of vice-chancellor of Oxford, and was nominated by King William and Queen Mary to the see of Bristol; which he refused to accept. His learning and talents were various. He was an orator, a philosopher, and a poet: he possessed an inexhaustible fund of wit, and was a facetious companion at 80 years of age. Ridicule was the weapon with which he used to correct the delinquents of his college; and he was so absolute a master of it, that he had it always at hand. His poetical pieces in the Musa Anglica are excellent in their kind. He wrote several poems, both in English and Latin; and died June 14, 1704, in the 84th year of his age.

BATHURST, Allen, earl of Bathurst, one of the last

wordiers
worthies of Queen Anne's reign, that shining period of triumphs, taste, genius, and elegance, was born in the year 1684. His studies and his education were equally conducive to the brilliant figure he was destined to make in social life and in the senate, as a polite scholar, a patriot, and a statesman. These talents he had an opportunity to display as early as the year 1705; when, at the request of his father Sir Benjamin Bathurst, and the solicitation of the constituents of Cirencester, he served in parliament for that borough, his native soil, with reputation and integrity. He distinguished himself particularly in the struggles and debates relative to the union between the two kingdoms, firmly supporting this measure, calculated to strengthen the vigour of government by its uniting force. Though he was contented to act a subordinate character in the great opposition planned by Mr Harley and Mr St John, his intimate friends, to sap the credit of the duke of Marlborough and his adherents, he was of infinite service to his party in arraigning, with spirit and eloquence, the conduct of the general and the earl of Godolphin, who had long governed the queen, and lavished the treasures of the nation on conquests more splendid than serviceable. The loss of the battle of Almanza seconded his efforts to dispel the intoxication of former successes. His personal regard for Lord Somers, president of the council, was never altered, though they were of different opinions in politics; and when he was divested of his office, Mr Bathurst acted with such tenderness and delicacy, as to preserve the esteem of Lord Somers in a private station. In consideration of his zeal and services, the queen advanced him, in 1711, to the dignity of a peer, by the title of Baron Bathurst, of Battlesden, in Bedfordshire.

His lordship continued to speak his sentiments with an undaunted freedom in the upper house; and kept forth as a formidable opponent to the court measures in the reign of George I. and during Sir Robert Walpole's administration. The acrimony of the prosecution carried on against the earl of Oxford, Lord Bolingbroke, and the duke of Ormond, stimulated his indignation and his eloquence against such vindictive proceedings; and he observed, "that the king of a faction was but the sovereign of half his subjects."

The South-sea scheme having infected the whole nation with a spirit of avaricious enterprise, the people awakened from their delirium, and an infinite number of families were involved in ruin. Lord Bathurst publicly impeached the directors, whose arts had enabled them by these vain expectations to amass surprising fortunes: he represented that the national honor was concerned in stripping them of their ill acquired wealth; and moved for having all the directors of the South-sea company punished by a forfeiture of their estates, for such a notorious act of sordid knavery.

When the bill was brought into the house of lords against Dr Atterbury bishop of Rochester, that learned prelate, who joined to the graces of style and elocution all the elegance of a just delivery, among the many friends the bishop's eloquence, politeness, and magnanimity had procured him, was Lord Bathurst. He spoke against the bill with great vehemence and propriety; observing, "that if such extraordinary proceedings were countenanced, he saw nothing remaining for him and others to do, but to retire to their country-houses, and there, if possible, quietly enjoy their estates with their own families, since the least correspondence, or intercepted letter, might be made criminal." Then turning to the bishops, he said, he "could hardly account for the inveterate hatred and malice some persons bore the ingenious bishop of Rochester, unless it was that they were intoxicated like the wild Americans, who fondly believe they inherit not only the spoils, but even the abilities, of the man they destroy." He was one of the lords who entered his protest against the bill.

His lordship was entirely averse to continental connections; and animadverted severely upon the monarch whose thoughts were turned to foreign concerns and alliances which could never be useful; complaining of the immense sums lavished in subsidies to needy and rapacious princes.

The directors of the charitable corporation having embezzled 500,000l. of the proprietors' capital, Lord Bathurst declared in the house of lords, his aberrance of this most iniquitous scene of fraud; asserting that not one shilling of the money was ever applied to the proper service, but became the reward of avarice and venality.

His lordship concurred, with all his power, in the opposition to Sir Robert Walpole, who now tottered on the brink of ruin. This minister, after obstinate struggles, having been forced to resign all his employments, Lord Bathurst was sworn of the privy council, and made captain of the gentlemen pensioners, which post he resigned in 1743. He was appointed treasurer to the present king, then prince of Wales, in 1757, and continued in the list of privy-councillors at his accession to the throne; but, on account of his great age, he chose to enjoy otium cum dignitate.

Lord Bathurst's integrity gained him the esteem even of his opponents; and his humanity and benevolence, the affection of all that knew him more intimately. He added to his public virtues all the good breeding, politeness, and elegance, of social intercourse. Dr Freind, Congreve, Vanbrugh, Swift, Prior, Rowe, Addison, Pope, Arbuthnot, Gay, and most men of genius in his own time, cultivated his friendship, and were proud of his correspondence.

Pope, in his Epistle to him on the Use of Riches, thus addresses him:

The sense to value riches, with the art
To enjoy them, and the virtue to impart;
To balance fortune by a just expense,
Join with economy magnificence;
With splendor, charity; with plenty, health;
O teach us, Bathurst, yet unspoil'd by wealth!
That secret race, between th' extremes to move,
Of mad good nature, and of mean self-love.

And Sterne, in his letters to Eliza, thus speaks of him: "This nobleman is an old friend of mine; he was always the protector of men of wit and genius; and has had those of the last century always at his table. The manner in which he met began of me, was as singular as it was polite. — He came up to me one day as I was at the princess of Wales's court. 'I want to know you, Mr Sterne; but it is fit you should know also who it is that wishes this pleasure: you have heard (continued he) of an old Lord Bathurst, of whom"
BATISTE, in commerce, a fine white kind of linen cloth, manufactured in Flanders and Picardy.

There are three kinds of batiste: the first very thin; the second less thin; and the third much thicker, called Holland Batiste, as coming very near the goodness of Hollands. They are used for neck-cloths, &c.

BATMAN, in commerce, a kind of weight used at Smyrna, containing six okes of 400 drams each, which amount to 16 pounds 6 ounces and 15 drams of English weight.

BATMANSON, John, prior of the Carthusian monastery, or Charter-house, in the suburbs of London. He was some time a student at Oxford, but it does not appear that he took any degree in that university. He was intimately acquainted with Edward Lee, archbishop of York, at whose request he wrote against Erasmus and Luther. He died in the year 1531, and was buried in the chapel belonging to the Charter-house. According to Bale, he was a proud forward person; and he says that Erasmus, in one of his letters to the bishop of Winchester, calls him an ignorant fellow. Pits, on the contrary, gives him the character of a man of singular genius, zeal, piety, and learning. He wrote, 1. Animadversiones in annotationes Erasmi in Nov. Testamentum. 2. A treatise against some of Luther's works. These two he afterwards retracted. 3. Commentaria in proverbia Solomonis. 4. In cantica cantorum. 5. De unica Magdalena. 6. Institutiones noviciorum. 7. De contemptu mundi. 8. De Christo duodenii. 9. On the words, Missus est, &c.

BATNEARS, or BATTIES, a people of the north of Hindostan. See SUPPLEMENT.

BATON, or BASTON. See BASTON.

BATRACHOMYOMACHIA, the Battle of the frogs and the mice, the title of a fine burlesque poem generally ascribed to Homer.—The subject of the work is the death of Psychrampus, a mouse, son to Toxartes, who being mounted on the back of Phygignathus, a frog, on a voyage to her palace, to which she had invited him, was seized with fear when he saw himself in the midst of the pond, so that he tumbled off and was drowned. Phygignathus being suspected to have shaken him off with design, the mice demanded satisfaction, and unanimously declared war against the frogs.

BATAE, in Ancient Geography, a people of Germany, formerly inhabitants of what is now called Hesse. Being dissatisfied with their situation there, they settled on the island formed by the Vahalis and Rhine, which from them took the name of Batavia, or Batavorum Insula. Their government was a mixture of monarchy, aristocracy, and democracy. Their chief was, properly speaking, nothing more than a principal citizen, whose business was rather to advise than to command. The principal men who exercised jurisdiction, and commanded the troops, in their respective districts, were chosen, as well as the kings, in an assembly of the people. A hundred persons selected from among the people, presided over every county, and acted as chiefs in the different hamlets. The whole nation was, in some measure, an army always in readiness. Each family composed a body of militia, which served under a captain of their own choosing. See BATAVORUM Insula.
BATTALIA, an army ranged in order of battle, or ready for engagement. The word seems formed from the Latin *batallia*, sometimes also written *batalia*, denoting a sort of military or gladiatorial exercise, as fighting with foils, or tilting at a post. In this sense, we meet with the depth of a battalia; to march in battalia, with the baggage in the middle; to break the battalia, &c. In the Roman battalia, the *hastati* made the front.

BATTALION, a small body of infantry, ranged in form of battle, and ready to engage. A battalion usually contains from 500 to 800 men; but the number it consists of is not determined. They are armed with firelocks, swords, and bayonets; and divided into 13 companies, one of which is a grenadiers. They are usually drawn up three men deep. Some regiments consist of but one battalion, others are divided into four or five.

BATTATAS, the Indian name of the potato. See *Convolvulus*.

BATTEL, a town of Sussex, five miles north-west of Hastings, situated in E. Long. 0. 35. N. Lat. 50. 55. It was formerly called *Epiton*; and is the place where William the Conqueror vanquished Harold king of England on October 14. 1066. William, in memory of this victory, erected an abbey, which he called Battel Abbey; and if a criminal could but reach this abbey, he was dismissed thence, and was afterwards in no danger for his past faults. The abbey was a large and noble structure, as may be judged by the gateway which is still entire, as well as from the other remains. This place is noted for making gunpowder equal to that of Dantzick; and the best goes by the name of Battel gunpowder. Population in 1811, 253.

BATTEL, or Law, or Trial by wager of battle, a species of trial of great antiquity, but now much disused. It seems to have owed its original to the military spirit of our ancestors, joined to a superstitious frame of mind; it being in the nature of an appeal to Providence, under an apprehension and hope (however presumptuous and unwarrantable), that Heaven would give the victory to him who had the right. The decision of suits, by this appeal to the God of battles, is by some said to have been invented by the Burgundians, one of the northern or German clans that planted themselves in Gaul. And it is true, that the first written injunction of judicial combats that we meet with, is in the laws of Gunderbal, A. D. 501, which are preserved in the Burgundian code. Yet it does not seem to have been merely a local custom of this or that particular tribe, but to have been the common usage of all those war-like people from the earliest times. And it may also seem, from a passage in Valerius Paternus, that the Goths, when first they became known to the Romans, were wont to decide all contests of right by the sword; for when Quintilius Varus endeavoured to introduce among them the Roman laws and method of trial, it was looked upon (says the historian) as a *novitas incognitae discipline, ut solita armis decerni jure terminarentur*. And among the ancient Goths in Sweden we find the practice of judicial duels established upon much the same footing as they formerly were in our own country.

This trial was introduced in England among other Norman customs by William the Conqueror; but was only used in three cases, one military, one criminal, and the third civil. The first in the court martial, or court of chivalry and honour; the second in appeals of felony; and the third upon issue joined in a writ of right, the last and most solemn decision of real property. For in writs of right the *ius proprietatis*, which is frequently a matter of difficulty, is in question; but other real actions being merely questions of the *ius possessivum*, which are usually more plain and obvious, our ancestors did not in them appeal to the decision of Providence. Another pretext for allowing it, upon these final writs of right, was also for the sake of such claimants as might have the true right, but yet by the death of witnesses or other defect of evidence be unable to prove it to a jury. But the most curious reason of all is given in the Mirror, that it is allowable upon warrant of the combat between David for the people of Israel of the one party, and Goliath for the Philistines of the other party: a reason which Pope Nicholas I. very seriously decides to be inconclusive. Of battel therefore on a writ of right we shall first speak; and although the writ of right itself, and of course this trial thereof, be at present disused; yet, as it is law at this day, it may be matter of curiosity, at least, to inquire into the forms of this proceeding, as we may gather them from ancient authors.

1. The last trial of battel that was waged in the court of common pleas at Westminster (though there was afterwards one in the court of chivalry in 1631, and another in the county palatine of Durham in 1638) was in the 13th year of Queen Elizabeth, A. D. 1571, as reported by Sir James Dyer; and was held in Tothill fields, Westminster, "*non sine magna furia consiliorum perturbatione*," saith Sir Henry Spelman, who was himself a witness of the ceremony. The form, as appears from the authors before cited, is as follows.

When the tenant in a writ of right pleads the general issue, viz. that he hath more right to hold than the demandant hath to recover; and offers to prove it by the body of his champion, which tender is accepted by the demandant; the tenant in the first place must produce his champion, who, by throwing down his glove as a gage or pledge, thus wages or stipulates battel with the champion of the demandant; who, by taking up the gage or glove, stipulates on his part to accept the challenge. The reason why it is waged by champions, and not by the parties themselves, in civil actions, is because, if any party to the suit dies, the suit must abate and be at an end for the present; and therefore no judgment could be given for the lands in question, if either of the parties were slain in battel: and also that no person might claim an exemption from this trial, as was allowed in criminal cases where the battel was waged in person.

A piece of ground is then in due time set out, of 60 feet square, enclosed with lists, and on one side a court erected for the judges of the court of common pleas, who attend there in their scarlet robes; and also a bar is prepared for the learned sergeants at law. When the court sits, which ought to be by surising, proclamation is made for the parties and their champions; who are introduced by two knights, and are dressed in a coat of armour, with red sandals, barelegged from the knee downwards, bareheaded, and with bare arms to the elbows. The weapons allowed them are only batons, or
or staves, of an all long, and a four-cornered leather target; so that death very seldom ensued this civil combat. In the court military, indeed, they fought with sword and lance, according to Spelman and Rushworth; and likewise in France: only villains fought with buckler and baton, gentlemen armed at all points. And upon this, and other circumstances, the president Montesquieu had with great ingenuity not only deduced the impious custom of private duels upon imaginary points of honour, but hath also traced the heroic madness of knight-errantry from the same original of judicial combats. But to proceed:

When the champions, thus armed with batons, arrive within the lists or place of combat, the champion of the tenant then takes his adversary by the hand, and makes oath that the tenements in dispute are not the right of the demandant; and the champion of the demandant, then taking the other by the hand, swears in the same manner that they are; so that each champion is, or ought to be, thoroughly persuaded of the truth of the cause he fights for. Next an oath against sorcery and enchantment is to be taken by both the champions, in this or a similar form: "Hear this, ye justices, that I have this day neither ate, drank, nor have upon me either bone, stone, nor grass; nor any enchantment, sorcery, or witchcraft, whereby the law of God may be abused, or the law of the devil exalted. So help me God and his saints."

The battle is thus begun, and the combatants are bound to fight till the stars appear in the evening: and, if the champion of the tenant can defend himself till the stars appear, the tenant shall prevail in his cause; for it is sufficient for him to maintain his ground, and make it a drawn battle, he being already in possession; but, if victory declares itself for either party, for him is judgment finally given. This victory may arise from the death of either of the champions: which indeed hath rarely happened; the whole ceremony, to say the truth, bearing a near resemblance to certain rural athletic diversions, which are probably derived from this original. Or victory is obtained if either champion proves recreant, that is, yields, and pronounces the horrible word of craven: a word of disgrace and obloquy, rather than of any determinate meaning. But a horrible word it indeed is to the vanquished champion; since, as a punishment to him for forfeiting the land of his principal by pronouncing that shameful word, he is condemned as a recreant, amittere liberram legem, that is, to become infamous, and not to be accounted liber et legulae homo; being supposed by the event to be proved forsworn, and therefore never to be put upon a jury, or admitted as a witness in any cause.

This is the form of a trial by battle; a trial which the tenant, or defendant in a writ of right, has in his election at this day to demand; and which was the only decision of such writ of right after the Conquest, till Henry II. by consent of parliament, introduced the ground assize, a peculiar species of trial by jury, in concurrence therewith; giving the tenant his choice of either the one or the other. Which example, of discountenancing these judicial combats, was imitated about a century afterwards in France, by an edict of Louis the Pious, A. D. 1262, and soon after by the rest of Europe. The establishment of this alternative, Clanvil, chief justice to Henry II. and probably his adviser herein, considers as a most noble improvement, as in fact it was, of the law.

2. In appeal of felony, the trial by battle may be demanded, at the election of the appellee, in either an appeal or an improvement; and it is carried on with equal solemnity as that on a writ of right; but with this difference, that there each party hires a champion, but here they must fight in their proper persons. And, therefore, if the appellant or approver be a woman, a priest, an infant, or of the age of 60, or lame, or blind, he or she may counterplead and refuse the wager of battle; and compel the appellee to put himself upon the country. Also peers of the realm, bringing an appeal, shall not be challenged to wage battle, on account of the dignity of their persons; nor the citizens of London, by special charter, because fighting seems foreign to their education and employment. So likewise, if the crime be notorious; as if the thief be taken with the mainour, or the murderer in the room with a bloody knife, the appellant may refuse the tender of battle from the appellee; and it is unreasonable an innocent man should stake his life against one who is already half-convicted.

The form and manner of waging battle upon appeals are much the same as upon a writ of right; only the oaths of the two combatants are vastly more striking and solemn. The appellee, when appealed of felony, pleads not guilty; and throws down his glove, and declares he will defend the same by his body: the appellee takes up the glove; and replies that he is ready to make good the appeal, body for body. And therefore, upon the appellee taking the book in his right hand, and in his left the right hand of his antagonist, swears to this effect: Hoc audis, homo, quem per manum tenes, &c. "Hear this, O man, whom I hold by the hand, who calleth thyself John by the name of baptism, that I, who call myself Thomas by the name of baptism, did not feloniously murder thy father, William by name, nor am any way guilty of the said felony. So help me God, and the saints; and this I will defend against thee by my body, as this court shall award." To which the appellee replies, holding the Bible and his antagonist's hand in the same manner as the other: "Hear this, O man, whom I hold by the hand, who callest thyself Thomas, by the name of baptism, that thou art perjured; and therefore perjured, because that thou feloniously didst murder my father, William by name. So help me God, and the saints; and this I will prove against thee by my body, as this court shall award." The battle is then to be fought, with the same weapons, viz. batons, the same solemnity, and the same oath against amulets and sorcery, that are used in the civil combat: and if the appellee be so far vanquished that he cannot or will not fight any longer, he shall be adjudged to be hanged immediately; and then, as well as if he be killed in battle, Providence is deemed to have determined in favour of the truth, and his blood shall be attained. But if he kills the appellant, or can maintain the fight from surprising till the stars appear in the evening, he shall be acquitted. So also, if the appellant becomes recreant, and pronounces the horrible word craven, he shall lose his liberam legem, and become infamous; and the appellee shall recover his damages, and also be for ever quit, not
only of the appeal, but of all indictments likewise for
the same offence.

BATTEN, a name that workmen give to a scant-
ing of wooden stuff, from two to four inches broad, and
about one inch thick; the length is pretty considerable,
but undetermined. This term is chiefly used in speak-
ing of doors and windows of shops, &c., which are not
framed of whole deal, &c., with stiles, rails, and pan-
nels like wainscot; but are made to appear as if they
were by means of these battens braded on the plain
board round the edges, and sometimes cross them, and
up and down.

BATTENBURG, a town of Dutch Guelderland,
seated on the north bank of the Meuse, almost opposite
to Ravenstein. E. Long. 5. 35. N. Lat. 50. 55.

BATTERING, the attacking a place, work, or
the like, with heavy artillery.

To batter in breach, is to play furiously on a work,
as the angle of a half-moon, in order to demolish and
make a gape therein. In this they observe never to
fire a piece at the top, but all at the bottom, from three
to six feet from the ground.

The battery of a camp is usually surrounded with a
trench, and palisadoes at the bottom, with two re-
doubts on the wings, or certain places of arms, capable
of covering the troops which are appointed for their
defence. See BATTERY.

BATTERING-RAM, in antiquity, a military engine
used to batter and beat down the walls of places be-
sieged. It is said to have been invented by Artemanes
of Clazomene, a Greek architect who flourished 441
B.C.—The machine is thus described by Josephus:
It is a vast beam, like the mast of a ship, strengthened
at the one end with a head of iron, something resembl-
ing that of a ram, whence it took its name. This
was hung by the middle with ropes to another beam,
which lay across two posts; and hanging thus equally
balanced, it was by a great number of men drawn
backwards and pushed forwards, striking the wall with
its iron head. But this engine did most execution
when it was mounted on wheels, which is said to have
been first done at the siege of Byzantium under Philip
of Macedon.

Plutarch informs us, that Mark Antony, in the
Parthian war, made use of a ram fourscore feet long;
and Vitruvius tells us, that they were sometimes 105,
and sometimes 120, feet in length; and to this per-
haps the force and strength of the engine was in a great
measure owing. The ram was managed at one time
by a whole century of soldiers; and they being spent,
were seconded by another century, so that it played
continually without any intermission.

Plate LXXXVIII. fig. 1, represents the battering-
ram suspended. 2. The ram. 3. The form of its head,
fastened to the enormous beam by three or four bands
of iron, four feet in breadth. At the extremity of
each of these bands (4) was a chain (5) of the same
metal, one end of which was fastened to a hook (6),
and at the other extremity of each of these chains was
a cable firmly bound to the last link. These cables
ran the whole length of the beam to the end of the
ram (7), where they were all bound together as fast
as possible with small ropes. To the end of these
cables another was fixed, composed of several strong
cords plaited together to a certain length, and then
running single (8). At each of these several men were
placed, to balance and work the machine. 10. The
chain or cable by which it hung to the cross beam (11),
fixed on the top of the frame. 12. The base of the
machine. — The suspended ram differed from this on-
ly in the manner of working it: for instead of being
slung by a chain or cable, it moved on small wheels on
another large beam.

BATTERING-RAM, in Heraldry, a bearing or coat
of arms resembling the military engine of the same
name.

BATTERY, in the military art, a parapet thrown
up to cover the gunners and men employed about the
guns from the enemy's shot. This parapet is cut into
embrasures, for the cannon to fire through. The height
of the embrasures on the inside is about three feet;
but they often sloping lower to the outside. Their wide-
ness is two or three feet, but open to six or seven on the
outside. The mass of earth that is betwixt two em-
brasures is called the merlon. The platform of a bat-
tery is a floor of planks and sleepers, to keep the wheels
of the guns from sinking into the earth; and is always
made sloping towards the embrasures, both to hinder
the reverse, and to facilitate the bringing back of the
gun.

BATTERY of Mortars differs from a battery of
guns; for it is sunk into the ground, and has no em-
brasures.

Cross-BATTERIES, are two batteries which play
athwart one another upon the same object, forming
there an angle, and beating with more violence and
destruction; because what one bullet shakes, the other
beats down.

BATTERY, Sunk or Buried, is when its platform is
sunk or let down into the ground, so that there must
be trenches cut out in the earth, against the muzzles
of the guns, for them to fire out at, and to serve for em-
brasures.

BATTERY d'Enfilade, is one that sweeps or occurs
the whole length of a straight line.

BATTERY en Echarpe is that which plays oblique.

BATTERY de Reverse, that which plays upon the en-
emy's back.

Comrade BATTERY, is when several guns play at
the same time upon one place.

BATTERY, in Law, is the unlawful beating of an-
other. The least touching of another's person willfully,
or in anger, is a battery, for the law cannot draw the
line between different degrees of violence, and there-
fore totally prohibits the first and lowest stage of it;
every man's person being sacred, and no other having
a right to meddle with it, in any the slightest manner.
And therefore, upon a similar principle, the Cornelian
law de injuriis prohibited pulsation as well as cer-
beration; distinguishing verberation, which was accom-
pained with pain, from pulsation which was attended
with none. But battery is in some cases justifiable or law-
ful; as where one who hath authority, a parent or
master, gives moderate correction to his child, his schol-
or, or his apprentice. So also on the principle of self-
defence: for if one strikes me first, or even only assau-
lants me, I may strike in my own defence; and if
sued for it, may plead son assault demence, or that it
was the plaintiff's own original assault that occasioned
it. So likewise in defence of my goods or possession,
if a man endeavors to deprive me of them, I may justly lay hands upon him and prevent him; and in case he persists with violence, I may proceed to beat him away. Thus too in the exercise of an office, as that of church warden or bundle, a man may lay hands upon another to turn him out of church, and prevent his disturbing the congregation. And if sued for this or the like battery, he may set forth the whole case, and plead that he laid hands upon him gently, mollaris manus imposuit, for this purpose. On account of these causes of justification, battery is defined to be the unlawful beating of another; for which the remedy is, as for assault, by action of trespass vis et armis: wherein the jury will give adequate damages.

BATTISTA, FRANCO, a celebrated painter, born at Venice, was one of the disciples of Michael Angelo, whose manner he followed so closely, that in the correctness of his outlines, he surpassed most of the masters of his time. His paintings are pretty numerous, and dispersed all over Italy and other parts of Europe; but his colouring being very dry, they are not much more esteemed than the prints etched by his hand. He died in 1561.

BATTLE, a general engagement between two armies in a country sufficiently open for them to encounter in front and at the same time (see War). The word is also written battell, battell, and battell. It is formed from the French battle, of the Latin verb batavare, to fence or exercise with arms: whence battaille and bataille, which properly denoted the action or exercise of those who learned to fence, and who were hence also denominated batautores.

The ancients never joined battle without much ceremony and preparation; as taking auguries, offering sacrifice, haranguing the soldiers, giving the word of aessera, &c. The signals of battle were, sounding the classicum or general charge, and displaying a peculiar flag, called by Plutarch a purple robe. To which may be added, singing psalms, raising military shouts, and the like. A Roman legion, ranged in order of battle, consisted of hastati, placed in the front; of principes, who were all old experienced soldiers, placed behind the former; and of triarii, heavy armed with large bucklers, behind the principes. The hastati were ranked close; the ranks of the principes were much opener, so that they could receive the hastati; and those of the triarii opener still, insomuch that they could receive both the principes and the hastati within them, without any disorder, and still facing the enemy. When therefore the hastati found themselves unable to stand the enemy's charge, they retired gently within the principes, where joining with them they renewed the combat. If these found themselves too weak to sustain the enemy, both retired among the triarii, where rallying, they formed a new corps, and charged with more vigour than ever. If these failed, the battle was lost: the Romans had no farther resource. The moderns are unacquainted with this method of inserting or embattling one company into another; without which the former cannot be well succoured or defended, and their places taken by others; which was a thing the Romans practised with great exactness. For the exiles, and in latter times the archers and slingers, were not drawn up in this regular manner, but either disposed of before the front of the hastati, or scattered up and down among the void spaces of the hastati, or sometimes placed in two bodies in the wings. These always began the combat, skirmishing in flying parties with the foremost troops of the enemy. If they were repulsed, which was usually the case, they fell back to the flanks of the army, or retired again in the rear.

When they retired, the hastati advanced to the charge. As to the cavalry, it was posted at the two corners of the army, like the wings on a body; and fought sometimes on foot, sometimes on horseback. The auxiliary forces composed the two points of the battle, and covered the whole body of the Romans.—Other less usual forms of battle among the Romans were the caneus, or wedge; globus, or round form; forfa, or pair of sheers; turris, or an oblong square figure; serra, or saw. The Greeks were inferior to the Romans in marshalling their armies for battle, as they drew up their whole army in a front, and trusted the success of the day to a single force. They had three forms of battle for the horse, viz. the square, the wedge, and the rhombus or diamond form. The first held best for the defensive; the latter for the offensive; the wedge being preferred as bringing most hands to fight.

The Greeks notified the places of their battles and victories by adding the word Mars, whence Nicomedes, Nicomedia, Thessalonica, &c. The ancient Britons did the like, by adding the word mainis, whence Maines, Maitland, Malmaisbury, &c. The English by the word field.—The Romans had their particular days, called praetorius dies, in which alone it was lawful to join battle, and others wherein it was unlawful, called dies atrii. The Athenians, by the ancient laws of their country, were not to draw out their forces for battle till after the seventh day of the month: And Lucian relates of the Lacedaemonians, that by the laws of Lycurgus, they were not to fight before full moon. Among the Germans, it was reputed an impiety to fight in the wane of the moon; and Caesar tells us, that Ariovistus was beaten by him, because, contrary to the laws of his country, he had fought when the moon was in her wane. The German soldiers were intimidated with the apprehension, and afforded Caesar an easy victory; acie commissa, impeditos religione hostes victis. It is well known that Jerusalem was taken by Pompey in an attack on the Sabbath-day, when by the Jewish superstitious notions, they were not allowed to fight, or even to defend themselves. The Romans did not carry their superstition so far: their atrii dies were only observed in respect of attacking; no day was too holy for them to defend themselves in. Among the ancients, we find frequent instances of battles in the night; it was by the moonlight that Pompey beat Mithridates, and Scipio Asdrubal and Syphax.

The first pitched battle, of which we have any distinct account is, that between Ceresus and Cyrus, described by Xenophon, concerning which we have a dissertation expressly by M. Fereet, wherein several points of the ancient tactics are well explained. In the modern war, we find few pitched or set battles; the chief view of the great commanders of late days is rather to harass or starve the enemy by frequent alarms, cutting off his provisions, carrying off his baggage, seizing his posts, &c. than to join issue with him, and put the whole on the event of one day; a battle generally deciding the fate of a campaign, sometimes of a whole war. Hence it is a rule never to venture a general
in 1866 to the kingy dignity, and on this occasion, Bavaria, and afterwards at the peace in 1809, enlarged his dominions at the expense of Austria. When the fortune of the war changed in 1813, Bavaria, like others of the small powers, endeavoured to secure the advantages she had gained by entering into terms with the stronger party; and at the peace of Paris in 1814, she was allowed to keep the greater part of his new acquisitions, restoring to Austria Salzburg and Berchtesgaden, with the parts of the Tirol and of the Hansruck formerly ceded to him. He obtained then also the greater part of what was formerly demeninated the palatinate of the Rhine, with the grand duchy of Wurtzburg. The whole kingdom of Bavaria at present embraces an area of 30,000 square English miles, and had a population of 3,560,000 in 1818. The revenue of Bavaria is the same year was estimated at 1,900,000l. ster. P; and the contingent of troops which it is bound to furnish to the German confederation is 35,600. About one-fourth or one-fifth of the inhabitants are Lutherans, the rest Catholics, with a small number of Calvinists and Jews. The Catholics were formerly distinguished by their bigotry and intolerance; but a great reformation has taken place in this and many other points since the present king ascended the throne. The greatest proportion of the numerous monasteries have been suppressed, and a part of the funds employed in endowing schools and academies. To crown these advantages, the king gave the nation a representative constitution in 1818; and Bavaria, which was lately the stronghold of ignorance and superstition, now bids fair to outstrip all her neighbours in the career of improvement. Munich is the capital. The country is fertile, but mountainous, and has mines of salt, coal, iron, and lead. Its vegetable productions are extremely various, and include chestnuts, Indian corn, and vines. Vast numbers of cattle are raised in the southern parts, and in the north there are considerable manufactures.

The house of Bavaria is universally allowed to be one of the most ancient in Germany. The counts of Scheyren, whose castle at present is a cloister, gave them the name. At that place are shown the tombs of more than 26 lords of Scheyren. The emperor Otho I established as counts-palatine of Bavaria and landgraves of Scheyren, Arnolph and Herman, sons of Arnolph brother to the duke of Berchtold of Carinthia, margrave of the county upon the Ets. After the death of Berchtold, the same emperor, instead of giving Bavaria to his son, gave it to Duke Henry his brother, who had married Judith sister to Arnolph and Herman. This Duke Henry of Bavaria had by his marriage with Isabella jansilson, who was succeeded by his son Henry, afterwards chosen emperor by the name of Henry II. This emperor having no children by Saint Conedogd his wife, Bavaria passed again to the family of Franconia, and afterwards to that of Suabia under Henry IV. who possessed it till the year 1071, when this last emperor gave that county to Count Wolf, or Guelph, of Ravensburg in Suabia. To this Guelph, who died in the island of Cyprus, succeeded Guelph II. and to him his brother Duke Henry IX. who was succeeded by his son Henry the Proud. This last had married the only daughter of the emperor Lotharius, and after the death of his father-in-law became also duke of Saxony; but refusing to deliver up the imperial ornaments of his father-in-law to the emperor Conrad III. duke of Sax-
university of Leyden, born at Lisse the 8th of August 1561. He began his studies at Aix-la-Chapelle, and continued them at Leyden. He removed from thence to Geneva, where he studied divinity. After residing here some time, he returned to Ghent, and from thence to Leyden, where he applied to the civil law, and was admitted doctor of law in June 1585. Soon after his admission, he accompanied the ambassadors from the States to England; and during his residence here became acquainted with several persons of distinction, particularly the famous Sir Philip Sidney. He was admitted advocate at the Hague the 5th of January 1587; but being soon tired of the bar, went to travel in France, where he remained 10 years. He was much esteemed in that kingdom, and gained many friends there. Achilles de Harlai, first president of the parliament of Paris, got him to be admitted advocate of the parliament of Paris in the year 1592. In 1602, he went to England with Christopher de Harlai, the president's son, who was sent ambassador to the court of London by Henry the Great. This same year Baudius having been named professor of eloquence at Leyden, went and settled in that university. He read lectures on history after the death of Morula, and was permitted also to do the same on the civil law. In 1611, the States conferred upon him the office of historiographer in conjunction with Mauricius; and in consequence thereof he wrote The History of the Truce. Baudius is an elegant prose writer, as appears from his letters, many of which were published after his death. He was also an excellent Latin poet. The first edition of his poems was printed in the year 1587: they consist of verses of all the different measures. He published separately a book of iambics in 1591, dedicated to Cardinal Bourbon. Some of his poems he dedicated to the king of England; others to the prince of Wales, in the edition of 1607, and went over to England to present them. He died at Leyden in 1613.

BAUDOBREGA, in Ancient Geography, a town of the Trevis in Germany; now Boppart, in the electorate of Triers. See BOPPART.

BAUDRAND, Michael Anthony, a celebrated geographer, born at Paris July 18, 1633. He traveled into several countries; and then applied himself to the revival of Ferrarius's Geographical Dictionary, which he enlarged by one half. He wrote, 1. Notes to Papirius Masso's description of the Rivers of France. 2. A Geographical and Historical Dictionary. 3. Christian Geography, or an Account of the Archbishops and Bishops of the whole world; and made several maps. He died at Paris, May 29, 1700.

BAUGE, a druggist manufactured in Burgundy, with thread spun thick and coarse wool.

BAUGE, a small town of Anjou, in France, in the department of Maine and Loire, seated on the river Coensoon. F. Long. 0. 10. N. Lat. 47. 30.

BAUHIN, John, a distinguished botanist, was born at Lyons in the year 1541. He was the son of an eminent physician who quitted France, his native country, on account of religion, and settled at Basel. In early life he travelled with Gesner, the celebrated naturalist, and collected plants in the Alps, in France, and Italy, for the purpose of the great botanical work which he afterwards accomplished. He practised medicine first at Basel, where he was also elected professor.
BAUIN, son of rhetoric in 1566. He resided some time at Yverdon; and was afterwards invited to be physician to the duke of Wirtzembourg at Montebellard, and in this situation he spent the remaining forty years of his life. He devoted his studies chiefly to botany, on which he bestowed great labour, comparing authors ancient and modern with each other, and with nature, and collecting information from all quarters. He likewise prosecuted other branches of natural history, and published an account of "Medicinal Waters throughout Europe," and especially in the duchy of Wurtzberg; and a particular account of the mineral spring of Boll, and the natural history of the place. His great work on plants was not completed at his death, which happened in 1613. A society at Yverdon published in 1619 the Prodromus of it; but it was not till 1650 and 1651 that the work itself appeared in three vols. fol. entitled Historia Plantarum nova et absolutissima, cum auctorum consensus et dissensus circa caus. Bauhin's son-in-law, Henry Cheveril, was also a contributor to the work. This is a great performance; and, with all its defects, has been pronounced by Haller to be without an equal. The plants are numerous, generally well described and discriminated, and many new species are added. It is still considered as a standard work; and the names of John Bauhin and his brother rank high among the founders and first promoters of botanical science.

BAUIN, Giuseppe, brother of the former, was born in 1566. He was early devoted to physic, and pursued his studies at Padua, Montpellier, and some of the celebrated schools in Germany. In his journeys he collected a number of plants which had escaped his brother's notice. Returning to Basel in 1580, he was admitted to the degree of doctor, and gave private lectures in botany and anatomy. In 1582 he was appointed to the Greek professorship in that university, and in 1588, to the anatomical and botanical chairs. He was at last made city physician, professor of the practice of medicine, rector of the university, and dean of his faculty. Thus distinguished and honoured, he acquired great reputation. He became eminent as a botanist, and was aided in his researches by the contributions of his disciples and friends in various parts of Europe. Haller gives him the character of being assiduous and laborious in collecting plants, by which he surpassed his brother in the number of them, and also in the accuracy of his figures; but he possesses less acuteness of judgment in distinguishing varieties, and detecting the same species under different names. He published several works relative to botany, of which the most valuable is his Pinax Theatri Botanici, seu index in Theophrasti, Dioscoridis, Plini, et botanicorum qui a seculo scripserunt opera, plantarum fere sex millium nominis, cum synonymis et differentiis. Opus XIV. annorum, 4to. The confusion that began to arise at this time from the number of botanical writers who described the same plant under different names, rendered such a task as this highly necessary; and though there are many defects in the execution, the Pinax of Bauhin is still a useful key to all writers before his time. Another great work which he planned was a Theatrum Botanicum, meant to comprise twelve parts, folio, of which he finished three, but only one was published. He also gave a very copious catalogue of the plants growing in the environs of Basel; and he edited the works of Mathius, with considerable additions.

Gaspard also wrote on anatomy, which he studied under Hieronymus ab Aquapendente, and pursued with vigour during his youth. The principal is Theatrum Anatomicum infantia locis, 4to. France, 1621; which is a kind of pinax of anatomical facts and opinions. He also published a collection of anatomical plates. He died in 1613.

BAUHINIA, MOUNTAIN EBONY. See BOTANY INDEX.

BAVINS, in War, brush faggots, made with the brush at length. See FASCINES; and FIRESHIPS, note (b).

BAUM, in Botany. See MELISSA, BOTANY INDEX.

BAUME, Anthony, a French chemist. See SUPPLEMENT.

BAUME, St., a mountain of Provence in France, between Marseilles and Toulon. Here Mary Magdalen is said to have died.

BAUMER-LE-NOEUIL, a town in France, in the department of Doubs, which had a rich nunnery, from whom it takes its name, seated on the river Doubs, in Long. 6° 20', Lat. 47° 12'. Five miles from this town is a remarkable cavern, whose entrance is 20 paces wide; and after descending 300 paces, the gate of a grotto is seen, twice as large as that of a city. The grotto is 35 paces deep, 60 wide, and is covered with a kind of vaulted roof, from which water continually drops. There is also a small brook, said to be frozen in summer, but not in winter; and at the bottom are stones that exactly resemble polished citron peel. When the peasants perceive a mist rising out of this cave, they affirm that it will certainly rain the next day.

BAUMEN, or BAUMAN, a cave of Lower Saxony, in Germany, about a mile from Wermigerode, and 18 from Goslar. The entrance is through a rock; and is so narrow, that not above one person can pass at a time. There are several paths in it, which the peasants have turned up, in searching for the bones of animals which they sell for unicorn's horns. Some think this cave reaches as far as Goslar; but be this as it will the skeletons of men have been found in it, who are supposed to have been lost in the turnings and windings.

BAUR, William, an eminent Flemish painter, was born at Strassburg, and was the disciple of Bredel. He was some time at Rome, where his studies were wholly employed about architecture and landscapes, which prevented his studying the antique. He painted small figures in distemper on vellum. He etched with great spirit. His largest works are in the historical way. He has given us many of the sieges, and battles, which wasted Flanders in the 16th century. They may be exact, and probably they are: but they are rather plans than pictures; and have little to recommend them but historic truth, and the freedom of the execution. His best pieces are some characters he has given us of different nations, in which the peculiarities of each are very well preserved. His Ovid is a poor performance. He died at Vienna in 1640.

BAUSK or Bauts, a small but important town in the duchy of Courland, on the frontiers of Poland, with a strong castle built on a rock. It was taken by the Swedes in 1625, and by the Russians in 1705, after
BAUX [475] BAX

It is situated on the river Musa, in E. Long. 24. 44.
N. Lat. 56. 30.

BAUTRY, or BAWTRY, a town in the west riding of Yorkshire, on the road from London to York. It has long been noted for millstones and grindstones brought hither by the river Idle, on which it is seated. W. Long. 1. 0. N. Lat. 53. 27.

BAUTZEN, or BODISSEN, a considerable town of Germany, and capital of Upper Lusatia, subject to the king of Saxony, with a strong citadel. Near this place a bloody battle was fought between the French and the allies in June 1813, in which the latter were defeated. E. Long. 14. 42. N. Lat. 51. 10.

BAUX, a town of Provence in France, now the department of the Mouts of the Rhone, with the title of a marquisate, seated on a rock, at the top of which is a strong castle. E. Long. 5. 0. N. Lat. 43. 42.

BAWD, a person who keeps a place of prostitution, or makes a trade of debauching women, and procuring or conducting of criminal intrigues. Some think the word is derived from the old French Baude, bold or impudent; though Verstegan has conjectured which would carry it higher, viz. from batte anciently written badde. In which sense baud originally import more than bath-holder, as if bagnio had anted the chief scenes of such prostitution.

The Romans had their male as well as female bawds; the former denominated leones and progores, among us panderers; the latter, lenae. Donatus, speaking of the habits of the ancient characters in comedy, says, Leno palis ovarii coloris utitur. But the ancient leones, it is to be observed, furnished boys as well as girls for venereal service. Another sort of these merchants or dealers in human flesh, were called mangores, by the Greeks αναγορακάρια, who sold eunuchs, slaves, &c. By a law of Constantine, bawds were to be punished by pouring melted lead down their throats. See the next article.

Bawdy-House, a house of ill fame, to which lewd persons of both sexes resort, and there have criminal conversation.

The keeping a bawdy-house is a common nuisance, not only on account that it endangers the public peace by drawing together debauched and idle persons, and promoting quarrels, but likewise for its tendency to corrupt the manners of the people. And therefore persons convicted of keeping bawdy-houses, are punishable by fine and imprisonment; also liable to stand in the pillory, and to such other punishment as the court at their discretion shall inflict. Persons resorting to a bawdy-house are likewise punishable, and they may be bound to their good behaviour.—It was always held infamous to keep a bawdy-house: yet some of our historians mention bawdy-houses publicly allowed here in former times till the reign of Henry VIII. and assign the number to be 18 thus allowed on the bank-side in Southwark. See STEWS and BROTHER.

Bawdy-houses are licensed in Holland, and pay a considerable tax to the state.

BAWLING, among sportsmen, is spoke of the dogs, when they are too busy before they find the scent good.

BAXTER, RICHARD, an eminent divine among the Nonconformists, was born at Rowton in Shropshire, November 12. 1615; and distinguished himself by his exemplary life, his pacific and moderate principles, and his numerous writings. He was remarkably for his piety even when he was very young. Upon the opening of the long parliament, he was chosen vicar of Kidderminster. In the heat of the civil wars he withdrew from that town to Coventry, and preached to the garrison and inhabitants. When Oliver Cromwell was made protector, he would by no means comply with his measures, though he preached once before him. He came to London just before the depositing of Richard Cromwell, and preached before the parliament the day before they voted the return of King Charles II. who upon his restoration appointed him one of his chaplains in ordinary. He assisted at the conference in the Savoy, as one of the commissioners for stating the fundamentals in religion, and then drew up a reformed liturgy. He was offered the bishopric of Hereford; which he refused; affecting no higher preferment than the liberty of continuing minister of Kidderminster; which he could not obtain, for he was not permitted to preach there above twice or thrice after the Restoration. Wherupon he returned to London, and preached occasionally about the city, till the act of uniformity took place. In 1662, Mr. Baxter was married to Margaret Charleton, daughter to Francis Charleton, Esq. of the county of Salop, who was esteemed one of the best justices of the peace in that county. She was a woman of great piety, and entered thoroughly into her husband's views concerning religion. During the plague in 1665 he retired into Buckinghamshire; but afterwards returned to Acton, where he staid till the act against conventicles expired; and then his audience was so large that he wanted room. Upon this he was committed to prison; but procuring a habeas corpus, he was discharged. After the indulgence in 1672, he returned to London; and in 1682 he was seized for coming within five miles of a corporation. In 1684 he was seized again; and if the reign of King James II. was committed prisoner to the King's Bench, and tried before the lord chief justice Jeffreys for his Paraphrase on the New Testament, which was called a scandalous and detestable book against the government. He continued in prison two years; from whence he was at last discharged, and had his fine remitted by the king. He died December the 8th 1691; and was buried in Christ-church.

Mr Sylvestre says, that Mr Baxter's "person was tall and slender, and stooped much: his countenance composed and grave, somewhat inclining to smile. He had a piercing eye, a very articulate speech, and deportment rather plain than complaiant." There is an original portrait of him at Dr Williams's library, founded for the use of Protestant Dissenting Ministers, in Red-cross street. Mr Sylvestre also says, that "he had a great command over his thoughts. He had that happy faculty, so as to answer the character that was given of him by a learned man dissenting from him, after discourse with him; which was that he could say what he would, and he could prove what he said. He was most intent upon the necessary things. Rational learning he most valued, and was a very extraordinary master of. And as to his expressive faculty, he spoke properly,
properly, plainly, pertinently, and pathetically. He could speak suitably, both to men's capacities and to the things insisted on. He was a person wonderful at extemporaneous preaching."

Mr Granger's character of him is too striking to be omitted. "Richard Baxter was a man famous for weakness of body and strength of mind; for having the strongest sense of religion himself, and exciting a sense of it in the thoughtless and profligate; for preaching more sermons, engaging in more controversies, and writing more books, than any other Nonconformist of his age. He spoke, disputed, and wrote with ease; and discovered the same intrepidity when he reproved Cromwell and expostulated with Charles II., as when he preached to a congregation of mechanics. His zeal for religion was extraordinary; but it seems never to have prompted him to faction, or carried him to enthusiasm. This champion of the Presbyterians was the common butt of men of every other religion, and of those who were of no religion at all. But this had very little effect upon him: his presence and his firmness of mind on no occasion forsook him. He was just the same man before he went into a prison, while he was in it, and when he came out of it; and he maintained an uniformity of character to the last gasp of his life. His enemies have placed him in hell; but every man who has not ten times the bigotry that Mr Baxter himself had, must conclude that he is in a better place. This is a very faint and imperfect sketch of Mr Baxter's character: men of his size are not to be drawn in miniature. His portrait, in full proportion, is in his Narrative of his own Life and Times; which though a rhapsody, composed in the manner of a diary, contains a great variety of memorable things, and is itself, as far as it goes, a History of Nonconformity."—Among his most famous works were, 1. The Saints Everlasting Rest. 2. Call to the Unconverted, of which 20,000 were sold in one year; and it was translated not only into all the European languages, but into the Indian tongue. 3. Poor Man's Family Book. 4. Dying Thoughts; and 5. A Paraphrase on the New Testament. His practical works have been printed in four volumes folio.

BAXTER, William, nephew and heir to the former, was an eminent schoolmaster and critic. He was born at Lanlugany in Shropshire, in the year 1650; and it is remarkable, that at the age of 18, when he first went to school, he knew not one letter nor understood one word of any language but Welsh; but he so well improved his time, that he became a person of great and extensive knowledge. His genius led him chiefly to the study of antiquities and philology, in which he composed several books. The first he published was a Latin Grammar, in 1679, entitled De Analogia seu Arte Latine Linguae Commentarius. He also published a new and correct edition of Anacreon, with notes; an edition of Horace; a Dictionary of the British antiquities, in Latin: and several other books. He was a great master of the ancient British and Irish tongues, was particularly skilled in the Latin and Greek, and in the northern and eastern languages. He died May 31, 1723, after being above 20 years master of Mercer's School in London.

BAXTER, Andrew, a very ingenuous metaphysical writer, was born in 1686 or 1687, at Old Aberdeen (where his father was a merchant), and educated in King's College there. His principal employment was that of a private tutor to young gentlemen; and among others of his pupils were Lord Gray, Lord Blantyre, and Mr Hay of Drummuizier. About 1724, he married the daughter of a clergyman in the shire of Berwick. A few years after he published in 4to, "An Inquiry into the Nature of the Human Soul, wherein its immateriality is evinced from the principles of reason and philosophy," without date. In 1741, he went abroad with Mr Hay, and resided some years at Utrecht; having there also Lord Blantyre under his care. He made excursions from thence into Flanders, France, and Germany; his wife and family residing, in the mean time, chiefly at Berwick-upon-Tweed. He returned to Scotland in 1747, and resided till his death at Whittingham, in the shire of East Lothian. He drew up, for the use of his pupils and his son, a piece entitled "Mutus; sive, Cosmochronia puellarum, Dialogus, In quo prima elementa de mundi ordine et ornatis prop unstur, &c.&c. This was afterwards greatly enlarged, and published in English, in two volumes 8vo. In 1750, was published, "An Appendix to his Inquiry into the Nature of the Human Soul:" wherein he endeavours to remove some difficulties which had been started against his notions of the vis inertiae of matter, by Maclaurin, in his "Account of Sir Isaac Newton's Philosophical Discoveries." To this piece Mr Baxter prefixed a dedication to Mr John Wilkes, with whom he had commenced an acquaintance abroad. He died April the 23rd, 1750, after suffering for some months under a complication of disorders, of which the gout was the chief. He left a wife, three daughters, and one son, Mr Alexander Baxter; from which last the authors of Biographia Britannica received, as they inform us, sundry particulars of his life.

His learning and abilities are sufficiently displayed in his writings. He was extremely studious, and sometimes sat up whole nights in reading and writing. His temper at the same time was very cheerful, and he was a friend to innocent merriment. It is said of Mr Baxter, that he entered with much good humour into the conversation and pleasures of young people, when they were of an innocent nature; and that he presided, all the time of his abode at Utrecht, at the ordinary which was frequented by all the young English gentlemen there, with much gravity and politeness, and in such a manner as gave universal satisfaction. He also frequented the most polite assemblies in that city, and his company and conversation were particularly acceptable to the ladies. So that Mr Baxter appears to have studied the graces, though without neglecting
Bay

Bay denotes likewise a pond-head made to keep in store of water for driving the wheels of the furnace or hammer belonging to an iron mill, by the stream that comes thence through a flood-gate called the pen-stock.

Bay-Colour denotes a sort of red inclining to chestnut, chiefly used in speaking of horse. In this sense, the word bay is formed from the Latin basus, or badius, and that from the Greek basae, a palm branch; so that basius or badius properly denotes color phaisicus. Hence also, among the ancients, those now called bay horses, were denominated epyt palmae. We have divers sorts and degrees of bays; as a light bay, a dapple bay, &c. All bay horses are said to have black manes; which distinguishes them from sorrels, which have red or white manes.

Bay, among huntsmen, is when the dogs have earthed a vermin, or brought a deer, boar, or the like, to turn head against them. In this case, not only the deer, but the dogs, are said to bay. It is dangerous going in to a hart at bay, especially at rutting-time; for then they are fiercest. There are bays at land, and others in the water.

Bay-Tree. See Laurus, Botany Index.
Bay-Salt. See Salt.

Baya, or Baja, a town of Lower Hungary, in the county of Bath, situated near the Danube. E. Long. 19. 30. N. Lat. 45. 25.

Bayard, Peter du Terrain de, esteemed by his contemporaries the model of soldiers and men of honour, and denounced The knight without fear and without reproach, was descended from an ancient and noble family in Dauphine. He was with Charles VII. at the conquest of the kingdom of Naples; when he gave remarkable proofs of his valour, especially at the battle of Fornoue. He was dangerously wounded at the taking of the city of Brescia: and there restored to the daughters of his host 2000 pistoles, which their mother had directed them to give him in order to prevent the house from being plundered; an action that has been celebrated by many historians. At his return to France, he was made lieutenant-general of Dauphine. He fought by the side of Francis I. at the battle of Marignan; and that prince afterwards insisted on being knighted by his hand, after the manner of the ancient knights. The chevalier Bayard defended Mezières during six weeks, against Charles V.'s army. In 1524, at the retreat of Rebec (the general Bonivet having been wounded and obliged to quit the field), the conduct of the rear was committed to the chevalier Bayard, who, though so much a stranger to the arts of a court that he never rose to the chief command, was always called, in times of real danger, to the posts of greatest difficulty and importance. He put himself at the head of the men at arms; and animating them by his presence and example to sustain the whole shock of the enemy's troops, he gained time for the rest of his countrymen to make good their retreat. But in this service he received a wound which he immediately perceived to be mortal; and being unable to continue any longer on horseback, he ordered one of his attendants to place him under a tree, with his face towards the enemy; then fixing his eyes on the guard of his sword, which he held up instead of a cross, he addressed his prayers to God; and in this posture, which became his character both as a soldier and as a Christian, he calmly waited.
waited the approach of death. Bourbon, who led the foremost of the enemy's troops, found him in this situation, and expressed regret and pity at the sight. "Pity me," cried the high-spirited chevalier, "I die as a man of honour ought, in the discharge of my duty: they indeed are objects of pity, who fight against their king, their country, and their oath." The marquis de Pescara, passing soon after, manifested his admiration of Bayard's virtue, as well as his sorrow for his fate, with the generosity of a gallant enemy; and finding that he could not be removed with safety from that spot, ordered a tent to be pitched there, and appointed proper persons to attend him. He died, notwithstanding their care, as his ancestors for several generations had done, in the field of battle. Pescara ordered his body to be embalmed, and sent to his relations; and such was the respect paid to military merit in that age, that the duke of Savoy commanded it to be received with royal honours in all the cities of his dominions: in Dauphiné, Bayard's native country, the people of all ranks came out in a solemn procession to meet it.

BAYEN, Peter, an eminent French chemist. See Supplement.

BAYEUX, a considerable town of France in the department of Calvados. The cathedral church is accounted extremely fine. Population in 1815, 12,600. W. Long. 33° N. Lat. 49° 16'.

BAYLE, Peter, author of the Historical and Critical Dictionary, was born November 18, 1673, at Carlis, a village in the county of Foix, in France, where his father John Bayle was a Protestant minister. In 1666, he went to the Protestant university at Puy-laurieux, where he studied with the greatest application; and in 1669, removed to the university of Toulouse, whither the Protestants at that time frequently sent their children to study under the Jesuits: but here, to the great grief of his father, he embraced the Roman religion. However, being soon sensible of his error, he left that university, and went to study at Geneva; after which he was chosen professor of philosophy at Sedan: but that Protestant university being suppressed by Louis XIV. in 1681, he was obliged to leave the city; and was soon after chosen professor of philosophy and history at Rotterdam, with a salary of about 450 a year. The year following he published his Letter concerning Comets. And Father Mainbourgh having published about this time his History of Calvinism, wherein he endeavours to draw upon the Protestants the contempt and resentment of the Catholics, Mr Bayle wrote a piece to confute his history. The reputation which he had now acquired, induced the States of Friesland, in 1684, to offer him a professorship in their university; but he wrote them a letter of thanks, and declined the offer. The same year he began to publish his Nouvelles de la republique des lettres.

In 1686, he was drawn into a dispute in relation to the famous Christina queen of Sweden. In his Journal for April, he took notice of a printed letter supposed to have been written by her Swedish majesty to the chevalier de Terlon, wherein she condemns the persecution of the Protestants in France. He inserted the letter itself in his Journal for May; and in that of June following he says, "What we hinted at in our last month is confirmed to us from day to day, that Christina is the real author of the letter concerning the persecutions in France, which is ascribed to her: it is a remainder of Protestantism." Mr Bayle received an anonymous letter; the author of which says, that he wrote to him of his own accord, being in duty bound to it as a servant of the queen. He complains that Mr Bayle, speaking of her majesty, called her only Christina, without any title; he finds also great fault with his calling the letter "a remainder of Protestantism." He blames him likewise for inserting the words "I am," in the conclusion of the letter. "These words (says this anonymous writer) are not her majesty's; a queen, as she is, cannot employ these words but with regard to a very few persons, and Mr de Terlon is not of that number." Mr Bayle wrote a vindication of himself as to these particulars, with which the author of the anonymous letter declared himself satisfied, excepting what related to "the remainder of Protestantism." He would not admit of the defence with regard to that expression; and in another letter, advised him to retract that expression. He adds in a postscript, "You mention, in your Journal of August, a second letter of the queen, which you scruple to publish. Her majesty would be glad to see that letter; and you will do a thing agreeable to her if you would send it to her. You might take this opportunity of writing to her majesty. This counsel may be of some use to you; do not neglect it." Mr Bayle took the hint, and wrote a letter to her majesty, dated the 14th of November 1686; to which the queen, on the 14th of December, wrote the following answer:--"Mr Bayle, I have received your excuses; and am willing you should know by this letter, that I am satisfied with them. I am obliged to the zeal of the person who gave you occasion of writing to me: for I am very glad to know you. You express so much respect and affection for me, that I pardon you sincerely; and I would have you know, that nothing gave me offence but that remainder of Protestantism, of which you accused me. I am very delicate on that head, because nobody can suspect me of it, without lessening my glory, and injuring me in the most sensible manner. You would do well if you should even acquaint the public with the mistake you have made, and with your regret for it. This is all that remains to be done by you, in order to deserve my being entirely satisfied with you. As to the letter which you have sent me, it is mine without doubt; and since you tell me that it is printed, you will do me a pleasure if you send me some copies of it. As I fear nothing in France, so neither do I fear any thing at Rome. My fortune, my blood, and even my life, are entirely devoted to the service of the church; but I flatter nobody, and will never speak any thing but the truth. I am obliged to those who have been pleased to publish my letter, for I do not at all disguise my sentiments. I thank God, they are too noble and too honourable to be disowned. However, it is not true that this letter was written to one of my ministers. As I have everywhere enemies and persons who envy me, so in all places I have friends and servants: and I have possibly as many in France, notwithstanding the court, as anywhere in the world. This is purely the truth, and you may regulate yourself accordingly. But you shall not get
get off so cheap as you imagine. I will enjoin you a
prance; which is, that you will henceforth take the
trouble of sending me all curious books that shall be
published in Latin, French, Spanish, or Italian, on
whatever subject or science, provided they are worthy
of being looked into; I do not even except romances
or satires: and above all, if there are any books of
chemistry, I desire you may send them to me as soon
as possible. Do not forget to send me your
Journal. I shall order that you be paid for whatever
you lay out, but do send me an account of it. This
will be the most agreeable and most important
service that can be done me. May God prosper you.

CHRISTINA ALEXANDRA.”

It now only remained that Mr Bayle should acquaint
the public with the mistake he had made, in order to
mitigate that princess’s entire satisfaction; and this he
did in the beginning of his Journal of the month of
January, 1695.

The persecution which the Protestants at this time
soured in France affected Mr Bayle extremely. He
made occasionally some reflections on their sufferings
in his Journal; and he wrote a pamphlet also on the
subject. Some time afterwards he published his Commen
taire Philosophique upon these words, “Compel
them to come in;” but the great application he gave
to this and his other works, threw him into a fit of
sickness, which obliged him to discontinue his Literary
Journal. Being advised to try a change of air, he
left Rotterdam on the 8th of August, and went to
Cleves; whence, after having continued some time, he
removed to Aix-la-Chapelle, and from thence returned
to Rotterdam on the 18th of October. In the year
1690, the famous book, entitled, Avis aux Refugies,
&c. made its appearance. Mr Jurieu, who took Mr
Bayle for the author thereof, wrote a piece against it;
and he prefixed an advice to the public, wherein he
calls Mr Bayle a profane person, and a traitor enga
ged in a conspiracy against the state. As soon as Mr
Bayle had read this libel against him, he went to the
grand schout of Rotterdam, and offered to go to priso
n, provided his accuser would accompany him, and
undergo the punishment he deserved if the accusation
was found unjust. He published also an answer to Mr
Jurieu’s charge; and as his reputation, nay his very
life, was at stake in case the accusation of treason
was proved, he therefore thought himself not obliged to
keep any terms with the accuser, and attacked him with
the utmost severity. Mr Jurieu lost all patience: he
applied himself to the magistrates of Amsterdam;
who advised him to a reconciliation with Mr Bayle,
and enjoined them not to publish any thing against
each other till it was examined by Mr Boyer, the pen
sioner of Rotterdam. But notwithstanding this prohi
bition, Mr Jurieu attacked Mr Bayle again with so
much passion, that he forced him to write a new vindici
ation of himself.

In November 1690, M. de Beauval advertised in
his Journal, A scheme for a Critical Dictionary. This
was the work of Mr Bayle. The articles of the three
first letters of the alphabet were already prepared; but
a dispute happening betwixt him and M. de Beauval,
obliged him for some time to lay aside the work. Nor
did he resume it till May 1692, when he published his
scheme: but the public not approving of his plan, he
threw it into a different form; and the first volume
was published in August 1695, and the second in October
following. The work was extremely well received by
the public; but it engaged him in fresh disputes, par
ticularly with Mr Jurieu and the abbé Renaudot. Mr
Jurieu published a piece, wherein he endeavoured to
engage the ecclesiastical assemblies to condemn the
dictionary; and he presented it to the senate sitting at Delft,
but they took no notice of the affair. The consistency
of Rotterdam granted Mr Bayle a hearing; and after
having heard his answers to their remarks on his dic
tionary, declared themselves satisfied, and advised him
to communicate this to the public. Mr Jurieu made
another attempt with the consistency in 1698; and so
far he prevailed with them, that they exhorted Mr
Bayle to be more cautious with regard to his princi
ples in the second edition of his dictionary; which was
published in 1702, with many additions and improve
ments.

Mr Bayle was a most laborious and indefatigable
writer. In one of his letters to Maizens, he says,
that since his 60th year he hardly remembers to have
had any leisure. His intense application contributed
perhaps to impair his constitution, for it soon began
to decline. He had a decay of the lungs, which weak
ened him considerably; and as this was a distemper
which had cut off several of his family, he judged it to
be mortal, and would take no remedies. He died the
26th of December 1706, after he had been writing the
greatest part of the day. He wrote several books be
sides what we have mentioned, many of which were in
his own defence against attacks he had received from
the abbé Renaudot, Mr Clerk, M. Jaquelot, and oth
ers. Among the productions which do honour to the
age of Louis XIV. M. Voltaire has not omitted the
Critical Dictionary of our author: “It is the first
work of the kind (he says) in which a man may learn
to think.” He censures indeed those articles which
contain only a detail of minute facts, as unworthy ei
ther of Bayle, an understanding reader, or peste
rous. “In placing him (continues the same author) among
the writers who do honour to the age of Louis XIV.
notwithstanding his being a refugee in Holland, I
only conform to the decrees of the parliament of Tou
louse, which, when it declared his will valid in France,
notwithstanding the rigour of the laws, expressly said,
that such a man could not be considered as a foreig
er.”

BAYLY, Lewis, author of that most memorable
book, entitled “The Practice of Piety.” He was
born at Caermarthern in Wales, educated at Oxford,
made minister of Evesham in Worcestershire about 1617,
became chaplain to King James, and was promoted to the
see of Bangor in 1616. His book is dedicated to the high and
mighty prince, Charles prince of Wales; and the author tells his highness, “that he had en
deavoured to extract out of the chaos of endless contro
versies the old practice of true piety, which flourished
before these controversies were hatched.” The design
was good; and the reception this book has met with
may be known from the number of its editions, that in
1632, 1734, being the fifty-ninth. This prelate died in
1632.

BAYON, a town of France, in Lorrain, now the
BAY

Bayon

Bayonne.

BAYONET, in the military art, a short broad dagger, formerly with a round handle fitted for the bore of a firelock, to be fixed there after the soldier had fired; but they are now made with iron handles and rings, that go over the muzzle of the firelock; and are screwed fast, so that the soldier fires with his bayonet on the muzzle of his piece, and is ready to act against the horse. This use of the bayonet fastened on the muzzle of the firelock was a great improvement, first introduced by the French, and to which, according to M. Folard, they owed a great part of their victories in the last century; and to the neglect of this in the next succeeding war, and trusting to their fire, the same author attributes most of the losses they sustained. At the siege of Malta, a weapon called piñeta was contrived to oppose the bayonets, being in some measure the converse thereof; as the latter consists of a dagger added to a fire-arm, the former consisted of a fire-arm added to a plume or pike.

Of late the bayonet has come into very general use; and battles have been won by it without firing a shot. This way of fighting was chiefly restored by the late king of Prussia, who made his troops rush forward at once with bayonets on the enemy.

BAYONNE, a city of Gascony, in France, now the department of the Lower Pyrenees; seated near the mouth of the river Adour, which forms a good harbour. In 1815 it contained 18,600 inhabitants, including the suburbs. It is divided into three parts. The great town is on this side the river Nive; the little town is between the Nive and the Adour; and the suburbs of Saint Esprit are beyond this last river. Both the former are surrounded with an old wall and a dry ditch, and there is a small castle in each. That of Great Bayonne is flanked with four round towers, and is the place where the governor resides. The new castle is flanked with four towers, in the form of bastions. The first enclosure is covered with another, composed of eight bastions, with a great horn-work, and a half-moon; all which are encompassed with a ditch, and a covered way. There is communication between the city and the suburbs by a bridge, and the suburbs are well fortified. The citadel is seated beyond the Adour, on the side of the suburbs above mentioned. The public buildings have nothing remarkable; it is the only city in the kingdom that has the advantage of two rivers, wherein the tide ebbs and flows. The river Nive is deeper than the Adour, but less rapid, by which means ships come up into the middle of the city. There are two bridges over the river, by which the old and new towns communicate with each other. The trade of this town is more considerable, on account of its neighbourhood to Spain, and the great quantity of wines which are brought hither from the adjacent country. The Dutch carry off a great number of pipes in exchange for spices and other commodities, which they bring thither. The inhabitants had formerly the privilege of guarding two of their three gates, and the third was kept by the king.

BAYS, in Commerce, a sort of open woollen stuff, having a long nap, sometimes frized, and sometimes not. This stuff is without wale; and is wrought in a loom with two tredlles, like flannel. It is chiefly manufactured at Colchester and Bockin in Essex, where there is a hall called the Dutch-bay hall or raw-bay. This manufacture was first introduced into England, with that of sayes, serges, &c. by the Flemings; who being persecuted by the duke of Alva for their religion, fled thither about the fifth of Queen Elizabeth's reign; and had afterwards peculiar privileges granted them by act of parliament 1 Charles II. 1666, which the bays-makers in the above places still enjoy. The exportation of bays was formerly much more considerable than at present when the French have learned to imitate them. However, the English bays are still sent in great quantities to Spain and Portugal, and even to Italy. Their chief use is for dressing the monks and nuns, and for linings, especially in the army. The looking-glass makers also use them behind their glasses, to preserve the tin or quicksilver; and the casemakers to line their cases. The breadth of bays is commonly a yard and a half, a yard and three quarters, or two yards, by 42 to 48 in length. Those of a yard and three quarters are most proper for the Spanish trade.

BAZAR, or BASAR, a denomination among the Turks and Persians, given to a kind of exchanges, or places where their finest stuffs and other wares are sold. These are also called bemesiins. The word bazar seems of Arabic origin, where it denotes sale, or exchange of goods. Some of the eastern bazars are open, like the market-places in Europe, and serve for the same uses, more particularly for the sale of the bulky and less valuable commodities. Others are covered with lofty ceilings, or even domes, pierced to give light; and it is in these the jewellers, goldsmiths, and other dealers in the richer wares, have their shops. The bazar or maidan of Isphahen is one of the finest places in Persia, and even surpasses all the exchanges in Europe; yet notwithstanding its magnificence, it is excelled by the bazar of Tauris, which is the largest that is known, having several times held 30,000 men ranged in order of battle. At Constantinople, there is the old and the new bazar, which are large square buildings, covered with domes, and sustained by arches and pilasters.

BAZAS, a town of Guienne in France, now the department of Gironde, and formerly a bishop's see. It is built on a rock, five miles from the Garonne, and 42 south-east of Bourdeaux, in W. Long. 0. 30. N. Lat. 44. 20.

BAZAT, or BAZA, in Commerce, a long, fine span cotton, which comes from Jerusalem, whence it is also called Jerusalem-cotton.

BAZEECURS, a tribe of Indians in Hindostan.

See Supplement.

BAZENGDES, in Natural History, the name of a substance used by the Turks and other eastern nations in their scarlet-dyeing. They mix it for this purpose with cochineal and tartar; the proportions being two ounces of the bazengdes to one ounce of cochineal. These are generally esteemed a sort of fruit, that are produced.
BEA (481)

BEACON[481]

BEACON produced on certain trees in Syria and other places; and it is usually supposed, that the scarcity and dearness of them is the only thing that makes them not used in Europe. But the bezgen-dzes seem to be no other than the horns of the turpentine tree in the eastern parts of the world; and it is not only in Syria that they are found, but China also affords them. Many things of this kind were sent over to Mr. Geoffroy at Paris from China as the substances used in the scarlet-dyeing of that country, and they all proved wholly the same with the Syrian and Turkish bezgen-dzes, and with the common turpentine horns. The lentisk, or mastic tree, is also frequently found producing many horns of a like kind with these, and of the same origin, all being owing to the pucerons, which make their way into the leaves to breed their young there.

BDELLIUM, a gummy resinous juice, produced by a tree in the East Indies, of which we have no satisfactory account. It is brought into Europe both from the East Indies and Arabia. It is in pieces of different sizes and figures, externally of a dark reddish brown, somewhat like myrrh; internally it is clear, and not unlike to gloce; to the taste it is slightly bitter and acuminent; its odour is very agreeable. If held in the mouth, it soon becomes soft and tenacious, sticking to the teeth. Laid on a red-hot iron, it readily catches flame, and burns with a cracking noise, and in proportion to its goodness it is more or less fragrant. Near half of its substance dissolves either in water or in spirit of wine; but the tincture made with spirit is somewhat stronger, and by much more agreeable. Vinegar, or verjuice, dissolves it wholly. The simple gum is a better medicine than any preparation from it. It is one of the weakest of the debrousant gums, but is used as a pectoral and an emmenagogue.

BEACHY-HEAD, a promontory on the coast of Sussex, between Hastings and Shoreham, where the French defeated the English and Dutch fleet in 1650.

BEACON, a signal for the better securing the kingdom from foreign invasions. See SIGNAL.

On certain eminent places of the country are placed long poles erect, whereon are fastened pitch-barrels to be fired by night, and smoke made by day, to give notice in a few hours to the whole kingdom of an approaching invasion. These are commonly called beacons; whence also comes beaunage. —We find beacons familiarly in use among the primitive Britons and Western Highlanders. The besieged capital of one of our northern isles in the third century actually lighted up a fire upon a tower; and Fingal instantly knew the green flame edged with smoke to be a token of attack and distress*. And there are to this day several cairns or heaps of stones upon the heights along the coasts of the Harries, on which the inhabitants used to burn heath as a signal of an approaching enemy.

BEACONS are also marks and signs erected on the coasts, for guiding and preserving vessels at sea, by night as well as by day.

The erection of beacons, light-houses, and sea-marks, is a branch of the royal prerogative. The king hath the exclusive power, by commission under his great seal, to cause them to be erected in fit and convenient places, as well upon the lands of the subject as upon the domains of the crown: which power is usually vested by letters patent in the office of lord high admiral. And by statute 8 Eliz. c. 13, the corporation of the Trinibhouse are empowered to set up any beacons or sea-marks wherever they shall think them necessary; and if the owner of the land or any other person shall destroy them, or shall take down any steeple, tree, or other known sea-mark, he shall forfeit 100l. or, in case of inability to pay it, shall be ipso facto outlawed.

BEACONAGE, money paid towards the maintenance of a beacon. See BEACON. The word is derived from the Saxon beacian, to nod, or show by a sign; hence also the word becon.

BEAD, a small globule or ball used in necklaces and made of different materials, as pearl, steel, garnet, coral, diamond, amber, crystal, paste, glass, &c. —The Romanists make great use of beads in their Ave-Marias, and Pater-nosters; and the like usage is found among the dervises and other religious throughout the East, as well Mahometans as Heathen. The ancient Druids appear also to have had their beads, many of which are still found; at least if the conjecture of an ingenious author may be admitted, who takes those antique glass globules, having a snake painted round them, and called adder-beads, or snake-buttons, to have been the beads of our ancient Druids. See ANGUISH, OPHTALMOLOGY INDEX.

BEADS are also used in speaking of those glass globules vended to the savages on the coast of Africa; thus denominated, because they are strong together for the convenience of traffic.

The common black glass of which beads are made for necklaces, &c. is coloured with manganese only: one part of manganese is sufficient to give a black colour to near twenty of glass.

BEAD, in Architecture, a round moulding, commonly made upon the edge of a piece of stuff, in the Corinthian and Roman orders, cut or carved in short embossments, like beads in necklaces.

BEAD-Makers, called by the French paternostriers; are those employed in the making, stringing, and selling of beads. At Paris before the revolution there were three companies of paternostriers, or bead-makers; one who made them of glass or crystal; another in wood and horn; and the third in amber, coral, jet, &c.

BEAD-PROOF, a term used by our distillers to express that sort of proof of the standard strength of spirituous liquors, which consists in their having, when shaken in a phial, or poured from on high into a glass, a crown of bubbles, which stand on the surface some time after. This is esteemed a proof that the spirit consists of equal parts of rectified spirits and phlegm. This is a fallacious rule as to the degree of strength in the goods; because any thing that will increase the tenacity of the spirit, will give it this proof, though it be under the due strength. Our malt-distillers spoil the greater part of their goods, by leaving too much of the stinking oil of the malt in their spirit, in order to give it this proof when somewhat under the standard strength. But this is a great deceit on the purchasers of malt spirits, as they have them by this means not only weaker than they ought to be, but stinking with an oil that
they are not easily cleared of afterwards. On the other hand, the dealers in brandy, who usually have the art of sophisticating it to a great nicety, are in the right when they buy it by the strongest bead-proof, as the grand mark of the best; for being a proof of the brandy containing a large quantity of its oil, it is, at the same time, a token of its high flavour, and of its being capable of bearing a very large addition of the common spirits of our own produce, without betraying their flavour, or losing its own. We value the French brandy for the quantity of this essential oil of the grape which it contains; and that with good reason, as it is with us principally used for drinking as an agreeably flavoured cordial: but the French themselves, when they want it for any curious purposes, are as careful in the rectification of it, and take as much pains to clear it from this oil, as we do to free our malt spirits from that nauseous and fetid oil which it originally contains.

**Bead-Roll**, among Papists, a list of such persons, for the rest of whose souls they are obliged to repeat a certain number of prayers, which they count by means of their beads.

**Bead-Tree.** See Melia, Botany Index.

**Beadle**, (from the Saxon bydel, a messenger), a crier or messenger of a court, who cites persons to appear and answer. Called also a summoner or apparitor. — Beadle is also an officer at an university, whose chief business is to walk before the masters with a mace, at all public processions. — There are also church beadles, whose office is well known.

**Beagles**, a small sort of hounds or hunting dogs. Beagles are of divers kinds; as the southern beagle, something less and shorter, but thicker than the deep-mouthed hound; the *fetct northern* or *cat beagle*, smaller, and of a finer shape than the southern, and a harder runner. From the two, by crossing the strains, is bred a third sort held preferable to either. To these may be added a still smaller sort of beagles, scarcely bigger than lap-dogs, which make very diversion in hunting the coney, or even the small hare in dry weather; but otherwise unserviceable, by reason of their size.

**Beak**, the bill or nis of a bird. See Ornithology Index.

**Beak**, or Beak-head, of a ship, that part without the ship, before the fore-castle, which is fastened to the stem, and is supported by the main-knee.

The beak, called by the Greeks *μόλυμα*, by the Latins *rostrum*, was an important part in the ancient ships of war, which were hence denominated *naves rostratae*. The beak was made of wood; but fortified with brass, and fastened to the prow, serving to annoy the enemy’s vessels. Its invention is attributed to Piseus an Italian. The first beaks were made long and high; but afterwards a Corinthian, named Ariston, contrived to make them short and strong, and placed so low, as to pierce the enemies vessels under water. By the help of these great havock was made by the Syracusans in the Athenian fleet.

**Beaked**, in Heraldry, a term used to express the beak or bill of a bird. When the beak and legs of a foul are of a different tincture from the body, we say beaked and membered of such a tincture.

**Beale, Mary**, particularly distinguished by her skill in painting, was the daughter of Mr Craddock, minister of Waltham upon Thames, and learned the rudiments of her art from Sir Peter Lely. She painted in oil, water-colours, and crayons, and had much business; her portraits were in the Italian style, which she acquired by copying pictures and drawings from Sir Peter Lely’s and the royal collections. Her master, says Mr Walpole, was supposed to have had a tender attachment to her; but as he was reserved in communicating to her all the resources of his pencil, it probably was a gallant rather than a successful one. Dr Woodfall wrote several pieces to her honour, under the name of *Bealia*. Mrs Beale died in Pall Mall, on the 28th of December 1697, aged 65. Her paintings have much nature, but the colouring is stiff and heavy.

**Bealt, Bealth, or Builth**, a town of Breconshire in South Wales, pleasantly seated on the river Wye. It contained 815 inhabitants in 1811, who are chiefly employed in the manufacture of stockings. W. Long. 4. 10. N. Lat. 52. 4.

**Beam**, in Architecture, the largest piece of wood in a building, which lies cross the walls, and serves to support the principal rafters of the roof, and into which the feet of these rafters are framed. No building has less than two of these beams, viz. one at each end; and into these the girders of the garret roof are also framed. The proportions of beams in or near London, are fixed by statute, as follows: a beam 15 feet long, must be 7 inches on one side its square, and 5 on the other; if it be 16 feet long, one side must be 8 inches, the other 6, and so proportionally to their lengths. In the country, where wood is more plenty, they usually make their beams stronger.

**Beams of a Ship** are the great main cross-timbers which hold the sides of the ship from falling together, and which also support the decks and orlops: the main beam is next the main-mast, and from it they are reckoned by first, second, third beam, &c.: the greatest beam of all is called the midsowth beam.

**Beam-Compass**, an instrument consisting of a square wooden or brass beam, having sliding sockets, that carry steel or pencil points; they are used for describing large circles, where the common compasses are useless.

**Beam-Bird, or Petty-chops.** See Motacilla.

**Beam** also denotes the lath, or iron, of a pair of scales: sometimes the whole apparatus for weighing of goods is so called: Thus we say, it weighs so much at the king’s beam.

**Beam of a Plough**, that in which all the parts of the plough-tail are fixed. See Plough, Agriculture Index.

**Beam, or Roller**, among weavers, a long and thick wooden cylinder, placed lengthwise on the back-part of the loom of those who work with a shuttle. That cylinder, on which the stuff is rolled as it is woven, is also called the beam or roller, and is placed on the fore-part of the loom.

**Bean.** See Vicia, Botany Index.

The ancients made use of beans in gathering the votes of the people, and for the election of magistrates. A white bean signified *absolution*, and a black one *condemnation*. Beans had a mysterious use in the *lemuralia* and *parentalia*; where the master of the family, after washing, was to throw a sort of black beans...
beans over his head, still repeating the words, "I redeem myself and family by these beans." Ovid * gives a lively description of the whole ceremony in verse.

Abstinence from beans was enjoined by Pythagoras, one of whose symbols is, καρασίσσωσιν, abstine a stabus. The Egyptian priests held it a crime to look at beans, judging the very sight unclean. The flamen dialis was not permitted even to mention the name. The precept of Pythagoras has been variously interpreted; some understand it of forbearing to meddle in trials and verdicts, which were then by throwing beans into an urn, others, building on the equivocation of the word καρασίσσωσιν, which equally signifies a bean and a human testicle, explain it by abstaining from venery. Clemens Alexandrinus grounds the abstinence from beans on this, that they render women barren, which is confirmed by Theophilus, who extends the effect even to plants. Cicero suggests another reason for this abstinence, viz. that beans are great enemies to tranquility of mind. For a reason of this kind it is, that Amphipius is said to have abstained from beans, even before Pythagoras, that he might enjoy a clearer divination by dreams.

Beans, as food for horses. See Farriery.

Bean-Caper. See Zygophyllum, Botany Index.

Bean-Col, a small fishing vessel, or pilot-boat, common on the sea-coasts and in the rivers of Portugal. It is extremely sharp forward, having its stem bent inward above into a great curve: the stem is also plated on the fore-side with iron, into which a number of bolts are driven, to fortify it, and resist the stroke of another vessel, which may fall athwart-house. It is commonly navigated with a large lateen sail, which extends over the whole length of the deck, and is accordingly well fitted to ply to windward.

Bean-Flour, called by the Romans lomentum, was of some repute among the ancient ladies as a cosmetic, wherewith to smooth the skin, and take away wrinkles.

Bean-Fly, in Natural History, the name given by authors to a very beautiful fly, of a pale purple colour, frequently found on bean-flowers. It is produced from the worm or maggot called by authors media.

Bean-Coque. See Anas, Ornithology Index.

Kidney-Bean. See Phaseolus.

Malacca-Beans, or Anacardia, the fruit of a tree growing in Malabar and other parts of the East Indies, supposed by some to be the Avicennia lomentosa; by others, the Bontia germinans. The fruit is of a shining black colour, of the shape of a heart flattened, about an inch long, terminating at one end in an obtuse point, and adhering to the other to a wrinkled stalk: it contains within two shells a kernel of a sweetish taste: betwixt the shells is lodged a thick and acrid juice.

The medicinal virtues of anacardia have been greatly disputed. Many have attributed to them the faculty of comforting the brain and nerves, fortifying the memory, and quickening the intellect: and hence a confection made from them has been dignified with the title of concoctio sopuetum: others think it better deserves the name of concoctio stultorum, and mention instances of its continued use having rendered people maniacal. But the kernel of anacardium is not different in quality from that of almonds. The ill effects attributed to this fruit belong only to the juice contained betwixt the kernels, whose acrimony is so great, that it is said to be employed by the Indians as a caustic. This juice is recommended externally for terrors, freckles, and other cutaneous deformities; which it removes only by exulcerating or excoriating the part, so that a new skin comes underneath.

BEAR, in Zoology. See Ursus, Mammalia Index.

Sea-Bear. See Phoca, Mammalia Index.

Bear, in Astronomy. See Ursus, Astronomy Index.

Order of the Bear was a military order in Switzerland, erected by the emperor Frederick II. in 1213, by way of acknowledgment for the service the Swiss had done him, and in favour of the abbey of St Gal. To the collar of the order hung a medal, on which was represented a bear raised on an eminence of earth.

Bear's-Breech. See Ascanthus, Botany Index.

Bear's Flesh was much esteemed by the ancients: even at this day, the paw of a bear salted and smoked, is served up at the tables of princes.

Bear's-Grease was formerly esteemed a sovereign remedy against cold disorders, especially rheumatiations. It is now much used in dressing ladies and gentlemen's hair.

Bear's-Skin makes a fur in great esteem, and on which depends a considerable article of commerce, being used in housings, on coach-boxes, &c. In some countries, clothes are made of it, more especially bags wherein to keep the feet warm in severe colds. Of the skins of bears cubs are made gloves, muffs, and the like.

Bearalston, a small town of Devonshire, which, however, is a borough by prescription, and sends two members to parliament.

Bear, the hair growing on the chin and adjacent parts of the face, chiefly of adults and males.

Various have been the ceremonies and customs of most nations in regard of the beard. The Tartars, out of a religious principle, waged a long and bloody war with the Persians, declaring them infidels, merely because they would not cut their whiskers after the rite of Tartary; and we find, that a considerable branch of the religion of the ancients consisted in the management of their beards. The Greeks wore their beards till the time of Alexander the Great; that prince having ordered the Macedonians to be shaved, for fear it should give a handle to their enemies. According to Pliny, the Romans did not begin to shave till the year of Rome 454, when P. Ticius brought over a stock of barbers from Sicily.—Persons of quality had their children shaved the first time by others of the same or greater quality, who, by this means, became godfather or adoptive father of the children. Anciently, indeed, a person became godfather of the child by barely touching his beard: thus historians relate, that one of the articles of the treaty between Avaric and Clovis was, that Avaric should touch the beard of Clovis to become his godfather.

As to ecclesiastics, the discipline has been very different on the article of beards: sometimes they have been enjoined to wear them, from a notion of too much effeminacy in shaving, and that a long beard was more suitable to the ecclesiastical gravity; and sometimes again they were forbid it, as imagining pride to lurk beneath
beneath a venerable beard. The Greek and Roman
courts had been long together by the ears about
their beards; since the time of their separation, the Ro-
nanists seem to have given more into the practice of
shaving, by way of opposition to the Greeks; and have
even made some express constitutions de radenis barbis.
The Greeks, on the contrary, espose very zealously the
cause of long beards, and are extremely scandalized at
the beardless images of saints in the Roman churches.
By the statutes of some monasteries, it appears, that the
lay-monks were to let their beards grow, and the priests
among them to shave; and that the beards of all that
were received into the monasteries, were blessed with a
great deal of ceremony. There are still extant the pray-
ers used in the solemnity of consecrating the beard to
God, when an ecclesiastic was shaven.

Le Compte observes, that the Chinese affect long
beards extravagantly; but nature has balked them, and
only given them very little ones, which, however, they
cultivate with infinite care: the Europeans are strange-
lly envied by them on this account, and esteemed the
greatest men in the world. Chrysostom observes, that
the kings of Persia had their beards woven or matted to-
gether with gold thread; and some of the first kings of
France had their beards knotted and buttoned with
gold.

Among the Turks, it is more infamous for any one
to have his beard cut off, than among us to be publicly
whipt or branded with a hot iron. There are abund-
ance in that country, who would prefer death to this
kind of punishment. The Arabs make the preservation
of their beards a capital point of religion, because Ma-
homet never cut his. Hence the razor is never drawn
over the Grand Signior's face. The Persians, who clip
them, and shave above the jaw, are reputed heretics.
It is likewise a mark of authority and liberty among
them, as well as among the Turks. They who serve in
the seraglio, have their beards shaven, as a sign of their
servitude. They do not suffer it to grow till the sultan
has set them at liberty, which is bestowed as a reward
upon them, and is always accompanied with some em-
ployment.

The most celebrated ancient writers, and several
modern ones, have spoken honourably of the fine beards
of antiquity. Homer speaks highly of the white beard
of Nestor and that of old King Priam. Virgil de-
scribes Mezentius's to us, which was so thick and long
as to cover all his breast; Chrysippus praises the noble
beard of Timothy, a famous player on the flute. Pliny
the Younger tells us of the white beard of Euphrates, a
Syrian philosopher; and he takes pleasure in relating
the respect mixed with fear with which it inspired the
people. Plutarch speaks of the long white beard of
an old Laconian, who being asked why he let it grow
so, replied, "This that, seeing continually my white beard,
I may do nothing unworthy of its whiteness." Strabo
relates, that the Indian philosophers, the Gymnosophists,
were particularly attentive to make the length of their
beards contribute to captivate the veneration of the
people. Diodorus, after him, gives a very particular
and circumstantial history of the beards of the Indians.
Juvenal does not forget that of Antiochus the son of
Nestor. Fenelon, in describing a priest of Apollo in
all his magnificence, tells us that he had a white beard
down to his girdle. But Persius seems to outdo all
these authors: this poet was so convinced that a beard
was the symbol of wisdom, that he thought he could
not bestow a greater encomium on the divine Socrates,
than by calling him the bearded master, "Magistrum
barbatum."

While the Gauls were under their sovereignty,
none but the nobles and Christian priests were per-
mitted to wear long beards. The Franks having
made themselves masters of Gaul, assumed the same
authority as the Romans; the bondmen were ex-
plicitly ordered to shave their chins; and this law
continued in force until the entire abolishment of ser-
vitude in France. So likewise, in the time of the first
race of kings, a long beard was the sign of nobility and
freedom. The kings, as being the highest nobles in
their kingdom, were emulous likewise to have the larg-
est beard: Eginard, secretary to Charlemagne, speak-
ing of the last kings of the first race, says, they came
to the assemblies in the Field of Mars in a carriage
drawn by oxen, and sat on the throne with their hair
dishvelled, and a very long beard, "crine profusa, barba
submissa, solio residerent, et speciem dominantis effigie-
rent.

To touch any one's beard, or cut off a bit of it,
was, among the first French, the most sacred pledge
of protection and confidence. For a long time all letters
that came from the sovereign had, for greater sanctio-
three hairs of his beard in the seal. There is still in
being a charter of 1221, which concludes with the
following words: "Quod us ratum et stabile persever-
in postern, presentis scripto nigrili mei robur opposi-
cum tribus pilis barba mea.

Several great men have honoured themselves with
the surname of Bearded. The emperor Constantine
is distinguished by the epithet of Pogosata, which sig-
ifies the Bearded. In the time of the Crusades, we
find there was a Geoffrey the Bearded: Baldwin IV,
earl of Flanders, was surnamed Handsome beard; and,
in the illustrious house of Montmorenci, there was a
famous Bouchard, who took a pride in the surname of
Bearded: he was always the declared enemy of the
monks, without doubt, because of their being
shaved.

In the tenth century, we find, that King Robert
(of France) the rival of Charles the Simple, was not
more famous for his exploits than for his long white
beard. In order that it might be more conspicuous to
the soldiers when he was in the field, he used to let it
hang down outside his cuirass: this venerable sight en-
couraged the troops in battle, and served to rally them
when they were defeated.

A celebrated painter in Germany, called John Maye,
had such a large beard that he was nicknamed Jobs
the Bearded; it was so long that he wore it fastened to
his girdle; and though he was a very tall man, it would
hang upon the ground when he stood upright. He took
the greatest care of this extraordinary beard; sometimes
he would untie it before the emperor Charles V. who
took great pleasure to see the wind make it fly against
the faces of the lords of his court.

In England, the famous chancellor Thomas More,
one of the greatest men of his time, being on the point
of falling a victim to court intrigues, was able, when
on the fatal scaffold, to procure respect to his beard in
presence of all the people, and saved it, as one may
say, from the fatal stroke which he could not escape himself. When he had laid his head on the block, he perceived that his beard was likely to be hurt by the axe of the executioner; on which he took it away, saying, My beard has not been guilty of treason; it would be an injustice to punish it.

But let us turn our eyes to a more flattering object, and admire the beard of the best of kings, the ever precious beard of the great Henry IV. of France, which diffused over the countenance of that prince a majestic sweetness and amiable openness, a beard ever dear to posterity, and which should serve as a model for that of every great king, as the beard of his illustrious minister should for that of every minister. But what dependence is there to be put on the stability of the things of this world? By an event, as fatal as unforeseen, the beard, which was arrived at its highest degree of glory, all of a sudden lost its favour, and was at length entirely proscribed. The unexpected death of Henry the Great, and the youth of his successor, were the sole causes of it.

Louis XIII. mounted the throne of his glorious ancestors without a beard. Every one concluded immediately, that the courtiers, seeing their young king with a smooth chin, would look upon their own as too rough. The conjecture proved right; for they presently reduced their beards to whiskers, and a small tuft of hair under the nether lip.

The people at first would not follow this dangerous example. The duke of Sully never would adopt this effeminate custom. This man, both great as a general and a minister, was likewise so in his retirement; he had the courage to keep his long beard, and to appear with it at the court of Louis XIII. where he was called to give his advice in an affair of importance. The young crop-bearded courtiers laughed at the sight of his grave look and old-fashioned phiz. The duke, nettled at the affront put on his fine beard, said to the king, "Sir, when your father, of glorious memory, did me the honour to consult me on his great and important affairs, the first thing he did was to send away all the buffoons and stage-dancers of his court."

The Czar Peter, who had so many claims to the surname of Great, seems to have been but little worthy of it on this occasion. He had the boldness to lay a tax on the beards of his subjects. He ordered that the noblemen and gentlemen, tradesmen and artisans (the priests and peasants excepted) should pay 100 rubles to be able to retain their beards; that the lower class of people should pay a copeck for the same liberty; and he established clerks at the gates of the different towns to collect these duties. Such a new and singular impost troubled the vast empire of Russia. Both religion and manners were thought in danger. Complaints were heard from all parts; they even went so far as to arise against the sovereign; but he was inflexible, and at that time powerful. Even the fatal scenes of St. Bartholomew were renewed against these unfortunate beards; and the most unlawful violences were publicly exercised. The razor and scissors were everywhere made use of. A great number, to avoid these cruel extremities, obeyed with reluctant sighs. Some of them carefully preserved the sad trimmings of their chins; and, in order to be never separated from these dear locks, ordered that they should be placed with them in their coffins.

Example, more powerful than authority, produced in Spain, what it had not been able to bring about in Russia without great difficulty. Philip V. ascended the throne with a shaved chin. The courtiers imitated the prince, and the people, in turn, the courtiers. However, though this revolution was brought about without violence and by degrees, it caused much lamentation and murmuring; the gravity of the Spaniards lost by the change. The favourite customs of a nation can never be altered without incurring displeasure. They have this old saying in Spain: Deside que no hay barba, no hay mas alma. "Since we have lost our beards, we have lost our souls."

Among the European nations that have been most curious in beards and whiskers, we must distinguish Spain. This grave romantic nation has always regarded the beard as the ornament which should be most prized; and the Spaniards have often made the loss of honour consist in that of their whiskers. The Portuguese, whose national character is much the same, are not the least behind them in that respect. In the reign of Catherine queen of Portugal, the brave John de Castro had just taken in India the castle of Din: victorious; but in want of every thing, he found himself obliged to ask the inhabitants of Goa to lend him a thousand pistoles for the maintenance of his fleet; and, as a security for that sum, he sent them one of his whiskers, telling them, "All the gold in the world cannot equal the value of this natural ornament of my valour; and I deposit it in your hands as a security for the money." The whole town was penetrated with his heroism, and every one interested himself about this invaluable whisker: even the women were desirous to give marks of their zeal for so brave a man: several sold their bracelets to increase the sum asked for; and the inhabitants of Goa sent him immediately both the money and his whisker. A number of other examples of this kind might be produced, which do as much honour to whiskers as to the good faith of those days.

In Louis XIII.'s reign, whiskers attained the highest degree of favour, at the expense of the expiring beards. In those days of gallantry, not yet empoisoned by wit, they became the favourite occupation of lovers. A fine black whisker, elegantly turned up, was a very powerful mark of dignity with the fair sex. Whiskers were still in fashion in the beginning of Louis XIV.'s reign. This king, and all the great men of his reign, took a pride in wearing them. They were the ornament of Turenne, Conde, Colbert, Corneille, Moliere, &c. It was then no uncommon thing for a favourite lover to have his whiskers turned up, combed, and pomatumed, by his mistress; and, for this purpose, a man of fashion took care to be always provided with every little necessary article, especially whisker-wax. It was highly flattering to a lady to have it in her power to praise the beauty of her lover's whiskers: which, far from being disgusting, gave his person an air of vivacity: several even thought them an incitement to love. It seems the levity of the French made them undergo several changes both in form and name; there were Spanish, Turkish, guard-dagger, &c. whiskers;
whiskers; in short, royal ones, which were the last worn; their smallness proclaimed their approaching fall.

Consecration of the Beard was a ceremony among the Roman youth, who, when they were shaved the first time, kept a day of rejoicing, and were particularly careful to put the hair of their beard into a silver or gold box, and make an offering of it to some god, particularly to Jupiter Capitolinus, as was done by Nero, according to Suetonius.

Kissing the Beard. The Turkish wives kiss their husbands beards, and children their fathers, as often as they come to salute them. The men kiss one another's beards reciprocally on both sides, when they salute in the streets, or come off from any journey.

The Fashion of the Beard has varied in different ages and countries; some cultivating and entertaining one part of it, some another. Thus the Hebrews wear a beard on their chin; but not on the upper lip or cheeks. Moses forbids them to cut off entirely the angle or extremity of their beard; that is, to manage it after the Egyptian fashion, who left only a little tuft of beard at the extremity of their chin; whereas the Jews to this day suffer a little fillet of hair to grow from the lower end of their ears to their chins, where, as well as on their lower lips, their beards are in a pretty long bunch. The Jews, in time of mourning, neglected to trim their beards, that is, to cut off what grew superfluous on the upper lips and cheeks. In time of grief and great affliction they also plucked off the hair of their beards.

Anointing the Beard with unguents was an ancient practice both among the Jews and Romans, and still continues in use among the Turks; where one of the principal ceremonies observed in serious visits is to throw sweet-scented water on the beard of the visitant, and to perfume it afterwards with aloes-wood, which sticks to this moisture, and gives it an agreeable smell, &c. In middle-age writers we meet with adlentare barbam, used for stroking and combing it, to render it soft and flexible. The Turks, when they comb their beards, hold a handkerchief on their knees, and gather very carefully the hairs that fall; and when they have got together a certain quantity, they fold them up in paper, and carry them to the place where they bury the dead.

Beard of a Comet, the rays which the comet emits towards that part of the heaven to which its proper motion seems to direct it; in which the beard of a comet is distinguished from the tail, which is understood of the rays emitted towards that part from whence its motion seems to carry it.

Beard of a Horse, that part underneath the lower mandible on the outside and above the chin, which bears the curb. It is also called the chuck. It should have but little flesh upon it, without any chaps, hardness, or swelling; and be neither too high raised nor too flat, but such as the curb may rest in its right place.

Beard of a Muscle, Oyster, or the like, denotes an assemblage of threads or hairs, by which these animals fasten themselves to stones. The hairs of this beard terminate in a flat spongy substance, which being applied to the surface of a stone, sticks thereto, like the wet leather used by boys.

Beards, in the history of insects, are two small, oblong, fleshy bodies, placed just above the trunk, in the gnats, and in the moths and butterflies.

BEARDED, denotes a person or thing with a beard, or some resemblance thereof. The faces on ancient Greek and Roman medals are generally bearded. Some are denominated pagonoti, as having long beards, e.g. the Parthian kings. Others have only a languid about the chin, as the Sicelenc family. Adrian was the first of the Roman emperors who nourished his beard; hence all imperial medals before him are beardless; after him, bearded.

BEARDED Women have been all observed to want the menstrual discharge; and several instances are given by Hippocrates, and other physicians, of grown women, especially widows, in whom the menses coming to stop, beards appeared. Eusebius Nieremberggius mentions a woman who had a beard reaching to her navel.

Of women remarkably bearded we have several instances. In the cabinet of curiosities of Stuttgard in Germany, there is the portrait of a woman called Bartel Graafzwa, whose chin is covered with a very large beard. She was drawn in 1587, at which time she was but 25 years of age. There is likewise in the same cabinet another portrait of her when she was more advanced in life, but likewise with a beard.—It is said, that the duke of Saxony had the portrait of a poor Swiss woman taken, remarkable for her long bushy beard; and those who were at the carnival at Venice in 1726, saw a female dancer astonish the spectators not more by her talents than by her chin covered with a black bushy beard.—Charles XII. had in his army a female grenadier: it was neither courage nor a beard that she wanted to be a man. She was taken at the battle of Pultowa, and carried to Petersburg, where she was presented to the Czar in 1724: her beard measured a yard and a half. We read in the Trévoux Dictionary, that there was a woman seen at Paris, who had not only a bushy beard on her face, but her body likewise covered all over with hair. Among a number of other examples of this nature, that of Margaret, the governor of the Netherlands, is very remarkable. She had a very long stiff beard, which she prized herself on; and being persuaded that it contributed to give her an air of majesty, she took care not to lose a hair of it. This Margaret was a very great woman.—It is said, that the Lombard women, when they were at war, made themselves beards with the hair of their heads, which they ingeniously arranged on their cheeks, in order that the enemy, deceived by the likeness, might take them for men. It is asserted, after Suidas, that in a similar case the Athenian women did as much. These women were more men than our Jimmy Jessamy countrymen.—About a century ago, the French ladies adopted the mode of dressing their hair in such a manner that curls hung down their cheeks as far as their bosom. These curls went by the name of whiskers. This custom undoubtedly was not invented after the example of the Lombard women, to fright the men. Neither is it with intention to carry on a very bloody war, that in our time they have affected to bring forward the hair of the temple on the cheeks.

BEARETS, in Heraldry. See SUPPORTERS.

BEARING, in Navigation, an arch of the horizon intercepted between the nearest meridian and any distinct
strict object, either discovered by the eye, or resulting from the finical proportion; as in the first case, at 4 P. M. Cape Spado, in the isle of Candia, bore S. by W. by the compass. In the second, the longitudes and latitudes of any two places being given, and consequently the difference of latitude and longitude between them, the bearing from one to the other is discovered by the following analogy:

As the meridional difference of latitude
Is to the difference of longitude,
So is the radius
To the tangent bearing.

Bearing is also the situation of any distant object, estimated from some part of the ship according to her position. In this sense, an object so discovered must be either ahead, astern, abreast on the bow, or on the quarter. These bearings, therefore, which may be called mechanical, are on the beam, before the beam, abaft the beam, on the bow, on the quarter, ahead, or astern. If the ship sails with a side-wind, it alters the names of such bearings in some measure, since a distant object on the beam is then said to be to leeward or to windward; on the lee-quarter or bow, and on the weather-quarter or bow.

Bearing, in the sea-language. When a ship sails towards the shore, before the wind, she is said to bear in with the land or harbour. To let the ship sail more before the wind, is to bear up. To put her right before the wind, is to bear round. A ship that keeps off from the land, is said to bear off. When a ship that was to windward comes under a ship's stern, and so gives her the wind, she is said to bear under her lee, &c. There is another sense of this word, in reference to the burden of a ship; for they say a ship bears, when having too slender or lean a quarter, she will sink too deep into the water with an overload freight, and thereby can carry but a small quantity of goods.

Bearings, in Heraldry, a term used to express a coat of arms, or the figures of armories by which the nobility and gentry are distinguished from the vulgar and from one another. See Heraldry.

Bearing Claus, among cock-fighters, denote the foremost toes, on which the bird goes; and if they be hurt or gravelled, he cannot fight.

Bearing of a Stag, is used in respect of the state of his head or the croches which he bears on his horns. If you be asked what a stag bears, you are only to reckon the croches, and never to express an odd number; as, if he have four croches on his near horn and five on his far, you must say he bears ten; a false right on his near horn: if but four on the near horn and six on the far horn, you must say he bears twelve; a double false right on the near horn.

Bearn, a late province of France, bounded on the east by Bigorre, on the south by the mountains of Aragon, on the west by Soule and part of Navarre, and on the north by Gascony and Armagnac. It lies at the foot of the Pyrenean mountains, being about 16 leagues in length and 12 in breadth. It is in general a barren country; yet the plains yield considerable quantities of flax, and a good quantity of Indian corn called millet. The mountains are rich in mines of iron, copper, and lead; some of them also are covered with vines, and others with pine trees; and they give rise to several mineral springs, and two considerable rivers, the one called the Gave of Oleron, and the other the Gave of Bearn. Some wine is exported from this country; and the Spaniards buy up great numbers of the horses and cattle, together with most of their linen, of which there is a considerable manufactory. The principal places are Pau, Lescar, Orthez, Novarrees, Salies, and Oleron. This province, with Basques, forms the department of the Lower Pyrenees.

Beast, in a general sense, an appellation given to all four-footed animals, fit either for food, labour, or sport.

Beasts of Burden, in a commercial sense, all four-footed animals which serve to carry merchandises on their backs. The beasts generally used for this purpose are, elephants, dromedaries, camels, horses, mules, asses, and the sheep of Mexico and Peru.

Beasts of the Chase are five, viz. the buck, the doe, the fox, the roe, and the marten.

Beasts and Fowls of the Warren, are the hare, the coney, the pheasant, and partridge.

Beasts of the Forest, are the hart, hind, hare, boar, and wolf.

Beast, among gamesters, a game at cards, played in this manner: The best cards are the king, queen, &c. whereof they make three heaps, the king, the play, and troilet. Three, four, or five, may play; and to every one is dealt five cards. However, before the play begins, every one stakes to the three heaps. He that wins most tricks, takes up the heap called the play; he that hath the king takes up the heap so called; and he that hath three of any sort, that is, three fours, three fives, three sixes, &c. takes up the troilet heap.

Beat, in a general signification, signifies to chastise, strike, knock, or vanquish.

This word has several other significations in the manufactures, and in the arts and trades. Sometimes it signifies to forge and hammer; in which sense smiths and farriers say, to beat iron. Sometimes it means to pound, to reduce into powder; thus we say, to beat drugs, to beat pepper, to beat spices; that is to say, to pulverise them.

Beat, in fencing denotes a blow or stroke given with the sword. There are two kinds of beats; the first performed with the foible of a man's sword on the foible of his adversary's, which in the schools is commonly called bariere, from the French barre, and chiefly used in a pursuit, to make an open upon the adversary. The second and best kind of beat, is performed with the fort of a man's sword upon the foible of his adversary's, not with a spring, as in binding, but with a jerk or dry beat; and is therefore most proper for the parades without or within the sword, because of the rebound a man's sword has thereby from his adversary's, whereby he procures to himself the better and surer opportunity of riposting.

Beat, in the manage. A horse is said to beat the dust, when at each stroke or motion he does not take in ground or way enough with his fore-legs. He is more particularly said to beat the dust at terra à terra, when he does not take in ground enough with his shoulders, making his strokes or motions too short, as if he made them all in one place. He beats the dust at remont, when he does them too precipitately and too low. He beats upon a walk, when he walks too short, and
BEAT, in clock-making. See BEATS.

BEAT, St, a town of France, in the department of Upper Garonne, at the confluence of the Garonne and the Pique. It is seated between two mountains which are close to the town on each side. The houses are chiefly built with marble. W. Long. 1° 6'. N. Lat. 42° 50'.

BEATER is applied, in matters of commerce, to divers sorts of workmen, whose business is to hammer or flatten certain matters, particularly metals.

Gold-beaters, are artisans, who, by beating gold and silver with a hammer on a marble in mounds of velum and bullocks guts, reduce them to thin leaves fit for gilding or silvering of copper, iron, steel, wood, &c. Gold-beaters differ from flatters of gold or silver; as the former bring their metal into leaves by the hammer, whereas the latter only flatten it by pressing it through a mill preparatory to beating.

There are also Tin-beaters employed in the looking-glass trade, whose business is to beat tin on large blocks of marble till it be reduced to thin leaves fit to be applied with quicksilver behind looking-glasses. See FOLIATING, GOLD-BEATING.

BEATIFICATION, an act by which the pope declares a person beatified or blessed after his death. It is the first step towards canonization, or raising any one to the honour and dignity of a saint. No person can be beatified till 50 years after his or her death. All certificates or attestations of virtues and miracles, the necessary qualifications for canonization, are examined by the congregation of rites. This examination often continues for several years; after which his holiness decrees the beatification. The corps and relics of the future saint are from henceforth exposed to the veneration of all good Christians; his images are crowned with rays, and a particular office is set apart for him; but his body and relics are not carried in procession; indulgences likewise, and remission of sins, are granted on the day of his beatification; which though not so pompous as that of canonization, is however very splendid.

BEATING, or PULSATION, in Medicine, the reciprocal agitation or palpitation of the heart or pulse.

BEATING FLAX or HEMP, is an operation in the dressing of these matters, contrived to render them more soft and pliant. When hemp has been swingleed a second time, and the hords and half dozes, make them up into large thick rolls, which being broached on long strikes, are set in the corner to dry; after which they lay them in a round trough made for the purpose, and there with beetles beat them well till they handle both without and within as pliant as possible, without any hardness or roughness to be felt; that done, they take them from the trough, open and divide the strikes at before; and if any be found not sufficiently beaten, they roll them up and beat them over as before.

BEATING hemp is a punishment inflicted on loose or disorderly persons.

BEATING, in book-binding, denotes the knocking a book in quires on a marble block, with a heavy broad-faced hammer, after folding, and before binding or stitching it. On the beating it properly, the elegance and excellence of the binding, and the easy opening of the book, principally depend.

BEATING, in the paper-works, signifies the beating of paper on a stone with a heavy hammer, with a large smooth head and short handle, in order to render it more smooth and uniform, and fit for writing.

BEATING the Wind, was a practice in use in the ancient method of trial by combat. If either of the combatants did not appear in the field at the time appointed, the other was to beat the wind, or make so many flourishes with his weapon; by which he was entitled to all the advantages of a conqueror.

BEATING the Hands or Fists, by way of praise or approbation. See APPLAUSE.

BEATING Time, in Music, a method of measuring and marking the time for performers in concert, by a motion of the hand and foot up or down successively and in equal times. Knowing the true time of a crotchet, and supposing the measure actually subdivided into four crotchets, and the half measure into two, the hand or foot being up, if we put it down with the very beginning of the first note or crotchet, and then raise it with the third, and then down with the beginning of the next measure; this is called BEATING the time; and, by practice, a habit is acquired of making this motion very equal. Each down and up is sometimes called a time or measure. The general rule is to contrive the division of the measure so, that every down and up of the beating shall end with a particular note, on which very much depends the distinctness, and, as it were, the sense of the melody. Hence the beginning of every time or beating in the measure is reckoned the accented part thereof.

Beating time is denoted, in the Italian music, by the term battuta, which is usually put after what they call recitative, where little or no time is observed, to denote, that here they are to begin again to mark or beat the time exactly.

The Romans aimed at somewhat of harmony in the strokes of their oars; and had an officer called porticulius in each galley, whose business was to beat time to the rowers, sometimes by a pole or mallet, and sometimes by his voice alone.

The ancients marked the rhyme in their musical compositions: but to make it more observable in the practice, they beat the measure or time, and this in different manners. The most usual consisted in a motion of the foot, which was raised from, and struck alternately against, the ground, according to the modern method. Doing this was commonly the province of the master of the music, who was thence called porticus and porticulus, because placed in the middle of the choir of musicians, and in an elevated situation, to be seen and heard more easily by the whole company. These beaters of measure were also called by the Greeks...
Greeks ἀκομο这就 and ἑκοτεῖα, because of the noise of their feet; and ἐκεῖος, because of the uniformity or monotony of the rhythm. The Latins denominated them pedarri, podarri, and pedricarri. To make the beats or strokes more audible, their feet were generally shod with a sort of sandals either of wood or iron, called by the Greeks πεδαρτία, ποδαρτία, and πεδρικαρτία, and by the Latins pedicula, scabella, or acibia, because like to little stools or footstools. Sometimes they beat upon sonorous footstools, with the foot shod with a wooden or iron sole. They beat the measure not only with the foot, but also with the right hand, all the fingers whereof they joined together, to strike into the hollow of the left. He who thus marked the rhythm, was called manusductor. The ancients also beat time or measure with shells, as oyster shells and bones of animals, which they struck against one another, much as the moderns now use castanets, and the like instruments. This the Greeks called ἀδορινια, as is noted by Hesychius. The scholar on Aristotle speaks much to the same purpose. Other noisy instruments, as drums, cymbals, citrins, &c. were also used on the same occasion. They beat the measure generally in two equal or unequal times; at least this holds of the usual rhythm of a piece of music, marked either by the noise of sandals, or the slapping of the hands. But the other rhythmic instruments last-mentioned, and which were used principally to excite and animate the dancers, marked the cadence after another manner; that is, the number of their percussions equalled, or even sometimes surpassed, that of the different sounds which composed the air or song played.

Beating, with hunters, a term used of a stag, which runs first one way and then another. He is then said to beat up and down. — The noise made by conies in rutting time is also called beating or tapping.

Beating, in Navigation, the operation of making a progress at sea against the direction of the wind, in a zig-zag line or traverse, like that in which we ascend a steep hill. See Tacking.

Beatitude imports the supreme good, or the highest degree of happiness human nature is susceptible of; or the most perfect state of a rational being, wherein the soul has attained to the utmost excellency and dignity it is framed for. In which sense, it amounts to the same with what we otherwise call blessedness and sovereign felicity; by the Greeks, ἀκομοντεῖα; and by the Latins, sumnum bonum, beatitudis, and beatitas.

Beatitude, among divines, denotes the beatific vision, or the fruition of God in a future life to all eternity.

Beatitude is also used in speaking of theses contained in Christ's sermon on the mount, whereby he pronounces blessed the poor in spirit, those that mourn, the meek, &c.

Beaton, David, archbishop of St Andrew's, and a cardinal of Rome, in the early part of the 16th century, was born in 1494. Pope Paul III. raised him to the degree of a cardinal in December 1538; and being employed by James V. in negotiating his marriage with the court of France, was then consecrated bishop of Mirepoix. Soon after his installation as archbishop of St Andrew's, he promoted a furious persecution of the reformers in Scotland; when the king's death put a stop, for a time, to his arbitrary proceedings, he being then excluded from affairs of government, and confined. He raised, however, so strong a party, that, when the coronation of the young Queen Mary, he was admitted of the council, made chancellor, and procured commission as legate de latere from the court of Rome. He now began to renew his persecution of heretics; and among the rest, of the famous Protestant preacher Mr George Wishart, whose sufferings at the stake the cardinal viewed from his window with apparent exultation. It is pretended, that Wishart at his death foretold the murder of Beat-ton; which indeed happened shortly after, he being assassinated in his chamber, May 20. 1547. He was a haughty, bigotted churchman, and thought severity the proper method of suppressing heresy; he had great talents, and great vices. See Scotland.

Beatorium insula, in Ancient Geography, seven days journey to the west of Thebes, a district of the Nomos Oasites; called an island, because surrounded with sand, like an island in the sea, (Ulpian); yet abounding in all the necessaries of life, though encompassed with vast sandy deserts, (Strabo); which some suppose to be a third Oasis, in the Regio Ammoniacæ; and the site of the temple of Ammon answers to the above description, as appears from the writers on Alex-ander's expedition thither. It was a place of relegation or banishment for criminals. (Ulpian).

Beattie, James, an eminent Scottish poet and moralist. See Supplement.

Beats, in a watch or clock, are the strokes made by the fangs or pallets of the spindle of the balance, or of the pads in a royal pendulum. See Clock and Watch.

Beaucaire, a town of France, in the department of Gard, on the Rhone, opposite Tarascon, with which it has a communication by a bridge of boats. One of the most celebrated fairs in Europe is annually held here. E. Long. 5. 49. N. Lat. 43. 39.

Beauce, a late province of France, lying between the Isle of France, Blésois, and Orleans. It is so very fertile in wheat, that it is called the Granary of Paris. Chartres is the principal town. It now forms the department of Eure and Loire.

Beaver, in Zoology. See Castor, Mammalia.

Beaver Skins, in commerce. Of these, merchants distinguish three sorts; the new, the dry, and the fat.

The new beaver, which is also called the white bea-ver, or Muscovy beaver, because it is commonly kept to be sent into Muscovy, is that which the savages catch in their winter hunting. It is the best, and the most proper for making fine furs, because it has lost none of its hair by shedding.

The dry beaver, which is sometimes called lean bea-ver, comes from the summer hunting, which is the time when these animals lose part of their hair. Though this sort of beaver be much inferior to the former, yet it may also be employed in furs; but it is chiefly used in the manufacture of hats. The French call it summer cas-tor, or beaver.

The fat beaver is that which has contracted a certain gross and oily humour, from the sweat which ex-}
some time. Though this sort be better than the dry beaver, yet it is used only in the making of hats.

Besides hats and furs, in which the beaver's hair is commonly used, they attempted in France, in the year 1699, to make other manufactures of it: and accordingly they made cloths, flannel, stockings, &c. partly of beaver's hair, and partly of Segovia wool. This manufacture, which was set up at Paris, in the suburb of St Anthony, succeeded at first pretty well; and according to the genius of the French, the novelty of the thing brought into some repute the stuff, stockings, gloves, and cloth, made of beavers hair. But they went out of fashion on a sudden, because it was found, by experience, that they were of a very bad wear, and besides that the colours faded very much; when they had been wet, they became dry and hard, like felt, which occasioned the miscarriage of the manufacture for that time.

When the hair has been cut off from the beavers skins, to be used in the manufacturing of hats, those skins are still employed by several workmen; namely, by the trunk-makers, to cover trunks and boxes; by the shoemakers, to put into slippers; and by turners, to make sieves for sieving grain and seeds.

BEAUFORT, a town of France, in the department of Maine and Loire, with a castle, near the river Authion. It contains two parishes, and formerly had a convent of Becoles, and contained about 6000 inhabitants in 1815. W. Long. 0. 3. N. Lat. 47. 26.

Beaufort gives title of duke in England to the noble family of Somerset, who are lineally descended from John of Gaunt, duke of Lancaster, whose duchess resided in this town.

BEAUFORT, a strong town of Savoy in Italy, on the river Oron. E. Long. 6. 48. N. Lat. 45. 40. BEAUGENCY, a town of France in the department of Loiret, seated on the river Loire. It is famous for its wines. E. Long. 1. 46. N. Lat. 47. 48.

BEAUJEU, a town of France, in the department of Rhone and Loire, with an old castle. It is seated on the river Ardieres, at the foot of a mountain, in E. Long. 4. 40. N. Lat. 46. 29. BEAUJOLOIS, a district of France, now included in the department of Rhone and Loire. It is 25 miles in length, and 20 in breadth; and Ville Franche is the capital town.

BEAULIEU, SEBASTIAN DE PONTAULT DE, a celebrated French engineer, and field-marshal under Louis XIV. He published plans of all the military expeditions of his master, with military lectures annexed. He died in 1674.

BEAUMARCHAIS, P. A. C. a French dramatic writer. See SUPPLEMENT.

BEAUMARIS, a market town of Anglesey in North Wales, which sends one member to parliament. W. Long. 4. 15. N. Lat. 52. 25.

It is pleasantly seated on a low land at the water's edge; is neat and well built, and contained 1510 inhabitants in 1811. Edward I. created the place; for after founding the castles of Caerarvon and Conway, he discovered that it was necessary to put another curb on the Welch. He therefore built a fortress here in 1295; and fixed on a marshy spot, near the chapel of St Meugan, such as gave him opportunity of forming a great fosse round the castle, and of filling it with water from the sea. He also cut a canal, in order to permit vessels to discharge their lading beneath the walls; and as a proof of the existence of such a convenience, there were within this century iron rings affixed to them, for the purpose of mooring the ships or boats. The marsh was in early times of far greater extent than at present, and covered with salt bushes. The first governor was Sir William Pickmore, a courier knight appointed by Edward I. There were a constable of the castle, and a captain of the town. The first had an annual fee of forty pounds, the last of twelve pounds three shillings and fourpence; and the porter of the gate of Beaumaris had nine pounds two shillings and sixpence. Twenty-four soldiers were allowed for the guard of the castle and town, at fourpence a-day to each. The constable of the castle was always captain of the town, except in one instance: in the 36th of Henry IV. Sir John Boteler held the first office, and Thomas Norreys the other. The castle was extremely burthensome to the country; quarrels were frequent between the garrison and the country people. In the time of Henry VI. a bloody fray happened, in which David ap Evan ap Huw of Llwydiarth, and many others, were slain. From the time of Sir Rowland Villellye, alias Britayne, reputed base son of Henry VII., and constable of the castle, the garrison was withdrawn till the year 1642, when Thomas Chedede, deputy to the earl of Dorset, then constable, put it into men and ammunition. In 1643, Thomas Bulkeley, Esq. soon after created Lord Bulkeley, succeeded: his son Colonel Richard Bulkeley, and several gentlemen of the county, held it for the king till June 1646, when it surrendered on honourable terms to General Mytton, who made Captain Evans his deputy-governor. In 1653, the annual expense of the garrison was seventeen hundred and three pounds. Edward I. when he built the town, surrounded it with walls, made it a corporation, and endowed it with great privileges, and lands to a considerable value. He removed the ancient freemen by exchange of property into other counties. Henllys, near the town, was the seat of Gwerydd ap Rhys Goch, one of fifteen tribes, and of his posterity till this period, when Edward removed them to Bodde Wyddan in Flintshire, and bestowed their ancient patrimony on the corporation. It sends one member to parliament. Its first representative was Maurice Griffith, who sat in the seventh year of Edward VI. There is very good anchorage for ships in the bay which lies before the town, and has seven fathoms water even at the lowest ebb. Vessels often find security here in hard gales. The town has no trade of any kind, yet has its customhouse for the casual reception of goods. The ferry lies near the town, and is passable at low water. It was granted by charter to the corporation in the 4th of Queen Elizabeth. There is an order from Edward III. to Robert Power, chamberlain of North Wales, to inspect into the state of the boat, which was then out of repair; and in case it was feasible, to cause it to be made fit for use, at the expense of the bailiwick: but if the boat proved past repair, a new one was to be built, and the expense allowed by the king. It appeared that the people of Beaumaris paid annually for the privilege of a ferry thirty shillings into the exchequer; but by this order
Of which of us two the best precedence have,
Mine to this wretched world, thine to the grave?
Thou should'st have follow'd me; but death, to blame,
Discounted years, and measured age by fame.
So dearly hast thou bought thy precious lines;
Their praise grew swiftly, so thy life declines.
Thy muse, the speaker's queen, the reader's love,
All ears, all hearts (but death's), could please and move.

The other is by Bishop Corbet. (Poems, p. 68.)

He that hath such acuteness and such wit,
As would ask ten good heads to husband it:
He that can write so well, that no man dare
Resume it for the best; let him beware:
Beaumont is dead; by whose sole death appears
Wit's a disease consumes men in few years.

He left a daughter, Frances Beaumont, who died in
Leicestershire since the year 1700. She had in her
possession several poems of her father's writing; but
they were lost at sea in her voyage from Ireland, where
she had lived for some time in the duke of Ormond's
family.

Mr John Fletcher was not more meanly descended
than his poetical colleague; his father, the Rev. Dr
Fletcher, having been first made bishop of Bristol, by
Queen Elizabeth, and afterwards by the same monarch,
in the year 1593, translated to the rich see of London.
Our poet was born in 1576; and was, as well as his
friend, educated at Cambridge, where he made a great
proficiency in his studies, and was accounted a very good
scholar. His natural vivacity of wit, for which he was
remarkable, soon rendered him a devotee to the muses;
and his close attention to their service, and fortunate
connection with a genius equal to his own, soon raised
him to one of the highest places in the temple of poetical
fame. As he was born near ten years before Mr
Beaumont, so did he also survive him by an equal number
of years; the general calamity of a plague, which
happened in the year 1625, involved him in its great
destruction, he being at that time 49 years of age.

During the joint lives of these two great poets, it
appears that they wrote nothing separately, excepting
one little piece by each, which seemed of too trivial a
nature for either to require assistance in, viz. The Faith-
ful Shepherd, a pastoral, by Fletcher; and the Masque
of Gray's-Inn Gentlemen, by Beaumont. Yet what
share each had in the writing or designing of the pieces
thus composed by them jointly, there is no possibility
of determining. It is however generally allowed, that
Fletcher's peculiar talent was wit, and Beaumont's,
though much the younger man, judgment. Nay, so
extraordinary was the latter property in Mr Beaumont,
that it is recorded of the great Ben Johnson, who seems
moreover to have had a sufficient degree of self-opinion
of his own abilities, that he constantly, so long as this
gentleman lived, submitted his own writings to his
censure, and, as it is thought, availed himself of his
judgment at least in the correcting, if not even in the
contriving all his plots. It is probable, therefore, that
the forming the plots and contriving the conduct of the
fable, the writing of the more serious and pathetic
parts, and lopping the redundant branches of Fletcher's

On death, thy murderer, this revenge I take;
I slight his terrors, and just question make,
wit, whose luxuriance, we are told, frequently stood in need of castigation, might be in general Beaumont's portion in the work: while Fletcher, whose conversation with the beau monde (which indeed both of them from their births and stations in life had been ever accustomed to), added to the volatile and lively turn he possessed, rendered him perfectly master of dialogue and polite language, might execute the designs formed by the other, and raise the superstructure of those lively and spirited scenes which Beaumont had only laid the foundation of; and in this he was so successful, that though his wit and ratiery were extremely keen and poignant, yet they were at the same time so perfectly genteel, that they used rather to please than disgust the very persons on whom they seemed to reflect. Yet that Fletcher was not entirely excluded from a share in the conduct of the drama, may be gathered from a story related by Winstanley, viz. that our two bards having concerted the rough draught of a tragedy over a bottle of wine at a tavern, Fletcher said, he would undertake to kill the king; which words being overheard by the waiter, who had not happened to have been witness to the context of their conversation, he lodged an information of treason against them. But on their explanation of it only to mean the destruction of a theatrical monarch, their loyalty moreover being unquestioned, the affair ended in a jest.

On the whole, the works of these authors have undoubtedly very great merit, and some of their pieces deservedly stand on the list of the present ornaments of the theatre. The plots are ingenious, interesting, and well managed; the characters strongly marked; and the dialogue spirited and natural; yet there is in the latter a coarseness which is not suitable to the politeness of the present age; and a fondness of repartee, which frequently runs into obscenity; and which we may suppose was the vice of that time, since even the delicate Shakespeare himself is not entirely free from it. But as these authors have more of that kind of wit than the last-mentioned writer, it is not to be wondered if their works were in the licentious reign of Charles II. preferred to his. Now, however, to the honour of the present taste be it spoken, the tables are entirely turned; and while Shakespeare's immortal works are our constant and daily fare, those of Beaumont and Fletcher, though delicate in their kind, are only occasionally served up; and even then great pains are taken to clear them of that fumet, which the haust gout of their contemporaries considered as their supremest refulsh, but which the more undepraved taste of ours has justly taught to look on, as what it really is, no more than a corrupt and unwholesome taint.

Some of their plays were printed in quarto during the lives of the authors; and in the year 1645 there was published in folio a collection of such plays as had not been printed before, amounting to between thirty and forty. This collection was published by Mr Shirley, after the shutting up of the theatres; and dedicated to the Earl of Pembroke by ten of the most famous actors. In 1679 there was an edition of all their plays published in folio; another edition in 1711 by Mr Tonson, in seven volumes 8vo, and the last in 1751.

Beaumont, a town of the Netherlands, in Hainault, on the confines of the territory of Liege. It was ceded to the French in 1684; and taken in 1691 by the English, who blew up the castle. It is situated between the rivers Meuse and Sambre, in E. Long. 41. N. Lat. 50. 12.

Beaumont le Roger, a town of Upper-Normandy in France. E. Long. 0. 56. N. Lat. 49. 2.

Beaumont le Vicomte, a town of Maine in France. E. Long. 0. 10. N. Lat. 48. 2.

Beaumont sur Oise, a town in the Isle of France, seated on the declivity of a hill, with a bridge over the river Oise. E. Long. 2. 29. N. Lat. 49. 9.

Beaune, a handsome town of France, in the department of Côte d'Or, remarkable for its excellent wine, and for an hospital founded here in 1443. Its collegiate church is also one of the finest in France; the great altar is adorned with a table enriched with jewels; and its organs are placed on a piece of architecture which is the admiration of the curious. E. Long. 40. 50. N. Lat. 47. 2.

Beausobre, Isaac de, a learned Protestant writer, of French original, was born at Niort in 1659. He was forced into Holland to avoid the execution of a sentence upon him, which condemned him to make the amende honorable; and this for having broken the royal signet, which was put upon the door of a church of the Reformed, to prevent the public profession of their religion. He went to Berlin in 1694; was made chaplain to the king of Prussia, and counsellor of the royal consistory. He died in 1733, aged 79, after having published several works: as, 1. Defense de la Doctrine des Reformes. 2. A Translation of the New Testament and Notes, jointly with M. Lefranc; much esteemed by the Reformed. 3. Dissertation sur les Administrations de Boheme; a curious work. 4. Histoire Critique de Manichée et du Manichéisme, 2 tom. in 4to. This has been deemed by philosophers an interesting question, and nobody has developed it better than this author. 5. Several dissertations in the Bibliothèque Britannique.

Mr Beausobre had strong sense with profound erudition, and was one of the best writers among the Reformed; he preached as he wrote, and he did both with warmth and spirit.

Beauty, in its native signification, is appropriated to objects of sight. Objects of the other senses may be agreeable, such as the sounds of musical instruments, the smoothness and softness of some surfaces; but the agreeableness called beauty belongs to objects of sight.

Objects of sight are more complex than those of any other sense: in the simplest we perceive colour, figure, length, breadth, thickness. A tree is composed of a trunk, branches, and leaves; it has colour, figure, size, and sometimes motion: by means of each of these particulars, separately considered, it appears beautiful; but a complex perception of the whole greatly augments the beauty of the object. The human body is a composition of numberless beauties arising from the parts and qualities of the object, various colours, various motions, figures, size, &c. all united in one complex object, and striking the eye with combined force. Hence it is, that beauty, a quality so remarkable in visible objects, lends its name to every thing that is eminently agreeable. Thus, by a figure of speech, we say, a beautiful sound, a beautiful thought, a beautiful discovery, &c.
considering attentively the beauty of visible objects, two kinds are discovered. the first may be termed intrinsic beauty, because it is discovered in a single object, without relation to any other; the other may be termed relative, being founded on the relation of objects. intrinsic beauty is a perception of sense merely; for to perceive the beauty of a spreading oak, or of a flowing river, no more is required but singly an act of vision. relative beauty is accompanied with an act of understanding and reflection: for we perceive not the relative beauty of a fine instrument or engine until we learn its use and destination. in a word, intrinsic beauty is ultimate; and relative beauty is that of means relating to some good end or purpose. these different beauties agree in one capital circumstance, that both are equally perceived as belonging to the object; which will be readily admitted with respect to intrinsic beauty, but is not so obvious with respect to the object. the utility of the plough, for example, may make it an object of admiration or of desire; but why should utility make it beautiful? a natural propensity of the human mind will explain this difficulty: by an easy transition of ideas, the beauty of the effect is transferred to the cause, and is perceived as one of the qualities of the cause. thus a utility; an effect of intrinsic beauty appears beautiful by its utility; a dwelling-house void of all regularity is however beautiful in the view of convenience; and the want of symmetry in a tree will not prevent its appearing beautiful, if it be known to produce good fruit.

when these two beauties concur in any object, it appears delightful. every member of the human body possesses both in a high degree. the beauty of utility, being accurately proportioned to the degree of utility, requires no illustration. but intrinsic beauty, being more complex, cannot be handled distinctly without being analyzed. if a tree be beautiful by means of its colour, figure, motion, size, &c. it is in reality possessed of so many different beauties. the beauty of colour is too familiar to need explanation. the beauty of figure is more: for example, viewing any body as a whole, the beauty of its figure arises from regularity and simplicity; viewing the parts with relation to each other, uniformity, proportion, and order, contribute to its beauty. the beauties of grandeur and motion are considered separately. see grandeur and motion.

we shall here make a few observations on simplicity, which may be of use in examining the beauty of single objects. a multitude of objects crowding into the mind at once, disturb the attention, and pass without making any lasting impression: in the same manner, even a single object, consisting of a multiplicity of parts, equals not, in strength of impression, a more simple object comprehended in one view. this justifies simplicity in works of art, as opposed to complicated circumstances and crowded ornaments.

it would be endless to enumerate the effects that are produced by the various combinations of the principles of beauty. a few examples will be sufficient to give the reader some idea of this subject. a circle and a square are each perfectly regular: a square, however, is less beautiful than a circle; and the reason is, that the attention is divided among the sides and angles of a square; whereas the circumference of a circle, being a single object, makes one entire impression: and thus simplicity contributes to beauty. for the same reason a square is more beautiful than a hexagon or octagon. a square is likewise more beautiful than a parallelogram, because it is more regular and uniform. but this holds with respect to intrinsic beauty only: for in many instances, as in the doors and windows of a dwelling-house, utility turns the scales on the side of the parallelogram.

again, a parallelogram depends, for its beauty, on the proportion of its sides: a great inequality of its sides annihilates its beauty: approximation toward equality hath the same effect; for proportion there degenerates into perfect uniformity, and the figure appears an unsuccessful attempt toward a square. and hence proportion contributes to beauty.

an equilateral triangle yields not to a square in regularity nor in uniformity of parts, and it is more simple. but an equilateral triangle is less beautiful than a square; which must be owing to inferiority of order in the position of its parts; the order arising from the equal inclination of the sides of such an angle is more obscure than the parallelism of the sides of a square. and hence order contributes to beauty not less than simplicity, regularity, or proportion.

uniformity is singular in one circumstance, that it is apt to disgust by excess. a number of things destined for the same use, as windows, chairs, &c. cannot be too uniform. but a scrupulous uniformity of parts in a large garden or field is far from being agreeable.

in all the works of nature simplicity makes a capital figure. it also makes a figure in works of art: profuse ornament in painting, gardening, or architecture, as well as in dress or in language, shows a mean or corrupted taste. simplicity in behaviour and manners has an enchanting effect, and never fails to gain our affection. very different are the artificial manners of modern times. a gradual progress from simplicity to complex forms and profuse ornament, seems to be the fate of all the fine arts; resembling behaviour, which from original candour and simplicity has degenerated into duplicity of heart and artificial refinements. at present, literary productions are crowded with words, epithets, figures: in music, sentiment is neglected for the luxury of harmony, and for difficult movement.

with regard to the final cause of beauty, one thing is evident, that our relish of regularity, uniformity, proportion, order, and simplicity, contributes greatly to enhance the beauty of the objects that surround us, and of course tends to our happiness. we may be confirmed in this thought, upon reflecting, that our taste for these particulars is not accidental, but uniform and universal, making a branch of our nature. at the same time, regularity, uniformity, order, and simplicity, contribute each of them to readiness of apprehension, and enable us to form more distinct ideas of objects than can be done where these particulars are wanting. in some instances, as in animals, proportion is evidently connected with utility, and is the more agreeable on that account.

beauty, in many instances, promotes industry; and as it is frequently connected with utility, it proves an additional incitement to enrich our fields and improve our manufactures. these, however, are but slight effects,
A. The look here meant is most frequently expressed by the best painters in their Magdalen; in which, if there were no tears on the face, you would see, by the humid reducts of the skin, that she had been weeping extremely.
thing distinct from all human beauty; and of a nature
greatly superior to it; something that seems like an
air of divinity: Which is expressed, or at least is to be
traced out, in but very few works of the artists; and
of which scarcely any of the poets have caught any ray
in their descriptions (or perhaps even in their ima-
gination), except Homer and Virgil, among the an-
cients; and our Shakespeare and Milton among the
moderns.

The beauty of the mere human form is much superior
to that of colour; and it may be partly for this reason,
that when one is observing the finest works of the artists
at Rome (where there is still the noblest collection of
any in the world), one feels the mind more struck and
more charmed with the capital statues, than with the
pictures of the greatest masters.

One of the old Roman poets, in speaking of a very
handsome man, who was candidate for the prize in
some of the public games, says, that he was much ex-
pected and much admired by all the spectators at his
first appearance; but that, when he flung off his robe,
and discovered the whole beauty of his shape alto-
ether, it was so superior, that it quite extinguished the
beauties they had before so much admired in his face.

Much the same effect may be felt in viewing the Venus
of Medici. If you observe the face only, it appears
evertheless beautiful: but if you consider all the other
elegancies of her make, the beauty of her face becomes
less striking, and is almost lost in such a multiplicity of
charms.

Whoever would learn what makes the beauty of
each part of the human body, may find it laid down
pretty much at large, by (a) Feliciensius; or may study it
with more pleasure to himself, in the finest pictures and
statues;

extremely. There is a very strong instance of this in a Magdalen by Le Brun, in one of the churches at Paris,
and several by Titian, in Italy; the very best of which is at the Barberino palace at Venice. In speaking of
which, Rosalba hardly went too far, when she said, “It wept all over;” or (in the very words she used) “Elle
pleure jusqu’aux bouts de doigts.”

(a) In his Entretiens, vol. ii. p. 14–45. The chief of what he says there, on the beauty of the different
parts of the female form, is as follows: That the head should be well rounded; and look rather inclining to
small than large. The forehead, white, smooth, and open (not with the hair growing down too deep upon it);
neither flat nor prominent, but like the head, well rounded; and rather small in proportion than large. The
hair either bright black or brown, not thin, but full and waving; and if it falls in moderate curls the better.
The black is particularly useful for setting off the whiteness of the neck and skin. The eyes black, chestnut, or
blue; clear, bright, and lively; and rather large in proportion than small. The eye-brows, well divided, rather
full than thin; semicircular, and broader in the middle than at the ends; of a neat turn, but not formal. The
cheeks should not be wide; should have a degree of plumpness, with the red and white finely blended together;
and should look firm and soft. The ear should be rather small than large; well folded, and with an agreeable
tinge of red. The nose should be placed so as to divide the face into two equal parts; should be of a moderate
size, straight, and well-squared; though sometimes a little rising in the nose, which is but just perceptible, may give
a very graceful look to it. The mouth should be small; and the lips not of equal thickness. They should be
well turned, small rather than gross; soft even to the eye; and with a living red in them. A truly pretty
mouth is like a rose-bud that is beginning to blow. The teeth should be middle-sized, white, well-ranged, and
even. The chin of a moderate size; white, soft, and agreeably rounded. The neck should be white, straight, and
of a soft, easy, and flexible make, rather long than short; less above, and increasing gently toward the shoulders.
The whiteness and delicacy of its skin should be continued, or rather go on improving to the bosom. The skin
in general should be white, properly tinged with red; with an apparent softness, and a look of thriving health
in it. The shoulders should be white, gently spread, and with a much softer appearance of strength than in those of
men. The arm should be white, round, firm, and soft; and more particularly so from the elbow to the hand.
The hand should unite insensibly with the arm; just as it does in the statue of the Venus of Medici. They
should be long and delicate, and even the joints and nervous part of them should be without either any hard-
ness or dryness. The fingers should be fine, long, round, and soft; small, and lessening towards the tips of
them:
The parts of the face in which the passions most
frequently make their appearance, are the eyes and
mouth; but from the eyes they diffuse themselves
very strongly about the eye-brows: as, in the other
case, they appear often in the parts all round the
mouth.

Philosophers may dispute as much as they please
about the seat of the soul; but wherever it resides,
we are sure that it speaks in the eyes. Perhaps it is
injuring the eye-brows, to make them only dependents
on the eye: for they, especially in lively faces, have,
as it were, a language of their own; and are extrem-
ely varied, according to the different sentiments and
passions of the mind.

Degree of pleasure may be often discerned in a la-
dy's eye-brow, though she have address enough not to
let it appear in her eyes; and at other times may be
discovered so much of her thoughts, in the line just
above her eye-brows, that she would probably be amaz-
ed how any body could tell what passed in her mind,
and (as she thought) undiscovered by her face, so par-
ticularly and distinctly.

Homer makes the eye-brows the seat of (c) majesty,
Virgil of (d) dejection, Horace of (x) modesty, and
Juvenal of (y) pride; and it is not certain whether
every one of the passions be not assigned, by one or
other of the poets, to the same part.

Having hitherto spoken only of the passions in gen-
eral, we will now consider a little which of them add to
beauty, and which of them take from it.

We may say, in general, that all the tender and kind
passions add to beauty; and all the cruel and unkind
ones add to deformity: And it is on this account that
good nature may very justly be said to be "the best
feature even in the finest face."

Mr Pope has included the principal passion of each
sort in two very pretty lines:

Love, hope, and joy, fair pleasure's smiling train;
Hate, fear, and grief, the family of pain.

The former of which naturally give an additional lustre
and

them: and the nails long, rounded at the ends, and pellucid. The bosom should be white and charming: and the
breasts equal in roundness, whiteness, and firmness; neither too much elevated nor too much depressed; rising
gently, and very distinctly separated; in one word, just like those of the Venus of Medici. The sides should
be long, and the hips wider than the shoulders; and turn off as they do in the same Venus; and go down rounding
and lessening gradually to the knee. The knee should be even and well rounded; the legs straight, but varied
by a proper rounding of the more fleshy part of them, and the feet finely turned, white, and little.

(c) Κρασίν

(d) Deo sancto nubem; plerumque modestus

(e) Occupat obscuri speciem. Horat. lib. i. epist. 18. 95.

(y) Malo Venustissam, quam te, Cornelia, mater

It is here that the Romans used the word superciliosus (as we do from it the word supercilious) for proud and
arrogant persons.
Beaut.

and enlivening to beauty; as the latter are too apt to

singe a gloom and cloud over it.

Yet in these, and all the other passions, moderation ought perhaps to be considered in a great measure the

rule of their beauty, almost as far as moderation in

actions is the rule of virtue. Thus an excessive joy may

be too boisterous in the face to be pleasing; and a de-
gree of grief in some faces, and on some occasions,

may be extremely beautiful. Some degrees of anger,

shame, surprise, fear, and concern, are beautiful; but

all excess is hurtful; and all excess ugly. Dullness,

austerity, impudence, pride, affectation, malice, and

envy, are all ugly.

The finest union of passions that can perhaps be ob-

served in any face, consists of a just mixture of modesty,

sensibility, and sweetness; each of which when taken

singly is very pleasing; but when they are all blended

together, in such a manner as either to enliven or cor-

rect each other, they give almost as much attraction

as the passions are capable of adding to a very pretty

face.

The prevailing passion in the Venus of Medici is

modesty; it is expressed by each of her hands, in her

looks, and in the turn of her head. And by the way

it may be questioned, whether one of the chief reasons

why side-faces please one more than full ones, be not

from the former having more of the air of modesty than

the latter. This at least is certain, that the best artists

usually choose to give a side-face rather than a full one;

in which attitudine, the turn of the neck too has more

beauty, and the passions more activity and force. Thus,

as to hatred and affection in particular, the look that

was formerly supposed to carry an infection with it from

malignant eyes, was a slanting regard; like that which

Milton gives to Satan, when he is viewing the happiness

of our first parents in paradise; and the fascination,
or stroke of love, is most usually conveyed, at first in a

side-glance.

It is owing to the great force of pleasingness which

attends all the kinder passions, "that lovers do not only

seem, but are really, more beautiful to each other

than they are to the rest of the world;" because when

they are together, the most pleasing passions are more

frequently exerted in each of their faces than they are

in either before the rest of the world. There is then

(as a certain French writer very well expresses it) "A

soul upon their countenances," which does not appear

when they are absent from each other; or even when

they are together conversing with other persons, that

are indifferent to them, or rather lay a restraint upon

their features.

The superiority which the beauty of the passions has

over the two parts of beauty first mentioned, will

probably be now pretty evident: or if this should ap-

pear still problematical to any one, let him consider a

little the following particulars, of which every body

must have met with several instances in their lifetime.

That there is a great deal of difference in the same

face, according as a person is in a better or worse

humour, or in a greater or less degree of liveliness:

That the best complexion, the finest features, and the

exactest shape, without any thing of the mind expressed

on the face, are as insipid and unmoving as the waxen

figure of the fine duchess of Richmond in Westminster-

Abbey: That the finest eyes in the world, with an

Vol. III. Part II.
But though one cannot punctually say what grace is, we may point out the parts and things in which it is most apt to appear.

The chief dwelling-place of grace is about the mouth; though at times it may visit every limb or part of the body. But the mouth is the chief seat of grace, as much as the chief seat for the beauty of the passions is in the eyes. Thus, when the French use the expression of une bouche fort gracieuse, they mean it properly of grace: but when they say, des yeux tres gracieux, it then falls to the share of the passions; and it means kind or favourable.

In a very graceful face, by which we do not so much mean a majestic as a soft and pleasing one, there is now and then (for no part of beauty is either so engaging or so uncommon) a certain deliciousness that almost always lives about the mouth, in something not quite enough to be called a smile, but rather an approach towards one, which varies gently about the different lines there like a little fluttering Cupid, and perhaps sometimes discovers a little dimple, that after just lightening upon you disappears and appears again by fits.

The grace of attitudes may belong to the position of each part as well as to the carriage or disposition of the whole body: but how much more it belongs to the head than to any other part may be seen in the pieces of the most celebrated painters; and particularly in those of Guido, who has been rather too lavish in bestowing this beauty on almost all his fine women: whereas nature has given it in so high a degree but to very few.

The turns of the neck are extremely capable of grace, and are very easy to be observed, though very difficult to be accounted for.

How much of this grace may belong to the arms and feet, as well as to the neck and head, may be seen in dancing. But it is not only in genteel motions that a very pretty woman will be graceful; and Ovid (who was so great a master in all the parts of beauty) had very good reason for saying, That when Venus, to please her gallant, imitated the hobbling gait of her husband, her very lameness had a great deal of prettiness and grace in it.

"Every motion of a graceful woman (says another writer of the same age) is full of grace." She designs nothing by it perhaps, and may even not be sensible of it herself: and indeed she should not be so too much; for the moment that any gesture or action appears to be affected, it ceases to be graceful.

Horace and Virgil seem to extend grace so far as to the flowing of the hair, and Tibullus even to the dress of his mistress; but then he assigns it more to her manner of putting on and appearing in whatever she wears than to the dress itself. It is true, there is another wicked poet (Ovid) who has said (with much less decency) "that dress is the better half of the woman."

Pars minima est ipsa puella sui. Ovid.

There are two very distinct (and, as it were, opposite) sorts of grace; the majestic and the familiar. The former belongs chiefly to the very fine women, and the latter to the very pretty ones: that is more commanding, and this the more delightful and engaging. The Grecian painters and sculptors used to express the former most strongly in the looks and attitudes of their Minervas, and the latter in those of Venus.

Xenophon, in his Choice of Hercules (or at least the excellent translator of that piece), has made just the same distinction in the personages of Wisdom and Pleasure; the former of which he describes as moving on to that young hero with the majestic sort of grace; and the latter with the familiar:

Graceful, yet each with different grace they move;  
This striking sacred awe, that softer winning love.

No poet seems to have understood this part of beauty so well as our own Milton. He speaks of these two sorts of grace very distinctly; and gives the majestic to his Adam, and both the familiar and majestic to Eve, but the latter in a less degree than the former:

Two of far nobler shape, erect and tall,  
Godlike erect, with native honour clad,  
In naked majesty, seem'd lords of all;  
And worthy seem'd: For in their looks divine  
The image of their glorious Maker shone:  
Truth, wisdom, sanctitude severe and pure;  
Severe, but in true filial freedom plac'd:  
Whence true authority in men: Though both  
Not equal, as their sex not equal, seem'd;  
For contemplation he, and valour, form'd;  
For softness she, and sweet attractive grace.  

Milton's Par. Lost, book iv. 298.

______
I espy'd thee, fair indeed and tall,  
Under a plantain; yet methought less fair,  
Less winning soft, less amiable mild,  
Than that smooth wat'ry image  
(Eve, of Adam and herself) Ib. ver. 480.

______
Her bea'ly form  
Angelick, but more soft and feminine;  
Her graceful innocence; her ev'ry air  
Of gesture, or least action.  
B. ix. 461.

Grace was in all her steps: Heav'n in her eye;  
In every gesture, dignity and love.  
B. viii. 489.

Speaking or mute, all comeliness and grace  
Attends thee; and each word, each motion, forms.  
Ib. 223.

Though grace is so difficult to be accounted for in general, yet there are two particular things which seem to hold universally in relation to it.

The first is, "That there is no grace without motion; that is, without some genteel or pleasing motion, either of the whole body or of some limb, or at least of some feature. And it may be hence that Lord Bacon calls grace by the name of decent motion; just as if they were equivalent terms: "In beauty, that favour is more than that of colour; and that of gracious and decent motion, more than that of favour."

Virgil in one place points out the majesty of Janus, and in another the graceful air of Apollo, by only saying that they move; and possibly he means no more when he makes the motion of Venus the principal thing by which Aeneas discovers her under all her disguise:
disguise: though the commentators, as usual, would
fain find out a more dark and mysterious meaning for
it.

All the best statues are represented as in some action
or motion; and the most graceful statue in the world
(the Apollo Belvedere) is so much so, that when one
faces it at a little distance, one is almost apt to imagine
that he is actually going to move on toward you.

All graceful heads, even in the portraits of the best
painters, are in motion; and very strongly on those of
Guido in particular; which are all either casing their
looks up toward heaven, or down toward the ground,
or side-way, as regarding some object. A head that is
quite unactive, and flung flat upon the canvas (like the
faces on medals after the fall of the Roman empire, or
the Gothic heads before the revival of the arts), will be
so far from having any grace, that it will not even have
any life in it.

The second observation is, "That there can be no
grace with impropriety;" or, in other words, that no-
thing can be graceful that is not adapted to the charac-
ters of the person.

The graces of a little lively beauty would become un-
graceful in a character of majesty: as the majestic airs
of an empress would quite destroy the prettiness of the
former. The vivacity that adds grace to beauty in
youth would give an additional deformity to old age;
and the very same airs which would be charming on
some occasions may be quite shocking when extremely
mistimed or extremely misplaced.

The inseparable union of propriety and grace seems
to have been the general sense of mankind, as we may
guess from the languages of several nations; and some
words that answer to our proper or becoming,
are used indifferently for beautiful or graceful. Thus,
among the Greeks the words προπειραι and καλος,
and among the Romans pulcherum and decens, or decorum,
are used indifferently for one another.

It appears wrong, however, to think (as some have
done) that grace consists entirely in propriety; because
propriety is a thing easy enough to be understood, and
grace (after all we can say about it) very difficult.
Propriety, therefore, and grace are no more one and
the same thing than grace and motion are. It is true,
it cannot subsist without either; but then there seems
to be something else, which cannot be explained, that
goes to the composition, and which possibly may give
it its greatest force and pleasingness.

Whatever are the causes of it, this is certain, that
grace is the chief or all the constituent parts of
beauty: and so much so, that it seems to be the only one
which is absolutely and universally admired: All the
rest are only relative. One like a brunette beauty
better than a fair one; I may love a little woman,
and you a large one, best; a person of a mild temper
will be fond of the gentler passions in the face, and one
of a bold cast may choose to have more vivacity and
more vigorous passions expressed there: But grace is
found in few, and is pleasing to all. Grace, like poe-
try, must be born with a person, and is never wholly
to be acquired by art. The most celebrated of all the
ancient painters was Apelles; and the most celebrated
of all the modern Raphael: and it is remarkable,
that the distinguishing character of each of them
was grace. Indeed, that alone could have given them
so high a pre-eminence over all their other competi-
tors.

Grace has nothing to do with the lowest part of be-
auty or colour; very little with shape, and very much
with the passions; for it is she who gives their highest
zest, and the most delicious part of their pleasingness
to the expressions of each of them.

All the other parts of beauty are pleasing in some
degree, but grace is pleasing itself. And the old
Romans in general seem to have had this notion of it,
as may be inferred from the original import of the
names which they used for this part of beauty: Gra-
tia from gratus, or "pleasing;" and decor from decens,
or "becoming;"}

The Greeks as well as the Romans must have been
of this opinion; when in settling their mythology, they
made the Graces the constant attendants of Venus, or
the cause of love. In fact, there is nothing causes love
so generally and so irresistibly as grace. It is like the
custus of the same goddess, which was supposed to
comprehend every thing that was winning and enga-
ging in it; and beside all, to oblige the heart to love
by a secret and inexplicable force like that of some mag-
ic charm.

She said; with awe divine, the queen of love
Obey'd the sister and the wife of Jove:
And from her fragrant breast the zone unbraided,
With various skill and high embroidery graced.
In this was every art, and every charm,
To win the wisest, and the coldest warm:
Fond love, the gentle vow, the gay desire,
The kind deceit, the still reviving fire.
Persuasive speech, and more persuasive sighs,
Silence that spoke, and eloquence of eyes.
This on her hand the Cyprian goddess laid;
Take this, and with it all thy wish, she said:
With smiles she took the charm; and smiling prest
The powerful Cestus to her snowy breast.

Pope, II. xiv. 256.

Although people in general are more capable of judg-
ing right of beauty, at least in some parts of it, than
they are of most other things; yet there are a great
many causes apt to mislead the generality in their judg-
ments of beauty. Thus if the affection is entirely en-
gaged by any one object, a man is apt to allow all per-
fections to that person, and very little in comparison to
any body else; or if they ever commend others highly,
it is for some circumstance in which they bear some
resemblance to their favourite object.

Again, people are very often misled in their judg-
ments, by a similitude either of their own temper or
personage in others. It is hence that a person of a mild
temper is more apt to be pleased with the gentler pas-
sions in the face of his mistress; and one of a very livel-
ly turn would choose more of spirit and vivacity in his :
that little people are inclined to prefer pretty women,
and larger people majestic ones; and so on in a great
variety of instances. This may be called falling in love
with ourselves at second hand; and self-love (whatever
other love may be) is sometimes so false-sighted, that
it may make the most plain, and even the most disagree-
able things, seem beautiful and pleasing.

Sometimes an idea of usefulness may give a turn to
our ideas of beauty; as the very same things are recog-
ized
In an account of some of the farthest travels that any of our people have made up the river Gambia, we are informed, that when they came to some villages where probably no Europeans had ever been before, the women ran frightened and screaming from them, on taking them to be devils, merely on account of the whiteness of their complexion.

We cannot avoid observing, however, that heaven is very good and merciful to mankind, even in making us capable of all this variety of mistakes. If every person judged exactly right of all men, that was in love in such a district, would be in love with the same woman. The superior beauty of each hamlet would be the object of the hate and malice of all the rest of her own sex in it, and the cause of dissension and murders among all of the other. If this would hold in one town, it would hold for the same reasons in every other town or district; and of course there would be nothing more wanting than this universal right judgment of beauty, to render the whole world one continued scene of blood and misery.

But now that fancy has perhaps more to do with beauty than judgment, there is an infinity of taste, and consequently an infinity of beauty; for to the mind of the lover, supposed beauty is full as good as real. Every body may now choose out what happens to his own turn and cast. This increases the extent of beauty vastly, and makes it in a manner universal: for there are but few people in comparison that are truly beautiful; but every body may be beautiful in the imagination of some one or other. Some may delight themselves in a black skin, and others in a white; some in a gentle natural rosiness of complexion, others in a high excided artificial red; some nations in waists disproportionably large, and others in waists as disproportionably small. In short, the most opposite things imaginable may each be looked upon as beautiful in whole different countries, or by different people in the same country.

We should perhaps make a distinction here again, as to the two former parts of beauty and the two latter. Fancy has much more to do in the articles of form and colour than in those of the passions and grace. The good passions, as they are visible on the face, are apparent goodness; and that must be generally amiable: and true grace, wherever it appears to any degree, one should think must be pleasing to every human creature; or perhaps this may never appear in the women of any nation, where the men are grown so savage and brutal as to have lost all taste of it.

Yet even as to grace itself, under the notion of pleasingness, it may become almost universal, and be as subject to the dominion of fancy as any of the less significant parts of beauty. A parent can see gentleness in the most awkward child perhaps that ever was born; and a person who is truly in love, will be pleased with every motion and air of the person beloved; which is the most distinguishing character that belongs to grace. See this subject more fully considered in the article BEAUTY in the Supplement.

BEAUTY, in Architecture, Painting, and other arts, is the harmony and justness of the whole composition taken together.

BEAUVIEUX, an episcopal city of France, in the department of Oise. The cathedral church, which
Beauvais is dedicated to St Peter, is much admired for its fine architecture. It contains a great number of relics, and a library of curious books. The town was in succession besieged by the English in 1443, and by the duke of Burgundy with an army of 80,000 men. In this last siege the women signalized themselves under the conduct of Jean Hachette, who set up a standard yet preserved in the church of the Jacobins. The duke was obliged to raise the siege; and in memory of this exploit, the women walk first in a procession on the 10th of July, the anniversary of their deliverance. The town had 12,800 inhabitants in 1815. Beauvais is situated on the river Thérain, 42 miles north of Paris, in E. Long. 2° 15'. N. Lat. 59° 26'.

Beauvais, a town of France in Upper Languedoc, seated on the river Tescou. E. Long. 4° 33'. N. Lat. 44° 2'.

Beauvin, a city of Burgundy in France, in E. Long. 5° 50'. N. Lat. 47'.

Beauvoir sur Mer, a maritime town of France, in the department of Vendée, 23 miles south-west of Nantes. W. Long. 1° 5'. N. Lat. 46° 45'.

Beauvoisins, a territory of France, formerly part of Picardy, now included under the department of Oise.

Béflinguen, a town of Suabia, in the kingdom of Wurttemberg in Germany, seated on a lake from which proceeds the river Worm. E. Long. 9° 8'. N. Lat. 47° 45'.

Bébricia, in Ancient Geography, an ancient name of Bithynia, so called from the Bebrices its inhabitants. The Bebrices were afterwards driven out by the Thracians, viz. the Bithyni and Thyini: from whom, in process of time, the country took the name of Bithynia. See Bithynia.

Béch, a town of France, in the department of Lower Seine, seated on a tongue of land, at the confluence of two rivers. E. Long. 0° 52'. N. Lat. 48° 45'.

Beckah, or Bekah, a Jewish coin, being half a shekel. In Dr Arthusbon's table of reductions, the beckah amounts to 1324; in Dr Prideaux's computation to 1s. 6d. Every Israelite paid an hundred Beckahs a head annually for the support of the temple.

Bécalm, in a general sense, signifies to appease, to ally.

Bécalm, in the sea language. A ship is said to be becalmed when there is not a breath of wind to fill the sails.

Bécanor, a town of India in Asia, seated on the river Ganges, in E. Long. 83° 5'. N. Lat. 27° 40'.

Beccabunga, Brooklime; the trivial name of a species of Veronica. See Veronica, Botany Index.

Beccaria, Cesare Bonesana, Marquis of, an Italian writer on jurisprudence. See Supplement.

Beccaria, Giambattista, an Italian natural philosopher. See Supplement.

Beckles, a town of Suffolk in England, containing 2977 inhabitants in 1811. E. Long. 1° 30'. N. Lat. 52° 38'.

Becker, John Joachim, a celebrated chemist, was born at Spires, in 1645. He was connected with the most learned men in Europe; and the emperors, the electors of Mentz and Bavaria, and other persons of high rank, furnished him with the means of making experiments in mathematics, natural philosophy, medicine, and chemistry. As his thoughts were very judicious and uncommon with respect to economy and to increasing the revenues of a state, he was invited to Vienna, where he contributed greatly to the establishment of several manufactures, a chamber of commerce, and an India company; but the jealousy of some of the ministers occasioned his disgrace and ruin. He was not less unhappy at Mentz, Munich, and Wurtzburg; which determined him to go to Haerlem, where he invented a machine for working a great quantity of silk in a little time, and with few hands: but new misfortunes made him come to England, and he died at London in 1685. He wrote many works; the principal of which are, 1. Physica Subterranea, which was reprinted at Leipsic in 1703, and 1739, in octavo, with a small treatise, by E. Stahl, entitled Specimen Baccelianum. 2. Experimentum chymicum novum, 8vo. 3. Character pro Notitia Linguarum universal. 4. Institutiones Chymicæ, seu Manuactio ad Philosophiam Hermeticam, 4to. 5. Institutiones Chymicae prodomæ, 12mo. 6. Experimentum novum ac curiosum de Minera arenaria perpetua, &c.

Bechin, a town of Bohemia, in the circle of the same name. It was taken and burnt by General Bruqui in 1619. It is seated on the river Lausauis, in E. Long. 15° 12'. N. Lat. 49° 14'.

Beck, or Beke, a word which imports a small stream of water issuing from some burn or spring. Hence Hell-becks, little brooks in the rough and wild mountains about Richmond near Lancashire, so called on account of their ghastliness and depth.

Beck is chiefly used among us in the composition of names of places originally situated on rivulets: hence Walbeck, Bournbeck, &c. The Germans use beck in the same manner.

Beck, David, an eminent portrait painter, was born at Arnhem in Guelderland in 1621, and became a disciple of Vandyck; from whom he acquired a fine manner of penciling, and that sweet style of colouring which is peculiar to that great master and to all the disciples trained up under his direction. He possessed besides, that freedom of hand, and readiness, or rather rapidity of execution, for which Vandyck was so remarkably famous; and King Charles I. when he observed the expeditious manner of Beck's painting, was so exceedingly surprised, that he told Beck, it was his opinion, he could paint if he was riding post. He was appointed portrait-painter and chamberlain to Queen Christina of Sweden; and by her recommendation, most of the illustrious persons in Europe sat to him for their pictures. He was agreeable, handsome, and polite, and lived in the highest favour with his royal mistress; but, having an earnest desire to visit his friends in Holland, and leaving the court of Sweden much against the queen's inclination, she apprehended that he intended never to return; and, as he died at the Hague, it was suspected that he was poisoned. This happened in 1656, when he was aged only 35 years. A very singular adventure happened to this painter as he travelled through Germany, which seems not unworthy of being recited. He was suddenly and violently taken ill at the inn where he lodged, and was laid out as a corpse, seeming to all appearance quite dead. His valets expressed the strongest marks of grief for the loss of their master, and while they sat beside his bed, they drank very freely by way of consolation.
At last one of them, who grew much intoxicated, said to his companions, Our master was fond of his glass while he was alive, and out of gratitude let us give him a glass now he is dead. As the rest of the servants assented to the proposal, he raised up the head of his master, and endeavoured to pour some of the liquor into his mouth. By the fragrance of the wine, or probably by a small quantity that imperceptibly got down his throat, Beck opened his eyes; and the servant being excessively drunk, and forgetting that his master was considered as dead, compelled him to swallow what wine remained in the glass. The painter gradually revived, and by proper management and care recovered perfectly, and escaped a premature interment. How highly the works of this master were esteemed, may appear from the many marks of distinction and honour which were shown him; for he received from different princes, as an acknowledgment of his singular merit, nine gold chains, and several medals of gold, of a very large size.

BECKET, THOMAS, lord chancellor of England, archbishop of Canterbury in the 12th century. The story of his birth is as extraordinary as that of his life. It is related that his father Gilbert Becket, some time sheriff of London, went on a pilgrimage to Jerusalem, where being surprised and enslaved by a party of Saracens, his master's daughter fell in love with him; and that when he made his escape she followed him to London. So singular an instance of heroic affection struck him; and after consulting with some bishops, he baptized her by the name of Matilda, and married her; from which marriage proceeded the haughty Thomas Becket. Being raised to the archbishopric, he began the great dispute between the crown and the mitre, and sided with the pope: at which King Henry II. was greatly offended; and calling an assembly of the bishops at Westminster, offered six articles against papal encroachments, which he urged Becket to assent to. Becket, at the importunities of several lords, signed them; but relapsing, he was ordered to be tried as a traitor: upon which he fled into Flanders. The king banished all his relations, and Becket excommunicated all his opposers. At last, after seven years, by the intercession of the French king and the pope, he was released, but refused to absolve these bishops and others he had excommunicated: whereupon the king grew enraged, and is reported to have dropped these expressions: "That he was an unhappy prince, who maintained a great number of lazy insignificant persons about him, none of whom had gratitude or spirit enough to revenge him on a single insolent prelate who gave him so much disturbance." These words of the king put four gentlemen of his court on forming a design against the archbishop's life, which they executed in the cathedral church of Canterbury, on the 29th of December 1171. They endeavoured to drag him out of the church; but finding they could not do this without difficulty, killed him there. The assassins being afraid they had gone too far, durst not return to the king's court at Normandy, but retired to Knaresborough in Yorkshire; where everybody avoided their company, hardly any person even choosing to eat or drink with them. They at length took a voyage to Rome, and being admitted to penance by Pope Alexander III. they went to Jerusalem; where, according to the pope's order, they spent their lives in penitential austerities, and died in the Black Mountain. They were buried at Jerusalem, without the church door belonging to the Templars. King Henry was, or affected to be, much disturbed at the news of Becket's death, and despatched an embassy to Rome to clear himself from the imputation of being the cause of it. Immediately all divine offices ceased in the church of Canterbury, and for this a year, excepting nine days; at the end of which, by order of the pope, it was reconsecrated. Two years after, Becket was canonized; and the following year, Henry returning to England, went to Canterbury, where he did penance as a testimony of his regret for the murder of Becket. When he came within sight of the church where the archbishop was buried, he alighted off his horse, and walked barefoot, in the habit of a pilgrim, till he came to Becket's tomb; where, after he had prostrated himself and prayed for a considerable time, he submitted to be scourged by the monks, and passed all that day and night without any refreshment, and kneeling upon the bare stone. In 1221 Becket's body was taken up, 50 years after his murder, in the presence of King Henry III. and a great concourse of the nobility and others, and deposited in a rich shrine, erected at the expense of Stephen Langton archbishop of Canterbury, which was soon visited from all parts, and enriched with the most costly gifts and offerings; and the miracles said to be wrought at his tomb were so numerous, that Gervase of Canterbury tells us, there were two large volumes of them kept in that church. The monks used to raise his body every year; and the day on which this ceremony was performed, which was called the day of his translation, was a general holiday: every 50th year there was celebrated a jubilee to his honour, which lasted 15 days; plenary indulgences were then granted to all that visited his tomb; and 100,000 pilgrims have been registered at a time in Canterbury. The devotion towards him had quite effaced in that town the adoration of the Deity; nay, even that of the Virgin. At God's altar, for instance, there were offered in one year 31. 2s. 6d.; at the Virgin's, 6s. 5d. 6d. at St Thomas's, 5s. 12d.; but not a penny was offered at God's altar; the Virgin's gained only 4s. 10d.; but St Thomas had got for his share 9s. 4d. 3d. Louis VII. of France had made a pilgrimage to this miraculous tomb, and had bestowed on the shrine a jewel which was esteemed the richest in Christendom. Henry VIII. to whom it may easily be imagined how obnoxious a saint of this character behaved to appear, and how much contrary to all his projects for degrading the authority of the court of Rome, not only pillaged the rich shrine dedicated to St Thomas, but made the saint himself be cited to appear in court, and be tried and condemned as a traitor: he ordered his name to be struck out of the calendar; the office for his festival to be expunged from all breviaries; and his bones to be burnt, and the ashes thrown in the air. From Mr. Thomas Warton we learn, that Becket was the subject of poetical legends. The Lion of the Saints in verse, in Bennet's library (Number CLXV.), contains his martyrdom and translation. This manuscript is supposed to be of the 14th century. The same ingenious writer informs us, from Peter de Bles, that the palace
BED

palace of Becket was perpetually filled with bishops highly accomplished in literature, who passed their time there in reading, disputing, and deciding important questions of the state. "These prelates, though men of the world, were a society of scholars; yet very different from those who frequented the universities, in which nothing was taught but words and syllables, unprofitable subtleties, elementary speculations, and trifling distinctions. De Blois was himself eminently learned, and one of the most distinguished ornaments of Becket's attendants. We know that John of Salisbury, his intimate friend, the companion of his exile, and the writer of his life, was scarcely exceeded by any man of his time for his knowledge in philological and polite literature."

BECKINGHAM, CHARLES, an English dramatic writer, was the son of a linen-dyer in London, and born in 1699. He was educated at that great nursery of learning Merchant Taylor's school, under the learned Dr Smith, where he made a very great proficiency in his studies, and gave the strongest testimonies of very extraordinary abilities. In poetry more particularly he very early discovered an uncommon genius, two dramatic pieces of his writing being represented on the stage before he had completed his 20th year: and those not such as required the least indulgence or allowance on account of his years; but such as bore evidence to a boldness of sentiment, and accuracy of diction, an ingenuity of conduct, and a maturity of judgment, which would have done honour to a much more ripened age. The titles of his plays, both of which are tragedies, are, 1. Henry IV. of France. 2. Scipio Africanus. At the representation of the last-mentioned piece, which indeed was the first he wrote, his schoolmaster Dr Smith gave all his boys a holiday on the afternoon of the author's benefit, in order to afford an opportunity to such of them as pleased to pay their compliments to their school-fellow on that occasion. Besides these dramatic pieces, he wrote several other poems: but his genius was not permitted any very long period to expand itself in; for he died on the 18th of February 1730, in the 32d year of his age.

BECKMAN, JOHN, an eminent German writer. See Supplement.

BECKUM, a town of the bishopric of Munster, in Germany, seated at the source of the river Verse, in E. Long. 8° 18'. N. Lat. 51° 46'.

BECSANGL, anciently Bithynia, a province of Natolia in Asia; bounded on the north by the Black sea; on the west, by the sea of Marmora; on the south, by Natolia Proper: and on the east, by the province of Boll. The principal town is Burra.

BECTASSE, an order or sect of religious among the Turks, denominated from their founder Bectash, preacher to Sultan Amurath. All the Janizaries belonging to the Porte are of the religion of Bectasse, being even said to have derived their origin from the founder of this sect. The habit of the Bectass is white: on their heads they wear white caps of several pieces, with turbans of wool twisted after fashion. They observe constantly the hour of prayer, which they perform in their own assemblies, and make frequent declarations of the unity of God.

BED, a convenience for stretching and composing the body on, for ease, rest, or sleep, consisting generally of feathers enclosed in a ticken case. There are varieties of beds, as a standing-bed, a settee-bed, a tent-bed, a truckle-bed, &c.

It was universally the practice, in the first ages, for Whitemankind to sleep upon skins of beasts. It was originally the custom of the Greeks and Romans. It was particularly the custom of the ancient Britons before the Roman invasion; and these skins were spread on the floor of their apartments. Afterwards they were changed for loose rushes and heath, as the Welsh a few years ago lay on the former, and the Highlanders of Scotland sleep on the latter to this present moment. In process of time, the Romans suggested to the interior Britons the use, and the introduction of agriculture supplied them with the means, of the greater convenience of straw beds. The beds of the Roman gentry a Pliny, at this period were generally filled with feathers, and lib. viii. those of the inns with the soft down of reeds. But for many ages the beds of the Italians had been constantly composed of straw; it still formed those of the soldiers and officers at the conquest of Lammer. In Scotland both, our countrymen learnt their use. But it appears to have been taken up only by the gentlemen, as the common Welsh had their beds thinly stuffed with rushes as late as the conclusion of the 12th century; and with the gentlemen it continued many ages afterwards. Straw was used even in the royal chambers of England as late as the close of the 13th. Most of the peasants about Manchester lie on chalk at present, as do likewise the common people all over Scotland: In the Highlands heath also is very generally used as bedding, even by the gentry; and the reposes on a heath bed have been celebrated by travellers as a peculiar luxury, superior to that yielded by down: in France and Italy, straw beds remain general to this day. But after the above period, beds were no longer suffered to rest upon the ground. The better mode, that had anciently prevailed in the east, and long before was introduced into Italy, was adopted in Britain; and they were now mounted on pedestals. This, however, was equally the custom among the gentlemen. The beds were continued on the floor among the common people. And the greatest custom, that had prevailed from the beginning was retained by the lower Britons to the last; and these ground-beds were laid along the walls of their houses, and formed one common dormitory for all the members of the family. The fashion continued universally among the inferior ranks of the Welsh within these four or five ages, and with the more uncivilized part of the Highlanders down to our own times. And even at no great distance from Manchester, in the neighbouring Buxton, and within these 60 or 70 years, the persons that repaired to the bath are all said to have slept in one long chamber together; the upper part being allotted to the ladies, and the lower to the gentlemen, and only partitioned from each other by a curtain.

Dining-Bed, lectus tricliniorum or discubitorium, that whereon, the ancients lay at meals. The dining or discubitory beds were four or five feet high. Three of these beds were ordinarily ranged by a square table, (whence both the table and the room where they sat were called triclinium) in such a manner that one of the sides of the table remained open and accessible to the waiters. Each bed would hold three or four, rarely five persons. These beds were unknown before the second
cond Punic war: the Romans, till then, sat down to
eat on plain wooden benches, in imitation of the heroes
of Homer, or, as Varro expresses it, after the manner
of the Lacedaemonians and Cretans. Scipio Africanus
first made an innovation: he had brought from
Carthage some of those little beds called punicae, or
archaici; being of a wood common enough, very low,
stuffed only with straw or hay, and covered with goats
or sheep's skins, hastinmis pellicus strati. In reality, there
was no great difference, as to delicacy, between these
newer and the ancient. For the ancients, and of frequent
bathing, which began then to obtain, by soft-
ening and relaxing the body, put men on trying to rest
themselves more commodiously by lying along than by
sitting down. For the ladies, it did not seem to rest
consistent with their modesty to adopt the mode of lying:
accordingly they kept to the old custom all the
time of the commonwealth; but, from the first Caesars,
they ate on their beds. For the youth who had not
yet put on the toga virilis, they were long kept to the
ancient discipline. When they were admitted to table,
they only sat on the edge of the beds of their nearest
relations. Never, says Suetonius, did the young Caesars,
Caio and Lucius, eat at the table of Augustus;
but they were set in imo loco, or, as Tacitus expresses
it, ad loci fulcrum. From the greatest simplicity, the
Romans by degrees carried their dining beds to the
most surprising magnificence. Pliny assures us, it was
no new thing to see them covered over with plates of
silver, adorned with the softest mats, and the richest
counterpanes. Lampridius, speaking of Heligabalus,
says, he had beds of solid silver, solidus argento habuit
lectos et tricliniares, et cubiculares. We may add,
that Pompey, in his third triumph, brought in beds of
gold.—The Romans had also beds wherein they studied,
and beds whereon the dead were carried to the funeral
pale.

Bed-Moulding, in Architecture, a term used for
those members of a cornice which are placed below
the coronet; and now usually consist of an ogee, a
list, a large boulée, and another list under the coro-
net.

Bed of Justice, in the old customs of France, a
throne upon which the king sat when he went to the
parliament. The king never held a bed of justice un-
less for affairs that concerned the state, and then all the
officers of parliament were clothed in scarlet robes.

Bed of the Carriage of a Great Gun, a thick plank,
that lies under the piece; being, as it were, the body
of the carriage.

Bed, in Masonry, a course or range of stones; and
the joint of the bed is the mortar between two stones,
placed over each other.

Bed, in Gardening, square or oblong pieces
of ground in a garden, raised a little above the level of
the adjoining ground, and wherein they sow seeds or plant
roots.

Hot-Bed. See Hot-Bed.

Lords of the Bed Chamber, in the British court, are
12 noblemen who attend in their turns, each a month;
during which time they lie in the king's bed-chamber,
and wait on him when he dines in private. Their salary
is 1000l. per annum.

Beda, commonly called Venerable Bede, one of
our most ancient historians, was born in the year 672,
in the neighbourhood of Weremouth, in the bishopric
of Durham. He was educated by the abbot Benedict
in the monastery of St Peter, near the mouth of the
river Wyre. At the age of 19 he was ordained deacon,
and priest in the year 702. About this time he was
invited to Rome by Pope Sergius; but there is no suf-
fi cient reason to believe that he accepted the invitation.
In the year 735 he published his Ecclesiastical History;
a work of so much merit, notwithstanding the legendary
tales it contains, that it was long sufficient to immor-
talize the author, but the volume of it, and the weight
of frequent consumption, probably occasioned by a sed-
erary life, and a long uninterrupted application to stu-
dy and literary compositions, of which he left as in-
credible number. He was buried in the church of his
convent at Jarrow: but his bones were afterwards re-
moved to Durham, and there deposited in the same
coffin with those of St Cuthbert. Bede was undoubt-
edly a singular phenomenon in an ignorant and illiterate
age. His learning, for the times, was extensive, his
application incredible, his piety exemplary, and his
modesty excessive. He was universally admired, con-
sulted, and esteemed, during his life: and his writings
are deservedly considered as the foundation of our ec-
clesiastical history. His language is neither elegant
nor pure, but perspicuous and easy.—All his works
are in Latin. The first general collection of them ap-
ppeared at Paris in 1544, in three volumes in folio.
They were printed again at the same place in 1554, in
eight volumes. They were also published in the same
size and number of volumes at Basel in 1553, reprinted
at Cologne in 1612, and at the same place in 1688.
Besides this general collection, there are several of his
compositions, which have been printed separately, or
amongst the collections of the writings of ancient au-
thors; and there are several manuscripts ascribed to
him, which are preserved in the different libraries in
Oxford and Cambridge.

Beadall, a town in the north riding of York-
shire. Through this town passes a Roman causeway to
Richmond, &c. W. Long. i. 40. N. Lat. 54. 30.
Beadarieux, or Be C'arieux, a town of Lus-
guedoc in France, now the department of Hérault,
seated on the river Obe, in E. Long. 3. 24. N. Lat.
42. 20.
Bede Does, Thomas, an eminent English medical
writer. See Supplement.

Bedel. See Beadle.

Bedel, a small town in the north riding of York-
shire, seated on a little brook, in W. Long. 1. 35.
N. Lat. 54. 30.
Bedel, Dr William, a learned prelate, born in
Essex in 1570. He went with Sir Henry Wotton
the English ambassador to the republic of Venice, as
his chaplain, in 1604; and continuing eight years in
that city, contracted an intimate acquaintance with the
famous Father Paul, of whom he learned Italian so well
as to translate the English Common Prayer Book into
that language: in return he drew up an English gram-
mar for Father Paul, who declared he had learned more
from him in all parts of divinity than from any one
beside. He was accordingly much concerned when
Bedell left Venice; and at his departure presented him
with his picture, the MSS. of his History of the Coun-
cil of Trent, his History of the Interdict and Inqui-

tion, with other literary donations. In 1629, he obtained the bishopric of Kilmore and Ardghe in Ireland; and finding these dioceses in great disorder, applied himself vigorously to reform the abuses there. He was no persecutor of Papists, but laboured with great success to convert the better sort of the Popish clergy: he procured an Irish translation of the Common Prayer Book, which he caused to be read in his cathedral every Sunday; and the New Testament having been translated by Archbishop Daniel, he procured one of the Old Testament; which he having been prevented from printing himself, was afterwards executed at the expense of the great Mr Robert Boyle. He published, in 1624, a controversial book against the Roman Catholics, which he dedicated to Charles prince of Wales; and assisted the archbishop of Spalatro in finishing his famous work De Republica Ecclesiasticæ. —When the bloody rebellion broke out in Ireland in Oct. 1641, the bishop at first did not feel the violence of its effects; for the very rebels had conceived a great veneration for him, and they declared he should be the last Englishman they would drive out of Ireland. He was the only house in the county of Cavan that was inviolate, and it was filled with the people who fled to him for shelter. About the middle of December, however, the rebels, pursuant to orders received from their council of state at Kilkenny, required him to dismiss the people that were with him; which he refused to do, declaring he would share the fate with the rest. Upon this, they seized him, his two sons, and Mr Clogy who had married his daughter-in-law, and carried them prisoners to the castle of Cloughbouther, surrounded by a deep water, where they put them all, except the bishop, in irons; after some time, however, this part of their severity was abated. After being confined for about three weeks, the bishop and his two sons, and Mr Clogy, were exchanged for some of the principal rebels: but the bishop died soon after, on the 7th of February 1642, his death being chiefly occasioned by his late imprisonment, and the weight of sorrows which lay upon his mind. The Irish did him unusual honours at his burial, and the chief of the rebels gathered their forces together, and with them accompanied his body to the church-yard.

BEDER, a strong town of Asia, in the dominions of the Great Mogul. E. Long. 81. 10. N. Lat. 16. 50.

BEDFORD, the county town of Bedfordshire in England, seated on both sides of the river Ouse, over which there is a stone bridge; in W. Long. 0. 20. N. Lat. 52. 6. It is an ancient town, and pleasantly situated, but not very large nor well built, though the buildings are much improved of late, and the river made navigable. It sends two members to parliament, and gives the title of duke to the noble family of Russell. At this place the Britons were overthrown in a great battle in 572, by Cuthwulf the Saxon king; and here was a strong castle, built in the time of the Normans by Pagan de Beauchamp, the third baron of Bedford. It was reduced by King Stephen after a long siege; and afterwards taken by King John, after a siege of 60 days, from Fulco de Brent, who rebelled against his sovereign, notwithstanding he had taken this castle before the barons, and had bestowed upon him by the king. The town is a very ancient corporation. The number of inhabitants in 1811 was 4605. The voters are said to be 1400. It is governed at present by a mayor, recorder, two bailiffs, twelve aldermen, two chamberlains, a town-clerk, and three sergeants. The neighbouring country is very fruitful in wheat, great quantities of which are carried from hence to Hitchin and Hertford markets, sold, ground, and conveyed to London. The town has five churches, a free school, and several hospitals, and enjoys a good trade in corn by the way of Lynn. When the river is swollen with rains, especially in winter, it is usual in Cambridge-shire to say, the bailiff of Bedford is coming; meaning that it is going to lay their fans under water.

BEDFORDSHIRE, an inland county of England. When the Romans landed in Britain, 55 years before Christ, it was included in the district inhabited by the Caticuculani, whose chief or governor Cassibellinus headed the forces of the whole island against Caesar, and the year following was totally defeated. In 310 the emperor Constantine divided Britain into five Roman provinces, when this county was included in the third division, called Flavilia Cesaris; in which state it continued 426 years, when the Romans quitted Britain. At the establishment of the kingdom of Mercia (one of the divisions of the Saxon septarchy) it was considered as part of that kingdom; and so continued from 582 to 827, when with the other petty kingdoms of the island it became subject to the West Saxons under Egbert, and the whole was named England. In 889, Alfred held the sovereignty, when England was divided into counties, hundreds, and tythings, and Bedfordshire first received its present name. It is in the Norfolk circuit, the province of Canterbury, and bishopric of Lincoln. Its form is oval, being about 33 miles long, 16 broad, and nearly 73 in circumference; containing an area of 275,000, or according to others of 307,200 square acres. It supplies 400 men to the national militia. It contains 124 parishes, 58 vicarages, and 11 market towns, viz. Bedford, Ampthill, Biggleswade, Dunstable, Leighton, Beaudesert, Luton, Potton, Shefford, Tuddington, and Wolvorn, and 55 villages. The total number of inhabitants, in 1811, amounted to 70,413, and the number of houses to 13,236, occupied by 14,927 families. It is divided into nine hundreds, seven senatorial, and 11 member-towns to parliament, and pays seven parts of 1/13 of the land tax. Its principal river, the Ouse, is navigable to Bedford; and divides the county into two parts, of which that to the south is the most considerable. In its course, which is very meandering, it receives several small streams; the principal one is the Ivel, which takes its rise in the southern part of the county. The air is healthy, and the soil in general a deep clay. The north side of the Ouse is fruitful and woody, but the south side is less fertile: yet producing great quantities of wheat and barley, excellent in their kind, and wood for dyers. The soil yields plenty of fullers earth for our woollen manufacture. The chief manufactures of the county are thread, lace, and straw ware. In this county there are many remains of Roman, Saxon, and Norman antiquities; and a few Roman stations, viz. Sandys near Potton, and the Magiovium of Antoninus, by others supposed to be the ancient Salome, containing 30 acres, where many urns, coins, &c. have been dug up. Another at Madining-bowre, or Maiden-bower, one mile from Dunstable, containing about nine acres, which Camden supposes to have been a Roman station, from coins of

cond Punic war: the Romans, till then, sat down to eat on plain wooden benches, in imitation of the heroes of Homer, or, as Varro expresses it, after the manner of the Lacedemonians and Cretans. Scipio Africanus first made an innovation: he had brought from Carthage some of those little beds called punifici, or archaisari, being of a wood common enough, very low, stuffed only with straw or hay, and covered with goats or sheep's skins, hæstis pelibus strati. In reality, there was no great difference, as to delicacy, between these new beds and the ancient benches; but the custom of frequent bathing, which began then to obtain, by softening and relaxing the body, put men on trying to rest themselves more commodiously by lying along than by sitting down. For the ladies, it did not seem at first consistent with their modesty to adopt the mode of lying: accordingly they kept to the old custom all the time of the commonwealth; but, from the first Caesars, they ate on their beds. For the youth who had not yet put on the toga virilis, they were long kept to the ancient discipline. When they were admitted to table, they only sat on the edge of the beds of their nearest relations. Never, says Suetonius, did the young Caesars, Caius and Lucius, eat at the table of Augustus; but they were set in tomo loco, or, as Tacitus expresses it, ad lecti fulcræ. From the greatest simplicity, the Romans by degrees carried their dining beds to the most surprising magnificence. Pliny assures us, it was no new thing to see them covered over with plates of silver, adorned with the softest mats, and the richest counterpanes. Lampridius, speaking of Heliodorus, says, he had beds of solid silver, solidum argentum habuit lectos et tricliniares, et cubiculaires. We may add, that Nemesius, in his celebrated triumph, brought in beds of gold. The Romans had also beds whereon they studied and beds whereon the dead were carried to the funeral pile.

Bed-Moulding, in Architecture, a term used for those members of a cornice which are placed below the cornet; and now usually consist of an ogee, a list, a large boulleau, and another list under the cornet.

Bed of Justice, in the old customs of France, a throne upon which the king sat when he went to the parliament. The king never held a bed of justice unless for affairs that concerned the state, and then all the officers of parliament were clothed in scarlet robes.

Bed of the Carriage of a Great Gun, a thick plank, that lies under the piece; being, as it were, the body of the carriage.

Bed, in Monument, a course or range of stones; and the joint of the bed is the mortar between two stones, placed over each other.

Bed, in Garden, a square or oblong pieces of ground in a garden, raised a little above the level of the adjoining ground, and wherein they sow seeds or plant roots.

Hot-Bed. See Hot-Bed.

Lords of the Bed Chamber, in the British court, are 12 noblemen who attend in their turn, each a month; during which time they lie in the king's bed-chamber, and wait on him when he dines in private. Their salary is 1000l. per annum.

BEDA, commonly called Venerable Bede, one of our most ancient historians, was born in the year 672, in the neighbourhood of Weremouth, in the bishopric of Durham. He was educated by the abbot Benedict in the monastery of St Peter, near the mouth of the river Wyre. At the age of 19 he was ordained deacon, and priest in the year 702. BEDFORDSHIRE, an inland county of England. When the Romans landed in Britain, 55 years before Christ, it was included in the district inhabited by the Caticcullani, whose chief or governor Cassibelinus headed the forces of the whole island against Caesar, and the year following was totally defeated. In 310 the emperor Constantine divided Britain into five Roman provinces, when this county was included in the third division, called Flavia Caesaris; in which state it continued 426 years, when the Romans quitted Britain. At the establishment of the kingdom of Mercia (one of the divisions of the Saxon heptarchy) it was considered as part of that kingdom; and so continued from 82 to 827, when with the other petty kingdoms of the island it became subject to the West Saxons under Egbert, and the whole was named England. In 889, Alfred held the sovereignty, when England was divided into counties, hundreds, and tythings, and Bedfordshire first received its present name. It is in the Norfolk circuit, the province of Canterbury, and bishopric of Lincoln. Its form is oval, being about 33 miles long, 16 broad, and nearly 73 in circumference; containing an area of 275,000, or according to others of 307,200 square acres. It supplies 400 men to the national militia. It contains 124 parishes, 58 vicarages, and 11 market towns, viz. Bedford, Amphilph, Biggleswade, Dunstable, Leighton, Beaudesert, Luton, Potton, Shefford, Tuddington, and Woburn, and 53 villages. The total number of inhabitants, in 1811, amounted to 70,415, and the number of houses to 13,286, occupied by 14,927 families. It is divided into nine hundreds, served two members to parliament, and pays seven parts of 7s. of the land tax. Its principal river, the Ouse, is navigable to Bedford; and divides the county into two parts, of which that to the south is the most considerable. In its course, which is very meandering, it receives several small streams; the principal one is the Ivel, which takes its rise in the southern part of the county. The air is healthy, and the soil in general a deep clay. The north side of the Ouse is fruitful and woody, but the south side is less fertile; yet producing great quantities of wheat and barley, excellent in their kind, and wood for dyes. The soil yields plenty of fullers earth for our woollen manufactury. The chief manufactures of the county are thread, lace, and straw ware. In this county there are many remains of Roman, Saxon, and Norman antiquities; and a few Roman stations, viz. Sandys near Potton, and the Megalithum of Antonius, by others supposed to be the ancient Salene, containing 30 acres, where many urns, coins, &c. have been dug up. Another at Mulbury-bower, or Maiden-bower, one mile from Dunstable, containing about nine acres, which Camden supposes to have been a Roman station, from coins of
BEDLOE, WILLIAM, who assumed the title of Captain, was an infamous adventurer of low birth, who had travelled over a great part of Europe under different names and disguises, and had passed among several ignorant persons for a man of rank and fortune. Encouraged by the success of Oates, he turned evidence, gave an account of Godfrey's murder, and added many circumstances to the narrative of the former. These villains had the boldness to accuse the queen of entering into a conspiracy against the king's life. A reward of 500l. was voted to Bedloe by the commons. He is said to have asserted the reality of the plot on his deathbed; but it abounds with absurdity, contradiction, and perjury; and still remains one of the greatest problems in the British annals. He died at Bristol 20th August 1682. Giles Jacob informs us, that he was author of a play called "The Excommunicated Prince, or the False Relic," 1699. The printer of it having, without the author's knowledge, added a second title, and called it "The Popish Plot in a Play," greatly excited the curiosity of the public, who were, however, much disappointed when they found the plan of the piece to be founded on a quite different story. Anthony Wood will not allow the captain the merit of this play; but asserts that it was written partly, if not entirely, by one Tho. Walter, M. A. of Jesus college, Oxford.

BEDOUINS, or BEDOUINS, a modern name of the wild Arabs, whether in Asia or Africa. When speaking of the Arabs, we should distinguish whether they are cultivators or pastors; for this difference in their mode of life occasions so great a one in their manners and genius, that they become almost foreign nations with respect to each other. In the former case, leading a sedentary life, attached to the same soil, and subject to regular governments, the social state in which they live, very nearly resembles our own. Such are the inhabitants of Yemen; and such also are the descendants of those ancient conquerors who have either entirely, or in part, given inhabitants to Syria, Egypt, and the Barbary states. In the second instance, having only a transient interest in the soil, perpetually removing their tents from one place to another, and under subjection to no laws, their mode of existence is neither that of polished nations nor of savages; and therefore more particularly merits our attention. Such are the Bedouins, or inhabitants of the vast deserts which extend from the confines of Persia to Morocco. Though divided into independent communities or tribes, not unfrequently hostile to each other, they may still be considered as forming one nation. The resemblance of their language is a manifest token of this relation: The only difference which exists between them is, that the African tribes are of a less ancient origin, being posterior to the conquest of these countries by the caliphs or successors of Mahomet; while the tribes of the desert of Arabia, properly so called, have descended by an uninterrupted succession from the remotest ages. To these the orientals are accustomed to appropriate the name of Arabs, as being the most ancient and the purest race. The term Bedouin is added as a synonymous expression, signifying, "inhabitants of the Desert."

It is not without reason that the inhabitants of the desert boast of being the purest and the best preserved race of all the Arab tribes; for never have they been conquered, nor have they mixed with any other people by making conquests; for those by which the general name of Arabs has been rendered famous, really belong only to the tribes of Hedjaz and Yemen. Those who dwelt in the interior of the country never emigrated at the time of the revolution effected by Mahomet; or if they did take any part in it, it was confined to a few individuals, detached by motives of ambition. Thus we find the prophet in his Khoran continually stying the Arabs of the desert rebelo and sindidea; nor has so great a length of time produced any very considerable change. We may assert they have in every respect retained their primitive independence and simplicity. See ARABIA.

The wandering life of these people arises from the very nature of their deserts. To paint to himself these deserts (says M. Volney), the reader must imagine a sky almost perpetually inflamed, and without clouds, immense and boundless plains, without houses, trees, rivulets, or hills, where the eye frequently meets nothing but an extensive and uniform horizon like the sea, though in some places the ground is uneven and stony. Almost invariably naked on every side, the earth presents nothing but a few wild plants thinly scattered, and thicketts, whose solitude is rarely disturbed but by antelopes, hares, locusts, and rats. Such is the nature of nearly the whole country, which extends six hundred leagues in length and three hundred in breadth, and stretches from Aleppo to the Arabian sea, and from Egypt to the Persian gulf. It must not, however, be imagined that the soil in so great an extent is everywhere the same; it varies considerably in different places. On the frontiers of Syria, for example, the earth is in general fat and cultivable, very even fruitful. It is the same also on the banks of the Euphrates; but in the internal parts of the country, and towards the south, it becomes white and chalky, as in the parallel of Damascus; rocky, as in the Tih and the Hedjaz, and a pure sand, as to the eastward of Yemen. This variety in the qualities of the soil is pro-
ductive of some minute differences in the condition of the Bedouins. For instance, in the more sterile countries, that is, those which produce but few plants, the tribes are feeble and very distant: which is the case in the desert of Suez, that of the Red sea, and the interior of the great desert called the Najd. When the soil is more fruitful, as between Damascus and the Euphrates, the tribes are more numerous and less remote from each other; and, lastly, in the cultivated districts, such as the pachalics of Aleppo, the Haaran, and the neighbourhood of Gaza, the camps are frequent and contiguous. In the former instances, the Bedouins are purely pastors, and subsist only on the produce of their herds, and on a few dates and flesh meat, which they eat either fresh, or dried in the sun and reduced to a powder. In the latter, they sow some land, and add cheese, barley, and even rice, to their flesh and milk meats.

In those districts where the soil is stony and sandy, as in the Tih, the Hedjaz, and the Najd, the rains make the seeds of the wild plants shoot, and revive the thickets, rancunculus, wormwood, and kaly. They cause marshes in the lower grounds, which produce weeds and grass; and the plain assumes a tolerable degree of verdure. This is the season of abundance both for the herds and their masters; but on the return of the heat, everything is parched up, and the earth, converted into a gray and fine dust, presents nothing but dry stems as hard as wood, on which neither horses, oxen, nor even goats can feed. In this state the desert would become uninhabitable, and must be totally abandoned, had not nature formed an animal so hardy and frugal that the soil is sterile and ungrateful. No creature seems so peculiarly fitted to the climate in which it exists. Designing the camel to dwell in a country where he can find little nourishment, Nature (says M. Volney) has been sparing of her materials in the whole of his formation. She has not bestowed on him the plump fleshiness of the ox, horse, or elephant; but limiting herself to what is strictly necessary, she has given him a small head without ears, at the end of a long neck without flesh. She has taken from his legs and thighs every muscle not immediately requisite for motion; and in short, has bestowed on his withered body only the vessels and tendons necessary to connect its frame together. She has furnished him with a strong jaw, that he may grind the hardest aliment; but lest he should consume too much, she has straitened his stomach, and obliged him to chew the cud. She has lined his foot with a lump of flesh, which sliding in the mud, and being no way adapted to climbing, fits him only for a dry, level, and sandy soil like that of Arabia: she has evidently destined him likewise to slavery, by refusing him every sort of defence against his enemies. Destination of the horns of the bull, the hoof of the horse, the tooth of the elephant, and the swiftness of the stag, how can the camel resist or avoid the attacks of the lion, the tiger, or even the wolf? To preserve the species, therefore, Nature has concealed him in the depth of the vast deserts, where the want of vegetables can attract no game, and whence the want of game repels every voracious animal. Tyranny must have expelled man from the habitable parts of the earth before the camel could have lost his liberty. Become domestic, he has rendered habitable the most barren soil the world contains. He alone supplies all his master's wants. The milk of the camel nourishes the family of the Arab, under the varied forms of curd, cheese, and butter; and they often feed upon his flesh. Slippers and harness are made of his skin, tents and clothing of his hair. Heavy burdens are transported by his means; and when the earth denies forage to the horse, so valuable to the Bedouin, the she camel supplies that deficiency by her milk, at no other cost, for so many advantages, than a few stalks of brambles or wormwood and pounded date kernels. So great is the importance of the camel to the desert, that were it deprived of that useful animal, it must infallibly lose every inhabitant.

Such is the situation in which nature has placed the Bedouins, to make of them a race of men equally singular in their physical and moral character. This singularity is so striking, that even their neighbours the Syrians regard them as extraordinary beings; especially those tribes which dwell in the depth of the deserts, such as the Anaza, Kaibar, Tai, and others, which never approach the towns. When in the time of Shaik Daher, some of their horsemen came as far as Acra, they excited the same curiosity there as a visit from the savages of America would among us. Every body viewed with surprise these men, who were more diminutive, meagre, and swarthy, than any of the known Bedouins. Their withered legs were only composed of tendons, and had no calves. Their bellies seemed to cling to their backs, and their hair was frizzled almost as much as that of the negroes. They on the other hand were no less astonished at every thing they saw; they could neither conceive how the houses and minarets could stand erect, nor how men ventured to dwell beneath them, and always in the same spot; but above all, they were in an ecstacy on beholding the sea, nor could they comprehend what that desert of water could be.

We may imagine that the Arabs of the frontiers are not such novices; there are even several small tribes of them, who living in the midst of the country, as in the valley of Bekaa, that of the Jordan, and in Palestine, are much nearer to the condition of the peasants; but these are despised by the others, who look upon them as bastard Arabs and Rayas, or slaves of the Turks.

In general, the Bedouins are small, meagre, and tawny; more so, however, in the heart of the desert than on the frontiers of the cultivated country; they are always of a darker hue than the neighbouring peasants. They also differ among themselves in the same camp; and M. Volney remarked, that the shaiks, that is, the rich, and their attendants, were always taller and more corpulent than the common class. He has seen some of them above five feet five and six inches high; though in general they do not (he says) exceed five feet two inches. This difference can only be attributed to their food, with which the former are supplied more abundantly than the latter. And the effects of this are equally evident in the Arabian and Turcoman camels; for these latter, dwelling in countries rich in forage, are become a species more robust and fleshy than the former. It may likewise be affirmed, that the lower class of Bedouins live in a state of habitual wretchedness and famine. It will appear almost incredible to us, but it is an undoubted fact, that
Bedouins. the quantity of food usually consumed by the greatest part of them does not exceed six ounces a-day. This abstinence is most remarkable among the tribes of the Najd and the Hedjaz. Six or seven dates soaked in melted butter, a little sweet milk or curds, serve a man a whole day; and he esteems himself happy when he can add a small quantity of coarse flour or a little ball of rice. Meat is preserved for the greatest festivals: and they never kill a kid but for a marriage or a funeral. A few wealthy and generous shaiks alone can kill young camels, and eat baked rice with their victuals. In times of dearth, the vulgar, always half famished, do not disdain the most wretched kinds of food; and eat locusts, rats, lizards, and serpents broiled on briars. Hence are they such plunderers of the cultivated lands, and robbers on the high-roads: hence also their delicate constitution and their diminutive and meagre bodies, which are rather active than vigorous. It may be worth while to remark, that their evacuations of every kind, even perspiration, are extremely small; their blood is so destitute of serosity, that nothing but the greatest heat can preserve its fluidity. This, however, does not prevent them from being tolerably healthy in other respects; for maladies are less frequent among them than among the inhabitants of the cultivated country.

From these facts we are by no means justified in concluding that the frugality of the Bedouins is a virtue purely of choice, or even of climate. The extreme heat in which they live unquestionably facilitates their abstinence, by destroying that activity which cold gives to the stomach. Their being habituated also to so sparing a diet, by hindering the dilatation of the stomach, becomes doubtless a means of their supporting such abstemiousness; but the chief and primary motive of this habit is with them, as with the rest of mankind, the necessity of the circumstances in which they are placed, whether from the nature of the soil, as has been before explained, or that state of society in which they live, and which remains now to be examined.

It has already remarked, that the Bedouin Arabs are divided into tribes, which constitute so many distinct nations. Each of these tribes appropriates to itself a tract of land forming its domain; in this they do not differ from cultivated nations, except that their territory requires a greater extent, in order to furnish subsistence for their herds throughout the year. Each tribe is collected in one or more camps, which are dispersed through the country, and which make a successive progress over the whole, in proportion as it is exhausted by the cattle; hence it is, that within a great extent a few spots only are inhabited, which vary from one day to another; but as the entire space is necessary for the annual subsistence of the tribe, whoever encroaches on it is deemed a violator of property; this is with them the law of nations. If, therefore, a tribe, or any of its subjects, enter upon a foreign territory, they are treated as enemies and robbers, and a war breaks out. Now, as all the tribes have affinities with each other by alliances of blood or conventions, leagues are formed, which render these wars more or less general. The manner of proceeding on such occasions is very simple. The offence made known, they mount their horses and seek the enemy: when they meet, they enter into a parley, and the matter is frequently made up; if not, they attack either in small bodies, or man to man. They encounter each other at full speed with fixed lances, which they sometimes dart, notwithstanding their length, at the flying enemy: the victory is rarely contested; it is decided by the first shock, and the vanquished take to flight at full gallop over the naked plain of the desert. Night generally favours their escape from the conqueror. The tribe which has lost the battle strikes its tents, removes to a distance by forced marches, and seeks an asylum among its allies. The enemy, satisfied with their success, drive their herds farther on, and the fugitives soon after return to their former situation. But the slaughter made in these engagements frequently sows the seeds of hatred which perpetuate these dissensions. The interest of the common safety has for ages established a law among them, which decrees that the blood of every man who is slain must be avenged by that of his murderer. This vengeance is called Tar, or retaliation; and the right of exacting it devolves on the nearest of kin to the deceased. So nice are the Arabs on this point of honour, that if any one neglects to seek his retaliation he is disgraced for ever. He therefore watches every opportunity of revenge: if his enemy perishes from any other cause, still he is not satisfied, and his vengeance is directed against the nearest relation. These animosities are transmitted as an inheritance from father to children, and never cease but by the extinction of one of the families, unless they agree to sacrifice the criminal, or purchase the blood for a stated price, in money, or in flocks. Without this satisfaction, there is neither peace, nor truce, nor alliances, between them, nor sometimes even between whole tribes: There is blood between us, say they on every occasion; and this expression is an insurmountable barrier. Such accidents being necessarily numerous in a long course of time, the greater part of the tribes have ancient quarrels, and live in a habitual state of war; which, added to their way of life, renders the Bedouins a military people, though they have made no great progress in war as an art.

Their camps are formed in a kind of irregular circle, composed of a single row of tents, with greater or less intervals. These tents, made of goat or camels hair, are black or brown, in which they differ from those of the Turcomans, which are white. They are stretched on three or four pickets, only five or six feet high, which gives them a very flat appearance; at a distance, one of these camps seems only like a number of black spots: but the piercing eye of the Bedouin is not to be deceived. Each tent inhabited by a family is divided by a curtain into two apartments, one of which is appropriated to the women. The empty space within the large circle serves to fold their cattle every evening. They never have any intrenchments; their only advanced guards and patrols are dogs; their horses remain saddled and ready to mount on the first alarm: but as there is neither order nor regularity, these camps, always easy to surprise, afford no defence in case of an attack; accidents, therefore, very frequently happen, and cattle are carried off every day; a species of marauding war in which the Arabs are very experienced.

The tribes which live in the vicinity of the Turks are
are still more accustomed to attacks and alarms; for these strangers, arrogating to themselves, in right of conquest, the property of the whole country, treat the Arabs as rebel vassals, or as turbulent and dangerous enemies. On this principle, they never cease to wage secret or open war against them. The pachas study every occasion to harass them. Sometimes they contest with them a territory which they had let them, and at others demand a tribute which they never agreed to pay. Should a family of shaihs be divided by interest or ambition, they alternately succeed each party, and conclude by the destruction of both. Frequently too they poison or assassinate those chiefs whose courage or abilities they dread, though they should even be their allies. The Arabs, on their side, regarding the Turks as usurpers and treacherous enemies, watch every opportunity to do them injury. Unfortunately, their vengeance falls oftener on the innocent than the guilty. The b酐 Yaş peasant generally suffers for the offences of the soldiers. On the slightest alarm, the Arabs cut their harvests, carry off their flocks, and intercept their communication and commerce. The peasant calls them thieves, and with reason; but the Bedouins claim the right of war, and perhaps they also are not in the wrong. However this may be, these depredations occasion a misunderstanding between the Bedouins and the inhabitants of the cultivated country, which renders them mutual enemies.

Such is the external situation of the Arabs. It is subject to great vicissitudes, according to the good or bad conduct of their chiefs. Sometimes a feeble tribe raises and aggrandizes itself, whilst another, which was powerful, falls into decay, or perhaps is entirely annihilated; not that all its members perish, but they incorporate themselves with some other; and this is the consequence of the internal constitution of the tribes. Each tribe is composed of one or more principal families, the members of which bear the title of shaihs, i.e. chiefs or lords. These families have a great resemblance to the patriarchs of Rome and the nobles of modern Europe. One of the shaihs has the supreme command over the others. He is the general of their little army; and sometimes assumes the title of emir, which signifies commander and prince. The more relations, children, and allies, he has, the greater is his strength and power. To these he adds particular adherents, whom he studiously attaches to him, by supplying all their wants. But besides this, a number of small families, who, not being strong enough to live independent, stand in need of protection and alliances, range themselves under the banners of this chief. Such an union is called kahila, or tribe. These tribes are distinguished from each other by the name of their respective chiefs, or by that of the ruling family; and when they speak of any of the individuals who compose them, they call them the children of such a chief, though they may not be all really of his blood, and he himself may have been long since dead. Thus they say, Beni Temin, Oulad Tai, the children of Temin and of Tai. This mode of expression is even applied, by metaphor, to the names of countries: the usual phrase for denoting its inhabitants being to call them the children of such a place. Thus the Arabs say, Oulad Musir, the Egyptians; Oulad Sham, the Syrians; they would also say, Oulad France, the French; Oulad Moscow, the Russians; a remark which is not unimportant to ancient history.

The government of this society is at once republican, aristocratical, and even despotic, without exactly corresponding with any of these forms. It is republican, inasmuch as the people have a great influence in all affairs, and as nothing can be transacted without the consent of a majority. It is aristocratical, because the families of the shaihs possess some of the prerogatives which everywhere accompany power; and, lastly, it is despotic, because the principal shaih has an indefinite and almost absolute authority, which, when he happens to be a man of credit and influence, he may even abuse; but the state of these tribes confines even this abuse to very narrow limits: for if a chief should commit an act of injustice; if, for example, he should kill an Arab, it would be almost impossible for him to escape punishment; the resentment of the offended party would pay no respect to his dignity; the law of retaliation would be put in force; and, should he not pay the blood, he would be in an ill-assassinated, which, from the simple and private life the shaihs lead in their camps, would be no difficult thing to effect. If he harasses his subjects by severity, they abandon him and go over to another tribe. His own relations take advantage of his misconduct to depose him and advance themselves to his station. He can have no resource in foreign troops: his subjects communicate too easily with each other to render it possible for him to divide their interests and form a faction in his favour. Besides, how is he to pay them, since he receives no kind of taxes from the tribe; the wealth of the greater part of his subjects being limited to absolute necessities, and his own confined to very moderate possessions; and those too loaded with great expenses?

The principal shaih in every tribe, in fact, defrays the charges of all who arrive at or leave the camp. He receives the visits of the allies, and of every person who has business with them. Adjoining to his tent is a large pavilion for the reception of all strangers and passengers. There are held frequent assemblies of the shaihs and principal men, to determine on encampments and removals; on peace or war; on the differences with the Turkish governors and the villages; on the litigations and quarrels of individuals. To this crowd, which enters successively, he must give coffees, bread baked on the ashes, rice, and sometimes roasted kid or camel; in a word, he must keep open table; and it is the more important to him to be generous, as this generosity is closely connected with matters of the greatest consequence. On the exercise of this depend his credit and his power. The famished Arab ranks the liberality which feeds him before every virtue; nor is this prejudice without foundation; for experience has proved that covetous chiefs never were men of enlarged views: hence the proverb, as just as it is brief, A close fist, a narrow heart. To provide for these expenses, the shaih has nothing but his herds, a few spots of cultivated ground, the profits of his plunder, and the tribute he levies on the high-roads; the total of which is very inconsiderable. The shaih with whom M. Volney resided in the country of Gaza, about the end of 1784, passed for one of the most powerful of those districts; yet it did not appear to our author that his expenditure was greater than that of an opulent farmer.
His personal effects, consisting of a few pelisses, carpets, arms; horses, and camels, could not be estimated at more than 50,000 livres (a little above 2000L.) and it must be observed, that in this calculation four mares of the breed of racers are valued at 6000 livres (250L.), and each camel at 10L. sterling. We must not therefore, when we speak of the Bedouins, affix to the words Prince and Lord the ideas they usually convey; we should come nearer to the truth by comparing them to substantial farmers in mountainous countries, whose simplicity they resemble in their dress as well as in their domestic life and manner of living. A shahab who has the command of 500 horses does not disdain to saddle and bridle his own, nor to give him barley and chopped straw. In his tent, his wife makes the coffee, kneads the dough, and superintends the dressing of the victuals. His daughters and kinswomen wash the linen, and go with pitchers on their head and veil over their faces to draw water from the fountain. These manners agree precisely with the descriptions in Homer and the history of Abraham in Genesis. But it must be owned that it is difficult to form a just idea of them without having ourselves been eye witnesses.

The simplicity, or perhaps more properly the poverty, of the lower class of the Bedouins is proportionate to that of their chieftains. All the wealth of a family consists of moveables; of which the following is a pretty exact inventory: a few male and female camels; some goats and poultry; a mare and her bridle and saddle; a tent; a lance 16 feet long; a crooked sabre; a rusty musket, with a flint and matchlock; a pipe; a portable mill; a pot for cooking; a leathern bucket; a small coffee roaster; a mat; some clothes; a mantle of black wool; and a few glass or silver rings, which the women wear upon their legs and arms. If none of these are wanting, their furniture is complete. But what the poor man stands most in need of, and what he takes most pleasure in, is his mare; for this animal is his principal support. With his mare the Bedouin makes his excursions against hostile tribes, or seeks plunder in the country and on the highways. The mare is preferred to the horse, because she is more docile, and yields milk, which on occasion satisfies the thirst and even the hunger of her master.

Thus confined to the most absolute necessities of life, the Arabs have as little industry as their wants are few; all their arts consist in weaving their clumsy tents and in making mats and butter. Their whole commerce only extends to the exchanging camels, kuds, stallions, and milk; for arms, clothing, a little rice or corn, and money, which they bury. They are totally ignorant of all science; and have not even any idea of astronomy, geometry, or medicine. They have not a single book; and nothing is so uncommon among the shaikhs as to know how to read. All their literature consists in reciting tales and histories in the manner of the Arabian Nights Entertainments. They have a peculiar passion for such stories, and employ in them almost all their leisure, of which they have a great deal. In the evening they seat themselves on the ground, at the threshold of their tents, or under cover, if it be cold; and there, ranged in a circle round a little fire of dung, their pipes in their mouths, and their legs crossed, they sit a while in quiet meditation, till on a sudden one of them breaks forth with Once upon a time,—and continues to recite the adventures of some young shah and female Bedouin; he relates in what manner the youth first got a secret glimpse of his mistress; and how he became desperately enamoured of her; he minutely describes the lovely fair; boasts her black eyes, as large and soft as those of the gazelle; her languid and empassioned looks; her arched eyebrows, resembling two bows of ebony; her waist straight and supple as a lance; he forgets not her steps, light as those of the young filly; nor her eyelashes, blackened with kohl; nor her lips painted blue; nor her nails, tinged with the gold-on-coloured henna; nor her breasts resembling two bunches of grapes; nor her voice, as sweet as honey. He recounts the sufferings of the young lover, associated with desire and passion, that his body no longer yields any shadow. At length, after detailing his various attempts to see his mistress, the obstacles of the parents, the invasions of the enemy, the captivity of the two lovers, &c. he terminates to the satisfaction of the audience, by restoring them, united and happy, to the paternal tent, and by receiving the tribute paid to his eloquence in the Ma cha allah (an exclamation of prayer, equivalent to admirably well!) he has merited. The Bedouins have likewise their love songs, which have more sentiment and nature in them than those of the Turks and inhabitants of the towns; doubtless, because the former, whose manners are chaste, know what love is: while the latter, abandoned to debauchery, are acquainted only with enjoyment.

When we consider how much the condition of the Bedouins, especially in the depths of the desert, resembles in many respects that of the savages of America, we shall be inclined to wonder why they have not the same ferocity; why, though they so often experience the extremity of hunger, the practice of devouring human flesh was never heard of among them; and why, in short, their manners are so much more sociable and mild. The following reasons are proposed by M. Volney as the true solution of this difficulty.

It seems at first view (he observes), that America, being rich in pastureage, lakes, and forests, is more adapted to the pastoral mode of life than to any other. But if we consider that these forests, by affording an easy refuge to animals, protect them more surely from the power of man, we may conclude that the savage has been induced to become a hunter instead of a shepherd, by the nature of the country. In this state, all his habits have concurred to give him a ferocity of character. The great fatigue of the chase have hardened his body; frequent and extreme hunger, followed by a sudden abundance of game, has rendered him voracious. The habit of shedding blood, and tearing his prey, has familiarized him to the sight of death and sufferings. Tormented by hunger, he has desired flesh; and finding it easy to obtain that of his fellow-creature, he could not long hesitate to kill him to satisfy the cravings of his appetite. The first experiment made, this cruelty degenerates into a habit: he becomes a cannibal, sanguinary and atrocious; and his mind acquires all the insensibility of his body.

The situation of the Arab is very different. Amid his vast naked plains, without water and without forests, he has not been able, for want of game or fish, to become either a hunter or a fisherman. The camel has determined him to a pastoral life, the manners of which have influenced his whole character. Finding
at hand a light, but constant and sufficient nourishment; he has acquired the habit of frugality. Content with his milk and his dates, he has not desired flesh; he has shed no blood; his hands are not accustomed to slaughter, nor his ears to the cries of suffering creatures; he has preserved a humane and sensible heart.

No sooner did the savage shepherd become acquainted with the use of the horse, than his manner of life was considerably changed. The facility of passing rapidly over extensive tracts of country, rendered him a wanderer. He was greedy from want, and became a robber from greediness; and such is in fact his present character. A plunderer, rather than a warrior, the Arab possesses no sanguinary courage; he attacks only to despoil; and if he meets with resistance, never thinks a small booty is to be put in competition with his life. To irritate him you must shed his blood; in which case he is found to be as obstinate in his vengeance as he was cautious in avoiding danger.

The Beduins have often been reproached with this spirit of rapine; but without wishing to defend it, we may observe that one circumstance has not been sufficiently attended to, which is, that it only takes place towards reputed enemies, and is consequently founded on the acknowledged laws of almost all nations. Among themselves they are remarkable for a good faith, a disinclination to avarice, a fulness to please, which would do honour to the most civilized people. What is there more noble than that right of asylum so respected among all the tribes? A stranger, even an enemy, touches the tent of the Beduin, and from that instant his person becomes inviolable. It would be reckoned a disgraceful meanness, an indelible shame, to satisfy even a just vengeance at the expense of hospitality. Has the Beduin consented to eat bread and salt with his guest, nothing in the world can induce him to betray him. The power of the sultan himself would not be able to force a refugee from the protection of a tribe, but by its total extermination. The Beduin, so rapacious without his camp, has no sooner set his foot within it, than he becomes liberal and generous. What little he possesses he is ever ready to divide. He has even the delicacy not to wait till it is asked: when he takes his repast, he affects to seat himself at the door of his tent, in order to invite the passengers: his generosity is so sincere, that he does not look upon it as a merit, but merely as a duty; and he therefore readily takes the same liberty with others. To observe the manner in which the Arabs conduct themselves towards each other, one would imagine that they possessed all their goods in common. Nevertheless they are no strangers to property; but it has none of that selfishness which the increase of the imaginary wants of luxury has given it among polished nations. Deprived of a multitude of enjoyments which nature has lavished upon other countries, they are less exposed to temptations which might corrupt and debase them. It is more difficult for their shanks to form a faction to enslave and impoverish the body of the nation. Each individual, capable of supplying all his wants, is better able to preserve his character and independence; and private property becomes at once the foundation and bulwark of public liberty.

This liberty extends even to matters of religion. We observe a remarkable difference between the Arabs of the towns and those of the desert; since, while the former crouch under the double yoke of political and religious despotism, the latter live in a state of perfect freedom from both: it is true, that on the frontiers of the Turks, the Bedouins, from policy, preserve the appearance of Mahometanism; but so relaxed is their observance of its ceremonies, and so little fervour has their devotion, that they are generally considered as infidels, who have neither law nor prophets. They even make no difficulty in saying that the religion of Mahomet was not made for them: "For (and they) how shall we make ablations who have no water? How can we bestow alms who are not rich? Why should we fast in the Ramadan, since the whole year with us is one continual fast? and what necessity is there for us to make the pilgrimage to Mecca, if God be present everywhere?" In short, every man acts and thinks as he pleases, and the most perfect toleration is established among them.

BEDRIACUM, in Ancient Geography, a village of Italy, situated, according to Tacitus, between Verona and Cremona, but nearer the latter than the former. For the account given by that historian, Cluverius conjectures that the ancient Bedriacum stood in the place where the city of Caneto now stands. This village was remarkable for the defeat of the emperor Galba by Otho, and afterwards of Otho by Vitellius.

BEDWIN MAGNA, a village five miles south of Hungerford in Berkshire in England. It has neither market nor fair; but is a borough by prescription, and sends two members to parliament. It is said to have been a considerable place in the time of the Saxons, and that the traces of its fortifications are still extant.

BEE, in Natural History, a genus of insects, for the characters and classification of which see Apis, Entomology Index. The mellifica, or domestic honey bee, its history and economy, form the subject of this article.

This species is furnished with downy hairs; has a dusky coloured breast, and brownish belly: the tibia of the hind legs are ciliated, and transversely streaked on the inside. Each foot terminates in two hooks, with their points opposite to each other; in the middle of these hooks there is a little thin appendix, which, when unfolded, enables the insects to fasten themselves to glass or the most polished bodies. This part they likewise employ for transmitting the small particles of crude wax, which they find upon flowers, to the cavity in their thigh, hereafter described. The queen and drones, who never collect wax in this manner, have no such cavity. This species is also furnished with a proboscis or trunk, which serves to extract the honey from flowers; and has, besides, a real mouth situated in the fore part of the head, with which it is able to feed on the farina of flowers, from which afterwards is made wax. The belly is divided into six rings or joints; which sometimes shorten the body, by slipping the one over the other. In the inside of the belly there is a small bladder or reservoir, in which the honey is collected, after having passed through the proboscis and a narrow pipe which runs through the head and breast. This bladder, when full of honey, is about the size of a small pea.
The sting, which is situated at the extremity of the belly, is a very curious weapon; and, when examined by the microscope, appears of a surprising structure. It has a bony sheath or scabbard, which includes two bearded darts. This sheath terminates in a sharp point, near the extremity of which a slit opens, through which, at the time of stinging, the two bearded darts are projected beyond the end of the sheath; one of these is a little longer than the other, and fixes its head first; and the other instantly following, they penetrate alternately deeper and deeper, taking hold of the flesh with their beards or hooks, till the whole sting is buried in the flesh; and then a venomous juice is injected through the same sheath, from a little bag at the root of the sting. Hence the wound occasions an acute pain and swelling of the part, which sometimes continues several days. These effects are best remedied by enlarging the wound directly to give it some discharge. This poison seems to owe its mischievous efficacy to certain pungent salts. Let a bee be provoked to strike its sting against a plate of glass, and there will be a drop of the poison discharged and left upon the glass. This being placed under a double microscope, as the liquor evaporates, the salts will be seen to concrete, forming oblong, pointed, clear crystals.—Mr Derham counted on the sting of a wasp eight beards on the side of each dart, somewhat like the beards of fish-hooks; and the same number is to be counted on the darts of the bee's sting. When these beards are struck deep in the flesh, if the wounded personellar, he decomposes the bee before it can disengage them, the sting is left behind, sticking in the wound; but if he has patience to stand quiet, the creature brings the hooks down close to the sides of the darts, and withdraws the weapon; in which case, the wound is always much less painful. The danger of being stung by bees may be in a great measure prevented by a quiet composed behaviour. A thousand bees will fly and buzz about a person without hurting him, if he stand perfectly still, and forbear disturbing them even when near his face; in which case he may observe them for hours together without danger, but if he molests or beats them away, he usually suffers for it. It has been lately affirmed, that a person is in perfect safety in the midst of myriads of bees, if he but carefully keep his mouth shut, and breathe gently through the nostrils only; the human breath, it would seem, being peculiarly offensive to their delicate organs: and merely with this precaution, it is said, the very hives may be turned up, and even part of the comb cut out, while the bees are at work.

I. Economy, Instincts, &c. of the Honey-Bee.

We may consider a hive of bees as a well-peopled city, in which are commonly found from 15,000 to 18,000 inhabitants. This city is in itself a monarchy—composed of a queen; of males which are the drones; and of working bees, which have been supposed and called neuters. The combs, which are of pure wax, serve as their magazine of stores, and for the nursing places of their young offspring. There is between the combs a space sufficient for two bees to march abreast, without embarrassing each other; and in some parts it is more spacious. There are also holes, or narrow passages, which cross the combs transversely, and are intended to shorten the way when the bees pass from one comb to another.

The Queen is easily distinguished from the other bees by the form of her body: she is longer and larger than they are, and her wings are much shorter than theirs in proportion to her body. For the wings of the other bees cover their whole body, whereas those of the queen hardly reach beyond her middle, or end at about the third ring of her belly. Her hinder parts are more taper than those of the other bees, terminating sharper. Her belly and legs are of a deep yellow, much resembling the purest gold. She is unadorned in her flight, a reason for her seldom flying but when she leaves the parent-hive to go and settle a colony. All the bees form her retinue, and like dutiful subjects repair to the place she chooses. She is armed with a vigorous sting. Less passionate however than her subjects, she only uses her sting when long provoked, or when in contest for imperial sway. Never more than one remains in a hive, and that is the conqueror.

A hive of bees cannot subsist without a queen, as she Attatchment of the hive of the subject bees account for the number of their numbers; and this to account for their fidelity and attachment to their sovereign are admirable.

Mr. Wildman, by his dexterity in the management of his bees, some years ago, surprised the whole kingdom. He can cause a swarm to light where he pleases; almost instantaneously; he can order them to settle on his head; then remove them to his hand; command them to de part and settle on a window, table, &c. at pleasure. We shall subjoin his method of performing these feats in his own words:

"Long experience has taught me, that as soon as I turn up a hive, and give it some taps on the sides and bottom, the queen immediately appears, to know the cause of this alarm, but soon retires again among her people. Being accustomed to see her so often, I readily perceive her at first glance; and long practice has enabled me to seize her instantly, with a tenuity that does not in the least endanger her person. This is of the utmost importance; for the least injury done to her brings immediate destruction to the hive, if you have not a spare queen to put in her place, as I have too often experienced in my first attempts. When possessed of her, I can without injury to her, or exciting that degree of resentment that might tempt her to sting me, slip her into my other hand, and, returning the hive to its place, hold her there, till the bees missing her, are all on wing, and in the utmost confusion. When the bees are thus distressed, I place the queen wherever I would have the bees to settle. The moment a few of them discover her, they give notice to those near them, and those to the rest; the knowledge of which soon becomes so general, that in a few minutes they all collect themselves round her; and are so happy in having recovered this sole support of their state, that they will long remain quiet in their situation. Nay, the scent of her body is so attractive of them, that the slightest touch of her, along any place or substance, will attach the bees to it, and induce them to pursue any path she takes." This was the only witchcraft used by Mr. Wildman, and is that alone which is practised by others who have since made similar exhibitions. In short, seize on the queen, and you are
When a queen dies by an accident, the bees of her hive immediately cease working, consume their own honey, fly about their own and other hives at unusual hours when other bees are at rest, and pine away if not soon supplied with another sovereign. Her loss is proclaimed by a clear and interrupted humming. This sign should be a warning to the owner of the bees, to take what honey remains in the hive, or to procure them another queen. In this last case the flock instantly revives; pleasure and activity are apparent through the whole hive; the presence of the sovereign restores vigour and exertion, and her voice commands universal respect and obedience; of such importance is the queen to the existence and prosperity of the other members of this community.

The dissection of the queen-bee shows evidently that she lays many thousand eggs. It is computed that the ovaries of a queen-bee contain more than 5,000 eggs at one time; and therefore it is not difficult to conceive that a queen-bee may produce 10,000 or 12,000 bees, or even more, in the space of two months.

The common drones are smaller than the queen, and larger than the working bees; and in flying they make a greater noise. The dissection of the drone gives as great proof of its being the male, as that of the queen does of her being female. In this creature there is no appearance of ovaries or eggs, nor any thing of the structure of the common working bees, but the whole abdomen is filled with transparent vessels, winding in various sinuosities, and containing a white or milky fluid. This is plainly analogous to that fluid in the males of other animals, which is destined to render the eggs of the female prolific: and this whole apparatus of vessels, which much resembles the turnings and windings of the seminal vessels in other animals, is plainly intended only for the preparation and retention of this matter, till the destined time of its being emitted. On squeezing the hinder parts also, may be forced out the penis, a small and slender fleshy body, contained between two horns of a somewhat harder substance, which join at their base, but gradually part asunder as they are continued in length. These parts, found in all the drones, and none of them in any other bees except these, seem to prove very evidently the difference of sex. If a hive is opened in the beginning of spring, not a single drone will be found in it; from the middle of May till the end of June, hundreds of them will be found, commonly from 200 or 300 to 1,000; and from thence to the following spring it would be vain to seek for them. They go not out till 11 in the morning, and return before six in the evening. But their expeditions are not those of industry. They have no sting, their rostra and feet are not adapted for collecting wax and honey, nor indeed are they obliged to labour. They only hover upon flowers to extract the sweets, and all their thoughts are pleasure. Their office is, to impregnate the eggs of the queen after they are deposited in the cells. And while their presence is thus necessary, they are suffered to enjoy the sweets of love and life; but as soon as they become useless in the hive, the working bees declare the most cruel war against them.

The working bees compose the greatest body of the working state. Columella informs us, that the ancients distinguished several kinds of them. He joins in opinion with Virgil, who approves of those which are small, oblong, smooth, bright, and shining, of a gentle and mild disposition: "for," continues be, "by how much the larger and rounder the bee is, by so much the worse it is: but if it be fierce and cruel, it is the worse of all. The angry disposition of bees of a better character is easily softened by the frequent intercourse of those who take care of them, for they grow more tame when they are often handled." The experience of ages has now established the sort of bees which have been found to answer best the purposes of keeping them.

The working bees have the care of the hive, collect the wax and honey, fabricate and work up the wax, build the cells, feed the young, keep the hive clean, drive from thence strangers, and employ themselves in all other concerns relating to the hive.

The working bee has two stomachs; one which contains the honey, and a second in which is contained the crude
Bee.

Bee. crude wax. The working bees have no parts analogous to the ovaria of the queen, or that resemble the male organs of the drones. Hence they have generally been supposed to be neutral or of neither sex. But a different doctrine has lately been established; which there will be occasion to notice in the sequel.

The sting is very necessary for a working bee, both as an offensive and as a defensive weapon; for their honey and wax excite the envy of many greedy and lazy insects; and they have also to defend themselves against enemies who are fond of eating them, than their honey. There is likewise a time when the drones must be sacrificed and exterminated for the good of the society; and as they are larger and stronger than the working bees, these last would have a very unequal match, were it not for this poisonous sting.

There happen also among bees, either of the same or of different hives, most deadly feuds, in which their stings are their chief weapons. In these contests, great skill may be discerned in their manner of pointing the sting between the scaly rings which cover their bodies, or to some other easily vulnerable part. The bee which first gains the advantage remains the conqueror; though the victory costs the victor his life, if he has left his sting in the body of the enemy; for, with the sting, so much of his body is torn out, that death inevitably follows. Bees have very severe conflicts when whole hives engage in a pitched battle, and many are slain on both sides. Their fighting and plundering one another ought chiefly to be imputed, as Mr Thorley observes, either to their perfect abhorrence of sloth and idleness, or to their insatiable thirst for honey; for when, in spring or autumn, the weather is fair, but no honey can be collected from plants, and is to be found only in the hives of other bees, they will venture their lives to get it there.

Dr Warder assigns another cause of their fighting; which is, the necessity that the bees are reduced to when their own hive has been plundered, at a season when it is too late for them to repair the loss by any industry in the fields.

Sometimes one of the queens is killed in battle. In this case, the bees of both hives unite as soon as her death is generally known among them. All then become one people; the vanquished go off with the robbers, richly laden with their own spoils, and return every day with their new associates to pillage their old habitation. This causes a strong, unusual for the season, at the door of the hive they are plundering; and if the owner lifts it up at night, when all are gone home, he will find it empty of inhabitants; though there perhaps will remain in it some honey, which he takes as his property.

When two swarms take flight at the same time, they sometimes quarrel, and great numbers are destroyed on both sides, till one of the queens is slain. This ends the contest, and the bees of both sides unite under the surviving sovereign.

When the bees begin to work in their hives, they divide themselves into four companies; one of which roves in the fields in search of materials; another employs itself in laying out the bottom and partitions of their cells; a third is employed in making the inside smooth from the corners and angles; and the fourth company brings food for the rest, or relieves those who return with their respective burdens. But they are not kept constant to one employment; they often change the tasks assigned them; those that have been at work being permitted to go abroad, and those that have been in the fields already take their places. They seem even to have signs, by which they understand each other; for when any of them wants food, it begins its trunks to the bee from whom it is expected, which then opens its honey-bag, and lets some drops fall into the other's mouth, which is at that time opened to receive it. Their diligence and labour are so great, that in a day's time, they are able to make cells which lie upon each other numerous enough to contain 3000 bees.

In the plan and formation of these cells they disco-

Of the most wonderful sagacity. In constructing habitations within a limited compass, an architect would have three objects in view: first, to use the smallest quantity that can be of materials; next, to give the edifice the greatest capacity in a determined space; and thirdly, to employ the spot in such a manner that some of it may be lost. On examination it would be found that the bees have obtained all these advantages in the hexagonal form of their cells: for, first, there is an economy of wax, as the circumference of one cell makes part of the circumferences of those contiguous to it; secondly, the economy of the spot, as these cells which join to one another leave no void between them; and thirdly, the greatest capacity or space; as, of all the figures which can be contiguous, that with six sides gives the largest area. This thriftiness prompts them to make the partitions of their cells thin; yet they are constructed so as that the solidity may compensate for the scantiness of materials. The parts most liable to injury are the entrance of the cells. Those the bees take care to strengthen, by adding quite round the circumference of the apertures a fillet of wax, by which means this mouth is three or four times thicker than the sides: and they are strengthened at the bottom by the angle formed by the bottom of three cells falling in the middle of an opposite cell. The combs lie parallel to each other; and there is left between every one of them a space which serves as a street, broad enough for two bees to pass by each other. There are holes which go quite through the combs, and serve as lanes for the bees to pass from one comb to another, without being obliged to go a great way about. When they begin their combs, they form at the top of the hive a root or stay to the whole edifice, which is to hang from it. Though they generally lay the foundations of the combs so that there shall be no more between them than what is sufficient for two bees to pass, yet they sometimes place those beginnings of two combs too far asunder; and, in this case, in order to fill up part of the void space arising from that bad disposition, they carry their combs on obliquely, and make them gradually approach each other. The void space is sometimes so considerable, that the bees build in it an intermediate comb, which they terminate as soon as the original combs have only their due distances. As the comb would be apt, when full, to overcome by their weight all the security which the bees can give them, against falling, they who prepare hives set them, crosswise, sticks, which serve as props to the combs, and save the bees a great deal of labour. It is
not easy to discover the particular manner of their working; for, notwithstanding the many contrivances used for this purpose, there are such numbers in continual motion, and succeed one another with such rapidity, that nothing but confusion appears to the sight. Some of them, however, have been observed carrying pieces of wax in their talons, and running to the places where they are at work upon the combs. These they fasten to the work by means of the same talons. Each bee is employed but a very short time in this way: but there is so great a number of them that go on in a constant succession, that the comb increases very perceptibly. Besides these, there are others that run about beating the work with their wings and the hinder part of their body, probably with a view to make it more firm and solid.

Whilst part of the bees are occupied in forming the cells, others are employed in perfecting and polishing those that are new modelled. This operation is performed by their talons, taking off every thing that is rough and uneven. These polishers are not so desultory in their operations as those that make the cells; they work long and diligently, never intermitting their labour, excepting to carry out of the cell the particles of wax which they take off in polishing. These particles are not allowed to be lost; others are ready to receive them from the polishers, and to employ them in some other part of the work.

The balls which we see attached to the legs of bees returning to the hives are not wax, but a powder collected from the stamens of flowers, not yet brought to the state of wax. The substance of these balls, heated in any vessel, does not melt as wax would do, but becomes dry, and hardens: it may even be reduced to a coal. If thrown into water, it will sink; whereas wax swims. To reduce this crude substance into wax, it must first be digested in the body of the bee.

Every bee, when it leaves the hive to collect this precious store, enters into the cup of the flower, particularly such as seem charged with the greatest quantity of this yellow farina. As the animal's body is covered over with hair, it rolls itself within the flower, and quickly becomes quite covered with the dust, which it soon after brushes off with its hind legs, and kneads into two little balls. In the thighs of the hind legs there are two cavities, edged with hair; and into these, as into a basket, the animal sticks its pellets. Thus employed, the bee flits from flower to flower, increasing its store, and adding to its stock of wax, until the ball upon each thigh becomes as big as a grain of pepper; by this time having got a sufficient load, it returns, making the best of its way to the hive.

After the bees have brought home this crude substance, they eat it by degrees; or at other times, three or four bees come and ease the loaded bee, by eating each of them a share, the loaded bee giving them a hint so to do. Hunger is not the motive of their thus eating the balls of waxy matter, especially when a swarm is first hived; but it is their desire to provide a speedy supply of real wax for making the combs. At other times, when there is no immediate want of wax, the bees lay this matter up in repositories, to keep it in store.

When this waxy matter is swallowed, it is, by the digestive powers of the bee, converted into real wax, which the bees again digests as they work it up into combs; for it is only while thus soft and pliant from the stomach that they can fabricate it properly. That the wax thus employed is taken from their stomachs, appears from their making a considerable quantity of comb soon after they are hived, and even on any tree or shrub where they have rested but a short while before their being hived, though no balls were visible on their legs, excepting those of a few which may be just returned from the field. This is farther confirmed by what happened in a swarm newly hived: for two days together from the time of their quitting their former home, it rained constantly, insomuch that not one bee was able to stir out during that time; yet at the end of the two days they had made a comb 15 or 16 inches long, and thick in proportion.

The crude wax, when brought home by the bees, is often of as different colours as are the flowers from which it is collected: but the new combs are always of a white colour, which is afterwards changed only by the impurities arising from the steam, &c. of the bees.

Bees collect crude wax also for food; for if this was not the case, there would be no want of wax after the combs are made: but they are observed, even in old hives, to return in great numbers loaded with such matter, which is deposited in particular cells, and is known by the name of bee-bread. We may guess that they consume a great deal of this substance in food by the quantity collected; which, by computation, may in some hives amount to an hundred weight in a season, whilst the real wax in such a hive does not perhaps exceed two pounds.

It is well known that the habitation of bees ought to be very close; and what their hives want from the negligence or unskilfulness of man, these animals, supply by their own industry: so that it is their principal care, when first hived, to stop up all the cranies. For this purpose they make use of a resinous gum, which is more tenacious than wax, and differs greatly from it. This the ancients called propolis. It will grow considerably hard in the hive, though it will in some measure soften by heat; and is often found different in consistence, colour, and smell. It has generally an agreeable aromatic odour when it is warm; and by some it is considered as a most grateful perfume. When the bees begin to work with it, it is soft; but it acquires a firmer consistence every day, till at length it assumes a brown colour, and becomes much harder than wax. The bees carry it on their hinder legs; and some think it is met with on the birch, the willow, and poplar. However it is procured, it is certain that they plaster the inside of their hives with this composition.

Honey is originally a juice digested in plants, which sweats through their pores, and chiefly in their flowers, or is contained in reservoirs in which nature stores it. The bees sometimes penetrate into these stores, and at other times find the liquor exuded. This they collect in their stomachs; so that, when loaded with it, they seem, to an inattentive eye, to come home without any booty at all.

Besides the liquor already mentioned, which is obtained from the flowers of plants, another substance, has been discovered, of which the article **bees my dew**.
bees are equally fond. Of this substance there are two kinds, both deriving their origin from vegetables, though in very different ways.

The first kind, the only one known to husbandmen, and which passes for a dew that falls on trees, is no other than a mild sweet juice, which, having circulated through the vessels of vegetables, is separated in proper reservoirs in the flowers, or on the leaves, where it is properly called the honey-dew: sometimes it is deposited in the pitch, as in the sugar-cane; and, at other times, in the juice of pulpy summer fruit when ripe. Such is the origin of the mawns which is collected on the ash and maple of Calabria and Briançon, where it flows in great plenty from the leaves and trunks of these trees, and thickens into the form in which it is usually seen.

The second kind of honey-dew, which is the chief resource of bees, after the spring-flowers and dew by transpiration on the leaves are past, owes its origin to a small mean insect, the excrement thrown out by which makes a part of the most delicate honey we ever taste.

From whatever source the bees have collected their honey, the instant they return home, they seek cells in which they may disgorge and deposit their loads. They have two sorts of stores: one which consists of honey laid up for the winter; and the other of honey intended for accidental use in case of bad weather, and for such bees as do not go abroad in search of it. Their method of securing each of these is different. They have in each cell a thicker substance, which is placed over the honey, to prevent its running out of the cell; and that substance is raised gradually as the cell is filled, till the bees find that the cell cannot contain any more, close it with a covering of wax, not to be opened till times of want, or during the winter.

It has been already observed, that the cells are intended for other purposes besides being places of store for honey. One of their chief uses is, their being nurseries for the young. The cells for those which are to be working bees are commonly half an inch deep; those for drones, three quarters of an inch; and those which are intended for keeping of honey only, still deeper. This accounts for the inequalities observed in the surface of combs.

The queen-bee is generally concealed in the most secret part of the hive, and is never visible but when she lays her eggs in such combs as are exposed to sight. When she does appear, she is always attended by ten or a dozen of the common sort, who form a kind of retinue, and follow her wherever she goes with a sedate and grave tread. Before she lays her eggs, she examines the cells where she designs to lay them; and if she finds that they contain neither honey, wax, nor any embryo, she introduces the posterior part of her body into the cell, and fixes to the bottom of it a small white egg, which is composed of a thin white membrane, full of a whitish liquor. In this manner she goes on, till she fills as many cells as she has eggs to lay, which are generally many thousands. Sometimes more than one egg has been deposited in the same cell; when this is the case, the working bees remove the supernumerary eggs, and leave only one in each cell. On the first or second day after the egg is lodged in the cell, the drone bee injects a small quantity of whitish liquid, which, in about a day, is absorbed by the egg. On the third or fourth day it produces a worm or maggot; which, when it is grown so as to touch the opposite angle, coils itself up in the shape of a semicircle, and floats in a proper liquid, whereby it is nourished and enlarged in its dimensions. This liquor is of a whitish colour, of the thickness of cream, and of an insipid taste like flour and water. Naturalists are not agreed as to the origin and qualities of this liquid. Some have supposed, that it consists of some generative matter, injected by the working bees into each cell, in order to give fecundity to the eggs; but the most probable opinion is, that it is the same with what some writers have called the bee-bread; and that it is a mixture of water with the juices of plants and flowers collected merely for the nutrition of the young, whilst they are in their weak and helpless state. Whatever be the nature of this aliment, it is certain that the common working bees are very industrious in supplying the worms with a sufficient quantity of it. The worm is fed by the working bees for about eight days, till one end touches the other in the form of a ring; and when it begins to feel itself uneasy in its first posture, it ceases to eat, and begins to unroll itself, thrusting that end forward towards the mouth of the cell which is to be the head. The attendant bees, observing these symptoms of approaching transformation, desert from their labours in carrying proper food, and employ themselves in fastening up the top of the cell with a lid of wax, formed in concentric circles, and by their natural heat in cherishing the brood, and hastening the birth. In this concealed state the worm extends itself at full length, and prepares a web of a sort of silk in the manner of the silk worm. This web forms a complete lining for the cell, and affords a convenient receptacle for the transformation of the worm into a nymph or chrysalis. Some naturalists suppose, that as each cell is destined to the successive breeding of several worms, the whole web, which is composed of many crusts or doubles, is in reality a collection of as many webs as there have been worms. M. Maraldi apprehends, that this lining is formed of the skin of the worm thrown off at its entrance into the nymph state: but it is urged, that if the cells are opened when newly covered by the bees, the worm within will be found in its own form, and detected in the act of spinning its web; and by means of glasses it will be found composed of fine threads regularly woven together, like those of other spinning animals. In the space of 18 or 20 days the whole process of transformation is finished, and the bee endeavours to discharge itself from confinement by forcing an aperture with its teeth through the covering of the cell. The passage is gradually dilated; so that one horn first appears, then the head, and afterwards the whole body. This is usually the work of three hours, and sometimes half a day. The bee, after it has disengaged itself, stands on the surface of the comb, till it has acquired its natural complexion, and full maturity and strength, so as to become fit for labour. The rest of the bees gather round it in this state, congratulate its birth, and offer it honey out of their own mouths. The exuviae and scattered pieces of wax which are left in the cell are removed by the working bees; and the matrix is so soon cleansed and fit for new fecundation, but the queen deposits another egg in it; inasmuch that, M. Maraldi.
Maraldi says, he has seen five bees produced in the same cell in the space of three months. The young bees are easily distinguished from the others by their colour; they are gray, instead of the yellowish brown of the common bees. The reason of this is, that their body is black, and the hairs that grow upon it are white, from the mixture of which seen together results a gray; but this colour forms itself into a brownish yellow by degrees, the rings of the body becoming more brown and the hairs more yellow.

The eggs from which drones are to proceed, are, as already observed, laid in larger cells than those of the working bees. The coverings of these cells, when the drones are in the nymph state, are convex or swelling outward, whilst the cells of the working bees are flat. This, with the privilege of leading idle effeminate lives, and not working for the public stock, is what distinguishes the drones.

The bees depart from their usual style of building when they are to raise cells for bringing up such maggots as are destined to become queens. These are of a longish oblong form, having one end bigger than the other, with their exterior surface full of little cavities. Wax, which is employed with so great a thriftiness in the raising of hexagonal cells, is expended with profusion in the cell which is to be the cradle of a royal maggot. They sometimes fix it in the middle, and at other times on one side of a comb. Several common cells are sacrificed to serve as a basis and support to it. It is placed almost perpendicular to the common cells, the largest end being uppermost. The lower end is open till the season for closing it comes, or till the maggot is ready for transformation. It would be difficult to conceive how a tender maggot can remain in a cell turned bottom upmost, if we did not find it buried in a substance scarcely fluid, and if it were not in itself, at first, small and light enough to be suspended in this clammy paste. As it grows it fills all the upper and larger part of the cell. As soon as the young queen comes out of her cell, that cell is destroyed, and its place is supplied by common cells; but as the foundation of the royal cell is left, this part of the comb is found thicker than any other. There are several such cells prepared; for if there was only one reared in each hive, the swarms might often want a conductress. Many accidents may also destroy the little maggot before it becomes a bee. It is therefore necessary that a number of such cells should be provided; and accordingly there are observed several young queens in the beginning of the summer, more than one of which often takes flight when a swarm departs. A young queen is in a condition to lead a swarm from a hive in which she was born in four or five days after she has appeared in it with wings. The bees of a swarm are in a great hurry when they know that their queen is ready to lay. In this case, they give to their new cells but part of the depth they are to have, and defer the finishing of them till they have traced the number of cells requisite for the present time. The cells first made are intended only for working bees; these being the most necessary.

When the hive is become too much crowded by the addition of the young brood, a part of the bees think of finding themselves a more commodious habitation, and with that view single out the most forward of the young queens. A new swarm is therefore constantly composed of one queen at least, and of several thousand working bees, as well as of some hundreds of drones. The working bees are some old, some young.

Scarce has the colony arrived at its new habitation, when the working bees labour with great diligence to procure materials for food and building. Their principal aim is not only to have cells in which they may depose their honey: a stronger motive seems to animate them. They seem to know that their queen is in haste to lay her eggs. Their industry is such that in 24 hours they will have made combs 20 inches long, and wide in proportion. They make more wax during the first fortnight, if the season is favourable, than they do during all the rest of the year. Other bees are at the same time busy in stopping all the holes and crevices they find in their new hive, in order to guard against the entrance of insects which covet their honey, their wax, or themselves; and also to exclude the cold air, for it is indispensably necessary that they be lodged warm.

When the bees first settle in swarming, indeed when they at any time rest themselves, there is something very particular in their method of taking their repose. It is done by collecting themselves in a heap, and hanging to each other by their feet. They sometimes extend these heaps to a considerable length. It would seem probable to us, that the bees from which the others hang must have a considerable weight suspended to them. All that can be said is, that the bees must find this to be a situation agreeable to themselves. They may perhaps have a method of distending themselves with air, thereby to lessen their specific gravity; in the same manner as fishes do in order to alter their gravity compared with water.

When a swarm divides into two or more bands, which settle separately, this division is a sure sign that there are two or more queens among them. One of these clusters is generally larger than the other. The bees of the smaller cluster or clusters, detach themselves by little and little, till at last the whole, together with the queen or queens, unite with the largest cluster. As soon as the bees are settled, the supernumerary queen or queens must be sacrificed to the peace and tranquillity of the hive. This execution generally raises a considerable commotion in the hive; and several other bees, as well as the queen or queens, lose their lives. Their bodies may be observed on the ground, near the hive. The queen that is chosen is of a more reddish colour than those which are destroyed; so that fruitfulness seems to be a great motive of preference in bees; for the nearer they are to the time of laying their eggs, the bigger, larger, and more shining are their bodies. The method of hiving these swarms will be explained hereafter.

Besides the capital instincts above mentioned, bees have other instincts necessary for their preservation and happiness. They anxiously provide against the entrance of insects into the hive, by gluing up with wax the smallest holes in the skep. Some stand as sentinels at the mouth of the hive, to prevent insects of any kind from getting in. But if a snail, or other large insect should get in, notwithstanding all resistance, they sting it to death; and even cover it over with a coat of propolis, to prevent
vent the bad smell or maggots which might proceed from the putrefaction of such a large animal. Bees seem to be warned of the appearance of bad weather by some particular feeling. It sometimes happens, even when they are very assiduous and busy, that they on a sudden cease from their work; not a single one stirs out; and those that are abroad hurry home in such prodigious crowds, that the doors of their habitations are too small to admit them. On this occasion look up to the sky, and you will soon discover some of those black clouds which denote impending rain. Whether they see the clouds gathering for it, as some imagine, or whether (as is much more probable) they feel some other effect of it upon their bodies, is not yet determined; but it is alleged, that no bee is ever caught even in what we call a sudden shower, unless it has been at a very great distance from the hive, or have been before injured by some accident, or be sickly and unable to fly so fast as the rest. Cold is a great enemy to them. To defend themselves against its effects during a hard winter, they crowd together in the middle of the hive, and buzz about, and thereby excite a warmth which is often perceptible by laying the hand upon the glass windows of the hive. They seem to understand one another by the motions of their wings: when the queen wants to quit the hive, she gives a little buzz; and all the others immediately follow her example, and retire along with her.

As to the age of bees, the large drones live but a little while, being destroyed without mercy by the working bees, probably to save honey, as already noticed. But of the other sort, lately discovered, no larger than the working bees, and not easily to be distinguished from them, the age has not yet been ascertained. Writers are not agreed as to the age of the working bees. Some maintain that they are annual, and others suppose that they live many years. Many of them, it is well known, die annually of hard labour; and though they may be preserved by succession in hives or colonies for several years, the most accurate observers are of opinion that their age is but a year, or at the longest no more than two summers.

Concerning the sex and fecundation of bees, various experiments have been made of late years, by which new light has been thrown upon the subject, and several difficulties which embarrassed the process of generation among these curious insects seem to have been removed.

Swammerdam, and after him Maraldi, discovered in the structure of the drones some resemblance to the male organs of generation, as has already been described, and from thence concluded that they were the males: but neither of those accurate and industrious observers could detect them in the act of copulation. Swammerdam, therefore, entertained a notion, that the female or queen-bee was fecundated without copulation; that it was sufficient for her to be near the males: and that her eggs were impregnated by a kind of vivifying aura, exhaled from the body of the male, and absorbed by the female. However, M. Reaumur, thought that he had discovered the actual copulation of the drones with the female-bee, and he has very minutely described the process of it. A very ingenious naturalist of the present day, without taking any notice of recent discoveries, seems to have given into the same idea.

The office of the males or drones (says he) is to render the queen pregnant. One single female should in the midst of seven or eight hundred males, one would think, be incessantly assailed. But nature has provided against that inconvenience, by making them of a constitution extremely frigid. The female chooses out one that pleases her; she is obliged to make the first advances, and excite him to love by her caresses. But this favour proves fatal to him: scarce has he ceased from amorous dalliance, but he is seen to perish. The pleasure of these observations may be taken, by putting a female with several males into a bottle.

Others again, as M. Shirach and M. Hattorf, reject the drones as bearing no share at all in the business of propagation, and assert the queen-bee to be self-prolific. But for what purpose then should wise nature have furnished the drones with that large quantity of seminal liquor? to what use so large an apparatus of fecundating organs so well described by Reaumur and Maraldi? The fact is, that the above gentlemen have founded their opinion upon observations that hives are propped at a time of the year when (as they suppose) there are no drones in being. But we have already noticed, that nature has provided drones of different sizes for the purpose of impregnation, adapted to different times, occasions, and circumstances: And the mistake of Messrs Shirach and Hattorf seems to have proceeded from their missing the large-sized drones, and not being acquainted with or not advertising to the other sort, so hardly distinguishable from the working bees.

Lastly, many of the ancients as well as moderns have supposed that the eggs of the female bee are not impregnated with the male sperm, while in the body of the creature, but that they are deposited unimpregnated in the cells; and that the male afterwards ejects the male sperm on them as they lie in the cells, in the same manner as the generation of fishes is supposed to be performed by the males impregnating the spawn after it is cast out by the females. M. Maraldi long since conjectured that this might be the case; and he was confirmed in his opinion, by observing a liquid whitish substance surrounding each egg at the bottom of the cell a little while after it had been laid, and that a great number of eggs, which are not encompassed by this liquor, remained barren in the cell.

This method of impregnation has been lately established beyond all contradiction by the observations of Mr. Debraw of Cambridge. Having put some bees into glass-hives with a large number of drones, he observed on the first or second day (always before the third) from the time in which the eggs were placed in the cells, which the queen generally lays on the fourth or fifth day after they are put into the hive, that a great number of bees fastened themselves to one another, and formed a kind of curtain from the tops to the bottom of the hive, probably in order to conceal the process of generation. Mr. Debraw, however, Mr Debraw, however, Mr Debraw, however, the bees could soon perceive several bees whose size he was not able to distinguish, inserting the posterior part of their bodies each into a cell, and sinking into it; after a little while they retired, and he could see with the naked eye a small quantity of whitish liquor left in the angle of the base of each cell containing an egg; this liquor
In order to prove farther that the eggs are fecundated by the males, and that their presence is necessary at the time of breeding, Mr. Debruw made the following experiments. They consist in leaving in a hive the queen, with only the common or working bees, without any drones, to see whether the eggs she laid would be prolific. To this end, he took a swarm, and shook all the bees into a tub of water, leaving them there till they were quite senseless: by which means he could distinguish the drones without any danger of being sting: Leaving these out, therefore, he restored the queen and working-bees to their former state, by spreading them on a brown paper in the sun; after this he replaced them in a glass-hive, where they soon began to work as usual. The queen laid eggs, which, to his great surprise, were impregnated; for he imagined he had separated all the drones or males, and therefore omitted watching them; at the end of twenty days he found several of his eggs had, in the usual course of changes, produced bees, while some had withered away, and others were covered with honey. Hence he inferred, that some of the males had escaped his notice, and impregnated part of the eggs. To convince himself of this, he took away all the brood comb that was in the hive, in order to oblige the bees to provide a fresh quantity, being determined to watch narrowly their motions after new eggs should be laid in the cells. On the second day after the eggs were placed in the cells, he perceived the same operation that was mentioned before; namely, that of the bees hanging down in the form of a curtain, while others thrust the posterior part of their body into the cells. He then introduced his hand into the hive, and broke off a piece of the comb, in which there were two of these insects: he found in neither of them any sting (a circumstance peculiar to the drones); upon dissection, with the assistance of a microscope, he discovered the four cylindrical bodies which contain the glutinous liquor, of a whitish colour, as observed by Maraldi in the large drones. He was therefore now under a necessity of repeating his experiments, in destroying the males, and even those which might be suspected to be such.

He once more immersed the same bees in water; and when they appeared in a senseless state, he gently pressed every one, in order to distinguish those armed with stings from those which had none, and which of course he supposed to be males: of those last he found fifty-seven, and replaced the same in a glass-hive, where they immediately applied again to the work of making honey; and on the fourth or fifth day, very early in the morning, he had the pleasure to see the queen bee deposit her eggs in those cells; he continued watching most part of the ensuing days, but could discover nothing of what he had seen before.

The eggs after the fourth day, instead of changing in the manner of caterpillars, were found in the same state they were the first day, except that some were covered with honey. A singular event happened the next day about noon: all the bees entered their own hive, and attempted to get into a neighbouring hive, probably in search of males; but the queen was found dead, having been killed in the engagement.

To be further satisfied, Mr. Debruw took the brood-comb, which had not been impregnated, and divided it into two parts: one he placed under a glass bell, No. 1. with honey-comb for the bees food, taking care to leave a queen, but no drones, among the bees confined in it: the other piece of brood-comb be placed under another glass bell, No. 2. with a few drones, a queen, and a proportionable number of common bees. The result was, that in the glass, No. 1. there was no impregnation, the eggs remained in the same state they were in when put into the glass; and on giving the bees their liberty on the seventh day, they all flew away, as was found to be the case in the former experiment; whereas in the glass, No. 2. the very day after the bees had been put into it, the eggs were impregnated by the drones, the bees did not leave their hive on receiving their liberty, the eggs at the usual time underwent the necessary transformations, and a numerous young colony was produced.

Naturalists have observed, that the queen bees are produced in a manner peculiar to themselves, and different from the drones and working bees. Some have supposed, that the eggs laid by the queen in a hive, and destined for the production of queen bees, are of a peculiar kind; but though this is not the case, as M. Shirach has lately discovered, yet there are particular cells appropriated for this purpose. These cells are generally near the edges, and at the bottom of the combs, and sometimes on the sides of a honey-comb: they are of an oblong circular form, and very strong; and are more or less numerous in different hives as occasion seems to require. It has also been supposed, that the matter with which they are nourished is of a different kind and quality from that employed for the nourishment of the other bees; that which has been collected out of the royal cells being of a gummy glutinous nature, of a deep transparent red, and dissolving in the fire rather than crumbling to powder.

It has been generally supposed, that the queen bee is the only female contained in the hive; and that the working bees are neutral, or of neither sex. But M. Shirach has lately established a different doctrine. He has been also confirmed by the later observations of Mr. Debruw. According to M. Shirach, all the working or common bees are females in disguise; and the queen-bee lays only two kinds of eggs, viz. those which are to produce the drones, and those from which the working bees are to proceed; and from any one or more of these, one or more queens may be produced; so that every worm of the latter or common kind, which has been hatched about three days, is capable, under certain circumstances, of becoming the queen or mother of a hive. In proof of this doctrine, new and singular as it may seem, he alleges a number of satisfactory and decisive experiments, which have been since verified by those of Mr. Debruw. In the early months of the spring, and in any preceding month, even so late as November, he cuts off from an old hive a piece of that part of the comb which contains the eggs of the working bees; taking care, however, that it contained likewise worms which had been hatched about three days. He fixes this in an empty hive, and together with a portion of honey-comb, &c., or, in other words, with a sufficiency of food and building materials, or wax, for the use of the intended colony.
BEE [ 320 ]

Bee. He then put into, and confined within the same box, a sufficient number of common working bees, taken from the same or any other hive. As soon as the members of this small community found themselves deprived of their liberty, and without a queen, a dreadful uproar ensued, which continued generally, with some short intervals of silence, for the space of about twenty-four hours; during which time it is to be supposed they were alternately meditating and holding council on the future support of the new republic. On the final cessation of this tumult, the general and almost constant result was, that they betook themselves to work; first proceeding to the construction of a royal cell, and then taking the proper measures for hatching and feeding the brood enclosed within them. Sometimes even on the second day the foundations of one or more royal cells were to be perceived; the view of which furnished certain indications that they had elected one of the enclosed worms to the sovereignty.

The operation has been hitherto conducted in the house. This new colony may now be safely trusted in the garden, if the weather be warm and have the liberty allowed them of passing out of the box; of which they instantly avail themselves, and are seen in a short time almost totally to desert their new habitation. In about two hours, however, they begin to re-enter it. We should not neglect to observe, that if they should be placed near the old hive, from which they were taken, they will very often attempt to enter it, but are as constantly repulsed by their former companions and brethren. It is prudent, therefore, to place them at a distance from the mother state, in order to avoid the inconveniences of a civil war. The final result of the experiment is, that the colony of working bees thus shut up, with a morsel of common brood, not only hatch it, but are found, at the end of eighteen or twenty days, to have produced from thence one or two queens; which have apparently proceeded from worms of the common sort, pitched upon them for that purpose; and which, under other circumstances, that is, if they had remained in the old hive, there is reason to suppose would have been changed into common working bees. In the present instance, the common worm appears to be converted by them into a queen-bee, merely because the hive was in want of one. Hence we may justly infer, that the kingdom of the bees is not, if the expression may be used, a jure divino or hereditary monarchy, but an elective kingdom; in which the choice of their future ruler is made by the body of the people, while she is yet in the cradle, or in embryo; and who are determined by motives of preference which will perhaps for ever elude the penetration of the most sagacious naturalists.

The conclusions drawn by M. Shirach, from experiments of the preceding kind, often repeated by himself and others with the same success, are, that all the common or working bees were originally of the female sex; but that when they have undergone their last metamorphosis, they are condemned to a state of perpetual virginity, and the organs of generation are obliterated; merely because they have not been lodged, fed, and brought up in a particular manner, while they were in the worm state. He supposes that the worm, designed by the community to be a queen, or mother, owes its metamorphosis into a queen, partly to the extraordinary size of its cell, and its peculiar position in it; but principally to a certain appropriate nourishment found there, and carefully administered to it by the working bees while it was in the worm state; by which, and possibly other means unknown, the development and extension of the germ of the female organs, previously existing in the embryo, is effected; and those differences in its form and size are produced, which afterwards so remarkably distinguish it from the common working bees.

This discovery is capable of being applied towards forming artificial swarms, or new colonies of bees, by which means their number might be increased, and their produce in honey and wax proportionately augmented.

Explanation of Plate LXXXIX. Fig. 1. is the queen bee. 2. Is the drone. 3. Is the working bee. 4. Represents the bees hanging to each other by the feet, which is the method of taking their repose. 5. The proboscis or trunk, which is one of the principal organs of the bees, wherewith they gather the honey and take their nourishment. 6. One of the hind legs of a working bee, loaded with wax. 7. A comb, in which the working bees are bred. The cells are the smallest of any. Two of them have the young bees enclosed. A royal cell is suspended on one side. 8. A comb in which the drones are bred, being larger than the former; the young drones being included in several of them; with two royal cells suspended on the side. 9. A similar comb, in which the royal cell is fixed in the middle of the comb; and several common cells are sacrificed to serve as a basis and support to it. In general, the royal cells are suspended on the side of a comb, as in fig. 7. and 8. To the side of fig. 9. two royal cells are begun, when they resemble pretty much the cup in which an acorn lies. The other royal cells have the young queens included in them. Fig. 10. exhibits the sting and all its parts. The sting is composed of a sheath or case, and two shanks, united to each other, and terminating in a sharp point, so as to look like a single part. 6. The poison bag. 7. The tube that serves to convey the poison from its bag to the thickest part of the sting's sheath. 8. The two shanks of the sting, mutually converging to each other. 9. The point of the sting. 10. The thickest end of the sheath, where the tube opens into it, by which it receives the insect's poison. 11. The extreme point of the sting, formed by the two shanks of that organ, that are in this place closely united. k k. The two blind extremities of the said tube. 11. Two pair of cartilages, of different forms, which are for the most part of a deep black, and articulated among themselves, and with the shanks of the sting mm. Two other cartilages less conspicuous than the former, with one pair of which they are articulated. These two cartilages mm, are almost entirely of a membraneous substance. m m m m m m m m m m. Eight places in which the foregoing cartilages are articulated among themselves, and with the shanks of the sting d d. o o o o o o o o o o. Four muscles serving to move the sting different ways, by the assistance of the same cartilages. p p. Two muscles which draw the shanks of the sting into its sheath.
II. Of the Management of Bees, and most approved Inventions for saving their Lives while we take their Honey and Wax.

1. Of the Apiary, and Hives. Columella directs of the apiary that the apiary face the south, and be situated in a warm place neither too hot nor too much exposed to the cold: that it be in a valley, in order that the loaded bees may with the greater ease descend to their homes; that it be near the mansion house, on account of the convenience of watching them; but so situated as not to be exposed to noisome smells, or to the din of men or cattle: that it be surrounded with a wall, which however should not rise above three feet high: that, if possible, a running stream be near them; or, if that cannot be, that water be brought near them in troughs, with pebbles or small stones in the water, for the bees to rest on while they drink; or that the water be confined within gently declining banks, in order that the bees may have safe access to it; they not being able to produce either combs, honey, or food for their maggots, without water; that the neighbourhood of rivers or basons of water with high banks be avoided, because winds may whirl the bees into them, and they cannot easily get on shore from thence to dry themselves; and that the garden in which the apiary stands be well furnished with such plants as afford the bees plenty of good pasture. The trees in this garden should be of the dwarf kind, and their heads bushy, in order that the swarms which settle on them may be the more easily hived.

The proprietor should be particularly attentive that the bees have also in their neighbourhood such plants as yield them plenty of food. Columella enumerates many of these fitted to a warm climate: among them he mentions thyme, the oak, the pine, the sweet-smelling cedar, and all fruit-trees. Experience has taught us, that furze, broom, mustard, clover, heath, &c. are excellent for this purpose. Pliny recommends broom, in particular, as a plant exceedingly grateful and very profitable to bees.

With regard to hives, those made of straw are gene- ally preferred, on several accounts; they are not liable to be over-heated by the rays of the sun; they keep out cold better than wood or any other materials; and the cheapness renders the purchase of them easy. As the ingenious Mr Wildman's hives are reckoned to be of a preferable construction to any other, we shall give an account of them in his own words.

"My hives (says he) are seven inches in height and ten in width. The sides are upright, so that the top and bottom are of the same diameter. A hive holds nearly a peck. In the upper row of straw there is a hoop of about half an inch in breadth; to which are nailed five bars of deal, full a quarter of an inch in thickness, and an inch and quarter wide, and half an inch asunder from one another; a narrow short bar is nailed at each side, half an inch distant from the bars next them, in order to fill up the remaining parts of the circle; so that there are in all seven bars of deal, to which the bees fix their combs. The space of half an inch between the bars allows a sufficient and easy"
passage for the bees from one comb to another. In order to give great steadiness to the combs, so that, upon moving the hive, the combs may not fall off, or incline out of their direction, a stick should be run through the middle of the hive, in a direction directly across the bars or at right angles with them. When the hives are made, a piece of wood should be worked into the lower row of straw, long enough to allow a door for the bees, of four inches in length, and half an inch in height.

The proprietor of the bees should provide himself with several flat covers of straw, worked of the same thickness as the hives, and a foot in diameter, that so it may be of the same width as the outside of the hives. Before the cover is applied to the hive, a piece of clean paper, of the size of the top of the hive, should be laid over it; and a coat of cow-dung, which is the least apt to crack of any cement easily to be obtained, should be laid all round the circumference of the hive. Let the cover be laid upon this, and made fast to the hive with a packing-needle and pack-thread, so that neither cold nor vermin may enter.

Each hive should stand single on a piece of deal, or other wood, somewhat larger than the bottom of the hive: That part of the stand which is at the mouth of the hive should project some inches, for the bees to rest on when they return from the field. This stand should be supported upon a single post, two and a half feet high; to which it should be screwed very securely, that high winds, or other accidents, may not blow down both stand and hive. A quantity of soot mixed with barley chaff should be strewn on the ground round the post; which will effectually prevent ants, slugs, and other vermin, from rising up to the hive. The soot and chaff should from time to time be renewed as it is blown or washed away; though, as it is sheltered by the stand, it remains a considerable time, especially if care be taken that no weeds rise through it. Weeds, indeed, should not be permitted to rise near the hive; for they may give shelter to vermin which may be hurtful to the bees.

The stands for bees should be four yards asunder; or if the apiary will not admit of so much, as far asunder as may be, that the bees of one hive may not interfere with those of another hive, as is sometimes the case when the hives are near one another or on the same stand; for the bees, mistaking their own hives, light sometimes at the wrong door, and a fray ensues, in which one or more may lose their lives.

The person who intends to erect an apiary should purchase a proper number of hives at the latter part of the year, when they are cheapest. The hives should be full of combs, and well stored with bees. The purchaser should examine the combs, in order to know the age of the hives. The combs of that season are white, those of the former year are of a darkish yellow, and where the combs are black, the hive should be rejected, because old hives are most liable to vermin and other accidents.

If the number of hives wanted were not purchased in the autumn, it will be necessary to remedy this neglect after the severity of the cold is past in the spring. At this season, bees which are in good condition will get into the fields early in the morning, return loaded, enter boldly, and do not come out of the hive in bad weather; for when they do, this indicates they are in great want of provisions. They are alert on the least disturbance, and by the loudness of their humming we judge of their strength. They preserve their hives free from all filth, and are ready to defend it against every enemy that approaches.

The summer is an improper time for buying bees, because the heat of the weather softens the wax, and thereby renders the combs liable to break, if they are not very well secured. The honey, too, being then thinner than at other times, is more apt to run out of the cells; which is attended with a double disadvantage, namely, the loss of the honey, and the damping of the bees, whereby many of them may be destroyed. A first and strong swarm may indeed be purchased; and, if leave can be obtained, permitted to stand in the same garden till the autumn; but if leave is not obtained, it may be carried away in the night after it has been hived.

I suppose, that, in the stocks purchased, the bees are in hives of the old construction. The only direction here necessary is, that the first swarm from these stocks should be put into one of my hives; and that another of my hives should in a few days be put under the old stock, in order to prevent its swarming again.

2. Of Hiving. Bees, as has been already observed, never swarm till the hive be too much crowded by the young brood. They first begin to swarm in May, or in the end of April, but earlier or later according to the warmth of the season. They seldom swarm before ten in the morning, and seldom later than three in the afternoon. We may know when they are about to swarm, by clusters of them hanging on the outside of the hive, and by the drones appearing abroad more than usual: But the most certain sign is, when the bees refrain from flying into the fields, though the season be inviting. Just before they take flight, there is an uncommon silence in the hive; after this, as soon as one takes flight, they all follow. Before the subsequent swarmings, there is a great noise in the hive, which is supposed to be occasioned by a contest whether the young or the old queen should go out. When the bees of a swarm fly too high, they are made to descend lower, by throwing handfuls of sand or dust among them, which they probably mistake for rain. For the same purpose, it is usual to beat on a kettle or frying-pan: This practice may have taken its rise from observing that thunder or any great noise prompts such bees as are in the fields to return home.

As soon as the swarm is settled, the bees which compose it should be got into a hive with all convenient speed, to prevent their taking wing again. If they settle on a small branch of a tree, easy to come at, it may be cut off and laid upon a cloth; the hive being ready immediately to put over them. If the branch cannot be conveniently cut off, the bees may be swept from it into a hive. Lodge the queen into the hive, and the rest will soon follow. If the bees must be considerably disturbed in order to get them into the hive, the most advisable way is to let them remain in the place where they have pitched till the evening, when there is less danger of their taking wing. If it be observed that they still hover about the place they first alighted upon, the branches may be rubbed with nee.

Bee.

Bee.

ree, or alder-leaves, or any other thing distasteful to them, to prevent their returning to it.

The hive employed on this occasion should be cleaned with the utmost care, and its inside be rubbed very hard with a coarse cloth, to get off the loose straw, or other impurities, which might cost them a great deal of time and labour to gnaw away. It may then be rubbed with fragrant herbs or flowers, the smell of which is agreeable to the bees; or with honey.

The hive should not be immediately set on the stool where it is to remain; but should be kept near the place at which the bees settled, till the evening, lest some stragglers should be lost. It should be shaded either with boughs or with a cloth, that the too great heat of the sun may not annoy the bees.

We sometimes see a swarm of bees, after having left their hive, and even alighted upon a tree, return to their first abode. This never happens but when the young queen did not come forth with them, for want of strength, or perhaps courage to trust her wings for the first time; or possibly from a consciousness of her not being impregnated.

When a swarm is too few in number for a hive, another may be added. The usual method of thus uniting swarms is very easy. Spread a cloth at night upon the ground close to the hive in which the two casts or swarms are to be united; lay a stick across this cloth; then fetch the hive with the new swarm, set it over the stick, give a smart stroke on the top of the hive, and all the bees will drop down upon the cloth in a cluster. This done, throw aside the empty hive, take the other from off the stool, and set this last over the bees, who will soon ascend into it, mix with those already there, and become one and the same family. Others, instead of striking the bees down upon the cloth, place with its bottom upmost the hive in which the united swarms are to live, and strike the bees of the other hive down into it. The former of these hives is then restored to its natural situation, and the bees of both hives soon unite. If some bees still adhere to the other hive, they may be brushed off on the cloth, and they will soon join their brethren. Or one may take the following method, which gives less disturbance to the bees. Set with its mouth upmost the hive into which the young swarm has been put, and set upon it the other hive. The bees in the lower hive, finding themselves in an inverted situation, will soon ascend into the upper.

Though all writers acknowledge, that one of the queens is constantly slain on these occasions, and generally a considerable number of the working bees; yet none of them, Columella excepted, has proposed the easy remedy of killing the queen of the latter cast or swarm before the union is made; a means by which the lives of the working bees may be preserved. This may be done either by intoxicating them and then picking her out, or by searching her out when the bees are beaten down upon the cloth; for this being done in the night, to prevent the battle which might otherwise ensue, there will be no great difficulty in finding her.

A large swarm may weigh eight pounds, and so gradually less to one pound: consequently a very good one may weigh five or six pounds. All such as weigh less than four pounds should be strengthened by uniting to each of them a less numerous swarm. The size of the hive should be proportioned to the number of the bees; and, as a general rule, it should be rather under than over sized, because bees require to be kept warmer than a large hive will admit of.

In the Letters from an American Farmer, we have the following entertaining account of the swarming of bees in America, discovering them there. A little experience renders it easy to predict the time of their swarming: but the difficult point is, when on the wing, to know whether they want to go to the woods or not. If they have pitched in some hollow trees, it is not the allurements of salt and water, of fennel, hickory leaves, &c. nor the finest box, that can induce them to stay. They will prefer those rude, rough, habitations, to the best polished mahogany hive. When that is the case with mine, I seldom thwart their inclinations. It is in freedom that they work. Were I to confine them, they would dwindle away and quit their labour. In such excursions we only part for a while. I am generally sure to find them again the following fall. This elopement of theirs only adds to my recreations. I know how to deceive even their superstitious instinct. Nor do I fear losing them, though 18 miles from my house, and lodged in the most lofty trees in the most impervious of our forests. After I have done sowing, by way of recreation I prepare for a week's jaunt in the woods, not to hunt either the deer or the bears, as my neighbours do, but to catch the more harmless bees. I cannot boast that this chase is so noble or so famous among men: but I find it less fatiguing, and full as profitable; and the last consideration is the only one that moves me. I take with me my dog, as a companion, for he is useless as to this game; my gun, for no one ought to enter the woods without one; my blanket, some provisions, some wax, vermilion, honey, and a small pocket-compass. With these implements I proceed to such woods as are at a considerable distance from any settlements. I carefully examine whether they abound with large trees; if so, I make a small fire, on some flat stones, in a convenient place. On the fire I put some wax: close by this fire, on another stone, I drop honey in distinct drops, which I surround with small quantities of vermilion, laid on the stone; and then I retire carefully to watch whether any bees appear. If there are any in that neighbourhood, I rest assured that the smell of the burnt wax will unavoidably attract them. They will soon find out the honey, for they are fond of preying on that which is not their own; and in their approach, they will necessarily tinge themselves with some particles of vermilion, which will adhere long to their bodies. I next fix my compass, to find out their course; which they keep invariably straight, when they are returning home loaded. By the assistance of my watch, I observe how long those are in returning which are marked with vermilion. Thus possessed of the course, and, in some measure, of the distance, which I can easily guess at, I follow the first, and seldom fail of coming to the tree where those republicans are lodged. Then mark it; and thus, with patience, I have found out sometimes 11 swarms in a season; and it is inconceivable what a quantity of honey these trees will sometimes afford. It entirely depends on the size of the hollow,
hollow, as the bees never rest or swarm till it is replenished; for, like men, it is only the want of room that induces them to quit the maternal hive. Next I proceed to some of the nearest settlements, where I procure proper assistance to cut down the trees, get all my prey secured, and then return home with my prize. The first bees I ever procured were thus found in the woods by mere accident; for, at that time, I had no kind of skill in this method of tracing them. The body of the tree being perfectly sound, they had lodged themselves in the hollow of one of its principal limbs, which I carefully sawed off; and with a good deal of labour and industry, brought it home, where I fixed it up in the same position in which I found it growing. This was in April. I had five swarms that year, and they have been ever since very prosperous. This business generally takes up a week of my time every fall, and to me it is a week of solitary ease and relaxation."

3. Of shifting the Abode of Bees. Great improvements may certainly be made in the essential article of providing plenty of pasture for bees, whenever this subject shall be more carefully attended to than it has hitherto been. A rich corn country is well known to be a barren desert to them during the most considerable part of the year; and therefore the practice of other nations, in shifting the places of abode of their bees, well deserves our imitation.

Columella informs us, that, as few places are so happily situated as to afford the bees proper pasture both in the beginning of the season and also in the autumn, it was the advice of Celsus, that after the vernal pastures are consumed, the bees should be transported to places abounding with autumnal flowers; as was practised by conveying the bees from Achaia to Attica, from Euboea and the Cyclad islands to Scyrus; and also in Sicily, where they were brought to Hybla from other parts of the island.

We find by Pliny, that this was likewise the practice of Italy in his time. "As soon," says he, "as the spring-food for bees has failed in the valleys near our towns, the hives of bees are put into boats, and carried up against the stream of the river, in the night, in search of better pasture. The bees go out in the morning in quest of provisions, and return regularly to their hives in the boats, with the stores they have collected. This method is continued, till the sinking of the boats to a certain depth in the water shows that the hives are sufficiently full; and they are then carried back to their former homes, where their honey is taken out of them." And this is still the practice of the Italians who live near the banks of the Po, (the river which Pliny instanced particularly in the above-quoted passage).

M. Maillet relates, in his curious Description of Egypt, that, "spite of the ignorance and rusticity which have got possession of that country, there yet remain in it several footsteps of the industry and skill of the ancient Egyptians. One of their most admirable contrivances is, their sending their bees annually into distant countries, in order to procure them sustenance there, at a time when they could not find any at home; and their afterwards bringing them back, like shepherds who should travel with their flock, and make them feed as they go. It was observed by the ancient inhabi-

In many parts of France, floating bee-houses are very common. They have on board one barge threescore or a hundred bee-hives, well defended from the inclemency of an accidental storm. With these the owners suffer themselves to float gently down the river, the bees continually choosing their flowery pasture along the banks of the stream; and thus a single floating bee-house yields the proprietor a considerable income.

They have also a method of transporting their bees by land, well worth our imitation in many parts of this kingdom. Their first care is, to examine those hives, some of whose honey-combs might be broken or separated by the jolting of the vehicle; they are made fast one to the other, and against the sides of the hive, by means of small sticks, which may be disposed differently as occasion will point out. This being done, every hive is set upon a packing-cloth, or something like it, the threads of which are very wide; the sides of this cloth are then turned up and laid on the outside of each hive, in which state they are tied together with a piece of small pack-thread wound several times round the hive. As many hives as a cart built for that purpose will hold, are afterwards placed in this vehicle. The hives are set two and two, the whole length of the cart. Over these are placed others; which make, as it were, a second story or bed of hives. Those which
which are stored with combs should always be turned topsy-turvy. It is for the sake of their combs, and to fix them the better, that they are disposed in this manner; for such as have but a small quantity of combs in them, are placed in their natural situation. Care is taken in this storage not to let one hive stop up another; it being essentially necessary for the bees to have air; and it is for this reason they are wrapped up in a coarse cloth, the threads of which were woven very wide, in order that the air may have a free passage, and lessen the heat which these insects raise in their hives, especially when they move about very tumultuously, as often happens in these carts. Those used for this purpose in Yver, hold from 30 to 48 hives. As soon as all are thus stowed, the caravan sets out. If the season is sultry, they travel only in the night; but a proper advantage is made of cool days. These caravans do not go fast. The horses must not be permitted even to trot: they are led slowly, and through the smoothest roads. When there are no combs in the hives sufficient to support the bees during their journey, the owner takes the earliest opportunity of resting them wherever they can collect wax. The hives are taken out of the cart, then set upon the ground, and after removing the cloth from over them, the bees go forth in search of food. The first field they come to serves them as an inn. In the evening, as soon as they are all returned, the hives are shut up; and being placed again in the cart, they proceed on their journey. When the caravan is arrived at the journey’s end, the hives are distributed in the gardens, or in the fields adjacent to the houses of different peasants, who, for a very small reward, undertake to look after them. Thus it is that, in such spots as do not abound in flowers at all seasons, means are found to supply the bees with food during the whole year.

These instances of the great advantages which attend shifting of bees in search of pasture, afford an excellent lesson to many places in this kingdom: they direct particularly the inhabitants of the rich vales, where the harvest for bees ends early, to remove their stocks to places which abound in heath, this plant continuing in bloom during a considerable part of autumn, and yielding great plenty of food to bees. Those in the neighbourhood of hills and mountains will save the bees a great deal of labour, by taking also the advantage of shifting their places of abode.

4. Of feeding and defending Bees in Winter. Providence has ordained, that insects which feed on leaves, flowers, and green succulent plants, are in an invincible and torpid state from the time that the winter’s cold has deprived them of the means of subsistence. Thus the bees during the winter are in a lethargic state, that little food supports them: but as the weather is very changeable, and very warm and sunny day revives them, and prompts them to return to exercise, food becomes necessary on these occasions.

Many hives of bees, which are thought to die of cold in the winter, in truth die of famine; when a rainy summer has hindered the bees from laying in a sufficient store of provisions. The hives should therefore be carefully examined in the autumn, and should then weigh at least 18 pounds.

Columella describes an annual distemper which seizes bees in the spring, when the spurge blossoms, and the elm discloses its seeds; for that, being allured by the first flowers, they feed so greedily upon them, that they surfeit themselves, and die of a looseness, if they are not speedily relieved.

The authors of the Maison Rustique impugne this purging to the bees feeding on pure honey, which does not form a food sufficiently substantial for them, unless they have bee-bread to eat at the same time; and advise giving them a honey-comb taken from another hive, the cells of which are filled with crude wax or bee-bread.

There is still, however, a want of experiments to ascertain both the time and the manner in which bees should be fed. The common practice is to feed them in the autumn, giving them as much honey as will bring the whole weight of the hive to near 20 pounds. To this end, the honey is diluted with water, and then put into an empty comb, split reeds, or, as Columella directs, upon clean wool, which the bees will suck perfectly dry. But the dilution with water makes the honey apt to be candied, and honey in that state is prejudicial to bees.

The following directions given in the Maison Rustique seem to be very judicious. Replenish the weak hives in September with such a portion of combs full of honey taken from other hives as shall be judged to be a sufficient supply for them. In order to do this, turn up the weak hives, after taking the precaution of defending yourself with the smoke of rags, cut out the empty combs, and put the full ones in their place; where secure them with pieces of wood run across, in such manner that they may not fall down when the hive is returned to its place. The bees will soon fix them more effectually. If this method be thought too troublesome, set under the hive a plate of liquid honey, unmixed with water, with straws laid across it, and over these a paper pierced full of holes, through which the bees will suck the honey without daubing themselves. This should be done in cloudy or rainy weather, when the bees stir least abroad; and the hive should be covered, to protect the bees from robbers, who might be allured to it by the smell of the honey.

Another circumstance which may render it very necessary to feed the bees, is, when several days of bad weather ensue immediately after they have swarmed; for then, being destitute of every supply beyond what they carried with them, they may be in great danger of starving. In this case, honey should be given them in proportion to the duration of the bad weather.

The degree of cold which bees can endure has not been ascertained. We find that they live in the cold parts of Russia, and often in hollow trees, without any care being taken of them. Their hives are frequently made of the bark of trees, which does not afford them much protection from cold. Mr White, therefore, judiciously observes, that bees which stand on the north side of a building whose height intercepts the sun’s beams all the winter, will waste less of their provisions (almost by half) than others which stand in the sun: for coming seldom forth, they eat little; and yet in the spring are as forward to work and swarm as those which had twice as much honey in the autumn before.

The owner should, however, examine their state in the winter; and if he finds, that, instead of being clustered
between the combs, they fall down in numbers on the stool or bottom of the hive, the hive should be carried to a warmer place, where they will soon recover. He must be cautious in returning them again to the cold, lest the honey be candied.

Where the winters are extremely severe, the authors of the Maison Rustique advise to lay on the bottom of an old cask the depth of half a foot of very dry earth, powdered and pressed down hard, and to set on this the stool with the hive; then, to preserve a communication with the air, which is absolutely necessary, to cut a hole in the cask, opposite to the mouth of the hive, and place a piece of reed, or of alder, made hollow, from the mouth of the hive to the hole in the cask; and after this to cover the hive with more of the same dry earth. If there be any room to fear that the bees will not have a sufficiency of food, a plate with honey, covered as before directed, may be put under the hive. If the number of hives be great, boxes may be made of deals nailed together, deep enough to contain the hives when covered with dry earth. The bees will thus remain all the winter free from any danger from cold, hunger, or enemies.

5. Of taking the Honey and Wax. In this country it is usual, in seizing the stores of these little animals, to rob them also of their lives. The common method is, that when those which are doomed for slaughter have been marked out (which is generally done in September), a hole is dug near the hive, and a stick, at the end of which is a rag that has been dipped in melted brimstone, being stuck in that hole, the rag is set on fire, the hive is immediately set over it, and the earth is instantly thrown up all round, so that none of the smoke can escape. In a quarter of an hour, all the bees are seemingly dead; and they will soon after be irrecoverably so, by being buried in the earth that is returned back into the hole. By this last means it is that they are absolutely killed; for it has been found by experiment, that all the bees which have been affected only by the fume of the brimstone, recover again, except such as have been singed or burnt by the flame. Hence it is evident, that fume of brimstone might be used for intoxicating the bees, with some few precautions. The heaviest and the lightest hives are alike treated in this manner: the former, because they yield the most profit, with an immediate return; and the latter, because they would not be able to survive the winter. Those hives which weigh from 15 to 20 pounds are thought to be the finest for keeping.

More humane and judicious methods were practised by the ancients; and the following simple method is at this day practised in Greece, degenerate as it is. "Mount Hymethus is celebrated for the best honey in all Greece. This mountain was not less famous in times past for bees and admirable honey; the ancients believing that bees were first bred here, and that all other bees were but colonies from this mountain; which if so, we assured ourselves that it must be from this part of the mountain that the colonies were sent; both because the honey here made is the best, and that there they never destroy the bees. It is of a good consistence, of a fair gold-colour, and the same quantity sweetens more water than the like quantity of any other doth. I no sooner knew that they never destroy or impair the stock of bees in taking away their honey, but I was inquisitive to understand their method of ordering the bees; which being an art so worthy the knowledge of the curious, I shall not think it beside the purpose, to relate what I saw, and was informed of to that effect by such as had skill in that place. "The hives they keep their bees in are made of willows or osiers, fashioned like our common dust-baskets, wide at top and narrow at the bottom, and plastered with clay or loam within and without. They are set as in fig. 1. with the wide end uppermost. The tops are covered with broad flat sticks, which are also plastered over with clay; and, to secure them from the weather, they cover them with a tuft of straw, as we do. Along each of these sticks, the bees fasten their combs; so that a comb may be taken out whole, without the least bruising, and with the greatest ease imaginable. To increase them in spring-time, that is in March or April, until the beginning of May, they divide them; first separating the sticks on which the combs and bees are fastened, from one another, with a knife: so, taking out the first comb and bees together on each side, they put them into another basket, in the same order as they were taken out, until they have equally divided them. After this, when they are both again accommodated with sticks and plastered, they set the new basket in the place of the old one, and the old one in some new place. And all this they do in the middle of the day, at such time as the greatest part of the bees are abroad; who at their coming home, without much difficulty, by this means divide themselves equally. This device hinders them from swarming and flying away. In August, they take out their honey. This they do in the day-time also, while they are abroad; the bees being thereby, say they, disturbed least: at which time they take out the combs laced with honey, as before; that is, beginning at each outside, and so taking away, until they have left only such a quantity of combs, in the middle, as they judge will be sufficient to maintain the bees in winter; sweeping those bees that are on the combs into the basket again; and then covering it with new sticks and plaster." The Greek method above related was introduced into France in 1754, as we are informed by M. de Beaumur and Du Hamel, in the memoirs of the Royal Academy for that year, p. 331.

Attempts have been made in our own country to attain the desirable end of getting the honey and wax without destroying the bees; the most approved of which we shall now relate as concisely as possible. Mr. Thorley, in his Inquiry into the Nature, Order, and Government of Bees, thinks colonies preferable to individual hives, for the following reasons: First, The more certain preservation of very many thousands of these useful creatures. Secondly, Their greater strength (which consists in numbers), and consequently their greater safety from robbers. Thirdly, Their greater wealth, arising from the united labours of the greater number. He tells us, that he has in some summers taken two boxes filled with honey from one colony; and yet sufficient store has been left for their maintenance during winter; each box weighing 40 pounds. Add to these advantages, the pleasure of viewing them, with the greatest safety, at all seasons, even in their busiest time of gathering, and their requiring a much less attendance.
tendency in swarming time. The bees thus managed are also more effectually secured from wet and cold, from mice and other vermin.

His boxes are made of deal, which, being spongy, sucks up the breath of the bees sooner than a more solid wood would do. Yellow halm-deal thoroughly seasoned is the best.

An octagon, being nearer to a sphere, is better than a square form; for as the bees, in winter, lie in a round body near the centre of the hive, a due heat is then conveyed to all the out-parts, and the honey is kept from canying.

The dimensions which Mr. Thorley, after many years experience, recommends for the boxes, are 18 inches depth, and 14 or 18 inches breadth in the inside. He has tried boxes containing a bushel or more, but found them not to answer the design like those of a lesser size. The larger are much longer in filling; so that it is later are you come to reap the fruits of the labour of the bees: nor is the honey there so good and fine, the effluvia even of their own bodies tainting it.

The best and purest honey is that which is gathered in the first five or six weeks: and in boxes of less dimensions you may take, in a month or little more, provided the season be favourable, a box full of the finest honey.

The top of the box should be made of an entire board a full inch thick after it has been planed; and it should project on all sides at least an inch beyond the dimensions of the box. In the middle of this top there must be a hole five inches square, for a communication between the boxes; and this hole should be covered with a sliding shutter, of deal or elm, running easily in a groove over the back window. The eight pannels, nine inches deep, and three quarters of an inch thick when planed, are to be let into the top so far as to keep them in their proper places; to be secured at the corners with plates of brass, and to be cramped with wires at the bottom to keep them firm; for the heat in summer will try their strength. There should be a glass window behind, fixed in a frame, with a thin deal-cover, two small brass hinges, and a button to fasten it. This window will be sufficient for inspecting the progress of the bees. Two brass handles, one on each side, are necessary to lift up the box: these should be fixed in with two thin plates of iron, near three inches long, so as to turn up and down, and put three inches below the top-board, which is nailed close down with sprigs to the other parts of the box.

Those who choose a frame within, to which the bees may fasten their combs, need only use a couple of deal sticks of an inch square, placed across the box, and supported by two pins of brass; one an inch and a half below the top, and the other two inches below it; by which means the combs will quickly find a rest. One thing more, which perfects the work, is, a passage, four or five inches long, and less than half an inch deep, for the bees to go in and out at the bottom of the box.

1. In keeping bees in colonies, a house is necessary, or at least a shed; without which the weather, especially the heat of the sun, would soon rend the boxes to pieces.

Your house may be made of any boards you please, but deal is the best. Of whatever sort the materials are, the house must be painted, to secure it from the weather.

The length of this house, we will suppose for six colonies, should be full 12 feet and a half, and each colony should stand a foot distance from the other. It should be three feet and a half high, to admit four boxes one upon another; but if only three boxes are employed, two feet eight inches will be sufficient. Its breadth in the inside should be two feet. The four corner-posts should be made of oak, and well fixed in the ground, that no stormy winds may overturn it; and all the rails should be of oak, supported by several uprights of the same, before and behind, that they may not yield or sink under 6, 7, or 8 cwt. or upwards. The floor of the house (about two feet from the ground) should be strong and smooth, that the lowest box may stand close to it.

This floor may be made with boards or planks of deal the full length of the bee-house; or, which is preferable, with a board or plank to each colony, of two feet four inches long, and fixed down to the rails; and that part which appears at the front of the house may be cut into a semicircle, as a proper alighting place for the bees. Place it to a slope, that the wet may fall off. When this floor to a single colony wants to be repaired, it may easily be removed, and another be placed in its room, without disturbing the other colonies, or touching any other part of the floor.

Upon this floor, at equal distances, all your colonies must be placed against a door or passage cut in the front of the house.

Only observe farther, to prevent any false step, that as the top-board of the box (being a full inch broader than the other part) will not permit the two mouths to come together, you must cut a third in a piece of deal of a sufficient breadth, and place it between the other two, so close that, not a bee may get that way into the house. And fixing the said piece of deal down to the floor with two lath rails, you will find afterwards to be of service, when you have occasion either to raise a colony, or take a box of honey, and may prove a means of preventing a great deal of trouble and mischief.

The house being in this forwardness, you may cover it to your own mind, with boards, fine slates, or tiles. But contrive their position so as to carry off the wet, and keep out the cold, rain, snow, or whatever might any way hurt and prejudice them.

The back-doors may be made of half-inch deal, two of them to shut close in a rabbit, cut in an upright pillar, which may be so contrived as to take in and out by a mortise in the bottom rail, and a notch in the inside of the upper rail, and fastened with a strong hasp. Place these pillars in the spaces between the colonies.

Concluding your house made after this model, without front-doors, a weather-board will be very necessary to carry the water off from the places where the bees settle and rest.

Good painting will be a great preservative. Forget not to paint the mouths of your colonies with different colours, as red, white, blue, yellow, &c. in form of a half-moon, or square, that the bees may the better know their own house. Such diversity will be a direction to them.

Thus your bees are kept warm in the coldest winter; and
and in the hottest summer greatly refreshed by the cool air, the back doors being set open without any air-holes made in the boxes.

Dr. Warden observes, that in June, July, and August, when the colonies come to be very full, and the weather proves very hot, the appearance of a shower drives the bees home in such crowds, that pressing to get in, they stop the passage so close, that those within are almost suffocated for want of air; which makes these last so uneasy, that they are like mad things. In this extremity, he has lifted the whole colony up a little on one side; and by this giving them air, has soon quieted them. He has known them, he says, come pouring out, on such an occasion, in numbers sufficient to have filled at once two or three quarts; as if they had been going to swarm. To prevent this inconvenience, he advises cutting a hole two inches square in the middle of one of the hinder pannels of each box. Over this hole, nail, in the inside of the box, a piece of tin-plate punched full of holes so small that a bee cannot creep through them; and have over it, on the outside, a very thin slider, made to run in grooves; so that, when it is thrust home, all may be close and warm; and when it is opened, in very hot weather, the air may pass through the hole, and prevent the suffocating heat. Or holes may be bored in the pannels themselves, on such an emergency, in a colony already settled.

Such a thorough passage for the air may be convenient in extreme heat, which is sometimes so great as to make the honey run out of the combs. The Memoirs of the truly laudable Berne Society, for the year 1764, give us a particular instance of this, when they say, that in 1761, many in Switzerland were obliged to smother their bees, when they saw the honey and wax trickling down; not knowing any other remedy for the losses they daily sustained. Some shaded these hives from the sun, or covered them with cloths wet several times a-day, and watered the ground all around.

The best time to plant the colonies is either in spring with new stocks full of bees, or in summer with swarms. If swarms are used, procure, if possible, two of the same day: hive them either in two boxes or in a hive and a box: at night, place them in the beehouse, one over the other; and with a knife and a little lime and hair stop close the mouth of the hive or upper box, so that not a bee may be able to go in or out but at the front door. This done, you will in a week or ten days with pleasure see the combs appear in the boxes; but if it be a hive, nothing can be seen till the bees have wrought down into the box. Never plant a colony with a single swarm, as Mr. Thorley says he has sometimes done, but with little success.

When the second box, or the box under the hive, appears full of bees and combs, it is time to raise your colony. This should be done in the dusk of the evening, and in the following manner:

Place your empty box, with the sliding shutter drawn back, behind the house, near the colony that is to be raised, and at nearly the height of the floor: then lifting up the colony with what expedition you can, let the empty box be put in the place where it is to stand, and the colony upon it; and shut up the mouth of the then upper box with lime and hair, as before directed.

When, by the help of the windows in the back of the boxes, you find the middle box full of combs, and a quantity of honey sealed up in it, the lowest box half full of combs, and few bees in the uppermost box, proceed thus:

About five o'clock in the afternoon, drive close with a mallet the sliding shutter under the hive or box that is to be taken from the colony. If the combs are new, the shutter may be forced home without a mallet; but be sure it be close, that no bees may ascend into the hive or box to be removed. After this shut close the doors of your house, and leave the bees thus cut off from the rest of their companions for the space of half an hour or more. In this space of time, having lost their queen, they will fill themselves with honey, and be impatient to be set at liberty.

If, in this interval, you examine the box or boxes beneath, and observe all to be quiet in them, you may be confident that the queen is there, and in safety. Hereupon raise the back part of the hive or box so far, by a piece of wood slipped under it, as to give the prisoners room to come out, and they will return to their fellows: then lifting the box from off the colony, and turning its bottom upmost, cover it with a cloth all night; and the next morning, when this cloth is removed, the bees that have remained in it will return to the colony. Thus you have a hive or box of honey, and all your bees safe.

If the bees do not all come out in this manner, Dr. Warden's method may be followed, especially if it be with a hive. It is to place the hive with the small end downward in a pail, peck, or flower-pot, so as to make it stand firm: then to take an empty hive, and set it upon the former, and to draw a cloth tight round the joining of the two hives, so that none of the bees may be able to get out: after this, to strike the full hive so smartly as to disturb the bees that are in it, but with such pauses between the strokes as to allow them time to ascend into the empty hive, which must be held fast while this is doing, lest it fall off by the shaking of the other. When you perceive, by the noise of the bees in the upper hive, that they are got into this last, carry it to a cloth spread for this purpose before the colony, with one end fastened to the landing-place, and knock them out upon it: they will soon crawl up the cloth, and join their fellows, who will gladly receive them.

Mr. Thorley next gives an account of his narcotic, and of the manner of using it.

The method which he has pursued with great success for many years, and which he recommends to the public as the most effectual for preserving bees in common hives, is incorporation, or uniting two stocks into one, by the help of a peculiar fume or opiate, which will put them entirely in your power for a time to divide and dispose of at pleasure. But as that dominion over them will be of short duration, you must be expeditious in this business.

The queen is immediately to be searched for, and killed. Hives which have swarmed twice, and are consequently reduced in their numbers, are the fittest to be joined together, as this will greatly strengthen and improve them. If a hive which you would take is both
both rich in honey and full of bees, it is but dividing
the bees into two parts, and putting them into two
boxes instead of one. Examine whether the stock to
which you intend to join the bees of another have ho-
oney enough in it to maintain the bees of both: it should
weigh full 20 pounds.

The narcotic, or stupifying fume, is made with the
fungus maxitns or puberulentus, the large mushroom,
commonly known by the name of bun, puck-fish, or
frogcheese. It is as big as a man's head, or bigger;
when ripe, it is of a brown colour, turns to powder,
and is exceeding light. Put one of these pucks into a large
paper, press it therein to two-thirds or near half
bulk of its former size and tie it up very close; then
put it into an oven some time after the household bread
has been drawn, and let it remain there all night; when
it is dry enough to hold fire, it is fit for use. The man-
er of using it is thus:

Cut off a piece of the puck, as large as a hen's egg,
and fix it in the end of a small stick slit for that pur-
pose, and sharpened at the other end; which place so
that the pluck may hang near the middle of an empty
hive. This hive must be set with the mouth upward,
in a pail or bucket, which should hold it steady, near
the stock you intend to take. This done, set fire to
the puck, and immediately place the stock of bees
over it, tying a cloth round the hives, that no smoke
may come forth. In a minute's time, or little more,
you will hear the bees fall like drops of hail into the
empty hive. You may then beat the top of the full
hive gently with your hand, to get out as many of them
as you can: after this, loosing the cloth, lift the hive
off to a table, knock it several times against the table,
several more bees will tumble out, and perhaps the
queen among them. She often is one of the last that
falls. If she is not there, search for her among the
main body in the empty hive, spreading them for this
purpose on a table.

You must proceed in the same manner with the other
hive, with the bees of which these are to be united.
One of the queens being secured, you must put the
bees of both hives together, mingle them thoroughly,
and drop them among the combs of the hive which
they are intended to inhabit. When they are all in,
cover it with a packing or other coarse cloth which will
admit air, and let them remain shut up all that night
and the next day. You will soon be sensible that they
are awakened from this sleep.

The second night after their union, in the dusk of
the evening, gently remove the cloth from off the mouth
of the hive (taking care of yourself), and the bees will
immediately rally forth with a great noise; but being
too late, they will soon return: then inserting two
pieces of tobacco-pipes to let in air, keep them confined
for three or four days, after which the door may be left
open.

The best time for uniting bees is, after their young
brood are all out, and before they begin to lodge in
the empty cells. As to the hour of the day, he ad-
vises young practitioners to do it early in the afternoon,
in order that having the longer light they may the
more easily find out the queen. He never knew such
combined stocks conquered by robbers. They will ei-
ther swarm in the next summer, or yield a hive full of
honey.

Mr. N. Thornley, son of the above-mentioned clergy-
man, has added to the edition which he has given of his
father's book, a postscript, purporting, that persons
who choose to keep bees in glass-hives may, after un-
covering the hole at the top of a flat topped straw-hive,
or box, place the glass over it so close that no bee can
go in or out but at the bottom of the hive or box.
The glass-hive must be covered with an empty hive or
with a cloth, that too much light may not prevent the
bees from working. As soon as they have filled the
straw-hive or box, they will begin to work up into the
glass-hive. He tells us, that he himself has had one of
these glass-hives filled by the bees in 30 days in a fine
season; and that it contained 38 pounds of fine honey.
When the glass is completely filled, slide a thin-plate
between it and the hive or box, so as to cover the pas-
sage, and in half an hour the glass may be taken off
with safety. What few bees remain in it, will readily
go to their companions. He has added a glass win-
dow to his straw-hives, in order to see what progress
bees make; which is of some importance, especially if
one hive is to be taken away whilst the season still con-
tinues favourable for their collecting honey; for when
the combs are filled with honey, the cells are sealed up,
and the bees forsake them, and reside mostly in the
hive in which their works are chiefly carried on. Ob-
serving also that the bees were apt to extend their combs
through the passage of communication in the upper hive,
whether glass or other, which rendered it necessary to
divide the comb when the upper hive was taken away,
he now puts in that passage a wire screen or netting, the
meshes of which are large enough for a loaded bee to go
easily through them. This prevents the joining of the
combs from one box to the other, and consequently ob-
viates the necessity of cutting them, and of spoiling some
of the honey, which running down among a crowd of
bees, used before to incommode them much, it being
difficult for them to clear their wings of it. Fig. 2. is Plate XC.
a drawing of one of his colonies.

2. The reverend Mr White informs us, that his
fondness for these little animals soon put him upon en-
deavouring if possible to save them from fire and brim-
tom; that he thought he had reason to be content to
share their labours for the present, and great reason to
rejoice if he could at any time preserve their lives, to
work for him another year; and that the main drift of
his observations and experiments has hitherto been, to
discover an easy and cheap method, suited to the abili-
ties of the common people, of taking away so much
honey as can be spared, without destroying or starving
the bees; and by the same means to encourage season-
able swarms.

In his directions how to make the bee-boxes of his
inventing, he tells us, speaking of the manner of con-
structing a single one, that it may be made of deal or any
other well-seasoned boards which are not apt to warp or
split. The boards should be near an inch thick; the
figure of the box square, and its height and breadth
nine inches and five-eighths, every way, measuring
within. With these dimensions it will contain near a
peck and a half. The front part must have a door
cut in the middle of the bottom edge, three inches
wide, and near half an inch in height, which will give
free liberty to the bees to pass through, yet not be large
enough for their enemy the mouse to enter. In the

Vol. III. Part II.
back part you must cut a hole with a rabbet in it, in which you are to fix a pane of the clearest and best crown-glass, about five inches in length, and three in breadth, and fasten it with putty; let the top of the glass be placed as high as the roof, withinside, that you may see the upper part of the combs, where the bees with their riches are mostly placed. You will by this means be better able to judge of their state and strength, than if your glass was fixed in the middle. The glass must be covered with a thin piece of board, by way of shutter, which may be made to hang by a string, or turn upon a nail, or slide sidewise between two mouldings. Such as are desirous of seeing more of the bees works, may make the glass as large as the box will admit without weakening it too much; or they may add a pane of glass on the top, which must likewise be covered with a shutter, fastened down with pegs, to prevent accidents.

The side of the box which is to be joined to another box of the same form and dimensions, as it will not be exposed to the internal air, may be made of a piece of slit deal not half an inch thick. This he calls the side of communication, because it is not to be wholly enclosed: a space is to be left at the bottom the whole breadth of the box, and a little more than an inch in height; and a hole or passage is to be made at top, three inches long, and more than half an inch wide. Through these the bees are to have a communication from one box to the other. The lower communication being on the floor, our labourers, with their burdens, may readily and easily ascend into either of the boxes. The upper communication is only intended as a passage between the boxes, resembling the little holes or narrow passes, which may be observed in the combs formed by our sagacious architects, to save time and shorten the way when they have occasion to pass from one comb to another; just as in populous cities, there are narrow lanes and alleys passing transversely from one large street to another.

In the next place you are to provide a loose board, half an inch thick, and large enough to cover the side where you have made the communications. You are likewise to have in readiness several little iron staples, an inch and half long, with the two points or end bended down more than half an inch. The use of these will be seen presently.

You have now only to fix two sticks crossing the box from side to side, and crossing each other, to be a stay to the combs; one about three inches from the bottom, the other the same distance from the top; and when you have painted the whole, to make it more durable, your box is finished.

The judicious bee-master will here observe, that the form of the box now described is as plain as possible for it to be. It is little more than five square pieces of board nailed together; so that a poor cottager who has but ingenuity enough to saw a board into the given dimensions, and to drive a nail, may make his own boxes well enough, without the help or expence of a carpenter.

No directions are necessary for making the other box, which must be of the same form and dimensions. The two boxes differ from each other only in this, that the side of communication of the one must be on your right hand; of the other on your left. Fig. 3. represents two of these boxes, with their openings of communication, ready to join to each other.

Mr White's manner of hiving a swarm into one or both of these boxes is thus:

You are to take the loose board, and fasten it to one of the boxes, so as to stop the communications. This may be done by three of the staples before mentioned; one on the top of the box near the front; the two others on the back, near the top and near the bottom. Let one end of the staple be thrust into a gimlet-hole made in the box, so that the other end may go as tight as can be to open the loose board, to keep it from slipping when it is handled. The next morning after the bees have been hived in this box, the other box should be added, and the loose board should be taken away. This will prevent a great deal of labour to the bees, and some to the proprietor.

Be careful to fasten the shutter so close to the glass that no light may enter through it; for the bees seem to look upon such a light as a hole or breach in their house, and on that account may not so well like their new habitation. But the principal thing to be observed at this time is, to cover the box as soon as the bees are hived with a linen cloth thrown closely over it, or with green boughs to protect it from the piercing heat of the sun. Boxes will admit the heat much sooner than straw-hives; and if the bees find their house too hot for them, they will be wise enough to leave it. If the swarm be larger than usual, instead of fastening the loose board to one box, you may join two boxes together with three staples, leaving the communication open from one to the other, and then hive your bees into both. In all other respects, they are to be hived in boxes after the same manner as in common hives.

The door of the second box should be carefully stopped up, and be kept constantly closed, in order that the bees may not have an entrance but through the first box.

When the boxes are set in the places where they are to remain, they must be screened from the summer's sun, because the wood will otherwise be heated to a greater degree than either the bees or their works can bear; and they should likewise be screened from the winter's sun, because the warmth of this will draw the bees from that lethargic state which is natural to them, as well as many other insects, in the winter season. For this purpose, and also to shelter the boxes from rain, our ingenious clergyman has contrived the following frame.

Fig. 4. represents the front of a frame for twelve colonies: a, a, are two cells of oak lying flat on the ground more than four feet long. In these cells are fixed four oaken posts, about the thickness of such as are used for drying linen. The two posts b, b, in the front, are about six feet two inches above the cells: the other two, standing backward, five feet eight inches. You are next to nail some boards of slit deal horizontally from one of the fore-posts to the other, to screen the bees from the sun. Let these boards be seven feet seven inches in length, and nailed to the inside of the posts; and be well seasoned that they may not shrink or crack in the joints. c, c, Are two splints of deal, to keep the boards even, and strengthen them.

Fig. 5. represents the back of the frame. d, d, d, Are four strong boards of the same length with the frame on which you are to place the boxes. Let the
in it to molest you; and likewise without dead bees, which, when you burn them, are often mixed with your honey, and both waste and damage it.

Mr White acknowledges, that he has sometimes found this method fail, when the mouth of the box to be taken away has not been constantly and carefully closed: the bees will in this case get acquainted with it as an entrance; and when you open the mouth in order to the leaving this box, many of them will be apt to return, and the communication being stopped, will in a short time carry away all the honey from this to the other box; so much do they abhor a separation. When this happens, he has recourse to the following expedient, which he thinks infallible. He takes a piece of deal, a little larger than will cover the mouth of the box, and cuts in it a square niche somewhat more than half an inch wide. In this niche he hangs a little trap-door, made of a thin piece of tin, turning upon a pin, with another pin crossing the niche a little lower, so as to prevent the hanging door from opening both ways. This being placed close to the mouth, the bees which want to get out will easily thrust open the door outwards, but cannot open it the other way to get it again; so must, and will readily, make to the other box, leaving this in about the space of two hours, with all its store, justly due to the tender-hearted bee-master as a ransom for their lives.

What led Mr White to prefer collateral boxes to those before in use, was, to use his own words, his compassion for the poor bees, who, after traversing the fields, return home weary and heavy laden, and must perhaps deposit their burden upon a pair of stairs, or in the garret. The lower room, it is likely, is not yet furnished with stairs; for, as is well known, our little architects lay the foundation of their structures at the top and build downward. In this case, the weary little labourer is to drag her load up the sides of the walls: and when she has done this, she will travel many times backward and forward, as I have frequently seen, along the roof, before she finds the door or passage into the second story; and here again she is perplexed with a like puzzling labyrinth, before she gets into the third. What a waste is here of that precious time which our bees value so much, and which they employ so well! and what an expense of strength and spirits, on which their support and sustenance depend! In the collateral boxes, the rooms are all on the ground floor; and because I know my bees are wise enough to value convenience more than state, I have made them of such a moderate, though decent, height, that the bees have much less way to climb to the top of them than they have to the crown of a common hive.

Mr Wildman's hives have been already described of the management of bees in (No. 23, 24). A good swarm will soon fill one of these hives, and therefore another hive may be put under it the next morning. The larger space allowed the bees to excite their industry in filling them with combs. The queen will lay some eggs in the upper hive; but so soon as the lower hive is filled with combs, she will lay most of them in it. In little more than three weeks, all the eggs laid in the upper hive will be turned into bees; and if the season is favourable, their cells will be soon filled with honey.

As soon as they want room, a third hive should be placed.
placed under the two former; and in a few days after
the end of three weeks from the time the swarm was
put into the hive, the top hive may be taken away
at noon of a fair day; and if any bees remain in it, carry
it to a little distance from the stand, and turning its
bottom up, and striking it on the sides, the bees will be
alarmed, take wing, and join their companions in the
second and third hives. If it is found that the bees are
very unwilling to quit it, it is probable that the queen
remains among them. In this case, the bees must be
treated in the manner that shall be directed when we
describe Mr. Wildman's method of taking the honey
and the wax. The upper hive now taken away should
be put in a cool place, in which no vermin, mice, &c.
can come at the combs, or other damage can happen to
them, and be thus preserved in reserve.

When the hives seem to be again crowded, and the
upper hive is well stored or filled with honey, a fourth
hive should be placed under the third, and the upper
hive be taken off the next fair day at noon, and treated
as already directed. As the honey made during the
summer is the best, and as it is needless to keep many
full hives in store, the honey may be taken out of the
combs of this second hive for use.

If the season is very favourable, the bees may still fill
a third hive. In this case, a fifth hive must be put un-
under the fourth, and the third taken away as before.
The bees will then fill the fourth for their winter store.

As the honey of the first hive is better than the ho-
ny collected so late as that in the third, the honey may
be taken out of the combs of the first, and the third
may be preserved with the same care as directed for
that.

In the month of September, the top hive should be
examined; if full, it will be a sufficient provision for
the winter; but if light, that is, not containing 20
pounds of honey, the more the better, then, in the
month of October, the fifth hive should be taken away,
and the hive kept in reserve should be put upon the re-
main ing one, to supply the bees with abundant provi-
sions for the winter. Nor need the owner grudge them
this ample store; for they are faithful stewards, and will
be proportioned by riches and more forward in the spring
and summer, when he will reap an abundant profit.
The fifth hive which was taken away should be care-
fully preserved during the winter, that it may be restored
to the same stock of bees, when an additional hive is
wanted next summer; or the first swarm that comes off
may be put into it. The combs in it, if kept free from
filth and vermin, will save much labour, and they will
at once go to the collecting of honey.

It is almost needless to observe, that when the hives
are changed, a cover, as already directed (see No. 23.)
should be put upon every upper hive; and that when a
lower hive becomes an upper hive, the door of it should
be shut up, that so their only passage out shall be by the
lower hive; for otherwise the queen would be apt to lay
eggs in both indiscriminately. The whole of the above
detail of the management of one hive may be extended
to any number; it may be proper to keep a register to
each set; because, in restoring hives to the bees, they
may be better pleased at receiving their own labours
than that of other stocks.

If in the autumn the owner has some weak hives,
which have neither provision nor number sufficient for
the winter, it is advisable to join the bees to richer
hives: for the greater number of bees will be a mutual
advantage to one another during the winter, and ac-
celerate their labours much in the spring. For this
purpose, carry a poor and a richer hive into a room a little
before night: then force the bees out of both hives into
two separate empty hives, in a manner that shall be
hereafter directed: shake upon a cloth the bees out of
the hive which contains the fewest; search for the
queen; and as soon as you have secured her with a suf-
cicient retinue, bring the other hive which contains the
greater number, and place it on the cloth on which the
other bees are, with a support under one side, and with
a spoon shovel the bees under it. They will soon ascend;
and, while under this impression of fear, will unite
peaceably with the other bees; whereas, had they been
added to the bees of the richer hive, while in possession
of their castle, many of the new-comers must have paid
with their lives for their intrusion.

It appears from the account of the management of
bees in Mr. Wildman's hives, that there is very little
art wanting to cause the bees to quit the hives which
are taken away, unless a queen happens by chance to
be among them. In that case, the same means may be
used as are necessary when we would rob one of the
common hives of part of their wealth. The method is
as follows:

Remove the hive from which you would take the
wax and honey into a room, into which admit but a little
light, that it may at first appear to the bees as if it
was late in the evening. Gently invert the hive, placing it
between the frames of a chair or other steady
support, and cover it with an empty hive, keeping that
side of the empty hive raised a little, which is next the
window, to give the bees sufficient light to get up in-
to it. While you hold the empty hive, steadily sup-
ported on the edge of the full hive, between your side
and your left arm, keep striking with the other hand
all round the full hive from top to bottom, in the man-
ner of beating a drum, so that the bees may be fright-
ened by the continued noise from all quarters; and
they will in consequence mount out of the full hive in-
to the empty one. Repeat the strokes rather quick
than strong round the hive, till all the bees are get out
of it, which in general will be in about five minutes.
It is to be observed, that the fuller the hive is of bees, the
sooner they will have left it. As soon as a number of
them have got into the empty hive, it should be raised
a little from the full one, that the bees may not con-
trive to run from the one to the other, but rather keep
ascending upon one another.

So soon as all the bees are out of the full hive, the
hive in which the bees are must be placed on the stand
from which the other hive was taken, in order to receive
the absent bees as they return from the fields.

If this is done early in the season, the operator
should examine the royal cells, that any of them that
have young in them may be saved, as well as the combs
which have young bees in them, which should on no
account be touched, though by sparing them a good
deal of honey be left behind. Then take out the other
combs with a long, broad, and pliable knife, such as
the apothecaries make use of. The combs should be
cut from the sides and crown as clean as possible, to
save the future labour of the bees, who must lick up
the
the honey spilt, and remove every remain of wax, and then the sides of the hive should be scraped with a table spoon to clear away what was left by the knife. During the whole of this operation, the hive should be placed inclined to the side from which the combs are taken, that the honey which is spilt may not daub the remaining combs. If some combs were unavoidably taken away, in which there are young bees, the parts of the combs in which they are should be returned into the hive, and secured by sticks in the best manner possible. Place the hive then for some time upright, that any remaining honey may drain out. If the combs are built in a direction opposite to the entrance, or at right angles with it, the combs which are the farthest from the entrance are to be preferred; because there they are best stored with honey, and have the fewest young bees in them.

Having thus finished taking the wax and honey, the next business is to return the bees to their old hive; and for this purpose place a table covered with a clean cloth near the stand, and giving the hive in which the bees are a sudden shake, at the same time striking it pretty forcibly, the bees will be shaken on the cloth. Put their own hive over them immediately, raised a little on one side, that the bees may the more easily enter; and when all are entered, place it on the stand as before. If the hive in which the bees are be turned bottom uppermost, and their own hive be placed over it, the bees will ascend into it, especially if the lower hive is struck on the sides to alarm them.

As the chief object of the bees during the spring and beginning of the summer is the propagation of their kind, honey during that time is not collected in such quantity as it is afterwards: and on this account it is scarcely worth while to rob a hive before the latter end of June; nor is it safe to do it after the middle of July, lest rainy weather may prevent their restoring the combs they have lost, and laying in a stock of honey sufficient for the winter, unless there is a chance of carrying them to a rich pasture. See the article Bee in the Supplement.

Bee is also used figuratively to denote sweetness, industry, &c. Thus Xenophon is called the Attic Bee, on account of the great sweetness of his style. Antonius got the denomination Melissus or Bee, on account of his collection of common places. Leo Allatus gave the appellation apes urbane to the illustrious men at Rome, from the year 1630 to the year 1632.

Bee's Bread. See Bee, N° 12. par. ult. Bee-Eater. See Merops, Ornithology Index. Bee-Flower. See Ophrys, Botany Index. Bee-Glue, called by the ancients propolis, is a soft, unctuous, glutinous matter, employed by bees to cement the combs to the hives, and to close up the cells. See Bee, N° 13. Bee-Hive. See Bee, N° 19, 34, 36. Beech-Tree. See Fagus, Botany Index. Beech-Mast, the fruit of the beech-tree, said to be good for fattening hogs, deer, &c. It has sometimes, even to men, proved an useful substitute for bread. Chios is said to have endured a memorable siege by means of it.

Beech-Oil, an oil drawn by expression from the mast of the beech-tree, after it has been shelled and pounded. This oil is very common in Picardy, and used there and in other parts of France instead of butter; but most of those who take a great deal of it complain of pains and heaviness in the stomach.

BEECH, the flesh of black-cattle prepared for food. According to Dr Cullen, beef, though of a more firm texture and less soluble than mutton, is equally alka.

BEELE, a kind of pick-axe, used by the miners for separating the ores from the rocks in which they lie; this instrument is called a tubber by the miners of Cornwall.

BEER, is a spirituous liquor made from any farinaceous grain, but generally from barley. It is, properly speaking, the wine of barley. The meals of any of these grains being extracted by a sufficient quantity of water, and remaining at rest in a degree of heat requisite for the spirituous fermentation, naturally undergo this fermentation, and are changed into a vinous liquor. But as all these matters render the water mucilaginous, fermentation proceeds slowly and imperfectly in such liquors. On the other side, if the quantity of farinaceous matter be so diminished that its extract or decoction may have a convenient degree of fluidity, this liquor will be impregnated with so small a quantity of fermentable matter, that the beer or wine of the grain will be too weak, and have too little taste.

These inconveniences are remedied by preliminary operations which the grain is made to undergo. These preparations consist in steeping it in cold water, that it may soak and swell to a certain degree; and in laying it in a heap with a suitable degree of heat, by means of which, and of the imbibed moisture, a germination begins, which is to be stopped by a quick drying, as soon as the bud shows itself. To accelerate this drying, and render it more complete, the grain is slightly roasted, by making it pass down an inclined canal sufficiently heated. This germination, and this slight roasting, changes considerably the nature of the mucilaginous fermentable matter of the grain. The germination attenuates much, and in some measure totally destroys, the viscoscity of the mucilage; and it does this, when not carried too far, without depriving the grain of any of its disposition to ferment. On the contrary, it changes the grain into a saccharine substance, as may be perceived by mashing grains beginning to germinate. The slight roasting contributes also to attenuate the mucilaginous fermentable matter of the grain. When the grain is thus prepared, it is fit to be ground, and to impregnate water with much of its substance without forming a glue or viscous mass. The grain thus prepared is called malt. This malt is then to be ground; and all its substance, which is fermentable and soluble in water, is to be extricated by means of hot water. This extract or infusion is sufficiently evaporated by boiling, in caldrons; and some plant of an agreeable bitterness, such as hops, is at that time added, to heighten the taste of the beer, and to render it capable of being longer preserved. Lastly, this liquor is put into casks, and allowed to ferment; nature performs the rest of the work, and is only to be assisted by the other most favourable circumstances for the spirituous fermentation. See Fermentation.
Foreigners have framed divers conjectures to account for the excellency of the British beer, and its superiority to that of other countries, even of Bremen, Mons, and Rostoch. It has been pretended our brewers throw dead dogs flayed into their wort, and boil them till the flesh is all consumed. Others, more equitable, attribute the excellency of our beer to the quality of our malt and water, and the skill of our brewers in preparing it.

Sour beer may be restored divers ways; as by salt made of the ashes of barley-straw, put into the vessel and stirred; or by three or four handfuls of beech-ashes thrown into the vessel, and stirred; or, where the liquor is not very sour, by a little put in a bag, without stirring; chalk calcined, oyster-shells, egg-shells, burnt sea-shells, crabs eyes, alkalized coral, &c. do the same, as they imibite the acidity, and unite with it into a sweetness. — Beer, it is said, may be kept from turning sour in summer, by hanging in the vessel a bag containing a new-laid egg, pricked full of little pinholes, some laurel-berries, and a few barley-grains; or by a new-laid egg and walnut-tree leaves. Glauber commends his sal mirabile and fixed nitre, put in a linen bag, and hung on the top of the cask so as to reach the liquor, not only for recovering sour beer, but preserving and strengthening it.

Laurel-berries, the skin being peeled off, will keep beer from deadness; and beer already dead may be restored by impregnating it with fixed air.

Beer tasting of the cask may be freed from it by putting a handful of wheat in a bag, and hanging it in the vessel.

BEEROOTH, a village of Judea, situated at the foot of Mount Gabaon, seven miles from Ælia or Jerusalem, on the road to Nicopolis (Jerome).

BEERSHEBA (Moses), a city to the south of the tribe of Judah, adjoining to Idumea (Josephus). See BERSABE.

BEESTINGS, or Breastings, a term used by country-people for the first milk taken from a cow after calving. — The beastings are of a thick consistence, and yellow colour, seeming impregnated with sulphur. Dr. Morgan imagines them peculiarly fitted and intended by nature to cleanse the young animal from the remnants gathered in its stomach and intestines during its long habituation in utero. The like quality and virtue he supposes in women’s first milk after delivery; and hence infers the necessity of the mother’s suckling her own child, rather than committing it to a nurse whose first milk is gone.

BEET. See Beta, Botany Index.

BEETLE. See Scarabeus, Entomology Index.

BEETLE also denotes a wooden instrument for driving piles, &c. It is likewise called a stamper, and by paviors a rammer.

BEEVES, a general name for oxen. See Bos, Mammalia Index.

BEFORT, a small town of France in the department of Upper Rhine. It was ceded to France by the treaty of Westphalia in 1648. It contains nearly 5000 inhabitants, and is important on account of the great road by this place from Franche Comté. The fortifications were greatly augmented by Louis XIV.

It is seated at the foot of a mountain. E. Long. 6. 2. Brev. N. Lat. 47. 35.

BEG, or Bây, in the Turkish affairs. See BET.

BEG is more particularly applied to the lords of a banner, called also in the same language songraj-beg. A beg has the command of a certain number of the spahis, or horse, maintained by the province under the denomination of timar-islam. All the begs of a province obey one governor-general, called begler-beg, or beyler-beg, q. d. lord of lords or of the begs of the province.

BEGS, or BEGBS, of Egypt, denote twelve generals, who had the command of the militia or standing forces of the kingdom; and were to secure the country from the insults of Arabs, as well as to protect the pilgrims in their annual expeditions to Mecca. They were formerly very rich and powerful; but the Turkish Pasha Ali, who has raised himself to independence in Egypt since the expulsion of the French, has annihilated the power of this class of officers.

BEGA, CORNELIUS, painter of landscape, cattle, and conversations, was born at Hœrelem in 1630, and was the disciple of Adrian Ostade. Falling into a dissipated way of life, he was disinherited by his father: for which reason he cast off his father’s name, which was Begeyn, and assumed that of Beg: his early pictures being marked with the former, and his latter works with the other. He had a fine pencil, and a delicate manner of handling his colours, so as to give them a look of neatness and transparency; and his performances are so much esteemed in the Low Countries, as to be placed among the works of the best artists. He caught the plague from a woman with whom he was deeply enamoured; and he showed so much sincerity of affection, that notwithstanding the expostulations of all his friends and physicians, he would attend her to the last moments of her life, and died a few days after, aged 44.

BEGGAR, a person who begs. See a general view of the condition and number of such persons in Britain, in the article Beggars in the Supplement.

BEGHARDS. See Beguards.

BEGLERBEG, a governor of one of the principal governments of the Turkish empire, and next in dignity to the grand vizier. To every beglerbeg the grand signor gives three ensigns or staves, trimmed with a horsetail; to distinguish them from the bashaws, who have but two; and from simple begs, or sanguic begs, who have but one.

The province or government of beglerbeg is called beglerbegik, or beylerbegik. There are two sorts; the first called basio begerbegik, which have a certain rent assigned out of the cities, countries, and signories allotted to the principality; the second called soltana beglerbegik, for maintenance of which is annexed a salary or rent, collected by the grand signior’s officers with the treasure of the empire. The beglerbegs of the first sort are in number 22, viz. those of Anatolias, Caramania, Diarbekir, Damascas, Aleppo, Tripoli, Trebizond, Buda, Timisswar, &c. The beglerbegs of the second sort are in number six, viz. those of Cairo, Babylon, &c. Five of the beglerbegs have the title of viziers, viz. those of Anatolias, Babylon, Cairo, Romania, and Buda.

The
The beglerbegs appear with great state, and a large retinue, especially in the camp, being obliged to bring a soldier for every 5000 aspers of rent which they enjoy. Those of Romania brought 10,000 effective men into the field.

The beglerbegs are become almost independent, and have under their jurisdiction several sangiacs or particular governments, and begs, agas, and other officers who obey them.

BEGUARDS, or BECHARDS, religious of the third order of St Francis in Flanders. They were established at Antwerp in the year 1228, and took St Begge for their patroness, whence they had their name. From their first institution they employed themselves in making linen cloth, each supporting himself by his own labour, and united only by the bonds of charity, without having any particular rule. But, when Pope Nicholas IV. had confirmed that of the third order of St Francis in 1289, they embraced it the year following. They were greatly favoured by the dukes of Brabant, particularly John II. and John III. who exempted them from all contributions and taxes. In the year 1425, they began to live in common, and made solemn vows in 1467, after having taken the habit of the Terziaries (or religious of the third order of St Francis) of Liege. At last, in 1472, they became subject to the general of the congregation of Zepperen in the diocese of Liege, to which they were united by Pope Sixtus IV. As the convent of Antwerp is since become very considerable, the name of Beguards has been given to all the other religious of the same congregation. But, in 1630, Pope Innocent X. having suppressed the general of the congregation of Zepperen, all the convents of the third order of St Francis, in the dioceses of Liege, Malines, and Antwerp, were submitted to the visitation, jurisdiction, and correction, of the general of Italy, and erected into a province, under the title of the province of Flanders. This province has at present 10 or 12 convents, the principal of which are those of Antwerp, Brussels, Maestricht, and Louvain.

BEGUINES, a congregation of religious or nuns, founded either by St Begge, founder likewise of the Beguards, or by Lambert le Begue; of whom the former died about the end of the seventh century, the latter about the end of the 12th. They were established first at Liege, and afterwards at Neville, in 1207; and from this last settlement sprang the great number of Beguines, which are spread over all Flanders, and which have passed from Flanders into Germany. In the latter country, some of these religious fell into extravagant errors, persuading themselves that it was possible, in the present life, to arrive at the highest perfection, even to impeccability, and a clear view of God; in short, to so eminent a degree of contemplation, that there was no necessity, after this, either to observe the laws of the church, or submit to the direction and laws of mortal men. The council of Vienna condemned these errors, and abolished the order of Beguines; permitting, nevertheless, those among them, who continued in the true faith, to live in chastity and penitence, either with or without vows. It is by favour of this latter clause, that there still subsist so many communities of Beguines in Flanders; who, since the council of Vienna, have conducted themselves with so much wisdom and piety, that Pope John XXII. by his decretal, which explains that of his predecessor made in the council of Vienna, took them under his protection; and Boniface VIII. in another, exempted them from the secular tribunal, and put them under the jurisdiction of the bishops.

There is scarcely a town in the Low Countries, in which there is not a society of Beguines; and, notwithstanding the change of religion at Amsterdam, there is a very flourishing one in that city. These societies consist of several houses placed together in one inclosure, with one or more churches, according to the number of Beguines. There is in every house a prioress, or mistress, without whose leave they dare not stir out. They make a sort of vow, which is conceived in the following terms: “I promise to be obedient and chaste as long as I continue in this Beguinage.” They observe a three years noviciate before they take the habit. The rector of the parish is superior of the Beguinage; and he does nothing without the advice of eight Beguines. They were formerly habited in different manners; some in gray, others in blue; but at present they all wear black. When they go abroad, in Amsterdam, they put on a black veil. Formerly they had as many different statutes as there were societies. In the visitations of the year 1600 and 1601, by the archbishop Matthias Havius, they were forbidden, under the penalty of a fine, to have lapdogs. The finest Beguinage in Flanders is that of Malines. That of Antwerp likewise is very spacious, and has two separate churches.

BEHEADING, a capital punishment, wherein the head is severed from the body by the stroke of an axe, sword, or other cutting instrument. 

Beheading was a military punishment among the Romans, known by the name of decollatio. Among them the head was laid on a cippus or block, placed in a pit dug for the purpose; in the army, without the vallum; in the city, without the walls, at a place near the porta decumena. Preparatory to the stroke, the criminal was tied to a stake, and whipped with cords. In the early ages the blow was given with an axe; but in aftertimes with a sword, which was thought the more reputable manner of dying. The execution was but clumsily performed in the first times; but afterwards they grew more expert, and took the head off clean, with one circular stroke.

In England, beheading is the punishment of nobles, as it was formerly in France; being reputed not to degrade from nobility, as hanging does.

In Scotland they do not behead with an axe, as in England; nor with a sword, as in Holland; but with an edged instrument called the Maiden. With an instrument similar to this, were the bloody executions perpetrated in France during the late revolution. It was called guillotine, from the name of the supposed inventor, who was a physician.

BEHEMOTH, the hippopotamus or river-horse. See Hippopotamus, Mammalia Index.

BEHEN, in Botany. See Cucubalus, Botany Index.

BEHMEN. See BOEHMEN.

BEHN, Aphiara, a celebrated authores, descended from a good family in the city of Canterbury, was born sometime in Charles I's reign, but in what year...
Behn's year is uncertain. Her father's name was John,
who through the interest of Lord Willoughby, to
whom he was related, being appointed lieutenant-
general of Surinam and 36 islands, undertook a journey
to the West Indies, taking with him his whole family,
among whom was our poetess, at that time very young.
Mr. Johnson died on the voyage; but his family reaching
Surinam, settled there for some years. Here it
was that she learned the history of, and acquired a
personal intimacy with, the American prince Oroonoko,
and his beloved Iminda, whose adventures she had
so pathetically related in her celebrated novel of that
name, and which Mr. Southerne afterwards made such
an admirable use of, in adopting it as the groundwork
of one of the best tragedies in the English lan-
guage.

On her return to London, she became the wife of
one Mr. Behn, a merchant, residing in that city, but
of Dutch extraction. How long he lived after their
marriage is not very apparent, probably not very long;
for her wit and abilities having brought her into high
estimation at court, King Charles II. fixed her as a
proper person to transact some affairs of importance
abroad during the course of the Dutch war. To this
purpose she went over to Antwerp, where, by her
intrigues and gallantries, she so far crept into the secrets
of state, as to answer the ends proposed by sending her
over. Nay, in the latter end of 1666, by means
of the influence she had over one Vander Albert, a
Dutchman of eminence, whose heart was warmly
attached to her, she contrived out of him the design formed
by De Ruyter, in conjunction with the family of
the De Wits, of sailing up the Thames and burning
the English ships in their harbours, which they afterwards
put in execution at Rochester. This she
immediately communicated to the English court; but though
the event proved her intelligence to be well grounded,
yet it was at that time only laughed at; which, together
probably with no great inclination shown to
reward her for the pains she had been at, determined her
to drop all further thoughts of political affairs, and
during the remainder of her stay at Antwerp to give herself
up entirely to the gaiety and gallantries of the place.
Vander Albert continued his addresses, and after having
made some unsuccessful attempts to obtain the possession
of her person on easier terms than matrimony, at length
consented to make her his wife; but while he was
preparing at Amsterdam for a journey to England with
that intent, a fever carried him off, and left her free
from any amorous engagements. In her voyage back
to England, she was very near being lost, the vessel she
was in being driven on the coast by a storm; but happen-
ing to founder within sight of land, the passengers
were, by the timely assistance of boats from the shore,
all fortunately preserved.

From this period she devoted her life entirely to pleas-
ure and the muses. Her works are extremely numer-
ous, and all of them have a lively and amorous turn.
It is no wonder then that her wit should have gained
her the esteem of Mr. Dryden, Southerne, and other
men of genius, as her beauty, of which in her younger
part of life she possessed a great share, did the love
of those of gallantry. Nor does she appear to have
been any stranger to the delicate sensations of that pas-

sion, as appears from some of her letters to a gentle-
man, with whom she corresponded under the name of
Lycida, and who seems not to have returned her
flame with equal ardor, or received it with that rap-
ture her charms might well have been expected to com-
mand.

She published three volumes of Miscellany Poems;
two volumes of Histories and Novels; translated Pas-
tenelle's Plurality of Worlds, and annexed a Criticism
on it; and her plays make four volumes. In the dra-
matic line, the turn of her genius was chiefly to com-
edy. As to the character her plays should maintain
in the records of dramatic history, it will be difficult
to determine, since their faults and perfections stand in
strong opposition to each other. In all, even the most
indifferent of her pieces, there are strong marks of gen-
ius and understanding. Her plots are full of business
and ingenuity, and her dialogue sparkles with the daz-
bling lustre of genuine wit, which everywhere glitters
among it. But then she has been accused, and that
not without great justice, of interlarding her comedies
with the most indecent scenes, and giving an indol-
ence to her wit in the most indecent expressions. To
this accusation she has herself made some reply in the
Preface to the Lucky Chance; but the retorting the
charge of prudery and preciseness on her accusers, is
far from being a sufficient exculpation of herself. The
best and perhaps the only true excuse that can be
made for it is, that, as she wrote for a livelihood, she
was obliged to comply with the corrupt taste of the
times.

After a life intermingled with numerous disappoint-
ments, she departed from this world on the 16th of
April 1689, and lies interred in the cloisters of West-
minster Abbey.

BEJA, an ancient town of Portugal, in the province
of Alentejo. It is seated in a very agreeable and fruit-
ful plain, remarkable for excellent wine. There are
three gates remaining, which are of Roman architecture,
and a great many Roman antiquities are dug out of the
earth. The town has a strong castle for its defence,
and is situated in W. Long. 7. 20. N. Lat. 37. 58. It
was taken from the Moors in 1162.

BEJAR, a town of Extremadura in Spain, famous for
its baths. It is seated in a very agreeable valley sur-
rrounded with high mountains whose tops are always cov-
ered with snow. Here the dukes of Bejar have a
handsome palace. In this neighbourhood are forests
filled with game, and watered by fine springs; a lake
abounding with excellent fish, particularly trout.
They pretend that this lake makes such a noise before
a storm, that it may be heard 15 miles off.

BEICHLINGEN, a town of Thuringia in Upper Saxonic, in E. Long. 11. 50. N. Lat. 51. 20.

BEILÀ, a town of Italy, in Piedmont. E. Long.
7. 45. N. Lat. 45. 2.

BEILSTEIN, a town of the landgraviate of Hesse in
Germany, in E. Long. 8. 0. N. Lat. 50. 30.

BEINASCHI, Giovanni Battista, called Ca-
valel Beinaschi, history painter, was a Piedmontese,
and born in 1634. He studied in Rome, under the
direction of Pietro del Po; and some authors afirm,
that he was afterwards the disciple of Lanfranc.
It was certain that he was peculiarly fond of the works
of Lanfranc, and at last became so thoroughly ac-
quainted with the style, manner, and touch, of that
excellent
excellent master, that many of the pictures of Beinaschi are at this day accounted the work of Lamfranc's own hand. He was an admirable designer; his lively invention furnished him with a surprising variety: his thought was noble; he was not only expeditious but correct; and as a public acknowledgment of his merit, the honour of knighthood was conferred upon him.

BEINHEIM, a fort of Alsace in France, seated on the river Sor, near its confluence with the Rhine, in E. Long. 8° 12'. N. Lat. 45° 2'.

BEIRA, a province of Portugal, bounded on the west by the ocean, on the south by the Portuguese Extremadura, on the south-east by the Spanish province of the same name, on the east by the province of Traves Montes, and on the north by the river Doura. It extends in length about 34 leagues, and in breadth about 30 leagues, and is divided into six commarsas. Within this province lies Lamego, where the first assembly of the states was held; the chief episcopal city of Coimbra, or Coimbra, which is likewise an university; and Viseo, also a bishopric, and formerly the capital of a dukedom. The country is equally agreeable and fruitful, producing corn, wines, &c. in abundance, and the hills affording excellent pasture to cattle and sheep. The population in 1810 was 880,602, and the number of parishes 1227.

BEIRAM, or BAIRAM. See BAIRAM.

BEIRALSTON, a town in Devonshire, which sends two members to parliament.

BEIZA, or BEIZATH, in Hebrew antiquity, a word signifying an egg; as also a certain measure in use among the Jews. The beiza was likewise a gold coin, weighing 40 drachmas, among the Persians, who gave out that Philip of Macedon owed their king Darius 1000 beizaths or golden eggs, for tribute-money; and that Alexander the Great refused to pay them, saying, that the bird which laid these eggs was flown into the other world.

BEEKER, BALTHASAR, one of the most famous Dutch divines, and author of the celebrated book, The World Bewitched, an ingenious piece against the vulgar notion of spirits. This raised a terrible clamour against him. He was deposed from the office of minister; but the magistrates of Amsterdam continued him his pension. He died in 1698.

BEL, MATTHIAS, was born in Hungary, and became a Lutheran minister at Presburg, and historiographer to the emperor Charles VI. He wrote, among other works, a History of Hungary, which was so much admired, that the emperor sent him letters of nobility; and notwithstanding his being a Lutheran, the Pope, in 1736, sent him his picture, and many large gold medals. He was a member of the Royal Society of London, and of the academies of Berlin and Petersburg; and died in 1749, at 66 years of age.

BEL, or BEIUS, the supreme god of the ancient Chaldeans or Babylonians. He was the founder of the Babylonian empire; and is supposed to be the Nimrod of Scripture, and the same as the Phoenician Baal. This god had a temple erected to him in the city of Babylon, on the very uppermost range of the famous tower of Babel, or Babylon, wherein were many statues of this deity; and one, among the rest, of massy gold, 40 feet high. The whole furniture of this magnificent temple was of the same metal, and valued at 800 talents of gold. This temple, with its riches, was in being till the time of Xerxes, who, returning from his unfortunate expedition into Greece, demolished it, and carried off the immense wealth which it contained. It was the statue of this god which Nebuchadnezzar, being returned to Babylon after the end of the Jewish war, set up and dedicated in the plain of Dura; the story of which is related at large in the third chapter of Daniel.

BEZ and the Dragon, the history of; an apocryphal and uncanonical book of Scripture. It was always rejected by the Jewish church, and is extant neither in the Hebrew nor the Chaldee language, nor is there any proof that it ever was so. St Jerome gives it no better title than the Fable of Bell and the Dragon. It is however permitted to be read, as well as the other apocryphal writings, for instruction and the improvement of manners.

BELAC, a small town of France, in the province of the Lyonnais, now the department of Upper Vienne, and district of La Marche. It contains about 3900 inhabitants. E. Long. 1° 3'. N. Lat. 46° 8'.

BELAY, on board a ship, signifies the same as fasten. Thus they say, delay the sheet, or tack, that is, fasten it to the keel, by winding it several times round a last, &c.

BELCASTRO, an episcopal city of Italy in the farther Calabria, and kingdom of Naples. It is seated on a mountain, in E. Long. 17° 15'. N. Lat. 39° 6'.

BELCHITE, a town of Spain, in the kingdom of Aragon, seated on the river Almonzir, in W. Long. 0° 30'. N. Lat. 41° 19'.

BELCHOE, a town of Ireland, in the province of Ulster, and county of Fermanagh, seated on Lough Nilly, in W. Long. 6° 6'. N. Lat. 54° 2'.

BELEM, a town of Extremadura in Portugal, about a mile from Lisbon. It is aided on the north side of the river Tejo, and is designed to defend the entrance to Lisbon; and here all the ships that sail up the river must bring to. In this place they inter the kings and queens of Portugal.

BELEMNITES, vulgarly called thunder-bolts or thunder-stones, are composed of several crusts of stone encircling each other, of a conical form, and various sizes; usually a little hollow, and somewhat transparent, formed of several strie radiating from the axis to the surface of the stone; and when burnt or rubbed against one another, or scraped with a knife, yield an odour like rasper horn. Their size is various, from a quarter of an inch to eight inches; and their colour and shape differ. They are supposed to be originally either a part of some sea production; or a stone formed in the cavity of some worm-shell, which being of a tender and brittle nature, has perished, after giving its form to the stone. They are very frequently found in many parts of England; and the common people have a notion, that they are always to be meet with after a storm. They are often enclosed in, or adhere to, other stones; and are most frequent amongst gravel, or in clay; they abound in Gloucestershire; and are found near Dedington in Oxfordshire, where they sometimes contain the silver marcasite.

BELERIUM, in Ancient Geography, a promontory of
BEL

BELESIS, or NANYBRUS, is said to have been the founder of the ancient Babylonish empire, and in conjunction with Arbaces the Mede to have put an end to the kingdom of the Assyrians by the defeat and death of Sardanapalus. This first prince is represented as a crafty and mean-spirited knave; and at the same time, as nothing less than a hero. It is said, he was base enough to circumvent Arbaces his colleague and friend in the most shameful manner; by pretending a vow he had, in the midst of the war, made to his god Belus. That if success was the event of it, and the palace of Sardanapalus was consumed, as it was, he would be at the charge and trouble of removing the ashes that were left to Babylon; where he would heap them up into a mount near the temple of his god; there to stand as a monument to all who should navigate the Euphrates, of the subversion of the Assyrian empire. He, it seems, had been privately informed, by an enuch, of the immense treasure which had been consumed in the conflagration at Nineveh; and knowing it to be a secret to Arbaces, his avarice suggested to him this artifice. Arbaces not only granted his request; but appointed him king of Babylon, with an exemption from all tribute. Belesis, by this artifice, carried a prodigious treasure with him to Babylon; but when the secret was discovered, he was called to an account for it, and tried by the other chiefs who had been assistant in the war, and who, upon his confession of the crime, condemned him to lose his head. But Arbaces, a munificent and generous prince, freely forgave him, left him in possession of the treasure, and also in the independent government of Babylon, saying. The good he had done ought to serve as a veil to his crime; and thus he became at once a prince of great wealth and dominion.

In process of time, and under the successor of Arbaces, he became a man of dress, show, and effeminacy, unworthy of the kingdom or province he held. Nanybrus, for so we must now call Belesis, understanding a certain robust Mede, called Parsondas, held him in the utmost contempt, and had solicited the emperor of the Medes to divest him of his dominions, and to confer them upon himself, offered a very great reward to the man who should take Parsondas and bring him to him. Parsondas hunting somewhere near Babylon with the king of the Medes, and struggling from the company, happened to fall in with some of the servants of the Babylonian Nanybrus, who had been tempted with the promised reward. They were purveyors to the king; and Parsondas being very thirsty, asked them for a draught of wine; which they not only granted, but prevailed upon him to take a meal with them. As he drank freely, suspecting no treachery, he was easily persuaded to pass that night in company with some beautiful women, brought on purpose to detain him.

But, while he was in a profound sleep, the servants of Nanybrus rushing upon him, bound him, and carried him to their prince; who bitterly reproached him for endeavouring to estrange his master the king of the Medes from him, and by that means place himself in his room on the throne of Babylon. Parsondas did not deny the charge; but with great intrepidity owned, that he thought himself more worthy of a crown than such an insipid and effeminate prince as he was. Nanybrus, highly provoked at the liberty he took, swore by the gods Belus and Mali, or rather Mylitta, that Parsondas himself should in a short time become so effeminate as to reproach none with effeminacy. Accordingly, he ordered the enuch who had the charge of his music-women, to shave, paint, and dress him after the manner of those women, to teach him the art, and in short to transform him by all possible means into a woman. His orders were obeyed; and the manly Parsondas soon excelled the fairest female in singing, playing, and the other arts of adornment.

In the mean time the king of the Medes, having in vain sought after his favourite servant, and in vain offered great rewards to such as should give him any information concerning him, concluded he had been destroyed by some wild beast in the chase. At length, after seven years, the Medes was informed of his state and condition by an enuch, who, being cruelly scourged by Nanybrus's order, fled, at the instigation of Parsondas into Media; and there disclosed the whole to the king, who immediately despatched an officer to demand him. Nanybrus pretended to know nothing of any such person: upon which another officer was sent by the Medes, with a peremptory order to seize on Nanybrus if he persisted in the denial, to bind him with his girdle, and tend him to immediate execution. This order had the desired effect: the Babylonian owned what he had before denied; promising to comply, without further delay, with the king's demand; and in the mean time invited the officer to a banquet, at which 150 women, among whom was Parsondas, made their appearance, singing and playing upon various instruments. But, of all, Parsondas appeared by far the most charming; insomuch, that Nanybrus inquiring of the Medes which he liked best, immediately pointed at him. At this the Babylonian clapt his hands; and, falling into an immoderate fit of laughter, told him who the person was whom he thus preferred to all the rest; adding, that he could answer what he had done before the king of the Medes. The officer was no less surprised at such an astonishing change than his master was afterwards, when Parsondas appeared before him. The only favour Parsondas begged of the king, for all his past services, was, that he would avenge on the Babylonian the base and highly injurious treatment he had met with at his hands. The Medes marched accordingly at his instigation to Babylon; and, notwithstanding the remonstrances of Nanybrus, urging, that Parsondas had, without the least provocation, endeavoured to deprive him both of his life and kingdom, declared that in ten days time he would pass the sentence on him which he deserved, for presuming to set as judge in his own cause, instead of appealing to him. But Nanybrus having in the mean time given with a large bribe Mitraphernes, the Mede's favourite enuch, the king was by him prevailed upon to sentence the Babylonian only to a fine; which made Parsondas curse the man who first found out gold, for the sake of which he was to live the sport and derision of an effeminate Babylonian.

BELESMIE, a town of Perche in France, in the department of Orne; in W. Long. o. 16. N. Lat. 48. 23.

BELEZERO,
BELZERO, a town of Russia, and capital of a province of the same name. It is situated on the southeast shore of the White Sea, in E. Long. 56. 34. N. Lat. 61. 50.

BELFAST, a town of Ireland, in the county of Antrim. It is situated at the bottom of Carrickfergus bay, and is the chief town and port in this part of Ireland, as well for beauty, as for its wealth, trade, and shipping. The customshouse duties for the year 1816 amounted to £42,417; and the inhabitants, who are mostly Scots, and of the Presbyterian religion, amounted in the same year to 30,000. W. Long. 5. 54. N. Lat. 54. 38.

BELFRIY, BELFREDUS, is used by military writers of the middle age for a sort of tower erected by besiegers to overlook and command the place besieged. Belfry originally denoted a high tower, wherein sentinels were placed to watch the avenues of a place, and prevent surprise from parties of the enemies, or to give notice of fires by ringing a bell. In the cities of Flanders, where there is no belfry on purpose, the tower of the chief church serves the same end. The word belfry is compounded of the Teutonic bell, and frid, "peace," because the bells were hung for preserving the peace.

Belfry is also used for that part of a steeple where the bells are hung. This is sometimes called by the middle-age writers campanile, clocher, and tritegum.

Belfry is more particularly used for the timberwork which sustains the bells in a steeple, or that wooden structure to which the bells in church-steeple are fastened.

BELGE, in Ancient Geography, a people of Britain, to the west: Now Hampshire, Wiltshire, and Somersetshire. (Camden).

BELGICA, a town of the Ubii in Gallia Belgica, midway between the rivers Rhine and Roer: Now called Breda (Claverius); a citadel of Juliers (Baudrard). Breda was the place of the Battle of Breda, in 1666.

BELGICA Gallia, one of Caesar’s three divisions of Gaul, contained between the ocean to the north, the rivers Seine and Marne to the west, the Rhine to the east, but on the south at different times within different limits. Augustus, instituting everywhere a new partition of provinces, added the Sequani and Helvetii, who till then made a part of Celtic Gaul, to the Belgic (Piny, Ptolemy). The gentilis name is Belgae, called by Caesar the bravest of the Gauls, because untainted by the imputation of luxuries. The epithet is Belgicus (Virgil).

BELGARDEN, a town of Germany, in East Pomerania, in a circle of the same name, and subject to Prussia. E. Long. 16. 5. N. Lat. 54. 10.

BELGINUM, a town of the Treviri, in Gallia Belgica: Now called Kleinen, in the electorate of Trier.

BELGIUM, manifestly distinguished from Belgics, as a part from the whole (Cesar); who makes Belgium the country of the Belgovaci; Hirtius adding the Atrebates. But as the Ambiani lay between the Bellovaci and Atrebates, we must also add these: and thus Belgium reached to the sea, because the Ambiani lay upon it; and these three people constituted the proper and genuine Belgae (all the rest being adventitious, or foreigners); and these were the people of Beauvais, Amiens, and Artois.

BELGOROD, a town of Russia, and capital of a province of the same name. It is seated on the river Donets, in E. Long. 18. 5. N. Lat. 51. 20.

BELGOROD, a strong town of Bessarabia in European Russia, seated at the mouth of the river Niester, on the Black sea, 80 miles south-east of Bender. E. Long. 31. 0. N. Lat. 46. 10.

BELGRADE, a city of Turkey in Europe, and capital of Servia, seated at the confluence of the Save and the Danube, in E. Long. 20. 10. N. Lat. 44. 52. The Danube is very rapid near this city, and its waters look whitish. Belgrade is built on a hill, and was once large, strong, and populous. It was surrounded with a double wall, flanked with a great number of towers, and had a castle situated on a rising ground, and built with square stones. The suburbs are very extensive: and resorted to by Turkish, Jew, Greek, Hungarian, and Slavonian merchants. The streets where the greatest trade is carried on are covered with wood, to shelter the dealers from the sun and rain. The rivers render it very convenient for commerce; and as the Danube falls into the Black sea, the trade is easily extended to distant countries, which renders it the staple town in these parts; and as the Danube runs up to Vienna, they send goods from thence with a great deal of ease. The Armenians have a church here, and the Jews a synagogue, both these being employed as factors. The shops are but small: and the sellers sit on tables, disposing of their commodities out of a window, for the buyers never go on the inside. The richest merchandise is exposed to sale in two bazaars or bazars, built crosswise. There are two exchanges, built with stone, and supported with pillars not unlike the Royal Exchange at London. It has been taken by the Turks and Imperialists alternately several times. The fine fortifications were demolished in 1799; and the place was finally ceded to the Turks in 1791. It was taken by the Servian insurgents in 1806.

BELGRADO, a town of Friuli, in the Venetian territories in Italy. It stands near the river Tejamento, in E. Long. 13. 5. N. Lat. 46. 0.

BELIA, in Ancient Geography, a town of Bithynia: Now Belchite, in the kingdom of Arragon. See Belchite.

BELIAL, בֵּיתַל, a Hebrew word which signifies a wicked worthless man, one who is resolved to endure no subjection. Thus the inhabitants of Gibeah, who abused the Levite’s wife (Judges xix. 22.), have the name of Belial given them. Hopni and Phineas, the high priest Eli’s sons, are likewise called sons of Belial (1 Sam. ii. 12.), upon account of the several crimes they had committed, and the unbecoming manner in which they behaved themselves in the temple of the Lord. Sometimes the name Belial is taken to denote the devil. Thus St Paul (Rom. xi. 13.) says, "What carnal mind can know Christ with Belial?" Whence it appears, that in his time the Jews, under the name of Belial, commonly understood the devil in the places where this term occurs in the Old Testament.

BELIDOR, BERNARD DE, a Catalan engineer in the service of France, and member of the academies of sciences at Paris and Berlin, and of the royal
BELOW

Belidor was a celebrated mathematician and author of military tracts in which the science of mathematics was applied to military uses. He died in 1765, aged 70.

BELIEF, in its general and natural sense, denotes a persuasion, or a strong assent of the mind to the truth of any proposition. In which sense, belief has no relation to any particular kind of means or arguments, but may be produced by any means whatever. Thus we are said to believe our senses, to believe our reason, to believe a witness, &c. And hence, in rhetoric, all sorts of proofs, from whatever topics deduced, are called

BELIEF, in its more restrained and technical sense, invented by the schoolmen, denotes that kind of assent which is grounded only on the authority or testimony of some person or persons, asserting or attesting the truth of any matter proposed.

In this sense, belief stands opposed to knowledge and science. We do not say we believe that snow is white, or that the whole is equal to its parts; but we see and know them to be so. That the three angles of a triangle are equal to two right angles, or that all motion is naturally rectilinear, are not said to be things credible, but scientific; and the comprehension of such truths is not belief but science.

But when a thing propounded to us is neither apparent to our sense, nor evident to our understanding; neither certainly to be collected from any clear and necessary connection with the cause from which it proceeds, nor with the effects which it naturally produces; nor is taken up upon any real arguments, or relation thereof to other acknowledged truths; and yet, notwithstanding, appears as true, not by manifestation, but by an attestation of the truth, and moves us to assent, not of itself, but in virtue of a testimony given to it—this is said to be properly credible; and an assent to this is the proper notion of belief or faith.

BELIEVERS, an appellation given toward the close of the first century to those Christians who had been admitted into the church by baptism, and instructed in all the mysteries of religion. They had also access to all the parts of divine worship, and were authorized to vote in the ecclesiastical assemblies. They were thus called in contradistinction to the catechumens, who had not been baptized, and were debarred from these privileges.

BELIO, in Ancient Geography, a river of Lusitania, called otherwise Limeneus, Limes, Limia, and Lethe, or the river of oblivion: the boundary of the expedition of Decimus Brutus. The soldiers out of superstition refusing to cross, he snatched an ensign out of the hands of the bearer, and passed over, by which his army was encouraged to follow (Livy). He was the first Roman who ever proceeded so far, and ventured to cross. The reason of the appellation, according to Strabo is, that in a military expedition a sedition arising between the Celtici and Turdui, after crossing that river, in which the general was slain, they remained dispersed there; and from this circumstance it came to be called the river of Lethe, or oblivion. Now called El Lima, in Portugal, running westward into the Atlantic, to the south of the Minho.

BELISARIUS, general of the emperor Justinian's army, who overthrew the Persians in the east, the Vandals in Africa, and the Goths in Italy. See Rome. But after all his great exploits, he was falsely accused of a conspiracy against the emperor. The real conspirators had been detected and seized, with daggers hidden under their garments. One of them died by his own hand, and the other was dragged from the sanctuary. Pressed by remorse, or tempted by the hopes of safety, he accused two officers of the household of Belisarius; and torture forced them to declare that they had acted according to the secret instructions of their patron. Posterity has falsely supposed that a hero who in the vigour of life had disdained the fairest offers of ambition and revenge, should stoop to the murder of his prince, whom he could not long expect to survive. His followers were impatient to fly; but flight must have been supported by rebellion, and he had lived enough for nature and for glory. Belisarius appeared before the council with less fear than indignation: after 40 years service, the emperor had prejudged his guilt; and injustice was sanctioned by the presence and authority of the patriarch. The life of Belisarius was graciously spared: but his fortunes were sequestered; and, from December to July, he was guarded as a prisoner in his own palace. At length his innocence was acknowledged; his freedom and honours were restored; and death, which might be hastened by resentment and grief, removed him from the world about eight months after his deliverance. That he was deprived of his eyes, and reduced by envy to beg his bread, "Give a penny to Belisarius the general!" is a fiction of later times; which has obtained credit, or rather favour, as a strange example of the vicissitudes of fortune.—The source of this idle fable may be derived from a miscellaneous work of the 12th century, the Chilias of John Tzetzes, a monk. He relates the blindness and beggary of Belisarius in tea vulgar or political verses (Chilian iii. No. 88. 339—348. in Corp. Poet. Graec. tom. ii. p. 311.).

Εκπαίδευσεν ἐξιλίου κρατων άμοιν το μιλή
Βελισαρίου ἀδελφόν ουτὶ τὸν τρεχάλοντης
Οι πολλ' ή μηδενες, απόδηλα υ ε φωμος.

This moral or romantic tale was imported into Italy with the language and manuscripts of Greece; repeated before the end of the 1st century by Crinites, Pontanus, and Volaterranus; attacked by Alciat for the honour of the law, and defended by Baronius (A. D. 557, No. 2, &c.) for the honour of the church. Yet Tzetzes himself had read in other chronicles, that Belisarius did not lose his sight; and that he recovered his fame and fortunes.—The statue in the Villa Borgesie at Rome, in a sitting posture, with an open book, which is vulgarly given to Belisarius, may be ascribed with more propriety to Augustus in the act of propitiating Nemesis (Winckelman, Hist. de l'Art. tom. iii. p. 266.) "Ex nocturno visu etiam stipem, quotannis, die certa, emendicabat a populo, cavam manum asse posse reginantis præbens." (Secoton. in Aug. c. 91.)

BELLE, a well known machine, ranked by musicians among the musical instruments of percussion.

The constituent parts of a bell are the body or barrel, the clapper on the inside, and the ear or cannon by which it hangs to a large beam of wood. The matter of which it is usually made is a composition called belled.
The thickness of a bell's edge is usually \( \frac{1}{4} \) of the diameter, and its height, 12 times its thickness. The bell-founders have a dispensation, or bell-scale, whereby they measure the size, thickness, weight, and tone, of their bells. For the method of casting bells, see Founders.

The sound of a bell is conjectured to consist in a vibratory motion of its parts, much like that of a musical string. The stroke of the clapper must necessarily change the figure of the bell, and of a round make it oval; but the metal having a great degree of elasticity, that part will return back again which the stroke drove the farthest off from the centre, and that even some small matter nearer the centre than before; so that the two parts which before were extremes of the longest diameter, do then become those of the shortest; and thus the external surface of the bell undergoes alternate changes of figure, and by that means gives that tremulous motion to the air in which the sound consists.

M. Perrault maintains, that the sound of the same bell or chord is a compound of the sounds of the several parts thereof; so that where the parts are homogeneous, and the dimensions of the figure uniform, there is such a perfect mixture of all these sounds as constitutes one uniform, smooth, even sound; and the contrary circumstances produce harshness. This he proves from the bells differing in tone according to the part you strike; and yet strike it anywhere, there is a mixture of all the parts. He therefore considers bells as a compound of an infinite number of rings, according to their different dimensions have different tones, as chords of different lengths have different notes; and when struck, the vibrations of the parts immediately struck determine the tone, being supported by a sufficient number of consonant tones in the other parts.

Bells are observed to be heard farther placed on plains than on hills; and still farther in valleys than on plains: the reason of which will not be difficult to assign, if it be considered that the higher the sonorous body is, the rarer is its medium: consequently, the less impulse it receives, and the less proper vehicle it is to convey it to a distance.

M. Beaumur, in the Memoirs of the Paris Academy, has the following observations relating to the shape most proper for bells, to give them the loudest and clearest sound. He observes, "that as pots and other vessels more immediately necessary to the service of life were doubtless made before bells, it probably happened that the observing these vessels to have a sound when struck, gave occasion to making bells, intended only for sound, in that form; but that it does not appear that this is the most eligible figure; for lead, a metal which is in its common state not at all sonorous, yet becomes greatly so on its being cast into a particular form, and that very different from the common shape of bells. In melting lead for the common occasions of casting in small quantities, it is usually done in an iron ladle: and as the whole is seldom poured out, the remainder which falls to the bottom of the ladle, cools into a mass of the shape of that bottom. This is consequently a segment of a sphere, thickest in the middle, and thinner towards the edges; nor is the ladle any necessary part of the operation, since if a mass of lead be cast in that form in a mould of earth or sand, in any of these cases it is found to be very sonorous. Now if this shape alone can give sound to a metal which in other forms is perfectly mute, how much more must it necessarily give it to other metals naturally sonorous in whatever form? It should seem, that bells would much better perform their office in this than in any other form: and that it must particularly be a thing of great advantage to the small bells of common house-clocks, which are required to have a shrill note, and yet are not allowed any great size." He adds, "that had our forefathers had opportunities of being acquainted with the sound of metals in this shape, we should probably have had all our bells at present of this form."

The use of bells is very ancient, as well as extensive. We find them among Jews, Greeks, Romans, Christians, and Heathens, variously applied; as on the necks of men, beasts, birds, horses, sheep: but chiefly hung in buildings, either religious, as in churches, temples, and monasteries; or civil, as in houses, markets, baths; or military, as in camps and frontier towns.

Among the Jews it was ordained, that the lower part of the blue tunic which the high priest wore when he performed religious ceremonies, should be adorned with pomegranates and gold bells, intermixed equally and at equal distances. As to the number of the bells worn by the high priest, the Scriptures are silent; and authors are not very well agreed: but the sacred historian has let us into the use and intent of them in these words (Exod. xxviii. 33–35), "And it shall be upon Aaron to minister, and his sound shall be heard when he goeth into the holy place before the Lord, and when he cometh out, that he die not." The kings of Persia are said to have the hem of their robes adorned like the Jewish high-priests with pomegranates and gold bells. It was in the opinion of Calmet, with a design of giving notice that the high-priest was passing by, that he wore little bells on the hem of his robe; or rather it was as it were a kind of public notice that he was going to the sanctuary: for, as in the king of Persia's court, no one was suffered to enter the apartments without giving notice thereof by the sound of something; so the high-priest, out of respect to the divine presence residing in the holy of holies, did, by the sound of little bells, fastened to the bottom of his robe, desire, as it were, permission to enter, that the sound of the bells might be heard, and he not be punished with death for an unmannerly intrusion. The figure of these bells is not known to us. The prophet Zachariah (xiv. 20.) speaks of bells hung to war horses. "In that day (says the prophet) there shall be upon the bells of horses, Holiness unto the Lord."

Among the Greeks, those who went the nightly rounds in camps or garrisons, carried with them a little bell, which they rang at each sentry box to see that the soldiers on watch were awake. A codoniphoros or bellman also walked in funeral processions, at a distance before the corpse, not only to keep off the crowd, but to advertise the flamen dialis to keep out of the way, for fear of being polluted by the sight, or by the funereal music. The priest of Proserpine at Athens, called hierophantus, rung a bell to call the people to sacrifice.

There were also bells in the houses of great men, to...
call up the servants in a morning. Zonaras assures us,
that bells were hung with whips on the triumphal chariots of their victorious generals, to put them in mind that they were still liable to public justice.

Bells were put on the necks of criminals going to execution, that persons might be warned by the noise to get out of the way of so ill an omen as the sight of the hangman or the condemned criminal, who was devoted and just going to be sacrificed to the old manes.

For bells on the necks of brutes, express mention is made of them in Phaedrus.—Cito eurice eminentes, Clarumque collo iactans tintinnabulum. Taking these bells away was construed by the civil law, theft; and if the beast was lost by this means, the person who took away the bells was to make satisfaction.

History of Manchester.

As to the origin of church-bells, Mr Whitaker observes, That bells being used, among other purposes, by the Romans to signify the times of bathing, were naturally applied by the Christians of Italy to denote the hours of devotion, and summon the people to church. The first application of them to this purpose is, by Polybius Virgili and others, ascribed to Paulinus bishop of Nola, a city of Campania, about the year 400. Hence, it is said, the names nola and campana were given them; the one referring to the city, the other to the country. Though others say they took the latter of these names, not from their being invented in Campania, but because it was here the manner of hanging and balancing them, now in use, was first practised; at least they were hung on the model of a sort of balance invented or used in Campania; for in Latin writers we find campana statira, for a steel-yard; and in the Greek σμαρτως, and πόλωρος, “to weigh.” In Britain, bells were applied to church-purposes, before the conclusion of the seventh century, in the monastic societies of Northumbria, and as early as the sixth even in those of Caledonia. And they were therefore used from the first erection of parish-churches among us. Those of France and England appear to have been furnished with several bells. In the time of Clothair II. king of France, and in the year 610, the army of that king was frighted from the siege of the city of Sens, by ringing the bells of St Stephen’s church. The second excorision of Egbert, about the year 739, which is adopted in a French capitulary of 801, commands every priest, at the proper hours, to sound the bells of his church, and then to go through the sacred offices to God. And the council of Engham, in 1021, requires all the mules for sins to be expended in the repairation of the church, clothing, and feeding the minister of God, and the purchase of church-vestments, church-books, and church-bells. These were sometimes composed of iron in France; and in England, as formerly at Rome, were frequently made of brass. And as early as the ninth century, there were many cast of a large size and deep note.

Ingulphus mentions, that Turcketus, abbot of Croyland, who died about the year 870, gave a great bell to the church of that abbey, which he named Guthlac; and afterwards six others, viz. two which he called Bartholomew and Bedellian, two called Turketul and Tatwin, and two named Pegge and Begge, all which rang together; the same author says, Non era tunc tantus consensuum campanarum in Saxon Anglia. Not long after, Kinsemarch bishop of York gave two great bells to the church of St John at Beverley, and at the same time provided that other churches in his diocese should be furnished with bells. Mention is made by St Aldean, and Wuliam of Malemesbury, of bells given by St Dunstan to the churches in the west. The number of bells in every church gave occasion to the curious and singular piece of architecture in the campanile or bell-tower; an addition, which is more susceptible of the grandeur of architecture than any other part of the edifice, and is generally therefore the principal or rudiments of it. It was the constant appendage to every parish-church of the Saxons, and is actually mentioned as such in the laws of Athelstan.

The Greek Christians are usually said to have been unacquainted with bells till the ninth century, when their construction was first taught them by a Venetian. Indeed, it is not true that the use of bells was entirely unknown in the ancient eastern churches, and that they called the people to church, as at present, with wooden mallets. Leo Allatius, in his dissertations on the Greek temples, proves the contrary from several ancient writers. It is his opinion, that bells first began to be used among them after the taking of Constantinople by the Turks; who, it seems, prohibited them lest their sound should disturb the repose of souls, which, according to them, wander in the air. He adds that they still retain the use of bells in places remote from the intercourse of the Turks; particularly, very ancient ones in Mount Athos. F. Simon thinks the Turks prohibited the Christians the use of bells rather out of political than religious reasons; insomuch that the ringing of bells might serve as a signal for the execution of revolts, &c.

In the ancient monasteries we find six kinds of bells enumerated by Durandus, viz. Squilla, rung in the refectorium; cymbalum, in the cloister; nola, in the choir; molula or dupla, in the clock; campana, in the steeple; and signum in the tower. Belethus has much the same; only that for squilla, he puts tintinnabulum, and places the campana in the tower, and campanella in the cloister. Others place the tintinnabulum or timohum, in the refectorium or dormitory; and add another bell called corniscula, rung at the time of giving discipline, to call the monks to be flogged. The cymbalum is sometimes also said to have been rung in the cloister, to call the monks to meat.

In the funeral monuments of Weever, are the following particulars relating to bells. “Bells had frequently these inscriptions on them:”

“Funebra plano, Fulgur utroque, Sabbata pange,”

“Excerto lento, Dissipun ventos, Paco cruente.”

“In the little sanctuary at Westminster, King Edward III erected a clochier, and placed therein three bells for the use of St Stephen’s chapel; about the biggest of them were cast in the metal these words:”

“King Edward made me thirtee thousand weight and three.”

“Take me down and wey mee, and more you shall fynd mee.”

“But these bells being to be taken down in the reign of King Henry VIII. one writes underneath with a code:”
"But Henry the eight
Will bait me of my weight."  
Ibid. 492.

This last distich alludes to a fact mentioned by Stow in his surveys of London, ward of Farringdon Within; to wit, that near to St Paul's school stood a clother, in which four bells called Jesu's bells, the greatest in all England, against which Sir Miles Partridge staked a hundred pounds, and won them of King Henry VIII. at a cast of dice. Nevertheless it appears that abroad there are bells of greater magnitude. In the steeple of the great church at Roan in Normandy is a bell with this inscription:

Jo suis George d'Ambois,
Qui trente cinque mille fois.
Mais lui qui me pesera,
Trente six mille me trouvera.

I am George of Ambois, 
Thirty-five thousand in weight: 
But he that shall weigh me, 
Thirty-six thousand shall find me.  
Ibid.

And it is a common tradition that the bells of King's college chapel, in the university of Cambridge, were taken by Henry V. from some church in France, after the battle of Agincourt. They were taken down some years ago, and sold to Phelps the bell-founder in White-chapel, who melted them down.

The uses of bells were summed up in the following distich, as well as that first above-mentioned:

Laudo Deum versus, plebeem voco, conjugo clerum,
Defunctorum piae, postem fuge, festa decore.

Matthew Paris observes, than ancient the use of bells was prohibited in time of mourning; though at present they make one of the principal ceremonies of mourning. Mabillon adds, that it was an ancient custom to ring the bells for persons about to expire, to advertise the people to pray for them; whence our passing bells. The passing bell, indeed, was anciently rung for two purposes: one, to bespeak the prayers of all good Christians for a soul just departing: the other, to drive away the evil spirits which stood at the bed's foot, and about the house, ready to seize their prey, or at least to molest and terrify the soul in its passage: but by the ringing of that bell (for Darnalus informs us, evil spirits are much afraid of bells), they were kept aloof; and the soul, like a hunted hare, gained the start, or had what is by sportmen called laur. Hence, perhaps, exclusive of the additional labour, was occasioned the high price demanded for tolling the greatest bell of the church; for that being louder, the evil spirits must go farther off to be clear of its sound, by which the poor soul got so much more the start of them: besides, being heard farther off, it would likewise procure the dying man a certain number of prayers. This dislike of spirits to bells is mentioned in the Golden Legend, by W. de Worde. "It is said, the evil spirytes that ben in the regyon of thayre, doubte moche when they here the belles rongen: and this is the cause why the belles ben rongen when it thondeth, and whan gretes tempeste and outrages of wether happen, to the ende that the feinds and wycked spirytes shold be abashed and flee, and cease of the morynge of tempeste." Lobineau observes, that the custom of ringing bells at the approach of thunder, is of some antiquity; but that the design was not so much to shake the air, and so dissipate the thunder, as to call the people to church to pray that the parish might be preserved from that terrible meteor.

In the times of Pepsey, bells were baptized and anointed olos chrismatis: they were exorcised, and blessed by the bishop; from a belief, that, when these ceremonies were performed, they had power to drive the devil out of the air, to calm tempests, to extinguish fire, and to recreate even the dead. The ritual for these ceremonies is contained in the Roman pontificale; and it was usual in their baptism to give to the bells the name of some saint. In Chamney's History of Hertfordshire, page 383, is a relation of the baptism of a set of bells in Italy with great ceremony, a short time before the writing that book. The bells of the parish church of Winnington in Bedfordshire had their names cast about the verge of every one in particular, with those rhyming hexameters.

Nomina Campanis hac usu dicta sunt quaque nostris.
2. NOMES Magdalene campana sonat melode.
3. SIX nomen Domini benedictum semper in onu.
4. Musa Raphaelis sonat auribus Immanuelis.
5. Sum Roan pulsata mundique Maria vocata.

Weev. Fun. 122.

By an old chartulary, once in the possession of Weever the antiquary, it appears that the bells of the priory of Little Dunmow in Essex were, anno 501, new cast, and baptized by the following names:

Prima in honore Sancti Michaelis Argentari.
Secunda in honore S. Johannis Evangelist.
Tertia in honore S. Johannis Baptist.
Quarta in honore Assumptionis beatae Mariae.
Quinta in honore sancta Trinitatis, et omnium sanctorum.

Ib. 533.

The bells of Osney abbey near Oxford were very famous; their several names were Duoc, Clement, Austin, Hauetecer [potius Hauetelerj, Gabriel, and John.

Nankin in China was anciently famous for the largeness of its bells; but their enormous weight brought down the tower, the whole building fell to ruin, and the bells have ever since lain on the ground. One of these bells is near 12 English feet high, the diameter seven and a half, and its circumference 23; its figure almost clylindric, except for a swelling in the middle; and the thickness of the metal about the edges seven inches. From the dimensions of this bell, its weight is computed at 50,000 pounds, which is more than double the weight of that of Erfurt, said by Father Kircher to be the greatest bell in the world. These bells were cast by the first emperor of the preceding dynasty, about 300 years ago. They have each their name; the hanger (tchou), the eater (che), the sleeper (chousi), the will (ft). Father le Compte adds, that there are seven other bells in Pekin cast in the reign of Yoolo, each of which weighs 120,000 pounds. But the sounds even of their biggest bells are very poor;
The practice of ringing bells in change, or regular peals, is said to be peculiar to England: whence Britain has been termed the ringing island. The custom seems to have commenced in the time of the Saxons, and was common before the Conquest. The ringing of bells, though a recreation chiefly of the lower sort, is in itself not incurious. The tolling a bell is nothing more than the producing a sound by a stroke of the clapper against the side of the bell, the bell itself being in a pendant position and at rest. In ringing, the bell, by means of a wheel and a rope, is elevated to a perpendicular; in its motion to this situation the clapper strikes forcibly on one side, and in its return downwards on the other side of the bell, producing at each stroke a sound. There are in London several societies of ringers, particularly one known by the name of the College Youths: of this it is said Sir Matthew Hale, lord chief justice of the court of King's Bench, was, in his youthful days, a member, and in the life of his learned and upright judge, written by Bishop Burnet, some facts are mentioned which favour this relation. In England the practice of ringing is reduced to a science, and peals have been composed which bear the name of the inventors. Some of the most celebrated peals now known were composed about 50 years ago by one Patrick. This man was a maker of barometers: in his advertisements he styled himself Torricellian Operator, from Torricelli, who invented instruments of this kind. In the year 1684, one Abraham Rudhall, of the city of Gloucester, brought the art of bell-founding to great perfection. His descendants in succession have continued the business of casting bells; and by a list published by them it appears, that at Lady-day 1774 the family, in peals and odd bells, had cast to the amount of 3,954. The peals of St. Dunstan's in the East, and St Bride's, London, and St Martin's in the Fields, Westminster, are in the number. The music of bells is altogether melody; but the pleasure arising from it consists in the variety of interchange, and the various succession and general predominance of the consonances in the sounds produced. Musical authors seem to have written but little upon this subject.

Electrical Bells are used in a variety of entertaining experiments by electricians. The apparatus, which is originally of German invention, consists of three small bells suspended from a narrow plate of metal; the two outermost by chains, and that in the middle, from which a chain passes to the floor, by a silken string. Two small knobs of brass are also hung by silken strings, one on each side of the bell in the middle, which serve for clappers. When this apparatus is connected with an electrified conductor, the outermost bells suspended by the chains will be charged, attract the clappers, and be struck by them. The clappers becoming electrified likewise will be repelled by these bells, and attracted by the middle bell, and discharge themselves upon it by means of the chain extending to the floor. After this, they will be again attracted by the outermost bells; and thus, by striking the bells alternately, occasion a ringing, which may be continued at pleasure. Flashes of light will be seen in the dark between the bells and clappers; and if the electrification be strong, the discharge will be made without actual contact, and the ringing will cease. An apparatus of this kind, connected with one of those conductors that are erected for securing buildings from lightning, will serve to give notice of the approach and passage of an electrical cloud.

Bell-Metal. See Chemistry Index.
Bell, in Chemistry, denotes a glass vessel placed over some matter in a state of exhalation, either to collect the vapour or gather the flowers. Chemical bells are a sort of receptacles chiefly used in preparing the oil or spirit of sulphur, for condensing fumes into a liquor.

Diving-Bell. See Diving.

Bell-Foundery. See Foundery.
Bell-Flower. See Campanula, Botany Index.
Bell-Weed. See Jacka, Botany Index.

Bella, Stefana De La, a most eminent engraver, was born at Florence A. D. 1670. His father was a goldsmith; and he himself began to work at his father's business. But whilst he was learning to draw, in order to perfect himself in that profession, some of the prints of Callot fell by accident into his hands; with which he was so delighted, that he prevailed upon his father to permit him to apply himself to engraving; and he became the disciple of Canta Gallina, who was also the instructor of Callot. De la Bella at first imitated the manner of Callot. His abilities soon began to manifest themselves; and as by degrees he acquired a facility in the handling of the point, he quitied the style in which he only shone as an imitator, and adopted one entirely his own, which in freedom and spirit is said even to have surpassed that of his fellow disciple. He went to Paris A. D. 1642, where he formed an acquaintance with Israel Silvestre, then newly returned from Rome; and he was much employed by Henriette the uncle of Silvestre. Some time after, Cardinal Richelieu engaged him to go to Arras, and make drawings of the siege and taking of that town by the royal army; which drawings he engraved at his return. He also went to Holland, where, it is reported, he saw some of the prints of Rembrandt Gerritz, and attempted to imitate them; but finding he did not succeed to his expectations, he dropped that design, and continued to pursue his own manner, most suitable to his genius. After abiding some considerable time at Paris, his family affairs obliged him to return to Florence; where he obtained a pension from the Great Duke, and was appointed to instruct the prince Cosmo his son in the art of design. Being subject to violent pains in the head, his life was rendered very uncomfortable by this cruel disorder, which at last put an end to it A. D. 1664, when he was only 54 years of age. De la Bella drew very correctly, and with great taste. His works manifest much genius and vast fertility of invention. The fire and animation which appear in them compensate for their slenderness; and we may reasonably expect to find them slight when we are told that he engraved 1400 plates.

BELLAC. See Bellac.

Belladona, the trivial name of a species of atropa. See Atropa, Botany Index.

BELLAI, William Du, lord of Langley, a French general,
Bellarmin, general, who signalized himself in the service of Francis I. He was also an able negotiator, so that the emperor Charles V. used to say, “that Languy's pen had fought more against him than all the lances in France.” He was sent to Piedmont in quality of viceroy, where he took several towns from the Imperialists. His address in penetrating into the enemy’s designs was surprising. In this he spared no expense, and thereby showed intelligence of the most secret counsels of the emperor and his generals. He was extremely active in influencing some of the universities of France to give their judgment agreeable to the desires of Henry VIII. of England, when this prince wanted to divorce his queen, in order to marry Anne Boleyn. It was then the interest of France to favour the king of England in this particular, it being an affront to the emperor, and a gratification to Henry, which might serve to form a strict alliance between him and Francis I. He was sent several times into Germany to the princes of the Protestant league, and was made a knight of the order of St Michael. He was also a man of learning, having given proofs of his abilities and genius as a writer. He composed several works; the most remarkable of which was, the History of his Own Times, in Lat. divided into ogdoades, that is, several parts, each consisting of eight books; most of which, however, have been lost. When Languy was in Piedmont in 1542 he had some remarkable intelligence which he was desirous himself to communicate to the king, and being very inquisitive, he ordered a litter for his conveyance; but after having passed the mountain of Taranta, betwixt Lyons and Roan, he found himself so extremely ill at St Saphorin that he was obliged to stop there, where he died the 9th of January, in the year 1543. He was buried in the church of Mans, and a noble monument was erected to his memory.

BELLARMIN, ROBERT, an Italian Jesuit, one of the best controversial writers of his time. In 1576 he read lectures at Rome on controversies; which he did with such applause, that Sixtus V. sending a legate into France in 1595, appointed him as a divine, in case any dispute in religion should happen to be discussed. He returned to Rome, and was raised successively to different offices, till at last, in 1599, he was honoured with a cardinal's hat; to accept of which dignity, it is said, they were obliged to force him by the threats of an anathema. It is certain, that no Jesuit ever did greater honour to his order than he; and that no author ever defended the cause of the Romish church in general, and that of the pope in particular, to more advantage. The Protestants have owned this sufficiently: for, during the space of 50 years, there was scarcely any considerable divine among them who did not fix upon this author for the subject of his books of controversy. Notwithstanding the zeal with which this Jesuit maintained the power of the pope over the temporality of kings, he displeased Sixtus V. in his work De Roman Pontifice, by not insisting that the power which Jesus Christ gave to his vicegerent was direct, but only indirect; and had the mortification to see it put into the index of the inquisition, though it was afterwards removed. He left, at his death, to the Virgin Mary one half of his soul, and to Jesus Christ the other.—Bellarmin is said to have been a man of great chastity and temperance, and remarkable for his patience. His stature was low, and his men very indifferent; but the excellence of his genius might be discovered from the traces of his countenance. He expressed himself with great perspicuity; and the words which he first made use of to explain his thoughts were generally so proper, that there appeared no rasure in his writings.

BELLA TRIX, in Astronomy, a ruddy glittering star of the second magnitude, in the left shoulder of Orion. It takes its name from bellum, as being anciently supposed to have a great influence in kindling wars, and forming warriors. Its longitude, according to Hevelius, for the year 1700, was 16° 47' 20"; and its latitude southward 16° 52' 11".

BELLCLEFRAY, a town of Ireland, in the province of Connaught, and county of Sligo. W. Long. 9° 5'. N. Lat. 52° 56'.

BELLE, a town of the French Netherlands, seated in E. Long. 2° 40'. N. Lat. 50° 45'.

BELLEAU, REMI, a French poet, born at Nogent le Rotrou, in the territory of Perche, and province of Orléans. He lived in the family of Renatus of Lorraine, marquis of Elbeuf, general of the French galleys; and attended him in his expedition into Italy, in 1537. This prince highly esteemed Belleau for his courage; and having also a high opinion of his genius and abilities, entrusted him with the education of his son Charles of Lorraine. Belleau was one of the seven poets of his time who were denounced under the French Pleiades. He wrote several pieces; and translated the odes of Anacreon into the French language, but in this he is thought not to have preserved all the natural beauties of the original. His pastoral pieces are in greatest esteem. His verses in that way (according to his eulogists) are expressed with such beauty and simplicity, that they seem to be a living picture of what they describe. He also wrote an excellent poem on the nature and difference of precious stones, which by some has been reputed his best performance. Belleau died at Paris, in the family of the duke d'Elbeuf, on the 6th of March, 1577. He was interred in the church Des Peres Augustines, near the Pont-neuf; several eulogists were made to his memory.

BELLEFOREST, FRANCIS DE, a French author, born in the province of Guienne, in 1530. He was but seven years of age when he lost his father; and his mother was left in poor circumstances, but she contributed all in her power to his education. He was supported some years by the queen of Navarre, sister to Francis I. Some time after he went to study at Bourdeaux; thence he removed to Toulouse; and at last to Paris, where he got acquainted with several men of learning, and was honoured with the friendship of many persons of quality. He wrote, 1. A History of the Nine Charles's of France; 2. Annotations on the books of St Augustine; 3. An universal History of the World; 4. The Chronicles of Nicholas Gillet, augmented; 5. An universal Cosmography; 6. Annals, or a general History of France: and many other works. In short, he supported his family by writing books on whatever subject was proposed to him by the booksellers, according to the taste of the public. He died in 1583.

BELLEGARDE,
BELLEGARDE, a town of France, in the department of the Eastern Pyrenees, on the Frontiers of Catalonia. It is an important place on account of its being a passage to the Pyrenean mountains. E. Long. 3. N. Lat. 42. 20.

BELLEGARDE, a town of France, in the department of Saone and Loire, seated on the river Saone, 15 miles south of Chalons, in E. Long. 4. N. Lat. 46. 57.

BELLEISLE, an island of France, on the coast of Brittany, 15 miles distant from it. This island is between 12 and 13 leagues in circumference. It is a mixture of craggy rocks and fertile soil but the inhabitants are very poor, and the only trade carried on in it is the curing of pilchards. There are three harbours in the island, viz. Palais, Sahzon, and Goulford; every one of which labours under some capital defect, either in being exposed, shallow, or dangerous in the entrance. It contains only one little city called Le Palais, three country towns, 103 villages, and 5570 inhabitants.

The island originally belonged to the earl of Cornouaille; but was afterwards yielded to the king, who in 1742 erected it into a duchy, in favour of Marshal Belleisle. The town of Palais takes its name from a castle which belonged to the duke de Belleisle, which stood in its neighbourhood; but was afterwards converted into a citadel fronting the sea, strongly fortified. Its fortifications are composed principally of hornworks; and it is provided with two dry ditches, the one next the counterscarp, and the other so contrived as to secure the interior fortifications. This citadel is divided from the largest part of the town by an inlet of the sea, over which there is a bridge of communication. From the other part of the town, and which is most inhabited, it is only divided by its own fortifications and a glacis. In this state was the island in 1761, when an expedition was undertaken against it by a British fleet under the command of Commodore Keppel, having on board a considerable land force commanded by General Hodgson. The fleet sailed from Spithead on the 29th of March, and arrived before Belleisle on the 5th of April.

The next day it was agreed to attempt a landing on the south-east part of the island, in a sandy bay, near Lochmara point. Here the enemy were in possession of a little fort; they had moreover entrenched themselves on a hill excessively steep, the foot of which was scarped away. The attempt was made in three places with great resolution; but the British were at last repulsed with the loss of 500 men. It was not before the 25th of April that the weather allowed a second attempt. This was made on a very strong place, where the enemy were rather less attentive, on account of the excessive steepness and difficulty of climbing up the rocks. Besides the principal attack, two feints were made at the same time to distract the enemy, while the men of war directed their fire with great success on the hills. The manoeuvres gave Brigadier-general Lambert, with a handful of men, an opportunity of climbing up a very steep rock without molestation. This little body formed themselves in good order without delay, and were immediately attacked by 300 French. The British, however, sustained this attack until the whole corps of Brigadier Lambert, which had now likewise ascended, came to their assistance, with whose help they repulsed the enemy. The landing of all the forces being soon after made good, the French were driven into the town of Palais. Here the chevalier de St Croix who commanded them, a brave and experienced officer, resolved to hold out to the last extremity; and it was not till the 7th of June that he capitulated, and the garrison marched out with the honours of war. The island, however, was restored to the French by the treaty concluded in 1763.

BELLEISLE, an island of North America, lying at the mouth of the strait between the country of the Esquimaux, or New Britain, and the north end of Newfoundland; whence the straits take also the name of Belleisle. W. Long. 58. 5. N. Lat. 51. 50.

BELLENDE, or BALLANTINE, William, a Scotch writer who flourished in the beginning of the 17th century, was professor of humanity or belles lettres at Edinburgh, and master of requests to James I. of England. But the former is supposed to have been only nominal, or early given up, and the latter also to have consisted in the name only, since he appears to have resided almost constantly at Paris, where he was in the favour of his sovereign, he was enabled to live in easy circumstances. There he published, in 1608, his Cicerio Princeps, a singular work; in which he extracted from Cicero's writings detached passages, and comprised them into a regular body, containing the rules of monarchical government, with the line of conduct to be pursued, and the virtues proper to be encouraged, by the prince himself: and the treatise, when finished, he dedicated, from a principle of patriotism and gratitude, to the son of his master, Henry, then prince of Wales. Four years afterwards, namely, in 1612, he proceeded to publish another work of a similar nature, which he called Ciceron Consilior, Senvaturque Romanes, in which he treated, with much perspicuity, and a fund of solid information, on the nature of the consular office, and the constitution of the Roman senate.

Finding these works received, as they deserved, with the unanimous approbation of the learned, he conceived the plan of a third work, De Statu prisci Orbis, which was to contain a history of the progress of government and philosophy, from the times before the flood to their various degrees of improvement under the Hebrews, Greeks, and Romans. He proceeded so far as to print a few copies of this work, in the year 1615, when it seems to have been suggested that his treatises, De Statu Principis, De Statu Reipublica, and De Statu Orbis, being on subjects so nearly resembling each other, there might be a propriety in uniting them into one work, by republishing the two former, and entitling the whole Bellendum De Statu. With this view, he recalled the few copies of his last work that were abroad, and after a delay of some months, published the three treatises together, under their new title, in 1616. These pieces have been lately reprinted by an ingenious political editor, who has thought proper to inscribe them to Mr Burke, Lord North, and Mr Fox, whose respective portraits are prefixed to each dedication, and whose talents and merits he celebrates and defends in a pref ace of 76 pages, containing a very free and bold discussion of our public men and measures in very classical language, and a strong and satirical representation, under borrowed names of antiquity, of the chiefs of the other party, or the present ministry.

Bellenden wrote another work, published after his death,
times, that they comprehend the art of war, by land and sea: in short, they are made to include all that we know, and whatever we please; so that, in treating on the belles lettres, they talk of the use of the sacraments, &c. Some comprehend under the term, all those instructive and pleasing sciences which occupy the memory and the judgment, and do not make part either of the superior sciences, of the polite arts, or of mechanic professions; hence they make history, chronology, geography, genealogy, blazonry, philology, &c. the belles lettres. In a word, it were an endless task to attempt to enumerate all the parts of literature which different learned men have comprehended under this title. Nor would it be of any use to the reader for us to pretend to fix the true import of the term. Whatever arts or sciences it may be supposed to include, they are severally explained in the course of this work.

BELLE VILLE, a town of France, in the department of the Rhone, seated near the river Saone. E. Long. 4. 46. N. Lat. 45° 5′.

BELLEVOIS, painter of sea-pieces, is known through all parts of France as a good painter, though no particulars have been handed down concerning his life. He died in 1684. His subjects are views of havens, sea-ports, shores, calms, and storms at sea; but in his calms he shows his peculiar excellence. Pictures of this master are often in public sales; and some of them, which seem of his best style, are sold for a tolerable price.

BELLEY, or BELLAY, a town of France, and capital of Bugey, in the department of Ain, containing 3800 inhabitants in 1816. It is seated near the river Rhone. E. Long. 5. 50. N. Lat. 45° 43′.

BELLEINGHAM, a town of Northumberland in England. W. Long. 2. 10. N. Lat. 55° 10′.

BELLINI, Gentil, a Venetian painter, born in the year 1421. He was employed by the republic of Venice; and to him and his brother the Venetians are indebted for the noble works which are to be seen in the council-hall. We are told that Mahomet II. emperor of the Turks, having seen some of his performances, was so struck with them, that he wrote to the republic, entreating them to send him. The painter accordingly went to Constantinople, where he did many excellent pieces. Among the rest, he painted the de-oration of St John the Baptist, whom the Turks reverence as a great prophet. Mahomet admired the proportion and shadowing of the work; but he remarked one defect in regard to the skin of the neck, from which the head was separated; and in order to prove the truth of his observation, he sent for a slave and ordered his head to be struck off. The sight so shocked the painter, that he could not be easy till he had obtained his dismissal; which the grand signior granted, and made him a present of a gold chain. The republic settled a pension upon him at his return, and made him a knight of St Mark. He died in 1507, in the 80th year of his age.

John Bellini, his brother, painted with more art and sweetness. He died in 1516, aged 90.

Bellini, Laurence, an eminent physician, born at Florence in the year 1643. After having finished his studies in polite literature, he went to Pisa, where he was assisted by the generosity of the grand duke Ferdinando
BELLINI, a town in Italy, in the Milanese, and one of the baliwicks which the Swiss possess in that country. It is seated on the river Tesino, five miles above the place where it falls into the Lago Maggiore, and is fortified with two strong castles formerly joined together by a wall flanked with towers; but the Swiss have demolished a part of the fortifications. E. Long. 9. 0. N. Lat. 45. 8.

BELLIS, the DAISY. See BOTANY INDEX.
Bellis Major. See CHrysanthemum, BOTANY INDEX.

BELLOM, a distemper common in countries where they smelt lead-ore. It is attended with languor, intolerable pains and sensations of gripings in the belly, and generally constiveness.—Beasts, poultry, &c. as well as men, are subject to this disorder: hence a certain space round the smelting-houses is called bellonground, because it is dangerous for an animal to feed upon it.

BELLONA, in Pagan Mythology, the goddess of war, is generally reckoned the sister of Mars, and some represent her as both his sister and wife. She is said to have been the inventress of the needle; and from that instrument is supposed to have taken her name Bellam, signifying a needle. This goddess was of a cruel and savage disposition, delighting in bloodshed and slaughter; and was not only the attendant of Mars, but took a pleasure in sharing his dangers. She is commonly represented in an attitude expressive of fury and distraction, her hair composed of snakes clotted with gore, and her garments stained with blood: she is generally depicted driving the chariot of Mars, with a bloody whip in her hand; but sometimes she is drawn holding a lighted torch or brand, and at others a trumpet. Bellona had a temple at Rome, near the Circus Flaminius, before which stood the column of war, from whence the consul threw his lance when he declared war. She was also worshipped at Comana, in Cappadocia; and Camden observes, that in the time of the emperor Verus, there was a temple of Bellona in the city of York.

BELLONARI, in antiquity, priests of BELLON; the goddess of wars and battles. The bellonari cut and mangled their bodies with knives and daggers in a cruel manner, to pacify the deity. In this they are singular, that they offered their own blood, not that of other creatures, in sacrifice. In the fury and enthusiasm wherewith they were seiz'd on these occasions, they ran about raging, uttering prophecies, and foretelling blood and slaughter, devastations of cities, revolutions of states, and the like: whence Martial calls them turba entheeta Bellona. In after-times, they seem to have abated much of their zeal and transport, and to have turned the whole into a kind of farce, contenting themselves with making signs and appearances of cutting and wounds. Lampadius tells us, the emperor Commodus, out of a spirit of cruelty, turned the farce again into a tragedy, obliging them to cut and mangle their bodies really.

BELLONIA (so named from the famous Petrus Bellonius, who left many valuable tracts on natural history, &c.), a genus of the monogynia order, belonging to the pentandria class of plants. Of this genus there is only one species known, viz. the aspera, with a rough balsam leaf. This is very common in the warm islands of America.

BELLORI, John Peter, of Rome; a celebrated antiquary and connoisseur in the polite arts; author of the lives of the modern painters, architects, and sculptors, and of other works on antiquities and medals. He died in 1696.

BELLOVACI, in Ancient Geography, a people of Gallia Belgica, reckoned the bravest of the Beiges: now Beavaisis, in the Isle of France.

BELLOWS, a machine so contrived as to expire and inspire the air by turns, by enlarging and contracting its capacity. This machine is used in chambers, kitchens, in stoves, forges, and foundries, to blow up the fire: it serves also for pumps and other pneumatic instruments, to give them a proper degree of air. All these are of various constructions, according to their different purposes; but in general they are composed of two flat boards, sometimes of an oval, sometimes of a triangular figure: Two or more hoops, bent according to the figure of the boards, are placed between them; a piece of leather, broad in the middle, and narrow at both ends, is nailed on the edges of the boards, which it thus unites together; as also on the hoops which separate the boards, that the leather may the easier open and fold again: a tube of iron, brass, or copper, is fastened to the undermost board, and there is a valve within, that covers the holes in the under board to keep in the air.

Anacharsis the Scythian is recorded as the inventor of bellows. The action of bellows bears a near affinity to that of the lungs; and what we call blowing in the former, affords a good illustration of what is called respiring in the latter. Animal life itself may on some occasions be subsisted by blowing into the lungs with a pair of bellows. Dr Hooke's experiment to this effect is famous: having laid the thorax of a dog bare, by cutting away the ribs and diaphragm, pericardium, &c. and having cut off the aspera arteria below the epiglottis, and bound it on the nose of a bellows,
Bel has been performed in different manners. One was to mark a parcel of arrows, and put 11 or more of them into a bag: these were afterwards drawn out; and according as they were marked or not, they judged of future events.

Another way was to have three arrows, upon one of which was wrote, "God orders it me;" upon another, "God forbids it me;" and upon the third nothing at all. These were put into a quiver, out of which they drew one of the three at random; if it happened to be that with the first inscription, the thing they consulted about was to be done: if it chanced to be that with the second inscription, it was let alone: but if it proved that without inscription, they drew over again.

Belomancy is an ancient practice, and probably that which Ezekiel mentions, chap. xxi. 21. At least St Jerome understands it so, and observes that the practice was frequent among the Assyrians and Babylonians. Something like it is also mentioned in Hesiod, chap. iv. only that staves are there mentioned instead of arrows, which is rather rhodomancy than belomancy. Grotsius, as well as Jerome, confounds the two together, and shows that it prevailed much among the Magi, Chaldeans, and Scythians; whence it passed to the Scythians, and thence to the Germans, whom Tacitus observes to make use of it.

Belon, Peter, of Le Mans, the capital of Le Maine, a province of France, flourished about the middle of the 16th century. He published several books in Latin. He wrote, in French, of birds, beasts, fishes, serpents, and the neglected culture of plants; and a book of travels, or observations of many singularities and memorable things found in Greece, Asia, Judea, Egypt, and other foreign countries. He was murdered near Paris by one of his enemies, in 1564.

Belone. See Exo, Ichthyology Index.

Beloochistan, a country of Asia, situated on the north-west of Hindostan. See Supplement.

Belshazzar, the last king of Babylon, generally supposed to be the son of Evil-merodach, and grandson to the great Nebuchadnezzar.—During the time that Babylon was besieged by Cyrus, Belshazzar made an entertainment for a thousand of his most eminent courtiers (Dan. v. 1 &c.); and being heated with wine, ordered that the vessels of gold and silver which his grandfather Nebuchadnezzar had taken out of the temple at Jerusalem might be brought to the banquetting house, that he and his princes, together with his wives and concubines, might drink out of them, which accordingly was done; and to add to their profaneness, in the midst of their cups, they sang songs in praise of their several idols. But it was not long before a damp was put to the king’s mirth, by a hand appearing upon the wall, which in three words wrote the sentence of his condemnation. The king saw the hand that wrote; and being exceedingly affrighted, commanded all his wise men, magicians, and astrologers, to be immediately called, that they might read the writing and explain its meaning. When they came, the king promised, that whoever should expound this writing should be made the third person of his kingdom in place...
BEL, the Great, a famous strait of Denmark, between the island of Zealand and that of Funen, at the entrance of the Baltic sea. It is not, however, so commodious, nor so much frequented as the Sound. In 1638 the whole strait was frozen so hard, that Charles Gustavus king of Sweden marched over it with a design to take Copenhagen.

BELT, the Lesser, lies to the west of the Great Belt, between the island of Funen and the coast of Jutland. It is one of the passages from the German ocean to the Baltic, though not three miles in breadth, and very crooked.

BELT, Balthus, properly denotes a kind of military girdle, usually of leather, wherewith the sword or other weapon is sustained.—Belts are known among the ancient and middle-age writers by divers names, as Chorion, Zephyra, Zona, Cingulum, Reminicum, Rincon, or Ringa, and Baldirellum. The belt was an essential piece of the ancient armour; insomuch that we sometimes find it used to denote the whole armour. In later ages, the belt was given to a person when he was raised to knighthood; whence it has also been used as a badge or mark of the knightly order.

The denomination belt is also applied to a sort of bandages in use among surgeons, &c. Thus we meet with quicksilver belts, used for the itch; belts for keeping the belly tight, and discharging the water in the operation of tapping, &c.

BELT, is also a frequent disease in sheep, cured by cutting their tails off, and laying the sore bare; then casting muid on it, and applyting tar and goose grease.

BELTS, in Astronomy, two zones or girdles surrounding the body of the planet Jupiter. See Astronomy.

BELTS, in Geography, certain straits between the German ocean and the Baltic. The Belts belong to the king of Denmark, who exacts a toll from all ships which pass through them, excepting those of Sweden, which are exempted.

BELTEIN, a superstitious custom observed in the Highlands of Scotland. It is a kind of rural sacrifice, performed by the herdsmen of every village on the 1st of May. They cut a square trench in the ground, leaving a turf in the middle: on that they make a fire of wood, on which they make a large cauldle of eggs, butter, oatmeal, and milk; and bring, besides the ingredients of the cauldle, plenty of beer and whisky; for each of the company must contribute something. The rites begin with spilling some of the cauldle on the ground, by way of libation: on that every one takes a cake of oatmeal, upon which are raised nine square knobs, each dedicated to some particular being, the supposed preserver of their flocks and herds, or to some particular animal, the real destroyer of them: each person then turns his face to the fire, breaks off a knob, and flinging it over his shoulder, says, This I give thee, preserve thou my horses; this to thee, preserve thou my sheep; and so on. After that, they use the same ceremony to the noxious animal: This I give thee, O fox! spare thou my lambs; this to thee, O hooded crow! this to thee, O eagle! When the ceremony is over, they dine on the cauldle, and after the feast is finished, what is left is hid by two persons deputed for that purpose; but on the next Sunday they re-assemble and finish the relics of the first entertainment.

BELTURBET, a town of Ireland in the county of Cavan, and province of Ulster, situated on the river Earn, in W. Long. 7. 35. N. Lat. 54. 7.

BELTZ, or Belzó, a province of Poland, which fell to the share of Austria in 1795. It was afterwards annexed to Bonaparte's kingdom of Poland, but was restored to Austria in 1815.

BELTZ, or Belso, a town of Austrian Poland, and capital of the province of the same name, seated on the confines of Upper Volhynia, among marshes, in E. Long. 24. N. Lat. 50. 5.

BELVEDERE, in the Italian Architecture, &c. denotes either a pavilion on the top of a building, or an artificial eminence in a garden; the word literally signifying a fine prospect.

BELVEDERE, a considerable town of Greece, and capital of a province of the same name in the Morea. The province lies on the western coast: it is the most fertile and rich in all the Morea; and from it the raisins called Belvederes take their name. The town is situated in E. Long. 22. 0. N. Lat. 38. 5.

BELVIDERE. See Chenopodium, Botany Index.

BELNUM, in Ancient Geography, a town of Rhætia, above Feltom, in the territory of the Veneti; now Belluno, capital of the Bellunese in the territory of Venice. See Belluno.

BELUS, in Ancient Geography, a small river of Galilee, at the distance of two stadia from Ptolemais, running from the foot of Mount Carmel out of the lake Cœdæa. Near this place, according to Josephus, was a round hollow or valley, where was a kind of sand fit for making glass; which, though exported in great quantities, was found to be inexhaustible. Strabo says, the whole of the coast from Tyre to Ptolemais has a sand fit for making glass; but that the sand of the
BEMA, in antiquity, denotes a step or pace. The bema made a kind of itinerary measure among the Greeks, the length of which was equivalent to one cubit and two thirds, or to ten palms. Whence also the term bema is in the Latin church ambo.

BEMA was also used for the bishop's chair, seat, or throne, placed in the sanctuary. It was called bema from the stem by which it was to be ascended.

BEMA was also used for the reader's desk. This in the Greek church was denominated βημα γραφιν in the Latin church ambo.

BEMA is more peculiarly used for the Manichees altar, which was in a different place from that of the Catholics.

BEMA was also a denomination given by this sect to the anniversary of the day when Manes was killed, which with them was a solemn feast and day of rejoicing. One of the chief ceremonies of the feast consisted in setting out and adorning their bema or altar with great magnificence.

BEMBA, a province of the kingdom of Angola in Africa. It is divided into Higher and Lower; and extends on one side along the sea, and on the other divides Angola from the foreign states on the south. The country is large, populous, and abounding with cattle; with the fat of which the inhabitants anoint their heads and bodies, and clothe themselves with their hides. They are addicted to the same idiosyncratic superstitions with the rest of the natives, but speak a quite different language. The province is watered by a river called Lubango or San Francisco, which abounds with crocodiles, sea-horses, and monstrous serpents, that do a great deal of mischief.

BEMBO, Peter, a noble Venetian, secretary to Leo X. and afterwards cardinal, was one of the best writers of the 16th century. He was a good poet both in Italian and Latin; but he is justly censured for the looseness and immodesty of some of his poems. He published, besides these, A History of Venice; Letters; and a book in praise of the duke and duchess of Urbino. He died in 1547, in the 72d year of his age.

BEMSTER, or Bemister, a town of Dorsetshire in England, settled on the river Ber, containing 2290 inhabitants in 1811. W. Long. 3° 15'. N. Lat. 50° 45'.

BEN. See Ben.

Ben, in Pharmacy, the name of an exotic purgative fruit, of the size and figure of a nut; whence it is also called the ben nut, sometimes balanus myrrha, or glans unguentaria.

Naturalists distinguish two kinds of ben; viz. the great, ben magnum, which resembles the filbert, and is by some called ovellana purgatrix, brought from America; and the small, ben parvum, brought from Ethiopia.

Ben nuts yield, by expression, much oil, which from its property of not becoming rancid, at least for years, is used as a menstruum for the extraction of the odoriferous parts of the flowers of jessamin, violets, roses, hyacinths, lilies of the valley, tuberoses, jonquils, clove jollyflowers, and others which like these yield little or no essential oil by distillation, but impart their fragrance to expressed oils. The method of impregnating oil of ben with the odor of flowers is this: Some fine carted cotton is dipped in the oil, and put in the bottom of a proper vessel. On this is spread a thick layer of fresh flowers, above which more cotton dipt in oil is placed; and thus alternately flowers and cotton are disposed, till the vessel (which may be made of tin, with a cover to be screwed on to it, or of porcelain) is full. By digestion during 24 hours in a water-bath, the oil will receive the odor of the flowers.

BENARES, a district of Hindostan Proper in the East Indies, which lies between the Ganges and the Brahmaputra; and comprehends the circars of Benares, Jionpour, Chunar, and Gazypour. It was ceded to the English in 1775; but only came entirely into their hands in 1781, when the nawab was expelled.

Benares, a populous city in the East Indies, and capital of the district of the same name. It is situated on the north side of the Ganges, which is here very broad and the banks are very high. Benares has been much celebrated as the ancient seat of Brahminical learning. Several Hindu temples embellish the banks of the river; and many other of the public and private buildings are extremely magnificent. The streets, however, are narrow, and the houses high, some of them even five stories, which are inhabited by different families. The more opulent inhabitants live in detached houses, which have an open court, and are surrounded by a wall. In the centre of the city there is a large Mahometan mosque, which was built by the emperor Aurungzebe, who destroyed a magnificent Hindoo temple which had been erected on the same spot. Many of the Hindoo temples were demolished by the Mahometaus, the ruins of which are still visible in different places round the city. The same manners and customs still prevail among these people, as at the remotest period which history has traced. No innovations either in civil or religious matters have been admitted. An insurrection was excited here in 1781, and by the formidable appearance which it assumed, threatened to prove fatal to the English interest in Hindostan. It was at length suppressed, and the nawab Chisty Singh was deposed in 1783. Benares has been and is still celebrated for its observatory. See Observatory. It is estimated to contain 600,000 souls, and is 425 miles southeast of Delhi, and 430 miles north-west of Calcutta.

BENAVARRI, a town of the kingdom of Arragon in Spain, seated on the frontiers of Catalonia. E. Long. 83° 10'. N. Lat. 25° 20'.

BENAVENTO, a town of Spain, in the kingdom of Leon, and Terra di Campos, with the title of a duchy. It is seated on the river Elva, in W. Long. 5° 5'. N. Lat. 42° 4'.

BENAVIDUS, or Bonavitus (Marcus Mantus), a celebrated civilian, taught civil law with reputation, during 60 years, at Padua the place of his birth; and died in 1582, aged 93. His principal works are, 1. Collectanea super Juris Civilis. 2. Consiliorum, tom. ii. 3. Problematum legatum. 4. De illustribus Jurisconsultis, &c.

BENCH, or Bank, in Law. See Banc.
Free-Bench signifies that estate in copy-hold-lands which the wife being espoused a virgin, has, after the decease of her husband, for her dower, according to the custom of the manor. As to this free-bench, several manors have several customs; as in the manors of East and West Enbourne, in the county of Berks, and other parts of England, there is a custom, that when a copyhold tenant dies, the widow shall have her free-bench in all the deceased husband’s lands, whilst she lives single and chaste; but if she commits incontinency, she shall forfeit her estate: nevertheless, upon her coming into the court of the manor, riding on a black ram, and having his tail in her hand, and at the same time repeating a form of words prescribed, the steward is obliged, by the custom of the manor, to re-admit her to her free-bench.

King’s Bench, a court in which the king was formerly accustomed to sit in person, and on that account was moved with the king’s household. This was originally the only court in Westminster-hall, and from this it is thought that the courts of common pleas and exchequer were derived. As the king in person is still presumed in law to sit in this court, though only represented by his judges, it is said to have supreme authority: and the proceedings in it are supposed to be coram nobis, that is, before the king. This court consists of a lord chief justice and three other justices or judges, who are invested with a sovereign jurisdiction over all matters whether of a criminal or public nature. The chief justice has a salary of 5300l. and the other judges 2400l. each.

All crimes against the public good, though they do not injure any particular person, are under the cognizance of this court; and no private subject can suffer any unlawful violence or injury against his person, liberty, or possessions, but a proper remedy is afforded him here; not only for satisfaction of damages sustained, but for the punishment of the offender; and wherever this court meets with an offence contrary to the first principles of justice, it may punish it. It frequently proceeds on informations found before other courts, and removed by certiorari into this. Persons illegally committed to prison, though by the king and council, or either of the houses of parliament, may be bailed in it; and in some cases even upon legal commitments.—Writs of mandamus are issued by this court, for the restoring of officers in corporations, &c. unjustly turned out, and freemenwrongfully disfranchised.

The court of King’s Bench is now divided into a crown side and plea side; the one determining criminal, and the other, civil causes.

On the crown side, or crown office, it takes cognizance of all criminal causes, from high treason down to the most trivial misdemeanour or breach of the peace. Into this court also indictments from all inferior courts may be removed by writ of certiorari; and tried either at bar, or at nisi prius, by a jury of the county out of which the indictment is brought. The judges of this court are the supreme coroners of the kingdom. And the court itself is the principal court of criminal jurisdiction known to the laws of England. For which reason, by the coming of the court of King’s Bench into any county (as it was removed to Oxford on account of the sickness in 1665,) all former commissions of oyer and terminer, and general gaol-delivery, are at once absorbed and determined ex parte factum: in the same manner as, by the old Gothic and Saxon constitutions, Jure vetusto obiitum, qui visse omnia inferius judicijs dicente jus regi. Into this court of King’s Bench hath reverted all that was good and salutary of the star-chamber.

On the plea side, this court determines all personal actions commenced by bill or writ; as actions of debt, upon the case, detinue, trover, ejectment, trespass, waste, &c. against any person in the custody of the marshal of the court, as every person sued here is supposed to be by law.

The officers on the crown side are the clerk and secondary of the crown; and on the side of the plea there are two chief clerks or prothonotaries, and their secondary and deputy, the custos brevium, two clerks of the papers, the clerk of the declarations, the signer and sealer of bills, the clerk of the rules, clerk of the errors, and clerk of the bailiffs; to which may be added the filiators, the marshal of the court, and the crier.

Amicable Bench. See Amicable.

BENCHERS, in the inns of court, the senior members of the society, who are invested with the government thereof.

BENCOOLEN, a fort and town of Asia, on the south-west coast of the island of Sumatra, belonging to the British. The place is known at sea by a slender mountain called the Sugar Loaf, which rises about 2500 feet above the sea, and stands on an Indian village, whose houses are small and low, and built on posts. The country about Bengoolen is mountainous and woody, and the air unhealthy; the mountains being continually covered with thick heavy clouds that produce lightning, thunder, and rain. There is no beef to be had, except that of buffaloes, which is not very palatable; and indeed provisions of all kinds, except fruit, are pretty scarce. The chief trade is in pepper, of which great quantities grow on the island. There are frequent bickerings between the natives and the factory, to the no small injury of the East India Company. The factory was once entirely deserted; and had not the natives found that trade decreased by reason of their absence, it is scarcely probable that ever the English would have been invited there again. E. Long. 101. 5. S. Lat. 4. 5.

BEND, in Heraldry, one of the nine honourable ordinaries, containing a third part of the field when charged, and a fifth when plain. It is sometimes, like other ordinaries, indented, ingrounded, &c. and is either dexter or sinister. See HERALDRY.

BEND, is in any thing, borne in arms, are placed obliquely from the upper corner to the opposite lower, as the bend lies.

BENDER, a town of Bessarabia in European Russia, seated on the river Niestier, in E. Long. 29. 5. N. Lat. 46. 40. It is remarkable for being the place of retreat of Charles XII. after he was defeated by the Russians at the battle of Pultowa in 1709.

BENDERMASEN, a town of the island of Borneo in Asia, and capital of a kingdom of the same name. It has a good harbour; and stands in E. Long. 113. 50. 8. Lat. 2. 40.

BENDIDA, in antiquity, a festival, not unlike the Bacchanalia, celebrated by the Athenians in honour of Diana.

BENDING,
BENDING, in a general sense, the reducing a straight body into a curve, or giving it a crooked form.

The bending of timber-boards, &c. is effected by means of heat, whereby their fibres are so relaxed that you may bend them into any figure.

**BENDING**, in the sea language, the tying two ropes or cables together: thus they say, *bend the cable*, that is, make it fast to the ring of the anchor; *bend the sail*, make it fast to the yard.

**BENDS**, in a ship, the same with what are called *swigs*, or eyes; the outmost timbers of a ship's side, on which men set their feet in climbing up. They are reckoned from the water, and are called the **first**, **second**, or **third bend**. They are the chief strength of a ship's sides; and have the beams, knees, and foot-books, bolted to them.

**BENDY**, in *Heraldry*, is the field divided into four, six, or more parts, diagonally, and varying in metal and colour. The general custom of England is to make an even number; but in other countries they regard it not, whether even or odd.

**BENCAPED**, among sailors. A ship is said to be *bencapped* when the water does not flow high enough to bring her off the ground, out of the dock or over the bar.

**BENEDICTO**, St., a considerable town of the Mantuan, in Italy, in E. Long. 11. 35. N. Lat. 45. 0.

**BENEDICITE**, among ecclesiastical writers, an appellation given to the song of the three children in the fiery furnace, on account of its beginning with the word *benedicite*. The use of this song in Christian worship is very ancient, it appearing to have been sung in all the churches as early as St. Chrysostom's time.

**BENEDICT XIV.** Pope, (Prosper Lambertini of Bologna), celebrated for his learning and moderation, which gained him the esteem of all sensible Protestants. He was the patron of learned men and celebrated artists; and an elaborate writer on theological subjects. His works made 12 vols. in folio. He died in 1758.

**BENEDIT, St.** the founder of the order of the Benedictine monks, was born in Italy about the year 480. He was sent to Rome when he was very young, and there received the first part of his education. At 14 years of age he was removed from thence to Sublac, about 40 miles distant. Here he lived a most ascetic life, and shut himself up in a cavern, where nobody knew anything of him except St. Romanus, who, we are told, used to descend to him by a rope, and to supply him with provisions. But being afterwards discovered by the monks of a neighbouring monastery, they chose him for their abbot. Their manners, however, not agreeing with those of Benedict, he returned to his solitude; whither many persons followed him, and put themselves under his direction, so that in a short time he built 12 monasteries. In the year 528, or the following, he retired to Mount Cassino, where idolatry was still prevalent, there being a temple of Apollo erected here. He instructed the people in the adjacent country, and having converted them, he broke the image of Apollo, and built two chapels on the mountain. Here he founded also a monastery, and instituted the order of his name which in time became so famous and extended all over Europe. It was here too that he composed his *Regula Monachorum*, which Gregory the Great speaks of as the most sensible and best written piece of that kind ever published. The time of his death is uncertain, but is placed between 540 and 550. He was looked upon as the Elisha of his time; and is reported to have wrought a great number of miracles, which are recorded in the second book of the Dialogues of St. Gregory the Great.

**BENEDICT**, abbot of Peterborough, was educated at Oxford, became a monk in the monastery of Christ's church in Canterbury, and some time after was chosen prior by the members of that society. Though he had been a great admirer of Archbishop Beket, and wrote a life of that prelate, he was so much esteemed by Henry II. that by the influence of that prince he was elected abbot of Peterborough, A. D. 1177. He assisted at the coronation of Richard I. A. D. 1189; and was advanced to be keeper of the great seal, A. D. 1191. But he did not long enjoy this high dignity, as he died on Michaelmas day, A. D. 1193. Besides his life of Archbishop Beket, he composed a History of Henry II. and Richard I. from A. D. 1170 to A. D. 1192; which hath been much and justly esteemed by many of our greatest antiquaries, as containing one of the best accounts of the transactions of those times. A beautiful edition of this work was published at Oxford, in two volumes, by Mr Hearne, A. D. 1735.

**BENEDICTINES**, in church history, an order of monks, who profess to follow the rules of St. Benedict.

The Benedictines, being those only that are properly called monks, wear a loose black gown, with large wide sleeves, and a capuche, or cowl, on their heads, ending in a point behind. In the canon law, they are styled *black friars*, from the colour of their habit.

The rules of St. Benedict, as observed by the English monks before the dissolution of the monasteries, were as follows: They were obliged to perform their devotions seven times in 24 hours, the whole circle of which devotions had a respect to the passion and death of Christ: they were obliged always to go two and two together: every day in lent they were obliged to fast till six in the evening, and abated of their usual time of sleeping and eating; but they were not allowed to practise any voluntary austerity without leave of their superior: they never conversed in their refectory at meals, but were obliged to attend to the reading of the Scriptures: they all slept in the same dormitory, but not two in a bed; they lay in their clothes: for small faults they were shut out from meals; for greater they were debarred religious commerce, and excluded from the chapel; and as to incorrigible offenders, they were excluded from the monasteries. Every monk had two coats, two cowls, a table-book, a knife, a needle, and a handkerchief; and the furniture of their bed was a mat, a blanket, a rog, and a pillow.

The time when this order came into England is well known; for to it the English owe their conversion from idolatry. In the year 596, Pope Gregory sent thither Augustine, prior of the monastery of St. Andrew at Rome, with several other Benedictine monks. St. Augustine became archbishop of Canterbury, and the Benedictines founded several monasteries in England, as also the metropolitan church of Canterbury, and all the cathedrals that were afterwards erected.
Pope John XXII, who died in 1334, after an exact inquiry, found, that, since the first rise of the order, there had been of it 24 popes, near 200 cardinals, 7000 archbishops, 15,000 bishops, 15,000 abbots of renown, above 4000 saints, and upwards of 37,000 monasteries. There have been likewise of this order 20 emperors and 10 empresses, 47 kings and above 50 queens, 20 sons of emperors, and 36 sons of kings: about 100 princesses, daughters of kings and emperors; besides dukes, marquises, earls, countesses, &c. innumerable. The order has produced a vast number of eminent writers and other learned men. Their Rahbanus set up the school of Germany. Their Alcuinus founded the university of Paris. Their Dionysius Exiguus perfected the ecclesiastical computation. Their Guido invented the scale of music; and their Sylvester, the organ. They boast to have produced Anselmus, Idenophonus, Venerable Bede, &c.

There are nuns likewise who follow the rule of St Benedict; among whom those who call themselves mitigated, eat flesh three times a week, on Sundays, Tuesdays, and Thursdays; the others observe the rule of St Benedict in its rigour, and eat no flesh, unless they are sick.

Benediction, in a general sense, the act of blessing, or giving praise to God, or returning thanks for his favours. Hence also benediction is still applied to the act of saying grace before or after meals. Neither the ancient Jews nor Christians ever ate without a short prayer. The Jews are obliged to rehearse 100 benedictions per day; of which 80 are to be spoken in the morning. The first treatise of the first order in the Talmud, entitled Scram, contains the form and order of the daily benedictions. It was usual to give benediction to travellers on their taking leave; a practice which is still preserved among the monks. Benedictions were likewise given among the ancient Jews, as well as Christians, by imposition of hands. And when at length the primitive simplicity of the Christian worship began to give way to ceremony, they added the sign of the cross, which was made with the same hand, as before, only elevated, or extended. Hence benediction, in the modern Romish church, is used, in a more particular manner, to denote the sign of the cross made by a bishop, or prelate, as conferring some grace on the people. The custom of receiving benediction, by bowing the head before the bishops, is very ancient; and was so universal, that emperors themselves did not decline this mark of submission. Under the name benediction, the Hebrews also frequently understand the presents which friends make to one another, in all probability because they are generally attended with blessings and compliments, both from those who give and those who receive them.

Nuptial Benediction, the external ceremony performed by the priest in the office of matrimony. This is also called sacramental and matrimonial benediction, by the Greeks, ἅγιον κομματίαν ἢ βοήθειαν. The nuptial benediction is not essential to, but the confirmation of, a marriage in the civil law.

Beatific Benediction, (beneficio beatifico), is the viaticum given to dying persons. The pope begins all his bulls with this form: Salutem et apostolicum benedictionem.

Benediction is also used for an ecclesiastical cere-
BENEFICE. A benefice, viz. 1. De jure, when the person enjoying it is guilty of certain crimes express'd in those laws, be he resy, simony, &c. 2. De facto, as well as de jure, by the natural death or the resignation of the incumbent; which resignation may be either express or tacit, as when he engages in a state, &c. inconsistent with it, as among the Romanists, by marrying, entering into a religious order, or the like. 3. By the sentence of a judge, by way of punishment for certain crimes, as concubinage, perjury, &c.

Benefices began about 500. The following account of those in England is given as the fact by Dr Burn, viz. that there were 1701 livings not exceeding 10l. per annum: 1467 livings above 10l. and not exceeding 20l. per annum; 1126 livings above 20l. and not exceeding 30l. per annum; 1049 livings above 30l. and not exceeding 40l. per annum; 884 livings above 40l. and not exceeding 50l. per annum; 7397 livings under 50l. per annum. It must be 500 years before every living can be raised to 60l. a-year by Queen Anne's bounty, and 330 years before any of them can exceed 50l. a-year. On the whole, there are above 11,000 church preferments in England, exclusive of bishoprics, deaneries, canonries, prebendaries, priest-vicars, lay-vicars, secondarys, &c. belonging to cathedrals, or choristers, or even curates, to well-beneficed clergymen.

Benefice in commendam is that, the direction and management of which, upon a vacancy, is given or recommended to an ecclesiastical, for a certain time, till he may be conveniently provided for.

Beneficiarii, in Roman antiquity, denote soldiers who attended the chief officers of the army, being exempted from other duty. Beneficiarii were also soldiers discharged from the military service or duty, and provided with beneficia to subsist on. These were probably the same with the former, and both might be comprised in the same definition. They were old experienced soldiers, who, having served out their legal time, or received a discharge as a particular mark of honour, were invited again to the service, where they were held in great esteem, exempted from all military drudgery, and appointed to guard the standard, &c. These, when thus recalled to service, were also denominated excossi; before their recall, emeriti.

Beneficiarius was also used for those raised to a higher rank by the favour of the tribunes or other magistrates. The word beneficiarius frequently occurs in the Roman inscriptions found in Britain, where consultus is always joined with it; but besides beneficiarius consultus, we find in Gratian beneficiarius tribuni, pratorii, legati, prefecti, proconsulis, &c.

Beneficiary, in general, something that relates to benefices.

Beneficiary, Beneficient, is more particularly used for a beneficed person, or him who receives and enjoys one or more benefices. A beneficiary is not the proprietor of the revenues of his church; he has only the administration of them, though unaccountable for the same to any but God.

Beneficiary is also used, in middle-age writers, for a feudatory or vassal. The denomination was also given to the clerks or officers who kept the accounts of the beneficia, and made the writings necessary thereto.

Beneficium, in military matters among the Romans, denoted a promotion to a higher rank by the beneficium favour of some person in authority.

Benfield, Sebastian, an eminent divine of the 17th century, was born in 1559, at Prestbury in Gloucestershire, and educated at Corpus Christi college in Oxford. In 1608 he took the degree of doctor in divinity, and five years after was chosen Margaret professor in that university. He had been presented several years before to the rectory of Mereham, in Gloucestershire. He published Commentaries upon the first, second, and third chapters of Amos; a considerable number of sermons; and some Latin treatises. He died in 1630.

Benefit of clergy. See Clergy.

Benefit Societies, institutions common among the labouring classes in Great Britain; and calculated for the relief of the sick, or the support of the aged. See Supplement.

Bensoeuf, a town of Egypt, seated on the western shore of the Nile, and remarkable for its hemp and flax. E. Long. 31. D. N. Lat. 29. 10.

Benevente, a town of the province of Leon, in Spain, seated on the river Esila, in W. Long. 5. 5. N. Lat. 42. 4.

Benevento, a city of Italy, in the kingdom of Naples, with an archbishop's see. It is situated near the confluence of the rivers Sabato and Calore, in a fertile valley called the Strait of Benevento. It has frequently suffered by earthquakes, particularly in 1703. E. Long. 14. 57. N. Lat. 41. 6.

The arch of Trajan, now called the Porta Aurea, forms one of the entrances to the city. This arch, though it appears to great disadvantage from the walls and houses that hem it in on both sides, is in tolerable preservation, and one of the most magnificent remains of Roman grandeur to be met with out of Rome. The architecture and sculpture are both singularly beautiful. This elegant monument was erected in the year of Christ 114, about the commencement of the Parthian war, and after the submission of Decebalus had entitled Trajan to the surname of Dacicus. The order is Composite; the materials white marble; the height 60 palms; length, 37 and a half; and depth 24. It consists of a single arch, the span of which is 20 palms, the height 35. On each side of it, two fluted columns, upon a joint pedestal, support an entablature and an attic. The intercolumniations and frize are covered with baso-relievos, representing the battles and triumphs of the Dacian war. In the attic is the inscription. As the sixth year of Trajan's consulate, marked on this arch, is also to be seen on all the military columns he erected along his new road to Brundusium, it is probable that the arch was built to commemorate so beneficial an undertaking. Except the old metropolis of the world, no city in Italy can boast of so many remains of ancient sculpture as are to be found in Benevento. Scarcely a wall is built of anything but altars, tombs, columns, and remains of entablatures.

The cathedral is a clumsy edifice, in a style of Gothic, or rather Lombard, architecture. This church, dedicated to the Virgin Mary, was built in the sixth century, enlarged in the 11th, and altered considerably in the 15th, when Archbishop Roger adorned it with a new front. To obtain a sufficient quantity of marble for this purpose, he spared neither sarcophagus, altar,
was appointed duke of Benevento, as a feudatory of Savelli, the king of Lombardy; and seems to have confined his rule to the city alone, from which he sailed forth to seek for booty. The second duke, whose name was Arechis, conquered almost the whole country that now constitutes the kingdom of Naples. His successors appear long to have remained satisfied with the extent of dominion he had transmitted to them. Grimwold, one of them, usurped the crown of Lombardy; but his son Romwald, though a very successful warrior, contested himself with the ducal title. The fall of Desiderius, last king of the Lombards, did not affect the state of Benevento. By an effort of policy or resolution, Arechis the second kept possession; and availing himself of the favourable conjuncture, asserted his independence, threw off all feudal submission, assumed the style of prince, and coined money with his own image upon it; a prerogative exercised by none of his predecessors as dukes of Benevento. During four reigns, this state maintained itself on a respectable footing; and might long have continued so, had not civil war, added to very powerful assaults from abroad, hastened its ruin. Radelchis and Siconulph aspired to the principality; and each of them invited the Saracens to his aid. The desolation caused by this conflict is scarcely to be described. No better method for terminating these fatal dissensions could be devised than dividing the dominions into two distinct sovereignties. In 851, Radelchis reigned as prince at Benevento; and his adversary fixed his court with the same title at Salerno. From this treaty of partition, the ruin of the Lombards became inevitable: a want of union undermined their strength, foreigners gained an ascendant over them, irresolution and weakness pervaded their whole system of government. The erection of Capua into a third principality was another destructive operation; and now the inroads of the Saracens, the attacks of the eastern and western emperors, anarchy and animosity at home, reduced the Lombard states to such wretchedness, that they were able to make a very feeble resistance to the Norman arms. The city of Benevento alone escaped their sway, by a grant which the emperor Henry II. had made of it to the bishop of Rome, in exchange for the territory of Bamberg in Germany, where the popes enjoyed a kind of sovereignty. From the year 1054 to this day, the Roman see, with some short interruptions of possession, has exercised temporal dominion over this city. Benevento has given three popes to the chair of St. Peter; viz. Felix III. Victor III. and Gregory VIII. and, what it is much prouder of, reckons St. Januarius in the list of its bishops.

BENEVENTUM, in Ancient Geography, a town of the Samnites, formerly called Maleventum from the unwholesomeness of the wind, and under that appellation it is mentioned by Livy; but after a Roman colony was led thither in the 49th year of the city, it came to have the name of Beneventum, as a more auspicious title. It is mentioned by Herodotus as an ancient city, said to have been built by Diomedes before the Trojan war. Now Benevento.

BENEVOLENCE, in morals, signifies the love of mankind in general, accompanied with a desire to promote their happiness. See Morals.

BENFIELD, a town of France, in the department of the Lower Rhine, whose fortifications were demolished.
BENGAL, a country of Hindostan in Asia, and one of the most valuable provinces held by the British in India, is bounded on the east by the kingdoms of Assam, Tipra, and Arracan; on the west by Malva and Bearer; on the north by Nepal and Bootan; and on the south by Oryza and the bay of Bengal. Its greatest length is about 400 miles, and its breadth, where greatest, is not less than 300; extending from 21 to 27 degrees of north latitude, and from 86 to 92 of east longitude.

As this country lies almost entirely within the torrid zone, and in the middle of a very extensive continent, it is sometimes subject to such extremes of heat as render it very fatal to European constitutions. Dr. Lind is of opinion, that the climate of Bengal is the most dangerous in this respect of any of the English territories, excepting Bengal on the coast of Somatra.

Part of this unhealthiness arises from the mere circumstance of heat; for in all the southern parts of India, where the wind blows over land, it is so extremely hot and suffocating as scarcely to be borne. The reason of this is evident from the mere inspection of a map of Asia, where it is evident, that whatever wind blows over land, especially in the southern parts, must pass over an immense tract of country strongly heated by the sun, and as in every part of this extensive continent there are sandy deserts of very considerable magnitude, the heat is thus prodigiously increased. This becomes very evident on the falling of a shower of rain at the time the wind-land prevails; for if the wind in its way passes through the shower, the air is agreeably cooled though the sky should be ever so clear; while those who reside only at a few miles distance, but out of the direct line of the shower, will be singing under the excessive heat. Here, indeed, when the air is clear, the sunbeams are much more powerful than in our climate, insomuch that the light at noon-day is too powerful for the eyes to bear, and the large stars, as Venus and Jupiter, shine with a surprising lustre. Thus the reflection of the sunbeams from the earth most necessarily occasion an extraordinary degree of heat in the atmosphere; so that from the winds above mentioned very great inconveniences sometimes arise, similar to those which are occasioned by the Harmattan in Africa. Mr. Ives tells us, that it is affirmed they will smoke glass if it be too much exposed to them; he has seen the veneering stripped off from a chest of drawers by their means; and they will certainly crack and chaff almost every piece of wood that is not well seasoned. In certain places they are so loaded with sand, that the horizon appears quite hazy where they blow, and it is almost impossible to prevent the eyes from being thus greatly injured. They have likewise a very pernicious effect on such people as are exposed to them while sleeping. This seldom fails to bring on a fit of the barbers, a kind of paralytic disorder attended with a total deprivation of the use of the limbs, and which the patient never gets the better of but by removing to some other climate. These hot winds are made use of with great success for cooling liquors, by wrapping a wet cloth round the bottles and exposing it to the air. The reason of this is explained under the article EVAPORATION. Mr. Ives remarks, that it will thus cool much sooner than by being exposed to the cool sea-breeze.

The great cause of the unhealthiness of Bengal, however, is owing to the inundations of the Ganges and Burmanpooter, by which such quantities of putrefiable matters are brought down as infect the air with the most malignant vapours when the waters retire. Though the rainy season begins in Bengal only in the month of June, the river begins to swell in the mountains of Thibet early in April, and by the latter end of that month in Bengal also. The reason of this is partly the melting of the snow on the mountains of Thibet, and partly the vast collection of vapours brought by the southerly or south-west monsoon, which are suddenly stopped by the high mountains of Thibet. Hence it is obvious, that the accumulation and condensation of these vapours must first take place in the neighbourhood of the mountains which oppose them; and thus the rainy season commences soonest in those places which lie nearest the mountains.

The rivers in Bengal begin to rise at first very slowly, the increase being only at the rate of one inch per day for the first fortnight. It then gradually augments to two and three inches before any quantity of rain falls in the low countries; and when the rain becomes general, the increase at a medium is five inches per day. By the latter end of July, all the lower parts of Bengal, contiguous to the Ganges and Burmanpooter, are overflowed, and present a surface of water more than 100 miles wide. This vast collection of fluid, however, is owing in a great measure to the rains which fall on the low country itself; for the lands in the neighbourhood are overflowed some time before the bed of the river is filled. It must be observed, that the ground on the bank of the river, and even to some miles distance, is higher than that which is more remote; and thus a separation is made for a considerable time betwixt the waters of the land-flood and those of the river.

As some of the lands in Bengal would receive damage from such a copious inundation, they must be guarded this reason be guarded by strong dykes to resist the waters, and admit only a certain quantity. These, collectively taken, are said to be more than 1000 miles in length, and are kept up at an enormous expense; yet they do not always answer the purpose, on account of the looseness of the earth of which they are composed, even though some are of the thickness of an ordinary rampart at the base. One particular branch of the Ganges (navigable only in the rainy season, and then equal in size to the Thames at Chelsea) is conducted for 70 miles between dykes: and when full, the passengers look down upon the adjacent country from an eminence.

As the tide loses its power of counteracting such an impetuous torrent of fresh water, the height of the inundation gradually diminishes as it approaches the sea, and totally vanishes at the point of confluence; which is owing to the facility with which the waters of the inundation spread over the level of the ocean. But when the force of winds conspires with that of the tide, the waters are retarded in such manner as sometime to raise the inundation two feet above the ordinary level; which has been known to occasion the loss by too of whole crops of rice. In the year 1763, a great an epidemic inundation.
BENGAL [ 558 ]

Bengal.

chol accident happened at Luckipur, when a strong gale of wind, conspireing with a high spring-tide, at a season when the periodical flood was within a foot and a half of its highest pitch, the waters are said to have risen six feet above their ordinary level. Thus the inhabitants of a particular district were swept away with their houses and cattle; and to aggravate the distress, it happened in a part of the country where it was scarce to find a tree for a drowning man to escape to.

For some days before the middle of August the inundation is at a stand, and then begins to abate by a cessation of rains in the mountains, though great quantities still continue to fall on the low country. The inundation does not, however, in its decrease, always keep pace with that of the river, by reason of the height of the banks; but after the beginning of October, when the rain has nearly ceased, the remainder goes off quickly by evaporation, leaving the ground exceedingly fertilized.

From the time that the monsoon changes in October to the middle of March, the rivers are in a state of tranquillity; when the north-west winds begin, and may be expected once in three or four days till the commencement of the rainy season. These are the most formidable enemies of the inland navigation carried on by the large rivers. They are sudden and violent squalls, attended with rain; and though their duration is commonly but short, sometimes produce fatal effects, whole fleets of trading boats having been sunk by them almost instantaneously. They are more frequent in the eastern than in the western part of Bengal, and happen oftener towards the close of the day than at any other time; but as they are indicated some time before they approach by the rising and singular appearance of the clouds, the traveller has commonly time enough to seek for a place of shelter. It is in the great rivers alone that they are so formidable, and that about the end of May or beginning of June, when the rivers are much increased in width. After the commencement of the rainy season, which varies in different parts from the middle to the end of June, tempestuous weather occasionally happens. At this season, places of shelter are more common that at any other time, by the filling up of the creeks and inlets as the river increases; and on the other hand, the bad weather, when it happens, is of longer continuance than during the season of the north-westers. The rivers being now spread to the distance of several miles, large waves are raised on them, particularly when blowing in a direction contrary to the rapid parts of the stream, which for obvious reasons ought to be avoided.

This navigation is performed in safety during the interval between the end of the rainy season and the beginning of the north-westers; an ordinary degree of attention being then only requisite to pilot the boat clear of shallows and stumps of trees. The season of the north-westers requires the greatest care and attention. Should one of these squalls approach, and no creek or inlet offer shelter, the steep bank of the river should be always sought as a place for shelter, if it is not in a crumbling state; whether it be to the windward or leeward, rather than the other. If this cannot be done, the flat side must be taken up with;

and if it be a lee shore, the anchor should be thrown out to prevent driving upon it. In these cases the mast is always supposed to be struck; and, provided this be done, and the cargo judiciously disposed of, there is little danger of any of the boats commonly made use of being overset.

The boats used in the inland navigation of Bengal are called budgeroes, and are formed somewhat like a boat to a pleasure barge. Some have cabins 14 feet broad and 22 feet proportionally long, drawing from four to five feet water. Their motion is very slow, not exceeding the rate of eight miles a-day when moved by their own; so that their progress down the river must depend principally on the motion of the current. From the beginning of November to the middle or latter end of May, the usual rate of going down the stream is about 40 miles in twelve hours, and during the rest of the year from 50 to 70 miles. The current is strongest while the waters of the inundation are draining off, which happens in part of August and September. In many of the shallow rivers, however, the current is exceedingly slow during the dry months; insomuch that the track-ropes is frequently used in going downwards. In towing against the stream, the steep side of the river is generally preferred on account of the depth of water, though the current runs much stronger there than on the opposite side. On these occasions it is necessary to provide a very long track-rop, as well for avoiding the fallen pieces of the steep bank on the one side, as the shallow water on the other, when it becomes necessary to change sides through the badness of the tracking ground. The anchor should always be kept ready for dropping in case the track-rop breaks. The usual rate of towing against the stream is from 7 to 10 miles a-day; and to make even this progress, the windings of the river require the boats to be dragged against the current at the rate of four miles and a half per hour for 12 hours. When the waters are high, a greater progress will be made, notwithstanding the superior strength of the current; because the filling of the river-bed gives many opportunities of cutting off angles and turnings, and sometimes even large windings, by going through creeks.

Bengal produces the vegetables and animals common to other countries in the torrid zone. Its great produce of grain is rice, which is commonly exported from thence into other countries. By various accidents, however, the crop of rice sometimes fails, and a famine is produced; and of this there have been many instances in Bengal as well as in other parts of Hindostan. One of the most deplorable of this kind happened in the year 1770. The nabob and several other men of the country distributed rice gratis to the poor until their stocks began to fail, when those donations were of consequence withdrawn. Vast multitudes then came down to Calcutta, the capital English settlement in the province, in hopes of meeting with relief at the place. The granaries of the Company, however, being quite empty, none could be afforded; so that famine had prevailed a fortnight, many thousands fell down in the streets and fields; whose bodies, mangled by the dogs and vultures, corrupting in the air, seemed to threaten a plague as the consequence of the famine. A hundred people were daily employed on the Company's account, with doolys, sledges, and bearers,
Bengal.

Bears, to throw them into the river. At this time the fish could not be eaten, the river being so full of carcasses; and many of those who ventured to feed upon them died suddenly. Hogs, ducks, and geese, also fed mostly on carrion; so that the only meat that could be procured was mutton; and this, from the dryness of the season, was so small, that a quarter of it would scarcely weigh a pound and a half.

In the month of August a most alarming phenomenon appeared, of a large black cloud at a distance in the air, which sometimes obscured the sun, and seemed to extend a great way over and above Calcutta. The hotter the day proved the lower this cloud seemed to descend, and for three days it occasioned great speculation. The bramins pretended, that this phenomenon, which was a cloud of insects, should make its appearance three times; and if ever they descended to the earth, the country would be destroyed by some untimely misfortune. They said, that above 150 years before there had been such another bad time, when the earth was parched for want of water; and this cloud of insects made its appearance, though it came much lower the second time than it had done before. On the third day, the weather being very hot and cloudy, they descended so low that they could be plainly seen. They seemed to be about the size of a horse-stinger, with a long red body, large head and eyes, keeping close together like a swarm of bees, and to appearance, flying quite on a line. None, however, were caught, as the people were so much frightened by the prognostications of the bramins. Whilst it rained they continued in one position for near a quarter of an hour; then they rose five or six feet at once, and in a little time descended as much, until a strong north-west wind blew for two days successively. During its continuance they ascended and descended, but more precipitately than before; and next morning the air was quite clear. For some days before the cloud made its appearance, the toads, frogs, and insects, which during the rains made a continual noise through the night, disappeared, and were neither heard nor seen, except in the river.

This dreadful famine was occasioned by a preternatural drought. In this country they have two harvests; one in April, called the little harvest, which consists of the smaller grain; the second called the grand harvest, is only of rice. But by a drought which happened in 1759, the great harvest of that year failed, as did also the little one of 1770, which produced the dreadful consequences already mentioned.

Among the vegetables produced in Bengal, Mr. Ives mentions the areca-tree, the woody part of which is as tough as whalebone. Here is also a beautiful tree called chulta, the flower of which is at first a hard green ball on footstalks about four inches in length. This opens, and the calyx is composed of five round thick and succulent leaves; the corolla consists of the like number of fine beautiful white petals. After one day the corolla falls off and the ball closes again, and is sold in the markets. There is a succession of these for several months. The mango tree grows here also in plenty. Its fruit is preferred to all others in the country, excepting very fine pine-apples; the gentlemen eat little else in the hot months when these fruits are in season. If no wine is drunk with them they are apt to produce boils, which are troublesome but healthful. In the walks of Bengal they have a tall tree called the tuloon, said to have been first brought into England by Captain Birch. The leaves are of a deep shining green, the lower part rather paler where it is ribbed, and undulated round the edges. The fruit is of the size, shape, and colour of an olive, with a moderately thin husk, and a kernel like that of the date; five or six grow on the same pedicle. Near Calcutta is a large spreading tree called the rvan, which makes a fine appearance when in full bloom. The natives say, that this and another near the Dutch settlement are the only two in Bengal. They pretend likewise that they can never find the seed; but Mr. Ives informs us, that this is to be met with in plenty, though in a bad condition, the ants and other vermin being so fond of them, that not a single pod is ever to be met with that is not touched by one or other of these species of insects. This tree bears flowers of bright crimson, and all the shades from thence down to a bright yellow. They are in such plenty as almost to cover the tree, but have little or no smell. The fruit is in a pod of the shape and size of a large garden-bean, containing four or five fleshy seeds, which easily fall into two when dry. They are brown on the outside, white within, and nearly square, but convex on the sides.

Among the animals to be met with in Bengal Mr. Ives makes mention of a kind of birds named argill or argilis (see Ardea, sp. 6). They are very large, and in the evenings would majestically stalk along like as many naked Indians, for which our author at first mistook them. On discovering that they were birds he resolved to shoot one of them; which, however, was very difficult to be done. The Indians showed evident marks of dissatisfaction at the attempt; and informed him that it was impossible to succeed, because these birds were possessed by the souls of bramins. At last, however, he succeeded; and informs us that the bird he shot extended 14 feet 10 inches between the tips of the wings; from the tip of the bill to the extremity of the claw was seven feet and a half; the legs were naked, as was also one half of the thighs; the naked parts being three feet in length. The feathers of the wings and back were of an iron colour, and very strong; those of the belly were very long, and on the breast was a great deal of down all of a dirty white. The bill was 16 inches round at the base, nearly of a triangular shape, and of different colours. In the claw was a land tortoise 10 inches long; and a large black male cat was found entire in its stomach.

Bengal is reckoned the richest and most populous province in the empire of Hindostan. Besides its own consumption, which is certainly very considerable, its exports are immense. One part of its merchandise is carried into the inland country. Tibet takes off a quantity of its cottons, besides some iron and cloths of European manufacture. The inhabitants of those mountains fetch them from Patan themselves, and give musket and rhubarb in exchange. But the trade of Tibet is nothing in comparison of that which Bengal carries on with Agra, Delhi, and the provinces adjacent to those superb capitals, in salt, sugar, opium, silk, silk-stuffs, and an infinite quantity of cottons, and particularly muslins. These
BENGAL. articles, taken together, amounted long ago to more than 1,700,000 a year. So considerable a sum was not conveyed to the banks of the Ganges; but it was the means of retaining one nearly equal, which must have issued from thence to pay the duties, for other purposes. Since the viceroy of the Mogul have made themselves nearly independent, and send him so revenues but such as they choose to allow him, the luxury of the court is greatly abated, and the trade we have been speaking of is no longer so considerable.

The maritime trade of Bengal, managed by the natives of the country, has not suffered the same diminution, nor was it ever so extensive, as the other. It may be divided into two branches, of which Cateek is in possession of the greater part.

Cateek is a district of some extent, a little below the most western mouth of the Ganges. Balasore, situated upon a navigable river, serves it for a port. The navigation of the Maldives, which the English and French have been obliged to abandon on account of the climate, is carried on entirely from this road. Here they load their vessels with rice, coarse cottons, and some silk stuffs, for these islands; and receive cowries in the exchange, which are used for money in Bengal, and sold to the Europeans.

The inhabitants of Cateek, and some other people of the Lower Ganges, maintain a considerable correspondence with the country of Asam. This kingdom, which is thought to have formerly made a part of Bengal, and is only divided from it by a river that falls into the Ganges, deserves to be better known, if what is asserted here be true, that gunpowder was discovered there, and that it was communicated from Asam to Pegu, and from Pegu to China. Its gold, silver, iron, and lead mines, would have added to its fame, if they had been properly worked. In the midst of these riches, which were of very little service to this kingdom, salt was an article of which the inhabitants were so much in want, that they were reduced to the expedient of procuring it from a dejection of certain plants.

In the beginning of the present century, some Brahmins of Bengal carried their superstitions to Asam, where the people were guided solely by the dictates of natural religion. The priests persuaded them, that it would be more agreeable to Bramins if they substituted the pure and wholesome salt of the sea to that which they used. The sovereign consented to this on condition that the exclusive trade should be in his hands; that it should only be brought by the people of Bengal; and that the boats laden with it should stop at the frontiers of his dominions. Thus have all these false religions been introduced by the influence and for the advantage of the priests who teach, and of the kings who admit them. Since this arrangement has taken place, 40 vessels from 500 to 600 tons burden each are annually sent from the Ganges to Asam laden with salt, which yields 200 per cent. profit. They receive in payment a small quantity of gold and silver, ivory, musk, eagle-wood, gum-lac, and a large quantity of silk.

Excepting these two branches of maritime trade, which, for particular reasons, have been confined to the natives of the country, all the rest of the vessels sent from the Ganges to the different sea-ports of India belong to the Europeans, and are built at Pegu.

A still more considerable branch of commerce, which the Europeans at Bengal carry on with the rest of India, is that of opium. Patna, situated on the Upper Ganges, is the most celebrated place in the world for the cultivation of opium. The fields are covered with it. Besides what is carried into the inland parts, there are annually 3000 or 4000 chests exported, each weighing 300 pounds. It sells upon the spot at the rate of between 24l. and 25l. a chest on an average. This opium is not purified like that of Syria and Persia, which we make use of in Europe; it is only a paste that has undergone no preparation, and has not a tenth part of the virtue of purified opium.

The Dutch send rice and sugar from their settlements to the coast of Coromandel, for which they are paid in specie, unless they have the good fortune to meet with some foreign merchandise at a cheap rate. They send out one or two vessels laden with rice, cottons, and silk: the rice is sold in Ceylon, the cottons at Malabar, and the silk at Surat; from whence they bring back cotton, which is usually employed in the coarser manufactures of Bengal. Two or three ships laden with rice, gum-lac, and cotton stuffs, are sent to Bassora; and return with dried fruits, rose-water, and a quantity of gold. The rich merchandise carried to Arabia is paid for entirely in gold and silver. The trade of the Ganges with the other sea-ports of India brings 1,200,000 annually into Bengal.

Though this trade passes through the hands of the Europeans, and is carried on under their protection, it is not entirely on their own account. The Moguls, indeed, who are usually satisfied with the places they hold under the government, have seldom any concern in these expeditions; but the Armenians, who, since the revolutions in Persia, are settled upon the banks of the Ganges, to which they formerly only made voyages, readily throw their capital into this trade. The Indians employ still larger sums in it. The impossibility of enjoying their fortunes under an oppressive government does not deter the natives of this country from labouring incessantly to increase them. As they would run too great a risk by engaging openly in trade, they are obliged to have recourse to clandestine methods. As soon as an European arrives, the Gentoo, who knows mankind better than is commonly supposed, studies his character; and, if they find him frugal, active, and well informed, offer to act as his brokers and cashiers, and lend or procure him money upon easy terms. This interest, which is usually nine per cent. at least, is higher when he is under a necessity of borrowing of the Cheyks.

These Cheyks are a powerful family of Indians, Chetas, who have, time immemorial, inhabited the banks of the Ganges. Their riches have long ago procured them the management of the bank belonging to the court, the farming of the public revenue, and the direction of the money, which they coin afresh every year, in order to receive annually the benefit arising from the mint. By uniting so many advantages, they are enabled to lend the government 1,750,000, 2,625,000, or even 4,375,000, at a time. When
is eighty leagues from the mouth of the Ganges, and a quarter of a league above the Hughly, the principal seat of their commerce. Their flag is still displayed, and there are a few unhappy wretches remaining there, who have forgotten their country after having been forgotten by it. This factory has no other employment than that of supplying the Moors and the Dutch with mistresses.

The exports from Bengal to Europe consist of musk, Exports. gum lac, nicaragua wood, pepper, cowries, and some other articles of less importance brought thither from other places. Those that are the immediate produce of the country are borax, saltpetre, silk stuffs, muslins, and several different sorts of cottons.

It would be a tedious and useless task to enumerate all the places where ticken and cottons, fit for table-linen, or intended to be worn plain, painted, or printed, are manufactured. It will be sufficient to refer to Dacca, which may be looked upon as the general mart of Bengal, where the greatest variety of finest cottons are to be met with, and in the greatest abundance. See Dacca.

The sum total of the purchases made in Bengal by the European nations, amounted a few years ago to no more than 870,000l. One third of this sum was paid in iron, lead, copper, woolens, and Dutch spices: the remainder was discharged in money. Since the English have made themselves masters of this rich country, its exports have been increased, and its imports diminished, because the conquerors have carried away a greater quantity of merchandise, and pay for it out of the revenues they receive from the country. The revenues of Bengal consist chiefly of rents paid to the government for land. In the year 1811-12, they amounted, including those of Behar and Oriza, to 2,590,000l, to which may be added nearly 200,000l for the monopolies of salt and opium.

For the history of Bengal, and its conquest by the British, see the article INDOSTAN.

BENGEO, a province of the kingdom of Angola in Africa, having the sea on the west, and the province of Moseche on the east. It produces plenty of banana trees; but the Portuguese have grubbed up vast quantities of these, and cultivated the land, which now abounds with maize, and the manioc root of which bread is made. See Jne-

The province is divided into a great number of districts, of which the chiefs are natives, but tributary to Portu-

gal, and obliged to till the lands belonging to the Por-

tuguese. They are Christians, and have eight churches.

BENGuela, a province of the kingdom of An-

gola in Africa, bounded on the east by the river Rim-

ba, on the north by the Coanza, and it extends west-

ward quite to Cape Negro. Benguela was formerly

governed by its own kings; but was entirely ruined by

the incursions of the barbarous Giagas, so that its be-

ing conquered by the Portuguese proved a great hap-

piness. It still retains the title of kingdom, and is al-

lowed to enjoy some small privileges; but is far from

being restored to the state of plenty it enjoyed before

its destruction by the Giagas already mentioned. It

produces abundance of salt, but inferior in quality to

that which is made in the province of Chissama. The

zimbis also, whose shells are current as money through

many countries of Africa, are caught upon the coast.

The country, which is mostly mountainous, abounds

with
with elephants, rhinoceroses, lions, tigers, crocodiles, &c. which are very dangerous, and destroy great numbers of cattle.

BENHINNOM, in Ancient Geography, a valley in the suburbs, and to the east of Jerusalem, either a part of or conjointly with the valley of Kidron, (Joshua); infamous for sacrificing children, or passing them through the fire. The place in the valley where the idol stood to which the sacrifice was made, was called Tophet, (2 Kings xxiii. 10. Jer. vii. 31. 32. and xix. 2.) from beating drums or tabours to drown the cries or shrieks of the children: called also Gecon or the Valley of Ennon: whence some derive Gehenna, the place of future punishment.

BENJAMIN. See BENZOIN and SYTRAX.

BENIARAX, an ancient and considerable town in the kingdom of Algiers in Africa, seated in W. Long. o. 30. N. Lat. 35. o.

BENIN, a country of Guinea, in Africa, has part of the gulf called the Bight of Benin, and the Slave Coast, on the west; part of Gago and Biafara on the north; Myjac and Makoko on the east; and Congo on the south, where it extends about one degree beyond the equinoctial line. The length from east to west is about 600 miles; but its north and south bounds are not so well determined. The land in general is low and woody; in some parts it has rivers and lakes, but in others there is a scarcity of water. There is here a great number of wild beasts, particularly elephants, lions, tigers, leopards, baboons, monkeys, wild boars, deer, &c. The birds are partridges, of which some are blue and some green, turkeys, wild ducks, woodcocks, &c. Their grain is Indian corn: they have no potatoes; but plenty of yams, which are of the potato kind, but vastly larger and more coarse: these are their ordinary food, and serve in the room of bread: they have two sorts of beans, like horse beans, but not near so good. Their fruits are cocoa-nuts, cormoantine apples, bananas, wild figs, &c.

The negroes have several colours which might serve for painting, and a good sort of soap made with palm-oil and wood-ashes; they have a great deal of cotton, which not only serves for their own use, but is exported to distant places. The river Rio or Benin has a great many arms; some of which are so large that they deserve the name of rivers; it abounds with fish, which the inhabitants eat smoke-dried as well as fresh. The place of trade in this river is at Arebo, about 120 miles distant from its mouth; and to this place the ships may sail up. Those who take this voyage see the mouths of a great many rivers fall into the principal channel to the right and the left; but how far it ascends into the country is not known. A little higher up, the country is very low and marshy, and seems to be divided into islands; and yet there are trees of all sizes growing on the banks; this renders the country very unhealthy, as many of our British sailors have found to their cost; it is also incommoded with vast numbers of flies, called mosquitoes, which sting terribly, and render the skin full of pustules. There are three principal villages to which the negroes come from the inland countries to traffic. One is called Boododou, and consists of about 50 houses, or rather huts, for they are made with reeds and covered with leaves. The second, called Arebo, was mentioned above: this is much larger than the former, and pretty well stocked with inhabitants; and the houses Benin. have much more room, but they are built after the same manner. The third has the name of Agaton, and was built upon a hill. It was almost ruined by the wars; but the negroes lately rebuilt it, on account of its agreeable situation. Great Benin is the place of residence of the king.

The inhabitants of Benin are very exact in their trading, and will not recede from any of their old customs: this renders them very slow in their dealings, and backward to pay their debts, which sometimes obliges the traders to sail before they receive satisfaction; but then they are paid as soon as they return. Some of the merchants are appointed by the government, which demands a sort of custom; but it is very trifling. There are three sorts of officers under the king; the first are always near him, and none can address him but by their means: there are several of the second sort; one takes care of the slaves, another of the cattle, another of the streets, another of war, and so on.

Children go almost naked till they are 14, and then they wrap a cotton cloth round their middles; the richer sort put on a sort of calico gowns when they go abroad, with a kind of drawers; but within they are contented with their usual cloth: the better sort of women wear their cotton cloths like petticoats, and have covering round their shoulders, but take care it shall be open before.

The richer sort of the inhabitants of Benin live upon beef, mutton, and poultry; their drink is water, and brandy when they can get it. The poorer sort live upon dried fish, bananas, and beans; their drink is water and palm-wine. Their chief handiworks are smiths, carpenters, and curriers; but they perform all their work in a very bungling manner. The men have as many wives as they can keep, which they take without any ceremony except treating their relations. The wives of the lower sort may go wherever they have a mind; but those of the rich are shut up: they allow their wives to be very familiar with the Europeans, and yet pretend to be very jealous of their own countrymen. When a woman is caught in adultery, she is turned away, and the goods of the man are forfeited to the husband; but if the relations of the woman are rich, they prevail on him to overlook the fault by dint of presents.

They use circumcision, which is performed seven days after the children are born, at which time the father makes a feast for the relations; they have also customs, relating to uncleanness, resembling those of the Jews. Thieves are punished by making the party amends if they can, otherwise they are bastinadoed; but murder is always punished with death. When a person is only suspected of a crime, they have several ways of putting him to trial, like the fire ordeal, or the bitter water of the Jews: but they are of such a nature, that the innocent may be as often condemned as the guilty.

With regard to their religion, they believe in an almighty and invisible God; yet worship images in a human form, and in those of all sorts of animals, making them offerings, every one being his own priest; they look upon these lesser deities as mediators between him and man; some of these idols are in the house, and some
in cabins by themselves. Every fifth day is holy; on which the rich kill cows, sheep, and goats, and other dogs, cats, and fowls, which they distribute among their poor neighbours.

Benin, the capital of a kingdom of the same name, is the residence of their kings, and is seated pretty far in the country: it stands in a plain, and is about four miles in compass. The streets are long and broad: and there are markets twice a-day, where they sell cows, cotton, elephants teeth, European merchanises, and whatever the country produces. The houses are large, with clay walls, and at a distance from each other: they are covered with reeds, straw, and leaves. The women in this place are the greatest slaves; for they go every day to market, manage the household affairs, take care of the children, cook the victuals, and till the ground. The king’s palace makes great part of the town; and, its great extent excepted, there is nothing worth taking notice of, it being only a confused heap of buildings, made with boards and clay, without regularity or neatness. In the middle, there is a wooden tower, about 70 feet high, made like a chimney, and on the top is a brazen serpent, hanging with its head downwards; this is pretty well made, and is the most curious thing in the town; there is a gallery of statues, but so wretchedly carved, that there is no knowing what they represent without being told: behind a curtain there are 11 brazen heads, with an elephant’s teeth on each; these are the king’s idols: his throne is made of ivory, on which sits a pavilion of India stuff. The king shows himself but once a year, on the day of a certain festival; and then he is surrounded with his wives and a great number of his officers, who walk out in procession to begin the feast by sacrificing to their gods; this done, he bestows victuals and wine among the multitude, which is imitated by his officers. All the inhabitants of this town and country go under the denomination of the king’s slaves, and some relations say, that none of them wear any habit till given them by the king: but this seems to be only a salvo to account for the great number of men and women that are daily seen naked in the streets; for it be true, that the king of Benin can bring 100,000 fighting men into the field, his subjects must be very numerous; and probably his majesty is not rich enough to bestow garments upon them all. The Europeans resort hither to purchase slaves.

E. Long. 5. 4. N. Lat. 7. 40.

Benish-days, among the Egyptians, a term for three days of the week, which are days of less ceremony in religion than the other four, and have their name from the benish, a garment of common use, not of ceremony. In Cairo, on Sundays, Tuesdays, and Thursdays, they go to the bashaw’s divan; and these are the general days of business. Friday they stay at home, and go to their mosques at noon; but though this is their day of devotion, they never abstain from business. The three other days of the week are the benish-days, in which they throw off all business and ceremony, and go to their little summer-houses in the country.

Benavena, or Bennavena, (Antonine) a town of Britain, on the Aunon Major, or the Anton of Tacitus: supposed to be Northampton on the Nen; but Camden says it is Wedon, a village six miles Bennavena to the west of Northampton.

Bennet, Henry, earl of Arlington, was born of an ancient family in Middlesex. In the beginning of the civil war, he was appointed under-secretary to George Lord Digby, secretary of state; afterward entered himself as a volunteer for the royal cause, and did his majesty good service, especially at Andover in Hampshire, where he received several wounds. When the wars were ended, he left not the king when success did, but attended his interest in foreign parts. He was made secretary to the duke of York; received the honour of knighthood from Charles II. at Bruges, in 1658: and was sent envoy to the court of Spain. His majesty, upon his return to England, called him home, made him keeper of his privy purse, and principal secretary of state. He had always a peculiar hatred to the lord chancellor Hyde; who on the other hand considered him as a concealed Papist. In 1670 he was one of the council distinguished by the title of the Council, and one of those who advised shutting up the exchequer. In 1672 he was made earl of Arlington and Viscount Thetford, and soon after knight of the Garter. In 1673, he was appointed one of the three plenipotentiaries from the court of Great Britain to Colonna, to mediate a peace between the emperor and the king of France. The house of commons, in 1673, drew up articles of impeachment against him. In 1674 he was made chamberlain of his majesty’s household, with this public reason, that it was in recompense of his long and faithful service, and particularly for his having performed the office of principal secretary of state for the space of 12 years, to his majesty’s great satisfaction. But afterward his interest began to decline, while that of the earl of Danby increased; for upon his return from his unsuccessful journey to Holland in 1675, his credit was so much sunk, that several persons at court diverted the king with mimicking his person and behaviour; yet he held his lord chamberlain’s place to the day of his death in 1685. His esteemed letters to Sir William Temple were published after his death.

Benet, Christopher, an eminent physician in the 16th century, was the son of John Benet, of Raynort, in Somersetshire. He was educated at Lincoln college, Oxford; and gave the public a treatise on consumptions, entitled, Theatrum Tabulatorum Vestibulum, 50c. also Exercitationes Diagnosticæ, cum Historia demonstrativa, quibus Alimentorum et Sanguinis vitæ deteguntur in plerisque morbis, 50c.

Benet, Dr Thomas, an eminent divine, born at Salisbury on the 7th of May 1673, and educated at St John’s college, Cambridge. In 1700, he was made rector of James’s in Colchester: afterwards he was lecturer of St Olave’s, Southwark, and morning-preacher at St Lawrence, Jewry; and at last was presented to the vicarage of St Giles’s, Cripplegate, worth 500l. a-year. While he was in this station, he was engaged in several expensive lawsuits in defence of the rights of the church, to which he recovered 150l. a-year. He wrote 1. An Answer to the Dissenters Plea for Separation. 2. A Confutation of Popery. 3. A Discourse of Schism. 4. An Answer to a book entitled Thomas against Benet. 5. A Confutation of Quakerism.
BENOIT, RENATUS, a famous doctor of the Sorbonne, and curate of Eustathius at Paris, in the 16th century. He was a secret favourer of the Protestant religion; and that his countrymen might be able to read the bible in their own tongue, he published at Paris the French translation, which had been made by the reformed ministers at Geneva. This translation was approved of by several doctors of the Sorbonne before it went to the press, and King Charles IX. had granted a privilege for the printing of it. Yet when it was published it was immediately condemned. He had been before that time confessor to the unhappy Mary queen of Scotland, during her stay in France, and attended her when she returned into Scotland. Some time before the death of Henry III. Dr Benoit, or some of his friends with his assistance, published a book, entitled, Apologie Catholique, i.e. The Catholic Apology; in which it was shown, that the Protestant religion, which Henry king of Navarre professed, was not a sufficient reason to deprive him of his right of succeeding to the crown of France. When Henry IV. was resolved to embrace the Catholic religion, he assisted at that assembly in which King Henry abjured the reformed religion. The king promised him to the bishopric of Toulouse in Champagne in 1597, but he could never obtain the pope’s bulls to be installed. However, he enjoyed the temporalities of that bishopric till he resigned it. He died in 1608.

BENESERADE, ISAAC DE, an ingenious French poet of the 17th century, was born at Lyons. He made himself known at court by his verses and his wit, and had the good fortune to please the cardinals de Richelieu and Mazarin. After the death of Richelieu, he got into favour with the duke de Breze, whom he accompanied in most of his expeditions; and when this nobleman died, he returned to court, where his poetry became highly esteemed. He wrote, 1. A Paraphrase upon Job. 2. Verses for Interludes. 3. Rondeaux upon Ovid. 4. Several Tragedies. A sonnet which he sent to a young lady with his Paraphrase on Job being put in competition with the Urania of Voiture caused him to be much spoken of; for what an honour was it to be head of a party against this celebrated author! Those who gave the preference to Benserade’s performance were styled the Jobissis, and their antagonists the Uranissis; and the dispute long divided the whole court and the wits. Some years before his death, he applied himself to works of piety, and translated almost all the Psalms.

M. l’Abbé Olivet says, that Benserade towards the latter end of his life, withdrew from court, and made Gently the place of his retirement. When he was a youth, he says it was the custom to visit the remains of the ornaments with which Benserade had embellished his house and gardens, where every thing savoured of his poetical genius. The bark of the trees was full of inscriptions; and, amongst others, he remembers the first which presented itself was as follows:

Aidez fortune, honneurs adieu, vous et les vôtres,
Je viens de vous oublier;
Aidez toi même amour, bien plus que les autres.
Difficile a agréer.

Fortune and honours, all adieu,
And whatsoever belongs to you.
I to this retirement run,
All your vanities to shun.
Thou too adieu, O powerful love;
From thee ’tis hardest to remove.

M. Voltaire is of opinion that these inscriptions were the best of his productions, and he regrets that they have not been collected.

Benseraude suffered at last so much from the stone, that, notwithstanding his great age, he resolved to submit to the operation of cutting. But his constancy was not put to this last proof; for a surgeon letting him blood, by way of precaution, pricked an artery, and, instead of endeavouring to stop the effusion of blood, ran away. There was but just time to call F. Commire, his friend and confessor, who came soon enough to see him die. This happened the 19th of October 1691, in the 82d year of his age.

BENSHEIM, a town of Germany in the grand duchy of Hesse, seated in E. Long. 8. 45. N. Lat. 52 23.

BENSON, DR. GEORGE, a learned dissenting minister, born at Great Saltield, in Cumberland, in 1699. His love of learning was so successful, that, at 11 years of age, he was able to read the Greek Testament. He afterwards studied at Dr Dixon’s academy at Whitchurch, from whence he removed to the university of Glasgow. In 1721, he was chosen pastor of a congregation of Dissenters at Abingdon in Berkshire; in 1729, he received a call from a society of dissenters in Southwark, with whom he continued 11 years; and in 1740, was chosen by the congregation of Crutched Friars, colleague to the learned and judicious Dr Lairner. From the time of his engaging in the ministry he proposed to himself the critical study of the Scriptures, particularly of the New Testament, as a principal part of his business. The first fruits of these studies which he presented to the public, was A Defence of the Reasonableness of Prayer, with a Translation of a Discourse of Maximus Tyrius, containing some popular Objections against Prayer, and an Answer to these. The light which Mr Locke had thrown on the obscure parts of St Paul’s epistles, by making him his own expositor, encouraged and determined Mr Benson to attempt to illustrate the remaining epistles in the same manner. In 1731, he published a Paraphrase and Notes on the Epistle to Philemon, as a specimen. This was well received, and the author encouraged to proceed in his design. With the epistle to Philemon was published A short dissertation, to prove from the spirit and sentiments the apostle discovered in his epistles, that he was neither an enthusiast nor impostor; and consequently that the religion which he asserted he received immediately from heaven, and confirmed by a variety of miracles, is indeed divine." This argument hath since been improved and illustrated, with great delicacy and strength, in a review of the apostle’s entire conduct and character by Lord Lyttelton. Mr Benson proceeded with great diligence and reputation to publish Paraphrases
BENSON

phrases and Notes on the two Epistles to the Thessalonians, the first and second to Timothy, and the Epistle to Titus; adding, Dissertations on several important Subjects, particularly on Inspiration. In the year 1733, our author published his History of the first Planting of Christianity, taken from the Acts of the Apostles, and their Epistles, in 2 vols 4to. In this work, besides illustrating throughout the history of the Acts and most of the epistles, by a view of the history of the times, the occasion of the several epistles, and the state of the churches to whom they were addressed, he established the truth of the Christian religion on a number of facts, the most public, important, and incontestable. He also wrote, The Reasonableness of the Christian Religion; The History of the Life of Jesus Christ; A Paraphrase and Notes on the seven Catholic Epistles; and several other works which procured him great reputation. One of the universities in Scotland sent him a diploma, with a doctor's degree; and many of high rank in the church of England, as Herring, Hoadley, Butler, Benson, Coneybeare, &c. showed him great marks of favour and regard. He died in the year 1763, in the 64th year of his age.

BENTHAM, THOMAS, bishop of Litchfield and Coventry, was born at Shirburn in Yorkshire in the year 1713, and educated in Magdalen College, Oxford. He took the degree of bachelor of arts in 1743, and in 1746 was admitted perpetual fellow, and proceeded master of arts the year following, which was that of Edward VI's accession to the crown. He now threw off the mask of Popery, which during the equivocal reign of Henry VIII. he had worn with reluctance. When Mary came to the crown, being deprived of his fellowship by her visitors, he prudently retired to Basel in Switzerland, where for some time he expounded the Scriptures to the English exiles in that city; but, being solicited by some Protestants in London, he returned to London before the death of the queen, and was appointed superintendent of a private congregation in the city. Immediately on the accession of Elizabeth, Bentham was preferred in the church, and in the second year of her reign was consecrated bishop of Litchfield and Coventry. He died at Ecclesial in Staffordshire in 1758, aged 65. He was buried in the chancel of the church there; and a monument was erected, with the effigy of himself, his wife, and four children, with the following inscription:

Hoc jacet in tumba Benthamus, episcopus ille
Doctus, divinus, largus, pascens, pius, alius...

Bishop Bentham had the character of a pious and zealous reformer, and was particularly celebrated for his knowledge of the Hebrew language. His works are, 1. Exposition of the Acts of the Apostles; manuscript. 2. A Sermon on Christ's Temptation; Lond. 8vo. 3. Epistle to M. Pärker; manuscript. 4. The Psalms, Ezekiel, and Daniel, translated into English in Queen Elizabeth's Bible.

BENTINCK, W. H. C. third duke of Portland, a late British statesman. See Supplement.

BENTIVOLIO, Guy, cardinal, born at Ferrara, in the year 1579. He went to study at Padua, where he made a considerable proficiency in polite literature. Upon his leaving the university, he went to reside at Rome, where he became universally esteemed. He was sent nuncio to Flanders, and then to France; in both which employments his behaviour was such as gave great satisfaction to Paul V. who made him a cardinal, which was the last promotion he made, a little before his death, which happened on the 28th of January 1621. Bentivoglio was at this time in France, where Louis XIII. and all the French court congratulated him on his new dignity; and when he returned to Rome, his Christian majesty entrusted him with the management of the French affairs at that court. Pope Urban VII. had a high regard for him on account of his fidelity, disinterestedness, and consummate knowledge in business. He was beloved by the people, and esteemed by the cardinals; and his qualities were such, that in all probability he would have been raised to the pontificate on the death of Urban, which happened on the 20th of July 1644; but having gone to the conclave during the time of the most intolerable heats at Rome, it affected his body to such a degree, that he could not sleep for 11 nights afterwards; and this want of rest threw him into a fever, of which he died the 7th of September 1644, aged 65. He has left several works, the most remarkable of which are, A History of the Civil Wars of Flanders, An Account of Flanders, with Letters and Memoirs.

BENTIVOLIO, a small town of Italy in the territory of Bologna, with a castle, situated in the Long. 11. 34. N. Lat. 44. 47.

BENTLEY, RICHARD, an eminent critic and divine, was born at Oulton, in the parish of Rothwell, near Wakefield. His ancestors, who were of some consideration, possessed an estate, and had a seat at Heperwall, in the parish of Halifax. His grandfather James Bentley was a captain in King Charles I.'s army at the time of the civil wars; and being involved in the fate of his party, had his house plundered, his estate confiscated, and was himself carried prisoner to Pomfret Castle, where he died. Thomas Bentley, the son of James, and father of Dr Bentley, married the daughter of Richard Willis of Oulton, who had been a major in the royal army. This lady, who was a woman of excelling good understanding, taught her son Richard his accidence. To his grandfather Willis, who was left his guardian, he was in part indebted for his education; and having gone through the grammar school at Wakefield with singular reputation, both for his proficiency and his exact and regular behaviour, he was admitted of St John's college, Cambridge, under the tuition of Mr Johnson, on the 24th of May 1676; being then only four months above 14 years of age. On the 22nd of March 1682-3, he stood candidate for a fellowship, and would have been unanimously elected, but he was not excluded by the statutes on account of his being too young for priest's orders. He was then a junior bachelor, and but little more than 19 years old. It was soon after this that he became a schoolmaster at Spalding. But that he did not continue long in this situation is certain from a letter of his grandfather Willis's, still preserved in the family, from which it appears, that he was with Dr Stilligfeet at the deanery of St Paul's on the 25th of April 1683. He had been recommended by his college to the dean as preceptor to his son; and Dr Stilligfeet gave Mr Bentley his choice whether he would carry his pupil to Cambridge.
Bentley. Cambridge or Oxford. He fixed upon the latter university on account of the Bodleian library, to the consulting of the manuscripts of which he applied with the closest attention. Being now of age, he made over a small estate which he derived from his family to his elder brother, and immediately laid out the money he obtained for it in the purchase of books. In July 1683, he took the degree of master of arts at St John’s college, Cambridge. In 1692, his patron being advanced to the see of Worcester, collated him to a prebend in that church, and also made him his domestic chaplain. That learned prelate, as well as Dr Will. Lloyd, then bishop of Litchfield, had seen many proofs of our author’s extraordinary merit, when they concurred in recommending him as a fit person to open the lectures upon Mr Boyle’s foundation, in defence of natural and revealed religion. This gave him a fine opportunity of establishing his fame. He saw it well; and resolved to push it to the utmost.

Sir Isaac Newton’s Principia had been published but a few years, and the book was little known and less understood. Mr Bentley therefore determined to spare no pains in displaying to the best advantage the profound demonstrations which that excellent work furnished in proof of a Deity; and that nothing might be wanting to complete the design, he applied to the author and received from him the solution of some difficulties which had not fallen within the plan of his treatise*. In short, our author’s sermons at Boyle’s lectures were universally admired, and highly raised his reputation as a preacher; notwithstanding that escape which led him open to the raillery of Dr Keil, viz. of proving the moon not to turn round her axis, because she always shows the same face to the earth. In 1693, he was made keeper of the royal library at St James’s.

In the following year arose the famous dispute between him and the honourable Mr Boyle, in relation to the epistles of Phalaris; of which Mr Boyle had published a very fine edition, with a Latin version of the text. These epistles the Doctor asserted to be spurious, the production of some sophist, and altogether contemptible as a literary performance. The principal pieces which appeared in this noted controversy were: 1. Dr Bentley’s dissertation upon the epistles of The mostocles, Socrates, Euripides, Phalaris, and the Fables of Æsop, at the end of the second edition of Mr Wotton’s Reflections on Ancient and Modern Learning: but afterwards printed by Dr Bentley entire, and added with great additions to his farther defence of it, in answer to Mr Boyle. 2. “Dr Bentley’s Dissertation on the Epistles of Phalaris and the Fables of Æsop examined by the Honourable Charles Boyle, Esq.” a book more commonly known by the title of Boyle against Bentley. 3. Dr Bentley’s Answer to the above, commonly known by the name of Bentley against Boyle; a curious piece, interspersed with a great deal of true wit and humour. From the caprice or partiality of the age the victory was adjudged to Mr Boyle; and the ridicule of the writers exercised upon Dr Bentley. Thus

Dr Bentley had also some ways who were his enemies even at Cambridge, who drew his picture in the hands of Phalaris’s guards, who were putting him into their master’s bull, and out of the Doctor’s mouth came a label with these words, I had rather be Roasted than Boyled. And Dean Swift, in his Tale of a Tub, had some strokes at Dr Bentley upon this occasion, but more especially in his Battle of the Books, where, on account of Dr Bentley’s Dissertation of Phalaris, &c. being annexed to Mr Wotton’s Reflections on Learning, and their being great friends, he makes Mr Wotton and Dr Bentley, standing side by side, in each other’s defence, to be both transfix’d to the ground by one stroke of the javelin of Mr Boyle, and thus he heightens by the simile of a cook’s spitting a brace of woodcocks. Nay, so strong is the influence of literary prejudice and fashion, that many even of Dr Bentley’s friends considered Boyle’s Examination as unanswerable. Nor could they be convinced of the contrary, till the Doctor, first asking them where it was so impregnable, and confuting one article after another upon the spot, as fast as they instanced, assured them it was all of the same kind. This he effectively showed in his answer. It now, however, seems to be the settled opinion of the literary world, that the Doctor has not only the evident advantage in respect of learning and argument, but he is little, if at all, inferior to his antagonist in point of wit and smartness. If they not, however, be amiss to recite a few testimonies on the subject. Mr Walpole, speaking of Mr Boyle’s translation of the Epistles of Phalaris, says, “This work occasioned the famous controversy with Dr Bentley;—who alone, and unworsted, sustained the attacks of the brightest geniuses in the learned world, and whose fame has not suffered by the wit to which it gave occasion.” Mr Towers, in his British Biography, expresses himself in the following terms: “In the controversy between him and Mr Boyle, the popular clamour, indeed, was in favour of the latter; but Bentley’s is unquestionably a much more valuable performance than that of Boyle. The latter, considered as a mere English composition, has the advantage in point of style; and pleased the generality, by the personal satire which it contained against Dr Bentley, who had many enemies. But Bentley had greatly the superiority with respect to just reasoning, critical sagacity, and extent of learning; and his vindication of himself also contained many shrewd and sarcastical strokes against Mr Boyle and his performance. Much has been said in favour of Mr Boyle, as a genteel and polite writer; and it must be confessed, that Dr Bentley’s manner was often too assuming, and that he was deficient in point of civility. But notwithstanding this, there was, perhaps, a much greater want of real candour and politeness, whatever affection of them there might be, in the very contemptuous and unfair manner in which Dr Bentley was treated throughout Mr Boyle’s book, than in any thing which Bentley had said against Boyle. Bentley, with all his foibles, was too respectable a character to be a proper subject of such treatment: though Swift, Garth, and Pope, have joined in contumaciously the popular prejudices against him.” Mr Dodwell, who resided at Oxford during the controversy, who made himself in some sort a party in it, and who had a very particular court paid to him by the Christ-Church men, declared to them that he never learned so much from any book of the size in his life,
Ben

Boyle.

In 1696, at the public commencement, Mr Bentley had been created doctor of divinity by the university of Cambridge; and some time thereafter, admitted, ad eundem, in the university of Oxford.

In 1700 he was presented to the mastership of Trinity college, Cambridge, which is reckoned worth near 1000l. per annum. Upon this promotion he resigned his prebend of Worcester; and, in 1701, was collated to the archdeaconry of Ely. Being thus placed in a state of ease and affluence, he entered into matrimony, and indulged his inclination in critical pursuits; and the fruits of his labours, which he occasionally published, all displayed such erudition and sagacity, that, by degrees, he obtained the character of being the greatest critic of the age. In the mean while, however, he carried matters with so high a hand in the government of his college, that, in 1709, a complaint was brought before the bishop of Ely, as visitor, against him, by several of the fellows, who charged him with embez-

zing the college money, and other misdemeanors. In answer to this, he presented his defence to the bishop, which he published in 1710, under the title of The present State of Trinity College, 8vo: and thus began a quarrel, which was carried on with the most vitriolic animosity on each side, for above 20 years, when it at last ended in the Doctor's favour. In 1716, upon the death of Dr James, he was appointed regius pro-

fessor of divinity in the former university, annexed to which was a good benefice in the bishopric of Ely. His majesty King George I. on a visit to the university in 1717, having, as usual, nominated by mandate several persons for a doctor's degree in divinity, our professor, to whose office it belonged to perform the ceremony called creation, demanded four guineas from each person, besides a broad piece of gold, and absolutely refused to create any doctor without these fees: hence there arose a long and warm dispute, during which, the doctor was first suspended, and then degraded; but on a petition to his majesty for relief from that sentence, the affair was referred to the court of King's bench, where the proceedings against him being reversed, a mandamus was issued, charging the university to restore him. With regard to Dr Bentley's long dispute with his college, Mr Whiston represents his having been induced in a single instance, after four years of unexceptionable conduct, to recede from the excellent rule of detur digniori, in the election to a fellowship, as the first false step which led to others, and was very prejudicial to his own happiness. A concise and accurate account of his controversies with his college and the university, and of the publications which appeared on these occasions, may be seen in Mr Gough's anecdotes of topography. There are likewise, in the Harleian collection of manuscripts in the British Mu-

museum, No. 7523, some authentic papers, relative to the proceedings of the university against Dr Bentley. Dr Bentley was endowed with a natural hardness of temper, which enabled him to ride out both these storms without any extraordinary disturbance, or interruption to his literary pursuits. In his private character, though he is generally allowed to have been too fond of money, he was hearty, sincere, and warm in his friendship, an affectionate husband, and a most indulgent father. He loved hospitality and respect; maintained the dignity and munificence of the ancient abbots in house-keeping at his lodge, which he beautified; and, in conversation, tempered the severity of the critic with such a peculiar strain of vivacity and pleasantry, as was very entertaining. He died at his lodge in Trinity college, on the 14th of July 1742, at 85 years of age. To his latest hour, he could read the smallest Greek Testament without spectacles; and he died of a young man's disorder, a pleuritic fever. He was of a large and robust frame of body, and of strong features. These gave a dignity, perhaps a severity, to his aspect, which probably heightened the opinion many had conceived of the haughtiness and roughness of his temper. But, in fact, he was of so tender a disposition, that he never read a touching story without tears. It was not, indeed, till after he had been afflicted with a slight paralytic stroke, that this particular effect of the softness of his nature was in every case apparent: so that it may possibly be imputed, in some degree, to his disorder. It is, however, certain that previous to that event he was ended with great tenderness and sensibility. In the contest about the visitatorial power, when he met Bishop Moore, he was so struck with seeing his old friend appear in a hostile manner against him, that he fainted away in the court.

When we consider the great abilities and uncommon erudition of which Dr Bentley was possessed, it reflects some disgrace on our country, says Dr Kippis, that even his literary reputation should be so long treated with contempt; that he should be represented as a mere verbal critic, and as a pedant without genius. The unjust light in which he was placed, was not entirely owing to the able men who opposed him in the Boylean controversy: it arose perhaps principally from the poets engaging on the same side of the question, and making him the object of their satire and ridicule. The "flashing Bentley" of Pope will be remembered and repeated by thousands who know nothing of the Doctor's real merit. Having mentioned this epithet, we shall add the candid note of the poet's right revere-
d editor. "This great man with all his faults, deserved to be put into better company. The following words of Cicero describe him not amiss: "Habuit a natura genus quoddam acuminis, quod etiam arte k

maverat, quod erat in reprehendis verbis versutum et solers; sed sepe stomachosum, nonnumquam frigidum, interdum etiam ficetum." In the fourth book of the Dunciad, Mr Pope introduces our critic at greater length, and with still greater severity. Perhaps it may be found that the asperity of Mr Pope was not entirely owing to the combination of certain wits and poets against Dr Bentley, but to personal resentment. We are told that Bishop Atterbury, having Bentley and Pope both at dinner with him, insisted on knowing what opinion the Doctor entertained of the English Homer. He for some time eluded the question; but at last, being urged to speak out, he said, "The verses are good verses; but the work is not Homer, it is Spandonus." It must indeed be acknowledged, that one cause of Dr Bentley's having enemies, was his not always bear-
ing his faculties with sufficient meekness. He appeared to have had a considerable degree of literary pride, and to have spoken of himself and others with uncommon freedom. Mr Whiston informs us of the Doctor's ba-

ving.
BENTLEY, ving said, "That when he himself should be dead, Wasse would be the most learned man in England." Dr Salter, who was extremely devoted to the memory of Dr Bentley, confessed that he was remarkable for his "fustus," especially towards his equals, and for speaking highly of himself. But at the same time, he is described by Dr Salter as having been a very amiable and pleasant man in private life, and as possessing much good nature, though he had been otherwise represented. This account agrees with the most authentic information from different quarters. It is related of Dr Bentley, that he used to pull off his hat to the younger students, but would not do it to the fellows of his college. Being asked the reason for making this difference, he answered, "That the young ones might come to something; but for the others, they never could be good for any thing."

The Doctor's principal works, besides those already mentioned, were: 1. Animadversions and Remarks on the poet Callimachus. 2. Annotations on the two first Comedies of Aristophanes. 3. Emendations, &c. on the Fragment of Menander and Philemon. 4. Remarks upon Collins's discourse of freethinking. 5. Beautiful and correct editions of Horace, Terence, Phedrus, and Milton, with notes.

In 1721 he published Proposals for printing a new edition of the Greek Testament, and St Hierom's Latin version; in which edition he intended to make no use of any manuscript that was not at least 1200 years old. Upon these proposals Dr Middleton published some remarks; and the work never made its appearance. "If Dr Middleton's attack contributed to this event (Dr Kippis observes), he certainly did no little disservice to the cause of sacred literature. The completion of Dr Bentley's noble undertaking was the principal employment of the latter part of his life. He had collected and collated all the manuscripts of Europe to which access could be obtained. For this purpose, his nephew Thomas Bentley, L.L. D. well known in the republic of letters, travelled through Europe at his uncle's expense. The work was of such magnitude, that he found it necessary, for the first time, to publish proposals for printing it by subscription. The whole was completed for publication; and he had received 2000l. in part of the subscription, all of which he returned to the subscribers when he took the resolution of not letting it appear in the world during his own life. The work is now in the possession of his executor Dr Richard Bentley, one of the senior fellows of Trinity College, and rector of Nailston near Ashby in Leicestershire; and it is hoped that at some future period it may yet see the light.—Other valuable remains of Dr Bentley are still in existence; some of which are in the hands of his executor, and some in those of Mr Cumberland his grandson. The latter gentleman is possessed of the Doctor's classic books, with his marginal notes. From these notes Mr Cumberland hath published an edition of Lucan; which though not perfect throughout, is full and complete with regard to the four first books. The same gentleman has a Homer of our great critic's, with many marginal notes and corrections, preparatory to an edition of it which he intended to have given. Dr Bentley's critical correspondence, with his numerous literary acquaintance, which must be very instructive and entertaining, is not only preserved, but designed to be laid before the public."

The Doctor's publication of Milton, it is said, was owing to Queen Caroline. Her majesty represented to him, that he had printed no edition of an English classic, and urged him to undertake Milton. His notes upon this great poet have been the worst received of any of his critical performances. The learned Bishop Newton speaks of them with considerable severity, intermixed, however, with some applause.

BENZOIN, in Materia Medica, a concrete resinous juice, obtained from a species of styrrx. See Chemistry and Materia Medica Index.

BERMAS, a coarse cloth, all made with cotton-thread, which comes from the East Indies, and particularly from Surat.

BERAR, a province of Asia, in the British East Indian possessions, adjoining to the province of Bengal. It abounds in corn, rice, pulse, and poppies, from which last they extract opium; and sugar-canes grow almost without cultivation. One fourth of the inhabitants are Mahometans and three fourths Hindoos.

BERAUM, a royal city of Bohemia, and capital of a circle of the same name. E. Long. 14. 25. N. Lat. 50. 2.

BERAY, a town of Normandy in France, situated in W. Long. 1. 20. N. Lat. 49. 6.

BERBERIS, the Barberry. See Botany Index.

BERBICE, a river of Terra Firma in America, which falls into the North sea, in S. Lat. 6. 30. The district on both sides of the river has the same name, and was long a Dutch colony, but in 1814 was ceded to Britain. See Berbice, Supplement.

BERCARIO, Berqueria, or Berkeria, in middle-age writers, denotes a sheep-fold, sheep-cote, sheepen, or other enclosure, for the safe keeping a flock of sheep.—The word is abbreviated from berbicaria or berbes, detorted from berex. Hence also a shepherd was denominated berbicarius and berquarius.

BERCHEROIT, or Berchero, a weight used at Archangel, and in all the Russian dominions, to weigh such merchandises as are heavy and bulky. It weighs about 364 lb. English avoirdupois weight.

BERCHEM, or BERCHEM, NICHOLAS, an excellent painter, was a native of Haerlem, and born in 1624. He received instructions from several very eminent masters: and it was no small addition to their fame that Berchem was their scholar. The charming pictures of cattle and figures by this admirable master are justly held in the highest estimation. He has been singularly happy in having many of them finely engraved by John Visscher, an artist of the first rank. Berchem had an easy expeditious manner of painting, and an inexpressible variety and beauty in the choice of sites for his landscapes; executing them with a surprising degree of neatness and truth. He possessed a clearness and strength of judgment, and a wonderful power and ease in expressing his ideas; and although his subjects were of the lower kind, yet his choice of nature was judicious, and he gave to every subject as much of beauty and elegance as it would admit. The leafing of his trees is exquisitely and freely touched; his skies are clear; and his clouds float lightly, as if supported by air. The distinguishing characters of the pictures of Berchem are, the breadth and just distribution..."
BERCHEFT, Peter, an eminent history painter, was born in France in 1659, and at the age of 18 was employed in the royal palaces. He came to England in 1681, to work under Rambour, a French painter of architecture; but, after staying a year, returned to Marli. He came again, and was sent by King William to the palace he was building at Loo, where he was employed 15 months; and then came a third time to England, where he had sufficient business. We are informed by Mr. Walsby, that he then painted the ceiling of the chapel of Trinity college, Oxford, the staircase at the duke of Schomberg's in Pall-mall, and the summer-house at Ranelagh. His drawings in the academy were much approved. Towards the close of his life he retired to Marybone, where he painted only small pieces of fabulous history, and died there in January 1720.

BERDASH, in antiquity, was a name formerly used in England for a certain kind of neck-dress; and hence a person who made or sold such neckcloths was called a berdasher, from which is derived our word haberdasher.

BERYCYNTHIA, the mother of the gods, in the Pagan theology.

BERENGARIANISM, a name given by ecclesiastical writers to the opinion of those who deny the truth and reality of the body and blood of Christ in the eucharist. The denomination took its rise from Berengarius, archdeacon and scholiast of the church of St. Mary at Anjou about the year 1033, who maintained, that the bread and wine, even after consecration, do not become the true body and blood of our Lord, but only a figure and sign thereof.

Berengarianism was strenuously opposed by Lanfranc, Guittmond, Adelmannus, Albericus, &c. Divers synods were held, wherein the author was condemned at Rome, Versailles, Florence, Tours, &c. He retractated, and returned again more than once; signed three several Catholic confessions of faith; the first in the second council of Rome, the second in the third, and the third in the fourth council of the same city. But he still relapsed to his former opinion when the storm was over; though Mabillon maintains he soon recovered from his fourth fall, and died an orthodox Catholic in 1088.

BERENICE, daughter of Ptolemy Auletes king of Egypt, succeeded her father before his death. This banished prince implored the assistance of the Romans. Pompey restored him. Berenice, to support herself on the throne, allured a prince, whose name was Seleucus, descended from the kings of Syria, and admitted him to her nuptial bed, and to her sceptre. She was soon weary of him, and put him to death. She next cast her eye on Archelaus, who married her, and put himself at the head of her troops to repulse the Romans. He was killed in a battle. Ptolemy returned to Alexandria, and put his rebellious daughter to death.

BERENICE, wife of Ptolemy Euergetes king of Egypt, cut off her hair in pursuance of a vow, and consecrated it in the temple of Venus. This deposit being afterwards lost, Conon the mathematician, in compliment to her, declared that the queen's locks had been conveyed to heaven, and composed those seven stars near the tail of the bull, called to this day consta Berenices.

BERENICE, daughter of Costobarus and of Salome sister to Herod the Great, was married first to Aristobulus, son of the same Herod and Mariamne. He having a brother who married the daughter of Archelaus king of Cappadocia, often upbraided Berenice that he was married below himself in wedding her. Berenice related all these discourses to her mother, and exasperated her so furiously, that Salome, who had much power over Herod's mind, made him suspect Aristobulus, and was the principal cause that urged this cruel father to get rid of him. She married again; and having lost her second husband, went to Rome, and got into the favour of Augustus. But, above all, she iniciuated herself into the good graces of Antonius, the wife of Drusus, which in the end proved of great service to Agrippa.

BERENICE, grand-daughter of the preceding, and daughter of Agrippa I. king of Judas, has been much talked of on account of her amours. She was betrothed to one Marcus, but he died before the marriage. Soon after, she married his uncle Herod, who at the desire of Agrippa, both his brother and father-in-law, was created king of Chalcis by the emperor Claudius. She lost her husband in the eighth year of the emperor Claudius; and in her widowhood, it was rumoured she committed incest with her brother Agrippa. To put a stop to this report, she offered herself in marriage to Ptolemon king of Cilicia, provided he would change his religion. He accepted her offers, was circumcised, and married her. Berenice soon left him to follow her own ways, and he abandoned Judaism to return to his former religion. She was always very well with her brother Agrippa, and seconded him in the design of preventing the desolation of the Jews. She got Titus into her snare; but the murmurs of the Roman people hindering her from becoming his wife, there remained nothing for her but the title of mistress or concubine of the emperor. The French stage, in the 17th century, resounded with the amours of Titus and Berenice.

BERENICE, in Ancient Geography, the name of several cities, particularly of a celebrated port-town in the Sinus Arabicus: Now Suez; which see. Berenice's Hair, Coma Berenices. See Berenice. BEREOREGIS, a town of Dorsetshire in England, in W. Long. 2. 15. N. Lat. 50. 40.

BERESOW, a division of the province of Tobolsk in Siberia. It is bounded on the north by the straits of Waigirtz, on the east by a large bay of the Frozen ocean, which runs into the land towards the south, and at the 65th degree of latitude separates into two arms; one of which is called the Obkasie-Guba, at
BERE"o", bay; and the other Tassowskaia-Guba, or the bay of Tassow. The river Oby empties itself into the former, and the Taz into the latter. This district was under the Russian dominion long before the other parts of Siberia were conquered, being reduced by the Czar Gabriel so early as the year 1530.

BEREWICHIA, or BEREWICA, in our old writers, denotes a village or hamlet belonging to some town or manor, situated at some distance therefrom.—The word frequently occurs in Doomsday-book: *Ista sunt bere-weiha ejusdem maneri.*

BERG, a duchy of Germany, in the circle of Westphalia. It is bounded on the north by the duchy of Cleves, on the west by the county of Mark and the duchy of Westphalia, on the south by Westerwald, and on the east by the diocese of Cologne, from which it is separated by the Rhine. It contains about 1,588 square miles, with 239,000 inhabitants. It is very fruitful along the Rhine, but mountainous and woody towards the county of Mark. It was formerly subject to the elector palatine, but since 1815 has been included in the grand duchy of the Lower Rhine, which belongs to Prussia. The duchy of Berg was taken from Bavaria in 1806, and bestowed upon Murat, afterwards king of Naples. It is a populous and flourishing district. The principal rivers, besides the Rhine, are the Wipper, Agger, and Sing.

BERG, St Winoc, a town of the Low Countries, in the country of Flanders, fortified by Vauban, and subject to France. It is situated on the river Colme, six miles from Dunkirk, and 31 from Ypres. The air is often very unwholesome, especially to strangers. The river Colme serves instead of a canal to go to Hondehot, St Omer's, and Gravelines. There is likewise another canal to go to Dunkirk. The villages in its territory are very famous for butter and cheese, of which they send a great quantity to France. Fort Lapin and Fort Pig in are within cannon shot of this place, and Fort St Francis is seated on the canal, near three miles from the town. E. Long. 2° 25'. N. Lat. 50° 37'.

BERG-ZABERN, a town of France, in the department of the Lower Rhine. E. Long. 7° 55'. N. Lat. 49° 4'.

BERG-Gruin, in Natural History, the name of an earth used in painting, and properly called green oke, though not known among the colour-men under that name. It is found in many parts of Germany, Italy, and England, commonly in the neighbourhood of copper-mines, from particles of which metal it receives its colour. In many parts of Germany, they have a purer kind of this, distinguished by no peculiar name, but separated by art from the waters draining from the copper-mines, and differing no otherwise from this native substance, than as the washed oke of Oxfordshire, &c. do from those sent us in their natural condition. The characters by which the native kind is known from other green earths, are these: it is a dense compact substance, considerably heavy, and of a pale but disagreeable green; of a rough and uneven, but not dusty surface, and somewhat unctuous to the touch. It adheres firmly to the tongue; does not break easily between the fingers; nor at all stain the hands. It is of a brackish disagreeable taste, and does not ferment with acids.

BERGAMASCO, a province of Italy, in the Austrovenetian territories. It is bounded on the east by the

Brescan, on the north by the Valtiline, on the west and Bregium south by the Alpines. It extends about 36 leagues from north to south, and go from east to west. It is watered by several rivers, which render it very fertile, and particularly it produces a great number of theatres. It has mines of iron, and quarries of marble, and other stones of which they make millstones. There are a great number of villages, but no city except Bergamo the capital. The people are very industrious, and make the best of their natural productions. They are well stocked with cattle, and make fine tapestry. Their language is the most corrupt of any in Italy.

BERGAMO, JAMES PHILIP DE, an Aquinian monk, born at Bergamo in 1434, wrote in Latin a Chronicle from the creation of the world to the year 1503, and a Treatise of Illustrious Women. He died in 1518.

BERGAMO, anciently Bergomus, a large and strong town of Italy, in the Venetian territory, and capital of the province of Bergamasco. It has a strong citadel, and is the seat of a bishop. Its situation near the Alps makes the inhabitants subject to swellings in their throats, owing to the coldness of the Alpine waters. E. Long. 9° 38'. N. Lat. 45° 42'.

BERGAMOT, a species of citrus, produced at first casually by an Italian grafting a citrus on the stock of a bergamot pear-tree, whence the fruit produced by this union participated both of the citrus-trees and the pear-tree. The fruit hath a fine taste and smell, and its essential oil is in high esteem as a perfume. The essence of bergamot is also called *camphora de cedro.* It is extracted from the yellow rind of the fruit by first cutting it in small pieces, then immediately squeezing the oil out of them into a glass vessel. This liquid is an ethereal oil. A water is distilled from the peel as follows: Take the outer rind of three bergamots, a gallon of pure proof-spirit, and four pints of pure water; draw off a gallon in a balsemum maris, then add as much of the best white sugar as will be agreeable. Or take of the essence of bergamot three drams and a half, of rectified spirit of wine three pints, of volatile sal ammoniac a dram; distil off three pints in a balsemum maris.

BERGAMOT is also the denomination of a coarse tapestry, manufactured with flocks of silk, wool, cotton, hemp, ox, cow, or goat's hair, and supposed to be invented by the people of Bergamo in Italy.

BERGARAC, a very rich, populous, and trading town of France, seated on the river Dordogne, in E. Long. 0° 37'. N. Lat. 50° 57'.

BERGAS, a town of Romania, in European Turkey, and the see of a Greek archbishop. It is seated on the river Larissa, in E. Long. 2° 30'. N. Lat. 41° 17'.

BERGEN, anciently Bergen, a city of Norway, and capital of the province of Bergenhus. It is the see of a bishop, and has a strong castle and a good port. It is a large place; but is subject to fires, as being all built of wood. It is surrounded with mountains, and the inhabitants amount to 17,000. The country is generally barren; in consequence of which, most of the corn is used in imported. The principal trade is in stockfish, fir, and deal-boards. E. Long. 5° 45'. N. Lat. 60° 11'.

BERGEN, a town of Pomerania in Germany, and capital
BERGEN [571]

BERGEN was among the number of the competitors; and without having before this period discovered any particular attention to chemistry, he published a memoir on the preparation of alum that astonished his friends as well as his adversaries. Nobody was able to conceive how in so short a time he could have made a course of experiments so complete, on a subject so new to him. His dissertation was warmly attacked in the periodical publications, and Wallerius himself criticised without reserve. But in the midst of so many enemies, he possessed a firm friend. The prince Gustavus, now king of Sweden, and then chancellor of the university, took cognizance of the affair. After having consulted two persons, the most able to give him advice, and whose testimony went in favour of Bergman, he addressed a memorial, written with his own hand, in answer to all the grievances alleged against the candidate, to the consistory of the university and to the senate, who confirmed the wishes of his Royal Highness.

Mr Bergman had now a hard duty to fulfil: he had to satisfy the hopes that were conceived of him; to fill the place of Wallerius; and to put envy to silence. He did not follow the common track in the study of chemistry. As he had received the lessons of no master, he was tainted with the prejudices of no school. Accustomed to precision, and having no time to lose, he applied himself to experiments without paying any attention to theories: he repeated those often which he considered as the most important and instructive, and reduced them to method; an improvement till then unknown. He first introduced into chemistry the process by analysis, which ought to be applied to every science; for there should be but one method of teaching and learning, as there is but one of judging well. These views have been laid down by Mr Bergman in an excellent discourse, which contains, if we may say so, his profession of faith in what relates to the sciences. It is here that he displays himself without disguise to his reader; and here it is of importance to study him with attention. The productions of volcanoes had never been analyzed when Messrs Ferber and Troil brought a rich collection of these into Sweden. At the sight of them Mr Bergman conceived the design of investigating their nature. He examined first of all the matters least altered by the fire, and the forms of which were still to be discerned: he followed them in their changes progressively; he determined, he imitated their more complicated appearances; he knew the effects which would result from the mixture and decomposition of the saline substances which are found abundantly in these productions. He discovered such as were formed in the humid way; and then in his laboratory he observed the process of nature; that combat of flames and explosions; that chaos in which the elements seem to clash and to confound one another, unveiled themselves to his eyes. He saw the fire of volcanoes kindled in the midst of pyrrhal combinations, and sea-salt decomposed by clays; he saw fixed air disengaged from calcined calcareous stones, spreading upon the surface of the earth, and filling caverns in which flame and animal life are equally extinguished; he saw the sulphurous acid thrown
thrown out in waves, convert itself into the vitriolic by mere contact with the air; and distilling through the rocks, form the saline and alkali of the Solfataras. He saw the bitumens as they melted; the inflammable and sulphureous airs exhaling; and the waters become mineral and impregnated with fire and vapours of these stupendous furaces, preparing for the beings that move and dispute on the crust of the abyss, a remedy for pain and a balsam for disease.

The continual application which Mr. Bergman bestowed on his studies having affected his health, he was advised to interrupt them if he wished to prolong his life: but he found happiness only in study, and wished not to forfeit his title to reputation by a few years more of inactivity and languor. He exhausted his strength, and died in the month of June in the year 1784. The university of Upsal paid the most distinguished honours to his memory; and the academy of Stockholm consecrated to him a medal to perpetuate the regret of all the learned in Europe for his loss. His Physical and Chemical Essays have been collected and translated by Dr. Edmund Cullen, and published in 2 vols. 8vo.

BERGOMUM, in Ancient Geography, a town of the Transpadana, built by the Gauls on their incursions into Italy. Now called Bergamo, on the territory of Venice. E. Long. 10°. N. Lat. 45° 40'.

BERIA, BERIE, BERRY, signifies a large open field; and those cities and towns in England which end with that word are built on plain and open places, and do not derive their names from boroughs as Sir Henry Spelman imagines. Most of our glossographers in the names of places have confounded the word berie with that of bury and borough, as if the appellative of ancient towns: whereas the true sense of the word berie, is a flat wide champaign, as is proved from sufficient authorities by the learned Da Fresne, who observes that Beria Sancti Edmundi, mentioned by Mat. Paris, sub ann. 1174, is not to be taken for the town, but for the adjoining plain. To this may be added, that many flat and wide meads, and other open grounds, are called by the name of beries and berry-fields; the spacious meadow between Oxford and Islay was in the reign of King Athelstan called Berry; as is now the largest pasture-ground in Quarendon in the county of Buckingham, known by the name of Berryfield. And though these meads have been interpreted demesne or manor meadows, yet they were truly any flat or open meadows that lay adjoining to any villa or farm.

BERING, SInus, of Copenhagen, a Latin lyric poet, flourished about 1560.

BERING'S STRAITS, the name of that narrow division of the old and new world, where the distance between Asia and America is only 13 leagues. They are so named from Captain Vitus Bering, a Dane by birth, and employed on the same plan of discovery in these parts as our great countryman Cook was in the late voyage. He was in the service of Peter the Great: who, by the strength of an extensive genius, conceiving an opinion of the vicinity of America to his Asiatic dominions, laid down a plan of discovery worthy of so extraordinary a monarch, but died before the attempt was begun; but his spirit survived in his successor. Bering, after a tedious and fatiguing journey through the wilds of Siberia, arrived in Kamtschatka, attended with the scanty materials for his voyage, the greatest part of which he was obliged to bring with him through a thousand difficulties. He sailed from the river of Kamtschatka on July 15, 1728; and on the 17th of August saw Serdze Kamen, or the heart-shaped rock, a name bestowed on it by the first discoverer.—From Serdze Kamen, to a promontory named by Captain Cook East Cape, the land trends southeast. The last is a circular peninsula of high cliffs, projecting far into the sea due east, and joined to the land by a long and very narrow isthmus, in lat. 66° 6. This is the Tschutschi Noss of our navigators, and forms the beginning of the narrow straits or division of the old and new world. The distance between Asia and America in this place, as already mentioned, is only 13 leagues. The country about the cape, and to the north-west of it, was inhabited. About mid-channel are two small islands, named by the Russians the isle of St. Diomedeis; neither of them above three or four leages in circuit. It is extremely extraordinary that Bering should have sailed through this confined passage, and yet that the object of his mission should have escaped him. His misfortune could only be attributed to the foggy weather, which he must have met with in a region notorious for mist; for the coast that he saw land neither to the north nor to the east. Our generous commander, determined to give him every honour his merit could claim, has dignified these with the name of Bering's Straits. The depth of these straits is from 12 to 29 or 30 fathoms. The greatest depth is in the middle, which has a slimy bottom; the shallowest parts are near each shore, which consist of sand mixed with bones and shells. The current or tide was very inconsiderable, and what there was came from the west. From East Cape the land trends south by west. In lat. 65° 36. is the bay in which Captain Cook had the interview with Tschutschi. Immediately beyond is the bay of St. Laurence, about five leagues broad in the entrance and four deep, bounded at the bottom by high land. A little beyond is a large bay, either bounded by low land at the bottom, or so extensive as to have the end invisible. To the south of this are two other bays; and in N. Lat. 64° 13. Long. 186° 36. is the extreme southern point of the land of the Tschutschi. This formerly was called the Anadricos Noss. Near it Bering had conversation with eight men, who came off to him in a bonard or boat covered with the skins of seals; from which Bering and others have named it the Tschutschi Noss.

BERITH, a simple mentioned in Scripture, used for cleansing or taking out spots (Jer. ii. 22). Some will have it to be the kela or salt-wort, from the ashes of which soap is made; and in our version it is rendered soape; others, after Rudebeck, made it to be the dye of the purple fish.

BERKELEY, GEORGE, the celebrated bishop of Cloyne, was the eldest son of William Berkeley, Esq. of Thomastown in the county of Kilkenny; a cadet of the family of Earl Berkeley of Berkeley castle. At eight years of age he was sent to the school of the Ormond foundation at Kilkenny, from which Swift had a few years before been removed to the university. Before Berkeley had attained his fourteenth year he was admitted a pensioner in Trinity college, Dublin, to which whilst S. A. he obtained a fellowship. Some
of his first essays as a writer were published in the
Spectator and Guardian, which entertaining works he
adorned with many pieces in favour of virtue and re-
ligion. His learning and his virtues, his wit and agree-
able conversation, made his friendship sought and his
acquaintance cultivated by many great and learned men:
and among others by the earl of Peterborough, Dr Swift,
Dr Arbuthnot, Mr Pope, and Mr Addison. The earl
took him as chaplain and secretary of embassy into Italy;
and during his absence on that occasion he became senior
fellow of his college, and was in 1717 created D.D. by
diploma.

Upon his return, his acquaintance among the great
was considerably extended; and Lord Burlington, who
at Rome had conceived for him a high esteem on ac-
count of his skill in architecture, obtained for him,
through the duke of Grafton, then (1721) lord-lieu-
tenant of Ireland, the king's grant of the deanship of
Down, worth 2000l. per annum. Such however was
the narrow system of politics at that time prevalent
in the Irish cabinet, that though his majesty had actu-
ally signed the grant, the lords justices recommended
back for the deanship of Down Swift's Dean Daniel,
celebrated for having in a state sermon styled Pompey
an unfortunate gentleman: and such was Dr Berkeley's
humility and mildness of temper, that he could not be
prevailed upon to dispute the matter, or even to ex-
postulate on the subject. His patron Lord Burlington
procured for him afterwards (1724) the deanship of
Derry, the next best in Ireland to that of Down; and
upon this preferment the Doctor resigned his fellow-
ship.

In the year 1722 his fortune received a considerable
increase from an event by him very unexpected. Upon
his first going to London (1727) he sent one morning
a note to Swift, desiring that they might dine together
that day at a tavern. The dean of St Patrick's return-
ed for answer, that they might enjoy another's company
at their ease where he himself was engaged to dine,
with the family of Mrs Esther Vanhomigh (the celebrated Vanessa); and thereto he took Mr Berkeley.
Some years before her death this lady removed to
Ireland, and fixed her residence at Cell-bridge, a
pleasant village in the neighbourhood of Dublin, most
probably with a view of frequently enjoying the company
of a man for whom she had conceived a very sin-
gular attachment. But finding herself totally disap-
pointed in that expectation, she altered her intention
of making the dean of St Patrick's her heir, and left
the whole of her fortune (8000l.) to be divided equally
between her near relation Judge Marshal of the
common pleas in Ireland, and Dr Berkeley, whom she
ever seen but once in her life, and that at the
distance of nine years.

In the interval between Dr Berkeley's return from
abroad and his preferment to the deanship of Derry, his
mind had been employed in conceiving a noble and be-
nevolent plan for the better supplying of the churches
in our foreign plantations, and for converting the sa-
vage Americans to Christianity, by erecting a college
in the Summer Islands. To this proposal the address
and abilities of its author procured, after a tedious at-
tendance on the great, an apparently successful recep-
tion; for he obtained a charter for its foundation, to-
gether with a parliamentary grant of 20,000l. for car-
rying it into execution, to which were added several
large subscriptions from individuals, to be paid as soon
as the public bounty should be received. Upon the
faith of this, our philosopher embarked for America;
where he became so generally and so justly venerated
by all descriptions of men, that each vied with the
other which should most honour him. The queen,
with whom he was a favourite, had endeavoured to di-
suade him from this enterprise, by offering him her in-
terest for an English bishopric; but he replied, that he
should prefer the headship of St Paul's college at Ber-
manda to the primacy of all England. From that head-
ship he was to enjoy a revenue of 100l. per annum:
and was bound by his charter to resign his deanship,
then worth 1100l. per annum, within a year and a half
after the 20,000l. should be paid by government. That
sum was never paid; and after two years residence on
Rhode Island and its neighbouring continent, during
which time every interest of piety and virtue was near to
his heart and cultivated by his labours, the dean was
obliged to return to Europe, and abandon one of the
noblest designs that had ever entered into the human heart
to form.

In August 1728, immediately before his departure
for America, he entered into marriage with Anne, the
eldest daughter of the right honourable John Forster,
Esq: speaker of the Irish house of commons; which lady
died in 1785. In May 1734 he was consecrated bi-
shop of Cloyne, and vacated his deanship. On that oca-
sion he said to his few intimates, "I will never ac-
cept of a translation." At Cloyne he distinguished
himself by pastoral vigilance, prelatical hospitality,
and constant residence. Through the whole of his cler-
ic life, he was, while his health permitted, a constant
and an extemporary preacher; nor is it known that he
ever reduced a single sermon to writing, except one
preached before the society for propagating the gospel
in foreign parts, which at their request was publish-
ed. He endeared himself to the people of his diocese
by promoting at once their temporal and their spiritual
happiness. He endeavoured by all means to raise
a spirit of industry, and to propagate the arts of cul-
tivation and agriculture in that neglected country; and
it may be truly said, that never man laboured more
earnestly to amass a fortune or to aggrandize a family,
than he did to promote the best interests of mankind,
considered either as citizens on earth or as candidates
for heaven.

The earl of Chesterfield, who had never seen him but
once, and that when they were both young men, on
being made lord lieutenant of Ireland sent to him a
most respectful offer of the then vacant see of Clogher,
of more than double the value of Cloyne, promising at
the same time his recommendation to any other Yicher
see that might be vacated during his administration.
But the good bishop declined the generous offer, re-
questing the lord lieutenant not to think of him on any
other vacancy, as he was resolved never to quit his first
bishoprick for any other. In 1751, finding the infimi-
ties of age come upon him, and wishing to retire from
the care of his diocese to superintend the education of
his son (then nominated a student of Christ-church, and
now prebendary of Canterbury), that the revenues of
the church might not be misapplied, nor the interests
of religion suffer by the absence of the pastor from
his
berkeley.

berkeley, his flock, he made great interest for leave to resign his bishopric, of which the income was then not less than 1700l. per annum. Failing of success in this application, he let the lands of his demesne at clonyne, on very easy terms, at the rent of 200l. which he directed to be distributed annually among the poor house-keepers of clonyne, youghall, and aghadha, until his return.

at oxford he lived highly respected by the learned members of that great university, till the hand of providence unexpectedly deprived them of the pleasure and advantage derived from his residence among them. on sunday evening, january 14th 1753, as he was sitting in the midst of his family, and just after he had concluded an extemporaneous comment on the 15th chapter of 1 cor. he was instantly translated, without a groan, from earth to heaven. a polypus in the heart was the cause of his dissolution. about a minute before his death he had seated himself on a couch and turned his face towards the wall; and had not he ceased speaking in the middle of a sentence, his lady and his son would not immediately have discovered their loss. his remains were, with much funeral solemnity, interred at christ-church, his friend bishop conybeare, then dean of that cathedral, performing the last service. an elegant marble monument, with a spirited inscription by the present archbishop of york, marks the spot where his ashes rest. as to his person, he was of the tall middle size; his countenance was very handsomely, and full of meaning and benigneity; and his bodily strength was uncommonly great, even to the last year of his life: but he was subject to grievous nervous colics, in which he thought tar-water gave him more efficacious relief than any other medicine. mr pope sums up his character in one line. after mentioning some particular virtues which characterized other prelates then living, he ascribes

berkeley ev'ry virtue under heav'n.

an admirable description is given of him in the following anecdote. bishop atterbury, having heard much of mr berkeley, wished to see him. accordingly he was one day introduced to that prelate by the earl of berkeley. after some time, mr berkeley quitted the room: on which lord berkeley said to the bishop, "does my cousin answer your lordship's expectations?" the bishop, lifting up his hands in astonishment, replied, "so much understanding, so much knowledge, so much innocence, and such humility, I did not think had been the portion of any but angels, till I saw this gentleman." his knowledge is said to have been extended to the minutest objects, and included the arts and business of common life. thus dr blackwell, in his memoirs of the court of augustus, having made an observation, "that the ingenious mechanic, the workers in stone and metal, and improvers in trade, agriculture, and navigation, ought to be searched out and conversed with no less than the professors of speculative science," adds the following eulogium on our prelate: "in this respect I would with pleasure do justice to the memory of a very great though singular sort of a man, dr berkeley, better known as a philosopher and intended founder of an university in the Bermudas or Summer Islands, than as bishop of clonyne in ireland. an inclination to carry me out on that expedition, as one of the young professors on his new foundation, having brought us often together, I scarce remember to have conversed with him on that art, liberal or mechanic, of which he knew not more than the ordinary practitioners. with the widest views, he descended into a minute detail, and grudged neither pains nor expense for the means of information. he travelled through a great part of sicily on foot; clambered over the mountains and crept into the caverns, to investigate its natural history, and discover the cause of its volcnoes: and I have known him sit for hours in forgeries and foundries to inspect their successive operations. I enter not into his peculiarities either religious or personal: but admire the extensive genius of the man, and think it a loss to the western world that his noble and exalted plan of an american university was not carried into execution. many such spirits in our country would quickly make learning wear another face."

he published many ingenious works, particularly, "an essay towards a new theory of vision;" "the principles of human knowledge;" "the singular notions in which gave rise to much controversy: "aleiphoron, or the minute philosopher." one of the most elegant and genteel defences of that religion in which he was born to vindicate both by his virtues and his ingenuity: "the analyst;" in which he endeavours to show that sir isaac newton's doctrine of fluxions is more incomprehensible than any mystery in the christian religion: "the querist;" in which the true interests of iberia are pointed out in a very striking light: and "siris, or a treatise on tar-water," which, under his sanction, became for a while a very popular medicine. in the gentleman's magazine for january 1777, it is said that the adventures of signior gaudentio di lucca have been generally attributed to bishop berkeley; but we have the best authority to say that they were not the offspring of his pen. the bishop never saw the work till it was put into his hands by his son; and when he read it, he expressed no small contempt for the style of a writer who describes his hero as a tall, clean-made gentleman; though he owned his fancy to be often brilliant. we believe the adventures of gaudentio di lucca were written by a roman priest for his amusement when a prisoner in the tower of london.

berkshire, is an inland county of england, which contained the whole of that british principality inhabited by the atrebati, who are supposed to have been originally from gaul. when constantine divided the island into roman provinces in 312, this principality was included in britannia prima, the first division, whose boundaries were the english channel on the south, and the thames and severn on the north. on the romans quitting the island, and civil discisions enabling the saxons to establish the heptarchy, this part of the country was included in the kingdom of the west saxons, which commenced in 519, and continued till 828, when it became the only remaining sovereignty, having conquered all the others, and they were incorporated by the name of england, under egbert, whose grandson, alfred, a native of wustage, in this county, in 889 divided his kingdom into counties, hundreds, and parishes, and at this time the division first received its appellation of berkshire, or berocesher. at present it is in the oxford circuit, the province
BERKSHIRE province of Canterbury, and diocese of Salisbury. The general shape of it somewhat resembles the form of a slipper or sandal. It is 42 miles long, 28 broad, about 137 in circumference, and contains an area of 438,977 acres, or by other accounts, 476,170. It is situated north-west of London; has 140 parishes, 62 vicarages, 12 market towns but no city, 671 villages; is divided into 20 hundreds; sends nine members to parliament, two for the county, two for Windsor, two for Reading, two for Wallingford, and one for Abingdon; and pays 10 parts of the proportion of the land-tax. In 1811 the number of houses was 22,104, and the whole population 118,277. Its principal river is the Thames. It also has the Kennet, great part of which is navigable; the Loddon, the Ock, and the Lambourn, a small stream, which contracts to smaller streams, is always highest in summer, and shrinks gradually as winter approaches. The air of this county is healthy even in the vales, and though the soil is not the most fertile, yet it is remarkably pleasant. It is well stored with timber, particularly oak and beech, and produces great plenty of wheat and barley. Its principal manufactories are woollen cloth, sail-cloth, and malt.

Its market towns are Abingdon, Faringdon, Hungerford, East Ilsley, Lower Lambourne, Maidenhead, Newbury, Ockingham, Reading, Wallingford, Wantage, and Windsor, remarkable for its royal castle, as the county is for White horse-hill, near Lambourne, where is the rude figure of a horse, which takes up near an acre of ground on the side of a green hill, said to have been made by Alfred in the reign of his brother Ethelred, as a monument to perpetuate a victory over the Danes in 872, at Ashdown, now Ashburp-Park.

The Roman Watling-street, from Dunsstable, enters Berkshire, at the village of Streatley, between Wallingford and Reading, and crossing this county proceeds to Marlborough. Another Roman road from Hampshire enters this county, leading to Reading and Newbury, the Spine of Camden, where it divides: one branch extends to Marlborough in Wilt, and the other to Cirencester in Gloucestershire. A branch from the Icknield-street proceeds from Wallingford to Wantage.

There is a Roman camp near Wantage on the brow of a hill, of a quadrangular form; there are other remains of encampments at East-Hampstead, near Ockingham, near White-horse-hill, near Pusey, and upon Snodden-hill, near Wallingford. At Lawrence Whallam is a Roman fort, and near Denchworth is Cherbury castle, a fortress of Canute. Ussington castle, near White-horse-hill, is supposed to be Danish; and near it is Dragon-hill, supposed to be the burying-place of Uter Pendragon, a British prince. Near White-horse hill are the remains of a funeral monument of a Danish chief slain at Ashdown by Alfred. In this county the following antiquities are worthy the notice of travellers: Abingdon church and abbey; Aldworth castle, near East Ilsley; Bysham monastery; Dunnington castle; Lambourne church; Reading abbey; Sunning chapel; Wallingford church and castle. Windsor castle beggars all description for situation, &c. Berkshire is an exsuvium belonging to a branch of the Howard family, the representative being earl of Suffolk and Berkshire. See BERKSHIRE, SUPPLEMENT.

BERLIN, a city of Germany, capital of the electorate of Brandenburg, and of the whole Prussian dominions, seated in E. Long. 13° 37′ N. Lat. 52° 53′. This city is one of the largest, best built, and best governed, of any in Germany. The streets are large, straight, clean, and well paved, and some of them very long and elegant. There are also several large and beautiful squares, with pleasant walks. It is surrounded with handsome gardens, which produce excellent fruit. The river Spree, that crosses the city, has a communication with the Havel Oder, and Elbe, which greatly facilitate commerce. The French refugees have greatly contributed to the embellishment of Berlin, by introducing various manufactures and arts. It contained 153,000 inhabitants in 1803.

Berlin is divided into five parts, without reckoning the suburbs, which are very large. The houses in these last are almost all of wood; but so well plastered, that they seem to be of stone. In the suburb called Spandau, is a house belonging to the royal family, with well contrived apartments, and furnished in a very fine taste. In the suburb of Stralau is a house and garden belonging to the king. The royal gate of the city is defended by a half moon, and two bastions, covered with brick; it fronts the royal street, which is one of the longest and most frequented in the city. It contains very handsome houses, particularly those belonging to some of the ministers of state.

The royal street is crossed by five others, which are large and fine. On the new bridge, which is of stone, over the Spree, is an equestrian statue of William the Great, which is esteemed an excellent piece of workmanship. The elector is represented in a Roman habit, and his horse stands on a pedestal of white marble adorned with basso relieves, and four slaves bound to the base.

After this bridge is past, the king's palace appears, which is a grand superb edifice; it is four stories high, and the apartments are extremely magnificent. No palace in Europe has such a great quantity of silver tables, stands, lustres, branched candles, &c. In the knight's hall there is a buffet, which takes up all one side, where there are basins and cisterns of gilt silver, of extraordinary magnificence. The furniture of the great apartment is extremely rich; and there is a very handsome gallery, adorned with paintings, representing the principal actions of Frederick I. Formerly there were fine gardens to the palace, but they are now turned into a place of arms. The king's stables are large, stand near the palace, and front the great street. Externally they make a Gothic appearance, but within they are very magnificent. The mangers are of stone, and the pillars that divide the stables are of iron, adorned with the king's cypher, gilt. Over the racks are pictures representing the finest horses which the king's stud has produced. Over the stables there are large rooms, containing all sorts of horse furniture, particularly the horse-equipage of Frederick I. all the metallic part of which is gold, set with diamonds. Besides these, there are handsome lodgings for the officers of the stables. Over the riding-house is a theatre, where plays have been acted, and balls have been made for the entertainment of the court.

The arsenal consists of four grand buildings, that form a court in the middle, like a college; each front has
BERLIN

has three large porticoes. On the principal gate is a medallion of Frederick II. in bronze; and the four cardinal virtues, of a colossal stature, placed on pedestals on each side of the portico, seem to look at the portrait of the king, which is supported by Fame and Victory. The Corinthian order is prevalent in the first stage, and is managed with a great deal of art. The whole edifice is surrounded in the upper part with a balustrade, adorned with trophies and statues, among which is Mars seated on a heap of several sorts of arms. This altogether forms a noble and majestic decoration. It is bounded with iron in the shape of cannon, which are placed at proper distances, and support iron chains that hang like festoons, to prevent passengers from approaching the windows below. The lower rooms are filled with a great number of brass cannon; the walls and pillars which sustain the floor are set off with cuirasses and helmets. The upper story contains several rooms filled with arms, which are disposed in a curious order. Behind the arsenal is the house of the general of the artillery, which includes the foundry, where they are continually at work. Besides this, there are other places where they keep the train of artillery.

The opera-house is an elegant modern edifice. The front has a noble portico supported by Corinthian columns, and a pediment adorned with baso relievo and statues. The columns that support the roof throw the whole into a grand saloon. It has three galleries, and is said to be capable of containing 2000 persons.

A rampart and fosse separate Worder from Dorothea Stadt, or the New Town, inhabited chiefly by French. There are seven great alleys or walks, which divide this quarter into two parts. The middle walk is broader than the rest, and is surrounded with balustrades, having a grass-mat in the middle; this is for persons that take the air on foot. The alleys on each side are paved, and serve for those that come abroad in coaches. These alleys, which are about three miles in length, are terminated with a bar, that leads towards the park. The alleys with trees are bounded by rows of houses. In one of these is a building, formerly called the lesser stables, and now made into lodgings for the guards. The apartments above these are occupied by the academy of painting, and the academy of arts and sciences. Behind these is the observatory, where there is a great number of astronomical and mathematical instruments.

There are other things worthy of observation, such as the cabinet of medals, and of the antiquities belonging to the king; that of natural curiosities; the chemical laboratory, and its furnaces and medals, of a new invention: the theatre for anatomical demonstrations; the royal library, which is one of the completest in Germany, and has many scarce books and manuscripts.

The city was taken in 1760 by an army of Russians, Austrians, Saxons, &c. who entered on the 9th of October. They totally destroyed the magazines, arsenals, and founderies, seized an immense quantity of military stores, and a number of cannon and arms; called first for the immediate payment of 800,000 guilders, and then laid on a contribution of 1,900,000 German crowns: not satisfied with this, many irregularities were committed by the soldiery; but, on the whole, though some shocking actions were committed, a far more exact discipline was observed than from such troops could have been expected upon such an occasion, where there was every incentive which could work upon the licit of a conquering army. Their officers no doubt with great difficulty preserved even that degree of order.

But though their behaviour was tolerable with regard to the private inhabitants, there was something shocking and ungenerous in their treatment of the king's palaces. The apartments of the royal castle of Charlottenburg were entirely plundered, the precious furniture spoiled, the pictures defaced, without even sparing the antique statues collected by Cardinal Polignac, which had been purchased by the house of Brandenburg. The castle of Schönhausen, belonging to the queen, and that of Fredericksfied, belonging to the Margrave Charles, were also plundered.

The palace of Potsdam, the famous Sans-ouic, had a better fate; Prince Esterhazy commanded there, and it was preserved from the smallest violation. The prince, on viewing the palace, only asked which picture of the king resembled him most; and being informed, desired that he might have leave to take it, together with two German flutes which the king used, to keep them, be said, in memory of his majesty. This was a sort of taking very different from pilage.

They stayed in the city four days: but bearing that the king, apprehensive of this stroke, was moving to the relief of his capital, they quitted it on the 13th of October; and having wasted the whole country round for a vast extent, and driven away all the cattle and horses they could find, retreated by different routes out of Brandenburg.

BERLIN, a sort of vehicle, of the chariot kind; taking its name from the city of Berlin, in Germany; though some attribute the invention of it to the Italians, and derive the word from berlina, a name given by them to a sort of stage, wherein persons are exposed to public shame. The berlin is a very convenient machine to travel in, being lighter, and less apt to be overturned, than a chariot. The body of it is hung high, on shafts, by leather braces; there being a kind of stirrup, or footstool, for the convenience of getting into it; instead of side-windows, some have curtains to let down in bad, and draw up in good, weather.

BERME, in Fortification, a space of ground left at the foot of the rampart, on the side next the country, designed to receive the ruins of the rampart, and prevent their filling up the fosse. It is sometimes pales and for the more security; and in Holland it is generally planted with a quickset hedge. It is also called limiere, relais, foreland, retrais, par de fort, &c.

BERMUDAS, or SUMMER-ISLANDS, a cluster of small islands in the Atlantic ocean, lying almost in the form of a shepherd's crook, in W. Long. 65. N. Lat. 32. 30. between 200 and 300 leagues distant from the nearest place of the continent of America, or any of the other West-India islands. The whole number of the Bermudas islands is said to be about 400, but very few of them are habitable. The principal is St George's, which is not above 16 miles long, and three at most in breadth. It is universally agreed, that the nature of this and the other Bermudas islands has undergone a surprising alteration for the worse since they were first discovered;
Bermuda. The air being much more inclement, and the soil much more barren than formerly. This is ascribed to the cutting down those fine spreading cedar trees for which the islands were famous, and which sheltered them from the blasts of the north wind, at the same time that it protected the undergrowth of the delicate plants and herbs. In short, the Summer islands are now far from being desirable spots; and their natural productions are but just sufficient for the support of the inhabitants, who, chiefly for that reason, perhaps, are temperate and lively even to a proverb. At first tobacco was raised upon these islands; but being of worse quality than that growing on the continent, the trade is now almost at an end. Large quantities of ambergris were also originally found upon the coasts, and afforded a valuable commerce; but that trade is also reduced, as likewise their whale trade, though the perquisites upon the latter part form part of the governor's revenue, being stated at 10l. for every whale that is caught. The Bermudas islands, however, might still produce some valuable commodities, were they properly cultivated. There is here found, about three or four feet below the surface, a white chalk stone which is easily chiseled, and is exported for building gentlemen's houses in the West Indies. Their palm trees, if properly manufactured, might turn to excellent account in making women's hats; and their oranges are still valuable. Their soil is also said to be excellent for the cultivation of vines, and it has been thought that silk and cochineal might be produced; but none of these things have yet been attempted. The chief resource of the inhabitants for subsistence is in the remains of their cedar wood, of which they fabricate small sloops, with the assistance of the New England pine, and sell many of them to the American colonies, where they are much admired. Their turtle-catching trade also is of service; and they are still able to rear great variety of tame-fowl, and have wild ones abounding in vast plenty. All the attempts to establish a regular whale fishery on these islands have hitherto proved unsuccessful; they have no cattle, and even the black hog breed, which was probably left by the Spaniards, is greatly decreased. The water on the islands, except that which falls from the clouds, is brackish; and at present the same diseases reign there as in the Caribbean islands. They have seldom any snow, or even much rain; but when it does fall, it is generally with great violence, and the north or north-east wind renders the air very cold. The storms generally come with the new moon; and if there be a halo or circle about it, it is a sure sign of a tempest, which is generally attended with dreadful thunder and lightning. The inhabited parts of the Bermudas islands are divided into nine districts called trices. 1. St. George. 2. Hamilton. 3. Ireland. 4. Devonshire. 5. Pembroke. 6. Pagets. 7. Warwick. 8. Southampton. 9. Sandys. There are but two places on the large island where a ship can safely come near the shore, and these are so well covered with high rocks that few will choose to enter in without a pilot; and they are so well defended by forts, that they have no occasion to dread an enemy. St. George's town is at the bottom of the principal haven; and is defended by nine forts, on which are mounted 70 pieces of cannon that command the entrance. The town has a handsome church, a fine library, and a noble town-house, where the governor, council, &c. assemble. Besides these there are about 1000 houses well built. The rivers of Southampton and Devonshire have each a parish church and library, and the former has a harbour of the same name; there are also scattered houses and hamlets over many of the islands, where particular plantations require them. The inhabitants are clothed chiefly with British manufactures, and all their implements for tilling the ground and building are made in Britain.

It is uncertain who were the first discoverers of the Bermudas islands. John Bermudas a Spaniard is commonly said to have discovered them in 1527; but this is disputed, and the discovery attributed to Henry May an Englishman. As the islands were without the reach of the Indian navigation, the Bermudas were absolutely uninhabited when first discovered by the Europeans. May above mentioned was shipwrecked upon St George's; and with the cedar which they felled there, assisted by the wreck of their own ship, he and his companions built another which carried them to Europe, where they published their accounts of the islands. When Lord Delaware was governor of Virginia, Sir Thomas Gates, Sir George Summers, and Captain Newport, were appointed to be his deputy-governors; but their ship being separated by a storm from the rest of the squadron, was in the year 1609 wrecked on the Bermudas, and the governor disagreeing among themselves, built each of them a new ship of the cedar they found there, in which they severally sailed to Virginia. On their arrival there, the colony was in such distress, that Lord Delaware, upon the report which his deputy-governors made him of the plenty they found at the Bermudas, despatched Sir George Summers to bring provisions from thence to Virginia in the same ship which brought him from Bermudas, and which had not one ounce of iron about it, except one bolt in the keel. Sir George, after a tedious voyage, at last reached the place of his destination, where, soon after his arrival, he died, leaving his name to the islands, and his orders to the crew to return with black hogs to the colony of Virginia. This part of his will, however, the sailors did not choose to execute; but setting sail in their cedar ship for England, landed safely at Whitechurch in Dorsetshire.

Notwithstanding this dereliction of the island, however, it was not without English inhabitants. Two sailors, Carter and Waters, being apprehensive of punishment for their crimes, had secreted themselves from their fellows when Sir George was wrecked upon the island, and had ever since lived upon the natural productions of the soil. Upon the second arrival of Sir George, they enticed one Chard to remain with them; but differing about the sovereignty of the island, Chard and Waters were on the point of cutting one another's throats, when they were prevented by the prudence of Carter. Soon after, they had the good fortune to find a great piece of ambergris weighing about 80 pounds, besides other pieces, which in those days were sufficient, if properly disposed of, to have made each of them master of a large estate. Where they were, this ambergris was useless; and therefore they came to the desperate resolution of carrying themselves and it in an open boat to Virginia or to Newfoundland, where they hoped to dispose of their treasure to advantage. In the mean time, however, the
Virginia Company claimed the property of the Bermudas islands; and accordingly sold it to 120 persons of their own society, who obtained a charter from King James for their possessing it. This New Bermuda Company, as it was called, fitted out a ship with 60 planters on board to settle on the Bermudas, under the command of one Mr Richard Moor, by profession a carpenter. The new colony arrived upon the island just at the time the three sailors were about to depart with their ambergis; which Moor having discovered, he immediately seized and disposed of it for the benefit of the company. So valuable a booty gave vast spirit to the new company; and the adventurers settled themselves upon St George's island, where they raised cabins. As to Mr Moor, he was indefatigable in his duty, and carried on the fortifying and planting the island with incredible diligence; for we are told, that he not only built eight or nine forts or rather blockhouses, but inured the settlers to martial discipline. Before the first year of his government was expired, Mr Moor received a supply of provisions and planters from England; and he planned out the town of St George as it now stands. The fame of this settlement soon awakened the jealousy of the Spaniards, who appeared off St George's with some vessels; but being fired upon from the forts, they sheered off, though the English at that time were so ill provided for a defence, that they had scarcely a single barrel of gunpowder on the island. During Moor's government the Bermudas were plagued with rats, which had been imported into them by the English ships. This vermin multiplied so fast in St George's island, that they even covered the ground, and had nests in the trees. They destroyed all the fruits and corn within doors; nay, they increased to such a degree, that St George's island was at last unable to maintain them; and they swam over to the neighbouring islands, where they made as great havoc. This calamity lasted five years, though probably not in the same degree, and at last it ceased all at once.

On the expiration of Moor's government, he was succeeded by Captain Daniel Tucker, who improved all his predecessor's schemes for the benefit of the island, and particularly encouraged the culture of tobacco. Being a severe disciplinarian, he held all under him so rigidly to duty, that five of his subjects planned as bold an enterprise for liberty as was perhaps ever put in execution. Their names were Barker, who is said to have been a gentleman; another Barker, a joiner; Goodwin, a ship-carpenter; Paet, a sailor; and Saunder, who planned the enterprise. Their management was as artful as their design was bold. Understanding that the governor was deterred from taking the pleasure of fishing in an open boat, on account of the dangers attending it, they proposed to build him one of a particular construction, which accordingly they did in a secret part of the island; but when the governor came to view his boat, he understood that the builders had put to sea in it. The intelligence was true: for the adventurers, having provided themselves with a few necessaries they wanted, sailed for England; and notwithstanding the storms they encountered, their being plundered by a French privateer, and the incredible miseries they underwent, they landed in 42 days time at Cork in Ireland, where they were generously relieved and entertained by the earl of Thomond.

In 1619 Captain Tucker resigned his government to Captain Butler. By this time the high character which the Summer islands bore in England rendered it fashionable for men of the highest rank to encourage their settlement; and several of the first nobility of England had purchased plantations among them. Captain Butler brought over with him 500 passengers, who became planters on the islands, and raised a monument to the memory of Sir George Summers. The island was now so populous (for it contained about a thousand whites), that Captain Butler applied himself to give it a new constitution of government by introducing an assembly, the government till this time being administered only in the name of the governor and council. A body of laws are likewise drawn up, as agreeable to the laws of England as the situation of the island would admit of. One Mr Barnward succeeded Captain Butler as governor, but died six weeks after his arrival on the island; upon which the council made choice of Mr Harrison to be governor, till a new one should be appointed. No fewer than 3000 English were now settled in the Bermudas, and several persons of distinction had curiosity enough to visit it from England. Among these was Mr Waller the poet, a man of fortune, who being embroiled with the parliament and commonwealth of England, spent some months in the Summer islands, which he has celebrated in one of his poems as the most delightful place in the world. The dangers attending the navigation, and the untoward situation of these islands, through their distance from the American continent, seem to be the reasons why the Bermudas did not now become the best peopled islands belonging to England, as we are told that some time ago they were inhabited by no fewer than 10,000 whites. The inhabitants, however, never showed any great spirit for commerce, and thus they never could become rich. This, together with the gradual alteration of the soil and climate, and the increased number of vessels, soon caused them to dwindle in their population; and at present the number of white inhabitants is only 5462, and of blacks 4919. Even these seem much more inclined to remove to some other place than to stay where they are; so that unless some beneficial change take place, the state of the Bermudas must daily grow worse. The exports in 1810 amounted to 36,600l.

BERN, one of the cantons of Switzerland, which holds the second rank among the 13; but as it was formerly by far the largest in extent, containing almost one-third of the whole country, it might be considered as the first. It is bounded to the north by the cantons of Basel and Solothurn, and the Austrian forest-towns; to the south by the lake of Geneva, the Valais, and duchy of Savoy; to the east by Uri, Unterwald, Lucern, and the county of Baden; and to the west by Solothurn, Neuchatel, Franche-Comte, the district of Biel, and the land of Gex. It is the most fruitful, the richest, and was by much the largest, of all the cantons, extending in length about sixty leagues, and in breadth thirty where broadest. It yields not only plenty of grain, fruit, and pasture; but also good wine, a variety of coloured earths and clays, sand-stone, muck, gypsium, pit.
coal, sulphur, and iron-ore. Here likewise are large
herds of cattle, great and small; and, in consequence
of that, great quantities of milk, butter, and cheese.
The rivers that water this canton are the Aar, the Emmat,
the Wigger, the Aa, the Ros, the Limmat, the Sanen,
the Sensen, and the Kandel. The principal
lake is that of Geneva: the length of which is about
18 leagues, and the greatest breadth between three and
four. The depth in some places is near 400 fathoms,
in others not above 40. The Rhone enters it at the
east end, near Bouvronet, and issues out again at the
west close by Geneva. In summer its waters are much
swollen by the melting of the snow on the mountains.
This lake, however, is not entirely surrounded by the
territory of Bern, but partly by Savoy and the country
of Gex (the former of which belongs to the king of
Sardinia, and the latter to France), and the territory of
Sion. Its borders are extremely fertile and beautiful,
being much embellished with vineyards, which yield
excellent wine, and interspersed with towns and villages,
both of which a considerable commerce is carried on.

The greater lakes, that are wholly or partly within
this canton, are those of Neuchatel, Biel, Murte,
Thun, Brien, and Halwyl, which all abound in fish,
particularly that of Geneva, where trout are sometimes
caught weighing 40 or 50 pounds. In that of Biel,
called also the Nyland-lake, are two small islands, one
of which is very beautiful. This lake is about three
leagues in length and one in breadth. Along the
whole west and north-west sides of the canton runs that
chain of mountains called by the general name of
Jur; but the several mountains of which it is com-
posed have all their particular names. This canton is
well cultivated, and very populous, and before it was
dismembered contained 407,000 souls. German is the
prevailing language, but almost all the people of fashion
speak either French or Italian; even the common peo-
ples in the Pays de Vaud, and other places that lie to-
towards France or Italy, speak corrupt French or Ita-
larian, or a jargon composed of both. The established
religion here and in the other Protestant cantons is Calv-
vinism, the same both in doctrine and discipline as in
Holland; nor is any other tolerated, except in the
common bailiwicks, and the vale of Frick. The min-
isters are divided into deans and classes, and hold
yearly chapters or synods. They are kept in a greater
dependence on the civil power here than in the other
cantons, and not suffered to interfere with matters of
state. The city of Bern first joined the confederacy in
the year 1353. Towards the defence thereof the can-
ton now furnishes 2000 men. Every male from 16
to 60 is enrolled in the militia, and about a third of
them regimented. There are officers for every district,
whose province it is to see that the men be regularly
exercised; that their arms, ammunition, and clothing,
be in good condition; and that they be kept in con-
stant readiness to march. Once a year they are drawn
out to a general review. The same attention is paid
to those that belong to the train of artillery. Some regi-
ments consist of married, and some of unmarried men;
some of foot, others of horse, and Dragoons. There
is a regiment and a troop of cuirassiers. The latter consists
entirely of burghers of Bern. Both the horsemen and
footmen find their horses, arms, and accoutrements.
Besides the arms and artillery in the arsenal at Bern, all
the castles, where the country governors or bailiffs re-
side, are well furnished with them. At Bern is a con-
stant guard or garrison of 200 men, and a small gar-
rison at Fort Arburg. In the same city is also an office,
which grants licenses for levies to foreign powers, and
where the recruits make their appearance and are re-
gistered. The bailiffs have the chief direction of af-
fairs in their several districts, being generals of the mi-
itia, and presiding in the courts of justice; but, in
civil causes above a certain value, an appeal lies from
them to Bern; and, in capital cases, their sentence must
be confirmed by the great council before it can be ex-
ecuted. When any bailiwick is to be disposed of, as many
bailies as there are competitors are put into a bag, whereof
one is girt, and he that draws that has the bailiwick.

Mr Keysler observes, that the wealthiest peasants in
Switzerland are those of Bern; it being difficult to
find a village without one, at least, who is worth be-
tween 20,000 or 30,000 guilders, and sometimes even
60,000. He says, the common people of both sexes
wear straw hats, and that the women's petticoats are
tied up so near their arm-pits, that hardly an hand's-
breadth is left for their shape; that the inns, not only
in this canton but throughout Switzerland, are in
general very good; that the manners of the people were
in many respects, greatly changed within 50 years be-
fore he visited them, which was about 30 years ago,
and consequently must be much more so now; that
instead of the plainness and honest simplicity of their
ancestors, the love of superfluities and high living
greatly prevailed; that luxury, pomp, and that infla-
tuation for foreign productions which had infected most
parts of Europe, had also extended its contagious in-
fluence to Switzerland, though not to such a degree
as in many other countries. Dr Burnet says, that
drinking is so common, and produces so many quarrels
and disorders, that the bailiffs not only subside the
fines payable for them, but often get estates, carrying
perhaps 20,000 crowns at the end of five years to Bern;
that their law is short and clear, insomuch that the
most intricate suit is ended after two or perhaps three
hearings, either in the first instance before the bailiff,
or in the second at Bern; that the civility expressed
in this country to women, at first meeting them, is not
by saluting them, but by shaking them by the hand,
and that none but strangers take off their hats to them.
Mr Addison says, that the peasants are generally
clothed in a coarse kind of canvas, the manufacture
of the country, and that their holiday-clothes go from
father to son, so that it is not uncommon to see a coun-
tryman in his great-grandfather's doublet and breeches;
that the belief of witchcraft prevailed among them so
much, that there were some executions on that account
while he was in the country; that the question, or tor-
ture, is used not only in this canton but all over Swit-
zerland; that though the subjects of the state are rich,
the public is poor; and though they could oppose a
sudden invasion, yet they could not spare the reinforce-
ments and recruits that would be necessary in a long
war. A law passed in 1764, rending the government
and aristocracy, gave great offence to the people, and,
in consequence of this the canton made a feeble defence
when invaded by the French in 1798. A democratic
constitution was then set up, and a part of the canton
was separated from the rest, and the two new cantons
of Aargau and Vaud created out of it. The canton again received a small increase in 1815; and at present contains 3872 square miles, and 215,000 inhabitants.

Bern, a city of Switzerland, and capital of the canton of that name, is situated in E. Long. 7° 40' N. Lat. 40° 0'. It is said that the taking of a bear on the day on which the foundation of this city was laid, gave occasion to its name; hence it is often in Latin called Arctopolis, i.e. the city of the bear, and has a bear for its coat of arms. It is almost surrounded by the river Aar. The houses are mostly built of white freestone, and in the principal streets have piazzas or arches under them, for the convenience of walking dry in wet weather. Most of the streets are paved with flints, and traversed by a canal lined with freestone, which is brought from a considerable distance, and is very useful in carrying off the filth of the city, extinguishing fires, and other purposes. The city is large, containing 13,340 inhabitants by the last enumeration; and it has several churches, of which one is called the Great Church, and the first minister the dean, who is the head of the city clergy. From an inscription near the great door of this church, it appears, that the first stone of it was laid in 1241. Over the same door is a representation of the last judgment, in which the sculptor hath placed the pope among the damned. In this city is also a college with eight professors, a large public library, and a museum; a stately granary, in which a great quantity of corn is always kept; a guildhall; a well stored arsenal; and several hospitals. In the arsenal is a wooden statue of the famous Tell, which represents him as taking aim at the apple placed on the head of his son. There is also the statue of Berchtold von Zähringen, the founder of the city; and two large horns of buffaloes, or wild bulls, called in Latin Urti, such as are used in war by the canton of Uri, instead of trumpets, and taken from it in the year 1712. Hard by also hang the grotesque dresses of those who blew them. The inhabitants of Uri, who boast their descent from the old Tau, bear a buffalo's head on their risca, coat of arms; and the person who blows the great horn in time of war, is called the bull of Uri. In the Dominican church, a hole in the wall is always shown to strangers, by means of which, it having a communication with the cell of a monk in an adjoining monastery, the pious fraud of making an image of the Virgin appear to speak was once carried on, which for a while answered the purposes of the monks very well; but they were at last detected and punished. This city, though larger, is not so populous nor so well built as that of Zurich. On the east side of it is a handsome stone bridge; and near the great church is a very fine promenade some hundred feet in height, which makes a most delightful walk, being planted with limes, and commanding a charming prospect, particularly of the mountains of the Grisons, covered with snow in the midst of summer. In 1654 a student of divinity, being on horseback, and in liquor, leaped over this terrace without receiving any other hurt than breaking a leg, and lived many years after; but the horse was killed. In the upper part of the city are always kept a number of bears in two enclosures, with fir trees for them to clamber and play upon. Of the burgheers of Bern, only those are qualified for the government and magistracy of the city who are the descendants of such as were made burgheers before the Bern-Mo-year 1635. Other qualifications are also necessary; in particular, they must not be under 30 years of age, and must be enrolled in one of the 12 companies. To obtain a country government, or to hold any considerable employment, the candidate must also be married. The great council, in which the sovereignty of the canton is vested, consists, when full, of 229; but in general much short of that number, 85 or more often dying before their places are filled up. The lesser council senate, or, as it is called, the daily council, because it meets every day, Sundays and holidays excepted, consists of 27 members, including the two prutors or advoures, the four tribunes of the people, the two treasurer, and the two himelichers, or secretaries, so called, because to them all secrets relating to the state are discovered. The members of the great and little councils mutually fill up the vacancies that happen in these two colleges. How the bailiffs are chosen we have already taken notice. Our limits will not permit us to enter into any farther detail with respect to the government: only it is to be observed in general, that all the officers of any note are chosen out of the great or little councils; and that all the bailiffs and castellans of the canton continue six years in office. The trade of the city is not very great; but was less before the French refugees settled therein: some, however, doubt whether it has been a gainer by them; as by their introduction of French modes and luxury, they have helped to banish the ancient Helvetica simplicity and frugality. The territory immediately under its jurisdiction is divided into four governments, with which the four venner, or standard-bearers, are invested. It declared for the Reformation in 1528, after a solemn disputation. Here the British envoy to the canton resides.

Bern. Machine, the name of an engine for rooting up trees, invented by Peter Sommer, a native of Bern in Switzerland.

This machine is represented by a figure on Plate LXXXVIII. drawn from a model in the machine room of the Society for the Encouragement of Arts, &c. It consists of three principal parts; the beam, the ram, and the lever. The beam ABC, (No. 1.) of which only one side is seen in the figure, is composed of two stout planks of oak three inches thick at least, and separated by two transverse pieces of the same wood at A and C, about three inches thick. These planks are bored through with corresponding holes, as represented in the figure, to receive iron pins, upon which the lever acts between the two sides of the beam, and which is shifted higher and higher as the tree is raised or rather pushed out of its place. The sides are well secured at the top and bottom by strong iron hoops. The iron pins on which the lever rests should be an inch and a quarter, and the holes through which they pass an inch and a half in diameter. The position of these holes is sufficiently indicated by the figure. The foot of the beam, when the machine is in action, is secured by stakes represented at G, driven into the earth. The ram D, which is made of oak, elm, or some other strong wood, is capped with three strong iron spikes, represented at J, which take fast hold of the tree. This ram is six or eight inches square;
The engine is given in an oblique direction, it will exert a greater or lesser force against the horizontal roots of the tree in proportion to the angle formed by the machine with the plane of the horizon; and that the angle of 45° is the maximum, or that when the machine will exert its greatest force against the horizontal roots of the tree.

BERNACLE, a species of goose. See ANAS, Ornithology Index.

BERNARD, St., the first abbot of Clairvaux, was born in the year 1091, in the village of Fountaine, in Burgundy. He acquired so great a reputation by his zeal and abilities, that all the affairs of the church appeared to rest upon his shoulders, and kings and princes seemed to have chosen him for a general arbitrator of their differences. It was owing to him that Innocent II. was acknowledged sovereign pontiff, and after the death of Peter Louis anti-pope, that Victor, who had been named successor, made a voluntary abdication of his dignity. He convicted Abelard at the council of Sens, in the year 1140. He opposed the monk Raoul; he persecuted the followers of Arnaud de Bresse; and, in 1146, he got Gilbert de la Forvée, bishop of Poitiers, and Ezone l’Etoile, to be condemned in the council of Rheims. By such zealous behaviour he verified (says Mr Bayle) the interpretation of his mother’s dream. She dreamed, when she was with child of him, that she should bring forth a white dog, whose barking should be very loud. Being astonished at this dream, she consulted a monk, who said to her, “Be of good courage; you shall have a son who shall guard the house of God, and bark loudly against the enemies of the faith.” But St Bernard went even beyond the prediction, for he barked sometimes against chimerical enemies: he was more happy in exterminating the heterodox, than in ruining the infidels; and yet he attacked these last, not only with the ordinary arms of his eloquence, but also with the extraordinary arms of prophecy. He preached up the crusade under Louis the Younger, and by this means he enlarged the troops of the crusaders beyond expression; but all the fine hopes with which he flattered the people were disappointed by the event; and when complaint was made that he had brought an infinite number of Christians to slaughter without going out of his own country, he cleared himself by saying that the sins of the croissants had hindered the effect of his prophecies. In short, he is said to have founded 150 monasteries, and to have wrought a great number of miracles. He died on the 20th of August 1153, at 63 years of age. The best edition of his works is that of 1690, by Esther Mahillon.

BERNARD, Dr Edward, a learned astronomer, linguist, and critic, was born at Perry St Paul, on the 2d of May, 1638, and educated at Merchant-Taylor’s school, and St John’s college, Oxford. During his stay at school, he had laid in an uncommon fund of classical learning; so that, on his going to the university, he was a great master of all the elegancies of the Greek and Latin tongues, and not unacquainted with the Hebrew. On his settling in the university, he applied himself with great diligence to history, philology, and philosophy; and made himself master of the Hebrew, Syriac, Arabic, and Coptic languages, and then applied himself to the study of the mathematics under the famous Dr Wallis. Having successively taken the degrees,
degrees of bachelor and master of arts, and afterwards
that of bachelor of divinity in 1668, he went to Ley-
den to consult several oriental manuscripts left to that
university by Joseph Scaliger and Levinus Warnerus.
At his return to Oxford, he collated and examined the
most valuable manuscripts in the Bodleian library;
which induced those who published any ancient au-
thors, to apply to him for his observations or emenda-
tions from the manuscripts at Oxford; which he rea-
dily imparted, grudging neither time nor pains to serve
the learned; and by this means he became engaged in
a very extensive correspondence with the learned of
most countries. In the year 1669, the famous Chi-
ristopher Wren, Savilian professor of astronomy at Ox-
ford, having been appointed surveyor-general of his ma-
jestys works, and being much detained at London by
this employment, he obtained leave to name a deputy
at Oxford, and pitched upon Mr Bernard, which en-

gaged the latter in a more particular application to the
study of astronomy. In 1676, he was sent by the earl
of Arlington to France, in order to be tutor to the
dukes of Grafton and Northumberland, sons to King
Charles II. by the duchess of Cleveland, who then
lived with their mother at Paris: but the simplicity of
his manners not suiting the gaiety of the duchess's fa-

mily, he returned about a year after to Oxford, and
pursued his studies; in which he made great proficien-
cy, as his many learned astronomical and critical works
show. He composed tables of the longitudes, lati-
u
ditudes, right ascensions, &c. of the fixed stars; Obser-
vations in Latin on the Obliquity of the Ecliptic; and
other pieces inserted in the Philosophical Transac-
tions. He also wrote, 1. A Treatise of the ancient Weights
and Measures. 2. Chronologia Samaritanarum Synopsis, in
two tables. 3. Testimonies of the Ancients concerning
the Greek Version of the Old Testament by the
Seventy; and several other learned works. He was a
person of great piety, virtue, and humanity, and died on
the 12th of January, 1696, in the 39th year of his age,
leaving behind him a great number of learned and va-

duable manuscripts.

BERNARD, James, professor of philosophy and ma-
thematics, and minister of the Walloon church at Ley-
den, was born September 1. 1658, at Nions in Daup-

hine. Having studied at Geneva, he returned to
France in 1679, and was chosen minister of Venterol,
a village in Dauphiné. Some time after, he was re-
moved to the church of Vinsobres in the same province.
But the persecution raised against the Protestants in
France having obliged him to leave his native country,
he retired to Holland, where he was received with
great civility, and was appointed one of the pension-
ary ministers of Gouda. In July 1688, he began a
political publication entitled Histoire abrégée de l'Eu-

erope, &c. which he continued monthly till December
1688, and makes five volumes in 12mo. In 1692, he
began his Lettres Historiques, containing an account
of the most important transactions in Europe, with
necessary reflections. He carried on this work, which
was also published monthly, till the end of the year
1698. It was afterwards continued by other hands,
and consists of a great many volumes. Mr Le Clerc
having left off his Bibliothèque Universelle, in 1691,
Mr Bernard wrote the greatest part of the 20th vo-

lume, and by himself carried on the five following to
the year 1693. In 1698, he collected and published
Actes et Negociations de la paix de Russie, in four vo-

lumes 12mo. In 1699 he began the Nouvelles de la
republique des lettres, which continued till December
1710. Mr Bernard having acquired great reputation
by his works, as well as by his sermons at Gavda and
the Hague, the congregation of the Walloon church
at Leyden became extremely desirous to have him for
one of their ministers; and a vacancy happening in
1705, he was unanimously chosen. About the same
time, Mr de Volder professor of philosophy and mathe-

matics at Leyden having resigned, Mr Bernard was
appointed his successor; and the university presented
him with the degrees of doctor of philosophy and ma-

ster of arts. His public and private lectures took up
a great part of his time; yet he did not neglect his pa-

tural function, but composed his sermons with great care:
he wrote also two excellent treatises, one on a late re-
pentance, the other on the excellency of religion. In
1716, he published a supplement to Morit's dictionary
in two volumes folio. The same year he resumed his
Nouvelles de la republique des lettres; which he con-

tinued till his death, which happened the 27th of April,
1718, in the 60th year of his age.

BERNARDINE, St, was born at Massa in Tus-
cany, in 1380. In 1404 he entered into a Francisci
monastery near Sienna, where he became an eminent
preacher; and was afterward sent to Jerusalem, as
commissionary of the Holy Land. On his return to Italy,
he visited several cities, where he preached with such
appraise, that the cities of Ferrara, Sienna, and Urbino,
desired Pope Eugenius IV. to appoint him their bishop:
but Bernardine refused the honour, accepting only the
office of vicar-general of the friars of the observance
for all Italy. He repaired and founded above 300 mon-
estories in that country; died in 1444; was canonized in
1452 by Pope Nicholas; and his works were pub-

lished at Venice in 1591, in 4 vols. 4to.

BERNARDINES, an order of monks, founded by
Robert abbot of Molene, and reformed by St Bernard.
They wear a white robe, with a black scapulary; and
when they officiate they are clothed with a large gwna,
which is all white, and hath great sleeves, with a hood
of the same colour.—The Bernardines differ very little
from the Cistercians. They had their origin toward
the beginning of the 12th century.

BERNAY, a town of Upper Normandy in France,
seated on the river Caronante, in E. Long. 0. 30. N.
Lat. 49. 6.

BERNBURG, a town of Germany, in the cir-
cle of Upper Saxon, and principality of Anhalt,
where a branch of the house of Anhalt resides. It
is seated on the river Saale, in E. Long. 12. 30. N.
Lat. 51. 55.

BERNERA, one of the Western Isles of Scotland,
lying about two leagues to the southward of Harris.
It is about five miles in circumference; the soil is sandy,
but when manured with the alga marina, extremely
fertile,
BÉRÉNÈRE, producing an increase of thirty-fold of barley; may, one grain has been known to produce 14 ears when the season was remarkably favourable. The face of the island is extremely agreeable in summer, exhibiting a pleasing variety of corn fields and clover pastures. Here is a fresh-water lake called Lochbris, diversified with small islands, and abounding with eels, which the natives by the help of lights catch in the night-time, as they fall down a rivulet towards the sea in heaps twisted together. There are two chapels in this island dedicated to St. Amph and St. Columb; and near the former is a stone standing about eight feet above the ground. At the east end of this island there is a strange reciprocation of the flux and reflex of the sea, and another no less remarkable upon the west side of the Long island. The tides from the south-west run along northward; so that during the ordinary course of the tides the flood runs east in the frith where Bérenère lies, and the ebb runs west; thus the sea ebb and flows regularly for four days before, and as long after, the full and change of the moon; the spring tides generally rising 14 feet perpendicular, and the others proportionately: but for four days before, and as many after, the quarter moons, there is a singular variation; at that time a southerly moon making high water, the course of the tide being eastward, it begins to flow at half an hour after nine in the morning, and continues to flow till half an hour after three in the afternoon, when it is high water; but when it begins to ebb, the current still runs eastward, until it is low water; so that the tide runs eastward 12 hours together, that is, from half past nine in the morning till half past nine at night; yet, when the night-tide begins to flow, the current turns and runs westward all night for 12 hours, during both flood and ebb: thus the reciprocations continue, one flood and ebb running eastward and another westward, till within four days of the full and change of the moon; then they resume their ordinary course, running east during the six hours of flood, and west during the six hours of ebb. There is another phenomenon in these tides no less remarkable than that just now mentioned. Between the vernal and autumnal equinox, that is, during one half of the year, the tides about the quarter moons run all day eastward and all night westward; and during the other six months their course is reversed, being westward in the day and eastward in the night.

BÉRNICLA, the trivial name of a species of goose. See ANAS, ORNITHOLOGY INDEX.

BÉRNICLE, a species of lepas. See LEPAS, CONCHOLOGY INDEX.

BÉRNIER, Nicholas, an eminent musician and composer, was born at Mante on the Seine, in the year 1654. By his merit in his profession he attained to be conductor of the music in the chapel of St. Stephen, and afterwards in that of the King. The regent duke of Orleans admired his works, and patronized their author. This prince having given him a motif of his own composition to examine, and being impatient for his observations thereon, went to the house of Bernier, and entering his study, found the abbé de la Croix there criticising his piece, while the musician himself was in weaker rooms, poring and singing with a company of his friends. The duke broke in upon and interrupted their mirth, with a reprimand of Bernier for his inattention to the task assigned him. This musician died at Paris in 1734. His five books of Cantatas and Songs for one and two voices, the words of which were written by Rousseau and Fuselier, have procured him great reputation. There are besides of his composition Les Nuits de Socoa, and many motets, which are still in great esteem.

BÉRNIER, Francis, surnamed the Mogul, on account of his travels and residence in that country, was born at Angers in France; and after he had taken his degree of doctor of physic at Montpellier, left his country in 1654, went to Egypt, to the Holy Land, and to the kingdom of the Mogul, where he was physician to that monarch, attended him in his journeys, and stayed there 12 years. Upon his return to France, he published the history of the countries he had visited; and spent the remainder of his life in composing various other works, particularly an Abridgment of the philosophy of Gassendus in 8 vols. 12mo. His first work is esteemed to be the best account we have of the countries which are the subject of it.

BÉRNINI, John Laurence, commonly called Cavalier Bernin, a Neapolitan, famous for his skill in painting, sculpture, architecture, and mechanics. He first began to be known under the pontificate of Paul V. Rome is indebted to this artist for some of its greatest ornaments; and there are in the church of St. Peter no less than 15 different works of his hand. He died at Rome in 1680.

BERNO, abbot of Richenoü, in the diocese of Constantine, who flourished about the year 1008, is celebrated as a poet, rhetor, musician, philosopher, and divine. He was the author of several treatises on music, particularly of one De Instrumentis Musicibus, beginning with the words Musica non esse canta: which he dedicated to Arraboe, archbishop of Mentz. He also wrote De Memoria Monochoris. But the most celebrated of his works is a treatise De Musica seu Tono, which he wrote and dedicated to Pellegrines archbishop of Cologne, beginning Fero mundi siti advena et perieroni. This latter tract is part of the Balol manuscript, and follows the Enchiridion of Odo: it contains a summary of the doctrines delivered by Boetius, an explanation of the ecclesiastical tones, intermixed with frequent exhortations to piety, and the application of music to religious purposes. He was highly favoured by the emperor Henry II. for his great learning and piety; and succeeded so well in his endeavours to promote learning, that his abbey of Richenoü was so famous in his time as those of St Gal and Cluni, then the most celebrated in France. He died in 1048; and was interred in the church of his monastery, which but a short time before he had dedicated to St Mark.

BERNOULLI, James, a celebrated mathematician, born at Basel the 30th of December 1654. Having taken his degrees in the university of Basel, he applied himself to divinity, not so much from inclination as compliance to his father. He gave very early proofs of his genius for mathematics, and soon became a geometeric, without any assistance from masters, and at first almost without books; for he was not allowed to have any books of this kind; and if one fell by chance into his hands, he was obliged to conceal it, that he might not incur the reprimands of his father, who designed him for other studies. This severity made
Bernoulli. him choose for his device, Phaeton driving the chariot of the sun, with these words, *INVOCAT PARE SIDERA VERUM.* "I traverse the stars against my father's inclination!"

This had a particular reference to astronomy, the part of mathematics to which he at first applied himself. But the precautions of his father did not avail, for he pursued his favourite study with great application. In 1676 he began his travels. When he was at Geneva, he fell upon a method to teach a young girl to write, though she had lost her sight when she was but two months old. At Amsterdam he composed universal geometrical tables, but they were never published. He returned from France to his own country in 1680. About this time there appeared a comet, the return of which he foretold; and wrote a small treatise upon it, which he afterwards translated into Latin. He went soon after to Holland, where he applied himself to the study of the new philosophy. After having visited Flanders and Brabant, he went to Calais, and passed over from thence to England. At London he contracted an acquaintance with all the most eminent men in the several sciences; and had the honour of being frequently present at the philosophical societies held at the house of the famous Mr Boyle. He returned to his native country in 1682; and he exhibited at Basel a course of experiments in natural philosophy and mechanics, which consisted of a variety of new discoveries. In 1684, he published his essay of a new system of comets; and the year following, his dissertation on the weight of air. Mr Leibnitz, about this time, having published in the *Acta Eruditorum* at Leipsic some essay of his new *Calculus differentialis, or infinimini petitis,* but concealed the art and method of it; Mr Bernoulli, and one of his brothers, discovered, by the little which they saw, the beauty and extent of it: they endeavoured to unravel the secret; which they did with such success, that Mr Leibnitz declared, that the invention belonged to them as much as to himself. In 1687, the professorship of mathematics at Basel being vacant, Mr Bernoulli was appointed his successor. He discharged this trust with universal applause; and his reputation drew a great number of foreigners from all parts to hear his lectures. He had an admirable talent in teaching, and adapting himself to the different genius and capacity of his scholars. In 1699, he was admitted into the academy of sciences at Paris as a foreign member, and in 1701 the same honour was conferred upon him by the academy of Berlin. He wrote several pieces in the *Acta Eruditorum* of Leipsic, the *Journal des Scavans,* and the *Histoire de l'Academie des Sciences.* His assiduous application to these studies brought upon him the guzt, and by degrees, a slow fever, of which he died the 16th of August 1705, in the 58th year of his age. Archimedes having found out the proportion of a sphere to a cylinder circumscribed about it, ordered it to be engraven upon his monument. In imitation of him Mr Bernoulli appointed, that a spiral logarithmic curve should be inscribed upon his tomb, with these words, *Eadem mutata resurgo;* in allusion to the hopes of the resurrection, which are represented in some measure by the properties of the curve which he had the honour of discovering.

Bernoulli, Daniel, a celebrated physician and philosopher, was born at Groningen, February 9, 1700. He was intended by his parents for trade, but his genius led him to different pursuits. He passed some time in Italy, and at 24 refused to be president of the academy meant to have been established at Genoa. He spent several years at St Petersburg with great credit; and in 1733 returned to Basil, where he successively filled the chair of physic, natural and speculative philosophy. In his first work, *Exercitationes Mathematicae,* he took the only title he then had, viz. "Son of John Bernoulli," and would never suffer any other to be added to it. This work appeared in Italy with the great inquisitor's privilege added to it, and it placed Bernoulli in the rank of inventors. He gained or divided nine prizes, which were contended for by the most illustrious mathematicians in Europe, from the academy of sciences. The only man who has had success of the same kind in Euler, his countryman, disciple, rival, and friend. His first prize he gained at 24 years of age. In 1734 he divided one with his father: but this hurt the family union: for the father construed the contest itself into a want of respect; and the son did not sufficiently conceal that he thought (what was really the case) his own piece better than his father's. Besides this, he declared for Newton, against whom his father had contended all his life. In 1740, Mr Bernoulli divided the prize "On the Tides of the Sea" with Euler and Macaurin. The academy at the same time crowned a fourth piece, whose only merit was that of being Cartesian; but this was the last public act of adoration paid by it to the authority of the author of the Vortices, which it had obeyed perhaps too long. In 1748, Mr Daniel Bernoulli succeeded his father in the academy of sciences, and was himself succeeded by his brother John; this place, since its first erection, i.e. 84 years, never having been without a Bernoulli to fill it. He was extremely respected at Basil; and to Daniel Bernoulli, when they met him in the streets, was one of the first lessons which every father gave his child. He used to tell two little adventures, which he said had given him more pleasure than all the other honours he had received. He was travelling with a learned stranger, who, being pleased with his conversation, asked his name: "I am Daniel Bernoulli," answered he with great modesty; "And I," said the stranger (who thought he meant to laugh at him), "I am Isaac Newton." Another time he was giving a dinner to the famous Koenig the mathematician, who boasted, with a sufficient degree of self-complacency, of a difficult problem he had resolved with much trouble. Bernoulli went on doing the honours of his table; and, when they went to drink coffee, presented him with a solution of the problem more elegant than his own. He died in March 1782.

Beroea, in Ancient Geography, a noble city of Macedonia, to the south of Edessa, or Aegae, and southeast of Cyrtus. The people are commended in Scripture for their reception of the Gospel on a fair and impartial examination. Another Beroea, of Syria (Strabon); called also Beroe, and by the inhabitants Beroua. It was the standing tradition for some ages, that it is the modern Aleppo; called Chalep in Nicetas, Nicephorus, and Zonaras; from which it is supposed the present appellation Aleppo is derived; distant 90 miles from the Levant sea and the port of Scanderoon, and about 100 miles west of the Euphrates. E. Long. 36. 0. N. Lat. 36. 30.

Beroe,
BEROOTH, or BAIROUT, a town of Phoenicus, a province of Syria, in Turkey in Asia. It is the ancient Berytus; but there are now no remains of its former beauty, except its situation. It stands in a plain, which from the foot of Lebanon runs out into the sea, narrowing to a point, about two leagues from the ordinary line of the shore, and the north side forms a pretty long road, which receives the river of Nahr-el-Salih, called also Nahr-Bairout. This river has such frequent floods in winter, as to have occasioned the building of a considerable bridge; but it is in so ruinous a state as to be impassable. The bottom of the road is rock, which chafes the cables, and renders it very insecure. From hence, as we proceed westward towards the point, we reach, after an hour's journey, the town of Beroth. This belonged to the Druzes, till lately it was taken from them, and a Turkish garrison placed in it. Still however it continues to be the emporium of the Maronites and the Druzes, whence they export their cottons and silks, almost all of which are destined for Cairo. In return, they receive rice, tobacco, coffee, and specie, which they exchange again for the corn of the Bekas and the Hauran. This commerce maintains near 6000 or 8000 persons. The dialect of the inhabitants is justly censured as the most corrupt of any in the country: it unites in itself the 12 faults enumerated by the Arabian grammarians. The port of Beroth, formed like all the others on the coast by a pier, is for some time choked up with mud and ruins. The town is surrounded by a wall, the soft and sandy stone of which may be pierced by a cannon ball without breaking or crumbling; which was unfavourable to the Russians in their attack: but in other respects this wall, and its old towers, are defenceless. Two inconveniences will prevent Beroth from ever becoming a place of strength; for it is commanded by a chain of hills to the south-east, and is entirely destitute of water, which the women are obliged to fetch from a well at the distance of half a quarter of a league, though what they find there is but indifferent. By digging in order to form reservoirs, subterraneous ruins have been discovered; from which it appears, that the modern town is built on the ancient one. The same may be observed of Latakia, Antioch, Tripoli, Baide, and the greater part of the towns on the coast; which has been occasioned by earthquakes that have destroyed them at different periods. We find likewise, without the walls to the west, heaps of rubbish, and some shafts of columns, which indicate that Beroth has been formerly much larger than at present. The plain around it is entirely planted with white mulberry trees, which are young and flourishing; by which means the silk produced here is of the very finest quality. In descending from the mountains (says M. Volney), no prospect can be more delightful than to behold, from their summits or declivities, the rich carpet of verdure formed by the tops of these useful trees in the distant bottom of the valleys. In summer, it is inconvenient to reside at Berooth on account of the heat and the warmth of the water: the town, however, is not unhealthy, though it is said to have been so formerly. It has ceased to be unhealthy since the Emir Fakr-el-din planted the wood of fir trees, which is still standing a league to the southward of the town. E. Long. 35. 38. N. Lat. 34. 13.

BEROSUS, priest of the temple of Belus at Baby-

lon, in the time of Ptolemy Philadephus, wrote the His-
tory of Chaldea, which is often cited by the ancients,
and of which Josephus gives some curious fragments.
The Athenians, according to Plistus, caused his statue,
with a golden tongue, to be placed in their Gymnasium.

BERRE, a town of France, in the department of the
Mouths of the Rhine, seated on a lake of the same
name. It contains 1800 inhabitants, and is remark-
able for the quantity and goodness of the salt that is
made there. E. Long. 4. 32. N. Lat. 43. 32.

BERRETINII DA CORTONA, PIETRO, painter of
history and landscape, was born at Crotona in 1568;
and, according to some writers, was a disciple of
Andrea Commedia; though others affirm that he was the
disciple of Baccio Ciampi, and the author of the Abrege
sage he was successively the disciple of both: but he is
allowed to have been as great and as enlarged a genius
as any of his profession, and to have painted more
agreeably than most of the artists who were his contem-
poraries. He went young to Rome, and applied him-
self diligently to study the antiques, the works of Ra-
phael, Buonaroti, and Polidoro; by which he so im-
proved his taste and his hand, that he distinguished
himself in a degree superior to any of the artists of his
time. He worked with remarkable ease and freedom;
his figures are admirably grouped; his distribution is
truly elegant; the chiaro-scuro is judiciously observed;
and through his whole compositions there appears un-
common grace: but De Fiesi observes, that it was not
such a grace as was the portion of Raphael and Corre-
gio; but a general grace, consisting rather in a habit
of making the air of his head always agreeable, than in
a choice of expressions suitable to each subject. In
his large compositions, the colouring had a good effect;
but his colouring in fresco is far superior to what he per-
formed in oil: nor do his easel pictures appear so fin-
ished as might be expected from so great a master, when
compared with what he painted in a larger size. By
the best judges it seems to be agreed, that although this
master was frequently incorrect; though not always ju-
dicious in his expressions; though irregular in his dra-
peries, and apt to design his figures too short and too
heavy; yet, by the magnificence of his composition,
the delicate air of his figures, the grandeur of his dec-
orations, and the astonishing beauty and gracefulness
of the whole together, he must be allowed to have been
the most agreeable mannerist that any age hath produ-
ced. — He died in 1669. Some of his most capital works
are in the Barberini palace at Rome, and the Palazzo
Pitti at Florence.

BERRETTONI, NICOLAO, history-painter, was born
at Macerata in 1617, and was a disciple of Carlo Ma-
ratti, with whom he studied design and colouring for
some years; and attained such excellence, that he ex-
cited even the jealousy and envy of his master, who
seemed to be apprehensive of finding a powerful compe-
titor and rival in his pupil. — His early works, after he
quitted the school of Maratti, were in the style and taste
of Guido; and they could not possibly have a more high
encomium or recommendation. He died in 1682.

BERRIMAN, DR WILLIAM, was the son of Mr
John Berriman apothecary in Bishopsgate-street, Lon-
don, where he was born in 1688. He studied at
Oriel college, Oxford, where he took his several de-
}E

"in
BERSABE, in Ancient Geography, a town in the tribe of Simeon (Joshua); the south boundary not only of its own tribe but of the whole land of Israel, as appears from the common expression "from Dan to Bersabe," in our translation it is Beersheba. It was the residence of the patriarchs; as first of Abraham, from whom it took its name, and of Isaac. It signifies the well or fountain of the oath; dug by Abraham, and claimed as his property by covenant and the religion of an oath, against the insults of the Philistines. Essebius and Jerome say, that there was a citadel and large village of that name in their time. It was called Beersheba of Judah in I Kings xix. 3, not to distinguish it from the Beersheba of Galilee, which probably did not then exist, but to ascertain the limits of the kingdom of Judah. In the lower age called Custrum Versabini.

BERSARI, in writers of the middle age, a kind of hunters, or sportmen, who pursued wild beasts in forests and chases. The word seems derived from the barbarous Latin bersere, "to shoot with a bow;" on which principle it should properly denote archers only, or bowmen. Or it might be derived from bere, "the fence or palis of a park;" in which view, it should primarily import those who hunt or poach in parks or forests.

Hinomer speaks of a kind of inferior officers in the court of Charlemagne, under the denomination of berarri, veltrarii, and beverarii. Spelman takes the first to denote those who hunted the wolf; the second, those who had the superintendence of the bounds for that use; and the third, those who hunted the beaver.

BERSELLO, a fortified town in Italy in the Modenese. It was taken by Prince Eugene in 1702; and by the French in 1703, who were obliged to abandon it in 1707. It is seated near the confluence of the rivers Linza and Po, in E. Long. 1° 30'. N. Lat. 44° 35'.

BERSUERE, a town of France in the department of the two Sevres. W. Long. 0° 27'. N. Lat. 46° 52'.

BERTHOUD FERDINAND, an eminent French chronometer maker. See Supplement.

BERTINERO, a town of Romagna in Italy, with a strong citadel. It is the see of a bishop; and is seated on a hill, in E. Long. 11° 47'. N. Lat. 44° 8'.

BERTRAND, 87, a town of France in the department of Upper Garonne. E. Long. 0° 58'. N. Lat. 43° 2'.

BERVY, a sea-port and royal burgh in the county of Mearns in Scotland. Population 927 in 1811. W. Long. 2° 0'. N. Lat. 56° 40'.

BERWICK, the Duke of, was natural son of James II. by Mrs Arabella Churchill, sister to the great duke of Marlborough. He followed the fate of his father, and came into France after the revolution with James II. Here the duke of Berwick was recommended to the court by his superior merit. He was created marshal of France, knight of the Holy Ghost, duke and peer of France, grandee of Spain, commander in chief of the French armies; in all which stations his behaviour was such, that few equalled, perhaps none surpassed him. He lived in an age when the renowned prince of Orange and many other of the greatest men commanded against him. His courage was of the cool steady kind; always possessing himself; taking all advantages; not foolishly rashly, but wantonly throwing away the lives of his soldiers. He kept up on all occasions the most strict discipline; and did not spare punishment among...
Berwick, among his soldiers for marauding and other crimes, when properly deserved; for which some inconsiderate people have blamed him. He has been reflected upon, by the very zealous and violent adherents of the Stuart family, for not being sufficiently attached to that party, which was his own family. But by a cool examination of his actions, it will appear, that his behaviour in this particular was, as in most parts of his life, sensible and just. When he accepted of employments, received honours, dignities, and became a naturalized Frenchman, he thought it his duty, as an honest man, to become a Frenchman, and a real subject to the monarch who gave him bread; and to be, or not to be, in the interest of the Stuart family, according to the will and commandment of the sovereign whom he served, and in the interest of France according to time and circumstances; for there is no serving two masters well. But when ordered by his king to be in that family's interest, he acted with the greatest sincerity, and took the most effectual and sensible methods to serve that unhappy house, as the following anecdote, if true, and it has great appearance of probability on its side, proves.

The duke of Marlborough, after the signing of the treaty of Utrecht, was censured by the British parliament for some of the army contracts in relation to bread and forage; upon which he retired into France; and it was then credibly asserted, the duke of Marlborough was brought over to the interest of the Stuart family; for it is now past a doubt, that Queen Anne had a very serious intention of having her brother upon the throne of England after her death: and several circumstances, as well as the time of that duke's landing in England, make many people believe he was gained over to the Stuart party. If the duke of Berwick was, directly or indirectly, the means of gaining his uncle over to that interest, he be more effectually served it, than that rash mock army of unhappy gentlemen who were taken prisoners at Preston in 1715 had it in their power to do. In a word, the duke of Berwick was, without being a bigot, a moral and religious man; and showed by his life and actions, that morality and religion are very compatible and consistent with the life of a statesman and a great general; and if they were often united in these two professions, it would be much happier for the rest of mankind. He was killed by a cannon-ball at the siege of Philippsburg in 1738.

Berwick, a county of Scotland; bounded by the river Tweed on the south; by East Lothian on the north; by the German ocean on the east; and on the west by the counties of Roxburgh, Peebles, and Mid-Lothian. Its extent in length may be stated at 54 miles, and its breadth 19. This county is nominally divided into three districts, viz. Lauderdale, Lammermuir, and Merse or March. The first is that opening or valley in the Lammermuir hills, through which the river Leader runs. Lammermuir comprehends the ridge of hills which separate this county from East Lothian, extending from the head of Leader water to the sea, below the town of Berwick. The Merse or March includes that fertile and populous plain, stretching from the hills, along the banks of the Tweed. Berwickshire contains one royal borough, viz. Lauder, and several large towns and villages, as Dunse, Coldstream, Coldingham, Aytoun, and Eyemouth. The chief rivers are the Tweed, the Leader, the Eye, the Whittadder, and Blackadder. The two roads to London pass through the county. In the Merse the state of agriculture is excellent; and, though so late as 60 years ago, the greater part was barren and uncultivated, it is now mostly enclosed and improved. The county of Berwick exports from the ports of Berwick and Eyemouth, above 30,000 bolls of wheat; and the same quantity is annually carried to the weekly markets of Edinburgh, Dalkeith, Haddington, and Dunbar. There is plenty of marl in the county; but the farmers prefer lime as the most profitable, though at the distance of 18 or 20 miles. The minerals in this district hitherto discovered, are few, and these are by no means valuable. Coal has been found only in small quantities near Eyemouth. There is plenty of freestone fit for building, and both rock and shell marl are found in different places. Copper has been wrought in the neighbourhood of Lander; and some years ago, a mine of the same metal was discovered in the parish of Buncle. The parish of Mordington contains ironstone, but of too small value to render it an object of manufacture. The rocks which compose the Lammermuir hills, are chiefly schistus, with alternate strata of sandstone. At Eyemouth is a rock of the species called puddingstone, in the pieces of which it is not uncommon to find fragments of porphyry, granite, and even limestone. Near the Whittadder, in the parish of Chirnside, is a species of gypseum, which has been of great use as a manure. The celebrated mineral well, called Dunse Spa, which is somewhat similar to Tunbridge, is situated about a mile from the town of Dunse. The rivers contain trout, and salmon; of which last a great quantity is annually exported from Berwick to London. From the situation of this county, on the border of England, it was necessary that it should be strongly fortified; accordingly, there are numerous strong castles and fortified places in almost every parish in the county. The following is the population of the county of Berwick according to the parishes, taken at two periods, from the Statistical History of Scotland.

Lennel
Beryl, in Natural History, called by our lapidaries aqua marina, is a pellicid gem of a bluish green colour, found in the East Indies and about the gold mines of Peru; we have also some from Silesia, but what are brought from thence are often more yellowish than real beryls; and when they are genuine, they are greatly inferior both in hardness and lustre to the oriental and Peruvian kinds.

The beryl, like most other gems, is met with both in the pebble and columnar form, but in the latter most frequently. In the pebble form it usually appears of a roundish but flattened figure, and commonly full of small flat faces, irregularly disposed. In the columnar or crystalline form it always consists of hexagonal columns, terminated by hexagonal pyramids. It never receives any admixture of colour into it, nor loses the blue and green tinge; it is of a deep and dusky to the palest imaginable of the hue of sea-water.

The beryl, in its perfect state, approaches to the hardness of the garnet, but is often softer; and its size is from that of a small pea, to that of a horse- or even a walnut. It may be imitated by adding to 20 pounds of crystal-glass made without magnesia, six ounces of calcined brass or copper, and a quarter of an ounce of prepared saffire. — The properties of the beryl were very wonderful in the opinion of the ancient naturalists; it kept people from falling into ambuscades of enemies, excited courage in the fearful, and cured distempers of the eyes and stomach. It does none of these things now; because people are not simple enough to believe it has the virtue to do them.

Berytus, in Ancient Geography, a sea-port town of Phoenicia on the Mediterranean, so ancient as to be thought to have been built by Saturn. It was destroyed by Tryphon, but rebuilt by the Romans. Agrippa placed here two legions, whence it became a colony. It enjoyed the jus Italicum, and had an excellent school for the study of the law in Justinian's time. New Berytus, which see.

Berys, or Bessis, in Roman antiquity, two-thirds of the ass. See Ass.

Besse also denotes two-thirds of the jugerum. See Jugerum.

Besse, or Bessus, in Latin, a writ that lies where the great-grandfather was seized in fee of any lands, &c. at the time of his death: and after his decease a stranger enters thereon, the same day, and keeps out the heir.

Besancon, a city of France, capital of the Franche Comte, now the department of Doubs. It is one of the most ancient cities of Europe, formerly the seat of an archbishop, and had a parliament as well as a university. It is seated on the river Dreuse, which...
besancon, which divides it into two parts, the greatest of which is a peninsula. The entrance is shut up by a mountain, on which they have built a large citadel, which commands all the city. There are many names of places in and about the city, that are plainly corruptions of the Latin, and are marks of its antiquity, as Chamars, Campus Martis; Chamane, Campus Musurus; Chandane, Campus Diane, &c. The metropolitan church is built at the bottom of St Stephen's hill and is a very handsome structure with a high tower steeple. The great altar is placed in the middle choir, where on high days they expose relics in silver shrines, enriched with gold and jewels. There are several tombs and other things remarkable in the churches; and after you have past the church of Notre Dame, and the square that it looks into, you come to a triumphal arch, erected in honour of the emperor Aurelian, on which are several figures of men and animals, pretty entire. It serves as a gate to the cloister of St John the Great. The great hospital of the order of the Holy Ghost is a structure worth seeing. The streets are wide and handsome; and the houses are well built with freestone, and covered with slate, chiefly about the square called Battan, which is adorned with a fountain, the water of which proceeds from a statue of Bacchus. The river Dreuex is passed over by a stone bridge. The market-place is at the entrance; and on the left is another square, adorned with a fountain, where the great street begins. The new square is not far from this street, from whence you go to the town-house, which is a large structure with four wings, before the front of which is the statue of Charles V. in bronze, with a globe in one hand and a sword in the other. The imperial eagle is raised over a large bason, and spouts out water by both his beaks; and there is also a fountain adorned with the figures of a armed woman, with water springing out at her nipples. The university, which was dissolved at the revolution, was re-established as a lyceum and college in 1801. The population in 1815 was 28,200. E. Long. 6. 10. N. Lat. 47. 26.

besant, or bezant, a coin of pure gold, of an uncertain value, struck at Byzantium, in the time of the Christian emperors; from hence the gold offered by the king at the altar is called besant or bissant.

besanted, or bezanted. This word means full of besants; and is used to denote a field, ordinary, or charge, covered with above eight besants; for if thare be but eight or fewer, their number must be particularly mentioned.

beseleel and olliah, architects, sculptors, and painters, supposed to have made all the ornaments in brass, silver, &c. of the first tabernacle in the wilderness, 1490 B.C.

besiers, or beziers, an ancient town of France, in Lower Languedoc, now the department of Hérault, formerly a bishopric, and containing 14,500 inhabitants in 1813. It has a delightful situation; and the country in which it stands is fertile in corn and oil, and produces excellent wine. It is seated on a hill near the river Orbe, in E. Long. 3. 23. N. Lat. 43. 21.

besistan, or bestein: Thus, at Constantinople, Adrianople, and in some other towns within the Grand Signior's dominions, they call those places where the merchants have their shops, and expose their merchandises to sale. Each sort of merchants have their particular besistan, which must also be understood of the workmen, all those of the same trade working in the same place. These besistans are commonly large galleries, vaulted over, whose gates are shut every night. Sometimes the wardens and keepers of the besistans will answer for the merchandises, on paying them a very moderate perquisite for every shop.

bleseria. see botany index.

besorch, a coin of tin, or some alloyed metal, current at Ormus at the rate of 27 parts of a farthing sterling.

besozzi, or bezutius, ambrogio, a painter of considerable eminence, was born at Milan in 1648. He worked some time under Gioseffo Danedi, called Montalto; he afterwards went to Rome, where he studied from the antiques and the pictures of the greatest masters; and at last perfected himself in the school of Ciro Ferri. His great excellency consisted in painting architecture, frizies, imitations of bas-relieves, and other decorations. He died at Milan in 1706, aged 58 years.

besrarabia, a territory lying between Moldavia, the Danube, and the Black sea, formerly belonging to Turkey, but ceded by that power to Russia in 1812. It is inhabited chiefly by Tartars, who maintain themselves by their cattle and husbandry. Their religion, manners, and customs, are the same with those of the Crim Tartars. The whole country contains about 8800 square miles, is level and fertile, but the inhabitants apply more to grazing than tillage. Although a number of small rivers traverse the country, both water and wood are scarce.

besarious, titular patriarch of Constantinople and archbishop of Nice, and one of those illustrious persons who contributed to the resurrection of letters in the 14th century, was born at Thrace. He was very zealous to reunite the Greek with the Latin church, and engaged the emperor John Paleologus to interest himself in bringing this great work about. He passed into Italy, appeared at the council of Florence, harangued the fathers, and made himself admired as well by his modesty as by his uncommon abilities. The Greek schismatics conceived so great an aversion to him, that he was obliged to remain in Italy; where Pope Eugenius IV. honoured him with the purple in 1439. He fixed his abode at Rome, and would have been raised to the papal chair, if Cardinal Alain had not opposed it, as injurious to the Latin church, to choose a Greek however illustrious. He was employed in several embassies, but that to France proved fatal to him. When legate at this court, he happened to visit the duke of Burgundy, before he saw Louis XI. which so displeased the capricious haughty monarch, as to occasion him a very ungracious reception. Nay, the king even took the cardinal's lega by his most significant beard, saying in Latin, "Romans, Greece genus retinet quod habere solebat;" and this affront so chagrined the cardinal, as to occasion his death at Ravenna upon his return in 1472. This at least is what Matthieu relates in his History of Louis XI. Besarios loved the litterati, and protected them. Argypolus, Theodore of Gaza, Poggio, Laurentius Valla, &c. formed in his house a kind of academy. His library was large and curious; and the senate of Venice, to whom he gave it, preserve it to this day with attention.
BESSICA, in Ancient Geography, a district of Thracia towards Mount Heamus, to the south of the Hebros. It was inhabited by a fierce and barbarous people noted for their robberies. Their chief city Ucudans is now known by the name of Varna. They lived under their own kings till the consulate of M. Licinius Lucullus and C. Cassius Varus; when the consul Lucullus invaded their country, and having gained a great victory over them, took their metropolis, and subjected the whole nation to the Roman laws. The Romans, notwithstanding they had subdued them by force of arms, still suffered them to live under their own kings; for Pisone, while he governed Macedon in quality of proconsul, having treacherously seized Rabocentus, whom Suetonius calls prince of the Bessi, caused him to be publicly beheaded. This afforded no exasperated the whole nation that they revolted; but were overthrown in a great battle by Octavius the father of Augustus. During the civil wars of Rome they attempted anew to recover their liberty, but were again defeated by the famous M. Brutus. In the reign of Augustus one Vologesus, a native of the country, and priest of Bacchos, having, under pretence of religion, drawn together great crowds of people, made himself master of the whole country; and, entering the Chersonese, committed there the most dreadful ravages. He was at last, however, overcome by L. Pisone who obliged the savage inhabitants to lay down their arms, and submit to such conditions as was pleased to impose upon them. From this time the Bessi continued subject to the Romans, without attempting any more to regain their liberty.

BESSIS. See BE.

BESTAIL, or BESTIAL, in ancient statutes, all kinds of beasts or cattle, especially those purveyed for the king's provision.

BESTIARIUM, in Roman antiquity, such as fought against beasts, or those who were exposed to them by sentence of the law. There were four kinds of beastiarium: the first were those who made a trade of it, and fought for money; the second were such young men as, to show their strength and dexterity in managing their arms, fought against beasts; the third kind was, where several bestiarii were let loose at once, well armed, against a number of beasts; and the fourth kind were those condemned to the beasts, consisting either of enemies taken prisoners in war, or as being slaves, and guilty of some enormous crime; these were all exposed naked, and without defence.

BESTRICIA, a town of Transylvania, remarkable for the gold mines in its neighbourhood. E. Long. 22° 6'. N. Lat. 48° 9'.

BETA, the BEET. See BOTANY and AGRICULTURE Index.

BETANZOS, a town of Galicia in Spain, seated on the Mandeo, and a bay of the sea, in W. Long. 7° 52'. N. Lat. 43° 21'.

BETEL, or BETLE, in Botany, an Indian plant (a species of PIPER), in great esteem in the east, where it makes a considerable article of commerce. See PIPER. See also BETEL, SUPPLEMENT.
Bethesda.

BET[ [ 591 ]

Bethesda, required frequent bathing. However, some will have the word Bethesda to be παλαιόν or the sick-house, or drain, because the waters which came from the temple, and the place where the victims were washed, flowed thither. From the Greek word ἠμισύλεια being used by Josephus (Antiq. xxv. 3) to denote the baths at Jericho, Dr Macknight, in his Harmony of the Gospels, concludes that their opinion seems to be without a proper foundation who affirm, that this pool served for washing the sheep designed for sacrifice before they were driven into the temple, and for washing the entrails of the beasts sacrificed there: besides, he thinks it inconsistent with the situation of Bethesda, near the sheep-gate (or market, as our English translators have rendered the Greek οντος τε προς την καταλήψειν, though some copies have it, εν τοις, &c.) in the south-east wall of the city; or, according to the compilers of the Universal History, in that which was on the north-east, a great way from the temple. However this may be, we are told (John v. 2, 3, &c.) that in the portico of this bath, at the time of a certain feast (which is generally supposed to have been the passover), there lay a multitude of impotent folk, such as the blind, halt, and withered, waiting for the moving of the waters: for an angel went down at a certain period into the pool, and troubled the water; that is, moved it in a sensible manner. Whosoever then first, after the troubling of the water, stepped into it, was made whole of whatever disease he had. Some writers confine the miracle of the pool of Bethesda to the season of this particular feast mentioned in verse 1 of this chapter, because they understand ωραίως μεταχείρισθης by times (verse 4), which our translators render a certain season, meant at that season; that is, the season mentioned verse 1; and since the evangelist does not say that the waters of Bethesda had their sanative quality at any other feast, we are at liberty to make what supposition seems most convenient. Perhaps the silence of Philo and Josephus upon this miracle may induce some to think that it happened only at one passover; for though many infirm people lay in Bethesda, if the angel, as is probable, descended frequently during that solemnity, the miracle would be no sooner known, than multitudes would come and wait at the pool to be cured by the moving of the waters: however, if the number of the sick who gathered on this occasion, and the phrase ωραίως μεταχείρισθης, shall incline any person to believe that the waters of Bethesda had an healing quality at other passovers also, Dr Macknight observes, that the silence of the writers before mentioned needs not be much regarded; it being well known that they have omitted greater transactions which they had an opportunity to know, viz. that multitude and variety of miracles which our Lord performed in the course of his ministry. That the waters of Bethesda should at this time have obtained a miraculous healing quality was, without doubt, as that writer remarks, in honour of the personal appearance of the Son of God on earth. Perhaps it was intended to show that Ezekiel's (xlvii.) vision of waters issuing out of the sanctuary was about to be fulfilled, of which waters it is said (ib. verse 9) "They shall be healed, and every thing shall live whither the river cometh." But it must be observed, that the fourth verse of this chapter of St John is not in the Cambridge MSS., which formerly was Beza's, nor in one or two more of great authority. See Dr Mill's judgment of it in Bethlehem, that part of his Prolegomena to which he refers the Bethlehem reader in his note on the text. But though it should be rejected, the difficulty for which some would have it cancelled, Dr Macknight observes, remains still: because the seventh verse implies that cures were performed in this pool, and that only one at a time was cured, and consequently that these cures were miraculous. If so, it is as easy to conceive that an angel moved the water, and gave it its healing quality, as to fancy those cures were performed miraculously any other way. Grotius thinks, that the angel is said to have descended, not because he was ever seen to do so, but because the Jews were persuaded that God brought such things to pass by the ministration of angels; so that from that violent motion of the water, and the cure following it, the presence of an angel was with reason supposed. Dr Hammond supposes, that the waters became medicinal by being impregnated with a healing warmth from the blood and entrails of the sacrificed beasts that were washed there; and that the ωραίως μεταχείρισθης, angel, or messenger, in the text, is not to be understood of those celestial beings that are usually distinguished by that name, but only of a common messenger, viz. an officer or servant of the priest, who at a proper season was sent by him to stir the pool.

BETHLEHEM, a town of Palestine, famous for the birth of Jesus Christ. It was once a flourishing town; but is now only a poor village. It is situated two leagues south-east of Jerusalem, on an eminence, in a country full of hills and valleys, and might be rendered very agreeable. The soil is the best in all those districts: fruits, vines, olives, and sesame succeed here extremely well; but cultivation is wanting. They reckon about 600 men in this village capable of bearing arms upon occasion; and this often occurs, sometimes to resist the pacha, sometimes to make war with the adjoining villages, and sometimes in consequence of intestine disensions. Of these 600 men, about 100 are Latin Christians, who have a vicar dependent on the great convent of Jerusalem. Formerly their whole trade consisted in the manufacture of beads; but the reverend fathers not being able to find a sale for all they could furnish, they have resumed the cultivation of their lands. They make a white wine, which justifies the former celebrity of the wines of Judea, but it has the bad property of being very heady. The necessity of uniting for their common defence prevails over their religious differences, and makes the Christians live here in tolerable harmony with the Mahometans, their fellow-citizens. Both are of the party Yomani, which, in opposition to that called Kafi, divides all Palestine into two factions, perpetually at variance. The currency of these peasants, which has been frequently tried, has rendered them formidable through all that country. Here is a church built by St Helena, in the form of a cross, which is very large; and from its top may be seen all the country round about. The roof is lofty, flat, and composed of cedar on the inside, and leaded without. Both sides of the nave are supported by two rows of marble pillars, each made of one piece, and eleven in a row, insomuch that they make as it were five naves, separated from each other by these rows of pillars, in each of which is the picture of some saint. On the wall over the pillars there
BETHELEM is a very beautiful mosaic work, on a gold ground. The walls were formerly overlaid with fine marble, but the Turks have taken it to adorn their mosques. The three upper ends of the cross terminate in three semicircles, having in each an altar. Over the chancel there is a stately cupola, covered with lead on the outside, and within adorned with mosaic work. Close to the church is the monastery of the Franciscans; which is large, but indifferently built. The gardens are defended with strong walls, and at the north-west of them stands a tower now almost in ruins. Their chapel is better taken care of. Through this there is a passage to a square cave, where they say the Innocents were buried. Beyond this there are passages to the tombs of St Jerome, St Paula, Eustochium, and Eusebius of Cremona. Beyond these there is a grot or cell, which they say was the lodging place of St Jerome when he translated the Bible. Another entrance leads to a vault or chapel, 12 feet wide and 40 long, whose floor is paved, and sides lined with white marble, and the roof is adorned with mosaic work, now much decayed. At the end of this there is an arched concavity, with an altar, over which is a picture of the nativity, and under it a vault, the middle of which is a star made with stones of various colours, to mark the place where they say our Saviour was born; and near this is the manger where they pretend he was laid; it is hewn out of a rock, and is now flagged with white marble.

BETHLEHEM, a town of the Netherlands, in the province of Brabant, subject to the house of Austria. E. Long. 4° 40'. N. Lat. 51° 2'.

BETHLEHEMITES, or BETHELEMITES, in church history, a sort of monks introduced into England in the year 1257, habited like the Dominicans, except that, on their breast, they wore a star with five rays, in memory of the star or comet which appeared over Bethlehem at the nativity of our Saviour. They were called at Cambridge, and had only one house in England.

There is also an order of Bethlehemites still subsisting in Peru, who have convents at Lima; one called of the Incurables, the other of our Lady of Mount Carmel. These Bethlehemites came originally from the city of Guatimala in Mexico, where they were instituted by the venerable Peter Joseph of Betanmor, for the service of the poor. Innocent XI. in 1687, approved the institute. They have already nine convents in Peru.

The Bethlehemites, though outwardly of great simplicity, pass for the most refined politicians; insomuch as to be called the quintessence of the Carmelites and Jesus. They are all friars. For their almoner they choose a secular priest, whom they hire, and who has no vote in the chapter.

BETHORON, in Ancient Geography, a town of Samaria; Upper and Nether, and both in the tribe of Ephraim, built by Shera, grand-daughter of Ephraim, 1 Chron. viii. 24, both which were restored by Solomon, after falling to decay, 1 Kings ix. 17, and 2 Chron. viii. 5. Their distance was almost the whole breadth of the tribe of Ephraim, the Upper being in the north, the Nether in the south, of that tribe, Joshua xvi. We know more of the Nether than of the Upper; it was situated on a mountain, and therefore Josephus and Jerome mention going up or ascending; and it stood on the public road to Lydda and Cesaras, distant an hour and a half from Jerusalem, or twelve miles, from Jerusalem; and on an account of this vicinity, some allot it to the tribe of Benjamin.

BETH-PEOR, in Ancient Geography, a town of the Rubenites, on the other side Jordan, at Mount Gogor, over against Jericho, six miles above Lias. It had a temple sacred to the idol Baal-Peor, Numbers xxv. 3, called Beel-Phegor by the Vulgate, interpreted Priapus by Jerome.

BETHPHAGE, in Ancient Geography, a place at the west descent or declivity of Mount Olivet, Matthew xxvi. 1. From which it may be gathered, that the whole of that declivity, with a part of the valley, and the extreme skirts of the city, went under the common name of Bethphage.

BETHSAIDA. See BETHARAMPTHIA.

BETHSHAN, or BETHESAN, in Ancient Geography, a town of Samaria, in the half tribe of Manasseh, on the borders of Galilee, about half a league from Jordan, on this side, having half of its territory in the Fezara; it was afterwards called Scythopolis; it was distant from Tiberias, situated on the lake Genesareth, 100 stadia, or 13 miles, to that of Jerusalem on the north, 660 stadia, or 75 miles. According to the origin of the appellation Scythopolis, there scarce appears anything in history that has a relation to it, but the irruption of the Scythians in the time of the Medes, when they overran all Asia. It was the greatest city of all the Decapolis, (Josephus). It is called Baeson by Stephanes.

BETHUNE, MAXIMILIAN DEK, duke of Sully, grand-master of the artillery, and marshal of France, sovereign prince of Enrichemont and Bois-Bell, marquis of Roeny, and one of the ablest and most upright ministers France ever had, was descended from an illustrious house, and was born in 1560. He entered very young into the service of Henry of Bourbon then king of Navarre, afterwards Henry IV. of France, who was only seven years older than Sully. He was bred in the reformed religion, and continued in the profession of it to the end of his life, though from political motives he advised his master to abjure it, as the only method of putting an end to the miseries of France. After Henry had gained possession of the kingdom, Sully performed all the duties of a great and good minister, while his master exercised all the offices of a great and good king. He had been at the battles of Condrieu, Andos, and Ivry; at the sieges of Paris, Noyon, Rouen, and Laon; and signalized himself on every important occasion. In 1597 he was made chief overseer of the highways of France; and the following year was raised to the post of superintendent of the finances. Though he was then but 40 years of age, and had hitherto signalized himself only in the army, he put the king's finances in such order, that he paid his debts, which amounted to two hundred millions of livres, and laid up great sums in the king's treasury. In 1601 he was made grand-master of the artillery, the next year governor of the Bastille, and afterwards superintendent of the fortifications. He was then sent into England as ambassador extraordinary; and had, at his return, the government of Poitou. At last Henry IV. in 1656, erected in his favour the territory of Sully on the Loire into a duchy and peerage, and
made him grand-master of the ports and havens. After the murder of that great prince in 1610, the duke of Sully, who had served him with the greatest zeal and fidelity, was obliged to retire to one of his houses, where he enjoyed a private life; but in 1634 he was made Marshal of France, upon which he resigned the post of grand-master of the artillery. He died in his castle of Villebon on the 21st of December 1641, at 83 years of age. His memoirs are ranked among the best books of French history: they contain a most particular account of whatever passed from the peace of 1570 to the death of Henry IV. in 1589; and acquire additional value from many curious personal anecdotes preserved in them. They were translated into English by Mrs Lennox in 1757.

BETHUNE, a town of France, in the department of the Straits of Calais, containing upwards of 5000 inhabitants. There is an entrance into this city through four gates, and it is surrounded with walls and fortified. The city and the castle taken together are of a triangular figure, but the castle itself is a very irregular building. The houses are very indifferent, and the streets ill paved; however, there is a large handsome square and several churches. In the marshy lands near the city there are several canals cut for the convenience of whitening linen. It is seated on a rock by the river Belfe. E. Long. 2. 48. N. Lat. 50. 32.

BETIS, governor of Gaza under Darius, famous for his valour and loyalty. He defended a place of consequence with a few men against Alexander, who was there shot through the shoulder. Betis thinking him slain, returned triumphantly to the city; but in a second assault he was wounded and brought to Alexander, who cruelly ordered him to be put to death.

BETLEY, a town of Staffordshire in England. It is seated on the confines of the county, next to Cheshire, in a barren sandy soil. W. Long. 2. 15. N. Lat. 53. 0.

BETLIS, a strong town of Armenia or Turcomania, belonging to a bey or prince of the country, who is very powerful, and is subject to neither the grand signior nor king of Persia. It lies on the road from Taurus to Aleppo, and the prince can stop caravans whenever he pleases; for the passage between the mountains is so narrow, that ten men can defend it against 1000. The town is seated between two mountains about a cannon-shot from each other, and the castle is on an eminence exactly in the middle. This eminence is in the shape of a sugar-loaf; and is so steep on all sides, that it is impossible to get up but by winding round about it. The people in and about the town are shepherds, but are ready to take up arms at the command of their prince. E. Long. 42. 40. N. Lat. 37. 20.

BETON, a name given by the French engineers to a kind of mortar, which they use in raising the foundations of masonry under water. It consists of twelve parts of pozzolana or Dutch tarrass, six of good sand, nine of unslaked lime, thirteen of stone splinters about the size of an egg, and three of tile-dust or cinders, or scales of iron out of a forge; this being well worked together, is left to stand for about 24 hours, or till it becomes so hard as not to be separated without a pickaxe.

BETONICA, Botony. See Botany Index.

BETONICA Aquatica. See Scrophularia, Botany Index.

BETONICA Pauli. See Veronica, Botany Index.

BETONIC. See Botonica, Botany Index.

BETROTMENT, a mutual promise or compact between two parties for a future marriage. The word imports as much as giving one's truth; that is, true faith, or promise. Betrotment amounts to the same with what is called by civilians and canonists sponsals, or espousals; sometimes desponsation, and by the French fiancallas.

BETTERTON, THOMAS, the celebrated actor, was the son of Mr Betterton, under-cook to King Charles I. and was born in Tothill-street Westminster in the year 1633. Having received the first rudiments of a genteel education, his fondness for reading induced him to request of his parents that they would bind him an apprentice to a bookseller, which was readily complied with, fixing on one Mr Rhodes near Charing-cross for his master. This gentleman, who had been wardrobe-keeper to the theatre in Blackfriars before the troubles, obtained a license in 1659, from the powers then in being, to set up a company of players in the Cockpit in Drury-Lane, in which company Mr Betterton entered himself, and, though not much above 20 years of age, immediately gave proof of the most capital genius and merit.

Soon after the Restoration, two distinct theatres were established by royal authority: the one in Drury-Lane in consequence of a patent granted to Henry Killigrew, Esq., which was called the King's Company; the other in Lincoln's-Inn-Fields, who styled themselves the Duke of York's Servants, the patentee of which was the ingenious Sir William Davenant; which last-mentioned gentleman having long had a close intimacy with and warm friendship for Mr Rhodes, engaged Mr Betterton, and all who had acted under Mr Rhodes, into his company; which opened in 1662 with a new play of Sir William's, in two parts, called the Siege of Rhodes. In this piece, as well as in the subsequent characters which Mr Betterton performed, he increased his reputation and esteem with the public, and indeed became so much in favour with King Charles II. that by his majesty's special command he went over to Paris to take a view of the French stage, that he might the better judge what would contribute to the improvement of our own; and it was upon this occasion, as is generally supposed, that moving scenes were first introduced upon the English theatre, which before had been only hung with tapestry.

In the year 1670 he married one Mrs Sanderson, a female performer on the same stage; who, both as an actress and a woman, was every thing that human perfection was capable of arriving at, and with whom he through the whole course of his remaining life possessed every degree of happiness that a perfect union of hearts can bestow.

When the duke's company removed to Dorset-Gardens, he still continued with them; and on the coalition of the two companies in 1684, he acceded to the treaty, and remained among them; Mrs Betterton maintaining the same foremost figure among the women that her husband supported among the male performers. And so great was the estimation that they were both held in, that in the year 1675, when a...
In 1693, Mr. Betterton having sounded the inclinations of a select number of the actors whom he found ready to join with him, obtained, through the influence of the earl of Dorset, the royal license for acting in a separate theatre; and was very soon enabled, by the voluntary subscriptions of many persons of quality, to erect a new playhouse within the walls of the Tennis Court in Lincoln’s-Inn-Fields. To this step Mr. Betterton is said to have been induced, partly by ill treatment from the managers, and partly with a view to repair, by the more enlarged profits of a manager, the loss of his whole fortune (upwards of 2000l.), which he had undergone in the year 1692, by adventuring it in a commercial scheme to the East Indies. But, in the new theatre opened in 1697 with Mr. Congreve’s Love for Love, the success of which was amazingly great. Yet, in a few years, it appeared that the profits arising from this theatre, opposed as it was by all the strength of Cibber’s and Vanbrugh’s writings at the other house, were very insignificant; and Mr. Betterton growing now into the infirmities of age, and labouring under violent attacks of the gout, he gladly quitted at once the fatigues of management and the hurry of the stage.

The public, however, who retained a grateful sense of the pleasure they had frequently received from this theatrical veteran, and sensible of the narrowness of his circumstances, resolved to continue the marks of their esteem to him by giving him a benefit. On the 7th of April 1709 the comedy of Love for Love was performed for this purpose, in which this gentleman himself, though then upwards of 70 years of age, acted the youthful part of Valentine; as in the September following he did that of Hamlet, his performance of which the author of the Tatler has taken particular notice of. On the former occasion, those very eminent performers, Mrs Barry, Mrs Bracegirdle, and Mr Doggett, who had all quitted the stage some years before, in gratitude to one whom they had had so many obligations to, acted the parts of Angelica, Mrs Frail, and Ben; and Mr Rowe wrote an epilogue for that night, which was spoken by the two ladies, supporting between them this once powerful supporter of the English stage. The profits of this night are said to have amounted to upwards of 300l. The prices having been raised to the same that the operas and oratorios are at present; and when the curtain drew up, almost as large an audience appearing behind as before it.

The next winter Mr. Betterton was prevailed on by Mr. Owen McSwiney, then manager of the opera-house in the Hay-market (at which plays were acted four times a week) to continue performing, though but seldom. In consequence of which, in the ensuing spring, viz. on the 23rd of April 1710, another play was given out for this gentleman’s benefit, viz. The Maid’s Tragedy of Beaumont and Fletcher, in which he himself performed his celebrated part of Melanchole.

This, however, was the last time of his appearing upon the stage. For having been suddenly seized with the gout, and being impatient at the thoughts of disappointing his friends, he made use of outward applications to reduce the swellings of his feet, which enabled him to walk on the stage, though obliged to have his foot in a slipper. But although he acted that day with unusual spirit and briskness, and met with universal applause; yet he paid very dear for this tribute he had paid to the public; for the fomentations he had made use of occasioning a revulsion of the gouty humour to the nobler parts, threw the distemper up into his head, and terminated his life on the 28th of that month. On the 2d of May his body was interred with much ceremony in the cloister of Westminster, and great honour paid to his memory by his friend the Taller, who has related in a very pathetic, and at the same time the most dignified manner, the process of the ceremonial. As an author, Mr. Betterton had a considerable degree of merit. His dramatic works are,

1. Amorous Widow, a comedy. 2. Dioclesian, a dramatic opera. 3. Masque in the Opera of the Prophets. 4. Revenge, a comedy. 5. Just Judge, a tragedy. 6. Woman made a justice, a comedy. As an actor, he was certainly one of the greatest of either his own or any other age; but those who are desirous of having him painted out in the most lively colours to their imagination, we must refer to the description given of him by his contemporaries and friend Colley Cibber, in the Apology for his own life.

BETTINELLI, XAVIER, a late Italian writer. See SUPPLEMENT.

BETUE, or BETAW, a territory of the Low Countries in the duchy of Gueldert, between the rivers Rhine and Leck.

BETULA, the Birch-tree. See BOTANY.

BETULIUS, SIXTUS, an able grammarian, a good Latin poet and philosopher, born at Memmingen in the year 1500; his true name was Birck. He taught the belles lettres and philosophy with reputation; and became principal of the college of Augsburg, where he died on the 16th of June 1554. He published several works in prose; and his dramatic pieces of Joseph, Susannah, and Judith, are esteemed.

BEVECUM, a town of the Netherlands, in the province of Brabant. E. Long. 4° 50. N. Lat. 50° 45.

BEVEL, among masons, carpenters, &c. a kind of square, one leg whereof is frequently crooked, according to the sweep of an arch or vault. It is moveable as a centre, and so may be set to any angle.

BEVELER-ANGLE, any other angle besides those of 90 or 45 degrees.

BEVELAND, NORTH and SOUTH, two islands in the province of Zealand, between the eastern and western branches of the river Scheldt, making part of the United Provinces.

BEVELLING, in ship-building, the art of beveling a timber with a proper and regular curve, according to a mould which is laid on one side of its surface.

"In order to beve a piece of timber to its proper..."
BEVELLING, a term used to signify that the side of a timber should be a plane. If this side be uppermost, and placed horizontally, or upon a level, it is plain, if the timber is to be hewed square, it may be done by a plummet and line; but if the timber is not hewed square, the line will not touch both the upper and lower edge of the piece; or if a square be applied to it, there will be wood wanting either at the upper or lower side. This is called within or without a square. When the wood is deficient at the under side, it is called under-beveling; and when it is deficient on the upper side, it is called standing-beveling: and this deficiency will be more or less according to the depth of the piece; so that, before the proper bevelings of the timbers are found, it will be sometimes very convenient to assign the breadth of the timbers; nay, in most cases it will be absolutely necessary, especially aforesaid and abated: though the breadth of two timbers, or the timber and room, which includes the two timbers and the space between them, may be taken without any sensible error, as far as the square body goes. For as one line represents the moulding side of two timbers, the foreside of the one being supposed to unite with the aft-side of the other; the two may be considered as one entire piece of timber. — Murray's Ship-Building.

BEVERAGE, in a general sense, signifies a drink: hence nectar is said to be the beverage of the gods. In writers of the middle age, beverage, beveragium, or biberagium, denotes money to give to an artificer, or other person, to drink, or above his hire or wages.

BEVERIDGE, WILLIAM, a learned English bishop, in the beginning of the 16th century, was born in the year 1538, and educated in St John's college, Cambridge, where he distinguished himself very early by his remarkable learning, and particularly by his knowledge of the oriental languages. Upon the deprivation of Dr Thomas Ken, bishop of Bath and Wells, for not taking the oaths to the government in 1661, he refused the offer of that see, though he was then chaplain to King William and Queen Mary. In 1704 he was consecrated to the bishopric of St Asaph; in which high function he so behaved himself all along, and discharged it so exemplary a manner, that he approved himself a truly primitive prelate. He died at his lodgings in the Cloisters in Westminster-abbey in 1707; aged 69. As his whole life was spent in acts of piety and charity, so he gave memorable instances of both at his death, leaving the bulk of his estate for the propagation of the gospel, and promoting of Christian knowledge, at home as well as abroad. His Private Thoughts upon a Christian Life is a very popular, though in many points a very exceptionable, book. He wrote several other works on various subjects, particularly on the oriental languages.

BEVERLAND, HADRIAN, a man of excellent genius in the end of the 17th century, but who prostituted it in the study and composition of books of a very obnoxious kind. He was a perfect master of Ovid, Catullus, Petronius, and authors of that stamp. He is famous for his book on Original Sin, in which he maintained, that Adam's sin consisted in his commerce with his wife, and that original sin is nothing else but the inclination of the sexes to each other: it was condemned to be burnt. He led a scandalous life, but seems to have repented of his wicked manners and lewd writings; for he published a treatise in the end of his life, De Formatione Cavenda, in 1698. It is said he died mad.

BEVERLEY, a town of Yorkshire, governed by a mayor, a recorder, 12 aldermen, &c. and sends two members to parliament. The minster here is a very fair and neat structure, and the roof is an arch of stone. In it are several monuments of the Percies, earls of Northumberland, who had added a little chapel to the choir, in the windows whereof there are several pictures of that family painted on glass. At the upper end of the choir, at the right of the altar-place, stands the freestone, made of one entire stone, to which every one that died had a right of protection. At the upper end of the body of the church, next the choir, hangs an ancient table, with the picture of King Athelstan, who founded the church. Between them is this inscription:

Ais free make I thee,
As heart can wish, or egh can see.

Hence the inhabitants pay no toll in any town or port in England. In the body of the church stands an ancient monument, called the Virgin's Tomb, because two virgin-sisters lie buried there, who gave the town a piece of land, into which any free man may put three milk-cows from Lady-day to Michaelmas. At the lower end of the body of the church is a large font of agate stone.

Near the minster, on the south side of it, is a place called Halt-Garth, wherein they keep a court of record, called Provost's Court. In this, cases arising within the liberties may be tried for any suit. The liberties contain above 100 towns and parts of towns, in Holderness and other parts of the east riding belonging to it. The town is a mile in length, having pleasant springs running quite through it. It is beautified with two stately churches; and has a free-school, with two fellowships, six scholarships, and three exhibitions in St John's college, Cambridge, belonging to it; besides six almshouses, where none are admitted but those that give bond to leave their effects to the poor when they die. The principal trade of this town is making malt, oatmeal, and tallow; and the poor people chiefly support themselves by making bone-lace. About a mile east from the town, there is a mineral water, which cures eruptions of the skin, and is beneficial in the king's evil. Population 6035 in 1811. E. Long. 0. 9. N. Lat. 53. 50.

BEVERLY, a sea-port of Massachusetts in North America, separated from Salem by a bridge. It is 20 miles north of Boston, in N. Lat. 42. 31. W. Long. 70. 50.

BEVERLY, JOHN, of, in Latin Joannes Beverlensis, archbishop of York in the eighth century, was born of a noble family at Harpham in Northumberland, and was justly esteemed one of the best scholars of his time. He was first a monk, and afterwards abbot of the monastery of St Hilda, when his merit recommended him to the favour of Alfred king of Northumberland, who in the year 685 advanced him to the see of Hagorstald or Hexham, and in 687 translated him to the archbishopric of York. This prelate was tutor to the famous Bede; and lived in the strictest
strictest friendship with Arca and other Anglo-Saxon doctors, several of whom he engaged to write comments on the Holy Scriptures. In 704, he founded a college at Beverley for secular priests; and after he had governed the see of York 34 years, being tired of the tumults and confusions that prevailed in the church, divested himself of his episcopal character, and retired to Beverley; where he died four years after, on the 7th of May 721.—Bede and other monkish writers ascribe several miracles to him. Between 300 and 400 years after his death, his body was taken up by Alfric archbishop of York, and placed in a shrine richly adorned with silver, gold, and precious stones; and in 1416, the day of his death was, by a synod held at London, appointed a festival. We are told that William the Conqueror, when he ravaged Northumberland with a numerous army, spared Beverley alone, out of a religious veneration for St John of that place. This prelate wrote some pieces which are mentioned by Bale and Pits, viz. 1. Pro Luca exponenda. 2. Homilce in Evangelica. 3. Epistolae ad Hildum Abbatissem. 4. Epistolae ad Herebalbum, Andenum et Beritum.

BEVERUNGEN, a town of Germany, in the diocese of Paderborn, seated at the confluence of the rivers Beve and Weser, in E. Long. 9. 30. N. Lat. 51. 40.

BEVILE, in Heraldry, a thing broken or opening like a carpenter's rule: Thus we say, he bearth argent, a chief beville, vert, by the name of Beveril.

BEVIN, ELWY, a musician eminently skilled in the knowledge of practical composition, flourished towards the end of Queen Elizabeth's reign. He was of Welsh extraction, and had been educated under Tallis, upon whom his recommendation it was that in 1589 he was sworn in gentleman extraordinary of the chapel; from whence he was expelled in 1637, it being discovered that he adhered to the Romish communion. He was also organist of Bristol cathedral, but forfeited that employment at the same time with his place in the chapel. Child, afterwards Doctor, was his scholar. He has composed sundry services, and a few anthems. Before Bevin's time the precepts for the composition of canon were known to few. Tallis, Bird, Waterhouse, and Farmer, were eminently skilled in this most abstract part of musical practice. Every canon, as given to the public, was a kind of enigma. Compositions of this kind were sometimes exhibited in the form of a cross, sometimes in that of a circle; there is now extant one resembling a horizontal sun-dial: and the resolution (as it was called) of a canon, which was the resolving it into its elements and reducing it into score, was deemed a work of almost as great difficulty as the original composition. But Bevin, with a view to the improvement of students, generously communicated the result of many years study and experience, in a treatise which is highly commended by all who have taken occasion to speak of it. This book was published in 1610, 1631, and dedicated to Goodman bishop of Gloucester, with the following title: 'A briefe and short instruction of the art of music, to teach how to make dissonant all proportions that are in use: very necessary for all such as are desirous to attain to knowledge in the art; and may practice, if they can sing, soon be able to compose three, four, and five parts, and also to compose all sorts of canons that are usual, by these directions of two or three parts in one upon the plain song.' The rules contained in this book, for composition, in general are very brief; but for the composition of canon there are in it a great variety of examples of almost all the possible forms in which it is capable of being constructed, even to the extent of 60 parts.

BEWDLY, a town of Worcestershire in England, seated on the bank of the river Severn, in W. Long. 2. 20. N. Lat. 5. 25. 1. It has its name Bevile, Beviley, or Beviley, from its pleasant situation on the declivity of a hill overlooking the river, and commanding a fine prospect of the country, and formerly the forest of Wyre, remarkable for its tall stately oaks and other trees, which have since been either blown or cut down. It was formerly accounted so delightful a place, that Henry VII. built a house here for Prince Arthur, which he called Tikenhall. Beviley sent burgesses to parliament very early, and had charters and great privileges from Edward IV. and Henry VII., which were confirmed with the addition of others, by Henry VIII. in whose time it was annexed to the county of Worcester. King James I. granted it a charter; of which a surrender was procured in Charles II.'s time, and the corporation was new-modelled. King James II. compelled it to accept of a new charter; but the former surrender, upon a trial, was held void, and a new charter was obtained of Queen Anne. In consequence of this it is governed by a bailiff and burgesses, recorder, steward, town-clerk, &c. The town is neat and well built; and carries on a considerable trade, by means of the Severn, in salt, glass, iron-ware, and Manchester goods; but its chief manufacture is in caps, commonly called Monmouth Caps. Beviley contained 3444 inhabitants in 1811.

BEWITS, in falconry, pieces of leather, to which a hawk's belfs are fastened, and buttoned to his legs.

BEY, among the Turks, signifies a governor of a country or town. The Turks write it beķ or bet, but pronounce it bey.

The word is particularly applied to a lord of a bann, whom, in the same language, they call sönge bey or bey. Every province in Turkey is divided into seven sängiers, or banners, each of which qualifies a bey; and these are all commanded by the governor of the province, whom they also call bergeld bey, that is, lord of all the beghs or beys of the province: these beys are much the same as banniers formerly in England.

Bey of Tunis, denotes a prince or king thereof; answering to what at Algiers is called el bey. In the kingdom of Algiers, each province is governed by a bey, or viceroys, who is appointed and removed at pleasure by the dey; but has a despotic power within his jurisdiction.

BEYKANEER, or BICANEER, a principality of Hindostan. See Supplement.

BEYS, GILES, a celebrated printer at Paris, in the 16th century, and the first introducer of the consonants j and v.

BEZA, THEODORE, one of the principal pillars of the reformed church, was born at Vezelai, in Burgundy, June 24th, 1519. He was brought up by his uncle...
Beza, counsellor of the parliament of Paris, till the month of December 1528, when he sent him to study at Orleans, and afterwards at Bourges, where he was under the care of Melchior Wolmar, under whom he made an extraordinary progress in polite learning, and from him imbibed the principles of Calvinism. His uncle intended him for the bar; but the law not suitting his disposition, he spent most of his time in reading the Greek and Latin authors, and in composing verses. In 1539, he took up his licentiate's degree, and went to Paris. He fell into serious works, and wrote some numerous things. Sickness awakened him; and he pursued a vow, he had formerly made, of entering into the reformed religion. According to this resolution, he went to Geneva and made public profession of the reformed religion. In 1549, he accepted of the Greek professorship at Lausanne, where he also read lectures in French on the New Testament to the refugees of both sexes who dwelt in that city. Having settled at Geneva, he adhered to Calvin in the strictest manner, and became in a little time his colleague in the church and in the university. He was sent to Nercy, at the solicitation of some great men of the kingdom, to convert the king of Navarre, and to confer with him upon affairs of importance. This was when the Guises had got the authority under the reign of Francis II. to the prejudice of the princes of the blood. The king of Navarre having testified, both by letters and deputies, that he desired that Beza might assist at the conference of Poitiers, the senate of Geneva consented. The assembly hearded and attentively at Nimes; after this, he assisted at the conferences of Montebello, and at those of Bern. The infirmities of old age beginning to fall heavy upon him in 1597, he could seldom speak in public: and at last he left it off entirely in the beginning of the year 1600. However, in 1597, he wrote some animated verses against the Jesuits, on the occasion of the report that was made of his death, and of his having before he died made profession of the Roman faith. He lived till the 13th of October 1605. He was a man of extraordinary merit, and one who did great services to the Protestant cause. This, however, exposed him to innumerable slanders and calumnies; but he showed both to the Catholics and Lutherans, that he understood how to defend himself. He wrote, 1. A Translation of the New Testament; 2. Turned the Psalms into Latin verse; 3. Published a Treatise on the Sacraments; 4. Some Sermons on the Passion of Jesus Christ and on Solomon's Song; 5. A version of the Canticles, in lyric verse; 6. A French tragi-comedy, entitled, The Sacrifice of Abraham; and many other pieces.

Bezans, cotton cloths, which come from Bengal: some are white, and others striped with several colors.

Bezetler, the branch of a deer's horn next below the brow-antler.

Bezoar, in Natural History and Medicine, a general name for certain animal substances supposed to be effectual in preventing the fatal consequences of poison. The word comes from the Persian badischar, bascher, or pachruar, which signifies an antidote.

The first mention made of bezoar is in Avenzoar, an Arabian physician, who gives a very romantic account of its origin. He describes it as generated of the tears or gum of the eyes of stags; who, after eating serpents, used to run into the water up to the nose, where they stood till their eyes began to ooze a humour, which, collecting under the eyes-lids, gradually thickened and coagulated, till, being grown hard, it was thrown off by the animal in rubbing frequently. Other opinions no less fabulous obtained till the time of Garcia al Horto, physician to the Portuguese vice-roy of the Indies, who gave the first genuine account of it. Kempfer afterwards gave a description of it, with some new particulars.

The bezoar is a calculous concretion found in the stomach of certain animals of the goat kind. See Capra. It is composed of concentrical coats surrounding one another, with a little cavity in the middle, containing a bit of wood, straw, hair, or the like substances.

There are two sorts of bezoar; one brought from Persia and the East Indies, the other from the Spanish West Indies. The first or best sort, called oriental bezoar, is of a shining dark-green or olive colour, and an even smooth surface; on removing the outward coat, which that lies underneath it appears likewise smooth and shining. The accidental has a rough surface, and less of a green colour than the foregoing; it is likewise much heavier, more brittle, and of a looser texture; the coats are thicker, and on breaking exhibit a number of strisc curiously interwoven. The oriental is generally less than a walnut; the accidental for the most part larger, and sometimes as big as a goose egg. The first is universally most esteemed, and is the only sort retained by the Leuven college; the Edinburgh, in the edition of their pharmacopoeia preceding the present, directed both; but they now seem to allow them to be used promiscuously, retaining in their catalogue only the name bezoar lapis.

This stone is in high esteem among the Persians, and even of greater value than in Europe, which, with sundry other circumstances needless to relate here, has given occasion to many to suspect, that the true bezoar is never brought to us. Some authors relate with great confidence, that all the stones commonly sold under this name are artificial compositions. That some of them are so, is evident; hence the great differences in the accounts which different persons have given of their qualities:
BEZOAR was not known to the ancient Greeks, and is first taken notice of by the Arabs (as above mentioned), who extol it in a great variety of disorders, particularly against poisons. Later writers also bestow extraordinary commendations on it as a sudorific and alexipharmic; virtues to which it certainly has no pre- tence. It has no smell or taste, is not digestible in the stomach of the animal in which it is found, and is scarce capable of being acted on by any of the juices of the human body. It cannot be considered in any other light than as an absorbent; and is much the weakest of all the common substances of that class. It has been given to half a dram, and sometimes a whole dram, without any sensible effect; though the general dose (on account of its great price) is only a few grains.

BEZOAR, in a more extensive sense, includes all substances formed stratum super stratum in the stomachs or intestines of animals; in which sense pearls, the concretions called erubia-eyes, &c. belong to the class of bezoars. To this also belong the hippolitibus, or bezoar equinus, and sometimes found in the stomach or intestines of a horse: the monkey-bezoar, a stone said to be found in the stomach of certain monkeys in Brazil and the East Indies, harder than the oriental bezoar, of a dark green colour, and very costly on account of its scarcity.—Bezoar boothum, is a yellowish stone found in the ox's gall-bladder.—Human bezoars are stony substances found in the intestines of several persons, formed from the stones of plums, or other fruits, retained in the cecon or other guts, and growing coated over, of which we have an instance given by Dr Cole, Phil. Trans. No. 233.—Bezoar microcum is the same with the human calculus; and is various in its degrees of hardness, as well as in its size and figure. It has been used in the place of the more costly sorts.—As to the bezoar hystrix, a concretion found in the gall-bladder of an Indian porcupine; and the German bezoar, or that found in mountain deer, especially on the Alps; these, not being stones, are more properly called by late writers egophalites; the former consisting of woolly fibres, and a bitter friable matter, having neither laminae nor membranes; the latter being a ball of hair or herbs, or perhaps roots, compacted in the stomach of the animal.—They are all, as medicines, unworthy of regard.—The bezoar boothum, or ox bezoar, is used by miniature-painters in several casts of yellow.

BEZOAR-MINERAL. See PHARMACY INDEX.

Fossil BEZOAR, is a kind of figured stone, formed like the animal bezoar, of several coats or strata ranged round some extraneous body which forms a nucleus, and supposed to have the same virtues. It is found chiefly in Sicily, in sand and clay pits. It is of a purple colour, with a rough surface, the size of a walnut, and light. When broken, it is found to be an ivory crust, containing in its hollow a fine greenish white earth, resembling pale bezoar. The earth is used and reci- nued. It is called Sicilian earth.

BEZOARDIC, an appellation given to whatever partakes of the nature of bezoar; also compound medicines whereof bezoar makes an ingredient.

BIA, in Commerce, a name given by the Siamese to those small shells which are called cowries throughout almost all the other parts of the East Indies. See COWRIES.

BLEUM, sumus, in Rhetoric, denotes a kind of counter argument, whereby something alleged for the adversary is retorted against him, and made to conclude a different way: for instance, Occidisti, quia ad- sististi interfecto.—sumus, Immo quia adstitit interfecit, non occidit; nam si id esset, in jugum me conficiens. "You killed the person because you were found standing by his body. Bieum. Rather I did not kill him because I was found standing by his body; since, in the other case, I should have fled away."

BLEUM, in the Grecian laws, was an action brought against those who ravished women, or used violence to any man's person.

BIAFAR, or BIAFRA, a kingdom of Africa, situated to the east of Benin, to the west of Medra, from which it is divided by a chain of mountains, and extending southward to the fourth degree of north latitude. The natives are the most of all negroes addicted to, and infatuated with, magic; imagining themselves capable of causing rain, thunder, and lightning; therefore they worship the devil with great zeal, and even sacrifice their children to him.

BIAFORA, in the costumes of the middle age, a form of cry or alarm to arms; on the hearing whereof the inhabitants of towns or villages were to issue forth, and attend their prince. The word seems originally from Gascony; and the Italians even now on a sudden insurrection of the people, commonly cry, Via-fora, by an usual change of the letter B into V.

BIARCHUS, an officer in the court of the emperors of Constantinople, intrusted with the care and inspection of the provisions of the soldiery.

BIALOGROD, or AKERMAN, a strong town of Bessarabia, in European Russia. It is seated on a lake called Viderno, near the sea-side, in E. Long. 22° 50'. N. Lat. 46° 24'.

Biana, a town of Asia in Hindostan, 50 miles west from Agra, remarkable for its excellent indigo, and formerly for its copper mines. E. Long. 77° 0'. N. Lat. 26° 20'.

Bianchi, Francesco, called Il Frari, an eminent painter, was born at Modena; and had the honour of being master to one of the most esteemed painters that ever appeared, Antonio Corregio. His colouring was delicately fine; his attitudes full of grace; and his invention extremely grand. His works had an astonishing beauty, and are prized as highly as all those of Corregio. He died in 1520.

Bianchini, Francis, one of the most learned men of his time, was born at Verona in 1622, of a noble and ancient family. His taste for natural philosophy and mathematics induced him to establish the academy at Aletofili, at Verona. He went to Rome in 1644; and
and was made librarian to Cardinal Ottoboni, who was afterwards pope under the name of Alexander VIII. He also became canon of St Mary de la Rotonde, and at length of St Lawrence in Damascus. He was esteemed by the learned; and was a member of many academies. He published several ingenious dissertations, &c. and died in 1720, aged 67.

Bias, one of the seven sages of Greece, flourished about 608 before Christ. He was accustomed to say, “It was a sickness of the mind to wish for impossible things.” During the siege of Priene, his native city, being asked why he was the only one who retired from the place without carrying anything with him, he replied, That he carried his all with him; meaning, that his knowledge and virtue were the only blessings that were peculiarly his own, since they could not be taken from him. He expired while pleading for one of his friends.

Bias, or Biaos, in a general sense, the inclination or bent of a person’s mind to one thing more than another. It also signifies the lead or weight put into a bowl, that draws or turns the course of it any way to which the bias looks.

Biberach, formerly a free and imperial city of Swabia in Germany, but now included in the kingdom of Wurttemberg. It has a large manufacture in flax, and is situated on the river Ross. E. Long. 10. 2. N. Lat. 48. 4.

Biberose, a town of Upper Hungary, situated in E. Long. 17. 25. N. Lat. 48. 35.

Biberna, Ferdinando Galli, an excellent painter and architect, was born at Bologna in 1571; and was surnamed Bibiena from a territory of that name in Tuscany, in which his father was born. He acquired such reputation by his skill in architecture, the decorations of the theatre and perspective, that the duke of Parma invited him to his court, and made him his first painter and architect. Bibiena at length went to the emperor’s court, where he had the same honours and advantages. He wrote two books of architecture; and died at Bologna, at above 80 years of age. His sons followed with success the same professions.

Bible (in Greek βιβλιον, the book), a name applied by Christians by way of eminence or distinction to the collection of sacred writings, or the holy scriptures of the Old and New Testaments; known also by various other appellations, as the Sacred Books, Holy Writ, Inspired Writings, Scriptures, &c. The Jews styled the Bible (that is the Old Testament) מִשְׁרַק; which signifies Lesson or Lecture.

This collection of the sacred writings containing those of the Old and New Testament, is justly looked upon as the foundation of the Jewish as well as the Christian religion. The Jews, it is true, acknowledged only the scriptures of the Old Testament, the correcting and publishing of which is unanimously ascribed, both by the Jews and Christians, to Ezra. Some of the ancient fathers, on no other foundation than that fabulous and apocryphal book, the second book of Ezechias, pretend, that the scriptures were entirely lost and destroyed at the Babylonish captivity, and that Ezra restored them all again by divine revelation. What is certain is, that in the reign of Josiah there was no other book of the law extant besides that found in the temple by Hilkiah; from which original, by order of that pious king, copies were immediately written out, and search made for all the other parts of the scriptures, (2 Kings xxii.); by which means copies of the whole became multiplied among the people, who carried them with them into their captivity. After the return of the Jews from the Babylonish captivity, Ezra got together as many copies as he could of the inferior writings, and out of them all prepared a correct edition, disposing the several books in their proper order, and setting the canon of scripture for his time. These books he divided into three parts: 1. The Law, 2. The Prophets, 3. The Cetubim or Hagiographia.

III. And the Hagiographia consists of, 1. The Psalms. 2. The Proverbs. 3. Ecclesiastes. 4. The Song of Solomon. This division was made for the sake of reducing the number of the sacred books to the number of the letters in their alphabet, which amount to 22. At present, the Jews reckon 24 books in their canon of Scripture, in disposing of which, the law stands as it did in the former division, and the prophets are distributed into the former and latter prophets.

The former prophets are, Joshua, Judges, Samuel, Kings.

The latter prophets are, Isaiah, Jeremiah, Ezekiel, and the 12 minor prophets.

And the hagiographia consists of, The Psalms, the Proverbs, Job, the Song of Solomon, Ruth, the Lamentations, Ecclesiastes, Esther, Daniel, Ezra, the Chronicles.

Under the name of Ezra, they comprehend Nehemiah. It is true this order hath not always been observed, but the variations from it are of little or no moment.

The five books of the law are divided into 54 sections. This division many of the Jews hold to have been appointed by Moses himself; but others, with more probability, ascribe it to Ezra. The design of this division was, that one of these sections might be read in their synagogues every sabbath-day. The number was 54, because in their intercalated years a month being then added, there were 54 sabbaths. In other years, they reduced them to 52, by twice joining together two short sections. Till the persecution of Antiochus Epiphanes, they read only the law; but the reading of it being then prohibited, they substituted in the room of it 54 sections out of the prophets; and when the reading of the law was restored by the Macabees, the section which was read every sabbath out of the law served for their first lesson, and the section out of the prophets for their second. These sections were divided into verses; of which division, if Ezra was not the author, it was introduced not long after him, and seems to have been designed for the use of the Targumist or Chaldee interpreters; for after the return of the Jews from the Babylonish captivity, when the Hebrew language ceased to be their mother tongue, and the Chaldee grew into use instead of it, the custom was that the law should be first read in the original Hebrew.
brew, and then interpreted to the people in the Chaldee language, for which purpose these shorter sections or periods were very convenient.

The division of the scriptures into chapters, as we at present have them, is of much later date. Some attribute it to Stephen Langton, archbishop of Canterbury, in the reigns of John and Henry III. But the true author of the invention was Hugo de Sancto Caro, commonly called Hugo Cardinalis, because he was the first Dominican that ever was raised to the degree of cardinal. This Hugo flourished about the year 1240. He wrote a comment on the scriptures, and projected the first concordance, which is that of the vulgar Latin Bible. The aim of this work being for the more easy finding out any word or passage in the scriptures, he found it necessary to divide the book into sections, and the sections into subdivisions: for till that time the vulgar Latin Bibles were without any division at all. These sections are the chapters into which the Bible has ever since been divided. But the subdivision of the chapters was not then into verses, as it is now. Hugo's method of subdividing them was by the letters A, B, C, D, E, F, G, placed on the margin at an equal distance from each other, according to the length of the chapters. The subdivision of the chapters into verses, as they now stand in our Bibles, had its original from a famous Jewish rabbi, named Mordecai Nathan, about the year 1445. This rabbi, in imitation of Hugo Cardinalis, drew up a concordance to the Hebrew Bible, for the use of the Jews. But though he followed Hugo in his division of the books into chapters, he refined upon his invention as to the subdivision, and contrived that by verses: this being found to be a much more convenient method, it has been ever since followed. And thus, as the Jews borrowed the division of the books of the Holy Scriptures into chapters from the Christians, in like manner the Christians borrowed that of the chapters into verses from the Jews.

The order and division of the books of the Bible, as well as of the New Testament, according to the disposition made by the council of Trent, by Decree I. session iv. are as follow: where we are to observe, that those books to which the asterisks are prefixed, are rejected by the Protestants as apocryphal.

Genesis,
Exodus,
Leviticus,
Numbers,
Deuteronomy,
Joshua,
Judges and Ruth,
1 Samuel, or 1 Kings,
2 Samuel, or 2 Kings,
1 Kings, otherwise called 3 Kings,
2 Kings, otherwise called 4 Kings,
1 Chronicles,
2 Chronicles,
1 Esdras (as the LXX and Vulgate call it), or the book of Ezra,
2 Esdras or (as we have it) the book of Nehemiah,
* Tobit,
* Judith,
Esther,
Job,
Psalms,
Proverbs,
Ecclesiastes,
The Song of Solomon,
* The book of Wisdom,
* Ecclesiasticus,
Isaiah,
Jeremiah and Baruch,
Ezekiel,
Daniel,
Hosea,
Joel,
Amos,
Obadiah,
Nahum, which we place immediately after Micah,
before Habakkuk,
Jonah, which we place immediately after Obadiah,
Micah,
Habakkuk,
Zephaniah,
Haggai,
Zechariah,
Malachi,
* 1 Maccabees,
* 2 Maccabees.

The books of the New Testament are,

St Peter, II.
St John, I.
St John, II.
St John, III.
St Jude.
The general
Epistle of
St Paul to
St Paul to
St Paul to

The Revelation of St John.

The apocryphal books of the Old Testament, according to the Romanists, are, the book of Enoch (see Judge 14.), the third and fourth books of Esdras, the third and fourth books of Maccabees, the prayer of Manasseh, the Testament of the twelve patriachs, the Psalter of Solomon, and some other pieces of this nature.

The apocryphal books of the New Testament are, the epistle of St Barnabas, the pretended epistle of St Paul,
Paul to the Laodiceans, several spurious gospels, Acts of the Apostles, and Revelations; the book of Hermas, entitled the Shepherd, Jesus Christ’s Letter to Abgarus, the epistles of St Paul to Seneca, and several other pieces of the like nature, as may be seen in the collection of the apocryphal writings of the New Testament made by Fabricius.

The books which are cited in the Old Testament, and now lost, are these; the book of the Righteous, or of Jasher, as our version of the Bible has it (Josh. x. 13. and 2 Sam. i. 18.); the book of the wars of the Lord, (Numb. xxii. 14.); the annals of the kings of Israel, so often cited in the books of the Kings and Chronicles. The authors of these annals were the prophets, who lived in the kingdoms of Judah and Israel. We have likewise but a part of Solomon’s 3000 proverbs and his 1005 songs, (1 Kings iv. 32.); and we have entirely lost what he wrote upon plants, animals, birds, fishes, and reptiles.

Ezra, in the opinion of most learned men, published the Scriptures in the Chaldee character; for that language being grown wholly into use among the Jews, he thought proper to change the old Hebrew character for it, which hath since that time been retained only by the Samaritans, among whom it is preserved to this day.

Prideaux is of opinion that Ezra made additions in several parts of the Bible, where any thing appeared necessary for illustrating, connecting, or completing, the work; in which he appears to have been assisted by the same spirit in which they were first written. Among such additions are to be reckoned the last chapter of Deuteronomy, wherein Moses seems to give an account of his own death and burial, and the succession of Joshua after him. To the same cause, our learned author thinks, are to be attributed many other interpolations in the Bible, which created difficulties and objections to the authenticity of the sacred text, no ways to be solved without allowing them. Ezra changed the names of several places which were grown obsolete, and instead of them put their new names, by which they were then called, in the text. Thus it is that Abraham is said to have pursued the kings who carried Lot away captive, as far as Dan; whereas that place in Moses’s time was called Laish; the name Dan being unknown till the Danites, long after the death of Moses, possessed themselves of it.

The Jewish canon of Scripture was then settled by Ezra, yet not so but that several variations have been made in it. Malachi, for instance, could not be put in the Bible by him, since that prophet is allowed to have lived after Ezra; nor could Nehemiah be there, since mention is made in that book, of Jaddus, as high-priest, and of Darius Codomannus, as king of Persia, who were at least 100 years later than Ezra. It may be added, that in the first book of Chronicles, the genealogy of the sons of Zerubbabel is carried down for so many generations as must necessarily bring it to the time of Alexander, and consequently this book could not be in the canon in Ezra’s days. It is probable, the two books of Chronicles, Ezra, Nehemiah, Esther, and Malachi, were adopted into the Bible in the time of Simon the Just, the last of the men of the great synagogue.

The Jews, at first, were very reserved in communi-
berg printed the folio Bible of Rabbi Benchajim, with his preface, the masoretical divisions, a preface of Aben Ezra, a double masora, and several various readings. The third edition was printed in 1618; it is the same with the second, but much more correct. From the former editions it was, that Buxtorf the father, printed his rabbinical Hebrew Bible at Basil in 1618; which, though there are many faults in it, is more correct than any of the former. In 1623 appeared at Venice a new edition of the rabbinical Bible by Leo of Modena, a rabbin of that city, who pretended to have corrected a great number of faults in the former edition; but, besides that it is much inferior to the other Hebrew Bibles of Venice, with regard to paper and print, it has passed through the hands of the inquisitors, who have altered many passages in the commentaries of the rabbins.

As to Hebrew Bibles in 40, that of R. Stephens is esteemed for the beauty of the characters; but it is very incorrect. Plantin also printed several beautiful Hebrew Bibles at Antwerp: one, in eight columns, with a preface by Arias Montanus in 1571, which far exceeds the Complutensian in paper and print, and contents; this is called the Royal Bible, because it was printed at the expense of Philip II. of Spain; another at Geneva in 1619; besides many more of different sizes, with and without points. Manasseh Ben Israel, a learned Portuguese Jew, published two editions of the Hebrew Bible at Amsterdam; the one in 40 in 1635; the other in 8vo in 1639: the first has two columns, and for that reason is commodious for the reader. In 1639, B. Jac. Lombr eco published a new edition in 40 at Venice, with small literal notes at the bottom of each page, where he explains the Hebrew words by Spanish words. This Bible is much esteemed by the Jews at Constantinople: in the text they have distinguished between words where the point comets is to be read with a comets-katuph, that is, by a, and not an a.

Of all the editions of the Hebrew Bible in 8vo, the most beautiful and correct are the two of Jo. Athias, a Jew of Amsterdam. The first, of 1661, is the best paper; but that of 1667 is the most exact; that, however, published since at Amsterdam by Vander Hooght, in 1703, is preferable to any of them.

After Athias, three Hebraizing Protestants, engaged in revising and publishing the Hebrew Bible, viz. Clodius, Jablonski, and Opitius. Clodius's edition was published at Frankfort in 1677, in 40. At the bottom of the page it has the various readings of the former editions; but the author does not appear sufficiently versed in the accenting, especially in the poetical books; besides, as it was not published under his eye, many faults have crept in. That of Jablonski in 1699, in 40 at Berlin, is very beautiful in letter and print; but, though the editor pretends he made use of the editions of Athias and Clodius, some critics find it scarce in any thing different from the 40 edition of Bomberg. That of Opitius is also in 40 at Keil, in 1709; the character is large and good, but the paper bad: it is done with a great deal of care; but the editor made use of no manuscripts but those of the German libraries; neglecting the French ones, which is an omission common to all three. They have this advantage, however, that besides the divi-

sions used by the Jews, both general and particu-
rar, into parasese and pesukim, they have also those of the Christians, or of the Latin Bibles, into chapters and verses; the heik ketib, or various readings, Latin summaries, &c. which made them of considerable use, with respect to the Latin edition and the concordances.

The little Bible of R. Stephens, in 1660, is very much prized for the beauty of the character. Care, however, must be taken, there being another edition of Geneva exceedingly like it, excepting that the press is worse, and the text less correct. To these may be added some other Hebrew Bibles without points, in 8vo and 24to, which are much coveted by the Jews; not that they are more exact, but more portable than the rest, and are used in their synagogues and schools: of these there are two beautiful editions, the one of Plantin, in 8vo, with two columns, and the other in 24to reprinted by Raphae grusius at Leyden, in 1660. There is also an edition of them by Laurence at Amsterdam in 1631, in a large character; and another in 12mo, at Franckfort, in 1694, full of faults, with a preface of M. Leusden at the head of it.

Houbigant published an elegant edition of the He-
brew Bible at Paris, in 1753, contained in four vol-
folios. The text is that of Van der Hooght, without points, to which he has added marginal notes; supplying the variations of the Samaritan copy. Dr. Kenni cott, after almost 20 years laborious collation of near 700 copies, manuscript and printed, either of the whole or of particular parts of the Bible, did, in 1776, publish the first volume of the Hebrew Bible in folio. The text is that of Everard Van der Hooght, already mentioned, differing from it only in the disposition of the poetical parts, which Dr. Kennicott has printed in hemistichs, into which they naturally divide themselves; however, the words follow one another in the same order as they do in the edition of Van der Hooght. This edition is printed on an excellent type; the Samaritan text, according to the copy in the London Polyglot, is exhibited in a column parallel with the Hebrew text; those parts of it only being introduced in which it differs from the Hebrew. The numerous variations both of the Samaritan manuscripts from the printed copy of the Samaritan text, and of the Hebrew manuscripts from the printed text of Van der Hooght, are placed separately at the bottom of the page, and marked with numbers referring to the copies from which they are taken. The editor regrets, that the dissertatio generalis, which would help to enrich this article, is not to be published till the second volume is ready.

Greek Bibles. There is a great number of editions of the Bible in Greek; but they may be still reduced to three or four principal ones, viz. that of Complutum, or Alenca de Heranes, that of Venice, that of Bocc, and that of Oxford. The first was published in 1555 by Cardinal Ximenes, and inserted in the Polyglot Bible, usually called the Complutensian Bible: this edition is not just, the Greek of the Seventy being altered in many places according to the Hebrew text. It has, however, been reprinted in the Polyglot Bible of Antwerp, in that of Paris, and in the 4to Bible, commonly called Patablin's Bible.

The second Greek Bible is that of Venice, printed by
BIB

All these reformation of the Latin Bible were made before the time of Pope Sixtus V. and Clement VIII.

since which people have not dared to make any alterations, excepting in comments and separate notes. The correction of Clement VIII. in 1592, is now the standard throughout all the Roman churches: that pontiff made two reformation; but it is the first of them that is followed. From this the Bibles of Plantin were done, and from those of Plantin all the rest: so that the common Bibles have none of the after corrections of the same Clement VIII. It is a heavy charge that lies on the editions of Pope Clement, viz. that they have some new texts added, and many old ones altered, to countenance and confirm what they call the Catholic doctrine; witness that celebrated passage of St John, t res sunt, &c. There are a great number of Latin Bibles of the third class, comprehending the versions from the originals of the sacred books made within these 200 years. The first is that of Santes Paginna, a Dominican, under the patronage of Pope Leo X. printed at Lyons, in 4to, in 1527, much esteemed by the Jews. This the author improved in a second edition. In 1542, there was a beautiful edition of the same at Lyons, in folio, with scholia, published under the name of Michael Villanovanus, i.e. Michael Servetus, author of the scholia. Those of Zurich have likewise published an edition of Paginna’s Bible in 4to; and R. Stephens reprinted it in folio, with the vulgate, in 1557, pretending to give it more correct than in the former editions. There is also another edition of 1586, in four columns, under the name of Vatablas; and we find it again in the Hamburg edition of the Bible in four languages.

In the number of Latin Bibles is also usually ranked the version of the same Paginna corrected, or rather rendered literal, by Arias Montanus; which correction being approved of by the doctors of Louvain, &c. was inserted in the Polyglot Bible of Philip II. and since in that of London. There have been various editions of this in folio, 4to, and 8vo; to which have been added the Hebrew text of the Old Testament, and the Greek of the New. The best of them all is the first, which is in folio, 1571. Since the Reformation there have been several Latin versions of the Bible from the originals by Protestants. The most esteemed are those of Munster, Leo Juda, Castalio, and Tremellius; the three last whereof have been reprinted various times. Munster published his version at Basel in 1534, which he afterwards revised; he published a correct edition in 1545. Castalio’s fine Latin pleases most people; but there are some who think it too much affected; the best edition thereof is that of 1573. Leo Juda’s version, also a little by the divines of Salamanca, was added to the ancient Latin edition, as published by R. Stephens, with notes, under the name of Vatablas’s Bible, in 1545. It was condemned by the Parisian divines, but printed with some alterations by the Spanish divines of Salamanca. That of Junius and Tremellius is preferred, especially by the Calvinists, and has undergo a great number of editions.

One may add a fourth class of Latin Bibles, comprehending the vulgate edition corrected from the originals. The Bible of Isidorus Clarius is of this number: that author, not being contended with restoring the ancient
ancient Latin copy, has corrected the translator in a
great number of places, which he thought ill rendered.
Some Protestants have followed the same method; and
among others, Andrew and Luke Osiander, who have
each published a new edition of the vulgate, corrected
from the originals.

Oriental Bibles.—At the head of the Oriental ver-
sions of the Bible must be placed the Samaritan; as
being the most ancient of all, though neither its age
nor author have been yet ascertained, and admitting
no more for holy scripture but the Pentateuch, or five
books of Moses. This translation is made from the
Samaritan Hebrew text, which is a little different from
the Hebrew text of the Jews. This version has never
been printed alone; nor anywhere in the Polyglots
of London and Paris.

Chaldee Bibles, are only the glosses or expositions
made by the Jews in the time when they spake the
Chaldee tongue. These they call by the name of Tar-
gumim, or paraphrases, as not being any strict versions
of the Scripture. They have been inserted entire in the
large Hebrew Bibles of Venice and Basel; but are
read more commodiously in the Polyglots, being there
attended with a Latin translation.

Syriac Bibles.—There are extant two versions of
the Old Testament in the Syriac language: one from
the Septuagint, which is ancient, and made probably
about the time of Constantine; the other called antiqua
et simplex, made from the Hebrew, as some suppose,
about the time of the apostles. This version is printed
in the Polyglots of London and Paris.

In the year 1562, Widmanstadius printed the whole
New Testament in Syriac, at Vienna, in a beautiful
character: after him there were several other editions;
and it was inserted in the Bible of Philip II, with a
Latin translation. Gabriel Sionita also published a
beautiful Syriac edition of the Psalms, at Paris, in
1525, with a Latin interpretation.

Arabic Bibles.—In the year 1516, Ang. Justinian,
bishop of Nabio, printed at Genoa an Arabic version of
the Psalter, with the Hebrew text and Chaldee paraphrase;
adding his interpretations. There are also Arabic versions of the whole Scriptures in the Poly-
glots of London and Paris; and we have an edition of
the Old Testament entire, printed at Rome in 1671,
by order of the congregation de propagando fide; but
it is of little esteem, as having been altered agreeably
to the vulgate edition. The Arabic Bibles among us
are not the same with those used with the Christians
in the east. Some learned men take the Arabic ver-
sion of the Old Testament, printed in the Polyglots,
to be that of Saadius, who lived about the year 900;
at least in the main. Their reason is, that Aben Ezra,
a great antagonist of Saadius, quotes some passages of
his version, which are the same with those in the Ara-
bic version of the Polyglots; yet others are of opinion,
that Saadius's version is not extant. In 1622, Erpe-
nius printed an Arabic Pentateuch, called also the Pen-
tateuch of Mauritanias, as being made by the Jews of
Barbary, and for their use. This version is very lite-
ral, and esteemed very exact. The four Evangelists
have also been published in Arabic, with a Latin ver-
sion, at Rome, in 1595, folio. These have been since
reprinted in the Polyglots of London and Paris, with
some little alterations of Gabriel Sionita. Erpenius

published an Arabic New Testament not entire, as he found it in his manuscript copy, at Leyden, in 1616.

There are some other Arabic versions of late date
mentioned by Walton in his Prolegomena; particularly
a version of the Psalms preserved in Sion College, Lon-
don, and another of the Prophets at Oxford; neither
of which have been published.

Coptic Bibles.—There are several manuscript copi-
es of the Coptic Bible in some of the great libraries,
especially in that of the French king. Dr. Wilkins pub-
lished the Coptic New Testament in 4to in the year
1716, and the Pentateuch also in 4to in 1731, with La-
tin translations. He reckons these versions to have
been made in the end of the second, or the beginning
of the third century.

Ethiopic Bibles.—The Ethiopians have also trans-
lated the Bible into their language. There have been
printed separately, the Psalms, Canticles, some chapters
of Genesis, Ruth, Joel, Jonah, Zephaniah, Malachi,
and the New Testament; all which have been since re-
printed in the Polyglot of London. A to the Ethiopic
New Testament, which was printed at Rome in
1548, it is a very inaccurate work, and is reprinted in
the English Polyglot with all its faults.

Armenian Bibles.—There is a very ancient Arme-
nian version of the whole Bible, done from the Greek
of the Seventy, by some of their doctors about the time
of Chrysostom. This was first printed entire in 1664,
by one of their bishops at Amsterdam, in 4to; with the

Persian Bibles.—Some of the fathers seem to say,
that all the Scripture was formerly translated into the
language of the Persians; but we have nothing now re-
maining of the ancient version, which was certainly
done from the Septuagint. The Persian Pentateuch
printed in the London Polyglot is, without doubt, the
work of Rabbi Jacob, a Persian Jew. It was publish-
ed by the Jews at Constantinople, in the year 1517.
In the same Polyglot we have likewise the four Evan-
gelists in Persian, with a Latin translation; but this
appears very modern, incorrect, and of little use.
Wilton says, this version was written above 100 years
ago. Another version of the Gospels was published at
Cambridge by Wheloc in the last century: there are
also two Persian versions of the Psalms made in the
last century from the vulgar Latin.

Gothic Bibles.—It is generally said that Uphils,
a Gothic bishop, who lived in the fourth century, made
a version of the whole Bible, excepting the book of
Kings, for the use of his countrymen. That book be
omitted, because of the frequent mention of the war
therein; as fearing to inspire too much of the military
genius into that people. We have nothing remaining
of this version but the four Evangelists, printed in 4to,
at Dort, in 1655, from a very ancient MS.

Whilst the Roman empire subsisted in Europe, the
reading of the Scriptures in the Latin tongue, which
was the universal language of that empire, prevailed
everywhere. But since the face of affairs in Europe
has been changed, and so many different monarchies
erected upon the ruins of the Roman empire, the Latin
tongue has by degrees grown into disuse: whence has
arisen a necessity of translating the Bible into the re-
spective languages of each people; and this has pro-

3
BIBLIA

French Bibles. The oldest French Bible we hear of is the version of Peter de Vaux, chief of the Waldenses, who lived about the year 1160. Raoul de Presle translated the Bible into French in the reign of Charles V. king of France, about the year 1380. Besides these, there are several old French translations of particular parts of the Scripture. The doctors of Louvain published the Bible in French at Louvain, by order of the emperor Charles V. in 1550. There is a version by Isaac le Maitre de Sacy, published in 1672, with explanations of the literal and spiritual meaning of the text, which was received with wonderful applause, and has been often reprinted. As to the New Testaments in French, which have been printed separately, one of the most remarkable is that of F. Amelot of the oratory, composed by the direction of some French prelates, and printed with annotations in the years 1666, 1667, and 1670. The author pretends he had been at the pains to search all the libraries in Europe, and collate the oldest manuscripts. But, in examining his work, it appears that he has produced no considerable readings, which had not before been taken notice of either in the London Polyglot or elsewhere. The New Testament of Mons, printed in 1665, with the archbishop of Cambrai's permission, and the king of Spain's license, made a great noise in the world. It was condemned by Pope Clement IX. in 1668, and by Pope Innocent XI. in 1679, and in several bishoprics of France at several times. The New Testament published at Trevoux in 1702, by M. Simon, with literal and critical annotations upon difficult passages, was condemned by the bishops of Paris and Mâcon in 1722. F. Bohnon, a Jesuit, with the collaboration of F. M. Tellier and Peter Bernier, Jesuits likewise, published a translation of the New Testament in 1697: but this translation is, for the most part, harsh and obscure, which was owing to the author's keeping too strictly to the Latin text from which he translated.

There are likewise French translations published by Protestant authors; one by Robert Peter Olivetan, printed at Geneva in 1555, and since often reprinted with the corrections of John Calvin and others; another by Sebastian Castalio, remarkable for particular ways of expression never used by good judges of the language. John Diodati likewise published a French Bible at Geneva in 1644; but some find fault with his method, in that he rather paraphrases the text than translates it. Faber Stapelansis translated the New Testament into French, which was revised and accommodated to the use of the reformed churches in Piedmont, and printed in 1534. Lastly, M. John le Clerc published a New Testament in French at Amsterdam in 1702, with annotations taken chiefly from Grotius and Hammond; but the use of this version was prohibited in Holland by order of the States-General, as tending to revive the errors of Sabellius and Socinus.

Italian Bibles. The first Italian Bible published by the Romanists is that of Nicholas Malermus, a Benedictine monk, printed at Venice in 1471. It was translated from the Vulgate. The version of Anthony Brunolzi, published at Venice in 1532, was prohibited by the Council of Trent. The Calvinists likewise have their Italian Bibles. There is one of John Diodati in 1607 and 1641, and another of Maximus Theophilus in 1551, dedicated to Francis de Medici duke of Tuscany. The Jews of Italy have no entire version of the Bible in Italian; the inquisition constantly refusing to allow them the liberty of printing one.

Spanish Bibles. The first Spanish Bible that we hear of is that mentioned by Cyprian de Valera, which he says was published about the year 1500. The Epistles and Gospels were published in that language by Ambrose de Moutesin in 1512; the whole Bible by Casiodore de Beyna, a Calvinist, in 1560; and the New Testament, dedicated to the emperor Charles V. by Francis Enzinas, otherwise called Drisander, in 1543. The first Bible which was printed in Spanish for the use of the Jews was that printed at Ferrara in 1553, in Gothic characters, and dedicated to Hercules d'Est duke of Ferrara. This version is very ancient, and was probably in use among the Jews of Spain before Ferdinand and Isabella expelled them out of their dominions in 1492.

German Bibles. The first and most ancient translation of the Bible in the German language is that of Ulphias bishop of the Goths, about the year 360. This bishop left out the book of Kings, which treats chiefly of war, lest it should too much encourage the martial humour of the Goths. An imperfect manuscript of this version was found in the abbey of Verden near Cologne, written in letters of silver, for which reason it is called Codex Argenteus; and it was published by Francis Junius in 1665. The oldest German printed Bible extant is that of Nuremberg, printed in 1447; but who the author of it was is uncertain. John Emser, chaplain to George duke of Saxony, published a version of the New Testament in opposition to Luther. There is a German Bible of John Eckius in 1488, with Emser's New Testament added to it; and one by Ulmerius of Westphalia, procured by Ferdinand duke of Bavaria, and printed in 1630. Martin Luther having employed eleven years in translating the Old and New Testament, published the Pentateuch in 1532, the historical books and the Psalms in 1524, the books of Solomon in 1527; Isaiah in 1529, the Prophets in 1531, and the other books in 1530: he published the New Testament in 1522. The learned agree, that his language is pure, and the version clear and free from intricacies: it was revised by several persons of quality, who were masters of all the delicacies of the German language. The German Bibles which have been printed in Saxony, Switzerland, and elsewhere, are for the most part the same with that of Luther, with very little variation. In 1604 John Piscator published a version of the Bible in German, taken from that of Junius and Tremellius: but his turn of expression is purely Latin, and not at all agreeable to the genius of the German language: the Anabaptists have a German Bible printed at Worms in 1529. John Crellius published his version of the New Testament at Racovia in 1630; and Felbinger his at Amsterdam in 1660.

Flemish Bibles. The Flemish Bibles of the Romanists are very numerous, and for the most part have no author's.
BIB [ 6c6 ] BIB

Saxon Bibles. The whole Scripture is said by some to have been translated into the Anglo-Saxon by Bede about the year 704; though others contend he only translated the Gospels.

We have certain books or parts of the Bible by several other translators; as, 1. The Psalms, by Adelin bishop of Shireborn, contemporary with Bede; though by others this version is attributed to King Alfred, who lived 200 years after. Another version of the Psalms in Anglo-Saxon was published by Spelman in 1645. 2. The Evangelists, still extant, done from the ancient vulgate, before it was revised by St Jerome, by an author unknown, and published by Matth. Parker in 1571. An Old Saxon version of several books of the Bible, made by Elfric abbot of Malmesbury, several fragments of which were published by Will. Lilly in 1638, the genuine copy by Edm. Whate in 1659, at Oxford.

Indian Bible. A translation of the Bible into the North American Indian language, by Elliot, was published in 4to at Cambridge in 1685.

English Bibles. The first English Bible we read of was that translated by J. Wickliffe about the year 1362, but never printed, though there are MS. copies of it in several of the public libraries. J. de Trevisa, who died about the year 1390, is also said to have translated the whole Bible; but whether any copies of it are remaining, does not appear.

Tindal's. The first printed Bible in our language was that translated by Wil. Tindal, assisted by Miles Coverdale, printed abroad in 1526; but most of the copies were bought up and burnt by Bishop Tunstal and Sir Thomas More. It only contained the New Testament, and was revised and republished by the same person in 1530. The prologues and prefaces added to it reflect on the bishops and clergy; but this edition was also suppressed, and the copies burnt. In 1537, Tindal and his associates finished the whole Bible except the Apocrypha, and printed it abroad: but while he was afterwards preparing for a second edition, he was taken up and burnt for heresy in Flanders.

Matthews's. On Tindal's death, his work was carried on by Coverdale, and John Rogers superintendent of an English church in Germany, and the first martyr in the reign of Queen Mary, who translated the Apocrypha, and revised Tindal's translation, comparing it with the Hebrew, Greek, Latin, and German, and adding prefaces and notes from Luther's Bible. He dedicated the whole to Henry VIII in 1537, under the borrowed name of Thomas Matthews; whence this has been usually called Matthews's Bible. It was printed at Hamburg, and license obtained for publishing it in England by the favour of Archbishop Cranmer and the bishops Latimer and Shaxton.

Cranmer's. The first Bible printed by authority in England, and publicly set up in churches, was the same Tindal's version, revised, compared with the Hebrew, and in many places amended, by Miles Coverdale afterwards bishop of Exeter; and examined after him by Archbishop Cranmer, who added a preface to it: whence this was called Cranmer's Bible. It was printed by Grafton, of the largest volume, and published in 1540; and, by a royal proclamation, every parish was obliged to set one of the copies in their church, under the penalty of 40s. a month yet, 100 years...
years after, the Popish bishops obtained its suppression of the king. It was restored under Edward VI, suppressed again under Queen Mary, and restored again in the first year of Queen Elizabeth, and a new edition of it given in 1562.

Genua.—Some English exiles at Geneva in Queen Mary's reign, Coverdale, Goodman, Gibbie, Sampson, Cole, Whittingham, and Knox, made a new translation, printed there in 1560, the New Testament having been printed in 1557; hence called the Geneva Bible; containing the variations of readings, marginal annotations, &c. on account of which it was much valued by the puritan party in that and the following reigns.

Bishops.—Archbishop Parker resolved on a new translation for the public use of the church, and engaged the bishops and other learned men to take each a share or portion. These being afterwards joined together, and printed with short annotations in 1568, in large folio, made what was afterwards called the Great English Bible, and commonly the Bishops Bible. The following year it was also published in 8vo, in a small but fine black letter: and here the chapters were divided into verses: but without any breaks for them, in which the method of the Geneva Bible was followed, which was the first English Bible where any distinction of verses was made. It was afterwards printed in large folio, with corrections, and several prologemena, in 1572: this is called Matthew Parker's Bible. The initial letters of each translator's name were put at the end of his part: e. gr. at the end of the Pentateuch, W. E. for William Exon; that is, William bishop of Exeter, whose allotment ended there; at the end of Samuel, R. M. for Richard Menevensis, or bishop of St David's, to whom the second allotment fell: and the like of the rest. The archbishop oversaw, directed, examined, and finished the whole. This translation was used in the churches for 40 years, though the Geneva Bible was more read in private houses, being printed above 30 times in as many years. King James bore it an inveterate hatred on account of the notes; which at the Hampton-court conference he charged as partial, untrue, seditions, &c. The Bishops Bible too had its faults. The king frankely owned he had yet seen no good translation of the Bible in English; but he thought that of Geneva the worst of all.

Rhemish.—After the translation of the Bible by the bishops, two other private versions had been made of the New Testament: The first by Laur. Thomson, made from Bex's Latin edition, together with the notes of Bexa, published in 1582 in 4to, and afterwards in 1589, varying very little from the Geneva Bible; the second by the Papists at Rheims in 1584, called the Rhemish Bible, or Rhemish Translation. These ending it impossible to keep the people from having the Scriptures in the vulgare tongue, resolved to give a version of their own as favourable to their cause as might be. It was printed on a large paper, with a fair letter and margin. One complaint against it was its retaining a multitude of Hebrew and Greek words untranslated, for want, as the editors express it, of proper and adequate terms in the English to render them by; as the words onyxmes, temnike, rational, holocast, prenec, pasche, &c. However, many of the copies were seized by the queen's searchers, and confiscated; and Ths. Cartwright was solicited by Secretary Walsingham to refute it; but after a good progress made thereon, Archbishop Whitgift prohibited his further proceeding thereon, as judging it improper the doctrine of the church of England should be committed to the defence of a puritan, and appointed Dr Fulke in his place, who refuted the Rhemists with great spirit and learning. Cartwright's refutation was also afterwards published in 1618, under Archbishop Abbot. About 30 years after their New Testament, the Roman Catholics published a translation of the Old at Doway, in 1609 and 1610, from the vulgare, with annotations; so that the English Roman Catholics have now the whole Bible in their mother-tongue; though it is to be observed, they are forbidden to read it without a license from their superiors.

King James's.—The last English Bible was that which proceeded from the Hampton-court conference in 1603, where many exceptions being made to the Bishops Bible, King James gave orders for a new one; not, as the preface expresses it, for a translation altogether new, nor yet to make of a bad one a good one, but to make a good one better, or of many good ones one best. Fifty-four learned persons were appointed for this office by the king, as appears by his letter to the archbishop, dated in 1604; which being three years before the translation was entered upon, it is probable seven of them were either dead or had declined the task, since Fuller's list of the translators makes but 47; who being ranged under six divisions, entered on their province in 1607. It was published in 1613, with a dedication to James, and a learned preface, and is commonly called King James's Bible. After this, all the other versions dropped and fell into disuse, except the Epistles and Gospels in the Common Prayer Book, which were still continued according to the Bishops translation till the alteration of the liturgy in 1661, and the Psalms and Hymns, which are to this day continued as in the old version.

The judicious Selden in his Table Talk, speaking of the Bible, says, "The English translation of the Bible is the best translation in the world, and renders the sense of the original best, taking in for the English translation the Bishops Bible, as well as King James's. The translators in King James's time took an excellent way. That part of the Bible was given to him who was most excellent in such a tongue (as the Apocrypha to Andrew Downes), and then they met together, and one read the translation, the rest holding in their hands some Bible either of the learned tongues, or French, Spanish, Italian, &c. If they found any fault, they spoke; if not, he read on." King James's Bible is that now read by authority in all the churches in Britain.

Welsh Bibles.—There was a Welsh translation of the Bible made from the original in the time of Queen Elizabeth, in consequence of a bill brought into the house of commons for this purpose in 1563. It was printed in folio in 1588. Another version, which is the standard translation for that language, was printed in 1620. It is called Parry's Bible. An impression of this was printed in 1690, called Bishop Lloyd's Bible. These were in folio. The first 8vo impression of the Welsh Bible was made in 1630.

Irish Bible.—Towards the middle of the 16th cent.,
BIBLIOGRAPHIA, a branch of archeography, employed in the judging and perusing of ancient manuscripts, whether written in books, on paper or parchment.

The sense of it is now extended; and it signifies a work intended to give information concerning the first or best editions of books, and the ways of selecting and distinguishing them properly. In short, it is used for a notitia or description of printed books, either in the order of the alphabet, of the times when printed, or of the subject matters. In which sense it is nearly the same as bibliotheca. See Bibliography, Supplement.

Literary journals afford also a kind of bibliographia.

BIBLIOMANCY, a kind of divination performed by means of the Bible. This amounts to much the same with what is otherwise called sortes biblice or sortes sanctarum. It consisted in taking passages of Scripture at hazzard, and drawing indications thence concerning things future; as in Augustine's tale et leges. It was much used at the consecration of bishops.

F. J. Davidis, a Jesuit, has published a bibliomancy under the borrowed name of Veridicus Christianissimus.

BIBLIOTHECA, in its original and proper sense, denotes a library or place for deposing books.

BIBLIOTHECA, in matters of literature, denotes a treatise giving an account of all the writers on a certain subject; thus we have bibliothecas of theology, law, philosophy, &c.

There are likewise universal bibliothecas, which treat indifferently of all kinds of books; also select bibliothecas, which give account of none but authors of reputation.

Many of the bibliothecas agree, in most respects, with what are otherwise called memoirs or journals of literature, except that these last are confined to new books; but there are other bibliothecas, that differ in nothing from catalogues of the writers on certain subjects.

BIBLISTS. So the Roman Catholics call those Christians who make Scripture, the sole rule of faith, in which sense, all Protestants either are or ought to be bibliists.

BIBLUS, Βίβλος, in Botany, an aquatic plant in Egypt, called also papyrus; of the skin whereof the ancient Egyptians made their paper. See PAPYRUS.

BIBRACUTE, in Ancient Geography, a citadel of the Αζυ-, according to Strabo; but Caesar describes it as a town well fortified, very large and populous, and of the greatest authority among that nation: Now Beuret, or Bevray; a desolate place four miles to the north-west of Autun.

BIBRACI, in Ancient Geography, an ancient people of Britain: Now the Hundred of Bray in Berks.

BICANER, a city of Asia, on the river Ganges, in the northern part of Hindostan. E. Long. 87. 20. N. Lat. 28. 40.

BICE, or BISE, among painters, a blue colour prepared from the lapis armenius.

Bice bears the best body of all bright blues used in common work, as house-painting, &c. but it is the palest in colour. It works indifferently well, but inclines a little to sandy, and therefore requires good grinding.

BICEPS, the name of several muscles; as the biceps humeri, or cubiti; biceps tibii; &c. See Anatomia, Table of the Muscles.

BICESTER, a straggling town of Oxfordshire in England, seated on the road between Oxford and Buckingham.

BICHAT, MARIE FRANCOIS XAVIER, an eminent French physiologist. See Supplement.

BICHET, a quantity or measure of corn, which differs according to the places where it is used. The bichet is not a wooden measure, as the minot at Paris, or the bushel at London; but it is compounded of several certain measures. It is used in many parts of France, &c.

BICLINIUM, in Roman antiquity, a chamber with two beds in it; or when two beds only were round a table.

BICORNES, an order of plants in the fragments methodi naturale of Linnaeus, so termed from the antithese having in appearance two horns. See Botany.

BIDACHE, a town of France, in the department of the Lower Pyrenees, seated on the river Bidone.

W. Long. 1. 9. N. Lat. 41. 31.

BIDAL, or BIDAL, in our ancient customs, denotes the invitation of friends to drink ale at some poor man's house, who in consideration hereof expects some contribution for his relief. This custom still obtains in the west of England, and is mentioned in some of our ancient statutes.

BIDDELL, JOHN, one of the most eminent English writers among the Socinians, was born at Wolton-under-Edge, in Gloucestershire, and educated in the free-school of that place. Being a hopeful youth, he was taken notice of; particularly by Lord George Berkeley, who allowed him an exhibition of ten pounds a-year. This caused him vigorously to apply
ply himself to his studies; and he was, while at school, author of a translation of Virgil's Bucolics, and of the two first satires of Juvenal. He continued at school till he was 13 years of age. However, having manifested in that early period a singular piety and contempt of secular affairs, he was sent to the university of Oxford, and entered a student in Magdalen hall. In 1641, the magistrates of Gloucester chose him master of the free school of that city; and he was much esteemed; but falling into some opinions concerning the Trinity different from those commonly received, and expressing his thoughts with too much freedom, he suffered various persecutions and imprisonments in the time of the commonwealth. During one of these confinements, which lasted for several years, being reduced to great indigence, he was employed by Roger Daniel of London to correct the impression of the Greek Septuagint Bible, which that printer was about to publish with great accuracy. In 1651, the parliament published a general act of oblivion, which restored him to his full liberty. He was afterwards imprisoned on account of his tenets; and at last the Protector banished him for life to St Mary's castle in the isle of Scilly, and sent him thither in October 1655. Soon after, he was allowed 100 crowns a year for subsistence. In 1658, he was set at full liberty. After the restoration of King Charles II. he was fined in 100l. and each of his hearers in 20l. to lie in prison till paid; which being put in execution, the want of fresh air and exercise made him contract a disease, of which he died on the 22d of September 1665, in the 47th year of his age. His life was published in Latin in 1682, by Mr Farrington of the Inner Temple, who represents him as possessed of extraordinary piety, charity, and humility. He would not discourse of those points in which he differed from others, with those that did not appear religious according to their knowledge; and was a strict observer himself, and a severe exactor in others, of reverence in speaking of God and Christ. He had so happy a memory, that he retained word for word the whole New Testament, not only in English, but in Greek, as far as the fourth chapter of the Revelation of St John.

BIDDIFORD, a town of Devonshire, seated on the river Toridge, over which there is a fine stone-bridge with 24 arches. It contains 3244 inhabitants, and carries on a considerable trade. W. Long. 4. 10. N. Lat. 51. 10.

BIDDING, or OFFERING, denotes the raising the price of a thing at a sale or auction. The French call this enchirer. It answers to what the Romans called licitari: they used to bid by holding up the hand or finger.

Bidding is also used for proclaiming or notifying. In which sense we meet with bidding of the banks, the same with what is otherwise called asking.

BIDDING PRAYER. It was one part of the office of the deacons in the primitive Christian church, to be a sort of monitors and directors of the people in the exercise of their public devotions in the church. To which end they made use of certain known forms of words, to give notice when each part of the service began. This was called by the Greeks λαμπαδία, and by the Latinus praedicatio: which therefore does not ordinarily signify to preach, as some mistake it, but to perform the office of a crier (saequi, or præce) in the assembly:

Vol. III. Part II.

 whence Synesius and others call the deacons λαμπαδίας, the holy priers of the church, appointed to bid or exhort the congregation to pray and join in the several parts of the service of the church. Agreeable to this ancient practice is the form Let us pray, repeated before several of the prayers in the English liturgy.

BIDDING of the Bells, a charge or warning which the parish-priest gave to his parishioners at certain special times, to say so many pater-nosters, &c. on their beads.

BIDENS, WATER HEMP-AGRIMONY. See Botany Index.

BIDENTAL, in Roman antiquity, a place blasted with lightning; which was immediately consecrated by an haruspex, with the sacrifice of a bidens. This place was afterwards accounted sacred, and it was unlawful to enter it or to tread upon it; for which reason it was commonly surrounded with a ditch, wall, hedge, ropes, &c. See next article.

BIDENTALES, in Roman antiquity, priests instituted to perform certain ceremonies and expiations when thunder fell on any place. Their principal office was the sacrificing a sheep of two years old, which in Latin is called bidens; from whence the place struck with thunder got the name of bidental.

BIDENTES, in middle-age writers, denotes two-yearlings, or sheep of the second year. The wool of these bidentes, or two years old sheep, being the first sheering, was sometimes claimed as a heriot to the king, on the death of an abbot. Among the ancient Romans, the word was extended further to any sorts of beasts used for victims, especially those of that age: whence we meet with sues bidentes.

BIDET, a nag or little horse, formerly allowed each trooper and dragoon, for his baggage and other occasions. Bidets are grown into disuse, on account of the expences thereof, and the disorders frequently arising from those who attended on them, &c.

BIDIS, in Ancient Geography, a small city of Sicily, not far from Syracuse, whose ruins are still to be seen in the territory of Syracuse, about 15 miles to the southwest, with a church called S. Giovanni di Bidini.

BIDLOO, GODFREY, author of several treatises on anatomy, was born at Amsterdam, March 12. 1649. In 1688, he was professor of anatomy at the Hague; and, in 1694, at Leyden; when King William III. of England appointed him his physician; which he would not accept but on condition of holding his professorship, which was readily granted him. He published, in Latin, 1. The Anatomy of the Human Body, demonstrated in 105 cuts, explained by the discoveries of the ancient and modern writers. 2. An Oration upon the Antiquity of Anatomy. 3. A Letter to Anthony Lecouwenbank on the animals sometimes found in the liver of sheep and other animals. 4. Two Decades of dissertations in Anatomy and Chirurgery; and other pieces. He died at Leyden, in April, 1713.

BIDON, a liquid measure, containing about five pints of Paris, that is, about five quarts English wine-measure. It is seldom used but among ships' crews.

BIE, ADRIAN DE, an eminent painter, was born at Lierre in 1594. After learning the rudiments of the art from different masters, he travelled to Rome, where he spent six years in studying the works of the best masters. His industry was then rewarded with proportionable success; for he found encouragement among
the most honourable persons at Rome, and in every part of Italy through which he travelled, from persons of the first distinction. His pencil was so exceedingly neat, and his touch and colouring so very delicate, that he was frequently employed to paint on jasper, agate, porphyry, and other precious materials.

**BIEEZ**, a town of Poland, in the palatinate of Cracovia, remarkable for its mines of vitriol. It is seated on the river Wesole, in E. Long. 2. 21. N. Lat. 49° 50'.

**BIEL.** See Bienna.

**BIELA**, a town of Russia, and capital of a province of the same name, seated on the river Opschaw, in E. Long. 34° 55'. N. Lat. 55° 0'.

**BIELA OZERO, or Belozero**, a town of the Russian empire, capital of a duchy, and situated on a lake of the same name, at the mouth of the river Consa, in E. Long. 39° 20'. N. Lat. 58° 55'.

**BIELA**, a town of Piedmont in Italy, and capital of the Bullese, near the river Cerva, in E. Long. 8° 3'. N. Lat. 45° 22'.

**BIELSKI**, a town of Poland, in the palatinate of Polachia, near one of the sources of the river Narow. E. Long. 22° 55'. N. Lat. 53° 50'.

**BIELSKOI**, a town of Russia, in the province of Smolensko. E. Long. 35° 5'. N. Lat. 56° 40'.

**BIENNA**, a town of Switzerland, seated on a lake of the same name. The inhabitants are Protestants, and in alliance with those of Bern, Soleure, and Friburg. E. Long. 7° 14'. N. Lat. 47° 11'.

**BIENNIAL PLANTS**; plants, as the title biennial imports, that are only of two years duration. Numerous plants are of this tribe, which being raised one year from seed, generally attain perfection either the same, or in about the period of a twelvemonth, or a little less or more, and the following spring or summer shoot up stalks, flower, and perfect seeds; soon after which they commonly perish; or if any particular sorts survive another year, they assume a dwindling and straggling growth, and gradually die off; so that biennials are always in their prime the first or second summer. Biennials consist both of esculent and flower plants. Of the esculent kinds, the cabbage, savoy, carrot, parsnip, beet, onion, leek, &c. are biennials. Of the flowery tribe, the Canterbury-bell, French honeysuckle, wall-flower, stock-july-flower, sweet-william, China-pink, common-pink, matted-pink, carnation, scabious, holly-bock, treemallow, vervain-mallow, tree-primrose, honesty or moonwort, &c. are all of the biennial tribe; all of which being sown in March, April, or May, rise the same year, and in spring following shoot up into stalks, flower, and perfect seeds in autumn; after which most of them dwindle; though sometimes the wall-flowers, hollybocks, carnations, and pinks, will survive and flower the following year; but the plants become straggling, the flowers small and badly coloured: it is therefore eligible to raise a supply annually from seed; although wall-flowers, carnations, and pinks, may be continued by slips and layers.

**BIEF, a wooden machine for carrying the bodies of the dead to be buried. The word comes from the French bierre, which signifies the same. It is called in Latin feretrum, a ferendo. Among the Romans the common bier, whereon the poorer sort were carried, was called sandsaphia; that used for the richer sort leccia, leccta furbris, sometimes lectus. The formet was only a sort of wooden chest, vilia arca, which was burnt with the body; the latter was enriched and gilt for pomp. It was carried bare, or uncovered, when the person died a natural and easy death; when he was much disfigured or distorted, it was veiled or covered off.

**BIER** is more particularly used for that wherein the bodies of saints are placed in the church to rest, and exposed to the veneration of the devout. This is also called, in middle-age writers, lectus, lectatura, lectura, and luculus; and was usually enriched with gold, silver, and precious stones, which was the cause that the bier of St Benedict was pillaged, and all its ornaments carried off.

**BIEROLIET**, a town of the Netherlands, in Dutch Flanders, where William Bruckfield, or Broukfield, who invented the method of pickling herrings, died in 1397. E. Long. 3° 42'. N. Lat. 51° 25'.

**BIFFRAE**, plants that flower twice a-year, in spring and autumn, as is common between the tropics.

**BIFRONES**, a person double-fronted, or two-faced.

Bifrons is more peculiarly an appellation of Joves, who was represented by the ancients with two faces, as being supposed to look both backwards and forwards: though other reasons for it are recited by Plutarch. Sometimes he was painted with four faces, quadrifronts, as respecting the four seasons.

**BIGA**, in antiquity, a chariot drawn by two horses abreast. Chariot-races, with two horses, were introduced into the Olympic games in the 93d Olympiad: but the invention was much more ancient; as we find that the heroes in the Iliad fight from chariots of that kind. The moon, night, and the morning, are by mythologists supposed to be carried in biga, the sun in quadriga. Statues in biga were at first only allowed to the gods, then to conquerors in the Grecian games; under the Roman emperors, the like statues, with biga, were decreed and granted to great and well-deserving men, as a kind of half triumph, being erected in most public places of the city. Figures of biga were also struck on their coins. The drivers of biga were called bigarii; a marble bust of one Florus a bigarius is still seen at Rome.

**BIGAMY**, properly signifies being twice married; but with us is used as synonymous with polygamy, or having a plurality of wives at once. Such second marriage, the former husband or wife living, is simply void, and a mere nullity, by the ecclesiastical law of England; and yet the legislature has thought it just to make it felony, by reason of its being so great a violation of the public economy and decency of a well-ordered state. For polygamy can never be endured under any rational civil establishment, whatever specious reasons may be urged for it by the eastern nations, the falselousness of which has been fully proved by many sensible writers: but in northern countries the very nature of the climate seems to reclaim against it; it never having obtained in this part of the world, even from the time of our German ancestors, who, as Tacitus informs us, "prope soli barbarorum singulae uxorum contenti sunt. It is therefore punished by the laws both of ancient and modern Sweden with death. And in Britain it is enacted by statute 1 Jac. I. c. 11, that
if any person being married, do afterwards marry again, the former husband or wife being alive, it is felony; but within the benefit of clergy. The first wife in this case shall not be admitted as an evidence against her husband, because she is the true wife; but the second may, for she indeed is no wife at all: and so, vice versa, of a second husband. This act makes an exception to five cases, in which such second marriage, though in the three first it is void, is yet no felony. 1. Where either party hath been continually abroad for seven years, whether the party in England hath notice of the other's being alive or no. 2. Where either of the parties hath been absent from the other seven years within this kingdom, and the remaining party hath had no knowledge of the other's being alive within that time. 3. Where there is a divorce (or separation à mensa et thoro) by sentence in the ecclesiastical court. 4. Where the first marriage is declared absolutely void by any such sentence, and the parties loosed à vinculo. Or, 3. Where either of the parties was under the age of consent at the time of the first marriage; for in such case the first marriage was voidable by the disagreement of either party, which the second marriage very clearly amounts to. But, if at the age of consent the parties had agreed to the marriage, which completes the contract, and is indeed the real marriage; and afterwards one of them should marry again; Judge Blackstone apprehends that such second marriage would be within the reason and penalties of the act.

BIGATI, in antiquity, a kind of ancient Roman silver coins, on one side whereof was represented a biga, or chariot drawn by two horses. The bigatus was properly the Roman denarius, whose impression, during the times of the commonwealth, was a chariot driven by Victory, and drawn either by two horses or four; according to which it was either denominated bigatus or quadrigatus.

BIGGAR, a town and parish in Lanarkshire, Scotland, containing 1376 inhabitants in 1811. Here are the ruins of a collegiate-church which was founded in 1545.

BIGGLESWADE, a town in Bedfordsire, in England, seated on the river Ivel, over which there is a handsome bridge. It lies on the principal road from London to York, and with the adjoining hamlets of Home and Stratton, contained 1895 inhabitants in 1811. W. Long. 0. 15. N. Lat. 52. 5.

BIGHT, among seamen, denotes one roll or round of a cable or rope, when coiled up.

BIGNON, JEROME, a French writer, was born at Paris in 1590. He gained an uncommon knowledge, under the care of his father, in philosophy, mathematics, history, civil law, and divinity, in a very short time; and was almost at the end of his studies at an age when it is usual to send children to school. At ten years of age he gave the public a specimen of his learning; in a Description of the Holy Land; and two years after, he published a Discourse concerning the principal antiquities and curiosities of Rome; and a summary Treatise concerning the election of Popes. Henry IV. desired to see him, and appointed him page to the dauphin, who was afterwards Louis XIII. He appeared at court with all the politeness of manners imaginable. He wrote at that time a treatise of the predecessor of the kings of France, which he dedicated to Henry IV., who gave him an express order to continue his researches on that subject; but the death of that prince interrupted his design. He published, in 1613, the Formulae of Marcus Plancius. He was in 1620 made advocate-general in the grand council; and discharged that post with such reputation, that the king nominated him some time after counsellor of state, and at last advocate-general in the parliament. He resigned his offices in 1641; and the year following was appointed chief library-keeper of the king's library. He was obliged to resign his office of advocate-general, and held it till his death. He was employed in the most important affairs of state. At last this great man, who had always made religion the basis of his other virtues, died with the most exemplary devotion in 1676.

BIGIONIA, TRUMPET-FLOWER, or SCARLET JASMIN. See BOTANY INDEX.

BIGORRE, a territory or county of France, in the province of Gascony, which is now included in the department of the Upper Pyrenees. It is bounded on the east by the valley of Aure, the viscounty of Neubassa, Riviere Verdon, and Pardiacc; by Bearn on the west; on the south, by the valleys of Broton and Penticous in Arragon; and on the north, by the county Riviere-Bas incorporated with Armagnac. It is 40 miles long from north to south, and 30 in breadth from east to west. It is divided into three parts, the mountains, the plains, and the Rustan. The mountains are enclosed between those of the valley of Aure on the east, those of Arragon on the south, and of Bearn on the west. This part contains two principal valleys, Lavedan and Barege. The valley of Bigorre is of an oval form, and has the hills of Rustan on the east. The remarkable towns are Tarbes the capital, Bagneres, Lourd, &c. The mountains are a barrier between France and Spain, and there are four different passages which the inhabitants are obliged to guard. Bigorre yields marble, basalt, stone, and slate; there are also mines of several sorts, but they are not worked. The rivers are the Adour, the Eiches, the Arrosset, and the Gave of Lavedan; there are also three lakes.

BIGOT, a person obstinately and perversely wedded to some opinion or practice, particularly of a religious nature. Camden, perhaps, has hit upon the true original of the word. He relates, that when Rollo, duke of Normandy, received Gisla, the daughter of Charles the Foolish, in marriage, together with the investiture of that dukedom, he would not submit to kiss Charles's foot: and when his friends urged him by all means to comply with that ceremony, he made answer in the English tongue, Ne se by God, i.e. Not so by God. Upon which, the king and his courtiers deriding him, and corruptly repeating his answer, called him bigot; from whence the Normans were called bigodi, or bigots.

BIGOT, in Italian bigontia, is used to denote a Venetian liquid measure, containing the fourth part of the amphora, or half the boot.

BILAEZ, a strong town of Croatia in Hungary, seated in an isle formed by the river Anna, in E. Long. 16. 2. N. Lat. 44. 25.

BILANDER, in Navigation, a small merchant ship with two masts, distinguished from other vessels of the same kind by the form of the main-sail. Few vessels are
Bilanderm is also rigged in the manner of bilanders; the name has been variously applied in different countries.

BILBILIS, in Ancient Geography, a town of His-pania Citerior, the birth-place of Martial; now supposed to be Calataujad in Arragon, on the Xalon.

BILBOA, a large, handsome, and rich town of Spain, capital of Biscay, containing 15,000 inhabitants, with a well-frequented harbour. The inhabitants have always preserved themselves from a mixture with the Jews and Moors; and therefore will admit no family to settle among them but who can prove themselves to be of Christian extraction. The number of ships great and small that visit the harbour yearly is from 500 to 600. The exports are wool and swords-blades, with some other manufactures of iron and steel. The town is seated at the mouth of the river Ibaicabal, in W. Long. 4° 20. N. Lat. 43° 23.

BILBOWS, a punishment at sea, answering to the stocks at land. The offender is laid in irons, or stocks, which are more or less ponderous according to the quality of the offence of which he is guilty.

BILDESTON, a town of Suffolk in England, seat-ed on a creek on the river Breton. The principal manufa-cure is woollen goods, especially blankets. E. Long. 0° 45. N. Lat. 52° 20.

BILGE of a ship, the bottom of her floor, or the breadth of the place the ship rests on when she is a-ground. Therefore, bilge-water is that which lies on her floor, and cannot go to the well of the pump: And bilge-pumps, or burn-pumps, are those that carry off the bilge-water. They likewise say the ship is bilged, when she has some of her timber struck off on a rock or anchor, and springs a leak.

BILE, a yellow, bitter juice, separated from the blood in the liver, collected in the porous biliary and gall-bladder, and thence discharged by the common duct into the duodenum. See Anatomy Index.

BILEDULGERID, or Belad Al Jerid, the Country of Dates, a kingdom of Africa. It is almost of a square form, extending itself more than 80 leagues every way, from 28. 30. to 32. 50. north latitude, and from 6 to 12 degrees of west longitude. It is bounded on the north by the kingdom of Tunis, on the east by a ridge of lofty mountains which divide it from Tripoli and part of Guadames, on the west by the countries of Zeb and Mezab, and on the south by the province of Vergheia. The whole country is barren, sandy, and mountainous, producing little or nothing besides dates, which grow here in such profusion, that the face of half the kingdom is covered over with date-trees, and from hence the whole country takes its name. The climate is hot and unhealthy; the people lean, swarthy, and shrivelled in their complexions; with their eyes inflamed, owing to the reflection of the sunbeams from the white hard soil; and the showers of dust and sand, driven by the high winds that blow here at certain seasons, are frequently so violent as to bury men and cattle under them. Another inconvenience with which the inhabitants are afflicted, for which no other reason is given besides their constant living on dates, is an inveterate scurvy in their gums, whence all their teeth drop out; though it frequently spreads over their whole bodies, and then they become the most unhappy and loathsome objects. They are almost entirely free from other diseases: so that when not afflicted with this, Biledulgerid they live to a good old age; though it is observable that they discover a bowed countenance, shrunken skin, hoary locks, and other symptoms of old age, very early in life, and before decrepitude, infirmity, or any decay of their faculties, appear. The plague is not known in Biledulgerid, though so frequent in Barbary, and though a constant intercourse is kept up between the two countries; whence it would seem, that in certain cases this terrible disease is not so infectious as it is usually thought to be. The same may be said of the smallpox, a disease little less contagious and fatal in hot countries than the plague itself. The natives are represented as a lewd, treacherous, thievish, and savage people, who delight in murder and robbery. They are mostly a mixture of Africans and wild Arabs who mingled themselves with them. The former live with some regularity and civil order in a kind of villages composed of a number of little huts; the latter in tents, ranging from place to place in quest of food and plunder. The Arabs, who pride themselves in their superiority of birth and talents above the primitive inhabitants, are wholly independent and free, frequently hiring themselves in the service of the neighbouring princes at war; from which policy arise the most valuable branches of their public revenue, if any thing can be called common or public in a nation of lawless rob-bers. The rest pursue no other occupation besides hunting and plundering; the first of which is their common employment, especially hunting of ostriches, which are said to be of a prodigious stature in this country, and as high as a man mounted on a tall horse. The inhabitants eat the flesh of these animals; barter their feathers for corse, pulse, and other things they want; and in their hearts in their necromantic and religious rites, their fat as a medicine of sovereign virtue, their talons for ear-pendants and other ornaments, and their skins they convert into pouches and knapsacks, so that not a part of the animal but is employed in some useful purpose. Besides dates and ostriches, the Arabs live likewise on the flesh of goats and camels; drinking either the liquor or broth in which that flesh is boiled, or the milk of their camels. In the whole country there is scarcely a town of any note, or even a stream of water that deserves notice, or that is not dried up half the year.

BILEWELT, a town of Germany in the circle of Westphalia and county of Ravensburg, subject to the king of Prussia, in E. Long. 8° 20. N. Lat. 52° 0.

BILFINGER, GEORGE BERNARD, a German philosopher and statesman. See Supplement.

BILINGUIS, in a general sense, signifies one that speaks two languages; but in law, is used for a jury that passes in any case between an Englishman and a foreigner, whereof part ought to be English and part strangers.

BILIOUS, in general, denotes something belonging to, or partaking of, the nature of bile. Hence, BILIOUS FEVERS are those occasioned by the over copiousness or bad qualities of the bile.

BILL, in Mechanics, an instrument made of iron, edged in the form of a crescent, and adapted to a handle. It is used by plumbers, to perform several parts of their work; by basket-makers, to cut the largest pieces of chestnut-trees and other wood; and by gardeners,
B I L [ 613 ]

... when short, it is called a hand-bill; and when long, a hedge-bill.

Bill, in Law, a declaration in writing, expressing either some wrong the complainant has suffered from the defendant, or a fault committed by the person complained of against some law or statute.—This bill is sometimes exhibited to justices at the general assizes, by way of indictment, or referred to others having jurisdiction; but it is more generally addressed to the lord chancellor. It contains the fact complained of, the damage sustained, and a petition or process against the defendant for redress; and is used both in criminal and civil cases. In the former, the words billa vera are inscribed by the grand jury upon a presentment, implying that they had the same founded on probable evidence, and therefore worthy of further consideration.

In Scots law, every summary application in writing, by way of petition to the court of session, is called a bill.

Bill of Attainder. See Attainder.

Bill of Appeal. See Appeal.

Bill signifies also a paper, either written or printed, in very large characters, which is posted up in some open and public place, to give notice of the sale of any merchandise or ship, or of the sailing of any vessel into foreign parts.

Bill, in trade, both wholesale and retail, as also among workmen, signifies an account of merchandises or goods delivered to a person, or of work done for one.

Bill, in Commerce, denotes a security for money under the hand and sometimes seal of the debtor, without any condition or forfeiture in case of non-performance; in which it is distinguished from a bond or obligation. It has been usually defined, a writing where-in one man is bound to another to pay a sum of money, on a day that is future, or presently on demand, according to the agreement of the parties at the time when it is drawn; on which, in case of failure, diligence or execution may be immediately done to force payment. These bills must be on stamped paper: if under 50l. the stamp to be 6d.; if for 50l. or upwards is.

Bank-Bill is a note or obligation signed on behalf of the company of the bank, by one of their cashiers, for value received. Or it is an obligation to pay on demand either to the bearer or to order; in Scotland, it is understood to be to order.

Bill of Entry, an account of the goods entered at the custom-house, both inwards and outwards. In this bill must be expressed, the merchant exporting or importing; the quantity of merchandise, and the divers species thereof; and whither transported, or from whence.

Bill of Exchange, is a security, originally invented among merchants in different countries, for the more easy remittance of money from the one to the other, which has since spread itself into almost all pecuniary transactions. It is an open letter of request from one man to another, desiring him to pay a sum named therein to a third person on his account; by which means a man at the most distant part of the world may have money remitted to him from any trading country. If A lives in Jamaica, and owes B who lives in England 100l.; now if C be going from England to Jamaica, he may pay B this 100l. and take a bill of exchange drawn by B in England upon A in Jamaica, and receive it when he comes thither. Thus does B receive his debt, at any distance of place, by transferring it to C; who carries over his money in paper credit, without danger of robbery or loss. This method is said to have been brought into general use by the Jews and Lombards, when banished for their usury and other vices; in order the more easily to draw their effects out of France and England into those countries in which they had chosen to reside. But the invention of it was a little earlier; for the Jews were banished out of Guienne in 1287, and out of England in 1290, and in 1296 the use of paper-credit was introduced into the Mogul empire in China. In common speech, such a bill is frequently called a draught; but a bill of exchange is the more legal as well as mercantile expression. The person, however, who writes this letter, is called, in law, the drawer; and he to whom it is written, the drawee; and the third person or negociator to whom it is payable (whether specially named or the bearer generally) is called the payee.

These bills are either foreign or inland; foreign, when drawn by a merchant residing abroad upon his correspondent in England, or vice versa; and inland, when both the drawer and the drawee reside within the kingdom. Formerly foreign bills of exchange were much more regarded in the eyes of the law than inland ones, as being thought of more public concern in the advancement of trade and commerce. But now by two statutes, the one 9 and 10 W. III. c. 17. the other 3 and 4 Ann. c. 9. inland bills of exchange are put upon the same footing as foreign ones: what was the law and customs of merchants with regard to the one, and taken notice of merely as such, being by those statutes expressly enacted with regard to the other. So that there is now in law no manner of difference between them. In drawing foreign bills of exchange, it is customary to give two or three of the same date and tenor to be sent by different conveyances, that in case of accidents the person to whom they are sent may not be disappointed; in which case it is mentioned in the body of the bill, that it is the 1st, 2d, or 3d bill of exchange; so that when one is paid it discharges all the rest. Inland bills for any sum must be on 6d. stamped paper.

Bill of Lading, an acknowledgement signed by the master of a ship, and given to a merchant, &c. containing an account of the goods which the master has received on board from that merchant, &c. with a promise to deliver them at an intended place for a certain salary. Each bill of lading must be treble, one for the merchant who loads the goods, another to be sent to the person to whom they are consigned, and the third to remain in the hands of the master of the ship. It must be observed, however, that a bill of lading is used only when the goods sent on board a ship are but part of the cargo: for when a merchant loads a whole vessel for his own personal account, the deed passed between him and the master of the ship is called charter-party. See Charter-Party.

Bills of Mortality, are accounts of the numbers of births and burials within a certain district, every week, month, quarter, or year. In this sense we say weekly bills.
BIL

bills, monthly bills, quarterly bills, yearly bills. The London bills of mortality, which were the first, are composed by the parish-clerks, and express the number of christenings of each sex, and of deaths from each disease. See Bills of Mortality. Supplement.

Bill of Parcels, an account given by the seller to the buyer, containing the particulars of all the sorts and prices of goods bought.

Bill of Sale, is when a person wanting a sum of money delivers goods as a security to the lender, to whom he gives his bill, empowering him to sell the goods, in case the sum borrowed is not repaid, with interest, at the appointed time.

Bill of Stores, a license granted at the custom-house to merchants, by which they have liberty to carry, custom-free, all such stores and provisions as they may have occasion for during the voyage.

Bill of Suffrance, a license granted to a merchant, at the custom-house, suffering him to trade from one English port to another without paying custom.

Lambard Bills, are instruments of an uncommon kind and figure, used in Italy and Flanders, and of late also in France; consisting of a piece of parchment, cut to an acute angle, about an inch broad at top, and, terminating in a point at bottom; chiefly given where private persons are concerned in the fitting out a ship on any long voyage. The manner is thus: The party, who is desirous to be concerned in the cargo or venture, carries his money to the merchant who fits out the ship, where it is entered down; the register at the same time the merchant writes down on a piece of parchment, upwards of an inch broad, and seven or eight inches long, the name of the lender and the sum lent; which being cut diagonal-wise, or from corner to corner, each party retains his half. On the return of the vessel, the lender brings his moiety to the merchant; which being compared with the other, he receives his dividend accordingly. Much the same is practised in Holland by those who lend money on pledges; the name of the borrower and the sum are written on a like slip of parchment, which is cut into two, and half given to the borrower, and the other half stitched to the pledge; that, upon comparing them together again, the borrower may receive his goods on paying the money stipulated.

Bill in Parliament, a paper containing propositions, offered to the houses to be passed by them, and then presented to the king to pass into a law.

To bring a bill into the house, if the relief sought by it is of a private nature, it is first necessary to prefer a petition; which must be presented by a member, and usually sets forth the grievances desired to be remedied. This petition (when founded on facts) may be in its nature disputed is referred to a committee of members, who examine the matter alleged, and accordingly report it to the house; and then (or, otherwise, upon the mere petition) leave is given to bring in the bill. In public matters, the bill is brought in upon motion made to the house, without any petition at all. Formerly all bills were drawn in the form of petitions, which were entered upon the parliament rolls, with the king's answer thereunto subjoined; not in any settled form of words, but as the circumstances of the case required, and at the end of each parliament the judges drew them into the form of a statute, which was entered on the statute-rolls. In the reign of Henry V. to prevent mistakes and abuses, the statutes were drawn up by the judges before the end of the parliament; and in the reign of Henry VI. bills in the form of acts according to the modern custom, were first introduced. The persons directed to bring in the bill, present it in a competent time to the house, drawn out on paper, with a multitude of blanks, or void spaces, where anything occurs that is dubious, or necessary to be settled by the parliament itself, such especially as the precise date of times, the nature and quantity of penalties, or of any sums of money to be raised; being indeed only the skeleton of the bill. In the house of lords, if the bill begins there, it is, (when of a private nature) referred to two of the judges, who examine and report the state of the facts alleged, to see that all necessary parties consent, and to settle all points of technical propriety. This is read a first time, and at a convenient distance second time; and after each reading, the speaker opens the house to the substance of the bill, and puts the question: Whether it shall proceed any farther? The introduction of the bill may be originally opposed, as the bill itself may at either of the readings; and, if the opposition succeeds, the bill must be dropped for that session; as it must also, if opposed with success in any of the subsequent stages.

After the second reading, it is committed; that is, referred to a committee: which is either selected by the house in matters of some importance, or else, upon a bill of consequence, the house resolves itself into a committee of the whole house. A committee of the whole house is composed of every member; and, to form it, the speaker quits the chair (another member being appointed chairman), and may sit and debate as a private member. In these committees the bill is debated clause by clause, amendments made, the blanks filled up, and sometimes the bill entirely new-modelled. After it has gone through the committee, the chairman reports it to the house with such amendments as the committee have made; and then the house considers the whole bill again, and the question is repeatedly put upon every clause and amendment. When the house hath agreed or disagreed to the amendments of the committee, and sometimes added new amendments of its own, the bill is then ordered to be engrossed, or written in a strong gross hand, on one or more long rolls (or presses) of parchment sewed together. When this is finished, it is read a third time, and amendments are sometimes then made to it; and if a new clause be added, it is done by tacking a separate piece of parchment on the bill, which is called a rider. The speaker then again opens the contents; and, in holding it up in his hands, puts the question, Whether the bill shall pass? If this is agreed to, the title to it is then settled; which used to be a general one for all the acts passed in the session, till in the fifth year of Hen. VIII. distinct titles were introduced for each chapter. After this, one of the members is directed to carry it to the lords and desire their concurrence; who, attended by several more, carries it to the bar of the house of peers, and there delivers it to their speaker, who comes down from his woolfsack to receive it.

It there passes through the same forms as in the other house (except engraving, which is already done); and, if
This statute or act is placed among the records of the kingdom; there needing no formal promulgation to give it the force of a law, as was necessary by the civil law with regard to the emperor’s edicts; because every man in Britain is, in judgment of law, party to the making of an edict of parliament, being present thereat by his representatives. However, a copy thereof is usually printed at the king’s press for the information of the whole land. And formerly, before the invention of printing, it was used to be published by the sheriff of every county; the king’s writ being sent to him at the end of every session, together with a transcript of all the acts made at that session, commanding him, ut statuta libri, et omnes articulos in eisdem conten-
tos, in singulis locis ubi expetit videlicet, publice proclami,
em et firmiter teneri et observari societati. And the usage was to proclaim them at his county court, and there to keep them, that whoever would, might read or take copies thereof; which custom continued till the reign of Henry VII.

An act of parliament thus made is the exercise of the highest authority that this kingdom acknowledges upon earth. It hath power to bind every subject in the land, and the dominions thereto belonging; may even bind the king himself, if it be given to him. And it cannot be altered, amended, dispensed with, suspended, or repealed, but in the same forms and by the same authority of parliament: for it is a maxim in law, that it requires the same strength to dissolve as to create an obligation. It is true, it was formerly held that the king might in many cases dispense with penal statutes; but now by statute 1 Will. M. stat. 2. c. 2. it is declared, that the suspending or dispensing with laws by regal authority, without consent of parliament, is illegal.

**Bill of Rights.** See the article Liberty.

**BILLERICAY,** a town of Essex in England, seated on a hill, in E. Long. c. 25. N. Lat. 51. 35.

**BILLET,** in Heraldry, a bearing in form of a long square. They are supposed to represent pieces of cloth of gold or silver; but Guillem thinks they represent a letter sealed up, and other authors take them for bricks. *Billet* signifies that the escutcheon is all over strewed with billets, the number not ascertained.

**Billett-Wood,** small wood for fuel, cut three feet and four inches long, and seven inches and a half in compass; the size of which is to be inquired of by justices.

**BILLETING,** in military affairs, is the quartering of soldiers in the houses of a town or village.—And, among fox-hunters, it signifies the ordure and dung of a fox.

**BILLIARDS,** an ingenious kind of game, played on a rectangular table, with little ivory balls, which are driven into hazards or holes, according to certain rules of the game.

This game was invented by the French, when it was played in a different manner from what it is at present, by having a pass or iron fixed on the table, through which the balls at particular periods of the game used to be played; but now this method is quite laid aside.

Soon after the French, the German, the Dutch, and Italians, brought this game into vogue throughout most parts of Europe, at which they became great proficient; and in a few years afterwards it became a fa-
B I I L

Billiards is a favorite diversion in many parts of England, particularly with persons of the first rank. Since that time, indeed, it has been given measure, prostituted by designing and vulgar sorts of people; notwithstanding, it will never be out of fashion, being of itself very entertaining, and attended with that kind of moderate exercise which renders it the more agreeable.

The table on which the game is played is generally about twelve feet long and six feet wide, or rather in the exact form of an oblong; it is covered with fine green cloth, and surrounded with cushions to prevent the balls running off, and to make them rebound.

There are six holes, nets, or pockets: these are fixed at the four corners, and in the middle, opposite to each other, to receive the balls, which when put into these holes or pockets are called hazards. The making of a hazard, that is, putting the adversary's ball in, at the usual game reckons for two in favour of the player.

The game is played with sticks called maces, or with cues; the first consists of a long straight stick, with a head at the end, and is the most powerful instrument of the two: the cue is a thick stick diminishing gradually to a point of about half an inch diameter; this instrument is played over the left hand, and supported by the fore-finger and thumb. It is the only instrument in vogue abroad, and is played with amazing address by the Italians and some of the Dutch; but in England the mace is the prevailing instrument, which the foreigners hold in contempt, as it requires not near so much address to play the game with, as when the cue is used; but the mace is preferred for its peculiar advantage, which some professed players have artfully introduced, under the name of trailing, that is, following the ball with the mace to such a convenient distance from the other ball as to make it an easy hazard. The degrees of trailing are various, and undergo different denominations amongst the connoisseurs at this game; namely, the scoop, the sweep, the long stroke, the trail, and the dead trail or turn up, all which secure an advantage to a good player according to their various gradations: even the butt end of the cue becomes very powerful, when it is made use of by a good tailor.

Rules generally observed at the common or usual game.

1. For the lead, the balls must be put at one end, and the player must strike them against the farthest cushion, in order to see which will be nearest the cushion that is next to them. 2. The nearest to the cushion is to lead and choose the ball if he pleases. 3. The leader is to place his ball at the nail, and not pass to the middle pocket; and if he holes himself in leading, he loses the lead. 4. He who follows the leader must stand within the corner of the table, and not place his ball beyond the nail. 5. He who plays upon the running ball loses one. 6. He who touches the ball twice and moves it, loses one. But these two rules are seldom or ever enforced, especially in England. 7. He who does not hit his adversary's ball, loses one. 8. He who touches both balls at the same time, makes a foul stroke, in which case if he should hole his adversary, nothing is gained by the stroke; but if he should put himself in, he loses two. 9. He who holes both balls, loses two. 10. He who strikes upon his adversary's ball, and holes himself, loses two. 11. He who plays at the ball without striking it, and holes himself, loses three. 12. He who strikes both balls over the table, loses two. 13. He who strikes his ball over the table, and does not hit his adversary's ball, loses three. 14. He who returns the end of his adversary's stick when playing, or endeavours to break his stroke, loses one. 15. He who plays another's ball or stroke without leave, loses one. 16. He who takes up his ball, or his adversary's without leave, loses one. 17. He who stops either ball when running, loses one; and being near the hole, loses two. 18. He who blows upon the ball when running loses one, and, if near the hole, loses two. 19. He who shakes the table when the ball is running, loses one. 20. He who strikes the table with the stick, or plays before his turn, loses one. 21. He who strikes his stick upon the table, and hits the ball, loses one. 22. If the ball stands upon the edge of the hole, and after being challenged it falls in, it is nothing, but must be put up where it was before. 23. If any person, not being one of the players, stops a ball, the ball must stand in the place where it was stopped. 24. He who plays without a foot upon the floor, and holes his adversary's ball, gets nothing for it, but loses the lead. 25. He who leaves the game before it is ended, loses it. 26. Any person may change his stick in play. 27. If any difference arise between players, he who marks the game or the majority of the company must decide it. 28. Those who do not pay must stand from the table, and make room for the players. 29. If any person lays any wager, and does not play, he shall not give advice to the players upon the game.

Different kinds of games played at billiards.—Besides the common winning game, which is twelve up, there are several other kinds of games, viz. the losing game, the winning and losing, choice of balls, brioche, carabole, Russian carabole, the bar-hole, the one-hole, the four-game, and hazards.

The losing game, is the common game nearly reversed; that is to say, except hitting the balls, which is absolutely necessary, the player gains by losing. By putting himself in, he wins two; by putting his adversary in, he loses two; but if he pockets both balls, he gets four. The game depends greatly upon particular strengths, and is therefore very necessary to be known to play the winning game well.

The winning and losing game, is a combination of both games; that is to say, all balls that are put in by striking first the adversary's ball, reckon towards game; and holing both balls reckons four. At this game and the losing, knocking over or forcing the balls over the cushion, goes for nothing, the striker only loses the lead.

Choice of the balls, is choosing each time which ball the player pleases, which is doubtless a great advantage, and is generally played against losing and winning.

Brioche, is being obliged to hit a cushion, and make the ball rebound or return to hit the adversary's ball, otherwise the player loses a point. This is a great disadvantage, and is reckoned between players to be equal to receiving about eight or nine points.

Carabole, is a game newly introduced from France. It is played with three balls, one being red, which is neutral, and is placed upon a spot on a line with the stringing.
no right to do; for, the lead should be given from the end of the table at which the hazard is made; but when a person happens to be a novice, this advantage is often taken.

The four-game consists of two partners on each side, at the common winning game; who play by succession after each hazard, or two points lost. The game is fifteen up; so that the point or hazard is an odd number, which makes a miss at this game of more consequence than it is at another; being as much at four, six, or eight, as it is at five, seven, or nine, at the single game.

Hazards are so called because they depend entirely upon the making of hazards, there being no account kept of any game. Any number of persons may play by having balls that are numbered; but the number seldom exceeds six, to avoid confusion. The person whose ball is put in, pays so much to the player according to what is agreed to be played for each hazard; and the person who misses, pays half the price of a hazard to him whose ball he played at. The only general rule is not to lay any ball a hazard for the next player, as he may in a great measure avoid it, by always playing upon the next player, and either bringing him close to the cushion, or putting him at a distance from the rest of the balls. The table, when hazards are played, is always paid for by the hour.

BILLINGHAM, a town of Northumberland in England, seated in W. Long. 1° 35'. N. Lat. 55° 20'.

BILLON, in the history of coins, a composition of precious and base metals, where the latter predominates. Wherefore gold under twelve carats fine, is called billon of gold; and silver under six pennyweight, billon of silver. So little attention was paid formerly to the purity of gold and silver, that the term billon of gold was applied only to that which was under twenty-one carats, and billon of silver to that which was lower than ten pennyweight.

BILLON, a town of France, in the department of Puy de Dome, containing 5200 inhabitants. E. Long. 3° 30'. N. Lat. 45° 36'.

BILSDON, a small town of Leicestershire in England, situated in W. Long. 0° 15'. N. Lat. 52° 40'.

BILSEN, a town of the Netherlands, in the principality of Liege, seated on the river Meuse, in E. Long. 5° 42'. N. Lat. 50° 48'.

BILSON, Thomas, bishop of Winchester, in which city he was born and educated. In 1565, he was admitted perpetual fellow of New College, and in 1570 completed his degrees in arts. He was made bachelor of divinity in 1579, and doctor the year following. His first prebendar was that of master of Winchester school; he was next made prebendar, and afterwards warden, of Winchester college. In 1596 he was consecrated bishop of Worcester; and about a year after, translated to the see of Winchester, and sworn of Queen Elizabeth's privy-council. He was one of the principal managers of the Hampton-court conference in 1604; and the English translation of the Bible in the reign of King James I. was finally corrected by this prelate, and Dr. Miles Smith bishop of Gloucester. He died in the year 1616, and was buried in Westminster abbey, near the entrance of St. Edmund's chapel, on the south side of the monument of King Richard II. The several authors who have mentioned
Bishop Bilson, in giving him the character of a learned divine, an able civilian, and an upright man.

His style is in general much more easy and harmonious than that of cotemporal ecclesiastics. His works are, 1. Several Latin poems and orations. Manuscript, in Ant. Wood's library. 2. The true difference between Christian subjection and unchristian rebellion. Oxon 1585, 4to. Lond. 1586, 8vo. 3. The perpetual government of Christ's church. Lond. 1593, 4to. Black Letter. 4. The effect of certain sermons touching the full redemption of mankind by the death and blood of Christ, &c. Lond. 1599, 4to. 5. The survey of Christ's suffering for man's redemption, and of his descent to Hades or Hell. Lond. 1604, fol. 6. A sermon preached before King James I. and his queen, at their coronation. Lond. 1603, 8vo.

BIMEDIAL, in Mathematics. If two medial lines, as AB and BC, commensurable only in power, containing a rational rectangle, are compounded, the whole line AC will be irrational, and is called a first bimedial line.

See Euclid, lib. x. prop. 38.

BIMINI, one of the Bahama islands, near the northwest extremity of the Bahama bank. It is about eight miles in length, and as much in breadth, covered with trees, and inhabited by the native Americans. It is very difficult of access on account of the shoals, but is a very pleasant place. W. Long. 79. 30. N. Lat. 25. 0.

BIMLIPATAN, a village in Hindostan, in the northern circars, seated on the west side of the bay of Bengal. The Dutch had formerly a small factory here, designed for buying up the cloth manufactured by the inhabitants. E. Long. 83. 5. N. Lat. 18. 0.

BINACLE, a wooden case or box, which contains the compasses, log-glasses, watch-glasses, and lights to show the compass at night. As this is called bitacle in all the old sea-books, even by mariners, it appears evidently to be derived from the French term habitacle (a small habitation), which is now used for the same purpose by the seamen of that nation. The binacle (Plate LXXXVIII. fig. 4.) is furnished with three compartments, with sliding shutters: the two side ones, a b, have always a compass in each d, to direct the ship's way; while the middle division c, has a lamp or candle with a pane of glass on either side to throw a light upon the compass in the night, whereby the man who steers may observe it in the darkest weather, as it stands immediately before the helm on the quarter-deck. There are always two binacles on the deck of a ship of war, one being designed for the man who steers, and the other for the person who superintends the stearing, whose office is called conning.

BINAROS, a small town of Spain, in the kingdom of Valencia, remarkable for good wine. It is seated near the sea, in E. Long. 0. 15. N. Lat. 40. 24.

BINARY ARITHMETIC, that wherein unity or 1 and 0 are only used. This was the invention of M. Leibnitz, who shows it to be very expedient in discovering the properties of numbers, and in constructing tables; and Mr Dangecourt, in the history of the royal academy of sciences, gives a specimen of it concerning arithmetical progressionals; where he shows, that because in binary arithmetic only two characters are used, therefore the laws of progression may be more easily discovered by it than by common arithmetic. All the characters used in binary arithmetic are 0 and 1; and the cypher multiplies every thing by 2, as in the common arithmetic by 10. Thus 1 is one; 10, two; 11, three; 100, four; 101, five; 110, six; 111, seven; 1000, eight; 1001, nine; 1010, ten; which is built on the same principles with common arithmetic. Hence immediately appears the reason of the celebrated property of the duplicate geometrical proportion in whole numbers; viz. that one number of each degree being had, we may thence compose all the other whole numbers above the double of the highest degree. It being here, v. gr. as if one should, 111 is the sum of 4, 2, and 1, which property may serve essayers to weigh all kinds of masses with a little weight; and may be used in coins, to give several values with small pieces. This method of expressing numbers once established, all the operations will be easy; and in multiplication particularly, there will be no need for a table, or getting anything by heart. The author, however, does not recommend this method for common use, because of the great number of figures required to express a number; adding, that if the common progression were from 12 to 12, or from 16 to 16, it would be still more expeditious; but its use is in discovering the properties of numbers, in constructing tables, &c. What makes the binary arithmetic the more remarkable is, that it appears to have been the same with that used 4000 years ago among the Chinese, and left in 

BINARY MEASURE, in Music, is a measure which is beaten equally, or where the time of rising is equal to that of falling. This is usually called common time.

BINARY NUMBER, that composed of two units.

BINCH, a small fortified town of the Low Countries, in the county of Hainault, subject to the house of Austria. E. Long. 3. 21. N. Lat. 50. 23.

BIND, a country word for a stalk of hops.

BIND of Eels, a quantity, consisting of 250, or 10 striking, each containing 25 eels.

BIND-WEEED, in Botany. See CONVOLVULUS, BOTANY INDEX.

BINDROKE, a town of Lincolnshire in England, seated in E. Long. 0. 10. N. Lat. 53. 32.

BINDING-JOINTS, in Architecture, are those joints in a floor, into which the trimmers of staircases, or walls of the stairs, and chimney-ways, are framed: they ought to be stronger than common joints.

BINDING, in the art of defence, a method of securing or crossing the adversary's sword with a pressure, accompanied with a spring from the wrist. See BEATING.

Unless a man by some kind of cross, secure, as it were, or render his adversary's sword incapable to offend him during the time of his performing a lesson upon him, it is impossible for him to be certain but that he may receive from his adversary, either a fortuitous contretémps, or an exchanged thrust, before the recovery of his body, or going off after a thrust.—The great objection made by some people, particularly those time-catchers, against the frequent use of bind.
BIOGRAPHY, a species of history which records the lives and characters of remarkable persons. This is at once the most entertaining and instructive kind of history. It admits of all the painting and passion of romance; but with this capital difference, that our passions are more keenly interested, because the characters and incidents are not all agreeable to nature, but strictly true. No books are so proper to be put into the hands of young people. See HISTORY.

BION, a bucolic poet, native of Smyrna, lived at the same time with Ptolemy Philadelphia, whose reign reached from the fourth year of the 123d Olympiad to the second year of the 133d. He was an incomparable poet, if we may believe the lamentations of his disciple Moschus. His few pieces which are left do not contradict this testimony. See MOSCHUS.

BION, surnamed Borysthenes, because he was of Borysthenes, was a philosopher of a great deal of wit, but of very little religion: he flourished about the 120th Olympiad; but, falling sick, he, like other profane persons, became superstitious.

BIORNBURG, a town of North Finland in Sweden, seated on the river Knone near its mouth in the gulf of Bothnia. E. Long. 22° 35'. N. Lat. 62° 6'.

BIOTHANATI, (from βίος, life, and θάνατος, death), in some medical writers, denotes those who die a violent death. The word is also written, and with more propriety, biathanatia; sometimes biathanthi.

In a more particular sense, it denotes those who kill themselves, more properly called autathanatia. In this sense it is that the word is used both by Greek and Latin writers. By the ancient discipline of the church, they were punished by denying them burial, and refusing all commemoration of them in the prayers and offices of the church.

BIOTHANATI (supposed by some to be derived from βίος, life, and θάνατος, death, and alluding to the belief of a future life after death) was also a name of reproach given by the Heathens to the primitive Christians, for their constancy and forswearing to lay down their lives in martyrdom.

BIOTHANATOS is also used, in some writers of the barbarous age, for wicked, damnable, or accursed.

BIOUAC, BIVOUAC, or BIVAC, in the military art, a nightly guard performed by the whole army when there is an apprehension of danger from the enemy. The word is formed by corruption from the German, wegwacht, a double watch or guard.

BIPENNIS, a two-edged axe, used anciently by the Amazons in fight; as also by the seamen, to cut under the ropes and cordage of the enemy's vessels. The bipennis was a weapon chiefly of the oriental nations, made like a double axe, or two axes joined back to back, with a short handle. Modern writers usually compare it to our halbard or partisan; from which it differed in that it had no point, or that its shaft or handle was much shorter.

BIQUADRAT, or Biquadratic, is the next power above the cube, or the square multiplied by itself.

BIQUADRATIC EQUATION, in Algebra, an equation raised to the fourth power, or where the unknown quantity of one of the terms has four dimensions: Thus \[x^4 + ax^3 + bx^2 + cx + d = 0\] is a biquadratic equation. See ALGEBRA.
BIRCH-BARK, being bituminous, and consequently warm and emollient, is used in fumigations to correct a distempered air. The inner silken bark was anciently used for writing-tables before the invention of paper; though Bay rather assigns the office of paper to the cuticle, or outer skin, which peels off yearly. And with the outward, thicker, and coarser part, are houses in Russia, Poland, and other northern tracts, covered instead of slates and tyle. The Indians make pinnacles with white cedar, which they cover with large flakes of birch-bark; sewing them with thread of spruce roots, and pitching them, as the ancient Britons did, with the willow. Flints speaks of a bitumen actually procured from the birch tree.

**Fungus of Birch**, an excrescence growing on its trunk. It is astringent, and good against hemorrhages. When boiled, beaten, and dried in an oven, it makes excellent spunk or touchwood.

**Birch-Leaves** are of use in the dropsy, itch, &c. either internally or externally applied.

**Birch-Twigs** serve to make rods and brooms; smeared with bird-lime, they are used by fowlers; to say nothing of the ancient fasces carried by licitors.

**Birch-Wine** is made by fermenting the vernal juice. Formerly it was in great repute against all naphritic disorders, but is left out in the modern London practice. The preparation of birch-wine is well and amply described in a book entitled *Vineum Britannicum*.

**BIRCH, Dr. Thomas**, an eminent historical and biographical writer, was born in London in 1705. His parents were both of them Quakers; and his father, Dr. Joseph Birch, was a coffee-mill maker by trade. Thomas being put to school, was indefatigable in his application, and stole many hours from sleep to increase his stock of knowledge. By this unremitting diligence, though he had not the happiness of an university education, he soon became qualified to take holy orders in the church of England, to the surprise of his acquaintance. In 1728 he married the daughter of the Rev. Mr. Cox, to whom he was curate: but his felicity was of short duration, Mrs. Birch dying of a puerperal fever in less than 12 months after their marriage; an event which deplores in a very elegant and pathetic poem, preserved in Nicholson’s Collection. In 1732 he was recommended to the friendship and favour of the late lord high chancellor Hardwicke, then attorney general; to which noble peer, and to the present earl of Hardwicke, he was indebted for all his preferments. The first proof he experienced of his patron’s regard was the living of Ulting in the county of Essex, in the gift of the crown, to which he was presented 1732. In 1734 he was appointed one of the domestic chaplains to the unfortunate earl of Kilmarnock, who was beheaded in 1746. Mr. Birch was chosen a member of the Royal Society, Feb. 20. 1734-5; and of the Society of Antiquaries, Dec. 11. 1735, of which he afterwards became director till his death. Before this, the Marischal college of Aberdeen had conferred on him, by diploma, the degree of master of arts. In 1743, by the interest of Lord Hardwicke, he was presented by the crown to the sinecure rectory of Landewy Welfy in the county of Pembroke; and in 1743-4 was preferred, in the same manner, to the rectory of Sidington in St. Peter’s, in the county and diocese of Gloucester. We find no traces of his having taken possession of this living; and indeed it is probable that he quitted it immediately for one more suitable to his inclinations and to his literary engagements, which required his almost constant residence in town; for on the 24th of February 1743-4, he was instituted to the united rectories of St. Michael Woodstreet, and St. Mary Staining; and in 1745-6, to the united rectories of St. Margaret Pattens and St. Gabriel, Fenchurche-street (by lord chancellor Hardwicke, in whose turn the presentation then was). In January 1752, he was elected one of the secretaries of the Royal Society, in the room of Dr. Cromwell Mortimer, deceased. In January 1753, the Marischal college of Aberdeen created him doctor of divinity; and in that year the same degree was conferred on him by Archbishop Herries. He was one of the trustees of the British Museum; for which honour he was probably indebted to the present earl of Hardwicke, as he was for his last preferment, the rectory of Depden in Essex, to which he was inducted Feb. 26. 1761. In the latter part of his life he was chaplain to the Princess Amelia. In 1765 he resigned his office of secretary to the Royal Society, and was succeeded by Dr. Morton. His health declining about this time, he was ordered to ride for the recovery of it; but being a bad horseman, and going out Jan. 9. 1766, he was unfortunately thrown from his horse, on the road between London and Hampstead, and died on the spot, in the 61st year of his age, to the great regret of the doctor’s numerous
numerous literary friends; and was buried in St Margaret Pattens. Dr Birch had in his lifetime been very generous to his relations; and none that were nearly allied to him being living at his decease, he bequeathed his library of books and manuscripts, with his picture painted in 1735, and all his other pictures and prints not otherwise disposed of by his will, to the British Museum. He likewise left the remainder of his fortune, which amounted to not more than 500l. to be laid out in government-securities, for the purpose of applying the interest to increase the stipend of the three assistant librarians; thus manifesting at his death, as he had done during his whole life, his respect for literature, and his desire to promote useful knowledge. To the Royal Society he bequeathed his picture painted by Wills in 1737, being the original of the mezzotinto print done by Pauber in 1741. His principal publications were: 1. The General Dictionary, Historical and Critical; including a new translation of Mr Bayle, and interspersed with several thousand new lives. Dr Birch's associates in this undertaking were, the Reverend John Peter Bernard, Mr John Lockman, and Mr George Sale. The whole design was completed in 10 volumes folio. 2. Dr Cadwright's Intellectual System (improved from the Latin edition of Mosheim), his Discourse on the true notion of the Lord's Supper, and two Sermons, with an account of his Life and Writings, 2 vols. 4to, 1743. 3. The Life of the Honourable Robert Boyle, 1744; prefixed to an edition of that excellent philosopher's works, revised by Dr Birch. 4. The Lives of illustrious Persons of Great Britain, annexed to the engravings of Houboken and Vertue. 1747—1752. 5. An inquiry into the Share which King Charles I. had in the Transactions of the Earl of Glamorgan, 1747; 8vo. 6. An edition of Spenser's Fairy Queens, 1751, 4to, quarto, with prints from designs by Kent. 7. The Miscellaneous Works of Sir Walter Raleigh; to which was prefixed the life of that great, unfortunate, and injured man, 1751, 2 vols. 8vo. 8. The Theological, Moral, Dramatic, and Poetical Works of Mrs Catharine Cockburn; with an account of the life of that very ingenious lady, 1751, 2 vols. 8vo. 9. The Life of the Most Reverend Dr John Tillotson, Lord Archbishop of Canterbury. Compiled chiefly from his original Papers and Letters, 1752, 8vo. 10. Milton's Prose Works, 1753, 2 vols. 4to; with a New Life of that great poet and writer. 11. Memoirs of the Reign of Queen Elizabeth, from the year 1581 till her death. In which the secret intrigues of her court, and the conduct of her favourite Robert earl of Essex, both at home and abroad, are particularly illustrated. From the original papers of his intimate friend Anthony Bacon, Esq.; and other manuscripts never before published, 1754, 2 vols. 4to. 12. The History of the Royal Society of London for improving natural knowledge, from its first rise. In which the particular, as to the commedible of those papers communicated to the Society, which have hitherto been published, are inserted in their proper order as a supplement to the Philosophical Transactions, 1756 and 1757; 4 vols. 4to. 13. The Life of Henry Prince of Wales, eldest son of King James I. Compiled chiefly from his own papers and other manuscripts, never before published, 1760, 8vo. His numerous communications to the Royal Society may be seen in the Philosophical Transactions; and his poetical talents are evident from the verses already referred to.

BIRD, William, an eminent musician and composer, was one of the children of the chapel in the reign of Edward VI. and, as it is asserted by Wood in the Ashmoelian MS. was bred up under Tallis. It appears, that in 1575 Tallis and Bird were both gentlemen and also organists of the royal chapel; but the time of their appointment to this latter office cannot now be ascertained.

The compositions of Bird are many and various; those of his younger years were mostly for the service of the church. He composed a work entitled Sacrorum Cantionum, quinque vocum, printed in 1589, among which is that noble composition, Civitas sancti tui, which for many years past has been sung in the church, as an anthem, to the words "Bow thine ear, O Lord." He was also the author of a work entitled Gradualia, ac Cantiones sacrae, quinex, quaternis, trimis vocibus concinnatae, lib. primas. Of this there are two editions, the latter published in 1610. Although it appears by these his works that Bird was in the strictest sense a church musician, he occasionally gave to the world compositions of a secular kind; and he seems to be the first among English musicians that ever made an essay in the composition of that elegant species of vocal harmony, the madrigal: the La Verginella of Arioistio, which he set in that form for five voices, being the most ancient musical composition of the kind to be met with in the works of English authors. Of his compositions for private entertainment, there are extant, "Songs of sundry natures, some of gravitie, and others of myrth, fit for all companies and voyces, printed in 1589;" and two other collections of the same kind, the last of them printed in 1611. But the most permanent memorials of Bird's excellencies are his motets and anthems; to which may be added, a fine service in the key of D with the minor third, the first composition in Dr Boyce's Cathedral Music, vol. iii. and that well-known canon of his, Non nobis Domine.

Besides his salaries and other emoluments of his profession, it is to be supposed that Bird derived some advantages from the patent granted by Queen Elizabeth to Tallis and him, for the sole printing of music and music paper: Dr Ward speaks of a book which he had seen with the letters T. E. for Thomas East, Est, or Este, who printed music under that patent. Tallis dying in 1585, the patent, by the terms of it, survived to Bird, who, no doubt for a valuable consideration, permitted East to exercise the right of printing under the protection of it; and he in the title-page of most of his publications styles himself the assignee of William Byrd.

Bird died in 1623.

Mocking-Bird.

Bird of Paradise.

Bird-Call, a little stick, cleft at one end, in which
is put a leaf of some plant, wherewith to counterfeit the cry or call of several birds, and bring them to the net, or snare, or lime-twig, to be taken. A laurel-leaf fitted on the bird-call, counterfeits the voice of lapwings; a leek that of nightingales, &c.

Bird-Catching, the art of taking birds or wild-fowl, whether for food, for the pleasure of their song, or for their destruction as pernicious to the husbandman, &c. The methods are by bird-line, nets, decoys, &c. See Bird-Line, infra; and Decoy.

In the suburbs of London (and particularly about Shoreditch) are several weavers and other tradesmen, who, during the months of October and March, get their livelihood by an ingenious, and, we may say, a scientific method of bird-catching, which is totally unknown in other parts of Great Britain. The reason of this trade being confined to so small a compass, arises from there being no considerable sale for singing-birds except in the metropolis: as the apparatus for this purpose is also heavy, and at the same time must be carried on a man's back, it prevents the bird-catchers going to above three or four miles distance.

This method of bird-catching must have been long practised, as it is brought to a most systematical perfection, and is attended with a very considerable expense.

The nets are a most ingenious piece of mechanism; they are generally twelve yards and a half long, and two yards and a half wide; and no one, on bare inspection, would imagine that a bird (which is so very quick in all its motions) could be caught by the nets flapping over each other, till he becomes eye-witness of the pullers seldom failing.

The wild birds fly (as the bird-catchers term it) chiefly during the month of October, and part of September and November; as the flight in March is much less considerable than that of Michelmas. It is to be noted also, that the several species of birds of flight do not make their appearance precisely at the same time, during the months of September, October, and November. The pipet (A), for example, begins to fly about Michaelmas; and then the woodlark, linnet, goldfinch, chaffinch, greenfinch, and other birds of flight succeed; all of which are not easily to be caught, or in any numbers, at any other time, and more particularly the pipet and the woodlark.

These birds, during the Michaelmas and March flights, are chiefly on the wing from daybreak to noon, though there is afterwards a small flight from two till night; but this however is so inconsiderable, that the bird-catchers always take up their nets at noon.

It may well deserve the attention of the naturalist whence these periodical flights of certain birds can arise. As the ground, however, is ploughed during the months of October and March for sowing the winter and lent corn, it should seem that they are thus supplied with a great profusion both of seeds and insect, which they cannot so easily procure at any other season.

It may not be improper to mention another circumstance, to be observed during their flight, viz. that they fly always against the wind: hence there is great contention amongst the bird-catchers who shall gain that point; if (for example) it is westerly, the bird-catcher who lays his nets most to the east, is sure almost of catching every thing, provided his call-birds are good: a gentle wind to the south-west generally produces the best sport.

The bird-catcher, who is a substantial man, and hath a proper apparatus for this purpose, generally carries with him five or six linnets, (of which more are caught than any singing bird), two goldfinches, two greenfinches, one woodlark, one redpoll, a yellowhammer, titlark, and aberdavine, and perhaps a goldfinch; these are placed at small distances from the nets in little cages. He hath, besides, what are called flag-birds, which are placed within the nets, are raised upon the flur (B), and gently let down at the time the wild bird approaches them. These generally consist of the linnet, the goldfinch, and the greenfinch, which are secured to the flur by what is called a brac (C); a contrivance that secures the birds without doing any injury to their plumage.

It having been found that there is a superiority between bird and bird, from the one being more in song than the other; the bird-catchers contrive that their call-birds should moult before the usual time. They therefore, in June or July, put them into a close box under two or three folds of blankets, and leave their dung in the cage to raise a greater heat; in which state they continue, being perhaps examined but once a week to have fresh water. As for food, the air is so putrid, that they eat little during the whole state of confinement, which lasts about a month. The birds frequently die under the operation; and hence the value of a stopped bird rises greatly. When the bird hath thus prematurely moulted, he is in song whilst the wild birds are out of song, and his note is louder and more piercing than that of a wild one; but it is not only in his note he receives an alteration; the plumage is equally improved. The black and yellow in the wings of the goldfinch, for example, become deeper and more vivid, together with a most beautiful gloss, which is not to be seen in the wild bird. The bill, which in the latter is likewise black at the end, in the stopped bird becomes white and more taper, as do its legs: in short, there is as much difference between a wild and a stopped bird, as there is between a horse which is kept in body-clothes and one at grass.

When the bird-catcher hath laid his nets, he disposes of his call-birds at proper intervals. It must be owned

(x) A small species of lark, but which is inferior to other birds of that genus in point of song.

(y) A moveable perch to which the bird is tied, and which the bird-catcher can raise at pleasure by means of a long string fastened to it.

(z) A sort of bandage, formed of a slender silken string that is fastened round the bird's body, and under the wings, in so artful a manner as to hinder the bird from being hurt, let it flutter ever so much in the raising.
Bird-catching.

Their sight and hearing infinitely exceed that of the bird-catcher. The instant that the (D) wild birds are perceived, notice is given by one to the rest of the call-birds, as it is by the first bound that hits on the scent to the rest of the pack; after which, follows the same sort of tumultuous ecstasy and joy. The call-birds, while the bird is at a distance, do not sing as a bird does in a chamber; they invite the wild ones by what the bird-catchers call short jerks, which, when the birds are good, may be heard at a great distance. The ascendency by this call or invitation is so great, that the wild bird is stopped in its course of flight; and, if not already acquainted with the nets (E), lights boldly within 20 yards of perhaps three or four bird-catchers, on a spot which otherwise it would not have taken the least notice of. Nay, it frequently happens, that if half a flock only are caught, the remaining half will immediately afterwards light in the nets, and share the same fate; and should only one bird escape, that bird will suffer itself to be pulled at till it is caught; such a fascinating power have the call-birds.

While we are on this subject of the jerking of birds, we cannot omit mentioning, that the bird-catchers frequently lay considerable wagers whose call-bird can jerk the longest, as that determines the superiority. They place them opposite to each other, by an inch of candle; and the bird who jerks the oftener, before the candle is burnt out, wins the wager. We have been informed, that there have been instances of a bird's giving 170 jerks in a quarter of an hour; and we have known a linnet, in such a trial, persevere in its emulation till it swooned from the perch: thus, as Pliny says of the nightingale, victa morte finit saepe vitam, spiritus prius deficiente quam castus. It may be here observed, that birds when near each other, and in sight, seldom jerk or sing. They either fight, or use short and wheeling calls; the jerking of these call-birds, therefore, face to face, is a most extraordinary instance of contention for superiority in song.

To these we may add a few particulars that fall within our notice during our inquiries among the bird-catchers; such as, that they immediately kill the hens of every species of birds they take, being incapable of singing, as also being inferior in plumage; the pippets likewise are indiscriminately destroyed, as the cock does not sing well; they sell the dead birds for threepence or fourpence a dozen. These small birds are so good, that we are surprised the luxury of the age neglects so delicate an acquisition to the table. The modern Italians are fond of small birds, which they eat under the common name of beccaficos: and the dear rate a Roman tragedian paid for a dish of singing birds is well known; (see the article Aesop).

Another particular we learned, in conversation with a London bird-catcher, was the vast price that is sometimes given for a single song-bird, which had not learned to whistle tunes. The greatest sum we heard of, was five guineas for a chaffinch, that had a particular and uncommon note, under which it was intended to train others; and we also heard of five pounds ten shillings being given for a call-bird linnet.

A third singular circumstance, which confirms an observation of Linnaeus, is, that the male chaffinches fly by themselves, and in the flight precede the females; but this is not peculiar to the chaffinches. When the titlarks are caught in the beginning of the season, it frequently happens, that forty are taken and not one female among them; and probably the same would be observed with regard to other birds, (as has been done with relation to the wheat-ear), if they were attended to. An experienced and intelligent bird-catcher informed us, that such birds as breed twice a-year, generally have in their first brood a majority of males, and in their second, of females, which may in part account for the above observation.

We must not omit mention of the bullfinch, though it does not properly come under the title of a singing bird, or a bird of flight, as it does not often move farther than from hedge to hedge; yet, as the bird sells well on account of its learning to whistle tunes, and sometimes flies over the fields where the nets are laid, the bird-catchers have often a call-bird to ensure it, though most of them can imitate the call with their mouths. It is remarkable with regard to this bird, that the female answers the purpose of a call-bird as well as the male, which is not experienced in any other bird taken by the London bird-catchers.

The nightingale is not a bird of flight, in the sense the bird-catchers use this term. Like the robin, wren, and many other singing birds, it only moves from hedge to hedge, and does not take the periodical flights in October and March. The persons, who catch these birds, make use of small trap-nets, without call-birds; and are considered as inferior in dignity to other bird-catchers, who will not rank with them. The arrival of the nightingale is expected by the trappers in the neighbourhood of London, the first week in April: at the beginning, none but cocks are taken; but in a few days the hens make their appearance, generally by themselves, though sometimes a few males come along with them. The latter are distinguished from the females not only by their superior size, but by a great swelling of their vent, which commences on the first arrival of the hens. They are caught in a net-trap, the bottom of which is surrounded with an iron-ring; the net itself is rather larger than a cabbage net. When the trappers hear or see them, they strew some fresh mould under the place, and bait the trap with a mealworm from the baker's shop. Ten or a dozen nightingales have been thus caught in a day.

The common way of taking larks, of which so many are used at our tables, is in the night, with those

---

(D) It may be also observed, that the moment they see a hawk, they communicate the alarm to each other by a plaintive note; nor will they then jerk or call though the wild birds are near.

(E) A bird acquainted with the nets, is by the bird-catchers termed a sharper; which they endeavour to drive away, as they can have no sport whilst it continues near them.
Bird-Catching

Those nets which are called trammels. These are usually made of 50 yards in length, and about six yards over, with six ribs of pack-thread, which at the ends are put upon two poles of about 15 feet long, and made lesser at each end. These are to be drawn over the ground by two men, and every five or six steps the net is made to touch the ground, otherwise it will pass over the birds without touching them, and they will escape. When they are felt to fly up against the net, it is clapped down, and then all are safe that are under it. The darkest nights are properest for this sport; and the net will not only take larks, but all other birds that roost on the ground; among which are woodcocks, snipes, partridges, quails, fieldfares, and several others. In the depth of winter people sometimes take great numbers of larks by nooses of horse-hair. The method is this: Take 100 or 200 yards of pack-thread; fasten at every six inches a noose made of double horse-hair; at every 20 yards the line is to be pegged down to the ground, and so left ready to take them. The time to use this is when the ground is covered with snow, and the larks are to be allured to it by some white oats scattered all the way among the nooses. They must be taken away as soon as three or four are hung; otherwise the rest will be frightened; but though the others are scared away just where the sportsman comes, they will be feeding at the other end of the line, and the sport may be thus continued for a long time. Those caught in the day are taken in clap-nets of fifteen yards length, and two and a half in breadth; and are enticed within the reach by means of bits of looking-glass, fixed in a piece of wood, and placed in the middle of the nets, which are put in a quick whirling motion by a string the larker commands; he also makes use of a decoy lark. These nets are used only till the 14th November: for the larks will not dare, or frolic in the air, except in fine sunny weather; and of course cannot be inveigled into the snare. When the weather grows gloomy, the larker changes his engine, and makes use of a trammel net, twenty-seven or twenty-eight feet long, and five broad; which is put on two poles, eighteen feet long, and carried by men under each arm, who pass over the fields and quarter the ground as a setting dog: when they hear or feel a lark hit the net, they drop it down, and so the birds are taken.

Multitudes of the inhabitants of each cluster of the Orkney isles feed during the season on the eggs of the birds of the cliffs. The method of taking them is so very hazardous, as to satisfy one of the extremity to which the poor people are driven for want of food. Copinsha, Hunda, Hoy, Foula, and Noss-head, are the most celebrated rocks; and the neighbouring natives the most expert climbers and adventurers after the game of the precipice. The height of some is above fifty fathoms; their faces roughened with shelves or ledges sufficient only for the birds to rest and lay their eggs. To these the dastardly fowlers will ascend, pass intrepidly from the one to the other, collect the eggs and birds, and descend with the same indifference. In most places the attempt is made from above: they are lowered from the slope contiguous to the brink, by a rope, sometimes made of straw, sometimes of the bristles of the hog: they prefer the last even to ropes of hemp, as it is not so liable to be cut by the sharpness of the rocks; the former is apt to twist. They trust themselves to a single assistant, who lets his companion down, and holds the rope, depending on his strength alone; which often fails, and the adventurer is sure to be dashed to pieces, or drowned in the adjacent sea. The rope is often shifted from place to place, with the impending weight of the fowler and his booty. The person above receives signals for the purpose, his associate being lost out of sight, who, during the operation, by help of a staff, springs from the face of the rock, to avoid injury from the projecting parts.

But the most singular species of bird-catchers is on the holm of Noss, a vast rock severed from the isle of Noss by some unknown convulsion, and only about sixteen fathoms distant. It is of the same stupendous height as the opposite precipice, with a raging sea between; so that the intervening chasm is of matchless horror. Some adventurous climber has reached the rock in a boat, gained the height, and fastened several stakes on the small portion of earth which is to be found on the top; correspondent stakes are placed on the edge of the corresponding cliffs. A rope is fixed to the stakes on both sides, along which a machine, called a cradle, is contrived to slide; and, by the help of a small parallel cord fastened in like manner, the adventurer wafts himself over, and returns with his booty.

The manner of bird-catching (see Plate XC. fig. 7.) in the Faroe islands is so very strange and hazardous, that the description should by no means be omitted. Necessity compels mankind to wonderful attempts. The cliffs which contain the object of their search are often two hundred fathoms in height, and are attempted from above and below. In the first case, the fowlers provide themselves with a rope 80 or 100 fathoms in length. The fowler fastens one end about his waist and between his legs, recommends himself to the protection of the Almighty, and is lowered down by six others, who place a piece of timber on the margin of the rock, to preserve the rope from wearing against the sharp edge. They have Besides a small line fastened to the body of the adventurer, by which he gives signals that they may lower or raise him, or shift him from place to place. The last operation is attended with great danger, by the loosening of the stones, which often fall on his head, and would infallibly destroy him, was it not protected by a strong thick cap; but even that is found unequal to save him against the weight of the larger fragments of rock. The dexterity of the fowlers is amazing; they will place their feet against the front of the precipice, and dart themselves some fathoms from it, with a cool eye survey the places where the birds nestle, and again shoot into their haunts. In some places the birds lodge in deep recesses. The fowler will alight there, disengage himself from the rope, fix it to a stone, and at his leisure collect the booty, fasten it to his girdle, and resume his pendulous seat. At times he will again spring from the rock, and in that attitude, with a fowling-net placed at the end of a staff, catch the old birds which are flying to and from their retreats. When he hath finished his dreadful employ, he gives a signal to his friends above, who pull him up, and share the hard-earned profit. The feathers are preserved for exportation.
The fowling from below has its share of danger. The party goes on the expedition in a boat; and when it has attained the base of the precipice, one of the most daring having fastened a rope about his waist, and furnished himself with a long pole with an iron hook at one end, either climbs, or is thrust up by his companions, who place a pole under his breech, to the next footing spot he can reach. He, by means of the rope, brings up one of the boat's crew; the rest are drawn up in the same manner, and each is furnished with his rope and fowling staff. They then continue their progress upwards in the same manner, till they arrive at the region of birds; and wander about the face of the cliff in search of them. They then act in pairs; one fastens himself to the end of his associate's rope, and in places where birds have nestled beneath his footing, he permits himself to be lowered down, depending for his security on the strength of his companion, who has to haul him up again: but it sometimes happens that the person above is overpowered by the weight, and both inevitably perish. They fling the fowl into the boat, which attends their motions, and receives the booty. They often pass seven or eight days in this tremendous employ, and lodge in the crannies which they find in the face of the precipice.

In some remote parts of Russia there is practised a singular invention for taking great quantities of gelifnottes or grouz. They choose the most open places in the birch woods; and there they plant long forks in the earth opposite the larger trees. On these forks is laid a horizontal stick, gallows-wise, to which are tied small bundles of ears of corn. At a small distance from this part of the contrivance is a kind of large funnel or inverted cone, made with long birch twigs, thin and flexible, the lower extremities of which are stuck in the earth, very near to one another; but by spreading towards the top, form there an opening of about a yard in diameter. In this opening is placed a wheel made of two circles that intersect each other, and are surrounded with straw and ears of corn. This wheel turns on an axis fastened to the side of the funnel, in such a manner, that there is room enough between the sticks of the cone and the circles to admit of the wheel's turning freely about. The birds first perch upon the transverse stick near the tree; and when they have a mind to fall upon the corn tied to the wheel, they must necessarily stand upon one of the projecting parts of the circles of which it is composed. At that instant the wheel turns, and the gelifnotte falls, head foremost, to the bottom of the trap, which is there so contracted that he cannot get out. They sometimes find the machine half full of gelifnottes.

The following simple but ingenious method of catching aquatic birds is used in Mexico by the natives. The lakes of the Mexican vale, as well as others of the kingdom, are frequented by a prodigious number of ducks, geese, and other water-birds. The Mexicans leave some empty gourds to float upon the water, where those birds resort, that they may be accustomed to see and approach them without fear. The bird-catcher goes into the water so deep as to hide his body, and covers his head with a gourd; the ducks come to peck at it; and then he pulls them by the feet under water; and in this manner secures as many as he pleases.
Bird-Lime. skimmed as often as any thing arises, and laid up for
use. To use it, a third part of nut-oil, or thin grease,
must be incorporated with it over the fire.
The juice of the yew-bark is a very peculiar substance.
But if trials were made, it seems probable, that many
other juices would be found to have the same clammy
nature. The mislodge affords a juice even superior to
that of the holly; and if a young shoot of the common
alder be cut through, there will a stringy juice draw
out in threads, and follow the knife like bird-lime or
the juice of the holly. It seems in this tree to be lodg-
ed, not in the bark, but in certain veins just within
the circle of the wood. The roots of all the hyacinths
also afford a tough and stringy juice of the same kind; and
so does the asphodel, the narcissus, and the black bryony
root, in a surprising quantity.

When twigs, &c. smeared with bird-lime, are to be
put in places subject to wet, the common bird-lime is
apt to have its force soon taken away. It is necessary,
therefore, to have recourse to a particular sort, which,
from its property of bearing water unbear, is called
water bird-lime; and is prepared thus: Take a pound
of strong and good bird-lime: wash it thoroughly in
spring-water, till the hardness is all removed; and
then beat it well, that the water may be clean separa-
ted, so as not a drop remains; then dry it well, and
put it into an earthen pot; add to it as much capon's
grease as will make it run. Then add two spoonfuls
of strong vinegar, one spoonful of oil, and a small quan-
tity of Venice turpentine. Let the whole boil for
some minutes over a moderate fire, stirring it all the
time. Then take it off: and when there is occasion to
use it, warm it, and cover the sticks well with it. This
is the best sort of bird-lime for snipes and other birds
that love wet places.

The most successful method of using the common
bird-lime is this: Cut down the main branch or bough
of any bushy tree whose twigs are thick, straight, long,
and smooth, and have neither knots nor prickles. The
willow and the birch-tree afford the best of this kind.
Let all the superfluous shoots be trimmed off, and
the twigs all made neat and clean; they must all be well
covered with the bird-lime, within four inches of the
bottom; but the main bough from which they grow
must not be touched with the lime. No part of the
bark, where the lime should come, must be left bare:
but it is a nice matter to lay it on properly; for if it
be too thick it will give the birds a distaste, and they
will not come near it; and if there be too little of it,
it will not hold them when they are there. When the
bush is thus prepared, it must be set up in some dead
hedge, or among some growing bushes near the out-
skirts of a town, a farmer's back-yard, or the like, if
it be in the spring; for these places are the resort of
the small birds at that time. If it be used in summer,
the bush must be placed in the midst of a quickset
hedge, or in groves, bushes, or white thorn trees, near
fields of corn, hemp, flax, and the like; and in the
winter, the proper places are about stacks of corn, ko-
vels, barns, and the like. When the lime-bush is thus
planted, the sportsman must stand as near it as he can
without being discovered; and with the mouth, or
otherwise, make such sorts of notes as the birds do
when they attack or call to one another. There are
bird-calls to be bought for this use; but the most ex-
pert method is to learn the notes of call of the several
bird-lime birds, and imitate them by a sort of whistling. When
one bird is thus enticed to the bush, and hung fast,
the business of the sportsman is now to take it,
but to be patient; for it will hang itself more fast
by its struggling to get away; and its fluttering will
bring more to the bush, so that several may be taken
together. The time of the day for this sport is from
sunrise to ten o'clock, and from one to sunset.

Another very good method of bringing the birds together,
is by a stale: a bat makes a very good stale; but it
must be fastened, so as to be in sight at a distance. An
owl is a still better stale; for this bird never goes a
broad but it is followed by all the small birds in the
neighbourhood. They will gather together in great
numbers about it; and having no convenient place to
sit on but the lime-bush, will be taken in great num-
bers. If a living owl or bat is not to be had, the skin
stuffed will serve the purpose, and will last twenty
years. Some have used the image of an owl carved in
wood, and painted in the natural colours; and it has
been found to succeed very well.

Divination by Birds. See August.

Migration of Birds. See Ornithology Index.

Notification of Birds. See Ornithology Index.

Singing Birds are, the nightingale, blackbird, en-
ring, thrush, linnet, lark, thrush, Canada-bird, bel-
him, goldfinch, &c. See some very curious expe-
riment and observations on the singing of birds, Phil.
Trans. vol. lxxxiii. part ii. N.° 31. Their first sound
is called chirp, which is a single sound repeated at short
intervals; the next call, which is a repetition of one
and the same note; and the third sound is called re-
cording, which a young bird continues to do for ten
or eleven months, till he is able to execute every part of
his song; and when he is perfect in his lesson, he
is said to sing his song round. Their notes are no more
innate than language in man; they all sing in the
same key. The honourable author Davie Barrington has
there attempted to reduce their comparative merits to
a scale; and to explain how they first came to have
particular notes. See Songs of Birds, Ornithology
Index.

Methods of preserving Birds. See Ornithology
Index.

Birds, in Heraldry, according to their several kinds,
represent either the contemplative or active life. They
are the emblems of liberty, expedition, readiness, swift-
ness, and fear. They are more honourable than fishes, because they participate more of air and
fire, the two noblest and highest elements, than of earth
and water. Birds must be borne in coat-armour, as is
best fitting the propriety of their natural actions of
going, sitting, standing, flying, &c. Birds that are
either whole-footed, or have their feet divided, and yet
have no talons, are said to be membered; but the cock,
and all birds of prey with sharp and hooked beaks and
talons for encounter or defence, are termed armed.
In the blazoning of birds, if their wings be not displayed,
they are said to be borne close; as, he beareth on egg
&c. close.

Birds-Nests, in Cookery, the nest of a small Indian
swallow, very delicately tasted, and frequently mixed in
among soups. On the sea-coasts of China, at certain
seasons of the year, there are seen vast numbers of these
birds.
BIRKENHEAD, or BERKENHEAD, Sir John, a famous political author, was born about the year 1615. Being recommended to Dr William Laud archbishop of Canterbury, he became his secretary; in which office he showed such capacity and diligence, that the archbishop, by his diploma, created him master of arts in 1639; and in the year following, by letter commendatory from the same prelate, he was chosen probationer fellow of All-Souls' College. This obliged him to reside constantly at Oxford; and on King Charles I.'s making that city his head-quarters during the civil war, our author was made choice of to write a kind of journal in defence of the royal cause, by which he gained great reputation. By his majesty's recommendation, he was chosen reader in moral philosophy; which employment he enjoyed till 1648, when he was expelled by the parliament visitors. He retired afterwards to London, where he wrote several poetical pieces; and having adhered steadily to his principles, he acquired the title of the loyal poet, and suffered several imprisonments. He published, while he thus lived in obscurity, some very satirical compositions, mostly levelled against the republican grandees, and written with great poignancy. Upon the restoration of King Charles II. our author was rewarded for his loyalty. He was created, April 16. 1661, on the king's letters sent for that purpose, doctor of the civil law by the university of Oxford; and in that quality, as an eminent civilian, was consulted by the convocation on the question, Whether bishops ought to be present in capital cases? He was about the same time elected to serve in parliament for Wilton in the county of Wilts. He was knighted November 14. 1662; and upon Sir Richard Fanshaw's going in a public character to the court of Madrid, he was appointed to succeed him as master of requests. He lived afterwards in credit and esteem, and received various favours from the court, which, however, drew upon him some very severe attacks from those who opposed the court. Mr Wood has treated him with great severity; but his memory has been transmitted with honour to posterity by others, particularly by Dryden, Langbaine, and Winstanley. He died in Westminster, December 4. 1679; and was interred in St Martin's in the Fields.

BIRKENFIELD, a thriving village of the Prussian states, in the grand duchy of the Lower Rhine. It is situated near the river Nahe, in E. Long. 7. 9. N. Lat. 49. 35.

BIRMINGHAM, a very large town of Warwickshire in England, situated in W. Long. 1. 35. N. Lat. 52. 30. It is no corporation, being only governed by two constables and two bailiffs; and it is therefore free for any person to come and settle there; which has contributed greatly not only to the increase of the buildings, but also of the trade, which is the most flourishing of any in England for all sorts of iron work, besides many other curious manufactures. The town stands on the side of a hill, nearly in the form of a half-moon. The lower part is filled with the workshops and warehouses of the manufacturers, and consists chiefly of old buildings. The upper part of the.
BIRK

town contains a number of new and regular streets, and a handsome square elegantly built. It has several handsome churches. A theatre was built here in 1792, which cost 14,000. There is a large and well conducted school on Lancastrian's principle, and another on Dr Bell's. There is a charity work-house, a general hospital built in 1766, and a dispensary built in 1808. Including the parishes of Aston and Edgebaston, Birmingham contained 85,733 inhabitants in 1811.

BIRON, ARMAND DE GONTAUT, LORD OF, MARSHAL OF FRANCE, and a celebrated general in the 16th century, signalized himself by his valour and conduct in several sieges and battles. He was made grand-master of the artillery in 1569, and nobody dared to assault him at the massacre of St Bartholomew. He was the first who declared for Henry IV. He brought a part of Normandy under his subjection, and dissuaded him from retiring to England or Rochelle. But he was killed by a cannon-ball, at the siege of Epernay, on the 26th of July 1592. He was a very universal scholar: and used to carry a pocket-book, in which he wrote down every thing that appeared remarkable; which gave rise to a proverb very much used at court: When a person happened to say anything uncommon, they told him, You have found that in Biron's pocket-book.

BIROTA, or BIRONUM, in Roman antiquity, a kind of vehicle, so denominated from its moving upon two wheels. It carried about 200 pound weight, and was drawn by three mules.

BIRRUS, in Roman antiquity, a cloak, made of woollen cloth, worn by the soldiers. Also a robe anciently worn by the priests or bishops.

BIRTH, in Midwifery, signifies the same with delivery. See MIDWIFERY.

BIRTH is also used for a person's descent; and is said to be high or low according to the circumstances of his ancestry.

There is scarcely any truth (Mr Knox observes in his Essays) of which the world has been more frequently reminded by the moralists, than the unreasonableness of that generation which is paid to birth. They have been told, that virtue alone is true nobility; but though they have acknowledged the assertion to be founded in reason, they have continued, with uniform perseverance, in the same error. The luminous glory of an illustrious ancestor, seems to have diffused a brilliancy over a long line of descendants, too opaque of themselves to emit any original irradiations.

Gratitude (continues our elegant author), which first raises a benefactor to a distinguished rank in civil honours, is willing to continue its kindness to its immediate offspring. The distinction is rendered hereditary. This predilection for an ancestor soon leads to the accumulation of honours and possessions in his successors; and the incense originally offered because it was deserved, is at last lavished at the shrine of opulence, independently of merit.

Subordination is, indeed, essential to society. The order of nobles, as hereditary guardians of the laws, is found an useful political establishment; and none seem so well adapted to supply it, as they who have been exalted to eminence by their ancestors, and who possess a territorial patrimony in the land which they are to protect. All that is contended for is, that the recompensation of birth may not set aside or depreciate real merit, the praise of learning, and the intrinsic value of virtuous exertions.

"It is a remarkable circumstance in the history of mankind, that some of the best books have been written, and some of the greatest achievements performed, by those whose origin was truly plebeian. The most genteel and learned books, whether the sentiments or the style be considered, have been produced by slaves, or the descendants of slaves. Horace, Thucydides, and Thucydides, wrote in a style which must have been the standard of a court, to an intercourse with which they were by no means entitled by their extraction. The founders of the most distinguished families emerged from the middle and the lower classes, by the superior vigour of their natural abilities, or by extraordinary efforts, assisted by fortune; and unless the adventitious circumstances of wealth and civil honours can effect a change in the constituent principles of the mind and body, there is certainly no real superiority to be derived in a boasted pedigree of Tudors and Plantagenets. And yet there have appeared flatterers, who have indirectly suggested, that the minds of the nobility seem to be cast in a finer mould, and to have an elegance inherent in their original constitution. According to this hypothesis, we must go on to suppose, that the mind of a commoner exalted to the higher order of senators, catches this elegance by the contagion of invincible effluvia. On his creation he undergoes a kind of new birth, and puts off the exuviae which encumbered and degraded him in the lower regions. Thus are all the occult perfections of noble blood to be inferred by the mandate of a monarch. But no," said Maximilian to a man who asked to be enabled by him, 'though I can give you riches and a title, I cannot make you noble.'

"In truth, there is many a nobleman, according to the genuine idea of nobility, even at the loom, at the plough, and in the shop; and many more in the middle ranks of mixed society. This genuine idea contains in it generosity, courage, spirit, and benevolence, the qualities of a warm and open heart, totally unconnected with the accidental advantages of riches and honour: and many an English sailor has possessed more of the real hero than a lord of the admiralty.

"If indeed there is any substantial difference in the quality of their blood, the advantage is probably on the side of the inferior classes. Their indigence and their manual employments require temperance and exercise, the best purifiers of the animal juices. But the indolence which wealth excites, and the pleasures which fashionable life admits without restraint, have a natural tendency to vitiate and enfeeble the body as well as the mind; and among the many privileges inherited by him who boasts nobility in his veins, he commonly receives the seeds of the most painful and the impurest diseases. He displays indeed a coroaset on his coat of arms, and he has a long pedigree to person with secret satisfaction; but he has often a gout or a scrofula, which make him wish to exchange every drop derived from his Norman ancestors, for the pure tide that warms a peasant's bosom.

"The spirit of freedom, moral, mental, and political, which prevails in Britain, precludes that unreason
BIRTH

sonable attachment to birth, which, in the countries of despotism, tends to elevate the noble to a rank superior to humanity. In our neighbour's land, the region of external elevation united with real meanness, the implicit veneration paid to birth adds to the weight of legal oppression. A Frenchman of the plebeian order attends to a count or a marquis with all the silent submission of idolatry; on the contrary, there is no doubt but that an English gondoler would box with the best lord in the land, if he were affronted by him, without the least regard for his star and ribbons. It would indeed be an additional pleasure to the natural delight of conquest, to have bruised a puny lord. Even the more refined and polished do not idolize illustrious birth. In truth, wealth appears to be the object of more universal veneration. Noble blood and noble titles, without an estate to support them, meet with great compassion indeed, but with little respect; nor is the man who has raised himself to eminence, and who behaves well in it, neglected and despised because he derives no lustre from his forefathers. In a commercial country, where gain is the general object, they who have been most successful in its pursuit will be revered by many, whatever was their origin. In France, where honour is pursued from the monarch to the cleaner of a jakes, the distinction of birth, even with extreme poverty, is enviable. The brother of a marquis would rather starve on a beggarly pension, than pollute himself with a trade by which he might acquire the revenues of a German kingdom. In our land of good sense this folly is losing ground; and the younger brothers of noble houses often think it no disgrace to rival the heir in a princely fortune acquired by honourable merchandise.

"As the world becomes more enlightened, the exorbitant value which has been placed on things not really valuable will decrease. Of all the effects of man's capricious admiration, there are few less rational than the preference of illustrious descent to personal merit, of diseased and degenerate nobility to health, to courage, to learning, and to virtue. All the objects of pursuit which are not in our own power, the want of distinguished birth may most easily be dispensed with, by those who possess a solid judgment of that which makes and keeps us happy. There may be some reason to repine at the want of wealth and fame; but he who has derived from his parent health, vigour, and all the powers of perception, need not lament that he is unnoticed at the herald's office.

"It has been observed, that virtue appears more amiable when accompanied with beauty; it may be added, that it is more useful when recommended to the notice of mankind by the distinction of an honourable ancestry. It is then greatly to be wished, that the nobly born would endeavour to deserve the respect which the world pays them with acclivity, by employing their influence to benevolent purposes; to those purposes which can at all times be accomplished, even when the patriotic exertions of the field and cabinet are precluded."

BIRTH, or BIRTH, the station in which a ship rides at anchor either alone or in a fleet, or the distance between the ship and any adjacent object, comprehending the extent of the space in which she ranges at the length of her cables: as, she lies in a good birth, i.e. in a convenient situation, or at a proper distance from the shore and other vessels; and where there is good anchoring ground, and shelter from the violence of the wind and sea.

BIRTH also signifies the room or apartment where any particular number of the officers and ship's company usually mess and reside. In a ship of war there is commonly one of these between every two guns.

BIRTH-DAY, the anniversary return of the day when a person was born. The ancients placed a good deal of religion in the celebration of birth-days, and took omones from thence of the felicity of the coming year. The manner of celebrating birth-days, was by a splendid dress: wearing a sort of rings peculiar to that day: offering sacrifices; the men to their genius, of wine, frankincense; the women to Juno: giving suppers, and treating their friends and clients; who in return made them presents, wrote and sung their panegyrics, and offered vows and good wishes for the frequent happy returns of the same day. The birth-days of emperors were also celebrated with public sports, feasts, vows, and medals struck on the occasion. But the ancients, it is to be observed, had other sorts of birth-days besides the days on which they were born. The day of their adoption was always reputed as a birth-day, and celebrated accordingly. The emperor Adrian, we are told, observed three birth-days; viz. the day of his nativity, of his adoption, and of his inauguration. In those times it was held, that men were not born only on those days when they first came into the world, but on those days when they arrived at the chief honours and commands in the commonwealth, e. gr. the consulate. Hence that of Cicero in his oration ad Quirites, after his return from exile: A parentibus, id quod necesse erat, parcus sum proceribus, a nobis natus sum consolationis.

BIRTHWORT. See ARISTOLOCIA, BOTANY INDEX.

BIRVIESCA, a town of Old Castile in Spain, and capital of a small territory called Bureta. W. Long. 2. 15. N. Lat. 42. 35.

BIRZA, a town of Poland, in the province of Samoqitia. E. Long. 25. 5. N. Lat. 56. 35.

BISA, or BIZA, a coin of Pegusa, which is current there for half a ducat. It is also a weight used in that kingdom.

BISACIA, a small handsome town of Italy, in the Ulterior Principe, and in the kingdom of Naples, with a bishop's see. E. Long. 15. 35. N. Lat. 41. 3.

BISACUTA, in middle-age writers, an axe with two edges, or which cuts either way; or a missile weapon pointed at both ends. Walsingham represents the secis bisacuta as peculiar to the Scottish nation. See BATTLE AXE.

BISBESA, a feast celebrated by the Messapici after the pruning of their vines, to obtain of the gods that they might grow again the better. The word is formed from Besa, used by some for a vine.

BISCARZA, a town of Africa in the kingdom of Algiers, seated in the eastern or Levantine government, in E. Long. 5. 50. N. Lat. 35. 10. This city belonged to the province of Zeb in Numidia, which lies south of the kingdom of Labez; but the Algerines, in their annual invasions to carry off slaves, made themselves masters.
the audience of Guadalajara. It has New Mexico on the north, Culiacan on the west, Zacatecas on the south, and Panuco with Florida on the east. It is about 300 miles from east to west, and 360 from north to south. In general it is well watered, fruitful, moderately temperate, and abounds in all sorts of provisions, except the mountains of Topia, which are barren. The original inhabitants are not all brought under subjection, they having four large towns in the marshes, that are of difficult access; for this reason the Spaniards have built three small fortified towns, which are well inhabited, for the defence of their silver mines. The latitude is from 25 to 28 degrees.

BISCHOFISHEIM, a town of Germany, in the county of Hanau Munzenberg, and now included in the territory of the free town of Frankfurt. It is three miles east of Hanau. E. Long. 9° 2'. N. Lat. 5° 5'.

BISCHOFF ZELL, a town of Switzerland, in the canton of Thun. It is governed by a council, partly Catholic and partly Lutheran; and both denominations hold divine service in the parish church. It was formerly subject to the bishop of Constance. It is seated on the Thur, at the place where the river falls into this river, and is almost half way between Constance and St. Gall. E. Long. 9° 23'. N. Lat. 47° 33'.

BISHOP, or BISHOP, JOHN, an excellent artist, born at the Hague in 1646. He is spoken of with great commendation as a painter, and his drawings from the great masters are held in the highest estimation by the curious. In these he had succeeded so happily, as to preserve with the greatest exactness the style of the painter whose pictures he copied. But as an engraver he is most generally known; and his works are numerous. They are chiefly etchings, harmonized with the graver; and though slight, yet free, spirited, and pleasing. He gives a richness to the colour, and a roundness to the figures, far beyond what is usually done with the point, so little assisted by the graver. His figures in general are well drawn; but in a manner, rather than a correct, style. The extremities indeed are not always well marked, or his heads equally expressive or beautiful. It is said of him, that he owed his excellence to his own genius alone, having never studied under any master by whose instruction he might have been benefited. He worked chiefly at Amsterdam, where he died in 1686, aged 40 years.

BISHOP, Cornelius, portrait and history painter, was born at Antwerp in 1630, and was the disciple of Ferdinand Bol. His pencil, his tint of colouring, his style and manner, had a strong resemblance of his master; and by many competent judges he is esteemed not inferior to him in historical subjects as well as in portrait, having been always assiduous to study after nature. A painting by this master, consisting of a few figures by candle light, was so much admired by Louis XIV. that he purchased it at a high price, and placed it in the royal collection; and the king of Denmark admitted his works among those of the best masters. However, notwithstanding the encomiums bestowed on this master by the Flemish writers, an impartial judge would perhaps think his compositions but heavy and without expression, and his works in general not worthy of all that commendation which is lavished upon them. He died in 1674.

BISHOP, Abraham, son of Cornelius Bishop, was instructed
BIS

Bishop

instructed by his father to design historical subjects and portraits; but preferred the painting of fowl, particularly those of the domestic kind, to any other subjects which were recommended to him. He designed every object after nature, and usually painted in a large size, such as ornamental furniture for grand halls; and every species of fowl was so exactly like nature in its attitude, character, and plumage, that his works were beheld with universal approbation.

BISCHWELLER, a fortress of France in the department of the Lower Rhine. E. Long. 7°. N. Lat. 48° 40'.

BISCHROMA, in Music, the same as our triple quaver. See Chroma.

BISCUTELLA, Buckler-Mustard, or Bastard Mithridate-Mustard. See Botany Index.

BISCEGLIA, a populous town of Italy, in the kingdom of Naples and Terra de Bari, with a bishop's see, seated near the gulf of Venice, in E. Long. 16° 49'. N. Lat. 41° 18'.

BISERHULA. See Botany Index.

BISERTA, a town of the kingdom of Tunis in Africa, seated on a gulf of the same name, in E. Long. 10° 40'. N. Lat. 37° 20'. The gulf is a very large one, and the Sinus Hippopotami of the ancients. It is formed by the Capes Bianco and Ziebech; and has a beautiful sandy inlet near four leagues wide, which once admitted the largest vessels, but through the negligence of the Turks can now admit only those of the smallest size, and is in danger in a short time of being totally choked up. Some remains of the great pier of Hippo are still extant; by which it appears to have run out into the sea so as to break the north-east wind, and make this one of the safest and most beautiful havens in these parts. On the south, this gulf hath a communication with a lake of the same name, so as to form a kind of canal between it and the Mediterranean sea. Through this canal a constant stream is observed alternately discharging itself from the sea to the lake, and from the lake to the sea, in the same manner as the Atlantic ocean is observed to do in the Mediterranean, and back again; so that what the lake loses by exhalations is soon recruted by the sea, which in hot seasons runs into it with a very brisk current to keep up the equilibrium. The millets of this lake are the best in Barbary; great quantities of their roots, dried and made into Botargo, are sent from hence into the Levant, where they are accounted a great dainty. The town was formerly very considerable; and, though not above a mile in circuit, is said to have contained 6000 houses; whereas both it and the villages under it now scarcely contain that number of inhabitants. It has still, however, some strong castles and batteries to defend it, especially towards the sea. There are also two very capacious prisons for slaves, a large magazine or warehouse for merchandise, and two towers with some other works to defend the entrance of the haven. The city, though so near the sea, is well supplied with fresh water from springs that surround it on every side towards the land. It is likewise well furnished with variety of fish from the adjacent lake. Most of the inhabitants of Biserta, as well as of the adjacent country on both sides of the canal, are employed in the fishing trade, which begins about the end of October, and ends in the beginning of May; for the rains then sweetening the waters, make the fish come into it in vast quantities during that season; but afterwards they either disappear, or grow lean, dry, and unfit to eat. The people here are extremely poor; yet, with kind, ill-natured, and faithless; insomuch that Moley Harvey, Bey, one of their sovereigns, used to say, that none of his subjects deserved his resentment so much as they, since neither fear nor love could keep them faithful. Biserta hath about eight villages under its government; a large plain called Matter or Mater; and the territory of Cheros, the Clypea or Corobis of the ancients. This is a tract of great extent, and would be very fertile were it not for the frequent incursions of the Arabs. The people are very poor, live meanly, and go worse clad. Their choicest dainty is their couscou, a kind of cake, made of flour, eggs, and salt, which they dry and keep all the year round. Their dress is nothing else than a piece of coarse cloth wrapped round their bodies, and another round their heads by way of a turban; and most of them go barefooted and bare-legged. The poorer sort have nothing but a few skins laid on the floor to sleep upon; but the rich have narrow couches fixed against the wall, about five or six feet high, to which they mount by a ladder. They are very expert horsemen, as most in these countries are, and ride without saddle or bridge; nor do they ever shoe their horses. They are still more miserable from the neighbourhood of the Arabs, who living altogether by plunder, robbery, and murder, oppress the poor inhabitants with their frequent inroads and cruel exactions. The Bisertines, both of the city and country, are the most superstitious people in Barbary, scarcely going anywhere without hanging a quantity of amulets about their own, or, if they ride, their horse’s neck also. Their amulets are only scraps of parchment or paper, with some strange characters written upon them, which they sew up in a piece of leather, silk, &c. and imagine when worn about them to be a preservative against all accidents.

BISFT, CHARLES EMANUEL, a painter of considerable eminence, was born at Mechlin in 1633; and even in his early productions showed a lively and ready invention. He was remarkable for introducing a multitude of figures into his designs, with an extraordinary variety of drapery peculiar to every nation. His general subjects were conversations, balls, concerts, and assemblies of gay and genteel persons, which were correctly designed and well coloured; though their actions and attitudes were sometimes very indecisive. His pictures had a strong effect at a distance; yet when they were more nearly inspected, they showed a neatness of pencil, a spirited touch, and a good expression.

BISHOP, a prelate or person consecrated for the spiritual government and direction of a diocese. The word comes from the Saxon bishop, and that from the Greek episcopus, an overseer or inspector: which was a title the Athenians gave to those whom they sent into the provinces subject to them, to see whether everything was kept in order; and the Romans gave the same title to those who were inspectors and visitors of the bread and provision. It appears from a letter of Cicero, that he himself had a bishopric; being episcopus Ora et Campaniae.

A bishop differs from an archbishop in the following particulars: That an archbishop with bishops consecrate a bishop, as a bishop with priests ordain a priest;
that the archbishop visits a province as the bishop a
diocese; that the archbishop convocates a provincial
synod as the bishop a diocesan one; and that the arch-
bishop has canonical authority over all the bishops of
his province, as the bishop over the priests in his dio-
cese. It is a long time since bishops have been distin-
guished from mere priests or presbyters; but whether
that distinction be of divine or human right, whether it
was settled in the apostolical age or introduced since, is
much controverted. But whether the apostles estab-
lished any thing of this kind themselves, or whether they
left the spiritual economy in the hands of the presby-
ters, or of those together with the people, it appears
that in a little time the functions of the priesthood
were divided, and the priests distinguished into degrees;
the political part of religion being, according to some,
assigned principally to bishops, and the evangelical to
the priests, &c. Or, according to others, the functions
of teaching and preaching were reserved to the bishop,
and that of ordination superadded; which was their
principal distinction, and the mark of their sovereignty
in their diocese.

By the ancient discipline, bishops were to be married
once, and not to put away their wives on pretence of
religion; but a second marriage was a disqualification
for this order. If they lived chaste, they were ranked
as confessors. Some bishops, in the middle age, on ac-
count of their regalia or temporalities, were obliged to
a military service called hostias, by which they were to
lead their vassals into the field, and attend the king in
his military expeditions. This Charlemagne excused,
and even forbade: but the prohibition was little re-
garded; since we find the thing often practised after-
wards.

The election of bishops was anciently placed in the
clergy, and the people of the parish, province, or dio-
cese; but afterwards, princes and magistrates, patriarchs
and popes, usurped the power. The election was to
be within three months after the vacancy of the see; and
the person to be chosen out of the clergy of that
church. Formerly the bishop claimed a share in the
election of an archbishop: but this was set aside by the
popes.

In England, during the Saxon times, all ecclesiasti-
cal dignities were conferred by the king in parliament.
At length, however, after several contests, especially
between Archbishop Anselm and Henry I. in conse-
quently of a grant of King John, recognized in Magna
Charta, and established by stat. 25 Edw. III. stat. 6.
§ 3. Bishops were elected by the chapters of monks or
canons, some shadow of which still remains in the pre-
ent method of disposing of bishoprics; but by stat.
25 Henry VIII. cap. 20. the right of nomination was
restored to the crown.

Ordinarily at least three bishops are required in the
ceremony of consecrating a bishop; but in some cases
a single one might suffice. The English succession of
Protestant bishops stands on this last ground. In Eng-
land, the king being certified of the death of a bishop
by the dean and chapter, and his leave requested to
elect another, the conge d'elire is sent to them, with a
letter missive, nominating the person whom he would
have chosen. The election is to be within twelve
days after the receipt of it, otherwise the king by let-
ters patent appoints whom he pleases; and the chapter,
in case of refusing the person named by the king, is
summoned and præmunire. After election, and its being ac-
cepted of the bishop, the king grants a mandate
under the great seal for confirmation; which the
bishop consigns to his vicar-general; consisting mostly
in a solemn citation of such as have any objections to
the bishop elect, a declaration of theircontumacy is
not appearing, and an administration of the oath of
allegiance and supremacy, of simony, and canonical
obedience. Sentence being read by the vicar-general,
the bishop is installed in the province of Canterbury by
the archdeacon; the fact is recorded by a public no-
tary; and the bishop is invested with full powers to
exercise all spiritual jurisdictions, though he cannot
for his temporalities till after consecration. Then
follows the consecration by the archbishop or some
other bishop appointed by lawful commissions, and two
assistant bishops: the ceremony of which is much the
same as in the Romish church, save that having put on
the episcopal robes, the archbishop and bishops lay
their hands on the new prelate's head, and consecrate
him with a certain form of words. The process of
the translation of a bishop to another bishopric only
differs in this, that there is no consecration. The age
of a bishop is to be at least thirty years; and by the an-
cient discipline, none were to be chosen but those who
had passed through all the inferior orders; but in some
cases of necessity this was dispensed with, and deacons,
may laymen, were raised per saltum to the episcopal
dignity.

The form of consecrating a bishop is different in dif-
f erent churches. In the Greek church, the bishop
elect being by the assistant bishops presented for con-
secration, and the instrument of election put in his
hand; after several prayers (the first called diaconica)
demanding consecration, makes profession of his faith
after which he receives a benediction. He is then in-
terrogated as to the belief of the Trinity; to which he
answers by a long profession of faith, and receives a
second benediction. Lastly, he is asked what he thinks
of the incarnation; to which he answers in a third pro-
fession of faith; which is followed by a third bencdi-
cion; after which the consecrator gives him the pasto-inal staff: then he is led up to the altar; where, after
certain prayers, and three crosses on his head, he re-
ceives the pallium, if he be an archbishop or patriarch;
the mitre, if he be an archdeacon; then he receives the kiss of peace of his consecrator and
two assistants; and sitting down, reads, prays, and gives
the communion to his consecrators and others.

In the Romish church, the bishop elect being pre-
sented by the elder assistant to the consecrator, takes
the oath: he is then examined as to his faith: and af-
ter several prayers, the New Testament is drawn over
his head, and he receives the chrism or unction on his
head. The pastoral staff, ring, and gospel, are then
given him; and after communion, the mitre is put on
his head; each ceremony being accompanied with pro-
per prayers, &c. The consecration ends with Te Deum.

These last-mentioned ceremonies are laid aside in the
consecration of English bishops. Nevertheless, the book
of consecration set forth in the time of Edward VI.
and confirmed by act of parliament, in which some of
them are enjoined, is declared to be the standard for
this purpose by the thirty-sixth article.

The function of a bishop in England may be con-
sidered
BIS

BISHOP'S COURT, an ecclesiastical court, held in the cathedral of each diocese, the judge whereof is the bishop's chancellor, who judges by the civil and canon law; and if the diocese be large, he has his commissions in remote parts, who hold what they call consistory courts, for matters limited to them by their commission.

BISHOP'S-AUKLAND. See AUKLAND.

BISHOP'S CASTLE, a town of Shropshire in England, seated near the river Clun. It is a corporation, sends two members to parliament, and contained 1367 inhabitants in 1811. W. Long. 255. N. Lat. 52. 30.

BISHOP'S-STORTFORD, a town of Hertfordshire in England, seated on the side of a hill, in E. Long. 0. 25. N. Lat. 51. 50. It has several good inns, but the streets are not paved. It has a large church, one Presbyterian and one Quaker meeting. Here was formerly a castle called Westmore Castle, wherein a garrison was kept. Population in 1811, 2630.

BISHOPING, a term among horse-dealers, to denote the sophistications used to make an old horse appear young, a bad one good, &c.

BISHOPRIC, the district over which a bishop's jurisdiction extends, otherwise called a diocese.

In England there are 24 bishoprics besides that of Sodor and Man; in Ireland 18.

BISI, BONAVENTURA, a celebrated miniature painter, was born at Bologna, and was a disciple of Lucio Massari. But his sole delight was in miniature paintings, and in that way he arrived at great excellence. Instead of working from his own invention, or original design, he employed himself to imitate, in small size, the pictures of Guido, Corregio, Titian, and other great masters, and those he finished with astonishing grace, neatness, and beauty. A great number of the works of this master are in the duke's gallery at Modena, and are highly valued. He died in 1662, his age unknown.

BISIGNANO, a town of Italy, in the kingdom of Naples, and in the Hither Calabria. It hath a strong fort, a bishop's see, and the title of a principality. It is seated on a mountain near the river Bocchons, in E. Long. 16. 40. N. Lat. 39. 37.

BISK or BISQUE, in cookery, a rich sort of broth or soup, made of pigeons, chickens, force-meat, mutton-gravy, and other ingredients. The word is French, formed, as some think, from bisque; because the bisque, consisting of a diversity of ingredients, needs several repeated coctions to bring it to perfection. There is also a demi-bisque, made at a low expence, in which only half the ingredients are used; and a bisque of fish, made of carps minced with their roes and lobsters.

BISKUIT, or BISCUIT, a kind of bread prepared by the confectioners, of fine flour, eggs, and sugar, and rose or orange water; or of flower, eggs, and sugar, with aniseeds, and citron peel, baked again and again in the oven, in tin or paper moulds. There are divers sorts of biscuit; as seed-biscuit, fruit-biscuit, long-biscuit, round-biscuit, Naples-biscuit, sponge-biscuit, &c.

Sea-Biskuit is a sort of bread much dried by passing the oven twice, to make it keep for sea-service. For long voyages they bake it four times, and prepare it six months before the embarkation. It will keep good a whole year.

To preserve sea-biskuit from insects, Mr Hales advises to make the flames of burning brimstone pass through the casks full of bread. Biskuit may be likewise preserved a long time, by keeping it in casks well called, and lined with tin.

The ancients had their biscuit prepared after the like manner, and for the like use, as the moderns. The Greeks called it after κριστα, q. d. bread put twice to the fire. The Romans give it the name of panis nauticus, or capita. Pliny denominates it ceras or nauticus panis iusus atque iterum cortus. By which it appears, that after the first baking, they ground or pounded it down again for a second. In some middle-age writers, it is called paximus, paximus, and panis paximatus. Among the Romans we also meet with
BIS

BISCUIT. A kind of land-biscuit for the camp service, called buc
cellatum, sometimes expeditionis annona, which was
baked much; but to make it lighter for carriage, and
less liable to corrupt, the coating was continued till the
bread was reduced one-fourth of its former weight.

BISHOP. See Bishop.

BISMILLAIH, a solemn form used by the Maho-
mometans at the beginning of all their books and other
writings, signifying, In the name of the most
merciful God.

BISMILLAH is also used among the Arabs as a word
of invitation to eat. An Arab prince will frequently
sit down to eat in the street before his own door, and
call to all that pass, even beggars, in this word, who
do not fail to come and sit down to eat with him; for
the Arabs are great levellers, and set every body upon
a footing with them.

BISMUTH, or Tin-Glass, a metal of a reddish or
yellowish-white colour and a lamellated texture. See
Chemistry and Mineralogy Index.

BISNAGAR, formerly a very large and powerful
kingdom of Asia, comprizing the kingdoms of
Kanara, Messowr, Travankor, Madura, Marava, and
Tanjour. It was called Binsagar from its capital city,
and took the name of Birisinga from one of its rajas
or kings. We know nothing certain concerning this
kingdom before the year 1520, when Krishna Rajah,
king of Binsagar, made war with Adel Khan, king of
Vissiapur, from whom he resolved to take the city of
Rachol, situated in the island of Salsette near Goas,
which he said had belonged to his ancestors. The
king of Binsagar's army consisted of 733,000 foot,
35,000 horse, 586 elephants with towers on their backs,
each of which had four men in it; besides these were
12,000 water-carriers, and the army was followed by
20,000 common women. The city, however, resisted
this formidable army for three months; at the end of
which, Adel Khan came to its relief with an army of
120,000 foot, 18,000 horse, 150 elephants, and many
heavy cannon. In the engagement the king of Binsa-
agar proved victorious, and almost entirely destroyed
the army of Adel Khan, taking from him 4000 horses,
100 elephants, 400 cannon, &c. Soon after he took
the city by assault; but consented to restore the booty
taken in the former battle, provided Adel Khan con-
sented to come and kiss his foot as the sovereign lord
of Kanara. This base condition was accepted, but
accidentally prevented from being put in execution.
From this time we hear of nothing remarkable till the
year 1558, when a Portuguese of the city of Meliapur
or St Thomas, on the coast of Coromandel, persuaded
Ramah Rajah, then king of Binsagar, to march against
that place, telling him the plunder would be worth
2,000,000, and that the destruction of Meliapur would
be of great service to the images in the pagods which
were thrown down by the Christians. The king set out
accordingly with an army of 500,000 men; but the in-
habitants, instead of preparing for their defence, sent
him a present of 4000 ducats. This somewhat ap-
peared him: however, he would not enter the city, but
ordered the inhabitants of both sexes, with all their
valuable effects, to be brought into his presence; which
being done, he found that the value of their whole sub-
stance did not exceed 80,000 ducats. On this he or-
dered the informer to be thrown to the elephants, who
bore him in pieces; after which he dismissed the citi-
zans, and restored all their goods so punctually, that
only a silver spoon happening to be missing, it was
sought for, and returned to the owner. In 1565, the
happy state of this kingdom excited the envy of the
kings of Dekan: who, having raised an army of 30,000
foot and 50,000 horse, defeated and killed the king of
Binsagar, though at the head of an army almost twice
as numerous, and took the royal city itself. They are
said to have spent five months in plundering it, although
the inhabitants had before carried off 1500 elephants
loaded with money and jewels to the amount of upwards
of 100,000,000 of gold; besides the royal chair for
state days, whose price could not be estimated. The
victors, however, found a diamond of the size of an
ordinary egg, besides another of a size somewhat
inferior, and several other gems of immense value.
Afterwards, however, they were forced to abandon the
kingdom, as being too large for them to keep in their
hands. From this time the kingdom of Binsagar re-
mained pretty much unassailed till about the year 1657,
when it was subdued by Aurengzebe, second son to
Shah Jehan, and hath ever since remained subject to
the Great Mogul. In some places of this kingdom, it
is said, the roads have great forests of bamboo on each
side, which are so thick that it is impossible for a man
to pass. These forests are full of monkeys; and what
is singular, those on one side seem to be enemies to
those on the other; for if a basket of rice is set down
on the road with a parcel of small sticks about it, the
monkeys on each side will come out and fall a-fighting
with the sticks till one of the parties retreats. This,
it is said, is often done by travellers for diversion.
They catch the wild elephants here in pitfalls, and give
them by means of others already tamed. The
town of Binsagar is now in ruins. It is situated in
E. Long. 78° 6. N. Lat. 15° 14.

BISNOW, or Bishchou, a sect of the Banians in
the East Indies; they call their god Ram-ram, and
give him a wife: They adorn his image with golden
chains, necklaces of pearls, and all sorts of precious
stones. They sing hymns in honour of their god, mix-
ing their devotion with dances and the sound of drums,
flagelets, brazen basons, and other instruments. This
sect lives wholly upon herbs and pulse, butter and milk.
In this sect, the wives do not burn themselves after
their husband's death, as is practised by those of the
Somarath sect; but content themselves with a perpetual
widowhood.

BISOMUM, or DISOMUM, in Roman antiquity,
a tomb for two dead bodies, or the ashes of two. The
ancients frequently buried two, three, or four bodies
in the same sepulchre, disposed aside of each other;
for it was held an impious to lay one on top of another.
Hence the sepulchers of the primitive Christians had
the words bisomi, trisomi, quadrisomi, &c. inscribed
on them, to indicate the number of bodies deposited in
them.

BISON, in Zoology, the trivial name of a species of
bos. See Bos, Mammalia Index.

BISQUIT, or Biskuit. See Biskuit.

BISSAGOS, a cluster of islands on the coast of
Negroland in Africa, situated between the mouth of
the
the rivers Gambia and Rio Grande. Their names are Bolam, Casambar, La Gallina, Coquey, Coticha, and Oronguana, with some other small islands: but the only one which merits a particular description is that of Bolam. Each of these islands is governed by a king of its own; and as all those petty monarchs are quite independent, they frequently make war with each other, yet they always unite against the inhabitants of Bifara, who are their common enemies. They have canoes that carry from 25 to 40 men with their provisions and arms, which are sabres and bows and arrows. The inhabitants are negroes; they are tall, strong, and healthy, though they live only on fish, nuts, and palm oil; choosing rather to sell the rice, millet, and other grain produced in their country, to the Europeans, than not to gratify their passion for trinkets and ornaments. In general they are idolaters; cruel and savage in their disposition, and when they happen to quarrel, and are disappointed of their revenge, they frequently drown or stab themselves. An attempt was made in 1792 to plant a colony on Bolama, one of these islands, but it entirely failed.

BISSAO, an island on the coast of Africa, a few leagues to the south-east of the river Gambia, and separated from the continent only by the channel of the river Gеваs. In this island the French have a factory, and there is also a fort belonging to the Portuguese, at both of which a great trade is carried on. The island is about 35 or 40 miles in circumference, having an agreeable prospect to the sea, from which it rises by a gentle ascent on every side to an eminence in the centre of the island. There are however a great many hills inferior in height to that in the middle, and separated by beautiful and fertile valleys divided by little rivulets, which at the same time augment the richness and elegance of the scene. So rich is the soil of Bissao, that wheat and maize spring up to the size of Indian corn, or rather resemble a field covered over with reeds or bamboos. The cattle also are of an extraordinary size, and seem to keep pace with the extravagant growth of the corn. Milk and wine are in the greatest abundance; but the island affords neither hogs nor horses. The former are forbid by the natives to be imported; and something in the soil or climate renders it unfit for the increase of the latter, which never thrive here. The dress of the men of all ranks in Bissao is only a skin fixed to the girdle before and behind. The dress of the married women consists of a cotton petticoat; but virgins go entirely naked, wearing only bracelets of different kinds on their arms and legs. If they are of high quality, their bodies are marked or painted with a variety of hideous forms of snakes and other figures, which, as their colour is jet-black, gives their skins somewhat the appearance of flowered satin. Even the princess royal herself, the eldest daughter of the emperor, is only distinguished from other women by the elegance of those paintings and the richness of her bracelets. One very extraordinary ornament used in this country is a large iron ring with a flat round surface on the outside instead of a stone, upon which the ring changes with a bit of iron, in such a manner as to converse with the greatest facility by means of the different sounds produced; but this kind of language is used only among the polite and the great. All the Bissaus are idolaters, nor has commerce introduced the smallest change in their manners, but their ideas of religion are exceedingly confused. Their chief idol is a little image called China, of which the worshippers give very absurd accounts; but, besides this, every man invents a god for himself: trees are held sacred; and if not adored as gods, are worshipped as the residence of some divinity. The government is despotic, the will of the emperor being a law to his people. Of this we have an instance in Bissao, not to be matched in any other country whatever. This is no other than a present which one subject may make of the house and estate of his neighbour to the emperor; and as it is most commonly his majesty's pleasure to accept of such presents, the proprietor dares not resist, but immediately sets about building another house, though even this he cannot do without the prince's leave; and if this should not be readily granted, he must live with his family in the open air till permission to build a new house can be obtained.

BISSAT, Peter, professor of canon law in the university of Bononia, in Italy, was descended from the earls of Fife in Scotland, and born in that country in the reign of James V. He was educated at St. Andrews: from thence he removed to Paris; and, having spent some time in that university, proceeded to Bononia, where he commenced doctor of laws, and was afterwards appointed professor of canon law. He continued in that honourable employment several years with great reputation, and died in the year 1568. He is said to have been not only a learned civilian, but an excellent poet, orator, and philosopher. Patriici Bissati opera omnia, viz. poemata, orationes, lectiones feriales, &c. Lib. de irregularitate, &c. were published at Venice in 1565, 4to.

Bissenpour, a small district of the kingdom of Bengal in the East Indies, which has all along preserved its independence. It has been governed time immemorial by a Brahmin family of the tribe of Rajahput. Here the purity and equity of the ancient political system of the Indians are found unaltered. This singular government, the finest and most striking monument in the world, has till now been beheld with too much indifference. We have no remains of ancient nations but brass and marble, which speak only to imagination and conjecture, those uncertain interpreters of manners and customs that no longer exist. Were a philosopher transported to Bissenpour, he would immediately be a witness of the life led by the first inhabitants of India many thousand years ago; he would converse with them; he would trace the progress of this nation, celebrated as it were from its very infancy; he would see the rise of a government which, being founded in happy prejudices, in a simplicity and purity of manners, in the mild temper of the people, and the integrity of the chieftains, has survived those innumerable systems of legislation, which have made only a transitory appearance on the stage of the world with the generations they were designed to torment. More solid and durable than those political structures, which, raised by imposture and enthusiasm, are the scourges of human kind, and are doomed to perish with the foolish opinions that gave them birth, the government of Bissenpour, the offspring of a just attention to order and the laws of nature, has been established and maintained

4 L 3
BIS [ 636 ] BIT

Bissett, or Bittsn, an essential part of a bridle. Its kinds are various. 1. The musrol, snaffle, or watering-bit. 2. The canon-mouth, joined in the middle. 3. The canon with a fast mouth, all of a piece, only kned in the middle, to form a liberty or space for the tongue; fit for horses too sensible or ticklish, and liable to be continually bearing on the hand. 4. The canon-mouth, with the liberty in form of a pigeon's neck; proper where a horse has too large a tongue. 5. The canon with a port-mouth, and an upset or mounting liberty; where a horse has a good mouth, but large tongue. 6. The scotch-mouth, with an upset; ruder but more secure than a canon-mouth. 7. The canon-mouth with a liberty; proper for a horse with a large tongue and round bars. 8. The masticodour, or slaverling bit, &c. The several parts of a snaffle, or curb-bit, are the mouth-piece, the cheeks and eyes, guard of the cheek, head of the cheeks, the port, the wels, the campanel or curb and hook, the bosses, the bolster and rabbets, the water-chains, the side-bolts and rings, kirkles of the bit or curb, tretch, top-rol, flap and jive. The importation of bits for bridles is now prohibited.

Bis, or Bitts, in Ship-Building, the name of two great timbers, usually placed abaft the manger, in the ship's
BITURIGES (Caesar); Bituriges Cubi (Strabo, Pliny, Ptolemy); a people in that part of Gallia Celtica afterwards assigned to Aquitania. Now called Berry.

BITURIGES Vibiscii (Ptolemy), a people of Aquitaine.

BIVALVES, a term sometimes used for such shells as consist of two pieces.—It is also an appellation given by botanists to such pods or capsules as consist of two valves enclosing the seeds.

BIVENTER, in Anatomy, called also digastric, or two-bellied, a muscle of the lower jaw. See Anatomy, Table of the Muscles.

BIUMBRES, in Geography, an appellation given to the inhabitants of the torrid zone, by reason, at two different seasons of the year, their shadows are projected two different ways. The biumbres are the same with those otherwise denominated amphisci.

BIXA, the ROUCOU or Arnatto Tree. See Botany Index.

BIZARRE, denoting capricious, &c. a term used among florists for a particular kind of carnation, which has its flowers striped or variegated with three or four colours.

BIZARRO, in the Italian music, denotes a fanciful kind of composition, sometimes fast, slow, soft, strong, &c. according to the fancy of the composer.

BIZOCHI, or BISÖCHI, in Church History, certain heretical monks, said to have assumed the religious habit contrary to the canons, rejected the sacraments, and maintained other errors.

BLACK, DR. Josph, distinguished for his discoveries in chemistry, was born in France, on the banks of the Garonne in the year 1728. His father was a native of Belfast, but descended from a Scotch family who had been some time settled there. Mr Black, the father, was engaged in the wine trade; and for the purpose of carrying it on, he resided chiefly at Bordeaux.

He is represented as a man of extensive information, of candid and liberal sentiments, and of amiable manners; but particularly distinguished by the strength of his attachments and the warmth of his heart. These amiable and estimable qualities in the character of Mr Black, attracted the attention, and procured the friendship and intimacy of the discerning and benevolent Montesquieu, who was one of the presidents of the court of justice in the province while Mr Black resided at Bordeaux. Letters and fragments of correspondence between the president and Mr Black are still preserved in the family, as precious relics and memorials of the intercourse, honourable to both, which subsisted between that great man and their ancestor.

Some time before Mr Black retired from business, he sent his son Joseph, then in his twelfth year, to Belfast, on account of his education. And having completed the usual course of instruction in a grammar school, he was sent to the university of Glasgow in the year 1746. During the time which he studied at that seminary, his attention seems to have been chiefly directed to physical science; and he became a favourite pupil of Dr Dick, then professor of natural philosophy. When Dr Black had finished the ordinary course of general study at the university, he made choice of the profession of medicine; and he directed his views to those
those pursuits and studies which were necessary to qualify him for that profession.

It was about this time that Dr Cullen had been appointed to the lectureship of chemistry in the university of Glasgow. Hitherto this science had been only treated as a curious and in some respect a useful art. This great man, conscious of his own strength, and taking a wide and comprehensive view, saw the unoccupied field of philosophical chemistry open before him. He was satisfied that it was susceptible of great improvement by means of liberal inquiry and rational investigation. He was therefore determined to enter the unexplored path, and to lead his followers to those regions which are included in the wide ranges of this comprehensive and attractive science. It was at this time that Dr Black became the pupil of Dr Cullen; and it was perhaps to this fortunate coincidence that Dr Black was indebted for the foundation of his future reputation as a philosopher and a chemist. The liberal and extensive views of Cullen happily acceded with the enlarged habits of thought which the young philosopher had previously acquired. Dr Cullen took a deep interest in the progress of his students. He delighted in encouraging and assisting them; and therefore perceiving the bias of Black's pursuits, soon attached himself to him. By the intercourse and intimacy which followed he was led into the same train of thought, and conducted into the same course of studies. He was received into a closer connexion, and became a valuable assistant in all Dr Cullen's chemical operations. The experiments of Black were frequently adduced to prove facts which were stated in the lecture, and they were considered as good authority. Thus commenced a mutual confidence and friendship which was highly honourable to both, and was never afterwards mentioned by Dr Black but with gratitude and respect.

In the year 1751 Dr Black went to Edinburgh to complete the course of his medical studies. There he resided in the house of his cousin-german, Mr Russell, professor of natural philosophy in that university, a gentleman of enlarged views and liberal sentiments, whose conversation and studies must have been both agreeable and profitable to his young friend.

At this time the mode of action of lithotritypic medicines, but particularly lime-water, in alleviating the pains of stone and gravel, divided the opinions of professors and practitioners. This subject became extremely interesting both to the physician and chemist. And as it is usual for the students to enter warmly into those discussions which give rise to much difference of opinion among the teachers, this subject, quite suited to his taste, particularly attracted and interested the attention of Mr Black, who was then one of Dr Cullen's most zealous and intelligent pupils. It appears from some of his memoranda, that he at first held the opinion that the causticity of alkalis is owing to the igneous matter from which they derive from quicklime. But having prosecuted his experiments on magnesia, this grand secret of nature was laid open to his view. This led him to conclude, that the action of these substances was owing to their combination with igneous particles; that it was their peculiar property; and that they lost this property and became mild, by combining with a certain portion of air, to which he gave the name of fixed air; because it was fixed or became solid in the substances in the composition of which it entered.

This grand discovery, which forms one of the most important eras of chemical science, was the subject of his inaugural dissertation, published at the time that he was admitted to his medical degree in the university of Edinburgh. He had not availed himself of the time he had studied at Glasgow, but took the whole course prescribed by the rules of the university. This delay, it has been supposed, may have been owing to the investigation of the subject in which he had engaged not having been completed, which determined him to proceed with caution, till he had established his doctrine by a train of decisive experiments.

About the time that Dr Black obtained his medical degree, Dr Cullen was removed to Edinburgh, which made a vacancy in the chemical chair at Glasgow. While he remained at that university, Dr Black had been a diligent and attentive student; and the discovery published in his inaugural essay had added much to his reputation. He was therefore looked up to as a person amply qualified to fill the vacant chair; and accordingly, in the year 1756, he was appointed professor of anatomy, and lecturer on chemistry in the university of Glasgow. And it was perhaps fortunate for himself, fortunate for the public and for science, that a situation so favourable presented itself, a situation which allowed him full time to dedicate his talents chiefly to the cultivation of chemistry, which had now become his favourite science.

Along with the lectureship on chemistry, Dr Black's first appointment in the university of Glasgow was to the professorship of anatomy. The latter branch of medical study was either not so suitable to his taste, or he did not consider himself so well qualified to be useful in it; for soon after, arrangements were made with the professor of medicine, by which the professors exchanged departments, when Dr Black undertook that of the institutes and practice of medicine.

At this time, his lectures on medicine formed his chief task. And the perspicuity and simplicity, the caution and moderation which he discovered in the doctrines which he delivered, gave great satisfaction. The time and attention which were occupied in these lectures, and in the medical practice in some measure necessarily connected with his situation, are supposed by some to have been the principal cause of Dr Black's having suddenly stopped short in that brilliant career on which he at first so successfully entered. It is, however, more probable, that the calm and unambitious temper which seems to have been a striking feature of his character, and which a less friendly hand than his learned biographer would have set down as nearly allied to indolence, checked the spirit of ardour and perseverance which was necessary to encourage and carry him forward in the path of discovery and research. Whatever may have been the cause, it is to be regretted, that Dr Black, so conspicuous for his patient, judicious, and elegant mode of investigation, and so distinguished for the simplicity, perspicuity, and precision of his reasonings and deductions, should have contributed so little in rearing the noble superstructure of chemical science, the foundation of which he had been the means of establishing on a firm and solid basis.
The theory of the nature of quicklime, and the cause of its causticity, was soon known to the German chemists, and from them it met with strong opposition. Various mysterious doctrines at this time prevailed in the German schools concerning the peculiar nature of fire. As their notions of the causticity of alkaline substances involved some of these doctrines, a great many objections were started to a theory which threatened to overthrow long established and favourite opinions. The most formidable opponent to the new theory was Professor Meyer of Osnaburgh. All the phenomena of the causticity and mildness of lime and alcalies, were, according to his explanation, to be accounted for, by the action of a substance of a peculiar nature, to which he gave the name of aci dum pingue. This substance, which was supposed to be formed in the lime during calcination, consisted of an igneous matter in a certain state of combination with other substances. It is a matter of some surprise that Dr Black should have experienced any unreason on the account of the opposition made to his discovery by mere hypothesis unsupported by facts or even by plausible argument, when his own doctrine had been fully and irrefragably established by the sure test of decisive experiment. Nor is it less surprising, that he should have taken great pains for several years in the course of his lectures, in refuting the arguments and in combating the objections of Meyer to his own theory.

Dr Black's reception at the university of Glasgow was highly flattering and encouraging. As a student, he had not only done himself much credit by his successful progress in the different pursuits in which he was engaged, but he had also during his residence there conciliated the attachment and affection of the professors in a high degree. When he returned as a professor, he was immediately connected in the strictest friendship with Dr Adam Smith, then professor of moral philosophy in that university. And this friendship, which now commenced, grew stronger and stronger, and was never interrupted through the whole of their lives. A simplicity and sensibility, an incorruptible integrity, the strictest delicacy and correctness of manners, marked the character of each of the philosophers, and firmly bound them in the closest union.

At Glasgow, Dr Black soon acquired great reputation as a professor, and became a favourite physician in that large and active city. His engaging countenance, his agreeable and attractive manners, free from all studied endeavours to please, and the kind concern he took in the cases intrusted to his care, made him a most welcome visitor in every family.

It was between the years 1759 and 1763, that he brought to maturity his speculations concerning heat, which had occupied his attention at intervals, from the very dawn of his philosophical investigations. His discoveries in this department of science, by far the most important of all that he made, and perhaps indeed the most valuable which appeared during the busy period of the 18th century. To enter fully into the nature of his investigations would be improper in this place; but the sum of them all was usually expressed by him in the following propositions.

When a solid body is converted into a fluid, there enters into it and unites with it, a quantity of heat, the presence of which is not indicated by the thermometer, and this combination is the cause of the fluidity which the body assumes. On the other hand, when a fluid body is converted into a solid, a quantity of heat separates from it, the presence of which was not formerly indicated by the thermometer. And this separation is the cause of the solid form which the fluid assumes.

When a liquid body is raised to the boiling temperature, by the continued and copious application of heat, its particles suddenly attract to themselves a great quantity of heat, and by this combination their mutual relation is so changed that they no longer attract each other, but are converted into an elastic fluid like air. On the other hand, when these elastic fluids, either by condensation or by the application of cold bodies, are recomposed into liquids, they give out a vast quantity of heat, the presence of which was not formerly indicated by the thermometer.

Thus water when converted into ice gives out 140° of heat, and ice when converted into water absorbs 140° of heat, and water when converted into steam absorbs about 1000° of heat without becoming sensibly hotter than 212°. Philosophers had been long accustomed to consider the thermometer as the surest method of detecting heat in bodies, yet this instrument gives no indication of the 140° of heat which enter into air when it is converted into water, nor of the 1000° which combine with water when it is converted into steam. Dr Black, therefore, said that the heat is concealed (latet) in the water and steam, and he briefly expressed this fact by calling the heat in that case latent heat.

Dr Black having established this discovery by simple and decisive experiments, drew up an account of the whole investigation, and read it to a literary society which met every Friday, in the faculty-room of the college, consisting of the members of the university, and several gentlemen of the city who had a relish for philosophy and literature. This was done April 23, 1762, as appears by the registers. This doctrine was immediately applied by its author to the explanation of a vast number of natural phenomena, and in his experimental investigations he was greatly assisted by his two celebrated pupils Mr Watt and Dr Irvine.

As Dr Black never published an account of his doctrine of latent heat, though he detailed it every year subsequent to 1762 in his lectures, which were frequently by men of science from all parts of Europe; it became known only through that channel, and this gave an opportunity to others to pilfer it from him piece-meal. Dr Crawford's ideas respecting the capacity of bodies for heat, were originally derived from Dr Black, who first pointed out the method of investigating that subject.

The investigations of Lavoisier and Laplace concerning heat, published many years after, were obviously borrowed from Dr Black, and indeed consisted in the repetition of the very experiments which he had suggested. Yet these philosophers never mention Dr Black at all: every thing in their dissertation assumes the air of originality; and indeed they appear to have been at great pains to prevent the opinions and discoveries of Dr Black from being known among their countrymen. But perhaps the most extraordinary procedure was that of Mr Deluc; this philosopher had expressed...
expressed his admiration of Dr. Black's theory of latent heat, and had offered to become his editor. Dr Black, after much entreaty, at last consented, and the proper information was communicated to Mr Deluc. At last the *Idées sur la Meteorologie* of that philosopher appeared in 1788. But what was the astonishment of Dr Black and his friends, when they found the doctrine claimed by Deluc as his own, and an expression of satisfaction at the knowledge which he had acquired of Dr Black's coincidence with him in opinion! (M. Deluc has published an answer to this charge in his own vindication. See Edin. Rev. Vol. 12. p. 105.)

Dr Black continued in the university of Glasgow from 1756 to 1766. In 1766 Dr Cullen was appointed professor of medicine in the university of Edinburgh, and thus a vacancy was made in the chemical chair of that university. Dr Black was with universal consent appointed his successor. In this new scene his talents were more conspicuous, and more extensively useful. He saw this, and while he could not be highly gratified by the great concourse of pupils which the high reputation of the medical school of Edinburgh brought to his lectures, his mind was forcibly impressed by the importance of his duties as a teacher. This had an effect which perhaps was on the whole rather unfortunate. He directed his whole attention to his lectures, and his object was to make them so plain that they should be adapted to the capacity of the most illiterate of his hearers. The improvement of the science seems to have been laid aside by him altogether. Never did any man succeed more completely. His pupils were not only instructed but delighted. Many became his pupils merely in order to be pleased. This contributed greatly to extend the knowledge of chemistry. It became in Edinburgh a fashionable part of the accomplishment of a gentleman.

Perhaps the delicacy of his constitution precluded him from exertion; the slightest cold, the most trifling approach to repletion, immediately affected his breast, occasioned feverishness, and if continued for two or three days brought on a spitting of blood. Nothing restored him but relaxation of thought and gentle exercise. The sedentary life to which study confined him was manifestly hurtful, and he never allowed himself to indulge in any intense thinking without finding these complaints sensibly increased.

So completely trammelled was he in this respect, that although his friends saw others disengaging enough to avail themselves of the novelties announced by Dr Black in his lectures, and therefore repeatedly urged him to publish an account of what he had done, this remained unaccomplished to the last. Dr Black often began the task, but was so nice in his notions of the manner in which it should be executed, that the pains he took in forming a plan of the work, never failed to affect his health, and obliged him to desist. Indeed he peculiarly disliked appearing as an author. His inaugural dissertation was the work of duty. His *Experiments on Magnesia, Quicklime, and other alkaline substances*, was necessary to put what he had indicated in his inaugural dissertations on a proper foundation. His *Observations on the more ready freezing of Water that has been boiled*, published in the Philosophical Transactions for 1774, was also called for; and his *Analysis of the Waters of some Botting Springs in Iceland*, made at the request of his friend T. I. Stanley, Esq. was read to the Royal Society of Edinburgh, and published by the council. And these are the only works of his which have appeared in print.

The aspect of Dr Black was comely and interesting. His countenance exhibited that pleasing expression of inward satisfaction, which, by giving ease to the beholder, never fails to please. His manner was unaffected and graceful. He was affable, and readily entered into conversation, whether serious or trivial. He was a stranger to none of the elegant accomplishments of life. He had a fine musical ear, with a voice which would obey it in the most perfect manner; for he sung, and performed on the flute, with great taste and feeling, and could sing a plain air at sight, which many instrumental performers cannot do. Without having studied drawing, he had acquired a considerable power of expressing with his pencil, and seemed in this respect to have the talents of a history painter. Figure indeed of every kind attracted his attention. Even a retort, or a crucible, was to his eye an example of beauty or deformity.

He had the strongest claim to the appellation of a man of propriety and correctness. Every thing was done in its proper season, and he ever seemed to have leisure in store. He loved society, and felt himself beloved in it; never did he lose a single friend, except by the stroke of death.

His only apprehension was that of a long continued sick bed, less perhaps from any selfish feeling, than from the consideration of the trouble and distress which it would occasion to attending friends: and never was this generous wish more completely gratified. On the 26th Nov. 1799, and in the 71st year of his age, he expired without any convulsions, shock, or stupor, to announce or retard the approach of death. Being at table with his usual fare, some bread, a few prunes, and a measured quantity of milk diluted with water, and having the cup in his hand, when the last stroke of the pulse was to be given, he set it down on his knees which were joined together, and kept it steady with his hand in the manner of a person perfectly at ease; and in this attitude expired without spilling a drop, and without a writh of his countenance, as if an experiment had been required to show to his friends the facility with which he departed. His servant opened the door to tell him that some one had left his name; but getting no answer, stepped about half-way towards him, and seeing him sitting in that easy posture, supporting his bason of milk with one hand, he thought that he had dropped asleep, which sometimes happened after his meals. He went back and shut the door, but before he went down stairs, some anxiety which he could not account for, made him return again and look at his master. Even then he was satisfied after coming pretty near him, and turned to go away; but returning again, and coming close up to him, he found him without life. *(Preface to Black's Lect. by Dr Robison.)*

**Black.** A well known colour, supposed to be owing to the absence of light, most of the rays falling upon black substances being not reflected but absorbed by them. Concerning the peculiar structure of such bodies as fits them for appearing of this or that particular colour, see COLOUR and DYEING.
BLACK-Act; the statute of 9 Geo. I. c. 22, is commonly called the Waltham black act, because it was occasioned by the devastations committed near Waltham in Essex, by persons in disguise, or with their faces blacked. By this statute it is enacted, that persons hunting armed and disguised, and killing or stealing deer, or robbing warrens, or stealing fish out of any river, &c. or any persons unlawfully hunting in his majesty's forests, &c. or breaking down the head of any fish-pond, or killing, &c. of cattle, or cutting down trees, or setting fire to house, barn, or wood, or shooting at any person, or sending letters either anonymous or signed with a fictitious name demanding money, &c. or rescuing such offenders, are guilty of felony, without benefit of clergy. This act is made perpetual by 31 Geo. II. c. 42.

BLACK-Bird. See TURDUS, ORNITHOLOGY Index. BLACK-Book of the Eschequer. See ESCHERER. BLACK-Books, a name given to those which treat of necromancy, or, as some call it, negromancy. The black-book of the English monasteries was a detail of the scandalous enormities practised in religious houses, compiled by order of the visitors under King Henry VIII. to blacken, and thus hasten their dissolution.

BLACK-Cap. See MOTACILLA, ORNITHOLOGY Index. BLACK-Cock. See TETRAO, ORNITHOLOGY Index. BLACK-Eagle. See FALCO, ORNITHOLOGY Index. BLACK-Eunuchs, in the customs of the eastern nations, are Ethiopians castrated, to whom their princes commonly commit the care of their women. See EU-NUCH.

BLACK-Forest, a forest of Germany, in Suabia, running from north to south between Orttau, Brisgaw, part of the duchy of Wirtemberg, the principality of Füstenburg towards the source of the Danube, as far as the Rhine above Basil. It is part of the ancient Hercynian forest.

BLACK-Friars, a name given to the Dominican order; called also preachers, and preaching friars, in France, Jacobins.

BLACK-Jack, or Blende, is a mineral also called false galena, blende, &c. See BLEND E, MINERALOLOGY Index. BLACK-Land, in Agriculture, a term by which the husbandmen denote a particular sort of clayey soil, which, however, they know more by its other properties than by its colour, which is rarely any thing like a true black, and often but a pale gray. This, however pale when dry, always blackens by means of rains, and when ploughed up at these seasons it sticks to the ploughshares, and the more it is wrought the muddier and duskier coloured it appears. This sort of soil always contains a large quantity of sand, and usually a great number of small white stones.

BLACK-Lead. See PLUMBAGO, MINERALOLOGY Index. BLACK-Leather, is that which has passed the curriers hands, where, from the russet, as it was left by the tanners, it is become black, by having been scored and rubbed three times on the grain-side with copperas water. See LEATHER.

BLACK-Legs, a name given in Leicestershire to a disease frequent among calves and sheep. It is a kind of jelly which settles in their legs, and often in the neck, between the skin and flesh.

Vol. III. Part II.
made for ordinary guests, and distinguished from their household loaf, or panis consentualis, which was pure manchet, or white bread.

Black Work, iron wrought by the blacksmiths; thus called by way of opposition to that wrought by whitesmiths.

Blackall, Dr Offspring, bishop of Exeter in the beginning of the 18th century, was born at London in 1654, and educated at Catharine-Hall, Cambridge. For two years he refused to take the oath of allegiance to King William and Queen Mary, but at last submitted to the government, though he seemed to condemn the Revolution, and all that had been done pursuant to it. He was a man of great piety, had much primitive simplicity and integrity, and a constant evenness of mind. In a sermon before the house of commons, January 30, 1669, he animadverted on Toland's assertion in his life of Milton, that Charles I. was not the writer of the Icon Basilike, and for some invinations against the authenticity of the Holy Scriptures; which produced a controversy between him and that author. In 1700, he preached a course of sermons in St Paul's by Boyle's lecture, which were afterwards published; and was consecrated bishop of Exeter in 1707. He died at Exeter in 1716, and was interred in the cathedral there.

Blackbank, a town of Ireland, in the county of Armagh and province of Ulster, seated in W. Long. 6. 15. N. Lat. 54. 12.

Blackberry, See Rubus, Botany Index.

Blackburn, a town of Lancashire in England, seated near the river Derwent. It takes its name from the brook Blackwater which runs through it. W. Long. 2. 15. N. Lat. 53. 40.

Blackening is sometimes used for a factitious black; as lamp-black, shoe-black, &c. A mixture of ivory or lamp-black with linseed-oil makes the common oil blacking. For a shining blacking, small-beer or water is used instead of oil, in the proportion of about a pint to an ounce of the ivory-black, with the addition of half an ounce of brown sugar, and as much gum arabic. The white of an egg substituted for the gum makes the black more shining; but is supposed to hurt the leather, and make it apt to crack.

Blacklock, Dr Thomas, a clergyman, was born at Annan in the south of Scotland in the year 1721. His father was a bricklayer; but though in this humble sphere of life, was of a respectable character, and not deficient in knowledge and urbanity. The son was not quite six months old when he lost his eyesight in the smallpox. This misfortune rendered him incapable of learning any of the mechanical arts; and therefore his father kept him at home, and with the assistance of some friends fostered that inclination which, at a very early period, he showed for books. This was done by reading to him first the simple sort of publications which are commonly put into the hands of children, and then several of our best authors, such as Milton, Spenser, Prior, Pope, and Addison. His companions, whom his early gentleness and kindness of disposition, as well as their compassion for his misfortune, strongly attached to him, were very assiduous in their good offices, in reading to instruct and amuse him. By their assistance he acquired some knowledge of the Latin tongue, but he never was at a grammar-school till at a more advanced period of life. Poetry was even their favourite reading; and he found an enthusiastic delight in the works of the best English poets, and in those of his countryman Allan Ramsay. Even at an age so early as twelve he began to write poems, one of which is preserved in the collection that was published after his death, and is not perhaps inferior to any of the premature compositions of boys assisted by the best education, which are only recalled into notice by the future fame of their authors.

He had attained the age of nineteen when his father was killed by the accidental fall of a multi-kiln belonging to his son-in-law. This loss, heavy to any one at that early age, would have been, however, to a young man possessing the ordinary means of support, and the ordinary advantages of education, comparatively light; but to him—thus suddenly deprived of that support on which his youth had leaned—destitute almost of every resource which industry affords to those who have the blessings of sight—with a body feeble and delicate from nature, and a mind congenially susceptible—it was not surprising that this blow was doubly severe, and threw on his spirits that despondent gloom to which he gave way in the following pathetic lines, and which sometimes overclouded them in the subsequent period of his life.

"Dejecting prospect! soon the hapless hour "May come; perhaps this moment it impends, "Which drives me forth to penury and cold, "Naked, and beat by all the storms of heaven, "Friendless and guideless to explore my way; "Till, on cold earth this poor unshelter'd head "Reclining, vainly from the ruthless blast "Respite I beg, and in the shock expire."

He lived with his mother for about a year after his father's death, and began to be distinguished as a young man of uncomman parts and genius. These were at that time unassisted by learning; the circumstances of his family affording him no better education than the mattering of Latin which his companions had taught him, and the perusal and recollection of the few English authors which they, or his father in the intervals of his professional labours, had read to him. Poetry, however, though it attains its highest perfection in a cultivated soil, grows perhaps as luxuriantly in a wild one. To poetry, as we have before mentioned, he was devoted from his earliest days; and about this time several of his poetical productions began to be handed about, which considerably enlarged the circle of his friends and acquaintance. Some of his compositions being shown to Dr Stevenson, an eminent physician of Edinburgh, who was accidentally at Dumfries on a professional visit, that gentleman formed the benevolent design of carrying him to the Scotch metropolis, and giving to his natural endowments the assistance of a classical education. He came to Edinburgh in the year 1741, and was enrolled a student of divinity in the university there, though at that time without any particular view of entering into the church. In that university he continued his studies under the patronage of Dr Stevenson till the year 1745, when he retired to Dumfries, and resided in the house of Mr McMurdo, who had married his sister, during the whole time of the civil war, which then raged in the country, and parti-
Blacklock, curiously disturbed the tranquility of the metropolis. When peace was restored to the nation, he returned to the university, and pursued his studies for six years longer. During this last residence in Edinburgh, he obtained, among other literary acquaintance, that of the celebrated Mr Hume, who attached himself warmly to Mr Blacklock's interests, and was afterwards particularly useful to him in the publication of the 4th edition of his Poems, which came out by subscription in London in the year 1755. Previously to this, two editions in 8vo had been published at Edinburgh, the first in 1745, and the second in 1754.

In the course of his education at Edinburgh, he acquired a proficiency in the learned languages, and became more a master of the French tongue than was then common in that city. For this last acquisition he was chiefly indebted to the social intercourse to which he had the good fortune to be admitted in the house of Provost Alexander, who had married a native of France. At the university he attained a knowledge of the various branches of philosophy and theology, to which his course of study naturally led, and acquired at the same time a considerable fund of learning and information in those various departments of science and belles lettres, from which his want of sight did not absolutely preclude him.

In 1757, he began a course of study, with a view to give lectures in oratory to young gentlemen intended for the bar or the pulpit. On this occasion he wrote to Mr Hume, informed him of his plan, and requested his assistance in the prosecution of it. But Mr Hume doubting the probability of its success, he abandoned the project; and then, for the first time, adopted the decided intention of going into the church of Scotland. After applying closely for a considerable time to the study of theology, he passed the usual trials in the presbytery of Dumfries, and was by that presbytery licensed a preacher of the gospel in the year 1759. As a preacher he obtained high reputation, and was fond of composing sermons, of which he has left some volumes in manuscript, as also a Treatise on Morals.

In 1762 he married Miss Sarah Johnston, daughter of Mr Joseph Johnston surgeon in Dumfries; a connexion which formed the great solace and blessing of his future life; and gave him, with all the tenderness of a wife, all the zealous care of a guardian and a friend. This event took place a few days before his being ordained minister of the town and parish of Kirkcudbright, in consequence of a presentation from the crown, obtained for him by the earl of Selkirk, a benevolent nobleman, whom Mr Blacklock's situation and genius had interested in his behalf. But the inhabitants of the parish, whether from that violent aversion to patronage, which was then so universal in the southern parts of Scotland, from some political disputes which at that time subsisted between them and his noble patron, or from those prejudices which some of them might naturally enough entertain against a pastor deprived of sight, or perhaps from all these causes united, were so extremely disinclined to receive him as their minister, that after a legal dispute of nearly two years, it was thought expedient by his friends, as it had always been wished by himself, to compromise the matter, by resigning his right to the living, and accepting a moderate annuity in its stead. With this slender provision he removed in 1764 to Edinburgh; and to make up by his industry a more comfortable and decent subsistence, he adopted the plan of receiving a certain number of young gentlemen as boarders into his house, whose studies in languages and philosophy he might, if necessary, assist. In this situation he continued till the year 1787, when he found his time of life and state of health required a degree of quiet and repose which induced him to discontinue the receiving of boarders. In 1767 the degree of doctor in divinity was conferred on him by the university and Marischal college of Aberdeen.

In the occupation which he thus exercised for so many years of his life, no teacher was perhaps ever more agreeable to his pupils, nor master of a family to its inmates, than Dr Blacklock. The gentleness of his manners, the benignity of his disposition, and that warm interest in the happiness of others which led him so constantly to promote it, were qualities that could not fail to procure him the love and regard of the young people committed to his charge; while the society, which esteem and respect for his character and his genius often assembled at his house, afforded them an advantage rarely to be found in establishments of a similar kind.

In this mixed society he appeared to forget the privation of sight, and the melancholy which it might at other times produce in his mind. He entered, with the cheerful playfulness of a young man, into all the sprightly narrative, the sportful fancy, and the humorous jest that arose around him. Next to conversation, music was perhaps the source of his greatest delight; for he not only relished it highly, but was himself a tolerable performer on several instruments, particularly the flute. He generally carried in his pocket a small flageolet, on which he played his favourite tunes; and was not displeased when asked in company to play or to sing them; a natural feeling for a blind man, who thus adds a scene to the drama of his society.

Of the happiness of others, however, we are incompetent judges. Companionship and sympathy bring forth those gay colours of mirth and cheerfulness which they put on for a while, to cover perhaps that sadness which we have no opportunity of witnessing. Of a blind man's condition we are particularly liable to form a mistaken estimate; we give him credit for all those gleams of delight which society affords him, without placing to their full account those dreary moments of darksome solitude to which the suspension of that society condemns him. Dr Blacklock had from nature a constitution delicate and nervous, and his mind, as is almost always the case, was in a great degree subject to the indisposition of his body. He frequently complained of a lowness and depression of spirits, which neither the attention of his friends, nor the unceasing care of a most affectionate wife, were able entirely to remove. The imagination we are so apt to envy and admire, serves but to irritate this disorder of the mind; and that fancy in whose creation we so much delight, can draw, from sources unknown to common men, subjects of disgust, disquietude, and affliction. Some of his latter poems express a chagrin, though not of an ungentle sort, at the supposed failure of his imaginative powers, or at the fastidiousness of modern times, which he despairs to please.
Blacklock. "Such were his efforts, such his cold reward,
Blackmore. "Whom once thy partial tongue pronounced a bard;
Extravagant, on the gentle gales of spring,
"He, you'd whilst thy favour impelled his timid wing;
"Exhausted genius now no more inspires,
But mourns abortive hopes, and faded fires;
"The short-lived wreath, which once his temple grace'd,
"Fades at the sickly breath of squemish taste;
"Whilst darker days his fainting flames ennoble,
In cheerless gloom and winter premature."

These lines are, however, no proof of "exhausted
genius," or "faded fires." "Abortive hopes" indeed,
must be the lot of all who, like Dr Blacklock,
reach the period of old age. In early youth, the heart
of every one is a poet; it creates a scene of imagined
happiness and delusive hopes; it clothes the world in
the bright colours of its own fancy; it refines what is
coarse, it exalts what is mean; it sees nothing but
disinterestedness in friendship, it promises eternal
fidelity in love. Even on the distresses of its situation
it can throw a certain romantic shade of melancholy,
that leaves a man sad, but does not make him unhappy.
But at a more advanced age, "the fairy visions fade,"
and he suffers most deeply who has indulged them the
most.

About the time that these verses were written, Dr
Blacklock was, for the first time, afflicted with what to
him must have been peculiarly distressful. He became
occasionally subject to deafness, which, though he sel-
dom felt it in any great degree, was sufficient, in his
situation, to whom the sense of hearing was almost the
only channel of communication with the external world,
to cause very lively uneasiness. Amidst these indispo-
sitions of body, however, and disquietudes of mind,
the gentleness of his temper never forsook him, and he
felt all that resignation and confidence in the Supreme
Being which his earliest and his latest life equally ac-
knowledged. In summer 1791 he was seized with a
feverish disorder, which at first seemed of a slight,
and never rose to a very violent kind; but a frame so little
robust as his was not able to resist it, and after about
a week's illness it carried him off on the 7th day of July
of that year.

Dr Blacklock's writings consist chiefly of poems, of
which an edition in 4to was published in 1793. To
that edition was added, an Essay on the Education of
the Blind, translated from the French of M. Hauy.
He was also the author of the article Blind in the last
edition of this work.

BLACKMORE, Sir Richard, a physician, and
voluminous writer of theological, poetical, and physical
works. Having declared himself early in favour
of the Revolution, King William, in 1687, chose him
one of his physicians in ordinary, and conferred the
honour of knighthood on him. On Queen Anne's
accession, Sir Richard was also appointed one of her
physicians, and continued so for some time. Dryden
and Pope treated the poetical performances of Black-
more with great contempt; and in a note to the men-
tion made of him in the Dunciad, we are informed
that his "indefatigable muse produced no less than six
epic poems; Prince and King Arthur, 20 books; Eliza,
12; Alfred, 12; The Redeemer, 6; beside Job,
in folio; the whole book of Psalms; The Creation,
seven books; Nature of Man, three books; and many
Black

more." But notwithstanding Blackmore was much
ridiculed by the wits, he is not without merit; and
Addison has, in the Spectator, bestowed some liberal
compliments on his poems on the Creation. It must
be mentioned, too, in honour of Sir Richard, that he
was a chaste writer, and a warm advocate for virtue, at
a time when an almost universal degeneracy prevailed.
He had been very free in his censures on the libertine
writers of his age; and it was owing to some liberty he
had taken of this kind, that he drew upon him the re-
sentment of Mr Dryden. He had likewise given
effence to Mr Pope; for having been informed by Mr
Curl that he was the author of a travesty of the first
Psalm, he took occasion to reprehend him for it in his
Essay on Polite Learning. Besides what are above
mentioned, Sir Richard wrote some theological tracts,
and several treatises on the plague, small-pox, consump-
tion, the spleen, gout, dropsy, &c. and many other poetical
pieces. He died October 9, 1729.

BLACKNESS, the quality of a black body; or a
colour arising from such a texture and situation of the
superficial parts of the body as does, as it were, diffuse,
or rather absorb, the light falling upon it, without
reflecting any, or very little of it, to the eye. In which
sense, blackness stands directly opposed to whiteness;
which consists in such a texture of parts as indifferently
reflects all the rays thrown upon it, of what colour so-
ever they be.

Descartes, says Dr Priestley, though mistaken with
respect to the nature of light and colours, yet distin-
guishes justly between black and white; observing
that black suffocates and extinguishes the light that falls
upon it, but that white reflects it. See BLACK.

BLACKS, in Physiology. See NEGROES.

BLACKS, is also a name given to an association of
disorderly and ill-designing persons, formerly herding
chiefly about Waltham in Essex, who destroyed deer,
robbed fish-ponds, ruined timber, &c. See BLACK.

BLACKSTONE, Sir William, an eminent Eng-
lish lawyer, was born at London, in July 1735. His
father, Mr Charles Blackstone, a silk-man, citizen,
and bowyer of London, died some months before the
birth of our author, who was the youngest of four chil-
dren: and their mother died before he was 3 years old.
Even from his birth, the care both of his educa-
tion and fortune was kindly undertaken by his mater-
nal uncle Mr Thomas Bigg, an eminent surgeon in
London, and afterwards on the death of his elder
brothers, owners of the Chilton estate, which is still
enjoyed by that family. In 1739, being about seven
years old, he was put to school at the Charter-house;
and in 1735 was, by the nomination of Sir Robert
Walpole, on the recommendation of Charles Wiber
of Hall in Hampshire, Esq. his cousin by the moth-
er's side, admitted upon the foundation there. In
this excellent seminary he applied himself to every
branch of youthful education, with the same assiduity
which accompanied his studies through life. His ta-

dents and industry rendered him the favourite of his
masters, who encouraged and assisted him with the ut-
most attention; so that at the age of 15 he was at the
head of the school, and although so young, was thought
well qualified to be removed to the university. He
was accordingly entered a commoner at Pembroke col-
lege.
June 1745 commenced bachelor of civil law; in the latter he applied himself closely to his profession, both in the hall and in his private studies, and on the 28th of November 1746 was called to the bar. Though he was little known or distinguished in Westminster hall, he was actively employed during his occasional residence at the university, in attending to its interests, and mingling with and improving its interior concerns. In May 1749, as a small reward for his services, and to give him further opportunities of advancing the interests of the college, Mr Blackstone was appointed steward of their manors. And in the same year, on the resignation of his uncle Seymour Richmond, Esq. he was elected recorder of the borough of Wallingford in Berkshire, and received the king's approbation on the 30th of May. The 26th of April 1750, he commenced doctor of civil law, and thereby became a member of the convocation, which enabled him to extend his views beyond the narrow circle of his own society, to the general benefit of the university at large. In the summer 1753, he took the resolution of wholly retiring to his fellowship and an academical life, still continuing the practice of his profession as a provincial counsel.

His Lectures on the Laws of England appear to have been an early and favourite idea; for in the Michaelmas term, immediately after he quitted Westminster-hall, he entered on the province of reading them at Oxford; and we are told by the author of his life, that even at their commencement, such were the expectations formed from the acknowledged abilities of the lecturer, they were attended by a very crowded class of young men of the first families, characters, and hopes; but it was not till the year 1758, that the lectures in the form they now bear were read at the university. Mr Viner having by his will left not only the copyright of his abridgment, but other property to a considerable amount, to the university of Oxford, to found a professorship, fellowships, and scholarships of common law, he was on the 20th October 1758 unanimously elected Viscount professor; and on the 21st of the same month read his first introductory lecture, which he published at the request of the vice-chancellor and heads of houses, and afterwards prefixed to the first volume of his Commentaries. His lectures now had gained such universal applause, that he was requested by a noble personage who superintended the education of our present sovereign, then prince of Wales, to read them to his royal highness; but as he was at that time engaged to a numerous class of pupils in the university, he thought he could not, consistently with that engagement, comply with this request, and therefore declined it. But he transmitted copies of many of them for the perusal of his royal highness; who, far from being offended at an excuse grounded on so honourable a motive, was pleased to order a handsome gratuity to be presented to him. It is doubtful whether the Commentaries were originally intended for the press; but many imperfect and incorrect copies having got abroad, and a pirated edition of them being either published, or preparing for publication in Ireland, the learned lecturer thought proper to print a correct edition himself; and in November 1765 published the first volume under the title of Commentaries on the Laws of England; and in the course of the four succeeding years, the remaining parts of this admirable work.

Nec hosisse puderet, sed non incidere ludum.
It ought to be remarked, that before this period the reputation his lectures deservedly acquired him had induced him to resume his practice in Westminsterhall; and in a course somewhat inverted from the general progress of his profession, he who had quitted the bar for an academic life, was sent back from the college to the bar, with a considerable increase of business. He was likewise elected into parliament, first for Hindon, and afterwards for Westbury in Wiltz; but in neither of these departments did he equal the expectations his writings had raised. The part he took in the Middlesex election drew upon him the attack of some persons of ability in the senate, and likewise a severe animadversion of one of the keenest pejoraters in the paper war of that day. This circumstance probably strengthened the aversion he professed to parliamentary attendance; "where, (he said) amidst the rage of contending parties, a man of moderation must expect to meet with no quarter from any side," and when, on the resignation of Mr Dunning in 1720, he was offered the place of solicitor-general, he refused that office; but shortly afterwards, on the promotion of Sir Joseph Yates to a seat in the court of common pleas, accepted a seat on the bench, and by the death of Sir Joseph succeeded him there also. As a judge, he was not inactive; but, when not occupied in the duties of his station, was generally engaged in some scheme of public utility. The act for detached houses for hard labour for convicts, as a substitute for transportation, owed its origin in a great measure to him.

It ought not to be omitted, that the last augmentation of the judges salaries, calculated to make up the deficiencies occasioned by the heavy taxes they are subject to, and thereby render them more independent, was obtained in a great measure by his industry and attention. This respectable and valuable man died on the 14th of February 1780, in the 50th year of his age.

BLACKWALL, ANTHONY, A.M. a learned author, after completing his academical education at Emanuel college, Cambridge, was appointed head master of the free school at Derby, and lecturer of Allhallows there, where he first distinguished himself in the literary world by an edition of Theognis, printed at London in 1706, and was afterwards head master of the free school at Market-Bosworth in Leicestershire. The grammar whereby he initiated the youth under his care into Latin, was of his own composing, and so happily fitted for the purpose, that he was prevailed on to make it public, though his modesty would not permit him to fix his name to it, because he would not be thought to prescribe to other instructors of youth. It is entitled, "A New Latin Grammar; being a short, clear, and easy introduction of young Scholars to the Knowledge of the Latin Tongue; containing an exact Account of the two first Parts of Grammar." In his "Introduction to the Classics," first published in 1711, 12mo, he displayed the beauties of those admirable writers of antiquity, to the end of standing and imitation even of common capacities; and that in so concise and clear a manner, as seemed peculiar to himself. But his greatest and most celebrated work was, "The sacred Classics defended and illustrated; or, An Essay humbly offered towards pre-bothed, serving the Purity, Propriety, and True Elegance of Blackwell the Writers of the New Testament," in 2 vols. Mr. Blackwall had the felicity to bring up many excellent scholars in his seminaries at Derby and Bosworth, among others, the celebrated Richard Dawes, author of the Miscellanea Critica. A gentleman who had been his scholar, being patron of the church of Clapham in Surrey, presented him to that living as a mark of his gratitude and esteem. This happening late in life, and Blackwall having occasion to wait upon the bishop of the diocese, he was somewhat pertly questioned by a young chaplain as to the extent of his learning. "Boy (replied the indignant veteran), I have forgot more than ever you know!" He died at Market-Bosworth, April 8, 1730.

BLACKWELL, THOMAS, an eminent Scottish writer, was son of a minister at Aberdeen, and born there 1701. He had his grammatical learning at a school in Aberdeen, studied Greek and philosophy at the Marischal college there, and took the degree of M. A. in 1718. Being greatly distinguished by uncommon parts, and an early proficiency in letters, he was, Dec. 1723, made Greek professor in the college where he had been educated; and continued to teach that language with applause even to his death. In 1737, was published at London, but without his name, "An Enquiry into the Life and Writings of Homer," 8vo; a second edition of which appeared in 1756; and not long after, "Proofs of the Enquiry into Homer's Life and Writings," which was a translation of the Greek, Latin, Spanish, Italian, and French notes, subjoined to the original work. In 1748, he published "Letters concerning Mythology," 8vo; without his name also. The same year, he was made principal of the Marischal college in Aberdeen, and is the only man who hath been appointed principal of that college, since the patronage came to the crown, by the forfeiture of the Marischal family, in 1716; all the other principals having been ministers of the church of Scotland. March 1752, he took the degree of doctor of laws: and the year following came out the first volume of his Memoirs of the Court of Augustus, 4to. The second volume appeared in 1755; and the third, which was posthumous, and left incomplete by the author, was fitted for the press by John Mills, Esq. and published in 1764. At the same time was published a third edition of the two former volumes: Which is a proof of the good reception the work met with from the public; though it must be acknowledged that the parade with which it is written, and the peculiarity of its language, exposed it to some severity of censure.

Soon after he became principal of his college, he married a merchant's daughter of Aberdeen, by whom he had no children. Several years before his death, his health began to decline: his disorder was of the consumptive kind, and thought to be forwarded by an excess of abstemiousness which he imposed upon himself. His disease was increasing, he was advised to travel. His advice was adopted, and accordingly set out in Feb. 1757; however, he was not able to go farther than Edinburgh, in which city he died the 8th of March following, in his 56th year. He was a very ingenious and very learned man; he had an equable flow of temper, and a truly philosophic spirit.
Blackwell, Alexander, son of a dealer in knit-hose, at Aberdeen, where he received a liberal education, studied physic under Boerhaave at Leyden, took the degree of M. D. and acquired a proficiency in the modern languages. On his return home, happening to stay some time at the Hague, he contracted an intimacy with a Swedish nobleman. Marrying a gentleman's daughter in the neighbourhood of Aberdeen, he proposed practising his profession in that part of the kingdom; but in two years finding his expectations disappointed, he came to London, where he met with still less encouragement as a physician, and commenced corrector of the press for Mr Wilkins a printer. After some years spent in this employment, he set up as a printer himself; and carried on several large works till 1734, when he became bankrupt. In the manner he resided for a considerable time after this event we do not learn, unless it was by the ingenuity of his wife, who published "A curious Herbal, containing 500 Cuts of the most useful Plants which are now used in the Practice of Physic, engraved on folio Copperplates, after Drawings taken from the Life, by Elizabeth Blackwell." To which is added a short Description of the Plants, and their common Uses in Physic, 1739," 2 vols. folio. In or about the year 1740 he went to Sweden, and renewing his intimacy with the nobleman he knew at the Hague, again assumed the medical profession, and was very well received in that capacity; till turning printer, he laid a scheme before his Swedish majesty for draining the fens and marshes, which was well received, and many thousands employed in prosecuting it under the doctor's direction, from which he had some small allowance from the king. This scheme succeeded so well, he turned his thoughts to others of greater importance, which in the end proved fatal to him. He was suspected of being concerned in a plot with Count Tessin, and was tortured; which not producing a confession, he was beheaded August 9. 1749; and soon after this event appeared "A genuine Copy of a Letter from a merchant in Stockholm to his correspondent in London; containing an Impartial Account of Doctor Alexander Blackwell, his Plot, Trial, Character, and Behaviour, both under Examination and at the Place of Execution; together with a copy of a Paper delivered to a Friend upon the Scaffold." He possessed a good natural genius, but was somewhat flighty and a little conceited. His conversation, however, was facetious and agreeable; and he might be considered on the whole as a well-bred accomplished gentleman.

BLADDER, in Anatomy, a thin expanded membranous body, found in several parts of an animal, serving as a receptacle of some juice, or of some liquid excrement; from whence it takes various denominations, as urine-bladder, gall-bladder, &c.

BLADDER, by way of eminence, is a large vessel which serves as a receptacle of the urine of animals, after its secretion from the blood in the kidneys. This is sometimes also called, by way of distinction, the urinary bladder, vesica urinaria. The bladder is situated in the pelvis of the abdomen; in men immediately on the rectum; in women on the vagina uteri. See Anatomy Index.

Though the urinary bladder be naturally single, yet there have been instances of nature's varying from itself in this particular. The bladder of the famous Cassaubon, upon dissecting his body after his death, was found to be double; and in the Philosophical Transactions, we have an account of a triple bladder found in the body of a gentleman who had long been ill and no one could guess the cause.

The urinary bladders of brutes are differently contrived from the human bladder, and from each other according to the structure, economy, and manners of living of each creature. See Anatomy Index.

Bladders, when below a certain magnitude, are more usually denominated by the diminutive vesicles, vesiculae. Of these we meet with many sorts both in the animal and vegetable world; some natural, as in the lungs, especially of frogs, and, as one may imagine, in the muscles; others morbid or preternatural, as the haemorrhages, and those observable in the itch. Naturalists have also discovered bladders in the thorax and abdomen of birds, as well as others in the belly of fishes, called air-bladders, and swims.

Vegetable bladders are found everywhere in the structure of the bark, the fruit, pith, and parenchyma or pulp; besides those morbid ones raised on the surface of leaves by the puncture of insects.

BLADDER-NUT. See STAPHYLEA, BOTANY INDEX.

BLADDER-SENNA. See COLUTEA, BOTANY INDEX.

BLADE, in commerce, a thin slender piece of metal, either forged by the hammer or cut and cast in moulds, to be afterwards sharpened to a point, edge, or the like.

Sword-blades are made by the armourers, knife-blades by the cutlers, &c. The English and Damascus blades are most esteemed; among the French, those of Vienne in Dauphiny have the preference. The conditions of a good blade of a small sword are, that it be light and tough, apter to bend than break. When it will stand in the bend, it is called a poor man's blade.

BLADEN, Martin, a translator and dramatic author, was formerly an officer in the army, bearing the commission of a lieutenant-colonel in Queen Anne's reign, under the great duke of Marlborough, to whom he dedicated a translation of Cesar's Commentaries, which he had completed, and which is to this day a book held in good estimation. In 1714, he was made one of the Lords Commissioners of Trade and Plantations; and in 1717 was appointed envoy extraordinary to the court of Spain, in the room of —— Brett, Esq., but declined it, choosing rather to keep the post he already had, which was worth 1000l. per annum, and which he never parted with till his death, which was in May 1746. He was also many years member of Parliament for the town of Portsmouth. He wrote two dramatic pieces; both of which (for the one is only a masque introduced in the third act of the other) were printed in the year 1705, without the author's consent. Their names are, 1. Orpheus and Euridice, a masque. 2. Silenus, a tragic-comedy.

BLADUM, in the middle-age writers, is taken for all sort of standing corn in the blade and ear. The word is also written biatum, blava, and blatum.

In our old charters, the word bladum included the whole
whole product of the ground, fruit, corn, flax, grass, &c. and whatever was opposed to living creatures. It was sometimes also applied to all sorts of grain or corn thrashed on the floor. But the word was more peculiarly appropriated to bread-corn, or wheat, called in French bïfé. Thus the knights templars are said to have granted to Sir Wido de Merion's wife duas summas bladi.

BLAEU, William, a famous printer of Amsterdam, a disciple and friend of Tycho Brahe's: his Atlas, his Treatises of the Globes, Astronomical Institutions, &c. and his fine impressions, have secured his memory. He died in 1638.

BLAFART, in commerce, a small coin, current at Cologne, worth something more than a farthing of our money.

BLAGRAVE, John, the second son of John Blaggrave of Bulmarsh-court near Sunning in Berkshire, descended of an ancient family in that county. From a grammar-school at Reading he was sent to St John's college at Oxford, where he applied himself chiefly to the study of mathematics, and without taking any degree, afterwards retired to his patrimonial seat of Southcole-lodge near Reading, where he spent the remainder of his life. In this mansion he died in the year 1611; and was buried in the church of St Lawrence, where a sumptuous monument was erected to his memory. Having never married, he bequeathed to all the posterity of his three brothers, the sum of 50l. each, payable at the age of 26; and he calculated his donation so well, that near fourscore of his nephews and their descendants have reaped the benefit of it. He also settled certain lands at Swallowfield in the same county, as a provision for the poor for ever. Among other charities, he left ten pounds to be annually disposed of in the following manner: On Good Friday, the church-wardens of each of the three parishes of Reading send to the town-hall one virtuous maid, who has lived five years with her mother; there, in the presence of the magistrates, these three virtuous maids throw dice for the ten pounds. The two losers are returned with a fresh one the year following, and again the third year, till each has had three chances. He is said to have been not more remarkable for his mathematical knowledge than for his candour and generosity to his acquaintance. His works are, 1. A mathematical jewel. Lond. 1585, fol. 2. Of the making and use of the familiar stuff. Lond. 1590, 4to. 3. Astralabium uranicum generale. Lond. 1596, 4to. 4. The art of dialling. Lond. 1609, 4to.

BLAIN, among farriers, a distemper incident to beasts, being a certain bladder growing on the root of the tongue against the wind-pipe, which swells to such a pitch as to stop the breath. It comes by great chafing and heating of the stomach, and is perceived by the beast's gaping and holding out his tongue, and foaming at the mouth. To cure it, cast the beast, take forth his tongue, and then, slitting the bladder, wash it gently with vinegar and a little salt.

BLAIR, Dr Hugh, a distinguished clergyman of the church of Scotland, was born in Edinburgh in 1601. His father, John Blair, was a merchant in that city, and grandson of the famous Mr Robert Blair, minister of St Andrew's, and chaplain to King Charles I.; and one of the most distinguished clergymen of the period in which he lived. The views of Dr Blair, from his earliest youth, were turned toward the church, and his education received a suitable direction. After the usual grammatical course at school, he entered the humanity class in the university of Edinburgh, in October 1730, and spent eleven years at that celebrated seminary, assiduously employed in the literary and scientific studies prescribed by the church of Scotland to all who are to become candidates for her license to preach the gospel. During this important period he was distinguished among his companions both for diligence and proficiency; and obtained from the professors under whom he studied repeated testimonies of approbation. One of them deserves to be mentioned particularly, because in his own opinion it determined the bent of his genius toward polite literature. An essay, De the beautiful, written by him when a student of logic in the usual course of academical exercises, had the good fortune to attract the notice of Professor Stevenson, and, with circumstances honourable to the author, was appointed to be read in public at the conclusion of the session. This mark of distinction made a deep impression on his mind; and the essay which merited it he ever after recollected with partial affection, and preserved to the day of his death as the first earnest of his fame.

At this time Dr Blair commenced a method of study which contributed much to the accuracy and extent of his knowledge, and which he continued to practise occasionally even after his reputation was fully established. It consisted in making abstracts of the most important works which he read, and in digesting them according to the train of his own thoughts. History, in particular, he resolved to study in this manner; and, in concert with some of his youthful associates, he constructed a very comprehensive scheme of chronological tables for receiving into its proper place every important fact that should occur. The scheme devised by a young student for his own private use was afterwards improved, filled up, and given to the public, by his learned friend Dr John Blair, prebendary of Westminster, in his valuable work, "Chronology and History of the World."

In the year 1739, Dr Blair took his degree of A.M. On that occasion he printed and defended a thesis, De Fundamentis et Obligatione Legis Naturae, which contains a short but masterly discussion of this important subject, and exhibits, in elegant Latin, an outline of the moral principles which have been since more fully unfolded and illustrated in his Sermons.

The university of Edinburgh, about this period, numbered among her pupils many young men who were soon to make a distinguished figure in the civil, ecclesiastical, and the literary history of their country. With most of them Dr Blair entered into habits of intimate connection, which no future competition or jealousy occurred to interrupt, which held them united through life in their views of public good, and which had the most beneficial influence on their own improvement, on the progress of elegance and taste among their contemporaries, and on the general interests of the community to which they belonged.

On the completion of his academical course, he underwent the customary trials before the presbytery of Edinburgh, and received from that venerable body a license
license to preach the gospel on the 21st of October 1741. His public life now commenced with very favourable prospects. The reputation which he brought from the university was fully justified by his first appearance in the pulpit; and, in a few months, the fame of his eloquence procured for him a presentation to the parish of Colessee in Fife, where he was ordained to the office of the holy ministry on the 23rd of September 1742. But he was not permitted to remain long in this rural retreat. A vacancy in the second charge of the Canongate of Edinburgh furnished to his friends an opportunity of recalling him to a station more suited to his talents. And, though one of the most popular and eloquent clergymen in the church was placed in competition with him, a great majority of the electors decided in favour of this young orator, and restored him, in July 1743, to the bounds of his native city.

In this station Dr Blair continued eleven years, discharging with great fidelity and success the various duties of the pastoral office. His discourses from the pulpit in particular attracted universal admiration. They were composed with uncommon care; and occupying a middle place between the dry metaphysical discussions of one class of preachers, and the loose incoherent declamation of another, they blended together, in the happiest manner, the light of argument with the warmth of exhortation, and exhibited captivating specimens of what had hitherto been rarely heard in Scotland—the polished, well-compacted, and regular didactic oration.

In consequence of a call from the town-council and general session of Edinburgh, he was translated from the Canongate to Lady Yester, one of the city churches, on the 11th of October 1754: and on the 15th of June 1758, he was promoted to the High Church of Edinburgh, the most important ecclesiastical charge in the kingdom. To this charge he was raised at the request of the lords of council and session, and of the other distinguished official characters, who have their seats in that church. And the uniform prudence, ability, and success, which, for a period of more than forty years, accompanied all his ministerial labours in that conspicuous and difficult station, sufficiently evince the wisdom of their choice.

Hitherto his attention seems to have been devoted almost exclusively to the attainment of professional excellence, and to the regular discharge of his parochial duties. No production of his pen had yet been given to the world by himself, except two sermons preached on particular occasions; some translations, in verse, of passages of Scripture, for the psalmody of the church; and a few articles in the Edinburgh Review, a publication begun in 1755, and conducted for a short time by some of the ablest men in the kingdom. But standing as he now did at the head of his profession, and released by the labour of former years from the drudgery of weekly preparation for the pulpit, he began to think seriously on a plan for teaching to others that art which had contributed so much to the establishment of his own fame. With this view, he communicated to his friends a scheme of Lectures on Composition; and having obtained the approbation of the university, he began to read them in the college on the 11th of December 1759. To this undertaking he brought all the qualifications requisite for executing it well; and along with them a weight of reputation which could not fail to give effect to the lessons he should deliver.

For beside the testimony given to his talents by his successive promotions in the church, the university of St Andrews, moved chiefly by the merit of his eloquence, had, in June 1757, conferred on him the degree of D.D. a literary honour which at that time was very rare in Scotland. Accordingly his first course of lectures was well attended, and received with great applause. The patrons of the university, convinced that they would form a valuable addition to the system of education, agreed in the following summer to institute a rhetorical class, under his direction, as a permanent part of their academical establishment; and on the 7th of April 1762, his majesty was graciously pleased "To erect and endow a professorship of rhetoric and belles lettres in the university of Edinburgh, and to appoint Dr Blair, in consideration of his approved qualifications, regius professor thereof, with a salary of 70l." These lectures he published in 1763; when he retired from the labours of the office; and the general voice of the public has pronounced them to be a most judicious, elegant, and comprehensive system of rules for forming the style, and cultivating the taste of youth.

About the time in which he was occupied in laying the foundations of this useful institution, he had an opportunity of conferring another important obligation on the literary world, by the part which he acted in rescuing from oblivion the poems of Ossian. It was by the solicitation of Dr Blair and Mr John Home that Mr Macpherson was induced to publish his Fragments of Ancient Poetry; and their patronage was of essential service in procuring the subscription which enabled him to undertake his tour through the Highlands, for collecting the materials of Fingal, and of those other delightful productions which bear the name of Ossian. To these productions Dr Blair applied the test of genuine criticism; and soon after their publication gave an estimate of their merits in a Dissertation, which, for beauty of language, delicacy of taste, and acuteness of critical investigation, has few parallels. It was printed in 1763, and spread the reputation of its author throughout Europe.

The great objects of his literary ambition being now attained, his talents were for many years consecrated solely to the important and peculiar employments of his station. It was not till the year 1777, that he could be induced to favour the world with a volume of the sermons which had so long furnished instruction and delight to his own congregation. But this volume being well received, the public approbation encouraged him to proceed; three other volumes followed at different intervals; and all of them experienced a degree of success of which few publications can boast. They circulated rapidly and widely, wherever the English tongue extends; they were soon translated into almost all the languages of Europe; and his present majesty, with that wise attention to the interests of religion and literature which distinguishes his reign, was graciously pleased to judge them worthy of a public reward. By a royal mandate to the exchequer in Scotland, dated the 25th of July 1780, a pension of 200l. a-year was conferred on their author, which continued unaltered till his death.

The motives which gave rise to the fifth volume are
are sufficiently explained by himself in his address to the reader. The sermons which it contains were composed at very different periods of his life; but they were all written out anew in his own hand, and in many parts recomposed, during the course of the summer 1805, after he had completed his eighty-second year. They were delivered to the publishers about six weeks before his death in the form and order in which they now appear. And it may gratify his readers to know that the last of them which he composed, though not the last in the order adopted for publication, was the sermon on a Life of Dissipation and Pleasure—a sermon written with great dignity and eloquence, and which should be regarded as his solemn parting admonition to a class of men whose conduct is highly important to the community, and whose reformation and virtue he had long laboured most zealously to promote.

The sermons which he has given to the world are universally admitted to be models in their kind; and they will long remain durable monuments of the piety, the genius, and sound judgment of their author. But they formed only a small part of the discourses he prepared for the pulpit. The remainder modesty led him to think unfit for the press: and, influenced by an excusable solicitude for his reputation, he left behind him an explicit injunction that his numerous manuscripts should be destroyed. The greatness of their number was creditable to his professional character, and exhibited a convincing proof that his fame as a public teacher had been honourably purchased by the most unwearied application to the private and unseen labours of his office. It rested on the uniform intrinsic excellence of his discourses in point of matter and composition, rather than on foreign attractions; for his deliver-y, though distinct, serious, and impressive, was not remarkably distinguished by that magic charm of voice and action which captivates the senses and imagination, and which in the estimation of superficial hearers, constitutes the chief merit of a preacher.

In that department of his professional duty which regarded the government of the church, Dr Blair was steadily attached to the cause of moderation. From diffidence, and perhaps from a certain degree of inaptitude for extemporary speaking, he took a less public part in the contests of ecclesiastical politics than some of his cotemporaries; and, from the same causes, he never would consent to become moderator of the general assembly of the church of Scotland. But his influence among his brethren was extensive: his opinion, guided by that sound uprightness of judgment which formed the predominant feature of his intellectual character, had been always held in high respect by the friends with whom he acted, and for many of the last years of his life it was received by them almost as a law. The great leading principle in which they cordially concurred with him, and which directed all their measures, was to preserve the church on the one side from a slavish corrupted dependence on the civil power, and on the other from a greater infusion of democratical influence than is compatible with good order, and the established constitution of the country.

The reputation which he acquired in the discharge of his public duties was well sustained by the great respectability of his private character. Deriving from family associations a strong sense of clerical decorum, feeling on his heart deep impressions of religious and moral obligation, and guided in his intercourse in the world by the same correct and delicate taste which appeared in his writings, he was eminently distinguished through life, by the prudence, purity, and dignified propriety of his conduct. His mind, by constitution and culture, was admirably formed for enjoying happiness—well balanced in itself by the nice proportion and adjustment of its faculties, it did not incline him to any of those eccentricities, either of opinion or of action, which are too often the lot of genius; free from all tincture of envy, it delighted cordially in the prosperity and fame of his companions; sensible to the estimation in which he himself was held, it disposed him to dwell at times on the thought of his success with a satisfaction which he did not affect to conceal; inaccessible alike to gloomy and to peevish impressions, it was always master of its own movements, and ready, in an uncommon degree, to take an active and pleasing interest in every thing, whether important or trilling, that happened to become for the moment the object of his attention. This habit of mind, tempered with the most unsuspecting simplicity, and united to eminent talents and inflexible integrity, while it secured to the last his own re lief of life, was wonderfully calculated to endear him to his friends, and to render him an invaluable member of any society to which he belonged. Indeed few men have been more universally respected by those who knew him, more sincerely esteemed in the circle of his acquaintance, or more tenderly beloved by those who enjoyed the blessings of his private and domestic connection.

In April 1748, he married his cousin Catharine Bannantine, daughter of the Rev. James Bannantine, one of the ministers of Edinburgh. By her he had a son who died in infancy, and a daughter who lived to her twenty-first year, the pride of her parents, and adorned with all the accomplishments that became her age and sex. Mrs Blair herself, a woman of great good sense and spirit, was also taken from him a few years before his death, after she had shared with the tenderest affection in all his fortunes, and contributed near half a century to his happiness and comfort.

Dr Blair had been naturally of a feeble constitution of body; but as he grew up his constitution acquired greater firmness and vigour. Though liable to occasional attacks from some of the sharpest and most painful diseases that afflict the human frame, he enjoyed a general state of good health; and, through habitual cheerfulness, temperance, and care, survived the usual term of human life. For some years he had felt himself unequal to the fatigue of instructing his very large congregation from the pulpit; and, under the impression which this feeling produced, he has been heard at times to say, with a sigh, 'that he was left almost the last of his contemporaries.' Yet he continued to the end in the regular discharge of all his other official duties, and particularly in giving advice to the afflicted, who from different quarters of the kingdom solicited his correspondence. His last summer was devoted to the preparation of his fifth volume of sermons; and in the course of it he exhibited a vigour of understanding and capacity of exertion equal to that of his best days.

He began the winter pleased with himself on account of the completion of this work, and his friends were
were flattered with the hope that he might live to enjoy the accession of emolument and fame which he expected it would bring. But the seeds of a mortal disease were lurking unperceived within him. On the 24th of December 1800, he complained of a pain in his bowels, which, during that and the following day, gave him but little uneasiness; and he received as usual the visits of his friends. On the afternoon of the 26th, the symptoms became violent and alarming: He felt that he was approaching the end of his appointed course: and returning to the last moment the full possession of his mental faculties, he expired on the morning of the 27th, with the composure and hope which became a Christian pastor.

Blair, John, a Scottish author, was cotemporary with, and the companion, some say the chaplain, of Sir William Wallace. He attended that great hero in almost all his exploits; and, after his death, which left so great a stain on the character of Edward I. of England, he wrote his memoirs in Latin. The injury of time has destroyed this work, which might have thrown the greatest light on the history of a very busy and remarkable period. An inaccurate fragment of it only has descended to us, from which little can be learned, and which was published, with a commentary, by Sir Robert Sibbald.

Blair, James, an eminent divine, was born and bred in Scotland, where he had at length a benefice in the episcopal church; but meeting with some discouragements, he came to England in the latter end of the reign of King Charles II. and was sent by Dr Compton as a missionary to Virginia, and was afterwards, by the same bishop, made commissary for that colony, the highest office in the church there. He distinguished himself by his exemplary conduct and unwearied labours in the work of the ministry; and finding that the want of proper seminaries for the advancement of religion and learning was a great damp upon all attempts for the propagation of the gospel, he formed a design of erecting and endowing a college at Williamsburgh in Virginia, for professors and students in academical learning. He therefore not only set on foot a voluntary subscription; but, in 1693, came to England to solicit the affair at court: when Queen Mary was so well pleased with the noble design, that she espoused it with particular zeal; and King William readily concurring with her majesty, a patent was passed for erecting and endowing a college by the name of the William and Mary college, of which Mr Blair was appointed president, and enjoyed that office near 50 years. He was also rector of Williamsburgh, and president of the council in that colony. He wrote, Our Saviour's divine Sermon on the Mount explained, in several sermons, 4 vols. octavo; and died in 1743.

Blair, John, an eminent chronologist, was educated at Edinburgh; and coming to London was for some time usher of a school in Hedge Lane. In 1734, he presented to the world that valuable publication, "The Chronology and History of the World, from the Creation to the year of Christ 1733. Illustrated in LVI. Tables; of which some are introductory and contain the centuries prior to the first Olympiad; and each of the remaining LII. contains in one expanded view 50 years, or half a century." This volume, which is dedicated to Lord Chancellor Hardwicke, was published by subscription, on account of the great expense of the plates, for which the author apologized in his preface, where he acknowledged great obligations to the earl of Bath, and announced some chronological dissertations, wherein he proposed to illustrate the disputed points, to explain the prevailing systems of chronology, and to establish the authorities upon which some of the particular eras depend. In January 1755, he was elected a fellow of the Royal Society; and in 1761 of the Society of Antiquaries. In 1756 he published a second edition of his "Chronological Tables." In September 1757, he was appointed chaplain to the princess dowager of Wales, and mathematical tutor to the duke of York; and on Dr Townsend's promotion to the deanery of Norwich, the services of Dr Blair were rewarded, March 10. 1767, with a prebendal stall at Westminster. The vicarage of Hinckley happening to fall vacant six days after, by the death of Dr Morris, Dr Blair was presented to it by the dean and chapter of Westminster; and in August that year he obtained a dispensation to hold it with the rectory of Burton Coggles in Lincolnshire. In September 1763 he attended his royal pupil the duke of York in a tour to the continent; had the satisfaction of visiting Lisbon, Gibraltar, Minorca, most of the principal cities in Italy, and several parts of France, and returned with the duke in August 1764. In 1768 he published an improved edition of his "Chronological Tables," which he dedicated to the princess of Wales, who had expressed her early approbation of the former edition. The new edition were annexed, "Fourteen Maps of Ancient and Modern Geography, for illustrating the Tables of Chronology and History. To which is prefixed a Dissertation on the Progress of Geography." In March 1771, he was presented by the dean and chapter of Westminster to the vicarage of St Bride's in the city of London; which made it necessary for him to resign Hinckley, where he had resided for any length of time. On the death of Mr Sims, in April 1778, he resigned St Bride's, and was presented to the rectorcy of St John the Evangelist in Westminster; and in June that year obtained a dispensation to hold the rectorcy of St John with that of Horton, near Colebrooke, Bucks. His brother Capt Blair falling gloriously in the service of his country in the memorable sea-fight of April 12, 1782, the shock accelerated the Doctor's death. He had at the same time the influenza in a severe degree, which put a period to his life, June 24. 1782. His library was sold by auction December 11-13th, 1782; and a course of his "Lectures on the Canons of the Old Testament" hath since been advertised as intended for publication by his widow.

Blair of Athol, a castle belonging to the duke of Athol, seated in a district of the same name, in Perthshire in Scotland. W. Long. 3, 30. N. Lat. 56. 46. This castle was besieged by the Highland army in 1746; and bravely defended by Sir Andrew Agnew, who was reduced to eat horse's flesh, until he was relieved by the Hessians under the earl of Crawford.

BLAISE, a military order instituted by the kings of Armenia, in honour of St Blaise, anciently bishop of Sebastia in that country, the patron saint of that nation.
Justinian calls them knights of St Blaise and St Mary, and places them not only in Armenia, but in Palestine. They made a particular vow to defend the religion of the church of Rome, and followed the rule of St Basil. The precise year of the institution of the knights of St Blaise is not known; but they appear to have commenced about the same time with the knights Templars and Hospitaliers; to the former of which they bore a near affinity, the regulars being the same in both.

BLAISOIS, a late province of France, bounded on the north by Beauce, on the east by the Orleans, on the south by Berry, and on the west by Touraine. It now forms the department of Loire and Cher. Blois is the capital town.

BLAKE, Robert, a famous English admiral, born August 1589 at Bridgewater in Somersetshire, where he was educated at the grammar-school. He went from thence to Oxford in 1615, where he was entered at St Alban's Hall. From thence he removed to Wadham college; and on the 10th of February 1617, he took the degree of bachelor of arts. In 1623, he wrote a copy of verses on the death of Mr Camden, and soon after left the university. He was initiated pretty early with republican principles, and disliking that severity with which Dr Laud, then bishop of Bath and Wells, pressed uniformity in his diocese, he began to fall into the puritanical opinions. His natural bluntness causing his principles to be well known, the puritan party returned him member for Bridgewater in 1640; and he served in the parliament army with great courage during the civil war; but when the king was brought to trial, he highly disapproved the measure as illegal, and was frequently heard to say, he would as freely venture his life to save the king, as ever he did to serve the parliament. But this is thought to have been chiefly owing to the humanity of his temper, since after the death of the king he fell in wholly with the republican party, and, next to Cromwell, was the ablest officer the parliament had.

In 1648-9, he was appointed, in conjunction with Colonel Dean and Colonel Popham, to command the fleet; and soon after blocked up Prince Maurice and Prince Rupert in Kinsale harbour. But these getting out, Blake followed them from port to port; and at last attacked them in that of Malaga, burnt and destroyed their whole fleet, two ships only excepted, the Reformation in which Prince Rupert himself was, and the Swallow commanded by his brother Prince Maurice. In 1652, he was constituted sole admiral; when he defeated the Dutch fleet commanded by Van Tromp, Royter, and de Witt, in three several engagements, in which the Dutch lost 11 men of war, 30 merchant ships, and according to their own accounts, had 1500 men slain. Soon after Blake and his colleagues, with a grand fleet of 100 sail, stood over to the Dutch coast; and forced their fleet to fly for shelter into the Texel, where they were kept for some time by Monk and Dean, while Blake sailed northward. At last, however, Tromp got out, and drew together a fleet of 120 men of war; and on the 3d of June, the generals Dean and Monk came to an engagement with the enemy off the North Foreland with indifferent success: but the next day Blake coming to their assistance with 18 ships, gained a complete victory; so that if the Dutch had not saved themselves on Calais sands, their whole fleet had been sunk or taken.

In April 1653, Cromwell turned out the parliament, and shortly after assumed the supreme power. The states hoped great advantages from this, but were disappointed. Blake said on this occasion to his officers, "It is not for us to mind state affairs, but to keep foreigners from fooling us."—In November 1654 Cromwell sent him with a strong fleet into the Mediterranean, with orders to support the honour of the English flag, and to procure satisfaction for the injuries that might have been done to our merchants. In the beginning of December, Blake came into the road of Cadiz, where he was treated with all imaginable respect; a Dutch admiral would not hoist his flag while he was there; and his name was now grown so formidable, that a French squadron having stopped one of his vessels, which had been separated from Blake in a storm, the admiral, as soon as he knew to whom it belonged, sent for the captain on board, and drank Blake's health before him with great ceremony, under a discharge of five guns, and then dismissed him. The Algerines were so much afraid of him, that, stopping the Sallee rovers, they obliged them to deliver up what English prisoners they had on board, and then sent them freely to Blake, in order to purchase his favour. This, however, did not prevent his coming on the 10th of March before Algiers, and sending an officer on shore to the bey to demand satisfaction for the piracies committed on the English, and the release of all the English captives. The bey, in his answer, alleged, that the ships and captains belonged to private men, and therefore he could not restore them without offending all his subjects, but that he might easily redeem them: and if he thought good, they would conclude a peace with him, and for the future offer no acts of hostility to the English; and having accompanied this answer with a large present of fresh provisions, Blake left Algiers, and sailed on the same errand to Tunis; the day of which place not only refused to comply with his request, but denied him the liberty of taking in fresh water. "Here (said he), are our castles of Goletto and Porto Ferino; do your worst." Blake, at hearing this, began, as his custom was when highly provoked, to curl his whiskers; and after a short consultation with his officers, bore into the bay of Porto Ferino with his great ships and their seconds; and coming within musket-shot of the castle and the line, fired on both so warmly, that in two hours' time the castle was rendered defenceless, and the guns on the works along the shore were dismounted, though 60 of them played at a time on the English. Blake found nine ships in the road, and ordered every captain to man his long boat with choice men, to enter the harbour and fire the Tunisians; which they happily effected, with the loss of 25 men killed and 48 wounded, whilst he and his men covered them from the castle by playing continually on them with their great guns. This daring action spread the terror of his name through Africa and Asia. From Tunis he sailed to Tripoli, caused the English slaves to be set at liberty, and concluded a peace with that government. Thence returning to Tunis, the Tunisians implored his mercy, and begged him to grant them peace, which he did upon terms highly advantageous to England. He next sailed to Malta, and obliged the knights to restore the effects taken
taken by their privateers from the English; and by these great exploits so raised the glory of the English name, that most of the princes and states in Italy thought fit to pay their compliments to the Protector, by sending solemn embassies to him.

He passed the next winter either in lying before Cadiz, or in cruising up and down the Straits: and was at his old station, at the mouth of that harbour, when he received information that the Spanish plate fleet had put into the bay of Sancta Cruz, in the island of Tenerife: upon this he weighed anchor, with 35 men of war, on the 13th of April 1657; and on the 20th rode with his ships off the bay of Sancta Cruz, where he saw 16 Spanish ships lying in the form of a half-moon. Near the mouth of the harbor stood a castle furnished with great ordnance; besides which there were seven forts round the bay, with six, four, and three guns on each, joined to each other by a line of communication manned with musketeers. To make all safe, Don Diego Dugas, general of the Spanish fleet, caused all the smaller ships to be moored close along the shore; and the six large galleons stood farther out at anchor, with their broadsides towards the sea. Blake having prepared for the fight, a squadron of ships was drawn out to make the first onset, commanded by Captain Stayner in the Speaker frigate; who no sooner received orders, than he sailed into the bay, and fell upon the Spanish fleet, without the least regard to the forts which spent their shot prodigallly upon them. No sooner were these entered into the bay, but Blake, following after, placed several ships to pour broadsides into the castle and forts; and these played their parts so well, that, after some time, the Spaniards found their forts too hot to be held. In the mean time, Blake struck in with Stayner, and bravely fought the Spanish ships, out of which the enemy were beaten by two o'clock in the afternoon; when Blake, finding it impossible to carry them away, ordered his men to set them on fire; which was done so effectually, that they were all reduced to ashes, except two, which sunk downright, nothing remaining above the water but part of the masts. The English having now obtained a complete victory, were reduced to another difficulty by the wind, which blew so strong into the bay, that they despaired of getting out. They lay under the fire of the castles and of all the forts, which must in a little time have torn them to pieces. But the wind suddenly shifting, carried them out of the bay; where they left the Spaniards in astonishment at the happy temerity of their audacious victors. This is allowed to have been one of the most remarkable actions that ever happened at sea. "It was so miraculous (says the Earl of Clarendon), that all men who knew the place wondered that any sober man, with what courage soever endowed, would ever have undertaken it; and they could hardly persuade themselves to believe what they had done; whilst the Spaniards comforted themselves with the belief, that they were devils and not men who had destroyed them in such a manner." This was the last and greatest action of the gallant Blake. He was consumed with a dysentery and scurvy; and hastened home, that he might yield up his last breath in his native country, which he had so much adorned by his valour. As he came within sight of land, he expired.——Never man, so zealous for a faction, was so much respected and esteemed by the opposite factions. Disinterested, generous, liberal; ambitious only of true glory, dreadful only to his avowed enemies; he forms one of the most perfect characters of that age, and the least stained with those errors and vices which were then so predominant. The Protector ordered him a pompous funeral at the public charge: but the tears of his countrymen were the most honourable panegyric on his memory. The lord Clarendon observes, "that he was the first man who brought ships to contemn castles on shore, which had ever been thought very formidable, and were discovered by him to make a noise only, and to fright those who could be rarely hurt by them. He was the first that infused that degree of courage into seamen, by making them see by experience what mighty things they could do if they were resolved; and the first that taught them to fight in fire as well as in water."

BLAMONT, a town of France, in the department of Meurthe, seated on a little river called Vesoune, 12 miles south of Luneville, and containing 1860 inhabitants in 1815. E. Long. 6. 51. N. Lat. 48. 35.

BLANC. See BLANK.

BLANC, a town of France, in the department of Indre, seated on the river Creuse, by which it is divided into two parts. The land about it is barren, and full of trees, heath, and lakes. Population 3850 in 1815. E. Long. 1. 13. N. Lat. 46. 38.

Mont Blanc, a stupendous mountain in Savoy, the highest of the Alps, and encompassed by those wonderful collections of snow and ice called the Glaciers. See ALPS.

Of these glaciers there are five, which extend almost to the plain of the vale of Chamouni, and are separated by wild forests, corn fields, and rich meadows; so that immense tracts of ice are blended with the highest cultivation, and perpetually succeed to each other in the most singular and striking vicissitude. All these several valleys of ice, which lie chiefly in the hollows of the mountains, and are some leagues in length, unite together at the foot of Mont Blanc; the highest mountain in Europe, and probably of the ancient world.

The summit of this mountain was deemed inaccessible before Dr. Paccard, a physician at Chamouni, attempted to reach it in August 1785, and succeeded in the attempt. Soon after, the same undertaking was accomplished by M. de Saussure, who has published a narrative of the journey. He arrived at Chamouni, situated at the foot of the mountain, in the beginning of July 1787; but bad weather prevented him from ascending until the first of August, when he began his expedition, accompanied by a servant and eighteen guides, who carried his philosophical and other apparatus. His son was left at the Priory in Chamouni, and was employed in making meteorological observations, with which those made on the top of the mountain might be compared. Although it is scarcely six miles and three quarters in a straight line from the priory of Chamouni to the top of Mont Blanc, it requires nevertheless 18 hours to gain the summit, owing to the bad roads, the windings, and the great perpendicular height of the mountain. That it might be perfectly at liberty to pass the night on what part of the mountain he pleased, he carried a tent with him; and
and he and his company slept in it the first night on that eminence which is first met with, and which is on the south of the priory, and about a mile perpendicularly above the village.

Hitherto the journey was free from danger, or even difficulty; the road being either rocky or covered with grass; but thence upwards it was either wholly covered with snow, or consisted of the most slippery ice. But the second day's journey was attended with many difficulties. The ice valley on the side of the hill must be passed, in order to gain the foot of that chain of rocks bordering on the perpetual snows which cover Mont Blanc. The passage through this valley is extremely dangerous, since it is intersected with numerous wide, deep, and irregular chasms, which can only be crossed by means of bridges naturally formed of snow, and these often very slender, extended as it were over an abyss. One of the guides had almost perished here the evening before, as he with two others went to reconnoitre the road. They had the precaution to tie themselves together with a long rope, and he in the middle had the misfortune to have the snow-bridge, over the wide and deep chasm, break under him, so that he remained suspended between his two comrades. M. de Saussure and his retinue passed very near the opening through which this man had fallen, and shuddered at the danger in which the poor fellow had been involved. The difficulties they had to encounter in this valley, and the winding road they were obliged to take through it, occasioned their being three hours in crossing it, although in a straight line its breadth is not above three quarters of a mile.

After having reached the rocks, they mounted in a serpentine direction to a valley filled with snow, which runs from north to south to the foot of the highest pinnacle. The surface of the snow in this valley has numerous fissures, which penetrate so deep that their bottom is nowhere to be seen, although they are of considerable breadth. The sides of these fissures, where the snow is broken perpendicularly, afford an opportunity of observing the successive horizontal layers of snow which are annually formed.

The guides were desirous of passing the night near one of the rocks on the side of this valley; but as the loftiest of them is at least 1400 yards perpendicularly lower than the summit of the mountain, M. de Saussure was desirous of ascending higher; in consequence of which it would be necessary to encamp on the snow: but he found it difficult to convince his companions of the practicability of the plan. They imagined that during the night an intolerable cold prevailed in those heights which were eternally covered with snow, and they were seriously afraid of perishing. By proper encouragements, however, he induced them to proceed; and at four in the afternoon they arrived at the second of the three plains of snow which they had to pass. Here they encamped at the height of 3100 yards above the priory of Chamouni, and 4250 yards above the level of the sea, which is about 200 yards higher than the peak of Teneriffe. They did not proceed to the last plain, on account of the day having been far advanced; and they were also apprehensive of exposing themselves to the avalanches which are frequently tumbling from the summit of the mountain. They dug a deep hole in the snow, sufficiently wide to contain the whole company, and covered its top with the tent-cloth.

In making this encampment, they began to experience the effects of the rarity of the atmosphere. Robust men, to whom seven or eight hours walking or rather climbing were an absolute nothing, had scarcely raised five or six shovels full of snow, before they were under the necessity of resting and relieving each other almost incessantly. One of them, who had gone back a small distance to fill a cask with some water which he had seen in one of the crevices of the snow, found himself so much disordered in his way, that he returned without the water, and passed the night in great pain.

M. de Saussure, who is so much accustomed to the air of mountains as to say, "That in general I feel myself better in such air than in that of the plains, was exhausted with the fatigue of making his meteorological observations. The principal inconvenience which the thinness of the air produces, is an excessive thirst. They had no means of procuring water but by melting the snow; and the little stove which they had carried with them, afforded but a feeble supply for twenty men."

This region of the mountain presents to the view nothing but snow of the purest and most dazzling whiteness, forming a very singular contrast with the sky, which appears remarkably black.

"No living creature (says M. de Saussure) is to be seen in these desolate regions, nor is the least trace of vegetation to be discovered. It is the habitation of cold and silence! When I reflected that Dr. Paccard, and his guide Jacques Balmat, who first visited these deserts, arrived here at the decline of the day, without shelter, without assistance, and wholly ignorant where or how they were to pass the night, without even the certainty that it was possible for men to exist in the places they had undertaken to visit; and yet that they were able to pursue their journey with unremitted intrepidity, I could not but admire their strength and courage. My guides were so firmly prepossessed with the fear of cold, that they shut up every aperture of the tent with the utmost exactness; so that I suffered very considerably from the heat and the vitiated air, which had become highly noxious from the breaths of so many people in a small room. I was frequently obliged, in the course of the night, to go out of the tent, in order to relieve my breathing. The moon shone with the brightest splendour, in the midst of a sky as black as ebony. Jupiter, raved like the sun, arose from behind the mountain in the east. The light of these luminaries was reflected from the white plain or rather bases in which we were situated; and dazzling eclipsed every star except those of the first and second magnitude. At length we composed ourselves to sleep. We were, however, soon awakened by the noise of an immense mass of snow (avalanche) which had fallen down from the top of the mountain, and covered part of the slope over which we were to climb the next day."

As they were obliged to melt a great quantity of snow, and prepare many necessaries for their further progress in their journey, it was late the next morning before they took their departure.

"We began our ascent (continues M. de Saussure) to the third and last plain, and then turned to the left, in our way to the highest rock, which is on the east part
part of the summit. The ascent is here very steep, being about 39 degrees inclined to the horizon, and bounded on each side by precipices. The surface of the snow was so hard and slippery, that our pioneers were obliged to hew out their footsteps with hatchets. Thus we were two hours in climbing a hill of about 530 yards high. Having arrived at this last rock, we turned to the westward, and climbed the last ascent, whose height is about 300 yards, and its inclination about 28 or 29 degrees. On this peak the atmosphere is so rare, that a man’s strength is exhausted with the least fatigue. When we came near the top, I could not walk fifteen or sixteen steps without stopping to take breath; and I frequently perceived myself so faint, that I was under the necessity of sitting down from time to time; and in proportion as I recovered my breath, I felt my strength renewed. All my guides experienced similar sensations, in proportion to their respective constitutions. We arrived at the summit of Mont Blanc at 11 o’clock in the forenoon.

I now enjoyed the grand spectacle which was under my eyes. A thin vapour, suspended in the inferior regions of the air, deprived me of the distinct view of the lowest and most remote objects, such as the plains of France and Lombardy; but I did not so much regret this loss, since I saw, with remarkable clearness, what I principally wished to see, viz. the assemblage of those high ridges, with the true form and situations of which I had long been desirous of becoming thoroughly acquainted. I could scarcely believe my eyes. I thought myself in a dream when I saw below my feet so many majestic peaks, especially the Needle, the Mi-
di-Argentiere, and Géant, whose bases had proved so difficult and dangerous of access. I obtained a perfect knowledge of their proportion to, and connexion with, each other; of their form and structure; and a single view removed more doubts, and afforded more information, than whole years of study.

While I was thus employed, my guides pitched my tent, and were fixing the apparatus for the experiments I had proposed to make on boiling water; but when I came to dispose my instruments for that purpose, I was obliged, almost at every instant, to desist from my labours, and turn all my thoughts to the means of respiration. When it is considered that the mercury in the barometer was no higher than 16 inches and a line (17.145 inches English), and that this air had consequently little more than half the density of that on the plains, the breathing must necessarily be increased, in order to cause, in a given time, the passage of a sufficient quantity of air through the lungs. The frequency of respiration increased the circulation of the blood, more especially as the arteries on the surface of the body had not the pressure they were usually accustomed to. We were all in a feverish state, as will be seen in the sequel.

While I remained perfectly still, I experienced but little uneasiness more than a slight oppression about my heart; but, on the smallest bodily exertion, or when I fixed my attention on any object for some moments together, and particularly when I pressed my chest in the act of stooping, I was obliged to rest and pant for two or three minutes. My guides were in a similar condition. We had no appetite; and our provisions, which were all frozen, were not well calculated to excite it; nor had we any inclination for wine or brandy, which increased our indisposition, most probably by accelerating the circulation of the blood. Nothing but fresh water relieved us; and much time and trouble were necessary to procure this article, as we could have no other than melted snow. I remained on the summit till half past three; and though I did not lose a single moment, I was not able to make all these experiments in four hours and a half, which I have frequently done in less than three on the sea-side. However, I made with great exactness those which were most essential.

We returned much easier than I had expected; since, in descending, we did not experience any bad effects from the compression of the thorax; our respiration was not impeded, and we were not under the necessity of resting, in order to recover our breath and strength. The road down to the first plain was nevertheless by no means agreeable, on account of the great declivity; and the sun, shining so bright on the tops of the precipices below us, made so dazzling an appearance, that it required a good head to avoid growing giddy from the prospect. We pitched our tent again on the snow, though we were more than 400 yards below our last night’s encampment. I was here convinced that it was the rarity of the air, and not the fatigue of the journey, that had incommoded us on the summit of the mountain, otherwise we should not have found ourselves so well, and so able to attack our supper with a good appetite. I could now also make my meteorological observations without any inconvenience. I am persuaded that the indisposition in consequence of the rarity of the atmosphere is different in different people. For my own part I felt no inconvenience at the height of 4000 yards, or nearly two miles and a quarter; but I began to be much affected when I was higher in the atmosphere.

The next day we found that the ice valley which we had passed on our first day’s journey had undergone a considerable change from the heat of the two preceding days, and that it was much more difficult to pass than it had been in our ascent. We were obliged to go down a declivity of snow of no less than 50 degrees of inclination, in order to avoid a chasm which had happened during our expedition. We at length got down as low as the first eminence on the side about half after nine, and were perfectly happy to find ourselves on a foundation which we were sure would not give way under our feet.

From the narrative, we learn, that the summit of the mountain is a ridge nearly horizontal, lying east and west: the slope at each extremity is inclined from 28 to 30 degrees, the south side between 15 and 25, and the north about 45 or 50. This ridge is so narrow as scarcely to allow two people to walk abreast, especially at the west end, where it resembles the roof of a house. It is wholly covered with snow; nor is any bare rock to be seen within 150 yards of the top. The surface of the snow is scaly, and in some places covered with an icy crust, under which the snow is white, and without inconstancy. The highest rocks are all granites; those on the east side are mixed with statites; those on the south and the west contain a large quantity of schoen, and a little lapis cornuus. Some of them, especially those on the east, which are about 150 yards be-
low the summit, seem to have been lately shivered with lightning.

M. de Saussure saw no animals on the mountain, except two butterflies, which he supposes must have been driven thither by the wind. Lichens are the only vegetables which are found on the more elevated parts of these mountains; the silene ocellata, which grows in great quantities on the lower parts, disappears at the height of about two miles above the level of the sea.

M. de Saussure has given us the height of the barometer on the top of Mont Blanc, August 3d at noon, 16 inches, 0 lines, and 1/2 of a line, French measure (i.e. 16.181 English); and Reaumur's thermometer was 2.3 below the freezing point. M. Sennebier, at the same time, observed at Geneva the barometer 27.24533 (29.020 inches English); and the thermometer 22.6 above freezing. From these data he makes the height of Mont Blanc 2218 toises, or 14180 English feet (about 21/2 miles), according to M. de Luc's rule; and 2272 toises, or 14525 English feet, according to M. Trembley's. To these heights 13 toises, or 83 feet, the height of M. Sennebier's room above the lake of Geneva must be added, to give the height of the mountain above the level of the lake, 14263 feet according to M. de Luc, and 14608 feet according to M. Trembley. Sir George Shuckburgh made the height of Mont Blanc, by trigonometrical measurement, 14429 feet above the lake, which is almost the mean between the other two. The result of the observations made at Chamouni, contemporary with those on Mont Blanc, agrees still nearer with Sir George's measurement. The general mean result makes the summit of Mont Blanc 2450 toises, 14973 English feet, or three miles nearly, above the level of the sea.

M. de Saussure found by his electrometer, that the electricity of the air on the summit of the mountain was positive. Water boiled at 68.993 degrees of a thermometer, which rises to 80 with the barometer 27 French inches high. The wind was north, and extremely piercing on the summit; but, southward of the ridge, the temperature of the air was agreeable. The experiments with lime-water, and with the caustic alkali, show that the air was mixed with carbonic acid or fixed air. See ATMOSPHERE.

BLANC-MANGER, Fr. q. d. white food, is a preparation of dissolved isinglass, milk, sugar, cinnamon, &c. boiled into a thick consistence, and garnished for the table with blanched almonds. It is cooling and strengthening.

BLANCARDS, a name given to certain linen-cloths, thus called, because the thread used to weave them has been half blanched or bleached before it was used. They are manufactured in Normandy, particularly in the places which are in the district or under the jurisdiction of Pont-Audemer, Bernay, and Lisieux.

BLANCH-FERME, or Blank farm, a white farm, that is, where the rent was to be paid in silver, not in cattle. In ancient times, the crown rents were many times reserved to be paid in libris albis, called blanch firmes: in which case the buyer was helden dealbare firmans, viz. his base money or coin, worse than standard, was melted down in the exchequer, and reduced to the fineness of standard silver; or instead thereof he paid to the king 1/2d. in the pound by way of addition.

BLANCH-HOLDING, in Law, a tenure by which the vassal is only bound to pay an annual yearly duty to his superior merely as an acknowledgment of his rights. See LAW.

BLANCHARD, JAMES, an excellent painter, was born at Paris, and learnt the rudiments of his profession under Nicholas Borreri his uncle; but left him at 20 years of age, and travelled into Italy. He stayed two years at Rome, and from thence went to Venice, where he was so charmed with the works of Titian, Tintoret, and Paul Veronese, that he resolved to follow their manner; and in this he succeeded so far, that at his return to Paris he soon became generally esteemed for the novelty, beauty, and force of his pencil. He painted two galleries at Paris, one belonging to Perault, the first president, and the other to Bullion, superintendent of the finances; but his capital piece is a picture of the descent of the Holy Ghost, in the church of Notre Dame. He was seized in the flower of his age, with a fever and imposthume in the lungs, of which he died in 1685. Of all the French painters Blanchard was esteemed the best colourist, he having carefully studied this part of painting in the Venetian school.

BLANCHING, the art or manner of making any thing white. See BLEACHING.

BLANCHING of Iron Plates, is performed with aquafortis and tin.

BLANCHING of Wooden Stuffe, is done with soap, chalk, or sulphur. See BLEACHING Index.

BLANCHING of Silk, is performed with soap and brimstone.

BLANCHING of Wax, is by exposing it to the sun and dew. See BLEACHING Index.

BLANCHING, in coinage, the operation performed on the planchetts, or pieces of silver, to give them the requisite lustre and brightness. They also blanch pieces of plate, when they would have them continue white, or have only some parts of them burnished.—Blanching, as is now practised, is performed by heating the pieces on a kind of peel with a wood fire, in the manner of a reverberatory; so that the flame passes over the peel. The pieces being sufficiently heated and cooled again, are put successively to boil in two pots, which are of copper: in these they put water, common salt, and tartar of Montpelier. When they have been well drained of this water in a copper sieve, they throw sand and fresh water over them; and when dry, they are well rubbed with towels.

BLANCHING, among gardeners, an operation whereby certain salads, roots, &c. are rendered whiter than they would otherwise be.—It is thus: After pruning off the tops and roots of the plants to be blanched, they plant them in trenches about ten inches wide, and as many deep, more or less as is judged necessary; as they grow up, care is taken to cover them with earth, within four or five inches of their tops: this is repeated from time to time, for five or six weeks; in which time they will be fit for use, and of a whitish colour where covered by the earth.

BLANCHING also denotes the operation of covering iron plates with a thin coat or crust of tin. See LATTICE.
BLANCO, a cape or promontory of Africa, in the Atlantic ocean. W. Long. 18. 30. N. Lat. 20. 0.
BLANCO, a promontory of Peru in South America, in the South sea. W. Long. 81. 10. N. Lat. 11. 50.
BLANDA, in Ancient Geography, a Roman city in the territory of Bascino in Hispania Citerior: Now Blanes, a sea-port town of Catalonia, situated near the river Tordera. E. Long. 5. 40. N. Lat. 41. 30.
BLANDFORD, a town of Dorsetshire in England. It is pleasantly situated on the river Stour near the Downs, but has been subject to several dreadful fires, particularly in 1751, when almost the whole town was burnt down; but it has since been rebuilt finer than before. It has the title of a marquisate, and contained 2425 inhabitants in 1811. W. Long. 2. 15. N. Lat. 50. 50.
BLANDONONA, in Ancient Geography, a small city of Liguria in Italy: Now Bron or Broni. See that article.
BLANES, See BLANDA.
BLANK, or BLANC, in a general sense, signifies white; and Blancus, or Blanca, is more particularly used for a kind of white or silver money, of base alloy, coined by Henry V. in those parts of France then subject to England, valued at 8d. sterling. They were forbidden by his successor to be current in this realm. In some ancient charters they are called solidi blanci, white shillings.
BLANK also denotes a small copper coin, formerly current in France, at the rate of five deniers Tournais. They had also great blanks, or pieces of three blanks, and others of six, in respect whereof the single sort were called little blanks: but of late they are all become only moneys of account.
BLANK, or BLANK-Ticket, in lotteries, that to which no prize is allotted. The French have a game, under the denomination blague, answering to our lottery.
BLANK, in coinage, a plate, or piece of gold or silver, cut and shaped for a coin, but not yet stamped.
BLANK-Stop, in Law, is used for the same use as what we call a common bar, and is the name of a plea in bar, which in an action of trespass is put in to oblige the plaintiff to assign the certain place where the trespass was committed.
BLANKS, in judicial proceedings, certain void spaces sometimes left by mistake. A blank (if something material be omitted) in a declaration abates the same: and such a blank is a good cause of demurrer.
BLANK-Verse, in the modern poetry, that composed of a certain number of syllables, without the assistance of rhyme. See POETRY, Part iii.
Point Blank. See POINT-BLANK.
BLANKENBURG, a town of Germany, in the circle of Westphalia and duchy of Berg. E. Long. 7. 18. N. Lat. 50. 54.
BLANKENBURG, a town of Germany, in the circle of Lower Saxony, and capital of the county of the same name, subject to the duke of Brunswick-Wolfenbuttel. The castle or palace is a modern building, and is the residence of the princess dowager. E. Long. 11. 20. N. Lat. 51. 50.
BLANKENHEIM, a small territory of Germany with the title of a county, which is part of that of Eyll, near the archbishopric of Cologne and duchy of Juliers.
BLANKET, in Commerce, a warm woolly sort of stuff, light and loose woven, chiefly used in bedding.
The manufacture of blankets is chiefly confined to Witney in Oxfordshire, where it is advanced to that height, that no other place comes near it. Some attribute a great part of the excellency of the Witney blankets to the abstrusive nitrous water of the river Windrush, wherewith they are scoured; others rather think they owe it to a peculiar way of loose spinning which the people have thereabouts. Be this as it will, the place has engrossed almost the whole trade of the nation for this commodity; insomuch that the wool fit for it centres here from the furthermost parts of the kingdom. Blankets are made of felt-wool, i. e. wool from off sheep-skins, which they divide into several sorts. Of the head wool and bay wool they make blankets of twelve, eleven, and ten quarters broad; of the ordinary and middle sort, blankets of eight and seven quarters broad; of the best tail wool, blankets of six quarters broad, commonly called cote, serving for seamen's hammocks. See Hykes.
Tossing in a Blanket, a ludicrous kind of punishment, of which we find mention in the ancients under the denomination sagatio. Martial describes it geographically enough. *Ibis ab excusco, misus ad astra, sago.*
A late writer represents it as one of Otho's imperial delights. But this is turning the tables: that emperor's diversion, as related by Suetonius, was not to be the subject, but the agent, in the affair: it being his practice to stroll out in dark nights, and where he met with a helpless or drunken man, to give him the discipline of the blanket.
BLANKOF, JOHN TEUNISZ, a painter of great abilities, was born at Alkmaar in 1628; and received his earliest instruction from Arent Tierling: but afterwards he was successively the disciple of Petrus Scheyenburgh and Caesar Van Everdingen. When he had spent some years with these masters, he went to Rome, where during his continuance in that city, he was studiously diligent in copying the works of the best masters, and was admitted into the society of the Flemish painters called Bentengel, who gave him the name of Jan Most (which in Dutch signifies mate or companion), and by that name he is most generally known. His subjects were landscapes, with views of rivers or sea shores, havens or ports, which he executed with a light free pencil; and in the representation of storms and calms (as nature was always his model) he described those subjects with great truth, exactness, and neatness of handling. The pictures of this master which are most commended are the Italian sea ports, with vessels lying before them. He possessed a lively imagination; nor was his hands less expeditious than his thoughts: and the connoisseurs agreed in opinion, that if he had bestowed more labour on his pictures than he usually did, or if he had finished them more highly, he would certainly have destroyed a great deal of their spirit, force, and effect. His most capital performance is a view of the sea shore, with the waves retiring at ebb tide; which is described by Houbraken as being wonderfully beautiful and natural. He died in 1670.
BLANQUILLE, in Commerce, a small silver coin current in the kingdom of Morocco, and all that part of the coast of Barbary; it is worth about three half-pence of our money.
BLA [ 658 ]

Bla

BLARE, in Commerce, a small copper coin of Bern, nearly of the same value with the riltz.

BLAGHENIES, a town of the Netherlands, in the province of Hainault, seated in E. Long. 3°. 35'. N. Lat. 50°. 30'. Near this place the English and their allies, under the duke of Marlborough obtained a bloody victory over the French in 1709. This is most commonly called the battle of Malplaquet. See Malplaquet.

BLASE, bishop of Sebastia in Cappadocia, in the second and third centuries, suffered death under Diocletian by decapitation, after being whipped and having his flesh torn with iron combs. He is a person of great note among the vulgar, who in their processions relative to the woollen trade, always carry a representation of him as the inventor or patron of the art of wool-combing; though that art must have been known long before his time. It is difficult to say how the invention came to be attributed to him; but it had probably no better origin than the circumstance of his being tortured by instruments used in combing of wool.

BLASIA, Leather-cup. See Botany Index.

BLASPHEMY (blasphemia, or blasphemiwm), in middle-age writers, denotes simply the blaming or condemning of a person or thing. The word is Greek, βλασφημία, from βλασφήμω, ludo. Among the Greeks to blaspheme was to use words of evil omen, or that portended something ill, which the ancients were careful to avoid, substituting in lieu of them other words of softer and gentler import; sometimes the very reverse of the proper ones.

BLASPHEMY is more peculiarly restrained to evil or reproachful words spoken of the Deity. Augustine says, jam vulgo blasphemia non accipitur nisi mala verba de Deo dicere.

According to Lindwood, blasphemy is an injury offered to God, by denying that which is due and belonging to him; or attributing to him what is not agreeable to his nature. By the Mosaic law, blasphemy was punished with death; Levit. xxiv. ver. 13—16. As also by the civil law; Novell. 77. In Spain, Naples, France, and Italy, the pains of death are not now inflicted. In the empire, neither amputation or death is made the punishment of this crime.

By the canon law, blasphemy was punished only by a solemn penance; and by custom either by a pecuniary or corporal punishment. By the English laws, blasphemies of God, as denying his being or providence, and all contumelious reproaches of Jesus Christ, &c. are offences by the common law, and punishable by fine, imprisonment, and pillory. And, by the statute law, he that denies one of the persons in the Trinity, or asserts there are more than one God, or denies Christianity to be true, for the first offence is rendered incapable of any office; for the second, adjudged incapable of suing, being executor or guardian, receiving any gift or legacy, and to be imprisoned for three years.

According to the law of Scotland, the punishment of blasphemy is death. The first species thereof consists in railing at or cursing God; and here the single act constitutes the crime. The second consists in denying the existence of the Supreme Being, or any of the persons of the Trinity; and therein obstinately persevering to the last. For reiterated denial does not fully constitute the crime, because the stat. of Charles II. Blasphemy, 1661, admits of repentance before conviction, as a complete expiation.

This statute of 1661 is ratified by a statute of King William, whereby the calling in question the existence of God, or of any of the persons of the Trinity, or the authority of Scriptures, or the Divine Providence, is made penal: For the first offence, imprisonment till satisfaction given by public repentance in sackcloth; for the second, a fine of a year's valued rent of the real estate, and twentieth part of the personal estate; and the trial in both these cases is competent to inferior judges. The trial of the third offence is death, to be tried only by the justices.

BLASPHEMY against the Holy Ghost. Divines are not agreed with respect to the nature of the crime thus denominated (Mat. chap. xii. ver. 31.), and the grounds of the extreme guilt ascribed to it. Dr Tillotson maintains, that it consisted in maliciously attributing the miraculous operations which Christ performed by the power of the Holy Ghost to the devil. Dr Whitby refers it to the dispensation of the Holy Ghost, which commenced after our Lord's resurrection and ascension; and those were guilty of the crime who persisted in their unbelief and blasphemed the Holy Ghost, representing him as an evil spirit. The crime was unpardonable, because it implied a wilful opposition to the last and most powerful evidence which God would vouchsafe to mankind, and prejudice the possibility of a recovery to faith and repentance.

BLAST, flatus, in the military art, a sudden compression of the air caused by the discharge of the bullet out of a great gun. The blast sometimes throws down part of the embrasures of the wall.

BLAST is also applied in a more general sense to any forcible stream of wind or air, excited by the mouth, bellows, or the air.

BLAST is also used in agriculture and gardening, for what is otherwise called a blast.

Blasts or blastings are by some supposed owing to cold; by others to the want of a due supply of sap; by others to ascending fumes of the earth; by others to sharp winds and frosts, immediately succeeding rains. That species called uredines or fire-blasts, is supposed by Mr Hales owing to the solar rays reflected from or condensed in the clouds, or even collected by the dense steam in hop-gardens and other places. The effect of them is to wither, shrivel, scorch, turn black, and as it were burn up the leaves, blossoms, and fruits of trees, shrubs, herbs, grass, corn, even for whole tracts of ground.

Physicians also speak of a kind of blasts affecting human bodies, and causing erysipelas, pellagra, &c.

BLASTS, among miners. See Damps.

BLASTED, something struck with a blast. Among the Romans, places blasted with lightning were to be consecrated to Jupiter, under the name of Indesulcia and putoelia. It was also a ceremonial of religion to burn blasted bodies in the fire.

BLASTING, among miners, a term for the tearing up rocks, which they find in their way, by gunpowder. The method of doing which is this: they make a long hole like the hollow of a large gun-barrel in the rock they would split; this they fill with gunpowder; then firmly stop up the mouth of the hole.
BLEACHING.

2. BLEACHING, or Blanching, (Blanchir, Fr.) originally signifies the art of whitening any substance by other means than painting; but it is more particularly applied to a branch of trade or manufacture exercised by persons called bleachers, who, by certain processes of a chemical nature, give to woolen, linen, and cotton stuffs, &c. the greatest degree of whiteness of which they are susceptible.

3. Till lately this art had not occupied any considerable share of attention, except to those who were more immediately concerned in the practice of it. Its processes were few, and though exceedingly tedious, were simple and easily understood. The late rapid progress of chemical science, has however thrown so much light on the theory of the art, and contributed so materially to the improvement of its processes, that it has become a most pleasing field of investigation, and demands a much more considerable space in a modern encyclopaedia than it has hitherto obtained.

4. The improvements made by these gentlemen have been so rapid in their succession, and so important in their consequences, as to have rather created a new art than ameliorated the old. It will hereafter be scarcely credible, that in the space of about twenty years, the whole of an ancient system of bleaching, which had prevailed from time immemorial, should have been entirely overthrown, and replaced by one of the most scientific accuracy, and expeditious management.

5. The origin of this art, like that of many others which are subservient to the comforts or conveniences of man, is involved in great obscurity. We find that a desire for rich and brilliant colours, and for garments of the purest white, has prevailed in civilized society from the earliest periods of which we have any accounts. This was more particularly the case in the eastern countries, as appears from the earliest writers, both of sacred and profane history. It is, however, probable, that the art of dyeing was antecedent to that of bleaching; but the effects of the sun and air in whitening garments, and in discharging the less permanent colours imprinted by the dyer, which must have been very observable in those climates, would soon lead an ingenious people to imitate or increase the action of the atmosphere, and turn to advantage as a luxury what in many cases must have been considered as an inconvenience. Of the methods employed by the ancients in whitening or scouring their various stuffs we are almost entirely ignorant; we know, however, that the Egyptians were accustomed to use some kinds of clay for these purposes, and that they availed themselves of the bleaching powers of the atmosphere. Pliny informs us, that a plant to which he gives the name redicula, was employed for scouring wool; this is probably the same with what we call soapwort. The acrid juice of some species of euphorbia, especially the peplus, is said to have been used in France for whitening linen.
BLEACHING.
6. The art of bleaching is very extensive, and comprehends a variety of objects, whether we consider it as a distinct branch of trade, or as an art called in to the assistance or completion of several of our manufactures. It is essential to the perfection of the linen, the cotton, the silken, the woolen manufacture; it is in many cases a necessary step in preparing stuffs for the dyer and the calico-printer; and to it the paper-maker and the wax-chandler are indebted for the beauty of their productions. To this art belong the scouring of clothes and stuffs, the removal of colours, spots, and stains, the cleaning of books and prints.
7. We shall in the following pages describe the various methods employed to answer these several purposes, and shall endeavour to trace the steps by which bleaching has arrived at the high degree of perfection which it has lately attained. In detailing the processes of the artist, we shall, however, avoid as much as possible his technical language, so as to render this article not only a useful assistant to the practical bleacher, but an interesting object to the philosophic chemist.
8. As the methods of bleaching animal and vegetable substances are different, we may properly divide this article into two parts; in the first of which we shall describe the processes for bleaching wool and silk, and in the second the methods employed in the bleaching of linen, cotton, paper, and other materials furnished by vegetables.

PART I. BLEACHING OF ANIMAL SUBSTANCES.

9. The substances which are derived from the animal kingdom, and which we more particularly employ as articles of clothing, differ essentially from those which are the produce of vegetables. The art of bleaching depends very much on an exact knowledge of those peculiar characters, which form the line of separation between these two classes of bodies, and it is therefore of importance to him who is desirous not only to be master of the several processes in this art, but to understand the theory of the subject, to be acquainted with the nature and properties of each.
10. The animals from whose spoils we obtain our principal clothing are nourished by vegetables, which as they pass through their organs lose their former properties, and acquire others more akin to animal bodies. In particular they are found to contain a new element, azote, which is but sparingly found in the vegetable kingdom, but constitutes one of the most abundant products of animal bodies. They also contain sulphur and phosphorus, as appears from the examination of those pestilential exhalations which always accompany the decomposition of animal matters.
11. It is found that animal matters are more easily separated into their component principles than vegetable, owing to the weaker degree of their mutual attraction. Hence the action of acids and alkalies is much more violent on the former than on the latter, and consequently much more caution is requisite in their employment.
12. In bleaching animal substances recourse must be had to the united action of the fixed alkalies, soap, ammonia or volatile alkali, and sulphurous acid, the choice, preparation, and use of which will be presently described. The animal matters with which the bleacher is more immediately concerned are wool and silk.

CHAP. I. Of Wool.

13. Wool, like hair, of which it is a variety, is composed of filaments or tubes filled with a substance of an oily nature. The surrounding surface of these tubes is pierced with an infinite number of small holes which communicate with the internal cavity. By chemical analysis wool is found to contain carbonat of ammonia, and a considerable quantity of oil. It is very little altered by exposure to the air, and undergoes no change from the action of boiling water. It is of great consequence that the bleacher should attend to this circumstance, as will appear immediately.
14. A solution of caustic alkali, or caustic ley, destroys it altogether, and forms with it a soap, for the discovery and application of which we are indebted to Chap. 3; it is but little acted on by acids, but the application of a violent heat reduces it to a state of fusion. From all these circumstances it appears that wool is nearly allied to oleaginous substances.
15. The examination of these chemical actions is of consequence to direct the bleacher in his operations on this substance: the trifling action which acids exert on wool, and its inalterability in water, even when assisted by heat, show the necessity of having recourse to alkalis or soapy matters; while at the same time the violent action which these exert will point out the propriety of being cautious in their use.

Of Bleaching Wool.

16. The wool as it comes into the hands of the manufacturer usually contains a large portion of the natural greasy matter, from which it must be purified before it can undergo the process of bleaching. Sometimes the farmer cleans it from most of its oil, so as to diminish its weight by 50 or 60 per cent. in order to enhance the value of the article; but care is taken to leave some portion, as the natural fat is found to be the best preservative against the attacks of moths and other insects.
17. The first object then is to carry off the whole of the oily matter, which is called the operation of scouring, and is performed by means of an ammoniacal ley, which is thus prepared. Five parts of river or other soft water are to be mixed with one part of stale purified urine, which is found to contain a large quantity of ammonia. (A)
BLEACHING.

This mixture is to be boiled for a short time, and into this, at about the beat of 50 degrees, or so that the hand of the workman can be easily held in it for a considerable time, the wool is to be thrown. Four or five pails will generally be sufficient for 20 pounds of wool. After steeping for a short time, the wool is to be stirred about in the mixture continually for about a quarter of an hour or 20 minutes, according to the quantity of greasy matter. It is then to be taken out and drained into a basket, so that the drainings may drop into the vessel in which it was steeped, that nothing may be lost. It must now be completely rinsed by exposing it in baskets to a continued stream of clear water, while a workman is perpetually employed in stirring it with a pole, till the water passes off perfectly clear. The wool is then removed, and a fresh quantity put into the basket, which is to be treated in the same manner. The steeping and rinsing are to be repeated till the wool has attained as great a degree of whiteness as it is capable of receiving from this operation. It is necessary, in order to conduct this process to the greatest advantage, that the workmen should attend to the following circumstances.

18. 1st. A quantity of fresh ley must be from time to time added to the bath, as the immersion of the wool is found to weaken its power; but it is better not entirely to renew the bath, as the grease abstracted from the wool, during its immersion, forms with the ammonia of the urine a kind of soap, which much increases the cleansing quality of the bath.

19. 2d. Increasing the temperature of the bath will augment its deterging powers, and may sometimes supply the want of an addition of stale urine; but both these circumstances require caution, as too great a degree of heat hardens the greasy matter, and renders it more difficult of solution; and again, too much urine makes the wool harsh.

20. 3d. After being much used, the bath becomes too foul, and must be entirely renewed.

21. The wool which has properly undergone the process of scouring should be white, soft, elastic, and open; whereas before it was hard, stiff, and greasy. By this operation the wool loses much more of its weight, so that 100 pounds of raw wool, when completely scoured, will not yield more than 30 or 40 lb for the manufacture of cloth.

22. After scouring, the wool is sometimes carried to the fallling mill, in which it acquires an additional degree of whiteness. The above is chiefly employed for the coarser wools, and wool that has yet to be carded for the making of broad cloth, but for the finer kind it is better to employ a bath in which soap has been dissolved. This method is more expensive, but the expense is compensated by the superior quality of the wool which is thus treated. This operation is performed by the comber, and is thus conducted. The wool is divided into parcels containing each about six pounds, and a half. A bath is prepared with two pounds and a half of green or black soap dissolved in a sufficient quantity of boiling water; and in this bath a parcel of the wool is to be washed for a longer or shorter time according to its fineness. It is then wrung by means of a hook, and hung in the sunshine or air to dry. Before it is combed it must undergo a second scouring, which clears it of all the natural oily matter.

23. This quantity of wool is not to be washed all at once, but in successive portions, and fresh hot water is to be added from time to time in order to free the wool more easily from the grease. For wringing it there is a hook fixed at each end of the washing-tub, on which the wool is fastened and turned round by means of a handle or winch, fixed to one of the hooks. As economy should be consulted in every manufacture, a method of scouring wool without soap, would be of considerable advantage. Fullers have long been in the habit of employing a species of clayey earth, called from them fuller's earth, which has the property of combining with the greasy matter and rendering it more soluble in water. A new earth has lately been found on an estate belonging to Lord Warwick, which by certain processes is made to answer the purpose of soap, and a patent for its preparation has been granted to Mr. John Vancouver. It is not distinguished by any particular name, and is disposed or situated in the ground in different strata or layers. The first or uppermost layer is of a greenish or grayish colour; the second layer is of a beautiful lilac or light purple, and the third or undermost is generally white, although the white is found intermixed with the purple. The stratum on which the earth lies, is indurated red marl, and it is superinduced by a bed of gravel. The thickness of the entire stratum of this earth is from four inches to one foot, and its general position is very even, regular, and level. When first taken out of the earth, its colours are very fine, particularly the lilac, which, on exposure to the sun's rays, or to the influence of frost, soon becomes white. On chemical examination, it appears to contain clay, siliceous sand, and the oxide of iron; but a more studied examination would probably show the existence of other peculiarities, from which the detergent property of this earth might be found to arise.

The processes for manufacturing this earth are performed as follows:—After digging it out of the vein, it is dried by means of stoves or otherwise; then pulverised, and sifted through fine sieves; a size is then prepared from white shreds of leather, and the dry sifted earth is beaten up with the size; after which it is formed into convenient parcels or cakes, resembling those of soap, and of such sizes, figures, and dimensions, as are best adapted to the purposes of its intended application. The use of the size is to keep the parts of the earth together, and to moderate the effect of its absorbent quality, which is so extreme, as to cause it to become pulverulent, like quick-lime, when water is added to the dried earth; and on this account the patentee does not confine himself to the use of save soap. At sea, where fresh water cannot be spared for the purpose of washing, the sailors are accustomed to scour their foul linen in stale urine, which so far cleanses them that a subsequent rinsing in salt water renders them tolerably pure and sweet.
BLEACHING.

Bleaching is the process of removing stains from textiles by chemical means. The most common method is the use of sodium hypochlorite (bleach), but other substances such as chlorine, hydrogen peroxide, and potassium permanganate are also used. The process involves the breakdown of the stain molecules, often through oxidation, to leave the fabric cleaner and whiter. Bleaching can be done on fabric in various forms, including washing with detergent and water, soaking in a solution, or spraying directly onto the fabric. The choice of method depends on the type of fabric, the nature of the stain, and the desired outcome. Bleaching is an essential process in the textile industry, allowing manufacturers to produce cleaner, whiter fabrics from a variety of raw materials.
and they will then comprise the whole of the apparatus which we are describing. A cock fixed in the bottom of each cylinder will facilitate the discharge of the liquor into the tub for immersion.

34. "The apparatus which we would recommend for the immersion of the woolen and silken goods in the ley of sulphurous acid perfectly resembles what will be described hereafter for the immersion in oxygenated muriatic acid, and which we have constructed after the principles of Rupp. From conversing on this apparatus with Cit. Widmer of Jouy, we have conceived the design of the present, which is now making at the manufactory of Essonne. Let us suppose an oblong box, divided by a partition in the middle; on each side of this partition is a large reel, on which the stuffs are to be rolled; at each angle is fixed a roller, over which the stuffs pass before they proceed through the partition to be drawn over a similar number of rollers which conduct them to the second reel. The object of this disposition is to make the stuffs pass through the bleaching liquor, and expose it to the greatest possible surface.

35. "For the purpose of turning this reel, we make use of an axis or column of glass which passes through a collar of leather, and has one of its extremities, which is square, fixed into the reel, while the other is fixed to a winch, which gives it the rotatory motion; and in this way we may entirely avoid employing any metallic substance within the vessel. To prevent the escape of the gas, the cover of the tub is made with a ledge which fits exactly into the rim of the box, and of which at least an inch should pass into the deterring liquor.

36. "I propose the following method of bleaching woolen stuffs: We are first to scour them by immersion in a ley slightly alkaline, in the proportion of a pound of potash to 30 pounds of wool. The bath is heated to the temperature of 30 degrees (8).

37. "The old method with stale urine may also be employed. Urine is preferred, because it holds in solution a quantity of salt, which is not sufficient to injure the wool.

38. "When the grease is dissolved, and the wool has been well purified, it is to be washed in warm soapy water. This part of the process is sometimes performed in the fulling mill, sometimes by beaters, and sometimes by treadling in the tub. In every case the grease must be separated by repeated washing before the sulphuring is employed. If we wish to obtain a brilliant whiteness, it would be proper to make the stuffs undergo heat a second, or even a third time, always in water slightly impregnated with soap, in the proportion of two ounces of this substance to a pound of wool. It would be better to repeat this operation, turning the stuffs about with a stick for half an hour, than to endanger injuring the quality of the stuffs by employing too strong a ley.

39. "After scouring with the greatest care, the stuffs are carried to the tubs for steeping in the liquid sulphurous acid, or, as it may be called, the sulphur water; the pieces are rolled upon the reels, and by turning the winch, are made to pass through the acid, till it is observed that they are sufficiently whitened. They are then taken out, and suffered to drain on a table covered with a cloth, that the action of the sulphurous acid on the wood may not injure them; they are afterwards washed in river water, and, if necessary, Spanish white is used. This is done by steeping the pieces in a tub of clear water, in which about eight pounds of Spanish white have been diffused. Two sulphurings are usually employed to obtain a fine white; but in our process, a single immersion, with turning for two or three hours, should be sufficient.

40. "Before recommending the employment of the liquid sulphurous acid, I have made a great many experiments on woolen threads and stuffs, varying the manipulations, and always with the most complete success."

41. Besides the whitening mentioned in the above extract, it is usual to pass the stuffs through water impregnated with blue, or, what is generally practised, after the whitening has been used, the stuffs are taken out, and to the same bath of Spanish whitening and water is added a pail of water, in which about an ounce and a half of fine indigo, or of Prussian blue, have been diffused, the blue being pounded, sifted, and tied up in a little bag, which is stirred round in the water. When the blue water has been added, the bath is well stirred, and the piece of cloth is again passed through it. It is afterwards laid on a packing cloth, and subjected to the fuller's thistle, to raise the nap, it being wetted from time to time with the liquor of the bath. It is then dried, and well beaten with twigs, to carry off the superfluous whitening.

42. Manufacturers have an idea that bad smells, such as foul breath, are capable of producing some change on the bath of blue and white, and thus render a repetition of the process necessary. It is certain, that without attention the white and blue will not be intimately diffused, and that thus a kind of vegetation will be produced on the cloth. When this happens, it must be washed by plunging it into hot water, and then the bath must be repeated.

43. It is chiefly to cloths that are to be of the finest quality that all these processes are adapted. For ordinary flannels, especially such as are intended to be worn next the skin, sulphuring and soap baths are less proper; and the soap especially diminishes the absorbency, which is so desirable a property in these flannels. They are usually prepared by scouring with bran and water, and subsequent rinsing in fair water.

**CHAP. II. Of the Bleaching of Silk.**

44. Silk is a substance possessing some degree of transparency, and is spun by a caterpillar from a matter contained within its body, which has the property of hardening when exposed to the air. The silk-worm is an inhabitant of the southern climates, being originally brought from Asia, and naturalized in the south of Europe about the period of the decline of the Roman empire.

45. The
45. The filaments of silk, as left by the silk-worm, are rolled together into a kind of ball or clew, and in their natural, or what is called the raw state, are covered with a yellow varnish or gum, which obscures their lustre, and gives them an unpleasant roughness.

46. Water has no effect on silk at the boiling temperature, and no change is produced on it by alcohol; but alkaline leys, when tolerably strong, attack, and are capable of dissolving it. The yellow varnish is soluble also in alkaline leys, and it may even be separated by long-continued boiling of the silk. When the varnish is thus carried off, the silk is found to have lost about a fourth of its original weight.

47. Two methods are in practice for bleaching silk; the first, in which it is unguammed or deprived of the natural varnish; the second, in which this is retained, in order to give them that stiffness which is required for gauzes, blonds, &c.

48. In the first process, the silk is to undergo a scouring, similar to what we have described, as necessary for depriving wool of the natural oil. For this purpose, a quantity of water is put into a boiler over a fire, and for every hundred pounds of silk to be scoured, thirty pounds of very fine soap are dissolved. The solution is generally boiled, but before the silk is put into it, the heat must be lowered to about 90 degrees of Fahrenheit, and at this temperature it must be kept during the process. The silks are to be hung in the liquor upon rods or frames, and left till the gum is sufficiently destroyed, care being taken to alter their position now and then, so that every part may be exposed to the action of the heat. When perfectly unguammed, they are flexible and of a dull whiteness; in this state they are to be wrung with the pin to clear them of the soapy water, then well shaken, and put into coarse linen bags, in parcels of from twenty to thirty pounds each.

49. These bags are now to be steeped in a fresh bath, or, as the workmen speak, are to be barked. The bath is prepared in a manner and proportion much as before, except that the quantity of soap may be somewhat diminished, as the heat is to be increased; for the silk is now to be boiled for two or three hours, taking care to keep the bags from sticking to the bottom of the boiler, by frequently stirring them with a stick.

50. For silk that is intended to be dyed, the former steeping in the lukewarm bath is unnecessary, and the present boiling only is employed, using a greater quantity of soap in proportion to the fineness of the colour. Thus for the ordinary colours, the proportion above laid down, or even less, will suffice; but for the saffronum colours, and the poppy and cherry red, even 50 pounds are sometimes employed to the 100 pounds of silk.

51. After boiling, the silk is wrung as before, and then washed thoroughly in a stream of water; they are then examined, and if it appears that they are not sufficiently or not uniformly scoured, they must be submitted to a fresh bath.

52. The white silk usually sold has a bluish shade. This is given it by a bath impregnated with limes, or indigo. This is prepared by dissolving a pound and a half of fine soap in about ninety gallons of water, in which a small quantity of limes or indigo has been diffused. The bath is heated to about 90 degrees, and the silk is passed through it over rods or reels till it have acquired the requisite shade. Being taken out, it is wrung and dried.

53. From these processes, the silk acquires a tolerably clear white, but the highest degree is given to it by the action of the sulphurous acid, either in the state of vapours, as is usually practised, or by immersing it in the liquid acid, according to the method of M. O'Reilly.

54. From what has been said above of the action of various substances on silk, it will easily be conceived, that during scouring it must suffer considerably in its quality. To avoid this, a method has been lately proposed of carrying off the varnish by the aid of steam under an increased pressure. As this has been more extensively employed in the bleaching of cottons, we shall delay giving a detailed account of the process till a future part of this article. The following is the method proposed by O'Reilly.

55. "Take a solution of caustic soda, so weak that it indicates at most but a quarter of a degree of the acrometer for salts, and fill with it the boiler of the apparatus for steam bleaching. Charge the frames with the skins of raw silk, and place them in the apparatus till it be filled, then close the door and cause the solution to boil; continue the ebullition for twelve hours; slacken the fire and open the door of the apparatus. The heat of the vapour, which is always above 100 degrees, will be sufficient to unguame and scour the silk. Wash the skins in warm water; wring them with the pin; and place them a second time on the frames of the apparatus to undergo another boiling. Then wash them in a considerable quantity of water, and if you desire the greatest degree of whiteness, rinse them in water slightly impregnated with soap, to give them a little softness."

56. "The last degree of whiteness is obtained by passing the skins through the sulphurous acid, using the method and apparatus which I have recommended for bleaching wool; and which here supersedes sulphuring. The incalculable advantage of that method over others, consists principally in the possibility of employing the operations in succession, without running the risk of injuring the quality of the silk by too strong leys."

57. Such are the most approved methods of bleaching silk when deprived of the yellow gum; but when this is not required, the bleaching is to be performed by some substance which has the property of whitening the silk and its varnish without dissolving the gum. Of this description is alcohol, and two French authors have proposed a method of bleaching silk by means of this and muriatic acid. It was first proposed by M. Rigaud in 1778, and is thus shortly described by Pajot de Charmes.

58. "The silk intended to be bleached, is put into a glass vessel containing a mixture of spirit of wine and

(c) About 250 degrees of Fahrenheit.
Chapter II.

BLEACHING.

Muriatic acid, in the proportion of a pound of the former to half an ounce of the latter, and in quantity sufficient to float the silk. The vessel is then closed with wet parchment, and exposed for 12 hours to the sun, or otherwise it may be left 24 hours in the shade, at a temperature of between 16° and 20° Reaumur. The silk is then taken out and pressed, and again macerated for the same time, and under the same circumstances, in fresh acidulated spirit of wine, in another similar vessel, closed as before. The silk is then taken out, pressed, and washed for four or five minutes in pure spirit of wine. In the next place, it is kept for 24 hours in the sun, or 36 in the shade, in a third vessel, containing pure spirit of wine, which is to be renewed at intervals; after which, the silk is to be taken out, pressed or washed two or three times in clear water, which is to be changed at each washing. Lastly, the silk is to be exposed to dry upon a frame, so contrived as to stretch it with considerable force, and prevent its curling up as it dries."

59. In 1795 M. Baume proposed an improvement of this method, with the means of recovering the alcohol, which we shall give in the words of Mr. Nicholson in his Journal.

60. "Berthollet, in his 'Elements de l'Art de la Teinture,' published in the year 1791, after describing the usual methods of depriving silk of its resinous or gummy matter, proceeds to remark that, in the manufacture of brands and gauzes, the natural elasticity and stiffness of this article are required to be preserved; whence it has become a desideratum to render the yellow silk of Europe white like that of China, without depriving it of its gum. He adds, that M. Baume has solved this interesting problem, but that his process is a secret; but from the facts he had possessed the means of obtaining, it appeared liable to accidents, and that the chief difficulty consisted in giving an uniform white colour when large quantities were operated upon. He also mentions a difficulty in dressing the whitened silk so as to prevent its curling, and observes that it ought certainly to be kept constantly stretched during the drying. It is besides requisite that the spirit of wine should be recovered after the process, which would also be rendered too expensive. This author does not say whether the white Chinese silk is subjected to the same inconvenience of curling when dyed, which, it may be remarked, is a property of no consequence where the material is to be applied in the manufacture of white goods. The motives which led M. Baume to communicate his process to the world, originally retained by him as a lucrative secret, do not appear. Whether the mistakes of those who carried it into effect in the large way might have led him to vindicate the reality of his discovery by publication; or whether the commercial advantages derived from superiority of quality and cheapness in this article over the Chinese silk in the market of France, might in the end have proved of less value than the scientific reputation to be derived from its disclosure; are circumstances which will, no doubt, have their proper weight with such manufacturers as may be induced gradually to adopt this process.

61. "The silk of Nankin is perfectly white, silvery, brilliant, and possesses all the elasticity of raw silk. Our author affirms, that the value of this article imported into Europe amounts to upwards of twenty millions of livres (about 830,000l. sterling), of which France consumes about four or five millions in gauzes, blondes, ribbands, &c. This was formerly supposed to be produced of a white colour from the worm. The late M. Trudaine, intendant of commerce, procured the eggs of silk-worms from China, and cultivated them. The product consisted of yellow cocoons, and others of the most perfect whiteness. The latter afforded silk equal in this respect to those of Nankin. But M. Baume affirms, that most of the Nankin silk is bleached by art, and, as he thinks, by a process similar to his own.

62. "As it is impossible to wind off a large quantity of silk in the short time previous to that of the insects eating their way through the mass, it is usual, in the first place, to deprive them of life. This is commonly done by exposing the cocoons, properly wrapped up, for two hours, to the heat of about 156 degrees of Fahrenheit in an oven; after which they are kept for a certain time in a mass to preserve their heat, and effectually destroy such of the insects as might have escaped the power of the oven. The effect of this process is, that the silk is hardened, and is more difficult to wind off than before. Hence the produce of silk is less by one-ninth part in quantity, and inferior in quality to what might have been obtained by winding off without this previous baking. M. Baume, not only from these views, but likewise because the silk which has not been baked proves susceptible of a greater lustre, was induced to destroy the chrysalis by spirit of wine. For this purpose he disposes them in a wooden box in a stratum six inches deep: upon each square foot half a chopin, or somewhat more, of spirit of wine is to be sprinkled with a small watering-pot made for that purpose. This quantity answers sufficiently near to our half pint. The liquid is to be equally distributed, but it is not necessary that all the cocoons should be wetted. They are then to be mixed by hand. In the next place, another stratum is to be formed over the first, nearly of the same depth, which is to be sprinkled and treated as before. By this method of proceeding, the box becomes filled, and must then be covered and left for long hours, during which time they become spontaneously heated to about 100 degrees, and the vapour of the spirit of wine exerts itself with wonderful activity. Five hundred French pounds (d) of the cocoons require 10 French pints, which is nearly the same number of English quarts. After this treatment they must be spread out to dry, which happens in a short time, and is absolutely necessary previous to winding off.

63. "When the operator proposes in this manner to extinguish various parcels of cocoons belonging to different individuals, each parcel may be tied up loosely in a canvas bag, and wetted on the outside previous to closing the box.

64. "The spirit of wine to be used in this operation, ought to be of the strength of 34 degrees of Baume's hydrometer at the temperature of 55 degrees. It is of

(d) The Paris pound is to the English avoirdupois pound as 756 to 700. These quantities are not reduced, because the operation requires no great precision.
Bleaching.

The greatest importance to use that spirit only which has been kept in vessels of glass, of tinned copper, or of pure tin. Leaden vessels are absolutely to be rejected; wooden vessels tinge the spirit, which gives the silk a degree of colour of considerable solidity, and very inimical to the bleaching process.

66. "The silk is wound off upon a reel, while the cocoons are kept immersed in water almost boiling. Upon this part of the process M. Baumé remarks, 1st, That the dead cocoons must be separated. These are known by the brown or black spots on their surface. 2. That well water, which on account of its clearness is almost universally used in the silk manufacturies, mostly contains nitre, and is extremely prejudicial to the bleaching process. The presence of nitrous acid gives a yellow colour, which resists bleaching and even souring; he therefore recommends river water. 3. In some countries a small quantity of alum is used. Neither this nor any other saline substance is of the least advantage to the colour, beauty, or quality of the silk.

67. "At the four places of contact of the silk upon the reel, all the threads stick together. It is absolutely necessary that this should be remedied. The method consists in soaking the silk in a sufficient quantity of warm water, at about 90 degrees, for about two hours; after which the threads are to be separated by opening the banks upon a pin, and lightly rubbing the parts which cohere. When the silk is dry, it is to be loosely folded in its original form, and is ready for bleaching.

68. "The silk while wet is soft, and part of its gummy matter is in such a state, that its threads would readily adhere, if wrung while warm for the purpose of clearing it of the water. After such improper treatment there would be no other remedy than to soak it again in warm water.

69. "The apparatus for bleaching the silk consists of a stone-ware vessel, nearly of a conical form, capable of holding about 12 gallons, having a large opening at the one end, and a smaller of about an inch diameter at the other end. Common pottery cannot be used in this operation, because it is soon rendered unserviceable by the action of the marine acid, and the stone-ware itself is not very durable. This vessel must be carefully examined, to ascertain that it does not leak in the slightest degree; after which the inside is to be rubbed with a pumice-stone, to clear it of asperities which might break the threads. A cover of the same material is to be fitted on by grinding; and the smaller aperture, which is near the lowest, is to be closed with a good cork, in the middle of which is thrust a small glass tube about a quarter of an inch in diameter; this is likewise stopped with a cork, excepting at the time when it is required to draw off the liquid contents of the jar. A small perforated false bottom is placed within the vessel, to prevent this tube from being obstructed.

70. "This jar, or as many of them as the purposes of the manufactury may require, is supported by a wooden frame or table, at such a height that a cask may be conveniently placed beneath to receive what may flow from the glass tube in the several periods of the operation.

71. "Six pounds of yellow raw silk are to be disposed in the earthen pot; upon this is to be poured a mixture, previously made, of 48 pounds (X) of spirit of wine at 30 degrees, with 12 ounces of very pure marine acid, absolutely exempt from all presence of nitrous acid, and of the strength of 14 or 15 degrees of Baumé's hydrometer. The pot is then to be covered, and the whole left in digestion till the following day, or until the liquor, which at first assumes a fine green colour, shall begin to assume that of a dusky brown (feuille morte).

72. "The acidulated spirit is then to be drawn off. To prevent evaporation, M. Baumé thrusts a cork in the bung-hole of the receiving cask, in which is a sliding glass tube. The use of this tube is completely to surround the small tube proceeding from the earthy vessel. When the whole of the fluid is thus almost entirely drawn off, clean spirit of wine is poured upon the silk, and drawn off repeatedly until it passes colourless. The silk is then suffered to drain without stirring it. In this state it is ready for a second infusion.

73. "Forty-eight pounds of spirit of wine acidulated with 12 ounces of marine acid is now to be poured on the silk, and the whole suffered to remain for 24 hours or longer, until the silk becomes perfectly white. The time required for this second infusion is commonly longer than for the first: it sometimes amounts to two, three, or even six days, according to circumstances, particularly the temperature and the nature of the silk. Silk which has been in the oven is in general more difficult to bleach.

74. "When the silk has thus obtained its utmost degree of whiteness, the acidulated spirit is to be drawn off into a separate vessel. This fluid is but slightly coloured, and may be used again in the first infusion of other yellow silk, with addition of six ounces more of marine acid. The receiving vessel is to be removed, and another clean vessel substituted in its place. The silk is then sprinkled with clean spirit, and occasionally pressed down with the hand. As soon as the spirit of wine comes off absolutely colourless, a third infusion is to be made, by pouring upon the silk 48 pounds of the pure spirit without acid, which is to remain till the following day: it is then to be drawn off, and

(E) The pound is nearly a pint, and is divided into 16 ounces.
BLEACHING.

and reserved for washing other silk after the first infusion.

75. "After the silk has been left to drain, and affords no more spirit, it still retains its own weight of that fluid. This is recovered by the very simple process of sprinkling the silk with a small quantity of very clear river water at a time. While the water applies itself and subsides along the silk, it drives the spirit of wine before it, so that the first portions which flow from the tube are scarcely diminished in strength. The addition of water is to be continued until nothing but mere water comes off below.

76. "In this situation the silk is found to be well bleached, but still retains a portion of marine acid sufficient to render it harsh to the touch, and after a time brittle. It must be washed off with water. The best method is to put the silk loosely into a coarse woollen bag, which is to be secured closely in another cloth like a small bed or pillow, then placed in a basket and left in a running stream for five or six hours; but where the convenience of a stream is wanting, the earthen pot containing the silk is to be covered with a cloth, and water pumped through it for five or six hours, or until that which issues from the lower aperture gives no red colour to the tincture of tournsiol. At this period the lower opening is to be closed and the vessel filled with water, which must be changed once or twice in 24 hours.

77. "The time required for washing was occasionally abridged by passing spirit of wine, or river water impregnated with a small portion of alkali, through the silk. The natural salt thus produced is, in fact, less adherent to the silk than the acid itself, but nevertheless requires to be washed off with a very large quantity of water.

78. "In these, as in every other process relating to the silk, great care must be taken to ascertain that the water made use of contains no nitrous acid, which would infallibly occasion imperfection of colour, or spots in the article. After this treatment the silk is ready for drying and lusterin; previous to the description of which, the author makes several remarks to the following purport:

79. "Though the mineral acids are the most powerful and destructive of all saline substances, yet they may be applied to silk, when diluted with spirit of wine, in very considerable doses. In trials, made to ascertain the maximum, two ounces of marine acid were added to one pound of spirit of wine, without altering the silk. Two drachms of marine acid cause a very perceptible alteration in one pound of silk. I suppose he means pure acid, or perhaps diluted with water; for the passage as it stands is obscure. Numerous experiments have shown that the marine acid is preferable to any other. The proportions admit of much latitude, though he prefers the dose herein before described.

80. "Spirit of wine which has been mixed with nitrous acid, cannot be used in bleaching, even though afterwards rectified upon the alkali, because it still retains a portion of nitrous gas.

81. "Pure spirit of wine without acid extracts a fine yellow colour from silk, which does not separate for years, even though exposed to the sun's light. Yel-

82. "In order to obtain a beautiful colour, it is essential that the silk should be immersed in a large quantity of the fluid, especially at the first infusion. Without this management it would become necessary to make three infusions in the acidi
culated spirit. When the first infusion is well managed, the silk will have lost all its yellow colour, and become considerably white, at the same time that the liquor will have begun to change colour a little. As long as it continues of a fine green, it is certain that it has not exhausted its whole action upon the silk.

83. "The duration of this first infusion may be longer or shorter, without inconvenience, according to the temperature. When the temperature is at 20 degrees of Baumur, which answers to 77 of Fahrenheit, the first infusion is often made in 10 or 12 hours. In small experiments the heat of the atmosphere may be supplied by the water-bath; in which case, all the infusions are easily made in the course of a day.

84. "When the first infusion is finished and the liquor drawn off, the silk appears greenish: the subsequent washings in spirit of wine clear it of the liquor it retained. The sprinkling should be made with the watering-pot, otherwise the quantity poured will be greater, and the management more wasteful.

85. "The cocones may be bleached in this way, but the inconveniences are too great to render this process desirable.

86. "Pieces of gauze and entire garments of silk have been successfully bleached in this way.

87. "The finest natural white silks are rendered infinitely whiter by this process. Spirit of wine alone has the property of depriving yellow silk of its colour, which it brings to the state of the naturally white silk. In this state the silk is disposed to acquire a greater degree of brightness by a single infusion in the acidi
culated spirit. This process has its advantages over the other, to which it is also inferior in certain respects; concerning neither of which the author has entered into any detail.

88. "The colouring matter was found to be a resin perfectly animalized, affording by distillation the same products as other animal matters, and the concrete volatile alkali.

89. "Silk whitened by scouring may be dried freely in the air without affecting its lustre. This is not the case with the silk bleached in the gum: if it be left at liberty to dry in the air, it resembles white flax without any lustre. The beauty of this silk consists in its shining brilliancy; to secure which, it must be dried in a state of tension. M. Baumé has contrived a simple machine for this purpose. It consists of a strong square frame of wood standing upright upon feet: the upper horizontal bar is six feet long, and has six iron pins driven through it at equal distances, so as to project on each side for the purpose of receiving twelve bobbins. The lower horizontal bar is moveable up and down in a mortice by means of a screw at each end: it is furnished with six holes, adapted to receive as many pins
BLEACHING.

Animal substances are to be dressed and arranged upon wooden pins, as they are taken out of the sack from washing. As soon as there are twelve together, they are to be wrung with a staff; after which the skins are to be hung one by one upon as many bobbins put upon the upper pins of the square frame. Another bobbin with tails is to be inserted in the lower loop of the skin, and fastened to the corresponding pin of the lower bar, by means of a strap and hook, which need not be described to such as are slightly acquainted with mechanical objects. When the machine is thus supplied with skins on both sides, the lower bar of the frame is to be pressed down by the screws until the silk is moderately stretched. When it is dry, the screws are to be equally slackened, the skins taken off, and folded with a slight twist, that they may not become entangled.

90. "After this description of the whole of his process, the author proceeds to make certain general remarks on the white China silk. He observes, that in this process the silks acquire the perfect whiteness without much handling, and consequently that there is little cause for them to become entangled. Accordingly the loss in unwinding is found to be no greater than when they are unwound in the yellow state: that is to say, from a drachm to a drachm and a half in the pound. This saving is of the greatest importance in the price of the silk.

91. "The silk of Nankin, which he supposes to be bleached by some process of the same nature, is probably handled much more. The loss is nearly twelve per cent. when it comes to be opened, and not unfrequently even 25 per cent.: a loss which cannot in any respect arise from the package. The quality of the Nankin silk differs much in the package; the external part being always of the best quality, and that which is packed within is of such inferior quality as sometimes not to exceed half the value. On examining this silk, it not only exhibited unequivocal marks of alkali, but its imperfections were also of the same kind as those which had occurred to M. Baumé during the progressive improvement of his own manipulations. The best China silk was neither improved nor injured by the process of Baumé; whence he concludes that they are not naturally white, but have undergone a process similar to his.

92. "The result of the whole is, that the yellow silks of Europe may be bleached to equal or greater perfection than those of Nankin; and that these may be even greatly exceeded by winding the naturally white silk apart from the other, and bleaching it by itself.

93. "To complete the description of M. Baumé's process for bleaching silk, nothing more remains, than to shew in what manner he recovers the ardent spirit, and ensures the purity of the acid made use of. These circumstances are of essential importance to the art; for the process would be much too expensive if the spirit were lost, and it could not be made to succeed at all if the acid were impure.

94. "The alcohol which has been used in bleaching silk, is acid, and loaded with colouring matter. In this state it cannot be again used. There are two methods of distilling it; which have their respective advantages and inconveniences. By the first, the acid is lost; which is saturated with potash, in order that the distillation may be afterwards performed in a copper alembic. The second is performed by distilling with glass retorts, or an alembic of silver. In either of these vessels, which are not acted upon by the marine acid, the distillation may be performed, and the greater part of the acid recovered. The inventor most generally practised the saturation of the acid from reasons of convenience; but recommends the use of a silver alembic, as being most economical upon the whole, in a manufactory.

95. "A solution of potash is to be poured into the acid spirit, and stirred about to promote the saturation. Carbonic acid is disengaged with strong effervescence from the alkali, and the point of saturation is known by the usual test, that the fluid does not redder the tincture of tourmaline. The distillation is then to be made in the copper alembic, and the alcohol reserved in proper vessels, as mentioned in the beginning of this memoir.

96. "If too much alkali should have been added, the liquor remaining in the alembic may be used in another saturation. The alkali in this process being an expensive article, M. Baumé endeavoured to supply its place by chalk, quick-lime, and lime which had been slaked by exposure to the air. But he found that the action of the spirit upon the calcareous earth, or perhaps the absence of water, prevented the acid from uniting with that substance. The union does not take place to perfect saturation in less than five or six weeks, even when the alcohol is diluted with upwards of 30 times its bulk of water.

97. "In the second process for distilling without alkali, the acid spirit is distributed into a great number of glass retorts, placed in the sand-bath, on the gallery of a furnace. The first product is scarcely acid; but what follows is more and more so, and must be kept in vessels of glass or stone-ware, which become embarrassing on account of their number. The fluid which remains in the retorts has the colour of beer slightly turbid, and contains the greatest part of the marine acid. It must be poured into one or more retorts, and concentrated by heat gradually applied. The first liquor which comes over is slightly red, turbid, and scarcely acid. This is to be thrown away, and the receivers changed. The succeeding product is the coloured marine acid, of an aromatic smell resembling the balsam of poplar. The resin of the silk remains in the retort decomposed by the acid. The marine acid thus obtained is weaker than it originally was: which is in fact of little consequence, as it is pure, and may be safely used, either by increasing the dose proportional to its diminished strength, or by concentrating it, if required, in the usual way.

98. "If this distillation be made in a silver alembic, instead of retorts of glass, and a capital and worm of pure tin be annexed, the alcohol will be obtained as slightly acid as scarcely to redder the tincture of tourmaline; but it is sufficiently acid to receive injury if preserved in a copper vessel.

99. "If a cucurbit of silver be prepared, of the capacity of three or four quarts, with a glass head, the residue of the first distillation may be treated in this vessel in the same manner as has been directed for glass retorts. M. Baumé affirms that he has practised all these
these operations with glass retorts and a small silver
alembic, with the most perfect success; but that he
made use of potash to saturate the marine acid, because
he had not a silver vessel of sufficient capacity. From
the danger of distilling large quantities of ardent spirit
in glass vessels, he is of opinion that no motives of eco-

nomy are sufficient to justify the risk attending this
method. In the use of tin, it is necessary to be careful that
it contains no adulteration of lead, because the vapours
of marine acid have sufficient power to alter this last
metal very considerably.

100. "Upon the first intimation of this new process
in France, manufactories were immediately established,
to the number of twenty or more, without the concurre-
cence of M. Baume, by persons who consequently were
not aware of the apparently minute but very important
circumstances necessary to ensure its success. In par-
cular, the inventor states that the marine acid of com-
merce is unfit for this purpose.

101. "This acid was formerly prepared with the
marine salt of the saltpetre manufacturers; and even
when it is made with good salt, the decomposition is
affected with a small quantity of vitriolic acid which
contains nitrous acid. Marine acid mixed with a small
quantity of nitrous acid does not prevent the silk from
being beautifully whitened; it even accelerates the pro-
cess considerably, and in the most satisfactory manner.
But the alcohol, every time it is used and rectified, be-
comes charged with the acid and gas of nitre, which as-
sume the characters of the nitrous anodyne liquor. In
this state, neither distillations nor repeated rectifica-
tions from alkali are sufficient to separate the nitrous matter
from the alcohol. Then it is that the success of the
operator vanishes, with a degree of rapidity equal to the
advances which encouraged his hopes at the commence-
ment. The same disappointments befell M. Baume at
the beginning of his labours; to prevent which, he di-
rects the preparation of the vitriolic and marine acids to
the following effect.

102. "The vitriolic acid of commerce is obtained by
burning sulphur in chambers of lead, with the addition
of saltpetre, either crude or of the second crystallization,
and a small portion of flax. This acid is concentrated
and rectified in France, at the place of its fabrication,
to 66° of Baumé's hydrometer, or specific gravity in
the usual form 1:848. It contains sulphur, lead, vitri-
olated tartar, Glauber's salt, alum, selenite, and parti-
cularly the nitrous and marine acid.

103. "To purify it, 100 pounds of this vitriolic
acid is to be mixed in a large basin of copper with the
same quantity of river water, and stirred with a wood-
en spatula. The mixture instantly becomes heated to the
boiling-water point, and a great quantity of red
vapour is disengaged, which has the smell of aqua re-
gia, and arises from the nitrous and marine acids. When
this mixture is made, it is proper to immerse the
basin to a suitable depth in a large vessel of water,
to hasten the cooling. As soon as it is sufficiently cool-
ed it is to be drawn off into bottles, and left to become
clear during several days. Great part of the sulphur
falls down. The author obtained from four to six
drachmas.

104. "A gallery must be provided, on which two
rows of iron pots of eleven or twelve inches in diame-
ter are to be properly placed for separate sand baths,
as M. Baume always practised in the sublimation of
sal ammoniac. By this means the retorts are isolated,
and if one breaks, the acid cannot diffuse itself and
break the others in its vicinity. An empty retort is
then to be placed in each pot, and covered with sand.
In this way they are much more convenient to arrange,
and are attended with no risk.

105. "The acid is in the next place to be decanted
and conveyed into the retorts by a syphon funnel, and
the rectification proceeded upon until it becomes per-
fectly white. Towards the end of the operation a small
quantity of sulphur sublimes in the neck of the retort.
Instead of receivers, a small glass cup is placed beneath
the aperture of each retort, in order to facilitate the dis-
sipation of the nitrous and marine acids.

106. "When the acid in the retorts is sufficiently
cooled, it is poured a second time into the copper bason,
and mixed with 100 pounds of river water, as at first,
and again concentrated in the retorts till it becomes
perfectly clear. Sulphur has been afforded in some in-
stances by the second rectification. The liquor which
distils is received in the cups as before, and the acid in
the retorts is then sufficiently pure: that is to say, it is
purified from all volatile matter. The lead and neutral
salt still remain combined with the acid, but fortunately
they can in no respect injure the purity of the marine
acid.

107. "This concentrated acid exhibits 68 degrees by
the hydrometer, or specific gravity 1:896. It still con-
tains a portion of gas, but so small in quantity as not to
injure the purity of the marine acid, to which it only
gives the property of crystallizing when the temperature
of the air is near the freezing point.

108. "During the rectification of this acid, what
first comes over is mere water, and must be thrown
away; but that which succeeds is the aqueous acid.
If this be set apart, and concentrated, a considera-
tble quantity of vitriolic acid is obtained of the greatest
purity. As it has been carried over in distillation, it con-
tains no foreign matter.

109. "The author attempted, but in vain, to dis-
sipate the nitrous acid from the acid of vitriol by ebul-
liation in an open vessel without concentration. The
experiment was made with 50 pounds of common vi-
triolic acid and 60 of river water. This was kept
boiling in the copper bason for four days, water being
added from time to time to supply the loss by evapora-
tion. The copper bason, by weighing before and after
the operation, had lost by solution no more than ten
drachmas of copper. The acid was blue, but became
white as usual during the rectification in the retorts.
From this experiment, as the author observes, it is seen
not only that the nitrous acid cannot be dissipated by
simple ebullition without concentration, but that the
acids of the vitriolic acid upon copper is extremely
slight.

110. "The marine acid is to be disengaged from
common salt by the application of this vitriolic acid
in the usual manner. But as M. Baume's ex-
perience led him to various simple manipulations
and remarks of importance, and more especially as he con-
siders the description of this process as part of the
new art of bleaching silk, he has annexed it to his me-
moir.

111. "The vitriolic acid obtained by the foregoing

BLEACHING.

Animal process being too concentrated, must be diluted in the Substances. Copper basin as before with river water. It is convenient to add 18 ounces of water to each pound of the acid, because the marine acid is not wanted in a state of high concentration. This mixture ought to give 35 or 36 degrees by Baumé's hydrometer; which last answers to a specific gravity of \(1.333\). When it is cold it may be preserved in bottles for use.

112. "In the next place, four pounds of marine salt dried, because in that state it pots best, is to be put into a retort of the capacity of five or six French pints, or English quarts. This may be done by means of a paper funnel, or a long-necked funnel of glass, which must enter the body of the retort in order that the neck may remain clean. A number of these must be disposed on a gallery in two opposite rows, with the necks properly enclosed and enveloped in sand as usual.

113. "A bottle or gauge being provided of such a size as by previous experiment is known to hold four pounds of the vitriolic acid before mentioned; this quantity of the acid must be measured into each of the retorts by means of a curved funnel, the tube of which may pass into the body, to prevent the acid being spilled in the neck. If nevertheless a few drops should fall, no inconvenience will follow, as this pure acid is not detrimental to the bleaching process.

114. "The supports for the receivers are then to be placed, and the receivers applied, each being pierced with a small hole. The junctures are to be made good with pasted paper, and the distillation begun. A Substances.

gradual heat is to be applied until the fluid boils gently. The marine acid which first rises is volatile and expan-
sible (\(?)\), and requires the small holes of the receiver to be occasionally opened; but after one-fourth part of the time of distillation the acid comes over freely, and the vapours cease to be elastic.

115. "The distillation lasts two days: but it is practicable to avoid sitting up the intermediate night. The fire must be so managed that the contents of the retort may be very liquid in the evening: if it begins to thicken, there is reason to apprehend that it may be too hard the next day; in which case the heat will dilute the concrete matter before it liquefies, and break the containing vessel.

116. "Towards the close of the distillation the matter swells up considerably. When this happens, it is proper to empty the receivers, and raise the retorts, that more sand may flow in beneath them. When the matter is dry, and nothing more comes over, the operation is finished.

117. "Each retort affords five pounds of marine acid, of the strength of 14 or 15 degrees; specific gravity \(1.114\). When the retorts are half cooled, one pound of hot river water is to be poured into each, and the distillation being resumed affords 24 ounces of the same marine acid from each retort."

PART II. BLEACHING OF VEGETABLE SUBSTANCES.

118. THE composition of vegetable substances differs materially from that of animal bodies in the proportions of the three principles which are common to both, namely, oxygen, hydrogen, and carbon; and in wanting for the most part azote, which in the latter acts so conspicuous a part. The proportion of sulphur and phosphorus is also exceedingly small in vegetables.

119. As in animals, the substances derived from vegetable nature are formed by a peculiar process of secretion, from the nourishment which plants draw from the bosom of the earth, which after being absorbed by the roots, undergoes, in passing through the vessels of the plant, new modifications, and enters into new combinations.

120. By spontaneous decomposition the principles of vegetables, as of other organized matter, are separated and enter into new states. The hydrogen combines with part of the oxygen to form water, while the rest of this latter element, uniting with the carbon, generates carbonic acid.

121. These changes are the natural effect of exposure to moisture, heat, and atmospheric air; and upon the effect of these agents the chief dependence has been till lately placed in the processes for dischar-

(?) It might be of advantage, even in the large way, to adapt a simple pneumatic apparatus to condense the marine acid air in water, as is usual in philosophical processes.
Part II. B L E A C H I N G.

Vegetable chemistry has conferred on the manufacturer, is the Vegetable purposes of clothing than the finer and more delicate nature of flax.

124. The use of flax appears to have originated in Egypt, and its introduction is attributed to Isis.

125. Cotton has probably been employed among the Asiatics for a very long time; in Europe it was the latest of all the materials of which clothing is manufactured.

126. On examining the stalks of hemp and flax when they are pulled, we shall find them composed of four distinct substances: a delicate bark, a green juice or sap, the fibres which are to be employed in the manufacture, matted or twisted together, and within these the wood of the plant. As the fibres are thus enveloped in useless matter, the first object is to separate them, to peel off the bark, wash away the sap, and strip the fibres from the wood. The two first of these are effected by water and fermentation. The plants tied in bundles are placed in water, and proper methods are taken to prevent their being carried away, if it be a stream, which is frequently the case (c). In a short time a fermentation begins to take place, which acts both on the bark, which it loosens, and on the sap, which it decomposes. It is necessary to be attentive not to let the fermentation proceed too far, as we thereby run the risk of injuring the texture of the fibres. As soon as is, on examining the plants, by rubbing them between the hands, it be found that the wood breaks easily, while the plants are still green, they must be removed from the water and spread out upon the grass to dry.

In this operation, which is called watering the flax or hemp, it is necessary to employ soft water; as it is found that in hard water the fibres are much more readily injured. To account for this, it must be remembered that these waters owe their hardness to their containing a quantity of an earthy salt*; and these salts are found to promote the process of putrefaction, particularly the sulphate of lime or gypsum, which is the most abundant of these salts contained in hard waters.

127. The process of watering destroys the sap of the plants by effecting its decomposition. This sap is found to be composed chiefly of water, and what modern chemists have called extractive: by fermentation, this extractive is separated into carbon, hydrogen, and oxygen. It is probable also that the water of the sap, as well as that in which the plants are steeped, is decomposed. These principles uniting again in different proportions form carbonated hydrogen, which is the cause of the offensive odour, and carbonic acid, which is found to proceed from the plants. The exposure to the air which they undergo, after steeping, contributes to the speedier escape of these principles.

After the drying the plants appear of a grayish white colour, which is called by workmen a flaxen gray.

128. One of the greatest advantages which modern

---

(c) It is very usual in Scotland to steep flax in burns or rivulets, as these are commonly found most convenient; but as the smell of the putrifying plants is intolerably offensive, and even unhealthy, and as the process is found to destroy any fish that may inhabit the stream, the practice ought to be discouraged, and in some countries is forbidden by the laws.
Bleaching.

Part II.

Vegetable Substance.

The color matter is loosened, the threads swell, and a part of the colouring matter is decomposed.

136. The gray substance, which it is the principal business of the bleacher to remove, is of a resinous nature; and as the theory of the processes which we are presently to describe depends on an intimate knowledge of its properties, we shall be somewhat particular respecting it.

137. Kirwan, to whom chemistry in all its departments is so highly indebted, has submitted this matter to a set of ingenious experiments.

He procured from the bleach ground a quantity of what the workmen called "dead ley," which is the alkaline ley in which cloth had been steeped, and is consequently charged in abundance with the colouring matter. He found this liquor to be turbid, of a bluish red color, having a peculiar taste, and a strong odour. It possessed neither alkaline nor acid properties.

138. To five pints of this liquor he added two ounces of weak muriatic acid, or spirit of salt; no effervescence was produced, but a considerable quantity of greenish matter was brought to the bottom, and the liquor above remained of a reddish amber colour.

139. He next day, by means of a syphon, decaanted off the supernatant liquor from the green precipitate, upon which he poured two pints of distilled water, stirred them well together, and allowed the matter again to subside: he then decaanted off the water, and added a like quantity of fresh. This water still exhibited strong marks of acidity, and was of a reddish colour.

He could not believe that after the addition of so much water, this acidity could arise from the muriatic acid which was employed, as this was scarcely more than sufficient to saturate the alkali, which the liquor had originally held in composition. He concluded therefore that the liquor had contained a peculiar acid, which from its weaker affinity with the alkali, had been separated from it by the muriatic acid. He set apart two pints of this for further experiments.

140. After successive washings of the precipitate, till it no longer appeared to retain any acid, he threw it on a filter; after being dried for some time, it became a tenacious mass of a greenish colour.

141. A very small portion of it was thrown into 60 times its weight of boiling water, but not a particle appeared to be dissolved. The remainder was dried in a sand-bath, after which it was brittle, of a glossy black without, and internally of a dull green; it weighed about an ounce and a half.

142. From eight pints more of the dead ley, he obtained a larger quantity of this green matter, on which he made the following experiments:

1. A portion of it was digested with rectified alcohol; a reddish tincture was produced, and a considerable part of the matter was dissolved; but on the addition of distilled water, the solution became milky, and a white precipitate gradually subsided. The black mass obtained in the former experiment, gave the same results.

2. These two matters were digested for a long time in linseed oil and essential oil of turpentine, but were not dissolved in either.

3. The black matter thrown on red-hot coals, burned with a yellow flame, and emitted a black smoke, leaving behind a soaly matter.

4. The green matter exposed to the action of sulphuric, muriatic, and nitric acids, gave a brown tinge to the solution, and a green to the latter.

143. It is very evident from these experiments, that the extractive matter of the fibres of flax, which is obtained from them by the action of alkalis, is a resin of a peculiar nature, differing from pure resins in its being insoluble in essential oils, and in this respect having some resemblance to lac.

144. Kirwan thought it necessary to try the action of alkalies on this matter. Eight grains were digested in a saturated solution of crystallized soda, at the temperature of 60° Fahrenheit, which was immediately tinged of a deep brown colour. Two measures of this solution of soda, weighing each 265 grains, did not entirely dissolve the matter, but two measures of a solution of potash dissolved the whole.

A measure of caustic soda of the specific gravity 1.053, dissolved nearly the whole, leaving a small quantity of a white substance.

A measure of caustic potash of the specific gravity 1.039, dissolved the whole.

A measure of an alkaline sulphuret or liver of sulphur, of the specific gravity 1.170, also dissolved the whole.

A measure of ammonium dissolved a small portion of it.

145. These experiments were sufficient to satisfy Mr. Kirwan; but, for the purposes of the manufacturer, he judged it proper to repeat them with the ordinary saline substances employed in bleaching, and with soap.

He therefore dissolved an ounce of the soda of commerce, and as much Dantzic potash, each in six ounces of distilled water; he added eight grains to an ounce measure of each solution, and allowed them to digest together in a temperature of 180° Fahrenheit for three hours and a half. At the end of this period it was found that more was dissolved in the potash than in the soda, and an ounce of this latter was required to complete the solution, whereas this was effected by the addition of half an ounce of the Dantzic potash liquor; thus shewing the superiority of the potash over soda.

An ounce of white soap was dissolved in eighteen ounces of distilled water; the solution remained turbid, and could be rendered transparent only by bringing it to the boiling heat, an operation which he found extremely difficult; for when the fluid was near boiling, it was thrown out to a distance of more than three feet from the matras. After completing the solution, he found that three ounces of it were required to dissolve eight grains of the colouring matter.

146. In forming an accurate idea of the comparative effect of these solutions, it must be observed, that an ounce of the soda of commerce contains only 114 grains of pure soda, and consequently, supposing the solution to have been made as above, in six ounces of water, each ounce will contain 19 grains of soda, while an ounce of the solution of Dantzic potash contains fifty grains.

147. He tried the effect of lime on the colouring matter, on which it produced little effect; three ounces of water saturated with lime were employed, which contain at most three grains of that earth.

148. Having been so full on the nature and previous preparation of flax and hemp, it remains only to say something
BLEACHING.

149. Cotton is a filamentous substance or down, which is found surrounding the seeds of the cotton plant. This substance, as it is first obtained from the plant, is covered with a brownish coloured matter, by which it is rendered dirty and opaque. This matter is of a greasy nature, in which it resembles the oil contained in wool, as is evident from the slowness with which raw cotton imbibes water, and the avidity with which it attracts it after having been scoured. Scouring, by removing this greasy matter, also renders it clear and transparent.

150. There is considerable variety in the quality of cottons, arising from their different kinds, the climate in which they were produced, and the degree of culture which they received. They are sometimes of a yellow colour, sometimes white, but most commonly their colour is a dirty yellow.

151. The bleaching of cotton does not call for those preparatory operations which we have described as necessary for hemp and flax. It is first to be scoured by steeping it in a slight alkaline solution, or, what is better, by exposing it to the vapour bath in the manner which we shall soon direct. After this operation, the cotton is to be placed in baskets in the stream of a river or other running water, so as to be well rinsed.

152. After the immersion of cotton in an alkaline ley, there is always left, however completely it be rinsed, a small quantity of an earthy sediment. This may be removed by the cautious use of acids. We know that cotton bears the action of acids much better than either hemp or flax, and that it may remain exposed to them for some time without injury. Advantage has been taken of so fortunate a discovery, and it is found, that by keeping the cotton for a short time pressed down in a very weak solution of sulphuric acid caused to percolate through washing, to remove all the acid, this earthy sediment may be completely removed.

153. The methods which have been employed or recommended for the bleaching of hemp, flax, and cotton, may be reduced to these, viz.,

1st. By the action of the atmospheric air, assisted by alkalies and soaps.

2d. By the action of water only.

3d. By the action of the oxygenated muriatic acid, or dephlogisticated marine acid of Scheele: and this method may be resolved into four; according as the acid is employed in its simple state of combination with water, or in combination with other matters.

a. By the action of oxy-muriatic acid alone.

b. By the action of oxy-muriatic acid combined with potash.

c. By the action of oxy-muriatic acid combined with lime or other earths.

d. By the action of oxy-muriatic acid combined with sulphur of lime.

4th. By the action of diluted sulphuric acid.

5th. By the action of steam impregnated with caustic alkali, or by employing this alternately with the oxymuriats. Of these we shall treat in the above order.

154. This is the method which was commonly adopted till within these twenty years, and is still retained in some old manufactories. After steeping the cloth, as has been related (134.), to remove the weaver’s dressing, the pieces are dried in the field, and then submitted to the operation of bucking.

For this purpose, a ley is prepared by dissolving a quantity of potashes in soft water, and boiling it for about half an hour, when it is allowed to settle, and forms what is called the mother ley. For bucking, this mother ley is weakened by the addition of 16 or 18 times its bulk of water; and to this is generally added a quantity of soap, or, for the sake of economy, a few gallons of ley which has already been employed for the first buckings. This liquor, which has been called the bucking ley, is now heated to about 100 degrees, and poured on the pieces sorted according to their quality. After pressing the cloth down in the ley, it is drawn off, heated a little higher, and again poured upon the cloth. This operation is repeated at intervals, allowing the ley to remain longer each succeeding time, and moderately increasing the heat to the bucking temperature, for five or six hours. Then the cloth is left steeping for three or four hours, when it is taken out, well rinsed, and carried to the field.

155. Here it is spread out upon the grass and secured by pins; water is sprinkled on it so as not to allow it to become dry for some hours. After it has lain about half a day the watering is less frequent, and at night it is left to the full action of the air and dews. On the succeeding days it is watered three or four times a day if the weather be dry, and thus it remains on the field till the air seems to have less effect in whitening. It is then brought back to the coppes, and bucked again with a ley somewhat stronger than the last, rinsed, and again spread out on the field. It is thus alternately bucked and watered 10 or 15 times according to the weather, making the bucking stronger and stronger till about the middle, and then weaker and weaker till the last, after which it undergoes the process of scouring or steeping in some acid liquor.

156. The acid which has been usually employed in the process of scouring is generated by the fermentation of bran and water; or, where the bleachfield was in the neighbourhood of a dairy, sour whey was used for this purpose. It has been found that a very weak solution of sulphuric acid is more convenient and not more injurious than these, and is now generally employed. The cloths are steeped in the scouring for five or six days, if it be formed of milk or bran, or a less time where the sulphuric acid is used, and they are then given to the washers to be rubbed with soap, which is more particularly necessary to the selvages, as these resist the action of the air and alkalies longer than the rest of the cloth.

157. After being well soaped, the cloth is again bucked in a strong ley, rinsed, and again watered and exposed to the air, and all these processes are repeated in succession till it has acquired the requisite degree of whiteness. It must be observed that the strength of the acid liquor is diminished at each succeeding immersion.
158. The theory of these operations was, till lately, very little understood, but it admits of an easy explanation by the principles of modern chemistry. It has been proved, as will be shown in chemistry, that the air of the atmosphere consists principally of two airs or gases, oxygen gas or vital air, and azotic gas, in the proportion of about 23 of the former to 77 of the latter. The only active principle in most of the operations of art and nature appears to be the oxygen, and this uniting with various inflammable bodies produces acids. Now the colouring matter of cloth is a compound inflammable matter or resin, composed chiefly of carbon (the base of charcoal), and hydrogen (the base of hydrogenous gas or inflammable air). As has been shewn, this is partly soluble in alkalies; hence the use of the alkaline lye in bucking is to dissolve as much as possible of the colouring matter; but, as the action of the alkali extends only to the surface of the cloth, it is soon over. The subsequent exposure to the air promotes the union of the carbon and hydrogen with the oxygen of the atmosphere, producing carbonic acid gas, or fixed air, and water.

When it was the fashion to denominate every combination of oxygen with an inflammable substance, combustion, this was considered a species of burning.

159. The great objection to this method of bleaching is its tediousness, two or three months being requisite to give the cloth the necessary whiteness. The simplicity of it, and the little apparatus it requires, recommend it however on some occasions, and accordingly it is employed by those country people who make their own cloth, particularly in Scotland.

The bucking of coarse cloths is expedited by boiling them in the ley, but this is seldom required for the finer kinds.

II. Bleaching by Water only.

160. We have observed (135.), that during the process of steeping, the cloth acquires some degree of whiteness; and it was long ago remarked, that the pulp from which paper is formed, when acted on by the stamper, was rendered whiter than before; it is found too, when the stalks of hemp and flax remain too long in the water in which they are steeped, they become considerably whiter, while, however, their texture is much injured. A manufacturer of Amiens, M. Brassée, conceived that, by cautious management, he might turn these facts to account, and bleach by means of water alone, which would be certainly one of the most economical methods. He allowed the hemp (for to this his experiments seem to have been confined) to remain steeping till the bark was pretty much destroyed by the fermentation. He then drew it through the teeth of a leek or comb, which easily tore away the half putrid bark, permitting the fibres to pass un injured between the teeth. During this process the hemp was perpetually immersed in water, by which means the green bark was much more easily separated, and the fibres acquired a much greater degree of brilliancy. Indeed, the whiteness produced in this way is truly surprising, and it is much to be regretted, that this cannot be obtained without injuring the quality of the cloth, which is prepared from the hemp thus treated. By this operation, however, the hemp does not acquire so pure a white as to render unnecessary the other processes, but by it these would be greatly shortened.

161. As it is a matter of the greatest consequence to the bleacher, to be perfectly acquainted with the nature of the substances which he employs, as well as the most economical and convenient methods of procuring or purifying them, we shall take an opportunity, in the course of this article, of treating these subjects pretty fully. There is no material which has been more extensively employed in bleaching than potash or potashes.

162. If a pile of wood, or a heap of land-plants tolerably dry, be kindled and burned in the open air till the whole is consumed, there remains a considerable quantity of ashes, which, on being boiled in water, impart to this fluid a strong saline taste, and give it the property of tingling syrup of violets, or any blue vegetable infusion, of a green colour. It was long ago known, that this liquor, thus impregnated, possessed the valuable property of facilitating the removal of dirt and grease from cloth or linen, and with these views it has been employed from time immemorial; and is still used for this purpose by the country people. At length it was discovered, that by driving off the water by evaporation, the useful part of the liquor might be obtained in the form of a whitish solid substance, which being thus rendered capable of being carried to market, or kept in a dry place to any length of time, was much more convenient than the liquor itself. It is said that the Germans were the first who procured this salt in the solid state from the ashes of wood; and as it was prepared by boiling in iron pots, it received the name of potash or potashes.

163. Potashes have long been a considerable and lucrative article of commerce, and a great quantity is annually imported into the British empire, for the purposes of several manufactures, but particularly for the process of bleaching. The greatest quantity is brought from Russia and America, and of these the American is considered as the best. Good potashes should be very soluble in water, and should leave a small quantity of sediment, and they should have the property of easily deliquescent or becoming moist when freely exposed to the air. But as the sale of potashes is extremely extensive and beneficial, it has been found convenient to the vender to increase their bulk by the addition of some other substance which he can procure at a cheaper rate; it is therefore of much importance that the manufacturer should be able to detect this imposition, which he will not find a difficult matter.

164. The ashes of most plants, besides the alkaline salt, which is more properly called potass, and of which we shall speak presently, contain a compound salt, formed of this potass united to sulphuric acid, called sulphat of potass. This salt is an injurious addition to the potass, as it possesses no detergent properties, and is very little soluble in water, one part requiring 16 of water at an ordinary temperature to dissolve it. This salt is sometimes added to the potass by the merchant or the manufacturer to increase its bulk, and as it is a very cheap article in comparison with potass, the adulteration turns out very profitable.

"During a mineralogical excursion through England," says Mr Higgins, "in the summer and autumn of the year
Part II.

Bleaching.

Vegetable year 1785, the different manufactures which fell in my substances way were not passed over. Upon inquiring of the distillers of aqua fortis (nitrous acid) how they disposed of the large residuum left in the still, which is sulphat of potash, and which is of little or no use in the arts, they informed me it was bought up by the Irish merchants.

"Sulphat of potash, when ground down, cannot readily be distinguished as to its external appearance, from pearl-ash, and being so much cheaper than the latter, is well calculated for the above fraudulent purpose.

"By no means do I imagine that this is a common practice, as from experience I know the contrary.

"However, to pass it over in silence would be unpardonable, when it is considered that the bleacher is at the expense of an article of no use whatever in bleaching, and that, by the adulteration, the proportion best known by experience to answer his purpose is varied, by which means his process, although not altogether frustrated, must be materially retarded."

155. The difficult solubility of sulphat of potash renders it easy to separate it from the pure alkaline salt. Higgins gives the following method.

"Three pounds of pearl-ash, and two quarts (a Scotch pint) of water, should be boiled together for a few minutes, then be removed from the fire and suffered to stand for twenty-four hours, when the clear liquor is to be decanted off. Half a pint more of cold water is to be poured upon the dregs, and this again drawn off when clear. The insoluble salt is afterwards to be well dried and weighed, which being a foreign salt, will give pretty nearly the quantity of impurities in the potash.

"I would recommend the above mode of analysis to the bleachers before they purchase or use this pot.

156. Though the potash in the state in which it is sold answers sufficiently well for many purposes, it is not, however, pure potash, but is an compound salt formed of this united to carbonic acid, and fixed air, and is called by modern chemists carbonate of potash. It is necessary for some processes to have it in the pure and caustic state, in which it acts much more powerfully. The carbolic acid is carried off by means of lime, for which it has a greater affinity than for potash. For this purpose a quantity of quicklime fresh burnt is to be blended with soft water in a wooden or iron pot, and afterwards the potash is to be added dissolved in water, after being purified in the manner above directed. They must stand together well covered from the air for some hours, frequently shaking the vessel, and then the fluid may be drawn off clear for use. This is commonly called soap-leys, as it is used in the manufacture of soft soap; it is called caustic alkali, from the violent action which it exerts on animal and vegetable matters, which it corrodes or burns very speedily; whereas the action of carbonate of potash is much less violent, and this is therefore distinguished by the name of mild alkali. The use of the caustic ley requires great caution, but when sufficiently diluted it is perfectly safe.

157. It is proper to remark here; for the sake of manufacturers who are not scientific chemists, that the lime is of no farther use here than taking the carbolic acid from the potash, by uniting with which it is converted into chalk or carbonate of lime. The effect which the lime has in rendering the alkali caustic, was long known to manufacturers, and they were led to suppose that it entered as an ingredient into the soap ley, and was itself useful as a detergent substance. This capital error led some into the employment of quick-lime in bleaching without any addition, by which means the texture of the cloth was greatly injured.

158. As potash is the alkali which has been most employed in bleaching, we have mentioned it first; there is, however, another of still greater consequence in most manufactures, and which deserves our particular attention, from its being employed in the method of bleaching by steam, to be described hereafter. This is called soda or mineral alkali.

When sea-weed or wrack, and several plants which grow on the sea-coasts, particularly several species of salvia and salicornia, are burned, the ashes form an impure alkaline mass of a different nature from that produced by the burning of land plants. What is obtained on our coasts from the sea-weed is called kelp, and that which is brought from the continent, especially from Spain, is called barilla, or baritha. The latter is the purer of the two, and is generally employed in the manufacture of soap. When these masses are reduced to powder, boiled in water, and the liquor filtered, sufficiently evaporated and set by to cool, a quantity of large beautiful crystals are obtained, which are carbonate of soda, or salt of soda.

159. The soda, as contained in barilla, is in a much more caustic state, or less of it is combined with carbolic acid, than potash in the raw state; neither of these alkalies will crystallize in the caustic state, but by standing for some time freely exposed to the atmosphere, they imbibe from it carbolic acid gas, and are then capable of crystallization. It is therefore necessary to allow the solution obtained from barilla or kelp to stand thus exposed for about a week. It must then be evaporated to a proper degree, determined by experience, or by the areometer, or by tests for salts, and set by to crystallize. To make sure of obtaining crystals, which it is not always easy to procure, it would be better to evaporate to dryness, then dissolve the dry mass in the least possible quantity of boiling water, and, on cooling, crystals will be formed.

160. Soda, as existing in barilla and kelp, is sometimes contaminated by the mixture of muriate of soda, or common salt, from which it may be freed by careful evaporation. Carbonat of soda is less soluble in cold than in hot water, while the solubility of muriat of soda is much the same in both. After obtaining the first crop of crystals, therefore, which will be pure carbonat of soda, the remainder of the solution must be gently evaporated to about one half, when part of the muriat will separate and remain at the bottom of the vessel: the hot liquor is now to be poured off from it and set by to cool; when a fresh crop of crystals will be obtained, and thus the remainder is to be successively treated till all the soda is procured, and all the salt separated.

171. For most purposes of the manufacturer, soda is required in its caustic state, and for this purpose, the carbolic acid is removed by means of quick-lime. But as barilla contains most of it in a state sufficiently caustic for the ordinary purposes of the bleacher, he is seldom at the pains of purifying it. The usual way is to tie up a quantity of powdered barilla in a thick canvas bag, which
BLEACHING.

is suspended in the copper in which the cloth is boiled. A sufficient quantity of the soda is thus dissolved in the water, and imbited by the cloth, while the insoluble drags remain behind in the canvas bag. For the finer cloths, however, and for the purposes of bleaching with vapour impregnated with caustic soda, it would be much better to obtain the soda in its purest form.

172. Soap is an article of the utmost importance to the bleacher, and which we are naturally led to consider after speaking of potash and soda.

These alkalis readily combine with vegetable oils and animal fat, and on this property is founded the manufacture of the detersive substances denominated soaps. There is a difference sufficiently marked between the soap produced by the union of fatty matters with soda, and that formed from their union with potash. The former combination produces a hard, the latter a soft soap. The invention of this valuable substance is attributed by Pliny to the Gauls. The original composition of soap seems to have been much the same in all ages, but the first attempts to make it appear to have been extremely rude. The ancients formed their soap of goats' fat mixed with the ashes of beech. Various improvements have been successively and gradually introduced into the manufacture, in proportion as accident, the parent of the most important discoveries, pointed out their necessity.

173. In France two kinds of soap are manufactured; hard, formed of soda, combined with olive-oil, and soft, composed of potash and vegetable oils, of inferior quality.

In Hungary and some parts of Germany, soap is made of tallow and barilla. A hard soap is prepared in Russia of bad salt butter, but it is held in little estimation, as the rancidity of the butter, and the quantity of cheesy matter which it contains, contribute to render it of a very inferior quality. We are informed by Weiglith that they also form a very hard soap of yellow and white bees wax, which has a very agreeable smell of almonds.

174. In Britain, where vegetable oils are by no means plentiful, and are consequently expensive, they manufacture this soap entirely with animal fat, employing either tallow, fish-oil, kitchen grease, or stale butter. There are four kinds of soap manufactured here.

1. A hard white soap formed of soda of Alicante, and of Varech, combined with tallow.
2. A marbled soap, made of soda, tallow, and kitchen grease; the marble is produced, not by a metallic oxide, as is the case in France, but by mixing a little lea towards the end of the boiling with the whole matter, drawing off the surplus to prevent the marbled part from setting, and then quickly conveying the soap into the frames to cool suddenly; this is at least the way in which the red marbled soap is made with us, but the motled appearance in the blue marbled wash-balls is said to be occasioned by indigo.
3. A hard yellow soap composed of soda, tallow, and resin, which last seems to be added to make the soap cheaper, as it certainly does not increase its deterptive property; and indeed it is said that the use of resin is very injurious both to the arms and hands of the washers who employ this soap, which it irritates exceedingly, and to the linen washed with it, to which it gives a yellow colour.
4. A soft soap, formed of whale or other fish oil combined with potash.

175. Attempts were long made to discover substances, which might supply the place of these fatty matters, in the manufacture of soap. It was reserved for Chaptaul to point out the road to this valuable end, by introducing his soap formed of wool, and thus converting scraps of cloth and pieces of old woollen garments, into an excellent soap. He has been followed in Britain by Sir John Dalrymple, who conceived, that by a process similar to Chaptaul's he might form a soap of the muscular parts of the fat fish. Some successful experiments completely proved the justice of the idea.

III. Of Bleaching by the Oxygenated Muriatic Acid.

176. The muriatic acid (see Chemistry), or spirit of salt, is not proved to contain oxygen, to which most other acids appear to owe their acidity. It is, however, capable of combining with this principle, by the addition of which it acquires new and very extraordinary properties. It will take oxygen from most of the metallic oxides or calces, as red lead, or, what is more commonly employed, the black oxide of manganese. If the muriatic acid be digested for some time, or either of these oxides, it acquires a most penetrating and suffocating odour, and instead of reddening a blue vegetable infusion, it banishes the colour altogether. It is this latter property of destroying colours, which renders the oxygenated muriatic acid of such importance in bleaching.

For the discovery of this acid, we are indebted to the immortal Scheele of Sweden, who was also acquainted with its property of discharging vegetable colours. The true application of this property, however, to the purposes of bleaching we owe to M. Berthollet, of whose paper in the annals of chemistry, (Annales de Chimie,) we shall present a brief abstract, as this was the foundation of all those improvements which have been lately made in the art, and of which we are now about to speak.

177. The oxygenated muriatic acid is obtained in the form of an air or gas, and was procured by Scheele in the following manner. He put a quantity of black oxide of manganese reduced to powder, into a glass retort, and poured on it some muriatic acid. To the retort he fixed a receiver, capable of holding twelve ounces; but containing only two drachms of water. On placing the retort in a sand bath, so that any acid which came over uncharged might fall back, and applying heat, the receiver was soon filled with a yellow-coloured gas. Having filled one receiver, he applied others successively, till no more gas was extricated, or till he had obtained sufficient for his experiments.

178. The experiments made by Scheele to ascertain the nature and property of this acid were few and simple; he suspended several substances in the necks of the receivers, and observed the following facts.

For a full account of the manufacture of this soap, vide Annales des Arts et Manufactures, par O'Reilly.
BLEACHING.

Part II.

Vegetable Substances.

1. The corks, which closed the mouths of the vessels containing the gas, were rendered yellow, as if they had been corroded by nitric acid (aqua fortis).

2. Paper tinged blue, with infusion of litmus or tansy, was rendered nearly white.

3. The red, blue, and yellow parts of flowers, as well as the green leaves of vegetables, were by the action of the gas rendered pale and colourless.

4. When these changes were produced by the action of water, by which this gas had been absorbed, the water was changed into very weak common muriatic acid.

5. Neither acids nor alkalies were capable of restoring the original colours thus changed.

179. Berthollet repeated and confirmed these experiments of Scheele's, and explained the theory of the changes produced by the action of this new substance.

"I have shown," says he, "that one portion of the common muriatic acid employed in the preparation dissolves the oxd of manganese, and displaces a part of the oxygen, or basis of vital air, which, in that substance, combined with the metal in larger proportion than is necessary for enabling it to be dissolved in acids. This superabundant and now disengaged oxygen being in a non-elastic form, or, as Priestley calls it, in a nascent state, and being thereby greatly disposed to enter into new combination, unites itself to the other portion of the muriatic acid, and, in consequence of this union, the oxygenated muriatic acid gas is produced."

Having examined and explained the experiments of Scheele, Berthollet goes on to make others of his own.

180. His first object was to examine the degree of solubility of the gas in water, which he suspected to be greater than Scheele had supposed.

181. "He soon perceived, if a body with a recurved tube be filled with this water, impregnated with the depillogisicated or oxygenated muriatic acid, and the outer extremity of the tube be immersed under a receiver filled with water; if, in this situation, the fluid be exposed to the light of the sun, bubbles are soon disengaged, which pass into the receiver, and are found to consist of pure or vital air. When the bubbles have ceased to be disengaged, the liquor is found to have lost its characteristic smell, colour, and all its distinctive properties; and is found to consist of mere water, containing a proportion of common muriatic acid. This simple experiment, M. Berthollet observes, ought to be sufficient to afford a conviction, that the oxygenated muriatic acid is really nothing but a combination of the muriatic acid with basis of vital air, or oxygen, which is found so abundantly in the black oxd or caix of manganese, that nothing more is necessary than to urge this oxd by a strong heat, in order to obtain a large quantity. Manganese, thus treated, is no longer proper to form the oxygenated muriatic acid; because it is deprived of that portion of oxygen which is required to combine with part of the muriatic acid.

182. "He remarks, that light possesses the property of disengaging the oxygen which was combined with the muriatic acid, by restoring that elasticity of which it was partly deprived; a restoration not to be effected by mere heat: he concludes therefore that the light combines with the oxygen, and that the elastic state of vital air is owing to this combination: which air, vegetable by losing a second time its elasticity in the process of combustion, that is to say, by a rapid combination with some other body, again suffers the principle of light to escape, at the same time that much heat is disengaged; the relation of which last substance with light is still an object for future discovery.

183. "If vegetable colours be plunged in the oxygenated muriatic acid, they disappear more or less speedily, and more or less perfectly. When the substance under examination possesses a mixture of different colouring parts, some disappear more readily, and leave only those which more effectually resist the power of this agent, but have nevertheless suffered a considerable alteration. The yellow colouring matters usually resist the most strongly, but at length they all disappear; and when the oxygenated muriatic acid has exerted its whole action, it is found to be reduced to the state of ordinary muriatic acid. Hence it follows, that the colouring matters have deprived it of its oxygen, or vital air; and have, by this combination, acquired new properties, at the same time that they have lost that of producing colours. This ingenious chemist declines entering, in his present memoir, into the properties of these oxygenated substances, and proceeds to observe, that the oxygenated muriatic acid owes its property of destroying colours to the oxygen, which not only is combined abundantly with it, but likewise adheres with very little force, and readily passes into a state of combination with such substances as have a certain degree of affinity with it. The habituses of such a variety of colouring matters as exist in nature, with the oxygen, with light, with alkalies, and with other chemical agents, cannot but form a highly interesting, and almost entirely unexplored, part of natural philosophy.

184. "After having observed the action which the oxygenated muriatic acid exercises in general upon colouring matter, he concluded that it might produce the same effect upon those substances which colour thread and linen, and which the art of bleaching proposes to destroy. Without confining himself to describe the process as now practised, he enters into a concise detail of the imperfect essays he made at first, a detail which will be by no means without its utility to such as are desirous of carrying the process into execution.

185. "He at first used a very concentrated liquor, which he renewed when exhausted, until the three pins which appeared sufficiently white; but in this way, he soon perceived that the texture was considerably weakened, and that they were even entirely deprived of their solidity. He therefore slightly diluted the liquor, and succeeded in bleaching his cloth, without altering it; but it soon became yellow by keeping, and more especially when it was heated, or subjected to the action of an alkaline lixivium. He directed his reflections, therefore, to the circumstances of the usual process of bleaching, which he endeavoured to imitate; because he had adopted the opinion, that the oxygenated muriatic acid ought to act in the same manner as the exposure of cloth upon bleach-grounds; which exposure alone is not sufficient for the purpose, but appears merely to dispose the colouring matter to solution in the alkali of lixiviums. He examined the dew which is precipitated from the atmosphere, and like-
BLEACHING.

Vegetablewise that which is afforded by the nocturnal transpiration of plants; and observed that both the one and the other were saturated with oxygen to such a degree, as to destroy the colour of paper weakly tinged with tournesol; and he remarks that the ancient prejudices respecting May dew, which is the season wherein the transpiration of plants is abundant, might probably depend on some observation of this nature.

186. "He therefore employed, alternately, the lixiviums, and the action of the oxygenated muriatic acid; by which means he obtained a permanent white. And as it is the practice, in the ordinary way of bleaching, to pass the cloth through sour milk, or vitriolic acid, diluted with a large quantity of water, he made the trial likewise of passing his cloths through a very diluted solution of vitriolic acid, and observed that the white was much brighter.

187. "As soon as he had made use of the intermediate lixiviums, he found that it was not necessary to use a concentrated liquor, or to leave the cloth long in the fluid at each immersion. By this observation he avoided two inconveniences, which might have rendered the process impracticable in the large way: the first is, the suffocating smell of the fluid, which would be very incommodious, and even highly dangerous to be respired for a long time, and which has discouraged several operators from pursuing their attempts in this way: the second is, the danger of weakening the cloth. At this period of his experiments he likewise gave up the idea of mixing alkali with the oxygenated muriatic acid, as he had before done in most of his experiments.

188. "This was the state of the experiments of this excellent chemist when he repeated them in the presence of the celebrated Mr Watt. A single glance, he observes, is sufficient to a philosopher whose abilities had been so long exercised upon the arts. Mr Watt soon afterwards wrote to him from England, that in his first operation he had bleached 500 pieces of cloth on the premises of Mr Grigor, who has large bleach-grounds at Glasgow, and continues to use this new process.

189. "In the mean time M. Bonjour, who had assisted M. Berthollet in his experiments, and who to a large share of sagacity has added a very extensive knowledge in chemistry, entered into an agreement with Mr Constant of Valenciennes to form an establishment in that town. The project was opposed by the prejudices and interest of the bleachers, who were apprehensive of the competition of a new method. Mr Constant could not even procure a piece of ground in the town of Valenciennes: but the Count de Belainge favoured this enterprise, and gave up a piece of ground which possessed every advantage; but, being at a certain distance from Valenciennes, would have the disadvantage of distance, if any manufactory should be established at Valenciennes itself. M. Bonjour had given up the well-founded hopes which his knowledge and talents gave him reason to expect at Paris: and had in return found, in the enterprise to which he had devoted his attention, nothing but those disgusting circumstances which usually accompany new processes in the arts. He addressed himself to the Bureau de Commerce, not to reward his services, but to request that he might be defended from the disadvantages and obstacles which prejudice and dislike can create in Valenciennes, by granting to him a certain space of two leagues round Valenciennes and Cambrai, in which he alone might, during a certain number of years, exercise this new art; without constraining in any respect those who might choose to adhere to the ancient processes, or attempt new processes, in which no use should be made of the oxygenated muriatic acid. He offered to instruct in his manufactory, in all the details of his process, all such as might be desirous of using it, and might obtain the sanction of the ministry. It is probable that, if his request had been granted, the establishment at Valenciennes might have produced a greater degree of confidence in those who had undertaken to make the necessary advances. It is probable, continues M. Berthollet, that they might have shortened their trials, instead of establishing the process at Courtray, as they have done; many artists might probably have been formed under the direction of M. Bonjour; and a great number of establishments might have been formed in the French provinces, by avoiding those fruitless trials which tend to throw discredit upon an useful art.

190. "As soon as M. Berthollet had reason to hope that the process might be executed in the large way, he endeavoured to diminish the price of the liquor, by decomposing the marine salt in the very operation which served to form it. His first trials were unsuccessful; but Mr Welser, a young ingenious chemist, to whom M. Berthollet had entrusted the management of the process, observed that it might be of advantage to dilute the vitriolic acid; and the operation then succeeded in the most satisfactory manner. He immediately wrote to M. Bonjour and Mr Watt, the latter of whom informed him that he had made this change from the first: and the operation was long afterwards described by Mr Chapal in a memoir forwarded to him to the Academy of Sciences. Mr Watt had likewise made use of a certain cask or butt, of a construction which M. Berthollet was not acquainted with; but, before this apparatus was mentioned, M. Welser had constructed one, which is not only very proper to prepare the oxygenated muriatic acid, but very well calculated for several other chemical operations.

191. "The intention of this apparatus is to multiply the surfaces of contact between the gas and the water, as it is evident that the combination can take place only at their surfaces. That part of the gas which did not enter into combination in the lower space, where it is first conveyed, passes into a second cavity or space, which is above the tube intended to give it vent. The vessel which is intermediate between the pneumatic cask and the distillatory matrass, is designed to retain that part of the muriatic acid which is not oxygenated: a small quantity of water is put into this vessel, a glass tube being plunged therein, the height of which exceeds that of the column of water the gas must overcome in the cask. The gas which passes out of the matrass compresses the water in the intermediate vessel with a force equal to that opposed to its disengagement; so that the water rises in the tube of safety, and forms a column equal to the weight of the water which
Part II.

BLEACHING.

Vegetable which passes on the tube through which the gas enters the cask. But if, during the operation, a sudden cooling or rapid absorption of gas should take place, the water descends again in the tube, the air of the atmosphere enters, and prevents a vacuum from being formed within, which would have been attended with a resorption of the liquor, and consequently break the distilling vessel by the sudden cooling.

192. "If the oxide or calx of manganese be of a good kind, in small crystals, and contain very little foreign matter, the proportions which M. Berthollet found best calculated for distillation, are the following:

193. "Six ounces of pulverized calx of manganese, one pound of pulverized sea salt, twelve ounces of concentrated vitriolic acid, and from eight to twelve ounces of water. If the calx of manganese contain foreign earth or metallic substances, the quantity must be augmented in proportion to its impurity. It will be known, after the operation, whether a sufficient quantity has been employed; because a small quantity ought to remain undecomposed, and of its original black colour: from this observation, the quantity proper to be used in the following operations may be ascertained.

194. "When the calx of manganese is found to contain calcareous spar, as may be known by its effervescence upon the contact of a small quantity of vitriolic acid, it is proper to wash it before the operation with diluted vitriolic acid, to separate the calcareous part, which might be troublesome on account of the effervescence it produces: the calx must be dried after this washing.

195. "M. Berthollet is of opinion, from his trials, that when the calx of manganese contains much phlogisticated air, it is scarcely proper to form the oxygenated muriatic acid: M. Fourcroy, however, asserts, that the phlogisticated air escapes in distillation from manganese by a degree of heat less than ignition, but that ignition is necessary to deprive it of its vital air. It might perhaps be found advantageous to make use of this information to purify such manganese as contains phlogisticated air, by distilling off this last aerial substance by a moderate heat before it is applied to the purpose of oxygenating the marine acid.

196. "A greater or less quantity of water must be added, not only according to the degree of the concentration of the sulphuric acid, but likewise according to the quantity of matter subjected to distillation. If this quantity be considerable, the acid must be more diluted than if it be small. It might be more advantageous to make use of an acid which had not been concentrated; because the operation of concentrating it adds to its price, and it is obliged to be again diluted with water. But M. Berthollet observes, that this saving can only take place when the manufacturing of the vitriolic acid is near at hand; for in those situations where this acid is to be brought from a considerable distance, the expense of carriage of a greater quantity of fluid might exceed that of concentrating it.

197. "When the materials are prepared, the calx of manganese must be carefully mixed with the seasalt, and the mixture introduced into the distillatory vessel, placed on a sand bath: the vitriolic acid must then be diluted, and suffered to cool; after which it is to be poured on the mixture, and the tube of communication between the matras and the intermediate vessel quickly fitted in. A particular attention to the luting is required in this operation. M. Chaptal takes notice that when the vapour is perceived to escape by the smell, it is sometimes difficult to ascertain the imperfect place; but that if a feather dipped in volatile alkali be passed on such occasions over the lutes, it will show the faulty place, by the white cloud of ammoniac formed in consequence of the combination of marine acid with the volatile alkali.

198. "The size of the vessels ought to be such, that the matras should be about one-third empty; and that, for the quantity here laid down, the casks should contain 100 pints of water, with an empty space of the bulk of about ten pints; because, when the gas comes to occupy the cavities designed to receive it, the water will require a space into which it may ascend.

199. "Before the operation is begun, the pneumatic cask must be filled. The mixture being made, the gas, which soon begins to be disengaged, first drives the atmospheric air out of the apparatus. As soon as it is apprehended that the atmospheric air has passed into the cavities, it is emptied out by means of a recurved tube, successively introduced beneath each; and in order to drive the water out which has entered into the tube, M. Berthollet recommends blowing strongly into it.

The operation is suffered to go on without the application of heat, until it is perceived that the bubbles are more slowly emitted: at this period, a slight degree of heat is applied. It must not be strongly urged at the beginning; but by a gradual increase it is at last to be carried to ebullition, towards the end of the operation. It may be known when the operation is near its termination, by the tube of communication and intermediate vessel becoming hot.

200. "When the gas is no longer disengaged but in small quantities, the fire is to be put out, and a sufficient time must be suffered to elapse until the matras is nearly cold. The tube of communication may then be removed, and hot water poured in to keep the matter in solution, that it may be more easily taken out: this residue is to be poured into a large vessel, intended to preserve it for a use to be presently mentioned. The operation lasts longer in proportion to the quantity of matter. With the before mentioned quantity, it ought to last five or six hours. It is proper not to be too much in haste, because a larger quantity of gas is by that means obtained. One single person may inspect and manage several of these apparatus, and the quantities may be much larger.

201. "The intermediate vessel gradually becomes filled with a fluid, which consists of pure but weak muriatic acid: several operations may, however, be made without taking it out; but when it is apprehended that there is not a sufficient space left empty, this acid is taken out by means of a syphon: and, when its quantity is considerable enough, it may be substituted instead of the mixture of sulphuric acid and muriate of soda, in a similar operation, if it be not wanted for another use. In order that the quantity of common muriatic acid which passes out of the matras, may be inconsiderable, it is expedient that the first tube should make a right angle, or even a more obtuse angle, with the body of the matras. During the operation, it is necessary to...
BLEACHING.

Vegetable stir the water, from time to time, by means of the agitator, in the apparatus, to favour the absorption of the gas by the water. When this is completed, the liquor is sufficiently strong to be used in bleaching. A smaller proportion of water may be put into the cask, and the fluid may afterwards be properly diluted.

202. "In this state of concentration, though the liquor remains capable of drawing swell, it cannot prove anxious, or even very inconvenient, to those who use it. It is, nevertheless, proper to conduct it into the vessels in which the clothes are arranged, by wooden channels, fitted to the opening at the lower part of the cask. It is proper to draw off the liquor from the vessels as soon as it is prepared, because it acts upon the wood, and not only becomes by that means weaker, but likewise hastens the destruction of the cask: but when it is conveyed into a vessel in which cloths are properly placed, these speedily weaken it to such a degree that it does not perceptibly act upon the wood.

203. "The clothes are to be prepared by leaving them 24 hours in water, or still better in the old lixivium, to extract the dressing; after which they must be once or twice well washed in alkaline lixiviuns, because all that part which can be extracted by the lixivium would have neutralised a portion of the liquor, which requires to be carefully used. After this the cloth must be carefully washed, and disposed upon sticks in such a manner that it may be impregnated with the liquor poured on it, without any part being compressed. The framing of the sticks, as well as the cask and vessel intended to contain the cloths, ought to be constructed without iron; because this metal becomes calcined by the oxygenated muriatic acid, and would produce iron moulds, not to be taken out but by means of salt of sorrel.

204. "The first immersion must be longer than the following ones; it may last three hours: after which, the cloth is to be taken out, lixiviated anew, and then put into a shallow vessel, in order that new liquor may be poured on it. It is sufficient that this immersion, and the following, should continue for the space of half an hour. The cloth is taken out, and cleared of the liquor by pressure; then lixiviated, and subjected to new immersions; the same liquor may be used until it is exhausted; and when it is found to be much weakened, a proportion of the liquor which has not been used may be added.

205. "When the cloth appears white, excepting at the selvages, and a few threads darker than the rest, it must be impregnated with black soap and strongly rubbed; after which it is to be lixiviated for the last time, and immersed once more in the liquor.

206. "The number of lixiviuns and immersions which are necessary cannot be determined, because it varies according to the nature of the cloth: the limits of this number, however, are between four and eight for linens and hempen clothes. M. Berthollet expresses his inability to point out the best method of making the alkaline lixiviuns; this useful art being still a matter of mere practice, and variously performed in different places. It appeared advantageous to him to render the alkali caustic, by mixing one-third of lime; but in this case care must be taken that the lixivium be strained through a cloth, in order that the calcareous earth may not mix itself with the linen, as its particles might corrode or wear it by their hardness. Vegetable.
BLEACHING.

Vegetable relative strength, in order that the experiments may all times be equally successful. M. de Croisselle makes use of a solution of indigo in the vitriolic acid; for which purpose he takes one part of finely-pulverized indigo, with eight parts of concentrated vitriolic acid. This mixture is kept in a matrass for several hours on the water bath; and, when the solution is complete, it is diluted with a thousand parts of water. In order to ascertain the force of the oxygenated muriatic acid, one measure of this solution is put into a graduated tube of glass, and the liquor or impregnated water is added until the colour of the indigo is completely destroyed. In this way it is ascertained, by means of the gradations, how many measures of any liquor whose goodness has been ascertained by direct experiments upon linen or cotton, are necessary to destroy the colour of one measure of the solution of indigo; and this number will serve to ascertain the respective force of all the liquors which are required to be compared together. Mr. Watt makes use of a solution of cochineal for the same purpose.

210. "In the sixth volume of the Annals of Chemistry, M. Berthollet has published some additions to the foregoing Memoir, which, on account of its extensive utility, I have scarcely at all shortened. They are the following:—Mr. Welter finds that it is advantageous to terminate the process, by exposing the thread or cloth for three or four days in the field; during which they must be occasionally watered, and afterwards washed with pure water. He considers this exposition as indispensable. But M. Berthollet observes, that other persons have bleached to the perfect satisfaction of artists without it; though he admits that it may happen, in the large way, that certain pieces may not turn out perfectly white after the last operation, in consequence of some of their parts having suffered casual pressure; and he thinks that, although a continuance of the operation would remove these imperfections, it might, in such cases, prove more advantageous to remove them by exposure on the grass; very little loss of time, and no considerable extent of premises, being required for this purpose.

211. "M. de Croisselle has excluded the use of wood in every part of his apparatus; and has applied the process not only to bleaching, but to the discharging of colours in dyed cottons or linens.

212. "M. Berthollet further observes, that the precaution of plunging the cotton in pure water, after they have been taken out of the acidulated water, is not sufficient; but it is necessary to plunge them into a weak caustic lixivium, moderately heated, and keep them there for a short time.

213. "When the liquor is suffered to run immediately into troughs, care must be taken to mix it well with the agitator; because otherwise the most saturated liquor, which occupies the lower part of the vessel, running first, would exert too strong an action; or if half or three quarters of the liquor be drawn off, and mixed with the proper quantity of water, according to the precautions before established, the rest of the fluid may be used together with the water for the succeeding operation: lastly, he observes that this process, simple as it is, can scarcely be carried into execution, without, in the first instances, being directed by a person to whom the operations of chemistry are familiar.

He observes that a diminution, or even an equality of vegetable the expences, relative to the ordinary process, is not to be hoped for, excepting for the bleaching of fine cloths, unless the operator possesses a good process to extract the soda from the residue of the distillation; and without this condition the bleaching of coarse cloths ought not to be undertaken, excepting in those cases wherein the advantages arising from the speed of the operation, the facility of performing it in all places and at all times, and the diminution of the stock or capital, are sufficient to compensate for the excess of the price. These observations are perhaps applicable to linens, and not cottons. It is not possible, he continues to observe, to lay down principles applicable to every particular case; but he advises those who may undertake this object, to begin by trials, and by means of those trials to form calculations, without any allowance on the favourable side. On the other hand, he advises the operator not to suffer himself to be imposed on by those losses which arise for want of being familiarized with the operations: as there is no great expense incurred by making trials for a time, by which this advantage is derived, that the operator renders himself more expert for carrying more extensive processes into effect."

Nicholls.

Chem. Dict.

214. Such is the method of procedure recommended by M. Berthollet, which was soon found liable to many inconveniences; and various amendments and alterations have been suggested, the principal of which we shall relate. Pajot de Charmes was one of the first improvers of the new method. He states the following objections to Berthollet's process.

1. He thinks the furnaces recommended by Berthollet not well adapted to the purpose, as they are difficult to procure and expensive; as they will only contain each one matrass; as they are not calculated to show the progress of the process, are too speedily heated, and consequently endanger the lutes; and lastly, as they will not always guard against absorption, notwithstanding the tube of safety in the intermediate vessel. The furnace which he would have employed in place of these is thus constructed:

215. The furnace is supported upon a frame-work of wood, between which and the hearth tiles are disposed in a bed of clay. The furnace itself is built of brick, which he recommends to be lined with plaster of Paris. It ought always to be double, and is divided by a partition in the middle. In the upper part at the front are two cavities intended to admit the vessels used in the distilling; they may be either round or square; and, as the latter is most convenient to the builder, they should perhaps be always square, provided with a ledge, and rounded at bottom. The combustible matter, which may be charcoal, is burned in a sort of chaffier, or in a portable grate, which is introduced by an opening in the side of the furnace: and this opening may be closed during the process by a door of plate-iron so as to prevent the too free access of air. From behind the distilling vessels and charcoal grate proceeds a funnel, through which the vapour and heat of the fuel is conveyed into a cavity with raised edges, over which is placed an oblong vessel of sheet iron, intended to be kept filled with muriat of soda, which may dry during the process. At each extremity of this cavity is a hole which may be opened or closed as required, so as to

he 4 R

1
BLEACHING.  

Vegetable substances admit a greater or less quantity of air. Below the drying place, in the sides of the empty space at the back of the furnace, are places where boxes of sheet iron, containing the requisite proportion of manganese and salt, ready mixed, are kept for the purpose of keeping the materials dry.

In each of the square spaces is placed a capsule, which may be made either to contain sand or water, in which the distilling vessels are to be inserted. These capsules rest with their rims upon the edges of the cavities, and are supported below by a small bar. The furnaces, according to the directions of De Charmes, are made so as to be portable, an advantage which may perhaps, in most manufactories, be dispensed with.

216. 2. De Charmes next objects to the curved tube as being liable to be broken; and thus expose the workmen to the noxious gas, of which the accident will also cause a considerable loss. Berthollet's method of applying the tube is also objectionable from the destructible nature of the cork stoppers, and the difficulty of preserving the stability of the latter.

He proposes, instead of the matrass, tube, and intermediate vessel, to substitute tubulated retorts, furnished with curved necks to take the gas or liquid; the base of which is leaded, to support a leaden support in the form of a funnel; and to that is adapted the end of a leaden tube which passes into the pneumatic tube, and has its lower extremity bent to a right angle, serving instead of the glass tube used by Berthollet.

217. 3. Berthollet's pneumatic tube was not provided with a cover close enough to prevent the escape of the gas; and his inverted vessels appear to De Charmes to be improper, from the difficulty there is of constructing their sides and borders so as to concentrate the gas in the best and most complete manner.

His pneumatic tube is conical, and divided into three parts by two false bottoms, which are made to rest on hoops or sliders within the tube, and kept there by means of pins.

218. The distilling vessels employed by De Charmes are not high enough to prevent a portion of the sulphuric acid from passing over without combination; and they are too small for ordinary use. In Ireland they employ leaden alembics of a sufficient height, and capable of containing 40 gallons of liquid, which is a capacity amply sufficient for allowing the swelling of the materials. These alembics are conical, have a broad bottom, which is supported in a vessel of water to regulate the heat; the neck is so long as to allow any sulphuric acid, which may rise, to fall back again, and the cover of it is perforated in two places; one of the perforations serving for the passage of a rod of iron with prongs entering within the alembic, but so covered with lead as to prevent the action of the sulphuric acid, and the handle passes through a leathern collar to prevent the escape of gas, the whole being intended for stirring the materials; the other hole intended to admit a leaden funnel carved like an S, to prevent the reaction of the gas on the diluted sulphuric acid which is to be introduced through it.

219. It is of the greatest importance to prevent the escape of the gas, as well to prevent danger to the workmen as loss to the manufacturer. "C. Widmer, at Jouy, has arranged his apparatus in such a manner as to lose the least gas possible during the condensation; he receives the gas under a capsule inverted at the bottom of the apparatus; and above these are two tomes de goussiere also inverted; then another capsule above these; then two more tomes de goussiere, and then another capsule, which terminates the apparatus. The disposition of his tube is such, that he places around it his laboratory several distilling apparatuses, which are going at the same time."

"Apparatus constructed on similar principles are also in use at Glasgow and Manchester. Bourbiol-de-Boussu has likewise invented an apparatus, consisting of several matrasses, ranged as in an aquafortis manufactory, the tubes of which are conveyed into a chamber containing concentrating tubs. His apparatus for the bleaching of paper is very ingenious, and deserves to be described. In the last piece, others have arranged five or six large casks, like Welle's apparatus, in such a manner as to make each cask perform the functions of a tubulated flask."

220. Before we proceed to describe the most approved method of immersing the cloths in the concentrated liquors, it will be proper to treat particularly of the materials employed in preparing this liquor, the method of preparing them for the process, and the method of adjusting the apparatus and conducting the distillation.

221. The selection and preparation of the materials is of the greatest importance, as on them will depend in a very great measure the success of the operation.

The materials are either the mercuriacid and black oxide of manganese, or this latter and sulphuric acid and muriat of soda, which are usually employed as being cheaper. There are, however, advantages in using the mercuriacid ready prepared, where the bleaching is in the neighbourhhood of such a manufactory, as the danger of breaking the vessels (where glass is employed) from the incrustation of the residue salt is much less in this case.

222. The crystallized ore of manganese is to be preferred, such as appears to be composed of spherical needles slightly adhering to each other; this variety is generally purer, and much more easily reduced to powder, and a smaller quantity of it is sufficient. It must be reduced to a very fine powder, a short time before it is wanted, as if kept long in the state of powder, it is said to be injured.

223. The grey muriat of soda is employed in France as being cheaper than the white, but probably the present regulations of the salt duties in this country are such as to preclude the manufacturer from employing it in this state. The salt is to be dried on an iron plate in that part of the furnace described in 205, and then rubbed to a fine powder, a short time before it is wanted, as if kept long in the state of powder, it is said to be injured.

224. In order to be more certain as to the proportion of the ingredients, the sulphuric acid should be procured in its concentrated state, and said of the same specific gravity should always be employed. Before using, it is to be lowered with its weight of water, and it is proper to observe, that in making the mixture, the water should not be added to the acid; but the acid should be poured in a gentle stream into the water, pouring it down the sides of the glass vessel in which the mixture..."
Part II.

BLEACHING.

Vegetable tare is made, adding the acid by portions at intervals, and turning the head aside to avoid any drops which may fly up from the effervescence produced, which, however, is much less in this way than when the mixture is made in any other way. As a heat greater than that of boiling water is generated, it is better that the vessels have the form of jugs with spouts and handles, that the mixture may be more easily poured into the distilling vessels.

225. The proportions in which the ingredients are employed, are variously adjusted by different manufacturers. De Charmes recommends the following:

Oxid of manganese crystallized, twenty ounces.
Muriate of soda, four pounds.
Sulphuric acid (at 60° of Massy's aërometer), 44 ozs.
Water, three pounds and a quarter.*

Mr Rupp of Manchester recommends the following, as affording him the strongest liquor:

Manganese, three parts.
Muriate of soda, four parts.
Sulphuric acid, six parts.
Water, twelve parts.

Mr Higgins uses the proportions as under:

Manganese, sixty pounds.
Muriate of soda, sixty pounds.
Sulphuric acid, fifty pounds.
Water, about thirty pounds.

In Germany, and in France at present, the proportions are nearly as follows:

Manganese, twenty parts.
Muriate, sixty-four parts.
Sulphuric acid, forty-four parts.
Water, fifty-four parts.

226. It would conduct much to the economy of this method of bleaching, if the manufactory of sulphuric acid could be carried on under the same roof with the bleaching process, or if some method could be devised to prepare this acid, without employing the nitrate of potash (salpetre). The latter has been attempted by De Charmes, and as his experiment may afford a hint to manufacturers, we shall copy it.

"The present is certainly the place to speak of the attempt I have made, to procure the sulphuric acid without the intermedium of nitre, and to describe the apparatus I made use of for that purpose. It consisted of a pitcher or pot of stone ware, perforated at the bottom, the neck of which communicated with two small two-necked glass bodies connected together, and each half filled with water. Under each of these glass vessels was lighted charcoal, to keep the water in a state of evaporation, and under the earthen pot there was likewise fire to heat and inflame the sulphur, which was put into the pot through the opening opposite the neck. This opening, which draws in the external air for the combustion of the sulphur, was closed with a stopper, perforated like the nozzle of a garden-pot."

"The sulphur, thus inflamed, soon filled the vacant part of the glass vessels with its whitish cloudy vapour. Vegetable this vapour, meeting that of the water, combined with it, and fell in acidicul drops on the lower water, over which the vapour of the sulphur circulating for a time, does also probably combine with it to a certain point. Another proof that this condensed water did combine with the vapour of the sulphur is, that the same vapour received in drops beyond the second glass vessel by means of a recorved adopter, came out in the acid state, reddening the tincture of tournsil, and effervescing with alkalis when concentrated. I have twice repeated this experiment with success, and with scarcely any inconvenience.

"I likewise attempted to burn sulphur and heat water, in two separate vessels communicating with a third. The two vapours combining together in the receiving vessel, likewise produced by their condensation a fluid, which afforded the same indications of acidity as that of the former experiment.

"When sulphur was burned in an earthen vessel, and its vapour communicated into an earthen jar, in which water almost boiling was poured, the results were the same.

"It is probable that if these experiments were repeated more at large, with a suitable apparatus, a longer series of glass vessels, and proper furnaces, the success would be more complete. I intend at some future time to resume this process, and shall hasten to communicate my success to the public, if success should attend my endeavours (1)向往.

227. The disposal of the apparatus for the distillation will next demand our attention; and as much of the success of this operation will depend on the goodness of the lute, it is proper to make a few remarks on this subject. The following is recommended by De Charmes (or rather M. Baume) as a fat lute. Take any quantity of good gray or blue clay, or, what answers extremely well, fillers earth. Let it be dried in thin cakes in an oven after the bread is baked, then pounded or sifted; a certain quantity of this clay is to be mixed with a sufficient quantity of boiled linseed oil, in an iron or bell-metal mortar, in which they must be well beaten together for a long time, so as to form a tenacious stiff paste of a uniform consistence, and perfectly free from lumps. A considerable quantity of lute is usually made at once; and, so far from losing any of its tenacity by being kept, it is asserted that lute which has been made a twelvemonth, provided that it has been preserved in a cool damp place, as a cellar, and in covered vessel, is more pliant and better than when first made. If too dry and hard, it may be easily rendered of a due consistence by being warmed and worked with the fingers, or beaten in a warm mortar.

The lute which has been used in one distillation must not be thrown away, as, with proper management, it may serve again, and is even better than before. It must be carefully freed from the burnt and hard parts, however, as these would render it crumby.

228. "When the quantity to be mixed, or kneaded up

(1) Chapter made a great number of experiments in the large way, for the purpose of discovering the means of acidifying sulphur, without the expense of nitre; but upon the whole they were unsuccessful.
BLEACHING.

Part II.

Vegetable up again, is very small, the trouble of beating it in the mortar may be avoided, because the operation is performed very well, by kneading the matter with the hands. For this purpose, a portion of the lute already kneaded in the mortar, and soaked with oil, may be taken and rolled in the vessel containing the pounded and sifted earth; the portion of earth which adheres may then be worked in; and, by a repetition of this manipulation, the mass will speedily become enlarged, and must be strongly compressed, rolled out, and doubled again, until it is found that it possesses the requisite softness and tenacity, and does not crack when doubled.

"If it should happen that the lute should become too soft by excess of oil, and clay is not at hand to correct this fault, the mass will soon acquire firmness by exposing it to the open air upon parchement, or upon a plate. It must not be laid upon paper, because it is very difficult to separate this material entirely; and if any particles should remain, there would be reason to fear that, when incorporated in the mixture, they would either prevent the perfect adhesion of the lute, or would allow the passage through that kind of void or pore, which the fragments of paper would form. It is, moreover, to be remarked, that this lute cannot be too smooth and uniform. It ought not to afford any perception of inequality when it is handled, or kneaded, nor indicate the presence of foreign substances, such as sand, straw, earthy particles, &c. which are capable of preventing the interconnection of its parts."

"I strongly insist on the perfection of this lute, because it is the soul of distillation.

229. "Boiled linseed oil is thus made: two pounds of common linseed oil being put into a saucepan, or proper vessel, of copper, iron, or pottery, add three ounces of red litharge, finely powdered and sifted; after stirring the whole well together, place the vessel on the fire, heating it gradually, until the litharge is completely dissolved. It is necessary to stir the mixture very frequently with a wooden spatula, until the whole solution, which at first acquires a brick-dust colour, is completed; it is then to be removed from the fire, and, when cold, transferred into a stone or earthen vessel, and kept well corked. This is the boiled linseed oil at the vessel directed to be mixed in the fat lute.

"When this oil, which is blackish after boiling, is well made, it congeals in the vessel as soon as it is cold. When it is required to be poured out, it may be rendered fluid by bringing it near the fire. To save the trouble of heating it, it may be poured, as soon as made, into a plate or shallow vessel, or left in the vessel used for boiling it. It is seldom necessary to heat it for the mere purpose of mixture; the quantities required for this purpose may be taken up with the fingers, or in any other manner.

"It is proper to observe, that the vessel in which the oil is boiled must be sufficiently high, to afford a space for the swelling of the fluid; for, as soon as the heat begins to act, it will rise and overflow the vessel, if particular attention be not paid to it. As soon as this process begins, the vessel must instantly be taken off the fire, and the mixture strongly agitated by plunging the spatula in it, at the same time blowing strongly at its surface with the mouth; by which means the ebullition will be checked. After this event has happened two or three times, it may with certainty be concluded, that the oil will be sufficiently consistent to form a good fat lute. By cooling, it immediately congeals, as has been remarked, to the consistence of plaster, of a black colour, inclining to brown.

230. "The lute made of linseed oil cake is thus made:

"The cake is first to be broken and pounded in an iron or bell-metal mortar, and afterwards sifted through a silken sieve; starch is then to be boiled up, to the consistence of size or glue; a small piece of this, being powdered with the flour of the oil-cake, is to be worked in a plate, or with the hands; more of the flour may then be added, and the kneading continued until the mass is absolutely without any lump, or inequality, and its consistence has become nearly the same as that of the fat lute; after which it is to be kept in a plate, or covered wooden bowl, in the cellar, for use. The same care must be taken with this, as with the fat lute, not to wrap it in paper, but in parchment, if thought necessary.

"This lute dries and hardens much on its outer surface, which remains uninjured at the place where it is applied; but it is decomposed more speedily than the fat lute, on account of its peculiar property to become hard and shrink with a strong heat. In this state, in consequence of the action of acids, it assumes a yellow colour, and is then good for nothing: it must be removed to the conjunction of its parts.

"A very good lute is likewise made with equal parts of the flour of almonds, of linseed, and of starch, kneaded together. It must be understood, that the latter is to be boiled to the consistence of starch.

"To these different luttes we may add that which is composed of lime and white of egg, which has the property of acquiring a considerable degree of hardness.

"Among all these luttes, that to which I have constantly given the preference, and is always kept in sight in the present work, is the fat lute. The lute of white of egg and lime, retained by a cloth and a bandage, may be advantageously used as a covering to the fat lute.

"The fat luttes adhere very much to the hands, during the kneading or working; but it is not difficult to wash off the remains after the operation: nothing more is necessary, than to use warm water and soap, or soap lyes, after having previously wiped off the greater part with blotting paper.

231. As the directions given by De Charmes for disposing the apparatus will, with a few modifications, apply to every case, it will be proper to give them without abridgment.

"Our distillation may be performed either in a retort, or a tubulated body or bottle. There can be no difficulty in properly placing these vessels. The junction of the neck or tube, communicating with the pneumatic vessel, is the only objection which requires particular care. The manner of joining these two parts, by means of lute alone, will be explained below.

"As the use of the retort requires more attention with regard to its form, and the application of the additional part, the following details will be of use to prevent accidents.

232. "When the retorts are new, and have not be-
Part II.

BLEACHING.

Vegetable Substances.

fore been luted to any additional part, it is advisable either to rub a small quantity of warmed wax on the parts where the lute is to be applied, that is to say, the neck of the retort, as well as the correspondent part of the additional piece, or to suffer a small quantity of starch or paste to dry upon those parts; without this precaution the lute could not be easily applied; it would slide and roll upon the glass instead of adhering.

Care must afterwards be taken to fix round the neck of the retort a mass of lute, somewhat greater than is supposed to be necessary to fill the additional part to the place where it is to be fixed, in order that by the forcing of that piece upon the neck of the retort, the lute may extend and apply itself more intimately. The same attention must also be paid to the mass of lute, which is required to secure the beak of the additional piece in its connection with the pneumatic apparatus. These observations are of more importance, in order that the two pieces may, by this compression, be made to operate as if they formed one entire vessel.

To apply these lutes with ease and convenience, the retort is to be held in one hand, in such a manner as that its body or lower part may not touch or rest upon anything whatever, because the slightest blow upon this very thin part will break it.

Before the lutes are applied, care must be taken to introduce the neck of the retort into the additional piece, and mark with lute or wax upon the additional piece the place where the extremity of the retort touches it internally; and, in like manner, on the retort itself, the place where the extremity of the additional piece touches its neck. By means of these marks it is easy to estimate the thickness of the masses of lute, by placing the two vessels near each other in the respective positions they ought to have been fixed. Lastly, they are united together by sliding the recurred additional piece upon the neck of the retort, which is to be held firmly by its neck, resting the hand on the surrounding part, if the retort is small; or holding it by the recurred part, if it be large, or the additional piece should be too long and heavy. The greatest attention must be paid not to turn the parts round, during this operation, more than is absolutely necessary to bring them together; and if this can be done without any turning at all, it will be still better, as the lute will hold more effectually. The neck of the retort must be entered into the additional piece as far as it is capable of compressing the lute, or nearly to the marks made upon the pieces before they were put together. In this situation the lute, which forms a mass round the edge of the additional piece, must be raised so as to cover both surfaces, after having first pressed it as firmly as possible into the joint; smoothing it upon the two pieces, so as to prevent the smallest opening or crack. It is advisable after all to spread a thin coating of the boiled linseed oil over the lute, which not only renders it smoother and more perfect, but by the density it acquires from evaporation, it forms a kind of varnish or pellicle, which supports the lute, and prevents the fissures which might be formed during the actual operation.

While the lute is thus spread and applied on the external part of the additional piece and the neck of the retort, the compound apparatus is to be held by the additional piece only, and the retort left to be supported, untouched, in the air, by its insertion at the neck only.

Instead of luting the additional piece to the retort, simply at the extremity of the neck of this last, and at the place where the wider part of that piece touches the retort, we might apply the lute upon the whole surface comprehended between those parts. But I have found that it is sufficient if these two parts be made secure. A retort luted in this manner forms one single and entire body with its additional neck; and with very little care and attention, the lute will seldom or ever have occasion to be renewed before one or two months service.

The tube on which the recurred additional piece rests during the distillation, and through which the gas is introduced into the pneumatic tube, is, as I have remarked, entirely of lead. If it be not cast, it ought to be carefully joined with strong solder; and for fear this last should fail, it will be prudent to cover it with a coating of yellow wax, pitch, or melted pitch.

That part of the tube, (if soldered as before mentioned) which passes under the lower false bottom, ought to be carefully bended with a round corner, before it is coated with the wax or pitch; and in the bending it is safer to cause the soldered part to lie within the angle. It is likewise proper to stop the mouth of the tube with paper, or a cork, during the time of waxing or tarring, in order to prevent any introduction of those substances into its cavity, taking care to withdraw this temporary stopper before the apparatus is applied to actual use. It is not absolutely necessary to coat any other part of the tube, but that which is to be placed within the pneumatic apparatus, because it is easy to stop any other part, out of which the gas might issue, with soft wax or lute.

The extremity of this tube, in which the recurred neck of the additional piece is to be inserted, must have the form of a small funnel, not only for the purpose of affording the most convenient support, and the more ready adaption to the various sizes of those necks, but also because it more readily supports the only kind of lute which in this work we suppose to be used. This lute is never deranged, if care be taken to press it against the internal surfaces of this small funnel, and of the glass or lead of the additional piece, so as to unite them as much as possible, it being always understood that the lute is good, and possesses the properties before described in treating of that substance.

I have remarked, that the use of the retort with its additional neck might be dispensed with, by simply using a body or bottle with a neck (even a wine bottle may be used in case of necessity, provided its bottom be either very thin, or very gradually heated). In the orifice of the neck of these vessels, is to be adapted a tube of lead, properly bended, and of a due size. This method is in fact very advantageous and economical; but care must be taken to join the tube, if it be of sheet-lead, particularly in the parts below the bottle which are liable to become heated, a short time before the end of the distillation; to join it I say, without solder, by fusing the two edges together. For in process of time the solder, though ever so strong, yet:
Vegetable yet because it contains tin, is liable to excessive corrosion by the oxygenated muriatic acid, which, notwithstanding its heat, is not found to attack lead in any perceptible degree.

"But it may, perhaps, be more convenient to cast such a tube at one heat, as well as the additional piece in the apparatus, with the retort; unless, indeed, it should be practicable to have it made of stone-ware or porcelain, the latter of which is the least permeable to the gas. Or we might, with more advantage, make use of a thick tube of common glass, which might be easily bended in a charcoal fire, and might be adapted to the tubulated bottle, as well as the leaden tube. But the danger of its breaking, and the difficulty of procuring others in case of need, together with the expence, have led me to reject this, as well as the tubes of pottery or porcelain.

"In order that the tube adapted to the neck of the bottle may accurately fit, and prevent all escape of the oxygenated muriatic acid, it is defended by but in such a manner, that it shall not be thrust into the neck of the bottle, without extruding a portion of that substance; and a border of luting must then be applied round the place of junction, which will effectually prevent the escape of any vapour which might issue through the first luting. Lastly, the whole surface of this external luting is to be smeared with boiled linseed oil; after which the distillatory apparatus may be considered as perfectly secure.

"If a tube of glass be used, it may be so adapted by grinding with emery as to fit the neck of the glass body, and require no luting. The same might be done with a tube of porcelain, if the material were sufficiently fine.

235. "With regard to the other neck which I have recommended, as well in the bottle as in the retort, it serves not only to introduce the materials when the leaden tube is previously luted in, but likewise to admit the external air, if by chance an absorption should be perceived to take place; that is to say, if the water, by diminution of the heat, which leaves a kind of vacuum, should rise from the pneumatic apparatus into the body: though even in this case there would be no reason to fear its breaking, notwithstanding its being considerably heated, as at the end of the operation. I have expressly made the trial several times, and always without any accident. The fluid becomes gradually heated in its passage along the sides of the tube or neck of the distilling apparatus, before it enters and mixes with the matter in the body itself; and again, if the tubulated bottle and tube be made use of, the water rising through the latter, and falling in the middle of that contained in the vessel, cannot directly touch the sides before it becomes mixed. But, at all events, if the smallest absorption be feared, it will be sufficient to raise the stopper, and return it to its place the instant after the introduction of the atmospheric air. Instead of a glass stopper, a cork may be used, which must be carefully luted round the neck, if there be any reason to think that the vapour should find its way through, in consequence of the neck being perfectly round.

236. "With regard to the pneumatic vessel, the following is the method of placing and fixing the false bottom:

"A common wooden hoop is placed flat on the side Vegetable which is to bear the false bottom, and fixed within the cask with pegs which do not pass quite through the staves. The false bottom, secured together by two dove-tails is placed upon this hoop, and fixed there by similar pegs, which penetrate part of the bottom itself, and by that means prevent it from either rising or turning. The cavities between the false bottom and the sides are then to be closed round with caulkers's stuff (brai sec), or melted pitch. It must be remembered, that the vertical axis with its cross-arms is to be placed beneath each false bottom. The arms are fixed in a mortice by means of two pins, which prevent them from vibrating or getting loose. The leaden pipe in which the extremity of the additional neck is to be inserted, is not to be put into its place till the first false bottom is immovably fixed. A notch is supposed to have been cut in this bottom to admit the tube; and when it is duly placed, the vacant space is to be made good, first with tow and then with melted pitch.

"Instead of the wooden hoop, which affords a solid support for the false bottom, it may answer the purpose very well, if cleats or blocks of wood, three inches thick, be pinned on, at different points of the circumference; or, which is still better, if the trouble be taken to fit the false bottom so well, that it may bear simply upon the inclination of the staves, which naturally oppose its descent. This method would certainly be the quickest, and is not very difficult to be done.

"When the false bottom is thus fixed, it must be retained in its place by pins placed at certain distances, and afterwards made tight by caulking.

"In order that the tube may not be exposed to vary in its position, a mark must be made on the edge of the funnel which terminates one of its extremities, by which it is easy to ascertain the position of the bent part below, and place the same in the most favourable situation. It will be convenient to fix the pipe in this proper situation, by means of two pegs, which must be drawn out previous to the last fixing of the false bottoms.

237. "When the first or lowest false bottom is secured in its place, the second arm of the agitator is to be fastened to the axis, and the other false bottom is to be placed and made fast in the same manner as the first.

"It is particularly necessary to place these two partitions in such a manner, as that the holes of communication may not be in the same vertical line, but as far as possible from each other; that is to say, diametrically opposite. This disposition is necessary in order that the gas may have time to concentrate in one part, before it escapes to the other. For the same reason, it is proper to direct the lower opening of the leaden tube to that extremity of the diameter which is opposite the pipe of communication from the first to the second bottom, in case one distilling vessel only is used. If two or more communicate with each pneumatic apparatus, the openings of the tubes must be respectively disposed at equal distances, as far as possible from each other, and from the opening in the false bottom next above them.

"If instead of false bottoms the preference should
Part II.

B L E A C H I N G.

Vegetable be given to inverted tubes (cuvettes), the following method may be used to make the rims or sides, and to fix them immovably.

"The rim may be made in two ways; either by short staves, fixed with wooden hoops as usual, scarfed or hooked together at their two extremities, or else, by simply fixing a broad wooden rim, like that of a sieve, round the bottom of this inverted vessel, by means of small wooden pins with heads.

Both these methods are good. The second has the advantage of taking less room and being cheaper. If this method be used, the point of the pins must be made a little thicker than the stem, in order that they may be less disposed to draw out of the holes bored in the bottom. With regard to the joining of the two ends of this kind of broad hoop, it may be effected very finely by sewing them together with a flat strip of osier, as it is done in the better sort of chip boxes, or it may be very well managed by means of two pins with heads, which may be driven through the overlapping part, and secured at the other side by driving a small wedge into the tail of each pin. With regard to the empty spaces or openings which may be between the rim and its bottom, they must be stopped with glaziers putty (mastic du vitrier), which may be smoothed with oil. This putty is of excellent service when the muriatic acid is used without potass; but it is soon destroyed if potass be put into the pneumatic vessel. In this case the internal part of the places of junction must be pitched or caulked, as has been already shown.

"The method of making these inverted vessels with staves and hoops, has the advantage of being close, and not requiring any particular caulking.

238. "Lastly, Instead of these inverted vessels, the operation may be performed merely by flat boards without rims, provided, however, that the upper board be some inches broader on every side than the lower, in order that the bubbles of gas may be forced in their ascent to strike each board in succession, and remain for a short time in contact with it. The essential circumference in this arrangement will be to keep the upper part of the vessel well closed, which is to be defended at the hole which admits the axis of the agitator by a central tube to retain the gas; and the partial escape which might take place between that axis and the covering, must be more effectually prevented by a cloth soaked in alkaline leys. This method, besides its convenience, requires less care in fixing, but it renders it necessary to work the agitator more frequently, in order to hasten the absorption of the gas in the water. I have determined to relate all the methods which I have successfully practised, in order that those who may undertake any work of this nature, may determine for themselves, not only with regard to general motives of preference, but likewise the facility with which their own situation or circumstances may enable them to carry the same into execution.

239. "The next object is to fix these inverted vessels in the pneumatic apparatus. This is a very simple operation, and consists merely in fixing pieces of wood or brackets, three inches in length, under each of the two bars which connect the pieces of the bottoms of the inverted vessels together. The bracket pieces are fastened to the side of the vessel with oak pegs, and the cross-bars which rest upon them are secured by pins of the same material driven above them and on each side, in such a manner that the central perforation is in its true place, and the whole is incapable of being removed or disturbed.

"In this operation, as I have already recommended with regard to the false bottoms, it is advisable to place the revolving axis in its proper situation, in order to ascertain that it is not likely to be impeded in its action. It is best, indeed, to avoid fixing either the two inverted vessels or the two false bottoms, if these be used, until the clear movement of the agitator has been ascertained; without which precaution, there might probably be occasion to displace them, either in whole, or in part, to remove the impediments which might prevent the free motion of the parts.

"From the description I have here given, it may be seen that my pneumatic vessels have only two false bottoms or inverted vessels. I think it advisable not to use more, because I have remarked that three of these vessels requiring a greater depth, the distillation became much more laborious, particularly when I made use of the intermediate apparatus. 1. The litres did not so well resist the pressure of the vapour. 2. It was not disengaged with the same speed, and consequently the operation was more tedious. It is better, therefore, to use shallower vessels, and enlarge their dimensions in the diametral direction, as I have constantly found. The proportions which have appeared to me to be advantageous for a small common workshop, are 14 feet in height, 32 inches in diameter below, and 36 inches diameter above, all inside measure.

240. "With regard to the kind of wood for constructing the vessels, it has appeared to me to be almost a matter of indifference. I used fir, oak, and chestnut, without observing that either the one or the other was productive of any inconvenience to the quality or clearness of the liquor, unless that, at the first or second distillation, the degree of force was a little altered, by soaking into the wood. That kind of wood may, therefore, be used which can the most readily be procured. I must, however, observe, that the large casks in which oil is brought from Languedoc, which are mostly made of chesnut-tree, are very convenient when cut in two to form the pneumatic vessels. They have even an advantage over the oak and fir casks, because they are closer in the joints, better hooped with iron and wooden hoops, and impregnated with the oil, in consequence of which they are not subject to become dry, how long soever they may be out of use, provided they are kept in a close place; whereas the tubs of fir wood require to be almost constantly filled with water. Oak does not contract so soon as fir.

"It must also be observed that the white deal must not be used, because it transmits water like a sponge. The yellow deal is to be preferred, because it undergoes less alteration from the fluid, no doubt on account of the resin it contains. But if the use of the white deal, or any other spongy wood cannot be avoided, it will be proper to paint the vessel within and without with one or two good coatings of white lead. I have had the great satisfaction to observe, that this treatment not only prevents the water from passing through, but likewise that the oxygenated muriatic acid..."
Bleaching.

Vegetable acid does not attack this colour, or, if it does attack it, a long course of time must be required for that purpose. Melted pitch or tar likewise afford a good defence for such wooden materials as have this defect.

A mixture of yellow wax and resin is likewise of excellent service as a coating for the whole internal surface of the pneumatic vessel, including the inverted vessels and the agitator.

241. "Besides the false bottoms, or inverted vessels we have described, each apparatus must likewise have its cover chamfered, to fit the circumference, with apertures to admit the tubes and the central axis; together with two others, namely, one of considerable size, to receive a funnel through which water is poured as occasion requires, and the other smaller, to be opened on such occasions, in order that the air may escape. The cover being nailed, or rather fastened with wooden pins, in its place, is afterwards secured by gluing slips of paper over the line where it is applied to the vessel.

"Instead of the wooden pneumatic vessel, it might be more advantageous to use similar vessels of gritstone (grès), rolled or cast lead, or cement of lorriot (k). Manufacturers must form an estimate of the advantages to be derived from the expenses they incur. If leaden vessels be used, it will be proper to defend the soldered places with one or more coats of white lead, or putty, or resin, or pitch mixed with beeswax. I have tried these preservatives against the destruction of the solder, and found them answer very well.

242. "As it is useful to possess a knowledge of the height and quantity of water contained in the tub, there is a tube of glass fixed against its outer side, the lower end of which is bended and enters the vessel about six inches from its bottom. This part, into which the tube is stuck by firm pressure, is to be previously defended by lute, which is afterwards trimmed and laid smooth upon the sides of the tube and the vessel.

"Lastly, as it is essentially necessary to ascertain, from time to time, the strength of the liquor, and to draw it off upon occasion, I have usually availed myself of a brass cock, covered with several coatings of white lead for this purpose. By means of this cock, it is easy to draw off any small quantity of the fluid at pleasure. It has likewise the advantage of readily filling the narrow-mouthed stone-ware or glass vessels, in which the liquor may be kept when there may be any to spare, or in case it is thought fit to preserve a quantity always in readiness.

"When it is required to draw off the acidulated water with speed and in abundance, it is convenient to use one or more wooden tubes or spigots, which may be opened separately, or all at once, into appropriate vessels. But it is most convenient that they should have stoppers of cork only, because those of wood, though covered with tow, are apt to burst the wooden tubes by their swelling; besides which they are very seldom fit with accuracy, unless turned with extraordinary care.

243. "With regard to the intermediate vessels mentioned in the Annales de Chimie, in case the operator is determined to use them, it is proper to avoid using stoppers of cork to close the orifices, and support the tubes at the same time. For this substance being very speedily acted upon by the corrosive gas, exposes the lutes and closures to frequent derangement, as well as the tubes which pass through them. At the beginning of my operations, I supplied the place of these stoppers as follows, when the necks were of a larger diameter than the tubes. I made stoppers of glass, with flanges on the sides. These were ground with emery upon the necks themselves, and they were perforated quite through with a hole, no larger than was proper to admit the passage of a glass or leaden tube. This tube was coated with lute of sufficient thickness, that it could not pass through the hole without forming a protruberant piece, which I pressed and smoothed against the tube as well as the orifice. Or if the stoppers of cork should, nevertheless, from convenience be chosen, the necks may be covered with lute, and the stoppers forced in. In case the interval be small, the parts may be heated a little, covered with virgin-wax, and then forced into the neck, and the small vacuities which may remain may be filled up with the same wax, melted and poured out of a spoon. Instead of lute, yellow wax may also be used to fix the tube of safety; and the same operation may be performed with regard to the glass or leaden tube, which communicates from the tube to the intermediate vessel. Stoppers and tubes luted in this manner, are, in some measure, fixed for ever; for when the wax is once hardened, they are in no further danger.

244. "If the operator be so situated, that he can order the intermediate vessels of whatever form he chooses, it will be advisable to have the orifices of no greater diameter than just to suffer the tubes to pass through. No other defence will then be necessary, than that they should be covered with lute at the time of placing them, which will render them sufficiently firm. The rim, or border of these orifices, ought likewise to be large enough to support the mass of lute which it is proper to apply round the tube."

245. Having adjusted the several parts of the apparatus, we proceed to prepare for the distillation, by filling the pneumatic tub with water, or such fluid as it is intended should be impregnated with the gas, and introducing the materials into the distilling vessels. The cover of the tub is first to be properly secured by pegs and slips of paper, pasted over the joinings. The tub is then, if not done before, to be filled to within

(k) The author does not appear to speak from experience in this place. It is not probable that any manufacturer would be tempted to incur the expense of stone vessels; but it is nevertheless proper to remark, that every stone which could with facility be wrought, contains lime or clay, or both; the former of which would no doubt be speedily corroded by the liquor, on which it would also have a pernicious effect. It is not likely that clay would be more durable. So that on the whole there is no temptation to use, and many reasons to reject, the earths.
Part II.  

BLEACHING.

Vegetable within an inch and a half of the top, with soft water. Care must be taken to leave open the orifice, by which the air may be allowed to escape on pouring in the water, as, were this close, the water would insinuate itself under the paper, and destroy the luting. The distilling vessels are now to be placed in the capsules, or the vessels of water, and firmly secured. De Charmes directs the mixture of manganese and muriatic acid to be introduced at this time; but perhaps it would be better to have this ready done before fixing the vessels, and then nothing remains, but to add the sulphuric acid, which is best done by means of the crooked funnel. This being done, the stoppers are to be well secured, and the various joints closed up with lute, where this has not been done before.

246. All these steps (except the addition of the acid) should be executed the evening before the distillation; and the next morning, the acid just distilled may be added, if the leaden alembics are used, but if glass retorts or bottles be employed, it is safer to allow the acid to cool before it is poured in.

"If the acid has been poured in warm, and the muriatic very dry, and well mixed, the sulphuric acid not more diluted than has been prescribed, and the manganese of a good quality, bubbles of air will be heard to pass into the wooden vessel, through the leaden tube, at the end of two or three minutes. If the above requisites be wanting, the escape will not take place till somewhat more than a quarter of an hour. In either case it may be necessary, a few instants after the pouring of the acid, to place a chafing dish with lighted charcoal beneath the vessel which holds the retort.

247. "About half an hour after the pouring of the acid, a considerable effervescence takes place, which sometimes swells the materials as high as the neck of the retort, if this last be too small for its charge. The bubbles of the froth are large, and covered with a kind of pellicle, formed by a portion of the mixture blown up during the agitation. This intumescence lasts about two hours, during which time the bubbles of oxygenated muriatic acid gas are most abundantly disengaged in the water. They even succeed with such rapidity, that the intervals are not distinguishable, and an incessant noise is heard in the pneumatic vessel, which very often lasts three or four hours, according to the management of the fire, and the goodness and accurate mixture of the materials. The agitation produced by this rapid escape is commonly such, that it is scarcely necessary to move the agitator.

"The fire is not to be renewed till the expiration of two hours, even though it may have gone out in the mean time. After this, it is not to be renewed till the end of an hour and a half, and after that period, at the end of an hour, and so forth, without any perceptible increase of its intensity. It will be sufficient after these periods to keep up the fire, excepting that during the last two hours the fire must be maintained without suffering the action to be almost suspended, as in former cases, before it is renewed. The chafing dish must be raised upon bricks, to bring it nearer the retort, during the last hour. I must observe, with regard to this chafing dish, that the grate must not be too open, lest the charcoal should be too rapidly consumed.

After the intumescence of the mixture has ceased, the rapid escape of bubbles does not diminish for a long time, in consequence of an effervescence which constantly proceeds. It is true that this continues generally diminishes, and towards the end of the distillation the bubbles, which pass into the tube appear only at intervals, notwithstanding the matter in the retort may, by the gradual augmentation of the heat, be brought into the state of ebullition. The heat is such, that eight or nine hours after the commencement of the operation, the hand can scarcely be endured near the aperture, or the neck of the retort, or other distilling vessel, though between the fourth and sixth hours the same parts are scarcely warm. The distillation of one or more retorts or bodies into a single vessel, according to the doses before mentioned, takes usually at least ten hours, and even less; the time for stopping the distillation is known from the escape of the bubbles being very slow, and the noise less perceptible. This slight noise is even a mark to form a judgment of the concentration of the gas, and the degree of saturation of the water. In order to hear the bubbles, it is often necessary to apply the ear against the tube. Moreover, the adopter of the retort begins to be heated, and the lute upon its neck becomes a little softened. Another indication that the process is near its termination, is had from the long vibrations of the water in the indicatory tube, placed on the outside of the tube, and likewise in the tube of safety, when an intermediate vessel is used.

248. "If a proper regard be not paid to the signs here enumerated, and the distillation be not stopped, there will not only be a loss of time and fuel, and a distillation of mere water; but the steam, when an intermediate vessel is used, will drive the water through the tube of safety, and itself immediately follow, if not instantly remedied by diminishing or removing the fire, and cooling the neck of the retort and its adopter with a wet cloth, or, which is better, by drawing the stopper of the retort for an instant.

"As soon as the distillation is stopped, the impregnated fluid of the pneumatic vessel is to be drawn off into tubs or other vessels, proper to receive the goods which are previously disposed therein. If it be not convenient to use it immediately, the liquor may be left in the tube without fear of any perceptible diminution of its virtue, provided the cover and its jointings be well closed with lute and stripes of paper pasted on, and likewise that the space between the axis of the agitator and the cover be similarly secured. It may likewise be drawn off in stoneware bottles well closed with corks, covered with lute at the place of their contact. In this manner the liquid may be preserved till wanted. I have kept it for several months without its goodness having been impaired.

249. "I must observe in this place, that if it be wished that the liquor at the upper part of the vessel should be equal in strength to that of the lower, without regarding the distillation (which may be uselessly prolonged for upwards of twelve hours), by an effect of the concentration of the gas in the bottom of the vessel, and the resistance it then opposes to its introduction, which singularly contributes to increase the heat of the retort); I have found no better method then that of drawing off the liquor, either into earthen pitchers or vessels filled with merchandise ready for immersion. I have done this after a limited time, ...
BLEACHING.

Vegetable time, and repeated proofs of the good quality of the
Substances, fluid. At the end of eight hours distillation, I drew off
one fourth of the contents of the vessel; a second fourth,
two hours afterwards; a third fourth after ten hours and
a half, or eleven hours; and the rest after twelve hours
distillation, which formed the conclusion.

"When the liquor is entirely drawn off from the
vessel, it must again be immediately filled with water,
or at least to the height of five or six inches above
the return of the leaden tube, otherwise the gas
which continues to escape from the distilling vessel, and then
affords no resistance, might attack the pneumatic vessel
itself."

250. "The fire must be taken from beneath the re-
tort as soon as the distillation is finished, not only to
prevent the effect of the gaseous vapours, which still
continue slowly to escape, from acting on the sides of
the tub, but likewise to dispose the retorts or bodies to
receive a quantity of warm water, which is to be
poured in up to the neck. There is no reason to fear
an excess of quantity, and the hotter the vessels are,
the better. It is essential, however, that it be not poured
in cold, for fear of breaking the glass. The adopter
is then to be unlinked from the neck of the leaden tube,
if the operator chooses; and in order that no vapour
may escape into the workshop, a bit of lute or a cork
may be applied to the beak of the adopter. The sand
bath easily permits the retort to be raised and returned
again to its place, as well as the application of the lute
or stopper to the neck of the adopter, this last being
raised with one hand while the cork is put in with the
other."

"Nevertheless, as the lutes which connect the adopter
with the retort are somewhat softened towards the end
of the operation, it would be more prudent to leave
everything in its place, for fear of deranging those
lutes. This danger is greater when the adopter is of
lead, because the great length of this additional piece
tends to force the luting still more on that account.
If it be required to proceed immediately to a new
distillation, the retort or battle with its capsule or pan
must be immediately taken from the furnace, and an-
other substituted in its place ready prepared during
the former distillation. This necessarily requires a double
set of vessels.

251. "When the distilling vessel is cold, or nearly
so, the whole of its contents must be shaken, by holding
this vessel by the neck with one hand, and apply-
ing the other to its bottom. The stopper must then
be taken out, and the vessel speedily inverted, shaking
the residue to facilitate its escape. In this last situ-
ation the retort is to be held by the neck with one hand,
and its side gently resting against the other. The ves-
sels into which the water and residual matter of the
retorts are poured, should rather be of stoneware, pot-
tery, or lead, than of wood, unless these last be oil ves-
sels, which are less subject to dry in the part above the
fluid. If this circumstance be not attended to, there
will be danger of losing great part of the contents.

"It is most convenient to disengage the retorts or
bodies while they are still warm, which continues to
be the case the next morning after distillation, in con-
sequence of the heat of the sand bath. If they be left
to cool entirely, the sulphate of soda will crystallize,
and it will be necessary to dissolve in hot water such
larger portions as cannot pass through the neck. But vegetable
this inconvenience is not likely to happen, unless the unadul-
terated quantity of water last added be too small, and the re-
sidues have been left undisturbed for several days. The
same observation is applicable to that kind of incursion
which is formed by the moritat, if not properly
polverized, dried, or mixed; this cannot be separated
from the bottom of the retort, but by means of hot wa-
ter poured at different successive times. It is likewise
essential to leave no crust or deposition of moritat, or
other matter, in the vessels which are emptied, unless
the same be movable, in which case the risk is less.
But if the urgency of business should then require that
the same vessels be used without entirely clearing them,
it will be necessary to range this residual matter on one
side, where it will be less exposed to the heat, and will
afford a greater degree of facility for the nitric acid to
act upon it.

"In order that the vapour which exhales from the
distilling vessels may not prove inconvenient, it is ne-
necessary to pour in a small quantity of alkaline lixivium
in the first place, which instantly destroys the smell.
This may be done immediately after the end of the
distillation, and the weak alkaline solution may supply
the place of the water used for diluting the residues.
At the instant of pouring this lixivial water, a strong
effervescence takes place; for which reason it is proper
to pour it in by several successive portions, waiting a
little between each time."

252. The oxygenated liquor prepared in this way is
very effectual in bleaching the stuffs which are im-
mersed in it; but at the same time possesses an odour
so suffocating as to render its use unpleasant and even
injurious to the workmen employed in the process,
should any of it escape. "I have witnessed, (says
O'Reilly) in an extensive manufactory near Paris, the
cruel sufferings experienced by the wretched workmen,
from these suffocating vapours; I have seen them roll-
ing on the ground in the excess of agony. Frequent-
ly even severe disorders are the consequence of the first
effects produced by the oxygenated liquor."

De Charmes gives a long account of the sufferings which
he underwent in his course of experiments with this
acid. It produces symptoms completely resembling
those of a violent cold, but which go off in a day or two
after having desisted from the use of the liquor.

This inconvenience may be avoided in two ways:
1. By rendering the vessels for immersion so tight as
to prevent the possibility of the escape of the gas.
2. By dissolving in the water some substance which
has the property of so far neutralizing the acid as to
correct its odour, without destroying its bleaching qua-

tity to any considerable degree.

253. Mr Rapp of Manchester contrived a tub for
immersion, which is admirably adapted to answer the
first purpose. Its construction is simple, and not ex-

"It would therefore, be desirable to have an apparatus
for the use of the pure oxygenated muriatic acid simply
dissolved in water, which is at once the cheapest and
best vehicle for it. This apparatus must be simple in
its construction, and obtainable at a moderate expence;
it must confine the liquor in such a manner as to pre-
vent the escape of the oxygenated muriatic acid gas,
which is not only a loss of power, but also an inconve-
nience
Vegetable substances to the workmen and dangerous to their health; and it must, at the same time, be so contrived, that every part of the stuff which is confined in it, shall certainly and necessarily be exposed to the action of the liquor in regular succession. Having invented an apparatus capable of fulfilling all these conditions, I have the pleasure of submitting a description of it to the society, by means of the annexed drawing.

Plate XCL. "Fig. 4 is a section of the apparatus. It consists of an oblong deal cistern, ABCD, made water-tight. A rib, EE, of ash or beech wood, is firmly fixed to the middle of the bottom CD, being mortised into the ends of the cistern. This rib is provided with holes, at FF, in which two perpendicular axes are to turn. The lid, AB, has a rim, GG, which sinks and fits into the cistern. Two tubes, HH, are fixed into the lid, their centres being perpendicularly over the centres of the sockets, FF, when the lid is upon the cistern. At I, is a tube by which the liquor is introduced into the apparatus. As it is necessary that the space within the rim, GG, be air-tight, its joints to the lid, and the joints of the tubes, must be very close; and, if necessary, secured with pitch. Two perpendicular axes, KK, made of ash or beech wood, pass through the tubes, HH, and rest in the sockets, FF. A piece of strong canvas, MM, is sewed very tight round the axis, KK, one end of it projecting from the axis. The other axis is provided with a similar piece of canvas, NN, pieces of cloth rolled upon the axis, L. Two plain pulleys, OO, are fixed to the axes, in order to prevent the cloth from slipping down. The shafts are turned by a moveable handle, P. Q, a moveable pulley, round which passes the cord, R. This cord, which is fastened on the opposite side of the lid (see fig. iv.), and passes over the small pulley, S, produces friction by means of the weight, T. By the spigot and faucet, V, the liquor is let off, when exhausted.

"Fig. iv. A plan of the apparatus, with the lid taken off.

The dimensions of this apparatus are calculated for the purpose of bleaching twelve or fifteen pieces of 1/2 calcicoses, or any other stuffs of equal breadth and substance. When the goods are ready for bleaching, the axis, L, is placed on a frame in the horizontal position, and one of the pieces, N, being fastened to the canvas, MM, by means of wooden skewers, in the manner represented in fig. 4, it is rolled upon the axis by turning it with the handle, P. This operation must be performed by two persons; the one turning the axis and the other directing the piece, which must be rolled on very tight and very even. When the first piece is on the axis, the next piece is fastened to the end of it by skewers, and wound on in the same manner as the first. The same method is pursued till all the pieces are wound upon the axis. The end of the last piece is then fastened to the canvas of the axis, K. Both axes are afterwards placed into the cistern, with their ends in the sockets, FF, and the lid is put on the cistern by passing the axes through the tubes, HH. The handle P is put upon the empty axis, and the pulley, Q, upon the axis on which the cloth is rolled, and the cord, R, with the weight, T, is put round it and over the pulley, S. The use of the friction, produced by this weight, is to make the cloth wind tight upon the other axis. But as the effect of the weight will increase as one cylinder increases and the other lessens, I recommend that three or four weights be suspended on the cord, which may be taken off gradually, as the person who works the machine may find it convenient. As the weights hang in open hooks, which are fastened to the cord, it will be little or no trouble to put them on and to remove them.

"Things being thus disposed, the bleaching liquor is to be transferred from the vessels in which it has been prepared into the apparatus, by a moveable tube passing through the tube, I, and descending to the bottom of the cistern. This tube being connected with the vessels, by means of leaden or wood pipes provided with cocks, hardly any vapours will escape in the transfer. When the apparatus is filled up to the line, a, the moveable tube is to be withdrawn, and the tube, I, closed. As the liquor rises above the edge of the rim, G, and above the tubes, HH, it is evident that no evaporation can take place, except where the rim does not apply closely to the sides of the box: which will, however, form a very trifling surface, if the carpenter's work be decently done. The cloth is now to be wound from the axis, L, upon the axis, K, by turning this; and when this is accomplished, the handle, P, and pulley, Q, are to be changed, and the cloth is to be wound back upon the axis, L. This operation is, of course, to be repeated as often as necessary. It is plain, that, by this process of winding the cloth from one axis upon the other, every part of it is exposed, in the most complete manner, to the action of the liquor in which it is immersed. It will be necessary to turn, at first, very briskly, not only because the liquor is then the strongest, but also because it requires a number of revolutions, when the axis is bare, to move a certain length of cloth in a given time, though this may be performed by a single revolution when the axis is filled. Experience must teach how long the goods are to be worked; nor can any rule be given respecting the quantity and strength of the liquor, in order to bleach a certain number of pieces. An intelligent workman will soon attain a sufficient knowledge of these points. It is hardly necessary to observe, that, if the liquor should retain any strength after a set of pieces are bleached with it, it may again be employed for another set.

"With a few alterations, this apparatus might be made applicable to the bleaching of yarn. If, for instance, the pulley, O, were removed from the end of the axis, L, and fixed immediately under the tube, H; if it were perforated in all directions, and tapes or strings passed through the holes, skains of yarn might be tied to these tapes underneath the pulley, so as to hang down towards the bottom of the box. The apparatus being afterwards filled with bleaching liquor and the axis turned, the motion would cause every thread to be acted upon by the liquor. Several axes might thus be turned in the same box, and being connected with each other by pulleys, they might all be worked by one person at the same time; and as all would turn the same way and with the same speed, the skains could not possibly entangle each other."

254. As far as respects the confinement of the gas, this apparatus of Mr. Hupp is extremely well contrived. pager 1.

482
BLEACHING.

The inconvenience arises from the axis being vertical, as when several pieces are rolled upon the same axis, some parts of them are liable to sway away, and thus render the action of the bleaching liquor unequal. He proposes to remedy this inconvenience by making the axis horizontal, and to make the passage of the stuff through the liquor more complete, he places a roller at each end of the vessel, above and below, and three others in the middle, as will be explained when we describe the apparatus.

255. Soon after the appearance of Berthollet’s paper in the *Annales de Chimie*, it was proposed to employ the oxygenated muriatic acid, in the state of gas applied immediately to the cloths previously moistened, and we believe that it has been so employed by some bleachers. We are, however, disposed to consider the method as highly injurious to cloth so bleached, although the danger to the workmen might be avoided, by the use of the immersing vessel above described.

256. In employing the simple oxygenated liquor, it is of consequence to possess some criterion, by which we may ascertain its comparative strength. The method contrived by M. Descroizilles has been described in paragraph 209. Mr Rupp has improved on this, by employing the acetate of indigo, prepared by pouring acetate of lead (sugar of lead) into a solution of indigo in sulphuric acid, as long as any precipitate appeared.

257. The second means of avoiding the unpleasant effects of the suffocating gas, we have said, consist in dissolving in the water through which the gas is passed, some substance which is capable of mixing with, and correcting it.

Two substances may be employed with this view, potash and lime.

258. When potash is employed, a quarter of a pound of the common potash, purified as directed in 165, is to be used for every pound of muriat of soda introduced into the distilling apparatus. This is to be dissolved in the water with which the pneumatic tub is filled. It is most convenient to dissolve the potash in a small quantity of water, and add the solution to the water in the tub; but care must be taken to stir them well together with the agitator, that the potash may be equally combined with the water.

But, although this weak solution of potash certainly renders the bleaching process much less inconvenient to the workmen employed, it is yet much more expensive than the simple oxygenated liquor, and more of it is necessary to perform the same work than is required of this latter. Mr Rupp has completely proved this by a set of ingenious experiments which he made, comparing the quantity of colouring matter in the acetate of indigo, and in an infusion of cochineal, destroyed by the same quantity of the two liquors. His experiments are highly interesting, and are thus related by himself.

*Experiment I.*—To half an ounce of oxygenated muriatic acid, I added a solution of indigo in acetous acid (l), drop by drop, till the oxygenated acid ceased to destroy any more colour. It destroyed the colour of 160 grains of the acetate of indigo.

*Experiment II.*—A repetition of Experiment I. The colour of 165 grains of acetate of indigo was destroyed in this experiment.

*Experiment III.*—A repetition of Experiments I and II. The colour of 160 grains of the acetate was destroyed.

*Experiment IV.*—To half an ounce of the oxygenated muriatic acid, were added eight drops of pure potash in a liquid state. This quantity of alkali was about sufficient to deprive the acid of its noxious odour. This mixture destroyed the colour of 150 grains of the acetate of indigo.

*Experiment V.*—A repetition of Experiment IV. The colour of 145 grains of the acetate was destroyed.

*Experiment VI.*—To half an ounce of the oxygenated muriatic acid, ten drops of the same alkali were added. It destroyed the colour of 125 grains of the acetate of indigo.

*Experiment VII.*—A mixture of half an ounce of the oxygenated acid, and 15 drops of the alkali, destroyed the colour of 120 grains of the acetate of indigo.

Though I had taken the precaution of avoiding the sulphuric acid, for the reason stated in the foregoing note, I was not quite satisfied with these experiments, on account of errors which might have taken place through a double affinity. I therefore made the following experiment, in which I employed a decoction of cochineal in water, instead of the acetate of indigo.

*Experiment VIII.*—To half an ounce of the oxygenated muriatic acid, a decoction of cochineal was added till the acid ceased to act on its colour. It destroyed the colour of 390 grains of the decoction.

*Experiment IX.*—A repetition of Experiment VIII. The colour of 385 grains of the decoction was destroyed in this experiment.

*Experiment X.*—To half an ounce of the acid, six drops of the liquid alkali were added. This mixture destroyed the colour of 315 grains of the decoction.

*Experiment XI.*—Eight drops of the alkali were mixed with half an ounce of the acid. This mixture destroyed the colour of 305 grains of the decoction.

In order to shew the usefulness of this apparatus still more clearly, I request the society to attend to the following statement of the expense of a given quantity of bleaching liquor, with and without alkali, but of equal strength.

---

(l) It has been usual to estimate the strength of the oxygenated muriatic acid by a solution of indigo in sulphuric acid. This method was inadmissible in these experiments on the comparative strength of the bleaching liquor, with and without alkali; because the sulphuric acid would have decomposed the muriat of potash, and thereby produced errors. I therefore added to a solution of indigo in sulphuric acid, after it had been diluted with water, acetate of lead, till the sulphuric acid was precipitated with the lead. The indigo remained dissolved in the acetous acid.
Part II.

With Alkali (m).

“It appears from this calculation, that a certain quantity of the liquor, for the use of my apparatus, costs only 2 l. 3s.; but that the same quantity of the alkaline liquor costs 3 l. 3s. 3d. which is 40 per cent. more than the other. The aggregate of so considerable a saving must form a large sum in the extensive manufacture of this country.”

259. “Indeed, that the addition of potash should diminish the bleaching power of the oxygenated muriatic acid might easily be inferred, from knowing that the oxygenated muriate of potash, or rather the hyperoxygenated muriate of potash, does not in any degree possess the power of destroying vegetable colours, and consequently, the more completely the acid is saturated with the potash, the more completely is its bleaching power destroyed.

260. The method of employing lime in correcting the oxygenated acid was first used in Ireland; and some years ago, there were not less than thirty apparatus for preparing this mixture established in the northern parts of that kingdom. It has been also employed at Glasgow; and a patent, which is now set aside, was obtained by a manufacturer there for preparing the liquor, and a solid oxyymuriate of lime, which might be employed at all times, and conveyed to any distance.

The pneumatic tub should be of such a capacity as to hold 800 gallons of water; and to this is to be added eight pounds of slaked and well sifted lime, which is to be well mixed with the water by means of the agitator, both at the time of making the mixture and during the distillation.

Between the tub and the distilling vessel is placed a leaden receiver capable of holding eight gallons, which is to be two-thirds filled with water, intended to retain any common muriatic acid which may come over.

For this purpose a leaden tube, three inches diameter in the bore, proceeds from the alembic, and passes nearly to the bottom of the receiver, and another tube of the same diameter passes from the upper part of this latter to the pneumatic tub. It is known that the limed water in the tub is saturated with acid, when on drawing off a portion of the liquor and adding lime to it, the lime sinks to the bottom. The liquor is then to be drawn off and mixed with thrice its bulk of water, when it is fit for bleaching.

The oxyymuriate of lime is found to be superior to the oxyymuriat of potash in bleaching, and it is certainly far less expensive. Barytes (ponderous earth) and strontites might probably be used with still greater advantage, from their greater solubility in water, and could be procured at a cheaper rate.

261. Previous to immersing the stuffs in any of this oxygenated liquor, they are to be steeped and filled in the same way as in the old method, to deprive them of the weavers dressing, and the saliva of the spinners. For this purpose it is proper to employ a weak alkaline ley.

In Britain and Ireland machinery is commonly employed in the filling process, but it is generally so constructed as to wear the cloth. O’Reilly has proposed the following machine for this purpose.

He constructs a circular platform, which revolves about a moveable axis, and is supported at the extremities of the spokes by rollers of cast iron, the circumference of the platform is indented to receive a paul or catch, which makes it recede one notch at each stroke produced by the motion of the mill-tree. To the axis of the mill-tree are fixed spokes which raise several wooden beaters, which falling on the platform loaded with cloth or thread, raise them more completely than can be effected in any other way, water being constantly supplied from gutters which are filled by buckets attached to a water wheel.

Cotton, thread, and stuffs, more particularly require this preparation, as without it the ley cannot penetrate the substance of the cotton, because of the resinous matter with which it is impregnated.

In some manufactories a bath of soap is employed; but this is unnecessary, as all that is requisite is to form a combination of the oily matter of the cotton with an alkali in order to render it soluble in water, and afterwards to submit the coloring matter to the action which another part of the alkali may exert on it. The preparations which the stuffs must undergo previous to their immersion in the oxygenated liquor consist therefore in steeping in an alkaline ley, rinsing in water, and subsequent pressing and wringing.

262. In disposing the apparatus for the immersions, regard must be had to the objects on which we are to work. Skains of thread are to be suspended in the tub which is intended to receive them; and the stuffs are to be rolled round the rollers of the immersing tub which we have described. The method of doing this is as follows: A piece of cloth is to be fastened to one of

(m) I make no mention of the expense attending the preparation of the liquor, it being the same in both cases.
BLEACHING.

Plate XCI.

fig. 3.

When the pieces are thus fastened, the immersing tub is filled with the liquor intended to be used from the pneumatic tub; and this, if it be the oxymurriet of lime, may be done by a funnel, but if it be the simple oxygenated liquor, it is best done by a stop-cock passing from the pneumatic tub into the immersing vessel: when this is filled, the handle of the axis to which the last end of the cloth is fastened is turned till the whole of the cloth is unrolled from the first axis round the second, and then the handle of the first is turned to reverse the situation of the cloth. Thus the cloth is made to pass to and fro through the liquor till the strength of this is exhausted.

263. This is discovered by pouring off a little of it, and adding to it a portion of the acetate of indigo; if the colour of this is not diminished, the liquor has lost its bleaching power, and the cloth may be removed, and the water, if the simple oxygenated liquor was employed, may be used for a new impregnation.

264. After the stuffs or thread have been removed, they must be well rinsed and again subjected to an alkaline ley. The lixiviations and immigrations are repeated as often as is requisite till the bleaching is completed.

The number of lixiviations and immigrations differs according to the articles. Cotton cloth requires only two operations of each; cotton-thread three; fine flax will require four; and articles of hemp five or six alternations.

265. As it is of essential consequence to be aware of certain events, or facts, by which the progress of the bleaching may be ascertained, I shall here point out the gradations of colour, which the pieces assume after each immersion in the oxygenated muriatic acid without smell, made according to the proportions here described. The first immersion gives the thread, or piece-goods, a reddish colour, slightly inclining to yellow; the second, a colour inclining to ruddy yellow; the third, a whisth yellow; the fourth, a white, slightly inclining to a ruddy tinge; and by the fifth and sixth, the white becomes clearer and clearer. These are very nearly the shades which are assumed by coarse goods, for the fine goods frequently pass to the second or third gradation by one single immersion.

"When the liquor is strongly concentrated in potash, such as that which is denoted in the Annals of Chemistry by the name of javelle, the goods immediately, and without previous lixiviation, assume the third colour; but I have observed, that it is difficult to bleach them further without using the sulphuric acid, to remove the lees with which they are loaded. It must, moreover, be remarked, that in order to obtain this shade of colour, it is sufficient that the lixivion be diluted with water, so as to mark two or three degrees only on the aerometer, instead of eighteen or twenty, which it may mark after it is prepared by distillation.

"There are some who do not approve the colour which the thread acquires after the first immersion; but it may immediately be reduced by steeping the goods in cold or hot lees. The latter produces its effect more speedily; and after subsequent rinsing and drying, the goods retain a grey white colour, more or less deep according to the shade it has received. Many vendors prefer this grey, or reduced colour, on account of its preferable sale in certain markets.

"With regard to the bright and perfect white, there are very few persons in the provinces who care for it, or appear to give it an exclusive preference. Two reasons may be given for this: first, because a prejudice is unfortunately established against the speed with which the new invented method of bleaching operates; and secondly, the consumer is constantly persuaded, whether the bleaching may have been performed in this manner or in the field, that when the goods have attained an extreme degree of whiteness, they cannot be so durable as such as are less white. It is thought to be rotten, or burnt; and this opinion leads to a preference for a light and even colour, which preserves after bleaching a solid shade of gray, or dulness in the white.

"From a prejudice of the same kind, it is, that in many countries, the women, particularly the peasants, prefer their linen, whether for clothing or household use, simply cleared without bleaching. The orders of proprietors, or purchasers, must therefore be attended to, and the number of immigrations and lixiviations regulated accordingly.

"It may be considered as a rule, that when the goods no longer communicate a perceptible colour to new lees, they are entirely finished, and consequently, that every subsequent lixiviation, or immersion, will be attended with absolute loss, unless the immersion is necessary to clear off the last lees, on the supposition that simple rinsing in a large quantity of water may not be sufficient.

"I must, nevertheless, remark, that thread bleached by the oxygenated muriatic acid, may be used by the sempstress with much more speed and briskness than thread of the same quality bleached in the field; it is less brittle, and, on that account, is better for the weft, as well as the warp. It likewise may be struck much more effectually home to its place in weaving, and does not afterwards move. I received this valuable observation from impartial and unprejudiced manufacturers, for whom I bleached thread according to this method for making handkerchiefs.*

266. The theory of these operations is simply this. The oxygenated liquor supplies to the cloth the place of the oxygen of the atmospheric air, and this in greater abundance, and in a state which renders its action on the cloth more expeditious and more complete. By the union of the oxygen with the carbon of the colouring matter of the cloth, carbonic acid is formed, to produce and carry off which is the object of the several processes which we have described. It is carried
Part II.

BLEACHING.

Vegetable alkali answers two purposes; part of it combining with the carbonic acid forms carbonate of potash, while another portion acts on the remaining colouring matter, and dissolving part of it prepares it for another immersion in the oxygenated liquors.

267. The expense of potash soon suggested to scientific bleachers the importance of endeavouring to discover a substitute for it which might render their process more economical. Kirwan with his usual ingenuity, discovered, that saline sulphures would answer the purpose, and Mr Higgins has lately much improved on the discovery by bringing into use the sulphur of lime, which he has fully proved may be employed as a substitute for potash with the greatest advantage. His account of his views, and of the method of preparing and using this substance are too interesting not to find a place in this article.

258. "Since I had the honour of being appointed chemist to the Linen Board, which is now more than three years, I have allotted a considerable portion of my time and attention to the investigation of the principles of that science, applicable to the art in which I am thus more particularly interested. It appeared, that until potash could be dispensed with, we must forever remain in the power of foreign nations as to our staple commodity; observing also, that all the late improvements in bleaching were exclusively confined to the one object, that of imparting oxygen to the cloth, in a safe and expeditious manner, but that there had been no effort made to supersede the necessity of potash, by far the most extensive and uncertain article employed by the bleacher, and for which he is entirely dependent upon foreign markets; I directed my attention chiefly to discover a substitute for potash which, provided it should be of Irish production, though it might be equally expensive, I conceived would be of the utmost national importance. Impressed with these ideas, I undertook a series of experiments with that view.

269. "To enumerate the many disappointments and failures I experienced during my investigation, would be endless, and an unnecessary intrusion upon my reader. Knowing, from an important observation of Mr Kirwan, that saline hepars, or the combination of an alkali with sulphur, might, from its detergent properties, be advantageously employed in bleaching, as a substitute for more alkali, by an obvious analogy I was led to expect a similar effect from sulphuric hepur, or, more properly speaking, sulphur of lime, being a combination of lime and sulphur.

270. "In these expectations I was not disappointed, but at that time (about three years since) I contented myself (rather through necessity, for large cities are very unfavourable to experiments on bleaching by exposure to the atmosphere), with pointing it out to some of the principal bleachers from the north then in the town, earnestly recommending it to them to give vegetable it a fair trial with and without potash. Since that time, substances alkaline salts having become progressively dearer, and in consequence of a late proposal of substituting lime for potash, in condensing the oxymuriated gas, I was instigated to resume the subject, and make further and more varied trials. The result of which has been, that the use of the sulphuret of lime may be most advantageously combined with that of the oxymuriated lime, and that thus cloth may be perfectly whitened without the use of a particle of alkali. This then alone would seem to give it a decided preference over the methods at present in use, while at the same time it possesses peculiar advantages, and is exempted from the principal objections to which other substitutes are liable: for, 1st, Quicklime and sulphur, the materials of which the calcareous hepur consists, are both articles of trivial expense, especially as the latter enters but sparingly into the composition; 2dly, Their combination is effected in the easiest and most expeditious manner possible, and perfectly level with the capacity of the meanest workman; 3dly, As the manner of its application is, by steeping the cloth in it cold, the saving of fuel is a matter of great magnitude; and, lastly, There is no danger to be apprehended in the use of it, from the unskilfulness or negligence of the workman, as it appears to be incapable of injuring the texture of the cloth.

271. "The sulphuret of lime is prepared in the following manner: Sulphur, or brimstone in fine powder, four pounds; lime well slaked and sifted, 20 pounds; water, 16 gallons: these are all to be well mixed and boiled for about half an hour in an iron vessel, stirring them briskly from time to time. Soon after the agitation of boiling is over, the solution of the sulphuret of lime clears, and may be drawn off free from the insoluble matter, which is considerable, and which rests upon the bottom of the boiler (n). The liquor, in this state, is pretty nearly of the colour of small beer, but not quite so transparent.

272. "Sixteen gallons of fresh water are afterwards to be poured upon the insoluble dregs in the boiler, in order to separate the whole of the sulphuret from them. When this clears (being previously well agitated) it is also to be drawn off and mixed with the first liquor; to these again, 33 gallons more of water may be added, which will reduce the liquor to a proper standard for steeping the cloth.

273. "Here we have, (an allowance being made for evaporation, and for the quantity retained in the dregs) 60 gallons of liquor from four pounds of brimstone.
273. "When the linen is freed from the weavers dressing, in the manner already described, it is to be steeped in the solution of sulphuret of lime (prepared as above) for about twelve or eighteen hours, then taken out and very well washed; when dry, it is to be steeped in the oxyminature of lime for twelve or fourteen hours, and then washed and dried. This process is to be repeated six times, that is, six alternate immersions in each liquor, which I found sufficient to whiten the linen.

"When I submitted the linen to six boilings in potash, and to six immersions in the oxygenated liquor, it was not better bleached than the above.

"The three first boilings in potash, it is true, produced a somewhat better effect than as many steeps in the sulphuret; but towards the conclusion, that is, when the linen was bleached, the smallest difference was not observable as to colour. The linen bleached with the potash was thinner, or more impoverished than that treated with sulphuret, and the latter stood the test of boiling with soap much better than the former, although it did acquire a slight yellowish tinge, which I should suppose a week's, or at most, a fortnight's grass, as they term it, would remove.

274. "I contrasted the effects of hot and cold sulphuret in various temperatures, and although the difference appeared in favour of the hot liquor, yet it was so trifling as not to deserve consideration, or the expenditure of the smallest quantity of fuel.

275. "When I steeped the linen in the sulphuret first, and afterwards boiled it in potash, and then immersed it once in the oxygenated liquor, a better effect was produced than from two previous boilings in potash, or from two steeps in the sulphuret; so that the two substances seem to co-operate with each other.

"Indeed, from what I have seen, two successive steeps in fresh sulphuret, previous to the immersion in the oxygenated liquor, seemed to afford very little better effect than a single one, which is not the case with respect to potash.

276. "It was observable, that the cloth was invariably thicker or more swelled coming out of the sulphuret, than after being boiled in potash, and remained so even when washed and dried.

"It appears to me, that the sulphuret opens the fibres of the linen more speedily and better than the latter, by softening and swelling, rather than dissolving, the resinous or colouring matter. This accounts for the better effect of potash upon the linen when previously steeped in the sulphuret, than when used by itself.

277. "Probably those bleachers who do not at present find it convenient to use the oxygenated liquor, but continue to bleach by exposure to air, may derive some advantage from this, by using the sulphuret and potash conjointly or alternately.

"Mr John Doffy, of Ball's bridge (who from his knowledge of chemistry is very well acquainted with the principles of bleaching), was kind enough to repeat the above experiments, and his report to me corresponded with my own observations.

278. "It is almost impossible to ascertain to the full extent, more especially by small experiments in an laboratory, the many advantages any substance not hitherto used in bleaching, will afford by varying the mode of application.

"The experimenter does a great deal by discovering the efficacy, proving the practicability, and ascertaining the safest and most economical method of directly using it, and also the best proportion of it. Before he can arrive at any one of these, many a round of changes are necessary; indeed a greater number than any man who is not used to experiments can be aware of. But I should hope that the bleacher need not hesitate to use it in the state in which I present it to him, more especially as he runs no risk of injuring the cloth with it. If he can make more of it hereafter, I shall feel happy upon the occasion; no discovery was ever brought to perfection at once.

"How gradually, and yet how progressively, the steam engine, from its first invention by the marquis of Worcester, was brought to its present degree of perfection! Undoubtedly, it was just so with respect to alkalies, the substances now used by the bleachers; it must have taken a considerable time after their first application in bleaching, before they could be made the most of.

279. "I will now conclude by pointing out the advantage likely to accrue from the use of the sulphuret, to the nation, and also the saving to the individual.

280. "Hence it seems, that the quantity of foreign alkalies imported into the kingdom every year, amounts to 265,968 pounds; and that the quantity used in bleaching alone, amounts to 215,307 pounds annually.

"The average price of brimstone for the last three years, is about 251. a-ton, which is at the rate nearly of 25d. a-pound; four pounds of brimstone, and twenty pounds of lime, as already observed, will produce 60 gallons of liquor. In this country twenty pounds of lime may be valued at about 4d. so that the bleacher may have the 60 gallons at the expense of 1s. 1d.

281. "By what I could learn from different bleachers, the common allowance of alkali for 60 gallons of water is six pounds of barilla or four pounds of potash at the very least, and most bleachers use more than this. The price of four pounds of potash at the rate of 6s. a-ton, is about 2s. 4d. which is 2d. more than double the price of the sulphuret; but as the brimstone must be ground, an allowance should be made for it; and being easy of pulverization, a farthing per pound is an ample consideration for the expense attending it.

282. "The saving of fuel only remains now to be taken into consideration; and as this cannot be calculated with any degree of accuracy, I shall content myself by particularizing facts. In the first place, but 16 gallons of liquid are to be boiled in preparing 60 gallons of the sulphuret, while the whole 60 gallons must be boiled when the alkali is used; hence it might appear that two-thirds of the fuel are saved in the quantity of liquor, but it is not quite so much, suppose we estimate it at one half, which is rather understating it. Let us add to this the time necessary to boil the different liquors; the sulphuret requires but about half an hour, and the alkaline lixivium at the very least seven hours, to boil the linen in it, which is in the proportion of one to fourteen.

283. "The saving altogether to the bleacher from
Part II.

BLEACHING.

Vegetable Substances. The Wicklow copper mines are sufficient to supply the whole kingdom, or indeed two such kingdoms, with abundance of sulphur, let the consumption be ever so great, the entire of the alkali, or 21,5307 pounds, must be annually saved to the nation.

"But suppose two-thirds only of the quantity of alkali generally consumed in bleaching were dispensed with by the use of the sulphuret (which is a supposition not warranted by my experiments), still the saving to the nation, and to the individual, must evidently be great indeed."

Hippolytus's Enemy.

284. The goods which have been bleached in the methods above described, require to undergo what are called dressings, to give them a clear and bright white. This is particularly necessary for the finer piece goods, sewing threads, stockings, gloves, and all cotton articles.

After the last immersion, the goods are to be pressed or wrung, and then immersed in a bath of water, holding in solution about a hundredth part of its weight of sulphuric acid. The acidulous bath may be employed cold, but it is better to heat it so moderately, that the hand may be borne in it. The best way to make the mixture of sulphuric acid and water, is to invert the bottle containing the acid in the water, when the acid by its greater specific gravity quits the bottle, and by agitation for a considerable time combines with the water.

It is usual to leave the goods for some days in the bath, but it is safer to allow them to remain only a few hours, and to renew the bath till they are sufficiently white. Too many articles must not be crowded together, nor too much pressed, that the acid may exert its action equally.

After removing the goods from the acid bath, they must be wrung, and washed repeatedly in fair water till they no longer retain any marks of acidity.

285. It is customary to give to linen cloth a bluish shade: this is produced by dispersing through the water in which it was last rinsed, a little indigo or Prussian blue; or it may be given by a solution of white or mottled soap, in which the cloth is washed, while it still retains a little acid.

286. As accidents are apt to occur during these processes, it is proper to inform the artist how these may be remedied.

287. "Accidents in the distillation.—The principal accident which is capable of interrupting the distillation, is when the lutes of the adopter suffer the gas to escape. The most speedy remedy, in this case, to prevent the exhalation of the acid, which cannot be retained but with difficulty, seldom for any length of time, and then very imperfectly, in consequence of its great expansion; the shortest method, I say, at least if the distillation be not near its conclusion, is to remove the fire immediately from beneath the capsule of the retort, and to suffer this last to cool for a certain time, by raising it a little in its sand bath. If it be not possible to take it out of the furnace, together with its capsule, on account of the heat, or its sticking too fast, the adopter must be united from the funnel of the leaden tube, and the aperture of this tube closed with a cork, or lute, to prevent the gas of the pneumatic vessel from evaporating; after which the retort must be raised, and placed gently upon a bag of straw, or on coarse cloths folded together; and then holding the retort by its neck, near the flexure, the adopter must be entirely unlieted, by twisting it round and drawing it off. The orifice of the neck of the retort is then to be closed with a cork stopper, but not so closely but that a very small portion of gas may be suffered to escape, for fear of an explosion. The stopper of the neck may, for greater safety, be slightly raised. This precaution is necessary, on account of the great expansion of the muriatic acid gas. The old lute must then be taken off, as well from the adopter as the retort, and the places to which they were applied must be well cleaned, in order to receive fresh lute, after having carefully wiped off the moisture with a cloth or a sponge. If the lute which comes off be still good, it may be kneaded again, adding, if required, a small quantity of boiled oil, or it may be mixed with new lute, if it be burned or decomposed. This decomposition in the fat lute may be known by the white or reddish colour which it acquires, and the facility with which it breaks, on account of its having lost the glutin which afforded it that toughness and tenacity, on which its goodness chiefly depends.

288. "With regard to the lute of linseed cake, it must, in almost every case, be totally renewed, particularly when internally applied, because the heat hardens it too much to admit of its being kneaded again, with any moderate degree of facility; the decomposition of this lute is known by the yellow colour it acquires, and the contraction it undergoes from the effect of the heat. The lutes being kneaded to a proper consistence, and duly placed according to the direction laid down in (232.) the adopter is to be fixed, previously removing the stopper from the mouth of the retort, and placing another in that of the small end of the adopter, to prevent any inconvenience from the vapour which might issue out during the time of fixing it. This vapour is likewise condensed within the adopter, in consequence of its coldness. The retort is then to be placed, as before, on the furnace, the adopter uncorked, and its beak luted into the tube of lead; after which, the fire is to be replaced beneath the capsule, and distillation very speedily recommences, and proceeds as usual. The operation is a work of some delicacy; it requires to be performed with speed, and great care must be taken while placing the lutes and the adopter in their proper situations, to stand always in such a position, that the current of the external air may drive the vapour from the operator himself.

289. "If the accident here described should take place towards the end of the distillation, as it may sometimes happen, in consequence of the strong heat which, at that time, may soften the lutes, it will be sufficient if the fire be taken from beneath the capsule. The distillation soon ceases when this is done, particularly if care be taken to condense the gas, by the prudent application of wet cloths on the neck of the retort, as well as of the adopter.

290. "This inconvenience would not take place, if the workmen in those glass-houses which are principally employed in the fabrication of chemical vessels, could make retorts with necks recurved in the form of the adopter. These kind of vessels may be assiduously supplied by making use of a tube of lead, so formed as
BLEACHING.

Vegetable to serve instead of the adopter, as I have already ob-
substances, served, with regard to the tubulated bottles or bodies
(2). If, by accident, the lute which is adapted should
fail, or suffer the gas to pass through, it may easily be
stopped, by applying a new lute to the place of junction.
Instead of the leaden tube, we may substitute, with still
greater convenience (the danger of breaking except-
ed), a tube of glass, of which the end nearest the bot-
tle, or tubulated body, should be ground with emery.
By these means there would be no application of lute,
and consequently no danger to be feared with regard
to the filtration of the gas, the escape of which is easi-
ly perceived by the smell which diffuses itself through
the workshop, and is more particularly perceived when
the nose is applied near the vessels, or the lute. But
as this last method of discovering the place where
the lute has failed may be attended with the most serious
consequences, if the greatest precaution be not used,
it is more prudent to apply an open bottle of ammoniac
near the suspected place; at the instant that it is pre-
sented, a white fume is formed, which immediately
points out the defective spot. The bottle must be pre-
sented above the current of air, which takes place near
the lute, or in the workshop. If this precaution be
not attended to, the operator might be induced to re-
move a good lute, instead of one which was really de-
corative.

"On the other hand, if in the course of the di-
stillation, and for want of keeping up the heat, the fluid
in the pneumatic vessel should be absorbed and rise into
the distilling apparatus, it is necessary the instant it is
perceived to withdraw for a moment the stopper out of
the neck of the retort, where, as I have already had
occasion to observe, the absorption instantly ceases. Ne-
evertheless, if, for want of being observed in time, the
water should rise so far as partly to fill the retort or bo-
dy (for it never entirely fills it), the distillation will be
stopped, from the coldness of the water, and its too
great quantity. The shortest remedy is to draw out the
excess of water, which is thus introduced into the distill-
ning vessel, by the assistance of a glass pump, or syphon,
and afterwards to heat the same vessel, first returning
the water into the pneumatic vessel, if thought expedi-
ten: but if the distillation be properly attended to, this
accident can never happen.

292. "Accidents in the lixiviations and immersions.
I place the accidents arising from these two operations
in the same class, because they can scarcely take place,
but by the joint operation of both.

"Any article which is badly cleared of the lixiv-
ium, and afterwards immersed in the oxygenated muri-
atic acid, becomes almost immediately of a nankeen co-
lour, particularly in the folds, either in spots where cer-
tain parts have not been sufficiently rinsed, or else the
colour is general, if the whole has not been well rin-
se.

"The same accident happens if soot has fallen on
the linen or thread. The difference is simply in the
colour, which approaches more to brown. The colours
are capable of becoming more and more deep if the
mismanagement be not remedied as soon as perceived. Vegetable
and that before the goods are subjected to other im-
merisons in the alkaline lees, or of the oxygenated
muratic acid. The same accident is to be expected,
if the goods, though white at the time of their im-
merison, are suffered to remain too long in the bleaching
liquor. This does not fail to happen, particularly if the
articles which are suffered to remain even in a week
solution, are kept in that state the whole night. The
next day they are found to be yellow, or charged with
lixivium.

293. "The only method of remedying these ac-
cidents consists in the use of water, slightly acidulated
with sulphuric acid, no matter whether cold or hot, but the
hot solution operates more speedily. The spotted or
tinged goods are to be soaked in this water for a few
minutes, or a quarter of an hour, according as the co-
lour may be more or less deep, in consequence of a se-
ries of lixiviations or immersions, more or less repeat-
ed. In this situation the offensive colour is seen almost
immediately to disappear.

294. "Instead of making a sulphuric solution ex-
pressly for that purpose, that which has served for the
dressing may answer very well: neither of these need
be stronger than has been there directed, unless the
goods be considerably charged with colour, and there be
a great quantity to immerse at once. The acidu-
lated water is tried by the specometer, and if, in con-
sequence of having been used, it should not be suffi-
ciently strong, it may be restored by adding the re-
quipped quantity of acid for that purpose. It is necessary,
when any new acid is poured in, to mix it well
with the water before any goods are immersed therin.

"It must, in this place, be observed, that though the
thread and piece-goods may become charged with a fo-
 reign colour, in consequence of the accidents here
pointed out, both these articles are frequently very well
bleached at the under surface. It is even a proof that
the muratic acid has operated effectually, in causing the
lixivium to produce such an effect; but these accidents
are difficult to be observed on objects simply cleared,
or in the crude state. In the latter case, a permanen-
ty of the original colour may alone shew the necessity
of using the sulphuric acid, particularly when the lees
and the muratic acid which have been used are not at all
exhausted.

295. "Accidents attending the preparation or dress-
ing. When the piece-goods are immersed in a solution
of soap, after having been taken out of the sulphuric
acid, while they are still too strongly acidulated, or
instead of rinsing them they be immediately conveyed
from the acid into the solution of soap; this last solu-
tion is subject to curdle, or become immediately decom-
posed; whence the operator has the mortification to ob-
serv the whole surface of the goods covered with an infinite
number of small spots of oil, in the form of clots, of a
yellowish colour, and very tenacious, particularly on
stockings or cotton goods, because they incorporate as
it were with the nap or texture of the goods: they dis-
appear.
Part II.

BLEACHING.

Vegetable Substances must particularly mention an accident which may happen to any one, namely, that of placing by mistake stockings or other bleached objects, which have received their first treatment in the solution of soap, upon articles which have been exposed to the vapour of sulphur. I have placed stockings upon guaze, which had been whitened by sulphur, and found, after that they had remained in this situation for the course of a night, they became entirely of a brown red at the place of contact. They appeared as if burnt or marked with a hot iron. This colour, which, no doubt, was produced by the combination of the volatile sulphuric acid, with the alkali of the soap, with which the stockings were still impregnated to a certain degree, immediately disappeared upon exposing them, first, to the action of a bath of the odorant oxygenated muriatic acid, and afterwards to another of water, slightly acidulated with the sulphuric acid.

296. "Every salt with excess of acid, such as the salt of sorrel, removes the ruddy spots here mentioned with equal ease. It is true, that this salt cannot with convenience be used, on account of its dearthiness; but the residue of the distilling vessels, that is to say, the water which holds in solution the residue of the distillation of the oxygenated muriatic acid, is very serviceable in this process, and may be advantageously used either hot or cold, to remove those very tenacious spots, which are not at all capable of being removed by soap or alkali leys.

297. "When the spots of oxide of iron, commonly distinguished by the name of iron mould, are small, they may easily be taken out with the salt of sorrel in powder, laid upon the spot itself, which is afterwards to be moistened with a small quantity of water; or the part which is spotted may be steeped in a solution of the same salt. It soon becomes fainter, and at length disappears, after which the place must be very well rinsed. The sulphuric acid may be usefully applied instead of the salt of sorrel, as Berthollet seems to affirm in his memoir; and I have proved with success, that, though the spots may penetrate quite through the cloth, and be very broad, yet if they be soaked in a bath of sulphuric acid, either warm or cold, when the goods are taken out of the bath of muriatic acid, the effect will be that the spots insensibly disappear. If the goods be of close texture, the operation of the acid is slower (q).

298. "With regard to the spots of rust which are frequently seen on thread or cotton stockings, they are produced by the needles of the engine, and commonly disappear during the dressing, that is to say, in the bath of sulphuric acid. The same observation is true of the spots of rust which sometimes appear on the piece-goods, in consequence of their having been in contact with iron. In general, the older any iron mould may be, the more tenacious it is, and the more difficult to be effaced; but every spot may be made to disappear in time.

299. "It frequently happens that piece-goods are spotted with tar, during their carriage by water, in Vegetable boats, where they are liable to be placed upon the pitchy parts of the vessels, or in contact with tarred ropes. These spots may be soon taken out, by rubbing them with oil of olive, which dissolves the tar; or still better, by holding the part in spirit of wine, if this process should be thought more convenient. The latter method operates by the complete solution of the tar.

300. "With regard to spots of wine, cyder, or any kind of fruit, they may be effaced by dropping a few drops of the oxygenated muriatic acid upon them, which causes them almost instantly to disappear. But there are certain fruits, such as plums, of which the spots are more difficult to efface; they requiring one or two lxi-vations. Those that are gray, or reddish, at first, assume a fine yellow colour in the muriatic acid, which does not disappear during a subsequent lxi-vation, but requires a second immersion in the bleaching liquor.

301. "I must not omit a second very simple and economical method to take out every kind of spot occasioned by fruits, such as strawberries, gooseberries, &c. It consists in causing the spotted part to imbibe water, and afterwards to burn one or two common brimstone matches over the place: the sulphurous gas which is discharged soon causes the spot to disappear.

302. "There is a kind of indelible spot which is produced from red ochre and the charcoal black, with which the weavers mark the turns of the beam, in order to ascertain the length of the chain of piece-goods. This kind of mark, which is impressed on the goods at equal distances, is so far from being effaced, that it seems, in some measure, to receive strength from the oxygenated muriatic acid, notwithstanding the intermediate action of the leys."

Use of the Oxygenated Muriatic Acid in discharging the colours of dyed or printed goods.

303. There are several processes allied to bleaching, which depend on the agency of the oxygenated muriatic acid, and of which we shall therefore treat before proceeding to describe the remaining bleaching processes. These are the discharging of dyed or printed colours; the bleaching of paper; the cleaning of books, maps, and prints; and the bleaching of wax.

304. White silk and wool, on being steeped in oxygenated muriatic acid, acquire a yellow colour; hence this acid is of no use in bleaching these animal substances. It readily discharges the simple colours with which silk has been dyed, such as, indigo blue, gray, lilac and crimson, and gray, orange, green, Saxonic blue, apple green, fawn colour, brown lemon, and dipped blue, with which wool has been dyed. It leaves the goods, however, of the same yellow cast as it imparts to white wool and silk; but this yellow colour is readily altered to a clear white, by immersion in the sulphurous acid, as described in the bleaching of these substances.

Silk dyed with some compound colours, as violets, greens, browns, blacks, requires the same yellow colour,

(q) The salt of sorrel is sold in London, in small bottles, by the perfumers and apothecaries, under the name of salt of lemon. The sulphuric acid, as prescribed above, must of course be diluted.
BLEACHING.

Vegetable lour, but not so speedily, two immersions being usually found necessary to discharge the colours completely. In the brown violet and pure colours, which are composed of blue and red, the blue commonly first disappears, and by a subsequent immersion the red is discharged. The same happens with the yellow, which forms a part of the composition of green and orange, the blue of the former, and the red of the latter remaining. In blacks which are composed of brown laid upon a blue or a root colour, the brown first vanishes.

When more than one immersion is required, it is proper to use a bath of sulphuric acid between them; and this is particularly necessary where iron has entered into any of the colours.

These effects of the oxygenated muriatic acid serve to explain the action of the air in discharging the less permanent colours of woollen and silken goods, and in giving to white clothes a yellow colour. It is evidently oxygen which is in both cases the active principle, but its action is more speedy in the acid than in the atmosphere, from the facility with which the former is decomposed. A similar effect is in the Adrin. 305. The colours employed in dyeing or printing cottons or linens are of two kinds; chemical, or, as they are sometimes called, false colours, and fast or true colours. The former disappear in a very short time upon one immersion in the acid, except one description of yellow, which contains in its composition sulphate of copper (blue vitriol), sulphate of iron (green vitriol or copperas), and acetate of lead (sugar of lead). Goods which have been dyed with this colour must first be well scoured with soap, which so far separates or decomposes the colour, that a subsequent immersion will readily discharge it, whereas, without this previous scouring, the acid would have completely fixed the colour.

Several of the fast colours, as the blues, yellows, and blacks, require a lixiviation before immersion; and two, or sometimes three, immersions, with intermediate baths of sulphuric acid, are necessary completely to remove them. Most other fast colours yield to a single immersion. A peculiar exception to this is the Adriapol red, which never becomes entirely white; however numerous the lixiviations, immersions, and acid baths employed.

306. "There is another thing no less worthy of remark, with regard to the black colour, which forms the outline or border of designs, namely, that if the muslin, or cleared fine piece, upon which the different flowers were designed which have been discharged, be folded together in several folds, or placed upon a dark-coloured ground, the effaced outline becomes visible according to the exposure of the piece under a certain obliquity of the light, exhibiting the appearance of a slight trace. The kind of outline which, under these circumstances, becomes visible, cannot be compared to any thing better than the embroidery of muslins placed on a coloured ground. This trace seen at a certain distance has the same effect, and even when closely observed, it is impossible to determine what it is, because it is not visible, except under a certain reflection of the light; nevertheless the whole piece appears white, and of a very superior quality. I have remarked, that this effect does not take place excepting with vegetable regard to the old prints of flowered designs of the true Chinese India calicoes imported from that part of the globe. For in the printed goods of our manufactures, such as those of Paris, Joly, St Denis, and Beauvais, all the traces of the designs completely disappeared, to my great surprise. It must, therefore, necessarily be admitted, that the difference in these results depends on the qualities of the mordants, which are more or less oily, or the manner of striking the blocks in the act of printing.

If this effect were produced by the mordant with the outlines of the designs in the pieces of printed goods, it might, perhaps, be of advantage to take the same method of obtaining a substitute, instead of the rich expensive embroideries with which the fine muslins of India and Switzerland are covered. These designs likewise do not appear in their full effect, but when they are placed upon a transparent stuff of a deep colour, which exhibits all the outline. This method of producing so rich an effect would be extremely simple, singularly permanent, and highly economical. I think, however, that I may add, that, after many trials, I have at last succeeded in discharging this mordant, sometimes by a batch of sulphuric acid, rather stronger than usual, and at other times by soaping the goods before and after the bath. This management is very essential to be known, in order that the operator may not be exposed to the mortification of seeing the same designs return again by the second action of the madder applied to the same bleached piece in a subsequent printing process. To obviate every accident of this kind, it will be proper to inform the owner which of the methods have been used to bleach their goods, and in case the new method may have been used, it would then be prudent to pass them previously through a good bath of sulphuric acid *."

307. Colours laid in oil, which do not contain madder or Discolor salt, must be first heated in an alkaline ley, and then scoured with soap.

Bleaching of Paper.

308. The bleaching of paper has been rendered considerably more expeditious by the use of the oxygenated muriatic acid. The following processes are given by De Charmes, as extracted from different French memoirs.

Bleaching of old printed Papers, to be worked up again.

309. "1. Boil your printed papers for an instant in a solution of soda rendered caustic by potash. The soda of warech is good.

4. Steep them in soap water, and then wash them, after which the material may be decomposed, or reduced to a pulp, by the machinery of the paper-mill. The washing with soap may be omitted without any great inconvenience.

Bleaching of old written Papers, to be worked up again.

310. "Steep your papers in a cold solution of sulphuric acid in water, after which wash them before they are taken to the mill. If the acidulated water be heated, it will be so much the more effectual.
Bleaching of Printed Papers without destroying the Texture of the Leaves.

1. Steep the leaves in a caustic solution of soda, either hot or cold. 2. And in a solution of soap. 3. Arrange the sheets alternately between cloths, in the same manner as the paper-makers dispose thin sheets of paper when delivered from the form. 4. Subject the leaves to the press, and they will become whiter, unless they were originally loaded with size and printers ink. If the leaves should not be entirely white by this first operation, repeat the process a second, and if necessary, a third time. The bleached leaves, when dried and pressed, may be used again for the same purposes as before.

Bleaching of Old Written Papers without destroying the Texture of the Leaves.

1. Steep the paper in water acidulated with sulphuric acid, either hot or cold. 2. And in the solution of oxygenated muriatic acid. These papers, when pressed and dried, will be fit for use as before.

The method of bleaching Rags of the natural brown colour for the Manufacture of White Paper.

1. Let the rags be opened or separated from each other, after previous soaking or maceration for a longer or a shorter time, according to their texture and quantity. 2. Give a lixiviation in caustic vegetable or mineral alkali. 3. Pass them through the oxygenated muriatic acid, more or less concentrated with alkali. 4. Let the mass be then worked for a sufficient time in the apparatus of the paper-mill, and it may be advantageously substituted instead of that which is afforded by white rags.

The white colour will be still better, if, after the maceration, the rags be opened, and subjected, as usual, to the action of the mill; after which the paste itself must be subjected to one lixiviation, one immersion, and a bath of sulphuric acid. The mass being then well washed and pressed out, may be thrown into a trough to be manufactured.

Method of bleaching Rags, of all Colours whatever, in order to make white Paper.

1. Let the rags be opened, as before. 2. Steep them in the oxygenated muriatic acid. 3. If, as it commonly happens, the colour is discharged by this first immersion, let these bleached and decomposed rags be immersed in water acidulated with sulphuric acid. 4. Complete the disorganization by the mallets or cylinders of the mill, after having previously well washed them.

If the colour should not be sufficiently discharged by the first immersion in the oxygenated muriatic acid, which is very seldom the case, give them another alkaline lixiviation, and after that a second immersion in the oxygenated muriatic acid; after which steep them in water acidulated with sulphuric acid, either hot or cold, the latter of which is the most active and effectual; and, lastly, let them be subjected to the action of the mallets or cylinders.

"Red and blue colours are most tenacious. With regard to black, it will be sufficient if they be steeped after opening their texture, 1. In a diluted solution of sulphuric acid; and, 2. In a solution of the oxygenated muriatic acid. If the operator could know that vegetable these rags had been dyed in the raw state, a still more satisfactory brilliant white might be obtained by following the second method described in the preceding article. But it very seldom happens that coloured rags have not been bleached before they were dried. The manipulations may be performed with sufficient speed to bleach at least three thousand pounds weight in the course of the day, without appropriating any extraordinary edifice or workshop to this purpose."

Nicholson's De Charmes.

But by far the best method of bleaching paper, is by applying the gas to it while in the state of paste; the method of doing which, with the states which led to it, are thus related in a Memoir of C. Lousiel, in the Ann. de Chimie, as translated by Mr Nicholson, in his valuable Journal, from which we have extracted it.

The process of bleaching the paste of the paper-maker, even when produced from the most common rags, will communicate to it the quality of the best sort. By these means our paper manufactories may supply our wants in fine white paper, and even obtain the preference in foreign markets. The result of this operation would be, that a greater number of workmen would find employment, and the advantages of this increase of industry would be of still greater national value, than even the foreign export which might be expected.

"The success of bleaching the paste of paper by the method of Citizen Berthollet is no longer problematical. The application which has been made to the paper used in making assignats, has placed this question beyond all doubt as to its solution.

"It was at the commencement of the year 2, that the committee of assignats and one of the national convention, of which I was a member, resolved to employ this method, together with that of stereotype, which had been adopted, to oppose new obstacles to the practice of forgery.

"We particularly consulted Citizens Berthollet, Fourcroy, and Guyton on this enterprise. Their approbation of the project, and the information they afforded us, soon gave us the power of realizing it. We were also assisted with the knowledge of Citizens Welet, Altran, Alby, Marchais and Ribaucour, who with great zeal communicated their processes, and permitted us to inspect their several manufactories.

"Our first processes were executed precisely according to the method of Citizen Berthollet. The rag was subjected in succession to different leys, to baths of the bleaching liquor and sulphuric acid pointed out in his memoir. Berthollet had shown, and we were also convinced by our own experience, that the gas is less confined in the simple fluid, prepared without addition of fixed alkali, that is in that which contains potash or soda; and that it is consequently more disposed to separate and enter into new combinations. We therefore at first made use of this simple liquor; but the workmen soon exhibited a strong repugnance to its use on account of the fumes it emits, which are extremely inconvenient, even when chalk is diffused in the liquor. This inconvenience forced us to abandon it, though with regret. This sacrifice was so much the more considerable, as it occasioned a loss of time, and considerable increase of expense. We decided that we
BLEACHING.

Vegetable we would receive the gas in a solution of potash; but as the doses in which this alkali may be used have limits of great extent, we endeavored to keep as near as possible to that preparation which is sufficient to prevent the spontaneous disengagement of the gas, and by that means cause the liquor to lose the odour we were desirous of avoiding. This dose was 5 kilograms of potash to 100 litres of water (11 pounds avoirdupois, to 21.4 ale gallons.)

319. "The rags bleached in this manner became of the most brilliant white. Nevertheless, a part of this perfection disappeared, when the rag was converted into paste, and that paste into paper. It was easy to discover the cause; namely, that the interior parts of the thread in the rag were less exposed to the action of the liquor than those at the surface. This motive determined us to abandon the bleaching of the rags, and to operate upon the paste itself.

320. "We were here opposed by new obstacles. When the rag is converted into a paste proper to be worked, its coherence is such that it softens, and no longer permits the eyes and hands of the bleaching liquor to penetrate through all its parts, in consequence of which property the paper was found to have veins and different shades of colour. We remedied this inconvenience, by taking the matter in a mean state between the rag and the paste proper to be converted into sheets of paper. We succeeded in this respect by destroying the texture of the rag under the first cylinder so as to separate its fibres, an operation which usually lasted two hours for a pile of 50 kilograms. Thus it was, that by successively avoiding the extremes of too much and too little mechanical connexion, we advanced towards our object.

321. "The apparatus which Citizen Welker imagined, and of which Citizen Berthollet has given a description in the first volume of the Journal of Arts and Manufactures, is applicable to all the methods which can be employed to procure the different kinds of bleaching liquor, whether the water of the receiver contains fixed alkali or not; whether the muriatic acid is used on the oxyd of manganese, or the gas be obtained by sulphuric acid, upon the mixture of oxyd of manganese and muriate of soda. This apparatus is particularly preferable to all others in the case where the water of the receiver contains no alkali, because the absorption of the gas is favoured by its being brought into contact with the water at a great number of surfaces. But as we had determined to use a solution of potash, we were able to make some modifications of this apparatus.

322. "One thousand litres of water are placed in the receiver, holding in solution fifty kilograms of white purified and calcined potash.

"When the disengagement of gas is effected by the muriatic acid, the materials are used in the following doses:

<table>
<thead>
<tr>
<th>Material</th>
<th>Quantity</th>
</tr>
</thead>
<tbody>
<tr>
<td>Oxyd of manganese</td>
<td>24 kilograms</td>
</tr>
<tr>
<td>Muriatic acid at 20 degrees of density according to the aerometer of Baumé</td>
<td>68</td>
</tr>
<tr>
<td></td>
<td>92</td>
</tr>
</tbody>
</table>

which makes for each of the eight distilling vessels 11.4 kilograms of material.

323. "The operation is begun by charging the receiver with 1000 litres of alkaline water, after which the aperture 8 is closed with its stopper well luted. Each matrasse is then placed in its sand-bed; and pulverized manganese is introduced. The muriatic acid is poured upon the manganese, and the stoppers into which the tubes of communication pass, are duly placed. The juncture is luted with paper soaked in starch.

And the lute is left to dry from six to twelve hours, after which the fire is lighted in the furnaces.

324. "The process of distillation lasts from ten to twelve hours. When it is finished the tubes are unluted, the fire extinguished, and the matrasse suffer to cool in their sand beds, till the temperature of these beds has descended to 60 or 70 degrees, (centigrade) at which period, water of the same heat is poured into the matrasse. The water dilutes the residue of the distillation, which mixture is to be poured out, and the vessels suffered to cool in baskets containing straw.

If the precaution of introducing hot water in this manner upon the residue were not taken, it would become too solid when the operation is performed with sulphuric acid, in the manner we are about to describe, that it could not be extracted without much trouble and danger of breaking the vessels.

325. "If the disengagement of the gas be made by sulphuric acid, the following doses are used:

<table>
<thead>
<tr>
<th>Material</th>
<th>Quantity</th>
</tr>
</thead>
<tbody>
<tr>
<td>Oxyd of manganese</td>
<td>25 kilograms</td>
</tr>
<tr>
<td>Muriate of soda</td>
<td>70</td>
</tr>
<tr>
<td>Sulphuric acid at 50 degrees of density 25</td>
<td></td>
</tr>
</tbody>
</table>

"The total is 120 kilograms.

326. "The oxyd of manganese and muriate of soda being pulverized are mixed together. The matrasse is to be charged and the operation conducted as before described. This method is the most economical, because the sulphuric acid is cheaper than the muriate, and also because it is practicable to obtain from the residue of the distillation, the soda of the muriate which is converted into sulphate of soda; that salt being decomposable by well known-processes.

"In order to measure the force of these liquors, or their bleaching power, we made use of the solution of indigo prescribed by Citizen Descroizilles.

"One part by measure of the bleaching liquid prepared as before mentioned, will usually destroy the blue colour of nine parts of proof solution of indigo; it was of the same strength as that of Javel, prepared by Citizen Alban.

Choice and Preparation of the Rags.

327. "The strength or tenacity of paper depends upon the staple or fibre of the material from which it is made. Rags of new cloth and cordage compose a paper more tough than old rags, and the finest of these materials presents a great variety on account of the quality of the hemp or flax of which they are formed.
Part II

Bleaching.

Rags of fine new cloth, whether raw or bleached by the

vegetable

oxynitric acid, stand in the first rank, after

which cardboard and old rags may be classed.

328. "Paper intended for bills of exchange, or other

commercial and legal instruments, ought to be tough,

in order that it may not be easily torn when thin.

For this paper the materials of the first class must be entire-

ly, or in large proportion, employed. The price which

the consumers are disposed to pay for this article, is

sufficient to indemnify the manufacturer for his care and

industry, as this kind of paper is sold in France for 5

or 6 francs the kilogram.

329. "The other papers also require to be more or

less tough, according to their thinness, and the use to

which they are applied, but a clear white colour is

sought in paper of every description. The first op-

eration to which the rags are subjected is sorting, in

order that each branch of the manufacture may have

its appropriate material, after which they are cut with

shears into pieces of about one decimeter, or three or

four inches square.

330. " It will suppose that the object of the manu-

facturer, is to obtain paper of a beautiful white. If it

is intended to be thin, so that, for example, a ream of

the size denominated ruche should weigh only four or

five kilograms, that is to say, about one-third of the

weight of common paper of the same form; the manu-

facturer makes choice either of new rags already of a

fine white, or of unbleached rags.

"In the case of the white rags, it is sufficient to pass

them under the first cylinder, then to give them a bath

of the bleaching liquor, and afterwards a bath of sul-

phuric acid, as we shall proceed to direct; after which

they are passed under the finishing cylinder for seven

or eight hours, and, lastly, conveyed to the working

trough to be made into sheets of paper.

331. " Rags, which have never been bleached, may

be treated by either of the following processes: that

is to say, the first, which preserves the utmost degree

toughness to the paper, but is likewise the most ex-

pensive, consists in decomposing the rag, and afterwards

applying the method of Citizen Berthelot for bleach-

ing piece goods; namely, subjecting it to three or four

lixiviations, and afterwards alternatingly to lixiviations,

baths of the bleaching liquor, and baths of sulphuric

acid. The weight of the raw unbleached material

is diminished from 50 to 45 per cent. in these opera-

tions.

332. "This method was the first which we used for

the assignat paper; but we soon perceived that we

might omit most of the lixiviations and baths of the

bleaching fluid, and still preserve as much toughness

as the paper required. Nothing further was necessary

for this purpose than to suffer the rag to undergo a de-

gree of fermentation more or less advanced, by leaving

it to rot. In this operation the colouring matter under-

goes a slow combustion, and passes to a kind of auto-

nomous state, and is carried off by the water, by wash-

ing the rags in the vessel of the first cylinder.

"One single lixiviation, to baths of the bleaching

liquor, and one of sulphuric acid, are then sufficient to

bleach completely the raw rags or cardboard. This is

the second method. We were not at that time ac-

quainted with the economical process of Citizen Chap-

tal in the operations of lixiviation. This will, no

doubt, be used; but the effect of rotting, carefully con-

ducted, will always be found very advantageous.

333. "Lastly, if the rags be neither whitely white,

nor raw and unbleached, but in a medium state,

they are left to rot for a shorter time, for example,

12 or 14 days, and are taken up when the heat of

the fermentation raises the thermometer to 30° or 35°,

after which the process is to be conducted as before

mentioned.

Composition of a bath of the bleaching liquor, for a pile

of decomposed rags, weighing 50 kilograms.

334. "For each heap of rags, a certain number, for

example, eight or nine, wooden tubs are disposed in a

line, capable of containing in the whole 600 litres of

water; 450 litres of pure water are poured in, and 90

litres of bleaching liquor are added in equal portions

to each of the vessels, after which the 50 kilograms of

decomposed rags are disposed in equal portions in each

tub. The stuff is left for about 22 hours in this bath,

agitating it from time to time, after which it is to be

completely washed in clean water, and put into a bath

of sulphuric acid, composed of water 200 litres, and

acid at 70 degrees 3 kilograms, which bath will then

have the strength of about four degrees of the acrometer

of Baumé.

"The immersion in the bath must continue for three

quarters of an hour or an hour, after which the materi-

als must be well washed in clear water, and carried

to the mill to be manufactured.

335. " If the action of the baths of bleaching li-

quor be not exhausted by the immersion of the decom-

posed rags (which may be ascertained by the solution

of indigo), it may be applied to other materials of the

same kind.

336. "Such was the state in which we left this new

art in the year 3. Since that time Citizen Welter, to

whom chemistry and the arts are indebted for a num-

ber of ingenious processes, has simplified that of pre-

paring the bleaching liquor. He has found, for ex-

ample, that instead of the three vessels of the receiver,

it is sufficient to employ two even for the simple liquor

that contains no fixed alkali.

"It was before seen that we were obliged to employ

an alkaline solution in the receiver, to prevent that

odour which the simple liquor emits when paper stuff

is agitated in the baths. The use of alkali answered

our purpose very well in this respect; but this ex-

penditure, besides weakening the bleaching liquor, near-

ly doubled our expense. Though this difference in the

price was of little consequence with regard to the object

we then had in view, it is not so with regard to the

common operation upon paper intended for sale. Every

means of economy must then be used. Now Citizen

Welter found that it is easy to obviate the inconveni-

cence of the same liquor in the operation. His method

consists in no longer agitating the goods or material in

an open bath, but to close it exactly by means of a

cover; and he agitates it by means of cross pieces at-

tached to a handle turned on the outside.

337. "A rough estimate of the price of the simple

bleaching liquor prepared by the sulphuric acid, this be-

ing the most economical process.

"The receiver is supposed to contain 1000 litres of

water.

25 kilograms
 BLEACHING. Part II.

25 kilograms of oxide of manganese cost at most 15 0  
70 kilograms of muriate of soda 7 0  
25 kilograms of sulphuric acid, at 50 c. 37 50  
Three days work principal men 9 0  
Three days do. assistant or labourer 4 50  
Fuel, about 3 0  
Wear and tear 6 0  

Our apparatus cost 622 francs, and the carriage and fixing increased our expense to 1000 francs, the interest of which, at 10 per cent. is 100 francs; and if the work be repeated so many times in the year, the interest per operation will be 1 0  

Fr. 83 0

" Hence the litre of bleaching liquor will cost nearly 9 cents in round numbers (6).

338. " Estimate of the increase of expense occasioned in the operation upon a pile of 50 kilograms of the paste of paper, supposing one bath of the bleaching liquor and one of sulphuric acid, which is most commonly the case.

Ninety litres of the bleaching liquor at nine cents 8 fr. 10 c.  
Three kilograms of sulphuric acid, at 1 fr. 50 c. 4 50  
Workmanship 0 50  

Total, 13 20

Which gives for each kilogram of paper an expense of 0.262 francs, or about 27 cents. Now the common paper in the market usually sells for about 1 fr. 30 c. or 1 fr. 40 c. the kilogram, and with the simple augmentation of 27 cents for the operations of bleaching, it obtains the preference beyond that which is sold for three, four, or even five francs, which can only be obtained in a limited quantity, on account of the selection of rags. The foregoing methods must therefore produce a great diminution in the price of fine paper. They are more particularly advantageous when applied to the manufacture of thin paper, because the expenses of bleaching are always proportioned to the weight of the material, and consequently are least upon thin paper."

Of Whitening and Cleaning Prints, Maps, Books, and other Articles of Paper.

339. The oxygenated muriatic acid was first applied to this purpose by Citizen Chapal, and the method has been employed with the greatest success by Citizens Vialard and Heudier.

The acid in the state of gas might be used for this purpose, but it is safer and equally efficacious to employ it in the liquid form.

(6) As the price of all these several items in France must materially differ from the same in England, it was thought unnecessary to reduce the numbers.
Part II.

**BLEACHING.**

**Vegetable Substances.**

342. "By this operation books are not only cleaned, but the paper acquires a degree of whiteness superior to what it possessed when first made. The use of this acid is attended also with the valuable advantage of destroying ink spots. This liquor has no action upon spots of oil, or animal grease; but it has been long known, that a weak solution of potash will effectually remove stains of that kind.

343. "When I had to repair prints so torn that they exhibited only scraps pasted upon other paper, I was afraid of losing these fragments in the liquid, because the paste became dissolved. In such cases I enclosed the prints in a cylindrical glass vessel, which I inverted on the water in which I had put the mixture proper for extracting the oxygenated muriatic acid gas. This vapour, by filling the whole inside of the jar, acted upon the print; extracted the grease as well as ink spots; and the fragments remained pasted to the paper.

344. Vialard and Heudier have by this process restored several of the most valuable books of the French national library, and we believe they were the first who carried Chaplet's process into actual execution.

It is necessary, that we may fully succeed in this process, to be very precise in the quantity of the acid employed, and to use considerable address in the management of it, otherwise we shall injure the paper, and render the books incapable of being bound again. But with caution and a little experience, the method is perfectly safe and easy.

345. As it is convenient to be able to prepare the acid employed for this purpose in the most simple and economical way, we may recommend the following:

"To oxygenate the muriatic acid, nothing is necessary but to dilute it, and mix it in a very strong glass-vessel with manganese, in such a manner, that the mixture may not occupy the whole content of the glass. Air bubbles are formed on the surface of the liquor; the empty space becomes filled with a greenish vapour; and, at the end of some hours, the acid may be farther diluted with water and then used. It has an acid taste, because the whole is not saturated with oxygen; but it possesses all the virtues of the oxygenated muriatic acid. This process may be followed when there is not time to set up an apparatus for distilling, in order to procure the oxygenated acid.

346. It has been said, that the acid is not capable of removing spots of grease from books and prints. A method of doing this was lately published by M. Dechamps junior, and is as follows:

"After having gently warmed the paper stained with grease, wax, oil, or any fat body whatever, take out as much as possible of it, by means of blotting-paper. Then dip a small brush in the essential oil of well rectified spirit of turpentine, heated almost to ebullition (for when cold it acts only very weakly), and draw it gently over both sides of the paper, which must be carefully kept warm. This operation must be repeated as many times as the quantity of the fat body imbibed by the paper, or the thickness of the paper, may render necessary. When the greasy substance is entirely removed, recourse may be had to the following method to restore the paper to its former whiteness, which is not completely re-

347. Before the discovery of oxymuriatic acid and its application to bleaching, this was effected by exposing the yellow wax, formed into thin cakes, to the free action of the air, sun, and dews. The acid, however, as being far more expeditious, is to be preferred.

In the bleaching of wax, it is proper to employ the simple acid, and its action would be the most effectual if used in the gaseous form. For this purpose, a pneumatic tub, with a cover secured in the manner recommended by Rupp, is the most proper. This should be filled with water, and the wax, abed very fine must be introduced, and the gas made to pass through the water, while the agitator is kept in constant motion. In the course of an hour or two the wax will be bleached, may be separated from the water, melted and formed into cakes.

348. Before we conclude our account of the various bleaching processes in which the oxygenated muriatic acid is concerned, it will be proper to inquire how far the materials employed in procuring this acid may be turned to account after the distillation.

The substances which remain in the distilling articles are a portion of undecomposed oxide of manganese, some sulphate of manganese, and a large quantity of sulphate of soda (Glauber's salt).

The whole mixture may be employed with advantage as a glazing to coarse earthen-ware. This glazing has a dark colour, something like that of bronze, which it receives from the manganese: it is attended with this advantage, that it is perfectly safe, and is therefore much superior to any glazing, where lead enters as a part of the composition.

349. But the object of most importance is to decompose the sulphate of soda, in order to obtain the alkali. There are several methods of effecting this, but perhaps the two following are the best.

350. The first is that contrived by M. M. Malherbe and Athenas. The first object in this process, is to reduce the sulphate to the state of an alkaline sulphuret (liver of sulphur). "Malherbe and Athenas have succeeded in this by employing iron as the intermediate substance: they mixed one part of charcoal dust with nine parts of the sulphate of soda, and exposed the mixture to the heat of a reverberating furnace: when the sulphuret entered into combustion, they added from three to five parts of old iron rendered as small as possible; and the whole being fused together, they obtained a black paste, composed of iron, soda, sulphat of iron, &c. This mixture was lixiviated, and filtered through a basket filled with..."
BLEACHING. Part II.

Vegetable Substances. With lime: it was then evaporated to dryness, and the residuum was calcined in a reverberatory furnace. When soda of a superior quality is required, the washing and calcination must be repeated.

"Dize and Le Blanc decomposed the sulphate of soda, by means of the carbonate of lime, in order to neutralize the alkali, by saturating it, at a very high temperature, with carbonic acid. Their process consists in taking two parts of sulphate of soda, dried to deprive it of its water of crystallization, two parts of well ground chalk (carbonate of lime), and one part of charcoal powder, mixing them well in a muffled mortar, and then bringing the mixture to a white heat in a reverberatory furnace: when the matter is fused, it is stirred till the sulphur is consumed, and the ebullition and the jet of the flame produced by the hydrogen gas have ceased to appear. It is then taken from the furnace, and it may be lixiviated to obtain the soda very pure. In whatever manner the sulphate is decomposed, this object merits the greatest attention at bleachfields on account of the considerable degree of economy which results from the different manipulations. The ley of soda degenerated must be obtained by little or no expense by bleachers, when they seriously set about extracting the soda from the sulphate formed during the distillation.

Bleaching by Sulphuric Acid.

351. From the effects produced by sulphuric acid in the processes of bleaching, in which it has been seen to act a material part, a proposal was lately made to employ it solely for this purpose, but we believe the project has never been carried into execution. It is certain, that a very weak bath containing one part of acid to five hundred of water may be employed with the greatest safety; and when cloth remains immersed in it for a considerable time, it acquires a high degree of whiteness.

Of Bleaching by Steam.

352. The various processes which we have described, form nearly a complete abridgment of the history of bleaching; we have endeavored to follow as closely as possible the progress of human genius, and to show how the rapid advances of modern chemistry have contributed to the improvement of this interesting art.

353. We are now to describe a new method, for which we are indebted to C. Chaptal. This ingenious and learned man, published some time since a memoir on the method of bleaching with steam, a process which we received from the Levant soon after the introduction of the art of dyeing Adrianople red, and which has been ever since employed in the interior of France, under the name of Blanchiment à la vapeur. At the time when the disinherited Chaptal published an account of this method, it was a secret, the knowledge of which was confined to a few manufacturers. They only employed it in bleaching cotton in the states of wool and thread, in imitation of the eastern nations; but Chaptal, with his usual ingenuity, perceived the possibility of extending the process to the bleaching of thread of flax and hemp, and he invited the assistance of artists for the purpose of effecting this desirable end.

354. This appeal of Chaptal, induced many manufacturers as well in France as in other countries, to make trial of this new method; and it was tried nearly at the same time at Paris and in Ireland. The apparatus constructed by C. Bawens, proprietor of the manufactory of cotton thread and stuff, at Bons Hommes near Passy, gave surprising results. He could bleach from two to three thousand ells of cotton in a day, with such facility, and at so moderate an expense, as proved the new method to be incomparably better than any before employed. The first trial was made on 1500 ells of cloth intended for printing; after the operation, it exhibited no variegation of surface, no shades, but one uniform complete whiteness. His apparatus resembles perfectly what has been described by C. Chaptal, and answers extremely well for bleaching cotton, both in the wool and when spun into thread, and several improvements lately made on it, which render it much more advantageous and of more extensive utility; but it will be proper, before examining these, to describe the apparatus recommended by Chaptal, which we shall do in his own words.

355. "At the distance of about sixteen inches above the grate of a common furnace, supplied with pit-coal, is fixed a copper boiler of a round form, 18 inches deep and four feet broad. The edges of this copper turned back, are made to rest on the side-walls of the brick-work of the furnace; they are about seven inches broad. The rest of the furnace is built of burnt stone, and forms an oval boiler six feet in height, and five feet in breadth at the centre: the upper part of this boiler has a round hole eighteen inches in diameter, which may be shut by a moveable piece of strong stone, or a copper lid adapted to it. Upon the edge of the copper boiler which forms the bottom of this kind of Paep's digester, is placed a grating made of wooden bars, so close together, that the cotton placed on them cannot fall through, and sufficiently strong to bear the weight of about 1600 pounds.

356. In the apparatus of C. Bawens, the mode of heating employed in Count Rumford's furnaces was used to reduce the quantity of fuel consumed, and thus render the process more economical. The heat of the chimney also served to heat the bath of weak sulphuric acid.

In other countries an apparatus has been employed, which possesses the advantage of winding up the stuff within the copper, which resembles that of a steam engine with its tubes, safety valves, and collars of leather; but it has this inconvenience, that the stuff must be introduced at the top (a).

357. C. O'Reilly, to whom Chaptal had communicat-

(a) The following passage translated by Nicholson from the Journal de Physique, is worthy of notice.

"A new method of bleaching has just been tried at Ballynah, and has completely succeeded. The principle of the process appears to have been published by a French chemist, Chaptal, who is much respected by our manufacturers. I speak of the art of discoloring piece-goods in a digester, by caustic alkaline ley. Though our first
Part II.

Bleaching.

Vegetable ed his ideas, soon conceived methods of improving the vegetable apparatus, and of applying it to various purposes suited to the different articles.

The first apparatus which he proposed to be executed at Jouy, represented an arched chamber of hewn stone, six feet eight inches long by three feet ten inches broad; and three feet and a half high above the level of the door. A grate (see Plate XCII, Fig. 8). At one end of the apparatus is a door three feet long and two high, which is closed by a plate of cast iron, in which a hole is made for the introduction of a conical valve which is kept in its position by a screw and a spring made as powerful as possible. The object of this valve was to guard against an explosion which might take place from the sudden expansion of the steam, which there is some cause to dread. The door was movable, and fastened by ten bars and as many screws, which press against the rabbit, which is covered with tow or wet leather) so as to prevent any of the steam from escaping this way. The door should be made, when iron handles, that it may be removed with the more ease.

The copper which forms the bottom of this apparatus, and in which the caustic alkaline solution is boiled, is 18 inches deep, and its other dimensions are less by four inches than those of the chamber. This gives room for the edges of the copper, and for a wooden grate on which the men may walk and conduct the operations. In the middle of the chamber are fixed two reels, on which from eighteen to twenty pieces of cloth are rolled. The axes of these reels pass through collars of leather, which prevent the escape of the steam; they have handles on the outside to roll and unroll the pieces, and there is a regulator communicating with the inside of the copper, to point out the substance height of the liquor, and shew how far it is exhausted. It is heated after Count Rumford's plan.

358. Another apparatus was constructed at Troyes for the purpose of bleaching hosiery. As these goods cannot be rolled up; and as the action of the vapour might be lessened were the goods received in lightly convoluted frames of wood covered with cloth, and placed at the distance of four inches, one above another. Upon these frames the goods were spread in such a manner that the vapour rising from the copper might penetrate to every part, destroy the colouring matter, and thus complete the bleaching.

359. From some farther observations he was led to propose a roller placed in such a way, that the cloth rolled on it might on occasion be drawn through the liquor in the copper, to moisten it now and then, and thus increase the action of the liquor

360. After this account of O'Reilly's apparatus, of which a more particular description will be given presently, we come to the actual method of bleaching by steam. The following are the directions given by Chapital.

561. "The cotton, disposed in handfuls, must first be impregnated with a slight solution of sodium caustic by lime. This operation is performed in a wooden or stone trough, in which the cotton is trod down by means of the feet covered with wooden shoes. When the alkaline liquor has uniformly penetrated the cotton, it is put into the boiler, and piled up on the wooden grate before mentioned; the redundant liquor runs through the bars into the copper boiler, and forms

first attempts did not perfectly succeed, we were not discouraged. The linen was exposed to the action of vapour in the apparatus, but it was not equally affected, as it appeared to be blotted in several places; we were, therefore obliged to construct an apparatus, in order to unravel and separate the goods, and to expose the greatest surface possible to the action of the vapour. Suppose the boiler of a steam engine, in the form of an elongated ellipsis, provided with a safety valve, two tubes with cocks, to shew the consumption of the liquor, and a mercury gage, to ascertain the strength of the steam. This boiler is bedded in masonry, or brick work, that it may resist the excessive pressure which necessarily takes place. In the interior part of the apparatus are six reels, three at each end, alternating with each other, in order that the action of the steam may be more equable upon the goods. These reels are slowly and uniformly carried round by simple tooth and pinion work of wood, and the first motion is given to an axis which passes out of the boiler through a stuffing box, which prevents the escape of vapour. At the top is an opening of about sixteen inches diameter, with a rim or flange, on which the cover is fitted, and firmly secured by screws. Between the two metallic faces are placed strips of soaked leather, to prevent the vapour from escaping. When the cover is taken off, the workmen can enter the boiler, to dispose the goods upon the rollers, each of which contains about fifteen or twenty pieces, making in the whole about forty-five or sixty. The raw material, namely, cotton-marks kelp, is an article of considerable expense, or else the soda extracted from sea salt, in which there remains indeed a small portion indecomposed, but which we procure at a very reasonable price. It is rendered caustic by the addition of some good lime, which is made from our limestone of Parre. With these a ley is formed, which is equal to fourteen degrees of our hydrometer. In this lixivium the pieces of goods are boiled, and then conveyed to the digester, on the bottom of which the ley stands to about five inches in depth. The workman stands upon a perforated stage, which prevents him from stepping into the ley while he is arranging the pieces: after which, having placed them on the rollers, the apparatus is closed, the fire lighted, and the operation begins. As soon as ebullition takes place, the handle on the outside is incessantly turned, and as soon as the roller at one end is filled, the handle is shifted to the other roller, and the turning performed in the contrary direction. In this manner the operation is continued till the whole of the contents is bleached. From this description you may easily understand how this operation is performed; I shall, however, take the first opportunity of sending you a plan and description of the apparatus, if you wish for further information. You are at liberty to make whatever use you please of this account: the expense of bleaching is not more than one farthing per yard, including costs, workmen's wages, &c. as well as interest for the capital employed in the apparatus."
BLEACHING. Part II.

Vegetable a stratum of liquid, which permits the mass to be heated without any danger of burning either the cotton or the metal. To form the alkaline ley, Alcoholic soda equal to a tenth of the weight of the cotton subjected to the operation is employed; and in a boiler such as that the dimensions of which I have given, about 830 pounds of cotton may be put at one time. The ley is generally of two degrees by the aeronometr. As soon as the cotton is introduced into it, and arranged in such a manner that the upper aperture is shut with its usual covering, scarcely any opening being left, that the steam developed by the fire may assume a much more considerable degree of heat, and react with force on the cotton. When every thing is arranged, the fire in the furnace is kindled, and the ley is maintained in a state of slight ebullition during 36 hours. The apparatus is then suffered to cool, and the cotton being taken out is carefully washed; after which it is exposed on the grass for two or three days, extending it on poles in the day time, and spreading it out on the grass during the night. The cotton will then have acquired a high degree of whiteness; and if any portions of it be still found coloured, they must be put into the boiler for a second operation, or be left on the grass some days longer. These shades in bleaching cotton arise, in particular, from all the parts of the cotton in the first operation not having been completely and unformly impregnated with the ley. They may be owing also to the cotton, when arranged in the boiler, having been too much accumulated on certain points. When it is judged that the ley has been exhausted by ebullition, the boiler is opened, and the dried cotton is moistened with a new quantity of the solution of soda: without this precaution it would be in danger of being burnt. It may be easily conceived, by an estimate of the matters and time employed in this operation, with how much saving of expence it is attended: cotton is bleached by this method in all the manufactories of the south of France, where it is used, at the low rate of two sols per pound.

362. Cloth may be bleached in the same way, but requires first to be freed from its weavers dressing, &c. as formerly directed.

363. While the goods are steeping so as to be perfectly impregnated with the alkaline ley, the copper is to be filled to the height of a foot with ley of the same strength. This may be done by means of a curved leaden funnel, but as the door is sufficiently large, the ley may be thrown in with buckets. A workman then enters the chamber, and fixes one end of a piece of cloth by means of packthread to one of the arms of the farthest reel A (fig. 9. Plate XCII.) while another workman without turns the handle till the whole piece is wound on; the end of another piece is then fastened to the first, and so on till 18 or 20 pieces are wound round the first reel. The remaining extremitie of the last piece is then passed over the roller B, near the arch of the chamber; from thence it is carried below the two rollers C, D, in the copper E E; is again carried to the arch, and made to pass over the roller F, and is lastly fastened to an arm of the other reel G. The workman then ascertains the height of the liquor in the copper by the regulator, and then shuts the cock, and closes up the door by bags and the proper screws, so as to prevent all escape of steam. The fire is then kindled, and the liquor made to boil. The workman then begins to wind off the pieces, commencing with the reel to which the last end was tied, till this has received the whole charge; he then lowers the cranks of the lower rollers, so as to plunge the goods into the boiling ley, and immediately begins to reel off with dispatch; again raises the rollers, and reels the pieces back without passing through the ley.

At the end of two hours, more or less according to the fineness of the pieces, the alkali carried up by the heat will completely have penetrated the fibres of the cloth, which are swelled by the extraordinary heat of the steam.

The fire is now extinguished, and as soon as all is sufficiently cool, the door is opened, and they prepare for immersing the stuffs in the oxygenated muriatic acid, after they are first well rinsed in fair water.

364. For immersion the tub described in 362 is employed, and the pieces are fastened and reeled in the manner there described, till the liquor on examination is found pretty much exhausted. The pieces are then taken out separately, well rinsed in a stream of water, and exposed on the grass for three or four days. They are then passed through a bath of very weak sulphuric acid, and will then have acquired a high degree of whiteness.

If linen or hempen cloth should retain a slight yellow cast, which will sometimes happen, the steaming must be repeated; and they must be exposed again for a day or two on the grass.

365. Hosiery and broads are bleached in the same way, but they are to be placed on frames at such a distance from each other that they may be easily penetrated by the steam; but as these articles cannot, like the cloths, be made to pass through the ley in the copper, the process is to be stopped at the end of two hours, and then the upper frame, is completely wet with ley, which oozes through, and thus moistens all the lower frames. The boiling is again commenced, and continued for four hours. For the immersion, the apparatus of Rupp with the vertical reels is the best possible, and the goods are to be hung on the upper end of the reel. After immersion, they are rinsed, exposed on the grass, and passed through the acid bath as other articles.

366. Chapital has lately applied this method to a very important object, the scouring and whitening of foul linen.

"I have no doubt," says he, "but that these garments may be bleached to advantage by the same process; but as it was necessary to bring these notions to the test of experiment, I invited Citizen Bawens to allow me to make the experiment on a large scale with his apparatus. Accordingly, on the 27th Floriose, in the year 9, I had 200 pair of sheets from the hospital of the Hotel Dieu at Paris, chosen among those that were most soiled, and taken to the manufactury of Citizen Bawens.

"Three experiments were made upon these sheets. "Experiment 1. One hundred and thirty sheets were impregnated with a caustic alkaline ley, containing one hundredth part of soda. They were kept for six hours in the engine of steam; after which they were impregnated again, in order to be placed again six hours in the same machine. "The same process was repeated a third time; after which they were carefully rinsed, and no spot of
BLEACHING.

Part II.

Vegetable Wine, grease, blood, or animal ejection, were to be seen.
Substances One quarter of a pound of soap was used in rinsing
these cloths.

"All the assistants were convinced that the ordinary
processes would not have given either so perfect a white,
or so agreeable a lustrous smell.

"The texture was in no respect altered.

"Experiment 2. The alkaline ley contained only six
parts of soda, but five pounds of soap were also added.
The cloths were treated in the same manner, and the
results appeared more advantageous. They were easily
washed out.

"Experiment 3. To the bath of the second experi-
ment a sufficient quantity of new ley was added. One
hundred and forty sheets were treated like the prece-
ding, and the result was the same.

"It must be observed that the water of the Seine,
in which these sheets were rinsed, was at that time very
yellow.

"This experiment appeared to me to offer several re-
results worth the attention of the Institute.

"In the first place the process is economical. Two
hundred pair of sheets, which were bleaching by three
successive operations, demanded an expenditure, accord-
ning to the account furnished by Citizen Bawens, which
is in the proportion of 7 to 10, compared with that com-
monly made in the hospitals. This expense may be re-
duced to less than one-third, if a suitable place and ap-
paratus were appropriated to this use.

"2. Two days at most are required to complete the
operation. This economy of time is incalculably ben-
eficial.

"3. The linen is neither changed nor torn, as it
passes through the hands only once, and it is of no use
to stop it.

"4. The extreme heat to which the linen is exposed
in the apparatus, causes its texture to be penetrated by
the alkaline fluid to such a degree, that the substances
with which it is impregnated cannot be masked from its
action; so that the putrid exhalations, and other sub-
stances attached to its texture, are necessarily destroyed
or changed in their nature.

"This effect must be more particularly seen with re-
gard to its value, by physicians, who are aware with
what facility the seeds of various disorders are perpetu-
ated in hospitals, and how insufficient the greater num-
ber of processes used in washing linen have proved to
destroy them."

367. It only remains that we should give a brief ex-
planation of the manner in which the steam, thus con-
fined, acts in bleaching the goods.

It has appeared from the former parts of this ar-
ticle, that the bleaching of vegetable substances de-
deends on the united influence of moisture, light, and
oxygen; and the mode in which these act, as also the
action which alkalies exert on the colouring matter of
cloth, has been explained. This action of the alkali is
materially assisted by the increased temperature of this
vapour bath, by which the fibres of the cloth, &c. are
swelled and opened; and thus the caustic alkali carried
up with the stream, greedily seizes on and destroys the
colouring matter; or, should some part of it escape, a
second steaming, after immersion and exposure to the
air, never fails to discharge it. The increased tempe-
ration, independently of swelling and opening the tex-
ture of the cloth, seems also to render the alkali more
active than it can be in the ordinary leys, in which the sub-
stances temperature never exceeds 162° Fahrenheit; for one
dergee of the aerometer is always a sufficient strength,
and very seldom more than half a degree is required.

By passing the goods through a single bath of oxyge-
nated muriatic acid, or oxymuriet of lime, a combina-
tion takes place between the oxygen of the liquor and
the carbon produced by the destruction of the extracto-
resinous matter by the alkali, and carbonic acid is for-
m- and this is dissipated by the subsequent exposure to the
atmosphere.

365. We cannot however agree with O'Reilly, who, a
steam itself possesses no bleaching power, as we are le Blanck.
convinced from the common process of cooking greenp.
vegetables in steam, by which, as is well known, they
lose their green colour, that this is not the case.

365. It has been supposed that the vapour arising
from a boiling solution of caustic alkali would not it-
self be caustic, or produce the same effects as the solu-
tion; a supposition which was founded on the concen-
tration of salts by evaporation; but we are by no means
to infer, from what takes place in the open air, where
the moisture is constantly absorbed as it rises, that the
same will happen in a close apparatus, where the tem-
perature is considerably increased; and, in fact, that
alkali is capable of being raised by steam is fully pro-
ved by suspending paper tinged blue over a boiling so-
lution of potash, when the blue will soon be converted
into a green.

We shall conclude this article with M. Chaptal's obser-
Vations on the art of scouring different kinds of
stuff.

"This art supposes, 1st, a knowledge of the differ-
ent substances capable of staining any kind of cloth;
2d, of the substances to which recourse must be had in
order to make those deposited on the stuff to disappear;
3d, a knowledge of the effects produced on colours by
those re-agents which it may be necessary to employ
to destroy stains; 4th, a knowledge of the manner in
which the cloth is affected by those re-agents; 5th,
of the art of restoring a colour changed or faded.—
Of these bodies which occasion spots on different kinds
of cloth, some are easily distinguished by their ap-
pearance, such as greasy substances; but others have more
complex effects, such as acids, alkalies, perspired mat-
ter, fruits, urine, &c. Acids reddens black, fawn,
violet and puce-colour, and every shade communicate
with orchidea, iron, astringents, and every blue
except indigo and Prussian blue. They render the
yellows paler, except that of arnotteto, which they change
into orange.

"Alkalies change to violet the reds produced by
Brazil wood, logwood, and cochineal. They render
the greens on woollen cloth yellowish, make yellow
brownish, and change the yellow produced by arnotteto
aurora. Perspired matter produces the same effects
as alkalies.

370. When the spots are produced by simple bodies
on stuffs, it is easy to remove them by the means already
known. Greasy substances are removed by alkalies,
soaps, the yolk of eggs, fat earths; oxides of iron, by
the nitric and oxalic acids; acids by alkalies, and re-
iroprocele. Stains of fruit on white stuffs may be re-
moved by the sulphurous acid, and still better by the
oxygenated.
BLEACHING.

Description of Apparatus.

Plate XCI.

Fig. 1. Elevation of the Apparatus.

A, The furnace which is made capable of containing three distilling vessels.

a, A curved funnel for introducing the sulphuric acid.

b, A tube passing from the matras to an intermediate leaden vessel B intended to condense the sulphuric acid which comes over undisposed, and having five necks, three of which receive tubes similar to b, and from the fourth passes the tube d.

c, A tube of safety.

d, A tube passing from the intermediate vessel to the first of the tall Wolfe's vessels C intended to condense the sulphuric acid.

d, The second of the Wolfe's vessels, with tubes to connect it with the first and third.

Each of these vessels has a leaden cock to empty the acid liquor into the immersing tubs.

Fig. 2. Plan of the above vessels.

Fig. 3. A vertical Section of Rupp's Immersing Tub, as improved by O'Reilly.

a, b, The tub.

c, d, The cover perfectly air-tight.

e, The partition dividing the tub into two parts.

f, A funnel filled with a plug.

g, A, The wooden reels on which the stuff is rolled.

h, h, h, b, b, h, h, Seven rollers, over and under which the stuffs pass, so as to expose a large surface to the bleaching liquor.

i, A leaden cock to draw off the liquor.

Fig. 4. Rupp's Original Apparatus, as described in 1843:

b, The place for the fire.
Part II.

Vegetable Substances.

c. A door by which fuel is introduced.
d. Door of the ash, with a register to regulate the draught of air.
e. A boiler of cast iron filled with hot water, in which is placed the alembic.
f. A, three-footed iron stand to support gg, A leaden alembic.
h. A glass or leaden curved funnel for introducing the sulphuric acid.
i. A leaden cover firmly fixed by lotting to the neck of the alembic, and pierced with three holes for the transmission of the funnel, the handle of an agitator, and a condensing tube.
j. The agitator formed of iron covered with lead.
k. A leaden tube three inches in diameter for conducting the gas into

m. An intermediate vessel of lead for condensing the acid which may pass over from the alembic uncombined.

The tube l descends through the first opening m 1, nearly to the bottom of the vessel, which is two-thirds filled with water; the oxygenated muriatic acid traverses the water, and passes out at the top through the leaden tube n into o, o, the pneumatic tub, made of wood fitted with a cover r, which is perfectly air-tight, and through which passes an agitator p, with three leaves for mixing the gas with the water.

q, q, q, Three shelves in the tub, which by retarding the ascent of the bubbles of gas, facilitate its union with the water.
s. A stop-cock for letting off the liquor.

Fig. 9. A Vertical Section of O'REILLY'S APPARATUS for Bleaching by Steam.

E, E, E, The boiler.
A, G, The two reeds.
B, F, The upper rollers.
C, D, The lower moveable rollers.
H, The regulator.
I, A stopcock.
K, The door of the chamber.

Fig. 10. The Apparatus, with Frames for Bleaching THREAD and HOSIERY.

Fig. 11. Plan of LOTSPEL'S APPARATUS for Bleaching VEGETABLE Substances.

1, 1, 1, &c. Eight furnaces, having a chimney of sheet iron common to each pair of furnaces.
2, 2, 2, &c. Eight vessels of cast iron, containing sand.
3, 3, 3, &c. Eight matrasses, balloons, or bottles of stone-ware, compact, and well baked, intended to contain the materials which afford the gas. Each matrass must be filled only to one-third of its capacity at most.
Bodies of glass of little thickness may also be used for this purpose.
4, 4, 4, &c. Tubes of glass to conduct the gas into the receiver. Or these tubes may be made of lead.
5. The receiver. It is composed of an internal vessel, covered with plates of lead well soldered together, and provided near its bottom with a cock 6, to draw off the liquor when prepared. 2. Another vessel, 7, likewise covered with plates of lead within and without. This second tub is inverted in the first, to contain the gas in proportion as it is disengaged, and to keep in contact with the water of the receiver that portion of gas which had not time to be dissoluted in passing through that fluid.

There is a hole, 8, in the upper part of this second vessel. It serves to suffer the common air to escape when water is first poured into this receiver, and it is afterwards closed with a stopper of lead or cork, covered with paper soaked in starch, and fastened to the cork by a piece of cloth or bladder, before the operation begin.

Fig. 12. Vertical section of the apparatus.

Fig. 13. Elevation of the apparatus.

The disposition of the furnaces about the receiver, and the circular form of the receiving vessels, was rendered necessary here by the local circumstances. In other circumstances square vessels might be employed, and all the furnaces might be ranged in a right line under a common chimney.

For an account of the most recent improvements in this art, see BLEACHING, SUPPLEMENT.

BLEACHINGLY, a town of Surry in England, which sends two members to parliament, and the bailiff who returns the members is chosen annually at the lord of the manor’s court. The town stands on a hill, and contained 11,160 inhabitants in 1811. W. Long. c. 15. N. Lat. 51. 20.

BLEEDING, in Therapeutics; see Medicine Index. As a surgical operation, see Surgery Index.

BLEEDING at the Nose, called Epistaxis. See Medicine Index.

BLEEDING is also used for a hemorrhage or flux of blood from a wound, rupture of a vessel, or other accident. See Hemorrhagy.

BLEEDING of a Corpse, is a phenomenon said to have frequently happened in the bodies of persons murdered, which, on the touch, or even the approach of the murderer, began to bleed at the nose, ears, and other parts; so as formerly to be admitted in England, and still allowed in some other parts, as a sort of detection of the criminal and proof of the fact. Numerous instances of these posthumous hemorrhages are given by writers. But this kind of evidence ought to be of small weight: for it is to be observed, that this bleeding does not ordinarily happen, even in the presence of the murderer; yet sometimes in that even of the nearest friends, or persons most innocent; and sometimes without the presence of any, either friend or foe. In effect, where is the impossibility that a body, especially if full of blood, upon the approach of external heat, having been considerably stirred or moved, and a putrefaction coming on, some of the blood vessels should burst, as it is certain they all will in time?

BLEEDING is also used for the drawing out of the sap of plants, otherwise called tapping. See Tapping.

BLEEKING, a province in the south part of Sweden, having the Baltic sea on the south, Skåland on the north, and the province of Schonen on the west. Its principal towns are Christianstadt, Elilenholm, Abya, Rotbergh, and Christianople, which last is the capital.

BLEMYES, or Blemmyes, a fabulous people of Ethiopia, said to have had no heads; their eyes, mouths, &c. being situated in their breasts. See Accephalous.

BLEND, or Blanche. See Blanch.

BLEND, or Blinde. See Blende, Mineralogy Index.

BLEND-Water, called also morehough, a distemper incident to black cattle, comes either from the blood, from the yellow, or from the change of ground. In order to cure it, take bile armoniacæ, and as much charcoal dust as will fill an egg shell, a good quantity of the inner bark of an oak, dried and powdered together to a powder, and give it to the beast in a quart of new milk and a pint of earing.

BLENHEIM, a village of Germany, in the kingdom of Bavaria; situated in E. Long. 2. 30. N. Lat. 48. 40. This village is remarkable for the defeat of the French and Bavarians in 1704, by the English and their confederates under Prince Eugene and the duke of Marlborough. The French army amounted to 60,000 veterans, who had shared in the conquests of their grand monarque; and were now commanded by two generals the most distinguished at that time in France, Marshal Tallard and the duke of Bavaria. The former had established his reputation by many victories. He was active and penetrating; his ardour often rose to impetuosity; but he was so shortsighted as to be incapable of seeing objects at a very small distance. The duke of Bavaria was equally experienced in the field, and had stronger motives for activity: His country was ravaged before his eyes, and nothing remained of his possessions but the army which he commanded. The allied army, commanded by Eugene and Marlborough amounted to about 32,000 men; troops who had long been familiar with victory, and who had seen the French, the Turks, and the Russians fly before them. Both armies, after many marches and counter-marches, approached each other. The French were posted on a hill near the town of Hochstet; their right covered by the Danube and the village of Blenheim; their left by the village of Lutzengen; and their front by a rivulet, the banks of which were steep and the bottom marshy. The right wing of the French was commanded by Marshal Tallard; their left by the duke of Bavaria; and under him General Marsin, an experienced Frenchman. Their position being advantageous, they were willing to await the enemy rather than offer battle. On the other hand, Marlborough and Eugene were stimulated to engage them at all events, in consequence of an intercepted letter from Villeroi, intimating that he was preparing to cut off all communication between the Rhine and the allied army. The dispositions, therefore, being made for the attack, and the orders communicated to the general officers, the allied forces advanced into the plain, and were ranged in order of battle. The cannonading began about nine in the morning, and continued to about half after twelve. The troops then advanced to the attack; the right under the direction of Prince Eugene, the left headed by Marlborough, and opposed to Marshal Tallard. Marlborough, at the head of the English troops, having passed the rivulet, attacked the cavalry of Tallard with great bravery. This general being then reviewing the disposition of his troops to the left, his cavalry fought for some time without the presence of their commander. Prince Eugene had not yet attacked the forces of the elector; and it was near an hour before he could bring up his troops to the engagement. Tallard was no sooner informed that his right was attacked by the duke, than he flew to its head, where he found a furious encounter already begun; his cavalry being thrice driven back, and rallying as often. He had posted a large body of forces in the village of Blenheim; and he made an attempt to bring them to the charge. They were attacked by a detachment of Marlborough’s troops, with vigour, that instead of assisting the main body, they could hardly maintain their ground. All the French cavalry being thus attacked in flank, was totally defeated. The English army now penetrated between the two bodies of the French, commanded by the marshall and elector, while the forces in the village of Blenheim were separated by another detachment. In this distressed situation Tallard flew to rally some squadrons; but from his shortsightedness mistaking a detachment of the enemy for his own, he was made prisoner by the Hessian troops who were in the allied army. Meanwhile, Prince
BLENHEIM on his part, after having been thrice repulsed, at last put the enemy into confusion. The rout then became general, and the flight precipitate. The consternation of the French soldiers was such, that they threw themselves into the Danube, without knowing whether they fled. The allies being now masters of the field of battle, surrounded the village of Blenheim, where a body of 13,000 men had been posted in the beginning of the action, and still maintained their ground. These troops seeing themselves cut off from all communication with the rest of the army, and despairing of being able to force their way through the allies, threw down their arms, and surrendered themselves prisoners of war. Thus ended the battle of Blenheim, one of the most complete victories that ever was obtained. Twelve thousand French and Bavarians were slain in the field or drowned in the Danube; 13,000 were made prisoners of war; and there were taken 100 pieces of cannon, 22 mortars, upwards of 100 pair of colours, 200 standards, 17 pair of kettle-drums, upwards of 3000 tents, 34 coaches, 300 loaded mules, two bridges of boats, and all the French baggage, with their military chest. Next day, when the duke of Marlborough visited his prisoner the marshal, the latter assured him that he had overcome the best troops in the world. "I hope, Sir (replied the duke), you will except those troops by whom they were conquered." The allies, in consequence of this victory, became masters of a country 100 leagues in extent.

BLENHEIM House, a noble and princely house erected in honour of the duke of Marlborough at Woodstock near Oxford, which with the manor of Woodstock is settled on the duke and his heirs, in consideration of the eminent services by him performed for the public; and for building of which house the sum of 500,000 l. was granted by parliament, &c. — The tenure by which his grace holds the manor of Woodstock is the presenting at the castle of Windsor annually on the day in which the battle of Blenheim was fought, a flag embroidered with flowers-de-lis; which flag is shown to all strangers who visit the castle.

BLENNIUS, the Blenny. See Ichthyology Index.

BLESS, Henry, painter of history and landscape, was born at Hovias, near Dinant, in 1480. He acquired his skill in the art merely by the strength of his natural genius, assisted by a diligent study and observation of the works of Patenier, without having any other instructor; and at last rendered himself very eminent, particularly by his landscapes. His best performances were bought up by the emperor Rudolph, and they are still preserved at Vienna. His style of composition in historical subjects resembles the style of the Flemish artists of that age, and exhibits a great number of figures finished with extreme neatness. But he crowded several subjects into one design; as in his picture of the disciples at Emmaus, he represented not only that incident, but, in different groups disposed in the back ground, he represented likewise the different parts of the passion of our Saviour. And yet, notwithstanding the impropriety of that manner of composing, his pictures were so delicately pencilled and finished, and his landscapes in particular so agreeably invented, so full of variety, and well executed, that even in Italy his works were in great request, and were distinguished there by the appellation of the owl-pictures.

BLESTIUM, a town in Britain. Now Old-town, not far from Hereford.

BLETANISM, a faculty of perceiving and indicating subterraneous springs and currents by sensation. The term is modern, and derived from a M. Bleton, who for some years past has excited universal attention by his possessing the above faculty, which seems to depend upon some peculiar organization. Concerning the reality of this extraordinary faculty, there occurred great doubts among the learned. But M. Thouvenel, a Frenchman of some consequence and a philosopher, seems to have put the matter beyond dispute, in two memoirs which he has published upon the subject. He was charged by the king with a commission to analyse the mineral and medicinal waters in France; and, by repeated trials, he had been so fully convinced of the capacity of Bleton to assist him with efficacy in this important undertaking, that he solicited the ministry to join him in the commission upon advantageous terms. All this shows that the operations of Bleton have a more solid support than the tricks of imposture or the delusions of fancy. In fact, a great number of his discoveries are ascertained by respectable affidavits. The following is a strong instance in favour of Bletanism. "For a long time the traces of several springs and their reservoirs in the lands of the abbé de Verian had been entirely lost. It appeared, nevertheless, by ancient deeds and titles, that these springs and reservoirs had existed. A neighbouring abbey was supposed to have turned their waters for its benefit into other channels, and a law-suit was commenced upon this supposition. M. Bleton was applied to: he discovered at once the new course of the waters in question: his discovery was ascertained, and the law-suit was terminated."

Bleton has been mistaken more than once; and our author enumerates, with the fairest candour, the cases in which he has failed; but these cases are very rare in comparison with those in which he has succeeded. Besides, even the mistakes of Bleton do not invalidate the reality of his talents; since a talent may be real without being perfect, or exerting itself with the same success in every trial.

Many were indisposed against Bletanism, because they looked upon the facts on which it is founded as inexplicable. But M. Thouvenel assigns principles upon which the impressions made by subterraneous waters and mines may be naturally enough accounted for. Having ascertained a general law by which subterraneous electricity exerts an influence upon the bodies of certain individuals eminently susceptible of that influence, and shown that this law is the same whether the electrical action arises from currents of warm or cold water, from currents of humid air, from coal or metallic mines, from sulphur, and so on, he observes, that there is a diversity in the physical and organical impressions which are procured by this electrical action, according as it proceeds from different fossil bodies which are more or less conductors of electrical emanations. There are also artificial processes, which concur in leading us to distinguish the different focuses or conductors of mineral electricity; and in these processes the
Blestonism, the use of electrometrical rods deserves the attention of philosophers, who might perhaps in process of time substitute in their place a more perfect instrument. Their physical and spontaneous mobility, and its electrical cause, are demonstrated by indisputable experiments.

On the other hand, our author proves, by very plausible arguments, the influence of subterraneous electrical currents, compares them with the electrical currents of the atmosphere, points out the different impressions they produce according to the number and quality of the bodies which act, and the diversity of those which are acted upon. The ordinary sources of cold water make impressions proportional to their volume, the velocity of their currents, and other circumstances. Their stagnation destroys every species of electrical influence; at least, in this state they have none that is perceptible. Their depth is indicated by geometrical processes, founded upon the motion and divergence of the electrical rays; but there are secondary causes which sometimes diversify these indications, and occasion seeming errors. These errors, however, according to our author, are only exceptions to the general rule; exceptions which depend on the difference of mediums and situations, and not on the inconstancy or incertitude of the organical, sensitive, or convulsive faculties of the Bletonist.

All the hot springs in France, traced by our author from the places where they flow to the places where their formation commences (sometimes at a distance of 5 leagues), lead him constantly to masses of coal; where they are collected and heated in basins of different depths and dimensions, nourished by the filtration of lakes and the course of torrents, and mineralized by saline, sulphurous, metallic, and bituminous substances, in the natural furnaces where they are heated, or in the strata through which they flow.

The last and the most singular and important phenomenon which our author met with in the course of his experiments must not be here omitted. Over the veins of iron mines alone the electrometrical rods assume a motion of rotation diametrically opposite to that which they exhibit over all other mines. This phenomenon takes place with the same distinction when iron and other metals are extracted from their mines and deposited under ground. But the most remarkable circumstance in this distinctive action of these metals is, that it has a uniform and constant direction from east to west in all metals, iron excepted, just as iron rendered magnetic has an action directed from south to north. The action of red metals is more palpable than that of the white, but the latter, though weaker, has nevertheless, a real existence in the sulphur. In the supplement to this memoir, there is an accurate account of the processes that have furnished these invariable results. They will naturally suggest, says our author, the idea of constructing an electrical compass, which may be of as eminent use in experimental philosophy as the magnetic compass is in navigation. The natural and spontaneous direction of metallic emanations towards the west being ascertained, it only remains to render them palpable by the construction of an instrument which may be substituted in the place of the electrometrical twig that goes vulgarly by the name of the divining rod.

His analysis of the hot springs of Bourbon-Lancy, Blestonism, to the source of which in the great mountains of Burgundy he was led by the electrical sensations of Bleton, shows the great intelligence and sagacity of our author in operations of this nature. He found the origin of these famous hot springs in the centre of an oblong rising ground, full of coal, and commanded on three sides by a group of mountains, of which the greatest part was filled with the same mineral. From a particular case, here circumstantially described, in which the electrical rays of the subterraneous water, and those of the adjacent coal crossed each other, our author deduces a very natural account of the errors which may sometimes, though rarely, mislead for a time the greatest adepts in Blestonism, when they find themselves in combined spheres of electrical activity. Another observation, which seems confirmed by several facts, accounts farther for this fallibility; the observation is, that electrical rays, whether direct or collateral, issuing from subterraneous focusses, seem to undergo in certain cases a sort of refraction as they pass from one medium to another, or traverse bodies which differ with respect to the property of transmitting this electricity. In a word, it follows from these observations, that when such privileged investigators of currents or minerals as Bleton are placed upon the electrical spheres of these bodies, they will indicate their situation and their respective depths according to the impressions they feel within themselves, or the motions they observe in the electrometrical instruments which they employ; and if they meet with second accidental causes or complications of electrical spheres, which modify or alter these methods of trial, this will necessarily occasion mistakes in the results of their operations which they may probably rectify; but which, at all events, it would be unjust to lay to their charge, or allege as an objection against the reality of their talent.

Blight, in Husbandry, a disease incident to plants, which affects them variously, the whole plant sometimes perishing by it, and sometimes only the leaves and blossoms, which will be scorched and shrivelled up, the rest remaining green and flourishing.

Some have supposed that blights are usually produced by an easterly wind, which brings vast quantities of insects eggs along with it, from some distant place, that, being lodged upon the surface of the leaves and flowers of fruit-trees, cause them to shrivel up and perish.

To cure this distemper, they advise the burning of wet litter on the windward side of the plants, that the smoke thereof may be carried to them by the wind, which they suppose will drive and destroy the insects, and thereby cure the distemper.

Others direct the use of tobacco-dust, or to wash the trees with water wherein tobacco-stalks have been infused for 12 hours; which they say will destroy those insects, and recover the plants.

Pepper-dust scattered over the blossoms of fruit-trees, &c. has been recommended as very useful in this case; and there are some that advise the pulling off the leaves that are distempered.

The true cause of blights seems to be continued dry easterly winds for several days together, without the inter-vention of showers, or any morning dew, by which the perspiration in the tender blossom is stopped; and
...if it so happens that there is a long continuance of the same weather, it equally affects the tender leaves, whereby their colour is changed, and they wither and decay.

The best remedy for this distemper, is gently to wash and sprinkle over the tree, &c. from time to time, with common water; and if the young shoots seem to be much infected, let them be washed with a woolen cloth, so as to clear them, if possible, from this glutinous matter, that their respiration and perspiration may not be obstructed. This operation ought to be performed early in the day, that the moisture may be exhaled before the cold of the night comes on: nor should it be done when the sun shines very hot.

Another cause of blights in the spring, is sharp hoarfrost, which are often succeeded by hot sunshine in the daytime. This is the most sudden and certain destroyer of the fruits that is known.

BLIGHTED CORN. See SMUT.

BLIND, an epithet applied to a person or sensitive creature deprived of the use of his eyes; or, in other words, to one from whom light, colours, and all the glorious variety of the visible creation, are intercepted by some natural or accidental disease. Such is the literal acceptance of the term: but it is likewise used in a metaphorical sense, to signify mental or intellectual darkness; and frequently implies, at the same time, some moral or spiritual depravity in the soul thus blinded, which is either the efficient or continuing cause of this internal malady. Yet, even in metaphor, the epithet of blind is sometimes applied to a kind of ignorance, which neither involves the idea of real guilt nor of voluntary error. It is, however, our present intention to consider the word, not in its figurative, but in its natural and primary sense. Nor do we mean in this place to regard it as a subject of medical speculation, or to explore its causes and enumerate its cures. These are in the department of another science. It is rather our design to consider, By what means this inexplicable misfortune may be compensated or alleviated to those who sustain it; what advantages and consolations they may derive from it; of what acquisitions they may be susceptible; what are the proper means of their improvement; or by what culture they may become useful to themselves, and important members of society.

There is not perhaps any sense or faculty of the corporeal frame, which affords so many resources of utility and entertainment as the power of vision; nor is there any loss or privation which can be productive of disadvantages or calamities so multiform, so various, and so bitter, as the want of sight. By no avenue of corporeal perception is knowledge in her full extent, and in all her forms, so accessible to the rational and inquiring soul, as by the glorious and delightful medium of light. For this not only reveals external things in all their beauties, in all their changes, and in all their varieties; but gives body, form, and colour, to intellectual ideas and abstract essences; so that the whole material and intelligent creation lie in open prospect, and the majestic frame of nature, in its whole extent, is, if we may speak so, perceived at a single glance. To the blind, on the contrary, the visible universe is totally annihilated; he is perfectly conscious of no space but that in which he stands, or to which his extremities can reach. Sound, indeed, gives him some ideas of distant objects; but those ideas are extremely obscure and indistinct. They are obscure, because they consist alone of the objects whose oscillations vibrate on his ear, and do not necessarily suppose any other bodies with which the intermediate space may be occupied, except that which gives the sound alone: they are indistinct, because sounds themselves are frequently ambiguous, and do not uniformly and exclusively indicate their real causes. And though by them the idea of distance in general, or even of some particular distances, may be obtained; yet they never fill the mind with those vast and exalting ideas of extension which are inspired by ocular perception. For though a clap of thunder, or an explosion of ordnance, may be distinctly heard after they have traversed an immense region of space; yet, when the distance is uncommonly great, it ceases to be indicated by sound; and therefore the ideas, acquired by auricular experiment, of extension and interval, are extremely confused and inadequate. The living and comprehensive eye darts its instantaneous view over expansive valleys, lofty mountains, protracted rivers, illimitable oceans. It measures; in an indivisible point of time, the mighty space from earth to heaven, or from one star to another. By the assistance of telescopes, its horizon is almost indefinitely extended, its objects prodigiously multiplied, and the spectacle nobly enlarged. By these means, the imagination, inured to vast impressions of distance, can not only recall them in their greatest extent with as much rapidity as they were at first imbibed; but can multiply them, and add one to another, till all particular boundaries and distances be lost in immensity. Thus nature, by profusely irradiating the face of things, and clothing objects in a robe of diversified splendour, not only invites the understanding to expatiate on a theatre so extensive, so diversified, and so attractive; but entertains and inflames the imagination with every possible exhibition of the sublime or beautiful. The man of light and colours beholds the objects of his attention and curiosity from far. Taught by experience, he measures their relative distances; distinguishes their qualities; determines their situations, positions, and attitudes; presages what these tokens may import; selects his favourites; traverses in security the space which divides them from him; stops at the point where they are placed; and either obtains them with ease, or immediately perceives the means by which the obstacles that intercept his passage to them may be surmounted. The blind not only may be, but really are, during a considerable period, apprehensive of danger in every motion towards any place from whence their contracted power of perception can give them no intelligence. All the various modes of delicate proportion, all the beautiful varieties of light and colours, whether exhibited in the works of nature or art, are to them irretrievably lost. Dependent for every thing, but mere subsistence, on the good offices of others; obnoxious to injury from every point, which they are neither capacitated to perceive nor qualified to resist; they are, during the present state of being, rather to be considered as prisoners at large, than citizens of nature. The sedentary life, to which by privation of sight they are destined, relaxes their frame, and subjects them to all the disagreeable sensations which arise from dejection of spirits. Hence the most feeble
Blind. feeble exertions create lassitude and uneasiness. Hence
the native tone of the nervous system, which alone is
compatible with health and pleasure, destroyed by in-
activity, exasperates and embitters every disagreeable
impression. Natural evils, however, are always sup-
portable; they not only arise from blind and undesign-
ing causes, but are either mild in their attacks, or short
in their duration: it is the miseries which are inflicted
by conscious and reflecting agents alone, that can de-
scribe the name of evils. These excruciate the soul with
inexpiable pignany, as expressive of indifference or
malignity in those by whom such bitter potions are
cruelly administered. The negligence of wantonness,
therefore, with which the blind are too frequently
tricked, is an enormity which God alone has justice to
feel or power to punish.

Those among them who have had sensibility to feel,
and capacity to express, the effects of their misfortunes,
have described them in a manner capable of penetra-
ting the most callous heart. The venerable father of
epic poetry, who in the person of Demodocus the Phan-
cian bard is said to have described his own situation,
proceeds thus:

Dear to the muse, who gave his days to flow
With mighty blessings mix'd with mighty wo,
In clouds and darkness quench'd his visual ray,
Yet gave him power to raise the lofty lay. FOLm.

Milton, in his address to light, after a sublime de-
scription of his arduous and gloomy journey from the
regions of primeval darkness to this our visible diurnal
sphere, thus continues to apostrophize the celestial
beam:

Caught by the heav'nly muse to venture down
The dark descent, and up to reascend,
Though hard and rare; thee I revisit safe,
And feel thy sov'reign vital lamp: but thou
Revisit't not these eyes, that roll in vain
To find thy piercing ray, and find no dawn:
So did a drop serene bath quench'd their orbs,
Or dim suffusion veil'd: Yet not the more
Cease I to wander, where the muses haunt
Clear spring, or shady grove, or sunny hill,
Smit with the love of sacred song: but chief
Thee, Sion, and the flow'ry brooks bereath,
That wash thy hallow'd feet, and warbling flow,
Nightly I visit; nor sometimes forget
Those other two equall'd with me in fate,
So were I equal'd with them in renown,
Blind Thamyris, and blind Mænides,
And Tiresias and Phineus prophets old:
Then feed on thoughts, that voluntary move
Harmonious numbers; as the wakeful bird
Sings darkling, and in shadiest covert hid
Tunes her nocturnal note. Thus with the year
Seasons return; but not to me returns
Day, or the sweet approach of ev'ry morn,
Or sight ofernal bloom, or summer's rose,
Or flocks, or herds, or human face divine;
But cloud instead, and ever-during dark,
Surrounds me, from the cheerfull ways of men

Ossian, the Caledonian bard, who lived before the au-
thenticative history of his nation dates its origin, who in
his old age participated the same calamity, has in more
than one passage of his works described his situation in
a manner so delicate, yet so pathetic, that it pierces the
inmost recesses, and excites the finest feelings of the
heart. Of these passages, take the following:

"O thou that rollest above, round as the shield of
my fathers! whence are thy beams, O sun! whence
thy everlasting light? Thou comest forth in thy awful
beauty, and the stars hide themselves in the sky; the

moon,
B L I

Blind.

moon, cold and pale, sinks in the western wave. But thou thyself movest alone: who can be a companion of thy course? The oaks of the mountains fall; the mountains themselves decay with years; the ocean shrinks and grows again; the moon herself is lost in heaven: but thou art for ever the same; rejoicing in the brightness of thy course. When the world is dark with tempests; when thunder rolls and lightning glances through the heavens; thou lookest in thy beauty from the clouds, and laughest at the storm. But to Ossian thou lookest in vain: for he beholds thy beams no more; whether thy yellow hair flows on the eastern clouds, or thou tremblest at the gates of the west. But thou art, perhaps, like me, for a season; and thy years will have an end; thou shalt sleep in thy clouds, careless of the voice of the morning.—Exult then, O sun, in the strength of thy youth! age is dark and unlovely; it is like the glimmering light of the moon, when it shines through broken clouds, and the mist is on the hills, the howling blast of the north is on the plain, the traveller shrinks in the midst of his journey."

Thus dependent on every creature, and passive to every accident, can the world, the uncharitable world, be surprised to observe moments when the blind are at variance with themselves and every thing else around them? With the same instincts of self-preservation, the same irascible passions which are common to the species, and exasperated by a sense of debility either for retaliation or defence; can the blind be real objects of resentment or contempt, even when they seem peevish or vindictive? This, however, is not always their character. Their behaviour is often highly expressive, not only of resignation, but even of cheerfulness; and though they are often coldly, and even inhumanly, treated by men, yet they are rarely, if ever, forsaken of heaven. The common Parent of nature, whose benignity is permanent as his existence, is no less his comfort and his guide. He has neither left his afflicted creatures without consolation or resource. Even from their loss, however oppressive and irretrievable, they derive advantages; not indeed adequate to recompense, but sufficient to alleviate, their misery. The attention of the soul, confined to these avenues of perception which she can command, is neither dissipated nor confounded by the immense multiplicity nor the rapid succession of surround-

B L I

ing objects. Hence her contemplations are more uniformly fixed upon herself, and the revolutions of her own internal frame. Hence her perceptions of such external things as are contiguous and obvious to her observation become more lively and exquisite. Hence even her instruments of corporeal sensation are more assiduously cultivated and improved, so that from them she derives such notices and presages of approaching pleasure or impending danger as entirely escape the attention of those who depend for security on the reports of their eyes. A blind man, when walking swiftly, or running, is kindly and effectually checked by nature from rudeley encountering such hard and extended objects as might hurt or bruise him. When he approaches bodies of this kind, he feels the atmosphere more sensibly resist his progress; and in proportion as his motion is accelerated, or his distance from the object diminished, the resistance is increased. He distinguishes the approach of his friend from far by the sound of his steps, by his manner of breathing, and almost by every audible token which he can exhibit. Prepared for the dangers which he may encounter from the surface of the ground upon which he walks, his step is habitually firm and cautious. Hence he not only avoids those falls which might be occasioned by its less formidable inequalities, but from its general bias he collects some ideas how far his safety is immediately concerned; and though those conjectures may be sometimes fallacious, yet they are generally so true, as to preserve him from such accidents as are not incurred by his own temerity. The rapid torrent and the deep cascade not only warn him to keep a proper distance, but inform him in what direction he moves, and are a kind of audible cynosures to regulate his course. In places to which he has been accustomed, be it so as it were recognizes his latitudes and longitude from every breath of varied fragrance that tingles in the gale, from every ascent or declivity in the road, from every natural or artificial sound that strikes his ear; if these indications be stationary, and confined to particular places. Regulated by these signs, the blind have not only been known to perform long journeys themselves, but to conduct others through dangerous paths at the dark and silent hour of midnight, with the utmost security and exactness (A).

A We have read, in authors of good credit, of a very surprising blind guide who used to conduct the merchants through the sands and deserts of Arabia. Vide Leo Afric. Descr. Afr. lib. vi. p. 246. and Cassau. Treat. of Enthus. c. ii. p. 45.

An instance no less marvellous exists at this present time, 1788, and in our own country. "John Metcalf, a native of the neighbourhood of Manchester, where he is well known, became blind at a very early age, so as to be entirely unconscious of light and its various effects. This man passed the younger part of his life as a waggoner, and occasionally as a guide in intricate roads during the night or when the tracks were covered with snow. Strange as this may appear to those who can see, the employment he has since undertaken is still more extraordinary: it is one of the last to which we could suppose a blind man would ever turn his attention. His present occupation is that of a projector and surveyor of highways in difficult and mountainous parts. With the assistance only of a long staff, I have several times met this man traversing the roads, ascending precipices, exploring valleys, and investigating their several extents, forms, and situations, so as to answer his designs in the best manner. The plans which he designs, and the estimates he makes, are done in a method peculiar to himself; and which he cannot well convey the meaning of to others. His abilities in this respect are nevertheless so great, that he finds constant employment. Most of the roads over the Peak in Derbyshire have been altered by his directions; particularly those in the vicinity of Buxton: and he is at this time constructing a new one betwixt Wilmslow and Congleton, with a view to open a communication to the great London road, without be-
It were endless to recapitulate the various mechanical operations of which they are capable, by their nicey and accuracy of touch. In some the tactile powers are said to have been so highly improved, as to perceive that texture and disposition of coloured surfaces by which some rays of light are reflected and others absorbed, and in this manner to distinguish colours. But the testimonies for this fact still appear to us too vague and general to deserve public credit. We have known a person who lost the use of his sight at an early period of infancy, who in the vivacity or deli-
cy of his sensations was not perhaps inferior to any one, and who had often heard of others in his own situation capable of distinguishing colours by touch with the utmost exactness and promptitude. Stimulated, therefore, partly by curiosity to acquire a new train of ideas, if that acquisition were possible; but still more by incredulity with respect to the facts related; he tried repeated experiments, by touching the surfaces of different bodies, and examining whether any such diversities could be found in them as might enable him to distinguish colours: but no such diversity could be ever ascertain. Sometimes, indeed, he imagined that objects which had no colour, or, in other words, such as were black, were somewhat different and peculiar in their surfaces; but this experiment did not always nor universally hold. His scepticism therefore still contin-
ues to prevail (b). That their acoustic perceptions are distinct and accurate, we may fairly conclude from the rapidity with which they ascertain the acuteness or gravity of different tones, as relative one to another: and from their exact discernment of the various kinds and modifications of sound, and of sonorous objects, if the sounds themselves be in any degree significant of their causes. From this vivacity and accuracy of ex-
ternal sensation, and from the assiduous and vigorous application of a comprehensive and attentive mind a-
alone, we are able to account for the rapid and astonishing progress which some of them have made, not only in those departments of literature which were most ob-
vions to their senses and accessible to their understand-
ings, but even in the abstractest, and (if we may be al-
lowed the expression) in the most occult sciences.

What, for instance, can be more remote from the con-
ceptions of a blind man than the abstract relations and properties of space and quantity? Yet the incompre-
sensible attainments of Dr Saunderson in all the branches of mathematics are now fully known and firmly believed by the whole literary world, both from the testimony of his pupils and the publication of his works. But should the fact be still uncertain, it might be sufficiently verified by a living prodigy of this kind with which our country is at present honoured. The gentleman of whom we now speak, though blind from his infancy, by the ardour and assiduity of his application, and by the force of a genius to which nothing is impenetrable, has not only made incredible advances in mechanical operations, in music, and in the languages; but is likewise profoundly skilled in geometry, in optics, in algebra, in astronomy, in chemistry, and in all the other branches of natural philosophy as taught by Newton and received by an admiring world. We are sorry that neither the modesty of this amiable philoso-
pher, nor the limits of this article, will permit us to delineate his character in its full proportions: All we can do is to exhibit his example, that by it the vulgar prejudice, which presumes to think blindness and learn-
ing incompatible, may be dissipated; and that an in-
stance of success so noble and recent may inflame the emulation and encourage the efforts of such as have genius and opportunity to pursue the same laudable path (c). If these glorious attempts should neither be perceived

ing obliged to pass over the mountains." Account by Dr Bew, published in the Transactions of the Manchester Society, vol. i.

(b) See, however, the extraordinary case subjoined to this article.

(c) As particular anecdotes of this astonishing genius have been, since a former edition of the Encyclopaedia, delivered to the Manchester Society, by G. Bew, M. D. and afterwards published, we shall here take the liberty to transcribe from the original volume in which they are inserted, as this freedom is authorized by a letter from Dr Bew's own hand.

Dr Henry Moyes, who occasionally read Lectures on Philosophical Chemistry at Manchester, like Dr Saun-
derson, the celebrated professor of Cambridge, lost his sight by the small pox in his early infancy. He never re-
collected to have seen: 'but the first traces of memory I have (says he), are in some confused ideas of the solar system.' He had the good fortune to be born in a country where learning of every kind is highly cultivated, and to be brought up in a family devoted to learning.

Possessed of native genius, and ardent in his application, he made rapid advances in various departments of erudition; and not only acquired the fundamental principles of mechanics, music, and the languages, but likewise entered deeply into the investigation of the profounder sciences, and displayed an acute and general know-
ledge of geometry, optics, algebra, astronomy, chemistry, and in short of most of the branches of the Newtonian philosophy.

Mechanical exercises were the favourite employment of his infant years. At a very early age he made him-
sel acquainted with the use of edged tools so perfectly, that notwithstanding his entire blindness, he was able to make little windmills; and he even constructed a loom with his own hands, which still show the cicatrices of wounds he received in the execution of these juvenile exploits.

By a most agreeable intimacy and frequent intercourse which I enjoyed with this accomplished blind gentleman, whilst he resided in Manchester, I had an opportunity of repeatedly observing the peculiar manner in which he arranged his ideas and acquired his information. Whenever he was introduced into company, I re-
marked that he continued some time silent. The sound directed him to judge of the dimensions of the room, and the different voices of the number of persons that were present. His distinction in these respects was very accurate:
perceived nor rewarded by an unfeeling world, if human nature should forget to recognize its own excellence so nobly displayed in instances of this kind; yet besides the enjoyments resulting from a sublime and comprehensive understanding, besides the immortal and inexhaustible sources of delight, which are the peculiar portion of a self-approving mind, these happy pupils and favourites of Nature are as it were indulged with her personal intercourse. They become more intimately acquainted with her ways, till by exploring the beneficence of her economy, the nobleness of her ends, the regularity of her procedure, and the beauties of her frame, they imbibe the spirit, and feel the presence of her glorious Author:

By swift degrees the love of nature works,
And warms the bosom; till at last, sublim'd
To rapture and enthusiastic heat,
We feel the present deity, and taste
The joy of God to see a happy world.

THOMSON.

Much labour has been bestowed to investigate, both from reason a priori and from experiment, what might be the primary effects of light and luminous objects upon such as have been born blind, or early deprived of sight, if at a materior period they should instantaneously recover their visual powers. But upon this topic there is much reason to fear, that nothing satisfactory has yet been said. The fallacy of hypothesis and conjecture, when formed a priori with respect to any organ of corporeal sensation and its proper object, is too obvious to demand illustration. But from the nature of the eye, and the medium of its perception, to attempt an investigation of the various and multiform phenomena of vision, or even of the varieties of which every particular phenomenon is susceptible according as the circumstances of its appearance are diversified, would be a project worthy of philosophy in a delirium. Nay, even the discoveries which are said to accrue from experiment, may still be held as extremely doubtful and suspicious, because in these experiments it does not appear to have been ascertained, that the organs to which visible objects were presented immediately after surgical operations, could be in a proper state to perceive them. Yet, after all, it is extremely probable, that figure, distance, and magnitude, are not immediate objects of ocular sensation, but acquired and adjusted by long and reiterated experience (d). There are, however, many desiderata, from which the perceptions of a man born blind might considerably illustrate, if his instruments of vision were in a right state, and assisted by a proper medium. Such a person might perhaps give a clearer account, why objects, whose pictures are inverted upon the retina of the eye, should appear to the mind in their real positions; or why, though each particular object is painted upon the retina of both our eyes, it should only be perceived as single. Perhaps, too, this new spectator of visible nature might equally amuse our curiosity and improve our theory, by attempting to describe his earliest sensations of colour, and its original effects upon his organ and his fancy. But, as we have already hinted, it is far from being certain, that trials of this kind have ever been fairly made. Such readers as may wish to see a more minute detail of these questions, may consult M. Diderot's Lettre sur les aveugles, a l'usage de ceux qui voient.

accurate; and his memory so retentive, that he seldom was mistaken. I have known him instantly recognize a person, on first hearing him speak, though more than two years had elapsed since the time of their last meeting. He determined pretty nearly the stature of those he was speaking with by the direction of their voices: and made tolerable conjectures respecting their tempers and disposition, by the manner in which they conducted their conversation.

"It must be observed, that this gentleman's eyes were not totally insensible to intense light. The rays refracted through a prism, when sufficiently vivid, produced certain distinguishable effects upon them. The red gave him a disagreeable sensation, which he compared to the touch of a saw. As the colours declined in violence, the harshness lessened, until the green afforded a sensation that was highly pleasing to him, and which he described as conveying an idea similar to what he felt in running his hand over a smooth polished surface. Polished surfaces, meandering streams, and gentle declivities, were the figures by which he expressed his ideas of beauty: Rugged rocks, irregular points, and boisterous elements, furnished him with expressions for terror and disgust. He excelled in the charms of conversation; was happy in his allusions to visual objects; and discoursed on the nature, composition, and beauty of colours, with pertinence and precision.

"Doctor Moyes was a striking instance of the power the human soul possesses of finding resources of satisfaction, even under the most rigorous calamities. Though involved in ever-during darkness, and excluded from the charming views of silent or animated nature; though dependent on an undertaking for the means of his subsistence, the success of which was very precarious; in short, though destitute of other support than his genius, and under the mercenary protection of a person whose integrity he suspected, still Dr. Moyes was generally cheerful, and apparently happy. Indeed it must afford much pleasure to the least kind heart to observe this hilarity of temper prevail almost universally with the blind. Though cut off from the ways of men, and the contemplation of the human face divine, they have this consolation; they are exempt from the discernment and contagious influence of those painful emotions of the soul that are visible on the countenance, and which hypocrisy itself can scarcely conceal. This disposition likewise may be considered as an internal evidence of the native worth of the human mind, that thus supports its dignity and cheerfulness under one of the severest misfortunes that can possibly befal us."

(d) The gentlemanouched by Mr Cheselden had no idea of distance; but thought that all the objects he saw, touched his eyes, as he felt did his skin. It was a considerable time before he could remember which was the cat and which the dog, though often informed, without first feeling them.
BLI

But delicacy and other particular circumstances forbid us to enter into this discussion with that minuteness and precision which it requires. We only mention the fact as one among the few resources for entertainment, and avenues to reputation, which are still reserved for the blind. Whoever thinks the subject of sufficient consequence to merit a more serious study, may consult the Preface to Blacklock’s Poems, written by G. G. Esq. and printed at Edinburgh 1754, or the account of his life and writings by the Rev. Mr Spence, prefixed to a quarto edition of his poems published at London in 1756.

It is hoped, however, that we shall not be suspected of partiality for inserting a character of the same author by one who was a foreigner, a stranger to his person, and prepossessed in his favour by his works alone.

“Blacklock will appear to posterity a fabulous character: even now he is a prodigy. It will be thought a fiction and a paradox, that a man quite blind since he was three years old (ξ), besides having made himself so good a master of various languages, of Greek, Latin, Italian, and French, should also be a great poet in his own; and without hardly ever having seen the light, should be so remarkably happy in description.”

It is impossible to enter into a detail of particulars of the education with respect to the education of the blind. These must be left to be determined by the genius, the capacity, the circumstances, of those to whom the general rules which may be given should be applied. Much, therefore, must depend on their fortunes, much on their temper and genius; for, unless these particulars were known, every answer which could be given to questions of this kind must be extremely general, and of consequence extremely superficial. Besides, the task is so much more arduous, because whoever attempts it can expect to derive no assistance from those who have written on education before him: And though the blind have excelled in more than one science; yet, except in the case of Saunderson, professor of mathematics in the university of Cambridge, concerning whom we shall afterwards have occasion to speak, it does not appear, that any of them have been conducted to that degree of eminence at which they arrived, upon a premeditated plan. One should rather imagine, that they have been led through the general course and ordinary forms of discipline; and that, if any circumstances were favourable to their genius, they rather proceeded from accident than design.

This fact, if not supported by irrefragable evidence, should, for the honour of human nature, have been suppressed. When contemplated by a man of benevolence and understanding, it is not easy to guess whether his mortification or astonishment would be most sensibly felt. If a heart that glows with real philanthropy must feel for the whole vital creation, and become, in some measure, the sensorium of every suffering insect or reptile; how must our sympathy increase in tenderness and force, when the distressed individuals of our own species become its objects? Nor do the blind bear so small an account of the world as we are prone to suppose.

(ξ) The author is here mistaken: Dr. Blacklock only saw the light for five months.
small a proportion to the whole community, as even in a political view, to be neglected. But in this, as in every other political crime, the punishment returns upon the society in which it is committed. Those abandoned and unimproved beings, who, under the influence of proper culture and discipline, might have successfully concurred in producing and augmenting the general welfare, become the nuisances and burdens of those very societies who have neglected them.

There is perhaps no rank of beings in the sensible universe, who have suffered from nature or accident, more meritorious of public compassion, or better qualified to repay its generous exertions, than the blind. They are meritorious of compassion; for their sphere of action and observation is infinitely more limited than that of the deaf, the lame, or of those who labour under any other corporeal infirmity consistent with health. They are better qualified to repay any friendly interposition for their happiness; because, free from the distraction which attends that multiplicity of objects and pursuits that are continually obvious to the sight, they are more attentive to their own internal economy, to the particular notices of good and evil impressed on their hearts, and to that peculiar province in which they are circumscribed by the nature and cultivation of their powers.

Proper employments for the blind.

It will easily occur to the reader, that, if the pupil should not be placed in easy circumstances, music is his readiest and most probable resource. Civil and ecclesiastical employments have either something in their own nature, or in the invincible prejudices of mankind, which renders them almost entirely inaccessible to those who have lost the use of sight. No liberal and cultivated mind can entertain the least hesitation in concluding, that there is nothing, either in the nature of things, or even in the positive institutions of genuine religion, repugnant to the idea of a blind clergyman. But the novelty of the phenomenon, while it astonishes vulgar and contracted understandings, inflames their zeal to rage and madness. Besides, the adventitious trappings and ceremonies assumed by some churches as the drapery of religion, would, according to these systems, render the sacerdotal office painful, if not impracticable, to the blind.

We have, some years ago, read of a blind gentleman, descended from the same family with the celebrated lord Verulam, who, in the city of Brussels, was with high approbation created doctor of laws; since that period we have been honoured with his correspondence. He was deprived of sight at nine years of age by an arrow from a cross bow whilst he was attempting to shoot it. When he had recovered his health, which had suffered by the shock, he pursued the same plan of education in which he had been engaged; and having heard that one Nicolas de Vourde, born blind, who lived towards the end of the 17th century, after having distinguished himself by his studies in the university of Louvain, took his degree as doctor of divinity in the university of Cologne; this motive prevailed with him to make the same attempt. But the public, cursed with prejudices for which the meanest sensitive nature might blush, prejudices equally beneath the brutality and ignorance of the lowest animal instinct, treated his intention with ridicule: even the professors were not far from being of that sentiment; and they admitted him into their schools, rather from an impression, that it might amuse him, than become of any use to him. He had the good fortune, however, contrary to their expectations, to obtain the first place among his disciplicles. It was then said, that such rapid advances might be made in the preliminary branches of his education; but would soon be effectually checked by studies of a more profound and abstracted nature. This, it seems, was repeated from school to school, through the whole circuit of his pursuits; and when, in the course of academical learning, it became necessary to study poetry, it was the general voice that all was over, and that at length he had reached his "ne plus ultra." But here be likewise confronted their prepossessions, and taught them the immense difference between blindness of body and blindness of soul. After continuing his studies in learning and philosophy for two years more, he applied himself to law, took his degree in that science, commenced pleading councillor or advocate in the council of Brabant, and has had the pleasure of terminating almost every suit in which he has been engaged to the satisfaction of his clients.

Had it not been for a fact so striking and so well authenticated, though there could have been no doubt, if it appeared that a blind man might discharge the office of a chamber-counsel with success; yet as a barrister, his difficulties must have appeared more formidable, if not absolutely insuperable. For he should remember all the sources, whether in natural equity or positive institutions, whether in common or statutory law, from whence his argument ought to be drawn. He must be able to specify, and to arrange in their proper order, all the material objections of his antagonists; these he must likewise answer as they were proposed, extemporaneously.

When, therefore, it is considered how difficult it is to temper the natural association of memory with the artificial arrangements of judgment, the desultory flights of imagination with the calm and regular deductions of reason, the energy and perturbation of passion with the coolness and tranquillity of deliberation; some idea may be formed of the arduous task which every blind man must acclimate, who undertakes to pursue the law as a profession. Perhaps assistance might be drawn from Cicero's treatise on Topica and on Invention; which, if happily applied and improved, might lessen the disparity of a blind man to others, but could scarcely place him on an equal footing with his brethren. And it ought to be fixed as an inviolable maxim, that no blind man ought ever to engage in any province in which it is not in his power to excel. This may at first sight appear paradoxical; but it is easily explained. For the consciousness of the obvious advantages the blind possess by others, habitually predisposes a blind man actually to dispensability: and if he ever gives way to despair (which he will be too apt to do when pursuing any acquisitions when others have a better chance of success than himself), the infirmity, for ever adverse, to all proficiencies. His soul sinks into irretrievable depression; his abortive attempts incessantly prey upon his spirit; and he not only loses that vigour and elasticity of mind which are necessary to carry him through life, but that patience and serenity which alone can qualify him to enjoy it.

In this recapitulation of the learned professions, we have
Blind.

Have intentionally omitted physic; because the obstacles which a blind man must encounter, whether in the theory or practice of that art, will be more easily conceived by our readers than described in detail. From this, therefore, let us pass to more general subjects.

It has been formerly hinted, that the blind were objects of compassion, because their sphere of action and observation was limited: and this is certainly true. For what is human existence, in its present state, if you deprive it of action and contemplation? Nothing then remains but the distinction which we derive from form or from sensitive and locomotive powers. But for these, unless directed to happier ends by superior faculties, few rational beings would, in our opinion, be grateful.

The most important view, therefore, which we can entertain in the education of a person deprived of sight, is to redress as effectually as possible the natural disadvantages with which he is encumbered; or, in other words, to enlarge as far as possible the sphere of his knowledge and activity. This can only be done by the improvement of his intellectual, imaginative, or mechanical powers; and which of these ought to be most assiduously cultivated, the genius of every individual alone can determine. Were men to judge of things by their intrinsic natures, less would be expected from the blind than others. But, by some pernicious and unaccountable prejudice, people generally hope to find them either possessed of preternatural talents, or more attentive to those which they have than others: For it was not Rochester’s opinion alone,

That if one sense should be suppress’d,
It but retires into the rest.

Hence it unluckily happens, that blind men, who in common life are too often regarded as rarities, when they do not gratify the extravagant expectations of their spectators, too frequently sink in the general opinion, and appear much less considerable and meritorious than they really are. This general deficiency of their power at once deprives them both of opportunity and spirit to exert themselves; and they descend, at last, to that degree of insignificance in which the public estimate has fixed them. From the original downfall, therefore, of reason and spirit, the parents and tutors of the blind ought to inculcate this maxim, That it is their indispensable duty to excel, and that it is absolutely in their power to attain a high degree of eminence. To impress this notion on their minds, the first objects presented to their observation, and the first methods of improvement applied to their understanding, ought, with no great difficulty, to be comprehensible by those internal powers and external senses which they possess. Not that improvement should be rendered quite easy to them, if such a plan were possible; For all difficulties, which are not really or apparently insuperable, heighten the charms and enhance the value of those acquisitions which they seem to retard. But care should be taken that these difficulties be not magnified or exaggerated by imagination; for it has before been mentioned, that the blind have a painful sense of their own incapacity, and consequently a strong propensity to despair continually awake in their minds. For this reason, parents and relations ought never to be too ready in offering their assistance to the blind in any office which they can perform, or in any acquisition which they can procure for themselves, whether they are prompted by amusement or necessity.

Let a blind boy be permitted to walk through the neighbourhood without a guide, not only though he should run some hazard, but even though he should suffer some pain.

If he has a mechanical turn, let him not be denied the use of edge-tools; for it is better that he should lose a little blood, or even break a bone, than be perpetually confined to the same place, debilitated in his frame, and depressed in his mind. Such a being can have no employment but to feel his own weakness, and become his own tormentor; or to transfer to others all the malignity and peevishness arising from the natural, adventitious, or imaginary evils which he feels. Scars, fractures, and dislocations in his body, are trivial misfortunes compared with imbecility, timidity, or fretfulness of mind. Besides the sensible and dreadful effects which inactivity must have in relaxing the nerves, and consequently in depressing the spirits, nothing can be more productive of jealousy, envy, peevishness, and every passion that corrodes the soul to agony, than a painful impression of dependence on others, and of our insufficiency for our own happiness. This impression, which, even in his most improved state, will be too deeply felt by every blind man, is redoubled by that utter incapacity of action which must result from the officious humanity of those who would anticipate or supply all his wants, who would prevent all his motions, who would do or procure every thing for him without his own interposition. It is the course of nature, that blind people, as well as others, should survive their parents; or, it may happen, that they should likewise survive those who, by the tides of blood and nature, are more immediately interested in their happiness than the rest of mankind. When, therefore, they fall into the hands of the world in general, such exigencies as they themselves cannot redress will be but coldly and languidly supplied by others. Their expectations will be high and frequent, their disappointments many and sensible; their petitions will often be refused, seldom fully gratified; and, even when granted, the concession will be so ungraceful, as to render its want infinitely more tolerable than its fruition. For all these reasons, we repeat it once more (because it can never be too frequently reiterated), that, in the formation of a blind man, it is infinitely better to direct than to supercede his own exertions. From the time that he can move and feel, let him be taught to supply his own exigencies; to dress and feed himself; to run from place to place, either for exercise, or in pursuit of his own toys or necessities.

In these excursions, however, it will be highly proper for his parent or tutor to superintend his motions at a distance, without seeming to watch over him. A vigilance too apparent, may impress him with a notion that malignity or some other selfish motion may have produced it. When dangers are obvious and great, such as we incur by rivers, prescipes, &c. those who are intrusted with the blind will find it neither necessary nor expedient to make their vigilance a secret. They ought then to acquaint their pupil, that they are present with him; and to interpose for his preservation, whenever his temerity renders it necessary. But ob-
Blind.

jects of a nature less noxious which may give him some pain without any permanent injury or mutilation, may with design be thrown in this way: providing, however, that this design be always industriously concealed. For his own experience of their bad effects will be an infinitely more eloquent and sensible monitor, than the abstract and frigid counsels of any adviser whatever.

24 Exercises suitable to the blind.

When the volatile season of puerile amusement is expired, and the impetuous hurry of animal-spirits subsides, through the whole demeanour of his pupil the tutor will probably observe a more sensible degree of timidity and precaution, and his activity will then require to be stimulated more than restrained. In this crisis, exercise will be found requisite, rather to preserve health, and facilitate the vital functions, than merely for recreation. Of all the different kinds of exercise, riding, not in a machine, but on horseback, is by far the most eligible, and most productive of its end. On these occasions, however, care must be taken that the horses employed may neither be capricious nor unmanageable; for on the mansuetude of the creature which he rides, not only his safety, but his confidence, will entirely depend. In these expeditions, whether short or short, his companion or attendant ought constantly to be with him; and the horse should always either be taught implicitly to follow its guide, or be conducted by a leading rein besides the bridle which he himself holds. Next to this model of exercise, is walking. If the constitution of the blind boy be tolerably robust, let him be taught to endure every vicissitude of weather which the human species can bear with impunity. For if he has been bred with too much delicacy, particular accidents may supersede all his former scruples, and subject him to the necessity of suffering what will not only be severe in its immediate sensation, but dangerous in its future consequences. Yet, when the cold is so intense, or the elements so tempestuous, as to render air and exercise abroad impracticable, there are methods of domestic exercise, which, though not equally salutary, may still be eligible; such as dumbbells, or the bath chair. The first of these are made of lead, consisting of a cylinder, the middle of which may either be rectilinear or arced for the convenience of holding, and terminates at each end in a semiglobular mass. Their weight must be conformable to the strength and age of the person who uses them. The method of employing them is to take one in each hand, and swing them backwards and forwards over his head describing a figure somewhat like a parabola. This not only strengthens the arms, and opens the chest, but promotes the circulation of the fluids. The bath chair is a deal of 1.2 feet in length, at free from knots and as elastic as possible, supported by a fulcrum at each end, upon which may be placed two rolling cylinders to give it greater play; when seated upon this, by alternately depressing it with his own weight, and suffering it to return to its natural situation, he gives himself a motion, though not equal in its energy, yet somewhat resembling the trot of a horse. There are other elastic seats of the same kind constructed with steel springs, but one of this simple fabrication may answer the purpose.

The spring-deal here recommended by the author, was preferred, as being suitable to the blind in all spheres or conditions of life; but he has since been taught by experience, in a valetudinary state, that the elastic chair is of infinitely greater utility. It consists of three false bottoms, and one real, which is the basis of the whole. The lowest is by far the most extensile. The highest is stuffed to render it an easy seat, and covered with plush, baize, or duffle. Between each of the false bottoms, at either end, behind and before, are placed steel springs, fixed above and below to the boards; not with nails, but staples, and curved in a spiral or serpentine form, each consisting of seven spires or columns. The columns are formed in such a manner, that one of them can pass through another, and thus give the springs full play in rising or descending. The lowest bottom or basis of the whole is pretented about four inches; which assists you to mount the seat with more facility, and serves as a support for your feet when you ride. This operation is performed by alternately depressing or raising yourself upon the seat, so that the springs yielding to your weight as you descend, and resisting as you rise, may give you a motion like that of the deal above described, but more violent, more rapid, and consequently more salutary. The whole frame of the seat is surrounded with leather, having different apertures to admit or reject the air occasioned by the motion. These general hints are sufficient to give any ingenious artisan an idea of the nature and structure of the machine, which he may alter or improve as convenience shall dictate.

To these modes of domestic exercise may be added that of a swing, which is formed by a rope suspended from two screws, which ought to be only fixed, at proper distances, in the joints of a capacious chamber, with a board and a cushion for a seat, and cords fastened behind and before, lest the impetuosity of the motion should shake the patient out of his position. But this instrument of health is so often formed by children for their amusement, and depends so much upon the form and extent of the area where it vibrates, that a more minute detail of its nature and office would be unnecessary.

His meals should be temperate, his diet light and Diet. of easy digestion. If the tone of his stomach be vigorous, vegetables should be preferred to animal food, particularly those vegetables which are most farinaceous and least ascescent. Fermented liquors and ardent spirits should never be given him but to gratify the real demands of exhausted nature; for though they exhilarate the spirits, they at the same time corrode the vessels and relax the nerves; a misfortune doubly pernicious to sedentary life. The safest and most wholesome beverages are milk and water. If he should be tired with these, he may be indulged in the variety of chocolate, balm, sage, or ground ivy. Coffee may sometimes be taken with impunity; but tea should be interdicted with inflexible severity; for no vegetable juice under heaven is more noxious to sedentary people. Let him also, for similar reasons, be prohibited the use of tobacco in all its forms. In the observations of diet and exercise, let him neither be mechanically regular, nor entirely eccentric. In the one case, he will be a slave to habit, which may create some inconvenience; in the other, he will form no habits at all, which may still be productive of greater.
We have more than once hinted, during the course of this article, that the blind, as liable to all the inconveniences of sedentary life, are peculiarly subjected to that disorder which may be called tacitum vitae or low spirits. This indisposition may be said to comprehend in it all the other diseases and evils of human life; because, by its immediate influence on the mind, it aggravates the weight and bitterness of every calamity to which we are obnoxious. In a private letter, we have heard of it described as a formidable precipice in the regions of misery, between the awful mists of suicide on the one hand and phrenzy on the other; into either of which, a gentle breeze, according to the force of its impulse and the line of its direction, may irrecoverably plunge the unhappy victim; yet from both of which he may providentially escape. Though the shades of the metaphor may, perhaps, be unnaturally deepened, yet those who have felt the force of the malady will not fail to represent it by the most dreadful images which its own feelings can suggest. Parents and tutors therefore, if they have the least pretence to conscience or humanity, cannot be too careful in observing and obviating the first symptoms of this impending plague. If the limbs of your blind child or pupil be tremulous; if he is apt to start, and easily susceptible of surprise; if he finds it difficult to sleep; if his slumbers, when commenced, are frequently interrupted, and attended with perturbation; if his ordinary exercises appear to him more terrible and more insuperable than usual; if his appetite become languid; and his digestion slow; if agreeable occurrences give him less pleasure, and adverse events more pain than they ought to inspire:—this is the crisis of vigorous interposition. The regimen and exercise above prescribed are the best preventives of this evil, and perhaps its best remedies when unhappily incurred. But if the symptoms should escape your attention till the patient is actually seized with the distemper, you may then, according to its depth and permanency, apply the cold bath, vietric acid, and Peruvian bark. Magnesia alba will, from time to time, be found useful to lenify the severe and corrosive acid, generated in the stomach; it is preferable to chalk, to crabs eyes, or any of the other absorbents, because of its laxative tendency. The tincture or infusion of wild salkelian, pills of asafetida, and white mustard-seed, are likewise prescribed. Care should be taken that the patient may never be suffered to remain obstinately; otherwise the function of digestion will be impeded. Gentle cathartics should therefore be administered; but with caution, that their operation may occur the bowels without weakening nature. Enemias may sometimes give the patient a temporary relief, by exerting and bracing the fibres of the stomach; but if used too frequently, they will have a contrary effect: previous to the use of bark, however, they should always be taken to prepare the vessel for its reception. The symptoms above enumerated would seem to indicate the origin of the distemper from extreme weakness or relaxation of nerves: that relaxation may be caused by severe and intemperate thought; by supine indolence; by excessive or habitual drinking; and above all, by venereal gratifications prematurely and frequently indulged, by which the approaches of this evil are accelerated, its continuance insured, and its poignancy augmented. Parents and tutors, therefore, as they value the welfare of their charge, and would answer to God for their conduct, should be scrupulously careful to observe when any of these illegitimate propensities inflame the youthful mind, to check, or rather elude them; not so much by severe reprehension and solemn interdict, as by endeavouring to preoccupy the soul, and engage the attention with other favourite amusements. Against every act of arbitrary power, the mind strongly and naturally revolts. She should therefore be rather allured to wise methods of instruction and moral motives and gentle methods, than by cruel menaces and stern commands. Those who are afflicted with low spirits may be said to be doubly unfortunate; for they have not only their own internal sufferings to sustain, but the contempt and ridicule of a thoughtless and unfeeling world, by whom their complaints are thought to be imaginary, and their depression affected. Should the sarcastic or sceptical reader apologize for his want of humanity, by asking in what these internal sufferings consist, it will be easy to give him a clear and solid answer: they arise from a severe and acute feeling of nature’s incapacity to discharge the vital functions with tolerable ease; from the sharp and constant irritation inflicted on the stomach and lower intestines by every thing not sweet or insipid that passes through them; and from a degree of sensibility too exquisite for the precarious and fluctuating state of our nature: these are the vindictive, inexorable demons that arm every thought with the stings of scorpions, and render the sense of existence itself insupportable. We have heard of hypochondriacs who thought themselves made of glass; and of others who believed their persons grown to a size so enormous, that they could not enter into any door: but it has never been our fortune to be personally acquainted with any of these fantasies. Those with whom we have conversed were rather inclined to exaggerate real, than to create imaginary, evils: rather to anticipate gloomy possibilities, than to dwell upon improbable or chimerical catastrophes: the tender parent, therefore, or the faithful guardian, will beware of treating them with neglect or levity. He will suit his conversation, as much as possible, to the present tone of their feelings; he will avoid all innovations in their management, except such as are absolutely necessary for their cure. Be careful never to reason or expostulate with your patient on the nature of his malady. Tell him not that his uneasy feelings, far from being real, are the fictitious impositions of a depraved fancy. His disagreeable sensations will be more than sufficient to demonstrate the falsehood of your assertions: thus your argumentative and persuasive powers will not only be exerted in vain, but may considerably retard, if not finally prevent, his recovery; and may leave such indelible prepossession against you, in his mind, as no length of time, no vicissitudes of life, will ever be able to efface. Opium has also been recommended; but, excepting desperate cases, it will be found a fallacious and dangerous remedy:—fallacious, because the ease it gives is only temporary, and infallibly succeeded by sharper paroxysms:—dangerous, because it may be rendered habitual, and subject the patient to unmixed torment when omitted. Though we have already inculcated a regimen and exercise which appeared proper...
present tranquillity, and of consequence to their future restoration. We have thought it necessary to expati ate thus far, on a subject gloomy and forbidding in itself, but of sufficient importance to demand particular attention; and, besides, what we have said may not only be useful to the blind in particular, but applicable to all those who labour under the same depres sion. It only remains to add, that the order, the periods, and the quantities, in which the remedies above enumer ated should be applied, must be determined by wisdom and experience, or regulated by the advice of a skilful and vigilant physician. We are sorry that truth obliges us to acknowledge, that we have found the faculty less intelligent in this disease, and less attentive to its various aspects, than could be wished, or than its malignity requires.

The natural curiosity of children renders them extremely and indifferently inquisitive. This disposition, naturally so, is often peculiarly prevalent in the blind. Parents and be graded by the parents, therefore, should gratify it whenever its answers can be intelligible to the pupil; when it is otherwise, let them candidly confess the impossibility of an in propriety of answering his questions. At this period, he be given, if their hearts be tender and their powers investive, they may render his amusements the vehicles, and his toys the instruments, of improvement: why, for instance, may not the centrifugal and centripetal forces be illustrated from the motion of a top, or the nature and power of elasticity by the rebound of a ball? These hints may lead to others, which, if happily improved and applied, may wonderfully facilitate the progress of knowledge. Nor will the violence of exercise, and the tumult of play, be productive of such perils and accidents as may be apprehended.

For the encouragement of such parents as choose to take these advices with regard to exercise, let us inform them, that though, till the age of twenty, some blind persons were on most occasions permitted to walk, to run, to play at large, they have yet escaped without any corporeal injury from these excursions.

Parents of middle, or of higher rank, who are so unfortunate as to have blind children, ought, by all possible means, to keep them out of vulgar company, and the herd of mankind have a wanton malignity, which eternally impels them to impose upon the blind, and to enjoy the painful situation in which these impositions place them. This is a stricture upon the humanity of our species, which nothing but the love of truth and the dictates of benevolence could have exerted from us. But we (7) have known some who have suffered so much from this diabolical mirth in their own persons, that it is natural for us, by all the means in our power, to prevent others from becoming its victims.

Blind people have infinitely more to fear from the levity and ignorance, than from the selfishness and ill nature, of mankind. In serious and important negotiations, pride and compassion suspend the efforts of knavery or spleen; and that very infirmity, which so frequently renders the blind defenceless to the acts of

(7) The author of these observations, though he chooses to express himself in this manner, is blind.
the insidious, or to the attempts of malice, is a powerful incentive to pity, which is capable of disarming fury itself. Villany, which frequently piques itself more upon the arts by which it prevails, than upon the advantages which it obtains, may often with contempt reject the blind, as subjects beneath the dignity of its operation; but the ill-natured buffoon considers the most malicious effects of his merriment as a mere jest, without reflecting on the shame or indignation which they inspire when inflicted on a sensible temper.

But vulgar credulity and ignorance are no less dangerous to those who want sight, than the false and mechanical wit so universally practised in common life. We know, we sympathetically feel, the strong propensity of every illustrious mind, to relate or to believe whatever is marvellous and dreadful. These impressions, when early imbibed, can scarcely be eradicated by all the consequent efforts of mature reason and confirmed experience. Those philosophers who have attempted to break the alliance between darkness and spectres, were certainly inspired by laudable motives. But they must give us leave to assert, that there is a natural and essential connection between night and horror. Were we endowed with senses to advertise us of every noxious object before its contiguity could render it formidable, our panics would probably be less frequent and sensible than we really feel them. Darkness and silence, therefore, have something dreadful in them, because they supersede the vigilance of those senses which give us the earliest notices of danger. If you talk to a blind boy of invisible beings, let benevolence be an inseparable ingredient in your character. You may, if you please, tell him of departed spirits, anxious for the welfare of their surviving friends; of ministering angels, who descend with pleasure from heaven to execute the purposes of their Maker's benignity; you may even regulate his imagination with the sportive gambols and innocent frolics of fairies; but let him hear as seldom as possible, even in stories which he knows to be fabulous, of vindictive ghosts, vindictive fiends, or avenging furies. They seize and pre-occupy every avenue of terror which is open in the soul; nor are they easily dispossessed. Sooner should we hope to exercise a ghost, or appease a fury, than to obliterate their images in a warm and susceptible imagination, where they have been habitually impressed, and where these feelings cannot be dissipated by external phenomena. If horrors of this kind should agitate the heart of a blind boy, which may happen notwithstanding the most strenuous endeavours to prevent it, the stories which he has heard will be most effectually discarded by ridicule. This, however, must be cautiously applied, by gentle and delicate gradations. If he is inspired with terror by effects upon his senses, the causes of which he cannot investigate, indefatigable pains must be taken to explain these phenomena, and to confirm that explanation, whenever it can be done, by the testimony of his own senses, and his own experience. The exertion of his locomotive and mechanical powers (the rights of which we have formerly endeavored to assert) will sensibly contribute to dispel these terrors.

His inventive faculties ought likewise to be indulged. The invention of the blind may be presented in such a manner, as to render discovery of the blind easy; but still let invention be allowed to co-operate. The internal triumph and exultation which anticipated the mind feels from the attainment and conviction of new truths heighten their charms, impress them deep on the memory, and give them an influence in practice of which they could not otherwise have boasted.

There are a sort of people in the world, whose views and education have been strictly confined to one province, and whose conversation is of consequence limited and technical. These, in literary intercourse, or fashionable life, are treated with universal contempt, and branded with the odious name of mere men of business. Nor is it any wonder that the conversation of such should prove nauseous and disgusting. It would be arrogance in them to expect, that indifferent persons should either enter into their private interests, or the peculiarities of their craft, with a warmth equal to their own. We have known the intrusion of such a person involve a numerous company in gloom, and terminate the freedom and vivacity of agreeable discourse in a sleepy, and discontented silence. Of all innocent characters, this ought to be avoided by the blind; because of all others, it is the character which they run the greatest hazard of adopting. The limitation of their powers naturally contracts their views and pursuits, and, as it were, concentrates their whole intellectual faculties in one, or at best in few objects. Care should therefore be taken to afford the mind a theatre for its exertions, as extensive as possible, without diverting it from one great end, which, in order to excel, it ought for ever to have in prospect.

There are few sciences in which the blind have not manifested themselves: even those whose acquisition seemed essentially to depend upon vision, have at last yielded to genius and industry, though deprived of that advantage. Dr Saunders, whom we formerly mentioned, has left behind him the most striking evidences of astonishing proficiency in those retired and abstract branches of mathematics which appeared least accessible to persons of his infirmity. Sculpture (c) and painting are not, perhaps, the most practicable arts for a blind man: yet he is not excluded from the pleasing creation and extensive regions of fancy. However unaccountable it may appear to the abstract philosophers, yet nothing is more certain in fact, than that a blind man may, by the inspiration of the muses, or, to strip the figure of its mythological dress, may, by the efforts of a cultivated genius, exhibit in poetry the most natural images and animated descriptions, even of visible objects.

(c) Yet there are instances of persons who have been enabled to take the figure and idea of a face by the touch, and mould it in wax with the utmost exactness; as was the case of the blind sculptor mentioned by De Piles, who thus took the likeness of the duke de Bracciano in a dark cellar, and made a marble statue of King Charles I. with great elegance and justness. Vide De Piles Cours de Peint. p. 339. and Weis. Psychol. Rat. 362.
BLI

BLI

It is much easier (says the author) to use signs already invented, than to become their inventor; as so

is forced to do, when engaged in circumstances for

which he is not provided. Of what advantage might

not this be to Saunderson to find a palpable arithmetic

of situations, already prepared for him at five years of age, which he

might have otherwise felt the necessity of inventing

for himself at the advanced period of twenty-five? This

Saunderson, Madam, is an author deprived of sight,

with whom it may not be foreign to our purpose to

amuse you. They relate prodigies of him; and of these

prodigies there is not one, which his progress in the

belles lettres, and his mathematical attainments, do not

render credible.

The same instrument served him for algebraical

calculations, and for the construction of rectilinear

gures. You would not perhaps be sorry that I should

give you an explanation of it, if you thought your mind

previously qualified to understand it; and you shall

soon perceive that it presupposes no intellectual

preparations of which you are already mistress; and

that it would be extremely useful to you if you should ever

be seized with the inclination of making long calcula-

tions by touch.

Imagine to yourself a square, such as you see

fig. 1, divided into four equal parts by perpendicular

lines at the sides, in such a manner, that it may

present you the nine points 1, 2, 3, 4, 5, 6, 7, 8, 9.

Suppose this square pierced with nine holes capable of

receiving pins of two kinds, all of equal length and

thickness, but some with heads a little larger than the

others.

The pins with large heads are never placed any-

where else but in the centre of the square; those with

smaller heads never but at the sides, except in one single

case, which is that of making the figure 1, where one

are placed at the sides. The sign of 0 is made by

placing a pin with a large head in the centre of the

little square, without putting any other pins on the side.

The number 1 is represented by a pin with a small

head placed in the centre of the square, without putting

any other pin at the sides; the number 2, by a pin

with a large head placed in the centre of the square,

and by a pin with a small head placed on one of the

sides at the point 1: the number 3, by a pin with a

large head placed in the centre of the square, and by a

pin with a small head placed on one of the sides

at the point 2: the number 4, by a pin with a large

head placed in the centre of the square, and by a pin

with a small head placed on one of the sides at the

point 3: the number 5, by a pin with a large head

placed in the centre of the square, and by a pin with

a small head placed on one of the sides at the point

4: the number 6, by a pin with a large head placed in the centre of the square, and by a pin with a small head placed on one of the sides at the point 5: the number 7, by a pin

with a large head placed in the centre of the square,

and by a pin with a small head placed on one of the

sides at the point 6: the number 8, by a pin with a

large head placed in the centre of the square, and by

a pin with a small head placed on one of the sides at

the point 7: the number 9, by a pin with a large

head placed in the centre of the square, and by a pin

with a small head placed on one of the sides at the

point 8.

Here
Here are plainly ten different expressions obvious to the touch, of which every one answers to one of our ten arithmetical characters. Imagine now a table as large as you please, divided into small squares, horizontally ranged, and separated one from the other at similar distances, as you see it in fig. 3. Thus you will have the instrument of Saunderson.

"You may easily conceive that there is not any number which one cannot express upon this table; and, by consequence, no arithmetical operation which one cannot execute upon it.

Let it be proposed, for instance, to find the sum, or to work the addition of the nine numbers following.

\[
\begin{array}{cccc}
1 & 2 & 3 & 4 \\
5 & 6 & 7 & 8 \\
9 & 0 & 1 & 2 \\
0 & 1 & 2 & 3 \\
\end{array}
\]

I express them on the table in the order as they are dictated to me; the first figure at the left of the first number, upon the first square to the left of the first line; the second figure to the left of the first number, upon the second square to the left of the same line; and so of the rest.

I place the second number upon the second row of squares, units beneath units, and tens beneath tens, &c.

I place the third number upon the third row of squares, and so of the rest. Then with my fingers running over each of the rows vertically from the bottom to the top, beginning with that which is nearest to my right, I work the addition of the numbers which are expressed, and mark the surplus of the tens at the foot of that column. I then pass to the second column, advancing towards the left; upon which I operate in the same manner; from thence to the third; and thus in succession I finish my addition.

We shall now see how the same table served him for demonstrating the properties of rectilinear figures. Let us suppose this proposition to be demonstrated, that parallelograms which have the same basis and the same height are equal in their surfaces. He placed his pins as may be seen in fig. 4. He gave names to the angular points, and finished his demonstration with his fingers.

If we suppose that Saunderson only employed pins with large heads to mark the limits of his figures, around these he might arrange his pins with small heads in nine different manners, all of which were familiar to him. Thus he scarcely found any embarrassment but in those cases where the great number of angular points which he was under a necessity of naming in his demonstration obliged him to recur to the letters of the alphabet. We are not informed how he employed them.

"We only know that his fingers ran over the board with astonishing agility; that he undertook with success the longest calculations; that he could interrupt the series, and discover his mistakes; that he proved them with the greatest ease; and that his labours required infinitely less time than one could have imagined, by the exactness and promptitude with which he prepared his instruments and disposed his table.

"This preparation consisted in placing pins with large heads in the centres of all the squares: having done this, no more remained to him than to fix their values by pins of smaller heads, except in cases where it was necessary to mark a unit; then he placed in the centre of a square a pin with a small head, in the place of a pin with a large head with which it had been occupied.

"Sometimes, instead of forming an entire line with these pins, he contented himself with placing some of them at all the angular points; or points of intersection; around which he tied silk threads, which finished the formation of the limits of his figures." See fig. 4.

It may be added by way of improvement, that for the division of one series of numbers from another, a thin piece of timber in the form of a ruler with which lines are drawn, having a pin at each end for the holes in the squares, might be interposed between the two series to be distinguished.

This geometeric left other instruments behind him; but as we do not know their uses, we need not add their descriptions.

It must be owned, that by the notation here exhibited, every modification of number may be expressed, and of consequence every arithmetical operation successfully performed; but we have been recently favoured with another form of palpable arithmetic, which appears to us equally comprehensive and much more simple than that of Saunderson. It was originally invented, and is still used in calculation, by Dr Henry Moyes; a gentleman whom we had formerly occasion to mention with merited applause in this article, and whose character and attainments we have endeavoured more fully to illustrate than had been done in the former edition, as well from personal knowledge as from the anecdotes of Dr Bew, as the most eligible introduction to the account of his notation, given in the words of his own letter, and exemplified in a figure copied from a drawing directed by himself.

"To the Editor of the Encyclopaedia Britannica.

"Sir, In compliance with your request, I send you Dr Moyes's the following brief account of a palpable notation form of which I have generally used for these 20 years to assist my memory in numerical computations. When I began to study the principles of arithmetic, which I did at an early period of life, I soon discovered, to my mortification, that a person entirely deprived of sight could scarcely proceed in that useful science without the aid of palpable symbols representing the ten numerical characters. Being at that time unacquainted with the writings of Saunderson, in which a palpable notation is described, I embraced the obvious, though, as I afterwards found, imperfect expedient of cutting into the form of the numerical characters thin pieces of wood or metal. By arranging these on the surface of a board, I could readily represent any given number, not only to the touch, but also to the eye; and by covering the board with a laminia of wax, my symbols were prevented from changing their places, they adhering to the board from the slightest pressure. By this contrivance,
Blind.

contrivance, I could solve, though slowly, any problem in the science of numbers; but it soon occurred to me, that my notation, consisting of ten species of symbols or characters, was much more complicated than was absolutely necessary, and that any given number might be distinctly expressed by three species of pegs alone. To illustrate my meaning, let A, B, C, D, (fig. 5.), represent a square piece of mahogany a foot broad and an inch in thickness; let the sides AB, BC, CD, DA, be each divided into 24 equal parts; let every two opposite divisions be joined by a groove cut in the board sufficiently deep to be felt with the finger, and let the board be perforated at each intersection with an instrument a tenth of an inch in diameter.

"The surface of the board being thus divided into 576 little squares, with a small perforation at each of their angles, let three sets of pegs or pins, resembling those represented in the plate at the figures 6, 7, 8, be so fitted to the holes in the board, that when stuck into them they may keep their positions like those of a fiddle, and require some force to turn them round. The head of each peg belonging to the first set is a right-angled triangle about one-tenth of an inch in thickness; the head of each peg belonging to the second set differs only from the former in having a small notch in its sloping side or hypothenuse; and the head of each peg belonging to the third set is a square of which the breadth should be equal to the base of the triangle of the other two. These pegs should be kept in a case consisting of three boxes or cells, each cell being allotted to a set, and the case must be placed close by the board previous to the commencement of every operation. Each set should consist of 60 or 70 pegs (at least when employed in long calculations); and when the work is finished, they should be collected from the board and carefully restored to their respective boxes.

"Things being thus prepared, let a peg of the first set be fixed into the board, and it will acquire four different values according to its position respecting the calculator. When its sloping side is turned towards the left, it denotes one, or the first digit; when turned upwards, or from the calculator, it denotes two, or the second digit; when turned to the right, it represents three; and when turned downwards, or towards the calculator, it denotes four, or the fourth digit. Five is denoted by a peg of the second set, having its sloping side or hypothenuse turned to the left; six, by the same turned upwards; seven, by the same turned to the right; and eight, by the same turned directly down, or towards the body of the calculator. Nine is expressed by a peg of the third set when its edges are directed to right and left; and the same peg expresses the cypher when its edges are directed up and down. By three different pegs the relative values of the ten digits may therefore be distinctly expressed with facility; and by a sufficient number of each set, the steps and result of the longest calculation may be clearly represented to the sense of feeling. It seems unnecessary to illustrate this by an example; suffice it to express in our characters the present year of the Christian era 1788: Take a peg of the first set, and fix it in the board with its sloping side turned towards the left, equal to one; take now a peg of the second set and fix it in the next hole in the same groove, proceeding as usual from left to right, with its sloping side turned to the right, equal to 7; next take a peg of the same set, and fix it in the next hole, with its sloping side turned downwards, equal to 8; lastly, take another peg of the same set, and place it in the next hole in the same position, equal to 3; and the whole will express the number required.

"When it is necessary to express a vulgar fraction, I place the numerator in the groove immediately above, and the denominator in that immediately below the groove in which the integers stand; and in decimal arithmetic an empty hole in the integer groove represents the comma or decimal point. By similar breaks I also denote pounds, shillings, pence, &c. and by the same expedient I separate in division the divisor and quotient from the dividend.

"This notation, which supplies me completely with coefficients and indices in algebra and fluxions, seems much superior to any of the kind hitherto made public in the west of Europe. That invented and described by Mr Grenville, having no less than ten sets of pegs, is by much too complicated for general practice; and that which we owe to the celebrated Sanderson is apt to puzzle and embarrass the calculator, as the pegs representing the numerical digits cannot or never be in the same straight line. If you agree with me that the above notation may promote the knowledge, and therefore the happiness, of persons denied the benefit of sight, you have my consent to give it a place in the present edition of your valuable work. I am, Sir, with respect, your obedient servant,

Henry Motte.

We have seen the machine above mentioned, which was exhibited to the society for the improvement of polite arts, &c. by Mr Grenville, who is himself also deprived of sight. But though this has met with the approbation of Mr Stanley, we cannot forbear to think it less simple in its structure than that of Dr Mayes's, more multiform in its apparatus, and of consequence more laborious and complex in the process of its operation; for where every single peg has only one power, and acquires no diversity of value from its position, their forms must be indefinitely varied and their numbers prodigiously multiplied; which must cost both the memory and judgment of the pupil numberless painful and fatiguing exertions before he contracts a habit of using the instrument with promptitude and success. On these accounts, a particular description of it is omitted in this place.

In the higher parts of mathematics, such as conic sections, the same solid figures which are mediums of perception to those who see, may perform the same useful office to the blind. But, for the structure of superficial figures, we should imagine, that a kind of matter might be found soft enough to be easily susceptible of impressions, yet hard enough to retain them till effaced by an equal pressure. Suppose, for instance, a table were formed, four feet broad and eight in length; for the figures, that they may be the more sensible to the touch, ought to be larger than ordinary. Suppose this table had brims, or a moulding round it, rising an inch above the surface: let the whole expand, then be filled with bees-wax, and the surface above pressed extremely
blind, extremely even with a polished board, formed exactly to fit the space within the moulding. This board will always be necessary to efface the figures employed in former propositions, and prepare the surface for new ones. We think we have pondered the minutest inconvenience that can arise from this method of delineating and conceiving geometrical truths; and, after all, the table appears to us the best and the least troublesome apparatus which a blind man can use. We can see no reason why general ideas of geography or topography might not be conveyed to him in the same manner, by spheres composed of or covered with the same impressive matter.

Such were the mediums that occurred to the author, when this article was originally written, for conveying to persons deprived of sight those remote and complicated truths which vision alone was thought capable of representing; but a work has lately been published at Paris which supersedes every former attempt to propose or facilitate the improvement of the blind. The invention of a plan so arduous in its appearance and so practicable in its execution, demanded the highest exertions of the noblest genius to produce it, and the most strenuous efforts of indefatigable humanity to render it effectual. It is entitled, "An Essay on the Education of the Blind." Its object is to teach them, by palpable characters impressed on paper, not only the liberal arts and sciences, but likewise the principles of mechanical operation, in such a manner, that those who have no genius for literary improvement may yet become respectable, useful, and independent members of society, in the capacity of common artisans. By these tangible signatures they are taught to read, to write, and to print; they are likewise instructed in geometry, in algebra, geography, and, in short, in every branch of natural philosophy. Nor are their efforts circumscribed by mere utility; a taste for the fine arts has likewise been cultivated among them. They have been taught to read music with their fingers as others do with their eyes; and though they cannot at once feel the notes and perform them upon an instrument, yet are they capable of acquiring any lesson with as much exactness and rapidity as those who enjoy all the advantages of sight. But we shall give a more particular account of the wonderful topics contained in this essay. In his first chapter, the author discovers the end proposed by that delineation of culture which he offers to the blind; it is to enlarge their sphere of knowledge, and of consequence to increase their capacities and improve their powers of action, so that they may become happy and independent in themselves, and useful and agreeable to others. The 2d chapter contains an answer to the objections urged against the general utility of this institution. These objections are strongly stated, and answered in the most satisfactory manner; but were we to recapitulate them in detail, it would protrast this article to a length much beyond its due proportion, even upon the extended plan of the Encyclopaedia. The 3d chapter treats of reading as adapted to the practice of the blind. The 4th chapter consists of answers to various objections against the method of reading proposed for the blind; but these, for reasons formerly given, we cannot with propriety delineate in this article. In the 5th chapter is shown the art of printing as practised by the blind for their peculiar use. In the 6th chapter is described the manner of teaching the blind the art of printing for those that see. In the 7th is represented the manner of teaching the blind to write. The 8th chapter explains the method of teaching the blind arithmetic; the 9th, geography; the 10th, music. The 11th, contains an account of the mechanical arts in which the blind are employed, and of the way by which they are formed for such occupations. The 12th shows in general the proper manner of instructing the blind, and draws a parallel between their education and that of the deaf and dumb. Chapter 13th treats of the method of instructing them in the languages, mathematics, history, &c. What remains of the book is taken up with notes which illustrate each particular chapter; a short historical account of the rise, the progress, and the present state, of the academy for the formation of the blind; an ode on the cultivation of the blind, by one that laboured under that affliction; an extract from the register of the royal academy of sciences; opinion of the printers; models of the various pieces which blind children are capable of printing; and an account of the exercises performed by blind children in presence of the king, queen, and royal family, during the Christmas solemnities 1786. Thus having given a cursory view of the various topics contained in the essay, we proceed to give some account of the manner in which the blind print and write.

The blind compositor, then, has a box for every alphabetical character in use; on the outside of these boxes are palpably marked the peculiar character belonging to each; they are filled with types, which he chooses and sets as they are called for, but not in the position in which they are to be read; on the contrary, they are inverted as objects are seen painted on the retina of an eye by an optician. Having thus fixed and arranged his types, he chooses a page of the strongest paper that can be found, which he gently moistens in a degree sufficient to render it more easily susceptible of impressions, without being dilacerated or worn by the shock which it must afterwards undergo. He then lays it upon the types; and by the cautious operation of the press, or by the easy strokes of a little hammer, which are frequently repeated over the whole expanse, he causes the impression of the type to rise on the opposite side of the paper, where, when dry, it continues not only obvious to the sight but the touch, and is far from being easily effaced. On the upper side of the paper, the letters appear in their proper position, and their sensible elevation above the common surface renders it practicable for the blind to read them with their fingers. Their manner of writing is analogous to this operation: the pupil, after repeating experiments, having familiarised himself to the forms of the letters, both by their inverted and in their proper position, gradually learns to delineate them upon paper, moistened as before, with the point of an iron pen, which has no split, and which is just sharp enough to impress without piercing the paper: thus, on the side next to the writer's hand, the letters are formed sunk and inverted; but when the paper is turned they appear right and in relief. Thus the blind are enabled to form and decipher, not only the characters required in common language, but also mathematical diagrams, arithmetical and geographical processes,
mine our efforts and animate our hopes in pursuing this last most important of all objects. What Cicero says of the arts and sciences may with great propriety be applied to religion: "Nam ex certa seque temporum sunt, seque extantiam omnium; seque locorum; at haec studio alectenim alium, nunc timentem occidentem, seuerum reum, adversa perissi gemaculum..."

The blind are susceptible of astronomy.

The knowledge of astronomy might likewise be of infinite use, both by enlarging the blind person's ideas of the universe, and by giving him higher and more confirmed impressions of that energy by which the stars are moved, and of that design by which their motions are regulated. But these objects are too vast; their distances, their magnitudes, their periods of revolution, are too complex to be apprehended in the mind, or impressed in the memory, without sensible mediums. For this purpose, an orrery, or some machine of a similar construction, will be indispensably requisite.

Of natural philosophy (as the most sublime and rational entertainment of which an intelligent being, in his present state, is susceptible. By this he might enter into the laws, the vicissitudes, the economy of nature. Nor is it absolutely necessary that he should be an ocular witness of the experiments by which these laws are detected and explained. He may safely take them for granted; and if, at any time, a particular experiment should prove fallacious, he may, from general principles, be able to discover its fallacy, whether in the nature of the subject, the inaptitude of the instruments, or the process of the execution. The laws of motion, the various ratios or proportions of forces, whether simple or compound, he may calculate and ascertain by the same means and in the same method so happily used by Saunderson.

The blind are susceptible of moral and theological knowledge. He may easily obtain, either from books, or instructions delivered ex voto. The last, if communicated by one who understands and feels the subject, with a proper degree of perspicuity and sensibility, are infinitely the most eligible. By morals, we would not merely be understood to mean a regular and insensible series of action, but the proper exertion and habitual arrangement of the whole internal economy, of which external actions are no more than mere expressions, and from which the highest and most permanent happiness alone can proceed. By theology, we do not mean that systematic or scholastic jargon, which too frequently usurps its venerable name; but those sublime and liberal ideas of the nature and government of a Supreme being, whether discoverable by nature or revealed in Scripture, which enforce every moral obligation, which teach us what is the ultimate good of our nature, which deter
If the blind must depend upon the exercise of their own powers for bread, we have already pointed out music as their easiest and most obvious province; but let it at the same time be remembered, that mediocrity in the most this art may prove the bitterest and most effectual proper curse which a parent can inflict upon his offspring, as payments for the which may be imbibed or cultivated from the lowest blind. 

Of grammar.

The paths of grammar, however, are dry and rugged; and it will be necessary for the pedagogue, whoever he is, to take all the opportunities that offer of enlightening the darkness and polishing the asperities of the road. When, therefore, the intellect of the pupil begins to open and exert its penetration, it will be proper to show him how the nature, the forms, and arrangements, of words, flow from our ideas and their relations. Every substance must naturally be in some state; it must either act, or be acted upon. The actions which it performs or suffers must be performed or suffered in some definite manner or degree. It must likewise have some qualities, whether temporary and accidental, or natural and permanent. These qualities must likewise be susceptible of degrees. When different substances are considered in the same state, its common participation forms a connexion: when regarded in different states, that difference forms an opposition. The constant repetition of the names of substances and qualities produces a disagreeable monotonous language. They must therefore be implied in other words, which likewise in some cases serve to connect the parts of a sentence. There is a difference between such words as imply the connexion of sentences, and such as imply the connection of states or circumstances. Actions to be performed or suffered may be either positively affirmed of any substance, or merely attributed to them. Living and percipient substances have immediate sensations of pain or pleasure, which likewise are productive of desire and aversion. To these sentiments particular sounds are adapted, whether immediately inspired by nature, or resulting from association and tacit convention.

Thus we have a foundation for all the different parts of speech; and from their natures and offices their forms and arrangements may be deduced, according to the analogy of every language.

The art of reasoning, the knowledge of history, and a taste for the belles lettres, are easily attainable by the blind; and as they are copious funds of entertainment, they should be inculcated, though at the expense of care and labour.

The relations of persons subjected to this misfortune, if in easy circumstances, will find it highly conducive to the improvement of their charge, to select some one among his coevals, of a sound understanding, a sweet and patient temper, a docile mind, a warm heart, and a communicative disposition. These two should be taught to find their interest and happiness in their connexion with one another. Their bed, their board, their walks, their entertainments, their lessons, should be common. These are the best eyes with which art can endow a blind man: and if properly selected, they will on some occasions yield very little, in utility and perfection, to those of nature; nay, at some junctures they may be preferable.

As it is the pleasure of the Almighty, that some persons are destitute of eye-sight; in like manner it is musical meditations.
his infinite goodness to make them a double-amends another way by giving them a greater share of memory, &c. whereby they become very dexterous in playing on musical instruments, mathematics, &c. as we may observe by Dr. Stanley organist of St. Andrew's Holborn in London, the blind professor of mathematics in the university of Cambridge, and many others too tedious here to mention, who were born blind, and never saw the least glance of light; yet God gave them such a light in knowledge, that they became the wonder of all such as had the benefit of seeing, &c.

"And as blind persons, at first, cannot possibly have so clear an idea of notes and musical characters as they see them, until they are taught by a master or tutor: I have (for the good-will I bear to such unfortunate persons) contrived the following table; that, by feeling, they may understand notes, and learn any tune that shall be set them, in their master's absence.

**A New Music-Table for such as are Blind.**

<table>
<thead>
<tr>
<th>A</th>
<th>B</th>
</tr>

</tbody>
</table>

**Explanation.**

"Let A—B be a smooth board, 3 or 4 feet long, 1 inch thick, and 9 inches wide, with 5 square ledges glued thereon, each being half an inch asunder, half an inch wide, and half an inch high; which rising ledges represent our 5 lines of music, and their spaces; and the 2 outward lines, being made a little lower, may serve as leger lines on occasion. The cyphers represent so many holes bored into every line and space, half an inch asunder; wherein pegs of different shapes are to be set, to represent the several sorts of notes and characters of the tune; which pegs the blind person may know by feeling, as well as he does his keys of the organ of harpsichord: so that, by keeping his fingers on the 5 lines, he feels the several pegs as they come on, and are set to represent the several sorts of notes, on both line and space; whilst his right hand strikes the respective key, &c. he first knowing the names of all his keys, his lines, spaces, and the mark of every peg. Let each peg be about half an inch high, when set in very fast. [N.B. The blind person must first be taught the names of the above lines and spaces in both the treble and bass clefs; and that he must feel his treble with his right hand, and his bass with the left hand; each being contrary, as you may see by the letters of the above table, A and B; and must learn each part separate.]

"Of pegs, he must have a great number of every sort, to set his tune with, which he may mark as follows:

**For a Semibreve,** 4 top-notches.
**Minim,** 2 top-notches.
**Crotchet,** 1 top-notch.
**Quaver,** 1 corner cut off.

"But it is best for every performer to make and mark his own pegs; and deliver them one by one as they are called for by the person that sets his tune."

Thus far our author. We have already complained that Tansure's Musical Notation is imperfect; and perhaps every table or instrument of the same kind may be liable to the same censure, as not being comprehensive of all the characters in the written language of music, so that the blind reader may find no deficiency in acquiring any lesson: yet as the cushion of Mr. Cheese appears to have more powers than any other instrument for the same purpose, that has hitherto occurred to our observation, though attended with many formidable objections, we here introduce it. It may possibly, however, be best for every blind adept in the musical art, after being sufficiently instructed in its theoretical and practical principles, to invent for himself a table, by which may be expressed all the various phenomena of music, in which, by varying the forms and positions of his pegs, he may habitually associate them with sounds, durations, rests, intervals, chords, cadences, descapos, repeats, and all the various graces which give animation and expression to musical sounds: for thus, being the immediate creatures of his own imagination, they will more easily become familiar to his memory, and be more strongly and readily associated with the phenomena.
phenomena which they are intended to signify, than if he had assumed the inventions of any other.

Mr Cheese's description of his machine for teaching music to people deprived of sight, and to enable them to preserve their compositions, in the act of composing, without the assistance of a copyist.—"That part of the machine which represents the book, or paper, is a small cushion stuffed, on a little frame; along which, is sewed a number of packthread strings at equal distances from each other; these represent the lines in a music book: the five which compose the stage, are made of large twine; and those which represent the leger or occasional lines, drawn through the heads of the notes, where the music exceeds the compass of the established stage, are made of small twine, and are on this machine of the same length as the others.

"If the practitioner only wishes to write harpsichord music, the cushion may be what length he pleases, and about five or six inches wide; the strings must be sewed in the following order: beginning with the first or lowest, near the edge of the cushion; four small ones, which correspond with the notes in the base of the instrument f, r, e, c.; Next five large ones, for the stage which correspond with the lines in the book, or notes in the instrument g, b, d, f, r; one small one which represents the occasional line between the base and treble, or middle c; five large ones for the treble stage, which makes the notes e, g, b, d, f; three small ones, which represent the leger lines when the music goes in alt. These provide for the note a, in alt, c in alt, and e in alt; in the space above which, next the edge of the cushion, the f in alt is wrote, when it is wanting, which completes the compass of the instrument.

"Those who only sing or play on single instruments, such as violins, &c. should have their cushions not above half the width of those above-mentioned, upon which there should be but one stage, and that in the following order:—Two small lines at bottom, five large ones in the middle, and three small ones at top. Neither of the outside lines of these small cushions should be sewed close to the edge, as there are notes supposed above and below. At either end of these small cushions, there should be a small wire staple, in order that any number of them may be combined together at pleasure, by running a rod through the staples: this will enable the practitioner to write what musicians call Score, in any number of parts he pleases; and by this means a thorough knowledge of the great works of Handel, and all other classical authors, may be acquired as well without sight as with it.

"The characters used to write on this machine are pins; some with two, three, or more heads; others bent in different forms—some, the heads taken off and the top beat flat; some of these are split; others the head taken off, and placed near the middle. The bars are pieces of wire crooked at each end; a double bar is made by placing two single ones close together; a double sharp and double flat in the same manner.

"The characters are kept in a box in the same style as the printer keeps his types; each different compartment of which must be marked with a character in writing signifying what each, contained in the several compartments, is intended to represent. That the master may be acquainted with them, the student must be taught to distinguish each of the characters contained in the box by the feel, as well as the names of each line and space upon the cushion. When he can do this readily, some music should be read to him, which it will be well for him to copy on the cushion: and when that is filled, let it be laid on the desk of the harpsichord before him; and then by feeling over a passage or sentence at a time, and afterwards playing it, his playing always commencing with the beginning of the piece, or at some particular part of it, this will soon enable him to recollect the whole, when the hands are taken off the cushion, to play what has been last felt. One of these characters, called a direct, must be placed against the note to be next felt: This will enable the student to go on again, after playing, without any difficulty. The person who reads the music, must be instructed not to call the lines or spaces by the letters which distinguish them, lest confusion may ensue, every eighth being the same; but must read in the following manner: first the name of the character must be mentioned, whether minim, crotchet, or quaver, or then the line or space; as for example, minim on the first line, crotchet on the first space, quaver on the second, &c. &c.

"When the music exceeds the compass of the stage, it must be particularly mentioned whether above or below, first calling the character, then the leger line or space.

"The technical term at the beginning of each piece, is better remembered than wrote down on the machine: The accidental terms, which are best marked by placing some character, not much used, either above or below the note on which it happens, the ingenious mind will find out a method of doing for itself.

"This machine will not only teach music; but calling the characters letters, any one will be enabled to spell, read, or write down his sentiments on any subject, and even convey them to his friend without the assistance of a secretary. Arithmetic may be also taught upon this machine; as by calling the dot 7, and the pause 0, a complete set of figures will be formed.

"Explanation of the figures. A, B, C, D, the form of the cushion, which in its full size is about three feet long, and five inches and three quarters wide, having thereon a representation of musical music, shown by different pins stuck on it. The lines a, b, c, d, e, are of large packthread; and the lines f, g, h, are of small twine.

"Pins, No. 1. A semibreve. 2. A semibreve rest. 3. A minim. 4. A minim rest. 5. Dots. 6. A crotchet. 7. A crotchet rest. 8. A quaver. 9. A quaver rest. 10. A sharp. 11. A semiquaver. 12. A semiquaver rest. 13. A demisemiquaver. 14. A demisemiquaver rest. 15. A flat. 16. A demisemiquaver. 17. A demisemiquaver rest. 18. A semidemiquaver. 19. A semidemiquaver rest. 20. A natural. 21. Bars. 22. A direct. 23. A tyre. 24. Bass. 25. Tenor cliff. 26. Treble cliff. 27. A repeat. 28. Pause. 29. This character placed on any line or space signifies as many notes on that line or space as there are doubles on the pins; if turned upwards, it implies the same number ascending; if downward, that number descending. 30. A beat or inverted shake. 31. A shake; and when there is a dot placed over it, signifies a turned shake. Two dots placed over each other, above the notes, without this character, signify a turn only. 32. This character is used over the note to signify forte; and if a dot is placed,
placed above it, fortissimo; if the dot is placed above the note and below the character, it implies crescendo; if the character is placed below the note, it implies piano; and if a dot is placed under it, pianissimo; but if the dot is above the character, and below the note, it signifies diminuendo. In concertos, the inventor uses the same character placed above the note in the same manner, with two dots over it, to signify trillo; and below the notes, with two dots under it, to signify solo: in vocal music, the same character above the notes, with three dots over it, signifies symphony; and below the notes, with three dots under it, signifies song."

It is certain, that when playing concertos, or, if you please, when performing in score, the blind must depend upon memory, and upon memory alone: but happily their retentive powers are remarkably strong; and there are few pieces in music which will be found either too intricate to be acquired, or too long to be remembered, by a person deprived of sight. Mr Stanley, the gentleman formerly mentioned by Tansure, performs what is still more astonishing. If our information, which we cannot doubt, be true, be accompanies any lesson with a thorough bass, though he never has heard it before. We have never yet heard of any person, though a denizen with the full use of sight, and with all the advantages accruing from it, who could thus anticipate harmony before the chords were sounded, and accompany it in a manner suitable to its nature.

When he becomes a more profound theorist, if he has adopted the notion that music and geometry are congenial and inseparable (which, however, in our judgement is frivolous), he may peruse Malcolm's Essay on Music, and Tredyffrin's Theory and Practice of Music. But if he chooses to hear the same principles delivered without that unnecessary parade and ostentation of profundity, let him be instructed by D'Alembert (see the article Music in this Dictionary); by Rameau, in his Principles of Composition; and by Rousseau's Musical Dictionary (the substance of which is engrossed in the present Work, either under the respective detached articles, or in the notes added to the article Music). It is true, that the forms and proportions of instruments, the thickness, length, and tension of musical strings, may be mathematically adjusted: their relations one to another may be determined by the coincidence of their vibrations, or by the number and velocity of these vibrations when dissonant; but experience and a good ear, are amply sufficient for these purposes. Yet, if the necessity of geometry in music should still remain an indelible article in his creed, he may peruse Dr Smith's Philosophical Principles of Harmony. There has also lately been published an explanation of Tartin's theory, entitled, The Principles and Power of Harmony; which, after he has made considerable progress, may be read to him with sensible improvement.

Thus we have endeavoured to form an estimate of the inconveniences suffered, and the advantages possessed, by the blind; we have attempted to show, of what kind of culture their remaining faculties are susceptible, and what appeared to us the easiest and properest means of their improvement. We have illustrated not only its possibility, but its certainty, by incontestable facts, which demonstrate, even in the eyes of scepticism and incredulity, to what degrees of eminence, both in the mechanical and liberal arts, the blind may be carried.

It now remains to demand a categorical answer from society. Whether it is more humane and eligible, that such unhappy persons should be suffered to languish out their lives in torpid and miserable obscurity, wretched in themselves, and burdensome to others; or to ennoble and improve their powers in such a manner, as that they may be qualified for internal enjoyment and public utility? Surely there is not a human being, who does not disgrace the works of God, that can be at any loss in answering this question. Have we not then a right to call the world to an account? have we not a right to demand, why rational beings, susceptible of felicity in themselves, and capable of transfusing happiness through the societies with whom they are connected, should be abandoned to a state of insignificance and misery? Is it possible that men who are every moment subjected to the same contingencies with which they behold their fellow-creatures afflicted, should not with all their sons endeavours to alleviate the misfortunes of their suffering brethren? Is the native and hereditary portion of human woe so light and supportable in itself, that we should neglect and despise those whom it is embittered by accidental instances of horror and distress? You who are parents, who feel the strong and powerful pleadings of nature, do not, by a brutal negligence and insensibility, render the existence which you have given a curse to its possessors. Do not give them reason to upbraid your memory; and to answer those who ask what patrimony you have left them, that their sole inheritance was ignorance, incapacity, and indigence. You men of wealth and eminence, you whom Providence has rendered conspicuous on the theatre of nature, to whom it has given the noblest opportunities of participating the divine beatitude by the exercise of universal benevolence and genuine patriotism; yours is the glorious province of bringing neglected merit from obscurity, of healing the wounds inflicted by adverse fortune, and of cultivating those talents which may be exerted for your own advantage and the honour of your species. Thus you shall rise in the heraldry of heaven, and your names diffuse a lustre through the extent of space and the archives of eternity. Otherwise the temporary glaze and parade of your situation can produce nothing else but a despicable mimicry of real and intrinsic greatness, and are no more than a splendid mask to cover what in itself is infamous or detestable.

By way of appendix to the preceding article, we shall add one or two very singular histories, with which it is hoped our readers will not be displeased.

An account of some remarkable particulars that happened to a lady after having had the kind of small-pox.] "In the course of this disease, during which the lady was attended by the late Sir Hans Sloane, several threatening symptoms appeared, which however were at length overcome; and the patient being thought out of danger, took several doses of such purgative medicines as are usually administered in the decline of the disease, without any bad consequence.

"But in the evening of the day on which she had taken the last dose that was intended to be given her on
tion of her sight and hearing, her touch and her smell became so exquisite, that she could distinguish the different colours of silk and flowers, and was sensible when any stranger was in the room with her.

"After she became blind, and deaf, and dumb, it was not easy to contrive any method by which a question could be asked her, and an answer received. This, however, was at last effected, by talking with the fingers, at which she was uncommonly ready. But those who conversed with her in this manner, were obliged to express themselves by touching her hand and fingers instead of their own.

"A lady who was nearly related to her, having an apron on, that was embroidered with silk of different colours, asked her, in the manner which has been described, if she could tell what colour it was? and after applying her fingers attentively to the figures of the embroidery, she replied, that it was red, and blue, and green, which was true. The same lady having a pink coloured ribbon on her head, and being willing still further to satisfy her curiosity and her doubts, asked what colour that was! her cousin, after feeling some time, answered, that it was pink colour: this answer was yet more astonishing, because it showed not only a power of distinguishing different colours, but different kinds of the same colour: the ribbon was not only discovered to be red, but the red was discovered to be of the pale kind called a pink.

"This unhappy lady, conscious of her own uncommon infirmities, was extremely unwilling to be seen by strangers, and therefore generally retired to her chamber, where none but those of the family were likely to come. The same relation, who had by the experiment of the apron and ribbon discovered the exquisite sensibility of her touch, was soon after convinced by an accident, that her power of smelling was acute and refined in the same astonishing degree.

"Being one day visiting the family, she went up to her cousin's chamber, and after making herself known, she intreated her to go down, and sit with her among the rest of the family, assuring her that there was no other person present: to this she at length consented, and went down to the parlour door; but the moment the door was opened, she turned back, and retired to her own chamber much disturbed; allaying, that there were strangers in the room, and that an attempt had been made to deceive her: it happened indeed that there were strangers in the room; but they had come in while the lady was above stairs, so that she did not know they were there. When she had satisfied her cousin of this particular, she was pacified; and being afterwards asked how she knew there were strangers in the room, she answered, by the smell.

"But though she could by this sense distinguish in general between persons with whom she was well acquainted and strangers, yet she could not so easily distinguish one of her acquaintance from another without other assistance. She generally distinguished her friends by feeling their hands; and when they came in, they used to present their hands to her, as a mean of making themselves known: the make and warmth of the hand produced, in general, the differences that she distinguished; but she sometimes used to span the wrist, and measure the fingers. A lady, with whom she was very well acquainted, coming in one very hot day, after
having walked a mile, presented her hand as usual; she
felt it longer than ordinary, and seemed to doubt whose
it was; but after spanning the wrist, and measuring the
fingers, she said, 'It is Mrs M., but she is warmer to-
day than ever I felt her before.'

'To amuse herself in the mournful and perpetual
solitude and darkness to which her disorder had reduced
her, she used to work much at her needle; and it is re-
markable, that her needle-work was uncommonly neat
and exact: among many other pieces of her work that
are preserved in the family, is a pin-cushion, which can
scarce be equalled. She used also sometimes to write:
and her writing was yet more extraordinary than her
needle-work: it was executed with the same regularity
and exactness; the character was very pretty, the lines
were all even, and the letters placed at equal distances
from each other: but the most astonishing particular of
all, with respect to her writing, is, that she could by
some means discover when a letter had by some mistake
been omitted, and would place it over that part of the
word where it should have been inserted with a caref
under it. It was her custom to sit up in bed at any
hour of the night, either to write or to work, when her
pain or any other cause kept her awake.

'These circumstances were so extraordinary, that it
was long doubted whether she had not some faint
remains both of hearing and sight, and many experi-
ments were made to ascertain the matter; some of these
experiments she accidentally discovered, and the dis-
covery always threw her into violent convulsions. The
thought of being suspected of insincerity, or supposed
capable of acting so wicked a part as to feign infirmi-
ties that were not inflicted, was an addition to her misery
which she could not bear, and which never failed to pro-
duce an agony of mind not less visible than that of her
body. A clergyman who found her one evening at work
by a table with a candle upon it, put his hat between
her eyes and the candle, in such a manner that it was
impossible she could receive any benefit from the light
of it if she had not been blind. She continued still at
her work, with great tranquillity; till, putting up her
hand suddenly to rub her forehead, she struck it against
the hat, and discovered what was doing; upon which
she was thrown into violent convulsions, and was not
without great difficulty recovered. The family were
by these experiments, and several accidental circum-
stances, fully convinced that she was totally deaf and
blind; particularly by sitting unconcerned at her work,
during a dreadful storm of thunder and lightning, though
she was then facing the window, and always used to be
much terrified in such circumstances. But Sir Hans
Sloane, her physician, being still doubtful of the truth
of facts which were scarce less than miraculous, he was
permitted to satisfy himself by such experiments and ob-
servations as he thought proper; the issue of which was,
that he pronounced her to be absolutely deaf and blind.

'She was at length sent to Bath, where she was in
some measure relieved; her convulsions being less fre-
frequent, and her pains less acute; but she never recovered
her speech, her sight, or her hearing, in the least degree.

'Many of the letters dated at Bath, in some of which
there are instances of interlineations with a care, the
writer of this narrative hath seen, and they are now in
the custody of the widow of one of her brothers, who,

with many other persons, can support the facts here re-
related, however wonderful, with such evidence as it would
not only be injustice, but folly, to disbelief.

An account of a French lady, blind from her infancy,
who can read, write, and play at cards, &c.—["An
Young gentlewoman of a good family in France, now
her 18th year," lost her sight when only two years
old, her mother having been advised to lay some pigeons
blood on her eyes, to preserve them in the small-box,
whereas, so far from answering the end, it ate into
them. Nature, however, may be said to have compen-
sated for the unhappy mistake, by beauty of person,
sweetness of temper, vivacity of genius, quickness of
conception, and many talents which certainly much al-
leviate her misfortune.

'She plays at cards with the same readiness as others
of the party. She first prepares the packs allotted to
her, by pricking them in several parts; yet so imper-
ceptibly, that the closest inspection can scarcely discern
her indexes. She sorts the suits, and arranges the
cards in their proper sequence, with the same precision,
and nearly the same facility, as they who have their
sight. All she requires of those who play with her, is
to name every card as it is played; and these she re-
tains so exactly, that she frequently performs some no-
table strokes, such as show a great combination and
strong memory.

'The most wonderful circumstance is, that she should
have learned to read and write; but even this is readily
believed on knowing her method. In writing to her,
no ink is used, but the letters are pricked down on the
paper; and by the delicacy of her touch, feeling each let-
ter she follows them successively, and reads every word
with her finger ends. She herself in writing makes use
of a pencil, as she could not know when her pen was
dry; her guide on her paper is a small thin ruler and of
the breadth of her writing. On finishing a letter, she
wets it, so as to fix the traces of her pencil, that they
be not obscured or effaced; then proceeds to fold and
seal it, and write the direction; all by her own address,
and without the assistance of any other person. Her
writing is very straight, well cut, and the spelling no
less correct. To reach this singular mechanism, the in-
defatigable cares of her affectionate mother were long
employed, who accustomed her daughter to feel letters
cut in cards or pasteboard, brought her to distinguish
an A from a B, and thus the whole alphabet, and after-
words to spell words; then, by the remembrance of the
shape of the letters, to delineate them on paper;
and, lastly, to arrange them so as to form words and
sentences.

'She has learned to play on the guitar, and has
even contrived a way of pricking down the tones as an
assistance to her memory. So delicate are her organs,
that in singing a tune, though new to her, she is able to
name the notes.

'In figured dances she acquits herself extremely
well, and in a minuet with inimitable ease and grace-
fulness. As for the works of her sex, she has a mas-
tery hand; she sews and bems perfectly well; and in
all her works she threads the needles for herself, how-
ever small.

'By the watch her touch never fails telling her ex-
actly the hour and minute,'
From this account, however, it would appear, that except reading and writing, the French lady has nothing to boast of in which she is not excelled by Mr Stanley already mentioned, if we may credit all that is reported of him. The works peculiar to her sex are gained mechanically; but the distinguishing colours, telling the precise time by a watch, naming the notes in music, and many other things depending upon the ear and touch, are said to be so familiar to him, that his friends cease to think them extraordinary. Attainments still more wonderful are ascribed to him; as, the naming the number of persons in a room on entering it; the directing his voice to each person in particular, even to strangers when they have once spoken; the missing any person absent, and telling who that person is; and, lastly, his being able to form just conceptions of youth, beauty, symmetry, and shape.

Pure-Blind, or Pur-blind. A person who is very shortsighted is said to be pur-blind.

Moon-Blind, denotes horses that lose their sight at certain times of the month. See FARRIERY Index.

Blind Harry. See Henry the Minstrel.

Blind-Worm. See Anguits, OPHALOGY Index.

BLINDE, among mineralists, a species of lead-marcasite, by our miners called mock-ore, mock-lead, and wild lead, &c. The German mineralists call it blende, whence our denomination blinde. It answers to what in Agricola is called Gallena trimis.

It usually lies immediately over the veins of lead-ore, in the mines which produce it, for it is not found in all. When the miners see this, they know the vein of ore is very near.

BLIND, or BLINDS, in the art of war, a sort of defence commonly made of ox-eyes, or branches interwoven, and laid across between two rows of stakes, about the height of a man, and four or five feet sander, used particularly at the heads of trenches, when they are extended in front towards the glacis; serving to shelter the workmen, and prevent their being overlooked by the enemy.

BLINDING, a species of corporal punishment anciently inflicted on thieves, adulterers, perjurers, and others; and from which the ancient Christians were not exempt. Sometimes lime and vinegar, or barely salting vinegar, was peered into the eyes till their balls were consumed; sometimes a rope was twisted round the head till the eyes started out. In the middle age, they changed total blindness for a great darkness or diminution of sight; which they produced by holding a red-hot iron dish or bason before the eyes till their humourous were dried and their coats shrivelled up.

The inhabitants of the city Apollonia executed it on their watch whom they found asleep.—Democritus (according to Plutarch, Ciceron, and A. Gellius), put out his own eyes, that he might be less disturbed in his mental contemplations, when thus freed from the distraction of the objects of sight.

BLINDNESS, a privation of the sense of sight, arising from a total deprivation of its organs, or an involuntary obstruction of their functions. See the article BLIND.

Total Blindness, is that wherein all sight or perception, even of light, is wanting, as in the case of those who are said to be stone-blind. A blind man, by the civil law, cannot make a testament except under certain modifications; but in every case he is disabled from being a witness to a testament, on account of his blindness.

Partial Blindness, is that wherein some faint glimmering is left, as is always the case in people who have severe cataracts, who are never so blind but they can discern day from night.

Perpetual Blindness, is that which remains alike under all the diversity of seasons, times, ages, &c.

Transient Blindness, is that which gives way of itself in due time, as that of whoels, which continues for several days, sometimes nine, rarely twelve, after they are littered. The Nogain Tartars, according to Father Du Ban the Jesuit, who lived among them, are born blind, and open not their eyes till several days.

Periodical Blindness, is that which comes and goes by turns, according to the season of the moon, time of day, and the like.

Diurnal Blindness, is called hemerocopia.

Nocturnal Blindness, called also nyctalopia, which ensues on the setting of the sun in persons who see perfectly in the day, but become quite blind as soon as night comes on. Brigg, in Phil. Trans. N. S. 159. p. 562, wherein he instance of it is given. See a singular case of this kind related by Dr Samuel Pye, in the Medic. Obscr. and Inquir. vol. 1. p. 1111.

The causes of blindness are either ordinary, as a decay of the optic nerve (an instance where we have in the Academy of Sciences, where upon opening the eye of a person long blind, the optic nerve was found extremely shrunk and decayed, and having no medulla in it); or some external violence, vicious conformation, growth of a cataract, gutta serena, small pox, or the like. See MEDICINE Index.

Extraordinary causes of blindness are malignant stenches, poisonous juices dropped into the eye, baneful vermin, long confinement in the dark, or the like. The docks which breed under ground, and break out into the Zirkhitzer sea in Carnioila after all great storms, are blind at their first eruption; but in some time come to their sight. The author of the Embassy of D. Garcia de Sylva Figueroa into Pernia tells us, that in several parts of that kingdom are found vast numbers of blind people of all ages, sexes, and conditions; by reason of a species of little flies which prick the eyes and lips, and enter the nostrils, carrying certain blindness with them when they light on the eyes.

Blindness, in FARRIERY, is a disease incident to horses, especially those of an iron gray or dapple-gray colour, when ridden too hard or backed too young. It may be discovered by the walk or step, which in a blind horse is always uncertain and unequal, because he dares not set down his feet boldly when led in one's hand; though if the same horse be mounted by an expert horseman, and the horse of himself be metted, the fear of the spur will make him go more freely; so that his blindness can hardly be perceived. Another mark whereby a horse may be known to have lost his sight is, that upon hearing anybody enter the stable, he will prick up his ears, and move them backwards and forwards, as mistrusting every thing and being in continual alarm by the least noise. Dr Loverist showed the cause of the ordinary blindness in horses, which...
which is a spongy excrescence, growing in one, sometimes in two or three places of the eye, which being at length overgrown, covers the pupil when the horse is brought into the light, though in a dark stable it dilates again.

BLINKEs, among ancient sportsmen, denoted boughs broken down from trees, and thrown in the way where deer are likely to pass, to hinder their running, or rather to mark which way a deer runs, in order to guide the hunter.

BLINKING OF BEER, in Lincolnshire, signifies letting the word stand for some time in the vat, till it hath acquired some degree of acidity, in order to dispose it to fine, and be the sooner ready for drinking.

BLISSOM, among husbandmen, corruptly called blossom, is the act of a ram when coupling with an ewe.

BLISTER, in Medicine, a thin bladder containing a watery humour, whether occasioned by burns and the like accidents, or by vesications applied to different parts of the body for that purpose.

BLITHE. See BLITUM, BOTANY Index.

BLITH, a town of Nottinghamshire, in England, seated in W. Long. 0. 55. N. Lat. 53. 25.

BLITUM, BLITHE, Strawberry Spinach. See Botany Index.

BLOATING, a puffing up or inflation of the exterior habit of the body, lodged chiefly in the adipose cells. It is the same with what physicians call an emphysema.

BLOCH, MARK ELEAZER, a German naturalist of Jewish extraction. See Supplement.

BLOOM, a piece for marble as it comes out of the quarry, before it has assumed any form from the hand of a workman.

BLOOM, in the mechanic arts, a large piece of solid wood whereon to fasten work or to fashion it; strength and stability being the requisite properties. In this sense, we say a chopping block; a sugar-finer’s block; a smith’s block, on which his anvil is fastened, &c.

BLOOM, among cutters in wood, is a form made of pear-tree, box, or other hard and close-grained wood, free from knots, on which they cut their figures in relief with knives, chisels, &c.

BLOOM, in Falconry, denotes the perch whereon a bird of prey is kept. This is to be covered with cloth.

BLOOMS, in sea-language, are pieces of wood belonging to ships, in which the shivers of pulleys are placed, and wherein the running-ropes go. Of these some are single, some double; and some have three, four, or five shivers in them. They are named and distinguished by the ropes they carry, and the uses they serve for.

BLOOM Machinery; machinery lately introduced into the naval dock-yards of Britain for manufacturing blocks. See Supplement.

Mounting-BLOOM, an eminence usually of stone, cut in steps or notches, serving as a help to mount on horseback. These were much in use among the ancients, who were unacquainted with stirrups. The Romans erected them at proper stations along all their great roads.

BLOOM, DANIEL, portrait painter, was born at Stettin, in Pomerania in 1580, and gave early proofs of a good genius, which induced his parents to place him as a disciple with Jacob Scherer, a master capable of giving him the best directions, to qualify him for proceeding successfully in his profession. He chiefly painted portraits, in which (according to Sandrart) he was very eminent, and had the honour to paint the portraits of Christian IV. king of Denmark, and of Gustavus Adolphus king of Sweden. The extraordinary merit of this master recommended him to the esteem of the prince of Mecklenburg, who retained him in his service for 44 years; and by order of that prince, he painted the portraits of his whole family at full length, as large as life, and in the antique habit; by which works his reputation was established effectually. By the agreeable manner of his colouring, and the easy attitudes of his figures, his paintings became so acceptable to all persons of rank, that before the decline of life, he had acquired a very large fortune; but unfortunately he lost it all, in the compass of a few hours, by the sudden eruption of a plundering party, and with great difficulty his own life was preserved. He died in 1652.

BLOCKADE, in the act of war, the blocking up a place, by posting troops at all the avenues leading to it, to keep supplies of men and provisions from getting into it; and by these means to starve it out. See Blockade, Supplement.

To raise a BLOCKADE, is to force the troops that keep the place blocked up from their posts.

BLOCKLAND, ANTHONY DE MONTFORT, history and portrait painter, was born of a noble family at Montfort in 1532. He learned the art of painting in the school of Francis Floris, whose manner he always followed; and became an artist of great distinction, by endeavouring principally to imitate the taste of the Roman school in design and composition. His genius was best adapted to grand compositions, of which he designed many; some at Delft, but more at Utrecht. His designs had grandeur, the airs of his heads were noble, and the profiles of his female figures approached near to the taste of Parmigiano. Several of his works are in so good a taste, and particularly a Venus, and the history of Joseph and his brethren, that they seem to have been painted by a master educated in the school of Florence. He died in 1613.

BLOCZIL, a fortress of Overysel in the United Provinces, seated on the river A, at the place where it falls into the Zuider Zee. It has a port sufficient to contain 200 vessels, and serves to defend those ships that cross the sea. Its fortifications, which were considerable, have been allowed to fall to decay. E. Long. 6°. 0. N. Lat. 52. 44.

BLOEMART, ABRAHAM, painter of landscape, cattle, history, and portrait, was born at Gorcum in 1564, according to Houbraken: but according to Sandrart, whose authority seems to claim the preference, he was born in 1567, and lived mostly at Utrecht. In his youth he applied himself diligently to design after the works of Francis Floris, and afterwards received instructions from several artists of no great repute; but the power of his own genius proved his principal director in the art of painting. He formed a manner peculiar to himself, making his model for many of the objects he painted, particularly his cattle, in which he excelled. He died in 1647. He left four sons.
two gardens, one of which is full of fruit-trees, and the other of parterres, fountains, cascades, and marble statues brought from Italy. Beyond these, there is a large park, where there is game in abundance. On all the gates of the city there is the image of the Virgin Mary, who they believe fed them from the plague in 1631. There are several parish-churches, chapters, and religious houses for both sexes. The church of St Solenne is the cathedral, and is the handsomest in the city. The front of the Jesuits church is decorated with three orders of architecture, the Doric, Ionic, and Corinthian; but there is only the Doric on the inside. The town-house is a tolerable building, and stands in a street which terminates at the quay, where there is a public walk that has a fine prospect on the Loire, over which there is a bridge that leads to the suburbs of Vienna. There are a few houses on the bridge, and a tower at each end to guard the entrance. About three quarters of a mile from the city, the water runs down the clefts of a rock into a large aqueduct, by which it is conveyed to a reservoir near the walls, and from hence distributed by leaden pipes to several parts of the city. The country about Blois produces corn, wine, cattle, and game of every kind, and the waters a great quantity of fish. The meadows are so rich and fertile, that the cows yield excellent milk, good in consumptive cases, and which affords the best cream in the kingdom. About a league from Blois, there are mineral springs, which have the same virtues as those of Forges. The trade of Blois is chiefly in wine and brandy; but they also make some serges and stuffs at this place. It contained 13,000 inhabitants in 1815. Several kings have kept their courts at Blois; for which reason they speak the French language in perfection. E. Long. i. 30. N. Lat. 47. 35.

BLOMARY, or BLOOMARY, in Metallurgy, the first forge through which iron passes, after it is melted out of the ore.

BLOEMEN, Peter Van, a celebrated painter, born at Antwerp, was brother to John Francis Van Bloemen, called by the Italians ORIZONTI, and lived for several years at Rome along with his brother. As soon as he found himself competently skilled in colouring and pencil-drawing, as well as in designing, he returned to his native city, where, in the year 1699, he was appointed director of the academy. The composition of this master is rich, and his pictures are generally filled with a number of figures. His subjects are, the marchings of squadrons of cavalry, encampments, artillery, battles, Italian fairs, markets, and festivals; in which he shewed great correctness in his design and in his drawing; and an elegance in the manner of dressing his figures, whom he frequently represented in oriental habits. He designed horses in an admirable style; and in his battles gave them abundance of spirit, graceful attitudes, and an expression that was full of life and nature. His landscapes are enriched with elegant architecture, with baso-relievs, and mutilated statues, in a noble taste; and rendered still more pleasing by a good tone of colour, by animals of different kinds, and excellent figures.—His best works are admired in all parts of Europe, and afford large prices: but it is to be observed, that some of his pictures seem rather to be too-
too much laboured or stiff, and (according to the artists phrase) smell of the palette; and those are proportionably less estimable.

BLOEMEN, John Francis Van. See ORIZONTO.

BLOEMEN, Norbert Van, brother of the preceding, was a painter of portraits and conversations; but in merit was very inferior to his brothers, although he had a good deal of employment.

BLOND, Christopher Le, painter of portraits in miniature and all kinds of subjects on paper, was born in 1670. Very few circumstances relative to his education or life are mentioned by any writers till he was known at Rome in the year 1716, being at that time painter to the Count Martinetti, ambassador at the court of Rome. By the solicitation of Overbeke he was induced to go to Amsterdam, and in that city he was employed to paint small portraits for bracelets, rings, and snuff-boxes; of which, although they were painted in water-colours, yet the colouring was as lively and natural as if they had been painted in oil. However, as he found his sight much impaired by the minuteness of his work, he discontinued water-colour painting, and attempted the use of oil with a reasonable degree of success. After he had resided for some years in the Low Countries, he went to England, and set up a new method of printing mezzotinto plates in colours so as to imitate the pictures of which they were copies. In this manner he executed in England, several large plates, from pictures of the greatest masters, and disposed of the prints by lottery. But those who obtained the prizes (Mr Strutt says) appear not to have held them in any very great estimation. "The prints (he adds) certainly possess some merit, exclusive of their novelty; but, in general, the colours are flat and dirty; the effect is neither striking nor judiciously managed; and the drawing is frequently very incorrect, especially in the extremities of his figures." Mr Pilkington speaks of them with greater approbation. "The artist (he says) imitated his models with so much skill, such exact resemblance, such correctness of outline, such similarity of colour and expression, that at first they amazed every beholder, who viewed them at a proper distance; and many of those prints are still extant, which are much esteemed by persons of good taste." And Mr Walpole observes, that some heads, coloured progressively, according to their several gradations, bear witness to the success and beauty of his invention. He had another merit to the public, with which few inventors begin; for he communicated his secret in a thin quarto, entitled Colorito, or "The harmony of colouring in painting reduced to mechanical practice, under easy precepts and infallible rules." His method was performed by several mezzotinto plates for one piece, each expressing different shades and parts of the piece in different colours. He was not, however, it is said, the original inventor of that manner of managing colours, but took it from Lastman and others, who, with much greater regularity of morals, equal capacities, and more discreet conduct, had before undertaken it without success. Le Blond, whose head was continually full of schemes, next set on foot a project for copying the cartoons of Raphael in tapestry, and made drawings from the pictures for that purpose. Houses were built and looms erected at the Mulberry Ground at Chelsea; but the expenses being too great, or the contributions not equal to the first expectations, the scheme was suddenly defeated, and Le Blond disappeared, to the no small dissatisfaction of those who were engaged with him. From hence he went to Paris, where, Basan informs us, he was in the year 1737; and in that city he died, 1740, in an hospital. Le Blond was also author of a treatise, in French, on ideal beauty. It was published in 1732, and has since been translated into English.

BLONDEL, David, a Protestant minister, distinguished by his skill in ecclesiastical and civil history, was born at Chalon on Marne, and was admitted minister at a synod of the Isle of France, in 1614. He wrote, 1. A defence of the reformed churches of France. 2. A work against the decretal epistles. 3. De Episcopis et Presbyteris; and other pieces. Bayle informs us, that he had a very singular way of studying; he lay on the ground, and had round about him the books which he wanted for the work he was about. He died in 1665, aged 64.

BLONDEL, Francis, regius professor of mathematics and architecture, was employed in several negotiations, arrived at the dignity of marshal de camp and counselor of state, and had the honour of being chosen to teach the dauphin the mathematics; he was also made member of the Academy of Sciences at Paris, and director of the Academy of Architecture. He died at Paris in 1688, aged 68. He wrote, 1. Notes on the Architecture of Savoy. 2. A course of architecture and mathematics. 3. The art of throwing bombs. 4. A new manner of fortifying places. 5. A comparison between Finder and Finsane; and other works.

BLONDUS, Flavius, an historian born at Folli, in Italy, in 1388, was secretary to Eugenius IV. and other popes. He composed a great many books; and, among others, a History from the year 400 to 1440. He died in 1463.

BLONIEZ, a town of Poland, in the province of Warsowia. E. Long. 20. 35. N. Lat. 52. 0.

BLOOD, a red liquor circulating through the vessels of the human body and the bodies of the larger animals, which appears immediately and essentially necessary to the preservation of life.

Though there is no living creature as yet known whose life doth not immediately depend upon the circulation of some kind of fluid through its vessels, yet unless such fluid is of a red colour, it does not obtain the name of blood; and therefore such creatures as have a colourless or milky liquor circulating through their vessels, are called exanguous animals.

The blood has a very different degree of thickness or Blood of different thickness in different animals, and even in the same animal at different times. Though it is in all cases ab- dowed with a considerable degree of tenacity, yet in strong animals that tenacity is remarkably greater than in weak ones; and hence the blood of bulls was made the use of by the ancients as a poison, of its extreme viscosity enabling it totally indigestible by the powers of the human stomach. It is well known also by physicians, that there are some states of the human body in which the blood becomes vastly tenacious, so as in a great measure to refuse any intimate connection with water; and others, in which its crisis is almost totally dissolved, so as to appear, when drawn out of the body, like a fluid and half putrid mass. See Medicine Index.
Blood.

The common appearance of the blood when drawn from a vein of the human body is well known. It first seems a homogeneous red liquor; then it consolidates into a uniform mass; in a little time, a yellowish watery liquor begins to separate from it, which is more or less in quantity according to the state in which the blood happens to be; the red mass, in the mean time, contracts greatly in its dimensions, and increases in solidity. But this increase of solidity is likewise proportional to the state of the blood at the time: in strong people, if attacked with a violent inflammatory disease, the solid part is exceedingly tough, insomuch that Dr Huxham says he has sometimes found it almost like a piece of flesh itself; whereas, in other diseases, the solid part is very soft and tender, breaking in pieces with the slightest touch. The spontaneous separation of the blood into crassamentum, serum, and coagulable lymph, has been already taken notice of under Anatomy. See Anatomy Index.

Blood chemically analysed.

The attention of physiologists hath been very much engaged by enquiries into the nature and composition of the blood, and accordingly it hath been examined in all possible ways. By a chemical analysis, it discovers the same principles with other animal substances; giving over in distillation a great quantity of phlegm, a volatile spirit, with much fetid oil; after which, there remains a charred matter, that, burnt in an open fire, leaves a white earthy similar to calcined barthorn. Some eminent chemists, Mr Homburg particularly, have asserted that blood contains an acid as well as an alkali, but that the former doth not arise till towards the end of the distillation; but what is very singular, and indeed must throw no small suspicion on the whole account is, that the acid and alkali, notwithstanding their great tendency on all other occasions to unite with each other, do here remain separate, so that the liquor may be even redistilled without their forming any neutral compound.

Experiment in confirmation of this is recorded in the memoirs of the Royal Academy for 1742. Six pounds of human blood distilled to dryness with a gentle heat, were reduced to a pound and a half; after which, the mass was warmed with a graduated fire, till the retort at last became red hot. The produce was 17 ounces of liquor; 12 of which were a red and very empyreumatic volatile spirit, the other five were oil. The caput mortuum was a light coal weighing four ounces and a half. On rectifying the volatile spirit in a small retort, about an ounce of red fetid liquor remained, which had a very acrid smell, and turned the juice of tourneu red. Mr Homburg now imagined, that the acid contained in the blood of animals could not disengage itself perfectly by these distillations without addition. He therefore determined to distill human blood with an admixture of some other substance; but as earthy contains a salt, which might render the operation uncertain, he determined to use only the caput mortuum of a former distillation of the same substance. For this purpose, four pounds of a coagulum of human blood being well mixed with a large quantity of this residuum, and the whole dried in the sun, it was put into a retort, and distilled with a fire, raised, towards the end of the operation, to the utmost violence. The oil being separated from the volatile spirit, the latter was rectified; and the consequence was, that there came over four pounds of a red acid liquor, that taine the tincture of tourneu very red. All the distillations of the aqueous liquors already mentioned, obtained by similar processes, being mixed together, and separated from their yet remaining oil, by careful dilution with water and filtration, they were at length distilled together; the liquor that came over was clear as water, and its first quantities contained a great deal of volatile salt, but the last two ounces were found to be as sour as distilled vinegar.—The same products were obtained from the blood of carnivorous animals, as well as from that of animals feeding solely upon vegetables.

In Dr Lewis's notes on Newman's Chemistry we Dr Lewis's have the following account of the blood, and the parts into which it may be resolved. Recent blood is equally fluid, and in taste somewhat saline. Viewed by a microscope, it appears composed of numerous red globules swimming in a transparent fluid. On standing for a little time, it separates into a thick crassamentum and fluid serum. By agitation, it continues fluid: A consistent polyposy matter adheres to the stirrer, which by repeated ablation with water becomes white. Received from the vein in warm water, it deposits a quantity of transient filamentous matter, the red portion continuing dissolved in the water. On evaporating the fluid, a red powdery substance is left.—It coagulates by frost, and becomes fluid again by warmth; after liquefaction, it quickly putrides.—Fluid and florid blood, exposed to a temperate air, putrifies sooner than such as is more dense. Inspissated to dryness, it leaves a dark-coloured mass, amounting, at a medium, to about one fourth of the weight of the blood, of a bitter saline taste, easily inflammable, burning with a bluish flame. The excised blood is not soluble in acid or alkaline liquors; but gives some tincture to water and to spirit of wine, and is more powerfully acted upon by dulcified spirit of nitre. Recent blood is coagulated by the mineral acids, and by most of the combinations of them with earthy and metallic bodies. With vegetable acids, and with solutions of neutral salts, it congeles equally without coagulation. Alkalies, both fixed and volatile, render it more fluid, and preserve it from coagulating.

"The serum of blood is more saline than the crassamentum, and does not so speedily putrefy. It freezes somewhat more difficulty than pure water; and its aqueous part evaporates, by a gentle warmth, somewhat more readily, leaving about one-twelfth of the weight of the serum of a solid yellowish pellicular matter. Exposed to heat a little greater than that of the human body, it coagulates into a solid mass, without any considerable evaporation. Both this coagulum and the inspissated serum are readily inflammable in the fire, not dissolable in water, or in spirits of wine, in acid or in alkaline liquors."

But the texture of the blood discoverable by a microscope, hath engaged the attention of the learned much more than the chemical analysis ever did. Leen-wenbock was the first who discovered, or fancied he discovered, that the blood, as it exists in the body of an animal, consists of a quantity of red globular particles swimming in a large quantity of transparent liquor. Each of these globules, he imagined, was composed of six smaller ones packed together. While the six continued to adhere, their colour was red; but when sepa-
Blood, when it is considered, that the blood of all animals is filled with these particles, we must believe that they serve some very important purpose in the animal economy; and since they are so complicated in their structure, it is impossible they should be made by mechanical agitation in the lungs or blood-vessels, as has been suspected, but probably have some organ set apart for their formation. This I set out to prove, when I have explained their structure a little more particularly, and mentioned the manner in which I exhibit it. I take the blood of a toad or frog, in which they are very large; I mix it with the serum of human blood to dilute it; I find them appear all flat; so they do in the blood-vessels of this animal, as I have distinctly seen in the web between its toes, whilst the animal was alive and fixed in the microscope. Their appearance in these animals is not unlike slices of cucumber. I next mix a little of the blood with water, which immediately makes them all round, and then begins to dissolve them whilst they are round. I incline the stage of the microscope, so as to make them roll down it; and then I can distinctly see the solid in the middle fall from side to side like a pea in a bladder. A neutral salt added to them at this time brings them back to their flat shape; but if the salt be not added, the water gradually dissolves away the vesicle; and the little sphere is left naked. Such is the composition of these particles. I have exhibited these experiments to a considerable number of my acquaintance, who all agree in their being satisfactory.

The microscope I use is a single lens, and therefore as little likely to deceive us as a pair of spectacles, which, as is allowed by all who use them, do not disfigure objects, but only represent them larger.

From farther experiments, I am convinced, that the use of the thymus and lymphatic glands is to make the middle solid pieces; and I can prove it in as satisfactory manner as you can do the use of any viscus in the body; that is, by opening these glands, and examining the fluid contained in their cells, which I find to be full of these little solids. I moreover find, that the lymphatic vessels take them up from these glands, and convey them into the blood-vessels, which carry them to the spleen, in whose cells they have the vesicles laid over them; so that the thymus and lymphatic glands make the central particles, and the spleen makes the vesicles that surround them. That this is the use of the spleen appears from examining the lymph which is returned from its lymphatic vessels; for that lymph, contrary to what is observed in other parts of the body, is extremely red.

But besides having these glands set apart for making the red vesicles of the blood, I find that they are also made in the lymphatic vessels in different parts of the body, whose coats have blood-vessels properly constructed for this secretion. So that the thymus and lymphatic glands are no more than appendages of the lymphatic system, for making the middle particles; and the spleen an appendage to the lymphatic vessels, for making the vesicles which contain these middle particles.

I conjecture that it is the coagulable lymph which is converted into this red part of the blood, from a curious fact that has long been known: namely, that the blood in the splenic vein does not coagulate when exposed...
Blood, as the blood of other veins does; so that it seems to be robbed of its coagulable lymph in passing through the spleen.

"It is very remarkable, that the spleen can be cut out of an animal, and the animal do well without it. I made the experiment on a dog, and kept him a year and a half without observing his health to be in the least impaired. From this some have concluded the spleen to be an useless weight; which is absurd, when we consider that all animals with red blood have it. Therefore it is more consistent with what we know of the animal economy, to conclude, that since an animal can do well without it, there is probably some part of the body that can supply its place.

"Insects have vessels constructed in a similar way to ours, but differing in colour. But insects have neither spleen, thymus, nor lymphatic glands; and therefore in them probably these vessels are entirely fabricated in the lymphatic vessels. But to us, and other of the more perfect animals, besides the lymphatic vessels, nature has given those glands, that a proper quantity of these important vessels might be the better secured to us; just as she has given us two ears, the better to secure us hearing through life, though we can hear perfectly well with one."

This letter, we apprehend, contains the strength of Mr Hewson's evidence for his hypothesis; on which we shall only remark, that if the red globules are prepared in the manner above mentioned, and the lymphatic vessels are excretory of those glands where the red particles are formed; then if there is any vessel where all these excretory unites, in that vessel the lymph ought to appear very red, on account of the accumulated quantity of red globules brought thither from all parts of the body. But no such redness seems ever to have been taken notice of by any anatomist: this therefore must be an objection to Mr Hewson's hypothesis; and such a one, perhaps, as will not be easily removed.

Many other hypotheses have been invented concerning the formation of the red blood, and various opinions delivered concerning its red colour. In a lecture delivered at Newcastle in 1773, by Dr Wilson of that place, he asserts "that it is self-evidently the office of the veins to elaborate the fluids into that form and composition which we know by the name of red blood." The self-evidence, here, however, is by no means apparent to us; nor doth he at all point it out in an intelligible manner. Dr Cullen, in his physiological part of the Institutions of Medicine, acknowledges that we know but little of the formation of any of the animal fluids; and concerning the microscopical observations, &c. on the blood, he gives his opinion in the following words, &c. celiiv. "The red globules have been considered as an oily matter, and from thence their distinct and globular appearance has been accounted for: but there is no direct proof of their oily nature; and their ready union with, and diffusibility in, water, renders it very improbable. As being microscopical objects only, they have been represented by different persons very differently. Some have thought them spherical bodies, but divisible into six parts, each of which in its separate state was also spherical; but other persons have not observed them to be thus divisible. To many observers they have appeared as perfectly spherical; while others judge them to be oblate spheroids, or lenticular. To some they have appeared as annular, and to others as containing a hollow vesicle. All this, with several other circumstances relating to them, very variously represented, show some uncertainty in microscopical observations; and it leaves me, who am not conversant in such observations, altogether uncertain with respect to the precise nature of this part of the blood. The chemical history of it is equally precarious; and, therefore, what has been hitherto said of the production and changes happening to these red globules, we choose to leave untouched. — We suppose that the red globules, when viewed singly, have very little to do with the colour of the blood; and that it is only when a certain number of the blood they are laid upon another, that the colour appears of a bright red; but this also hath its limits; so that when the number of globules laid on one another is considerable, the colour becomes of a darker red. Upon this supposition, the colour of the mass of blood will be brighter or darker as the colouring part is more or less diffused among the other parts of the mass; and we think this appears to be truly the case from every circumstance that attends the changes which have been at any time observed in the colour of the blood."

Concerning the uncertainty of microscopical as well as chemical experiments, we shall not dispute; though we have the conclusion against them seems carried too far. But from with regard to the colour of the blood, we apprehend the action it hath been known, almost, if not altogether, since the of the air. discovery of the circulation, that the florid or dark colour depends on the presence or absence of air, and not upon any number of globules. Thus the blood returning from the veins is of a dark colour. Though diluted with the fresh chyle from the subclavian vein, it continues of the same dark colour till it passes through the lungs, upon which it instantly assumes a very florid red; but it can never be proved that the globules in the pulmonary vein are at all less numerous than in the pulmonary artery.—That this change of colour may be effected by the air through membranes much thicker than we can suppose the vessels of the lungs to be, has been demonstrated by Dr Priestley, but whether the change is occasioned by the mere separation of some principle from the blood, or by the absorption of another in its stead, is not yet determined, though the latter is indeed acknowledged by Dr Priestley himself to be the more probable opinion. He even supposes the redness to be owing to a portion of phlogisticated air absorbed in the lungs. It must therefore be the elastic principle of this air, which is absorbed, while the other combined with part of the phlogiston emitted by the blood is converted into fixed air.

This leads us to consider the uses to which the blood Uses of the is subservient in the animal economy, and the changes blood in that happen to it in respiration. The uses of this fluid are so various, and of such an important nature, that the vital some have not scrupled to affirm the blood to be acti-principle possessed of a living principle, and that the life of thought by the whole body is derived from it. This opinion was first broached by the celebrated Harvey, the discoverer of the circulation; but in this he was never much followed; and the hypothesis itself, indeed, has been pretty much laid aside and neglected, till of late that it was revived by Mr J. Hunter, professor of anatomy.
in London. This gentleman supports his opinion by the following arguments: 1. The blood unites living parts, in some circumstances, as certainly as the yet recent juices of the branch of one tree unite it with that of another. Were either of these fluids to be considered as extraneous or dead matters, he thinks they would act as stimuli, and no union would take place in the animal or vegetable kingdom. This argument, Mr. Hunter imagines, is still farther established by the following experiment. Having taken off the testicle from a living cock, he introduced it into the belly of a living hen. Many weeks afterwards, upon injecting the liver of the hen, he injected the testicle of the cock; which had come in contact with the liver, and adhered to it. He alleges, that in the nature of things, there is not a more intimate connection between life and a solid, than between life and a fluid. For although we are more accustomed to connect it with the one than the other, yet the only real difference which can be shown between a solid and a fluid is, that the particles of the one are less moveable among themselves than those of the other. Besides, we often see the same body fluid in one case and solid in another. 2. The blood becomes vascular like other living parts. Mr. Hunter affirms, that, after amputations, the coagula in the extremities of arteries may be injected by injecting these arteries; and he has a preparation in which he thinks he can demonstrate vessels rising from the centre of what had been a coagulum of blood, and opening into the stream of the circulating blood. 3. Blood taken from the arm in the most intense cold which the human body can bear, raises the thermometer to the same height as blood taken in the most sultry heat. This he considers as a strong proof of the blood's being alive; as living bodies alone have the power of resisting great degrees both of heat and cold, and of maintaining in almost every situation, while in health, that temperature which we distinguish by the name of animal heat. 4. Blood is capable of being acted upon by a stimulus. In proof of this, he observes, that it coagulates from exposure, as certainly as the cavities of the abdomen and thorax inflame from the same cause. The more it is alive, that is, the more the animal is in health, it coagulates the sooner on exposure; and the more it has lost of its living principle, as in the case of violent inflammations, the less is it sensible to the stimulus produced from its being exposed, and it coagulates the later. 5. The blood preserves life in different parts of the body. When the nerves going to a part are tied or cut, the part becomes paralytic, and loses all power of motion; but it does not mortify. If the artery be cut, the part dies, and mortification ensues. What keeps it alive in the first case? Mr. Hunter believes it is the living principle which alone can keep it alive; and he thinks that this phenomenon is inexplicable on any other supposition, than that life is supported by the blood. 6. Another argument he draws from the case of a fractured os humeri he had occasion to observe. A man was brought into St. George's hospital for a simple fracture of the os humeri, and died about a month after the accident. As the bones had not united, Mr. Hunter injected the arm after death. He found that the cavity between the extremities of the bones was filled up with blood which had coagulated. This blood was become vascular. In some places it was very much so. He does not maintain that all coagulated blood becomes vascular; and indeed the reason is obvious; for, if it is often thrown out and coagulated in parts where its becoming vascular could answer no end in the system, as, for example, in the cavities of aneurismatic sacs. If it be supposed, that, in such cases as that just now mentioned, the vessels are not formed in the coagulum, but come from the neighbouring arteries, he thinks it equally an argument that the blood is alive; for the substance into which vessels shoot must be so. The very idea that such a quantity of dead matter as the whole mass of blood circulates in a living body, appears to him absurd.

The system which at present stands opposed to that of Mr. Hunter, considers the brain and nervous system as the fountain of life; and that, so far from receiving its life from the blood, the nervous system is capable of instantaneously changing the crisis of the blood, or any other animal fluid; and though the nervous system can vitally protract its action for any length of time if the action of the blood-vessels is suspended, yet the heart and blood-vessels cannot act for a single moment without the influence of the nervous fluid. Hence, say they, it is plain, we must suppose the nervous system, and not the blood, to contain properly the life of the animal, and consequently to be the principal vital organ. The secretion of the vital fluid from the blood by means of the brain, is, by the supporters of this hypothesis, denied. They say, that any fluid secreted from the blood must be aqueous, inelastic, and inactive; whereas the nervous fluid is full of vigour, elastic, and volatile in the highest degree. The great necessity for the circulation of the blood through all parts of the body, notwithstanding the presence of the nervous fluid in the same parts, they say, is, because some degree of tension is necessary to be given to the fibres, in order to fill them with the influx of the nervous fluid; and this tension they receive from the repulsion of the blood-vessels, which are everywhere dispersed along with the nerves.

To follow this dispute through every argument that hath been, or that may be, used by both parties, would prove tedious, and to us appears in a great measure unnecessary, as the following short considerations seem sufficient to decide the matter absolutely against the patrons of the nervous system. In the first place, then, if we can prove the life of the human body to have existed in, or to have been communicated from a fluid to the nervous system, the analogical argument will be very strongly in favour of the supposition that the case is so still. Now, that the case once was so, is most evident; for the human body, as well as the body of every other living creature, in its first state, is well known to be a gelatinous mass, without muscles, nerves, or blood-vessels. Nevertheless, this gelatinous matter, even at that time, contained the nervous fluid. Of this there can be no doubt, because the nerves were formed out of it, and had their power originally from it; and what is remarkable, the brain is observed to be that part of the animal which is first formed. Of this gelatinous fluid we can give no other account, than that it was the nutritive matter from which the whole body appears to be formed. At the original formation of man, and other animals, therefore, the nutritive matter was the substratum of the whole body, consisting of muscles, nerve, blood,
...blood-vessels, &c. may more, it was the immediate efficient cause of the nervous power itself. Why should it not be so now as well as then! Again, in the formation of the embryo, we see a vital principle existing as it were at large, and forming to itself a kind of regulator to its own motions, or a habituation in which it chooses to reside, rather than to act at random in the fluid. This habituation, or regulator, was undoubtedly the nervous system, and continues so to this moment; but at the same time, it is no less evident that a nutritious fluid was the immediate origin of these same nerves, and of that very nervous fluid. Now we know, that the fluid which in the womb nourishes the bodies of all embryo animals, is necessarily equivalent to the blood which nourishes the bodies of adult ones; and consequently, as soon as the blood became the only nutritious juice of the body, at the same time the vital or nervous fluid took up its residence there, and from the blood diffused itself along the nerves, where it was regulated exactly according to the model originally formed in the embryo. Perhaps it may be said, that the vital power, when once it hath taken possession of the human or any other body, requires no addition or supply, but continues there in the same quantity from first to last. If we suppose the nervous power to be immaterial, this will indeed be the case, and there is an end of reasoning upon the subject; but if we call this power a volatile and elastic fluid, it is plain that there will be more occasion for recruits to such a power than to any other fluid of the body, as its volatility and elasticity will promote its escape in great quantities through every part of the body. It may also be objected, that it is absurd to suppose any fluid, or mechanical cause, capable of putting matter in such a form as to direct its own motions in a particular way; but even of this we have a positive proof in the case of the electric fluid. For if any quantity of this matter has a tendency to go from one place to another where it meets with difficulty, through the air for instance, it will throw small conducting substances before it, in order to facilitate its progress. Also, if a number of small and light conducting substances are laid between two metallic bodies, so as to form a circle, for example, a shock of electricity will destroy that circle, and place the small conducting substances nearer to a straight line between the two metals, as if the fluid knew there was a shorter passage, and resolved to take that, if it should have occasion to return. Lastly, it is universally allowed, that the brain is a secretory organ, made up of an infinite number of small glands, which have no other excretories than the medullary fibres and nerves. As a considerable quantity of blood is carried to the brain, and the minute arteries end in these small glands, it follows, that the fluid, whatever it is, must come from the blood. Now, there is no gland whatever, in the human, or any other body, but will discharge the fluid it is appointed to secrete, in a very considerable quantity, if its excretory is cut. Upon the cutting of a nerve, therefore, the fluid secreted by the brain ought to be discharged; but no such discharge is visible. A small quantity of glairy matter is indeed discharged from the large nerves; but this can be no other than the nutritious juice necessary for their support. This makes it plain, even to demonstration, that the fluid secreted in the brain is immovable in its nature; and as we know the nervous fluid hath its residence in the brain, it is very probable, to use no stronger expression, that it is the peculiar province of the brain to secrete this fluid from the blood, and consequently that the blood originally contains the vital principle.

After it is allowed that the blood contains the vital Vivifying principle, it becomes another question, not very easy spirit supposed to be solved. Whence is this vital principle derived?—For we derived this we can only discover two sources; namely, the chyle from the or aliment from which the blood is prepared, and respiration. The latter hath been commonly held as the principal source of the vital principle; and, for a long time, it was generally thought that there was a kind of vivifying spirit in the air, which being absorbed by the blood at each inspiration, communicated to that fluid the quality necessary for preserving animal life. As a proof of this it was urged, that life cannot be supported without respiration, and that air which hath been often breathed ceases to be capable of supporting life; because when once it has been totally deprived of its vivifying spirit, it can communicate none to the blood in any subsequent respirations. This doctrine, however, has been denied, and generally thought to be exploded by modern discoveries. Dr Hales brings several experiments against it; of which the following may be ascribed to serve a specimen, and which we shall give in his own words.

"I tied a middle-sized dog alive on a table, and Dr Hales's having laid bare his windpipe, I cut it asunder just at the larynx, and fixed fast to it the small end of a common feset: the other end of the feset had a large bladder tied to it, which contained 162 cubic inches: and to the other end of the bladder was tied the great end of another feset whose orifice was covered with a valve that opened inwards, so as to admit any air that was blown into the bladder, but none could return that way; yet, for further security, that passage was also stopped by a spigot.

"As soon as the feset was tied fast to the windpipe, the bladder was blown full of air through the other feset; when the dog had breathed the air in the bladder to and fro for a minute or two, he then breathed very fast, and showed great uneasiness, as being almost suffocated.

"Then with my hand I pressed the bladder hard, so as to drive the air into his lungs with some force; and thereby made his abdomen rise by the pressure of the diaphragm, as in natural breathing; then taking alternately my hand off the bladder, the lungs with the abdomen subsided: I continued in this manner to make the dog breathe for an hour; during which time, I was obliged to blow fresh air into the bladder every five minutes, three parts in four of that air being either absorbed by the vapours in the lungs, or escaping through the ligatures upon my pressing hard on the bladder.

"During this hour, the dog was frequently near expiring, whenever I pressed the air but weakly into his lungs; as I found by his pulse, which was very plain to be felt in the great carotid artery near the groin, which place an assistant held his finger on most part of the time: but the languid pulse was accelerated so as to beat fast, soon after I dilated the lungs much by pressing hard upon the bladder; especially when the motion of the lungs was promoted by pressing alternately..."
the abdomen and the bladder, whereby both the conduction and dilatation of the lungs were increased.

And I could by this means raise the languid pulse whenever I pleased, not only at the end of every five minutes, when more air was blown into the bladder from a man's lungs, but also towards the end of the five minutes, when the air was fullest of fumes.

At the end of the hour, I intended to try whether I could have by the same means kept the dog alive some time longer, when the bladder was filled with the fumes of burning brimstone; but being obliged to cease for a little time from pressing the air into his lungs, while matters were preparing for this additional experiment, in the mean time the dog died, which might otherwise have lived longer if I had continued to force the air into the lungs.

Now, though this experiment was so frequently disturbed, by being obliged to blow more air into the bladder 12 times during the hour; yet since he was almost suffocated in less than two minutes, by breathing of himself and from the first air in the bladder, he would have died in less than two minutes when one-fourth of the old air remained in the bladder immediately to taint the new air admitted from a man's lungs; so that his continuing to live through the whole hour, must be owing to the forcible dilatation of the lungs by compressing the bladder, and not to the vivifying spirit of the air.

Dr Priestley at first concluded from his own observations, and no doubt very justly, that air which hath been often breathed becomes pernicious by its accumulated phlogiston, stimulating the lungs, and making the animal fall into convulsions. Respiration, therefore, he supposed to be a phlogistic process, in which the blood parts with its superfluous phlogiston. He did not say, that the blood receives nothing in exchange; but rather that it may receive some nitrous principle, which gives it the red colour; but as to a vivifying spirit, he does not appear to have the least idea of any such thing being received at that time. Wise, in his first volume, p. 277, he expressly adopts the other hypothesis, namely, that the vital principle is received from the chyle. "My conjecture (says he) is, that animals have a power of converting phlogiston, from the state in which they receive it in their nutrient into that state in which it is called the electrical fluid; that the brain, besides its other proper uses, is the great laboratory and repository for this purpose; that by means of the nerves, this great principle, thus exhaled, is directed into the muscles, and forces them to act in the same manner as they are forced into action, when the electric fluid is thrown in them ob extra."

These theories were opposed in the former edition of this work. With regard to Dr Hales's opinion, that the want of elasticity, or pressure, is the reason why phlogisticated air cannot support animal life, we apprehended it to be totally inconclusive, because it doth not at all appear that phlogisticated air wants elasticity; on the contrary, from Dr Priestley's experiments, it appears to be more elastic than common air. Besides, we know that the elasticity of every fluid must always be in proportion to the pressure upon it; as reaction is always equal to action. Supposing therefore the elasticity of any portion of air to be destroyed, the pressure of the superincumbent atmosphere will reduce it into a proportionably less bulk, and then it is equally elastic with the rest; for if it was not, it would behave it still to yield under the pressure. Hence we may see, that as the bladder made use of in Dr Hales's experiment was by no means sufficient to keep off the pressure of the external atmosphere, the death of the dog could not be fairly ascribed to want of elasticity in the tainted air. When he applied more force that the natural elasticity of the air, he kept the dog alive, as he calls it, for an hour; but by this means allows a mechanical circulation of the blood to be life, any more than we can allow a dead body to be alive on account of the motion of its arm or any other member by mechanical means. The experiment, however, is valuable, because it shows that respiration is one of the immediate mechanical agents by which the circulation of the blood is carried on; and in order to prove that the dog was really kept alive by this means, he ought to have recovered from the effects of the experiment. Had Dr Hales tried a similar experiment on himself, by taking the foseat in his mouth, closing his nostrils, and causing another person compress the bladder, we have not the least doubt that he would then have felt such a method of breathing not to be a way of preserving life, but of destroying it.

As to Dr Priestley's conclusions, it was argued, that Conclusion 14, though it found air diminished by admitting phlogiston to it, Dr Priestley finds the mere access of any material substance cannot diminish, but must increase, its bulk. The diminution, therefore, on the access of phlogiston, is an evident proof that some part of the air is actually taken away. That the phlogiston received is not incorporated with the air is likewise evident, as well as that it takes up space in the tainted air, because, by agitation in water, the phlogistic matter separates from the air, and enters into the water. The consequence of this is, that the air is still farther diminished in bulk; and what remains is pure air, fit for supporting animal life, and of being further diminished by phlogiston as before. It appears also certain, that phlogiston is not endowed with any inherent power by which it can expand itself; otherwise it would fly off in vacuo, which it is never known to do. Another circumstance we must also attend to, that the action of phlogiston seems to be entirely confined to a particular part of the atmosphere; namely, that which is now so well known by the name of fixed air. This it entirely deprives of its elastic principle, so that it is actually so longer air, but becomes a solid substance, making a part, and that no inconsiderable one, of increscent terrestrial substances, as chalk, limestone, &c."

That the justness of the conclusion about to be drawn from Dr Priestley's experiments may be more apparent, the phenomena were summed up in the two following propositions. "1. Phlogiston cannot act by itself without the assistance of air. 2. The emission of phlogiston is attended with the total destruction of the elasticity of a certain quantity of fixed air, which then ceases to be fluid. This was shown in the experiments: it is not the phlogistic substance which acts upon the air, but the elastic principle in the fixed air contained in the com-"
quantity, and takes its place: and hence proceeds the first diminution of the air, not from an accession of phlogiston, but from an escape of the elastic principle belonging to fixed air. The phlogiston and fixed particles of the air now hang loose like smoke or vapour, and are ready to be attracted by any thing capable of imbuing them; and hence proceeds the second diminution by agitation in water.

**Proof of a reception of the vivifying principles from the air.**

Now to apply this reasoning to the point in question: The blood is found to emit phlogiston from the lungs at every expiration: therefore we affirm that it had received a proportional quantity of elastic vapour which it had not before. Again: The air expelled from the lungs is found to contain much of the fixable part floating loose, and capable of being attracted by lime-water, &c.; therefore we say, this elastic principle hath come from that part of the atmosphere. But, to put the matter beyond doubt, the very inspection of arterial and venous blood will show, that the first hath a quantity of elastic matter in it which the last wants; and as the brain as well as all other parts of the body are supplied with arterial blood, we think it abundantly evident, that this elastic principle is absolutely essentially necessary to life; that it is continually expanded thereon; and that it may be said with the utmost propriety, that every time we draw the air into our lungs, we receive a portion of vivifying or vital spirit from it into our blood. Add to all this, that many substances which are commonly observed to phlogisticate air, appear to receive an elastic spirit by so doing. Putrefying bodies swell; they would not do so in vacuo; and therefore we must conclude, that they receive this elastic principle which swells them from the external air; and experience shows that it is communicated by this fixable part of the atmosphere.

The foregoing reasoning, which to us appeared sufficiently conclusive, leads to a very important discovery in natural philosophy, viz. That it is to the atmosphere, and to that particular part of it which goes by the name of fixed air, that we are every moment indebted for that vital spirit which animates our bodies, and is the immediate bond of union between our immaterial spirit and this visible world. It may be asked indeed, if fixed air is capable of supplying this spirit in such plenty, how comes it to be so instantly and totally fatal when breathed? The reply to this, however, is obvious: it communicates too great a degree of elasticity to the blood; whence the circulation is stopped, and instant death ensues. That this is really the case, appears from the following account of the symptoms observed on the dissection of persons who have been suffocated by this kind of air.

**Objection answered.**

1. The vessels of the brain are gorged with blood, and the ventricles of that viscus are filled sometimes with a frothy, sometimes with a bloody, serosity. 2. The trunk of the pulmonary artery is much distended, and the lungs appear nearly in a natural state. 3. The right ventricle and auricle of the heart, the venae cavae, and jugular veins, are full of frothy blood. 4. Bloody serosity is often found in the bronchiae. 5. The trunk of the pulmonary veins, and the left auricle, are either empty, or almost empty, of blood. 6. The blood found in the places that have been mentioned is generally fluid, and as it were in a dissolved state. It is easily extravasated into the cellular texture, of the heart particularly, because it is in this part that it abounds most. 7. The epiglottis in suffocated persons is raised, and the glottis open and free. 8. The tongue is much swelled, and can hardly be contained within the mouth.

9. The eyes protrude, and preserve their lustre to the second or third day. They are often even brighter than natural. 10. The body preserves its heat for a long time. Nay the heat is sometimes greater than it is during life, or at least consistently with health. 11. The limbs are flexible for a long time after death. 12. The face is more swelled, and often more red than usual. 13. The neck and upper extremities are sometimes so much swelled, that they appear to be inflamed. These swellings, however, do not, like edematous ones, preserve the impressions of the finger.

**This account seemed so much in favour of what we**

**Fixed air** had already advanced concerning the action of fixed supposed air, that no observation was made upon it farther than the cause that this elastic principle would seem also to be the cause of animal heat: for as the blood evidently received a vast quantity of elastic fluid, it also received a much greater proportion of heat than usual. Such was the mode of reasoning adopted at that time, derived from the discoveries which had been made corrected in Aerology. Succeeding discoveries, however, have made it evident, that fixed air is not one of the natural component parts of our atmosphere, but that it consists of two different fluids; one of which has been called phlogisticated, the other dephlogisticated, air. It is the latter which supplies the vital principle; and the above reasoning still holds good, only substituting the words dephlogisticated air for fixed air. The poisonous quality of the latter seems also still to depend on its too easy decomposition; by which means the elastic principle is discharged into the blood in such quantity as to burst the small vessels, as has already been observed. This is shown indeed by the remedies most proper for the recovery of those who have suffered from the noxious qualities of fixed air. These consist in evacuation, and especially sprinkling the body with cold water, in order to take off the superfluous heat, and produce an universal contraction of the vessels.

It now remains only to give some account of the Contractions means by which the circulation of the blood is carried on in the living body. From the time of Harvey till very lately, this was supposed to be chiefly the muscular power of the heart and arteries, which by some physiologists have been thought to be prodigiously great; and accordingly many calculations, requiring no small degree of mathematical knowledge to understand them, have been made of the forces requisite to perform this circulation. Other physiologists, however, have thought proper to take in several auxiliary helps, as the motion of the muscles, respiration, &c.; and from Dr Hales's experiment above mentioned, it appears that respiration hath a considerable influence in this matter. It cannot, however, be the sole cause, seeing the circulation is carried on in animals which do not respire. In 1773, Dr Wilson, in the lecture already quoted, suggested a new principle of motion, which we believe was never used before to account for the circulation of animal fluids. It is this very shortly: As the fluids of the New human body do all of them suffer a continual waste, and the consequent require a constant supply in proportion, Dr Wilson we must look upon their going out of the body to be
Blood. [750]

Blood. Even this cause, however, he says, would not be sufficient to carry on the circulation for a single moment, without the presence of another which he calls life, and does not consider as absolutely unmechanical, though we cannot reduce it either to mechanical rules or ideas.

But as we apprehend all speculations concerning such causes must be arbitrary and without foundation, we forbear to give any account of the doctor’s opinion on this subject.

It hath been a general opinion, that blood, as it exists in the bodies of animals, contains a considerable quantity of air; and indeed it is certain, that blood, after it has been drawn from the veins of any animal, and afterwards placed under the receiver of an air-pump, yields a very considerable quantity of air upon exhausting the receiver: but if a portion of any blood- vessel is tied up so as to prevent the escape of its contents, and then cut out of the body and placed under a receiver, it will not swell, or show the least sign of its containing any quantity of air whatever.

Blood was formerly held in great esteem as a medicine for some particular diseases. Baths of the blood of infants have been recommended as an infallible remedy of for the elephantiasis, &c.; and the blood of goats and some other animals was used by the Galenists, and is recommended even by Dr Mead in pleurisies: but the first abominable medicine, as well as the other, is now deservedly exploded. The principal use of blood in the arts is for making Russian blue, or sometimes for clarifying certain liquors; it is also recommended in agriculture as an excellent manure for fruit-trees. A mixture of blood with lime makes an exceedingly strong cement; and hence it is of use in the preparation of some chemical lutes, the making floors, &c. As a food it hath been disputed whether blood really affords any nourishment or not. The best judges, now, however, are generally agreed that it is very nutritious; and though out of the body, like the white of an egg, it is very insoluble, yet, like that too, in the body it is commonly of easy digestion. It is, however, highly alkalescent in hot climates: on which account the prohibition of it to the Israelites was very proper. Even in this country, when blood was used as food in great quantity, the scurvy was more frequent than at other times; but to a moderate use of it here no such objection takes place.

In some countries, we are told that the barbarians were accustomed to intoxicate themselves by drinking the warm blood of animals; and as it has been shown that this fluid is the immediate reservoir of the vital principle, it seems by no means improbable that it may be possessed of an incendiary quality. Some expressions in Scripture seem to countenance this hypothesis.

Religious uses of Blood. Among the ancients blood was used for the sealing and ratifying of covenants and alliances, which was done by the contracting parties drinking a little of each others blood; and for appeasing the manes of the dead; in order to which blood was offered on their tombs as part of the funeral ceremony.

The blood of victims was anciently the portion of the gods; and accordingly was poured or sprinkled on the altars in oblation to them.

The priests made another use of blood, viz. for divination:
Ecclesiastical judges retire, when judgment is to be
given in cases of blood, by reason the church is supposed
to abhor blood: it condemns no person to death; and
its members become irregular, or disabled from their
functions, by the effusion of blood.

Field of Blood, in Syriac Acedama, was a field pur-
chased by the Jews with the thirty pieces of silver
which had been given to Judas for betraying his mas-
ter, and which he had restored. It still serves for a
burial-ground, in which all pilgrims who die in their
pilgrimage at Jerusalem, are interred.

Blood-Hound, in Zoology, the canis sagax of Lin-
neas, le chien courant of Buffon, the sleuthhound of the Scots: The hound or dog, with long, smooth, and
pendulous ears. It was a dog of great use, and, in
high esteem with our ancestors: its employ was to re-
cover any game that had escaped wounded from the
hunter, or been killed and stole out of the forest. It
was remarkable for the acuteness of its smell, tracing
the lost beast by the blood it had spilt; from whence
the name is derived. This species could, with the ut-
most certainty, discover the thief by following his
footsteps, let the distance of his flight be ever so great,
and through the most secret and thickest covert; nor
would it cease its pursuit till it had taken the felon.
They were likewise used by Wallace and Bruce during
the civil wars. The poetical historians of the two he-
roes frequently relate very curious passages on this sub-
ject; of the service these dogs were of to their masters,
and the escapes they had from those of the enemy.
The blood-hound was in great request on the confines
of England and Scotland; where the borderers were con-
tinually preying on the herds and flocks of their neigh-
bours. The true blood-hound was large, strong, mus-
cular, broad-breasted, of a stern countenance, of a deep
tan-colour, and generally marked with a black spot
above each eye.

BLOOD-Wort. See ROMEX. BOTANY INDEX.
BLOOD, Thomas, generally known by the appella-
tion of Colonel Blood, was a disbanded officer of Oliver
Cromwell, famous for his daring crimes and his good
fortune. He was first distinguished by engaging in a
conspiracy to surprise the castle of Dublin; which was
defeated by the vigilance of the duke of Ormond, and
some of his accomplices were executed. Escaping to
England, he meditated revenge against Ormond; and
actually seized him one night in his coach at St James's
street, where he might have finished his purpose if he
had not studied refinements in his vengeance. He
bound him on horseback behind one of his associates,
resolving to hang him at Tyburn, with a paper pin-
ned to his breast: but, when they got into the fields,
the duke, in his efforts for liberty, threw himself and
the assassin, to whom he was fastened, to the ground;
and, while they were struggling in the mire, he was res-
cued by his servants; but the authors of this attempt
were not then discovered. A little after, in 1671, Blood
formed a design of carrying off the crown and regalia
from the Tower; a design to which he was prompted,
as well by the surprising boldness of the enterprise, as
by the views of profit. He was very near succeeding.
He had bound and wounded Edwards the keeper of
the jewel-office, and had got out of the Tower with his
prey; but was overtaken and seized, with some of his
associates. One of them was known to have been con-
cerned in the attempt upon Ormond; and Blood was
immediately concluded to be the ringleader. When
questioned, he frankly avowed the enterprise; but re-
used to discover his accomplices. "The fear of death
(his said) should never engage him either to deny a
guilt or betray a friend." All these extraordinary cir-
cumstances made him the general subject of conver-
sation; and the king was moved with an idle curiosity
to see and speak with a person so noted for his con-
trary and his crimes. Blood might now esteem himself
secure of pardon; and he wanted not address to
improve the opportunity. He told Charles, that he
had been engaged, with others, in a design to kill him
with a carabine above Battersea, where his majesty of-
ten went to bathe; that the cause of this resolution was
the severity exercised over the consciences of the godly,
in restraining the liberty of their religious assemblies:
that when he had taken his stand among the reeds, full
of these bloody resolutions, he found his heart checked
with an awe of majesty; and he not only relented him-
self, but diverted his associates from their purpose: that
he had long ago brought himself to an entire indiffer-
ence about life, which he now gave for lost; yet could
not forbear warning the king of the danger which
might attend his execution: that his associates had
bound themselves by the strictest oaths to revenge the
death of any of their confederacy; and that no precau-
tion or power could secure any one from the effect of
their desperate resolutions. Whether these considera-
tions excited fear or admiration in the king, they con-
formed his resolution of granting a pardon to Blood;
but he thought it a requisite point of decency first to
obtain the duke of Ormond's consent. Arlington came
to Ormond in the king's name, and desired that he
would not prosecute Blood, for reasons which he was
commanded to give him. The duke replied, that his
majesty's commands were the only reason that could be
given: and being sufficient, he might therefore spare
the rest. Charles carried his kindness to Blood still
farther; he granted him an estate of 3000 a-year in
Ireland; he encouraged his attendance about his per-
son; he showed him great countenance; and many ap-
plications were made to him for promoting their pretensions at court.
And while old Edwards, who had bravely ventured his
life, and had been wounded in defending the crown
and regalia, was forgotten and neglected, this man,
who deserved only to be stared at and detested as a
monster, became a kind of favourite. Blood enjoyed his
pension about ten years, till being charged with fixing
an imputation of a scandalous nature on the dukes
of Buckingham, he was thrown into prison, where he died
August 24. 1680.

BLOODY, something belonging to or abounding
with blood.

BLOODY-Flux. See MEDICINE INDEX.
BLOODY-Hand is when a trespasser is apprehended
in a forest with his hands or other parts bloody; which
is a circumstance of his having killed the deer, though
he be not found chasing or hunting them.

BLOODY-Rain. See RAIN.

BLOODY-Sweat. Many instances of this are recorded,
in which it has been owing to bodily disorder, or ex-
treme mental agitation and agony. See particularly
Aristotle's Hist. Animal. lib. iii. cap. 19, apud Oper.

BLOODY-Urine. See MEDICINE INDEX.

BLOOM, a mass of iron after having undergone the
first hammering called blomary. It has yet to under-
go many hammerings before it become iron fit for the
smith's use, and he first made what they call the en-
covy. See ANONY.

BLOOT, Peter, a Flemish painter, whose works
are not frequently seen in these kingdoms; nor are
they easily purchased in Holland, being carefully
reserved in private collections, and are highly esteemed.
The subjects he chose to paint were always taken from
the lowest life; such as boors drinking, feasting, danc-
ing, or quarrelling; shepherds piping, and some-
times the marriages of villagers. He was a faithful,
and indeed too servile an imitator of nature; never de-
parting from the actions, attitudes, or draperies of his
models. He showed a good knowledge of the chiar-
scuro and perspective; he had a delicate manner of
penciling, and his colouring was mellow; but he had
no idea of elegance; yet his pictures have in many
respects great merit, and his defects seem rather im-
putable to the taste of his country than to his own
genius; some of his works being for the lightness of
the touch, the neatness of handling, and transparency
of colour, equal to the best of his time. He died in
1667.

BLOSSOM, in a general sense, denotes the flower
of any plant. See the article FLOWER.

BLOSSOM, in a more proper sense, is restricted to
the flowers of trees which they put forth in the spring,
and
He became acquainted with a janizary at Venice, and conducted him into the Turkish dominions. Having been abroad two years, he returned and published a relation of his travels in the Levant, which went through several editions. He was knighted by Char. I. and was at the battle of Edge-Hill, at which time he is supposed to have had the charge of the young princes; but, after the king's death, was employed by the parliament, and by Cromwell. Yet after the restoration of the royal family he was appointed high sheriff of the county of Hertford, and from that time lived as a private gentleman above 20 years. He published, 1. An account of his travels. 2. Six comedies written by John Lilly, under the title of Court Comedies. 3. The Exchange Walk, a satire; and, 4. An Epistle in praise of Tobacco. He died October 9. 1682.

Blount, Sir Thomas Pope, baronet, an eminent writer, and the eldest son of the former, was born at Upper Holloway, in the county of Middlesex, September 12. 1649. He was educated under the eye of his father; and always distinguished himself as a lover of liberty, a sincere friend to his country, and a true patron of learning. He was advanced to the degree of baronet by King Charles II. in whose reign he was elected burgess for St Alban's in two parliaments, and was knight of the shire in three parliaments after the Revolution. He wrote in Latin, 1. A critique on the most celebrated writers. 2. Essays on several subjects. 3. A natural history, extracted out of the best modern writers; and, 4. Remarks upon poetry, with characters and censures of the most considerable poets, whether ancient or modern. He died June 30. 1697.

Blount, Charles, younger brother of Sir Thomas Pope Blount, had also an excellent capacity, and was an eminent writer. His Anima Mundi, or An Historical narration of the opinions of the ancients, concerning man's soul after this life, according to unenlightened nature, gave great offence, and was complained of to the bishop of London. But the work which rendered him most known, was his translation of Philostratus's Life of Apollonius Tyaneus, published in 1680; which was soon suppressed, as an attack on revealed religion. Another work of the same complexion he published the same year, called Great is Diana of the Ephesians, &c. in which, under colour of exposing superstition, he struck at revelation. In 1684, he printed a kind of Introduction to Polite Literature. In the warmth of his zeal for the Revolution, he wrote a pamphlet to prove King William and Queen Mary conquerors; which was condemned to be burnt by both houses of parliament. The close of his life was very unhappy. For, after the death of his wife, he became enamoured of her sister, who was only scrupulous against their union on account of their prior connexion by the marriage. On this subject he wrote a letter, as the case of a third person, with great learning and address. But the archbishop of Canterbury and other divines deciding against him, and the lady on this growing inflexible, threw him into a frenzy, in which he shot himself, in 1693. After his death, his miscellaneous pieces were collected and published.

Blow, Dr John, a famous musician and composer, was born in 1648 at North Collingham in the county...
 county of Nottingham; and was one of the first set of children after the Restoration, being bred up under Captain Henry Cook. He was also a pupil of Hingeston, organist to Oliver Cromwell, and after that of Dr Christopher Gibbons. On the 16th day of March, 1673, he was sworn one of the gentlemen of the chapel in the room of Roger Hill; and in July 1674, upon the decease of Mr Pelham Humphrey, was appointed master of the children of the chapel. In 1685, he was made one of his majesty's private music; and in 1687, was appointed almoner and master of the choristers of the cathedral church of St Paul. Blow was not a graduate of either university; but Archbishop San
croft, in virtue of his own authority in that respect, conferred on him the degree of doctor in music. Upon the decease of Purcell in 1695, he became organist of Westminster-abbey. In the year 1690, he was ap
pointed composer to his majesty, with a salary. Blow was a composer of anthems while a chapel-boy, and on the score of his merit, was distinguished by Charles II.

The king admired very much a little duet of Carissimi to the words 'Dite o Cielo,' and asked of Blow if he could imitate it. Blow modestly answered he would try; and composed in the same measure, and the same key of D with a minor third, that fine song, 'Go per
jured man.' The Orpheus Britannicus of Purcell had been published by his widow soon after his decease; and contained in it some of that author's finest songs: the
favourable reception it met with was a motive with Blow to the publication, in the year 1700, of a work of the same kind, entitled Amphion Anglicus, containing com
positions for one, two, three, and four voices, with accompaniments of instrumental music, and a thorough bass figured for the organ, harpsichord, or theorobulate.

To this book are prefixed commendatory verses by sundry persons; and among them an ode, in the second stanza of which are the following lines:

't His Gloria Patri long ago reach'd Rome,
'Sung and rever'd too in St Peter's dome;
'A canon will outlive her jubilees to come.'

The canon here meant is that fine one to which the Gloria Patri in Dr Blow's gamut service is set. Dr Blow set to music an ode for St Cecilia's day, in 1684, the words by Mr Oldham, published together with one of Purcell on the same occasion performed the pre
ceding year. He also composed and published a collection of lessons for the harpsichord or spinet, and an ode on the death of Purcell, written by Mr Dry
den. There are also extant of his composition sundry hymns printed in the 'Harmonia Sacra,' and a great number of catches in the latter editions of the Musical Companion. This great musician died in the year 1708, and lies buried in the north aisle of Westminster-abbey. On his monument is the canon above men
tioned, engraven on a book with an inscription above it.

BLOW, in a general sense, denotes a stroke given either with the hand, a weapon, or instrument. In fencing, blows differ from thrusts, as the former are given by striking, the latter by pushing.

Military BLOW, ala pa militari, that given with a sword on the neck or shoulder of a candidate for knighthood, in the ceremony of dubbing him. The custom seems to have taken its rise from the ancient ceremony of manumission. In giving the blow, the prince used the formula Est bonus miles, 'Be a va
liant soldier;' upon which the party rose a complete knight, and qualified to bear arms in his own right.

BLOW, in Law. See BATTERY.

Fly-BLOWS, the ova of flies deposited on flesh, or other substances proper for hatching them.

BLOW-Pipe, in Chemistry and Mineralogy, an instrument by which the blast of the breath may be directed upon the flame of a lamp or candle, in such a manner as to vitrify any small portion of mineral substance; and thus the process of assaying in the dry way may be performed in a very short time, where either want of instru
ments or opportunity prevents other methods from being used.

Mr Bergman observes, that this instrument is extremely useful to chemists, as many experiments are daily neglected, either because they require furnaces and a large apparatus of vessels; from the want of time to examine them in the ordinary way; or from the quantity required in the common way for exami
nation, when the matter may be too scarce or too dear. In all these cases the blow-pipe may be advantageously used; as 1. Most of the experiments which can be performed in the large way may also be done with the blow-pipe. 2. The experiments which in the large way require many hours, may in this method be finish
ed in a few minutes; and 3. The smallest particle is sufficient. The only defect is, that the proportions cannot be determined with any precision; and therefore experiments on a large scale are still to be prefered. See Chemistry and Mineralogy Index. See also BLOW-Pipe, SUPPLEMENT.

BLOWING, in a general sense, denotes an agita
tion of the air, whether performed with a pair of bells, the mouth, a tube, or the like. Butchers have a practice of blowing up veal, especially the loins, as soon as killed, with a pipe made of a sheep's Shank, to make it look larger and fairer.

BLOWING of Glass, one of the methods of forming the various kinds of works in the glass manufac
ture. It is performed by dipping the point of an iron blow
ning pipe in the melted glass, and blowing through it with the mouth, according to the circumstances of the glass to be blown. See GLASS.

BLOWING of Tin, denotes the melting its ore, after being first burnt to destroy the munde.

BLOWING Machines. See also BLOWING MACHINES, SUPPLEMENT.

BLOWING, among gardeners, denotes the action of flowers, whereby they open and display their leaves. In which sense, blowing amounts to much the same with flowering or blossoming.

The regular blowing season is in the spring; though some plants have other extraordinary times and man
ners of blowing, as the Glastonbury thorn. Divers flowers also, as the tulip, close every evening, and blow again in the morning. Annual plants blow sooner or later as their seeds are put in the ground; whence the curious in gardening sow some every month in summer, to have a constant succession of flowers. The blowing of roses may be retarded by soiling off the buds as they put forth.

BLUBBER, denotes the fat of whales and other large sea-animals, whereof is made train-oil. It is
properly the adge of the animal: it lies immediately under the skin, and over the muscular flesh. In the purpose it is firm and full of fibres, and invests the body about an inch thick. In the whale its thickness is ordinarily six inches; but about the under lip, it is found two or three feet thick. The whole quantity yielded by one of these animals ordinarily amounts to 40 or 50, sometimes to 80 or more, hundred weight. The use of blubber to the animal seems to be partly to poison the body, and render it equipollent to the water; partly to keep off the water at some distance from the blood, the immediate contact whereof would be apt to chill it; and partly also for the same use that clothes serve us, to keep the fish warm, by reflecting or reverberating the hot streams of the body, and so redoubling the heat: since all fat bodies are, by experience, found less sensible of the impressions of cold than lean ones. Its use in trade and manufactures is to furnish train-oil, which it does by boiling down. Formerly this was performed ashore in the country where the whales were caught: but of late the fishers do not go ashore; they bring the blubber home stowed in caasks, and afterwards boil it down in the preparation of the oil.

See Blubber. See Medusa.

BLUE, one of the seven colours into which the rays of light divide themselves when refracted through a glass prism. For an account of the particular structure of bodies by which they appear, a blue colour, see the article Chromatics. The principal blues used in painting are Prussian blue, bice, saunders blue, azure, or smalt, verditer, &c.; for the preparation of which, see Colour-Making. In dyeing, the principal ingredients for giving a blue colour, are indigo and woad. See Dyeing.

Blue Colour of the Sky. See Sky.

Blue Bird. See Motacilla, Ornithology Index.

Blue-Fish. See Coryphaena, Ichthyology Index.

Blue Japan. Take gum-water, what quantity you please; and white-lead a sufficient quantity; grind them well upon a porphry; then take the glass size what quantity you please, of the finest and best smalt, a sufficient quantity; mix them well; and which add, of your white-lead, before ground, so much as may give it a sufficient body. Mix all these together to the consistence of a paint.

Blue John, among miners, a kind of mineral which has lately been fabricated into vases and other ornamental figures. It is of the same quality with the cubical spar, with respect to its fusibility in the fire. It loses its colour, and becomes white in a moderate heat; the weight of a cubic foot of the bluest kind is 3180 ounces, and that of the least blue is 3140 ounces. This substance began first to be applied to use about 18 years ago at one of the oldest mines in Derbyshire, called Odin mine, probably from its being dedicated to Odin the great god of the northern nations, at the foot of a high mountain called Mam-Tor in Castleton. Here the greatest quantities are still found; the largest pieces are sold for 9l. a ton, the middle-sized for 6l. and the least for 50s.

Prussian Blue. See Chemistry Index.

Bluing, the act or art of communicating a blue colour to bodies otherwise destitute thereof. Laundresses blue their linen with smalt; dyers their stuffs and woools with wood or indigo.

Bluing of Metals is performed by heating them in the fire till they assume a blue colour; particularly practised by gliders, who blue their metals before they apply the gold and silver leaf.

Bluing of Iron, a method of beautifying that metal sometimes practised; as for mourning buckles, swords, and the like. The manner is thus: Take a piece of grindstone or whetstone, and rub hard on the work, to take off the black scurf from it: then heat it in the fire; and as it grows hot, the colour changes by degrees, coming first to light, then to a darker gold colour, and lastly to a blue. Sometimes they also grind indigo and salad-oil together; and rub the mixture on the work with a woollen rag, while it is heating, leaving it to cool of itself. Among sculptors we also find mention of bluing a figure of bronze, by which is meant the heating of it, to prepare it for the application of gold-leaf, because of the bluish cast it acquires in the operation.

Bluff-head, among sailors. A ship is said to be bluff-headed that has an upright stern.

Blunderbuss, a short fire-arm with a wide bore, capable of holding a number of bullets at once.

Blushing, a suffusion or redness of the cheeks, excited by a sense of shame, on account of consciousness of some failing or imperfection.

Blushing is supposed to be produced from a kind of consent or sympathy between several parts of the body, occasioned by the same nerve being extended to them all. Thus the fifth pair of nerves being branched from the brain to the eye, ear, muscles of the lips, cheeks, palate, tongue, and nose: a thing seen or heard that is shameful, affects the cheeks with blushes, driving the blood into the minute vessels thereof, at the same time that it affects the eye and ear. For the same reason it is, as Mr Derham observes, that a savoury thing seen or smelt affects the glands and parts of the mouth: if a thing heard be pleasing, it affects the muscles of the face with laughter: if melancholy, it exerts itself on the glands of the eyes, and occasions weeping, &c. And to the same cause Dr Willis ascribes the pleasure of kissing.

Boa, or Boa-aram, in Ancient Geography, an island on the coast of Illyricum over against Tragurium. A place of banishment for condemned persons; now called Buia, an island in the Adriatic, joined to the continent and to Tragurium, now Tran, by a bridge.

Boa. See Ophology Index.

Boadada Bashee, in the Turkish military orders, an officer of the janizaries whose business it is to walk every day about the principal parts of the city, with a number of janizaries to attend him, to keep order, and see that all things are regular, even to the dress. This office is for three months, and from this the person is usually advanced to be a serach.

Boadicea, a valiant British queen in the time of Nero, the emperor, wife to Frasutagus king of the Iceni in Britain, who by his will left the emperor and his own daughters co-heirs to his great treasures, in expectation of procuring by that means Nero's protection for his family and people: but he was no sooner dead, than the emperor's officers seiz'd all. Boadicea opposed these unjust proceedings, which was resisted.
to such a pitch of brutality, that they ordered the lady to be publicly whipped, and her daughters to be ravished by the soldiers. The Britons took arms, with Boudicca at their head, to shake off the Roman yoke; and made a general and bloody massacre of the Romans in all parts. The whole province of Britain would have been lost, if Suetonius Paulinus had not hastened from the isle of Mona to London, and with 10,000 men engaged the Britons. The battle was fought for a long time with great vigour and doubtful success, till at last victory inclined to the Romans. Boudicca, who had behaved with all the bravery imaginable, despatched herself by poison.

**Boar**

In the manage. A horse is said to boar when he shoots out his nose as high as his ears, and tosses his nose in the wind.

**Boar**, a male swine. See Sus.

The wild boar, among huntsmen, has several names, according to its different ages: the first it is called a pig of the saunter; the second it is called a hog; the third, a hog-steer; and the fourth, a boar; when leaving the saunter, he is called a singer or sanger. The boar generally lives to 25 or 30 years, if he escapes accidents. The time of going to rut is in December, and lasts about three weeks. They feed on all sorts of fruits, and on the roots of many plants; the root of fern in particular seems a great favourite with them; and when they frequent places near the sea-coasts, they will descend to the shores, and demolish the tenderer shell-fish in very great numbers. Their general places of rest are among the thickest bushes that can be found: and they are not easily put out of them, but will stand the bay a long time. In April and May they sleep more sound than at any other time of the year, and this is therefore the successful time for the taking them in the toils. When a boar is roused out of the thicket, he always goes from it, if possible, the same way by which he came to it; and when he is once up, he will never stop till he comes to some place of more security. If it happens that a saunter of them are found together, when any one breaks away, the rest all follow the same way. When the boar is hunted in the wood where he was bred, he will scarcely ever be brought to quit it; he will sometimes make towards the sides to listen to the noise of the dogs, but retires into the middle again, and usually dies or escapes there. When it happens that a boar runs a-head, he will not be stopped or put out of his way, by man or beast, so long as he has any strength left. He makes no doubles or crossings when chased; and, when killed, makes no noise, if an old boar; the sows and pigs will squeal when wounded.

The season for hunting the wild boar begins in September, and ends in December, when they go to rut. If it be a large boar, and one that has lain long at rest, he must be hunted with a great number of dogs, and those such as will keep close to him; and the huntsman, with his spear, should always be riding in among them, and charging the boar as often as he can, to discourage him: such a boar as this, with five or six couples of dogs, will run to the first convenient place of shelter, and there stand at bay and make at them as they attempt to come up with him. There ought always to be relays also set of the best and staunchest hounds, in the kennel; for if they are of young eager dogs, they will be apt to seize him, and be killed or spoiled before the rest come up. The putting collar with bells about the dogs' necks is a great security for them: for the boar will not so soon strike at them when they have these, but will rather run before them. The huntsmen generally kill the boar with their swords or spears: but great caution is necessary in making the blows; for he is very apt to catch them upon his snout or tusks; and if wounded and not killed, he will attack the huntsman in the most furious manner. The place to give the wound with the spear is either between the eyes in the middle of the forehead, or in the shoulder; both these places make the wound mortal.

When this creature makes at the hunter, there is nothing for it but courage and address; if he flies for it, he is surely overtaken and killed. If the boar comes straight up, he is to be received at the point of the spear; but if he makes doubles and windings, he is to be watched very cautiously, for he will attempt getting hold of the spear in his mouth; and if he does so, nothing can save the huntsman but another person attacking him behind; he will on this attack the second person, and the first must then attack him again: two people will thus have enough to do with him; and were it not for the forks of the boar-spears that make it impossible to press forward upon them, the huntsman who gives the creature his death wound, would seldom escape falling a sacrifice to his revenge for it. The modern way of boar-hunting is generally to dispatch the creature by all the huntsmen striking him at once; but the ancient Roman way was, for a person on foot, armed with a spear, to keep the creature at bay; and in this case the boar would run of himself upon the spear to come at the huntsman, and push forward till the spear pierced him through.

The hinder claws of a boar are called guards. In the corn, he is said to feed; in the meadows or fallow-fields, to rout, worm, or form; in a close, to grama. The boar is farrowed with as many teeth as he will ever have; his teeth only increasing in bigness, not in number: among these there are four called tusks, or touts; the two biggest of which do not hurt when he strikes, but serve only to whet the other two lowest, with which the beast defends himself, and frequently kills, as being greater and longer than the rest.

It is very remarkable, that these creatures in the West Indies are subject to the stone; few of them are absolutely free from it, yet scarcely any have the stones of any considerable size. It is common to find a great number in the same bladder; and they are usually of about a scruple weight, are angular, and very regular, each having five angles.

Among the ancient Romans a boar's flesh was a delicacy; a boar served up whole was a dish of state.

The boar was sometimes also the military ensign borne by the Roman armies, in lieu of the eagle.

Among physicians, a boar's bladder has been reputed a specific for the epilepsy. The tush of the wild boar still passes with some as of great efficacy in quinsies and pleurisies.

**BOARD**, a long piece of timber, sawed thin for building and several other purposes. See Timber.

Deal-boards are generally imported into England ready sawed, because done cheaper abroad, in regard as
BOA [ 757 ]

we want saw-mills. Cap-boards are imported from Sweden and Dantzig. Oak-boards chiefly from Sweden and Holland; some from Dantzig. We also import white boards for shoemakers; mill and scale-boards, &c. for divers artificers. Scale-board is a thinner sort, used for the covers of prancers, thin boxes, and the like. It is made with large planes; but might probably be sawed with mills to advantage.

Boards are also used for a kind of table or bench, whereon several artificers perform their work. In this sense we say a work-board, shop-board, tailor's-board, &c.

Boards is also used for a flat machine, or frame, used in certain games, and the like. In this sense, we say a draught-board, chess board, a shovel board, and the like.

Board, Bureau, is also used for an office where accounts are taken, payments ordered, and the like. In this sense, we say the board of works, board of ordnance, board of treasury, and the like.

Board, among seamen. To go aboard, signifies to go into the ship. To slip by the board, is to slip down by the ship's side. Board and board, is when two ships come so near as to touch one another, or when they lie side by side. To make a board, is to turn to windward; and the longer your boards are, the more you work into the wind. To board it up, is to beat it up, sometimes upon one tack and sometimes upon another. She makes a good board, that is, the ship advances much at one tack. The weather board, is that side of the ship which is to windward.

BOARDING, in a naval engagement, is a desperate and furious assault made by one ship on another, after having found every other method to reduce her ineffectually: it may be performed in different places of the ship, according to their circumstances and situation, by the assailant attaching a number of men armed with pistols and cutlasses on the decks of his antagonist, who stands in the same predicament with a city stormed by the besiegers. This expedient, however, is rarely attempted by king's ships, which generally decide the combat without grappling each other; but is chiefly practised by privateers, which, bearing down on the enemy's quarter or broadside, drop from the bowsprit, which projects over the defendant's deck, an earthen shell, called a stink-pot, charged with very and suffocating combustibles, which immediately bursts, catches fire, and fills the deck with inoffensive stench and smoke; in the middle of the confusion thus occasioned, the privateer's crew rush aboard, under cover of the smoke, and easily overpower the astonished enemy, unless they have close quarters to which they can retreat and beat them off the deck.

BOAT, a small open vessel, conducted on the water by rowing or sailing. The construction, machinery, and even the names of boats, are very different, according to the various purposes for which they are calculated, and the services on which they are employed. Thus they are occasionally slight or strong, sharp or flat bottomed, open or decked, plain or ornamented; as they may be designed for swiftness or burden, for deep or shallow water, for sailing in a harbour or at sea, and for convenience or pleasure.

The largest boat that usually accompanies a ship is the long-boat, which is generally furnished with a mast and sails: those which are fitted for men of war, may be occasionally decked, armed, and equipped, for cruising short distances against merchant ships of the enemy, or smugglers, or for impressing seamen, &c. The barges are next in order, which are longer, lighter, and narrower: they are employed to carry the principal sea-officers, as admirals, and captains of ships of war, and are very unfit for sea. Pinasses exactly resemble barges, only that they are somewhat smaller, and never row more than eight oars; whereas a barge properly never rows less than ten. These are for the accommodation of the lieutenants, &c. Cutters of a ship, are broader, deeper, and shorter, than the barges and pinasses; they are fitter for sailing, and are commonly employed in carrying stores, provisions, passengers, &c. to and from the ship. In the structure of this sort of boats, the lower edge of every plank in the side overlays the upper edge of the plank below, which is called by shipwrights clinch-work. Yawls are something less than cutters, nearly of the same form, and used for similar services; they are generally rowed with six oars.

The above boats more particularly belong to men of war; as merchant-ships have seldom more than two: viz. a long-boat and yawl; when they have a third, it is generally calculated for the countries to which they trade, and varies in its construction accordingly. Merchant-ships employed in the Mediterranean find it more convenient to use a lunch, which is longer, more flat-bottomed, and better adapted every way to the harbours of that sea, than a long-boat.

A wherry is a light sharp boat, used in a river or harbour for carrying passengers from place to place. Punts are a sort of oblong flat-bottomed boats, nearly resembling floating stages; they are used by shipwrights and caulkers, for bremming, caulking, or repairing a ship's bottom. A moses is a very flat broad boat, used by merchant-ships amongst the Caribbee islands, to bring hogsheads of sugar off from the sea beach to the shipping which are anchored in the roads. A felucca is a strong passage-boat used in the Mediterranean, from 10 to 16 banks of oars. The natives of Barbary often employ boats of this sort as cruisers.

For the larger sort of boats, see the articles CRAFT, CUTTER, PÉLAGUE, and SAILLOP. Of all the small boats, a Narrow punt seems to be the best calculated for a high sea, as it will often venture out to a great distance from the coast of that country, when a stout ship can hardly carry any sail.

An account of several trials made on a Boat, or Sloop, fit for inland navigation, coasting voyages, and short passages by sea, which is not, like ordinary vessels, liable to be overcast or sunk by winds, waves, water-spouts, or too heavy a boat; contrived and constructed by Monsieur Berthier, director of the bridges and causeways in France, &c. &c.] Some of these trials were made on the first of August 1777, at the gate of the Invalids in Paris, in the presence of the provost of the merchants, of the body of the town, and a numerous concourse of spectators of all conditions.

The experiments were made in the way of comparison with another common boat of the same place, and of equal size. Both boats had been built ten years, and their exterior forms appeared to be exactly similar. The common boat contained only eight men, who rocked it and made it incline so much to one side, that
it presently filled with water, and sunk; so that the men were obliged to save themselves by swimming; a thing common in all vessels of the same kind, either from the imprudence of those who are in them, the strength of the waves or wind, a violent or unexpected shock, their being overloaded, or overpowering in any other way.

The same men who had just escaped from the boat which sunk, got into the boat of M. Bernieries; rocked it, and filled it, as they had done the other, with water. But, instead of sinking to the bottom, though brim full, it bore being rowed about the river, loaded as it was with men and water, without any danger to the people in it.

M. Bernieries carried the trial still farther. He ordered a mast to be erected in this same boat, when filled with water; and to the top of the mast had a rope fastened, and drawn till the end of the mast touched the surface of the river, so that the boat was entirely on one side, a position into which neither winds nor waves could bring her; yet as soon as the men who had hauled her into this situation let go the rope, the boat and mast recovered themselves perfectly in less than the quarter of a second; a convincing proof that the boat could neither be sunk nor overturned, and that it afforded the greatest possible security in every way. These experiments appeared to give the greater pleasure to the public, as the advantages of the discovery are not only so sensible, but of the first importance to mankind.

See CANCELO.

Boat-Insect. See NOTONECTA, ENTOMOLOGY Index.

BOATING, a kind of punishment in use among the ancient Persians for capital offenders. The manner of boating was thus: the person condemned to it being laid on his back in a boat, and having his hands stretched out, and tied fast on each side of him, had another boat put over him, his head being left out through a place fit for it. In this posture they fed him, till the worms, which were bred in the excrements he voided as he thus lay, ate out his bowels, and so caused his death, which was usually 20 days in effecting, the criminal lying all this while in most exquisite torments.

BOATSWAIN, the officer who has the boats, sails, rigging, colours, anchors, and cables, committed to his charge.

It is the duty of the boatswain particularly to direct whatever relates to the rigging of a ship, after she is equipped from a royal dock-yard. Thus he is to observe that the masts are properly supported by their shrouds, stays, and back-stays, so that each of those ropes may sustain a proportional effort, when the mast is strained by the violence of the wind, or the agitation of the ship. He ought also to take care that the blocks and running-ropes are regularly placed, so as to answer the purposes for which they are intended; and that the sails are properly fitted to their yards and stays, and well furled or reefed when occasion requires.

It is likewise his office to summon the crew to their duty; to assist with his mates in the necessary business of the ship; and to relieve the watch when it expires. He ought frequently to examine the condition of the masts, sails, and rigging; and remove whatever may be judged unfit for service, or supply what is deficient; and he is ordered by his instructions to perform this duty with as little noise as possible.

BOATSWAIN's Mate has the peculiar command of the long-boat, for the setting forth of anchors, weighing or fetching home an anchor, warping, towing, or hoisting; and is to give an account of his store.

BOB, a term used for the ball of a short pendulum.

BORAX. See BORAXINE.

BOBBIN, a small piece of wood turned in the form of a cylinder, with a little border jutting out at each end, bored through to receive a small iron pivot. It serves to spin with the spinning-wheel, or to wind thread, worsted, hair, cotton, silk, gold, and silver.

BOBBING, among fishermen, a particular manner of catching eels, different from snigling. Bobbing for eels is thus performed: They scour well some large lobe, and with a needle run a twisted silk through them from end to end, taking so many as that they may warp them about a board a dozen times at least: then they tie them fast with the two ends of the silk, that they may hang in so many banks; which done, they fasten all to a strong cord, and, about a handful and a ball above the worms, fix a plummet three quarters of a pound weight, and make the cord fast to a strong pole. With this apparatus fishing in muddy water they feel the eels tug lustily at the bait; when they think they have swallowed it sufficiently, they gently draw up the rope to the top, and bring them ashore.

BOBIO, an episcopal town of Italy, in the Sardian part of the Milanese, seated on the river Trebia, in L. Long 9. 30. N. Lat. 44. 48.

BOCA CHICA, the strait or entrance into the harbour of Carthagena in South America. It is defended by several forts belonging to the Spaniards, all which were taken by the English in 1741; they were nevertheless obliged to raise the siege of Carthagena in a short time after.

BOCADEL-Drago, a strait so called, between the island of Trinidad and Andalusia, in the province of Terra Firme in South America.

BOCANUM, in Ancient Geography, a town of Mauritania Tingitana, to the south of Mount Atlas; said to be that of Morocco in Africa. W. Long. 9. 0. N. Lat. 31. 0.

BOCCA, in glass-making, the round hole in the working furnace, by which the metal is taken out of the great pots, and by which the pots are put into the furnace. This is to be stopped with a cover made of earth and brick, and removable at pleasure, to preserve the eyes of the workmen from the violence of the heat.

BOCCACE, or Boccacio, John, one of the most polite and learned writers of his age, was born in Tuscany in 1313. His father first placed him with a merchant; but as he gave signs of genius, he was put afterward to study the canon law: he lost almost as much time at this as at the last occupation; and thought of nothing but poetry. He came under the instruction of Petrarch; but did not so entirely devote himself to poetry, as to forget other studies. In the prosecution of these, however, as he sought everywhere for the best masters, and had not an income sufficient for his expenses, he was reduced to such circumstances as to stand in need of the bounty of others; he was particularly obliged to Petrarch, who furnished him with money as well as books, and assisted him in many other respects. Boccace was a great admirer of the
the Greek language: he found means to get Homer translated into Latin for his own use; and procured a professor's chair at Florence for Leonis Pylatus, in order to explain this poet. The republic of Florence honoured Boccace with the freedom of that city; and employed him in public affairs, particularly to negotiate the return of Petrarch: but this poet not only refused to return to Florence, but persuaded Boccace also to retire from thence, on account of the factions which prevailed in that republic. Having quitted Florence, he went to several places in Italy, and stopped at last at the court of Naples, where King Robert gave him a very kind reception. He conceived a violent affection for the natural daughter of that prince, which made him remain a considerable time at Naples. He also made a long stay in Sicily, where he was in high favour with Queen Joan. He returned to Florence when the troubles were a little appeased: but not liking the course of life he must have followed there, he retired to Certaldo; and, far from the noise of business, he spent his time in study agreeably to his own honour. His great application brought on him an indisposition, of which he died in 1376. He wrote several books, some learned and serious, others of gallantry and full of stories. It is by his Decameron chiefly that he has immortalized himself. Petrarch found so many charms in this composition, that he was at the pains to translate it into Latin for his own satisfaction.

BOCCALE, or BOCAL, a liquid measure used at Rome, answering to what among us is called a bottle, being equivalent to about an English quart. Seven boccales and a half make the rubbia.

BOCCALINI, Trajan, a celebrated satirical writer, born at Rome, who, in the beginning of the 17th century, obtained the admiration of all Italy by his refined and delicate criticisms. Sovereign princes themselves did not escape the lash of his satire. The cardinals Borghese and Gesta having declared themselves his protectors, he published his Ragguaglio di Parnasso, and La Secretaria di Apollo, which is the continuation of the former. These two works were received by the public with uncommon applause. He there feigned, that Apollo, holding his court at Parnassus, heard the complaints of the whole world, and did justice according as the cases required. He at length printed his Pietra de Paradone; wherein he attacks the court of Spain, setting forth their designs against the liberty of Italy, and inveighing particularly against them for the tyranny they exercised in the kingdom of Naples. The Spaniards complained of him in form, and were determined at any rate to be revenged. Boccalini was frightened, and retired to Venice; but was there assassinated in a very strange manner. He lodged with one of his friends, who having got up early one morning, left Boccalini in bed: a minute after, some armed men entered his chamber, and gave him so many blows with bags full of sand, that they left him for dead; so that his friend returning some time after, found him speechless. Great search was made at Venice for the authors of this murder; and though they were never discovered, it was universally believed that they were employed by the court of Spain.

BOCCARELLA, in the glass-manufacture, a small hole or aperture of the furnace, one of which is placed on each side of the bocca, almost horizontally with it. Out of them the servitors take coloured or finer metal from the piling pot.

BOCCARDI, Clemente, called Clementone, historian and portrait painter, was born at Genoa in 1620, and was the disciple of Bernardo Strozzi, an artist of good reputation; but he found in himself so strong an ambition to arrive at excellence in his profession, that he left Genoa and went to Rome; there to explore that true sublimity of style, which can only be obtained by a judicious observation of the ancient sculptures and the works of the celebrated modern artists. By the guidance of an excellent genius, and also by a most industrious application to design, he discovered the art of uniting and blending the antique and modern gusto in a style that at once exhibited both gracefulness and strength. Most of the works of this master (except his portraits, which were lively, natural, and graceful) are in the chapels of Genoa, Pisa, and other cities of Italy; of which places they are, at this day, accounted the greatest ornaments, and are most exceedingly esteemed.

BOCCONI, Sylvio, a celebrated natural historian, born at Palermo in Sicily. After he had gone through the usual course of studies, he applied himself chiefly to natural history, in which he made a most surprising progress. He was afterwards ordained priest, and entered into the Cistercian order, at which time he changed his Christian name Paul into that of Sylvio. This new way of life did not in the least divert him from his favourite study: for he pursued it with greater vigour than ever, and travelled not only over Sicily, but likewise visited the isle of Malta, Italy, the Low Countries, England, France, Germany, Poland, and several other nations; and, in 1656, was admitted a member of the academy of the virtuosi in Germany. Upon his return to Sicily, he retired to a convent of his own order near Palermo; where he died in 1704, being 71 years of age. He left many curious works.

BOCCONIA, Greater Tree Celandine. See Botany Index.

BOCHART, Samuel, one of the most learned men in the 17th century, was born at Aum in Normandy. He made a very early progress in learning, and became a great proficient in the oriental languages. He was many years pastor of a Protestant church at Caen; where he was tutor to Wentworth Dillon earl of Roscomon, author of the Essay on Translated Verse. Here he particularly distinguished himself by his public disputations with Father Veron, a very famous controvertist. The dispute was held in the castle of Caen, in the presence of a great number of Catholics and Protestants. Bochart came off with great honour and reputation: which were not a little increased in the year 1646, upon the publication of his Phaës and Canaan, which are the titles of the two parts of his Geographia Sacra. He acquired also great fame by his Hierosolymon, printed in London in 1675. This treatise de animalibus sacræ scripturæ. The great learning he displayed in his works rendered him esteemed not only among those of his own profession, but amongst all lovers of knowledge of whatever denomination. In 1652, the queen of Sweden invited him to Stockholm, where she gave him many proofs of her regard and esteem. At his return to Caen, he resumed the functions of the ministry,
BODKIN, a small instrument made of steel, bone, ivory, &c. used for making holes.

BODLEY, SIR THOMAS, founder of the Bodleian library at Oxford, was born at Exeter in Devonshire, in 1544. When he was about 12 years of age, his father, Mr John Bodley, being a Protestant, was obliged to leave the kingdom. He settled at Geneva with his family, and continued there till the death of Queen Mary. In that university, then in its infancy, young Bodley studied the learned languages, &c. under several eminent professors. On the accession of Queen Elizabeth, he returned with his father to England; and was soon after entered at Magdalen college in Oxford. In 1563, he took the degree of bachelor of arts, and the year following was admitted fellow of Merton college. In 1565, he read a Greek lecture in the hall of that college. He took a master of arts degree the year after, and read natural philosophy in the public schools. In 1569, he was one of the proctors of the university, and for some time assessor as public orator. In the year 1576, he quitted Oxford, and made the tour of Europe; but returned to his college after four years absence. He became gentleman usher to Queen Elizabeth, in the year 1583; and in 1585 he married the widow of Mr Bell, daughter of Mr Carew of Bristol, a lady of considerable fortune. Mr Bodley was soon after sent ambassador to the king of Denmark, and other German princes. He was next charged with an important commission to Henry III. of France; and in 1588, went ambassador to the United Provinces, where he continued till the year 1597. On his return to England, finding his preference obstructed by the jarring interests of Burleigh and Essex, he retired from court, and could never afterwards be prevailed on to accept of any employment. He now began the foundation of the Bodleian library, which was completed in 1599. Soon after the accession of King James I. he received the honour of knighthood, and died in the year 1612. He was buried in the choir of Merton college. His monument is of black and white marble, on which stands his effigy in a scholar's gown, surrounded with books. At the four corners are the emblematical figures of Grammar, Rhetoric, Music, and Arithmetic; two angels, &c.; with a short inscription, signifying his age and time of his death. Sir Thomas Bodley was a polite scholar, an able statesman, and a worthy man. Mr Grainger observes, that he merited much as a man of letters; but incomparably more in the ample provision he made for literature, in which he stands unrivalled; and that his library is a mausoleum which will perpetuate his memory as long as books themselves endure. Sir Thomas wrote his own Life to the year 1609; which, together with the first draught of the Statutes, and his Letters, have been published from the
Gratitude for this promotion engaged him to write with particular attention the Life of that prelate. It appeared in the history of the diocese of Aberdeen; and may be considered, perhaps, as the most valuable portion of that work. His History of Scotland, a more useful undertaking, was first published in the year 1526. In 1574 it underwent a second impression, and was enriched with the 18th book and a part of the 19th. A farther continuation of it was executed by Joannes Ferrierius Pedemontannus. Boece died about the year 1550. He has been compared, and not without reason, to Geoffrey of Monmouth. He had a propensity to fable and exaggeration; a fault which the elegance of his expression does not compensate. His judgment was not equal to his genius; and his fictions as a historian are a contrast to his probity as a man. John Ballenden, archdeacon of Murray, translated his history into the Scottish language at the desire of James V. This translation William Harrison converted, though with imperfections, into English; and his associate Hollingshead published his work in his chronicle, with additions and improvements by the ingenious Francis Thynne.

BOEDROMIA, in antiquity, solemn feasts held at Athens in memory of the sacrifice bought by Ion to the Athenians, when invaded by Eumolpus son of Neptune in the reign of Erechtheus. Plutarch gives another account of the Boedromia; which, according to him, were celebrated in memory of the victory obtained by Theseus over the Amazons, in the month Boedromion.

BOEDROMION, in Chronology, the third month of the Athenian year, answering to the latter part of our August and beginning of September.

BOEHEMEN, JACOB, called the Teutonic philosopher, was a noted visionary of the 17th century, born in a village of Germany near Gorlitz, in 1575. He was bred a shoemaker: and marrying, supported a large family by this occupation; until, after amusing himself with chemistry, a visionary turn of mind, heated by sermons and German divinity, got the better of his common sense, and produced raptures and notions of divine illumination. These he first gave vent to in 1612, by a treatise entitled Aurora, or the Rising of the Sun; being a mixture of astrology, philosophy, chemistry, and divinity, written in a quaint obscure style. This being censured by the magistrates of Gorlitz, he remained silent for seven years; but improving that interval by pursuing the flights of his imagination, he resumed his pen; and resolving to redeem the time he had lost, in the remaining five years of his life, he published above 20 books, which greatly needed what he concluded with, A Table of his Principles, or a Key to his Writings; though this has not proved sufficient to render them intelligible to common apprehensions. The key above mentioned appeared in 1624, and he did not long survive it. For early in the morning of the 18th of November that year, he called one of his sons, and asked him "if he also heard that excellent music?" to which being answered in the negative, he ordered the door to be set open, that the music might be the better heard. He asked afterwards what o'clock it was? and being told it had struck two, he said "It is not yet my time; my time is three hours hence." In the interim he was heard to speak these words:
"O thou strong God of hosts, deliver me according to thy will! O thou crucified Lord Jesus, have mercy upon me, and receive me into thy kingdom!" When it was near six o'clock, he took his leave of his wife and sons, and blessed them, and said, "Now I go hence into paradise!" then bidding his son turn him, he immediately expired his last breath in a deep sigh. A great number of persons have been misled by the visions of this fanatic, notwithstanding his talents in involving the plainest things in mystery and enigmatical jargon. Among others, the famous Quirinus Kahl- man may be reckoned the principal of his followers in Germany: who says, he had learned more being alone in his study, from Boehmen, than he could have learned from all the wise men of that age together; and, that we may not be in the dark as to what sort of knowledge this was, he acquaints us, that amidst an infinite number of visions it happened, that, being snatched out of his study, he saw thousands of thousands of lights rising round about him. Nor has he been without admirers, and those in no small number, in England: among the foremost of whom stands the famous Mr William Law, author of Christian Perfection, &c. who has favoured his countrymen with an English edition of Jacob Boehmen's works in 2 vols. 4to.

BOETOTIA, the name of two ancient kingdoms, one of which was founded or rather restored by Cadmus, and named by him Boeotia, from the ox which is said to have directed him to the place where he built the capital of his new kingdom, better known afterwards by the name of Thebes. But as the inhabitants were scarcely ever distinguished as a nation by the name of Boeotians, but of Thebans, we refer to the article THEBES for their history, &c.

The other Boeotia was in Thessaly, and is said to have been founded by Bocotus the son of Neptune and brother of Aetolus, by Arce the daughter of Aetolus, king of Aetolia. This last, having sent his daughter to Metapontum a city of Italy, she was there delivered of those two sons, the eldest of whom she called after her father's name Eolus; and he possessed himself of the islands in the Tyrrenian sea, the Tuscan sea, and built the city of Lipara. Bocotus the younger son went to his grandfather and succeeded him in his kingdom, called it after his own name, and the capital city Anea, from his mother. All that we know of these Boeotians is, that they held this settlement upwards of 200 years; and that the Thessalians expelled them from it; upon which they came and took possession of that country, which till then had been called Cadmeia, and gave it the name of Boeotia. Diodorus and Homer tell us, that these Boeotians signalized themselves at the Trojan war; and the latter adds, that five of Bocotus's grandsons, viz. Peleus, Leitus, Pro裥or, Arceius, and Clonius, were the chiefs who led the Boeotian troops thither.

BOERHAAVE, HERMAN, one of the greatest physicians, as well as the best men, that this or perhaps any age has ever produced, was born in 1668, at Vorhout, a village near Leyden. At the age of 16 he found himself without parents, protection, advice, or counsel. He had already studied theology and the other ecclesiastical sciences, with the design of devoting himself to a clerical life; but the science of nature,
BOERHAVAE

The page contains a passage discussing the life and writings of Boerhaave, noting his suppression of impetuous and ungodly passions. It mentions his service to the sick, his medical practices, and his dedication to Christianity. The passage also highlights his work on pharmacology, comparing his school of medicine to that of Boethius. The text is a part of a larger work, possibly a medical or philosophical treatise, discussing the life and legacy of Boerhaave.
and, as well to enrich his mind with the study of philosophy as to perfect himself in the Greek language, he was sent to Athens. Returning young to Rome, he was soon distinguished for his learning and virtue, and promoted to the principal dignities in the state, and at length to the consulate. Living in great affluence and splendour, he addicted himself to the study of theology, mathematics, ethics, and logic; and how great a master he became in each of these branches of learning, appears from those works of his now extant. The great offices which he bore in the state, and his consummate wisdom and inflexible integrity, procured him such a share in the public councils, as proved in the end his destruction: for as he employed his interest with the king for the protection and encouragement of deserving men, so he exerted his utmost efforts in the detection of fraud, the repressing of violence, and the defence of the state against invaders. At this time Theodoric the Goth had attempted to ravage Campania; and it was owing to the vigilance and resolution of Boethius that this country was preserved from destruction. At length, having murdered Odoacer, Theodoric became king of Italy, where he governed 33 years with prudence and moderation, during which time Boethius possessed a large share of his esteem and confidence. It happened about this time that Justin, the emperor of the east, upon his succeeding to Anastasius, made an edict condemning all the Arians, except the Goths, to perpetual banishment from the eastern empire: in this edict Hormisdas bishop of Rome, and also the senate, concurred. But Theodoric, who, as being a Goth, was an Arian, was extremely troubled at it; and conceived an aversion against the senate for the share they had borne in this proscription. Of this disposition in the king, three men of profligate lives and desperate fortunes, Gaudentius, Obilo, and Basilius, took advantage. Having entertained a secret desire of revenge against Boethius, for having been instrumental in the dismissal of the latter from a lucrative employment under the king, they accused him of treason and crimes; such as subverting the state, and whereof was to involve the whole senate in the guilt of treason; and an attempt, by dethroning the king, to restore the liberty of Italy; and, lastly, they suggested, that, to acquire the honours he was in possession of, Boethius had had recourse to magical art. Boethius was at this time at a great distance from Rome; however, Theodoric transmitted the complaint to the senate, enforcing it with a suggestion that the safety, as well of the people as the prince, was rendered very precarious by this supposed design to exterminate the Goths. The senate, perhaps fearing the resentment of the king, and having nothing to hope from the success of an enterprise which, supposing it ever to have been meditated, was now rendered abortive, without summoning him to his defence, condemned Boethius to death. The king, however, apprehending some bad consequence from the execution of a sentence so flagrantly unjust, mitigated it to banishment. The place of his exile was Ticinum, now the city of Pavia, in Italy. Being in that place separated from his relations, who had not been permitted to follow him into his retirement, he endeavoured to derive from philosophy those comforts which that alone was capable of affording to one in his forlorn situation, sequestered from his friends, in the power of his enemies, and at the mercy of a capricious tyrant; and accordingly he there composed that valuable discourse, entitled, De Consolatione Philosophiae.

About two years after his banishment Boethius was beheaded in prison by the command of Theodoric. His tomb is to be seen in the church of St Augustine, at Pavia, near the steps of the chancel.

The extensive learning and eloquence of this great man are conspicuous in his works, which seem to have been collected with great care: an edition of them was printed at Venice, in one volume folio, in 1549. In 1570, Glareanus, of Basil, collated that with several manuscripts, and published it, with a few various readings in the margin. His chief performance is that above mentioned, De Consolatione Philosophiae; a work well known in the learned world, and to which the afflicted have often applied. In particular, our Saxon King Alfred, whose reign, though happy upon the whole, was attended with great vicissitudes of fortune, had recourse to it at a time when his distresses compelled him to seek retirement: and that he might the better impress upon his mind the noble sentiments inscribed in it, he made a complete translation of it into the Saxon language, which, within these few years, has been given to the world in its proper character. And Camden relates, that Queen Elizabeth, during the time of her confinement by her sister Mary, to mitigate her grief, read and afterwards translated it into very elegant English. But it deserves also particular notice, that he is the most considerable of all the Latin writers on music; and that his treatise De Musica supplied for centuries the want of those Greek manuscripts which were supposed to have been lost.

BOG properly signifies a quagmire, covered with grass, but not solid enough to support the weight of the body; in which sense it differs only from marshes or fens, as a part from the whole: some even restrain the term bog to quagmires pent up between two hills; whereas fens lie in champaign and low countries, where the descent is very small. In the ancient borrow lands, a good method is, to make trenches of a sufficient depth to carry off the moisture; and if these are partly filled up with rough stones, and then covered with thornbushes and straw, to keep the earth from filling up the interstices, a stratum of good earth and turf may be laid over all; the cavities among the stones will give passage to the water, and the turf will grow at top.

BOG, or Bog of Gight, a small town of Scotland, seated near the mouth of the river Spey, in W. Long. 2. 23. N. Lat. 57. 48.

BOGALCUND, a province of Hindostan. See Supplemment.

BOGARMTÆ. See Bogomil.

BOCHO, or Buell, a town in the county of Nice in Piedmont, situated in the frontiers of France, in E. Long. 6. 45. N. Lat. 44. 12.

BOGOLIO, a district in the territories of the duke of Savoy, lying on the river Tinca on the frontiers of Provence; the capital is of the same name.

BOGOLIO, a town of Piedmont, and county of Nice, being the capital of a territory of the same name. E. Long. 6. 55. N. Lat. 44. 5.

BOGOMILTI, or Bogarmitæ, in church history,
BOHEMIA, a kingdom of Europe subject to the house of Austria, and surrounded on every side with woods and mountains as with a natural rampart. It is bounded on the east by Moravia and part of Silesia, on the north by Lusatia and Upper Saxony, on the west by Franconia, and on the south by Bavaria. Although this kingdom is situated in the middle of Germany, and its king is an elector of the empire, it has nevertheless its particular assemblies, customs, and language, different from the Germans. It is one of the most elevated countries of Europe; for no river enters into it, though many have their source there; the chief of which are the Elbe, the Oder, the Vistula, and the Morava. Its greatest length is 200 miles, its breadth 180, and it comprehends an area of 20,000 square miles. The climate of the interior is temperate and healthy, but on the frontiers it is raw and inclement, on account of the high grounds. The soil is generally rich. Besides corn, flax, hemp, hops, saffron, it produces wine, though only in small quantity. Nearly one-third of the country is covered with wood. It is rich in minerals. Its gold mines are exhausted; but it has mines of silver, iron, copper, lead, cobalt, zinc, calamine, antimony, pitch; and its mines of tin are next in value to those of Cornwall. Its manufactures consist of yarn, linen, cambric, stockings, lace, woolen stuffs, glass, cotton and silk stuffs, leather, &c; and amounted in value in 1792 to 3,630,000 sterling, of which about a third is exported.

Bohemia is the most populous of all the Austrian dominions beyond the Alps. The number of inhabitants in 1789 was 2,852,463, and in 1817 it was 3,236,140. The Bohemian nobility consists of 10 princes, 110 counts, 82 barons, and 239 knights. The original language of the people is a dialect of the Sclavonian; but German is spoken in all the large towns. The established religion is the Roman Catholic; but there are about 200,000 dissenters, consisting of Jews, Lutherans, and Calvinists. There is a university at Prague, the chief town, and there are about 2200 schools in the country.

The name Bohemia, in the German language, signifies the home or abode of the Boi, a people of ancient Gaul, who under their leader, Sergoeus, settled in that country about 500 years before the Christian era. The Boi were soon after expelled by the Marcomanni, a nation of the Suevi, who were afterwards subdued by the Scali, a people of Scythia, whose language is still spoken in Bohemia and Moravia. Notwithstanding this expulsion of the Boi, the present inhabitants are still called Bohemians by foreigners, but the natives call themselves Zeche. At first they were governed by dukes; but the emperor Otto I. conquered the duke of Bohemia, and reduced the province under the empire. Afterwards Henry V. gave the title of king to Ladislaus duke of Bohemia; and since that time these kings have been electors and chief cup-bearers of the empire, and the kingdom has been elective; which privileges have been confirmed by the golden bull. Formerly the kings of Bohemia received the kingdom as a fief of the empire, which ceremony was practised upon the frontiers; after which the standards of the principalities of which it is composed were given to them, without being torn and given to the people, as is done with the ensigns of the other fiefs of the empire. Ferdinand I. of Austria, having married Anne, sister of Louis, last king of Bohemia, who died without issue, and being elected king, that kingdom has remained in his family ever since. But the crown is conferred with some appearance of election; which right the states of Bohemia still pretend to claim, notwithstanding that, by the treaty of Westphalia, Bohemia is declared hereditary in the house of Austria.

The king of Bohemia was formerly the first secular elector, and gave his opinion after the elector of Cologne. The states of Bohemia have never been represented in the government but in the circles of the empire; they are not subject to any of its jurisdictions, nor to the Roman months, taxes, or public contributions; and they owed nothing to the empire but what the king voluntarily imposed upon himself. The government of Bohemia is different from that of all other states, the affairs of the kingdom being managed by six different courts. First, the council of the regency, or the great royal council, in which presides the great judge or burgrave of Bohemia, and who has under him 18 lieutenants of the king and other assessors. Secondly, the council or superior chamber of justice, at which the great master of the kingdom is president. Thirdly, the chamber of fiefs. Fourthly, the new tribunals to judge the appeals of the German vassals in their differences on the account of fiefs; which court has also its president, vice-president, and assessors. Fifthly, the royal chamber of finances, which has a president and vice-president. Sixthly, the chancery, which always follows the court. Besides, every circle of Bohemia is governed by two bailiffs, who administer justice in their prefecture. The states are composed of the clergy, lords, nobles, and burghers. As to Moravia, there is a grand bailiff who governs it in the name of the king of Bohemia, as margrave of Moravia. He is at the head of the royal council, which is composed of three assessors, and in which all is transacted in the name of the king. This province is divided into five circles, each of which has a bailiff. There are, besides, other officers of justice, who have a right of judging only at certain times, and in particular cases, where an appeal is allowed.

Bohemia was divided by the emperor Charles IV. into 12 provinces, in each of which he ordered two captains to be appointed every year for the administration of the government. The same emperor caused the church of Prague to be erected into an archbishopric, with
with this advantage, that the archbishop of Prague should have the prerogative that the archbishop of Mentz formerly enjoyed, viz. of crowning the king of Bohemia. The duchy of Silesia, the marquisate of Moravia, and that of Lusatia, formerly held of this crown; but now only that of Moravia, which is incorporated with the kingdom of Bohemia, and is in the possession of the house of Austria. The total revenue of Bohemia is about 3,000,000l. sterling; and its peace establishment amounts to 30,000 or 60,000 men. The only remarkable occurrence in the Bohemian history, is the rebellion of the disciples of John Huss, and Jerome of Prague, on account of their leaders having been burnt as heretics. This occasioned a bloody war of 16 years continuance; for a particular account of which, see the article Hussites.

**BOHEMIAN BOLE.** See BOLE.

**BOHEMIAN BRETHREN.** A sect of Christian reformers which sprung up in Bohemia in the year 1457. They treated the pope and cardinals as antichrist, and the church of Rome as the whore spoken of in the Revelation. They rejected the sacraments of the Romish church, and chose laymen for their ministers. They held the Scriptures to be the only rule of faith, and rejected the popish ceremonies in the celebration of the mass, nor did they make use of any other prayer than the Lord's Prayer. They consecrated leavened bread. They allowed no adornment but of Jesus Christ, in the communion. They rebaptized all such as joined themselves to their congregations. They abhorred the worship of saints and images, prayers for the dead, celibacy, vows, and fasts; and kept none of the festivals but Christmas, Easter, and Whitsunday.

In 1504, they were accused by the Catholics to King Ladislaus II, who published an edict against them, forbidding them to hold any meeting either privately or publicly. When Luther declared himself against the church of Rome, the Bohemian Brethren endeavoured to join his party. At last, that reformer showed a great aversion to them; but the Bohemians sending their deputies to him in 1523 with a full account of their doctrines, he acknowledged that they were a society of Christians whose doctrines came nearest to the purity of the gospel. The sect published another confession of faith in 1535, in which they renounced infant baptism, which they at first practised: upon which a union was concluded with the Lutherans, and afterwards with the Zuinglans, whose opinions from thenceforth they continued to follow.

**BOHOL,** one of the Philippine islands in Asia, lying to the northward of Mindanao, in E. Long. 122° 5'.

**BOLANO,** a town of Italy, in the kingdom of Naples, and county of Molese, with a bishop's see. It is seated at the foot of the Apennines, near the river Teverno, in E. Long. 14° 38'.

**BOIARDO,** Matteo Maria, of Ferrara, count of Scandiano, celebrated for his Italian poems, lived in the 15th century. His principal work is his Orlando innamorato. His Latin elegies and sonnets are also much admired.

**BOIARS,** denote Russian noblemen. See RUSSIA.

**BOIEMUM,** in Ancient Geography, a part of Germany, surrounded with the Montes Sudeti (Polemy); now called Bohemia. It took its name from the Boii, a people of Gaul, who removed thither before Cæsar's expedition into that country. (Cæsar) though he seems to err in the name. The Boi were afterwards driven out by the Marcomanni, and settled in the west of Visigdia, which was afterwards called Bavaria, and hence the name Bavaria.

**BOI, (Cæsar);** a people of Celtica, extending from the Liguria to the Elaver, whence came the Boi of Gallia Cisalpina, whose migration is related by Livy.

**BOI.** See BOHEMIA.

**BOIGUACU,** in Zoology, a synonyme of the boa constrictor. See BOA, OPHIOLOGY Index.

**BOIL, or FURNACE.** See the Index subjoined to MEDICINE and SURGERY.

**BOILEAU, Sieur Nicholas Despreate,** a celebrated French poet, was born at Paris in 1656. After he had gone through his course of polite literature and philosophy, his relations engaged him to the study of the law, and he was admitted advocate. Though he had all the talents necessary for the bar, yet he could not adapt himself to a science which turns upon continual equivocations, and often obliges those who follow it to clothe falsehood in the garb of truth. He therefore determined to study theology; but he could not long endure the thorns of school divinity. He imagined, that, to allure him more cunningly, chicanery, which he thought to avoid, had only changed her habit; and so he renounced the Sorbonne, betook himself entirely to the belles lettres, and took possession of one of the foremost places in Parnassus. The public gave his works the encomium they deserved; and Louis XIV. who always loved to encourage the sciences and polite literature, was not only pleased to have M. Boileau's works read to him constantly as he composed them, but settled a yearly pension of 2000livres upon him, and gave him the privilege of printing all his works. He was afterwards chosen a member of the French academy, and also of the academy of medals and inscriptions. This great man, who was as remarkable for his integrity, his innocence, and diffusive benevolence, as for the keenness of his satire, died of a dropsey on the 20th of March 1711, in the 75th year of his age. The Lutrin of Boileau, still considered by some French critics of the present time as the best poem to which France has given birth, was first published in 1674. It is with great reason and justice that Voltaire confesses the Lutrin inferior to the Rape of the Lock. Few poets can so properly be compared as Pope and Boileau; and, wherever their writings will admit of comparison, we may, without any national partiality, adjudge the superiority to the English bard. These two great authors resembled each other as much in the integrity of their lives, as in the subjects and execution of their several compositions. There are two actions recorded of Boileau, which sufficiently prove that the inexorable satirist had a most generous and friendly heart. When Patru, the celebrated advocate, who was ruined by his passion for literature, found himself under the painful necessity of selling his extensive library, and had almost agreed to part with it for a moderate sum, Boileau gave him a much superior price; and, after paying the money, added this condition to the purchase, that Patru should retain, during his life, the possession of the books. The noble instance of the poet's generosity is yet nobler:—when it was rumoured at court that the king intended to retrieve the pension of Corneille, Boileau hastened to Madame de Montespan,
Boiling, or Ebullication, the bubbling up of any fluid. The term is most commonly applied to that bubbling which happens by the application of fire, though that which ensues on the mixture of an acid and alkali is sometimes also distinguished by the same name. Boiling, in general, is occasioned by the discharge of an elastic fluid through that which is said to boil; and the appearance is the same, whether it is common air, fixed air, or steam, that makes its way through the fluid. The boiling of water is proved by Dr. Hamilton of Dublin, in his essay on the ascent of vapour, to be occasioned by the lowermost particles of the water being heated and rarified into vapour by reason of the vicinity of the bottom of the containing vessel; in consequence of which, being greatly inferior in specific gravity to the surrounding fluid, they ascend with great velocity, and lacerating and pushing up the body of water in their ascent, give it the tumultuous motion called boiling. That this is occasioned by steam, and not by particles of air or fire, as some have imagined, may be very easily proved in the following manner: Let a common drinking glass be filled with hot water, and then inverted into a vessel of the same: as soon as the water in the vessel begins to boil, large bubbles will be observed to ascend in the glass, which will displace the water in it, and in a short time there will be a continual bubbling from under its edge; but if the glass is then drawn up, so that its mouth may only touch the water, and a cloth dipped in cold water be applied to the outside, the steam within it will be instantly condensed, and the water will ascend so as to fill it entirely, or very nearly so. See the article Evaporation.

Boiling, in trade and manufactures, is a preparation given to divers sorts of bodies by making them pass over the fire, chiefly in water, though sometimes in other liquors. In this sense we speak of the boiling of salt, boiling of sugar, copperas, &c.

Boiling of Silk with Soap is the first preparation in order to dyeing it. Thread is also boiled in a strong lixivium of ashes to prepare it for dyeing.

Boiling, in the culinary art, is a method of dressing meats by coction in hot water, intended to soften them, and dispose them for easier digestion. The effects of boiling are different according to the kind and qualities of the water. Pulse boiled in sea-water grow harder; mutton boiled in the same becomes softer and tenderer than in fresh water, but tastes saltish and bitter.

Boiling to Death (coldarium decocuerunt), in the middle age; a kind of punishment inflicted on thieves, false coiners, and some other criminals.

Boiling is also a method of trying or essaying the goodness or falseness of a colour or dye. The stuff is to be boiled in water with certain drugs, different according to the kind or quality of the colour, to try whether or no it will discharge, and give a tincture to the water. With this view crimson silks are boiled with alum, and scarlets with soap, in quantity equal to the weight of the silk.

Boiling-Wells, in Natural History. See Burning-Springs, and Iceland.

Boinitz, a town of Upper Hungary, in the county of Zell, remarkable for its baths and the quantity of saffron that grows about it. E. Long. 19° 10'. N. Lat. 48° 42'.

Boiofi, in Zoology, the name of a species of serpent found in America, and called by the Portuguese cobra de verd. It is about an ell in length, of the thickness of a man's thumb, and is all over of a very beautiful and shining green. Its mouth is very large, and its tongue black. It loves to be about houses, and never injures any creature unless provoked or hurt; but it will then bite, and its poison is very fatal. The natives take as a remedy against its poison, the root caca apia bruised and mixed with water. See Caca Apia.

Boiorum Deserta, in Ancient Geography, a district of Pannonia, so called from the excision of the Boi by the Goths. Now the Weinswald, of Lower Austria, towards Styria, to the east of Mount Cetius, or the Hahlenberg, and south of Vindobona or Vienna.

Boiquira, the American name for the rattlesnake.

Bois-le-Duc, called by the Dutch Hertogen-boch, a large, strong, and handsome town of the Netherlands, in Dutch Brabant, seated between the rivers Dommel and Aa, among morasses, in E. Long. 6° 16'. N. Lat. 51° 45'.

Bois de Soignies, the forest of Soignies in the Austrian Netherlands and province of Brabant, about three miles south-east of Brussels.

Bois de Coixii, the name given to a South American tree growing about Surinam, held in the highest estimation by the Indians in that part of the world, and now recommended to the physicians of Europe by Dr. Fernin in a treatise lately published at Amsterdam. The root is esteemed an excellent stomachic, restoring the appetite and assisting digestion; but it is chiefly celebrated as an infallible remedy against even the most invertebrate intermitents. It is said also to be used with great safety and advantage in every species of remittent and continued fever, with patients of all ages, sexes, and conditions, even during pregnancy, and in the puerperal state. Before employing it, however, it is absolutely necessary to administer either a purgative or emetic. The best method of exhibiting it is in decoction: half an ounce of the bark of the root must be boiled in a close vessel with six pints of water till one half
hald be consumed; the decoction is then strained off,
and a cupful taken every two hours till the fever is
entirely extinguished. Six or seven days after a cure
is thus performed, it is generally necessary to repeat
the purgative.

BOISSARD, JOHN JAMES, a famous antiquarian,
born at Besançon the capital of Franche Comte in
France. He published several collections which are
of great use to such as are desirous to understand the
Roman antiquities. He had a great passion for this
study; and drew with his own hand plans of all the
ancient monuments of Italy. He died at Metz, Octo-
ber 30th, 1602. His principal works are, 1. Four
volumes in folio of Roman antiquities, adorned with plates
engraved by Theodore de Bey and his two sons. 2.
Theatrum Vita Humanae; which contains the lives of
108 famous persons, with their portraits. 3. A treatise
De Divatede et Magicae Priestigii. These works
are scarce, and esteemed by the antiquarians.

BOIT, an excellent painter in enamel. He was
born in Stockholm, and bred a jeweller; which pro-
Fession he intended to follow in England; but changed
his design, and went into the country, where he taught
children to draw. He there engaged a gentleman's
daughter, who was one of his scholars, to promise him
marriage; but the affair being discovered, he was
thrown into prison. In that confinement, which lasted
two years, he studied enamelling; an art to which he
fixed, on his return to London, and practised with the
greatest success. The price he is said to have obtained
for his work are almost incredible; but being en-
gaged in a very large design for the court, and Queen
Anne dying before it was completed, he ran in debt, his
goods were seized by execution, and he fled to France;
where he changed his religion, was countenanced by
the regent, and obtained a pension of 2501. per annum,
but died suddenly at Paris in 1726. There is a large
piece done by him at Kensington, representing Queen
Anne sitting, and Prince George standing by her; and
at Bedford-house is another very large plate of the
duke's father and mother.

BOITJAPO, in Zoology, the name of a species of
serpent found in America; and called by the Portu-
guese there, cobra de apo. It grows to seven or eight
feet long, is about the thickness of a man's arm, and
very small and taper towards the tail. Its back is of
an olive colour; its belly yellow, and covered with very
regular and elegant triangular scales. It feeds on
frogs, &c. but is very poisonous, and its bite extremely
fatal.

BOKHARA, a city of Tartary, in Asia, and capi-
tal of Great Bokharia, situated one day's journey to the
north of the river Jehun, or Amu; in E. Long. 52. 45.
N. Lat. 39. 15. In 1219 it was besieged by Jenghiz
Khan, as being part of Sultan Mohammed's domin-
ions, a descendant of the famous Mahmud Gazni.
At that time, besides the city-walls, which were very
strong, Bokhara had an outward enclosure 12 leagues
in compass, which was in round enclosure 12 leagues
but also many pleasant seats and farms watered by the ri-
ver Sogd, from whence the ancient Sogdiana took its
name. The Mogul army arrived before the place in
July, and continued the siege during the following
winter. In March 1220, they forced the outer wall,
and began to besiege the city in form. Sultan Mo-
hammed had left in the city a very numerous garrison
under the command of three generals, who made a sally
at the head of 20,000 men; but being repulsed with
great loss, their courage failed them; and, instead of
staying to defend the inhabitants, as soon as they had
got into the city by one gate, passed out by another
with their families, and almost all their soldiers, hoping
to escape by the darkness of the night; but their de-
sign being discovered, they were pursued by a detach-
ment of 30,000 Moguls; and being overtaken at the
river Amu, they were, after a bloody dispute, almost
cut to pieces. Mean time, Jenghiz Khan, being in-
formed of the confusion into which the city had been
thrown by the desertion of the garrison, ordered an at-
tack to be made on all sides at once; but while he was
preparing for this, the magistrates and clergy went
out and presented him with the keys of the city. Jen-
ghiz Khan granted them their lives, on condition that
they gave no shelter to any of the sultan's soldiers, and
put out all who should be suspected of being in that
prince's interest; which they promised to do upon
oath. All the young people, however, who were dis-
pleased with the surrender, retired with the governor
to the castle, which was very strong, and resolved to
defend themselves to the last extremity. Jenghiz Khan
having taken possession of Bokhara, entered on horse-
back into the great mosque, and asked merrily if that
was the sultan's palace? On being answered that it
was the house of God, he alighted; and giving the
principal magistrate his horse to hold, mounted the gal-
ley where the ecclesiastics usually sat, and then taking
up the Koran, threw it under the feet of his horses.
Having said there for some time, he retired to his
Camp; where, some days after, having assembled the
principal people of Bokhara, and ascended a pulpit
erected for that purpose in the midst of them, he be-
gan his speech by praising God, and recounted all the
favours he had received from the Almighty; he then
mentioned the perfidious behaviour of their sultan to-
wards himself, telling them that God had sent him, to
rid the world of such wicked men. As to them, he
testified his satisfaction for their having freely furni-
shed his army with necessaries; and promised that his
soldiers should not meddle with any goods which they
made use of in their houses; but commanded them to
deliver up what they had hidden, under pain of being
tortured. This speech had such an effect, that the poor
inhabitants delivered up every thing, as well what they
had concealed as what they had present use for; not-
withstanding which, the tyrant soon after caused the
city to be burnt, on pretence that some of the sultan's
soldiers were concealed in it. As all the houses were
made of wood, except the sultan's palace which was
built of stone, and some few private houses of brick,
the whole was utterly consumed; and Jenghiz Khan
having found some few soldiers that had actually con-
cealed themselves, put them all to death without mer-
cy. The castle surrendered at discretion soon after;
and though it was demolished, the governor and gar-
nishment, out of a very extraordinary piece of clemency
from so bloody a tyrant, had their lives spared. Bokhara
continued in ruins for some years, but at length Jen-
ghiz Khan ordered it to be rebuilt. It is now large
and populous; and is the residence of a khan who is
altogether despotic, though his power reaches but a
little
BOL [769] BOL

little way without the city. The town is seated on a rising ground, with a slender wall of earth and a dry ditch. The houses are low, built mostly of mud: but the caravansers and mosques, which are numerous, are all of brick. The bazaars or market-places, which have been stately buildings, are now mostly in ruins. The inhabitants are said to amount to 100,000, and are more civilized and polite than some of their neighbours. Great numbers of Jews and Arabsians frequent this place. A plan was proposed so far back as 1557, and revived in 1744, for the supply of the town with English goods; but it was found that the price brought was not sufficient to indemnify the hazard of the conveyance.

BOL, Hans or John, a painter, born at Mechlin in 1534. He received his first instructions from a master of no great repute, whom he soon left; and going to Heidelberg, employed himself in copying several pictures of the eminent artists. His subjects are chiefly landscapes with animals; but he also sometimes painted history, with no small success. We have by him a set of landscapes, views in Holland, slightly etched, but in a style that indicates the hand of the master. He died in 1593.

BOL, Ferdinand, a celebrated painter both of history and portraits, was born at Dort in 1611, and educated at Amsterdam. In the school of the celebrated Rembrandt Gerretsz, he received his instructions as a painter; and imitated the style of his master with little success, not only in his pictures but in his engravings. Bol's etchings are bold and free. The lights and shadows in them are broad and powerful, which renders the effect very striking; but they want that lightness of touch and admirable taste which those of Rembrandt possess in so great a degree. Bol died at Dort, the place of his birth, in 1681, aged 70.

BOKHARIA. See BUKHARIA.

BOLANDUS, John, a famous Jesuit, born at Tilemont in the Netherlands, in 1696. He distinguished himself by writing the lives of the saints, under the title of Acta Sanctorum, of which he published five volumes in folio; but died while he was labouring at the sixth, in the 70th year of his age. The continuators of that work are called Bolanditi.

BOLBITINUM, in Ancient Geography, the second mouth of the Nile reckoning from west to east; now very small, choked up with sand, and called le Bras de Bétin.

BOLENTIUM, in Ancient Geography, a town of Pannonia Superior; now Rackersburg. See RACKERSBURG.

BOLES, are viscid earths, less coherent and more friable than clay; more readily uniting with water, and more freely subsiding from it. They are soft and unctuous to the touch; adhere to the tongue: and by degrees melt in the mouth, impressing a light sense of astrinency. There is a great variety of these earths; the principal of which are the following.

1. Armenian bole, when pure, is of a bright red colour with a tinge of yellow: It is one of the hardest and most compact bodies of this class, and not smooth and glossy like the others, but generally of a rough and dusty surface. It does not effervesc with acids, though some part of it is dissolved by all of them. Neuman observes, that four ounces of Armenian bole

Vol. III. Part II.

distilled in a glass retort in an open fire, yielded three drachmas of a saline phlegm, which smelt a little ursinous, and changed syrup of violets green. In the neck of the retort was found a little powdery saline matter which had an ammoniacal taste, but it was in too small quantity to be collected or further examined. Like most other coloured earths, this kind of bole contains a portion of ferruginous matter, to which the colour is owing; and which may be separated by the magnet, after the bole has been calcined with oil or other inflammable matters. It is likewise impregnated with vitriolic acid; and hence, when mixed with nitre or sea salt, it extricates the acids of those salts in the fire.

2. French bole is of a pale red colour, variegated with irregular specks of white and yellow. It is much softer than the Armenian, and slightly effervescences with acids.

3. Bole of Blois is yellow, remarkably lighter than most of the other yellow earths, and effervescences strongly with acids.

4. Bohemian bole is of a yellow colour, with a cast of red, and generally of a flaky texture. It is not acted on by acids.

5. Lennian earth is of a pale red colour, and slightly effervescences with acids.

6. Silesian bole is of a pale yellow colour, and acids have no sensible effect upon it.

These and other earths, made into little masses, and stamped with certain impressions, are called terrae sigil- latae. They have been recommended as astringent, sudorific, and alexipharmic; but these and many other virtues that have been ascribed to them appear to have no foundation. They are still, however, prescribed in fluxes and complaints of the prime vine.

BOELESLAUF, or BUNTZLAU, a town of Silesia, seated on the river Bobar, in E. Long. 16 0. N. Lat. 51° 12'.

BOELESLAUS I. and II. kings of Poland. See POLAND.

BOLETUS, SPUNK. See BOTANY INDEX.

BOLEYN, Ann, queen of Henry VIII. of England; memorable in the English history, as the first cause of the reformation, as the mother of Queen Elizabeth under whom it was completely established, and also on account of her own sufferings. She was the daughter of Sir Thomas Boleyn, and born in 1507. She was carried into France at seven years of age by Henry VIII's sister, who was wife of Louis XII.; nor did she return into England when that queen retired thither after the death of her husband; but stayed in the service of Queen Claudia the wife of Francis I. and after the death of that princess went to the duchess of Alençon. The year of her return is not well known: some will have it to have been in 1527, others in 1525. This much is certain, that she was maid of honour to Queen Catharine of Spain, Henry VIII.'s first wife; and that the king fell extremely in love with her. She behaved herself with so much art and address, that by refusing to satisfy his passion, she brought him to think of marrying her: and the king, deceived by her into a persuasion that she should never enjoy her unless he made her his wife, was induced to set on foot the affair of his divorce with Catharine, which at last was executed with
Boleyn, with great solemnity and form. A celebrated author observes, that "That which would have been very praise-worthy on another occasion, was Anne Boleyn's chief crime: since her refusing to comply with an amorous king, unless he would divorce his wife, was a much more enormous crime than to have been his concubine. A concubine (says he) would not have de-throned a queen, nor taken her crown or her husband from her; whereas the crafty Anne Boleyn, by pretending to be chaste and scrupulous, aimed only at the usurpation of the throne, and the exclusion of Catherine of Arragon and her daughters from all the honours due to them." In the mean time, Henry could not procure a divorce from the Pope; which, we know, made him resolve at length to throw off his authority, and to dangle off his yokte. Nevertheless he married Anne Boleyn privately upon the 14th of November 1532, without waiting any longer for a release from Rome; and as soon as he perceived that his new wife was with child, he made his marriage public. He caused Anne Boleyn to be declared queen of England on Easter-eve 1533, and to be crowned the first of June following. She was brought to bed upon the 7th of September of a daughter, who was afterwards Queen Elizabeth. She continued to be much beloved by the king, till the charms of Jane Seymour had fired that prince's heart in 1536. Then his love for his wife was changed into violent hatred; he believed her to be unchaste, and caused her to be imprisoned and tried. "She was indicted of high treason, for that she had procured her brother and other four to lie with her, which they had done often: that she had said to them, that the king never had her heart; and had said to every one of them by themselves, that she loved him better than any person whatever; which was to the slander of the issue that was begotten between the king and her. And this was treason according to the statute made in the 26th year of this reign; so that the law which was made for her and the issue of her marriage, is now made use of to destroy her." She was condemned to be either burnt or beheaded; and she underwent the latter on the 10th of May 1536. The right reverend author of the History of the Reformation, relates some very remarkable things of her behaviour during the time of her imprisonment, and a little before her execution. When she was imprisoned, she is said to have acted very different parts; sometimes seeming devout and shedding abundance of tears, then all of a sudden breaking out into a loud laughter. A few hours before her death, she said, that the executioner was very handy; and besides, that she had a very small neck; at the same time feeling it with her hands, and laughing heartily. However, it is agreed that she died with great resolution; taking care to spread her gown about her feet, that she might fall with decency; as the poets have related of Polyxena, and the historians of Julius Caesar. Roman Catholic writers have taken all occasions to rail at this unhappy woman, as well through vexation at the schism which she occasioned, as for the sake of defaming and di-honouring Queen Elizabeth by this means; and they have triumphed vehemently, that in the long reign of that queen, no endeavours were used to justify her mother. But either Queen Elizabeth or her ministers are greatly to be admired for prudence in this respect; since it is certain, that Anne Boleyn's justification could never have been carried on without discovering many things which must have been extremely prejudicial to the queen, and have weakened her right instead of establishing it. For though the representations of the papists are in no wise to be regarded, yet many things might have been said to the disadvantage of her mother, without transgressing the laws of true history; as that she was a woman gay even to immodeest, indiscreet in the liberties she took, and of an irregular and licentious behaviour.

Boilingbrooke, or Bullingbrooke, a town of Lincolnshire in England, and of great antiquity, but now in a mean condition. It gives title of viscount to the St Johns of Battersea. Population 361 in 1811. E. Long. o. 40. N. Lat. 53. 15.

Boilingbrooke, Henry St John, lord viscount, a great statesman and philosopher, descended from an ancient and noble family, was born about the year 1672. He had a regular and liberal education; and by the time he left the university, was considered as a person of uncommon qualifications: but with great parts, he had, as it usually happens, great passions, and these hurried him into many indiscretions and follies. Contrary to the inclinations of his family, he cultivated Tory connections; and gained such an influence in the house of commons, that in 1704 he was appointed secretary of war and of the marines. He was closely united in all political measures with Mr Harley; when therefore, that gentleman was removed from the seals in 1707, Mr St John resigned his employment; and in 1710, when Mr Harley was made chancellor of the exchequer, the post of secretary of state was given to Mr St John. In 1712 he was created Baron St John of Lediard-Tregoze in Wiltshire, and Viscount Bolingbrooke. But being overlooked in the bestowal of vacant ribbons of the order of the Garter, he resented the affront, renounced the friendship of Harley then earl of Oxford, and made his court to the Whigs. Nevertheless on the accession of George I. the seals were taken from him; and being informed that a resolution was taken to pursue him to the scaffold, for his conduct regarding the treaty of Utrecht, he withdrew to France. Here he accepted an invitation to enter into the Pretender's service, and accepted the seals as his secretary; but he was as unfortunate in his new connections as in those he had renounced; for the year 1715 was scarcely expired, when at the same time that he was attained of high treason at home, the seals and papers of his foreign secretary's office were taken from him; followed by an accusation from the Pretender and his party, of neglect, incapacity, and treachery. Such a complication of distressful events threw him into a state of reflection, that produced by way of relief a consolatio philosophica, which he wrote the same year under the title of Reflections upon exile; and the following year he drew up a vindication of his conduct with respect to the Tories, in the form of A Letter to Sir William Wyndham. His first lady being dead, he about this time espoused a niece of the famous Madame Maintenon, and widow of the Marquis de Vilette, with whom he had a very large fortune. In 1723 the king was prevailed on to grant him a free pardon, and he returned in consequence to England; but was by no means satisfied within, while he was yet no more than a mere titular lord, and remained excluded from the house.
BOLISAW, a town of the kingdom of Bohemia in Germany, situated in E. Long. 14. 35. N. Lat. 22. 25.

BOLKOWITZ, a town of Silesia in the duchy of Glücksburg. E. Long. 15. 20. N. Lat. 51. 27.

BOLLARDS, large posts set into the ground on each side of a dock. On docking or undocking ships, large blocks are lashed to them; and through these blocks are reeled the transporting hawsers to be brought to the capstans.

BOLITO, a name by which the Italians call a sea-green colour in artificial crystal. To prepare this colour, you must have in the furnace a pot filled with 40 lb. of good crystal, first carefully skimmed, boiled, and purified, without any manganese: then you must have twelve ounces of the powder of small leaves of copper thrice calcined, and half an ounce of saffire in powder: mix them together; and put them at four times into the pot, that they may the better mix with the glass; stirring them well each time of putting in the powder, lest the mixture should swell and run over.

BOLOGNA, an ancient, large, and very handsome town of Italy, in the territory of the church, and capital of the Bolognese; an archbishop's see, and an university. The public buildings are magnificent, as well with regard to the architecture as the ornaments, especially the paintings, which are done by the greatest masters. There is a vast number of palaces, in one of which the pope's nuncio resides; the private houses are also well built. Here are 169 churches, and in 1806 the town contained 63,420 inhabitants. It is a place of great trade, which is in some measure owing to a canal that runs from the city to the river Po. The Reno, which runs near Bologna, turns 400 mills that are employed in the silk-works; besides, they deal in wax, soap, hams, sausages, and even lap-dogs, which are greatly esteemed. This city fell into the hands of the French in 1796, was retaken by the Austrians in 1799, but lost again after the battle of Marengo. It was restored to the pope in 1815. It is seated at the foot of the Apennine mountains. E. Long. 11. 30. N. Lat. 44. 27.

BOLOGNESE, a small province of Italy, in the territory of the church, bounded on the north by the Ferrarese, on the west by the duchy of Modena, on the south by Tuscany, and on the east by Romagna. It is watered by a great number of small rivers, which render its soil the most fertile of any in Italy. Bologna is the capital, and from the great produce of the land about it is called Bologna the fat. It produces abundance of all sorts of grain and fruits; particularly muscadine grapes, which are in high esteem. Here are mines of alum and iron; and the inhabitants fabricate large quantities of linen, silk stockings, and cloth. This territory was overrun by the French in 1796, but was restored to the pope in 1815.

BOLOGNESE. See Grimaldi.

BOLOGNIAN or BONOMIAN STONE, a phosphoric substance first discovered near Bologna in Italy, whence it received its name. It has been supposed to contain some metallic matter, on account of its great specific gravity; but it is now found to be only a compound of ponderous earth and sulphuric acid. See BARYTES, MINERALOGY INDEX.

BOLSANE, a town of Germany, in the territory of Tyrol, and circle of Austria. It is very agreeably situated in the midst of a fine large valley, full of villages, and abounding in vineyards. The wines in this valley are the best in all Tyrol; but they must be drank the year after that of their growth, otherwise they become unfit for use. E. Long. 11. 11. N. Lat. 46. 42.

BOLSENA, a town of Italy, in the territories of the pope, seated on a lake of the same name. E. Long. 11. 3. N. Lat. 42. 37.

BOLSTER, among surgeons, a soft yielding substance, either laid under the head or a broken limb. In this sense, bolsters are contrived for crooked, bunched, and otherwise distorted backs, shoulders, &c.

By a constitution made under Archbishop Burchier, the clergy are forbidden to wear bolsters about their shoulders, in their gowns, coats, or doublets. The occasion of the prohibition is variously construed. Some say that bolsters came in fashion in the reign of King Richard III., who being necessitated, by his natural deformity, to pad the courtiers, and even the clergy, did the same, out of complaisance to their prince; so that every body who had the misfortune to be born straight, was obliged to wear a bolster on his shoulders to be in the fashion. Others, however, controvert this; alleging that the constitution above mentioned was made 20 years before the usurpation of Richard.

BOLSTERS OF A SADDLE, those parts of a great saddle, which are raised upon the bows, both before and behind, to hold the rider's thigh, and keep him in a right posture.

BOLSWAERT, a town of the United Provinces, in West Friesland, and in the county of Westgoe. E. Long. 5. 35. N. Lat. 53. 6.
BOLSHERT, or BOLSHERD, Boetius Adam, an engraver and printer, established at Antwerp, was the descendant of a family who resided at the city of Bolswert in Friesland, from whence he derived his name. He flourished about 1620; but by what master he was instructed in the art of engraving, does not appear. He worked with the graver only; the free open style of the Bloemars heimitated with great success; and perhaps perfected himself in their school. When he worked from Rubens, he altered that style; and his plates are nester, fuller of colour, and more highly finished. The two following from this master may be here mentioned. 1. The resurrection of Lazarus, a large upright plate. 2. The Last Supper, it companion. Basan, speaking of this print, says, that it proves by its beauty, and the knowledge with which it is engraved, that Boetius could sometimes equal his brother Schelius.

BOLSHERT, or BOLSHERD, Schelius, an admirable engraver, was the brother of Boetius Adam. Bolswert mentioned in the preceding article. We have no other account of his family than what is there given; nor unfortunately any of himself of the least consequence. The time of his birth and of his death, and the name of the master he studied under, are equally unknown. Bolswert worked entirely with the graver, and never called in the assistance of the point. His general character as an artist is well drawn by Basan, in the following words: "We have a large number of prints, which are held in great esteem, by this artist, from various masters; but especially from Rubens, whose pictures he has copied with all possible knowledge, taste, and great effect. The freedom with which this excellent artist handled the graver, the picturesque roughness of etching, which he could imitate without any other assisting instrument, and the ability he possessed of distinguishing the different masses of colours, have always been admired by the connoisseurs, and give him a place in the number of those celebrated engravers, whose prints ought to be considered as models by all historical engravers, those are desirous of rendering their works as useful as they are agreeable, and of acquiring a reputation as lasting as it is justly merited." He drew excellently, and without any manner of his own; for his prints are the exact transcripts of the pictures he engraved from. His best works, though not always equally near or finished, are always beautiful, and manifest the hand of the master. Sometimes we find his engravings are in a bold, free, open style; as the Brazen Serpent, the Marriage of the Virgin, &c. from Rubens. At other times they are very neat and sweetly finished as, the Crowning with Thorns, and the Crucifixion, &c. from Vandyck. Mr. Strutt observes, that his boldest engravings are from Rubens, and his nearest from Vandyck and Jordens. How greatly Bolswert varied his manner of engraving appears from some prints, which, like the greater part of those of his brother Boetius, bear great resemblance to the free engravings of the Bloemars, and to those of Frederic Bloemart especially; and form a part of the plates for a large folio volume, entitled Academie de l'Esper, by Girard Thibault of Antwerp, where it was published, A. D. 1628; and to these he signs his name "Schelius," and sometimes "Schelius Bolswert," adding the word Bruxelle. His name is usually affixed to his plates in this manner, "S. A. Bolswert." It is very necessary to caution the collectors of this master's works (those especially who are not very conversant with them), that many of them have been copied in a very careful manner, so as easily to deceive the unskillful. Some of these copies, as the Marriage of the Virgin, from Rubens, &c. are by Lauwers. But those which are most likely to mislead, are by Rast, a French engraver, employed by Mariette the printseller, who frequently meeting with the reverses of counterproofs from the prints of Bolswert, gave them to the engraver; and he imitated them with the utmost precision. By this means the impressions from the plate copied come upon the paper the same way with the original. It is true his name is usually affixed at the bottom; but it is often cut off, and then the copy is not easily distinguished from the original. Among other prints thus imitated by Rast, from Bolswert, is Christ crucified between the two Thieves, where the soldier is represented throwing his side, from Rubens.

Among the variety of estimable engravings by this great artist, the few following may be here mentioned: 2. The Brazen Serpent, a large plate, lengthwise, from Rubens. Those impressions are the most estimable which have only the word Antwerpiae at the right-hand corner, without the name of Giles Hendrix, which was afterwards inserted above it, and part of the small circle over the arms is left white. 3. The education of the Virgin by Saint Anne, a middling-sized upright plate, from Rubens. Those impressions without the name of Hendrix are the most esteemed. 4. The marriage of the Virgin, a middling-sized upright plate, from the same painter. Those impressions are best in which the word Antwerpiae is not added to the name of Hendrix. 5. The adoration of the wise men, a middling-sized upright plate, from the same. The good impression of this plate have the name of Vanden Enden. 6. The feast of Herod, in which is represented the daughter of Herodias, presenting the head of John the Baptist to her mother; a large plate, lengthwise, from the same. 7. The miraculous draught of fishes; a large print lengthwise, on three plates, from the same. 8. Christ crowned with thorns; a large upright plate from Vandyck: An admirable print; with the name of Vanden Enden. 9. A crucifixion, where a figure appears presenting the sponge to Christ, St. John and the Virgin are standing at the foot of the cross, and Mary Magdalene is reclining towards it; a large upright plate, from Vandyck. Of this admirable engraving there appear to have been four different impressions; though Basan mentions only three, and says that in the first the left hand of St. John is hid. The chief marks of those impressions are: In the first, St. John's left hand appears on the shoulder of the Virgin (A).
In the 2d impression, the hand is erased: This Basan calls the first impression; and it sells at a very high price. In the 3d impression, the hand is restored: In the 4th, it is again erased: And in both, the short strokes upon the ground near the great toe of the figure who holds the sponge are crossed with second strokes; which cross-hatchings are not in the two first impressions. There are several other crucifixions by the same master after different designs. 10. The god Pan playing upon his flute, from Jordaeus. 11. Mercury and Argus, a large plate lengthwise, from the same. 12. A drunken Silenus, supported by a satyr, and another figure; a middling-sized upright plate, from Rubens. Of these three last, the impressions without the address of Bloeteling are the best. 13. A chase of lions; a large plate lengthwise, from the same. 14. A variety of landscapes.

BOLT, among builders, is an iron fastening fixed to doors and windows. They are generally distinguished into three kinds, viz. plate, round and spring bolts.

BOLTS, in Gunnery, are of several sorts; as, 1. Transum-bolts, that go between the cheeks of a gun-carriage, to strengthen the transums. 2. Prise bolts; the large knobs of iron on the cheeks of a carriage, which keep the handspikes from sliding, when it is poising the breech of a piece. 3. Traverse bolts; the two short bolts, that being put one in each end of a mortar carriage, serve to traverse her. 4. Bracket-bolts; the bolts that go through the cheeks of a mortar, and by the help of quoins keep her fixed at the given elevation. And, 5. Bed bolts; the four bolts that fasten the brackets of a mortar to the bed.

BOLTS, in a ship, are iron pins, of which there are several sorts, according to their different makes and uses. Such are drive-bolts, used to drive out others. Ray-bolts, with jags or barbs on each side, to keep them from flying out of their holes. Cleech-bolts, which are chanced with riveting hammers. Forelock-bolts, which have at the end a forelock of iron driven in to keep them from starting back. Set-bolts used for forcing the planks, and bringing them close together. Pend or fender bolts, made with long and thick heads, and struck into the uttermost beams of the ship, to save her sides from bruises. And ring-bolts, used for bringing to of the planks, and those parts whereby are fastened the breeches and tackling of the guns.

Bolt of Canvas, in commerce, the quantity of 28 ells.

Bolt Rope, in naval affairs, a rope passing round the sail, to which the edges of it are sewed, to prevent the sail from tearing: the bottom part of it is called the foot-rope; the side leechees; and if the sail be oblong or square, the upper part is called the head-rope.

BOLTED FLOUR, that which has passed through the bolters. See the following article.

BOLTER, or Boulter, a kind of sieves for meal, having the bottoms made of woolen, hair, or even wire. The bakers use bolters which are worked by the hand; millers have a larger sort, wrought by the motion of the mill.

BOLTING, a term of art used in our inns of court, whereby is intended a private arguing of cases. The manner of it at Gray's Inn is thus: An ancient and two barristers sit as judges; three students bring each a case, out of which the judges choose one to be argued; which done, the students first argue it, and after them the barristers. It is inferior to mootings: and may be derived from the Saxon word bolt, "a house," because done privately in the house for instruction. In Lincoln's Inn, Mondays and Wednesdays are the bolting days in vacation time; and Tuesdays and Thursdays the moot days.

BOLTING, or Boulting, the act of separating the flour from the bran by means of a sieve or bolter. See BOLTER.

BOLTING-Cloth, or Bolster-cloth, sometimes also called Boulting-cloth, denotes a linen or hair-cloth for setting meal or flour.

BOLTING-Mill, a versatile engine for sifting with more ease and expedition. The cloth round this is called the bolter.

BOLTON, or Boulton, Edmund, an ingenious English antiquarian, who lived in the beginning of the 17th century. His most considerable work is that entitled Nero Caesar, or Monarchia depravata, dedicated to the Duke of Buckingham, Lord-Admiral, printed at London 1624, folio, and adorned with several curious and valuable medals. It is divided into 55 chapters, in some of which are introduced curious remarks and observations. In the 24th and 25th chapters he gives an account of the revolt in Britain, against the Romans, under the conduct of Boadicea, which he introduces with a recapitulation of the affairs in Britain from the first entrance of the Romans into this island under Julius Cæsar, till the revolt in the reign of Nero. In chapter 36th he treats of the East India trade in Nero's time, which was then carried on by the river Nile, and from thence by caravans over land to the Red sea, and thence to the Indian ocean; the ready coin carried yearly from Rome up to this account amounting, according to Pliny's computation, to above 300,000 sterling; and the usual returns in December and January yielding in clear gain a hundred for one. Besides this he wrote, 1. An English translation of Laction Florus's Roman History. 2. Hypercritica, or a rule of judgment for reading or writing our histories. 3. The elements of armories, &c.; and some other works.

BOLTON, a town of Lancashire in England, seated on the river Croeill. It has a manufacture of fustians, and the market is considerable for cloth and provisions. Great and Little Bolton together contained 24,149 inhabitants in 1811. W. Long. 2. 1. 5. N. Lat. 53. 55.

BOLUS, in Pharmacy, an extemporaneous form of a medicine, soft, coherent; a little thicker than honey, and the quantity of which is a little more or mouthful; for which reason it is by some called buccella.

BOMAL, a town of Luxembourg in the Netherlands, situated on the river Our, in E. Long. 5. 30. N. Lat. 50. 20.

BOMB; in military affairs, a large shell of cast iron, having a great vent to receive the fusee, which is made of wood. The shell being filled with gunpowder, the fuse
Bomb is driven into the vent or aperture, within an inch of the head, and fastened with a cement made of quicklime, ashes, brick-dust, and steel filings, worked together in a glutinous water; or of four parts of pitch, two of saltpetre, one of turpentine, and one of wax. This tube is filled with a combustible matter, made of two ounces of nitre, one of sulphur, and three of gunpowder-dust, well rammed. To preserve the fusee, they pitch it over, but uncase it when they put the bomb into the mortar, and cover it with gunpowder-dust; which having taken fire by the flash of the powder in the chamber of the mortar, burns all the time the bomb is in the air; and the composition in the fusee being spent, it fires the powder in the bomb, which bursts with great force, blowing up whatever is about it. The great height a bomb goes in the air, and the force with which it falls, makes it go deep into the earth.

Bombs may be used without mortar-pieces, as was done by the Venetians at Candia, when the Turks had possessed themselves of the ditch, rolling down bombs upon them along a plank set sloping towards their works, with ledges on the sides, to keep the bomb right forward. They are sometimes also buried under ground to blow up. See Caissone.—Bombs came not into common use before the year 1634, and then only in the Dutch and Spanish armies. One Malthus an English engineer is said to have first carried them into France, where they were put in use at the siege of Collioure. The French have lately invented a new sort of bombs of vast weight, called Comminges.—The art of throwing bombs makes a branch of gunnery, founded on the theory of projectiles, and the laws and qualities of gunpowder. See GUNNERY, PROJECTILES, GUNPOWDER, &c.

Bomb-Chest is a kind of chest filled usually with bombs, sometimes only with gunpowder, placed under ground, to tear and blow it up in the air with those who stand on it. Bomb-chests were formerly much used to drive enemies from a post; they had several or were about to take possession of: they were set on fire by means of a saucisse fastened at one end, but they are now much disused.

Bomb-Vessels, which are small ships formed for throwing bombs into a fortress, are said to be the invention of M. Reynau, and to have been first used at the bombardment of Algiers. Till then it had been judged impracticable to bombard a place from the sea. See KETCH.

Bombard, a piece of ordnance anciently in use, exceedingly short and thick, and with a very large mouth. There have been bombardes which have thrown a ball of 300 pounds weight. They made use of cranes to load them. The bombard is by some called basilisk, and by the Dutch donberboss.

Bombardier, a person employed about a mortar. His business is to drive the fusee, fix the shell, and load and fire the mortar. See CARABUS, ENTOMOLOGY INDEX.

Bombardment, the havoc committed in throwing bombs into a town or fortress.

Bombardo, a musical instrument of the wind kind, much the same as the bassoon, and used as a bass to the hautboy.

BOMASINE, a name given to two sorts of stuff, Bomsasine the one of silk, and the other crossed of cotton. BOMBAST, in composition, is a serious endeavour, by strained description, to raise a low or familiar subject beyond its rank; which, instead of being sublime, never fails to be ridiculous. The mind in some animating passions is indeed apt to magnify its objects beyond natural bounds; but such hyperbolical description has its limits; and when carried beyond these, it degenerates into burlesque, as in the following example.

Sejanus.——Great and high, The world knows only two, that's Rome and I. My roof receives me not; 'tis air I tread, And at each step I feel my advanc'd head Knock out a star in heaven.

SEIAN, of Ben Johnson, Act v.

A writer who has not natural elevation of genius is extremely apt to deviate into bombast. He strains above his genius, and the violent effort he makes carries him generally beyond the bounds of propriety.

BOMBAX, or Silk Cotton Tree. See BOTANY INDEX.

Bombax, in Zoology, a synonyme of a species of Conus. Bombax is also used sometimes for silk or cotton; but the true botanic name of cotton is Gossypium. It is likewise applied by Linneaus to signify such insects as have incumbent wings, and feelers resembling a comb.

Bombay, an island in the East Indies near the coast of Decan, situated in N. Lat. 19°. and E. Long. 73°. It has its present name from the Portuguese Buon-bahia, on account of the excellent bay formed by it, together with the wading of other islands adjacent. The harbour is spacious enough to contain any number of ships, and has likewise excellent anchoring ground, affording also, by its land-locked situation, a shelter from any winds to which the mouth may be exposed.

This island was formerly reckoned exceedingly unhealthy, insomuch that it had the name of the burying ground of the English, though it is now so far improved in this respect as to be no worse than any other place in the East Indies under the same parallel of latitude. The reasons of this unhealthiness and the subsequent improvements are enumerated by Mr. Grose.

1. The nature of the climate, and the precautions required by it, being less understood than they are at present.

2. Formerly there obtained a very pernicious practice of employing a small fry of fish as manure for the cocoa-trees which grow in plenty on the island; though this has been denied by others, and perhaps with justice, as the putrid effluvia of animal bodies seems to be very effectually absorbed by the earth, when buried in it. All agree, however, that the habitations in the woods or cocoa-nut groves are unwholesome, by reason of the moisture, and want of a free circulation of air. 3. Another cause has been assigned for the superior healthiness of this island, viz. the lessening of the waters by the banking of a breach of the sea, though this does not appear satisfactory to our author. There is still, says he, a great body of salt water on the inside of the breach, the communication of which with the ocean being less free than before the breach was built,

In this journal our author makes no mention of the elephants above mentioned from Mr. Grose as the fore-runner of the rainy season, though he mentions a storm.

---

**Account of the quantity of rain that falls during the rainy season.**

The quantity of rain that falls at Bombay in one season has been accurately measured by Mr. Thomas, Mr. Ives's predecessor as hospital surgeon. His apparatus consisted of a lead cylinder about nine inches diameter, and as many deep, marked on the inside with inches and tenths. To prevent the water from splashing over, be cut a hole two inches from the bottom, and placed the cylinder in a glazed earthen vessel; after which a wax-cloth was securely tied round it, so as to cover the vessel, and prevent any water from getting in, excepting what passed through the cylinder. When more than two inches fell, the hole in the side was stopped with wax, and the water poured from the vessel into the cylinder to ascertain its quantity. It was kept in an open place free from houses, and measured at six in the morning, noon, and six in the evening. The following table shows the quantity of rain that fell from the 25th of May, when it first began, though the sky looked cloudy over land from the beginning of the month.

**Total 110**.
under that name on the 9th of October. It was an excessive hard gale, with violent thunder, lightning, and rain; of which last there fell two inches in no more than four hours. Neither is the quantity of thunder and lightning at all comparable to what people unacquainted with hot climates might be apt to expect. The only thunder-storms mentioned in the journal were on May 31st, June 3d, 5th, 12th, 14th, September 7th, October 9th, an elephants; and some thunder on the 17th of the same month.

The vegetable productions of Bombay are very insignificant. Mr Ives says, that its soil is so barren as not to produce any one thing worth mentioning; but afterwards informs us, that its natural produce is the cocoa-nut tree, from which they extract a liquor called toddy. This is soft and mild when drunk immediately: but if it stands long, it gathers strength, and becomes very intoxicating; whence probably arose the term toddy-headed. For each tree a tax of 28s. a-year is paid to the company, which is appropriated towards maintaining the garrison and ships of war.

Mr Grose gives an account somewhat different.

"The oarte, or cocoa-nut groves, make the most considerable part of the landed property, being planted wherever the situation and soil is favourable to them. When a number of these groves lie contiguous to each other, they form what is called the woods; through which there is a due space left for roads and path-ways, where one is pleasantly defended from the sun at all hours in the day. They are also thick set with houses belonging to the respective proprietors, as well as with the huts of the poorer sort of people; but are very wholesome, for the reasons already given. As to the cocoa-nut tree itself, not all the minute descriptions I have met with in many authors seem to me to come up to the reality of its wonderful properties and use. The cultivation of it is extremely easy, by means of channels conveying water to the roots, and by the manure already mentioned laid round them. An owner of 200 cocoa-nut trees is supposed to have a competency to live on.

"As to the rice fields, they differ in value, according to the fineness and quantity of rice they produce. The growth of this grain has a particularity not unworthy of notice, viz. that as it loves a watery soil, so to whatever height the water rises wherever it is planted, the growth of the rice keeps measure with it, even to that of 12 and 14 feet; the summit always appearing above the surface of the water. It is also remarked, that the eating of new rice affects the eyes. The fact is certain, though the physical reason of it is unknown.

"Here and there are interspersed some few brab trees, or rather wild palm trees (the word brab being derived from braba, which in the Portuguese signifies sold). They bear an insipid kind of fruit, about the bigness of a common pear; but the chief profit from them is the toddy, or liquor drawn from them by incisions at the top, of which the arrec, or root, betters than that produced by the cocoa-nut trees. They are generally near the sea-side, as they delight most in a sandy soil. It is on this tree that the toddy birds, so called from their attachment to it, make their exquisitely curious nests, wrought out of the thinnest reeds and filaments of branches, with an imitable mecha

This island is a strong instance of the benefits of a good government, and a numerous population; for not a spot of it remains uncultivated; so that though it is far from producing sufficient for the consumption of its inhabitants, and notwithstanding its many disadvantages of situation and soil, it yields incomparably more than the adjacent island of Salsette.

Among the curiosities of Bombay Mr Ives mentionslar large teropin or land tortoise kept at the governor's in this house, the age of which was upwards of 300 years. Frogs, which abound everywhere through the East Indies, are very large at Bombay. Our author saw one that measured 22 inches from the extremities of the fore and hind feet when extended; and he supposes that its weight would not have been less than four or five pounds. On the sea-shore round the island are a great variety of beautiful shells, particularly the sort called ventile-traps or ventile-traps, held in great esteem among the ladies some time ago. Several pounds sterling are said to have been given by a virtuoso for one of these shells when Commodore Leslie's collection of shells was sold by auction.

Mr Ives enumerates the following kinds of snakes found on this island and other parts of the British em-lands of the East Indies. 1. The cobra de capella, growing from four to eight or nine feet long. They kill by their bite in 15 minutes. 2. The cobra manila is a small bluish snake, the size of a man's little finger, and about a foot long, frequently seen about old walls. A species of these found at Bombay kill much sooner than even the former. 3. The palmira, a very thin beautiful snake, of different colours: its head is like that of the common viper, but much thicker than the body. Our author saw one that was four feet long, and the body not much thicker than a swan's quill. 4. The green snake is of a very bright green colour, with a sharp head: towards the tail it is smaller than in the middle. The largest part of it is no bigger than a tobacco-pipe. 5. The sand snake is small and short, but not less deadly than the others. 6. The cobra de aurelia resembles an earth-worm, is about six inches long, and no bigger than a small crow-quill. It kills by getting into the ear, causing madness, &c. 7. The manila bomba is a very beautiful snake, of almost the same size throughout the whole length, except at the two ends, where it comes to a point. It is white on the belly, but finely variegated on the back. It lives in the sand, and is said to sting with its tail, which occasions contractions in the joints.

Bombay is the most considerable English settlement on the Malabar coast; and by reason of its situation, may be styled the grand storehouse of all the Arabian and Persian commerce. It is also the most convenient place in all the East Indies for careening or heaving down large ships; and for small ones they have a very good dock. They have also a very good ropeward; and indeed, says Mr Ives, 'this is the only place, in this distant part of the world, for shattered ships to refit at, having always a good quantity of naval stores, and its very name conveys an idea of a safe retreat in foul weather.'

On this island are many little forts and batteries, which forts, &c.
BOM [ 777 ]

Bombay, which carry some guns; but the principal fort, which defends the place, has above an hundred. Mr Grose finds fault with the situation of this last fort, which, he says, not only does not command the harbour sufficiently, but is itself overlooked by an eminence called Dungaree point. The castle itself is a regular quadrangle, well built of strong hard stone. In one of the bastions facing Dungaree point is a large tank or cistern which contains a great quantity of water constantly replenished by the stationary rains. There is also a well within the fort, but the water is not very good, and liable to be dried up by the heats. The water of Bombay in general indeed is not good, which has been given as a reason why the Bombay merchants were not fond of settling upon it; for as they drink no wine nor spirituous liquors, they are very nice judges of the taste and qualities of waters.

When the town of Bombay began to increase considerably, it was judged proper to add the security of a wall round it to the strength of the fort it had before. Even then, however, it was neglected to take in the dangerous post of Dungaree, which now evidently commands both the town and fort. There has since that time been added, at a great expense, a ditch that encompasses the wall, and can be flooded at pleasure, by letting in the sea, which terminates the ditch on two sides, so that the town is now entirely surrounded with water, and is one of the strongest places in India.

Next to Bombay, the most considerable fort on the island is that of Mahim. It is situated at the opposite extremity of the island, and commands the pass of Bandra, a fact directly opposite to it on the coast of Salsette. From this island the Bombay merchants were by an arm of the sea, capable of receiving only small craft. The other forts are capable of making but a slight defence.

About two miles out of town, towards the middle of the island, the sea had gained so far as almost to divide it in two, and rendered the roads impassable. A great quantity of this water, however, was drained off at a very considerable expense, and a causeway raised which kept it from overflowing again. This causeway is above a quarter of a mile in length, and considerably broad; but (says Mr Grose), there is one gross fault remarked in it; that, being bending near the middle, the architect has opposed to the sea a re-entering angle instead of a salient one." Within the beach, however, there is still a considerable body of water, that has a free communication with the sea, as appears by its ebbing and flowing; so that it is probable the causeway itself, erected at the expense of at least 100,000l. may be for a long time be totally undermined and thrown down.

When the island of Bombay was ceded to the English by the Portugese, it was divided and still continues to be so, into three Roman Catholic parishes, Bombay, Mahim, and Salavacam. The churches of these are governed by priests of that religion, and of any nation excepting Portugal, who were expressly objected to at the time of cession. The bulk of the land-proprietors at that time were Mestizos and Canarias. The former are a mixed breed of the natives and Portugese; the latter purely aborigines of the country converted to the Popish religion. The other

land-owners were Moors, Gentooos, and Parsees; but the last are of more modern date, having purchased estates on the island. The company has also a very considerable landed estate either by purchases, confisca-
tions for crimes, or seizures for debt. The land is laid out in cocoa-nut groves, rice fields, and onion grounds, which last are reckoned of an excellent quality.

There is only one English church at Bombay, a very neat commodious building, seated in a spacious area called the Green; which continues from the church to the fort, and is pleasantly laid out in walks planted with trees, round which are the houses of the English inhabitants are mostly situated. These are generally only ground-floored, with a court-yard before and behind, in which are the offices and out-houses. They are substantially built of stone and lime, and smooth plastered on the outside. They are often kept white-washed, which, however neat, is in some respects very disagreeable, by reason of the excessive glare it occasions in reflecting the light of the sun. Few of them have glass windows to any apartment; the sashes being generally paneled with a kind of transparent oyster-shells, square cut; which have the singular property of transmitting sufficient light, at the same time that they exclude the violent glare of the sun, and have beside a cool look. The flooring is generally composed of a kind of loam or stucco called chunam, being a lime made of burnt shells, which if well tempered in a peculiar manner known to the natives, is extremely hard and lasting, and takes such a smooth polish, that one may see his own face in it. But where terraces are made of this substance, they are not properly prepared, and which is very expensive, it is apt to crack by the sun's heat. Some attempts have been made to paint the stucco walls in apartments; but these have proved abortive through the ignorance of the artists, who have not chosen colours capable of resisting the alkaline power of the lime. Our author remarks, that in the gardens of Surat he saw this kind of stucco made for use of instead of gravel for the walks. They were a little raised above the garden beds, so that they must be instantly dry after the most violent rain; though their whiteness and polish must not only produce a disagreeable reflection in sunshine, but be extremely slippery to walk on. The houses of the black merchants are for the most part extremely ill built and inconvenient; the window lights small, and the apartments ill distributed. Some, however, make a better appearance if only one story high; but even the best of them have a certain meanness in the manner, and clumsiness in their execution, which renders the architecture contemptible in comparison of the Europeans. There is one convenience, however, in all the houses of Bom-
bay, viz. small ranges of pillars that support a penthouse or shed, forming what are called in the Portugese language verandas, either all round the house, or on particular sides of it, which afford a pleasing shelter from the sun, and keep the inner apartments cool and refreshed by the draught of air under them. The pagodas, or temples of the Gentooos, are low mean buildings, having usually no light but what is admitted by the door; facing which is the principal idol. They imagine that a dark gloomy place inspires a kind of religious horror and reverence; and are very fond

Digitized by Google
The natives of Bombay, though composed of almost every Asiatic nation, are shorter of stature and stronger than the inhabitants of the Coromandel coast. Here a palquine, which requires six men to carry it at Madras, or Fort St David, is carried by four. Here are some Parsees, who like their forefathers the ancient Persians, remember the tenets of Zoroaster, who is said to have reduced into order the religion of the Persian magi; the fundamental maxim of which was the worshipping of one God under the symbol of light. They adore the sun, particularly when rising, with the most profound reverence and veneration; and likewise pay a kind of adoration to common fire. Mr Ives had once the opportunity of observing the manner in which they perform this devotion. A large brass pan was placed in the middle of the house with fire in it: before this fire, or rather on each side of it, two men were kneeling at their devotions, pronouncing their prayers with great rapidity. He was afterwards informed, that one of them was a priest, at that time on a visit to another priest in a fit of sickness. He was likewise informed, that the Parsees have such a veneration for the fire, that they never put it out, or even breathe upon it; and he observed, that while the two priests were at their prayers over the pan of coals, they had a little white bib over their mouths, as he supposed to prevent their breath from approaching their favourite element. These prayers, however, from the similarity of the sounds, appeared to him only to be a repetition of the same set of words. The visiting priest used many gestures with his hands over the fire, and afterwards stroked down the face of the sick priest, which our author looked upon to be the final benediction, as the ceremony ended immediately.

As the Gentooos burn their dead, one would imagine that the Parsees, who have such a veneration for fire, would be desirous of having their bodies consumed by that element; but instead of this, they expose their dead bodies to be devoured by birds of prey; because, say they, a living man is composed of all the elements; so that it is but reasonable, after he is dead, that every particular element should receive its own again. On the top of Malabar hill, about two miles from the town of Bombay, there are two round buildings for receiving the dead bodies of the Parsees, which remain there till the bones are clean picked by the birds. This is certainly an abominable custom, and affords very shocking spectacles; however, it is always placed at a little distance to prevent people from prying too narrowly into these matters, or, as Mr Ives says, to ensure the vultures of their repast without any disturbance. Mr Grose tells us, that on his going to take a look into one of these repositories, a Parsee advised him in a friendly manner to let it alone, as no person, who was not a party concerned, would long survive such curiosity. He tells us also, that the person appointed to look after the dead, carefully observes which eye is first picked out by the birds, and from hence judges of the situation of the soul of the deceased; a state of happiness being indicated by the right eye being first picked out. Mr Ives observes, that by reason of the heat of the sun, much less remains upon the body, and that the flesh being soon shrivelled up, and the bones turning quite black.

At the extreme point of Malabar hill there is a rock, on the descent to the sea, flat on the top, in which there is a natural crevice, which communicates with a hollow terminating at an exterior opening to the sea. This place is used by the Gentooos as a purifier from their sins. This purification is effected by their going in at the opening, and coming through the arch, though it seems too small for people of any consequence to pass.

In Bombay, and indeed in many other places of the Orient and East Indies, oxen are generally used instead of horses for drawing carriages but for riding; and however ridiculous such a practice may seem to us, it appears that they are not in this respect inferior to ordinary horses, being capable of going at the rate of seven or eight miles an hour. They are commonly of a white colour, with large perpendicular horns, and black noses. The only inconvenience that attends them, is, that, by being naturally subject to a lax habit of body, they sometimes accommodate the rider with little thrown upon them by the continual motion of their tails. In other respects they are far preferable to Indian horses, and will trot and gallop as naturally as the horses of this country. Admiral Watson, while at Bombay, was allowed a chaise drawn by two of these oxen by the East India company. At the end of every stage the driver puts the near bullock in the place of the other; he then puts his hand into their mouths, to take out the feed, without this they would be in danger of suffocation.

See Bombay Supplement.

For the History, Government, &c. of Bombay, see the articles Hindostan and East India Company.

Bombeych, a small vessel built and strengthened with large beams for the use of mortars at sea.

Bombeus, in Music, an artificial motion with the hands, imitating in cadence and harmony the buzzing of bees. The word is originally Greek, and signifies the buzz or noise of bees, gnats, and the like. In this sense, bombeus made one of the species of applause used by the ancient auditors.

Bombeus, in Medicine, denotes a murmuring noise, as of wind breaking out of a narrow into a larger cavity, frequently heard in the thick intestines. The bombae heard in the ears in acute diseases, is laid down by Hippocrates as a sign of death.

Bombylius. See Entomology Index.

Bomene, a sea-port town of the United provinces, in Zealand, on the northern shore of the island of Schonen, opposite to the island of Goree, in E Long. 4° 0'. N Lat. 51° 50'.

Bommel, a town of Dutch Guelderland, situated on the northern shore of the river Waal, in E Long. 3° 50'. N Lat. 52° 0'.

Bonomici, in Grecian antiquity, young men of Lacedemon, who contended at the sacrifices of Diana which of them was able to endure most lashes; being secured before the altar of this goddess.

Bona, by the Moors called Balederna, a sea-port town of the kingdom of Algiers in Africa, situated in E Long. 7° 57'. N Lat. 36° 5'. It was formerly rich, populous,
BONA, the same name under the kingdom of Constantinople, and is supposed by some to be the ancient Hippo, once the seat of the great St Amint, and a sea-port built by the Romans. The inhabitants, however, deny it to be the ancient Hippo, which had been so often taken, retaken, and destroyed by the wars; and pretend it to be since rebuilt at the distance of two or three miles from the ancient Hippo, out of its ruins, and called Baked-el-Ugned, from a sort of trees of that name that grow in the neighbourhood. It is now a very mean place, poorly built, and thinly inhabited, with scarce any traces of its former grandeur, except the ruins of a cathedral, or, as others guess, of a monastery, built by St Amint, about three miles distant from the city. Near these ruins is a famed spring called by his name, much resorted to by the French and Italian sailors, who come to drink of its waters, and pay their devotions to a maidened statue said also to belong to the saint, but so mutilated that no traces either of face or dress are remaining; and as each of them strives to break off some splinter, or to scrape off some part of it on account of its supposed sanctity, it will probably be soon reduced to a state of non-existence. Bona was taken by the pirate Barbarossa, and joined to his new kingdom of Algiers; but as quickly lost, and recovered by its old masters the Tunisium, who soon after lost it again. It is commanded by a little fort, in which is a garrison of about 300 Turks, under the command of an aga, who is also governor of the town. The road for the ships is good for nothing before the town, but a little farther west is very deep and safe. Dr Shaw tells us, that the continual discharging of ballast into the road, and the neglect of cleaning the port, is the cause of both becoming so unsafe and incommodious. In 1816, a number of Neapolitans, Genoese, &c. assembled here for the purpose of prosecuting the coral fishery, were attacked and massacred by a body of Turkish troops.

Bona Dea, the good goddess, in Pagan mythology, one of the names of Cybele. Others say, she was a Roman lady, the wife of one Faunus, and was famous for her chastity, and that after her death she was deified. Her sacrifices were performed only by matrons; and in so secret a manner, that it was no less than death for any man to be present at the assembly (see CYBELE). Cicero reproaches Cadius with having entered into this temple disguised as a singing woman, and having by his presence polluted the mysteries of the good goddess. What kind of mysteries these were, we may learn from Juvenal, Sat. vi. 313. The poet there mentions the adventure of Cadius.

Atque usum ritus veteres, et publica saltem
His intacta miles agerentur sacra: sed omnes
Novarum Mauri, atque Indi, quaea paupertio penem
Maejorum, quam sint duo Casarius Anticatones,
Ihno testiculi sibi conscius, unde fugit mus,
Intulerit.

I wish at least our sacred rites were free
From those pollutions of obscenity:
But 'tis well known what singer, how disguisd'd,
A loud and anxious action enter'd:
Into the fane, with women mix'd, he went,
Arm'd with a huge two-hand'd instrument;

A grateful present to these holy choirs,
Where the mouse, conscious of his sex, retires.

Dryden.

Bona Fides, in Law. When a person performs any action which he believes at the time to be just and lawful, he is said to have acted bona fide.

Bona Mobilia, the same with moveable effects or goods.

Bona Notabilia, are such goods as a person dying heir in another diocese than that wherein he dies, amounting to the value of 5l. at least; in which case the will of the deceased must be proved, or administration granted, in the court of the archbishop of the province, unless, by composition or custom, any dioceses are authorised to do it, when rated at a greater sum.

Bona Patria, an assize of countrymen or good neighbours, where 12 or more are chosen out of the country to pass upon an assize, being sworn judicially in the presence of the party.

Bona Peritura, perishable goods. By Stat. 13 Ed. I. cap. 4. the cargo of a ship that has been cast away shall be kept for a year and a day, and restored to the rightful owner; and if the goods are such as will not endure so long, they are bona peritura, which the sheriff is allowed to sell, and to account in money for the value.

Bona Vacantia, goods, such as royal fish, shipwrecks, treasure-trove, waifs, and estrays, in which no one can claim a property. These goods by the law of nature, and by the imperial law, belonged to the first occupant or finder; but in the modern constitutions of European governments, they are annexed to the supreme power by the positive laws of the state.

Bonaire, an island of South America, near the north coast of Terra firma. It lies about 30 miles east of CURACAO, and abounds in kabriotes and salt. W. Long. 69° 18'. N. Lat. 12° 30'.

Bona, very high mountains in Italy, in the duchy of Savoy, not far from Lassereburg: in some seasons they cannot be ascended without great danger.

Bonarelli, Count Guidi Ubaldo, an Italian poet, was the son of Count Pietro Bonarelli, minister of the duke of Urbino. He was intrusted with several important negotiations, and was esteemed an able politician and learned philosopher. He was the author of a fine Italian pastoral entitled Fili di Sciro. He died at Fano, in 1608, aged 43.

Bona Ventura, The Bay of, in America on the coast next the South sea, in the Popayan. It has a port and harbour for ships; but the air is very unwholesome. W. Long. 79° 8'. N. Lat. 3° 50'.

Bona Ventura, a celebrated cardinal, called, from his works, the seraphic doctor. He was born at Bagnares, a small town of Tuscany, in 1291; and his original name was John Fidemano. He took the habit of a monk of the order of St Francis in 1243, became doctor of Paris in 1255, and the next year general of his order. After the death of Clement IV, the cardinals disagreeing about the election of a new pope, engaged themselves by a solemn promise to elect him who should be named by Bonaventure, even though it should be himself; but he chose Teobald archdeacon.

of Liege, who was then in the Holy Land, and took
the name of Gregory X. This pope, in return, in 1272,
made him cardinal and bishop of Alba, and ordered him
to assist at the second general council of Lyons, where
he died in 1274. His works were printed at Rome in
8 vols folio.

BONAVISTA, an island in the Atlantic ocean, the
most easterly and first discovered of the Cape of Ver
dlands. It is 20 miles long, and 13 broad; has plenty
of goats and cotton, and some indigo. The inhabitants
are remarkable for slothfulness; they have a town, and
two roads where ships come to an anchor. W. Long.
23. 6. N. Lat. 16. 5.

BOND, John, a commentator on Horace and
Persius, was born in Somersetshire in the year 1590,
and educated at Winchester school. In 1619 he was
entered a student of the university of Oxford, probably
in the New college, of which he became either one of
the clerks or one of the chaplains. He took his ba-
chelor of arts degree in 1573, and that of master in
1579; soon after which he was appointed by his col-
ge, master of the free school at Taunton in Somer-
setshire. In this employment he continued many years
with great reputation: but being at length weary of
his laborious employment, he commenced physician, and
we are told became eminent in that capacity. He died
in the year 1612, possessed of several lands and ten-
ements in his neighbourhood; but whether acquired by
the practice of physic, does not appear. He wrote,
1. Commentarii in poema Q. Horatii, 8vo. 2. Com-
mentarii in sex satyrias Persii, Lond. 1614, 8vo.

BOND, in Law, is a deed whereby the obligor obliges
himself, his heirs, executors, and administrators, to pay
a certain sum of money to another at a day appointed.
If this be all, the bond is called a simple one, simplex
obligatio. But there is generally a condition added,
that if the obligor does some particular act, the obliga-
tion shall be void, or else shall remain in full force: as
payment of rent; performance of covenants in a deed;
or repayment of a principal sum of money borrowed of
the obligee, with interest; which principal sum is usually
one half the penal sum specified in the bond. In case
this condition is not performed, the bond becomes for-
feited, or absolute at law, and charges the obligor while
living; and after his death the obligation descends upon
his heir, who (on defect of personal assets) is bound to
discharge it, provided he has real assets by descent as
a recompense.

If the condition of a bond be impossible at the time
of making it, or to be done a thing contrary to some rule
of law that is merely positive, or be uncertain, or in-
sensible, the condition alone is void, and the bond shall
stand single and unconditional: for it is the folly of the
obligor to enter into such an obligation from which he
can never be released. If it be to do a thing that is
nullum in se, the obligation itself is void: for the whole
is an unlawful contract, and the obligee shall take no
advantage from such a transaction. And if the condi-
tion be possible at the time of making it, and after-
wards becomes impossible by the act of God, the act of
law, or the act of the obligee himself, there the penalty
of the obligation is saved: for no prudence or foresight
of the obligor could guard against such a contingency.
On the forfeiture of a bond, or its becoming single,
the whole penalty was recoverable at law; but here the
courts of equity interposed, and would not permit a man
to take more in conscience than he ought, viz. his prin-
cipal, interest, and expenses, in case the forfeiture oc-
curred by non-payment of money borrowed: the damages
sustained upon non-performance of covenants; and the like.
And the statute 4 & 5 Ann. c. 16. hath also
enacted, in the same spirit of equity, that in case of a
bond, conditioned for the payment of money, the pay-
ment or tender of the principal sum due, with interest
and costs, even though the bond be forfeited and a suit
commenced thereon, shall be a full satisfaction and dis-
charge.

BOND, in masonry and brick-laying, is when bricks
or stones are as it were knit and interwoven; and when
they say, make good bond, they mean that the joints
are not made over or upon other joints; but reach at least
six inches, both within the wall and on the surface, as
the art of building requires.

BONDSAGE, properly signifies the same with slav-
ery, but in old law books is used for villainage (see
VillENAGE). Tenants in bondage paid rents, and
did fealty; they were not to fell trees in their own
garden, without license of the lord. The widow of a
tenant in bondage held her husband's estate quam
viserit sine mariito, "as long as she lived single."

Bondage by the Forelock, or Bondagium per ante-
cores criminis capitatis, was when a freeman renounced
his liberty, and became a slave to some great man; which
was done by the ceremony of cutting off a lock of hair
from the forehead, and delivering it to his lord; de-
noting that he was to be maintained by him for the
future. Such a bondman, if he reclaimed his liberty,
or were fugitive from his master, might be drawn with
his servitude by the nose, whence the origin of the popu-
lar menace to pull a man by the nose.

BONDMAN, in the English law, is used for a vil-
lain, or tenant in the villainage—The Romans had two
kinds of bondmen; one called servus, who were those
and either bought for money, taken in war, left by sub-
cession, or purchased by some other lawful acquisition;
or else born of their bondwomen, and called serfus.
We may add a third kind of bondmen mentioned by Ju-
nian, called adscriptitus glebe, or agricenfus; who were
not bound to the person, but to the ground or place,
and followed him who had the land. These in our law
are called villanues regardantes, as belonging to the manor
or place.

BONE-ACE, a game at cards played thus: The de-
aler deals out two cards to the first hand, and turns up
the third, and so on through all the players, who may
be seven, eight, or as many as the cards will permit;
that he that has the highest card turned up to him carries
the bone; that is, one half of the stake; the other
half remaining to be played for. Again, if there be
three kings, three queens, three tens, &c. turned up,
the eldest hand wins the bone. But it is to be ob-
erved, that the ace of diamonds is bone-ace, and wins
all other cards whatever. Thus much for the bone:
and as for the other half of the stake, the nearest to 31
wins it; and he that turns up or draws 31 wins it im-
mediately.

BONES, their origin, formation, composition, tex-
ture, variety, offices, &c. See Anatomy.

Bones Whitened for Skeletons. Two processes are
described in the Acta Hoffmannis for whitening bones.
Professor Rau had a method of giving them a great degree of whiteness. By bare exposure to the air, sun, and rain, for a length of time, they become notably white; but the whitest bones, kept in a room tainted with smoke or fuliginous vapours, grow in a little time yellowish, brownish, and unsightly. It is customary for the purification of bones, to boil them in alkaline liquors; which, by dissolving and extracting the superfluous fat, improves their whiteness.

Bones Hardened and Softened. Boerhaave observes, that alkaline salts render bones harder and firmer, and that acids make them softer and more flexible. These effects succeed in certain circumstances, but not universally; for bones may be hardened and softened both by acids and alkalies, according to the quantity of saline matter employed, and the manner in which it is applied. Newman made bones harder and more compact by treating them with the strongest of the mineral acids; though, when the acid is in sufficient proportion, it destroys or dissolves them. In Papin's digester (a strong close vessel in which the steam of boiling liquors is confined, and the fluid by this means made to undergo a greater degree of heat than it could otherwise sustain), the hardest bones are reduced in a short time, by the action of simple water into a soft pap or jelly; and alkaline liquors produce this effect still sooner.

In the history of the French Academy for the years 1742 and 1743, there is an account that Mr Geoffroy produced before the academy a small ivory spoon, which by long lying in mustard, became flexible and transparent like horn: that Mr Fouchy saw an ivory spoon, which, by lying for a considerable time in milk, became supple like leather; and that Mr Hnau had produced bones, which had been softened by steeping in vinegar, afterwards hardened to their natural state by steeping in water, and softened a second time by steeping in vinegar. Dr Lewis observed that the nitrous and marine acids diluted, and the acetic acid, make bones flexible and tough like leather; but that the diluted vitriolic acid, though it renders them notably soft, makes them at the same time brittle. It seems as if a great part of the earthy matter, which is the basis of the bone, and on which its hardness depends, was dissipated by the first three first; whilst the latter, incapable of dissolving this kind of earth into a liquid form, only corrodes it into a kind of selenitic concrete, which remains intermixed in minute particles among the gelatinous matter. Dr Lewis did not find that the softened bones, whatever acid they were softened by, recovered their hardness by steeping in water. Slips of softened ivory, after lying above a month in water, continued nearly as soft as when they were taken out of the acid liquor.

There is a singular induration of bones produced by fire; the effects of which agent are here remarkably different according to its degree and the circumstances of its application. Bones exposed to a moderate fire, either in open vessels, or in contact with the burning fuel, become opaque, white, and friable throughout; and an increase of fire, after they have once suffered this change, renders them only more and more friable. But if they are urged at first with a strong fire, such as that in which copper or iron melts, they become hard, semitransparent, and porous, like the hard mica.

**BONE**

This curious experiment deserves to be further prosecuted.

**Colouring of Bones.** Bones may be stained of a variety of colours by the common dyeing infusions and decoctions of animal and vegetable substances. They are stained also, without heat, by metallic solutions; and by means of these may be spotted or variegated at pleasure. Thus, solution of silver in aquafortis gives a brown or black according to its quantity; solution of gold in aqua regia, or in the spirit of salt, a fine purple; solution of copper in the acetous acid, a fine green; and solutions of the same metal in volatile alkalies, a blue, which is at first deep and beautiful, but changes, upon exposure to the air, into a green or bluish-green. If the bone is but touched with the two first solutions, and exposed to the air, it does not fail to acquire the colour in a few hours: In the two latter, it requires to be steeped for a day or longer in order to its imbibing the colour. In these and other cases where immersion for some time is necessary, the bone may be variegated, by covering such parts as are to remain white, with wax or any other matter that the liquor will not dissolve or penetrate.

**Oeconomical Uses of Bones.** Bones are a very useful article, not only for making different kinds of toys, but likewise in several of the chemical arts; as, for making cast iron malleable, for absorbing the sulphur of sulphurous oars; for forming tests and cuprels, or vessels for refining gold and silver with lead (burnt bones composing a mass of a porous texture, which absorbs the vitriled lead and other matters, while the unvitriable gold and silver remain entirely behind); for the preparation of milky glasses and porcelains; for the rectification of volatile salts and empyreumatic oils; and for making glue. The bones of different animals are not equally fit for these uses: even the glue, or gelatinous part of the bones of one animal is notably different both in quantity and cohesiveness from that of another.

The human skull-bone, or cranium, the natural defence of the seat of sensation and perception in the noblest animal, has been recommended medicinally as a cure for epilepsies, deliria, and all disorders of the senses, from the same philosophy which ascribes antistimetric virtues to the lungs of the long-winded fox; and expected, because fowls are said to die at even small stones, that the skin of the gizzard, dried and powdered, would produce a similar effect in the human stomach. To such lengths of extravagance have the sons of physic been carried by the blind superstition of former ages!

**Bones in the Funeral Solemnities of the Ancients.**—Divers usages and ceremonies relating to the bones of the dead have obtained in different ages; as gathering them from the funeral pile, washing, anointing, and depositing them in urns, and then into tombs: translating them, which was not to be done without the authority of the pontiffs; not to say worshipping of them, still practised to the bones of the saints in the Roman church. Among the ancients, the bones of travellers and soldiers dying in foreign countries were brought home to be buried; till, by an express S. C. made during the Italian war, it was forbid, and the soldiers bodies ordered to be buried where they died.

The Romans had a peculiar deity under the denomination,
Bon

Bones

formation of Ossilago, to whom the care of the induration and knitting of the human bones was committed; and who, on that account, was the object of the adoration of all breeding women.

Fossil or Petrified Bones, are those found in the earth, frequently at great depths, in all the strata, even in the bodies of stones and rocks; some of them of a huge size, usually supposed to be the bones of giants, but more truly of elephants or hippopotami. It is supposed they were reposing in those strata when all things were in a state of solution; and that they incorporated and petrified with the bodies where they happened to be lodged.

In the museum of the Russian Academy of Sciences, there is a vast collection of fossil bones, teeth, and horns, of the elephant, rhinoceros, and buffalo, which have been found in different parts of this empire, but more particularly in the southern regions of Siberia. Naturalists have been puzzled to account for so great a variety being found in a country where the animals of which they formerly made a part were never known to exist. It was the opinion of Peter, who, though he deserves to be esteemed a great monarch, was certainly no great naturalist, that the teeth found near Voronet were the remains of elephants belonging to the army of Alexander the Great, who, according to some historians, crossed the Don, and advanced as far as Koskinus. The celebrated Bayer, whose authority carries greater weight in the literary world, conjectures, that the bones and teeth found in Siberia belonged to elephants common in that country during the wars which the Huns marched on with the Persians and Indians; and this plausible supposition seems in some measure to be corroborated by the discovery of the entire skeleton of an elephant in one of the Siberian tombs. But this opinion, as Mr. Palas very justly observes, is sufficiently refuted by the consideration, that the elephants employed in the armies of all India could never have afforded the vast quantities of teeth which have been discovered, not to mention those which it is justly to be presumed may still be buried. They have been already dug up in such plenty as to make a considerable article of trade. The same ingenious naturalist has given an ample description of those fossil bones, and has endeavoured to account for their origin. Upon examining those in the museum, he was led to conclude, that as these bones are equally dispersed in all the northern regions of Europe, the climate probably was in the earlier ages less severe than at present, and then possibly sufficiently warm to be the native countries of the elephant, rhinoceros, and other quadrupeds, now found only in the southern climates. But when he visited, during his travels, the spots where the fossil bodies were dug up, and could form a judgment from his own observations, and not from the accounts of others, he renounced his former hypothesis; and, in conformity with the opinions of many modern philosophers, asserted, that they must have been brought by the waters; and that nothing but a sudden and general inundation, such as the deluge, could have transported them from their native countries in the south, to the regions of the north. In proof of this assertion, he adds, that the bones are generally found separate, as if they had been scattered by the waves, covered with a stratum of mud evidently formed by the waters, and commonly intermixed with the remains of marine plants, and similar substances; instances of which he himself observed during his progress through Siberia, and which sufficiently prove that these regions of Asia were once overwhelmed with the sea.

We often find in the earth petrified bones, the greatest part of their gelatinous matter being extracted by the moisture, and a stony one introduced in its room. In some parts of France petrified bones are met with which have an impregnation of copper. Hence, on being calcined in an oven fire, a white salt is produced from the remains of their gelatinous principle, and the bone is tinged throughout of a fine greenish blue colour, copper always striking a blue with volatile alkalies. The French turquoise stones are no other than these bones prepared by calcination; they are very durable, and bear to be worked and polished nearly in the same manner as glass; without the imperfection, inseparable from glassy bodies, of being brittle. See the article Turquoise.

There have been lately discovered several enormous skeletons, five or six feet beneath the surface, on the banks of the Ohio, not far from the river Miami in America, 700 miles from the sea-coast. Some of the tusks are seven, others ten feet long; one foot six inches in circumference at the base, and one foot near the point; the cavity at the root or base, 19 inches deep. Besides their size, there are several other differences which will not allow the supposition of their having been elephants: the tusks of the true elephant have sometimes a very slight lateral bend; these have a larger twist, or spiral curve, towards the great and specific difference consists in the shape of the grinding teeth: which, in these newly found, are fashioned like the teeth of a carnivorous animal; not flat and ribbed transversely on their surface like those of the modern elephant, but furnished with a double row of high and conic processes, as if intended to masticate, not to grind, their food. A third difference is in the thigh-bone, which is of great disproportionable thickness to that of the elephant; and has also some other anatomical variations. These fossil bones have been also found in Peru and the Brazils; and when cut and polished by the workers in ivory, appear in every respect similar. It is the opinion of Mr. Hunter, that they must have belonged to a larger animal than the elephant; and differing from it in being carnivorous. But as yet this formidable creature has evaded our search; and if indeed, such an animal exists, it is happy for man that it keeps at a distance; since what ravage might not be expected from a creature, endowed with more than the strength of the elephant, and all the rapacity of the tiger? See Mammoth.

Bon Esperance, the same with the Cape of Good Hope. See Good Hope.

Bonet, Theophilus, an eminent physician, born at Geneva, March 15th 1620. He took his degree in physic in 1643, after he had gone through most of the famous universities, and was for some time physician to the duke of Longueville. Meanwhile his skill in his profession got him considerable practice; but being seized with deafness, it obliged him to retire from business, which gave him leisure to collect all the observa-
BON

should be conferred on no other than the bishop of Rome. Boniface IV. obtained from the same emperor, the Pantheon, a famous basilica temple built by Agrippa, and converted it into a church which is now called "Our Lady della Rotonda." Several works are also attributed to him, but they appear to be spurious.

Boniface VII. had the title of antipope; because in 974 he caused Benedict VI. to be strangled in prison, and after the election of Benedict VII. removed the treasures of the church to Constantinople. He, however, at length returned after the death of Benedict, and caused his successor John XIV. to be murdered; but died himself soon after, and was dragged naked by the feet about the streets. Boniface VIII. canonized St. Lewis in 1297, and in 1300 appointed the jubilee to be solemnized every 100 years after.

Boniface is also the name of a saint, who before he took that name was called Winfred, and was born at Kirton in Devonshire. He chose to go and preach the gospel among the barbarous nations; and though created archbishop of Mentz, soon after resigned his office, to go and preach in East Friesland, where he was killed by the Pagans on the 5th of June 754. His letters were published by Senarius.

Bonifacio, a town in the island of Corsica, beyond the mountains, near the strait called Boca di Bonificcio. It is well fortified, and contains 3170 inhabitants. E. Long. 9. o. N. Lat. 41. 25.

Bonis non amovendis, in Law, is a writ directed to the sheriffs of London, &c. charging them that a person against whom judgment is obtained, and prosecuting a writ of error, be not suffered to remove his goods until the error is determined.

Bonito. See Scobert, Ichthyology Indec.

Bonn, an ancient and strong city of Germany, in the duchy of the Lower Rhine, subject to Prussia. It is of great consequence in the time of war; because it is situated on the Rhine, in a place where it can stop every thing that comes down that river. It is well fortified, and 1801 in contained 8837 inhabitants. The Jews are the principal traders. E. Long. 7. 5. N. Lat. 50. 44.

Bonna, in Ancient Geography, one of the 50 citadels built by Drusus on the Rhine; supposed by some to be the same with the Ara Ubosum: Now Bona.

Bonnefons, John, or Bonnefons, a Latin poet, was born at Clermont in Auvergne, in 1554. He became an advocate in the parliament of Paris, and was appointed lieutenant-general of Bar sur Seine, and acquired great reputation by his Pancharis, and other poems. He died under the reign of Louis XIII. He ought not to be confounded with John Bonnefons his son, another Latin poet.

Bonner, Edmund, bishop of London, of infamous memory, was born at Hanley in Worcestershire, and generally supposed to be the natural son of one Savage a priest; and that priest was the natural son of Sir John Savage of Clifton in the same county. Strype, however, says, he was positively assured that Bonner was the legitimate offspring of a poor man, who lived in a cottage known to this day by the name of Bonner's place. About the year 1512, he entered student of Brasenose Hall in Oxford. In 1519, he was admitted bachelor of the canon and civil law. About the
same time he took orders, and obtained some preferment in the diocese of Worcester. In 1525, he was created doctor of canon law. Having now acquired the reputation of a shrewd politician and civilian, he was soon distinguished by Cardinal Wolsey, who made him his commissary for the faculties, and heaped upon him a variety of preferments. He possessed the same time the livings of Blydon and Cherry-Burton in Yorkshire, Ripple in Worcestershire, East Derham in Norfolk, the prebend of St. Paul's, and arch-deaconry of Leicester. Bonner was with the cardinal at Caw-wood, when he was arrested for high treason. After the death of that minister, he soon found means to insinuate himself into the favour of Henry VIII. who made him one of his chaplains, and employed him in several embassies abroad, particularly to the pope. In 1532, he was sent to Rome, with Sir Edward Kame, to answer for the king, whom his holiness was to appear in person or by proxy. In 1533, he was again despatched to Pope Clement VII. at Marseilles, upon the excommunication of King Henry on account of his divorce. On this occasion he threatened the pope with so much resolution, that his holiness talked of burning him alive, or throwing him into a caldron of melted lead; upon which Bonner thought fit to decamp. His inoffensiveness did not foresee that the man whom he thus threatened was predestined to burn himself in England. In 1538, being then ambassador at the court of France, he was nominated bishop of Hereford; but, before consecration, was translated to the see of London, and enthroned in April 1540. Henry VIII. died in 1547, at which time Bonner was ambassador with the emperor Charles V. During this reign he was constantly zealous in his opposition to the pope; and, in compliance with the king, favoured the reformation. Henry VIII. was not to be trifled with; but on the accession of young Edward, Bonner refused the oath of supremacy, and was committed to the Fleet; however, he soon thought fit to promise obedience to the laws, and was accordingly released. He continued to comply with reformation; but with such manifest neglect and reluctance, that he was twice reprimanded by the privy council, and in 1549, after a long trial, was committed to the Marshalsea, and deprived of his bishopric. The succeeding reign gave him ample opportunity of revenge. Mary was scarce seated on the throne before Bonner was restored to his bishopric; and soon after appointed vicar-general and president of the convocation. From this time he became the chief instrument of papal cruelty: he is said to have condemned no less than 200 Protestants to the flames in the space of three years. Nor was this monster of a priest more remarkable for his cruelty than his impudence. When Queen Elizabeth came to the crown, he had the insolence to meet her, with the rest of the bishops, at Highgate. In the second year of her reign, refusing to take the oath of allegiance and supremacy, he was again deprived, and committed to the Marshalsea; where he died in 1559, after ten years confinement. There cannot be a stronger instance of the comparative lenity of the Protestant church, than its suffering this miscreant to die a natural death. Several pieces were published under his name.

BONNESTABLE, a town of France, in the department of Sare, which carries on a great trade in corn. E. Long. 0. 30. N. Lat. 48. 11. BONNET, CHARLES, an eminent naturalist, was born in 1720 at Geneva, of a French family who had been forced on account of religious principles to leave their native country. As he was an only son, his father paid great attention to his education, and finding that he made little progress at the public schools, sent him to a school for the study of grammar, andleness, with which he was very early afflicted, he put him under the care of a domestic tutor, and under his progress was rapid and successful in general literature. At the early age of 16, his attention was so deeply engaged in the perusal and study of Le Spectacle de la Nature, that it seems to have directed the bias and taste of his future studies. The history and the habits of the ant-lion (formica lep), particularly attracted his attention, and led him to make his first observations in natural history. He discovered the haunts of this curious insect, watched and studied its manners and habits, and added many observations to those of Poupart and Reaumur. Reaumur's Memoir on insects happening to fall accidentally in his way, he pursued it with great eagerness, and thisՍհուկը probably decided his taste for natural history. To these observations and experiments of that naturalist, Bonnet added many new facts which he had obtained in England, chiefly in those with which he was communicated to Reaumur, who, was not less surprised than pleased to find so much sagacity and acuteness of research exhibited in the investigations of a young man of eighteen.

Young Bonnet had been destined by his father to the profession of the law; but it was with no small reluctance that he entered on the studies necessary to qualify himself for that profession. The bias of his mind leaned too strongly to natural history, to permit him to occupy his attention with other pursuits. The study of some of the elementary books on law was therefore submitted to merely as a task. In the years 1738 and 1739, he sent to Reaumur many interesting observations on different species of caterpillars; and in 1740, he communicated a paper to the Academy of Sciences respecting the propagation or multiplication of aphides, or tree-lice, without actual conjugation. This question had been left unsettled by Reaumur. It was now determined by decisive experiments, and his paper on the subject obtained him the honour of being admitted a correspondent member of the Academy. His experiments on the generation of these insects were conducted with such closeness of attention, and such minuteness of research, as to injure his eyesight to such a degree as he never afterwards recovered. In the year 1741, he instituted a set of experiments, on the effects that follow the division of worms, and he found that many species possessed in some degree the same reproductive power as the polype. In the following year his investigations and experiments were directed to the peculiarities in the mode of respiration of caterpillars and butterflies; and he proved that this function was performed by means of pores to which the name of stigma has been given. It was about the same time that he performed some curious discoveries respecting the tapeworm, or tapeworm. In the year 1743, when he was raised to the rank of doctor of laws, he procured a welcome dispensation.
Bonnet.

BON [ 785 ]

Bonnet.

dispensation from the farther prosecution of studies which had never been agreeable to him, and which being no longer absolutely necessary, he relinquished for ever. In consequence of a memoir on insects which he communicated to the Royal Society of London, the same year, he was admitted a member of that body. Next year he published in one work, his observations on aphides and worms, under the title of Insectology. To this work he prefixed a preface, in which he exhibits a philosophical sketch of his ideas concerning the system of the development of germs, and the mode of organized beings. This work was in general well received by the public. The want of delicacy was objected to in some journals, which, it was alleged, appeared in his descriptions of the mode of propagation of tree-lace.

But the constant labours to which Bonnet had subjected himself in all his inquiries began to produce very serious consequences on his health. His eyes particularly began to be affected with severe pains, and his general health visibly declined. This not only obliged him to lay aside the use of the microscope, but also to forego for a time all reading and writing. Like a true philosopher, he bore his afflictions with patience. But he was not idle: for though he was interdicted from all observation, his mind was fully occupied in reflection. After some time’s relaxation from his usual pursuits, he was at last restored to tolerable health and ease, but he never could employ his eyes with the same freedom as formerly. About the year 1746, he undertook a course of experiments on the vegetation of plants in moss and other substances; and in the following year his researches were directed to the functions of the leaves of plants, with the view of ascertaining the different action of the different sides of the leaves. Another question in vegetation offered itself to his consideration. This was the ascent of the sap. And to determine whether it rose by the bark or wood, he employed coloured injections. This investigation, with some observations which he made on vegetable monsters, was the foundation of one of his most interesting and original works, his "Inquiries into the use of the Leaves of Plants." This work was first published in 1750 at Leyden in 1754. A supplement was added to it in 1779.

Observation and experiment had been the first passion of Bonnet, yet these now began to give way to speculation; and his inquiries in natural history, in which he had so much studied the nature and generation of the lowest part of the scale of beings, led him to consider the faculties and destination of the highest. Malebranche and Leibnitz laid the foundation of his metaphysical ideas. He engaged deeply in all the discussions connected with the history of the human mind; and the first fruit of his meditations was a kind of abridgement of the materials he had collected, under the title of an "Essay on Physiology," published in London in 1755, but without his name, nor did he acknowledge it till nearly thirty years afterwards. This work contains in a concise form the fundamental principles of his philosophy. It traces the origin and progress of the human mind, from the first germ of life to the development of all its faculties, the mutual dependence of which it points out, as deduced from actual observation. It enters into the difficult subject of human liberty, and endeavours to reconcile it with the divine prescience, and the philosophical principle, that every effect must have an adequate cause. From the essential properties of the activity of the soul, and the effects of habit upon it, the whole art of education and government is deduced; and a system of the former is laid down, materially different from the usually established methods. It was the freedom with which he had discussed some of these delicate points, and the fear of being involved in personal controversy, which induced the author to remain so long concealed. It met with a number of critics, yet its success was brilliant.

The next work of Bonnet was a development of part of the substance of the preceding, viz. the origin and progress of the mental faculties. After a labour of five years on the subject, he produced his "Analytical Essay on the faculties of the soul." This was first printed at Copenhagen in 1760, in 4to, at the expense of the king of Denmark. In this work, like that of the abbé Condillac, he takes the supposition of a statute organized like the human body, which he by degrees animates, and shows how its ideas would arise from impressions on the organs of sense. This work was well received by philosophers, though with some it subjected him to the charge of materialism. To these he made no reply, but contented himself with proceeding in those efforts for the service of religion and morals, to which the best part of his life was devoted. His retired and studious habits, together with his deafness and other bodily infirmities, had ever prevented him from joining in the assemblies of the young and gay; at the same time they rendered domestic comforts more essential to him. In 1756, he married a lady of the respectable family of de la Rive, and with her he passed thirty-seven years of that perfect union which results from mutual tenderness, directed by good sense and virtue. The celebrated Saussure was the nephew of Mad. Bonnet, and it was no small pleasure to her husband to witness the early display of genius and knowledge in this extraordinary young man.

The next work of our author was properly the physical part of his great system. It appeared at Amsterdam in 1762, under the title of "Considerations on organized bodies," 2 vols. 8vo. Its principal objects were, to give in an abridged form all the most interesting and well-ascertained facts respecting the origin, development, and reproductions of organized bodies; to refute the different systems founded upon epigenesis; and to explain and defend the system of germs. This publication, though well received by philosophers in general, was, from some suspicion of its principles, prohibited in France; but a remonstrance from the author to M. des Malesherbes, then licensor of the press, caused the interdict to be removed, after a new examination. His "Contemplation of Nature," which appeared in 1764, Amst. 2 vols. 8vo, was a work neither meant for popular use, in which the principal facts relative to the different orders of created beings are displayed in a manner both instructive and entertaining, and set off by the charms of an elegant style, with a continual reference to final causes, and the proofs of wisdom and benevolence in the Creator. It has been translated into most of the European languages, and enriched with notes by several hands, as well as by the author himself in a new edition.
The concluding work of Bonnet was his "Palingenesis Philosophica," printed at Geneva in 1769, 2 vols 8vo. In this he treats on the past and future state of living beings, and supports the idea of the survival of all animals, and the perfecting of their faculties in a future state. Attached to this work is "An Inquiry into the Evidences of the Christian Revelation, and the Doctrines of Christianity," which, with a treatise "On the Existence of God," was published separately at Geneva in 1770. It was likewise translated into German, and dedicated by the translator to a celebrated Jew, with a summons to him to refute it, or acknowledge his conviction. Bonnet, who had an invincible repugnance for controversy, no sooner heard of this step, than he wrote to the Jew, assuring him, that he had no share in it; and the two philosophers mutually agreed to forbear any discussion of a topic in which their opinions were totally different. The temper of Bonnet was, indeed, totally the reverse of that which disposes to contention; and tranquility was the great object of his life. He readily corrected his own errors; and never but once entered into a defence of himself. This was on occasion of a charge of plagiarism brought against him as having borrowed from Leibnitz his hypothesis on the resurrection. He had, in the earlier part of life, made an anonymous attack in the French Mercury upon Rousseau's discourse on the origin of inequality among men, to which that writer made a reply; but the controversy went no further.

After having in some measure relinquished speculative philosophy, he resumed his attention to natural history, and in 1773, published in Rozier's Journal a memoir on the method of preserving insects and fish in cabinets. In 1774 he communicated to the same journal a memoir on the loves of plants, originating in the discovery of a kind of cleft or mouth in the pistil of a lily. Some experiments on the reproduction of the heads of snails, and of the limbs and organs of the water salamander, furnished matter for other memoirs. He also made observations on the pipa or Surinam toad, on bees, on the blue colour acquired by mushrooms from exposure to the air, and on various other subjects in natural history, which agreeably occupied his leisure. His reputation was now fully established. There was scarcely an eminent learned society in Europe which did not associate him as a member: and these honours were crowned in 1783 by his election into the small and very select number of foreign associates of the academy of sciences at Paris. His literary correspondents were numerous. Among these were the distinguished names of Reaumur, Du Hamel, De Geer, Haller, Van Swieten, Spallanzani, and Merian. Though attached by inclination to the pursuit of scientific studies in retirement, he did not entirely withdraw from public duties. He entered into the great council of the republic in 1772, and kept his seat in it till 1768, having frequently distinguished himself by the manly eloquence with which he supported wise and moderate measures, and his constant zeal in the cause of morals and religion, on which he thought the prosperity of the state essentially founded. The last twenty-five years of his life he passed entirely in the country, in a simple and uniform mode of living, happy in an easy competence, and in a small circle of friends. It appears that he was, for some time, engaged in the education of youth, an employment for which he was peculiarly fitted, and in which he obtained the warmest attachment of his pupils. The publication of all his works, corrected and revised, in a general collection, occupied near eight years of his life, which greatly injured his health, from the intense application which he bestowed upon it. This appeared at Neuchâtel, in 9 vols 4to, and 18 vols 8vo; and besides the works already mentioned, contains a number of smaller pieces, both in natural history and metaphysics. They are all written in French. It was not till about 1788 that his constitution, feeble as it was, visibly gave way. The symptoms of a dropsy in the chest then began to manifest appearance; and these with some intervals, gradually increased upon him, occasioning a variety of sufferings, which he bore with great patience and serenity. He died on May 20, 1793, at the age of 73. Public honours were rendered to his remains by his fellow-citizens, and his funeral oration was pronounced by his learned friend and kinsman, M. de Saussure.

Bonnet, in a general sense, denotes a cover for the head, in common use before the introduction of hats. Bonnets are still used in many parts of Scotland.

Bonnet, in Fortification, a small work consisting of two faces, having only one parapet with two rows of pilasters, at about 12 feet distance; it is generally raised before the salient angle of the counter-scarp, and has a communication with the covered way, by a trench cut through the glacis, and pilasters on each side.

Bonnet a Pretre, or Priest's Bonnet, in Fortification, is an out-work, having at the head three salient angles, and two inwards. It differs from the double entaille only in this, that its sides, instead of being parallel, are like the queue d'aronde, or swallow's tail, that is, narrowing, or drawing close at the gorge, and opening at the head.

Bonnet, in the sea-language, denotes an addition to a sail; thus we say, lace on the bonnet, or shake off the bonnet.

Bonneval, Claudius Alexander, Count de, known in the latter part of his life by the name of Osman Bashaw, descended from a family related to the blood-royal of France, entered himself at the age of 16 in the service of that crown, and married the daughter of Marshal de Biron. He made the campaign of Flanders in 1690; but soon after left the French army, and entered into the Imperial service under Prince Eugene, who honoured him with intimate friendship. The intrigues of the marquis de Frie, his inveterate enemy, ruined his credit, however, at the court of Vienna, and caused him to be banished the empire. He then offered his service to the republic of Venice and to Russia; which being declined, his next tender was to the Grand Signior, who gladly received him. It was stipulated that he should have a body of 30,000 men at his disposal; that a government should be conferred on him, with the rank of bashaw of three tails, and a salary of 10,000 aspers a-day; and that, in case of war, he should be commander in chief. The first expedition he engaged in after his arrival at Constantinople, was to quell an insurrection in Arabia.
BONNAVERI, which he happily effected; and at his return had large offers made him by Koul Khan, but he did not choose to accept them. Some time after, he commanded the Turkish army against the emperor, over whose forces he gained a victory on the banks of the Danube. But success does not always protect a person against disgrace, for Bonneval, notwithstanding his services, was first imprisoned, and then banished to the island of Chio. The sultan, however, continued his friend; and the evening before his departure made him, bashaw-general of the Archipelago, which, with his former appointment of begierberg of Arabia, rendered him one of the most powerful persons in the Ottoman empire. In this island he found a retirement quite agreeable to his wishes; but did not long enjoy it, being sent for back, and made tophori or master of the ordnance, a post of great honour and profit. He died in this employment, aged 75, in 1747; and wrote the memoirs of his own life.

BONNEVAL, a town of France, in the department of Eure and Loire, which had before the revolution a fine Benedictine abbey. It is seated on the river Loire, in E. Long. 1. 50. N. Lat. 48. 10.  

BONNEVILLE, a town of Savoy, capital of Faucigny, situated on the north side of the river Arve, and subject to the king of Sardinia. It is situated at the foot of a mountain called the Male, and is 20 miles south of Geneva. E. Long. 6. 10. N. Lat. 46. 18.  

BONNY, among miners, a bed of ore, differing early from a squat as being round, whereas the squat is flat. See Squat.

BONNY, a town of France, in the department of Loiret, seat of the institute of a river of the same name with the Loire. E. Long. 2. 54. N. Lat. 47. 36.  

BONONCINI, GIANNI, an eminent composer of music, for some time divided the opinions of the conso-accepts of this kingdom with respect to the comparative merits of himself and the great Handel, which gave occasion for the following epigram, said to have been written by Dr Swift:

Some say that Signor Bononcini Compar'd to Handel's a mere ninny; Oth'rs aver, that to him Handel Is scarcely fit to hold the candle. Strange! that such high disputes should be 'Twixt Tweedle Dum and Tweedle Dee.

There is one opera (Italian) published with his name prefixed to it, entitled Pharmaces; but whether the words, or only the music, are his composition, is uncertain; and indeed, in the general, the language of those pieces, written merely for musical representation, is so extremely paltry, and so opposite to every thing that can be deemed poetry, that the greatest compliment that can be paid to the authors of them, is to suffer their names to lie buried in the shades of obscurity.

BONONIA, in Ancient Geography, a town of Gallia Belgica, supposed to be the Portus Icicius of Cesar, and the Gessariusum of Mela, and to have had three different names (Cluverius). Peutinger's map expressly calls it Gessariusum Bononia. Nova Bologna. E. Long. 2. 50. N. Lat. 50. 40.

BONOSIA, a town of Italy, in the Gallia Cispadan a; a name probably given by the Gauls, there being a Bononia in Gallia Belgica. Its ancient name, when in the hands of the Tuscani, who were expelled by the Gauls, was Follina. In the 5th year of the city the Romans led a colony thither; which, about the beginning of the Acts, was increased by Augustus, and is the Colonisa Bononiesiana of Tacitus. Now Bologna; which see.

BONONIA, a town of Panonia Inferior, between Muria to the north-west, and Tarvisium to the east.—Another Bononia, a town of Mosia Superior, on the Danube; now Bodza in Bulgaria. See BODONIA.

BONONIANI, or Bonosiani, an ancient branch of Aduaitani, in the fourth century, denominated from their leader Bonous, a bishop of Macedon. The Bonosiani were prior to the Feliciani, and even to Nestorius; whence some rather consider them as a branch of Arians. They allowed Christ to be no otherwise the Son of God than by adoption.

BONPOURNICKEL, a coarse kind of bread used in Westphalia. See BREAD.

BONS HOMMES, or Bons-hommes, a sort of hermits of St Augustin, founded by F. de Paula. They were brought over into England in 1283, by Edmund Earl of Cornwall, and settled at Asherg in Bucks, besides which they had only one house more at Edington in Wilts. They followed the rule of St Austin, and wore a blue habit. The name is said to have arisen from Louis XI. of France, who used to call F. de Paula, prior of the order, Le bon homme. Till then they had been called the Minimi, or the order of Grammat. See ALIENENES.

BONTIA, WILD OLIVE OF BARBADOS. See BOTANY INDEX.

BONVINCINO, ALESSANDRO, called LE MORETO, history and portrait painter, was born at Rovato in 1514. He was first the disciple of Titian, under whose direction he studied diligently for some years. But, having accidentally seen the designs of Raphael, he felt an elevation of mind that he never had before experienced. He therefore gave himself up entirely to study those masterpieces of art and genius; and his observations were guided with such judgment, as well as attention, that his improvement was truly surprising, and he became an exceeding good painter. His works were eagerly bought up, as being extremely admired for the tenderness of the penilest; for the correctness and spirited expression of the figures; for the neatness of the finishing; and for the rich variety of his drape ries, which usually consisted of velvets, damasks, or satin, all copied after nature, and being wonderfully imitated. He was also equally excellent in portrait, and by many was placed in competition even with Titian. He died in 1564.

BONUS HENRICUS. See CHENOPODIUM, BOTANY INDEX.

BONZES, Indian priests. The Tonquinese have a pagod or temple in each town; and each pagod has at least two bonzes belonging to it: some have 30 or 40. These bonzes, in order to distinguish themselves from the laity, wear a chaplet about their necks consisting of 100 beads; and carry a staff, at the end of which is a wooden bird. They live upon the alms of the people; yet are very charitably disposed; and maintain several orphans and widows out of their own collections.
The bonzes of China are the priests of the Fohists or sect of Fohi. It is one of their established tenets that there are rewards allotted for the righteous, and punishments for the wicked, in the next world; and that there are various mansions in which the souls of men will reside, according to their different degrees of merit. But, in order to deserve the favour of heaven, the bonzes instruct the people to treat the priests with respect and reverence, to support and maintain them, and to erect temples and monasteries for them. They tell them, that, unless they comply with these injunctions, they will be cruelly tormented after death, and pass through a disagreeable variety of transmigrations: in short, that they will be changed into mules, asses, rats, and mice.

The Chinese bonzes, according to F. le Compte, are no better than a gang of dissolute idle fellows. All their aim is to incite people to commiserate their abject condition: to which end they have recourse to several tricks and impostures. When the common arts of address fail them, they try what public acts of penance will do. Some of them drag heavy chains 30 feet long after them; some sit in the highway knocking their heads against flint stones; others set particular drugs on fire upon their heads: all these are several ways of drawing the attention and exciting the compassion of the people, and they seldom fail of success.

The bonzes of Japan are generally gentlemen of the highest extraction; for when a gentleman of quality finds his family grow too numerous, nay, when he has only two sons, he very often makes the youngest a bonze, to prevent all domestic broils and confusions. These priests are dressed in various colours; their apartments are very commodious, and situated in the healthiest parts of the country.

F. Navarrete tells us, that the bonzes are obliged to chastity; and that, on the 22d of April 1667, a petty king of Canton had condemned 11 of them to be burnt alive for incontinence. He adds, that it was reported of an empress of the last reigning family, who had a particular kindness for the bonzes, that she granted them a dispensation for the use of women during three days. The bonzes of China, according to the same author, are computed at 50,000.

BOOBY. See PELICANUS, ORNITHOLOGY INDEX.

BOOK, the general name of almost every literary composition; but, in a more limited sense, is applied only to such compositions as are large enough to make a volume. As to the origin of books or writing, those of Moses are undoubtedly the most ancient that are extant: But Moses himself cites many books which it believed to be written before his time.

Of profane books, the oldest extant are Homer's poems, which were so even in the time of Sextus Empiricus; though we find mention in Greek writers of several others prior to Homer; as Hermes, Orpheus, Daphne, Horus, Luzus, Musæus, Palamedes, Zoroaster, &c. But of the greater part of these there is not the slightest fragment remaining; and of others, the names which go under their names are generally held, by the learned, to be suppositions.

Several sorts of materials were used formerly in making books: Plates of lead and copper, the bark of trees, bricks, stone, and wood, were the first materials employed to engrave such things upon as men were willing to have transmitted to posterity. Josephus speaks of two columns, the one of stone, the other of brick, on which the children of Seth wrote their inventions and astronomical discoveries: Porphyry makes mention of some pillars, preserved in Crete, on which the ceremonies observed by the Corybantes in their sacrifices were recorded. Hesiod's works were originally written upon tables of lead, and deposited in the temple of the Muses, in Eceotia: The ten commandments, delivered to Moses, were written upon stone; and Solomon's laws upon wooden planks. Tables of wood, box, and ivory, were common among the ancients: When of wood, they were frequently covered with wax, that people might write upon them with more ease, or blot out what they had written. The leaves of the palm-trees were afterwards used instead of wooden planks, and the finest and thinnest part of the bark of such trees, as the lime, the ash, the maple, and the elm; from hence comes the word liber, which signifies the inner bark of the trees: and as these barks are rolled up, in order to be removed with greater ease, these rolls were called volume, a volume; a name afterwards given to the like rolls of paper or parchment.

Thus we find books were first written on stones, witnessed the Decalogue given to Moses: Then on the parts of plants; as leaves, chiefly of the palm-tree, the rind and barks, especially of the titia, or phyllyrea, and the Egyptian papyrus. By degrees wax, then leather, were introduced, especially the skins of goats and sheep, of which at length parchment was prepared; then lead came into use; also linen, silk, horn, and lastly paper itself.

The first books were in the form of blocks and tables; but as flexible matter came to be wrote on, they found it more convenient to make their books in the form of rolls: These were composed of several sheets fastened to each other, and rolled upon a stick, or umbilicus; the whole making a kind of column, or cylinder, which was to be managed by the umbilicus as a handle, it being reputed a crime to take hold of the roll itself: The outside of the volume was called from; the ends of the umbilicus, cornus, which were usually carved, and adorned with silver, ivory, or even gold and precious stones: The title, στηλαξας, was struck on the outside; the whole volume, when extended, might make a yard and a half wide, and fifty long. The form which obtains among us is the square, composed of separate leaves; which was also known, though little used, by the ancients.

To the form of books belongs also the internal economy, as the order and arrangement of points and letters into lines and pages, with margins and other appurtenances. This has undergone many varieties. At first the letters were only divided into lines; then into separate words; which, by degrees, were noted with accents, and distributed, by points and stops, into periods, paragraphs, chapters, and other divisions. In some countries, as among the orientals, the lines began from the right and ran leftward; in others, as the northern and western nations, from left to right; and others, as the Greeks, followed both directions, alternately going in the one, and returning in the other, called boustrophedon: In most countries, the lines run
from one side to the other; in some, particularly the Chinese, from top to bottom.

Multitude of Books has been long complained of: the complaint is as old as Solomon, who lived three thousand years ago: they are grown too numerous not only to procure and read, but to see, to learn the names of, or even to number. England has more to fear on this score than other countries; since, besides our own produce, we have for some years past drained our neighbours. However, as Bishop Crambush's scheme miscarried, which was to write about an hundred volumes in folio, and then prevail on the civil and military powers to oblige all their subjects to read them, we need not much regret the multitude of books.

As knowledge, however, is naturally advantageous, and as every man ought to be in the way of information, even a superficiality of books is not without its use, since hereby they are brought to obtrude themselves on us, and engage us when we had least design. This advantage, an ancient father observes, we owe to the multiplicity of books on the same subject, that one falls in the way of one man, and another best suits the level or the apprehension of another. "Every thing that is written (says he) does not come into the hands of all persons: perhaps some may meet with my books, who may hear nothing of others which have treated better of the same subject. It is of service, therefore, that the same questions be handled by several persons, and after different methods, though all on the same principles, that the explanation of difficulties and arguments for the truth may come to the knowledge of every one by one way or other." Add, that the multitude is the only security against the total loss or destruction of books: it is this that has preserved them against the injuries of time, the rage of tyrants, the zeal of persecutors, and the ravages of barbarians; and handed them down, through long intervals of darkness and ignorance, safe to our days. Soluque non norunt hac monumenta morti.

Scarcity of Books. Of the scarcity and value of books during the seventh and many subsequent centuries, the following curious account is given by Mr Warton in his history of English Poetry, vol. i.: "Towards the close of the seventh century (says he) even in the papal library at Rome, the number of books was so inconsiderable, that Pope Saint Martin requested Sanctamund bishop of Maestricht, if possible, to supply this defect from the remotest parts of Germany. In the year 895, Lupus, abbot of Ferrières in France, sent two of his monks to Pope Benedict III. to beg a copy of Cicero de Oratore, and Quintilian's Institutes, and some other books: 'for (says the abbot) although we have part of these books, yet there is no whole or complete copy of them in all France.' Albert, abbot of Gemblours, who with incredible labour and immense expense had collected a hundred volumes on theological, and fifty on profane subjects, imagined he had formed a splendid library. About the year 799, Charlemagne granted an unlimited right of hunting to the abbot and monks of Sithin, for making their gloves and girdles of the skins of the deer they killed, and covers for their books. We may imagine that these religious were more fond of hunting than reading. It is certain that they were obliged to hunt before they could read: and at least it is probable, that under these circumstances, and of such materials, they did not manufacture many volumes. At the beginning of the tenth century books were so scarce in Spain, that one and the same copy of the Bible, Saint Jerome's epistles, and some volumes of ecclesiastical offices and martylogies, often served several different monasteries. Among the constitutions given to the monks of England by Archbishop Lanfranc, in the year 1072, the following injunction occurs. At the beginning of Lent, the librarian is ordered to deliver a book to each of the religious: a whole year was allowed for the perusal of this book; and at the returning Lent, those monks who had neglected to read the books they had respectively received, are commanded to prostrate themselves before the abbot, and to supplicate his indulgence. This regulation was partly occasioned by the low state of literature which Lanfranc found in the English monasteries. But at the same time it was a matter of necessity, and is in a great measure to be referred to the scarcity of copies of useful and suitable authors. In an inventory of the goods of John de Pontissara, bishop of Winchester, contained in his capital palace of Wulvelsey, all the books which appear are nothing more than Septendecem specierum librum de diversis scientiis. This was in the year 1294. The same prelate, in the year 1299, borrows of his cathedral convent of St Swithin at Winchester, Bibliam bene glossatam; that is, the Bible with marginal annotations, in two large folio volumes; but gives a bond for due return of the loan, drawn up with great solemnity. This Bible had been bequeathed to the convent the same year by Pontissara's predecessor, Bishop Nicholas de Ely: and in consideration of so important a bequest, that is, pro bona Biblia dicti episcopi bene glossata, and one hundred marks in money, the monks founded a daily mass for the soul of the donor. When a single book was bequeathed to a friend or relation, it was seldom without many restrictions and stipulations. If any person gave a book to a religious house, he believed that so valuable a donation merited eternal salvation; and he offered it on the altar with great ceremony. The most formidable anathemas were peremptorily denounced against those who should dare to alienate a book presented to the cloister or library of a religious house. The prior and convent of Rochester declare, that they will every year pronounce the irrevocable sentence of damnation on him who shall purloin or conceal a Latin translation of Aristotle's Physics, or even obliterate the title. Sometimes a book was given to a monastery on condition that the donor should have the use of it during his life; and sometimes to a private person, with the reservation that he who receives it should pray for the soul of his benefactor. The gift of a book to Lincoln cathedral, by Bishop Repington, in the year 1422, occurs in this form, and under these curious circumstances. The memorial is written in Latin with the bishop's own hand, which I will give in English, at the beginning of Peter's Breuariy of the Bible. 'I Philip of Repyond, late bishop of Lincoln, give this book, called Pater de Aureola, to the new library to be built within the church of Lincoln: reserving the use and possession of it to Richard Trysely, clerk, canon, and prebendary, of Milton, in fee, and to the term of his life; and afterwards to be given up and restored to the said library, or the keepers
keepers of the same, for the time being, faithfully, and
without delay. Written with my own hand, A.D.
1422." When a book was bought, the affair was of
so much importance, that it was customary to assemble
persons of consequence and character, and to make a
formal record that they were present on this occasion.
Among the royal manuscripts, in the book of the Sen-
tences of Peter Lombard, an archdeacon of Lincoln, has
left this entry: "This book of the Sentences be-
longs to master Robert archdeacon of Lincoln, which
he bought of Geoffrey the chaplain, brother of Henry
vicar of Northelkington, in the presence of master Ro-
bert de Lee, master John of Lirling, Richard of Luda
clerk, Richard the almoner, the said Henry the vicar,
and his clerk, and others: and the said archdeacon
gave the said book to God and St Oswald, and to
Peter abbott of Barton, and the convent of Barden." The
disputed property of a book often occasioned the most
violent altercations. Many claims appear to have been
made to a manuscript of Matthew Paris, belonging to the
last-mentioned library; in which John Rulse, bi-
shop of Lincoln, thus conditionally defends or explains
his right of possession. "If this book can be proved
to be or to have been the property of the exempt mo-
nastery of St Alban in the diocese of Lincoln, I de-
clare this to be my mind, that in that case I use it at
present as a loan under favour of those monks who be-
long to the said monastery. Otherwise, according to
the condition under which this book came into my po-
session, I will that it shall belong to the college of the
blessed Winchester Mary at Oxford, of the foundation
of William Wykham. Written with my own hand at
Buckdane, 1st Jan. A.D. 1488. Jo. Lincoln. Who-
ever shall obliterate or destroy this writing, let him be
anathema." About the year 1225, Roger de Insula,
dean of York, gave several Latin Bibles to the univer-
sity of Oxford, with a condition that the students who
perused them should deposit a cautionary pledge. The
library of that university, before the year 1350, con-
sisted only of a few tracts, chained or kept in chests in
the choir of St Mary's church. In the year 1327, the
scholars and citizens of Oxford assaulted and entirely
pillaged the opulent Benedictine abbey of the neigh-
brrowing town of Abingdon. Among the books they
found there, were one hundred psalters, as many gospels,
and 40 missals, which undoubtedly belonged to the
choir of the church: but besides these, there were only
twenty-two codices, which I interpret books on com-
mon subjects. And although the invention of paper,
at the close of the eleventh century, contributed to
multiply manuscripts, and consequently to facilitate
knowledge, yet, even so late as the reign of our Hen-
ry VI. I have discovered the following remarkable
instance of the inconveniences and impediments to
study, which must have been produced by a scarcity of
books. It is in the statutes of St Mary's college at
Oxford, founded as a seminary to Osney abbey in the
year 1446: "Let no scholar occupy a book in the
library above one hour, or two hours at most, so that
others be hindered from the use of the same." The
famous library established in the university of Oxford,
by that munificent patron of literature Humphrey duke
of Gloucester, contained only 600 volumes. About
the commencement of the 14th century there were
only four classics in the royal library of Paris. These
were one copy of Cicero, Ovid, Lucan, and Boethius.
The rest were chiefly books of devotion, which inclu-
ded but few of the fathers: many treatises of astro-
logy, geomancy, chiromancy, and medicine, original-
ly written in Arabic, and translated into Latin or
French: pandects, chronicles, and romances. This
collection was principally made by Charles V. who be-
gan his reign in 1365. This monarch was passionat-
ely fond of reading; and it was the fashion to send him
presents of books from every part of the kingdom of
France. These he ordered to be elegantly transcribed
and richly illuminated; and he placed them in a tower
of the Louvre, from thence called La Tour de la Li-
brary. The whole consisted of 900 volumes. They
were deposited in three chambers; which, on this oc-
casion were wainscotted with Irish oak, and ceiled
with cypress curiously carved. The windows were of paint-
ained glass, fenced with iron bars and copper wire. The
English became masters of Paris in the year 1425; on
this event the duke of Bedford, regent of France,
sent the whole library, then consisting of only 853
volumes, and valued at 2223 livres, into England;
where perhaps they became the ground-work of Duke
Humphrey's library, just mentioned. Even so late as
the year 1471, when Louis XI. of France borrowed
the works of the Arabian physician Rhazes from the
faculty of medicine at Paris, he not only deposited,
by way of pledge, a quantity of valuable plate, but,
was obliged to procure a nobleman to join with him as
surety in a deed, by which he bound himself to re-
turn it under a considerable forfeiture. The excessive
prices of books in the middle ages afford numerous
and curious proofs. I will mention a few only. In the
year 1174, Walter, prior of St Swithin's at Winchester,
afterwards elected abbot of Westminster, a writer in La-
tin of the lives of the bishops who were his patrons, pur-
chased of the monks of Dorchester in Oxfordshire, Bede's
Homilies and St Austin's Psalter, for twelve measures
of barley, and a poll on which was embroidered in silver
the history of St. Birinus converting a Saxon king.
Among the royal manuscripts in the British museum,
there is Comestor's Scholastic History in French; which
as it is recorded in a blank page at the beginning, was
taken from the king of France at the battle of Poictiers,
when being purchased by William Montague, Earl of Sa-
sbury for 100 marcs, was ordered to be sold by the last
will of his cousiness Elizabeth for 40 livres. About the
year 1400, a copy of John of Meun's Roman de la Rose,
was sold at Paris for 40 crowns, or 33l. 6s. 6d. See
Bibliography, Supplement.

Books, Burning of, was a kind of punishment much
in use among the Romans, by legal sentence: sometimes
the care of the execution was committed to triunvi
apointed on purpose; sometimes to the priesters,' and
sometimes to the ediles. Labienus, whom from his
satirical spirit some have called Rabiicus, is said to
have been the first who underwent the severity of it.
His enemies procured a senatusconsultum, whereby all
his books published during seven years were ordered to
be collected and burnt. "The thing (says Seneca) then
appeared new and strange, to take revenge on learn-
ing?" Res nova et insensata? supplicium de studiis sumi.
Cassius Servius, a friend of Labienus, hearing the sen-
tence pronounced, cried aloud, "That they must
burn him too, since he had got all the books by heart."
Nunc me vivum scripserit, quia illas didici. Labienus could not survive his books, but shutting himself up in the tomb of his ancestors, pined away, and was buried alive. Divers other ancient testimonies concerning the burning of books are given in Reimn. Idea Synt. Antiq. Liter. p. 389.

Book is also used for a part or division of a volume or large work. In this sense we say, the book of Genesis, the first book of Kings, the five books of Moses, &c. The Digest is contained in fifty books, the Code in twelve books.

Books are usually subdivided into chapters, sometimes into sections or paragraphs: accurate writers quote chapter and book.

Everlasting Book.—We find in Signor Castaño's account of the asbestos, a scheme for the making of a book, which, from its imperishable nature, he is for calling the book of eternity. The leaves of this book were to be of the asbestos paper, the covers of a thicker sort of work of the same matter, and the whole sewed with thread spun from the same substance. The things to be commemorated in this book were to be written in letters of gold; so that the whole matter of the book being incombustible, and everlastingly permanent against the force of all the elements, and subject to no changes from fire, water, or air, must remain for ever, and always preserve the writing committed to it. He carried this project so far towards execution, as to find a way of making a sort of paper from the asbestos, which was so tractable and soft, that it very well resembled a thin parchment; this, by the same process, was capable of being thickened or thinned at pleasure, and in either state equally resisted the fire. The covering of the thinnest kind of this paper with fire, only makes it red hot and very clear, the fire seeming to pass through it without wasting or altering any part of it. Copper, iron, or any other metal except gold or silver, exposed to the same degree of fire in the same thin plates, would be found not to bear it in this manner, but to scale and burn into scorums at the surface, which this stone does not.
