"As all the nations under the dominion of Cyrus, beside the ordinary tributes, were obliged to maintain him and his army, the monarch and his troops were supported by all Asia. The country of Babylon alone was obliged to maintain him four months of the year; its fertility, therefore, yielded a third of the produce of Asia. The government of this country, which the Persians termed *satrapy*, was richer and more extensive than any of the rest. It maintained for the king, beside the war-horses, a stud of 800 stallions, and 16,000 mares. So great a number of Indian dogs were likewise bred in this province for the king, that four of its cities kept those animals; and in return, they were exempted from all taxes and tributes. Babylonia.

"It rained very seldom in this country, according to Herodotus. The earth was watered by the river, which was here diffused by human industry, as the Nile over Egypt by nature; for all the country of Babylon was divided by canals, the greatest of which was navigable, and flowed from south to north, from the Euphrates to the Tigris. In short, it was one of the finest countries for corn in the world; but for producing trees, the fig-tree, the vine, and the olive, it was not famous. It was so luxuriant in grain, that it commonly yielded a hundred times more than what was sown; and in good years it yielded three hundred times more than it received. The leaves of its wheat and barley were four inches broad. 'Though I know,' says Herodotus, 'that the millet and the sesame of that country grow to the size of trees, I will not describe them particularly; lest those who have not been in Babylonia should think my account fabulous.'

"They had no oil but what they made from Indian corn. The country abounded with palm-trees, which grew spontaneously; and most of them bore fruit, of which the inhabitants made bread, wine, and honey. They cultivated these trees and their fig-trees in the same manner. Some of them, as of other trees, the Greeks called *male* ones. They tied the fruit of the male to the trees which bore dates; that the mosquito, leaving the male, might cause the date to ripen, by penetrating it; for without that assistance it came not to maturity. Mosquitos bred in the male palms as in the wild fig-trees.

"But we must not here omit to give an account of the peculiar and surprising construction of their boats of skins, in which they sailed along the river to Babylon. These boats were invented by the Armenians, whose country lay north from Babylonia. They made them with poles of willow, which they bent, and covered with skins; the bare side of the skins they put outwards; and they made them so tight, that they resembled boards. The boats had neither prow nor stern, but were of a round form like a buckler. They put straw on the bottom. Two men, each with an oar, rowed them down the river, laden with different wares, but chiefly with palm wine. Of these boats some were very large, and some very small. The largest carried the weight of 500 talents. There was room for an ass in one of their small boats; they put many into a large one. When they had unloaded, after their arrival at Babylon, they sold the poles of their boats and the straw; and loading their asses with the skins, returned to Armenia: for they could not sail up the river, its current was so rapid. For this reason they made their boats of skins, instead of wood; and on their return to Armenia with their asses, they applied the skins to their former use.

"As to their dress, they wore a linen shirt, which came down to their feet. Over it they wore a woollen robe; their outer garment was a white vest. Their shoes resembled those of the Thebans. They let their hair grow. On their heads they wore a turban. They rubbed their bodies all over with fragrant liquors. Each

Each man had a ring on his finger, and an elegant cane in his hand, with an apple at the top, or a rose, a lily, or an eagle or some other figure; for they were not suffered to use canes without devices.

"With regard to their policy, Herodotus thinks that their best law was one which the Heneti, an Illyrian people, likewise observed in every town and village. When the girls were marriageable, they were ordered to meet in a certain place, where the young men likewise assembled. They were then sold by the public crier: but he first sold the most beautiful one. When he had sold her at an immense price, he put up others to sale, according to their degrees of beauty. The rich Babylonians were emulous to carry off the finest women, who were sold to the highest bidders. But as the young men who were poor could not aspire to have fine women, they were content to take the ugliest with the money which was given them: for when the crier had sold the handsomest, he ordered the ugliest of all the women to be brought; and asked, if any one was willing to take her with a small sum of money. Thus she became the wife of him who was most easily satisfied: and thus the finest women were sold; and from the money which they brought, small fortunes were given to the ugliest, and to those who had any bodily infirmity. A father could not marry his daughter as he pleased; nor was he who bought her allowed to take her home, without giving security that he would marry her. But, after the sale, if the parties were not agreeable to each other, the law enjoined that the purchase-money should be restored. The inhabitants of any of their towns were permitted to marry wives at these auctions. Such were the early customs of the Babylonians.

"But they afterwards made a law, which prohibited the inhabitants of different towns to intermarry, and by which husbands were punished for treating their wives ill. When they had become poor by the ruin of their metropolis, fathers used to prostitute their daughters for gain. There was a sensible custom among the Babylonians, worthy to be related. They brought their sick into the forum, to consult those who passed on their diseases; for they had no physicians. They asked those who approached the sick, if they ever had the same distemper? If they knew any one who had it? and how he was cured? Hence, in this country, every one who saw a sick person was obliged to go to him and inquire into his distemper.

"They embalmed their dead with honey; and their mourning was like that of the Egyptians.

"There were three Babylonian tribes, who lived only upon fish, and who prepared them in the following manner: they dried them in the sun, and then beat them in a mortar to a kind of flour, which after they had sifted through linen, they baked it in rolls.

"The Babylonians at first worshipped only the sun and the moon; but they soon multiplied their divinities. They deified Baal, Bel, or Belus, one of their kings, and Merodach-Baladan. They also worshipped Venus, under the name of *Mylitta*. She and Belus were the principal deities of the Babylonians. They counted their day from sunrise to sunrise. They solemnized five days of the year with great magnificence, and almost the same ceremonies with which the Romans celebrated their Saturnalia.

"The Babylonians were very much addicted to judicial astrology. Their priests, who openly professed that art, were obliged to commit to writing all the events of the lives of their illustrious men; and on a fancied connection between those events and the motions of the heavenly bodies, the principles of their art were founded. They pretended that some of their books, in which their historical transactions and revolutions were accurately compared with the courses of the stars, were thousands of years old. This assertion of their judicial astrologers we may reasonably dispute; but that their astronomers had made a long series of observations, is incontestably true. It is certain that some of those observations were extant in the days of Aristotle, and that they were older than the empire of the Babylonians." See *History of* ASTRONOMY.

BABYLONIAN, BABYLONIUS, is used in some ancient writers for an astrologer, or any thing relating to astrology. Hence *Babylonia cura*, the art of casting nativities; and *numeri Babylonii*, the computation of astrologers.

BABYLONICA TEXTA, a rich sort of weavings, or hangings, denominated from the city Babylon, where the practice of interweaving divers colours in their hangings first obtained. Hence also Babylonic garments, Babylonic skins, Babylonic carpets, housings, &c. *Babylonica solana*, coverings laid over couches, &c. painted with gold, purple, and other colours.

BABYLONICS, BABYLONICA, in *Natural History*, a fragment of the ancient history of the world, ending at 267 years before Christ; and composed by Berosus, or Berossus, a priest of Babylon, about the time of Alexander. The Babylonics are sometimes also cited in ancient writers by the title of *Chaldaics*. They were very consonant with Scripture, as Josephus and the ancient Christian chronologers assure; whence the author is usually supposed to have consulted the Jewish writers. Berosus speaks of an universal deluge, an ark, &c. He reckons ten generations between the first man and the deluge; and marks the duration of the several generations by *sari*, or periods of 223 lunar months; which reduced to years, differ not much from the chronology of Moses.—The Babylonics consisted of three books, including the history of the ancient Babylonians, Medes, &c. But only a few imperfect extracts are now remaining of the work; preserved chiefly by Josephus and Syncellus, where all the passages of citations of ancient authors out of Berosus are collected with great exactness. Annius of Viterbo, to supply the loss, forged a complete Berosus out of his own head. The world has not thanked him for the imposture.

BABYROUSSA, in *Zoology*, a synonime of a species of sus. See SUS, MAMMALIA *Index*.

BAC, in *Navigation*, is used for a praam, or ferryboat.

BAC, in *Brewing*, a large flat kind of tub, or vessel, wherein the wort is put to stand and cool before boiling. The ingredients of beer pass through three kinds of vessels. They are masked in one, worked in another, and cooled in a third called *bacs* or *coolers*.

BAC, in *Distillery*, vessels into which the liquor to be

Digitized by Google

be fermented is pumped from the cooler, in order to be worked with yeast.

Bac-Maker, is one who makes liquor-bacs, under-bacs, coolers, mash-tuns, working-tuns, &c. for the brewers. The workmanship is partly carpentry, in a particular manner, for it must be tight enough to hold liquor; and partly cooperage, viz. the mash-tun, or vat, which is hooped. There are not many of this trade; and it requires chiefly strength, with a little art. A small stock of stuff, besides tools, will set a man up tolerably well; but with 200l. or 300l. he will make a good figure in business.

BACA, or Baza, a town of Spain in the kingdom of Granada. W. Long. 3. 6. N. Lat. 37. 18. It is situated in a valley called *Hoya de Baza*. It is encompassed with old walls, and has a castle half ruined. It contains about 4000 houses, but has nothing remarkable except the church dedicated to the Virgin Mary. The land about it is well cultivated for half a league round, and is fertile in wheat, wine, honey, hemp, and flax, being watered by the little river Guadalantin.

BACACUM, a town of the Nervii in Gallia Belgica; now *Bavay*, in Hainault. E. Long. 3. 30. N. Lat. 50. 25.

BACAIM, a handsome sea-port town of the kingdom of Visapour, on the Malabar coast, in Asia. It is subject to the Portuguese; and stands in E. Long. 73. 10. N. Lat. 19. 0.

BACASERAY, a town in the peninsula of Crim Tartary, formerly considered as the capital of the country, the khan having had his residence there. E. Long. 35. 10. N. Lat. 45. 30.

BACANTIBI, in ecclesiastical antiquity, wandering clerks, who strolled from church to church.—The word seems formed by corruption from *vacantivi*.

BACCA, Berry, in *Botany*, is used to signify such fruits as consist of a pericarpium full of juice and seeds, without any valves.

BACCALARIA, in middle-age writers, denotes a kind of country-farms, consisting of several manses.

Baccalaria dominicaria, or *indominicata*, was more particularly used for a farm belonging to the lord, and kept in his own hands.

BACCARACH, a town of the Prussian states in the duchy of the Lower Rhine, containing 1250 inhabitants. It is famous for excellent wine; and is situated on the Rhine, in E. Long. 7. 5. N. Lat. 49. 57.

BACCHÆ, in antiquity, the priestesses of Bacchus, who celebrated the *orgia* or mysteries of that god.—The word was also used for the ivy crowns or garlands worn by the priests of Bacchus, in offering sacrifices to him.

BACCHANALIA, feasts celebrated in honour of Bacchus by the ancients. The two most remarkable were called the *greater* and *lesser*. The latter called *Lenæa*, from a word signifying a *wine press*, were held in the open fields about autumn; the greater, called *Dionysia*, from one of the names of Bacchus, were celebrated in the city, about the spring-time. Both these feasts were accompanied with games, spectacles, and theatrical representations; and it was at this time the poets contended for the prize of poetry. Those who were initiated into the celebration of these feasts, represented, some Silenus, others Pan, others Satyrs, and in this manner appeared in public, night and day, counterfeiting drunkenness, dancing obscenely, and committing all kinds of licentiousness and debauchery. See Bacchus.

BACCHARIS, Ploughman's Spikenard. See Botany *Index*.

BACCHI, in *Mechanics*, a kind of ancient machines, in form of goats, used by Jupiter, in his wars against the giants. Rudbeck describes two kinds of bacchi, one made like the battering-ram, wherewith Jupiter demolished the enemy's fortifications; the other contrived to cast fire out of, from whence the Greeks are conjectured to have framed their idea of the *chimera*.

BACCHIC, something relating to the ceremonies of Bacchus. The celebrated *intaglio*, called Michael Angelo's ring, is a representation of a Bacchic feast.

Bacchic song, is sometimes used for a *chanson à boire*, or composition to inspire jollity. But in a more proper sense it is restrained to a dithyrambic ode or hymn.

BACCHINI, Benedict, a Benedictine monk, and one of the most learned men in his time, was born at Borgo San Domino in 1651; and wrote a great number of books in Latin and Italian, the most considerable of which is a Literary Journal. He died at Bologna in 1721, aged 70.

BACCHIUS, a follower of Aristoxenus, supposed by Fabricius to have been tutor to the emperor Marcus Antoninus, and consequently to have lived about A. C. 140. He wrote in Greek a very short introduction to music, in dialogue, which, with a Latin translation thereof, Meibomius has published. It seems it was first published in the original by Mersennus, in his Commentary on the first six chapters of Genesis; and that afterwards he published a translation of it in French, which Meibomius in the preface to his edition of the ancient musical authors, censures as being grossly erroneous.

Bacchius, in ancient poetry, a kind of foot composed of a short syllable and two long ones; as the word [ăvārī]. It takes its name from the god Bacchus, because it frequently entered into the hymns composed in his honour. The Romans called it likewise *œnotrius*, *tripodius*, *saltans*.

BACCHUS, in *Heathen Mythology*, the god of wine, with whose fabulous adventures every school-boy is acquainted. This personage is seldom named in modern times but as a sensual encourager of feast and jollity; but he was regarded in a more respectable light by the ancients, who worshipped him in different countries under the following appellations: in Egypt, he was called *Osiris*; in Mysia, *Fanaces*; in India *Dionysius*; *Liber*, throughout the Roman dominions; *Adoneus*, in Arabia; and *Pentheus*, by the Lucanians. Mythologists furnish reasons for all these different names given to the same god, which may be seen in the second volume of Banier's Mythology.

It is natural to suppose that the Greeks and Romans, as usual, bestowed upon the one Bacchus which they worshipped, the several actions and attributes of the many divinities known by that name, and by other equivalent denominations, in different countries. However,

Bacchus, Bacchylides.

ever, antiquity chiefly distinguished two gods under the title of *Bacchus;* that of Egypt, the son of Ammon, and the same as Osiris; and that of Thebes in Bœotia, the son of Jupiter and Semele.

The Egyptian Bacchus was brought up at Nysa, a city of Arabia Felix, whence he acquired the name of *Dionysius*, or the god of Nysa; and this was the conqueror of India. Though this Bacchus of the Egyptians was one of the elder gods of Egypt, yet the son of Semele was the youngest of the Grecian deities. Diodorus Siculus tells us, that Orpheus first deified the son of Semele by the name of Bacchus, and appointed his ceremonies in Greece, in order to render the family of Cadmus, the grandfather of the Grecian Bacchus, illustrious.

The great Bacchus, according to Sir Isaac Newton, flourished but one generation before the Argonautic expedition. This Bacchus, says Hermippus, was potent at sea, conquered eastward as far as India, returned in triumph, brought his army over the Hellespont, conquered Thrace, and left music, dancing, and poetry there. And, according to Diodorus Siculus, it was the son of Semele who invented farces and theatres, and who first established a music school, exempting from all military functions such musicians as discovered great abilities in their art; on which account, says the same author, musicians formed into companies have since frequently enjoyed great privileges.

Dr Burney* observes, that the dithyrambics which gave birth to dramatic representations, are as ancient as the worship of Bacchus in Greece; and there is little doubt but that the ceremonies of his mysteries gave rise to the pomp and illusions of the theatre. Many of the most splendid exhibitions upon the stage for the entertainment of the people of Athens and Rome, being performed upon the festivals of Bacchus, gave occasion to the calling all those that were employed in them, whether for singing, dancing, or reciting, *servants of Bacchus*.

* *History of Music*, p. 298. *et seq.*

Pausanias, in his Attics, speaks of a place at Athens consecrated to *Bacchus the singer;* thus named, he says, for the same reason as Apollo is called the *chief* and *conductor* of the muses. Whence it should seem that Bacchus was regarded by the Athenians not only as the god of wine, but of song; and it must be owned, that his followers, in their cups, have been much inclined to singing ever since. Indeed we are certain, that in none of the orgies, processions, triumphs, and festivals, instituted by the ancients to the honour and memory of this prince of *bons vivans*, music was forgotten, as may be still gathered from ancient sculpture, where we find not only that musicians, male and female, regaled him with the lyre, the flute, and with song; but that he was accompanied by fawns and satyrs playing upon timbrels, cymbals, bagpipes, and horns; these Suidas calls his minstrels; and Strabo gives them the appellations of *Bacchi*, *Sileni*, *Satyri*, *Bacchæ*, *Lenæ*, *Thyæ*, *Mamillones*, *Naiades*, *Nymphæ*, and *Tityri*. These representations have furnished subjects for the finest remains of ancient sculpture; and the most voluptuous passages of ancient poetry are descriptions of the orgies and festivals of Bacchus. See Orgia.

BACCHYLIDES, a famous Greek poet, was the nephew of Simonides, and the cotemporary and rival of Pindar. Both sung the victories of Hiero at the public games. Besides odes to athletic victors, he was author of Love Verses; Prosodies; Dithyrambics; Hymns; Pæans; Hyporchemes; Parthenia, or songs to be sung by a chorus of virgins at festivals. The chronology of Eusebius places the birth of Bacchylides in the 82d Olympiad, about 450 B. C.

Bacchylides || Bachelor.

BACCIO, or Baccius, Andrew, a celebrated physician of the 16th century, born at St Elpideo. He practised physic at Rome with great reputation, and was first physician to Pope Sixtus V. The most scarce and valuable of his works are, 1. *De Thermis*. 2. *De Naturali Vinorum Historia*. 3. *De Venenis et Antidotis*. 4. *De Gemmis ac Lapidibus Pretiosis*.

Baccio, *Fra. Bartolomeo*, called *Bartelemi di S. Marco*, a celebrated painter of history and portrait, was born at Savignano near Florence in 1469, and was a disciple of Cosumo Roselli; but his principal knowledge in the art of painting was derived from Leonardo da Vinci. He understood the true principles of design better than most masters of his time, and was also a considerable painter in perspective; which induced Raphael to have recourse to him after he had quitted the school of Perugino; and under his direction likewise Raphael studied the art of managing and uniting colours, as well as the rules of perspective. Some years after the departure of Raphael from Florence, Baccio visited Rome; and by the observations he made on the antiques, and the works of Raphael which were then the admiration of the whole world, he was extremely improved, and manifested his acquired abilities by a picture of S. Sebastian, which he finished at his return to Florence. It was so well designed, so naturally and beautifully coloured, and had so strong an expression of pain and agony, that it was removed from the place where it was publicly seen (in the chapel of a convent), as it had been observed to have made too strong an impression on the imaginations of many women who beheld it. He was very laborious, and made nature his perpetual study; he designed the naked correctly; his figures had a great deal of grace, and his colouring was admirable. He is accounted to have been the first inventor of that machine called a *layman* by the artists, and which to this day is in general use. Upon that he placed his draperies, to observe with greater exactness their natural and their more elegant folds. A capital picture of the ascension by Baccio, is in the Florentine collection. He died in 1517.

BACHELOR, or Batchelor, a common term for a man not married, or who is yet in a state of celibacy.—The Roman censors frequently imposed fines on old bachelors. Dion Halicarnasseus mentions an old constitution, by which all persons of full age were obliged to marry. But the most celebrated law of this kind, was that made under Augustus, called the *Lex Julia de Maritandis Ordinibus;* by which bachelors were made incapable of legacies or inheritances by will, unless from their near relations. This brought many to marry, according to Plutarch's observation, not so much for the sake of raising heirs to their own estates, as to make themselves capable of inheriting those of other men.—The rabbins maintain, that, by the laws of Moses, every body, except some few particulars, is obliged in conscience to marry at 20 years of age: this makes

Digitized by Google

makes one of their 613 precepts. Hence those maxims so frequent among their casuists, that he who does not take the necessary measures to leave heirs behind him, is not a man, but ought to be reputed a homicide.—Lycurgus was not more favourable; by his laws, bachelors are branded with infamy, excluded from all offices civil and military, and even from the shows and public sports. At certain feasts they were forced to appear, to be exposed to the public derision, and led round the market place. At one of their feasts, the women led them in this condition to the altars, where they obliged them to make *amende honourable* to nature, accompanied with a number of blows and lashes with a rod at discretion. To complete the affront, they forced them to sing certain songs composed in their own derision. The Christian religion is more indulgent to the bachelor state: the ancient church recommended it as in some circumstances preferable to, and more perfect than, the matrimonial. In the canon law, we find injunctions on bachelors, when arrived at puberty, either to marry or to turn monks and profess chastity in earnest.—In England, there was a tax on bachelors, after 25 years of age, 12l. 10s. for a duke, a common person 1s. by 7 Will. III. 1695. In Britain, at present, they are taxed by an extra-duty on their servants. Every man of the age of 21 years and upwards, never having been married, who shall keep one male servant or more, shall pay 1l. 5s. for each above or in addition to the ordinary duties leviable for SERVANTS. Every man of the age of 21 years and upwards, never having been married, keeping one female servant, shall pay 2s. 6d. in addition to the former 2s 6d.; 5s. in addition for each, if he has two female servants; and 10s. in addition for each for three or more female servants.

BACHELOR, was anciently a denomination given to those who had attained to knighthood, but had not a number of vassals sufficient to have their banner carried before them in the field of battle; or if they were not of the order of bannerets, were not of age to display their own banner, but obliged to march to battle under another's banner. It was also a title given to young cavaliers, who having made their first campaign, received the military girdle accordingly. And it served to denominate him who had overcome another in a tournament the first time he ever engaged.—The word *bachelor*, in a military sense, is derived by Cujas from *buccelarius*, a kind of cavalry, anciently in great esteem. Du Cange deduces it from *baccalaria*, a kind of fees or farms, consisting of several pieces of ground, each whereof contained 12 acres, or as much as two oxen would plough; the possessors of which baccalaria were called *bachelors*. Caseneuve and Altaserra derive bachelor from *baculus*, or *bacillus*, "a staff," because the young cavaliers exercised themselves in fighting with staves. Martinius derives it from *baccalaureus*, i. e. *bacca laurea donatus*, in allusion to the ancient custom of crowning poets with laurel, *baccis lauri*, as was the case with Petrarch at Rome in 1341. Alciat and Vives are of the same opinion: nor is this etymology improbable.

Knights-BACHELORS, the most ancient, but the lowest orders of knights in England; known by the name of *knights* only. They are styled *knights-bachelors*, either (according to some) as denoting their degree, *quasi bas chevaliers*; or, according to others, because this title does not descend to their posterity.

The custom of the ancient Germans was to give their young men a shield and a lance in the great council: this was equivalent to the *toga virilis* of the Romans. Before this, they were not permitted to bear arms, but were accounted as part of the father's household; after it, as part of the public. Hence some derive the usage of knighting, which has prevailed all over the western world, since its reduction by colonies from those northern heroes. Knights are called in Latin *equites aurati; aurati*, from the gilt spurs they wore; and *equites*, because they always served on horseback; for it is observable, that almost all nations call their knights by some appellation derived from a horse. They are also called in our law *milites*, because they formed a part, or indeed the whole, of the royal army, in virtue of their feudal tenures; one condition of which was, that every one who held a knight's fee (which in Henry II.'s time amounted to 20l. per annum) was obliged to be knighted, and attend the king in his wars, or pay a fine for his non-compliance. The exertion of this prerogative, as an expedient to raise money in the reign of Charles I. gave great offence, though warranted by law and the recent example of Queen Elizabeth. At the Restoration, it was, together with all other military branches of the feudal law, abolished; and it now only exists as an honorary title; though, on account of its indiscriminate attainment, not very generally regarded. It is conferred indiscriminately upon gownsmen, burghers, and physicians, by the king's lightly touching the person, who is then kneeling, on the right shoulder with a drawn sword, and saying *Rise, Sir*. See the articles KNIGHT and NOBILITY.

BACHELORS, in a university sense, are persons that have attained to the baccalaureate, or who have taken the first degree in the liberal arts and sciences.

The degree of bachelor was first introduced in the 13th century by Pope Gregory IX. but it remains still unknown in Italy. At Oxford, before a person is entitled to the degree of *bachelor of arts*, he must have studied there four years; three years more to become master of arts; and seven more to commence bachelor of divinity.—At Cambridge, to commence bachelor of arts, he must have been admitted near four years; and above three years more before he commence master; and seven more still to become bachelor of divinity. He may commence bachelor of law after having studied it six years.—At Paris, to pass bachelor in theology, a person must have studied two years in philosophy and three years in theology, and held two acts of examination in the Sorbonne.—Bachelors in the canon law are admitted after two years study in the same, and sustaining an act according to the forms. A bachelor of physic must have studied two years in medicine, after having been four years master of arts in the university, and have stood an examination; after which he is invested with the fur, in order to be licensed.—In the university of Paris, before the foundation of divinity-professorships, those who had studied divinity six years were admitted to go through their course, whence they were called *baccalarii cursores*; and as there were two courses, the first employed in explaining the Bible during

Digitized by Google

during three successive years, the second for explaining the master of the sentences for one year, those who were in their Bible-course were called *baccalarii Biblici*, and those arrived at the sentences *baccalarii sententiarii*. And, lastly, those who had gone through both were denominated *baccalarii formati*, or *formed bachelors*.

At present, *formed bachelor* denotes a person who has taken the degree regularly after the due course of study and exercises required by the statutes; by way of opposition to a *current bachelor*, who is admitted in the way of grace, or by diploma.

We also find mention of bachelors of the church, *baccalarii ecclesiæ*. The bishop with his canons and *baccalarii*, *cum consilio et consensu omnium canonicorum suorum et baccalariorum*.

BACHELORS, in the livery companies of London, are those not yet admitted to the livery. These companies generally consist of a master, two wardens, the livery, and the bachelors, who are yet but in expectation of dignity in the company, and have their function only in attendance on the master and wardens. They are also called *yeomen*.

BACHELOR is also a name given in the six companies of merchants at Paris to the elders, and such as, having served the offices, have a right to be called by the masters and wardens to be present with them, and assist them in some of the functions, particularly in what relates to the *chef-d'œuvres* or masterpieces of such as are candidates for being admitted masters.

BACHIAN, one of the Molucca islands, belonging to the Dutch; situated under the equator, in E. Long. 125°. It is the largest of all the small Molucca islands, being 54 miles long, and 20 broad. It produces gold dust and sago, besides the usual tropical fruits. The inhabitants are Malay Mahometans, and are governed by a chief who was once very powerful.

BACHU, a city of Shirvan in Persia, and the best haven in the Caspian sea. It is defended by a double wall, as also by a ditch and redoubts, made by the Russians when they were masters of the place. It had a sumptuous castle, but it is reduced to a ruinous state by the Russians. Formerly many merchants resided here, and carried on a considerable traffic in raw silk; but that commerce is now given up. All the country round is much impregnated with sulphur, which renders the water very unpleasant. The neighbourhood of this city supplies the countries adjacent with naphtha, brimstone, and rock-salt; and is the only place thereabouts which produces saffron. Round Bachu are several very steep craggy mountains, on which are strong watch-towers. E. Long. 49. 5. N. Lat. 40. 0.

BACK, BACK-*Bone*, or SPINE. See ANATOMY *Index*.

BACK, in the manege, and among farriers. A horse's back should be straight, not hollow, which is called *saddle-backed*: horses of this kind are generally light, and carry their heads high, but want in strength and service. A horse with a weak back is apt to stumble. In the French riding-schools, to mount a horse *à dos*, is to mount him bare-backed, without a saddle.

BACK-*Gammon*, an ingenious game played with dice, upon a table, by two persons.

Manner of playing the game. The table is divided into two parts, upon which there are 24 black and white spaces, called *points*. Each adversary has 15 men, black and white, to distinguish them; and they are disposed of in the following manner: Supposing the game to be played in the right-hand table, two are placed upon the ace-point in the adversary's table, five upon the six point in the opposite table, three upon the cinque point in the hithermost table, and five on the six point in the right-hand table. The grand object in this game is for each player to bring the men round into his right-hand table, by throwing with a pair of dice those throws that contribute towards it, and at the same time prevent the adversary doing the like. The first best throw upon the dice is esteemed aces, because it stops the six point in the outer table, and secures the cinque in the thrower's table; whereby the adversary's two men upon the thrower's ace point cannot get out with either quatre, cinque, or six. This throw is an advantage often given to the antagonist by the superior player.

When he carries his men home in order to lose no point, he is to carry the most distant man to his adversary's bar point, that being the first stage he is to place it on; the next stage is six points farther, viz. in the place where the adversary's five men are first placed out of his tables. He must go on in this method till all his men are brought home, except two, when by losing a point, he may often save the gammon, by throwing two fours or two fives.

When a hit is only played for, he should endeavour to gain either his own or adversary's cinque point; and if that fails by his being hit by the adversary, and he finds him forwarder than himself, in that case he must throw more men into the adversary's tables; which is done in this manner: He must put a man upon his cinque or bar point; and if the adversary neglects to hit it, he may then gain a forward game instead of a back game; but if the adversary hits him, he should play for a back game; and then the greater number of men which are taken up makes his game the better, because by these means he will preserve his game at home: and then he should endeavour to gain both his adversary's ace and trois points, or his ace and deuce points, and take care to keep three men upon the adversary's ace point, that in case he hits him from thence, that point may remain still secure to himself.

A back game should not be played for at the beginning of a set, because it would be a great disadvantage, the player running the risk of a gammon to win a single hit.

Rules for playing at setting out all the throws on the dice, when the player is to play for a gammon or for a single hit (A). 1. Two aces are to be played on the cinque

(A) The rules marked thus † are for a gammon only; those marked thus * are for a hit only.

Back-gammon.

cinque point and bar point, for a gammon or for a hit. 2. Two sixes, to be played on the adversary's bar point and on the thrower's bar point, for a gammon or for a hit. 3. † Two trois, to be played on the cinque point, and the other two on the trois point in his own tables, for a gammon only. 4. † Two deuces, to be played on the quatre point in his own tables, and two to be brought over from the five men placed in the adversary's tables for a gammon only. 5. † Two fours, to be brought over from the five men placed in the adversary's table, and to be put upon the cinque point in his own tables for a gammon only. 6. Two fives, to be brought over from the five men placed in the adversary's tables, and to be put on the trois point in his own tables, for a gammon or for a hit. 7. Size ace, he must take his bar point for a gammon or for a hit. 8. Size deuce, a man to be brought from the five men placed in the adversary's tables, and to be placed in the cinque point in his own tables, for a gammon or for a hit. 9. Six and three, a man to be brought from the adversary's ace point, as far as he will go, for a gammon or for a hit. 10. Six and four, a man to be brought from the adversary's ace point, as far as he will go, for a gammon or for a hit. 11. Six and five, a man to be carried from the adversary's ace point, as far as he can go, for a gammon or for a hit. 12. Cinque and quatre, a man to be carried from the adversary's ace point, as far as he can go, for a gammon or for a hit. 13. Cinque trois, to make the trois point in his table, for a gammon or for a hit. 14. Cinque deuce, to play two men from the five placed in the adversary's tables, for a gammon or for a hit. 15. † Cinque ace, to bring one man from the five placed in the adversary's tables for the cinque, and to play one man down on the cinque point in his own tables for the ace, for a gammon only. 16. Quatre trois, two men to be brought from the five placed in the adversary's tables, for a gammon or for a hit. 17. Quatre deuce, to make the quatre point in his own tables, for a gammon or for a hit. 18. † Quatre ace, to play a man from the five placed in the adversary's tables for the quatre; and for the ace, to play a man down upon the cinque point in his own tables, for a gammon only. 19. † Trois deuce, two men to be brought from the five placed in the adversary's tables, for a gammon only. 20. Trois ace, to make the cinque point in his own tables, for a gammon or for a hit. 21. † Deuce ace, to play one man from the five men placed in the adversary's table for the deuce; and for the ace to play a man down upon the cinque point in his own tables, for a gammon only. 22. * Two trois, two of them to be played on the cinque point in his own tables, and with the other two he is to take the quatre point in the adversary's tables. 23. * Two deuces, two of them are to be played on the quatre point in his own tables, and with the other two he is to take the trois point in the adversary's tables. By playing these two cases in this manner, the player avoids being shut up in the adversary's tables, and has the chance of throwing out the tables to win the hit.

24. * Two fours, two of them are to take the adversary's cinque point in the adversary's tables, and for the other two, two men are to be brought from the five placed in the adversary's tables. 25. * Cinque ace, the cinque should be played from the five men placed in the adversary's tables, and the ace from the adversary's ace point. 26. * Quatre ace, the quatre to be played from the five men placed in the adversary's ace point. 27. * Deuce ace, the deuce to be played from the five men placed in the adversary's tables, and the ace from the adversary's ace point.

The three last chances are played in this manner; because an ace being laid down in the adversary's tables, there is a probability of throwing deuce ace, trois deuce, quatre trois, or size cinque, in two or three throws; either of which throws secures a point, and gives the player the best of the hit.

Cautions, &c. The player must understand by the directions given to play for a gammon, that he is to make some blots on purpose, the odds being in his favour that they are not hit: but if it should happen that any blot is hit, as in this case there will be three men in the adversary's tables, he must then endeavour to secure the adversary's cinque, quatre, or trois point, to prevent a gammon, and must be very cautious of his fourth man's not being taken up.

He must not crowd his game at any time if he can help it; that is to say, he should not put many men either upon the trois or deuce points in his own tables, being the same as losing those men, not having them in play. Besides, by crowding the game, and attempting to save a gammon, the player is often gammoned. His game being crowded in his own tables, the adversary has room to play as he thinks proper.

The following calculations will show the odds of entering a single man upon any certain number of points; and accordingly the game should be played.

It is necessary to know that there are thirty-six chances upon two dice, and the points that are upon these thirty-six chances are as follow:

Viz.	Points.
2 Aces	4
2 Deuces	8
2 Trois	12
2 Fours	16
2 Fives	20
2 Sixes	24
6 And 5 twice	22
6 And 4 twice	20
6 And 3 twice	18
6 And 2 twice	16
6 And 1 twice	14
5 And 4 twice	18
5 And 3 twice	16
5 And 2 twice	14
5 And 1 twice	12
4 And 3 twice	14
4 And 2 twice	12
4 And 1 twice	10
3 And 2 twice	10
3 And 1 twice	8
2 And 1 twice	6

Divide by 36)294(8
and it proves, that upon an average the player has a right to 8 points each throw — 288, remainder 6

The

Back-gammon.

The chances upon two dice calculated for back-gammon are as follow:

	2 Sixes	1
	2 Fives	1
	2 Fours	1
	2 Trois	1
	2 Deuces	1
†	2 Aces	1
	6 And 5 twice	2
	6 And 4 twice	2
	6 And 3 twice	2
	6 And 2 twice	2
†	6 And 1 twice	2
	5 And 4 twice	2
	5 And 3 twice	2
	5 And 2 twice	2
†	5 And 1 twice	2
	4 And 3 twice	2
	4 And 2 twice	2
†	4 And 1 twice	2
	3 And 2 twice	2
†	3 And 1 twice	2
†	2 And 1 twice	2
		36

As it may seem difficult to find out by this table of thirty-six chances what are the odds of being hit upon a certain or flat die, let the following method be pursued.

The player may observe in the table that what are thus † marked are,

†	2 Aces	1
†	6 And 1 twice	2
†	5 And 1 twice	2
†	4 And 1 twice	2
†	3 And 1 twice	2
†	2 And 1 twice	2
	Total,	11
	When deducted from	36
	There remains	25

So that it appears it is twenty-five to eleven against hitting an ace upon a certain or flat die.

The above method holds good with respect to any other flat die. For example what are the odds of entering a man upon 1, 2, 3, 4, or 5 points?

Answer.

To enter it upon	for against		for ag.
1 point is	11 to 25	Or about	4 to 9
2 points	20 - 16	-	5 4
3 -	27 - 9	-	3 1
4 -	32 - 4	-	8 1
5 -	35 - 1	-	35 1

The following table shows the odds of hitting with any chance, in the reach of a single die.

To hit upon	for against		for ag.
1 is -	11 to 25	Or about -	4 to 9
2 -	12 - 24	-	1 - 2
3 -	14 - 22	-	2 - 3
4 -	15 - 21	-	5 - 7
5 -	15 - 21	-	5 - 7
6 -	17 - 19	-	$8\frac{1}{2}$ $9\frac{1}{2}$

Back-gammon.

The odds of hitting with double dice are as follow:

To hit upon	for against		for ag.
7 is -	6 to 30	Or about -	1 to 5
8 -	6 30	- -	1 5
9 -	5 31	- -	1 6
10 -	3 33	- -	1 11
11 -	2 34	- -	1 17
12 -	1 36	- -	1 35

How to find out the odds of being hit upon a six, by the table of thirty-six chances.

2 Sixes	1
2 Trois	1
2 Deuces	1
6 And 5 twice	2
6 And 4 twice	2
6 And 3 twice	2
6 And 2 twice	2
6 And 1 twice	2
5 And 1 twice	2
4 And 2 twice	2
	17
Which deducted from	36
There remains	19

By which it appears to be 19 to 17 against being hit upon a six.

The odds on the hits.

2 Love is about	5 to 2
2 to 1 is	2 1
1 Love is	3 2

Directions for the player to bear his men. If a player has taken up two of the adversary's men, and happens to have two, three, or more points made in his own tables, he should spread his men, that he either may take a new point in his tables, or be ready to hit the man which the adversary may happen to enter. If he finds upon the adversary's entering, that the game is upon a par, or that the advantage is on his own side, he should take the adversary's man up whenever he can, it being 25 to 11 that he is not hit: except when he is playing for a single hit only; then, if playing the throw otherwise gives him a better chance for it, he ought to do it.

It being five to one against his being hit with double dice, he should never be deterred from taking up any one man of the adversary's.

If he has taken up one of the adversary's men, and should happen to have five points in his own tables, and forced to leave a blot out of his tables, he should endeavour to leave it upon doublets preferable to any other chance, because in that case the odds are 35 to one that he is not hit; whereas it is only 17 to one but he is hit upon any other chance.

When the adversary is very forward, a player should never move a man from his own quarter, trois, or deuce points, thinking to bear that man from the point where he put it, as nothing but high doublets can give him any chance for the hit. Instead of playing an ace or a deuce from any of those points, he should play them from his own size or highest points, so that throwing two fives, or two fours, his size and cinque points being eased, would be a considerable advantage

 to

Digitized by Google

Back-gammon.

to him; whereas, had they been loaded, he must have been obliged to play otherwise.

It is the interest of the adversary to take up the player as soon as he enters. The blot should be left upon the adversary's lowest point; that is to say, upon his deuce point rather than upon his trois point; or upon his trois point rather than his quatre point, or upon his quatre point preferable to his cinque point, for a reason before mentioned; all the men the adversary plays upon his trois or his deuce points are deemed lost, being greatly out of play; so that those men not having it in their power to make his cinque point, and his game being crowded in one place, and open in another, the adversary must be greatly annoyed by the player.

If the player has two of the adversary's men in his tables, he has a better chance for a hit than if he had more, provided his game is forwarder than that of his antagonist; for if he had three or more of the adversary's men in his tables, he would stand a worse chance to be hit.

When a player is running to save the gammon, if he should have two men upon his ace point, and several men abroad, although he should lose one point or two in putting his men into his tables, it is his interest to leave a man upon the adversary's ace point, because it will prevent his adversary from bearing his men to the greatest advantage, and at the same time the player will have a chance of the adversary's making a blot, which he may chance to hit. However, if a player finds upon a throw, that he has a probability of saving his gammon, he should never wait for a blot, as the odds are greatly against his hitting it, but should embrace that opportunity.

How to calculate the odds of saving or winning the gammon. Suppose the adversary has so many men abroad as require three throws to put them into his tables, and at the same time that the player's tables are made up, and that he has taken up one of the adversary's men; in this case, it is about an equal wager that the adversary is gammoned. For in all probability the player has bore two men before he opens his tables, and when he bears the third man, he will be obliged to open his size or cinque point. It is then probable that the adversary is obliged to throw twice before he enters his men in the player's tables, twice more before he puts that man into his own tables and three throws more to put the men which are abroad into his own tables; in all seven throws. Now the player having 12 men to bear, he may be forced to make an ace or a deuce twice before he can bear all his men, and consequently will require seven throws in bearing them; so that, upon the whole, it is about equal whether the adversary is gammoned or not.

Suppose a player has three men upon his adversary's ace point and five points in his own tables, and that the adversary has all his men in his tables, three upon each of his five highest points. Has the player a probability of gammoning his adversary or not?

	Points.
For bearing three men from his 6th point is	18
From the 5th point	15
	33
Carried forwards	33
From his 4th point	12
From his 3d point	6
From his 2d point	9
In all	60
Bringing his three men from the adversary's ace point to his size point in his own tables, being 18 points each, and making together	54
There must remain	6

It is plain from this calculation, that the player has much the best of the probability of the gammon, exclusive of one or more blots which the adversary is liable to make in bearing his men, supposing at the same time the throws to be upon an equality.

Suppose two blots are left, either of which cannot be hit but by double dice; one must be hit by throwing eight and the other by throwing nine; so that the adversary has only one die to hit either of them. What are the odds of hitting either of them? The chances of two dice being in all 36

The chances to hit 8 or 6 and 2 twice	2
5 and 3 twice	2
2 Deuces	1
3 Fours	1
The chances to hit 9 or 6 and 3 twice	2
5 and 4 twice	2
2 Trois	1
For hitting in all	11
Chances for not hitting, remain	25

So that the odds are 25 to 11 against hitting either of these blots.

This method may be taken to find out the odds of hitting three, four, or five blots upon double dice; or blots made upon double and single dice at the same time. After knowing how many chances there are to hit any of these blots, they must be added all together, and then subtracted from the number 36, which are the chances of the two dice, and the question is solved.

A critical case for a Back-game. Suppose the foregame to be played by A, and that all his men are placed as usual; B has fourteen of his men placed upon his adversary's ace point, and one man upon his adversary's deuce point, and B is to throw. Who has the best of the hit?—*Answer*: A has the best of it, gold to silver: because, if B does not throw an ace to take his adversary's deuce point, which is 25 to 11 against him, A will take up B's men in his tables, either singly or to make points; and then if B secures either A's deuce or trois point, A will put as many men down as possible, in order to hit, and thereby get a back-game. It is evident that the back-game is very powerful; consequently, whoever practises it must become a greater proficient at the game than he could by any other means.

Another critical case. Suppose A to have five men placed upon his size point, as many upon his quatre point, and the same number upon his deuce point, all in his own tables. At the same time, let us suppose B to have three men placed upon A's ace point, as many

Digitized by Google

Back-gammon.

many upon A's trois point, and the same number upon A's cinque point, in his own tables, and three men placed as usual out of his tables. Who has the best of the hit?—*Answer:* The game is equal till B has gained his cinque and quatre points in his own tables; which if he can effect, and by playing two men from A's cinque point, in order to force his adversary to blot by throwing an ace, which should B hit, he will have the best of the hit.

A case of curiosity and instruction: in which is shown the probability of making the hit last by one of the players for many hours, although they shall both play as fast as usual. Suppose B to have bore 13 men, and that A has his fifteen men in B's tables, viz. three men upon his size point, as many upon his cinque point, three upon his quatre point, the same number upon his trois point, two upon his deuce point, and one upon his ace point. A in this situation can prolong it, as aforesaid by bringing his 15 men home, always securing six close points till B has entered his two men, and brought them upon any certain point; as soon as B has gained that point, A will open an ace, deuce, or trois point, or all of them; which done, B hits one of them, and A taking care to have two or three men in B's tables, is ready to hit that man; and also he being certain of taking up the other man, has it in his power to prolong the hit almost to any length, provided he takes care not to open such points as two fours, two fives, or two sixes, but always to open the ace, deuce, or trois points, for B to hit him.

A critical game to play. Suppose A and B place their men for a hit in the following manner: A to have three men upon the size point in his own tables, three men out of his tables upon the usual point, and nine men upon his adversary's ace, deuce, and trois points: that is, three upon each: and suppose B's men to be placed in his own and his adversary's tables in the same order. So situated, the best player should win the hit. The game being so equal, that in this case the dice should be thrown for. Now if A throws first, he should endeavour to gain his adversary's cinque point: this being done, he should lay as many blots as possible, to tempt B to hit him, as it puts him backwards, and A thereby gains an advantage. A should always endeavour to have three men upon each of his adversary's ace and deuce points; because when B makes a blot, these points will remain secure, and when A has bore five, six, or more men, A yet may secure six close points out of his tables, in order to prevent B from getting his man home, at which time he should calculate who has the best of the hit. If he finds that B is foremost, he should then try to lay such blots as may be taken up by his adversary, that he may have a chance of taking up another man, in case B should happen to have a blot at home.

Laws of Back-gammon. 1. If a man is taken from any point, it must be played; if two men are taken from it, they also must be played. 2. A man is not supposed to be played till it is placed upon a point and quitted. 3. If a player has only fourteen men in play, there is no penalty inflicted, because by his playing with a lesser number than he is entitled to, he plays to a disadvantage for want of the deficient man to make up his tables. 4. If he bears any number of men before he has entered a man taken up, and which of course he was obliged to enter, such men so borne must be entered again in the adversary's tables as well as the man taken up. 5. If he has mistaken his throw and played it, and his adversary has thrown, it is not in the choice of either of the players to alter it, unless they both agree so to do.

Back-gammon, Back-painting.

Back-Painting, the method of painting mezzotinto prints, pasted on glass, with oil colours. See Mezzotinto.

The art consists chiefly in laying the print upon a piece of crown-glass, of such a size as fits the print.

In order to do this, take your print, and lay it in clean water for two days and two nights, if the print be on very strong, close, and hard gummed paper: but if upon an open, soft, spongy paper, two hours will sometimes suffice, or more, according as the paper is.

The paper or picture having been sufficiently soaked, take it out and lay it upon two sheets of paper, and cover it with two more; and let it lie there a little to suck out the moisture.

In the mean time take the glass the picture is to be put upon, and set it near the fire to warm; take Strasburg turpentine, warm it over the fire till it is grown fluid, then with a hog's hair brush spread the turpentine very smoothly and evenly on the glass.

When this has been done, take the mezzotinto print from between the papers, and lay it upon the glass; beginning first at one end, rubbing it down gently as you go on, till it lie close, and there be no wind bladders between.

Then, with your fingers, rub or roll off the paper from the backside of the print, till it looks black, i. e. till you can see nothing but the print like a thin film left upon the glass, and set it by to dry.

When it is dry, varnish it over with some white transparent varnish, that the print may be seen through it; and then it is fit for painting.

The utmost care will be necessary in rubbing or rolling the paper off the print, so as not to tear it, especially in the light parts.

You may, instead of soaking your prints two days and two nights, roll them up and boil them for about two hours, more or less, according to the quantity of the paper, in water; and that will render it as fit for rubbing, rolling, or peeling, as the other way.

This being done, and your oil-colours prepared, ground very fine, and tempered up very stiff, lay on the back side of the transparent prints such colours as each particular part requires; letting the master-lines of the print still guide your pencil, and so each particular colour will lie fair to the eye on the other side of the glass, and look almost as well as a painted piece, if it be done neatly.

The shadows of the print are generally sufficient for the shadow of every colour: but if you have a mind to give a shadow by your pencil, then let the shadows be laid on first, and the other colours afterward.

In laying on colours in this kind of back-painting, you need not be curious as to the laying them on smooth. This is not at all requisite here, where the chief aim is only to have the colours appear well on the fore side of the print; and therefore the only care to be be used in this work, is to lay the colours on thick enough, that its body may strike the colour of it plainly through the glass.

Back-Staff, a name formerly given to a sea-quadrant, invented by Captain Davis: because the back of the artist is turned towards the sun at the time of observation. See Quadrant.

Back-Stays, of a ship, are ropes belonging to the mainmast and foremast, and the masts belonging to them; serving to keep them from pitching forwards or overboard.

Back-Tack, in *Scots Law*: When a wadsetter, instead of possessing the wadset-lands, grants a tack thereof to the reverser for payment of a certain sum in name of tack-duty, that tack is called a *back tack*.

Back-Worm. See Filanders.

BACKER, or Bakker, Jaques, a painter of history, was born at Antwerp in 1530; and learned the principles of painting from his father, who was an artist very knowing in his profession, though his works were in no great estimation. After the death of his father, he lived in the house of Jacopo Palermo, a dealer in pictures, who avariciously took care to keep him incessantly employed, and sent his paintings to Paris to be disposed of, where they happened to be exceedingly admired. The judicious were very eager to purchase them; and though the transactor sold them at a great price, yet the poor artist was not proportionally rewarded, but continued in the same obscure and depressed condition. His merit, indeed, was universally allowed; but his name, and the narrowness of his circumstances, were as universally unknown. He had a clean light manner of penciling, and a tint of colour that was extremely agreeable.—He died in 1560.

Backer, or Bakker, *Jacob*, painter of portrait and history, was born at Harlingen in 1609, but spent the greatest part of his life at Amsterdam; and by all the writers on this subject, he is mentioned as an extraordinary painter, particularly of portraits, which he executed with strength, spirit, and a graceful resemblance. He was remarkable for an uncommon readiness of hand and freedom of pencil; and his incredible expedition in his manner of painting, appeared even in one portrait of a lady from Haerlem, that he painted at half length, which was begun and finished in one day, though he adorned the figure with rich drapery and several ornamental jewels. He also painted historical subjects with good success; and in that style there is a fine picture of Cimon and Iphigenia, which is accounted by the connoisseurs an excellent performance. In designing academy figures his expression was so just, and his outlines so correct, that he obtained the prize from all his competitors; and his works are still bought up at very high prices in the Low Countries. In the collection of the Elector Palatine there is an excellent head of Brouwer, painted by this master; and in the Carmelites church at Antwerp is preserved a capital picture of the Last Judgement, which is well designed and well coloured. He died in 1651.

BACKEREEL, called Bacquerelli, *William*, a painter of history, was born at Antwerp, and was a disciple of Rubens at the same time that Vandyck was educated in that school. When each of them quitted that master, and commenced painter, Backereel was very little inferior to Vandyck, if not nearly his equal. And this may be manifestly seen in the works of the former, which are in the church of the Augustine monks at Antwerp; where those two great artists painted in competition, and both were praised for their merit in their different ways; but the superiority was never determined in favour either of the one or the other. He had likewise a good taste for poetry; but, by exercising that talent too freely, in writing satires against the Jesuits, these ecclesiastics pursued him with unremitted revenge, till they compelled him to fly from Antwerp; and by that means deprived his own country of such paintings as would have contributed to its perpetual honour.—Sandrart takes notice, that in his time there were seven or eight painters, who were very eminent, of the name of Backereel, in Italy and the Low Countries.

BACKHUYSEN, Ludolph, an eminent painter, was born at Embden in 1631, and received his earliest instruction from Albert Van Everdingen; but acquired his principal knowledge by frequenting the painting rooms of different great masters, and observing their various methods of touching and colouring. One of these masters was Henry Dubbels, whose understanding in his art was very extensive: and he was as remarkably communicative of his knowledge to others. From him Backhuysen obtained more real benefit than from all the painters of his time, either by studying their works, or personally conversing with them. His subjects were sea-pieces, ships, and sea-ports. He had not practised very long when he became the object of general admiration; so that even his drawings were sought after, and several of them were bought up at 100 florins a-piece. It was observed of him, that while he was painting, he would not suffer even his most intimate friends to have access to him, lest his fancy might be disturbed, and the ideas he had formed in his mind be interrupted. He studied nature attentively in all her forms; in gales, calms, storms, clouds, rocks, skies, lights, and shadows; and he expressed every subject with so sweet a pencil, and such transparence and lustre, as placed him above all the artists of his time in that style, except the younger Vandervelde, who is deservedly esteemed the first in that manner of painting. It was a frequent custom with Backhuysen, whenever he could procure resolute mariners, to go to sea in a storm, in order to store his mind with grand images, directly copied from nature, of such scenes as would have filled any other head and heart with terror and dismay; and the moment he landed he always impatiently ran to his palette to secure those incidents, of which the traces might by delay be obliterated.—He perfectly understood the management of the chiaroscuro, and by his skill in that part of his art, he gave uncommon force and beauty to his objects. He observed strictly the art of perspective, in the distances of his vessels, the receding of the grounds on the shores, and the different buildings which he described in the sea-ports: whether they were the result of his own imagination, or sketched, as he usually did, after nature. His works may easily be distinguished by an observant eye, from the freedom and neatness of his touch; from the clearness and natural agitation or quiescence of the water; from a peculiar tint in his clouds and skies; and also from the exact proportions of

Digitized by Google

of his ships, and the gracefulness of their position. For the burgomasters of Amsterdam he painted a large picture, with a multitude of vessels, and a view of the city at a distance, for which they gave him thirteen hundred guilders, and a considerable present; which picture they afterwards presented to the king of France, who placed it in the Louvre. No painter was ever more honoured by the visits of kings and princes than Backhuysen; the king of Prussia was one of the number; and the czar Peter the Great took delight to see him paint, and often endeavoured to draw after vessels which he had designed. He was remarkably assiduous, and yet it seems astonishing to consider the number of pictures which he finished, and the exquisite manner in which they are painted. He died in 1709.

BACKING, in *Horsemanship*. See HORSEMANSHIP.

Backing the Sails, in *Navigation*; to arrange them in a situation that will force the ship to retreat, or move backwards. This is, however, only done in narrow channels, when a ship is carried along sidewise by the tide or current, and wants to avoid any thing that may interrupt her progress, as shoals, vessels at anchor, &c. or in the line of battle, when a ship wants to be immediately opposite to another with which she is engaged.

BACKS, among dealers in leather, denote the thickest and best tanned hides, used chiefly for soles of shoes.

BACKS, in *Brewing* and *Distilling*. See BAC.

BACULARIUS, in writers of the middle age, an ecclesiastical apparitor, or verger; who carries a staff, *baculus*, in his hand, as an ensign of his office.

BACON, swines flesh salted, and dried in the chimney.—Old historians and law-writers speak of the *service of the bacon*, a custom in the manor of Whichenacre in Staffordshire, and priory of Dunmore in Essex; in the former of which places, by an ancient grant of the lord, a flitch of bacon, with half a quarter of wheat, was to be given to every married couple who could swear, that, having been married a year and a day, they would never within that time have once exchanged their mate for any other person on earth, however richer, fairer, or the like. But they were to bring two of their neighbours to swear with them that they believed they swore the truth. On this the lord of another neighbouring manor, of Rudlow, was to find a horse saddled, and a sack to carry the bounty in, with drums and trumpets, as far as a day's journey out of the manor: all the tenants of the manor being summoned to attend, and pay service to the bacon. The bacon of Dunmore, first erected under Henry III. was on much the same footing; only the tenor of the oath was, that the parties had never once repented, or wished themselves unmarried again.

BACON, *Roger*, a Franciscan friar of amazing genius and learning, was born near Ilchester in Somersetshire, in the year 1214. He began his studies at Oxford; but in what school or college is uncertain. Thence he removed to the university of Paris, which, in those times was esteemed the centre of literature. Here, we are told, he made so rapid a progress in the sciences, that he was esteemed the glory of that university, and was much caressed by several of his countrymen, particularly by Robert Grouthead, afterwards, bishop of Lincoln, his singular friend and patron. About the year 1240, he returned to Oxford; and assuming the Franciscan habit, prosecuted his favourite study of experimental philosophy with unremitting ardour and assiduity. In this pursuit, in experiments, instruments, and in scarce books, he tells us, he spent, in the space of 20 years, no less than 2000l.; which, it seems, was given him by some of the heads of the university, to enable him to prosecute his noble inquiries. But such extraordinary talents, and astonishing progress in sciences, which, in that ignorant age, were totally unknown to the rest of mankind, whilst they raised the admiration of the more intelligent few, could not fail to excite the envy and malice of his illiterate fraternity; who found no difficulty of possessing the vulgar with the notion of Bacon's dealing with the devil. Under this pretence, he was restrained from reading lectures; his writings were confined to his convent; and finally, in 1278, he himself was imprisoned in his cell. At this time he was 64 years of age. Nevertheless, being permitted the use of his books, he went on in the rational pursuit of knowledge, corrected his former labours, and wrote several curious pieces. When he had been ten years in confinement, Jerome de Ascoli being elected pope, Bacon solicited his holiness to be released; in which, it seems, he did not immediately succeed. However, towards the latter end of that pope's reign, he obtained his liberty, and spent the remainder of his life in the college of his order, where he died in the year 1294, in the 80th year of his age, and was buried in the Franciscan church. Such are the few particulars which the most diligent researches have been able to discover concerning this very great man; who, like a single bright star in a dark hemisphere, shone forth the glory of his country, and the pride of human nature. His works are, 1. *Epistola Fratris Rogeri Baconis de Secretis Operibus Artis et Naturæ, et de Nullitate Magiæ.* Paris, 1542, 4to. Basil, 1593, 8vo. 2. *Opus Majus.* Lond. 1733, folio, published by Dr Jebb. 3. *Thesaurus Chemicus*, Francf. 1603, 1620. This was probably the editor's title; but it contains several of our author's treatises on this subject. These printed works of Bacon contain a considerable number of essays, which, in the catalogue of his writings by Bale, Pits, &c. have been considered as distinct books; but there remain in different libraries several manuscripts not yet published. By an attentive perusal of his works, the reader will be astonished to find, that this great luminary of the 13th century was a great linguist and a skilful grammarian, that he was well versed in the theory and practice of perspective; that he understood the use of convex and concave glasses, and the art of making them; that the *camera obscura*, burning-glasses, and the power of the telescope were known to him; that he was well versed in geography and astronomy; that he knew the great error in the kalendar, assigned the cause, and proposed the remedy; that he understood chronology well; that he was an adept in chemistry, and was really the inventor of gun-powder; that he possessed great knowledge in the medical art; that he was an able mathematician, logician, metaphysician, and theologist.

BACON, *Sir Nicholas*, lord keeper of the great seal in the reign of Queen Elizabeth, was born at Chislehurst, in Kent, in 1510, and educated at the university

Digitized by Google

ty of Cambridge; after which he travelled into France, and made some stay at Paris. On his return, he settled in Gray's Inn, and applied himself with such assiduity to the study of the law, that he quickly distinguished himself so, that on the dissolution of the monastery of St Edmund's Bury, in Suffolk, he had a grant from King Henry VIII. in the 36th year of his reign, of several manors. In the 38th of the same king, he was promoted to the office of attorney in the court of wards, which was a place both of honour and profit. In this office he was continued by King Edward VI.; and in 1552 he was elected treasurer of Gray's Inn. His great moderation and consummate prudence preserved him through the dangerous reign of Queen Mary. In the very dawn of that of Elizabeth he was knighted; and on the 22d of December 1558, the great seal of England, being taken from Nicholas Heath archbishop of York was delivered to him with the title of *lord keeper*, and he was also made one of the queen's privy council. He had a considerable share in the settling of religion: as a statesmen, he was remarkable for a clear head and deep counsels: but his great parts and high preferment were far from raising him in his own opinion, as appears from the modest answer he gave Queen Elizabeth, when she told him his house at Redgrave was too little for him: "Not so, madam, (returned he); but your majesty has made me too great for my house." After having had the great seal more than 20 years, this able statesman and faithful counsellor was suddenly removed from this life, as Mr Mallet informs us, by the following accident: he was under the hands of the barber, and thinking the weather warm, had ordered a window before him to be thrown open, but fell asleep as the current of fresh air was blowing in upon him, and awakened some time after distempered all over. He was immediately removed into his bed-chamber, where he died a few days after, on the 26th of February 1578-9, equally lamented by the queen and her subjects. He was buried in St Paul's, where a monument was erected to him, which was destroyed by the fire of London in 1666. Mr Granger observes, that he was the first lord keeper that ranked as lord chancellor; and that he had much of that penetrating genius, solidity, and judgement, persuasive eloquence, and comprehensive knowledge of law and equity, which afterwards shone forth with so great a lustre in his son, who was as much inferior to his father in point of prudence and integrity, as his father was to him in literary accomplishments.

Bacon, *Francis*, lord high chancellor of England under King James I. was son of Sir Nicholas Bacon lord keeper of the great seal in the reign of Queen Elizabeth, by Anne daughter of Sir Anthony Cook, eminent for her skill in the Latin and Greek tongues. He was born in 1560; and showed such marks of genius, that he was particularly taken notice of by Queen Elizabeth when very young. He was educated at Trinity College, Cambridge; and made such incredible progress in his studies, that, before he was 16, he had not only run through the whole circle of the liberal arts as they were then taught, but began to perceive those imperfections in the reigning philosophy, which he afterwards so effectually exposed, and thereby not only overturned that tyranny which prevented the progress of true knowledge, but laid the foundation of that free and useful philosophy which has since opened a way to so many glorious discoveries. On his leaving the university, his father sent him to France; where, before he was 19 years of age, he wrote a general view of the state of Europe: but Sir Nicholas dying, he was obliged suddenly to return to England; when he applied himself to the study of the common law, at Gray's Inn. At this period the famous earl of Essex, who could distinguish merit, and who passionately loved it, entered into an intimate friendship with him; zealously attempted, though without success, to procure him the office of queen's solicitor; and, in order to comfort his friend under the disappointment, conferred on him a present of land to the value of 1800l. Bacon, notwithstanding the friendship of so great a person; notwithstanding the number and power of his own relations; and, above all, notwithstanding the early prepossession of her majesty in his favour; met with many obstacles to his preferment during her reign. In particular, his enemies represented him as a speculative man, whose head was filled with philosophical notions, and therefore more likely to perplex than forward public business. It was not without great difficulty that lord treasurer Burleigh obtained for him the reversion of register to the star-chamber, worth about 1600l. a-year, which place fell to him about 20 years after. Neither did he obtain any other preferment all this reign; though if obedience to a sovereign in what must be the most disagreeable of all offices, viz. the casting reflections on a deceased friend, entitled him, he might have claimed it. The people were so clamorous even against the queen herself on the death of Essex, that it was thought necessary to vindicate the conduct of the administration. This was assigned to Bacon, which brought on him universal censure, nay his very life was threatened. Upon the accession of King James, he was soon raised to considerable honours; and wrote in favour of the union of the two kingdoms of Scotland and England, which the king so passionately desired. In 1616, he was sworn of the privy council. He then applied himself to the reducing and recomposing the laws of England. He distinguished himself, when attorney general, by his endeavours to restrain the customs of duels, then very frequent. In 1617, he was appointed lord keeper of the great seal. In 1618, he was made lord chancellor of England, and created lord Verulam. In the midst of these honours and applauses, and multiplicity of business, he forgot not his philosophy, but in 1620 published his great work entitled *Novum Organum*. We find by several letters of his, that he thought convening of parliaments was the best expedient for the king and people. In 1621 he was advanced to the dignity of Viscount St Albans, and appeared with the greatest splendour at the opening of the session of parliament. But he was soon after surprised with a melancholy reverse of fortune. For, about the 12th of March, a committee of the house of commons was appointed to inspect the abuses of the courts of justice. The first thing they fell upon was bribery and corruption, of which the lord chancellor was accused. For that very year complaints being made to the house of commons of his lordship's having received bribes, those complaints were sent up to the house of lords; and new ones being daily made of a like nature, things soon grew

Digitized by Google

grew too high to be got over. The king found it was impossible to save both his chancellor, who was openly accused of corruption, and Buckingham his favourite, who was secretly and therefore more dangerously attacked as the encourager of whatever was deemed most illegal and oppressive: he therefore forced the former to abandon his defence, giving him positive advice to submit himself to his peers, and promising upon his princely word to screen him in the last determination, or, if that could not be, to reward him afterwards with an ample retribution of favour. The chancellor, though he foresaw his approaching ruin if he did not plead for himself, resolved to obey; and the house of peers, on the third of May 1621, gave judgement against him, "That he should be fined 40,000l. and remain prisoner in the Tower during the king's pleasure; that he should for ever be incapable of any office, place, or employment, in the state or commonwealth; and that he should never sit in parliament, or come within the verge of the court." The fault which, next to his ingratitude to Essex, thus tarnished the glory of this illustrious man, is said to have principally proceeded from his indulgence to his servants, who made a corrupt use of it. One day, during his trial, passing through a room where several of his domestics were sitting, upon their rising up to salute him, he said, "Sit down, my masters; your rise hath been my fall." *Stephens*, p. 54. And we are told by Rushworth, in his historical collections, "That he treasured up nothing for himself or family, but was over-indulgent to his servants, and connived at their takings, and their ways betrayed him to that error; they were profuse and expensive, and had at their command whatever he was master of. The gifts taken were for the most part for interlocutory orders; his decrees were generally made with so much equity, that though gifts rendered him suspected for injustice, yet never any decree made by him was reversed as unjust." It was peculiar to this great man (say the authors of the Biogr. Brit.) to have nothing narrow and selfish in his composition: he gave way without concern whatever he possessed; and believing other men of the same mould, he received with as little consideration. He retired, after a short imprisonment, from the engagements of an active life, to which he had been called much against his genius, to the shade of a contemplative one, which he had always loved. The king remitted his fine, and he was summoned to parliament in the first year of King Charles I. It appears from the works composed during his retirement, that his thoughts were still free, vigorous, and noble. The last five years of his life he devoted wholly to his studies. In his recess he composed the greatest part of his English and Latin works. He expired on the 9th of April 1626; and was buried in St Michael's church at St Alban's, according to the direction of his last will, where a monument of white marble was erected to him by Sir Thomas Meautys, formerly his secretary, and afterwards clerk of the privy council under two kings. A complete edition of this great man's works was published at London in the year 1740.—Addison has said of him, That he had the sound, distinct, comprehensive knowledge of Aristotle, with all the beautiful light graces and embellishments of Cicero. The honourable Mr Walpole calls him the *Prophet of Arts* which Newton was afterwards to reveal; and adds, that his genius and his works will be universally admired as long as science exists. "As long as ingratitude and adulation are despicable, so long shall we lament the depravity of this great man's heart. Alas! that he who could command immortal fame, should have stooped to the little ambition of power."

BACON, *Sir Nathaniel*, knight of the Bath, and an excellent painter, was a younger son of the lord keeper, and half brother to the great Sir Francis. He travelled into Italy, and studied painting there; but his manner and colouring approaches nearer to the style of the Flemish school. Mr Walpole observes, that at Culford, where he lived, are preserved some of his works; and at Gorhambury, his father's seat, is a large picture by him in oil, of a cook-maid with a dead fowl, admirably painted, with great nature, neatness, and lustre of colouring. In the same house is a whole length of him, by himself, drawing on a paper, his sword and pallet hung up, and a half length of his mother by him.

BACON, *John*, an eminent British sculptor. See SUPPLEMENT.

BACONTHORP, JOHN, called the *resolute doctor*, a learned monk, was born towards the end of the 13th century at Baconthorp, a village in Norfolk. He spent the early part of his life in the convent of Blackney, near Walsingham in the same county; whence he removed to Oxford, and from thence to Paris; where being distinguished for his learning, he obtained degrees in divinity and laws, and was esteemed the principal of the Averroists*. In 1329 he returned to England, and was immediately chosen twelfth provincial of the English Carmelites. In 1333 he was sent for to Rome; where, we are told, he first maintained the pope's sovereign authority in cases of divorce, but that he afterwards retracted his opinion. He died in London in the year 1346. Leland, Bale, and Pits, unanimously gave him the character of a monk of genius and learning. He wrote, 1. *Commentaria seu questiones super quatuor libros sententiarum*; and, 2. *Compendium legis Christi, et quodlibeta*; both which underwent several editions at Paris, Milan, and Cremona.

* See *Averroes*.

BACTRIA, or BACTRIANA, now *Chorassan* or *Khorasan*, an ancient kingdom of Asia, bounded on the west by Margiana, on the north by the river Oxus, on the south by Mount Paropismus, and on the east by the Asiatic Scythia and the country of the Massagetæ. It was a large, fruitful, and well-peopled country, containing according to Ammianus Marcellinus 1000 cities, though of these only a few are particularly mentioned by historians, of which that formerly called *Maracanda*, now *Samarcand*, is the most considerable.

Of the history of this country we know but little. Authors agree that it was subdued first by the Assyrians, afterwards by Cyrus, and then by Alexander the Great. Afterwards it remained subject to Seleucus Nicator and his successors till the time of Antiochus Theos; when Theodorus, from governor of that province, became king, and strengthened himself so effectually in his kingdom, while Antiochus was engaged in a war with Ptolemy Philadelphus king of Egypt, that he could never afterwards dispossess him of his acquisitions. His posterity continued to enjoy the king-

Digitized by Google

dom for some time, till they were driven out by the Scythians, who reigned in Bactria at the time of Adrian, Antoninus Pius, &c. The Scythians were in their turn driven out by the Huns or Turks, and these often conquered by the Saracens and Tartars; nevertheless they continued in possession of this country in the time of Ladislaus IV. king of Hungary.

In early times the Bactrians differed little in their manners from the Nomades; and being near neighbours of the Scythians, who were a very warlike people, the Bactrian soldiers were reckoned the best in the world. Their appearance was very savage; being of an enormous stature, having a terrible aspect, rough beards, and long hair hanging down their shoulders. Some authors assert that they kept dogs on purpose to devour such as arrived at extreme old age, or who were exhausted by long sickness. They add, that for all their fierceness, the Bactrian husbands were such dupes to their wives, that they durst not complain of them even for conjugal infidelity, to which it seems the latter were very much addicted.

BACTROPERATA, an ancient appellation given to philosophers by way of contempt, denoting a man with a staff and a budget.

We suppose it is of the same people that Pauchasias Radbertus speaks under the corrupt name of *Bacoperitæ* or *Bacchionitæ*, whom he described as philosophers who had so great a contempt for all earthly things, that they kept nothing but a dish to drink out of; and that one of this order seeing a peasant scooping up the water in his hand, threw away his cup as a superfluity: which is nothing but the old story of Diogenes the Cynic.

BACCULE, in *Fortification*, a kind of portcullis, or gate, made like a pit-fall with a counterpoise, and supported by two great stakes. It is usually made before the corpade-guard, not far from the gate of a place.

BACULOMETRY, the art of measuring accessible or inaccessible heights, by the help of one or more baculi, staves, or rods. See GEOMETRY.

BACURIUS, or BATURIUS, king of the Iberians, a people on the side of the Caspian sea. One day being a-hunting, he lost sight of his company, through a great storm and sudden darkness; upon which he vowed to the God of his Christian slave, that if he were delivered he would worship him alone: the day breaking up immediately, he made good his promise, and became the apostle of his country.

BADAGSHAN, a very ancient city of Great Bukharia, in the province of Balkh, situated at the foot of those high mountains which separate Hindostan from Great Tartary. The city is exceedingly strong by its situation; and belongs to the khan of Proper Bukharia, who uses it as a kind of state-prison to secure those he is jealous of. The town is not large, but well built, and very populous. It stands on the north side of the river Amu, about 100 miles from its source, and is a great thoroughfare for the caravans travelling to Little Bukharia. The inhabitants are enriched by mines of gold, silver, and rubies, which are in the neighbourhood; and those who live at the foot of the mountains gather a great quantity of gold and silver dust brought down in the spring by torrents occasioned by the melting of the snow on the top.

BADAJOZ, a large and strong town, capital of Estremadura in Spain. It is seated on the river Guadiana, over which there is a fine bridge built by the Romans. On this bridge the Portuguese were defeated in 1661, by Don John of Austria. The population of Badajoz is computed at 14,500 inhabitants. It was taken by storm by the British under Lord Wellington, after a memorable conflict, on the 6th April 1812. W. Long. 7. 3. N. Lat. 38. 35.

BADELONA, a town of Catalonia in Spain, seated on the Mediterranean. Lord Peterborough landed here in 1704, when, with Charles then king of Spain, he laid siege to Barcelona, from which it is ten miles distant. E. Long. 2. 20. N. Lat. 41. 12.

BADEN, a district in Swisserland, has three cities, Baden, Keifers Stoul, and Klingnaw, besides a town that passes for a city, named *Zurzach*. It is one of the finest countries in Swisserland; and is watered with three navigable rivers, the Limmet, Russ, and Are. The land is fertile in corn and fruit, and there are places on the sides of the Limmet which produce wine. It maintains a communication between the cantons of Zurich and Berne, being seated between their north extremities. It extends on one side to the Are, as far as the place where it falls into the Rhine, and on the other side beyond the Rhine, where there are some villages which depend thereon. Most of the inhabitants are Papists. By the treaty of peace at the conclusion of the war which broke out in 1712 between the Protestant and Popish cantons, this country was yielded to the Protestant cantons of Zurich and Bern. The constitution of 1798 restored it for a time to its original independence; but on the reorganization of the cantons by Bonaparte in 1803, it was united to that of Argau. It contained at that time 46,381 inhabitants.

BADEN, the capital of the above district, is an agreeable city, moderately large, seated on the side of the Limmet, in a plain flanked by two high hills, between which the river runs. This city owes its rise to its baths, which were famous before the Christian era. Several monuments of antiquity have been found here from time to time, particularly in 1240. When they were opening the large spring of the baths, they found statues of several heathen gods, made of alabaster; Roman coins, made of bronze, of Augustus, Vespasian, Decius, &c.; and several medals of the Roman emperors, of gold, silver, copper, and bronze. There are two churches in Baden; one of which is collegiate, and makes a good appearance; the other is a monastery of the Capuchins, near the townhouse. This last building served formerly not only for the assemblies of their own council, but also for those of the cantons. The diet assembled in a handsome room made for that purpose; the deputies of Zurich sat at the bottom behind a table, as the most honourable place; the ambassadors of foreign powers were seated on one side to the right, and the deputies of the other cantons were ranged on each side the room. The bailiff of Baden resides in a castle at the end of a handsome wooden bridge, which is covered in. Before this castle there is a stone pillar, erected in honour of the emperor Trajan, who paved a road in this country 85 Italian miles in length. The inhabitants are rigid Roman Catholics, and formerly behaved in a most insolent manner to the Protestants, but they are now obliged by their masters to be more

Digitized by Google

more submissive. The baths which are on each side of the river are a quarter of a league from the city. Joining to the small baths there is a village, and to the large a town which may pass for a second Baden. It is seated on a hill, of which the ascent is steep. There the baths are brought into inns and private houses, by means of pipes, which are about 60 in all. There are also public baths in the middle of the town, from a spring which rises in the street, where the poor bathe *gratis*, but they are exposed quite naked to all that pass by. All the baths are hot, and one to so great a degree as to scald the hand; and they are impregnated with a great deal of sulphur, with some alum and nitre. They are useful for drinking as well as bathing; and are said to cure all diseases from a cold cause, headaches, vertigoes, &c. They strengthen the senses, cure diseases of the breast and bowels, asthmas, and obstructions. They are peculiarly excellent for women's diseases. E. Long. 8. 25. N. Lat. 47. 27.

BADEN, formerly a margravate, now a grand duchy in Germany. It is bounded by Hesse Darmstadt and Bavaria on the north; by Wirtemburg, on the east; by Switzerland, on the south; and by the Rhine, which divides it from Alsace, on the west. It is about 170 miles in length, from north to south; but not above 30 or 40 in breadth; and contained, in 1816, 5800 square English miles, with 1,001,700 inhabitants. It was erected into a duchy in 1806, and was subsequently divided into ten circles. The French code was introduced in the time of Bonaparte, and is still in force, with some modifications. The public revenue of the duchy is estimated at 550,000l. sterling. The country is generally fertile, producing corn and wine. About two-thirds of the people are Lutherans, the other third are Calvinists. In 1819 the grand duke gave his subjects a representative constitution. The principal rivers are the Rhine, Neckar, Ems, and Wirmbs. Carlsruhe is the chief town, and seat of the government.

BADEN, the chief city of the margravate, contains 2000 inhabitants, and has a few manufactures of pottery, leather, soap, &c. The town is seated among hills, on rocky and uneven ground, which renders the streets inconvenient and crooked. It is famous for its baths, the springs of which are said to be above 300. Some of them are hot, and accounted to be very good in nervous cases. They partake of salt, alum, and sulphur. E. Long. 8. 15. N. Lat. 48. 50.

BADEN, a town of Germany, in the archduchy of Austria, seated on the Little Suechat, is a neat little walled town, standing in a plain not far from a ridge of hills which run out from the mountain Cetius. It is much frequented by the people of Vienna, and the neighbouring parts, on account of its baths. The springs supply two convenient baths within the town, five without the walls, and one beyond the river. They are good for distempers of the head, the gout, dropsy, and most chronic diseases. E. Long. 16. 10. N. Lat. 48. 0.

BADENOCH, the most easterly part of Inverness-shire, in Scotland, extending about 33 miles in length from east to west, and 27 from north-east to south-west where broadest. It has no considerable town, and is very barren and hilly, but abounds with deer, and other kinds of game.

BADEN-WEILLER, a town of Germany, belonging to the lower margravate of Baden. E. Long. 7. 50. N. Lat. 47. 55.

BADENS, FRANCIS, historical and portrait painter, was born at Antwerp in 1571; and the first rudiments of the art were communicated to him by his father, who was but an ordinary artist. However, he visited Rome, and several parts of Italy, and there formed a good taste of design, and a manner exceedingly pleasing. When he returned to his own country his merit procured for him great employment, and still greater reputation, and he was usually distinguished by the name of the Italian painter. His touch was light and spirited, and his colouring warm; and he had the honour of being the first who introduced a good taste of colouring among his countrymen. While his acknowledged merit was rewarded with every public testimony of esteem and applause, unhappily he received an account of the death of his brother, who had been assassinated on a journey; and the intelligence affected him so violently, that it occasioned his own death, to the inexpressible regret of every lover of the art, in 1603.

BADGE, in naval architecture, signifies a sort of ornament placed on the outside of small ships, very near the stern, containing either a window for the convenience of the cabin, or a representation of it. It is commonly decorated with marine figures, martial instruments, or such like emblems.

BADGER, in *Zoology*, the English name of a species of ursus. See URSUS.

BADGER, in old law-books, one that was licensed to buy corn in one place and carry it to another to sell, without incurring the punishment of an engrosser.

BADIA, an ancient town of Bætica, on the Anas; now supposed to be Badajoz on the Guadiana.

BADIAGA, in the *Materia Medica*, the name of a sort of spongy plant, common in the shops in Moscow, and some other northern kingdoms. The use of it is the taking away of livid marks from blows and bruises, which the powder of this plant is said to do in a night's time.

BADIANE, or BANDIAN, the seed of a tree which grows in China, and smells like anise-seed. The Chinese, and the Dutch in imitation of them, sometimes use the badiane to give their tea an aromatic taste.

BADIGEON, a mixture of plaster and free-stone, well ground together, and sifted; used by statuaries to fill up the little holes, and repair the defects in stones, whereof they make their statues and other work.

The same term is also used by joiners for saw-dust mixed with strong glue, wherewith they fill up the chaps and other defects in wood after it is wrought.

BADILE, ANTONIA, history and portrait painter, was born at Verona in 1480, and by great study and application acquired a more extensive knowledge of the true principles of painting than any of his predecessors. He was confessedly a most eminent artist; but he derived greater honour from having two such disciples as Paolo Veronese and Baptista Zelotti, than he did even from the excellence of his own compositions. He died in 1560. His colouring was admirably good; his carnations beautiful; and his portraits preserved the perfect resemblance of flesh and real life: nor had he any cause to envy the acknowledged merit

Digitized by Google

merit of Titian, Giorgione, or the best of his cotemporaries.

BADIS, a fortress of Livonia, subject to Russia. E. Long. 23. 10. N. Lat. 59. 15.

BADIUS, Conrad, and Stephen Robert, his brother; French refugees; celebrated as printers at Geneva, and Conrad as an author. The latter died in 1566.

BÆCKEA. See Botany *Index*.

BÆTERRÆ, an ancient town of the Tectosages in Gallia Narbonensis; now *Besiers*, on the east bank of the Obris, now *Orbis* or *Orbe*, in Lower Languedoc.

BÆTICA, a province of ancient Spain, so called from the famed river Bætis, afterwards *Tartessus*, now *Guadalquiver*, or the great river. It was bounded on the west by Lusitania; on the south, by the Mediterranean, and Sinus Gaditanus: on the north by the Cantabric sea, now the bay of Biscay. On the east and north-east, its limits cannot be so well ascertained, as they are very reasonably thought to have been in a continual state of fluctuation, as each petty monarch had an opportunity of encroaching upon his neighbour. The province was divided in two by the river Bætis already mentioned. On the one side of which, towards the Anas, were situated the Turdetani, from whence the kingdom was called *Turdetania*, though more generally known by the name of *Bæturia*. On the other side were situated the Bastuli, Batestani, and Contestani, along the Mediterranean coasts. The Bastuli were supposed to be of Phœnician extraction, and dwelt along the coasts of the Mediterranean, till, driven from thence by the Moors, they fled into the mountainous parts of Galicia, which they then called from their own name *Bastulia*. The Batestani were seated higher up, on the same coasts. The teritories of both these made part of what has since become the kingdom of *Granada*; in which there is a ridge of very high mountains, called from the above-mentioned people, the *Batestanian mountains*. Mention is also made of their capital Batestana; a place of such strength, that King Ferdinand was six months besieging it before he could take it from the Moors. The whole province of Bætica, according to the most probable account, contained what is now called *Andalusia*, part of the kingdom of Granada, and the outward boundaries of Estremadura.

BÆTIS. See Bætica.

BÆTULO, a town of ancient Spain in the Tarraconensis; now *Badelona* in Catalonia.

BÆTYLIA, anointed stones, worshipped by the Phœnicians, by the Greeks before the time of Cecrops, and by other barbarous nations. They were commonly of a black colour, and consecrated to some god, as Saturn, Jupiter, the Sun, &c. Some are of opinion that the true original of these idols is to be derived from the pillar of stone which Jacob erected at Bethel, and which was afterwards worshipped by the Jews.

These *bætylia* were much the object of the veneration of the ancient heathens. Many of their idols were no other. In reality, no sort of idol was more common in the eastern countries, than that of oblong stones erected, and hence termed by the Greeks, κιονες, *pillars*. In some parts of Egypt they were planted on both sides of the highways. In the temple of Heliogabalus, in Syria, there was one pretended to have fallen from heaven. There was also a famous black stone in Phrygia, said to have fallen from heaven. The Romans sent for it and the priests belonging to it with much ceremony, Scipio Nasica being at the head of the embassy.

BÆZA, a city of Andalusia in Spain, seated on a high hill three miles from the Guadalquiver; it is the see of a bishop, and has a kind of university founded by John d'Avila. It was taken from the Moors about the end of the 15th century. E. Long. 3. 15. N. Lat. 37. 45.

BAFFETAS, or Bastas, a cloth made of coarse white cotton thread, which comes from the East Indies. That of Surat is the best.

BAFFIN's bay, a gulf of North America, running north-east from Cape Farewell in West Greenland, from 6° to 8° of north latitude.

BAFFO, a considerable town in the island of Cyprus, with a fort built near ancient Paphos, of which some considerable ruins yet remain, particularly some broken columns, which probably belonged to the temple of Venus. E. Long. 32. 20. N. Lat. 34. 50.

BAG, in commerce, a term signifying a certain quantity of some particular commodity: a bag of almonds, for instance, is about 300 weight; of aniseseeds, from 300 to 400, &c.

Bags, are used in most countries to put several sorts of coin, either of gold, silver, brass or copper. Bankers, and others, who deal much in current cash, label their bags of money, by tying a ticket or note at the mouth of the bag, signifying the coin therein contained, the sum total, its weight, and of whom it was received. Tare is allowed for the bag.

Bag, among farriers, is when, in order to retrieve a horse's lost appetite, they put in an ounce of asafœtida, and as much powder of savin, into a bag, to be tied to the bit, keeping him bridled for two hours, several times a-day; as soon as the bag is taken off he will fall to eating. The same bag will serve a long time.

BAGAMADER, or Bagamedri, a province of the kingdom of Abyssinia in Africa. It is said to receive its name from the great number of sheep bred in it; *meder* signifying land or earth, and *bag* a sheep. Its length is estimated about 60 leagues, and its breadth 20: but formerly it was much more extensive; several of its provinces having been dismembered from it, and joined to that of Tigre. A great part of it, especially towards the east, is inhabited by wandering Gallas and Caffres.

BAGAUDÆ, or Bacaudæ, an ancient faction of peasants, or malecontents, who ravaged Gaul. The Gauls being oppressed with taxes, rose about the year of Christ 290, under the command of Amand and Elian; and assumed the name *bagaudæ*, which, according to some authors, signified in the Gallic language *forced rebels;* according to others, *tribute;* according to others, *robbers;* which last signification others allow the word had, but then it was only after the time of the *bagaudæ*, and doubtless took its rise from them.

BAGDAD, a celebrated city of Asia in Irak Arabia, seated on the eastern banks of the Tigris, in E. Long. 44. 10. N. Lat. 33. 15. By many authors this city is very

Bagdad. very improperly called *Babylon*. The latter stood on the Euphrates at a considerable distance.

This city, for many years the capital of the Saracen empire, was founded by the caliph Al Mansur, the second of the house of Al Abbas, after an attempt by the Rawandians to assassinate him, as already mentioned. See ARABIA, N° 184.

1 Why the city was built. The reasons assigned by the Arabian historians for building the city of Bagdad are, That the above-mentioned attempt to assassinate the caliph had disgusted him at his Arabian subjects in general, and that the spot where Bagdad stood was at a considerable distance from the city of Cufa particularly; the inhabitants of which were remarkable for their treachery and inconstancy, Al Mansur himself having felt several instances of it. Besides, the people of Irac, who had always continued faithful to him, represented, that by building his capital near the confluence of the Euphrates and Tigris, it would be in a great measure secured from the insults and attacks of those who should have an inclination to dispute the caliphate with him; and that by being situated as it were in the middle of the tract comprehending the districts of Basrah, Cufa, Waset, Mawsel, and Swada, at no great distance from these cities, it would be plentifully supplied with provisions by means of the aforesaid rivers.

2 Ancient city described. Concerning the origin of the name *Bagdad*, there are various accounts, which, being equally uncertain and trifling, merit no attention. The first city that went by this name was situated on the western bank of the Tigris; from whence Al Mansur despatched his son Al Mohdi with a body of Moslem troops to the opposite bank. Here the young prince took post, and fortified the place on which he had encamped with a wall, in order to cover his troops, as well as the workmen employed by his father on the other side of the river, from the incursions of the Persians, who seemed to have taken umbrage at the erection of a new metropolis so near the frontiers of their dominions. Hence that part of the city soon after built on the eastern banks of the Tigris, received the name of the *Camp* or *Fortress of Al Mohdi*. The caliph had a superb and magnificent palace both in the eastern and western part of the town. The eastern palace was surrounded on the land side by a semicircular wall that had six gates; the principal of which seems to have been called *the gate of prefects*, whose entrance was generally kissed by the princes and ambassadors that came to the caliph's court. The western part of the city was entirely round, with the caliph's palace in the centre, and having the great mosque annexed to it. The eastern part consisted of an interior and exterior town, each of which was surrounded by a wall. For some time the building of the city went but slowly on, owing to a scarcity of materials for building; for which reason the caliph was sometimes inclined to remove the materials of Al Madayen, the ancient metropolis of the Persian empire. But, upon trial, he found the stones to be of such immense size, that the removal of them to Bagdad would be attended with great difficulty and expence; besides, he considered that it would be a reflection upon himself to have it said that he could not finish his metropolis without destroying such a pile of building, as perhaps could not be paralleled in the whole world; for which reasons he at length gave over his design, and erected the city of Bagdad most probably out of the ruins of the ancient cities of Seleucia and Ctesiphon, putting an end to his undertaking in the 149th year of the Hegira, or four years after the city was begun.

From the building of the city of Bagdad to the death of Al Mansur nothing very remarkable happened, excepting some irruptions made into the territories of the Greeks, and by the Arabs into some of the caliph's other territories. In the 157th year of the Hegira also, a grievous famine was felt in Mesopotamia, which was quickly after followed by a plague that destroyed great numbers. This year likewise, the Christians, who had been all along very severely dealt with by Al Mansur, were treated with the utmost rigour by Musa Ebn Mosaab the caliph's governor; every one who was unable to pay the enormous tribute exacted of them being thrown into prison without distinction.

3 Death of Al Mansur. The next year, being the 158th of the Hegira, the caliph set out from Bagdad, in order to perform the pilgrimage to Mecca: but, being taken ill on the road, he expired at Bir Maimun, whence his body was carried to Mecca; where, after a hundred graves had been dug, that his sepulchre might be concealed, he was interred, having lived according to some 63, according to others 68 years, and reigned 22. He is said to have been extremely covetous, and to have left in his treasury 600,000,000 dirhems, and 24,000,000 dinars. He is reported to have paid his cook by assigning him the heads and legs of the animals dressed in his kitchen, and to have obliged him to procure at his own expence all the fuel and vessels he had occasion for.

4 Succeeded by Al Mohdi. When Al Mansur expired at Bir Maimun, he had only his domestics and Rabi his freedman with him. The latter of these, for some time, kept his death concealed, and pretended to have a conference with him, in which, as he gave out, the caliph commanded him to exact an oath of allegiance to Al Mohdi his son, as his immediate successor, and to Isa Ebn Musa his cousin-german, as the next apparent heir to the crown. He then despatched a courier to Bagdad with the news of Al Mansur's death; upon which Al Mohdi was unanimously proclaimed caliph. Isa Ebn Musa, however, no sooner heard this news, than he began to entertain thoughts of setting up for himself at Cufa, where he then resided; and in order to facilitate the execution of his scheme, fortified himself in that city. But Al Mohdi being apprised of his defection, sent a detachment of 1000 horse to bring him to Bagdad; which being done, Al Mohdi not only prevailed upon him to own his allegiance to him, but also to give up his right to the succession for 10,000 according to some, or according to others for 10,000,000 dinars.

5 Rebellion of Al Mokanna. From the accession of Al Mohdi to the 164th year of the Hegira, the most remarkable event was the rebellion of Al Mokanna. This impious impostor, whose true name was *Hakem Ebn Hesham*, came originally from Khorasan, and had been an under secretary to Abu Moslem governor of that province. He afterwards turned soldier, and passed thence into Mawaralnahr, where he gave himself out for a prophet. The name of Al Mokanna, as also that of Al Borkai, that is, the *veiled*, he took from his custom of covering his face with a veil or girdle mask, to conceal his deformity; he having lost an eye in the wars, and being otherwise

Bagdad. otherwise of a despicable appearance; though his followers pretended he did this for the same reason that Moses did, viz. lest the splendour of his countenance should dazzle the eyes of his beholders. In some places he made a great many proselytes, deluding the people with a number of juggling tricks which they swallowed as miracles, and particularly by causing the appearance of a moon to rise out of a well for many nights together; whence he was also called in the Persian tongue, *Sazendeh mak*, or the *moon-maker*. This wretch, not content with being reckoned a prophet, arrogated to himself divine honours; pretending that the Deity resided in his person, having proceeded to him from Abu Moslem, in whom he had taken up his residence before. At last this impostor raised an open rebellion against the caliph, and made himself master of several fortified places in Khorasan, so that Al Mohdi was obliged to send one of his generals with an army against him. Upon the approach of the caliph's troops, Al Mokanna retired into one of his strong fortresses which he had well provided for a siege; and sent his emissaries abroad to persuade the people that he raised the dead to life, and foretold future events.

6 Dreadful catastrophe of him and all his family.

But being closely besieged by the caliph's forces, and seeing no possibility of escaping, he gave poison in wine to his whole family and all that were with him, in the castle; when they were dead, he burnt their bodies, together with all their furniture, provisions, and cattle; and lastly, he threw himslf into the flames, or, as others say, into a tub of aquafortis, or some other preparation, which consumed every part of him except the hair. When the besiegers therefore entered the place, they found no living creature in it, except one of Al Mokanna's concubines, who, suspecting his design, had hid herself, and now discovered the whole matter. This terrible contrivance, however, failed not to produce the desired effect. He had promised his followers, that his soul should transmigrate into the form of an old man riding on a grayish-coloured beast, and that after so many years he would return and give them the earth for their possession; which ridiculous expectation kept the sect in being for several years.

7 Harun Al Raschid's success against the Greeks.

All this time war had been carried on with the Greeks, but without any remarkable success on either side. In the 164th year of the Hegira, however, Al Mohdi ordered his son Harun Al Raschid to penetrate into the Greek territories with an army of 95,000 men. Harun, then, having entered the dominions of the empress Irene, defeated one of her commanders that advanced against him; after which he laid waste several of the imperial provinces with fire and sword, and even threatened the city of Constantinople itself. By this the empress was so terrified, that she purchased a peace with the caliph by paying him an annual tribute of 70,000 pieces of gold; which, for the present at least, delivered her from the depredations of these barbarians.

8 Unaccountable darkness.

After the signing of the treaty, Harun returned home laden with spoils and glory. This year, according to some of the oriental historians, the sun one day, a little after his rising, totally lost his light in a moment, without being eclipsed, when neither any fog nor any cloud of dust appeared to obscure him. This frightful darkness continued till noon, to the great astonishment of the people settled in the countries where it happened.

9 Al Mohdi poisoned;

In the 169th year of the Hegira, Al Mohdi was poisoned, though undesignedly, by one of his concubines named *Hasanah*. She had designed to destroy one of her rivals whom she imagined to have too great an ascendant over the caliph, by giving her a poisoned pear. This the latter, not suspecting any thing, gave to the caliph; who had no sooner eaten it than he felt himself in exquisite torture, and soon after expired.

10 as likewise his successor Al Hadi.

On the death of Al Mohdi, he was succeeded by his eldest son Al Hadi; who having formed a design to deprive his younger brother Harun Al Raschid of his right of succession, and even to assassinate him, was poisoned by his vizier in the 170th year of the Hegira; and on his death the celebrated caliph Harun Al Raschid ascended the throne.

11 Harun Al Raschid caliph.

This was one of the best and wisest princes that ever sat on the throne of Bagdad. He was also extremely fortunate in all his undertakings, though he did not much extend his dominions by conquest. In his time the Moslem empire may be said to have been in its most flourishing state, though by the independency of the Moslems in Spain, who had formerly set up a caliph of the house of Ommiyah, his territories were not quite so extensive as those of some of his predecessors.

12 Extent of his empire.

He possessed the provinces of Syria, Palestine, Arabia, Persia, Armenia, Natolia, Media or *Aderbijan*, Babylonia, Assyria, Sindia, Sijistan, Khorasan, Tabrestan, Jorjan, Zablestan or *Sablestan*, Mawaralnahr or *Great Bukharia*, Egypt, Libya, Mauritania, &c.; so that his empire was by far the most powerful of any in the world, and extended farther than the Roman empire ever had done.

13 He finds a ring he had thrown into the Tigris.

The first instance of Harun's good fortune, and which was taken for a presage of a prosperous and happy reign, was his finding a valuable ring which he had thrown into the Tigris to avoid being deprived of it by his brother Al Hadi. He was able to give the divers no other direction than by throwing a stone from the bridge of Bagdad, about the same place of the river in which he had thrown the ring; notwithstanding which, they found it without any great difficulty.

14 Divides the empire among his sons, and settles the succession.

In the 186th year of the Hegira, beginning January 10. 802, the caliph divided the government of his extensive dominions among his three sons, in the following manner: To Al Amin the eldest, he assigned the provinces of Syria, Irak, the three Arabias, Mesopotamia, Assyria, Media, Palestine, Egypt, and all that part of Africa extending from the confines of Egypt and Ethiopia to the straits of Gibraltar, with the dignity of caliph; to Al Mamun the second, he assigned Persia, Kerman, the Indies, Khorasan, Tabrestan, Cablestan, and Zablestan, together with the vast province of Mawaralnahr; and to his third son Al Kasem, he gave Armenia, Natolia, Jorjan, Georgia, Circassia, and all the Moslem territories bordering upon the Euxine sea. As to the order of succession, Al Amin was to ascend the throne immediately after his father's decease; after him, Al Mamun; and then Al Kasem, whom he had surnamed *Al Mutaman*.

The most considerable exploits performed by this caliph

Bagdad.

15 His successful wars with the Greeks.

caliph were against the Greeks, who by their perfidy provoked him to make war upon them, and whom he always overcame. In the 187th year of the Hegira, the caliph received a letter from the Greek emperor Nicephorus, soon after he had been advanced to the imperial dignity, commanding him to return all the money he had extorted from the empress Irene, though that had been secured to him by the last treaty concluded with that princess, or expect soon to see an imperial army in the heart of his territories. This insolent letter so exasperated Harun, that he immediately assembled his forces and advanced to Heraclea, laying the country through which he passed waste with fire and sword. For some time also he kept that city straitly besieged; which so terrified the Greek emperor, that he submitted to pay an annual tribute. Upon this Harun granted him a peace, and returned with his army. But a hard frost soon after happening in these parts, Nicephorus took for granted that Al Rashid would not pay him another visit, and therefore broke the treaty he had concluded. Of this the caliph receiving advice, he instantly put himself in motion; and, notwithstanding the inclemency of the weather, forced the emperor to accept of the terms proposed. According to a Persian historian, before the hostilities at this time commenced, Nicephorus made the caliph a present of several fine swords, giving him thereby plainly to understand that he was more inclinable to come to blows than to make peace with him. All these swords Harun cut asunder with his famous sword *Samsamah*, as if they had been so many radishes, after which severe proof there did not appear the least flaw in the blade; a clear proof of the goodness of the sword, as the cutting the others with it was of the strength of Harun's arm. This sword had fallen into Al Rashid's hands among the spoils of Ebn Dakikan, one of the last Hamyaritic princes of Yaman; but is said to have belonged originally to a valiant Arab named *Amru Ebn Maadi Carb*, by whose name it generally went among the Moslems. This man is said to have performed very extraordinary feats with his sword, which induced a certain prince to borrow it from him; but he not being able to perform any thing remarkable with it, complained to Amru that it had not the desired effect: upon which that brave man took the liberty to tell him, that he had not sent him his arm along with his sword.

In the 188th year of the Hegira, war was renewed with the Greeks, and Nicephorus with a great army attacked the caliph's forces with the utmost fury. He was, however, defeated with the loss of 40,000 men, and received three wounds in the action; after which the Moslems committed terrible ravages in his territories, and returned home laden with spoils. The next year Harun invaded Phrygia; defeated an imperial army sent to oppose him; and having ravaged the country, returned without any considerable loss. In the 190th year of the Hegira, commencing November 27. 805, the caliph marched into the imperial territories with an army of 135,000 men, besides a great number of volunteers and others who were not enrolled among his troops. He first took the city of Heraclea, from whence he is said to have carried 16,000 prisoners; after which he made himself master of several other places: and in the conclusion of the expedition, he made a descent on the island of Cyprus, which he plundered in a terrible manner. This success so intimidated Nicephorus, that he immediately sent the tribute due to Harun, the withholding of which had been the cause of the war, and concluded a peace upon the caliph's own terms; one of which was, that the city of Heraclea should never be rebuilt. This perhaps Harun would not have so readily granted, had not one 16
Rafe Ebn Al Leith revolted against him at Samarcand, Rebellion
and assembled a considerable force to support him in in Khorasan.
his defection.

The next year being the 191st of the Hegira, the caliph removed the governor of Khorasan from his employment, because he had not been sufficiently attentive to the motions of the rebel Rafe Ebn Al Leith. As this governor had also tyrannized over his subjects in the most cruel manner, his successor no sooner arrived than he sent him in chains to the caliph; but notwithstanding all Harun's care, the rebels made this year a great progress in the conquest of Khorasan.

Next year the caliph found it necessary to march in person against the rebels, who were daily becoming more formidable. The general rendezvous of his troops was in the plains of Rakka, from whence he advanced at the head of them to Bagdad. Having at that place supplied the troops with every thing necessary, he continued his march to the frontiers of Jorjan, where he was seized with an illness which grew more violent after he had entered that province. Finding himself therefore unable to pursue his journey, he resigned the command of the army to his son Al Mamun, retiring himself to Tus in Khorasan. We were told by Khondemir, 17
that, before the caliph departed from Rakka, he had a The caliph's death
dream, wherein he saw a hand over his head full of red predicted
earth, and at the same time heard a person pronouncing by a dream.
these words, "See the earth where Harun is to be buried." Upon this he demanded where he was to be buried; and was instantly answered, "At Tus." This dream greatly discomposing him, he communicated it to his chief physician, who endeavoured to divert him, telling the caliph that the dream had been occasioned by the thoughts of his expedition against the rebels. He therefore advised him to pursue some favourite diversion that might draw his attention another way. The caliph accordingly, by his physician's advice, prepared a magnificent regale for his courtiers, which lasted several days. After this, he put himself at the head of his forces, and advanced to the confines of Jorjan, where he was attacked by the distemper that proved fatal to him. As his disorder increased, he found himself obliged to retire to Tus; where being arrived, he sent for his physician, and said to him, "Gabriel, do you remember my dream at Rakka? We are now arrived at Tus, the place, according to what was predicted in that dream, of my interment. Send one of my eunuchs to fetch me a handful of earth in the neighbourhood of this city." Upon this, *Masrur*, one of his favourite eunuchs, was despatched to bring a little of the soil of the place to the caliph. He soon returned and brought a handful of red earth, which he presented to the caliph with his arm half bare. At the sight of this Harun instantly cried out, "In truth this is the earth, and this the very arm, that I saw in my dream." His spirits immediately failing, and his malady being greatly increased by the perturbation of mind ensuing

Bagdad.

upon this sight, he died three days after, and was buried in the same place. According to Abul Faraj, Bashir Ebn Al Leith the arch rebel's brother was brought in chains to the caliph, who was then at the point of death. At the sight of whom Harun declared, that if he could speak only two words he would say *kill him*; and immediately ordered him to be cut to pieces in his presence. This being done, the caliph soon after expired, in the year of the Hegira 193, having reigned 23 years. The distemper that put an end to his days is said to have been the bloody flux.

18 He dies according to the prediction.

19 Succeeded by his son Al Amin.

Upon the arrival of a courier from Tus, with the news of Al Rashid's death, his son Al Amin was immediately proclaimed caliph; and was no sooner seated on the throne, than he formed a design of excluding his brother Al Mamun from the succession. Accordingly he deprived him of the furniture of the imperial palace of Khorasan; and in open violation of his father's will, who had bestowed on Al Mamun the perpetual government of Khorasan, and of all the troops in that province, he ordered these forces to march directly to Bagdad. Upon the arrival of this order, Al Mamun expostulated with the general Al Fadl Ebn Rabbi who commanded his troops, and endeavoured to prevent his marching to Bagdad; but without effect, for he punctually obeyed the orders sent by the caliph. Al Mamun, however, took care not to be wanting in fidelity to his brother. He obliged the people of Khorasan to take an oath of fidelity to Al Amin, and reduced some who had actually excited a considerable body of the people to revolt, while the general Al Fadl having ingratiated himself with the caliph by his ready compliance with his orders, was chosen prime vizir, and governed with an absolute sway: Al Amin abandoning himself entirely to drunkenness.

20 Infamous behaviour of the new caliph.

Al Fadl was a very able minister; though fearing Al Mamun's resentment if ever he should ascend the throne, he gave Al Amin such advice as proved in the end the ruin of them both. He told him that his brother had gained the affection of the people of Khorasan by the good order and police he had established among them; that his unwearied application to the administration of justice had so attracted their esteem, that the whole province was entirely at his devotion; that his own conduct was by no means relished by his subjects, whose minds were almost totally alienated from him; and therefore that he had but one part to act, which was to deprive Al Mamun of the right of succession that had been given him by his father, and transfer it to his own son Musa, though then but an infant. Agreeable to this pernicious advice, the caliph sent for his brother Al Kasem from Mesopotamia, and recalled Al Mamun from Khorasan, pretending he had occasion for him as an assistant in his councils.

21 Al Mamun takes up arms against his brother.

By this treatment Al Mamun was so much provoked, that he resolved to come to an open rupture with his brother, in order if possible to frustrate his wicked designs. Instead, therefore, of going to Bagdad as he had been commanded, he cut off all communication between his own province and that capital: pretending, that as his father Harun had assigned him the lieutenancy of Khorasan, he was responsible for all the disorders that might happen there during his absence. He also coined money, and would not suffer Al Amin's name to be impressed upon any of the dirhems, or dinars struck in that province. Not content with this, he prevailed upon Rafe Ebn Al Leith, who had been for some time in rebellion, to join him with a body of troops; whose example was soon after followed by Harthema Ebn Aafan; which put him in possession of all the vast territory of Khorasan. Here he governed with an absolute sway, officiated in the mosque as *Imam*, and from the pulpit constantly harangued the people.

The following year, being the 195th year of the Hegira, beginning October 4. 810, the caliph Al Amin, finding that his brother set him at defiance, declared war against him, and sent his general Ali Ebn Isa with an army of 60,000 men to invade Khorasan. Al Mamun, being informed that Ali was advancing against him with such a powerful army, put on foot all the troops he could raise, and gave the command to Thaher Ebn Hosein, one of the greatest generals of his age. Thaher being a man of undaunted resolution, chose only 4000 men, whom he led against Al Amin's army. Ali, seeing so small a number of troops advancing against him, was transported with joy, and promised himself an easy victory. Despising his enemies, therefore, he behaved in a secure and careless manner; the consequence of which was, that his army was entirely defeated, and himself killed, his head being afterwards sent as a present to Al Mamun, who amply rewarded Thaher and Harthema for their services.

22 Al Amin's forces defeated.

After this victory, Al Mamun assumed the title of *caliph*, ordered Al Amin's name to be omitted in the public prayers, and made all necessary preparations for carrying the war into the very heart of his brother's dominions. For this purpose he divided his forces into two bodies, and commanded them to march into Irak by different routes. One of them obeyed the orders of Thaher, and the other of Harthema. The first directed his march towards Ahwas, and the other towards Holwan, both of them proposing to meet in the neighbourhood of Bagdad, and after their junction to besiege that city.

23 Al Mamun's rapid conquests.

In the 196th year of the Hegira, Thaher Ebn Hosein made a most rapid progress with the troops under his command. Having advanced towards Ahwas, he there defeated a body of the caliph's forces; and though the victory was by no means decisive, it so intimidated the commander of Ahwas, that he thought fit to surrender that fortress to him. This opened him a way to Waset upon the Tigris, and facilitated the conquest of that place. After this he marched with his army to Al Madayen; the inhabitants of which immediately opened their gates to him. The rapidity of these conquests, and the infamous conduct of Al Amin, excited the people of Egypt, Syria, Hejaz, and Yaman, unanimously to declare for Al Mamun; who was accordingly proclaimed caliph in all these provinces.

24 Siege of Bagdad.

The next year, Al Mamun's forces under Thaher and Harthema, laid siege to Bagdad. As the caliph was shut up in that place, and it had a numerous garrison, the besieged made a vigorous defence, and destroyed a great number of their enemies. The besiegers, however, incessantly played upon the town with their catapults and other engines, though they were in their turn not a little annoyed by the garrison with the same sort of military machines. The latter likewise made continual

continual sallies, and fought like men in despair, though they were always at last beaten back into the town with considerable loss. In short the siege continued during the whole of this year, in which the greatest part of the eastern city, called the *Camp of Al Mohdi*, was demolished or reduced to ashes. The citizens, as well as the garrison, were reduced to the last extremity, by the length and violence of the siege.

In the beginning of the 198th year of the Hegira, Al Amin finding himself deserted by his troops, as well as by the principal men of Bagdad, who had kept a private correspondence with Thaher, was obliged to retire to the old town on the west bank of the Tigris. He did not, however, take this step, before the inhabitants of the new town had formally deposed him, and proclaimed his brother Al Mamun caliph. Thaher, receiving advice of this, caused the old town to be immediately invested, planted his engines against it, and at last starved it to surrender. Al Amin being thus reduced to the necessity of putting himself into the hands of one of the generals, chose to implore the protection of Harthema, whom he judged to be of a more humane disposition than Thaher. Having obtained this, he embarked in a small vessel in order to arrive at that part of the camp where Harthema was posted; but Thaher being informed of his design, which, if put in execution, he thought would eclipse the glory he had acquired, laid an ambush for him, which he had not the good fortune to escape. Upon his arrival in the neighbourhood of Harthema's tent, Thaher's soldiers

25 Al Amin murdered.

rushed upon him, drowned all his attendants, and put himself in prison. Here he was soon after massacred by Thaher's servants, who carried his head in triumph to their master, by whose order it was afterwards exposed to public view in the streets of Bagdad. Thaher afterwards sent to Al Mamun in Khorasan, together with the ring or seal of the caliphate, the sceptre and the imperial robe. At the sight of these, Al Mamun fell down on his knees, and returned thanks to God for his success; making the courier who brought them a present of a million of dirhems, in value about 100,000l. sterling.

26 Succeeded by Al Mamun.

The same day that Al Amin was assassinated, his brother Al Mamun was proclaimed caliph at Bagdad. He had not long been seated on the throne when he

27 Khorasan dismembered from the empire.

was alarmed by rebellions breaking out in different parts of the empire. These, however, were at last happily extinguished; after which, Thaher Ebn Hosein had the government of Khorasan conferred upon him and his descendants with almost absolute and unlimited power. This happened in the 205th year of the Hegira, from which time we may date the dismemberment of that province from the empire of the caliphs.

During the reign of this caliph nothing remarkable happened; only the African Moslems invaded the

28 Death of Al Mamun.

island of Sicily, where they made themselves masters of several places. He died of a surfeit in the 218th year of the Hegira, having reigned 20, and lived 48 or 49 years.

On the death of Al Mamun, his brother Al Motasem, by some of the oriental historians surnamed *Billah*, was saluted caliph. He succeeded by virtue of Al Mamun's express nomination of him, to the exclusion of his own son Al Abbas and his other brother Al Kasem, who had been appointed by Harun Al Raschid. In the beginning of his reign he was obliged to employ the whole forces of his empire against one Babec, who had been for a considerable time in rebellion in Persia and Persian Irak. This Babec first appeared in the year of the Hegira 201, when he began to take upon him the title of a *prophet*. What his particular doctrine was, is now unknown; but his religion is said to have differed from all others then known in Asia. He gained a great number of proselytes in Aderbijan and the Persian Irak, where he soon grew powerful enough to wage war with the caliph Al Mamun, whose troops he often beat, so that he was now become extremely formidable. The general sent by Al Motasem to reduce him was Haider Ebn Kaus, surnamed *Afshin*, a Turk by nation, who had been brought a slave to the caliph's court, and having been employed in disciplining the Turkish militia there, had acquired the reputation of a great captain. By him Babec was defeated with prodigious slaughter, no fewer than 60,000 men being killed in the first engagement. The next year, being the 220th of the Hegira, he received a still greater overthrow, losing 100,000 men either killed or taken prisoners. By this defeat he was obliged to retire into the Gordyæan mountains; where he fortified himself in such a manner, that Afshin found it impossible to reduce him till the year of the Hegira 222. This commander having reduced with invincible patience all Babec's castles one after another, the impostor was obliged to shut himself up in a strong fortress called *Cashabad*, which was now his last resource. Here he defended himself with great bravery for several months; but at last finding he should be obliged to surrender, he made his escape into a neighbouring wood, from whence he soon after came to Afshin, upon that general's promising him pardon. But Afshin no sooner had him in his power, than he first caused his hands and feet, and afterwards his head, to be cut off. Babec had supported himself against the power of the caliphs for upwards of 20 years, during which time he had cruelly massacred 250,000 people; it being his custom to spare neither man, woman, nor child, of the Mahometans or their allies. Amongst the prisoners taken at Cashabad there was one Nud, who had been one of Babec's executioners, and who owned that in obedience to his master's commands he had destroyed 20,000 Moslems with his own hands; to which he added, that vast numbers had also been executed by his companions, but that of these he could give no precise account.

29 War between the new caliph Al Motasem and Babec.

30 Babec defeated.

31 Taken prisoner and put to death.

32 He destroyed vast numbers of Moslems.

In the 223d year of the Hegira, the Greek emperor Theophilus invaded the caliph's territories, where he behaved with the greatest cruelty, and by destroying Sozopetra the place of Al Motasem's nativity, notwithstanding his earnest entreaties to the contrary, occasioned the terrible destruction of *Amorium* mentioned under that article. The rest of this caliph's reign is remarkable for nothing but the execution of Afshin, who was accused of holding correspondence with the caliph's enemies. After his death a great number of idols were found in his house, which were immediately burned, as also several books said to contain impious and detestable opinions.

33 Death of Al Motasem.

In the 227th year of the Hegira died the caliph Al Motasem, in the 48th or 49th year of his age. He reigned eight years eight months and eight days, was born

Digitized by Google

Bagdad.

born in the eighth month of the year, fought eight battles, had 8000 slaves, and had 8,000,000 dinars and 80,000 dirhems in his treasury at his death; whence the oriental historians gave him the name of *Al Mothaman*, or the *Octonary*. He is said to have been so robust, that he once carried a burden of 1000 pounds weight several paces. As the people of Bagdad disturbed him with frequent revolts and commotions, he took the resolution to abandon that city, and build another for his own residence. The new city he built was first called *Samarra*, and afterwards *Sarra Manray*, and stood in the Arabian Irak. He was attached to the opinion of the Motazalites, who maintain the creation of the Koran; and both he and his predecessor cruelly persecuted those who believed it to be eternal.

34 He built the city of Sarra Manray.

35 His successors Al Wathek and Al Motawakkel.

Al Motasem was succeeded by Al Wathek Bilah, who, the following year, being the 228th of the Hegira, invaded and conquered Sicily. Nothing remarkable happened during the rest of his reign; he died in the 232d year of the Hegira, and was succeeded by his brother Al Motawakkel.

36 Monstrous cruelty of Al Motawakkel.

The new caliph began his reign with an act of the greatest cruelty. The late caliph's vizir having treated Al Motawakkel ill in his brother's lifetime, and opposed his election to the caliphate, was on that account now sent to prison. Here the caliph ordered him to be kept awake for several days and nights together: after this, being suffered to fall asleep, he slept a whole day and night; and after he awoke was thrown into an iron furnace lined with spikes or nails heated red hot, where he was miserably burnt to death. During this reign nothing remarkable happened, except wars with the Greeks, which were carried on with various success. In the year 859 too, being the 245th of the Hegira, violent earthquakes happened in many provinces of the Moslem dominions; and the springs at Mecca failed to such a degree, that the celebrated well Zemzem was almost dried up, and the water sold for 100 dirhems a bottle.

37 He is assassinated.

In the 247th year of the Hegira, the caliph was assassinated at the instance of his son Al Montaser; who succeeded him, and died in six months after. He was succeeded by Al Mostain, who in the year of the Hegira 252 was forced to abdicate the throne by his brother Al Motazz, who afterwards caused him to be privately murdered. He did not long enjoy the dignity of which he had so iniquitously possessed himself; being deposed by the Turkish militia (who now began to set up and depose caliphs as they pleased) in the 255th year of the Hegira. After his deposition he was sent under an escort from Sarra Manray to Bagdad, where he died of thirst or hunger, after a reign of four years and about seven months.

38 Hard fate of Al Motazz, a succeeding caliph.

The fate of this caliph was peculiarly hard: the Turkish troops had mutinied for their pay; and Al Motazz, not having money to satisfy their demands, applied to his mother named *Kabiha* for 50,000 dinars. This she refused, telling him that she had no money at all, although it afterwards appeared that she was possessed of immense treasures. After his deposition, however, she was obliged to discover them, and even deposite them in the hands of the new caliph Al Mokhtadi. They consisted of 1,000,000 dinars, a bushel of emeralds, and another of pearls, and three pounds and three quarters of rubies of the colour of fire.

Al Mokhtadi, the new caliph, was the son of one of Al Wathek's concubines named *Korb*, or *Karb*, who is by some supposed to have been a Christian. The beginning of his reign is remarkable for the irruption of the Zenjians, a people of Nubia, Ethiopia, and the country of the Caffres, into Arabia, where they penetrated into the neighbourhood of Basra and Cufa. The chief of this gang of robbers, who, according to some of the Arab historians, differed but little from wild beasts, was Ali Ebn Mohammed Ebn Abdalrahman, who falsely gave himself out to be of the family of Ali Ebn Abu Taleb. This made such an impression upon the Shiites in those parts, that they flocked to him in great numbers; which enabled him to seize upon the cities of Basra and Ramla, and even to pass the Tigris at the head of a formidable army. He then took the title of *Prince of the Zenjians*, in order to ingratiate himself with those barbarians, of whom his army was principally composed.

Bagdad. 39 Irruption of the Zenjians in the reign of Al Mokhtadi.

In the 256th year of the Heigra, Al Mokhtadi was barbarously murdered by the Turks who had raised him to the throne, and was succeeded by Al Montamed the son of Al Motawakkel. This year the prince of the Zenjians, Ali, or as he is also called *Al Habib*, made incursions to the very gates of Bagdad, doing prodigious mischief wherever he passed. The caliph therefore sent against him one Jolan with a considerable army; he was overthrown, however, with very great slaughter by the Zenjian, who made himself master of 24 of the caliph's largest ships in the bay of Basra, put a vast number of the inhabitants of Obolla to the sword, and seized upon the town. Not content with this, he set fire to it, and soon reduced it to ashes, the houses mostly consisting of the wood of a certain plane tree called by the Arabians *Saj*. From thence he marched to Ahadan, which likewise surrendered to him. Here he found immense treasure, which he enabled him to possess himself of the whole district of Ahwaz. In short, his forces being now increased to 80,000 strong, most of the adjacent territories, and even the caliph's court itself, were struck with terror.

40 Al Habib's success.

In the 257th year of the Hegira. Al Habib continued victorious, defeated several armies sent against him by the caliph, reduced the city of Basra, and put 20,000 of the inhabitants to the sword. The following year, the caliph, supported by his brother Al Mowaffek, had formed a design of circumscribing the power of the Turkish soldiery, who had for some time given law to the caliphs themselves. But this year the Zenjians made so rapid a progress in Persia, Arabia, and Irak, that he was obliged to suspend the execution of his design, and even to employ the Turkish troops to assist his brother Al Mowaffek in opposing these robbers. The first of the caliph's generals who encountered Al Habib this year, was defeated in several engagements, and had his army at last entirely destroyed. After this Al Mowaffek and another general named *Mosleh*, advanced against him. In the first engagement Mosleh being killed by an arrow, the caliph's troops retired; but Al Mowaffek put them afterwards in such a posture of defence, that the enemy durst not renew the attack. Several other sharp encounters happened this year, in which neither party gained great advantage; but, at last, some contagious distempers breaking out

Digitized by Google

Bagdad. out in Al Mowaffek's army, he was obliged to conclude a truce, and retire to Waset to refresh his troops.

In the 259th year of the Hegira, commencing Nov. 7. 872, the war between the caliph and Al Habib still continued. Al Mowaffek, upon his arrival at Bagdad, sent Mohammed surnamed *Al Mowalled* with a powerful army to act against the Zenjians; but he could not hinder them from ravaging the province of Ahwaz, cutting off about 50,000 of the caliph's subjects, and dismantling the city of Ahwaz; and notwithstanding the utmost efforts of all the caliph's generals, no considerable advantages could be gained either this or the following year.

41 Rebellion in Fars, Ahwaz, and Basra.

In the 261st year of the Hegira, beginning October 16. 874, Mohammed Ebn Wasel, who had killed the caliph's governor of Fars, and afterwards made himself master of that province, had several engagements with Al Habib, but with what success is not known. The caliph, having been apprised of the state of affairs on that side, annexed the government of Fars, Ahwaz, and Basra, to the prefecture he had given to Musa Ebn Baga, whom he looked upon as one of the best generals he had. Musa, soon after his nomination to that post, sent Abdalrahman Ebn Mosleh as his deputy to Ahwaz, giving him as a colleague and assistant one Tisam, a Turk. Mohammed Ebn Wasel, however, refusing to obey the orders of Abdalrahman and Tisam, a fierce conflict ensued, in which the latter was defeated, and Abdalrahman taken prisoner. After this victory, Mohammed advanced against Musa Ebn Baga himself; but that general finding he could not take possession of his new government without a vast effusion of blood, recalled the deputies from their provinces, and made the best of his way to Sarra Manray. After this, Yakub Ebn Al Leit, having taken Khorasan from the descendants of Thaher, attacked and defeated Mohammed Ebn Wasel, seizing on his palace, where he found a sum of money amounting to 40,000,000 dirhems.

42 Rebels defeated, but cannot be reduced.

The next year Yakub Ebn Leit being grown formidable by the acquisition of Ahwaz and a considerable portion of Fars, or at least the Persian Irak, declared war against the caliph. Against him Al Motamed despatched Al Mowaffek; who having defeated him with prodigious slaughter, plundered his camp, and pursued him into Khorasan; where meeting with no opposition, he entered Nisabur, and released Mahomet the Thaherian, whom Yakub had detained in prison three years. As for Yakub himself, he made his escape with great difficulty, though he and his family continued several years in possession of many of the conquests he had made. This war with Yakub proved a seasonable diversion in favour of Al Habib, who this year defeated all the forces sent against him, and ravaged the district of Waset.

43 Al Habib still victorious.

The following year, being the 263d of the Hegira, beginning September 24. 876, the caliph's forces, under the command of Ahmed Ebn Lebuna, gained two considerable advantages over Al Habib; but being at last drawn into an ambuscade, they were almost totally destroyed, their general himself making his escape with the utmost difficulty; nor were the caliph's forces able, during the course of the next year, to make the least impression upon these rebels.

In the 265th year of the Hegira, beginning September 3. 878, Ahmed Ebn Tolun rebelled against the caliph, and set up for himself in Egypt. Having assembled a considerable force, he marched to Antioch, and besieged Sima the governor of Aleppo and all the provinces known among the Arabs by the name of *Al Awasem*, in that city. As the besieged found that he was resolved to carry the place by assault, they thought fit, after a short defence, to submit, and to put Sima into his hands. Ahmed no sooner had that officer in his power, than he caused him to be beheaded; after which he advanced to Aleppo, the gates of which were immediately opened unto him. Soon after, he reduced Damascus, Hems, Hamath, Kinnisrin, and Al Rakka, situated upon the eastern bank of the Euphrates. This rebellion so exasperated Al Motamed, that he caused Ahmed to be publicly cursed in all the mosques belonging to Bagdad and Irak; and Ahmed on his part ordered the same malediction to be thundered out against the caliph in all the mosques within his jurisdiction. This year also a detachment of Al Habib's troops penetrated into Irak, and made themselves masters of four of the caliph's ships laden with corn; then they advanced to Al Nomanic, laid the greatest part of it in ashes, and carried off with them several of the inhabitants prisoners. After this they possessed themselves of Jarjaraya, where they found many prisoners more, and destroyed all the adjacent territory with fire and sword.

Bagdad. 44 Rebellion in Egypt which cannot be suppressed.

This year there were four independent powers in the Moslem dominions, besides the house of Ommiyah in Spain, viz. the African Moslems, or Aglabites, who had for a long time acted independently; Ahmed in Syria and Egypt; Al Leit in Khorasan; and Al Habib in Arabia and Irak.

45 Four independent powers in the caliph's nominal dominions.

In the 266th year of the Hegira, beginning August 23. 879, Al Habib reduced Ramhormoz, burnt the stately mosque there to the ground, put a vast number of the inhabitants to the sword, and carried away great numbers, as well as a vast quantity of spoil.—This was his last successful campaign; for the year following, Al Mowaffek, attended by his son Abul Abbas, having attacked him with a body of 10,000 horse and a few infantry, notwithstanding the vast disparity of numbers (Al Habib's army amounting to 100,000 men), defeated him in several battles, recovered most of the towns he had taken, together with an immense quantity of spoil, and released 5000 women that had been thrown into prison by these barbarians. After these victories, Al Mowaffek took post before the city of Al Mabiya', built by Al Habib, and the place of his residence; burnt all the ships in the harbour; thoroughly pillaged the town; and then entirely dismantled it. After the reduction of this place, in which he found immense treasures, Al Mowaffek pursued the flying Zenjians, put several of their chiefs to the sword, and advanced to Al Mokhtara, a city built by Al Habib. As the place was strongly fortified, and Al Habib was posted in his neighbourhood, with an army, according to Abu Jaafer Al Tabari, of 300,000 men, Al Mowaffek perceived that the reduction of it would be a matter of some difficulty. He therefore built a fortress opposite to it, where he erected a mosque, and coined money. The new city, from its founder, was called by the Arabs *Al Mowaffekkia*, and soon rendered considerable by the settlement of several wealthy merchants there. The city of Al Mokhtara being reduced to great straits, was at last taken by storm, and given up to be

46 Al Habib's bad success and death.

Digitized by Google

Bagdad. be plundered by the caliph's troops; after which Al Mowaffek defeated the numerous forces of Al Habib in such a manner, that they could no more be rallied during that campaign.

The following year, being the 268th of the Hegira, Al Mowaffek penetrated again into Al Mabiya', and demolished the fortifications which had been raised since its former reduction, though the rebels disputed every inch of ground. Next year he again attacked Al Habib with great bravery; and would have entirely defeated him, had he not been wounded in the breast with an arrow, which obliged him to sound a retreat. However, as soon as he was cured of his wound, Al Mowaffek advanced a third time to Al Mabiya', made himself master of that metropolis, threw down the walls that had been raised, put many of the inhabitants to the sword, and carried a vast number of them into captivity.

The 270th year of the Hegira, commencing July 11. 883, proved fatal to the rebel Al Habib. Al Mowaffek made himself a fourth time master of Al Mabiya', burnt Al Habib's palace, seized upon his family, and sent them to Sarra Manray. As for the usurper himself, he had the good fortune to escape at this time; but being closely pursued by Al Mowaffek into the province of Ahwaz, where the shattered remains of his forces were entirely defeated, he at last fell into the hands of the victor, who ordered his head to be cut off, and carried through a great part of that region which he had so long disturbed. By this complete victory Al Mowaffek obtained the title of *Al Nasir Lidmilbah*, that is, *the protector of Mahometanism*. This year also died Ahmed Ebn Tolun, who had seized upon Egypt and Syria, as we have already observed; and was succeeded by his son *Khamarawiyah*.

47 Success of the Sultan of Egypt. The next year, a bloody engagement happened between the caliph's forces commanded by Al Mowaffek's son, and those of Khamarawiyah, who had made an irruption into the caliph's territories. The battle was fought between Al Ramla and Damascus. In the beginning, Khamarawiyah found himself so hard pressed, that his men were obliged to give way; upon which, taking for granted that all was lost, he fled with great precipitation, even to the borders of Egypt; but, in the mean time, his troops being ignorant of the flight of their general, returned to the charge, and gained a complete victory. After this, Khamarawiyah, by his just and mild administration, so gained the affections of his subjects, that the caliph found it impossible to gain the least advantage over him. In the 276th year of the Hegira, he overthrew one of the caliph's generals named Abul Saj, at Al Bathnia near the city of Damascus; after which he advanced to Al Rakka on the Euphrates, and made himself master of that place. Having annexed several large provinces to his former dominions, and left some of his friends in whom he could confide to govern them, he then returned into Egypt, the principal part of his empire, which now extended from the Euphrates to the borders of Nubia and Ethiopia.

48 Al Mowaffek dies. The following year, being the 278th of the Hegira, was remarkable for the death of Al Mowaffek. He died of the elephantiasis or leprosy; and while in his lats illness, could not help observing, that of 100,000 men whom he commanded, there was not one so miserable as himself. This year is also remarkable for the first disturbances raised in the Moslem empire by the Karmatians. The origin of this sect is not certainly known; but the most common opinion is, that a poor fellow, by some called *Karmata*, came from Khuzestan to the villages near Cufa, and there pretended great sanctity and strictness of life, and that God had enjoined him to pray 50 times a-day; pretending also to invite people to the obedience of a certain imam of the family of Mahomet; and this way of life he continued till he had made a very great party, out of whom he chose twelve as his apostles to govern the rest, and to propagate his doctrines. He also assumed the title of *prince*, and obliged every one of his earlier followers to pay him a dinar a-year. But Al Haidam, the governor of that province, finding men neglected their work, and their husbandry in particular, to say those 50 prayers a-day, seized the fellow, and having put him in prison, swore that he should die. This being overheard by a girl belonging to the governor, she, out of compassion, took the key of the dungeon at night from under her master's head, released the man, and restored the key to its place while her master slept. The next morning the governor found his prisoner gone; and the accident being publicly known, raised great admiration; Karmata's adherents giving out that God had taken him into heaven. After this he appeared in another province, and declared to a great number of people he got about him, that it was not in the power of any person to do him hurt; notwithstanding which, his courage failing him, he retired into Syria, and was never heard of any more. After his disappearance, the sect continued and increased; his disciples pretending that their master had manifested himself to be a true prophet, and had left them a new law, wherein he had changed the ceremonies and form of prayer used by the Moslems, &c. From this year, 278, these sectaries gave almost continual disturbance to the caliphs and their subjects, committing great disorders in Chaldæa, Arabia, and Mesopotamia, and at length established a considerable principality.

49 Origin of the Karmatians.

In the 279th year of the Hegira died the caliph Al Motamed; and was succeeded by Al Motaded, son to Al Mowakeff. The first year of his reign, Al Motaded demanded in marriage the daughter of Khamarawiyah, sultan, or caliph, of Egypt; which was agreed to by him with the utmost joy, and their nuptials were solemnized with great pomp in the 282d year of the Hegira. He carried on a war with the Karmatians; but very unsuccessfully, his forces being defeated with great slaughter, and his general Al Abbas taken prisoner. This caliph also granted to Harun, son to Khamarawiyah, the perpetual prefecture of Awasam and Kinnisrin, which he annexed to that of Egypt and Syria, upon condition that he paid him an annual tribute of 45,000 dinars. He died in the year of the Hegira 289, and was succeeded by his son Al Moctasi. 50 Sultan of Egypt's daughter married to the caliph Al Motaded.

This caliph proved a warlike and successful prince. He gained several advantages over the Karmatians, but was not able to reduce them. The Turks, however, having invaded the province of Mawaralnahr, were defeated with great slaughter; after which Al Moctasi carried on a successful war against the Greeks, from whom he took Seleucia. After this he invaded Syria and 51 Egypt, &c. recovered by the caliph Al Moctasi.

Digitized by Google

Bagdad. and Egypt, which provinces he recovered from the house of Ahmed Ebn Tolun.

52 Distressed state of the caliphs after his death.

The reduction of Egypt happened in the 292d year of the Hegira, after which the war was renewed with success against the Greeks and Karmatians. The caliph died in the 295th year of the Hegira, after a reign of about six years and a half. He was the last of the caliphs who made any figure by their warlike exploits. His successors Al Moktader, Al Kaher, and Al Radi, were so distressed by the Karmatians and numberless usurpers who were every day starting up, that by the 325th year of the Hegira they had nothing left but the city of Bagdad. In the 324th year of the Hegira, commencing November 30. 935, the caliph Al Radi, finding himself distressed on all sides by usurpers, and having a vizir of no capacity, instituted a new office superior to that of vizir, which he entitled *Emir Al Omra*, or *Commandant of commandants*. This great officer was trusted with the management of all military affairs, and had the entire management of the finances in a much more absolute and unlimited manner than any of the caliphs vizirs ever had. Nay, he officiated for the caliph in the great mosque at Bagdad, and had his name mentioned in the public prayers throughout the kingdom. In short, the caliph was so much under the power of this officer, that he could not apply a single dinar to his own use without the leave of the Emir Al Omra. In the year 325, the Moslem empire, once so great and powerful, was shared among the following usurpers.

53 New office of Emir Al Omra instituted by Al Radi.

54 Division of the Moslem empire in the 325th year of the Hegira.

The cities of Waset, Basra, and Cufa, with the rest of the Arabian Irak, were considered as the property of the Emir Al Omra, though they had been in the beginning of the year seized upon by a rebel called *Al Baridi*, who could not be driven out of them.

The country of Fars, Farsestan, or *Persia* properly so called, was possessed by Amado'ddawla Ali Ebn Buiya, who resided in the city of Shiraz.

Part of the tract denominated *Al Jebal*, together with Persian Irak, which is the mountainous part of Persia, and the country of the ancient Parthians, obeyed Rucno'ddawla, the brother of Amado'ddawla, who resided at Ispahan. The other part of that country was possessed by Washmakin the Deylamite.

Diyar Rabia, Diyar Becr, Diyar Modar, and the city of Al Mawsel, or Mosul, acknowledged for their sovereigns a race of princes called *Hamdanites*.

Egypt and Syria no longer obeyed the caliphs, but Mahomet Ebn Taj, who had formerly been appointed governor of these provinces.

Africa and Spain had long been independent.

Sicily and Crete were governed by princes of their own.

The provinces of Khorasan and Mawaralnahr, were under the dominion of Al Nasr Ebn Ahmed, of the dynasty of the Sammarians.

The provinces of Tabrestan, Jorjan or Georgia, and Mazanderan, had kings of the first dynasty of the Deylamites.

The province of Kerman was occupied by Abu Ali Mahomet Ebn Eylia Al Sammani, who had made himself master of it a short time before. And,

Lastly, the provinces of Yamama and Bahrein, including the district of Hajr, were in the possession of Abu Thaher the Karmatian.

Thus the caliphs were deprived of all their dominions, and reduced to the rank of sovereign pontiffs; in which light, though they continued for some time to be regarded by the neighbouring princes, yet their power never arrived at any height. In this low state the caliphs continued till the year of the Hegira 656, commencing January 8. 1258. This year was rendered remarkable by the taking of Bagdad by Hulaku the Mogul or Tartar; who likewise abolished the caliphate, putting the reigning caliph Al Mostasem Bilah to a most cruel death. These diabolical conquerors, after they had taken the city, massacred, according to custom, a vast number of the inhabitants; and after they had plundered it, set it on fire. The spoil they took from thence was prodigiously great, Bagdad being then looked upon as the first city in the world.

55 Bagdad taken by the Tartars.

56 History of the city since that time.

Bagdad remained in the hands of the Tartars or Moguls to the year of the Hegira 795, of Christ 1392, when it was taken by Tamerlane from Sultan Ahmed Ebn Weis; who being incapable of making head against Tamerlane's numerous forces, found himself obliged to send all his baggage over the Tigris, and abandoned his capital to the conqueror. He was, however, hotly pursued by his enemy's detachments to the plain of Karbella, where several skirmishes happened, and a considerable number of men were lost on both sides. Notwithstanding this disaster, he found means to escape the fury of his pursuers, took refuge in the territories of the Greek emperor, and afterwards repossessed himself of the city of Bagdad. There he remained till the year of the Hegira 803, when the city was taken a second time by Tamerlane; who nevertheless restored it to him, and he continued sovereign of the place till driven from thence by Miram Shaw. Still, however, he found means to return; but in the 815th year of the Hegira was finally expelled by Kara Yusef the Turcoman. The descendants of Kara Yusef continued masters of Bagdad till the year of the Hegira 875, of Christ 1470, when they were driven out by Usun Cassun. The family of this prince continued till the year of the Hegira 914, of our Lord 1508, when Shah Ishmael, surnamed *Sufi* or *Sofi*, the first prince of the royal family reigning in Iran, or Persia, till the dethroning of the late Shah Hosein, made himself master of it. From that time to this Bagdad has continued to be a bone of contention between the Turks and Persians. It was taken by Soliman surnamed the *Magnificent*, and retaken by Shah Abbas the Great, king of Persia; but being at length besieged by Amruth or Morad IV. with a formidable army, it was finally obliged to surrender to him in the year 1638; since which time the Persians have never been able to make themselves masters of it for any length of time.

57 Its present state.

The city is large and populous; and the advantage of the Tigris is considerable, with regard to commerce. The climate is excessively hot, and in other respects far from being agreeable. The number of its inhabitants is probably from 60,000 to 90,000; but earlier writers carry it as high as 300,000; and Mr Eton in his Survey, states, that it had fallen even so low as 20,000 after the plague in 1773. The bashaw is continually extorting money from the poor inhabitants, and none suffer more than the unfortunate Jews and Christians, many of whom are put to the most cruel tortures in

order

Digitized by Google

Bagdad. order to force their property from them. This series of tyranny and oppression has almost entirely driven them out of the city; in consequence of which the trade must suffer very considerably, they being generally the principal merchants in the place. In the months of June, July, and August, the weather is so extremely hot, as to oblige the inhabitants to live for these months in subterraneous apartments, which are arched over, to admit the free circulation of the air. The houses are generally large, built of brick and cement, and are arched over. Many of the windows are made of elegant Venetian glass; the ceilings are mostly ornamented with a kind of chequered work, which has generally a noble appearance; most of the houses have a court-yard before them, in the middle of which is a little plantation of orange trees, &c. that has a very pleasing effect. The soil, which would produce not only every conveniency in life, but almost every luxury, is through the natural indolence of the Turks, and the many faults in the government of the country, in a great measure uncultivated and neglected. The revenues are computed at 125 lacks of piastres, or 1,562,500l. sterling: but a quarter part of this is not collected, owing to the slothfulness of the Turks, who suffer the Arabs to plunder them of the remainder. This in some measure accounts for the cruelties and extortions that are continually practised here. As the bashaw lives in all the splendour of a sovereign prince, and maintains a very large army, he could not be able to defray his expences, was he not to have recourse to oppression and injustice; and he, by his extensive power, acting almost independent of the Porte, only acknowledges it to bring in a balance from thence yearly in his favour.

The bazars or markets here are large and extensive; being covered over with arches built of masonry, and divided into different streets, filled with shops of all kinds of merchandise, to the number of 1200. Every thing an Asiatic can have occasion for may be had there, though a European has many wants which could not be supplied. Each house and shop pay an annual tribute to the bashaw, which produces a very considerable sum. Besides the revenue derived from this source, the bashaw exacts large sums under the pretext of their being necessary to keep the fortifications in repair, though very little is actually expended on such objects. Likewise clearing the river and mending the bridge become a charge greater than their income, and probably not the value of an English shilling is expended.— To support the expence of the seraglio, their clothes, caparisons of their horses, and every outward pomp, the amount is considerable.

On the north side of the town stands the citadel which commands the river; and consists of curtains and bastions, on which some very long cannon are mounted, with two mortars in each bastion, placed on no other beds than the ground, and in very bad condition. The carriages of the guns are likewise so unwieldy, and in such a shattered condition, that from their appearance they would not support one firing, but would be shaken in pieces. Their elevations were from 30 to 40 degrees, but they had no quoins to level them. There are, besides, a number of small towers, and loop-holes for musketry, placed at certain distances, all well encompassed by a ditch of 25 feet deep, which can be filled at any time by the waters of the Tigris. The citadel is so close to the houses, that it might be easily taken if possession was once gained of the town; but an attack made towards the land would not probably be successful, as sluices might with the greatest facility be cut into the ditch, and so overflow the country for miles round; but it is said an advantageous attack might be made from the water.

The city, which is fortified by lofty thick walls of brick covered with earth, and strengthened by great towers much resembling cavalier bastions, the whole being surrounded by a deep ditch, is in the form of an irregular square; but the walls in many places are broken down, occasioned by the disputes which happened on the death of Abdulla Bashaw a few years ago, when two competitors arose in Bagdad for the bashawic, who fought several times in the town and citadel, and laid great part of it in ruins. In the interim, the governor of Moussul and Nineveh being appointed bashaw by the Porte, came hither with a considerable army, and took possession of the sovereignty, vanquishing his two opponents. Opposite to the city, on the other side of the river, are very extensive suburbs, from whence shells might be thrown into the town, which would have a dreadful effect on a place so closely built. There is a communication between the city and suburbs by a bridge of boats; the only kind of bridge which that river will admit of, as it is broad and deep, and in its ordinary course very rapid. At certain seasons it swells to a prodigious height, and overflowing the country occasions many morasses on that side opposite to the city. Among these are several towns and villages, whose inhabitants are said to be the ancient Chaldeans: they are of a particular religion, which they pretend is that of Seth. The inhabitants of this city are composed chiefly of Persians, Armenians, Turks, Arabs, and Jews, which last act in the capacity of schroffs, or bankers, to the merchants. The Jews, notwithstanding the severe treatment they meet with from the government, are induced to live here from a reverence to the prophet Ezekiel, whose mausoleum they pretend is a day's journey from the city. Besides the Jews who reside here, there are many that come every year out of devotion to visit the prophet's tomb. There are also some European gentlemen, Venetians, and Frenchmen, with a small number of Romish priests generally. Two chapels are permitted for those of the Romish and Greek persuasions; at the former the priests officiate. In the city are several large beautiful mosques, but into which Christians are never suffered to enter if known to be such, for fear it should defile them. The Mahometan women are very richly dressed, wearing bracelets on their arms and jewels in their ears: the Arabian women have the partition between their nostrils bored, wherein they wear rings.

There are also a number of antique buildings. At the distance of about ten miles stand the ruins of an ancient tower called the *Tower of Nimrod.* Whether this tower was at first of a square or round form is now difficult to determine; though the former is most probable, because all the remaining bricks are placed square,

square, and not in the least circular. The bricks are all twelve inches square and four and a half thick. The cement is of mud or slime, mixed with broken reed, as we mix hair with mortar; which slime might either have been had from one of the great rivers, or taken out of one of the swamps in the plain, with which the country hereabout very much abounds. The height of the ruin is 126 feet; the diameter of the largest and middle part about 100 feet. It would appear to be solid to the centre; yet near the top there is a regular opening of an oval form. The circumference of that part of the tower which remains, and is above the rubbish, is about 300 feet; but probably could the foundation be come at, it would be found of far greater extent. The present Turks, Jews, and Arabians, are fond of believing this to be the identical ruin of the ancient tower of Babel, for which they assign a variety of reasons; but all so void of the appearance of truth, that to set about confuting them would be losing time in trifles. It appears to have been a beacon or watch-tower, to give notice of the approach of an enemy: or perhaps was used as an observatory to inspect the various motions of the heavenly bodies; which science was so much cultivated among the ancient inhabitants of this country, that even the Grecians, though desirous of being esteemed the inventors of all arts and sciences, could never deny the Babylonians the honour of having laid the foundation of astronomy.

BAGGAGE, in military affairs, denotes the clothes, tents, utensils of divers sorts, provisions, and other necessaries, belonging to the army.

Before a march, the baggage with the waggons is marshalled according to the rank which the several regiments bear in the army; being sometimes ordered to follow the respective columns of the army, sometimes to follow the artillery, and sometimes to form a column by themselves. The general's baggage marches first; and each waggon has a flag, showing the regiment to which it belongs.

Packing up the BAGGAGE, *vasa colligere*, was a term among the Romans, for preparing to go to war, or to be ready for an expedition.

The Romans distinguished two sorts of baggage; a *greater* and *less*. The lesser was carried by the soldier on his back, and called *sarcina;* consisting of the things most necessary to life, and which he could not do without. Hence *colligere sarcinas*, packing up the baggage, is used for decamping, *castra movere*. The greater and heavier was carried on horses and vehicles, and called *onera*. Hence *onera vehiculorum, sarcinæ hominum*. The baggage-horses were denominated *sagmentarii equi*.

The Roman soldiers in their marches were heavy loaden; insomuch, that they were called by way of jest *muli mariani*, and *ærumnæ*. They had four sorts of luggage, which they never went without, viz. corn or *buccellatum*, utensils, valli, and arms. Cicero observes, that they used to carry with them above half a month's provisions; and we have instances in Livy, where they carried provisions for a whole month. Their utensils comprehended those proper for gathering fuel, dressing their meat, and even for fortification or intrenchment; and what is more, a chain for binding captives. For arms, the foot carried a spear, shield, saw, basket, rutrum, hatchet, lorum, falx, &c. Also stakes or pales, *valli*, for the sudden fortifying a camp; sometimes seven or even twelve of these pales were carried by each man, though generally, as Polybius tells us, only three or four. On Trajan's column we see soldiers represented with this fardle of corn, utensils, pales, &c. gathered into a bundle and laid on their shoulders. Thus inured to labour, they grew strong, and able to undergo any fatigue in battle; the greatest heat of which never tired them, or put them out of breath. In aftertimes, when discipline grew slack, this luggage was thrown on carriages and porters shoulders.

The Macedonians were not less inured to hardship than the Romans; when Philip first formed an army, he forbade all use of carriages; yet, with all their load, they would march, in a summer's day, 20 miles in military rank.

BAGLANA, or BUGLANA, a province of the kingdom of Dekkan in Hindostan. It is bounded on the north and east by Guzzerat and Ballagat; and on the south and west by that part of Visiapour called *Konkan*, belonging to the Mahrattas. It ends in a point at the sea coast between Daman and Balsora, and is the least province in the kingdom. The Portuguese territories begin in this province at the port Daman, 21 leagues south of Surat; and run along the coast by Bassaim, Bombay, and Chawl, to Dabul, almost 50 leagues to the north of Goa.

BAGLIVI, GEORGE, a most illustrious physician of Italy, was a native of Apulia, and born about the year 1668. He studied at Padua, where he became doctor; and then went to Rome, where he was chosen professor of anatomy. He was a man of most uncommon force of understanding, of which he gave ample proofs in many curious and accurate productions, philosophical as well as medicinal. He died at Rome in 1706, in the flower of his age, and when he was no more than 38. A collection of his works was printed first in 1710, quarto; and has since been reprinted, in the same size, at various places. His *Praxis Medica*, and *De Fibra Matricis*, are the principal pieces. He wrote a Dissertation upon the Anatomy, Bite, and Effects, of the Tarantula, which is the production of his country; and gave a particular account of the earthquake at Rome and the adjacent cities in 1703. His works are all in Latin.

BAGNAGAR, a town of Asia, in Hindostan, better known by the name of Hyderabad. It is situated on the south bank of the river Musa, six miles from the strong fortress of Golconda. It is a fine and populous city, about seven miles in circumference, and is surrounded by a wall as a security against sudden incursions. It is chiefly remarkable for a magnificent reservoir of water, surrounded with a colonnade supported by arches. E. Long. 78. 20. N. Lat. 17. 10.

BAGNARA, a sea-port town of Italy in the kingdom of Naples, in the farther Calabria, with the title of a duchy. E. Long. 16. 8. N. Lat. 38. 15.

BAGNAREA, a town of Italy in St Peter's patrimony, and in the territory of Orvieta, with a bishop's see. E. Long. 12. 10. N. Lat. 42. 36.

BAGNERES, a town of France in Gascony, and

Digitized by Google

in the county of Bigorre, now the department of the Upper Pyrenees, so called from its mineral waters, which are much resorted to. It is seated on the river Adour, in E. Long. 0. 12. N. Lat. 43.3.

BAGNIALACK, a large town of Turkey in Europe, in the province of Bosnia. E. Long. 18. 10. N. Lat. 44. 0.

BAGNIO, an Italian word signifying *a bath*. We use it for a house with conveniences for bathing, cupping, sweating, and otherwise cleansing the body; and sometimes for worse purposes. In Turkey it is become a general name for the prisons where the slaves are enclosed, it being usual in these prisons to have baths.

BAGNOLAS, a town of Lower Languedoc, now the department of Gard in France, containing 4800 inhabitants. It has a handsome square, and two fountains which rise in the middle of the town; the waters of which, being received in a bason, are conveyed by a canal out of town, and from thence to the lands about it. E. Long. 4. 43. N. Lat. 44. 10.

BAGNOLIANS, or BAGNOLANSES, in church history, a sect of heretics, who in reality were Manichees, though they somewhat disguised their errors. They rejected the Old Testament and part of the New; held the world to be eternal: and affirmed that God did not create the soul when he infused it into the body.

BAGOI, among the ancient Persians, were the same with those called by the Latins *spadones*, viz. a species of eunuchs, in whom the canal of the penis was so contorted by a tight vinculum, that they could not emit the semen.

BAG-PIPE, a musical instrument, of the wind kind, chiefly used in Scotland and Ireland. The peculiarity of the bag-pipe, and from which it takes its name, is, that the air which blows it is collected into a leathern bag, from whence it is pressed out by the arm into the pipes. These pipes consist of a bass, and tenor or rather treble; and are different according to the species of the pipe. The bass part is called the *drone*, and the tenor or treble part the *chanter*. In all the species, the bass never varies from its uniform note, and therefore very deservedly gets the name of *drone;* and the compass of the chanter is likewise very limited. There is a considerable difference between the Highland and Lowland bag-pipe of Scotland; the former being blown with the mouth, and the latter with a small bellows: though this difference is not essential, every species of bag-pipes being capable, by a proper construction of the reeds, of producing music either with the mouth or bellows. The following are the species of bag-pipes most commonly known in this country.

1. The *Irish Pipe*. This is the softest, and in some respects the most melodious of any, so that music-books have been published with directions how to play on it. The chanter, like that of all the rest, has eight holes like the English flute, and is played on by opening and shutting the holes as occasion requires; the bass consists of two short drones and a long one. The lowest note of the chanter is D on the German flute, being the open note on the counter-string of a violin; the small drone (one of them commonly being stopped up) is tuned in unison with the note above this, and the large one to an octave below; so that a great length is required in order to produce such a low note, on which account the drone hath sometimes two or three turns. The instrument is tuned by lengthening or shortening the drone till it sounds the note desired.

2. The *Highland Bag-Pipe*. This consists of a chanter and two short drones, which sound in unison the lowest note of the chanter except one. This is exceedingly loud, and almost deafening if played in a room; and is therefore mostly used in the field, for marches, &c. It requires a prodigious blast to sound it; so that those unaccustomed to it cannot imagine how Highland pipers can continue to play for hours together, as they are often known to do. For the same reason, those who use the instrument are obliged either to stand on their feet or walk when they play. This instrument hath but nine notes; its scale, however, hath not yet been reduced to a regular standard by comparing it with that of other instruments, so that we can say nothing about its compass. Those who are best acquainted with it, however, affirm that it plays only the natural notes, without being capable of variation by flats or sharps.

3. The *Scots Lowland Pipe*. This is likewise a very loud instrument, though less so than the former. It is blown with bellows, and hath a bass like the Irish pipe. This species is different from all the rest, as it cannot play the natural notes, but hath F and C sharp. The lowest note of a good bag-pipe of this kind is unison with C sharp on the tenor of a violin tuned concert-pitch; and, as it hath but nine notes, the highest is D in alt. From this peculiar construction, the Highland and Lowland bag-pipes play two species of music essentially different from one another, as each of them also is from every other species of music in the world. Hence these two species of bag-pipes deserve notice as curiosities; for the music which they play is accompanied with such peculiar ornaments, or what are intended as such, as neither violin, or even organ, can imitate, but in a very imperfect manner.

This kind of bag-pipe was formerly very much used in Scotland at weddings and other festivals; being indeed extremely well calculated for playing that peculiar species of Scots music called *reels*. It has been often a matter of surprise how this was possible, as the instrument has only a compass of nine or ten notes at the utmost, and which cannot be varied as in other instruments. In this repect, however, it has a very great compass, and will play an inconceivable variety of tunes. As its notes are naturally so high, there is scarce any one tune but what is naturally transposed by it, so that what would be a flat note on the key proper for the violin, may be a sharp one on the bag-pipe; and though the latter cannot play any flat note, it may nevertheless in this manner play tunes which on other instruments would be flat, to as great perfection as these instruments themselves.

4. The *Small Pipe*. This is remarkable for its smallness, the chanter not exceeding eight inches in length; for which reason, the holes are so near each other, that it is with difficulty they can be closed. This hath only eight notes, the lower end of the chanter being commonly stopped. The reason of this is, to prevent the slurring of all the notes, which is unavoidable in the other

Digitized by Google

Bag-pipe. other species; so that in the hands of a bad player they become the most shocking and unintelligible instruments imaginable: but this, by having the lower hole closed, and also by the peculiar way in which the notes are expressed, plays all its tunes in the way called by the Italians *staccato*, and cannot slur at all. It hath no species of music peculiar to itself; and can play nothing which cannot be much better done upon other instruments; though it is surprising what volubility some performers on this instrument will display, and how much they will overcome the natural disadvantages of it. Some of this species, instead of having drones like the other, have their bass parts consisting of a winding cavity in a kind of short case, and are tuned by opening these to a certain degree by means of sliding covers; from which contrivance they are called *shuttle-pipes*. Besides these there are a variety of others, called *Italian*, *German*, *Organ*, &c. bag-pipes, which have nothing different in their construction from those above described, nor any good quality to recommend them.

As to the origin of bag-pipe music, some are of opinion that it is to be derived from the Danes; but Mr Pennant thinks differently, and gives the following reasons for deriving it from Italy.

Voyage to the Hebrides, p. 30.

"Neither of these instruments (the Highland and Lowland bag-pipes above described) were the invention of the Danes, or, as is commonly supposed, of any of the northern nations; for their ancient writers prove them to have been animated by the *clangor tubarum*. Notwithstanding they have had their sœck pipe long amongst them, as their old songs prove, yet we cannot allow them the honour of inventing this melodious instrument, but must assert, that they borrowed it from the invaded Caledonians. We must still go farther, and deprive even that ancient race of the credit; and derive its origin from the mild climate of Italy, perhaps from Greece.

"There is now in Rome a most beautiful bas relievo, a Grecian sculpture of the highest antiquity, of a bag-piper playing on his instrument, exactly like a modern Highlander. The Greeks had their Ασκαυλης, or instrument composed of a pipe and blown-up skin: the Romans in all probability borrowed it from them, and introduced it among their swains, who still use it under the names of *piva* and *cornu-musa*.

"That master of music, Nero, used one; and had not the empire been so suddenly deprived of that great artist, he would (as he graciously declared his intention) have treated the people with a concert, and among other curious instruments, would have introduced the *utricularius* or bag-pipe. Nero perished; but the figure of the instrument is preserved on one of his coins, but highly improved by that great master: it has the bag and two of the vulgar pipes; but was blown with a bellows like an organ, and had on one side a row of nine unequal pipes, resembling the syrinx of the god Pan. The bag-pipe, in the unimproved state, is also represented in an ancient sculpture; and appears to have had two long pipes or drones, and a single short pipe for the fingers. Tradition says, that the kind played on by the mouth was introduced by the Danes; as theirs was wind-music, we will admit that they might have made improvement, but more we cannot allow: they were skilled in the use of the trumpet; the Highlanders in the piobb, or bag-pipe.

Non tuba in usu illis, conjuncta at tibia in utrem
Dat belli signum, et martem vocat horrida in arma."*

* *Melvini Topogr. Scot.*

The bag-pipe appears to have been an instrument of great antiquity in Ireland, though it is uncertain whence they derived it. Mr Pennant, by means of an antique found at Richborough in Kent, has determined that the bag-pipe was introduced at a very early period into Britain; whence it is probable that both Irish and Danes might borrow the instrument from the Caledonians with whom they had such frequent intercourse. Aristides Quintilianus informs us, that it prevailed in the Highlands in very early ages; and indeed the genius of the people seems to render the opinion highly probable. The attachment of that people to their music called *pibrachs* is almost incredible, and on some occasions is said to have produced effects little less marvellous than those ascribed to the ancient music. At the battle of Quebec in 1760, while the British troops were retreating in great disorder, the general complained to a field officer in Frazer's regiment of the bad behaviour of his corps. "Sir (said he with some warmth), you did very wrong in forbidding the pipers to play this morning: nothing encourages the Highlanders so much in the day of action. Nay, even now they would be of use."—"Let them blow like the devil, then (replies the general), if it will bring back the men." The pipers were then ordered to play a favourite martial air; and the Highlanders, the moment they heard the music, returned and formed with alacrity in the rear. In the late war in India, Sir Eyre Coote, aware of the attachment of the Highlanders to their favourite instrument, gave them 50l. to buy a pair of bag-pipes after the battle of Porto Nuovo.

Formerly there was a kind of college in the island of Skye, where the Highland bag-pipe was taught; the teachers making use of pins stuck into the ground instead of musical notes. This college, however, has been for some time entirely dissolved, and the use of the Highland pipe become much less general than before. At last a society of gentlemen, thinking it perhaps impolitic to allow the ancient martial music of the country to decline, resolved to revive it by giving an annual prize to the best performers on the instrument. These competitions were first held at Falkirk, but for a good number of years at Edinburgh; where the only surviving member of the ancient college of Skye is now *professor* of bag-pipe music.

The Lowland pipe, as has been already observed, is an instrument essentially different from the Highland pipe; it was reformed, and the music improved, by George Mackie, who is said to have attended the college of Skye seven years. He had before been the best performer on that instrument in that part of the country where he lived: but, while attending the college at Skye, he adapted the graces of the Highland music to the Lowland pipe. Upon his return, he was heard with astonishment and admiration; but unluckily, not being able to commit his improvements to writing, and indeed the nature of the instrument scarcely admitting of it, the knowledge of this kind of music hath continued to decay ever since, and will probably soon wear out altogether. What contributes much to this is, that bag-pipers, not content with the natural nine notes, which their instrument can play easily, force

Digitized by Google

force it to play tunes requiring higher notes, which disorders the whole instrument in such a manner as to produce the most horrid discords; and this practice brings, though undeservedly, the instrument itself into contempt.

BAGUETTE, in *Architecture*, a small round moulding, less than an astragal, and so called from the resemblance it bears to a ring.

BAHAMA, or LUCAYA, ISLANDS, are the eastermost of the Antilles, lying in the Atlantic ocean. They are situated to the south of Carolina, between 22 and 27 degrees N. Lat. and 73 and 81 degrees W. Long. They extend along the coast of Florida quite down to the isle of Cuba, and are said to be 500 in number, some of them only bare rocks; but twelve of them are large, fertile, and in nothing different from the soil of Carolina: only a few are inhabited. Providence, which is 200 miles east of the Floridas, is the seat of government; though some others are larger and more fertile, on which the English have plantations. Between them and the continent of Florida is the gulf of Bahama or Florida, through which the Spanish galeons sail in their passage to Europe.

These islands are the first fruits of Columbus's discoveries; but they were not known to the English till 1667, when Captain Seyle, being driven among them in his passage to Carolina, gave his name to one of them; and being a second time driven upon it, gave it the name of *Providence*. The English, observing the advantageous situation of these islands for being a check on the French and Spaniards, attempted to settle them in the reign of Charles II. Some unlucky accidents prevented this settlement from being of any advantage; and the isle of Providence became a harbour for the bucaneers or pirates, who for a long time infested the American navigation. This obliged the government in 1718 to send out Captain Woodes Rogers with a fleet to dislodge the pirates, and for making a settlement. This the captain effected; a fort was erected, and an independent company was stationed in the island. Ever since this last settlement these islands have been improving, though they advance but slowly. In 1773 there were 2052 white inhabitants, and 2241 blacks; but in 1803 the whole population was 14,318, of whom 11,395 were persons of colour and blacks. The Spaniards and Americans captured these islands during the last war; but they were retaken by a detachment from St Augustine, April 7. 1783. Cotton is now successfully cultivated; sugar does not succeed so well; but coffee, with oranges, lemons, and most of the tropical fruits, are raised in considerable quantities. Cattle and sheep thrive, and salt is procured in abundance from salt ponds.

BAHAR, or BARRE, in *Commerce*, weights used in several places in the East Indies.

There are two of these weights; one the great bahar, with which they weigh pepper, cloves, nutmegs, ginger, &c. and contains 550 pounds of Portugal, or about 524 lb. 9 oz. avoirdupois weight. With the little bahar, they weigh quicksilver, vermilion, ivory, silk, &c. It contains about 437 lb. 9 oz. avoirdupois weight.

BAHAREN, an island in the Persian gulf, situated in E. Long. 50. 0. N. Lat. 26. 0. This island is chiefly remarkable for its pearl-fishery, and has often changed its masters. It fell with Ormus under the dominion of the Portuguese, was again restored to Persia by Thamas Kouli Khan; and after his death the confusion into which his empire was thrown, gave an opportunity to an enterprising and ambitious Arab of taking possession of the island, where he still maintains his authority. Baharen was famous for its pearl-fishery even at the time when pearls were found at Ormus, Karek, Kashy, and other places in the Persian gulf: but it is now become of much greater consequence; all the other banks having been exhausted, while this has suffered no sensible diminution. The time of fishing begins in April, and ends in October. It is confined to a tract four or five leagues in breadth. The pearls taken at Baharen, though not so white as those of Ceylon or Japan, are much larger than those of the former place, and more regularly shaped than those of the latter. They have a yellowish colour; but have also this good quality, that they preserve their golden hue, whereas the whiter kind lose much of their lustre by keeping, especially in hot countries. The annual revenue from the Baharen pearl-fishery is computed at about 157,500l. The greatest part of the pearls that are uneven are carried to Constantinople and other ports of Turkey, where the larger go to compose ornaments for head-dresses, and the smaller are used in embroideries. The perfect pearls must be reserved for Surat, whence they are distributed through all Indostan.

BAHI, a province of Luçon or Manilla, one of the Philippine islands in the East Indies, belonging to the Spaniards. It is remarkable for producing excellent betel, which the inhabitants, Spaniards as well as natives, perpetually chew from morning till night. It is also the place where most of the ships are built. But the natives suffer much from this work; several hundreds of them being constantly employed in it, on the mountains, or at the port of Cavite. The king allows these labourers a piece of eight per month, with a sufficient quantity of rice. The whole province contains about 6000 tributary natives.

BAHIA, DE TODOS LOS SANCTOS, a province of Brasil in South America, belonging to the Portuguese, and the richest in the whole country; but unhappily the air and climate do not correspond with other natural advantages; yet so fertile is the province in sugar and other commercial articles, that the Portuguese flock hither not only as it is the seat of affluence, but also of pleasure and grandeur. The capital, called *St Salvador*, or *Cividad de Bahia*, is populous, magnificent, and one of the most gay and opulent cities in Brasil. It stands on a bay in S. Lat. 12. 11. is strong by nature, well fortified, and always defended by a numerous garrison. It contains 12,000 or 14,000 Portuguese, and about three times as many negroes, besides people of different nations who choose to reside in that city.

BAHIR, a Hebrew term signifying *famous* or *illustrious;* but particularly used for a book of the Jews, treating of the profound mysteries of the cabbala, being the most ancient of the Rabbinical works.

BAHUS, a strong town of Sweden, and capital of a government of the same name, seated on a rock in a small island, in E. Long. 11. 10. N. Lat. 57. 52.

BAJA, BAYJAH, or BEGIA, a town of the kingdom of Tunis in Africa, supposed to be the ancient *Vacca* of Sallust, and *Oppidum Vaggense* of Pliny. It was

Digitized by Google

Baja, Baiæ.

was formerly, and still continues to be, a place of great trade, and the chief market of the kingdom for corn; of which the adjacent territories produce such abundance, that they can supply more than the whole kingdom with it; and the Tunisians say, that if there was in the kingdom such another town as this for plenty of corn, it would become as cheap as sand. Here is also a great annual fair, to which the most distant Arabian tribes resort with their families and flocks. Notwithstanding all this, however, the inhabitants are very poor, and great part of the land about the town remains uncultivated, through the cruel exactions of the government, and the frequent incursions of the Arabs, who are very powerful in these parts. The town stands on the declivity of a hill on the road to Constantina, about ten leagues from the northern coast, and 36 south-west from Tunis; and hath the convenience of being well watered. On the highest part is a citadel that commands the whole place, but is now of no great strength. The walls were raised out of the ruins of the ancient Vacca, and have some ancient inscriptions.

BAJA, a populous town of Hungary, on the Danube, in E. Long. 19. 50. N. Lat. 46. 40.

BAIÆ, an ancient village of Campania in Italy, between the promontory of Misenum and Puteoli, on the Sinus Balanus; famous for its natural hot baths, which served the wealthier Romans for the purposes both of medicine and pleasure. The variety of those baths, the softness of its climate, and the beauty of its landscape, captivated the minds of opulent nobles, whose passion for bathing knew no bounds. Abundance of linen, and disuse of ointments, render the practice less necessary in modern life: but the ancients performed no exercise, engaged in no study, without previous ablutions, which at Rome required an enormous expence in aqueducts, stoves and attendants: a place therefore, where waters naturally heated to every degree of warmth bubble spontaneously out of the ground, in the pleasantest of all situations, was such a treasure as could not be overlooked. Baiæ was this place in the highest perfection; its easy communication with Rome was also a point of great weight. Hither at first retired for a temporary relaxation the mighty rulers of the world, to string anew their nerves and revive their spirits, fatigued with bloody campaigns and civil contests. Their habitations were small and modest; but soon increasing luxury added palace to palace with such expedition and sumptuosity, that ground was wanting for the vast demand; enterprising architects, supported by infinite wealth, carried their foundations into the sea, and drove that element back from its ancient limits: it has since taken ample revenge, and recovered much more than it ever lost. From being a place of resort for a season, Baiæ now grew up to a permanent city: whoever found himself disqualified by age, or infirmity, for sustaining any longer an active part on the political theatre; whoever, from an indolent disposition, sought a place where the pleasures of a town were combined with the sweets of a rural life; whoever wished to withdraw from the dangerous neighbourhood of a court, and the baneful eye of informers, flocked hither to enjoy life untainted with fear and trouble. Such affluence of wealthy inhabitants rendered Baiæ as much a miracle of art as it was before of nature; its splendour may be inferred from its

Swinburne's Sicily.

innumerable ruins, heaps of marbles, mosaics, stucco, and other precious fragments of taste.—It flourished in full glory down to the days of Theodoric the Goth; but the destruction of these enchanted palaces followed quickly upon the irruption of the northern conquerors, who overturned the Roman system, sacked and burnt all before them, and destroyed or dispersed the whole race of nobility. Loss of fortune left the Romans neither the means, nor indeed the thought, of supporting such expensive establishments, which can only be enjoyed in perfection during peace and prosperity. No sooner had opulence withdrawn her hand, than the unbridled sea rushed back upon its old domain; moles and buttresses were torn asunder and washed away; whole promontories, with the proud towers that once crowned their brows, were undermined and tumbled headlong into the deep, where, many feet below the surface, pavements of streets, foundations of houses, and masses of walls, may still be descried. Internal commotions of the earth contributed also largely to this general devastation; mephitic vapours and stagnated waters have converted this favourite seat of health into the den of pestilence, at least during the estival heats: yet Baiæ in its ruined state, and stripped of all its ornaments, still presents many beautiful and striking subjects for the pencil. E. Long. 14. 45. N. Lat. 41. 6.

Baiæ || Bajazet.

BAJADOR, a cape on the west coast of Africa, south of the Canary islands. W. Long. 15. 20. N. Lat. 27. 0.

BAIANUS SINUS, a bay so called from *Baiæ*, (Suetonius); *Portus Baiarum*, (Pliny); which was enlarged by Augustus, by giving entrance to the sea into the Lacus Lucrinus and Averni, ordering it to be called *Portus Julius apud Baias*, (Suetonius). We also read *Baianus Lacus* in Tacitus, which some interpret the *Lucrinus*. The modern name is *Golfo de Pozzuolo*. From the highest point that forms the bay, a large castle commands the road where foreign ships of war usually ride at anchor, the harbour of Naples not being spacious enough for the reception of a fleet; here they enjoy good shelter, watering, and victualling; but in summer risk the health of their crews, on account of the unwholesomeness of the air.

BAJAZET I. sultan of the Turks, a renowned warrior but a tyrant, was conquered by Tamerlane, and exposed by him in an iron cage; the fate he had destined (it is said) for his adversary if he had been the victor.

The iron cage, however, so long and so often repeated as a moral lesson, has been rejected as a fable by modern writers, who smile at the vulgar credulity. They appeal to the Persian history of Sherefeddin Ali, of which a French version has been given, and from which Mr Gibbon has collected the following more specious narrative of this memorable transaction. "No sooner was Timour informed that the captive Ottoman was at the door of his tent, than he graciously stepped forwards to receive him, seated him by his side, and mingled with just reproaches a soothing pity for his rank and misfortune. "Alas! (said the emperor) the decree of fate is now accomplished by your own fault: it is the web which you have woven, the thorns of the tree which yourself have planted. I wished to spare, and even to assist, the champion of the Moslems; you braved our threats, you despised our friendship;

Bajazet. ship; you forced us to enter your kingdom with our invincible armies. Behold the event. Had you vanquished, I am not ignorant of the fate which you reserved for myself and my troops. But I disdain to retaliate: your life and honour are secure; and I shall express my gratitude to God by my clemency to man." The royal captive showed some signs of repentance, accepted the humiliation of a robe of honour, and embraced with tears his son Mousa, who, at his request, was sought and found among the captives of the field. The Ottoman princes were lodged in a splendid pavilion; and the respect of the guards could be surpassed only by their vigilance. On the arrival of the haram from Boursa, Timour restored the queen Despina and her daughter to their father and husband; but he piously required, that the Servian princess, who had hitherto been indulged in the profession of Christianity, should embrace without delay the religion of the prophet. In the feast of victory, to which Bajazet was invited, the Mogul emperor placed a crown on his head, and a sceptre in his hand, with a solemn assurance of restoring him with an increase of glory to the throne of his ancestors. But the effect of this promise was disappointed by the sultan's untimely death: amidst the care of the most skilful physicians, he expired of an apoplexy at Akshehr, the Antioch of Pisidia, about nine months after his defeat. The victor dropped a tear over his grave; his body, with royal pomp, was conveyed to the mausoleum which he had erected at Boursa; and his son Mousa, after receiving a rich present of gold and jewels, of horses and arms, was invested by a patent in red ink with the kingdom of Anatolia.

"Such is the portrait of a generous conqueror, which has been extracted from his own memorials, and dedicated to his son and grandson, 19 years after his decease; and, at a time when the truth was remembered by thousands, a manifest falsehood would have implied a satire on his real conduct. On the other hand, of the harsh and ignominious treatment of Bajazet there is also a variety of evidence. The Turkish annals in particular, which have been consulted or transcribed by Leunclavius, Pocock, and Cantemir, unanimously deplore the captivity of the iron cage; and some credit may be allowed to national historians, who cannot stigmatize the Tartar without uncovering the shame of their king and country." From these opposite premises, Mr Gibbon thinks a fair and moderate conclusion may be deduced. He is satisfied that Sherefeddin Ali has faithfully described the first ostentatious interview, in which the conqueror, whose spirits were harmonized by success, affected the character of generosity. But his mind was insensibly alienated by the unseasonable arrogance of Bajazet; the complaints of his enemies the Anatolian princes, were just and vehement; and Timour betrayed a design of leading his royal captive in triumph to Samarcand. An attempt to facilitate his escape by digging a mine under the tent, provoked the Mogul emperor to impose a harsher restraint; and in his perpetual marches, an iron cage on a waggon might be invented, not as a wanton insult but as a rigorous precaution. Timour had read in some fabulous history a similar treatment of one of his predecessors, a king of Persia; and Bajazet was condemned to represent the person and expiate the guilt of the Roman Cæsar. But the strength of his mind and body fainted under the trial, and his premature death might without injustice be ascribed to the severity of Timour. He warred not, however, with the dead; a tear, and a sepulchre were all that he could bestow on a captive who was delivered from his power; and if Mousa, the son of Bajazet, was permitted to reign over the ruins of Boursa, the greatest part of the province of Anatolia had been restored by the conqueror to their lawful sovereigns.

Bajazet || Bail.

BAIKAL, a great lake in Siberia, lying between 52 and 55 degrees of north latitude. It extends 366 miles in length; its breadth varies from 20 to 53 miles, and its depth from 20 to 90 fathoms. It is environed on all sides by high mountains. In one part of it, which lies near the river Bargusian, it throws up an inflammable sulphureous liquid called *maltha*, which the people of the adjacent country burn in their lamps. There are likewise several sulphureous springs near this lake. Its water at a distance appears of a sea-green colour: it is fresh, and so clear, that objects may be seen in it several fathoms deep. It does not begin to freeze till near the latter end of December, and thaws again about the beginning of May: from which time till September, a ship is seldom known to be wrecked upon it; but by the high winds which then blow, many shipwrecks happen. This lake is called by the neighbouring people *Swiatoie More*, or *the Holy Lake*; and they imagine, that when storms happen on it, they will be preserved from all danger, by complimenting it with the title of *sea*. When it is frozen over, people travel upon it in the road to China; but they must be very sharp shod, otherwise they cannot stand upon the ice, which is exceedingly smooth. Notwithstanding that the ice on this lake is sometimes two ells thick, there are some open places in it to which tempestuous winds will often drive those who are crossing it; in which case they are irrecoverably lost. The camels that pass along have a particular kind of shoes sharp at bottom, and the oxen have sharp irons driven through their hoofs, without which it would be impossible for them to pass. Here are plenty of large sturgeon and pike; with many seals of the black, but none of the spotted, kind. It contains several islands; and the borders are frequented by black sables and civet-cats.

BAIL, Ballium, (from the French *bailler*, which comes of the Greek βαλλειν, and signifies to deliver into hands), is used in our common law for the freeing or setting at liberty of one arrested or imprisoned upon any action, either civil or criminal, on surety taken for his appearance at a day and place certain.

The reason why it is called *bail*, is because by this means the party restrained is delivered into the hands of those that bind themselves for his forthcoming, in order to a safe keeping or protection from prison; and the end of bail is to satisfy the condemnation and costs, or render the defendant to prison.

With respect to bail in civil cases, it is to be observed that there is both common and special bail. Common bail is an action of small concernment, being called *common*, because any sureties in that case are taken; whereas in causes of great weight, as actions upon bonds, or speciality, &c. where the debt amounts to 10l. *special* bail or surety must be taken,

 such

Digitized by Google

such as subsidy men at least, and they according to the value.

The commitment of a person being only for safe custody, wherever bail will answer the same intention, it ought to be taken, as in most of the inferior crimes: but in felonies, and other offences of a capital nature, no bail can be a security equivalent to the actual custody of the person. For what is there that a man may not be induced to forfeit to save his own life? and what satisfaction or indemnity is it to the public, to seize the effects of them who have bailed a murderer, if the murderer himself be suffered to escape with impunity? Upon a principle similar to which, the Athenian magistrates, when they took a solemn oath never to keep a citizen in bonds that could give three sureties of the same quality with himself, did it with an exception to such as had embezzled the public money, or been guilty of treasonable practices.

Bail may be taken either in court, or, in some particular cases, by the sheriff or other magistrate; but mostly used by the justices of the peace. To refuse or delay to bail any person bailable, is an offence against the liberty of the subject, in any magistrate, by the common law; as well as by the statute Westm. 1. 3 Edw. I. c. 15. and the *habeas corpus* act, 31 Car. II. c. 2. And, lest the intention of the law should be frustrated by the justices requiring bail to a greater amount than the nature of the case demands, it is expressly declared by statute 1 W. and M. st. 2. c. 1. that excessive bail ought not to be required; though what bail shall be called *excessive*, must be left to the courts, on considering the circumstances of the case, to determine. And on the other hand, if the magistrate take insufficient bail, he is liable to be fined, if the criminal doth not appear.

In *civil* cases, every defendant is bailable. But it is otherwise in

Criminal matters. Regularly, in all offences, either against the common law or act of parliament, that are below felony, the offender ought to be admitted to bail unless it be prohibited by some special act of parliament.—By the ancient common law, before and since the Conquest, all felonies were bailable, till murder was excepted by statute: so that persons might be admitted to bail almost in every case. But the statute West. 1. 3 Edw. I. c. 15. takes away the power of bailing in treason, and in divers instances of felony. The statutes 23 Hen. VI. c. 9. and 1 and 2 Ph. and Mar. c. 13. gave farther regulations in this matter: and upon the whole we may collect, that no justices of the peace can bail. 1. Upon an accusation of treason: nor, 2. Of murder: nor, 3. In case of manslaughter, if the prisoner be clearly the slayer, and not barely suspected to be so; or if any indictment be found against him; nor, 4. Such as, being committed for felony, have broken prison; because it not only carries a presumption of guilt, but is also superadding one felony to another: 5. Persons outlawed: 6. Such as have abjured the realm: 7. Persons taken with the mainour, or in the fact of felony: 8. Persons charged with arson: 9. Excommunicated persons, taken by writ *de excommunicato capiendo*: all which are clearly not admissible to bail by the justices. Others are of a dubious nature; as, 10. Thieves openly defamed and known: 11. Persons charged with other felonies, or manifest and enormous offences, not being of good fame: and, 12. Accessories to felony, that labour under the same want of reputation. These seem to be in the discretion of the justices, whether bailable or not. The last class are such as *must* be bailed upon offering sufficient surety; as, 13. Persons of good fame, charged with a bare suspicion of manslaughter, or other infamous homicide: 14. Such persons being charged with petit larceny or any felony, not before specified: or, 15. With being accessory to any felony. Lastly, it is agreed, that the court of king's bench, (or any judge thereof in time of vacation) may bail for any crime whatsoever, be it treason, murder, or any other offence, according to the circumstances of the case. And herein the wisdom of the law is very manifest. To allow bail to be taken commonly for such enormous crimes, would greatly tend to elude the public justice: and yet there are cases, though they rarely happen, in which it would be hard and unjust to confine a man in prison, though accused even of the greatest offence. The law has therefore provided one court, and only one, which has a discretionary power of bailing in any case: except only, even to this high jurisdiction, and of course to all inferior ones, such persons as are committed by either house of parliament, so long as the session lasts; or such as are committed for contempts by any of the king's superior courts of justice. See Law.

Clerk of the Bails, is an officer belonging to the court of the kings bench: he files the bail-pieces taken in that court, and attends for that purpose.

Bail, or Bale, in the sea-language. The seamen call throwing the water by hand out of the ship's or boat's hold, *bailings*. They also call those hoops that bear up the tilt of a boat, its *bails*.

BAILIE, in *Scots Law*, a judge anciently appointed by the king over such lands not erected into a regality as happened to fall to the crown by forfeiture or otherwise, now abolished. It is also the name of a magistrate in royal boroughs, and of the judge appointed by a baron over lands erected into a barony. See Law.

BAILIFF, (*ballivus*) from the French word *bayliff*, that is, *præfectus provinciæ;* and as the names of the office itself was answerable to that of France; where there are eight parliaments, which are high courts from whence there lies no appeal, and within the precincts of the several parts of that kingdom which belong to each parliament there are several provinces to which justice is administered by certain officers called *bailiffs:* and in England there are several counties in which justice hath been administered to the inhabitants by the officer who is now called *sheriff* or *viscount* (one of which names descends from the Saxons, the other from the Normans); and though the sheriff is not called *bailiff*, yet it is probable that was one of his names also, because the county is often called *balliva*. And in the statute of Magna Charta, cap. 28. and 14 Ed. III. c. 9. the world *bailiff* seems to comprise as well sheriffs as bailiffs of hundreds. As the realm is divided into counties, so every county is divided into hundreds; within which in ancient times the people had justice ministered to them by the officers of every hundred. But now the hundred courts, except certain franchises, are swallowed up in the county-courts; and the bailiff's bailiff's name and office is grown into contempt, they being generally officers to serve writs, &c. within their liberties. Though in other respects, the name is still in good esteem: for the chief magistrates in divers towns are called *bailiffs*, or *bailies;* and sometimes the persons to whom the king's castles are committed are termed *bailiffs*, as the *bailiff of Dover Castle*, &c.

Of the ordinary bailiffs there are several sorts, viz. sheriffs bailiffs, bailiffs of liberties, &c.

Sheriffs bailiffs, or sheriffs officers, are either bailiffs of hundreds, or special bailiffs. Bailiffs of hundreds are officers appointed over those respective districts by the sheriffs, to collect fines therein; to summon juries; to attend the judges and justices at the assises and quarter sessions; and also to execute writs and process in the several hundreds. But as these are generally plain men, and not thoroughly skilful in this latter part of their office, that of serving writs and making arrests and executions, it is now usual to join special bailiffs with them; who are generally mean persons employed by the sheriffs on account only of their adroitness and dexterity in hunting and seizing of their prey.

Bailiffs of liberties are those bailiffs who are appointed by every lord within his liberty, to execute process, and do such offices therein as the bailiff errant doth at large in the county; but bailiffs errant or itinerant, to go up and down the county to serve process, are out of use.

There are also bailiffs of forests, and bailiffs of manors, who direct husbandry, fell trees, gather rents, pay quit-rent, &c.

Water-Bailiff, an officer appointed in all port-towns, for the searching of ships, gathering the toll for anchorage, &c. and arresting persons for debts, &c. on the water.

BAILII, David, painter of perspective views and portraits, was the son of Peter Bailii, an artist of some note; and was born at Leyden in 1584. From his father he learned to draw and design; but he was afterwards placed under the care of Adrian Verburg, and continued with him for some time; and when he quitted that master, he studied to much greater advantage with Cornelius Vandervoort, an excellent portrait painter, and with him he spent about six years. As Vandervoort possessed many capital paintings of some great masters, Bailii, for his own improvement, copied them with critical care and observation; and particularly copied one perspective view of the inside of a church, originally painted by Stenwyck, which he finished with such accuracy, that even Stenwyck himself could scarcely determine which was the original, or which the copy when both were placed before him. He travelled through several parts of Italy to see the works of the celebrated masters of that country, and for a few years resided at Rome; and abroad, as well as in his own country, the correctness of his drawing, and the delicate handling of his pictures, procured him employment, admirers, and friends. In the latter part of his life he discontinued painting, and only drew portraits on vellum with a pen, which he heightened with black lead, and gave them wonderful force and roundness. He died in 1638.

BAILIWICK, that liberty which is exempted from the sheriff of the county; over which liberty the lord thereof appoints his own bailiff, with the like power within his precinct as an under sheriff exercises under the sheriff of the county: Or it signifies the precinct of a bailiff, or the place within which his jurisdiction is terminated.

BAILLET, Adrian, a very learned French writer and critic, born in 1649 at the village of Neuville near Beauvais in Picardy. His parents were too poor to give him a proper education, which, however, he obtained by the favour of the bishop of Beauvais, who afterwards presented him with a small vicarage. In 1680 he was appointed librarian to M. de Lamoignon, advocate-general to the parliament of Paris; of whose library he made a copious index in 35 vols. folio, all written with his own hand. He died in 1706, after writing many works, the principal of which are, *A History of Holland from 1609, to the peace of Nimeguen in 1679*, 4 vols. 12mo; *Lives of the Saints*, 3 vols. folio, which he professed to have purged from fables; *Jugemens des Sçavans*, which he extended to 9 vols. 12mo.; and *The Life of Des Cartes*, 2 vols. 4to, which he abridged, and reduced to one vol. 12mo.

BAILLEUL, a town of France, in the department of the North, formerly very strong, but now without any fortifications. It has been several times burnt by accident, and contains now only about 500 houses. E. Long. 2. 45. N. Lat. 50. 45.

BAILLY, Jean Sylvain, a celebrated philosopher and astronomer, was born at Paris on the 15th September 1736. He was originally intended for the profession of painting, which his family had pursued for several generations, and he even had made some progress in the art. But the bias of his mind leaned too much to literary pursuits, especially to poetry, and works of imagination, to permit him to give that application which is necessary to secure success and eminence in any profession.

The friends of Bailly, who had witnessed the early dawn of his genius, saw that it was equally fitted to appear with advantage in the study of polite literature, or to shine in the walks of science: and recommended the latter chiefly to his attention. His acquaintance with La Caille the celebrated geometer commenced, and this at once decided the object of his studies, which were now almost entirely devoted to scientific investigations. The first of his labours was the calculation of the comet which appeared in the year 1759. In January 1763, he was admitted a member of the Academy of Sciences; and in the same year he published a reduction of the observations made by La Caille in 1760 and 1761 on the zodiacal stars; an elaborate compilation, and of extensive utility. His attention was afterwards directed to the consideration of the theory of Jupiter's satellites. La Grange, who now promised to be the first mathematician in Europe, was the formidable rival of Bailly in the competition for this prize question in 1764. The results of his investigations were collected into a treatise, which also contained the history of that part of astronomy, and were published in 1766. In 1771 appeared his interesting and important memoir on the Light of the Satellites, which was marked with a degree of precision and accuracy till that time altogether unknown in the observations of their eclipses.

The studies of Bailly were not entirely limited to the cultivation of abstract science, or to profound physical

Digitized by Google

sical speculations; his genius shone with equal lustre in those departments of literature which require the rare talent of nice discrimination of characters, and no common power of eloquence, to reach excellence. The eloges which he composed for Charles V. Corneille, Leibnitz, Moliere, Cook, La Caille, and Gresset, were universally admired as valuable specimens of fine writing, and added much to his reputation. The distinguished place of secretary of the Academy of Sciences became vacant in 1771; and supported by the patronage and influence of Buffon, he offered himself a candidate. But here he was unsuccessful. Condorcet, who was then rising into reputation, and was supported by the active influence of D'Alembert, was preferred to the office.

In the year 1775, he published at Paris the first volume of the "History of Ancient Astronomy." The second volume of the same work appeared in 1787. In 1779 he gave to the world his "History of Modern Astronomy," from the foundation of the Alexandrian school to the present age. These works are of inestimable value, distinguished by animated description, luminous narration, and interesting detail. He also published a work entitled, "Letters on the Origin of the Sciences, and of the People of Asia;" which was afterwards followed by another series of "Letters on the Atlantis of Plato, and the ancient History of Asia," as a continuation of the same work. These volumes were addressed to Voltaire, with whom he had commenced an ingenious correspondence and discussion on this curious subject. The coincidence of his opinions with those of Buffon in points respecting some of the favourite theories of the latter, brought him into an intimate acquaintance and close friendship with that celebrated naturalist, which, however, declined and was entirely dissolved, in consequence of the opposition which Bailly made to the election of the abbé Maury into the French Academy. Bailly had been chosen secretary of this academy in 1784; and in the following year he was admitted into the Academy of Inscriptions and Belles Lettres. This was the only instance, since the time of Fontenelle, of the same person being at once a member of all the three academies.

In the year 1784 he was nominated one of the commission to investigate the nature of the animal magnetism of Mesmer, which was practised by Deslon; and he drew up an elegant report, which was presented to the Academy of Sciences. This report, which was soon afterwards translated into English, not only marked the acuteness and discernment of the author, and contained the most satisfactory and decisive evidence with regard to its object, but may be held up as an excellent model of imitation for those who are engaged in similar investigations. In developing the physical effects produced by moral causes, it is of the greatest value; and it is particularly interesting when we consider the political influence which causes of this nature have imposed on the general opinions of society, and even on the destiny of nations.

Hitherto we have contemplated Bailly in the shades of retirement, and in the calm undisturbed retreats of philosophy, employing the energy of a vigorous and comprehensive mind in the profound researches of physical truth: we are now to follow him in his political career, and behold him struggling with the adverse interests of party faction, and contending with the unbridled fury of a lawless mob, in defence of the rights of a people whose minds were not prepared to understand, and whose habits were not yet formed to enjoy, the blessings of rational liberty. He was one of the first and most zealous promoters of the revolution in France,—a revolution which not only astonished and convulsed all Europe, but of which the immediate consequences to themselves, and to their country, were neither foreseen nor imagined by those who embarked in it, nor can its ultimate effects even at the present period be appreciated or conjectured,—a revolution which holds out an awful lesson to the leaders of popular faction to curb and repress, rather than to excite and encourage, that spirit of tumult and disorder among a people thrown loose from the necessary restraints of law, which bursts forth with ungovernable fury, and at last involves all in one general ruin. In the part which he acted in this bloody struggle, Bailly has had the good fortune to be well spoken of by opposite parties. He has not been charged with want of integrity or selfish designs in any part of his conduct; but actuated by a misguided zeal, and dazzled with the prospect of freedom which the warmth of imagination held out, he rashly stepped forward in a cause which he espoused with enthusiasm, and supported with his utmost exertions. But in that cause he fell a sacrifice to the unrelenting spirit of violence and party faction which had been roused, and which could neither be subdued nor regulated. When the states-general of France were assembled in 1789, he was elected a deputy to the *Tiers Etat;* was afterwards chosen president; and when the national assembly was constituted, he continued in the chair, and was president at the time that the king's proclamation was issued ordering them to disperse. During the struggle which took place between the popular part of the assemblies and the court, Bailly was among the most forward in asserting those popular rights which were then new in France: and he dictated the famous oath to the members of the *Tiers Etat,* "to resist tyrants and tyranny, and never to separate till they had obtained a free constitution." On the 14th of July following, the day on which the Bastile was stormed and taken by the people, he was appointed, with universal consent, mayor of Paris. In this high office, he is allowed to have discharged the arduous and difficult duties of it with great integrity, courage, and moderation. And while he held this conspicuous situation, he was a powerful agent in promoting the various measures by which the popular party prevailed over that of the court: and for this, and various other popular actions, he obtained a high degree of favour among the people. But the tide of public opinion now swelled beyond all bounds; no restraint could oppose its violent course. The multitude, unshackled by the fetters of despotism, fond of novelty, and with enthusiastic and unsettled notions of freedom, daily panting for change, could bear no opposition. Bailly, who perhaps now saw when it was too late the general disposition of the people to anarchy, still wished the laws to be respected, and hoped by their vigorous execution to restore and preserve tranquillity. He ordered some deputies from the military insurgents of Nancy to be arrested, and he firmly opposed the rash proceedings of Marat and Hubert; he became

Digitized by Google

came a member of a less promiscuous club than that of the Jacobins; and exerted himself strongly to persuade the populace to permit the king and royal family to depart to St Cloud. But these measures, which were little relished by a frantic and lawless people, he lost their confidence and favour. But what finally destroyed his popularity, was the tumultuous meeting of the populace on the 17th of July 1791, to demand the abolition of monarchy, when, being called by the national assembly to disperse the mob, who had assaulted the soldiery, he ordered the latter to fire, by which 40 persons were killed and above 100 wounded. Thus become obnoxious to the people whom he had faithfully served, it was no longer desirable for him to hold his charge. He therefore resigned his office at the dissolution of the constituent assembly in the end of the year 1791. After this period he lived in retirement, having resumed his philosophical researches. But the times of bloody proscription approached, and he must fall a sacrifice to the ferocious vengeance of the tyrant who now bore unlimited sway. He was accordingly denounced as an enemy to the republic, apprehended and thrown into prison. He was arraigned before a sanguinary tribunal, summarily condemned to death as a conspirator, and was executed the day following, near the spot where he had given the order for the military to fire on the people. On the day of execution, his sufferings, which he bore with the utmost calmness and magnanimity, were studiously protracted. Instead of that sympathy and compassion which even the worst and the lowest criminal often experiences when he is about to expiate his offences with his life, he was treated by an incensed and barbarous populace, with the most ignominious indignity and cruelty. He wore the red shirt, or badge of conspiracy, and was placed in a cart, with his hands tied behind his back. During the whole time of his progress to the place of execution, the rain poured incessantly on his head. The populace as he passed threw mud at him, and cruelly insulted him with every kind of opprobrious language. It was found necessary to remove the guillotine from the place where it was first erected to firmer ground. During this time he was forced to get out of the cart, and walk round the field, to gratify more fully the implacable and unrelenting malice of the mob. When he was ascending the platform, a spectator who was near him, in a tone of insult exclaimed, "Bailly, you tremble: "Yes (he instantly replied), but not with fear."

Thus perished Bailly in the 57th year of his age. In his person he was tall, and of a sedate but striking countenance. He possessed great firmness and decision of character, but far removed from sullenness or apathy. Few philosophers have been more distinguished in so many various departments of science and literature, or have acquired such deserved reputation. In his public stations, as well as in the retirement of domestic life, his integrity and disinterestedness remained pure and untainted. In the time of his magistracy he spent part of his fortune in relieving the wants of the poor. His wife, whom he married in 1787, survived him. She was the widow of Raymond Gaye, who had been his intimate friend 25 years.

BAILMENT, in *Law*, is a delivery of goods in trust upon a contract, expressed or implied, that the trust shall be faithfully executed on the part of the bailee. As if cloth be delivered, or (in our legal dialect) bailed, to a taylor to make a suit of clothes, he has it upon an implied contract to render it again when made, and that in a workmanly manner. If money or goods be delivered to a common carrier to convey from Oxford to London, or from Glasgow to Edinburgh, &c. he is under a contract in law to pay, or carry them to the person appointed. If a horse or other goods be delivered to an innkeeper or his servants, he is bound to keep them safely, and restore them when his guest leaves the house. If a man takes in a horse, or other cattle, to graze and depasture in his grounds, which the law calls *agistment*, he takes them upon an implied contract to return them on demand to the owner. If a pawnbroker receives plate or jewels as a pledge or security for the repayment of money lent thereon at a day certain, he has them upon an express contract or condition to restore them if the pledger performs his part by redeeming them in due time; for the due execution of which contract, many useful regulations are made by statute 30 Geo. II. c. 24. And so, if a landlord distrains goods for rent, or a parish officer for taxes, these for a time are only a pledge in the hands of the distrainers; and they are bound by an implied contract in law to restore them on payment of the debt, duty, and expences, before the time of sale; or when sold, to render back the overplus. If a friend delivers any thing to his friend to keep for him, the receiver is bound to restore it on demand: and it was formerly held, that in the mean time he was answerable for any damage or loss it might sustain, whether by accident or otherwise; unless he expressly undertook to keep it only with the same care as his own goods, and then he should not be answerable for theft or other accidents. But now the law seems to be settled on a much more rational footing; that such a general bailment will not charge the bailee with any loss, unless it happens by gross neglect, which is construed to be an evidence of fraud: but if the bailee undertakes specially to keep the goods safely and securely, he is bound to answer all perils and damages that may befal them for want of the same care with which a prudent man would keep his own.

BAILO; thus they style at Constantinople the ambassador of the republic of Venice, who resides at the Porte. This minister, besides the political charge, acts there the part of a consul of Venice.

BAINBRIDGE, Dr John, an eminent physician and astronomer, born at Ashby de la Zouche in Leicestershire, in 1582. He taught a grammar school for some years, and practised physic, employing his leisure hours in astronomy, which was his favourite study: at length he removed to London, was admitted a fellow of the college of physicians, and raised his character by his description of the comet in 1618. The next year Sir Henry Savile appointed him his first professor of astronomy at Oxford; and the masters and fellows of Merton-college made him first junior, and then superior, reader of Linacre's lecture. He died in 1643, having written many works, some of which have never been published: but the MSS. are preserved in the library of Trinity-college, Dublin.

BAIOCAO, a copper coin, current at Rome, and throughout the whole state of the church, ten of which make a julio, and a hundred a Roman crown.

BAIRAM, or BEIRAM, a Turkish word which signifies a solemn feast. The Mahometans have two Bairams, the *Great* and the *Little*. The *Little* Bairam is properly that held at the close of the fast Ramazan, beginning with the first full moon in the following month Shawal. This is called in Arabic *Id al Fetz*, or *the Feast of breaking the Fast;* by European writers, *the Turkish Easter*, because it succeeds Ramazan, which is their Lent, more usually the *Great Bairam*, because observed with great ceremony and rejoicing at Constantinople, and through Turkey, for three days, and in Persia for five six days, at least by the common people, to make themselves amends for the mortification of the preceding month. The feast commencing with the new moon, the Mahometans are very scrupulous in observing the time when the new moon commences; to which purpose, observers are sent to the tops of the highest mountains, who, the moment they spy the appearance of a new moon, run to the city, and proclaim *Mushdaluk*, "welcome news;" as it is the signal for beginning the festivity.—The *Great Bairam*, is properly that held by the pilgrims at Mecca, commencing on the tenth of Dhu'lhajia, when the victims are slain, and lasting three drys. This is called by the Arabs *Id al adha*, that is, *the feast of sacrifice*, as being celebrated in memory of the sacrifice of Abram, whose son God redeemed with a great victim. By European writers it is called the *Lesser Bairam*, as being less taken notice of by the generality of the people, who are not struck with it, because the ceremonies it is observed withal, are performed at Mecca, the only scene of the solemnity.—On the feast of Bairam, after throwing little stones, one after another, into the valley of Mina, they usually kill one or more sheep, some a goat, bullock, or even a camel; and after giving a part thereof to the poor, eat the rest with their friends. After this, they shave themselves. The second is a day of rest. On the third, they set out on their return home.

BAIRUT. See BEEROOT.

BAIT, among fishermen, implies a substance proper to be fastened to a hook, in order to catch the different sorts of fish. See FISHING.

BAITING, the act of smaller or weaker beasts attacking and harassing greater and stronger. In this sense we hear of the baiting of bulls or bears by mastiffs or bull-dogs with short noses, that they may take the better hold.

Utility is pled in justification of *bull-baiting*. This animal is rarely killed without being first baited; the chafing and exercise whereof makes his flesh tenderer and more digestible. In reality, it disposes it for putrefaction; so that, unless taken in time, baited flesh is soon lost. But a spirit of barbarism had the greatest share in supporting the sport: bulls are kept on purpose, and exhibited as standing spectacles for the public entertainment. The poor beasts have not fair play: they are not only tied down to a stake, with a collar about their necks and a short rope, which gives them not above four or five yards play; but they are disarmed too, and the tips of their horns cut off, or covered with leather, to prevent their hurting the dogs. In this sport, the chief aim of the dog is to catch the bull by the nose, and hold him down; to which end he will even creep on his belly: the bull's aim, on the contrary, is, with equal industry, to defend his nose; in order to which, he thrusts it close to the ground, where his horns are also in readiness to toss the dog.—Bull-baiting was first introduced into England as an amusement in the reign of King John, about 1209.

BAJULUS, an ancient officer in the court of the Greek emperors. There were several degrees of bajuli; as, the grand *bajulus*, who was preceptor to the emperor; and the simple *bajuli*, who were sub-preceptors. The word is derived from the Latin verb *bajulare*, "to carry or bear a thing on the arms or on the shoulders;" and the origin of the office is thus traced by antiquaries. Children, and especially those of condition, had anciently, beside their nurse, a woman called *gerula*, as appears from several passages of Tertullian; when weaned, or ready to be weaned, they had men to carry them about and take care of them, who were called *geruli* and *bajuli*, *à gerendo et bajulando*. Hence it is, that governors of princes and great lords were still denominated *bajuli*, and their charge or government *bajulatio*, even after their pupils were grown too big to be carried about. The word passed in the same sense into Greece.

BAJULUS is also used by Latin writers in the several other senses wherein BAILIFF is used among us.

BAJULUS was also the name of a conventual officer in the ancient monasteries, to whom belonged the charge of gathering and distributing the money and legacies left for masses and obits; whence he was also denominated *bajulus obituum novorum*.

BAKAN, a large and handsome town of Asia in the East Indies, in the kingdom of Ava. E. Long. 98. 0. N. Lat. 19. 33.

BAKER, SIR RICHARD, author of the Chronicle of the Kings of England, was born at Sessinghers̄t, in Kent, about the year 1568. After going through the usual course of academical learning at Hart-hall, in Oxford, he travelled into foreign parts; and upon his return home was created master of arts, and soon after, in 1603, received from King James I. the honour of knighthood. In 1620, he was high sheriff of Oxfordshire; but engaging to pay some of the debts of his wife's family, he was reduced to poverty, and obliged to betake himself for shelter to the Fleet prison, where he composed several books; among which are, 1. Meditations and Disquisitions on the Lord's Prayer. 2. Meditations, &c. on several of the Psalms of David. 3. Meditations and Prayers upon the seven Days of the Week. 4. *Cato Variegatus*, or Cato's Moral Distichs varied, &c.—Mr Granger observes, that his Chronicle of the Kings of England was ever more esteemed by readers of a lower class than by such as had a critical knowledge of history. The language of it was, in this reign, called polite; and it long maintained its reputation, especially among country gentlemen. The author seems to have been sometimes more studious to please than to inform, and with that view to have sacrificed even chronology itself to method. In 1658, Edward Philips, nephew to Milton, published a third edition of this work, with the addition of the reign of Charles I. It has been several times reprinted since, and is now carried as low as the reign of George I.

Baker.

Sir Richard also translated several works from the French and Italian; and died very poor in the Fleet prison, on the 18th of February 1645.

BAKER, *Thomas*, an eminent mathematician, was born at Ilton in Somersetshire about the year 1625, and entered at Magdalen hall, Oxon, in 1640; after which he was vicar of Bishop's-Nymmet, in Devonshire, where he wrote The Geometrical Key, or the Gate of Equations unlocked; by which he gained a considerable reputation. A little before his death, the members of the Royal Society sent him some mathematical queries, to which he returned so satisfactory an answer, that they presented him a medal with an inscription full of honour and respect. He died at Bishop's Nymmet on the 5th of June 1690.

BAKER, *Thomas*, a very ingenious and learned antiquary, descended from a family ancient and well esteemed, distinguished by its loyalty and affection for the crown, was born at Crook in 1656. He was educated at the free school at Durham, and thence removed to St John's college Cambridge in 1674. He proceeded B. A. 1677; M. A. 1681; was elected fellow, March 1679-80; ordained deacon by Bishop Compton of London, December 20. 1685; priest by Bishop Barlow of Lincoln, December 19. 1686. Dr Watson tutor of the college, who was nominated, but not yet consecrated, bishop of St David's, offered to take him for his chaplain, which he declined, probably on the prospect of a like offer from Lord Crew bishop of Durham, which he soon after accepted. His lordship collated him to the rectory of Long-Newton in his diocese, and the same county, June 1687; and, as Dr Grey was informed by some of the bishop's family, intended to have given him that of Sedgefield, worth 600l. or 700l. a-year, with a golden prebend, had he not incurred his displeasure and left his family for refusing to read King James II.'s declaration for liberty of conscience. The bishop, who disgraced him for this refusal, and was excepted out of King William's pardon, took the oaths to that king, and kept his bishopric till his death. Mr Baker resigned Long Newton August 1. 1690, refusing to take the oaths; and retired to his fellowship at St John's, in which he was protected till January 20. 1716-17, when, with one-and twenty others, he was dispossessed of it. After the passing the Registering Act 1723, he was desired to register his annuity of 40l. which the last act required before it was amended and explained. Though this annuity, left him by his father for his fortune, with 20l. per annum out of his collieries by his elder brother from the day of his death August 1699, for the remaining part of the lease, which determined at Whitsuntide 1722, was now his whole subsistence, he could not be prevailed on to secure himself, against the act. He retained a lively resentment of his deprivations; and wrote himself in all his books, as well as in those which he gave to the college library, *socius ejectus*, and in some *ejectus rector*. He continued to reside in the college as commoner-master, till his death, which happened July 2. 1740, of a paralytic stroke, being found on the floor of his chamber. In the afternoon of June 29. being alone in his chamber, he was struck with a slight apoplectic fit; which abating a little, he recovered his senses, and knew all about him, who were his nephew Burton, Drs Bedford and Heberden. He seemed perfectly satisfied and resigned; and when Dr Bedford desired him to take some medicine then ordered, he declined it, saying, he would only take his usual sustenance, which his bed-maker knew the times and quantities of giving: he was thankful for the affection and care his friends showed him; but, hoping the time of his dissolution was at hand, would by no means endeavour to retard it. His disorder increased, and the third day from this seizure he departed. Being appointed one of the executors of his elder brother's will, by which a large sum was bequeathed to pious uses, he prevailed on the other two executors, who were his other brother Francis and the Hon. Charles Montagu, to lay out 1310l. of the money upon an estate to be settled upon St John's college for six exhibitioners. He likewise gave the college 100l. for the consideration of 6l. a-year (then only legal interest) for his life; and to the library several choice books, both printed and MS. medals, and coins; (besides what he left to it by his will; which were "all such books, printed and MS. as he had, and were wanting there." All that Mr Baker printed was, 1. "Reflections on Learning, showing the insufficiency thereof in its several particulars, in order to evince the usefulness and necessity of Revelation, Lond. 1709-10," (which went through eight editions: and Mr Boswel, in his "Method of Study," ranks it among the English classics for purity of style); and, 2. "The preface to Bishop Fisher's Funeral Sermon for Margaret countess of Richmond and Derby, 1708; both without his name. Dr Grey had the original MS. of both in his own hands. The latter piece is a sufficient specimen of the editor's skill in antiquities to make us regret that he did not live to publish his "History of St John's College from the foundation of old St John's house to the present time; with some occasional and incidental account of the affairs of the university, and of such private colleges as held communication or intercourse with the old house or college: collected principally from MSS. and carried on through a succession of masters to the end of Bishop Gunning's mastership, 1670." The original, fit for the press, is among the Harleian MSS. N° 7028. His MS. collections relative to the history and antiquities of the university of Cambridge, amounting to 49 volumes in folio and three in quarto, are divided between the British Museum and the public library at Cambridge; the former possesses 23 volumes, which he bequeathed to the earl of Oxford, his friend and patron; the latter 16 in folio and three in quarto, which he bequeathed to the university. Dr Knight styles him "the greatest master of the antiquities of this our university;" and Hearne says, *Optandum est ut sua quoque collectanea de antiquitatibus Cantabrigiensibus juris faciat publici Cl. Bakerus, quippe qui eruditione summa judicioque acri et subacto polleat.* Mr Baker intended something like an *Athenæ Cantabrigienses*, on the plan of the *Athenæ Oxonienses*.

BAKER, *Henry*, an ingenious and diligent naturalist, was born in Fleet-street London, either near the end of the 17th, or very early in the beginning of the 18th, century. His father's profession is not known; but his mother was, in her time, a midwife of great practice. He was brought up under an eminent bookseller, who preceded the elder Dodsley, to the business of a bookseller; in which, however, he appears

Baker.

pears not to have engaged at all after his apprenticeship; or, if he did, it was soon relinquished by him: for though it was in his power to have drawn away all his master's best customers, he would not set up against him. Mr Baker being of a philosophical turn of mind, and having diligently attended to the methods which might be practicable and useful in the cure of stammering, and especially in teaching deaf and dumb persons to speak, he made this the employment of his life. In the prosecution of so valuable and difficult an undertaking, he was very successful; and several of his pupils, who are still living, bear testimony to the ability and good effect of his instructions. He married Sophia, youngest daughter of the famous Daniel Defoe, who brought him two sons, both of whom he survived. On the 29th of January 1740, Mr Baker was elected a fellow of the Society of Antiquaries; and, on the 12th of March following, the same honour was conferred upon him by the Royal Society. In 1744, Sir Godfrey's Copley's gold medal was bestowed upon him, for having, by his microscopical experiments on the crystallizations and configuration of saline particles, produced the most extraordinary discovery during that year. Having led a very useful and honourable life, he died at his apartments in the Strand on the 25th of November 1774, being then above 70 years of age. His wife had been dead some time before; and he only left one grandson, William Baker, who was born February 17. 1763, and to whom, on his living to the age of 21, he bequeathed the bulk of his fortune, which he had acquired by his profession of teaching deaf and dumb persons to speak. His furniture, printed books (but not MSS.), curiosities, and collections of every sort, he directed should be sold, which was accordingly done. His fine collection of native and foreign fossils, petrifactions, shells, corals, vegetables, ores, &c. with some antiquities and other curiosities, were sold by auction March 13. 1775, and the nine following days. He was buried, as he desired, in an unexpensive manner, in the churchyard of St Mary-le-strand; within which church, on the south wall, he ordered a small tablet to be erected to his memory. "An inscription for it (he said) would probably be found among his papers; if not, he hoped some learned friend would write one agreeable to truth." This friendly office, however, remains as yet to be performed. Mr Baker was a constant and useful attendant at the meetings of the Royal and Antiquarian Societies, and in both was frequently chosen one of the council. He was peculiarly attentive to all the new improvements which were made in natural science, and very solicitous for the prosecution of them. Several of his communications are printed in the Philosophical Transactions; and besides the papers written by himself, he was the means, by his extensive correspondence, of conveying to the society the intelligence and observations of other inquisitive and philosophical men, both at home and abroad. The Society for the encouragement of arts, manufactures, and commerce, is under singular obligations to our worthy naturalist. As he was one of the earliest members of it, so he contributed in no small degree to its rise and establishment. At its first institution he officiated for some time *gratis* as secretary. He was many years chairman of the committee of accounts; and he took an active part in the general deliberations of the society. He drew up a short account of the original of this society, and of the concern he himself had in forming it; which was read before the society of antiquaries, and would be a pleasing present to the public. Mr Baker was a poetical writer in the early part of his life. His *Invocation of Health* got abroad without his knowledge; but was reprinted by himself in his *Original Poems, serious and humorous*, Part I. 8vo. 1725. Part II. came out in 1726. Among these poems are some tales as witty and as loose as Prior's. He was the author likewise of *The Universe*, a poem intended to restrain the pride of man; which has been several times reprinted. His account of the water polype, which was originally published in the Philosophical Transactions, was afterwards enlarged into a separate treatise, and hath gone through several editions. But his principal publications are, *The Microscope made Easy*, and *Employment for the Microscope*. The first of these, which was originally published in 1742 or 1743, hath gone through six editions. The second edition of the other, which, to say the least of it, is equally pleasing and instructive, appeared in 1764. These treatises, and especially the latter, contain the most curious and important of the observations and experiments which Mr Baker either laid before the Royal Society or published separately. It has been said of Mr Baker, that *he was a philosopher in little things*. If it was intended by this language to lessen his reputation, there is no propriety in the stricture. He was an intelligent, upright, and benevolent man, much respected by those who knew him best. His friends were the friends of science and virtue: and it will always be remembered by his contemporaries, that no one was more ready than himself to assist those with whom he was conversant in their various researches and endeavours for the advancement of knowledge and the benefit of society.

Baker.

BAKER, *David Erskine*, son to the former, was a young man of genius and learning. Having been adopted by an uncle, who was a silk-throwster in Spitalfields, he succeeded him in the business; but wanted the prudence and attention which are necessary to secure prosperity in trade. He married the daughter of Mr Clendon, a reverend empiric. Like his father, he was both a philosopher and a poet; and wrote several occasional poems in the periodical collections, some of which were much admired at the time; but so violent was his turn for dramatic performance, that he repeatedly engaged with the lowest strolling companies, in spite of every effort of his father to reclaim him. The public was indebted to him for "The Companion to the Play-house," in two volumes, 1764, 12mo; a work which, though imperfect, had considerable merit, and showed that he possessed a very extensive knowledge of our dramatic authors; and which has since (under the title of "Biographia Dramatica") been considerably improved by the attention of a gentleman in every respect well qualified for the undertaking.

BAKER, a person whose occupation or business is to bake bread. See the articles BAKING and BREAD.

The learned are in great doubt about the time when baking first became a particular profession, and bakers were introduced. It is however generally agreed, that they had their rise in the east, and passed from Greece

Digitized by Google

to Italy after the war with Pyrrhus, about the year of Rome 583. Till which time every housewife was her own baker; for the word *pistor*, which we find in Roman authors before that time, signified a person who ground or pounded the grain in a mill or mortar to prepare it for baking, as Varro observes. According to Athenæus, the Cappadocians were the most applauded bakers, after them the Lydians, then the Phœnicians.—To the foreign bakers brought into Rome, were added a number of freedmen, who were incorporated into a body, or, as they called it, a *college;* from which neither they nor their children were allowed to withdraw. They held their effects in common, and could not dispose of any part of them. Each bake-house had a patronus, who had the superintendency thereof; and these patroni elected one out of their number each year, who had superintendence over all the rest, and the care of the college. Out of the body of the bakers every now and then one was admitted among the senators.—To preserve honour and honesty in the college of bakers, they were expressly prohibited all alliance with comedians and gladiators; each had his shop or bake-house, and they were distributed into fourteen regions of the city. They were excused from guardianships and other offices, which might divert them from their employment.—By our own statutes, bakers are declared not to be handicrafts. No man for using the mysteries or sciences of baking, brewing, surgery, or writing, shall be interpreted a handicraft. The bakers were a brotherhood in England before the year 1155, in the reign of King Henry II. though the white bakers were not incorporated till 1407, by King Edward III. and the brown bakers not till 1621, in King James I.'s time. Their hall is in Harp-lane, Thames-street; and their court-day on the first Monday of the month.—They make the 19th company; and consist of a warden, 4 masters, 30 assistants, and 140 men on the livery, besides the commonalty.—The French had formerly a great baker, *grand panetier de France*, who had the superintendency of all the bakers of Paris. But since the beginning of this century, they have been put under the jurisdiction of the lieutenant-general *de police*. In some provinces of France, the lord is the only baker in his seigneury; keeping a public oven, to which all the tenants are obliged to bring their bread. This right is called *furnagium*, or *furnaticum*, and makes part of the *bannalite*.

BAKEWELL, a pretty large town of Derbyshire in England, seated on the river Wye, on the north side of the Peak. It has a considerable trade in lead. W. Long. 2. 30. N. Lat. 55. 15.

BAKING, the art of preparing bread, or reducing meals of any kind, whether simple or compound, into bread. See the article BREAD.

The various forms of baking among us may be reduced into two, the one for unleavened, the other for leavened bread. For the first the chief is manchet-baking; and the process whereof is as follows: The meal, ground and boulted, is put into a trough; and to every bushel are poured in about three pints of warm ale, with barm and salt to season it. This is kneaded well together with the hands through the brake; or, for want thereof, with the feet, through a cloth; after which, having lain an hour to swell, it is moulded into manchets; which, scotched in the middle, and pricked up at top, to give room to rise, are baked in the oven by a gentle fire.—For the second, sometimes called *cheat-bread baking*, it is thus: Some leaven (saved from a former batch) filled with salt, laid up to sour, and at length dissolved in water, is strained through a cloth into a hole made in the middle of the heap of meal in the trough; then it is worked with some of the flour into a moderate consistence; this is covered up with meal, where it lies all night; and in the morning the whole heap is stirred up, and mixed with a little warm water, barm, and salt, by which it is seasoned, softened, and brought to an even leaven: it is then kneaded, moulded, and baked, as before.

Method of raising a bushel of flour with a tea-spoonful of barm; by James Stone, of Amport, in Hampshire.—Suppose you want to bake a bushel of flour, and have but one tea-spoonful of barm.—Put your flour into your kneading-trough or trendle; then take about three quarters of a pint of warm water, and take the tea-spoonful of thick steady barm and put it into the water; stir it until it is thoroughly mixed with the water: then make a hole in the middle of the flour large enough to contain two gallons of water; pour in your small quantity; then take a stick about two feet long, (which you may keep for that purpose), and stir in some of the flour, until it is as thick as you would make batter for a pudding; then strew some of the dry flour over it, and go about your usual business for about an hour: then take about a quart of warm water more, and pour in; for in one hour you will find that small quantity raised so, that it will break through the dry flour which you shook over it; and when you have poured in the quart of warm water, take your stick as before, and stir in some more flour, until it is as thick as before; then shake some more dry flour over it, and leave it for two hours more, and then you will find it rise and break through the dry flour again; then you may add three quarts or a gallon of water more, and stir in the flour and make it as thick as at first, and cover it with dry flour again; in about three or four hours more you may mix up your dough, and then cover it up warm; and in four or five hours more you may put it into the oven, and you will have as light bread as though you had put a pint of barm. It does not take above a quarter of an hour more time than the usual way of baking, for there is no time lost but that of adding water three or four times.

The author of this method assures us, that he constantly bakes this way in the morning about six or seven o'clock, puts the flour out, and puts this small quantity of barm into the before-mentioned quantity of water, in an hour's time some more, in two hours more a greater quantity, about noon makes up the dough, and about six in the evening it is put into the oven, and he has always good bread, never heavy nor bitter.

When you find, he says, your body of flour spunged large enough, before you put in the rest of your water, you should, with both your hands, mix that which is spunged and the dry flour altogether, and then add the remainder of warm water, and your dough will rise the better and easier.

The reason he assigns why people make heavy bread is, not because they have not barm enough, but because they do not know that barm is the same to flour as

Digitized by Google

as fire is to fuel; that as a spark of fire will kindle a large body by only blowing of it up, so will a thimblefull of barm, by adding of warm water, raise or spunge any body of flour; for warm water gives fresh life to to that which is before at work; so that the reason of making bread heavy is, because the body spunged is not large enough, but was made up and put into the oven before it was ripe.

In regard to the difference of seasons, he prescribes, that in the summer you should put your water bloodwarm; and in winter, in cold frosty weather, as warm as you can bear your hand in it without making it smart; being sure you cover up your dough very warm in the winter, and your covering of it with dry flour every time you add warm water, will keep in the heat; when you have added six or eight quarts of warm water, as before mentioned, in such a gradual way, you will find all the body of flour which is mixed with the warm water, by virtue of that one tea-spoonful of barm, brought into great agitation, waxing or fermenting; for it is to the flour what the spirit is to the body. See BAKING, SUPPLEMENT.

BAKOU, or BAKU, a town of Persia, in the province of Shirvan, situated at the extremity of the gulf of Ghilan on the Caspian sea. It is esteemed the most commodious haven in this sea, as vessels may there ride securely at anchor in seven fathom water; but the number of shoals, islands, and sand-banks, render the entrance in some places extremely difficult and dangerous, particularly to the Russians, who are not very expert sailors. Baku is a fortress surrounded with high brick walls; its inhabitants, like those of Derbent, are Persians, Tartars, and a few Armenian merchants. The principal articles of exportation which support the trade of this place are naphtha, and the finest rock salt, of both which there are mines on the east side of the bay. The inhabitants cultivate saffron and the cotton tree, but not to any considerable advantage. The trade of Baku, though more valuable than that of Derbent, is still inconsiderable, and chiefly carried on with Shamakee, from whence it draws raw silk and silken stuffs. A Russian consul is resident at this place. In 1777 Baku belonged to Melik-Mehmed, who was tributary to Feth Ali khan of Kuba: the latter possessed the whole province of Shirvan, and was the most powerful prince, next to the khan of Ghilan, upon the coast of the Caspian. Before we quit the province of Shirvan, it may not be improper to mention its capital, the inland town of Shamakee, which is only 66 miles from Baku, and supplies that port with raw silk and silken stuffs. It owed its former commercial importance to the silk which is cultivated in the neighbouring district; this rich production still preserves the town from ruin; though its traffic is greatly reduced by the exorbitant exactions of the khan of Kuba. Formerly the Russians had a factory at this place; and it was also crowded with Turkish and Greek merchants; but at present there are only a few Armenian and Indian traders. The inhabitants manufacture silk and cotton stuffs, but far inferior to those made at this place in the beginning of the present century. The silk of this province is exported into the interior part of Persia, Turkey, Georgia, and Russia. E. Long. 51. 30. N. Lat. 40. 20.

BALAAM, a prophet and diviner of the city of Pethor upon the Euphrates, whose practices with Balak king of the Moabites are recorded in the book of Numbers, chap. xxii. It is a question much debated among divines, whether Balaam was a true prophet of God, or no more than a magician or fortune-teller. The Jews indeed are generally of opinion, that he was a busy and pretending astrologer, who, observing when men were under a bad aspect of the stars, pronounced a curse upon them; which sometimes coming to pass, gained him in some neighbouring nations a reputation in his way. Several of the ancient fathers suppose him to be no more than a common soothsayer, who undertook to tell future events, and discover secrets, and by no very justifiable arts. Origen will needs have it, that he was no prophet, but only one of the devil's sorcerers, and that of him he went to inquire; but that God was pleased to prevent him, and put what answers he pleased into his mouth. It cannot be denied, however, that the scripture expressly calls him a prophet (Pet. ii. 5.); and therefore some later writers have imagined that he had once been a good man and true prophet, till loving the wages of iniquity, and prostituting the honour of his office to covetousness, he apostatized from God, and betaking himself to idolatrous practices, fell under the delusion of the devil, of whom he learned all his magical enchantments, though at this juncture, when the preservation of his people was concerned, it might be consistent with God's wisdom to appear to him, and vouchsafe his revelations. As to what passed between him and his ass, when that animal was miraculously enabled to speak to its master, commentators are divided in their opinions concerning this fact, whether it really and literally happened as Moses relates it; or whether it be an allegory only, or the mere imagination or vision of Balaam. This indeed is so wonderful an instance, that several of the Jewish doctors, who upon other occasions are fond enough of miracles, seem as if they would hardly be induced to assent to this. Philo, in his *Life of Moses*, passes it over in silence; and Maimonides pretends that it happened to Balaam in a prophetic vision only. But St Peter (2 Pet. ii. 16.) speaks of this fact as literal and certain, and so all interpreters explain it. St Austin, who understands it exactly according to the letter, finds nothing in the whole account more surprising than the stupidity of Balaam, who heard his ass speak to him, and answered it as if he talked with a reasonable person. He is of opinion, that this diviner was accustomed to prodigies like this, or that he was strangely blinded by his avarice not to be stopped by an event of so extraordinary a nature. Le Clerc thinks, that Balaam might probably have imbibed the doctrine of transmigration of souls, which was certainly very common in the east; and from thence he might be the less astonished at hearing a brute speak. And Dr Patrick thinks that Balaam was in such a rage and fury at the supposed perverseness of his beast crushing his foot, that for the present he could think of nothing else; though the conciseness of Moses's relation, who must be presumed to have omitted many circumstances, which if rightly known would dispel this and many more difficulties that may be imagined in this transaction, does certainly furnish us with a better and more satisfactory answer. St Austin is of opinion, that God had not given the ass a reasonable soul; but permitted it to pronounce

Digitized by Google

nounce certain words, in order to reprove the prophet's covetousness. Gregory of Nyssa seems to think that the ass did not utter any word articulately or distinctly; but that, having brayed as usual, the diviner, whose practice it had been to draw presages from the cries of beasts and singing of birds, comprehended easily the ass's meaning by its noise; Moses, designing to ridicule this superstitious art of augurs and soothsayers, as if the ass really spoke in words articulate.

We must own, says Calmet, that this is a miraculous fact related by an inspired writer, whose authority we are not allowed to call in question in the least particular: but we should study such ways of explaining it as are most conformable to reason, and most proper to solve the difficulties of it, without attacking the truth of the history. Now it is very possible for God to make an ass speak articulately; it is indeed miraculous, and above the ordinary faculty of this animal, but not against the laws of nature.

BALADAN, the scripture name for a king of Babylon (Is. xxxix. 1. 2 Kings xx. 12.), called by profane authors *Belesus*, or *Belesis*, *Nabonassar*, or *Nanybrus*. Baladan at first was no more than governor of Babylon; but entering into a confederacy with Arbaces governor of Media, and rebelling against Sardanapalus king of Assyria, these two generals marched against him with an army of 400,000 men, and were beat in three different battles. But the Bactrians deserting the king, and coming over to Baladan and Arbaces, the rebels attacked the enemy in the night, and made themselves masters of his camp. After this misfortune, Sardanapalus retreated to Nineveh, and left the command of his army to his brother-in-law Salamenes. The conspirators attacked Salamenes, and defeated him in two great battles; after which they laid siege to Nineveh. Sardanapalus sustained the siege for three years; but the Tigris, in the third year, overflowing its banks, beat down 20 furlongs of the walls; whereupon the conspirators entered the city and took possession of it, after Sardanapalus had burnt himself and all his most valuable effects upon a funeral pile erected for that purpose in his palace. Baladan was acknowledged king of Babylon as Arbaces was of Media. Berodach-baladan, who sent ambassadors to Hezekiah (2 Kings xx.), was the son of Baladan.

BALA, a town of Merionethshire in Wales. W. Long. 3. 37. N. Lat. 52. 54.

BALÆNA, or WHALE. See CETOLOGY *Index*.

BALAGATE, a province of Hindostan, and the largest of the three that compose the kingdom of Dekkan. It has Kandish and Barar to the north, Tellinga to the east, Baglana with part of Guzerat to the west, and Visiapour to the south. It is a fruitful and pleasant country, abounding with cotton and sugar. Here they have sheep without horns; but so strong, that when bridled and saddled they will carry boys of ten years of age. Its present capital is Aurengabad, but formerly was Dowlet-Abad; and from the latter the whole province is sometimes called *Dowlet-Abad*.

BALAGATE Mountains, a chain of mountains which divides the coast of Malabar from that of Coromandel, running almost the whole length of the peninsula on this side the Ganges. Some parts of them are covered with fine red earth, which is blown by the strong west winds as far as the island of Ceylon; and when the rays of the sun are reflected from these mountains, they seem to be all on fire. They make surprising alterations in the seasons; for on the north side of Cape Comorin, it is winter in May, June, July, August, and September, in which months it is summer on the south side of the cape; on one side there are continual tempests, thunder, and lightning, while the other enjoys a constant serenity. When black clouds are gathered about the mountains, they are followed by sudden rain, which causes the overflowing of the rivers, and chokes them up with sand, insomuch that they are unnavigable, for some time afterwards. The buildings and clothes of the inhabitants are scarcely sufficient to defend them from the weather. They live upon rice, milk, roots, and herbs, with very little meat; they have likewise a sort of small arrack, but are never given to drunkenness; nor do they import foreign vices, for they never travel abroad.

BALAGNIA, a town of Muscovy, in the province of Saratow, seated on the Wolga. E. Long. 45. 5. N. Lat. 50. 36.

BALAGUER, a city of Catalonia in Spain, seated on the north bank of the river Segra, at the foot of a high mountain, on which there was formerly a fortress. E. Long. 0. 48. N. Lat. 41. 38.

BALAMBUAN, or PADAMBUAN, a strong town of Asia, in the Indies, on the east end of the island of Java, and capital of a territory of the same name. E. Long. 114. 10. S. Lat. 7. 50.

BALANCE, one of the six simple powers, in mechanics, principally used in determining the equality or difference of weights in heavy bodies, and consequently their masses or quantities of matter.

The balance is of two kinds: the ancient and the modern. The ancient or Roman, called also the *statera Romana*, or steel-yard, consists of a lever or beam, moveable on a centre, and suspended near one of its extremities: the bodies to be weighed are applied on one side of the centre; and their weight is shewn by the division marked on the beam, where the weight, which is moveable along the lever, keeps the steel-yard *in equilibrio*. This balance is still frequently used in weighing heavy bodies.

The modern balance now generally used consists of a lever or beam suspended exactly in the middle, having scales or basons hung to each extremity. The lever is called the *jugum* or *beam*; and the two moieties thereof on each side the axis, the *brachia* or *arms*. The line on which the beam turns, or which divides its brachia, is called the *axis*; and when considered with regard to the length of the brachia, is esteemed a point only, and called the *centre of the balance*; the handle whereby it is held, or by which the whole apparatus is suspended, is called *trutina*; and the slender part perpendicular to the beam, whereby either the equilibrium or preponderancy of bodies is indicated, is called the *tongue* of the balance. Thus in fig. 1. Plate LXXXIV. *a b* is the beam, divided into two equal brachia or arms by the white spot in the centre, which is the axis or centre of the balance, and *c* is the tongue. The trutina, on which the axis is suspended, is not represented in this figure, in order to render the other parts more conspicuous.

It follows, from what has been observed, therefore, that

that in the Roman balance, the weight used for a counterpoise is the same, but the point of application varies; in the common balance the counterpoise is various, and the point of application the same. The principle on which each is founded, may be very easily understood from the following observations, and the general properties of the lever. See LEVER.

The beam AB (fig. 2.), is a lever of the first kind; but instead of resting on a fulcrum, is suspended by something fastened to its centre of motion: consequently the mechanism of the balance depends on the same theorems as the lever.

Hence as the quantity of matter in a known weight is to its distance from the centre of motion, so is the distance of the unknown weight to its quantity of matter. Hence the nature and use of the steel-yard is easily known. Let AB (fig. 2.) represent an instrument of this kind; *a*, the trutina, or handle on which the beam turns; *k*, a ring on which the balance may be suspended on a nail or hook; *f*, the hook on which the body to be weighed is hung; *c*, a collar or guard by which the hook *f* is fastened to the beam; *g*, a moveable collar; *h*, a swivel; *i*, the counterpoise. From what has been said it evidently follows, that if the body to be weighed is fastened to the hook *f*, and the whole suspended by the ring *k*, the division on which the counterpoise is placed to maintain an equilibrium in the balance, will show the weight of the body required; provided the weight of the counterpoise *i* be known, and the large divisions, 1, 2, 3, &c. be equal to the distance between the centre of the balance and the screw which fastens the guard *c* to the shorter arm of the balance. It will also be necessary that the steelyard itself, with its whole apparatus, exclusive of the counterpoise, be *in equilibrio*, when suspended on the ring *k*. If the body to be weighed be heavier than the divisions on the longer arm will indicate, the balance is turned the lower side upwards, and suspended on the other ring *b*; by which means the divisions become shorter, because the distance between the trutina *d*, and the screw on which the guard *c* moves, is less: the divisions in the figure on this side extending to 17, whereas they extend only to 6 on the other. It will be unnecessary perhaps to observe, that the same precaution, with regard to the centre of gravity when the balance is suspended, is also necessary when this side of the balance is used, as we before mentioned with regard to the other.

We have already observed, that in the common scales the two brachia or arms of the balance, *e f*, *e g*, fig. 3. are equal to each other, and consequently equal weights placed in the scales *d*, *d*, will be *in equilibrio*, when the balance is suspended on its centre *e*, as in the figure, where the ring at the extremity of the trutina is hung on the tapering rod *a b*, fixed in the foot or basis *c*.

The Deceitful BALANCE, or that which cheats by the inequality of its brachia, is founded on the same principle as the steel-yard. Let there be, for example, a balance so constructed, that both the brachia with their scales shall equiponderate, but that the length of the one arm shall be to that of the other as 10 to 9. In this case, a weight of nine pounds put into the longest arm, will counterpoise one of ten pounds put into the shorter one: but the cheat is immediately discovered by shifting the weight from one scale to the other; in which case, the balance will no longer remain *in equilibrio*.

Assay-BALANCE, a very nice balance used in docimastical operations, to determine exactly the weight of minute bodies; see fig. 4. This balance should be made of the best steel, and of the hardest kind; because that metal is not so easily spoiled with rust as iron; and it is more apt than any other to take a perfect polish, which at the same time prevents the rust.

The structure of the assayer's scale is little different from that of common scales, otherwise than by its nicety and smallness. The longer the beam of it is, the more exact may the weight of a body be found; however, 10 or 12 inches are sufficient length. Let the thickness of it be so little, that two drachms may hardly be hung at either of its extremities without its bending; for the largest weight put upon it seldom exceeds one drachm. The whole surface of this beam must be altogether without ornaments, which only increase the weight and gather dust, &c. The beam is suspended in a fork, the two legs of which are steel springs joined at top, but kept together below with a brass pliant clasp, parallel, and two lines and a half distant from each other. This clasp being taken off, and the legs of the fork being stretched out, the axis of the beam may be put into two holes made for that purpose at the ends of the legs, or be taken away from them. Let a very sharp needle be fixed in the head of the fork, standing perpendicularly downwards, if the fork is suspended, and so long, as that it may almost touch the top of the tongue of the beam put into the fork when in equilibrio. This needle is the mark of the equilibrium; and that the artist may be able to observe this, the legs of the fork must be broader in that place, and have an opening two or three lines wide; this fork may be adorned at pleasure, provided the motion of the balance is not hindered by such ornaments: then take two scales made of thin plate of silver, one inch and a half in diameter, hanging on three small silk strings, almost as long as the beam, tied together at top, with a silver hook in form of an S, and hang them to the extremities of the beam: a smaller silver dish or blued steel, somewhat less than one inch in diameter, belongs to each of these scales. You first put into these dishes, with a pair of pincers, the bodies to be weighed, or with a spoon or a small shovel, when they are pounded, and then you put them into the scales; therefore the small dishes must be perfectly equal in weight. We use them, that bodies may be more conveniently put into and taken out of the scales, and that these which are vastly thin may not be bent or soiled, and thence rendered false by wiping.

This balance is suspended on a moveable brass or copper support, which consists of a pedestal, and of a column set upon it about 20 inches high, at the top of which comes out at right angles an arm one inch long. At the extremity of this arm, put a small pulley three lines in diameter, another at the top of the column, and a third near the bottom of it; all which pulleys must turn very easily on their axes. At the distance of one inch and a half below the upper arm, let another arm one inch and a half long come out of the column at right angles, having a hole through it two lines long, a quarter of a line broad, and placed perpendicularly,

pendicularly below the pulley of the upper arm, to receive a small plate, one inch and a half long; and of such breadth and thickness, as that it may freely move up and down, and yet not have too much play within the hole. This plate must also have a small hook at each extremity.

And as such a balance will hardly stand still in the open air, and becomes false when soiled with dust, it must be put, together with its support, into a small case as represented in fig. 4. having glasses, *a*, *a*, *a*, at top, and all round it, that you may see what is within.

Manner of using the Assay-Balance.—Pass a silk string over the three pulleys of the support, and tie it at its upper extremity to the small hook introduced into the hole of the inferior arm; then put the support in the middle of the small case, and pass the other extremity of the silk string below, through a hole bored in the middle of the lower part of the frame, containing the window in the fore-part of the case, and fasten it to a small weight of a cubic form. Suspend the fork of the balance on the inferior hook of the plate. By this means if you move backwards and forwards the weight fastened to the string, placed upon the top of the drawer jutting out beyond the fore-part of the case, the balance within is either lifted up or let down. But you must put the bodies to be weighed, and the weights themselves, into the small silver dishes; and these, when loaded, into the scales, through the side-windows, which must be opened for that purpose. When any thing is to be added or taken out of them, you do it with the small pincers; or, if it is powder, with the small shovel or spoon: but you must let the balance down every time any thing is to be added or taken away, that the scales may rest upon the bottom of the case; and shut the windows before the balance is lifted up again, especially if the air is not perfectly calm.

Hydrostatic Balance, an instrument contrived to determine accurately the specific gravity of both solid and fluid bodies. It is constructed in various forms; but we shall content ourselves here with describing that which appears of all others the most accurate.

VCG (fig. 5.) is the stand or pillar of this hydrostatic balance, which is to be fixed in a table. From the top A hangs, by two silk strings, the horizontal bar BB, from which is suspended, by a ring *i*, the fine beam of a balance *b*; which is prevented from descending too low on either side by the gently springing piece *t x y z*, fixed on the support M. The harness is annulated at *o*, to show distinctly the perpendicular position of the examen, by the small pointed index fixed above it.

The strings by which the balance is suspended, passing over two pulleys, one on each side the piece at A, go down to the bottom on the other side, and are hung over the hook at *v*; which hook, by means of a screw P, is moveable about one inch and a quarter, backward and forward, and therefore the balance may be raised or depressed so much. But if a greater elevation or depression be required, the sliding piece S, which carries the screw P, is readily moved to any part of the square brass rod VK, and fixed by means of a screw.

The motion of the balance being thus adjusted, the rest of the apparatus is as follows. HH is a small board, fixed upon the piece D, under the scales *d* and *e*, and is moveable up and down in a low slit in the pillar above C, and fastened at any part by a screw behind. From the point in the middle of the bottom of each scale hangs, by a fine hook, a brass wire *a d* and *a c*. These pass through two holes *m m* in the table. To the wire *a d* is suspended a curious cylindric wire *r s*, perforated at each end for that purpose: this wire *r s* is covered with paper, graduated by equal divisions, and is about five inches long.

In the corner of the board at E, is fixed a brass tube, on which a round wire *h l* is so adapted as to move neither too tight nor too free, by its flat head I. Upon the lower part of this moves another tube Q, which has sufficient friction to make it remain in any position required: to this is fixed an index T, moving horizontally when the wire *h l* is turned about, and therefore may be easily set to the graduated wire *r s*. To the lower end of the wire *r s* hangs a weight L; and to that a wire *p n*, with a small brass ball *g* about one-fourth of an inch diameter. On the other side, to the wire *a c*, hangs a large glass bubble R, by a horse hair.

Let us first suppose the weight L taken away, and the wire *p n* suspended from S: and, on the other side, let the bubble R be taken away, and the weight F, suspended at *c*, in its room. This weight F we suppose to be sufficient to keep the several parts hanging to the other scale in equilibrium; at the same time that the middle point of the wire *p n* is at the surface of the water in the vessel N. The wire *p n* is to be of such a size, that the length of one inch shall weigh four grains.

Now it is evident, since brass is eight times heavier than water, that for every inch the wire sinks in the water it will become half a grain lighter, and half a grain heavier for every inch it rises out of the water: consequently, by sinking two inches below the middle point, or rising two inches above it, the wire will become one grain lighter or heavier. Therefore, if, when the middle point is at the surface of the water in equilibrium, the index T be set to the middle point *a* of the graduated wire *r s*, and the distance on each side *a r* and *a s* contains 100 equal parts: then, if in weighing bodies the weight is required to the hundredth part of a grain, it may be easily had by proceeding in the following manner.

Let the body to be weighed be placed in the scale d. Put the weight X in the scale e; and let this be so determined, that one grain more shall be too much, and one grain less too little. Then the balance being moved gently up or down, by the screw P, till the equilibrium be nicely shown at *o*; if the index T be at the middle point *a* of the wire *r s*, it shows that the weights put into the scale e are just equal to the weight of the body. By this method we find the absolute weight of the body; the relative weight is found by weighing it hydrostatically in water, as follows.

Instead of putting the body into the scale e, as before, let it hang with the weight F, at the hook *c*, by a horse hair, as at R, supposing the vessel O of water were away. The equilibrium being then made, the index T standing between *a* and *r*, at the 36 division,

Digitized by Google

sion, shows the weight of the body put in to be 1095.36 grains. As it thus hangs, let it be immersed in the water of the vessel O, and it will become much lighter: the scale e will descend till the beam of the balance rest on the support z. Then suppose 100 grains put into the scale d restore the equilibrium precisely, so that the index T stand at the 36 division above *a*; it is evident that the weight of an equal bulk of water would, in this case, be exactly 100 grains.

Balance of Power, a principle admitted in the modern policy of Europe, the object of which is to prevent any single state from acquiring such a preponderance as to endanger the independence of the others. See Balance of Power in the Supplement.

Balance of Trade. What is commonly meant by the balance of trade, is the equal importing of foreign commodities with the exporting of the native. A favourable balance is when the exports exceed the imports; because in this case the balance of the account must be made up in bullion or money; and the nation grows so much richer. This idea is, however, now regarded as entirely fallacious by all sound political economists.

Balance of a Clock, or *Watch*, is that part which regulates the beats. See *Clock-Making*.

Balance-Fish. See Squalus, Ichthyology *Index*.

BALANCER, in the history of insects, a style, or oblong body, ending in a protuberance or head, found under each wing of the two-winged flies; these, it is supposed, serve to poise the body of the fly.

BALANCING, among seamen, the contracting a sail into a narrower compass, in a storm, by retrenching, or folding up a part of it at one corner: this method is used in contradistinction to reefing, which is common to all the principal sails; whereas balancing is peculiar to few, such as the mizen of a ship, and the main sail of those vessels wherein it is extended by a boom. See Boom and Reef.—The balance of the mizen is thus performed: the mizen yard is lowered a little, then a small portion of the sail is rolled up at the peek or upper corner, and fastened to the yard about one fifth inward from the outer end or yard-arm toward the mast. See Mizen.—A boom main-sail is balanced, after all its reefs are taken in, by rolling up a similar portion of the hindmost or aftmost lower corner called the *clue*, and fastening it strongly to the boom, having previously wrapped a piece of old canvas round the part (which is done in both cases) to prevent the sail from being fretted by the cord which fastens it.

BALANUS, the trivial name of a species of lepas. See Lepas, Conchology *Index*.

BALAUSTINES, in *Botany*. See Punica, Botany *Index*.

BALAYAN, a province of the island of Manilla in the East Indies, belonging to the Spaniards.—It lies next to the city of Manilla, and extends along the coast on the east side of the island, a little beyond the bay of Batangas. There were formerly gold mines in it, but they have been long since abandoned. It is inhabited by about 2500 tributary Indians, and abounds in cotton, rice, and palm-trees. The province is well cultivated; and the Spaniards, generally speaking, have country-houses in it.

BALBASTRO, an episcopal town of Spain, in the kingdom of Arragon, and capital of a district of the same name. E. Long. 0. 20. N. Lat. 41. 50.

BALBEC, a city of Asia, in Syria, anciently called *Heliopolis*, and by the Arabians *The wonder of Syria*. It is situated at the foot of Anti-Lebanon, precisely on the last rising ground where the mountain terminates in the plain. As we arrive from the south we discover the city only at the distance of a league and a half, behind a hedge of trees, over the verdant tops of which appears a white edging of domes and minarets. After an hour's journey we reach these trees, which are very fine walnuts; and soon after, crossing some ill cultivated gardens, by winding paths, arrive at the entrance of the city. We there perceive a ruined wall, flanked with square towers, which ascends the declivity to the right, and traces the precincts of the ancient city. This wall, which is only ten or twelve feet high, permits us to have a view of those void spaces and heaps of ruins which are the invariable appendage of every Turkish city; but what principally attracts our attention is a large edifice on the left, which, by its lofty walls and rich columns, manifestly appears to be one of those temples which antiquity has left for our admiration. These ruins, which are some of the most beautiful and best preserved of any in Asia, merit a particular description.

To give a just idea of them, we must suppose ourselves descending from the interior of the town. After having crossed the rubbish and huts with which it is filled, we arrive at a vacant place which appears to have been a square; there in front, towards the west, we perceive a grand ruin, which consists of two pavilions ornamented with pilasters, joined at their bottom angle by a wall 160 feet in length. This front commands the open country from a sort of terrace, on the edge of which we distinguish with difficulty the bases of twelve columns, which formerly extended from one pavilion to the other, and formed a portico. The principal gate is obstructed by heaps of stones; but, that obstacle surmounted, we enter an empty space, which is a hexagonal court of 180 feet diameter. This court is strewed with broken columns, mutilated capitals, and the remains of pilasters, entablatures, and cornices; around it is a row of ruined edifices, which display all the ornaments of the richest architecture. At the end of this court, opposite the west, is an outlet, which formerly was a gate, through which we perceive a still more extensive range of ruins, whose magnificence strongly excites curiosity. To have a full prospect of these, we must ascend a slope, up which were the steps to this gate; and then we arrive at the entrance of a square court, much more spacious than the former, being 350 feet wide and 336 in length. The eye is first attracted by the end of this court, where six enormous and majestic columns render the scene astonishingly grand and picturesque. Another object not less interesting is a second range of columns to the left, which appear to have been part of the peristyle of a temple; but before we pass thither, we cannot refuse particular attention to the edifices which enclose this court on each side. They form a sort of gallery

Digitized by Google

Balbec. gallery which contains various chambers, seven of which may be reckoned in each of the principal wings, viz. two in a semicircle, and five in an oblong square. The bottom of these apartments still retains pediments of niches and tabernacles, the supporters of which are destroyed. On the side of the court they are open, and present only four and six columns totally destroyed. It is not easy to conceive the use of these apartments; but this does not diminish our admiration at the beauty of their pilasters and the richness of the frize of the entablature. Neither is it possible to avoid remarking the singular effect which results from the mixture of the garlands, the large foliage of the capitals, and the sculpture of wild plants with which they are everywhere ornamented. In traversing the length of the court, we find in the middle a little square esplanade, where was a pavilion, of which nothing remains but the foundation. At length we arrive at the foot of the six columns; and then first conceive all the boldness of their elevation and the richness of their workmanship. Their shafts are 21 feet eight inches in circumference, and 58 high; so that the total height, including the entablature, is from 71 to 72 feet. The sight of this superb ruin, thus solitary and unaccompanied, at first strikes us with astonishment; but, on a more attentive examination, we discover a series of foundations, which mark an oblong square of 268 feet in length and 146 wide, and which, it seems probable, was the peristyle of a grand temple, the primary purpose of this whole structure. It presented to the great court, that is to the east, a front of ten columns, with 19 on each side, which, with the other six, make in all 54. The ground on which it stood was an oblong square, on a level with this court, but narrower than it, so that there was only a terrace of 27 feet wide round the colonnade; the esplanade this produces fronts the open country towards the west, by a sloping wall of about 30 feet. This descent, as you approach the city, becomes less steep, so that the foundation of the pavilion is on a level with the termination of the hill; whence it is evident that the whole ground of the courts has been artificially raised. Such was the former state of this edifice; but the southern side of the grand temple was afterwards blocked up to build a smaller one, the peristyle and walls of which are still remaining. This temple, situated somewhat lower than the other, presents a side of 13 columns by eight in front (in all 34), which are likewise of the Corinthian order; their shafts are 15 feet eight inches in circumference, and 44 in height. The building they surround is an oblong square, the front of which, turned towards the east, is out of the line of the left wing of the great court. To reach it you must cross trunks of columns, heaps of stone, and a ruinous wall by which it is now hid. After surmounting these obstacles you arrive at the gate, where you may survey the enclosure which was once the habitation of a god; but instead of the awful scene of a prostrate people and sacrifices offered by a multitude of priests, the sky is seen through the open roof, which lets in light to show a chaos of ruins covered with dust and weeds. The walls, formerly enriched with all the ornaments of the Corinthian order, now present nothing but pediments of niches and tabernacles, of which almost all the supporters are fallen to the ground. Between these niches is a range of fluted pilasters, whose capitals support a broken entablature; but what remains of it displays a rich frize of foliage resting on the heads of satyrs, horses, bulls, &c. Over this entablature was the ancient roof, which was 57 feet wide and 110 in length. The walls which supported it are 31 feet high, and without a window. It is impossible to form any idea of the ornaments of this roof, except from the fragments lying on the ground; but it could not have been richer than the gallery of the peristyle: the principal remaining parts contain tablets in the form of lozenges, on which are represented Jupiter seated on his eagle; Leda caressed by the swan; Diana with her bow and crescent; and several busts which seem to be figures of emperors and empresses. It would lead us too far to enter more minutely into the description of this astonishing edifice. The lovers of the arts will find it described with the greatest truth and accuracy in a work published at London in 1757, under the title of *Ruins of Balbec*. This work, compiled by Mr Robert Wood, the world owes to the attention and liberality of Mr Dawkins, who in 1751 visited Balbec and Palmyra. But several changes, however, have taken place since their journey; for example, they found nine large columns standing, and in 1784 Mr Volney found but six. They reckoned 29 at the lesser temple, but there now remain but 20; the others having been overthrown by the earthquake of 1759. It has likewise so shaken the walls of the lesser temple, that the stone of the soffit, or cross stone at the top of the gate, has slid between the two adjoining ones, and descended eight inches; by which means the body of the bird sculptured on that stone is suspended, detached from its wings and the two garlands which hung from its beak, and terminated in two genii. Nature alone has not effected this devastation; the Turks have had their share in the destruction of the columns. Their motive is to procure the iron cramps, which serve to join the several blocks of which each column is composed. These cramps answer so well the end intended, that several of the columns are not even disjointed by their fall; one, among others, as Mr Wood observes, has penetrated a stone of the temple wall without giving way. Nothing can surpass the workmanship of these columns; they are joined without any cement, yet there is not room for the blade of a knife between their interstices. After so many ages, they in general still retain their original whiteness. But what is still more astonishing, is the enormous stones which compose the sloping wall. To the west the second layer is formed of stones which are from 28 to 35 feet long, by about nine in height. Over this layer, at the north-west angle, there are three stones which alone occupy a space of 175½ feet; viz. the first 58 feet seven inches, the second 58 feet 11, and the third exactly 58 feet; and each of these is 12 feet thick. These stones are of a white granite, with large shining flakes like gypsum; there is a quarry of this kind of stone under the whole city and in the adjacent mountain, which is open in several places, and among others on the right, as we approach the city. There is still lying there a stone, hewn on three sides, which is 69 feet two inches long, 12 feet 10 inches broad, and 13 feet three in thickness. By what means could the ancients move these enormous masses? This is doubtless

Digitized by Google

less a problem in mechanics curious to resolve. The inhabitants of Balbec have a very commodious manner of explaining it, by supposing these edifices to have been constructed by *Djenoun*, or genii, who obeyed the orders of King Solomon; adding, that the motive of such immense works was to conceal in subterraneous caverns vast treasures, which still remain there. To discover these, many have descended into the vaults which range under the whole edifice: but the inutility of their researches, added to the oppressions and extortions of the governors, who have made their supposed discoveries a pretext, have at length disheartened them; but they imagine the Europeans would be more successful, nor would it be possible to persuade them but that we are possessed of the magic art of destroying talismans. It is in vain to oppose reason to ignorance and prejudice: and it would be no less ridiculous to attempt to prove to them that Solomon never was acquainted with the Corinthian order, which was only in use under the Roman emperors. But their tradition on the subject of this prince may suggest three important observations. First, That all tradition relative to high antiquity is as false among the Orientals as the Europeans. With them, as with us, facts which happened 100 years before, when not preserved in writing, are altered, mutilated, or forgotten. To expect information from them with respect to events in the time of David or Alexander, would be as absurd as to make inquiries of the Fleming peasants concerning Clovis or Charlemagne. Secondly, That throughout Syria, the Mahometans, as well as the Jews and Christians, attribute every great work to Solomon: not that the memory of him still remains by tradition in those countries, but from certain passages in the Old Testament; which, with the gospel, is the source of almost all their tradition, as these are the only historical books read or known; but as their expounders are very ignorant, their applications of what they are told are generally very remote from truth. By an error of this kind they pretend Balbec is *the house of the forest of Lebanon* built by Solomon: nor do they approach nearer probability, when they attribute to that king the well of Tyre and the buildings of Palmyra. Thirdly, That the belief in hidden treasures has been confirmed by discoveries which have been really made from time to time. It is not many years since a small coffer was found at Hebron full of gold and silver medals, with an ancient Arabic book on medicine. In the country of the Druses an individual discovered likewise, some time since, a jar with gold coin in the form of a crescent; but as the chiefs and governors claim a right to these discoveries, and ruin those who have made them, under pretext of obliging them to make restoration, those who find any thing endeavour carefully to conceal it; they secretly melt the antique coins, nay frequently bury them again in the same place where they found them, from the same fears which caused their first concealment, and which prove the same tyranny formerly existed in these countries.

When we consider the extraordinary magnificence of the temple of Balbec, we cannot but be astonished at the silence of the Greek and Roman authors. Mr Wood, who has carefully examined all the ancient writers, has found no mention of it except in a fragment of John of Antioch, who attributes the construction of this edifice to Antoninus Pius. The inscriptions which remain corroborate this opinion, which perfectly accounts for the constant use of the Corinthian order, since that order was not in general use before the third age of Rome; but we ought by no means to allege as an additional proof the bird sculptured over the gate; for if his crooked beak, large claws, and the caduceus he bears, give him the appearance of an eagle, the tuft of feathers on his head, like that of certain pigeons, proves that he is not the Roman eagle: besides that the same bird is found in the temple of Palmyra; and is therefore evidently an Oriental eagle, consecrated to the sun, who was the divinity adored in both these temples. His worship existed at Balbec in the most remote antiquity. His statue, which resembled that of Osiris, had been transported thither from the Heliopolis of Egypt, and the ceremonies with which he was worshipped there have been described by Macrobius, in his curious work entitled *Saturnalia*. Mr Wood supposes with reason, that the name of Balbec, which in Syriac signifies *City of Bal*, or of the sun, originated in this worship. The Greeks, by naming it *Heliopolis*, have in this instance only given a literal translation of the oriental word: a practice to which they have not always adhered. We are ignorant of the state of this city in remote antiquity; but it is to be presumed, that its situation on the road from Tyre to Palmyra, gave it some part of the commerce of these opulent capitals. Under the Romans, in the time of Augustus, it is mentioned as a garrison town: and there is still remaining, on the wall of the southern gate, on the right, as we enter, an inscription which proves the truth of this, the words KENTURIA PRIMA, in Greek characters, being very legible. One hundred and forty years after, Antoninus built there the present temple, instead of the ancient one, which was doubtless falling into ruins: but Christianity having gained the ascendency under Constantine, the modern temple was neglected, and afterwards converted into a church; a wall of which is now remaining, that hid the sanctuary of the idols. It continued thus until the invasion of the Arabs, when it is probable they envied the Christians so beautiful a building. The church being less frequented fell to decay; wars succeeded; and it was converted into a place of defence; battlements were built on the wall which surrounded it, on the pavilions and at the angles which still subsist; and from that time, the temple, exposed to the fate of war, fell rapidly to ruin. The state of the city is not less deplorable. The wretched government of the emirs of the house of Harfoushe had already greatly impaired it, and the earthquake of 1759 completed its destruction. The wars of the Emir Yousef and Djezzar have rendered it still more deserted and ruinous. Of 5000 inhabitants, at which number they were estimated in 1751, not 1200 are now remaining; and all these poor, without industry or commerce, and cultivating nothing but a little cotton, some maize, and water-melons.

BALBINUS, Decimus Coelius, the Roman emperor, being chosen by the senate in 237, was massacred by the soldiers, who had a dislike to such emperors as were elected only by the senators. This prince was eloquent, and wrote pretty good verses.

BALBOA, Vasco Nugnes de, a Castilian; a

Digitized by Google

celebrated navigator, and one of the first discoverers of South America. He was beheaded by the Spanish governor of St Mary, through jealousy of his growing reputation, in 1517, aged 42.

BALBUS, Lucius Cornelius Theophanes, was born at Cadiz, and distinguished himself by his valour in the war carried on by the Romans in Spain against Sertorius and the Lusitanians, on which account Pompey gave him the privileges of a Roman citizen. He was consul in the 714th year of Rome, and was the first foreigner on whom that dignity was conferred. He was the friend of Pompey, Cæsar, Crassus, and Cicero.—There were many other illustrious Romans of the name of *Balbus*.

BALCONY, in *Architecture*, a projecture in the front of a house, or other building, supported by pillars or consoles, and encompassed with a balustrade.

BALDACHIN, or Baldaquin, in *Architecture*, a building in form of a canopy, supported by pillars, and frequently used as a covering to insulated altars. Some also use the term *balduchin* for the shell over a door.

BALDINUCCI, Philip, of Florence; a connoisseur in the polite arts, and the continuator of Vasari's Lives of the Painters. He died in 1696, aged 72.

BALDIVIA, or Valdivia, a sea-port town of Chili, in America, belonging to the Spaniards. It is situated between the rivers Callaculles and Portero, where they fall into the South sea. W. Long. 74. 2. S. Lat. 39. 55. It was built in 1551 by the Spanish general Baldivia, from whom it takes its name. We may judge of its importance from the sum granted annually by the king for maintaining the garrisons and keeping the fortifications in repair, being no less than 300,000 pieces of eight. It is defended by four strong castles, mounting 100 pieces of fine brass cannon. Notwithstanding which, however, as the garrison is composed mostly of transported criminals, on whom no dependence can be placed, and generally ill supplied with ammunition, &c. it could make but a poor defence. In 1643 it was easily taken by the Dutch, who would probably have maintained their conquest against all the power of the Spanish viceroy, had they not been obliged to relinquish it through sickness and famine. The inhabitants of Baldivia amount to about 2000. The trade is less considerable than formerly, because the gold mines in the neighbourhood are shut up. It formerly carried on a considerable trade with Lima, in corn, hides, salt provisions, &c.; but this must now have ceased, since Baldivia, with all the other parts of Chili, has fallen into the hands of the independent party.

BALDINJER, Ernest G. a German physician. See Supplement.

BALDNESS, a defect of hair, chiefly on the sinciput. It differs from *alopecia*, *area*, *ophiasis*, and *tinea*, as these all arise from some vice in the nutritious humour; *baldness*, from the defect of it. When the eyelids shed their hair, it is called a *ptilosis*. Among the causes of baldness, immoderate venery is reputed one of the chief; old age usually brings it on of course. Some will have the proximate cause of baldness to be the dryness of the brain, and its shrinking from the cranium; it having been observed, that in bald persons there is always a vacuity or empty space between the skull and the brain.—*Calvus*, *bald-pate*, was a frequent term of reproach among the Romans; among whom this defect was in great discredit. Hence divers arts to conceal it, as false hair, a *galericulus* contrived on purpose. The later Romans, however, seem to have been reconciled to baldness; for we find among them a kind of officers, or servants, called *glabratores* or *glabrarii*, whose business was to take off the hair from all parts, even from the head. In an ancient inscription, there is mention of one Diophantus, TI, CÆSARIS, ornator glabr, that is, *Ornator Glabrarius*.

BALDOC, a town of Hertfordshire, in England, chiefly noted for its trading in malt. Population 1438. W. Long. 0. 10. N. Lat. 51. 55.

BALDOCK, Ralph de, bishop of London in the reigns of Edward I. and II. was educated at Merton-college, in Oxford; became dean of St Paul's; was afterwards promoted to the see of London; and at last was made lord high chancellor of England. He had a very amiable character both for morals and learning; and wrote *Historia Anglica*, or a History of the British Affairs down to his own time; and, A Collection of the Statutes and Constitutions of the church of St Paul. Bishop Baldock died at Stepney, July 24. 1313.

BALDWIN, archbishop of Canterbury, was born of obscure parents at Exeter, where, in the early part of his life, he taught a grammar school; after which he took orders, and was made archdeacon of Exeter; but he resigned that dignity, and became a Cistertian monk in the monastery of Ford in Devonshire, of which in a few years he was made abbot. In the year 1180, he was consecrated bishop of Worcester. In 1184, he was promoted to the see of Canterbury by Pope Lucius III. and by his successor Urban III. was appointed legate for that diocese. He laid the foundation of a church and monastery in honour of Thomas Becket, at Hackington, near Canterbury, for secular priests; but, being opposed by the monks of Canterbury and the pope, was obliged to desist. In 1190 he crowned King Richard I. at Westminster; and soon after followed that prince to the Holy Land, where he died at the siege of Ptolemais. Giraldus Cambrensis, who accompanied him in this expedition, says, he was of a mild disposition, and of great abstinence. He wrote various tracts on religious subjects, which were collected and published by Bertrand Tissier in 1662.

BALE, John, bishop of Ossory in Ireland, was born at Cove, near Dunwich in Suffolk, in the year 1495. At 12 years of age he was entered in the monastery of Carmelites at Norwich, and was thence sent to Jesus college in Oxford. He was educated a Roman Catholic, but was converted to the Protestant religion by Thomas Lord Wentworth. On the death of Lord Cromwell, favourite of Henry VIII. who protected him from the persecutions of the Romish clergy, he was obliged to fly into the Low Countries, where he continued eight years. Soon after the accession of Edward VI. he was recalled; and being first presented to the living of Bishop's Stocke in Hampshire, in 1552, he was nominated to the see of Ossory. During his residence in Ireland he was remarkably assiduous in propagating the Protestant doctrines; but to very little purpose, and frequently at the hazard of his life. Once, in particular, they murdered five of his domestics, who were making hay in a meadow near his

Digitized by Google

his house; and would probably have done the same by him, if the sovereign of Kilkenny had not come to his assistance with 100 horse and 300 foot. On the accession of Queen Mary, the tide of opposition became so powerful, that, to avoid assassination, he embarked for Holland, but was very unfortunate in his escape. First he was taken by a Dutch man of war, and robbed by the captain of all his effects. Then, being forced by stress of weather into St Ive's in Cornwall, he was confined on suspicion of treason. Being, however, released after a few days confinement, the ship anchored in Dover road, where he was again seized on a false accusation. After his arrival in Holland, he was kept prisoner for three weeks, and at length obtained his liberty on paying 30l. From Holland he travelled to Basil in Switzerland, where he continued till Queen Elizabeth ascended the throne. After his return to England he was in 1560 made prebendary of Canterbury, probably not choosing to return to his former flock of wolves. He died in November 1563, at Canterbury, in the 68th year of his age. He was so severe a writer against the church of Rome, that his books are particularly prohibited in the expurgatory index published at Madrid, in folio, in the year 1667. He is the earliest dramatic writer in the English language, or at least author of the first pieces of that kind that we find in print. Of his writings in that way no fewer than 21 have been enumerated: only three of them, however, have been seen in print, viz. 1. God's Promises, an interlude; 2. St John Baptist, an interlude; 3. Concerning the Laws of Nature corrupted: the first of which has been reprinted by Dodsley, in the first volume of his collection of old plays; and the only copy extant of the last is preserved in St Sepulchre's library in Dublin. As to the rest, they are mentioned by himself as his own, in his account of the writers of Britain before mentioned. He also translated the tragedies of Pammachius. His other works are very numerous; but the chief is his catalogue of British Authors: a book of some merit, as it contains some information which is not elsewhere to be found; but he has destroyed his credit by his intemperate Billingsgate abuse of all those who differed from him in religion. The authentic part of his work is transcribed from Leland. The title of it is, *Illustrium Majoris Britanniæ scriptorum catalogus, à Japheto sanctissimi Noa filio ad an. Dom.* 1557.

BALE, in commerce. Any goods packed up in cloth, and corded round very tight, in order to keep them from breaking, or preserve them from the weather, is called a *bale*.—A bale of cotton yarn is from 300 to 400 weight; of raw silk, is from 100 to 400; of lockram or dowlas, either three, three and a half, or four pieces.

BALE Goods, among the English merchants, are all such as are imported or exported in bales; but the French give that name to certain hardwares and other sorts of merchandise which come to Paris, and are commonly made by bad workmen of different materials.

BALEARES INSULÆ, or the *Balearic Islands*. The appellation is commonly derived from Βαλλειν, because the inhabitants were excellent slingers. But Bochart makes the name of Punic or Phœnician original, as were the people: *Baal-jare*, a master, or skilful at throwing; the Phœnicians and Hebrews being dexterous at the use of the sling. The Greeks called these islands *Gymnesiæ* (Strabo); because in summer the inhabitants went naked (Diodorus, Livy), or rather because only armed with a sling in war (Hesychius). They are two in number, the Greater and the Less, or Major and Minor; and hence the modern names *Majorca* and *Minorca*. The Major is distant from the Minor 30 miles to the west, in length 40 miles, and in circuit 150 (Pliny). They were subdued by Quintus Metellus, thence surnamed *Balearicus*, in the year 120 B. C. The Baleares, together with the adjacent islands, were a part of the Provincia Citerior or Tarraconensis, and of the resort of the Conventus Carthaginiensis or New Carthage. These islands are called *Choearades* by Apollonius, and *Choeradades* by Strabo, i. e. "rocky." See MAJORCA and MINORCA.

BALEARIC ISLANDS. See the preceding article.

BALECHOU, JOHN JOSEPH, a very celebrated and well known French engraver, flourished about 1750. He died, according to Basan, some few years since, at Avignon. This extraordinary artist worked entirely with the graver; and he was perfectly master of that instrument. The clearness of his strokes, and the depth of colour which he produced, are far beyond any production prior to his own. The two large plates which he did from Vernet, one representing a *storm*, the other a *calm*, must ever be considered as very astonishing exertions of the artist. They are too well known, and too much admired, to need any further eulogium; and were never equalled until they were perhaps surpassed by our countryman Woollet.

BALEN, HENDRICK VAN, history and portrait painter, was born at Antwerp in 1560, and was a disciple of Adam Van Oort; but he quitted that master to acquire a better taste of design and composition, by pursuing his studies at Rome, where he resided for a considerable time. He copied the antiques; he attended to the works of the most memorable modern artists; and at his return to his own country, the visible improvement of his taste recommended him to the favour and esteem of the ablest judges of the art. He distinguished himself by a good manner of designing, and his works are admitted into the cabinets of the curious among those of the principal painters. He particularly excelled in the naked, and gave to his figures so much truth, roundness, and correctness of outline, that few of his cotemporaries could enter into competition with him. Several fine portraits of his hand are at the Hague; among which there is one adorned with allegorical figures of Wisdom and Justice, which extorts commendation from all who attentively consider it. He died in 1632. All the historical subjects painted by Van Balen have abundant merit. His designs of the Deluge, of Moses striking the Rock, and the drowning of Pharaoh, are grand and noble compositions. Houbraken observes, that Van Balen with great judgment, hath introduced the Israelites in a clear light in the back-ground, but the Egyptians in a strong shadow in the fore-ground, which had a very fine effect; the figures being well designed, the attitudes and draperies well chosen, and the number of the figures being very considerable. Of this painter's hand also, the Judgment of Paris is accounted a masterly performance;

Digitized by Google

performance; in which the figure of Venus is so elegantly designed, so full of life, and so round, that it seems to stand forth from the surface. The landscapes and back grounds of the pictures composed by Van Balen were generally painted by the Velvet Breughel.

BALEN, *John Van*, painter of history, landscapes, and boys, was born at Antwerp in 1611; and derived his knowledge of the art, and his fine taste of drawing and design, from his father Hendrick Van Balen; but as soon as he had made a competent progress, he travelled to Rome, and lived for several years in that and other cities of Italy. There he acquired a good gusto of design, though he was sometimes incorrect; and his particular merit was shown in his naked figures of boys, cupids, nymphs bathing or hunting, of which subjects he painted a considerable number; and he procured both praise and riches by his landscapes and histories. His pictures were well handled, his trees touched with spirit, and his herbage and verdure looked natural and lively. The carnations of his figures were clear and fresh; his colouring in general was transparent; and the airs of his heads were in the manner of Albano.

BALES, PETER, a famous master in the art of penmanship, or fair writing; and one of the first inventors of short-hand writing. He was born in 1547, and is styled by Anthony Wood "a most dexterous person in his profession, to the great wonder of scholars and others;" who adds, that "he spent several years in sciences among Oxonians, particularly as it seems in Gloucester-hall: but that study, which he used for a diversion only, proved at length an employment of profit." He is recorded for his skill in micrography, or miniature-writing, in Hollingshed's Chronicle, anno 1575; and Mr Evelyn also has celebrated his wonderful skill in this delicate operation of the hand. "Hadrian Junius, speaking as a miracle of somebody, who wrote the Apostles Creed, and the beginning of St John's Gospel, within the compass of a farthing: what would he have said," says Mr Evelyn, "of our famous Peter Bales; who, in the year 1575, wrote the Lord's Prayer, the Creed, Decalogue, with two short prayers in Latin, his own name, motto, day of the month, year of the Lord, and reign of the Queen, to whom he presented it at Hampton Court, all of it written within the circle of a single penny, inchaced in a ring and borders of gold; and covered with a crystal so accurately wrought, as to be very plainly legible, to the great admiration of her Majesty, the whole Privy-Council, and several ambassadors then at Court?" He was farther very dexterous in imitating hand-writing, and about 1586, was employed by Secretary Walsingham in certain political manœuvres. We find him at the head of a school, near the Old Bailey, London, in 1590; in which year he published his "Writing Schoolmaster, in three parts: the first teaching swift writing; the second, true writing; the third, fair writing." In 1595, he had a great trial of skill in the Blackfriars with one Daniel Johnson, for a golden pen of 20l. value, and won it; and a contemporary author farther relates, that he had also the arms of Calligraphy given him, which are Azure, a Pen, Or, as a prize, at a trial of skill in this art among the best penmen in London. In 1597, he republished his "Writing Schoolmaster;" which was in such high reputation, that no less than eighteen copies of commendatory verses composed by learned and ingenious men of that time, were printed before it. Wood says, that he was engaged in Essex's treasons in 1600; but Wood was mistaken: he was only engaged, and very innocently so, in serving the treacherous purposes of one of that earl's mercenary dependants. We know little more of this curious person, but that he seems to have died about the year 1610.

BALESTRA, ANTONIO, an excellent historical painter, was born at Verona in 1666. At the age of 21 he went to Venice, where he entered himself in the school of Antonio Bellucci, and continued for three years under his direction; but from thence he visited Bologna and Rome, and at the latter became the disciple of Carlo Maratti. Under the tuition of so eminent a genius, he made a very great proficiency, and exerted himself for some hours of each day in designing after the antiques, after Raphael, Correggio, Hannibal Carracci, and other admired painters; by which conduct he so effectually confirmed his taste and freedom of hand, that he obtained the prize of merit in the Academy of St Luke, in the year 1694, when he was only 28 years of age. From that time his reputation was established, and he received sufficient encouragement; being engaged to work for most of the churches, and in the palaces of the nobility; and his paintings were admired in every part of Europe. His style is sweet and agreeable, not unlike that of Maratti; and the judicious observe in the works of Balestra, a certain mixture of the several manners of Raphael, Correggio, and Carracci. He died in 1740. In the church of Santa Maria Mater Domini at Venice, there is one of the most capital performances of Balestra, representing the nativity of our Saviour. It is designed in a grand style, the composition is excellent, and has a great deal of grace. The heads are peculiarly fine; and the whole has a noble effect, with remarkable harmony. In a chapel belonging to the church of S. Geminiano, in the same city, there is a dead Christ in the arms of the Virgin, painted by this master in a grand taste; and although the composition consists but of a few figures, they are finely designed; and in every part of it there is sufficient merit to claim and justify applause.

BALEY, WALTER, the son of Henry Baley of Warnwell in Dorsetshire, was born at Potsham in the same county, and educated at Westminster school. From thence he was sent to Oxford; and, after two years probation, was admitted perpetual fellow of New College in the year 1550. Having taken his degrees in arts, he practised physic, and in 1558 was proctor of the university. About this time he obtained a prebend of Wells, which he resigned in 1579. In the year 1561 he was appointed queen's professor of physic, in 1563 proceeded doctor in that faculty, and afterwards became one of her majesty's physicians in ordinary. He was thought skilful in his profession, and had considerable practice. He died in 1592, aged 63; and was buried in the inner chapel of New College. His works are, 1. *A discourse of three kinds of paper in common use*, 1588, 8vo. 2. *Brief treatise of the preservation of the eye sight;* first printed in the reign of Elizabeth, in 12mo; afterwards at Oxford in 1616 and 1654, 8vo. 3. *Directions for health natural and artificial;*

Digitized by Google

tificial; with medicines for all diseases of the eyes, 1626, 4to. 4. *Explicatio Galeni de potu convalescentium et senum*, &c. manuscript, formerly in Lord Aylesbury's library.

BALI, an island of Asia, in the East Indies, forming the north side of the straits of Java, through which the East India ships sometimes return from China to Europe: but the passage is commonly difficult on account of contrary winds. The island is extremely populous, and abounds in rice and other productions peculiar to that climate. The inhabitants are Pagans, and very warlike. E. Long. 115. 30. S. Lat. 9. 0.

BALIOL, or BALLIOL, SIR JOHN DE, founder of Baliol-college in Oxford, was the son of Hugh Baliol, of Bernard's castle, in the diocese of Durham; and was a person very eminent for his power and riches. During the contests and wars between King Henry III. and his barons, he firmly adhered to the king. In 1263, he began the foundation and endowment of Baliol college, which was afterwards perfected by his widow. He died in the year 1269.

BALIOL, BALLIOL, or BOILLIOL, *John*, the competitor with Robert Bruce for the crown of Scotland, was the great grandson of David earl of Huntington, third son of King David I. See SCOTLAND.

BALISORE, a sea port town of Asia, in the East Indies, to the north-west of the bay of Bengal. It is about four miles from the sea by land, but 20 by the river; seated in a very fruitful soil, producing rice, wheat, aromatic seeds, tobacco, &c. The inhabitants make several sorts of stuffs of cotton, silk, and a kind of grass. The place was given up to the English by the Nagpore rajah at the peace in 1803. E. Long. 86. 50. N. Lat. 21. 30.

BALISTES. See ICHTHYOLOGY *Index*.

BALIVO AMOVENDO, in *Law*, was a writ for removing a bailiff from his office, for want of having sufficient land in his bailiwick to answer the king and his people, according to the statute of Westminster, 2 reg. Orig. 78.

BALK, among builders, is sometimes used for the summer beam of a house; sometimes for the poles and rafters, which support the roofs of barns, &c.; and sometimes for the beams used in making sea-holds.

BALK, or *Balkh*, a province of Great Bukharia in Asia, about 360 miles long and 250 broad, situated to the south of the province of Samarkand, and to the east of Bukharia Proper. It is the least of the three provinces that make up what is called *Great Bukharia;* but being extremely fertile and well cultivated, the prince draws a great revenue from it. The country particularly abounds with silk, of which the inhabitants make pretty manufactures. The Uzbecks subject to the khan of Balkh are the most civilized of all the Tartars inhabiting Great Bukharia, owing probably to their commerce with the Persians: they are likewise more industrious, and more honest, than the rest; but in other respects have the same customs with the rest of the Tartars. The province is subdivided into several countries; the most remarkable of which are Khotlan or Katlan, Tokharestan, and Badagshan. It was formerly subject to Persia, but is now a dependency on the kingdom of Cabul.

BALK, the capital of the above-mentioned province, situated on the frontiers of Persia, in E. Long. 65. 20. N. Lat. 36. 45. It is probably the ancient Bactra, capital of the kingdom of Bactria; and is said by the Persians to have been founded by Kay-umaraz the first king of Persia, because he met his brother upon the spot where it stood, after he had been lost for a long time; *balkhiden*, or *balghiden*, in the Persic language, signifying to receive and embrace a friend. The first kings of Persia, who resided in the province of Media or *Aderbijan*, considered this city as one of their principal frontiers on the side of Scythia. In the 27th year of the Hegira, of Christ 647, Balk was reduced by the Arabs, under the command of Abdallah Ebn Amer. It continued subject to Arab princes till the year of the Hegira 432, of Christ 1041; when it was reduced by Togrol Beg, the Tangrolipix of the Greeks, and prince of the Seljukian dynasty. It was taken by Jenghiz Khan, A. D. 1221, who with his usual and unparalleled cruelty caused all the inhabitants to be brought without the walls, and massacred without mercy. In 1369, Sultan Hosein, the last of the race of Jenghiz Khan, was driven from Balk by Tamerlane, whose successors were driven out by the Uzbecks in the 15th century. It was afterwards redeemed by Shah Ismael Sufi; but finally wrested out of his hands by the Uzbeck Tartars, between whom and the Persians it is the occasion of almost continual wars. It was not long since the residence of a khan of Tartars. It is the most considerable city possessed in these parts by the Mahometan Tartars, is large, well built, and populous, the houses consisting for the most part of stone or brick. The fortifications consist of bulwarks of earth, fenced without with a strong wall, high enough to cover the soldiers employed in defence of those fortifications. As this place is the resort of all the business transacted between the Indies and Great Bukharia, trade flourishes extremely at Balk; especially as it has a fine river passing through its suburbs, which is of vast service to the town. This river falls into the Amu, in N. Lat. 38. 30. upon the confines of Great Bukharia and Kowarazm. The khan's palace, or castle, is a large edifice built after the oriental manner; and consists almost entirely of marble, of which there are fine quarries in the neighbourhood. The khan of Balk was obliged in 1739 to submit to the Persians under Khouli Kan; but since that time the country has been separated from Persia, and is now subject to the kingdom of Cabul.

BALKERS, in the fishery, persons placed on rocks and eminences at sea to spy the herring droves, and give notice to the fishermen, by waving boughs, what way they go, and where they may be found.

BALL, in a general sense, a spherical and round body, whether naturally so, or formed into that figure by art.

BALL, in the military art, comprehends all sorts of bullets for fire-arms, from the cannon to the pistol. Cannon-balls are of iron; musket-balls, pistol-balls, &c. are of lead. The experiment has been tried of iron balls for pistols and fusees; but they are justly rejected, not only on account of their lightness, which prevents them from flying straight, but because they are apt to furrow the barrel of the pistol, &c.

BALL *of a Pendulum*, the weight at the bottom. In shorter pendulums this is called the *bob*.

BALL, in *Pyrotechnics*, is also a composition of various

Digitized by Google

Balls. rious combustible ingredients, serving to burn, smoke, give light, &c. In this sense we read of fire-balls, light-balls, smoke-balls, stink-balls, sky-balls, water-balls, land-balls.

Ball, among the Cornish miners, signifies a tin-mine.

Ball, among printers, a kind of wooden tunnel stuffed with wool, contained in a leather cover, which is nailed to the wood, with which the ink is applied on the forms to be wrought off. See Printing.

Horse-Balls, among farriers. Horses have a very nice taste; it is therefore proper to give the more disagreeable drugs in the form of balls, and to make drenches of the more palatable. Balls should be of an oval shape, not exceeding the size of a pullet's egg; and should be dipped in sweet oil to make them slip down the easier. Some horses have a strait gullet, which makes them very averse to a ball being thrust down their throats; such horses had better have drenches given them, or their medicines may be mixed with bran, or in their mashes. See Farriery, *passim*.

Ball-Vein, in *Mineralogy*, a name given by the miners of Sussex to a sort of iron ore common there, and wrought to considerable advantage. It yields not any great quantity of metal, but what it has runs freely in the fire; it is usually found in loose masses, not in the form of a stratum, and is often covered with one or more crusts. It generally contains some sparkling particles; and is usually of a circular form in the perfect masses, thickest in the middle, and gradually thinner as it approaches the sides. The ores of Sussex in general are poor, but they require very little trouble in the working; so that a considerable profit is made annually from them.

Ball and Socket, an instrument made of brass, with a perpetual screw, so as to move horizontally, vertically, and obliquely; and is generally used for the managing of surveying or astronomical instruments.

Puff-Ball, the English name of the lycoperdon. See Lycoperdon, Botany *Index*.

Martial Balls, in *Pharmacy*, are a mixture of filings of iron and cream of tartar, formed into a solid consistence and form of a ball, which is used to impregnate water or other liquids with iron dissolved by the tartareous acid. To make these balls, one part of filings of iron and two parts powdered cream of tartar are mixed well together, and put into an earthen or iron vessel with some water. This mixture is to be stirred from time to time, till it becomes almost dry; and then it is to receive more water, and to be stirred as before. This treatment is to be continued till it acquires, when nearly dry, somewhat of the consistence and tenacity of softened rosin. Then it is to be rolled up in the form of a ball, which is generally kept tied up in a rag; and when intended to be used, it is to be infused in water, till it gives some colour to that liquid. The infusion of martial balls is tonic, vulnerary, discutient, and aperitive; and is employed both internally and externally. Iron being soluble in all acids, is attacked in this preparation by the tartareous acid, which reduces it to a kind of neutral salt not crystallizable. This salt would remain liquid, and would form a soluble martial tartar, called *tartarised tincture of Mars*. If proper proportions of filings of iron and cream of tartar be used, and treated long enough for an entire and complete combination, nothing would be obtained but a liquor or magma, which could not be preserved in a solid form, but would be continually moist. Therefore, in the martial ball there is a good deal of the cream of tartar and filings of iron not combined together, by which its solidity is preserved.

Mercurial Balls, in *Pharmacy*, are an amalgam of mercury and tin, sufficiently solid to be moulded, and to preserve a given form. The method of making them is by adding mercury to melted tin, and pouring the fluid mass into a round hollow mould. These balls are employed to purify water, in which they are boiled; for which purpose travellers often carry some along with them. Nothing, however, can be more pernicious than such a practice, should the water contain any nitrous acid, which it very often does.

Balls of Silk-worms and Spiders, are little cases or cones of silk, wherein those insects deposite their eggs. Spiders are extremely tender of their balls, which they carry about with them, adhering to the papillæ about their anus. Grew mentions balls or bags of a species of silk-worms in Virginia as big as hens eggs, and containing each four aurelias.

Zoologists speak of a sort of balls of hair covered over with a smooth shining coat or shell, found in the stomachs of oxen, cows, calves, horses, sheep, and goats. See the article Bezoar.

Balls of Fire, in *Meteorology*. See Fire, *Balls of*.

Balls, in *Electricity*, are two pieces of cork, or pith of elder, nicely turned in a lathe to the size of a small pea, and suspended by fine linen threads; intended as electrometers, and of excellent use to discover small degrees of electricity, to observe the changes of it from positive to negative, and *vice versa;* and to estimate the force of a shock before the discharge, so that the operator should always be able to tell very nearly before the discharge, by knowing how high he has charged his jars, what the explosion will be.

Fire-Balls, are bags of canvas filled with gunpowder, sulphur, saltpetre, pitch, &c. to be thrown by the soldiers, or out of mortars, in order to fire the houses incommoding trenches, advanced posts, or the like.—The Greeks had divers kinds of fire-balls, or Πυροβολοι λιθοι; one kind called, more particularly, σκυταλια, or σκυταλιδες, made of wood, sometimes a foot or even a cubit long; their heads being armed with spikes of iron, beneath which were hemp, pitch, and other combustibles, which being set on fire, they were cast among the enemy. The preparations of fire-balls, among the moderns, consist of several operations, viz. making the bag, preparing the composition, tying, and, lastly, dipping the ball. 1. The bags for this purpose are either oval or round. 2. The composition wherewith fire-balls are filled is various: To ten pounds of meal-gunpowder add two of saltpetre, one of sulphur, and one of colophony; or to six pounds of gunpowder, add four of saltpetre, four of sulphur, one of powdered glass, half a pound of antimony, as much camphor, an ounce of sal-ammoniac, and four of common salt, all pulverised. Sometimes they even fill fire-balls with hand grenades. 3. For tying the fire-balls, they prepare two iron rings, one fitted round the aperture,

Digitized by Google

aperture, where the ball is to be lighted, the other near its base. A cord is tied to these rings in such a manner, as that the several turns represent semicircles of the sphere cutting the globe through the poles: over the cords, extended according to the length of the ball, others are tied, cutting the former at right angles, and parallel to each other, making a knot at each intersection: lastly, after putting in a leaden bullet, the rest of the space is filled with tow or paper. 4. Thus completed, the fire-ball remains to be dipped in a composition of melted pitch four pounds, colophony two, and linseed oil or oil of turpentine two; after dipping, they cover it round with tow, and dip again, till it be brought to the just diameter required.

Light-Balls, are such as diffuse an intense light around; or they are balls which, being cast out of the hand or a mortar, burn for some time, and illuminate the adjacent parts. 1. Luminous or light-balls for the hand are made of ground powder, saltpetre, brimstone, camphor, and borax, all sprinkled with oil, and moulded into a mass with suet; and this is wrapped up in tow, with a sheet of strong paper over it. To fire it, they make a hole into it with a bodkin, into which they put some priming, that will burn slow. Its use is to be cast into any works they would discover in the night-time. 2. For the larger light-balls, or those to be thrown to a greater distance, they melt equal quantities of sulphur, turpentine, and pitch; and therein dip an earthen or stone ball, of a diameter much less than that of the mortar out of which the fire-ball is to be cast: then rolling it in gunpowder, and covering it round with gauze, they dip it again, and repeat the rest till it come to fit the cavity of the mortar: lastly, they sprinkle it round with gunpowder. This, being once kindled, will strongly illuminate all around the place where it is thrown, and give opportunity to examine the state and condition thereof.

Smoke or *Dark-Balls*, those which fill the air with smoke, and thus darken a place to prevent discoveries. To prepare a darkening ball, make an oval or spherical bag; melt rosin over the coals, and add an equal part of saltpetre not purified, also of sulphur, and a fifth part of charcoal. The whole being well incorporated, put in tow first shred, and fill the bags with this composition, and dip it after the same manner as a fire-ball.

Stink-Balls, those which yield a great stench where fired to annoy the enemy. Their preparation is thus: Melt ten pounds of pitch, six of rosin, twenty of saltpetre, eight of gunpowder, and four of colophony; to these add two of charcoal, six of horse-hoofs cut small, three of asafœtida, one of stinking-saracen, and any other offensive ingredients. The rest as in the former.

Sky-Balls, those cast on high out of mortars, and which, when arrived at their height, bursting like rockets, afford a spectacle of decoration. Sky-balls are made of a wooden shell, filled with various compositions, particularly that of the stars of rockets. These are sometimes intermixed with crackers and other combustibles, making rains of fire, &c.

Water-Balls, those which swim and burn a considerable time in the water, and at length burst therein. These are made in a wooden shell, the cavity of which is filled with refined saltpetre, sulphur, saw-dust boiled in water of saltpetre, and dried; to which sometimes other ingredients are added, as iron filings, Greek pitch, amber dust, powdered glass, and camphor. The ingredients are to be ground, mixed up, and moistened with linseed oil, nut oil, olive oil, hempseed oil, or petrol. At the bottom is placed an iron coffin, filled with whole gunpowder, that the ball may at last burst with a greater noise: and, lastly, the ball is by the addition of lead or otherwise, made of the same specific gravity with water.

Land-Balls are those which, being thrown out of a mortar, fall to the ground, burn, and burst there. The ingredients are much the same as in the *water-balls*, only the specific gravity is not attended to.

BALLAD, a kind of song, adapted to the capacity of the lower class of people; who, being mightily taken with this species of poetry, are thereby not a little influenced in the conduct of their lives. Hence we find, that seditious and designing men never fail to spread ballads among the people, with a view to gain them over to their side.

BALLAGHAN, a town of Ireland, in the county of Sligo, and province of Connaught. W. Long. 9. 50. N. Lat. 53, 48.

BALLAN, or BALLON, a town of France, in the department of Sarthe, seated on the river Orne. E. Long. 0. 20. N. Lat. 48. 10.

BALLAST, any heavy matter, as stone, gravel, iron, &c. thrown into the hold of a ship, in order to make her sink a proper depth in the water, that she may be capable of carrying a sufficient quantity of sail without oversetting.

There is often great difference in the proportion of ballast required to prepare ships of equal burden for a voyage; the quantity being always more or less according to the sharpness or flatness of the ship's bottom, which seamen call the *floor*.

The knowledge of ballasting a ship with propriety, is certainly an article that deserves the attention of the skilful mariner: for though it is known, that ships in general will not carry a sufficient quantity of sail till they are laden so deep that the surface of the water will nearly glance on the extreme breadth amidships, yet there is more than this general knowledge required; since, if she has a great weight of heavy ballast, as lead, iron, &c. in the bottom, it will place the centre of gravity too low in the hold; and although this will enable her to carry a great sail, she will nevertheless sail very heavily, and run the risk of being dismasted by her violent rolling.

To ballast a ship, therefore, is the art of disposing those materials so that she may be duly poised, and maintain a proper equilibrium on the water, so as neither to be too *stiff* nor too *crank*, qualities equally pernicious: as in the first, although the ship may be fitted to carry a great sail, yet her velocity will not be proportionably increased; whilst her masts are more endangered by her sudden jerks and excessive labouring: and in the last, she will be incapable of carrying sail, without the risk of oversetting.

Stiffness, in ballasting, is occasioned by disposing a great quantity of heavy ballast, as lead, iron, &c. in the bottom, which naturally places the centre of gravity very near the keel; and that being the centre about which

which the vibrations are made, the lower it is placed, the more violent will be the motion of rolling.

Crankness, on the other hand, is occasioned by having too little ballast, or by disposing the ship's lading so as to raise the centre of gravity too high, which also endangers the mast in carrying sail when it blows hard: for when the masts lose their perpendicular height, they strain on the shrouds in the nature of a lever, which increases as the sine of their obliquity; and a ship that loses her masts is in great danger of being lost.

The whole art of ballasting, therefore, consists in placing the centre of gravity to correspond with the trim and shape of the vessel, so as neither to be too high nor too low, neither too far forwards nor too far aft; and to lade the ship so deep, that the surface of the water may nearly rise to the extreme breadth, amidships; and thus she will be enabled to carry a good sail, incline but little, and ply well to the windward.

Ships are said to be *in ballast* when they have no other loading. Masters of vessels are obliged to declare the quantity of ballast they bear, and to unload it at certain places. They are prohibited unloading their ballast in havens, roads, &c. the neglect of which has ruined many excellent ports.—Ships and vessels taking in ballast in the river Thames are to pay so much a ton to Trinity-house, Deptford; who shall employ ballast-men, and regulate them; and their lighters to be marked, &c. on pain of 10l.

BALLATOONS, large heavy luggage-boats used for carrying wood by the river from Astracan and the Caspian sea to Moscow. These will carry from 100 to 200 tons, and have from 100 to 120 men employed to row and tow them along.

BALLENDEN, Sir John, a Scottish poet, in the reign of James V. of Scotland, was descended from an ancient family in that kingdom. His father, Mr Thomas Ballenden of Auchinoul, was director to the chancery in the year 1540, and clerk register in 1541. Where our poet was educated, we are not informed; but from one of his poems we learn, that in his youth he had some employment at the court of King James V. and that he was in great favour with that prince. Having taken orders, and being created doctor of divinity at the Sorbonne, he was made canon of Ross, and archdeacon of Moray. He likewise obtained the place of clerk-register, but was afterwards deprived of that employment by the factions of the times; however, in the succeeding reign of Mary, he recovered that office, and was one of the lords of session. Being a zealous Papist, he, in conjunction with Dr Laing, was extremely assiduous in retarding the progress of the reformation; till at last, finding the opposition too powerful, he quitted Scotland, and went to Rome, where he died in the year 1550. He is generally esteemed one of the best Scottish poets of that age. His works are, 1. *The History and Chronicles of Scotland of Hector Boëis* (Boethius), *translated by Mr John Ballenden*, Edinb. 1536. This is not a mere translation, Ballenden having corrected several mistakes of his author, and made large additions. It is in folio, and black letter. 2. *Cosmography to the History of Scotland*, with a poetical poem. 3. *A Description of Albany*. 4. *Translation of Boethius's Description of Scotland*. 5. *Epistles to King James V.* Bale says he had seen these letters. 6. Several poems in Carmichael's collection of Scottish poems; besides many others in manuscript, in private libraries in Scotland. 7. *Virtue and Vyce*, a poem addressed to King James V.

BALLET, Balet, or Balletto, a kind of dramatic poem, representing some fabulous action or subject divided into several entries; wherein several persons appear, and recite things under the name of some deity, or other illustrious character.

Ballet is more particularly used for a kind of comic dance, consisting of a series of several airs of different kinds of movements, which together represent some subject or action. They are performed chiefly by masks representing sylvans, tritons, nymphs, shepherds, and the like; and consist of three parts, the entry, figure, and the retreat. The word is of Greek origin, formed from βαλλειν, *jacere*, to cast, throw, or toss; whence also in writers of the middle age, we find *ballationes* for *saltationes*, dancings; and *ballare* for *saltare*, to dance.

BALLIAGE, or Bailiage, in *Commerce*, a small duty paid to the city of London by aliens, and even denizens, for certain commodities exported by them.

BALLICONNEL, a town of Ireland in the county of Cavan, and province of Ulster. W. Long. 7. 45. N. Lat. 54. 6.

BALLISHANNON, a large town of Ireland in the county of Donegal, or Tyrconnel, with a good haven. W. Long. 8. 25. N. Lat. 54. 25.

BALLISTA, a machine used by the ancients for shooting darts; it resembled in some measure our cross-bow. The word is Latin, signifying a cross-bow; and is derived from the Greek βαλλω, to *shoot*, or *throw*.

Vegetius informs us, that the ballista discharged darts with such rapidity and violence that nothing could resist their force: and Athenæus adds, that Agistratus made one of little more than two feet in length, which shot darts 500 paces.

In Plate LXXXIV. is represented the balista used in sieges, according to the chevalier Folard: 2, 2, the base of the ballista; 3, 4, upright beams; 5, 6, transverse beams; 7, 7, the two capitals in the upper transverse beam, (the lower transverse beam has also two similar capitals, which cannot be seen in this transverse figure); 9, 9, two posts or supports for strengthening the transverse beams; 10, 10, two skains of cords fastened to the capitals; 11, 11, two arms inserted between the two stands, or parts of the skains; 12, a cord fastened to the two arms; 13, darts which are shot by the ballista; 14, 14, curves in the upright beams, and in the concavity of which cushions are fastened, in order to break the force of the arms, which strike against them with great force when the dart is discharged; 16, the arbor of the machine, in which a groove or canal perfectly straight is formed, and in which the darts are placed in order to their being shot by the ballista; 17, the nut of the trigger; 18, the roll or windlass, about which the cord is wound; 19, a hook, by which the cord is drawn towards the centre, and the ballista cocked; 20, a stage or table on which the arbor is in part sustained.

BALLISTEUM, or Ballistræa, in antiquity, a military song or dance used on occasions of victory. Vopiscus has preserved the *balisteum* sung in honour of Aurelian, who, in the Sarmatian war, was said to have

Digitized by Google

have killed 48 of the enemy in one day with his own hand. *Mille, mille, mille, mille, mille, mille decollavimus: Unus homo mille, mille, mille, mille decollavit; mille, mille, mille vivat, qui mille, mille occidit. Tantum vini habet nemo, quantum fudit sanguinis.* The same writer subjoins another popular song of the same kind: *Mille Francos, mille Sarmatas, semel occidimus; mille, mille, mille, mille, mille, Persas, quærimus.* It took the denomination *ballisteum* from the Greek Βαλλω, *jacio*, or *jacto*, to cast or toss, on account of the motions used in this dance, which was attended with great elevations and swingings of the hands. The *ballistea* were a kind of popular ballads, composed by poets of the lower class, without much regard to the laws of metre.

BALLISTIC PENDULUM, an ingenious machine invented by Benjamin Robbins for ascertaining the velocity of military projectiles, and consequently the force of fired gunpowder. It consists of a large block of wood, annexed to the end of a strong iron stem, having a cross steel axis at the other end, placed horizontally, about which the whole vibrates together like the pendulum of a clock. The machine being at rest, a piece of ordnance is pointed straight towards the wooden block, or ball of this pendulum, and then discharged: the consequence is this; the ball discharged from the gun strikes and enters the block, and causes the pendulum to vibrate more or less according to the velocity of the projectile, or the force of the blow; and by observing the extent of the vibration, the force of that blow becomes known, or the greatest velocity with which the block is moved out of its place, and consequently the velocity of the projectile itself which struck the blow and urged the pendulum. *Hutton's Mathemat. Dict.*

BALLOON, or BALON, in a general sense, signifies any spherical hollow body, of whatever matter it be composed, or for whatever purposes it be designed. Thus, with chemists, balloon denotes a round short-necked vessel, used to receive what is distilled by means of fire; in architecture, a round globe on the top of a pillar; and among engineers, a kind of bomb made of pasteboard, and played off, in fire-works, either in the air or on the water, in imitation of a real bomb.

Air-BALLOON. See AEROSTATION.

BALLOON also denotes a kind of game something resembling tennis. The balloon is played in the open field, with a great round ball of double leather blown up with wind, and thus driven to and fro with the strength of a man's arm, fortified with a brace of wood.

BALLOON, or BALLOEN, is more particularly used among voyagers for the state-barges of Siam. The balloons are a kind of brigantine, managed with oars, of very odd figures, as serpents, sea-horses, &c. but by their sharpness and number of oars, of incredible swiftness. The balloons are said to be made of a single piece of timber, of uncommon length; they are raised high, and much decorated with carving at head and stern: some are gilt over, and carry 120 or even 150 rowers on each side. The oars are either plated over with silver, or gilt, or radiated with gold; and the dome or canopy in the middle, where the company is placed, is ornamented with some rich stuff, and furnished with a ballustrade of ivory, or other costly matter, enriched with gilding. The edges of the balloon just touch the water, but the extremities rise with a sweep to a great height. Some are adorned with a variety of figures, made of pieces of mother-of-pearl inlaid: the richer sort, instead of a dome, carry a kind of steeple in the middle; so that, considering the slenderness of the vessel, which is usually 100 or 120 feet long, and scarce six broad, the height of the two ends, and of the steeple with the load of decorations, it is a kind of miracle they are not overset.

BALLOON, in the French paper trade, is a term for a quantity of paper, containing 24 reams.

BALLOON, BALLON, or BALLOT, in the French glass-trade, signifies a certain quantity of glass-plates, smaller or greater according to their quality. The ballon of white glass contains 25 bundles, of six plates per bundle; but the ballon of coloured glass is only of 12½ bundles, and of three plates to a bundle.

BALLOTA, WHITE HOREHOUND. See BOTANY *Index*.

BALLOTADE, in the manege, the leap of a horse between two pillars, or upon a straight line, made with justness of time, with the aid of the hand and the calves of the legs: and in such a manner, that when his fore-feet are in the air, he shows nothing but the shoes of his hinder feet without yerking out.

BALLOTING, a method of voting at elections, &c. by means of little balls usually of different colours, by the French called *ballots*; which are put into a box privately.

BALLS, or BALLETS, in *Heraldry*, a frequent bearing in coats of arms, usually denominated, according to their colour, bezantes, plates, hurts, &c.

BALLUSTER, a small kind of pillar used for ballustrades.

BALLUSTRADE, a series or row of ballusters, joined by a rail; serving as well for a rest to the elbows as for a fence or enclosure to balconies, altars, staircases, &c. See ARCHITECTURE, N° 74.

BALM. See MELISSA, BOTANY *Index*.

BALM, or BALSAM. See BALSAM.

BALM of Gilead. See SUPPLEMENT.

BALNAVES, HENRY, a Scottish Protestant divine, born in the shire of Fife, in the reign of James V. and educated at the university of St Andrew's. He went afterwards to France in order to finish his studies; and returning to Scotland, was admitted into the family of the earl of Arran, who at that time governed the kingdom: but in the year 1542 the earl dismissed him for having embraced the Protestant religion. In 1564, he joined, says Mackenzie, the murderers of Cardinal Beaton; for which he was declared a traitor, and excommunicated. Whilst that party were besieged in the castle of St Andrew's, they sent Balnaves to England, who returned with a considerable supply of provisions and money; but being at last obliged to surrender to the French, he was sent with the rest of the garrison to France. He returned to Scotland, about the year 1559; and having joined the Congregation, he was appointed one of the commissioners to treat with the duke of Norfolk on the part of Queen Elizabeth. In 1563 he was made one of the lords of session, and appointed by the general assembly, with other learned men, to revise the book of Discipline. Knox, his cotemporary, and fellow-labourer, gives him the character of a very learned and pious divine. He died

Digitized by Google

died at Edinburgh in the year 1579. He wrote, 1. A Treatise concerning Justification. Edinb. 1550, 8vo. 2. A Catechism, or Confession of Faith. Edinb. 1584, 8vo.

BALNEARII SERVI, in antiquity, servants or attendants belonging to the baths. Some were appointed to heat them, called *fornicatores;* others were denominated *capsarii*, who kept the clothes of those that went into them; others *alliptæ*, whose care it was to pull off the hair; others *unctuarii*, who anointed and perfumed the body.

BALNEARIUS FUR, in antiquity, a kind of thief who practised stealing the clothes of persons in the baths; sometimes also called *fur balnearum*. The crime of those thieves was a kind of sacrilege; for the hot baths were sacred: hence they were more severely punished than common thieves who stole out of private houses. The latter were acquitted with paying double the value of the thing stolen; whereas the former were punished with death.

BALNEUM, a term used by chemists to signify a vessel filled with some matter, as sand, water, or the like, in which another is placed that requires a more gentle heat than the naked fire.

BALSA, an ancient town of Lusitania, in the Ager Cunæus; now *Tavira*, capital of Algarva.

BALSAM, or NATIVE BALSAM, an oily, resinous, liquid substance, flowing either spontaneously, or by means of incision, from certain plants. There are a great variety of balsams, generally denominated from the substances from which they are obtained; and which are explained under their names as they occur.

BALSAMICS. *Balsamica* is a Latin word which signifies *mitigating*. The term *balsamic* is a very lax one; it includes medicines of very different qualities, as emollients, detergents, restoratives, &c. but in medicines of all these kinds there seems to be this requisite in them, viz. that they be soft, yielding, and adhesive, also that by their smallness they have a ready disposition to motion. Medicines of this tribe are generally required for complaints whose seat is in the viscera; and as they cannot be conveyed there but by the common road of the circulation, it follows, that no great effects can be expected from them but by their long continuation. Hoffman calls by the name of *balsamics* those medicines which are hot and acrid, also the natural balsams, gums, &c. by which the vital heat is increased.

Motherby's Med. Dict.

BALSORA. See BASSORA.

BALTAGI, among the Turks, porters and hewers of wood, in the court of the grand signior; who also mount on horseback when the emperor rides out. Part of them also, who, for that purpose, must be castrated, keep watch at the gates of the first and second courts of the seraglio. The first are called *capigi*, and their commander *capigi pascha*.

BALTIC SEA, a great gulf surrounded by Sweden, Russia, Courland, Prussia, Pomerania, and Denmark. The king of Denmark levies a tax at Elsineur on every ship that enters the Baltic sea. It is remarkable that this sea neither ebbs nor flows, and there is always a current sets through the Sound into the ocean. It is generally frozen over three or four months in the year. See BALTIC, SUPPLEMENT.

BALTIMORA. See BOTANY *Index*.

BALTIMORE, a town of Ireland in the county of Cork, a province of Munster, with the title of a barony. It is seated on a headland which runs into the sea, five miles north-east of Cape Clear. W. Long. 9. 10. N. Lat. 51. 15.

BALTIMORE, a town of Maryland, in North America. It is situated round the head of a small bay, which is an arm of the Chesapeake, and near the mouth of the river Patapsco. The bason which forms the harbour is of a circular form, with a narrow entrance guarded by a fort, and is large enough to contain 2000 merchant vessels. Baltimore is now the third port in point of trade in the United States, New York and Philadelphia only being superior. Its progress has been rapid beyond example. In 1750 it was a village of 10 or 12 houses, and in 1818 it contained 60,000 inhabitants. The merchants here are rated as being among the most enterprising in the United States. The tonnage belonging to the port in 1815 amounted to 107,137 tons. A British force attacked Baltimore in September 1814; but the ships of war being unable to force the entrance to the harbour, the attack by land proved unsuccessful, and the troops withdrew, with the loss of the commander, General Ross, and 200 men. The houses in Baltimore are generally well built, and many of the public edifices are extremely handsome. The Roman Catholics are the most numerous class; the other considerable sects are the Episcopalians, Presbyterians, Baptists, and Quakers. The democratic party have a more decided superiority in Baltimore than in any other great city in the United States. W. Long. 76. 40. N. Lat. 39. 10.

BALTIMORE-Bird. See ORIOLUS, ORNITHOLOGY *Index*.

BALTZAR, THOMAS, a native of Lubec, was an eminent musical composer, and esteemed the finest performer on the violin of his time. He came into England in the year 1658, and lived about two years in the house of Sir Anthony Cope of Hanwel in Oxfordshire. He was the great competitor of Davis Mell, who, though a clockmaker by trade, was, till Baltzar came hither, allowed to be the finest performer on the violin in England; and after his arrival he divided with him the public applause, it being agreed that Mell excelled in the fineness of his tone and the sweetness of his manner, and Baltzar in the power of execution and command of the instrument. Moreover, it is said of the latter, that he first taught the English the practice of shifting, and the use of the upper part of the finger-board. Baltzar was given to intemperance, and is said to have shortened his days by excessive drinking: he was buried in Westminster-abbey on the 27th day of July 1663.

BALUCLAVO, or JAMBOL, a sea-port town of the Crimea on the Black sea, where they build ships for the grand signior. E. Long. 35. 15. N. Lat. 44. 50.

BALUZE, STEPHEN, a French writer, born in 1651, and some time librarian to M. Colbert. In 1693 he obtained a pension, with the post of director of the Royal College, for writing the lives of the popes of Avignon; both which advantages he soon lost in the fluctuation of court parties. M. Baluze is much more noted for collecting ancient MSS. and illustrasing them by notes, than famed for his own compositions.

BALYUR, or BALIUR, a sea-port of Africa in the kingdom

Digitized by Google

kingdom of Dancali, about 14 hours journey west from Babel-Mandel. It is remarkable only for being the landing place of the Abyssinian patriarch Alphonsus Mendez, with his Jesuits and Portuguese, on April 3d 1724. The royal palace they found to consist of about half a dozen of tents, and a score of huts, fenced about with a thorn hedge, and shaded by some wild kinds of trees. The hall of audience was only a large tent about a musket-shot from the rest. At the upper end was a kind of throne made of stones and clay, covered with a carpet, and two velvet cushions. At the other end was his majesty's horse, with the saddle and other accoutrements hanging one side.

BALZAC, John Lewis Guez de, born at Angouleme in 1595. Voltaire allows him the merit of having given numbers and harmony to the French prose, but censures his style as somewhat bombastic. The critics of his own time gave him no little disquiet; and he gave them no little advantage over him by his sallies of vanity, and some particular propositions which were a little dangerous. M. Balzac, getting rid of these disputes by his moderation, settled at his country-seat; refined his style and genius; and got by his letters and other writings which he published from time to time, the reputation of being the first writer in France. He was at length drawn from his retirement by the hopes of making his fortune under Cardinal Richlieu, who had formerly courted his friendship: but in a few years he retired again, disgusted with the slavish dependence of a court life. All he obtained from the court was a pension of 2000 livres, with the titles of counsellor of state and historiographer of France. He died in 1654; and was buried in the hospital of Notre Dame des Anges, to which he bequeathed 12,000 livres. He left an estate of 100 franks per annum, for a gold medal to be bestowed every two years for the best discourse on some moral subject. Besides his letters he wrote a work called *Oeuvres Diverses*, i. e. on various subjects; The Prince; The Christian Socrates, &c. and many other pieces; all of which have been published in two vols folio.

BAMBA, a province of the kingdom of Congo in Africa.—It is situated between the rivers of Ambrisi and Lose; the last of which parts it from Pemba on the east, as the Ambrisi does from the province of Sogno on the north. Along the sea-coast it extends itself northward to the river Lelunda; and on the south to that of Danda, which parts it from the kingdom of Angola. The governors of this province bear the title of *dukes*, and are always some of the princes of the royal family. They are as despotic and arbitrary as if they were really kings, notwithstanding the care and pains their monarchs have taken to keep them within due bounds. The soil of this province is very fertile; and would produce all the necessaries of life in great plenty, were the inhabitants but industrious in its cultivation. The sea coasts produce a vast quantity of salt, which could be purified with little trouble, and would yield an extraordinary revenue if the duties were duly paid: but these the governors find means to sink mostly into their own coffers.—Here is also the fishery of the zimbis, or little sea-snail, whose shell is the current coin not only in this and the neighbouring kingdoms, but also in the most distant parts of Africa. Here are also said to be mines of gold, silver, quicksilver, copper, tin, and iron; but none except the iron mines are allowed to be worked.

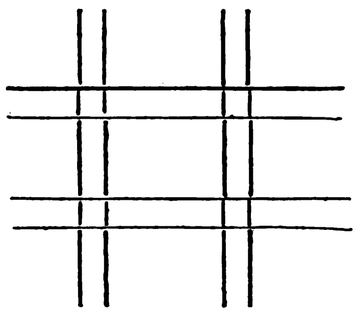
BAMBERG, a large handsome town of Franconia in Germany, and capital of a bishopric of the same name. It was formerly imperial, but is now subject to Bavaria. The country about it produces plenty of corn, fruits, and liquorice. It has an university, founded in 1585; and is situated at the confluence of the rivers Main and Regnitz. E. Long. 10. 15. N. Lat. 50. 10.

Bamberg, a town of Bohemia, situated at the foot of a mountain. E. Long. 16. 50. N. Lat. 49. 53.

BAMBOCCIO, a celebrated painter of conversations, landscapes, cattle, &c. was born at Laeren near Narden in 1613. His name was Peter Van Laer; but in Italy they gave him the name of Bamboccio, on account of the uncommon shape of his body, the lower part being one-third longer than the upper, and his neck so short that it was buried between his shoulders. He had, however, an ample amends for the unseemliness of his limbs, in the superior beauties of his mind: he was endowed with an extensive genius; and, indeed, had an universal taste for every part of painting. He resided at Rome for sixteen years successively; every day studying to improve himself by those beautiful models which were continually open to his observation, and by the lovely scenery in the environs of that city. He was held in the highest esteem by all ranks of men, as well as by those of his own profession; not only on account of his extraordinary abilities, but also for the amiable qualities of his mind. He studied nature incessantly; observing with a curious exactness every effect of light on different objects, at different hours of the day; and whatsoever incident afforded pleasure to his imagination, his memory for ever perfectly retained. His style of painting is sweet and true; and his touch delicate, with great transparency of colouring. His figures are always of a small size, well proportioned, and correctly designed; and although his subjects are taken but from the lower kind of nature, such as plunderings, playing at bowls, inns, farriers shops, cattle, or conversations; yet whatever he painted was so excellently designed, so happily executed, and so highly finished, that his manner was adopted by many of the Italian painters of his time. His works are still universally admired, and he is justly ranked among the first class of the eminent masters. His hand was as quick as his imagination, so that he rarely made sketches or designs for any of his works; he only marked the subject with a crayon on the canvas, and finished it without more delay. His memory was amazing: for whatever objects he saw, if he considered them with any intention to insert them in his compositions, the idea of them was so strongly impressed on his mind, that he could represent them with as much truth as if they were placed before his eyes. Sandrart observes, that although painters who are accustomed to a small size are frequently inaccurate in the disposition of the different parts of their subject, seeming content if the whole appears natural; yet Bamboccio was as minutely exact in having his figures, trees, grounds, and distances, determined with the utmost precision and perspective truth, as the best masters usually are in pictures of the largest size; which is is one circumstance that causes the eye to be so agreeably deluded by the paintings of Bamboccio. In the latter part of his life, he was severely tormented with an asthmatic complaint, which he endured with much impatience; and it is reported, that as the disorder seemed to him insupportable, he threw himself into a canal to shorten his misery, and was drowned. His death happened in 1673.

BAMBOE, in *Botany*, the trivial name of a species of arundo. See ARUNDO, BOTANY *Index*.

Bamboe-Habit; a Chinese contrivance by which a person who cannot swim may easily keep himself above water. The following account of it is from a letter to the author of the *Seaman's Preservative*. "In the year 1730, I was passenger in a ship from Batavia to China, burden about 400 tons, called the *Pridae*, Francisco Xavier commander, freighted by English, Chinese, and Portuguese. Near the coast of China we met one of those storms called a *tuftoon* (*tau-fong*), or a great wind, which carried away all our masts, bowsprit and rudder; and in our hold we had six feet of water, expecting every moment the ship would founder.—We consequently were consulting our preservation: the English and Portuguese stood in their shirts only, ready to be thrown off; but the Chinese merchants came upon deck, not in a cork-jacket, but I will call it a *bamboe-habit*, which had lain ready in their chests against such dangers; and it was thus constructed; four bamboes, two before and two behind their bodies, were placed horizontally, and projected about 28 inches. These were crossed on each side by two others, and the whole properly secured, leaving a space for their body; so that they had only to put it over their heads, and tie the same securely, which was done in two minutes, and we were satisfied they could not possibly sink." The shape is here subjoined.



BAMBOROUGH, an inconsiderable village in Northumberland, on the sea coast, 14 miles north of Alnwick, was once a royal borough, and sent two members to parliament: it even gave name to a large tract extending southward, which was called *Bamboroughshire*. It had also three religious foundations; a house of friars preachers founded by Henry III. a cell of canons regular of St Austin, and an hospital. Its very ancient castle stands on an almost perpendicular rock close to the sea, and accessible only on the south-east side, on a spot where, according to the monkish historians, there stood the castle or palace of the kings of Northumberland; built, as it is said, by King Ida, who began his reign about the year 559. Part of the present ruins are by some supposed to be the remains of King Ida's work. The ancient name of this place was, it is said, *Bebbanborough;* which name Camden, from the authority of Bede, imagines borrowed from Bebba, Ida's queen: but the author of the additions to that writer is of a contrary opinion, as in the Saxon copy it is called *Cynclicanberg*, or the "royal mansion." According to Florilegus, King Ida at first fenced it only with a wooden enclosure, but afterwards surrounded it with a wall. It is thus described by Roger Hoveden, who wrote in the year 1192: "Bebba is a very strong city, but not exceeding large; containing not more than two or three acres of ground. It has but one hollow entrance into it, which is admirably raised by steps. On the top of a hill stands a fair church; and in the western point is a well curiously adorned, and of sweet clean water." This castle was besieged anno 642 by Penda, the Pagan king of the Mercians, who, as the story goes, attempted to burn it: for which purpose he laid vast quantities of wood under the walls, and set fire to it as soon as the wind was favourable; but no sooner was it kindled, than by the prayers of St Adian, the wind changed and carried the flames into his camp, so that he was obliged to raise the siege. In 710, King Osred, on the death of Alfred his father, took shelter in this castle with Brithric his tutor or guardian; one Edulph having seized the crown, by whom, with his partizans, they were unsuccessfully besieged. Brithric made so gallant a defence, that the siege was turned into a blockade, which gave the royal subjects time to arm in defence of their young king. On their marching hither to his relief, Edulph fled: but was followed, taken, and put to death by Brithric, who thereby securely seated Osred on the throne, when this castle became his palace. In the reign of Egbert, Kenulph bishop of Lindisfarne was confined here 30 years, from 750 to 780. In 933, it was plundered and totally ruined by the Danes; but being of great importance in defending the northern parts against the continual incursions of the Scots, it was soon after repaired, and made a place of considerable strength. It is said to have been in good repair at the time of the Conquest, when it was probably put into the custody of some trusty Norman, and had in all likelihood some additions made to its works; and this is the more probable, as the present area, contained within its walls, measures upwards of 80 acres, instead of three, as when described by Hoveden. About the year 1095 it was in possession of Robert de Mowbray earl of Northumberland, who engaging in some treasonable practices against William Rufus, that king laid siege to it and obliged it to surrender. In the next reign it was entrusted by Henry I. to Eustace Fitz-John, who was dispossessed of it and his other employments by King Stephen, that king being jealous of his attachment to Maud, daughter of Henry I. Irritated at this, Fitz-John delivered the castle of Alnwick to David king of Scotland, and brought to his aid all the forces he could raise; he was, however, afterwards reconciled to King Stephen, and held the manors of Burg and Knaresborough in Yorkshire, but never recovered the government of this castle.

In the 16th of Henry II. some great repairs seem to have been done here, as in Madox's history of the exchequer, under the article of Amercements, it appears one William, son of Waldef, was fined five marks for refusing his assistance in the king's works at Baenburg castle.

Digitized by Google

castle. Its keep is supposed to have been the work of this reign.

Edward I. summoned Baliol to meet him here 1296; and on his refusal invaded Scotland and took him prisoner. Edward II. sheltered Gaveston here 1310. It was taken by the Yorkists after the battle of Hexham. In the reign of Elizabeth, Sir John Forester, warden of the marches, was governor of it, and made a knight banneret after the battle of Musselburgh; and his grandson John obtained a grant of both castle and manor from James I. His descendant Thomas forfeited it in 1715; but his maternal uncle, Nathaniel Crew bishop of Durham, purchased and bequeathed them to unconfined charitable uses. The ruins are still considerable; but many of them are now filled with sand, caught up by the winds which rage here with great violence, and carried to very distant places. The remains of a great hall are very singular; it had been warmed by two fire-places of a vast size, and from the top of every window ran a flue like that of a chimney, which reached the summits of the battlements. These flues seem designed as so many supernumerary chimneys to give vent to the smoke that the immense fires of those hospitable times filled the rooms with; for halls smoky, but filled with good cheer, were in those days thought no inconvenience. In the year 1757, the trustees for Lord Crew's charity began the repairs of the keep or great tower; the direction and management being committed to Dr Sharp archdeacon of Durham, one of their number; who has made a most judicious and humane application of his lordship's generous bequest. The walls are from 9 to 12 feet thick. The upper parts of the building have been formed into granaries; whence, in times of scarcity, corn is sold to the indigent without any distinction at four shillings per bushel. A hall and some small apartments are reserved by the Doctor, who frequently resides here to see that this noble plan is properly executed.—Among the variety of distressed who find relief from the judicious disposition of this charity, are the mariners navigating this dangerous coast, for whose benefit a constant watch is kept on the top of the tower; from whence signals are given to the fishermen of Holy Island when any ship is discovered in distress, these fishermen by their situation being able to put off their boats when none from the land can get over the breakers. The signals are so regulated as to point out the particular place where the distressed vessel lies. Besides which, in every great storm, two men on horseback patrole the adjacent coast from sunset to sunrise; who, in case of any shipwreck, are to give immediate notice at the castle. Premiums are likewise paid for the earliest information of any such misfortune. By these means the lives of many seamen have been, and will be, preserved, who would otherwise have perished for want of timely assistance. Nor does this benevolent arrangement stop here. The shipwrecked mariner finds an hospitable reception in this castle; and is here maintained for a week or longer, as circumstances may require. Here, likewise, are store-houses for depositing the goods which may be saved; instruments and tackle for weighing and raising the sunken and stranded vessels; and, to complete the whole, at the expence of this fund, the last offices are decently performed to the bodies of such drowned sailors as are cast on shore.

BAMBUCK, a country of Africa, of which the following account is given by the Abbé Raynal, on the credit of a modern traveller whom he does not name. "In the interior part of Africa, under the 12th or 13th degree of north latitude, there is (says a modern traveller) a pretty large country, known by the name of *Bambuck*. It is not subject to a particular king; but governed by village lords, called *farims*. These hereditary and independent chiefs are all obliged to unite for the defence of the state, when it is either attacked as a community, or only in one of its branches.

"The territory of this aristocratical state is dry and barren. It produces neither maize, rice, nor pulse. The insupportable heat it is subject to, proceeds in part from its being surrounded by high mountains, which prevent the wind from refreshing the air. The climate is as unwholesome as it is disagreeable: vapours, which continually issue from the bowels of a soil replete with minerals, render this country unfit to live in, especially to strangers.

"It is gold that hath made this miserable country an object worthy of notice; gold, which in the eyes of the covetous man seems to compensate for all the evils of nature, though in reality it increases them all. This metal is so common in this country, that it is found almost indiscriminately everywhere. To obtain it, sometimes it is sufficient to scrape the surface of the earth, which is clayish, light, and mixed with sand. When the mine is very rich, it is digged only to the depth of a few feet, and never deeper; though it has been observed, that the lower it was digged, the more gold the soil afforded. The miners are too indolent to pursue a toil which constantly becomes more tedious, and too ignorant to perceive the inconveniences it would be attended with. Their negligence and their folly are in this instance so extraordinary, that in washing the gold, in order to separate it from the earth, they only preserve the larger pieces: the light parts pass away with the water, which flows down an inclined plane.

"The inhabitants of Bambuck do not work these mines at all times, nor are they at liberty to do it when they please. They are obliged to wait till private or public wants determine the farims to grant this permission. When it is proclaimed, all who are able to avail themselves of this advantage meet at the appointed place. When their work is finished, a division is made. Half of the gold goes to the lord, and the remainder is equally distributed among the labourers. Those who want gold at any other time than that of the general digging, search for it in the beds of the rivers, where it is very common.

"The French and English have successively been desirous of appropriating to themselves those real or imaginary riches. Some thought they could reach this country by the Niger, others by the Salum. Far from having succeeded in their attempts of becoming masters of this country, they have not yet ascertained its existence. The unsuccessfulness of past efforts hath redoubled the activity of sanguine minds; sensible and judicious merchants have chosen to limit themselves to a commerce much more important, which is that of slaves."

BAMFF,

Digitized by Google

BAMFF, a shise of Scotland, comprehending part of Buchan, with the districts of Strathdevron, Boyn, Enzie, Strathaven, and Balvenie, extends 52 miles in length, with a breadth varying from 8 to 25, and has an area of 622 square miles. On the south and east it is bounded by Aberdeenshire; on the north it is watered by the German ocean; on the west it is bounded by the county of Elgin; and on the south-west, it borders on Inverness-shire. The face of the country is agreeably diversified with hill and dale, not without woods, well watered with rivers, and exhibiting many seats and plantations. The air is pure and keen, the climate healthy, and the soil fertile, producing plentiful crops of corn. The district of Buchan, extending northwards from the river Ugie to the sea, and westward as far as Devron, comprehending a tract of 20 miles in length and nine in breadth, is more free from hills and mountains than any other district of the same extent in the kingdom of Scotland. It is inhabited chiefly by Lowlanders, and gives the title of *earl* to the family of Erskine; of which family, however, Erskine of Mar is the chief. The county of Bamff abounds with the necessaries and comforts of life. The pasture-grounds yield sheep, cattle, and horses: the arable lands produce plenty of corn; while the rivers and sea supply great quantities of fish. Various minerals have been found in different parts of the shire; and a piece of amber, as large as a horse, was once cast ashore on the beach. In the mountainous district of Balvenie on the western side of the shire, watered by the Spey, there is a noted rock, which produces hones and whetstones sufficient to supply the whole island. Here are also veins of alum stone, and springs of alum water. Strathallan, another district to the north-east of Balvenie, abounds with such plenty of limestone, that the inhabitants use it as common stone in building their houses; and moreover burn a great quantity of it into lime, which they sell to good advantage in the village of Keith, on the river Devron. Along this whole coast, there are ancient Danish monuments, such as cairns, tumuli, and huge stones standing erect. In Strathaven, a hilly country, lying along the limpid river Aven, which falls into the Spey, we meet with Gordon castle, belonging to the duke of Gordon, the most princely edifice in the north of Scotland, environed with fine gardens and parks well stored with fallow deer. The valued rent is 79,200l. Scots; and in 1811 the real gross rent of lands was 79,396l. 3s. 4d. as ascertained by the property-tax returns.

The following is the population of the different parishes of this county at different periods:

	Parishes.	Population in 1755.	Population in 1790—98.
1	Aberlour	1010	920
	Alva	1161	1070
	Bamff	3000	3510
	Bellie	1730	1919
5	Boharm	835	1294
	Botriphnie	953	630
	Boyndie	994	1260
	Cullen	900	1214
	Deskford	940	752
10	Fordyce	3212	3425
	Forglen	607	600
	Gamrie	2083	3000
	Grange	1797	1572
	Inveraven	2460	2244
15	Inverkiethnie	571	460
	Keith	2683	3057
	Kirkmichael	1288	1276
	Marnoch	1894	1960
	Mortlich	2374	1918
20	Ordiquhill	666	517
	Rathven	2898	3524
	Rothiemay	1190	1125
23	St Fergus	1271	1240
		36,521	38,487

Population in 1811, 36,668. See BANFFSHIRE, SUPPLEMENT.

BAMFF, the capital of the shire of that name in Scotland, is pleasantly situated on the side of a hill, at the mouth of the river Devron. It has several streets, of which that with the town-house in it, adorned with a new spire, is very handsome. This place was erected into a borough by virtue of a charter from Robert II. dated October 7. 1372, endowing it with the same privileges, and putting it on the same footing, with the burgh of Aberdeen; but tradition says it was founded in the reign of Malcolm Canmore. The number of inhabitants in 1811 was 2860. The harbour is very bad, as the entrance of the mouth of the Devron is very uncertain, being often stopped by the shifting of the sands, which are continually changing in great storms; the pier is therefore placed on the outside. Much salmon is exported from hence. About Troophead some kelp is made; and the adventurers pay the lord of the manor 50l. per annum for the liberty of collecting the materials. Near the town is a most magnificent seat lately built by the earl of Fife. It lies in a beautiful plain washed by the Devron, the lofty banks of which, clothed with wood on the opposite side, afford a delightful contrast to the soft vale beneath. W. Long. 2. 5. N. Lat. 57. 40.

BAMIER, the name of a plant common in Egypt. It produces a pyramidal husk, with several compartments, of the colour of a lemon, and filled with musky seeds. This husk dressed with meat is a wholesome food, and has a very agreeable flavour. The Egyptians make great use of it in their ragouts.

BAMIYAN, a city of Asia, situated in the province of Zablestan, 10 days journey from Balkh, and eight from Gazna. It is remarkable only for its dreadful catastrophe when taken by Jenghiz Khan in 1221. At that time the city belonged to Sultan Jalalladin, the last of the famous Mahmud Gazni's race. Jenghiz Khan was at that time about to attack Gazna, that prince's capital; but was stopped by the garrison of Bamiyan, which he had hoped would give him no trouble. In this, however, he was disappointed. The people had for a long time expected an attack; and had therefore ruined the country for five or six leagues round, while the peasants had carried away the stones, and every thing that could be of use to the besiegers,

Accordingly,

Digitized by Google

Accordingly, Jenghiz Khan having erected wooden towers, and planted his engines upon them, was in a short time obliged to give over his attacks till millstones and other materials could be brought from a great distance. The walls of the city were very strong, so that the engines of the Moguls made but little impression; and the garrison making frequent and furious sallies, cut off whole squadrons of their enemies, and frequently overthrew their towers and engines. This exceedingly chagrined Jenghiz Khan; who one day returning from a fruitless attack, and hearing of the defeat of one of his generals by Jalallodin, swore to be revenged on Bamiyan. This fury cost the life of one of his grandchildren; who exposing himself too much, to please his grandfather, was slain with an arrow.—At last, however, by the numberless multitude of the Moguls, who continued the attacks without intermission, the city was taken, after its walls had been ruined in many places, and the bravest soldiers and officers of the garrison slain in its defence. The mother of the young prince who had been killed entering with the troops, and more deserving the name of a fiend than a woman, caused the throats of all the inhabitants to be cut, without excepting one. She even gave orders to rip up the bellies of all the women with child, that not an infant might be left alive. In short, to gratify the rage of this inhuman monster, the buildings were all levelled with the ground; the cattle, and every living creature, destroyed; insomuch that the hardened Moguls themselves gave this place the name of *Maubalig*, which in their language signifies *the unfortunate city*. A strong castle has since been built out of its ruins.

BAMOTH-BAAL, in *Ancient Geography*, one of the towns of the tribe of Reuben, which seems also to have had a temple of Baal on an eminence; lying eastwards, and not far from the river Arnon, and the territory of Moab. Jerome calls it *Bamoth*, a city of the Amorites, beyond Jordan, in the possession of the sons of Reuben. Whether the same with that mentioned Numb. xxi. is doubtful, from the disagreement of interpreters; and yet we may admit it to be the place of encampment of the Israelites, and of Balaam's first station, or where he had the first view of the rear of the people.

BAMPTON, a town of Devonshire, situated in a bottom surrounded with high hills, and containing 1232 inhabitants in 1811. W. Long. 4. 25. N. Lat. 51. 5.

BAN, or BANS. See BANN.

BAN, in commerce, a sort of fine smooth muslin, which the English import from the East Indies. The piece is almost a yard broad, and runs about 20 yards and a half.

BANANA TREE, a species of the musa or plantain. See MUSA, BOTANY *Index*.

BANARES, or BENARES, a town of Hindostan, greatly celebrated for its sanctity, and being the university of the Indian Bramins. It is seated on the north side of the river Ganges, and contains nearly 600,000 inhabitants. E. Long. 82. 30. N. Lat. 26. 20. See OBSERVATORY.

BANBURY, a town of Oxfordshire in England, situated on the river Charwell, in W. Long. 1. 20. N. Lat. 52. 0. It sends one member to parliament.

BANC, or BENCH, in *Law*, denotes a tribunal, or judgment-seat; hence *king's banc* is the same with the *court of king's bench*, and *common banc* with that of *common pleas*.

BANCI JUS, or the privilege of having a bench, was anciently only allowed to the king's judges, *qui summam administrant justitiam*. Inferior courts, as courts-baron, hundred courts, &c. were not allowed that prerogative; and even at this day the hundred-court at Freibridge in Norfolk is held under an oak at Gey-wood; and that of Woolfry in Herefordshire, under an oak near Ashton in that county, called *Hundred oak*.

BANCA, an island of Asia in the East Indies, between Sumatra and Borneo; from the first of which it is separated only by a narrow channel. This island is famous on account of its tin mines. The prince of the island, who is also possessor of the territory of Palambang on the river of the same name in Sumatra, where he has his constant residence, had a contract with the Dutch, by whose troops his authority and independence are preserved, for the tin which he compels his subjects to deliver to him at a low price. Their profit, it is said, was not less than 150,000l. annually. In consequence of the perfection which the miners had arrived at in the reduction of the ore, the tin of this island was preferred to the tin from Europe at the Canton market. E. Long. 105. 10. N. Lat. 13. 25.

BANCALIS, a sea-port town on the east coast of the island of Sumatra, where the Dutch have a settlement. E. Long. 99. 7. N. Lat. 1. 5.

BANCK, PETER VANDER, an engraver of considerable repute, was born at Paris, and received his instructions in the art from the celebrated François de Poilly. He came over into England with Gascar the painter, about the year 1674; and married the sister of a gentleman of estate in Hertfordshire, named Forester. He was a laborious artist: but the pay he received for his plates being by no means adequate to the time he bestowed upon them, he was reduced to want; and, retiring from business, sought an asylum in the house of his brother-in-law. He died at Bradfield, and was buried in the church there, in 1674; leaving his widow in possession of the chief part of his plates, which she disposed of to Brown, a printseller, to great advantage, and left an easy fortune.—His chief employment was engraving of portraits; and, according to Virtue's account of this artist published by the Hon. Mr Walpole, he was the first in England who engraved them on so large a scale. But even their novelty, it seems, added to their merit, could not sufficiently recommend them to support the artist. Like many of Poilly's disciples, his great merit, according to Mr Strutt, consists in the laboured neatness and management of the mechanical part of the art. Freedom, harmony, and chasteness of outline, are by no means the characteristic of his prints. However, though they cannot rank with the superior productions of Edelink or Nanteuil, &c. they have their share of merit; and doubtless will be always esteemed in England, as preserving the best resemblance of many eminent persons who were living at that time.

BANCO, an Italian word which signifies *bank*. It is commonly used to signify the bank of Venice.

BANCOCK, a town of the kingdom of Siam in Asia,

Digitized by Google

Asia, with a fort, which was once in the possession of the French, but they were driven from it in 1688. E. Long. 101. 5. N. Lat. 13. 25.

BAND, in a general sense, some small narrow ligament, wherewith any thing is bound, tied, or fastened.

BAND, in *Architecture*, a general name for any flat low member, or moulding, that is broad but not very deep.

BAND of Soldiers, in military affairs, those who fight under the same flag or ensign.

BAND of Pensioners, a company of 120 gentlemen, who receive a yearly allowance of 100l. for attending on his majesty on solemn occasions.

BAND is also the denomination of a military order in Spain, instituted by Alphonsus XI. king of Castile, for the younger sons of the nobility; who, before their admission, must serve 10 years at least, either in the army or at court; and are bound to take up arms for the catholic faith against the infidels.

BAND, in *Surgery*. See BANDAGE.

BANDA ISLANDS, the general name of five islands in the East Indies, belonging to the Dutch. Two of them are uncultivated, and almost entirely uninhabited; the other three claim the distinction of being the only islands in the world that produce the nutmeg.

If we except this valuable spice, the islands of Banda, like all the Moluccas, are barren to a dreadful degree. What they produce in superfluities they want in necessaries. The land will not bring forth any kind of corn; and the pith of the sago serves the natives of the country instead of bread.

As this food is not sufficient for the Europeans who settle in the Moluccas, they are allowed to fetch provisions from Java, Macassar, or the extremely fertile island of Bali. The company itself carries some merchandise to Banda.

This is the only settlement in the East Indies that can be considered as an European colony; because it is the only one where the Europeans are proprietors of lands. The company finding that the inhabitants of Banda were savage, cruel, and treacherous, because they were impatient under their yoke, resolved to exterminate them. Their possessions were divided among the white people, who got slaves from some of the neighbouring islands to cultivate the lands. These white people are for the most part Creoles, or malecontents who have quitted the service of the country. In the small island of Rosinging, there are likewise several banditti, whom the laws have branded with disgrace; and young men of abandoned principles, whose families wanted to get rid of them: so that Banda is called the *island of Correction*. The climate is so unhealthy, that these unhappy men live but a short time. It is on account of the loss of so great a number of hands, that attempts have been made to transfer the culture of the nutmeg to Amboyna; and the company were likewise probably influenced by two other strong motives of interest, as their trade would be carried on with less expence and greater safety. But the experiments that have been made have proved unsuccessful, and matters remain in their former state.

BANDAGE, in *Surgery*, a fillet, roller, or swath, used in dressing and binding up wounds, restraining dangerous hemorrhagies, and in joining fractured and dislocated bones.

BANDALEER, or BANDELEER, in military affairs, a large leathern belt, thrown over the right shoulder, and hanging under the left arm; worn by the ancient musqueteers, both for the sustaining of their fire-arms, and for the carriage of their musket charges, which being put up in little wooden cases, coated with leather, were hung, to the number of twelve, to each bandaleer.

BANDELET, or BANDLET, in *Architecture*, any little band, or flat moulding, as that which crowns the Doric architrave.

BANDER CONGO, a small sea-port town in Asia, seated on the Persian gulf. E. Long. 54. 10. N. Lat. 19. 0.

BANDERET, a general, or one of the commanders in chief of the forces. This appellation is given to the principal commanders of the troops of the canton of Bern in Switzerland, where there are four banderets, who command all the forces of that canton.

BANDEROLL, a little flag, in form of a guidon, extended more in length than in breadth, used to be hung out on the masts of vessels, &c.

BANDITTI, from the Italian *bandito;* persons proscribed, or, as we call it, outlawed: sometimes denominated *banniti* or *foris banniti*. It is also a denomination given to highwaymen or robbers who infest the roads in troops, especially in Italy, France, and Sicily. Mr Brydone, in his tour through Sicily, informs us, that in the eastern part, called *Val Demoni* from the devils that are supposed to inhabit Mount Ætna, it has ever been found altogether impracticable to extirpate the banditti; there being numberless caverns and subterraneous passages round that mountain, where no troops could possibly pursue them: besides, they are known to be perfectly determined and resolute, never failing to take a dreadful revenge on all who have offended them. Hence the prince of Villa Franca has embraced it, not only as the safest, but likewise as the wisest and most political scheme, to become their declared patron and protector: and such of them as think proper to leave the mountains and forests, though perhaps only for a time, are sure to meet with good encouragement and a certain protection in his service, where they enjoy the most unbounded confidence, which, in no instance, they have ever yet been found to make an improper or a dishonest use of. They are clothed in the prince's livery, yellow and green, with silver lace; and wear likewise a badge of their honourable order, which entitles them to universal fear and respect from the people.

In some circumstances, these banditti are the most respectable people of the island, and have by much the highest and most romantic notions of what they call their point of honour. However criminal they may be with regard to society in general; yet with respect to one another, and to every person to whom they have once professed it, they have ever maintained the most unshaken fidelity. The magistrates have often been obliged to protect them, and pay them court, as they are known to be perfectly determined and desperate, and so extremely vindictive, that they will certainly put any person to death that has ever given

Digitized by Google

given them just cause of provocation. On the other hand, it never was known that any person who had put himself under their protection, and showed that he had confidence in them, had cause to repent of it, or was injured by any of them in the most minute trifle; but, on the contrary, they will protect him from impositions of every kind, and scorn to go halves with the landlord, like most other conductors and travelling servants, and will defend him with their lives if there is occasion. Those of their number who have thus enlisted themselves in the service of society, are known and respected by the other banditti all over the island; and the persons of those they accompany are ever held sacred. For these reasons, most travellers choose to hire a couple of them from town to town: and may thus travel over the whole island in safety.

BANDORA, the capital of the island of Salset, on the west coast of the peninsula on this side the Ganges. It is separated from the island of Bombay by a narrow channel, and subject to the Portuguese. E. Long. 72. 30. N. Lat. 19. 0.

BANDORE, the name of a musical instrument with strings, resembling a lute, and said to be invented in the fourth year of Queen Elizabeth, by John Rose, a citizen of London.

BANDY-LEGS, from the French *bander*, 'to bend,' a distortion of the legs, when they turn either inward or outward on either side; arising from some defect in the birth, or imprudence in the nurse, endeavouring to make a child stand or walk before his legs were strong enough to sustain the weight of his body. See VALGUS.

BANE (from the Saxon *bana*, a murderer), signifies destruction or overthrow. Thus, "I will be the *bane* of such a man," is a common saying. So, when a person receives a mortal injury by any thing, we say, "it was his *bane*:" and he who is the cause of another man's death, is said to be *le bane*, i. e. a malefactor.

BANFF. See BAMFF.

BANGHIR, a town of Ireland, in King's county in the province of Leinster, seated on the river Shannon. W. Long. 8. 5. N. Lat. 53. 10.

BANGLE EARS, an imperfection in a horse, remedied in the following manner. Place his ears in such a manner as you would have them stand; bind them with two little boards so fast that they cannot stir, and then clip away all the empty wrinkled skin close by the head.

BANGIUS, THOMAS, a Danish divine, and an elegant Latin writer on the origin of languages and a variety of other subjects. He died in 1661.

BANGOR, an episcopal city of Caernarvonshire in North Wales. In ancient times it was so considerable, that it was called *Bangor the Great*, and defended by a strong castle; but it is now a very mean place; the principal buildings being the cathedral, the bishop's palace, and free school. The see is of very great antiquity, and its founder unknown. The church is dedicated to St Daniel, who was bishop here about the year 516; but for near 500 years afterwards, there is no certainty of the names of his successors. Owen Glendower greatly defaced the cathedral church; but Bishop Dean repaired it again. This see met a still more cruel ravager than Owen Glendower, in the person of Bishop Bulkeley; who not only alienated many of the lands belonging to it, but even sold the bells of the church. This diocese contains the whole of Caernarvonshire except three parishes, the shire of Anglesey, and part of the shires of Denbigh, Merioneth, and Montgomery; in which are 107 parishes, whereof 36 are impropriated. It has three archdeaconries, viz. Bangor, Anglesey, and Merioneth; of which the two first are commonly annexed to the bishopric for its better support. This see is valued in the king's books at 131l. 16s. 4d. and is computed to be worth annually 1200l. The tenths of the clergy are 151l. 14s. 3½d. To the cathedral there belong a bishop, a dean, an archdeacon, a treasurer, and two prebendaries, endowed; a precentor, a chancellor, and three canons, not endowed; three vicars choral, an organist, lay-clerks, choristers, and two officers. W. Long. 4. 10. N. Lat. 53. 20.

BANGOR, a town of Ireland, in the county of Down and province of Ulster. It is seated on the south shore of the bay of Carrick Fergus, opposite to the town of that name; and has a considerable fishery for soles, turbot, &c. W. Long. 6. N. Lat. 54. 42.

BANGUE, a species of opiate, in great use throughout the east, for drowning cares and inspiring joy.—This by the Persians is called *beng*; by the Arabs, *essrar*, corruptly *asseral*, and *assarth*; by the Turks, *bengitie*, and vulgarly called *mastack*; by the European naturalists, *bangue* or *bang*.—It is the leaf of a kind of wild hemp, growing in the countries of the Levant; it differs little, either as to leaf or seed, from our hemp, except in size. Some have mistaken it for a species of althæa.

There are divers manners of preparing it, in different countries. Olearius describes the method used in Persia. Mr Sale tells us, that, among the Arabs, the leaf is made into pills, or conserves. But the most distinct account is that given by Alexander Maurocordato, counsellor and physician of the Ottoman Porte, in a letter to Wedelius. According to this author, bangue is made of the leaves of wild hemp, dried in the shade, then ground to powder; put into a pot wherein butter has been kept; set in an oven till it begin to torrify: then taken out, and pulverized again; thus to be used occasionally, as much at a time as will lie on the point of a knife. Such is the Turkish bangue.—The effects of this drug are, To confound the understanding; set the imagination loose; induce a kind of folly and forgetfulness, wherein all cares are lost, and joy and gaiety take place thereof. Bangue, in reality, is a succedaneum to wine, and obtains in those countries where Mahometanism is established; which prohibiting the use of that liquor absolutely, the poor Mussulmans are forced to have recourse to succedanea, to rouse their spirits. The principal are *opium* and this bangue. As to the opinion among Europeans, that the Turks prepare themselves for battle by a dose of bangue, which rouses their courage, and drives them, with eagerness, to certain death; Dr Maurocordato assures us, that it is a popular error: the Turks think they are then going assuredly to receive the crown of martyrdom; and would not, for any consideration, lose the merit of it, which they would do, by eating the bangue, as being held unlawful by their apostle, among other things which intoxicate.

BANIALUCH, or BAGNALUCH, a city of European Turkey, the capital of Bosnia, upon the frontiers of Dalmatia, near the river Setina. E. Long. 18. 20. N. Lat. 44. 20.

BANIAN-TREE. See FICUS, BOTANY *Index*.

BANIANS, a religious sect in the empire of the Mogul, who believe a metempsychosis; and will therefore eat no living creature, nor kill even noxious animals, but endeavour to release them when in the hands of others.—The name of *Banian* is used with some diversity, which has occasioned much confusion, and many mistakes. Sometimes it is taken in a less proper sense, and extended to all the idolaters of India, as contradistinguished from the Mahometans: in which sense, Banians includes the Bramins and other casts. *Banians*, in a more proper sense, is restrained to a peculiar cast, or tribe of Indians, whose office or profession is trade and merchandise: in which sense, *Banians* stand contradistinguished from *Bramins*, *Cuttery*, and *Wyse*, the three other casts into which the Indians are divided. The four casts are absolutely separate as to occupation, relation, marriage, &c. though all of the same religion; which is more properly denominated the religion of the Bramins, who make the ecclesiastical tribe, than of the *Banians*, who make the mercantile. The proper *Banians* are called, in the *Shaster*, or book of their law, by the name of *Shuddery;* under which are comprehended all who live after the manner of merchants, or that deal and transact for others, as brokers; exclusive of the mechanics or artificers, who make another cast, called *Wyse*. These *Banians* have no peculiar sect or religion, unless it be, that two of the eight general precepts given by their legislator Brama to the Indian nation, are, on account of the profession of the Banians, supposed more immediately to relate to them, viz. those which enjoin veracity in their word and dealings, and avoiding all practices of circumvention in buying and selling. Some of the Banians, quitting their profession, and retiring from the world, commence religious, assume a peculiar habit, and devote themselves more immediately to God, under the denomination of *Vertea*. These, though, they do not hereby change their cast, are commonly reckoned as bramins of a more devout kind; much as monks in the Romish church, though frequently not in orders, are reputed as a more sacred order than the regular clergy. The name *Banian* imports as much, in the Bramin language (wherein their law is written), as a people innocent and harmless; void of all guile; so gentle, that they cannot endure to see either a fly or a worm injured; and who, when struck, will patiently bear it, without resisting or returning the blow.—Their mien and appearance is described by Lord *, in terms a little precise, but very significant: "A people presented themselves to my eyes clothed in linen garments, somewhat low descending; of a gesture and garb, as I may say, maidenly, and well nigh effeminate; of a countenance shy and somewhat estranged." Gemelli Careri divides the Banians into 22 tribes, all distinct, and not allowed to marry with each other. Lord assures us they are divided into 82 casts or tribes, correspondent to the casts or divisions of the Bramins or priests, under whose discipline they are as to religious matters; though the generality of the Banians choose to be under the direction of the two Bramin tribes, the Visalnagranaugers and Volnagranaugers.

* *Discov. Relig. Banian.*

The Banians are the great factors, by whom most of the trade of India is managed; in this respect, comparable to the Jews and Armenians, and not behind either, in point of skill and experience, in whatever relates to commerce. Nothing is bought but by their mediation. They seem to claim a kind of *jus divinum* to the administration of the traffic of the nation, grounded on their sacred books, as the Bramins do that of religion. They are dispersed, for this purpose, through all parts of Asia, and abound in Persia, particularly at Ispahan and Gombroon, where many of them are extremely rich, yet not above acting as brokers, where a penny is to be got. The chief agents of the English, Dutch, and French East India Companies, are of this nation: they are faithful, and are generally trusted with the cash of those companies in their keeping. They act also as bankers, and can give bills of exchange for most cities in the East Indies. Their form of contract in buying and selling is remarkable; being done without words, in the profoundest silence, only by touching each other's fingers: the buyer loosing his pamerin or girdle, spreads it on his knee, and both he and the seller having their hands underneath, by the intercourse of the fingers, mark the price of pounds, shillings, &c. demanded, offered, and at length agreed on. When the seller takes the buyer's whole hand, it denotes a thousand; and, as many times as he squeezes it, as many thousand pagods, or rupees, according to the species in question, are demanded; when he only takes the five fingers, it denotes five hundred; and when only one, one hundred: taking only half a finger, to the second joint, denotes fifty; the small end of the finger, to the first joint, stands for ten.

BANIE, ANTHONY, licentiate in laws, member of the academy of inscriptions and belles lettres, an ecclesiastic of the diocese of Clermont in Auvergne; died in November 1741, aged 69. He is principally celebrated for his translation of the Metamorphoses of Ovid, with historical remarks and explanations; which was published in 1732, at Amsterdam, in folio, finely ornamented with copperplates, by Picart; and reprinted at Paris 1738, in two vols 4to: and for his Mythology, or Fables of the Ancients, explained by history; a work full of the most important information, which was translated into English, and printed at London in 1741, in 4 vols 8vo.

BANISHMENT, exile, among us is of two kinds: the one voluntary, and upon oath; the other by compulsion, for some offence or crime. The former, properly called *abjuration*, is now ceased; the latter is chiefly enjoined by judgment of parliament. Yet outlawing and transportation may also be considered as species of exile.

BANISTER, JOHN, a physician and surgeon in the reign of Queen Elizabeth, was educated at Oxford, where, says Anthony Wood, he studied logicals for a time; but afterwards applied himself solely to physic and surgery. In 1573 he took the degree of bachelor of physic; and, obtaining a license from the university to practise, settled at Nottingham, where he lived many years in great repute, and wrote several medical treatises.

treatises. His works were collected and published in 1633, 4to.

BANISTERIA. See BOTANY *Index*.

BANK, in *Commerce*, a common repository, where many persons agree to keep their money, to be always ready at their call or direction: or, certain societies or communities, who take the charge of other people's money, either to improve it, or to keep it secure.

The first institution of banks was in Italy, where the Lombard Jews kept benches in the market-places for the exchange of money and bills; and *banco* being the Italian name for *bench*, banks took their title from this word.

I. Company-banks.

Banks are of two principal kinds. 1. One sort is either *public*, consisting of a company of moneyed men, who being duly established, and incorporated by the laws of their country, agree to deposite a considerable fund, or joint stock, to be employed for the use of the society, as in lending money upon good security, buying and selling bullion, discounting bills of exchange, &c.: or *private*, i. e. set up by private persons, or partnerships, who deal in the same way as the former upon their own single stock and credit.

Bank of England; its establishment, regulations, importance, &c.

The greatest bank of circulation in Europe is the *Bank of England.* The company was incorporated by parliament in the fifth and sixth years of King William and Queen Mary, by the name of *The Governors and Company of the Bank of England:* in consideration of the loan of 1,200,000l. granted to the government; for which the subscribers received almost 8 per cent. By this charter, the company are not to borrow under their common seal, unless by act of parliament; they are not to trade, or suffer any person in trust for them to trade, in any goods or merchandise; but they may deal in bills of exchange, in buying or selling bullion, and foreign gold and silver coin, &c.

By an act of parliament passed in the 8th and 9th years of William III. they were empowered to enlarge their capital stock to 2,201,171l. 10s. It was then also enacted, that bank-stock should be a personal, and not a real estate; that no contract either in word or writing for buying or selling bank-stock, should be good in law, unless registered in the books of the bank within 7 days, and the stock transferred in 14 days; and that it shall be felony, without benefit of clergy, to counterfeit the common seal of the bank, or any sealed bank-bill, or any bank-note, or to alter or erase such bills or notes. By another act passed in the 7th of Queen Anne, the company were empowered to augment their capital to 4,402,343l. and they then advanced 400,000l. more to the government; and in 1714, they advanced another loan of 1,500,000l.

In the third year of the reign of King George I. the interest of their capital stock was reduced to 5 per cent. when the bank agreed to deliver up as many exchequer bills as amounted to 2,000,000l. and to accept an annuity of 100,000l. and it was declared lawful for the bank to call from their members, in proportion to their interests in the capital stock, such sums of money as in a general court should be found necessary. If any member should neglect to pay his share of the moneys so called for, at the time appointed by notice in the London Gazette, and fixed upon the Royal Exchange, it should be lawful for the bank, not only to stop the dividend of such member, and to apply it towards payment of the money in question, but also to stop the transfers of the share of such defaulter, and to charge him with an interest of 5 per cent. per annum, for the money so omitted to be paid; and if the principal and interest should be three months unpaid, the bank should then have power to sell so much of the stock belonging to the defaulter as would satisfy the same. After this, the bank reduced the interest of the 2,000,000l. lent to the government, from 5 to 4 per cent. and purchased several other annuities, which were afterwards redeemed by the government, and the national debt due to the bank reduced to 1,600,000l. But in 1742, the company engaged to supply the government with 1,600,000l. at 3 per cent. which is now called the 3 per cent. annuities; so that the government was now indebted to the company 3,200,000l. the one half carrying 4, and the other 3 per cent.

In the year 1746, the company agreed that the sum of 986,800l. due to them in the exchequer bills unsatisfied, on the duties for licenses to sell spirituous liquors by retail, should be cancelled, and in lieu thereof to accept of an annuity of 39,442l. the interest of that sum at 4 per cent. The company also agreed to advance the further sum of 1,000,000l. into the exchequer, upon the credit of the duties arising by the malt and land tax at 4 per cent. for exchequer bills to be issued for that purpose; in consideration of which, the company were enabled to augment their capital with 986,800l. the interest of which, as well as that of the other annuities, was reduced to $3\frac{1}{2}$ per cent. till the 27th of December 1757, and from that time to carry only 3 per cent.

And in order to enable them to circulate the said exchequer bills, they established what is now called *bank circulation.* The nature of which may be understood from what follows.

The company of the bank are obliged to keep cash sufficient not only to answer the common, but also any extraordinary demand that may be made upon them; and whatever money they have by them, over and above the sum supposed necessary for these purposes, they employ in what may be called the *trade of the company;* that is to say, in discounting bills of exchange, in buying of gold and silver, and in government securities, &c. But when the bank entered into the above-mentioned contract, as they did not keep unemployed a larger sum of money than what they deemed necessary to answer their ordinary and extraordinary demands, they could not conveniently take out of their current cash so large a sum as a million, with which they were obliged to furnish the government, without either lessening that sum they employed in discounting, buying gold and silver, &c. (which would have been very disadvantageous to them), or inventing some method that should answer all the purposes of keeping the million in cash. The method which they chose, and which fully answers their end, was as follows:

They opened a subscription, which they renew annually, for a million of money; wherein the subscribers advance 10 per cent. and enter into a contract to pay the remainder, or any part thereof, whenever the bank shall call upon them, under penalty of forfeiting the 10 per cent. so advanced: in consideration of which, the bank pays the subscribers 4 per cent. interest for the

Bank.

the money paid in, and ¼ per cent. for the whole sum they agree to furnish; and in case a call shall be made upon them for the whole, or any part thereof, the bank further agrees to pay them at the rate of 5 per cent. per annum for such sum till they repay it, which they are under an obligation to do at the end of the year. By this means the bank obtains all the purposes of keeping a million of money by them; and though the subscribers, if no call is made upon them (which is in general the case), receive 6½ per cent. for the money they advance, yet the company gains the sum of 23,500l. per annum by the contract; as will appear by the following account:

The bank receives from the government for the advance of a million -	L.30,000
The bank pays the subscribers who advance 100,000l. and engage to pay (when called for) 900,000l. more - - -	6,500
The clear gain to the bank therefore is	23,500

This is the state of the case, provided the company should make no call on the subscribers; which they will be very unwilling to do, because it would not only lessen their profit, but affect the public credit in general.

Bank-stock may not improperly be called a *trading stock*, since with this they deal very largely in foreign gold and silver, in discounting bills of exchange, &c. Besides which, they are allowed by the government very considerable sums annually for the management of the annuities paid at their office. All which advantages render a share in their stock very valuable; though it is not equal in value to the East India stock. The company make dividends of the profits half yearly, of which notice is publicly given; when those who have occasion for their money may readily receive it; but private persons, if they judge convenient, are permitted to continue their funds, and to have their interest added to the principal.

This company is under the direction of a governor, deputy-governor, and 24 directors, who are annually elected by the general court, in the same manner as in the East India Company. Thirteen, or more, compose a court of directors for managing the affairs of the company. The officers of this company are very numerous.

The stability of the bank of England is equal to that of the British government. All that it has advanced to the public must be lost before its creditors can sustain any loss. No other banking company in England can be established by act of parliament, or can consist of more than six members. It acts, not only as an ordinary bank, but (as we have already seen) as a great engine of state; receiving and paying the greater part of the annuities which are due to the creditors of the public; circulating exchequer bills; and advancing to government the annual amount of the land and malt taxes, which are frequently not paid up till some years thereafter. It likewise has, upon several different occasions, supported the credit of the principal houses, not only in England, but of Hamburgh and Holland. Upon one occasion it is said to have advanced for this purpose, in one week, about 1,600,000l. a great part of it in bullion.

Bank.

Scotch banks, public and private.

In Scotland there are two public banks, both at Edinburgh. The one, called *The Bank of Scotland*, was established by act of parliament in 1695; the other, called *The Royal Bank*, by royal charter in 1727.

Within these 30 years there have also been erected private banking companies in almost every considerable town, and even in some villages. Hence the business of the country is almost entirely carried on by paper-currency, *i. e.* by the notes of those different banking companies; with which purchases and payments of all kinds are commonly made. Silver very seldom appears, except in the change of a twenty-shilling bank-note, and gold still seldomer. But though the conduct of all those different companies has not been unexceptionable, and has accordingly required an act of parliament to regulate it; the country, notwithstanding, has evidently derived great benefit from their trade. It has been asserted, that the trade of the city of Glasgow doubled in about 15 years after the first erection of the banks there; and that the trade of Scotland has more than quadrupled since the first erection of the two public banks at Edinburgh. Whether the trade, either of Scotland in general, or of the city of Glasgow in particular, has really increased in so great a proportion, during so short a period, we do not pretend to know. If either of them has increased in this proportion, it seems to be an effect too great to be accounted for by the sole operation of this cause. That the trade and industry of Scotland, however, have increased very considerably during this period, and that the banks have contributed a good deal to this increase, cannot be doubted.

Smith's *Wealth of Nations*, Book II. chap. ii.

The value of the silver money which circulated in Scotland before the Union in 1707, and which immediately after it was brought into the bank of Scotland in order to be recoined, amounted to 411,117l. 10s. 9d. sterling. No account has been got of the gold coin: but it appears from the ancient accounts of the mint of Scotland, that the value of the gold annually coined somewhat exceeded that of the silver. There were a good many people too upon this occasion, who, from a diffidence of repayment, did not bring their silver into the bank of Scotland; and there was, besides, some English coin, which was not called in. The whole value of the gold and silver, therefore, which circulated in Scotland before the Union, cannot be estimated at less than a million sterling. It seems to have constituted almost the whole circulation of that country; for though the circulation of the bank of Scotland, which had then no rival, was considerable, it seems to have made but a very small part of the whole. In the present times, the whole circulation of Scotland cannot be estimated at less than two millions, of which that part which consists of gold and silver most probably does not amount to half a million. But though the circulating gold and silver of Scotland have suffered so great a diminution during this period, its real riches and prosperity do not appear to have suffered any. Its agriculture, manufactures, and trade, on the contrary, the annual produce of its land and labour, have evidently been augmented.

Discounting of bills.

It is chiefly by discounting bills of exchange, that is, by advancing money upon them before they are due, that the greater part of banks and bankers issue their promissory notes. They deduct always upon whatever

Digitized by Google

ever sum they advance, the legal interest till the bill shall become due. The payment of the bill, when it becomes due, replaces to the bank the value of what had been advanced, together with a clear profit of the interest. The banker, who advances to the merchant whose bill he discounts not gold and silver, but his own promissory notes, has the advantage of being able to discount to a greater amount, by the whole value of his promissory notes, which he finds by experience are commonly in circulation. He is thereby enabled to make his clear gain of interest on so much larger a sum.

The commerce of Scotland, which at present is not very great, was still more inconsiderable when the two first banking companies were established; and those companies would have had but little trade, had they confined their business to the discounting of bills of exchange. They invented, therefore, another method of issuing their promissory notes, by granting what they called *cash accounts;* that is, by giving credit to the extent of a certain sum (2000l. or 3000l. for example), to any individual who could procure two persons of undoubted credit and good landed estate to become surety for him, that whatever money should be advanced to him within the sum for which the credit had been given should be repaid upon demand, together with the legal interest. Credits of this kind are commonly granted by banks and bankers in all different parts of the world. But the easy terms on which the Scots banking companies accept of repayment, are peculiar to them, and have perhaps been the principal cause, both of the great trade of these companies and of the benefit which the country has received from it.

Cash-accounts.

Advantages from these

Whoever has a credit of this kind with one of those companies, and borrows 1000l. upon it, for example, may repay this sum piecemeal, by 20l. and 30l. at a time, the company discounting a proportional part of the interest of the great sum from the day on which each of those small sums is paid in, till the whole be in this manner repaid. All merchants, therefore, and almost all men of business, find it convenient to keep such cash-accounts with them; and are thereby interested to promote the trade of those companies, by readily receiving their notes in all payments, and by encouraging all those with whom they have any influence to do the same. The banks, when their customers apply to them for money, generally advance it to them in their own promissory notes. These the merchants pay away to the manufacturers for goods, the manufacturers to the farmers for materials and provisions, the farmers to their landlords for rent, the landlords repay them to the merchants for the conveniences and luxuries with which they supply them, and the merchants again return them to the banks in order to balance their cash-accounts, or to replace what they may have borrowed of them; and thus almost the whole money business of the country is transacted by means of them. Hence the great trade of those companies.

to the banks, and

By means of those cash-accounts, every merchant can, without imprudence, carry on a greater trade than he otherwise could do. If there are two merchants, one in London, and the other in Edinburgh, who employ equal stocks in the same branch of trade, the Edinburgh merchant can, without imprudence, carry on a greater trade, and give employment to a greater number of people, than the London merchant. The London merchant must always keep by him a considerable sum of money, either in his own coffers, or in those of his banker (who gives him no interest for it), in order to answer the demands continually coming upon him for payment of the goods which he purchases upon credit. Let the ordinary amount of this sum be supposed 500l. The value of the goods in his warehouse must always be less by 500l. than it would have been, had he not been obliged to keep such a sum unemployed. Let us suppose that he generally disposes of his whole stock upon hand, or of goods to the value of his whole stock upon hand, once in the year. By being obliged to keep such a great sum unemployed, he must sell in a year 500l. worth less goods than he might otherwise have done. His annual profits must be less by all that he could have made by the sale of 500l. worth more goods; and the number of people employed in preparing his goods for the market, must be less by all those that 500l. more stock could have employed. The merchant in Edinburgh, on the other hand, keeps no money unemployed for answering such occasional demands. When they actually come upon him, he satisfies them from his cash-account with the bank, and gradually replaces the sum borrowed with the money or paper which comes in from the occasional sales of his goods. With the same stock, therefore, he can, without imprudence, have at all times in his warehouse a larger quantity of goods than the London merchant; and can thereby both make a greater profit himself, and give constant employment to a greater number of industrious people who prepare those goods for the market. Hence the great benefit which the country has derived from this trade.

to the country.

The late multiplication of banking companies in both parts of the united kingdom, an event by which many people have been much alarmed, instead of diminishing, increases the security of the public. It obliges all of them to be more circumspect in their conduct, and, by not extending their currency beyond its due proportion to their cash, to guard themselves against those malicious runs which the rivalship of so many competitors is always ready to bring upon them. It restrains the circulation of each particular company within a narrower circle, and reduces their circulating notes to a smaller number. By dividing the whole circulation into a greater number of parts, the failure of any one company, an accident which, in the course of things, must sometimes happen, becomes of less consequence to the public. This free competition too obliges all bankers to be more liberal in their dealings with their customers, lest their rivals should carry them away. In general, if any branch of trade, or any division of labour, be advantageous to the public, the freer and more general the competition, it will always be the more so. See further, the article *Paper-Money*.

2. The other kind of banks consist of such as are instituted wholly on the public account, and are called *Banks of Deposit;* the nature of which not being generally understood, the following particular explanation may not be unacceptable.

II. Banks of deposit.

The currency of a great state, such as Britain, generally, Bank.

Smith's Wealth of Nations, Book IV. chap. iii.

nerally consists almost entirely of its own coin. Should this currency, therefore, be at any time worn, clipt, or otherwise degraded below its standard value, the state by a reformation of its coin can effectually re-establish its currency. But the currency of a small state, such as Genoa or Hamburgh, can seldom consist altogether in its own coin, but must be made up, in a great measure, of the coins of all the neighbouring states with which its inhabitants have a continual intercourse. Such a state, therefore, by reforming its coin, will not always be able to reform its currency. If foreign bills of exchange are paid in this currency, the uncertain value of any sum, of what is in its own nature so uncertain, must render the exchange always very much against such a state, its currency being, in all foreign states, necessarily valued below even what it is worth. In order to remedy the inconvenience to which this disadvantageous exchange must have subjected their merchants, such small states, when they began to attend to the interest of trade, have frequently enacted, that foreign bills of exchange of a certain value should be paid, not in common currency, but by an order upon, or by a transfer in, the books of a certain bank, established upon the credit and under the protection of the state; this bank being always obliged to pay, in good and true money, exactly according to the standard of the state. The banks of Venice, Genoa, Amsterdam, Hamburgh, and Nuremberg, seem to have been all originally established with this view, though some of them may have afterwards been made subservient to other purposes. The money of such banks, being better than the common currency of the country, necessarily bore an agio, which was greater or smaller, according as the currency was supposed to be more or less degraded below the standard of the state. The agio of the bank of Hamburgh, for example, which is said to be commonly about 14 per cent. is the supposed difference between the good standard money of the state, and the clipt, worn, and diminished currency poured into it from all the neighbouring states.

Before 1609, the great quantity of clipt and worn foreign coin, which the extensive trade of Amsterdam brought from all parts of Europe, reduced the value of its currency about 9 per cent. below that of good money fresh from the mint. Such money no sooner appeared, than it was melted down or carried away, as it always is in such circumstances. The merchants, with plenty of currency, could not always find a sufficient quantity of good money to pay their bills of exchange; and the value of those bills, in spite of several regulations which were made to prevent it, became in a great measure uncertain. In order to remedy these inconveniences, a bank was established in 1609 under the guarantee of the city. The bank received both foreign coin, and the light and worn coin of the country, at its real and intrinsic value in the good standard money of the country, deducting only so much as was necessary for defraying the expence of coinage, and other necessary expence of management. For the value which remained after this small deduction was made, it gave a credit in its books. This credit was called *bank-money*; which, as it represented money exactly according to the standard of the mint, was always of the same real value, and intrinsically worth more

Bank of Amsterdam, one of the most famous. Its institution, regulation, utility, &c.

than current money. It was at the same time enacted, that all bills drawn upon or negotiated at Amsterdam of the value of 600 guilders and upwards should be paid in bank-money, which at once took away all uncertainty in the value of those bills. Every merchant, in consequence of this regulation, was obliged to keep an account with the bank in order to pay his foreign bills of exchange, which necessarily occasioned a certain demand for bank-money.

Bank-money, over and above both its intrinsic superiority to currency, and the additional value which this demand necessarily gives it, has likewise some other advantages. It is secure from fire, robbery, and other accidents; the city of Amsterdam is bound for it; it can be paid away by a simple transfer, without the trouble of counting, or the risk of transporting it from one place to another. In consequence of those different advantages, it seems from the beginning to have born an agio; and it is generally believed that all the money originally deposited in the bank was allowed to remain there, nobody caring to demand payment of a debt which he could sell for a premium in the market. Besides, this money could not be brought from these coffers, as it will appear by and by, without previously paying for the keeping.

Those deposits of coin, or which the bank was bound to restore in coin, constituted the original capital of the bank, or the whole value of what was represented by what is called *bank-money*. At present they are supposed to constitute but a very small part of it. In order to facilitate the trade in bullion, the bank has been for these many years in the practice of giving credit in its books upon deposits of gold and silver bullion. The credit is generally about 5 per cent. below the mint price of such bullion. The bank grants at the same time what is called a *recipice* or receipt, entitling the person who makes the deposit, or the bearer, to take out the bullion again at any time within six months, upon re-transferring to the bank a quantity of bank-money equal to that for which credit had been given in its books when the deposit was made, and upon paying $\frac{1}{4}$ per cent. for the keeping if the deposit was in silver, and $\frac{1}{2}$ per cent. if it was in gold; but at the same time declaring, that in default of such payment, and upon the expiration of this term, the deposit should belong to the bank at the price at which it had been received, or for which credit had been given in the transfer books. What is thus paid for the keeping of the deposit may be considered as a sort of warehouse-rent; and why this warehouse-rent should be so much dearer for gold than for silver, several different reasons have been assigned. The fineness of gold, it has been said, is more difficult to be ascertained than that of silver. Frauds are more easily practised, and occasion a greater loss in the more precious metal. Silver, besides, being the standard metal, the state, it has been said, wishes to encourage more the making of deposits of silver than those of gold.

Deposits of bullion are most commonly made when the price is somewhat lower than ordinary; and they are taken out again when it happens to rise. In Holland the market price of bullion is generally above the mint price, for the same reason that it was so in England before the late reformation of the gold coin. The difference is said to be commonly from about six to sixteen

Digitized by Google

Bank. sixteen stivers upon the mark, or eight ounces of silver of eleven parts fine and one part alloy. The bank-price, or the credit which the bank gives for deposits of such silver (when made in foreign coin, of which the fineness is well known and ascertained, such as Mexico dollars), is 22 gilders the mark; the mint-price is about 23 gilders; and the market-price is from 23 gilders six stivers to 23 gilders 16 stivers, or from 2 to 3 per cent. above the mint-price. The proportion between the bank-price, the mint-price, and the market-price, of gold bullion, are nearly the same. A person can generally sell his receipt for the difference between the mint-price of bullion and the market-price. A receipt for bullion is almost always worth something; and it very seldom happens therefore that anybody suffers his receipt to expire, or allows his bullion to fall to the bank at the price at which it had been received, either by not taking it out before the end of the six months, or by neglecting to pay the ¼ or ½ per cent. in order to obtain a new receipt for another six months. This, however, though it seldom happens, is said to happen sometimes, and more frequently with regard to gold than with regard to silver, on account of the higher warehouse-rent which is paid for the keeping of the more precious metal.

The person who by making a deposit of bullion obtains both a bank-credit and a receipt, pays his bills of exchange as they become due with his bank-credit; and either sells or keeps his receipt, according as he judges that the price of bullion is likely to rise or to fall. The receipt and the bank-credit seldom keep long together, and there is no occasion that they should. The person who has a receipt, and who wants to take out bullion, finds always plenty of bank-credits, or bank-money, to buy at the ordinary price; and the person who has bank-money, and wants to take out bullion, finds receipts always in equal abundance.

The owners of bank-credits and the holders of receipts constitute two different sorts of creditors against the bank. The holder of a receipt cannot draw out the bullion for which it is granted, without re-assigning to the bank a sum of bank-money equal to the price at which the bullion had been received. If he has no bank-money of his own, he must purchase it of those who have it. The owner of bank-money cannot draw out bullion without producing to the bank receipts for the quantity which he wants. If he has none of his own, he must buy them of those who have them. The holder of a receipt, when he purchases bank-money, purchases the power of taking out a quantity of bullion, of which the mint-price is 5 per cent. above the bank-price. The agio of 5 per cent. therefore, which he commonly pays for it, is paid not for an imaginary, but for a real value. The owner of bank-money, when he purchases a receipt, purchases the power of taking out a quantity of bullion, of which the market-price is commonly from 2 to 3 per cent. above the mint-price. The price which he pays for it, therefore, is paid likewise for a real value. The price of the receipt, and the price of the bank money, compound or make up between them the full value or price of the bullion.

Upon deposits of the coin current in the country, the bank grants receipts likewise as well as bank-credits; but those receipts are frequently of no value, and will bring no price in the market. Upon ducatoons, for example, which in the currency pass for three gilders three stivers each, the bank gives a credit of three gilders only, or 5 per cent. below their current value. It grants a receipt likewise entitling the bearer to take out the number of ducatoons deposited at any time within six months, upon paying ¼ per cent. for the keeping. This receipt will frequently bring no price in the market. Three gilders bank-money generally sell in the market for three gilders three stivers, the full value of the ducatoons if they were taken out of the bank; and before they can be taken out, ¼ per cent. must be paid for the keeping, which would be mere loss to the holder of the receipt. If the agio of the bank, however, should at any time fall to 3 per cent. such receipts might bring some price in the market, and might sell for 1¾ per cent. But the agio of the bank being now generally about 5 per cent. such receipts are frequently allowed to expire, or, as they express it, to fall to the bank. The 5 per cent. which the bank gains, when deposits either of coin or bullion are allowed to fall to it, may be considered as the warehouse rent for the perpetual keeping of such deposits.

The sum of bank-money for which the receipts are expired must be very considerable. It must comprehend the whole original capital of the bank, which, it is generally supposed, has been allowed to remain there from the time it was first deposited, nobody caring either to renew his receipt or to take out his deposit, as, for the reasons already assigned, neither the one nor the other could be done without loss. But whatever may be the amount of this sum, the proportion which it bears to the whole mass of bank-money is supposed to be very small. The bank of Amsterdam has for these many years past been the great warehouse of Europe for bullion, for which the receipts are very seldom allowed to expire, or, as they express it, to fall to the bank. The far greater part of the bank-money, or of the credits upon the books of the bank, is supposed to have been created, for these many years past, by such deposits which the dealers in bullion are continually both making and withdrawing.

No demand can be made upon the bank but by means of a recipice or receipt. The smaller mass of bank-money, for which the receipts are expired, is mixed and confounded with the much greater mass for which they are still in force; so that, though there may be a considerable sum of bank-money for which there are no receipts, there is no specific sum or portion of it which may not at any time be demanded by one. The bank cannot be debtor to two persons for the same thing; and the owner of bank-money who has no receipt cannot demand payment of the bank till he buys one. In ordinary and quiet times, he can find no difficulty in getting one to buy at the market-price, which generally corresponds with the price at which he can sell the coin or bullion it entitles him to take out of the bank.

It might be otherwise during a public calamity; an invasion, for example, such as that of the French in 1672. The owners of bank-money being then all eager to draw it out of the bank, in order to have it in their own keeping, the demand for receipts might raise their price to an exorbitant height. The holders of them might

Bank

might form extravagant expectations, and instead of 2 or 3 per cent. demand half the bank-money for which credit had been given upon the deposits that the receipts had respectively been granted for. The enemy, informed of the constitution of the bank, might even buy them up in order to prevent the carrying away of the treasure. In such emergencies, the bank, it is supposed, would break through its ordinary rule of making payment only to the holders of receipts. The holders of receipts, who had no bank-money, must have received within 2 or 3 per cent. of the value of the deposit for which their respective receipts had been granted. The bank, therefore, it is said, would in this case make no scruple in paying, either with money or bullion, the full value of what the owners of bank-money who could get no receipts were credited for in its books; paying at the same time 2 or 3 per cent. to such holder of receipts as had no bank-money, that being the whole value which in this state of things could justly be supposed due to them.

Even in ordinary and quiet times it is the interest of the holders of receipts to depress the agio in order either to buy bank-money (and consequently the bullion which their receipts would then enable them to take out of the bank) so much cheaper, or to sell their receipts to those who have bank-money, and who want to take out bullion, so much dearer; the price of a receipt being generally equal to the difference between the market-price of bank-money and that of the coin or bullion for which the receipt had been granted. It is the interest of the owners of bank-money, on the contrary, to raise the agio, in order either to sell their bank-money so much dearer, or to buy a receipt so much cheaper. To prevent the stock-jobbing tricks which those opposite interests might sometimes occasion, the bank has of late years come to a resolution to sell at all times bank-money for currency, at 5 per cent. agio, and to buy it again at 4 per cent. agio. In consequence of this resolution, the agio can never either rise above 5 or sink below 4 per cent. and the proportion between the market-price of the bank and that of current money is kept at all times very near to the proportion between their intrinsic values. Before this resolution was taken, the market-price of money used sometimes to rise so high as 9 per cent. agio, and sometimes to sink so low as par, according as opposite interests happened to influence the market.

The bank of Amsterdam professes to lend out no part of what is deposited with it, but, for every gilder for which it gives credit in its books, to keep in its repositories the value of a gilder either in money or bullion. That it keeps in its repositories all the money or bullion for which there are receipts in force, for which it is at all times liable to be called upon, and which, in reality, is continually going from it and returning to it again, cannot well be doubted. But whether it does so likewise with regard to that part of its capital for which the receipts are long ago expired, for which in ordinary and quiet times it cannot be called upon, and which in reality is very likely to remain with it for ever, or as long as the States of the United Provinces subsist, may appear perhaps more uncertain. At Amsterdam, however, no part of faith is better established, than that for every gilder circulated as bank-money, there is a correspondent gilder in gold and silver to be found in the treasure of the bank. The city is guarantee that it should be so. The bank is under the direction of the four reigning burgomasters, who are changed every year. Each new set of burgomasters visits the treasure, compares it with the books, receives it upon oath and delivers it over, with the same awful solemnity, to the set which succeeds it; and in that sober and religious country oaths are not yet disregarded. A rotation of this kind seems alone a sufficient security against any practices which cannot be avowed. Amidst all the revolutions which faction has ever occasioned in the government of Amsterdam, the prevailing party has at no time accused their predecessors of infidelity in the administration of the bank. No accusation could have affected more deeply the reputation and fortune of the disgraced party; and if such an accusation could have been supported, we may be assured that it would have been brought. In 1672, when the French king was at Utrecht, the bank of Amsterdam paid so readily as left no doubt of the fidelity with which it had observed its engagements. Some of the pieces which were then brought from its repositories appeared to have been scorched with the fire which happened in the town-house soon after the bank was established. Those pieces, therefore, must have lain there from that time.

What may be the amount of the treasure in the bank is a question which has long employed the speculations of the curious. Nothing but conjecture can be offered concerning it. It is generally reckoned, that there are about 2000 people who keep accounts with the bank; and allowing them to have, one with another, the value of 1500l. lying upon their respective accounts (a very large allowance), the whole quantity of bank-money, and consequently of treasure in the bank, will amount to 3,000,000l. or, at 11 gilders the pound sterling, 33,000,000 of gilders; a great sum, and sufficient to carry on a very extensive circulation, but vastly below the extravagant ideas which some people have formed of this treasure.

The city of Amsterdam derives a considerable revenue from the bank. Besides what may be called the *warehouse-rent* above-mentioned, each person, upon first opening an account with the bank, pays a fee of 10 gilders, and for every new account, 3 gilders 3 stivers; for every transfer, 2 stivers; and if the transfer is for less than 300 gilders, 6 stivers; in order to discourage the multiplicity of small transactions. The person who neglects to balance his accounts twice in the year forfeits 25 gilders. The person who orders a transfer for more than is upon his accounts, is obliged to pay 3 per cent. for the sum overdrawn, and his order is set aside into the bargain. The bank is supposed, too, to make a considerable profit by the sale of the foreign coin or bullion which sometimes falls to it by the expiring of receipts, and which is always kept till it can be sold with advantage. It makes a profit likewise by selling bank-money at 5 per cent. agio, and buying it in at 4. These different emoluments amount to a good deal more than what is necessary for paying the salaries of officers, and defraying the expence of management. What is paid for the keeping of bullion upon receipts, is alone supposed to amount to a neat annual revenue of between 150,000 and 200,000 gilders. Public utility, however, and not revenue, was the original object of this

Digitized by Google

this institution. Its object was to relieve the merchants from the inconvenience of a disadvantageous exchange. The revenue which has arisen from it was unforeseen. See BANKING, SUPPLEMENT.

BANKS for Savings, a class of institutions lately introduced with the view of encouraging habits of economy among the labouring classes. See the article in the SUPPLEMENT.

BANK, in sea affairs, denotes an elevation of the ground or bottom of the sea, so as sometimes to surmount the surface of the water, or at least to leave the water so shallow as usually not to allow a vessel to remain afloat over it.—In this sense, *bank* amounts to much the same as flat, shoal, &c.

BANKER, a person who traffics and negociates in money; who receives and remits money from place to place by commission from correspondents, or by means of bills or letters of exchange, &c.

The ancient bankers were called *argentarii*, and *nummularii;* by the Greeks, *τραπεζῖται*, *κολλυβισται*, and *αργυραμοιβοι*. Their chief business was to put out the money of private persons to interest; they had their boards and benches, for this purpose, in all the markets and public places, where they took in the money from some to lend it to others.

BANKING, the making of banks to oppose the force of the sea, rivers, or the like, and secure the land from being overflowed thereby. With respect to the water which is to be kept out, this is called *banking;* with respect to the land, which is hereby to be defended, *imbanking*.

BANKING is also applied to the keeping a bank, or the employment of a banker. Banking, in this sense, signifies the trading in money, or remitting it from place to place, by means of bills of exchange. This answers to what the French call *faire la banque*. In France, every body is allowed to bank, whether merchant or not; even foreigners are indulged in this kind of traffic. In Italy, banking does not derogate from nobility, especially in the republican states; whence it is, that most of the younger sons of great families engage in it. In reality, it was the nobility of Venice and Genoa, that, for a long time, were the chief bankers in the other countries of Europe.

BANKISH, a province of the Mogul's dominions, in the north part of the Hither India, lying south-west of the province of Cassimere.

BANKRUPT, (*bancus ruptus*), is so called, because, when the bank or stock is broken or exhausted, the owner is said to be a *bankrupt*. And this word *bankrupt* is derived from the French *banqueroute*, which signifies a breaking or failing in the world: *banque* in French is as much as *mensa* in Latin, and *route* is the same as *vestigium;* and this term is said to have been taken originally from the Roman *mensarii*, which were set in public places; and when a tradesman slipped away, with an intention to deceive his creditors, he left only some *vestigia* or signs of his table or shop behind him. But a bankrupt with us, from the several descriptions given of him in our statute-law, may be defined "a trader, who secrets himself, or does certain other acts tending to defraud his creditors." For the better understanding of this article, it will be proper to consider, 1. *Who* may become a bankrupt. 2. What *acts* make a bankrupt. 3. The *proceedings* on a commission of bankruptcy: and, 4. In what manner an estate in goods and chattels may be *transferred* by bankruptcy.—But of these, the two last being treated under the article *COMMISSION of Bankruptcy*, the two first only belong to this place.

1. A bankrupt was formerly considered merely in the light of a criminal or offender; and in this spirit we are told by Sir Edward Coke, that we have fetched as well the name, as the wickedness of bankrupts from foreign nations. But at present the laws of bankruptcy are considered as laws calculated for the benefit of trade, and founded on the principles of humanity as well as justice; and to that end they confer some privileges not only on the creditors, but also on the bankrupt or debtor himself. On the creditors; by compelling the bankrupt to give up all his effects to their use, without any fraudulent concealment: on the debtor, by exempting him from the rigour of the general law, whereby his person might be confined at the discretion of his creditor, though in reality he has nothing to satisfy the debt; whereas the law of bankrupts, taking into consideration the sudden and unavoidable accidents to which men in trade are liable, has given them the liberty of their persons, and some pecuniary emoluments, upon condition they surrender up their whole estate to be divided among their creditors.

In this respect our legislature seems to have attended to the example of the Roman law. We mean not the terrible law of the twelve tables, whereby the creditors might cut the debtor's body into pieces, and each of them take his proportionable share: if indeed that law, *de debitore in partes secando*, is to be understood in so very butcherly a light; which many learned men have with reason doubted. Nor do we mean those less inhuman laws (if they may be called so, as *their* meaning is indisputably certain), of imprisoning the debtor's person in chains; subjecting him to stripes and hard labour, at the mercy of his rigid creditor; and sometimes selling him, his wife, and children, to perpetual foreign slavery *trans Tiberim* (A): an oppression which produced so many popular insurrections, and secessions to the *mons sacer*. But we mean the law of cession, introduced by the Christian emperors; whereby, if a debtor *ceded*, or yielded up all his fortune to his creditors, he was secured from being dragged to a gaol, "*omni quoque corporali cruciatu semoto.*" For, as the emperor justly observes, "*inhumanum erat spoliatum fortunis suis in solidum damnari.*" Thus far was just and reasonable: but as the departing from one extreme is apt to produce its opposite, we find it afterwards enacted, that if the debtor by any unforeseen accident was reduced to low circumstances, and would swear that he had not sufficient left to pay his debts, he should not be compelled to cede or give up even that

Blackst. Comm. II. 472, &c.

(A) In Pegu, and the adjacent countries in the East Indies, the creditor is entitled to dispose of the debtor himself, and likewise of his wife and children; insomuch that he may even violate with impunity the chastity of the debtor's wife; but then, by so doing, the debt is understood to be discharged.

Digitized by Google

Bankrupt. which he had in his possession; a law which, under a false notion of humanity, seems to be fertile of perjury, injustice, and absurdity.

The laws of England, more wisely, have steered in the middle between both extremes: providing at once against the inhumanity of the creditor, who is not suffered to confine an honest bankrupt after his effects are delivered up; and at the same time taking care that all his just debts shall be paid, so far as the effects will extend. But still they are cautious of encouraging prodigality and extravagance by this indulgence to debtors; and therefore they allow the benefit of the laws of bankruptcy to none but actual traders; since that set of men are, generally speaking, the only persons liable to accidental losses, and to an inability of paying their debts, without any fault of their own. If persons in other situations of life run in debt without the power of payment, they must take the consequence of their own indiscretion, even though they meet with sudden accidents that may reduce their fortunes: for the law holds it to be an unjustifiable practice, for any person but a trader to encumber himself with debts of any considerable value. If a gentleman, or one in a liberal profession, at the time of contracting his debts, has a sufficient fund to pay them, the delay of payment is a species of dishonesty, and a temporary injustice to his creditor: and if, at such a time, he has not sufficient fund, the dishonesty and injustice is the greater. He cannot therefore murmur, if he suffers the punishment which he has voluntarily drawn upon himself. But in mercantile transactions the case is far otherwise. Trade cannot be carried on without mutual credit on both sides; the contracting of debts is therefore here not only justifiable but necessary. And if, by accidental calamities, as by the loss of a ship in a tempest, the failure of brother-traders, or by the non-payment of persons out of trade, a merchant or trader becomes incapable of discharging his own debts, it is his misfortune and not his fault. To the misfortunes therefore of debtors, the law has given a compassionate remedy, but denied it to their faults; since, at the same time that it provides for the security of commerce, by enacting that every considerable trader may be declared a bankrupt, for the benefit of his creditors as well as himself, it has also, to discourage extravagance, declared that no one shall be capable of being made a bankrupt, but only a trader; nor capable of receiving the full benefit of the statutes, but only an industrious trader.

In the interpretation of the several statutes made concerning English bankrupts *, it hath been held, that buying only, or selling only, will not qualify a man to be a bankrupt; but it must be both buying and selling, and also getting a livelihood by it; as, by exercising the calling of a merchant, a grocer, a mercer, or, in one general word, a *chapman*, who is one that buys and sells any thing. But no handicraft occupation (where nothing is bought or sold, and therefore an extensive credit, for the stock in trade, is not necessary to be had) will make a man a regular bankrupt: as that of a husbandman, a gardener, and the like, who are paid for their work and labour. Also an innkeeper cannot, as such, be a bankrupt: for his gain or livelihood does not arise from buying and selling in the way of merchandise, but greatly from the use of his rooms and furniture, his attendance, and the like; and though he may buy corn and victuals, to sell again at a profit, yet that no more makes him a trader, than a schoolmaster or other person is, that keeps a boarding-house, and makes considerable gains by buying and selling what he spends in the house, and such a one is clearly not within the statute. But where persons buy goods, and make them up into saleable commodities, as shoemakers, smiths, and the like; here, though part of the gain is by bodily labour, and not by buying and selling, yet they are within the statutes of bankrupts: for the labour is only in melioration of the commodity, and rendering it more fit for sale.

* 34 *Hen.* VIII. c. 4. 13 *Eliz.* c. 21. *Jac.* I. c. 19. 5 *Geo.* II. c. 30.

2. To learn what the acts of bankruptcy are which render a man a bankrupt, we must consult the several statutes, and the resolutions formed by the courts thereon. Among these may therefore be reckoned, 1. Departing from the realm, whereby a man withdraws himself from the jurisdiction and coercion of the law, with an intent to defraud his creditors. 2. Departing from his own house, with an intent to secrete himself and avoid his creditors. 3. Keeping in his own house, privately (except for just and necessary cause), so as not to be seen or spoken with by his creditors; which is likewise construed to be an intention to defraud his creditors, by avoiding the process of the law. 4. Procuring or suffering himself willingly to be arrested, or outlawed, or imprisoned, without just and lawful cause; which is likewise deemed an attempt to defraud his creditors. 5. Procuring his money, goods, chattels, and effects, to be attached or sequestrated by any legal process; which is another plain and direct endeavour to disappoint his creditors of their security. 6. Making any fraudulent conveyance to a friend, or secret trustee, of his lands, tenements, goods, or chattels: which is an act of the same suspicious nature with the last. 7. Procuring any protection, not being himself privileged by parliament, in order to screen his person from arrests; which also is an endeavour to elude the justice of the law. 8. Endeavouring, or desiring, by any petition to the king, or bill exhibited in any of the king's courts against any creditors, to compel them to take less than their just debts; or to procrastinate the time of payment, originally contracted for; which are an acknowledgment of either his poverty or his knavery. 9. Lying in prison for two months, or more, upon arrest or other detention for debt, without finding bail, in order to obtain liberty. For the inability to procure bail argues a strong deficiency in his credit, owing either to his suspected poverty, or ill character; and his neglect to do it, if able, can arise only from a fraudulent intention; in either of which cases, it is high time for his creditors to look to themselves, and compel a distribution of his effects. 10. Escaping from prison after an arrest for a just debt of 100l. or upwards: for no man would break prison, that was able and desirous to procure bail: which brings it within the reason of the last case. 11. Neglecting to make satisfaction for any just debt to the amount of 100l. within two months after service of legal process, for such debt, upon any trader having privilege of parliament.

These are the several acts of bankruptcy expressly defined by the statutes relating to this article; which being

Digitized by Google

being so numerous, and the whole law of bankrupts being an innovation on the common law, our courts of justice have been tender of extending or multiplying acts of bankruptcy by any construction or implication. And therefore Sir John Holt held, that a man's removing his goods privately to prevent their being seized in execution, was no act of bankruptcy. For the statutes mention only fraudulent gifts to third persons, and procuring them to be seized by sham process, in order to defraud creditors; but this, though a palpable fraud, yet, falling within neither of those cases, cannot be adjudged an act of bankruptcy. So also it has been determined expressly, that a banker's stopping or refusing payment is no act of bankruptcy: for it is not within the description of any of the statutes; and there may be good reasons for his so doing, as suspicion of forgery, and the like; and if, in consequence of such refusal, he is arrested, and puts in bail, still it is no act of bankruptcy; but if he goes to prison, and lies there two months, then, and not before, is he become a bankrupt.

As to the consequences resulting from the unhappy situation of a bankrupt, see the article *Commission of Bankruptcy*.

BANKS, John, a dramatic writer, was bred to the law, and belonged to the society of Gray's Inn; but this profession not suiting his natural disposition, he quitted it for the service of the muses. Here, however, he found his rewards by no means adequate to his deserts. His emoluments at the best were precarious, and the various successes of his pieces too feelingly convinced him of the error in his choice. This, however, did not prevent him from pursuing with cheerfulness the path he had taken; his thirst of fame, and warmth of poetic enthusiasm, alleviating to his imagination many disagreeable circumstances into which indigence, the too frequent attendant on poetical pursuits, frequently threw him. His turn was entirely to tragedy; his merit in which is of a peculiar kind. For at the same time that his language must be confessed to be extremely unpoetical, and his numbers uncouth and unharmonious; nay, even his characters very far from being strongly marked or distinguished, and his episodes extremely irregular: yet it is impossible to avoid being deeply affected at the representation, and even at the reading, of his tragic pieces. This is owing in the general to a happy choice of his subjects; which are all borrowed from history, either real or romantic; and indeed the most of them from circumstances in the annals of our own country, which, not only from their being familiar to our continual recollection, but even from their having some degree of relation to ourselves, we are apt to receive with a kind of partial prepossession, and a pre-determination to be pleased. He has constantly chosen as the basis of his plays such tales as were in themselves and their well-known catastrophes most truly adapted to the purposes of the drama. He has indeed but little varied from the strictness of historical facts; but he seems to have made it his constant rule to keep the scene perpetually alive, and never suffer his characters to droop. His verse is not poetry, but prose run mad. Yet will the false gem sometimes approach so near in glitter to the true one, at least in the eyes of all but real connoisseurs (and how small a part of an audience are to be ranked in this class it will need no ghost to inform us), that bombast will frequently pass for the true sublime; and where it is rendered the vehicle of incidents in themselves affecting, and in which the heart is apt to interest itself, it will perhaps be found to have a stronger power on the human passions than even that property to which it is in reality no more than a bare succedaneum. And from these principles it is that we must account for Mr Banks's writings having in the general drawn more tears from, and excited more terror in, even judicious audiences, than those of much more correct and more truly poetical authors. The tragedies he has left behind him are, 1. Albion Queens. 2. Cyrus the Great. 3. Destrustion of Troy. 4. Innocent Usurper. 5. Island Queens. This is only the Albion Queens altered. 6. Rival Kings. 7. Virtue Betrayed. 8. Unhappy Favourite. The Albion Queens was rejected by the managers in 1684; but was acted by Queen Anne's command in 1706, with great applause, and has been several times revived. The Unhappy Favourite continued till very lately a stock tragedy at the theatres; but gives way at present to the later tragedies from the same story, by Jones and Brooke.—Neither the time of the birth, nor that of the death, of this author, are ascertained. His remains, however, lie interred in the church of St James's, Westminster.

BANKS'S island, a small island in the South sea, discovered by Captain Cook in 1770, in S. Lat. 53. 32. W. Long. 186. 30. It is of a circular figure, and about 24 leagues in compass: it is sufficiently high to be seen at the distance of 12 or 15 leagues; and the land has a broken irregular surface, with the appearance of barrenness rather than fertility. It is, however, inhabited; as some straggling savages were observed upon it.

BANKSIA. See Botany *Index*.

BANN, or Ban (from the Brit. *ban*, i. e. clamour), is a proclamation or public notice; any public summons or edict, whereby a thing is commanded or forbidden. It is a word ordinary among the feudists; and there is both *banus* and *banum*, which signify two several things.—The word *banns* is particularly used in England in publishing matrimonial contracts; which is done in the church before marriage, to the end that if any persons can speak against the intention of the parties, either in respect of kindred, precontract, or for other just cause, they may take their exception in time before the marriage is consummated; and in the canon law, Bannæ *sunt proclamationes sponsi et sponsæ in ecclesiis fieri solitæ*. But there may be a faculty or license for the marriage, and then this ceremony is omitted: and ministers are not to celebrate matrimony between any persons without a license, except the banns have been first published three several times, upon pain of suspension, &c. Can. 62.

The use of matrimonial banns is said to have been first introduced in the Gallican church, though something like it obtained even in the primitive times; and it is this that Tertullian is supposed to mean by *trinundina promulgatio*. The council of Lateran first extended, and made the usage general. By the ordinance of Blois, no person could validly contract marriage, without a preceding proclamation of three banns; nor could any person whatever be dispensed with, except

Digitized by Google

cept for the two last. But the French themselves have abated much of this severity; and only minors are now under an absolute necessity of submitting to the formality of banns. For majors, or those of age, after publication of the first banns, the two latter are easily bought off.

BANN is also used to denote proscription or banishment for a crime proved; because anciently published by sound of trumpet; or, as Vossius thinks, because those who did not appear at the above-mentioned summons, were punished by proscription. Hence *to put a prince under the bann of the empire*, is to declare him divested of all his dignities. The sentence only denotes an interdict of all intercourse, and offices of humanity, with the offender; the form of which seems taken from that of the Romans, who banished persons by forbidding them the use of fire and water. Sometimes also cities are put under the imperial bann; that is, stripped of their rights and privileges.

BANN also denotes a pecuniary mulct, or penalty, laid on a delinquent for offending against a bann.

BANN, or BANNUS, a title anciently given to the governor or viceroy of Croatia, Dalmatia, and Sclavonia.

Episcopal BANN (*Bannus Episcopalis*), a mulct paid to the bishop by those guilty of sacrilege and other crimes.

BANN is also used for a solemn anathema, or excommunication attended with curses, &c. In this sense we read of *papal banns*, &c.

BANN, in military affairs, a proclamation made in the army by beat of drum, sound of trumpet, &c. requiring the strict observance of discipline, either for the declaring a new officer, or punishing an offender.

BANNER denotes either a square flag, or the principal standard belonging to a prince.

We find a multiplicity of opinions concerning the etymology of the word *banner*; some deriving it from the Latin *bandum*, "a band or flag;" others from the word *bann*, "to summons the vassals to appear in arms;" others again from the German *ban*, "a field or tenement," because landed men alone were allowed a banner: and, finally, there are some who think it is a corruption of *panniere*, from *pannus*, "cloth," because banners were originally made of cloth.

The BANNER *of France*, was the largest and richest of all the flags borne by the ancient kings in their great military expeditions. St Martin's cap was in use 600 years as the banner of France; it was made of taffety, painted with the image of that saint, and laid one or two days on his tomb to prepare it for use. About the year 1100 came in a more pompous apparatus. The banner royal was fastened to the top of a mast, or some tall tree, planted on a scaffold; borne on a carriage drawn by oxen, covered with velvet housings, decorated with devices or cyphers of the prince reigning. At the foot of the tree was a priest, who said mass early every morning. Ten knights mounted guard on the scaffold night and day, and as many trumpets at the foot of the tree never ceased flourishing, to animate the troops. This cumbersome machine, the model of which was brought from Italy, continued in use about 130 years. Its post was in the centre of the army. And here it was that the chief feats were performed, to carry off and defend the royal banner; for there was no victory without it, nor was any army reputed vanquished till they had lost their banner.

BANNERETS, an ancient order of knights, or feudal lords; who, possessing several large fees, led their vassals to battle under their own flag or banner, when summoned thereto by the king. The word seems formed from *banner*, "a square flag," or from *band*, which anciently denoted a flag.—Bannerets are also called in ancient writers *milites vexilliferi*, and *vexillarii bannerarii*, *bannarii*, *banderisii*, *&c.*

Anciently there were two kinds of knights, *great* and *little*; the first whereof was called *bannerets*, the second *bachelors*; the first composed the upper, the second the middle, nobility.

The banneret was a dignity allowed to march under his own flag, whereas the *bachelarius eques* followed that of another. To be qualified for a banneret, one must be a gentleman of family, and must have a power to raise a certain number of armed men, with estate enough to subsist at least 28 or 30 men. This must have been very considerable in those days; because each man, besides his servant, had two horsemen to wait on him armed, the one with a cross-bow, the other with a bow and hatchet. As he was not allowed to be a baron who had not above 13 knights fees, so he was not admitted to be a banneret if he had less than 10.

Banneret, according to Spelman, was a middle order between a baron and a simple knight; called sometimes also *vexillarius minor*, to distinguish him from the greater, that is, from the baron, to whom alone properly belonged *jus vexilli*, or privilege of the square flag. Hence the banneret was also called *bannerettus*, *quasi baro minor*; a word frequently used by English writers in the same sense as banneret was by the French, though neither of them occur before the time of Edward II.

Some will have bannerets to have originally been persons who had some portion of a barony assigned them; and enjoyed it under the title of *baro proximus*, and that with the same prerogatives as the baron himself. Some, again, find the origin of bannerets in France, others in Brittany, others in England. These last attribute the institution of bannerets to Conan, lieutenant of Maximus, who commanded the Roman legions in England under the empire of Gratian in 383. This general, say they, revolting, divided England into 40 cantons, and in these cantons distributed 40 knights; to whom he gave a power of assembling, on occasion, under their several banners, as many of the effective men as were found in their respective districts: whence they are called *bannerets*. However this be, it appears from Froissart, &c. that anciently such of the military men as were rich enough to raise and subsist a company of armed men, and had a right to do so, were called *bannerets*. Not, however, that these qualifications rendered them knights, but only bannerets; the appellation of *knight* being only added thereto, because they were simple knights before.

Bannerets were second to none but knights of the Garter. They were reputed the next degree below the nobility; and were allowed to bear arms with supporters, which none else may under the degree of a baron. In France, it is said, the dignity was hereditary; but in England it died with the person that gained

Digitized by Google

gained it. The order dwindled on the institution of baronets by King James I. and at length became extinct. The last person created banneret was Sir John Smith, made so after Edgehill fight, for rescuing the standard of King Charles I.

The form of the banneret's creation was this. On a day of battle, the candidate presented his flag to the king or general; who, cutting off the train or skirt thereof, and making it a square, returned it again, the proper banner of bannerets; who are hence sometimes called *knights of the square flag*. There seem to have been bannerets created either in a different manner, or by others than the sovereign; since King James, in the patents of baronets, gives them precedence to all knights bannerets, except such as are created by the king himself in the field; which implies, either that there are some of this order created out of the field, or by inferior persons. See CHIVALRY, SUPPLEMENT.

BANNERET is also the name of an officer or magistrate of Rome towards the close of the 14th century. —The people of that city, and throughout the territory of the church, during the disputes of the antipopes, had formed a kind of republican government; where the whole power was lodged in the hands of a magistrate called *senator*, and twelve heads of quarters called *bannerets*, by reason of the banners which each raised in his district.

BANNOCK, a kind of oat-cake, baked in the embers, or on a stone placed before the fire. It is common in the northern parts of this kingdom.

BANNOCKBURN, a village in Scotland, near Stirling, celebrated as the place of a great battle between the Scots and English. See SUPPLEMENT.

BANNUM, in *Law*, signifies the utmost bounds of a manor or town.

BANQUET, a feast or entertainment where people regale themselves with pleasant foods or fruits.

BANQUET, in the manege, that small part of the branch of a bridle that is under the eye; which gathers and joins the extremities of the bit to the branch.

Banquet-Line, an imaginary line drawn, in making a bit, along the banquet, and prolonged up or down, to adjust the designed force or weakness of the branch, in order to make it stiff or easy.

BANQUET, or *Banquette*, in *Fortification*, a little foot-bank, or elevation of earth, forming a path which runs along the inside of a parapet, upon which the musketeers get up, in order to discover the counterscarp, or to fire on the enemy, in the moat or in the covert-way.

BANQUETING ROOM or HOUSE. See SALOON. The ancient Romans supped in the atrium, or vestibule, of their houses; but, in after times, magnificent saloons, or banqueting-rooms, were built, for the more commodious and splendid entertainment of their guests. Lucullus had several of these, each distinguished by the name of some god; and there was a particular rate of expence appropriated to each. Plutarch relates with what magnificence he entertained Cicero and Pompey, who went with a design to surprise him, by only telling a slave who waited, that the cloth should be laid in the Apollo. The emperor Claudius, among others, had a splendid banqueting-room named *Mercury*. But every thing of this kind was outdone by the lustre of that celebrated banqueting-house of Nero, called *domus aurea*; which, by the circular motion of its partitions and ceilings, imitated the revolution of the heavens, and represented the different seasons of the year, which changed at every service, and showered down flowers, essences, and perfumes, on the guests.

BANSTICKLE. See GASTEROSTEUS, ICHTHYOLOGY *Index*.

BANTAM, a town of the island of Java, in the East Indies, situated in E. Long. 105. 16. S. Lat. 6. 20. It is the capital of a kingdom of the same name, with a harbour and castle; but the harbour is now so choked up that it is inaccessible to vessels of any great burden. It is divided into two towns separated by a river, and one of them inhabited by Chinese. Bantam once enjoyed a flourishing trade. It was a great mart for pepper and other spices; but this trade, as well as the power of its sovereign, has fallen to decay. For its history, &c. see JAVA.

BANTAM-WORK, a kind of painted or carved work, resembling that of Japan, only more gaudy.

There are two sorts of Bantam, as well as of Japan work. As, in the latter, some are flat, lying even with the black, and others high and embossed; so in Bantam-work, some are flat and others in-cut, or carved into the wood, as we find in many large screens: with this difference, that the Japan artists work chiefly in gold and other metals; and those of Bantam generally in colours, with a small sprinkling of gold here and there: for the flat Bantam-work is done in colours, mixed with gum-water, proper for the thing designed to be imitated. For the carved, or in-cut kind, the method of performing it is thus described by an ingenious artist: First, the wood is to be primed with whiting and size, so often till the primer lie near a quarter of an inch thick; then it is to be water-plained, i. e. rubbed with a fine wet cloth, and some time after, rubbed very smooth, the blacks laid on, varnished up with a good body, and polished well, though with a gentle hand. This done, the design is to be traced out with vermilion and gum-water, exactly in the manner wherein it is intended to be cut; the figures, trees, building, &c. in their due proportion: then the graver is applied, with other tools, of proper shapes, differing according to the workman's fancy: with these he cuts deep or shallow, as is found convenient, but never deeper than the whiting lies, the wood being never to feel the edge of the instrument. Lines, or parts of the black, are still to be left for the draperies, and other outlines, and for the distinction of one thing from another; the rule being to cut where the white is, and leave the black untouched. The carving being finished, then take to the pencil, with which the colours are laid into the cut-work: after this, the gold is to be laid in those places which the design requires; for which purpose a strong thick gum-arabic water is taken and laid with a pencil on the work; and, while this remains wet, leaf-gold is cut with a sharp smooth-edged knife, in little pieces, shaped to the bigness and figure of the places where they are to be laid. These being taken up with a little cotton, they daub them with the same close to the gum water, which affords a rich lustre. The work thus finished, they clear up the black with oil, taking care not to touch the colours. The European workmen ordinarily use brass dust, which is less bright and beautiful.

BANTRY, a town of Ireland, in the county of Cork, and province of Munster. It is seated on a bay of the same name, in W. Long. 9. 15. N. Lat. 51. 30.

BAOBAB, the name given by Prosper Alpinus to the African calabash-tree, since called ADANSONIA. See BOTANY *Index*.

BAPTISM, in matters of religion, the ceremony of washing; or a sacrament, by which a person is initiated into the Christian church.—The word is formed from the Greek βαπτιζω, of βαπτω, *to dip* or *wash*. Baptism is known, in ecclesiastical writers, by divers other names and titles. Sometimes it is called *palingenesia*, or *laver of regeneration;* sometimes *salus*, or *life and salvation;* sometimes σφραγις, *signaculum Domini*, and *signaculum fidei*, or *the seal of faith;* sometimes absolutely *mysterium*, and *sacramentum;* sometimes *the sacrament of faith;* sometimes *viaticum*, from its being administered to departing persons; sometimes *sacerdotium laici*, or *the lay priesthood*, because allowed, in cases of necessity, to be conferred by laymen: sometimes it is called the *great circumcision*, because it was imagined to succeed in the room of circumcision, and to be a seal of the Christian covenant, as that was the seal of the covenant made with Abraham: so, in regard that baptism had Christ for its author, and not man, it was anciently known by the name of Δωρον and χαρισμα Κυριυ, *the gift of the Lord:* sometimes it was simply called δωρον, without any other addition, by way of eminence, because it was both a gratuitous and singular gift of Christ: in reference to the making men complete members of Christ's body, the church, it had the name of Τελειωσις, and Τελεια, the *consecration* and *consummation;* because it gave men the perfection of Christians, and a right to partake of the Το Τελειον, which was *the Lord's Supper:* it had also the name of μυησις and μυσταγωγια, the *initiation*, because it was the admittance of men to all the sacred rites and mysteries of the Christian religion.

Various names given to baptism.

Bingham's Orig. Eccles.

Its origin, &c.

Baptism has been supposed by many learned authors to have had its origin from the Jewish church, in which, as they maintain, it was the practice long before Christ's time, to baptize proselytes or converts to their faith, as part of the ceremony of their admission: a practice which, according to some, obtains among them to this day; a person turning Jew, is first circumcised, and, when healed, is bathed, or baptized in water, in presence of their rabbins; after which he is reputed a good Jew. Others, however, insist that the Jewish proselyte baptism is not by far so ancient, and that John the Baptist was the first administrator of baptism among the Jews. Of this opinion were Deylingius, J. G. Carpzovius, Boernerus, Wernsdorfius, Zeltnerus, Owen, Knatchbull, Jennings, Gill, and others.

Grotius is of opinion, that the rite of baptism had its original from the time of the deluge; immediately after which, he thinks, it was instituted in memory of the world having been purged by water. Some learned men think it was added to circumcision, soon after the Samaritan schism, as a mark of distinction to the orthodox Jews. Spencer, who is fond of deriving the rites of the Jewish religion from the ceremonies of the Pagans, lays it down as a probable supposition, that the Jews received the baptism of proselytes from the neighbouring nations, who were wont to prepare candidates for the more sacred functions of their religion, by a solemn ablution; that by this affinity of sacred rites, they might draw the Gentiles to embrace their religion, and that the proselytes (in gaining of whom they were extremely diligent) might the more easily comply with the transition from Gentilism to Judaism. In confirmation of this opinion, he observes, first, that there is no divine precept for the baptism of proselytes, God having enjoined only the rite of circumcision for the admission of strangers into the Jewish religion. Secondly, that, among foreign nations, the Egyptians, Persians, Greeks, Romans, and others, it was customary that those who were to be initiated into their mysteries, or sacred rites, should be first purified by dipping their whole body in water. That learned writer adds, as a farther confirmation of his opinion, that the cup of blessing likewise, added to the paschal supper, seems plainly to have been derived from a pagan original: for the Greeks, at their feasts, had one cup, called ποτηριον αγαθυ δαιμονος, *the cup of the good dæmon or god*, which they drank at the conclusion of their entertainment, when the table was removed. Since then, a rite of Gentile origin was added to one of the Jewish sacraments, viz. the passover, there can be no absurdity in supposing, that baptism, which was added to the other sacrament, namely circumcision, might be derived from the same source. In the last place, he observes, that Christ, in the institution of his sacraments, paid a peculiar regard to those rites which were borrowed from the Gentiles: for rejecting circumcision and the paschal supper, he adopted into his religion baptism and the sacred cup; thus preparing the way for the conversion and reception of the Gentiles into his church.

The design of the Jewish baptism, if baptism be practised by them, is supposed to be, to import a regeneration, whereby the proselyte is rendered a new man, and of a slave becomes free. The effect of it is, to cancel all former relations; so that those who were before akin to the person, after the ceremony ceased to be so. It is to this ceremony Christ is supposed to have alluded, in his expression to Nicodemus, that it was necessary that he should be born again, in order to become his disciple.—The necessity of baptism to salvation is grounded on those two sayings of our Saviour; *He that believeth, and is baptized, shall be saved;* and *Except a man be born of water and of the Spirit, he cannot enter into the kingdom of God.* The ancients did not generally think the mere want of baptism, where the procuring it was impracticable, excluded men absolutely from the hopes of eternal salvation. Some few of them, indeed, are pretty severe upon infants dying without baptism; and some others seem also, in general terms, to deny eternal life to adult persons dying without it: but when they interpret themselves, and speak more distinctly, they make some allowances, and except several cases, in which the want of baptism may be supplied by other means. Such are, martyrdom, which commonly goes by the name of *second baptism in men's own blood*, in the writings of the ancients; because of the power and efficacy it was thought to have to save men by the invisible baptism of the Spirit, without the external element of water. Faith, and repentance, were also esteemed a supplement to the want of baptism, in such catechumens as died while they were piously preparing themselves for baptism. Constantly

Opinions concerning the effects of baptism.

Digitized by Google

communicating with the church, was thought to supply the want of baptism in persons who had been admitted to communion, on a presumption of their being duly baptized, though the contrary afterwards appeared. For infants dying without baptism, the case was thought more dangerous; as here, no personal faith, repentance, or the like, could be pleaded, to supply the defect, and wash away original sin: on this account, they who spoke most favourably of them, as Greg. Nazianzen, and Severus bishop of Antioch, only assigned them a middle state, neither in heaven nor hell. But the Latins, as St Augustin, Fulgentius, Marius Mercator, &c. who never received the opinion of a middle state, concluded, as they could not be received into heaven, they must go to hell. Pelagius, and his followers, who denied original sin, asserted, that they might be admitted to eternal life, and salvation, though not to the kingdom of heaven; between which they distinguished. Where the fault was not on the side of the child, nor his parents, but of the minister, or where any unavoidable accident rendered baptism absolutely impossible, Hincmar, and others, make an exception, in holding the child saved without baptism.

Of the time, place, and subjects of baptism.

The receiving baptism is not limited to any time, or age of life. Some contend for its being administered like circumcision, precisely on the eighth day, as Greg. Nazianzen; and others would have it deferred till the child is three years of age, and able to hear the mystic words, and make answer thereto, though he do not undestand them. In the canon law we find divers injunctions against deferring the baptism of infants beyond the 37th day, 30th day, and the 9th day; some of them under pecuniary forfeitures.

Salmasius, and Suicerus from him, deliver it as authentic history, that for the two first ages, no one received baptism, who was not first instructed in the faith and doctrine of Christ, so as to be able to answer for himself, that he believed; because of those words, *He that believeth and is baptized;* which, in effect, is to say, that no infant, for the first two ages, was ever admitted to Christian baptism. But, afterwards, they own, that pædo-baptism came in, upon the opinion that baptism was necessary to salvation. But Vossius, Dr Forbes, Dr Hammond, Mr Walker, and especially Mr Wall, who has exactly considered the testimony and authority of almost every ancient writer that has said any thing upon this subject, endeavour to evince, that infants were baptized even in the apostolical age. It is certain, Tertullian pleads strongly against giving baptism to infants; which shows, at least, that there was some such practice in his age, though he disapproved of it. It is certain, the ordinary subjects of this sacrament, in the first ages, were converts from Judaism and Gentilism, who, before they could be admitted to baptism, were obliged to spend some time in the state of catechumens, to qualify them to make their professions of faith, and a Christian life, in their own persons: for, without such personal professions, there was ordinarily no admission of them to the privilege of baptism. Those baptized in their sick-beds were called *clinici;* and were held in some reproach, as not being reputed true Christians. Hence several censures, in councils and ecclesiastical writers, of clinic baptism. This clinic baptism was not sufficient to qualify the person, in case of recovery, for ordination. Some had their baptism put off by way of punishment, when they fell into gross and scandalous crimes, which were to be expiated by a longer course of discipline and repentance. This was sometimes 5, 10, 20 years or more; even all their lives to the hour of death, when their crimes were very flagrant.

In the earliest ages of the church, there was no stated time or place for the reception of baptism. Afterwards Easter, Whitsuntide, and Epiphany, became solemn seasons, out of which baptism was not administered, except in cases of necessity. The catechumens who were to receive it at these times, were called *competentes:* and to these it is that St Cyril addresses his catecheses. In the apostolical age, and some time after, before churches and baptisteries were generally erected, they baptized in any place where they had convenience; as John baptized in Jordan, and Philip baptized the eunuch in the wilderness, and Paul the jailor in his own house. But in after ages, baptisteries were built adjoining to the church; and then rules were made, that baptism should ordinarily be administered nowhere but in these buildings. Justinian, in one of his novels, refers to ancient laws, appointing that none of the sacred mysteries of the church should be celebrated in private houses. Men might have private oratories for prayer in their own houses; but they were not to administer baptism or the eucharist in them, unless by a particular license from the bishop of the place. Such baptisms are frequently condemned in the ancient councils, under the name *παραβαπτίσματα, baptisms in private conventicles.*

Ancient ceremonies.

As to the attendant ceremonies and manner of baptism in the ancient church: The person to be baptized, if an adult, was first examined by the bishop or officiating priest, who put some questions to him; as, first, Whether he abjured the devil and all his works; secondly, Whether he gave a firm assent to all the articles of the Christian faith: to both which he answered in the affirmative. If the person to be baptized was an infant, these interrogatories were answered by his *sponsores*, or godfathers. Whether the use of sponsors was as old as the apostles days, is uncertain: perhaps it was not, since Justin Martyr, speaking of the method and form of baptism, says not a word of them.—After the questions and answers, followed exorcism; the manner and end of which was this: The minister laid his hands on the person's head, and breathed in his face, implying thereby the driving away or expelling of the devil from him, and preparing him for baptism, by which the good and holy spirit was to be conferred upon him.—After exorcism, followed baptism itself: and first the minister, by prayer, consecrated the water for that use. Tertullian says, "any waters may be applied to that use: but then God must be first invocated; and then the Holy Ghost presently comes down from heaven, and moves upon them, and sanctifies them." The waters being consecrated, the person was baptized "in the name of the Father, and of the Son, and of the Holy Ghost;" by which "dedication of him to the blessed Trinity, the person, (says Clemens Alexandrinus) is delivered from the corrupt trinity, the devil, the world, and the flesh." In performing the ceremony of baptism, the usual custom (except in clinical cases, or

Digitized by Google

Baptism

or where there was scarcity of water), was to immerse and dip the whole body. Thus St Barnabas, describing a baptized person, says, "We go down into the water full of sin and filth, but we ascend bearing fruit in our hearts." And this practice of immersing the whole body was so general, that we find no exceptions made in respect either to the tenderness of infants, or the bashfulness of the other sex, unless in case of sickness or other disability. But to prevent any indecency, men and women were baptized apart. To which end, either the baptisteries were divided into two apartments, one for the men, the other for the women, as Bingham has observed; or the men were baptized at one time and the women at another, as is shown by Vossius, from the *Ordo Romanus*, Gregory's *Sacramentarium*, &c. Add, that there was anciently an order of deaconesses, one part of whose business was to assist at the baptism of women. The precautions, however, rather indicate a scrupulous attention to delicacy, than imply any indecency in the circumstance of immersion itself. From the candidates being immersed, there is at least no reason to infer that they were naked: The present Baptists never baptize naked, though they always immerse. After immersion, followed the unction; by which (says St Cyril) was signified that they were now cut off from the wild olive, and were ingrafted into Christ, the true olive tree; or else to shew that they were now to be champions for the gospel, and were anointed thereto, as the old athletæ were against their solemn games. With this anointing was joined the sign of the cross, made upon the forehead of the person baptized; which being done, he had a white garment given him, to denote his being washed from the defilements of sin, or in allusion to that of the apostle, "As many as are baptized in Christ have put on Christ." From this custom the feast of Pentecost, which was one of the annual seasons of baptism, came to be called *Whitsunday*, i. e. *White-sunday*. This garment was afterwards laid up in the church, that it might be an evidence against such persons as violated or denied that faith which they had owned in baptism.—When the baptism was performed, the person baptized, according to Justin Martyr, "was received into the number of the faithful, who then sent up their public prayers to God, for all men, for themselves, and for those who had been baptized."

The ordinary ministers, who had the right of administering this sacrament, that is, of applying the water to the body, and pronouncing the formula, were presbyters or bishops; though on extraordinary occasions laymen were admitted to perform the same.

Modern forms—In the church of Rome.

As to the present form of administering baptism, the church of Rome uses the following. When a child is to be baptized, the persons who bring it wait for the priest at the door of the church, who comes thither in his surplice and purple stole, attended by his clerks. He begins with questioning the godfathers, whether they promise, in the child's name, to live and die in the true catholic and apostolic faith, and what name they would give the child. Then follows an exhortation to the sponsors; after which the priest, calling the child by its name, asks it as follows: *What dost thou demand of the church?* The godfather answers, *Eternal life*. The priest goes on: *If you are desirous of obtaining eternal life, keep God's commandments, thou shalt love the Lord thy God*, &c. After which he breathes three times in the child's face, saying, *Come out of this child, thou evil spirit, and make room for the Holy Ghost*. This said, he makes the sign of the cross on the child's forehead and breast, saying, *Receive the sign of the cross on thy forehead, and in thy heart*. Then taking off his cap, he repeats a short prayer; and laying his hand gently on the child's head, repeats a second prayer: which ended, he blesses some salt; and putting a little of it into the child's mouth, pronounces these words, *Receive the salt of wisdom*. All this is performed at the church door. The priest, with the godfathers and god-mothers, coming into the church, and advancing towards the font, repeat the apostles creed and the Lord's prayer. Being come to the font, the priest exorcises the evil spirit again; and taking a little of his own spittle, with the thumb of his right hand, rubs it on the child's ears and nostrils, repeating, as he touches the right ear, the same word (*Ephatha, be thou opened*) which our Saviour made use of to the man born deaf and dumb. Lastly, they pull off its swaddling-clothes, or strip it below the shoulders, during which the priest prepares the oils, &c. The sponsors then hold the child directly over the font, observing to turn it due east and west: whereupon the priest asks the child, *Whether he renounces the devil and all his works?* and the godfather having answered in the affirmative, the priest anoints the child between the shoulders in the form of a cross. Then taking some of the consecrated water, he pours part of it thrice on the child's head, at each perfusion calling on one of the Persons of the Holy Trinity. The priest concludes the ceremony of baptism with an exhortation.—The Romish church allows midwives, in cases of danger, to baptize a child before it comes entirely out of its mother's womb: where it is to be observed, that some part of the body of the child must appear before it can be baptized, and that it is baptized on the part which first appears: if it be the head, it is not necessary to rebaptize the child; but if only a foot or hand appears, it is necessary to repeat baptism. A stillborn child thus baptized may be buried in consecrated ground.

In the Greek church.

The Greek church differs from the Romish, as to the rite of baptism, chiefly in performing it by immersion, or plunging the infant all over in the water.

English form in the liturgy of King Edward.

The forms of administering baptism among us being too well known to require a particular description, we shall only mention one or two of the more material differences between the form, as it stood in the first liturgy of King Edward, and that in the English Common Prayer Book at present. First, the form of consecrating the water did not make a part of the office, in King Edward's liturgy, as it does in the present, because the water in the font was changed, and consecrated, but once a month. The form likewise itself was something different from that now used; and was introduced with a short prayer, that *Jesus Christ, upon whom (when he was baptized) the Holy Ghost came down in the likeness of a dove, would send down the same Holy Spirit, to sanctify the fountain of baptism;* which prayer was afterwards left out, at the second review.—By King Edward's first book, the minister is to dip the child in the water thrice; first, dipping the right side; secondly, the left; the third time, dipping the face toward the foot. This trine immersion was a very ancient

Baptism.

cient practice in the Christian church, and used in honour of the Holy Trinity; though some later writers say, it was done to represent the death, burial, and resurrection, of Christ, together with his three days continuance in the grave. Afterwards, the Arians making an ill use of it, by persuading the people that it was used to denote that the three Persons in the Trinity were three distinct substances, the orthodox left it off, and used only one single immersion.

By the first common-prayer of King Edward, after the child was baptized, the godfathers and godmothers were to lay their hands upon it, and the minister was to put on him the white vestment commonly called the *chrysome*, and to say, "Take this white vesture, as a token of the innocency, which, by God's grace, in this holy sacrament of baptism, is given unto thee; and for a sign, whereby thou art admonished, so long as thou livest, to give thyself to innocence of living, that after this transitory life thou mayest be partaker of the life everlasting. Amen." As soon as he had pronounced these words, he was to anoint the infant on the head, saying, "Almighty God, the father of our Lord Jesus Christ, who hath regenerated thee by water and the Holy Ghost, and hath given unto thee remission of all thy sins; may he vouchsafe to anoint thee with the unction of his Holy Spirit, and bring thee to the inheritance of everlasting life. Amen." This was manifestly done in imitation of the practice of the primitive church.

The custom of sprinkling children, instead of dipping them in the font, which at first was allowed in case of the weakness or sickness of the infant, has so far prevailed, that immersion is at length quite excluded. What principally tended to confirm the practice of affusion or sprinkling, was, that several of our Protestant divines, flying into Germany and Switzerland during the bloody reign of Queen Mary, and returning home when Queen Elizabeth came to the crown, brought back with them a great zeal for the Protestant churches beyond sea, where they had been sheltered and received; and having observed, that at Geneva and some other places, baptism was administered by sprinkling, they thought they could not do the church of England a greater piece of service than by introducing a practice dictated by so great an oracle as Calvin. This, together with the coldness of our northern climate, was what contributed to banish entirely the practice of dipping infants in the font.

Notions concerning the effects of baptism.

Many different notions have been entertained concerning the effects of baptism, which it would be endless to enumerate.—The Remonstrants and Socinians reduce baptism to a mere sign of divine grace. The Romanists, on the contrary, exalt its power; holding, that all sin is entirely taken away by it; that it absolutely confers the grace of justification, and consequently grace *ex opere operato*. Some also speak of an indelible character impressed on the soul by it, called *character dominicus*, and *character regius*: but this is held, by others, a mere chimera; for that the spiritual character, conferred in regeneration, may easily be effaced by mortal sins. Dodwell maintained, that it is by baptism the soul is made immortal; so that those who die without it will not rise again. It must be added, he restrains this effect to episcopal baptism alone. From the effects ordinarily ascribed to baptism, even by ancient writers, it should seem, that the ceremony is as much of heathen as Jewish origin; since Christians do not restrain the use of it, like the Jews, to the admission of new members into the church, but hold, with the heathens, a virtue in it for remitting and washing away sins. The Bramins are still said to baptize with this latter view, at certain seasons, in the river Ganges; to the waters whereof they have annexed a cleansing or sanctifying quality; and hence it is that they flock from all parts, even of Tartary, driven by the expectation of their being eased of their load of sins. But, in this point, many Christians seem to have gone beyond the folly of the heathens. It was only the smaller sins of infirmity which these latter held to be expiable by washing; for crimes of a blacker dye, they allowed no water could efface them, no purgation could discharge them. The Christian doctrine of a total remission of sins by baptism could not fail, therefore, to scandalize many among the heathens, and furnished Julian an occasion of satirizing Christianity itself: "Whoever (says he) is guilty of rapes, murders, sacrilege, or any abominable crime, let him be washed with water, and he will become pure and holy."

In the ancient church, baptism was frequently conferred on Jews by violence: but the church itself never seems to have allowed of force on this occasion. By a canon of the fourth council of Toledo, it is expressly forbid to baptize any against their wills. That which looks most like force in this case, allowed by law, were two orders of Justinian; one of which appoints the heathens, and the other Samaritans, to be baptized, with their wives and children and servants, under pain of confiscation. By the ancient laws, baptism was not to be conferred on image-makers, stage-players, gladiators, *aurigæ* or public drivers, magicians, or even strolling beggars, till they quitted such professions. Slaves were not allowed the privilege of baptism without the testimony and consent of their masters; excepting the slaves of Jews, Heathens, and heretics; who were not only admitted to baptism, but, in consequence thereof, had their freedom. Vossius has a learned and elaborate work *De Baptismo*, wherein he accurately discusses all the questions concerning baptism according to the doctrine of the ancients.

Bingham. Orig. Eccl. lib. xi. c. 5. § 4. lib. viii. c. 14. § 7.

Baptism by Fire, spoken of by St John the Baptist, has occasioned much conjecture. The generality of the fathers held, that believers, before they enter paradise, are to pass through a certain fire, which is to purify them from all pollutions remaining on them unexpiated. Others, with St Basil, understand it of the fire of hell; others, of that of tribulation and temptation. Others, with St Chrysostom, will have it denote an abundance of graces. Others suppose it to mean the descent of the Holy Ghost on the apostles, in form of fiery tongues. Lastly, others maintain, that the word *fire* here is an interpolation; and that we are only to read the text, *He that shall come after me will baptize you with the Holy Ghost*. In reality, it is not found in divers manuscript copies of St Matthew.

The ancient Selucians and Hermians, understanding the passage literally, maintained, that material fire was necessary in the administration of baptism. But we do not find how or to what part of the body they applied it, or whether they were satisfied with obliging the

Digitized by Google

the person baptized to pass through the fire. Valentinus rebaptized all who had received water-baptism, and conferred on them the baptism of fire.

Bis docuit tingi, traductoque corpore flamma.
TERTULL. Carm. contr. Marc. l. 1.

Heracleon, cited by Clemens Alexandrinus, says, that some applied a red-hot iron to the ears of the person baptized, as if to impress some mark upon him.

Baptism of the Dead, a custom which anciently prevailed among some people in Africa, of giving baptism to the dead. The third council of Carthage speak of it as a thing that ignorant Christians were fond of. Gregory Nazianzen also takes notice of the same superstitious opinion prevailing among some who delayed to be baptized. In his address to this kind of men, he asks, whether they stayed to be baptized after death? Philastrius also notes it as the general error of the Montanists or Cataphrygians, that they baptized men after death. The practice seems to be grounded on a vain opinion, that, when men had neglected to receive baptism in their life-time, some compensation might be made for this default by receiving it after death.

Baptism of the Dead was also a sort of vicarious baptism, formerly in use, when a person dying without baptism, another was baptized in his stead.

St Chrysostom tells us, this was practised among the Marcionites with a great deal of ridiculous ceremony; which he thus describes: After any catechumen was dead, they hid a living man under the bed of the deceased; then coming to the dead man, they asked him whether he would receive baptism; and he making no answer, the other answered for him, and said, he would be baptized in his stead: and so they baptized the living for the dead.

Epiphanius assures us, the like was also practised among the Corinthians. This practice they pretended to found on the Apostle's authority; alleging that text of St Paul for it, *If the dead rise not at all, what shall they do who are baptized for the dead?* A text which has given occasion to a great variety of different systems and explications. Vossius enumerates no less than nine different opinions among learned divines concerning the sense of the phrase, *being baptized for the dead.*

St Ambrose and Walafred Strabo seem clearly of opinion, that the apostle had respect to such a custom then in being; and several moderns have given into the same opinion, as Baronius, Jos. Scaliger, Justellus, and Grotius.

Several among the Roman Catholics, as Bellarmin, Salmeron, Menochius, and a number of schoolmen, understand it of the baptism of tears, and penance, and prayers, which the living undergo for the dead; and thus allege it as a proof of the belief of purgatory in St Paul's days.

Hypothetical Baptism, that formerly administered in certain doubtful cases, with this formula: *If thou art baptized, I do not rebaptize; if thou art not, I baptize thee in the name of the Father*, &c. This sort of baptism, enjoined by some ancient constitutions of the English church, is now fallen into disuse.

Solemn Baptism, that conferred at stated seasons; such, in the ancient church, were the *Paschal baptism*, and that at Whitsuntide. This is sometimes also called *general baptism.*

Lay Baptism, we find to have been permitted by both the Common-prayer Books of King Edward and that of Queen Elizabeth, when an infant is in immediate danger of death, and a lawful minister cannot be had. This was founded upon the mistaken notion of the impossibility of salvation without the sacrament of baptism: but afterwards, when they came to have clearer notions of the sacraments, it was unanimously resolved in a convocation, held in the year 1575, that even private baptism, in a case of necessity, was only to be administered by a lawful minister.

BAPTISM is also applied, abusively, to certain ceremonies used in giving names to things inanimate.

The ancients knew nothing of the custom of giving baptism to inanimate things, as bells, ships, and the like, by a superstitious consecration of them. The first notice we have of this is in the Capitulars of Charles the Great, where it is only mentioned to be censured: but, afterwards, it crept into the Roman offices by degrees. Baronius carries its antiquity no higher than the year 968, when the greatest bell of the church of Lateran was christened by Pope John III. At last it grew to that superstitious height, as to be thought proper to be complained of in the *Centum Gravamina* of the German nation, drawn up in the public diet of the empire held at Nuremberg *anno* 1581; where (after having described the ceremony of baptizing a bell, with godfathers, who make responses as in baptism, and give it a name, and clothe it with a new garment as Christians were used to be clothed, and all this to make it capable of driving away tempests and devils) they conclude against it, as not only a superstitious practice, but contrary to the Christian religion, and a mere seduction of the simple people.

BAPTISM, in the sea language, a ceremony in long voyages on board merchant ships, practised both on persons and vessels who pass the tropic or line for the first time. The baptizing the vessels is simple, and consists only in washing them throughout with sea-water; that of the passengers is more mysterious. The oldest of the crew, that has past the tropic or line, comes with his face blacked, a grotesque cap on his head, and some sea-book in his hand, followed by the rest of the seamen dressed like himself, each having some kitchen utensil in his hand, with drums beating; he places himself on a seat on the deck, at the foot of the mainmast. At the tribunal of this mock magistrate, each passenger, not yet initiated, swears he will take care the same ceremony be observed, whenever he is in the like circumstances: Then, by giving a little money by way of gratification, he is discharged with a little sprinkling of water; otherwise he is heartily drenched with streams of water poured upon him; and the ship boys are enclosed in a cage, and ducked at discretion.—The seamen, on the baptizing a ship, pretend to a right of cutting off the beak-head unless redeemed by the captain.

BAPTISMAL, something belonging to baptism; thus we say baptismal vow, presents, &c.

Baptismal Vow or *Covenant*, a profession of obedience to the laws of Christ, which persons in the ancient church made before baptism. It was an indispensable

Digitized by Google

pensable part of the obligation on catechumens before they were admitted to the ceremony of regeneration. It was made by turning to the east; for what mystical reasons, is not well agreed on.

Baptismal Presents are in use in Germany, made by the sponsors to the infant, consisting of money, plate, or even sometimes fiefs of lands; which by the laws of the country are to be kept for the child till of age, the parents having only the trust, not the right, of disposing of them. An anonymous author has published a discourse express on this occasion, entitled, *De pecunia lustrica.*

BAPTIST, John Monnoyer, a painter of flowers and fruit, was born at Lisle in 1635, and educated at Antwerp, where he perfected himself in the knowledge of his art, and in his first years was intended for a painter of history: but having soon observed that his genius more strongly inclined him to the painting of flowers, he applied his talents to those subjects, and in that style became one of the greatest masters. His pictures are not so exquisitely finished as those of Van Huysum, but his composition and colouring are in a bolder style. His flowers have generally a remarkable freedom and looseness, as well in the disposition as in the penciling; together with a tone of colouring that is lively, admirable, and nature itself. The disposition of his objects is surprisingly elegant and beautiful; and in that respect his compositions are easily known, and as easily distinguished from the performances of others. He died in 1699.—He left a son, Anthony, who painted flowers in the same style and manner, and had great merit.

BAPTISTS, in ecclesiastical history, (from βαπτίζω, *I baptize*); a denomination of Christians, distinguished from other Christians by their particular opinions respecting the mode and the subjects of baptism.

Instead of administering the ordinance by sprinkling or pouring water, they maintain that it ought to be administered only by immersion. Such, they insist, is the meaning of the word βαπτίζω; so that a command to baptize is a command to immerse. Thus it was understood by those who first administered it. John the Baptist, and the apostles of Christ, administered it in Jordan and other rivers and places where there was much water. Both the administrators and the subjects are described as going down into, and coming up again out of, the water; and the baptized are said to be buried in baptism, and to be raised again: which language could not, they say, be properly adopted on supposition of the ordinance being administered in any other manner than by immersion. Thus also, they affirm, it was in general administered in the primitive church. Thus it is now administered in the Russian and Greek church: and thus it is, at this day, directed to be administered in the church of England, to all who are thought capable of submitting to it in this manner. With regard to the subjects of baptism, the Baptists say, that this ordinance ought not to be administered to children or infants at all, nor to grown up persons in general; but to adults only of a certain character and description. Our Saviour's commission to his apostles, by which Christian baptism was instituted, is to go and teach all nations, baptizing them: that is, say they, not to baptize all they meet with; but first to instruct them—to teach all nations, or to preach the gospel to every creature—and whoever receives it, him to baptize in the name of the Father, and of the Son, and of the Holy Ghost. To such persons, and to such only, baptism appears to have been administered by the apostles, and the immediate disciples of Christ. They are described as repenting of their sins, as believing in Christ, and as having gladly received the word. Without these qualifications, Peter acquaints those who were converted by his sermon, that he could not have admitted them to baptism. Philip holds the same language in his discourse with the eunuch; and Paul treats Lydia, the jailor, and others, in the same manner. Without these qualifications, Christians in general think it wrong to admit persons to the Lord's supper; and, for the same reasons, without these qualifications, at least a profession of them, the Baptists think it wrong to admit any to baptism. Wherefore they withhold it, not only from the impenitently vicious and profane, and from infidels who have no faith; but also from infants and children, who have no knowledge, and are incapable of every action civil and religious. They further insist, that all positive institutions depend entirely upon the will and declaration of the institutor: and therefore, that reasoning by analogy from abrogated Jewish rites is to be rejected, and the express commands of Christ respecting the mode and subjects of baptism ought to be our only rule.

The Baptists in England form one of the denominations of Protestant dissenters. They separate from the establishment for the same reasons as their brethren of the other denominations do; and from additional motives derived from their particular tenets respecting baptism. The constitution of their churches, and their modes of worship, are congregational or independent: in the exercise of which they are protected, in common with other dissenters, by the act of toleration. Before this act, they were liable to pains and penalties as nonconformists, and often for their peculiar sentiments as Baptists. A proclamation was issued out against them, and some of them were burnt in Smithfield in 1538. They bore a considerable share in the persecutions of the last and of the preceding centuries; and, as it should seem, in those of some centuries before; for there were several among the Lollards and the followers of Wickliff, who disapproved of infant baptism. There were many of this persuasion among the Protestants and reformers abroad. In Holland, Germany, and the North, they went by the names of Anabaptists, and Mennonites; and, in Piedmont and the south, they were found among the Albigenses and Waldenses. See the histories of the Reformation and the above articles in this Dictionary.

The *Baptists* subsist under two denominations, viz. the *Particular* or Calvinistical, and the *General* or Arminian. The former is by far the most numerous. Some of both denominations allow of *mixed communion*, viz. of persons who have been sprinkled in their infancy, and therefore unbaptized in the view of the Baptists; others disallow it; and some of them observe the seventh day of the week as the Sabbath, apprehending the law that enjoined it not to have been repealed by Christ or his apostles. But a difference of opinion respecting these

and

Digitized by Google

and other matters, is not peculiar to the Baptists: it is common to all Christians, and to all bodies of men who think and judge for themselves.

BATISTERY, in ecclesiastical writers, a place in which the ceremony of baptism is performed.

In the ancient church it was one of the exedræ or buildings distinct from the church itself: and consisted of a porch or anti-room where the persons to be baptized made their confession of faith, and an inner room where the ceremony of baptism was performed. Thus it continued till the sixth century, when the baptisteries began to be taken into the church-porch, and afterwards into the church itself.

The ancient baptisteries were commonly called φωτιστηρια, *photisteria*, q..d. places of illumination; an appellation sometimes given to baptism. Or they might have the name for another reason, because they were the places of an illumination, or instruction, preceding baptism: for here the catechumens seem to have been trained up, and instructed in the first rudiments of the Christian faith.

Those baptisteries were anciently very capacious: because, as Dr Cave observes, the stated times of baptism returning but seldom, there were usually great multitudes to be baptized at the same time: and then the manner of baptizing, by immersion, or dipping under water, made it necessary to have a large font likewise. In *Venantius Fortunatus*, it is called *aula baptismatis*, the large hall of baptism; which was indeed so capacious, that we sometimes read of councils meeting and sitting therein. This hall, or chapel, was always kept shut during Lent, and the door sealed up with the bishop's seal, not to be opened till Maunday-Thursday.

The baptistery was always reputed a sacred place. In the Roman order, we find the ceremonies used in the consecration of the baptisteries: they were to be built of a round figure, and distinguished with the image of St John the Baptist; over the basen or font was a figure of a dove in gold or silver, to represent the Holy Ghost.

The name *baptistery* is sometimes also given to a kind of chapel in a large church, which served for the same office. It is an observation of some learned men, that anciently there was but one baptistery in a city, and that at the bishop's church; and that afterwards they were set up in parish churches, with the special allowance however of the bishop.

BAR, in a general sense, denotes a slender piece of wood or iron, for keeping things close together.

BAR, in courts of justice, an enclosure made with a strong partition of timber, where the counsel are placed to plead causes. It is also applied to the benches where the lawyers or advocates are seated, because anciently there was a bar to separate the pleaders from the attorneys and others. Hence our lawyers who are called to the bar, or licensed to plead, are termed *barristers*, an appellation equivalent to *licentiate* in other countries.

BAR, or *Barr*, (Latin *barra*, and in French *barre*), in a legal sense, is a plea or peremptory exception of a defendant, sufficient to destroy the plaintiff's action. And it is divided into bar to common intendment, and bar special; bar temporary, and perpetual. Bar to a common intendment is an ordinary or general bar, which usually disableth the declaration of the plaintiff; bar special is that which is more than ordinary, and falls out upon some special circumstance of the fact as to the case in hand. Bar temporary is such a bar as is good for the present, but may afterwards fail; and bar perpetual is that which overthrows the action of the plaintiff for ever.

BAR, in *Heraldry*, an ordinary in form of the fess, but much less. See HERALDRY.

BAR, in the manege, the highest part of that place of a horse's mouth situated between the grinders and tushes, so that the part of the mouth which lies under and at the side of the bars retains the name of the gum. A horse with sensible bars has a fine light mouth, with an even and firm appui. See APPUI.

To BAR a Vein, in *Farriery*, is an operation performed upon the veins of the legs of a horse and other parts, with intent to stop the malignant humours. It is done by opening the skin above it, disengaging it, and tying it both above and below, and striking between the two ligatures.

BAR, in *Music*, a stroke drawn perpendicularly across the lines of a piece of music, including between each two a certain quantity or measure of time, which is various as the time of the music is either triple or common. In common time, between each two bars is included the measure of four crotchets; in triple, three. The principal use of bars is to regulate the beating of time in a concert. The use of bars is not to be traced higher than the time when the English translation of Adrian le Roy's book on the Tablature was published, viz. the year 1574; and it was some time after that before the use of bars became general. To come nearer to the point, Barnard's cathedral music, printed in 1641, is without bars; but bars are to be found throughout in the *Ayres and Dialogues* of Henry Lawes published in 1653; from whence it may be conjectured that we owe to Lawes this improvement.

BAR, in *Hydrography*, denotes a bank of sand, or other matter, whereby the mouth of a river is in a manner choked up.

The term *bar* is also used for a strong beam wherewith the entrance of a harbour is secured: this is more commonly called *boom*.

BAR of a tavern or coffeehouse, the place where the waiters attend to answer the calls of the customers.

BAR, among printers, denotes a piece of iron with a wooden handle, whereby the screw of the press is turned in printing. See PRINTING.

BARS of Iron, are made of the metal of the sows and pigs as they come from the furnace. These pass through two forges, called the *finery* and the *chaufery*; where, undergoing five several heats, they are formed into bars.

BAR, a very strong city of Podolia in Poland, upon the river Kiow. E. Long. 28. 30. N. Lat. 50. 6.

BAR, formerly a duchy of France, now the department of Meuse, is bounded on the east by Lorrain, on the north by Luxembourg, on the west by Champagne, on the south by part of the same country, and by Franche Compte. It is crossed by the river Meuse from north to south, and watered by several other rivers, which render it very fertile. It was divided into four balliages, viz. Bassilyni, Bar, St Michael, and

Digitized by Google

and Clermont. The chief towns are Bar-le-duc, Clermont, St Michael, Longuey, Pont à Mousson, and Stenay. In 1736, it was given to Stanislaus then king of Poland.

Bar le-duc, the capital of the late duchy of Bar, in the department of Meuse, is seated on the declivity of a hill. It is divided into the higher and lower town: the lower is watered by the rivulet Orney, which abounds with excellent trouts. The wines are excellent, and not inferior to those of Champagne. E. Long. 5. 30. N. Lat. 48. 35.

Bar-le-Mont, a town of France, in the department of the North, situated on the river Sambre. E. Long. 3. 40. N. Lat. 50. 10.

Bar sur Aube, an ancient town of France, in the department of Aube, seated at the foot of a mountain. It is much celebrated for excellent wines. E. Long. 4. 50. N. Lat. 48. 14.

Bar sur Seine, a town of France, in the duchy of Burgundy, now in the department of Aube, seated between a mountain which covers it on the west, and the river Seine which runs on the east. E. Long. 4. 30. N. Lat. 48. 5.

Bar-Master, among miners, the person who keeps the gauge, or dish, for measuring the ore.

BARA, in *Ancient Geography*, a small island in the Adriatic, opposite to Brundusium: the *Pharos* of Mela. Also a frith or arm of the sea of Britannia Secunda (Ptolemy); supposed to be the Murray frith.

Bara, one of the Hebrides or Western islands of Scotland. It is a small rock, only a quarter of a mile in circumference, being part of a chain called the *Long Island*, the whole cluster appearing at low water as one island. Bara is altogether barren; but abounds with great numbers of sea-fowl, such as solan geese, guillamotes, puffins, &c.

Bara, the name of a festival celebrated with much magnificence at Messina, and representing the assumption of the Virgin. The *bara*, though used as the general denomination of this festival, signifies more particularly a vast machine 50 feet high, at the top of which a young girl of 14, representing the Virgin, stands upon the hand of an image of Jesus Christ.

Houel's Descriptive Travels through Sicily, &c.

Round him turn vertically, in a circle, 12 little children which represent the seraphims; below them, in another circle, which turns horizontally, are 12 more representing the cherubims: below these a sun turns vertically, with a child at the extremity of each of the four principal *radii* of his circle, who ascend and descend with his rotation, yet still stand upright. Below the sun is the lowest circle, about seven feet from the ground, in which 12 boys turn horizontally without interruption; these are intended for the twelve apostles, who are supposed to surround the tomb of the Virgin at the moment when she ascends into heaven. This complication of superstitious whirligigs may have already nearly turned the stomachs of some of our readers, or at least rendered them squeamish. But think of the poor little cherubims, seraphims, and apostles, who are twirled about in this procession! for, says Mr Houel, some of them fall asleep, many of them vomit, and several do still worse: but these unseemly effusions are no drawback upon the edification of the people; and nothing is more common than to see fathers and mothers soliciting with ardour for their boys and girls the pious distinction of puking at the bara. This machine is not drawn by asses or mules, but by a multitude of robust monks.

BARABINZIANS, a tribe of Tartars, living on both sides of the river Irtis. They seem to derive their name from the *Barabaian* desert, whose lakes supply them abundantly with fish, on which and their cattle they chiefly subsist. They have plenty of game and wild-fowl of every kind, particularly ducks and puffins. Most of them are heathens, but Mahometanism daily gains ground among them. Some of them pay tribute to the empress of Russia, and others to the Khan Taisha.

BARACOA, a town in the north-east part of the island of Cuba. W. Long. 74. 50. N. Lat. 20. 25.

BARALIPTON, among logicians, a term denoting the first indirect mode of the first figure of syllogism. A syllogism in baralipton, is when the two first propositions are general, and the third particular, the middle term being the subject in the first proposition and the predicate in the second. The following is of this kind.

> Ba. Every evil ought to be feared;
> ra. Every violent passion is an evil;
> lip. Therefore something that ought to be feared is a violent passion.

BARALLOTS, in *Church History*, a sect of heretics at Bologna in Italy, who had all things in common, even their wives and children. Their facility in complying with all manner of debauchery made them get the name *obedientes*, "compliers."

BARANCA de malambo, a town of Terra Firma in America, with a bishop's see and a good haven. It is a place of great trade, and is seated on the river Magdaline. W. Long. 75. 30. N. Lat. 11. 10.

BARANGI, officers among the Greeks of the lower empire. Cujas calls them in Latin *protectores*, and others give them the name of *securigeri*. It was their business to keep the keys of the city gates, where the emperor resided.

BARANWAHR, a town of Lower Hungary, in a county of the same name, taken by the emperor of Germany from the Turks in 1684. It is seated between Buda and Belgrade, in E. Long. 18. 5. N. Lat. 46. 0.

BARATHRUM, in antiquity, a deep dark pit at Athens, into which condemned persons were cast headlong. It had sharp spikes at the top, that no man might escape out; and others at the bottom, to pierce and torment such as were cast in. Its depth and capaciousness made it to be applied proverbially to a covetous person: to a glutton, called *Barathro* by the Romans (Lucretius, Horace); and *Barathrum* in the same sense (Horace); and for a common prostitute (Plautus).

BARATIERE, Philip, a most extraordinary instance of the early and rapid exertion of mental faculties. This surprising genius was the son of Francis Baratiere, minister of the French church at Schwobach near Nuremberg, where he was born Jan. 10. 1721. The French was his mother tongue, together with some words of High Dutch; but by means of his father insensibly talking Latin to him, it became as familiar to him as the rest: so that, without knowing the rules of grammar, he at four years of age talked French to his mother,

mother, Latin to his father, High Dutch to the maid or neighbouring children; and all this without mixing or confounding the respective languages. About the middle of his fifth year he acquired Greek in like manner; so that in 15 months he perfectly understood all the Greek books in the Old and New Testament, which he readily translated into Latin. When he was five years and eight months old, he entered upon Hebrew; and in three years time was so expert in the Hebrew text, that from a bible without points, he could give the sense of the original in Latin or French; or translate extempore the Latin or French versions into Hebrew, almost word for word; and had all the Hebrew psalms by heart. He composed at this time a dictionary of rare and difficult Hebrew words, with critical remarks and philological observations, in about 400 pages in 4to; and, about his tenth year, amused himself for twelve months with the Rabbinical writers. With these he intermixed a knowledge of the Chaldaic, Syriac, and Arabic; and acquired a taste for divinity and ecclesiastical antiquity, by studying the Greek fathers, and councils of the first four ages of the church. In the midst of these occupations, a pair of globes coming into his possession, he could in 8 or 10 days time resolve all the problems on them; and in about three months, in Jan. 1735, devised his project for the discovery of the longitude, which he communicated to the Royal Society at London and the Royal Academy of Sciences at Berlin. In June 1731, he was matriculated in the university of Altorf; and at the close of the year 1732, he was presented by his father at the meeting of the reformed churches of the circle of Franconia; who, astonished at his wonderful talents, admitted him to assist in the deliberations of the synod; and to preserve the memory of so singular an event, it was ordered to be registered in their acts. In 1734, the margrave of Brandenburg Auspach granted this young scholar the use of whatever books he wanted from the Anspach library, together with a pension of 50 florins, which he enjoyed three years; and his father receiving a call from the French church at Stetin in Pomerania, young Baratiere was, on the journey, admitted master of arts, with universal applause, at the university of Hall: at Berlin he was honoured with several conversations with the king of Prussia, and was received into the Royal Academy. Towards the close of his life he acquired a taste for medals, inscriptions, and antiquities; metaphysical inquiries, and experimental philosophy, intervening occasionally between these studies. He wrote several essays and dissertations; made astronomical remarks, and laborious calculations; took great pains toward a history of the heresies of the anti-trinitarians, and of the 30 years war in Germany: his last publication, which appeared in 1740, was on the succession of the bishops of Rome. The final work he engaged in, and for which he had gathered large materials, was *Inquiries concerning the Egyptian Antiquities*. But the substance of this blazing meteor was now almost exhausted: he was always weak and sickly; and died October 5. 1740, aged 19 years 8 months and 16 days. He published 11 different pieces, and left 29 manuscripts on various subjects, the contents of which may be seen in his life written by M. Formey professor of philosophy at Berlin.

BARATZ, (*Turkish*), letters-patent granted by the Turkish emperors to the Greek patriarch, bishops, &c. for the exercise of their ecclesiastical functions. This *Baratz* gives the bishops full power and authority to establish and depose the inferior clergy, and all other religious persons; to grant licenses for marriages, and issue out divorces; to collect the revenues belonging to the churches; to receive the pious legacies bequeathed to them; in short, to enjoy all the privileges and advantages belonging to their high station; and all this (as it is expressed in the baratz itself) "according to the vain and idle ceremonies of the Christians."

BARB, or BARBE, a horse brought from Barbary. See EQUUS, MAMMALIA *Index*.

BARBA, in *Botany*, a species of *pubes*, or down, with which the surface of some plants is covered. The term was invented by Linnæus; and by its application in the *Species Plantarum*, seems to signify a tuft or bunch of strong hairs terminating the leaves. *Mesembryanthemum barbatum* furnishes an example.

The word is also often used in composition with some other, to form the trivial names of several plants, as *barba jovis*, *barba capræ*, &c.

BARBACAN, or BARBICAN, an outer defence or fortification to a city or castle, used especially as a fence to the city or walls; also an aperture made in the wall of a fortress, to fire through upon the enemy. See CASTLE.

BARBACAN is also used to denote a fort at the entrance of a bridge, or the outlet of a city, having a double wall with towers.

BARBADOES, the most easterly of all the Caribbee islands, subject to Great Britain, and according to the best geographers, lying between 59° 50′ and 60° 2′ of west longitude, and between 12° 56′ and 13° 16′ of north latitude. It lies 20 leagues east from St Vincent, which may be seen in a clear day. It is 21 miles in length and 14 in breadth; but these mensurations are subject to so many uncertainties, that it will perhaps convey a more adequate idea of this island, to tell the reader that in reality it does not contain above 107,000 acres. The climate is hot, but not unwholesome, the heat being qualified by sea-breezes; and a temperate regimen renders this island as safe to live in as any climate south of Great Britain; and, according to the opinion of many, as even Great Britain itself. The island has on its east side two streams that are called rivers, and in the middle is said to have a bituminous spring which sends forth a liquor like tar, which serves for the same uses as pitch or lamp-oil. The island abounds in wells of good water, and has several reservoirs for rain-water. Some parts of the soil are said to be hollowed into caves, some of them capable of containing 300 people. These are imagined to have been the lurking-places of runaway negroes, but may as probably be natural excavations. The woods that formerly grew upon the island have been all cut down, and the ground converted into sugar plantations. When those plantations were first formed, the soil was prodigiously fertile, but has since been worn out, insomuch, that about the year 1730, the planters were obliged to raise cattle for the sake of their dung, by which means the profit of their plantations was reduced to less than a tenth of its usual value. Notwithstanding the smallness of Barbadoes, its soil is different;

Digitized by Google

Barbadoes. different; being in some places sandy and light, in others rich, and in others spongy; but all of it is cultivated according to its proper nature, so that the island presents to the eye the most beautiful appearance that can be imagined. Oranges and lemons grow in Barbadoes in great plenty, and in their utmost perfection. The lemon juice here has a peculiar fragrancy. The citrons of Barbadoes afford the best drams and sweetmeats of any in the world, the Barbadoes ladies excelling in the art of preserving the rind of the citron fruit. The juice of the limes, or dwarf-lemons, is the most agreeable souring we know, and great quantities of it have of late been imported into Britain and Ireland. The pine apple is also a native of Barbadoes, and grows there to much greater perfection than it can be made to do in Europe by any artificial means. A vast number of different trees peculiar to the climate are also found to flourish in Barbadoes in great perfection; such as the aloe, mangrove, calabash, cedar, cotton, mastich, &c. Here likewise are produced some sensitive plants, with a good deal of garden stuff, which is common in other places. In short, a native of the finest, the richest, and most diversified country in Europe, can hardly form an idea of the variety of delicious and at the same time nutritive vegetable productions with which this island abounds.

When Barbadoes was first discovered by the English, few or no quadrupeds were found upon it, except hogs, which had been left there by the Portuguese. For convenience of carriage to the sea side, some of the planters at first procured camels; which undoubtedly would in all respects have been preferable to horses for their sugar and other works; but the nature of the climate disagreeing with that animal, it was found impossible to preserve the breed. They then applied for horses to Old and New England: from the former they had those that were fit for show and draught; from the latter those that were proper for mounting their militia, and for the saddle. They had likewise some of an inferior breed from Curassoa, and other settlements. They are reported to have had their first breed of black cattle from Bonavista and the isle of Mayo; they now breed upon the island, and often do the work of horses. Their asses are very serviceable in carrying burdens to and from the plantations. The hogs of Barbadoes are finer eating than those of Britain, but the few sheep they have are not near so good. They likewise have goats, which when young are excellent food. Racoons and monkeys are also found here in great abundance. A variety of birds are produced in Barbadoes, of which the humming bird is the most remarkable. Wild fowl do not often frequent this island: but sometimes teal are found near their ponds. A bird which they call the *man of war*, is said to meet ships at 20 leagues from land, and their return is, to the inhabitants, a sure sign of the arrival of these ships. When the wind blows from the south and south-west, they have flocks of curlews, plovers, snipes, wild pigeons, and wild ducks. The wild pigeons are very fat and plentiful at such seasons, and rather larger than those of England. The tame pigeons, pullets, ducks, and poultry of all kinds, that are bred at Barbadoes, have also a fine flavour, and are accounted more delicious than those of Europe. Their rabbits are scarce; they have no hares; and if they have deer of any kind, they are kept as curiosities. Barbadoes. The insects of Barbadoes are not venomous, nor do either their snakes or scorpions ever sting. The musketoes are troublesome, and bite, but are more tolerable in Barbadoes than on the continent. Various other insects are found on the island, some of which are troublesome, but in no greater degree than those that are produced by every warm summer in England. Barbadoes is well supplied with fish; and some caught in the sea surrounding it are almost peculiar to itself; such as the parrot-fish, snappers, gray cavallos, terbums, and coney-fish. The mullets, lobsters, and crabs, caught here are excellent; and the green turtle is perhaps the greatest delicacy that ancient or modern luxury can boast of. At Barbadoes this delicious shell-fish seldom sells for less than a shilling a pound, and often for more. There is found in this island a kind of land crab, which eats herbs wherever it can find them, and shelters itself in houses and hollows of trees. According to report, they are a shell-fish of passage; for in March they travel to the sea in great numbers. See CANCER.

The inhabitants may be reduced to three classes; viz. the masters, the white servants, and the blacks. The former are either English, Scots, or Irish: but the great encouragement given by government to the peopling this and other West Indian islands, induced some Dutch, French, Portuguese, and Jews, to settle among them with their estates; by which, after a certain time, they acquire the rights of naturalization in Great Britain. The white servants, whether by covenant or purchase, lead more easy lives than the day-labourers in England; and when they come to be overseers, their wages and other allowances are considerable. As to the treatment of the negro slaves in this and the other islands, that falls to be spoken of under the articles NEGRO, SLAVE, WEST-INDIES; which see. The manners of the white inhabitants, in general, are the same as in most polite towns and countries in Europe. The capital of the island is called *Bridge-Town*; see that article.

As the history of this island furnishes no very remarkable events, the following short hints concerning it may suffice.

When the English, some time after the year 1625, first landed here, they found it the most savage and destitute place they had hitherto visited. It had not the least appearance of ever having been peopled even by savages. There was no kind of beasts of pasture or of prey, no fruit, no herb, no root fit for supporting the life of man. Yet as the climate was so good, and the soil appeared fertile, some gentlemen of small fortune in England resolved to become adventurers thither. The trees were so large, and of a wood so hard and stubborn, that it was with great difficulty they could clear as much ground as was necessary for their subsistence. By unremitting perseverance, however, they brought it to yield them a tolerable support; and they found that cotton and indigo agreed well with the soil; and that tobacco, which was beginning to come into repute in England, answered tolerably. These prospects, together with the storm between the king and parliament, which was beginning to break out in England, induced many new adventurers to transport themselves into this island. And what is extremely

Digitized by Google

tremely remarkable, so great was the increase of people in Barbadoes, 25 years after its first settlement, that in 1650 it contained more than 50,000 whites, and a much greater number of negro and Indian slaves. The latter they acquired by means not at all to their honour: for they seized upon all those unhappy men, without any pretence, in the neighbouring islands, and carried them into slavery; a practice which has rendered the Caribbee Indians irreconcilable to us ever since. They had begun a little before this to cultivate sugar, which soon rendered them extremely wealthy. The number of slaves, therefore, was still augmented; and in 1676 it is supposed that their number amounted to 100,000, which, together with 50,000 whites, make 150,000 on this small spot: a degree of population unknown in Holland, in China, or any other part of the world most renowned for numbers. Their annual exports, in sugar, indigo, ginger, cotton, and citron-water, were above 350,000l. and their circulating cash at home was 200,000l. Such was the increase of population, trade, and wealth, in the course of 50 years. But these accounts are supposed by Mr Bryan Edwards to be greatly exaggerated. But since that time this island has been much on the decline; which is to be attributed partly to the growth of the French sugar colonies, and partly to their own establishments in the neighbouring isles. Their numbers in 1811 were 16,289 whites, 62,258 slaves, and 3392 free persons of colour. The official value of the exports in 1810 was 271,597l. and of the imports 311,400l.

Barbadoes-Tar, a mineral fluid of the nature of the thicker fluid bitumens, of a nauseous bitterish taste, very strong and disagreeable smell, found in many parts of America trickling down the sides of the mountains, and sometimes floating on the surface of the waters. It has been greatly recommended in coughs and other disorders of the breast and lungs.

BARBARA, among logicians, the first mode of the first figure of syllogisms. A syllogism in barbara is one whereof all the propositions are universal and affirmative; the middle term being the subject of the first proposition, and attribute in the second.

Examp. Bar. Every wicked man is miserable;
Ba. All tyrants are wicked men;
Ra. Therefore all tyrants are miserable.

BARBARIAN, a name given by the ancient Greeks and Romans to all who were not of their own country, or were not initiated in their language, manners, and customs. In this sense, the word signified with them no more than foreigner; not signifying, as among us, a wild, rude, or uncivilized person.

BARBARISM, in a general sense, a rudeness of language or behaviour.

Barbarism, in *Grammar*, an offence against the purity of style or language; or an ungrammatical way of speaking or writing, contrary to the true idiom of any particular language.

BARBAROSSA, Aruch, and Hayradin, two famous corsairs, the sons of a potter in the isle of Lesbos; who, turning pirates, carried on their depredations with such success and conduct, that they were soon possessed of 12 galleys besides smaller vessels. Of this fleet Aruch the elder brother, called *Barbarossa* from the redness of his beard, was admiral, and Hayradin the second in command: they called themselves the *friends of the sea*, and the *enemies of all who sailed upon it*; and their names became terrible from the straits of Dardanelles to those of Gibraltar. With such a power they wanted an establishment; and the opportunity of settling themselves offered in 1516, by the inconsiderate application of Eutemi king of Algiers to them for assistance against the Spaniards. Aruch, leaving his brother to command the fleet, carried 5000 men to Algiers, where he was received as their deliverer; and secretly murdering the prince he came to aid, caused himself to be proclaimed king in his stead. To this usurpation he added the conquest of Tremecen; when his exploits and piracies induced the emperor Charles V. to furnish the marquis de Gomarez, governor of Oran, with troops to suppress him; by whom he was defeated and killed near Tremecen. His brother Hayradin, known also by the name of *Barbarossa*, assumed the sceptre at Algiers with the same abilities, and with better fortune; for the Spaniards, sufficiently employed in Europe, giving him no disturbance, he regulated the interior police of his kingdom with great prudence, carried on his naval operations with vigour, and extended his conquests on the continent of Africa. He put his dominions under the protection of the Grand Signior, Solyman the Magnificent; and obtained the command of the Turkish fleet. With so powerful a protector, he acquired the kingdom of Tunis in a manner similar to that by which his brother gained Algiers. Since the time of the Barbarossas, Algiers has been understood to be dependent on the Porte; but this dependence is now little more than merely nominal.

BARBARUS, Francis, a noble Venetian, was a man of great fame in the 15th century, not only for learning, but likewise for a skilful address in the management of public affairs. He is author of a book *De Re Uxoria*, and some speeches.

Barbarus, *Hermolaus*, grandson of the preceding, one of the most learned men in the 15th century. The public employments he was intrusted with early, did not prevent him from cultivating polite learning with great application. As he was very skilful in the Greek, he undertook the most difficult translations, and began with a famous paraphrase upon Aristotle. He then attempted Dioscorides, whose text he corrected, gave a translation of him, and added a commentary. But of all his works, there is none which has gained him so much reputation as that which he made upon Pliny; he corrected in him above 5000 passages, and occasionally restored 300 in Pomponius Mela. Pope Innocent VIII. to whom he was ambassador, conferred the patriarchate of Aquileia upon him. He was so imprudent as to accept of it without waiting for the consent of his superiors; though he could not be ignorant that the republic of Venice had made laws to forbid all the ministers they sent to the court of Rome to accept any benefice. His superiors were inflexible; and not being able to gain any thing upon them either by his flattery or his father's interest, the father died of grief, and the son soon followed him.

Barbarus, *Daniel*, of the same family with the preceding, was patriarch of Aquileia, and famous for his learning. He was ambassador from Venice to England;

Digitized by Google

land; and was one of the fathers of the council of Trent, where he acted with great zeal for the interest of the pope. He wrote, 1. A commentary on Vitruvius. 2. *Catena Græcorum Patrum in quinquaginta Psalmos Latinè Versa.* 3. *La Pratica della Perspectiva.* He died in 1569, at 41 years of age.

BARBARY, a region of Africa, including the states of *Algiers*, *Morocco*, *Tripoli*, and *Tunis;* (see those articles). This country contains almost the whole of

1 Extent, &c.

what the Romans possessed of the continent of Africa, excepting Egypt. It stretches itself in length from east to west, beginning at the southern limits of Egypt, to the straits of Gibraltar, full 35 degrees of longitude; and from thence to Santa Cruz, the utmost western edge of it, about six more, in all 41 degrees; so that the utmost length of Barbary from east to west is computed at above 759 German leagues. On the south, indeed, it is confined within much narrower bounds, extending no farther than from 27 to 35½ degrees of north latitude; so that its utmost breadth, from north to south, does not exceed 128 German miles. More particularly, Barbary begins on the west of the famed Mount Atlas, called by the Arabs *Ay Duacal*, or *Al Duacal*, enclosing the ancient kingdoms of Suez and Dela, now provinces of Morocco; thence stretching north-eastward along the Atlantic to the pillars of Hercules at Cape Finisterre, then along the coast of the Mediterranean, it is at last bounded by the city of Alexandria in Egypt.

2 Whence named.

Concerning the origin of the name *Barbary*, there are many conjectures. According to some, the Romans, after they had conquered this large country, gave it that name out of contempt and dislike to the barbarous manners of the natives, according to their custom of calling all other people but themselves *Barbarians*. Marmol, on the contrary, derives the word *Barbary* from *Berber*, a name which the Arabs gave to its ancient inhabitants, and which they retain to this day in many parts of the country, especially along the great ridge of the mountains of Atlas; and which name was given them on account of the barrenness of their country. According to Leo Africanus, the name of Barbary was given by the Arabs on account of the strange language of the natives, which appeared to them more like a murmur or grumbling of some brute animals than articulate sounds. Others, however, derive it from the Arabic word *bar*, signifying a desert, twice repeated; which was given by one *Ifric*, or *Africus*, a king of Arabia, from whom the whole continent of Africa is pretended to have taken its name. According to them, this king being driven out of his own dominions, and closely pursued by his enemies, some of his retinue called out to him *Bar, Bar;* that is, *To the desert, To the desert;* from which the country was afterwards called *Barbary*.

3 Subject to the Romans.

Among the Romans this country was divided into the provinces of Mauritania, Africa Propria, &c. and they continued absolute masters of it from the time of Julius Cæsar till the year of Christ 428. At that time Bonifacius the Roman governor of these provinces, having through the treachery of Ætius been forced to

4 Bonifacius calls in the Vandals.

revolt, called in to his assistance Genseric king of the Vandals, who had been some time settled in Spain. The terms offered, according to Procopius, were, that Genseric should have two thirds, and Bonifacius one third, of Africa, provided they could maintain themselves against the Roman power; and to accomplish this they were to assist each other to the utmost.—This proposal was instantly complied with; and Genseric set sail from Spain in May 428, with an army of 80,000 men, according to some, or only 24,000 according to others, together with their wives, children, and all their effects. In the mean time, however, the empress Placidia having discovered the true cause of Bonifacius's revolt, wrote a most kind and obliging letter to him, in which she assured him of her favour and protection for the future, exhorting him to return to his duty, and exert his usual zeal for the welfare of the empire, by driving out the Barbarians whom the malice of his enemies had obliged him to call in for his own safety and preservation.

5 Endeavours unsuccessfully to persuade them to return.

Bonifacius readily complied with this request, and offered the Vandals considerable sums if they would retire out of Africa and return to Spain. But Genseric, already master of the greatest part of the country, first returned a scoffing answer, and then, falling unexpectedly on him, cut most of his men to pieces, and obliged Bonifacius himself to fly to Hippo, which place he invested in May 430. The siege lasted till the month of July the following year; when the Vandals were forced, by a famine that began to rage in their camp, to drop the enterprise, and retire. Soon after, Bonifacius having received two reinforcements, one from Rome, and the other under the conduct of the celebrated Aspar, from Constantinople, a resolution was taken by the Roman generals to offer the enemy

6 Romans defeated by Genseric king of the Vandals.

battle. The Vandals readily accepting the challenge, a bloody engagement ensued, in which the Romans were utterly defeated, a prodigious number of them taken, and the rest obliged to shelter themselves among the rocks and mountains. Aspar, who commanded the eastern troops, escaped with difficulty to Constantinople, and Bonifacius was recalled to Italy. Upon their departure, the Vandals overran all Africa, committing everywhere the most terrible ravages; which struck the inhabitants of Hippo with such terror, that they abandoned their city, which was first plundered, and then set on fire by the victorious enemy; so that Cirtha and Carthage were now the only strong places possessed by the Romans.

7 Peace concluded with the Vandals.

In 435, Genseric, probably being afraid of an attack by the united forces of the eastern and western empires, concluded a peace with the Romans, who yielded to him part of Numidia, the province of Proconsularis, and likewise Byzancene; for which, according to Prosper, he was to pay a yearly tribute to the emperor of the east. Genseric delivered up his son Hunneric by way of hostage; but so great was the confidence which the Romans placed in this barbarian, that some time after they sent him back his son. Of this they soon had reason to repent; for in 439, the Romans being engaged in a war with the Goths in Gaul,

8 Genseric's treachery.

Genseric laid hold of that opportunity to seize upon the city of Carthage; by which he considerably enlarged his African dominions. Valentinian, the Roman emperor, however, maintained as long as he lived the two Mauritanias, with Tripolitana, Tingitana, and that part of Numidia where Cirtha stood.

On the taking of Carthage, Genseric made it the seat of his empire; and in 440 made a descent on the

Barbary.

island of Sicily, where he ravaged the open country, and even laid siege to Palermo. Not being able, however, to reduce that place, he soon returned to Africa with an immense booty and a vast number of captives. Being now become formidable to both empires, Theodosius emperor of the east resolved to assist Valentinian against so powerful an enemy. Accordingly, he fitted out a fleet consisting of 1100 large ships; and putting on board of it the flower of his army, under the conduct of Arcovindas, Ansilas, and Germanus, he ordered them to land in Africa, and joining the western forces there, to drive Genseric out of the countries he had seized. But Genseric in the mean time pretending a desire to be reconciled with both empires, amused the Roman general with proposals for peace, till the season for action was over; and, next year, Theodosius being obliged to recal his forces to oppose the Huns, Valentinian found it necessary to conclude a peace with the Vandals; and this he could obtain on no other terms than yielding to them the quiet possession of the countries they had seized.

So powerful was Genseric now become, or rather so low was the Roman empire by this time reduced, that in 455 he took and plundered the city of Rome

9 Makes himself master of all the Roman provinces.

itself, as is fully related under the article ROME; and, after his return to Africa, made himself master of the remaining countries held by the Romans in that part of the world. Hereupon Avitus, who had succeeded Valentinian in the empire, despatched ambassadors to Genseric, putting him in mind of the treaty he had concluded with the empire in 442; and threatening, if he did not observe the articles at that time agreed upon, to make war upon him not only with his own forces, but with those of his allies the Vesigoths, who were ready to pass over into Africa. To this Genseric was so far from paying any regard, that he immediate-

10 Defeated by Ricimer and Majorianus.

ly put to sea with a fleet of 60 ships; but being attacked by the Roman fleet under Ricimer, he was utterly defeated, and forced to fly back into Africa: he returned, however, soon after with a more powerful fleet, committing great ravages on the coast of Italy; but in a second expedition he was not attended with so good success; the Romans falling unexpectedly upon his men while busied in plundering the country, put great numbers of them to the sword, and among the rest the brother-in-law of Genseric himself. Not content with this small advantage, Majorianus, at that time emperor, resolved to pass over into Africa, and attempt the recovery of that country. For this purpose he made great preparations; but his fleet being surprised and defeated by the Vandals, through the treachery, it is said, of some of his commanders, the enterprise miscarried.

Notwithstanding this misfortune, however, Majorianus persisted in his resolution; and would in all likelihood have accomplished his purpose, had not he himself been murdered soon after by Ricimer. After his death, Genseric committed what ravages he pleased in the poor remains of the western empire, and even made descents on Peloponnesus and the islands belonging to

11 Genseric defeats the eastern emperor's fleet.

the emperor of Constantinople. To revenge this affront, Leo made vast preparations for the invasion of Africa, insomuch, that, according to Procopius, he laid out 130,000 pounds weight of gold in the equipment of his army and navy. The forces employed on this occasion were sufficient for expelling the Vandals, had they been much more powerful than they were; but the command being given to Basiliscus, a covetous and ambitious man, the fleet was utterly defeated through his treachery, and all the vast preparations came to nothing. By this last defeat the power of the Vandals in Africa was fully established, and Genseric made himself master of Sicily, as well as of all the other islands between Italy and Africa, without opposition from the western emperors, whose power was entirely taken away in the year 476.

12 Kingdom of the Vandals founded.

Thus was the Vandalic monarchy in Barbary founded by Genseric, between the years 428 and 468. If we take a view of that prince's government in his new dominions, it presents no very agreeable prospect. Being

13 Barbarity and tyranny of Genseric.

himself an absolute barbarian in the strictest sense of the word, and an utter stranger to every useful art, he did not fail to show his own prowess by the destruction of all the monuments of Roman greatness which were so numerous in the country he had conquered. Accordingly, instead of improving his country, he laid it waste, by demolishing all the stately structures both public and private, and all other valuable and sumptuous works with which those proud conquerors had adorned this part of their dominions. So that, whatever monuments the Romans had been at such an immense expence to erect, in order to eternize their own glory, the barbarous Vandals were now at no less pains to reduce into heaps of ruins. Besides this kind of devastations, Genseric made his dominions a scene of blood and slaughter, by persecuting the orthodox Christians; being himself, as well as most of his countrymen, a zealous Arian; and for this his long reign is chiefly remarkable. He died in 477, after a reign of 60 years: and was succeeded by his son Hunneric.

14 Hunneric a bloody tyrant.

The new king proved yet a greater tyrant than his father, persecuting the orthodox with the utmost fury; and, during his short reign of seven years and a half, destroyed more of them than Genseric had done in all

15 His terrible death.

his lifetime. He is said to have died in the same manner as the heresiarch Arius *; before which time his flesh had been rotting upon his bones, and crawling with worms, so that he looked more like a dead carcase than a living man. Concerning his successors Gutamund, Thrasamund, and Hilderic, we find nothing remarkable, except that they sometimes persecuted, and sometimes were favourable to, the orthodox; and by his favour for them the last king was ruined. For, having unadvisedly published, in the beginning of his reign, a manifesto, wherein he repealed all the acts of his predecessors against the orthodox, a rebellion was the imme-

16 Hilderic deposed by Gilimer.

diate consequence. At the head of the malcontents was one Gilimer, or Gildemar, a prince of the blood-royal, who by degrees became so powerful, as to depose Hilderic in the seventh year of his reign; after which he caused the unhappy monarch, with all his family, to be closely confined, and was himself crowned king of the Vandals at Carthage.

Gilimer proved a greater tyrant than any that had gone before him. He not only cruelly persecuted the orthodox, but horribly oppressed all the rest, so that

17 Belisarius invades Africa;

he was held in universal abhorrence and detestation when the Greek emperor Justinian projected an invasion of Africa. This expedition of Justinian's is said to have

* See Arius.

have been occasioned by an apparition of Lætus an African bishop, who had been murdered some time before, but now commanded the emperor to attempt the recovery of Africa, and assured him of success. Accordingly, this, or some other motive, prevailed upon Justinian so far, that, notwithstanding his being at that time engaged in a war with Persia, he sent a powerful fleet and army to Africa, under the command of the celebrated general Belisarius, who was for that reason recalled from Persia.

So much was Gilimer, all this time, taken up with his own pleasures, or with oppressing his subjects, that he knew little or nothing of the formidable preparations that were making against him. On the arrival of Belisarius, however, he was constrained to put himself into a posture of defence. The management of his army he committed to his two brothers Gundimer and Gelamund, who accordingly attacked the Romans at the head of a numerous force. The engagement was

18 Belisarius defeats the Vandals.

long and bloody; but at last the Vandals were defeated, and the two princes slain. Gilimer, grown desperate at this news, sallied out at the head of his corps de reserve, with full purpose to renew the attack with the utmost vigour; but by his own indiscretion lost a fair opportunity of defeating the Romans. For no sooner did they perceive Gilimer hastening after them at the head of a fresh army, than they betook themselves to flight; and the greatest part were dispersed in such a manner, that, had the king followed them close, they must have been totally cut off. Instead of this, however, stumbling unfortunately on the body of one of his slain brothers, the sight of it made him lose all thoughts about the enemy; and instead of pursuing them, he spent part of his time in idle lamentation, and part in burying the corpse with suitable pomp and dignity. By this means Belisarius had an opportunity of rallying his men; which he did so effectually, that, coming unexpectedly upon Gilimer, he easily obtained a new and complete victory over him.

19 takes Carthage;

This defeat was followed by the loss of Carthage, which the barbarians had been at no pains to put into a posture of defence. After which Gilimer, having in vain endeavoured to obtain assistance from the Moors and Goths, was obliged to recal his brother Tzason from Sardinia. The meeting between the two brothers was very mournful; but they soon came to a resolution of making one desperate attempt to regain the lost kingdom, or at least recover their captives out of the hands of the enemy. The consequence of this resolution was another engagement, in which Tzason was killed with 800 of his choicest men, while the Romans lost no more than 50; after which Belisarius moving suddenly forward at the head of all his army, fell upon the camp of the Vandals. This Gilimer was no sooner apprised of, than, without staying to give any more orders to the rest of his army, he fled towards Numidia in the utmost consternation. His flight was not immediately known among his troops; but when it was, such an universal confusion ensued, that they abandoned their camp to the Romans, who had now nothing to do but plunder it; and not content with this, they massacred all the men found in it, carrying away the women captives.

20 and puts an end to the Vandalic monarchy.

Thus a total end was put to the power of the Vandals in Barbary, and the Romans once more became masters of this country. The Vandal inhabitants were permitted to remain as they were, on condition of exchanging the heresy of Arius for the orthodox faith. As for Gilimer, he fled with the utmost expedition to Medamus, a town situated on the top of the Pappuan mountain, and almost inaccessible by reason of its height and ruggedness. The siege of this place was committed to Pharas, an officer of great experience, who having shut up all avenues to the town, the un-

21 Gilimer's extreme distress.

happy Gilimer was reduced to the greatest straits for want of provisions. Pharas being soon apprised of the distress he was in, wrote him a most friendly and pathetic letter, earnestly exhorting him to put an end to the distress of himself and his friends by a surrender. This Gilimer declined; but at the same time concluded his answer with a most submissive request, that Pharas would so far pity his great distress as to send him a loaf of bread, a sponge, and a lute. This strange request greatly surprised Pharas; but at last it was explained by the messenger, who told him that the king had not tasted any baked bread since his arrival on that mountain, and earnestly longed to eat a morsel of it before he died: the sponge he wanted to allay a tumour that was fallen on one of his eyes; and the lute, on which he had learned to play, was to assist him in setting some elegiac verses he had composed on the subject of his misfortunes to a suitable tune. At this mournful report Pharas could not refrain from tears, and immediately despatched the messenger with the things he wanted.

Gilimer had spent near three winter months on the summit of this inhospitable mountain, his misery hardening him still more against the thoughts of surrendering, when a melancholy scene in his own family at once reconciled him to it. This was a bloody struggle between two boys, one of them his sister's son, about a flat bit of dough, laid on the coals; which the one seized upon, burning hot as it was, and clapped it into his mouth; but the other by dint of blows forced it out, and ate it from him. This quarrel, which might have ended fatally had not Gilimer interposed, made so deep an impression upon him, that he immediately despatched a messenger to Pharas, acquainting him that he was willing to surrender himself and all his effects upon the conditions he had offered, as soon as he was assured that they were embraced by Belisarius. Pharas lost no time to get them ratified and sent back to him; after which he was conducted to Belisarius, who gave him a very kind reception. Gilimer was afterwards brought before Justinian in gold chains, whom he besought in

22 Kindly treated by Justinian.

the most submissive manner to spare his life. This was readily granted by the emperor; who also allowed him a handsome yearly pension to live upon as a private gentleman. But his mind and heart were too much unsettled and broken to enjoy the sweets of a private state; so that Gilimer, oppressed with grief, died in the year 534, the first of his captivity, and five years after he had been raised to the throne.

23 Barbary reduced by the Saracens.

Barbary being thus again reduced under the power of the Romans, its history falls to be taken notice of under that of Rome. In the caliphate of Omar, this country was reduced by the Saracens, as we have already related under the article Arabia. It continued subject to the caliphs of Arabia and Bagdad till the reign of Harun Al Raschid, who having appointed Ibrahim

24 Principal city of the Aglabites founded.

brahim Ebn Aglab governor of the western parts of his empire, that prefect took the opportunity, first of assuming greater powers to himself than had been granted by the caliph, and then erecting a principality altogether independent of the caliphs. The race of Aglab continued to enjoy their new principality peaceably till the year of the Hegira 297 or 298, during which time they made several descents on the island of Sicily, and conquered part of it. About this time, however, one Obeidallah rebelled against the house of Aglab, and assumed the title of caliph of *Kairwan* (the ancient Cyrene, and residence of the Aglabite princes). To give the greater weight to his pretensions, he also took the surname of Al Mohdi, or Al Mahedi, the *director*. According to some, also, he pretended to be descended in a right line from Ali Ebn Abu Taleb, and Fatima the daughter of Mahomet; for which reason, say they, the Arabs called him and his descendants *Fatemites*. He likewise encouraged himself and his followers by a traditional prophecy of Mahomet, that at the end of 300 years the sun should rise out of the west. Having at length driven the Aglabites into Egypt, where they became known by the name of *Magrebians*, he extended his dominions in Africa and Sicily, making Kairwan the place of his residence.

25 Driven out by Al Mohdi the first Fatemite caliph.

26 His general Habbasah invades Egypt.

In the 300th year of the Hegira, Habbasah, one of Al Mohdi's generals, overthrew the caliph Al Mokhtader's forces in the neighbourhood of Barca, and made himself master of that city. After which he reduced Alexandria itself; and was making great progress in the conquest of the whole country, when Al Mokhtader despatched against him his two generals, Takin and Al Kasem, with an army of 100,000 men. Habbasah being informed that the caliph's troops were in motion, advanced at the head of his army to give them battle, and at last came up with them in an island called by the Arabs *Ard Al Khamsin*. Here he attacked them with incredible bravery, notwithstanding their force was much superior to his; but the approach of night obliged both generals to sound a retreat.—The action therefore was by no means decisive, though extremely bloody, the caliph's generals having lost 20,000, and Habbasah 10,000. The latter, however, durst not renew the fight next morning; but stole off in the night, and returned home, so that Al Mokhtader in effect gained a victory. In the 302d year of the Hegira, however, Habbasah returned, possessed himself of Alexandria a second time, defeated a body of the caliph's forces, and killed 7000 of them upon the spot. What further progress he made at that time we are not certainly told; but in the 307th year of the Hegira, Abul Kasem, son to the Fatemite caliph Al Mohdi, again entered Egypt with an army of 100,000 men. At first he met with extraordinary success, and overran a considerable part of that fine country. He made himself master of Alexandria, Al Tayum, Al Baknasa, and the isle of Al Ashmaryin, penetrating even to Al Jizah, where the caliph's army under the command of Munes was posted in order to oppose him. In this country he found means to maintain himself till the 308th year of the Hegira. This year, however, he was entirely defeated by Munes, who made himself master of all his baggage, as well as of the plunder he had acquired; and this blow obliged him to fly to Kairwan with the shattered remains of his army, where he remained without making any further attempt on Egypt.

27 As does also his son Abul Kasem,

28 who is utterly defeated by Munes.

Al Mohdi reigned 24 years; and was succeeded by his son Abul Kasem above mentioned, who then took the surname *Al Kayem Mohdi*. During his reign we read of nothing remarkable, except the revolt of one Yezid Ebn Condat, a man of mean extraction, but who, having been raised to the dignity of chancellor, found means to raise such a strong party, that the caliph was obliged to shut himself up in the castle of Mohedia. Yezid, being then at the head of a powerful army, soon reduced the capital of Kairwan, the cities of Al Rakkada and Tunis, and several other fortresses. He was no less successful in defeating a considerable number of troops which Al Kayem had raised and sent against him; after which he closely besieged the caliph himself in the castle where he had shut himself up. The siege continued seven months; during which time the place was reduced to such straits, that the caliph must either have surrendered it or been starved, when death put an end to his anxiety in the 12th year of his reign, and the 334th of the Hegira.

29 Rebellion of Yezid.

Al Kayem was succeeded by his son Ishmael, who immediately took upon himself the title of *Al Mansur*. This caliph thought proper to conceal the death of his father till he had made the preparations necessary for reducing the rebels. In this he was so successful that he obliged Yezid to raise the siege of Mohedia the same year; and in the following gave him two great overthrows, obliging him to shut himself up in the fortress of Kothama, or Cutama, where he besieged him in his turn. Yezid defended the place a long time with desperate bravery; but finding the garrison at last obliged to capitulate, he made shift to escape privately. Al Mansur immediately despatched a body of forces in pursuit of him; who overtook, and brought him back in fetters; but not till after a vigorous defence, in which Yezid received several dangerous wounds, of which he died in prison. After his death, Al Mansur caused his body to be flayed, and his skin stuffed and exposed to public view. Of Al Mansur's exploits in Sicily an account is given under that article. Nothing farther remarkable happened in his African dominions; and he died after a reign of seven years and 16 days, in the 341st of the Hegira.

30 Al Mansur caliph.

31 Death of Yezid.

Al Mansur was succeeded by his son Abu Zammin Moad, who assumed the surname of *Al Moez Ledinillah*. He proved a very warlike prince, and maintained a bloody contest with Abdalrahman, caliph of Andalusia; for a particular account of which see the article Spain. In the 347th year of the Hegira, beginning March 25th, 958, Al Moez sent a powerful army to the western extremity of Africa, under the command of Abul Hasan Jawhar, one of his slaves, whom he had advanced to the dignity of vizir. Jawhar first advanced to a city called *Tahart*, which he besieged for some time ineffectually. From thence he marched to Fez, and made proper dispositions for attacking that city. But finding that Ahmed Ebn Becr, the emir of the place, was resolved to defend it to the last, he thought proper to abandon the enterprise. However, having traversed all the tract between that capital and the Atlantic ocean, he again sat down before Fez, and took it by storm the following year.

32 Al Moez Ledinillah caliph.

But

Barbary, Barbatelli. But the greatest achievement performed by this caliph was his conquest of Egypt, and the removal of the caliphate to that country. This conquest, though
33 He conquers Egypt, long projected, he did not attempt till the year of the Hegira 358. Having then made all necessary preparations for it, he committed the care of that expedition to a faithful and experienced general called *Giafar*, or *Jaafar*; but in the mean time, this enterprise did not divert Al Moez from the care of his other conquests, particularly those of Sicily and Sardinia: to the last of which he sailed in the year of the Hegira 361, continuing a whole year in it, and leaving the care of his African dominions to an experienced officer named *Yusef Ben Zeiri*. He sailed thence the following year for Tripoli in Barbary, where he had not staid long before he received the agreeable news that his general had made himself master of Alexandria. He lost no time, but immediately embarked for it, leaving the government of his old African dominions in the hands of his trusty servant Yusef above mentioned, and arriving safely at that port was received with all the de-
34 and transfers the seat of government to that country. monstrations of joy. Here he began to lay the foundations of his new Egyptian dynasty, which was to put a final end to the old one of Kairwan after it had continued about 65 years.

Al Moez preserved all his old dominions of Kairwan or Africa Proper. But the ambition or avarice of the governors whom he appointed suffered them to run quickly to a shameful decay; particularly the new and opulent metropolis of Mohedia, on which immense sums had been lavished, as well as labour and care, so as to render it not only one of the richest and stateliest, but one of the strongest, cities in the world: so that we may truly say, the wealth and splendour of this once famed, though short-lived state, took their final leave of it with the departure of the caliph Al Moez, seeing the whole maritime tract from the Egyptian confines to the straits of Gibraltar hath since become the nest of the most odious piratical crew that can be imagined.

Under the article ALGIERS we have given a short account of the erection of a new kingdom in Barbary by Texefien; which, however, is there no farther continued than is necessary for the proper understanding the history of that country. A general history might here be given of the whole country of Barbary; but as that would necessarily occasion repetitions under the articles MOROCCO, TRIPOLI, TUNIS, &c. we must refer to those articles for the historical part, as well as for an account of the climate, inhabitants, &c.

BARBATELLI, BERNARDINO, otherwise called *Pochetti*, a painter of history, fruit, animals, and flowers, was born at Florence in 1542. He was the disciple of Ridolfo Ghirlandaio at Florence; from whose school he went to Rome, and studied there with such uncommon assiduity, that he was frequently so abstracted, and so absolutely engrossed by the objects of his contemplations, as to forget the necessary refreshments of sleep and food. He was excellent for painting every species of animals, fruit, or flowers; and in those subjects not only imitated, but equalled nature. His touch was free, light and delicate, and the colouring of his objects inexpressibly true; and, beside his merit in this most usual style of painting, the historical subjects which he designed from sacred or profane authors were much esteemed and admired. He died in 1612. Barbe ‖ Barberino.

BARBE, or BARB. See BARB.

BARBE in the military art. To fire in barbe, means to fire the cannon over the parapet, instead of firing through the embrasures; in which case the parapet must not be above three feet and a half high.

BARBE, or BARDE, is an old word, denoting the armour of the horses of the ancient knights and soldiers, who were accoutred at all points. It is said to have been an armour of iron and leather, wherewith the neck, breast, and shoulders of the horse were covered.

BARBE, *St*, a town of Biscay in Mexico, near which are rich silver mines. W. Long. 109. 55. N. Lat. 26. 0.

BARBED, in a general sense, bearded like a fish-hook set with barbs; also shaved or trimmed.

BARBED and Crested, in *Heraldry*, an appellation given to the combs and gills of a cock, when particularized for being of a different tincture from the body.

A *barbed cross*, is a cross the extremities whereof are like the barbed irons used for striking fish.

BARBEL, in *Ichthyology*. See CYPRINUS.

BARBELICOTÆ, an ancient sect of Gnostics, spoken of by Theodoret. Their doctrines were absurd, and their ceremonies too abominable to be repeated.

BARBER, one who makes a trade of shaving or trimming the beards of other men for money. Anciently a lute or viol, or some such musical instrument, was part of the furniture of a barber's shop, which was used then to be frequented by persons above the ordinary level of the people, who resorted to the barber either for the cure of wounds, or to undergo some chirurgical operation, or as it was then called, to be *trimmed*, a word that signified either shaving or cutting and curling the hair; these, together with letting blood, were the ancient occupations of the barber-surgeon. As to the other important branch of surgery, the setting of fractured limbs, that was practised by another class of men called *bone-setters*, of whom there are hardly any now remaining. The musical instruments in his shop were for the entertainment of waiting customers; and answered the end of a newspaper, with which at this day those who wait for their turn at the barber's amuse themselves. For the origin of the barber's *pole*, see the article APPELLATION.

BARBERINI, FRANCIS, one of the most excellent poets of his age, was born at Barberino, in Tuscany, in the year 1264. As his mother was of Florence, he settled in that city; where his profession of the law, but especially the beauty of his poetry, raised him a very considerable character. The greatest part of his works are lost; but that which is entitled the *Precepts of Love*, which is a moral poem calculated to instruct those in their duty who have a regard for glory, virtue, and eternity, has had a better fate. It was published at Rome, adorned with beautiful figures, in 1640, by Frederic Ubaldini: he prefixed the author's life; and as there are in the poem many words which are grown obsolete, he added a glossary to explain them, which illustrates the sense by the authority of cotemporary poets.

BARBERINO, a town of Tuscany in Italy, situated

tuated at the foot of the Apennine mountains, in E. Long. 12. 25. N. Lat. 43. 40.

BARBERRY. See BERBERIS, BOTANY *Index*.

BARBESUL, in *Ancient Geography*, a town and river of Bætica, and a colony in the resort of the Conventus Gaditanus in Spain: now *Morbella* in Granada.

BARBET, in *Natural History*, a name given by M. Reaumur, and other of the French writers, to a peculiar species of the worms which feed on the pucerons or aphides. See APHIS, ENTOMOLOGY *Index*.

BARBETS, the name of the inhabitants of several valleys in Piedmont, particularly those of Lucern, Angrona, Perusa, and St Martin.

BARBEYRAC, JOHN, was born at Besiers in Lower Languedoc in 1674. He was made professor of law and history at Lausanne in 1710; which he enjoyed for seven years, and during that time was three times rector: in 1717, he was professor of public and private law at Groningen. He translated into French the two celebrated works of Puffendorff, his *Law of Nature and Nations*, and his *Duties of a Man and a Citizen;* to both which he wrote excellent notes, and to the former an introductory preface. He translated also Grotius's treatise *De Jure Belli ac Pacis*, with large and excellent notes; and several of Tillotson's sermons. He wrote a work entitled *Traité de Jeu*, 2 vols. 8vo.

BARBEZIEUH, a town of France, in the department of Charente. It had a manufactory of linen cloth; and contained 2740 inhabitants in 1815. W. Long. 0. 5. N. Lat. 45. 23.

BARBICAN, or BARBACAN. See BARBACAN.

BARBIERI, GIOVANNI FRANCESCO, otherwise called *Guercino da Cento*, an eminent historical painter, was born at Cento, a village not far from Bologna, in 1590. At first he was the disciple of Benedetto Gennari; but he afterwards studied for some time in the school of the Caracci, though he did not adopt the manner of that famous academy. He seemed to prefer the style of Caravaggio to that of Guido or Albano, imagining it impossible to imitate nature truly, without the assistance of strong lights and strong shadows; and from that principle, his light was admitted into his painting room from above. In effect, by the opposition of his strong lights and shadows, he gave such force to his pictures, that few, except those of Caravaggio, can stand near them, and not seem feeble in their effect: however, that manner is censured as not being like nature, because it makes objects appear as if they were seen by candle-light, or by the brightness of a sun-beam, which alone can justify the deepness of his shadowing. The principal attention of Guercino seems to have been fixed on arriving at perfection in colouring; he saw the astonishing effects produced by the colouring of the celebrated Venetian masters; and observed, that notwithstanding any imperfections in regard to grace, correctness, or elegance, the works of these masters were the objects of universal admiration. From which observation, he seems to have devoted his whole study to excel in colouring; as if he were convinced, that few are qualified to discern the elevation of thought, which constitutes the excellence of a composition; few may be touched with the grandeur or beauty of the design, or perhaps have a capacity to examine even the correctness of any part of a painting; and yet every eye, and even every imperfect judge of a picture, may be sensibly affected by the force and beauty of the colouring. His taste of design was natural, easy, and often grand, but without any extraordinary share of elevation, correctness, or elegance. The airs of his heads often want dignity, and his local colours want truth. However, there is great union and harmony in his colours, although his carnations are not very fresh; and in all his works there is a powerful and expressive imitation of life, which will for ever render them estimable. Towards the decline of his life, he observed that the clearer and brighter style of Guido and Albano had attracted the admiration of all Europe; and therefore he altered his manner, even against his own judgment. But he apologized for that conduct, by declaring, that in his former time he painted for fame, and to please the judicious; and he now painted to please the ignorant, and enrich himself. He died in 1666.—The most capital performance of Guercino, is the history of S. Petronilla, which is considered as one of the ornaments of St Peter's at Rome.

BARBIERI, *Paolo Antonio*, da Cento, painter of still life and animals, was the brother of Guercino, and born at Cento in 1596. He chose for his subjects fruits, flowers, insects, and animals; which he painted after nature with a lively tint of colour, great tenderness of pencil, and a strong character of truth and life. He died in 1640.

BARBITOS, or BARBITON, an ancient instrument of music, mounted with three, others say seven, strings; much used by Sappho and Alcæus, whence it is also denominated *Lesboum*.

BARBLES, or BARBS, in *Farriery*, the knots or superfluous flesh that grow up in the channels of a horse's mouth; that is, in the intervals that separate the bars, and lie under the tongue. These, which are also called *barbes*, obtain in black cattle as well as horses, and obstruct their eating. For the cure, they cast the beast, take out his tongue, and clip off the barbles with a pair of scissars, or cut them with a sharp knife; others choose to burn them off with a hot iron.

BARBOUR, JOHN, archdeacon of Aberdeen, was esteemed an excellent poet in the reign of David II. He wrote the history of Robert the Bruce, in a heroic poem, which is still extant, and which contains many facts and anecdotes omitted by other historians. The latest edition of this book is that of Glasgow, 8vo, printed in the year 1672. It is entitled, "The acts and life of the most victorious conqueror Robert Bruce king of Scotland; wherein also are contained the martial deeds of the valiant princes Edward Bruce, Sir James Dowglass, Earl Thomas Randel, Walter Steward, and sundry others." In one passage, he calls it a *romance;* but that word was then of good reputation: every body knows that the 'Romant of romants' has been innocently applied to true history, as well as the 'Ballad of ballads' to a sacred song.

BARBUDA, one of the British Caribbee islands, about 20 miles long and 12 broad. It is low land, but fruitful and pretty populous. The inhabitants employ themselves in husbandry, and find always a ready market for their corn and cattle in the sugar islands. Barbuda is the property of the Codrington family, who have

Digitized by Google

have great numbers of negroes here as well as in Barbadoes. It lies in W. Long. 61. 3. N. Lat. 18. 5.

BARCA, a large country of Africa, lying on the coast of the Mediterranean sea, between the kingdoms of Egypt and Tripoli, extending itself in length from east to west from the 39th to the 46th degree of east longitude, and in breadth from north to south about 30 leagues, as is generally supposed. It is for the most part, especially in the middle, a dry sandy desert: on which account the Arabs call it *Sahart* or *Ceyart Barka*, that is, the desert or road of whirlwinds or hurricanes. It labours almost everywhere under a great scarcity of water; and except in the neighbourhood of towns and villages, where the ground produces some small quantities of grain, such as millet and some maize, the rest is in a manner quite barren and uncultivated, or, to speak more properly, uncultivable: and even of that small quantity which those few spots produce, the poor inhabitants are obliged to exchange some part with their indigent neighbours, for dates, sheep, and camels, which they stand in greater need of than they, by reason of their great scarcity of grass and other proper food; for want of which, those that are brought to them seldom thrive or live long. In this country stood the famed temple of Jupiter Ammon; and notwithstanding the pleasantness of the spot where it stood, this part of the country is said to have been the most dangerous of any, being surrounded with such quick and burning sands as are very detrimental to travellers; not only as they sink under their feet, but being light, and heated by the rays of the sun, are easily raised by every breath of wind; which, if it chance to be in their faces, almost burns their eyes out, and stifles them for want of breath; or, if vehement, often overwhelms whole caravans. Against this temple Cambyses king of Persia despatched an army of 50,000 men. They set out from Thebes in Upper Egypt, and under the conduct of proper guides reached the city of Oasis seven days journey from that place: but what was their fate afterwards is uncertain; for they never returned either to Egypt or to their own country. The Ammonians informed Herodotus, that, after the army had entered the sandy desert which lies beyond Oasis a violent wind began to blow from the south at the time of their dinner, and raised the sand to such a degree, that the whole army was overwhelmed and buried alive.

Concerning the government or commerce of this country we know nothing certain. Most probably the maritime towns are under the protection of the Porte: but whether under the bashaw of Egypt or Tripoli, or whether they have formed themselves into independent states like those of Algiers and Tunis, we cannot say; only we are told that the inhabitants of the maritime towns are more civilized than those that dwell in the inland parts. The first profess Mahometanism, and have imbibed some notions of humanity and justice; whilst the latter, who have neither religion nor any sign of worship among them, are altogether savage and brutish. They are a sort of Arabs, and like them live entirely upon theft and plunder. By them this tract, which before was a continued desert, was first inhabited. At their first coming in, they settled themselves in one of the best places of the country; but as they multiplied, and had frequent wars with one another, the strongest drove the weakest out of the best spots, and sent them to wander in the desert parts, where they live in the most miserable manner, their country hardly affording one single necessary of life. Hence it is that they are said to be the ugliest of all the Arabs: their bodies having scarcely any thing but skin and bone, their faces meagre, with fierce ravenous looks; their garb, which is commonly what they take from the passengers who go through those parts, tattered with long wearing; whilst the poorest of them have scarce a rag to cover their nakedness. They are most expert and resolute robbers, that being their chief employment and livelihood; but the travellers in these parts are so few, that the Barcans are often necessitated to make distant excursions into Numidia, Libya, and other southern countries. Those that fall into their hands are made to drink plenty of warm milk: then they hang them up by the feet, and shake them, in order to make them vomit up any money they think they have swallowed; after which, they strip them of all their clothes, even to the last rag: but with all this inhumanity, they commonly spare their life, which is more than the other African robbers do. Yet notwithstanding every artifice they can use, the Barcans are so poor, that they commonly let, pledge, or even sell their children to the Sicilians and others from whom they have their corn, especially before they set out on any long excursion.

BARCALON, an appellation given to the prime minister of the king of Siam. The barcalon has in his department every thing relating to commerce, both at home and abroad. He is likewise superintendant of the king's magazines.

BARCELONA, a handsome, rich, and strong city of Spain, in the province of Catalonia, of which it is the capital. This city was originally founded by Hamilcar Barcas, and from him called *Barcino*. It was reduced by the Romans, and continued subject to them till the kingdom of Spain was overrun by the Goths and Vandals, and afterwards by the Saracens and Moors. In the beginning of the 9th century, Barcelona was in the hands of the Moors, and under the government of one *Zade*. This governor having more than once abused the clemency of Charlemagne, at last irritated Lewis king of Aquitain, and son to Charles, to such a degree, that he gave orders to his generals to invest the city, and not to rise from before it till they had put Zade into his hands. The Moor made a most obstinate resistance, so that the siege lasted many months: at last, finding it impossible to preserve the city much longer, and being destitute of all hopes of relief, he determined, or rather was compelled by the inhabitants, to go to the Christian camp and implore the emperor's mercy; but here he was no sooner arrived than he was arrested and sent prisoner to Charlemagne, who condemned him to perpetual banishment. The people gaining nothing by this expedient, continued to hold out for six weeks longer, when the king of Aquitain himself took the command of the siege. To him they made a proposal, that if he would allow them to march out and go where they pleased, they would surrender the place. Lewis having agreed to this, made his public entry into Barcelona, where he formed a design of extending his father's dominions as far as the Ebro; but being recalled before he could put his design in execution, he

Digitized by Google

he appointed one Bera count of Barcelona. The city continued subject to him and his successors, who still enjoyed the title of *counts of Barcelona*, from the year 802 to 1131; during which time we find nothing remarkable, except that the city was once taken by the Moors, but soon after retaken by the assistance of Lewis IV. king of France. In 1131 it was united to the crown of Arragon by the marriage of Don Raymond V. count of Barcelona with the daughter of Don Ramiro the monk, king of Arragon. In 1465 the Catalonians revolted against Don Juan II. king of Arragon, out of hatred to his queen Donna Juanna; the consequence of which was, that Barcelona was besieged by that monarch in 1471. Various efforts were made by Lewis XI. of France and the duke of Lorrain in order to raise the siege, but without effect. Things at length were brought to the utmost extremity, when the king offered to pardon them all, without the smallest punishment either in person or property, provided they would submit: but these terms they rejected, chiefly through the influence of the count de Pailhars, who had been pardoned the year before. The army, on the other hand, was very earnest on being led on to the assault, in hopes of plunder. The king, however, wrote a letter to the citizens, dated the 6th of October, in terms as affectionate as if he had been writing to his children, bewailing the miseries they had brought on themselves, and concluding with a protestation that they, and not he, must be answerable for the consequences. Upon this, at the persuasion of a priest who had a reputation for sanctity, they sent deputies to the king, and made a capitulation on the 17th of the same month. In this the king acknowledged they had taken up arms on just motives; and forgave every body except Pailhars, who was, however, suffered to escape. On the 22d of October the king made his entry into the city, and confirmed all their ancient privileges. In 1697, Barcelona was taken by the French, after a bloody siege of 52 days; and the loss of this city had a considerable effect in disposing the Spaniards to agree to the treaty of Ryswick. In Queen Anne's time it was taken by the allies under the earl of Peterborough. In 1808 it was surprised by a body of French troops under General Duhesme, and continued in their possession till 1814. It contains 10,200 houses, and 111,500 inhabitants, including the contiguous town of Barcelonetta.

Barcelona is situated by the sea-side, of a form between a square and an oval. It is surrounded with a good brick wall, round which is another, with 14 bastions, horn-works, ramparts, and ditches; the ramparts are high, broad, and spacious, insomuch that 100 coaches may be seen every evening driving thereon for pleasure. The city is divided into two parts, the Old and the New, which are separated from each other by a wall and a large ditch; the streets are handsome, well paved with large stones, wide, and very clean. It is the residence of a viceroy, is a bishop's see, has a fine university, a mint, a good port, and is adorned with handsome buildings. Here is a court of inquisition, which the inhabitants look upon as an advantage. The remarkable buildings are the cathedral, which is large, handsome, and adorned with two high towers, the church of the Virgin Mary, the palace of the bishop, that of the inquisition, and several religious houses: add to these the palace of the viceroy; the arsenal,

which contains arms for 1000 men; the exchange, where the merchants meet; the tersana, where they build the galleys; and the palace where the nobility of the country meet, called *La Casa de la Deputation.* This last is built with fine large freestone, and adorned with columns of marble: there is in it a large hall, with a gilt ceiling and a handsome portico, wherein persons may either walk or sit; the hall is adorned with the portraits of all the counts of Barcelona. There are several fine squares, particularly that of St Michael, into which all the great streets run. The port is wide, spacious, deep, and safe; defended on the one side by a great mole, and on the other sheltered from the west wind by two mountains that advance into the sea, and form a kind of promontory: the mole is 750 paces long, with a quay, at the end of which is a light-house and a small fort. One of the mountains, called *Mount Joy*, is very high, and rises in the middle of the plain near the city: it is covered with gardens, vineyards, groves of trees, and has a strong fort for the defence of the city. This mountain, being a rock, yields an inexhaustible quarry of fine hard freestone. Barcelona is a place of great trade, on account of the conveniency of its harbour. Since the trade with Mexico has been thrown open, the commerce of this port has increased surprisingly. Before the late revolution its trade inward and outward was computed at 1,750,000l. Sterling. The number of vessels that entered the harbour in 1803, was 1333. The women are well shaped, and as handsome as any in Spain; they are brisk and lively in their conversation, and more free and unrestrained in their behaviour than in other parts of Spain. E. Long. 2. 5. N. Lat 41. 26.

BARCELONETTE, a town of France, in the department of the Lower Alps, formerly in the government of Dauphiny, and capital of the valley of its own name. It belonged to the duke of Savoy, and was ceded to France by the treaty of Utrecht in 1712. E. Long. 6. 40. N. Lat. 44. 26.

BARCELOR, a town of Asia, in the East Indies, on the coast of Malabar. It is supposed to be the ancient Barace, and has a considerable trade in pepper. E. Long. 74. 15. N. Lat. 13. 45.

BARCELOS, a town of Portugal, with the title of a duchy. It is seated on the river Cavado, over which there is a handsome bridge. W. Long. 7. 0. N. Lat. 41. 20.

BARCINO, in *Ancient Geography*, a town of the Tarraconensis in Spain, and capital of the Laletani. Now BARCELONA. See that article.

BARCLAY, ALEXANDER, a learned monk in the reign of Henry VIII. Where he was born, though of no great importance, was nevertheless a matter of virulent contention among his former biographers. Bale, who was his cotemporary, is of opinion he was born in Somersetshire. There is indeed a village of his name, and a numerous family, in that county. Pits thinks he was born in Devonshire. Mackenzie is positive he was a Scotchman; but without proof, unless we admit as such his name *Alexander*. He was, however, educated in Oriel-college, Oxford. After leaving the university he went abroad, and continued some time in France, Italy, and Germany, where he acquired a competent knowledge of the languages of those countries, as appears from several translations of books, which

Digitized by Google

Barclay.

which he afterwards published. On his return to England, he was made chaplain to his patron the bishop of Tyne, who likewise appointed him a priest of St Mary, at the college of Ottery in Devonshire, founded by Grandison bishop of Exeter. After the death of his patron, he became a Benedictine monk of Ely. On the dissolution of that monastery, he first obtained the vicarage of St Matthew at Wokey in Somersetshire; and, in 1549, being then doctor of divinity, was presented to the vicarage of Much Badew in Essex. In 1552, he was appointed rector of Allhallows, Lombard-street, which he lived to enjoy but a very short time. He died at Croydon in Surry in June 1552. He is generally allowed to have improved the English language, and to have been one of the politest writers of his time. He composed several original works; but was chiefly remarkable for his translations from the Latin, Italian, French, and German languages. His version from Sallust of the war of Jugurtha is accurate, and not without elegance. His lives of several saints, in heroic verse, are still unpublished. His *Stultifera navis*, or *The ship of fools*, is the most singular of his performances. It was printed by Richard Pynson at London, 1509, in folio; and contains a variety of wooden plates, which are worthy the inspection of the curious.

Barclay, *William*, a learned civilian, was born in Aberdeenshire in the year 1541. He spent the early part of his life, and much of his fortune, at the court of Mary queen of Scots, from whose favour he had reason to expect preferment. In 1573 he went over to France, and at Bourges commenced student of civil law under the famous Cujacius. He continued some years in that seminary, where he took a doctor's degree; and was soon after appointed professor of civil law in the university of Pont à Mousson, then first founded by the duke of Lorrain. That prince afterwards made him counsellor of state and master of requests. Barclay, in the year 1581, married Ann de Mallaville, a French lady, by whom he had a son, who became a celebrated author, and of whom the reader will find an account in the next article. This youth the Jesuits would gladly have received into their society. His father refused his consent, and for that reason these disciples of Jesus soon contrived to ruin him with the duke his patron. Barclay now embarked for Britain, where King James I. offered him a considerable preferment, provided he would become a member of the church of England: but not choosing to comply, he returned to France in 1604; and, soon after his arrival, was appointed professor of civil law in the university of Angers, where he died the year following, and was buried in the Franciscan church. He was esteemed a learned civilian; and wrote elaborately in defence of the divine right of kings, in answer to Buchanan and others. The titles of his works are, 1. *De regno et regali potestate*, &c. 2. *Commentarius in tit. pandectarum de rebus creditis, et de jurejurando*. 3. *De potestate papæ*, &c. 4. *Primitiæ in vitam Agricolæ*.

Barclay, *John*, son of the former, was, as we have above mentioned, so great a favourite of the Jesuits, that they used all their efforts to engage him in their society. His father would not consent, and carried his son with him into England, who was already an author, for he had published "A Commentary upon the Thebais of Statius," and a Latin poem on the coronation of King James, and the first part of *Euphormio*, 1603. He returned to France with his father; and after his father's death went to Paris, and soon after came back to London: he was there in 1606. He published "The History of the Gunpowder Plot," a pamphlet of six leaves, printed at Amsterdam. He published at London in 1610 "An Apology for the Euphormio," and his father's treatise *De potestate papæ*. And at Paris, 1612, he published a book entitled *Pietas*, in answer to Cardinal Bellarmin, who had written against William Barclay's book concerning the power of the Pope. Two years after he published *Icon Animorum*. He was invited to Rome by Pope Paul V. and received a great deal of civility from Cardinal Bellarmin, though he had written against him. He died at Rome in 1621, while his *Argenis* was printing at Paris. This celebrated work has since gone through a great number of editions, and has been translated into most languages. M. de Peiresc, who had the care of the first edition, caused the effigies of the author to be placed before the book; and the following distich, written by Grotius, was put under it:

Gente Caledonius, Gallus natalibus, hic est,
Romam Romano qui docet ore loqui.

Barclay, *Robert*, one of the most eminent among the Quakers, the son of Colonel David Barclay, descended of the ancient family of Barclays, was born at Edinburgh in 1648. He was educated under an uncle at Paris, where the Papists used all their efforts to draw him over to their religion. He joined the Quakers in 1669, and distinguished himself by his zeal and abilities in defence of their doctrines. In 1676 he published in Latin at Amsterdam his "Apology for the Quakers;" which is the most celebrated of his works, and esteemed the standard of the doctrine of the Quakers. The *Theses Theologicæ*, which were the foundation of this work, and addressed to the clergy of what sort soever, were published before the writing of the *Apology*, and printed in Latin, French, High-Dutch, Low Dutch, and English. The dedication of his *Apology* to King Charles II. is very remarkable for the uncommon frankness and simplicity with which it is written. Amongst many other extraordinary passages, we meet with the following: "There is no king in the world who can so experimentally testify of God's providence and goodness; neither is there any who rules so many free people, so many true Christians; which thing renders thy government more honourable, thyself more considerable, than the accession of many nations filled with slavish and superstitious souls. Thou hast tasted of prosperity and adversity; thou knowest what it is to be banished thy native country, to be over-ruled as well as to rule and sit upon the throne; and being oppressed, thou hast reason to know how hateful the oppressor is both to God and man: if, after all those warnings and advertisements, thou dost not turn unto the Lord with all thy heart, but forget him who remembered thee in thy distress, and give thyself up to follow lust and vanity, surely great will be thy condemnation."—He travelled with the famous Mr William Penn through the greatest part of England,

 Holland,

Barclay || Bard.

Holland, and Germany, and was everywhere received with the highest respect; for though both his conversation and behaviour were suitable to his principles, yet there was such liveliness and spirit in his discourse, and such serenity and cheerfulness in his deportment, as rendered him extremely agreeable to all sorts of people. When he returned to his native country, he spent the remainder of his life in a quiet and retired manner. He died at his own house at Ury on the 3d of Oct. 1690, in the 42d year of his age.

BARCOCHEBAS, or rather BARCOCHAB, a Jewish impostor, whose real name was *Akiba;* but he took that of *Barcochab*, which signifies the *Son of a Star;* in allusion to the prophecy of Balaam, "There shall a star arise out of Jacob." He proclaimed himself the Messiah; and talking of nothing but wars, victories, and triumphs, made his countrymen rise against the Romans, by which means he was the author of innumerable disorders; he ravaged many places, took a great number of fortresses, and massacred an infinite multitude of people, particularly the Christians. The emperor sent troops to Rufus, governor of Judea, to suppress the sedition. Rufus in obedience exercised a thousand cruelties, but could not finish his attempt. The emperor was therefore obliged to send Julius Severus, the greatest general of that time; who attained his end without a direct battle: he fell on them separately; cut off their provisions; and at last the whole contest was reduced to the siege of Bitter, in the 18th year of Hadrian. The impostor perished there. This war cost the Romans a great deal of blood.

BARD, a word denoting one who was a poet by his genius and profession; and "who sung of the battles of heroes, or the heaving breasts of love." *Ossian's Poems*, I. 37.

Kaimes's Sketches, Sk. v. sect. ii.

The curiosity of man is great with respect to the transactions of his own species; and when such transactions are described in verse, accompanied with music, the performance is enchanting. An ear, a voice, skill in instrumental music, and, above all, a poetical genius, are requisite to excel in that complicated art. As such talents are rare, the few that possessed them were highly esteemed; and hence the profession of a bard, which, besides natural talents, required more culture and exercise than any other known art. Bards were capital persons at every festival and at every solemnity. Their songs, which, by recording the achievements of kings and heroes, animated every hearer, must have been the entertainment of every warlike nation. We have Hesiod's authority, that in his time bards were as common as potters or joiners, and as liable to envy. Demodocus is mentioned by Homer as a celebrated bard; and Phemius, another bard, is introduced by him deprecating the wrath of Ulysses in the following words:

"O King! to mercy be thy soul inclin'd,
"And spare the poet's ever-gentle kind:
"A deed like this thy future fame would wrong,
"For dear to gods and men is sacred song.
"Self-taught I sing; by heav'n, and heav'n alone,
"The genuine seeds of poesy are sown;
"And (what the gods bestow) the lofty lay,
"To gods alone, and godlike worth, we pay.
"Save then the poet, and thyself reward;
"'Tis thine to merit, mine is to record."

Odyssey, viii.

Bard.

Cicero reports, that at Roman festivals, anciently, the virtues and exploits of their great men were sung. The same custom prevailed in Peru and Mexico, as we learn from Garcilasso and other authors. We have for our authority Father Gobien, that even the inhabitants of the Marian islands have bards, who are greatly admired, because in their songs are celebrated the feats of their ancestors.

But in no part of the world did the profession of bard appear with such lustre as in Gaul, in Britain, and in Ireland. Wherever the Celtæ or Gauls are mentioned by ancient writers, we seldom fail to hear of their druids and their bards; the institution of which two orders, was the capital distinction of their manners and policy. The druids were their philosophers and priests; the bards, their poets and recorders of heroic actions: and both these orders of men seem to have subsisted among them, as chief members of the state, from time immemorial. The Celtæ possessed, from very remote ages, a formed system of discipline and manners, which appears to have had a deep and lasting influence. Ammianus Marcellinus * gives them this express testimony, that there flourished among them the study of the most laudable arts; introduced by the bards, whose office it was to sing in heroic verse the gallant actions of illustrious men; and by the druids, who lived together in colleges or societies, after the Pythagorean manner, and philosophizing upon the highest subjects, asserted the immortality of the human soul. Though Julius Cæsar, in his account of Gaul, does not expressly mention the bards; yet it is plain, that, under the title of *Druids*, he comprehends that whole college or order; of which the bards, who, it is probable, were the disciples of the druids, undoubtedly made a part. It deserves remark, that, according to his account, the druidical institution first took rise in Britain, and passed from thence into Gaul; so that they who aspired to be thorough masters of that learning were wont to resort to Britain. He adds too, that such as were to be initiated among the druids, were obliged to commit to their memory a great number of verses, insomuch that some employed 20 years in this course of education; and that they did not think it lawful to record these poems in writing, but sacredly handed them down by tradition from race to race.

Blair's Dissertation, subjoined to Ossian's Poems, vol. ii. p. 306.

* Lib. xv. c. 9.

De Bel. Gal. lib. vi.

So strong was the attachment of the Celtic nations to their poetry and their bards, that amidst all the changes of their government and manners, even long after the order of the druids was extinct, and the national religion altered, the bards continued to flourish; not as a set of strolling songsters, like the Greek Ἀοιδοὶ or *rhapsodists*, in Homer's time, but as an order of men highly respected in the state, and supported by a public establishment. We find them, according to the testimonies of Strabo and Diodorus, before the age of Augustus Cæsar; and we find them remaining under the same name, and exercising the same functions as of old, in Ireland, and in the north of Scotland, almost down to our own times. It is well known, that, in both

Bard.

both these countries, every *regulus* or chief had his own bard, who was considered as an officer of rank in his court.

Of the honour in which the bards were held, many instances occur in Ossian's poems. On all important occasions, they were the ambassadors between contending chiefs; and their persons were held sacred. "Cairbor feared to stretch his sword to the bards, though his soul was dark. Loose the bards (said his brother Cathmor), they are the sons of other times. Their voice shall be heard in other ages, when the kings of Temora have failed."—The bards, as well as the druids, were exempted from taxes and military services, even in times of the greatest danger; and when they attended their patrons in the field, to record and celebrate their great actions, they had a guard assigned them for their protection. At all festivals and public assemblies they were seated near the person of the king or chieftain, and sometimes even above the greatest nobility and chief officers of the court. Nor was the profession of the bards less lucrative than it was honourable. For, besides the valuable presents which they occasionally received from their patrons when they gave them uncommon pleasure by their performances, they had estates in land allotted for their support. Nay, so great was the veneration which the princes of these times entertained for the persons of their poets, and so highly were they charmed and delighted with their tuneful strains, that they sometimes pardoned even their capital crimes for a song.

Ossian, ii. 22.

Henry's History, vol. i. p. 365.

We may very reasonably suppose, that a profession that was at once so honourable and advantageous, and enjoyed so many flattering distinctions and desirable immunities, would not be deserted. It was indeed very much crowded; and the accounts which we have of the numbers of the bards in some countries, particularly in Ireland, are hardly credible. We often read, in the poems of Ossian, of a hundred bards belonging to one prince, singing and playing in concert for his entertainment. Every chief bard, who was called *Allah Redan*, or *doctor in poetry*, was allowed to have 30 bards of inferior note constantly about his person; and every bard of the second rank was allowed a retinue of 15 poetical disciples.

Though the ancient Britons of the southern parts of this island had originally the same taste and genius for poetry with those of the north, yet none of their poetical compositions of this period have been preserved. Nor have we any reason to be surprised at this. For after the provincial Britons had submitted quietly to the Roman government, yielded up their arms, and had lost their free and martial spirit, they could take little pleasure in hearing or repeating the songs of their bards in honour of the glorious achievements of their brave ancestors. The Romans, too, if they did not practise the same barbarous policy which was long after practised by Edward I. of putting the bards to death, would at least discourage them, and discountenance the repetition of their poems, for very obvious reasons. The sons of the song being thus persecuted by their conquerors, and neglected by their countrymen, either abandoned their country or their profession; and their songs being no longer heard, were soon forgotten.

It is probable that the ancient Britons, as well as many other nations of antiquity, had no idea of poems that were made only to be repeated, and not to be sung to the sound of musical instruments. In the first stages of society in all countries, the two sister arts of poetry and music seem to have been always united; every poet was a musician, and sung his own verses to the sound of some musical instrument. This, we are directly told by two writers of undoubted credit, was the case in Gaul, and consequently in Britain, in this period. "The bards (says Diodorus Siculus *) sung their poems to the sound of an instrument not unlike a lyre." "The bards (according to Ammianus Marcellinus †, as above hinted) celebrated the brave actions of illustrious men, in heroic poems, which they sung to the sweet sounds of the lyre." This account of these Greek and Latin writers is confirmed by the general strain, and by many particular passages, of the poems of Ossian. "Beneath his own tree, at intervals, each bard sat down with his harp. They raised the song, and touched the string, each to the chief he loved ‡."

Bard || Bardas.

* Lib. v. sect. 31.

† Lib. xv. c. 9.

‡ Vol. ii. p. 112, 113.

The invention of writing made a considerable change in the bard profession. It is now an agreed point, that no poetry is fit to be accompanied with music, but what is simple: a complicated thought or description requires the utmost attention, and leaves none for the music; or, if it divide the attention, it makes but a faint impression §. The simple operas of Quinault bear away the palm from every thing of the kind composed by Boileau or Racine. But when a language, in its progress to maturity, is enriched with variety of phrases fit to express the most elevated thoughts, men of genius aspired to the higher strains of poetry, leaving music and song to the bards: which distinguished the profession of a poet from that of a bard. Homer, in a lax sense, may be termed a bard; for in that character he strolled from feast to feast. But he was not a bard in the original sense: he, indeed, recited his poems to crowded audiences; but his poems are too complex for music, and he probably did not sing them, nor accompany them with the lyre. The Trovadores of Provence were bards in the original sense, and made a capital figure in the days of ignorance, when few could read, and fewer write. In later times, the songs of the bards were taken down in writing, which gave every one access to them without a bard; and the profession sunk by degrees into oblivion. Among the Highlanders of Scotland, reading and writing in their own tongue is not common even at present; and that circumstance supported long the bard profession among them, after being forgot among the neighbouring nations.

Kaimes's Sketches, ubi supra.

§ See the article *Attention*.

BARDANA, or BURDOCK. See ARCTIUM, BOTANY *Index*.

BARDARIOTÆ, in antiquity, were a kind of ancient guard attending the Greek emperors, armed with rods, wherewith they kept off the people from crowding too near the prince when on horseback. Their captain, or commander, was denominated *primivergius*.—The word was probably formed from the *bardæ*, or housings on their horses.

BARDAS, the brother of the empress Theodora, and uncle of the famous Photius, is said to have had no other good quality besides that of loving the sciences and polite literature, which he established in the Eastern

Eastern empire; for he was treacherous, cruel, and ambitious. In the year 856, he assassinated Theoctistes, general of the emperor Michael's forces, and obtained his post. At length he caused the disgrace of the empress Theodora; and St Ignatius, patriarch of Constantinople, reproaching him for his vices, he had him deposed in 858, in order to make room for Photius. Bardas was assassinated by Basilius the Macedonian, in 866.

BARDED, in *Heraldry*, is used in speaking of a horse that is caparisoned. He bears sable, a *cavalier d'or*, the horse *barded*, argent.

BARDESANISTS, a sect of ancient heretics, thus denominated from their leader, Bardesanes, a Syrian of Edessa in Mesopotamia. Bardesanes, born in the middle of the second century, became eminent, after his conversion to Christianity, for his zeal against heretics; against whom, we are informed by St Jerome and Eusebius, he wrote a multitude of books: yet had he the misfortune to fall, himself, into the errors of Valentinus, to which he added some others of his own. He taught, that the actions of men depend altogether on fate, and that God himself is subject to necessity. His followers went further, and denied the resurrection of the body, and the incarnation and death of our Saviour; holding that these were only apparent or fantastical.

BARDEWICK, a town of Germany, in the circle of Lower Saxony and duchy of Lunenburg; formerly a very large place; but being ruined in 1189, by the duke of Saxony, has never yet recovered itself. It is seated on the river Ilmenau, in E. Long. 10. 6. N. Lat. 53. 40.

BARDT, a strong and rich town of Germany, in the duchy of Pomerania, with a castle and spacious harbour. It is subject to the Swedes; and is situated near the Baltic sea, in E. Long. 13. 20. N. Lat. 54. 23.

BARE, in a general sense, signifies *not covered*. Hence we say bare-headed, bare-footed, &c.

The Roman women, in times of public distress and mourning, went *bare-headed*, with their hair loose.—Among both Greeks, Romans, and Barbarians, we find a feast called *Nudipedalia*.—The Abyssinians never enter their churches, nor the palaces of kings and great men, but *bare-footed*.

Bare-Foot Carmelites and Augustines, are religious of the order of St Carmel and St Austin, who live under a strict observance, and go without shoes, like the Capuchins. There are also bare-foot fathers of mercy. Formerly there were bare-foot Dominicans, and even bare-foot nuns of the order of St Augustine.

BAREITH, a town of Germany in Franconia, now subject to Bavaria, and containing 10,000 inhabitants. It was formerly the chief town of a margravate of the same name. E. Long. 11. 50. N. Lat. 50. 0.

BARENT, Diteric, an excellent painter, was born at Amsterdam, and was the son of a very industrious painter. He studied in Italy, and became the favourite disciple of Titian, with whom he lived a long time; but at length returned to Amsterdam, where he painted many extraordinary pieces. He died in 1582, aged 48.

BARFLEUR, a town of France, in Normandy, now the department of the Channel. It was ruined, and had its harbour filled up by the English in 1346. The cape of that name is 12 miles east of Cherburg, and near it part of the French fleet was destroyed in 1692. W. Long. 1. 6. N. Lat. 49. 40.

BARGAIN and Sale, a species of conveyance in the English law. It is a kind of a real contract, whereby the bargainer for some pecuniary consideration bargains and sells, that is, contracts to convey, the land of the bargainee; and becomes by such bargain a trustee for, or seized to the use of, the bargainee; and then the statute of uses completes the purchase: or, as it hath been well expressed, the bargain first vests the use, and then the statute vests the possession. But as it was foreseen that conveyances, thus made, would want all those benefits of notoriety which the old common-law assurances were calculated to give; to prevent therefore clandestine conveyances of freeholds, it was enacted in the same session of parliament, by statute 27 Hen. VIII. c. 16. that such bargains and sales should not endure to pass a freehold, unless the same be made by indenture, and enrolled within six months in one of the courts of Westminster-hall, or with the *custos rotulorum* of the county. Clandestine bargains and sales of chattel interests, or leases for years, were thought not worth regarding, as such interests were very precarious till about six years before; which also occasioned them to be overlooked in framing the statute of uses: and therefore such bargains and sales are not directed to be enrolled. But how impossible it is to foresee, and provide against, all the consequences of innovations! This omission has given rise to the species of conveyance by lease and release.

BARGE (*Bargie*, Dutch), a vessel or boat of state, furnished with elegant apartments, canopies, and cushions; equipped with a band of rowers, and decorated with flags and streamers: they are generally used for processions on the water, by noblemen, officers of state, or magistrates of great cities. Of this sort, too, we may naturally suppose the famous barge or galley of Cleopatra, which, according to Shakespeare,

——— Like a burnish'd throne,
Burnt on the water: the poop was beaten gold:
Purple her sails; and so perfum'd, that
The winds were love-sick with them: the oars were silver,
Which to the tune of flutes kept time, and made
The water which they beat to follow faster,
As amorous of their strokes.——
———— At the helm
A seeming mermaid steer'd: the silken tackles
Swell'd with the touches of those flower-soft hands
That yarely 'form'd their office.——

There are likewise other barges of a smaller kind, for the use of admirals and captains of ships of war. These are of a lighter frame, and may be easily hoisted into and out of the ships to which they occasionally belong.

Barge is also the name of a flat-bottomed vessel of burden, for lading and discharging ships, and removing their cargoes from place to place in a harbour.

Barge Couples, in *Architecture*, a beam mortised into another, to strengthen the building.

Barge-Course, with bricklayers, a term used for that

Digitized by Google

that part of the tiling which projects over without the principal rafters, in all sorts of buildings where there is either a gable or a kirkin-head.

BARGHMASTER, Barmer, or Bar-Master, in the royal mines, the steward or judge of the barmote.—The bar-master is to keep two great courts of barmote yearly; and every week a small one, as occasion requires.

BARGHMOTE, or Barmote, a court which takes cognizance of causes and disputes between miners.—By the custom of the mines, no person is to sue any miner for ore-debt, or for ore, or for any ground in variance, but only in the court of barmote, on penalty of forfeiting the debt, and paying the charges at law.

BARI, a very handsome and rich town of Italy, in the kingdom of Naples; the capital of Terra di Bari, and an archbishop's see. It is well fortified, is seated on the gulf of Venice, and had formerly a good harbour, but it was destroyed by the Venetians. E. Long. 17. 40. N. Lat. 41. 31.

Bari, or *Terra di Bari*, a territory of Italy, in the kingdom of Naples, of which the above-mentioned city is the capital. It is bounded on the north by the Capitanata, on the north-west by the Ulterior Principato, on the south by the Basilicata, on the south-east by the Terra de Otranto, and on the north-east by the gulf of Venice. It has no considerable river except the Offanto, which separates it from the Capitanata. The air is temperate; and the soil produces plenty of corn, fruit, and saffron: but there are a great many serpents, and spiders called *tarantulas*. See Aranea. The principal towns are Bari the capital, Frani, Andria, Bavo, Bilonto, Conversano, Monopoli, Polignano, Barletto, and Malsetto. The two first are archiepiscopal, and all the rest episcopal.

BARILLA, or Barilha, the name of a plant cultivated in Spain for its ashes, from which the purest kinds of mineral alkali or soda are obtained.

There are four plants, which, in the early part of their growth, bear so strong a resemblance to each other as would deceive any but the farmers and nice observers. These four are, *barilla*, *gazul* (or, as some call it, *algazul*), *soza*, and *salicornia* or *salicor*. They are all burnt to ashes; but applied to different uses, as being possessed of different qualities. Some of the roguish farmers mix more or less of the three last with the first; and it requires a complete knowledge of the colour, taste, and smell of the ashes to be able to detect their knavery.

Barilla is sown afresh every year. Its greatest height above ground is four inches: each root pushes out a vast number of little stalks, which again are subdivided into smaller sprigs resembling samphire; and all together form a large spreading tufted bush. The colour is bright green; as the plant advances towards maturity, this colour vanishes away till it comes at last to be a dull green tinged with brown.

Gazul bears the greatest affinity to barilla, both in quality and appearance: the principal difference consists in its growing on a still drier salter earth, consequently it is impregnated with a stronger salt. It does not rise above two inches out of the ground, spreading out into little tufts. Its sprigs are much flatter and more pulpy than those of barilla, and are still more like samphire. It is sown but once in three, four, or five years, according to the nature of the soil.

Soza, when of the same size, has the same appearance as gazul; but in time grows much larger, as its natural soil is a strong salt marsh, where it is to be found in large tufts of sprigs, treble the size of barilla, and of a bright green colour, which it retains to the last.

Salicor has a stalk of a deep green colour inclining to red, which last becomes by degrees the colour of the whole plant. From the beginning it grows upright, and much resembles a bush of young rosemary. Its natural soil is on the declivities of hills near the salt marshes, or on the edges of the small drains or channels cut by the husbandmen for the purpose of watering the fields; before it has acquired its full growth, it is very like the barilla of those seasons in which the ground has been dunged before sowing. In those years of manuring, barilla, contrary to its usual nature, comes up with a tinge of red; and when burnt falls far short of its wonted goodness, being bitter, more impregnated with salts than it should be, and raising a blister if applied for a few minutes to the tongue. Barilla contains less salt than the others: when burnt, it runs into a mass resembling a spongy stone, with a faint cast of blue.

Gazul, after burning, comes as near barilla in its outward appearance as it does while growing in its vegetable form; but if broken, the inside is of a deeper and more glossy blue. Soza and salicor are darker, and almost black within, of a heavier consistence, with very little or no sign of sponginess.

All these ashes contain a strong alkali; but barilla the best and purest, though not in the greatest quantity. Upon this principle, it is fittest for making glass and bleaching linen; the others are used in making soap. Each of them would whiten linen; but all, except barilla, would burn it. A good crop of barilla impoverishes the land to such a degree, that it cannot bear good barilla a second time, being quite exhausted. For this reason the rich farmers lay manure upon the ground, and let it lie fallow for a season; at the end of which it is sown afresh without any danger, as the weeds that have sprung up in the year of rest have carried off all the pernicious effects of the dung. A proper succession of crops is thus secured by manuring and fallowing the different parts of the farm, each in their turn. The poorer tribe of cultivators cannot pursue the same method for want of capital; and are therefore under the necessity of sowing their lands immediately after manuring, which yields them a profit just sufficient to afford a present scanty subsistence, though the quality and price of their barilla be but trifling.

The method used in making barilla is the same as that followed in Britain in burning kelp. The plant as soon as ripe is plucked up and laid in heaps, then set on fire. The salt juices run out below into a hole made in the ground, where they run into a vitrified lump, which is left about a fortnight to cool. An acre may give about a tun.

BARING of trees, in *Agriculture*, the taking away some of the earth about the roots, that the winter-rain and snow-water may penetrate farther into

into the roots. This is frequently practised in the autumn.

BARJOLS, a town of Provence, now the department of Var, in France, containing 3025 inhabitants in 1815. E. Long. 5. 23. N. Lat. 43. 35.

BARIUM, in *Ancient Geography*, a town of Apulia, on the Adriatic; so called from the founders, who being expelled from the island Bara, built this town. It is now called BARI; see that article.

BARK, in the anatomy of plants, the exterior part of trees, corresponding to the skin of an animal. For its organization, texture, &c. see the article PLANTS.

As animals are furnished with a panniculus adiposus, usually replete with fat, which invests and covers all the fleshy parts, and screens them from external cold; plants are encompassed with a bark replete with fatty juices, by means whereof the cold is kept out, and in winter-time the spiculæ of ice prevented from fixing and freezing the juices in the vessels: whence it is, that some sort of trees remain evergreen the year round, by reason their barks contain more oil than can be spent and exhaled by the sun, &c.

The bark has its peculiar diseases, and is infested with insects peculiar to it.—It appears from the experiments of M. Buffon, that trees stripped of their bark the whole length of their stems, die in about three or four years. But it is very remarkable, that trees thus stripped in the time of the sap, and suffered to die, afford timber heavier, more uniformly dense, stronger, and fitter for service, than if the trees had been cut down in their healthy state. Something of a like nature has been observed by Vitruvius and Evelyn.

The ancients wrote their books on bark, especially of the ash and lime tree, not on the exterior, but on the inner and finer bark called *philyra*.

There are a great many kinds of barks in use in the several arts. Some in agriculture, and in tanning leather, as the oak-bark; some in physic, as the *quinquina* or Jesuit's bark, mace, &c.; others in dyeing, as the bark of alder, and walnut-trees; others in spicery, as cinnamon, cassia lignea, &c.; and others for divers uses, as the bark of the cork tree, &c.

In the East Indies, they prepare the bark of a certain tree so as to spin like hemp. After it has been beat and steeped in water, they extract long threads from it, which are something between silk and common thread; being neither so soft nor so glossy as silk, nor so rough and hard as hemp. They mix silk with it in some stuffs; and these are called *nillaes*, and *cherquemolles*.

Of the bark of a species of mulberry-tree the Japanese make their paper. See MORUS.

In the island of Otaheite, the natives make their cloth, which is of three kinds, of the bark of three different trees; the paper-mulberry above mentioned, the bread-fruit tree, and the cocoa tree. That made of the mulberry is the finest and whitest, and worn chiefly by the principal people. It is manufactured in the following manner. When the trees are of a proper size, they are drawn up, and stripped of their branches; after which, the roots and tops are cut off: the bark of these rods being then slit up longitudinally, is easily drawn off; and, when a proper quantity has been procured, it is carried down to some running water, in which it is deposited to soak, and secured from floating away by heavy stones: when it is supposed to be sufficiently softened, the women servants go down to the brook, and stripping themselves, sit down in the water, to separate the inner bark from the green part on the outside: to do this, they place the under side upon a flat smooth board, and with a kind of shell scrape it very carefully, dipping it continually in the water till nothing remains but the fine fibres of the inner coat. Being thus prepared in the afternoon, they are spread out upon plantain leaves in the evening; they are placed in lengths of about 11 or 12 yards, one by the side of another, till they are about a foot broad, and two or three layers are also laid one upon the other: care is taken that the cloth shall be in all parts of an equal thickness, so that if the bark happens to be thinner in any one particular part of one layer than the rest, a piece that is somewhat thicker is picked out to be laid over in the next. In this state it remains till the morning, when great part of the water which it contained when it was laid out is either drained off or evaporated, and the several fibres adhere together, so as that the whole may be raised from the ground in one piece. It is then taken away, and laid upon the smooth side of a long piece of wood prepared for the purpose, and beaten by the women servants. The instrument used for this purpose is a square wooden club, having each of its four sides or faces marked, lengthwise, with small grooves, or furrows, of different degrees of fineness; those on one side being of a width and depth sufficient to receive a small pack-thread, and the others finer in a regular gradation, so that the last are not more than equal to sewing silk. They beat it first with the coarsest side of this mallet, keeping time like our smiths; it spreads very fast under the strokes, chiefly however in the breadth, and the grooves in the mallet mark it with the appearance of threads; it is successively beaten with the other sides, last with the finest, and is then fit for use. Of this cloth there are several sorts, of different degrees of fineness, in proportion as it is more or less beaten. The other cloth also differs in proportion as it is beaten; but they differ from each other in consequence of the different materials of which they are made. The bark of the bread-fruit is not taken till the trees are considerably longer and thicker than those of the mulberry; the process afterwards is the same.—Of the bark, too, of a tree which they call *poerou**, they manufacture excellent matting; both a coarse sort which serves them to sleep upon, and a finer to wear in wet weather. Of the same bark they also make ropes and lines, from the thickness of an inch to the size of a small pack-thread.

* *Hibiscus tiliaceus* of Linnæus.

BARK, or *Jesuit's Bark*, is a name given by way of eminence to the quinquina, or cinchona. See CINCHONA.

BARK, in *Navigation*, a general name given to small ships; it is, however, peculiarly appropriated by seamen to those which carry three masts without a mizen topsail. Our northern mariners, who are trained in the coal-trade, apply this distinction to a broad-sterned ship which carries no ornamental figure on the stern or prow.

Water-BARKS, are little vessels used in Holland for the carriage of fresh water to places where it is wanting,

Digitized by Google

ing, as well as for the fetching sea-water to make salt of. They have a deck, and are filled with water up to the deck.

Bark-Binding, a distemper incident to trees; cured by slitting the bark, or cutting along the grain.

Bark-Galling, is when the trees are galled with thorns, &c. It is cured by binding clay on the galled places.

Bark-Longue, or *Barca Longa*, a small, low, sharp-built, but very long vessel, without a deck. It goes with sails and oars, and is very common in Spain.

BARKHAMSTEAD, or BERKHAMSTEAD, a town of Hertfordshire in England, seems to have been the site of a Roman town. It had formerly a strong castle, which has long since been demolished. Population 1963 in 1811. W. Long. 0. 35. N. Lat. 45. 49.

BARKING, a town of Essex, in England, with 2421 inhabitants, seated on the river Roding, not far from the Thames, in a very unwholesome air. It has been chiefly noted for a large monastery, now in ruins; there being nothing left standing but a small part of the walls and a gate-house. E. Long. 0. 13. N. Lat. 51. 30.

Barking of Trees, the peeling off the rind or bark. This must be done, in our climate, in the month of May, because at that time the sap of the tree separates the bark from the wood. It would be very difficult to perform it at any other time of the year, unless the season was extremely wet and rainy; for heat and dryness are a very great hindrance to it.

By the French laws, all dealers are forbid to bark their wood while growing, on the penalty of 500 livres. This law was the result of ignorance; it being now found that barking of trees, and letting them die, increases the strength of timber.

BARKLEY, a town of Gloucestershire in England, seated on a branch of the river Severn, with 616 inhabitants in 1811. It had formerly a nunnery, and has still the title of a barony. W. Long. 2. 30. N. Lat. 51. 40.

BARKWAY, a town of Hertfordshire in England, on the great road from London to York. W. Long. 0. 5. N. Lat. 52.

BARLÆUS, GASPAR, professor of philosophy at Amsterdam, and one of the best Latin poets of the 17th century. There was scarce any thing great that happened in the world, while he lived, but he made a pompous elegy upon it, when reasons of state were no obstacle to it. He was a great defender of Arminius; and showed his abilities in history by his relation of what passed in Brasil during the government of Count Maurice of Nassau, published in 1647. He died the year after.

BARLERIA, SNAP-DRAGON. See BOTANY *Index*.

BARLETTA, a handsome and strong town of Italy, in the kingdom of Naples, and in the Terra di Bari, with a bishop's see. It is situated on the gulf of Venice, in E. Long. 16. 32. N. Lat. 41. 30.

BARLEY, in *Botany*. See HORDEUM, BOTANY and AGRICULTURE *Index*.

The principal use of barley among us is for making beer; in order to which it is first malted. See the article BEER.

The Spaniards, among whom malt liquors are little known, feed their horses with barley as we do with oats. In Scotland, barley is a common ingredient in broths; and the consumpt of it for that purpose is very considerable, *barley-broth* being a dish as frequent there as that of *soup* in France.

Pearl Barley, and *French Barley*; barley freed of the husk by a mill; the distinction between the two being, that the pearl barley is reduced to the size of small shot, all but the very heart of the grain being ground away.

Barley-Water, is a decoction of either of these, reputed soft and lubricating, of frequent use in physic. This well known decoction is a very useful drink in many disorders; and is recommended, with nitre, by some authors of reputation, in slow fevers.

Barley-Corn is used to denote a long measure, containing in length the third part of an inch, and in breadth the eighth. The French carpenters also use barley-corn, *grain d'orge*, as equivalent to a line, or the twelfth part of an inch.

Barley-Corn (*grain d'orge*), is also used in building for a little cavity between the mouldings of joiners work, served to separate or keep them asunder; thus called because made of a kind of plane of the same name.

BARLOW, WILLIAM, bishop of Chichester, descended of an ancient family in Wales, was born in the county of Essex. In his youth he favoured the Reformation; and travelled to Germany to be instructed by Luther, and other preachers of the new doctrine. How long he continued a Protestant is uncertain: but from his letter to King Henry VIII. quoted below, it appears that he wrote several books against the church of Rome. However, he was a regular canon in the Augustine monastery of St Osith in the county of Essex, and studied some time at Oxford with the brothers of that order, where he took the degree of doctor in divinity. He was then made prior of the convent at Bisham in Berkshire; and afterwards succeeded to the several priories of Blackmore, Typtree, Lega, Bromhole, and Haverford-west. On the dissolution of abbeys, he resigned not only with a good grace, but persuaded several other abbots to follow his example. King Henry was so pleased with his ready obedience on this occasion, that he sent him, in 1535, on an embassy to Scotland; in the same year made him bishop of St Asaph; in two months after, translated him to the see of St David's, and in 1547 to that of Bath and Wells. During this time, our good bishop, as appears from the following epistle to the king, was, or pretended to be, a staunch Papist: it was written in 1533. "Prayse be to God, who of his infynyte goodness and mercy inestymable hath brought me out of darkness into light, and from deadly ignorance into the quick knowledge of the truth. From which, through the fiend's instigation and false persuasion, I have greatly swerved. In so much that I have made certayn bokes, and have suffered them to be emprinted, as the tretise of the *Buryall of the Mass*, &c. In these tretises I perceive and acknowledge myself grievously to have erred, namely against the blessed sacrament of the altare; disallowing the masse and denying purgatory, with slanderous infamy of the pope and my lord cardinal, and outrageous rayling against the clergy; which I have forsaken and utterly renounced—Asks pardon William Barlow." However, when Edward VI. came to the crown, he was again a Protestant; and for that

Digitized by Google

that reason, on Queen Mary's accession, was deprived of his bishopric, and sent prisoner to the Fleet, where he continued some time. At length he found means, to escape, and immediately joined the other English Protestants in Germany. When Queen Elizabeth ascended the throne, our prelate was raised to the see of Chichester, and soon after made first prebendary of the collegiate church of Westminister. He died in 1568, and was buried in the cathedral at Chichester. He had five daughters, each of whom married a bishop. He wrote, 1. The Buryal of the masse. 2. The climbing up of Fryers and religious Persons, portred with Figures. 3. Christian Homilies. 4. A book upon Cosmography. 5. The godly and pious Institution of a Christian Man, commonly called the *Bishop's Book;* and several other works. He is said to be the translator of the Apocrypha as far as the book of Wisdom. His letters to M. Parker are in manuscript in Corpus Christi college, Cambridge, Misc. i. 445.

BARLOW, *William*, a mathematician and divine, the son of the bishop of Chichester, was born in Pembrokeshire whilst his father was bishop of St David's. In 1560, he was entered commoner of Baliol college in Oxford; and in 1564, took a degree in arts, which having completed by determination, he left the university and went to sea; but in what capacity is uncertain: however, he acquired considerable knowledge in the art of navigation. About the year 1573, he entered into orders, and became prebendary of Winchester and rector of Easton near that city. In 1588 he was made prebendary of Litchfield, which he exchanged for the place of treasurer of that church. Some years after, he was made chaplain to Prince Henry, the son of King James I.; and in 1614, archdeacon of Salisbury. He was the first writer on the nature and properties of the magnet. Barlow died in the year 1625, and was buried in the church at Easton. His works are, 1. "The Navigator's Supply, containing many things of principal importance belonging to navigation, and use of diverse instruments framed chiefly for that purpose." London, 1597, 4to, Dedicated to Robert earl of Essex. 2. "Magnetical Advertisements, or diverse pertinent Observations and approved Experiments concerning the Nature and Properties of the Loadstone." London, 1616, 4to. 3. "A brief Discovery of the idle Animadversions of Mark Ridley, M. D. upon a Treatise entitled Magnetical Advertisements." London, 1618, 4to.

BARLOW, *Thomas*, born in 1607, was appointed fellow of Queen's college in Oxford in 1633; and two years after was chosen reader of metaphysics to the university. He was keeper of the Bodleian library, and in 1657 was chosen provost of Queen's college. After the restoration of King Charles II. he was nominated one of the commissioners for restoring the members unjustly expelled in 1648. He wrote at that time The Case of Toleration in Matters of Religion, to Mr R. Boyle. In 1675, he was made bishop of Lincoln. After the popish plot, he published several tracts against the Roman catholic religion; in which he shows an uncommon extent of learning, and skill in polemical divinity. Nevertheless, when the duke of York was proclaimed king, he took all opportunities of expressing his affection toward him; but after the revolution he as readily voted that the king had abdicated his kingdom; and was very vigorous in excluding those of the clergy who refused the oaths, from their benefices.

Mr Granger observes, that "this learned prelate, whom nature designed for a scholar, and who acted in conformity with the bent of nature, was perhaps as great a master of the learned languages, and of the works of the celebrated authors who have written in those languages, as any man in his age. The greatest part of his writings, of which Mr Wood has given us a catalogue, are against Popery: and his conduct for some time, like that of other Calvinists, appeared to be in direct opposition to the church of Rome. But after James ascended the throne, he seemed to approach much nearer to Popery than he ever did before. He sent the king an address of thanks for his declaration for liberty of conscience, and is said to have written reasons for reading that declaration. His compliances were much the same after the revolution. His moderation, to call it by the softest name, was very great; indeed so great as to bring the firmness of his character in question. But casuistry reconciles seeming contradictions. He was, abstracted from this laxity of principles, a very great and worthy man." He died at Buckden, in Huntingdonshire, on the 8th of October 1691, in the 85th year of his age.

BARLOW, *Francis*, an English painter, was born in Lincolnshire. On his coming to London, he was placed with one Shephard, a limner; but his genius led him chiefly to drawing of birds, fish, and other animals. There are six books of animals from his drawings, and he painted some ceilings with birds for noblemen and gentlemen in the country. His etchings are numerous; his illustration of Esop is his greatest work. He died in 1702. There is something pleasing in the composition and manner of this master, though neither is excellent. His drawing too is very indifferent; nor does he characterize any animal justly. His birds in general are better than his beasts.

BARLOW, *Joel*, an American literary and political character. See SUPPLEMENT.

BARM, the same with yest. See YEST.—Barm is said to have been first used by the Celtæ in the composition of bread. About the time of Agricola's entrance into Lancashire, a new sort of loaf had been introduced at Rome, which was formed only of water and flour, and much esteemed for its lightness: and it was called the *water cake* from its simple composition, and the *Parthian roll* from its original inventors. But even this was not comparable to the French or Spanish bread for its lightness. The use of curmi*, and the knowledge of brewing, had acquainted the Celtes with an ingredient for their bread, which was much better calculated to render it light and pleasant, than the leaven, the eggs, the milk, or the wine and honey, of other nations. This was the spume which arose on the surface of their curmi in fermentation, and which the Welch denominate *burm*, and we *barm*. The Celtes of Gaul, of Spain, and most probably therefore of South Britain, had long used it; and their bread was, in consequence of this, superior in lightness to that of any other nation in the world†. See the articles BAKING and BREAD.

* See *Ale*.

† *Pliny*, lib. xviii. c. 7.

BARMAS, an East Indian people, who in 1515 possessed

Digitized by Google

possessed all the coast extending from Bengal to Pegu. It appears also, that they were formerly masters of Ava, the dominions of which extended as far as China; and of consequence the Barmas were masters of most of the northern parts of the peninsula beyond the Ganges. Their dominions, however, were afterwards reduced to very narrow bounds, and their king became tributary to the king of Pegu; but by degrees they not only recovered their former empire, but conquered the kingdoms of Pegu, Siam, and several others. By the latest accounts, their kingdom extends from the province of Yun-nan in China, about 800 miles in length from north to south, and 250 in breadth from east to west. See ASIA and PEGU.

BARN, in *Husbandry*, a covered place or house, with air-holes in the sides, for laying up any sort of grain, hay, or straw.

ST BARNABAS'S DAY, a Christian festival, celebrated on the 11th of June.—St Barnabas was born in Cyprus, and descended of the tribe of Levi, whose Jewish ancestors are thought to have retired thither to secure themselves from violence during the troublesome times in Judea. His proper name was *Joses;* to which, after his conversion to Christianity, the apostles added that of *Barnabas*, signifying either *the son of prophecy*, or *the son of consolation;* the first respecting his eminent *prophetic gifts*, the other his *great charity* in selling his estate for the comfort and relief of the poor Christians. He was educated at Jerusalem, under the great Jewish doctor Gamaliel; which might probably lay the foundation of that intimate friendship which was afterwards contracted between this apostle and St Paul. The time of his conversion is uncertain; but he is generally esteemed one of the seventy disciples chosen by our Saviour himself.

At Antioch, St Paul and St Barnabas had a contest, which ended in their separation: but what followed it with respect to St Barnabas is not related in the *Acts of the Apostles*. Some say, he went into Italy, and founded a church at Milan. At Salamis, we are told, he suffered martyrdom; whither some Jews, being come out of Syria, set upon him, as he was disputing in the synagogue, and stoned him to death. He was buried by his kinsman Mark, whom he had taken with him, in a cave near that city. The remains of his body are said to have been discovered in the reign of the emperor Zeno, together with a copy of St Matthew's gospel, written with his own hand, and lying on his breast.

St BARNABAS's Epistle, an apocryphal work ascribed to St Barnabas, and frequently cited by St Clement of Alexandria and Origen. It was first published in Greek, from a copy of Father Hugh Menard, a Benedictine monk. An ancient version of it was found in a manuscript of the abbey of Coebey, near a thousand years old. Vossius published it, in the year 1656, together with the epistles of St Ignatius.

St BARNABAS's Gospel, another apocryphal work, ascribed to St Barnabas the apostle, wherein the history of Jesus Christ is related in a manner very different from the account given us by the four Evangelists. The Mahometans have this gospel in Arabic, and it corresponds very well with those traditions which Mahomet followed in his Koran. It was, probably, a forgery of some nominal Christians; and afterwards altered and interpolated by the Mahometans, the better to serve their purpose.

BARNABITES, a religious order, founded in the 16th century by three Italian gentlemen, who had been advised by a famous preacher of those days to read carefully the epistles of St Paul. Hence they were called *clerks of St Paul;* and *Barnabites*, because they performed their first exercise in a church of St Barnabas at Milan. Their habit is black; and their office to instruct, catechise, and serve in mission.

BARNACLE, a species of goose. See ANAS, ORNITHOLOGY *Index*.

BARNACLES, in *Farriery*, an instrument composed of two branches joined at one end with a hinge, to put upon horses noses when they will not stand quietly to be shod, blooded, or dressed.

BARNADESIA. See BOTANY *Index*.

BARNARD, or BERNARD, JOHN, the son of John Barnard gent. was born at Castor in Lincolnshire, and educated at Cambridge. After several preferments, he was made a prebendary of the church of Lincoln. He wrote *Censura Clerior*, against scandalous ministers not fit to be restored to church livings; the Life of Dr Heylyn; and a few other works. He died at Newark, August 17. 1683.

BARNARD Castle, seated on the river Tees in the county of Durham, is a town and barony belonging to Vane earl of Darlington. It is indifferently large, and has a manufactory of stockings. W. Long. 1. 45. N. Lat. 54. 35.

BARNES, JOSHUA, professor of the Greek language at Cambridge, in the beginning of the 18th century. He was chosen queen's professor of Greek in 1695, a language he wrote and spoke with the utmost facility. His first publication was a whimsical tract, entitled *Gerania*, or a New Discovery of the little sort of people called Pygmies. After that appeared his Life of Edward III. in which he introduces his hero making long and elaborate speeches. In the year 1700, when he published many of his works, Mrs Mason, of Hemmingford, in Huntingdonshire, a widow lady of between 40 and 50, with a jointure of 200l. per annum, who had been for some time a great admirer of him, came to Cambridge, and desired leave to settle 100l. a-year upon him after her death; which he politely refused, unless she would likewise condescend to make him happy with her person, which was not very engaging. The lady was too obliging to refuse any thing to Joshua, for whom she said, "the sun stood still;" and they were accordingly married. Mr Barnes wrote several other books besides those above mentioned, particularly, Sacred Poems; The Life of Oliver Cromwell, the Tyrant; several dramatic pieces; a poetical Paraphrase on the History of Esther, in Greek verse, with a Latin translation, &c.: and he published editions of Euripides, Anacreon, and Homer's Iliad and Odyssey, with notes and a Latin translation. He wrote with greater ease in Greek than even in English, and yet is generally allowed not to have understood the delicacies of that language. He was of such a humane disposition, and so unacquainted with the world, that he gave his only coat to a vagrant begging at his door. This excellent man died on the 3d of August 1712, in the 58th year of his age.

BARNEVELDT, JOHN D'OLDEN, the celebrated Dutch

Digitized by Google

Dutch statesman, and one of the founders of the civil liberty of Holland. His patriotic zeal inducing him to limit the authority of Maurice prince of Orange the second stadtholder of Holland, the partizans of that prince falsely accused him of a design to deliver his country into the hands of the Spanish monarch. On this absurd charge he was tried by 26 commissaries deputed from the seven provinces, condemned, and beheaded in 1619. His sons William and Réné, with a view of revenging their father's death, formed a conspiracy against the stadtholder, which was discovered. William fled: but Réné was taken and condemned to die; which fatal circumstance has immortalized the memory of his mother, of whom the following anecdote is recorded. She solicited a pardon for Réné; upon which Maurice expressed his surprise that she should do that for her son which she had refused for her husband. To this remark, she replied with indignation, "I would not ask a pardon for my husband, because he was innocent. I solicit it for my son, because he is guilty."

BARNET, a town partly in Middlesex and partly in Hertfordshire. It is a great thoroughfare, and the market is very remarkable for hogs. Population 1579. W. Long. 0. 5. N. Lat. 51. 42.

BARNSLEY, or BLACK BARNSLEY, a town of the west riding of Yorkshire, seated on the side of a hill, and five furlongs in length, and containing 5014 inhabitants in 1811. W. Long. 1. 20. N. Lat. 53. 35.

BARNSTABLE, a sea-port town of Devonshire, seated on the river Tau, over which there is a good bridge. It sends two members to parliament, and had 4019 inhabitants in 1811. W. Long. 4. 5. N. Lat. 51. 15.

BARO, or BARON, PETER, professor of divinity in the university of Cambridge, in the 16th century, was born at Estampes in France, and educated in the university of Bourges, where he was admitted a licentiate in the law: but being of the Protestant religion, he was obliged to leave his native country to avoid persecution; and withdrawing into England, was kindly entertained by Lord Burleigh. He afterwards settled at Cambridge; and by the recommendation of his noble patron, was, in 1574, chosen Lady Margaret's professor there. For some years he quietly enjoyed his professorship; but there was at last raised a restless faction against him, by his opposing the doctrine of absolute predestination; which rendered his place so uneasy to him, that he chose to leave the university, and to settle in London. He wrote, 1. *In Jonam Prophetam Prælectiones* xxxix. 2. *De Præstantia et Dignitate Divinæ Legis*; and other pieces. He died in London, about the year 1600.

BAROCCI, FREDERIC, a celebrated painter, was born at Urbino, where the genius of Raphael inspired him. In his early youth he travelled to Rome; where he painted several things in fresco. He then returned to Urbino; and giving himself up to intense study, acquired a great name in painting. His genius particularly led him to religious subjects. At his leisure hours, he etched a few prints from his own designs; which are highly finished, and executed with great softness and delicacy. The *Salutation* is his capital performance in that way: of which we seldom meet with any impressions, but those taken from the retouched plate, which are very harsh. He died at Urbino in 1612, aged 84.

BAROCHE, or BROACH, a town of Cambaya, in Hindostan; it is walled round, and was formerly a place of great trade. It is now inhabited by weavers and such mechanics as manufacture cotton cloth. Here they have the best cotton in the world, and the best bastas are manufactured in this place. It was taken possession of by the British in 1803, and is still retained by them. E. Long. 72. 5. N. Lat. 22. 15.

BAROCO, in *Logic*, a term given to the fourth mode of the second figure of syllogisms. A syllogism in baroco has the first proposition universal and affirmative, but the second and third particular and negative, and the middle term is the predicate in the two first propositions. For example,

Nullus homo non est bipes:
Non omne animal est bipes:
Non omne animal est homo.

BAROMETER (from βαρος, *weight*, and μετρον, *measure*), an instrument for measuring the weight of the atmosphere, and of use in foretelling the changes of the weather, and also for measuring the height of mountains, &c.

1 Principles of the barometer.

The common barometer consists of a glass tube hermetically sealed at one end, and filled with quicksilver well defecated and purged of its air. The finger being then placed on the open end, in immediate contact with the mercury, so as not to admit the least particle of air, the tube is inverted, and the lower end plunged into a bason of the same prepared mercury; then upon removing the finger, the mercury in the tube will join that in the bason, and the mercurial column in the tube will subside to the height of 29 or 30 inches, according to the state of the atmosphere at that time. This is the principle on which all barometers are constructed. Of their invention, the different kinds of them, and the theories by which their phenomena are solved, we shall proceed to give an historical account.

2 Discovered by Galileo, and improved by Torricelli.

In the beginning of the last century, when the doctrine of a plenum was in vogue, philosophers were of opinion, that the ascent of water in pumps was owing to the abhorrence of a vacuum; and that by means of suction, fluids might be raised to any height whatever. But Galileo, who flourished about that time, discovered that water could not ascend in a pump unless the sucker reached within 33 feet of its surface in the well. From hence he concluded, that not the power of suction, but the pressure of the atmosphere, was the cause of the ascent of water in pumps; that a column of water 33 feet high was a counterpoise to one of air, of an equal base, whose height extended to the top of the atmosphere; and that for this reason the water would not follow the sucker any farther. From this Torricelli, Galileo's disciple, took the hint; and considered, that if a column of water of about 33 feet in height was equal in weight to one of air having the same base, a column of mercury no longer than about $29\frac{1}{2}$ inches would be so too, because mercury being about 14 times heavier than water, a column of mercury must be 14 times shorter than one of water equally heavy. Accordingly, having filled a glass tube with mercury, and inverted it into a bason of the same, he found the mercury in the tube to descend till it stood about $29\frac{1}{2}$ inches above the surface of that in the bason.

3 Strange hypothesis of Linus.

Notwithstanding this clear proof of the pressure of the atmosphere, however, the assertors of a plenum left no means untried to solve the phenomena of the Torricellian experiment by some other hypothesis. The most ridiculous solution, and which at the same time gave the adverse party the greatest difficulty to overthrow it, was that of Linus. He contended, that in the upper part of the tube, there is a film or *rope of mercury*, extended through the seeming vacuity; and that, by this rope, the rest of the mercury was suspended, and kept from falling into the bason.

4 Experiments in confirmation of it.

Even this so absurd hypothesis he pretended to confirm by the following experiments. Take, says he, a small tube, open at both ends, suppose about 20 inches long; fill this tube with mercury, stopping the lower orifice with your thumb: Then closing the upper end with your finger, and immerging the lower in stagnant mercury, you shall perceive, upon the removal of your thumb, a manifest suction of your finger into the tube; and the tube and mercury will both stick so close to it that you may carry them about the room. Therefore, says he, the internal cylinder of mercury in the tube is not held up by the preponderate air without; for if so, whence comes so strong a suction, and so firm an adhesion of the tube to the finger?—The same effect follows, though the tube be not quite filled with mercury; for if a little space of air is left at the top, after the tube is immerged in the stagnant mercury, there will be a considerable suction as before.

5 Refuted.

These experiments, which are themselves clear proofs of the pressure of the air, supported for some time the *funicular* hypothesis, as it was called, of Linus. But when it was discovered, that if the tube was carried to the top of a high mountain the mercury stood lower than on the plain, and that if removed into the vacuum of an air-pump it fell out altogether, the hypothesis of Linus was rejected by every body.

6 Remarkable experiments by Mr Huygens.

—There, are, however, two experiments which create a considerable difficulty. One is mentioned by Mr Huygens, viz. that if a glass tube 75 inches long, or perhaps longer, is filled with mercury well purged of its air, and then inverted, the whole will remain suspended; whereas, according to the Torricellian experiment, it ought to subside immediately to the height of 29 or 30 inches. It is true indeed, that, upon shaking the tube, the mercury presently subsides to that height; but why it should remain suspended at all, more than twice the height to which it can be raised by the pressure of the most dense atmosphere, seems not easily accounted for:

7 Unsatisfactorily accounted for in the Philosophical Transactions.

and accordingly, in the Philosophical Transactions we find attempts to account for it by the pressure of a medium more subtile than the common air, and capable of pervading both the mercury and glass. We find there also another very surprising fact of the same kind mentioned; viz. that a pretty large tube under 29 inches in length, filled with mercury, and inverted into a bason of the same, will remain full, though there be a small hole in the top. This too, is there accounted for by the pressure of a medium more subtile than common air; but by no means in a satisfactory manner.

8 Mr Rowning's solution.

Mr Rowning, who mentions the phenomenon of the 75 inch tube, accounts for it in the following manner. "The cause of this phenomenon seems to be, that by the great weight of so long a column of mercury, it was pressed into so close contact with the glass in pouring in, that, by the mutual attraction of cohesion between the mercury and the glass, the whole column was sustained after the tube was inverted."

9 Insufficient.

—Here, however, we must observe, that this solution seems equally unsatisfactory with that of the subtile medium already mentioned; because it is only one end of the column which sustains so great a pressure from the weight of the mercury; and therefore, though five or six inches of the upper part of the tube, where the pressure had been strongest, might thus remain full of mercury, yet the rest ought to fall down. Besides, it is only the outside of the mercurial column that is in contact with the glass, and consequently these parts only ought to be attracted. Therefore, even granting the pressure to be equally violent, on the inversion of the tube, all the way from 29 to 75 inches, yet the glass ought to be only as it were silvered over by a very thin film of mercury, while the middle parts of the column ought to fall out by reason of their fluidity.

10 Another experiment with siphons.

The other experiment hinted at, is with regard to siphons: which, though it belongs more properly to the article HYDROSTATICS, yet seems necessary to be mentioned here. It is this: That a siphon, once set a running, will continue to do so though set under the receiver of an air-pump and the air exhausted in the most perfect manner; or if a siphon is filled, and then set under a receiver and the air exhausted, if by any contrivance the end of the lower leg is opened, it will immediately begin to run, and discharge the water of any vessel in which the other leg is placed, as though it was in the open air. The cause of this phenomenon, as well as the former, seems very difficult to be investigated.

11 Another solution.

Some philosophers have attempted a solution on a principle something similar to that of the funicular hypothesis of Linus above-mentioned; namely, that "fluids in siphons seem as it were to form one continued body; so that the heavier part, descending, like a chain pulls the lighter after it." This might be deemed a sufficient explanation, if the siphon were only to empty the water it at first contains in itself:

12 Insufficient.

but when we consider that the water in the vessel, which much exceeds the quantity contained in the siphon, is likewise evacuated, this hypothesis can by no means be admitted; because this would be like the lighter part of a chain pulling the heavier after it.

13 Another solution from the action of electricity.

Concerning the cause of these singular phenomena, we can only offer the following conjecture. The existence of a medium much more subtile than air, and which pervades the vacuum of an air-pump with the utmost facility, is now sufficiently ascertained in the phenomena of electricity. It is also well known, that this fluid surrounds the whole earth to an indeterminate height. If, therefore, this fluid either is the power of gravity itself, or is acted upon by that power, it must necessarily press upon all terrestrial bodies in a manner similar to the pressure of the atmosphere. If then we could from any vessel entirely exclude this subtile fluid, and form an electrial vacuum, as well as we can do an aerial one by means of the air-pump, we would in that case see fluids as evidently raised by the pressure of the electric matter, as we now see them raised by that of the air. But though this cannot be done, we are assured that there are certain substances, of which glass is one, through which the electric manner cannot

pass,

Digitized by Google

Barometer. pass but with difficulty. We are likewise certain, that though the electric matter passes through the pores of water, metals, &c. with very great facility, yet it still must meet with some resistance from their solid and impenetrable parts, which cannot be pervaded by any material substance. We know also, that all substances do naturally contain a certain quantity of this electric matter, which they are not always ready to part with; and when by any means the fluid they contain is set in motion, they are then said to be *electrified*. Now, though we are certain, that the friction of glass by mercury does set in motion the electric fluid contained in the mercury or in the glass; yet when the tube is filled with the metallic fluid, whatever quantity has been extricated either from the glass or mercury during the time of filling, will be re-absorbed again by the metal and conveyed to the earth during the time of inversion; and consequently, the mercurial tube, when inverted, will not be electrified, but both glass and mercury will be in their natural state. Here, then, the pressure of the electrical fluid is kept off in some measure from the upper part of the mercury by the glass, which it cannot penetrate easily at least. To the mercury in the bason it has free access, and therefore presses more upon the lower than the upper part; the consequence of which is a suspension of the mercury. It is true, this fluid very easily penetrates the metallic matter; but it must be considered, that the electric fluid itself is in some measure entangled in the particles of the quicksilver, and cannot be extricated without motion. As soon therefore as the tube is shaken, some part of the electricity is extricated, and the mercury begins to descend. The subtility of the medium is such, that no sooner has it begun to extricate itself, than, by the motion of the metal downwards, it issues forth in great quantities, so as to become visible, like a blue flame, in the dark. The equilibrium is therefore destroyed in an instant, as it would be were we to admit air to the top of the barometer; nay, in a more effectual manner. For if a small quantity of air was admitted to the top of a barometer, the mercury would only descend in proportion to the quantity of air admitted; but here, no sooner is a quantity of electric matter admitted, than it procures admission for a vast deal more, and consequently the mercury descends with accelerated velocity.—On this principle the ascent of water in the siphon while *in vacuo* is so easily accounted for, that we need not take up time in explaining it farther.—But why an inverted glass tube should remain full of mercury when it has a hole either great or small in the top, is more difficult to be accounted for, and requires this farther circumstance to be taken into consideration, viz. that though all solid bodies will, by the action of gravity, or by any other impulse, easily approach very near to one another, yet they cannot be brought into absolute contact without a very considerable force, much greater than is sufficient to overcome their gravity; and thus it appears from some experiments, that the links of a chain are by no means in contact with one another, till the chain has a considerable weight appended to it. This may be the case with the tube in question. The air by its gravity descends upon it, and is ready to enter the small hole in the top; but, by a repulsive power from the glass, its action is prevented, so that the mercury cannot fall.

It was, however, some time after the Torricellian experiment had been made, and even after it had been universally agreed that the suspension of the mercury was owing to the weight of the atmosphere, before it was discovered that this pressure of the air was different at different times though the tube was kept in the same place. But the variations of altitude in the mercurial column were too obvious to remain long unobserved; and accordingly philosophers soon became careful enough to mark them. When this was done, it was impossible to avoid observing also, that the changes in the height of the mercury were accompanied, or very quickly succeeded, by changes in the weather. Hence the instrument obtained the name of the *weather-glass*, and was generally made use of with a view to the fore-knowledge of the weather. In this character, its principal phenomena are as follow:

14 Barometer used for prognosticating the weather.

15 Its phenomena as a weather-glass by Mr Patrick.

1. The rising of the mercury presages, in general, fair weather; and its falling, foul weather, as rain, snow, high winds, and storms.

2. In very hot weather, the falling of the mercury foreshows thunder.

3. In winter, the rising presages frost; and in frosty weather, if the mercury falls three or four divisions, there will *certainly* follow a thaw. But in a continued frost, if the mercury rises, it will *certainly* snow.

4. When foul weather happens soon after the falling of the mercury, expect but little of it; and, on the contrary, expect but little fair weather when it proves fair shortly after the mercury has risen.

5. In foul weather, when the mercury rises much and high, and thus continues for two or three days before the foul weather is quite over, then expect a continuance of fair weather to follow.

6. In fair weather, when the mercury falls much and low, and thus continues for two or three days before the rain comes, then expect a great deal of wet, and probably high winds.

7. The unsettled motion of the mercury denotes uncertain and changeable weather.

8. You are not so strictly to observe the words engraven on the plates (though in general it will agree with them), as the mercury's *rising* and *falling*. For if it stand at *much rain*, and then rises up to *changeable*, it presages fair weather; though not to continue so long as if the mercury had risen higher: and so, on the contrary, if the mercury stood at *fair*, and falls to *changeable*, it presages foul weather; though not so much of it as if it had sunk lower.

16 Remarks by Mr Rowning.

These are the observations of Mr Patrick, on which Mr Rowning makes the following remarks: "From these observations it appears, that it is not so much the height of the mercury in the tube that indicates the weather, as the motion of it up and down: wherefore, in order to pass a right judgment of what weather is to be expected, we ought to know whether the mercury is actually rising or falling; to which end the following rules are of use.

"1. If the surface of the mercury is convex, standing higher in the middle of the tube than at the sides, it is generally a sign that the mercury is then rising.

"2. If the surface is concave, it is then sinking: and,

"3. If it is plain, the mercury is stationary; or rather, if it is a little convex: for mercury being put into a

Barometer. a glass tube, especially a small one, will naturally have its surface a little convex, because the particles of mercury attract one another more forcibly than they are attracted by glass. Further,

"4. If the glass is small, shake the tube; and if the air is grown heavier, the mercury will rise about half the tenth of an inch higher than it stood before; if it is grown lighter, it will sink as much. This proceeds from the mercury's sticking to the sides of the tube, which prevents the free motion of it till it is disengaged by the shock: and therefore, when an observation is to be made with such a tube, it ought always to be shaken first; for sometimes the mercury will not vary of its own accord, till the weather it ought to have indicated is present.

17 These phenomena peculiar to the temperate and frigid zones.

Here we must observe, that the above-mentioned phenomena are peculiar to places lying at a considerable distance from the equator; for, in the torrid zone, the mercury in the barometer seldom either rises or falls much. In Jamaica, it is observed by Sir William Beeston *, that the mercury in the morning constantly stood at one degree below *changeable*, and at noon sunk to one degree above *rain*; so that the whole scale of variation there was only $\frac{1}{10}$ of an inch. At St Helena, too, where Dr Halley made his observations, he found the mercury to remain wholly stationary whatever weather happened. Of these phenomena, their causes, and why the barometer indicates an approaching change of weather, the Doctor gives us the following account:

* *Philos. Transact.* N° 220.

18 Phenomena of the barometer solved by Dr Halley.

"1. In calm weather, when the air is inclined to rain, the mercury is commonly low.

"2. In serene, good, and settled weather, the mercury is generally high.

"3. Upon very great winds, though they be not accompanied with rain, the mercury sinks lowest of all. With relation to the point of the compass the wind blows upon,

"4. *Cæteris paribus*, the greatest heights of the mercury are found upon easterly, or north-easterly, winds.

"5. In calm frosty weather, the mercury generally stands high.

"6. After very great storms of wind, when the mercury has been very low, it generally rises again very fast.

"7. The more northerly places have greater alterations of the barometer than the more southerly.

"8. Within the tropics, and near them, those accounts we have had from others, and my own observations at St Helena, make very little or no variation of the height of the mercury in all weathers.

"Hence I conceive, that the principal cause of the rise and fall of the mercury is from the variable winds which are found in the temperate zones, and whose great inconstancy here in England is notorious.

"A second cause is, the uncertain exhalation and precipitation of the vapours lodging in the air, whereby it comes to be at one time much more crowded than at another, and consequently heavier; but this latter depends in a great measure upon the former. Now from these principles I shall endeavour to explicate the several phenomena of the barometer, taking them in the same order I have laid them down. Thus,

"1. The mercury's being lower inclines it to rain; because the air being light, the vapours are no longer supported thereby, being become specifically heavier than the medium wherein they floated; so that they descend towards the earth, and, in their fall, meeting with other aqueous particles, they incorporate together, and form little drops of rain: but the mercury's being at one time lower than another, is the effect of two contrary winds blowing from the place where the barometer stands; whereby the air of that place is carried both ways from it, and consequently the incumbent cylinder of air is diminished, and accordingly the mercury sinks: As, for instance, if in the German ocean it should blow a gale of westerly wind, and at the same time, an easterly wind in the Irish sea; or, if in France it should blow a northerly wind, and in Scotland a southerly; it must be granted, that that part of the atmosphere impendant over England would thereby be exhausted and attenuated, and the mercury would subside, and the vapours which before floated in these parts of the air of equal gravity with themselves would sink to the earth.

"2. The greater height of the barometer is occasioned by two contrary winds blowing towards the place of observation, whereby the air of other places is brought thither and accumulated; so that the incumbent cylinder of air being increased both in height and weight, the mercury pressed thereby must needs stand high, as long as the wind continues so to blow; and then the air being specifically heavier, the vapours are better kept suspended, so that they have no inclination to precipitate and fall down in drops, which is the reason of the serene good weather which attends the greater heights of the mercury.

"3. The mercury sinks the lowest of all by the very rapid motion of the air in storms of wind. For the tract or region of the earth's surface, wherein the winds rage, not extending all round the globe, that stagnant air which is left behind, as likewise that on the sides, cannot come in so fast as to supply the evacuation made by so swift a current; so that the air must necessarily be attenuated when and where the said winds continue to blow, and that more or less according to their violence: add to which, that the horizontal motion of the air being so quick as it is, may in all probability take off some part of the perpendicular pressure thereof; and the great agitation of its particles is the reason why the vapours are dissipated, and do not condense into drops so as to form rain, otherwise the natural consequence of the air's rarefaction.

"4. The mercury stands highest upon the easterly and north-easterly winds; because in the great Atlantic ocean, on this side the 35th degree of north latitude, the winds are almost always westerly or south-westerly; so that whenever here the wind comes up at east and north-east, it is sure to be checked by a contrary gale as soon as it reaches the ocean; wherefore, according to our second remark, the air must needs be heaped over this island, and consequently the mercury must stand high as often as these winds blow. This holds true in this country; but is not a general rule for others, where the winds are under different circumstances: and I have sometimes seen the mercury here as low as 29 inches upon an easterly wind; but then it blew exceedingly hard, and so comes to be accounted for by what was observed in the third remark.

"5. In calm frosty weather the mercury generally stands

Barometer. stands high; because (as I conceive) it seldom freezes but when the winds come out of the northern and north-eastern quarters, or at least unless those winds blow at no great distance off. For the north parts of Germany, Denmark, Sweden, Norway, and all that tract from whence north-eastern winds come, are subject to almost continual frost all the winter: and thereby the lower air is very much condensed, and in that state is brought hitherward by those winds, and, being accumulated by the opposition of the westerly wind blowing in the ocean, the mercury must needs be pressed to a more than ordinary height; and as a concurring cause, the shrinking of the lower parts of the air into lesser room by cold, must needs cause a descent of the upper parts of the atmosphere, to reduce the cavity made by this contraction to an equilibrium.

"6. After great storms, when the mercury has been very low, it generally rises again very fast: I once observed it to rise one inch and a half in less than six hours after a long-continued storm of south-west wind. The reason is, because the air being very much rarefied by the great evacuations which such continued storms make thereof, the neighbouring air runs in the more swiftly to bring it to an equilibrium; as we see water runs the faster for having a greater declivity.

"7. The variations are greater in the more northerly places, as at Stockholm greater than at Paris (compared by M. Paschal); because the more northerly parts have usually greater storms of wind than the more southerly, whereby the mercury should sink lower in that extreme; and then the northerly winds bringing in the more dense and ponderous air from the neighbourhood of the pole, and that again being checked by a southerly wind at no great distance, and so heaped, must of necessity make the mercury in such case stand higher in the other extreme.

"8. Lastly, This remark, that there is little or no variation near the equinoctial, does above all others confirm the hypothesis of the variable winds being the cause of these variations of the height of the mercury; for in the places above named there is always an easy gale of wind blowing nearly upon the same point, viz. E. N. E. at Barbadoes, and E. S. E. at St Helena; so that there being no contrary currents of air to exhaust or accumulate it, the atmosphere continues much in the same state: however, upon hurricanes, the most violent of storms, the mercury has been observed very low; but this is but once in two or three years, and it soon recovers its settled state, about $29\frac{1}{2}$ inches."

19 Objections to this theory.

This theory has been controverted, and the principal objections are, "That if the wind was the sole agent in raising or depressing the mercury, the alterations of its height in the barometer would be only relative or topical; there would still be the same quantity supported at several places taken collectively: thus what a tube at London lost, another at Paris, Pisa, or Zurich, &c. would gain. But the contrary is found to be the case; for, from all the observations hitherto made, the barometers in several distant parts of the globe rise and fall together. This is a very surprising fact; and deserves to be well examined. Again, setting aside all other objections, it is impossible, on Dr Halley's hypothesis, to explain the mercury's fall before, and rise after, rain. For suppose two contrary winds sweeping the air from over London: We know that few if any of the winds reach above a mile high; all therefore they can do will be to cut off a certain part of the column of air over London: if the consequence of this be the fall of the mercury, yet there is no apparent reason for the rains following it. The vapours indeed may be let lower; but it will only be till they come into an air of the same specific gravity with themselves; and there they will stick as before. Lastly, it is impossible, according to the laws of fluids, that the air above any place could be exhausted by the blowing of two contrary winds from it; for, suppose a north-east and south-west wind both blow from London at the same time, there will be two others at the same time blowing towards it from opposite points, viz. a north-west and south-east one, which will every moment restore the equilibrium, so that it can never be lost in any considerable degree at least."

20 Hypothesis of Mr Leibnitz.

Mr Leibnitz accounted for the sinking of the mercury before rain upon another principle, viz. That as a body specifically lighter than a fluid, while it is suspended by it, adds more weight to that fluid than when, by being reduced in its bulk, it becomes specifically heavier, and descends; so the vapour, after it is reduced into the form of clouds, and descends, adds less weight to the air than before; and therefore the mercury falls. To which it is answered, 1. That when a body descends in a fluid, its motion in a very little time becomes uniform, or nearly so, a farther acceleration of it being prevented by the resistance of the fluid; and then, by the third law of nature, it forces the fluid downwards with a force equal to that whereby it tends to be farther accelerated, that is, with a force equal to its whole weight. 2. The mercury by its descent foretels rain a much longer time before it comes, than the vapour after it is condensed into clouds can be supposed to take up in falling. 3. Supposing that as many vapours as fall in rain during a whole year were at once to be condensed into clouds, and even quite cease to gravitate upon the air, its gravity would scarcely be diminished thereby so much as is equivalent to the descent of two inches of mercury in the barometer. Besides, in many places between the tropics, the rains fall at certain seasons in very great quantities, and yet the barometer shows there very little or no alteration in the weight of the atmosphere. — 21 Refuted.

22 Another hypothesis, but insufficient.

Another hypothesis somewhat similar to that of Leibnitz has been given: but as it is liable to the objections just now mentioned, especially the last, we forbear to give any particular account of it; and shall attempt, upon other principles, to give a satisfactory solution of this phenomenon.

23 Another theory.

The necessary preliminaries to our hypothesis are, 1. That vapour is formed by an intimate union between the element of fire and that of water, by which the fire or heat is so totally enveloped, and its action so entirely suspended by the watery particles, that it not only loses its properties of giving light and of burning, but becomes incapable of affecting the most sensible thermometer; in which case, it is said by Dr Black, the author of this theory, to be in the latent state. For the proofs of this, see the articles EVAPORATION, COLD, CONGELATION, &c. 2. If the atmosphere is affected

Barometer.

affected by any unusual degree of heat, it thence becomes incapable of supporting so long a column of mercury as before, for which reason that in the barometer sinks. This appears from the observations of Sir William Beeston already mentioned; and likewise from those of De Luc, which shall be afterwards taken notice of.

These axioms being established, it thence follows, that as vapour is formed by an union of fire with water, or if we please to call it an *elective* attraction between them, or solution of the water in the fire, it is impossible that the vapour can be condensed until this union, attraction, or solution, be at an end. The beginning of the condensation of the vapour then, or the first symptoms of an approaching rain, must be the separation of the fire which lies hid in the vapour. This may be at first slow and partial, or it may be sudden and violent: in the first case, the rain will come on slowly, and after a considerable interval; and in the other, it will be very quick, and in great quantity. But Dr Black hath proved, that when fire quits its latent state, however long it may have lain dormant and insensible, it always assumes its proper qualities again, and affects the thermometer as though it had never been absorbed. The consequence of this must be, that in proportion as the latent heat is discharged from the vapour, it must sensibly affect those parts of the atmosphere into which it is discharged; and in proportion to the heat communicated to these, they will become specifically lighter, and the mercury sink of course. Neither are we to imagine that the quantity of heat discharged by the vapour is inconsiderable; for Dr Black hath shown, that when any quantity of water, a pound for instance, is condensed from the vapour of a common still, as much heat is communicated to the head and refrigeratory as would have been sufficient to heat the pound of water red hot, could it have borne that degree of sensible heat.

The causes by which this separation between the fire and water is, or may be effected, come to be considered under the articles RAIN, CONDENSATION, VAPOUR, &c. Here we have only to observe, that as the separation may be gradual and slow, the barometer may indicate rain for a considerable time before it happens: or if the sensible heat communicated from the vapour to the atmosphere shall be absorbed by the colder parts, or by any unknown means carried off, or prevented from affecting the specific gravity of the air, the barometer will not be affected; and yet the water being deprived of the heat necessary to sustain it, must descend in rain; and thus it is found that the indications of the barometer do not always hold true. Hence also it appears, that though the specific gravity of the air is diminished, unless that diminution proceeds from a discharge of the latent heat contained in the vapours, no rain will follow; and thus the sinking of the barometer may prognosticate wind as well as rain, or sometimes nothing at all.

The difficulty, however, on this hypothesis, is to account for the barometer being stationary in all weathers between the tropics; whereas it ought to move up and down there as well as here, only more suddenly, as the changes of weather there are more sudden than here. But it must be considered, that in these climates, during the daytime, the action of the sun's rays is so violent, that what is gained by the discharge of latent heat from the vapour, is lost by the interposition of the clouds betwixt the sun and earth, or by the great evaporation which is constantly going on; and in the night, the cold of the atmosphere is so much increased, that it absorbs the heat as fast as the vapour discharges it, so that no sensible effect can be produced; for in warm climates, though the day is excessively hot, the night is observed to be vastly colder in proportion than it is with us. This, however, does not prevent the barometer from being affected by other causes, as well as with us; for Dr Halley observes, that in the time of hurricanes it sinks very low. The cause of this is most probably a great commotion in the electric fluid, by which the air is internally agitated, and its power of gravitation in part suspended.—A confirmation of the above hypothesis, however, is taken from the different heights at which the mercury arrives in different climates. The barometer range, for instance, at the latitude of 45° is the greatest of all; because here the evaporation and condensation of the vapours are both very considerable, at the same time that the latent heat discharged cannot be absorbed so suddenly as in the torrid zone, the difference betwixt the length of the days and nights being greater, and consequently the nights warmer in summer and colder in winter. Farther to the northward the range is less, and in the latitude of 60° only two inches, by reason of the greater cold and length of the days and nights; whence the quantity of vapour condensed, or of latent heat expelled, becomes proportionably less.

14 Different kinds of barometers described.

Having thus given an account of the several phenomena of the barometer considered as a weather-glass, and likewise endeavoured to account for them in the most satisfactory manner, we now proceed to give a particular description of the barometers most commonly made use of, with various schemes for their improvement.

Plate LXXXV.

Fig. 1. represents the common barometer, such as was invented by Torricelli, and such as we have already given a general description of. AB represents a tube of glass, a quarter of an inch in diameter, and 34 inches long, hermetically sealed at A. This tube being supposed to be filled with mercury, is then inverted into the bason CD; upon which the mercury in the tube falls down to GH, somewhat above 28 inches, while that in the bason rises to CF. The lowest station of the mercury in this country is found to be 28 inches, and the highest 31. From the surface of the mercury CF, therefore, 28 inches are to be measured on the tube AB, which suppose to reach to the point K. This point, therefore, is the lowest of the scale of variation, and in the common barometers is marked *stormy*. In like manner, the highest point of the scale of variation I, is placed 31 inches above EF; and is marked *very dry* on one side for the summer, and *very hard frost* on the other for the winter. The next half inch below is marked *set fair* on the one side, and *set frost* on the other. At 30 inches from CF is marked the word *fair* on one side, and *frost* on the other. Half an inch below that, is wrote the word *changeable*, which answers both for summer and winter. At 29 inches is *rain* on the one side, and *snow* on the other; and at $28\frac{1}{2}$ are the words *much rain* on the one side, and *much snow* on the other. Each of these large

Digitized by Google

 large divisions is usually subdivided into 10; and there is a small sliding index fitted to the instrument, by which the ascent or descent of the mercury to any number of divisions is pointed out. Each of these tenths is sometimes divided into *ten* more, or *hundredths* of an inch, by means of a sliding slip of brass with a *vernier* scale on it, which shall be hereafter described and explained. This kind of barometer is the most common, and perhaps the most useful and accurate, of any that has yet been invented, from the following circumstance, that the natural simplicity of its construction, in preference to others hereafter described, does not admit of any kind of resistance to the free motion of the column of mercury in the tube. The scale of variation being only three inches, and it being naturally wished to discover more minute variations than can thus be perceived, several improvements have been thought of.

The improvement most generally adopted is the diagonal barometer represented fig. 2. in which the scale of variation, instead of three inches, may be made as many feet, by bending the tube so as to make the upper part of it the diagonal of a parallelogram, of which the shortest side is the three-inches scale of variation of the common barometer. This, however, has a very great inconvenience: for not only is the friction of the mercury upon the glass so much increased that the height doth not vary with every slight change of air; but the column of mercury is apt to break in the tube, and part of it to be left behind, upon any considerable descent.

Fig. 3. is the rectangular barometer; where AC represents a pretty wide cylinder of glass, from which proceeds the tube CDF bent into a right angle at D. Suppose now the cylinder AC to be four times larger than the tube CD, so that every inch of the cylinder from C to A should be equal in capacity to four inches of the tube CD. The whole being then filled with mercury, and inverted, the mercury will subside from A to B, at the same time that it cannot run out at the open orifice F, because the air presses in that way. If any alteration then happens in the weight of the air, suppose such as would be sufficient to raise the mercury an inch from B towards A, it is evident that this could not be done without the mercury in the horizontal leg retiring four inches from E towards D; and thus the scale of variation counted on the horizontal leg would be 12 inches. But the inconveniences of friction are much greater here than in the diagonal barometer; and besides, by the least accident, the mercury is apt to be driven out at the open orifice F.

The pendant barometer (fig. 4.) consists of a single tube, suspended by a string fastened to the end A. This tube is of a conical or tapering figure, the end A being somewhat less than the end B. It is hermetically sealed at A, and filled with mercury: then will the mercury sink to its common station, and admit of a length of altitude CD, equal to that in the common barometers. But from the conical bore of the tube, the mercury will descend as the air grows lighter, till it reaches its lowest altitude, when the mercury will stand from the lower part of the tube B to E, so that BE will be equal to 28 inches: consequently the mercury will, in such a tube, move from A to E, or 32 inches, if the tube be five feet, or 60 inches; and therefore the scale AE is here above ten times greater than in the common barometer: but the fault of this barometer is, that the tubes being of a very small bore, the friction will be considerable, and prevent its moving freely; and if the tube is made of a wider bore, the mercury will be apt to fall out.

Fig. 5. is an invention of Mr Rowning, by which the scale of variation may be increased to any length, or even become infinite. ABC is a compound tube hermetically sealed at A, and open at C, empty from A to D, filled with mercury from thence to B, and from thence to E with water. Let GBH be a horizontal line; then it is plain, from the nature of the siphon, that all the compound fluid contained in the part from H to G, will be always *in æquilibrio* with itself, be the weight of the air what it will, because the pressure at H and G must be equal. Whence it is evident that the column of mercury DH is *in æquilibrio* with the column of water GE, and a column of air taken conjointly, and will therefore vary with the sum of the variations of these. That the variation in this barometer may be infinite, will appear from the following computation. Let the proportion between the bores of the tube AF and FC be such, that when HD, the difference of the legs wherein the mercury is contained, is augmented one inch, GE, the difference of the legs wherein the water is contained, shall be diminished 14; then, as much as the pressure of the mercury is augmented, that of the water will be diminished, and so the pressure of both taken together will remain as it was; and consequently, after it has begun to rise, it will have the same tendency to rise on, without ever coming to an equilibrium with the air.

Fig. 6. represents Dr Hook's wheel-barometer. Here ACDG is a glass tube, having a large round head at A, and turned up at the lower end F. Upon the surface of the mercury in the bent leg is an iron ball G, with a string going over a pulley CD. To the other end of the string is fastened a smaller ball H, which as the mercury rises in the leg FG, turns the index KL from N towards M, on the graduated circle MNOP; as it rises in the other leg, the index is carried the contrary way by the descent of the heavier ball G along with the mercury. The friction of this machine, however, unless it is made with very great accuracy, renders it useless.

Fig. 7. is another barometer, invented by Mr Rowning, in which also the scale may be infinite. ABCD is a cylindrical vessel, filled with a fluid to the height W, in which is immerged the barometer SP consisting of the following parts: The principal one is the glass tube TP (represented separately at *tp*), whose upper end T is hermetically sealed: this end does not appear to the eye, being received into the lower end of a tin pipe GH, which in its other end G receives a cylindric rod or tube ST, and thus fixes it to the tube TP. This rod ST may be taken off, in order to put in its stead a larger or a lesser as occasion requires. S is a star at the top of the rod ST: and serves as an index by pointing to the graduated scale LA, which is fixed to the cover of the vessel ABCD. MN is a large cylindrical tube made of tin (represented separately at *mn*), which receives in its cavity the smaller part of the tube TP, and is well cemented to it at both ends, that none of the fluid may get in. The tube TP, with this apparatus,

Barometer.

apparatus, being filled with mercury, and plunged into the bason MP, which hangs by two or more wires upon the lower end of the tube MN, must be so poised as to float in the liquor contained in the vessel ABCD; and then the whole machine rises when the atmosphere becomes lighter, and *vice versa.* Let it now be supposed, that the fluid made use of is water; that the given variation in the weight of the atmosphere is such, that, by pressing upon the surface of the water at W, the surface of the mercury at X may be raised an inch higher (measuring from its surface at P) than before; and that the breadth of the cavity of the tube at X, and of the bason at P, are such, that by this ascent of the mercury, there may be a cubic inch of it in the cavity X more than before, and consequently in the bason a cubic inch less. Now, upon this supposition, there will be a cubic inch of water in the bason more than there was before; because the water will succeed the mercury, to fill up its place. Upon this account the whole machine will be rendered heavier than before by the weight of a cubic inch of water; and therefore will sink, according to the laws of hydrostatics, till a cubic inch of that part of the rod WS, which was above the surface of the water at W, comes under it. Then, if we suppose this rod so small, that a cubic inch of it shall be 14 inches in length, the whole machine will sink 14 inches lower into the fluid than before; and consequently the surface of the mercury in the bason will be pressed, more than it was before, by a column of water 14 inches high. But the pressure of 14 inches of water is equivalent to one of mercury; this additional pressure will make the mercury ascend at X as much as the supposed variation in the weight of the air did at first. This ascent will give room for a second cubic inch of water to enter the bason; the machine will therefore be again rendered so much heavier, and will subside 14 inches farther, and so on *in infinitum.* If the rod was so small that more than fourteen inches of it were required to make a cubic inch, the variation of this machine would be negative with respect to the common barometer; and instead of coming nearer to an equilibrium with the air by its ascent or descent, it would continually recede farther from it: but if less than 14 inches of rod were required to make a cubic inch, the scale of variation would be finite, and might be made in any proportion to the common one. Neither this nor the other infinite barometer have ever been tried, so that how far they would answer the purposes of a barometer is as yet unknown.

Fig. 8. represents another contrivance for enlarging the scale of the barometer to any size.—AB is the tube of a common barometer open at B and sealed at A, suspended at the end of the lever which moves on the fulcrum E.—CD is a fixed glass tube, which serves in place of the cistern. This last tube must be so wide as to allow the tube AB to play up and down within it.—AB being filled with mercury, is nearly counterbalanced by the long end of the lever. When the atmosphere becomes lighter, the mercury descends in the long tube, and the surface of the mercury rising in the cistern pushes up the tube AB, which at the same time becoming lighter, the lever preponderates, and points out the most minute variations. Here too the friction occasions inconveniences; but this may be in some measure remedied by a small shake of the apparatus at each inspection.

In the Philosophical Transactions, Mr Caswell gives the following account of a barometer, which has been commended as a very accurate one: "Let ABCD (fig. 9.) represent a bucket of water in which is the barometer *erezosm*, which consists of a body *ersm*, and a tube *ezyo*: the body and tube are both concave cylinders communicating with one another, and made of tin: the bottom of the tube, *zy*, has a lead weight to sink it so that the top of the body may just swim even with the surface of the water by the addition of some grain weights on the top. The water, when the instrument is forced with its mouth downwards, gets up into the tube to the height *yu*. There is added on the top a small concave cylinder, which I call the *pipe*, to distinguish it from the bottom small cylinder which I call the *tube*. This pipe is to sustain the instrument from sinking to the bottom: *md* is a wire; *ms*, *de*, are two threads oblique to the surface of the water, which threads perform the office of diagonals: for that while the instrument sinks more or less by the attraction of the gravity of the air, there, where the surface of the water cuts the thread, is formed a small bubble; which bubble acsends up the thread, as the mercury in the common barometer ascends.

The dimensions of this instrument given there are, 21 inches for the circumference of the body, the altitude 4, each base having a convexity of $6\frac{1}{2}$ inches. The inner circumference of the tube is 5.14 inches, and its length $4\frac{1}{2}$; so that the whole body and tube will contain almost $2\frac{1}{2}$ quarts. The circumference of the pipe, that the machine may not go to the bottom on every small alteration of the gravity of the air, is 2.14 inches; according to which dimensions, he calculates that it will require 44 grains to sink the body to the bottom, allowing it only four inches to descend; at the same time that it is evident, that the fewer grains that are required to sink it to this depth, the more nice the barometer will be. He also calculates, that when the mercury in the common barometer, is $30\frac{1}{2}$ inches high, the body with a weight of 44 grains on its top will be kept *in æquilibrio* with the water; but when the mercury stands at 28 inches, only 19 grains can be supported: and lastly, by computing the length of the diagonal threads, &c. he finds, that his instrument is 1200 times more exact than the common barometer. The following are his observations on the use of it.

25 Mr Caswell's observations with his barometer.

"1. While the mercury of the common barometer is often known to be stationary 24 hours together, the bubble of the new barometer is rarely found to stand still one minute.

"2. Suppose the air's gravity increasing, and accordingly the bubble ascending; during the time that it ascends 20 inches, it will have many short descents of the quantity of half an inch, one, two, three, or more inches; each of which being over, it will ascend again. These retrocessions are frequent, and of all varieties in quantity and duration; so that there is no judging of the general course of the bubble by a single inspection, though you see it moving, but by waiting a little time.

"3. A small blast of wind will make the bubble descend; a blast that cannot be heard in a chamber of the town will sensibly force the bubble downward. The blasts of wind sensible abroad, cause many of the above-mentioned retrocessions or accelerations in the general course; as I found by carrying my barometer to a place where the wind was perceptible.

"4. Clouds make the bubble descend. A small cloud approaching the zenith, works more than a great cloud near the horizon. In cloudy weather, the bubble descending, a break of the clouds (or clear place) approaching to the zenith, has made the bubble to ascend; and after that break had passed the zenith a considerable space, the bubble again descended.

"5. All clouds (except one) hitherto by me observed, have made the bubble to descend. But the other day, the wind being north, and the course of the bubble descending, I saw to the windward a large thick cloud near the horizon, and the bubble still descended: but as the cloud drew near the zenith, it turned the way of the bubble, making it to ascend; and the bubble continued ascending till the cloud was all passed, after which it resumed its former descent. It was a cloud that yielded a cold shower of small hail."

These are the most remarkable contrivances for the improvement of the common barometer; the last, on account of its being so exceedingly sensible, and likewise easy of construction and portable, seems to deserve attention much more than the others, which are always the more inaccurate, and the less easily moved, according to the enlargement of their scale; whereas this is seemingly subject to no such inconvenience. It is evident, however, that none of these could be used at sea, on account of the unsteady motion of the ship: for which reason Dr Hook thought of constructing a barometer upon other principles.

26 Marine barometer by Mr Hook.

This contrivance was no other than two thermometers. The one was the common spirit-of-wine thermometer, which is affected only by the warmth of the air: the other, which acts by the expansion of a bubble of air included, is affected not only by the external warmth, but by the various weight of the atmosphere. Therefore, keeping the spirit thermometer as a standard, the excess of the ascent or descent of the other above it would point out the increase or decrease of the specific gravity of the atmosphere. This instrument is recommended by Dr Halley, who speaks of it as follows. "It has been observed by some, that, in long keeping this instrument, the air included either finds means to escape, or deposits some vapours mixed with it, or else from some other cause becomes less elastic, whereby in process of time it gives the height of the mercury somewhat greater than it ought: but this, if it should happen in some of them, hinders not the usefulness thereof, for that it may at any time very easily be corrected by experiment; and the rising and falling thereof are the things chiefly remarkable in it, the just height being barely a curiosity.

27 Recommended by Dr Halley.

"I had one of these barometers with me in my late southern voyage, and it never failed to prognosticate and give early notice of all the bad weather we had, so that I depended thereon, and made provision accordingly; and from my own experience I conclude, that a more useful contrivance hath not for this long time been offered for the benefit of navigation."

Fig. 10. represents a kind of *Chamber Barometer*, or a complete instrument for observing in a fixed place, such as a room, &c. the changes in the atmosphere. It is constructed by Mr W. Jones, optician, London; and consists of a barometer *d*, thermometer *a a*, and hygrometer *c*, all in one mahogany frame. One advantage of this instrument is, that either the thermometer or hygrometer may be taken from the frame, and occasionally made use of in another place if required. The thermometer is separated by only unscrewing two screws *a, a*; and the hygrometer by unscrewing a brass pin at the back of the frame, not seen in this figure. The index of the hygrometer is at any time set, by only moving with your finger the brass wheel seen at *c*; the two sliding indexes of the barometer and thermometer are moved by a rack-work motion, set in action by the key *g* placed in the holes *h* and *i*. The divisions of the barometer plate *b* are in *tenths* of an inch, from 28 to 31 inches; these again subdivided into *hundredths* by means of the *vernier scale*, placed oppositely on a sliding slip of brass similar to the common barometers, most of which are now made with this *vernier*. On this vernier are *ten equal parts*, or divisions; (see A, fig. 11. which for the sake of perspicuity is drawn larger). All of these together are equal just to 11 of those on the scale of inches; that is, to eleven tenths. By this artifice the height of the mercury at E is evident by inspection only, to the one hundredth part of an inch. To understand this, nothing more is necessary than to consider, that *one tenth part of a tenth of an inch* is the *one hundredth part of an inch*. Now every tenth of an inch in the scale B is divided into ten equal parts by the slip or *vernier* A: for since ten divisions on that exceed ten on the scale by one division, that is, by one tenth of an inch; therefore one division on the vernier will exceed one division on the scale by *one tenth part*; and two divisions on the *vernier* will exceed two on the scale by *two tenths*, and so on: Therefore every division on the *vernier* will exceed the same number of divisions in the scale *by so many tenths of a tenth*, or *by so many hundredth parts of an inch*. Therefore the ten equal divisions of an inch on the scale B, must be looked upon as so many *ten hundredth parts of an inch*, and numbered thus, 10, 20, 30, 40, &c. parts of an inch; then the *vernier* gives the unit to each ten, thus: Set the index C very nicely to the top of the surface of the mercury E; and if at the same time the beginning of the divisions at C coincides with a line of division in the scale B, then it shows the altitude of the mercury in *inches* and *tenths of an inch* exactly. But suppose the index line C of the *vernier* falls *between* two divisions or tenths on the scale B, then there will be a coincidence of lines on both at that number of the vernier, which shows how many tenth parts of that tenth the index of the vernier has passed the last decimal division of the scale. Thus, for example, suppose the index of the vernier were to point somewhere between the sixth and seventh tenth above 30 on the scale: then if, by looking down the *vernier*, you observe the coincidence at number 8, it shows that the altitude of the mercury is 30 inches and 68 parts of a hundredth of another inch; or simply thus, 30.68 inches.

28 Chamber barometer by Mr William Jones.

29 Method of using the vernier scale.

Barometer.

The screw at fig. 10. serves to press the mercury quite up into the tube, when required to be much moved or carried about, thereby rendering the barometer of the kind called *portable*. To the lower extremity of the tube (see fig. 14.) is cemented a wooden reservoir A, with a kind of leathern bag at bottom, the whole containing the mercury, but not quite full: and though the external air cannot get into the bag to suspend the mercury in the tube, by pressing on its surface, as in the common one; yet it has the same effect by pressing on the outside of the bag; which being flexible, yields to the pressure, and keeps the mercury suspended in the tube to its proper height. Through the under part of the frame passes the screw *f*, with a flat round plate at its end; by turning of this screw, the bag may be so compressed as to force the mercury up to the top of the tube, which keeps it steady, and hinders the tube from breaking by the mercury dashing against the top when carried about, which it is otherwise apt to do.

30 Marine barometer by Mr Nairne.

A new kind of marine barometer has lately been invented by Mr Nairne. It differs from the common one in having the bore of the tube small for about two feet in its lower part; but above that height it is enlarged to the common size. Through the small part of the instrument the mercury is prevented from ascending too hastily by the motion of the ship; and the motion of the mercury in the upper wide part is consequently lessened. Much is found to depend on the proper suspension of this instrument; and Mr Nairne has since found, by experiment, the point from which it may be suspended so as not to be affected by the motion of the ship.

31 By Passemente.

Another marine barometer has been invented by one Passemente, a French artist. It is only a common one having the middle of the tube twisted into a spiral consisting of two revolutions. By this contrivance, the impulses which the mercury receives from the motions of the ship are destroyed by being transmitted in contrary directions.

32 Barometer applied to the mensuration of altitudes.

We must now speak of the barometer in its second character, namely, as an instrument for measuring accessible altitudes. This method was first proposed by M. Pascal; and succeeding philosophers have been at no small pains to ascertain the proportion between the sinking of the mercury and the height to which it is carried. For this purpose, however, a new improvement in the barometer became necessary, viz. the making of it easily portable from one place to another without danger of its being broken by the motion of the mercury in the tube; which was effected by the contrivance already mentioned.

33 Statical barometer.

Among the number of portable barometers we may perhaps reckon what Mr Boyle called his *Statical* Barometer. It consisted of a glass bubble, about the size of a large orange, and blown very thin, so as to weigh only 70 grains. This being counterpoised by brass weights in a pair of scales that would turn with the 20th part of a grain, was found to act as a barometer. The reason of this was, that the surface of the bubble was opposed to a vastly larger portion of air than that of the brass weight, and consequently liable to be affected by the various specific gravity of the atmosphere: thus, when the air became specifically light, the bubble descended, and *vice versa*; and thus, he says, he could have perceived variations of the atmosphere no greater than would have been sufficient to raise or lower the mercury in the common barometer an eighth part of an inch.

34 Method of measuring the changes of the air by the sound of a wire.

To these we may add an account of a new and very singular barometer mentioned by M. Lazowski in his tour through Switzerland. "A curè, shortsighted, who nevertheless amused himself with firing at a mark, thought of stretching a wire in such a manner as to draw the mark to him, in order to see how he had aimed. He observed, that the wire sometimes sounded as if it had been oscillatory; and that this happened when a change was about to ensue in the atmosphere; so that he came to predict with considerable accuracy when there was to be rain or fine weather. On making further experiments, it was observed, that this wire was more exact, and its sounds more distinct, when extended in the plane of the meridian than in other positions. The sounds were more or less soft, and more or less continued, according to the changes of weather that were to follow; though the matter was not reduced to any accuracy, and probably is not capable of much. Fine weather, however, was said to be announced by the sounds of counter tenor, and rain by those of bass. M. Volta was said to have mounted 15 chords at Pavia, in order to bring this method to some perfection; but there are as yet no accounts of his success.

35 Difficulties in measuring heights by the barometer.

The portable barometer, as already observed, has long been in use for the mensuration of accessible altitudes; and, in small heights, was found to be more exact than a trigonometrical calculation, the mercury descending at the rate of about one inch for 800 feet of height to which it was carried: but, in great heights, the most unaccountable differences were found between the calculations of the most accurate observers; so that the same mountain would sometimes have been made thousands of feet higher by one person than another; nay, by the same person at different times. All these anomalies M. de Luc of Geneva undertook to account for, and to remove; and in this undertaking he persisted with incredible patience for 20 years. The result of his labour is as follows.

36 Removed by M. de Luc.

The first cause of irregularity observed was a fault in the barometer itself. M. de Luc found, that two barometers, though perfectly alike in their appearance, did not correspond in their action. This was owing to air contained in the tube. The air was expelled by boiling the mercury in them; after which, the motions of both became perfectly consonant.

37 Mercury, how boiled in the tubes, with the effects.

That the tubes may bear boiling, they must not be very thick, the thickness of the glass not above half a line, and the diameter of the bore ought to be from two and a half to three lines. The operation is performed in the following manner: A chaffing dish with burning coals is placed on a table; the tube hermetically sealed at one end, is inverted, and filled with mercury within two inches of the top; the tube is gradually brought near the fire, moving it obliquely up and down, that the whole length of it may be heated; and advancing it nearer and nearer, till it is actually in the flame, the globules of air begin to move visibly towards the top. The boiling at last commences; and it is easy to make it take place from one end to the other, by causing the several parts of the tube successively pass with rapidity

through

through the flame. By this operation the mercury is freed from all aerial particles, particularly those which line the inside of the tube, and which cannot easily be got clear of by any other method. When this last stratum of air is discharged, the tube may be afterwards emptied, and filled even with cold mercury, when it will be found nearly as free of air as before. The mercury in the tube thus prepared by a determinate quantity of heat, will rise higher than those in the common sort, and the barometers will more nearly correspond with each other: whereas there will be a difference of six or eight lines in the ascent of mercury in the common barometers. Instruments of this kind rise uniformly in a heated room, whilst those of the common kind descend in different proportions. On cooling the room, the former descend uniformly, while the latter descend unequally, by reason of the unequal proportions of air in them.

38
Variation of the height of the mercury by heat.

The next cause of variation was a difference of temperature. To discover the effects of heat on the mercury, several barometers were chosen that for a long time had been perfectly consonant in their motions. One of these was placed in an apartment by itself, to mark the change in the external air, if any should happen. The rest were situated in another apartment, along with three thermometers, graduated according to the scale of M. de Reaumur, and exactly correspondent with one another. The point at which the mercury stood when the experiment began, was carefully noted, and also the precise height of the thermometers. The latter apartment then was gradually heated; and with so much uniformity, that the thermometers continued still to agree. When the heat had been augmented as much as possible, the altitudes both of the barometers and thermometers were again accurately marked, to ascertain the differences that corresponded to one another. This experiment was repeated several times with next to no variation; and from the barometer in the first apartment it appeared, that no sensible alteration had taken place in the external air. Hence M. de Luc found, that an increase of heat sufficient to raise the thermometer from the point of melting ice to that of boiling water, augments the height of the mercury in the barometer precisely six lines; and, therefore, dividing the distance between these two points on the thermometer into 96 equal parts, there will be $\frac{1}{16}$th of a line to add to, or subtract from, the height of the mercury in the barometer, for every degree of variation of the thermometer so graduated. A scale of this kind, continued above boiling or below freezing water, accompanies his portable barometer and thermometer.—So accurate, he says, did long practice make him in barometrical observations, that he could distinguish a variation of $\frac{1}{16}$ of a line in the height of the mercury. He allows of no inclination of the tube, or other means to augment the scale, as all these methods diminish the accuracy of the instrument. Two observations are always required to measure the altitude of a mountain: one with a barometer left on the plain, and another on the summit; and both must be accompanied with a thermometer.

39
M. de Luc's portable barometer.

His portable barometer consists of two tubes, one of 34 French inches in length; and from the top, for this length, perfectly straight; but below this, it is bent round, so that the lower end turns up for a short space parallel to the straight part. On this open end is fixed a cock; and on the upper side of this cock is placed another tube, of the same diameter with the former, eight inches in length, open at both ends, and communicating with the long tube, through the cock. When the barometer is carried from one place to another, it is inverted very slowly, to hinder any air getting in; the quicksilver retires into the long tube on which the key of the cock is turned; and to preserve the cock from too great pressure of the mercury, the barometer is conveyed about in this inverted posture. When an observation is to be made, the cock is first opened; the tube is then turned upright, very slowly, to prevent, as much as possible, all the vibration of the mercury, which disturbs the observation; and according to the weight of the atmosphere, the mercury falls in the longer branch, and rises up through the cock, into the shorter.

The whole of the cock is made of ivory, except the key. The extremities of the tubes are wrapped round with the membrane employed by the gold-beaters, done over with fish-glue, in order to fix them tight, the one in the lower, and the other in the upper, end of the perpendicular canal of the cock. The part of the key that moves within the cock is of cork, and the outward part or the handle is of ivory. The cock is fastened firmly to the ivory by means of a broad thin plate of steel, which cuts both the ivory and cork, lengthwise, through the centre, and reaches inward to the hole of the key. This plate also counteracts the flexibility of the cork, and makes it obey the motion of the handle, notwithstanding it is very considerably compressed by the ivory, to render it tight. That this compression may not abridge the diameter of the hole of the key, it is lined with a thin hollow ivory cylinder, of the same diameter with the tubes.

On the upper end of the shorter tube is fixed, in the intervals of observation, a kind of funnel, with a small hole in it, which is shut with an ivory stopple. The use of it is to keep the tube clean; to replace the mercury that may have made its way through the cock in consequence of any dilatation; and likewise to replace the mercury taken out of the shorter tube, after shutting the cock, on finishing an observation; because, when the mercury is left exposed to the air; it contracts a dark pellicle on its surface, that sullies both itself and the tube. The shorter tube should be wiped from time to time, by a little brush of sponge fixed on the end of a wire.

The barometer, thus constructed, is placed in a long box of fir, the two ends of which are lined on the inside with cushions of cotton covered with leather. This box may be carried on a man's back, like a quiver, either walking or riding; and should have a cover of wax-cloth to defend it against rain. It should be kept at some distance from the body of the man, and be protected from the sun by an umbrella, when near the place of observation, to prevent its being affected by any undue degree of heat. The barometer should, farther, be attended with a plummet, to determine the perpendicular position of it; and a tripod to support it firm in that position at the time of observation.

The scale of the barometer begins on the long tube, at a point on a level with the upper end of the short one; and

Digitized by Google

Barometer. and rises, in the natural order of the numbers, to 21 inches. Below the above point, the scale is transferred to the short tube: and descends on it, in the natural order of the numbers, to 7 inches. The whole length of the scale is 28 French inches: and since, as the mercury falls in the one tube, it must rise in the other, the total altitude will always be found by adding that part of the scale, which the mercury occupies in the long tube, to that part of it which the mercury does not occupy in the short one. In estimating, however, the total fall or rise on the long tube, every space must be reckoned twice; because, of barometers of this construction, half the real variation only appears in one of the branches.

Near the middle of the greater tube is placed the thermometer above mentioned, for ascertaining the corrections to be made on the altitude of the mercury in consequence of any change in the temperature of the air. It is placed about the middle of the barometer, that it may partake as much as possible of its mean heat. The ball is nearly of the same diameter with the tube of the barometer, that the dilatations or condensations of the fluids they contain may more exactly correspond. The scale is divided into 96 parts, between the points of boiling water and melting ice; and the term of 0 is placed one-eighth part of this interval above the lower point; so that there are 12 degrees below, and 84 above it. The reason for placing 0 here is, that as 27 French inches are about the mean height of the barometer, so the 12th degree above freezing is nearly the mean altitude of the thermometer. Hence, by taking these two points, the one for the mean altitude, and the other for the mean heat, there will be fewer corrections necessary to reduce all observations to the same state, than if any higher or lower points had been fixed upon.

If then the barometer remains at 27 inches, and the thermometer at 0, there are no corrections whatever to be made. But if, while the barometer continues at 27 inches, the thermometer shall rise any number of degrees above 0, so many sixteenths of a line must be subtracted from the 27 inches, to obtain the true height of the barometer produced by the weight of the atmosphere, and to reduce this observation to the state of the common temperature. If, on the other hand, the thermometer shall fall any number of degrees below 0, while the barometer still stands at 27 inches, so many sixteenths must be added to that height, to obtain the true altitude.

Nothing is more simple than these corrections, when the barometer is at or near 27 inches of height. If, however, it fall several inches below this point, as the portable barometer very frequently must, the dilatations will no longer keep pace with the degrees of heat, after the rate of $\frac{1}{16}$ of a line for every degree of the thermometer; because the columns of mercury being shortened, the quantity of fluid to be dilated will be diminished. The truth is, the quantity of the dilatations for the same degree of heat is just as much diminished as the column is shortened. If, then, it shall still be found convenient to reckon the dilatations by sixteenths of a line, these sixteenths must be counted on a scale, of which the degrees shall be as much longer than the degrees of the first scale, as the shortened column of mercury is less than 27 inches, the height to which the length of the degrees of the first scale was adapted. For instance, let the mercury descend to $13\frac{1}{2}$ inches, half the mean column, and let the thermometer ascend 10 degrees above the mean heat; 10 sixteenths should be deduced from the mean column, for this temperature, according to the rule; but 10 half-sixteenths only, or 5 whole sixteenths, must be subtracted from the column of $13\frac{1}{2}$ inches, because the sum of its dilatations will be half that of the former, the quantities of fluid being to one another in that proportion.

It would cause considerable embarassment if the sixteenths of correction were always to be subdivided into less fractions, proportional to every half inch of descent of the barometer; and the same end is obtained in a very easy manner, by reckoning the corrections on different scales of the same length, but of which the degrees are longer according as the columns of the barometer are shorter. For example, the degrees of correction on the scale applicable to the column of $13\frac{1}{2}$ inches, will be double in length what the same degrees are for the column of 27 inches; and of course the number of corrections will be reduced likewise one half, which we have seen by the rule they ought to be.

The author constructed, on a piece of vellum, scales with these properties, for no less than 23 columns of mercury, being all those between 18 inches and 29 inclusive, counting from half inch to half inch; within which extremes, every practical case will be comprehended. He wrapped this vellum on a small hollow cylinder, including a spring, like a spring-curtain, and fixed it on the right side of the thermometer. The vellum is made to pass from right to left, behind the tube of the thermometer, and to graze along its surface. The observer, to find the corrections to be made, pulls out the vellum till the scale corresponding to the observed altitude of the barometer comes to touch the thermometer, and on that scale he counts them. The vellum is then let go, and the screw gently furls it up.

40 His operations on the mountain of Saleve.

The author having now, as he imagined, completely finished the instruments necessary for the accurate mensuration of heights, proceeded to establish, by experiment, the altitudes corresponding to the different descents of the mercury. Much had been written, and many rules had been given, on this subject, by different eminent philosophers, since the days of Pascal, who first broached it: but these disagreed so much with one another, and presented so little good reason why any one of them should be preferred, that no conclusion could with confidence be deduced from them. It became requisite, therefore, to lay them all aside, and to endeavour to discover by practice what could not be ascertained by theory. Saleve, a mountain near Geneva, was chosen for the scene of these operations. This mountain is near 3000 French feet high. The height of it was twice measured by levelling, and the result of the mensurations differed only $10\frac{1}{2}$ inches; though there intervened six months between them, and the total altitude was so considerable. On this mountain were chosen no less than 15 different stations, rising after the rate of 200 feet, one above another, as nearly as

Barometer. as the ground would admit. At these stations, it was proposed to make such a number of observations as might be a good foundation either for establishing a new rule of proportion between the height of places and the descents of the mercury, or for preferring some one of those formerly discovered.

41
Strange anomalies of the barometer at different times of the day.

Little progress was made in this plan, when a phenomenon, altogether unexpected, presented itself. The barometer being observed, at one of the stations, twice in one day, was found to stand higher in the latter observation than in the former. This alteration gave little surprise, because it was naturally imputed to a change of the weight of the atmosphere, which would affect the barometer on the plain in the same manner. But it produced a degree of astonishment, when on examining the state of the latter, it was found, instead of corresponding with the motions of the former, to have held an opposite course, and to have fallen while the other rose. This difference could not proceed from any inaccuracy in the observations, which had been taken with all imaginable care; and it was so considerable as to destroy all hopes of success, should the cause not be detected and compensated.

The experiment was repeated several times at intervals, that no material circumstance might escape notice. An observer on the mountain, and another on the plain, took their respective stations at the rising of the sun, and continued to mark an observation, every quarter of an hour, till it set. It was found, that the lower barometer gradually descended for the first three quarters of the day; after which it reascended, till in the evening it stood at nearly the same height as in the morning. While the higher barometer ascended for the first three-fourths of the day; and then descended, so as to regain likewise, about sunset, the altitude of the morning.

42
Accounted for.

The following theory seems to account in a satisfactory manner for this phenomenon. When the sun rises above the horizon of any place, his beams penetrate the whole of the section of the atmosphere of which that horizon is the base. They fall, however, very obliquely on the greater part of it, communicate little heat to it, and consequently produce little dilatation of its air. As the sun advances, the rays become more direct, and the heat and rarefaction of course increase. But the greatest heat of the day is not felt even when the rays are most direct, and the sun is in the meridian. It increases while the place receives more rays than it loses, which it will do for a considerable time after mid-day; in like manner as the tide attains not its highest altitude till the moon has advanced a considerable way to the west of the meridian. The heat of the atmosphere is greatest at the surface of the earth, and seems not to ascend to any great distance above it. The dilatations, for this reason, of the air, produced by the sun, will be found chiefly, if not solely, near the earth. A motion must take place, in all directions, of the adjacent air, to allow the heated air to expand itself. The heated columns extending themselves vertically, will become longer, and at the same time specifically lighter, in consequence of the rarefaction of their inferior parts. The motion of air, till it arises into wind, is not rapid: these lengthened columns, therefore, will take some time to dissipate their summits among the adjacent less rarefied columns that are not so high; at least, they will not do this as fast as their length is increased by the rarefaction of their bases.

The reader, we presume, anticipates the application of this theory to the solution of the phenomenon in question. The barometer on the plain begins to fall a little after morning, because the column of air that supports it becomes specifically lighter on account of the rarefaction arising from the heat of the sun. It continues to fall for the first three quarters of the day; because, during that time, the heat, and consequently the rarefaction, are gradually increasing. It rises again after this period; because the cold, and of course the condensation, coming on, the specific gravity is augmented by the rushing in of the adjacent air. The equilibrium is restored, and the mercury returns to the altitude of the morning.

The barometer on the eminence rises after morning, and continues to do so for three-fourths of the day, for two reasons. The density of the columns of air is greatest near the earth, and decreases as the distance from it increases. The higher, for this reason, we ascend in the atmosphere, we meet with air specifically lighter. But by the rarefaction of the base of the column that supports the mercury of the barometer on the eminence, the denser parts of that column are raised higher than naturally they would be if left to the operation of their own gravity. On this account, the higher barometer is pressed with a weight, nearly as great as it would sustain, were it brought down, in the atmosphere, to the natural place of that denser air now raised above it by the prolongation of the base of the column. The other reason is, that as the rarefaction does not take place at any great distance from the earth, little change is produced in the specific gravity of the portion of the column that presses on the higher barometer, and the summit of that column dissipates itself more slowly than it increases. Thus, we see how this barometer must ascend during the first three-fourths of the day, and pursue a course the reverse of that on the plain. The condensation returning after this time, the denser air subdues, the equilibrium takes place, and the mercury descends to its first position.

43
Render another pair of thermometers necessary.

This phenomenon prompted the idea of a second pair of thermometers, to measure the mean heat of the column of air intercepted between the barometers. These thermometers are extremely delicate and sensible. The tubes are the finest capillary, the glass very thin, and the diameters of the balls only three lines. The balls are insulated, or detached from the scales, which are fixed to the tubes only, by ligatures of fine brass-wire covered with silk. The air, by this contrivance, has free communication with the balls on all sides; and, if the direct rays of the sun be intercepted at some distance by a bit of paper, or even the leaf of a tree, the thermometers will quickly mark the true temperature of the air.

44
Method of computing the altitudes.

The reader, perhaps, will ask here, Could not this end have been gained by the first pair of thermometers? But we must request him to suspend his judgement till we have explained the theory of computing the altitudes from the descents of the mercury. He will

will then find the scales of these thermometers so different, that neither of them could, without much inconveniency, serve the purpose of the other.

The altitudes are computed by logarithms. A table of logarithms contains two series of numbers, running parallel to one another. The first has its terms in geometrical progression, and the second its terms in arithmetical. The natural numbers 1, 2, 3, 4, &c. form the first series; which, though in arithmetical progression when standing detached, are in geometrical in regard of the second series; whose terms are in arithmetical progression, and are called *logarithms*, because they express the distance of their correspondent terms of the geometrical progression from the beginning of the series.

To apply this table to the present purpose: let us suppose the whole atmosphere divided into concentric spherical sections, whose common centre is that of the earth. Suppose also all these sections of equal thickness, namely, 12.497 toises, which is found to be the thickness of the lowest section, and balances a line of mercury, when the barometer stands at 348 lines or 26 inches. Add, then, all these sections together; and we shall have the total altitude of the atmosphere expressed in an arithmetical progression, whose common difference is 12.497 toises. Consequently, in this view, the heights are proportioned to the logarithms.

It remains only to find the descents of the mercury, which measures the weights of the respective sections, in geometrical proportion, in order to justify the application of the logarithmic table to the computation of the altitudes. Now, it is easy to prove, in a very satisfactory manner, that the mean densities of these sections, which are in proportion of their weights, must be in geometrical progression, when the altitudes are in arithmetical; consequently, it is with great propriety and convenience that the logarithms are employed in the computation of the altitudes corresponding to the descents of the mercury. For, to find the vertical distance between two barometers, at different heights, no more is necessary than to look, in a table of logarithms, for the numbers that express in lines, or sixteenths of a line, the altitudes of the two columns of mercury, and take the logarithms of these numbers, whose difference will give this distance accurately, in thousandth parts of a toise. Multiply the toises by 6, which will furnish the altitudes in French feet.

This author made about 500 different observations at the several stations on the mountain of Saleve, which both suggested and verified the computation by logarithms. Many, however, of these observations, produced conclusions that deviated considerably from the results of the actual mensuration, on account of the different temperatures in which they were taken. It was the design of the second pair of thermometers to point out the corrections of these deviations. In settling the scales necessary for this end, the first object was, to mark the temperature of all the observations where the logarithms gave the altitudes exactly, or nearly equal to what they were found to be by levelling. This temperature corresponded to 16¾ on the scale of Reaumur, and to 70 on that of Fahrenheit, and at it was fixed the term 0. The next step was, to determine the corrections of the heights that became necessary, according as the state of the air was warmer or colder than the fixed point. With this view, all the remaining observations were collected, and compared with the different temperatures in which they were taken; and from an attentive examination of these circumstances, it was discovered, that for every 215 feet of height furnished by the logarithms, one foot of correction must be added or subtracted, for every degree of the thermometer, according as it stood above or below the term 0.

The scale of Reaumur did not conveniently express this correction of 1 to 215. The author wished to adopt the ratio of 1 to 1000, in forming a new scale for that purpose; but the divisions would have been too small. He employed, therefore, that of 1 to 500: because, by doubling the degrees of the higher thermometer above or below 0; or, which amounted nearly to the same thing, by doubling the mean heat of the column of air in taking the sum of the degrees of both thermometers, there resulted the ratio of 1 to 1000. The new scale, then, was divided by the following proportion: As 215, the last term of the ratio found by Reaumur's scale, is to 500, the last term of the ratio to be applied on the new scale: so is 80, the parts between the fixed points of the first scale, to 186, the number of parts between the same points on the second. And as 80 is to 186; so is 16¾, the point on Reaumur's scale at which the logarithms give the altitudes without correction, to 39, the point at which they give them on the new scale. The term 0 is placed at this point, 39 at melting ice, and 147 at that of boiling water. To reduce all observations to the same temperature by this scale, nothing more is necessary than to multiply the heights found from the logarithms by the sum of the degrees of both thermometers above or below 0, and to divide the product by 1000. The quotient must be added to, or subtracted from, the logarithmic height, according as the temperature is positive or negative.

45. Specimen of this method of mensuration.

As a specimen of the author's method, we shall now present our readers with the result of his operations at the 15 stations on Saleve. In one column are marked the heights found by levelling, and opposite to them the same heights found by the barometer; to the latter are prefixed the number of observations of which they are the mean.

Stations.	*Heights by Levelling.* Feet.	Inches.	*Numbers of Observations.*	*Heights by Barometer.* Feet.
1	216	2	12	$230\frac{1}{2}$
2	428	10	13	$435\frac{1}{15}$
3	586	0	13	$591\frac{13}{15}$
4	728	8	21	$732\frac{3}{7}$
5	917	0	24	$919\frac{12}{18}$
6	1218	8	27	$1221\frac{7}{17}$
7	1420	0	23	$1418\frac{17}{18}$
8	1800	0	17	$1798\frac{8}{17}$
9	1965	3	17	$1962\frac{2}{7}$
10	2211	0	17	2210
11	2333	0	17	$2331\frac{6}{17}$
12	2582	4	16	$2583\frac{13}{16}$
13	2700	0	15	$2703\frac{6}{15}$
14	2742	0	10	$2741\frac{1}{5}$
15	2626	0	11	$2924\frac{10}{18}$

From this table we presume the reader will be inclined to entertain the most favourable opinion of the abilities

Barometer. abilities and industry of M. de Luc. Notwithstanding the amazing pains, however, which he has taken to remove every inaccuracy in the barometer, it did not remain entirely free from error; nor in many instances have the observations made by different persons exactly corresponded. Considerable improvements have been suggested by Colonel Roy and Sir George Shuckburgh, &c. (see Phil. Trans. vol. lxvii. and lxviii.); and put in execution, with improvements, by Mr Ramsden, and other ingenious instrument-makers in London. The following is a description of a very portable one constructed by Mr William Jones of Holborn, which, from its principle, comprehends every advantage that M. de Luc's instrument possesses; in many particulars is exempted from the errors to which his is liable; and is not subject to be deranged by carriage or other motion.

46 Description of the most improved barometer yet invented.

Fig. 12. is a representation of the instrument as enclosed in its mahogany case by means of three metallic rings *b b b*: This case is in the form of a hollow cone divided into three arms or legs from *a* to *c*, and is so carved in the inside as to contain steadily the body of the barometer: The arms, when separated, form three firm legs or supports for the barometer when making observations (see fig. 13.): The instrument is suspended at the part *g* of the case, by a kind of improved gimbals; and therefrom, with its own weight, is sufficiently steady in exposed weather. In that part of the frame where the barometer tube is seen (*a e*), there is a long slit or opening made, so that the altitude of the mercury may be seen against the light, and the vernier piece *a* brought down to coincide with the edge of the mercury to the greatest possible exactness. When the instrument is placed on its support, the screw *f* is to be let down in order that the mercury may subside to its proper height; and also a peg at *p* must be loosened, to give admission to the action of the external air upon the mercury contained in the box *b*. The adjustment or mode of observing what is called the *zero*, or 0, division of the column of mercury, is by the mercury being seen in the transparent part of the box *b*; the inside of which is a glass tube or reservoir for the mercury, and an edge piece of metal fixed on the external part of the box. The mercury is to be brought into contact with the edge by turning the screw *f* towards the right or left as necessary. The vernier piece at *a* that determines the altitude of the column of mercury, is to be brought down by the hand to a near contact, and then accurately adjusted by turning the screw *h* at top of the instrument. This barometer has usually two different sorts of scales inserted on it: that on the right at *a e*, is a scale of French inches from 19 to 31, measured from the surface or *zero* of the mercury in the box *b* below, divided into 12th parts or lines, and each line subdivided by the *vernier* into ten parts, so that the height of the column of mercury may be ascertained to the 120th part of a French inch. The scale which is on the other side, or left of observation, is of the same length; but divided into English inches, each of which is subdivided into 20ths of an inch, and the *vernier* subdivides each 20th into 25 parts; so that the height of the mercury is hereby ascertained to the 500th part of an English inch (viz. $20 \times 25 = 500$). But this *vernier* is figured *double* for the conveniency of calculation, viz. the first five divisions are marked 10, the 20 marked 40, and the 25 marked 50; then each exact division is reckoned as the *two thousandth* of an inch, which amounts to the same; for $\frac{1}{500}$ is the same in value as $\frac{2}{1000}$ of an inch. A *thermometer* is always attached to the barometer, and indeed is indispensably necessary: it is fastened to the body at *c*, countersunk beneath the surface of the frame, which makes it less liable to be broken: the degrees of the thermometer are marked on two scales, one on each side, viz. that of Fahrenheit and Reaumur, scales generally known; the freezing point of the former being at 32, and the latter at 0. On the right hand side of these two scales there is a third, called a scale of *correction*; it is placed oppositely to that of Fahrenheit, with the words *add* and *subtract*: it serves as a necessary correction to the observed altitude of the mercury at any given temperature of the air shown by the thermometer. There are several other valuable pieces of mechanism about the instrument that cannot clearly be represented in the figure; but what has already been said, we presume, is sufficient for the reader's general information. For the manner of making the necessary observations, and calculating the necessary particulars deducible therefrom, a full information may be obtained from M. de Luc, *Recherches sur les Modifications de l'Atmosphere*, and the Philos. Trans. vol. lxvii. and lxviii. before cited.

It may be necessary to add here, that by very small additional contrivances to this instrument, Mr Jones renders it equally useful for making observations at sea, with any *marine* barometer that has hitherto been invented.

This article may not be improperly concluded by an observation of Mr Magellan *, relative to a principal cause of error in barometrical measurements. This he states to be owing to the inattention of observers to the *specific gravity* of the mercury with which their barometers were made. If two barometers were both at 30 inches high, and equally circumstanced in every other respect, excepting only the specific gravity of the quicksilver; so that one be filled with the first kind I have tried, viz. whose specific gravity was =13.62 and the other =13.45. In this case, and in all probability many of this kind have often occurred, the error must have been no less than 327 feet; because the heights of the mercurial columns in each barometer must be in the inverse ratio of their specific gravities: viz. 13,45 : 1362 : : 30 : 30,379.

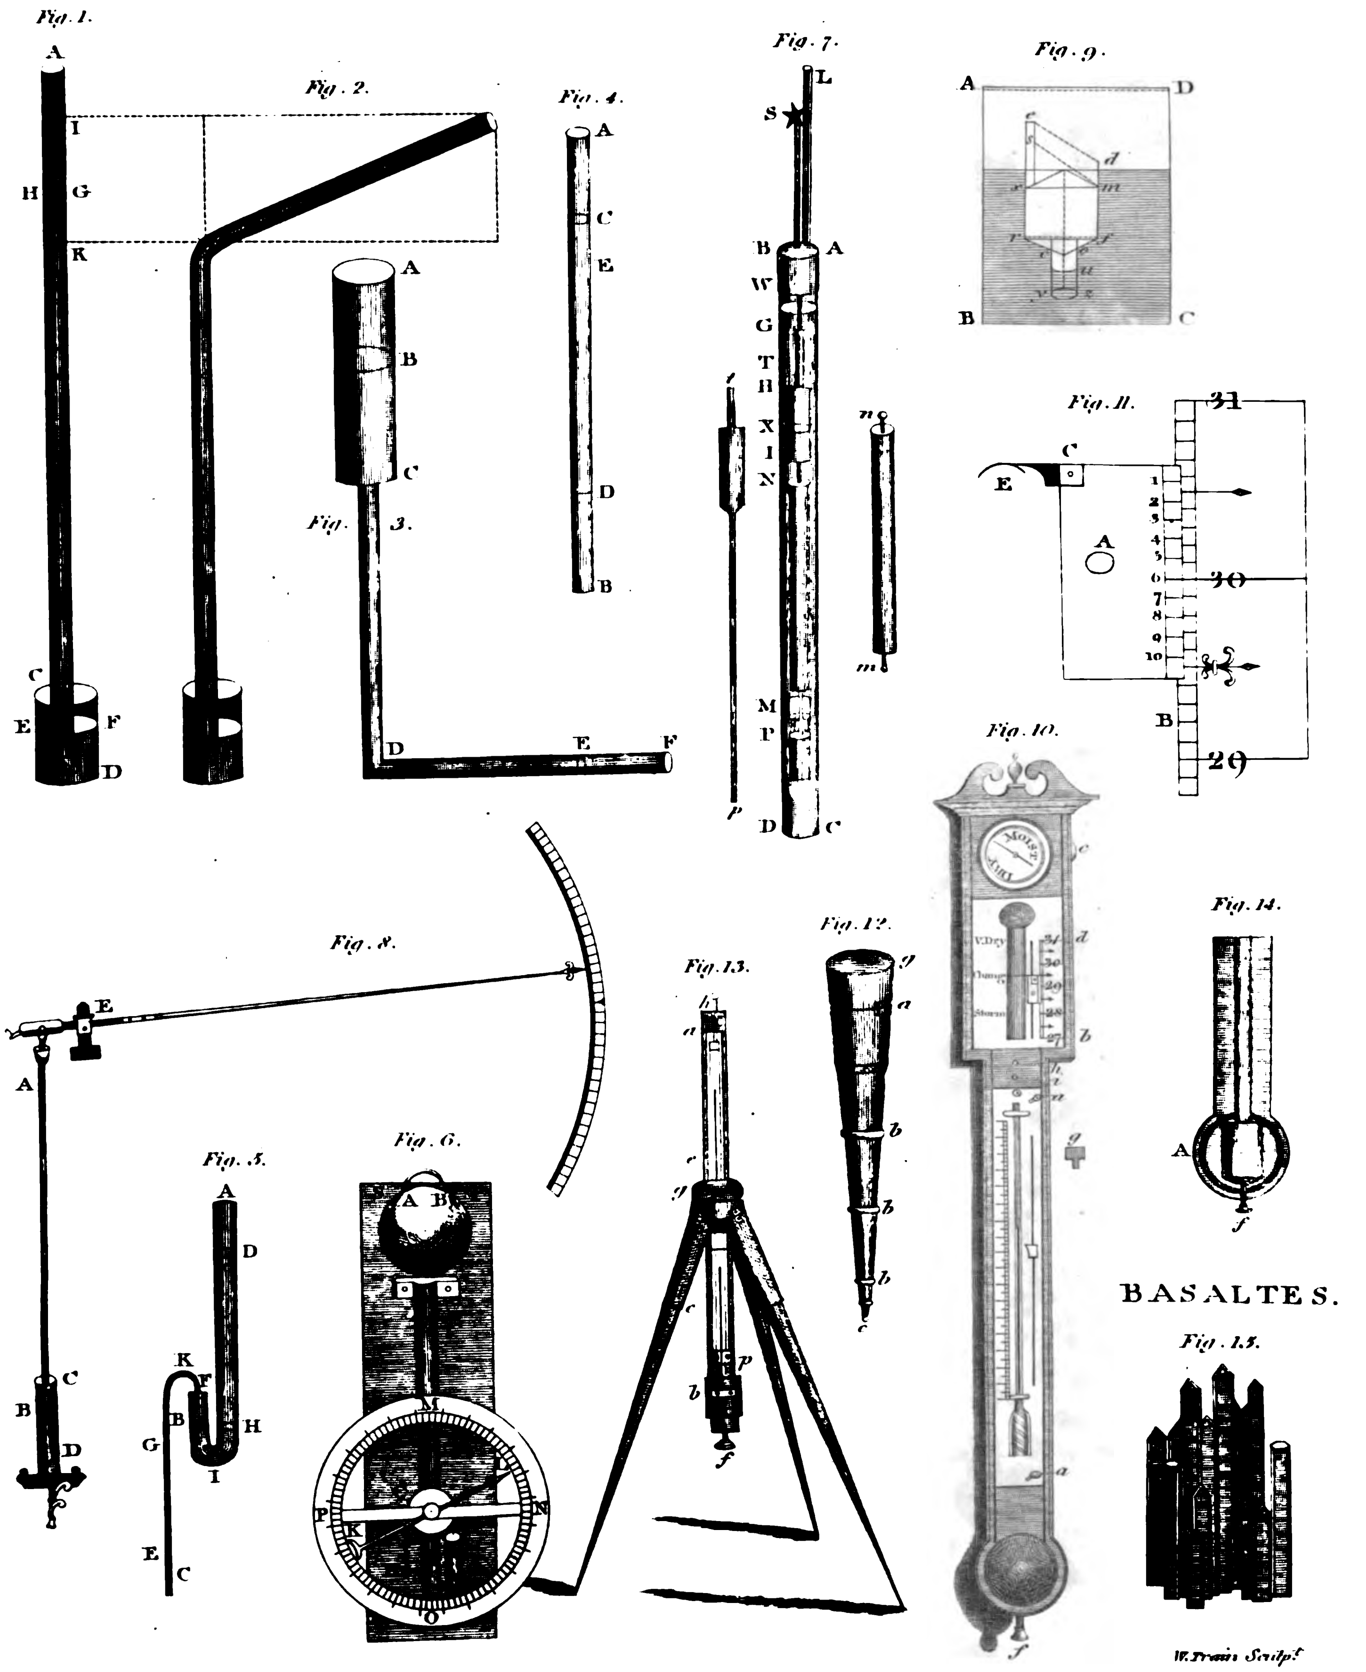
Now the logarithm of 30=4771.21
ditto of 30,379=4825.73

the difference is = 54.52

which difference shows, that there are 54.52 fathoms between one place and another, or 327 feet; though in reality both places are on the same level.

* Magellan's edition of Cronstedt's Mineralogy, Notes on Mercury.

"But if the specific gravity of the mercury, in the two barometers, were as the two above alluded to of Bergman and Fourcroy; viz. one of 14,110, and the other of 13,000, which may happen to be the case, as the heaviest is commonly reputed the purest mercury; on this supposition the error must have amounted to 355,76 toises or above 2134 feet and a half; because 13,000 : 14,110 : : 30 : 32,561, and the difference between



Digitized by Google

between the logarithms of 30 and 32,561 is 355,76, which converted into feet gives 2134,5.

A historical account of the invention and progressive improvement of the Barometer, and of its application to the mensuration of heights, will be found under the articles BAROMETER and BAROMETRICAL MEASUREMENTS in the SUPPLEMENT.

BARON, a person who holds a barony. The origin and primary import of this term are much contested.

Menage derives it from the Latin *baro*, which we find used in the pure age of that language for *vir*, a *stout* or *valiant man;* whence, according to this author, it was, that those placed next the king in battles were called *barones*, as being the bravest men in the army; and as princes frequently rewarded the bravery and fidelity of those about them with fees, the word came to be used for any noble person who holds a fee immediately of the king. Isidore, and after him Camden, take the word in its original sense, to signify a *mercenary soldier*. Messieurs of the Port Royal derive it from βαρυς, *weight* or *authority*. Cicero uses the word *baro* for a stupid brutal man; and the old Germans make mention of *buffeting a baron*, i. e. a *villain;* as the Italians use the word *barone* to signify a *beggar*. M. de Marca derives baron from the German *bar*, *man*, or *freeman;* others derive it from the old Gaulish, Celtic, and Hebrew languages; but the most probable opinion is, that it comes from the Spanish *varo*, a *stout*, *noble person;* whence wives used to call their husbands, and princes their tenants, *barons*. In the Salic law, as well as the laws of the Lombards, the word *baron* signifies a *man* in the general; and the old glossary of Philomenes translates baron by ανηρ, *man*.

BARON is more particularly used among us, for a lord or peer of the lowest class; or a degree of nobility next below that of a viscount, and above that of a knight or baronet. In ancient records the word *baron* included all the nobility of England, because regularly all noblemen were barons, though they had also a higher dignity. But it hath sometimes happened, that, when an ancient baron hath been raised to a new degree of peerage, in the course of a few generations the two titles have descended differently; one perhaps to the male descendants, the other to the heirs general; whereby the earldom or other superior title hath subsisted without a barony: and there are also modern instances where earls and viscounts have been created without annexing a barony to their other honours: so that now the rule doth not hold universally that all peers are barons.

The original and antiquity of barons has occasioned great inquiries among our English antiquarians. The most probable opinion is supposed to be, that they were the same with our present lords of manors; to which the name of *court baron* (which is the lord's court, and incident to every manor) gives some countenance. It is said the original name of this dignity in England was *vavassour*, which by the Saxons was changed to *thane*, and by the Normans into *baron*. It may be collected from King John's *magna charta*, that originally all lords of manors, or barons, had seats in the great council or parliament: but such is the deficiency of public records, that the first precept to be found is of no higher date than the 49th year of King Henry III.; which, although it was issued out in the king's name, was neither by his authority nor by his direction: for, not only the king himself, but his son Prince Edward, and most of the nobility who stood loyal to him, were then prisoners in the hands of the rebellious barons; having been so made in the month of May preceding, at the battle of Lewes, and so continued until the memorable battle of Evesham, which happened in August the year following; when, by the happy escape of Prince Edward, he rescued the king and his adherents out of the hands of Simon Mountfort earl of Leicester. It cannot be doubted but that several parliaments were held by King Henry III. and King Edward I.; yet no record is to be found giving any account thereof (except the 5th of King Edward I.), until the 22d year of the reign of the last mentioned king.

Before the 49th of Henry III. the ancient parliaments consisted of the archbishops, bishops, abbots, earls, and barons. Of these barons there were two sorts: the *greater barons*, or the king's chief tenants, who held of him *in capite* by barony; and the *lesser barons*, who held of the first military service *in capite*. The former had summons to parliament by several writs; and the latter (i. e. all those who were possessed of thirteen knights fees and a quarter) had a general summons from the sheriff in each county. Thus things continued till the 49th of Henry III. But then, instead of keeping to the old form, the prevailing powers thought fit to summon, not all, but only those of the greater barons who were of their party; and, instead of the lesser barons who came with large retinues, to send their precepts to the sheriff of each county, to cause two knights in every shire to be chosen, and one or two burgesses for each borough, to represent the body of the people residing in these counties and boroughs; which gave rise to the separation into two houses of parliament. By degrees the title came to be confined to the greater barons, or lords of parliament only; and there were no other barons among the peerage but such as were summoned by writ, in respect of the tenure of their lands or baronies, till Richard II. first made it a mere title of honour, by conferring it on divers persons by his letters patent. See further on this subject the article LAW.

When a baron is called up to the house of peers by writ of summons, the writ is in the king's name, and he is directed to come to the parliament appointed to be held at a certain time and place, and there to treat and advise with his majesty, the prelates, and nobility, about the weighty affairs of the nation. The ceremony of the admission of a baron into the house of peers is thus: He is brought into the house between two barons, who conduct him up to the lord chancellor, his patent or writ of summons being carried by a king at arms, who presents it kneeling to the lord chancellor, who reads it, and then congratulates him on his becoming a member of the house of peers, and invests him with his parliamentary robe. The patent is then delivered to the clerk of the parliament, and the oaths are administered to the new peer, who is then conducted to his seat on the barons bench. Some barons hold their seats by tenure. The first who was raised to this dignity by patent was John de Beauchamp of Holt Castle, created baron of Kidderminster in Worcestershire, to him and his heirs male, by King Richard II. in the 11th year of his reign. He

Digitized by Google

invested him with a mantle and cap. The coronation-robes of a baron are the same as an earl's, except that he has only two rows of spots on each shoulder. In like manner, his parliamentary robes have but two guards of white fur, with rows of gold lace. In other respects they are the same as other peers. King Charles II. granted a coronet to the barons. It has six pearls, set at equal distances on the chaplet. His cap is the same as a viscount's. His style is *Right Honourable;* and he is styled by the king or queen, *Right Trusty and Well Beloved.*

Barons by ancient tenure were those who held certain territories of the king, who still reserved the tenure in chief to himself. We also read of *barons by temporal tenure;* who are such as hold honours, castles, manors, as heads of their barony, that is, by grand sergeanty; by which tenure they were anciently summoned to parliament. But at present a baron by tenure is no lord of parliament, till he be called thither by writ.

The barons by tenure after the Conquest, were divided into *majores* and *minores*, and were summoned accordingly to parliament; the *majores* or greater barons, by immediate writ from the king; the *minores*, or lesser barons, by general writ from the high sheriff, at the king's command.

Anciently they distinguished the greater barons from the less, by attributing high, and even sovereign jurisdiction, to the former, and only inferior jurisdiction over smaller matters to the latter.

Barons of the Exchequer, the four judges to whom the administration of justice is committed, in causes between the king and his subjects relating to matters concerning the revenue. They were formerly barons of the realm, but of late are generally persons learned in the laws. Their office is also to look into the accounts of the king, for which reason they have auditors under them. See Exchequer.

Barons of the Cinque-ports are members of the house of commons, elected by the five ports, two for each port. See the article Cinque-ports.

Baron and Feme, in the *English Law*, a term used for husband and wife, in relation to each other: and they are deemed but one person; so that a wife cannot be witness for or against her husband, nor he for or against his wife, except in cases of high treason.

Baron and Feme, in *Heraldry*, is when the coats of arms of a man and his wife are born par pale in the same escutcheon, the man's being always on the dexter side, and the woman's on the sinister; but here the woman is supposed not an heiress, for then her coat must be borne by the husband on an escutcheon of pretence.

BARON, Robert, a dramatic author, who lived during the reign of Charles I. and the protectorship of Oliver Cromwell. He received the earlier parts of his education at Cambridge, after which he became a member of the honourable society of Gray's Inn. During his residence at the university, he wrote a novel called the *Cyprian Academy*, in which he introduced the two first of the dramatic pieces mentioned below. The third of them is a much more regular and perfect play, and was probably written when the author had attained a riper age. The names of them are, 1. *Deorum Dona*, a masque. 2. *Gripus and Hegio*, a pastoral. 3. *Mirza*, a tragedy. Mr Baron had a great intimacy with the celebrated Mr James Howell, the great traveller, in whose collections of Letters * there is one to this gentleman, who was at that time at Paris. To Mr Howell in particular, and to all the ladies and gentlewomen in England in general, he has dedicated his romance.

* Vol. ii. Let. 41.

BARONET, a dignity or degree of honour next beneath a baron, and above a knight; having precedency of all knights excepting those of the Garter, and being the only knighthood that is hereditary.

The dignity of baronet is given by patent, and is the lowest degree of honour that is hereditary. The order was founded by King James I. at the suggestion of Sir Robert Cotton, in 1611, when 200 baronets were created at once; to which number it was intended they should always be restrained: but it is now enlarged at the king's pleasure, without limitation.

They had several considerable privileges given them, with an *habendam* to them and their heirs male. They were allowed to charge their coat with the arms of Ulster, which are, in a field argent, a sinister hand, gules; and that upon condition of their defending the province of Ulster in Ireland against the rebels, who then harassed it extremely: to which end they were each to raise and keep up 30 soldiers at their own expence for three years together, or to pay into the exchequer a sum sufficient to do it; which, at 8d. per day per head, was 1095l. So that, including fees, the expence of this dignity may be about 1200l. sterling. To be qualified for it, one must be a gentleman born, and have a clear estate of 1000l. per annum.

Baronets take place according to the dates of their patents; by the terms of which no honour is to be erected between barons and baronets. The title *Sir* is granted them by a peculiar clause in their patents, though they be not dubbed knights: but both a baronet, and his eldest son, being of full age, may claim knighthood.—The first baronet who was created was Sir Nicholas Bacon of Redgrave in Suffolk, whose successor is therefore styled *Primus Baronetorum Angliæ.*

Baronets of Scotland, called also *Baronets of Nova Scotia.* The order of knights baronets was also designed to be established in Scotland in the year 1621, by king James I. for the plantation and cultivation of the province of Nova Scotia in America; but it was not actually instituted till the year 1625 by his son Charles I. when the first person dignified with this title was Sir Robert Gordon of Gordonstone, a younger son of the earl of Sutherland. The king granted a certain portion of land in Acadia or New Scotland, to each of them, which they were to hold of Sir William Alexander (afterwards earl of Stirling), for their encouragement who should hazard their lives for the good and increase of that plantation, with precedency to them, and their heirs-male for ever, before all knights called *equites aurati*, and all lesser barons called *lairds*, and all other gentlemen, except Sir William Alexander his majesty's lieutenant in Nova Scotia, his heirs, their wives and children; that the title of *Sir* should be prefixed to their Christian name, and *Baronet* added to their surname; and that their own and their eldest sons wives should enjoy the title of *Lady, Madame*, or *Dame.*

Digitized by Google

Dame.—His majesty was so desirous of adding every mark of dignity to this his favourite order, that, four years after its institution, he issued a royal warrant, granting them the privilege of wearing an orange ribbon and a medal; which last was presented to each of them by the king himself, according to the words of the warrant. All the privileges of the order, particularly this of wearing the medal, were confirmed at the king's request by the convention of estates in the year 1630; and in order to establish them on the most solid foundation, they were again confirmed by an act of the parliament of Scotland in the year 1633. This mark of distinction fell to the ground with all the other honours of Scotland during the usurpation of the long parliament and of Oliver Cromwell. It continued in general, though not total, disuse after the Restoration. There have been former meetings of the order to revive the use of it, one in the year 1721, and another in 1734. These meetings proved ineffectual, because the proper steps towards its revival were not taken; but, under the auspices of our illustrious monarch George III. such measures were concerted in the year 1775 as have effectually established this honourable dignity.

Baronets of Ireland. This order was likewise instituted by King James I. in the 18th year of his reign, for the same purpose and with the same privileges within the kingdom of Ireland, as he had conferred on the like order in England; for which the Irish baronets paid the same fees into the treasury of Ireland. The first of that kingdom who was advanced to this hereditary dignity was Sir Francis Blundell, then secretary for the affairs of Ireland. Since his time several have been created, no number being limited.

BARONI, Leonora, a celebrated singer and composer, was born at Naples, but spent the greatest part of her life at Rome. She was daughter of Adriana Baroni of Mantua, baroness of Pian-caretta; a lady also distinguished for her musical talents, and for her beauty surnamed the *fair*. Leonora had less beauty than her mother; but excelled her in her profound skill in music, the fineness of her voice, and the charmingness of her manner. She is said by Mr Bayle to have been one of the finest singers in the world. She was, as well as her mother, celebrated by the wits, who strove to excel each other in recording her praises; and in 1639 there was published, at Bracciano, a collection of Latin, Greek, Italian, Spanish, and French poems addressed to her, under this title, *Applausi Poetici alle Glorie della Signora Leonora Baroni*. Among the Latin poems of Milton are no fewer than three entitled *Ad Leonoram Romæ canentem*, wherein this lady is celebrated for her singing, with an allusion to her mother's exquisite performance on the lute. A fine eulogium on this accomplished woman is contained in a discourse on the music of the Italians, printed with the life of Malherbe, and some other treatises at Paris, 1672, in 12mo. This discourse was composed by M. Maugars prior of St Peter de Mac, the king's interpreter of the English language, and besides so famous a performer on the viol, that the king of Spain and several other sovereign princes of Europe desired to hear him. The character given by this person of Leonora Baroni is as follows: She is endowed with fine parts; she has a very good judgment to distinguish good from bad music; she understands it perfectly well, and even composes; which makes her absolute mistress of what she sings, and gives her the most exact pronunciation and expression of the sense of her words. She does not pretend to beauty, neither is she disagreeable or a coquet. She sings with a bold and generous modesty, and an agreeable gravity; her voice reaches a large compass of notes, and is exact, loud, and harmonious; she softens and raises it without straining or making grimaces. Her raptures and sighs are not lascivious; her looks having nothing impudent, nor does she transgress a virgin modesty in her gestures, In passing from one key to another, she shows sometimes the divisions of the enharmonic and chromatic kind with so much art and sweetness, that every body is ravished with that fine and difficult method of singing. She has no need of any person to assist her with a theorbo or viol, one of which is necessary to make her singing complete; for she plays perfectly well herself on both these instruments. In short, I have had the good fortune to hear her sing several times above 30 different airs, with second and third stanzas composed by herself. I must not forget to tell you, that one day she did me the particular favour to sing with her mother and her sister. Her mother played upon the lute, her sister upon the harp, and herself upon the theorbo. This concert, composed of three fine voices, and of three different instruments, so powerfully transported my senses, and threw me into such raptures, that I forgot my mortality, and thought myself already among the angels enjoying the felicity of the blessed."

BARONIUS, Cæsar, a pious and learned cardinal, was born at Sore in 1538. He studied at Rome, and put himself under the discipline of St Philip de Neri. In 1593, he was made general of the congregation of the Oratory by the resignation of the founder Philip de Neri. Pope Clement VIII. made him his confessor, and created him a cardinal in 1596. He was afterwards made librarian to the Vatican; and died in 1605, at 68 years of age. He wrote several works, the principal of which is his *Annales Ecclesiastici*, from A. D. 1. to 1198, in 12 vols folio; which has been abridged by several persons, particularly by Henry Spondæus, Bzovius, and Ludovico Arelio.

BARONY, Baronia, or *Baronagium*, the lordship or fee of a baron, either temporal or spiritual: In which sense *barony* amounts to the same with what is otherwise called *honour*.

A barony may be considered as a lordship held by some service in chief of the king, coinciding with what is otherwise called *grand serjeanty*. Baronies, in their first creation, moved from the king himself, the chief lord of the whole realm, and could be holden immediately of no other lord. For example, the king enfeoffed a man of a great seigneurie in land, to hold to the person enfeoffed and his heirs, of the king and his heirs, by baronial service; to wit, by the service of 20, 40, 60 knights, or of such other number of knights, either more or fewer, as the king by his enfeoffment limited or appointed.—In the ages next after the Conquest, when a great lord was enfeoffed by the king of a large seigneurie, such seigneurie was called a *barony*, but more commonly an *honour*; as, the honour of Gloucestershire, the honour of Wallingford, the honour,

Digitized by Google

nour of Lancaster, the honour of Richmond, and the like. There were in England certain honours, which were often called by Norman or other foreign names; this is to say, sometimes by the English and sometimes by the foreign name. This happened when the same person was lord of an honour in Normandy, or some other foreign country, and also of an honour in England. For example, William de Forz, de Force, or de Fortibus, was lord of the honour of Albemarle in Normandy: he was also lord of two honours in England; to wit, the honour of Holderness, and the honour of Skipton in Cravene. These honours in England were sometimes called by the Norman name, the honour of Albemarle, or the honour of the earl of Albemarle. In like manner, the earl of Britannie was lord of the honour of Britannie in France, and also of the honour of Richmond in England: the honour of Richmond was sometimes called by the foreign name, the honour of Britannie, or the honour of the earl of Britannie. This serveth to explain the terms "honour of Albemarle in England," *honor Albemarliæ*, or *comitis Albemarliæ in Anglia; honor Britanniæ*, or *comitis Britanniæ in Anglia*, "the honour of Britannie," or "the earl of Britannie in England." Not that Albemarle or Britannie were in England, but that the same person respectively was lord of each of the said honours abroad and of each of the said honours in England. The baronies belonging to bishops are by some called *regalia*, as being held solely on the king's liberality. These do not consist in one barony alone, but in many: for *tot erant baroniæ, quot majora prædia.*

A barony, according to Bracton, is a right indivisible. Wherefore, if an inheritance be to be divided among coparceners, though some capital messuages may be divided, yet if the capital messuage be the head of a county or barony, it may not be parcelled: and the reason is, lest by this division many of the rights of counties and baronies by degrees come to nothing, to the prejudice of the realm, which is said to be composed of counties and baronies.

BARRA, or BARRAY, island of. See BARRAY.

BARRA, in *Commerce*, a long measure used in Portugal and some parts of Spain, to measure woollen cloths, linen cloths, and serges. There are three sorts: the barra of Valencia, 13 of which make $12\frac{6}{7}$ yards English measure; the barra of Castile, 7 of which make $6\frac{4}{7}$ yards; and the barra of Arragon, 3 of which make $2\frac{4}{7}$ yards English.

BARRABA, DESERT OF; a tract of land in Siberia, lying between the rivers Irtis and Oby, in the province of Tobolsk. It is uninhabited, but not through any deficiency of the soil; for that is excellent for tillage, and part of it might also be laid out in meadows and pastures. It is interspersed with a great number of lakes, which abound with a species of carp called by the neighbouring people *karawschen;* and the country produces great numbers of elks, deer, foxes, ermine, and squirrels. Between the Irtis and Oby are some rich copper mines; particularly on a mountain called *Pictowa*, from the *picta* or white firs that grow upon it. Every hundred weight of the ore found here yields 12 pounds of pure copper; and there is no occasion for digging deep in order to come at it. Most of these ores, besides being very rich in copper, yield a great deal of silver, which affords so much gold as makes rich returns for the trouble and expence of extracting it.

BARRACAN, in *Commerce*, a sort of stuff, not diapered, something like camblet, but of a coarser grain. It is used to make cloaks, surtouts, and such other garments, to keep off the rain.—The cities where the most barracans are made in France are Valenciennes, Lisle, Abbeville, Amiens, and Roan. Those of Valenciennes are the most valued; they are all of wool, both the warp and the woof.

BARRACIDA, a species of pike. See ESOX, ICHTHYOLOGY *Index*.

BARRACKS, or BARACKS, places for soldiers to lodge in, espcially in garrisons.—Barracks, when damp, are greatly prejudicial to the health of the soldiers lodged in them; occasioning dysenteries, intermitting fevers, coughs, rheumatic pains, &c. For which reason, quarter-masters ought to be careful in examining every barrack offered by the magistrates of a place; rejecting all ground-floors in houses that have either been uninhabited, or have any signs of moisture.

BARRATOR, or BARRETOR, in *Law*, a person guilty of barretry. See BARRETRY.

Lambert derives the word *barretor* from the Latin *balatro*, "a vile knave;" but the proper derivation is from the French *barrateur*, i. e. "a deceiver;" and this agrees with the description of a common barretor in my Lord Coke's report, viz. that he is a common mover and maintainer of suits in disturbance of the peace, and in taking and detaining the possession of houses and lands or goods by false inventions, &c. And therefore it was adjudged that the indictment against him ought to be in these words, viz. That he is *communis malefactor, calumniator, et seminator litium et discordiarum inter vicinos suos, et pacis regis perturbator*, &c. And there it is said that a common barretor is the most dangerous oppressor in the law, for he oppresseth the innocent by colour of law, which was made to protect them from oppression.

BARRATRY, in *Law*. See BARRETRY.

BARRATRY, in a shipmaster, is his cheating the owners. If goods delivered on ship-board are embezzled, all the mariners ought to contribute to the satisfaction of the party that lost his goods, by the maritime law; and the cause is to be tried in the admiralty. In a case where a ship was insured against the barratry of the master, &c. and the jury found that the ship was lost by the fraud and negligence of the master, the court agreed, that the fraud was barratry, though not named in the covenant; but that negligence was not.

BARRAUX, a fortress of Dauphiny, belonging to France, now in the department of Isere. It stands in the valley of Gresivaudan, and was built by a duke of Savoy in 1597. The French took it in 1598, and have kept it ever since. It is seated on the river Isere, in E. Long. 5. 10. N. Lat. 45. 0.

BARRAY, or BARRA, one of the Western isles, in the county of Inverness, Scotland; is eight miles in length, and four in breadth. The soil in general is thin and fit only for pasture, but in some places it produces corn and potatoes. The population amounted to 1969 in 1811. The inhabitants are chiefly employed in the cod and ling fishery, which is here very successful.

In

Digitized by Google

In the year 1787 they carried 30,000 ling to the Glasgow market. The fish is carried to market in the same boat in which it is taken, either by going round the mull of Cantire, or drawing the boat by horses across the isthmus of Tarbet. There is a good harbour in the north-east side. Some cattle are reared in the island, and a little kelp is burned on the shore.

BARRE, Louis Francois Joseph de la, of Tournay, author of several works printed at Paris. Amongst others, *Imper. Orientale*, *Recueil des Medailles des Empereurs*, "Memoirs for the history of France," &c. He died in 1738.

BARREL, in *Commerce*, a round vessel, extending more in length than in breadth, made of wood, in form of a little tun. It serves for holding several sorts of merchandise.

Barrel is also a measure of liquids. The English barrel, wine measure, contains the eighth part of a tun, the fourth part of a pipe, and one half of a hogshead; that is to say, it contains $31\frac{1}{2}$ gallons: a barrel, beer-measure, contains 36 gallons; and ale-measure 32 gallons. The barrel of beer, vinegar, or liquor preparing for vinegar, ought to contain 34 gallons, according to the standard of the ale quart.

Barrel also denotes a certain weight of several merchandises, which differ according to the several commodities. A barrel of Essex butter weighs 106 pounds; and of Suffolk butter, 256 pounds. The barrel of herrings ought to contain 32 gallons wine-measure, which amount to about 28 gallons old standard, containing about 1000 herrings. The barrel of salmon must contain 42 gallons; the barrel of eels the same. The barrel of soap must weigh 256 lb.

Barrel, in *Mechanics*, a term given by watchmakers to the cylinder about which the spring is wrapped; and by gunsmiths to the cylindrical tube of a gun, pistol, &c. through which the ball is discharged.

Barrel, in *Anatomy*, a pretty large cavity behind the tympanum of the ear, about four or five lines deep, and five or six wide.

Fire-Barrels. See *Fire-Ship*.

Thundering Barrels, in the military art, are filled with bombs, grenades, and other fire-works to be rolled down a breach.

BARRENNESS, the same with sterility. See Sterility.

BARRETRY, in *Law*, is the offence of frequently exciting and stirring up suits and quarrels between his majesty's subjects, either at law or otherwise. The punishment for this offence, in a common person, is by fine and imprisonment: but if the offender (as is too frequently the case) belongs to the profession of the law, a barretor who is thus able as well as willing to do mischief ought also to be disabled from practising for the future. And indeed it is enacted by statute 12 Geo. I. c. 29. that if any one, who hath been convicted of forgery, perjury, subornation of perjury, or common barretry, shall practise as an attorney, solicitor, or agent, in any suit; the court, upon complaint, shall examine it in a summary way; and, if proved, shall direct the offender to be transported for seven years. Hereunto also may be referred another offence, of equal malignity and audaciousness; that of suing another in the name of a fictitious plaintiff, either one not in being at all, or one who is ignorant of the suit. This offence, if committed in any of the king's superior courts, is left, as a high contempt, to be punished at their discretion: but in courts of a lower degree, where the crime is equally pernicious, but the authority of the judges not equally extensive, it is directed by statute 8 Eliz. c. 2. to be punished by six months imprisonment, and treble damages to the party injured.

BARRICADE, or Barricado, a military term for a fence formed in haste with vessels, baskets of earth, trees, pallisades, or the like, to preserve an army from the shot or assault of the enemy.—The most usual materials for barricades consist of pales or stakes, crossed with batoons, and shod with iron at the feet, usually set up in passages or breaches.

Barricade, in naval architecture, a strong wooden rail, supported by stanchions, extending across the foremost part of the quarter-deck. In a vessel of war the vacant spaces between the stanchions are commonly filled with rope-matts, cork, or pieces of old cable; and the upper part, which contains a double rope-netting above the rail, is stuffed with full hammocks to intercept the motion, and to prevent the execution of small-shot in the time of battle.

BARRIER, in *Fortification*, a kind of fence made at a passage, retrenchment, &c. to stop up the entry thereof. It is composed of great stakes, about four or five feet high, placed at the distance of eight or ten feet from one another, with transums, or overthwart rafters, to stop either horse or foot, that would enter or rush in with violence: in the middle is a moveable bar of wood, that opens or shuts at pleasure. A barrier is commonly set up in a void space, between the citadel and the town, in half moons, &c.

Barriers, signifies that which the French call *jeu de barres*, i. e. *palestra;* a martial exercise of men armed and fighting together with short swords, within certain bars or rails which separated them from the spectators: it is now disused in this country.

BARRING a vein, in *Farriery*, an operation performed upon the veins of a horse's legs, and other parts of his body, with intent to stop the course, and lessen the quantity, of the malignant humours that prevail there.

BARRINGTON, John Shute, Lord Viscount Barrington, a nobleman distinguished for theological learning, was the youngest son of Benjamin Shute, merchant, and was born in 1678. He received part of his education at the university of Utrecht; and, after returning to England, studied law in the Inner Temple. In 1701 he commenced writer in favour of the civil rights of Protestant dissenters, to which body he belonged. At the recommendation of Lord Sommers he was employed to engage the Presbyterians in Scotland to favour the union of the two kingdoms; and in 1708, for this service, was appointed to the place of commissioner of the customs. From this he was removed by the Tory ministry of Queen Anne; but his fortune was, in the mean time, improved by the bequest of two considerable estates; one of them left him by Francis Barrington of Tofts, Esq. whose name he assumed by act of parliament. Mr Barrington now stood at the head of the Dissenters. On the accession of George I. he was returned member of

Digitized by Google

parliament for Berwick-upon-Tweed; and in 1720 the king raised him to the Irish Peerage, by the style of Viscount Barrington of Ardglass. He was unfortunately engaged as sub-governor in one of the bubbles of the time, the Harburgh lottery, and underwent the disgrace of expulsion from the house of commons, in 1723; a censure which was thought greatly too severe, and altogether unmerited on his part. In 1725 he published his principal work, entitled *Miscellanea Sacra*, or a new method of considering so much of the History of the Apostles as is contained in Scripture, in an abstract of their history, an abstract of that abstract, and four critical essays; 2 vols. 8vo. This work traces the methods taken by the first preachers of the gospel for propagating Christianity, and explains the several gifts of the Spirit, by which they were enabled to discharge their office. It has always been reckoned a valuable and judicious defence of the Christian cause; and was reprinted with additions and corrections, in 3 vols. 8vo, 1770, by his son, afterwards bishop of Durham. In the same year he published "An Essay on the several Dispensations of God to Mankind, in the Order in which they lie in the Bible, &c." 8vo, 1725. He wrote various other tracts, chiefly on subjects relative to toleration in matters of religion. He died in 1734, in his 56th year, leaving several children, of whom five sons had the uncommon fortune of rising to high stations in the church, the law, the army, and the navy. Lord Barrington was a friend and disciple of Locke, and adopted his sentiments as to the right and advantage of free inquiry, and the value of civil and religious liberty. He contributed greatly to the rising spirit of liberal scriptural criticism among those who wished to render religion rational. He was a man of great moderation, and, though chiefly connected with the Dissenters, he occasionally frequented and communicated with the established church. *Gen. Biog.*

BARRINGTON, *Daines*, fourth son of Lord Viscount Barrington, distinguished as an antiquarian and naturalist, was educated for the profession of the law, and, after possessing various posts, was appointed a Welsh judge in 1757, and afterwards second justice of Chester. He never rose to much eminence at the bar, but he showed his knowledge of the law as an object of liberal study, by a valuable publication entitled "Observations on the Statutes, chiefly the more ancient, from Magna Charta to 21 James I. c. 27.: with an Appendix, being a proposal for new-modelling the Statutes," 4to, 1766. This work has been quoted with great respect by many of our historians and constitutional antiquaries. In 1773 he published an edition of *Orosius*, with Alfred's Saxon version, and an English translation and notes of his own, which met with some severe animadversion from the critics. His "Tracts on the Probability of reaching the North Pole," 1775, 4to, were written in consequence of the northern voyage of discovery undertaken by Captain Phipps (now Lord Mulgrave). He accumulates in them a variety of evidence favourable to his own opinion of the practicability of attaining the object in which that voyage failed; but there is little probability that the attempt will be renewed. Mr Barrington's other writings, which are numerous, are chiefly to be found in the publications of the Royal and Antiquarian Societies, of both of which he was long an assiduous member, and of the latter, vice-president. They relate to a variety of topics in natural history and antiquities, and show great industry and extent of research, though with an occasional leaning to singularity and paradox. Many of his tracts were collected by him in a 4to volume entitled, "Miscellanies on various Subjects," 1781. His "Experiments and Observations on the Singing of Birds," and his "Essay on the Language of Birds," are among the most curious and ingenious of his papers. These, and many others, prove that he was not only deeply conversant in books, but was a very attentive and sagacious observer of nature. In private life he was a man of worth and integrity, unambitious, and devoted to study and literary conversation. He resigned his office of justice of Chester in 1785, and afterwards lived in retirement in his chambers in King's-Bench-Walks, Inner-Temple, associating chiefly with his brother benchers, and amusing himself with superintending the improvements of the gardens. He died March 14. 1800, and was buried in the Temple church.

BARRINGTONIA, See BOTANY *Index*.

BARRISTER, is a counsellor learned in the law, admitted to plead at the bar, and there to take upon him the protection and defence of clients. They are termed *jurisconsulti*; and in other countries called *licentiati in jure*: and anciently barristers at law were called *apprentices* of the law, in Latin *apprenticii juris nobiliores*. The time before they ought to be called to the bar, by the ancient orders, was eight years, now reduced to five; and the exercises done by them (if they were not called *ex gratia*) were twelve grand moots performed in the inns of Chancery in the time of the grand readings, and 24 petty moots in the term times, before the readers of the respective inns: and a barrister newly called is to attend the six (or four) next long vacations the exercise of the house, viz. in Lent and Summer, and is thereupon for those three (or two) years styled a *vacation barrister*. Also they are called *utter barristers*, i. e. pleaders *ouster* the bar, to distinguish them from benchers, or those that have been readers, who are sometimes admitted to plead within the bar, as the king, queen, or prince's counsel are.

BARRITUS is a word of German original, adopted by the Romans to signify the general shout usually given by the soldiers of their armies on their first encounter, after the *classicum* or alarm. This custom, however, of setting up a general shout was not peculiar to the Romans, but prevailed among the Trojans according to Homer, amongst the Germans, the Gauls, Macedonians and Persians. See CLASSICUM.

BARROS, JOHN, a celebrated Portuguese historian, born at Visco in 1496. He was educated at the court of King Emanuel, among the princes of the blood, and made a great progress in Greek and Latin. The Infant John, to whom he attached himself, and became preceptor, having succeeded the king his father in 1521, Barros obtained a place in this prince's household; and in 1522, was made governor of St George del Mina, on the coast of Guinea. Three years after, the king having recalled him to court, made him treasurer of the Indies, and this post inspired him with the thought of writing this history, for which purpose

Digitized by Google

Barros, Barrow.

purpose he retired to Pompas, where he died in 1570. His history of Asia and the Indies is divided into decades; the first of which he published in 1552, the second in 1553, and the third in 1563; but the fourth decade was not published till the year 1615, when it appeared by order of King Philip III. who had the manuscript purchased of the heirs of John Barros. Several authors have continued it, so that we have at present 12 decades. He left many other works; some of which have been printed, and others remain in manuscript.

BARROW, Isaac, an eminent mathematician and divine, was the son of Mr Thomas Barrow a linen draper in London, where he was born in 1630. He was at first placed at the Charter-house school for two or three years. There, however, his conduct gave but little hopes of success in the profession of a scholar; for he was extremely fond of fighting, and promoting it among his schoolfellows: but being removed from thence, his disposition took a happier turn; and having soon made great progress in learning, he was admitted a pensioner of Peter-house in Cambridge. He now applied himself with great diligence to the study of all parts of literature, especially to that of natural philosophy. He afterwards turned his thoughts to the profession of physic, and made considerable progress in anatomy, botany, and chemistry; after this he studied chronology, astronomy, and geometry. He then travelled into France and Italy, and in a voyage from Leghorn to Smyrna, gave a proof of his bravery; for the ship being attacked by an Algerine pirate, he remained upon deck, and with the greatest intrepidity fought, till the pirate, perceiving the stout resistance the ship made, sheered off and left her (A).

At Smyrna he met with a most kind reception from Mr Bretton the English consul, upon whose death he afterwards wrote a Latin elegy. From thence he proceeded to Constantinople, where he received the like civilities from Sir Thomas Bendish the English ambassador, and Sir Thomas Dawes, with whom he afterwards preserved an intimate friendship. At Constantinople he read over the works of St Chrysostom, once bishop of that see, whom he preferred to all the other fathers. When he had been in Turkey somewhat more than a year, he returned to Venice. From thence he came home in 1659, through Germany and Holland; and was episcopally ordained by Bishop Brownrig. In 1660, he was chosen to the Greek professorship at Cambridge. When he entered upon this province, he intended to have read upon the tragedies of Sophocles; but he altered his intention, and made choice of Aristotle's rhetoric. These lectures having been lent to a friend who never returned them, are irrecoverably lost. July the 16th 1662, he was elected professor of geometry in Gresham college, by the recommendation of Dr Wilkins, master of Trinity-college, and afterwards bishop of Chester. Upon the 20th of May 1663 he was elected a fellow of the Royal Society, in the first choice made by the council after their charter. The same year the executors of Mr Lucas having, according to his appointment, founded a mathematical school at Cambridge, they fixed upon Mr Barrow for the first professor; and though his two professorships were not inconsistent with each other, he chose to resign that of Gresham college, which he did May the 20th, 1664. In 1669 he resigned his mathematical chair to his learned friend Mr Isaac Newton, being now determined to give up the study of mathematics for that of divinity. Upon quitting his professorship, he was only a fellow of Trinity-college, till his uncle gave him a small sinecure in Wales, and Dr Seth Ward bishop of Salisbury conferred upon him a prebend in his church. In the year 1670 he was created doctor in divinity by mandate; and, upon the promotion of Dr Pearson master of Trinity-college to the see of Chester, he was appointed to succeed him by the king's patent, bearing date the 13th of February 1672. When the king advanced him to this dignity, he was pleased to say, "he had given it to the best scholar in England." His majesty did not speak from report, but from his own knowledge: the doctor being then his chaplain, he used often to converse with him, and in his humorous way, to call him an "unfair preacher," because he exhausted every subject, and left no room for others to come after him. In 1675 he was chosen vice-chancellor of the university. The doctor's works are very numerous, and such as do honour to the English nation. They are, 1. Euclid's Elements. 2. Euclid's Data. 3. Optical Lectures, read in the public school of Cambridge. 4. Thirteen Geometrical Lectures. 5. The Works of Archimedes, the four Books of Apollonius's Conic Sections, and Theodosius's Spherics explained in a new Method. 6. A Lecture, in which Archimedes's Theorems of the Sphere and Cylinder are investigated and briefly demonstrated. 7. Mathematical Lectures, read in the public schools of the university of Cambridge: the above were all printed in Latin: and as to his English works, they are printed together in four volumes folio.—"The name of Dr Barrow (says the reverend and learned Mr Granger) will ever be illustrious

(A) There is another anecdote told of him, which not only showed his intrepidity, but an uncommon goodness of disposition, in circumstances where an ordinary share of it would have been probably extinguished. He was once in a gentleman's house in the country, where the necessary was at the end of a long garden, and consequently at a great distance from the room where he lodged: as he was going to it before day, for he was a very early riser, a fierce mastiff who used to be chained up all day, and let loose at night for the security of the house, perceiving a strange person in the garden at that unseasonable time, set upon him with great fury. The doctor catched him by the throat, threw him, and lay upon him; and whilst he kept him down, considered what he should do in that exigence: once he had a mind to kill him; but he altered this resolution, upon recollecting that it would be unjust, since the dog did only his duty, and he himself was in the fault, for rambling out of his room before it was light. At length he called out so loud, that he was heard by some of the house, who came presently out, and freed the doctor and the dog from the danger they were both in.

Digitized by Google

lustrious for a strength of mind and compass of knowledge that did honour to his country. He was unrivalled in mathematical learning, and especially in the sublime geometry; in which he has been excelled only by one man, and that man was his pupil, the great Sir Isaac Newton. The same genius that seemed to be born only to bring hidden truths to light, to rise to the heights or descend to the depths of science, would sometimes amuse itself in the flowery paths of poetry, and he composed verses both in Greek and Latin. He at length gave himself up entirely to divinity; and particularly to the most useful part of it, that which has a tendency to make men wiser and better. He has, in his excellent sermons on the Creed, solved every difficulty and removed every obstacle that opposed itself to our faith, and made divine revelation as clear as the demonstrations in his own Euclid. In his sermons he knew not how to leave off writing till he had exhausted his subject; and his admirable discourse on the duty and Reward of Bounty to the Poor, took him up three hours and a half in preaching. This excellent person, who was a bright example of Christian virtue, as well as a prodigy of learning, died on the 4th of May 1677, in the 47th year of his age; and was interred in Westminster abbey, where a monument, adorned with his bust, was soon after erected, by the contribution of his friends.

BARROWS, in *Ancient Topography*, artificial hillocks or mounts, met with in many parts of the world, intended as repositories for the dead, and formed either of stones heaped up, or of earth. For the former, more generally known by the name of *cairns*, see CAIRNS.—Of the latter Dr Plott takes notice of two sorts in Oxfordshire: one placed on the military ways; the other in the fields, meadows, or woods; the first sort doubtless of Roman erection, the other more probably erected by the Britons or Danes. We have an examination of the barrows in Cornwall by Dr Williams, in the Phil. Trans. N° 458. from whose observations we find that they are composed of foreign or adventitious earth; that is, such as does not rise on the place, but is fetched from some distance.—Monuments of this kind are also very frequent in Scotland. On digging into the barrows, urns have been found in some of them, made of calcined earth, and containing burnt bones and ashes; in others, stone chests containing bones entire; in others, bones neither lodged in chests nor deposited in urns. These tumuli are round, not greatly elevated, and generally at their bases surrounded with a fosse. They are of different sizes; in proportion, it is supposed, to the greatness, rank, and power, of the deceased person. The links or sands of Skail, in Sandwick, one of the Orkneys, abound in round barrows. Some are formed of earth alone, others of stone covered with earth. In the former was found a coffin, made of six flat stones. They are too short to receive a body at full length: the skeletons found in them lie with the knees pressed to the breast, and the legs doubled along the thighs. A bag, made of rushes, has been found at the feet of some of these skeletons, containing the bones, most probably, of another of the family. In one were to be seen multitudes of small beetles; and as similar insects have been discovered in the bag which enclosed the sacred *Ibis*, we may suppose that the Egyptians, and the nation to whom these tumuli did belong, might have had the same superstition respecting them. On some of the corpses interred in this island, the mode of burning was observed. The ashes, deposited in an urn which was covered on the top with a flat stone, have been found in the cell of one of the barrows. This coffin or cell was placed on the ground, then covered with a heap of stones, and that again cased with earth and sods. Both barrow and contents evince them to be of a different age from the former. These tumuli were in the nature of family vaults: in them have been found two tiers of coffins. It is probable, that on the death of any one of the family, the tumulus was opened, and the body interred near its kindred bones.

Ancient Greece and Latium concurred in the same practice with the natives of this island. Patroclus among the Greeks, and Hector among the Trojans, received but the same funeral honours with our Caledonian heroes; and the ashes of Dercennus the Laurentine monarch had the same simple protection. The urn and pall of the Trojan warrior might perhaps be more superb than those of a British leader: the rising monument of each had the common materials from our mother earth.

> The snowy bones his friends and brothers place,
> With tears collected, in a golden vase.
> The golden vase in purple palls they roll'd
> Of softest texture and inwrought with gold.
> Last o'er the urn the sacred earth they spread,
> And rais'd a tomb, memorial of the dead.
>
> *Pope's Homer's Iliad*, xxiv. 1003.

Or, as it is more strongly expressed by the same elegant translator, in the account of the funeral of Patroclus;

> High in the midst they heap the swelling bed
> Of rising earth, memorial of the dead.
>
> Ib. xxiii. 319.

The Grecian barrows, however, do not seem to have been all equally simple. The barrow of Alyattes, father of Crœsus king of Lydia, is described by Herodotus as a most superb monument, inferior only to the works of the Egyptians and Babylonians. It was a vast mound of earth heaped on a basement of large stones by three classes of the people; one of which was composed of girls who were prostitutes. Alyattes died, after a long reign, in the year 562 before the Christian era. Above a century intervened, but the historian relates, that to his time five stones (*ουροι*, *termini* or *stelæ*) on which letters were engraved, had remained on the top, recording what each class had performed; and from the measurement it had appeared, that the greater portion was done by the girls. Strabo likewise has mentioned it as a huge mound raised on a lofty basement by the multitude of the city. The circumstance was six stadia or three quarters of a mile; the height two plethra or two hundred feet; and the width thirteen plethra. It was customary among the Greeks to place on barrows either the image of some animal, or *stelæ*, commonly round pillars with inscriptions. The famous barrow of the Athenians in the plain of Marathon, described by Pausanias, is an instance of the latter usage. An ancient monument in Italy by the Appian-way, called without reason

Barrows.

reason the sepulchre of the Curiatii, has the same number of *termini* as remained on the barrow of Alyattes; the basement, which is square, supporting five round pyramids.—Of the barrow of Alyattes the apparent magnitude is described by travellers as now much diminished, and the bottom rendered wider and less distinct than before, by the gradual increase of the soil below. It stands in the midst of others by the lake Gygæus; where the burying-place of the Lydian princes was situated. The barrows are of various sizes; the smaller made perhaps for children of the younger branches of the royal family. Four or five are distinguished by their superior magnitude, and are visible as hills at a great distance. That of Alyattes is greatly supereminent. The lake it is likely furnished the soil. All of them are covered with green turf; and all retain their conical form without any sinking in of the top.

Barrows, or similar tumuli, are also found in great numbers in America. These are of different sizes, according to Mr Jefferson's* account; some of them constructed of earth, and some of loose stones. That they were repositories of the dead has been obvious to all; but on what particular occasion constructed, was matter of doubt. Some have thought they covered the bones of those who have fallen in battles fought on the spot of interment. Some ascribed them to the custom said to prevail among the Indians, of collecting at certain periods the bones of all their dead, wheresoever deposited at the time of death. Others again supposed them the general sepulchre for towns, conjectured to have been on or near these grounds; and this opinion was supported by the quality of the lands in which they are found (those constructed of earth being generally in the softest and most fertile meadow grounds on river sides), and by a tradition, said to be handed down from the aboriginal Indians, that when they settled in a town, the first person who died was placed erect, and earth put about him, so as to cover and support him; that when another died, a narrow passage was dug to the first, the second reclined against him, and the cover of earth replaced, and so on. "There being one of these barrows in my neighbourhood (says Mr Jefferson), I wished to satisfy myself whether any, and which of these opinions were just. For this purpose I determined to open and examine it thoroughly. It was situated on the low grounds of the Rivanna, about two miles above its principal fork, and opposite to some hills, on which had been an Indian town. It was of a spheroidical form, of about 40 feet diameter at the base, and had been of about 12 feet altitude, though now reduced by the plough to seven and a half, having been under cultivation about a dozen years. Before this it was covered with trees of 12 inches diameter, and round the base was an excavation of five feet depth and width, from whence the earth had been taken of which the hillock was formed. I first dug superficially in several parts of it, and came to collections of human bones, at different depths, from six inches to three feet below the surface. These were lying in the utmost confusion, some vertical, some oblique, some horizontal, and directed to every point of the compass, entangled, and held together in clusters by the earth. Bones of the most distant parts were found together; as, for instance, the small bones of the foot in the hollow of a skull: many skulls would sometimes be in contact, lying on the face, on the side, on the back, top or bottom, so as on the whole to give the idea of bones emptied promiscuously from a bag or basket, and covered over with earth, without any attention to their order. The bones of which the greatest numbers remained, were skulls, jaw-bones, teeth, the bones of the arms, the thighs, legs, feet, and hands. A few ribs remained, some vertebræ of the neck and spine, without their processes, and one instance only of the bone which serves as a base to the vertebral column. The skulls were so tender, that they generally fell to pieces on being touched. The other bones were stronger. There were some teeth which were judged to be smaller than those of an adult; a skull which, on a slight view, appeared to be that of an infant, but it fell to pieces on being taken out, so as to prevent satisfactory examination; a rib, and a fragment of the under-jaw of a person about half-grown; another rib of an infant; and part of the jaw of a child, which had not yet cut its teeth. This last furnishing the most decisive proof of the burial of children here, I was particular in my attention to it. It was part of the right half of the under-jaw. The processes by which it was articulated to the temporal bones were entire; and the bone itself firm to where it had been broken off, which, as nearly as I could judge, was about the place of the eye tooth. Its upper edge, wherein would have been the sockets of the teeth, were perfectly smooth. Measuring it with that of an adult, by placing their hinder processes together, its broken end extended to the penultimate grinder of the adult. This bone was white, all the others of a sand colour. The bones of infants being soft, they probably decay sooner, which might be the cause so few were found here. I proceeded then to make a perpendicular cut through the body of the barrow, that I might examine its internal structure. This passed about three feet from its centre, was opened to the former surface of the earth, and was wide enough for a man to walk through and examine its sides. At the bottom, that is, on the level of the circumjacent plain, I found bones; above these a few stones, brought from a cliff a quarter of a mile off, and from the river one-eighth of a mile off; then a large interval of earth, then a stratum of bones, and so on. At one end of the section were four strata of bones plainly distinguishable; at the other, three; the strata in one part not ranging with those in another. The bones nearest the surface were least decayed. No holes were discovered in any of them, as if made with bullets, arrows, or other weapons. I conjectured that in this barrow might have been a thousand skeletons. Every one will readily seize the circumstances above related, which militate against the opinion that it covered the bones only of persons fallen in battle; and against the tradition also which would make it the common sepulchre of a town, in which the bodies were placed upright, and touching each other. Appearances certainly indicate that it has derived both origin and growth from the accustomary collection of bones, and deposition of them together; that the first collection had been deposited on the common surface of the earth, a few stones put over it, and then a covering of earth; that the second had been laid on this, had covered more or less of it in proportion to the

* *Notes on the State of Virginia*, p. 156.

Digitized by Google

the number of bones, and was then also covered with earth, and so on. The following are the particular circumstances which give it this aspect. 1. The number of bones. 2. Their confused position. 3. Their being in different strata. 4. The strata in one part having no correspondence with those in another. 5. The different states of decay in these strata, which seem to indicate a difference in the time of inhumation. 6. The existence of infant bones among them. But on whatever occasion they may have been made, they are of considerable notoriety among the Indians; for a party passing, about thirty years ago, through the part of the country where this barrow is, went through the woods directly to it, without any instructions or enquiry; and having staid about it for some time, with expressions which were construed to be those of sorrow, they returned to the high road, which they had left about half a dozen miles to pay this visit, and pursued their journey. There is another barrow, much resembling this in the low grounds of the south branch of the Shenandoah, where it is crossed by the road leading from the Rock-fish gap to Staunton. Both of these have, within these dozen years, been cleared of their trees and put under cultivation, are much reduced in their height, and spread in width, by the plough, and will probably disappear in time. There is another on a hill in the Blue ridge of mountains, a few miles north of Wood's gap, which is made up of small stones thrown together. This has been opened and found to contain human bones as the others do. There are also many others in other parts of the country."

Barrows, in the salt-works, are wicker cases, almost in the shape of a sugar-loaf, wherein the salt is put to drain.

BARRULET, in *Heraldry*, the fourth part of the bar, or the one half of the closset; an usual bearing in coat-armour.

BARRULY, in *Heraldry*, is when the field is divided bar-ways, that is, across from side to side, into several parts.

BARRY, Girald, commonly called *Giraldus Cambrensis*, i. e. *Girald of Wales*, a historian and ecclesiastic in the reigns of Henry II. and Richard I. was born at the castle of Mainarper, near Pembroke, A. D. 1146. By his mother he was descended from the princes of South Wales; and his father, William Barry, was one of the chief men of that principality. Being a younger brother, and intended for the church, he was sent to St David's, and educated in the family of his uncle, who was bishop of that see. He acknowledges, in his history of his own life and actions, that in his early youth he was too playful; but being severely reproached for it by his preceptors, he became a very hard student, and greatly excelled all his school-fellows in learning. When he was about 20 years of age, he was sent, A. D. 1166, for his further improvement, to the university of Paris; where he continued for three years, and became, according to his own account, a most excellent rhetorician; which rendered him very famous. On his return into Britain, he entered into holy orders, and obtained several benefices both in England and Wales. Observing, with much concern, that his countrymen, the Welch, were very backward in paying the tithes of wool and cheese, which he was afraid would involve them in eternal damnation, he applied to Richard archbishop of Canterbury, and was appointed his legate in Wales for rectifying that disorder, and for other purposes. He executed this commission with great spirit; excommunicating all, without distinction, who refused to save their souls by surrendering the tithes of their cheese and wool. Not satisfied with enriching, he also attempted to reform, the clergy; and dilated the archdeacon of Brecon to the archbishopric, for the unpardonable crime of matrimony; and the poor old man, refusing to put away his wife, was deprived of his archdeaconry; which was bestowed upon our zealous legate. In discharging the duties of this new office, he acted with great vigour, which involved him in many quarrels; but, if we may believe himself, he was always in the right, and always victorious. His uncle, the bishop of St David's, dying A. D. 1176, he was elected his successor by the chapter: but this election having been made without the permission, and contrary to the inclination of Henry II. our author prudently declined to insist upon it, and went again to Paris to prosecute his studies, particularly in the civil and canon law, and theology. He speaks with great raptures of the prodigious fame he acquired by his eloquent declamations in the schools, and of the crowded audiences who attended them, who were at a loss to know whether the sweetness of his voice, the beauty of his language, or the irresistible force of his arguments, were most to be admired. Having spent about four years at Paris, he returned to St David's; where he found every thing in confusion; and the bishop being expelled by the people, he was appointed administrator by the archbishop of Canterbury, and governed the diocese in that capacity to A. D. 1184, when the bishop was restored. About the same time he was called to court by Henry II. appointed one of his chaplains, and sent into Ireland A. D. 1185, with Prince John. By this prince he was offered the united bishoprics of Fernes and Leighlin, but declined them; and employed his time in collecting materials for his Topography of Ireland, and his History of the conquest of that island. Having finished his Topography, which consisted of three books, he published it at Oxford, A. D. 1187, in the following manner, in three days. On the first day he read the first book to a great concourse of people, and afterwards entertained all the poor of the town; on the second day he read the second book, and entertained all the doctors and chief scholars; and, on the third day, he read the third book, and entertained the young scholars, soldiers, and burgesses. "A most glorious spectacle! (says he) which revived the ancient times of the poets, and of which no example had been seen in England." He attended Baldwin archbishop of Canterbury, in his progress through Wales, A. D. 1186, in preaching a croisade for the recovery of the Holy Land; in which, he tells us, he was far more successful than the primate; and particularly, that the people were prodigiously affected with his Latin sermons, which they did not understand, melting into tears, and coming in crowds to take the cross. Although Henry II. as our author assures us, entertained the highest opinion of his virtues and abilities; yet he would never advance him to any higher dignity in the church, on account of his relation to the princes and great men of Wales. But on the accession of Richard I. (A. D. 1189), his projects of preferment became

became better: for he was sent by that prince into Wales to preserve the peace of that country, and was even joined in commission with William Longchamp, bishop of Ely, as one of the regents of the kingdom. He did not, however, improve this favourable opportunity: refusing the bishopric of Bangor in A. D. 1190, and that of Landaff the year after, having fixed his heart on the see of St David's, the bishop of which was very old and infirm. In A. D. 1192, the state of public affairs, and the course of interest at court, became so unfavourable to our author's views, that he determined to retire. At first he resolved to return to Paris to prosecute his studies; but meeting with some difficulties in this, he went to Lincoln, where William de Monte read lectures in theology with great applause. Here he spent about six years in the study of divinity, and in composing several works. The see of St David's, which had long been the great object of his ambition, became vacant, A. D. 1198, and brought him again upon the stage. He was unanimously elected by the chapter; but met with so powerful an adversary in Hubert archbishop of Canterbury (who opposed his promotion with great violence), that it involved him in a litigation which lasted five years, cost him three journeys to Rome, at a great expence, and in which he was at last defeated, A. D. 1203. Soon after this he retired from the world, and spent the last 17 years of his life in a studious privacy, composing many books, of which we have a very correct catalogue in the Biographia Britannica. That Girald of Wales was a man of uncommon activity, genius, and learning, is undeniable; but these and his other good qualities were much tarnished by his insufferable vanity.

Barry, *James*, an eminent British painter. See Supplement.

Barry, in *Heraldry*, is when an escutcheon is divided bar-ways, that is, across from side to side, into an even number of partitions, consisting of two or more tinctures, interchangeably disposed; it is to be expressed in the blazon by the word *barry*, and the number of pieces must be specified; but if the divisions be odd, the field must be first named, and the number of bars expressed.

Barry-Bendy is when an escutcheon is divided evenly, bar and bend-ways, by lines drawn transverse and diagonal, interchangeably varying the tinctures of which it consists.

Barry-Pily is when a coat is divided by several lines drawn obliquely from side to side, where they form acute angles.

BARSA, in *Ancient Geography*, an island on the coast of France, in the English channel, (Itinerary): *Basepool* according to some; but according to others, *Bardsey*.

BARSALLI, a kingdom of Africa, bordering on the river Gambia, inhabited by a tribe of negroes called *Jaloffs*. The government of this kingdom is a most despotic monarchy: all people being obliged to prostrate themselves on the earth when any of the royal family makes his appearance. In time of war, every soldier has his share of the booty, and the king but a certain proportion, which is moderate, considering that if he pleased he might keep the whole. The kingdom is divided into a number of provinces, over which governors called *bumeys* are appointed by the king. These bumeys are absolute within their jurisdiction; but they seldom carry their prerogative so far as to incur the dislike of the people, which would quickly prove fatal to them. The Mahometan religion is professed by the king and his court; though little regard is paid to that part of the impostor's creed which forbids the use of wine; for the king cannot live without brandy, nor is he ever more devout than when he is drunk. When his majesty is in want of brandy or other necessaries, he sends to beg of the governor of James-fort that he will despatch a boat with the merchandise he has occasion for; and to purchase this he plunders the neighbouring towns, and seizes a certain number of his subjects, whom he sells for slaves to the Europeans in exchange for their commodities. This is his method of supplying himself if he happens to be at peace with his neighbours; for which reason the people are never so happy as when at war; and hence they pursue war with great vigour, and continue it with obstinacy.—The general dress of the people is a kind of loose calico surplice, that hangs down below the knee; which they sometimes plait about the waist in a very agreeable manner. They wear a great number of gold trinkets in their hair, ears, noses, and round their necks, arms, and legs; but the women especially are fond of these ornaments. The king of Barsalli, whom Moor saw in 1732, had a prodigious number of women: but when he went abroad he was seldom attended by more than two, who seemed to be dressed out in the whole finery and jewels of the seraglio. He had likewise a number of brethren; but it was seldom that he deigned to speak to them: if ever he did them that honour, they were forced to treat him with the same respect as other subjects, and fall prostrate on the earth the moment they came into his presence, notwithstanding they were the presumptive heirs of the crown. It is indeed usual for the king's children to dispute the right of succession with his brethren, and the longest sword generally carries away the prize.

BARSANTI, Francisco, an eminent musical performer and composer, was born at Lucca about the year 1690. He studied the civil law in the university of Padua; but, after a short stay there, chose music for his profession. Accordingly, he put himself under the tuition of some of the ablest masters in Italy; and having attained to a considerable degree of proficiency in the science of practical composition, took a resolution to settle in England, and came thither with Geminiani, who was also a Luccese, in the year 1714. He was a good performer on the hautboy, and also on the flute; in the former capacity he found employment in the opera band, and in the latter derived considerable advantages by teaching. He published, with a dedication to the earl of Burlington, six solos for a flute with a thorough-bass, and afterwards six solos for a German flute and a bass. He also made into sonatas, for two violins and a bass, the first six solos of Geminiani. He continued many years a performer at the opera house: at length reflecting that there was a prospect of advantage for one of his profession in Scotland, he went thither; and, with greater truth than the same is asserted of David Rizzio, may be said to have meliorated the music of this country, by collecting and making basses to a great number of the most popular Scots tunes. About the year 1750 Bar-

Digitized by Google

santi returned to England; but being advanced in years, he was glad to be taken into the opera band as a performer on the tenor violin; and in the summer season into that of Vauxhall. At this time he published 12 concertos for violins; and shortly after, Sei Antifone, in which he endeavoured to imitate the style of Palestrina, and the old composers of motets; but from these publications so little profit resulted, that, towards the end of his life, the industry and economy of an excellent wife, whom he had married in Scotland, and the studies and labours of a daughter, whom he had qualified for the profession of a singer, but who is now an actress at Covent-Garden, were his chief support.

BARTAS, William de Salluste du, a French poet, who lived in the 16th century. He was employed by Henry IV. of France, in England, Denmark, and Scotland; and commanded a troop of horse in Gascony, under the marshal de Martignan. He was a Calvinist; and died in 1560, aged 46. He wrote a great number of poems; the most famous of which are, 1. The Week, or the Creation of the World, in seven books. 2. The Poem of Judith; and, 3. The battle of Ivry, gained by Henry IV. in 1590. Du Bartas wrote in a bombast style.

BARTAR, or Truck, is the exchanging of one commodity for another. The word comes from the Spanish *barator*, to deceive or circumvent in bargaining, perhaps because those who deal this way usually endeavour to overreach one another.

To transact properly, the price of one of the commodities and an equivalent quantity of the other, must be found either by practice or by the rule of three.

Quest. 1. How many pounds of cotton, at 9d. per lb. must be given in bartar for 13 C. 3 Q. 14 lb. of pepper, at 2l. 16s. per C.?

First, Find the price or value of the commodity whose quantity is given as follows:

	C.	Q.	lb.		L.	s.
	13	3	14	at	2	16
	26					
2l.	10	8				
16s.	1	8				
2Q.		14				
1Q.		7				
14lb.						
	L.38	17				

Secondly, Find how much cotton, at 9d. per lb. 38l. 17s. will purchase as under:

```
   d.  lb.   L.  s.
If 9 : 1 :: 38  17
             20
           ----
            777
             12
           ----
        9)9324(        C.  Q.
   Ans. 1036lb.=9  1
```

If the above question be wrought decimally, the operation may stand as follows:

```
     C.   L.      C.
If 1 : 2.8 :: 13.875
                 2.8
             -------
              111000
              27750
             ------- lb.   C. Q.
    .0375)38.8500(1036=9  1 Ans.
          37.5...
          -----
           1350
           1125
           -----
            2250
            2250
```

The value or price of the goods received and delivered in bartar being always equal, it is obvious that the product of the quantities received and delivered, multiplied in their respective rates, will be equal.

Hence arises a rule which may be used with advantage in working several questions; namely, Multiply the given quantity and rate of the one commodity, and the product divided by the rate of the other commodity quotes the quantity sought; or divided by the quantity quotes the rate.

Quest. 2. How many yards of linen, at 4s. per yard, should I have in bartar for 120 yards of velvet, at 15s. 6d.?

```
Yds.   Sixp.         Sixp.   Yds.
120×    31 = 3720, and 8)3720(459 Ans.
```

BARTH, or Bart, John, a brave fisherman of Dunkirk, who rose to the rank of an admiral; and is celebrated for his signal valour and naval exploits, in the annals of France. He died in 1702, aged 51.

BARTHELEMY, John James, a celebrated literary character, born at Cassis, a little sea-port on the shores of the Mediterranean, January 1716.

At twelve years of age he was sent to school at Marseilles. Being admitted into the college of the oratory, he was put under the care of Father Renaud, a person of taste and wit, who soon discovered similar qualities in his pupil, and became uncommonly attentive to his progress. M. de Visclede, a man of letters, and friend to the former, also concurred with him in his endeavours, and young Barthelemy's career soon became equally rapid and brilliant.

He had resolved to dedicate himself to the church; but, in order to prepare for this, it became necessary to change his place of residence, for M. de Belzunce, then bishop of Marseilles, being actuated by a narrow jealousy, refused to admit the students of the oratory to holy orders. Barthelemy, therefore, quitting his old masters with regret, found himself under the necessity of studying philosophy and theology with the Jesuits.

As he had not at first the good fortune to fall into able hands, he determined to follow a private plan of education, independent of the professors. He accordingly applied himself to the ancient languages, and was indefatigable in obtaining a knowledge of the Greek, Hebrew, Chaldean, and Syriac. His passion for learning had, however, nearly cost him his life, for he fell dangerously ill, and did not recover his strength until he had entered the seminary where he received the *tonsure*.

Digitized by Google

Barthelemy.

In this retreat, he dedicated his leisure hours to the study of Arabic. A young Maronite, who had been educated at Rome, afforded him his assistance, and enabled him not only to read, but even to speak it. On this, his new friend proposed to him to render all the services in his power to the Maronites, Armenians, and other catholic Arabians, who were but slightly acquainted with the language of the country in which they resided: in other words, he wished that he would announce the word of God to them in their native tongue, and accordingly presented him with some Arabic sermons, composed by a Jesuit, who belonged to the *propaganda*.

Barthelemy got one or two of them by heart, and pronounced them in a spacious hall belonging to the seminary, to the entire satisfaction of his oriental auditors.

His reputation now rose high, and he began to be considered as a youth of uncommon promise, when a trifling incident occurred which tended not a little to increase it. Ten or twelve of the principal merchants of Marseilles one day introduced a person to him who had implored their charity on the exchange, observing that he was by birth a Jew, and had been raised, on account of his great learning, to the dignity of a rabbin; but having perceived, in consequence of his studies, that the Christian was the true religion, he had become a convert. He at the same time added, that he was profoundly instructed in the oriental languages, and demanded to be put to the proof, by being confronted with some learned man.

Barthelemy, not then 21 years of age, was immediately pitched upon. It was in vain he assured them, that although he could read, he was unable to speak the languages in question; they pressed him to enter into conversation with the native of the east; and the stranger himself entreated that the conference might immediately commence.

The challenge was at length accepted, and the foreigner began the contest, from which Barthelemy retired with the character of a prodigy of eastern erudition.

Barthelemy having now finished his education at the seminary, retired to Aubagne, and spent some time in the bosom of his family, by all the members of which he was greatly beloved. He was accustomed, however, to repair frequently to Marseilles, on purpose to visit the academicians, and other learned men residing there. Among those to whom he attached himself in a particular manner, was a M. Cary, the possessor of a fine cabinet of medals and a valuable collection of books, which were quite analogous to the favourite subject of his pursuits and studies. They spent whole days together in conversing on literary subjects; after which, Barthelemy, as if insatiable of knowledge, would retire to the Minims, where Father Sigaloux, a correspondent of the academy of sciences, was employed in making astronomical observations. In these labours the young abbé became his associate, for he was ambitious of improving in every kind of knowledge.

But he began at length to perceive, that in order to render his studies profitable, it would be necessary to circumscribe them, as mediocrity of knowledge, the inevitable result of a diversity of applications, was but little preferable to ignorance itself. Occupied with these sentiments, he repaired to Paris in 1744, with a view to devote himself entirely to literature. He was furnished with a letter to M. de Boze, keeper of the medals, and perpetual secretary of inscriptions and belles lettres. This learned man, so estimable in every point of view, received him with great politeness, and introduced him to the acquaintance of the most distinguished members of the three academies, who dined twice a-week at his apartments. Mixing with society of this kind, Barthelemy became more deeply enamoured than ever with a love of letters, and a respect for those who cultivated them.

M. de Boze, in the mean time, carefully studied the character and disposition of the young man, and at length favoured him with his friendship, and even with his confidence; at least he conferred as much of these as was possible for a man of so much circumspection and reserve.

As the increasing age, and declining health, of M. de Boze would not permit him to apply any longer with the intense investigation necessary for the completion of the cabinet of medals, he had entertained some thoughts of associating M. de Bastie, a learned antiquary belonging to the academy of inscriptions, as a partner in his labours. That gentleman lost the appointment, however, in consequence of an unlucky expression, and Barthelemy was selected a few months afterwards: this nomination was approved of by M. Bignon the librarian, and Maurepas the minister of the department. From that moment the abbé dedicated both his days and nights to the study of those medals which his colleague had been prevented, by his infirmities, from arranging.

Amidst his multiplied occupations, Barthelemy began to enjoy a mode of life so conformable to his taste and his talents, when he beheld with affright a new career present itself. In the course of his journey to the capital he had seen M. de Bausset, then a canon, at Aix. They were friends and countrymen; for M. de Bausset was born at Aubagne, where his family had been long established. As he was a young man of considerable expectations, he had promised that Barthelemy should become his vicar-general the moment he himself was decorated with the mitre. Such a flattering offer was not to be rejected; and as the canon was now nominated to the bishopric of Bezieres, he did not fail to remind his old acquaintance of their mutual engagement. The sorrow of the medalist on this occasion was too great to be concealed: he was, however, too scrupulous an observer of his word to break his promise; but the prelate, who saw and felt for the embarrassment of Barthelemy, immediately desisted from his importunities.

On the death of M. de Boze, keeper of the cabinet of medals, in 1753, Barthelemy, who had been his colleague during seven years, of course expected to succeed him in that honourable situation. One person, however, started as a candidate; but notwithstanding the abbé, relying on the justice of his pretensions, took no step whatever to obtain the appointment, yet the zeal of his friends rendered all solicitations on his part unnecessary, for they were both numerous and powerful. M. de Malesherbes, whose unfortunate and tragical death all worthy men deplore; M. de Stainville,

Barthelemy. ville, afterwards a duke and minister; and M. de Gontaut, brother of the last Marshal de Biron, supported his pretensions, and he was accordingly nominated successor to his friend in 1753.

M. de Stainville, afterwards better known during his administration by the title of duke de Choiseul, in 1754 was oppointed ambassador to Rome, Madame de Stainville, a lady both young and beautiful, being passionately attached to learning and learned men, conceived a particular regard for the abbé, and it was proposed that he should occupy a place in their carriage, on this occasion, and make the tour of Italy along with them. Such a proposition could not fail to be highly flattering; but he was obliged, from principles of duty, to refrain for a time from complying with their wishes. He set out soon after, however, and arrived in November at Rome, where he and his companion were received and treated in the kindest manner by the French plenipotentiary, who lived in a magnificent style. Pope Benedict XIV. who then wore the tiara, being a learned man himself, did not fail to distinguish Barthelemy by the most courteous reception. But his stay at Rome was not long, for he was desirous of visiting Naples, rendered particularly interesting to an antiquary, at that period, by the recent discoveries made in its neighbourhood. He and his fellow-traveller were occupied during a whole month in admiring the curiosities of that capital, and in studying ancient literature; after which they took a journey of 30 leagues, to behold the monuments of Grecian architecture, still existing on the site of the ancient city of Pæstum.

The spacious apartments of the palace of Portici, containing the antiquities of Herculaneum and Pompeii, were still more interesting, and excited a far greater degree of curiosity in the breasts of the French philosophers. There they beheld an immense quantity of paintings, statues, busts, vases, and utensils of every kind; objects peculiarly calculated to engage their attention and excite their applause. It was not, however, without a certain mixture of grief and surprise that they noticed the four or five hundred manuscripts, saved from the ruins of Herculaneum, lying in the same forlorn state in which they were discovered. Two or three only had been unrolled, of which the learned Mazocchi has given an explanation: as these contained nothing important, the operation was abandoned.

But Barthelemy was not so easily discouraged, for he unceasingly solicited, he almost condescended to intrigue, with a view to engage the possessors of these treasures to turn them to the best advantage. He, at length, perceived his labours about to be crowned with success a few years afterwards, but he was finally disappointed by the death of the marquis Caraccioli, the minister of Naples, who had entered most cordially into his views.

Another subject about this time also engaged the attention of the abbé. He was exceedingly desirous of presenting the learned men of France with a specimen of the ancient writing employed in the Greek manuscripts. He accordingly addressed himself, on this subject, to his friend Mazocchi, and also to M. Paderno, who superintended the treasures of Portici: both, however, replied that they were expressly enjoined not to communicate any thing. On this he solicited permission to look, for a few minutes only, on a page of a manuscript which had been cut from top to bottom since its discovery. It contained 28 lines, and Barthelemy read it over six different times with extreme attention; after this he retired to a corner and transcribed the precious fragment, on a piece of paper, from memory. He then returned, and having made a mental collation between the copy and the original he corrected two or three trifling errors that had escaped his attention. Barthelemy.

Having thus rendered himself master of a *fac-simile* of the MS. which related to the persecution of the Greek philosophers during the time of Pericles, he transmitted the literary plunder in the course of that very day to the academy of belles lettres, strictly enjoining secrecy, however, that Mazocchi and Paderno might escape all manner of blame.

M. de Stainville having been appointed ambassador to the court of Vienna, in 1757, the abbé accompanied his lady thither. On his arrival he found that his friend and protector had made certain engagements with the French ministry, on purpose to gratify his passion for antiquities. In consequence of this he had leave to visit Greece and the sea-ports of the Mediterranean, at the king's expence, where he was to amass new treasures, and return with them to his native country by Marseilles. But, notwithstanding all the attractions that this project presented, his scrupulous attachment to his duty prevailed over his passion for knowledge; as he deemed it highly improper that the cabinet of medals should be so long shut.

At length, towards the end of 1758, M. de Stainville, now become duke de Choiseul, was nominated minister for foreign affairs in the room of the abbé de Bernis, who had retired with a cardinal's hat. No sooner did this event take place, than both he and his lady determided to provide for their friend. They accordingly requested Barthelemy to state the sum that would make him easy for life, and he instantly mentioned 6000 livres a-year; blushing at the same time at the largeness of the demand.

As the purse of the nation was now open to the patron, he distributed his favours with a liberal hand; and it must be owned that, on this occasion, an object worthy of remuneration presented itself in the person of the learned abbé. Accordingly, in 1759, he presented him with a pension on the archbishopric of Alby; in 1765 he conferred on him the treasurership of St Martin de Tours, and in 1768 he made him secretary-general to the Swiss guards. In addition to these the abbé also enjoyed a pension of 5000 livres on the Mercury. His income was now very large, but he employed it nobly; for he distributed the surplus, which was considerable, among indigent men of letters.

In 1771 M. de Choiseul was disgraced, being succeeded in his office by his enemy the duke d'Aiguillon, and exiled to his estate at Chanteloupe. On this occasion he was forsaken as usual by the courtiers, who had basked in the sunshine of his favour; but he was not deserted by the grateful antiquary, who instantly repaired thither to pay his respects; nay, when the king demanded the duke's resignation of the post of colonel-general of the Swiss guards, the abbé, with a spirit

Barthelemy.

spirit that does honour to his memory, insisted on sending in his own resignation of the secretaryship; but the ex-minister interfered, and prevailed upon him not to deliver it up without an indemnification, which should be sanctioned by the great seal, and authorized by letters patent enregistered in parliament.

Barthelemy was now in possession of more than 1200l. sterling per annum; of this he distributed between three and four hundred in the manner before related: the remainder was not dissipated in pomp and ostentation, but employed in such a manner as to enable him to enjoy philosophic ease. He also educated and established three nephews in life, one of whom has been successively ambassador and director: he at the same time supported the rest of his family in Provence, and selected a noble library, which he disposed of some years before his death.

After having thus possessed an ample income during more than twenty years, the abbé Barthelemy found himself, towards the latter end of his existence, reduced to live on a pittance calculated merely to furnish the indispensable necessaries of life, in consequence of the suppression of places and appointments that ensued immediately after the revolution. He was never heard, however, to complain; nay, he did not seem to perceive the change; and, while he was still permitted by his age and infirmities to walk from one end of Paris to the other, to pay his respects to Madame de Choiseul, he seemed to the full as happy as before.

In 1788 appeared his celebrated work, entitled *Voyage du jeune Anacharsis en Greece, dans le milieu du quatrieme siecle avant l'ere Chretienne.* He had begun it in 1757, and, during an uninterrupted succession of 30 years, occupied his leisure hours in bringing it to maturity.

His hero, a young Scythian, descended from the famous philosopher Anacharsis, whose name he bears, is supposed to repair to Greece, for his instruction in his early youth, and, after making a tour of her republics, her colonies, and her islands, he returns to his native country and writes this book, in his old age, after the hero of Macedon had overturned the Persian empire. In the manner of modern travellers, he gives an account of the customs, government, and antiquities, of the country he has visited; a copious introduction supplies whatever may be wanting in respect to historical details; while various dissertations on the music of the Greeks, on the literature of the Athenians, and on the economy, pursuits, ruling passions, manners and customs, of all the surrounding states, afford ample gratification to the reader of taste.

In 1789 the author became a candidate for a chair in the French academy; and such was the reputation he had obtained by his labours, that this learned body became particularly anxious to enrol him among its members; he was accordingly elected by acclamation. The speech delivered by the Abbé on his inauguration has been equally celebrated for its simplicity and modesty.

In 1790 M. de St Priest, minister of the department of Paris, made him an offer of the place of librarian to the king, then vacant by the resignation of M. le Noir. This was, at that period, a very flattering proposal, but it was not accepted; for the Abbé imagined that it might interfere with his literary occupations, and therefore, after expressing his gratitude, he declined the intended favour.

In the mean time, while Barthelemy was thus refusing one of the most honourable offices that a man of letters could at that time aspire to, he did not neglect the department which had so long been confided to his charge. His ardour, in respect to every thing that concerned the cabinet of medals, remained unabated and unaltered through life, and he now found means to have his nephew, Barthelemy Courçy, associated with him in his labours. This grand collection had received a considerable increase, and been embellished with a number of fine specimens since it was confided to his care. To enrich it still more, he carried on a correspondence, not only with the various provinces of France, but also with all parts of Europe.

In the mean time, the health of the learned medallist declined daily, and, in 1792, his strength began to fail him. Towards the beginning of the next year he became subject to fainting fits, which deprived him of the exercise of his faculties for several hours together. Being naturally calm and courageous, he did not appear, however, to be in the least affected by these accidents, but his friends considered them as symptoms of a speedy dissolution.

He was now seventy-eight years of age, sixty of which had been spent in literary toils, when an event occurred, calculated to excite the most bitter indignation. On the 30th August, 1793, this feeble old man was denounced as an aristocrat, and his nephew and several other young men employed about the library were included in the supposed guilt. The accusation proceeded from a person of the name of Duby, a clerk in the library, and was conveyed in a letter written by him to a person of the name of Chrétien, a pastry-cook, who happened to be a member of the section, before which it was first read, and then transmitted to the municipality. It ought not to be omitted here that Duby did not know Chrétien, or Chrétien Duby, and that Barthelemy was not acquainted with either of them!

A warrant was immediately issued against the supposed culprits, and this was signified by the officers of justice to the Abbé, who happened to be at Madame de Choiseul's, on the morning of the 2d of September. On this he instantly arose, and, without discovering any symptoms of fear, took his leave of that lady, and was conducted to the Magdelonettes, where he found his nephew Courçy. Such, however, was the respect paid to his virtue and his talents, even within the walls of a prison, that, on entering the gate, he was received with every expression of regard by the inhabitants of this dreary mansion, and the gaoler, whose name was Vanbertrand, paid the utmost attention to him. He was accordingly lodged in a little apartment along with his relation, and in the course of that evening he received a visit from Madame de Choiseul, who had taken care to intimate the event to the government. No sooner was the committee informed that the Abbé Barthelemy had been included in the order that was meant only to extend to some of the subalterns employed in the library, than orders were instantly issued for his release, and we are assured by his friend the duke de Nivernois, that the clerks in the public offices displayed the utmost zeal in forwarding the necessary papers for his liberation:

Barthelemy

beration: accordingly at eleven o'clock at night he was awaked from his sleep, and conducted to the house of his fair friend.

But the attention of the government did not stop here; for in a few weeks afterwards, the place of national librarian being vacant by the death of Carra, and the resignation of Chamfort, who had held it jointly, it was offered to the Abbé, with the most flattering marks of attention. His age and infirmities, however, afforded but too good a pretext for his refusal.

In 1794 his approaching dissolution was apparent to every one but himself, for his fainting fits became longer and more frequent; however, as he did not retain any remembrance of them, he occupied his time as usual; in other words, he devoted all his hours to friendship and literature.

He had now reached the 80th year of a life which had been entirely spent in a laborious and incessant application to study, which had secretly weakened the springs of existence. The rigour of the winter of 1795, against which he had adopted no precautions, is supposed to have hastened the catastrophe; this did not occur, however, until the spring.

On the 25th of April he dined with Madame de Choiseul. In the course of the night he became so weak that he was unable to ring his bell; and in the morning, when his servant entered, he was found with his feet in the bed and his head on the floor, entirely deprived of sensation. After being replaced, his recollection returned, but he grew gradually worse, and he was carried off without experiencing any pain, April 30. 1795.

He retained full possession of all his senses until the very last moment. At one o'clock he read Horace as if nothing extraordinary had occurred; but his hands turning cold, in consequence of the approach of death, became unable to support the book, which fell to the ground. His head soon after was seen to incline on one side, he appeared to sleep, and it was believed by his nephew and his attendants that this was really the case; but it was soon discovered that his respiration had ceased, and that this learned man was no more!

Thus died, without any of the usual struggles that accompany death, John James Barthelemy, one of the greatest ornaments of his age, regretted by all his relations as if he had been their common father, whose life presented an example, and whose works form a model for literary men. In person he was above the middle size, and, if we are to give credit to his admirers, his countenance displayed an air of antiquity wonderfully correspondent to his studies. His bust, carved by the chissel of Houdon, is allowed to be a masterpiece of art, and that able sculptor has contrived to infuse into the physiognomy a mixture of the mildness, simplicity, good-nature, and grandeur, so visible in the original.

BARTHEZ, Paul Joseph, an eminent French physician. See Supplement.

Barthius.

BARTHIUS, Gaspar, a very learned and copious writer, born at Custrin in Brandenburg, the 22d of June 1576. Mr Baillet has inserted him in his *Enfans Celebres;* where he tells us, that at 12 years of age he translated David's Psalms into Latin verse of every measure, and published several Latin poems. Upon the death of his father (who was professor of civil law at Francfort, counsellor to the elector of Brandenburg, and his chancellor at Custrin), he was sent to Gotha, then to Eisenach, and afterwards, according to custom, went through all the different universities in Germany. When he had finished his studies, he travelled into Italy, France, Spain, and England. He studied the modern as well as ancient languages, and his translations from the Spanish and French show that he was not content with a superficial knowledge. Upon his return to Germany, he took up his residence at Leipsic, where he led a retired life, his passion for study having made him renounce all sort of employment. He wrote a vast number of books; the principal of which are, 1. His *Adversaria*, a large volume in folio; the second and third volumes of which he left in manuscript. 2. A Translation of Æneas Gazæus. 3. A large volume of Notes upon Claudian, in 4to. 4. Three large volumes upon Statius; &c. He died at Leipsic, in 1658, aged 71.

Bartholinus.

BARTHOLINUS Caspar, a learned physician and anatomist in the 17th century, was born at Malmoe, a town in the province of Schonen, which then belonged to Denmark. At three years of age he had such a quick capacity, that in 14 days he learned to read; and in his 13th year he composed Greek and Latin orations, and pronounced them in public. When he was about 18 he went to the university of Copenhagen, and afterwards studied at Rostock and Wirtemberg. He next set out upon his travels; during which he neglected no opportunity of improving himself at the different universities to which he came, and everywhere receiving marks of respect. He was in 1613 chosen professor of physic in that university, which he enjoyed 11 years; when, falling into a dangerous illness, he made a vow, that if it should please God to restore him, he would solely apply himself to the study of divinity. He recovered, and kept his word; and soon after obtained the professorship of divinity, and the canonry of Roschild. He died on the 13th of July 1629, after having written several small works chiefly on metaphysics, logic, and rhetoric.

Bartholinus, *Thomas*, a celebrated physician, son of the former, was born at Copenhagen in 1616. After studying some years in his own country, he in 1637 went to Leyden, where he studied physic during three years. He then travelled into France; and resided two years at Paris and Montpelier, in order to improve himself under the famous physicians of those universities. Afterwards going to Italy, he continued three years at Padua; and at length went to Basil, where he obtained the degree of doctor of philosophy. Soon after, he returned to Copenhagen; where in 1647 he was appointed professor of the mathematics; and next year was nominated to the anatomical chair, an employment better suited to his genius and inclination; which he discharged with great assiduity for 13 years, and distinguished himself by making several discoveries with respect to the lacteal veins and lymphatic vessels. His close application, however, having rendered his constitution very infirm, he, in 1661, resigned his chair; but the king of Denmark allowed him the title of *honorary professor*. He now retired to a little estate he had purchased at Hagested, near Copenhagen, where he hoped to have spent the remainder of his days in peace and tranquillity: but his house being burnt in 1650,

Digitized by Google

1560, his library, with all his books and manuscripts, was destroyed. In consideration of this loss the king appointed him his physician with a handsome salary, and exempted his land from all taxes; the university of Copenhagen also appointed him their librarian; and, in 1675, the king did him the honour to give him a seat in the grand council of Denmark. He wrote, 1. *Anatomia Caspari Bartholini Parentis, novis Observationibus primum locupletata*, 8vo. 2. *De Monstris in Natura et Medicina*, 4to. 3. *De Armillis Veterum, præsertim Danorum, Schedion*, 8vo; and several other works. This great man died on the 4th of December 1680.

St BARTHOLOMEW'S DAY, a festival of the Christian church, celebrated on the 24th of August. St Bartholomew was one of the twelve apostles; and is esteemed to be the same as Nathanael, one of the first disciples that came to Christ.

It is thought this apostle travelled as far as India, to propagate the gospel; for Eusebius relates, that a famous philosopher and Christian, named *Pantænus*, desiring to imitate the apostolical zeal in propagating the faith, and travelling for that purpose as far as India, found there, among those who yet retained the knowledge of Christ, the gospel of St Matthew, written, as the tradition asserts, by St Bartholomew, one of the twelve apostles, when he preached the gospel in that country. From thence he returned to the more northern and western parts of Asia, and preached to the people of Hierapolis; then in Lycaonia; and lastly at Albania, a city upon the Caspian sea, where his endeavours to reclaim the people from idolatry were crowned with martyrdom, he being (according to some writers) flayed alive, and crucified with his head downwards.—There is mention made of a Gospel of St Bartholomew, in the preface to Origen's Homilies on St Luke, and in the preface to St Jerome's Commentary on St Matthew: but it is generally looked upon as spurious, and is placed by Pope Gelasius among the apocryphal books.

BARTHOLOMEW, *St*, one of the Caribbee islands, belonging to the French, but ceded by them to Sweden in 1785. It is about 24 miles in compass, and has a good haven. W. Long. 62. 15. N. Lat. 18. 16.

BARTHOLOMITES, a religious order founded at Genoa in the year 1307; but the monks leading very irregular lives, the order was suppressed by Pope Innocent X. in 1650, and their effects were confiscated. In the church of the monastery of this order at Genoa is preserved the image which it is pretended Christ sent to King Abgarus. See ABGARUS.

BARTOLOCCI, JULIUS, a learned monk, and professor of Hebrew at Rome, was born at Celeno, in 1613; and distinguished himself by writing an excellent Hebrew and Latin catalogue of the Hebrew writers and writings, in 4 vols folio, a continuation of which was performed by Imbonati his disciple. He died in 1687.

BARTOLOMEO, FRANCISCO, a celebrated painter, born at Savignano, a village 10 miles from Florence, in the year 1469, was the disciple of Cosimo Rosselli, but was much more beholden to the works of Leonardo da Vinci for his extraordinary skill in painting. He was well versed in the fundamentals of design. Raphael, after quitting the school of Perugino, applied to this master; and under him studied the rules of perspective, with the art of managing and uniting his colours. In the year 1500, he turned Dominican friar; and some time after was sent by his superiors to the convent of St Martin, in Florence. He painted both portraits and histories; but his scrupulous conscience would hardly ever suffer him to draw naked figures, though nobody understood them better. He died in 1517, aged 48.

BARTON, a town of Lincolnshire, seated on the river Humber, where there is a considerable ferry to pass over into Yorkshire. Population 2204 in 1811. W. Long. 0. 10. N. Lat. 53. 40.

BARTSIA, PAINTED CUP. See BOTANY *Index*.

BARUCH, THE PROPHECY OF, one of the apocryphal books, subjoined to the canon of the Old Testament. Baruch was the son of Neriah, who was the disciple and amanuensis of the prophet Jeremiah. It has been reckoned part of Jeremiah's prophecy, and is often cited by the ancient fathers as such. Josephus tells us, Baruch was descended of a noble family; and it is said in the book itself, that he wrote this prophecy at Babylon; but at what time is uncertain. It is difficult to determine in what language this prophecy was originally written. There are extant three copies of it; one in Greek, the other two in Syriac; but which of these, or whether any one of them, be the original, is uncertain.

BARULES, in church history, certain heretics, who held, that the Son of God had only a phantom of a body; that souls were created before the world, and that they lived all at one time.

BARUTH, an ancient town of Turkey, in Syria, with a Christian church of the Nestorian persuasion. It is situated in a fine fertile soil, but is inconsiderable now to what it was formerly. E. Long. 34. 40. N. Lat. 33. 30.

BARUTH, an Indian measure, containing 17 gantans: It ought to weigh about three pounds and a half English avoirdupois.

BARYTONUM, in the Greek grammar, denotes a verb, which having no accent marked on the last syllable, a grave accent is to be understood. In Italian music, *barytona* answers to our common pitch of bass.

BAS CHEVALIER. See BACHELOR.

BAS-Relief. See *BASSO-Relievo*.

BAS, *James Philip le*, a modern French engraver, by whom we have some excellent prints. His great force seems to lie in landscapes and small figures, which he executed in a superior manner. His style of engraving is extremely neat; but yet he proves the freedom of the etching, and harmonizes the whole with the graver and dry point. We have also a variety of pretty vignettes by this artist. He flourished about the middle of the present century; but we have no account of the time of his birth or death.

1 Name, derivation, &c.

BASALTES, (from *basal*, "iron," or *βασανιζω*, *diligenter examino*), in *Natural History*, a heavy, hard stone, chiefly black or green, consisting of prismatic crystals, the number of whose sides is uncertain. The English miners call it *cockle*; the German *schoerl*. Its specific gravity is to that of water as 3000 or upwards to 1000. It frequently contains iron: and consists either of particles of an indeterminate figure, or of a sparry, striated, or fibrous texture. It has a flinty hardness, is insoluble by acids, and is fusible by fire.

Basaltes. The following is an analysis of some basaltes by Mr Bergman; and as the resemblance of it to lava will be frequently mentioned in the succeeding part of this article, we shall here contrast this analysis with that of lava by the same author.

2 Comparative analysis of basaltes and lava.

Basaltes, 100 parts contains		Lava, 100 parts contains	
Siliceous earth	50	Siliceous earth	49
Argillaceous	15	Argillaceous	35
Calcareous	8	Calcareous	4
Magnesia	2	Iron	12
Iron	25		

Dr Kennedy, an ingenious chemist, analyzed several species of basalt, whinstone, and lava, of which the following are the results.

Phil. Tran. Edin. vol. v.

Basalt from Staffa contains, in 100 parts,

Silex	48
Argil	16
Oxyd of iron	16
Lime	9
Moisture and other volatile matter	5
Soda, about	4
Muriatic acid, about	1
	99

Whinstone of Salisbury rock near Edinburgh contains, in 100 parts,

Silex	46
Argil	19
Oxyd of iron	17
Lime	8
Moisture and other volatile matter	4
Soda, about	3.5
Muriatic acid, about	1
	98.5

Whinstone from Caltonhill near Edinburgh contains, in 100 parts,

Silex	50
Argil	18.5
Oxyd of iron	16.75
Carbonate of lime	3
Moisture and other volatile matter	5
Soda, about	4
Muriatic acid, about	1
	98.25

Lava from Catania, Mount Ætna, contains, in 100 parts,

Silex	51
Argil	19
Oxyd of iron	14.5
Lime	9.5
Soda, about	4
Muriatic acid, about	1
	99

Lava from Sta Venere, Ætna, contains, in 100 parts, Basaltes.

Silex	50.75
Argil	17.5
Oxyd of iron	14.25
Lime	10
Soda, about	4
Muriatic acid, about	1
	97.5

The most remarkable property of this substance is its figure, being never found in strata, like other marbles, but always standing up in the form of regular angular columns, composed of a number of joints, one placed upon, and nicely fitted to another, as if formed by the hands of a skilful workman. See Plate LXXXV. fig. 15.

3 Basaltes, where found.

Basaltes was originally found in columns in Ethiopia, and fragments of it in the river Tmolus, and some other places. We now have it frequently, both in columns and small pieces, in Spain, Russia, Poland, near Dresden, and in Silesia; but the noblest store in the world seems to be that called the Giant's Causeway in Ireland and Staffa, one of the western isles of Scotland *. Great quantities of basaltes are likewise found in the neighbourhood of Mount Ætna in Sicily, of Hecla in Iceland, and of the volcano in the island of Bourbon. These are the only three active volcanoes in whose neighbourhood it is to be met with; but it is also found in the extinguished volcanoes in Italy, though not in the neighbourhood of Vesuvius.

* See Giant's Causeway and Staffa.

4 Of the Giant's Causeway in Ireland.

In Ireland the basaltes rises far up the country, runs into the sea, crosses at the bottom, and rises again on the opposite land. In Staffa the whole end of the island is supported by natural ranges of pillars, mostly above 50 feet high, standing in natural colonnades, according as the bays and points of land have formed themselves, upon a firm basis of solid unformed rock. Above these, the stratum, which reaches to the soil or surface of the island, varies in thickness, as the island itself is formed into hills or valleys, each hill, which hangs over the valleys below, forming an ample pediment. Some of these, above 60 feet in thickness from the base to the point, are formed by the sloping of the hill on each side, almost into the shape of those used in architecture.

The pillars of the Giant's Causeway have been very particularly described and examined. The most accurate account of them is to be met with in a work entitled, "Letters concerning the northern coast of the county of Antrim;" from which the following particulars relative to the present subject are extracted.

5 Particular account of the pillars.

"1. The pillars of the Causeway are small, not very much exceeding 1 foot in breadth and 30 in length; sharply defined, neat in their articulation, with concave or convex terminations to each point. In many of the capes and hills they are of a larger size; more imperfect and irregular in their figure and articulation, having often flat terminations to their joints. At Fairhead they are of a gigantic magnitude, sometimes exceeding 5 feet in breadth and 100 in length; oftentimes apparently destitute of joints altogether. Through many parts of the country, this species of stone is entirely rude and unformed, separating in loose blocks; in

Plate LXXXVI. fig. 1.

Digitized by Google

Basaltes. in which state, it resembles the stone known in Sweden by the name of *trappe*.

"2. The pillars of the Giant's Causeway stand on the level of the beach; from whence they may be traced through all degrees of elevation to the summit of the highest grounds in the neighbourhood.

"3. At the Causeway, and in most other places, they stand perpendicular to the horizon. In some of the capes, and particularly near Usbet harbour, in the isle of Bagherry, they lie in an oblique position. At Doon point in the same island, and along the Balintoy shore, they form a variety of regular curves.

"4. The stone is black, close, and uniform; the varieties of colour are blue, reddish, and gray; and of all kinds of grain, from extreme fineness to the coarse granulated appearance of a stone which resembles imperfect granite, abounding in crystals of schorl, chiefly black, though sometimes of various colours.

"5. Though the stone of the Giant's Causeway be in general compact and homogeneous; yet it is remarkable, that the upper joint of each pillar, where it can be ascertained with any certainty, is always rudely formed and cellular. The gross pillars also in the capes and mountains frequently abound in these air-holes through all their parts, which sometimes contain fine clay, and other apparently foreign bodies: and the irregular basaltes beginning where the pillars cease, or lying over them, is in general extremely honey-combed; containing in its cells crystals of zeolite, little morsels of fine brown clay, sometimes very pure steatite, and in a few instances bits of agate.

6 Account of those in Staffa.

Sir Joseph Banks observes, that the bending pillars of Staffa differ considerably from those of the Giant's Causeway. In Staffa they lie down on their sides, each forming the segment of a circle; and in one place, a small mass of them very much resembles the ribs of a ship. Those of the Giant's Causeway which he saw, ran along the face of a high cliff, bent strangely in the middle, as if unable, at their first formation, while in a soft state, to support the mass of incumbent matter.

7 Rocks of the Cyclops described.

The rocks of the Cyclops, in the neighbourhood of Ætna, exhibit very magnificent basaltic pillars. A general view of them is given on Plate LXXXVI. fig. 2. where *a*, *b*, *c*, are the three principal rocks; *e* is the extremity of an island, one half of which is composed of lava, on a base of basaltes, of no uncommon nature; above which there is a crust of pozzolana, combined with a certain white calcareous matter, which is pretty hard and compact; and which, as it is composed by the action of the air, appears like a piece of knotty porous wood. That rock, at some former period, became so hard as to split; and the clefts were then filled up with a very hard and porous matter like scoriæ. This matter afterwards acquiring new hardness, also split, leaving large interstices, which in their turn have been filled up with a species of compound yellow matter. The island was formerly inhabited; and there still remains a flight of steps leading from the shore to the ruins of some houses which appear to have been hewn in the rock.

The rock *b* has the straightest and most regular columns of any. It is represented distinctly in Plate LXXXVII. fig. 1. and likewise a general view of *c* and *d*, with the foot of Ætna leading to Catanea. These basaltic columns, at first view, seem to resemble those of the Giant's Causeway, and others commonly met with: but on a nearer inspection, we find a remarkable difference; being assembled in groups of five or six about one, which serves as their common centre. They are of various sizes and forms; some square, others hexagonal, heptagonal, or octagonal. One half of this rock is composed of perpendicular columns; the other of another species of basaltes disposed in inclined, and almost rectilinear, layers. These are in contact with the columns, and are as closely connected with them as they are with one another. The layers are longer at the base than towards the top of the rock. It is further to be remarked, that most of these layers are subdivided as they rise upwards; so that towards these upper extremities, one layer presents to the eye sometimes one, sometimes two, and sometimes three, divisions. The fragments of basaltes taken off from these layers are of a rhomboidal figure, because the layers break obliquely.

These layers, though inclined towards the base, become almost perpendicular towards the upper part of the rock, where they appear united in a point, and overtop most of the visible and elevated parts of the prismatic columns. These columns terminate in such a manner as to form a kind of staircase. They appear even to rise under a species of clay with which they are covered at one extremity, till they reunite themselves with the point which is formed by the most elevated parts of the layers of basaltes beside them.

This extraneous matter with which these columns are covered, and of which the summit of this pyramid consists, appears to be of the same species with the former, composing the upper part of the island already described.

The basaltes of that island has one particularity, viz. that it is full of small crystals of about the size of peas. These appear no less beautiful than rock-crystal; but they are much softer, and yield even to the action of the air. We see here large fragments of basaltes which were formerly full of crystals, but destroyed by time. They are now not unlike a sponge, from the great number of holes which appear all over their surface. Those pieces of basaltes which contain most of these crystals are not so hard as those which contain fewer of them.

8 Basaltes on the promontory of the Castel d'Iaci described.

The promontory of Castel d'Iaci, which terminates the basis of Ætna, is almost entirely composed of basaltes, but of a kind very different from the former. It consists of a great number of cylinders, from the diameter of six inches to that of twenty feet. Some of these are solid, others hollow like cannon: some extended in layers, others similar to carrots of tobacco consisting of a number of pieces squeezed together. Some of these cylinders are straight, others curved into a variety of forms. Some look like globes enclosed in the rocks; and in the fractures of these globes we perceive the strata of which they are composed.

Fig. 2. represents the basaltes at the foot of this promontory on the south side. The little mounts into which it appears to be collected, are sometimes only one French foot in diameter, sometimes six. They are composed of small prisms or needles, or of cubic trapezoids, and consist of a matter distinguished by the name of *dirty lava*. It is made up of pozzolana, consolidated

Basaltes. solidated by a certain liquid, which, while it has communicated solidity to the pozzolana, has at the same time suffered that substance to shrink considerably, in such a manner as to leave large chinks between the pieces of basaltes, which are thus formed by the operation of the liquid on the pozzolana. It appears also to have insinuated itself into the clay with which the promontory is covered; which is become hard in its turn, and which has also split into chinks that appear to contain a kind of hard matter.

These descriptions and figures will serve to give an idea of the appearance of the basaltes, which is now generally accounted a kind of marble. Wallerius considers it as a species of the corneous or horn-rock; and Cronstedt enumerates it among those substances which he calls *garnet earths*. The largest block of this stone that ever was seen, was placed according to Pliny, by Vespasian in the temple of Peace. It represented the figure of Nilus, with 16 children playing about it, denoting as many cubits of the rise of the river. The statue of Memnon, in the temple of Serapis at Thebes, which sounded at the rising of the sun, was also made of the same material, if we may believe this author. Most of the Egyptian figures are likewise made of basaltes. Some of the ancients call it *lapis Lydius*, from Lydia, where it seems it was formerly found in greatest abundance. The moderns denominate it the *touchstone*, as being used for the trial of gold and silver.

9 Basaltes used in different ancient works.

10 Substances mixed with basaltes.

Various substances are found intermixed with basaltes; of which Mr Hamilton, in the letters above-mentioned, enumerates the following: 1. Extensive layers of red ochre, varying in all degrees from a dull ferruginous colour to a bright red, answering very well for coarse painting. 2. Veins of iron ore, sometimes very rich, commonly of a very brown or reddish cast, at other times of a blue colour. 3. Steatites, generally of a greenish soapy appearance, more rarely of a pure white, and raising an imperfect saponaceous froth when agitated with water. 4. Zeolite, of a bright and pure white colour; in masses, varying in weight from a grain to a pound; generally disposed in cavities of the cellular basaltes; often affecting a crystallization, in which the fibres proceed as rays from a centre; and in some instances have a beautiful spangled appearance, resembling that of thistle-down. The most remarkable property of this substance is, that with any of the mineral acids, but especially with that of nitre, it forms a gelatinous mixture in the course of a few hours. 5. Peperino stone, a friable matrix of indurated clay and iron, studded with little bits of zeolite or other substances; and which is often of a reddish burnt colour. 6. Pumice-stone of a black colour, containing iron not entirely dephlogisticated, but still acting on the magnetical needle.

11 Of the nature of basaltes.

12 Mr Hamilton's state of the arguments concerning it.

These substances are met with among the basaltes of the Giant's Causeway in Ireland. In other places its attendants may perhaps vary according to circumstances. The basaltes itself has been considered by some as a crystallization from water; but others strenuously maintain that it is only a species of lava, and in defence of these opinions very considerable disputes have been carried on. The following is a state of the arguments on both sides from Mr Hamilton's treatise already mentioned.

In support of the volcanic origin of the basaltes it has been argued,

1. That it agrees almost entirely with lava in its elementary principles, in its grain, the species of the foreign bodies it includes, and all the diversities of its texture.

2. The iron of the basaltes is found to be in a metallic state, capable of acting on the magnetical needle, which is also the case with that found in compact lava.

3. The basaltes is fusible *per se;* a property which it has in common with lavas.

4. The basaltes is a foreign substance superinduced on the original limestone-soil of the country, in a state of softness capable of allowing the flints to penetrate considerably within its lower surface.

5. Those extensive beds of red ochre which abound among our basaltes are supposed to be an iron earth reduced to that state by the powerful action of heat; for such a change may be produced on iron in our common furnaces, provided there be a sufficient afflux of fresh air; and the basaltes itself, in such circumstances, is easily reducible to an impure ochre. This is also found to take place in the living volcanoes, particularly within their craters; and is therefore supposed to afford a presumptive argument of the action of fire in the neighbourhood of basaltes.

6. Though zeolite is not yet proved to be the actual production of a volcano, yet its presence is always supposed to give countenance to this hypothesis; because zeolite is found in countries where the action of subterraneous fire is still visible, and where there is reason to believe that the whole soil has been ravaged by that principle. Thus it abounds in Iceland, where the flames of Hecla yet continue to blaze; and in the isle of Bourbon, where there is still a volcano in force. It is therefore supposed to arise from the decomposition of the products of a volcano, where the fires have been long extinct.

7. Crystals of schorl appear in great plenty among many kinds of our basaltes; and these, though not absolutely limited to volcanic countries, yet being found in great abundance among the Italian lavas, in circumstances exactly corresponding to those of our basaltes, are thought to supply a good probable argument in the present case.

8. The peperino stone is thought to be undoubtedly of a volcanic origin. It has frequently the burnt and spongy appearance of many of the volcanic products; and that of the Giant's Causeway agrees exactly with the peperino of Iceland and Bourbon.

9. Puzzolane earth is met with among the basaltes of France; and there is very little reason to doubt that our basaltes, if pulverized, would agree with it in every respect; that is, it would produce a fine sharp powder, containing the same elementary parts, and probably agreeing with it in its valuable uses as a cement. This earth is also found in the Canary islands, which are thought to have other marks of fire; it is met with in all the volcanized parts of Italy, and is never found excepting where there are other evident marks of fire.

10. Pumice-stone is universally allowed to be produced by fire, and indeed bears the resemblance of a cinder

Basaltes. der so obviously, that one must be instantly convinced of its original. This is also found among the basaltes of Ireland.

11. There are three living volcanoes, within whose neighbourhood the basaltes and most of its usual attendant fossils have been observed, viz. Ætna in Sicily, Hecla in Iceland, and the island of Bourbon on the coast of Africa. To which it may be added, that it is found throughout all the volcanized parts of Italy, though not anywhere immediately in the neighbourhood of Vesuvius. Sir William Hamilton, however, informs us, that in the year 1779 he "picked up some fragments of large and regular crystals of close-grained lava or basalt; the diameter of which, when the prisms are complete, might have been eight or nine inches." He observes, that Vesuvius does not exhibit any lavas regularly crystallized, and forming what are called *Giants Causeways*, except a lava that ran into the sea, near Torre del Græco, in the year 1631, which has a small degree of such an appearance. As the fragments of basaltes which he found on this mountain, however, had been evidently thrown out of the crater in their proper form, he puts the question, "May not lavas be more ready to crystallize within the bowels of a volcano than after their emission? And may not many of the Giants Causeways already discovered be the nuclei of volcanic mountains, whose lighter and less solid parts may have been worn away by the hand of time?" Mr Faujas de St Fond gives an example of basalt columns placed deep within the crater of an extinguished volcano.

13 Of the basaltes thrown out by Vesuvius.

12. It is well ascertained by experience, that there are vast beds of pyrites dispersed through the interior parts of the earth at all depths; and it is also a certain fact, that this compound substance may be decompounded by the accidental effusion of water, in such a manner as to become hot, and at last to burn with great fury. This accession of pyrites is by many supposed to be the true origin of the volcanic fire; and an argument for this is, that the present volcanoes do pour forth great quantities of the component parts of pyrites, particularly sulphur, iron, and clay. Now, among the superinduced substances of the county of Antrim, and the same may probably be said of every other basaltic country, it is certain that the quantity of iron and clay diffused through almost every species of fossil, amounts to more than one half of the whole material; so that two of the principal elements of the pyrites are still found there, reduced in many instances to a slag or scoria. The third principle, viz. the sulphur, cannot be expected to remain; because sulphur is totally consumed by combustion; and what might perhaps escape and be sublimed would no doubt have since perished by decomposition, in consequence of being exposed to the air.

14 Glass sometimes appears in the form of prismatic crystals.

13. Another argument, which to Sir William Hamilton appears very convincing, is, that glass sometimes takes on the appearance of prisms, or crystallizes in cooling. He received some specimens of this kind from Mr Parker of Fleet-street, who informed him that a quantity of his glass had been rendered unserviceable by taking such a form. Some of these were in laminæ, which may be easily separated, and others resemble basaltic columns in miniature, having regular faces. "Many of the rocks of lava in the island of Ponza (says he) are, with respect to their configurations, strikingly like the specimens of Mr Parker's glass above mentioned; none being very regularly formed basaltes, but all having a tendency towards it. Mr Parker could not account for the accident that occasioned his glass to take the basaltic form; but I have remarked, both in Naples and Sicily, that such lavas as have run into the sea are either formed into regular basaltes, or have a great tendency towards such a form. The lavas of Mount Ætna, which ran into the sea near Jaci, are perfect basaltes; and a lava that ran into the sea from Vesuvius, near Torre del Græco in 1631, has an evident tendency to the basaltic form."

15 Lavas which run into the sea have a tendency to run into basaltes.

16 Arguments in opposition to the volcanic theory.

In opposition to these arguments it is urged, that in many of the countries where basaltes most abound, there are none of the characteristics of volcanic mountains. They assert, therefore, that the basaltes is a fossil, very extensively spread over the surface of the earth; and that, where it is found in the neighbourhood of volcanic mountains, we ought to suppose these to be accidentally raised on a basaltic soil rather than to have created it. But the advocates for the volcanic system are not much embarrassed with this argument. According to them, the basaltes has been formed under the earth itself, and within the bowels of these very mountains; where it could never have been exposed to view until, by length of time or some violent shock of nature, the incumbent mass must have undergone a very considerable alteration, such as should go near to destroy every exterior volcanic feature. In support of this it may also be observed, that the promontories of Antrim do bear evident marks of some very violent convulsion, which has left them in their present situation; and that the island of Bagherry, and some of the Western isles of Scotland, do really appear like the surviving fragments of a country, great part of which might have been buried in the ocean. It is further added, that though the exterior volcanic character be in a great measure lost in the basaltic countries; yet this negative evidence can be of little weight, when we consider, that the few instances where the features have been preserved afford a sufficient answer to this objection. Thus the Montagne de la Coupe in France still bears the marks of its having been formerly a volcano: and this mountain is observed to stand on a base of basaltic pillars, not disposed in the tumultuary heap into which they must have been thrown by the furious action of a volcanic eruption, tearing up the natural soil of the country; but arranged in all the regularity of a Giant's Causeway, such as might be supposed to result from the crystallization of a bed of melted lava, where rest and a gradual refrigeration contributed to render the phenomenon as perfect as possible.

17 Answered.

18 Mr Ferber's argument from the crystals found in black lava.

To these arguments stated by Mr Hamilton we shall add another from Mr Ferber: viz. That at the time he went from Rome to Ostia they were paving the road with a species of black lava. In some of the broken pieces he observed little empty holes, of the bigness of a walnut, incrusted all around their sides by white or amethystine, semipellucid, pointed, or truncated pyramidal crystallizations, entirely resembling the agate nodules or geodes, which are commonly filled with quartz crystallizations. There was no crack or fissure

in

Basaltes.

in the ambient compact lava; the crystal sherls were pretty hard, and might rather be called *quartz*. Some fine brownish dust lay in the rest of the holes, as impalpable and light as ashes. He tells us also, that in the greatest part of the Paduan, Veronese, and Vicentine lavas, we meet with an infinite quantity of white polygonal sherl crystallizations, whose figure is as regular, and still more polygonal, than the basaltes.

19 Mr Bergman's theory.

These may be considered as the principal arguments in favour of the volcanic theory of basaltes. On the other hand, the late celebrated Mr Bergman expresses himself to the following purpose.

"Ten years ago it was a general opinion, that the surface of the earth, together with the mountains, had been produced by moisture. It is true that some declared fire to be the first original cause, but the greater number paid little attention to this opinion. Now, on the contrary, the opinion that subterraneous fire had been the principal agent gains ground daily; and every thing is supposed to have been melted, even to the granite. It is not improbable, that both the fire and water have contributed their share in this operation; though in such a proportion, that the force of the former extends much farther than the latter; and, on the contrary, that the fire has only worked in some parts of the surface of the earth. It cannot be doubted that there has been some connection betwixt the basaltic pillars and subterraneous fire; as they are found in places where the marks of fire are yet visible; and as they are even found mixed with lava, tophus, and other substances produced by fire.

20 Both fire and water contribute to form basaltes.

21 Of the methods by which mineral crystals are naturally formed.

"As far as we know, nature makes use of three methods to produce regular forms in the mineral kingdom. 1. That of crystallization or precipitation; 2. The crusting or settling of the external surface of a liquid mass while it is cooling; and, 3. The bursting of a moist substance while it is drying.

"The first method is the most common; but to all appearance, nature has not made use of it in the present case. Crystals are seldom or never found in any quantity running in the same direction; but either inclining from one another, or, what is still more common, placed towards one another in sloping directions. They are also generally separated a little from one another when they are regular. The nature of the thing requires this, because the several particles of which the crystals are composed must have the liberty of obeying that power which affects their constitution. The basaltic columns, on the contrary, whose height is frequently from 30 to 40 feet, are placed parallel to one another in considerable numbers, and so close together that the point of a knife can hardly be introduced between them. Besides, in most places, each pillar is divided into several parts or joints, which seem to be placed on one another. And indeed it is not uncommon for crystals to be formed above one another in different layers, while the solvent has been visibly diminished at different times: but then the upper crystals never fit so exactly upon one another as to produce connected prisms of the same length or depth in all the strata taken together; but each stratum, separately taken, produces its own crystals.

"Precipitation, both in the wet and dry way, requires that the particles should be free enough to arrange themselves in a certain order; and as this is not practicable in a large melted mass, no crystallizations appear, excepting on its surface or in its cavities. Add to this, that the basaltes in a fresh fracture do not show a plain smooth surface under the microscope; but appear sometimes like grains of different magnitude, and at other times resemble fine rays running in different directions, which does not correspond with the internal structure of crystals.

"Hence the opinion of basaltes being formed by crystallization either in the wet or dry method must become less probable; but it must not be omitted, that the spars exhibit a kind of crystallization, which at first sight resembles a heap of basaltes, but upon a closer examination a very great difference is to be found. The form of the spar is everywhere alike, but the basaltes differ from one another in size and the number of their sides. The former, when broken, consists of many small unequal cubes; but the basalt does not separate in regular parts, &c. &c.

"Nature's second method of producing regular forms is that of crusting the outer surface of a melted mass. By a sudden refrigeration, nature, to effect this purpose, makes use of polyhedrous and irregular forms. If we suppose a considerable bed which is made fluid by fire, and spread over a plain, it evidently appears, that the surface must first of all lose the degree of heat requisite for melting, and begin to congeal. But the cold requisite for this purpose likewise contracts the uppermost congealed stratum into a narrower space; and consequently causes it to separate from the remaining liquid mass, as the side exposed to the air is already too stiff to give way. In this manner a stratum is produced, running in a parallel direction with the whole mass; others are still produced by the same cause in proportion as the refrigeration penetrates deeper. Hence we may very plainly see how a bed may be divided into strata. In the same manner the refrigeration advances on the sides; which consequently divides the strata into polyhedrous pillars, which can hardly ever be exactly square, as the strongest refrigeration in the inner parts of the mass advances almost in a diagonal line from the corners. If we add to this, that a large mass cannot be equal through its composition, nor everywhere liquid in the same degree, it will be easy to discover the cause of several irregularities. If the depth of the bed be very considerable in proportion to its breadth, prismatic pillars without cross divisions will be formed at least lengthwise from the uppermost surface downwards.

"The third way is perfectly similar to the preceding in its effect; but it is different from it by the mass being soaked in water, and by the bursting of it asunder, being the effect of the contraction while it is drying. If we suppose such a bed to be spread over a level space, the drying advances in the same manner as the refrigeration in the former case. This separation into strata properly happens when a considerable quantity of clay enters into the whole composition, because the clay decreases more than any other kind of earth in drying.

"It is most probable, therefore, that the pillars have been produced out of the basaltic substance while it was yet soft, or at least not too hard to be softened by exhalations. If we therefore suppose a bed to be spread over a place where a volcano begins to work, it

22 How the basaltes have been formed, according to this theory.

Digitized by Google

it is evident that a great quantity of the water always present on such occasions must be driven upwards in exhalations or vapours; which, it is well known, possess a penetrating softening power, by means of which they produce their first effect: but when they are increased to a sufficient quantity, they force this tough moist substance upwards: which then gradually falls, and during this time bursts in the manner above described.

23 Reasons for supposing that the basaltes has not been melted.

"The reasons for this supposition are as follows: 1. We do not find the internal substance of the basaltes melted or vitrified; which, however, soon happens by fusion; and for which only a very small degree of fire is requisite. It is of consequence very hard to explain how this substance could have been so fluid that no traces of bubbles appear in it; and yet, when broken, seem dull and uneven. Lava is seldom vitrified within; but the greater number of bubbles and pores which are found in the whole mass, are more than sufficient proofs, that it has not been perfectly melted to its smallest parts, but has only been brought to be near fluid. Secondly, the basaltes so much resemble the finer trapp, both in their grain and original composition, that they can hardly be distinguished in small fragments."

24 Mr Kirwan's opinion.

Mr Kirwan is of opinion, that the basaltes owe their origin both to fire and water: they seem to have been at first a lava; but this, while immersed in water, was so diffused or dissolved in it with the assistance of heat, as to crystallize when cold, or coalesce into regular forms. That basaltes is not the effect of mere fusion he concludes from comparing its form with its texture. Its form, if produced by fusion, ought to be the effect of having flowed very thin; but in that case its texture should be glassy: whereas it is merely earthy and devoid of cavities. Hence we may understand how it comes to pass that lava perfectly vitrified, and even water, have been found enclosed in basaltes.

25 Mr Houel's theory.

Mr Houel, in his *Voyage Pittoresque*, is at considerable pains to account for the origin of the different species of basaltes he met with in the neighbourhood of Ætna. "Some modern writers (says he) attribute the configuration of the basaltes to the sudden cooling of the lava, in consequence of the effects produced upon it by the coldness of sea-water, when it reaches the sea in a state of fusion. They suppose that the shock, which it then receives, is the cause of those different configurations which this substance assumes; the most remarkable of which have been already mentioned. This assertion, however, seems to be ill founded. By considering the basaltic rock, the first of the Cyclops represented in the plate, we find that the pile is not in its original state, and that the series of columns is at present incomplete. It is very probable, that the species of clay found there, and which is extraneous to the basaltes, has by some means taken possession of its place; and it likewise appears, that not one of the basaltes here described is entire.

"It seems, incredible, however, that a mass of matter reduced by fire to a state of liquefaction, and flowing into the sea, should be suddenly changed into regular figures by the shock of coming into contact with cold water; and that all the figures which are thus formed should be disposed in the same manner with regard to one another. For if we suppose that the water made its way into the cavity of the lava at the instant when it retreated backwards, then might the same quantity of water penetrate into the most remote parts of the mass; and by that means prolong the cavity which it had begun to form when it first entered the mass. The water then being lodged within this burning mass, and being in a state of dilatation, would have expelled whatever opposed it, and swelled the whole mass in such a manner as to form much larger interstices than those which appear between the basaltic columns; since these are everywhere in close contact with one another. Besides, how could the sudden cooling of the lava divide the upper part and sides of such an enormous mass as exactly as if they had been cast in a mould made on purpose?

"It remains also for those who adopt the hypothesis in question to explain how the shock occasioned by the cold water should make itself felt beyond a certain depth; since the very first moment it comes into contact with the liquid lava, it must cease to be cold; for the lava cannot but communicate to it a greater degree of heat than it communicates of cold in return, as the water is more easily penetrable by the burning lava than the mass of lava by the surrounding water. But farther, if at the first moment after the lava enters the water it were cooled and contracted, the water would soon prevent, by the contraction of its whole surface, any continuation of the effect which it had first occasioned.

"This seems to be the great difficulty: for how is it thus possible for the water to extend its influence to the centre of any very considerable mass? and even supposing it to act at the centre, how could it be able to fix the common centre of all the different columns?

"Let us next consider what a degree of ebullition must take place in the water when it receives such a vast quantity of lava heated not only more intensely than common fire, but than red-hot iron! Though that mass, 100 fathoms in diameter, were to proceed from the bottom of the sea; or though it were immersed in it, the degree of ebullition would still be the same; and it is difficult to conceive what shock can be occasioned by a cold which does not exist, on a mass which burns, or causes to boil, whatever comes near it.

"One peculiarity attending the basaltes is, that it remains fixed in the recess which it has once occupied. Another, not less essential, is its power of dividing itself in the midst of any one of its hardest parts, and to form two distinct pieces, one of which is always concave, and the other convex; a division which seems the most singular curiosity of the whole.

"A third peculiarity might still be found in the interior part of these columns, if we were to meet with any that had suffered more by the lapse of time than those already described; but it is impossible for all this to be effected by water. How can water, which is everywhere the same, and which may be expected always to produce the same effects, produce such a variety on basaltes by mere contact?

"The cause of all these varieties, therefore, seems to be this, that these lavas are originally composed of materials extremely different in their natures, and from which such a variety of effects naturally proceed. The

Basaltes. same species of matter, when actuated by the same cause, will constantly produce the same effects. This variety of effects therefore is much less owing to the influence of the water, than to the variety of materials of which those lavas are composed; and these are combined in different forms and quantities, according to the nature and quantity of the various materials which have been reduced by the volcano to a state of fusion.

"The form of the basaltes therefore proceeds from two causes. One of them, viz. the cooling, belongs indifferently to every species, independent of its meeting with water. The other is the diversity of the quantities and of the materials of which the lava is composed. From these causes alone proceed all the beauties and varieties which are beheld with admiration in this class of bodies. These take place, from the most irregular fractures in the lava, to those which display the greatest exactness and symmetry. Every new erupted lava differs from those which preceded it, and from those which will follow. In the various principles of these lavas we must seek for the causes of those cavities discoverable in the basaltes, and for the causes which produce those basaltes, at the time when the matter of which it is composed contracted itself, and consolidated all its parts. In the act of condensation, it appears to have formed various foci, around which we may distinguish the line which sets bounds to the power of each of them; and this is the line which marks the spaces intervening between the different pieces: because all of them are possessed of the same attractive force. The first emitted by the lava, at the time the basaltes is formed, produces upon it the same effect that is produced by the evaporation of the aqueous moisture from those bodies where water forms a part of the original constitution; which bodies harden in proportion as they become dry, by reason of the approach of their constituent parts to one another. The abstraction of fire produces the same effect upon basaltes, by suffering its component parts to come into closer union.

"A new proof of this theory is deducible from the form of the basaltes represented Plate LXXXVII. fig. 2. The insterstices there are pretty numerous; because the lava being of that species denominated *dirty*, and consisting of parts, most of which have but little solidity, they have left much larger spaces between them at their contraction. From this want of solidity we may perceive how much the basaltic mass lost of the fire by which it was dilated while in a state of fusion.

"The void spaces left by the contraction of the basaltes, are filled with a spongy matter, which by drying has also left large interstices: and these have been filled in their turn with a kind of yellow matter similar to that which covers the promontory of Castel d'Iaci.

"Whatever variety of forms we meet with among the basaltes, and whatever divisions and subdivisions may be observable among these varieties, they are owing, 1. To the minuteness; 2. To the homogeneous nature; or, 3. To the diversity among the particles which compose the basaltes. Among the varieties already enumerated, we find reddish, earthy, soft and porous substances, together with the zeolite crystals. We see others extremely hard and compact, very finely grained, and containing likewise schoerl and zeolite crystals. Others are very hard and dense, wich appear to be a mixture of small gray and white bodies; and of each of these colours many different shades, from light to darker, containing also zeolite crystals. Lastly, we find some consisting of a matter similar to clay, mixed with round black sand.

Basaltes || Base.

"It may be objected, that the late eruptions of Ætna afford no basaltes, nor have they any divisions similar to those above mentioned. But to this we may reply, that if they afford neither such basaltes, nor such regular divisions, the reason is, that neither their quantity, nor the ingredients of which they are composed, are such as are necessary for the production of basaltes: and for a proof of this we may refer to lavas of the most remote antiquity, which have no more resemblance to basaltes than those that are more modern.

"Lastly, an argument, to which no plausible reply can be made, that the basaltes are not formed by seawater, is, that in the year 1669, the lava of Mount Ætna ran into the sea for two leagues and a half, without having the least appearance of being converted into basaltes."

BASAN, or BASHAN, in *Ancient Geography*, a territory beyond Jordan, mentioned in Scripture. By Josephus, Eusebius, and Jerome, it is called *Batanæa*. On the entering of the Israelites into the land of Canaan, the whole of the country beyond Jordan, from that of the Moabites, or Arabia, as far as Mount Hermon and Lebanon, was divided into two kingdoms, viz. that of Sihon king of the Amorites, and of Og king of Basan or *Bashan*; the former to the south, and the latter to the north. The kingdom of Sihon extended from the river Arnon and the country of Moab, to the river Jabbok; which running in an oblique course from the east, was at the same time the boundary of the Ammonites, as appears from Numb. xxi. 24. and Deut. ii. 37. and iii. 16. The kingdom of Sihon fell to the lot of the Reubenites and Gadites, and Basan to the half-tribe of Manasseh. To this was annexed a part of the hilly country of Gilead, and the district of Argob; yet so that Basan continued to be the principal and greatest part: but, after the Babylonish captivity, Basan was subdivided; so that only a part was called *Batanea* or *Basan*, another *Trachonitis*, a third *Auranitis* or *Ituræa*, and some part also *Gaulonitis*; but to settle the limits of each of these parts is a thing now impossible.—Bashan was a country famous for its pastures and breed of large cattle.

BASARTSCHIK, a considerable town of Romania, in Turkey in Europe. It is pretty well built, and hath clean and broad streets; has a great trade; and is situated on the river Meritz, in E. Long. 24. 30. N. Lat. 41. 49.

BASARUCO, in commerce, a small base coin in the East Indies, being made only of very bad tin. There are, however, two sorts of this coin, a good and a bad; the bad is one-sixth in value lower than the good.

BASE, in *Geometry*, the lowest side of the perimeter of a figure: Thus, the base of the triangle may be said of any of its sides, but more properly of the lowest, or that which is parallel to the horizon. In rectangled

led triangles, the base is properly that side opposite to the right angle.

Base of a Solid Figure, the lowest side, or that on which it stands.

Base of a Conic Section, a right line in the hyperbola and parabola, arising from the common intersection of the secant plane and the base of the cone.

Base, in *Architecture*, is used for any body which bears another, but particularly for the lower part of a column and pedestal.—The ancients, in the early times of architecture, used no bases. The Doric columns in the temple of Minerva at Athens have none, but stand immediately upon the floor of the porch. Columns came afterwards to be supported on square pieces called *plinths*, and after that on pedestals. When we see a column, of whatsoever order, on a pedestal, the base is that part which comes between the top of the pedestal, and the bottom of the shaft of the column; when there is no pedestal, it is the part between the bottom of the column and the plinth: some have included the plinth as a part of the base; but it is properly the piece on which the base stands, as the column stands upon that.—The pedestal also has its base, as well as the column, and the pilaster. The base of columns is differently formed in the different orders; but in general it is composed of certain spires or circles, and was thence in early times called the *spire of a column*. These circles were in this case supposed to represent the folds of a snake as it lies rolled up; but they are properly the representations of several larger and smaller rings or circles of iron, with which the trunks of trees, which were the ancient columns, were surrounded to prevent their bursting: these were rude and irregular, but the sculptor who imitated them in stone found the way to make them elegant.

Base, in *Fortification*, the exterior side of the polygon, or that imaginary line which is drawn from the flanked angle of a bastion to the angle opposite to it.

Base, in *Gunnery*, the least sort of ordnance, the diameter of whose bore is $1\frac{1}{4}$ inch, weight 200 pounds, length 4 feet, load 5 pounds, shot $1\frac{5}{8}$ pound weight, and diameter $1\frac{1}{8}$ inch.

Base, in *Chemistry*. See Basis.

Base, in *Law*. *Base estate*, such as base tenants have in their hands. *Base tenure*, the holding by villenage, or other customary services; as distinguished from the higher tenures *in capite*, or by military service. *Base fee*, is to hold in fee at the will of the lord, as distinguished from soccage tenure. *Base court*, any court not of record.

BASEDOW, John Bernard, a celebrated German writer upon ethics and religion. See Supplement.

BASEMENT, in *Architecture*. See Architecture.

BASHARIANS, a sect of Mahometans, being a branch or subdivision of the Motazalites. The Basharians are those who maintain the tenets of Bashar Ebn Motamer, a principal man among the Motazalites, who varied, in some points, from the general tenets of the sect, as carrying man's free agency to a great length, and even to the making him independent.

BASHAW, a Turkish governor of a province, city, or other district.

A bashaw is made with the solemnity of carrying a flag or banner before him, accompanied with music and songs, by the mirialem, an officer on purpose for the investiture of bashaws. *Bashaw*, used absolutely, denotes the prime vizier; the rest of the denomination being distinguished by the addition of the province, city, or the like, which they have the command of; as the bashaw of Egypt, of Palestine, &c. The bashaws are the emperor's sponges. We find loud complaints among Christians of their avarice and extortion. As they buy their governments, every thing is venal with them. They live in their governments in a style of princely splendour and profusion. When glutted with wealth, the emperor frequently makes them a present of a bowstring, and becomes heir to all their spoils.

BASIL, St, the Great, one of the most learned and eloquent doctors of the church, was born at Cæsarea, in Cappadocia, about the year 328; and went to finish his studies at Athens, where he contracted a strict friendship with St Gregory Nazianzen. He returned to his native country in 355, where he taught rhetoric. Some time after, he travelled into Syria, Egypt, and Libya, to visit the monasteries of these countries; and the monastic life so much suited his disposition, that upon his return home he resolved to follow it, and he was the first institutor thereof in Pontus and Cappadocia. His reputation became so great, that, upon the death of Eusebius bishop of Cæsarea, in 370, he was chosen his successor. It was with some difficulty that he accepted of this dignity; and no sooner was he raised to it, than the emperor Valens began to persecute him because he refused to embrace the doctrine of the Arians. Being at length let alone, he began to use his utmost endeavours to bring about a reunion betwixt the eastern and western churches, who were then much divided about some points of faith, and in regard to Melefius and Paulinus two bishops of Antiochia. But all his efforts were ineffectual, this dispute not being terminated till nine months after his death. Basil had a share in all the disputes which happened in his time in the east in regard to the doctrine of the church; and died the first of January, 379.—There have been several editions of his works in Greek and Latin. The best is that of Father Garnier, printed in Greek and Latin, in three volumes folio. St Basil's style is pure and elegant, his expressions are grand and sublime, and his thoughts noble and full of majesty. Erasmus places him among the greatest orators of antiquity.

Basil, a canton of Switzerland, which joined the confederacy in 1501. It is bounded on the south by the canton of Solothurn; on the north by part of the margravate of Baden Dourlach, and the territory of Rheinfelden; on the east by Frickthal; and on the west by part of Solothurn, the diocese of Basil, and the Sundgare; being upwards of 20 miles in length, and about 18 in breadth. It contains 270 square English miles, and had a population of 49,200 in 1815. It is entirely Protestant. The lower parts of it afford corn and wine, and pasture; but the mountains are barren. Here are many medicinal springs and baths, and the air is wholesome and temperate. Both men and women for the most part wear the French dress; but the language commonly spoken is the High Dutch, though the French is also much used. The government is aristocratical; and its revenues arise chiefly from secularized abbeys, and imposts on goods carried through the country, to and from France, Italy, and Germany. Besides the military establishment of the city of Basil, there are two provincial regiments, consisting each of ten companies, and a troop of dragoons.—The places of most note are Basil the capital, Wallenburg, St Jacob, Neue-Haus, &c.

BASIL, the capital of the canton of that name, is the largest city in all Switzerland, and contains about 15,000 inhabitants. Its environs are exceedingly beautiful, consisting of a fine level tract of fields and meadows. The city is divided into two parts by the Rhine, over which there is a handsome bridge. It is thought by some to have risen on the ruins of the old Augusta Rauracorum. For its name of *Basilia* it is indebted to Julian the Apostate, who would have it so called in honour of his mother Basilina. It is fortified with walls, moats, towers, and bastions, and contains several churches, besides the cathedral, which is an old Gothic structure; a commandery of the order of St John, and another of the Teutonic order; a public granary and arsenal; a stately townhouse, in which is an exquisite piece of the sufferings of Christ, by Holbein, and a statue of Munatius Plancus, a Roman general, who about 50 years before Christ, built the ancient city of Augusta Rauracorum; an university which was founded in 1459, and has a curious physic-garden, library, and museum; a gymnasium; a stately palace, belonging to the margrave of Baden-Dourlach; besides a chamber of curiosities, several hospitals, &c. In the arsenal is shown the armour in which Charles the Bald lost his life, with the furniture of his horse, and the kettle-drums and trumpets of his army. On the staircase of the council-house, is a picture of the last judgement, in which, though drawn before the Reformation, popes, cardinals, monks, and priests, are represented in the torments of hell. Over-against the French church, on a long covered wall, is painted the dance of death; where the king of terrors is represented as mixing with all ranks and ages, and complimenting them, in German verses, on their arrival at the grave. St Peter's square, planted with elm and lime trees, makes a pleasant walk; but a spot regularly planted with trees, close by the river, and near the minster, makes still a finer, as commanding a most beautiful and extensive prospect. The celebrated Erasmus died here in 1536, in the 70th year of his age, and was buried in the great church. He left his library and cabinet of rarities to one Amberbach, a learned lawyer of this city, of whose heirs they were purchased by the university. Besides this cabinet, there are several other curious private ones. The clocks of this city go an hour faster than elsewhere, except at Constance; a circumstance which some ascribe to the famous councils held there, when it was thought the best expedient to bring the fathers early to the assembly, for the quicker despatch of business; but others say, that, in Basil, it was owing to an assault being defeated by that means. About 400 years ago, according to the story, the city was threatened with an assault by surprise. The enemy was to begin the attack when the large clock of the tower at one end of the bridge should strike one after midnight. The artist who had the care of the clock, being informed that this was the expected signal, caused the clock to be altered, and it struck two instead of one; so the enemy, thinking they were an hour too late, gave up the attempt: and in commemoration of this deliverance, all the clocks in Basil have ever since struck two at one o'clock, and so on. But this practice is said now to be abolished. They show, by way of confirmation, a head, which is placed near to this patriotic clock, with the face turned to the road by which the enemy was to have entered. This same head lolls out its tongue every minute, in the most insulting manner possible. This was originally a piece of mechanical wit of the famous clockmaker's who saved the town. He framed it in derision of the enemy, whom he had so dexterously deceived. It has been repaired, renewed, and enabled to thrust out its tongue every minute for these four hundred years, by the care of the magistrates, who think so excellent a joke cannot be too often repeated. Trade still flourishes here, especially in silk, ribbons, and wines; and the police is under excellent regulations. Most of the offices are bestowed by lot among well qualified persons. No person, without the city, must wear lace of gold or silver. All young women are prohibited from wearing silks; and the nearest relations only are to be invited to a marriage-feast. For the government of the city there are several councils or colleges, and officers. Of the last, the two burgomasters, and two wardens of trades, are the chief. The great council is composed of the representatives of the several companies of the greater and lesser city. Basil was the see of a bishop till the Reformation; but though there is one that still bears the title, he has now no jurisdiction here, and lives at Porentru, near the Upper Alsace. The two Buxtorffs, father and son, and the famous painter Holbein, were natives of this place. The council held here, in 1431, sat in the vestry of the cathedral.

BASIL. See OCYMUM, BOTANY *Index*.

BASIL, among joiners, the sloping edge of a chissel, or of the iron of a plane, to work on soft wood: they usually make the basil 12 degrees, and for hard wood 18; it being remarked, that the more acute the basil is, the better the instrument cuts; and the more obtuse, the stronger, and fitter it is for service.

BASILEUS, Βασιλευς, a title assumed by the emperors of Constantinople, exclusive of all other princes, to whom they give the title *rex*, "king." The same quality was afterwards given by them to the kings of Bulgaria, and to Charlemagne, from the successors of which last they endeavoured to wrest it back again.

The title *basileus* has been since assumed by other kings, particularly the kings of England, *Ego Edgar totius Angliæ basileus confirmavi*. Hence also the queen of England was entitled *Basilea* and *Basilissa*.

BASILIAN MONKS; religious of the order of St Basil. That saint, having retired into a desert, in the province of Pontus, founded a monastery for the convenience of himself and his numerous followers: and for the better regulation of this new society, he drew up in writing the orders and rules he would have them follow. This new order soon spread all over the east; nor was it long before it passed into the west. The rule of St Basil was approved by Pope Liberius, the same year

Digitized by Google

year in which it was written and published; and afterwards by several other popes; and, in these last ages, by Pope Gregory XIII. who approved the abridgement made of it by Cardinal Bessarion, in the pontificate of Eugenius IV.—Some authors pretend, that St Basil, before he died, saw himself the spiritual father of more than 90,000 monks, in the east only. But this order, which flourished so greatly for more than three centuries, was afterwards considerably diminished by heresy, schism, and a change of empire. The greatest storm it felt, was in the reign of Constantine Copronymus; who persecuted the monks of St Basil, imprisoning some, and banishing others; insomuch that the monasteries were abandoned and spoiled of all their goods.

The historians of this order tell us, that it has produced 1805 bishops; and beatified, or acknowledged as saints, 3010 abbots, 11,805 martyrs, and an infinite number of confessors and virgins. They likewise place among the religious of the order of St Basil 14 popes, some cardinals, and a very great number of patriarchs, archbishops, and bishops. This order likewise boasts of several emperors and empresses, kings and queens, princes and princesses, who have embraced its rule.

This order was introduced in the west in 1057; and was reformed in 1569, by Pope Gregory XIII. who united the religious of this order in Italy, Spain, and Sicily, into one congregation; of which the monastery of St Saviour at Messina is the chief, and enjoys preeminence over the rest. Each community has its particular rule, besides the rule of St Basil, which is very general, and prescribes little more than the common duties of a Christian life.

BASILIC, or Basilica, in the ancient architecture, denotes a kind of public hall or court of judicature, where the princes or magistrates sat to administer justice. The word is originally Greek, βασιλικη, *q. d. royal house, palace.*

The basilics consisted of a great hall, with ailes, porticoes, tribunes, and tribunals. The bankers too had one part of the basilica allotted for their residence. The scholars also went thither to make their declamations, according to the testimony of Quintilian. In after-times the denomination *basilica* was also given to other buildings of public use, as town-houses, exchanges, burses, and the like. The Roman *basilicæ* were covered, by which they were distinguished from the *fora*, which were public places open to the air. The first basilica was built at Rome by Cato the elder, whence it was called *Porcia;* the second was called *Opimia;* the third was that of Paulus, built with a great expence, and with much magnificence, whence it was called by some *regia Pauli;* another was built by Julius Cæsar, called *basilica Julia;* of which Vitruvius tells us he had the direction. There were others also, to the number of eighteen or twenty. The *basilica Julia* not only served for the hearing of causes, but for the reception and audience of foreign ambassadors. It was supported by a hundred marble pillars in four rows, and enriched with decorations of gold and precious stones. In it were 13 tribunals or judgment-seats, where the prætors sat to despatch causes.

Basilic is also used, in ecclesiastical writers, for a church. In which sense, the name frequently occurs in St Ambrose, St Austin, St Jerome, Sidonius Apollinaris, and other writers of the fourth and fifth centuries. It is thought that the name was thus applied, from many of the ancient churches having been formed of the Roman halls mentioned in the preceding article. In reality, on the conversion of Constantine, many of the ancient *basilicæ* were given to the church, and turned to another use, viz. for Christian assemblies to meet in, as may be collected from that passage of Ausonius, where speaking to the emperor Gratian, he tells him, the *basilicæ*, which heretofore were wont to be filled with men of business, were now thronged with votaries praying for his safety. By which he must needs mean, that the Roman halls or courts were turned into Christian churches: and hence, we conceive, the name *basilicæ* came to be a general name for churches in after ages.

Basilic is chiefly applied, in modern times, to churches of royal foundation; as those of St John de Lateran, and St Peter of the Vatican at Rome, founded by the emperor Constantine.

Basilics were also little chapels built by the ancient Franks over the tombs of their great men, so called, as resembling the figure of the sacred *basilicæ*, or churches. Persons of inferior condition had only *tumbæ* or *porticuli* erected over them. By an article in the Salic law, he that robbed a *tumba* or *porticulus*, was to be fined fifteen *solidi;* but he that robbed a basilica, thirty *solidi.*

Basilics, in literary history, a name supposed to have been given by the emperor Leo to a collection of laws in honour of his father Basilius Macedo, who began it in the year 867, and in the execution chiefly made use of Sabbathius Protospatharius, who carried the work as far as 40 books. Leo added 20 books more, and published the work in 880. The whole, 30 years after, was corrected and improved by Constantine Porphyrogenitus, son of Leo; whence many have held him the author of the Basilica. Six books of the Basilica were translated into Latin in 1557, by Gentian Hervetus. An edition of the Greek Basilics, with a Latin version, has been since published at Paris, in 1647, by Annib. Fabrottus, in 7 volumes. There are still wanting 19 books, which are supposed to be lost. Fabrottus has endeavoured to supply in some measure the defect from the synopsis of the Basilica, and the glosses; of which several had been made under the succeeding emperors, and contained the whole Justinian law, excepting the superfluities, in a new and more consistent order, together with the later constitutions of the emperors posterior to Justinian.

BASILICA, in *Anatomy*, the interior branch of the axillary vein, running the whole length of the arm.

BASILICATA, a territory of Italy, bounded on the north by the Otranto, Bari, and Capitanata; on the west by the Principato, and a small part of the Tuscan sea; on the south by Calabria; and on the east by the gulf of Taranto. It is watered by several rivers: but as it is almost all occupied by the Apennine mountains, it is neither very populous nor fertile; however it produces enough to maintain its inhabitants, and has a small quantity of cotton. The principal towns,

Digitized by Google

towns are Cirenza the capital, Mesi, Tursi, Rapollo, Muro, Lavello, Tracarico, Monte Pelose, and Veneso, which are all episcopal sees.

BASILICI, a denomination given in the Greek empire to those who carried the emperor's orders and commands.

BASILICON, in *Pharmacy*, a name given to several compositions to be found in ancient medicinal writers. At present it is confined to three officinal ointments, distinguished by the epithets black, yellow, and green. See PHARMACY.

BASILIDIANS, ancient heretics, the followers of Basilides, an Egyptian, who lived near the beginning of the second century. He was educated in the Gnostic school, over which Simon Magus presided; with whom he agreed that Christ was a man in appearance, that his body was a phantom, and that he gave his form to Simon the Cyrenian, who was crucified in his stead. We learn from Eusebius, that this heresiarch wrote 24 books upon the gospel, and that he forged several prophets; to two of which he gave the names *Barcaba* and *Barcoph*. We have still the fragment of a Basilidian gospel. His disciples supposed there were particular virtues in names: and taught with Pythagoras and Plato, that names were not formed by chance, but naturally signified something.—Basilides, to imitate Pythagoras, made his disciples keep silence for five years.

In general, the Basilidians held much the same opinions with the Valentinians, another branch of the Gnostic family. They asserted, that all the actions of men are necessary; that faith is a natural gift, to which men are forcibly determined, and should therefore be saved though their lives were ever so irregular. Irenæus and others assure us, they acted consistently with their principles; committing all manner of villanies and impurities, in confidence of their natural election. They had a particular hierarchy of divine persons, or Æons. Under the name *Abraxas*, they are said to have worshipped the supreme God, from whom as a principle, all other things proceeded. There are several gems still subsisting, inscribed with the name *Abraxas*, which were used by the Basilidians as amulets against diseases and evil spirits. See ABRASAX and ABRAXAS.

BASILIPPUM, in *Ancient Geography*, a town of Bætica in Spain; now *Cantillana*, a citadel of Andalusia, above Seville, on the Guadalquivir.

BASILISCUS, in *Zoology*, the trivial name of a species of lacerta. See LACERTA, ERPETOLOGY *Index*.

BASILISK, a fabulous kind of serpent, said to kill by its breath or sight only. Galen says, that it is of a colour inclining to yellow; and that it has three little eminences upon its head, speckled with whitish spots, which have the appearance of a sort of crown. Ælian says, that its poison is so penetrating, as to kill the largest serpents with its vapour only; and that if it but bite the end of any man's stick, it kills him. It drives away all other serpents by the noise of its hissing. Pliny says, it kills those who look upon it.—The generation of the basilisk is not less marvellous, being said to be produced from a cock's egg, brooded on by a serpent. These, and other things equally ridiculous, are related by Matthiolus, Galen, Dioscorides, Pliny, and Erasistratus. Hirchmayer and Vander Wiel have given the history of the basilisk, and detected the folly and imposture of the traditions concerning it.—In some apothecaries shops there are little dead serpents shown, which are said to be basilisks. But these seem rather to be a kind of small bird, almost like a cock, but without feathers: its head is lofty, its wings are almost like a bat's, its eyes large, and its neck is very short. As to those which are shown and sold at Venice, and in other places, they are nothing but little thornbacks artificially put into a form like that of a young cock, by stretching out their fins, and contriving them with a little head and hollow eyes; and this, Calmet says, he has in reality observed in a supposed basilisk, at an apothecary's shop at Paris, and in another at the Jesuits of Pont-a-Mousson.

BASILISK, in military affairs, a large piece of ordnance, thus denominated from its resemblance to the supposed serpent of that name. The basilisk throws an iron ball of 200 pounds weight. It was much talked of in the time of Solyman emperor of the Turks, in the wars of Hungary; but seems now out of use. Paulus Jovius relates the terrible slaughter made by a single ball from one of these basilisks in a Spanish ship; after penetrating the boards and planks in the ship's head, it killed above 30 men. Maffeus speaks of basilisks made of brass, which were drawn each by 100 yoke of oxen. —Modern writers also give the name *basilisk* to a much smaller and sizeable piece of ordnance, which the Dutch make 15 feet long, and the French only 10. It carries 48 pounds.

BASILIUS, surnamed the *Macedonian*, emperor of the Greeks. He was a common soldier, and of an obscure family in Macedonia, and yet raised himself to the throne: for having pleased the emperor Michael by his address in the management of his horses, he became his first equerry, and then his great chamberlain. He at length assassinated the famous Bardas, and was associated to the empire in 849. He held the eighth general council at Constantinople; deposed the patriarch Photius, but in 858 restored him to the patriarchate; and declared against the popes, who refused to admit him into their communion. He was dreaded by his enemies the Saracens, whom he frequently vanquished; and loved by his subjects, for his justice and clemency. He died in 886. Under his reign the Russians embraced Christianity, and the doctrine of the Greek church. He ought not to be confounded with Basilius the Younger, who succeeded Zemisces in 975, and after a reign of 50 years died in 1025.

BASINGSTOKE, a corporation town of Hampshire in England, and a great thoroughfare on the western road. It is seated on a small brook, and had 2656 inhabitants in 1811. W. Long. 1. 10. N. Lat. 51. 20.

BASIOGLOSSUS, a muscle arising from the base of the os hyoides. See ANATOMY, *Table of the Muscles*.

BASIS, or BASE, in *Geometry*. See BASE.

BASIS, or *Base*, in *Chemistry*. Any body which is dissolved by another body, which it receives and fixes, and with which it forms a compound, may be called the *basis* of that compound. Thus, for example, the basis of neutral salts are the alkaline, earthy, and metallic matters which are saturated by the several acids, and form with them these neutral salts. In this sense it is that these neutral salts are called *salts with earthy bases*,

Digitized by Google

bases, salts with alkaline bases, salts with metallic bases; also the appellations *basis of alum, basis of nitre, basis of Glauber's salt, basis of vitriol,* &c. signify the argillaceous earth, which, with the sulphuric acid, forms alum; the vegetable alkali, which, with the nitric acid, forms nitre; the mineral alkali, which with the sulphuric acid, forms Glauber's salts; and the metal, which with the sulphuric acid, forms a sulphate; because these substances are supposed to be fixed, unactive, and only yielding to the action of the acids, which they fix, and to which they give a body and consistence.

Basis, among physicians, denotes the principal ingredients in compound medicines.

BASKERVILLE, John, an eminent artist, especially in letter-founding and printing, of the 18th century. He was born in 1706 at Woverley in Worcestershire, and was heir to an estate of about 60l. a-year; the whole of which income he allowed to his parents till their deaths. In his early years he conceived a love for fine writing and cutting in stone; and being brought up to no particular profession, he commenced writing-master in Birmingham when about 20 years of age. The improvements in different manufactures there soon drew his attention, and he applied to the japan business, which he carried on for a long time with distinguished excellence and success. In 1750 he applied himself to letter-founding, the bringing of which to perfection cost him much labour and expence. In a few years he proceeded to printing: and his first work was an edition of Virgil in royal quarto, which now sells for three guineas. In a short time he obtained leave from the university of Cambridge to print a Bible in royal folio, and editions of the Common Prayer in three sizes: for which he paid a large sum to the university. He afterwards printed Horace, Terence, Catullus, Lucretius, Juvenal, Sallust, and Florus, in royal quarto; Virgil in octavo; and several books in duodecimo. He published likewise some of the English classics. The best testimonies of the merit of these performances are themselves; and Mr Baskerville's name is deservedly ranked among those who, in modern times, have brought the art of printing to its greatest perfection. Not meeting, however, with that encouragement from the booksellers which he expected, he set up his letter-foundery for sale a little before his death. He died without issue in July 1776.

BASKET, an utensil made of twigs interwoven together, in order to hold fruit, earth, &c. As a measure, it denotes an uncertain quantity; as, a basket of medlars is two bushels, of asafœtida from 20 to 50 pounds weight. The ancient Britons were noted for their ingenuity in making baskets, which they exported in large quantities. These baskets were of very elegant workmanship, and bore a high price; and are mentioned by Juvenal among the extravagant expensive furniture of the Roman tables in his time.

> *Adde et bascaudas et mille escaria.*
>
> Add baskets, and a thousand other dishes.

That these baskets were manufactured in Britain, we learn from the following epigram of Martial:

> *Barbara de pictis veni bascauda Britannis,*
> *Sed me jam mavult dicere Roma suam.*
>
> A basket I, by painted Britons wrought,
> And now to Rome's imperial city brought.

See Basket-making, Supplement.

Baskets of Earth, in the military art, in French *corbeillers*, are placed on the parapet of a trench, filled with earth. They are about a foot and a half high, about a foot and a half in diameter at the top, and 8 or ten inches at bottom; so that, being set together, there is a sort of embrasures left at their bottoms, through which the soldiers fire, without exposing themselves.

Basket-Fish, a species of sea-star. See Asterias.

Basket-Salt, that made from salt-springs; being purer, whiter, and composed of finer grains than the common brine-salt. See Salt.

BASKING-shark, or *Sun-Fish of the Irish.* See Squalus.

BASNAGE, James, a learned and accomplished author, and pastor of the Walloon church at the Hague, was born at Rouen in Normandy, August 8. 1653. He was the son of Henry Basnage, one of the ablest advocates in the parliament of Normandy. At 17 years of age, after he had made himself master of the Greek and Latin authors, as well as the English, Spanish and Italian languages, he went to Geneva, where he began his divinity studies under Mestrezat, Turretin, and Tronchin; and finished them at Sedan, under the professors Jurieu and Le Blanc de Beaulieu. He then returned to Rouen, where he was received as minister, September 1676; in which capacity he remained till the year 1685, when the exercise of the Protestant religion being suppressed at Rouen, he obtained leave of the king to retire to Holland. He settled at Rotterdam, and was a minister pensionary there till 1691, when he was chosen pastor of the Walloon church of that city. In 1709 Pensionary Heinsius got him chosen one of the pastors of the Walloon church at the Hague, intending not only to employ him in religious but in state affairs. He was employed in a secret negociation with Marshal d'Uxelles, plenipotentiary of France at the congress of Utrecht; and he executed it with so much success, that he was afterwards entrusted with several important commissions, all which he discharged in such a manner as to gain a great character for his abilities and address; a celebrated modern writer has therefore said of him, that he was fitter to be minister of state than of a parish. The Abbé du Bois, who was at the Hague in 1716, as ambassador plenipotentiary from his most Christian majesty, to negociate a defensive alliance between France, England, and the States General, was ordered by the duke of Orleans, regent of France, to apply himself to M. Basnage, and to follow his advice; they accordingly acted in concert, and the alliance was concluded in January 1717. He kept an epistolary correspondence with several princes, noblemen of high rank, and ministers of state, both Catholic and Protestant, and with a great many learned men in France, Italy, Germany, and England. The Catholics esteemed him no less than the Protestants; and the works he wrote, which are mostly in French, spread his reputation almost all over Europe: among these are, 1. The History of the religion of the Reformed Churches. 2. Jewish Antiquities. 3. The History of the Old and New Testament;

Digitized by Google

Testament; and many others. He died September 22. 1723.

Basnage, *Henry, Sieur de Beauval*, second son to Henry Basnage, and brother to James mentioned in the last article. He applied himself to the study of the law, and was admitted advocate in the parliament of Rouen in the year 1679. He did not follow the bar immediately upon his admission; but went to Valencia, where he studied under M. de Marville. Upon his return from thence, he practised with great reputation till the year 1687, when the revocation of the edict of Nantz obliged him to fly to Holland, where he composed the greatest part of his works, and died there the 29th of March 1710. His chief work is *Histoire des Ouvrages des Sçavans*. Rotterd. 24 vol. in duodecimo. This work was begun in the month of September 1687, and continued till June 1709. When he arrived in Holland, Mr Bayle, through indisposition, had been obliged to drop his *Nouvelles de la Republique des Lettres*, which induced Mr Basnage to undertake a work of the same kind under a different title.

BASON, in *Hydraulics*, a reservoir of water, used for various purposes: thus we say, *The bason of a jet d'eau, the bason of a fountain*, and likewise *the bason of a port or harbour*.

Bason, in Jewish antiquities, the laver of the tabernacle, made of the brass looking-glasses belonging to those devout women who watched and stood centinels at the door of the tabernacle.

Bason, or *Dish*, among glass-grinders. These artificers use various kinds of basons, of copper, iron, &c. and of various forms, some deeper, others shallower, according to the focus of the glasses that are to be ground. In these basons it is that convex glasses are formed, as concave ones are formed on spheres or bowls.

Glasses are worked in basons two ways. In the first, the bason is fitted to the arbor or tree of a lathe, and the glass (fixed with cement to a handle of wood) presented and held fast in the right hand within the bason, while the proper motion is given by the foot to the bason. In the other, the bason is fixed to a stand or block, and the glass with its wooden handle moved. The moveable basons are very small, seldom exceeding five or six inches in diameter; the others are larger, sometimes above ten feet diameter. After the glass has been ground in the bason, it is brought smoother with grease and emery; and polished first with tripoli, and finished with paper cemented to the bottom of the bason.

Bason, among hatters, is a large round shell or case, ordinarily of iron, placed over a furnace; wherein the matter of the hat is moulded into form. The hatters have also basons for the brims of hats, usually of lead, having an aperture in the middle, of a diameter sufficient for the largest block to go through.

BASQUES, a small territory of France, towards the Pyrenean mountains. It comprehends Labourd, Lower Navarre, and the district of Soule, which, with Bearn, form the department of the Lower Pyrenees.

BASS, the lowest in the four parts of music: of uncertain etymology; whether from the Greek word βασις, "a foundation;" or from the Italian adjective *basso*, signifying "low." Of all the parts it is the most important, and it is upon this that the chords proper to constitute a particular harmony are determined. Hence the maxim among musicians, that when the bass is properly formed, the harmony can scarcely be bad.

Basses are of different kinds. Of which in their order.

Thorough-Bass is the harmony made by the bass-viols, or theorbos, continuing to play both while the voices sing and the other instruments perform their parts, and also filling up the intervals when any of the other parts stop. It is played by figures marked over the notes, on the organ, spinet, harpsichord, &c. and frequently simply and without figures on the bass-viol and bassoon.

Counter-Bass is a second or double bass, where there are several in the same concert.

Bass-Viol, a musical instrument of the like form with that of a violin, but much larger. It is struck with a bow as that is; has the same number of strings; and has eight stops, which are subdivided into semistops. Its sound is grave, and has a much nobler effect in a concert than that of the violin.

Bass, *Isle of*, a rock, about a mile in circumference, in the mouth of the frith of Forth, at a small distance from the town of North Berwick in East Lothian. It is steep and inaccessible on all sides, except to the south-west; and even there it is with great difficulty that a single man can climb up with the help of a rope or ladder. It was formerly kept as a garrison. A party of King James's adherents surprised it at the Revolution, and it was the last place in the three kingdoms that submitted to the new government; upon which its fortifications were ordered to be neglected. In summer, this remarkable rock, which rises to a great height above the water, in form of a cone, is quite covered with sea-fowl which come hither to breed. The chief of these are the solan geese *, which arrive in June, and retire in September. It also contains a small warren for rabbits, and affords pasture for a few sheep. The force of the tides has now almost worn a hole quite through this rock. W. Long. 2. 15. N. Lat. 56. 3.

* See Pelecanus, Ornithology Index.

BASSAN, Giacomo de Pont, or Le Bassan, a celebrated Venetian painter, was born in 1510. His subjects generally were peasants and villagers, busy at their different rural occupations, according to the various seasons of the year; cattle, landscapes, and historical designs; and in all those subjects the figures were well designed, and the animals and landscapes have an agreeable resemblance of simple nature. His compositions cannot boast of much elegance or grandeur of taste, not even those which are historical; but they have abundance of force and truth. His local colours are very well observed, his carnations are fresh and brilliant, and the chiaro-scuro and perspective well understood. His touch is free and spirited; and the distances in his landscapes are always true, if not sometimes too dark in the nearer parts. His works are spread all over Europe: many of them were purchased by Titian; and there are several in the French king's cabinet, the royal palace, and the Hotel de Toulouse. They are more readily known than those of most other painters; from the similitude of characters and countenances in the figures and animals; from the taste in the buildings, utensils, and draperies; and, besides

Digitized by Google

from a violet or purple tint that predominates in every one of his pictures. But the genuine pictures of his hand are not so easily ascertained; because he frequently repeated the same design, and his sons were mostly employed in copying the works of their father, which he sometimes retouched. As he lived to be very old, he finished a great number of pictures; yet, notwithstanding his application and years, the real pictures of Giacomo are not commonly met with. Many of those which are called originals by purchasers as well as dealers, being at best no more than copies by the sons of Bassan, who were far inferior to him; or perhaps by some painter of still meaner abilities. But the true pictures of Giacomo always bear a considerable price if they happen to be undamaged. He died in 1592, aged 82.—Francis and Leander, his sons, distinguished themselves in the same art; but inheriting a species of lunacy from their mother, both came to an untimely end.

BASSINI, Giovanni Battista, maestro di cappella of the cathedral church of Bologna, about the middle of the last century, was a very voluminous composer of music, having given to the world no fewer than 31 different works. He is equally celebrated both as a composer for the church and for concerts; and was besides a celebrated performer on the violin, and, as it is said, taught Corelli on that instrument. His compositions consist of masses, psalms, motets with instrumental parts, and sonatas for violins; his fifth opera in particular, containing 12 sonatas for two violins and a bass, is most esteemed; it is written in a style wonderfully grave and pathetic, and abounds with evidences of great learning and fine invention. The first and third operas of Corelli are apparently formed after the model of this work. Bassani was one of the first who composed motets for a single voice, with accompaniments of violins; a practice which is liable to objection, as it assimilates church-music too nearly to that of the chamber; and of his sol-motets it must be confessed that they differ in style but little from opera airs and cantatas; two operas of them, viz. the eighth and thirteenth, were printed in London by Pearson above 50 years ago, with the title of *Harmonia Festiva.*

BASSANTIN, James, a Scotch astronomer, son of the laird of Bassantin in Mers, was born in the reign of James IV. He was educated at the university of Glasgow, travelled through Germany and Italy, and then fixed his abode in the university of Paris, where he taught mathematics with great applause. Having acquired some fortune in this occupation, in 1562 he returned to Scotland, where he died in the year 1568. From his writings, he appears to have been no contemptible astronomer, considering the times; but, like most of the mathematicians of that age, he was not a little addicted to judicial astrology. Sir James Melvil, in his Memoirs, says that his brother Sir Robert, when he was exerting his abilities to reconcile the two queens Elizabeth and Mary, met with one Bassantin, a man learned in the high sciences, who told him, "that all his travel would be in vain; for, said he, they will never meet together; and next, there will never be any thing but dissembling and secret hatred for a while, and at length captivity and utter wreck to our queen from England." He added, "that the kingdom of England at length shall fall, of right, to the crown of Scotland: but it shall cost many bloody battles; and the Spaniards shall be helpers, and take a part to themselves for their labour." Sir James Melvil is an author of credit; therefore it is probable that our astrologer ventured to utter his prediction: but, as it proved true only in part, either he misunderstood the stars, or they deceived the astrologer. His works are, 1. *Astronomia Jacobi Bassantini Scoti, opus absolutissimum, &c. ter editum Latinè et Gallicè.* Genev. 1599. fol. This is the title given it by Tornæsius, who translated it into Latin from the French, in which language it was first published. 2. *Paraphrase de l'Astrolabe, avec un amplification de l'usage de l'Astrolabe.* Lyons 1555. Paris 1617, 8vo. 3. *Mathematic. genethliaca.* 4. *Arithmetica.* 5. *Musica secundum Platonem.* 6. *De Mathesi in genere.*

BASSE, or Bass, a town of the French Netherlands, in the county of Flanders, on the confines of Artois, remarkable on account of the many sieges it has sustained; but its fortifications are now demolished. It is seated on a canal which runs as far as Deule. E. Long. 3. 0. N. Lat. 50. 53.

Basse Terre, part of the island of St Christopher's, one of the Caribbee islands, formerly occupied by the French, but ceded to Great Britain by the treaty of Utrecht in 1713.

BASSET, or Basette, a game with cards, said to have been invented by a noble Venetian, for which he was banished. It was first introduced in France by Signior Justiniani, ambassador of Venice, in 1674. Severe laws were made against it by Louis XIV. to elude which they disguised basset under the name of *pour et contre*, that is, "for and against," which occasioned new arrêts and prohibitions of parliament. The parties concerned in it are, a dealer or banker; his assistant, who supervises the losing cards; and the punter, or any one who plays against the banker.

Besides these, there are other terms used in this game: as, 1. The *fasse* or *face*, which is the first card turned up by the tailleur belonging to the pack, by which he gains the value of half the money laid down on every card of that sort by the punters. 2. The *couch*, or first money which every punter puts on each card; each person that plays having a book of 13 several cards before him, on which he may lay his money, more or less, at discretion. 3. The *paroli*; which is, when a punter having won the first stake, and having a mind to pursue his good fortune, crooks the corner of his card, and lets his prize lie, aiming at a *sept et le va*. 4. The *masse*; when having won the first stake, the punter is willing to venture more money on the same card. 5. The *pay*; when the punter having won the first stake, be it a shilling, half crown, guinea, or whatever he laid down on his card, and not caring to hazard the paroli, leaves off, or *goes the pay*; in which case, if the card turns up wrong, he loses nothing, having won the couch before; whereas, if it turn right, he by this adventure wons double the money staked. 6. The *alpiew*; much the same with paroli, and used when a couch is won by turning up or crooking the corner of the winning card. 7. *Sept et le va*, the first great chance or prize, when the punter, having won the couch, makes a paroli, and goes on to a second chance; so that if his winning card turns up again, it comes to *sept et le va*, which is seven times

times as much as he laid down on his card. 8. *Quinze et le va* is the next higher prize, when the punter having won the former, is resolved to push his fortune, and lay his money a second time on the same card by crooking another corner; in which case, if it comes up, he wins fifteen times the money he laid down. 9. *Trent et le va* is the next higher prize, when the punter, crooking the fourth corner of his winning card, if it turn up, wins 33 times the money he first staked. 10. *Soixant et le va* is the highest prize, and entitles the winner to 67 times his first money; which, if it were considerable, stands a chance to break the bank; but the bank stands many chances first of breaking the punter. This cannot be won but by the tailleur's dealing the cards over again.

The rules of the game of basset are as follow: 1. The banker holds a pack of 52 cards, and having shuffled them, he turns the whole pack at once, so as to discover the last card; after which he lays down all the cards by couples. 2. The punter has his book of 13 cards in his hand, from the king to the ace; out of these he takes one card, or more at pleasure, upon which he lays a stake. 3. The punter may, at his choice, either lay down his stake before the pack is turned, or immediately after it is turned, or after any number of couples are down. 4. Supposing the punter to lay down his stake after the pack is turned, and calling 1, 2, 3, 4, 5, &c. the places of those cards which follow the card in view, either immediately after the pack is turned, or after any number of couples are drawn. Then, 5. If the card upon which the punter has laid a stake comes out in any even place, except the first, he wins a stake equal to his own. 6. If the card upon which the punter has laid a stake come out in any even place, except the second, he loses his stake. 7. If the card of the punter comes out in the first place, he neither wins nor loses, but takes his own stake again. 8. If the card of the punter comes out in the second place, he does not lose his whole stake, but only one half; and this is the case in which the punter is said to be *faced*. 9. When the punter chooses to come in after any number of couples are down, if his card happens to be but once in the pack, and is the last of all, there is an exception from the general rule; for though it comes out in an odd place, which should entitle him to win a stake equal to his own, yet he neither wins nor loses from that circumstance, but takes back his own stake.

This game has been the object of mathematical calculations. M. de Moivre solves this problem; to estimate at basset the loss of the punter under any circumstance of cards remaining in the stock when he lays his stake, and of any number of times that his card is repeated in the stock. From this solution he has formed a table showing the several losses of the punter in whatsoever circumstances he may happen to be. From this table it appears, 1. That the fewer the cards are in the stock, the greater is the loss of the punter. 2. That the least loss of the punter, under the same circumstances of cards remaining in the stock, is when the card is but twice in it; the next greater when but three times; still greater when four times; and the greatest when but once. The gain of the banker upon all the money adventured at basset is 15s. 3d. per cent.

BASSET, *Peter*, a gentleman of good family, was chamberlain or gentleman of the privy chamber to King Henry V. a constant attendant on that brave prince, and an eye-witness of his most glorious actions both at home and abroad; all which he particularly described in a volume, entitled, *The Acts of King Henry V.* which remains in MS. in the college of heralds.

BASSETING, in the coal mines, denotes the rise of the vein of coal towards the surface of the earth, till it come within two or three feet of the surface itself. This is also called by the workmen *cropping*; and stands opposed to *dipping*, which is the descent of the vein to such a depth that it is rarely, if ever, followed to the end.

BASSIA. See BOTANY *Index*.

BASSO-RELIEVO, or BAS-RELIEF; a piece of sculpture, where the figures or images do not protuberate, jet, or stand out, far above the plane on which they are formed.—Whatever figures or representations are thus cut, stamped, or otherwise wrought, so that not the entire body, but only part of it, is raised above the plane, are said to be done in *relief* or *relievo*; and when that work is low, flat, and but little raised, it is called *low relief*. When a piece of sculpture, a coin, or a medal, has its figure raised so as to be well distinguished, it is called *bold*, and we say its *relief is strong*.

BASSOON, a musical instrument of the wind-sort, blown with a reed, furnished with 11 holes, and used as a bass in a concert of hautboys, flutes, &c. To render this instrument more portable, it is divided into two parts, whence it is called a *faggot*. Its diameter at bottom is nine inches, and its holes are stopped like those of a large flute.

BASSORA, BALSORA, or *Basrah*, a city between Arabia and Persia, situated in the extremity of the deserts of Irak, a little to the west of the Tigris, in about 57° east longitude, and 30° north latitude. It was built by the command of the caliph Omar, in the 15th year of the Hegira, for the sake of carrying on more commodiously an extensive commerce between the Syrians, Arabians, Persians, and Indians. It contains 50,000 or 60,000 inhabitants; and stands upon a thick stony soil, as the word *basra* imports, about a day and a half's journey from one of the mouths of the Tigris, where it empties itself into the Persian gulf, denominated likewise from this town the *Bay of Basra*. The circumjacent tract is looked upon by the Arabs to be one of the most delightful spots in Asia, and even as one of the most beautiful gardens in the world; however, the hot winds that frequently blow there are very troublesome to travellers, and sometimes overwhelm them with sand driven by the force of these winds out of the neighbouring deserts. The city is inhabited by Jacobites, Nestorians, Jews, Mahometans, and Chaldean Christians, commonly called *Christians of St John*, which last are pretty numerous here.

The abbé Raynal values the merchandise annually brought to Bassora at 525,000l.: of which the English furnish 175,000l.; the Dutch 87,500l.; and the Moors, Banians, Armenians, and Arabs, furnish the remainder. "The cargoes of these nations (says he) consist of rice, sugar; plain, striped, and flowered muslins from Bengal; spices from Ceylon and the Molucca islands; coarse white and blue cottons from Coromandel; cardamom, pepper, sanders wood, from Malabar; gold and silver stuffs, turbans, shawls, indigo, from

Bassora, Bastard.

from Surat; pearls from Baharen, and coffee from Mocha; iron, lead, and woollen cloth, from Europe. Other articles of less consequence are imported from different places. Some of these commodities are shipped on board small Arabian vessels; but the greater part is brought by European ships, which have the advantage of a considerable freight.

"This merchandise is sold for ready money; and passes through the hands of the Greeks, Jews, and Armenians. The Banians are employed in changing the coin current at Bassora, for that which is of higher value in India.

"The different commodities collected at Bassora are distributed into three channels. One half of them goes to Persia, whither they are conveyed by the caravans; there being no navigable river in the whole empire. The chief consumption is in the northern provinces, which have not been so much ravaged as those of the south. Both of them formerly made their payments in precious stones, which were become common by the plunder of India. They had afterwards recourse to copper utensils, which had been exceedingly multiplied from the great abundance of copper mines. At last they gave gold and silver in exchange, which had been concealed during a long scene of tyranny, and are continually dug out of the bowels of the earth. If they do not allow time for the trees that produce gum, and have been cut, to make fresh shoots; if they neglect to multiply the breed of goats which afford such fine wool, and if the silks, which are hardly sufficient to supply the few manufactures remaining in Persia, continue to be so scarce;—in a word, if this empire does not rise again from its ashes, the mines will be exhausted, and this source of commerce must be given up.

BASTARD, a natural child, or one begotten and born out of lawful wedlock.

Blackst. Comment.

The civil and canon laws do not allow a child to remain a bastard, if the parents afterwards intermarry; and herein they differ most materially from our law; which, though not so strict as to require that a child shall be *begotten*, yet makes it an indispensable condition that it shall be *born*, after lawful wedlock. And the reason of our law is surely much superior to that of the Roman, if we consider the principal end and design of establishing the contract of marriage, taken in a civil light; abstractedly from any religious views, which has nothing to do with the legitimacy or illegitimacy of the children. The main end and design of marriage, therefore, being to ascertain and fix upon some certain person, to whom the care, the protection, the maintenance, and the education of the children, should belong; this end is undoubtedly better answered by legitimating all issue born after wedlock, than by legitimating all issue of the same parties, even born before wedlock, so as wedlock afterwards ensues: 1. Because of the very great uncertainty there will generally be, in the proof that the issue was really begotten by the same man; whereas, by confining the proof to the birth, and not to the begetting, our law has rendered it perfectly certain, what child is legitimate, and who is to take care of the child. 2. Because, by the Roman law, a child may be continued a bastard, or made legitimate, at the option of the father and mother, by a marriage *ex post facto;* thereby opening a door to many frauds and partialities, which by our law are prevented. 3. Because by those laws a man may remain a bastard till 40 years of age, and then become legitimate by the subsequent marriage of his parents; whereby the main end of marriage, the protection of infants, is totally frustrated. 4. Because this rule of the Roman law admits of no limitation as to the time, or number of bastards to be so legitimated; but a dozen of them may, 20 years after their birth, by the subsequent marriage of their parents, be admitted to all the privileges of legitimate children. This is plainly a great discouragement to the matrimonial state; to which one main inducement is usually not only the desire of having children, but also the desire of procreating lawful heirs. Whereas, our constitution guards against this indecency, and, at the same time, gives sufficient allowance to the frailties of human nature. For if a child be begotten while the parents are single, and they will endeavour to make an early reparation for the offence, by marrying within a few months after, our law is so indulgent as not to bastardize the child, if it be born, though not begotten, in lawful wedlock; for this is an incident that can happen but once; since all future children will be begotten, as well as born, within the rules of honour and civil society.

From what has been said it appears, that all children born before matrimony are bastards by our law: and so it is of all children born so long after the death of the husband, that by the usual course of gestation, they could not be begotten by him. But this being a matter of some uncertainty, the law is not exact as to a few days. But if a man dies, and his widow soon after marries again, and a child is born within such a time as that by the course of nature it might have been the child of either husband: in this case he is said to be more than ordinarily legitimate; for he may, when he arrives to years of discretion, choose which of the fathers he pleases. To prevent this, among other inconveniences, the civil law ordained that no widow should marry *infra annum luctus;* a rule which obtained so early as the reign of Augustus, if not of Romulus; and the same constitution was probably handed down to our early ancestors from the Romans, during their stay in this island; for we find it established under the Saxon and Danish governments.

As bastards may be born before the coverture or marriage-state is begun, or after it is determined, so also children born during wedlock may in some circumstances be bastards. As if the husband be out of the kingdom of England (or as the law loosely phrases it, *extra quatuor maria*) for above nine months, so that no access to his wife can be presumed, her issue during that period shall be bastards. But generally during the coverture, access of the husband shall be presumed, unless the contrary shall be shown; which is such a negative as can only be proved by shewing him to be elsewhere; for the general rule is, *præsumitur pro legitimatione*. In a divorce *à mensa et thoro*, if the wife breeds children, they are bastards; for the law will presume the husband and wife conformable to the sentence of separation, unless access be proved: but in a voluntary separation by agreement, the law will suppose access, unless the negative be shown. So also, if there is an apparent impossibility of procreation on the part of the husband, as if he be only eight years old, or the like, there the issue of the wife shall be bastard. Likewise, in

Bastard.

in case of divorce in the spiritual court *à vinculo matrimonii*, all the issue born during the coverture are bastards; because such divorce is always upon some cause that rendered the marriage unlawful and null from the beginning.

As to the *duty* of parents to their bastard children, by our law, it is principally that of maintenance. For though bastards are not looked upon as children to any civil purposes, yet the ties of nature, of which maintenance is one, are not so easily dissolved; and they hold indeed as to many other intentions; as particularly that a man shall not marry his bastard sister or daughter. The method in which the English law provides maintenance for them is as follows: When a woman is delivered, or declares herself with child, of a bastard, and will by oath before a justice of the peace charge any person having got her with child, the justice shall cause such person to be apprehended, and commit him till he gives security, either to maintain the child, or appear at the next quarter sessions to dispute and try the fact. But, if the woman dies, or is married, before delivery, or miscarries, or proves not to have been with child, the person shall be discharged; otherwise the sessions, or two justices out of sessions, upon original application to them, may take order for the keeping of the bastard, by charging the mother or the reputed father with the payment of money or other sustentation for that purpose. And if such putative father, or lewd mother, run away from the parish, the overseers, by direction of two justices, may seize their rent, goods, and chattels, in order to bring up the said bastard child. Yet such is the humanity of our laws, that no woman can be compulsively questioned concerning the father of her child till one month after her delivery; which indulgence is, however, very frequently a hardship upon parishes, by giving the parents opportunity to escape.

As to the *rights* and *incapacities* which appertain to a bastard: The former are very few, being only such as he can *acquire*; for he can *inherit* nothing, being looked upon as the son of nobody, and sometimes called *filius nullius*, sometimes *filius populi*. Yet he may gain a surname by reputation, though he has none by inheritance. All other children have their primary settlement in their father's parish; but a bastard in the parish where born, for he hath no father. However, in case of fraud, as if a woman either be sent by order of justices, or comes to beg as a vagrant, to a parish which she does not belong to, and drops her bastard there, the bastard shall, in the first case, be settled in the parish from whence she was illegally removed; or in the latter case, in the mother's own parish, if the mother be apprehended for her vagrancy. Bastards also, born in any licensed hospital for pregnant women, are settled in the parish to which the mothers belong.—The *incapacity* of a bastard consists principally in this, that he cannot be heir to any one; for being *nullius filius*, he is therefore of kin to nobody, and has no ancestor from whom an inheritable blood can be derived: Therefore, if there be no other claimant upon an inheritance than such illegitimate child, it shall escheat to the lord. And as bastards cannot be heirs themselves, so neither can they have any heirs but those of their own bodies. For as all collateral kindred consists in being derived from the same common ancestor, and as a bastard has no legal ancestor, he can have no collateral kindred; and consequently can have no legal heirs, but such as claim by a lineal descent from himself. And therefore, if a bastard purchases land, and dies seized thereof without issue, and intestate, the land shall escheat to the lord of the fee. A bastard was also, in strictness, incapable of holy orders; and though that were dispensed with, yet he was utterly disqualified from holding any dignity in the church, but this doctrine seems now obsolete; and in all other respects there is no distinction between a bastard and another man. And really any other distinction but that of not inheriting, which civil policy renders necessary, would, with regard to the innocent offspring of his parent's crimes, be odious, unjust, and cruel, to the last degree; and yet the civil law so boasted of for its equitable decisions, made bastards in some cases incapable even of a gift from their parents. A bastard may, lastly, be made legitimate, and capable of inheriting, by the transcendant power of an act of parliament, and not otherwise; as was done in the case of John of Gaunt's bastard children, by a statute of Richard II.

As to the *punishment* for having bastard children: By the statute of 18 Eliz. c. 3. two justices may take order for the punishment of the mother and reputed father; but what that punishment shall be is not therein ascertained: though the cotemporary exposition was, that a corporeal punishment was intended. By statute 7 Jac. I. c. 4. a specific punishment (viz. commitment to the house of correction) is inflicted on the woman only. But in both cases it seems that the penalty can only be inflicted, if the bastard becomes chargeable to the parish; for otherwise the very maintenance of the child is considered as a degree of punishment. By the last mentioned statute the justices may commit the mother to the house of correction, there to be punished and set on work for one year: and in case of a second offence, till she find sureties never to offend again.

He that gets a bastard in the hundred of Middleton in Kent, forfeits all his goods and chattels to the king *.

If a bastard be got under the umbrage of a certain oak in Knollwood in Staffordshire, belonging to the manor of Terley castle, no punishment can be inflicted, nor can the lord nor the bishop take cognizance of it †.

It is enacted by statute 21 Jac. I. c. 27. that if any woman be delivered of a child, which, if born alive, should by law be a bastard; and endeavours privately to conceal its death, by burying the child or the like; the mother so offending shall suffer death, as in the case of murder, unless she can prove by one witness at least that the child was actually born dead. This law, which savours pretty strongly of severity, in making the concealment of the death almost conclusive evidence of the child's being murdered by the mother, is nevertheless to be also met with in the criminal codes of many other nations of Europe; as the Danes, the Swedes, and the French: but it has of late years been usual with us, upon trials for this offence, to require some sort of presumptive evidence that the child was born alive, before the other constrained presump-

tion (that the child, whose death is concealed, was therefore killed by its parent) is admitted to convict the prisoner.

Concerning bastards in Scotland, and the laws with regard to them, see LAW.

BASTARD, in respect of artillery, is applied to those pieces which are of an unusual or illegitimate make or proportion. These are of two kinds, long and short, according as the defect is on the redundant or defective side. The long bastards again, are either common or uncommon. To the common kind belong the double culverin extraordinary, half culverin extraordinary, quarter culverin extraordinary, falcon extraordinary, &c. The ordinary bastard culverin carries a ball of eight pounds.

BASTARDS is also an appellation given to a kind of faction or troop of banditti, who rose in Guienne about the beginning of the fourteenth century, and joining with some English parties, ravaged the country, and set fire to the towns.—Mezeray supposes them to have consisted of the natural sons of the nobility of Guienne, who being excluded the right of inheriting from their fathers, put themselves at the head of robbers and plunderers to maintain themselves.

BASTARD Flower-fence. See ADENANTHERA.—The flowers of this plant bruised and steeped in milk are said to be gently anodyne; for which purpose they are often given in the West Indies to quiet very young children. The leaves are used instead of sena in Barbadoes and the Leeward islands. In Jamaica, the plant is called *sena*.

BASTARD Hemp. See DATISCA, BOTANY *Index*.

BASTARD Rocket, *Dyers-Weed*, or *Wild Woad*. See RESEDA, BOTANY *Index*.

BASTARD Star-of-Bethlehem See ALBUCA, BOTANY *Index*.

BASTARD-Scarlet is a name given to red dyed with bale madder, as coming nearest the bow-dye, or new scarlet.

BASTARDY, is a defect of birth objected to one born out of wedlock. Eustathius will have bastards among the Greeks to have been in equal favour with legitimate children, as low as the Trojan war; but the course of antiquity seems against him. Potter and others show, that there never was a time when bastardy was not in disgrace.

In the time of William the Conqueror, however, bastardy seems not to have implied any reproach, if we may judge from the circumstance of that monarch himself not scrupling to assume the appellation of bastard. His epistle to Alan count of Bretagne begins, *Ego Willielmus cognomento bastardus* *.

* *Du Cange Gloss. Lat.* tom. i. p. 502.

BASTARDY, in relation to its trial in law, is distinguished into general and special. *General* bastardy is a certificate from the bishop of the diocese, to the king's justices, after inquiry made, whether the party is a bastard or not, upon some question of inheritance. Bastardy *special* is a suit commenced in the king's courts against a person that calls another a bastard.

Arms of BASTARDY should be crossed with a bar, fillet, or traverse from the right to the left. They were not formerly allowed to carry the arms of their father, and therefore they invented arms for themselves; and this is still done by the natural sons of a king.

Right of BASTARDY, *Droit de batardise*, in the French laws, is a right, in virtue whereof the effects of bastards dying intestate devolve to the king or the lord.

BASTARNÆ, or BASTERNÆ, a people of German original, manners, and language; who extended themselves a great way to the east of the Vistula, the east boundary of Germany, among the Sarmatæ, as far as the mouth of the Ister and the Euxine; and were divided into several nations.

BASTARNICÆ ALPES, in *Ancient Geography*, mountains extending between Poland, Hungary, and Transylvania, called also the *Carpates*, and now the *Carpathian* mountains.

BASTI, in *Ancient Geography*, a town of the province of Bætica in Spain, situated to the west of the Campus Spartarius. Now *Baza* in Granada.

BASTIA, a sea-port town of Albania in Turkey in Europe, over against the island of Corfu, at the mouth of the river Calamu. E. Long. 10. 35. N. Lat. 39. 40.

BASTIA, the capital of the island of Corsica in the Mediterranean. It has a good harbour, and is strongly fortified. It is situated on the western part of the coast, 70 miles south-south-west of Leghorn, in E. Long. 9. 42. N. Lat. 42. 35.

BASTILE, denotes a small antique castle, fortified with turrets. Such was the Bastile of Paris, which seems to have been the last castle that retained the name: it was begun to be built in 1369 by order of Charles V. and was finished in 1383 under the reign of his successor.—Its chief use was for the custody of state prisoners; or, more properly speaking, for the clandestine purpose of unfeeling despotism.

The lieutenant-general of the police of Paris was the sub-delegate of the ministry for the department of the Bastile. He had under him a titular commissary, who was called the commissary of the Bastile. He had a fixed salary for drawing up what were called instructions, but he did not do this exclusively. He had no inspection or function but in cases where he received orders: the reason of which was that all that was done in this castle was arbitrary.

Each prisoner on coming to the Bastile had an inventory made of every thing about him. His trunks, clothes, linens, and pockets were searched, to discover whether there were any papers in them relative to the matter for which he was apprehended. It was not usual to search persons of a certain rank; but they were asked for their knives, razors, scissars, watches, canes, jewels, and money. After this examination, the prisoner was conducted into an apartment, where he was locked up within three doors. They who had no servants made their own bed and fire. The hour of dining was eleven, and of supping six.

At the beginning of their confinement they had neither books, ink, or paper; they went neither to mass, nor on the walks; they were not allowed to write to any one, not even to the lieutenant of the police, on whom all depended, and of whom permission must first have been asked by means of the major, who seldom refused. At first they went to mass only every other Sunday. When a person had obtained leave to write to the lieutenant of the police, he might have asked his permission to write to his family, and to receive their answers; to have with him his servant or an attendant,

Digitized by Google

Bastile. tendant, &c. which requests were either granted or refused according to circumstances. Nothing could be obtained but through this channel.

The officers of the staff took the charge of conveying the letters of the prisoners to the police. They were sent regularly at noon and at night: but if they desired it, their letters were sent at any hour by expresses, who were paid out of the money of those who were confined. The answers were always addressed to the major, who communicated them to the prisoner. If no notice was taken of any request contained in the letter of the prisoner, it was a refusal. The attendants whom they appointed for those who were not allowed their own servants, or who had none of their own, were commonly invalid soldiers.

Sometimes a prisoner obtained permission of having books, his watch, knife, and razors, and even paper and ink. He might have asked to see the lieutenant of the police when he came to the Bastile. This officer commonly caused prisoners to be brought down some days after their arrival. Sometimes he went to visit them in their chambers.

When the lieutenant of the police saw a prisoner, the conversation turned upon the cause of his confinement. He sometimes asked for written and signed declarations. In general, as much circumspection was necessary in these conferences as in the examination itself, since nothing that a person might have said or written was forgotten.

When a prisoner wanted to transmit any thing to the lieutenant of the police, it was always by means of the major. Notes might have been sent to this officer by the turnkeys. A person was never anticipated in any thing—he must have asked for every thing; even for permission to be shaved. This office was performed by the surgeon; who also furnished sick or indisposed prisoners with sugar, coffee, tea, chocolate, confections, and the necessary remedies.

The time of walking was an hour a-day; sometimes an hour in the morning and an hour in the evening, in the great court.

A prisoner might have been interrogated a few days after his entrance into the Bastile, but frequently this was not done till after some weeks. Sometimes he was previously informed of the day when this was to be done; often he was only acquainted with it the moment he was brought down to the council-chamber. This commission of interrogatory was executed by the lieutenant of the police, a counsellor of state, a master of requests, a counsellor or a commissioner of the Chatelet. When the lieutenant of the police did not himself interrogate, he usually came at the end of the examination.

The commissioners were purely passive beings. Frequently they attempted to frighten a prisoner; they laid snares for him, and employed the meanest artifices to get a confession from him. They pretended proofs, exhibited papers, without suffering him to read them: asserting that they were instruments of unavoidable conviction. Their interrogatories were always vague. They turned not only on the prisoner's words and actions, but on his most secret thoughts, and on the discourse and conduct of persons of his acquaintance, whom it was wished to bring into question.

The examiners told a prisoner that his life was at stake; that his fate depended on himself; that if he would make a fair declaration, they were authorized to promise him a speedy release; but if he refused to confess, he would be given up to a special commission: that they were in possession of decisive documents, of authentic proofs, more than sufficient to ruin him; that his accomplices had discovered all; that the government had unknown resources, of which he could have no suspicion. They fatigued prisoners by varied and infinitely multiplied interrogatories. According to the persons, they employed promises, caresses, and menaces. Sometimes they used insults, and treated the unhappy sufferers with an insolence that filled up the measure of that tyranny of which they were the base instruments.

If the prisoner made the required confession, the commissioners then told him, that they had no precise authority for his enlargement, but that they had every reason to expect it; that they were going to solicit it, &c. The prisoner's confessions, far from bettering his condition, gave occasion to new interrogatories, often lengthened his confinement, drew in the persons with whom he had connexions, and exposed himself to new vexations.

Although there were rules for all occasions, yet every thing was subject to exceptions arising from influence, recommendations, protection, intrigue, &c. because the first principle in this place was arbitrary will. Very frequently, persons confined on the same account were treated very differently, according as their recommendations were more or less considerable.

There was a library, founded by a foreign prisoner who died in the Bastile in the beginning of the last century. Some prisoners obtained leave to go to it; others, to have the books carried to their chambers.

The falsest things were told the prisoners with an air of sincerity and concern. "It is very unfortunate that the king has been prejudiced against you. His majesty cannot hear your name mentioned without being irritated. The affair for which you have lost your liberty is only a pretext—they had designs against you before—you have powerful enemies." These discourses were the etiquette of the place.

It would have been in vain for a prisoner to ask leave to write to the king—he could never obtain it.

The perpetual and most insupportable torment of this cruel and odious inquisition, were vague, indeterminate, false, or equivocal promises, inexhaustible and constantly deceitful hopes of a speedy release, exhortations to patience, and blind conjectures, of which the lieutenant of the police and officers were very lavish.

To cover the odium of the barbarities exercised here, and slacken the zeal of relations or patrons, the most absurd and contradictory slanders against a prisoner were frequently published. The true causes of imprisonment, and real obstacles to release, were concealed. These resources, which were infinitely varied, were inexhaustible.

When a prisoner who was known and protected had entirely lost his health, and his life was thought in danger, he was always sent out. The ministry did not choose that persons well known should die in the Bastile. If a prisoner did die there, he was interred in the parish of St Paul, under the name of a domestic;

Bastile.

tie; and this falsity was written in the register of deaths, in order to deceive posterity. There was another register in which the true names of the deceased were entered; but it was not without great difficulty that extracts could be procured from it. The commissary of the Bastile must first have been informed of the use the family intended to make of the extract.

In 1674 the baggage of Louis chevalier de Rohan, grand huntsman of France, having been taken and rummaged in a skirmish, some letters were found which caused a suspicion that he had treated with the English for the surrender of Havre de Grace. He was arrested and put into the Bastile. The Sieur de la Tuanderie, his agent, concealed himself. The proof was not sufficient. A commission was named to proceed against the accused for treason. La Tuanderie was discovered at Rouen: an attempt was made to arrest him; but he fired on the assailants, and obliged them to kill him on the spot. Persons attached to the chevalier de Rohan went every evening round the Bastile, crying through a speaking trumpet, "La Tuanderie is dead, and has said nothing;" but the chevalier did not hear them. The commissioners, not being able to get any thing from him, told him, "that the king knew all, that they had proofs, but only wished for his own confession, and that they were authorised to promise him pardon if he would declare the truth." The chevalier, too credulous, confessed the whole. Then the perfidious commissioners changed their language, They said, "that with respect to the pardon, they could not answer for it: but that they had hopes of obtaining it, and would go and solicit it." This they troubled themselves very little about; and condemned the criminal to lose his head. He was conducted on a platform to the scaffold, by means of a gallery raised to the height of the window of the armoury in the arsenal, which looks towards the little square at the end of the *Rue des Tournelles*. He was beheaded on November 27. 1674.

The Jesuits of the college of Clermont, in the *Rue St Jacques*, Paris, having this same year (1674) invited the king (Louis XIV.) to honour with his presence a tragedy to be performed by their scholars, that prince accepted the invitation. These able courtiers took care to insert in the piece several strokes of flattery, with which the monarch, greedy of such incense, was greatly pleased. When the rector of the college was conducting the king home, a nobleman in the train applauded the success of the tragedy. Louis said, "Do you wonder at it? *this is my college*." The Jesuits did not lose a word of this. The very same night they got engraved in large golden letters on black marble, *Collegium Lodovici Magni*, instead of the former inscription which was placed beneath the name of Jesus on the principal gate of the college (*Collegium Claramontanum Societatis Jesus*); and in the morning the new inscription was put up in place of the old one. A young scholar of quality, aged 13, who was witness to the zeal of the reverend fathers, made the two following verses, which he posted up at night on the college gate:

Abstulit hinc Jesum, posuitque insignia regis
Impia gens: alium non colit illa Deum.

The Jesuits did not fail to cry out sacrilege: the young author was discovered, taken up, and put into the Bastile. The implacable society caused him, as a matter of *favour*, to be condemned to perpetual imprisonment; and he was transferred to the citadel of the isle St Marguerite. Several years after, he was brought back to the Bastile. In 1705 he had been a prisoner 31 years. Having become heir to all his family, who possessed great property, the Jesuit Riquelet, then confessor of the Bastile, remonstrated to his brethren on the necessity of restoring the prisoner to liberty. The golden shower which forced the tower of Danaë had the same effect on the castle of the Bastile. The Jesuits made a merit with the prisoner of the protection they granted him; and this man of rank, whose family would have become extinct without the aid of the society, did not fail to give them extensive proofs of his gratitude.

Nowhere else on earth, perhaps, has human misery, by human means, been rendered so lasting, so complete, or so remediless. This the following case may suffice to evince; the particulars of which are translated from that elegant and energetic writer M. Mercier. The heinous offence which merited an imprisonment surpassing torture and rendering death a blessing, though for obvious reasons not specified by our author, is known from other sources to have consisted in some unguarded expressions implying disrespect concerning the late Gallic monarch Louis XV.

Upon the accession of Louis XVI. to the throne, the ministers then in office, moved by humanity, began their administration with an act of clemency and justice; they inspected the registers of the Bastile, and set many prisoners at liberty. Among those there was an old man who had groaned in confinement for 47 years between four thick and cold stone-walls. Hardened by adversity, which strengthens both the mind and the constitution, when they are not overpowered by it, he had resisted the horrors of his long imprisonment with an invincible and manly spirit. His locks white, thin, and scattered, had almost acquired the rigidity of iron; whilst his body, environed for so long a time by a coffin of stone, had borrowed from it a firm and compact habit. The narrow door of his tomb, turning upon its grating hinges, opened not as usual by halves; and an unknown voice announced his liberty, and bade him depart. Believing this to be a dream, he hesitated; but at length rose up and walked forth with trembling steps, amazed at the space he traversed: The stairs of the prison, the halls, the court, seemed to him vast, immense, and almost without bounds. He stopped from time to time, and gazed around like a bewildered traveller: His vision was with difficulty reconciled to the clear light of day: He contemplated the heavens as a new object: His eyes remained fixed, and he could not even weep. Stupified with the newly acquired power of changing his position, his limbs, like his tongue, refused, in spite of his efforts, to perform their office; at length he got through the formidable gate.

When he felt the motion of the carriage prepared to transport him to his former habitation, he screamed out, and uttered some inarticulate sounds; and as he could not bear this new movement, he was obliged to descend. Supported by a benevolent arm, he sought out the street where he had formerly resided: he found it, but no trace of his house remained; one of the public

Digitized by Google

Bastile. lic edifices occupied the spot where it had stood. He now saw nothing that brought to his recollection, either that particular quarter, the city itself, or the objects with which he had formerly been acquainted. The houses of his nearest neighbours, which were fresh in his memory, had assumed a new appearance. In vain were his looks directed to all the objects around him; he could discover nothing of which he had the smallest remembrance. Terrified, he stopped and fetched a deep sigh. To him, what did it import that the city was peopled with living creatures? None of them were alive to him; he was unknown to all the world, and he knew nobody: And whilst he wept, he regretted his dungeon.

At the name of the Bastile, which he often pronounced and even claimed as an asylum, and the sight of his clothes that marked a former age, the crowd gathered round him: curiosity, blended with pity, excited their attention. The most aged asked him many questions, but had no remembrance of the circumstances he recapitulated. At length accident brought in his way an ancient domestic, now a superannuated porter, who, confined to his lodge for 15 years, had barely sufficient strength to open the gate:—Even he did not know the master he had served; but informed him that grief and misfortune had brought his wife to the grave 30 years before, that his children were gone abroad to distant climes, and that of all his relations and friends none now remained. This recital was made with the indifference which people discover for events long passed, and almost forgot. The miserable man groaned, and groaned alone. The crowd around, offering only unknown features to his view, made him feel the excess of his calamities even more than he would have done in the dreadful solitude that he had left.

Overcome with sorrow, he presented himself before the minister to whose humanity he owed that liberty which was now a burden to him. Bowing down, he said, "Restore me again to that prison from which you have taken me: I cannot survive the loss of my nearest relations; of my friends; and, in one word, of a whole generation: Is it possible in the same moment to be informed of this univeral destruction, and not to wish for death? This general mortality, which to the rest of mankind comes slowly and by degrees, has to me been instantaneous, the operation of a moment. Whilst secluded from society, I lived with myself only; but here I neither can live with myself nor with this new race, to whom my anguish and despair appear only as a dream. There is nothing terrible in dying; but it is dreadful indeed to be the last." The minister was melted; he caused the old domestic to attend this unfortunate person, as only he could talk to him of his family. This discourse was the single consolation that he received: for he shunned all intercourse with a new race, born since he had been exiled from the world; and he passed his time in the midst of Paris in the same solitude as he had done whilst confined in a dungeon for almost half a century. But the chagrin and mortification of meeting no person who could say to him, We were formerly known to one another, soon put an end to his existence.

Such was the nature of this celebrated fortress. Many of our readers will probably recollect that it was attacked and taken by the Parisian mob on the 14th July 1789. At that time only seven prisoners were found in it, and it did not appear that any of them were the victims of tyranny or wanton oppression.

Bastile ‖ Baston.

BASTIMENTOS, the name of some small islands near Terra Firma in South America, at the mouth of the bay of Nombre de Dios.

BASTINADO. See BASTANADO.

BASTION, in the modern fortification, a huge mass of earth, faced usually with sods, sometimes with brick, and rarely with stone, standing out from a rampart whereof it is a principal part, and is what, in the ancient fortification, was called a *bulwark*.

Solid BASTIONS, are those that have the void space within them filled up entirely, and raised of an equal height with the rampart.

Void and Hollow BASTIONS, are those that are only surrounded with a rampart and parapet, having the space within void and empty, where the ground is so low, that, if the rampart be taken, no retrenchment can be made in the centre, but what will lie under the fire of the besieged.

Flat BASTION, is a bastion built in the middle of the curtain, when it is too long to be defended by the bastion at its extremes.

Cut BASTION, is that whose point is cut off, and instead thereof has a re-entering angle, or an angle inwards, with two points outwards; and is used either when without such a contrivance the angle would be too acute, or when water or some other impediment hinders the carrying on the bastion to its full extent.

Composed BASTION, is when two sides of the interior polygon are very unequal, which makes the gorges also unequal.

Deformed BASTION, is when the irregularity of the lines and angles makes the bastion out of shape; as when it wants one of its demigorges, one side of the interior polygon being too short.

Demi-BASTION, is composed of one face only, and but one flank, and a demigorge.

Double BASTION, is that which is raised on the plane of another bastion.

Regular BASTION, is that which has its true proportion of faces, flanks, and gorges.

BASTION *of France*, a fortress on the coast of Barbary, belonging to the French.

BASTITANI, in *Ancient Geography*, a people of the province of Bætica in Spain. See BÆTICA.

BASTOIGNE, a small town of the Netherlands, in the duchy of Luxemburgh. E. Long. 6. 0. N. Lat. 50. 10.

BASTON, in *Law*, one of the servants to the warden of the Fleet-prison, who attended the king's courts with a red staff, for taking into custody such as are committed by the court. He also attends on such prisoners as are permitted to go at large by license.

BASTON, or *Battoon*, in *Architecture*, a moulding in the base of a column, called a *tore*.

BASTON, *Baton*, or *Batune*. This word is French, and signifies a staff or cudgel: it should be spelt *Bâton*; but is, by most English writers, corruptly spelt as above. It is only borne in English coats of arms, as a badge of illegitimacy; but French heralds introduce it in arms as a difference, or mark of consanguinity.

BASTON, *Robert*, a Carmelite monk, afterwards prior

3

prior of the convent of that order at Scarborough, and also poet laureat and public orator at Oxford, flourished in the fourteenth century. King Edward I. in his expedition into Scotland in 1304, took Robert Baston with him, in order to celebrate his victories over the Scots; but our poet being taken prisoner, was obliged to change his note, and sing the successes of Robert Bruce. He wrote several books in Latin, on the wars of Scotland, the Luxury of Priests, Synodical Sermons, &c.; and also a volume of tragedies and comedies, in English. He died about the year 1310.

BASTONADO, BASTONADE, the punishment of beating or drubbing a criminal with a stick. The word is formed of the French *baston*, a "stick" or "staff." The bastonade was a punishment used both among the ancient Greeks, Romans and Jews, and still obtains among the Turks. The Romans called it *fustigatio*, *fustium admonitio*, or *fustibus cædi*; which differed from the *flagellatio*, as the former was done with a stick, the latter with a rod or scourge. The fustigation was a lighter punishment, and inflicted on freemen; the flagellation a severer, and reserved for slaves. It was also called *tympanum*, because the patient here was beat with sticks, like a drum.—The punishment is much in use in the east to this day. The method there practised is thus: the criminal being laid on his belly, his feet are raised, and tied to a stake, held fast by officers for the purpose; in which posture he is beaten with a cudgel on the soles of his feet, back, chin, &c. to the number of 100 or more blows.

BASTWICK, DR JOHN, born at Writtle in Essex, in 1593; practised physic at Colchester; but being a man of warm imagination, and a good Latin scholar, applied himself to writing books against popery. About the year 1633, he printed in Holland a Latin treatise, entitled *Elenchus religionis Papisticæ*, with *Flagellum pontificis et episcoporum Latialium*, in which the English prelates thinking themselves also aimed at, he was fined 1000l. in the high commission court, excommunicated, prohibited practising physic, his books ordered to be burnt, and himself to remain in prison until he made a recantation. Instead of recanting, he wrote in prison, *Apologeticus ad præsules Anglicanos*: and another book called, *The Litany*; wherein he severely exclaimed against the proceedings of that court, and taxed the bishops with an inclination towards popery. Prynne and Burton coming under the lash of the star-chamber court at the same time, they were all censured as scandalous seditious persons, condemned to a fine of 5000l. each, to be pilloried, to lose their ears, and to perpetual imprisonment in three remote parts of the kingdom. The parliament in 1640 reversed these proceedings; and ordered Dr Bastwick a reparation of 5000l. out of the estates of the commissioners and lords who had persecuted him, which the ensuing confusions prevented his receiving: however, his wife had, in 1644, an allowance ordered for her and her husband's maintenance. What became of him afterward is not known.

BAT, in *Zoology*. See VESPERTILIO, MAMMALIA *Index*.

BAT-Fowling, a method of catching birds in the night, by lighting some straw, or torches, near the place where they are at roost; for upon beating them up, they fly to the flame, where, being amazed, they are easily caught in nets or beat down with bushes fixed to the end of poles, &c.

BAT, *Bate*, or *Batz*, a small copper coin, mixed with a little silver, current in several cities of Germany: it is worth four crutzers. It is also a coin in Switzerland, current at five livres, or 100 sols, French money.

BATABLE, or DEBATABLE GROUND, that land which lay between Scotland and England, when the kingdoms were distinct, to which both nations pretended a right.

BATACALA, a small kingdom on the coast of Malabar in the East Indies. It had a very large town of the same name; but there is nothing now left, except 11 or 12 small pagods covered with copper and stone. The country produces a good deal of pepper: the English formerly had a factory here; but were all massacred by the natives, because one of their bulldogs had killed a consecrated cow.

BATACALA, a fortified town and castle on the east coast of the island of Ceylon in the East Indies. The Dutch drove away the Portuguese, and possessed themselves of part of the adjacent country. E. Long. 81. 3. N. Lat. 7. 55.

BATANISTS, or BATENITES. See BATENITES.

BATASEK, a town of Lower Hungary, seated on the Danube, in E. Long. 19. 50. N. Lat. 46. 30.

BATAVA (*Castra* understood), a citadel of Vindelicia, so called from the Cohors Batava, in garrison under the commander in Rhætia: now *Pasau*: being first called *Batau*, from the Batavi; then *Bassau*: and *Passau*; situated in Bavaria, at the confluence of the Danube, Inn, and Ills. See PASSAU.

BATAVIA, the captial of the Dutch settlements in the East Indies; a city of the kingdom of Bantam in the island of Java. See JAVA.

BATAVORUM INSULA, the island of the Batavians, in *Ancient Geography*. Of this island Tacitus gives the following description. "The Rhine flowing in one channel, or only broken by small islands, is divided, at its entering Batavia, as it were into two rivers. One continues its course through Germany, retaining the same name, and violent current, till it falls into the ocean. The other washing the coast of Gaul, with a broader and more gentle stream, is called by the inhabitants *Vahalis*; which name it soon changes for that of *Mosa*, by the immense mouth of which river it discharges itself into the same ocean." According to Tacitus, therefore, the island of the Batavians was bounded by the ocean, the Rhine, and the Vahalis, now the *Wale*. Cæsar extends it to the Mosa, or *Meuse*; but Pliny agrees with Tacitus. However, this island was of greater extent in Tacitus's time than in Cæsar's; Drusus, the father of Germanicus, having by a new canal conveyed the waters of the Rhine into the ocean a considerable way north of the former mouth of that river. The Batavi were a branch of the Catti, who in a domestic sedition, being expelled their country, occupied the extremity of the coast of Gaul, at that time uninhabited, together with this island situated among shoals. Their name *Batavi* they carried with them from Germany; there being some towns in the territory of the Catti called *Battenberg*, and *Battenhausen*. The bravery of the Batavi, especially the horse,

Digitized by Google

horse, procured them not only great honour from the Romans, being called their *brothers* and *friends;* but an exception from taxes, being obliged only to furnish men and arms. The modern name of this island is *Betu* or *Betaw*.

Batavorum Oppidum, in *Ancient Geography*, a town in the island of the Batavi, mentioned by Tacitus, without any particular name; which has given rise to several surmises about it, some supposing it to be *Nimeguen*, but Cluverius, *Batavadurum* or *Batemburg*, both without the island; which situation renders both these places inadmissible, since Tacitus places this nameless town within the island.

BATCHELOR. See Bachelor.

BATE, George, an eminent physician, born at Maid's Morton, near Buckingham, in the year 1608. In 1629 he obtained a license, and for some years practised in and about Oxford: his practice was chiefly amongst the Puritans, who at that time considered him as one of their party. In 1637, he took his degree of doctor in physic, and became very eminent in his profession, so that when King Charles kept his court at Oxford, he was his principal physician. When the king's affairs declined, Dr Bate removed to London, where he accommodated himself so well to the times, that he became physician to the Charter-house, fellow of the college of physicians, and afterwards principal physician to Oliver Cromwell. Upon the Restoration, he got into favour with the royal party, was made principal physician to the king, and fellow of the Royal Society; and this, we are told, was owing to a report raised on purpose by his friends, according to Mr Wood, that he gave the protector a dose which hastened his death. Dr Bate wrote in Latin an account of the late commotions in England, and some other pieces. He died at his house in Hatton-garden, and was buried at Kingston upon Thames in Surry.—There was another George Bate, who wrote a work entitled, "The Lives, Actions, and Execution, of the prime Actors and principal Contrivers of that horrid Murther of our late pious and sacred King Charles I."

BATENITES, a sect of apostates from Mahometanism, dispersed through the East, who professed the same abominable practices with the Ismaelians and Karmatians. The word properly signifies *esoteric*, or people of inward or hidden light.

BATES, William, D. D. an eminent Presbyterian divine, born in November 1625. He was admitted in Emanuel college, Cambridge, and from thence removed to King's college in 1644. He was one of the commissioners, at the conference in the Savoy, for reviewing the public liturgy, and was concerned in drawing up the exceptions against the Common Prayer: however, soon after the Restoration, he was appointed chaplain to King Charles II. and became minister of St Dunstan's in the West, but was deprived of that benefice for nonconformity. Dr Bates bore a good and amiable character; and was honoured with the friendship of the lord keeper Bridgman, the lord chancellor Finch, the earl of Nottingham, and Archbishop Tillotson. He was offered, at the Restoration, the deanery of Litchfield; which he refused. He published Select Lives of illustrious and pious persons, in Latin; and since his death, all his works, except his Select Lives, have been printed in one volume in folio. He died in July 14. 1699, in the 74th year of his age.

BATH, a city of Somersetshire in England, seated in W. Long. 2. 30. N. Lat. 51. 27. All the different names that this city has borne in different ages and languages have been taken from its medicinal waters, as the ὕδατα θερμὰ, or "hot waters," of Ptolemy; the *Aquæ Solis*, or "waters of the sun," of Antoninus; the *Caer Baden*, and *Caer Ennant*, i. e. "the city of baths," and "the city of ointment," of the Britons; and the *Ackmanchester*, i. e. "the city of valetudinarians," of the Saxons. The baths consist of the King's bath, the Queen's bath, the Cross-bath, the Hot-bath, the Leper's bath, and the duke of Kingston's bath. This place was of old a resort only for cripples and diseased persons; but now it is more frequented by the sound for pleasure than by the sick for health. The waters are very pleasant to the taste; and impregnated with a vitriolic principle, yielding, upon evaporation, a little neutral salt, and a calcareous earth and iron. They are very efficacious in strengthening the bowels and stomach, bracing the relaxed fibres, and invigorating the circulation. In bilious complaints they are counted specific; and proved serviceable in most nervous, paralytic, rheumatic, and gouty, complaints. At the King's bath is a handsome pump-room, where the gentlemen and ladies go in a morning to drink the waters; and there is a band of music that plays all the time. In the Cross-bath is a monument of marble, representing the descent of the Holy Ghost attended by angels, erected by the earl of Melfort (who was secretary of state for Scotland) when King James II. met his queen here. The King's bath is a large bason of 65 feet 10 inches by 40 feet 10 inches, containing 346 tons 2 hogsheads and 36 gallons of water when filled to its usual height. In the middle is a wooden building with niches and seats for the accommodation of the bathers. There are also iron rings all round for them to hold by; and guides, both male and female, to attend them in the bath. The person intending to bathe puts on, at his own lodgings, a bathing dress of brown canvas hired for the purpose; and is carried in a close chair, of a particular make, to one of the slips which open into the bath. There he descends by steps into the water, where he is attended by a guide. Having staid his stated time in the bath, he ascends again into the slip, where he puts off his bathing-dress, and being wrapt up in blankets, is carried home to bed, where he lies for some time to encourage perspiration. The King's bath is overlooked by the company in the pump-room; and adjoining to it are places furnished with pumps to pour the hot streams on any particular part of the body. The Queen's bath communicates with the King's, from which it is filled; therefore the water of it is not so hot, being at a greater distance from the source. As the heat is here more moderate, the bathers descend first into the Queen's bath, and advance gradually to the centre of the other. In the year 1755, the abbey-house or priory, belonging to the duke of Kingston, was taken down, in order to erect a more commodious pile of building; and in digging for the foundation, the workmen discovered, about twenty feet below the surface of the earth, the remains of Roman baths and sudatories constructed upon

Digitized by Google

Bath. on an elegant plan, with floors suspended on pillars, and surrounded with tubulated bricks, for the conveyance of heat and vapour. These were supplied by a spring of hot water, of the same properties and temperature with those of the King's-bath; and the sewer was found still entire, that conveyed the waste water into the river. The duke, having cleared the spring and the sewer, has erected several convenient baths and sudatories on the spot, where invalids may be accommodated at all hours, by night as well as by day. The two seasons are the spring and fall; but those who take the waters purely for their health do not regard the seasons, but drink them all the year round. There are a number of genteel sedan chairs, which carry people to any distance, not exceeding half a mile, for sixpence. The company assemble in the afternoon alternately at two stately rooms, to converse together, or play at cards. At a very pretty new theatre near the parades, plays are acted every other night; and there are balls twice a-week; for which and the rooms, and books at the libraries, the gentry generally subscribe. The city is surrounded with hills on all sides, except a little opening to the east and west, through which the Avon runs. This river, which has been made navigable to Bristol by act of parliament, washes the city on the east and south sides, and there is an elegant bridge over it. This city hath formerly had a slight wall, of which some part still remains, as well as one or two of its gates; but almost all the new buildings, and much the greatest and finest part of the city, is without the walls, particularly the fine square called *Queen's-square*, in the middle of which is a small garden, with gravel walks, and an obelisk in the centre. But the greatest ornament at Bath is the circus: it is of a circular form, consisting of houses built on an uniform plan, with three openings at equal distances to the south, east, and west, leading into as many streets. The fronts of the houses, which are all three stories high, are adorned with three rows of columns in pairs, of the Doric, Ionic, and Corinthian orders, the frize embellished with sculpture. The whole has an air of magnificence, which cannot fail to strike the most indifferent spectator. In the centre of the area is a reservoir, or bason, filled by two or three springs rising in the neighbouring hills; whence the streets in this district are supplied with water. On the south side of the town are the north and south parades, two noble walks, paved with hewn stone, raised upon arches, facing each an elegant row of houses on one side, and having a stone balustrade on the other. These, with the two streets that join them, were planned and executed by one Mr Wood, an able architect, who likewise built the square and projected the circus. The two public rooms stand betwixt the north parade and Orange-grove; which last is a square planted with trees, having in the middle a stone obelisk, inscribed in Latin to the late prince of Orange, who recovered his health in consequence of drinking the Bath waters, and gave his name to this part of the town. Several new streets and rows have of late years been built on the north side of Bath, in the neighbourhood of the square, such as Gay-street, Milsom-street, Edgar-row, Harlequin-row, Bladud's-buildings, King's-mead-street, and Brock-street. Their advantages for building here are very great, having excellent freestone, limestone, and slate, in the neighbourhood. One sort of their lime is as white as snow. The guild-hall of Bath stands in the market-place, and is said to be built on a plan of Inigo Jones, which, however, exhibits nothing worthy of that great architect: besides, one end of it has been rebuilt in a different style. The hall is ornamented with some portraits of the late prince of Wales and other remarkable personages; but the greatest curiosity of the place is a Minerva's head in bronze, a real antique, dug up in Stall-street, in the year 1725. Bath boasts a noble infirmary, or general hospital, for the reception of the sick and lame from all parts of the three kingdoms. It extends 100 feet in front, and 90 in depth, being capable of receiving 150 patients. Here was anciently a monastery, of which the present cathedral was the church. It is a venerable pile: the principal front of which is adorned with angles ascending and descending. There are three other churches in Bath, and several chapels and meeting-houses. Besides the infirmary, there are several other hospitals, alms-houses, and charity schools. The corporation consists of a mayor; eight aldermen, of whom two are justices of the peace; and 24 common-council men. The city is extremely well provided with stage coaches, post coaches, chaises, machines, and waggons. Bath is the general hospital of the nation, and a great number of invalids find benefit from the waters: but as the city lies in a bottom surrounded by very high hills, the air is constantly surcharged with damps; and indeed this place is more subject to rain than most other parts in England. The markets are remarkably well supplied with provisions of all kinds at reasonable rates, particularly fish and poultry. They also afford excellent mutton fed upon Lansdown, one of the highest hills that overlook the city. This down, remarkable for its pure air, extends about three miles; and at the extremity of it there is a stone monument, with an inscription, erected to the memory of Sir Beville Granville, who was here killed in a battle which he fought with the parliament's army in the reign of Charles I. Bath sends two members to parliament. The earldom of Bath was bestowed on William Pultney in the end of Sir Robert Walpole's administration, but is now extinct. The population varies of course considerably, but is estimated on a mean at 38,000.

Bath is joined with Wells to form a bishopric, called the diocese of Bath and Wells. The bishop's seat is at Wells, whose cathedral church was built by Ina, king of the West Saxons in 704, and by him dedicated to St Andrew. Several other of the West Saxon kings endowed it, and it was erected into a bishopric in 905, during the reign of King Edward the Elder. The present church was begun by Robert the 18th bishop of this see, and completed by his immediate successor. John de Villula, the 16th bishop, having purchased the city of Bath for 500 merks of King Henry I. transferred his seat to that city in 1088. From this, disputes arose between the monks of Bath and the canons of Wells, about the election of a bishop; but they were at last compromised by Robert the 18th bishop, who decreed, that from henceforward the bishop should be styled from both places, and that the precedency should be given to Bath; that in the vacancy of the see, the bishop should be elected by a certain number of delegates from both churches; and that he should be in-

Digitized by Google

stalled in them both; both of them to constitute the bishop's chapter; and all his grants and patents to be confirmed in both. So it stood till the Reformation. But in the 35th of King Henry VIII. an act of parliament passed for the dean and chapter of Wells to make one sole chapter for the bishop. This diocese hath yielded to the church of Rome one cardinal, and to the civil state of England six lord chancellors, five lord treasurers, one lord privy seal, one lord president of Wales, and principal secretary of state. The diocese contains the whole county of Somerset, except a few churches in the city of Bristol; the number of parishes amounting to 388, and the churches and chapels to 503. Of the parishes 160 are impropriate. It is valued in the king's books at 535l. 1s. 3d. and computed to be worth annually 2200l. The clergy's tenth is 353l. 18s. 0½d. To the cathedral belong a bishop, a dean, three archdeacons, a chancellor, a treasurer, a sub-dean, fifty-nine prebendaries, four priest-vicars, eight lay vicars, an organist, six choristers, and other officers.

Knights of the Bath, a military order in England, concerning the origin of which antiquaries differ in their accounts. The most probable deduction seems to be the following.

The knighthood of the Bath is supposed to have been practised by the ancient Franks, the inhabitants of Lower Germany, with whom it is highly probable the Saxons, who invaded England, had the same common descent, and, with other customs, upon their setling here, introduced the same method of knighthood. These ancient Franks, when they conferred knighthood, observed, amongst other solemn rites, bathing before they performed their vigils; which custom continues to be practised in England: they were from thence denominated *Knights of the Bath*.

In the reign of Henry IV. there was a degree of knighthood specified under the express appellation of *the Bath*. That king, on the day of his coronation in the tower of London, conferred the same upon 46 esquires, who had watched all the night before, and had bathed themselves. From that time it was customary with our kings to confer this dignity preceding their coronations, the coronations of their queens, the birth and marriage of the royal issue, and their first advancement to honours, upon their designed expeditions against their foreign enemies, upon installations of knights of the Garter, and when some grand anniversary festivals were celebrated. The last knights of the Bath so made were at the coronation of King Charles II. in 1661; after which the order was neglected until the year 1725, when George I. was pleased to revive it, and to order a book of statutes for the government of the order. By this the number of knights is fixed to 38, viz. the sovereign, and 37 knights-companions.

The apparel of a knight of the Bath is a red surcoat, lined and edged with white, girded about with a white girdle, without any ornament thereon; the mantle is of the same colour and lining, made fast about the neck with a lace of white silk, having a pair of white gloves tied therein, with tassels of silk and gold at the end; which mantles are adorned upon the left shoulders with the ensign of the order, being three imperial crowns *or*, surrounded with the ancient motto of this knighthood, *Tria juncta in uno*, wrought upon a circle *gules*, with a glory or rays issuing from the centre, and under it the lace of white silk heretofore worn by the knights of the Bath. They have red breeches and stockings, and have white hats, with a plume of white feathers thereon. The king allowed the chapel of King Henry VII. to be the chapel of the order, and ordered that each knight's banner, with plates of his arms and style, should be placed over their several stalls, in like manner as the knights of the Garter in St George's chapel in the castle of Windsor; and he allowed them supporters to their arms. His Royal Highness Prince William, second son to the prince of Wales, on this occasion, was made the first knight-companion, and his grace the duke of Montague grand master of the order, the dean of Westminster (for the time being) dean of the order; the other officers of which are, Bath king of arms, a genealogist, register and secretary, gentleman usher, and messenger.

Bath, *Balneum*, a convenient receptacle of water for persons to wash or plunge in, either for health or pleasure.—Baths are distinguished into *hot* and *cold*; and these again are either natural or artificial. The natural hot baths are formed of the water of hot springs, of which there are many in different parts of the world; especially in those countries where there are or have evidently been volcanoes. The artificial hot baths consist either of water or of some other fluid made hot by art. The cold bath consists of water, either fresh or salt, in its natural degree of heat; or it may be made colder by art, as by a mixture of nitre, sal-ammoniac, &c. The chief hot baths in our country are those of Bath and Bristol, in Somersetshire; and those others of Buxton and Matlock, in Derbyshire; which latter, however, are rather warm or tepid than hot. The use of these baths is found beneficial in diseases of the head, as palsies, &c. in cuticular diseases, as leprosies, &c. obstructions and constipations of the bowels, the scurvy and stone, and in most diseases of women and children. The baths have performed many cures, and are commonly used as a last remedy in obstinate chronic diseases; where they succeed well, if they agree with the constitution of the patient: but whether they will agree or not, cannot be known without trial.

As to the origin of those hot waters, of which the natural hot baths are formed, we are very much in the dark. All that can be affirmed with certainty is, that where there are volcanoes, there also there are hot springs in great abundance; but how the heat of the volcano should be constantly communicated to the waters of a spring for many ages, during a great part of which the volcano itself has lain in a dormant state, seems almost beyond the reach of investigation. Another thing that creates a great difficulty is, that the fire of a volcano must certainly lie very deep in the earth, and most probably shifts from place to place; but the waters of a spring must always issue from a place situated lower than the origin of the spring itself. Besides, though we should suppose the water to come from the top of a volcano itself, and consequently boiling hot, it could not be supposed to percolate far through cold earth, without losing all the heat it acquired from the volcano. From some observations, however,

however, it certainly does appear, that there are some spots on the earth which have a power of producing heat within themselves, independent of any thing foreign; and that water is so far from being able to destroy this power, that it seems rather to promote and continue it. We know that water hath this effect upon a mixture of iron filings and sulphur; but whatever quantities of similar substances we may suppose to be contained in the earth, we must also suppose to be destroyed by one great confiagration soon after they have begun to act upon each other, so that by their means no lasting heat in waters could be produced. Dr Stukely indeed would solve this, and several other phenomena, by making the fire and smoke of volcanoes the effects of electricity: but here sufficient proof is wanting; for electricity, even in its most powerful state, is not very apt to set bodies on fire. The thought, however, deserves attention; for if electricity is capable of setting a volcano on fire, it is undoubtedly capable of producing solfaterras where it meets with proper materials, and from them springs of any degree of heat.

The cold bath is found one of the most universal and innocent remedies yet discovered, though still its use is not to be adopted without precautions.

Baths in vapour, the fume or steam of some decoction is received upon the body to promote a perspiration.—These are also by some called *Balnea Laconica.*

Vapour baths are, when the patient is not plunged into what is prepared for the bath, but only receives its steam upon those parts of his body which require it: as in some distempers of the fundament and womb, where the patient sits and receives the fumes of some proper fomentation, &c. To these may be added the bagnio; where people are made to sweat by the heat of a room, and pouring on of hot water; after which they generally go into a hot bath or bagnio.

A peculiar sort of vapour-bath was much used by the ancient Mexicans, and is still in use among the present Indians their descendants. According to the abbé Clavigero, these baths are built of raw bricks, and their form is similar to that of ovens for baking bread: but with this difference, that the pavement of the bath is a little convex, and lower than the surface of the earth; whereas that of most ovens is plain, and a little elevated for the accommodation of the baker. The greatest diameter of a bath is about eight feet, and its greatest height six. The entrance, like the mouth of an oven, is wide enough to allow a man to creep easily in. In the place opposite to the entrance there is a furnace of stone or raw bricks, with its mouth outwards to receive the fire, and a hole above it to carry off the smoke. The part which unites the furnace to the bath, and which is about two feet and a half square, is shut with a certain dry stone of a porous texture. In the upper part of the vault there is an air-hole, like that to the furnace. This is the usual structure of the temazcalli; but there are others that are without vault or furnace, mere little square chambers, yet well covered and defended from the air.—When any person goes to bathe, he first lays a mat within the temazcalli, a pitcher of water, and a bunch of herbs or leaves of maize. He then causes a fire to be made in the furnace, which is kept burning until the stones which join the bath and furnace are quite hot. The person who is to use the bath enters commonly naked, and generally accompanied for the sake of convenience, or on account of infirmity, by one of his domestics. As soon as he enters, he shuts the entrance close, but leaves the air-hole at top for a little time open, to let out any smoke which may have been introduced through the chinks of the stone; when it is all out he likewise stops up the air-hole. He then throws water upon the hot stones, from which immediately arises a thick steam to the top of the temazcalli. While the sick person lies upon the mat, the domestic drives the vapour downwards, and gently beats the sick person, particularly on the ailing part, with the bunch of herbs which are dipped for a little while in the water of the pitcher, which has then become a little warm. The sick person falls immediately into a soft and copious sweat, which is increased or diminished at pleasure, according as the case requires. When the evacuation desired is obtained, the vapour is let off, the entrance is cleared, and the sick person clothes himself, or is transported on the mat to his chamber; as the entrance to the bath is usually within some chamber of his habitation.—This sort of bath, called *temazcalli* by the natives, has been regularly used in several disorders, particularly in fevers occasioned by costiveness. The Indian women use it commonly after childbirth, and also those persons who have been stung or wounded by any poisonous animal. It is undoubtedly a powerful remedy for all those who have occasion to carry off gross humours; and certainly it would be most useful in Italy, where the rheumatism is so frequent and afflicting. When a very copious sweat is desired, the sick person is raised up and held in the vapour; as he sweats the more nearer he is to it. The temazcalli is so common, that in every place inhabited by the Indians there are many of them.

Baths, Dry, are those made of ashes, salt, sand, shreds of leather, and the like.—The ancients had divers ways of sweating by a dry heat; as by the means of a hot sand, stove-rooms, or artificial bagnios, and certain natural hot steams of the earth, received under a proper arch, or hot-house, as we learn from Celsus. They had also another kind of bath by insolation, where the body was exposed to the sun for some time, in order to draw forth the superfluous moisture from the inward parts; and to this day it is a practice in some nations to bury the body over with horse-dung, especially in chronical diseases, to digest and breathe out the humour that causes the distemper. In New England they make a kind of stoves of turf, wherein the sick are shut up to bathe or sweat.

The same name is sometimes also given to another kind of bath, made of kindled coals, or burning spirit of wine; the patient being placed in a convenient close chair for the reception of the fume, which rises and provokes sweat in a plentiful manner: care is here taken to keep the head out, and to secure respiration. This bath has been found very effectual in removing old obstinate pains in the limbs; and venereal complaints; and will often complete a cure left unperformed by salivation.

Some authors speak of bloody baths, *balnea sanguinolenta*,

Digitized by Google

nolenta, prepared especially of the blood of infants, anciently supposed to be a kind of specific for the leprosy.

Baths, Metalline, those made of water impregnated with the *scoriæ* of metals. The most common and useful of this kind are those prepared with the *scoriæ* of iron, which abound with the earthy, saline, and sulphureous substance of the metal; and these are of excellent service for strengthening and bracing up the part to which they are applied, and recovering weak and decayed limbs; stopping various kinds of bleeding; and restoring the menstrual and hemorrhoidal flux where obstructed; insomuch that they may well be substituted for the natural iron baths.

Adjacent to the smelting huts where metals are run from their ore, are to be found large quantities of the slag of copper, antimony, and cobalt, which abounding with sulphur, vitriolic salt, and an earthy principle, make serviceable baths for strengthening the lost tone of the fibres, and relaxing them when they are too stiff. These baths have likewise a detersive and cleansing virtue; so that with prudence, and due regard to circumstances, they may be used on many occasions. The way of making these artificial baths is, either to take the slags as they come hot from the furnace, or else to heat them afresh, and throw them into hot water; which is afterwards to be used either in the way of bath, or fomentation, occasionally. There are other artificial baths, prepared of alum and quicklime, by boiling them together in fine rain-water. Such baths are highly serviceable in paralytic disorders and weakness of the limbs.

The pepper bath, or peffer wasser, on the Alps, is one of the most celebrated in Europe, and has been the subject of particular treatises, besides what has been said of it occasionally by Scheuchzer and others. It was first discovered in the year 1240, and is of the periodical kind. The water breaks forth in a dreadful place, scarce accessible to the sunbeams, or indeed to men, unless of the greatest boldness, and such as are not in the least subject to dizziness. These baths have this singularity above all others, that they commonly break forth in May, and that with a sort of impetuosity, bringing with them beech leaves, crabs or other wood-fruit; and that their course desists in September or October. Scheuchzer professes himself of opinion, that these waters are not impregnated with any minerals, or, if they do contain any, that their virtues in curing distempers and preserving health do not proceed from them. They are exceedingly clear, destitute of colour, taste, or smell.

Baths, *Balnea*, in *Architecture*, denote large pompous buildings among the ancients, erected for the sake of bathing. Baths made a part of the ancient *gymnasia*, though they were frequented more for the sake of pleasure than health.

The most magnificent baths were those of Titus, Paulus Æmilius, and Dioclesian, of which there are some ruins still remaining. It is said that at Rome there were 856 public baths. Fabricius adds, that the excessive luxury of the Romans appeared in nothing more visible than in their baths. Seneca complains, that the baths of plebeians were filled from silver pumps; and that the freedmen trod on gems. Macrobius tells us of one Sergius Oratus, a voluptuary, who had pendant baths hanging in the air.

According to Dion, Mæcenas was the first who made a bath at Rome; yet there are instances of public baths prior to this; but they were of cold water, small, and poorly decorated. Agrippa, in his ædilate, built 160 places for bathing, where the citizens might be accommodated, either with hot or cold *gratis*. After this example, Nero, Vespasian, Titus, Domitian, Severus, Gordian, Aurelian, Maximian, Dioclesian, and most of the emperors who studied to gain the affections of the people, erected baths laid with the richest marble, and wrought according to the rules of the most delicate architecture. The rich had baths at home, and frequently very magnificent ones, especially after the time that the practice of pillaging the provinces had begun; but they only used them on extraordinary occasions. The great men, and even emperors themselves, sometimes bathed in public with the rest of the people. Alexander Severus was the first who allowed the public baths to be opened in the night-time during the heats of summer.

The Greek baths were usually annexed to *palestræ* or *gymnasia*, of which they were considered as a part. These baths consisted of seven different apartments, usually separated from each other, and intermixed with other buildings belonging to the other sorts of exercises. These were, 1st, The cold bath, *frigida lavatio*; 2dly, The *elæothesium*, or room where they were anointed with oil; 3dly, The *frigidarium*, or cooling room; 4thly, The *propnigeum*, or entrance of the *hypocaustum* or stove; 5thly, The vaulted room for sweating in, or vapour-bath, called *concamerata sudatio*, or *tepidarium*; 6thly, The *laconicum*, or dry stove; 7thly, The hot bath, called *callida lavatio*.

As for the baths separate from the *palestræ*, they appear to have been usually double, one for men, the other for women; but so near, that the same furnace heated both. The middle part was possessed by a large bason that received water by several pipes, and was surrounded by a balustrade, behind which there was an area for the reception of those who waited to use the bath. They were vaulted over, and only received light from the top.

In the Roman baths, the first part that appeared was a large bason, called κολυμβηθρα in Greek, and *natatio* or *piscina* in Latin. In the middle was the *hypocaustum*, which had a row of four apartments on each side, called *balnearia*: these were the stove, the bath, cold bath, and *tepidarium*. The two stoves, called *laconicum* and *tepidarium*, were circular and joined together. Their floor was hollow and suspended, in order to receive the heat of a large furnace, which was communicated to the stoves through the vacuities of their floor. This furnace also heated another room called *vasarium*, in which were three large brazen vessels called *milliaria*, respectively containing hot, warm, and cold water; which were so disposed, that the water might be made to pass by syphons and pipes out of one or other of them into the bath, in order to adjust its temperature. The description is given by Vitruvius. At three in the afternoon, which is what Pliny calls *hora octava et nona*, the Romans all repaired to the baths, either the public or the private ones: this

Digitized by Google

was called the *bath hour*, *hora balnei*, which in winter was at nine, in summer at eight. The public baths were all opened at the sound of a bell, and always at the same hour. Those who came too late, stood a chance for bathing in cold water.

They began with hot water; after which, as the pores were now opened, and might give room for too plentiful a perspiration, they thought it necessary for their health to close them again, either with the cold bath, or at least with a sprinkling of cold water. During the bath, the body was scraped with a kind of knives, or small strigils, such as are still found in the cabinets of the curious. After bathing succeeded unction and perfuming, from which they went fresh to supper.

The Romans, when they found their stomachs overcharged with meat, went to the bath, as we learn from Juvenal, who inveighs against those who, having gorged themselves with eating, were forced to go into the baths to give themselves relief. They found also that a bath was good to refresh themselves after some considerable fatigue or travel, as Celsus tells us; which makes Plautus say, that all the baths in this world were not sufficient to remove the weariness he felt. After Pompey's time, the humour of bathing was carried to great excess, by which many were ruined, several having brought themselves to such a pitch, that they could not bear food without bathing first. The emperor Titus is said to have lost his life thereby. Hence Pliny inveighs severely against those physicians who held, that hot baths digested the food. The emperor Hadrian first laid a restraint on the immoderate humour of bathing, by a public edict, prohibiting all persons to bathe before the eighth hour.

Baths of Agrippa, (*thermæ Agrippinæ*,) were built of brick, but painted in enamel: those of Nero, *thermæ Neronianæ*, were not only furnished with fresh water, but even had the sea brought into them: those of Caracalla were adorned with 200 marble columns, and furnished with 1600 seats of the same matter. Lipsius assures us they were so large, that 1800 persons might conveniently bathe in them at the same time. But the baths of Dioclesian, *thermæ Dioclesianæ*, surpassed all the rest in magnificence. One hundred and forty thousand men were employed many years in building them. Great part of these, as well as those of Caracalla, are still standing; and with the vast high arches, the beautiful and stately pillars, the extraordinary plenty of foreign marble, the curious vaulting of the roofs, the prodigious number of spacious apartments, and a thousand other ornaments, make one of the greatest curiosities of modern Rome.

Bath, in *Chemistry*. Several kinds of apparatus employed to transmit heat are called baths; but the substances most frequently used by chemists for this purpose are water and sand. When water is employed, it is called *Balneum Mariæ*, or *water bath;* which is very much used, very convenient for many operations, and may be employed successfully for all degrees of heat inferior to that of boiling water. As water, when exposed to fire in any vessel from which it can evaporate; does only receive a determinate degree of heat, which always remains the same when once it has arrived at the boiling heat, it follows, that by the water bath, a degree of heat always equal may be transmitted with certainty. Farther, this degree of heat being incapable of burning, or of communicating an empyreumatic quality to matters susceptible of it, the water bath has also the advantage of not exposing substances to this inconvenience. When vessels in which distillations and digestions are made, are placed in sand, then a sand bath is formed. This intermediate substance of sand is very convenient, to moderate the too great activity of the naked fire, and to transmit any degree of heat, from the weakest to a red heat. As this bath is attended with less trouble, and requires less apparatus than the water bath, it is much used in laboratories. Nothing is requisite for the sand bath, but an earthen or iron vessel full of fine sand, which is fitted into a furnace, and capable of containing the cucurbits, retorts, matrasses, or other vessels containing the matter to be operated upon.

Bath, in *Metallurgy*, is used to signify the fusion of metallic matter in certain operations. In refining or cupelling, for example, the metals are said to be in bath when they are melted. When gold is purified by antimony, this semi-metal, melted, is called by some the *bath of gold;* alchemists, who consider gold as the king of metals, call antimony the *bath of the king only;* because in fact gold only can resist the action of antimony.

Bath, in Hebrew antiquity, a measure of capacity, containing the tenth part of an omar, or seven gallons and four pints, as a measure for things liquid; or three pecks and three pints, as a measure for things dry.

Bath-Kol, the daughter of a voice. So the Jews call one of their oracles, which is frequently mentioned in their books, especially the Talmud; being a fantastical way of divination invented by the Jews themselves, though called by them a revelation from God's will, which he made to his chosen people, after all verbal prophecies had ceased in Israel. It was in fact a method of divination similar to the *sortes Virgilianæ* of the Heathens. For as, with them, the first words they happened to dip into, in the works of that poet, were a kind of oracle whereby they predicted future events; so with the Jews, when they appealed to Bath-kol, the first words they heard from any man's mouth were looked upon as a voice from heaven, directing them in the matter they inquired about. The Christians were not quite free from this superstition, making the same use of the book of the Scriptures as the Pagans did of the works of Virgil. It was practised by Heraclius, emperor of the east, in the beginning of the seventh century: for, being at war with Chosroes king of Persia, and in doubt, after a successful campaign, where to take up his winter quarters, he consulted the book of the scriptures in this way of divination, and was determined thereby. In France, it was the practice for several ages to use this kind of divination at the consecration of a bishop, in order to discover his life, manners, and future behaviour. This usage came into England with the Norman conquest; for we are told, that at the consecration of William, the second Norman bishop of the diocese of Norwich, the words which first occurred on dipping into the Bible were, *Not this man, but Barrabas:* soon after which, William died, and Herbert de Lozinga, chief simony broker to King William Rufus, succeeded him; at whose consecration the words at which the Bible opened were the same which

Digitized by Google

which Jesus spoke to Judas the traitor; *Friend, wherefore art thou come?* This circumstance so affected Herbert, that it brought him to a thorough repentance of his crime; in expiation of which he built the cathedral church of Norwich, the first stone of which he laid in the year 1096.

BATHA, BATH, or *Bachia*, a town of Hungary, and capital of a county of the same name, seated on the Danube. E. Long. 20. 40. N. Lat. 46. 40.

BATHING, the act of using or applying a bath; that is, of immerging the body, or part of it, in water or other fluid.

Bathing is a practice of great antiquity. The Greeks, as early as the heroic age, are said to have bathed themselves in the sea, in rivers, &c. We even find mention in Homer of hot baths in the Trojan times; but these seem to have been very rare, and only used on extraordinary occasions. Athenæus speaks of hot baths as unusual even in his age. In reality, public baths appear to have been discouraged, and even prohibited, by the ancient Greeks, who were contented to wash themselves at home in a sort of bathing tubs. The method of bathing among the ancient Greeks was, by heating water in a large vessel with three feet, and thence pouring it on the head and shoulders of the person seated in a tub for that purpose, who at coming out was anointed with oil.

The Romans were also long before they came into the use of baths; the very name of which, *thermæ*, shows they borrowed it from the Greeks. As the ancient Romans were chiefly employed in agriculture, their custom was, every evening after work, to wash their arms and legs, that they might sit down to supper with more decency: for it is to be observed, the use of linen was then unknown: and the people of that age went with their arms and legs bare, and consequently exposed to dust and filth. But this was not all; for every ninth day, when they repaired to the city, either to the nundinæ or to attend at the assemblies of the people, they bathed all over in the Tiber, or some other river which happened to be nearest them. This seems to have been all the bathing known till the time of Pompey, when the custom began of bathing every day. See BATH.

The Celtic nations were not without the use of bathing: the ancient Germans bathed every day, in warm water in winter, and in summer in cold. In England, the famous bath in Somersetshire is said by some to have been in use 800 years before Christ. Of this, however, it must be owned, we have but very slender evidence; but Dr Musgrave makes it probable that it was a place of considerable resort in Geta's time; there being still the remains of a statue erected to that general, in gratitude for some benefactions he had conferred upon it.

Although bathing, among the ancients, made, as it were, a part of diet, and was used as familiarly as eating or sleep; yet it was in high esteem among their physicians for the cure of diseases, as appears from Strabo, Pliny, Hippocrates, and Oribasius; whence frequent exhortations to washing in the sea, and plunging into cold water. The first instance of cold bathing, as a medicine, is Melampus's bathing the daughters of the king of Argos; and the first instance of warm bathing is Medea's use of it, who was said to boil people alive, because Pelias king of Thessaly died in a warm bath under her hands. The cold bath was used with success by Antonius Musa, physician to the emperor Augustus, for the recovery of that prince; but fell into neglect after the death of Marcellus, who was thought to have been destroyed by the improper use of it. It was again brought into request towards the close of the reign of Nero, by means of a physician of Marseilles named *Charmis;* but during the ignorance of the succeeding ages, the practice was again banished for a long time.—Both hot and cold bathing are now prescribed in many cases by the physicians, though they are not agreed as to the manner in which they operate on the human body. See MEDICINE *Index*.

Bathing among the Turks, as among the ancients, makes a part of diet and luxury; and in every town, and even village, there is a public bath. Indeed, the necessity of cleanliness, in a climate where one perspires so copiously, has rendered bathing indispensable; the comfort it produces preserves the use of it; and Mahomet, who knew its utility, has reduced it to a precept. Of these baths, and the manner of bathing, particularly at Cairo, the following account is given by M. Savary in his Letters on Egypt.

"The first apartment one finds in going to the bath, is a large hall, which rises in the form of a rotunda. It is open at the top, to give a free circulation to the air. A spacious estrade, or raised floor, covered with a carpet, and divided into compartments, goes round it, on which one lays one's clothes. In the middle of the building, a jet-d'eau spouts up from a bason, and agreeably entertains the eye. When you are undressed, you tie a napkin round your loins, take a pair of sandals, and enter into a narrow passage, where you begin to be sensible of the heat. The door shuts to; and at 20 paces off, you open a second, and go along a passage, which forms a right angle with the former. Here the heat increases. They who are afraid of suddenly exposing themselves to a stronger degree of it, stop in a marble hall, in the way to the bath properly so called. The bath is a spacious and vaulted apartment, paved and lined with marble, around which there are four closets. The vapour incessantly arising from a fountain and cistern of hot water, mixes itself with the burning perfumes. These, however, are never burnt except the persons who are in the bath desire it. They are mixed with the steam of the water, and produce a most agreeable effect.

"The bathers are not imprisoned here, as in Europe, in a sort of tub, where one is never at one's ease. Extended on a cloth spread out, the head supported by a small cushion, they stretch themselves freely in every posture, whilst they are wrapped up in a cloud of odoriferous vapours, which penetrate into all their pores. After reposing there some time, until there is a gentle moisture over the whole body, a servant comes, presses you gently, turns you over, and when the limbs are become supple and flexible he makes all the joints crack without any difficulty. He masses * and seems to knead the flesh without making you feel the smallest pain. This operation finished, he puts on a stuff glove, and rubs you a long time. During this operation, he detaches from the body of the patient, which is running with sweat, a sort of small scales, and removes even

* "Masser" comes from the Arabic verb *mass*, which signifies touching a delicate the masser.

Digitized by Google

the imperceptible dirt that stops the pores. The skin becomes soft and smooth like satin. He then conducts you into a closet, pours the lather of perfumed soap upon your head, and withdraws. The ancients did more honour to their guests, and treated them in a more voluptuous manner. Whilst Telemachus was at the court of Nestor, 'the beautiful Polycasta, the handsomest of the daughters of the king of Pylos, led the son of Ulysses to the bath; washed him with her own hands; and, after anointing his body with precious oils, covered him with rich habits and a splendid cloak.' Pisistratus and Telemachus were not worse treated in the palace of Menelaus. "When they had admired its beauties, they were conducted to basons of marble, where a bath was prepared: Beautiful female slaves washed them; and, after anointing them with oil, covered them with rich tunics and superb pellices.

"The closet to which one is conducted is furnished with a cistern and two cocks; one for cold and the other for hot water. There you wash yourself. Soon after the servant returns with a depilatory pomatum, which in an instant makes the hair fall off the places it is applied to. Both men and women make general use of it in Egypt. It is composed of a mineral called *rusma;* which is of a deep brown. The Egyptians burn it lightly, knead it with water, mixing it with half the quantity of slaked lime. This grayish paste applied to the hair, makes it fall off in two or three minutes, without giving the slightest pain.

"After being well washed and purified, you are wrapped up in hot linen, and follow the guide through the windings that lead to the outer apartment. This insensible transition from heat to cold prevents one from suffering any inconvenience from it. On arriving at the estrade, you find a bed prepared for you; and scarcely are you laid down before a child comes to press every part of your body with his delicate fingers, in order to dry you thoroughly. You change linen a second time, and the child gently grates the callosity of your feet with pumice stone. He then brings you a pipe and Moka coffee.

"Coming out of a stove where one was surrounded by a hot and moist fog, where the sweat gushed from every limb, and transported into a spacious apartment open to the external air, the breast dilates, and one breathes with voluptuousness. Perfectly massed, and as it were regenerated, one experiences an universal comfort. The blood circulates with freedom; and one feels as if disengaged from an enormous weight, together with a suppleness and lightness to which one has been hitherto a stranger. A lively sensation of existence diffuses itself to the very extremities of the body. Whilst it is lost in delicate sensations, the soul, sympathizing with the delight, enjoys the most agreeable ideas. The imagination, wandering over the universe, which it embellishes, sees on every side the most enchanting pictures, everywhere the image of happiness. If life be nothing but the succession of our ideas, the rapidity with which they then recur to the memory, the vigour with which the mind runs over the extended chain of them, would induce a belief that in the two hours of that delicious calm that succeeds the bath, one has lived a number of years."

Such are the baths, the use of which were so strongly recommended by the ancients, and which are still the delight of the Egyptians. It is by means of them that they prevent or dispel rheumatisms, catarrhs, and such cutaneous disorders as are produced by want of perspiration. Hence likewise they find a radical cure for that fatal evil which attacks the sources of generation, the remedy for which is so dangerous in Europe. By the same resource they get rid of that uncomfortable feeling so common to all nations who do not pay so much attention to the cleanliness of their bodies.—M. Tournefort, indeed, who had used steam baths at Constantinople, where there is less refinement in them than at Cairo, is of opinion that they injure the breast. But, according to M. Savary, this is an error which further experience would have corrected. There are no people who make more frequent use of them than the Egyptians, and there is no country where there are fewer asthmatic people. The asthma is scarcely known there.

The women are passionately fond of these baths. They frequent them at least once a-week, and take with them slaves properly qualified for the purpose. More luxurious than the men, they use rose-water. It is there that female head-dressers form their long black hair into tresses, which they mix with precious essences instead of powder and pomatum. It is there that they blacken the edge of their eye-lids, and lengthen their eye-brows with cohel, a preparation of tin burnt with gall-nuts; it is there they stain the finger and toe nails with the leaves of hennè, a shrub common in Egypt, and which gives them a golden colour. The linen and clothing they make use of are passed through the sweet steam of the wood of aloes; and when the work of the toilet is at an end, they remain in the outer apartment, and pass the day in entertainments. Females entertain them with voluptuous songs and dances, or tell them tales of love.

The medical effects of bathing are considered under the article BATHING, in the SUPPLEMENT.

BATHURST, RALPH, M. D. an eminent physician, poet, and divine, born in the year 1620. He studied divinity in Trinity college, Oxford; but the times of confusion coming on, he changed the course of his studies, and applied himself to physic. He took a doctor's degree in that faculty; in which he rose to such eminence, that he was in the time of the usurpation, appointed physician to the state. Upon the Restoration, he quitted his profession of physic; was elected a fellow of the Royal Society, and president of his college; and having entered into holy orders, he was made chaplain to the king, and afterwards dean of Wells. Soon after, he served the office of vice-chancellor of Oxford, and was nominated by King William and Queen Mary to the see of Bristol; which he refused to accept. His learning and talents were various. He was an orator, a philosopher, and a poet: he possessed an inexhaustible fund of wit, and was a facetious companion at 80 years of age. Ridicule was the weapon with which he used to correct the delinquents of his college; and he was so absolute a master of it, that he had it always at hand. His poetical pieces in the *Musæ Anglicanæ* are excellent in their kind. He wrote several poems, both in English and Latin; and died June 14. 1704, in the 84th year of his age.

BATHURST, *Allen*, earl of Bathurst, one of the last worthies

Digitized by Google

Bathurst. worthies of Queen Anne's reign, that shining period of triumphs, taste, genius, and elegance, was born in the year 1684. His studies and his education were equally conducive to the brilliant figure he was destined to make in social life and in the senate, as a polite scholar, a patriot, and a statesman. These talents he had an opportunity to display as early as the year 1705; when, at the request of his father Sir Benjamin Bathurst, and the solicitation of the constituents of Cirencester, he served in parliament for that borough, his native soil, with reputation and integrity. He distinguished himself particularly in the struggles and debates relative to the union between the two kingdoms, firmly supporting this measure, calculated to strengthen the vigour of government by its uniting force. Though he was contented to act a subordinate character in the great opposition planned by Mr Harley and Mr St John, his intimate friends, to sap the credit of the duke of Marlborough and his adherents, he was of infinite service to his party in arraigning, with spirit and eloquence, the conduct of the general and the earl of Godolphin, who had long governed the queen, and lavished the treasures of the nation on conquests more splendid than serviceable. The loss of the battle of Almanza seconded his efforts to dispel the intoxication of former successes. His personal regard for Lord Somers, president of the council, was never altered, though they were of different opinions in politics; and when he was divested of his office, Mr Bathurst acted with such tenderness and delicacy, as to preserve the esteem of Lord Somers in a private station. In consideration of his zeal and services, the queen advanced him, in 1711, to the dignity of a peer, by the title of Baron Bathurst, of Battlesden, in Bedfordshire.

His lordship continued to speak his sentiments with an undaunted freedom in the upper house; and stept forth as a formidable opponent to the court measures in the reign of George I. and during Sir Robert Walpole's administration. The acrimony of the prosecution carried on against the earl of Oxford, Lord Bolingbroke, and the duke of Ormond, stimulated his indignation and his eloquence against such vindictive proceedings; and he observed, "that the king of a faction was but the sovereign of half his subjects."

The South-sea scheme having infected the whole nation with a spirit of avaricious enterprise, the people awaked from their delirium, and an infinite number of families were involved in ruin. Lord Bathurst publicly impeached the directors, whose arts had enabled them by these vain expectations to amass surprising fortunes: he represented that the national honour was concerned in stripping them of their ill acquired wealth; and moved for having all the directors of the South-sea company punished by a forfeiture of their estates, for such a notorious act of sordid knavery.

When the bill was brought into the house of lords against Dr Atterbury bishop of Rochester, that learned prelate, who joined to the graces of style and elocution all the elegance of a just delivery; among the many friends, the bishop's eloquence, politeness, and ingenuity had procured him, was Lord Bathurt. He spoke against the bill with great vehemence and propriety; observing, "that if such extraordinary proceedings were countenanced, he saw nothing remaining for him and others to do, but to retire to their country-houses, and there, if possible, quietly enjoy their estates within their own families, since the least correspondence, or intercepted letter, might be made criminal." Then turning to the bishops, he said, he "could hardly account for the inveterate hatred and malice some persons bore the ingenious bishop of Rochester, unless it was that they were infatuated like the wild Americans, who fondly believe they inherit not only the spoils, but even the abilities, of the man they destroy." He was one of the lords who entered his protest against the bill.

His lordship was entirely averse to continental connections; and animadverted severely upon the monarch whose thoughts were turned to foreign concerns and alliances which could never be useful; complaining of the immense sums lavished in subsidies to needy and rapacious princes.

The directors of the charitable corporation having embezzled 500,000l. of the proprietors capital, Lord Bathurst declared in the house of lords, his abhorrence of this most iniquitous scene of fraud; asserting that not one shilling of the money was ever applied to the proper service, but became the reward of avarice and venality.

His lordship concurred, with all his power, in the opposition to Sir Robert Walpole, who now tottered on the brink of ruin. This minister, after obstinate struggles, having been forced to resign all his employments, Lord Bathurst was sworn of the privy council, and made captain of the gentlemen pensioners, which post he resigned in 1744. He was appointed treasurer to the present king, then prince of Wales, in 1757, and continued in the list of privy-counsellors at his accession to the throne; but, on account of his great age, he chose to enjoy *otium cum dignitate*.

Lord Bathurst's integrity gained him the esteem even of his opponents; and his humanity and benevolence, the affection of all that knew him more intimately. He added to his public virtues all the good breeding, politeness, and elegance, of social intercourse. Dr Freind, Congreve, Vanbrugh, Swift, Prior, Rowe, Addison, Pope, Arbuthnot, Gay, and most men of genius in his own time, cultivated his friendship, and were proud of his correspondence.

Pope, in his Epistle to him on the Use of Riches, thus addresses him:

> The sense to value riches, with the art
> T'enjoy them, and the virtue to impart;
> To balance fortune by a just expence,
> Join with economy magnificence;
> With splendor, charity; with plenty, health:
> O teach us, Bathurst, yet unspoil'd by wealth!
> That secret rare, between th' extremes to move,
> Of mad good nature, and of mean self-love.

And Sterne, in his letters to Eliza, thus speaks of him: "This nobleman is an old friend of mine: he was always the protector of men of wit and genius; and has had those of the last century always at his table. The manner in which his notice began of me, was as singular as it was polite.—He came up to me one day as I was at the princess of Wales's court. 'I want to know you, Mr Sterne; but it is fit you should know also who it is that wishes this pleasure: you have heard (continued he) of an old Lord Bathurst, of whom

Digitized by Google

whom your Popes and Swifts have sung and spoken so much: I have lived my life with geniuses of that cast, but have survived them; and despairing ever to find their equals, it is some years since I have closed my accounts, and shut up my books, with thoughts of never opening them again: but you have kindled a desire in me of opening them once more before I die, which I now do: so go home, and dine with me.' This nobleman, I say, is a prodigy: for at 85 he has all the wit and promptness of a man of 30; a disposition to be pleased, and a power to please others beyond whatever I knew! added to which, a man of learning, courtesy, and feeling."

His lordship, in the latter part of his life, preserved his natural cheerfulness and vivacity, always accessible, hospitable, and beneficent. Lately he delighted in rural amusements; and enjoyed, with a philosophical satisfaction, the shade of the lofty trees he had planted himself. Till within a month of his death he constantly rode out on horseback two hours before dinner, and constantly drank his bottle of claret or Madeira after dinner. He used to declare, in a jocose manner, he never could think of adopting Dr Cadogan's method, as Dr Cheyne had assured him, 50 years ago, he would never live seven years longer unless he abridged himself of his wine. Pursuant to this maxim, his lordship having, some years ago, invited several of his friends to spend a few cheerful days with him at his seat at Cirencester, and being one evening very loth to part with them; on his son the late chancellor's objecting to their sitting up any longer, and adding that health and long life were best secured by regularity, he suffered him to retire: but, as soon as he was gone, the cheerful father said, "Come, my good friends, since the old gentleman is gone to bed, I think we may venture to crack another bottle."

His lordship was advanced to the dignity of earl in 1772; and lived to see the above nobleman, his eldest son, several years lord high chancellor of Great Britain, and promoted to the peerage in 1771 by the title of Baron Apsley. Lord Bathurst married Catharine daughter of Sir Peter Apsley, by whom he had two other sons and five daughters. His death happened, after a few days illness, at his seat near Cirencester, in the 91st year of his age, and on the 16th of September 1775.

BATHYLLUS *and* PYLADES, inventors of pantomime entertainments on the stage. Bathyllus succeeded in representing comedy; Pylades in tragedy. The art consisted in expressing the passions by gestures, attitudes, and dumb show; not, as in modern times, in machinery, and the fooleries of Harlequin. They flourished at Rome, under Augustus, about A. D. 10. Each of them kept scholars, who perpetuated their master's name: for the followers of Bathyllus, who excelled in the comic part, called themselves *Bathylli;* and those of Pylades, who excelled in the tragic, called themselves *Pyladæ.*

BATILLUS, a musical instrument made of metal, in the form of a staff, furnished with metalline rings, which being struck, yielded a kind of harmonical sounds; used by the Armenians in their church-service.

BATIS. See BOTANY *Index.*

BATISTE, in commerce, a fine white kind of linen cloth, manufactured in Flanders and Picardy.

There are three kinds of batiste; the first very thin; the second less thin; and the third much thicker, called *Holland Batiste,* as coming very near the goodness of Hollands. They are used for neck-cloths, &c.

BATMAN, in commerce, a kind of weight used at Smyrna, containing six okes of 400 drams each, which amount to 16 pounds 6 ounces and 15 drams of English weight.

BATMANSON, JOHN, prior of the Carthusian monastery, or Charter-house, in the suburbs of London. He was some time a student at Oxford, but it does not appear that he took any degree in that university. He was intimately acquainted with Edward Lee archbishop of York, at whose request he wrote against Erasmus and Luther. He died in the year 1531, and was buried in the chapel belonging to the Charter-house. According to Bale, he was a proud forward person; and he says that Erasmus, in one of his letters to the bishop of Winchester, calls him an ignorant fellow. Pits, on the contrary, gives him the character of a man of singular genius, zeal, piety, and learning. He wrote, 1. *Animadversiones in annotationes Erasmi in Nov. Testamentum.* 2. A treatise against some of Luther's works. These two he afterwards retracted. 3. *Commentaria in proverbia Solomonis.* 4. *In cantica canticorum.* 5. *De unica Magdalena.* 6. *Institutiones noviciorum.* 7. *De contemptu mundi.* 8. *De Christo duodenni.* 9. On the words, *Missus est,* &c.

BATNEARS, or BATTIES, a people of the north of Hindostan. See SUPPLEMENT.

BATON, or BASTON. See BASTON.

BATRACHOMYOMACHIA, the battle of the frogs and the mice, the title of a fine burlesque poem generally ascribed to Homer.—The subject of the work is the death of Psycharpax, a mouse, son to Toxartes, who being mounted on the back of Physignathus, a frog, on a voyage to her palace, to which she had invited him, was seized with fear when he saw himself in the middle of the pond, so that he tumbled off and was drowned. Physignathus being suspected to have shaken him off with design, the mice demanded satisfaction, and unanimously declared war against the frogs.

BATTÆ, in *Ancient Geography,* a people of Germany, formerly inhabitants of what is now called *Hesse.* Being dissatisfied with their situation there, they settled on the island formed by the Vahalis and Rhine, which from them took the name of *Batavia,* or *Batavorum Insula.* Their government was a mixture of monarchy, aristocracy, and democracy. Their chief was, properly speaking, nothing more than a principal citizen, whose business was rather to advise than to command. The principal men who exercised jurisdiction, and commanded the troops, in their respective districts, were chosen, as well as the kings, in an assembly of the people. A hundred persons selected from among the people, presided over every county, and acted as chiefs in the different hamlets. The whole nation was, in some measure, an army always in readiness. Each family composed a body of militia, which served under a captain of their own choosing. See BATAVORUM *Insula.*

Digitized by Google

BATTALIA, an army ranged in order of battle, or ready for engagement. The word seems formed from the Latin *batualia*, sometimes also written *batalia*, denoting a sort of military or gladiatorial exercise, as fighting with foils, or tilting at a post. In this sense, we meet with the depth of a battalia; to march in battalia, with the baggage in the middle; to break the battalia, &c. In the Roman battalia, the *hastati* made the front.

BATTALION, a small body of infantry, ranged in form of battle, and ready to engage.

A battalion usually contains from 500 to 800 men; but the number it consists of is not determined. They are armed with firelocks, swords, and bayonets; and divided into 13 companies, one of which is grenadiers. They are usually drawn up three men deep. Some regiments consist of but one battalion, others are divided into four or five.

BATTATAS, the Indian name of the potato. See CONVOLVULUS.

BATTEL, a town of Sussex, five miles north-west of Hastings, situated in E. Long. 0. 35. N. Lat. 50. 55. It was formerly called *Epiton;* and is the place where William the Conqueror vanquished Harold king of England on October 14. 1066. William, in memory of this victory, erected an abbey, which he called *Battel Abbey;* and if a criminal could but reach this abbey, he was dismissed from thence, and was afterwards in no danger for his past faults. The abbey was a large and noble structure, as may be judged by the gateway which is still entire, as well as from the other remains. This place is noted for making gunpowder equal to that of Dantzick; and the best goes by the name of *Battel gunpowder*. Population in 1811, 2531.

BATTEL, in *Law*, or *Trial by wager of battle*, a species of trial of great antiquity, but now much disused. It seems to have owed its original to the military spirit of our ancestors, joined to a superstitious frame of mind; it being in the nature of an appeal to Providence, under an apprehension and hope (however presumptuous and unwarrantable), that Heaven would give the victory to him who had the right. The decision of suits, by this appeal to the God of battles, is by some said to have been invented by the Burgundi, one of the northern or German clans that planted themselves in Gaul. And it is true, that the first written injunction of judiciary combats that we meet with, is in the laws of Gundebal, A. D. 501, which are preserved in the Burgundian code. Yet it does not seem to have been merely a local custom of this or that particular tribe, but to have been the common usage of all those warlike people from the earliest times. And it may also seem, from a passage in Velleius Paterculus, that the Germans, when first they became known to the Romans, were wont to decide all contests of right by the sword: for when Quintilius Varus endeavoured to introduce among them the Roman laws and method of trial, it was looked upon (says the historian) as a *novitas incognitæ disciplinæ, ut solita armis decerni jure terminarentur*. And among the ancient Goths in Sweden we find the practice of judiciary duels established upon much the same footing as they formerly were in our own country.

This trial was introduced in England among other Norman customs by William the Conqueror; but was only used in three cases, one military, one criminal, and the third civil. The first in the court martial, or court of chivalry and honour; the second in appeals of felony; and the third upon issue joined in a writ of right, the last and most solemn decision of real property. For in writs of right the *jus proprietatis*, which is frequently a matter of difficulty, is in question; but other real actions being merely questions of the *jus possessionis*, which are usually more plain and obvious, our ancestors did not in them appeal to the decision of Providence. Another pretext for allowing it, upon these final writs of right, was also for the sake of such claimants as might have the true right, but yet by the death of witnesses or other defect of evidence be unable to prove it to a jury. But the most curious reason of all is given in the Mirror, that it is allowable upon warrant of the combat between David for the people of Israel of the one party, and Goliath for the Philistines of the other party: a reason which Pope Nicholas I. very seriously decides to be inconclusive. Of battel therefore on a writ of right we shall first speak: and although the writ of right itself, and of course this trial thereof, be at present disused; yet, as it is law at this day, it may be matter of curiosity, at least, to inquire into the forms of this proceeding, as we may gather them from ancient authors.

1. The last trial of battel that was waged in the court of common pleas at Westminster (though there was afterwards one in the court of chivalry in 1631, and another in the county palatine of Durham in 1638) was in the 13th year of Queen Elizabeth, A. D. 1571, as reported by Sir James Dyer; and was held in Tothill-fields, Westminster, "*non sine magna juris consultorum perturbatione*," saith Sir Henry Spelman, who was himself a witness of the ceremony. The form, as appears from the authors before cited, is as follows.

When the tenant in a writ of right pleads the general issue, viz. that he hath more right to hold than the demandant hath to recover; and offers to prove it by the body of his champion, which tender is accepted by the demandant; the tenant in the first place must produce his champion, who, by throwing down his glove as a gage or pledge, thus wages or stipulates battel with the champion of the demandant; who, by taking up the gage or glove, stipulates on his part to accept the challenge. The reason why it is waged by champions, and not by the parties themselves, in civil actions, is because, if any party to the suit dies, the suit must abate and be at an end for the present; and therefore no judgment could be given for the lands in question, if either of the parties were slain in battel: and also that no person might claim an exemption from this trial, as was allowed in criminal cases where the battel was waged in person.

A piece of ground is then in due time set out, of 60 feet square, enclosed with lists, and on one side a court erected for the judges of the court of common pleas, who attend there in their scarlet robes; and also a bar is prepared for the learned serjeants at law. When the court sits, which ought to be by sunrising, proclamation is made for the parties and their champions; who are introduced by two knights, and are dressed in a coat of armour, with red sandals, barelegged from the knee downwards, bareheaded, and with bare arms to the elbows. The weapons allowed them are only batons, or

Digitized by Google

Battel or staves, of an ell long, and a four-cornered leather target; so that death very seldom ensued this civil combat. In the court military, indeed, they fought with sword and lance, according to Spelman and Rushworth; and likewise in France: only villains fought with buckler and baton, gentlemen armed at all points. And upon this, and other circumstances, the president Montesquieu had with great ingenuity not only deduced the impious custom of private duels upon imaginary points of honour, but hath also traced the heroic madness of knight-errantry from the same original of judicial combats. But to proceed:

When the champions, thus armed with batons, arrive within the lists or place of combat, the champion of the tenant then takes his adversary by the hand, and makes oath that the tenements in dispute are not the right of the demandant; and the champion of the demandant, then taking the other by the hand, swears in the same manner that they are; so that each champion is, or ought to be, thoroughly persuaded of the truth of the cause he fights for. Next an oath against sorcery and enchantment is to be taken by both the champions, in this or a similar form: "Hear this, ye justices, that I have this day neither ate, drank, nor have upon me either bone, stone, nor grass; nor any enchantment, sorcery, or witchcraft, whereby the law of God may be abased, or the law of the devil exalted. So help me God and his saints."

The battel is thus begun, and the combatants are bound to fight till the stars appear in the evening: and, if the champion of the tenant can defend himself till the stars appear, the tenant shall prevail in his cause; for it is sufficient for him to maintain his ground, and make it a drawn battel, he being already in possession; but, if victory declares itself for either party, for him is judgment finally given. This victory may arise from the death of either of the champions: which indeed hath rarely happened; the whole ceremony, to say the truth, bearing a near resemblance to certain rural athletic diversions, which are probably derived from this original. Or victory is obtained if either champion proves *recreant*, that is, yields, and pronounces the horrible word of *craven*: a word of disgrace and obloquy, rather than of any determinate meaning. But a horrible word it indeed is to the vanquished champion; since, as a punishment to him for forfeiting the land of his principal by pronouncing that shameful word, he is condemned as a recreant, *amittere liberam legem*, that is, to become infamous, and not to be accounted *liber et legalis homo*; being supposed by the event to be proved forsworn, and therefore never to be put upon a jury, or admitted as a witness in any cause.

This is the form of a trial by battel; a trial which the tenant, or defendant in a writ of right, has it in his election at this day to demand; and which was the only decision of such writ of right after the Conquest, till Henry II. by consent of parliament, introduced the *grand assise*, a peculiar species of trial by jury, in concurrence therewith; giving the tenant his choice of either the one or the other. Which example, of discountenancing these judicial combats, was imitated about a century afterwards in France, by an edict of Louis the Pious, A. D. 1260, and soon after by the rest of Europe. The establishment of this alternative, Glanvil, chief justice to Henry II. and probably his adviser herein, considers as a most noble improvement, as in fact it was, of the law.

2. In appeal * of felony, the trial by battel may be demanded, at the election of the appellee, in either an appeal or an improvement; and it is carried on with equal solemnity as that on a writ of right; but with this difference, that there each party hires a champion, but here they must fight in their proper persons. And, therefore, if the appellant or approver be a woman, a priest, an infant, or of the age of 60, or lame, or blind, he or she may counterplead and refuse the wager of battel; and compel the appellee to put himself upon the country. Also peers of the realm, bringing an appeal, shall not be challenged to wage battel, on account of the dignity of their persons; nor the citizens of London, by special charter, because fighting seems foreign to their education and employment. So likewise, if the crime be notorious; as if the thief be taken with the *mainour*, or the murderer in the room with a bloody knife, the appellant may refuse the tender of battel from the appellee; and it is unreasonable an innocent man should stake his life against one who is already half-convicted.

* See *Appeal*.

The form and manner of waging battel upon appeals are much the same as upon a writ of right; only the oaths of the two combatants are vastly more striking and solemn. The appellee, when appealed of felony, pleads *not guilty*; and throws down his glove, and declares he will defend the same by his body: the appellant takes up the glove; and replies that he is ready to make good the appeal, body for body. And thereupon, the appellee taking the book in his right hand, and in his left the right hand of his antagonist, swears to this effect: *Hoc audi, homo, quem per manum teneo*, &c. "Hear this, O man, whom I hold by the hand, who callest thyself *John* by the name of baptism, that I, who call myself *Thomas* by the name of baptism, did not feloniously murder thy father, *William* by name, nor am any way guilty of the said felony. So help me God, and the saints; and this I will defend against thee by my body, as this court shall award." To which the appellant replies, holding the Bible and his antagonist's hand in the same manner as the other: "Hear this, O man, whom I hold by the hand, who callest thyself *Thomas*, by the name of baptism, that thou art perjured; and therefore perjured, because that thou feloniously didst murder my father, *William* by name. So help me God, and the saints; and this I will prove against thee by my body, as this court shall award." The battel is then to be fought, with the same weapons, viz. batons, the same solemnity, and the same oath against amulets and sorcery, that are used in the civil combat: and if the appellee be so far vanquished that he cannot or will not fight any longer, he shall be adjudged to be hanged immediately; and then, as well as if he be killed in battel, Providence is deemed to have determined in favour of the truth, and his blood shall be attainted. But if he kills the appellant, or can maintain the fight from sunrising till the stars appear in the evening, he shall be acquitted. So also, if the appellant becomes recreant, and pronounces the horrible word *craven*, he shall lose his *liberam legem*, and become infamous; and the appellee shall recover his damages, and also be for ever quit, not only

Digitized by Google

only of the appeal, but of all indictments likewise for the same offence.

BATTEN, a name that workmen give to a scantling of wooden stuff, from two to four inches broad, and about one inch thick; the length is pretty considerable, but undetermined.—This term is chiefly used in speaking of doors and windows of shops, &c. which are not framed of whole deal, &c. with stiles, rails, and pannels like wainscot; but are made to appear as if they were by means of these battens braded on the plain board round the edges, and sometimes cross them, and up and down.

BATTENBURG, a town of Dutch Guelderland, seated on the north bank of the Meuse, almost opposite to Ravenstein. E. Long. 5. 35. N. Lat. 50. 55.

BATTERING, the attacking a place, work, or the like, with heavy artillery.

To batter in breach, is to play furiously on a work, as the angle of a half-moon, in order to demolish and make a gape therein. In this they observe never to fire a piece at the top, but all at the bottom, from three to six feet from the ground.

The battery of a camp is usually surrounded with a trench, and pallisadoes at the bottom, with two redoubts on the wings, or certain places of arms, capable of covering the troops which are appointed for their defence. See BATTERY.

BATTERING-Ram, in antiquity, a military engine used to batter and beat down the walls of places besieged. It is said to have been invented by Artemanes of Clazomene, a Greek architect who flourished 441 B. C.—The machine is thus described by Josephus: It is a vast beam, like the mast of a ship, strengthened at the one end with a head of iron, something resembling that of a ram, whence it took its name. This was hung by the middle with ropes to another beam, which lay across two posts; and hanging thus equally balanced, it was by a great number of men drawn backwards and pushed forwards, striking the wall with its iron head. But this engine did most execution when it was mounted on wheels, which is said to have been first done at the siege of Byzantium under Philip of Macedon.

Plutarch informs us, that Mark Antony, in the Parthian war, made use of a ram fourscore feet long: and Vitruvius tells us, that they were sometimes 106, and sometimes 120, feet in length; and to this perhaps the force and strength of the engine was in a great measure owing. The ram was managed at one time by a whole century of soldiers; and they being spent, were seconded by another century, so that it played continually without any intermission.

Plate LXXXVIII. fig. 1. represents the battering-ram suspended. 2. The ram. 3. The form of its head, fastened to the enormous beam by three or four bands of iron, four feet in breadth. At the extremity of each of these bands (4) was a chain (5) of the same metal, one end of which was fastened to a hook (6), and at the other extremity of each of these chains was a cable firmly bound to the last link. These cables ran the whole length of the beam to the end of the ram (7), where they were all bound together as fast as possible with small ropes. To the end of these cables another was fixed, composed of several strong cords plaited together to a certain length, and then running single (8). At each of these several men were placed, to balance and work the machine. 10. The chain or cable by which it hung to the cross beam (11), fixed on the top of the frame. 12. The base of the machine.—The unsuspended ram differed from this only in the manner of working it: for instead of being slung by a chain or cable, it moved on small wheels on another large beam.

BATTERING-Rams, in *Heraldry*, a bearing or coat of arms resembling the military engine of the same name.

BATTERY, in the military art, a parapet thrown up to cover the gunners and men employed about the guns from the enemy's shot. This parapet is cut into embrasures, for the cannon to fire through. The height of the embrasures on the inside is about three feet; but they go sloping lower to the outside. Their wideness is two or three feet, but open to six or seven on the outside. The mass of earth that is betwixt two embrasures, is called the *merlon*. The platform of a battery is a floor of planks and sleepers, to keep the wheels of the guns from sinking into the earth; and is always made sloping towards the embrasures, both to hinder the reverse, and to facilitate the bringing back of the gun.

BATTERY of Mortars differs from a battery of guns; for it is sunk into the ground, and has no embrasures.

Cross-BATTERIES, are two batteries which play athwart one another upon the same object, forming there an angle, and beating with more violence and destruction; because what one bullet shakes, the other beats down.

BATTERY, Sunk or *Buried*, is when its platform is sunk or let down into the ground, so that there must be trenches cut in the earth, against the muzzles of the guns, for them to fire out at, and to serve for embrasures.

BATTERY d'Enfilade, is one that sweeps or scours the whole length of a straight line.

BATTERY en Echarpe is that which plays obliquely.

BATTERY de Reverse, that which plays upon the enemy's back.

Camerade BATTERY, is when several guns play at the same time upon one place.

BATTERY, in *Law*, is the unlawful beating of another. The least touching of another's person wilfully, or in anger, is a battery, for the law cannot draw the line between different degrees of violence, and therefore totally prohibits the first and lowest stage of it; every man's person being sacred, and no other having a right to meddle with it, in any the slightest manner. And therefore, upon a similar principle, the Cornelian law *de injuriis* prohibited *pulsation* as well as *verberation*; distinguishing verberation, which was accompanied with pain, from pulsation which was attended with none. But battery is in some cases justifiable or lawful; as where one who hath authority, a parent or master, gives moderate correction to his child, his scholar, or his apprentice. So also on the principle of self-defence: for if one strikes me first, or even only assaults me, I may strike in my own defence; and if sued for it, may plead *son assault demesne*, or that it was the plaintiff's own original assault that occasioned it. So likewise in defence of my goods or possession, if

Digitized by Google

if a man endeavours to deprive me of them, I may justify laying hands upon him to prevent him; and in case he persists with violence, I may proceed to beat him away. Thus too in the exercise of an office, as that of church warden or beadle, a man may lay hands upon another to turn him out of church, and prevent his disturbing the congregation. And if sued for this or the like battery, he may set forth the whole case, and plead that he laid hands upon him gently, *molliter manus imposuit*, for this purpose. On account of these causes of justification, battery is defined to be the unlawful beating of another; for which the remedy is, as for assault, by action of *trespass vi et armis*: wherein the jury will give adequate damages.

BATTISTA, Franco, a celebrated painter, born at Venice, was one of the disciples of Michael Angelo, whose manner he followed so closely, that, in the correctness of his outlines, he surpassed most of the masters of his time. His paintings are pretty numerous, and dispersed all over Italy and other parts of Europe; but his colouring being very dry, they are not much more esteemed than the prints etched by his hand. He died in 1561.

BATTLE, a general engagement between two armies in a country sufficiently open for them to encounter in front and at the same time (see War). The word is also written *battel*, *battell*, and *battail*. It is formed from the French *battaille*, of the Latin verb *batuere*, to *fence* or *exercise with arms*: whence *batualia* and *batalia*, which properly denoted the action or exercise of those who learned to fence, and who were hence also denominated *batuatores*.

The ancients never joined battle without much ceremony and preparation; as taking auguries, offering sacrifice, haranguing the soldiers, giving the word or a *tessera*, &c. The signals of battle were, sounding the *classicum* or general charge, and displaying a peculiar flag, called by Plutarch a *purple robe*. To which may be added, singing pæans, raising military shouts, and the like. A Roman legion, ranged in order of battle, consisted of *hastati*, placed in the front; of *principes*, who were all old experienced soldiers, placed behind the former; and of *triarii*, heavy armed with large bucklers, behind the *principes*. The *hastati* were ranked close; the ranks of the *principes* were much opener, so that they could receive the *hastati;* and those of the *triarii* opener still, insomuch that they could receive both the *principes* and the *hastati* within them, without any disorder, and still facing the enemy. When therefore the *hastati* found themselves unable to stand the enemy's charge, they retired gently within the *principes*, where joining with them they renewed the combat. If these found themselves too weak to sustain the enemy, both retired among the *triarii*, where rallying, they formed a new corps, and charged with more vigour than ever. If these failed, the battle was lost: the Romans had no farther resource. The moderns are unacquainted with this method of inserting or embattling one company into another; without which the former cannot be well succoured or defended, and their places taken by others; which was a thing the Romans practised with great exactness. For the *velites*, and in latter times the archers and slingers, were not drawn up in this regular manner, but either disposed of before the front of the *hastati*, or scattered up and down among the void spaces of the *hastati*, or sometimes placed in two bodies in the wings. These always began the combat, skirmishing in flying parties with the foremost troops of the enemy. If they were repulsed, which was usually the case, they fell back to the flanks of the army, or retired again in the rear. When they retired, the *hastati* advanced to the charge. As to the cavalry, it was posted at the two corners of the army, like the wings on a body; and fought sometimes on foot, sometimes on horseback. The auxiliary forces composed the two points of the battle, and covered the whole body of the Romans.—Other less usual forms of battle among the Romans were the *cuneus*, or wedge; *globus*, or round form; *forfex*, or pair of sheers; *turris*, or an oblong square figure; *serra*, or saw. The Greeks were inferior to the Romans in marshalling their armies for battle, as they drew up their whole army in a front, and trusted the success of the day to a single force. They had three forms of battle for the horse, viz. the square, the wedge, and the rhombus or diamond form. The first held best for the defensive; the latter for the offensive; the wedge being preferred as bringing most hands to fight.

The Greeks notified the places of their battles and victories by adding the word Νικη; whence Nicomedia Nicopolis, Thessalonica, &c. The ancient Britons did the like, by adding the word *mais;* whence Maisseveth, Malmaisbury, &c. The English by the word *field*.—The Romans had their particular days, called *præliares dies*, in which alone it was lawful to join battle, and others wherein it was unlawful, called *dies atri*. The Athenians, by the ancient laws of their country, were not to draw out their forces for battle till after the seventh day of the month: And Lucian relates of the Lacedæmonians, that by the laws of Lycurgus, they were not to fight before full moon. Among the Germans, it was reputed an impiety to fight in the wane of the moon; and Cæsar tells us, that Ariovistus was beaten by him, because, contrary to the laws of his country, he had fought when the moon was in her wane. The German soldiers were intimidated with the apprehension, and afforded Cæsar an easy victory; *acie commissa, impeditos religione hostes vicit*. It is well known that Jerusalem was taken by Pompey in an attack on the Sabbath-day, when by the Jewish superstitious notions, they were not allowed to fight, or even to defend themselves. The Romans did not carry their superstition so far: their *atri dies* were only observed in respect of attacking; no day was too holy for them to defend themselves in. Among the ancients, we find frequent instances of battles in the night; it was by the moonlight that Pompey beat Mithridates, and Scipio Asdrubal and Syphax.

The first pitched battle, of which we have any distinct account is, that between Crœsus and Cyrus, described by Xenophon, concerning which we have a dissertation expressly by M. Freret, wherein several points of the ancient tactics are well explained. In the modern war, we find few pitched or set battles; the chief view of the great commanders of late days is rather to harass or starve the enemy by frequent alarms, cutting off his provisions, carrying off his baggage, seizing his posts, &c. than to join issue with him, and put the whole on the event of one day; a battle generally deciding the fate of a campaign, sometimes of a whole war. Hence it is a rule never to venture a general

Digitized by Google

neral battle, unless either you fight to advantage, or be forced to it. Joining or giving battle should always be by design: a general should never suffer himself to be forced to fight. All the measures, movements, encampments, he makes, are to lead to the execution of his great design, which is to fight to advantage, till by some mistake of the enemy, he at length find the favourable opportunity. It is in this that a superior genius will at length prevail over an inferior: in the course of a campaign, he will take a number of advantages over him, which together are equivalent to a battle, the event of which is ever doubtful.

Battle-Axe, an ancient military weapon. Axes were a principal part of the offensive armour of the Celtæ. At the siege of the Roman Capitol by the Gauls under Brennus, we find one of the most distinguished of their warriors armed with a battle-axe. And Ammianus Marcellinus, many centuries afterwards, describing a body of Gauls, furnishes them all with battle-axes and swords. Some of these weapons have been found in the sepulchres of the Britons, on the downs of Wiltshire, and in the north of Scotland. Within these four or five centuries the Irish went constantly armed with an axe. At the battle of Bannockburn, King Robert Bruce clave an English champion down to the chine, at one blow, with a battle-axe. The axe of Lochaber hath remained a formidable implement of destruction in the hands of our Highlanders, even nearly to the present period; and it is still used by the city-guard of Edinburgh in quelling mobs, &c.

BATTLEMENTS, in *Architecture*, are indentures or notches in the top of a wall or other building, in the form of embrasures, for the sake of looking through them.

BATTOLOGY, in *Grammar*, a superfluous repetition of some words or things.

BATTON, in merchandise, a name given to certain pieces of wood or deal for flooring or other purposes.

BATTORY, a name given by the Hans Towns to their magazines or factories abroad. The chief of these Battories are those at Archangel, Novogorod, Berghmen, Lisbon, Venice, and Antwerp.

BATUA, Butua, *Buthoe*, or *Buthoece*, in *Ancient Geography*, a town of Dalmatia, situated on the Adriatic; now *Budoa*; which see.

BATTUS, an order of penitents at Avignon and in Provence, whose piety carries them to exercise severe discipline upon themselves both in public and private.

BATZ, a copper coin mixed with some silver, and current at different rates, according to the alloy in Nuremberg, Basil, Fribourg, Lucerne, and other cities of Germany and Switzerland.

BAVARIA, formerly a duchy and electorate, but now a kingdom of Germany. Bavaria has experienced a great variety of changes within the last twenty years. She received a considerable accession of territory at the settling of the German indemnities in 1802, consisting of the bishoprics of Freysingen, Bamberg, Augsburg, and Kempten, ten abbeys, fifteen imperial towns, and some other small districts, which were given as an equivalent for the palatinate of the Rhine, the duchies of Juliers, and Deux Ponts, and other possessions in the Netherlands. He assumed at the same time the title of duke of Franconia. The duke having still adhered to the French, Bonaparte raised him in 1806 to the kingly dignity, and on this occasion, and afterwards at the peace in 1809, enlarged his dominions at the expence of Austria. When the fortune of the war changed in 1813, Bavaria, like others of the small powers, endeavoured to secure the advantages he had gained by entering into terms with the stronger party; and at the peace of Paris in 1814 he was allowed to keep the greater part of his new acquisitions, restoring to Austria Saltzburg and Bertholsgaden, with the parts of the Tirol and of the Hansruck formerly ceded to him. He obtained then also the greater part of what was formerly denominated the palatinate of the Rhine, with the grand duchy of Wurtsburg. The whole kingdom of Bavaria at present embraces an area of 30,000 square English miles, and had a population of 3,560,000 in 1818. The revenue of Bavaria in the same year was estimated at 1,900,000l. sterling; and the contingent of troops which it is bound to furnish to the German confederation is 35,600. About one-fourth or one-fifth of the inhabitants are Lutherans, the rest Catholics, with a small number of Calvinists and Jews. The Catholics were formerly distinguished by their bigotry and intolerance; but a great reformation has taken place in this and many other points since the present king ascended the throne. The greatest proportion of the numerous monasteries have been suppressed, and a part of the funds employed in endowing schools and academies. To crown these advantages, the king gave the nation a representative constitution in 1818; and Bavaria, which was lately the stronghold of ignorance and superstition, now bids fair to outstrip all her neighbours in the career of improvement. Munich is the capital. The country is fertile, but mountainous, and has mines of salt, coal, iron, and lead. Its vegetable productions are extremely various, and include chesnuts, Indian corn, and vines. Vast numbers of cattle are raised in the southern parts, and in the north there are considerable manufactures.

The house of Bavaria is universally allowed to be one of the most ancient in Germany. The counts of Scheyren, whose castle at present is a cloister, gave them the name. At that place are shown the tombs of more than 26 lords of Scheyren. The emperor Otho I. established as counts-palatine of Bavaria and landgraves of Scheyren, Arnolph and Herman, sons of Arnolph brother to the duke of Berchtold of Carinthia, marquis of the county upon the Ens. After the death of Berchtold, the same emperor, instead of giving Bavaria to his son, gave it to Duke Henry his brother, who had married Judith sister to Arnolph and Herman. This Duke Henry of Bavaria had by his marriage Henry Hezillon, who was succeeded by his son Henry, afterwards chosen emperor by the name of Henry II. This emperor having no children by Saint Conegond his wife, Bavaria passed again to the family of Franconia, and afterwards to that of Suabia under Henry IV. who possessed it till the year 1071, when this last emperor gave that county to Count Wolf, or Guelph, of Ravensburg in Suabia. To this Guelph, who died in the island of Cyprus, succeeded Guelph II. and to him his brother Duke Henry IX. who was succeeded by his son Henry the Proud. This last had married the only daughter of the emperor Lotharius, and after the death of his father-in-law became also duke of Saxony; but refusing to deliver up the imperial ornaments of his father-in-law to the emperor Conrad III. duke of Suabia,

bia, or to acknowledge him for emperor, he was put to the ban of the empire, and lost his states. After the death of Henry, Conrad made his brother Leopold marquis of Austria and duke of Bavaria; who, dying without issue, was succeeded by his brother Henry XI. whom the emperor Frederic I. made duke of Austria, joining together the two counties above and below the Ens, and declaring them free and independent of the government of Bavaria. The same emperor gave Bavaria thus dismembered, with Saxony, to Henry the Lion, son of Henry the Proud. But Henry the Lion afterwards losing the favour of this emperor, was put to the ban of the empire: and lost all his possessions except Brunswick and Lunenburg, which still remain to his descendants. In 1180, the duchy of Bavaria was given by the emperor to Otho the landgrave of Wittelsbach, count-palatine of the house of Bavaria. In the time of this Otho, the castle of Scheyren was changed into a monastery, in which the duke was buried. From him are descended the two great families that remain to this day in Germany; viz. the counts-palatine of the Rhine, and the electors, now kings of Bavaria. Prince Eugene Beauharnois, stepson to Bonaparte, is married to a princess of this family. See Bavaria, Supplement.

BAVAY, a small town of the late province of Hainault, now the department of the North, in France, which has been often ruined by the wars of the Low Countries. It was taken by the Austrians in 1792, but retaken the same year. E. Long. 3. 45. N. Lat. 50. 25.

BAUCIS, in fabulous history, an old woman who lived with Philemon her husband in a cottage in Phrygia. Jupiter and Mercury travelling over that country, were well received by them, after having been refused entertainment by every body else. To punish the people for their inhumanity, these gods laid the country waste with water; but took Baucis and Philemon with them to the top of a mountain, where they saw the deluge, and their own little hut above the waters turned into a temple. Having a wish granted them, they desired to officiate in this temple as priest and priestess, and also that they might die both together; which was granted them.

BAUCONICA, in *Ancient Geography*, a town of the Vangiones in Gallia Belgica; nine miles from Mogontiacum, and eleven from Borbitomagum; and therefore supposed to be *Oppenheim*, a town in the palatinate of the Rhine, and situated on that river.

BAUDELOT, Charles Cæsar, a learned advocate in the parliament of Paris, distinguished himself by his skill in ancient monuments, and was received into the Academy of Belles Lettres in 1705. He wrote a Treatise on the Advantages of Travelling; many Letters and Dissertations on Medals, &c.; and died in 1722, aged 74.

BAUDIER, Michael, a gentleman of Languedoc, lived in the reign of Louis XIII. and published several books, which procured him the character of a copious and laborious author; among which are, 1. An Inventory of the General History of the Turks. 2. The History of the Seraglio. 3. That of the Religion of the Turks. 4. That of the Court of the King of China. 5. The Life of Cardinal Ximenes, &c.

BAUDIUS, Dominic, professor of history in the university of Leyden, born at Lisle the 8th of August 1561. He began his studies at Aix-la-Chapelle, and continued them at Leyden. He removed from thence to Geneva, where he studied divinity. After residing here some time, he returned to Ghent, and from thence to Leyden, where he applied to the civil law, and was admitted doctor of law in June 1585. Soon after his admission, he accompanied the ambassadors from the States to England; and during his residence here became acquainted with several persons of distinction, particularly the famous Sir Philip Sidney. He was admitted advocate at the Hague the 5th of January 1587; but being soon tired of the bar, went to travel in France, where he remained 10 years. He was much esteemed in that kingdom, and gained many friends there. Achilles de Harlai, first president of the parliament of Paris, got him to be admitted advocate of the parliament of Paris in the year 1592. In 1602, he went to England with Christopher de Harlai, the president's son, who was sent ambassador to the court of London by Henry the Great. This same year Baudius having been named professor of eloquence at Leyden, went and settled in that university. He read lectures on history after the death of Morula, and was permitted also to do the same on the civil law. In 1611, the States conferred upon him the office of historiographer in conjunction with Meursius; and in consequence thereof he wrote The History of the Truce. Baudius is an elegant prose writer, as appears from his letters, many of which were published after his death. He was also an excellent Latin poet. The first edition of his poems was printed in the year 1587: they consist of verses of all the different measures. He published separately a book of iambics in 1591, dedicated to Cardinal Bourbon. Some of his poems he dedicated to the king of England; others to the prince of Wales, in the edition of 1607, and went over to England to present them. He died at Leyden in 1613.

BAUDOBRIGA, in *Ancient Geography*, a town of the Treviri in Germany; now *Boppart*, in the electorate of Triers. See Boppart.

BAUDRAND, Michael Anthony, a celebrated geographer, born at Paris July 18. 1633. He travelled into several countries; and then applied himself to the revisal of Ferrarius's Geographical Dictionary, which he enlarged by one half. He wrote, 1. Notes to Papirius Masso's description of the Rivers of France. 2. A Geographical and Historical Dictionary. 3. Christian Geography, or an Account of the Archbishoprics and Bishoprics of the whole world; and made several maps. He died at Paris, May 29. 1700.

BAUGE, a drugget manufactured in Burgundy, with thread spun thick and coarse wool.

Bauge, a small town of Anjou, in France, in the department of Maine and Loire, seated on the river Coesnon. E. Long. 0. 10. N. Lat. 47. 30.

BAUHIN, John, a distinguished botanist, was born at Lyons in the year 1541. He was the son of an eminent physician who quitted France, his native country, on account of religion, and settled at Basil. In early life he travelled with Gesner, the celebrated naturalist, and collected plants in the Alps, in France, and Italy, for the purpose of the great botanical work which he afterwards accomplished. He practised medicine first at Basil, where he was also elected profes-

Digitized by Google

Bauhin.

sor of rhetoric in 1566. He resided some time at Yverdun; and was afterwards invited to be physician to the duke of Wirtemberg at Montbelliard, and in this situation he spent the remaining forty years of his life. He devoted his studies chiefly to botany, on which he bestowed great labour, comparing authors ancient and modern with each other, and with nature, and collecting information from all quarters. He likewise prosecuted other branches of natural history, and published an account of "Medicinal Waters throughout Europe," and especially in the duchy of Wirtemberg; and a particular account of the mineral spring of Boll, and the natural history of the place. His great work on plants was not completed at his death, which happened in 1613. A society at Yverdun published in 1619 the *Prodromus* of it; but it was not till 1650 and 1651 that the work itself appeared in three vols. fol. entitled *Historia Plantarum nova et absolutissima, cum auctorum consensu et dissensu circa eas.* Bauhin's son-in-law, Henry Cherler, was also a contributor to the work. This is a great performance; and, with all its defects, has been pronounced by Haller to be without an equal. The plants are numerous, generally well described and discriminated, and many new species are added. It is still considered as a standard work; and the names of John Bauhin and his brother rank high among the founders and first promoters of botanical science.

Bauhin, *Gaspard*, brother of the former, was born in 1560. He was early devoted to physic, and pursued his studies at Padua, Montpellier, and some of the celebrated schools in Germany. In his journeys he collected a number of plants which had escaped his brother's notice. Returning to Basil in 1580, he was admitted to the degree of doctor, and gave private lectures in botany and anatomy. In 1582 he was appointed to the Greek professorship in that university, and in 1588, to the anatomical and botanical chairs. He was at last made city physician, professor of the practice of medicine, rector of the university, and dean of his faculty. Thus distinguished and honoured, he acquired great reputation. He became eminent as a botanist, and was aided in his researches by the contributions of his disciples and friends in various parts of Europe. Haller gives him the character of being assiduous and laborious in collecting plants, by which he surpassed his brother in the number of them, and also in the accuracy of his figures; but he possesses less acuteness of judgment in distinguishing varieties, and detecting the same species under different names. He published several works relative to botany, of which the most valuable is his *Pinax Theatri Botanici, seu index in Theophrasti, Dioscoridis, Plinii, et botanicorum qui a seculo scripserunt opera, plantarum fere sex millium nomina, cum synonymiis et differentiis. Opus* XIV. *annorum*, 4to. The confusion that began to arise at this time from the number of botanical writers who described the same plant under different names, rendered such a task as this highly necessary; and though there are many defects in the execution, the *Pinax* of Bauhin is still a useful key to all writers before his time. Another great work which he planned was a *Theatrum Botanicum*, meant to comprise twelve parts, folio, of which he finished three, but only one was published. He also gave a very copious catalogue of the plants growing in the environs of Basil; and he edited the works of Mathiolus, with considerable additions.

Bauhin | Bausk.

Gaspard also wrote on anatomy, which he studied under Hieronymus ab Aquapendente, and pursued with vigour during his youth. The principal is *Theatrum Anatomicum infinitis locis auctum*, 4to. Frankf. 1621; which is a kind of pinax of anatomical facts and opinions. He also published a collection of anatomical plates. He died in 1613.

BAUHINIA, Mountain Ebony. See Botany *Index*.

BAVINS, in *War*, brush faggots, made with the brush at length. See Fascines; and Fire-ship, note (d).

BAUM, in *Botany*. See Melissa, Botany *Index*.

BAUME', Anthony, a French chemist. See Supplement.

Baume, *St*, a mountain of Provence in France, between Marseilles and Toulon. Here Mary Magdalen is said to have died.

Baume-les-Nomes, a town in France, in the department of Doubs, which had a rich nunnery, from whence it takes its name, seated on the river Doux, in E. Long. 6. 20. N. Lat. 47. 12. Five miles from this town is a remarkable cavern, whose entrance is 20 paces wide; and after descending 300 paces, the gate of a grotto is seen, twice as large as that of a city. The grotto is 35 paces deep, 60 wide, and is covered with a kind of vaulted roof, from which water continually drops. There is also a small brook, said to be frozen in summer, but not in winter; and at the bottom are stones that exactly resemble candied citron peel. When the peasants perceive a mist rising out of this cave, they affirm that it will certainly rain the next day.

BAUMEN, or Bauman, a cave of Lower Saxony, in Germany, about a mile from Wermigerode, and 18 from Goslar. The entrance is through a rock; and so narrow, that not above one person can pass at a time. There are several paths in it, which the peasants have turned up, in searching for the bones of animals which they sell for unicorn's horns. Some think this cave reaches as far as Goslar; but be this as it will the skeletons of men have been found in it, who are supposed to have been lost in the turnings and windings.

BAUR, William, an eminent Flemish painter, was born at Strasburg, and was the disciple of Brendel. He was some time at Rome, where his studies were wholly employed about architecture and landscapes, which prevented his studying the antique. He painted small figures in distemper on vellum. He etched with great spirit. His largest works are in the historical way. He has given us many of the sieges, and battles, which wasted Flanders in the 16th century. They may be exact, and probably they are: but they are rather plans than pictures; and have little to recommend them but historic truth, and the freedom of the execution. His best prints are some characters he has given us of different nations, in which the peculiarities of each are very well preserved. His Ovid is a poor performance. He died at Vienna in 1640.

BAUSK or Bautko, a small but important town in the duchy of Courland, on the frontiers of Poland, with a strong castle built on a rock. It was taken by the Swedes in 1625, and by the Russians in 1705, af-

Digitized by Google

ter a bloody battle between them and the Swedes. It is situated on the river Musa, in E. Long. 24. 44. N. Lat. 56. 30.

BAUTRY, or BAWTRY, a town in the west riding of Yorkshire, on the road from London to York. It has long been noted for millstones and grindstones brought hither by the river Idle, on which it is seated. W. Long. 1. 0. N. Lat. 53. 27.

BAUTZEN, or BUDISSEN, a considerable town of Germany, and capital of Upper Lusatia, subject to the king of Saxony, with a strong citadel. Near this place a bloody battle was fought between the French and the allies in June 1813, in which the latter were defeated. E. Long. 14. 42. N. Lat. 51. 10.

BAUX, a town of Provence in France, now the department of the Mouths of the Rhone, with the title of a marquisate, seated on a rock, at the top of which is a strong castle. E. Long. 5. 0. N. Lat. 43. 42.

BAWD, a person who keeps a place of prostitution, or makes a trade of debauching women, and procuring or conducting of criminal intrigues. Some think the word is derived from the old French *Baude*, bold or impudent; though Verstegan has a conjecture which would carry it higher, viz. from *bathe* anciently written *bade*. In which sense *bawd* originally imported no more than bath-holder, as if bagnios had anciently been the chief scenes of such prostitution.

The Romans had their male as well as female bawds; the former denominated *lenones* and *proagogi*, among us *panders;* the latter, *lenæ*. Donatus, speaking of the habits of the ancient characters in comedy, says, *Leno paliis varii coloris utitur*. But the ancient *lenones*, it is to be observed, furnished boys as well as girls for venereal service. Another sort of these merchants or dealers in human flesh, were called *mangones*, by the Greeks ανδρoκαπηλοι, who sold eunuchs, slaves, &c. By a law of Constantine, bawds were to be punished by pouring melted lead down their throats. See the next article.

BAWDY-House, a house of ill fame, to which lewd persons of both sexes resort, and there have criminal conversation.

The keeping a bawdy-house is a common nuisance, not only on account that it endangers the public peace by drawing together debauched and idle persons, and promoting quarrels, but likewise for its tendency to corrupt the manners of the people. And therefore persons convicted of keeping bawdy-houses, are punishable by fine and imprisonment; also liable to stand in the pillory, and to such other punishment as the court at their discretion shall inflict. Persons resorting to a bawdy-house are likewise punishable, and they may be bound to their good behaviour.—It was always held infamous to keep a bawdy-house: yet some of our historians mention bawdy-houses publicly allowed here in former times till the reign of Henry VIII. and assign the number to be 18 thus allowed on the bank-side in Southwark. See STEWS and BROTHEL.

Bawdy-houses are licensed in Holland, and pay a considerable tax to the state.

BAWLING, among sportsmen, is spoke of the dogs, when they are too busy before they find the scent good.

BAXTER, RICHARD, an eminent divine among the Nonconformists, was born at Rowton in Shropshire, November 12. 1615; and distinguished himself by his exemplary life, his pacific and moderate principles, and his numerous writings. He was remarkable for his piety even when he was very young. Upon the opening of the long parliament, he was chosen vicar of Kidderminster. In the heat of the civil wars he withdrew from that town to Coventry, and preached to the garrison and inhabitants. When Oliver Cromwell was made protector, he would by no means comply with his measures, though he preached once before him. He came to London just before the deposing of Richard Cromwell, and preached before the parliament the day before they voted the return of King Charles II. who upon his restoration appointed him one of his chaplains in ordinary. He assisted at the conference in the Savoy, as one of the commissioners for stating the fundamentals in religion, and then drew up a reformed liturgy. He was offered the bishoprick of Hereford; which he refused; affecting no higher preferment than the liberty of continuing minister of Kidderminster; which he could not obtain, for he was not permitted to preach there above twice or thrice after the Restoration. Whereupon he returned to London, and preached occasionally about the city, till the act of uniformity took place. In 1662, Mr Baxter was married to Margaret Charleton, daughter to Francis Charleton, Esq. of the county of Salop, who was esteemed one of the best justices of the peace in that county. She was a woman of great piety, and entered thoroughly into her husband's views concerning religion. During the plague in 1665 he retired into Buckinghamshire; but afterwards returned to Acton, where he staid till the act against conventicles expired; and then his audience was so large that he wanted room. Upon this he was committed to prison; but procuring a habeas corpus, he was discharged. After the indulgence in 1672, he returned to London; and in 1682 he was seized for coming within five miles of a corporation. In 1684 he was seized again; and in the reign of King James II. was committed prisoner to the King's Bench, and tried before the lord chief justice Jefferies for his Paraphrase on the New Testament, which was called a *scandalous* and *seditious* book against the government. He continued in prison two years; from whence he was at last discharged, and had his fine remitted by the king. He died December the 8th 1691; and was buried in Christ-church.

Mr Sylvester says, that Mr Baxter's "person was tall and slender, and stooped much: his countenance composed and grave, somewhat inclining to smile. He had a piercing eye, a very articulate speech, and deportment rather plain than complimental." There is an original portrait of him at Dr Williams's library, founded for the use of Protestant Dissenting Ministers, in Red-cross street. Mr Sylvester also says, that "he had a great command over his thoughts. He had that happy faculty, so as to answer the character that was given of him by a learned man dissenting from him, after discourse with him; which was that *he could say what he would, and he could prove what he said*. He was most intent upon the necessary things. Rational learning he most valued, and was a very extraordinary master of. And as to his expressive faculty, he spake

Digitized by Google

Baxter. properly, plainly, pertinently, and pathetically. He could speak suitably, both to men's capacities and to the things insisted on. He was a person wonderful at extemporate preaching." But his common practice appears to have been to preach with notes; though he said, "That he thought it very needful for a minister to have a body of divinity in his head." He was honoured with the friendship of some of the greatest and best men in the kingdom (as the earl of Lauderdale, the earl of Balcarras, Lord Chief Justice Hales, Dr Tillotson, &c.); and held correspondence with some of the most eminent foreign divines.—He wrote above 120 books, and had above 60 written against him. The former, however, it should seem, were greatly preferable to the latter; since Dr Barrow, an excellent judge, says, that "his practical writings were never mended, his controversial seldom confuted."

Mr Granger's character of him is too striking to be omitted. "Richard Baxter was a man famous for weakness of body and strength of mind; for having the strongest sense of religion himself, and exciting a sense of it in the thoughtless and profligate: for preaching more sermons, engaging in more controversies, and writing more books, than any other Nonconformist of his age. He spoke, disputed, and wrote with ease; and discovered the same intrepedity when he reproved Cromwell and expostulated with Charles II. as when he preached to a congregation of mechanics. His zeal for religion was extraordinary; but it seems never to have prompted him to faction, or carried him to enthusiasm. This champion of the Presbyterians was the common butt of men of every other religion, and of those who were of no religion at all. But this had very little effect upon him: his presence and his firmness of mind on no occasion forsook him. He was just the same man before he went into a prison, while he was in it, and when he came out of it; and he maintained an uniformity of character to the last gasp of his life. His enemies have placed him in hell; but every man who has not ten times the bigotry that Mr Baxter himself had, must conclude that he is in a better place. This is a very faint and imperfect sketch of Mr Baxter's character: men of his size are not to be drawn in miniature. His portrait, in full proportion, is in his *Narrative of his own Life and Times;* which though a rhapsody, composed in the manner of a diary, contains a great variety of memorable things, and is itself, as far as it goes, a History of Nonconformity."—Among his most famous works were, 1. The Saints Everlasting Rest. 2. Call to the Unconverted, of which 20,000 were sold in one year; and it was translated not only into all the European languages, but into the Indian tongue. 3. Poor Man's Family Book. 4. Dying Thoughts; and, 5. A Paraphrase on the New Testament. His practical works have been printed in four volumes folio.

Baxter, *William*, nephew and heir to the former, was an eminent schoolmaster and critic. He was born at Lanlugany in Shropshire, in the year 1650; and it is remarkable, that at the age of 18, when he first went to school, he knew not one letter nor understood one word of any language but Welsh; but he so well improved his time, that he became a person of great and extensive knowledge. His genius led him chiefly to the study of antiquities and philology, in which he composed several books. The first he published was a Grammar, in 1679, entitled *De Analogia seu Arte Latinæ Linguæ Commentariolus.* He also published a new and correct edition of Anacreon, with notes; an edition of Horace; a Dictionary of the British antiquities, in Latin: and several other books. He was a great master of the ancient British and Irish tongues, was particularly skilled in the Latin and Greek, and in the northern and eastern languages. He died May 31. 1723, after being above 20 years master of Mercer's School in London.

Baxter, *Andrew*, a very ingenious metaphysical writer, was born in 1686 or 1687, at Old Aberdeen (where his father was a merchant), and educated in King's College there. His principal employment was that of a private tutor to young gentlemen; and among others of his pupils were Lord Gray, Lord Blantyre, and Mr Hay of Drummelzier. About 1724 he married the daughter of a clergyman in the shire of Berwick. A few years after he published in 4to, "An Inquiry into the Nature of the Human Soul, wherein its immateriality is evinced from the principles of reason and philosophy;" without date. In 1741 he went abroad with Mr Hay, and resided some years at Utrecht; having there also Lord Blantyre under his care. He made excursions from thence into Flanders, France, and Germany; his wife and family residing, in the mean time, chiefly at Berwick-upon-Tweed. He returned to Scotland in 1747, and resided till his death at Whittingham, in the shire of East Lothian. He drew up, for the use of his pupils and his son, a piece entitled *Matho; sive, Cosmotheoria puerilis, Dialogus. In quo prima elementa de mundi ordine et ornatu proponuntur, &c.* This was afterwards greatly enlarged, and published in English, in two volumes 8vo. In 1750 was published, "An Appendix to his Inquiry into the Nature of the Human Soul:" wherein he endeavours to remove some difficulties which had been started against his notions of the *vis inertiæ* of matter, by Maclaurin, in his "Account of Sir Isaac Newton's Philosophical Discoveries." To this piece Mr Baxter prefixed a dedication to Mr John Wilkes, with whom he had commenced an acquaintance abroad. He died April the 23d, 1750, after suffering for some months under a complication of disorders, of which the gout was the chief. He left a wife, three daughters, and one son, Mr Alexander Baxter; from which last the authors of Biographia Britannica received, as they inform us, sundry particulars of his life.

His learning and abilities are sufficiently displayed in his writings. He was extremely studious, and sometimes sat up whole nights in reading and writing. His temper at the same time was very cheerful, and he was a friend to innocent merriment. It is said of Mr Baxter, that he entered with much good humour into the conversation and pleasures of young people, when they were of an innocent nature: and that he presided, all the time of his abode at Utrecht, at the ordinary which was frequented by all the young English gentlemen there, with much gaiety and politeness, and in such a manner as gave universal satisfaction. He also frequented the most polite assemblies in that city, and his company and conversation were particularly acceptable to the ladies. So that Mr Baxter appears to have studied the graces, though without neglecting

Digitized by Google

neglecting more valuable acquisitions and accomplishments. He was at once the scholar and the gentleman. In conversation he was modest, and not apt to make much show of the extensive knowledge of which he was possessed. In the discharge of the several social and relative duties of life, his conduct was exemplary. He had the most reverential sentiments of the Deity, of whose presence and immediate support he had always a strong impression upon his mind; and the general tenor of his life appears to have been conformable to the rules of virtue. Mr Baxter paid a strict attention to economy, though he dressed elegantly, and was not parsimonious in his other expences. It is known also that there were several occasions on which he acted with remarkable disinterestedness; and so far was he from courting preferment, that he has repeatedly declined considerable offers of that kind which were made him, if he would have taken orders in the church of England. The French, German, and Dutch languages were spoken by him with much ease, and the Italian tolerably; and he wrote and read them all, together with the Spanish. His friends and correspondents were numerous and respectable; and among them are particularly mentioned Mr Pointz, preceptor to the late duke of Cumberland, and Dr Warburton, bishop of Gloucester. He was a man also of great benevolence and candour; which appears most strikingly from this, inasmuch as though Mr Wilkes had made himself so very obnoxious to the Scottish nation in general, yet Mr Baxter kept up with him an affectionate correspondence to the last, even after he was unable to write with his own hand. He left many manuscripts behind him; he would gladly have finished his work upon the human soul: "I own," says he, in a letter to Mr Wilkes, "if it had been the will of heaven, I would gladly have lived till I had put in order the second part of the Enquiry, showing the immortality of the human soul; but Infinite Wisdom cannot be mistaken in calling me sooner. Our blindness makes us form wishes." It was indeed, what he considered it, his capital work: a second edition of it was published in two volumes 8vo in 1737, and a third in 1745. In another letter, speaking of his endeavours to establish the particular providence of the Deity, and to show his incessant influence and action on all the parts of matter, through the wide universe, from the inactivity of this dead substance; expresses his hope, that when the present party-zeal subsides a little, men will come more easily in to own such a plain truth." "His prediction," the editors of the Biographia Britannica observe, "hath not yet been accomplished. Several eminent names seem rather disposed to increase than to lessen the powers of matter; and they have expressly maintained that the soul of man is material. However, other names equally eminent have asserted the essential distinction between the mind and the body. Perhaps, in the revolutions of opinion, the doctrine of immateriality may again obtain the general suffrage of metaphysical and philosophical inquiry."

BAY, in *Geography*, an arm of the sea shooting up into the land, and terminating in a nook. It is a kind of lesser gulf bigger than a creek, and is larger in its middle within than at its entrance. The largest and most noted bays in the world are those of Biscay, Bengal, Hudson's, Panama, &c.

BAY denotes likewise a pond-head made to keep in store of water for driving the wheels of the furnace or hammer belonging to an iron mill, by the stream that comes thence through a flood-gate called the *pen-stock*.

BAY-Colour denotes a sort of red inclining to chesnut, chiefly used in speaking of horses. In this sense, the word *bay* is formed from the Latin *baius*, or *badius*, and that from the Greek *βαϊς*, a *palm branch;* so that *badius* or *bay* properly denotes *color phœniceus*. Hence also, among the ancients, those now called *bay* horses, were denominated *equi palmati*. We have divers sorts and degrees of bays; as a light bay, a dapple bay, &c. All bay horses are said to have black manes; which distinguishes them from sorrels, which have red or white manes.

BAY, among huntsmen, is when the dogs have earthed a vermin, or brought a deer, boar, or the like, to turn head against them. In this case, not only the deer, but the dogs, are said to bay. It is dangerous going in to a hart at bay, especially at rutting-time; for then they are fiercest. There are bays at land, and others in the water.

BAY-Tree. See LAURUS, BOTANY *Index.*

BAY-Salt. See SALT.

BAYA, or BAJA, a town of Lower Hungary, in the county of Bath, situated near the Danube. E. Long. 19. 30. N. Lat. 46. 25.

BAYARD, PETER DU TERRAIL DE, esteeemed by his cotemporaries the model of soldiers and men of honour, and denominated *The knight without fear and without reproach*, was descended from an ancient and noble family in Dauphiné. He was with Charles VIII. at the conquest of the kingdom of Naples; where he gave remarkable proofs of his valour, especially at the battle of Fornoue. He was dangerously wounded at the taking of the city of Brescia: and there restored to the daughters of his host 2000 pistoles, which their mother had directed them to give him in order to prevent the house from being plundered; an action that has been celebrated by many historians. At his return to France, he was made lieutenant-general of Dauphiné. He fought by the side of Francis I. at the battle of Marignan; and that prince afterwards insisted on being knighted by his hand, after the manner of the ancient knights. The chevalier Bayard defended Meziers during six weeks, against Charles V.'s army. In 1524, at the retreat of Rebec * (the general Bonivet having been wounded and obliged to quit the field), the conduct of the rear was committed to the chevalier Bayard, who, though so much a stranger to the arts of a court that he never rose to the chief command, was always called, in times of real danger, to the posts of greatest difficulty and importance. He put himself at the head of the men at arms; and animating them by his presence and example to sustain the whole shock of the enemy's troops, he gained time for the rest of his countrymen to make good their retreat. But in this service he received a wound which he immediately perceived to be mortal; and being unable to continue any longer on horseback, he ordered one of his attendants to place him under a tree, with his face towards the enemy; then fixing his eyes on the guard of his sword, which he held up instead of a cross, he addressed his prayers to God; and in this posture, which became his character both as a soldier and as a Christian, he calmly waited

* *Hist. of Charles V.* book v.

Digitized by Google

waited the approach of death. Bourbon, who led the foremost of the enemy's troops, found him in this situation, and expressed regret and pity at the sight. "Pity not me," cried the high-spirited chevalier, "I "die as a man of honour ought, in the discharge of "my duty: they indeed are objects of pity, who fight "against their king, their country, and their oath." The marquis de Pescara, passing soon after, manifested his admiration of Bayard's virtue, as well as his sorrow for his fate, with the generosity of a gallant enemy; and finding that he could not be removed with safety from that spot, ordered a tent to be pitched there, and appointed proper persons to attend him. He died, notwithstanding their care, as his ancestors for several generations had done, in the field of battle. Pescara ordered his body to be embalmed, and sent to his relations; and such was the respect paid to military merit in that age, that the duke of Savoy commanded it to be received with royal honours in all the cities of his dominions: in Dauphiné, Bayard's native country, the people of all ranks came out in a solemn procession to meet it.

BAYEN, Peter, an eminent French chemist. See Supplement.

BAYEUX, a considerable town of France in the department of Calvados. The cathedral church is accounted extremely fine. Population in 1815, 10,600. W. Long. 0. 33. N. Lat. 49. 16.

BAYLE, Peter, author of the Historical and Critical Dictionary, was born November 18. 1657, at Carla, a village in the county of Foix, in France, where his father John Bayle was a Protestant minister. In 1666, he went to the Protestant university at Puylaureus, where he studied with the greatest application; and in 1669, removed to the university of Toulouse, whither the Protestants at that time frequently sent their children to study under the Jesuits: but here, to the great grief of his father, he embraced the Romish religion. However, being soon sensible of his error, he left that university, and went to study at Geneva; after which he was chosen professor of philosophy at Sedan: but that Protestant university being suppressed by Louis XIV. in 1681, he was obliged to leave the city; and was soon after chosen professor of philosophy and history at Rotterdam, with a salary of about 45l. a year. The year following he published his Letter concerning Comets. And Father Maimbourg having published about this time his History of Calvinism, wherein he endeavours to draw upon the Protestants the contempt and resentment of the Catholics, Mr Bayle wrote a piece to confute his history. The reputation which he had now acquired, induced the States of Friezland, in 1684, to offer him a professorship in their university; but he wrote them a letter of thanks, and declined the offer. The same year he began to publish his *Nouvelles de la république des lettres*.

In 1686, he was drawn into a dispute in relation to the famous Christina queen of Sweden. In his Journal for April, he took notice of a printed letter supposed to have been written by her Swedish majesty to the chevalier de Terlon, wherein she condemns the persecution of the Protestants in France. He inserted the letter itself in his Journal for May; and in that of June following he says, "What we hinted at in our last month is confirmed to us from day to day, that Christina is the real author of the letter concerning the persecutions in France, which is ascribed to her: it is a remainder of Protestantism." Mr Bayle received an anonymous letter; the author of which says, that he wrote to him of his own accord, being in duty bound to it as a servant of the queen. He complains that Mr Bayle, speaking of her majesty, called her only *Christina*, without any title; he finds also great fault with his calling the letter "a remainder of Protestantism." He blames him likewise for inserting the words "I am," in the conclusion of the letter. "These words (says this anonymous writer) are not her majesty's; a queen, as she is, cannot employ these words but with regard to a very few persons, and Mr de Terlon is not of that number." Mr Bayle wrote a vindication of himself as to these particulars, with which the author of the anonymous letter declared himself satisfied, excepting what related to "the remainder of Protestantism." He would not admit of the defence with regard to that expression; and in another letter, advised him to retract that expression. He adds in a postscript, "You mention, in your Journal of August, a second letter of the queen, which you scruple to publish. Her majesty would be glad to see that letter; and you will do a thing agreeable to her if you would send it to her. You might take this opportunity of writing to her majesty. This counsel may be of some use to you; do not neglect it." Mr Bayle took the hint, and wrote a letter to her majesty, dated the 14th of November 1686; to which the queen, on the 14th of December, wrote the following answer:—"Mr Bayle, I have received your excuses; and am willing you should know by this letter, that I am satisfied with them. I am obliged to the zeal of the person who gave you occasion of writing to me: for I am very glad to know you. You express so much respect and affection for me, that I pardon you sincerely; and I would have you know, that nothing gave me offence but that *remainder of Protestantism*, of which you accused me. I am very delicate on that head, because nobody can suspect me of it, without lessening my glory, and injuring me in the most sensible manner. You would do well if you should even acquaint the public with the mistake you have made, and with your regret for it. This is all that remains to be done by you, in order to deserve my being entirely satisfied with you. As to the letter which you have sent me, it is mine without doubt; and since you tell me that it is printed, you will do me a pleasure if you send me some copies of it. As I fear nothing in France, so neither do I fear any thing at Rome. My fortune, my blood, and even my life, are entirely devoted to the service of the church; but I flatter nobody, and will never speak any thing but the truth. I am obliged to those who have been pleased to publish my letter, for I do not at all disguise my sentiments. I thank God, they are too noble and too honourable to be disowned. However, it is not true that this letter was written to one of my ministers. As I have everywhere enemies and persons who envy me, so in all places I have friends and servants: and I have possibly as many in France, notwithstanding of the court, as anywhere in the world. This is purely the truth, and you may regulate yourself accordingly. But you shall not get

Digitized by Google

get off so cheap as you imagine. I will enjoin you a penance; which is, that you will henceforth take the trouble of sending me all curious books that shall be published in Latin, French, Spanish, or Italian, on whatever subject or science, provided they are worthy of being looked into; I do not even except romances or satires; and above all, if there are any books of chemistry, I desire you may send them to me as soon as possible. Do not forget likewise to send me your Journal. I shall order that you be paid for whatever you lay out, do but send me an account of it. This will be the most agreeable and most important service that can be done me. May God prosper you.

CHRISTINA ALEXANDRA."

It now only remained that Mr Bayle should acquaint the public with the mistake he had made, in order to merit that princess's entire satisfaction; and this he did in the beginning of his Journal of the month of January, 1687.

The persecution which the Protestants at this time suffered in France affected Mr Bayle extremely. He made occasionally some reflections on their sufferings in his Journal; and he wrote a pamphlet also on the subject. Some time afterwards he published his *Commentaire Philosophique* upon these words, "Compel them to come in;" but the great application he gave to this and his other works, threw him into a fit of sickness, which obliged him to discontinue his Literary Journal. Being advised to try a change of air, he left Rotterdam on the 8th of August, and went to Cleves; whence, after having continued some time, he removed to Aix-la-Chapelle, and from thence returned to Rotterdam on the 18th of October. In the year 1690, the famous book, entitled, *Avis aux Refugiez*, &c. made its appearance. Mr Jurieu, who took Mr Bayle for the author thereof, wrote a piece against it; and he prefixed an advice to the public, wherein he calls Mr Bayle a profane person, and a traitor engaged in a conspiracy against the state. As soon as Mr Bayle had read this libel against him, he went to the grand schout of Rotterdam, and offered to go to prison, provided his accuser would accompany him, and undergo the punishment he deserved if the accusation was found unjust. He published also an answer to Mr Jurieu's charge; and as his reputation, nay his very life, was at stake in case the accusation of treason was proved, he therefore thought himself not obliged to keep any terms with the accuser, and attacked him with the utmost severity. Mr Jurieu lost all patience: he applied himself to the magistrates of Amsterdam; who advised him to a reconciliation with Mr Bayle, and enjoined them not to publish any thing against each other till it was examined by Mr Boyer, the pensioner of Rotterdam. But notwithstanding this prohibition, Mr Jurieu attacked Mr Bayle again with so much passion, that he forced him to write a new vindication of himself.

In November 1690, M. de Beauval advertised in his Journal, *A scheme for a Critical Dictionary*. This was the work of Mr Bayle. The articles of the three first letters of the alphabet were already prepared; but a dispute happening betwixt him and M. de Beauval, obliged him for some time to lay aside the work. Nor did he resume it till May 1692, when he published his scheme: but the public not approving of his plan, he threw it into a different form; and the first volume was published in August 1695, and the second in October following. The work was extremely well received by the public; but it engaged him in fresh disputes, particularly with Mr Jurieu and the abbé Renaudot. Mr Jurieu published a piece, wherein he endeavoured to engage the ecclesiastical assemblies to condemn the dictionary; he presented it to the senate sitting at Delft, but they took no notice of the affair. The consistory of Rotterdam granted Mr Bayle a hearing; and after having heard his answers to their remarks on his dictionary, declared themselves satisfied, and advised him to communicate this to the public. Mr Jurieu made another attempt with the consistory in 1698; and so far he prevailed with them, that they exhorted Mr Bayle to be more cautious with regard to his principles in the second edition of his dictionary; which was published in 1702, with many additions and improvements.

Mr Bayle was a most laborious and indefatigable writer. In one of his letters to Maizeux, he says, that since his 20th year he hardly remembers to have had any leisure. His intense application contributed perhaps to impair his constitution, for it soon began to decline. He had a decay of the lungs, which weakened him considerably; and as this was a distemper which had cut off several of his family, he judged it to be mortal, and would take no remedies. He died the 28th of December 1706, after he had been writing the greatest part of the day. He wrote several books besides what we have mentioned, many of which were in his own defence against attacks he had received from the abbé Renaudot, Mr Clerk, M. Jaquelot, and others. Among the productions which do honour to the age of Louis XIV. M. Voltaire has not omitted the Critical Dictionary of our author: "It is the first work of the kind (he says) in which a man may learn to think." He censures indeed those articles which contain only a detail of minute facts, as unworthy either of Bayle, an understanding reader, or posterity. "In placing him (continues the same author) amongst the writers who do honour to the age of Louis XIV. notwithstanding his being a refugee in Holland, I only conform to the decree of the parliament of Toulouse, which, when it declared his will valid in France, notwithstanding the rigour of the laws, expressly said, *that such a man could not be considered as a foreigner*."

BAYLY, LEWIS, author of that most memorable book, entitled "The Practice of Piety." He was born at Caermarthen in Wales, educated at Oxford, made minister of Evesham in Worcestershire about 1611, became chaplain to King James, and was promoted to the see of Bangor in 1616. His book is dedicated to the high and mighty prince, Charles prince of Wales; and the author tells his highness, "that he had endeavoured to extract out of the chaos of endless controversies the old practice of true piety, which flourished before these controversies were hatched." The design was good; and the reception this book has met with may be known from the number of its editions, that in 8vo, 1734, being the fifty-ninth. This prelate died in 1632.

BAYON, a town of France, in Lorrain, now the department

department of Meurthe, seated on the river Moselle. E. Long. 14. 42. N. Lat. 48. 30.

BAYON, or *Bayona*, a town of Galicia, in Spain, seated on a small gulf of the Atlantic ocean, about 12 miles from Tuy. It has a very commodious harbour, and the country about it is fertile. W. Long. 9. 30. N. Lat. 43. 3.

BAYONET, in the military art, a short broad dagger, formerly with a round handle fitted for the bore of a firelock, to be fixed there after the soldier had fired; but they are now made with iron handles and rings, that go over the muzzle of the firelock; and are screwed fast, so that the soldier fires with his bayonet on the muzzle of his piece, and is ready to act against the horse. This use of the bayonet fastened on the muzzle of the firelock was a great improvement, first introduced by the French, and to which, according to M. Folard, they owed a great part of their victories in the last century; and to the neglect of this in the next succeeding war, and trusting to their fire, the same author attributes most of the losses they sustained. At the siege of Malta, a weapon called *pila ignea* was contrived to oppose the bayonets, being in some measure the converse thereof; as the latter consists of a dagger added to a fire-arm, the former consisted of a fire-arm added to a pilum or pike.

Of late the bayonet has come into very general use; and battles have been won by it without firing a shot. This way of fighting was chiefly restored by the late king of Prussia, who made his troops rush forward at once with bayonets on the enemy.

BAYONNE, a city of Gascony, in France, now the department of the Lower Pyrenees; seated near the mouth of the river Adour, which forms a good harbour. In 1815 it contained 18,600 inhabitants, including the suburbs. It is divided into three parts. The great town is on this side the river Nive; the little town is between the Nive and the Adour; and the suburb of Saint Esprit is beyond this last river. Both the former are surrounded with an old wall and a dry ditch, and there is a small castle in each. That of Great Bayonne is flanked with four round towers, and is the place where the governor resides. The new castle is flanked with four towers, in the form of bastions. The first enclosure is covered with another, composed of eight bastions, with a great horn-work, and a half-moon; all which are encompassed with a ditch, and a covered way. There is communication between the city and the suburbs by a bridge, and the suburbs are well fortified. The citadel is seated beyond the Adour, on the side of the suburbs above mentioned. The public buildings have nothing remarkable; it is the only city in the kingdom that has the advantage of two rivers, wherein the tide ebbs and flows. The river Nive is deeper than the Adour, but less rapid, by which means ships come up into the middle of the city. There are two bridges over the river, by which the old and new towns communicate with each other. The trade of this town is the more considerable, on account of its neighbourhood to Spain, and the great quantity of wines which are brought hither from the adjacent country. The Dutch carry off a great number of pipes in exchange for spices and other commodities, which they bring thither. The inhabitants had formerly the privilege of guarding two of their three gates, and the third was kept by the king. W. Long. 1. 20. N. Lat 43. 20.

BAYS, in *Commerce*, a sort of open woollen stuff, having a long nap, sometimes frized, and sometimes not. This stuff is without wale; and is wrought in a loom with two treddles, like flannel. It is chiefly manufactured at Colchester and Bockin in Essex, where there is a hall called the *Dutch-bay hall* or *raw-hall*. This manufacture was first introduced into England, with that of says, serges, &c. by the Flemings; who being persecuted by the duke of Alva for their religion, fled thither about the fifth of Queen Elizabeth's reign; and had afterwards peculiar privileges granted them by act of parliament 12 Charles II. 1660, which the bays-makers in the above places still enjoy. The exportation of bays was formerly much more considerable than at present when the French have learned to imitate them. However, the English bays are still sent in great quantities to Spain and Portugal, and even to Italy. Their chief use is for dressing the monks and nuns, and for linings, especially in the army. The looking-glass makers also use them behind their glasses, to preserve the tin or quicksilver; and the casemakers to line their cases. The breadth of bays is commonly a yard and a half, a yard and three quarters, or two yards, by 42 to 48 in length. Those of a yard and three quarters are most proper for the Spanish trade.

BAZAR, or BASAR, a denomination among the Turks and Persians, given to a kind of exchanges, or places where their finest stuffs and other wares are sold. These are also called *bezestins*. The word *bazar* seems of Arabic origin, where it denotes sale, or exchange of goods. Some of the eastern bazars are open, like the market-places in Europe, and serve for the same uses, more particularly for the sale of the bulky and less valuable commodities. Others are covered with lofty ceilings, or even domes, pierced to give light; and it is in these the jewellers, goldsmiths, and other dealers in the richer wares, have their shops. The bazar or maidan of Ispahan is one of the finest places in Persia, and even surpasses all the exchanges in Europe; yet notwithstanding its magnificence, it is excelled by the bazar of Tauris, which is the largest that is known, having several times held 30,000 men ranged in order of battle. At Constantinople, there is the old and the new bazar, which are large square buildings, covered with domes, and sustained by arches and pilasters.

BAZAS, a town of Guienne in France, now the department of Gironde, and formerly a bishop's see. It is built on a rock, five miles from the Garonne, and 42 south-east of Bourdeaux, in W. Long. 0. 30. N. Lat. 44. 20.

BAZAT, or BAZA, in *Commerce*, a long, fine spun cotton, which comes from Jerusalem, whence it is also called *Jerusalem-cotton*.

BAZEEGURS, a tribe of Indians in Hindostan. See SUPPLEMENT.

BAZGENDGES, in *Natural History*, the name of a substance used by the Turks and other eastern nations in their scarlet-dyeing. They mix it for this purpose with cochineal and tartar; the proportions being two ounces of the bazgendges to one ounce of cochineal. These are generally esteemed a sort of fruit, that are produced

Digitized by Google

produced on certain trees in Syria and other places; and it is usually supposed, that the scarcity and dearness of them is the only thing that makes them not used in Europe. But the bazgendges seem to be no other than the horns of the turpentine tree in the eastern parts of the world; and it is not only in Syria that they are found, but China also affords them. Many things of this kind were sent over to Mr Geoffroy at Paris from China as the substances used in the scarlet-dyeing of that country, and they all proved wholly the same with the Syrian and Turkish bazgendges, and with the common turpentine horns. The lentisk, or mastic tree, is also frequently found producing many horns of a like kind with these, and of the same origin, all being owing to the pucerons, which make their way into the leaves to breed their young there.

BDELLIUM, a gummy resinous juice, produced by a tree in the East Indies, of which we have no satisfactory account. It is brought into Europe both from the East Indies and Arabia. It is in pieces of different sizes and figures, externally of a dark reddish brown, somewhat like myrrh; internally it is clear, and not unlike to glue; to the taste it is slightly bitterish and pungent; its odour is very agreeable. If held in the mouth, it soon becomes soft and tenacious, sticking to the teeth. Laid on a red-hot iron, it readily catches flame, and burns with a crackling noise, and in proportion to its goodness it is more or less fragrant. Near half of its substance dissolves either in water or in spirit of wine; but the tincture made with spirit is somewhat stronger, and by much more agreeable. Vinegar, or verjuice, dissolves it wholly. The simple gum is a better medicine than any preparation from it. It is one of the weakest of the deobstruent gums, but is used as a pectoral and an emmenagogue.

BEACHY-HEAD, a promontory on the coast of Sussex, between Hastings and Shoreham, where the French defeated the English and Dutch fleet in 1690.

BEACON, a signal for the better securing the kingdom from foreign invasions. See SIGNAL.

On certain eminent places of the country are placed long poles erect, whereon are fastened pitch-barrels to be fired by night, and smoke made by day, to give notice in a few hours to the whole kingdom of an approaching invasion. These are commonly called *beacons*; whence also comes *beaconage*.—We find beacons familiarly in use among the primitive Britons and Western Highlanders. The besieged capital of one of our northern isles in the third century actually lighted up a fire upon a tower; and Fingal instantly knew "the green flame edged with smoke" to be a token of attack and distress *. And there are to this day several cairns or heaps of stones upon the heights along the coasts of the Harries, on which the inhabitants used to burn heath as a signal of an approaching enemy.

* Ossian, vol. i. p. 198.

BEACONS are also marks and signs erected on the coasts, for guiding and preserving vessels at sea, by night as well as by day.

The erection of beacons, light-houses, and sea-marks, is a branch of the royal prerogative. The king hath the exclusive power, by commission under his great seal, to cause them to be erected in fit and convenient places, as well upon the lands of the subject as upon the demesnes of the crown: which power is usually vested by letters patent in the office of lord high admiral. And by statute 8 Eliz. c. 13. the corporation of the Trinity-house are impowered to set up any beacons or sea-marks wherever they shall think them necessary; and if the owner of the land or any other person shall destroy them, or shall take down any steeple, tree, or other known sea-mark, he shall forfeit 100l. or, in case of inability to pay it, shall be *ipso facto* outlawed.

BEACONAGE, money paid towards the maintenance of a beacon. See BEACON.—The word is derived from the Saxon *beacnian*, to nod, or show by a sign; hence also the word *beckon*.

BEACONSFIELD, a town of Buckinghamshire in England, seated on a hill in the road between London and Oxford. It contained 1461 inhabitants in 1811. W. Long. 0. 25. N. Lat. 51. 36.

BEAD, a small globule or ball used in necklaces; and made of different materials, as pearl, steel, garnet, coral, diamond, amber, crystal, pastes, glass, &c.—The Romanists make great use of beads in rehearsing their *Ave-Marias*, and *Pater-nosters*; and the like usage is found among the dervises and other religious throughout the East, as well Mahometan as Heathen. The ancient Druids appear also to have had their beads, many of which are still found; at least if the conjecture of an ingenious author may be admitted, who takes those antique glass globules, having a snake painted round them, and called *adder-beads*, or *snake-buttons*, to have been the beads of our ancient Druids. See ANGUIS, OPHIOLOGY *Index*.

BEADS are also used in speaking of those glass globules vended to the savages on the coast of Africa; thus denominated, because they are strung together for the convenience of traffic.

The common black glass of which beads are made for necklaces, &c. is coloured with manganese only: one part of manganese is sufficient to give a black colour to near twenty of glass.

BEAD, in *Architecture*, a round moulding, commonly made upon the edge of a piece of stuff, in the Corinthian and Roman orders, cut or carved in short embossments, like beads in necklaces.

BEAD-Makers, called by the French *paternostriers*, are those employed in the making, stringing, and selling of beads. At Paris before the revolution there were three companies of paternostriers, or bead-makers; one who made them of glass or crystal; another in wood and horn; and the third in amber, coral, jet, &c.

BEAD-Proof, a term used by our distillers to express that sort of proof of the standard strength of spirituous liquors, which consists in their having, when shaken in a phial, or poured from on high into a glass, a crown of bubbles, which stand on the surface some time after. This is esteemed a proof that the spirit consists of equal parts of rectified spirits and phlegm. This is a fallacious rule as to the degree of strength in the goods; because any thing that will increase the tenacity of the spirit, will give it this proof, though it be under the due strength. Our malt-distillers spoil the greater part of their goods, by leaving too much of the stinking oil of the malt in their spirit, in order to give it this proof when somewhat under the standard strength. But this is a great deceit on the purchasers of malt spirits, as they have them by this means not only weaker than they ought to be, but stinking with an oil that they

Digitized by Google

they are not easily cleared of afterwards. On the other hand, the dealers in brandy, who usually have the art of sophisticating it to a great nicety, are in the right when they buy it by the strongest bead-proof, as the grand mark of the best; for being a proof of the brandy containing a large quantity of its oil, it is, at the same time, a token of its high flavour, and of its being capable of bearing a very large addition of the common spirits of our own produce, without betraying their flavour, or losing its own. We value the French brandy for the quantity of this essential oil of the grape which it contains; and that with good reason, as it is with us principally used for drinking as an agreeably flavoured cordial: but the French themselves, when they want it for any curious purposes, are as careful in the rectification of it, and take as much pains to clear it from this oil, as we do to free our malt spirits from that nauseous and fetid oil which it originally contains.

Bead-Roll, among Papists, a list of such persons, for the rest of whose souls they are obliged to repeat a certain number of prayers, which they count by means of their beads.

Bead-Tree. See Melia, Botany *Index*.

BEADLE, (from the Saxon *bydel*, a *messenger*), a crier or messenger of a court, who cites persons to appear and answer. Called also a *summoner* or *apparitor*. —*Beadle* is also an officer at an university, whose chief business is to walk before the masters with a mace, at all public processions.—There are also *church beadles*, whose office is well known.

BEAGLES, a small sort of hounds or hunting dogs. Beagles are of divers kinds; as the *southern beagle*, something less and shorter, but thicker than the deep-mouthed hound; the *fleet northern* or *cat beagle*, smaller, and of a finer shape than the southern, and a harder runner. From the two, by crossing the strains, is bred a third sort held preferable to either. To these may be added a still smaller sort of beagles, scarce bigger than lap-dogs, which make pretty diversion in hunting the coney, or even the small hare in dry weather; but otherwise unserviceable, by reason of their size.

BEAK, the bill or nib of a bird. See Ornithology *Index*.

Beak, or *Beak-head*, of a ship, that part without the ship, before the fore-castle, which is fastened to the stem, and is supported by the main-knee.

The beak, called by the Greeks εμϐολον, by the Latins *rostrum*, was an important part in the ancient ships of war, which were hence denominated *naves rostratæ*. The beak was made of wood; but fortified with brass, and fastened to the prow, serving to annoy the enemy's vessels. Its invention is attributed to Pisæus an Italian. The first beaks were made long and high; but afterwards a Corinthian, named *Aristo*, contrived to make them short and strong, and placed so low, as to pierce the enemies vessels under water. By the help of these great havock was made by the Syracusans in the Athenian fleet.

BEAKED, in *Heraldry*, a term used to express the beak or bill of a bird. When the beak and legs of a fowl are of a different tincture from the body, we say *beaked and membered of such a tincture*.

BEALE, Mary, particularly distinguished by her skill in painting, was the daughter of Mr Craddock, minister of Waltham upon Thames, and learned the rudiments of her art from Sir Peter Lely. She painted in oil, water-colours, and crayons, and had much business; her portraits were in the Italian style, which she acquired by copying pictures and drawings from Sir Peter Lely's and the royal collections. Her master, says Mr Walpole, was supposed to have had a tender attachment to her; but as he was reserved in communicating to her all the resources of his pencil, it probably was a gallant rather than a successful one. Dr Woodfall wrote several pieces to her honour, under the name of *Belesia*. Mrs Beale died in Pall-mall, on the 28th of December 1697, aged 65. Her paintings have much nature, but the colouring is stiff and heavy.

BEALT, Bealth, or *Builth*, a town of Brecknockshire in South Wales, pleasantly seated on the river Wye. It contained 815 inhabitants in 1811, who are chiefly employed in the manufacture of stockings. W. Long. 4. 10. N. Lat. 52. 4.

BEAM, in *Architecture*, the largest piece of wood in a building, which lies cross the walls, and serves to support the principal rafters of the roof, and into which the feet of these rafters are framed. No building has less than two of these beams, viz. one at each end; and into these the girders of the garret roof are also framed. The proportions of beams in or near London, are fixed by statute, as follows: a beam 15 feet long, must be 7 inches on one side its square, and 5 on the other; if it be 16 feet long, one side must be 8 inches, the other 6, and so proportionally to their lengths. In the country, where wood is more plenty, they usually make their beams stronger.

Beams of a Ship are the great main cross-timbers which hold the sides of the ship from falling together, and which also support the decks and orlops: the main beam is next the main-mast, and from it they are reckoned by first, second, third beam, &c.: the greatest beam of all is called the *midship beam*.

Beam-Compass, an instrument consisting of a square wooden or brass beam, having sliding sockets, that carry steel or pencil points; they are used for describing large circles, where the common compasses are useless.

Beam-Bird, or *Petty-chaps*. See Motacilla.

Beam also denotes the lath, or iron, of a pair of scales: sometimes the whole apparatus for weighing of goods is so called: Thus we say, it weighs so much at the king's beam.

Beam of a Plough, that in which all the parts of the plough-tail are fixed. See Plough, Agriculture *Index*.

Beam, or *Roller*, among weavers, a long and thick wooden cylinder, placed lengthwise on the back-part of the loom of those who work with a shuttle. That cylinder, on which the stuff is rolled as it is weaved, is also called the *beam* or *roller*, and is placed on the fore-part of the loom.

BEAMINSTER, a town of Dorsetshire in England, seated on the river Bert. Population 2290 in 1811. W. Long. 2. 50. N. Lat. 52. 45.

BEAN. See Vicia, Botany *Index*.

The ancients made use of beans in gathering the votes of the people, and for the election of magistrates. A white bean signified *absolution*, and a black one *condemnation*. Beans had a mysterious use in the *lemuralia* and *parentalia*; where the master of the family, after washing, was to throw a sort of black beans

Digitized by Google

beans over his head, still repeating the words, "I redeem myself and family by these beans." Ovid * gives a lively description of the whole ceremony in verse.—Abstinence from beans was enjoined by Pythagoras, one of whose symbols is, κυαμων απεχεσθαι, *abstine à fabis.* The Egyptian priests held it a crime to look at beans, judging the very sight unclean. The *flamen dialis* was not permitted even to mention the name. The precept of Pythagoras has been variously interpreted: some understand it of forbearing to meddle in trials and verdicts, which were then by throwing beans into an urn, others, building on the equivoque of the word κυαμος, which equally signifies a *bean* and a human *testicle*, explain it by abstaining from venery. Clemens Alexandrinus grounds the abstinence from beans on this, that they render women barren; which is confirmed by Theophrastus, who extends the effect even to plants. Cicero suggests another reason for this abstinence, viz. that beans are great enemies to tranquillity of mind. For a reason of this kind it is, that Amphiaraus is said to have abstained from beans, even before Pythagoras, that he might enjoy a clearer divination by dreams.

* Fast. lib. v. 4. 435.

Beans, as food for horses. See Farriery.

Bean-Caper. See Zygophyllum, Botany *Index.*

Bean-Cod, a small fishing vessel, or pilot-boat, common on the sea-coasts and in the rivers of Portugal. It is extremely sharp forward, having its stem bent inward above into a great curve: the stem is also plated on the fore-side with iron, into which a number of bolts are driven, to fortify it, and resist the stroke of another vessel, which may fall athwart-hause. It is commonly navigated with a large lateen sail, which extends over the whole length of the deck, and is accordingly well fitted to ply to windward.

Bean-Flour, called by the Romans *lomentum*, was of some repute among the ancient ladies as a cosmetic, wherewith to smooth the skin, and take away wrinkles.

Bean-Fly, in *Natural History*, the name given by authors to a very beautiful fly, of a pale purple colour, frequently found on bean-flowers. It is produced from the worm or maggot called by authors *mida.*

Bean-Goose. See Anas, Ornithology *Index.*

Kidney-Bean. See Phaseolus.

Malacca-Beans, or *Anacardia*, the fruit of a tree growing in Malabar and other parts of the East Indies, supposed by some to be the Avicennia *tomentosa;* by others, the Bontia *germinans.* The fruit is of a shining black colour, of the shape of a heart flattened, about an inch long, terminating at one end in an obtuse point, and adhering by the other to a wrinkled stalk: it contains within two shells a kernel of a sweetish taste: betwixt the shells is lodged a thick and acrid juice.

The medicinal virtues of anacardia have been greatly disputed. Many have attributed to them the faculty of comforting the brain and nerves, fortifying the memory, and quickening the intellect: and hence a confection made from them has been dignified with the title of *confectio sapientum:* others think it better deserves the name of *confectio stultorum*, and mention instances of its continued use having rendered people maniacal. But the kernel of anacardium is not different in quality from that of almonds. The ill effects attributed to this fruit belong only to the juice contained betwixt the kernels, whose acrimony is so great, that it is said to be employed by the Indians as a caustic. This juice is recommended externally for tetters, freckles, and other cutaneous deformities; which it removes only by exulcerating or excoriating the part, so that a new skin comes underneath.

BEAR, in *Zoology.* See Ursus, Mammalia *Index.*

Sea-Bear. See Phoca, Mammalia *Index.*

Bear, in *Astronomy.* See Ursa, Astronomy *Index.*

Order of the Bear was a military order in Switzerland, erected by the emperor Frederick II. in 1213, by way of acknowledgment for the service the Swiss had done him, and in favour of the abbey of St Gal. To the collar of the order hung a medal, on which was represented a bear raised on an eminence of earth.

Bear's-Breech. See Acanthus, Botany *Index.*

Bear's Flesh was much esteemed by the ancients: even at this day, the paw of a bear salted and smoked, is served up at the tables of princes.

Bear's-Grease was formerly esteemed a sovereign remedy against cold disorders, especially rheumatisms. It is now much used in dressing ladies and gentlemen's hair.

Bear's-Skin makes a fur in great esteem, and on which depends a considerable article of commerce, being used in housings, on coach-boxes, &c. In some countries, clothes are made of it, more especially bags wherein to keep the feet warm in severe colds. Of the skins of bears cubs are made gloves, muffs, and the like.

BEARALSTON, a small town of Devonshire, which, however, is a borough by prescription, and sends two members to parliament.

BEARD, the hair growing on the chin and adjacent parts of the face, chiefly of adults and males.

Various have been the ceremonies and customs of most nations in regard of the beard. The Tartars, out of a religious principle, waged a long and bloody war with the Persians, declaring them infidels, merely because they would not cut their whiskers after the rite of Tartary; and we find, that a considerable branch of the religion of the ancients consisted in the management of their beards. The Greeks wore their beards till the time of Alexander the Great; that prince having ordered the Macedonians to be shaved, for fear it should give a handle to their enemies. According to Pliny, the Romans did not begin to shave till the year of Rome 454, when P. Ticinius brought over a stock of barbers from Sicily.—Persons of quality had their children shaved the first time by others of the same or greater quality, who, by this means, became godfather or adoptive father of the children. Anciently, indeed, a person became godfather of the child by barely touching his beard: thus historians relate, that one of the articles of the treaty between Alaric and Clovis was, that Alaric should touch the beard of Clovis to become his godfather.

As to ecclesiastics, the discipline has been very different on the article of beards: sometimes they have been enjoined to wear them, from a notion of too much effeminacy in shaving, and that a long beard was more suitable to the ecclesiastical gravity; and sometimes again they were forbid it, as imagining pride to lurk

Digitized by Google

beneath a venerable beard. The Greek and Roman churches have been long together by the ears about their beards; since the time of their separation, the Romanists seem to have given more into the practice of shaving, by way of opposition to the Greeks; and have even made some express constitutions *de radendis barbis*. The Greeks, on the contrary, espouse very zealously the cause of long beards, and are extremely scandalized at the beardless images of saints in the Roman churches. By the statutes of some monasteries, it appears, that the lay-monks were to let their beards grow, and the priests among them to shave; and that the beards of all that were received into the monasteries, were blessed with a great deal of ceremony. There are still extant the prayers used in the solemnity of consecrating the beard to God, when an ecclesiastic was shaven.

Le Compte observes, that the Chinese affect long beards extravagantly; but nature has balked them, and only given them very little ones, which, however, they cultivate with infinite care: the Europeans are strangely envied by them on this account, and esteemed the greatest men in the world. Chrysostom observes, that the kings of Persia had their beards wove or matted together with gold thread; and some of the first kings of France had their beards knotted and buttoned with gold.

Among the Turks, it is more infamous for any one to have his beard cut off, than among us to be publicly whipt or branded with a hot iron. There are abundance in that country, who would prefer death to this kind of punishment. The Arabs make the preservation of their beards a capital point of religion, because Mahomet never cut his. Hence the razor is never drawn over the Grand Signior's face. The Persians, who clip them, and shave above the jaw, are reputed heretics. It is likewise a mark of authority and liberty among them, as well as among the Turks. They who serve in the seraglio, have their beards shaven, as a sign of their servitude. They do not suffer it to grow till the sultan has set them at liberty, which is bestowed as a reward upon them, and is always accompanied with some employment.

The most celebrated ancient writers, and several modern ones, have spoken honourably of the fine beards of antiquity. Homer speaks highly of the white beard of Nestor and that of old King Priam. Virgil describes Mezentius's to us, which was so thick and long as to cover all his breast; Chrysippus praises the noble beard of Timothy, a famous player on the flute. Pliny the Younger tells us of the white beard of Euphrates, a Syrian philosopher; and he takes pleasure in relating the respect mixed with fear with which it inspired the people. Plutarch speaks of the long white beard of an old Laconian, who being asked why he let it grow so, replied, *'Tis that, seeing continually my white beard, I may do nothing unworthy of its whiteness.* Strabo relates, that the Indian philosophers, the Gymnosophists, were particularly attentive to make the length of their beards contribute to captivate the veneration of the people. Diodorus, after him, gives a very particular and circumstantial history of the beards of the Indians. Juvenal does not forget that of Antilochus the son of Nestor. Fenelon, in describing a priest of Apollo in all his magnificence, tells us that he had a white beard down to his girdle. But Persius seems to outdo all these authors: this poet was so convinced that a beard was the symbol of wisdom, that he thought he could not bestow a greater encomium on the divine Socrates, than by calling him the bearded master, *Magistrum barbatum.*

While the Gauls were under their sovereignty, none but the nobles and Christian priests were permitted to wear long beards. The Franks having made themselves masters of Gaul, assumed the same authority as the Romans; the bondsmen were expressly ordered to shave their chins; and this law continued in force until the entire abolishment of servitude in France. So likewise, in the time of the first race of kings, a long beard was the sign of nobility and freedom. The kings, as being the highest nobles in their kingdom, were emulous likewise to have the largest beard: Eginard, secretary to Charlemagne, speaking of the last kings of the first race, says, they came to the assemblies in the Field of Mars in a carriage drawn by oxen, and sat on the throne with their hair dishevelled, and a very long beard, *crine profuso, barba submissa, solio residerent, et speciem dominantis effingerent.*

To touch any one's beard, or cut off a bit of it, was, among the first French, the most sacred pledge of protection and confidence. For a long time all letters that came from the sovereign had, for greater sanction, three hairs of his beard in the seal. There is still in being a charter of 1121, which concludes with the following words: *Quod ut ratum et stabile perseveret in posterum, præsentis scripto sigilli mei robur apposui cum tribus pilis barbæ meæ.*

Several great men have honoured themselves with the surname of *Bearded.* The emperor Constantine is distinguished by the epithet of *Pogonata*, which signifies *the Bearded.* In the time of the Crusades, we find there was a *Geffrey the Bearded:* Baldwin IV. earl of Flanders, was surnamed *Handsome beard;* and, in the illustrious house of Montmorenci, there was a famous *Bouchard*, who took a pride in the surname of *Bearded:* he was always the declared enemy of the monks, without doubt, because of their being shaved.

In the tenth century, we find, that King Robert (of France) the rival of Charles the Simple, was not more famous for his exploits than for his long white beard. In order that it might be more conspicuous to the soldiers when he was in the field, he used to let it hang down outside his cuirass: this venerable sight encouraged the troops in battle, and served to rally them when they were defeated.

A celebrated painter in Germany, called *John Mayo*, had such a large beard that he was nicknamed *John the Bearded;* it was so long that he wore it fastened to his girdle; and though he was a very tall man, it would hang upon the ground when he stood upright. He took the greatest care of this extraordinary beard; sometimes he would untie it before the emperor Charles V. who took great pleasure to see the wind make it fly against the faces of the lords of his court.

In England, the famous chancellor Thomas More, one of the greatest men of his time, being on the point of falling a victim to court intrigues, was able, when on the fatal scaffold, to procure respect to his beard in presence of all the people, and saved it, as one may say,

Digitized by Google

Beard.

say, from the fatal stroke which he could not escape himself. When he had laid his head on the block, he perceived that his beard was likely to be hurt by the axe of the executioner; on which he took it away, saying, *My beard has not been guilty of treason; it would be an injustice to punish it.*

But let us turn our eyes to a more flattering object, and admire the beard of the best of kings, the ever precious beard of the great Henry IV. of France, which diffused over the countenance of that prince a majestic sweetness and amiable openness, a beard ever dear to posterity, and which should serve as a model for that of every great king, as the beard of his illustrious minister should for that of every minister. But what dependence is there to be put on the stability of the things of this world? By an event, as fatal as unforeseen, the beard, which was arrived at its highest degree of glory, all of a sudden lost its favour, and was at length entirely proscribed. The unexpected death of Henry the Great, and the youth of his successor, were the sole causes of it.

Louis XIII. mounted the throne of his glorious ancestors without a beard. Every one concluded immediately, that the courtiers, seeing their young king with a smooth chin, would look upon their own as too rough. The conjecture proved right; for they presently reduced their beards to whiskers, and a small tuft of hair under the nether lip.

The people at first would not follow this dangerous example. The duke of Sully never would adopt this effeminate custom. This man, both great as a general and a minister, was likewise so in his retirement; he had the courage to keep his long beard, and to appear with it at the court of Louis XIII. where he was called to give his advice in an affair of importance. The young crop-bearded courtiers laughed at the sight of his grave look and old-fashioned phiz. The duke, nettled at the affront put on his fine beard, said to the king, "Sir, when your father, of glorious memory, did me the honour to consult me on his great and important affairs, the first thing he did was to send away all the buffoons and stage-dancers of his court."

The Czar Peter, who had so many claims to the surname of *Great*, seems to have been but little worthy of it on this occasion. He had the boldness to lay a tax on the beards of his subjects. He ordered that the noblemen and gentlemen, tradesmen and artisans (the priests and peasants excepted) should pay 100 rubles to be able to retain their beards; that the lower class of people should pay a copeck for the same liberty; and he established clerks at the gates of the different towns to collect these duties. Such a new and singular impost troubled the vast empire of Russia. Both religion and manners were thought in danger. Complaints were heard from all parts; they even went so far as to write libels against the sovereign; but he was inflexible, and at that time powerful. Even the fatal scenes of St Bartholomew were renewed against these unfortunate beards, and the most unlawful violences were publicly exercised. The razor and scissars were everywhere made use of. A great number, to avoid these cruel extremities, obeyed with reluctant sighs. Some of them carefully preserved the sad trimmings of their chins; and, in order to be never separated from these dear locks, ordered that they should be placed with them in their coffins.

Example, more powerful than authority, produced in Spain, what it had not been able to bring about in Russia without great difficulty. Philip V. ascended the throne with a shaved chin. The courtiers imitated the prince, and the people, in turn, the courtiers. However, though this revolution was brought about without violence and by degrees, it caused much lamentation and murmuring; the gravity of the Spaniards lost by the change. The favourite customs of a nation can never be altered without incurring displeasure. They have this old saying in Spain: *Desde que no hay barba, no hay mas alma.* "Since we have lost our beards, we have lost our souls."

Among the European nations that have been most curious in beards and whiskers, we must distinguish Spain. This grave romantic nation has always regarded the beard as the ornament which should be most prized; and the Spaniards have often made the loss of honour consist in that of their whiskers. The Portuguese, whose national character is much the same, are not the least behind them in that respect. In the reign of Catherine queen of Portugal, the brave John de Castro had just taken in India the castle of Diu: victorious, but in want of every thing, he found himself obliged to ask the inhabitants of Goa to lend him a thousand pistoles for the maintenance of his fleet; and, as a security for that sum, he sent them one of his whiskers, telling them, "All the gold in the world cannot equal the value of this natural ornament of my valour; and I deposit it in your hands as a security for the money." The whole town was penetrated with his heroism, and every one interested himself about this invaluable whisker: even the women were desirous to give marks of their zeal for so brave a man: several sold their bracelets to increase the sum asked for; and the inhabitants of Goa sent him immediately both the money and his whisker. A number of other examples of this kind might be produced, which do as much honour to whiskers as to the good faith of those days.

In Louis XIII.'s reign, whiskers attained the highest degree of favour, at the expence of the expiring beards. In those days of gallantry, not yet empoisoned by wit, they became the favourite occupation of lovers. A fine black whisker, elegantly turned up, was a very powerful mark of dignity with the fair sex. Whiskers were still in fashion in the beginning of Louis XIV.'s reign. This king, and all the great men of his reign, took a pride in wearing them. They were the ornament of Turenne, Conde, Colbert, Corneille, Moliere, &c. It was then no uncommon thing for a favourite lover to have his whiskers turned up, combed, and pomatumed, by his mistress; and, for this purpose, a man of fashion took care to be always provided with every little necessary article, especially whisker-wax. It was highly flattering to a lady to have it in her power to praise the beauty of her lovers's whiskers: which, far from being disgusting, gave his person an air of vivacity: several even thought them an incitement to love. It seems the levity of the French made them undergo several changes both in form and name; there were *Spanish*, *Turkish*, *guard-dagger*, &c.

whiskers;

Digitized by Google

whiskers; in short, *royal* ones, which were the last worn; their smallness proclaimed their approaching fall.

Consecration of the BEARD was a ceremony among the Roman youth, who, when they were shaved the first time, kept a day of rejoicing, and were particularly careful to put the hair of their beard into a silver or gold box, and make an offering of it to some god, particularly to Jupiter Capitolinus, as was done by Nero, according to Suetonius.

Kissing the BEARD. The Turkish wives kiss their husbands beards, and children their fathers, as often as they come to salute them. The men kiss one another's beards reciprocally on both sides, when they salute in the streets, or come off from any journey.

The Fashion of the BEARD has varied in different ages and countries; some cultivating and entertaining one part of it, some another. Thus the Hebrews wear a beard on their chin; but not on the upper lip or cheeks. Moses forbids them to cut off entirely the angle or extremity of their beard; that is, to manage it after the Egyption fashion, who left only a little tuft of beard at the extremity of their chin; whereas the Jews to this day suffer a little fillet of hair to grow from the lower end of their ears to their chins, where, as well as on their lower lips, their beards are in a pretty long bunch. The Jews, in time of mourning, neglected to trim their beards, that is, to cut off what grew superfluous on the upper lips and cheeks. In time of grief and great affliction they also plucked off the hair of their beards.

Anointing the BEARD with unguents was an ancient practice both among the Jews and Romans, and still continues in use among the Turks; where one of the principal ceremonies observed in serious visits is to throw sweet-scented water on the beard of the visitant, and to perfume it afterwards with aloes-wood, which sticks to this moisture, and gives it an agreeable smell, &c. In middle-age writers we meet with *adlentare barbam*, used for stroking and combing it, to render it soft and flexible. The Turks, when they comb their beards, hold a handkerchief on their knees, and gather very carefully the hairs that fall; and when they have got together a certain quantity, they fold them up in paper, and carry them to the place where they bury the dead.

BEARD *of a Comet*, the rays which the comet emits towards that part of the heaven to which its proper motion seems to direct it; in which the beard of a comet is distinguished from the tail, which is understood of the rays emitted towards that part from whence its motion seems to carry it.

BEARD *of a Horse*, that part underneath the lower mandible on the outside and above the chin, which bears the curb. It is also called the *chuck*. It should have but little flesh upon it, without any chops, hardness, or swelling; and be neither too high raised nor too flat, but such as the curb may rest in its right place.

BEARD *of a Muscle, Oyster*, or the like, denotes an assemblage of threads or hairs, by which these animals fasten themselves to stones. The hairs of this beard terminate in a flat spongy substance, which being applied to the surface of a stone, sticks thereto, like the wet leather used by boys.

BEARDS, in the history of insects, are two small, oblong, fleshy bodies, placed just above the trunk, as in the gnats, and in the moths and butterflies.

BEARDED, denotes a person or thing with a beard, or some resemblance thereof. The faces on ancient Greek and Roman medals are generally bearded. Some are denominated *pogonati*, as having long beards, e. g. the Parthian kings. Others have only a lanugo about the chin, as the Seleucid family. Adrian was the first of the Roman emperors who nourished his beard; hence all imperial medals before him are *beardless*; after him, *bearded*.

BEARDED *Women* have been all observed to want the menstrual discharge; and several instances are given by Hippocrates, and other physicians, of grown women, especially widows, in whom the menses coming to stop, beards appeared. Eusebius Nierembergius mentions a woman who had a beard reaching to her navel.

Of women remarkably bearded we have several instances. In the cabinet of curiosities of Stutgard in Germany, there is the portrait of a woman called *Bartel Graetje*, whose chin is covered with a very large beard. She was drawn in 1587, at which time she was but 25 years of age. There is likewise in the same cabinet another portrait of her when she was more advanced in life, but likewise with a beard.—It is said, that the duke of Saxony had the portrait of a poor Swiss woman taken, remarkable for her long bushy beard; and those who were at the carnival at Venice in 1726, saw a female dancer astonish the spectators not more by her talents than by her chin covered with a black bushy beard.—Charles XII. had in his army a female grenadier: it was neither courage nor a beard that she wanted to be a man. She was taken at the battle of Pultowa, and carried to Petersburg, where she was presented to the Czar in 1724: her beard measured a yard and a half. We read in the Trévoux Dictionary, that there was a woman seen at Paris, who had not only a bushy beard on her face, but her body likewise covered all over with hair. Among a number of other examples of this nature, that of Margaret, the governess of the Netherlands, is very remarkable. She had a very long stiff beard, which she prided herself on; and being persuaded that it contributed to give her an air of majesty, she took care not to lose a hair of it. This Margaret was a very great woman.—It is said, that the Lombard women, when they were at war, made themselves beards with the hair of their heads, which they ingeniously arranged on their cheeks, in order that the enemy, deceived by the likeness, might take them for men. It is asserted, after Suidas, that in a similar case the Athenian women did as much. These women were more men than our Jemmy Jessamy countrymen.—About a century ago, the French ladies adopted the mode of dressing their hair in such a manner that curls hung down their cheeks as far as their bosom. These curls went by the name of *whiskers*. This custom undoubtedly was not invented after the example of the Lombard women, to fright the men. Neither is it with intention to carry on a very bloody war, that in our time they have affected to bring forward the hair of the temple on the cheeks.

BEARERS, in *Heraldry*. See SUPPORTERS.

BEARING, in *Navigation*, an arch of the horizon intercepted between the nearest meridian and any distinct

Digitized by Google

stinct object, either discovered by the eye, or resulting from the finical proportion; as in the first case, at 4 P. M. Cape Spado, in the isle of Candia, bore S. by W. by the compass. In the second, the longitudes and latitudes of any two places being given, and consequently the difference of latitude and longitude between them, the bearing from one to the other is discovered by the following analogy:

As the meridional difference of latitude
Is to the difference of longitude;
So is the radius
To the tangent bearing.

Bearing is also the situation of any distant object, estimated from some part of the ship according to her position. In this sense, an object so discovered must be either ahead, astern, abreast on the bow, or on the quarter. These bearings, therefore, which may be called *mechanical*, are on the beam, before the beam, abaft the beam, on the bow, on the quarter, ahead, or astern. If the ship sails with a side-wind, it alters the names of such bearings in some measure, since a distant object on the beam is then said to be to leeward or to windward; on the lee-quarter or bow, and on the weather-quarter or bow.

Bearing, in the sea-language. When a ship sails towards the shore, before the wind, she is said to *bear in* with the land or harbour. To let the ship sail more before the wind, is to *bear up*. To put her right before the wind, is to *bear round*. A ship that keeps off from the land, is said to *bear off*. When a ship that was to windward comes under a ship's stern, and so gives her the wind, she is said to *bear under her lee*, &c. There is another sense of this word, in reference to the burden of a ship; for they say a ship bears, when having too slender or lean a quarter, she will sink too deep into the water with an overlight freight, and thereby can carry but a small quantity of goods.

Bearings, in *Heraldry*, a term used to express a coat of arms, or the figures of armories by which the nobility and gentry are distinguished from the vulgar and from one another. See Heraldry.

Bearing Claws, among cock-fighters, denote the foremost toes, on which the bird goes; and if they be hurt or gravelled, he cannot fight.

Bearing of a Stag, is used in respect of the state of his head or the croches which he bears on his horns. If you be asked what a stag bears, you are only to reckon the croches, and never to express an odd number; as, if he have four croches on his near horn and five on his far, you must say he bears ten; a false right on his near horn: if but four on the near horn and six on the far horn, you must say he bears twelve; a double false right on the near horn.

BEARN, a late province of France, bounded on the east by Bigorre, on the south by the mountains of Arragon, on the west by Soule and part of Navarre, and on the north by Gascony and Armagnac. It lies at the foot of the Pyrenean mountains, being about 16 leagues in length and 12 in breadth. It is in general a barren country; yet the plains yield considerable quantities of flax, and a good quantity of Indian corn called *mailloc*. The mountains are rich in mines of iron, copper, and lead; some of them also are covered with vines, and others with pine trees; and they give rise to several mineral springs, and two considerable rivers, the one called the *Gave of Oleron*, and the other the *Gave of Bearn*. Some wine is exported from this country; and the Spaniards buy up great numbers of the horses and cattle, together with most of their linen, of which there is a considerable manufactory. The principal places are Pau, Lescar, Ortez, Novarreins, Sallies, and Oleron. This province, with Basques, forms the department of the Lower Pyrenees.

BEAST, in a general sense, an appellation given to all four-footed animals, fit either for food, labour, or sport.

Beasts of Burden, in a commercial sense, all four-footed animals which serve to carry merchandises on their backs. The beasts generally used for this purpose are, elephants, dromedaries, camels, horses, mules, asses, and the sheep of Mexico and Peru.

Beasts of the Chase are five, viz. the buck, the doe, the fox, the roe, and the marten.

Beasts and Fowls of the Warren, are the hare, the coney, the pheasant, and partridge.

Beasts of the Forest, are the hart, hind, hare, boar, and wolf.

Beast, among gamesters, a game at cards, played in this manner: The best cards are the king, queen, &c. whereof they make three heaps, the king, the play, and troilet. Three, four, or five, may play; and to every one is dealt five cards. However, before the play begins, every one stakes to the three heaps. He that wins most tricks, takes up the heap called the *play*; he that hath the king takes up the heap so called; and he that hath three of any sort, that is, three fours, three fives, three sixes, &c. takes up the troilet heap.

BEAT, in a general signification, signifies to chastise, strike, knock, or vanquish.

This word has several other significations in the manufactures, and in the arts and trades. Sometimes it signifies to forge and hammer; in which sense smiths and farriers say, to *beat iron*. Sometimes it means to pound, to reduce into powder: thus we say, to *beat drugs*, to *beat pepper*, to *beat spices*; that is to say, to *pulverize them*.

Beat, in fencing denotes a blow or stroke given with the sword. There are two kinds of beats; the first performed with the foible of a man's sword on the foible of his adversary's, which in the schools is commonly called *baterie*, from the French *batre*, and is chiefly used in a pursuit, to make an open upon the adversary. The second and best kind of beat, is performed with the fort of a man's sword upon the foible of his adversary's, not with a spring, as in binding, but with a jerk or dry beat; and is therefore most proper for the parades without or within the sword, because of the rebound a man's sword has thereby from his adversary's, whereby he procures to himself the better and surer opportunity of risposting.

Beat, in the manege. A horse is said *to beat the dust*, when at each stroke or motion he does not take in ground or way enough with his fore-legs. He is more particularly said to beat the dust at *terra à terra*, when he does not take in ground enough with his shoulders, making his strokes or motions too short, as if he made them all in one place. He *beats the dust at curvets*, when he does them too precipitately and too low. He *beats upon a walk*, when he walks too short, and

Digitized by Google

and thus rids but little ground, whether it be in straight lines, rounds, or passings.

Beat of Drum, in the military art, is to give notice by beat of drum of a sudden danger; or, that scattered soldiers may repair to their arms and quarters, is to beat an alarm, or to arms. Also to signify, by different manners of sounding a drum, that the soldiers are to fall on the enemy; to retreat before, in, or after, an attack; to move or march from one place to another; to permit the soldiers to come out of their quarters at break of day; to order to repair to their colours, &c. is to beat a charge, a retreat, a march, &c.

Beat, in clock-making. See Beats.

Beat, *St*, a town of France, in the department of Upper Garonne, at the confluence of the Garonne and the Pique. It is seated between two mountains which are close to the town on each side. The houses are chiefly built with marble. W. Long. 1. 6. N. Lat. 42. 50.

BEATER is applied, in matters of commerce, to divers sorts of workmen, whose business is to hammer or flatten certain matters, particularly metals.

Gold-Beaters, are artisans, who, by beating gold and silver with a hammer on a marble in moulds of vellum and bullocks guts, reduce them to thin leaves fit for gilding or silvering of copper, iron, steel, wood, &c. Gold-beaters differ from flatters of gold or silver; as the former bring their metal into leaves by the hammer, whereas the latter only flatten it by pressing it through a mill preparatory to beating.

There are also *Tin-Beaters* employed in the looking-glass trade, whose business is to beat tin on large blocks of marble till it be reduced to thin leaves fit to be applied with quicksilver behind looking-glasses. See Foliating, *Gold-Beating*.

BEATIFICATION, an act by which the pope declares a person beatified or blessed after his death. It is the first step towards canonization, or raising any one to the honour and dignity of a saint. No person can be beatified till 50 years after his or her death. All certificates or attestations of virtues and miracles, the necessary qualifications for saintship, are examined by the congregation of rites. This examination often continues for several years; after which his holiness decrees the beatification. The corps and relics of the future saint are from henceforth exposed to the veneration of all good Christians; his images are crowned with rays, and a particular office is set apart for him; but his body and relics are not carried in procession: indulgences likewise, and remission of sins, are granted on the day of his beatification; which though not so pompous as that of canonization, is however very splendid.

BEATING, or Pulsation, in *Medicine*, the reciprocal agitation or palpitation of the heart or pulse.

Beating Flax or *Hemp*, is an operation in the dressing of these matters, contrived to render them more soft and pliant. When hemp has been swingled a second time, and the hurds laid by, they take the strikes, and dividing them into dozens and half dozens, make them up into large thick rolls, which being broached on long strikes, are set in the chimney corner to dry; after which they lay them in a round trough made for the purpose, and there with beetles beat them well till they handle both without and within as pliant as possible, without any hardness or roughness to be felt; that done, they take them from the trough, open and divide the strikes as before; and if any be found not sufficiently beaten, they roll them up and beat them over as before.

Beating hemp is a punishment inflicted on loose or disorderly persons.

Beating, in book-binding, denotes the knocking a book in quires on a marble block, with a heavy broad-faced hammer, after folding, and before binding or stitching it. On the beating it properly, the elegance and excellence of the binding, and the easy opening of the book, principally depend.

Beating, in the paper-works, signifies the beating of paper on a stone with a heavy hammer, with a large smooth head and short handle, in order to render it more smooth and uniform, and fit for writing.

Beating the Wind, was a practice in use in the ancient method of trial by combat. If either of the combatants did not appear in the field at the time appointed, the other was to beat the wind, or make so many flourishes with his weapon; by which he was entitled to all the advantages of a conqueror.

Beating the Hands or *Feet*, by way of praise or approbation. See Applause.

Beating Time, in *Music*, a method of measuring and marking the time for performers in concert, by a motion of the hand and foot up or down successively and in equal times. Knowing the true time of a crotchet, and supposing the measure actually subdivided into four crotchets, and the half measure into two, the hand or foot being up, if we put it down with the very beginning of the first note or crotchet, and then raise it with the third, and then down with the beginning of the next measure; this is called *beating the time*; and, by practice, a habit is acquired of making this motion very equal. Each down and up is sometimes called a *time* or *measure*. The general rule is to contrive the division of the measure so, that every down and up of the beating shall end with a particular note, on which very much depends the distinctness, and, as it were, the sense of the melody. Hence the beginning of every time or beating in the measure is reckoned the accented part thereof.

Beating time is denoted, in the Italian music, by the term *à battuta*, which is usually put after what they call *recitativo*, where little or no time is observed, to denote, that here they are to begin again to mark or beat the time exactly.

The Romans aimed at somewhat of harmony in the strokes of their oars; and had an officer called *portisculus* in each galley, whose business was to beat time to the rowers, sometimes by a pole or mallet, and sometimes by his voice alone.

The ancients marked the rhime in their musical compositions: but to make it more observable in the practice, they beat the measure or time, and this in different manners. The most usual consisted in a motion of the foot, which was raised from, and struck alternately against, the ground, according to the modern method. Doing this was commonly the province of the master of the music, who was thence called μεσοχορος and κορυφαιος, because placed in the middle of the choir of muscians, and in an elevated situation, to be seen and heard more easily by the whole company. These beaters of measure were also called by the

Greeks ποδοκτυποι and ποδοψοφοι, because of the noise of their feet; and συιλεσμαριοι, because of the uniformity or monotony of the rhythm. The Latins denominated them *pedarii*, *podarii*, and *pedicularii*. To make the beats or strokes more audible, their feet were generally shod with a sort of sandals either of wood or iron, called by the Greeks κρουπεζια, κρουπαλα, κρουπετα, and by the Latins *pedicula*, *scabella*, or *scabilla*, because like to little stools or footstools. Sometimes they beat upon sonorous footstools, with the foot shod with a wooden or iron sole. They beat the measure not only with the foot, but also with the right hand, all the fingers whereof they joined together, to strike into the hollow of the left. He who thus marked the rhythm, was called *manuductor*. The ancients also beat time or measure with shells, as oyster shells and bones of animals, which they struck against one another, much as the moderns now use castanets, and the like instruments. This the Greeks called κρεμβαλιαζειν, as is noted by Hesychius. The scholiast on Aristophanes speaks much to the same purpose. Other noisy instruments, as drums, cymbals, citterns, &c. were also used on the same occasion. They beat the measure generally in two equal or unequal times; at least this holds of the usual rhythm of a piece of music, marked either by the noise of sandals, or the slapping of the hands. But the other rhythmic instruments last-mentioned, and which were used principally to excite and animate the dancers, marked the cadence after another manner; that is, the number of their percussions equalled, or even sometimes surpassed, that of the different sounds which composed the air or song played.

BEATING, with hunters, a term used of a stag, which runs first one way and then another. He is then said *to beat up and down*.—The noise made by conies in rutting time is also called *beating* or *tapping*.

BEATING, in *Navigation*, the operation of making a progress at sea against the direction of the wind, in a zig-zag line or traverse, like that in which we ascend a steep hill. See TACKING.

BEATITUDE imports the supreme good, or the highest degree of happiness human nature is suceptible of; or the most perfect state of a rational being, wherein the soul has attained to the utmost excellency and dignity it is framed for. In which sense, it amounts to the same with what we otherwise call *blessedness* and *sovereign felicity;* by the Greeks, ευδαιμονια; and by the Latins, *summum bonum*, *beatitudo*, and *beatitas*.

BEATITUDE, among divines, denotes the beatific vision, or the fruition of God in a future life to all eternity.

BEATITUDE is also used in speaking of the theses contained in Christ's sermon on the mount, whereby he pronounces blessed the poor in spirit, those that mourn, the meek, &c.

BEATON, DAVID, archbishop of St Andrew's, and a cardinal of Rome, in the early part of the 16th century, was born in 1494. Pope Paul III. raised him to the degree of a cardinal in December 1538; and being employed by James V. in negociating his marriage with the court of France, he was there consecrated bishop of Mirepoix. Soon after his instalment as archbishop of St Andrew's, he promoted a furious persecution of the reformers in Scotland; when the king's death put a stop, for a time, to his arbitrary proceedings, he being then excluded from affairs of government, and confined. He raised, however, so strong a party, that, upon the coronation of the young Queen Mary, he was admitted of the council, made chancellor, and procured commission as legate *à latere* from the court of Rome. He now began to renew his persecution of heretics; and among the rest, of the famous Protestant preacher Mr George Wishart, whose sufferings at the stake the cardinal viewed from his window with apparent exultation. It is pretended, that Wishart at his death foretold the murder of Beaton; which indeed happened shortly after, he being assassinated in his chamber, May 29. 1547. He was a haughty bigotted churchman, and thought severity the proper method of suppressing heresy; he had great talents, and great vices. See SCOTLAND.

BEATORUM INSULA, in *Ancient Geography*, seven days journey to the west of Thebæ, a district of the Nomos Oasites; called an *island*, because surrounded with sand, like an island in the sea, (Ulpian); yet abounding in all the necessaries of life, though encompassed with vast sandy deserts, (Strabo); which some suppose to be a third Oasis, in the Regio Ammoniaca; and the site of the temple of Ammon answers to the above description, as appears from the writers on Alexander's expedition thither. It was a place of relegation or banishment for criminals. (Ulpian).

BEATTIE, JAMES, an eminent Scottish poet and moralist. See SUPPLEMENT.

BEATS, in a watch or clock, are the strokes made by the fangs or pallets of the spindle of the balance, or of the pads in a royal pendulum. See CLOCK and WATCH.

BEAUCAIRE, a town of France, in the department of Gard, on the Rhone, opposite Tarascon, with which it has a communication by a bridge of boats. One of the most celebrated fairs in Europe is annually held here. E. Long. 5. 49. N. Lat. 43. 39.

BEAUCE, a late province of France, lying between the Isle of France, Blasois, and Orleannois. It is so very fertile in wheat, that it is called the *Granary* of Paris. Chartres is the principal town. It now forms the department of Eure and Loire.

BEAVER, in *Zoology*. See CASTOR, MAMMALIA *Index*.

BEAVER *Skins*, in commerce. Of these, merchants distinguish three sorts; the new, the dry, and the fat.

The new beaver, which is also called the *white beaver*, or *Muscovy beaver*, because it is commonly kept to be sent into Muscovy, is that which the savages catch in their winter hunting. It is the best, and the most proper for making fine furs, because it has lost none of its hair by shedding.

The dry beaver, which is sometimes called *lean beaver*, comes from the summer hunting, which is the time when these animals lose part of their hair. Though this sort of beaver be much inferior to the former, yet it may also be employed in furs; but it is chiefly used in the manufacture of hats. The French call it *summer castor*, or *beaver*.

The fat beaver is that which has contracted a certain gross and oily humour, from the sweat which exhales from the bodies of the savages, who wear it for some

Digitized by Google

some time. Though this sort be better than the dry beaver, yet it it used only in the making of hats.

Besides hats and furs, in which the beaver's hair is commonly used, they attempted in France, in the year 1699, to make other manufactures of it: and accordingly they made cloths, flannels, stockings, &c. partly of beavers hair, and partly of Segovia wool. This manufactory, which was set up at Paris, in the suburb of St Anthony, succeeded at first pretty well; and according to the genius of the French, the novelty of the thing brought into some repute the stuffs, stockings, gloves, and cloth, made of beavers hair. But they went out of fashion on a sudden, because it was found, by experience, that they were of a very bad wear, and besides that the colours faded very much; when they had been wet, they became dry and hard, like felt, which occasioned the miscarriage of the manufactory for that time.

When the hair has been cut off from the beavers skins, to be used in the manufacturing of hats, those skins are still employed by several workmen; namely, by the trunk-makers, to cover trunks and boxes; by the shoemakers, to put into slippers; and by turners, to make sieves for sifting grain and seeds.

BEAUFORT, a town of France, in the department of Maine and Loire, with a castle, near the river Authion. It contains two parishes, and formerly had a convent of Recolets, and contained about 6000 inhabitants in 1815. W. Long. 0. 3. N. Lat. 47. 26.

Beaufort gives title of duke in England to the noble family of Somerset, who are lineally descended from John of Gaunt duke of Lancaster, whose duchess resided in this town.

BEAUFORT, a strong town of Savoy in Italy, on the river Oron. E. Long. 6. 48. N. Lat. 45. 40.

BEAUGENCY, a town of France in the department of Loire, seated on the river Loire. It is famous for its wines. E. Long. 1. 46. N. Lat. 47. 48.

BEAUJEU, a town of France, in the department of Rhone and Loire, with an old castle. It is seated on the river Ardieres, at the foot of a mountain, in E. Long. 4. 40. N. Lat. 46. 9.

BEAUJOLOIS, a district of France, now included in the department of Rhone and Loire. It is 25 miles in length, and 20 in breadth; and Ville Franche is the capital town.

BEAULIEU, SEBASTIAN DE PONTAULT DE, a celebrated French engineer, and field-marshal under Louis XIV. He published plans of all the military expeditions of his master, with military lectures annexed. He died in 1674.

BEAUMARCHAIS, P. A. C. a French dramatic writer. See SUPPLEMENT.

BEAUMARIS, a market town of Anglesey in North Wales, which sends one member to parliament. W. Long. 4. 15. N. Lat. 53. 25.

It is pleasantly seated on a low land at the water's edge; is neat and well built, and contained 1510 inhabitants in 1811. Edward I. created the place; for after founding the castles of Caernarvon and Conway, he discovered that it was necessary to put another curb on the Welch. He therefore built a fortress here in 1295; and fixed on a marshy spot, near the chapel of St Meugan, such as gave him opportunity of forming a great foss round the castle, and of filling it with water from the sea. He also cut a canal, in order to permit vessels to discharge their lading beneath the walls: and as a proof of the existence of such a convenience, there were within this century iron rings affixed to them, for the purpose of mooring the ships or boats. The marsh was in early times of far greater extent than at present, and covered with fine bulrushes. The first governor was Sir William Pickmore, a Gascon knight appointed by Edward I. There were a constable of the castle, and a captain of the town. The first had an annual fee of forty pounds, the last of twelve pounds three shillings and fourpence; and the porter of the gate of Beaumaris had nine pounds two shillings and sixpence. Twenty-four soldiers were allowed for the guard of the castle and town, at fourpence a-day to each. The constable of the castle was always captain of the town, except in one instance: in the 36th of Henry IV. Sir John Boteler held the first office, and Thomas Norreys the other. The castle was extremely burthensome to the country; quarrels were frequent between the garrison and the country people. In the time of Henry VI. a bloody fray happened, in which David ap Evan ap Howel of Llwydiarth, and many others, were slain. From the time of Sir Rowland Villeville, *alias* Britayne, reputed base son of Henry VII. and constable of the castle, the garrison was withdrawn till the year 1642, when Thomas Cheadle, deputy to the earl of Dorset, then constable, put into it men and ammunition. In 1643, Thomas Bulkeley, Esq. soon after created Lord Bulkeley, succeeded: his son Colonel Richard Bulkeley, and several gentlemen of the county, held it for the king till June 1646, when it surrendered on honourable terms to General Mytton, who made Captain Evans his deputy-governor. In 1653, the annual expence of the garrison was seventeen hundred and three pounds. Edward I. when he built the town, surrounded it with walls, made it a corporation, and endowed it with great privileges, and lands to a considerable value. He removed the ancient freeholders by exchange of property into other counties. Henllys, near the town, was the seat of Gwerydd ap Rhys Goch, one of fifteen tribes, and of his posterity till this period, when Edward removed them to Boddle Wyddan in Flintshire, and bestowed their ancient patrimony on the corporation. It sends one member to parliament. Its first representative was Maurice Griffydd, who sat in the seventh year of Edward VI. There is very good anchorage for ships in the bay which lies before the town, and has seven fathom water even at the lowest ebb. Vessels often find security here in hard gales. The town has no trade of any kind, yet has its customhouse for the casual reception of goods. The ferry lies near the town, and is passable at low water. It was granted by charter to the corporation in the 4th of Queen Elizabeth. There is an order from Edward II. to Robert Power, chamberlain of North Wales, to inspect into the state of the boat, which was then out of repair; and in case it was feasible, to cause it to be made fit for use, at the expence of the bailiwick: but if the boat proved past repair, a new one was to be built, and the expence allowed by the king. It appeared that the people of Beaumaris paid annually for the privilege of a ferry thirty shillings into the exchequer; but by this order it

Digitized by Google

Beaumaris, Beaumont. it seems that the king was to find the boat. After passing the channel, the distance over the sands to Aber in Caernarvonshire, the point the passenger generally makes for, is four miles. The sands are called *Traeth Telavan*, and *Wylofaen*, or the *place of weeping*, from the shrieks and lamentations of the inhabitants when it was overwhelmed by the sea, in the days of Helig ap Clunog. The church is dependant on Llandegvan, which is in the gift of Lord Bulkeley. The former is called the *chapel of the blessed virgin;* yet in ancient writings one aisle is called *St Mary's chapel*, and another that of *St Nicholas*.

BEAUMONT, Sir John, the elder brother of Mr Francis Beaumont the famous dramatic poet, was born in the year 1582, and in 1626 had the dignity of a baronet conferred upon him by King Charles I. In his youth he applied himself to the Muses with good success; and wrote, The Crown of Thorns, a poem, in eight books: a miscellany, entitled *Bosworth Field:* Translations from the Latin poets: and several poems on religions and political subjects; as, On the Festivals; On the Blessed Trinity; A Dialogue between the World, a Pilgrim, and Virtue; Of the miserable State of Man; Of sickness, &c. He died in 1628. His poetic genius was celebrated by Ben Johnson, Michael Drayton, and others.

Beaumont and Fletcher, two celebrated English dramatic writers, who flourished in the reign of James I. and so closely connected both as authors and as friends, that it has been judged not improper to give them under one article.

Mr Francis Beaumont was descended from an ancient family of his name at Grace-dieu in Leicestershire, where he was born about the year 1585 or 1586, in the reign of Queen Elizabeth. His grandfather, John Beaumont, was master of the rolls, and his father Francis Beaumont one of the judges of the common-pleas. He was educated at Cambridge, and afterwards admitted of the Inner Temple. It is not, however, apparent that he made any great proficiency in the law, that being a study probably too dry and unentertaining to be attended to by a man of his fertile and sprightly genius. And indeed we should scarcely be surprised to find that he had given no application to any study but poetry, nor attended on any court but that of the Muses: but, on the contrary, our admiration might fix itself on the opposite extreme, and fill us with astonishment at the extreme assiduity of his genius and rapidity of his pen, when we look back on the voluminousness of his works, and then inquire into the time allowed him for them; works that might well have taken up a long life to have executed. For although, out of 53 plays which are collected together as the labours of these united authors, Mr Beaumont was concerned in much the greater part of them, yet he did not live to complete his 30th year, the king of terrors summoning him away in the beginning of March 1615, on the 9th day of which he was interred in the entrance of St Benedict's chapel in Westminster-Abbey. There is no inscription on his tomb: But there are two epitaphs to his memory; one by his elder brother Sir John Beaumont:

On death, thy murderer, this revenge I take;
I slight his terrors, and just question make,
Which of us two the best precedence have,
Mine to this wretched world, thine to the grave?
Thou should'st have follow'd me; but death, to blame,
Miscounted years, and measur'd age by fame.
So dearly hast thou bought thy precious lines;
Their praise grew swiftly, so thy life declines.
Thy muse, the hearer's queen, the reader's love,
All ears, all hearts (but death's), could please and move.
Bosworth Field, p. 164.

Beaumont.

The other is by Bishop Corbet. (*Poems*, p. 68.)

He that hath such acuteness and such wit,
As would ask ten good heads to husband it:
He that can write so well, that no man dare
Resume it for the best; let him beware:
Beaumont is dead; by whose sole death appears,
Wit's a disease consumes men in few years.

He left a daughter, Frances Beaumont, who died in Leicestershire since the year 1700. She had in her possession several poems of her father's writing; but they were lost at sea in her voyage from Ireland, where she had lived for some time in the duke of Ormond's family.

Mr John Fletcher was not more meanly descended than his poetical colleague; his father, the Rev. Dr Fletcher, having been first made bishop of Bristol, by Queen Elizabeth, and afterwards by the same monarch, in the year 1593, translated to the rich see of London. Our poet was born in 1576; and was, as well as his friend, educated at Cambridge, where he made a great proficiency in his studies, and was accounted a very good scholar. His natural vivacity of wit, for which he was remarkable, soon rendered him a devotee to the muses; and his close attention to their service, and fortunate connection with a genius equal to his own, soon raised him to one of the highest places in the temple of poetical fame. As he was born near ten years before Mr Beaumont, so did he also survive him by an equal number of years; the general calamity of a plague, which happened in the year 1625, involved him in its great destruction, he being at that time 49 years of age.

During the joint lives of these two great poets, it appears that they wrote nothing separately, excepting one little piece by each, which seemed of too trivial a nature for either to require assistance in, viz. The Faithful Shepherd, a pastoral, by Fletcher; and the Masque of Gray's-Inn Gentlemen, by Beaumont. Yet what share each had in the writing or designing of the pieces thus composed by them jointly, there is no possibility of determining. It is however generally allowed, that Fletcher's peculiar talent was *wit*, and Beaumont's, though much the younger man, *judgment*. Nay, so extraordinary was the latter property in Mr Beaumont, that it is recorded of the great Ben Johnson, who seems moreover to have had a sufficient degree of self-opinion of his own abilities, that he constantly, so long as this gentleman lived, submitted his own writings to his censure, and, as it is thought, availed himself of his judgment at least in the correcting, if not even in the contriving all his plots. It is probable, therefore, that the forming the plots and contriving the conduct of the fable, the writing of the more serious and pathetic parts, and lopping the redundant branches of Fletcher's wit,

Digitized by Google

wit, whose luxuriance, we are told, frequently stood in need of castigation, might be in general Beaumont's portion in the work: while Fletcher, whose conversation with the *beau monde* (which indeed both of them from their births and stations in life had been ever accustomed to), added to the volatile and lively turn he possessed, rendered him perfectly master of dialogue and polite language, might execute the designs formed by the other, and raise the superstructure of those lively and spirited scenes which Beaumont had only laid the foundation of; and in this he was so successful, that though his wit and raillery were extremely keen and poignant, yet they were at the same time so perfectly genteel, that they used rather to please than disgust the very persons on whom they seemed to reflect. Yet that Fletcher was not entirely excluded from a share in the conduct of the drama, may be gathered from a story related by Winstanley, viz. that our two bards having concerted the rough draught of a tragedy over a bottle of wine at a tavern, Fletcher said, he would undertake to *kill the king;* which words being overheard by the waiter, who had not happened to have been witness to the context of their conversation, he lodged an information of treason against them. But on their explanation of it only to mean the destruction of a theatrical monarch, their loyalty moreover being unquestioned, the affair ended in a jest.

On the whole, the works of these authors have undoubtedly very great merit, and some of their pieces deservedly stand on the list of the present ornaments of the theatre. The plots are ingenious, interesting, and well managed; the characters strongly marked; and the dialogue sprightly and natural: yet there is in the latter a coarseness which is not suitable to the politeness of the present age; and a fondness of repartee, which frequently runs into obscenity; and which we may suppose was the vice of that time, since even the delicate Shakespeare himself is not entirely free from it. But as these authors have more of that kind of wit than the last-mentioned writer, it is not to be wondered if their works were in the licentious reign of Charles II. preferred to his. Now, however, to the honour of the present taste be it spoken, the tables are entirely turned; and while Shakespeare's immortal works are our constant and daily fare, those of Beaumont and Fletcher, though delicate in their kind, are only occasionally served up; and even then great pains are taken to clear them of that *fumet*, which the *haut gout* of their contemporaries considered as their supremest relish, but which the more undepraved taste of ours has been justly taught to look on as, what it really is, no more than a corrupt and unwholesome taint.

Some of their plays were printed in quarto during the lives of the authors; and in the year 1645 there was published in folio a collection of such plays as had not been printed before, amounting to between thirty and forty. This collection was published by Mr Shirley, after the shutting up of the theatres; and dedicated to the earl of Pembroke by ten of the most famous actors. In 1679 there was an edition of all their plays published in folio; another edition in 1711 by Mr Tonson, in seven volumes 8vo, and the last in 1751.

Beaumont, a town of the Netherlands, in Hainault, on the confines of the territory of Liege. It was ceded to the French in 1684; and taken in 1691 by the English, who blew up the castle. It is situated between the rivers Maese and Sambre, in E. Long. 4. 1. N. Lat. 50. 12.

Beaumont le Roger, a town of Upper Normandy in France. E. Long. 0. 56. N. Lat. 49. 2.

Beaumont le Vicompte, a town of Maine in France. E. Long. 0. 10. N. Lat. 48. 12.

Beaumont sur Oise, a town in the Isle of France, seated on the declivity of a hill, with a bridge over the river Oise. E. Long. 2. 29. N. Lat. 49. 9.

BEAUNE, a handsome town of France, in the department of Coté d'Or, remarkable for its excellent wine, and for an hospital founded here in 1443. Its collegiate church is also one of the finest in France; the great altar is adorned with a table enriched with jewels; and its organs are placed on a piece of architecture which is the admiration of the curious. E. Long. 4. 50. N. Lat. 47. 2.

BEAUSOBRE, Isaac de, a learned Protestant writer, of French original, was born at Niort in 1659. He was forced into Holland to avoid the execution of a sentence upon him, which condemned him to make the *amende honourable;* and this for having broken the royal signet, which was put upon the door of a church of the Reformed, to prevent the public profession of their religion. He went to Berlin in 1694; was made chaplain to the king of Prussia, and counsellor of the royal consistory. He died in 1738, aged 79, after having published several works: as, 1. *Defense de la Doctrine des Reformes.* 2. A Translation of the New Testament and Notes, jointly with M. Lenfant; much esteemed by the Reformed. 3. *Dissertation sur les Adamites de Boheme;* a curious work. 4. *Histoire Critique de Manichee et du Manicheisme*, 2 tom. in 4to. This has been deemed by philosophers an interesting question, and nobody has developed it better than this author. 5. Several dissertations in the *Bibliotheque Britannique.*—Mr Beausobre had strong sense with profound erudition, and was one of the best writers among the Reformed; he preached as he wrote, and he did both with warmth and spirit.

BEAUTY, in its native signification, is appropriated to objects of sight. Objects of the other senses may be agreeable, such as the sounds of musical instruments, the smoothness and softness of some surfaces; but the agreeableness called *beauty* belongs to objects of sight.

Objects of sight are more complex than those of any other sense: in the simplest we perceive colour, figure, length, breadth, thickness. A tree is composed of a trunk, branches, and leaves; it has colour, figure, size, and sometimes motion: by means of each of these particulars, separately considered, it appears beautiful; but a complex perception of the whole greatly augments the beauty of the object. The human body is a composition of numberless beauties arising from the parts and qualities of the object, various colours, various motions, figures, size, &c. all united in one complex object, and striking the eye with combined force. Hence it is, that beauty, a quality so remarkable in visible objects, lends its name to every thing that is eminently agreeable. Thus, by a figure of speech, we say, a *beautiful sound*, a *beautiful thought*, a *beautiful discovery*, &c.

Considering

Beauty.

Considering attentively the beauty of visible objects, two kinds are discovered. The first may be termed *intrinsic* beauty, because it is discovered in a single object, without relation to any other: the other may be termed *relative*, being founded on the relation of objects. Intrinsic beauty is a perception of sense merely; for to perceive the beauty of a spreading oak, or of a flowing river, no more is required but singly an act of vision. Relative beauty is accompanied with an act of understanding and reflection: for we perceive not the relative beauty of a fine instrument or engine until we learn its use and destination. In a word, intrinsic beauty is ultimate; and relative beauty is that of means relating to some good end or purpose. These different beauties agree in one capital circumstance, that both are equally perceived as belonging to the object; which will be readily admitted with respect to intrinsic beauty, but is not so obvious with respect to the other. The utility of the plough, for example, may make it an object of admiration or of desire; but why should utility make it beautiful? A natural propensity of the human mind will explain this difficulty: By an easy transition of ideas, the beauty of the effect is transferred to the cause, and is perceived as one of the qualities of the cause. Thus a subject void of intrinsic beauty appears beautiful by its utility; a dwelling-house void of all regularity is however beautiful in the view of convenience; and the want of symmetry in a tree will not prevent its appearing beautiful, if it be known to produce good fruit.

When these two beauties concur in any object, it appears delightful. Every member of the human body possesses both in a high degree.

The beauty of utility, being accurately proportioned to the degree of utility, requires no illustration: But intrinsic beauty, being more complex, cannot be handled distinctly without being analyzed. If a tree be beautiful by means of its colour, figure, motion, size, &c. it is in reality possessed of so many different beauties. The beauty of colour is too familiar to need explanation. The beauty of figure is more: for example, viewing any body as a whole, the beauty of its figure arises from regularity and simplicity; viewing the parts with relation to each other, uniformity, proportion, and order, contribute to its beauty. The beauties of grandeur and motion are considered separately. See GRANDEUR and MOTION.

We shall here make a few observations on simplicity, which may be of use in examining the beauty of single objects. A multitude of objects crowding into the mind at once, disturb the attention, and pass without making any lasting impression: In the same manner, even a single object, consisting of a multiplicity of parts, equals not, in strength of impression, a more simple object comprehended in one view. This justifies simplicity in works of art, as opposed to complicated circumstances and crowded ornaments.

It would be endless to enumerate the effects that are produced by the various combinations of the principles of beauty. A few examples will be sufficient to give the reader some idea of this subject. A circle and a square are each perfectly regular: a square, however, is less beautiful than a circle; and the reason is, that the attention is divided among the sides and angles of a square; whereas the circumference of a circle, being a single object, makes one entire impression: And thus simplicity contributes to beauty. For the same reason a square is more beautiful then a hexagon or octagon. A square is likewise more beautiful than a parallelogram, because it is more regular and uniform. But this holds with respect to intrinsic beauty only: for in many instances, as in the doors and windows of a dwelling-house, utility turns the scales on the side of the parallelogram.

Again, a parallelogram depends, for its beauty, on the proportion of its sides: A great inequality of its sides annihilates its beauty: Approximation toward equality hath the same effect; for proportion there degenerates into perfect uniformity, and the figure appears an unsuccessful attempt toward a square. And hence proportion contributes to beauty.

An equilateral triangle yields not to a square in regularity nor in uniformity of parts, and it is more simple. But an equilateral triangle is less beautiful than a square; which must be owing to inferiority of order in the position of its parts; the order arising from the equal inclination of the sides of such an angle is more obscure than the parallelism of the sides of a square. And hence order contributes to beauty not less than simplicity, regularity, or proportion.

Uniformity is singular in one circumstance, that it is apt to disgust by excess. A number of things destined for the same use, as windows, chairs, &c. cannot be too uniform. But a scrupulous uniformity of parts in a large garden or field is far from being agreeable.

In all the works of nature simplicity makes a capital figure. It also makes a figure in works of art: Profuse ornament in painting, gardening, or architecture, as well as in dress or in language, shows a mean or corrupted taste. Simplicity in behaviour and manners has an enchanting effect, and never fails to gain our affection. Very different are the artificial manners of modern times. A gradual progress from simplicity to complex forms and profuse ornament, seems to be the fate of all the fine arts; resembling behaviour, which from original candour and simplicity has degenerated into duplicity of heart and artificial refinements. At present, literary productions are crowded with words, epithets, figures: In music, sentiment is neglected for the luxury of harmony, and for difficult movement.

With regard to the final cause of beauty, one thing is evident, that our relish of regularity, uniformity, proportion, order, and simplicity, contributes greatly to enhance the beauty of the objects that surround us, and of course tends to our happiness. We may be confirmed in this thought, upon reflecting, that our taste for these particulars is not accidental, but uniform and universal, making a branch of our nature. At the same time, regularity, uniformity, order, and simplicity, contribute each of them to readiness of apprehension, and enable us to form more distinct ideas of objects than can be done where these particulars are wanting. In some instances, as in animals, proportion is evidently connected with utility, and is the more agreeable on that account.

Beauty, in many instances, promotes industry; and as it is frequently connected with utility, it proves an additional incitement to enrich our fields and improve our manufactures. These, however, are but slight effects,

effects, compared with the connections that are formed among individuals in society by means of beauty. The qualifications of the head and heart are undoubtedly the most solid and most permanent foundations of such connections: But as external beauty lies more in view, and is more obvious to the bulk of mankind, than the qualities now mentioned, the sense of beauty has a more extensive influence in forming these connections. At any rate, it concurs in an eminent degree with mental qualifications, in producing social intercourse, mutual good will, and consequently mutual aid and support, which are the life of society; it must not however be overlooked, that the sense of beauty does not tend to advance the interests of society, but when in a due mean with respect to strength. Love, in particular, arising from a sense of beauty, loses, when excessive, its social character: the appetite for gratification, prevailing over affection for the beloved object, is ungovernable, and tends violently to its end, regardless of the misery that must follow. Love, in this state, is no longer a sweet agreeable passion: it becomes painful, like hunger or thirst; and produceth no happiness but in the instant of fruition. This suggests an important lesson, that moderation in our desires and appetites, which fits us for doing our duty, contributes at the same time the most to happiness; even social passions, when moderate, are more pleasant than when they swell beyond proper bounds.

Human or Personal BEAUTY, only slightly touched upon in the preceding article, merits more particular discussion; and may be considered under these four heads: Colour, Form, Expression, and Grace; the two former being, as it were, the Body, the two latter the Soul, of beauty.

1. *Colour*. Although this be the lowest of all the constituent parts of beauty, yet it is vulgarly the most striking and the most observed. For which there is a very obvious reason to be given; that "every body can see, and very few can judge;" the beauties of colour requiring much less of judgment than either of the other three.

As to the colour of the body in general, the most beautiful perhaps that ever was imagined, was that which Apelles expressed in his famous Venus; and which, though the picture itself be lost, Cicero has in some degree preserved to us, in his excellent description of it. It was (as we learn from him, a fine red, beautifully intermixed and incorporated with white; and diffused, in its due proportions, through each part of the body. Such are the descriptions of a most beautiful skin, in several of the Roman poets; and such often is the colouring of Titian, and particularly in his sleeping Venus, or whatever other beauty that charming piece was meant to represent.

The reason why these colours please so much, is not only their natural liveliness, nor the much greater charms they obtain from their being properly blended together, but is also owing in some degree to the idea they carry with them of good health; without which all beauty grows languid and less engaging: and with which it always recovers an additional life and lustre.

As to the colour of the face in particular, a great deal of beauty is owing (beside the causes already mentioned) to variety; that being designed by nature for the greatest concourse of different colours, of any part in the human body. Colours please by opposition; and it is in the face that they are the most diversified, and the most opposed.

It is an observation apparently whimsical, but perhaps not unjust, that the same thing which makes a fine evening, makes a fine face; that is, as to the particular part of beauty now under consideration.

The beauty of an evening sky, about the setting of the sun, is owing to the variety of colours that are scattered along the face of the heavens. It is the fine red clouds, intermixed with white, and sometimes darker ones, with the azure bottom appearing here and there between them, which makes all that beautiful composition that delights the eye so much, and gives such a serene pleasure to the heart. In the same manner, if you consider some beautiful faces, you may observe that it is much the same variety of colours which gives them that pleasing look; which is so apt to attract the eye, and but too often to engage the heart. For all this sort of beauty is resolvable into a proper variation of flesh colour and red, with the clear blueness of the veins pleasingly intermixed about the temples and the going off of the cheeks, and set off by the shades of full eyebrows; and of the hair, when it falls in a proper manner round the face.

It is for much the same reason that the best landscape painters have been generally observed to choose the autumnal part of the year for their pieces, rather than the spring. They prefer the variety of shades and colours, though in their decline, to all the freshness and verdure in their infancy; and think all the charms and liveliness even of the spring, more than compensated by the choice, opposition, and richness of colours, that appear almost on every tree in the autumn.

Though one's judgment is apt to be guided by particular attachments (and that more perhaps in this part of beauty than any other), yet the general persuasion seems well founded, that a complete brown beauty is really preferable to a perfect fair one; the bright brown giving a lustre to all the other colours, a vivacity to the eyes, and a richness to the whole look, which one seeks in vain in the whitest and most transparent skins. Raphael's most charming Madonna is a brunette beauty; and his earlier Madonnas (or those of his middle style) are generally of a lighter and less pleasing complexion. All the best artists in the noblest age of painting, about Leo the tenth's time, used this deeper and richer kind of colouring; and perhaps one might add, that the glaring lights introduced by Guido, went a great way towards the declension of that art; as the enfeebling of the colours by Carlo Marat (or his followers) hath since also completed the fall of it in Italy.

Under this article *colour*, it seems doubtful whether some things ought not to be comprehended which are not perhaps commonly meant by that name. As that appearing softness or silkiness of some skins: that (A) Magdalen-

(A) The look here meant is most frequently expressed by the best painters in their Magdalens; in which, if there were no tears on the face, you would see, by the humid redness of the skin, that she had been weeping extremely.

Digitized by Google

Beauty.

Magdalen-look in some fine faces, after weeping; that brightness, as well as tint, of the hair; that lustre of health that shines forth upon the features; that luminousness that appears in some eyes, and that fluid fire, or glistening, in others: Some of which are of a nature so much superior to the common beauties of colour, that they make it doubtful whether they should not have been ranked under a higher class, and reserved for the expressions of the passions. They are, however, mentioned here; because even the most doubtful of them appear to belong partly to this head, as well as partly to the others.

2. *Form.* This takes in the turn of each part, as well as the symmetry, of the whole body, even to the turn of an eye-brow, or the falling of the hair. Perhaps, too, the attitude, while fixed, ought to be reckoned under this article: By which is not only meant the posture of the person, but the position of each part; as the turning of the neck, the extending of the hand, the placing of a foot, and so on to the most minute particulars.

The general cause of beauty in the form or shape in both sexes is a proportion, or a union and harmony, in all parts of the body.

The distinguishing character of beauty in the female form, is delicacy and softness; and in the male, either apparent strength or agility. The finest exemplars that can be seen for the former, is the Venus of Medici; and for the two latter, the Hercules Farnese and the Apollo Belvedere.

There is one thing indeed in the last of these figures which exceeds the bounds of our present inquiry; what an Italian artist called *Il sovra umano;* and what we may call the transcendent, or celestial. It is something distinct from all human beauty, and of a nature greatly superior to it; something that seems like an air of divinity: Which is expressed, or at least is to be traced out, in but very few works of the artists; and of which scarcely any of the poets have caught any ray in their descriptions (or perhaps even in their imagination), except Homer and Virgil, among the ancients; and our Shakespeare and Milton among the moderns.

The beauty of the mere human form is much superior to that of colour; and it may be partly for this reason, that when one is observing the finest works of the artists at Rome (where there is still the noblest collection of any in the world), one feels the mind more struck and more charmed with the capital statues, than with the pictures of the greatest masters.

One of the old Roman poets, in speaking of a very handsome man, who was candidate for the prize in some of the public games, says, that he was much expected and much admired by all the spectators at his first appearance; but that, when he flung off his robes, and discovered the whole beauty of his shape altogether, it was so superior, that it quite extinguished the beauties they had before so much admired in his face. Much the same effect may be felt in viewing the Venus of Medici. If you observe the face only, it appears extremely beautiful: but if you consider all the other elegancies of her make, the beauty of her face becomes less striking, and is almost lost in such a multiplicity of charms.

Whoever would learn what makes the beauty of each part of the human body, may find it laid down pretty much at large, by (B) *Felibiens;* or may study it with more pleasure to himself, in the finest pictures and statues;

---

extremely. There is a very strong instance of this in a Magdalen by Le Brun, in one of the churches at Paris; and several by Titian, in Italy; the very best of which is at the Barberino palace at Venice. In speaking of which, Rosalba hardly went too far, when she said, "It wept all over;" or (in the very words she used) "Elle pleure jusqu' aux bouts de doigts."

(B) In his *Entretiens*, vol. ii. p. 14—45. The chief of what he says there, on the beauty of the different parts of the female form, is as follows: That the head should be well rounded; and look rather inclining to small than large. The forehead, white, smooth, and open (not with the hair growing down too deep upon it); neither flat nor prominent, but like the head, well rounded; and rather small in proportion than large. The hair either bright black or brown; not thin, but full and waving; and if it falls in moderate curls the better. The black is particularly useful for setting off the whiteness of the neck and skin. The eyes black, chesnut, or blue; clear, bright, and lively; and rather large in proportion than small. The eye-brows, well divided, rather full than thin; semicircular, and broader in the middle than at the ends; of a neat turn, but not formal. The cheeks should not be wide; should have a degree of plumpness, with the red and white finely blended together; and should look firm and soft. The ear should be rather small than large; well folded, and with an agreeable tinge of red. The nose should be placed so as to divide the face into two equal parts; should be of a moderate size, straight, and well-squared; though sometimes a little rising in the nose, which is but just perceivable, may give a very graceful look to it. The mouth should be small; and the lips not of equal thickness. They should be well turned, small rather than gross; soft even to the eye; and with a living red in them. A truly pretty mouth is like a rose-bud that is beginning to blow. The teeth should be middle-sized, white, well-ranged, and even. The chin of a moderate size; white, soft, and agreeably rounded. The neck should be white, straight, and of a soft, easy, and flexible make, rather long than short; less above, and increasing gently toward the shoulders: The whiteness and delicacy of its skin should be continued, or rather go on improving to the bosom. The skin in general should be white, properly tinged with red; with an apparent softness, and a look of thriving health in it. The shoulders should be white, gently spread, and with a much softer appearance of strength than in those of men. The arm should be white, round, firm, and soft; and more particularly so from the elbow to the hand. The hand should unite insensibly with the arm; just as it does in the statue of the Venus of Medici. They should be long and delicate, and even the joints and nervous part of them should be without either any hardness or dryness. The fingers should be fine, long, round, and soft; small, and lessening towards the tips of them:

Beauty.

statues; for in life we commonly see but a small part of the human body, most of it being either disguised or altered by what we call dress.

In fact we do not only thus, in a great measure, hide beauty; but even injure, and kill it, by some parts of dress. A child is no sooner born into the world, than it is bound up, almost as firmly as an old Egyptian mummy, in several folds of linen. It is in vain for him to give all the signs of distress that nature has put in his power, to show how much he suffers whilst they are thus imprisoning his limbs; or all the signs of joy, every time they are set at liberty. In a few minutes, the old witch who presides over his infirmest days falls to tormenting him afresh, and winds him up again in his destined confinement. When he comes to be drest like a man, he has ligatures applied to his arms, legs, and middle, in short all over him, to prevent the natural circulation of his blood, and make him less active and healthy: and if it be a child of the tenderer sex, she must be bound yet more straitly about the waist and stomach, to acquire a disproportion that nature never meant in her shape.

The two other constituent parts of beauty, are expression and grace; the former of which is common to all persons and faces; but the latter is to be met with in very few.

3. *Expression.* By this is meant the expression of the passions; the turns and changes of the mind, so far as they are made visible to the eye by our looks or gestures.

Though the mind appears principally in the face and attitudes of the head; yet every part almost of the human body, on some occasion or other, may become expressive. Thus the languishing hanging of the arm, or the vehement exertion of it; the pain expressed by the fingers of one of the sons in the famous group of Laocoon, and in the toes of the dying gladiator. But this again is often lost among us by our dress; and indeed is of the less concern, because the expression of the passions passes chiefly in the face, which we (by good luck) have not as yet concealed.

The parts of the face in which the passions most frequently make their appearance, are the eyes and mouth; but from the eyes they diffuse themselves very strongly about the eye-brows: as, in the other case, they appear often in the parts all round the mouth.

Philosophers may dispute as much as they please about the seat of the soul; but wherever it resides, we are sure that it speaks in the eyes. Perhaps it is injuring the eye-brows, to make them only dependents on the eye: for they, especially in lively faces, have, as it were, a language of their own; and are extremely varied, according to the different sentiments and passions of the mind.

Degree of pleasure may be often discerned in a lady's eye-brow, though she have address enough not to let it appear in her eyes; and at other times may be discovered so much of her thoughts, in the line just above her eye-brows, that she would probably be amazed how any body could tell what passed in her mind, and (as she thought) undiscovered by her face, so particularly and distinctly.

Homer makes the eye-brows the seat of (C) majesty, Virgil of (D) dejection, Horace of (E) modesty, and Juvenal of (F) pride; and it is not certain whether every one of the passions be not assigned, by one or other of the poets, to the same part.

Having hitherto spoken only of the passions in general, we will now consider a little which of them add to beauty, and which of them take from it.

We may say, in general, that all the tender and kind passions add to beauty; and all the cruel and unkind ones add to deformity: And it is on this account that good nature may very justly be said to be "the best feature even in the finest face."

Mr Pope has included the principal passion of each sort in two very pretty lines:

> Love, hope, and joy, fair pleasure's smiling train;
> Hate, fear, and grief, the family of pain.

The former of which naturally give an additional lustre and

---

them: and the nails long, rounded at the ends, and pellucid. The bosom should be white and charming; and the breasts equal in roundness, whiteness, and firmness; neither too much elevated nor too much depressed; rising gently, and very distinctly separated; in one word, just like those of the Venus of Medici. The sides should be long, and the hips wider than the shoulders; and turn off as they do in the same Venus; and go down rounding and lessening gradually to the knee. The knee should be even and well rounded; the legs straight, but varied by a proper rounding of the more fleshy part of them, and the feet finely turned, white, and little.

(C) Η, και κυανεησιν επ' οφρυσι νευσε Κρονιων·
Αμβροσιαι δ' αρα χαιται επερρωσαντο ανακτος
Κρατος απ' αθανατοιο· μεγαν δ' ελελιξεν Ολυμπον. *Iliad.* i. 528.

It was from this passage that Phidias borrowed all the ideas of that majesty which he had expressed so strongly in his famous statues of the Jupiter Olympius; and Horace, probably, his——Cuncta supercilio moventis. *Lib.* iii. *Od.* 1. 8.

(D) Frons læta parum, et dejecto lumina vultu. *Virgil Æn.* vi. 863.

(E) Deme supercilio nubem; plerumque modestus
Occupat obscuri speciem. *Horat.* lib. i. epist. 18. 95.

(F) Malo Venusinam, quam te, Cornelia, mater
Gracchorum; si cum magnus virtutibus affers
Grande supercilium, et numeras in dote triumphos. *Juvenal, Sat.* vi. 168.

It is here that the Romans used the word *superciliosus* (as we do from it the word *supercilious*) for proud and arrogant persons.

Beauty.

and enlivening to beauty; as the latter are too apt to fling a gloom and cloud over it.

Yet in these, and all the other passions, moderation ought perhaps to be considered in a great measure the rule of their beauty, almost as far as moderation in actions is the rule of virtue. Thus an excessive joy may be too boisterous in the face to be pleasing; and a degree of grief in some faces, and on some occasions, may be extremely beautiful. Some degrees of anger, shame, surprise, fear, and concern, are beautiful; but all excess is hurtful; and all excess ugly. Dulness, austerity, impudence, pride, affectation, malice, and envy, are always ugly.

The finest union of passions that can perhaps be observed in any face, consists of a just mixture of modesty, sensibility, and sweetness; each of which when taken singly is very pleasing; but when they are all blended together, in such a manner as either to enliven or correct each other, they give almost as much attraction as the passions are capable of adding to a very pretty face.

The prevailing passion in the Venus of Medici is modesty; it is exprest by each of her hands, in her looks, and in the turn of her head. And by the way it may be questioned, whether one of the chief reasons why side-faces please one more than full ones, be not from the former having more of the air of modesty than the latter. This at least is certain, that the best artists usually choose to give a side-face rather than a full one; in which attitude, the turn of the neck too has more beauty, and the passions more activity and force. Thus, as to hatred and affection in particular, the look that was formerly supposed to carry an infection with it from malignant eyes, was a slanting regard; like that which Milton gives to Satan, when he is viewing the happiness of our first parents in paradise; and the fascination, or stroke of love, is most usually conveyed, at first in a side-glance.

It is owing to the great force of pleasingness which attends all the kinder passions, "that lovers do not only seem, but are really, more beautiful to each other than they are to the rest of the world;" because when they are together, the most pleasing passions are more frequently exerted in each of their faces than they are in either before the rest of the world. There is then (as a certain French writer very well expresses it) "A soul upon their countenances," which does not appear when they are absent from each other; or even when they are together conversing with other persons, that are indifferent to them, or rather lay a restraint upon their features.

The superiority which the beauty of the passions has over the two parts of beauty first mentioned, will probably be now pretty evident: or if this should appear still problematical to any one, let him consider a little the following particulars, of which every body must have met with several instances in their lifetime: That there is a great deal of difference in the same face, according as a person is in a better or worse humour, or in a greater or less degree of liveliness: That the best complexion, the finest features, and the exactest shape, without any thing of the mind expressed on the face, are as insipid and unmoving as the waxen figure of the fine duchess of Richmond in Westminster-Abbey: That the finest eyes in the world, with an excess of malice or rage in them, will grow as shocking as they are in that fine face of Medusa on the famous seal in the Strozzi family at Rome: That a face without any good features in it, and with a very indifferent complexion, shall have a very taking air; from the sensibility of the eyes, the general good-humoured turn of the look, and perhaps a little agreeable smile about the mouth. And these three things perhaps would go a great way toward accounting for the *Je ne sçai quoi*, or that inexplicable pleasingness of the face (as they choose to call it), which is so often talked of and so little understood; as the greater part, and perhaps all the rest of it, would fall under the last article, that of grace.

Thus it appears that the passions can give beauty without the assistance of colour or form; and take it away where they have united the most strongly to give it. And hence the superiority of this part of beauty to the other two.

This, by the way, may help us to account for the justness of what Pliny asserts in speaking of the famous statue of Laocoon and his two sons: He says, it was the finest piece of art in Rome; and to be preferred to all the other statues and pictures, of which they had so noble a collection in his time. It had no beauties of colour to vie with the paintings and other statues there; and the Apollo Belvedere and the Venus of Medici, in particular, were as finely proportioned as the Laocoon: But this had much greater variety of expression even than those fine ones; and it must be on that account alone that it could have been preferable to them and all the rest.

Before quitting this head, two things before mentioned deserve to be repeated: That the chief rule of the beauty of the passions is moderation; and that the part in which they appear most strongly is the eyes. It is there that love holds all his tenderest language: It is there that virtue commands, modesty charms, joy enlivens, sorrow engages, and inclination fires the hearts of the beholders: It is there that even fear, and anger, and confusion, can be charming. But all these, to be charming, must be kept within their due bounds and limits; for too sullen an appearance of virtue, a violent and prostitute swell of passion, a rustic and overwhelming modesty, a deep sadness, or too wild and impetuous a joy, become all either oppressive or disagreeable.

4. The last finishing and noblest part of beauty is *Grace;* which every body is accustomed to speak of as a thing inexplicable; and in a great measure perhaps it is so. We know that the soul is, but we scarce know what it is: every judge of beauty can point out grace; but no one seems even yet to have fixed upon a definition for it.

Grace often depends on some very little incidents in a fine face; and in actions it consists more in the manner of doing things than in the things themselves. It is perpetually varying its appearance, and is therefore much more difficult to be considered than in any thing fixed and steady. While you look upon one, it steals from under the eye of the observer; and is succeeded perhaps by another that flits away as soon and as imperceptibly. It is on this account that grace is better to be studied in Corregio's, Guido's, and Raphael's pictures, than in real life.

Beauty.

But though one cannot punctually say what grace is, we may point out the parts and things in which it is most apt to appear.

The chief dwelling-place of grace is about the mouth; though at times it may visit every limb or part of the body. But the mouth is the chief seat of grace, as much as the chief seat for the beauty of the passions is in the eyes. Thus, when the French use the expression of *une bouche fort gracieuse*, they mean it properly of grace: but when they say, *des yeux tres gracieux*, it then falls to the share of the passions; and it means kind or favourable.

In a very graceful face, by which we do not so much mean a majestic as a soft and pleasing one, there is now and then (for no part of beauty is either so engaging or so uncommon) a certain deliciousness that almost always lives about the mouth, in something not quite enough to be called a smile, but rather an approach towards one, which varies gently about the different lines there like a little fluttering Cupid, and perhaps sometimes discovers a little dimple, that after just lightening upon you disappears and appears again by fits.

The grace of attitudes may belong to the position of each part as well as to the carriage or disposition of the whole body: but how much more it belongs to the head than to any other part may be seen in the pieces of the most celebrated painters; and particularly in those of Guido, who has been rather too lavish in bestowing this beauty on almost all his fine women; whereas nature has given it in so high a degree but to very few.

The turns of the neck are extremely capable of grace, and are very easy to be observed, though very difficult to be accounted for.

How much of this grace may belong to the arms and feet, as well as to the neck and head, may be seen in dancing. But it is not only in genteel motions that a very pretty woman will be graceful; and Ovid (who was so great a master in all the parts of beauty) had very good reason for saying, That when Venus, to please her gallant, imitated the hobbling gait of her husband, her very lameness had a great deal of prettiness and grace in it.

De arte Amandi, ii. 570.

"Every motion of a graceful woman (says another writer of the same age) is full of grace." She designs nothing by it perhaps, and may even not be sensible of it herself: and indeed she should not be so too much; for the moment that any gesture or action appears to be affected, it ceases to be graceful.

Tibullus, lib. iv. l. 2. 8.

Horace and Virgil seem to extend grace so far as to the flowing of the hair, and Tibullus even to the dress of his mistress; but then he assigns it more to her manner of putting on and appearing in whatever she wears than to the dress itself. It is true, there is another wicked poet (Ovid) who has said (with much less decency) "that dress is the better half of the woman:"

—— *Pars minima est ipsa puella sui.* OVID.

There are two very distinct (and, as it were, opposite) sorts of grace; the majestic and the familiar. The former belongs chiefly to the very *fine* women, and the latter to the very *pretty* ones: *That* is more commanding, and *this* the more delightful and engaging. The Grecian painters and sculptors used to express the former most strongly in the looks and attitudes of their Minervas, and the latter in those of Venus.

Xenophon, in his Choice of Hercules (or at least the excellent translator of that piece), has made just the same distinction in the personages of Wisdom and Pleasure; the former of which he describes as moving on to that young hero with the majestic sort of grace; and the latter with the familiar:

Graceful, yet each with different grace they move;
This striking sacred awe, that softer winning love.

No poet seems to have understood this part of beauty so well as our own Milton. He speaks of these two sorts of grace very distinctly; and gives the majestic to his Adam, and both the familiar and majestic to Eve, but the latter in a less degree than the former:

Two of far nobler shape, erect and tall,
Godlike erect, with native honour clad,
In naked majesty, seem'd lords of all;
And worthy seem'd. For in their looks divine
The image of their glorious Maker shone:
Truth, wisdom, sanctitude severe and pure;
Severe, but in true filial freedom plac'd:
Whence true authority in men: Though both
Not equal, as their sex not equal, seem'd;
For contemplation he, and valour, form'd;
For softness she, and sweet attractive grace.
MILTON'S *Par. Lost*, book iv. 298.

———— I espy'd thee, fair indeed and tall,
Under a plantain; yet methought less fair,
Less winning soft, less amiably mild,
Than that smooth wat'ry image——
(*Eve, of Adam and herself*) *Ib.* ver. 480.

———————— Her heav'nly form
Angelic, but more soft and feminine;
Her graceful innocence; her ev'ry air
Of gesture, or least action.—— B. ix. 461.

Grace was in all her steps; Heav'n in her eye;
In every gesture, dignity and love. B. viii. 489.

Speaking or mute, all comeliness and grace
Attends thee; and each word, each motion, forms.
Ib. 223.

Though grace is so difficult to be accounted for in general, yet there are two particular things which seem to hold universally in relation to it.

The first is, "That there is no grace without motion; that is, without some genteel or pleasing motion, either of the whole body or of some limb, or at least of some feature. And it may be hence that Lord Bacon calls grace by the name of decent motion; just as if they were equivalent terms: "In beauty, that of favour is more than that of colour; and that of gracious and decent motion, more than that of favour."

Works, vol iii. p. 312.

Virgil in one place points out the majesty of Juno, and in another the graceful air of Apollo, by only saying that they move; and possibly he means no more when he makes the motion of Venus the principal thing by which Æneas discovers her under all her disguise:

Æn. i. 46. iv. 47. Æn. i. 405.

Beauty.

disguise: though the commentators, as usual, would fain find out a more dark and mysterious meaning for it.

All the best statues are represented as in some action or motion; and the most graceful statue in the world (the Apollo Belvedere) is so much so, that when one faces it at a little distance, one is almost apt to imagine that he is actually going to move on toward you.

All graceful heads, even in the portraits of the best painters, are in motion; and very strongly on those of Guido in particular; which are all either casting their looks up toward heaven, or down toward the ground, or side-way, as regarding some object. A head that is quite unactive, and flung flat upon the canvas (like the faces on medals after the fall of the Roman empire, or the Gothic heads before the revival of the arts), will be so far from having any grace, that it will not even have any life in it.

The second observation is, "That there can be no grace with impropriety;" or, in other words, that nothing can be graceful that is not adapted to the characters of the person.

The graces of a little lively beauty would become ungraceful in a character of majesty: as the majestic airs of an empress would quite destroy the prettiness of the former. The vivacity that adds a grace to beauty in youth would give an additional deformity to old age; and the very same airs which would be charming on some occasions may be quite shocking when extremely mistimed or extremely misplaced.

The inseparable union of propriety and grace seems to have been the general sense of mankind, as we may guess from the languages of several nations; in which some words that answer to our proper or becoming, are used indifferently for beautiful or graceful. Thus, among the Greeks the words Πρεπον and Καλον, and among the Romans *pulchrum* and *decens*, or *decorum*, are used indifferently for one another.

It appears wrong, however, to think (as some have done) that grace consists entirely in propriety; because propriety is a thing easy enough to be understood, and grace (after all we can say about it) very difficult. Propriety, therefore, and grace are no more one and the same thing than grace and motion are. It is true, it cannot subsist without either; but then there seems to be something else, which cannot be explained, that goes to the composition, and which possibly may give it its greatest force and pleasingness.

Whatever are the causes of it, this is certain, that grace is the chief of all the constituent parts of beauty: and so much so, that it seems to be the only one which is absolutely and universally admired: All the rest are only relative. One likes a brunette beauty better than a fair one; I may love a little woman, and you a large one, best; a person of a mild temper will be fond of the gentler passions in the face, and one of a bolder cast may choose to have more vivacity and more vigorous passions expressed there: But grace is found in few, and is pleasing to all. Grace, like poetry, must be born with a person, and is never wholly to be acquired by art. The most celebrated of all the ancient painters was Apelles; and the most celebrated of all the modern Raphael: And it is remarkable, that the distinguishing character of each of them was grace. Indeed, that alone could have given them so high a pre-eminence over all their other competitors.

Grace has nothing to do with the lowest part of beauty or colour; very little with shape, and very much with the passions; for it is she who gives their highest zest, and the most delicious part of their pleasingness to the expressions of each of them.

All the other parts of beauty are pleasing in some degree, but grace is pleasingness itself. And the old Romans in general seem to have had this notion of it, as may be inferred from the original import of the names which they used for this part of beauty: *Gratia* from *gratus*, or "pleasing;" and *decor* from *decens*, or "becoming."

The Greeks as well as the Romans must have been of this opinion; when in settling their mythology, they made the Graces the constant attendants of Venus, or the cause of love. In fact, there is nothing causes love so generally and so irresistibly as grace. It is like the cestus of the same goddess, which was supposed to comprehend every thing that was winning and engaging in it; and beside all, to oblige the heart to love by a secret and inexplicable force like that of some magic charm.

She said; with awe divine, the queen of love
Obey'd the sister and the wife of Jove:
And from her fragrant breast the zone unbrac'd,
With various skill and high embroidery grac'd.
In this was every art, and every charm,
To win the wisest, and the coldest warm:
Fond love, the gentle vow, the gay desire,
The kind deceit, the still reviving fire.
Persuasive speech, and more persuasive sighs,
Silence that spoke, and eloquence of eyes.
This on her hand the Cyprian goddess laid;
Take this, and with it all thy wish, she said:
With smiles she took the charm; and smiling prest
The powerful Cestus to her snowy breast.

POPE, *Il.* xiv. 256.

Although people in general are more capable of judging right of beauty, at least in some parts of it, than they are of most other things; yet there are a great many causes apt to mislead the generality in their judgements of beauty. Thus if the affection is entirely engaged by any one object, a man is apt to allow all perfections to that person, and very little in comparison to any body else; or if they ever commend others highly, it is for some circumstance in which they bear some resemblance to their favourite object.

Again, people are very often misled in their judgements, by a similitude either of their own temper or personage in others. It is hence that a person of a mild temper is more apt to be pleased with the gentler passions in the face of his mistress; and one of a very lively turn would choose more of spirit and vivacity in his: that little people are inclined to prefer pretty women, and larger people majestic ones; and so on in a great variety of instances. This may be called falling in love with ourselves at second hand; and self-love (whatever other love may be) is sometimes so false-sighted, that it may make the most plain, and even the most disagreeable things, seem beautiful and pleasing.

Sometimes an idea of usefulness may give a turn to our ideas of beauty; as the very same things are reckoned

Digitized by Google

koned beauties in a coach horse which would be so many blemishes in a race horse.

But the greatest and most general misleader of our judgments, in relation to beauty, is custom, or the different national tastes for beauty, which turn chiefly on the two lower parts of it, colour and form.

It was from the most common shape of his countrywomen, that Rubens, in his pictures, delights so much in plumpness; not to give it a worse name. Whenever he was to represent the most beautiful women, he is sure it give them a good share of corpulence. It seems as if nobody could be a beauty with him under two hundred weight. His very Graces are all fat.

But this may go much farther than mere bulk; it will reach even to very great deformities, which sometimes grow into beauties, where they are habitual and general. One of our own countrymen (who was a particularly handsome man) in his travelling over the Alps, was detained by a fever in one of those villages, where every grown person has that sort of swellings in the neck which they call *goitres;* and of which some are very near as big as their heads. The first Sunday that he was able, he went to their church (for he was a Roman catholic) to return thanks to heaven for his recovery. A man of so good a figure, and so well drest, had probably never before been within the walls of that chapel. Every body's eyes were fixed upon him: and as they went out, they cried out loud enough for him to hear them, "O how completely handsome would that man be, if he had but a *goitre!*"

In some of the most military nations of Africa, no man is reckoned handsome that has not five or six scars in his face. This custom might possibly at first be introduced among them to make them less afraid of wounds in that part in battle: but however that was, it grew at last to have so great a share in their idea of beauty, that they now cut and slash the faces of their poor little infants, in order to give them those graces, when they are grown up, which are so necessary to win the hearts of their mistresses; and which, with the assistance of some jewels or ingots of gold in their noses, ears, and lips, must certainly be irresistible to the ladies of that country.

The covering each cheek all over with a burning sort of red colour, has long been looked upon in a neighbouring country to be as necessary to render a fine lady's face completely beautiful, as these scars are for the beaux in Africa.

The natural complexion of the Italian ladies is of a higher glow than ours usually are; and yet Mr Addison is very just, in making a Numidian call the ladies of the same country *pale unripened beauties.*

The glowing dames of Zama's royal court
Have faces flusht with more exalted charms:
The sun, that rolls his chariot o'er their heads,
Works up more fire and colour in their cheeks:
Were you with these, my prince, you'd soon forget
The pale unripen'd beauties of the north!

Syphax to *Juba:* in *Cato*, act i. scene 4.

The prince of Anamaboo, who had been so long and latterly so much used to the European complexion, yet said of a certain lady a little before he left London, "That she would be the most charming woman in the world if she was but a negro."

In an account of some of the farthest travels that any of our people have made up the river Gambia, we are informed, that when they came to some villages where probably no Europeans had ever been before, the women ran frightened and screaming from them, on taking them to be devils, merely on account of the whiteness of their complexion.

We cannot avoid observing, however, that heaven is very good and merciful to mankind, even in making us capable of all this variety of mistakes. If every person judged exactly right of beauty, every man that was in love in such a district, would be in love with the same woman. The superior beauty of each ham'et would be the object of the hate and malice of all the rest of her own sex in it, and the cause of dissension and murders among all of the other. If this would hold in one town, it would hold for the same reasons in every other town or district; and of course there would be nothing more wanting than this universal right judgment of beauty, to render the whole world one continued scene of blood and misery.

But now that fancy has perhaps more to do with beauty than judgment, there is an infinity of tastes, and consequently an infinity of beauty; for to the mind of the lover, supposed beauty is full as good as real. Every body may now choose out what happens to hit his own turn and cast. This increases the extent of beauty vastly, and makes it in a manner universal: for there are but few people in comparison that are truly beautiful; but every body may be beautiful in the imagination of some one or other. Some may delight themselves in a black skin, and others in a white; some in a gentle natural rosiness of complexion, others in a high exalted artificial red; some nations in waists disproportionably large, and others in waists as disproportionably small. In short, the most opposite things imaginable may each be looked upon as beautiful in whole different countries, or by different people in the same country.

We should perhaps make a distinction here again, as to the two former parts of beauty and the two latter. Fancy has much more to do in the articles of form and colour than in those of the passions and grace. The good passions, as they are visible on the face, are apparent goodness; and that must be generally amiable: and true grace, wherever it appears to any degree, one should think must be pleasing to every human creature; or perhaps this may never appear in the women of any nation, where the men are grown so savage and brutal as to have lost all taste of it.

Yet even as to grace itself, under the notion of pleasingness, it may become almost universal, and be as subject to the dominion of fancy as any of the less significant parts of beauty. A parent can see gentleness in the most awkward child perhaps that ever was born; and a person who is truly in love, will be pleased with every motion and air of the person beloved; which is the most distinguishing character that belongs to grace. See this subject more fully considered in the article Beauty in the Supplement.

Beauty, in *Architecture*, *Painting*, and other arts, is the harmony and justness of the whole composition taken together.

BEAUVAIS, an episcopal city of France, in the department of Oise. The cathedral church, which is

Digitized by Google

is dedicated to St Peter, is much admired for its fine architecture. It contains a great number of relics, and a library of curious books. The town was ineffectually besieged by the English in 1443, and by the duke of Burgundy with an army of 80,000 men. In this last siege the women signalized themselves under the conduct of Jean Hachette, who set up a standard yet preserved in the church of the Jacobins. The duke was obliged to raise the siege; and in memory of this exploit, the women walk first in a procession on the 10th of July, the anniversary of their deliverance. The town had 12,800 inhabitants in 1815. Beauvais is situated on the river Therin, 42 miles north of Paris, in E. Long. 2. 15. N. Lat. 49. 26.

BEAUVAIS, a town of France in Upper Languedoc, seated on the river Tescou. E. Long. 1. 43. N. Lat. 44. 2.

BEAUVIN, a city of Burgundy in France, in E. Long. 4. 50. N. Lat. 47.

BEAUVOIR *sur Mer*, a maritime town of France, in the department of Vendee, 25 miles south-west of Nantes. W. Long. 1. 5. N. Lat. 46. 45.

BEAUVOISIS, a territory of France, formerly part of Picardy, now included under the department of Oise.

BEBELINGUEN, a town of Suabia, in the kingdom of Wirtemberg in Germany, seated on a lake from which proceeds the river Worm. E. Long. 9. 8. N. Lat. 48. 45.

BEBRYCIA, in *Ancient Geography*, an ancient name of Bithynia, so called from the Bebryces its inhabitants. The Bebryces were afterwards driven out by the Thracians, viz. the Bithyni and Thyni: from whom, in process of time, the country took the name of *Bithynia*. See BITHYNIA.

BEC, a town of France, in the department of Lower Seine, seated on a tongue of land, at the confluence of two rivers. E. Long. 0. 52. N. Lat. 48. 45.

BECAH, or BEKAH, a Jewish coin, being half a shekel. In Dr Arbuthnot's table of reductions, the bekah amounts to 13$\frac{11}{16}$d.; in Dr Prideaux's computation to 1s. 6d. Every Israelite paid an hundred bekahs a head annually for the support of the temple.

BECALM, in a general sense, signifies to appease, to allay.

BECALM, in the sea language. A ship is said to be becalmed when there is not a breath of wind to fill the sails.

BECANOR, a town of India, in Asia, seated on the river Ganges, in E. Long. 83. 5. N. Lat. 27. 40.

BECCABUNGA, BROOKLIME; the trivial name of a species of veronica. See VERONICA, BOTANY *Index*.

BECCARIA, CÆSAR BONESANA, MARQUIS OF, an Italian writer on jurisprudence. See SUPPLEMENT.

BECCARIA, *Giambattista*, an Italian natural philosopher. See SUPPLEMENT.

BECCLES, a town of Suffolk in England, containing 2979 inhabitants in 1811. E. Long. 1. 30. N. Lat. 52. 38.

BECHER, JOHN JOACHIM, a celebrated chemist, was born at Spires, in 1645. He was connected with the most learned men in Europe; and the emperor, the electors of Mentz and Bavaria, and other persons of high rank, furnished him with the means of making experiments in mathematics, natural philosophy, medicine, and chemistry. As his thoughts were very judicious and uncommon with respect to economy and to increasing the revenues of a state, he was invited to Vienna, where he contributed greatly to the establishment of several manufactures, a chamber of commerce, and an India company; but the jealousy of some of the ministers occasioned his disgrace and ruin. He was not less unhappy at Mentz, Munich, and Wurtzburg; which determined him to go to Haerlem, where he invented a machine for working a great quantity of silk in a little time, and with few hands: but new misfortunes made him come to England, and he died at London in 1685. He wrote many works; the principal of which are, 1. *Physica Subterranea*, which was reprinted at Leipsic in 1703, and 1739, in octavo, with a small treatise, by E. Stahl, entitled *Specimen Becherianum*. 2. *Experimentum chymicum novum*, 8vo. 3. *Character pro Notitia Linguarum universali*. 4. *Institutiones Chymicæ, seu Manuductio ad Philosophiam Hermeticam*, 4to. 5. *Institutiones Chymicæ prodromæ*, 12mo. 6. *Experimentum novum ac curiosum de Minera arenaria perpetua*, &c.

BECHIN, a town of Bohemia, in the circle of the same name. It was taken and burnt by General Bequoi in 1619. It is seated on the river Lausuics, in E. Long. 15. 12. N. Lat. 49. 14.

BECK, or BEKE, a word which imports a small stream of water issuing from some burn or spring. Hence *Hell-becks*, little brooks in the rough and wild mountains about Richmond near Lancashire, so called on account of their ghastliness and depth.

BECK is chiefly used among us in the composition of names of places originally situated on rivulets: hence Walbeck, Bournbeck, &c. The Germans use *bech* in the same manner.

BECK, *David*, an eminent portrait painter, was born at Arnheim in Guelderland in 1621, and became a disciple of Vandyck; from whom he acquired a fine manner of penciling, and that sweet style of colouring which is peculiar to that great master and to all the disciples trained up under his direction. He possessed besides, that freedom of hand, and readiness, or rather rapidity of execution, for which Vandyck was so remarkably famous; and King Charles I. when he observed the expeditious manner of Beck's painting, was so exceedingly surprised, that he told Beck, it was his opinion, he could paint if he was riding post. He was appointed portrait-painter and chamberlain to Queen Christina of Sweden; and by her recommendation, most of the illustrious persons in Europe sat to him for their pictures. He was agreeable, handsome, and polite, and lived in the highest favour with his royal mistress: but, having an earnest desire to visit his friends in Holland, and leaving the court of Sweden much against the queen's inclination, she apprehended that he intended never to return; and, as he died soon after at the Hague, it was suspected that he was poisoned. This happened in 1656, when he was aged only 35 years. A very singular adventure happened to this painter as he travelled through Germany, which seems not unworthy of being recited. He was suddenly and violently taken ill at the inn where he lodged, and was laid out as a corpse, seeming to all appearance quite dead. His valets expressed the strongest marks of grief for the loss of their master, and while they sat beside his bed, they drank very freely by way of consolation.

At

At last one of them, who grew much intoxicated, said to his companions, Our master was fond of his glass while he was alive, and out of gratitude let us give him a glass now he is dead. As the rest of the servants assented to the proposal, he raised up the head of his master, and endeavoured to pour some of the liquor into his mouth. By the fragrance of the wine, or probably by a small quantity that imperceptibly got down his throat, Beck opened his eyes; and the servant being excessively drunk, and forgetting that his master was considered as dead, compelled him to swallow what wine remained in the glass. The painter gradually revived, and by proper management and care recovered perfectly, and escaped a premature interment. How highly the works of this master were esteemed, may appear from the many marks of distinction and honour which were shown him; for he received from different princes, as an acknowledgment of his singular merit, nine gold chains, and several medals of gold, of a very large size.

BECKET, Thomas, lord chancellor of England, archbishop of Canterbury in the 12th century. The story of his birth is as extraordinary as that of his life. It is related that his father Gilbert Becket, some time sheriff of London, went on a pilgrimage to Jerusalem, where being surprised and enslaved by a party of Saracens, his master's daughter fell in love with him; and that when he made his escape she followed him to London. So singular an instance of heroic affection struck him; and after consulting with some bishops, he baptized her by the name of Matilda, and married her; from which marriage proceeded the haughty Thomas Becket. Being raised to the archbishopric, he began the great dispute between the crown and the mitre, and sided with the pope: at which King Henry II. was greatly offended; and calling an assembly of the bishops at Westminster, offered six articles against papal encroachments, which he urged Becket to assent to. Becket, at the importunities of several lords, signed them; but relapsing, he was ordered to be tried as a traitor: upon which he fled into Flanders. The king banished all his relations, and Becket excommunicated all his opposers. At last, after seven years, by the intercession of the French king and the pope, he returned; but refused to absolve these bishops and others he had excommunicated: whereupon the king grew enraged, and is reported to have dropped these expressions: "That he was an unhappy prince, who maintained a great number of lazy insignificant persons about him, none of whom had gratitude or spirit enough to revenge him on a single insolent prelate who gave him so much disturbance." These words of the king put four gentlemen of his court on forming a design against the archbishop's life, which they executed in the cathedral church of Canterbury, on the 29th of December 1171. They endeavoured to drag him out of the church; but finding they could not do this without difficulty, killed him there. The assassins being afraid they had gone too far, durst not return to the king's court at Normandy, but retired to Knaresborough in Yorkshire; where everybody avoided their company, hardly any person even choosing to eat or drink with them. They at length took a voyage to Rome, and being admitted to penance by Pope Alexander III. they went to Jerusalem; where, according to the pope's order, they spent their lives in penitential austerities, and died in the Black Mountain. They were buried at Jerusalem, without the church door belonging to the Templars. King Henry was, or affected to be, much disturbed at the news of Becket's death, and despatched an embassy to Rome to clear himself from the imputation of being the cause of it. Immediately all divine offices ceased in the church of Canterbury, and this for a year, excepting nine days; at the end of which, by order of the pope, it was reconsecrated. Two years after, Becket was canonized; and the following year, Henry returning to England, went to Canterbury, where he did penance as a testimony of his regret for the murder of Becket. When he came within sight of the church where the archbishop was buried, he alighted off his horse, and walked barefoot, in the habit of a pilgrim, till he came to Becket's tomb; where, after he had prostrated himself and prayed for a considerable time, he submitted to be scourged by the monks, and passed all that day and night without any refreshment, and kneeling upon the bare stone. In 1221 Becket's body was taken up, 50 years after his murder, in the presence of King Henry III. and a great concourse of the nobility and others, and deposited in a rich shrine, erected at the expence of Stephen Langton archbishop of Canterbury, which was soon visited from all parts, and enriched with the most costly gifts and offerings; and the miracles said to be wrought at his tomb were so numerous, that Gervase of Canterbury tells us, there were two large volumes of them kept in that church. The monks used to raise his body every year; and the day on which this ceremony was performed, which was called the *day of his translation*, was a general holiday: every 50th year there was celebrated a jubilee to his honour, which lasted 15 days: plenary indulgences were then granted to all that visited his tomb; and 100,000 pilgrims have been registered at a time in Canterbury. The devotion towards him had quite effaced in that town the adoration of the Deity; nay, even that of the Virgin. At God's altar, for instance, there were offered in one year 3l. 2s. 6d.; at the Virgin's, 63l. 5s. 6d.; at St Thomas's, 832l. 12s. 3d. But next year the disproportion was still greater: there was not a penny offered at God's altar; the Virgin's gained only 4l. 1s. 8d.; but St Thomas had got for his share 954l. 6s. 3d. Louis VII. of France had made a pilgrimage to this miraculous tomb, and had bestowed on the shrine a jewel which was esteemed the richest in Christendom. Henry VIII. to whom it may easily be imagined how obnoxious a saint of this character behoved to appear, and how much contrary to all his projects for degrading the authority of the court of Rome, not only pillaged the rich shrine dedicated to St Thomas, but made the saint himself be cited to appear in court, and be tried and condemned as a traitor: he ordered his name to be struck out of the kalendar; the office for his festival to be expunged from all breviaries; and his bones to be burnt, and the ashes thrown in the air. From Mr Thomas Warton we learn, that Becket was the subject of poetical legends. *The Lives of the Saints* in verse, in Bennet's library (Number CLXV.), contain his martyrdom and translation. This manuscript is supposed to be of the 14th century. The same ingenious writer informs us, from Peter de Blois, that the palace

Digitized by Google

palace of Becket was perpetually filled with bishops highly accomplished in literature, who passed their time there in reading, disputing, and deciding important questions of the state. "These prelates, though men of the world, were a society of scholars; yet very different from those who frequented the universities, in which nothing was taught but words and syllables, unprofitable subtleties, elementary speculations, and trifling distinctions. De Blois was himself eminently learned, and one of the most distinguished ornaments of Becket's attendants. We know that John of Salisbury, his intimate friend, the companion of his exile, and the writer of his life, was scarcely exceeded by any man of his time for his knowledge in philological and polite literature."

BECKINGHAM, Charles, an English dramatic writer, was the son of a linen-draper in London, and born in 1699. He was educated at that great nursery of learning Merchant Taylor's school, under the learned Dr Smith, where he made a very great proficiency in all his studies, and gave the strongest testimonials of very extraordinary abilities. In poetry more particularly he very early discovered an uncommon genius, two dramatic pieces of his writing being represented on the stage before he had completed his 20th year: and those not such as required the least indulgence or allowance on account of his years; but such as bore evidence to a boldness of sentiment, and accuracy of diction, an ingenuity of conduct, and a maturity of judgement, which would have done honour to a much more ripened age. The titles of his plays, both of which are tragedies, are, 1. Henry IV. of France. 2. Scipio Africanus. At the representation of the last-mentioned piece, which indeed was the first he wrote, his schoolmaster Dr Smith gave all his boys a holiday on the afternoon of the author's benefit, in order to afford an opportunity to such of them as pleased to pay their compliments to their school-fellow on that occasion. Besides these dramatic pieces, he wrote several other poems: but his genius was not permitted any very long period to expand itself in; for he died on the 18th of February 1730, in the 32d year of his age.

BECKMAN, John, an eminent German writer. See Supplement.

BECKUM, a town of the bishopric of Munster, in Germany, seated at the source of the river Verse, in E. Long. 8. 18. N. Lat. 51. 46.

BECSANGIL, anciently Bithynia, a province of Natolia in Asia; bounded on the north by the Black sea; on the west, by the sea of Marmora; on the south, by Natolia Proper: and on the east, by the province of Bolli. The principal town is Bursa.

BECTASSE, an order or sect of religious among the Turks, denominated from their founder *Bectash*, preacher to Sultan Amurath. All the Janizaries belonging to the Porte are of the religion of Bectasse, being even said to have derived their origin from the founder of this sect. The habit of the Bectasse is white: on their heads they wear white caps of several pieces, with turbans of wool twisted rope-fashion. They observe constantly the hour of prayer, which they perform in their own assemblies, and make frequent declarations of the unity of God.

BED, a convenience for stretching and composing the body on, for ease, rest, or sleep, consisting generally of feathers enclosed in a ticken case. There are varieties of beds, as a standing-bed, a settee-bed, a tent-bed, a truckle-bed, &c.

It was universally the practice, in the first ages, for mankind to sleep upon skins of beasts. It was originally the custom of the Greeks and Romans. It was particularly the custom of the ancient Britons before the Roman invasion; and these skins were spread on the floor of their apartments. Afterwards they were changed for loose rushes and heath, as the Welsh a few years ago lay on the former, and the Highlanders of Scotland sleep on the latter to this present moment. In process of time, the Romans suggested to the interior Britons the use, and the introduction of agriculture supplied them with the means, of the greater conveniency of straw beds. The beds of the * Roman gentry at this period were generally filled with feathers, and those of the inns with the soft down of reeds. But for many ages the beds of the Italians had been constantly composed of straw; it still formed those of the soldiers and officers at the conquest of Lancashire; and from both, our countrymen learnt their use. But it appears to have been taken up only by the gentlemen, as the common Welsh had their beds thinly stuffed with rushes as late as the conclusion of the 12th century; and with the gentlemen it continued many ages afterwards. Straw was used even in the royal chambers of England as late as the close of the 13th. Most of the peasants about Manchester lie on chaff at present, as do likewise the common people all over Scotland: In the Highlands heath also is very generally used as bedding, even by the gentry; and the repose on a heath bed has been celebrated by travellers as a peculiar luxury, superior to that yielded by down: In France and Italy, straw beds remain general to this day. But after the above period, beds were no longer suffered to rest upon the ground. The better mode, that had anciently prevailed in the east, and long before been introduced into Italy, was adopted in Britain; and they were now mounted on pedestals †. This, however, was equally confined to the gentlemen. The bed still continued on the floor among the common people. And the gross custom, that had prevailed from the beginning was retained by the lower Britons to the last; and these ground-beds were laid along the walls of their houses, and formed one common dormitory for all the members of the family. The fashion continued universally among the inferior ranks of the Welsh within these four or five ages, and with the more uncivilized part of the Highlanders down to our own times. And even at no great distance from Manchester, in the neighbouring Buxton, and within these 60 or 70 years, the persons that repaired to the bath are all said to have slept in one long chamber together; the upper part being allotted to the ladies, and the lower to the gentlemen, and only partitioned from each other by a curtain.

Whittaker's History of Manchester.

* Pliny, lib. viii. c. 48. and xvi. c. 36.

† Gen. xlix.

Dining-Bed, *lectus tricliniaris* or *discubitorius*, that whereon the ancients lay at meals. The dining or discubitory beds were four or five feet high. Three of these beds were ordinarily ranged by a square table, (whence both the table and the room where they ate were called *triclinium*) in such a manner that one of the sides of the table remained open and accessible to the waiters. Each bed would hold three or four, rarely five persons. These beds were unknown before the se-

Digitized by Google

cond Punic war: the Romans, till then, sat down to eat on plain wooden benches, in imitation of the heroes of Homer, or, as Varro expresses it, after the manner of the Lacedemonians and Cretans. Scipio Africanus first made an innovation: he had brought from Carthage some of those little beds called *punicani*, or *archaici;* being of a wood common enough, very low, stuffed only with straw or hay, and covered with goats or sheep's skins, *hædinis pellibus strati*. In reality, there was no great difference, as to delicacy, between these new beds and the ancient benches; but the custom of frequent bathing, which began then to obtain, by softening and relaxing the body, put men on trying to rest themselves more commodiously by lying along than by sitting down. For the ladies, it did not seem at first consistent with their modesty to adopt the mode of lying: accordingly they kept to the old custom all the time of the commonwealth; but, from the first Cæsars, they ate on their beds. For the youth who had not yet put on the *toga virilis*, they were long kept to the ancient discipline. When they were admitted to table, they only sat on the edge of the beds of their nearest relations. Never, says Suetonius, did the young Cæsars, Caius and Lucius, eat at the table of Augustus; but they were set *in imo loco*, or, as Tacitus expresses it, *ad lecti fulcra*. From the greatest simplicity, the Romans by degrees carried their dining beds to the most surprising magnificence. Pliny assures us, it was no new thing to see them covered over with plates of silver, adorned with the softest mats, and the richest counterpanes. Lampridius, speaking of Heliogabalus, says, he had beds of solid silver, *solido argento habuit lectos et tricliniares, et cubiculares*. We may add, that Pompey, in his third triumph, brought in beds of gold.—The Romans had also beds whereon they studied, and beds whereon the dead were carried to the funeral pile.

Bed-Moulding, in *Architecture*, a term used for those members of a corniche which are placed below the coronet; and now usually consist of an ogee, a list, a large boultine, and another list under the coronet.

Bed of Justice, in the old customs of France, a throne upon which the king sat when he went to the parliament. The king never held a bed of justice unless for affairs that concerned the state, and then all the officers of parliament were clothed in scarlet robes.

Bed of the Carriage of a Great Gun, a thick plank, that lies under the piece; being, as it were, the body of the carriage.

Bed, in *Masonry*, a course or range of stones; and the joint of the bed is the mortar between two stones, placed over each other.

Bed, in *Gardening*, square or oblong pieces of ground in a garden, raised a little above the level of the adjoining ground, and wherein they sow seeds or plant roots.

Hot-Bed. See *Hot-Bed*.

Lords of the Bed Chamber, in the British court, are 12 noblemen who attend in their turns, each a month; during which time they lie in the king's bed-chamber, and wait on him when he dines in private. Their salary is 1000l. per annum.

BEDA, commonly called *Venerable Bede*, one of our most ancient historians, was born in the year 672, in the neighbourhood of Weremouth, in the bishopric of Durham. He was educated by the abbot Benedict in the monastery of St Peter, near the mouth of the river Wyre. At the age of 19 he was ordained deacon, and priest in the year 702. About this time he was invited to Rome by Pope Sergius; but there is no sufficient reason to believe that he accepted the invitation. In the year 731 he published his Ecclesiastical History; a work of so much merit, notwithstanding the legendary tales it contains, that it were alone sufficient to immortalize the author. He died in the year 735 of a lingering consumption, probably occasioned by a sedentary life, and a long uninterrupted application to study and literary compositions, of which he left an incredible number. He was buried in the church of his convent at Jarrow: but his bones were afterwards removed to Durham, and there deposited in the same coffin with those of St Cuthbert. Bede was undoubtedly a singular phenomenon in an ignorant and illiterate age. His learning, for the times, was extensive, his application incredible, his piety exemplary, and his modesty excessive. He was universally admired, consulted, and esteemed, during his life: and his writings are deservedly considered as the foundation of our ecclesiastical history. His language is neither elegant nor pure, but perspicuous and easy.—All his works are in Latin. The first general collection of them appeared at Paris in 1544, in three volumes in folio. They were printed again at the same place in 1554, in eight volumes. They were also published in the same size and number of volumes at Basil in 1563, reprinted at Cologne in 1612, and at the same place in 1688. Besides this general collection, there are several of his compositions, which have been printed separately, or amongst the collections of the writings of ancient authors; and there are several manuscripts ascribed to him, which are preserved in the different libraries in Oxford and Cambridge.

BEDALL, a town in the north riding of Yorkshire. Through this town passes a Roman causeway to Richmond, &c. W. Long. 1. 40. N. Lat. 54. 30.

BEDARIEUX, or Bec d'Arieux, a town of Languedoc in France, now the department of Herault, seated on the river Obe, in E. Long. 3. 24. N. Lat. 43. 29.

BEDDOES, Thomas, an eminent English medical writer. See Supplement.

BEDEL. See Beadle.

Bedel, a small town in the north riding of Yorkshire, seated on a little brook, in W. Long. 1. 30. N. Lat. 54. 30.

BEDELL, Dr William, a learned prelate, born in Essex in 1570. He went with Sir Henry Wotton the English ambassador to the republic of Venice, as his chaplain, in 1604; and continuing eight years in that city, contracted an intimate acquaintance with the famous Father Paul, of whom he learned Italian so well as to translate the English Common Prayer Book into that language: in return he drew up an English grammar for Father Paul, who declared he had learned more from him in all parts of divinity than from any one beside. He was accordingly much concerned when Bedell left Venice; and at his departure presented him with his picture, the MSS. of his History of the Council of Trent, his History of the Interdict and Inquisi-

Digitized by Google

tion, with other literary donations. In 1629, he obtained the bishopric of Kilmore and Ardagh in Ireland; and finding these dioceses in great disorder, applied himself vigorously to reform the abuses there. He was no persecutor of Papists, but laboured with great success to convert the better sort of the Popish clergy: he procured an Irish translation of the Common Prayer Book, which he caused to be read in his cathedral every Sunday; and the New Testament having been translated by Archbishop Daniel, he procured one of the Old Testament; which he having been prevented from printing himself, was afterwards executed at the expence of the great Mr Robert Boyle. He published, in 1624, a controversial book against the Roman Catholics, which he dedicated to Charles prince of Wales; and assisted the archbishop of Spalatro in finishing his famous work *De Republica Ecclesiastica*.—When the bloody rebellion broke out in Ireland in Oct. 1641, the bishop at first did not feel the violence of its effects; for the very rebels had conceived a great veneration for him, and they declared he should be the last Englishman they would drive out of Ireland. His was the only house in the county of Cavan that was inviolated, and it was filled with the people who fled to him for shelter. About the middle of December, however, the rebels, pursuant to orders received from their council of state at Kilkenny, required him to dismiss the people that were with him; which he refused to do, declaring he would share the same fate with the rest. Upon this, they seized him, his two sons, and Mr Clogy who had married his daughter-in-law, and carried them prisoners to the castle of Cloughboughter, surrounded by a deep water, where they put them all, except the bishop, in irons; after some time, however, this part of their severity was abated. After being confined for about three weeks, the bishop and his two sons, and Mr Clogy, were exchanged for some of the principal rebels: but the bishop died soon after, on the 7th of February 1642, his death being chiefly occasioned by his late imprisonment, and the weight of sorrows which lay upon his mind. The Irish did him unusual honours at his burial; for the chief of the rebels gathered their forces together, and with them accompanied his body to the church-yard.

BEDER, a strong town of Asia, in the dominions of the Great Mogul. E. Long. 81. 10. N. Lat. 16. 50.

BEDFORD, the county town of Bedfordshire in England, seated on both sides of the river Ouse, over which there is a stone bridge; in W. Long. 0. 20. N. Lat. 52. 6. It is an ancient town, and pleasantly situated, but not very large nor well built, though the buildings are much improved of late, and the river made navigable. It sends two members to parliament, and gives the title of *duke* to the noble family of Russel. At this place the Britons were overthrown in a great battle in 572, by Cuthwulf the Saxon king; and here was a strong castle, built in the time of the Normans by Pagan de Beauchamp, the third baron of Bedford. It was reduced by King Stephen after a long siege; and afterwards taken by King John, after a siege of 60 days, from Fulco de Brent, who rebelled against his sovereign, notwithstanding he had taken this castle before from the barons, and had it bestowed upon him by the king. The town is a very ancient corporation. The number of inhabitants in 1811 was 4605. The voters are said to be 1400. It is governed at present by a mayor, recorder, two bailiffs, twelve aldermen, two chamberlains, a town-clerk, and three serjeants. The neighbouring country is very fruitful in wheat, great quantities of which are carried from hence to Hitchen and Hertford markets, sold, ground, and conveyed to London. The town has five churches, a free school, and several hospitals, and enjoys a good trade in corn by the way of Lynn. When the river is swelled with rains, especially in winter, it is usual in Cambridgeshire to say, *the bailiff of Bedford is coming;* meaning that it is going to lay their fens under water.

BEDFORDSHIRE, an inland county of England. When the Romans landed in Britain, 55 years before Christ, it was included in the district inhabited by the Catieuchlani, whose chief or governor Cassibelinus headed the forces of the whole island against Cæsar, and the year following was totally defeated. In 310 the emperor Constantine divided Britain into five Roman provinces, when this county was included in the third division, called *Flavia Cæsariensis;* in which state it continued 426 years, when the Romans quitted Britain. At the establishment of the kingdom of Mercia (one of the divisions of the Saxon heptarchy) it was considered as part of that kingdom; and so continued from 582 to 827, when with the other petty kingdoms of the island it became subject to the West Saxons under Egbert, and the whole was named *England*. In 889, Alfred held the sovereignty, when England was divided into counties, hundreds, and tythings, and Bedfordshire first received its present name. It is in the Norfolk circuit, the province of Canterbury, and bishopric of Lincoln. Its form is oval, being about 33 miles long, 16 broad, and nearly 73 in circumference; containing an area of 275,000, or according to others of 307,200 square acres. It supplies 400 men to the national militia. It contains 124 parishes, 58 vicarages, and 11 market-towns, viz. Bedford, Ampthill, Biggleswade, Dunstable, Leighton, Beaudesart, Luton, Potton, Shefford, Tuddington, and Woburn, and 55 villages. The total number of inhabitants, in 1811, amounted to 70,213, and the number of houses to 13,286, occupied by 14,927 families. It is divided into nine hundreds, sends two members to parliament, and pays seven parts of 513 of the land tax. Its principal river, the Ouse, is navigable to Bedford; and divides the county into two parts, of which that to the south is the most considerable. In its course, which is very meandering, it receives several small streams; the principal one is the Ivel, which takes its rise in the southern part of the county. The air is healthy, and the soil in general a deep clay. The north side of the Ouse is fruitful and woody, but the south side is less fertile: yet producing great quantities of wheat and barley, excellent in their kind, and woad for dyers. The soil yields plenty of fullers earth for our woollen manufactory. The chief manufactures of the county are thread, lace, and straw ware. In this county there are many remains of Roman, Saxon, and Norman antiquities; and a few Roman stations, viz. Sandys near Potton, and the Magiovinum of Antoninus, by others supposed to be the ancient Salenæ, containing 30 acres, where many urns, coins, &c. have been dug up. Another at Madining-bowre, or Maiden-bower, one mile from Dunstable, containing about nine acres, which Camden supposes to have been a Roman station, from coins of

cond Punic war: the Romans, till then, sat down to eat on plain wooden benches, in imitation of the heroes of Homer, or, as Varro expresses it, after the manner of the Lacedemonians and Cretans. Scipio Africanus first made an innovation: he had brought from Carthage some of those little beds called *punicani*, or *archaici*; being of a wood common enough, very low, stuffed only with straw or hay, and covered with goats or sheep's skins, *hædinis pellibus strati*. In reality, there was no great difference, as to delicacy, between these new beds and the ancient benches; but the custom of frequent bathing, which began then to obtain, by softening and relaxing the body, put men on trying to rest themselves more commodiously by lying along than by sitting down. For the ladies, it did not seem at first consistent with their modesty to adopt the mode of lying: accordingly they kept to the old custom all the time of the commonwealth; but, from the first Cæsars, they ate on their beds. For the youth who had not yet put on the *toga virilis*, they were long kept to the ancient discipline. When they were admitted to table, they only sat on the edge of the beds of their nearest relations. Never, says Suetonius, did the young Cæsars, Caius and Lucius, eat at the table of Augustus; but they were set *in imo loco*, or, as Tacitus expresses it, *ad lecti fulcra*. From the greatest simplicity, the Romans by degrees carried their dining beds to the most surprising magnificence. Pliny assures us, it was no new thing to see them covered over with plates of silver, adorned with the softest mats, and the richest counterpanes. Lampridius, speaking of Heliogabalus, says, he had beds of solid silver, *solido argento habuit lectos et tricliniares, et cubiculares*. We may add, that Pompey, in his third triumph, brought in beds of gold.—The Romans had also beds whereon they studied, and beds whereon the dead were carried to the funeral pile.

Bed-Moulding, in *Architecture*, a term used for those members of a corniche which are placed below the coronet; and now usually consist of an ogee, a list, a large boultine, and another list under the coronet.

Bed of Justice, in the old customs of France, a throne upon which the king sat when he went to the parliament. The king never held a bed of justice unless for affairs that concerned the state, and then all the officers of parliament were clothed in scarlet robes.

Bed of the Carriage of a Great Gun, a thick plank, that lies under the piece; being, as it were, the body of the carriage.

Bed, in *Masonry*, a course or range of stones; and the joint of the bed is the mortar between two stones, placed over each other.

Bed, in *Gardening*, square or oblong pieces of ground in a garden, raised a little above the level of the adjoining ground, and wherein they sow seeds or plant roots.

Hot-Bed. See *Hot-Bed*.

Lords of the Bed Chamber, in the British court, are 12 noblemen who attend in their turns, each a month; during which time they lie in the king's bed-chamber, and wait on him when he dines in private. Their salary is 1000l. per annum.

BEDA, commonly called *Venerable Bede*, one of our most ancient historians, was born in the year 672, in the neighbourhood of Weremouth, in the bishopric of Durham. He was educated by the abbot Benedict in the monastery of St Peter, near the mouth of the river Wyre. At the age of 19 he was ordained deacon, and priest in the year 702. About this time he was invited to Rome by Pope Sergius; but there is no sufficient reason to believe that he accepted the invitation. In the year 731 he published his Ecclesiastical History; a work of so much merit, notwithstanding the legendary tales it contains, that it were alone sufficient to immortalize the author. He died in the year 735 of a lingering consumption, probably occasioned by a sedentary life, and a long uninterrupted application to study and literary compositions, of which he left an incredible number. He was buried in the church of his convent at Jarrow: but his bones were afterwards removed to Durham, and there deposited in the same coffin with those of St Cuthbert. Bede was undoubtedly a singular phenomenon in an ignorant and illiterate age. His learning, for the times, was extensive, his application incredible, his piety exemplary, and his modesty excessive. He was universally admired, consulted, and esteemed, during his life: and his writings are deservedly considered as the foundation of our ecclesiastical history. His language is neither elegant nor pure, but perspicuous and easy.—All his works are in Latin. The first general collection of them appeared at Paris in 1544, in three volumes in folio. They were printed again at the same place in 1554, in eight volumes. They were also published in the same size and number of volumes at Basil in 1563, reprinted at Cologne in 1612, and at the same place in 1688. Besides this general collection, there are several of his compositions, which have been printed separately, or amongst the collections of the writings of ancient authors; and there are several manuscripts ascribed to him, which are preserved in the different libraries in Oxford and Cambridge.

BEDALL, a town in the north riding of Yorkshire. Through this town passes a Roman causeway to Richmond, &c. W. Long. 1. 40. N. Lat. 54. 30.

BEDARIEUX, or Bec d'Arieux, a town of Languedoc in France, now the department of Herault, seated on the river Obe, in E. Long. 3. 24. N. Lat. 43. 29.

BEDDOES, Thomas, an eminent English medical writer. See Supplement.

BEDEL. See Beadle.

Bedel, a small town in the north riding of Yorkshire, seated on a little brook, in W. Long. 1. 30. N. Lat. 54. 30.

BEDELL, Dr William, a learned prelate, born in Essex in 1570. He went with Sir Henry Wotton the English ambassador to the republic of Venice, as his chaplain, in 1604; and continuing eight years in that city, contracted an intimate acquaintance with the famous Father Paul, of whom he learned Italian so well as to translate the English Common Prayer Book into that language: in return he drew up an English grammar for Father Paul, who declared he had learned more from him in all parts of divinity than from any one beside. He was accordingly much concerned when Bedell left Venice; and at his departure presented him with his picture, the MSS. of his History of the Council of Trent, his History of the Interdict and Inquisition,

Digitized by Google

tion, with other literary donations. In 1629, he obtained the bishopric of Kilmore and Ardagh in Ireland; and finding these dioceses in great disorder, applied himself vigorously to reform the abuses there. He was no persecutor of Papists, but laboured with great success to convert the better sort of the Popish clergy: he procured an Irish translation of the Common Prayer Book, which he caused to be read in his cathedral every Sunday; and the New Testament having been translated by Archbishop Daniel, he procured one of the Old Testament; which he having been prevented from printing himself, was afterwards executed at the expence of the great Mr Robert Boyle. He published, in 1624, a controversial book against the Roman Catholics, which he dedicated to Charles prince of Wales; and assisted the archbishop of Spalatro in finishing his famous work *De Republica Ecclesiastica*.—When the bloody rebellion broke out in Ireland in Oct. 1641, the bishop at first did not feel the violence of its effects; for the very rebels had conceived a great veneration for him, and they declared he should be the last Englishman they would drive out of Ireland. His was the only house in the county of Cavan that was inviolated, and it was filled with the people who fled to him for shelter. About the middle of December, however, the rebels, pursuant to orders received from their council of state at Kilkenny, required him to dismiss the people that were with him; which he refused to do, declaring he would share the same fate with the rest. Upon this, they seized him, his two sons, and Mr Clogy who had married his daughter-in-law, and carried them prisoners to the castle of Cloughboughter, surrounded by a deep water, where they put them all, except the bishop, in irons; after some time, however, this part of their severity was abated. After being confined for about three weeks, the bishop and his two sons, and Mr Clogy, were exchanged for some of the principal rebels: but the bishop died soon after, on the 7th of February 1642, his death being chiefly occasioned by his late imprisonment, and the weight of sorrows which lay upon his mind. The Irish did him unusual honours at his burial; for the chief of the rebels gathered their forces together, and with them accompanied his body to the church-yard.

BEDER, a strong town of Asia, in the dominions of the Great Mogul. E. Long. 81. 10. N. Lat. 16. 50.

BEDFORD, the county town of Bedfordshire in England, seated on both sides of the river Ouse, over which there is a stone bridge; in W. Long. 0. 20. N. Lat. 52. 6. It is an ancient town, and pleasantly situated, but not very large nor well built, though the buildings are much improved of late, and the river made navigable. It sends two members to parliament, and gives the title of *duke* to the noble family of Russel. At this place the Britons were overthrown in a great battle in 572, by Cuthwulf the Saxon king; and here was a strong castle, built in the time of the Normans by Pagan de Beauchamp, the third baron of Bedford. It was reduced by King Stephen after a long siege; and afterwards taken by King John, after a siege of 60 days, from Fulco de Brent, who rebelled against his sovereign, notwithstanding he had taken this castle before from the barons, and had it bestowed upon him by the king. The town is a very ancient corporation. The number of inhabitants in 1811 was 4605. The voters are said to be 1400. It is governed at present by a mayor, recorder, two bailiffs, twelve aldermen, two chamberlains, a town-clerk, and three serjeants. The neighbouring country is very fruitful in wheat, great quantities of which are carried from hence to Hitchen and Hertford markets, sold, ground, and conveyed to London. The town has five churches, a free school, and several hospitals, and enjoys a good trade in corn by the way of Lynn. When the river is swelled with rains, especially in winter, it is usual in Cambridgeshire to say, *the bailiff of Bedford is coming*; meaning that it is going to lay their fens under water.

BEDFORDSHIRE, an inland county of England. When the Romans landed in Britain, 55 years before Christ, it was included in the district inhabited by the Catieuchlani, whose chief or governor Cassibelinus headed the forces of the whole island against Cæsar, and the year following was totally defeated. In 310 the emperor Constantine divided Britain into five Roman provinces, when this county was included in the third division, called *Flavia Cæsariensis*; in which state it continued 426 years, when the Romans quitted Britain. At the establishment of the kingdom of Mercia (one of the divisions of the Saxon heptarchy) it was considered as part of that kingdom; and so continued from 582 to 827, when with the other petty kingdoms of the island it became subject to the West Saxons under Egbert, and the whole was named *England*. In 889, Alfred held the sovereignty, when England was divided into counties, hundreds, and tythings, and Bedfordshire first received its present name. It is in the Norfolk circuit, the province of Canterbury, and bishopric of Lincoln. Its form is oval, being about 33 miles long, 16 broad, and nearly 73 in circumference; containing an area of 275,000, or according to others of 307,200 square acres. It supplies 400 men to the national militia. It contains 124 parishes, 58 vicarages, and 11 market-towns, viz. Bedford, Ampthill, Biggleswade, Dunstable, Leighton, Beaudesart, Luton, Potton, Shefford, Tuddington, and Woburn, and 55 villages. The total number of inhabitants, in 1811, amounted to 70,213, and the number of houses to 13,286, occupied by 14,927 families. It is divided into nine hundreds, sends two members to parliament, and pays seven parts of 513 of the land tax. Its principal river, the Ouse, is navigable to Bedford; and divides the county into two parts, of which that to the south is the most considerable. In its course, which is very meandering, it receives several small streams; the principal one is the Ivel, which takes its rise in the southern part of the county. The air is healthy, and the soil in general a deep clay. The north side of the Ouse is fruitful and woody, but the south side is less fertile: yet producing great quantities of wheat and barley, excellent in their kind, and woad for dyers. The soil yields plenty of fullers earth for our woollen manufactory. The chief manufactures of the county are thread, lace, and straw ware. In this county there are many remains of Roman, Saxon, and Norman antiquities; and a few Roman stations, viz. Sandys near Potton, and the Magiovinum of Antoninus, by others supposed to be the ancient Salenæ, containing 30 acres, where many urns, coins, &c. have been dug up. Another at Madining-bowre, or Maiden-bower, one mile from Dunstable, containing about nine acres, which Camden supposes to have been a Roman station, from coins of

Digitized by Google

of the emperors having been frequently dug up there, and calls it *Magintum*. Leighton Beaudesart is supposed to have been a Roman camp. There is another at Arlesey near Shefford; and a Roman amphitheatre may be traced near Bradford Magna. The Roman road, Icknield-street, crosses this county, entering at Leighton Beaudesart, from whence it passes Dunstable, where it inclines northward, over Wardon-hills, to Badlock in Hertfordshire. The Watling-street enters this county near Luton from St Albans, passes a little north of Dunstable, where it crosses the Icknield-street, and from thence to Stoney Stratford in Buckinghamshire. A Roman road also enters near Potton, passes on to Sandy, and from thence to Bedford, where it crosses the Ouse, and proceeds to Newport Pagnell in Buckinghamshire. The following antiquities in this county are worthy of notice: Bedford Bridge and Priory; Chicksand Abbey near Shefford; Dunstable Priory near Luton; Eaton Park House or Eaton Bray; Five Knolls near Dunstable; Newnham Priory near Bedford; Northill Church, three miles from Biggleswade; Summeris Tower near Luton; Wardon Abbey near Shefford; Woburn Abbey. See BEDFORDSHIRE, SUPPLEMENT.

BEDLOE, WILLIAM, who assumed the title of *Captain*, was an infamous adventurer of low birth, who had travelled over a great part of Europe under different names and disguises, and had passed among several ignorant persons for a man of rank and fortune. Encouraged by the success of Oates, he turned evidence, gave an account of Godfrey's murder, and added many circumstances to the narrative of the former. These villains had the boldness to accuse the queen of entering into a conspiracy against the king's life. A reward of 500l. was voted to Bedloe by the commons. He is said to have asserted the reality of the plot on his deathbed: but it abounds with absurdity, contradiction, and perjury; and still remains one of the greatest problems in the British annals. He died at Bristol 20th August 1680. Giles Jacob informs us, that he was author of a play called "The Excommunicated Prince, or the False Reliet," 1679. The printer of it having, without the author's knowledge, added a second title, and called it "The Popish Plot in a Play," greatly excited the curiosity of the public, who were, however, much disappointed when they found the plan of the piece to be founded on a quite different story. Anthony Wood will not allow the captain the merit of this play; but asserts that it was written partly, if not entirely, by one Tho. Walter, M. A. of Jesus college, Oxford.

BEDOUINS, or BEDOUIS, a modern name of the wild Arabs, whether in Asia or Africa. When speaking of the Arabs, we should distinguish whether they are cultivators or pastors; for this difference in their mode of life occasions so great a one in their manners and genius, that they become almost foreign nations with respect to each other. In the former case, leading a sedentary life, attached to the same soil, and subject to regular governments, the social state in which they live, very nearly resembles our own. Such are the inhabitants of Yemen; and such also are the descendants of those ancient conquerors who have either entirely, or in part, given inhabitants to Syria, Egypt, and the Barbary states. In the second instance, having only a transient interest in the soil, perpetually removing their tents from one place to another, and under subjection to no laws, their mode of existence is neither that of polished nations nor of savages; and therefore more particularly merits our attention. Such are the Bedouins, or inhabitants of the vast deserts which extend from the confines of Persia to Morocco. Though divided into independent communities or tribes, not unfrequently hostile to each other, they may still be considered as forming one nation. The resemblance of their language is a manifest token of this relationship. The only difference that exists between them is, that the African tribes are of a less ancient origin, being posterior to the conquest of these countries by the caliphs or successors of Mahomet; while the tribes of the desert of Arabia, properly so called, have descended by an uninterrupted succession from the remotest ages. To these the orientals are accustomed to appropriate the name of *Arabs*, as being the most ancient and the purest race. The term *Bedaoui* is added as a synonymous expression, signifying, "inhabitants of the Desert."

It is not without reason that the inhabitants of the desert boast of being the purest and the best preserved race of all the Arab tribes: for never have they been conquered, nor have they mixed with any other people by making conquests; for those by which the general name of Arabs has been rendered famous, really belong only to the tribes of Hedjaz and Yemen. Those who dwelt in the interior of the country never emigrated at the time of the revolution effected by Mahomet; or if they did take any part in it, it was confined to a few individuals, detached by motives of ambition. Thus we find the prophet in his Khoran continually styling the Arabs of the desert *rebels* and *infidels*; nor has so great a length of time produced any very considerable change. We may assert they have in every respect retained their primitive independence and simplicity. See ARABIA.

The wandering life of these people arises from the very nature of their deserts. To paint to himself these deserts (says M. Volney), the reader must imagine a sky almost perpetually inflamed, and without clouds, immense and boundless plains, without houses, trees, rivulets, or hills, where the eye frequently meets nothing but an extensive and uniform horizon like the sea, though in some places the ground is uneven and stony. Almost invariably naked on every side, the earth presents nothing but a few wild plants thinly scattered, and thickets, whose solitude is rarely disturbed but by antelopes, hares, locusts, and rats. Such is the nature of nearly the whole country, which extends six hundred leagues in length and three hundred in breadth, and stretches from Aleppo to the Arabian sea, and from Egypt to the Persian gulf. It must not, however, be imagined that the soil in so great an extent is everywhere the same; it varies considerably in different places. On the frontiers of Syria, for example, the earth is in general fat and cultivable, nay even fruitful. It is the same also on the banks of the Euphrates: but in the internal parts of the country, and towards the south, it becomes white and chalky, as in the parallel of Damascus; rocky, as in the Tih and the Hedjaz; and a pure sand, as to the eastward of Yemen. This variety in the qualities of the soil is productive

Digitized by Google

Bedouins. ductive of some minute differences in the condition of the Bedouins. For instance, in the more sterile countries, that is, those which produce but few plants, the tribes are feeble and very distant: which is the case in the desert of Suez, that of the Red sea, and the interior of the great desert called the *Najd*. When the soil is more fruitful, as between Damascus and the Euphrates, the tribes are more numerous and less remote from each other; and, lastly, in the cultivable districts, such as the pachalics of Aleppo, the Hauran, and the neighbourhood of Gaza, the camps are frequent and contiguous. In the former instances, the Bedouins are purely pastors, and subsist only on the produce of their herds, and on a few dates and flesh meat, which they eat either fresh, or dried in the sun and reduced to a powder. In the latter, they sow some land, and add cheese, barley, and even rice, to their flesh and milk meats.

In those districts where the soil is stony and sandy, as in the Tih, the Hedjaz, and the Najd, the rains make the seeds of the wild plants shoot, and revive the thickets, ranunculi, wormwood, and kali. They cause marshes in the lower grounds, which produce reeds and grass; and the plain assumes a tolerable degree of verdure. This is the season of abundance both for the herds and their masters; but on the return of the heats, every thing is parched up, and the earth, converted into a gray and fine dust, presents nothing but dry stems as hard as wood, on which neither horses, oxen, nor even goats can feed. In this state the desert would become uninhabitable, and must be totally abandoned, had not nature formed an animal no less hardy and frugal than the soil is sterile and ungrateful. No creature seems so peculiarly fitted to the climate in which it exists. Designing the camel to dwell in a country where he can find little nourishment, Nature (says M. Volney) has been sparing of her materials in the whole of his formation. She has not bestowed on him the plump fleshiness of the ox, horse, or elephant; but limiting herself to what is strictly necessary, she has given him a small head without ears, at the end of a long neck without flesh. She has taken from his legs and thighs every muscle not immediately requisite for motion; and in short, has bestowed on his withered body only the vessels and tendons necessary to connect its frame together. She has furnished him with a strong jaw, that he may grind the hardest aliments; but lest he should consume too much, she has straitened his stomach, and obliged him to chew the cud. She has lined his foot with a lump of flesh, which sliding in the mud, and being no way adapted to climbing, fits him only for a dry, level, and sandy soil like that of Arabia: she has evidently destined him likewise to slavery, by refusing him every sort of defence against his enemies. Destitute of the horns of the bull, the hoof of the horse, the tooth of the elephant, and the swiftness of the stag, how can the camel resist or avoid the attacks of the lion, the tiger, or even the wolf? To preserve the species, therefore, nature has concealed him in the depth of the vast deserts, where the want of vegetables can attract no game, and whence the want of game repels every voracious animal. Tyranny must have expelled man from the habitable parts of the earth before the camel could have lost his liberty. Become domestic, he has rendered habitable the most barren soil the world contains. He alone supplies all his master's wants. The milk of the camel nourishes the family of the Arab, under the varied forms of curd, cheese, and butter; and they often feed upon his flesh. Slippers and harness are made of his skin, tents and clothing of his hair. Heavy burdens are transported by his means: and when the earth denies forage to the horse, so valuable to the Bedouin, the she camel supplies that deficiency by her milk, at no other cost, for so many advantages, than a few stalks of brambles or wormwood and pounded date kernels. So great is the importance of the camel to the desert, that were it deprived of that useful animal, it must infallibly lose every inhabitant.

Such is the situation in which nature has placed the Bedouins, to make of them a race of men equally singular in their physical and moral character. This singularity is so striking, that even their neighbours the Syrians regard them as extraordinary beings: especially those tribes which dwell in the depth of the deserts, such as the Anaza, Kaibar, Tai, and others, which never approach the towns. When in the time of Shaik Daher, some of their horsemen came as far as Acre, they excited the same curiosity there as a visit from the savages of America would among us. Every body viewed with surprise these men, who were more diminutive, meagre, and swarthy, than any of the known Bedouins. Their withered legs were only composed of tendons, and had no calves. Their bellies seemed to cling to their backs, and their hair was frizzled almost as much as that of the negroes. They on the other hand were no less astonished at every thing they saw; they could neither conceive how the houses and minarets could stand erect, nor how men ventured to dwell beneath them, and always in the same spot; but above all, they were in an ecstacy on beholding the sea, nor could they comprehend what that desert of water could be.

We may imagine that the Arabs of the frontiers are not such novices; there are even several small tribes of them, who living in the midst of the country, as in the valley of Bekaa, that of the Jordan, and in Palestine, approach nearer to the condition of the peasants; but these are despised by the others, who look upon them as bastard Arabs and Rayas, or slaves of the Turks.

In general, the Bedouins are small, meagre, and tawny; more so, however, in the heart of the desert than on the frontiers of the cultivated country; but they are always of a darker hue than the neighbouring peasants. They also differ among themselves in the same camp; and M. Volney remarked, that the shaiks, that is, the rich, and their attendants, were always taller and more corpulent than the common class. He has seen some of them above five feet five and six inches high; though in general they do not (he says) exceed five feet two inches. This difference can only be attributed to their food, with which the former are supplied more abundantly than the latter: And the effects of this are equally evident in the Arabian and Turcoman camels; for these latter, dwelling in countries rich in forage, are become a species more robust and fleshy than the former. It may likewise be affirmed, that the lower class of Bedouins live in a state of habitual wretchedness and famine. It will appear almost incredible to us, but it is an undoubted fact, that the

Digitized by Google

Bedouins. the quantity of food usually consumed by the greatest part of them does not exceed six ounces a-day. This abstinence is most remarkable among the tribes of the Najd and the Hedjaz. Six or seven dates soaked in melted butter, a little sweet milk or curds, serve a man a whole day; and he esteems himself happy when he can add a small quantity of coarse flour or a little ball of rice. Meat is preserved for the greatest festivals: and they never kill a kid but for a marriage or a funeral. A few wealthy and generous shaiks alone can kill young camels, and eat baked rice with their victuals. In times of dearth, the vulgar, always half famished, do not disdain the most wretched kinds of food; and eat locusts, rats, lizards, and serpents broiled on briars. Hence are they such plunderers of the cultivated lands, and robbers on the high-roads: hence also their delicate constitution and their diminutive and meagre bodies, which are rather active than vigorous. It may be worth while to remark, that their evacuations of every kind, even perspiration, are extremely small; their blood is so destitute of serosity, that nothing but the greatest heat can preserve its fluidity. This, however, does not prevent them from being tolerably healthy in other respects; for maladies are less frequent among them than among the inhabitants of the cultivated country.

From these facts we are by no means justified in concluding that the frugality of the Bedouins is a virtue purely of choice, or even of climate. The extreme heat in which they live unquestionably facilitates their abstinence, by destroying that activity which cold gives to the stomach. Their being habituated also to so sparing a diet, by hindering the dilatation of the stomach, becomes doubtless a means of their supporting such abstemiousness; but the chief and primary motive of this habit is with them, as with the rest of mankind, the necessity of the circumstances in which they are placed, whether from the nature of the soil, as has been before explained, or that state of society in which they live, and which remains now to be examined.

It has been already remarked, that the Bedouin Arabs are divided into tribes, which constitute so many distinct nations. Each of these tribes appropriates to itself a tract of land forming its domain; in this they do not differ from cultivated nations, except that their territory requires a greater extent, in order to furnish subsistence for their herds throughout the year. Each tribe is collected in one or more camps, which are dispersed through the country, and which make a successive progress over the whole, in proportion as it is exhausted by the cattle; hence it is, that within a great extent a few spots only are inhabited, which vary from one day to another; but as the entire space is necessary for the annual subsistence of the tribe, whoever encroaches on it is deemed a violator of property; this is with them the law of nations. If, therefore, a tribe, or any of its subjects, enter upon a foreign territory, they are treated as enemies and robbers, and a war breaks out. Now, as all the tribes have affinities with each other by alliances of blood or conventions, leagues are formed, which render these wars more or less general. The manner of proceeding on such occasions is very simple. The offence made known, they mount their horses and seek the enemy: when they meet, they enter into a parley, and the matter is frequently made up; if not, they attack either in small bodies, or man to man. They encounter each other at full speed with fixed lances, which they sometimes dart, notwithstanding their length, at the flying enemy: the victory is rarely contested; it is decided by the first shock, and the vanquished take to flight at full gallop over the naked plain of the desert. Night generally favours their escape from the conqueror. The tribe which has lost the battle strikes its tents, removes to a distance by forced marches, and seeks an asylum among its allies. The enemy, satisfied with their success, drive their herds farther on, and the fugitives soon after return to their former situation. But the slaughter made in these engagements frequently sows the seeds of hatreds which perpetuate these dissensions. The interest of the common safety has for ages established a law among them, which decrees that the blood of every man who is slain must be avenged by that of his murderer. This vengeance is called *Tar*, or retaliation; and the right of exacting it devolves on the nearest of kin to the deceased. So nice are the Arabs on this point of honour, that if any one neglects to seek his retaliation he is disgraced for ever. He therefore watches every opportunity of revenge: if his enemy perishes from any other cause, still he is not satisfied, and his vengeance is directed against the nearest relation. These animosities are transmitted as an inheritance from father to children, and never cease but by the extinction of one of the families, unless they agree to sacrifice the criminal, or *purchase the blood* for a stated price, in money, or in flocks. Without this satisfaction, there is neither peace, nor truce, nor alliances, between them, nor sometimes even between whole tribes: *There is blood between us*, say they on every occasion; and this expression is an insurmountable barrier. Such accidents being necessarily numerous in a long course of time, the greater part of the tribes have ancient quarrels, and live in a habitual state of war; which, added to their way of life, renders the Bedouins a military people, though they have made no great progress in war as an art.

Their camps are formed in a kind of irregular circle, composed of a single row of tents, with greater or less intervals. These tents, made of goat or camels hair, are black or brown, in which they differ from those of the Turcomans, which are white. They are stretched on three or four pickets, only five or six feet high, which gives them a very flat appearance; at a distance, one of these camps seems only like a number of black spots: but the piercing eye of the Bedouin is not to be deceived. Each tent inhabited by a family is divided by a curtain into two apartments, one of which is appropriated to the women. The empty space within the large circle serves to fold their cattle every evening. They never have any intrenchments; their only advanced guards and patroles are dogs; their horses remain saddled and ready to mount on the first alarm; but as there is neither order nor regularity, these camps, always easy to surprise, afford no defence in case of an attack; accidents, therefore, very frequently happen, and cattle are carried off every day; a species of marauding war in which the Arabs are very experienced.

The tribes which live in the vicinity of the Turks are

Digitized by Google

Bedouins. are still more accustomed to attacks and alarms; for these strangers, arrogating to themselves, in right of conquest, the property of the whole country, treat the Arabs as rebel vassals, or as turbulent and dangerous enemies. On this principle, they never cease to wage secret or open war against them. The pachas study every occasion to harass them. Sometimes they contest with them a territory which they had let them, and at others demand a tribute which they never agreed to pay. Should a family of shaiks be divided by interest or ambition, they alternately succour each party, and conclude by the destruction of both. Frequently too they poison or assassinate those chiefs whose courage or abilities they dread, though they should even be their allies. The Arabs, on their side, regarding the Turks as usurpers and treacherous enemies, watch every opportunity to do them injury. Unfortunately, their vengeance falls oftener on the innocent than the guilty. The harmless peasant generally suffers for the offences of the soldier. On the slightest alarm, the Arabs cut their harvests, carry off their flocks, and intercept their communication and commerce. The peasant calls them thieves, and with reason; but the Bedouins claim the right of war, and perhaps they also are not in the wrong. However this may be, these depredations occasion a misunderstanding between the Bedouins and the inhabitants of the cultivated country, which renders them mutual enemies.

Such is the external situation of the Arabs. It is subject to great vicissitudes, according to the good or bad conduct of their chiefs. Sometimes a feeble tribe raises and aggrandizes itself, whilst another, which was powerful, falls into decay, or perhaps is entirely annihilated: not that all its members perish, but they incorporate themselves with some other; and this is the consequence of the internal constitution of the tribes. Each tribe is composed of one or more principal families, the members of which bear the title of shaiks, i. e. chiefs or lords. These families have a great resemblance to the patricians of Rome and the nobles of modern Europe. One of the shaiks has the supreme command over the others. He is the general of their little army; and sometimes assumes the title of *emir*, which signifies commander and prince. The more relations, children, and allies, he has, the greater is his strength and power. To these he adds particular adherents, whom he studiously attaches to him, by supplying all their wants. But besides this, a number of small families, who, not being strong enough to live independent, stand in need of protection and alliances, range themselves under the banners of this chief. Such an union is called *kabila*, or tribe. These tribes are distinguished from each other by the name of their respective chiefs, or by that of the ruling family; and when they speak of any of the individuals who compose them, they call them the *children* of such a chief, though they may not be all really of his blood, and he himself may have been long since dead. Thus they say, *Beni Temin*, *Oulad Tai*, the children of Temin and of Tai. This mode of expression is even applied, by metaphor, to the names of countries: the usual phrase for denoting its inhabitants being to call them *the children of such a place*. Thus the Arabs say, *Oulad Masr*, the Egyptians; *Oulad Sham*, the Syrians; they would also say, *Oulad Fransa*, the French; *Oulad Mouskou*, the Russians; a remark which is not unimportant to ancient history. Bedouins.

The government of this society is at once republican, aristocratical, and even despotic, without exactly corresponding with any of these forms. It is republican, inasmuch as the people have a great influence in all affairs, and as nothing can be transacted without the consent of a majority. It is aristocratical, because the families of the shaiks possess some of the prerogatives which everywhere accompany power; and, lastly, it is despotic, because the principal shaik has an indefinite and almost absolute authority, which, when he happens to be a man of credit and influence, he may even abuse; but the state of these tribes confines even this abuse to very narrow limits: for if a chief should commit an act of injustice; if, for example, he should kill an Arab, it would be almost impossible for him to escape punishment; the resentment of the offended party would pay no respect to his dignity; the law of retaliation would be put in force; and, should he not pay the blood, he would be infallibly assassinated, which, from the simple and private life the shaiks lead in their camps, would be no difficult thing to effect. If he harasses his subjects by severity, they abandon him and go over to another tribe. His own relations take advantage of his misconduct to depose him and advance themselves to his station. He can have no resource in foreign troops: his subjects communicate too easily with each other to render it possible for him to divide their interests and form a faction in his favour. Besides, how is he to pay them, since he receives no kind of taxes from the tribe; the wealth of the greater part of his subjects being limited to absolute necessaries, and his own confined to very moderate possessions, and those too loaded with great expences?

The principal shaik in every tribe, in fact, defrays the charges of all who arrive at or leave the camp. He receives the visits of the allies, and of every person who has business with them. Adjoining to his tent is a large pavilion for the reception of all strangers and passengers. There are held frequent assemblies of the shaiks and principal men, to determine on encampments and removals; on peace and war; on the differences with the Turkish governors and the villages; and the litigations and quarrels of individuals. To this crowd, which enters successively, he must give coffee, bread baked on the ashes, rice, and sometimes roasted kid or camel; in a word, he must keep open table; and it is the more important to him to be generous, as this generosity is closely connected with matters of the greatest consequence. On the exercise of this depend his credit and his power. The famished Arab ranks the liberality which feeds him before every virtue; nor is this prejudice without foundation; for experience has proved that covetous chiefs never were men of enlarged views: hence the proverb, as just as it is brief, *A close fist, a narrow heart*. To provide for these expences, the shaik has nothing but his herds, a few spots of cultivated ground, the profits of his plunder, and the tribute he levies on the high-roads; the total of which is very inconsiderable. The shaik with whom M. Volney resided in the country of Gaza, about the end of 1784, passed for one of the most powerful of those districts; yet it did not appear to our author that his expenditure was greater than that of an opulent farmer.

His

Digitized by Google

Bedouins. His personal effects, consisting of a few pelisses, carpets, arms, horses, and camels, could not be estimated at more than 50,000 livres (a little above 2000l.); and it must be observed, that in this calculation four mares of the breed of racers are valued at 6000 livres (250l.), and each camel at 10l. sterling. We must not therefore, when we speak of the Bedouins, affix to the words *Prince* and *Lord* the ideas they usually convey; we should come nearer to the truth by comparing them to substantial farmers in mountainous countries, whose simplicity they resemble in their dress as well as in their domestic life and manners. A shaik who has the command of 500 horse does not disdain to saddle and bridle his own, nor to give him barley and chopped straw. In his tent, his wife makes the coffee, kneads the dough, and superintends the dressing of the victuals. His daughters and kinswomen wash the linen, and go with pitchers on their head and veils over their faces to draw water from the fountain. These manners agree precisely with the descriptions in Homer and the history of Abraham in Genesis. But it must be owned that it is difficult to form a just idea of them without having ourselves been eye witnesses.

The simplicity, or perhaps more properly the poverty, of the lower class of the Bedouins is proportionate to that of their chiefs. All the wealth of a family consists of moveables; of which the following is a pretty exact inventory; a few male and female camels; some goats and poultry; a mare and her bridle and saddle; a tent; a lance 16 feet long; a crooked sabre; a rusty musket, with a flint and matchlock; a pipe; a portable mill; a pot for cooking; a leathern bucket; a small coffee roaster; a mat; some clothes; a mantle of black wool: and a few glass or silver rings, which the women wear upon their legs and arms. If none of these are wanting, their furniture is complete. But what the poor man stands most in need of, and what he takes most pleasure in, is his mare; for this animal is his principal support. With his mare the Bedouin makes his excursions against hostile tribes, or seeks plunder in the country and on the highways. The mare is preferred to the horse, because she is more docile, and yields milk, which on occasion satisfies the thirst and even the hunger of her master.

Thus confined to the most absolute necessities of life, the Arabs have as little industry as their wants are few; all their arts consist in weaving their clumsy tents and in making mats and butter. Their whole commerce only extends to the exchanging camels, kids, stallions, and milk; for arms, clothing, a little rice or corn, and money, which they bury. They are totally ignorant of all science; and have not even any idea of astronomy, geometry, or medicine. They have not a single book; and nothing is so uncommon among the shaiks as to know how to read. All their literature consists in reciting tales and histories in the manner of the Arabian Nights Entertainments. They have a peculiar passion for such stories, and employ in them almost all their leisure, of which they have a great deal. In the evening they seat themselves on the ground, at the threshold of their tents, or under cover, if it be cold; and there, ranged in a circle round a little fire of dung, their pipes in their mouths, and their legs crossed, they sit a while in silent meditation, till on a sudden one of them breaks forth with *Once upon a time,*—and continues to recite the adventures of some young shaik and female Bedouin; he relates in what manner the youth first got a secret glimpse of his mistress; and how he became desperately enamoured of her: he minutely describes the lovely fair; boasts her black eyes, as large and soft as those of the gazelle; her languid and empassioned looks; her arched eyebrows, resembling two bows of ebony; her waist straight and supple as a lance: he forgets not her steps, light as those of the *young filley;* nor her eyelashes, blackened with *kohl;* nor her lips painted blue; nor her nails, tinged with the golden-coloured *henna;* nor her breasts resembling two pomegranates; nor her words sweet as honey. He recounts the sufferings of the young lover, so *wasted with desire and passion, that his body no longer yields any shadow.* At length, after detailing his various attempts to see his mistress, the obstacles of the parents, the invasions of the enemy, the captivity of the two lovers, &c. he terminates to the satisfaction of the audience, by restoring them, united and happy, to the paternal tent, and by receiving the tribute paid to his eloquence, in the *Ma cha allah* (an exclamation of praise, equivalent to *admirably well!*) he has merited. The Bedouins have likewise their love songs, which have more sentiment and nature in them than those of the Turks and inhabitants of the towns; doubtless, because the former, whose manners are chaste, know what love is: while the latter, abandoned to debauchery, are acquainted only with enjoyment.

When we consider how much the condition of the Bedouins, especially in the depths of the desert, resembles in many respects that of the savages of America, we shall be inclined to wonder why they have not the same ferocity; why, though they so often experience the extremity of hunger, the practice of devouring human flesh was never heard of among them; and why, in short, their manners are so much more sociable and mild. The following reasons are proposed by M. Volney as the true solution of this difficulty.

It seems at first view (he observes), that America, being rich in pasturage, lakes, and forests, is more adapted to the pastoral mode of life than to any other. But if we consider that these forests, by affording an easy refuge to animals, protect them more surely from the power of man, we may conclude that the savage has been induced to become a hunter instead of a shepherd, by the nature of the country. In this state, all his habits have concurred to give him a ferocity of character. The great fatigues of the chase have hardened his body; frequent and extreme hunger, followed by a sudden abundance of game, has rendered him voracious. The habit of shedding blood, and tearing his prey, has familiarized him to the sight of death and sufferings. Tormented by hunger, he has desired flesh; and finding it easy to obtain that of his fellow-creature, he could not long hesitate to kill him to satisfy the cravings of his appetite. The first experiment made, this cruelty degenerates into a habit; he becomes a cannibal, sanguinary and atrocious; and his mind acquires all the insensibility of his body.

The situation of the Arab is very different. Amid his vast naked plains, without water and without forests, he has not been able, for want of game or fish, to become either a hunter or a fisherman. The camel has determined him to a pastoral life, the manners of which have influenced his whole character. Finding

Bedouins.

at hand a light, but constant and sufficient nourishment, he has acquired the habit of frugality. Content with his milk and his dates, he has not desired flesh; he has shed no blood: his hands are not accustomed to slaughter, nor his ears to the cries of suffering creatures; he has preserved a humane and sensible heart.

No sooner did the savage shepherd become acquainted with the use of the horse, than his manner of life was considerably changed. The facility of passing rapidly over extensive tracts of country, rendered him a wanderer. He was greedy from want, and became a robber from greediness; and such is in fact his present character. A plunderer, rather than a warrior, the Arab possesses no sanguinary courage; he attacks only to despoil; and if he meets with resistance, never thinks a small booty is to be put in competition with his life. To irritate him you must shed his blood; in which case he is found to be as obstinate in his vengeance as he was cautious in avoiding danger.

The Bedouins have often been reproached with this spirit of rapine; but without wishing to defend it, we may observe that one circumstance has not been sufficiently attended to, which is, that it only takes place towards reputed enemies, and is consequently founded on the acknowledged laws of almost all nations. Among themselves they are remarkable for a good faith, a disinterestedness, a generosity, which would do honour to the most civilized people. What is there more noble than that right of asylum so respected among all the tribes? A stranger, nay even an enemy, touches the tent of the Bedouin, and from that instant his person becomes inviolable. It would be reckoned a disgraceful meanness, an indelible shame, to satisfy even a just vengeance at the expence of hospitality. Has the Bedouin consented to eat bread and salt with his guest, nothing in the world can induce him to betray him. The power of the sultan himself would not be able to force a refugee from the protection of a tribe, but by its total extermination. The Bedouin, so rapacious without his camp, has no sooner set his foot within it, than he becomes liberal and generous. What little he possesses he is ever ready to divide. He has even the delicacy not to wait till it is asked: when he takes his repast, he affects to seat himself at the door of his tent, in order to invite the passengers: his generosity is so sincere, that he does not look upon it as a merit, but merely as a duty; and he therefore readily takes the same liberty with others. To observe the manner in which the Arabs conduct themselves towards each other, one would imagine that they possessed all their goods in common. Nevertheless they are no strangers to property; but it has none of that selfishness which the increase of the imaginary wants of luxury has given it among polished nations. Deprived of a multitude of enjoyments which nature has lavished upon other countries, they are less exposed to temptations which might corrupt and debase them. It is more difficult for their shaiks to form a faction to enslave and impoverish the body of the nation. Each individual, capable of supplying all his wants, is better able to preserve his character and independence; and private property becomes at once the foundation and bulwark of public liberty.

This liberty extends even to matters of religion. We observe a remarkable difference between the Arabs of the towns and those of the desert; since, while the former crouch under the double yoke of political and religious despotism, the latter live in a state of perfect freedom from both: it is true, that on the frontiers of the Turks, the Bedouins, from policy, preserve the appearance of Mahometanism; but so relaxed is their observance of its ceremonies, and so little fervour has their devotion, that they are generally considered as infidels, who have neither law nor prophets. They even make no difficulty in saying that the religion of Mahomet was not made for them: "For (add they) how shall we make ablutions who have no water? How can we bestow alms who are not rich? Why should we fast in the Ramadan, since the whole year with us is one continual fast? and what necessity is there for us to make the pilgrimage to Mecca, if God be present everywhere?" In short, every man acts and thinks as he pleases, and the most perfect toleration is established among them.

Bedouins ‖ Bee.

BEDRIACUM, in *Ancient Geography*, a village of Italy, situated, according to Tacitus, between Verona and Cremona, but nearer the latter than the former. For the account given by that historian, Cluverius conjectures that the ancient Bedriacum stood in the place where the city of Caneto now stands. This village was remarkable for the defeat of the emperor Galba by Otho, and afterwards of Otho by Vitellius.

BEDWIN MAGNA, a village five miles south of Hungerford in Berkshire in England. It has neither market nor fair; but is a borough by prescription, and sends two members to parliament. It is said to have been a considerable place in the time of the Saxons, and that the traces of its fortifications are still extant.

BEE, in *Natural History*, a genus of insects, for the chararcters and classification of which see APIS, ENTOMOLOGY *Index*. The mellifica, or domestic honey bee, its history and economy, form the subject of this article.

1 Description of the honey-bee.

This species is furnished with downy hairs; has a dusky coloured breast, and brownish belly: the tibiae of the hind legs are ciliated, and transversely streaked on the inside. Each foot terminates in two hooks, with their points opposite to each other; in the middle of these hooks there is a little thin appendix, which, when unfolded, enables the insects to fasten themselves to glass or the most polished bodies. This part they likewise employ for transmitting the small particles of crude wax, which they find upon flowers, to the cavity in their thigh, hereafter described. The queen and drones, who never collect wax in this manner, have no such cavity. This species is also furnished with a proboscis or trunk, which serves to extract the honey from flowers; and has, besides, a real mouth situated in the fore part of the head, with which it is able to feed on the farina of flowers, from which afterwards is made wax. The belly is divided into six rings or joints; which sometimes shorten the body, by slipping the one over the other. In the inside of the belly there is a small bladder or reservoir, in which the honey is collected, after having passed through the proboscis and a narrow pipe which runs through the head and breast. This bladder, when full of honey, is about the size of a small pea.

The

Bee.

2
Its sting.

The sting, which is situated at the extremity of the belly, is a very curious weapon; and, when examined by the microscope, appears of a surprising structure. It has a horny sheath or scabbard, which includes two bearded darts. This sheath ends in a sharp point, near the extremity of which a slit opens, through which, at the time of stinging, the two bearded darts are protruded beyond the end of the sheath: one of these is a little longer than the other, and fixes its beard first: and the other instantly following, they penetrate alternately deeper and deeper, taking hold of the flesh with their beards or hooks, till the whole sting is buried in the flesh; and then a venomous juice is injected through the same sheath, from a little bag at the root of the sting. Hence the wound occasions an acute pain and swelling of the part, which sometimes continues several days. These effects are best remedied by enlarging the wound directly to give it some discharge. This poison seems to owe its mischievous efficacy to certain pungent salts. Let a bee be provoked to strike its sting against a plate of glass, and there will be a drop of the poison discharged and left upon the glass. This being placed under a double microscope, as the liquor evaporates, the salts will be seen to concrete, forming oblong, pointed, clear crystals.—Mr Derham counted on the sting of a wasp eight beards on the side of each dart, somewhat like the beards of fish-hooks; and the same number is to be counted on the darts of the bee's sting. When these beards are struck deep in the flesh, if the wounded person starts, or discomposes the bee before it can disengage them, the sting is left behind sticking in the wound: but if he have patience to stand quiet, the creature brings the hooks down close to the sides of the darts, and withdraws the weapon: in which case, the wound is always much less painful. The danger of being stung by bees may be in a great measure prevented by a quiet composed behaviour. A thousand bees will fly and buzz about a person without hurting him, if he stand perfectly still, and forbear disturbing them even when near his face; in which case he may observe them for hours together without danger; but if he molests or beats them away, he usually suffers for it. It has been lately affirmed *, that a person is in perfect safety in the midst of myriads of bees, if he but carefully keep his mouth shut, and breathe gently through the nostrils only; the human breath, it would seem, being peculiarly offensive to their delicate organs: and merely with this precaution, it is said, the very hives may be turned up, and even part of the comb cut out, while the bees are at work.

* See *Edinburgh Medical Commentaries*, vol. iv. p. 352.

I. Economy, Instincts, &c. *of the* Honey-Bee.

We may consider a hive of bees as a well-peopled city, in which are commonly found from 15,000 to 18,000 inhabitants. This city is in itself a monarchy;—composed of a *queen;* of males which are the *drones;* and of *working bees*, which have been supposed and called neuters. The combs, which are of pure wax, serve as their magazine of stores, and for the nursing places of their young offspring. There is between the combs a space sufficient for two bees to march abreast, without embarrassing each other; and in some parts it is more spacious. There are also holes, or narrow passes, which cross the combs transversely, and are intended to shorten the way when the bees pass from one comb to another.

3
Queen bee.

The Queen is easily distinguished from the other bees by the form of her body: she is longer and larger than they are, and her wings are much shorter than theirs in proportion to her body; for the wings of the other bees cover their whole body, whereas those of the queen hardly reach beyond her middle, or end at about the third ring of her belly. Her hinder parts are more taper than those of the other bees, terminating sharper. Her belly and legs are of a deep yellow, much resembling the purest gold. She is unwieldy in her flight, a reason for her seldom flying but when she leaves the parent-hive to go and settle a colony. All the bees form her retinue, and like dutiful subjects repair to the place she chooses. She is armed with a vigorous sting. Less passionate however than her subjects, she only uses her sting when long provoked, or when in contest for imperial sway. Never more than one remains in a hive, and that is the conqueror.

4
Attachment of her subjects.

A hive of bees cannot subsist without a queen, as she alone produces their numerous posterity; and on this account their fidelity and attachment to their sovereign are admirable.

5
Mr Wildman's feats by means of the queen.

Mr Wildman, by his dexterity in the management of bees, some years ago, surprised the whole kingdom. He can cause a swarm to light where he pleases, almost instantaneously; he can order them to settle on his head, then remove them to his hand; command them to depart and settle on a window, table, &c. at pleasure. We shall subjoin his method of performing these feats in his own words:

"Long experience has taught me, that as soon as I turn up a hive, and give it some taps on the sides and bottom, the queen immediately appears, to know the cause of this alarm, but soon retires again among her people. Being accustomed to see her so often, I readily perceive her at first glance; and long practice has enabled me to seize her instantly, with a tenderness that does not in the least endanger her person. This is of the utmost importance; for the least injury done to her brings immediate destruction to the hive, if you have not a spare queen to put in her place, as I have too often experienced in my first attempts. When possessed of her, I can without injury to her, or exciting that degree of resentment that might tempt her to sting me, slip her into my other hand, and, returning the hive to its place, hold her there, till the bees missing her, are all on wing, and in the utmost confusion. When the bees are thus distressed, I place the queen wherever I would have the bees to settle. The moment a few of them discover her, they give notice to those near them, and those to the rest; the knowledge of which soon becomes so general, that in a few minutes they all collect themselves round her; and are so happy in having recovered this sole support of their state, that they will long remain quiet in their situation. Nay, the scent of her body is so attractive of them, that the slightest touch of her, along any place or substance, will attach the bees to it, and induce them to pursue any path she takes." This was the only witchcraft used by Mr Wildman, and is that alone which is practised by others who have since made similar exhibitions. In short, seize on the queen, and you are

Digitized by Google

are sure of leading all the bees of a hive to any place you please.

6 Consequences of her death, &c.

When a queen dies by an accident, the bees of her hive immediately cease working, consume their own honey, fly about their own and other hives at unusual hours when other bees are at rest, and pine away if not soon supplied with another sovereign. Her loss is proclaimed by a clear and interrupted humming. This sign should be a warning to the owner of the bees, to take what honey remains in the hive, or to procure them another queen. In this last case the flock instantly revives; pleasure and activity are apparent through the whole hive; the presence of the sovereign restores vigour and exertion, and her voice commands universal respect and obedience: of such importance is the queen to the existence and prosperity of the other members of this community.

The dissection of the queen-bee shews evidently that she lays many thousand eggs. It is computed that the ovaria of a queen-bee contain more than 5000 eggs at one time; and therefore it is not difficult to conceive that a queen-bee may produce 10,000 or 12,000 bees, or even more, in the space of two months.

7 Of the drones.

The common DRONES are smaller than the queen, and larger than the working bees; and in flying they make a greater noise. The dissection of the drone gives as great proof of its being the male, as that of the queen does of her being female. In this creature there is no appearance of ovaries or eggs, nor any thing of the structure of the common working bees, but the whole abdomen is filled with transparent vessels, winding about in various sinuosities, and containing a white or milky fluid. This is plainly analogous to that fluid in the males of other animals, which is destined to render the eggs of the female prolific: and this whole apparatus of vessels, which much resembles the turnings and windings of the seminal vessels in other animals, is plainly intended only for the preparation and retention of this matter, till the destined time of its being emitted. On squeezing the hinder parts also, may be forced out the penis, a small and slender fleshy body, contained between two horns of a somewhat harder substance, which join at their base, but gradually part asunder as they are continued in length. These parts, found in all the drones, and none of them in any other bees except these, seem to prove very evidently the difference of sex. If a hive is opened in the beginning of spring, not a single drone will be found in it; from the middle of May till the end of June, hundreds of them will be found, commonly from 200 or 300 to 1000; and from thence to the following spring it would be in vain to seek for them. They go not out till 11 in the morning, and return before six in the evening. But their expeditions are not those of industry. They have no sting, their rostrum and feet are not adapted for collecting wax and honey, nor indeed are they obliged to labour. They only hover upon flowers to extract the sweets, and all their thoughts are pleasure. Their office is, to impregnate the eggs of the queen after they are deposited in the cells. And while their presence is thus necessary, they are suffered to enjoy the sweets of love and life; but as soon as they become useless in the hive, the working bees declare the most cruel war against them, and make terrible slaughter of them. This war affects not only the bees already in life, but even the eggs and maggots; for the law which has pronounced the destruction of the males has no exception, it extends equally to those which do not yet breathe and to those which do; the hive is cleared of every egg, maggot, or nymph; the whole is torn away and carried off. After the season proper for increasing the number of bees is past, and when they should attend only to the supplying of their magazines sufficiently with winter stores, every vestige of the drones is destroyed, to make room for honey. Whenever these drones are observed to remain in a hive late in the autumn, it is held to be a bad sign of the state of the hive.

But besides these larger drones, Maraldi and Reaumur had long ago discovered that there were others of a lesser size, not exceeding that of the common working bees. This fact, however, was not fully ascertained before the late experiments of Mr Debraw, to be afterwards mentioned. It is well known, as has been already noticed, that the large drones never appear in the hive before the middle of April; that they are all dead before the end of August, when the principal breeding season terminates; and that they are destroyed, together with all their worms or nymphs, by the working bees, probably by order of the queen, to save honey: yet it is equally certain, that the bees begin to breed early in the spring, sometimes in February, if the weather is mild; and that many broods are completed before these drones appear. But if drones of a smaller size are suffered to remain, which in a time of scarcity consume less honey than the others, these will answer the purpose of supplying the early broods, and the larger drones are produced against a time of greater plenty. Some observers affirm, that the smaller drones are all dead before the end of May, when the larger species appear and supersede their use. These circumstances accord with the suggestion of Abbé le Pluche in his *Spectacle de la Nature*, That a small number of drones are reserved to supply the necessities of the ensuing year; and that these drones are very little, if at all, larger than the common bees.

The WORKING BEES compose the greatest body of the state. Columella informs us, that the ancients distinguished several kinds of them. He joins in opinion with Virgil, who approves of those which are small, oblong, smooth, bright, and shining, of a gentle and mild disposition: "for," continues he, "by how much the larger and rounder the bee is, by so much the worse it is: but if it be fierce and cruel, it is the worst of all. The angry disposition of bees of a better character is easily softened by the frequent intercourse of those who take care of them, for they grow more tame when they are often handled." The experience of ages has now established the sort of bees which have been found to answer best the purposes of keeping them. 8 The working bees.

The working bees have the care of the hive, collect the wax and honey, fabricate and work up the wax, build the cells, feed the young, keep the hive clean, drive from thence strangers, and employ themselves in all other concerns relating to the hive.

The working bee has two stomachs; one which contains the honey, and a second in which is contained the crude

Digitized by Google

Bee.

crude wax. The working bees have no parts analogous to the ovaria of the queen, or that resemble the male organs of the drones. Hence they have generally been supposed to be neutral or of neither sex. But a different doctrine has lately been established; which there will be occasion to notice in the sequel.

The sting is very necessary for a working bee, both as an offensive and as a defensive weapon: for their honey and wax excite the envy of many greedy and lazy insects; and they have also to defend themselves against enemies who are fonder of eating them than their honey. There is likewise a time when the drones must be sacrificed and exterminated for the good of the society; and as they are larger and stronger than the working bees, these last would have a very unequal match, were it not for this poisonous sting.

9 Of their battles.

There happen also among bees, either of the same or of different hives, most deadly feuds, in which their stings are their chief weapons. In these contests, great skill may be discerned in their manner of pointing the sting between the scaly rings which cover their bodies, or to some other easily vulnerable part. The bee which first gains the advantage remains the conqueror; though the victory costs the victor his life, if he has left his sting in the body of the enemy; for, with the sting, so much of his body is torn out, that death inevitably follows. Bees have very severe conflicts when whole hives engage in a pitched battle, and many are slain on both sides. Their fighting and plundering one another ought chiefly to be imputed, as Mr Thorley observes, either to their perfect abhorrence of sloth and idleness, or to their insatiable thirst for honey; for when, in spring or autumn, the weather is fair, but no honey can be collected from plants, and is to be found only in the hives of other bees, they will venture their lives to get it there.

Dr Warder assigns another cause of their fighting; which is, the necessity that the bees are reduced to when their own hive has been plundered, at a season when it is too late for them to repair the loss by any industry in the fields.

Sometimes one of the queens is killed in battle. In this case, the bees of both hives unite as soon as her death is generally known among them. All then become one people; the vanquished go off with the robbers, richly laden with their own spoils, and return every day with their new associates to pillage their old habitation. This causes a throng, unusual for the season, at the door of the hive they are plundering; and if the owner lifts it up at night, when all are gone home, he will find it empty of inhabitants; though there perhaps will remain in it some honey, which he takes as his property.

When two swarms take flight at the same time, they sometimes quarrel, and great numbers are destroyed on both sides, till one of the queens is slain. This ends the contest, and the bees of both sides unite under the surviving sovereign.

10 Their labours.

When the bees begin to work in their hives, they divide themselves into four companies; one of which roves in the fields in search of materials; another employs itself in laying out the bottom and partitions of their cells; a third is employed in making the inside smooth from the corners and angles; and the fourth company brings food for the rest, or relieves those who return with their respective burdens. But they are not kept constant to one employment; they often change the tasks assigned them; those that have been at work being permitted to go abroad, and those that have been in the fields already take their places. They seem even to have signs, by which they understand each other; for when any of them wants food, it bends down its trunk to the bee from whom it is expected, which then opens its honey-bag, and lets some drops fall into the other's mouth, which is at that time opened to receive it. Their diligence and labour are so great, that in a day's time, they are able to make cells which lie upon each other numerous enough to contain 3000 bees.

11 Of the combs.

In the plan and formation of these cells they discover a most wonderful sagacity. In constructing habitations within a limited compass, an architect would have three objects in view: first, to use the smallest quantity that can be of materials; next, to give to the edifice the greatest capacity in a determined space; and thirdly, to employ the spot in such a manner that none of it may be lost. On examination it would be found that the bees have obtained all these advantages in the hexagonal form of their cells: for, first, there is an economy of wax, as the circumference of one cell makes part of the circumferences of those contiguous to it; secondly, the economy of the spot, as these cells which join to one another leave no void between them; and thirdly, the greatest capacity or space; as, of all the figures which can be contiguous, that with six sides gives the largest area. This thriftiness prompts them to make the partitions of their cells thin; yet they are constructed so as that the solidity may compensate for the scantiness of materials. The parts most liable to injury are the entrance of the cells. These the bees take care to strengthen, by adding quite round the circumference of the apertures a fillet of wax, by which means this mouth is three or four times thicker than the sides: and they are strengthened at the bottom by the angle formed by the bottom of three cells falling in the middle of an opposite cell. The combs lie parallel to each other; and there is left between every one of them a space which serves as a street, broad enough for two bees to pass by each other. There are holes which go quite through the combs, and serve as lanes for the bees to pass from one comb to another, without being obliged to go a great way about. When they begin their combs, they form at the top of the hive a root or stay to the whole edifice, which is to hang from it. Though they generally lay the foundations of the combs so that there shall be no more between them than what is sufficient for two bees to pass, yet they sometimes place those beginnings of two combs too far asunder; and, in this case, in order to fill up part of the void space arising from that bad disposition, they carry their combs on obliquely, to make them gradually approach each other. This void space is sometimes so considerable, that the bees build in it an intermediate comb, which they terminate as soon as the original combs have only their due distances. As the combs would be apt, when full, to overcome by their weight all the security which the bees can give them against falling, they who prepare hives set in them, crosswise, sticks, which serve as props to the combs, and save the bees a great deal of labour. It is not

Bee.

not easy to discover the particular manner of their working; for, notwithstanding the many contrivances used for this purpose, there are such numbers in continual motion, and succeed one another with such rapidity, that nothing but confusion appears to the sight. Some of them, however, have been observed carrying pieces of wax in their talons, and running to the places where they are at work upon the combs. These they fasten to the work by means of the same talons. Each bee is employed but a very short time in this way: but there is so great a number of them that go on in a constant succession, that the comb increases very perceptibly. Besides these, there are others that run about beating the work with their wings and the hinder part of their body, probably with a view to make it more firm and solid.

Whilst part of the bees are occupied in forming the cells, others are employed in perfecting and polishing those that are new modelled. This operation is performed by their talons, taking off every thing that is rough and uneven. These polishers are not so desultory in their operations as those that make the cells; they work long and diligently, never intermitting their labour, excepting to carry out of the cell the particles of wax which they take off in polishing. These particles are not allowed to be lost; others are ready to receive them from the polishers, and to employ them in some other part of the work.

12 Of their building-materials and provisions. 1. *Wax.*

The balls which we see attached to the legs of bees returning to the hives are not wax, but a powder collected from the stamina of flowers, not yet brought to the state of wax. The substance of these balls, heated in any vessel, does not melt as wax would do, but becomes dry, and hardens: it may even be reduced to a coal. If thrown into water, it will sink; whereas wax swims. To reduce this crude substance into wax, it must first be digested in the body of the bee.

Every bee, when it leaves the hive to collect this precious store, enters into the cup of the flower, particularly such as seem charged with the greatest quantity of this yellow farina. As the animal's body is covered over with hair, it rolls itself within the flower, and quickly becomes quite covered with the dust, which it soon after brushes off with its two hind legs, and kneads into two little balls. In the thighs of the hind legs there are two cavities, edged with hair; and into these, as into a basket, the animal sticks its pellets. Thus employed, the bee flits from flower to flower, increasing its store, and adding to its stock of wax, until the ball upon each thigh becomes as big as a grain of pepper; by this time having got a sufficient load, it returns, making the best of its way to the hive.

After the bees have brought home this crude substance, they eat it by degrees; or at other times, three or four bees come and ease the loaded bee, by eating each of them a share, the loaded bee giving them a hint so to do. Hunger is not the motive of their thus eating the balls of waxy matter, especially when a swarm is first hived; but it is their desire to provide a speedy supply of real wax for making the combs. At other times, when there is no immediate want of wax, the bees lay this matter up in repositories, to keep it in store.

When this waxy matter is swallowed, it is, by the digestive powers of the bee, converted into real wax, which the bees again disgorge as they work it up into combs; for it is only while thus soft and pliant from the stomach that they can fabricate it properly. That the wax thus employed is taken from their stomachs, appears from their making a considerable quantity of comb soon after they are hived, and even on any tree or shrub where they have rested but a short while before their being hived, though no balls were visible on their legs, excepting those of a few which may be just returned from the field. This is farther confirmed by what happened in a swarm newly hived: for two days together from the time of their quitting their former home, it rained constantly, insomuch that not one bee was able to stir out during that time; yet at the end of the two days they had made a comb 15 or 16 inches long, and thick in proportion.

The crude wax, when brought home by the bees, is often of as different colours as are the flowers from which it is collected: but the new combs are always of a white colour, which is afterwards changed only by the impurities arising from the steam, &c. of the bees.

Bees collect crude wax also for food; for if this was not the case, there would be no want of wax after the combs are made: but they are observed, even in old hives, to return in great numbers loaded with such matter, which is deposited in particular cells, and is known by the name of *bee-bread*. We may guess that they consume a great deal of this substance in food by the quantity collected; which, by computation, may in some hives amount to an hundred weight in a season, whilst the real wax in such a hive does not perhaps exceed two pounds.

13 2. The *propolis.*

It is well known that the habitation of bees ought to be very close; and what their hives want from the negligence or unskilfulness of man, these animals, supply by their own industry: so that it is their principal care, when first hived, to stop up all the cranies. For this purpose they make use of a resinous gum, which is more tenacious than wax, and differs greatly from it. This the ancients called *propolis*. It will grow considerably hard in the hive, though it will in some measure soften by heat; and is often found different in consistence, colour, and smell. It has generally an agreeable aromatic odour when it is warmed; and by some it is considered as a most grateful perfume. When the bees begin to work with it, it is soft; but it acquires a firmer consistence every day, till at length it assumes a brown colour, and becomes much harder than wax. The bees carry it on their hinder legs; and some think it is met with on the birch, the willow, and poplar. However it is procured, it is certain that they plaster the inside of their hives with this composition.

14 3. The *honey.*

Honey is originally a juice digested in plants, which sweats through their pores, and chiefly in their flowers, or is contained in reservoirs in which nature stores it. The bees sometimes penetrate into these stores, and at other times find the liquor exuded. This they collect in their stomachs; so that, when loaded with it, they seem, to an inattentive eye, to come home without any booty at all.

Besides the liquor already mentioned, which is obtained from the flowers of plants, another substance, called *honey-dew* *, has been discovered, of which the bees

* See the article *Honey-dew.*

Bee.

bees are equally fond. Of this substance there are two kinds, both deriving their origin from vegetables, though in very different ways.

The first kind, the only one known to husbandmen, and which passes for a dew that falls on trees, is no other than a mild sweet juice, which, having circulated through the vessels of vegetables, is separated in proper reservoirs in the flowers, or on the leaves, where it is properly called the *honey-dew:* sometimes it is deposited in the pith, as in the sugar-cane; and, at other times, in the juice of pulpy summer fruit when ripe. Such is the origin of the manna which is collected on the ash and maple of Calabria and Briançon, where it flows in great plenty from the leaves and trunks of these trees, and thickens into the form in which it is usually seen.

The second kind of honey-dew, which is the chief resource of bees, after the spring-flowers and dew by transpiration on the leaves are past, owes its origin to a small mean insect *, the excrement thrown out by which makes a part of the most delicate honey we ever taste.

* See the articles *Aphis* and *Honey-dew.*

From whatever source the bees have collected their honey, the instant they return home, they seek cells in which they may disgorge and deposite their loads. They have two sorts of stores: one which consists of honey laid up for the winter; and the other of honey intended for accidental use in case of bad weather, and for such bees as do not go abroad in search of it. Their method of securing each of these is different. They have in each cell a thicker substance, which is placed over the honey, to prevent its running out of the cell; and that substance is raised gradually as the cell is filled, till the bees, finding that the cell cannot contain any more, close it with a covering of wax, not to be opened till times of want, or during the winter.

15
Of the manner in which they breed.

It has been already observed, that the cells are intended for other purposes besides being places of store for honey. One of their chief uses is, their being nurseries for the young. The cells for those which are to be working bees are commonly half an inch deep; those for drones, three quarters of an inch; and those which are intended for keeping of honey only, still deeper. This accounts for the inequalities observed in the surface of combs.

The queen-bee is generally concealed in the most secret part of the hive, and is never visible but when she lays her eggs in such combs as are exposed to sight. When she does appear, she is always attended by ten or a dozen of the common sort, who form a kind of retinue, and follow her wherever she goes with a sedate and grave tread. Before she lays her eggs, she examines the cells where she designs to lay them; and if she finds that they contain neither honey, wax, nor any embryo, she introduces the posterior part of her body into the cell, and fixes to the bottom of it a small white egg, which is composed of a thin white membrane, full of a whitish liquor. In this manner she goes on, till she fills as many cells as she has eggs to lay, which are generally many thousands. Sometimes more than one egg has been deposited in the same cell; when this is the case, the working bees remove the supernumerary eggs, and leave only one in each cell. On the first or second day after the egg is lodged in the cell, the drone bee injects a small quantity of whitish liquid, which, in about a day, is absorbed by the egg. On the third or fourth day is produced a worm or maggot; which, when it is grown so as to touch the opposite angle, coils itself up in the shape of a semicircle, and floats in a proper liquid, whereby it is nourished and enlarged in its dimensions. This liquor is of a whitish colour, of the thickness of cream, and of an insipid taste like flour and water. Naturalists are not agreed as to the origin and qualities of this liquid. Some have supposed, that it consists of some generative matter, injected by the working bees into each cell, in order to give fecundity to the eggs: but the most probable opinion is, that it is the same with what some writers have called the *bee-bread;* and that it is a mixture of water with the juices of plants and flowers collected merely for the nutrition of the young, whilst they are in their weak and helpless state. Whatever be the nature of this aliment, it is certain that the common working bees are very industrious in supplying the worms with a sufficient quantity of it. The worm is fed by the working bees for about eight days, till one end touches the other in the form of a ring; and when it begins to feel itself uneasy in its first posture, it ceases to eat, and begins to unroll itself, thrusting that end forward towards the mouth of the cell which is to be the head. The attendant bees, observing these symptoms of approaching transformation, desist from their labours in carrying proper food, and employ themselves in fastening up the top of the cell with a lid of wax, formed in concentric circles, and by their natural heat in cherishing the brood, and hastening the birth. In this concealed state the worm extends itself at full length, and prepares a web of a sort of silk in the manner of the silk worm. This web forms a complete lining for the cell, and affords a convenient receptacle for the transformation of the worm into a nymph or chrysalis. Some naturalists suppose, that as each cell is destined to the successive breeding of several worms, the whole web, which is composed of many crusts or doubles, is in reality a collection of as many webs as there have been worms. M. Maraldi apprehends, that this lining is formed of the skin of the worm thrown off at its entrance into the nymph state: but it is urged, that if the cells are opened when newly covered by the bees, the worm within will be found in its own form, and detected in the act of spinning its web; and by means of glasses it will be found composed of fine threads regularly woven together, like those of other spinning animals. In the space of 18 or 20 days the whole process of transformation is finished, and the bee endeavours to discharge itself from confinement by forcing an aperture with its teeth through the covering of the cell. The passage is gradually dilated; so that one horn first appears, then the head, and afterwards the whole body. This is usually the work of three hours, and sometimes of half a day. The bee, after it has disengaged itself, stands on the surface of the comb, till it has acquired its natural complexion, and full maturity and strength, so as to become fit for labour. The rest of the bees gather round it in this state, congratulate its birth, and offer it honey out of their own mouths. The exuviæ and scattered pieces of wax which are left in the cell are removed by the working bees; and the matrix is no sooner cleansed and fit for new fecundation, but the queen deposites another egg in it; insomuch that, M.

Maraldi

Digitized by Google

Maraldi says, he has seen five bees produced in the same cell in the space of three months. The young bees are easily distinguished from the others by their colour; they are gray, instead of the yellowish brown of the common bees. The reason of this is, that their body is black, and the hairs that grow upon it are white, from the mixture of which seen together results a gray; but this colour forms itself into a brownish yellow by degrees, the rings of the body becoming more brown and the hairs more yellow.

The eggs from which drones are to proceed, are, as already observed, laid in larger cells than those of the working bees. The coverings of these cells, when the drones are in the nymph state, are convex or swelling outward, whilst the cells of the working bees are flat. This, with the privilege of leading idle effeminate lives, and not working for the public stock, is what distinguishes the drones.

The bees depart from their usual style of building when they are to raise cells for bringing up such maggots as are destined to become queens. These are of a longish oblong form, having one end bigger than the other, with their exterior surface full of little cavities. Wax, which is employed with so geometrical a thriftiness in the raising of hexagonal cells, is expended with profusion in the cell which is to be the cradle of a royal maggot. They sometimes fix it in the middle, and at other times on one side of a comb. Several common cells are sacrificed to serve as a basis and support to it. It is placed almost perpendicular to the common cells, the largest end being uppermost. The lower end is open till the season for closing it comes, or till the maggot is ready for transformation. It would be difficult to conceive how a tender maggot can remain in a cell turned bottom upmost, if we did not find it buried in a substance scarcely fluid, and if it were not in itself, at first, small and light enough to be suspended in this clammy paste. As it grows it fills all the upper and larger part of the cell. As soon as the young queen comes out of her cell, that cell is destroyed, and its place is supplied by common cells; but as the foundation of the royal castle is left, this part of the comb is found thicker than any other. There are several such cells prepared; for if there was only one reared in each hive, the swarms might often want a conductress. Many accidents may also destroy the little maggot before it becomes a bee. It is therefore necessary that a number of such cells should be provided; and accordingly there are observed several young queens in the beginning of the summer, more than one of which often takes flight when a swarm departs.

A young queen is in a condition to lead a swarm from a hive in which she was born in four or five days after she has appeared in it with wings. The bees of a swarm are in a great hurry when they know that their queen is ready to lay. In this case, they give to their new cells but part of the depth they are to have, and defer the finishing of them till they have traced the number of cells requisite for the present time. The cells first made are intended only for working bees; these being the most necessary.

16
Of their swarming.

When the hive is become too much crowded by the addition of the young brood, a part of the bees think of finding themselves a more commodious habitation, and with that view single out the most forward of the young queens. A new swarm is therefore constantly composed of one queen at least, and of several thousand working bees, as well as of some hundreds of drones. The working bees are some old, some young.

Scarce has the colony arrived at its new habitation, when the working bees labour with the utmost diligence to procure materials for food and building. Their principal aim is not only to have cells in which they may deposite their honey: a stronger motive seems to animate them. They seem to know that their queen is in haste to lay her eggs. Their industry is such that in 24 hours they will have made combs 20 inches long, and wide in proportion. They make more wax during the first fortnight, if the season is favourable, than they do during all the rest of the year. Other bees are at the same time busy in stopping all the holes and crevices they find in their new hive, in order to guard against the entrance of insects which covet their honey, their wax, or themselves; and also to exclude the cold air, for it is indispensably necessary that they be lodged warm.

When the bees first settle in swarming, indeed when they at any time rest themselves, there is something very particular in their method of taking their repose. It is done by collecting themselves in a heap, and hanging to each other by their feet. They sometimes extend these heaps to a considerable length. It would seem probable to us, that the bees from which the others hang must have a considerable weight suspended to them. All that can be said is, that the bees must find this to be a situation agreeable to themselves. They may perhaps have a method of distending themselves with air, thereby to lessen their specific gravity; in the same manner as fishes do in order to alter their gravity compared with water.

When a swarm divides into two or more bands, which settle separately, this division is a sure sign that there are two or more queens among them. One of these clusters is generally larger than the other. The bees of the smaller cluster or clusters, detach themselves by little and little, till at last the whole, together with the queen or queens, unite with the largest cluster.

As soon as the bees are settled, the supernumerary queen or queens must be sacrificed to the peace and tranquillity of the hive. This execution generally raises a considerable commotion in the hive; and several other bees, as well as the queen or queens, lose their lives. Their bodies may be observed on the ground, near the hive. The queen that is chosen is of a more reddish colour than those which are destroyed; so that fruitfulness seems to be a great motive of preference in bees; for the nearer they are to the time of laying their eggs, the bigger, larger, and more shining are their bodies. The method of hiving these swarms will be explained hereafter.

17
Other instincts.

Besides the capital instincts above mentioned, bees are possessed of others, some of which are equally necessary for their preservation and happiness.—They anxiously provide against the entrance of insects into the hive, by gluing up with wax the smallest holes in the skep. Some stand as centinels at the mouth of the hive, to prevent insects of any kind from getting in. But if a snail, or other large insect should get in, notwithstanding all resistance, they sting it to death; and even cover it over with a coat of propolis, to prevent

vent the bad smell or maggots which might proceed from the putrefaction of such a large animal. Bees seem to be warned of the appearance of bad weather by some particular feeling. It sometimes happens, even when they are very assiduous and busy, that they on a sudden cease from their work; not a single one stirs out; and those that are abroad hurry home in such prodigious crowds, that the doors of their habitations are too small to admit them. On this occasion look up to the sky, and you will soon discover some of those black clouds which denote impending rain. Whether they see the clouds gathering for it, as some imagine, or whether (as is much more probable) they feel some other effects of it upon their bodies, is not yet determined; but it is alleged, that no bee is ever caught even in what we call a sudden shower, unless it have been at a very great distance from the hive, or have been before injured by some accident, or be sickly and unable to fly so fast as the rest. Cold is a great enemy to them. To defend themselves against its effects during a hard winter, they crowd together in the middle of the hive, and buzz about, and thereby excite a warmth which is often perceptible by laying the hand upon the glass windows of the hive. They seem to understand one another by the motions of their wings: when the queen wants to quit the hive, she gives a little buzz; and all the others immediately follow her example, and retire along with her.

18
Age of bees.

As to the age of bees, the large drones live but a little while, being destroyed without mercy by the working bees, probably to save honey, as already noticed. But of the other sort, lately discovered, no larger than the working bees, and not easily to be distinguished from them, the age has not yet been ascertained. Writers are not agreed as to the age of the working bees. Some maintain that they are annual, and others suppose that they live many years. Many of them, it is well known, die annually of hard labour; and though they may be preserved by succession in hives or colonies for several years, the most accurate observers are of opinion that their age is but a year, or at the longest no more than two summers.

19
Opinions concerning the sex and fecundation of bees.

Concerning the sex and fecundation of bees, various experiments have been made of late years, by which new light has been thrown upon the subject, and several difficulties which embarrassed the process of generation among these curious insects seem to have been removed.

Swammerdam, and after him Maraldi, discovered in the structure of the drones some resemblance to the male organs of generation, as has already been described, and from thence concluded that they were the males: but neither of those accurate and industrious observers could detect them in the act of copulation. Swammerdam, therefore, entertained a notion, that the female or queen-bee was fecundated without copulation; that it was sufficient for her to be near the males; and that her eggs were impregnated by a kind of vivifying aura, exhaled from the body of the males, and absorbed by the female. However, M. Reaumur, thought that he had discovered the actual copulation of the drones with the female-bee, and he has very minutely described the process of it. A very ingenious naturalist * of the present day, without taking any notice of recent discoveries, seems to have given into the same idea. "The office of the males or drones (says he) is to render the queen pregnant. One single female should in the midst of seven or eight hundred males, one would think, be incessantly assailed. But nature has provided against that inconvenience, by making them of a constitution extremely frigid. The female chooses out one that pleases her; she is obliged to make the first advances, and excite him to love by her caresses. But this favour proves fatal to him: scarce has he ceased from amorous dalliance, but he is seen to perish. The pleasure of these observations may be taken, by putting a female with several males into a bottle."

* Barbut, Genera of Insects, p. 286.

Others again, as M. Shirach and M. Hattorf, reject the drones as bearing no share at all in the business of propagation, and assert the queen-bee to be self-prolific. But for what purpose then should wise nature have furnished the drones with that large quantity of seminal liquor? to what use so large an apparatus of fecundating organs so well described by Reaumur and Maraldi? The fact is, that the above gentlemen have founded their opinion upon observations that hives are peopled at a time of the year when (as they suppose) there are no drones in being. But we have already noticed, that nature has provided drones of different sizes for the purpose of impregnation, adapted to different times, occasions, and circumstances: And the mistake of Messrs Shirach and Hattorf seems to have proceeded from their missing the large-sized drones, and not being acquainted with or not adverting to the other sort, so hardly distinguishable from the working bees.

Lastly, many of the ancients as well as moderns have supposed that the eggs of the female bee are not impregnated with the male sperm, while in the body of the creature, but that they are deposited unimpregnated in the cells; and that the male afterwards ejects the male sperm on them as they lie in the cells, in the same manner as the generation of fishes is supposed to be performed by the males impregnating the spawn after it is cast out by the females. M. Maraldi † long since conjectured that this might be the case; and he was confirmed in his opinion, by observing a liquid whitish substance surrounding each egg at the bottom of the cell a little while after it had been laid, and that a great number of eggs, which are not encompassed by this liquor, remained barren in the cell.

† Hist. Acad. Sc. 1712, p. 331.

This method of impregnation has been lately established beyond all contradiction by the observations of Mr Debraw of Cambridge ‡. Having put some bees into glass-hives with a large number of drones, he observed on the first or second day (always before the third) from the time in which the eggs were placed in the cells, which the queen generally lays on the fourth or fifth day after they are put into the hive, that a great number of bees fastened themselves to one another, and formed a kind of curtain from the top to the bottom of the hive, probably in order to conceal the process of generation. 20

Mr Debraw's experiments and discoveries.

Mr Debraw, however, could soon perceive several bees, whose size he was not able to distinguish, inserting the posterior part of their bodies each into a cell, and sinking into it; after a little while they retired, and he could see with the naked eye a small quantity of whitish liquor left in the angle of the base of each cell containing an egg; this liquor

‡ Phil. Trans. vol. lxvii. part i. art. ;

liquor was less liquid than honey, and had no sweet taste.

In order to prove farther that the eggs are fecundated by the males, and that their presence is necessary at the time of breeding, Mr Debraw made the following experiments. They consist in leaving in a hive the queen, with only the common or working bees, without any drones, to see whether the eggs she laid would be prolific. To this end, he took a swarm, and shook all the bees into a tub of water, leaving them there till they were quite senseless: by which means he could distinguish the drones without any danger of being stung: Leaving these out, therefore, he restored the queen and working-bees to their former state, by spreading them on a brown paper in the sun; after this he replaced them in a glass-hive, where they soon began to work as usual. The queen laid eggs, which, to his great surprise, were impregnated; for he imagined he had separated all the drones or males, and therefore omitted watching them; at the end of twenty days he found several of his eggs had, in the usual course of changes, produced bees, while some had withered away, and others were covered with honey. Hence he inferred, that some of the males had escaped his notice, and impregnated part of the eggs. To convince himself of this, he took away all the brood comb that was in the hive, in order to oblige the bees to provide a fresh quantity, being determined to watch narrowly their motions after new eggs should be laid in the cells. On the second day after the eggs were placed in the cells, he perceived the same operation that was mentioned before; namely, that of the bees hanging down in the form of a curtain, while others thrust the posterior part of their body into the cells. He then introduced his hand into the hive, and broke off a piece of the comb, in which there were two of these insects: he found in neither of them any sting (a circumstance peculiar to the drones); upon dissection, with the assistance of a microscope, he discovered the four cylindrical bodies which contain the glutinous liquor, of a whitish colour, as observed by Maraldi in the large drones. He was therefore now under a necessity of repeating his experiments, in destroying the males, and even those which might be suspected to be such.

He once more immersed the same bees in water; and when they appeared in a senseless state, he gently pressed every one, in order to distinguish those armed with stings from those which had none, and which of course he supposed to be males: of those last he found fifty-seven, and replaced the same in a glass-hive, where they immediately applied again to the work of making cells; and on the fourth or fifth day, very early in the morning, he had the pleasure to see the queen-bee deposite her eggs in those cells; he continued watching most part of the ensuing days, but could discover nothing of what he had seen before.

The eggs after the fourth day, instead of changing in the manner of caterpillars, were found in the same state they were the first day, except that some were covered with honey. A singular event happened the next day about noon: all the bees left their own hive, and attempted to get into a neighbouring hive, probably in search of males; but the queen was found dead, having been killed in the engagement.

To be further satisfied, Mr Debraw took the brood-comb, which had not been impregnated, and divided it into two parts: one he placed under a glass bell, N° 1. with honey-comb for the bees food, taking care to leave a queen, but no drones, among the bees confined in it: the other piece of brood-comb he placed under another glass bell, N° 2. with a few drones, a queen, and a proportionable number of common bees. The result was, that in the glass, N° 1. there was no impregnation, the eggs remained in the same state they were in when put into the glass; and on giving the bees their liberty on the seventh day, they all flew away, as was found to be the case in the former experiment; whereas in the glass, N° 2. the very day after the bees had been put into it, the eggs were impregnated by the drones, the bees did not leave their hive on receiving their liberty, the eggs at the usual time underwent the necessary transformations, and a numerous young colony was produced.

Naturalists have observed, that the queen bees are produced in a manner peculiar to themselves, and different from the drones and working bees. Some have supposed, that the eggs laid by the queen in a hive, and destined for the production of queen bees, are of a peculiar kind; but though this is not the case, as M. Shirach has lately discovered, yet there are particular cells appropriated for this purpose. These cells are generally near the edges, and at the bottom of the combs, and sometimes on the sides of a honey-comb: they are of an oblong circular form, and very strong; and are more or less numerous in different hives as occasion seems to require. It has also been supposed, that the matter with which they are nourished is of a different kind and quality from that employed for the nourishment of the other bees; that which has been collected out of the royal cells being of a gummy glutinous nature, of a deep transparent red, and dissolving in the fire rather than crumbling to powder.

It has been generally supposed, that the queen bee is the only female contained in the hive; and that the working bees are neutral, or of neither sex. But M. Shirach * has lately established a different doctrine, which has been also confirmed by the later observations of Mr Debraw †. According to M. Shirach, all the working or common bees are females in disguise; and the queen-bee lays only two kinds of eggs, viz. those which are to produce the drones, and those from which the working bees are to proceed: and from any one or more of these, one or more queens may be produced; so that every worm of the latter or common kind, which has been hatched about three days, is capable, under certain circumstances, of becoming the queen or mother of a hive. In proof of this doctrine, new and singular as it may seem, he alleges a number of satisfactory and decisive experiments, which have been since verified by those of Mr Debraw. In the early months of the spring, and in any preceding month, even so late as November, he cut off from an old hive a piece of that part of the comb which contains the eggs of the working bees; taking care, however, that it contained likewise worms which had been hatched about three days. He fixed this in an empty hive, or box, together with a portion of honey-comb, &c. or, in other words, with a sufficiency of food and building materials, or wax, for the use of the intended colony.

21
M. Schirach's discoveries.

Bee.

lony. He then put into, and confined within the same box, a sufficient number of common working bees, taken from the same or any other hive. As soon as the members of this small community found themselves deprived of their liberty, and without a queen, a dreadful uproar ensued, which continued generally, with some short intervals of silence, for the space of about twenty-four hours; during which time it is to be supposed they were alternately meditating and holding council on the future support of the new republic. On the final cessation of this tumult, the general and almost constant result was, that they betook themselves to work; first proceeding to the construction of a royal cell, and then taking the proper measures for hatching and feeding the brood enclosed within them. Sometimes even on the second day the foundations of one or more royal cells were to be perceived; the view of which furnished certain indications that they had elected one of the enclosed worms to the sovereignty.

The operation has been hitherto conducted in the house. This new colony may now be safely trusted in the garden, if the weather be warm and have the liberty allowed them of passing out of the box; of which they instantly avail themselves, and are seen in a short time almost totally to desert their new habitation. In about two hours, however, they begin to re-enter it. We should not neglect to observe, that if they should be placed near the old hive, from which they were taken, they will very often attempt to enter it, but are as constantly repulsed by their former companions and brethren. It is prudent, therefore, to place them at a distance from the mother state, in order to avoid the inconveniences of a civil war. The final result of the experiment is, that the colony of working bees thus shut up, with a morsel of common brood, not only hatch it, but are found, at the end of eighteen or twenty days, to have produced from thence one or two queens; which have apparently proceeded from worms of the common sort, pitched upon by them for that purpose; and which, under other circumstances, that is, if they had remained in the old hive, there is reason to suppose would have been changed into common working bees. In the present instance, the common worm appears to be converted by them into a queen-bee, merely because the hive was in want of one. Hence we may justly infer, that the kingdom of the bees is not, if the expression may be used, a *jure divino* or hereditary monarchy, but an elective kingdom; in which the choice of their future ruler is made by the body of the people, while she is yet in the cradle, or in embryo; and who are determined by motives of preference which will perhaps for ever elude the penetration of the most sagacious naturalists.

The conclusions drawn by M. Shirach, from experiments of the preceding kind, often repeated by himself and others with the same success, are, that all the common or working bees were originally of the female sex; but that when they have undergone their last metamorphosis, they are condemned to a state of perpetual virginity, and the organs of generation are obliterated; merely because they have not been lodged, fed, and brought up in a particular manner, while they were in the worm state. He supposes that the worm, designed by the community to be a queen, or mother, owes its metamorphosis into a queen, partly to the extraordinary size of its cell, and its peculiar position in it; but principally to a certain appropriate nourishment found there, and carefully administered to it by the working bees while it was in the worm state; by which, and possibly other means unknown, the developement and extension of the germ of the female organs, previously existing in the embryo, is effected; and those differences in its form and size are produced, which afterwards so remarkably distinguish it from the common working bees.

Bee.

This discovery is capable of being applied towards forming artificial swarms, or new colonies of bees, by which means their number might be increased, and their produce in honey and wax proportionably augmented.

Explanation of Plate LXXXIX. Fig. 1. is the queen bee. 2. Is the drone. 3. Is the working bee. 4. Represents the bees hanging to each other by the feet, which is the method of taking their repose. 5. The proboscis or trunk, which is one of the principal organs of the bees, wherewith they gather the honey and take their nourishment. 6. One of the hind legs of a working bee, loaded with wax. 7. A comb, in which the working bees are bred. The cells are the smallest of any. Two of them have the young bees enclosed. A royal cell is suspended on one side. 8. A comb in which the drones are bred, being larger than the former; the young drones being included in several of them; with two royal cells suspended on the side. 9. A similar comb, in which the royal cell is fixed in the middle of the comb; and several common cells are sacrificed to serve as a basis and support to it. In general, the royal cells are suspended on the side of a comb, as in fig. 7. and 8. To the side of fig. 9. two royal cells are begun, when they resemble pretty much the cup in which an acorn lies. The other royal cells have the young queens included in them. Fig. 10. exhibits the sting and all its parts. The sting is composed of a sheath or case, and two shanks, united to each other, and terminating in a sharp point, so as to look like a single part. *b*, The poisonous bag. *c*, The tube that serves to convey the poison from its bag to the thickest part of the sting's sheath. *d d*, The two shanks of the sting, mutually converging to each other. *e e*, The sheath of the sting. *f f*, The thickest end of the sheath, where the tube opens into it, by which it receives the insect's poison. *g*, The extreme point of the sting, formed by the two shanks of that organ, that are in this place closely united. *h h*, The beards with which the shanks of the sting are armed at their extremities. *i*, The tube that serves to secrete the poison, which it discharges into the poison-bag. *k k*, The two blind extremities of the said tube. *l l l l*, Two pair of cartilages, of different forms, which are for the most part of a deep black, and articulated among themselves, and with the shanks of the sting. *m m*, Two other cartilages less conspicuous than the former, with one pair of which they are articulated. These two cartilages *m m*, are almost entirely of a membranaceous substance. *n n n n n n n n*, Eight places in which the foregoing cartilages are articulated among themselves, and with the shanks of the sting *d d*. *o o o o*, Four muscles serving to move the sting different ways, by the assistance of the same cartilages. *p p*, Two muscles which draw the shanks of the sting into its sheath.

sheath. *q q*, Two appendages of the sting which are moved along with it, and seem to answer no other purpose but that of ornament.—Fig. 11. The ovary.—Fig. 12. Six eggs drawn after nature, and placed on their ends: These eggs are oblong, very slender, but somewhat thicker on their upper parts.—Fig. 13. An egg viewed with a microscope: it resembles the skin of a fish, divested of its scales, but still retaining the marks of their insertion.—Fig. 14. Worms of bees, of different sizes, drawn after nature. *a*, A worm newly hatched. *bcde*, Four worms that have received more nourishment, and are more grown. *fg*, Two worms still bigger than the former, having had more time to make use of the nourishment provided for them. They are here represented as they lie doubled in their cells. *h*, A worm placed on its belly so as to show on its back a black line, inclining to a light blue or gray. This line denotes the stomach, which appears in this place through the transparent parts that lie over it. *i*, A worm lying on its back, and beginning to draw in the hinder part of its body, and move its head.—Fig. 15. A full-grown worm, viewed with a microscope. *a a*, Its 14 annular incisions or divisions. *h*, The head and eyes, &c. *ccc*, Ten breathing-holes.—Fig. 16. The worm forming its web. *a a*, The sides of the cell that contain it. *b*, The bottom of the cell. *c*, The entrance or door of the cell. The worm is here represented as making its web in the properest manner to shut up this entrance.—Fig. 17. Worm taken out of the web in which it had enclosed itself, and just ready to cast its skin.—Fig. 18. A cell containing the worm changed into a nymph, and perfectly lined with the said worm's web. Likewise the said web entire, with the nymph contained in it, as they appear on opening the cell. *a a*, The sides of the cell, lined with the worm's web. *b*, The mouth of the cell, perfectly closed by the web. *c*, The bottom of the cell. *d*, The web entire, as it appears on opening the cell, which it greatly resembles in form. *e*, The upper part of the web, of a convex form. This part shows its filaments pretty distinctly. *f*, The enclosed nymph appearing through the transparent sides of the web. *g*, The bottom of the web, answering to that of the wax cell.—Fig. 19. Worm changed to a nymph, of its natural size and form, yet so as to exhibit its limbs, which are folded up in a most wonderful manner.—Fig. 20. The nymph of the bee viewed with the microscope, displaying in a distinct manner all the parts of the enclosed insect, and the beautiful manner in which they are laid up. *a*, The head, bloated with humours. *b b*, The eyes, projecting considerably. *c c*, The horns, or antennæ. *d*, The lip. *e e*, The teeth, or jaw-bones. *ff*, The first pair of joints belonging to the proboscis. *h*, The proboscis itself. *i i*, The first pair of legs. *k k*, Two transparent stiff little parts, lying against the lowest joints of the first pair of legs. These little parts are not to be found, as they remain in the skin it sheds on quitting the nymph state. *l l*, The second pair of legs. *m m*, The wings. *n n*, The blade-bones. *o o*, The last pair of legs. *p p*, The abdominal rings. *q*, (*g*) The hinder part of the body. The sting projects a little in this place. *r*, Two little parts accompanying the sting. *s*, The anus.—Fig. 21. *a*, A cell full of bees bread, placed in layers. *b*, Little grains, of which the said substance, viewed with the microscope, appears to consist.

II. *Of the* Management *of* Bees, *and most approved Inventions for saving their Lives while we take their Honey and Wax.*

1. *Of the Apiary, and Hives.* Columella directs that the apiary face the south, and be situated in a place neither too hot nor too much exposed to the cold: that it be in a valley, in order that the loaded bees may with the greater ease descend to their homes; that it be near the mansion house, on account of the conveniency of watching them; but so situated as not to be exposed to noisome smells, or to the din of men or cattle: that it be surrounded with a wall, which however should not rise above three feet high: that, if possible, a running stream be near them; or, if that cannot be, that water be brought near them in troughs, with pebbles or small stones in the water, for the bees to rest on while they drink; or that the water be confined within gently declining banks, in order that the bees may have safe access to it; they not being able to produce either combs, honey, or food for their maggots, without water; that the neighbourhood of rivers or basons of water with high banks be avoided, because winds may whirl the bees into them, and they cannot easily get on shore from thence to dry themselves; and that the garden in which the apiary stands be well furnished with such plants as afford the bees plenty of good pasture. The trees in this garden should be of the dwarf kind, and their heads bushy, in order that the swarms which settle on them may be the more easily hived. 22 Of the apiary.

The proprietor should be particularly attentive that the bees have also in their neighbourhood such plants as yield them plenty of food. Columella enumerates many of these fitted to a warm climate: among them he mentions thyme, the oak, the pine, the sweet-smelling cedar, and all fruit-trees. Experience has taught us, that furze, broom, mustard, clover, heath, &c. are excellent for this purpose. Pliny recommends broom, in particular, as a plant exceedingly grateful and very profitable to bees.

With regard to hives, those made of straw are generally preferred, on several accounts; they are not liable to be over-heated by the rays of the sun; they keep out cold better than wood or any other materials; and the cheapness renders the purchase of them easy. As the ingenious Mr Wildman's hives are reckoned to be of a preferable construction to any other, we shall give an account of them in his own words. 23 Of hives.

"My hives (says he) are seven inches in height and ten in width. The sides are upright, so that the top and bottom are of the same diameter. A hive holds nearly a peck. In the upper row of straw there is a hoop of about half an inch in breadth; to which are nailed five bars of deal, full a quarter of an inch in thickness, and an inch and quarter wide, and half an inch asunder from one another; a narrow short bar is nailed at each side, half an inch distant from the bars next them, in order to fill up the remaining parts of the circle; so that there are in all seven bars of deal, to which the bees fix their combs. The space of half an inch between the bars allows a sufficient and easy passage

passage for the bees from one comb to another. In order to give great steadiness to the combs, so that, upon moving the hive, the combs may not fall off, or incline out of their direction, a stick should be run through the middle of the hive, in a direction directly across the bars or at right angles with them. When the hives are made, a piece of wood should be worked into the lower row of straw, long enough to allow a door for the bees, of four inches in length, and half an inch in height.

"The proprietor of the bees should provide himself with several flat covers of straw, worked of the same thickness as the hives, and a foot in diameter, that so it may be of the same width as the outside of the hives. Before the cover is applied to the hive, a piece of clean paper, of the size of the top of the hive, should be laid over it; and a coat of cow-dung, which is the least apt to crack of any cement easily to be obtained, should be laid all round the circumference of the hive. Let the cover be laid upon this, and made fast to the hive with a packing-needle and pack-thread, so that neither cold nor vermin may enter.

"Each hive should stand single on a piece of deal, or other wood, somewhat larger than the bottom of the hive: That part of the stand which is at the mouth of the hive should project some inches, for the bees to rest on when they return from the field. This stand should be supported upon a single post, two and a half feet high; to which it should be screwed very securely, that high winds, or other accidents, may not blow down both stand and hive. A quantity of soot mixed with barley chaff should be strewed on the ground round the post; which will effectually prevent ants, slugs, and other vermin, from rising up to the hive. The soot and chaff should from time to time be renewed as it is blown or washed away; though, as it is sheltered by the stand, it remains a considerable time, especially if care be taken that no weeds rise through it. Weeds, indeed, should not be permitted to rise near the hive; for they may give shelter to vermin which may be hurtful to the bees.

"The stands for bees should be four yards asunder; or if the apiary will not admit of so much, as far asunder as may be, that the bees of one hive may not interfere with those of another hive, as is sometimes the case when the hives are near one another or on the same stand; for the bees, mistaking their own hives, light sometimes at the wrong door, and a fray ensues, in which one or more may lose their lives.

24
Of the proper season for purchasing hives of bees.

"The person who intends to erect an apiary should purchase a proper number of hives at the latter part of the year, when they are cheapest. The hives should be full of combs, and well stored with bees. The purchaser should examine the combs, in order to know the age of the hives. The combs of that season are white, those of the former year are of a darkish yellow; and where the combs are black, the hive should be rejected, because old hives are most liable to vermin and other accidents.

"If the number of hives wanted were not purchased in the autumn, it will be necessary to remedy this neglect after the severity of the cold is past in the spring. At this season, bees which are in good condition will get into the fields early in the morning, return loaded, enter boldly, and do not come out of the hive in bad weather; for when they do, this indicates they are in great want of provisions. They are alert on the least disturbance, and by the loudness of their humming we judge of their strength. They preserve their hives free from all filth, and are ready to defend it against every enemy that approaches.

"The summer is an improper time for buying bees, because the heat of the weather softens the wax, and thereby renders the combs liable to break, if they are not very well secured. The honey, too, being then thinner than at other times, is more apt to run out of the cells; which is attended with a double disadvantage, namely, the loss of the honey, and the daubing of the bees, whereby many of them may be destroyed. A first and strong swarm may indeed be purchased; and, if leave can be obtained, permitted to stand in the same garden till the autumn; but if leave is not obtained, it may be carried away in the night after it has been hived.

"I suppose, that, in the stocks purchased, the bees are in hives of the old construction. The only direction here necessary is, that the first swarm from these stocks should be put into one of my hives; and that another of my hives should in a few days be put under the old stock, in order to prevent its swarming again."

25
Of hiving the swarm.

2. *Of Hiving*. Bees, as has been already observed, never swarm till the hive be too much crowded by the young brood. They first begin to swarm in May, or in the end of April, but earlier or later according to the warmth of the season. They seldom swarm before ten in the morning, and seldom later than three in the afternoon. We may know when they are about to swarm, by clusters of them hanging on the outside of the hive, and by the drones appearing abroad more than usual: But the most certain sign is, when the bees refrain from flying into the fields, though the season be inviting. Just before they take flight, there is an uncommon silence in the hive; after this, as soon as one takes flight, they all follow. Before the subsequent swarmings, there is a great noise in the hive, which is supposed to be occasioned by a contest whether the young or the old queen should go out. When the bees of a swarm fly too high, they are made to descend lower, by throwing handfuls of sand or dust among them, which they probably mistake for rain. For the same purpose, it is usual to beat on a kettle or frying-pan: This practice may have taken its rise from observing that thunder or any great noise prompts such bees as are in the fields to return home.

As soon as the swarm is settled, the bees which compose it should be got into a hive with all convenient speed, to prevent their taking wing again. If they settle on a small branch of a tree, easy to come at, it may be cut off and laid upon a cloth; the hive being ready immediately to put over them. If the branch cannot be conveniently cut, the bees may be swept from off it into a hive. Lodge but the queen into the hive, and the rest will soon follow. If the bees must be considerably disturbed in order to get them into the hive, the most advisable way is to let them remain in the place where they have pitched till the evening, when there is less danger of their taking wing. If it be observed that they still hover about the place they first alighted upon, the branches there may be rubbed with rue,

Digitized by Google

Bee. rue, or alder-leaves, or any other thing distasteful to them, to prevent their returning to it.

The hive employed on this occasion should be cleaned with the utmost care, and its inside be rubbed very hard with a coarse cloth, to get off the loose straws, or other impurities, which might cost them a great deal of time and labour to gnaw away. It may then be rubbed with fragrant herbs or flowers, the smell of which is agreeable to the bees; or with honey.

The hive should not be immediately set on the stool where it is to remain; but should be kept near the place at which the bees settled, till the evening, lest some stragglers should be lost. It should be shaded either with boughs or with a cloth, that the too great heat of the sun may not annoy the bees.

We sometimes see a swarm of bees, after having left their hive, and even alighted upon a tree, return to their first abode. This never happens but when the young queen did not come forth with them, for want of strength, or perhaps courage to trust her wings for the first time; or possibly from a consciousness of her not being impregnated.

26 Of uniting swarms. When a swarm is too few in number for a hive, another may be added. The usual method of thus uniting swarms is very easy. Spread a cloth at night upon the ground close to the hive in which the two casts or swarms are to be united; lay a stick across this cloth; then fetch the hive with the new swarm, set it over the stick, give a smart stroke on the top of the hive, and all the bees will drop down upon the cloth in a cluster. This done, throw aside the empty hive, take the other from off the stool, and set this last over the bees, who will soon ascend into it, mix with those already there, and become one and the same family. Others, instead of striking the bees down upon the cloth, place with its bottom upmost the hive in which the united swarms are to live, and strike the bees of the other hive down into it. The former of these hives is then restored to its natural situation, and the bees of both hives soon unite. If some bees still adhere to the other hive, they may be brushed off on the cloth, and they will soon join their brethren. Or one may take the following method, which gives less disturbance to the bees. Set with its mouth upmost the hive into which the young swarm has been put, and set upon it the other hive. The bees in the lower hive, finding themselves in an inverted situation, will soon ascend into the upper.

Though all writers acknowledge, that one of the queens is constantly slain on these occasions, and generally a considerable number of the working bees; yet none of them, Columella excepted, has proposed the easy remedy of killing the queen of the latter cast or swarm before the union is made; a means by which the lives of the working bees may be preserved. This may be done either by intoxicating them and then picking her out, or by searching her out when the bees are beaten down upon the cloth; for this being done in the night, to prevent the battle which might otherwise ensue, there will be no great difficulty in finding her.

A large swarm may weigh eight pounds, and so gradually less to one pound: consequently a very good one may weigh five or six pounds. All such as weigh less than four pounds should be strengthened by uniting to each of them a less numerous swarm. The size of the hive should be proportioned to the number of the bees; and, as a general rule, it should be rather under than over sized, because bees require to be kept warmer than a large hive will admit of.

In the *Letters from an American Farmer*, we have the following entertaining account of the swarming of bees, their flight into the woods, and the method of discovering them there. A little experience renders it easy to predict the time of their swarming: but the "difficult point is, when on the wing, to know whether they want to go to the woods or not. If they have previously pitched in some hollow trees, it is not the allurements of salt and water, of fennel, hickory leaves, &c. nor the finest box, that can induce them to stay. They will prefer those rude, rough, habitations, to the best polished mahogany hive. When that is the case with mine, I seldom thwart their inclinations. It is in freedom that they work. Were I to confine them, they would dwindle away and quit their labour. In such excursions we only part for a while. I am generally sure to find them again the following fall. This elopement of theirs only adds to my recreations. I know how to deceive even their superlative instinct. Nor do I fear losing them, though 18 miles from my house, and lodged in the most lofty trees in the most impervious of our forests. After I have done sowing, by way of recreation I prepare for a week's jaunt in the woods, not to hunt either the deer or the bears, as my neighbours do, but to catch the more harmless bees. I cannot boast that this chase is so noble or so famous among men: but I find it less fatiguing, and full as profitable; and the last consideration is the only one that moves me. I take with me my dog, as a companion, for he is useless as to this game; my gun, for no one ought to enter the woods without one; my blanket, some provisions, some wax, vermilion, honey, and a small pocket-compass. With these implements I proceed to such woods as are at a considerable distance from any settlements. I carefully examine whether they abound with large trees; if so, I make a small fire, on some flat stones, in a convenient place. On the fire I put some wax: close by this fire, on another stone, I drop honey in distinct drops, which I surround with small quantities of vermilion, laid on the stone; and then I retire carefully to watch whether any bees appear. If there are any in that neighbourhood, I rest assured that the smell of the burnt wax will unavoidably attract them. They will soon find out the honey, for they are fond of preying on that which is not their own; and in their approach, they will necessarily tinge themselves with some particles of vermilion, which will adhere long to their bodies. I next fix my compass, to find out their course; which they keep invariably straight, when they are returning home loaded. By the assistance of my watch, I observe how long those are in returning which are marked with vermilion. Thus possessed of the course, and, in some measure, of the distance, which I can easily guess at, I follow the first, and seldom fail of coming to the tree where those republicans are lodged. I then mark it; and thus, with patience, I have found out sometimes 11 swarms in a season; and it is inconceivable what a quantity of honey these trees will sometimes afford. It entirely depends on the size of the

Bee. 27 Bee-hunting in America.

Bee.

hollow, as the bees never rest or swarm till it is replenished; for, like men, it is only the want of room that induces them to quit the maternal hive. Next I proceed to some of the nearest settlements, where I procure proper assistance to cut down the trees, get all my prey secured, and then return home with my prize. The first bees I ever procured were thus found in the woods by mere accident; for, at that time, I had no kind of skill in this method of tracing them. The body of the tree being perfectly sound, they had lodged themselves in the hollow of one of its principal limbs, which I carefully sawed off, and with a good deal of labour and industry, brought it home, where I fixed it up in the same position in which I found it growing. This was in April. I had five swarms that year, and they have been ever since very prosperous. This business generally takes up a week of my time every fall, and to me it is a week of solitary ease and relaxation."

28 Shifting the bees in search of pasture.

3. *Of shifting the Abode of Bees.* Great improvements may certainly be made in the essential article of providing plenty of pasture for bees, whenever this subject shall be more carefully attended to than it has hitherto been. A rich corn country is well known to be a barren desert to them during the most considerable part of the year; and therefore the practice of other nations, in shifting the places of abode of their bees, well deserves our imitation.

Lib. ix. c. 14.

Columella informs us, that, as few places are so happily situated as to afford the bees proper pasture both in the beginning of the season and also in the autumn, it was the advice of Celsus, that after the vernal pastures are consumed, the bees should be transported to places abounding with autumnal flowers; as was practised by conveying the bees from Achaia to Attica, from Eubœa and the Cyclad islands to Scyrus; and also in Sicily, where they were brought to Hybla from other parts of the island.

Lib. xxi. c. 12.

We find by Pliny, that this was likewise the practice of Italy in his time. "As soon," says he, "as the spring-food for bees has failed in the valleys near our towns, the hives of bees are put into boats, and carried up against the stream of the river, in the night, in search of better pasture. The bees go out in the morning in quest of provisions, and return regularly to their hives in the boats, with the stores they have collected. This method is continued, till the sinking of the boats to a certain depth in the water shows that the hives are sufficiently full; and they are then carried back to their former homes, where their honey is taken out of them." And this is still the practice of the Italians who live near the banks of the Po, (the river which Pliny instanced particularly in the above-quoted passage).

Vol. ii. p. 24.

M. Maillet relates, in his curious Description of Egypt, that, "spite of the ignorance and rusticity which have got possession of that country, there yet remain in it several footsteps of the industry and skill of the ancient Egyptians. One of their most admirable contrivances is, their sending their bees annually into distant countries, in order to procure them sustenance there, at a time when they could not find any at home; and their afterwards bringing them back, like shepherds who should travel with their flock, and make them feed as they go. It was observed by the ancient inhabitants of Lower Egypt, that all plants blossomed, and the fruits of the earth ripened, above six weeks earlier in Upper Egypt than with them. They applied this remark to their bees; and the means then made use of by them, to enable these usefully industrious insects to reap advantage from the more forward state of nature there, were exactly the same as are now practised, for the like purpose, in that country. About the end of October, all such inhabitants of Lower Egypt as have hives of bees, embark them on the Nile, and convey them up that river quite into Upper Egypt; observing to time it so that they arrive there just when the inundation is withdrawn, the lands have been sown, and the flowers begin to bud. The hives thus sent are marked and numbered by their respective owners, and placed pyramidically in boats prepared for the purpose. After they have remained some days at their farthest station, and are supposed to have gathered all the wax and honey they could find in the fields within two or three leagues around; their conductors convey them in the same boats two or three leagues lower down, and there leave the laborious insects so long time as is necessary for them to collect all the riches of this spot. Thus, the nearer they come to the place of their more permanent abode, they find the productions of the earth, and the plants which afford them food, forward in proportion. In fine, about the beginning of February, after having travelled through the whole length of Egypt, gathering all the rich produce of the delightful banks of the Nile, they arrive at the mouth of that river, towards the ocean; from whence they set out, and from whence they are now returned to their several homes: for care is taken to keep an exact register of every district from whence the hives were sent in the beginning of the season, of their numbers, of the names of the persons who sent them, and likewise of the mark or number of the boat in which they were placed."

In many parts of France, floating bee-houses are very common. They have on board one barge threescore or a hundred bee-hives, well defended from the inclemency of an accidental storm. With these the owners suffer themselves to float gently down the river, the bees continually choosing their flowery pasture along the banks of the stream; and thus a single floating bee-house yields the proprietor a considerable income.

They have also a method of transporting their bees by land, well worth our imitation in many parts of this kingdom. Their first care is, to examine those hives, some of whose honey-combs might be broken or separated by the jolting of the vehicle; they are made fast one to the other, and against the sides of the hive, by means of small sticks, which may be disposed differently as occasion will point out. This being done, every hive is set upon a packing-cloth, or something like it, the threads of which are very wide; the sides of this cloth are then turned up and laid on the outside of each hive, in which state they are tied together with a piece of small pack-thread wound several times round the hive. As many hives as a cart built for that purpose will hold, are afterwards placed in this vehicle. The hives are set two and two, the whole length of the cart. Over these are placed others; which make, as it were, a second story or bed of hives. Those which

Digitized by Google

which are stored with combs should always be turned topsy-turvy. It is for the sake of their combs, and to fix them the better, that they are disposed in this manner; for such as have but a small quantity of combs in them, are placed in their natural situation. Care is taken in this stowage not to let one hive stop up another, it being essentially necessary for the bees to have air; and it is for this reason they are wrapped up in a coarse cloth, the threads of which were wove very wide, in order that the air may have a free passage, and lessen the heat which these insects raise in their hives, especially when they move about very tumultuously, as often happens in these carts. Those used for this purpose in Yevre, hold from 30 to 48 hives. As soon as all are thus stowed, the caravan sets out. If the season is sultry, they travel only in the night; but a proper advantage is made of cool days. These caravans do not go fast. The horses must not be permitted even to trot: they are led slowly, and through the smoothest roads. When there are not combs in the hives sufficient to support the bees during their journey, the owner takes the earliest opportunity of resting them wherever they can collect wax. The hives are taken out of the cart, then set upon the ground, and after removing the cloth from over them, the bees go forth in search of food. The first field they come to serves them as an inn. In the evening, as soon as they are all returned, the hives are shut up; and being placed again in the cart, they proceed on their journey. When the caravan is arrived at the journey's end, the hives are distributed in the gardens, or in the fields adjacent to the houses of different peasants, who, for a very small reward, undertake to look after them. Thus it is that, in such spots as do not abound in flowers at all seasons, means are found to supply the bees with food during the whole year.

These instances of the great advantages which attend shifting of bees in search of pasture, afford an excellent lesson to many places in this kingdom: they direct particularly the inhabitants of the rich vales, where the harvest for bees ends early, to remove their stocks to places which abound in heath, this plant continuing in bloom during a considerable part of autumn, and yielding great plenty of food to bees. Those in the neighbourhood of hills and mountains will save the bees a great deal of labour, by taking also the advantage of shifting their places of abode.

29 Management of bees in winter.

4. *Of feeding and defending Bees in Winter.* Providence has ordained, that insects which feed on leaves, flowers, and green succulent plants, are in an insensible and torpid state from the time that the winter's cold has deprived them of the means of subsistence. Thus the bees during the winter are in so lethargic a state, that little food supports them: but as the weather is very changeable, and every warm and sunny day revives them, and prompts them to return to exercise, food becomes necessary on these occasions.

Many hives of bees, which are thought to die of cold in the winter, in truth die of famine; when a rainy summer has hindered the bees from laying in a sufficient store of provisions. The hives should therefore be carefully examined in the autumn, and should then weigh at least 18 pounds.

Columella describes an annual distemper which seizes bees in the spring, when the spurge blossoms, and the elm discloses its seeds; for that, being allured by the first flowers, they feed so greedily upon them, that they surfeit themselves, and die of a looseness, if they are not speedily relieved.

The authors of the *Maison Rustique* impute this purging to the bees feeding on pure honey, which does not form a food sufficiently substantial for them, unless they have bee-bread to eat at the same time; and advise giving them a honey-comb taken from another hive, the cells of which are filled with crude wax or bee-bread.

There is still, however, a want of experiments to ascertain both the time and the manner in which bees should be fed. The common practice is to feed them in the autumn, giving them as much honey as will bring the whole weight of the hive to near 20 pounds. To this end, the honey is diluted with water, and then put into an empty comb, split reeds, or, as Columella directs, upon clean wool, which the bees will suck perfectly dry. But the dilution with water makes the honey apt to be candied, and honey in that state is prejudicial to bees.

The following directions given in the *Maison Rustique* seem to be very judicious. Replenish the weak hives in September with such a portion of combs full of honey taken from other hives as shall be judged to be a sufficient supply for them. In order to do this, turn up the weak hive, after taking the precaution of defending yourself with the smoke of rags, cut out the empty combs, and put the full ones in their place; where secure them with pieces of wood run across, in such manner that they may not fall down when the hive is returned to its place. The bees will soon fix them more effectually. If this method be thought too troublesome, set under the hive a plate of liquid honey, unmixed with water, with straws laid across it, and over these a paper pierced full of holes, through which the bees will suck the honey without daubing themselves. This should be done in cloudy or rainy weather, when the bees stir least abroad; and the hive should be covered, to protect the bees from robbers, who might be allured to it by the smell of the honey. Tom. i. p. 435.

Another circumstance which may render it very necessary to feed the bees is, when several days of bad weather ensue immediately after they have swarmed; for then, being destitute of every supply beyond what they carried with them, they may be in great danger of starving. In this case, honey should be given them in proportion to the duration of the bad weather.

The degree of cold which bees can endure has not been ascertained. We find that they live in the cold parts of Russia, and often in hollow trees, without any care being taken of them. Their hives are frequently made of the bark of trees, which does not afford them much protection from cold. Mr White, therefore, judiciously observes, that bees which stand on the north side of a building whose height intercepts the sun's beams all the winter, will waste less of their provisions (almost by half) than others which stand in the sun: for coming seldom forth, they eat little; and yet in the spring are as forward to work and swarm as those which had twice as much honey in the autumn before. The owner should, however, examine their state in the winter; and if he finds, that, instead of being clustered between

Digitized by Google

Bee.

between the combs, they fall down in numbers on the stool or bottom of the hive, the hive should be carried to a warmer place, where they will soon recover. He must be cautious in returning them again to the cold, lest the honey be candied.

Where the winters are extremely severe, the authors of the *Maison Rustique* advise to lay on the bottom of an old cask the depth of half a foot of very dry earth, powdered and pressed down hard, and to set on this the stool with the hive; then, to preserve a communication with the air, which is absolutely necessary, to cut a hole in the cask, opposite to the mouth of the hive, and place a piece of reed, or of alder, made hollow, from the mouth of the hive to the hole in the cask; and after this to cover the hive with more of the same dry earth. If there be any room to fear that the bees will not have a sufficiency of food, a plate with honey, covered as before directed, may be put under the hive. If the number of hives be great, boxes may be made of deals nailed together, deep enough to contain the hives when covered with dry earth. The bees will thus remain all the winter free from any danger from cold, hunger, or enemies.

30
Methods of taking the honey and the wax. Common method in this country.

5. *Of taking the Honey and Wax.* In this country it is usual, in seizing the stores of these little animals, to rob them also of their lives. The common method is, That when those which are doomed for slaughter have been marked out (which is generally done in September), a hole is dug near the hive, and a stick, at the end of which is a rag that has been dipped in melted brimstone, being stuck in that hole, the rag is set on fire, the hive is immediately set over it, and the earth is instantly thrown up all round, so that none of the smoke can escape. In a quarter of an hour, all the bees are seemingly dead; and they will soon after be irrecoverably so, by being buried in the earth that is returned back into the hole. By this last means it is that they are absolutely killed; for it has been found by experiment, that all the bees which have been affected only by the fume of the brimstone, recover again, except such as have been singed or hurt by the flame. Hence it is evident, that fume of brimstone might be used for intoxicating the bees, with some few precautions. The heaviest and the lightest hives are alike treated in this manner: the former, because they yield the most profit, with an immediate return; and the latter, because they would not be able to survive the winter. Those hives which weigh from 15 to 20 pounds are thought to be the fittest for keeping.

More humane and judicious methods were practised by the ancients *; and the following simple method is at this day practised in Greece, degenerate as it is.

* Vide *Columella*, lib. ix. c. 15. and *Varro de Re Rustica*, lib. iii. c. 16.

31
Greek method of sharing the honey with the bees. See *Wheeler's Journey into Greece*, p. 411.

"Mount Hymethus is celebrated for the best honey in all Greece. This mountain was not less famous in times past for bees and admirable honey; the ancients believing that bees were first bred here, and that all other bees were but colonies from this mountain; which if so, we assured ourselves that it must be from this part of the mountain that the colonies were sent; both because the honey here made is the best, and that here they never destroy the bees. It is of a good consistence, of a fair gold-colour, and the same quantity sweetens more water than the like quantity of any other doth. I no sooner knew that they never destroy or impair the stock of bees in taking away their honey, but I was inquisitive to understand their method of ordering the bees; which being an art so worthy the knowledge of the curious, I shall not think it beside the purpose, to relate what I saw, and was informed of to that effect by such as had skill in that place.

"The hives they keep their bees in are made of willows or osiers, fashioned like our common dust-baskets, wide at top and narrow at the bottom, and plastered with clay or loam within and without. They are set as in fig. 1. with the wide end uppermost. The tops are covered with broad flat sticks, which are also plastered over with clay; and, to secure them from the weather, they cover them with a tuft of straw, as we do. Along each of these sticks, the bees fasten their combs; so that a comb may be taken out whole, without the least bruising, and with the greatest ease imaginable. To increase them in spring-time, that is in March or April, until the beginning of May, they divide them; first separating the sticks on which the combs and bees are fastened, from one another, with a knife: so, taking out the first comb and bees together on each side, they put them into another basket, in the same order as they were taken out, until they have equally divided them. After this, when they are both again accommodated with sticks and plastered, they set the new basket in the place of the old one, and the old one in some new place. And all this they do in the middle of the day, at such time as the greatest part of the bees are abroad; who at their coming home, without much difficulty, by this means divide themselves equally. This device hinders them from swarming and flying away. In August, they take out their honey. This they do in the day-time also, while they are abroad; the bees being thereby, say they, disturbed least: at which time they take out the combs laden with honey, as before; that is, beginning at each outside, and so taking away, until they have left only such a quantity of combs, in the middle, as they judge will be sufficient to maintain the bees in winter; sweeping those bees that are on the combs into the basket again, and then covering it with new sticks and plaster."

Plate XC.

The Greek method above related was introduced into France in 1754, as we are informed by M. de Reaumur and Du Hamel, in the memoirs of the Royal Academy for that year, p. 331.

Attempts have been made in our own country to attain the desirable end of getting the honey and wax without destroying the bees; the most approved of which we shall now relate as concisely as possible.

32
Mr Thorley's observations, &c.

Mr Thorley, in his *Inquiry into the Nature, Order, and Government of Bees*, thinks colonies preferable to hives, for the following reasons: *First*, The more certain preservation of very many thousands of these useful creatures. *Secondly*, Their greater strength (which consists in numbers), and consequently their greater safety from robbers. *Thirdly*, Their greater wealth, arising from the united labours of the greater number. He tells us, that he has in some summers taken two boxes filled with honey from one colony; and yet sufficient store has been left for their maintenance during the winter; each box weighing 40 pounds. Add to these advantages, the pleasure of viewing them, with the greatest safety, at all seasons, even in their busiest time of gathering, and their requiring a much less attendance

tendance in swarming time. The bees thus managed are also more effectually secured from wet and cold, from mice and other vermin.

His boxes are made of deal, which, being spongy, sucks up the breath of the bees sooner than a more solid wood would do. Yellow dram-deal thoroughly seasoned is the best.

An octagon, being nearer to a sphere, is better than a square form; for as the bees, in winter, lie in a round body near the centre of the hive, a due heat is then conveyed to all the out-parts, and the honey is kept from candying.

The dimensions which Mr Thorley, after many years experience, recommends for the boxes, are 10 inches depth, and 12 or 14 inches breadth in the inside. He has tried boxes containing a bushel or more, but found them not to answer the design like those of a lesser size. The larger are much longer in filling; so that it is later ere you come to reap the fruits of the labour of the bees: nor is the honey there so good and fine, the effluvia even of their own bodies tainting it.

The best and purest honey is that which is gathered in the first five or six weeks: and in boxes of less dimensions you may take, in a month or little more, provided the season be favourable, a box full of the finest honey.

The top of the box should be made of an entire board a full inch thick after it has been planed; and it should project on all sides at least an inch beyond the dimensions of the box. In the middle of this top there must be a hole five inches square, for a communication between the boxes; and this hole should be covered with a sliding shutter, of deal or elm, running easily in a groove over the back window. The eight pannels, nine inches deep, and three quarters of an inch thick when planed, are to be let into the top so far as to keep them in their proper places; to be secured at the corners with plates of brass, and to be cramped with wires at the bottom to keep them firm; for the heat in summer will try their strength. There should be a glass window behind, fixed in a frame, with a thin deal-cover, two small brass hinges, and a button to fasten it. This window will be sufficient for inspecting the progress of the bees. Two brass handles, one on each side, are necessary to lift up the box: these should be fixed in with two thin plates of iron, near three inches long, so as to turn up and down, and put three inches below the top-board, which is nailed close down with sprigs to the other parts of the box.

Those who choose a frame within, to which the bees may fasten their combs, need only use a couple of deal sticks of an inch square, placed across the box, and supported by two pins of brass; one an inch and a half below the top, and the other two inches below it; by which means the combs will quickly find a rest. One thing more, which perfects the work, is, a passage, four or five inches long, and less than half an inch deep, for the bees to go in and out at the bottom of the box.

33 Management of bees in colonies, and method of taking their honey and wax.

1. In keeping bees in colonies, a house is necessary, or at least a shed; without which the weather, especially the heat of the sun, would soon rend the boxes to pieces.

Your house may be made of any boards you please, but deal is the best. Of whatever sort the materials are, the house must be painted, to secure it from the weather.

The length of this house, we will suppose for six colonies, should be full 12 feet and a half, and each colony should stand a foot distance from the other. It should be three feet and a half high, to admit four boxes one upon another; but if only three boxes are employed, two feet eight inches will be sufficient. Its breadth in the inside should be two feet. The four corner-posts should be made of oak, and well fixed in the ground, that no stormy winds may overturn it; and all the rails should be of oak, supported by several uprights of the same, before and behind, that they may not yield or sink under 6, 7, or 8 cwt. or upwards. The floor of the house (about two feet from the ground) should be strong and smooth, that the lowest box may stand close to it.

This floor may be made with boards or planks of deal the full length of the bee-house; or, which is preferable, with a board or plank to each colony, of two feet four inches long, and fixed down to the rails; and that part which appears at the front of the house may be cut into a semicircle, as a proper alighting place for the bees. Plane it to a slope, that the wet may fall off. When this floor to a single colony wants to be repaired, it may easily be removed, and another be placed in its room, without disturbing the other colonies, or touching any other part of the floor.

Upon this floor, at equal distances, all your colonies must be placed against a door or passage cut in the front of the house.

Only observe farther, to prevent any false step, that as the top-board of the box (being a full inch broader than the other part) will not permit the two mouths to come together, you must cut a third in a piece of deal of a sufficient breadth, and place it between the other two, so close that not a bee may get that way into the house. And fixing the said piece of deal down to the floor with two lath-nails, you will find afterwards to be of service, when you have occasion either to raise a colony, or take a box of honey, and may prove a means of preventing a great deal of trouble and mischief.

The house being in this forwardness, you may cover it to your own mind, with boards, fine slates, or tiles. But contrive their position so as to carry off the wet, and keep out the cold, rain, snow, or whatever might any way hurt and prejudice them.

The back-doors may be made of half-inch deal, two of them to shut close in a rabbet, cut in an upright pillar, which may be so contrived as to take in and out, by a mortise in the bottom rail, and a notch in the inside of the upper rail, and fastened with a strong hasp. Place these pillars in the spaces between the colonies.

Concluding your house made after this model, without front-doors, a weather-board will be very necessary to carry the water off from the places where the bees settle and rest.

Good painting will be a great preservative. Forget not to paint the mouths of your colonies with different colours, as red, white, blue, yellow, &c. in form of a half-moon, or square, that the bees may the better know their own home. Such diversity will be a direction to them.

Thus your bees are kept warm in the coldest winter; and

Digitized by Google

and in the hottest summer greatly refreshed by the cool air, the back doors being set open without any air-holes made in the boxes.

Dr Warden observes, that in June, July, and August, when the colonies come to be very full, and the weather proves very hot, the appearance of a shower drives the bees home in such crowds, that pressing to get in, they stop the passage so close, that those within are almost suffocated for want of air; which makes these last so uneasy, that they are like mad things. In this extremity, he has lifted the whole colony up a little on one side; and by thus giving them air, has soon quieted them. He has known them, he says, come pouring out, on such an occasion, in numbers sufficient to have filled at once two or three quarts; as if they had been going to swarm. To prevent this inconvenience, he advises cutting a hole two inches square in about the middle of one of the hinder pannels of each box. Over this hole, nail, in the inside of the box, a piece of tin-plate punched full of holes so small that a bee cannot creep through them; and have over it, on the outside, a very thin slider, made to run in grooves; so that, when it is thrust home, all may be close and warm; and when it is opened, in very hot weather, the air may pass through the hole, and prevent the suffocating heat. Or holes may be bored in the pannels themselves, on such an emergency, in a colony already settled.

Such a thorough passage for the air may be convenient in extreme heat, which is sometimes so great as to make the honey run out of the combs. The Memoirs of the truly laudable Berne Society, for the year 1764, give us a particular instance of this, when they say, that, in 1761, many in Switzerland were obliged to smother their bees, when they saw the honey and wax trickling down; not knowing any other remedy for the losses they daily sustained. Some shaded these hives from the sun, or covered them with cloths wet several times a-day, and watered the ground all around.

The best time to plant the colonies is either in spring with new stocks full of bees, or in summer with swarms. If swarms are used, procure, if possible, two of the same day: hive them either in two boxes or in a hive and a box: at night, place them in the bee-house, one over the other; and with a knife and a little lime and hair stop close the mouth of the hive or upper box, so that not a bee may be able to go in or out but at the front door. This done, you will in a week or ten days with pleasure see the combs appear in the boxes; but if it be a hive, nothing can be seen till the bees have wrought down into the box. Never plant a colony with a single swarm, as Mr Thorley says he has sometimes done, but with little success.

When the second box, or the box under the hive, appears full of bees and combs, it is time to raise your colony. This should be done in the dusk of the evening, and in the following manner:

Place your empty box, with the sliding shutter drawn back, behind the house, near the colony that is to be raised, and at nearly the height of the floor: then lifting up the colony with what expedition you can, let the empty box be put in the place where it is to stand, and the colony upon it; and shut up the mouth of the then upper box with lime and hair, as before directed.

When, by the help of the windows in the back of the boxes, you find the middle box full of combs, and a quantity of honey sealed up in it, the lowest box half full of combs, and few bees in the uppermost box, proceed thus:

About five o'clock in the afternoon, drive close with a mallet the sliding shutter under the hive or box that is to be taken from the colony. If the combs are new, the shutter may be forced home without a mallet; but be sure it be close, that no bees may ascend into the hive or box to be removed. After this shut close the doors of your house, and leave the bees thus cut off from the rest of their companions for the space of half an hour or more. In this space of time, having lost their queen, they will fill themselves with honey, and be impatient to be set at liberty.

If, in this interval, you examine the box or boxes beneath, and observe all to be quiet in them, you may be confident that the queen is there, and in safety. Hereupon raise the back part of the hive or box so far, by a piece of wood slipped under it, as to give the prisoners room to come out, and they will return to their fellows: then lifting the box from off the colony, and turning its bottom upmost, cover it with a cloth all night; and the next morning, when this cloth is removed, the bees that have remained in it will return to the colony. Thus you have a hive or box of honey, and all your bees safe.

If the bees do not all come out in this manner, Dr Warder's method may be followed, especially if it be with a hive. It is to place the hive with the small end downward in a pail, peck, or flower-pot, so as to make it stand firm: then to take an empty hive, and set it upon the former, and to draw a cloth tight round the joining of the two hives, so that none of the bees may be able to get out: after this, to strike the full hive so smartly as to disturb the bees that are in it, but with such pauses between the strokes as to allow them time to ascend into the empty hive, which must be held fast while this is doing, lest it fall off by the shaking of the other. When you perceive, by the noise of the bees in the upper hive, that they are got into this last, carry it to a cloth spread for this purpose before the colony, with one end fastened to the landing-place, and knock them out upon it: they will soon crawl up the cloth, and join their fellows, who will gladly receive them.

Mr Thorley next gives an account of his narcotic, and of the manner of using it.

The method which he has pursued with great success for many years, and which he recommends to the public as the most effectual for preserving bees in common hives, is incorporation, or uniting two stocks into one, by the help of a peculiar fume or opiate, which will put them entirely in your power for a time to divide and dispose of at pleasure. But as that dominion over them will be of short duration, you must be expeditious in this business.

The queen is immediately to be searched for, and killed. Hives which have swarmed twice, and are consequently reduced in their numbers, are the fittest to be joined together, as this will greatly strengthen and improve them. If a hive which you would take is both

Digitized by Google

Bee.

both rich in honey and full of bees, it is but dividing the bees into two parts, and putting them into two boxes instead of one. Examine whether the stock to which you intend to join the bees of another have honey enough in it to maintain the bees of both: it should weigh full 20 pounds.

The narcotic, or stupifying fume, is made with the *fungus maximus* or *pulverulentus*, the large mushroom, commonly known by the name of *bunt*, *puckfist*, or *frogcheese*. It is as big as a man's head, or bigger; when ripe, it is of a brown colour, turns to powder, and is exceeding light. Put one of these pucks into a large paper, press it therein to two-thirds or near half the bulk of its former size, and tie it up very close; then put it into an oven some time after the household bread has been drawn, and let it remain there all night; when it is dry enough to hold fire, it is fit for use. The manner of using it is thus:

Cut off a piece of the puck, as large as a hen's egg, and fix it in the end of a small stick slit for that purpose, and sharpened at the other end; which place so that the pluck may hang near the middle of an empty hive. This hive must be set with the mouth upward, in a pail or bucket, which should hold it steady, near the stock you intend to take. This done, set fire to the puck, and immediately place the stock of bees over it, tying a cloth round the hives, that no smoke may come forth. In a minute's time, or little more, you will hear the bees fall like drops of hail into the empty hive. You may then beat the top of the full hive gently with your hand, to get out as many of them as you can: after this, loosing the cloth, lift the hive off to a table, knock it several times against the table, several more bees will tumble out, and perhaps the queen among them. She often is one of the last that falls. If she is not there, search for her among the main body in the empty hive, spreading them for this purpose on a table.

You must proceed in the same manner with the other hive, with the bees of which these are to be united. One of the queens being secured, you must put the bees of both hives together, mingle them thoroughly, and drop them among the combs of the hive which they are intended to inhabit. When they are all in, cover it with a packing or other coarse cloth which will admit air, and let them remain shut up all that night and the next day. You will soon be sensible that they are awakened from this sleep.

The second night after their union, in the dusk of the evening, gently remove the cloth from off the mouth of the hive (taking care of yourself), and the bees will immediately sally forth with a great noise; but being too late, they will soon return: then inserting two pieces of tobacco-pipes to let in air, keep them confined for three or four days, after which the door may be left open.

The best time for uniting bees is, after their young brood are all out, and before they begin to lodge in the empty cells. As to the hour of the day, he advises young practitioners to do it early in the afternoon, in order that having the longer light they may the more easily find out the queen. He never knew such combined stocks conquered by robbers. They will either swarm in the next summer, or yield a hive full of honey.

Mr N. Thornley, son of the above-mentioned clergyman, has added to the edition which he has given of his father's book, a postscript, purporting, that persons who choose to keep bees in glass-hives may, after uncovering the hole at the top of a flat-topped straw-hive, or box, place the glass over it so close that no bee can go in or out but at the bottom of the hive or box. The glass-hive must be covered with an empty hive or with a cloth, that too much light may not prevent the bees from working. As soon as they have filled the straw-hive or box, they will begin to work up into the glass-hive. He tells us, that he himself has had one of these glass-hives filled by the bees in 30 days in a fine season; and that it contained 38 pounds of fine honey. When the glass is completely filled, slide a tin-plate between it and the hive or box, so as to cover the passage, and in half an hour the glass may be taken off with safety. What few bees remain in it, will readily go to their companions. He has added a glass window to his straw-hives, in order to see what progress bees make; which is of some importance, especially if one hive is to be taken away whilst the season still continues favourable for their collecting honey; for when the combs are filled with honey, the cells are sealed up, and the bees forsake them, and reside mostly in the hive in which their works are chiefly carried on. Observing also that the bees were apt to extend their combs through the passage of communication in the upper hive, whether glass or other, which rendered it necessary to divide the comb when the upper hive was taken away, he now puts in that passage a wire screen or netting, the meshes of which are large enough for a loaded bee to go easily through them. This prevents the joining of the combs from one box to the other, and consequently obviates the necessity of cutting them, and of spilling some of the honey, which running down among a crowd of bees, used before to incommode them much, it being difficult for them to clear their wings of it. Fig. 2. is a drawing of one of his colonies.

Bee. 34 Glass-hives.

Plate XC.

35 Of bees in boxes, and method of taking their honey and wax.

2. The reverend Mr White informs us, that his fondness for these little animals soon put him upon endeavouring if possible to save them from *fire* and *brimstone*; that he thought he had reason to be content to share their labours for the present, and great reason to rejoice if he could at any time preserve their lives, to work for him another year; and that the main drift of his observations and experiments has hitherto been, to discover an easy and cheap method, suited to the abilities of the common people, of taking away so much honey as can be spared, without destroying or starving the bees; and by the same means to encourage seasonable swarms.

In his directions how to make the bee-boxes of his inventing, he tells us, speaking of the manner of constructing a single one, that it may be made of deal or any other well-seasoned boards which are not apt to warp or split. The boards should be near an inch thick; the figure of the box square, and its height and breadth nine inches and five-eighths, every way, measuring within. With these dimensions it will contain near a peck and a half. The front part must have a door cut in the middle of the bottom edge, three inches wide, and near half an inch in height, which will give free liberty to the bees to pass through, yet not be large enough for their enemy the mouse to enter. In the back

Digitized by Google

back part you must cut a hole with a rabbet in it, in which you are to fix a pane of the clearest and best crown-glass, about five inches in length, and three in breadth, and fasten it with putty; let the top of the glass be placed as high as the roof, withinside, that you may see the upper part of the combs, where the bees with their riches are mostly placed. You will by this means be better able to judge of their state and strength, than if your glass was fixed in the middle. The glass must be covered with a thin piece of board, by way of shutter, which may be made to hang by a string, or turn upon a nail, or slide sidewise between two mouldings. Such as are desirous of seeing more of the bees works, may make the glass as large as the box will admit without weakening it too much; or they may add a pane of glass on the top, which must likewise be covered with a shutter, fastened down with pegs, to prevent accidents.

The side of the box which is to be joined to another box of the same form and dimensions, as it will not be exposed to the internal air, may be made of a piece of slit deal not half an inch thick. This he calls the *side of communication*, because it is not to be wholly enclosed: a space is to be left at the bottom the whole breadth of the box, and a little more than an inch in height; and a hole or passage is to be made at top, three inches long, and more than half an inch wide. Through these the bees are to have a communication from one box to the other. The lower communication being on the floor, our labourers, with their burdens, may readily and easily ascend into either of the boxes. The upper communication is only intended as a passage between the boxes, resembling the little holes or narrow passes, which may be observed in the combs formed by our sagacious architects, to save time and shorten the way when they have occasion to pass from one comb to another; just as in populous cities, there are narrow lanes and alleys passing transversely from one large street to another.

In the next place you are to provide a loose board, half an inch thick, and large enough to cover the side where you have made the communications. You are likewise to have in readiness several little iron staples, an inch and half long, with the two points or end bended down more than half an inch. The use of these will be seen presently.

You have now only to fix two sticks crossing the box from side to side, and crossing each other, to be a stay to the combs; one about three inches from the bottom, the other the same distance from the top; and when you have painted the whole, to make it more durable, your box is finished.

The judicious bee-master will here observe, that the form of the box now described is as plain as possible for it to be. It is little more than five square pieces of board nailed together; so that a poor cottager who has but ingenuity enough to saw a board into the given dimensions, and to drive a nail, may make his own boxes well enough, without the help or expence of a carpenter.

No directions are necessary for making the other box, which must be of the same form and dimensions. The two boxes differ from each other only in this, that the side of communication of the one must be on your right hand; of the other on your left. Fig. 3. represents two of these boxes, with their openings of communication, ready to join to each other.

Mr White's manner of hiving a swarm into one or both of these boxes is thus:

You are to take the loose board, and fasten it to one of the boxes, so as to stop the communications. This may be done by three of the staples before mentioned; one on the top of the box near the front; the two others on the back, near the top and near the bottom. Let one end of the staple be thrust into a gimlet-hole made in the box, so that the other end may go as tight as can be over the loose board, to keep it from slipping when it is handled. The next morning after the bees have been hived in this box, the other box should be added, and the loose board should be taken away. This will prevent a great deal of labour to the bees, and some to the proprietor.

Be careful to fasten the shutter so close to the glass that no light may enter through it; for the bees seem to look upon such a light as a hole or breach in their house, and on that account may not so well like their new habitation. But the principal thing to be observed at this time is, to cover the box as soon as the bees are hived with a linen cloth thrown closely over it, or with green boughs to protect it from the piercing heat of the sun. Boxes will admit the heat much sooner than straw-hives; and if the bees find their house too hot for them, they will be wise enough to leave it. If the swarm be larger than usual, instead of fastening the loose board to one box, you may join two boxes together with three staples, leaving the communication open from one to the other, and then hive your bees into both. In all other respects, they are to be hived in boxes after the same manner as in common hives.

The door of the second box should be carefully stopped up, and be kept constantly closed, in order that the bees may not have an entrance but through the first box.

When the boxes are set in the places where they are to remain, they must be screened from the summer's sun, because the wood will otherwise be heated to a greater degree than either the bees or their works can bear; and they should likewise be screened from the winter's sun, because the warmth of this will draw the bees from that lethargic state which is natural to them, as well as many other insects, in the winter season. For this purpose, and also to shelter the boxes from rain, our ingenious clergyman has contrived the following frame.

Fig. 4. represents the front of a frame for twelve colonies: *a*, *a*, are two cells of oak lying flat on the ground more than four feet long. In these cells are fixed four oaken posts, about the thickness of such as are used for drying linen. The two posts *b*, *b*, in the front, are about six feet two inches above the cells: the other two, standing backward, five feet eight inches. You are next to nail some boards of slit deal horizontally from one of the fore-posts to the other, to screen the bees from the sun. Let these boards be seven feet seven inches in length, and nailed to the inside of the posts; and be well seasoned that they may not shrink or gape in the joints. *c*, *c*, Are two splints of deal, to keep the boards even, and strengthen them.

Fig. 5. represents the back of the frame. *d*, *d*, *d*, *d*, Are four strong boards of the same length with the frame on which you are to place the boxes. Let the upper

upper side of them be very smooth and even, that the boxes may stand true upon them: or it may be still more advisable, to place under every pair of boxes a smooth thin board, as long as the boxes, and about a quarter of an inch wider. The bees will soon fasten the boxes to this board in such a manner that you may move or weigh the boxes and board together, without breaking the wax or resin, which for many reasons ought to be avoided. These floors must be supported by pieces of wood or bearers, which are nailed from post to post at each end. They are likewise to be well nailed to the frame, to keep them from sinking with the weight of the boxes. *f* Represents the roof, which projects backward about seven or eight inches beyond the boxes, to shelter them from rain. You have now only to cut niches or holes in the frame, over against each mouth or entrance into the boxes, at *h*, *h*, *h*, in fig. 4. Let these niches be near four inches long; and under each you must nail a small piece of wood for the bees to alight upon. The morning or evening sun will shine upon one or both ends of the frame, let its aspect be what it will: but you may prevent its overheating the boxes, by a loose board set up between the posts, and kept in by two or three pegs.

The same gentleman, with great humanity, observes, that no true lover of bees ever lighted the fatal match without much concern: and that it is evidently more to our advantage to spare the lives of our bees, and be content with part of their stores, than to kill and take possession of the whole.

About the latter end of August, says he, by a little inspection through your glasses, you may easily discover which of your colonies you may lay under contribution. Such as have filled a box and a half with their works, will pretty readily yield you the half box. But you are not to depend upon the quantity of combs, without examining how they are stored with honey. The bees should, according to him, have eight or nine pounds left them, by way of wages for their summer's work.

The most proper time for this business is the middle of the day; and as you stand behind the frame, you will need no armour, except a pair of gloves. The operation itself is very simple and easily performed, thus: Open the mouth of the box you intend to take; then with a thin knife cut through the resin with which the bees have joined the boxes to each other, till you find that you have separated them; and after this, thrust a sheet of tin gently in between the boxes. The communication being hereby stopped, the bees in the fullest box, where it is most likely the queen is, will be a little disturbed at the operation; but those in the other box where we suppose the queen is not, will run to and fro in the utmost hurry and confusion, and send forth a mournful cry, easily distinguished from their other notes. They will issue out at the newly opened door; not in a body as when they swarm, nor with such calm and cheerful activity as when they go forth to their labours; but by one or two at a time, with a wild flutter and visible rage and disorder. This, however, is soon over: for as soon as they get abroad and spy their fellows, they fly to them instantly and join them at the mouth of the other box. By this means, in an hour or two, for they go out slowly, you will have a box of pure honey, without leaving a bee in it to molest you; and likewise without dead bees, which, when you burn them, are often mixed with your honey, and both waste and damage it.

Mr White acknowledges, that he has sometimes found this method fail, when the mouth of the box to be taken away has not been constantly and carefully closed: the bees will in this case get acquainted with it as an entrance; and when you open the mouth in order to their leaving this box, many of them will be apt to return, and the communication being stopped, will in a short time carry away all the honey from this to the other box; so much do they abhor a separation. When this happens, he has recourse to the following expedient, which he thinks infallible. He takes a piece of deal, a little larger than will cover the mouth of the box, and cuts in it a square niche somewhat more than half an inch wide. In this niche he hangs a little trapdoor, made of a thin piece of tin, turning upon a pin, with another pin crossing the niche a little lower, so as to prevent the hanging door from opening both ways. This being placed close to the mouth, the bees which want to get out will easily thrust open the door outwards, but cannot open it the other way to get it again; so must, and will readily, make to the other box, leaving this in about the space of two hours, with all its store, justly due to the tender-hearted bee-master as a ransom for their lives.

What led Mr White to prefer collateral boxes to those before in use, was, to use his own words, his "compassion for the poor bees, who, after traversing the fields, return home weary and heavy laden, and must perhaps deposit their burden up two pair of stairs, or in the garret. The lower room, it is likely, is not yet furnished with stairs: for, as is well known, our little architects lay the foundation of their structures at the top and build downward. In this case, the weary little labourer is to drag her load up the sides of the walls: and when she has done this, she will travel many times backward and forward, as I have frequently seen, along the roof, before she finds the door or passage into the second story; and here again she is perplexed with a like puzzling labyrinth, before she gets into the third. What a waste is here of that precious time which our bees value so much, and which they employ so well! and what an expence of strength and spirits, on which their support and sustenance depend! In the collateral boxes, the rooms are all on the ground floor; and because I know my bees are wise enough to value convenience more than state, I have made them of such a moderate, though decent, height, that the bees have much less way to climb to the top of them than they have to the crown of a common hive."

36 Of the management of bees in Mr Wildman's hives.

Mr Wildman's hives have been already described (N° 23, 24.). A good swarm will soon fill one of these hives, and therefore another hive may be put under it the next morning. The larger space allowed the bees will excite their industry in filling them with combs. The queen will lay some eggs in the upper hive; but so soon as the lower hive is filled with combs, she will lay most of them in it. In little more than three weeks, all the eggs laid in the upper hive will be turned into bees; and if the season is favourable, their cells will be soon filled with honey.

As soon as they want room, a third hive should be placed

Bee.

placed under the two former; and in a few days after the end of three weeks from the time the swarm was put into the hive, the top hive may be taken away at noon of a fair day; and if any bees remain in it, carry it to a little distance from the stand, and turning its bottom up, and striking it on the sides, the bees will be alarmed, take wing, and join their companions in the second and third hives. If it is found that the bees are very unwilling to quit it, it is probable that the queen remains among them. In this case, the bees must be treated in the manner that shall be directed when we describe Mr Wildman's method of taking the honey and the wax. The upper hive now taken away should be put in a cool place, in which no vermin, mice, &c. can come at the combs, or other damage can happen to them, and be thus preserved in reserve.

When the hives seem to be again crowded, and the upper hive is well stored or filled with honey, a fourth hive should be placed under the third, and the upper hive be taken off the next fair day at noon, and treated as already directed. As the honey made during the summer is the best, and as it is needless to keep many full hives in store, the honey may be taken out of the combs of this second hive for use.

If the season is very favourable, the bees may still fill a third hive. In this case, a fifth hive must be put under the fourth, and the third taken away as before. The bees will then fill the fourth for their winter store.

As the honey of the first hive is better than the hony collected so late as that in the third, the honey may be taken out of the combs of the first, and the third may be preserved with the same care as directed for that.

In the month of September, the top hive should be examined; if full, it will be a sufficient provision for the winter; but if light, that is, not containing 20 pounds of honey, the more the better, then, in the month of October, the fifth hive should be taken away, and the hive kept in reserve should be put upon the remaining one, to supply the bees with abundant provisions for the winter. Nor need the owner grudge them this ample store; for they are faithful stewards, and will be proportionally richer and more forward in the spring and summer, when he will reap an abundant profit. The fifth hive which was taken away should be carefully preserved during the winter, that it may be restored to the same stock of bees, when an additional hive is wanted next summer; or the first swarm that comes off may be put into it. The combs in it, if kept free from filth and vermin, will save much labour, and they will at once go to the collecting of honey.

It is almost needless to observe, that when the hives are changed, a cover, as already directed (see N° 23.) should be put upon every upper hive; and that when a lower hive becomes an upper hive, the door of it should be shut up, that so their only passage out shall be by the lower hive; for otherwise the queen would be apt to lay eggs in both indiscriminately. The whole of the above detail of the management of one hive may be extended to any number; it may be proper to keep a register to each set; because, in restoring hives to the bees, they may be better pleased at receiving their own labours than that of other stocks.

If in the autumn the owner has some weak hives, which have neither provision nor number sufficient for the winter, it is advisable to join the bees to richer hives: for the greater number of bees will be a mutual advantage to one another during the winter, and accelerate their labours much in the spring. For this purpose, carry a poor and a richer hive into a room a little before night: then force the bees out of both hives into two separate empty hives, in a manner that shall be hereafter directed: shake upon a cloth the bees out of the hive which contains the fewest; search for the queen; and as soon as you have secured her with a sufficient retinue, bring the other hive which contains the greater number, and place it on the cloth on which the other bees are, with a support under one side, and with a spoon shovel the bees under it. They will soon ascend; and, while under this impression of fear, will unite peaceably with the other bees; whereas, had they been added to the bees of the richer hive, while in possession of their castle, many of the new-comers must have paid with their lives for their intrusion.

It appears from the account of the management of bees in Mr Wildman's hives, that there is very little art wanting to cause the bees to quit the hives which are taken away, unless a queen happens by chance to be among them. In that case, the same means may be used as are necessary when we would rob one of the common hives of part of their wealth. The method is as follows:

37 His method of taking the honey and wax.

Remove the hive from which you would take the wax and honey into a room, into which admit but little light, that it may at first appear to the bees as if it was late in the evening. Gently invert the hive, placing it between the frames of a chair or other steady support, and cover it with an empty hive, keeping that side of the empty hive raised a little, which is next the window, to give the bees sufficient light to get up into it. While you hold the empty hive, steadily supported on the edge of the full hive, between your side and your left arm, keep striking with the other hand all round the full hive from top to bottom, in the manner of beating a drum, so that the bees may be frightened by the continued noise from all quarters; and they will in consequence mount out of the full hive into the empty one. Repeat the strokes rather quick than strong round the hive, till all the bees are got out of it, which in general will be in about five minutes. It is to be observed, that the fuller the hive is of bees, the sooner they will have left it. As soon as a number of them have got into the empty hive, it should be raised a little from the full one, that the bees may not continue to run from the one to the other, but rather keep ascending upon one another.

So soon as all the bees are out of the full hive, the hive in which the bees are must be placed on the stand from which the other hive was taken, in order to receive the absent bees as they return from the fields.

If this is done early in the season, the operator should examine the royal cells, that any of them that have young in them may be saved, as well as the combs which have young bees in them, which should on no account be touched, though by sparing them a good deal of honey be left behind. Then take out the other combs with a long, broad, and pliable knife, such as the apothecaries make use of. The combs should be cut from the sides and crown as clean as possible, to save the future labour of the bees, who must lick up the

the honey spilt, and remove every remain of wax, and then the sides of the hive should be scraped with a table spoon to clear away what was left by the knife. During the whole of this operation, the hive should be placed inclined to the side from which the combs are taken, that the honey which is spilt may not daub the remaining combs. If some combs were unavoidably taken away, in which there are young bees, the parts of the combs in which they are should be returned into the hive, and secured by sticks in the best manner possible. Place the hive then for some time upright, that any remaining honey may drain out. If the combs are built in a direction opposite to the entrance, or at right angles with it, the combs which are the farthest from the entrance are to be preferred; because there they are best stored with honey, and have the fewest young bees in them.

Having thus finished taking the wax and honey, the next business is to return the bees to their old hive; and for this purpose place a table covered with a clean cloth near the stand, and giving the hive in which the bees are a sudden shake, at the same time striking it pretty forcibly, the bees will be shaken on the cloth. Put their own hive over them immediately, raised a little on one side, that the bees may the more easily enter; and when all are entered, place it on the stand as before. If the hive in which the bees are be turned bottom uppermost, and their own hive be placed over it, the bees will ascend into it, especially if the lower hive is struck on the sides to alarm them.

As the chief object of the bees during the spring and beginning of the summer is the propagation of their kind, honey during that time is not collected in such quantity as it is afterwards: and on this account it is scarcely worth while to rob a hive before the latter end of June; nor is it safe to do it after the middle of July, lest rainy weather may prevent their restoring the combs they have lost, and laying in a stock of honey sufficient for the winter, unless there is a chance of carrying them to a rich pasture. See the article BEE in the SUPPLEMENT.

BEE is also used figuratively to denote sweetness, industry, &c. Thus Xenophon is called the *Attic Bee*, on account of the great sweetness of his style. Antonius got the denomination *Melissa* or *Bee*, on account of his collection of common places.—Leo Allatius gave the appellation *apes urbanæ* to the illustrious men at Rome, from the year 1630 to the year 1632.

BEE's-Bread. See BEE, N° 12. par. *ult*.

BEE-Eater. See MEROPS, ORNITHOLOGY *Index*.

BEE-Flower. See OPHRYS, BOTANY *Index*.

BEE-Glue, called by the ancients *propolis*, is a soft, unctuous, glutinous matter, employed by bees to cement the combs to the hives, and to close up the cells. See BEE, N° 13.

BEE-Hives. See BEE, N° 19, 34, 36.

BEECH-TREE. See FAGUS, BOTANY *Index*.

BEECH-Mast, the fruit of the beech-tree, said to be good for fattening hogs, deer, &c.—It has sometimes, even to men, proved an useful substitute for bread. Chios is said to have endured a memorable siege by means of it.

BEECH-Oil, an oil drawn by expression from the mast of the beech-tree, after it has been shelled and pounded. This oil is very common in Picardy, and used there and in other parts of France instead of butter; but most of those who take a great deal of it complain of pains and a heaviness in the stomach.

BEEF, the flesh of black-cattle prepared for food. According to Dr Cullen*, beef, though of a more firm texture and less soluble than mutton, is equally alkalescent, perspirable, and nutritious: and if in the southern countries it is not esteemed so, it is on account of its imperfection there.

* *Lect. on Mat. Med.*

BEELE, a kind of pick-axe, used by the miners for separating the ores from the rocks in which they lie; this instrument is called a *tubber* by the miners of Cornwall.

BEER, is a spirituous liquor made from any farinaceous grain, but generally from barley. It is, properly speaking, the wine of barley. The meals of any of these grains being extracted by a sufficient quantity of water, and remaining at rest in a degree of heat requisite for the spirituous fermentation, naturally undergo this fermentation, and are changed into a vinous liquor. But as all these matters render the water mucilaginous, fermentation proceeds slowly and imperfectly in such liquors. On the other side, if the quantity of farinaceous matter be so diminished that its extract or decoction may have a convenient degree of fluidity, this liquor will be impregnated with so small a quantity of fermentable matter, that the beer or wine of the grain will be too weak, and have too little taste.

These inconveniences are remedied by preliminary operations which the grain is made to undergo.—These preparations consist in steeping it in cold water, that it may soak and swell to a certain degree; and in laying it in a heap with a suitable degree of heat, by means of which, and of the imbibed moisture, a germination begins, which is to be stopped by a quick drying, as soon as the bud shows itself. To accelerate this drying, and render it more complete, the grain is slightly roasted, by making it pass down an inclined canal sufficiently heated. This germination, and this slight roasting, changes considerably the nature of the mucilaginous fermentable matter of the grain. The germination attenuates much, and in some measure totally destroys, the viscosity of the mucilage; and it does this, when not carried too far, without depriving the grain of any of its disposition to ferment. On the contrary, it changes the grain into a saccharine substance, as may be perceived by mashing grains beginning to germinate. The slight roasting contributes also to attenuate the mucilaginous fermentable matter of the grain. When the grain is thus prepared, it is fit to be ground, and to impregnate water with much of its substance without forming a glue or viscous mass. The grain thus prepared is called *malt*. This malt is then to be ground; and all its substance, which is fermentable and soluble in water, is to be extricated by means of hot water. This extract or infusion is sufficiently evaporated by boiling, in caldrons; and some plant of an agreeable bitterness, such as hops, is at that time added, to heighten the taste of the beer, and to render it capable of being longer preserved. Lastly, this liquor is put into casks, and allowed to ferment; nature performs the rest of the work, and is only to be assisted by the other most favourable circumstances for the spirituous fermentation. See FERMENTATION.

Foreigners

Digitized by Google

Foreigners have framed divers conjectures to account for the excellency of the British beer, and its superiority to that of other countries, even of Bremen, Mons, and Rostoch. It has been pretended our brewers throw dead dogs flayed into their wort, and boil them till the flesh is all consumed. Others, more equitable, attribute the excellency of our beer to the quality of our malt and water, and the skill of our brewers in preparing it.

Sour beer may be restored divers ways; as by salt made of the ashes of barley-straw, put into the vessel and stirred; or by three or four handfuls of beech-ashes thrown into the vessel, and stirred; or, where the liquor is not very sour, by a little put in a bag, without stirring; chalk calcined, oyster-shells, egg-shells, burnt sea-shells, crabs eyes, alkalized coral, &c. do the same, as they imbibe the acidity, and unite with it into a sweetness.—Beer, it is said, may bé kept from turning sour in summer, by hanging in the vessel a bag containing a new-laid egg, pricked full of little pin-holes, some laurel-berries, and a few barley-grains; or by a new-laid egg and walnut-tree leaves. Glauber commends his sal mirabile and fixed nitre, put in a linen bag, and hung on the top of the cask so as to reach the liquor, not only for recovering sour beer, but preserving and strengthening it.

Laurel-berries, the skin being peeled off, will keep beer from *deadness;* and beer already dead may be restored by impregnating it with fixed air.

Beer *tasting of the cask* may be freed from it by putting a handful of wheat in a bag, and hanging it in the vessel.

BEEROTH, a village of Judea, situated at the foot of Mount Gabaon, seven miles from Ælia or Jerusalem, on the road to Nicopolis (Jerome).

BEERSHEBA (Moses), a city to the south of the tribe of Judah, adjoining to Idumea (Josephus). See Bersabe.

BEESTINGS, or Breastings, a term used by country-people for the first milk taken from a cow after calving.—The beestings are of a thick consistence, and yellow colour, seeming impregnated with sulphur. Dr Morgan imagines them peculiarly fitted and intended by nature to cleanse the young animal from the recrements gathered in its stomach and intestines during its long habitation *in utero.* The like quality and virtue he supposes in women's first milk after delivery; and hence infers the necessity of the mother's suckling her own child, rather than committing it to a nurse whose first milk is gone.

BEET. See Beta, Botany *Index.*

BEETLE. See Scarabæus, Entomology *Index.*

Beetle also denotes a wooden instrument for driving piles, &c. It is likewise called a *stamper*, and by paviors a *rammer.*

BEEVES, a general name for oxen. See Bos, Mammalia *Index.*

BEFORT, a small town of France in the department of Upper Rhine. It was ceded to France by the treaty of Westphalia in 1648. It contains nearly 5000 inhabitants, and is important on account of the great road by this place from Franche Compte. The fortifications were greatly augmented by Louis XIV. It is seated at the foot of a mountain. E. Long. 6. 2. N. Lat. 47. 38.

BEG, or Bey, in the Turkish affairs. See Bey.

Beg is more particularly applied to the lord of a banner, called also in the same language *sangiak-beg.* A beg has the command of a certain number of the spahis, or horse, maintained by the province under the denomination of *timariots.* All the begs of a province obey one governor-general, called *begler-beg*, or *beyler-beg*, q. d. lord of lords or of the beys of the province.

Begs, or Beghs, of Egypt, denote twelve generals, who had the command of the militia or standing forces of the kingdom; and were to secure the country from the insults of Arabs, as well as to protect the pilgrims in their annual expeditions to Mecca. They were formerly very rich and powerful; but the Turkish Pasha Ali, who has raised himself to independence in Egypt since the expulsion of the French, has annihilated the power of this class of officers.

BEGA, Cornelius, painter of landscape, cattle, and conversations, was born at Haerlem in 1620, and was the disciple of Adrian Ostade. Falling into a dissipated way of life, he was disinherited by his father: for which reason he cast off his father's name, which was Begeyn, and assumed that of Bega: his early pictures being marked with the former, and his latter works with the other. He had a fine pencil, and a delicate manner of handling his colours, so as to give them a look of neatness and transparence; and his performances are so much esteemed in the Low Countries, as to be placed among the works of the best artists. He caught the plague from a woman with whom he was deeply enamoured; and he showed so much sincerity of affection, that notwithstanding the expostulations of all his friends and physicians, he would attend her to the last moments of her life, and died a few days after, aged 44.

BEGGAR, a person who begs. See a general view of the condition and number of such persons in Britain, in the article Beggar in the Supplement.

BEGHARDS. See Beguards.

BEGLERBEG, a governor of one of the principal governments of the Turkish empire, and next in dignity to the grand vizier. To every beglerbeg the grand signior gives three ensigns or staves, trimmed with a horsetail; to distinguish them from the bashaws, who have but two; and from simple begs, or sangiac begs, who have but one.

The province or government of beglerbeg is called *beglerbeglik*, or *beglierbeglik.* There are two sorts; the first called *basilo beglerbeglik*, which have a certain rent assigned out of the cities, countries, and signiories allotted to the principality: the second called *saliane beglerbeglik*, for maintenance of which is annexed a salary or rent, collected by the grand signior's officers with the treasure of the empire. The beglerbegs of the first sort are in number 22, viz. those of Anatolia, Caramania, Diarbekir, Damascus, Aleppo, Tripoli, Trebizond, Buda, Timiswar, &c. The beglerbegs of the second sort are in number six, viz. those of Cairo, Babylon, &c. Five of the beglerbegs have the title of *viziers*, viz. those of Anatolia, Babylon, Cairo, Romania, and Buda.

 The

Digitized by Google

The beglerbegs appear with great state, and a large retinue, especially in the camp, being obliged to bring a soldier for every 5000 aspers of rent which they enjoy. Those of Romania brought 10,000 effective men into the field.

The beglerbegs are become almost independent, and have under their jurisdiction several sangiacs or particular governments, and begs, agas, and other officers who obey them.

BEGUARDS, or Beghards, religious of the third order of St Francis in Flanders. They were established at Antwerp in the year 1228, and took St Begghe for their patroness, whence they had their name. From their first institution they employed themselves in making linen cloth, each supporting himself by his own labour, and united only by the bonds of charity, without having any particular rule. But, when Pope Nicholas IV. had confirmed that of the third order of St Francis in 1289, they embraced it the year following. They were greatly favoured by the dukes of Brabant, particularly John II. and John III. who exempted them from all contributions and taxes. In the year 1425, they began to live in common, and made solemn vows in 1467, after having taken the habit of the Terciaries (or religious of the third order of St Francis) of Liege. At last, in 1472, they became subject to the general of the congregation of Zepperen in the diocese of Liege, to which they were united by Pope Sixtus IV. As the convent of Antwerp is since become very considerable, the name of *Beguards* has been given to all the other religious of the same congregation. But, in 1650, Pope Innocent X. having suppressed the general of the congregation of Zepperen, all the convents of the third order of St Francis, in the dioceses of Liege, Malines, and Antwerp, were submitted to the visitation, jurisdiction, and correction, of the general of Italy, and erected into a province, under the title of *the province of Flanders*. This province has at present 10 or 12 convents, the principal of which are those of Antwerp, Brussels, Maestricht, and Louvain.

BEGUINES, a congregation of religious or nuns, founded either by St Begghe, founder likewise of the Beguards, or by Lambert le Begue; of whom the former died about the end of the seventh century, the latter about the end of the 12th. They were established first at Liege, and afterwards at Neville, in 1207; and from this last settlement sprang the great number of Beguinages, which are spread over all Flanders, and which have passed from Flanders into Germany. In the latter country, some of these religious fell into extravagant errors, persuading themselves that it was possible, in the present life, to arrive at the highest perfection, even to impeccability, and a clear view of God; in short, to so eminent a degree of contemplation, that there was no necessity, after this, either to observe the fasts of the church, or submit to the direction and laws of mortal men. The council of Vienna condemned these errors, and abolished the order of Beguines; permitting, nevertheless, those among them, who continued in the true faith, to live in chastity and penitence, either with or without vows. It is by favour of this latter clause, that there still subsist so many communities of Beguines in Flanders; who, since the council of Vienna, have conducted themselves with so much wisdom and piety, that Pope John XXII. by his decretal, which explains that of his predecessor made in the council of Vienna, took them under his protection; and Boniface VIII. in another, exempted them from the secular tribunal, and put them under the jurisdiction of the bishops.

There is scarcely a town in the Low Countries, in which there is not a society of Beguines; and, notwithstanding the change of religion at Amsterdam, there is a very flourishing one in that city. These societies consist of several houses placed together in one inclosure, with one or more churches, according to the number of Beguines. There is in every house a prioress, or mistress, without whose leave they dare not stir out. They make a sort of vow, which is conceived in the following terms: "I N. promise to be obedient and chaste as long as I continue in this Beguinage." They observe a three years noviciate before they take the habit. The rector of the parish is superior of the Beguinage; and he does nothing without the advice of eight Beguines. They were formerly habited in different manners; some in gray, others in blue; but at present they all wear black. When they go abroad, in Amsterdam, they put on a black veil. Formerly they had as many different statutes as there were societies. In the visitations of the year 1600 and 1601, by the archbishop Matthias Hovius, they were forbidden, under the penalty of a fine, to have lapdogs. The finest Beguinage in Flanders is that of Malines. That of Antwerp likewise is very spacious, and has two separate churches.

BEHEADING, a capital punishment, wherein the head is severed from the body by the stroke of an axe, sword, or other cutting instrument.

Beheading was a military punishment among the Romans, known by the name of *decollatio*. Among them the head was laid on a *cippus* or block, placed in a pit dug for the purpose; in the army, without the *vallum*; in the city, without the walls, at a place near the *porta decumana*. Preparatory to the stroke, the criminal was tied to a stake, and whipped with cords. In the early ages the blow was given with an axe; but in after-times with a sword, which was thought the more reputable manner of dying. The execution was but clumsily performed in the first times; but afterwards they grew more expert, and took the head off clean, with one circular stroke.

In England, beheading is the punishment of nobles, as it was formerly in France; being reputed not to derogate from nobility, as hanging does.

In Scotland they do not behead with an axe, as in England; nor with a sword, as in Holland; but with an edged instrument called the Maiden. With an instrument similar to this, were the bloody executions perpetrated in France during the late revolution. It was called *guillotine*, from the name of the supposed inventor, who was a physician.

BEHEMOTH, the hippopotamus or river-horse. See Hippopotamus, Mammalia *Index*.

BEHEN, in *Botany*. See Cucubalus, Botany *Index*.

BEHMEN. See Boehmen.

BEHN, Aphara, a celebrated authoress, descended from a good family in the city of Canterbury, was born some time in Charles I.'s reign, but in what year

Digitized by Google

year is uncertain. Her father's name was *Johnson*, who through the interest of Lord Willoughby, to whom he was related, being appointed lieutenant-general of Surinam and 36 islands, undertook a journey to the West Indies, taking with him his whole family, among whom was our poetess, at that time very young. Mr Johnson died on the voyage; but his family reaching Surinam, settled there for some years. Here it was that she learned the history of, and acquired a personal intimacy with, the American prince Oroonoko, and his beloved Imoinda, whose adventures she hath so pathetically related in her celebrated novel of that name, and which Mr Southerne afterwards made such an admirable use of, in adopting it as the groundwork of one of the best tragedies in the English language.

On her return to London, she became the wife of one Mr Behn, a merchant, residing in that city, but of Dutch extraction. How long he lived after their marriage is not very apparent, probably not very long; for her wit and abilities having brought her into high estimation at court, King Charles II. fixed on her as a proper person to transact some affairs of importance abroad during the course of the Dutch war. To this purpose she went over to Antwerp, where, by her intrigues and gallantries, she so far crept into the secrets of state, as to answer the ends proposed by sending her over. Nay, in the latter end of 1666, by means of the influence she had over one Vander Albert, a Dutchman of eminence, whose heart was warmly attached to her, she wormed out of him the design formed by De Ruyter, in conjunction with the family of the De Wits, of sailing up the Thames and burning the English ships in their harbours, which they afterwards put in execution at Rochester. This she immediately communicated to the English court: but though the event proved her intelligence to be well grounded, yet it was at that time only laughed at; which, together probably with no great inclination shown to reward her for the pains she had been at, determined her to drop all further thoughts of political affairs, and during the remainder of her stay at Antwerp to give herself up entirely to the gaiety and gallantries of the place. Vander Albert continued his addresses, and after having made some unsuccessful attempts to obtain the possession of her person on easier terms than matrimony, at length consented to make her his wife; but while he was preparing at Amsterdam for a journey to England with that intent, a fever carried him off, and left her free from any amorous engagements. In her voyage back to England, she was very near being lost, the vessel she was in being driven on the coast by a storm; but happening to founder within sight of land, the passengers were, by the timely assistance of boats from the shore, all fortunately preserved.

From this period she devoted her life entirely to pleasure and the muses. Her works are extremely numerous, and all of them have a lively and amorous turn. It is no wonder then that her wit should have gained her the esteem of Mr Dryden, Southerne, and other men of genius, as her beauty, of which in her younger part of life she possessed a great share, did the love of those of gallantry. Nor does she appear to have been any stranger to the delicate sensations of that passion, as appears from some of her letters to a gentleman, with whom she corresponded under the name of Lycida, and who seems not to have returned her flame with equal ardour, or received it with that rapture her charms might well have been expected to command.

She published three volumes of Miscellany Poems; two volumes of Histories and Novels; translated Fontenelle's Plurality of Worlds, and annexed a Criticism on it; and her plays make four volumes. In the dramatic line, the turn of her genius was chiefly to comedy. As to the character her plays should maintain in the records of dramatic history, it will be difficult to determine, since their faults and perfections stand in strong opposition to each other. In all, even the most indifferent of her pieces, there are strong marks of genius and understanding. Her plots are full of business and ingenuity, and her dialogue sparkles with the dazzling lustre of genuine wit, which everywhere glitters among it. But then she has been accused, and that not without great justice, of interlarding her comedies with the most indecent scenes, and giving an indulgence to her wit in the most indelicate expressions. To this accusation she has herself made some reply in the Preface to the Lucky Chance; but the retorting the charge of prudery and preciseness on her accusers, is far from being a sufficient exculpation of herself. The best and perhaps the only true excuse that can be made for it is, that, as she wrote for a livelihood, she was obliged to comply with the corrupt taste of the times.

After a life intermingled with numerous disappointments, she departed from this world on the 16th of April 1689, and lies interred in the cloisters of Westminster Abbey.

BEJA, an ancient town of Portugal, in the province of Alentejo. It is seated in a very agreeable and fruitful plain, remarkable for excellent wine. There are three gates remaining, which are of Roman architecture, and a great many Roman antiquities are dug out of the earth. The town has a strong castle for its defence, and is situated in W. Long. 7. 20. N. Lat. 37. 58. It was taken from the Moors in 1162.

BEJAR, a town of Estremadura in Spain, famous for its baths. It is seated in a very agreeable valley surrounded with high mountains whose tops are always covered with snow. Here the dukes of Bejar have a handsome palace. In this neighbourhood are forests filled with game, and watered by fine springs; also a lake abounding with excellent fish, particularly trouts. They pretend that this lake makes such a noise before a storm, that it may be heard 15 miles off.

BEICHLINGEN, a town of Thuringia in Upper Saxony, in E. Long. 11. 50. N. Lat. 51. 20.

BEILA, a town of Italy, in Piedmont. E. Long. 7. 45. N. Lat. 45. 2.

BEILSTEIN, a town of the landgravate of Hesse in Germany, in E. Long. 8. 0. N. Lat. 50. 30.

BEINASCHI, GIOVANNI BATTISTA, called *Cavalier Beinaschi*, history painter, was a Piedmontese, and born in 1634. He studied in Rome, under the direction of Pietro del Po; and some authors affirm, that he was afterwards the disciple of Lanfranc. It was certain that he was peculiarly fond of the works of Lanfranc, and at last became so thoroughly acquainted with the style, manner, and touch, of that excellent

Digitized by Google

excellent master, that many of the pictures of Beinaschi are at this day accounted the work of Lanfranc's own hand. He was an admirable designer; his lively invention furnished him with a surprising variety: his thought was noble; he was not only expeditious but correct; and as a public acknowledgment of his merit, the honour of knighthood was conferred upon him.

BEINHEIM, a fort of Alsace in France, seated on the river Sur, near its confluence with the Rhine, in E. Long. 8. 12. N. Lat. 45. 2.

BEIRA, a province of Portugal, bounded on the west by the ocean, on the south by the Portuguese Estremadura, on the south-east by the Spanish province of the same name, on the east by the province of Tra los Montos, and on the north by the river Douro. It extends in length about 34 leagues, and in breadth about 30 leagues, and is divided into six commarcas. Within this province lies Lamego, where the first assembly of the states was held; the chief episcopal city of Conimbra, or Coimbra, which is likewise an university; and Viseo, also a bishopric, and formerly the capital of a dukedom. The country is equally agreeable and fruitful, producing corn, wines, &c. in abundance, and the hills affording excellent pasture to cattle and sheep. The population in 1810 was 880,602, and the number of parishes 1227.

BEIRAM, or BAIRAM. See BAIRAM.

BEIRALSTON, a town in Devonshire, which sends two members to parliament.

BEIZA, or BEIZATH, in Hebrew antiquity, a word signifying an *egg;* as also a certain measure in use among the Jews. The beiza was likewise a gold coin, weighing 40 drachms, among the Persians, who gave out that Philip of Macedon owed their king Darius 1000 beizaths or golden eggs, for tribute-money; and that Alexander the Great refused to pay them, saying, that the bird which laid these eggs was flown into the other world.

BEKKER, BALTHASAR, one of the most famous Dutch divines, and author of the celebrated book, The World Bewitched, an ingenious piece against the vulgar notion of spirits. This raised a terrible clamour against him. He was deposed from the office of minister; but the magistrates of Amsterdam continued him his pension. He died in 1698.

BEL, MATTHIAS, was born in Hungary, and became a Lutheran minister at Presburg, and historiographer to the emperor Charles VI. He wrote, among other works, a History of Hungary, which was so much admired, that the emperor sent him letters of nobility; and notwithstanding his being a Lutheran, the Pope, in 1736, sent him his picture, and many large gold medals. He was a member of the Royal Society of London, and of the academies of Berlin and Petersburg; and died in 1749, at 66 years of age.

BEL, or *Belus*, the supreme god of the ancient Chaldeans or Babylonians. He was the founder of the Babylonian empire; and is supposed to be the Nimrod of Scripture, and the same as the Phœnician Baal. This god had a temple erected to him in the city of Babylon, on the very uppermost range of the famous tower of Babel, or Babylon, wherein were many statues of this deity; and one, among the rest, of massy gold, 40 feet high. The whole furniture of this magnificent temple was of the same metal, and valued at 800 talents of gold.—This temple, with its riches, was in being till the time of Xerxes, who, returning from his unfortunate expedition into Greece, demolished it, and carried off the immense wealth which it contained. It was the statue of this god which Nebuchadnezzar, being returned to Babylon after the end of the Jewish war, set up and dedicated in the plain of Dura; the story of which is related at large in the third chapter of Daniel.

BEL and the Dragon, the history of; an apocryphal and uncanonical book of Scripture. It was always rejected by the Jewish church, and is extant neither in the Hebrew nor the Chaldee language, nor is there any proof that it ever was so. St Jerome gives it no better title than the *Fable of Bell and the Dragon*. It is however permitted to be read, as well as the other apocryphal writings, for instruction and the improvement of manners.

BELAC, a small town of France, in the province of the Lyonnois, now the department of Upper Vienne, and district of La Marche. It contains about 3900 inhabitants. E. Long. 1. 3. N. Lat. 46. 8.

BELAY, on board a ship, signifies the same as fasten.—Thus they say, belay the sheet, or tack, that is, fasten it to the kevel, by winding it several times round a last, &c.

BELCASTRO, an episcopal city of Italy in the farther Calabria, and kingdom of Naples. It is seated on a mountain, in E. Long. 17. 15. N. Lat. 39. 6.

BELCHITE, a town of Spain, in the kingdom of Arragon, seated on the river Almonazir, in W. Long. 0. 30. N. Lat. 41. 19.

BELCHOE, a town of Ireland, in the province of Ulster, and county of Fermanagh, seated on Lough Nilly, in W. Long. 6. 6. N. Lat. 54. 2.

BELEM, a town of Estremadura in Portugal, about a mile from Lisbon. It is seated on the north side of the river Tajo, and is designed to defend the entrance to Lisbon; and here all the ships that sail up the river must bring to. In this place they inter the kings and queens of Portugal.

BELEMNITES, vulgarly called *thunder-bolts* or *thunder-stones*, are composed of several crusts of stone encircling each other, of a conical form, and various sizes; usually a little hollow, and somewhat transparent, formed of several striæ radiating from the axis to the surface of the stone; and when burnt or rubbed against one another, or scraped with a knife, yield an odour like rasped horn. Their size is various, from a quarter of an inch to eight inches; and their colour and shape differ. They are supposed to be originally either a part of some sea production; or a stone formed in the cavity of some worm-shell, which being of a tender and brittle nature, has perished, after giving its form to the stone. They are very frequently found in many parts of England; and the common people have a notion, that they are always to be met with after a storm. They are often enclosed in, or adhere to, other stones; and are most frequent amongst gravel, or in clay; they abound in Gloucestershire; and are found near Dedington in Oxfordshire, where they sometimes contain the silver marcasite.

BELERIUM, in *Ancient Geography*, a promontory of

Digitized by Google

of the Dunmonii or Damnonii, the westmost Britons. Now called the *Land's End*, in Cornwall.

BELESIS, or NANYBRUS, is said to have been the founder of the ancient Babylonish empire, and in conjunction with Arbaces the Mede to have put an end to the kingdom of the Assyrians by the defeat and death of Sardanapulus. This first prince is represented as a crafty and mean-spirited knave; and at the same time, as nothing less than a hero. It is said, he was base enough to circumvent Arbaces his colleague and friend in the most shameful manner; by pretending a vow he had, in the midst of the war, made to his god Belus, That if success was the event of it, and the palace of Sardanapalus was consumed, as it was, he would be at the charge and trouble of removing the ashes that were left to Babylon; where he would heap them up into a mount near the temple of his god; there to stand as a monument to all who should navigate the Euphrates, of the subversion of the Assyrian empire. He, it seems, had been privately informed, by an eunuch, of the immense treasure which had been consumed in the conflagration at Nineveh; and knowing it to be a secret to Arbaces, his avarice suggested to him this artifice. Arbaces not only granted him his request; but appointed him king of Babylon, with an exemption from all tribute. Belesis, by this artifice, carried a prodigious treasure with him to Babylon; but when the secret was discovered, he was called to an account for it, and tried by the other chiefs who had been assistant in the war, and who, upon his confession of the crime, condemned him to lose his head. But Arbaces, a munificent and generous prince, freely forgave him, left him in possession of the treasure, and also in the independent government of Babylon, saying, The good he had done ought to serve as a veil to his crime; and thus he became at once a prince of great wealth and dominion.

In process of time, and under the successor of Arbaces, he became a man of dress, shew, and effeminacy, unworthy of the kingdom or province he held. Nanybrus, for so we must now call Belesis, understanding a certain robust Mede, called *Parsondas*, held him in the utmost contempt, and had solicited the emperor of the Medes to divest him of his dominions, and to confer them upon himself, offered a very great reward to the man who should take Parsondas and bring him to him. Parsondas hunting somewhere near Babylon with the king of the Medes, and straggling from the company, happened to fall in with some of the servants of the Babylonian Nanybrus, who had been tempted with the promised reward. They were purveyors to the king; and Parsondas being very thirsty, asked them for a draught of wine; which they not only granted, but prevailed upon him to take a meal with them. As he drank freely, suspecting no treachery, he was easily persuaded to pass that night in company with some beautiful women, brought on purpose to detain him. But, while he was in a profound sleep, the servants of Nanybrus rushing upon him, bound him, and carried him to their prince; who bitterly reproached him for endeavouring to estrange his master the king of the Medes from him, and by that means place himself in his room on the throne of Babylon. Parsondas did not deny the charge; but with great intrepidity owned, that he thought himself more worthy of a crown than such an indolent and effeminate prince as he was. Nanybrus, highly provoked at the liberty he took, swore by the gods Belus and Malis, or rather Mylitta, that Parsondas himself should in a short time become so effeminate as to reproach none with effeminacy. Accordingly, he ordered the eunuch who had the charge of his music-women, to shave, paint, and dress him after the manner of those women, to teach him the art, and in short to transform him by all possible means into a woman. His orders were obeyed; and the manly Parsondas soon excelled the fairest female in singing, playing, and the other arts of allurement.

In the mean time the king of the Medes, having in vain sought after his favourite servant, and in vain offered great rewards to such as should give him any information concerning him, concluded he had been destroyed by some wild beast in the chase. At length, after seven years, the Mede was informed of his state and condition by an eunuch, who, being cruelly scourged by Nanybrus's order, fled, at the instigation of Parsondas into Media; and there disclosed the whole to the king, who immediately despatched an officer to demand him. Nanybrus pretended to know nothing of any such person: upon which another officer was sent by the Mede, with a peremptory order to seize on Nanybrus if he persisted in the denial, to bind him with his girdle, and lead him to immediate execution. This order had the desired effect: the Babylonian owned what he had before denied; promising to comply, without further delay, with the king's demand; and in the mean time invited the officer to a banquet, at which 150 women, among whom was Parsondas, made their appearance, singing and playing upon various instruments. But, of all, Parsondas appeared by far the most charming; insomuch, that Nanybrus inquiring of the Mede which he liked best, immediately pointed at him. At this the Babylonian clapt his hands; and, falling into an immoderate fit of laughter, told him who the person was whom he thus preferred to all the rest; adding, that he could answer what he had done before the king of the Medes. The officer was no less surprised at such an astonishing change than his master was afterwards, when Parsondas appeared before him. The only favour Parsondas begged of the king, for all his past services, was, that he would avenge on the Babylonian the base and highly injurious treatment he had met with at his hands. The Mede marched accordingly at his instigation to Babylon; and, notwithstanding the remonstrances of Nanybrus, urging, that Parsondas had, without the least provocation, endeavoured to deprive him both of his life and kingdom, declared that in ten days time he would pass the sentence on him which he deserved, for presuming to act as judge in his own cause, instead of appealing to him. But Nanybrus having in the mean time gained with a large bribe Mitraphernes the Mede's favourite eunuch, the king was by him prevailed upon to sentence the Babylonian only to a fine; which made Parsondas curse the man who first found out gold, for the sake of which he was to live the sport and derision of an effeminate Babylonian.

BELESME, a town of Perche in France, in the department of Orne, in W. Long. 0. 16. N. Lat. 48. 23.

BELEZERO, a town of Russia, and capital of a province of the same name. It is situated on the south-east shore of the White sea, in E. Long. 36. 10. N. Lat. 61. 50.

BELFAST, a town of Ireland, in the county of Antrim. It is seated at the bottom of Carrickfergus bay, and is the chief town and port in this part of Ireland, as well for beauty, as for its wealth, trade, and shipping. The customhouse duties for the year 1816 amounted to 349,417l.; and the inhabitants, who are mostly Scots, and of the Presbyterian religion, amounted in the same year to 30,000. W. Long. 5. 54. N. Lat. 54. 38.

BELFRY, Belfredus, is used by military writers of the middle age for a sort of tower erected by besiegers to overlook and command the place besieged. Belfry originally denoted a high tower, whereon sentinels were placed to watch the avenues of a place, and prevent surprise from parties of the enemies, or to give notice of fires by ringing a bell. In the cities of Flanders, where there is no belfry on purpose, the tower of the chief church serves the same end. The word *belfry* is compounded of the Teutonic *bell*, and *freid*, "peace," because the bells were hung for preserving the peace.

Belfry is also used for that part of a steeple wherein the bells are hung. This is sometimes called by the middle-age writers *campanile*, *clocaria*, and *tristegum*.

Belfry is more particularly used for the timber-work which sustains the bells in a steeple, or that wooden structure to which the bells in church-steeples are fastened.

BELGÆ, in *Ancient Geography*, a people of Britain, to the west: Now Hampshire, Wiltshire, and Somersetshire, (Camden).

BELGICA, a town of the Ubii in Gallia Belgica, midway between the rivers Rhine and Roer: Now called *Balchusen* (Cluverius); a citadel of Juliers (Baudrand).

Belgica Gallia, one of Cæsar's three divisions of Gaul, contained between the ocean to the north, the rivers Seine and Marne to the west, the Rhine to the east, but on the south at different times within different limits. Augustus, instituting everywhere a new partition of provinces, added the Sequani and Helvetii, who till then made a part of Celtic Gaul, to the Belgic (Pliny, Ptolemy). The gentilitious name is *Belgæ*, called by Cæsar the bravest of the Gauls, because untainted by the importation of luxuries. The epithet is *Belgicus* (Virgil).

BELGARDEN, a town of Germany, in East Pomerania, in a circle of the same name, and subject to Prussia. E. Long. 16. 5. N. Lat. 54. 10.

BELGINUM, a town of the Treviri, in Gallia Belgica: Now called *Baldenau*, in the electorate of Triers.

BELGIUM, manifestly distinguished from Belgica, as a part from the whole (Cæsar); who makes Belgium the country of the Bellovaci; Hirtius adding the Atrebates. But as the Ambiani lay between the Bellovaci and Atrebates, we must also add these: and thus Belgium reached to the sea, because the Ambiani lay upon it: and these three people constituted the proper and genuine Belgæ (all the rest being adventitious, or foreigners); and these were the people of Beauvais, Amiens, and Artois.

BELGOROD, a town of Russia, and capital of a province of the same name. It is seated on the river Donnets, in E. Long. 18. 5. N. Lat. 51. 20.

Belgorod, a strong town of Bessarabia in European Russia, seated at the mouth of the river Niester, on the Black sea, 80 miles south-east of Bender. E. Long. 31. 0. N. Lat. 46. 10.

BELGRADE, a city of Turkey in Europe, and capital of Servia, seated at the confluence of the Save and the Danube, in E. Long. 20. 10. N. Lat. 44. 52. The Danube is very rapid near this city, and its waters look whitish. Belgrade is built on a hill, and was once large, strong, and populous. It was surrounded with a double wall, flanked with a great number of towers, and had a castle situated on a rising ground, and built with square stones. The suburbs are very extensive: and resorted to by Turkish, Jewish, Greek, Hungarian, and Sclavonian merchants. The streets where the greatest trade is carried on are covered with wood, to shelter the dealers from the sun and rain. The rivers render it very convenient for commerce; and as the Danube falls into the Black sea, the trade is easily extended to distant countries, which renders it the staple town in these parts; and as the Danube runs up to Vienna, they send goods from thence with a great deal of ease. The Armenians have a church here, and the Jews a synagogue; both these being employed as factors. The shops are but small: and the sellers sit on tables, disposing of their commodities out of a window, for the buyers never go on the inside. The richest merchandise is exposed to sale in two bezesteins or bazars, built crosswise. There are two exchanges, built with stone, and supported with pillars not unlike the Royal Exchange at London. It has been taken by the Turks and Imperialists alternately several times. The fine fortifications were demolished in 1739; and the place was finally ceded to the Turks in 1791. It was taken by the Servian insurgents in 1806.

BELGRADO, a town of Friuli, in the Venetian territories in Italy. It stands near the river Tejamento, in E. Long. 13. 5. N. Lat. 46. 0.

BELIA, in *Ancient Geography*, a town of hither Spain: Now *Belchite*, in the kingdom of Arragon. See Belchite.

BELIAL, בליאל, a Hebrew word which signifies a wicked worthless man, one who is resolved to endure no subjection. Thus the inhabitants of Gibeah, who abused the Levite's wife (Judges xix. 22.), have the name of Belial given them. Hophni and Phineas, the high priest Eli's sons, are likewise called sons of Belial (1 Sam. ii. 12.), upon account of the several crimes they had committed, and the unbecoming manner in which they behaved themselves in the temple of the Lord. Sometimes the name Belial is taken to denote the devil. Thus St Paul says (Cor. vi. 15.) "What concord hath Christ with Belial?" Whence it appears, that in his time the Jews, under the name of Belial, commonly understood the devil in the places where this term occurs in the Old Testament.

BELIDOR, Bernard Forest de, a Catalonian engineer in the service of France, and member of the academies of sciences at Paris and Berlin, and of the royal

Digitized by Google

royal society at London; a celebrated mathematician, and author of a number of military tracts in which the science of mathematics is applied to military uses. Died in 1765, aged 70.

BELIEF, in its general and natural sense, denotes a persuasion, or a strong assent of the mind to the truth of any proposition. In which sense, belief has no relation to any particular kind of means or arguments, but may be produced by any means whatever. Thus we are said to believe our senses, to believe our reason, to believe a witness, &c. And hence, in rhetoric, all sorts of proofs, from whatever topics deduced, are called πιστις, because apt to beget belief or persuasion touching the matter in hand.

Belief, in its more restrained and technical sense, invented by the schoolmen, denotes that kind of assent which is grounded only on the authority or testimony of some person or persons, asserting or attesting the truth of any matter proposed.

In this sense, belief stands opposed to knowledge and science. We do not say we believe that snow is white, or that the whole is equal to its parts; but we see and know them to be so. That the three angles of a triangle are equal to two right angles, or that all motion is naturally rectilinear, are not said to be things credible, but scientifical; and the comprehension of such truths is not belief but science.

But when a thing propounded to us is neither apparent to our sense, nor evident to our understanding; neither certainly to be collected from any clear and necessary connection with the cause from which it proceeds, nor with the effects which it naturally produces; nor is taken up upon any real arguments, or relation thereof to other acknowledged truths; and yet, notwithstanding, appears as true, not by manifestation, but by an attestation of the truth, and moves us to assent, not of itself, but in virtue of a testimony given to it—this is said to be properly credible; and an assent to this is the proper notion of belief or faith.

BELIEVERS, an appellation given toward the close of the first century to those Christians who had been admitted into the church by baptism, and instructed in all the mysteries of religion. They had also access to all the parts of divine worship, and were authorized to vote in the ecclesiastical assemblies. They were thus called in contradistinction to the catechumens, who had not been baptized, and were debarred from these privileges.

BELIO, in *Ancient Geography*, a river of Lusitania, called otherwise *Limæus*, *Limeas*, *Limias*, and *Lethe*, or the *river of oblivion*: the boundary of the expedition of Decimus Brutus. The soldiers out of superstition refusing to cross, he snatched an ensign out of the hands of the bearer, and passed over, by which his army was encouraged to follow (Livy). He was the first Roman who ever proceeded so far, and ventured to cross. The reason of the appellation, according to Strabo is, that in a military expedition a sedition arising between the Celtici and Turduli, after crossing that river, in which the general was slain, they remained dispersed there; and from this circumstance it came to be called the *river of Lethe*, or *oblivion*. Now called *El Lima*, in Portugal, running westward into the Atlantic, to the south of the Minho.

BELISARIUS, general of the emperor Justinian's

army, who overthrew the Persians in the east, the Vandals in Africa, and the Goths in Italy. See Rome. But after all his great exploits, he was falsely accused of a conspiracy against the emperor. The real conspirators had been detected and seized, with daggers hidden under their garments. One of them died by his own hand, and the other was dragged from the sanctuary. Pressed by remorse, or tempted by the hopes of safety, he accused two officers of the household of Belisarius; and torture forced them to declare that they had acted according to the secret instructions of their patron. Posterity will not hastily believe, that a hero who in the vigour of life had disdained the fairest offers of ambition and revenge, should stoop to the murder of his prince, whom he could not long expect to survive. His followers were impatient to fly; but flight must have been supported by rebellion, and he had lived enough for nature and for glory. Belisarius appeared before the council with less fear than indignation: after 40 years service, the emperor had prejudged his guilt; and injustice was sanctified by the presence and authority of the patriarch. The life of Belisarius was graciously spared: but his fortunes were sequestered; and, from December to July, he was guarded as a prisoner in his own palace. At length his innocence was acknowledged; his freedom and honours were restored; and death, which might be hastened by resentment and grief, removed him from the world about eight months after his deliverance. That he was deprived of his eyes, and reduced by envy to beg his bread, "Give a penny to Belisarius the general!" is a fiction of later times; which has obtained credit, or rather favour, as a strange example of the vicissitudes of fortune.—The source of this idle fable may be derived from a miscellaneous work of the 12th century, the Chiliads of John Tzetzes, a monk. He relates the blindness and beggary of Belisarius in ten vulgar or political verses (Chiliad iii. N° 88. 339—348. in Corp. Poet. Græc. tom. ii. p. 311.).

Εκπωμα ξυλινον κρατων εβοα τῳ μιλιῳ
Βελισαριῳ οβολον δοτε τῳ στρατηλατῃ
Ον τυχη μεν εδοξασεν, αποτυφλοι δ' ὁ φθονος.

This moral or romantic tale was imported into Italy with the language and manuscripts of Greece; repeated before the end of the 15th century by Crinitus, Pontanus, and Volaterranus; attacked by Alciat for the honour of the law, and defended by Baronius (A. D. 561, N° 2, &c.) for the honour of the church. Yet Tzetzes himself had read in other chronicles, that Belisarius did not lose his sight, and that he recovered his fame and fortunes.—The statue in the Villa Borghese at Rome, in a sitting posture, with an open hand, which is vulgarly given to Belisarius, may be ascribed with more propriety to Augustus in the act of propitiating Nemesis (*Winckleman*, *Hist. de l'Art*. tom. iii. p. 266.). "Ex nocturno visu etiam stipem, quotannis, die certo, emendicabat à populo, cavam manum asses porrigentibus præbens." (*Seuton. in Aug.* c. 91.).

BELL, a well known machine, ranked by musicians among the musical instruments of percussion.

The constituent parts of a bell are the body or *barrel*, the *clapper* on the inside, and the ear or *cannon* by which it hangs to a large beam of wood. The matter of which it is usually made is a composition called *bell-metal*.

metal. The thickness of a bell's edge is usually $\frac{1}{15}$ of the diameter, and its height, 12 times its thickness. The bell-founders have a diapason, or bell-scale, wherewith they measure the size, thickness, weight, and tone, of their bells. For the method of casting bells, see FOUNDERY.

The sound of a bell is conjectured to consist in a vibratory motion of its parts, much like that of a musical chord. The stroke of the clapper must necessarily change the figure of the bell, and of a round make it oval: but the metal having a great degree of elasticity, that part will return back again which the stroke drove farthest off from the centre, and that even some small matter nearer the centre than before; so that the two parts which before were extremes of the longest diameter, do then become those of the shortest; and thus the external surface of the bell undergoes alternate changes of figure, and by that means gives that tremulous motion to the air in which the sound consists. M. Perrault maintains, that the sound of the same bell or chord is a compound of the sounds of the several parts thereof; so that where the parts are homogeneous, and the dimensions of the figure uniform, there is such a perfect mixture of all these sounds as constitutes one uniform, smooth, even sound; and the contrary circumstances produce harshness. This he proves from the bells differing in tone according to the part you strike; and yet strike it anywhere, there is a motion of all the parts. He therefore considers bells as a compound of an infinite number of rings, which according to their different dimensions have different tones, as chords of different lengths have; and when struck, the vibrations of the parts immediately struck determine the tone, being supported by a sufficient number of consonant tones in the other parts.

Bells are observed to be heard farther placed on plains than on hills; and still farther in valleys than on plains: the reason of which will not be difficult to assign, if it be considered that the higher the sonorous body is, the rarer is its medium: consequently, the less impulse it receives, and the less proper vehicle it is to convey it to a distance.

M. Reaumur, in the Memoirs of the Paris Academy, has the following observations relating to the shape most proper for bells, to give them the loudest and clearest sound. He observes, "that as pots and other vessels more immediately necessary to the service of life were doubtless made before bells, it probably happened that the observing these vessels to have a sound when struck, gave occasion to making bells, intended only for sound, in that form; but that it does not appear that this is the most eligible figure; for lead, a metal which is in its common state not at all sonorous, yet becomes greatly so on its being cast into a particular form, and that very different from the common shape of bells. In melting lead for the common occasions of casting in small quantities, it is usually done in an iron ladle: and as the whole is seldom poured out, the remainder which falls to the bottom of the ladle, cools into a mass of the shape of that bottom. This is consequently a segment of a sphere, thickest in the middle, and thinner towards the edges; nor is the ladle any necessary part of the operation, since if a mass of lead be cast in that form in a mould of earth or sand, in any of these cases it is found to be very sonorous. Now if this shape alone can give sound to a metal which in other forms is perfectly mute, how much more must it necessarily give it to other metals naturally sonorous in whatever form? It should seem, that bells would much better perform their office in this than in any other form: and that it must particularly be a thing of great advantage to the small bells of common house-clocks, which are required to have a shrill note, and yet are not allowed any great size." He adds, "that had our forefathers had opportunities of being acquainted with the sound of metals in this shape, we should probably have had all our bells at present of this form."

The use of bells is very ancient, as well as extensive. We find them among Jews, Greeks, Romans, Christians, and Heathens, variously applied; as on the necks of men, beasts, birds, horses, sheep: but chiefly hung in buildings, either religious, as in churches, temples, and monasteries; or civil, as in houses, markets, baths; or military, as in camps and frontier towns.

Among the Jews it was ordained, that the lower part of the blue tunic which the high priest wore when he performed religious ceremonies, should be adorned with pomegranates and gold bells, intermixed equally and at equal distances. As to the number of the bells worn by the high priest, the Scriptures are silent; and authors are not very well agreed: but the sacred historian has let us into the use and intent of them in these words (Exod. xxviii. 33—35.), "And it shall be upon Aaron to minister, and his sound shall be heard when he goeth into the holy place before the Lord, and when he cometh out, that he die not." The kings of Persia are said to have the hem of their robes adorned like the Jewish high-priests with pomegranates and gold bells. It was in the opinion of Calmet, with a design of giving notice that the high-priest was passing by, that he wore little bells on the hem of his robe; or rather it was as it were a kind of public notice that he was going to the sanctuary: for, as in the king of Persia's court, no one was suffered to enter the apartments without giving notice thereof by the sound of something; so the high-priest, out of respect to the divine presence residing in the holy of holies, did, by the sound of little bells fastened to the bottom of his robe, desire, as it were, permission to enter, that the sound of the bells might be heard, and he not be punished with death for an unmannerly intrusion. The figure of these bells is not known to us. The prophet Zachariah (xiv. 20.) speaks of bells hung to war horses. "In that day (says the prophet) there shall be upon the bells of horses, Holiness unto the Lord."

Among the Greeks, those who went the nightly rounds in camps or garrisons, carried with them a little bell, which they rung at each centry box to see that the soldiers on watch were awake. A codonophorous or bellman also walked in funeral processions, at a distance before the corpse, not only to keep off the crowd, but to advertise the *flamen dialis* to keep out of the way, for fear of being polluted by the sight, or by the funerary music. The priest of Proserpine at Athens, called *hierophantus*, rung a bell to call the people to sacrifice.

There were also bells in the houses of great men, to call

call up the servants in a morning. Zonaras assures us, that bells were hung with whips on the triumphal chariots of their victorious generals, to put them in mind that they were still liable to public justice.

Bells were put on the necks of criminals going to execution, that persons might be warned by the noise to get out of the way of so ill an omen as the sight of the hangman or the condemned criminal, who was devoted and just going to be sacrificed to the *dii manes*.

For bells on the necks of brutes, express mention is made of them in Phædrus,—*Celsa cervice eminens, Clarumque collo jactans tintinnabulum.* Taking these bells away was construed by the civil law, theft; and if the beast was lost by this means, the person who took away the bells was to make satisfaction.

As to the origin of *church-bells*, Mr Whittaker *; observes, That bells being used, among other purposes, by the Romans to signify the times of bathing, were naturally applied by the Christians of Italy to denote the hours of devotion, and summon the people to church. The first application of them to this purpose is, by Polydore Virgil and others, ascribed to Paulinus bishop of Nola, a city of Campania, about the year 400. Hence, it is said, the names *nolæ* and *campanæ* were given them; the one referring to the city, the other to the country. Though others say they took the latter of these names, not from their being invented in Campania, but because it was here the manner of hanging and balancing them, now in use, was first practised; at least they were hung on the model of a sort of balance invented or used in Campania; for in Latin writers we find *campana statera*, for a steelyard: and in the Greek *καμπανίζειν*, and *ponderare*, "to weigh." In Britain, bells were applied to church-purposes, before the conclusion of the seventh century, in the monastic societies of Northumbria, and as early as the sixth even in those of Caledonia. And they were therefore used from the first erection of parish-churches among us. Those of France and England appear to have been furnished with several bells. In the time of Clothair II. king of France, and in the year 610, the army of that king was frighted from the siege of the city of Sens, by ringing the bells of St Stephen's church. The second excerption of Egbert, about the year 750, which is adopted in a French capitulary of 801, commands every priest, at the proper hours, to sound the bells of his church, and then to go through the sacred offices to God. And the council of Enham, in 1011, requires all the mulcts for sins to be expended in the reparation of the church, clothing, and feeding the minister of God, and the purchase of church-vestments, church-books, and church-bells. These were sometimes composed of iron in France; and in England, as formerly at Rome, were frequently made of brass. And as early as the ninth century, there were many cast of a large size and deep note.

* History of Manchester.

Ingulphus mentions, that Turketulus, abbot of Croyland, who died about the year 870, gave a great bell to the church of that abbey, which he named *Guthlac*; and afterwards six others, viz. two which he called *Bartholomew* and *Bettelin*, two called *Turketul* and *Tatwin*, and two named *Pega* and *Bega*, all which rang together; the same author says, *Non erat tunc tanta consonantia campanarum in tota Anglia.* Not long after, Kinseus archbishop of York gave two great bells to the church of St John at Beverly, and at the same time provided that other churches in his diocese should be furnished with bells. Mention is made by St Aldhem, and William of Malmesbury, of bells given by St Dunstan to the churches in the west. The number of bells in every church gave occasion to the curious and singular piece of architecture in the campanile or bell-tower; an addition, which is more susceptible of the grander beauties of architecture than any other part of the edifice, and is generally therefore the principle or rudiments of it. It was the constant appendage to every parish-church of the Saxons, and is actually mentioned as such in the laws of Athelstan.

The Greek Christians are usually said to have been unacquainted with bells till the ninth century, when their construction was first taught them by a Venetian. Indeed, it is not true that the use of bells was entirely unknown in the ancient eastern churches, and that they called the people to church, as at present, with wooden mallets. Leo Allatius, in his dissertations on the Greek temples, proves the contrary from several ancient writers. It is his opinion, that bells first began to be disused among them after the taking of Constantinople by the Turks; who, it seems, prohibited them lest their sound should disturb the repose of souls, which, according to them, wander in the air. He adds that they still retain the use of bells in places remote from the intercourse of the Turks; particularly, very ancient ones in Mount Athos. F. Simon thinks the Turks prohibited the Christians the use of bells rather out of political than religious reasons; inasmuch as the ringing of bells might serve as a signal for the execution of revolts, &c.

In the ancient monasteries we find six kinds of bells enumerated by Durandus, viz. *Squilla*, rung in the refectory; *cymbalum*, in the cloister; *nola*, in the choir; *nolula* or *dupla*, in the clock; *campana*, in the steeple; and *signum* in the tower. Belethus has much the same; only that for *squilla*, he puts *tintinnabulum*, and places the *campana* in the tower, and *campanella* in the cloister. Others place the *tintinnabulum* or *tinniolum*, in the refectory or dormitory; and add another bell called *corrigiuncula*, rung at the time of giving discipline, to call the monks to be flogged. The *cymbalum* is sometimes also said to have been rung in the cloister, to call the monks to meat.

In the funeral monuments of Weever, are the following particulars relating to bells. "Bells had frequently these inscriptions on them:

"*Funera plango, Fulgura frango, Sabbata pango,*
"*Excito lentos, Dissipo ventos, Paco cruentos.*

"In the little sanctuary at Westminster, King Edward III. erected a clochier, and placed therein three bells for the use of St Stephen's chapel: about the biggest of them were cast in the metal these words:

"King Edward made mee thirtie thousand weight and three.
"Take me down and wey mee, and more you shall fynd mee.

"But these bells being to be taken down in the reign of King Henry VIII. one writes underneath with a coale:
"But

Bell.

"But Henry the eight
"Will bait me of my weight." *Ibid.* 492.

This last distich alludes to a fact mentioned by Stow in his survey of London, ward of Farringdon Within; to wit, that near to St Paul's school stood a clochier, in which were four bells called *Jesus's bells*, the greatest in all England, against which Sir Miles Partridge staked a hundred pounds, and won them of King Henry VIII. at a cast of dice. Nevertheless it appears that abroad there are bells of greater magnitude. In the steeple of the great church at Roan in Normandy is a bell with this inscription:

Je suis George d'Ambois,
Qui trente cinque mille pois.
Mais lui qui me pesera,
Trente six mille me trouvera.

I am George of Ambois,
Thirty-five thousand in pois:
But he that shall weigh me,
Thirty-six thousand shall find me. *Ibid.*

And it is a common tradition that the bells of King's college chapel, in the university of Cambridge, were taken by Henry V. from some church in France, after the battle of Agincourt. They were taken down some years ago, and sold to Phelps the bell-founder in Whitechapel, who melted them down.

The uses of bells were summed up in the following distich, as well as that first above-mentioned:

Laudo Deum verum, plebem voco, conjugo clerum,
Defunctos ploro, pestem fugo, festa decoro.

Matthew Paris observes, than anciently the use of bells was prohibited in time of mourning; though at present they make one of the principal ceremonies of mourning. Mabillon adds, that it was an ancient custom to ring the bells for persons about to expire, to advertise the people to pray for them; whence our passing bells. The passing bell, indeed, was anciently rung for two purposes: one, to bespeak the prayers of all good Christians for a soul just departing: the other, to drive away the evil spirits who stood at the bed's foot, and about the house, ready to seize their prey, or at least to molest and terrify the soul in its passage: but by the ringing of that bell (for Durandus informs us, evil spirits are much afraid of bells), they were kept aloof; and the soul, like a hunted hare, gained the start, or had what is by sportsmen called *law*. Hence, perhaps, exclusive of the additional labour, was occasioned the high price demanded for tolling the greatest bell of the church; for that being louder, the evil spirits must go farther off to be clear of its sound, by which the poor soul got so much more the start of them: besides, being heard farther off, it would likewise procure the dying man a greater number of prayers. This dislike of spirits to bells is mentioned in the Golden Legend, by W. de Worde. "It is said, the evil spirytes that ben in the regyon of thayre, doubte moche when they here the belles rongen: and this is the cause why the belles ben rongen when it thondreth, and whan grete tempeste and outrages of wether happen, to the ende that the feinds and wycked spirytes shold be abashed and flee, and cease of the movynge of tempeste." Lobineau observes, that the custom of ringing bells at the approach of thunder, is of some antiquity; but that the design was not so much to shake the air, and so dissipate the thunder, as to call the people to church to pray that the parish might be preserved from that terrible meteor.

In the times of Popery, bells were baptized and anointed *oleo chrismatis*: they were exorcised, and blessed by the bishop; from a belief, that, when these ceremonies were performed, they had power to drive the devil out of the air, to calm tempests, to extinguish fire, and to recreate even the dead. The ritual for these ceremonies is contained in the Roman pontifical; and it was usual in their baptism to give to bells the name of some saint. In Chauncy's History of Hertfordshire, page 383, is a relation of the baptism of a set of bells in Italy with great ceremony, a short time before the writing that book. The bells of the parish church of Winnington in Bedfordshire had their names cast about the verge of every one in particular, with these rhyming hexameters.

Nomina Campanis hæc indita sunt quoque nostris.
1. *Hoc signum Petri pulsatur nomine Christi.*
2. *Nomen Magdalene campana sonat melode.*
3. *Sit nomen Domini benedictum semper in eum.*
4. *Musa Raphaelis sonat auribus Immanuelis.*
5. *Sum Rosa pulsata mundique Maria vocata.*

Weev. Fun. 122.

By an old chartulary, once in the possession of Weever the antiquary, it appears that the bells of the priory of Little Dunmow in Essex were, anno 1501, new cast, and baptized by the following names:

Prima in honore Sancti Michaelis Archangeli.
Secunda in honore S. Johannis Evangelisti.
Tertia in honore S. Johannis Baptisti.
Quarta in honore Assumptionis beatæ Mariæ.
Quinta in honore sanctæ Trinitatis, et omnium sanctorum. Ib. 633.

The bells of Osney abbey near Oxford were very famous; their several names were Douce, Clement, Austin, Hautecter [potius Hautcleri], Gabriel, and John.

Nankin in China was anciently famous for the largeness of its bells; but their enormous weight brought down the tower, the whole building fell to ruin, and the bells have ever since lain on the ground. One of these bells is near 12 English feet high, the diameter seven and a half, and its circumference 23; its figure almost cylindric, except for a swelling in the middle; and the thickness of the metal about the edges seven inches. From the dimensions of this bell, its weight is computed at 50,000 pounds, which is more than double the weight of that of Erfort, said by Father Kircher to be the greatest bell in the world. These bells were cast by the first emperor of the preceding dynasty, about 300 years ago. They have each their name; the hanger (*tchoui*), the eater (*che*), the sleeper (*choui*), the will (*fi*). Father le Compte adds, that there are seven other bells in Pekin cast in the reign of Youlo, each of which weighs 120,000 pounds. But the sounds even of their biggest bells are very poor;

Bell.

Hawkins's History of Music, vol. iv. p. 152.

poor; being struck with a wooden in lieu of an iron clapper.

The practice of ringing bells in change, or regular peals, is said to be peculiar to England: whence Britain has been termed the *ringing island*. The custom seems to have commenced in the time of the Saxons, and was common before the Conquest. The ringing of bells, though a recreation chiefly of the lower sort, is in itself not incurious. The tolling a bell is nothing more than the producing a sound by a stroke of the clapper against the side of the bell, the bell itself being in a pendant position and at rest. In ringing, the bell, by means of a wheel and a rope, is elevated to a perpendicular; in its motion to this situation the clapper strikes forcibly on one side, and in its return downwards on the other side of the bell, producing at each stroke a sound. There are in London several societies of ringers, particularly one known by the name of the *College Youths*: of this it is said Sir Matthew Hale, lord chief justice of the court of King's Bench, was, in his youthful days, a member; and in the life of this learned and upright judge, written by Bishop Burnet, some facts are mentioned which favour this relation. In England the practice of ringing is reduced to a science, and peals have been composed which bear the name of the inventors. Some of the most celebrated peals now known were composed about 50 years ago by one Patrick. This man was a maker of barometers: in his advertisements he styled himself *Torricellian Operator*, from Torricelli, who invented instruments of this kind. In the year 1684, one Abraham Rudhall, of the city of Gloucester, brought the art of bell-founding to great perfection. His descendants in succession have continued the business of casting bells; and by a list published by them it appears, that at Lady-day 1774 the family, in peals and odd bells, had cast to the amount of 3594. The peals of St Dunstan's in the East, and St Bride's, London, and St Martin's in the Fields, Westminster, are in the number.

The music of bells is altogether melody; but the pleasure arising from it consists in the variety of interchange, and the various succession and general predominance of the consonances in the sounds produced. Musical authors seem to have written but little upon this subject.

Electrical BELLS are used in a variety of entertaining experiments by electricians. The apparatus, which is originally of German invention, consists of three small bells suspended from a narrow plate of metal; the two outermost by chains, and that in the middle, from which a chain passes to the floor, by a silken string. Two small knobs of brass are also hung by silken strings, one on each side of the bell in the middle, which serve for clappers. When this apparatus is connected with an electrified conductor, the outermost bells suspended by the chains will be charged, attract the clappers, and be struck by them. The clappers becoming electrified likewise will be repelled by these bells, and attracted by the middle bell, and discharge themselves upon it by means of the chain extending to the floor. After this, they will be again attracted by the outermost bells; and thus, by striking the bells alternately, occasion a ringing, which may be continued at pleasure. Flashes of light will be seen in the dark between the bells and clappers; and if the electrification be strong, the discharge will be made without actual contact, and the ringing will cease. An apparatus of this kind, connected with one of those conductors that are erected for securing buildings from lightning, will serve to give notice of the approach and passage of an electrical cloud.

Bell | Bellai.

BELL-*Animal*. See ANIMALCULE, N° 24—28.

BELL-*Metal*. See CHEMISTRY *Index*.

BELL, in *Chemistry*, denotes a glass vessel placed over some matter in a state of exhalation, either to collect the vapour or gather the flowers. Chemical bells are a sort of receptacles chiefly used in preparing the oil or spirit of sulphur, for condensing fumes into a liquor.

Diving-Bell. See DIVING.

BELLA, STEFANA DE LA, a most eminent engraver, was born at Florence A. D. 1610. His father was a goldsmith; and he himself began to work at his father's business. But whilst he was learning to draw, in order to perfect himself in that profession, some of the prints of Callot fell by accident into his hands; with which he was so delighted, that he prevailed upon his father to permit him to apply himself to engraving; and he became the disciple of Canta Gallina, who was also the instructor of Callot. De la Bella at first imitated the manner of Callot. His abilities soon began to manifest themselves: and as by degrees he acquired a facility in the handling of the point, he quitted the style in which he only shone as an imitator, and adopted one entirely his own, which in freedom and spirit is said even to have surpassed that of his fellow disciple. He went to Paris A. D. 1642, where he formed an acquaintance with Israel Silvestre, then newly returned from Rome; and he was much employed by Henriette the uncle of Silvestre. Some time after, Cardinal Richelieu engaged him to go to Arras, and make drawings of the siege and taking of that town by the royal army; which drawings he engraved at his return. He also went to Holland, where, it is reported, he saw some of the prints of Rembrandt Gerretsz, and attempted to imitate them: but finding he did not succeed to his expectations, he dropped that design, and continued to pursue his own manner, as most suitable to his genius. After abiding some considerable time at Paris, his family affairs obliged him to return to Florence; where he obtained a pension from the Great Duke, and was appointed to instruct the prince Cosmo his son in the art of design. Being subject to violent pains in the head, his life was rendered very uncomfortable by this cruel disorder, which at last put an end to it A. D. 1664, when he was only 54 years of age. De la Bella drew very correctly, and with great taste. His works manifest much genius and vast fertility of invention. The fire and animation which appear in them compensate for their slightness; and we may reasonably expect to find them slight when we are told that he engraved 1400 plates.

BELLAC. See BELAC.

BELLADONA, the trivial name of a species of atropa. See ATROPA, BOTANY *Index*.

BELLAI, WILLIAM DU, lord of Langey, a French general,

Digitized by Google

general, who signalized himself in the service of Francis I. He was also an able negociator, so that the emperor Charles V. used to say, "that Langey's pen had fought more against him than all the lances in France." He was sent to Piedmont in quality of viceroy, where he took several towns from the Imperialists. His address in penetrating into the enemy's designs was surprising. In this he spared no expence, and thereby had intelligence of the most secret counsels of the emperor and his generals. He was extremely active in influencing some of the universities of France to give their judgment agreeable to the desires of Henry VIII. king of England, when this prince wanted to divorce his queen, in order to marry Anne Bullen. It was then the interest of France to favour the king of England in this particular, it being an affront to the emperor, and a gratification to Henry, which might serve to form a strict alliance between him and Francis I. He was sent several times into Germany to the princes of the Protestant league, and was made a knight of the order of St Michael. He was also a man of learning, having given proofs of his abilities and genius as a writer. He composed several works; the most remarkable of which was, the History of his Own Times, in Latin; divided into ogdoades, that is, several parts, each consisting of eight books; most of which, however, have been lost. When Langey was in Piedmont in 1542 he had some remarkable intelligence which he was desirous himself to communicate to the king, and being very infirm, he ordered a litter for his conveyance; but after having passed the mountain of Tarara, betwixt Lyons and Roan, he found himself so extremely bad at St Saphorin that he was obliged to stop there, where he died the 9th of January, in the year 1543. He was buried in the church of Mans, and a noble monument was erected to his memory.

BELLARMIN, Robert, an Italian Jesuit, one of the best controversial writers of his time. In 1576 he read lectures at Rome on controversies; which he did with such applause, that Sixtus V. sending a legate into France in 1590, appointed him as a divine, in case any dispute in religion should happen to be discussed. He returned to Rome, and was raised successively to different offices, till at last, in 1599, he was honoured with a cardinal's hat; to accept of which dignity, it is said, they were obliged to force him by the threats of an anathema. It is certain, that no Jesuit ever did greater honour to his order than he; and that no author ever defended the cause of the Romish church in general, and that of the pope in particular, to more advantage. The Protestants have owned this sufficiently: for, during the space of 50 years, there was scarcely any considerable divine among them who did not fix upon this author for the subject of his books of controversy. Notwithstanding the zeal with which this Jesuit maintained the power of the pope over the temporality of kings, he displeased Sixtus V. in his work *De Romano Pontifice*, by not insisting that the power which Jesus Christ gave to his vicegerent was direct, but only indirect; and had the mortification to see it put into the index of the inquisition, though it was afterwards removed. He left, at his death, to the Virgin Mary one half of his soul, and to Jesus Christ the other.—Bellarmin is said to have been a man of great chastity and temperance, and remarkable for his patience. His stature was low, and his mien very indifferent; but the excellence of his genius might be discovered from the traces of his countenance. He expressed himself with great perspicuity; and the words which he first made use of to explain his thoughts were generally so proper, that there appeared no rasure in his writings.

BELLATRIX, in *Astronomy*, a ruddy glittering star of the second magnitude, in the left shoulder of Orion. It takes its name from *bellum*, as being anciently supposed to have a great influence in kindling wars, and forming warriors. Its longitude, according to Hevelius, for the year 1700, was 16° 47′ 20″; and its latitude southward 16° 52′ 11″.

BELLCLARE, a town of Ireland, in the province of Connaught, and county of Sligo. W. Long. 9. 5. N. Lat. 53. 56.

BELLE, a town of the French Netherlands, seated in E. Long. 2. 40. N. Lat. 50. 45.

BELLEAU, Remi, a French poet, born at Nogent le Rotrou, in the territory of Perche, and province of Orleanois. He lived in the family of Renatus of Lorrain, marquis of Elbeuf, general of the French galleys; and attended him in his expedition into Italy, in 1557. This prince highly esteemed Belleau for his courage; and having also a high opinion of his genius and abilities, entrusted him with the education of his son Charles of Lorrain. Belleau was one of the seven poets of his time who were denominated the *French Pleiades*. He wrote several pieces; and translated the odes of Anacreon into the French language, but in this he is thought not to have preserved all the natural beauties of the original. His pastoral pieces are in greatest esteem. His verses in that way (according to his eulogists) are expressed with such beauty and simplicity, that they seem to be a living picture of what they describe. He also wrote an excellent poem on the nature and difference of precious stones, which by some has been reputed his best performance. Belleau died at Paris, in the family of the duke d'Elbeuf, on the 6th of March, 1577. He was interred in the church Des Peres Augustines, near the Pont-neuf; several eulogiums were made to his memory.

BELLEFOREST, Francis de, a French author, born in the province of Guienne, in 1530. He was but seven years of age when he lost his father; and his mother was left in poor circumstances, but she contributed all in her power to his education. He was supported some years by the queen of Navarre, sister to Francis I. Some time after he went to study at Bourdeaux; thence he removed to Toulouse; and at last to Paris, where he got acquainted with several men of learning, and was honoured with the friendship of many persons of quality. He wrote, 1. A History of the Nine Charles's of France; 2. Annotations on the books of St Augustin; 3. An universal History of the World; 4. The Chronicles of Nicholas Gillet, augmented; 5. An universal Cosmography; 6. Annals, or a general History of France: and many other works. In short, he supported his family by writing books on whatever subject was proposed to him by the booksellers, according to the taste of the public. He died in 1583.

Bellegarde, Belleisle.

BELLEGARDE, a town of France, in the department of the Eastern Pyrenees, on the frontiers of Catalonia. It is an important place on account of its being a passage to the Pyrenean mountains. E. Long. 3. 0. N. Lat. 42. 20.

BELLEGARDE, a town of France, in the department of Saone and Loire, seated on the river Saone, 15 miles south-east of Chalons, in E. Long. 4. 0. N. Lat. 46. 57.

BELLEISLE, an island of France, on the coast of Brittany, 15 miles distant from it. This island is between 12 and 13 leagues in circumference. It is a mixture of craggy rocks and fertile soil; but the inhabitants are very poor, and the only trade carried on in it is the curing of pilchards. There are three harbours in the island, viz. Palais, Sahzon, and Goulford; every one of which labours under some capital defect, either in being exposed, shallow, or dangerous in the entrance. It contains only one little city called *Le Palais*, three country towns, 103 villages, and 5570 inhabitants. The island originally belonged to the earl of Cornouaille; but was afterwards yielded to the king, who in 1742 erected it into a duchy, in favour of Marshal Belleisle. The town of Palais takes its name from a castle which belonged to the duke de Belleisle, which stood in its neighbourhood; but was afterwards converted into a citadel fronting the sea, strongly fortified. Its fortifications are composed principally of hornworks; and it is provided with two dry ditches, the one next the counterscarp, and the other so contrived as to secure the interior fortifications. This citadel is divided from the largest part of the town by an inlet of the sea, over which there is a bridge of communication. From the other part of the town, and which is most inhabited, it is only divided by its own fortifications and a glacis. In this state was the island in 1761, when an expedition was undertaken against it by a British fleet under the command of Commodore Keppel, having on board a considerable land force commanded by General Hodgson. The fleet sailed from Spithead on the 29th of March, and arrived before Belleisle on the 7th of April. The next day it was agreed to attempt a landing on the south-east part of the island, in a sandy bay, near Lochmaria point. Here the enemy were in possession of a little fort; they had moreover entrenched themselves on a hill excessively steep, the foot of which was scarped away. The attempt was made in three places with great resolution; but the British were at last repulsed with the loss of 500 men. It was not before the 25th of April that the weather allowed a second attempt. This was made on a very strong place, where the enemy were rather less attentive, on account of the excessive steepness and difficulty of climbing up the rocks. Besides the principal attack, two feints were made at the same time to distract the enemy, while the men of war directed their fire with great success on the hills. These manœuvres gave Brigadier-general Lambert, with a handful of men, an opportunity of climbing up a very steep rock without molestation. This little body formed themselves in good order without delay, and were immediately attacked by 300 French. The British, however, sustained this attack until the whole corps of Brigadier Lambert, which had now likewise ascended, came to their assistance, with whose help they repulsed the enemy. The landing of all the forces being soon after made good, the French were driven into the town of Palais. Here the chevalier de St Croix who commanded them, a brave and experienced officer, resolved to hold out to the last extremity; and it was not till the 7th of June that he capitulated, and the garrison marched out with the honours of war. The island, however, was restored to the French by the treaty concluded in 1763.

Belleisle, Bellenden.

BELLEISLE, an island of North America, lying at the mouth of the strait between the country of the Esquimaux, or New Britain, and the north end of Newfoundland; whence the straits take also the name of *Belleisle*. W. Long. 58. 5. N. Lat. 51. 50.

BELLENDEN, or BALLANTINE, WILLIAM, a Scotch writer who flourished in the beginning of the 17th century, was professor of humanity or belles lettres at Edinburgh, and master of requests to James I. of England. But the former is supposed to have been only nominal, or early given up, and the latter also to have consisted in the name only, since he appears to have resided almost constantly at Paris, where by the favour of his sovereign, he was enabled to live in easy circumstances. There he published, in 1608, his *Cicero Princeps*, a singular work; in which he extracted from Cicero's writings detached passages, and comprised them into one regular body, containing the rules of monarchical government, with the line of conduct to be pursued, and the virtues proper to be encouraged, by the prince himself: and the treatise, when finished, he dedicated, from a principle of patriotism and gratitude, to the son of his master, Henry, then prince of Wales. Four years afterwards, namely, in 1612, he proceeded to publish another work of a similar nature, which he called *Cicero Consul, Senator Senatusque Romanus*, in which he treated, with much perspicuity, and a fund of solid information, on the nature of the consular office, and the constitution of the Roman senate. Finding these works received, as they deserved, with the unanimous approbation of the learned, he conceived the plan of a third work, *De Statu prisci Orbis*, which was to contain a history of the progress of government and philosophy, from the times before the flood to their various degrees of improvement under the Hebrews, Greeks, and Romans. He proceeded so far as to print a few copies of this work, in the year 1615, when it seems to have been suggested that his treatises, *De Statu Principis, De Statu Reipublicæ*, and *De Statu Orbis*, being on subjects so nearly resembling each other, there might be a propriety in uniting them into one work, by republishing the two former, and entitling the whole *Bellendenus De Statu.* With this view, he recalled the few copies of his last work that were abroad, and after a delay of some months, published the three treatises together, under their new title, in 1616. These pieces have been lately reprinted by an ingenious political editor, who has thought proper to inscribe them to Mr Burke, Lord North, and Mr Fox, whose respective portraits are prefixed to each dedication, and whose talents and virtues he celebrates and defends in a preface of 76 pages, containing a very free and bold discussion of our public men and measures in very classical language, and a strong and satirical representation, under borrowed names of antiquity, of the chiefs of the other party, or the present ministry. Bellenden wrote another work, published after his death,

Digitized by Google

death, *De tribus Luminibus Romanorum*, whom he conceives to be Cicero, Seneca, and the elder Pliny. The editor gives an account of this work, from whence he took his idea of drawing his characters of the three luminaries of Great Britain. He marks the proficiency in Greek and Roman literature which once distinguished the Scotch, before the civil dissensions drove their brightest geniuses abroad, and celebrates the ardour for philosophy and literature so prevalent in North Britain at present. Dr Middleton has been charged with borrowing not only the matter, but the arrangement, of his "Life of Cicero," from Bellenden, without the least acknowledgment, and the editor confesses himself of this opinion. It is surprising how little is known of Bellenden or his writings: concerning his lineage, birth, private life, and death, no notices have been transmitted even by tradition.

BELLEROPHON, in fabulous history, the son of Glaucus king of Epirus, happening accidentally to kill his brother, fled to Prœtus king of Argos, who gave him a hospitable reception: but Sthenobea, his queen, falling in love with the beautiful stranger, and finding that nothing could induce him to injure his benefactor, she accused him to her husband of an attempt to violate her honour. Prœtus, however, not being willing to act contrary to the laws of hospitality, sent him to Iobates king of Lysia, and the father of Sthenobea, with letters desiring him to be put to death: whence the proverb *Bellerophontis literas afferet*, equivalent to *Literæ Uriæ*. That prince, at the receipt of these letters, was celebrating a festival of nine days, which prevented Bellerophon's destruction. Iobates, however, sent him in the mean time to subdue the Solymi, the Amazons, and Lysians, and thought to get rid of him by exposing him to the greatest dangers; but by his prudence and courage he came off victorious. Iobates next employed him to destroy the Chimæra; when Minerva or according to others, Neptune, in consideration of his innocence, furnished him with the horse Pegasus, by whose assistance he killed the Chimæra. Iobates, on his return, being convinced of his truth and integrity, and charmed with his heroic virtues, gave him his daughter Philonoë in marriage, and declared him his successor: which when Sthenobea heard, she killed herself. Bellerophon at length growing vain with his prosperity, resolved, by the assistance of Pegasus, to ascend the skies; when Jupiter checked his presumption, by striking him blind in his flight; on which he fell down to the earth, and wandered till his death in contempt and misery: but Pegasus mounting into heaven, Jupiter placed him among the constellations.

BELLES LETTRES. Whether we consult the voluminous dictionaries of the French language, or those treatises that profess to point out the method of studying and teaching the belles lettres, we find not, in the one or the other, either a clear definition, or a succinct explication of the words *belles lettres*, nor any summary of those sciences which are comprehended under that general and collective denomination. It appears to be a vague term, under which every one may include whatever he thinks proper. Sometimes we are told, that by the belles lettres is meant, the knowledge of the arts of poetry and oratory; sometimes that the true belles lettres are natural philosophy, geometry, and other essential parts of learning; and sometimes, that they comprehend the art of war, by land and sea: in short, they are made to include all that we know, and whatever we please; so that, in treating on the belles lettres, they talk of the use of the sacraments, &c.*. Some comprehend under the term, all those instructive and pleasing sciences which occupy the memory and the judgment, and do not make part either of the superior sciences, of the *polite arts* †, or of mechanic professions; hence they make history, chronology, geography, genealogy, blazonry, philology, &c. the belles lettres. In a word, it were an endless task to attempt to enumerate all the parts of literature which different learned men have comprehended under this title. Nor would it be of any use to the reader for us to pretend to fix the true import of the term. Whatever arts or sciences it may be supposed to include, they are severally explained in the course of this work.

* *Rollin on the Belles Lettres.*

† See Arts, *Polite*.

BELLE VILLE, a town of France, in the department of the Rhone, seated near the river Saone. E. Long. 4. 46. N. Lat. 45. 5.

BELLEVOIS, painter of sea-pieces, is known through all parts of Europe as a good painter, though no particulars have been handed down concerning his life. He died in 1684. His subjects are views of havens, sea-ports, shores, calms, and storms at sea; but in his calms he shows his peculiar excellence. Pictures of this master are often in public sales; and some of them, which seem of his best style, are sold for a tolerable price.

BELLEY, or Bellay, a town of France, and capital of Bujey, in the department of Ain, containing 3800 inhabitants in 1816. It is seated near the river Rhone. E. Long. 5. 50. N. Lat. 45. 43.

BELLINGHAM, a town of Northumberland in England. W. Long. 2. 10. N. Lat. 55. 10.

BELLINI, Gentil, a Venetian painter, born in the year 1421. He was employed by the republic of Venice; and to him and his brother the Venetians are indebted for the noble works which are to be seen in the council-hall. We are told that Mahomet II. emperor of the Turks, having seen some of his performances, was so struck with them, that he wrote to the republic, entreating them to send him. The painter accordingly went to Constantinople, where he did many excellent pieces. Among the rest, he painted the decollation of St John the Baptist, whom the Turks revere as a great prophet. Mahomet admired the proportion and shadowing of the work; but he remarked one defect in regard to the skin of the neck, from which the head was separated; and in order to prove the truth of his observation, he sent for a slave and ordered his head to be struck off. The sight so shocked the painter, that he could not be easy till he had obtained his dismission; which the grand signior granted, and made him a present of a gold chain. The republic settled a pension upon him at his return, and made him a knight of St Mark. He died in 1501, in the 80th year of his age.

John Bellini, his brother, painted with more art and sweetness. He died in 1512, aged 90.

Bellini, *Laurence*, an eminent physician, born at Florence in the year 1643. After having finished his studies in polite literature, he went to Pisa, where he was assisted by the generosity of the grand duke Ferdinand

dinand II. and studied under two of the most learned men of that age, Oliva and Borelli. Oliva instructed him in natural philosophy, and Borelli taught him mathematics. At 20 years of age, he was chosen professor of philosophy at Pisa, but did not long continue in this office; for he had acquired such a reputation for his skill in anatomy, that the grand duke procured him a professorship in that science. This prince was often present at his lectures, and was highly satisfied with his abilities and performances. Bellini, after having held his professorship almost 30 years, accepted of an invitation to Florence, when he was about 50 years of age. Here he practised physic with great success, and was advanced to be first physician to the grand duke Cosmo III. He wrote the following books in Latin: 1. An Anatomical discourse on the Structure and Use of the Kidneys. 2. A Speech by way of thanks to the serene duke of Tuscany. 3. Some Anatomical Observations, and a proposition in Mechanics. 4. Of the Urine and Pulse, of Blood-letting, Fevers, and diseases of the Head and Breasts. 5. Several Tracts concerning Urine, the motion of the Heart, and Bile, &c. He died January 8. 1703, being 60 years of age. His works were read and explained publicly during his life, by the famous Scotch physician Dr Pitcairn, professor of physic in Leyden.

BELLINZONA, a town of Italy, in the Milanese, and one of the bailiwicks which the Swiss possess in that country. It is seated on the river Tesino, five miles above the place where it falls into the Lago Maggiore, and is fortified with two strong castles formerly joined together by a wall flanked with towers; but the Swiss have demolished a part of the fortifications. E. Long. 9. 0. N. Lat. 46. 8.

BELLIS, the DAISY. See BOTANY *Index*.

BELLIS Major. See CHRYSANTHEMUM, BOTANY *Index*.

BELLON, a distemper common in countries where they smelt lead-ore. It is attended with languor, intolerable pains and sensations of gripings in the belly, and generally costiveness.—Beasts, poultry, &c. as well as men, are subject to this disorder: hence a certain space round the smelting-houses is called *bellon-ground*, because it is dangerous for an animal to feed upon it.

BELLONA, in *Pagan Mythology*, the goddess of war, is generally reckoned the sister of Mars, and some represent her as both his sister and wife. She is said to have been the inventress of the needle; and from that instrument is supposed to have taken her name Βελονη, signifying a *needle*. This goddess was of a cruel and savage disposition, delighting in bloodshed and slaughter; and was not only the attendant of Mars, but took a pleasure in sharing his dangers. She is commonly represented in an attitude expressive of fury and distraction, her hair composed of snakes clotted with gore, and her garments stained with blood: she is generally depictured driving the chariot of Mars, with a bloody whip in her hand; but sometimes she is drawn holding a lighted torch or brand, and at others a trumpet. Bellona had a temple at Rome, near the Circus Flaminius, before which stood the column of war, from whence the consul threw his lance when he declared war. She was also worshipped at Comana, in Cappadocia; and Camden observes, that in the time of the emperor Severus, there was a temple of Bellona in the city of York.

BELLONARII, in antiquity, priests of Bellona, the goddess of wars and battles. The bellonarii cut and mangled their bodies with knives and daggers in a cruel manner, to pacify the deity. In this they are singular, that they offered their own blood, not that of other creatures, in sacrifice. In the fury and enthusiasm wherewith they were seized on these occasions, they ran about raging, uttering prophecies, and foretelling blood and slaughter, devastations of cities, revolutions of states, and the like: whence Martial calls them *turba entheata Bellonæ*. In after-times, they seem to have abated much of their zeal and transport, and to have turned the whole into a kind of farce, contenting themselves with making signs and appearances of cutting and wounds. Lampridius tells us, the emperor Commodus, out of a spirit of cruelty, turned the farce again into a tragedy, obliging them to cut and mangle their bodies really.

BELLONIA (so named from the famous Petrus Bellonius, who left many valuable tracts on natural history, &c.), a genus of the monogynia order, belonging to the pentandria class of plants. Of this genus there is only one species known, viz. the aspera, with a rough balm leaf. This is very common in the warm islands of America.

BELLORI, JOHN PETER, of Rome; a celebrated antiquary and connoisseur in the polite arts; author of the lives of the modern painters, architects, and sculptors, and of other works on antiquities and medals. He died in 1696.

BELLOVACI, in *Ancient Geography*, a people of Gallia Belgica, reckoned the bravest of the Belgæ: now *Beauvasis*, in the Isle of France.

BELLOWS, a machine so contrived as to exspire and inspire the air by turns, by enlarging and contracting its capacity. This machine is used in chambers and kitchens, in forges, furnaces, and founderies, to blow up the fire: it serves also for organs and other pneumatic instruments, to give them a proper degree of air. All these are of various constructions, according to their different purposes; but in general they are composed of two flat boards, sometimes of an oval, sometimes of a triangular figure: Two or more hoops, bent according to the figure of the boards, are placed between them; a piece of leather, broad in the middle, and narrow at both ends, is nailed on the edges of the boards, which it thus unites together; as also on the hoops which separate the boards, that the leather may the easier open and fold again: a tube of iron, brass, or copper, is fastened to the undermost board, and there is a valve within, that covers the holes in the under board to keep in the air.

Anacharsis the Scythian is recorded as the inventor of bellows. The action of bellows bears a near affinity to that of the lungs; and what we call blowing in the former, affords a good illustration of what is called *respiring* in the latter. Animal life itself may on some occasions be subsisted by blowing into the lungs with a pair of bellows. Dr Hooke's experiment to this effect is famous: having laid the thorax of a dog bare, by cutting away the ribs and diaphragm, pericardium, &c. and having cut off the aspera arteria below the epiglottis, and bound it on the nose of a bellows, he

Digitized by Google

he found, that as he blewed, the dog recovered, and as he ceased, fell convulsive; and thus was the animal kept alternately alive and dead above the space of an hour. There are bellows made wholly of wood, without any leather about them; one of which is preserved in the repository of the Royal Society; and Dr Plot describes another in the copper-works at Ellaston in Staffordshire. Ant. della Fruta contrived a substitute for bellows, to spare the expence thereof in the fusion of metals. This is called by Kircher *camera æolia*, and in England commonly the *water-bellows;* where water falling through a funnel into a close vessel, sends from it so much air continually as blows the fire. See the article FURNACE, where different blowing machines of this kind are described.

Smiths and founders bellows, whether single or double, are wrought by means of a rocker, with a string or chain fastened thereto, which the workman pulls. The bellows pipe is fitted into that of the tewel. One of the boards is fixed, so as not to play at all. By drawing down the handle of the rocker, the moveable board rises, and by means of a weight on the top of the upper board, sinks again. The bellows of forges and furnaces of mines usually receive their motion from the wheels of a water-mill. Others, as the bellows of enamellers, are wrought by means of one or more steps or treddles under the workman's feet. Lastly, the bellows of organs are wrought by a man called the *blower;* and in small organs by the foot of the player. Butchers have also a kind of blast or bellows of a peculiar make, by which they bloat or blow up their meat when killed, in order to piecing or parting it the better.

*Bone-*BELLOWS, φυσήτηρες οστεοι, occur in Herodotus for those applied by the Scythians to the genitals of mares, in order to distend the uterus, and by this compression make them yield a greater quantity of milk.

Hessian BELLOWS are a contrivance for driving air into a mine for the respiration of the miners. This M. Papin improved, changing its cylindrical form into a spiral one; and with this, working it only with his foot, he could make wind to raise a two pound weight.

Hydrostatic BELLOWS. See HYDROSTATICS.

BELLUNESE, a territory of Italy, formerly belonging to the Venetians, but now to the Austrians. It lies between Friuli, Codorino, Feltrino, the bishopric of Trent and Tirol. It has good iron mines, but the only considerable place is Belluno.

BELLUNO, a town of Italy, in the Austrian territories, and capital of the Bellunese. It is a bishop's see; and is situated among the Alps, on the river Piave, between the towns Cadora and Trevigni, in E. Long. 12. 15. N. Lat. 46. 9.

BELLY, in *Anatomy*, the same with what is more usually called *abdomen*. See ANATOMY *Index*.

BELMONTE, a town of Italy, in the hither Calabria, and kingdom of Naples. It is situated on the coast of the Tuscan sea. E. Long. 16. 50. N. Lat. 30. 20.

BELOMANCY; BELOMANTIA, a kind of divination by means of arrows, practised in the east, but chiefly among the Arabians. The word is of Greek origin; compounded of βελος, *arrow*, and μαντεια, *divination.*

Belomancy has been performed in different manners. One was to mark a parcel of arrows, and put 11 or more of them into a bag: these were afterwards drawn out; and according as they were marked or not, they judged of future events.

Another way was to have three arrows, upon one of which was wrote, "God orders it me;" upon another, "God forbids it me;" and upon the third nothing at all. These were put into a quiver, out of which they drew one of the three at random; if it happened to be that with the first inscription, the thing they consulted about was to be done: if it chanced to be that with the second inscription, it was let alone: but if it proved that without inscription, they drew over again.

Belomancy is an ancient practice, and probably that which Ezekiel mentions, chap. xxi. 21. At least St Jerome understands it so, and observes that the practice was frequent among the Assyrians and Babylonians. Something like it is also mentioned in Hosea, chap. iv. only that staves are there mentioned instead of arrows, which is rather rhabdomancy than belomancy. Grotius, as well as Jerome, confounds the two together, and shows that it prevailed much among the Magi, Chaldeans, and Scythians; whence it passed to the Sclavonians, and thence to the Germans, whom Tacitus observes to make use of it.

BELON, PETER, of Le Mans, the capital of Le Maine, a province of France, flourished about the middle of the 16th century. He published several books in Latin. He wrote, in French, of birds, beasts, fishes, serpents, and the neglected culture of plants; and a book of travels, or observations of many singularities and memorable things found in Greece, Asia, Judæa, Egypt, and other foreign countries. He was murdered near Paris by one of his enemies, in 1564.

BELONE. See ESOX, ICHTHYOLOGY *Index*.

BELOOCHISTAN, a country of Asia, situated on the north-west of Hindostan. See SUPPLEMENT.

BELSHAZZAR, the last king of Babylon, generally supposed to be the son of Evil-merodach, and grandson to the great Nebuchadnezzar.—During the time that Babylon was besieged by Cyrus, Belshazzar made an entertainment for a thousand of his most eminent courtiers (Dan. v. 1. &c.); and being heated with wine, ordered that the vessels of gold and silver which his grandfather Nebuchadnezzar had taken out of the temple at Jerusalem might be brought to the banqueting house, that he and his princes, together with his wives and concubines, might drink out of them, which accordingly was done; and to add to their profaneness, in the midst of their cups, they sang songs in praise of their several idols. But it was not long before a damp was put to the king's mirth, by a hand appearing upon the wall, which in three words wrote the sentence of his condemnation. The king saw the hand that wrote; and being exceedingly affrighted, commanded all his wise men, magicians, and astrologers, to be immediately called, that they might read the writing and explain its meaning. When they came, the king promised, that whoever should expound this writing should be made the third person of his kingdom in place

and

Digitized by Google

and power. But the Magi could comprehend nothing of this writing; which increased the disorder and uneasiness that the king was in, together with his whole court: whereupon, at the instance of the queen-mother, Daniel was sent for. The king made him the same offer of honours and presents that he had done to his own magicians if he would explain the writing. Daniel modestly refused those offers: but having undertaken to perform what he required of him, he first reproved the king with great freedom for his ingratitude to God, who had advanced him to the rank of a sovereign, and for the profanation of the vessels which were consecrated to his service; and then proceeded to the interpretation of the words, which were these, *Mene*, *Tekel*, *Upharsin*. *Mene*, says he, which signifies *number*, intimates, that the days both of your life and reign are numbered, or that you have but a short time to live; *Tekel*, which signifies *weight*, intimates, that you have been weighed in the balance of God's justice, and found too light; and *Upharsin*, (or *Peres*, as Daniel has it, and means the same thing), which signifies a *fragment*, intimates, that your kingdom shall be divided and given to the Medes and Persians. Which accordingly came to pass: for that very night, in the midst of their feasting and revelling, the city was taken by surprise, Belshazzar slain, and the kingdom translated to Cyaxares, whom the Scripture calls *Darius the Mede*. See BABYLON.

BELT, the *Great*, a famous strait of Denmark, between the island of Zeeland and that of Funen, at the entrance of the Baltic sea. It is not, however, so commodious, nor so much frequented as the Sound. In 1658 the whole strait was frozen so hard, that Charles Gustavus king of Sweden marched over it with a design to take Copenhagen.

BELT, the *Lesser*, lies to the west of the Great Belt, between the island of Funen and the coast of Jutland. It is one of the passages from the German ocean to the Baltic, though not three miles in breadth, and very crooked.

BELT, *Baltheus*, properly denotes a kind of military girdle, usually of leather, wherewith the sword or other weapons are sustained.—Belts are known among the ancient and middle-age writers by divers names, as ζωη, ζωμα, *zona*, *cingulum*, *reminiculum*, *rinca* or *ringa*, and *baldrellus*. The belt was an essential piece of the ancient armour; insomuch that we sometimes find it used to denote the whole armour. In later ages, the belt was given to a person when he was raised to knighthood; whence it has also been used as a badge or mark of the knightly order.

The denomination *belt* is also applied to a sort of bandages in use among surgeons, &c. Thus we meet with quicksilver belts, used for the itch; belts for keeping the belly tight, and discharging the water in the operation of tapping, &c.

BELT, is also a frequent disease in sheep, cured by cutting their tails off, and laying the sore bare; then casting mould on it, and applying tar and goose grease.

BELTS, in *Astronomy*, two zones or girdles surrounding the body of the planet Jupiter. See ASTRONOMY.

BELTS, in *Geography*, certain straits between the German ocean and the Baltic. The Belts belong to the king of Denmark, who exacts a toll from all ships which pass through them, excepting those of Sweden, which are exempted.

BEL-TEIN, a superstitious custom observed in the Highlands of Scotland. It is a kind of rural sacrifice, performed by the herdsmen of every village on the first of May. They cut a square trench in the ground, leaving a turf in the middle: on that they make a fire of wood, on which they make a large caudle of eggs, butter, oatmeal, and milk; and bring, besides the ingredients of the caudle, plenty of beer and whisky; for each of the company must contribute something. The rites begin with spilling some of the caudle on the ground, by way of libation: on that, every one takes a cake of oatmeal, upon which are raised nine square knobs, each dedicated to some particular being, the supposed preserver of their flocks and herds, or to some particular animal, the real destroyer of them: each person then turns his face to the fire, breaks off a knob, and flinging it over his shoulder, says, *This I give to thee, preserve thou my horses; this to thee, preserve thou my sheep;* and so on. After that, they use the same ceremony to the noxious animal: *This I give to thee, O fox! spare thou my lambs; this to thee, O hooded crow! this to thee, O eagle!* When the ceremony is over, they dine on the caudle; and after the feast is finished, what is left is hid by two persons deputed for that purpose; but on the next Sunday they re-assemble and finish the reliques of the first entertainment. Pennant's Tour.

BELTURBET, a town of Ireland in the county of Cavan, and province of Ulster, situated on the river Earn, in W. Long. 7. 35. N. Lat. 54. 7.

BELTZ, or BELZO, a province of Poland, which fell to the share of Austria in 1795. It was afterwards annexed to Bonaparte's kingdom of Poland, but was restored to Austria in 1815.

BELTZ, or *Belzo*, a town of Austrian Poland, and capital of the province of the same name, seated on the confines of Upper Volhynia, among marshes, in E. Long. 24. N. Lat. 50. 5.

BELVEDERE, in the *Italian Architecture*, &c. denotes either a pavilion on the top of a building, or an artificial eminence in a garden; the word literally signifying a *fine prospect*.

BELVEDERE, a considerable town of Greece, and capital of a province of the same name in the Morea. The province lies on the western coast: it is the most fertile and rich in all the Morea; and from it the raisins called *Belvederes* take their name. The town is situated in E. Long. 22. 0. N. Lat. 38. 5.

BELVIDERE. See CHENOPODIUM, BOTANY *Index*.

BELUNUM, in *Ancient Geography*, a town of Rhætia, above Feltria, in the territory of the Veneti; now *Belluno*, capital of the Bellunese in the territory of Venice. See BELLUNO.

BELUS, in *Ancient Geography*, a small river of Galilee, at the distance of two stadia from Ptolemais, running from the foot of Mount Carmel out of the lake Cendevia. Near this place, according to Josephus, was a round hollow or valley, where was a kind of sand fit for making glass; which, though exported in great quantities, was found to be inexhaustible. Strabo says, the whole of the coast from Tyre to Ptolemais has a sand fit for making glass; but that the sand of the

Digitized by Google

the rivulet Belus and its neighbourhood is a better sort; and here, according to Pliny, the making of glass was first discovered.

BEMA, in antiquity, denotes a step or pace. The bema made a kind of itinerary measure among the Greeks, the length of which was equivalent to one cubit and two thirds, or to ten palms. Whence also the term *bematizein*, βηματιζειν, to *measure* a road.

Bema, in ecclesiastical writers, denotes the altar or sanctuary in the ancient churches. In which sense *bema* made the third or innermost part of the church, answering to the chancel among us.

Bema was also used for the bishop's chair, seat, or throne, placed in the sanctuary. It was called *bema* from the steps by which it was to be ascended.

Bema was also used for the reader's desk. This in the Greek church was denominated βημα γνωσων, in the Latin church *ambo*.

Bema is more peculiarly used for the Manichees altar, which was in a different place from that of the Catholics.

Bema was also a denomination given by this sect to the anniversary of the day when Manes was killed, which with them was a solemn feast and day of rejoicing. One of the chief ceremonies of the feast consisted in setting out and adorning their bema or altar with great magnificence.

BEMBEA, a province of the kingdom of Angola in Africa. It is divided into Higher and Lower; and extends on one side along the sea, and on the other divides Angola from the foreign states on the south. The country is large, populous, and abounding with cattle; with the fat of which the inhabitants anoint their heads and bodies, and clothe themselves with their hides coarsely dressed. They are addicted to the same idolatrous superstitions with the rest of the natives, but speak a quite different language. The province is watered by a river called *Lutano* or *San Francisco*, which abounds with crocodiles, sea-horses, and monstrous serpents, that do a great deal of mischief.

BEMBO, Peter, a noble Venetian, secretary to Leo X. and afterwards cardinal, was one of the best writers of the 16th century. He was a good poet both in Italian and Latin; but he is justly censured for the looseness and immodesty of some of his poems. He published, besides these, A History of Venice; Letters; and a book in praise of the duke and duchess of Urbino. He died in 1547, in the 72d year of his age.

BEMSTER, or Bemister, a town of Dorsetshire in England, seated on the river Bert, containing 2290 inhabitants in 1811. W. Long. 3. 15. N. Lat. 50. 45.

BEN. See Behn.

Ben, in *Pharmacy*, the name of an exotic purgative fruit, of the size and figure of a nut; whence it is also called the *ben nut*, sometimes *balanus myrepsica*, or *glans unguentaria*.

Naturalists distinguish two kinds of bens: viz. the great, *ben magnum*, which resembles the filbert, and is by some called *avellana purgatrix*, brought from America; and the small, *ben parvum*, brought from Ethiopia.

Ben-nuts yield, by expression, much oil, which from its property of not becoming rancid, at least for years, is used as a menstruum for the extraction of the odoriferous parts of the flowers of jessamin, violets, roses, hyacinths, lilies of the valley, tuberoses, jonquils, clove julyflowers, and others which like these yield little or no essential oil by distillation, but impart their fragrance to expressed oils. The method of impregnating oil of ben with the odour of flowers is this: Some fine carded cotton is dipped in the oil, and put in the bottom of a proper vessel. On this is spread a thick layer of fresh flowers, above which more cotton dipt in oil is placed; and thus alternately flowers and cotton are disposed, till the vessel (which may be made of tin, with a cover to be screwed on to it, or of porcelain) is full. By digestion during 24 hours in a water-bath, the oil will receive the odour of the flowers.

BENARES, a district of Hindostan Proper in the East Indies, which lies between Bahar and Oude; and comprehends the circars of Benares, Jionpour, Chunar, and Gazypour. It was ceded to the English in 1775; but only came entirely into their hands in 1781, when the rajah was expelled.

Benares, a populous city in the East Indies, and capital of the district of the same name. It is situated on the north side of the Ganges, which is here very broad and the banks are very high. Benares has been much celebrated as the ancient seat of Braminical learning. Several Hindoo temples embellish the banks of the river; and many other of the public and private buildings are extremely magnificent. The streets, however, are narrow, and the houses high, some of them even five stories, which are inhabited by different families. The more opulent inhabitants live in detached houses, which have an open court, and are surrounded by a wall. In the centre of the city there is a large Mahometan mosque, which was built by the emperor Aurengzebe, who destroyed a magnificent Hindoo temple which had been erected on the same spot. Many of the Hindoo temples were demolished by the Mahometans, the ruins of which are still visible in different places round the city. The same manners and customs still prevail among these people, as at the remotest period which history has traced. No innovations either in civil or religious matters have been admitted. An insurrection was excited here in 1781, and by the formidable appearance which it assumed, threatened to prove fatal to the English interest in Hindostan. It was at length suppressed, and the rajah Cheyt Sing was deposed in 1783. Benares has been also long celebrated for its observatory. See Observatory. It is estimated to contain 600,000 souls, and is 425 miles south-east of Delhi, and 400 miles north-west of Calcutta. E. Long. 83. 10. N. Lat. 25. 20.

BENAVARRI, a town of the kingdom of Arragon in Spain, seated on the frontiers of Catalonia. E. Long. 0. 40. N. Lat. 41. 55.

BENAVENTO, a town of Spain, in the kingdom of Leon, and Terra di Campos, with the title of a duchy. It is seated on the river Ela, in W. Long. 5. 0. N. Lat. 42. 4.

BENAVIDUS, or Bonavitus (Marcus Mantua), a celebrated civilian, taught civil law with reputation, during 60 years, at Padua the place of his birth; and died in 1582, aged 93. His principal works are, 1. *Collectanea super Jus Cæsareum*. 2. *Consiliorum*, tom. ii. 3. *Problematum legalium*. 4. *De illustribus Jurisconsultis*, &c.

BENCH, or Banc, in *Law*. See Banc.

Free-

Digitized by Google

Free-Bench, King's Bench.

Free-Bench signifies that estate in copyhold-lands which the wife being espoused a virgin, has, after the decease of her husband, for her dower, according to the custom of the manor. As to this free-bench, several manors have several customs; as in the manors of East and West Enbourne, in the county of Berks, and other parts of England, there is a custom, that when a copyhold tenant dies, the widow shall have her free-bench in all the deceased husband's lands, whilst she lives single and chaste; but if she commits incontinency, she shall forfeit her estate: nevertheless, upon her coming into the court of the manor, riding on a black ram, and having his tail in her hand, and at the same time repeating a form of words prescribed, the steward is obliged, by the custom of the manor, to re-admit her to her free-bench.

King's Bench, a court in which the king was formerly accustomed to sit in person, and on that account was moved with the king's household. This was originally the only court in Westminster-hall, and from this it is thought that the courts of common pleas and exchequer were derived. As the king in person is still presumed in law to sit in this court, though only represented by his judges, it is said to have supreme authority: and the proceedings in it are supposed to be *coram nobis*, that is, before the king. This court consists of a lord chief justice and three other justices or judges, who are invested with a sovereign jurisdiction over all matters whether of a criminal or public nature. The chief justice has a salary of 5500l. and the other judges 2400l. each.

All crimes against the public good, though they do not injure any particular person, are under the cognizance of this court; and no private subject can suffer any unlawful violence or injury against his person, liberty, or possessions, but a proper remedy is afforded him here; not only for satisfaction of damages sustained, but for the punishment of the offender; and wherever this court meets with an offence contrary to the first principles of justice, it may punish it. It frequently proceeds on indictments found before other courts, and removed by *certiorari* into this. Persons illegally committed to prison, though by the king and council, or either of the houses of parliament, may be bailed in it; and in some cases even upon legal commitments.—Writs of mandamus are issued by this court, for the restoring of officers in corporations, &c. unjustly turned out, and freemen wrongfully disfranchised.

The court of King's Bench is now divided into a crown side and plea side; the one determining criminal, and the other, civil causes.

On the crown side, or crown office, it takes cognizance of all criminal causes, from high treason down to the most trivial misdemeanour or breach of the peace. Into this court also indictments from all inferior courts may be removed by writ of *certiorari*; and tried either at bar, or at *nisi prius*, by a jury of the county out of which the indictment is brought. The judges of this court are the supreme coroners of the kingdom. And the court itself is the principal court of criminal jurisdiction known to the laws of England. For which reason, by the coming of the court of King's Bench into any county (as it was removed to Oxford on account of the sickness in 1665,) all former commissions of *oyer* and *terminer*, and general gaol-delivery, are at once absorbed and determined *ipso facto*: in the same manner as, by the old Gothic and Saxon constitutions, *Jure vetusto obtinuit, quievisse omnia inferiora judicia dicente jus rege*. Into this court of King's Bench hath reverted all that was good and salutary of the *star-chamber*.

King's Bench || Bendida.

On the plea side, this court determines all personal actions commenced by bill or writ; as actions of debt, upon the case, detinue, trover, ejectment, trespass, waste, &c. against any person in the custody of the marshal of the court, as every person sued here is supposed to be by law.

The officers on the crown side are the clerk and secondary of the crown; and on the side of the pleas there are two chief clerks or prothonotaries, and their secondary and deputy, the custos brevium, two clerks of the papers, the clerk of the declarations, the signer and sealer of bills, the clerk of the rules, clerk of the errors, and clerk of the bails; to which may be added the filazers, the marshal of the court, and the crier.

Amicable Bench. See Amicable.

BENCHERS, in the inns of court, the senior members of the society, who are invested with the government thereof.

BENCOOLEN, a fort and town of Asia, on the south-west coast of the island of Sumatra, belonging to the British. The place is known at sea by a slender mountain called the *Sugar Loaf*, which rises about 20 miles inland. About a quarter of a mile from the sea stands an Indian village, whose houses are small and low, and built on posts. The country about Bencoolen is mountainous and woody, and the air unwholesome, the mountains being continually covered with thick heavy clouds that produce lightning, thunder, and rain. There is no beef to be had, except that of buffaloes, which is not very palatable; and indeed provisions of all kinds, except fruit, are pretty scarce. The chief trade is in pepper, of which great quantities grow on the island. There are frequent bickerings betwixt the natives and the factory, to the no small injury of the East India Company. The factory was once entirely deserted; and had not the natives found that trade decreased by reason of their absence, it is scarcely probable that ever the English would have been invited there again. E. Long. 101. 5. S. Lat. 4. 5.

BEND, in *Heraldry*, one of the nine honourable ordinaries, containing a third part of the field when charged, and a fifth when plain. It is sometimes, like other ordinaries, indented, ingrailed, &c. and is either dexter or sinister. See Heraldry.

In Bend, is when any things, borne in arms, are placed obliquely from the upper corner to the opposite lower, as the bend lies.

BENDER, a town of Bessarabia in European Russia, seated on the river Niester, in E. Long. 29. 5. N. Lat. 46. 40. It is remarkable for being the place of retreat of Charles XII. after he was defeated by the Russians at the battle of Pultowa in 1709.

BENDERMASSEN, a town of the island of Borneo in Asia, and capital of a kingdom of the same name. It has a good harbour; and stands in E. Long. 113. 50. S. Lat. 2. 40.

BENDIDA, in antiquity, a festival, not unlike the Bacchanalia, celebrated by the Athenians in honour of Diana.

BENDING,

Digitized by Google

BENDING, in a general sense, the reducing a straight body into a curve, or giving it a crooked form.

The bending of timber-boards, &c. is effected by means of heat, whereby their fibres are so relaxed that you may bend them into any figure.

BENDING, in the sea language, the tying two ropes or cables together: thus they say, *bend the cable*, that is, make it fast to the ring of the anchor; *bend the sail*, make it fast to the yard.

BENDS, in a ship, the same with what are called *wails*, or *wales*: the outmost timbers of a ship's side, on which men set their feet in climbing up. They are reckoned from the water, and are called the *first*, *second*, or *third bend*. They are the chief strength of a ship's sides; and have the beams, knees, and foot-hooks, bolted to them.

BENDY, in *Heraldry*, is the field divided into four, six, or more parts, diagonally, and varying in metal and colour.—The general custom of England is to make an even number; but in other countries they regard it not, whether even or odd.

BENCAPED, among sailors. A ship is said to be *bencaped* when the water does not flow high enough to bring her off the ground, out of the dock or over the bar.

BENEDETTO, St, a considerable town of the Mantuan, in Italy, in E. Long. 11. 25. N. Lat 45. 0.

BENEDICITE, among ecclesiastical writers, an appellation given to the song of the three children in the fiery furnace, on account of its beginning with the word *benedicite*. The use of this song in Christian worship is very ancient, it appearing to have been sung in all the churches as early as St Chrysostom's time.

BENEDICT XIV. Pope, (Prosper Lambertini of Bologna), celebrated for his learning and moderation, which gained him the esteem of all sensible Protestants. He was the patron of learned men and celebrated artists; and an elaborate writer on theological subjects. His works made 12 vols. in folio. He died in 1758.

BENEDICT, St, the founder of the order of the Benedictine monks, was born in Italy about the year 480. He was sent to Rome when he was very young, and there received the first part of his education. At 14 years of age he was removed from thence to Sublaco, about 40 miles distant. Here he lived a most ascetic life, and shut himself up in a cavern, where nobody knew any thing of him except St Romanus, who, we are told, used to descend to him by a rope, and to supply him with provisions. But being afterwards discovered by the monks of a neighbouring monastery, they chose him for their abbot. Their manners, however, not agreeing with those of Benedict, he returned to his solitude; whither many persons followed him, and put themselves under his direction, so that in a short time he built 12 monasteries. In the year 528, or the following, he retired to Mount Cassino, where idolatry was still prevalent, there being a temple of Apollo erected here. He instructed the people in the adjacent country, and having converted them, he broke the image of Apollo, and built two chapels on the mountain. Here he founded also a monastery, and instituted the order of his name which in time became so famous and extended all over Europe. It was here too that he composed his *Regula Monachorum*, which Gregory the Great speaks of as the most sensible and best written piece of that kind ever published. The time of his death is uncertain, but is placed between 540 and 550. He was looked upon as the Elisha of his time; and is reported to have wrought a great number of miracles, which are recorded in the second book of the Dialogues of St Gregory the Great.

BENEDICT, abbot of Peterborough, was educated at Oxford, became a monk in the monastery of Christ's church in Canterbury, and some time after was chosen prior by the members of that society. Though he had been a great admirer of Archbishop Becket, and wrote a life of that prelate, he was so much esteemed by Henry II. that by the influence of that prince he was elected abbot of Peterborough, A. D. 1177. He assisted at the coronation of Richard I. A. D. 1189; and was advanced to be keeper of the great seal, A. D. 1191. But he did not long enjoy this high dignity, as he died on Michaelmas day, A. D. 1193. Besides his life of Archbishop Becket, he composed a History of Henry II. and Richard I. from A. D. 1170 to A. D. 1192; which hath been much and justly esteemed by many of our greatest antiquaries, as containing one of the best accounts of the transactions of those times. A beautiful edition of this work was published at Oxford, in two volumes, by Mr Hearne, A. D. 1735.

BENEDICTINES, in church history, an order of monks, who profess to follow the rules of St Benedict.

The Benedictines, being those only that are properly called *monks*, wear a loose black gown, with large wide sleeves, and a capuche, or cowl, on their heads, ending in a point behind. In the canon law, they are styled *black friars*, from the colour of their habit.

The rules of St Benedict, as observed by the English monks before the dissolution of the monasteries, were as follows: They were obliged to perform their devotions seven times in 24 hours, the whole circle of which devotions had a respect to the passion and death of Christ: they were obliged always to go two and two together: every day in lent they were obliged to fast till six in the evening, and abated of their usual time of sleeping and eating; but they were not allowed to practise any voluntary austerity without leave of their superior: they never conversed in their refectory at meals, but were obliged to attend to the reading of the Scriptures: they all slept in the same dormitory, but not two in a bed; they lay in their clothes: for small faults they were shut out from meals; for greater they were debarred religious commerce, and excluded from the chapel; and as to incorrigible offenders, they were excluded from the monasteries. Every monk had two coats, two cowls, a table-book, a knife, a needle, and a handkerchief; and the furniture of their bed was a mat, a blanket, a rug, and a pillow.

The time when this order came into England is well known; for to it the English owe their conversion from idolatry. In the year 596, Pope Gregory sent hither Augustine, prior of the monastery of St Andrew at Rome, with several other Benedictine monks. St Augustine became archbishop of Canterbury, and the Benedictines founded several monasteries in England, as also the metropolitan church of Canterbury, and all the cathedrals that were afterwards erected.

Benedictines, Benediction.

Pope John XXII. who died in 1334, after an exact inquiry, found, that, since the first rise of the order, there had been of it 24 popes, near 200 cardinals, 7000 archbishops, 15,000 bishops, 15,000 abbots of renown, above 4000 saints, and upwards of 37,000 monasteries. There have been likewise of this order 20 emperors and 10 empresses, 47 kings and above 50 queens, 20 sons of emperors, and 48 sons of kings: about 100 princesses, daughters of kings and emperors; besides dukes, marquises, earls, countesses, &c. innumerable. The order has produced a vast number of eminent writers and other learned men. Their Rabanus set up the school of Germany. Their Alcuinus founded the university of Paris. Their Dionysius Exiguus perfected the ecclesiastical computation. Their Guido invented the scale of music; and their Sylvester, the organ. They boast to have produced Anselmus, Ildephonsus, Venerable Bede, &c.

There are nuns likewise who follow the rule of St Benedict; among whom those who call themselves *mitigated*, eat flesh three times a week, on Sundays, Tuesdays, and Thursdays; the others observe the rule of St Benedict in its rigour, and eat no flesh, unless they are sick.

BENEDICTION, in a general sense, the act of blessing, or giving praise to God, or returning thanks for his favours. Hence also benediction is still applied to the act of saying grace before or after meals. Neither the ancient Jews nor Christians ever ate without a short prayer. The Jews are obliged to rehearse 100 benedictions per day; of which 80 are to be spoken in the morning. The first treatise of the first order in the Talmud, entitled *Scraim*, contains the form and order of the daily benedictions. It was usual to give benediction to travellers on their taking leave; a practice which is still preserved among the monks. Benedictions were likewise given among the ancient Jews, as well as Christians, by imposition of hands. And when at length the primitive simplicity of the Christian worship began to give way to ceremony, they added the sign of the cross, which was made with the same hand, as before, only elevated, or extended. Hence benediction, in the modern Romish church, is used, in a more particular manner, to denote the sign of the cross made by a bishop, or prelate, as conferring some grace on the people. The custom of receiving benediction, by bowing the head before the bishops, is very ancient; and was so universal, that emperors themselves did not decline this mark of submission. Under the name *benediction*, the Hebrews also frequently understand the presents which friends make to one another, in all probability because they are generally attended with blessings and compliments, both from those who give and those who receive them.

Nuptial BENEDICTION, the external ceremony performed by the priest in the office of matrimony. This is also called *sacerdotal* and *matrimonial benediction*, by the Greeks ιερολογια and ιεροτελεστια. The nuptial benediction is not essential to, but the confirmation of, a marriage in the civil law.

Beatic BENEDICTION, (*benedictio beatica*), is the viaticum given to dying persons. The pope begins all his bulls with this form: *Salutem et apostolicam benedictionem.*

BENEDICTION is also used for an ecclesiastical ceremony, whereby a thing is rendered sacred or venerable. In this sense benediction differs from consecration, as in the latter unction is applied, which is not in the former: Thus the chalice is consecrated, and the pix blessed; as the former, not the latter, is anointed: though, in the common usage, these two words are applied promiscuously.—The spirit of piety, or rather of superstition, has introduced into the Romish church benedictions for almost every thing. We read of forms of benedictions for wax candles, for boughs, for ashes, for church-vessels, and ornaments; for flags or ensigns, arms, first-fruits, houses, ships, pascal eggs, cilicium or the hair-cloth of penitents, churchyards, &c. In general, these benedictions are performed by aspersions of holy water, signs of the cross, and prayers suitable to the nature of the ceremony. The forms of these benedictions are found in the Roman pontifical, in the Roman missal, in the book of ecclesiastical ceremonies printed in Pope Leo X.'s time, and in the rituals and ceremonies of the different churches, which are found collected in Father Martene's work on the rites and discipline of the church.

Benediction, Benefice.

BENEFICE (*beneficium*), in middle-age writers, is used for a fee, sometimes denominated more peculiarly *beneficium militare*. In this sense, benefice was an estate in land, at first granted for life only; so called, because it was held *ex mero beneficio* of the donor: and the tenants were bound to swear fealty to the lord, and to serve him in the wars. In after-times, as these tenures became perpetual and hereditary, they left their name of *beneficia* to the livings of the clergy; and retained to themselves the name of *feuds*.

BENEFICE, in an ecclesiastical sense, a church endowed with a revenue for the performance of divine service; or the revenue itself assigned to an ecclesiastical person, by way of stipend, for the service he is to do that church.

All church-preferments, except bishoprics, are called *benefices;* and all benefices are, by the canonists, sometimes styled *dignities:* but we now ordinarily distinguish between benefice and dignity; applying dignity to bishoprics, deaneries, archdeaconries, and prebendaries; and benefice to parsonages, vicarages, and donatives.

Benefices are divided by the canonists into simple and sacerdotal. In the first there is no obligation but to read prayers, sing, &c. such as canonries, chaplainships, chantries, &c.: the second are charged with the cure of souls, or the direction and guidance of consciences; such as vicarages, rectories, &c.

The Romanists again distinguish benefices into regular and secular. *Regular* or titular benefices are those held by a religious, or a regular who has made profession of some religious order; such are abbeys, priories, conventuals, &c.; or rather, a regular benefice is that which cannot be conferred on any but a religious, either by its foundation, by the institution of some superior, or by prescription: for prescription, forty years possession by a religious makes the benefice regular. *Secular* benefices are only such as are to be given to secular priests, i. e. to such as live in the world and are not engaged in any monastic order. All benefices are reputed secular, till the contrary is made to appear. They are called *secular benefices*, because held by seculars; of which kind are almost all cures.

The canonists distinguish three manners of vacating a

a benefice, viz. 1. *De jure*, when the person enjoying it is guilty of certain crimes expressed in those laws, as heresy, simony, &c. 2. *De facto*, as well as *de jure*, by the natural death or the resignation of the incumbent; which resignation may be either express or tacit, as when he engages in a state, &c. inconsistent with it, as, among the Romanists, by marrying, entering into a religious order, or the like. 3. By the *sentence of a judge*, by way of punishment for certain crimes, as concubinage, perjury, &c.

Benefices began about 500. The following account of those in England is given as the fact by Dr Burn, viz. that there are 1071 livings not exceeding 10l. per annum: 1467 livings above 10l. and not exceeding 20l. per annum; 1126 livings above 20l. and not exceeding 30l. per annum; 1049 livings above 30l. and not exceeding 40l. per annum; 884 livings above 40l. and not exceeding 50l. per annum; 5597 livings under 50l. per annum. It must be 500 years before every living can be raised to 60l. a-year by Queen Anne's bounty, and 339 years before any of them can exceed 50l. a-year. On the whole, there are above 11,000 church preferments in England, exclusive of bishoprics, deaneries, canonries, prebendaries, priest-vicars, lay-vicars, secondaries, &c. belonging to cathedrals, or choristers, or even curates, to well-beneficed clergymen.

BENEFICE *in commendam* is that, the direction and management of which, upon a vacancy, is given or recommended to an ecclesiastic, for a certain time, till he may be conveniently provided for.

BENEFICIARII, in Roman antiquity, denote soldiers who attended the chief officers of the army, being exempted from other duty. Beneficiarii were also soldiers discharged from the military service or duty, and provided with *beneficia* to subsist on. These were probably the same with the former, and both might be comprised in the same definition. They were old experienced soldiers, who, having served out their legal time, or received a discharge as a particular mark of honour, were invited again to the service, where they were held in great esteem, exempted from all military drudgery, and appointed to guard the standard, &c. These, when thus recalled to service, were also denominated *evocati*; before their recal, *emeriti*.

BENEFICIARII was also used for those raised to a higher rank by the favour of the tribunes or other magistrates. The word *beneficiarius* frequently occurs in the Roman inscriptions found in Britain, where *consulis* is always joined with it; but besides *beneficiarius consulis*, we find in Grutar *beneficiarius tribuni*, *prætorii*, *legati*, *præfecti*, *proconsulis*, &c.

BENEFICIARY, in general, something that relates to benefices.

BENEFICIARY, *Beneficiarius*, is more particularly used for a beneficed person, or him who receives and enjoys one or more benefices. A beneficiary is not the proprietor of the revenues of his church; he has only the administration of them, though unaccountable for the same to any but God.

BENEFICIARY is also used, in middle-age writers, for a feudatory or vassal. The denomination was also given to the clerks or officers who kept the accounts of the *beneficia*, and made the writings necessary thereto.

BENEFICIUM, in military matters among the Romans, denoted a promotion to a higher rank by the favour of some person in authority.

BENEFIELD, SEBASTIAN, an eminent divine of the 17th century, was born in 1559, at Prestonbury in Gloucestershire, and educated at Corpus Christi college in Oxford. In 1608 he took the degree of doctor in divinity, and five years after was chosen Margaret professor in that university. He had been presented several years before to the rectory of Meysey-Hampton, in Gloucestershire. He published Commentaries upon the first, second, and third chapters of Amos; a considerable number of sermons; and some Latin treatises. He died in 1630.

BENEFIT OF CLERGY. See CLERGY.

BENEFIT Societies, institutions common among the labouring classes in Great Britain; and calculated for the relief of the sick, or the support of the aged. See SUPPLEMENT.

BENESOEUF, a town of Egypt, seated on the western shore of the Nile, and remarkable for its hemp and flax. E. Long. 31. 0. N. Lat. 29. 10.

BENEVENTE, a town of the province of Leon, in Spain, seated on the river Esla, in W. Long. 5. 5. N. Lat. 42. 4.

BENEVENTO, a city of Italy, in the kingdom of Naples, with an archbishop's see. It is situated near the confluence of the rivers Sabato and Calore, in a fertile valley called the *Strait of Benevento*. It has frequently suffered by earthquakes, particularly in 1703. E. Long. 14. 57. N. Lat. 41. 6.

The arch of Trajan, now called the *Porta Aurea*, forms one of the entrances to the city. This arch, though it appears to great disadvantage from the walls and houses that hem it in on both sides, is in tolerable preservation, and one of the most magnificent remains of Roman grandeur to be met with out of Rome. The architecture and sculpture are both singularly beautiful. This elegant monument was erected in the year of Christ 114, about the commencement of the Parthian war, and after the submission of Decebalus had entitled Trajan to the surname of Dacicus. The order is Composite; the materials white marble; the height 60 palms; length, 37 and a half; and depth 24. It consists of a single arch, the span of which is 20 palms, the height 35. On each side of it, two fluted columns, upon a joint pedestal, support an entablement and an attic. The intercolumniations and frize are covered with basso-relievos, representing the battles and triumphs of the Dacian war. In the attic is the inscription. As the sixth year of Trajan's consulate, marked on this arch, is also to be seen on all the milliary columns he erected along his new road to Brundusium, it is probable that the arch was built to commemorate so beneficial an undertaking. Except the old metropolis of the world, no city in Italy can boast of so many remains of ancient sculpture as are to be found in Benevento. Scarce a wall is built of any thing but altars, tombs, columns, and remains of entablatures.

The cathedral is a clumsy edifice, in a style of Gothic, or rather Lombard, architecture. This church, dedicated to the Virgin Mary, was built in the sixth century, enlarged in the 11th, and altered considerably in the 13th, when Archbishop Roger adorned it with a new front. To obtain a sufficient quantity of marble for this purpose, he spared neither sarcophagus,

Benevento. altar, nor inscription; but fixed them promiscuously and irregularly in the walls of his barbarous structure. Three doors (a type of the Trinity, according to the rules established by the mystical Vitruvii of those ages) opened into this façade. That in the centre is of bronze, embossed with the life of Christ, and the effigies of the Beneventine metropolitan, with all his suffragan bishops. The inside offers nothing to the curious observer but columns, altars, and other decorations, executed in the most inelegant style that any of the church-building barbarians ever adopted. In the court stands a small Egyptian obelisk, of red granite, crowded with hieroglyphics. In the adjoining square are a fountain and a very indifferent statue of Benedict XIII. long archbishop of Benevento.

Of the Beneventine history the following abstract is given by Mr Swinburne, in his *Travels in Sicily*. According to some authors (he informs us), Diomed was the founder of Beneventum; whence its origin must be referred to the "years that immediately succeeded the Trojan war. Other writers assign it to the Samnites, who made it one of their principal towns, where they frequently took refuge when worsted by the Romans. In their time its name was *Maleventum*, a word of uncertain etymology: however, it sounded so ill in the Latin tongue, that the superstitious Romans, after achieving the conquest of Samnium, changed it into Beneventum, in order to introduce their colony under fortunate auspices. Near this place, in the 479th year of Rome, Pyrrhus was defeated by Curius Dentatus. In the war against Hannibal, Beneventum signalized its attachment to Rome, by liberal tenders of succour and real services. Its reception of Gracchus, after his defeat of Hanno, is extolled by Livy; and, from the gratitude of the senate, many solid advantages accrued to the Beneventines. As they long partook, in a distinguished manner, of the glories and prosperity of the Roman empire, they also severely felt the effects of its decline, and shared in a large proportion the horrors of devastation that attended the irruption of the northern nations.

"The modern history of this city will appear interesting to those readers who do not despise the events of ages which we usually and justly call dark and barbarous. They certainly are of importance to all the present states of Europe; for at that period originated the original existence of most of them. Had no northern savages descended from their snowy mountains, to overturn the Roman colossus, and break asunder the fetters of mankind, few of those powers, which now make so formidable a figure, would ever have been so much as heard of. The avengers of the general wrongs were, no doubt, the destroyers of arts and literature, and brought on the thick clouds of ignorance, which for many centuries no gleam of light could penetrate; but it is to be remembered, also, that the Romans themselves had already made great progress in banishing true taste and knowledge, and would very soon have been a barbarous nation, though neither Goths nor Vandals had ever approached the frontier.

"The Lombards came the last of the Scythian or Scandinavian hordes to invade Italy. After fixing the seat of their empire at Pavia, they sent a detachment to possess the southern provinces. In 571, Zotto was appointed duke of Benevento, as a feudatory of the king of Lombardy; and seems to have confined his rule to the city alone, from which he sallied forth to seek for booty. The second duke, whose name was Arechis, conquered almost the whole country that now constitutes the kingdom of Naples. His successors appear long to have remained satisfied with the extent of dominion he had transmitted to them. Grimwald, one of them, usuped the crown of Lombardy; but his son Romwald, though a very successful warrior, contented himself with the ducal title. The fall of Desiderius, last king of the Lombards, did not affect the state of Benevento. By an effort of policy or resolution, Arechis the second kept possession; and availing himself of the favourable conjuncture, asserted his independence,—threw off all feudal submission,—assumed the style of prince,—and coined money with his own image upon it; a prerogative exercised by none of his predecessors as dukes of Benevento. During four reigns, this state maintained itself on a respectable footing; and might long have continued so, had not civil war, added to very powerful assaults from abroad, hastened its ruin. Radelchis and Siconulph aspired to the principality; and each of them invited the Saracens to his aid. The desolation caused by this conflict is scarcely to be described. No better method for terminating these fatal dissensions could be devised than dividing the dominions into two distinct sovereignties. In 851, Radelchis reigned as prince at Benevento; and his adversary fixed his court with the same title at Salerno. From this treaty of partition, the ruin of the Lombards became inevitable: a want of union undermined their strength,—foreigners gained an ascendant over them, irresolution and weakness pervaded their whole system of government. The erection of Capua into a third principality was another destructive operation: and now the inroads of the Saracens, the attacks of the eastern and western emperors, anarchy and animosity at home, reduced the Lombard states to such wretchedness, that they were able to make a very feeble resistance to the Norman arms. The city of Benevento alone escaped their sway, by a grant which the emperor Henry II. had made of it to the bishop of Rome, in exchange for the territory of Bamberg in Germany, where the popes enjoyed a kind of sovereignty. From the year 1054 to this day, the Roman see, with some short interruptions of possession, has exercised temporal dominion over this city. Benevento has given three popes to the chair of St Peter; viz. Felix III. Victor III. and Gregory VIII. and, what it is much prouder of, reckons St Januarius in the list of its bishops."

Beneventum || Benfield.

BENEVENTUM, in *Ancient Geography*, a town of the Samnites, formerly called *Maleventum* from the unwholesomeness of the wind, and under that appellation it is mentioned by Livy; but after a Roman colony was led thither in the 485th year of the city, it came to have the name of *Beneventum*, as a more auspicious title. It is mentioned by Horace as an ancient city, said to have been built by Diomedes before the Trojan war. Now BENEVENTO.

BENEVOLENCE, in morals, signifies the love of mankind in general, accompanied with a desire to promote their happiness. See MORALS.

BENFIELD, a town of France, in the department of the Lower Rhine, whose fortifications were demolished

Benfeld, Bengal.

lished in consequence of the treaty of Westphalia. E. Long. 7. 45. N. Lat. 48. 14.

BENGAL, a country of Hindostan in Asia, and one of the most valuable provinces held by the British in India, is bounded on the east by the kingdoms of Assam, Tipra, and Arracan; on the west by Malva and Berar; on the north by Nepal and Bootan; and on the south by Orixa and the bay of Bengal. Its greatest length is about 400 miles, and its breadth, where greatest, is not less than 300; extending from 21 to 27 degrees of north latitude, and from 86 to 92 of east longitude.

1 Climate extremely unhealthy.

As this country lies almost entirely within the torrid zone, and in the middle of a very extensive continent, it is sometimes subject to such extremes of heat as render it very fatal to European constitutions. Dr Lind is of opinion, that the climate of Bengal is the most dangerous in this respect of any of the English territories, excepting Bencoolen on the coast of Sumatra.

2 Extreme heat of the land wind, and its surprising effects.

Part of this unhealthiness arises from the mere circumstance of heat; for in all the southern parts of India, when the wind blows over land, it is so extremely hot and suffocating as scarcely to be borne. The reason of this is evident from the mere inspection of a map of Asia, where it is evident, that whatever wind blows over land, especially in the southern parts, must pass over an immense tract of country strongly heated by the sun; and as in every part of this extensive continent there are sandy deserts of very considerable magnitude, the heat is thus prodigiously increased. This becomes very evident on the falling of a shower of rain at the time the land-wind prevails; for if the wind in its way passes through the shower, the air is agreeably cooled though the sky should be ever so clear; while those who reside only at a few miles distance, but out of the direct line of the shower, will be fainting under the excessive heat. Here, indeed, when the air is clear, the sunbeams are much more powerful than in our climate, insomuch that the light at noon-day is too powerful for the eyes to bear; and the large stars, as Venus and Jupiter, shine with a surprising lustre. Thus the reflection of the sunbeams from the earth must necessarily occasion an extraordinary degree of heat in the atmosphere; so that from the winds above mentioned very great inconveniences sometimes arise, similar to those which are occasioned by the *Harmattan* in Africa. Mr Ives tells us, that it is affirmed they will snap glass if it be too much exposed to them; he has seen the veneering stripped off from a chest of drawers by their means; and they will certainly crack and chap almost every piece of wood that is not well seasoned. In certain places they are so loaded with sand, that the horizon appears quite hazy where they blow, and it is almost impossible to prevent the eyes from being thus greatly injured. They have likewise a very pernicious effect on such people as are exposed to them while sleeping. This seldom fails to bring on a fit of the *barbiers*, a kind of paralytic distemper attended with a total deprivation of the use of the limbs, and which the patient never gets the better of but by removing to some other climate. These hot winds are made use of with great success for cooling liquors, by wrapping a wet cloth round the bottles and exposing it to the air. The reason of this is explained under the article EVAPORATION. Mr Ives remarks, that it will thus cool much sooner than by being exposed to the cool sea-breeze.

Bengal.

3 Inundations of the Ganges, &c. described.

The great cause of the unhealthiness of Bengal, however, is owing to the inundations of the Ganges and Burrampooter, by which such quantities of putrescible matters are brought down as infect the air with the most malignant vapours when the waters retire. Though the rainy season begins in Bengal only in the month of June, the river begins to swell in the mountains of Thibet early in April, and by the latter end of that month in Bengal also. The reason of this is partly the melting of the snow on the mountains of Thibet, and partly the vast collection of vapours brought by the southerly or southwest monsoon, which are suddenly stopped by the high mountains of Thibet. Hence it is obvious, that the accumulation and condensation of these vapours must first take place in the neighbourhood of the mountains which oppose them; and thus the rainy season commences soonest in those places which lie nearest the mountains.

The rivers in Bengal begin to rise at first very slowly, the increase being only at the rate of one inch per day for the first fortnight. It then gradually augments to two and three inches before any quantity of rain falls in the low countries; and when the rain becomes general, the increase at a medium is five inches per day. By the latter end of July, all the lower parts of Bengal, contiguous to the Ganges and Burrampooter, are overflowed, and present a surface of water more than 100 miles wide. This vast collection of fluid, however, is owing in a great measure to the rains which fall on the low country itself; for the lands in the neighbourhood are overflowed some time before the bed of the river is filled. It must be observed, that the ground on the bank of the river, and even to some miles distance, is higher than that which is more remote; and thus a separation is made for a considerable time betwixt the waters of the land-flood and those of the river.

4 Some lands guarded from too copious an inundation.

As some of the lands in Bengal would receive damage from such a copious inundation, they must for this reason be guarded by strong dykes to resist the waters, and admit only a certain quantity. These, collectively taken, are said to be more than 1000 miles in length, and are kept up at an enormous expence; yet they do not always answer the purpose, on account of the looseness of the earth of which they are composed, even though some are of the thickness of an ordinary rampart at the base. One particular branch of the Ganges (navigable only in the rainy season, and then equal in size to the Thames at Chelsea) is conducted for 70 miles between dykes: and when full, the passengers look down upon the adjacent country as from an eminence.

As the tide loses its power of counteracting such an impetuous torrent of fresh water, the height of the inundation gradually diminishes as it approaches the sea, and totally vanishes at the point of confluence; which is owing to the facility with which the waters of the inundation spread over the level of the ocean. But when the force of winds conspires with that of the tide, the waters are retarded in such a manner as sometimes to raise the inundation two feet above the ordinary level; which has been known to occasion the loss of whole crops of rice. In the year 1763, a melancholy

5 Disasters occasioned by too great an inundation.

Digitized by Google

Bengal. choly accident happened at Luckipour, when a strong gale of wind, conspiring with a high spring-tide, at a season when the periodical flood was within a foot and a half of its highest pitch, the waters are said to have risen six feet above their ordinary level. Thus the inhabitants of a particular district were swept away with their houses and cattle; and to aggravate the distress, it happened in a part of the country where it was scarce possible to find a tree for a drowning man to escape to.

For some days before the middle of August the inundation is at a stand, and then begins to abate by a cessation of rains in the mountains, though great quantities still continue to fall on the low country. The inundation does not, however, in its decrease, always keep pace with that of the river, by reason of the height of the banks; but after the beginning of October, when the rain has nearly ceased, the remainder goes off quickly by evaporation, leaving the ground exceedingly fertilized.

6 Dangerous effects of the north west winds.

From the time that the monsoon changes in October to the middle of March, the rivers are in a state of tranquillity; when the north-west winds begin, and may be expected once in three or four days till the commencement of the rainy season. These are the most formidable enemies of the inland navigation carried on by the large rivers. They are sudden and violent squalls, attended with rain; and though their duration is commonly but short, sometimes produce fatal effects, whole fleets of trading boats having been sunk by them almost instantaneously. They are more frequent in the eastern than in the western part of Bengal, and happen oftener towards the close of the day than at any other time; but as they are indicated some time before they approach by the rising and singular appearance of the clouds, the traveller has commonly time enough to seek for a place of shelter. It is in the great rivers alone that they are so formidable, and that about the end of May or beginning of June, when the rivers are much increased in width. After the commencement of the rainy season, which varies in different parts from the middle to the end of June, tempestuous weather occasionally happens. At this season, places of shelter are more common that at any other time, by the filling up of the creeks and inlets as the river increases; and on the other hand, the bad weather, when it happens, is of longer continuance than during the season of the north-westers. The rivers being now spread to the distance of several miles, large waves are raised on them, particularly when blowing in a direction contrary to the rapid parts of the stream, which for obvious reasons ought to be avoided.

7 Of the inland navigation in Bengal.

This navigation is performed in safety during the interval between the end of the rainy season and the beginning of the north-westers; an ordinary degree of attention being then only requisite to pilot the boat clear of shallows and stumps of trees. The season of the north-westers requires the greatest care and attention. Should one of these squalls approach, and no creek or inlet offer for shelter, the steep bank of the rivers should be always sought as a place for shelter, if it is not in a crumbling state *, whether it be to the windward or leeward, rather than the other. If this cannot be done, the flat side must be taken up with; and if it be a lee shore, the anchor should be thrown out to prevent driving upon it. In these cases the mast is always supposed to be struck; and, provided this be done, and the cargo judiciously disposed of, there is little danger of any of the boats commonly made use of being overset.

* See *Ganges*.

8 Budgerows, a kind of boats, described.

The boats used in the inland navigation of Bengal are called *budgerocs*, and are formed somewhat like a pleasure barge. Some have cabins 14 feet broad and proportionally long, drawing from four to five feet water. Their motion is very slow, not exceeding the rate of eight miles a-day when moved by their oars; so that their progress down the river must depend principally on the motion of the current. From the beginning of November to the middle or latter end of May, the usual rate of going down the stream is about 40 miles in twelve hours, and during the rest of the year from 50 to 70 miles. The current is strongest while the waters of the inundation are draining off, which happens in part of August and September. In many of the shallow rivers, however, the current is exceedingly slow during the dry months; insomuch that the track-rope is frequently used in going downwards. In towing against the stream, the steep side of the river is generally preferred on account of the depth of water, though the current runs much stronger there than on the opposite side. On these occasions it is necessary to provide a very long track-rope, as well for avoiding the fallen pieces of the steep bank on the one side, as the shallow water on the other, when it becomes necessary to change sides through the badness of the tracking ground. The anchor should always be kept ready for dropping in case the track-rope breaks. The usual rate of towing against the stream is from 17 to 20 miles a-day; and to make even this progress, the windings of the river require the boats to be dragged against the current at the rate of four miles and a half per hour for 12 hours. When the waters are high, a greater progress will be made, notwithstanding the superior strength of the current; because the filling of the river-bed gives many opportunities of cutting off angles and turnings, and sometimes even large windings, by going through creeks.

9 Account of a dreadful famine in 1770.

Bengal produces the vegetables and animals common to other countries in the torrid zone. Its great produce of grain is rice, which is commonly exported from thence into other countries. By various accidents, however, the crop of rice sometimes fails, and a famine is produced; and of this there have been many instances in Bengal as well as in other parts of Hindostan. One of the most deplorable of this kind happened in the year 1770. The nabob and several other men of the country distributed rice *gratis* to the poor until their stocks began to fail, when those donations were of consequence withdrawn. Vast multitudes then came down to Calcutta, the capital English settlement in the province, in hopes of meeting with relief at the place. The granaries of the Company, however, being quite empty, none could be afforded; so that when the famine had prevailed a fortnight, many thousands fell down in the streets and fields; whose bodies, mangled by the dogs and vultures, corrupting in the air, seemed to threaten a plague as the consequence of the famine. A hundred people were daily employed on the Company's account, with doolys, sledges, and bearers,

Digitized by Google

Bengal.

bearers, to throw them into the river. At this time the fish could not be eaten, the river being so full of carcases; and many of those who ventured to feed upon them died suddenly. Hogs, ducks, and geese, also fed mostly on carnage; so that the only meat that could be procured was mutton; and this, from the dryness of the season, was so small, that a quarter of it would scarcely weigh a pound and a half.

10 Surprising cloud of insects.

In the month of August a most alarming phenomenon appeared, of a large black cloud at a distance in the air, which sometimes obscured the sun, and seemed to extend a great way over and above Calcutta. The hotter the day proved the lower this cloud seemed to descend, and for three days it occasioned great speculation. The bramins pretended, that this phenomenon, which was a cloud of insects, should make its appearance three times; and if ever they descended to the earth, the country would be destroyed by some untimely misfortune. They said, that above 150 years before there had been such another bad time, when the earth was parched for want of water; and this cloud of insects made its appearance, though it came much lower the second time than it had done before. On the third day, the weather being very hot and cloudy, they descended so low that they could be plainly seen. They seemed to be about the size of a horse-stinger, with a long red body, large head and eyes, keeping close together like a swarm of bees, and to appearance, flying quite on a line. None, however, were caught, as the people were so much frightened by the prognostications of the bramins. Whilst it rained they continued in one position for near a quarter of an hour; then they rose five or six feet at once, and in a little time descended as much, until a strong north-west wind blew for two days successively. During its continuance they ascended and descended, but more precipitately than before; and next morning the air was quite clear. For some days before the cloud made its appearance, the toads, frogs, and insects, which during the rains made a continual noise through the night, disappeared, and were neither heard nor seen, except in the river.

11 Cause of the famine.

This dreadful famine was occasioned by a preternatural drought. In this country they have two harvests; one in April, called the *little harvest*, which consists of the smaller grain; the second called the *grand harvest*, is only of rice. But by a drought which happened in 1769, the great harvest of that year failed, as did also the little one of 1770, which produced the dreadful consequences already mentioned.

12 Vegetable productions.

Among the vegetables produced in Bengal, Mr Ives mentions the areca-tree, the woody part of which is as tough as whalebone. Here is also a beautiful tree called *chulta*, the flower of which is at first a hard green ball on footstalks about four inches in length. This opens, and the calyx is composed of five round thick and succulent leaves; the corolla consists of the like number of fine beautiful white petals. After one day the corolla falls off and the ball closes again, and is sold in the markets. There is a succession of these for several months. The mango tree grows here also in plenty. Its fruit is preferred to all others in the country, excepting very fine pine-apples; the gentlemen eat little else in the hot months when these fruits are in season. If no wine is drunk with them they are apt to produce boils, which are troublesome but healthful. In the walks of Bengal they have a tall tree called the *tutoon*, said to have been first brought into England by Captain Birch. The leaves are of a deep shining green, the lower part rather paler where it is ribbed, and undulated round the edges. The fruit is of the size, shape, and colour of an olive, with a moderately thin husk, and a kernel like that of the date; five or six grow on the same pedicle. Near Calcutta is a large spreading tree called the *russa*, which makes a fine appearance when in full bloom. The natives say, that this and another near the Dutch settlement are the only two in Bengal. They pretend likewise that they can never find the seed; but Mr Ives informs us, that this is to be met with in plenty, though in a bad condition, the ants and other vermin being so fond of them, that not a single pod is ever to be met with that is not touched by one or other of these species of insects. This tree bears flowers of bright crimson, and all the shades from thence down to a bright yellow. They are in such plenty as almost to cover the tree, but have little or no smell. The fruit is a pod of the shape and size of a large garden-bean, containing four or five fleshy seeds, which easily fall into two when dry. They are brown on the outside, white within, and nearly square, but convex on the sides.

13 Birds of an extraordinary size.

Among the animals to be met with in Bengal Mr Ives makes mention of a kind of birds named *argill* or *hurgill* (see ARDEA, sp. 6.). They are very large, and in the evenings would majestically stalk along like as many naked Indians, for which our author at first mistook them. On discovering that they were birds he resolved to shoot one of them; which, however, was very difficult to be done. The Indians showed evident marks of dissatisfaction at the attempt; and informed him that it was impossible to succeed, because these birds were possessed by the souls of bramins. At last, however, he succeeded; and informs that the bird he shot extended 14 feet 10 inches between the tips of the wings; from the tip of the bill to the extremity of the claw was seven feet and a half: the legs were naked, as was also one half of the thighs; the naked parts being three feet in length. The feathers of the wings and back were of an iron colour, and very strong; those of the belly were very long, and on the breast was a great deal of down all of a dirty white. The bill was 16 inches round at the base, nearly of a triangular shape, and of different colours. In the craw was a land tortoise 10 inches long; and a large black male cat was found entire in its stomach.

14 Commerce inland.

Bengal is reckoned the richest and most populous province in the empire of Hindostan. Besides its own consumption, which is certainly very considerable, its exports are immense. One part of its merchandise is carried into the inland country. Thibet takes off a quantity of its cottons, besides some iron and cloths of European manufacture. The inhabitants of those mountains fetch them from Patan themselves, and give musk and rhubarb in exchange.

But the trade of Thibet is nothing in comparison of that which Bengal carries on with Agra, Delhi, and the provinces adjacent to those superb capitals, in salt, sugar, opium, silk, silk-stuffs, and an infinite quantity of cottons, and particularly muslins. These

articles

Bengal. articles, taken together, amounted long ago to more than 1,750,000l. a-year. So considerable a sum was not conveyed to the banks of the Ganges; but it was the means of retaining one nearly equal, which must have issued from thence to pay the duties, or for other purposes. Since the viceroys of the Mogul have made themselves nearly independent, and send him no revenues but such as they choose to allow him, the luxury of the court is greatly abated, and the trade we have been speaking of is no longer so considerable.

15 Maritime.

The maritime trade of Bengal, managed by the natives of the country, has not suffered the same diminution, nor was it ever so extensive, as the other. It may be divided into two branches, of which Catek is in possession of the greater part.

Catek is a district of some extent, a little below the most western mouth of the Ganges. Balasore, situated upon a navigable river, serves it for a port. The navigation of the Maldives, which the English and French have been obliged to abandon on account of the climate, is carried on entirely from this road. Here they load their vessels with rice, coarse cottons, and some silk stuffs, for these islands; and receive cowries in the exchange, which are used for money in Bengal, and sold to the Europeans.

The inhabitants of Catek, and some other people of the Lower Ganges, maintain a considerable correspondence with the country of Asham. This kingdom, which is thought to have formerly made a part of Bengal, and is only divided from it by a river that falls into the Ganges, deserves to be better known, if what is asserted here be true, that gunpowder has been discovered there, and that it was communicated from Asham to Pegu, and from Pegu to China. Its gold, silver, iron, and lead mines, would have added to its fame, if they had been properly worked. In the midst of these riches, which were of very little service to this kingdom, salt was an article of which the inhabitants were so much in want, that they were reduced to the expedient of procuring it from a decoction of certain plants.

In the beginning of the present century, some Bramins of Bengal carried their superstitions to Asham, where the people were guided solely by the dictates of natural religion. The priests persuaded them, that it would be more agreeable to Brama if they substituted the pure and wholesome salt of the sea to that which they used. The sovereign consented to this on condition that the exclusive trade should be in his hands; that it should only be brought by the people of Bengal; and that the boats laden with it should stop at the frontiers of his dominions. Thus have all these false religions been introduced by the influence and for the advantage of the priests who teach, and of the kings who admit them. Since this arrangement has taken place, 40 vessels from 500 to 600 tons burden each are annually sent from the Ganges to Asham laden with salt, which yields 200 per cent. profit. They receive in payment a small quantity of gold and silver, ivory, musk, eagle-wood, gum-lac, and a large quantity of silk.

Excepting these two branches of maritime trade, which, for particular reasons, have been confined to the natives of the country, all the rest of the vessels sent from the Ganges to the different sea-ports of India belong to the Europeans, and are built at Pegu. See Pegu.

A still more considerable branch of commerce, which the Europeans at Bengal carry on with the rest of India, is that of opium. Patna, situated on the Upper Ganges, is the most celebrated place in the world for the cultivation of opium. The fields are covered with it. Besides what is carried into the inland parts, there are annually 3000 or 4000 chests exported, each weighing 300 pounds. It sells upon the spot at the rate of between 24l. and 25l. a chest on an average. This opium is not purified like that of Syria and Persia, which we make use of in Europe; it is only a paste that has undergone no preparation, and has not a tenth part of the virtue of purified opium.

The Dutch send rice and sugar from their settlements to the coast of Coromandel, for which they are paid in specie, unless they have the good fortune to meet with some foreign merchandise at a cheap rate. They send out one or two vessels laden with rice, cottons, and silk: the rice is sold in Ceylon, the cottons at Malabar, and the silk at Surat; from whence they bring back cotton, which is usually employed in the coarser manufactures of Bengal. Two or three ships laden with rice, gum-lac, and cotton stuffs, are sent to Bassora; and return with dried fruits, rose-water, and a quantity of gold. The rich merchandise carried to Arabia is paid for entirely in gold and silver. The trade of the Ganges with the other sea-ports of India brings 1,225,000l. annually into Bengal.

Though this trade passes through the hands of the Europeans, and is carried on under their protection, it is not entirely on their own account. The Moguls, indeed, who are usually satisfied with the places they hold under the government, have seldom any concern in these expeditions; but the Armenians, who, since the revolutions in Persia, are settled upon the banks of the Ganges, to which they formerly only made voyages, readily throw their capital into this trade. The Indians employ still larger sums in it. The impossibility of enjoying their fortunes under an oppressive government does not deter the natives of this country from labouring incessantly to increase them. As they would run too great a risk by engaging openly in trade, they are obliged to have recourse to clandestine methods. 16
Gentoo brokers.
As soon as an European arrives, the Gentoos, who know mankind better than is commonly supposed, study his character; and, if they find him frugal, active, and well informed, offer to act as his brokers and cashiers, and lend or procure him money upon bottomry, or at interest. This interest, which is usually nine per cent. at least, is higher when he is under a necessity of borrowing of the Cheyks. 17
Cheyks, a powerful Indian family.
These Cheyks are a powerful family of Indians, who have, time immemorial, inhabited the banks of the Ganges. Their riches have long ago procured them the management of the bank belonging to the court, the farming of the public revenue, and the direction of the money, which they coin afresh every year, in order to receive annually the benefit arising from the mint. By uniting so many advantages, they are enabled to lend the government 1,750,000l. 2,625,000l. or even 4,375,000l. at a time. When the

Digitized by Google

the government finds it impossible to refund the money, they are allowed to indemnify themselves by oppressing the people.

The Europeans who frequent the Ganges have not been sufficiently alarmed at this despotism, which ought to have prevented them from submitting to a dependence upon the Cheyks. They have fallen into the snare, by borrowing considerable sums of these avaricious financiers, apparently at nine, but in reality at thirteen, per cent. if we take into the account the difference between the money that is lent them and that in which they are obliged to make their payments. The engagements entered into by the French and Dutch companies have been kept within some bounds; but those of the English company have been unlimited. In 1755, they were indebted to the Cheyks about 1,225,000l.

The Portuguese, who first frequented this rich country, had the wisdom to establish themselves at Chatigan, a port situated upon the frontier of Arracan, not far from the most eastern part of the Ganges. The Dutch, who, without incurring the resentment of an enemy at that time so formidable, were desirous of sharing in their good fortune, were engaged in searching for a port which, without obstructing their plan, would expose them the least to hostilities. In 1603, their attention was directed to Balasore; and all the companies, rather through imitation than in consequence of any well-concerted schemes, followed their example. Experience taught them the propriety of fixing as near as possible to the markets from whence they had their merchandise; and they sailed up that branch of the Ganges which, separating itself from the main river at Mourcha above Cossimbuzar, falls into the sea near Balasore under the name of the river *Hughly*. The government of the country permitted them to erect warehouses wherever there was plenty of manufactures, and to fortify themselves upon this river.

18 Principal towns.

The first town that is met with in passing up the river is Calcutta, the principal settlement of the English company. See CALCUTTA.

Six leagues higher is situated Frederic Nagore, founded by the Danes in 1756, in order to supply the place of an ancient settlement where they could not maintain their ground. This new establishment has not yet acquired any importance, and there is all the reason imaginable to believe that it will never become considerable.

Two leagues and a half higher lies Chandernagore, a settlement belonging to the French. See CHANDERNAGORE.

At the distance of a mile from Chandernagore is Chinsura, better known by the name of *Dougli*, being situated near the suburbs of that anciently renowned city. The Dutch have no other possessions there, but merely their fort; the territory round it depending on the government of the country, which hath frequently made it feel its power by its extortions. Another inconvenience attending this settlement is a sand bank that prevents ships from coming up to it: they proceed no farther than Tulta, which is 20 miles below Calcutta; and this of course occasions an additional expence to the government.

The Portuguese had formerly made Bandel, which is eighty leagues from the mouth of the Ganges, and a quarter of a league above the Hughly, the principal seat of their commerce. Their flag is still displayed, and there are a few unhappy wretches remaining there, who have forgotten their country after having been forgotten by it. This factory has no other employment than that of supplying the Moors and the Dutch with mistresses.

19 Exports.

The exports from Bengal to Europe consist of musk, gum lac, nicaragua wood, pepper, cowries, and some other articles of less importance brought thither from other places. Those that are the immediate produce of the country are borax, saltpetre, silk stuffs, muslins, and several different sorts of cottons.

It would be a tedious and useless task to enumerate all the places where ticken and cottons, fit for table-linen, or intended to be worn plain, painted, or printed, are manufactured. It will be sufficient to refer to DACCA, which may be looked upon as the general mart of Bengal, where the greatest variety of finest cottons are to be met with, and in the greatest abundance. See DACCA.

The sum total of the purchases made in Bengal by the European nations, amounted a few years ago to no more than 870,000l. One third of this sum was paid in iron, lead, copper, woollens, and Dutch spices: the remainder was discharged in money. Since the English have made themselves masters of this rich country, its exports have been increased, and its imports diminished, because the conquerors have carried away a greater quantity of merchandise, and pay for it out of the revenues they receive from the country. The revenues of Bengal consist chiefly of rents paid to the government for land. In the year 1811-12, they amounted, including those of Behar and Orixa, to 2,590,000l, to which may be added nearly 200,000l for the monopolies of salt and opium.

For the history of Bengal, and its conquest by the British, see the article INDOSTAN.

BENGO, a province of the kingdom of Angola in Africa, having the sea on the west, and the province of Moseche on the east. It produces plenty of banana trees; but the Portuguese have grubbed up vast quantities of these, and cultivated the land, which now abounds with maize, and the manioc root of which bread is made*. The province is divided into a great number of districts, of which the chiefs are natives, but tributary to Portugal, and obliged to till the lands belonging to the Portuguese. They are Christians, and have eight churches.

* See *Jatropha.*

BENGUELA, a province of the kingdom of Angola in Africa, bounded on the east by the river Rimba, on the north by the Coanza, and it extends westward quite to Cape Negro. Benguela was formerly governed by its own kings; but was entirely ruined by the incursions of the barbarous Giagas, so that its being conquered by the Portuguese proved a great happiness. It still retains the title of kingdom, and is allowed to enjoy some small privileges; but is far from being restored to the state of plenty it enjoyed before its destruction by the Giagas already mentioned. It produces abundance of salt, but inferior in quality to that which is made in the province of Chissama. The zimbis also, whose shells are current as money through many countries of Africa, are caught upon the coast. The country, which is mostly mountainous, abounds with

Digitized by Google

with elephants, rhinoceroses, lions, tigers, crocodiles, &c. which are very dangerous, and destroy great numbers of cattle.

BENHINNOM, in *Ancient Geography*, a valley in the suburbs, and to the east of Jerusalem, either a part of or conjoined with the valley of Kidron, (Joshua); infamous for sacrificing children, or passing them through the fire. The place in the valley where the idol stood to which the sacrifice was made, was called *Tophet*, (2 Kings xxiii. 10. Jer. vii. 31. 32. and xix. 2.), from beating drums or tabours to drown the cries or shrieks of the children: called also *Geenon* or the *Valley of Ennon*: whence some derive *Gehenna*, the place of future punishment.

BENJAMIN. See BENZOIN and STYRAX.

BENIARAX, an ancient and considerable town in the kingdom of Algiers in Africa, seated in W. Long. 0. 30. N. Lat. 35. 0.

BENIN, a country of Guinea, in Africa, has part of the gulf called the *Bite of Benin*, and the Slave Coast, on the west; part of Gago and Biafara on the north; Myjac and Makoko on the east; and Congo on the south, where it extends about one degree beyond the equinoctial line. The length from east to west is about 600 miles; but its north and south bounds are not so well determined. The land in general is low and woody; in some parts it has rivers and lakes, but in others there is a scarcity of water. There is here a great number of wild beasts, particularly elephants, lions, tigers, leopards, baboons, monkeys, wild boars, deer, &c. The birds are partridges, of which some are blue and some green, turtles, wild ducks, woodcocks, &c. Their grain is Indian corn: they have no potatoes; but plenty of yams, which are of the potato kind, but vastly larger and more coarse: these are their ordinary food, and serve in the room of bread; they have two sorts of beans, like horse beans, but not near so good. Their fruits are cocoa-nuts, cormantine apples, bananas, wild figs, &c.

The negroes have several colours which might serve for painting, and a good sort of soap made with palm-oil and wood-ashes; they have a great deal of cotton, which not only serves for their own use, but is exported to distant places. The river Rio or Benin has a great many arms; some of which are so large that they deserve the name of rivers: it abounds with fish, which the inhabitants eat smoke-dried as well as fresh. The place of trade in this river is at Arebo, about 120 miles distant from its mouth; and to this place the ships may sail up. Those who take this voyage see the mouths of a great many rivers fall into the principal channel to the right and the left; but how far it ascends into the country is not known. A little higher up, the country is very low and marshy, and seems to be divided into islands; and yet there are trees of all sizes growing on the banks; this renders the country very unhealthy, as many of our British sailors have found to their cost; it is also incommoded with vast numbers of flies, called *mosquitoes*, which sting terribly, and render the skin full of pustules. There are three principal villages to which the negroes come from the inland countries to traffic. One is called *Boodadou*, and consists of about 50 houses, or rather huts, for they are made with reeds and covered with leaves. The second, called *Arebo*, was mentioned above: this is much larger than the former, and pretty well stocked with inhabitants; and the houses have much more room, but they are built after the same manner. The third has the name of *Aguton*, and was built upon a hill. It was almost ruined by the wars; but the negroes lately rebuilt it, on account of its agreeable situation. Great Benin is the place of residence of the king.

The inhabitants of Benin are very exact in their trading, and will not recede from any of their old customs: this renders them very slow in their dealings, and backward to pay their debts, which sometimes obliges the traders to sail before they receive satisfaction; but then they are paid as soon as they return. Some of the merchants are appointed by the government, which demands a sort of custom; but it is very trifling. There are three sorts of officers under the king; the first are always near him, and none can address him but by their means: there are several of the second sort; one takes care of the slaves, another of the cattle, another of the streets, another of war, and so on.

Children go almost naked till they are 14, and then they wrap a cotton cloth round their middles; the richer sort put on a sort of callico gowns when they go abroad, with a kind of drawers; but within they are contented with their usual cloth: the better sort of women wear their cotton cloths like petticoats, and have a covering round their shoulders, but take care it shall be open before.

The richer sort of the inhabitants of Benin live upon beef, mutton, and poultry; their drink is water, and brandy when they can get it. The poorer sort live upon dried fish, bananas, and beans; their drink is water and palm-wine. Their chief handicraftmen are smiths, carpenters, and curriers; but they perform all their work in a very bungling manner. The men have as many wives as they can keep, which they take without any ceremony except treating their relations. The wives of the lower sort may go wherever they have a mind; but those of the rich are shut up: they allow their wives to be very familiar with the Europeans, and yet pretend to be very jealous of their own countrymen. When a woman is caught in adultery, she is turned away, and the goods of the man are forfeited to the husband; but if the relations of the woman are rich, they prevail on him to overlook the fault by dint of presents.

They use circumcision, which is performed seven days after the children are born, at which time the father makes a feast for the relations; they have also customs, relating to uncleanness, resembling those of the Jews. Thieves are punished by making the party amends if they can, otherwise they are bastinadoed; but murder is always punished with death. When a person is only suspected of a crime, they have several ways of putting him to trial, like the fire ordeal, or the bitter water of the Jews: but they are of such a nature, that the innocent may be as often condemned as the guilty.

With regard to their religion, they believe in an almighty and invisible God; yet worship images in a human form, and in those of all sorts of animals, making them offerings, every one being his own priest; they look upon these lesser deities as mediators between him and man; some of these idols are in the house, and some in in cabins by themselves. Every fifth day is holy; on which the rich kill cows, sheep, and goats, and others dogs, cats, and fowls, which they distribute among their poor neighbours.

Benin, the capital of a kingdom of the same name, is the residence of their kings, and is seated pretty far in the country: it stands in a plain, and is about four miles in compass. The streets are long and broad: and there are markets twice a-day, where they sell cows, cotton, elephants teeth, European merchandises, and whatever the country produces. The houses are large, with clays walls, and at a distance from each other; they are covered with reeds, straw, and leaves. The women in this place are the greatest slaves; for they go every day to market, manage the household affairs, take care of the children, cook the victuals, and till the ground. The king's palace makes great part of the town; and, its great extent excepted, there is nothing worth taking notice of, it being only a confused heap of buildings, made with boards and clay, without regularity or neatness. In the middle, there is a wooden tower, about 70 feet high, made like a chimney, and on the top is a brazen serpent, hanging with its head downwards; this is pretty well made, and is the most curious thing in the town; there is a gallery of statues, but so wretchedly carved, that there is no knowing what they represent without being told: behind a curtain there are 11 brazen heads, with an elephant's tooth on each; these are the king's idols: his throne is made of ivory, on which he sits in a pavilion of India stuff. The king shows himself but once a year, on the day of a certain festival; and then he is surrounded with his wives and a great number of his officers, who walk out in procession to begin the feast by sacrificing to their gods; this done, he bestows victuals and wine among the multitude, which is imitated by his officers. All the inhabitants of this town and country go under the denomination of the *king's slaves*, and some relations say, that none of them wear any habit till given them by the king: but this seems to be only a salvo to account for the great number of men and women that are daily seen naked in the streets; for if it be true, that the king of Benin can bring 100,000 fighting men into the field, his subjects must be very numerous; and probably his majesty is not rich enough to bestow garments upon them all. The Europeans resort hither to purchase slaves. E. Long. 5. 4. N. Lat. 7. 40.

BENISH-days, among the Egyptians, a term for three days of the week, which are days of less ceremony in religion than the other four, and have their name from the *benish*, a garment of common use, not of ceremony. In Cairo, on Sundays, Tuesdays, and Thursdays, they go to the bashaw's divan; and these are the general days of businesss. Friday they stay at home, and go to their mosques at noon; but though this is their day of devotion, they never abstain from business. The three other days of the week are the benish-days, in which they throw off all business and ceremony, and go to their little summer-houses in the country.

BENNAVENTA, or Bennavenna, (Antonine) a town of Britain, on the Ausona Major, or the Antona of Tacitus: supposed to be Northampton on the Nen; but Camden says it is Wedon, a village six miles to the west of Northampton.

BENNET, Henry, earl of Arlington, was born of an ancient family in Middlesex. In the beginning of the civil war, he was appointed under-secretary to George Lord Digby, secretary of state; afterward entered himself as a volunteer for the royal cause, and did his majesty good service, especially at Andover in Hampshire, where he received several wounds. When the wars were ended, he left not the king when success did, but attended his interest in foreign parts. He was made secretary to the duke of York; received the honour of knighthood from Charles II. at Bruges, in 1658: and was sent envoy to the court of Spain. His majesty, upon his return to England, called him home, made him keeper of his privy purse, and principal secretary of state. He had always a peculiar hatred to the lord chancellor Hyde; who on the other hand considered him as a concealed Papist. In 1670 he was one of the council distinguished by the title of the *Cabal*, and one of those who advised shutting up the exchequer. In 1672 he was made earl of Arlington and Viscount Thetford, and soon after knight of the Garter. In 1673, he was appointed one of the three plenipotentiaries from the court of Great Britain to Cologn, to mediate a peace between the emperor and the king of France. The house of commons, in 1673, drew up articles of impeachment against him. In 1674 he was made chamberlain of his majesty's household, with this public reason, that it was in recompense of his long and faithful service, and particularly for his having performed the office of principal secretary of state for the space of 12 years, to his majesty's great satisfaction. But afterward his interest began to decline, while that of the earl of Danby increased; for upon his return from his unsuccessful journey to Holland in 1675, his credit was so much sunk, that several persons at court diverted the king with mimicking his person and behaviour; yet he held his lord chamberlain's place to the day of his death in 1685. His esteemed letters to Sir William Temple were published after his death.

Bennet, *Christopher*, an eminent physician in the 16th century, was the son of John Bennet, of Raynton, in Somersetshire. He was educated at Lincoln college, Oxford; and gave the public a treatise on consumptions, entitled, *Theatri Tabidorum Vestibulum, &c.* also *Exercitationes Diagnosticæ, cum Historiis demonstrativis, quibus Alimentorum et Sanguinis vitia deteguntur in plerisque morbis, &c.*

Bennet, *Dr Thomas*, an eminent divine, born at Salisbury on the 7th of May 1673, and educated at St John's college, Cambridge. In 1700, he was made rector of James's in Colchester: afterwards he was lecturer of St Olave's, Southwark, and morning-preacher at St Lawrence, Jewry; and at last was presented to the vicarage of St Giles's, Cripplegate, worth 500l. a-year. While he was in this station, he was engaged in several expensive law-suits in defence of the rights of the church, to which he recovered 150l. a-year. He wrote 1. An Answer to the Dissenters Plea for Separation. 2. A Confutation of Popery. 3. A Discourse of Schism. 4. An Answer to a book entitled Thomas against Bennet. 5. A Confutation of

Digitized by Google

Quakerism. 6. A brief History of the joint Use of pre-conceived Forms of Prayer. 7. An Answer to Dr Clarke's Scripture-doctrine of the Trinity. 8. A Paraphrase, with Annotations on the Book of Common Prayer. 9. A Hebrew Grammar; and other pieces. He died October 9. 1728, in the 56th year of his age.

BENOIT, Renatus, a famous doctor of the Sorbonne, and curate of Eustathius at Paris, in the 16th century. He was a secret favourer of the Protestant religion; and that his countrymen might be able to read the bible in their own tongue, he published at Paris the French translation, which had been made by the reformed ministers at Geneva. This translation was approved of by several doctors of the Sorbonne before it went to the press, and King Charles IX. had granted a privilege for the printing of it. Yet when it was published it was immediately condemned. He had been before that time confessor to the unhappy Mary queen of Scotland, during her stay in France, and attended her when she returned into Scotland. Some time before the death of Henry III. Dr Benoit, or some of his friends with his assistance, published a book, entitled, *Apologie Catholique*, i. e. The Catholic Apology; in which it was shewn, that the Protestant religion, which Henry king of Navarre professed, was not a sufficient reason to deprive him of his right of succeeding to the crown of France. When Henry IV. was resolved to embrace the Catholic religion, he assisted at that assembly in which King Henry abjured the reformed religion. The king promoted him to the bishopric of Troyes in Champagne 1597, but he could never obtain the pope's bulls to be installed. However, he enjoyed the temporalities of that bishopric till he resigned it. He died in 1608.

BENSERADE, Isaac de, an ingenious French poet of the 17th century, was born at Lyons. He made himself known at court by his verses and his wit, and had the good fortune to please the cardinals de Richelieu and Mazarin. After the death of Richelieu, he got into favour with the duke de Breze, whom he accompanied in most of his expeditions; and when this nobleman died, he returned to court, where his poetry became highly esteemed. He wrote, 1. A Paraphrase upon Job. 2. Verses for Interludes. 3. Rondeaux upon Ovid. 4. Several Tragedies. A sonnet which he sent to a young lady with his Paraphrase on Job being put in competition with the Urania of Voiture caused him to be much spoken of; for what an honour was it to be head of a party against this celebrated author! Those who gave the preference to Benserade's performance were styled the *Jobists*, and their antagonists the *Uranists*; and the dispute long divided the whole court and the wits. Some years before his death, he applied himself to works of piety, and translated almost all the Psalms.

M. l'Abbé Olivet says, that Benserade towards the latter end of his life, withdrew from court, and made Gentilly the place of his retirement. When he was a youth, he says it was the custom to visit the remains of the ornaments with which Benserade had embellished his house and gardens, where every thing savoured of his poetical genius. The bark of the trees was full of inscriptions: and, amongst others, he remembers the first which presented itself was as follows:

Adieu fortune, honneurs adieu, vous et les votres,
Je viens ici vous oublier;
Adieu toi meme amour, bien plus que les autres
Difficile a congedier.

Fortune and honours, all adieu,
And whatsoe'er belongs to you.
I to this retirement run,
All your vanities to shun.
Thou too adieu, O powerful love;
From thee 'tis hardest to remove.

M. Voltaire is of opinion that these inscriptions were the best of his productions, and he regrets that they have not been collected.

Benserade suffered at last so much from the stone, that, notwithstanding his great age, he resolved to submit to the operation of cutting. But his constancy was not put to this last proof; for a surgeon letting him blood, by way of precaution, pricked an artery, and, instead of endeavouring to stop the effusion of blood, ran away. There was but just time to call F. Commire, his friend and confessor, who came soon enough to see him die. This happened the 19th of October 1691, in the 82d year of his age.

BENSHEIM, a town of Germany in the grand duchy of Hesse, seated in E. Long. 8. 45. N. Lat. 52. 23.

BENSON, Dr George, a learned dissenting minister, born at Great Salkeld, in Cumberland, in 1699. His love of learning was so successful, that, at 11 years of age, he was able to read the Greek Testament. He afterwards studied at Dr Dixon's academy at Whitehaven, from whence he removed to the university of Glasgow. In 1721, he was chosen pastor of a congregation of Dissenters at Abingdon in Berkshire; in 1729, he received a call from a society of dissenters in Southwark, with whom he continued 11 years; and in 1740, was chosen by the congregation of Crutched Friars, colleague to the learned and judicious Dr Lardner. From the time of his engaging in the ministry he proposed to himself the critical study of the Scriptures, particularly of the New Testament, as a principal part of his business. The first fruits of these studies which he presented to the public was, A Defence of the reasonableness of Prayer, with a Translation of a Discourse of Maximus Tyrius, containing some popular Objections against Prayer, and an Answer to these. The light which Mr Locke had thrown on the obscurest parts of St Paul's epistles, by making him his own expositor, encouraged and determined Mr Benson to attempt to illustrate the remaining epistles in the same manner. In 1731, he published a Paraphrase and Notes on the Epistle to Philemon, as a specimen. This was well received, and the author encouraged to proceed in his design. With the epistle to Philemon was published "A short dissertation, to prove from the spirit and sentiments the apostle discovered in his epistles, that he was neither an enthusiast nor impostor; and consequently that the religion which he asserted he received immediately from heaven, and confirmed by a variety of miracles, is indeed divine." This argument hath since been improved and illustrated, with great delicacy and strength, in a review of the apostle's entire conduct and character by Lord Lyttelton. Mr Benson proceeded with great diligence and reputation to publish Paraphrases

Digitized by Google

phrases and Notes on the two Epistles to the Thessalonians, the first and second to Timothy, and the Epistle to Titus; adding, Dissertations on several important Subjects, particularly on Inspiration. In the year 1735, our author published his History of the first Planting of Christianity, taken from the Acts of the Apostles, and their Epistles, in 2 vols 4to. In this work, besides illustrating throughout the history of the Acts and most of the epistles, by a view of the history of the times, the occasion of the several epistles, and the state of the churches to whom they were addressed, he established the truth of the Christian religion on a number of facts, the most public, important, and incontestable. He also wrote, The Reasonableness of the Christian Religion; The History of the Life of Jesus Christ; A Paraphrase and Notes on the seven Catholic Epistles; and several other works which procured him great reputation. One of the universities in Scotland sent him a diploma, with a doctor's degree; and many of high rank in the church of England, as Herring, Hoadley, Butler, Benson, Coneybeare, &c. showed him great marks of favour and regard. He died in the year 1763, in the 64th year of his age.

BENTHAM, Thomas, bishop of Litchfield and Coventry, was born at Shirburn in Yorkshire in the year 1513, and educated in Magdalene college, Oxford. He took the degree of bachelor of arts in 1543, and in 1546 was admitted perpetual fellow, and proceeded master of arts the year following, which was that of Edward VI's accession to the crown. He now threw off the mask of Popery, which during the equivocal reign of Henry VIII. he had worn with reluctance. When Mary came to the crown, being deprived of his fellowship by her visitors, he prudently retired to Basil in Switzerland, where for some time he expounded the Scriptures to the English exiles in that city; but, being solicited by some Protestants in London, he returned to London before the death of the queen, and was appointed superintendant of a private congregation in the city. Immediately on the accession of Elizabeth, Bentham was preferred in the church, and in the second year of her reign was consecrated bishop of Litchfield and Coventry. He died at Eccleshal in Staffordshire in 1578, aged 65. He was buried in the chancel of the church there; and a monument was erected, with the effigy of himself, his wife, and four children, with the following inscription:

Hac jacet in tumba Benthamus, episcopus ille
Doctus, divinus, largus, pascens, pius, almus.
Ob. 19. *Feb.* 1578.

Bishop Bentham had the character of a pious and zealous reformer, and was particularly celebrated for his knowledge of the Hebrew language. His works are, 1. Exposition of the Acts of the Apostles; manuscript. 2. A Sermon on Christ's Temptation; Lond. 8vo. 3. Epistle to M. Parker; manuscript. 4. The Psalms, Ezekiel, and Daniel, translated into English in Queen Elizabeth's Bible.

BENTINCK, W. H. C. third duke of Portland, a late British statesman. See Supplement.

BENTIVOGLIO, Guy, cardinal, born at Ferrara, in the year 1579. He went to study at Padua, where he made a considerable proficiency in polite literature. Upon his leaving the university, he went to reside at Rome, where he became universally esteemed. He was sent nuncio to Flanders, and then to France; in both which employments his behaviour was such as gave great satisfaction to Paul V. who made him a cardinal, which was the last promotion he made, a little before his death, which happened on the 28th of January 1621. Bentivoglio was at this time in France, where Louis XIII. and all the French court congratulated him on his new dignity; and when he returned to Rome, his Christian majesty entrusted him with the management of the French affairs at that court. Pope Urban VII. had a high regard for him on account of his fidelity, disinterestedness, and consummate knowledge in business. He was beloved by the people, and esteemed by the cardinals; and his qualities were such, that in all probability he would have been raised to the pontificate on the death of Urban, which happened on the 29th of July 1644; but having gone to the conclave during the time of the most intolerable heats at Rome, it affected his body to such a degree, that he could not sleep for 11 nights afterwards; and this want of rest threw him into a fever, of which he died the 7th of September 1644, aged 65. He has left several works; the most remarkable of which are, A History of the Civil Wars of Flanders, An Account of Flanders, with Letters and Memoirs.

Bentivoglio, a small town of Italy in the territory of Bologna, with a castle, situated in E. Long. 11. 34. N. Lat. 44. 47.

BENTLEY, Richard, an eminent critic and divine, was born at Oulton, in the parish of Rothwell, near Wakefield. His ancestors, who were of some consideration, possessed an estate, and had a seat at Hepenstall, in the parish of Halifax. His grandfather James Bentley was a captain in King Charles I.'s army at the time of the civil wars; and being involved in the fate of his party, had his house plundered, his estate confiscated, and was himself carried prisoner to Pomfret Castle, where he died. Thomas Bentley, the son of James, and father of Dr Bentley, married the daughter of Richard Willis of Oulton, who had been a major in the royal army. This lady, who was a woman of exceeding good understanding, taught her son Richard his accidence. To his grandfather Willis, who was left his guardian, he was in part indebted for his education; and having gone through the grammar school at Wakefield with singular reputation, both for his proficiency and his exact and regular behaviour, he was admitted of St John's college, Cambridge, under the tuition of Mr Johnson, on the 24th of May 1676; being then only four months above 14 years of age. On the 22d of March 1681-2, he stood candidate for a fellowship, and would have been unanimously elected, had he not been excluded by the statutes on account of his being too young for priest's orders. He was then a junior bachelor, and but little more than 19 years old. It was soon after this that he became a schoolmaster at Spalding. But that he did not continue long in this situation is certain from a letter of his grandfather Willis's, still preserved in the family, from which it appears, that he was with Dr Stillingfleet at the deanery of St Paul's on the 25th of April 1683. He had been recommended by his college to the dean as preceptor to his son; and Dr Stillingfleet gave Mr Bentley his choice whether he would carry his pupil to Cambridge.

Bentley. Cambridge or Oxford. He fixed upon the latter university on account of the Bodleian library, to the consulting of the manuscripts of which he applied with the closest attention. Being now of age, he made over a small estate which he derived from his family to his elder brother, and immediately laid out the money he obtained for it in the purchase of books. In July 1683, he took the degree of master of arts at St John's college, Cambridge. In 1692, his patron being advanced to the see of Worcester, collated him to a prebend in that church, and also made him his domestic chaplain. That learned prelate, as well as Dr Will. Lloyd, then bishop of Litchfield, had seen many proofs of our author's extraordinary merit, when they concurred in recommending him as a fit person to open the lectures upon Mr Boyle's foundation, in defence of natural and revealed religion. This gave him a fine opportunity of establishing his fame. He saw it well; and resolved to push it to the utmost. Sir Isaac Newton's *Principia* had been published but a few years, and the book was little known and less understood. Mr Bentley therefore determined to spare no pains in displaying to the best advantage the profound demonstrations which that excellent work furnished in proof of a Deity; and that nothing might be wanting to complete the design, he applied to the author and received from him the solution of some difficulties which had not fallen within the plan of his treatise *. In short, our author's sermons at Boyle's lectures were universally admired, and highly raised his reputation as a preacher; notwithstanding that escape which laid him open to the raillery of Dr Keil, viz. of proving the moon not to turn round her axis, because she always shows the same face to the earth. In 1693, he was made keeper of the royal library at St James's.

* Vid. *Four Letters from Sir Isaac Newton to Dr Bentley*, Lond. 1756.

In the following year arose the famous dispute between him and the honourable Mr Boyle, in relation to the epistles of Phalaris; of which Mr Boyle had published a very fine edition, with a Latin version of the text. These epistles the Doctor asserted to be spurious, the production of some sophist, and altogether contemptible as a literary performance. The principal pieces which appeared in this noted controversy were, 1. Dr Bentley's dissertation upon the epistles of Themistocles, Socrates, Euripides, Phalaris, and the Fables of Æsop, at the end of the second edition of Mr Wotton's Reflections on Ancient and Modern Learning: but afterwards printed by Dr Bentley entire, and added with great additions to his farther defence of it, in answer to Mr Boyle. 2. "Dr Bentley's Dissertation on the Epistles of Phalaris and the Fables of Æsop examined by the Honourable Charles Boyle, Esq." a book more commonly known by the title of *Boyle against Bentley*. 3. Dr Bentley's Answer to the above, commonly known by the name of *Bentley against Boyle;* a curious piece, interspersed with a great deal of true wit and humour. From the caprice or partiality of the age the victory was adjudged to Mr Boyle, and the ridicule of the writs exercised upon Dr Bentley. Thus Dr Garth, in the Dispensary,

So Diamonds take a lustre from their foil,
And to a BENTLEY *'tis we owe a* BOYLE.

Dr Bentley had also some wags who were his enemies *even* at Cambridge, who drew his picture in the hands of Phalaris's guards, who were putting him into their master's bull, and out of the Doctor's mouth came a label with these words, *I had rather be* ROASTED *than* BOYLED. And Dean Swift, in his Tale of a Tub, had some strokes at Dr Bentley upon this occasion, but more especially in his Battle of the Books, where, on account of Dr Bentley's Dissertation of Phalaris, &c. being annexed to Mr Wotton's Reflections on Learning, and their being great friends, he makes Mr Wotton and Dr Bentley, standing side by side, in each other's defence, to be both transfixed to the ground by one stroke of the javelin of Mr Boyle, and this he heightens by the simile of a cook's spitting a brace of woodcocks. Nay, so strong is the influence of literary prejudice and fashion, that many even of Dr Bentley's friends considered Boyle's Examination as unanswerable. Nor could they be convinced of the contrary, till the Doctor, first asking them where it was so impregnable, and confuting one article after another upon the spot, as fast as they instanced, assured them it was all of the same kind. This he effectually showed in his answer. It now, however, seems to be the settled opinion of the literary world, that the Doctor has not only the evident advantage in respect of learning and argument, but that he is little, if at all, inferior to his antagonist in point of wit and smartness. It may not, however, be amiss to recite a few testimonies on the subject. Mr Walpole, speaking of Mr Boyle's translation of the Epistles of Phalaris, says, "This work occasioned the famous controversy with Dr Bentley;—who alone, and unworsted, sustained the attacks of the brightest geniuses in the learned world, and whose fame has not suffered by the wit to which it gave occasion." Mr Towers, in his British Biography, expresses himself in the following terms: "In the controversy between him and Mr Boyle, the popular clamour, indeed, was in favour of the latter; but Bentley's is unquestionably a much more valuable performance than that of Boyle. The latter, considered as a mere English composition, has the advantage in point of style; and pleased the generality, by the personal satire which it contained against Dr Bentley, who had many enemies. But Bentley had greatly the superiority with respect to just reasoning, critical sagacity, and extent of learning; and his vindication of himself also contained many shrewd and sarcastical strokes against Mr Boyle and his performance. Much has been said in favour of Mr Boyle, as a genteel and polite writer; and it must be confessed, that Dr Bentley's manner was often too assuming, and that he was deficient in point of civility. But notwithstanding this, there was, perhaps, a much greater want of real candour and politeness, whatever affectation of them there might be, in the very contemptuous and unfair manner in which Dr Bentley was treated throughout Mr Boyle's book, than in any thing which Bentley had said against Boyle. Bentley, with all his foibles, was too respectable a character to be a proper subject of such treatment: though Swift, Garth, and Pope, have joined in countenancing the popular prejudices against him." Mr Dodwell, who resided at Oxford during the controversy, who made himself in some sort a party in it, and who had a very particular court paid to him by the Christ-Church men, declared to them that he never learned so much from any book of the size in his life,

Bentley.

life, as he had done from Dr Bentley's Answer to Boyle.

In 1696, at the public commencement, Mr Bentley had been created doctor of divinity by the university of Cambridge; and some time thereafter, admitted, *ad eundem*, in the university of Oxford.

In 1700 he was presented to the mastership of Trinity college, Cambridge, which is reckoned worth near 1000l. per annum. Upon this promotion he resigned his prebend of Worcester; and, in 1701, was collated to the archdeaconry of Ely. Being thus placed in a state of ease and affluence, he entered into matrimony, and indulged his inclination in critical pursuits; and the fruits of his labours, which he occasionally published, all displayed such erudition and sagacity, that, by degrees, he obtained the character of being the greatest critic of the age. In the mean while, however, he carried matters with so high a hand in the government of his college, that, in 1709, a complaint was brought before the bishop of Ely, as visitor, against him, by several of the fellows, who charged him with embezzling the college money, and other misdemeanors. In answer to this, he presented his defence to the bishop, which he published in 1710, under the title of *The present State of Trinity College*, 8vo; and thus began a quarrel, which was carried on with the most virulent animosity on each side, for above 20 years, when it at last ended in the Doctor's favour. In 1716, upon the death of Dr James, he was appointed regius professor of divinity in the former university; annexed to which was a good benefice in the bishopric of Ely. His majesty King George I. on a visit to the university in 1717, having, as usual, nominated by mandate several persons for a doctor's degree in divinity, our professor, to whose office it belonged to perform the ceremony called *creation*, demanded four guineas from each person, besides a broad piece of gold, and absolutely refused to create any doctor without these fees: hence there arose a long and warm dispute, during which, the doctor was first suspended, and then degraded; but on a petition to his majesty for relief from that sentence, the affair was referred to the court of King's-bench, where the proceedings against him being reversed, a mandamus was issued, charging the university to restore him. With regard to Dr Bentley's long dispute with his college, Mr Whiston represents his having been induced in a single instance, after four years of unexceptionable conduct, to recede from the excellent rule of *detur digniori*, in the election to a fellowship, as the first false step which led to others, and was very prejudicial to his own happiness. A concise and accurate account of his controversies with his college and the university, and of the publications which appeared on these occasions, may be seen in Mr Gough's anecdotes of topography. There are likewise, in the Harleian collection of manuscripts in the British Museum, N° 7523, some authentic papers, relative to the proceedings of the university against Dr Bentley. Dr Bentley was endowed with a natural hardiness of temper, which enabled him to ride out both these storms without any extraordinary disturbance, or interruption to his literary pursuits. In his private character, though he is generally allowed to have been too fond of money, he was hearty, sincere, and warm in his friendship, an affectionate husband, and a most indulgent father. He loved hospitality and respect; maintained the dignity and munificence of the ancient abbots in house-keeping at his lodge, which he beautified; and, in conversation, tempered the severity of the critic with such a peculiar strain of vivacity and pleasantry, as was very entertaining. He died at his lodge in Trinity college, on the 14th of July 1742, at 80 years of age. To his latest hour, he could read the smallest Greek Testament without spectacles; and he died of a young man's disorder, a pleuritic fever. He was of a large and robust frame of body, and of strong features. These gave a dignity, perhaps a severity, to his aspect, which probably heightened the opinion many had conceived of the haughtiness and roughness of his temper. But, in fact, he was of so tender a disposition, that he never read a touching story without tears. It was not, indeed, till after he had been afflicted with a slight paralytic stroke, that this particular effect of the softness of his nature was in every case apparent: so that it may possibly be imputed, in some degree, to his disorder. It is, however, certain that previous to that event he was endued with great tenderness and sensibility. In the contest about the visitatorial power, when he met Bishop Moore, he was so struck with seeing his old friend appear in a hostile manner against him, that he fainted away in the court.

When we consider the great abilities and uncommon erudition of which Dr Bentley was possessed, it reflects some disgrace on our country, says Dr Kippis, that even his literary reputation should be so long treated with contempt; that he should be represented as a mere verbal critic, and as a pedant without genius. The unjust light in which he was placed, was not entirely owing to the able men who opposed him in the Boylean controversy: it arose perhaps principally from the poets engaging on the same side of the question, and making him the object of their satire and ridicule. The "flashing Bentley" of Pope will be remembered and repeated by thousands who know nothing of the Doctor's real merit. Having mentioned this epithet, we shall add the candid note of the poet's right reverend editor. "This great man with all his faults, deserved to be put into better company. The following words of Cicero describe him not amiss: "*Habuit à natura genus quoddam acuminis, quod etiam arte limaverat, quod erat in reprehendis verbis versutum et solers; sed sæpe stomachosum, nonnunquam frigidum, interdum etiam facetum.*" In the fourth book of the Dunciad, Mr Pope introduces our critic at greater length, and with still greater severity. Perhaps it may be found that the asperity of Mr Pope was not entirely owing to the combination of certain wits and poets against Dr Bentley, but to personal resentment. We are told that Bishop Atterbury, having Bentley and Pope both at dinner with him, insisted on knowing what opinion the Doctor entertained of the English Homer. He for some time eluded the question; but at last, being urged to speak out, he said, "The verses are good verses; but the work is not Homer, it is Spondanus." It must indeed be acknowledged, that one cause of Dr Bentley's having enemies, was his not always bearing his faculties with sufficient meekness. He appears to have had a considerable degree of literary pride, and to have spoken of himself and others with uncommon freedom. Mr Whiston informs us of the Doctor's having

Bentley.

ving said, "That when he himself should be dead, Wasse would be the most learned man in England." Dr Salter, who was extremely devoted to the memory of Dr Bentley, confessed that he was remarkable for his *fastus*, especially towards his equals, and for speaking highly of himself. But at the same time, he is described by Dr Salter as having been a very amiable and pleasant man in private life, and as possessing much good nature, though he had been otherwise represented. This account agrees with the most authentic information from different quarters. It is related of Dr Bentley, that he used to pull off his hat to the younger students, but would not do it to the fellows of his college. Being asked the reason for making this difference, he answered, "That the young ones might come to something; but for the others, they never could be good for any thing."

The Doctor's principal works, besides those already mentioned, were, 1. Animadversions and Remarks on the poet Callimachus. 2. Annotations on the two first Comedies of Aristophanes. 3. Emendations, &c. on the Fragment of Menander and Philemon. 4. Remarks upon Collins's discourse of freethinking. 5. Beautiful and correct editions of Horace, Terence, Phædrus, and Milton, with notes.

In 1721 he published Proposals for printing a new edition of the Greek Testament, and St Hierom's Latin version; in which edition he intended to make no use of any manuscript that was not at least 1000 years old. Upon these proposals Dr Middleton published some remarks; and the work never made its appearance. "If Dr Middleton's attack contributed to this event (Dr Kippis observes), he certainly did no little disservice to the cause of sacred literature. The completion of Dr Bentley's noble undertaking was the principal employment of the latter part of his life. He had collected and collated all the manuscripts of Europe to which access could be obtained. For this purpose, his nephew Thomas Bentley, LL. D. well known in the republic of letters, travelled through Europe at his uncle's expence. The work was of such magnitude, that he found it necessary, for the first time, to publish proposals for printing it by subscription. The whole was completed for publication; and he had received 2000l. in part of the subscription, all of which he returned to the subscribers when he took the resolution of not letting it appear in the world during his own life. The work is now in the possession of his executor Dr Richard Bentley, one of the senior fellows of Trinity College, and rector of Nailston near Ashby in Leicestershire; and it is hoped that at some future period it may yet see the light:—Other valuable remains of Dr Bentley are still in existence; some of which are in the hands of his executor, and some in those of Mr Cumberland his grandson. The latter gentleman is possessed of the Doctor's classic books, with his marginal notes. From these notes Mr Cumberland hath published an edition of Lucan; which though not perfect throughout, is full and complete with regard to the four first books. The same gentleman has a Homer of our great critic's, with many marginal notes and corrections, preparatory to an edition of it which he intended to have given. Dr Bentley's critical correspondence with his numerous literary acquaintance, which must be very instructive and entertaining, is not only preserved, but designed to be laid before the public."

Bentley ‖ Berchem.

The Doctor's publication of Milton, it is said, was owing to Queen Caroline. Her majesty represented to him, that he had printed no edition of an English classic, and urged him to undertake Milton. His notes upon this great poet have been the worst received of any of his critical performances. The learned Bishop Newton speaks of them with considerable severity, intermixed, however, with some applause.

BENZOIN, in *Materia Medica*, a concrete resinous juice, obtained from a species of styrax. See CHEMISTRY and MATERIA MEDICA *Index*.

BERMAS, a coarse cloth, all made with cotton-thread, which comes from the East Indies, and particularly from Surat.

BERAR, a province of Asia, in the British East Indian possessions, adjoining to the province of Bengal. It abounds in corn, rice, pulse, and poppies, from which last they extract opium; and sugar-canes grow almost without cultivation. One fourth of the inhabitants are Mahometans and three fourths Hindoos.

BERAUM, a royal city of Bohemia, and capital of a circle of the same name. E. Long. 14. 25. N. Lat. 50. 2.

BERAY, a town of Normandy in France, situated in W. Long. 1. 20. N. Lat. 49. 6.

BERBERIS, the BARBERRY. See BOTANY *Index*.

BERBICE, a river of Terra Firma in America, which falls into the North sea, in S. Lat. 6. 30. The district on both sides of the river has the same name, and was long a Dutch colony, but in 1814 was ceded to Britain. See BERBICE, SUPPLEMENT.

BERCARIA, BERQUERIA, or *Berkeria*, in middle-age writers, denotes a sheep-fold, sheep-cote, sheep-pen, or other enclosure, for the safe keeping a flock of sheep.—The word is abbreviated from *berbicaria*; of *berbex*, detorted from *vervex*. Hence also a shepherd was denominated *berbicarius* and *berquarius*.

BERCHEROIT, or BERKOITS, a weight used at Archangel, and in all the Russian dominions, to weigh such merchandises as are heavy and bulky. It weighs about 364lb. English avoirdupois weight.

BERCHEM, or BERGHEM, NICHOLAS, an excellent painter, was a native of Haerlem, and born in 1624. He received instructions from several very eminent masters: and it was no small addition to their fame that Berchem was their scholar. The charming pictures of cattle and figures by this admirable master are justly held in the highest estimation. He has been singularly happy in having many of them finely engraved by John Visscher, an artist of the first rank. Berchem had an easy expeditious manner of painting, and an inexpressible variety and beauty in the choice of sites for his landscapes; executing them with a surprising degree of neatness and truth. He possessed a clearness and strength of judgment, and a wonderful power and ease in expressing his ideas; and although his subjects were of the lower kind, yet his choice of nature was judicious, and he gave to every subject as much of beauty and elegance as it would admit. The leafing of his trees is exquisitely and freely touched; his skies are clear; and his clouds float lightly, as if supported by air. The distinguishing characters of the pictures of Berchem are, the breadth and just distribution

Digitized by Google

stribution of the lights; the grandeur of his masses of light and shadow; the natural ease and simplicity in the attitudes of his figures, expressing their several characters; the just gradation of his distances; the brilliancy and harmony, as well as the transparence, of his colouring; the correctness and true perspective of his design; and the elegance of his composition: and where any of those marks are wanting, no authority ought to be sufficient to ascribe any picture to him. He painted every part of his subjects so extremely well, as to render it difficult to determine in which he excelled most; his trees, buildings, waters, rocks, hills, cattle, and figures, being all equally admirable.

BERCHETT, Peter, an eminent history painter, was born in France in 1659, and at the age of 18 was employed in the royal palaces. He came to England in 1681, to work under Rambour, a French painter of architecture; but, after staying a year, returned to Marli. He came again, and was sent by King William to the palace he was building at Loo, where he was employed 15 months; and then came a third time to England, where he had sufficient business. We are informed by Mr Walpole, that he then painted the ceiling of the chapel of Trinity college, Oxford, the staircase at the duke of Schomberg's in Pall-mall, and the summer-house at Ranelagh. His drawings in the academy were much approved. Towards the close of his life he retired to Marybone, where he painted only small pieces of fabulous history, and died there in January 1720.

BERDASH, in antiquity, was a name formerly used in England for a certain kind of neck-dress; and hence a person who made or sold such neckcloths was called a *berdasher*, from which is derived our word *haberdasher*.

BERECYNTHIA, the mother of the gods, in the Pagan theology.

BERENGARIANISM, a name given by ecclesiastical writers to the opinion of those who deny the truth and reality of the body and blood of Christ in the eucharist. The denomination took its rise from Berengarius, archdeacon and scholiasticus of the church of St Mary at Anjou about the year 1035, who maintained, that the bread and wine, even after consecration, do not become the true body and blood of our Lord, but only a figure and sign thereof.

Berengarianism was strenuously opposed by Lanfranc, Guitmond, Adelmannus, Albericus, &c. Divers synods were held, wherein the author was condemned at Rome, Versailles, Florence, Tours, &c. He retracted, and returned again more than once; signed three several Catholic confessions of faith; the first in the second council of Rome, the second in the third, and the third in the fourth council of the same city. But he still relapsed to his former opinion when the storm was over; though Mabillon maintains he soon recovered from his fourth fall, and died an orthodox Catholic in 1088.

BERENICE, daughter of Ptolemy Auletes king of Egypt, succeeded her father before his death. This banished prince implored the assistance of the Romans. Pompey restored him. Berenice, to support herself on the throne, allured a prince, whose name was Seleucus, descended from the kings of Syria, and admitted him to her nuptial bed, and to her sceptre. She was soon weary of him, and put him to death. She next cast her eye on Archelaus, who married her, and put himself at the head of her troops to repulse the Romans. He was killed in a battle. Ptolemy returned to Alexandria, and put his rebellious daughter to death.

Berenice, wife of Ptolemy Euergetes king of Egypt, cut off her hair in pursuance of a vow, and consecrated it in the temple of Venus. This deposit being afterwards lost, Connon the mathematician, in compliment to her, declared that the queen's locks had been conveyed to heaven, and composed those seven stars near the tail of the bull, called to this day *coma Berenices*.

Berenice, daughter of Costobarus and of Salome sister to Herod the Great, was married first to Aristobulus, son of the same Herod and Mariamne. He having a brother who married the daughter of Archelaus king of Cappadocia, often upbraided Berenice that he was married below himself in wedding her. Berenice related all these discourses to her mother, and exasperated her so furiously, that Salome, who had much power over Herod's mind, made him suspect Aristobulus, and was the principal cause that urged this cruel father to get rid of him. She married again; and having lost her second husband, went to Rome, and got into the favour of Augustus. But, above all, she insinuated herself into the good graces of Antonia, the wife of Drusus, which in the end proved of great service to Agrippa.

Berenice, grand-daughter of the preceding, and daughter of Agrippa I. king of Judea, has been much talked of on account of her amours. She was betrothed to one Marcus, but he died before the marriage. Soon after, she married his uncle Herod, who at the desire of Agrippa, both his brother and father-in-law, was created king of Chalcis by the emperor Claudius. She lost her husband in the eighth year of the emperor Claudius; and in her widowhood, it was rumoured she committed incest with her brother Agrippa. To put a stop to this report, she offered herself in marriage to Polemon king of Cilicia, provided he would change his religion. He accepted her offers, was circumcised, and married her. Berenice soon left him to follow her own ways, and he abandoned Judaism to return to his former religion. She was always very well with her brother Agrippa, and seconded him in the design of preventing the desolation of the Jews. She got Titus into her snares; but the murmurs of the Roman people hindering her from becoming his wife, there remained nothing for her but the title of mistress or concubine of the emperor. The French stage, in the 17th century, resounded with the amours of Titus and Berenice.

Berenice, in *Ancient Geography*, the name of several cities, particularly of a celebrated port-town in the Sinus Arabicus: Now *Suez*; which see.

Berenice's Hair, *Coma Berenices*. See Berenice.

BERE-regis, a town of Dorsetshire in England, in W. Long. 2. 15. N. Lat. 50. 40.

BERESOW, a division of the province of Tobolsk in Siberia. It is bounded on the north by the straits of Waigatz, on the east by a large bay of the Frozen ocean, which runs into the land towards the south, and at the 65th degree of latitude separates into two arms; one of which is called the *Obskaia-Guba*, or

Digitized by Google

Oby-bay; and the other *Tazowskaia-Guba*, or the bay of *Tazow*. The river Oby empties itself into the former, and the Taz into the latter. This district was under the Russian dominion long before the other parts of Siberia were conquered, being reduced by the Czar Gabriel so early as the year 1530.

BEREWICHA, or BEREWICA, in our old writers, denotes a village or hamlet belonging to some town or manor, situated at some distance therefrom.—The word frequently occurs in Doomsday-book: *Istæ sunt berewichæ ejusdem manerii.*

BERG, a duchy of Germany, in the circle of Westphalia. It is bounded on the north by the duchy of Cleves, on the west by the county of Mark and the duchy of Westphalia, on the south by Wetteravia, and on the east by the diocese of Cologne, from which it is separated by the Rhine. It contains about 1188 square miles, with 295,000 inhabitants. It is very fruitful along the Rhine, but mountainous and woody towards the county of Mark. It was formerly subject to the elector palatine, but since 1815 has been included in the grand duchy of the Lower Rhine, which belongs to Prussia. The duchy of Berg was taken from Bavaria in 1806, and bestowed upon Murat, afterwards king of Naples. It is a populous and flourishing district. The principal rivers, besides the Rhine, are the Wipper, Agger, and Sieg.

BERG, *St Winox*, a town of the Low Countries, in the country of Flanders, fortified by Vauban, and subject to France. It is seated on the river Colme, six miles from Dunkirk, and 21 from Ypres. The air is often very unwholesome, especially to strangers. The river Colme serves instead of a canal to go to Hondshot, St Omer's, and Gravelines. There is likewise another canal to go to Dunkirk. The villages in its territory are very famous for butter and cheese, of which they send a great quantity to Flanders. Fort Lapin and Fort Suisse are within cannon shot of this place, and Fort St Francis is seated on the canal, near three miles from the town. E. Long. 2. 25. N. Lat. 50. 57.

BERG-ZABERN, a town of France, in the department of the Lower Rhine. E. Long. 7. 55. N. Lat. 49. 4.

Berg-Gruin, in *Natural History*, the name of an earth used in painting, and properly called *green okre*, though not known among the colour-men under that name. It is found in many parts of Germany, Italy, and England, commonly in the neighbourhood of copper-mines, from particles of which metal it receives its colour. In many parts of Germany, they have a purer kind of this, distinguished by no peculiar name, but separated by art from the waters draining from the copper-mines, and differing no otherwise from this native substance, than as the washed okres of Oxfordshire, &c. do from those sent us in their natural condition. The characters by which the native kind is known from other green earths, are these: it is a dense compact substance, considerably heavy, and of a pale but not disagreeable green; of a rough and uneven, but not dusty surface, and somewhat unctuous to the touch. It adheres firmly to the tongue; does not break easily between the fingers; nor at all stains the hands. It is of a brackish disagreeable taste, and does not ferment with acids.

BERGAMASCO, a province of Italy, in the Austro-Venetian territories. It is bounded on the east by the

Bressan, on the north by the Valteline, on the west and south by the Milanese. It extends about 36 leagues from north to south, and 30 from east to west. It is watered by several rivers, which render it very fertile, and particularly it produces a great number of chesnuts. It has mines of iron, and quarries of marble, and other stones of which they make millstones. There are a great number of villages, but no city except Bergamo the capital. The people are very industrious, and make the best of their natural productions. They are well stocked with cattle, and make fine tapestry. Their language is the most corrupt of any in Italy.

BERGAMO, JAMES PHILIP DE, an Augustin monk, born at Bergamo in 1434, wrote in Latin a Chronicle from the creation of the world to the year 1503, and a Treatise of Illustrious Women. He died in 1518.

BERGAMO, anciently *Bergomum*, a large and strong town of Italy, in the Venetian territory, and capital of the province of Bergamasco. It has a strong citadel, and is the see of a bishop. Its situation near the Alps makes the inhabitants subject to swellings in their throats, owing to the badness of the Alpine waters. E. Long. 9. 38. N. Lat. 45. 42.

BERGAMOT, a species of citron, produced at first casually by an Italian's grafting a citron on the stock of a bergamot pear-tree, whence the fruit produced by this union participated both of the citron-tree and the pear-tree. The fruit hath a fine taste and smell, and its essential oil is in high esteem as a perfume. The essence of bergamot is also called *essentia de cedra*. It is extracted from the yellow rind of the fruit by first cutting it in small pieces, then immediately squeezing the oil out of them into a glass vessel. This liquor is an etherial oil. A water is distilled from the peel as follows: Take the outer rind of three bergamots, a gallon of pure proof-spirit, and four pints of pure water; draw off a gallon in a balneum mariæ, then add as much of the best white sugar as will be agreeable. Or take of the essence of bergamot three drams and a half, of rectified spirit of wine three pints, of volatile sal ammoniac a dram; distil off three pints in a balneum mariæ.

BERGAMOT is also the denomination of a coarse tapestry, manufactured with flocks of silk, wool, cotton, hemp, ox, cow, or goat's hair, and supposed to be invented by the people of Bergamo in Italy.

BERGARAC, a very rich, populous, and trading town of France, seated on the river Dordogne, in E. Long. 0. 37. N. Lat. 50. 57.

BERGAS, a town of Romania, in European Turkey, and the see of a Greek archbishop. It is seated on the river Larissa, in E. Long. 27. 30. N. Lat. 41. 17.

BERGEN, anciently *Bergi*, a city of Norway, and capital of the province of Bergenhus. It is the see of a bishop, and has a strong castle and a good port. It is a large place; but is subject to fires, as being all built of wood. It is surrounded with mountains, and the inhabitants amount to 15,000. The country is generally barren; in consequence of which, most of the corn used is imported. The principal trade is in stock-fish, fir, and deal-boards. E. Long. 5. 45. N. Lat. 60. 11.

BERGEN, a town of Pomerania in Germany, and capital

Digitized by Google

pital of the isle of Rugen, now subject to Prussia. E. Long. 13. 0. N. Lat. 54. 30.

BERGEN-OP-ZOOM, a town of the Low Countries, in Dutch Brabant, and in the marquisate of the same name. It is seated on an eminence, in the middle of a morass, about a mile and a half from the eastern branch of the Scheld, with which it has a communication by a navigable canal. The houses are well built, the market-places and squares handsome and spacious, and the place contains about 4800 inhabitants. The church before the last siege was reckoned a good building. It has a very advantageous situation on the confines of Brabant, Holland, Zealand, and Flanders. It is strong by nature as well as by art, being so secured by the morasses about it, which are formed by the river Zoom, that it was reckoned impregnable. It was, however, taken in 1747 by the French, but it is thought not without the help of treachery. The fortifications are allowed to be the masterpiece of that great engineer Cohorn. It had been twice besieged before without success. When the marquis of Spinola invested it, he was forced to raise the siege with the loss of 10,000 men; and, in 1814, an unsuccessful attempt to take it was made by a British force under Sir Thomas Graham. E. Long. 4. 15. N. Lat. 51. 30.

BERGHEM. See BERCHEM.

BERGHMONT, an assembly or court held upon a hill in Derbyshire, for deciding controversies among the miners.

BERGMAN, SIR TORBERN, a celebrated chemist and natural philosopher, was born in the year 1735 at Catharineberg in Westgothland. His father was receiver-general of the finances, and had destined him to the same employment; but nature had designed him for the sciences. To them he perceived an irresistible inclination from his earliest years, and nature proved more powerful than the will of his friends. His first studies were confined to mathematics and physics: and the efforts that were made to divert him from science having proved ineffectual, he was sent to Upsal, with permission to follow the bent of his inclination. Linnæus at that time filled the whole kingdom with his fame. Instigated by his example, the Swedish youth flocked around him: and accomplished disciples leaving his school, carried the name and the system of their master to the most distant parts of the globe. Bergman was struck with the splendour of his renown; he attached himself to the man whose merit had procured it, and by whom he was very soon distinguished. He applied himself at first to the study of insects, and made several ingenious researches into their history; among others into that of the genus of *tenthredo*, so often and so cruelly preyed on by the larvæ of the ichneumons, that nestle in their bowels and devour them. He discovered that the leech was oviparous; and that the coccus aquaticus is the egg of this animal, from whence issue ten or twelve young. Linnæus, who had at first denied this fact, was struck with astonishment when he saw it proved. *Vidi et obstupui!* were the words he pronounced, and which he wrote at the foot of the memoir when he gave it his sanction. Mr Bergman soon distinguished himself as an astronomer, naturalist, and geometrician; but these are not the titles by which he acquired his fame. The chair of chemistry and mineralogy, which had been filled by the celebrated Wallerius, becoming vacant by his resignation, Mr Bergman was among the number of the competitors: and without having before this period discovered any particular attention to chemistry, he published a memoir on the preparation of alum that astonished his friends as well as his adversaries. Nobody was able to conceive how in so short a time he could have made a course of experiments so complete, on a subject so new to him. His dissertation was warmly attacked in the periodical publications, and Wallerius himself criticised without reserve. But in the midst of so many enemies, he possessed a firm friend. The prince Gustavus, now king of Sweden, and then chancellor of the university, took cognizance of the affair. After having consulted two persons, the most able to give him advice, and whose testimony went in favour of Bergman, he addressed a memorial, written with his own hand, in answer to all the grievances alleged against the candidate, to the consistory of the university and to the senate, who confirmed the wishes of his Royal Highness.

Mr Bergman had now a hard duty to fulfil: he had to satisfy the hopes that were conceived of him; to fill the place of Wallerius; and to put envy to silence. He did not follow the common track in the study of chemistry. As he had received the lessons of no master, he was tainted with the prejudices of no school. Accustomed to precision, and having no time to lose, he applied himself to experiments without paying any attention to theories: he repeated those often which he considered as the most important and instructive, and reduced them to method; an improvement till then unknown. He first introduced into chemistry the process by analysis, which ought to be applied to every science; for there should be but one method of teaching and learning, as there is but one of judging well. These views have been laid down by Mr Bergman in an excellent discourse, which contains, if we may say so, his profession of faith in what relates to the sciences. It is here that he displays himself without disguise to his reader; and here it is of importance to study him with attention. The productions of volcanoes had never been analyzed when Messrs Ferber and Troil brought a rich collection of these into Sweden. At the sight of them Mr Bergman conceived the design of investigating their nature. He examined first of all the matters least altered by the fire, and the forms of which were still to be discerned: he followed them in their changes progressively; he determined, he imitated their more complicated appearances; he knew the effects which would result from the mixture and decomposition of the saline substances which are found abundantly in these productions. He discovered such as were formed in the humid way; and then in his laboratory he observed the process of nature; that combat of flames and explosions; that chaos in which the elements seem to clash and to confound one another, unveiled themselves to his eyes. He saw the fire of volcanoes kindled in the midst of pyritical combinations, and sea-salt decomposed by clays; he saw fixed air disengaged from calcined calcareous stones, spreading upon the surface of the earth, and filling caverns in which flame and animal life are equally extinguished; he saw the sulphureous acid thrown out in waves, convert itself into the vitriolic by mere contact with the air; and distilling through the rocks, form the alum veins of the Solfatara. He saw the bitumens as they melted; the inflammable and sulphureous airs exhaling; and the waters become mineral and impregnated with the fire and vapours of these stupendous furnaces, preparing for the beings that move and dispute on the crust of the abyss, a remedy for pain and a balsam for disease.

The continual application which Mr Bergman bestowed on his studies having affected his health, he was advised to interrupt them if he wished to prolong his life: but he found happiness only in study, and wished not to forfeit his title to reputation by a few years more of inactivity and languor. He exhausted his strength, and died in the month of June in the year 1784. The university of Upsal paid the most distinguished honours to his memory; and the academy of Stockholm consecrated to him a medal to perpetuate the regret of all the learned in Europe for his loss. His Physical and Chemical Essays have been collected and translated by Dr Edmund Cullen, and published in 2 vols. 8vo.

BERGOMUM, in *Ancient Geography*, a town of the Transpadana, built by the Gauls on their incursions into Italy. Now called *Bergamo*, in the territory of Venice. E. Long. 10. N. Lat. 45. 40.

BERIA, BERIE, *Berry*, signifies a large open field; and those cities and towns in England which end with that word are built on plain and open places, and do not derive their names from boroughs as Sir Henry Spelman imagines. Most of our glossographers in the names of places have confounded the word *berie* with that of *bury* and *borough*, as if the appellative of ancient towns: whereas the true sense of the word *berie*, is a flat wide champaign, as is proved from sufficient authorities by the learned Du Fresne, who observes that *Beria Sancti Edmundi*, mentioned by Mat. Paris. sub ann. 1174, is not to be taken for the town, but for the adjoining plain. To this may be added, that many flat and wide meads, and other open grounds, are called by the name of *beries* and *bery-fields*; the spacious meadow between Oxford and Islay was in the reign of King Athelstan called *Bery;* as is now the largest pasture-ground in Quarendon in the county of Buckingham, known by the name of *Beryfield.* And though these meads have been interpreted demesne or manor meadows, yet they were truly any flat or open meadows that lay adjoining to any villa or farm.

BERING, SINUS, of Copenhagen, a Latin lyric poet, flourished about 1560.

BERING'S STRAITS, the name of that narrow division of the old and new world, where the distance between Asia and America is only 13 leagues. They are so named from Captain Vitus Bering, a Dane by birth, and employed on the same plan of discovery in these parts as our great countryman Cook was in the late voyage. He was in the service of Peter the Great: who, by the strength of an extensive genius, conceiving an opinion of the vicinity of America to his Asiatic dominions, laid down a plan of discovery worthy of so extraordinary a monarch, but died before the attempt was begun; but his spirit survived in his successor. Bering, after a tedious and fatiguing journey through the wilds of Siberia, arrived in Kamtschatka, attended with the scanty materials for his voyage, the greatest part of which he was obliged to bring with him through a thousand difficulties. He sailed from the river of Kamtschatka on July 15. 1728; and on the 15th of August saw Serdze Kamen, or the heart-shaped rock, a name bestowed on it by the first discoverer.—From Serdze Kamen, to a promontory named by Captain Cook *East Cape*, the land trends south-east. The last is a circular peninsula of high cliffs, projecting far into the sea due east, and joined to the land by a long and very narrow isthmus, in lat. 66. 6. This is the Tschutski Noss of our navigators, and forms the beginning of the narrow straits or division of the old and new world. The distance between Asia and America in this place, as already mentioned, is only 13 leagues. The country about the cape, and to the north-west of it, was inhabited. About mid-channel are two small islands, named by the Russians the *isles of St Diomedes;* neither of them above three or four leagues in circuit. It is extremely extraordinary that Bering should have sailed through this confined passage, and yet that the object of his mission should have escaped him. His misfortune could only be attributed to the foggy weather, which he must have met with in a region notorious for mists; for he says that he saw land neither to the north nor to the east. Our generous commander, determined to give him every honour his merit could claim, has dignified these with the name of *Bering's Straits.* The depth of these straits is from 12 to 29 or 30 fathoms. The greatest depth is in the middle, which has a slimy bottom; the shallowest parts are near each shore, which consist of sand mixed with bones and shells. The current or tide was very inconsiderable, and what there was came from the west. From East Cape the land trends south by west. In lat. 65. 36. is the bay in which Captain Cook had the interview with Tschutski. Immediately beyond is the bay of St Laurence, about five leagues broad in the entrance and four deep, bounded at the bottom by high land. A little beyond is a large bay, either bounded by low land at the bottom, or so extensive as to have the end invisible. To the south of this are two other bays; and in N. Lat. 64. 13. Long. 186. 36. is the extreme southern point of the land of the Tschutski. This formerly was called the *Anadirskoi Noss.* Near it Bering had conversation with eight men, who came off to him in a *baidar* or boat covered with the skins of seals; from which Bering and others have named it the *Tschutski Noss.*

BERITH, a simple mentioned in Scripture, used for cleansing or taking out spots (Jer. ii. 22.). Some will have it to be the *kali* or salt-wort, from the ashes of which soap is made; and in our version it is rendered *soap:* others, after Rudbeck, made it to be the dye of the purple fish.

BERKELEY, GEORGE, the celebrated bishop of Cloyne, was the eldest son of William Berkeley, Esq. of Thomastown in the county of Kilkenny; a cadet of the family of Earl Berkeley of Berkeley castle. At eight years of age he was sent to the school of the Ormond foundation at Kilkenny, from which Swift had a few years before been removed to the university. Before Berkeley had attained his fourteenth year he was admitted a pensioner in Trinity college, Dublin, in which whilst B. A. he obtained a fellowship. Some of

Digitized by Google

Berkeley. of his first essays as a writer were published in the Spectator and Guardian, which entertaining works he adorned with many pieces in favour of virtue and religion. His learning and his virtues, his wit and agreeable conversation, made his friendship sought and his acquaintance cultivated by many great and learned men: and among others by the earl of Peterborough, Dr Swift, Dr Arbuthnot, Mr Pope, and Mr Addison. The earl took him as chaplain and secretary of embassy into Italy; and during his absence on that occasion he became senior fellow of his college, and was in 1717 created D. D. by *diploma*.

Upon his return, his acquaintance among the great was considerably extended; and Lord Burlington, who at Rome had conceived for him a high esteem on account of his skill in architecture, obtained for him, through the duke of Grafton, then (1721) lord-lieutenant of Ireland, the king's grant of the deanery of Down, worth 200ol. per annum. Such however was the narrow system of politics at that time prevalent in the Irish cabinet, that though his majesty had actually signed the grant, the lords justices recommended *back* for the deanery of Down Swift's Dean *Daniel*, celebrated for having in a state sermon styled Pompey an *unfortunate gentleman*: and such was Dr Berkeley's humility and mildness of temper, that he could not be prevailed upon to dispute the matter, or even to expostulate on the subject. His patron Lord Burlington procured for him afterwards (1724) the deanery of Derry, the next best in Ireland to that of Down; and upon this preferment the Doctor resigned his fellowship.

In the year 1722 his fortune received a considerable increase from an event by him very unexpected. Upon his first going to London (1717) he sent one morning a note to Swift, desiring that they might dine together that day at a tavern. The dean of St Patrick's returned for answer, that they might enjoy one another's company at their ease where he himself was engaged to dine, with the family of Mrs Esther Vanhomrigh (the celebrated Vanessa); and thither he took Mr Berkeley. Some years before her death this lady removed to Ireland, and fixed her residence at Cell-bridge, a pleasant village in the neighbourhood of Dublin, most probably with a view of frequently enjoying the company of a man for whom she had conceived a very singular attachment. But finding herself totally disappointed in that expectation, she altered her intention of making the dean of St Patrick's her heir, and left the whole of her fortune (8000l.) to be divided equally between her near relation Judge Marshal of the common pleas in Ireland, and Dr Berkeley, whom she had never seen but once in her life, and that at the distance of nine years.

In the interval between Dr Berkeley's return from abroad and his preferment to the deanery of Derry, his mind had been employed in conceiving a noble and benevolent plan for the better supplying of the churches in our foreign plantations, and for converting the savage Americans to Christianity, by erecting a college in the Summer Islands. To this proposal the address and abilities of its author procured, after a tedious attendance on the great, an apparently successful reception; for he obtained a charter for its foundation, together with a parliamentary grant of 20,000l. for carrying it into execution, to which were added several large subscriptions from individuals, to be paid as soon as the public bounty should be received. Upon the faith of this, our philosopher embarked for America; where he became so generally and so justly venerated by all descriptions of men, that each vied with the other which should most honour him. The queen, with whom he was a favourite, had endeavoured to dissuade him from this enterprise, by offering him her interest for an English bishopric; but he replied, that he should prefer the headship of St Paul's college at Bermuda to the primacy of all England. From that headship he was to enjoy a revenue of 100l. per annum: and was bound by his charter to resign his deanery, then worth 1100l. per annum, within a year and a half after the 20,000l. should be paid by government. That sum was never paid; and after two years residence on Rhode Island and its neighbouring continent, during which time every interest of piety and virtue was near to his heart and cultivated by his labours, the dean was obliged to return to Europe, and abandon one of the noblest designs that had ever entered into the human heart to form.

In August 1728, immediately before his departure for America, he entered into marriage with Anne, the eldest daughter of the right honourable John Forster, Esq. speaker of the Irish house of commons; which lady died in 1785. In May 1734 he was consecrated bishop of Cloyne, and vacated his deanery. On that occasion he said to his few intimates, "I will never accept of a translation." At Cloyne he distinguished himself by pastoral vigilance, prelatical hospitality, and constant residence. Through the whole of his clerical life, he was, while his health permitted, a constant and an extemporaneous preacher; nor is it known that he ever reduced a single sermon to writing, except one preached before the society for propagating the gospel in foreign parts, which at their request was published. He endeared himself to the people of his diocese by promoting at once their temporal and their spiritual happiness. He endeavoured by all means to raise a spirit of industry, and to propagate the arts of cultivation and agriculture in that neglected country; and it may be truly said, that never man laboured more earnestly to amass a fortune or to aggrandize a family, than he did to promote the best interests of mankind, considered either as citizens on earth or as candidates for heaven.

The earl of Chesterfield, who had never seen him but once, and that when they were both young men, on being made lord lieutenant of Ireland sent to him a most respectful offer of the then vacant see of Clogher, of more than double the value of Cloyne, promising at the same time his recommendation to any other richer see that might be vacated during his administration. But the good bishop declined the generous offer, requesting the lord lieutenant not to think of him on any other vacancy, as he was resolved never to quit his first bishoprick for any other. In 1751, finding the infirmities of age come upon him, and wishing to retire from the care of his diocese to superintend the education of his son (then nominated a student of Christ-church, and now prebendary of Canterbury), that the revenues of the church might not be misapplied, nor the interests of religion suffer by the absence of the pastor from his

his flock, he made great interest for leave to resign his bishopric, of which the income was then not less than 1700l. per annum. Failing of success in this application, he let the lands of his demesne at Cloyne, on very easy terms, at the rent of 200l. which he directed to be distributed annually among the poor house-keepers of Cloyne, Youghall, and Aghadda, until his return.

At Oxford he lived highly respected by the learned members of that great university, till the hand of Providence unexpectedly deprived them of the pleasure and advantage derived from his residence among them. On Sunday evening, January 14th 1753, as he was sitting in the midst of his family, and just after he had concluded an extemporaneous comment on the 15th chapter of 1 Cor. he was instantly translated, without a groan, from earth to heaven. A polypus in the heart was the cause of his dissolution. About a minute before his death he had seated himself on a couch and turned his face towards the wall; and had he not ceased speaking *in the middle of a sentence*, his lady and his son would not immediately have discovered their loss. His remains were, with much funeral solemnity, interred at Christ-church, his friend Bishop Conybeare, then dean of that cathedral, performing the last service. An elegant marble monument, with a spirited inscription by the present archbishop of York, marks the spot where his ashes rest. As to his person, he was of the tall middle size; his countenance was very handsome, and full of meaning and benignity; and his bodily strength was uncommonly great, even to the last year of his life: but he was subject to grievous nervous colics, in which he thought tar-water gave him more efficacious relief than any other medicine. Mr Pope sums up his character in one line. After mentioning some particular virtues which characterized other prelates then living, he ascribes

To Berkeley ev'ry virtue under heav'n.

An admirable description is given of him in the following anecdote. Bishop Atterbury, having heard much of Mr Berkeley, wished to see him. Accordingly he was one day introduced to that prelate by the earl of Berkeley. After some time, Mr Berkeley quitted the room: on which Lord Berkeley said to the bishop, "Does my cousin answer your lordship's expectations?" The bishop, lifting up his hands in astonishment, replied, "So much understanding, so much knowledge, so much innocence, and such humility, I did not think had been the portion of any but angels, till I saw this gentleman." His knowledge is said to have been extended to the minutest objects, and included the arts and business of common life. Thus Dr Blackwell, in his Memoirs of the court of Augustus, having made an observation, "that the ingenious mechanic, the workers in stone and metal, and improvers in trade, agriculture, and navigation, ought to be searched out and conversed with no less than the professors of speculative science," adds the following eulogium on our prelate: "In this respect I would with pleasure do justice to the memory of a very great though singular sort of a man, Dr Berkeley, better known as a philosopher and intended founder of an university in the Bermudas or Summer Islands, than as bishop of Cloyne in Ireland. An inclination to carry me out on that expedition, as one of the young professors on his new foundation, having brought us often together, I scarce remember to have conversed with him on that art, liberal or mechanic, of which he knew not more than the ordinary practitioners. With the widest views, he descended into a minute detail, and grudged neither pains nor expence for the means of information. He travelled through a great part of Sicily on foot; clambered over the mountains and crept into the caverns, to investigate its natural history, and discover the cause of its volcanoes: and I have known him sit for hours in forgeries and founderies to inspect their successive operations. I enter not into his peculiarities either religious or personal: but admire the extensive genius of the man, and think it a loss to the western world that his noble and exalted plan of an American university was not carried into execution. Many such spirits in our country would quickly make learning wear another face."

He published many ingenious works, particularly, "An essay towards a new theory of vision:" "The principles of human knowledge;" the singular notions in which gave rise to much controversy: "Alciphron, or the minute philosopher:" one of the most elegant and genteel defences of that religion which he was born to vindicate both by his virtues and his ingenuity: "The Analyst;" in which he endeavours to show that Sir Isaac Newton's doctrine of fluxions is more incomprehensible than any mystery in the Christian religion: "The Querist;" in which the true interests of Ireland are pointed out in a very striking light: and "Siris, or a treatise on tar-water," which, under his sanction, became for a while a very popular medicine. In the Gentleman's Magazine for January 1777, it is said that the adventures of Signior Gaudentio di Lucca have been generally attributed to Bishop Berkeley; but we have the best authority to say that they were not the offspring of his pen. The bishop never saw the work till it was put into his hands by his son; and when he read it, he expressed no small contempt for the style of a writer who describes his hero as a *tall, clean-made gentleman;* though he owned his fancy to be often brilliant. We believe the adventures of Gaudentio di Lucca were written by a Romish priest for his amusement when a prisoner in the Tower of London.

BERKSHIRE, is an inland county of England, which contained the whole of that British principality inhabited by the Atrebatii, who are supposed to have been originally from Gaul. When Constantine divided the island into Roman provinces in 310, this principality was included in Britannia Prima, the first division, whose boundaries were the English channel on the south, and the Thames and Severn on the north. On the Romans quitting the island, and civil dissensions enabling the Saxons to establish the Heptarchy, this part of the country was included in the kingdom of the West Saxons, which commenced in 519, and continued till 828, when it became the only remaining sovereignty, having conquered all the others, and they were incorporated by the name of England, under Egbert; whose grandson, Alfred, a native of Wantage, in this county, in 889 divided his kingdom into counties, hundreds, and parishes, and at this time this division first received its appellation of Berkshire, or Berocshire. At present it is in the Oxford circuit, the province

Digitized by Google

Berkshire province of Canterbury, and diocese of Salisbury. The general shape of it somewhat resembles the form of a slipper or sandal. It is 42 miles long, 28 broad, about 137 in circumference, and contains an area of 438,977 acres, or by other accounts, 476,170. It is situated north-west of London; has 140 parishes, 62 vicarages, 12 market towns but no city, 671 villages; is divided into 20 hundreds; sends nine members to parliament, two for the county, two for Windsor, two for Reading, two for Wallingford, and one for Abingdon; and pays 10 parts of the proportion of the land-tax. In 1811 the number of houses was 22,104, and the whole population 118,277. Its principal river is the Thames. It also has the Kennet, great part of which is navigable; the Loddon, the Ocke, and the Lambourne, a small stream, which, contrary to all other rivers, is always highest in summer, and shrinks gradually as winter approaches. The air of this county is healthy even in the vales; and though the soil is not the most fertile, yet it is remarkably pleasant. It is well stored with timber, particularly oak and beech, and produces great plenty of wheat and barley. Its principal manufactures are woollen cloth, sail-cloth, and malt.

Its market towns are Abingdon, Faringdon, Hungerford, East Ilsley, Lower Lambourne, Maidenhead, Newbury, Ockingham, Reading, Wallingford, Wantage, and Windsor, remarkable for its royal castle, as the county is for White horse-hill, near Lambourne, where is the rude figure of a horse, which takes up near an acre of ground on the side of a green hill, said to have been made by Alfred in the reign of his brother Ethelred, as a monument to perpetuate a victory over the Danes in 872, at Ashdown, now Ashburg-Park.

The Roman Watling-street, from Dunstable, enters Berkshire, at the village of Streatley, between Wallingford and Reading, and crossing this county proceeds to Marlborough. Another Roman road from Hampshire enters this county, leads to Reading and Newbury, the Spinæ of Camden, where it divides: one branch extends to Marlborough in Wilts, and the other to Cirencester in Gloucestershire. A branch from the Icknield-street proceeds from Wallingford to Wantage.

There is a Roman camp near Wantage on the brow of a hill, of a quadrangular form; there are other remains of encampments at East-Hampstead, near Ockingham, near White-horse-hill, near Pusey, and upon Sinodun-hill, near Wallingford. At Lawrence Waltham is a Roman fort, and near Denchworth is Cherbury castle, a fortress of Canute. Ussington castle, near White-horse hill, is supposed to be Danish; and near it is Dragon-hill, supposed to be the burying-place of Uter Pendragon, a British prince. Near White-horse hill are the remains of a funeral monument of a Danish chief slain at Ashdown by Alfred. In this county the following antiquities are worthy the notice of travellers: Abingdon church and abbey: Aldworth castle, near East Ilsley; Bysham monastery; Dunnington castle; Lambourne church; Reading abbey; Sunning chapel; Wallingford church and castle. Windsor castle beggars all description for situation, &c. Berkshire is an earldom belonging to a branch of the Howard family, the representative being earl of Suffolk and Berkshire. See BERKSHIRE, SUPPLEMENT.

Berlin. BERLIN, a city of Germany, capital of the electorate of Brandenburg, and of the whole Prussian dominions, seated in E. Long. 13. 37. N. Lat. 52. 53. This city is one of the largest, best built, and best governed, of any in Germany. The streets are large, straight, clean, and well paved, and some of them very long and elegant. There are also several large and beautiful squares, with pleasant walks. It is surrounded with handsome gardens, which produce excellent fruit. The river Spree, that crosses the city, has a communication with the Havel Oder, and Elbe, which greatly facilitate commerce. The French refugees have greatly contributed to the embellishment of Berlin, by introducing various manufactures and arts. It contained 153,000 inhabitants in 1803.

Berlin is divided into five parts, without reckoning the suburbs, which are very large. The houses in these last are almost all of wood; but so well plastered, that they seem to be of stone. In the suburb called *Spandau*, is a house belonging to the royal family, with well contrived apartments, and furnished in a very fine taste. In the suburb of Stralau is a house and garden belonging to the king. The royal gate of the city is defended by a half moon, and two bastions, covered with brick; it fronts the royal street, which is one of the longest and most frequented in the city. It contains very handsome houses, particularly those belonging to some of the ministers of state.

The royal street is crossed by five others, which are large and fine. On the new bridge, which is of stone, over the Spree, is an equestrian statue of William the Great, which is esteemed an excellent piece of workmanship. The elector is represented in a Roman habit, and his horse stands on a pedestal of white marble adorned with basso relievos, and four slaves bound to the base.

After this bridge is past, the king's palace appears, which is a grand and superb edifice; it is four stories high, and the apartments are extremely magnificent. No palace in Europe has such a great quantity of silver tables, stands, lustres, branched candlesticks, &c. In the knights hall there is a buffet, which takes up all one side, where there are basons and cisterns of gilt silver, of extraordinary magnitude. The furniture of the great apartment is extremely rich; and there is a very handsome gallery, adorned with paintings, representing the principal actions of Frederick I. Formerly there were fine gardens to the palace, but they are now turned into a place of arms. The king's stables are large, stand near the palace, and front the great street. Externally they make a Gothic appearance, but within they are very magnificent. The mangers are of stone, and the pillars that divide the stalls are of iron, adorned with the king's cypher, gilt. Over the racks are pictures representing the finest horses which the king's stud has produced. Over the stables there are large rooms, containing all sorts of horse furniture, particularly the horse-equipage of Frederick I. all the metallic part of which is gold, set with diamonds. Besides these, there are handsome lodgings for the officers of the stables. Over the riding-house is a theatre, where plays have been acted, and balls have been made for the entertainment of the court,

The arsenal consists of four grand buildings, that form a court in the middle, like a college: each front has

Digitized by Google

has three large porticoes. On the principal gate is a medallion of Frederick II. in bronze; and the four cardinal virtues, of a colossal stature, placed on pedestals on each side of the portico, seem to look at the portrait of the king, which is supported by Fame and Victory. The Corinthian order is prevalent in the first stage, and is managed with a great deal of art. The whole edifice is surrounded in the upper part with a balustrade, adorned with trophies and statues, among which is Mars seated on a heap of several sorts of arms. This altogether forms a noble and majestic decoration. It is bounded with iron in the shape of cannon, which are placed at proper distances, and support iron chains that hang like festoons, to prevent passengers from approaching the windows below. The lower rooms are filled with a great number of brass cannon; the walls and pillars which sustain the floor are set off with cuirasses and helmets. The upper story contains several rooms filled with arms, which are disposed in a curious order. Behind the arsenal is the house of the general of the artillery, which includes the foundery, where they are continually at work. Besides this, there are other places where they keep the train of artillery.

The opera-house is an elegant modern edifice. The front has a noble portico supported by Corinthian columns, and a pediment adorned with basso relievos and statues. The columns that support the roof throw the whole into a grand saloon. It has three galleries, and is said to be capable of containing 2000 persons.

A rampart and fosse separate Worder from Dorothea Stadt, or the New Town, inhabited chiefly by French. There are seven great alleys or walks, which divide this quarter into two parts. The middle walk is broader than the rest, and is surrounded with balustrades, having a grass-plot in the middle: this is for persons that take the air on foot. The alleys on each side are paved, and serve for those that come abroad in coaches. These alleys, which are about three miles in length, are terminated with a bar, that leads towards the park. The alleys with trees are bounded by rows of houses. In one of these is a building, formerly called the *lesser stables*, and now made into lodgings for the guards. The apartments above these are occupied by the academy of painting and the academy of arts and sciences. Behind these is the observatory, where there is a great number of astronomical and mathematical intruments.

There are other things worthy of observation, such as the cabinet of medals, and of the antiquities belonging to the king; that of natural curiosities; the chemical laboratory, and its furnaces and medals, of a new invention: the theatre for anatomical demonstrations; the royal library, which is one of the completest in Germany, and has many scarce books and manuscripts.

The city was taken in 1760 by an army of Russians, Austrians, Saxons, &c. who entered on the 9th of October. They totally destroyed the magazines, arsenals, and founderies, seized an immense quantity of military stores, and a number of cannon and arms; called first for the immediate payment of 800,000 guilders, and then laid on a contribution of 1,900,000 German crowns: not satisfied with this, many irregularities were committed by the soldiery; but, on the whole, though some shocking actions were committed, a far more exact discipline was observed than from such troops could have been expected upon such an occasion, where there was every incentive which could work upon the license of a conquering army. Their officers no doubt with great difficulty preserved even that degree of order.

But though their behaviour was tolerable with regard to the private inhabitants, there was something shocking and ungenerous in their treatment of the king's palaces. The apartments of the royal castle of Charlottenburg were entirely plundered, the precious furniture spoiled, the pictures defaced, without even sparing the antique statues collected by Cardinal Polignac, which had been purchased by the house of Brandenburg. The castle of Schonhausen, belonging to the queen, and that of Fredericsfeld, belonging to the Margrave Charles, were also plundered.

The palace of Potsdam, the famous Sans-souci, had a better fate; Prince Esterhazi commanded there, and it was preserved from the smallest violation. The prince, on viewing the palace, only asked which picture of the king resembled him most; and being informed, desired that he might have leave to take it, together with two German flutes which the king used, to keep them, he said, in memory of his majesty. This was a sort of taking very different from pillage.

They staid in the city four days: but hearing that the king, apprehensive of this stroke, was moving to the relief of his capital, they quitted it on the 13th of October; and having wasted the whole country round for a vast extent, and driven away all the cattle and horses they could find, retreated by different routes out of Brandenburg.

Berlin, a sort of vehicle, of the chariot kind; taking its name from the city of Berlin, in Germany: though some attribute the invention of it to the Italians, and derive the word from *berlina*, a name given by them to a sort of stage, whereon persons are exposed to public shame. The berlin is a very convenient machine to travel in, being lighter, and less apt to be overturned, than a chariot. The body of it is hung high, on shafts, by leathern braces; there being a kind of stirrup, or footstool, for the conveniency of getting into it: instead of side-windows, some have screens to let down in bad, and draw up in good, weather.

BERME, in *Fortification*, a space of ground left at the foot of the rampart, on the side next the country, designed to receive the ruins of the rampart, and prevent their filling up the fosse. It is sometimes palisadoed, for the more security; and in Holland it is generally planted with a quickset hedge. It is also called *lisiere*, *relais*, *foreland*, *retrait*, *pais de souris*, &c.

BERMUDAS, or Summer-islands, a cluster of small islands in the Atlantic ocean, lying almost in the form of a shepherd's crook, in W. Long. 65. N. Lat. 32. 30. between 200 and 300 leagues distant from the nearest place of the continent of America, or any of the other West-India islands. The whole number of the Bermudas islands is said to be about 400, but very few of them are habitable. The principal is St George's, which is not above 16 miles long, and three at most in breadth. It is universally agreed, that the nature of this and the other Bermudas islands has undergone a surprising alteration for the worse since they were first discovered;

Digitized by Google

Bermudas. covered; the air being much more inclement, and the soil much more barren than formerly. This is ascribed to the cutting down those fine spreading cedar trees for which the islands were famous, and which sheltered them from the blasts of the north wind, at the same time that it protected the undergrowth of the delicate plants and herbs. In short, the Summer islands are now far from being desirable spots; and their natural productions are but just sufficient for the support of the inhabitants, who, chiefly for that reason, perhaps, are temperate and lively even to a proverb. At first tobacco was raised upon these islands; but being of worse quality than that growing on the continent, the trade is now almost at an end. Large quantities of ambergris were also originally found upon the coasts, and afforded a valuable commerce; but that trade is also reduced, as likewise their whale trade, though the perquisites upon the latter form part of the governor's revenue, he having 10l. for every whale that is caught. The Bermudas islands, however, might still produce some valuable commodities, were they properly cultivated. There is here found, about three or four feet below the surface, a white chalk stone which is easily chisseled, and is exported for building gentlemen's houses in the West Indies. Their palmetto leaves, if properly manufactured, might turn to excellent account in making women's hats; and their oranges are still valuable. Their soil is also said to be excellent for the cultivation of vines, and it has been thought that silk and cochineal might be produced; but none of these things have yet been attempted. The chief resource of the inhabitants for subsistence is in the remains of their cedar wood, of which they fabricate small sloops, with the assistance of the New England pine, and sell many of them to the American colonies, where they are much admired. Their turtle-catching trade is also of service; and they are still able to rear great variety of tame-fowl, and have wild ones abounding in vast plenty. All the attempts to establish a regular whale fishery on these islands have hitherto proved unsuccessful; they have no cattle, and even the black hog breed, which was probably left by the Spaniards, is greatly decreased. The water on the islands, except that which falls from the clouds, is brackish; and at present the same diseases reign there as in the Caribbee islands. They have seldom any snow, or even much rain: but when it does fall, it is generally with great violence, and the north or north-east wind renders the air very cold. The storms generally come with the new moon; and if there is a halo or circle about it, it is a sure sign of a tempest, which is generally attended with dreadful thunder and lightning. The inhabited parts of the Bermudas islands are divided into nine districts called *tribes*. 1. St George. 2. Hamilton. 3. Ireland. 4. Devonshire. 5. Pembroke. 6. Pagets. 7. Warwick. 8. Southampton. 9. Sandys. There are but two places on the large island where a ship can safely come near the shore, and these are so well covered with high rocks that few will choose to enter in without a pilot; and they are so well defended by forts, that they have no occasion to dread an enemy. St George's town is at the bottom of the principal haven; and is defended by nine forts, on which are mounted 70 pieces of cannon that command the entrance. The town has a handsome church, a fine library, and a noble town-house, where the governor, council, &c. assemble. Besides these there are about 1000 houses well built. The tribes of Southampton and Devonshire have each a parish-church and library, and the former has a harbour of the same name; there are also scattered houses and hamlets over many of the islands, where particular plantations require them. The inhabitants are clothed chiefly with British manufactures, and all their implements for tilling the ground and building are made in Britain.

It is uncertain who were the first discoverers of the Bermudas islands. John Bermudas a Spaniard is commonly said to have discovered them in 1527; but this is disputed, and the discovery attributed to Henry May an Englishman. As the islands were without the reach of the Indian navigation, the Bermudas were absolutely uninhabited when first discovered by the Europeans. May above mentioned was shipwrecked upon St George's; and with the cedar which they felled there, assisted by the wreck of their own ship, he and his companions built another which carried them to Europe, where they published their accounts of the islands. When Lord Delaware was governor of Virginia, Sir Thomas Gates, Sir George Summers, and Captain Newport, were appointed to be his deputy-governors; but their ship being separated by a storm from the rest of the squadron, was in the year 1609 wrecked on the Bermudas, and the governors disagreeing among themselves, built each of them a new ship of the cedar they found there, in which they severally sailed to Virginia. On their arrival there, the colony was in such distress, that Lord Delaware, upon the report which his deputy-governors made him of the plenty they found at the Bermudas, despatched Sir George Summers to bring provisions from thence to Virginia in the same ship which brought him from Bermudas, and which had not one ounce of iron about it, except one bolt in the keel. Sir George, after a tedious voyage, at last reached the place of his destination, where, soon after his arrival, he died, leaving his name to the islands, and his orders to the crew to return with black hogs to the colony of Virginia. This part of his will, however, the sailors did not choose to execute; but setting sail in their cedar ship for England, landed safely at Whitechurch in Dorsetshire.

Notwithstanding this dereliction of the island, however, it was not without English inhabitants. Two sailors, Carter and Waters, being apprehensive of punishment for their crimes, had secreted themselves from their fellows when Sir George was wrecked upon the island, and had ever since lived upon the natural productions of the soil. Upon the second arrival of Sir George, they enticed one Chard to remain with them; but differing about the sovereignty of the island, Chard and Waters were on the point of cutting one anothers throats, when they were prevented by the prudence of Carter. Soon after, they had the good fortune to find a great piece of ambergris weighing about 80 pounds, besides other pieces, which in those days were sufficient, if properly disposed of, to have made each of them master of a large estate. Where they were, this ambergris was useless; and therefore they came to the desperate resolution of carrying themselves and it in an open boat to Virginia or to Newfoundland, where they hoped to dispose of their treasure to advantage. In the mean time, however, the

Bermudas. Virginia Company claimed the property of the Bermudas islands; and accordingly sold it to 120 persons of their own society, who obtained a charter from King James for their possessing it. This New Bermudas Company, as it was called, fitted out a ship with 60 planters on board to settle on the Bermudas, under the command of one Mr Richard Moor, by profession a carpenter. The new colony arrived upon the island just at the time the three sailors were about to depart with their ambergris; which Moor having discovered, he immediately seized and disposed of it for the benefit of the company. So valuable a booty gave vast spirit to the new company; and the adventurers settled themselves upon St George's island, where they raised cabins. As to Mr Moor, he was indefatigable in his duty, and carried on the fortifying and planting the island with incredible diligence; for we are told, that he not only built eight or nine forts or rather blockhouses, but inured the settlers to martial discipline. Before the first year of his government was expired, Mr Moor received a supply of provisions and planters from England; and he planned out the town of St George as it now stands. The fame of this settlement soon awakened the jealousy of the Spaniards, who appeared off St George's with some vessels; but being fired upon from the forts, they sheered off, though the English at that time were so ill provided for a defence, that they had scarcely a single barrel of gunpowder on the island. During Moor's government the Bermudas were plagued with rats, which had been imported into them by the English ships. This vermin multiplied so fast in St George's island, that they even covered the ground, and had nests in the trees. They destroyed all the fruits and corn within doors; nay, they increased to such a degree, that St George's island was at last unable to maintain them; and they swam over to the neighbouring islands, where they made as great havock. This calamity lasted five years, though probably not in the same degree, and at last it ceased all of a sudden.

On the expiration of Moor's government, he was succeeded by Captain Daniel Tucker, who improved all his predecessor's schemes for the benefit of the island, and particularly encouraged the culture of tobacco. Being a severe disciplinarian, he held all under him so rigidly to duty, that five of his subjects planned as bold an enterprise for liberty as was perhaps ever put in execution. Their names were Barker, who is said to have been a gentleman; another Barker, a joiner; Goodwin, a ship-carpenter; Paet, a sailor; and Saunders, who planned the enterprise. Their management was as artful as their design was bold. Understanding that the governor was deterred from taking the pleasure of fishing in an open boat, on account of the dangers attending it, they proposed to build him one of a particular construction, which accordingly they did in a secret part of the island; but when the governor came to view his boat, he understood that the builders had put to sea in it. The intelligence was true: for the adventurers, having provided themselves with a few necessaries they wanted, sailed for England; and notwithstanding the storms they encountered, their being plundered by a French privateer, and the incredible miseries they underwent, they landed in 42 days time at Corke in Ireland, where they were generously relieved and entertained by the earl of Thomond.

Bermudas. Bern.

In 1619 Captain Tucker resigned his government to Captain Butler. By this time the high character which the Summer islands bore in England rendered it fashionable for men of the highest rank to encourage their settlement; and several of the first nobility of England had purchased plantations among them. Captain Butler brought over with him 500 passengers, who became planters on the islands, and raised a monument to the memory of Sir George Summers. The island was now so populous (for it contained about a thousand whites), that Captain Butler applied himself to give it a new constitution of government by introducing an assembly, the government till this time being administered only in the name of the governor and council. A body of laws are likewise drawn up, as agreeable to the laws of England as the situation of the island would admit of. One Mr Barnard succeeded Captain Butler as governor, but died six weeks after his arrival on the island; upon which the council made choice of Mr Harrison to be governor, till a new one should be appointed. No fewer than 3000 English were now settled in the Bermudas, and several persons of distinction had curiosity enough to visit it from England. Among these was Mr Waller the poet, a man of fortune, who being embroiled with the parliament and commonwealth of England, spent some months in the Summer islands, which he has celebrated in one of his poems as the most delightful place in the world. The dangers attending the navigation, and the untowardly situation of these islands, through their distance from the American continent, seem to be the reasons why the Bermudas did not now become the best peopled islands belonging to England, as we are told that some time ago they were inhabited by no fewer than 10,000 whites. The inhabitants, however, never showed any great spirit for commerce, and thus they never could become rich. This, together with the gradual alteration of the soil and climate already taken notice of, soon caused them to dwindle in their population; and at present the number of white inhabitants is only 5462, and of blacks 4919. Even these seem much more inclined to remove to some other place than to stay where they are; so that unless some beneficial change take place, the state of the Bermudas must daily grow worse. The exports in 1810 amounted to 36,600l.

BERN, one of the cantons of Switzerland, which holds the second rank among the 13; but as it was formerly by far the largest in extent, containing almost one-third of the whole country, it might be considered as the first. It is bounded to the north by the cantons of Basil and Solothurn, and the Austrian forest-towns; to the south by the lake of Geneva, the Valais, and duchy of Savoy; to the east by Uri, Underwald, Lucern, and the county of Baden; and to the west by Solothurn, Neufchatel, Franche-Compte, the district of Biel, and the land of Gex. It is the most fruitful, the richest, and was by much the largest, of all the cantons, extending in length about sixty leagues, and about thirty where broadest. It yields not only plenty of grain, fruit, and pasture; but also good wine, a variety of coloured earths and clays, sand-stone, mundick, gypsum, pit-coal,

coal, sulphur, and iron-ore. Here likewise are large herds of cattle, great and small; and, in consequence of that, great quantities of milk, butter, and cheese. The rivers that water this canton are the Aar, the Emmat, the Wigger, the Aa, the Rusz, the Limmat, the Sanen, the Sensen, and the Kandel. The principal lake is that of Geneva: the length of which is about 18 leagues, and the greatest breadth between three and four. The depth in some places is near 400 fathoms, in others not above 40. The Rhone enters it at the east end, near Bouveret, and issues out again at the west close by Geneva. In summer its waters are much swelled by the melting of the snow on the mountains. This lake, however, is not entirely surrounded by the territory of Bern, but partly by Savoy and the country of Gex (the former of which belongs to the king of Sardinia, and the latter to France), and the territory of Sion. Its borders are extremely fertile and beautiful, being much embellished with vineyards, which yield excellent wine, and interspersed with towns and villages, betwixt which a considerable commerce is carried on. The other great lakes, that are wholly or partly within this canton, are those of Neufchatel, Biel, Murte, Thun, Brien, and Halwyl, which all abound in fish, particularly that of Geneva, where trouts are sometimes caught weighing 40 or 50 pounds. In that of Biel, called also the *Nydau-lake*, are two small islands, one of which is very beautiful. This lake is about three leagues in length and one in breadth. Along the whole west and north-west sides of the canton runs that chain of mountains called by the general name of *Jura;* but the several mountains of which it is composed have all their particular names. This canton is well cultivated, and very populous, and before it was dismembered contained 407,000 souls. German is the prevailing language, but almost all the people of fashion speak either French or Italian; even the common people in the Pais de Vaud, and other places that lie towards France or Italy, speak a corrupt French or Italian, or a jargon composed of both. The established religion here and in the other Protestant cantons is Calvinism, the same both in doctrine and discipline as in Holland; nor is any other tolerated, except in the common bailiages, and the vale of Frick. The ministers are divided into deaneries and classes, and hold yearly chapters or synods. They are kept in a greater dependence on the civil power here than in the other cantons, and not suffered to interfere with matters of state. The city of Bern first joined the confederacy in the year 1353. Towards the defence thereof the canton now furnishes 2000 men. Every male from 16 to 60 is enrolled in the militia, and about a third of them regimented. There are officers for every district, whose province it is to see that the men be regularly exercised; that their arms, ammunition, and clothing, be in good condition; and that they be kept in constant readiness to march. Once a-year they are drawn out to a general review. The same attention is paid to those that belong to the train of artillery. Some regiments consist of married, and some of unmarried men; some of foot, others of dragoons. There is also one regiment and a troop of cuirassiers. The latter consists entirely of burghers of Bern. Both the horsemen and footmen find their horses, arms, and accoutrements. Besides the arms and artillery in the arsenal at Bern, all the castles, where the country governors or bailiffs reside, are well furnished with them. At Bern is a constant guard or garrison of 200 men, and a small garrison at Fort Arburg. In the same city is also an office, which grants licenses for levies to foreign powers, and where the recruits make their appearance and are registered. The bailiffs have the chief direction of affairs in their several districts, being generals of the militia, and presiding in the courts of justice; but, in civil causes above a certain value, an appeal lies from them to Bern; and, in capital cases, their sentence must be confirmed by the great council before it can be executed. When any bailiwick is to be disposed of, as many balls as there are competitors are put into a bag, whereof one is gilt, and he that draws that has the bailiwick.

Mr Keysler observes, that the wealthiest peasants in Switzerland are those of Bern; it being difficult to find a village without one, at least, who is worth between 20,000 or 30,000 guilders, and sometimes even 60,000. He says, the common people of both sexes wear straw hats, and that the women's petticoats are tied up so near their arm-pits, that hardly an hand's-breadth is left for their shape; that the inns, not only in this canton but throughout Switzerland, are in general very good; that the manners of the people were in many respects, greatly changed within 50 years before he visited them, which was about 50 years ago, and consequently must be much more so now; that instead of the plainness and honest simplicity of their ancestors, the love of superfluities and high living greatly prevailed; that luxury, pomp, and that infatuation for foreign productions which had infected most parts of Europe, had also extended its contagious influence to Switzerland, though not to such a degree as in many other countries. Dr Burnet says, that drinking is so common, and produces so many quarrels and disorders, that the bailiffs not only subsist by the fines payable for them, but often get estates, carrying perhaps 20,000 crowns at the end of five years to Bern; that their law is short and clear, insomuch that the most intricate suit is ended after two or perhaps three hearings, either in the first instance before the bailiff, or in the second at Bern; that the civility expressed in this country to women, at first meeting them, is not by saluting them, but by shaking them by the hand, and that none but strangers take off their hats to them. Mr Addison says, that the peasants are generally clothed in a coarse kind of canvas, the manufacture of the country, and that their holiday-clothes go from father to son; so that it is not uncommon to see a countryman in his great-grandfather's doublet and breeches; that the belief of witchcraft prevailed among them so much, that there were some executions on that account while he was in the country; that the question, or torture, is used not only in this canton but all over Switzerland; that though the subjects of the state are rich, the public is poor; and though they could oppose a sudden invasion, yet they could not spare the reinforcements and recruits that would be necessary in a long war. A law passed in 1764, rendering the government an aristocracy, gave great offence to the people; and in consequence of this the canton made a feeble defence when invaded by the French in 1798. A democratic constitution was then set up, and a part of the canton was separated from the rest, and the two new cantons of

Digitized by Google

Bern. of Aargau and Vaud created out of it. The canton again received a small increase in 1815; and at present contains 3872 square miles, and 215,000 inhabitants.

Bern, a city of Switzerland, and capital of the canton of that name, is situated in E. Long. 7. 40. N. Lat. 40. 0. It is said that the taking of a bear on the day on which the foundation of this city was laid, gave occasion to its name; hence it is often in Latin called *Arctopolis*, i. e. the city of the bear, and has a bear for its coat of arms. It is almost surrounded by the river Aar. The houses are mostly built of white freestone, and in the principal streets have piazzas or arches under them, for the conveniency of walking dry in wet weather. Most of the streets are paved with flints, and traversed by a canal lined with freestone, which is brought from a considerable distance, and is very useful in carrying off the filth of the city, extinguishing fires, and other purposes. The city is large, containing 13,340 inhabitants by the last enumeration; and it has several churches, of which one is called the *Great Church*, and the first minister *the dean*, who is the head of the city clergy. From an inscription near the great door of this church, it appears, that the first stone of it was laid in 1421. Over the same door is a representation of the last judgment, in which the sculptor hath placed the pope among the damned. In this city is also a college with eight professors, a large public library, and a museum; a stately granary, in which a great quantity of corn is always kept; a guildhall; a well stored arsenal; and several hospitals. In the arsenal is a wooden statue of the famous Tell, which represents him as taking aim at the apple placed on the head of his son. There is also the statue of Berchtold von Zahringen, the founder of the city; and two large horns of buffaloes, or wild bulls, called in Latin *Uri*, such as are used in war by the canton of Uri, instead of trumpets, and taken from it in the year 1712. Hard by also hang the grotesque dresses of those who blew them. The inhabitants of Uri, who boast their descent from the old Tau, bear a buffalo's head on their risci, coat of arms; and the person who blows the great horn in time of war, is called the *bull of Uri*. In the Dominican church, a hole in the wall is always shown to strangers, by means of which, it having a communication with the cell of a monk in an adjoining monastery, the pious fraud of making an image of the Virgin appear to speak was once carried on, which for a while answered the purposes of the monks very well; but they were at last detected and punished. This city, though larger, is not so populous nor so well built as that of Zurich. On the east side of it is a handsome stone bridge; and near the great church is a very fine platform some hundred feet in height, which makes a most delightful walk, being planted with limes, and commanding a charming prospect, particularly of the mountains of the Grisons, covered with snow in the midst of summer. In 1654 a student of divinity, being on horseback, and in liquor, leaped over this terrace without receiving any other hurt than breaking a leg, and lived many years after; but the horse was killed. In the upper part of the city are always kept a number of bears in two enclosures, with fir trees for them to clamber and play upon. Of the burghers of Bern, only those are qualified for the government and magistracy of the city who are the descendants of such as were made burghers before the year 1635. Other qualifications are also necessary; in particular, they must not be under 30 years of age, and must be enrolled in one of the 12 companies. To obtain a country government, or to hold any considerable employment, the candidate must also be married. The great council, in which the sovereignty of the canton is vested, consists, when full, of 229; but is generally much short of that number, 80 or more often dying before their places are filled up. The lesser council senate, or, as it is called, the *daily council*, because it meets every day, Sundays and holidays excepted, consists of 27 members, including the two prætors or advoyers, the four tribunes of the people, the two treasurers, and the two heimlichers, or secrecy-men, so called, because to them all secrets relating to the state are discovered. The members of the great and little councils mutually fill up the vacancies that happen in these two colleges. How the bailiffs are chosen we have already taken notice. Our limits will not permit us to enter into any farther detail with respect to the government: only it is to be observed in general, that all the officers of any note are chosen out of the great or little councils; and that all the bailiffs and castellans of the canton continue six years in office. The trade of the city is not very great; but was less before the French refugees settled therein: some, however, doubt whether it has been a gainer by them; as by their introduction of French modes and luxury, they have helped to banish the ancient Helvetic simplicity and frugality. The territory immediately under its jurisdiction is divided into four governments, with which the four venners, or standard-bearers, are invested. It declared for the Reformation in 1528, after a solemn disputation. Here the British envoy to the cantons resides.

Bern, Bern-Machine.

Bern-Machine, the name of an engine for rooting up trees, invented by Peter Sommer, a native of Bern in Switzerland.

This machine is represented by a figure on Plate LXXXVIII. drawn from a model in the machine room of the Society for the Encouragement of Arts, &c. It consists of three principal parts; the beam, the ram, and the lever. The beam ABC, (N° 1.) of which only one side is seen in the figure, is composed of two stout planks of oak three inches thick at least, and separated by two transverse pieces of the same wood at A and C, about three inches thick. These planks are bored through with corresponding holes, as represented in the figure, to receive iron pins, upon which the lever acts between the two sides of the beam, and which is shifted higher and higher as the tree is raised or rather pushed out of its place. The sides are well secured at the top and bottom by strong iron hoops. The iron pins on which the lever rests should be an inch and a quarter, and the holes through which they pass an inch and a half in diameter. The position of these holes is sufficiently indicated by the figure. The foot of the beam, when the machine is in action, is secured by stakes represented at G, driven into the earth. The ram D, which is made of oak, elm, or some other strong wood, is capped with three strong iron spikes, represented at *f*, which take fast hold of the tree. This ram is six or eight inches square;

square; and a slit is cut lengthwise through the middle of it, from its lower end at K to the first ferule *a*, in order to allow room for the chain *g h* to play round the pulley K, which should be four inches thick, and nine inches in diameter. This ram is raised by means of the chain *g h*, which should be about ten feet long, with links four inches and three quarters in length, and an inch thick. One end of this chain is fastened to the top of the beam at C, while the other, after passing through the lower part of the ram, and over the pulley K, terminates in a ring or link represented N° 3. the two ears *m n* of which serve to keep it in a true position between the two planks of the beam. In this ring the hook P is inserted. The hook is represented in profile, N° 2. where F is the part that takes hold of the ring. But it must be observed that the parts of this machine, represented at N° 2, 3. are drawn on a scale twice as large as the whole engine. The hook F, N° 2. should be made of very tough iron, as well as the handle D, and the arch E *c*. This handle should be two inches thick at *z*, where it joins to the hook, and the thickness gradually lessen by degrees up to the arch, which need not be more than half an inch thick. On each side of the pin *z*, is a semicircular notch, *x*, *y*, which rests alternately on the pins when the machine is worked. The hole D, and the arch E*c*, serve to fix a long lever of wood EF, N° 1. by means of two iron pins; and by this contrivance the lever is either raised or depressed at pleasure, in order to render the working of the machine easy in whatever part of the beam the lever may be placed: for without this contrivance the extremity of the lever EF, would, when the handle is near the top of the beam, be much higher than men standing upon the ground could reach. It must however be remembered, that the lever is often shortened by this contrivance, and consequently its power lessened.

The machine is worked in the following manner: It is placed against a tree, in the manner represented in the figure, so that the iron spikes at *f* may have hold of the tree, and the end of the beam A be supported by stakes represented at G. The iron handle, N° 2. is placed in the opening between the two planks of the beam, and the wooden lever fixed to it by means of the iron pins already mentioned. The hook F takes hold of the chain, and one of the iron pins is thrust into the outer row of holes, by which means the outer notch *x* will rest on the pin, which will be now the centre of motion; and the end of the lever E, N° 1. being pressed downwards, the other notch *y*, N° 2. will be raised, and at the same time the chain, and consequently the ram. The other iron pin is now to be thrust into the hole in the inner row, next above that which was before the centre of motion, and the end of the lever E elevated or pushed upwards, the latter pin on which the notch *y* rests now becoming the centre of motion. By this alternate motion of the lever, and shifting the pins, the chain is drawn upwards over the pulley K, and consequently the whole force of the engine exerted against the tree. There is a small wheel at L, in order to lessen the friction of that part of the machine.

From this account the reader will very easily perceive that the machine is nothing more than a single pulley compounded with a lever of the first and second order. It must however be remembered, that as the push of the engine is given in an oblique direction, it will exert a greater or lesser force against the horizontal roots of the tree in proportion to the angle formed by the machine with the plane of the horizon; and that the angle of 45° is the maximum, or that when the machine will exert its greatest force against the horizontal roots of the tree.

BERNACLE, a species of goose. See ANAS, ORNITHOLOGY *Index*.

BERNARD, ST, the first abbot of Clairvaux, was born in the year 1091, in the village of Fountaine, in Burgundy. He acquired so great a reputation by his zeal and abilities, that all the affairs of the church appeared to rest upon his shoulders, and kings and princes seemed to have chosen him for a general arbitrator of their differences. It was owing to him that Innocent II. was acknowledged sovereign pontiff, and after the death of Peter Louis anti-pope, that Victor, who had been named *successor*, made a voluntary abdication of his dignity. He convicted Abelard at the council of Sens, in the year 1140. He opposed the monk Raoul; he persecuted the followers of Arnaud de Bresse; and, in 1148, he got Gilbert de la Porvicé, bishop of Poitiers, and Eonde l'Etoile, to be condemned in the council of Rheims. By such zealous behaviour he verified (says Mr Bayle) the interpretation of his mother's dream. She dreamed, when she was with child of him, that she should bring forth a white dog, whose barking should be very loud. Being astonished at this dream, she consulted a monk, who said to her, "Be of good courage; you shall have a son who shall guard the house of God, and bark loudly against the enemies of the faith." But St Bernard went even beyond the prediction, for he barked sometimes against chimerical enemies: he was more happy in exterminating the heterodox, than in ruining the infidels; and yet he attacked these last, not only with the ordinary arms of his eloquence, but also with the extraordinary arms of prophecy. He preached up the crusade under Louis the Younger, and by this means he enlarged the troops of the crusaders beyond expression: but all the fine hopes with which he flattered the people were disappointed by the event; and when complaint was made that he had brought an infinite number of Christians to slaughter without going out of his own country, he cleared himself by saying that the sins of the croises had hindered the effect of his prophecies. In short, he is said to have founded 160 monasteries, and to have wrought a great number of miracles. He died on the 20th of August 1153, at 63 years of age. The best edition of his works is that of 1690, by Father Mabillon.

BERNARD, *Dr Edward*, a learned astronomer, linguist, and critic, was born at Perry St Paul, on the 2d of May, 1638, and educated at Merchant-Taylor's school, and St John's college, Oxford. During his stay at school, he had laid in an uncommon fund of classical learning; so that, on his going to the university, he was a great master of all the elegancies of the Greek and Latin tongues, and not unacquainted with the Hebrew. On his settling in the university, he applied himself with great diligence to history, philology, and philosophy; and made himself master of the Hebrew, Syriac, Arabic, and Coptic languages, and then applied himself to the study of the mathematics under the famous Dr Wallis. Having successively taken the degrees,

Digitized by Google

Bernard. degrees of bachelor and master of arts, and afterwards that of bachelor of divinity in 1668, he went to Leyden to consult several oriental manuscripts left to that university by Joseph Scaliger and Levinus Warnerus. At his return to Oxford, he collated and examined the most valuable manuscripts in the Bodleian library; which induced those who published any ancient authors, to apply to him for his observations or emendations from the manuscripts at Oxford; which he readily imparted, grudging neither time nor pains to serve the learned; and by this means he became engaged in a very extensive correspondence with the learned of most countries. In the year 1669, the famous Christopher Wren, Savilian professor of astronomy at Oxford, having been appointed surveyor-general of his majesty's works, and being much detained at London by this employment, he obtained leave to name a deputy at Oxford, and pitched upon Mr Bernard, which engaged the latter in a more particular application to the study of astronomy. In 1676, he was sent by the earl of Arlington to France, in order to be tutor to the dukes of Grafton and Northumberland, sons to King Charles II. by the duchess of Cleveland, who then lived with their mother at Paris: but the simplicity of his manners not suiting the gaiety of the duchess's family, he returned about a year after to Oxford, and pursued his studies; in which he made great proficiency, as his many learned astronomical and critical works show. He composed tables of the longitudes, latitudes, right ascensions, &c. of the fixed stars; Observations in Latin on the Obliquity of the Ecliptic; and other pieces inserted in the Philosophical Transactions. He also wrote, 1. A Treatise of the ancient Weights and Measures. 2. *Chronologiæ Samaritanæ Synopsis*, in two tables. 3. Testimonies of the Ancients concerning the Greek Version of the Old Testament by the Seventy; and several other learned works. He was a person of great piety, virtue, and humanity, and died on the 12th of January, 1696, in the 59th year of his age, leaving behind him a great number of learned and valuable manuscripts.

Bernard, *James*, professor of philosophy and mathematics, and minister of the Walloon church at Leyden, was born September 1. 1658, at Nions in Dauphiné. Having studied at Geneva, he returned to France in 1679, and was chosen minister of Venterol, a village in Dauphiné. Some time after, he was removed to the church of Vinsobres in the same province. But the persecution raised against the Protestants in France having obliged him to leave his native country, he retired to Holland, where he was received with great civility, and was appointed one of the pensionary ministers of Gauda. In July 1688, he began a political publication entitled *Histoire abregée de l'Europe*, &c. which he continued monthly till December 1688, and makes five volumes in 12mo. In 1692, he began his *Lettres Historiques*, containing an account of the most important transactions in Europe, with necessary reflections. He carried on this work, which was also published monthly, till the end of the year 1698. It was afterwards continued by other hands, and consists of a great many volumes. Mr Le Clerc having left off his *Bibliothèque Universelle*, in 1691, Mr Bernard wrote the greatest part of the 20th volume, and by himself carried on the five following to the year 1693. In 1698, he collected and published *Actes et Negociations de la paix de Ryswic*, in four volumes 12mo. In 1699 he began the *Nouvelles de la republique de lettres*, which continued till December 1710. Mr Bernard having acquired great reputation by his works, as well as by his sermons at Gauda and the Hague, the congregation of the Walloon church at Leyden became extremely desirous to have him for one of their ministers; and a vacancy happening in 1705, he was unanimously chosen. About the same time, Mr de Volder professor of philosophy and mathematics at Leyden having resigned, Mr Bernard was appointed his successor; and the university presented him with the degrees of doctor of philosophy and master of arts. His public and private lectures took up a great part of his time; yet he did not neglect his pastoral function, but composed his sermons with great care: he wrote also two excellent treatises, one on a late repentance, the other on the excellency of religion. In 1716, he published a supplement to Morri's dictionary in two volumes folio. The same year he resumed his *Nouvelles de la republique des lettres*; which he continued till his death, which happened the 27th of April, 1718, in the 60th year of his age.

Bernard | Bernera.

Bernard, *St*, the Great; a mountain in Savoy and Switzerland, between Valais and the valley of Aoust, at the source of the rivers Drance and Doria. The top is always covered with snow; and there is a great monastery seated thereon, where the monks always entertain travellers without distinction of religion for three days.

BERNARDINE, St, was born at Massa in Tuscany, in 1380. In 1404 he entered into a Franciscan monastery near Sienna, where he became an eminent preacher; and was afterward sent to Jerusalem, as commissary of the Holy Land. On his return to Italy, he visited several cities, where he preached with such applause, that the cities of Ferrara, Sienna, and Urbino, desired Pope Eugenius IV. to appoint him their bishop: but Bernardine refused the honour, accepting only the office of vicar-general of the friars of the observance for all Italy. He repaired and founded above 300 monasteries in that country; died in 1444; was canonized in 1450 by Pope Nicholas; and his works were published at Venice in 1591, in 4 vols. 4to.

BERNARDINES, an order of monks, founded by Robert abbot of Moleme, and reformed by St Bernard. They wear a white robe, with a black scapulary; and when they officiate they are clothed with a large gown, which is all white, and hath great sleeves, with a hood of the same colour.—The Bernardines differ very little from the Cistercians. They had their origin toward the beginning of the 12th century.

BERNAY, a town of Upper Normandy in France, seated on the river Carantone, in E. Long. 0. 50. N. Lat. 49. 6.

BERNBURG, a town of Germany, in the circle of Upper Saxony, and principality of Anhalt, where a branch of the house of Anhalt resides. It is seated on the river Sara, in E. Long. 12. 30. N. Lat. 51. 55.

BERNERA, one of the Western Isles of Scotland, lying about two leagues to the southward of Harries. It is about five miles in circumference; the soil is sandy, but when manured with the alga marina, extremely fertile,

Digitized by Google

fertile, producing an increase of thirty-fold of barley; nay, one grain has been known to produce 14 ears when the season was remarkably favourable. The face of the island is extremely agreeable in summer, exhibiting a pleasing variety of corn fields and clover pastures. Here is a fresh-water lake called *Lochbruis*, diversified with small islands, and abounding with eels, which the natives by the help of lights catch in the night-time, as they fall down a rivulet towards the sea in heaps twisted together. There are two chapels in this island dedicated to St Asaph and St Columbus; and near the former is a stone standing about eight feet above the ground. At the east end of this island there is a strange reciprocation of the flux and reflux of the sea, and another no less remarkable upon the west side of the Long island. The tides from the south-west run along northward; so that during the ordinary course of the tides the flood runs east in the frith where Bernera lies, and the ebb runs west: thus the sea ebbs and flows regularly for four days before, and as long after, the full and change of the moon; the spring tides generally rising 14 feet perpendicular, and the others proportionably: but for four days before, and as many after, the quarter moons, there is a singular variation; at that time a southerly moon making high water, the course of the tide being eastward, it begins to flow at half an hour after nine in the morning, and continues to flow till half an hour after three in the afternoon, when it is high water; but when it begins to ebb, the current still runs eastward, until it is low water; so that the tide runs eastward 12 hours together, that is, from half past nine in the morning till half past nine at night; yet, when the night-tide begins to flow, the current turns and runs westward all night for 12 hours, during both flood and ebb: thus the reciprocations continue, one flood and ebb running eastward and another westward, till within four days of the full and change of the moon; then they resume their ordinary course, running east during the six hours of flood, and west during the six hours of ebb. There is another phenomenon in these tides no less remarkable than that just now mentioned. Between the vernal and autumnal equinox, that is, during one half of the year, the tides about the quarter moons run all day eastward and all night westward; and during the other six months their course is reversed, being westward in the day and eastward in the night.

BERNICLA, the trivial name of a species of goose. See ANAS, ORNITHOLOGY *Index*.

BERNICLE, a species of lepas. See LEPAS, CONCHOLOGY *Index*.

BERNIER, NICHOLAS, an eminent musician and composer, was born at Mante on the Seine, in the year 1664. By his merit in his profession he attained to be conductor of the music in the chapel of St Stephen, and afterwards in that of the king. The regent duke of Orleans admired his works, and patronized their author. This prince having given him a motet of his own composition to examine, and being impatient for his observations thereon, went to the house of Bernier, and entering his study, found the abbé de la Croix there criticising his piece, while the musician himself was in another room carousing and singing with a company of his friends. The duke broke in upon and interrupted their mirth, with a reprimand of Bernier for his inattention to the task assigned him. This musician died at Paris in 1734. His five books of Cantatas and Songs for one and two voices, the words of which were written by Rousseau and Fuselier, have procured him great reputation. There are besides of his composition Les Nuits de Sceaux, and many motets, which are still in great esteem.

BERNIER, *Francis*, surnamed the *Mogul*, on account of his travels and residence in that country, was born at Angers in France; and after he had taken his degree of doctor of physic at Montpelier, left his country in 1654, went to Egypt, to the Holy Land, and to the kingdom of the Mogul, where he was physician to that monarch, attended him in his journeys, and stayed there 12 years. Upon his return to France, he published the history of the countries he had visited; and spent the remainder of his life in composing various other works, particularly an Abridgment of the philosophy of Gassendus in 8 vols 12mo. His first work is esteemed to be the best account we have of the countries which are the subject of it.

BERNINI, JOHN LAURENCE, commonly called *Cavalier Bernin*, a Neapolitan, famous for his skill in painting, sculpture, architecture, and mechanics. He first began to be known under the pontificate of Paul V. Rome is indebted to this artist for some of its greatest ornaments; and there are in the church of St Peter no less than 15 different works of his hand. He died at Rome in 1680.

BERNO, abbot of Richenou, in the diocese of Constance, who flourished about the year 1008, is celebrated as a poet, rhetor, musician, philosopher, and divine. He was the author of several treatises on music, particularly of one *De Instrumentis Musicalibus*, beginning with the words *Musicam non esse contem!* which he dedicated to Arrabon, archbishop of Mentz. He also wrote *De Mensura Monochordi*. But the most celebrated of his works is a treatise *De Musica seu Tonis*, which he wrote and dedicated to Pelegrines archbishop of Cologne, beginning *Vero mundi isti advenæ et peregrino*. This latter tract is part of the Baliol manuscript, and follows the Enchiridion of Odo: it contains a summary of the doctrines delivered by Boetius, an explanation of the ecclesiastical tones, intermixed with frequent exhortations to piety, and the application of music to religious purposes. He was highly favoured by the emperor Henry II. for his great learning and piety; and succeeded so well in his endeavours to promote learning, that his abbey of Richenou was as famous in his time as those of St Gal and Cluni, then the most celebrated in France. He died in 1048; and was interred in the church of his monastery, which but a short time before he had dedicated to St Mark.

BERNOULLI, JAMES, a celebrated mathematician, born at Basil the 27th of December 1654. Having taken his degrees in the university of Basil, he applied himself to divinity, not so much from inclination as complaisance to his father. He gave very early proofs of his genius for mathematics, and soon became a geometrician, without any assistance from masters, and at first almost without books: for he was not allowed to have any books of this kind; and if one fell by chance into his hands, he was obliged to conceal it, that he might not incur the reprimands of his father, who designed him for other studies. This severity made him

Digitized by Google

Bernoulli. him choose for his device, Phaeton driving the chariot of the sun, with these words, *Invito patre sidera verso*, "I traverse the stars against my father's inclination:" This had a particular reference to astronomy, the part of mathematics to which he at first applied himself. But the precautions of his father did not avail, for he pursued his favourite study with great application. In 1676 he began his travels. When he was at Geneva, he fell upon a method to teach a young girl to write, though she had lost her sight when she was but two months old. At Bourdeaux he composed universal gnomonic tables, but they were never published. He returned from France to his own country in 1680. About this time there appeared a comet, the return of which he foretold; and wrote a small treatise upon it, which he afterwards translated into Latin. He went soon after to Holland, where he applied himself to the study of the new philosophy. After having visited Flanders and Brabant, he went to Calais, and passed over from thence to England. At London he contracted an acquaintance with all the most eminent men in the several sciences; and had the honour of being frequently present at the philosophical societies held at the house of the famous Mr Boyle. He returned to his native country in 1682; and he exhibited at Basil a course of experiments in natural philosophy and mechanics, which consisted of a variety of new discoveries. In 1682, he published his essay of a new system of comets; and the year following, his dissertation on the weight of air. Mr Leibnitz, about this time, having published in the *Acta Eruditorum* at Leipsic some essay of his new *Calculus differentialis*, or *infinimens petits*, but concealed the art and method of it; Mr Bernoulli, and one of his brothers, discovered, by the little which they saw, the beauty and extent of it: they endeavoured to unravel the secret; which they did with such success, that Mr Leibnitz declared, that the invention belonged to them as much as to himself. In 1687, the professorship of mathematics at Basil being vacant, Mr Bernoulli was appointed his successor. He discharged this trust with universal applause; and his reputation drew a great number of foreigners from all parts to hear his lectures. He had an admirable talent in teaching, and adapting himself to the different genius and capacity of his scholars. In 1699, he was admitted into the academy of sciences at Paris as a foreign member, and in 1701 the same honour was conferred upon him by the academy of Berlin. He wrote several pieces in the *Acta Eruditorum* of Leipsic, the *Journal des Sçavans*, and the *Histoire de l' Academie des Sciences*. His assiduous application to these studies brought upon him the gout, and by degrees, a slow fever, of which he died the 16th of August 1705, in the 58th year of his age.—Archimedes having found out the proportion of a sphere to a cylinder circumscribed about it, ordered it to be engraven upon his monument. In imitation of him Mr Bernoulli appointed, that a spiral logarithmical curve should be inscribed upon his tomb, with these words, *Eadem mutata resurgo;* in allusion to the hopes of the resurrection, which are represented in some measure by the properties of the curve which he had the honour of discovering.

Bernoulli, *Daniel*, a celebrated physician and philosopher, was born at Groningen, February 9. 1700. He was intended by his parents for trade, but his genius led him to different pursuits. He passed some time in Italy, and at 24 refused to be president of an academy meant to have been established at Genoa. He spent several years at St Petersburg with great credit; and in 1733 returned to Basil, where he successively filled the chair of physic, natural and speculative philosophy. In his first work, *Exercitationes Mathematicæ*, he took the only title he then had, viz. "Son of John Bernoulli," and would never suffer any other to be added to it. This work appeared in Italy with the great inquisitor's privilege added to it, and it classed Bernoulli in the rank of inventors. He gained or divided nine prizes, which were contended for by the most illustrious mathematicians in Europe, from the academy of sciences. The only man who has had success of the same kind is Euler, his countryman, disciple, rival, and friend. His first prize he gained at 24 years of age. In 1734 he divided one with his father: but this hurt the family union: for the father construed the contest itself into a want of respect; and the son did not sufficiently conceal that he thought (what was really the case) his own piece better than his father's. Besides this, he declared for Newton, against whom his father had contended all his life. In 1740, Mr Bernoulli divided the prize "On the Tides of the Sea" with Euler and Maclaurin. The academy at the same time crowned a fourth piece, whose only merit was that of being Cartesian; but this was the last public act of adoration paid by it to the authority of the author of the Vortices, which it had obeyed perhaps too long. In 1748, Mr Daniel Bernoulli succeeded his father in the academy of sciences, and was himself succeeded by his brother John; this place, since its first erection, i. e. 84 years, never having been without a Bernoulli to fill it. He was extremely respected at Basil; and to bow to Daniel Bernoulli, when they met him in the streets, was one of the first lessons which every father gave his child. He used to tell two little adventures, which he said had given him more pleasure than all the other honours he had received. He was travelling with a learned stranger, who, being pleased with his conversation, asked his name: "I am Daniel Bernoulli," answered he with great modesty; "And I," said the stranger (who thought he meant to laugh at him), "I am Isaac Newton." Another time he was giving a dinner to the famous Koenig the mathematician, who boasted, with a sufficient degree of self-complacency, of a difficult problem he had resolved with much trouble. Bernoulli went on doing the honours of his table; and, when they went to drink coffee, presented him with a solution of the problem more elegant than his own. He died in March 1782.

Beroea. BEROEA, in *Ancient Geography*, a noble city of Macedonia, to the south of Edessa, or Ægæ, and south-east of Cyrtus. The people are commended in Scripture for their reception of the Gospel on a fair and impartial examination.—Another *Berœa*, of Syria (Stephanus); called also *Beroe*, and by the inhabitants *Beroëa*. It was the standing tradition for some ages, that it is the modern Aleppo; called *Chalep* in Nicetas, Nicephorus, and Zonaras; from which it is supposed the present appellation *Aleppo* is derived; distant 90 miles from the Levant sea and the port of Scanderoon, and about 100 miles west of the Euphrates. E. Long. 36. 0. N. Lat. 36. 30.

BEROOT,

Digitized by Google

BEROOT, or BAIROUT, a town of Phœnicia, a province of Syria, in Turkey in Asia. It is the ancient Berytus; but there are now no remains of its former beauty, except its situation. It stands in a plain, which from the foot of Lebanon runs out into the sea, narrowing to a point, about two leagues from the ordinary line of the shore, and on the north side forms a pretty long road, which receives the river of Nahr-el-Salib, called also *Nahr-Bairout*. This river has such frequent floods in winter, as to have occasioned the building of a considerable bridge; but it is in so ruinous a state as to be impassable. The bottom of the road is rock, which chafes the cables, and renders it very insecure. From hence, as we proceed westward towards the point, we reach, after an hour's journey, the town of Beroot. This belonged to the Druzes, till lately that it was taken from them, and a Turkish garrison placed in it. Still however it continues to be the emporium of the Maronites and the Druzes, whence they export their cottons and silks, almost all of which are destined for Cairo. In return, they receive rice, tobacco, coffee, and specie, which they exchange again for the corn of the Bekaa and the Hauran. This commerce maintains near 6000 or 8000 persons. The dialect of the inhabitants is justly censured as the most corrupt of any in the country: it unites in itself the 12 faults enumerated by the Arabian grammarians.—The port of Beroot, formed like all the others on the coast by a pier, is like them choked up with sand and ruins. The town is surrounded by a wall, the soft and sandy stone of which may be pierced by a cannon ball without breaking or crumbling; which was unfavourable to the Russians in their attack: but in other respects this wall, and its old towers, are defenceless. Two inconveniences will prevent Beroot from ever becoming a place of strength; for it is commanded by a chain of hills to the south-east, and is entirely destitute of water, which the women are obliged to fetch from a well at the distance of half a quarter of a league, though what they find there is but indifferent. By digging in order to form reservoirs, subterraneous ruins have been discovered; from which it appears, that the modern town is built on the ancient one. The same may be observed of Latakia, Antioch, Tripoli, Saide, and the greater part of the towns on the coast; which has been occasioned by earthquakes that have destroyed them at different periods. We find likewise, without the walls to the west, heaps of rubbish, and some shafts of columns, which indicate that Beroot has been formerly much larger than at present. The plain around it is entirely planted with white mulberry trees, which are young and flourishing; by which means the silk produced here is of the very finest quality. In descending from the mountains (says M. Volney), no prospect can be more delightful than to behold, from their summits or declivities, the rich carpet of verdure formed by the tops of these useful trees in the distant bottom of the valley. In summer, it is inconvenient to reside at Beroot on account of the heat and the warmth of the water: the town, however, is not unhealthy, though it is said to have been so formerly. It has ceased to be unhealthy since the Emir Fakr-el-din planted the wood of fir trees, which is still standing a league to the southward of the town. E. Long. 35. 38. N. Lat. 34. 18.

BEROSUS, priest of the temple of Belus at Babylon, in the time of Ptolemy Philadelphus, wrote the History of Chaldea, which is often cited by the ancients, and of which Josephus gives some curious fragments. The Athenians, according to Pliny, caused his statue, with a golden tongue, to be placed in their Gymnasium.

BERRE, a town of France, in the department of the Mouths of the Rhone, seated on a lake of the same name. It contains 1800 inhabitants, and is remarkable for the quantity and goodness of the salt that is made there. E. Long. 4. 32. N. Lat. 43. 32.

BERRETINI DA CORTONA, PIETRO, painter of history and landscape, was born at Crotona in 1596; and, according to some writers, was a disciple of Andrea Commodi; though others affirm that he was the disciple of Baccio Ciarpi, and the author of the Abrege says he was successively the disciple of both: but he is allowed to have been as great and as enlarged a genius as any of his profession, and to have painted more agreeably than most of the artists who were his cotemporaries. He went young to Rome, and applied himself diligently to study the antiques, the works of Raphael, Buonaroti, and Polidoro; by which he so improved his taste and his hand, that he distinguished himself in a degree superior to any of the artists of his time. He worked with remarkable ease and freedom; his figures are admirably grouped; his distribution is truly elegant; the chiaro-scuro is judiciously observed; and through his whole compositions there appears uncommon grace: but De Piles observes, that it was not such a grace as was the portion of Raphael and Corregio; but a general grace, consisting rather in a habit of making the airs of his head always agreeable, than in a choice of expressions suitable to each subject. In his large compositions, the colouring had a good effect; but his colouring in fresco is far superior to what he performed in oil: nor do his easel pictures appear so finished as might be expected from so great a master, when compared with what he painted in a larger size. By the best judges it seems to be agreed, that although this master was frequently incorrect; though not always judicious in his expressions; though irregular in his draperies, and apt to design his figures too short and too heavy; yet, by the magnificence of his composition, the delicate airs of his figures, the grandeur of his decorations, and the astonishing beauty and gracefulness of the whole together, he must be allowed to have been the most agreeable mannerist that any age hath produced.—He died in 1669. Some of his most capital works are in the Barberini palace at Rome, and the Palazzo Pitti at Florence.

BERRETONI, NICOLO, history-painter, was born at Macerata in 1617, and was a disciple of Carlo Maratti, with whom he studied design and colouring for some years; and attained such excellence, that he excited even the jealousy and envy of his master, who seemed to be apprehensive of finding a powerful competitor and rival in his pupil.—His early works, after he quitted the school of Maratti, were in the style and taste of Guido; and they could not possibly have a more high encomium or recommendation. He died in 1682.

BERRIMAN, DR WILLIAM, was the son of Mr John Berriman apothecary in Bishopsgate-street, London, where he was born in 1688. He studied at Oriel college, Oxford, where he took his several degrees, and became curate and lecturer of All-hallows in in Thames-street, and lecturer of St Michael's Queenhithe. In 1720, he was appointed domestic chaplain to Dr Robinson bishop of London, who soon after collated him to the living of St Andrew's Undershaft; and in 1727, he was elected fellow of Eton college. He died in 1750, in the 62d year of his age. He wrote, 1. A seasonable Review of Mr Whiston's Account of Primitive Doxologies. 2. A Historical Account of the Trinitarian Controversy, in eight sermons, at Lady Moyer's lecture. 3. Brief Remarks on Mr Chandler's Introduction to the History of the Inquisition. 4. Sermons at Boyle's lectures, 2 vols 8vo. 5. Christian Doctrines and Duties explained and recommended, in 2 vols. 8vo; and other works.

BERRY. See BACCA.

BERRY, a province of France, which had the title of a duchy. It now forms the two departments of Cher and Indre; and is bounded on the north by Salome, on the south by Marche, on the east by Nivernois and Bourbonnois, and on the west by Touraine. It is 90 miles in length from north to south, and 73 in breadth from east to west. The air is very temperate; and the soil produces wheat, rye, and wine little inferior to Burgundy; that of Sancerre, St Satur, and Lavernusse, is the best. The fruits are in plenty, and pretty good. The pastures are proper to fatten sheep. This country produces also a good deal of hemp and flax. There are mines of iron and silver, but they are neglected. The stone quarries, within half a league of Bourges, are very serviceable. In the parish of St Hilare there is a mine of ochre, made use of in melting metals and for painting. Near Bourges there is a cold mineral spring, which has a clammy fat pellicle over it every morning, of different colours. It lets fall a fine black smooth sediment, which has the same smell, and almost the same taste, as gunpowder, which makes some conclude it partakes of sulphur, vitriol, and ochre. The pellicle is as thick as a crown piece; and when put on a red-hot fire-shovel, will bounce and sparkle, as will also the sediment. It is certain there is saltpetre in these waters, though vitriol seems to be the most predominant. These waters, drank on the spot, temperate the heat of the blood and humours, open obstructions, and strengthen the fibres. Berry is watered by several rivers; the principal of which are the Loire, the Creuse, the Cher, the Indre, the Orron, the Evre, the Aurette, the Maulon, the Great and Little Saudre, the Nerre, &c. Near Liniers, there is a lake 20 miles round. Berry is divided into the Upper and the Lower, and Bourges is the capital city. The inhabitants of Bourges carry on a small trade with corn down the Loire; but that of the wine above mentioned is much more considerable, it being transported to Paris by means of that river and the canal of Briare. But the principal commerce consists in the fat cattle which they send to Paris, and the great number of sheep; these last bear fine wool, which is used in the manufactures of this province and other parts of the kingdom. There are two sorts of manufactures in Berry; the one for cloths and serges, and the other for knit and wove stockings. There is likewise a great quantity of hemp, which is transported elsewhere; for they have not yet got the art of manufacturing it themselves. At Aubigny there are 2000 persons generally employed in the making of cloth.

BERSABE, in *Ancient Geography*, a town in the tribe of Simeon (Joshua); the south boundary not only of its own tribe but of the whole land of Israel, as appears from the common expression "from Dan to Bersabe:" in our translation it is Beersheba. It was the residence of the patriarchs; as first of Abraham, from whom it took its name, and of Isaac. It signifies the well or fountain of the oath; dug by Abraham, and claimed as his property by covenant and the religion of an oath, against the insults of the Philistines. Eusebius and Jerome say, that there was a citadel and large village of that name in their time. It was called *Beersheba of Judah* in 1 Kings xix. 3. not to distinguish it from the Beersheba of Galilee, which probably did not then exist, but to ascertain the limits of the kingdom of Judah. In the lower age called *Castrum Versabini.*

BERSARII, in writers of the middle age, a kind of hunters, or sportsmen, who pursued wild beasts in forests and chases. The word seems derived from the barbarous Latin *bersare*, "to shoot with a bow;" on which principle it should properly denote archers only, or bowmen. Or it might be derived from *bersa*, "the fence or pales of a park;" in which view, it should primarily import those who hunt or poach in parks or forests.

Hincmar speaks of a kind of inferior officers in the court of Charlemagne, under the denomination of *bersarii*, *veltrarii*, and *beverarii*. Spelman takes the first to denote those who hunted the wolf; the second, those who had the superintendency of the hounds for that use; and the third, those who hunted the beaver.

BERSELLO, a fortified town of Italy in the Modenese. It was taken by Prince Eugene in 1702; and by the French in 1703, who were obliged to abandon it in 1707. It is seated near the confluence of the rivers Linza and Po, in E. Long. 10. 30. N. Lat. 44. 55.

BERSUIRE, a town of France in the department of the two Sevres. W. Long. 0. 27. N. Lat. 46. 52.

BERTHOUD FERDINAND, an eminent French chronometer maker. See SUPPLEMENT.

BERTINERO, a town of Romagna in Italy, with a strong citadel. It is the see of a bishop; and is seated on a hill, in E. Long. 11. 47. N. Lat. 44. 8.

BERTRAND, ST, a town of France in the department of Upper Garonne. E. Long. 0. 38. N. Lat. 43. 2.

BERVY, a sea-port and royal burgh in the county of Mearns in Scotland. Population 927 in 1811. W. Long. 2. 0. N. Lat. 56. 40.

BERWICK, THE DUKE OF, was natural son of James II. by Mrs Arabella Churchill, sister to the great duke of Marlborough. He followed the fate of his father, and came into France after the revolution with James II. Here the duke of Berwick was recommended to the court by his superior merit. He was created marshal of France, knight of the Holy Ghost, duke and peer of France, grandee of Spain, commander in chief of the French armies; in all which stations his behaviour was such, that few equalled, perhaps none surpassed him. He lived in an age when the renowned prince of Orange and many other of the greatest men commanded against him. His courage was of the cool steady kind; always possessing himself; taking all advantages; not foolishly, rashly, or wantonly throwing away the lives of his soldiers. He kept up on all occasions the most strict discipline; and did not spare punishment among

among his soldiers for marauding and other crimes, when properly deserved; for which some inconsiderate people have blamed him. He has been reflected upon, by the very zealous and violent adherents of the Stuart family, for not being sufficiently attached to that party, which was his own family. But by a cool examination of his actions, it will appear, that his behaviour in this particular was, as in most parts of his life, sensible and just. When he accepted of employments, received honours, dignities, and became a naturalized Frenchman, he thought it his duty, as an honest man, to become a Frenchman, and a real subject to the monarch who gave him bread; and to be, or not to be, in the interest of the Stuart family, according to the will and commands of the sovereign whom he served, and in the interest of France according to time and circumstances; for there is no serving two masters well. But when ordered by his king to be in that family's interest, he acted with the greatest sincerity; and took the most effectual and sensible methods to serve that unhappy house, as the following anecdote, if true, and it has great appearance of probability on its side, proves. The duke of Marlborough, after the signing of the treaty of Utrecht, was censured by the British parliament for some of the army contracts in relation to bread and forage; upon which he retired into France: and it was then credibly asserted, the duke of Marlborough was brought over to the interest of the Stuart family; for it is now past a doubt, that Queen Anne had a very serious intention of having her brother upon the throne of England after her death: and several circumstances, as well as the time of that duke's landing in England, make many people believe he was gained over to the Stuart party. If the duke of Berwick was, directly or indirectly, the means of gaining his uncle over to that interest, he more effectually served it, than that rash mock army of unhappy gentlemen who were taken prisoners at Preston in 1715 had it in their power to do. In a word, the duke of Berwick was, without being a bigot, a moral and religious man; and showed by his life and actions, that morality and religion are very compatible and consistent with the life of a statesman and a great general; and if they were oftener united in these two professions, it would be much happier for the rest of mankind. He was killed by a cannon-ball at the siege of Philipsburg in 1738.

Berwick, a county of Scotland; bounded by the river Tweed on the south; by East Lothian on the north; by the German ocean on the east; and on the west by the counties of Roxburgh, Peebles and Mid-Lothian. Its extent in length may be stated at 34 miles, and its breadth 19. This county is nominally divided into three districts, viz. Lauderdale, Lammermuir, and Merse or March. The first is that opening or valley in the Lammermuir hills, through which the river Leader runs. Lammermuir comprehends the ridge of hills which separate this county from East-Lothian, extending from the head of Leader water to the sea, below the town of Berwick. The Merse or March includes that fertile and populous plain, stretching from the hills, along the banks of the Tweed. Berwickshire contains one royal borough, viz. Lauder, and several large towns and villages, as Dunse, Coldstream, Coldingham, Ayton, and Eyemouth. The chief rivers are the Tweed, the Leader, the Eye, the Whittadder, and Blackadder. The two roads to London pass through the county. In the Merse the state of agriculture is excellent; and, though so late as 60 years ago, the greater part was barren and uncultivated, it is now mostly enclosed and improved. The county of Berwick exports from the ports of Berwick and Eyemouth, above 80,000 bolls of victual; and the same quantity is annually carried to the weekly markets of Edinburgh, Dalkeith, Haddington, and Dunbar. There is plenty of marl in the county; but the farmers prefer lime as the most profitable, though at the distance of 18 or 20 miles. The minerals in this district hitherto discovered, are few, and these are by no means valuable. Coal has been found only in small quantities near Eyemouth. There is plenty of freestone fit for building, and both rock and shell marl are found in different places. Copper has been wrought in the neighbourhood of Lauder; and some years ago, a mine of the same metal was discovered in the parish of Buncle. The parish of Mordington contains ironstone, but of too small value to render it an object of manufacture. The rocks which compose the Lammermuir hills, are chiefly *schistus*, with alternate strata of sandstone. At Eyemouth is a rock of the species called puddingstone, in the pieces of which it is not uncommon to find fragments of porphyry, granite, and even limestone. Near the Whittadder, in the parish of Chirnside, is a species of gypsum, which has been of great use as a manure. The celebrated mineral well, called *Dunse Spa*, which is somewhat similar to Tunbridge, is situated about a mile from the town of Dunse. The rivers contain trout, and salmon; of which last a great quantity is annually exported from Berwick to London. From the situation of this county, on the border of England, it was necessary that it should be strongly fortified; accordingly, there are numerous strong castles and fortified places in almost every parish in the county. The following is the population of the county of Berwick according to the parishes, taken at two periods, from the Statistical History of Scotland.

	Parishes.	Population in 1755.	Population in 1790—98.
1	Abbey	80	164
	Ayton	797	1245
	Buncle	691	622
	Channelkirk	531	600
5	Chirnside	383	961
	Cockburnspath	919	883
	Coldingham	2313	2391
	Cranshaws	214	164
	Dunse	2593	3324
10	Earlston	1197	1351
	Eccles	1489	1780
	Edrom	898	1336
	Eyemouth	792	1000
	Fogo	566	450
15	Fouldean	465	344
	Gordon	737	912
	Greenlaw	895	1210
	Home	959	1000
	Hutton	751	920
20	Ladykirk	386	590
	Langton	290	435
	Lauder	1795	2000

See BERWICKSHIRE, SUPPLEMENT.

BERWICK, *North*, a royal borough, and sea-port in the county of East Lothian in Scotland, containing 700 inhabitants. W. Long. 2. 29. N. Lat. 55. 56.

BERWICK-upon-Tweed, is a town on the border of England, and Scotland, and a county of itself. It stands on the north or the Scotish side of the river Tweed; and is pleasantly situated on an easy declivity, almost close to the sea. It has a ditch on the north and east; but on the south and west it has high walls, regularly fortified, and planted with cannon, and to which the river serves as a moat. The houses are generally well built; and the town-house is a handsome structure, with a lofty turret, in which are eight bells, and a fine clock which tells the quarters, with four dials, one on each side the square. The church is a neat building, but has no bells. The bridge is 947 feet long, and is supported by fifteen arches. The barracks form a large regular square, and will hold two regiments of foot very conveniently. The town is governed by a mayor, recorder, town-clerk, and four bailiffs; and has a coroner, a treasurer, four serjeants at mace, and a water bailiff. It had a strong castle, which now lies quite in ruins. It has a market on Saturdays, extremely well supplied; and a fair on Friday in Trinity-week for black cattle and horses. Corn and eggs are shipped from hence for London and other ports; but the principal trade is the salmon which are caught in the Tweed, and reckoned to be as good as any in the kingdom. Some are sent alive, and some pickled in kits by persons who subsist on that employment, and are called *salmon coopers*. A new pier was begun for the harbour in 1811. Though this town is not admitted to be either in England or Scotland, the English judges hold assizes here; and it is subject to the bishop of Durham. It sends two members to parliament. Population 7746 in 1811. W. Long. 1. 35. N. Lat. 55. 58.

BERY, or BURY, the villa or seat of habitation of a nobleman, a dwelling or mansion-house, being the chief of a manor: from the Saxon *beorg*, which signifies a *hill* or *castle*; for heretofore noblemen's seats were castles situated on hills, of which we have still some remains; as in Herefordshire there are the *beries* of Stockton, Hope, &c. It was anciently taken for a sanctuary.

BERY. See BERIA.

BERYL, in *Natural History*, called by our lapidaries *aqua marina*, is a pellucid gem of a bluish green colour, found in the East Indies and about the gold mines of Peru: we have also some from Silesia, but what are brought from thence are oftener coloured crystals than real beryls; and when they are genuine, they are greatly inferior both in hardness and lustre to the oriental and Peruvian kinds.

The beryl, like most other gems, is met with both in the pebble and columnar form, but in the latter most frequently. In the pebble form it usually appears of a roundish but flatted figure, and commonly full of small flat faces, irregularly disposed. In the columnar or crystalline form it always consists of hexangular columns, terminated by hexangular pyramids. It never receives any admixture of colour into it, nor loses the blue and green, but has its genuine tinge in the degrees from a very deep and dusky to the palest imaginable of the hue of sea-water.

The beryl, in its perfect state, approaches to the hardness of the garnet, but is often softer; and its size is from that of a small tare, to that of a pea, a horse-bean, or even a walnut. It may be imitated by adding to 20 pounds of crystal-glass made without magnesia, six ounces of calcined brass or copper, and a quarter of an ounce of prepared zaffre.—The properties of the beryl were very wonderful in the opinion of the ancient naturalists; it kept people from falling into ambuscades of enemies, excited courage in the fearful, and cured diseases of the eyes and stomach. It does none of these things now; because people are not simple enough to believe it has the virtue to do them.

BERYL-Crystal, in *Natural History*, a species of what Dr Hill calls *ellipomacrostyla*, or imperfect crystals, is of an extremely pure, clear, and equal texture, and scarce ever subject to the slightest films or blemishes. It is ever constant to the peculiarity of its figure, which is that of a long and slender column, remarkably tapering towards the top, and very irregularly hexangular. It is of a very fine transparence, and naturally of a pale brown, and carries such evident marks of distinction from all brown crystals, that our lapidaries call it, by way of eminence, the *beryl crystal*, or simply the *beryl*.

BERYTUS, in *Ancient Geography*, a sea-port town of Phœnicia on the Mediterranean, so ancient as to be thought to have been built by Saturn. It was destroyed by Tryphon, but rebuilt by the Romans. Agrippa placed here two legions, whence it became a colony. It enjoyed the *jus Italicum*, and had an excellent school for the study of the law in Justinian's time. Now BEROOT; which see.

BES, or BESSIS, in Roman antiquity, two-thirds of the as. See AS.

BES also denotes two-thirds of the jugerum. See JUGERUM.

BESAILE, signifies the father of a grandfather.

BESAILE, in *Law*, a writ that lies where the great-grandfather was seized in fee of any lands, &c. at the time of his death: and after his decease a stranger enters thereon, the same day, and keeps out the heir.

BESANCON, a city of France, capital of the Franche Compte, now the department of Doubs. It is one of the most ancient cities of Europe, was formerly the see of an archbishop, and had a parliament as well as a university. It is seated on the river Dreux, which

Digitized by Google

which divides it into two parts, the greatest of which is a peninsula. The entrance is shut up by a mountain, on which they have built a large citadel, which commands all the city. There are many names of places in and about the city, that are plainly corruptions of the Latin, and are marks of its antiquity, as Chamars, *Campus Martis;* Chamuse, *Campus Musarum;* Chandane, *Campus Dianæ*, &c. The metropolitan church is built at the bottom of St Stephen's hill; and is a very handsome structure with a high tower steeple. The great altar is placed in the middle choir, where on high days they expose reliques in silver shrines, enriched with gold and jewels. There are several tombs and other things remarkable in the churches; and after you have past the church of Notre Dame, and the square that it looks into, you come to a triumphal arch, erected in honour of the emperor Aurelian, on which are several figures of men and animals, pretty entire. It serves as a gate to the cloister of St John the Great. The great hospital of the order of the Holy Ghost is a structure worth seeing. The streets are wide and handsome; and the houses are well built with free-stone, and covered with slate, chiefly about the square called *Battan*, which is adorned with a fountain, the water of which proceeds from a statue of Bacchus. The river Dreux is passed over by a stone bridge. The market-place is at the entrance; and on the left is another square, adorned with a fountain, where the great street begins. The new square is not far from this street, from whence you go to the town-house, which is a large structure with four wings, before the front of which is the statue of Charles V. in bronze, with a globe in one hand and a sword in the other. The imperial eagle is raised over a large bason, and spouts out water by both his beaks; and there is also a fountain adorned with the figure of a naked woman, with water springing out at her nipples. The university, which was dissolved at the revolution, was re-established as a lyceum and college in 1801. The population in 1815 was 28,200. E. Long. 6. 10. N. Lat. 47. 26.

BESANT, or BEZANT, a coin of pure gold, of an uncertain value, struck at Byzantium, in the time of the Christian emperors; from hence the gold offered by the king at the altar is called *besant* or *bisant*.

BESANTED, or BEZANTED. This word means *full of besants;* and is used to denote a field, ordinary, or charge, covered with above eight besants; for if there be but eight or fewer, their number must be particularly mentioned.

BESELEEL *and* OOLIAH, architects, sculptors, and painters, supposed to have made all the ornaments in brass, silver, &c. of the first tabernacle in the wilderness, 1490 B. C.

BESIERS, or BEZIERS, an ancient town of France, in Lower Languedoc, now the department of Herault, formerly a bishop's see, and containing 12,500 inhabitants in 1815. It has a delightful situation; and the country in which it stands is fertile in corn and oil, and produces excellent wine. It is seated on a hill near the river Orbe, in E. Long. 3. 23. N. Lat. 43. 21.

BESISTAN, or BERSTEIN: Thus, at Constantinople, Adrianople, and in some other towns within the Grand Signior's dominions, they call those places where the merchants have their shops, and expose their merchandises to sale. Each sort of merchants have their particular besistan, which must also be understood of the workmen, all those of the same trade working in the same place. These besistans are commonly large galleries, vaulted over, whose gates are shut every night. Sometimes the wardens and keepers of the besistans will answer for the merchandises, on paying them a very moderate perquisite for every shop.

BESLERIA. See BOTANY *Index*.

BESORCH, a coin of tin, or some alloyed metal, current at Ormus at the rate of $\frac{7}{17}$ parts of a farthing sterling.

BESOZZI, or BEZUTIUS, AMBROGIO, a painter of considerable eminence, was born at Milan in 1648. He worked some time under Gioseffo Danedi, called *Montalti:* he afterwards went to Rome, where he studied from the antiques and the pictures of the greatest masters; and at last perfected himself in the school of Ciro Ferri. His great excellency consisted in painting architecture, friezes, imitations of bass-relieves, and other decorations. He died at Milan in 1706, aged 58 years.

BESSARABIA, a territory lying between Moldavia, the Danube, and the Black sea, formerly belonging to Turkey, but ceded by that power to Russia in 1812. It is inhabited chiefly by Tartars, who maintain themselves by their cattle and husbandry. Their religion, manners, and customs, are the same with those of the Crim Tartars. The whole country contains about 8800 square miles, is level and fertile, but the inhabitants apply more to grazing than tillage. Although a number of small rivers traverse the country, both water and wood are scarce.

BESSARION, titular patriarch of Constantinople and archbishop of Nice, and one of those illustrious persons who contributed to the resurrection of letters in the 15th century, was born at Trebisond. He was very zealous to reunite the Greek with the Latin church, and engaged the emperor John Paleologus to interest himself in bringing this great work about. He passed into Italy, appeared at the council of Florence, harangued the fathers, and made himself admired as well by his modesty as by his uncommon abilities. The Greek schismatics conceived so great an aversion to him, that he was obliged to remain in Italy; where Pope Eugenius IV. honoured him with the purple in 1439. He fixed his abode at Rome, and would have been raised to the papal chair, if Cardinal Alain had not opposed it, as injurious to the Latin church, to choose a Greek however illustrious. He was employed in several embassies, but that to France proved fatal to him. When legate at this court, he happened to visit the duke of Burgundy, before he saw Louis XI. which so displeased the capricious haughty monarch, as to occasion him a very ungracious reception. Nay, the king even took the cardinal legate by his most magnificent beard, saying in his fine Latin, *Barbara Græca genus retinent quod habere solebant:* and this affront so chagrined the cardinal, as to occasion his death at Ravenna upon his return in 1472. This at least is what Matthieu relates in his History of Louis XI. Bessarion loved the literati, and protected them. Argyropilus, Theodore of Gaza, Poggius, Laurentius Valla, &c. formed in his house a kind of academy. His library was large and curious; and the senate of Venice, to whom he gave it, preserve it to this day with attention.

Digitized by Google

attention and regard. He left some works, which rank among those that helped to revive letters; as, *Defensio Doctrinæ Platonicæ*, &c.; Translations of some Pieces of Aristotle; Orations; Epistles, &c.

BESSICA, in *Ancient Geography*, a district of Thrace towards Mount Hæmus, to the south of the Hebrus. It was inhabited by a fierce and barbarous people noted for their robberies. Their chief city Uscudama is now know by the name of *Adrianople*. They lived under their own kings till the consulate of M. Licinius Lucullus and C. Cassius Varus; when the consul Lucullus invaded their country, and having gained a great victory over them, took their metropolis, and subjected the whole nation to the Roman laws. The Romans, notwithstanding they had subdued them by force of arms, still suffered them to live under their own kings; for Piso, while he governed Macedon in quality of proconsul, having treacherously seized Rabocentus, whom Suetonius calls *prince of the Bessi*, caused him to be publicly beheaded. This affront so exasperated the whole nation that they revolted; but were overthrown in a great battle by Octavius the father of Augustus. During the civil wars of Rome they attempted anew to recover their liberty, but were again defeated by the famous M. Brutus. In the reign of Augustus one Vologesus, a native of the country, and priest of Bacchus, having, under pretence of religion, drawn together great crowds of people, made himself master of the whole country; and, entering the Chersonesus, committed there the most dreadful ravages. He was at last, however, overcome by L. Piso; who obliged the savage inhabitants to lay down their arms, and submit to such conditions as he was pleased to impose upon them. From this time the Bessi continued subject to the Romans, without attempting any more to regain their liberty.

BESSIS. See Bes.

BESTAIL, or Bestial, in ancient statutes, all kinds of beasts or cattle, especially those purveyed for the king's provision.

BESTIARII, in Roman antiquity, such as fought against beasts, or those who were exposed to them by sentence of the law. There were four kinds of bestiarii: the first were those who made a trade of it, and fought for money; the second were such young men as, to show their strength and dexterity in managing their arms, fought against beasts; the third kind was, where several bestiarii were let loose at once, well armed, against a number of beasts; and the fourth kind were those condemned to the beasts, consisting either of enemies taken prisoners in war, or as being slaves, and guilty of some enormous crime; these were all exposed naked, and without defence.

BESTRICIA, a town of Transylvania, remarkable for the gold mines in its neighbourhood. E. Long. 22. 5. N. Lat. 48. 0.

BETA, the Beet. See Botany and Agriculture *Index*.

BETANZOS, a town of Gallicia in Spain, seated on the Mandeo, and a bay of the sea, in W. Long. 7. 50. N. Lat. 43. 21.

BETEL, or Betle, in *Botany*, an Indian plant (a species of Piper), in great esteem in the east, where it makes a considerable article of commerce. See Piper. See also Betel, Supplement.

BETELFAGUI, a town of Asia, in Arabia Felix, famous for the vast quantity of coffee bought and sold there; being the mart where the country people bring their coffee to sell; and where the Europeans come, or send their factors or brokers, to purchase it. E. Long. 57. 20. N. Lat. 15. 40.

BETHABARA, in *Ancient Geography*, a term denoting *a passage*; and therefore by many referred to the passage at Jericho, where the Israelites passed over dry-shod; by Lightfoot, to the passage at Scythopolis: but Cellarius refers it to the midway between both; because there were doubtless several middle passages or fords on the Jordan. Here John is said to have baptized on the other side Jordan, (Evangelists).

BETHAGLA, or Beth-hagla, in *Ancient Geography*, a town of the tribe of Benjamin (Joshua xviii. 21.). In Jerome's time there was a village called *Agla*, ten miles from Eleutheropolis, towards Gaza, and supposed to be Bethagla.

BETHANY, in *Ancient Geography*, a village at the foot of Mount Olivet, on the side, about two miles to the east of Jerusalem, (John, Jerome); where Lazarus dwelt and was raised from the dead; and where happened the ascension of our Saviour.

BETHARAMPHTHA, in *Ancient Geography*, a town of Galilee, (Ptolemy) of the Peræa, (Josephus); which being walled round by Herod Antipas, was called *Julias*, after Julia, the daughter of Augustus, and consort of Tiberius: it stood to the north of the lake of Genesareth, at the influx of the Jordan into that lake; and here Dr Wells places Bethsaida.

BETHARAN, in *Ancient Geography*, a town of the Peræa, or on the other side Jordan. Said to be called *Livias*, or *Libias*, in the Greek manner, by Herod in honour of Livia, (Eusebius, Jerome); and of the same latitude almost with Jerusalem, (Ptolemy); called *Julius* by Josephus, who always calls the Livia of Augustus *Julia*.

BETHAVEN, in *Ancient Geography*, a town in the tribe of Ephraim, and a name given Bethel by Hosea, after the establishment of the idolatry of Jeroboam there; meaning it to have become the house of iniquity, from being the house of God; but Bethaven was a distinct town (Joshua vii. 2.) to the south-east of Bethel.

BETHEL, in *Ancient Geography*, a city of Samaria, on the borders of the tribe of Benjamin, anciently called *Luz*, (Moses); but they seem to be distinguished, (Joshua xvi. 2.). They were, however, contiguous places. Bethel was properly the place of Jacob's vision; and Luz, or Lus, an adjoining town, afterwards called *Bethel*, the former name being lost in that of *Bethel*. It was twelve miles to the north-east of Jerusalem (Jerome); and called *Bethaven* (Hosea).

BETHESDA, (called in the Greek, κολυμβηθρα προβατικη, and thence in the Vulgate, *Piscina Probatica*; because, according to some, the sheep were washed in it, which were appointed for sacrifices), was the Hebrew name for a pool or public bath, which had five porticos, piazzas, or covered walks, around it. This bath, for its singular usefulness, was called Bethesda, בית חסדה, or *Beth Chesda*, or the *house of Mercy*, because, as Pool in his Annotations observes, the erecting of baths was an act of great kindness to the common people, whose indispositions in hot countries required

Digitized by Google

quired frequent bathing. However, some will have the word Bethesda to be ביתאשדה or the *sink-house*, or *drain*, because the waters which came from the temple, and the place where the victims were washed, flowed thither. From the Greek word κολυμβηθρα being used by Josephus (*Antiq.* xv. 3.) to denote the baths at Jericho, Dr Macknight, in his Harmony of the Gospels, concludes that their opinion seems to be without a proper foundation who affirm, that this pool served for washing the sheep designed for sacrifice before they were driven into the temple, and for washing the entrails of the beasts sacrificed there: besides, he thinks it inconsistent with the situation of Bethesda, *near the sheep-gate* (or *market*, as our English translators have rendered the Greek επι τη προβατικη κολυμβηθρα, though some copies have it, Εν τη, &c.) in the south-east wall of the city; or, according to the compilers of the Universal History, in that which was on the north-east, a great way from the temple. However this may be, we are told (John v. 2, 3, &c.) that in the porticos of this bath, at the time of a certain feast (which is generally supposed to have been the passover), there lay a multitude of impotent folk, such as the blind, halt, and withered, waiting for the moving of the water: for an angel went down at a certain period into the pool, and troubled the water; that is, moved it in a sensible manner. Whosoever then first, after the troubling of the water, stepped into it, was made whole of whatever disease he had. Some writers confine the miracle of the pool of Bethesda to the season of this particular feast mentioned in verse 1. of this chapter, because they understand κατα καιρον *by times* (verse 4), which our translators render *a certain season*, meant *at that season*; that is, the season mentioned verse 1.; and since the evangelist does not say that the waters of Bethesda had their sanative quality at any other feast, we are at liberty to make what supposition seems most convenient. Perhaps the silence of Philo and Josephus upon this miracle may induce some to think that it happened only at one passover; for though many infirm people lay in Bethesda, if the angel, as is probable, descended frequently during that solemnity, the miracle would be no sooner known, than multitudes would come and wait at the pool to be cured by the moving of the waters: however, if the number of the sick who gathered on this occasion, and the phrase κατα καιρον, shall incline any person to believe that the waters of Bethesda had an healing quality at other passovers also, Dr Macknight observes, that the silence of the writers before mentioned needs not be much regarded; it being well known that they have omitted greater transactions which they had an opportunity to know, viz. that multitude and variety of miracles which our Lord performed in the course of his ministry. That the waters of Bethesda should at this time have obtained a miraculous healing quality was, without doubt, as that writer remarks, in honour of the personal appearance of the Son of God on earth. Perhaps it was intended to show that Ezekiel's (xlvii.) vision of waters issuing out of the sanctuary was about to be fulfilled, of which waters it is said (ib. verse 9.) "They shall be healed, and every thing shall live whither the river cometh." But it must be observed, that the fourth verse of this chapter of St John is not in the Cambridge MSS. which formerly was Beza's, nor in one or two more of great authority. See Dr Mill's judgment of it in that part of his *Prolegomena* to which he refers the reader in his note on the text. But though it should be rejected, the difficulty for which some would have it cancelled, Dr Macknight observes, remains still: because the seventh verse implies that cures were performed in this pool, and that only one at a time was cured, and consequently that these cures were miraculous. If so, it is as easy to conceive that an angel moved the water, and gave it its healing quality, as to fancy those cures were performed miraculously any other way. Grotius thinks, that the angel is said to have descended, not because he was ever seen to do so, but because the Jews were persuaded that God brought such things to pass by the ministration of angels; so that from that violent motion of the water, and the cure following it, the presence of an angel was with reason supposed. Dr Hammond supposes, that the waters became medicinal by being impregnated with a healing warmth from the blood and entrails of the sacrificed beasts that were washed there; and that the αγγελος, *angel*, or *messenger*, in the text, is not to be understood of those celestial beings that are usually distinguished by that name, but only of a common messenger, viz. an officer or servant of the priest, who at a proper season was sent by him to stir the pool.

BETHLEHEM, a town of Palestine, famous for the birth of Jesus Christ. It was once a flourishing town, but is now only a poor village. It is situated two leagues south-east of Jerusalem, on an eminence, in a country full of hills and valleys, and might be rendered very agreeable. The soil is the best in all these districts: fruits, vines, olives, and sesamum succeed here extremely well; but cultivation is wanting. They reckon about 600 men in this village capable of bearing arms upon occasion; and this often occurs, sometimes to resist the pacha, sometimes to make war with the adjoining villages, and sometimes in consequence of intestine dissensions. Of these 600 men, about 100 are Latin Christians, who have a vicar dependent on the great convent of Jerusalem. Formerly their whole trade consisted in the manufacture of beads; but the reverend fathers not being able to find a sale for all they could furnish, they have resumed the cultivation of their lands. They make a white wine, which justifies the former celebrity of the wines of Judea, but it has the bad property of being very heady. The necessity of uniting for their common defence prevails over their religious differences, and makes the Christians live here in tolerable harmony with the Mahometans, their fellow-citizens. Both are of the party *Yamani*, which, in opposition to that called *Kaisi*, divides all Palestine into two factions, perpetually at variance. The courage of these peasants, which has been frequently tried, has rendered them formidable through all that country. Here is a church built by St Helena, in the form of a cross, which is very large; and from its top may be seen all the country round about. The roof is lofty, flat, and composed of cedar on the inside, and leaded without. Both sides of the nave are supported by two rows of marble pillars, each made of one piece, and eleven in a row, insomuch that they make as it were five naves, separated from each other by these rows of pillars, in each of which is the picture of some saint. On the wall over the pillars there

is

Digitized by Google

is a very beautiful mosaic work, on a gold ground. The walls were formerly overlaid with fine marble, but the Turks have taken it to adorn their mosques. The three upper ends of the cross terminate in three semicircles, having in each an altar. Over the chancel there is a stately cupola, covered with lead on the outside, and within adorned with mosaic work. Close to the church is the monastery of the Franciscans; which is large, but indifferently built. The gardens are defended with strong walls, and at the north-west of them stands a tower now almost in ruins. Their chapel is better taken care of. Through this there is a passage to a square cave, where they say the Innocents were buried. Beyond this there are passages to the tombs of St Jerome, St Paula, Eustochium, and Eusebius of Cremona. Beyond these there is a grot or cell, which they say was the lodging place of St Jerome when he translated the Bible. Another entrance leads to a vault or chapel, 12 feet wide and 40 long, whose floor is paved, and sides lined with white marble, and the roof is adorned with mosaic work, now much decayed. At the end of this there is an arched concavity, with an altar, over which is a picture of the nativity, and under it a vault, the middle of which is a star made with stones of various colours, to mark the place where they say our Saviour was born; and near this is the manger where they pretend he was laid; it is hewn out of a rock, and is now flagged with white marble.

Bethlehem, a town of the Netherlands, in the province of Brabant, subject to the house of Austria. E. Long. 4. 40. N. Lat. 51. 2.

BETHLEHEMITES, or Bethlemites, in church history, a sort of monks introduced into England in the year 1257, habited like the Dominicans, except that, on their breast, they wore a star with five rays, in memory of the star or comet which appeared over Bethlehem at the nativity of our Saviour. They were celled at Cambridge, and had only one house in England.

There is also an order of Bethlehemites still subsisting in Peru, who have convents at Lima; one called of the Incurables, the other of our Lady of Mount Carmel. These Bethlehemites came originally from the city of Guatimala in Mexico, where they were instituted by the venerable Peter Joseph of Betaneur, for the service of the poor. Innocent XI. in 1687, approved the institute. They have already nine convents in Peru.

The Bethlehemites, though outwardly of great simplicity, pass for the most refined politicians; insomuch as to be called the quintessence of the Carmelites and Jesuits. They are all friars. For their almoner they choose a secular priest, whom they hire, and who has no vote in the chapter.

BETHORON, in *Ancient Geography*, a town of Samaria; Upper and Nether, and both in the tribe of Ephraim, built by Shera grand-daughter of Ephraim, 1 Chron. viii. 24. both which were restored by Solomon, after falling to decay, 1 Kings ix. 17. and 2 Chron. viii. 5. Their distance was almost the whole breadth of the tribe of Ephraim, the Upper being in the north, the Nether in the south, of that tribe, Joshua xvi. We know more of the Nether than of the Upper; it was situated on a mountain, and therefore Josephus and Jerome mention going up or ascending; and it stood on the public road to Lydda and Cæsarea, distant an hundred stadia, or twelve miles, from Jerusalem: and on account of this vicinity, some allot it to the tribe of Benjamin.

BETH-PEOR, in *Ancient Geography*, a town of the Reubenites, on the other side Jordan, at Mount Fogor, over against Jericho, six miles above Livias. It had a temple sacred to the idol Baal-Peor, Numbers xxv. 3. called Beel-Phegor by the Vulgate, interpreted Priapus by Jerome.

BETHPHAGE, in *Ancient Geography*, a place at the west descent or declivity of Mount Olivet, Matthew xxi. 1. From which it may be gathered, that the whole of that declivity, with a part of the valley, and the extreme skirts of the city, went under the common name of Bethphage.

BETHSAIDA. See Betharamphtha.

BETHSAN, or Bethsean, in *Ancient Geography*, a town of Samaria, in the half tribe of Manasseh, on the borders of Galilee, about half a league from Jordan, on this side, having half of its territory in the Peræa: it was afterwards called *Scythopolis*: it was distant from Tiberias, situated on the lake Genesareth, 120 stadia, or 15 miles, to the south; and from Jerusalem to the north, 600 stadia, or 75 miles. As to the origin of the appellation Scythopolis, there scarce appears any thing in history that has a relation to it, but the irruption of the Scythians in the time of the Medes, when they overran all Asia. It was the greatest city of all the Decapolis, (Josephus). It is called Baeson by Stephanus.

BETHUNE, Maximilian de, duke of Sully, grand-master of the artillery, and marshal of France, sovereign prince of Enrichemont and Bois-Bell, marquis of Rosny, and one of the ablest and most upright ministers France ever had, was descended from an illustrious house, and was born in 1560. He entered very young into the service of Henry of Bourbon then king of Navarre, afterwards Henry IV. of France, who was only seven years older than Sully. He was bred in the reformed religion, and continued in the profession of it to the end of his life, though from political motives he advised his master to abjure it, as the only method of putting an end to the miseries of France. After Henry had gained possession of the kingdom, Sully performed all the duties of a great and good minister, while his master exercised all the offices of a great and good king. He had been at the battles of Coutras, Arques, and Ivry; at the sieges of Paris, Noyon, Rouen, and Laon; and signalized himself on every important occasion. In 1597 he was made chief overseer of the highways of France; and the following year was raised to the post of superintendant of the finances. Though he was then but 40 years of age, and had hitherto signalized himself only in the army, he put the king's finances in such order, that he paid his debts, which amounted to two hundred millions of livres, and laid up great sums in the king's treasury. In 1601 he was made grand-master of the artillery, the next year governor of the Bastile, and afterwards superintendant of the fortifications. He was then sent into England as ambassador extraordinary; and had, at his return, the government of Poictou. At last Henry IV. in 1606, erected in his favour the territory of Sully on the Loire into a duchy and peerage, and

made

made him grand-master of the ports and havens. After the murder of that great prince in 1610, the duke of Sully, who had served him with the greatest zeal and fidelity, was obliged to retire to one of his houses, where he enjoyed a private life; but in 1634 he was made marshal of France, upon which he resigned the post of grand-master of the artillery. He died in his castle of Villebon on the 21st of December 1641, at 82 years of age. His memoirs are ranked among the best books of French history: they contain a most particular account of whatever passed from the peace of 1570 to the death of Henry IV. in 1610: and acquire additional value from the many curious personal anecdotes preserved in them. They were translated into English by Mrs Lennox in 1757.

Bethune, a town of France, in the department of the Straits of Calais, containing upwards of 5000 inhabitants. There is an entrance into this city through four gates, and it is surrounded with walls and fortified. The city and the castle taken together are of a triangular figure, but the castle itself is a very irregular building. The houses are very indifferent, and the streets ill paved; however, there is a large handsome square and several churches. In the marshy lands near the city there are several canals cut for the conveniency of whitening linen. It is seated on a rock by the river Belfe. E. Long. 2. 48. N. Lat. 50. 32.

BETIS, governor of Gaza under Darius, famous for his valour and loyalty. He defended a place of consequence with a few men against Alexander, who was there shot through the shoulder. Betis thinking him slain, returned triumphantly to the city; but in a second assault he was wounded and brought to Alexander, who cruelly ordered him to be put to death.

BETLEY, a town of Staffordshire in England. It is seated on the confines of the county, next to Cheshire, in a barren sandy soil. W. Long. 2. 15. N. Lat. 53. 0.

BETLIS, a strong town of Armenia or Turcomania, belonging to a bey or prince of the country, who is very powerful, and is subject to neither the grand signior nor king of Persia. It lies on the road from Tauris to Aleppo, and the prince can stop caravans whenever he pleases; for the passage between the mountains is so narrow, that ten men can defend it against 1000. The town is seated between two mountains about a cannon-shot from each other, and the castle is on an eminence exactly in the middle. This eminence is in the shape of a sugar-loaf; and is so steep on all sides, that it is impossible to get up but by winding round about it. The people in and about the town are shepherds, but are ready to take up arms at the command of their prince. E. Long. 42. 40. N. Lat. 37. 20.

BETON, a name given by the French engineers to a kind of mortar, which they use in raising the foundations of masonry under water. It consists of twelve parts of pozzolana or Dutch tarrass, six of good sand, nine of unslaked lime, thirteen of stone splinters about the size of an egg, and three of tile-dust or cinders, or scales of iron out of a forge; this being well worked together, is left to stand for about 24 hours, or till it becomes so hard as not to be separated without a pickaxe.

BETONICA, Betony. See Botany *Index*.

Betonica Aquatica. See Scrophularia, Botany *Index*.

Betonica Pauli. See Veronica, Botany *Index*.

BETONY. See Betonica, Botany *Index*.

BETROTHMENT, a mutual promise or compact between two parties for a future marriage. The word imports as much as giving one's troth; that is, true faith, or promise. Betrothment amounts to the same with what is called by civilians and canonists *sponsalia*, or "espousals;" sometimes *desponsation*, and by the French *fiancailles*.

BETTERTON, Thomas, the celebrated actor, was the son of Mr Betterton, under-cook to King Charles I. and was born in Tothil-street Westminster in the year 1635. Having received the first rudiments of a genteel education, his fondness for reading induced him to request of his parents that they would bind him an apprentice to a bookseller, which was readily complied with, fixing on one Mr Rhodes near Charing-cross for his master. This gentleman, who had been wardrobe-keeper to the theatre in Blackfriars before the troubles, obtained a license in 1659, from the powers then in being, to set up a company of players in the Cockpit in Drury-Lane, in which company Mr Betterton entered himself, and, though not much above 20 years of age, immediately gave proof of the most capital genius and merit.

Soon after the Restoration, two distinct theatres were established by royal authority: the one in Drury-Lane in consequence of a patent granted to Henry Killigrew, Esq. which was called the *King's Company*: the other in Lincoln's-Inn-Fields, who styled themselves the *Duke of York's Servants*, the patentee of which was the ingenious Sir William Davenant; which last-mentioned gentleman having long had a close intimacy with and warm friendship for Mr Rhodes, engaged Mr Betterton, and all who had acted under Mr Rhodes, into his company; which opened in 1662 with a new play of Sir William's, in two parts, called the *Siege of Rhodes*. In this piece, as well as in the subsequent characters which Mr Betterton performed, he increased his reputation and esteem with the public, and indeed became so much in favour with King Charles II. that by his majesty's special command he went over to Paris to take a view of the French stage, that he might the better judge what would contribute to the improvement of our own; and it was upon this occasion, as is generally supposed, that moving scenes were first introduced upon the English theatre, which before had been only hung with tapestry.

In the year 1670 he married one Mrs Sanderson, a female performer on the same stage; who, both as an actress and a woman, was every thing that human perfection was capable of arriving at, and with whom he through the whole course of his remaining life possessed every degree of happiness that a perfect union of hearts can bestow.

When the duke's company removed to Dorset-Gardens, he still continued with them; and on the coalition of the two companies in 1684, he acceded to the treaty, and remained among them; Mrs Betterton maintaining the same foremost figure among the women that her husband supported among the male performers. And so great was the estimation that they were both held in, that in the year 1675, when a pastoral

Digitized by Google

Betterton. storal called *Calista*, or the *Chaste Nymph*, written by Mr Crown, at the desire of Queen Catharine consort to Charles II. was to be performed at court by persons of the greatest distinction, our English Roscius was employed to instruct the gentlemen, and Mrs Betterton honoured with the tutorage of the ladies, among whom were the two princesses Mary and Anne, daughters of the duke of York, both of whom succeeded to the crown of these realms. In grateful remembrance of which, the latter of them,' when queen, settled a pension of 100l. per annum on her old instructress.

In 1693, Mr Betterton having sounded the inclinations of a select number of the actors whom he found ready to join with him, obtained, through the influence of the earl of Dorset, the royal license for acting in a separate theatre; and was very soon enabled, by the voluntary subscriptions of many persons of quality, to erect a new playhouse within the walls of the Tennis Court in Lincoln's-Inn-Fields. To this step Mr Betterton is said to have been induced, partly by ill treatment from the managers, and partly with a view to repair, by the more enlarged profits of a manager, the loss of his whole fortune (upwards of 2000l.), which he had undergone in the year 1692, by adventuring it in a commercial scheme to the East Indies. Be this, however, as it will, the new theatre opened in 1695 with Mr Congreve's Love for Love, the success of which was amazingly great. Yet, in a few years, it appeared that the profits arising from this theatre, opposed as it was by all the strength of Cibber's and Vanbrugh's writings at the other house, were very insignificant; and Mr Betterton growing now into the infirmities of age, and labouring under violent attacks of the gout, he gladly quitted at once the fatigues of management and the hurry of the stage.

The public, however, who retained a grateful sense of the pleasure they had frequently received from this theatrical veteran, and sensible of the narrowness of his circumstances, resolved to continue the marks of their esteem to him by giving him a benefit. On the 7th of April 1709 the comedy of Love for Love was performed for this purpose, in which this gentleman himself, though then upwards of 70 years of age, acted the youthful part of Valentine; as in the September following he did that of Hamlet, his performance of which the author of the Tatler has taken particular notice of. On the former occasion, those very eminent performers, Mrs Barry, Mrs Bracegirdle, and Mr Dogget, who had all quitted the stage some years before, in gratitude to one whom they had had so many obligations to, acted the parts of Angelica, Mrs Frail, and Ben; and Mr Rowe wrote an epilogue for that night, which was spoken by the two ladies, supporting between them this once powerful supporter of the English stage. The profits of this night are said to have amounted to upwards of 500l. the prices having been raised to the same that the operas and oratorios are at present; and when the curtain drew up, almost as large an audience appearing behind as before it.

The next winter Mr Betterton was prevailed on by Mr Owen M'Swinney, then manager of the opera-house in the Hay-market (at which plays were acted four times a week) to continue performing, though but seldom. In consequence of which, in the ensuing spring, viz. on the 25th of April 1710, another play was given out for this gentleman's benefit, viz. The Maid's Tragedy of Beaumont and Fletcher, in which he himself performed his celebrated part of Melanthus. This, however, was the last time of his appearing upon the stage. For having been suddenly seized with the gout, and being impatient at the thoughts of disappointing his friends, he made use of outward applications to reduce the swellings of his feet, which enabled him to walk on the stage, though obliged to have his foot in a slipper. But although he acted that day with unusual spirit and briskness, and met with universal applause, yet he paid very dear for this tribute he had paid to the public; for the fomentations he had made use of occasioning a revulsion of the gouty humour to the nobler parts, threw the distemper up into his head, and terminated his life on the 28th of that month. On the 2d of May his body was interred with much ceremony in the cloister of Westminster, and great honour paid to his memory by his friend the Tatler, who has related in a very pathetic, and at the same time the most dignified manner, the process of the ceremonial. As an author, Mr Betterton had a considerable degree of merit. His dramatic works are, 1. Amorous Widow, a comedy. 2. Dioclesian, a dramatic opera. 3. Masque in the Opera of the Prophetess. 4. Revenge, a comedy. 5. Unjust Judge, a tragedy. 6. Woman made a justice, a comedy. As an actor, he was certainly one of the greatest of either his own or any other age; but those who are desirous of having him painted out in the most lively colours to their imagination, we must refer to the description given of him by his cotemporary and friend Colley Cibber, in the Apology for his own life.

Betterton | Bevelling.

BETTINELLI, Xavier, a late Italian writer. See Supplement.

BETUE, or Betaw, a territory of the Low Countries in the duchy of Guelderland, between the rivers Rhine and Leck.

BETULA, the Birch-tree. See Botany *Index*.

BETULEIUS, Sixtus, an able grammarian, a good Latin poet and philosopher, born at Memmingen in the year 1500; his true name was *Birck*. He taught the belles lettres and philosophy with reputation; and became principal of the college of Augsburg, where he died on the 16th of June 1554. He published several works in prose; and his dramatic pieces of Joseph, Susannah, and Judith, are esteemed.

BEVECUM, a town of the Netherlands, in the province of Brabant. E. Long. 4. 50. N. Lat. 50. 45.

BEVEL, among masons, carpenters, &c. a kind of square, one leg whereof is frequently crooked, according to the sweep of an arch or vault. It is moveable on a centre, and so may be set to any angle.

Bevel-Angle, any other angle besides those of 90 or 45 degrees.

BEVELAND, North and South, two islands in the province of Zealand, between the eastern and western branches of the river Scheldt, making part of the United Provinces.

BEVELLING, in ship-building, the art of hewing a timber with a proper and regular curve, according to a mould which is laid on one side of its surface. "In order to hew any piece of timber to its proper bevel,

Digitized by Google

bevel, it will be necessary, first, to make one side *fair* and *out of winding*; a term used to signify that the side of a timber should be a plane. If this side be uppermost, and placed horizontally, or upon a level, it is plain, if the timber is to be hewed square, it may be done by a plummet and line; but if the timber is not hewed square, the line will not touch both the upper and lower edge of the piece; or if a square be applied to it, there will be wood wanting either at the upper or lower side. This is called *within* or *without* a square. When the wood is deficient at the under side, it is called *under-bevelling*; and when it is deficient on the upper side, it is called *standing-bevelling*; and this deficiency will be more or less according to the depth of the piece; so that, before the proper bevellings of the timbers are found, it will be sometimes very convenient to assign the breadth of the timbers; nay, in most cases it will be absolutely necessary, especially afore and abaft: though the breadth of two timbers, or the timber and room, which includes the two timbers and the space between them, may be taken without any sensible error, as far as the square body goes. For as one line represents the moulding side of two timbers, the foreside of the one being supposed to unite with the aft-side of the other; the two may be considered as one entire piece of timber." *Murray's Ship-Building.*

BEVERAGE, in a general sense, signifies a *drink*: hence nectar is said to be the beverage of the gods. In writers of the middle age, beverage, *beveragium*, or *biberagium*, denotes money to give to an artificer, or other person, to drink, over and above his hire or wages.

BEVERIDGE, William, a learned English bishop, in the beginning of the 18th century, was born in the year 1638, and educated in St John's college Cambridge, where he distinguished himself very early by his extensive learning, and particularly by his knowledge of the oriental languages. Upon the deprivation of Dr Thomas Ken, bishop of Bath and Wells, for not taking the oaths to the government in 1691, he refused the offer of that see, though he was then chaplain to King William and Queen Mary. In 1704 he was consecrated to the bishopric of St Asaph; in which high function he so behaved himself all along, and discharged it in so exemplary a manner, that he approved himself a truly primitive prelate. He died at his lodgings in the Cloisters in Westminster-abbey in 1707; aged 69. As his whole life was spent in acts of piety and charity, so he gave remarkable instances of both at his death, leaving the bulk of his estate for the propagation of the gospel, and promoting of Christian knowledge, at home as well as abroad. His Private Thoughts upon a Christian Life is a very popular, though in many points a very exceptionable, book. He wrote several other works on various subjects, particularly on the oriental tongues.

BEVERLAND, Hadrian, a man of excellent genius in the end of the 17th century, but who prostituted it in the study and composition of books of a very obnoxious kind. He was a perfect master of Ovid, Catullus, Petronius, and authors of that stamp. He is famous for his book on Original Sin, in which he maintained, that Adam's sin consisted in his commerce with his wife, and that original sin is nothing else but the inclination of the sexes to each other: it was condemned to be burnt. He led a scandalous life, but seems to have repented of his wicked manners and lewd writings; for he published a treatise in the end of his life, *De Fornicatione Cavenda*, in 1698. It is said he died mad.

BEVERLEY, a town of Yorkshire, governed by a mayor, a recorder, 12 aldermen, &c. and sends two members to parliament. The minster here is a very fair and neat structure, and the roof is an arch of stone. In it are several monuments of the Percies, earls of Northumberland, who had added a little chapel to the choir, in the windows whereof there are several pictures of that family painted on glass. At the upper end of the choir, at the right of the altar-place, stands the freed stool, made of one entire stone, to which every one that fled had a right of protection. At the upper end of the body of the church, next the choir, hangs an ancient table, with the picture of King Athelstane, who founded the church. Between them is this inscription:

Als free make I thee,
As heart can wish, or egh can see.

Hence the inhabitants pay no toll in any town or port in England. In the body of the church stands an ancient monument, called the *Virgins Tomb*, because two virgin-sisters lie buried there, who gave the town a piece of land, into which any free man may put three milk-cows from Lady-day to Michaelmas. At the lower end of the body of the church is a large font of agate stone.

Near the minster, on the south side of it, is a place called *Hall-Garth*, wherein they keep a court of record, called *Provost's Court*. In this, causes arising within the liberties may be tried for any sum. The liberties contain above 100 towns and parts of towns, in Holdernesse and other parts of the east riding belonging to it. The town is a mile in length, having pleasant springs running quite through it. It is beautified with two stately churches; and has a free-school, with two fellowships, six scholarships, and three exhibitions in St John's college, Cambridge, belonging to it; besides six alms-houses, where none are admitted but those that give bond to leave their effects to the poor when they die. The principal trade of this town is making malt, oatmeal, and tanned leather; and the poor people chiefly support themselves by making bone-lace. About a mile east from the town, there is a mineral water, which cures eruptions of the skin, and is beneficial in the king's evil. Population 6035 in 1811. E. Long. 0. 9. N. Lat. 53. 50.

BEVERLY, a sea-port of Massachusets in North America, separated from Salem by a bridge. It is 20 miles north of Boston, in N. Lat. 42. 31. W. Long. 70. 50.

Beverly, *John of*, in Latin *Joannes Beverlacius*, archbishop of York in the eighth century, was born of a noble family at Harpham in Northumberland, and was justly esteemed one of the best scholars of his time. He was first a monk, and afterwards abbot of the monastery of St Hilda, when his merit recommended him to the favour of Alfred king of Northumberland, who in the year 685 advanced him to the see of Hagustald or Hexham, and in 687 translated him to the archbishopric of York. This prelate was tutor to the famous Bede; and lived in the strictest

strictest friendship with Acca and other Anglo-Saxon doctors, several of whom he engaged to write comments on the Holy Scriptures. In 704, he founded a college at Beverly for secular priests; and after he had governed the see of York 34 years, being tired of the tumults and confusions that prevailed in the church, divested himself of his episcopal character, and retired to Beverly; where he died four years after, on the 7th of May 721.—Bede and other monkish writers ascribe several miracles to him. Between 300 and 400 years after his death, his body was taken up by Alfric archbishop of York, and placed in a shrine richly adorned with silver, gold, and precious stones; and in 1416, the day of his death was, by a synod held at London, appointed a festival. We are told that William the Conqueror, when he ravaged Northumberland with a numerous army, spared Beverly alone, out of a religious veneration for St John of that place. This prelate wrote some pieces which are mentioned by Bale and Pits, viz. 1. *Pro Luca exponenda.* 2. *Homiliæ in Evangelica.* 3. *Epistolæ ad Hildum Abbatissam.* 4. *Epistolæ ad Herebaldum, Andenum et Bertinum.*

BEVERUNGEN, a town of Germany, in the diocese of Paderborn, seated at the confluence of the rivers Beve and Weser, in E. Long. 9. 30. N. Lat. 51. 40.

BEVILE, in *Heraldry*, a thing broken or opening like a carpenter's rule: Thus we say, he beareth argent, a chief bevile, vert, by the name of *Beverlis.*

BEVIN, Elway, a musician eminently skilled in the knowledge of practical composition, flourished towards the end of Queen Elizabeth's reign. He was of Welsh extraction, and had been educated under Tallis, upon whose recommendation it was that in 1589 he was sworn in gentleman extraordinary of the chapel; from whence he was expelled in 1637, it being discovered that he adhered to the Romish communion. He was also organist of Bristol cathedral, but forfeited that employment at the same time with his place in the chapel. Child, afterwards Doctor, was his scholar. He has composed sundry services, and a few anthems. Before Bevin's time the precepts for the composition of canon were known to few. Tallis, Bird, Waterhouse, and Farmer, were eminently skilled in this most abstruse part of musical practice. Every canon, as given to the public, was a kind of enigma. Compositions of this kind were sometimes exhibited in the form of a cross, sometimes in that of a circle; there is now extant one resembling a horizontal sun-dial: and the *resolution* (as it was called) of a canon, which was the resolving it into its elements and reducing it into score, was deemed a work of almost as great difficulty as the original composition. But Bevin, with a view to the improvement of students, generously communicated the result of many years study and experience, in a treatise which is highly commended by all who have taken occasion to speak of it. This book was published in 4to, in 1631, and dedicated to Goodman bishop of Gloucester, with the following title: 'A briefe and short instruction of the art of music, to teach how to make discant of all proportions that are in use: very necessary for all such as are desirous to attain to knowledge in the art; and may by practice, if they can sing, soon be able to compose three, four, and five parts, and also to compose all sorts of canons that are usual, by these directions of two or three parts in one upon the plain song.' The rules contained in this book, for composition, in general are very brief; but for the composition of canon there are in it a great variety of examples of almost all the possible forms in which it is capable of being constructed, even to the extent of 60 parts.

Hawkins's Hist. of Music.

BEWDLY, a town of Worcestershire in England, seated on the bank of the river Severn, in W. Long. 2. 20. N. Lat. 52. 25. It has its name *Bewdley, Beawley,* or *Beaulieu,* from its pleasant situation on the declivity of a hill overlooking the river, and commanding a fine prospect of the country, and formerly of the forest of Wyre, remarkable for its tall stately oaks and other trees, which have since been either blown or cut down. It was formerly accounted so delightful a place, that Henry VII. built a house here for Prince Arthur, which he called *Tiken-hall.* Bewdley sent burgesses to parliament very early, and had charters and great privileges from Edward IV. and Henry VII. which were confirmed with the addition of others, by Henry VIII. in whose time it was annexed to the county of Worcester. King James I. granted it a charter; of which a surrender was procured in Charles II.'s time, and the corporation was new-modelled. King James II. compelled it to accept of a new charter; but the former surrender, upon a trial, was held void, and a new charter was obtained of Queen Anne. In consequence of this it is governed by a bailiff and burgesses, recorder, steward, town-clerk, &c. The town is neat and well built; and carries on a considerable trade, by means of the Severn, in salt, glass, iron-ware, and Manchester goods; but its chief manufacture is in caps, commonly called *Monmouth Caps.* Bewdly contained 3454 inhabitants in 1811.

BEWITS, in falconry, pieces of leather, to which a hawk's bells are fastened, and buttoned to his legs.

BEY, among the Turks, signifies a governor of a country or town. The Turks write it *begh* or *bek,* but pronounce it *bey.*

The word is particularly applied to a lord of a banner, whom, in the same language, they call *sangiac beg* or *bey.* Every province in Turkey is divided into seven sangiacs, or banners, each of which qualifies a bey; and these are all commanded by the governor of the province, whom they also call *beglerbeg,* that is, lord of all the beghs or beys of the province: these beys are much the same as banners were formerly in England.

Bey of Tunis, denotes a prince or king thereof; answering to what at Algiers is called the *dey.* In the kingdom of Algiers, each province is governed by a bey, or viceroy, who is appointed and removed at pleasure by the dey; but has a despotic power within his jurisdiction.

BEYKANEER, or Bicanere, a principality of Hindostan. See Supplement.

BEYS, Giles, a celebrated printer at Paris, in the 16th century, and the first introducer of the consonants j and v.

BEZA, Theodore, one of the principal pillars of the reformed church, was born at Vezelai, in Burgundy, June 24th, 1519. He was brought up by his uncle

uncle Nicholas de Beza, counsellor of the parliament of Paris, till the month of December 1528, when he sent him to study at Orleans, and afterwards at Bourges, where he was under the care of Melchior Wolmar, under whom he made an extraordinary progress in polite learning, and from him imbibed the principles of Calvinism. His uncle intended him for the bar; but the law not suiting his disposition, he spent most of his time in reading the Greek and Latin authors, and in composing verses. In 1539, he took up his licentiate's degree, and went to Paris. He fell into snares in his youth, and wrote some licentious things. Sickness awakened him; and he pursued a vow, he had formerly made, of entering into the reformed religion. According to this resolution, he went to Geneva and made public profession of the reformed religion. In 1549, he accepted of the Greek professorship at Lausanne, where he also read lectures in French on the New Testament to the refugees of both sexes who dwelt in that city. Having settled at Geneva, he adhered to Calvin in the strictest manner, and became in a little time his colleague in the church and in the university. He was sent to Nerac, at the solicitation of some great men of the kingdom, to convert the king of Navarre, and to confer with him upon affairs of importance. This was when the Guises had got the authority under the reign of Francis II. to the prejudice of the princes of the blood. The king of Navarre having testified, both by letters and deputies, that he desired that Beza might assist at the conference of Poissi, the senate of Geneva consented. The assembly hearkened attentively to his harangue, till, speaking of the real presence, he said, that the body of Jesus Christ was as distant from the bread and wine, as the highest heaven is from the earth. This made a murmur: some cried out, *Blasphemavit!* others got up to go away. Cardinal de Tournon, who sat in the first place, desired the king and queen either to silence Beza, or to permit him and his company to withdraw. The king did not stir, nor any of the princes; and leave was given to go on. Throughout the whole conference he behaved himself with great ability. He often preached before the queen of Navarre, the prince of Condé, and in the suburbs of Paris. After the massacre of Vassi, he was deputed to the king to complain of this violence. The civil war followed soon after, during which the prince of Condé kept him with him; and while the prince was imprisoned, he lived with Admiral de Coligni, and did not return to Geneva till after the peace 1563. In 1571, he was chosen moderator at the national synod of Rochelle: and in the year after, assisted at that of Nismes; after this, he assisted at the conferences of Montbeliard, and at those of Bern. The infirmities of old age beginning to fall heavy upon him in 1597, he could seldom speak in public: and at last he left it off entirely in the beginning of the year 1600. However, in 1597, he wrote some animated verses against the Jesuits, on the occasion of the report that was made of his death, and of his having before he died made profession of the Roman faith. He lived till the 13th of October 1605. He was a man of extraordinary merit, and one who did great services to the Protestant cause. This, however, exposed him to innumerable slanders and calumnies; but he showed both to the Catholics and Lutherans, that he understood how to defend himself. He wrote, 1. A Translation of the New Testament; 2. Turned the Psalms into Latin verse; 3. Published a Treatise on the Sacraments; 4. Some Sermons on the Passion of Jesus Christ and on Solomon's Song; 5. A version of the Canticles, in lyric verse; 6. A French tragi-comedy, entitled, The Sacrifice of Abraham; and many other pieces.

BEZANS, cotton cloths, which come from Bengal: some are white, and others stripped with several colours.

BEZANTLER, the branch of a deer's horn next below the brow-antler.

BEZOAR, in *Natural History* and *Medicine*, a general name for certain animal substances supposed to be effectual in preventing the fatal consequences of poison. The word comes from the Persian *badzcher*, *bazcher*, or *pahazar*, which signifies an antidote.

The first mention made of bezoar is in Avenzoar, an Arabian physician, who gives a very romantic account of its origin. He describes it as generated of the tears or gum of the eyes of stags; who, after eating serpents, used to run into the water up to the nose, where they stood till their eyes began to ooze a humour, which, collecting under the eye-lids, gradually thickened and coagulated, till, being grown hard, it was thrown off by the animal in rubbing frequently. Other opinions no less fabulous obtained till the time of Garcias al Horto, physician to the Portuguese viceroy of the Indies, who gave the first genuine account of it. Kempfer afterwards gave a description of it, with some new particulars.

The bezoar is a calculous concretion found in the stomach of certain animals of the goat kind. See CAPRA. It is composed of concentrical coats surrounding one another, with a little cavity in the middle, containing a bit of wood, straw, hair, or the like substances.

There are two sorts of bezoar; one brought from Persia and the East Indies, the other from the Spanish West Indies. The first or best sort, called *oriental bezoar*, is of a shining dark-green or olive colour, and an even smooth surface; on removing the outward coat, that which lies underneath it appears likewise smooth and shining. The *occidental* has a rough surface, and less of a green colour then the foregoing; it is likewise much heavier, more brittle, and of a looser texture; the coats are thicker, and on breaking exhibit a number of striæ curiously interwoven. The oriental is generally less than a walnut; the occidental for the most part larger, and sometimes as big as a goose egg. The first is universally most esteemed, and is the only sort now retained by the London college; the Edinburgh, in the edition of their pharmacopœia preceding the present, directed both; but they now seem to allow them to be used promiscuously, retaining in their catalogue only the name *bezoar lapis*.

This stone is in high esteem among the Persians, and even of greater value than in Europe, which, with sundry other circumstances needless to relate here, has given occasion to many to suspect, that the true bezoar is never brought to us. Some authors relate with great confidence, that all the stones commonly sold under this name are artificial compositions. That some of them are so, is evident; hence the great differences in the accounts which different persons have given of their qualities:

Digitized by Google

qualities: the stones examined by Slare as oriental bezoar did not dissolve in acids; those which Grew and Boyle made trial of, did; those employed by Geoffroy (in some experiments related in the French memoirs 1710) did not seem to be acted on by rectified spirits; whilst some of those examined by Neumann at Berlin almost totally dissolved therein. The common mark of the goodness of this stone, is its striking a deep green colour on white paper that has been rubbed with chalk.

Bezoar was not known to the ancient Greeks, and is first taken notice of by the Arabians (as above mentioned), who extol it in a great variety of disorders, particularly against poisons. Later writers also bestow extraordinary commendations on it as a sudorific and alexipharmac; virtues to which it certainly has no pretence. It has no smell or taste, is not digestible in the stomach of the animal in which it is found, and is scarce capable of being acted on by any of the juices of the human body. It cannot be considered in any other light than as an absorbent; and is much the weakest of all the common substances of that class. It has been given to half a dram, and sometimes a whole dram, without any sensible effect; though the general dose (on account of its great price) is only a few grains.

Bezoar, in a more extensive sense, includes all substances formed stratum super stratum in the stomachs or intestines of animals; in which sense pearls, the concretions called *crabs-eyes*, &c. belong to the class of bezoars. To this also belong the hippolithus, or *bezoar equinum*, a stone sometimes found in the stomach or intestines of a horse: the monkey-bezoar, a stone said to be found in the stomachs of certain monkeys in Brazil and the East Indies, harder than the oriental bezoar, of a dark green colour, and very costly on account of its scarcity.—*Bezoar bovinum*, is a yellowish stone found in the ox's gall-bladder.—*Human bezoars* are stony substances found in the intestines of several persons, formed from the stones of plums, or other fruits, retained in the cœcum or other guts, and growing coated over, of which we have an instance given by Dr Cole, Phil. Trans. N° 235.—*Bezoar microcosmicum* is the same with the human calculus; and is various in its degrees of hardness, as well as in its size and figure. It has been used in the place of the more costly sorts.—As to the *bezoar hystricis*, a concretion found in the gall-bladder of an Indian porcupine; and the German bezoar, or that found in mountain deer, especially on the Alps; these, not being stones, are more properly called by late writers *egagrophilæ;* the former consisting of woolly fibres, and a bitter friable matter, having neither laminæ nor membranes; the latter being a ball of hair or herbs, or perhaps roots, compacted in the stomach of the animal.—They are all, as medicines, unworthy of regard.—The bezoar bovinum, or ox bezoar, is used by miniature-painters in several casts of yellow.

Bezoar-Mineral. See Pharmacy *Index*.

Fossil Bezoar, is a kind of figured stone, formed like the animal bezoar, of several coats or strata ranged round some extraneous body which forms a nucleus, and supposed to have the same virtues. It is found chiefly in Sicily, in sand and clay pits. It is of a purple colour, with a rough surface, the size of a walnut, and light. When broken, it is found to be an irony crust, containing in its hollow a fine greenish white earth, resembling pale bezoar. The earth is used and not the shells. It seems to be of the nature of bole armeniac. It is called *Sicilian earth.*

BEZOARDIC, an appellation given to whatever partakes of the nature of bezoar; also compound medicines whereof bezoar makes an ingredient.

BIA, in *Commerce*, a name given by the Siamese to those small shells which are called *cowries* throughout almost all the other parts of the East Indies. See Cowries.

BIÆUM, βιαιον, in *Rhetoric*, denotes a kind of counter argument, whereby something alleged for the adversary is retorted against him, and made to conclude a different way: for instance, *Occidisti, quia adstitisti interfecto.*—βιαιον, *Immo quia adstiti interfecto, non occidi; nam si id esset, in fugam me conjecissem.* "You killed the person because you were found standing by his body. *Biæum*, Rather I did not kill him because I was found standing by his body; since, in the other case, I should have fled away."

Biæum, in the Grecian laws, was an action brought against those who ravished women, or used violence to any man's person.

BIAFAR, or Biafra, a kingdom of Africa, situated to the east of Benin, to the west of Medra, from which it is divided by a chain of mountains, and extending southward to the fourth degree of north latitude. The natives are the most of all negroes addicted to, and infatuated with, magic; imagining themselves capable of causing rain, thunder, and lightning: therefore they worship the devil with great zeal, and even sacrifice their children to him.

BIAFORA, in the customs of the middle age, a form of cry or alarm to arms; on the hearing whereof the inhabitants of towns or villages were to issue forth, and attend their prince. The word seems originally from Gascony; and the Italians even now on a sudden insurrection of the people, commonly cry, *Via-fora*, by an usual change of the letter B into V.

BIARCHUS, an officer in the court of the emperors of Constantinople, intrusted with the care and inspection of the provisions of the soldiery.

BIALOGOROD, or Akerman, a strong town of Bessarabia, in European Russia. It is seated on a lake called *Vidono*, near the sea-side, in E. Long. 22. 50. N. Lat. 46. 24.

BIANA, a town of Asia in Hindostan, 50 miles west from Agra, remarkable for its excellent indigo, and formerly for its copper mines. E. Long. 77. 0. N. Lat. 26. 20.

BIANCHI, Francesco, called *Il Frari*, an eminent painter, was born at Modena; and had the honour of being master to one of the most esteemed painters that ever appeared, Antonio Corregio. His colouring was delicately fine; his attitudes full of grace; and his invention extremely grand. His works had an astonishing beauty, and are prized as highly as even those of Corregio. He died in 1520.

BIANCHINI, Francis, one of the most learned men of his time, was born at Verona in 1662, of a noble and ancient family. His taste for natural philosophy and mathematics induced him to establish the academy at Aletofili, at Verona. He went to Rome in 1684;

Digitized by Google

and was made librarian to Cardinal Ottoboni, who was afterwards pope under the name of Alexander VIII. He also became canon of St Mary de la Rotonda, and at length of St Lawrence in Damaso. He was esteemed by the learned; and was a member of many academies. He published several ingenious dissertations, &c. and died in 1729, aged 67.

BIAS, one of the seven sages of Greece, flourished about 608 before Christ. He was accustomed to say, "It was a sickness of the mind to wish for impossible things." During the siege of Priene, his native city, being asked why he was the only one who retired from the place without carrying any thing with him, he replied, That he carried his all with him; meaning, that his knowledge and virtue were the only blessings that were peculiarly his own, since they could not be taken from him. He expired while pleading for one of his friends.

BIAS, or *Biass*, in a general sense, the inclination or bent of a person's mind to one thing more than another.—It also signifies the lead or weight put into a bowl, that draws or turns the course of it any way to which the bias looks.

BIBERACH, formerly a free and imperial city of Suabia in Germany, but now included in the kingdom of Wirtemberg. It has a large manufacture in fustians, and is seated on the river Russ. E. Long. 10. 2. N. Lat. 48. 4.

BIBERSBERG, a town of Upper Hungary, situated in E. Long. 17. 25. N. Lat. 48. 35.

BIBIENA, FERDINAND GALLI, an excellent painter and architect, was born at Bologna in 1657; and was surnamed *Bibiena* from a territory of that name in Tuscany, in which his father was born. He acquired such reputation by his skill in architecture, the decorations of the theatre and perspective, that the duke of Parma invited him to his court, and made him his first painter and architect. Bibiena at length went to the emperor's court, where he had the same honours and advantages. He wrote two books of architecture; and died at Bologna, at above 80 years of age. His sons followed with success the same professions.

BIBLE (in Greek βιβλος, *the book*), a name applied by Christians by way of eminence or distinction to the collection of sacred writings, or the holy scriptures of the Old and New Testaments; known also by various other appellations, as, the Sacred Books, Holy Writ, Inspired Writings, Scriptures, &c. The Jews styled the Bible (that is the Old Testament) *mikra;* which signifies *Lesson* or *Lecture*.
