This collection of the sacred writings containing those of the Old and New Testament, is justly looked upon as the foundation of the Jewish as well as the Christian religion. The Jews, it is true, acknowledged only the scriptures of the Old Testament, the correcting and publishing of which is unanimously ascribed, both by the Jews and Christians, to Ezra. Some of the ancient fathers, on no other foundation than that fabulous and apocryphal book, the second book of Esdras, pretend, that the scriptures were entirely lost and destroyed at the Babylonish captivity, and that Ezra restored them all again by divine revelation. What is certain is, that in the reign of Josiah there was no other book of the law extant besides that found in the temple by Hilkiah; from which original, by order of that pious king, copies were immediately written out, and search made for all the other parts of the scriptures, (2 Kings xxii.); by which means copies of the whole became multiplied among the people, who carried them with them into their captivity. After the return of the Jews from the Babylonish captivity, Ezra got together as many copies as he could of the sacred writings, and out of them all prepared a correct edition, disposing the several books in their proper order, and settling the canon of scripture for his time. These books he divided into three parts. 1. The Law, 2. The Prophets. 3. The Cetubim or Hagiographia. i. e. *The Holy Writings*.

I. The Law contains, 1. Genesis. 2. Exodus. 3. Leviticus. 4. Numbers. 5. Deuteronomy.

II. The writings of the prophets are, 1. Joshua. 2. Judges, with Ruth. 3. Samuel. 4. Kings. 5. Isaiah. 6. Jeremiah, with his Lamentations. 7. Ezekiel. 8. Daniel. 9. The twelve minor prophets. 10. Job. 11. Ezra. 12. Nehemiah. 13. Esther.

III. And the Hagiographia consists of, 1. The Psalms. 2. The Proverbs. 3. Ecclesiastes. 4. The Song of Solomon. This division was made for the sake of reducing the number of the sacred books to the number of the letters in their alphabet, which amount to 22. At present, the Jews reckon 24 books in their canon of Scripture, in disposing of which the law stands as it did in the former division, and the prophets are distributed into the former and latter prophets.

The former prophets are,
Joshua, Judges, Samuel, Kings.

The latter prophets are,
Isaiah, Jeremiah, Ezekiel, and the 12 minor prophets.

And the hagiographia consists of
The Psalms, the Proverbs, Job, the Song of Solomon, Ruth, the Lamentations, Ecclesiastes, Esther, Daniel, Ezra, the Chronicles.

Under the name of Ezra, they comprehend Nehemiah. It is true this order hath not always been observed, but the variations from it are of little or no moment.

The five books of the law are divided into 54 sections. This division many of the Jews hold to have been appointed by Moses himself; but others, with more probability, ascribe it to Ezra. The design of this division was, that one of these sections might be read in their synagogues every sabbath-day. The number was 54, because in their intercalated years a month being then added, there were 54 sabbaths. In other years, they reduced them to 52, by twice joining together two short sections. Till the persecution of Antiochus Epiphanes, they read only the law; but the reading of it being then prohibited, they substituted in the room of it 54 sections out of the prophets; and when the reading of the law was restored by the Maccabees, the section which was read every sabbath out of the law served for their first lesson, and the section out of the prophets for their second These sections were divided into verses; of which division, if Ezra was not the author, it was introduced not long after him, and seems to have been designed for the use of the Targumists or Chaldee interpreters: for after the return of the Jews from the Babylonish captivity, when the Hebrew language ceased to be their mother tongue, and the Chaldee grew into use instead of it, the custom was that the law should be first read in the original Hebrew,

Digitized by Google

brew, and then interpreted to the people in the Chaldee language, for which purpose these shorter sections or periods were very convenient.

The division of the scriptures into chapters, as we at present have them, is of much later date. Some attribute it to Stephen Langton, archbishop of Canterbury, in the reigns of John and Henry III. But the true author of the invention was Hugo de Sancto Caro, commonly called *Hugo Cardinalis*, because he was the first Dominican that ever was raised to the degree of cardinal. This Hugo flourished about the year 1240. He wrote a comment on the scriptures, and projected the first concordance, which is that of the vulgar Latin Bible. The aim of this work being for the more easy finding out any word or passage in the scriptures, he found it necessary to divide the book into sections, and the sections into subdivisions: for till that time the vulgar Latin Bibles were without any division at all. These sections are the chapters into which the Bible has ever since been divided. But the subdivision of the chapters was not then into verses, as it is now. Hugo's method of subdividing them was by the letters A, B, C, D, E, F, G, placed on the margin at an equal distance from each other, according to the length of the chapters. The subdivision of the chapters into verses, as they now stand in our Bibles, had its original from a famous Jewish rabbi, named Mordecai Nathan, about the year 1445. This rabbi, in imitation of Hugo Cardinalis, drew up a concordance to the Hebrew Bible, for the use of the Jews. But though he followed Hugo in his division of the books into chapters, he refined upon his invention as to the subdivision, and contrived that by verses: this being found to be a much more convenient method, it has been ever since followed. And thus, as the Jews borrowed the division of the books of the Holy Scriptures into chapters from the Christians, in like manner the Christians borrowed that of the chapters into verses from the Jews.

The order and division of the books of the Bible, as well of the Old as of the New Testament, according to the disposition made by the council of Trent, by Decree I. session iv. are as follow: where we are to observe, that those books to which the asterisms are prefixed, are rejected by the Protestants as apocryphal.

Genesis,
Exodus,
Leviticus,
Numbers,
Deuteronomy,
Joshua,
Judges and Ruth,
1 Samuel, or 1 Kings,
2 Samuel, or 2 Kings,
1 Kings, otherwise called 3 Kings,
2 Kings, otherwise called 4 Kings,
1 Chronicles,
2 Chronicles,
1 Esdras (as the LXX and Vulgate call it), or the book of Ezra,
2 Esdras or (as we have it) the book of Nehemiah,
* Tobit,
* Judith,
Esther,
Job,
Psalms,
Proverbs,
Ecclesiastes,
Song of Solomon,
* The book of Wisdom,
* Ecclesiasticus,
Isaiah,
Jeremiah and *Baruch,
Ezekiel,
Daniel,
Hosea,
Joel,
Amos,
Obadiah,
Nahum, which we place immediately after Micah, before Habakkuk,
Jonah, which we place immediately after Obadiah,
Micah,
Habakkuk,
Zephaniah,
Haggai,
Zechariah,
Malachi,
* 1 Maccabees,
* 2 Maccabees.

The books of the New Testament are,

The Gospel of { St Matthew, St Mark, St Luke, St John.

The Acts of the Apostles.

The Epistle of St Paul to { the Romans, the Corinthians, I. the Corinthians, II. the Galatians, the Ephesians, the Philippians, the Colossians, the Thessalonians, I. the Thessalonians, II. Timothy, I. Timothy, II. Titus, Philemon, the Hebrews.

The general Epistle of { St James, St Peter, I. St Peter, II. St John, I. St John, II. St John, III. St Jude.

The Revelation of St John.

The apocryphal books of the Old Testament, according to the Romanists, are, the book of Enoch (see Jude 14.), the third and fourth books of Esdras, the third and fourth books of Maccabees, the prayer of Manasseh, the Testament of the twelve patriarchs, the Psalter of Solomon, and some other pieces of this nature.

The apocryphal books of the New Testament are, the epistle of St Barnabas, the pretended epistle of St Paul

Digitized by Google

Paul to the Laodiceans, several spurious gospels, Acts of the Apostles, and Revelations; the book of Hermas, entitled the Shepherd, Jesus Christ's Letter to Abgarus, the epistles of St Paul to Seneca, and several other pieces of the like nature, as may be seen in the collection of the apocryphal writings of the New Testament made by Fabricius.

The books which are cited in the Old Testament, and now lost, are these; the book of the *Righteous*, or of Jasher, as our version of the Bible has it (Josh. x. 13. and 2 Sam. i. 18.); the book of the wars of the Lord, (Numb. xxi. 14.); the annals of the kings of Israel, so often cited in the books of the Kings and Chronicles. The authors of these annals were the prophets, who lived in the kingdoms of Judah and Israel. We have likewise but a part of Solomon's 3000 proverbs and his 1005 songs, (1 Kings iv. 32.); and we have entirely lost what he wrote upon plants, animals, birds, fishes, and reptiles.

Ezra, in the opinion of most learned men, published the Scriptures in the Chaldee character: for that language being grown wholly into use among the Jews, he thought proper to change the old Hebrew character for it, which hath since that time been retained only by the Samaritans, among whom it is preserved to this day.

Prideaux is of opinion that Ezra made additions in several parts of the Bible, where any thing appeared necessary for illustrating, connecting, or completing, the work; in which he appears to have been assisted by the same spirit in which they were first written. Among such additions are to be reckoned the last chapter of Deuteronomy, wherein Moses seems to give an account of his own death and burial, and the succession of Joshua after him. To the same cause, our learned author thinks, are to be attributed many other interpolations in the Bible, which created difficulties and objections to the authenticity of the sacred text, no ways to be solved without allowing them. Ezra changed the names of several places which were grown obsolete, and instead of them put their new names, by which they were then called, in the text. Thus it is that Abraham is said to have pursued the kings who carried Lot away captive, as far as Dan; whereas that place in Moses's time was called *Laish;* the name *Dan* being unknown till the Danites, long after the death of Moses, possessed themselves of it.

The Jewish canon of Scripture was then settled by Ezra, yet not so but that several variations have been made in it. Malachi, for instance, could not be put in the Bible by him, since that prophet is allowed to have lived after Ezra; nor could Nehemiah be there, since mention is made in that book, of Jaddus, as high-priest, and of Darius Codomannus, as king of Persia, who were at least 100 years later than Ezra. It may be added, that in the first book of Chronicles, the genealogy of the sons of Zerubbabel is carried down for so many generations as must necessarily bring it to the time of Alexander, and consequently this book could not be in the canon in Ezra's days. It is probable, the two books of Chronicles, Ezra, Nehemiah, Esther, and Malachi, were adopted into the Bible in the time of Simon the Just, the last of the men of the great synagogue.

The Jews, at first, were very reserved in communicating their Scripture to strangers: despising and shunning the Gentiles, they would not disclose to them any of the treasures concealed in the Bible. We may add, that the people bordering on the Jews, as the Egyptians, Phœnicians, Arabs, &c. were not very curious to know the laws or history of a people, whom in their turn they hated or despised. Their first acquaintance with these books was not till after the several captivities of the Jews, when the singularity of the Hebrew laws and ceremonies induced several to desire a more particular knowledge of them. Josephus seems surprised to find such slight footsteps of the Scripture-history interspersed in the Egyptian, Chaldean, Phœnician, and Grecian history; and accounts for it hence, that the sacred books were not as yet translated into Greek or other languages, and consequently not known to the writers of those nations.

The first version of the Bible was that of the SEPTUAGINT into Greek, in the time of Ptolemy Philadelphus; though some maintain that the whole was not then translated, but only the Pentateuch; between which and the other books in the version called of the Seventy, the critics find a great diversity in point of style and expression, as well as of accuracy.

Hebrew BIBLES are either manuscript or printed. The best manuscript Bibles are those copied by the Jews of Spain. Those copied by the Jews of Germany are less exact, but more common. The two kinds are easily distinguished from each other; the former being in beautiful characters, like the Hebrew Bibles of Bomberg, Stephens, and Plantin: the latter in characters like those of Munster and Gryphius. F. Simon observes, that the oldest manuscript Hebrew Bibles are not above six or seven hundred years old; nor does Rabbi Menaham, who quotes a vast number of them, pretend that any of them exceed six hundred years.

Dr Kennicot, in his Dissertatio Generalis prefixed to his Hebrew Bible, p. 21. observes, that the most ancient manuscripts were written between the years 900 and 1100: but though those that are the most ancient are not more than 800 or 900 years old, they were transcribed from others of a much more ancient date. The manuscript preserved in the Bodleian library is not less than 800 years old. Another manuscript, not less ancient, is preserved in the Cæsarean library at Vienna.

The most ancient printed Hebrew Bibles are those published by the Jews of Italy, especially of Pelaro and Bresse. Those of Portugal also printed some parts of the Bible at Lisbon, before their expulsion.—This may be observed in the general, that the best Hebrew Bibles are those printed under the inspection of the Jews; there being so many *minutiæ* to be observed, that it is scarce possible for any other to succeed in it.

In the beginning of the 16th century Dan. Bomberg printed several Hebrew Bibles in folio and quarto at Venice, most of which are esteemed both by the Jews and Christians: the first in 1517, which is the least exact, and generally goes by the name of Felix Pratensis, the person who revised it. This edition contains the Hebrew text, the targum, and the commentaries of several rabbins. In 1528, the same Bomberg

Digitized by Google

berg printed the folio Bible of Rabbi Benchajim, with his preface, the masoretical divisions, a preface of Aben Ezra, a double *masora*, and several various readings. The third edition was printed in 1618; it is the same with the second, but much more correct. From the former editions it was, that Buxtorf the father, printed his rabbinical Hebrew Bible at Basil in 1618; which, though there are many faults in it, is more correct than any of the former. In 1623 appeared at Venice a new edition of the rabbinical Bible by Leo of Modena, a rabbin of that city, who pretended to have corrected a great number of faults in the former edition; but, besides that it is much inferior to the other Hebrew Bibles of Venice, with regard to paper and print, it has passed through the hands of the inquisitors, who have altered many passages in the commentaries of the rabbins.

As to Hebrew Bibles in 4to, that of R. Stephens is esteemed for the beauty of the characters; but it is very incorrect. Plantin also printed several beautiful Hebrew Bibles at Antwerp: one, in eight columns, with a preface by Arias Montanus in 1571, which far exceeds the Complutensian in paper and print, and contents; this is called the Royal Bible, because it was printed at the expence of Philip II. of Spain: another at Geneva in 1619; besides many more of different sizes, with and without points. Manasseh Ben Israel, a learned Portuguese Jew, published two editions of the Hebrew Bible at Amsterdam; the one in 4to in 1635; the other in 8vo in 1639: the first has two columns, and for that reason is commodious for the reader. In 1639, R. Jac. Lombroso published a new edition in 4to at Venice, with small literal notes at the bottom of each page, where he explains the Hebrew words by Spanish words. This bible is much esteemed by the Jews at Constantinople: in the text they have distinguished between words where the point *camets* is to be read with a *camets-katuph*, that is, by *o*, and not an *a*.

Of all the editions of the Hebrew Bible in 8vo, the most beautiful and correct are the two of Jo. Athias, a Jew of Amsterdam. The first, of 1661, is the best paper; but that of 1667 is the most exact; that, however, published since at Amsterdam by Vander Hooght, in 1705, is preferable to any of them.

After Athias, three Hebraizing Protestants, engaged in revising and publishing the Hebrew Bible, viz. Clodius, Jablonski, and Opitius. Clodius's edition was published at Franckfort in 1677, in 4to. At the bottom of the page it has the various readings of the former editions; but the author does not appear sufficiently versed in the accenting, especially in the poetical books; besides, as it was not published under his eye, many faults have crept in. That of Jablonski in 1699, in 4to, at Berlin, is very beautiful as to letter and print: but, though the editor pretends he made use of the editions of Athias and Clodius, some critics find it scarce in any thing different from the 4to edition of Bomberg. That of Opitius is also in 4to at Keil, in 1709; the character is large and good, but the paper bad: it is done with a great deal of care; but the editor made use of no manuscripts but those of the German libraries; neglecting the French ones, which is an omission common to all three. They have this advantage, however, that besides the divisions used by the Jews, both general and particular, into *paraskes* and *pesukim*, they have also those of the Christians, or of the Latin Bibles, into chapters and verses; the *keir ketib*, or various readings, Latin summaries, &c. which made them of considerable use, with respect to the Latin edition and the concordances.

The little Bible of R. Stephens, in 16to, is very much prized for the beauty of the character. Care, however, must be taken, there being another edition of Geneva exceedingly like it, excepting that the print is worse, and the text less correct. To these may be added some other Hebrew Bibles without points, in 8vo and 24to, which are much coveted by the Jews; not that they are more exact, but more portable than the rest, and are used in their synagogues and schools: of these there are two beautiful editions, the one of Plantin, in 8vo, with two columns, and the other in 24to reprinted by Raphalengius at Leyden, in 1610. There is also an edition of them by Laurence at Amsterdam in 1631, in a large character; and another in 12mo, at Franckfort, in 1694, full of faults, with a preface of M. Leusden at the head of it.

Houbigant published an elegant edition of the Hebrew Bible at Paris, in 1753, contained in four vols. folio. The text is that of Van der Hooght, without points, to which he has added marginal notes, supplying the variations of the Samaritan copy. Dr Kennicott, after almost 20 years laborious collation of near 700 copies, manuscript and printed, either of the whole or of particular parts of the Bible, did, in 1776, publish the first volume of the Hebrew Bible in folio. The text is that of Everand Van der Hooght, already mentioned, differing from it only in the disposition of the poetical parts, which Dr Kennicott has printed in hemistichs, into which they naturally divide themselves; however, the words follow one another in the same order as they do in the edition of Van der Hooght. This edition is printed on an excellent type; the Samaritan text, according to the copy in the London Polyglot, is exhibited in a column parallel with the Hebrew text; those parts of it only being introduced in which it differs from the Hebrew. The numerous variations both of the Samaritan manuscripts from the printed copy of the Samaritan text, and of the Hebrew manuscripts from the printed text of Van der Hooght, are placed separately at the bottom of the page, and marked with numbers referring to the copies from which they are taken. The editor regrets, that the dissertatio generalis, which would help to enrich this article, is not to be published till the second volume is ready.

Greek Bibles. There is a great number of editions of the Bible in Greek; but they may be all reduced to three or four principal ones, viz. that of Complutum, or Alcala de Henares, that of Venice, that of Rome, and that of Oxford. The first was published in 1515, by Cardinal Ximenes, and inserted in the Polyglot Bible, usually called the *Complutensian Bible*: this edition is not just, the Greek of the Seventy being altered in many places according to the Hebrew text. It has, however, been reprinted in the Polyglot Bible of Antwerp, in that of Paris, and in the 4to Bible, commonly called *Vatablus's Bible*.

The second Greek Bible is that of Venice, printed by

Digitized by Google

by Aldus in 1518. Here the Greek text of the Septuagint is reprinted just as it stood in the manuscript, full of faults of the copyists, but easily amended. This edition was reprinted at Strasburg in 1526, at Basil in 1545, at Frankfort in 1597, and other places, with some alterations to bring it nearer the Hebrew. The most commodious is that of Frankfort; there being added to this little *scholia*, which show the different interpretations of the old Greek translators: the author of this collection has not added his name, but it is commonly ascribed to Junius.

The third Greek Bible is that of Rome, or the Vatican, in 1587, with Greek *scholia* collected from the manuscripts in the Roman libraries by Pet. Morin. It was first set on foot by Cardinal Montalbo, afterwards Pope Sixtus Quintus. This fine edition has been reprinted at Paris 1628 by J. Morin, priest of the oratory, who has added the Latin translation, which in the Roman was printed separately with *scholia*. The Greek edition of Rome has been printed in the Polygot Bible of London; to which are added, at bottom, the various readings of the Alexandrian manuscript. This has been also reprinted in England in 4to and 12mo, with some alterations. It has been again published at Franeker in 1709 by Bos, who has added all the various readings he could find.

The fourth Greek Bible is that done from the Alexandrian manuscript, begun at Oxford by Dr Grabe in 1707. In this the Alexandrian manuscript is not printed such as it is, but such as it was thought it should be; i. e. it is altered wherever there appeared any fault of the copyists, or any word inserted from any particular dialect: this some think an excellence, but others a fault; urging that the manuscript should have been given absolutely and entirely of itself, and all conjectures as to the readings should have been thrown into the notes.

Latin Bibles, how numerous soever, may be all reduced to three classes; the ancient vulgate, called also *Italica*, translated from the Greek Septuagint; the modern vulgate, the greatest part of which is done from the Hebrew text; and the new Latin translations, done also from the Hebrew text, in the 16th century. We have nothing remaining of the ancient vulgate, used in the primitive times in the western churches, but the Psalms, Wisdom, and Ecclesiastes. Nobilius has endeavoured to retrieve it from the works of the ancient Latin fathers; but it was impossible to do it exactly, because most of the fathers did not keep close to it in their citations.

As to the modern vulgate, there is a vast number of editions very different from each other. Cardinal Ximenes has inserted one in the Bible of Complutum, corrected and altered in many places. R. Stephens and the doctors of Louvain have taken great pains in correcting the modern vulgate.

The best edition of Stephens's Latin Bible is that of 1540, reprinted in 1545, in which are added on the margin the various readings of several Latin manuscripts which he had consulted. The doctors of Louvain revised the modern vulgate after R. Stephens; and added the various readings of several Latin manuscripts. The best of the Louvain editions are those at the end of which are added the critical notes of Francis Lucas of Bruges.

All these reformations of the Latin Bible were made before the time of Pope Sixtus V. and Clement VIII. since which people have not dared to make any alterations, excepting in comments and separate notes. The correction of Clement VIII. in 1592, is now the standard throughout all the Romish churches: that pontiff made two reformations; but it is the first of them that is followed. From this the Bibles of Plantin were done, and from those of Plantin all the rest; so that the common Bibles have none of the after corrections of the same Clement VIII. It is a heavy charge that lies on the editions of Pope Clement, viz. that they have some new texts added, and many old ones altered, to countenance and confirm what they call the Catholic doctrine; witness that celebrated passage of St John, *tres sunt*, &c. There are a great number of Latin Bibles of the third class, comprehending the versions from the originals of the sacred books made within these 200 years. The first is that of Santes Pagninus, a Dominican, under the patronage of Pope Leo X. printed at Lyons, in 4to, in 1527, much esteemed by the Jews. This the author improved in a second edition. In 1542, there was a beautiful edition of the same at Lyons, in folio, with *scholia*, published under the name of *Michael Villanovanus*, i. e. Michael Servetus, author of the *scholia*. Those of Zurich have likewise published an edition of Pagninus's Bible in 4to; and R. Stephens reprinted it in folio, with the vulgate, in 1557, pretending to give it more correct than in the former editions. There is also another edition of 1586, in four columns, under the name of *Vatablus*: and we find it again in the Hamburgh edition of the Bible in four languages.

In the number of Latin Bibles is also usually ranked the version of the same Pagninus corrected, or rather rendered literal, by Arias Montanus; which correction being approved of by the doctors of Louvain, &c. was inserted in the Polyglot Bible of Philip II. and since in that of London. There have been various editions of this in folio, 4to, and 8vo; to which have been added the Hebrew text of the Old Testament, and the Greek of the New. The best of them all is the first, which is in folio, 1571.

Since the Reformation there have been several Latin versions of the Bible from the originals by Protestants. The most esteemed are those of Munster, Leo Juda, Castalio, and Tremellius; the three last whereof have been reprinted various times. Munster published his version at Basil in 1534, which he afterwards revised; he published a correct edition in 1546. Castalio's fine Latin pleases most people; but there are some who think it too much affected; the best edition thereof is that in 1573. Leo Juda's version, altered a little by the divines of Salamanca, was added to the ancient Latin edition, as published by R. Stephens, with notes, under the name of *Vatablus's Bible*, in 1545. It was condemned by the Parisian divines, but printed with some alterations by the Spanish divines of Salamanca. That of Junius and Tremellius is preferred, especially by the Calvinists, and has undergone a great number of editions.

One may add a fourth class of Latin Bibles, comprehending the vulgate edition corrected from the originals. The Bible of Isidorus Clarus is of this number: that author, not being contented with restoring the ancient

Bible.

ancient Latin copy, has corrected the translator in a great number of places, which he thought ill rendered. Some Protestants have followed the same method; and among others, Andrew and Luke Osiander, who have each published a new edition of the vulgate, corrected from the originals.

Oriental Bibles.—At the head of the Oriental versions of the Bible must be placed the Samaritan; as being the most ancient of all, though neither its age nor author have been yet ascertained, and admitting no more for holy scripture but the Pentateuch, or five books of Moses. This translation is made from the Samaritan Hebrew text, which is a little different from the Hebrew text of the Jews. This version has never been printed alone; nor anywhere but in the Polyglots of London and Paris.

Chaldee Bibles, are only the glosses or expositions made by the Jews in the time when they spake the Chaldee tongue. These they call by the name of *Targumim*, or *paraphrases*, as not being any strict versions of the Scripture. They have been inserted entire in the large Hebrew Bibles of Venice and Basil; but are read more commodiously in the Polyglots, being there attended with a Latin translation.

Syriac Bibles.—There are extant two versions of the Old Testament in the Syriac language: one from the Septuagint, which is ancient, and made probably about the time of Constantine; the other called *antiqua et simplex*, made from the Hebrew, as some suppose, about the time of the apostles. This version is printed in the Polyglots of London and Paris.

In the year 1562, Widmanstadius printed the whole New Testament in Syriac, at Vienna, in a beautiful character: after him there were several other editions; and it was inserted in the Bible of Philip II. with a Latin translation. Gabriel Sionita also published a beautiful Syriac edition of the Psalms, at Paris, in 1525, with a Latin interpretation.

Arabic Bibles.—In the year 1516, Aug. Justinian, bishop of Nebio, printed at Genoa an Arabic version of the Psalter, with the Hebrew text and Chaldee paraphrase, adding Latin interpretations. There are also Arabic versions of the whole Scriptures in the Polyglots of London and Paris; and we have an edition of the Old Testament entire, printed at Rome in 1671, by order of the congregation *de propaganda fide;* but it is of little esteem, as having been altered agreeably to the vulgate edition. The Arabic Bibles among us are not the same with those used with the Christians in the east. Some learned men take the Arabic version of the Old Testament, printed in the Polyglots, to be that of Saadias, who lived about the year 900; at least in the main. Their reason is, that Aben Ezra, a great antagonist of Saadias, quotes some passages of his version, which are the same with those in the Arabic version of the Polyglots; yet others are of opinion, that Saadias's version is not extant. In 1622, Erpenius printed an Arabic Pentateuch, called also the Pentateuch of Mauritania, as being made by the Jews of Barbary, and for their use. This version is very literal, and esteemed very exact. The four Evangelists have also been published in Arabic, with a Latin version, at Rome, in 1591, folio. These have been since reprinted in the Polyglots of London and Paris, with some little alterations of Gabriel Sionita. Erpenius published an Arabic New Testament entire, as he found it in his manuscript copy, at Leyden, in 1616.

There are some other Arabic versions of late date mentioned by Walton in his Prolegomena; particularly a version of the Psalms preserved in Sion College, London, and another of the Prophets at Oxford: neither of which have been published.

Cophtic Bibles.—There are several manuscript copies of the Cophtic Bible in some of the great libraries, especially in that of the French king. Dr Wilkins published the Cophtic New Testament in 4to in the year 1716, and the Pentateuch also in 4to in 1731, with Latin translations. He reckons these versions to have been made in the end of the second, or the beginning of the third century.

Ethiopic Bibles.—The Ethiopians have also translated the Bible into their language. There have been printed separately, the Psalms, Canticles, some chapters of Genesis, Ruth, Joel, Jonah, Zephaniah, Malachi, and the New Testament; all which have been since reprinted in the Polyglot of London. As to the Ethiopic New Testament, which was first printed at Rome in 1548, it is a very inaccurate work, and is reprinted in the English Polyglot with all its faults.

Armenian Bibles.—There is a very ancient Armenian version of the whole Bible, done from the Greek of the Seventy, by some of their doctors about the time of Chrysostom. This was first printed entire in 1664, by one of their bishops at Amsterdam, in 4to; with the New Testament in 8vo.

Persian Bibles.—Some of the fathers seem to say, that all the Scripture was formerly translated into the language of the Persians; but we have nothing now remaining of the ancient version, which was certainly done from the Septuagint. The Persian Pentateuch printed in the London Polyglot is, without doubt, the work of Rabbi Jacob, a Persian Jew. It was published by the Jews at Constantinople, in the year 1551. In the same Polyglot we have likewise the four Evangelists in Persian, with a Latin translation; but this appears very modern, incorrect, and of little use. Wilton says this version was written above 400 years ago. Another version of the Gospels was published at Cambridge by Wheloc in the last century: there are also two Persian versions of the Psalms made in the last century from the vulgar Latin.

Gothic Bibles.—It is generally said that Ulphilas, a Gothic bishop, who lived in the fourth century, made a version of the whole Bible, excepting the book of Kings, for the use of his countrymen. That book he omitted, because of the frequent mention of the wars therein; as fearing to inspire too much of the military genius into that people. We have nothing remaining of this version but the four Evangelists, printed in 4to, at Dort, in 1665, from a very ancient MS.

Whilst the Roman empire subsisted in Europe, the reading of the Scriptures in the Latin tongue, which was the universal language of that empire, prevailed everywhere. But since the face of affairs in Europe has been changed, and so many different monarchies erected upon the ruins of the Roman empire, the Latin tongue has by degrees grown into disuse: whence has arisen a necessity of translating the Bible into the respective languages of each people; and this has produced

Digitized by Google

ced as many different versions of the Scriptures in the modern languages, as there are different nations professing the Christian religion. Hence we meet with French, Italian, Spanish, German, Flemish, Danish, Sclavonian, Polish, Bohemian, and Russian or Muscovite Bibles; besides the Anglo-Saxon, and modern English and Irish Bibles.

French Bibles. The oldest French Bible we hear of is the version of Peter de Vaux, chief of the Waldenses, who lived about the year 1160. Raoul de Presle translated the Bible into French in the reign of Charles V. king of France, about the year 1380. Besides these, there are several old French translations of particular parts of the Scripture. The doctors of Louvain published the Bible in French at Louvain, by order of the emperor Charles V. in 1550. There is a version by Isaac le Maitre de Sacy, published in 1672, with explanations of the literal and spiritual meaning of the text, which was received with wonderful applause, and has been often reprinted, As to the New Testaments in French, which have been printed separately, one of the most remarkable is that of F. Amelotte of the oratory, composed by the direction of some French prelates, and printed with annotations in the years 1666, 1667, and 1670. The author pretends he had been at the pains to search all the libraries in Europe, and collate the oldest manuscripts. But, in examining his work, it appears that he has produced no considerable various readings, which had not before been taken notice of either in the London Polyglot or elsewhere. The New Testament of Mons, printed in 1665, with the archbishop of Cambray's permission, and the king of Spain's license, made a great noise in the world. It was condemned by Pope Clement IX. in 1668, and by Pope Innocent XI. in 1679, and in several bishoprics of France at several times. The New Testament published at Trevoux in 1702, by M. Simon, with literal and critical annotations upon difficult passages, was condemned by the bishops of Paris and Meaux in 1702. F. Bohours, a Jesuit, with the assistance of F. F. Michael Tellier and Peter Bernier, Jesuits likewise, published a translation of the New Testament in 1697: but this translation is, for the most part, harsh and obscure, which was owing to the author's keeping too strictly to the Latin text from which he translated,

There are likewise French translations published by Protestant authors; one by Robert Peter Olivetan, printed at Geneva in 1535, and since often reprinted with the corrections of John Calvin and others; another by Sebastian Castalio, remarkable for particular ways of expression never used by good judges of the language. John Diodati likewise published a French Bible at Geneva in 1644; but some find fault with his method, in that he rather paraphrases the text than translates it. Faber Stapalensis translated the New Testament into French, which was revised and accommodated to the use of the reformed churches in Piedmont, and printed in 1534. Lastly, M. John le Clerc published a New Testament in French at Amsterdam in 1703, with annotations taken chiefly from Grotius and Hammond; but the use of this version was prohibited in Holland by order of the States-General, as tending to revive the errors of Sabellius and Socinus.

Italian Bibles. The first Italian Bible published by the Romanists is that of Nicholas Malerme, a Benedictine monk, printed at Venice in 1471. It was translated from the Vulgate. The version of Anthony Brucioli, published at Venice in 1532, was prohibited by the Council of Trent. The Calvinists likewise have their Italian Bibles. There is one of John Diodati in 1607 and 1641, and another of Maximus Theophilus in 1551, dedicated to Francis de Medicis duke of Tuscany. The Jews of Italy have no entire version of the Bible in Italian; the inquisition constantly refusing to allow them the liberty of printing one.

Spanish Bibles. The first Spanish Bible that we hear of is that mentioned by Cyprian de Valera, which he says was published about the year 1500. The Epistles and Gospels were published in that language by Ambrose de Montesin in 1512; the whole Bible by Cassiodore de Reyna, a Calvinist, in 1569; and the New Testament, dedicated to the emperor Charles V. by Francis Enzinas, otherwise called *Driander*, in 1543. The first Bible which was printed in Spanish for the use of the Jews was that printed at Ferrara in 1553, in Gothic characters, and dedicated to Hercules d'Est duke of Ferrara. This version is very ancient, and was probably in use among the Jews of Spain before Ferdinand and Isabella expelled them out of their dominions in 1492.

German Bibles. The first and most ancient translation of the Bible in the German language is that of Ulphilas bishop of the Goths, about the year 360. This bishop left out the book of Kings, which treats chiefly of war, lest it should too much encourage the martial humour of the Goths. An imperfect manuscript of this version was found in the abbey of Verden near Cologne, written in letters of silver, for which reason it is called *Codex Argenteus;* and it was published by Francis Junius in 1665. The oldest German printed Bible extant is that of Nuremberg, printed in 1447; but who the author of it was is uncertain. John Emzer, chaplain to George duke of Saxony, published a version of the New Testament in opposition to Luther. There is a German Bible of John Eckius in 1537, with Emzer's New Testament added to it; and one by Ulembergius of Westphalia, procured by Ferdinand duke of Bavaria, and printed in 1630. Martin Luther having employed eleven years in translating the Old and New Testament, published the Pentateuch in 1552, the historical books and the Psalms in 1524, the books of Solomon in 1527; Isaiah in 1529, the Prophets in 1531, and the other books in 1530: he published the New Testament in 1522. The learned agree, that his language is pure, and the version clear and free from intricacies: it was revised by several persons of quality, who were masters of all the delicacies of the German language. The German Bibles which have been printed in Saxony, Switzerland, and elsewhere, are for the most part the same with that of Luther, with very little variation. In 1604 John Piscator published a version of the Bible in German, taken from that of Junius and Tremellius: but his turn of expression is purely Latin, and not at all agreeable to the genius of the German language: the Anabaptists have a German Bible printed at Worms in 1529. John Crellius published his version of the New Testament at Racovia in 1630; and Felbinger his at Amsterdam in 1660.

Flemish Bibles. The Flemish Bibles of the Romanists are very numerous, and for the most part have no author's, author's name prefixed to them, till that of Nicolas Vinck, printed at Louvain in 1548. The Flemish versions made use of by the Calvinists till the year 1637, were copied principally from that of Luther. But the synod of Dort having in 1618 appointed a new translation of the bible into Flemish, deputies were named for the work, which was not finished till the year 1637.

Danish BIBLES. The first Danish Bible was published by Peter Palladius, Olaus Chrysostom, John Syningius, and John Maccabæus, in 1550, in which they followed Luther's first German version. There are two other versions, the one by John Paul Resenius bishop of Zealand, in 1605; the other, being the New Testament only, by John Michel, in 1524.

Swedish BIBLE. In 1534 Olaus and Laurence published a Swedish Bible from the German version of Martin Luther. It was revised in 1617, by order of King Gustavus Adolphus, and was afterwards almost universally received.

Bohemian, Polish, Russian or Muscovite, and Sclavonian BIBLES. The Bohemians have a Bible translated by eight of their doctors, whom they had sent to the schools of Wirtemberg and Basil, on purpose to study the original languages. It was printed in Moravia in the year 1539. The first Polish version of the Bible, it is said, was that composed by Hadewich wife of Jagellon duke of Lithuania, who embraced Christianity in the year 1390. In 1599 there was a Polish translation of the Bible published at Cracow, which was the work of several divines of that nation, and in which James Wieck, a Jesuit, had a principal share. The Protestants, in 1596, published a Polish Bible from Luther's German version, and dedicated it to Uladislaus IV. king of Poland. The Russians or Muscovites published the Bible in their language in 1581. It was translated from the Greek by St Cyril, the apostle of the Sclavonians; but this old version being too obscure, Ernest Gluk, who had been carried prisoner to Moscow after the taking of Narva, undertook a new translation of the Bible into Sclavonian; who dying in 1705, the Czar Peter appointed some particular divines to finish the translation: but whether it was ever printed, we cannot say.

English Saxon BIBLES. If we inquire into the versions of the Bible of our own country, we shall find that Adelm bishop of Shireborn, who lived in 709, made an English Saxon version of the Psalms; and that Eadfrid, or Ecbert, bishop of Lindisferne, who lived about the year 730, translated several of the books of Scripture into the same language. It is said likewise, that Venerable Bede, who died in 785, translated the whole Bible into Saxon. But Cuthbert, Bede's disciple, in the enumeration of his master's works, speaks only of his translation of the Gospels; and says nothing of the rest of the Bible. Some pretend, that King Alfred, who lived in 890, translated a great part of the Scriptures. We find an old version in the Anglo-Saxon of several books of the Bible, made by Elfric abbot of Malmesbury: it was published at Oxford in 1699. There is an old Anglo-Saxon version of the four Gospels, published by Matthew Parker archbishop of Canterbury in 1571, the author whereof is unknown. Dr Mill observes, that this version was made from a Latin copy of the old Vulgate.

Saxon BIBLES. The whole Scripture is said by some to have been translated into the Anglo-Saxon by Bede about the year 701, though others contend he only translated the Gospels.

We have certain books or parts of the Bible by several other translators; as, 1. The Psalms, by Adelm bishop of Shireborn, contemporary with Bede; though by others this version is attributed to King Alfred, who lived 200 years after. Another version of the Psalms in Anglo-Saxon was published by Spelman in 1640. 2. The Evangelists, still extant, done from the ancient vulgate, before it was revised by St Jerome, by an author unknown, and published by Matth. Parker in 1571. An old Saxon version of several books of the Bible, made by Elfric abbot of Malmesbury, several fragments of which were published by Will. Lilly in 1638, the genuine copy by Edm. Thwaites in 1699, at Oxford.

Indian BIBLE. A translation of the Bible into the North American Indian language, by Elliot, was published in 4to at Cambridge in 1685.

English BIBLES. The first English Bible we read of was that translated by J. Wickliffe about the year 1360; but never printed, though there are MS. copies of it in several of the public libraries. J. de Trevisa, who died about the year 1398, is also said to have translated the whole Bible; but whether any copies of it are remaining, does not appear.

Tindal's. The first printed Bible in our language was that translated by Wil. Tindal, assisted by Miles Coverdale, printed abroad in 1526; but most of the copies were bought up and burnt by Bishop Tunstal and Sir Thomas More. It only contained the New Testament, and was revised and republished by the same person in 1530. The prologues and prefaces added to it reflect on the bishops and clergy; but this edition was also suppressed, and the copies burnt. In 1532, Tindal and his associates finished the whole Bible except the Apocrypha, and printed it abroad: but while he was afterwards preparing for a second edition, he was taken up and burnt for heresy in Flanders.

Matthews's. On Tindal's death, his work was carried on by Coverdale, and John Rogers superintendant of an English church in Germany, and the first martyr in the reign of Queen Mary, who translated the Apocrypha, and revised Tindal's translation, comparing it with the Hebrew, Greek, Latin, and German, and adding prefaces and notes from Luther's Bible. He dedicated the whole to Henry VIII. in 1537, under the borrowed name of Thomas Matthews; whence this has been usually called *Matthews's Bible.* It was printed at Hamburgh, and license obtained for publishing it in England by the favour of Archbishop Cranmer and the bishops Latimer and Shaxton.

Cranmer's. The first Bible printed by authority in England, and publicly set up in churches, was the same Tindal's version, revised, compared with the Hebrew, and in many places amended, by Miles Coverdale afterwards bishop of Exeter; and examined after him by Archbishop Cranmer, who added a preface to it: whence this was called *Cranmer's Bible.* It was printed by Grafton, of the largest volume, and published in 1540; and, by a royal proclamation, every parish was obliged to set one of the copies in their church, under the penalty of 40s. a-month; yet, two years

Digitized by Google

Bibles.

years after, the Popish bishops obtained its suppression of the king. It was restored under Edward VI. suppressed again under Queen Mary, and restored again in the first year of Queen Elizabeth, and a new edition of it given in 1562.

Geneva.—Some English exiles at Geneva in Queen Mary's reign, Coverdale, Goodman, Gilbie, Sampson, Cole, Whittingham, and Knox, made a new translation, printed there in 1560, the New Testament having been printed in 1557; hence called the *Geneva Bible;* containing the variations of readings, marginal annotations, &c. on account of which it was much valued by the puritan party in that and the following reigns.

Bishops.—Archbishop Parker resolved on a new translation for the public use of the church, and engaged the bishops and other learned men to take each a share or portion. These being afterwards joined together, and printed with short annotations in 1568, in a large folio, made what was afterwards called the *Great English Bible*, and commonly the *Bishops Bible.* The following year it was also published in 8vo, in a small but fine black letter: and here the chapters were divided into verses: but without any breaks for them, in which the method of the Geneva Bible was followed, which was the first English Bible where any distinction of verses was made. It was afterwards printed in large folio, with corrections, and several prolegomena, in 1572: this is called *Matthew Parker's Bible.* The initial letters of each translator's name were put at the end of his part: e. gr. at the end of the Pentateuch, W. E. for William Exon; that is, William bishop of Exeter, whose allotment ended there; at the end of Samuel, R. M. for Richard Menevensis, or bishop of St David's, to whom the second allotment fell: and the like of the rest. The archbishop oversaw, directed, examined, and finished the whole. This translation was used in the churches for 40 years, though the Geneva Bible was more read in private houses, being printed above 30 times in as many years. King James bore it an inveterate hatred on account of the notes; which at the Hampton-court conference he charged as partial, untrue, seditious, &c. The Bishops Bible too had its faults. The king frankly owned he had yet seen no good translation of the Bible in English; but he thought that of Geneva the worst of all.

Rhemish.—After the translation of the Bible by the bishops, two other private versions had been made of the New Testament: The first by Laur. Thomson, made from Beza's Latin edition, together with the notes of Beza, published in 1582 in 4to, and afterwards in 1589, varying very little from the Geneva Bible; the second by the Papists at Rheims in 1584, called the *Rhemish Bible*, or *Rhemish Translation.* These finding it impossible to keep the people from having the Scriptures in the vulgar tongue, resolved to give a version of their own as favourable to their cause as might be. It was printed on a large paper, with a fair letter and margin. One complaint against it was its retaining a multitude of Hebrew and Greek words untranslated, for want, as the editors express it, of proper and adequate terms in the English to render them by; as the words *azymes*, *tunike*, *rational*, *holocaust*, *prepuce*, *pasche*, &c. However, many of the copies were seized by the queen's searchers, and confiscated; and Th. Cartwright was solicited by Secretary Walsingham to refute it: but after a good progress made therein, Archbishop Whitgift prohibited his further proceeding thereing, as judging it improper the doctrine of the church of England should be committed to the defence of a puritan, and appointed Dr Fulke in his place, who refuted the Rhemists with great spirit and learning. Cartwright's refutation was also afterwards published in 1618, under Archbishop Abbot. About 30 years after their New Testament, the Roman Catholics published a translation of the Old at Doway, in 1609 and 1610, from the vulgate, with annotations; so that the English Roman Catholics have now the whole Bible in their mother-tongue; though it is to be observed, they are forbidden to read it without a license from their superiors.

King James's.—The last English Bible was that which proceeded from the Hampton-court conference in 1603, where many exceptions being made to the Bishops Bible, King James gave orders for a new one; not, as the preface expresses it, for a translation altogether new, nor yet to make of a bad one a good one, but to make a good one better, or of many good ones one best. Fifty-four learned persons were appointed for this office by the king, as appears by his letter to the archbishop, dated in 1604; which being three years before the translation was entered upon, it is probable seven of them were either dead or had declined the task, since Fuller's list of the translators makes but 47; who being ranged under six divisions, entered on their province in 1607. It was published in 1613, with a dedication to James, and a learned preface, and is commonly called *King James's Bible.* After this, all the other versions dropped and fell into disuse, except the Epistles and Gospels in the Common Prayer Book, which were still continued according to the Bishops translation till the alteration of the liturgy in 1661, and the Psalms and Hymns, which are to this day continued as in the old version.

The judicious Selden in his Table Talk, speaking of the Bible, says, "The English translation of the Bible is the best translation in the world, and renders the sense of the original best, taking in for the English translation the Bishops Bible, as well as King James's. The translators in King James's time took an excellent way. That part of the Bible was given to him who was most excellent in such a tongue (as the Apocrypha to Andrew Downs), and then they met together, and one read the translation, the rest holding in their hands some Bible either of the learned tongues, or French, Spanish, Italian, &c. If they found any fault, they spoke; if not, he read on."

King James's Bible is that now read by authority in all the churches in Britain.

Welch Bibles.—There was a Welch translation of the Bible made from the original in the time of Queen Elizabeth, in consequence of a bill brought into the house of commons for this purpose in 1563. It was printed in folio in 1588. Another version, which is the standard translation for that language, was printed in 1620. It is called *Parry's Bible.* An impression of this was printed in 1690, called *Bishop Lloyd's Bible.* These were in folio. The first 8vo impression of the Welch Bible was made in 1630.

Irish Bible.—Towards the middle of the 16th century,

tury, Bedell, bishop of Kilmore, set on foot a translation of the Old Testament into the Irish language; the New Testament and the Liturgy having been before translated into that language. The bishop appointed one King to execute this work, who not understanding the oriental languages, was obliged to translate it from the English. This work was revised by Bedell, who, after having compared the Irish translation with the English, compared the latter with the Hebrew, the LXX. and the Italian version of Diodati. When this work was finished, the bishop would have been himself at the charge of the impression, but his design was stopped upon advice given to the lord lieutenant and the archbishop of Canterbury, that it would prove a shameful thing for a nation to publish a Bible translated by such a despicable hand as King. However, the manuscript was not lost, for it went to press in the year 1685.

Erse Bible.—There is also (lately finished at Edinburgh) a version of the Bible in the Gaelic or Erse language.

BIBLIANDER, Theodore, professor of divinity at Zurich in the 16th century. As he understood the oriental languages, he set about a new edition of the Koran; the text of which he corrected, by collating the Arabic and Latin copies. To this edition he subjoined the life of Mahomet and his successors; and prefixed an apology by way of preface, which has been loudly exclaimed against.

BIBLIOGRAPHIA, a branch of archæographia, employed in the judging and perusing of ancient manuscripts, whether written in books, on paper or parchment.

The sense of it is now extended; and it signifies a work intended to give information concerning the first or best editions of books, and the ways of selecting and distinguishing them properly. In short, it is used for a *notitia* or description of printed books, either in the order of the alphabet, of the times when printed, or of the subject matters. In which sense it is nearly the same as biliotheca. See Bibliography, Supplement.

Literary journals afford also a kind of bibliographia.

BIBLIOMANCY, a kind of divination performed by means of the Bible. This amounts to much the same with what is otherwise called *sortes biblicæ* or *sortes sanctorum*. It consisted in taking passages of Scripture at hazard, and drawing indications thence concerning things future; as in Augustine's *tolle et lege*. It was much used at the consecration of bishops.—F. J. Davidius, a Jesuit, has published a bibliomancy under the borrowed name of *Veridicus Christianus*.

BIBLIOTHECA, in its original and proper sense, denotes a library or place for depositing books.

Bibliotheca, in matters of literature, denotes a treatise giving an account of all the writers on a certain subject: thus we have bibliothecas of theology, law, philosophy, &c.

There are likewise universal bibliothecas, which treat indifferently of all kinds of books; also select bibliothecas, which give account of none but authors of reputation.

Many of the bibliothecas agree, in most respects, with what are otherwise called memoirs or journals of literature, except that these last are confined to new books; but there are other bibliothecas, that differ in nothing from catalogues of the writers on certain subjects.

BIBLISTS. So the Roman Catholics call those Christians who make Scripture the sole rule of faith, in which sense, all Protestants either are or ought to be biblists.

BIBLUS, βιβλος, in *Botany*, an aquatic plant in Egypt, called also *papyrus;* of the skin whereof the ancient Egyptians made their paper. See Papyrus.

BIBRACTE, in *Ancient Geography*, a citadel of the Ædui, according to Strabo; but Cæsar describes it as a town well fortified, very large and populous, and of the greatest authority among that nation: Now *Beuvect*, or Bevray; a desolate place four miles to the north-west of Autun.

BIBROCI, in *Ancient Geography*, an ancient people of Britain: Now the *Hundred of Bray* in Berks.

BICANER, a city of Asia, on the river Ganges, in the northern part of Hindostan. E. Long. 87. 20. N. Lat. 28. 40.

BICE, or Bise, among painters, a blue colour prepared from the lapis armenus.

Bice bears the best body of all bright blues used in common work, as house-painting, &c. but it is the palest in colour. It works indifferently well, but inclines a little to sandy, and therefore requires good grinding.

BICEPS, the name of several muscles: as the biceps humeri, or cubiti; biceps tibiæ; &c. See Anatomy, *Table of the Muscles*.

BICESTER, a straggling town of Oxfordshire in England, seated on the road between Oxford and Buckingham.

BICHAT, Marie Francois Xavier, an eminent French physiologist. See Supplement.

BICHET, a quantity or measure of corn, which differs according to the places where it is used. The bichet is not a wooden measure, as the minot at Paris, or the bushel at London; but it is compounded of several certain measures. It is used in many parts of France, &c.

BICLINIUM, in Romany antiquity, a chamber with two beds in it: or when two beds only were round a table.

BICORNES, an order of plants in the *fragmenta methodi naturalis* of Linnæus, so termed from the antheræ having in appearance two horns. See Botany.

BIDACHE, a town of France, in the department of the Lower Pyrenees, seated on the river Bidouse. W. Long. 1. 9. N. Lat. 41. 31.

BIDAL, or Bidale, in our ancient customs, denotes the invitation of friends to drink ale at some poor man's house, who in consideration hereof expects some contribution for his relief. This custom still obtains in the west of England, and is mentioned in some of our ancient statutes.

BIDDEL, John, one of the most eminent English writers among the Socinians, was born at Wotton-under-Edge in Gloucestershire, and educated in the free-school of that place. Being a hopeful youth, he was taken notice of; particularly by Lord George Berkeley, who allowed him an exhibition of ten pounds a-year. This caused him vigorously to apply

Digitized by Google

ply himself to his studies; and he was, while at school, author of a translation of Virgil's Bucolics, and of the two first satires of Juvenal. He continued at school till he was 13 years of age. However, having manifested in that early period a singular piety and contempt of secular affairs, he was sent to the university of Oxford, and entered a student in Magdalen hall. In 1641, the magistrates of Gloucester chose him master of the free school of that city; and he was much esteemed: but falling into some opinions concerning the Trinity different from those commonly received, and expressing his thoughts with too much freedom, he suffered various persecutions and imprisonments in the time of the commonwealth. During one of these confinements, which lasted for several years, being reduced to great indigence, he was employed by Roger Daniel of London to correct the impression of the Greek Septuagint Bible, which that printer was about to publish with great accuracy. In 1651, the parliament published a general act of oblivion, which restored him to his full liberty. He was afterwards imprisoned on account of his tenets; and at last the Protector banished him for life to St Mary's castle in the isle of Scilly, and sent him thither in October 1655. Soon after, he was allowed 100 crowns a year for subsistence. In 1658, he was set at full liberty. After the restoration of King Charles II. he was fined in 100l. and each of his hearers in 20l. to lie in prison till paid; which being put in execution, the want of fresh air and exercise made him contract a disease, of which he died on the 22d of September 1662, in the 47th year of his age. His life was published in Latin in 1682, by Mr Farrington of the Inner Temple, who represents him as possessed of extraordinary piety, charity, and humility. He would not discourse of those points in which he differed from others, with those that did not appear religious according to their knowledge; and was a strict observer himself, and a severe exactor in others, of reverence in speaking of God and Christ. He had so happy a memory, that he retained word for word the whole New Testament, not only in English, but in Greek, as far as the fourth chapter of the Revelation of St John.

BIDDIFORD, a town of Devonshire, seated on the river Toridge, over which there is a fine stone-bridge with 24 arches. It contains 3244 inhabitants, and carries on a considerable trade. W. Long. 4. 10. N. Lat. 51. 10.

BIDDING, or OFFERING, denotes the raising the price of a thing at a sale or auction. The French call this *enchirer*. It answers to what the Romans called *licitari*: they used to bid by holding up the hand or finger.

BIDDING is also used for proclaiming or notifying. In which sense we meet with *bidding of the* BANNS, the same with what is otherwise called *asking*.

BIDDING Prayer. It was one part of the office of the deacons in the primitive Christian church, to be a sort of monitors and directors of the people in the exercise of their public devotions in the church. To which end they made use of certain known forms of words, to give notice when each part of the service began. This was called by the Greeks κηρυττειν, and by the Latins *prædicare*: which therefore does not ordinarily signify to *preach*, as some mistake it, but to perform the office of a crier (κηρυξ, or *præco*) in the assembly: whence Synesius and others call the deacons ἱεροκηρυκες, the *holy criers* of the church, appointed to bid or exhort the congregation to pray and join in the several parts of the service of the church. Agreeable to this ancient practice is the form *Let us pray*, repeated before several of the prayers in the English liturgy.

BIDDING of the Beads, a charge or warning which the parish-priest gave to his parishioners at certain special times, to say so many pater-nosters, &c. on their beads.

BIDENS, WATER HEMP-AGRIMONY. See BOTANY *Index*.

BIDENTAL, in Roman antiquity, a place blasted with lightning; which was immediately consecrated by an haruspex, with the sacrifice of a bidens. This place was afterwards accounted sacred, and it was unlawful to enter it or to tread upon it; for which reason it was commonly surrounded with a ditch, wall, hedge, ropes, &c. See next article.

BIDENTALES, in Roman antiquity, priests instituted to perform certain ceremonies and expiations when thunder fell on any place. Their principal office was the sacrificing a sheep of two years old, which in Latin is called *bidens*; from whence the place struck with thunder got the name of *bidental*.

BIDENTES, in middle-age writers, denotes two-yearlings, or sheep of the second year. The wool of these bidentes, or two years old sheep, being the first sheering, was sometimes claimed as a heriot to the king, on the death of an abbot. Among the ancient Romans, the word was extended further to any sorts of beasts used for victims, especially those of that age: whence we meet with *sues bidentes*.

BIDET, a nag or little horse, formerly allowed each trooper and dragoon, for his baggage and other occasions. Bidets are grown into disuse, on account of the expences thereof, and the disorders frequently arising from those who attended on them, &c.

BIDIS, in *Ancient Geography*, a small city of Sicily, not far from Syracuse, whose ruins are still to be seen in the territory of Syracuse, about 15 miles to the south-west, with a church called *S. Giovanni di Bidini*.

BIDLOO, GODFREY, author of several treatises on anatomy, was born at Amsterdam, March 12. 1649. In 1688, he was professor of anatomy at the Hague; and, in 1694, at Leyden; when King William III. of England appointed him his physician; which he would not accept but on condition of holding his professorship, which was readily granted him. He published, in Latin, 1. The Anatomy of the Human Body, demonstrated in 105 cuts, explained by the discoveries of the ancient and modern writers. 2. An Oration upon the Antiquity of Anatomy. 3. A Letter to Anthony Leeuwenhoeck on the animals sometimes found in the liver of sheep and other animals. 4. Two Decades of dissertations in Anatomy and Chirurgery; and other pieces. He died at Leyden, in April, 1713.

BIDON, a liquid measure, containing about five pints of Paris, that is, about five quarts English wine-measure. It is seldom used but among ships crews.

BIE, ADRIAN DE, an eminent painter, was born at Liere in 1594. After learning the rudiments of the art from different masters, he travelled to Rome, where he spent six years in studying the works of the best masters. His industry was then rewarded with proportionable success; for he found encouragement among the

Digitized by Google

the most honourable persons at Rome, and in every part of Italy through which he travelled, from persons of the first distinction. His penciling was so exceedingly neat, and his touch and colouring so very delicate, that he was frequently employed to paint on jasper, agate, porphyry, and other precious materials.

BIEEZ, a town of Poland, in the palatinate of Cracovia, remarkable for its mines of vitriol. It is seated on the river Weseloke, in E. Long. 2. 21. N. Lat. 49. 50.

BIEL. See BIENNA.

BIELA, a town of Russia, and capital of a province of the same name, seated on the river Opschaw, in E. Long. 34. 55. N. Lat. 55. 0.

BIELA OSERO, or BELOZERO, a town of the Russian empire, capital of a duchy, and situated on a lake of the same name, at the mouth of the river Consa, in E. Long. 39. 10. N. Lat. 58. 55.

BIELA, a town of Piedmont in Italy, and capital of the Bellese, near the river Cerva, in E. Long. 8. 3. N. Lat. 45. 22.

BIELSKI, a town of Poland, in the palatinate of Polachia, near one of the sources of the river Narew. E. Long. 22. 55. N. Lat. 53. 50.

BIELSKOI, a town of Russia, in the province of Smolensko. E. Long. 35. 5. N. Lat. 56. 40.

BIENNA, a town of Switzerland, seated on a lake of the same name. The inhabitants are Protestants, and in alliance with those of Bern, Soleure, and Friburg. E. Long. 7. 14. N. Lat. 47. 11.

BIENNIAL PLANTS; plants, as the title *biennial* imports, that are only of two years duration. Numerous plants are of this tribe, which being raised one year from seed, generally attain perfection either the same, or in about the period of a twelvemonth, or a little less or more, and the following spring or summer shoot up stalks, flower, and perfect seeds; soon after which they commonly perish; or if any particular sorts survive another year, they assume a dwindling and straggling growth, and gradually die off; so that biennials are always in their prime the first or second summer. Biennials consist both of esculents and flower plants. Of the esculent kinds, the cabbage, savoy, carrot, parsnip, beet, onion, leek, &c. are biennials. Of the flowery tribe, the Canterbury-bell, French honeysuckle, wall-flower, stock-july-flower, sweet-william, China-pink, common-pink, matted-pink, carnation, scabious, holly-hock, tree-mallow, vervain-mallow, tree-primrose, honesty or moonwort, &c. are all of the biennial tribe; all of which being sown in March, April, or May, rise the same year, and in spring following shoot up into stalks, flower, and perfect seeds in autumn; after which most of them dwindle: though sometimes the wall-flowers, hollyhocks, carnations, and pinks, will survive and flower the following year; but the plants become straggling, the flowers small and badly coloured: it is therefore eligible to raise a supply annually from seed; although wall-flowers, carnations, and pinks, may be continued by slips and layers.

BIER, a wooden machine for carrying the bodies of the dead to be buried. The word comes from the French *bierre*, which signifies the same. It is called in Latin *feretrum*, *à ferendo*. Among the Romans the common bier, whereon the poorer sort were carried, was called *sandapila*; that used for the richer sort *lectica*, *lectica funebris*, sometimes *lectus*. The former was only a sort of wooden chest, *vilis arca*, which was burnt with the body; the latter was enriched and gilded for pomp. It was carried bare, or uncovered, when the person died a natural and easy death; when he was much disfigured or distorted, it was veiled or covered over.

BIER is more particularly used for that whereon the bodies of saints are placed in the church to rest, and exposed to the veneration of the devout. This is also called, in middle-age writers, *lectus*, *feretrum*, *lectica*, and *loculus*; and was usually enriched with gold, silver, and precious stones, which was the cause that the bier of St Benedict was pillaged, and all its ornaments carried off.

BIEROLIET, a town of the Netherlands, in Dutch Flanders, where William Bruckfield, or *Beukelings*, who invented the method of pickling herrings, died in 1397. E. Long. 3. 42. N. Lat. 51. 25.

BIFFERÆ, plants that flower twice a-year, in spring and autumn, as is common between the tropics.

BIFRONS, a person double-fronted, or two-faced.

BIFRONS is more peculiarly an appellation of Janus, who was represented by the ancients with two faces, as being supposed to look both backwards and forwards: though other reasons for it are recited by Plutarch. Sometimes he was painted with four faces, *quadrifrons*, as respecting the four seasons.

BIGA, in antiquity, a chariot drawn by two horses abreast. Chariot-races, with two horses, were introduced into the Olympic games in the 93d Olympiad: but the invention was much more ancient; as we find that the heroes in the Iliad fight from chariots of that kind. The moon, night, and the morning, are by mythologists supposed to be carried in *bigæ*, the sun in *quadrigæ*. Statues in *bigæ* were at first only allowed to the gods, then to conquerors in the Grecian games; under the Roman emperors, the like statues, with *bigæ*, were decreed and granted to great and well-deserving men, as a kind of half triumph, being erected in most public places of the city. Figures of *bigæ* were also struck on their coins. The drivers of *bigæ* were called *bigarii*; a marble bust of one Florus a *bigarius* is still seen at Rome.

BIGAMY, properly signifies being *twice married*; but with us is used as synonymous with polygamy, or having a plurality of wives at once. Such second marriage, the former husband or wife living, is simply void, and a mere nullity, by the ecclesiastical law of England; and yet the legislature has thought it just to make it felony, by reason of its being so great a violation of the public economy and decency of a well-ordered state. For polygamy can never be endured under any rational civil establishment, whatever specious reasons may be urged for it by the eastern nations, the fallaciousness of which has been fully proved by many sensible writers: but in northern countries the very nature of the climate seems to reclaim against it; it never having obtained in this part of the world, even from the time of our German ancestors, who, as Tacitus informs us, "*prope soli barbarorum singulis uxoribus contenti sunt*. It is therefore punished by the laws both of ancient and modern Sweden with death. And in Britain it is enacted by statute 1 Jac. I. c. 11. that if

Digitized by Google

if any person being married, do afterwards marry again, the former husband or wife being alive, it is felony; but within the benefit of clergy. The first wife in this case shall not be admitted as an evidence against her husband, because she is the true wife; but the second may, for she indeed is no wife at all: and so, *vice versa*, of a second husband. This act makes an exception to five cases, in which such second marriage, though in the three first it is void, is yet no felony. 1. Where either party hath been continually abroad for seven years, whether the party in England hath notice of the other's being alive or no. 2. Where either of the parties hath been absent from the other seven years within this kingdom, and the remaining party hath had no knowledge of the other's being alive within that time. 3. Where there is a divorce (or separation *à mensa et thoro*) by sentence in the ecclesiastical court. 4. Where the first marriage is declared absolutely void by any such sentence, and the parties loosed *à vinculo*. Or, 5. Where either of the parties was under the age of consent at the time of the first marriage; for in such case the first marriage was voidable by the disagreement of either party, which the second marriage very clearly amounts to. But, if at the age of consent the parties had agreed to the marriage, which completes the contract, and is indeed the real marriage; and afterwards one of them should marry again; Judge Blackstone apprehends that such second marriage would be within the reason and penalties of the act.

BIGATI, in antiquity, a kind of ancient Roman silver coins, on one side whereof was represented a *biga*, or chariot drawn by two horses. The *bigatus* was properly the Roman denarius, whose impression, during the times of the commonwealth, was a chariot driven by Victory, and drawn either by two horses or four; according to which it was either denominated *bigatus* or *quadrigatus*.

BIGGAR, a town and parish in Lanarkshire, Scotland, containing 1376 inhabitants in 1811. Here are the ruins of a collegiate church which was founded in 1545.

BIGGLESWADE, a town in Bedfordshire, in England, seated on the river Ivel, over which there is a handsome bridge. It lies on the principal road from London to York, and with the adjoining hamlets of Home and Stratton, contained 1895 inhabitants in 1811. W. Long. 0. 15. N. Lat. 52. 5.

BIGHT, among seamen, denotes one roll or round of a cable or rope, when coiled up.

BIGNON, Jerome, a French writer, was born at Paris in 1590. He gained an uncommon knowledge, under the care of his father, in philosophy, mathematics, history, civil law, and divinity, in a very short time; and was almost at the end of his studies at an age when it is usual to send children to school. At ten years of age he gave the public a specimen of his learning, in a Description of the Holy Land; and two years after, he published a Discourse concerning the principal antiquities and curiosities of Rome: and a summary Treatise concerning the election of Popes. Henry IV. desired to see him, and appointed him page to the dauphin, who was afterwards Louis XIII. He appeared at court with all the politeness of manners imaginable. He wrote at that time a treatise of the precedency of the kings of France, which he dedicated to Henry IV. who gave him an express order to continue his researches on that subject; but the death of that prince interrupted his design. He published, in 1613, the Formulæ of Marculphus. He was in 1620 made advocate-general in the grand council; and discharged that post with such reputation, that the king nominated him some time after counsellor of state, and at last advocate-general in the parliament. He resigned his offices in 1641; and the year following was appointed chief library-keeper of the king's library. He was obliged to resume his office of advocate-general, and held it till his death. He was employed in the most important affairs of state. At last this great man, who had always made religion the basis of his other virtues, died with the most exemplary devotion in 1656.

BIGNONIA, Trumpet-flower, or Scarlet Jasmine. See Botany *Index*.

BIGORRE, a territory or county of France, in the province of Gascony, which is now included in the department of the Upper Pyrenees. It is bounded on the east by the valley of Aure, the viscounty of Neboussa, Riviere Verdun, and Pardiac; by Bearne on the west; on the south, by the valleys of Brotou and Penticouse in Arragon; and on the north, by the county Riviere-Bas incorporated with Armagnac. It is 40 miles long from north to south, and 30 in breadth from east to west. It is divided into three parts, the mountains, the plains, and the Rustan. The mountains are enclosed between those of the valley of Aure on the east, those of Arragon on the south, and of Bearne on the west. This part contains two principal valleys, Lavedan and Barege. The valley of Bigorre is of an oval form, and has the hills of Rustan on the east. The remarkable towns are Tarbes the capital, Bagneres, Lourd, &c. The mountains are a barrier between France and Spain, and there are four different passages which the inhabitants are obliged to guard. Bigorre yields marble, jasper, stone, and slate; there are also mines of several sorts, but they are not worked. The rivers are the Adour, the Elches, the Arroset, and the Gave of Lavedan; there are also three lakes.

BIGOT, a person obstinately and perversely wedded to some opinion or practice, particularly of a religious nature. Camden, perhaps, has hit upon the true original of the word. He relates, that when Rollo, duke of Normandy, received Gisla, the daughter of Charles *the Foolish*, in marriage, together with the investiture of that dukedom, he would not submit to kiss Charles's foot: and when his friends urged him by all means to comply with that ceremony, he made answer in the English tongue, Ne se by God, i. e. *Not so by God*. Upon which, the king and his courtiers deriding him, and corruptly repeating his answer, called him *bigot*; from whence the Normans were called *bigodi*, or *bigots*.

Bigot, in Italian *bigontia*, is used to denote a Venetian liquid measure, containing the fourth part of the amphora, or half the boot.

BIHAEZ, a strong town of Croatia in Hungary, seated in an isle formed by the river Anna, in E. Long. 16. 2. N. Lat. 44. 35.

BILANDER, in *Navigation*, a small merchant ship with two masts, distinguished from other vessels of the same kind by the form of the main-sail. Few vessels are

Digitized by Google

are now rigged in the manner of bilanders; the name has been variously applied in different countries.

BILBILIS, in *Ancient Geography*, a town of Hispania Citerior, the birth-place of Martial; now supposed to be Calatajud in Arragon, on the Xalon.

BILBOA, a large, handsome, and rich town of Spain, capital of Biscay, containing 15,000 inhabitants, with a well-frequented harbour. The inhabitants have always preserved themselves from a mixture with the Jews and Moors; and therefore will admit no family to settle among them but who can prove themselves to be of Christian extraction. The number of ships great and small that visit the harbour yearly is from 500 to 600. The exports are wool and sword-blades, with some other manufactures of iron and steel. The town is seated at the mouth of the river Ibaicabal, in W. Long. 4. 20. N. Lat. 43. 23.

BILBOWS, a punishment at sea, answering to the stocks at land. The offender is laid in irons, or stocks, which are more or less ponderous according to the quality of the offence of which he is guilty.

BILDESTON, a town of Suffolk in England, seated on a creek on the river Breton. The principal manufacture is of woollen goods, especially blankets. E. Long. 0. 45. N. Lat. 52. 20.

BILDGE of a ship, the bottom of her floor, or the breadth of the place the ship rests on when she is aground. Therefore, *bildge-water* is that which lies on her floor, and cannot go to the well of the pump: And *bildge-pumps*, or burr-pumps, are those that carry off the bildge-water. They likewise say the ship is *bildged*, when she has some of her timber struck off on a rock or anchor, and springs a leak.

BILE, a yellow, bitter juice, separated from the blood in the liver, collected in the porus biliarius and gall-bladder, and thence discharged by the common duct into the duodenum. See ANATOMY *Index*.

BILEDULGERID, or BELAD AL JERID, the *Country of Dates*, a kingdom of Africa. It is almost of a square form, extending itself more than 80 leagues every way, from 28. 30. to 32. 50. north latitude, and from 6 to 12 degrees of west longitude. It is bounded on the north by the kingdom of Tunis, on the east by a ridge of lofty mountains which divide it from Tripoli and part of Guadamis, on the west by the countries of Zeb and Mezeb, and on the south by the province of Verghela. The whole country is barren, sandy, and mountainous, producing little or nothing besides dates, which grow here in such profusion, that the face of half the kingdom is covered over with date-trees, and from hence the whole country takes its name. The climate is hot and unhealthy; the people lean, swarthy, and shrivelled in their complexions; with their eyes inflamed, owing to the reflection of the sunbeams from the white hard soil; and the showers of dust and sand, driven by the high winds that blow here at certain seasons, are frequently so violent as to bury men and cattle under them. Another inconvenience with which the inhabitants are afflicted, for which no other reason is given besides their constant living on dates, is an inveterate scurvy in their gums, whence all their teeth drop out; though it frequently spreads over their whole bodies, and then they become the most unhappy and loathsome objects. They are almost entirely free

from other diseases: so that when not afflicted with this, they live to a good old age; though it is observable that they discover a furrowed countenance, shrivelled skin, hoary locks, and other symptoms of old age, very early in life, and before decrepitude, infirmity, or any decay of their faculties, appear. The plague is not known in Biledulgerid, though so frequent in Barbary, and though a constant intercourse is kept up between the two countries; whence it would seem, that in certain cases this terrible distemper is not so infectious as it is usually thought to be. The same may be said of the smallpox, a disease little less contagious and fatal in hot countries than the plague itself. The natives are represented as a lewd, treacherous, thievish, and savage people, who delight in murder and robbery. They are mostly a mixture of Africans and wild Arabs who mingled themselves with them. The former live with some regularity and civil order in a kind of villages composed of a number of little huts; the latter in tents, ranging from place to place in quest of food and plunder. The Arabs, who pride themselves in their superiority of birth and talents above the primitive inhabitants, are wholly independent and free, frequently hiring themselves in the service of the neighbouring princes at war; from which policy arise the most valuable branches of their public revenue, if any thing can be called common or public in a nation of lawless robbers. The rest pursue no other occupation besides hunting and plundering; the first of which is their common employment, especially hunting of ostriches, which are said to be of a prodigious stature in this country, and as high as a man mounted on a tall horse. The inhabitants eat the flesh of these animals; barter their feathers for corn, pulse, and other things they want; use their hearts in their necromantic and religious rites, their fat as a medicine of sovereign virtue, their talons for ear-pendants and other ornaments, and their skins they convert into pouches and knapsacks, so that not a part of the animal but is employed in some useful purpose. Besides dates and ostriches, the Arabs live likewise on the flesh of goats and camels; drinking either the liquor or broth in which that flesh is boiled, or the milk of their camels. In the whole country there is scarcely a town of any note, or even a stream of water that deserves notice, or that is not dried up half the year.

BILEVELT, a town of Germany in the circle of Westphalia and county of Ravensburg, subject to the king of Prussia, in E. Long. 8. 20. N. Lat. 52. 0.

BILFINGER, GEORGE BERNARD, a German philosopher and statesman. See SUPPLEMENT.

BILINGUIS, in a general sense, signifies one that speaks two languages; but in law, is used for a jury that passes in any case between an Englishman and a foreigner, whereof part ought to be English and part strangers.

BILIOUS, in general, denotes something belonging to, or partaking of, the nature of bile. Hence,

BILIOUS Fevers are those occasioned by the over copiousness or bad qualities of the bile.

BILL, in *Mechanics*, an instrument made of iron, edged in the form of a crescent, and adapted to a handle. It is used by plumbers, to perform several parts of their work; by basket-makers, to cut the largest pieces of chesnut-trees and other wood; and by gardeners,

Digitized by Google

gardeners, to prune trees. When short, it is called a *hand-bill;* and when long, a *hedge-bill.*

Bill, in *Law*, a declaration in writing, expressing either some wrong the complainant has suffered from the defendant, or a fault committed by the person complained of against some law or statute.—This bill is sometimes exhibited to justices at the general assizes, by way of indictment, or referred to others having jurisdiction; but it is more generally addressed to the lord chancellor. It contains the fact complained of, the damage sustained, and a petition or process against the defendant for redress; and is used both in criminal and civil cases. In the former, the words *billa vera* are indorsed by the grand jury upon a presentment, implying that they find the same founded on probable evidence, and therefore worthy of further consideration.

In Scots law, every summary application in writing, by way of petition to the court of session, is called a *bill.*

Bill of Attainder. See Attainder.

Bill of Appeal. See Appeal.

Bill signifies also a paper, either written or printed, in very large characters, which is posted up in some open and public place, to give notice of the sale of any merchandise or ship, or of the sailing of any vessel into foreign parts.

Bill, in trade, both wholesale and retail, as also among workmen, signifies an account of merchandises or goods delivered to a person, or of work done for one.

Bill, in *Commerce*, denotes a security for money under the hand and sometimes seal of the debtor, without any condition or forfeiture in case of non-performance; in which it is distinguished from a bond or obligation. It has been usually defined, a writing wherein one man is bound to another to pay a sum of money, on a day that is future, or presently on demand, according to the agreement of the parties at the time when it is drawn; on which, in case of failure, diligence or execution may be immediately done to force payment. These bills must be on stamped paper: if under 50l. the stamp to be 6d.; if for 50l. or upwards 1s.

Bank-Bill is a note or obligation signed on behalf of the company of the bank, by one of their cashiers, for value received. Or it is an obligation to pay on demand either to the bearer or to order; in Scotland, it is understood to be to order.

Bill of Entry, an account of the goods entered at the custom-house, both inwards and outwards. In this bill must be expressed, the merchant exporting or importing; the quantity of merchandise, and the divers species thereof; and whither transported, or from whence.

Bill of Exchange, is a security, originally invented among merchants in different countries, for the more easy remittance of money from the one to the other, which has since spread itself into almost all pecuniary transactions. It is an open letter of request from one man to another, desiring him to pay a sum named therein to a third person on his account; by which means a man at the most distant part of the world may have money remitted to him from any trading country. If A lives in Jamaica, and owes B who lives in England 1000l.; now if C be going from England to Jamaica, he may pay B this 1000l. and take a bill of exchange drawn by B in England upon A in Jamaica, and receive it when he comes thither. Thus does B receive his debt, at any distance of place, by transferring it to C; who carries over his money in paper credit, without danger of robbery or loss. This method is said to have been brought into general use by the Jews and Lombards, when banished for their usury and other vices; in order the more easily to draw their effects out of France and England into those countries in which they had chosen to reside. But the invention of it was a little earlier; for the Jews were banished out of Guienne in 1287, and out of England in 1290, and in 1236 the use of paper-credit was introduced into the Mogul empire in China.—In common speech, such a bill is frequently called a *draught;* but a bill of exchange is the more legal as well as mercantile expression. The person, however, who writes this letter, is called, in law, the *drawer;* and he to whom it is written, the *drawee;* and the third person or negociator to whom it is payable (whether specially named or the bearer generally) is called the *payee.*

These bills are either foreign or inland; foreign, when drawn by a merchant residing abroad upon his correspondent in England, or *vice versâ;* and inland, when both the drawer and the drawee reside within the kingdom. Formerly foreign bills of exchange were much more regarded in the eye of the law than inland ones, as being thought of more public concern in the advancement of trade and commerce. But now by two statutes, the one 9 and 10 W. III. c. 17. the other 3 and 4 Ann. c. 9. inland bills of exchange are put upon the same footing as foreign ones: what was the law and customs of merchants with regard to the one, and taken notice of merely as such, being by those statutes expressly enacted with regard to the other. So that there is now in law no manner of difference between them. In drawing foreign bills of exchange, it is customary to give two or three of the same date and tenor to be sent by different conveyances, that in case of accidents the person to whom they are sent may not be disappointed; in which case it is mentioned in the body of the bill, that it is the 1st, 2d, or 3d bill of exchange; so that when one is paid it discharges all the rest. Inland bills for any sum must be on 6d. stamped paper.

Bill of Lading, an acknowledgement signed by the master of a ship, and given to a merchant, &c. containing an account of the goods which the master has received on board from that merchant, &c. with a promise to deliver them at an intended place for a certain salary. Each bill of lading must be treble, one for the merchant who loads the goods, another to be sent to the person to whom they are consigned, and the third to remain in the hands of the master of the ship. It must be observed, however, that a bill of lading is used only when the goods sent on board a ship are but part of the cargo: for when a merchant loads a whole vessel for his own personal account, the deed passed between him and the master of the ship is called *charter-party.* See *Charter-Party.*

Bills of Mortality, are accounts of the numbers of births and burials within a certain district, every week, month, quarter, or year. In this sense we say *weekly bills,* Bill. *bills, monthly bills, quarterly bills, yearly bills.* The London *bills of mortality*, which were the first, are composed by the parish-clerks, and express the number of christenings of each sex, and of deaths from each disease. See BILLS OF MORTALITY, SUPPLEMENT.

BILL of Parcels, an account given by the seller to the buyer, containing the particulars of all the sorts and prices of goods bought.

BILL of Sale, is when a person wanting a sum of money delivers goods as a security to the lender, to whom he gives his bill, empowering him to sell the goods, in case the sum borrowed is not repaid, with interest, at the appointed time.

BILL of Stores, a license granted at the custom-house to merchants, by which they have liberty to carry, custom-free, all such stores and provisions as they may have occasion for during the voyage.

BILL of Sufferance, a license granted to a merchant, at the custom-house, suffering him to trade from one English port to another without paying custom.

Lombard BILLS, are instruments of an uncommon kind and figure, used in Italy and Flanders, and of late also in France; consisting of a piece of parchment, cut to an acute angle, about an inch broad at top, and, terminating in a point at bottom: chiefly given where private persons are concerned in the fitting out a ship on any long voyage. The manner is thus: The party, who is desirous to be concerned in the cargo or venture, carries his money to the merchant who fits out the ship, where it is entered down in a register; at the same time the merchant writes down on a piece of parchment, upwards of an inch broad, and seven or eight inches long, the name of the lender and the sum lent; which being cut diagonal-wise, or from corner to corner, each party retains his half. On the return of the vessel, the lender brings his moiety to the merchant; which being compared with the other, he receives his dividend accordingly. Much the same is practised in Holland by those who lend money on pledges; the name of the borrower and the sum are written on a like slip of parchment, which is cut into two, and half given to the borrower, and the other half stitched to the pledge; that, upon comparing them together again, the borrower may receive his goods on paying the money stipulated.

BILL in Parliament, a paper containing propositions, offered to the houses to be passed by them, and then presented to the king to pass into a law.

To bring a bill into the house, if the relief sought by it is of a private nature, it is first necessary to prefer a petition; which must be presented by a member, and usually sets forth the grievance desired to be remedied. This petition (when founded on facts that may be in their nature disputed) is referred to a committee of members, who examine the matter alleged, and accordingly report it to the house; and then (or, otherwise, upon the mere petition) leave is given to bring in the bill. In public matters, the bill is brought in upon motion made to the house, without any petition at all. Formerly all bills were drawn in the form of petitions, which were entered upon the parliament rolls, with the king's answer thereunto subjoined; not in any settled form of words, but as the circumstances of the case required, and at the end of each parliament the judges drew them into the form of a statute, which was entered on the statute-rolls. In the reign of Henry V. to prevent mistakes and abuses, the statutes were drawn up by the judges before the end of the parliament; and in the reign of Henry VI. bills in the form of acts according to the modern custom, were first introduced.

The persons directed to bring in the bill, present it in a competent time to the house, drawn out on paper, with a multitude of blanks, or void spaces, where any thing occurs that is dubious, or necessary to be settled by the parliament itself, such especially as the precise date of times, the nature and quantity of penalties, or of any sums of money to be raised; being indeed only the skeleton of the bill. In the house of lords, if the bill begins there, it is, (when of a private nature) referred to two of the judges, who examine and report the state of the facts alleged, to see that all necessary parties consent, and to settle all points of technical propriety. This is read a first time, and at a convenient distance a second time; and after each reading, the speaker opens to the house the substance of the bill, and puts the question, Whether it shall proceed any farther? The introduction of the bill may be originally opposed, as the bill itself may at either of the readings; and, if the opposition succeeds, the bill must be dropped for that session; as it must also, if opposed with success in any of the subsequent stages.

After the second reading, it is committed; that is, referred to a committee: which is either selected by the house in matters of small importance; or else, upon a bill of consequence, the house resolves itself into a committee of the whole house. A committee of the whole house is composed of every member; and, to form it, the speaker quits the chair (another member being appointed chairman), and may sit and debate as a private member. In these committees the bill is debated clause by clause, amendments made, the blanks filled up, and sometimes the bill entirely new-modelled. After it has gone through the committee, the chairman reports it to the house with such amendments as the committee have made; and then the house considers the whole bill again, and the question is repeatedly put upon every clause and amendment. When the house hath agreed or disagreed to the amendments of the committee, and sometimes added new amendments of its own, the bill is then ordered to be engrossed, or written in a strong gross hand, on one or more long rolls (or presses) of parchment sewed together. When this is finished, it is read a third time, and amendments are sometimes then made to it; and if a new clause be added, it is done by tacking a separate piece of parchment on the bill, which is called a *ryder*. The speaker then again opens the contents; and, in holding it up in his hands, puts the question, Whether the bill shall pass? If this is agreed to, the title to it is then settled; which used to be a general one for all the acts passed in the session, till in the fifth year of Hen. VIII. distinct titles were introduced for each chapter. After this, one of the members is directed to carry it to the lords and desire their concurrence; who, attended by several more, carries it to the bar of the house of peers, and there delivers it to their speaker, who comes down from his woolsack to receive it.

It there passes through the same forms as in the other house (except engrossing, which is already done); and, if

if rejected, no more notice is taken, but it passes *sub silentio*, to prevent unbecoming altercations. But if it is agreed to, the lords send a message by two masters in chancery (or sometimes two of the judges) that they have agreed to the same: and the bill remains with the lords, if they have made no amendments to it. But if any amendments are made, such amendments are sent down with the bill to receive the concurrence of the commons. If the commons disagree to the amendments, a conference usually follows between members deputed from each house; who for the most part settle and adjust the difference: but if both houses remain inflexible, the bill is dropped. If the commons agree to amendments, the bill is sent back to the lords by one of the members, with a message to acquaint them therewith. The same forms are observed, *mutatis mutandis*, when the bill begins in the house of lords. But when an act of grace or pardon is passed, it is first signed by his majesty, and then read once only in each of the houses, without any new engrossing or amendment. And when both houses have done with any bill, it always is deposited in the house of peers, to wait the royal assent; except in the case of a bill of supply, which after receiving the concurrence of the lords is sent back to the house of commons.

The royal assent may be given two ways: 1. In person; when the king comes to the house of peers, in his crown and royal robes, and sending for the commons to the bar, the titles of all the bills that have passed both houses are read; and the king's answer is declared by the clerk of the parliament in Norman-French: a badge it must be owned (now the only one remaining), of conquest; and which one could wish to see fall into total oblivion; unless it be reserved as a solemn memento to remind us that our liberties are mortal, having been once destroyed by a foreign force. If the king consents to a public bill, the clerk usually declares, *Le roy le veut*, "The king wills it so to be;" if to a private bill, *Soit fait comme il est desiré*, "Be it as it is desired." If the king refuses his assent, it is in the gentle language of *Le roy s'avisera*, "The king will advise upon it." When a bill of supply is passed, it is carried up and presented to the king by the speaker of the house of commons; and the royal assent is thus expressed, *Le roy remercie ses loyal subjects, accepte leur benevolence, et aussi le veut;* "The king thanks his loyal subjects, accepts their benevolence, and wills it so to be." In case of an act of grace, which originally proceeds from the crown and has the royal assent in the first stage of it, the clerk of the parliament thus pronounces the gratitude of the subject: *Les prelats, seigneurs, et commons, en ce present parliament assemblees, au nom de touts vous autres subjects, remercient tres humblement votre majeste, et prient à Dieu vous donner en santé bone vie et longue;* "The prelates, lords, and commons in this present parliament assembled, in the name of all your other subjects, most humbly thank your majesty, and pray to God to grant you in health and wealth long to live." 2. By the statute 33 Hen. VIII. c. 21. the king may give his assent by letters patent under his great seal, signed with his hand, and notified in his absence to both houses assembled together in the high house. And when the bill has received the royal assent in either of these ways, it is then, and not before, a statute or act of parliament.

This statute or act is placed among the records of the kingdom; there needing no formal promulgation to give it the force of a law, as was necessary by the civil law with regard to the emperor's edicts; because every man in Britain is, in judgment of law, party to the making of an edict of parliament, being present thereat by his representatives. However, a copy thereof is usually printed at the king's press for the information of the whole land. And formerly, before the invention of printing, it was used to be published by the sheriff of every county; the king's writ being sent to him at the end of every session, together with a transcript of all the acts made at that session, commanding him, *ut statuta illa, et omnes articulos in eisdem contentos, in singulis locis ubi expedire viderit, publicè proclamari, et firmiter teneri et observari faciat*. And the usage was to proclaim them at his county court, and there to keep them, that whoever would, might read or take copies thereof; which custom continued till the reign of Henry VII.

An act of parliament thus made is the exercise of the highest authority that this kingdom acknowledges upon earth. It hath power to bind every subject in the land, and the dominions thereunto belonging; nay, even the king himself, if particularly named therein. And it cannot be altered, amended, dispensed with, suspended, or repealed, but in the same forms and by the same authority of parliament: for it is a maxim in law, that it requires the same strength to dissolve as to create an obligation. It is true, it was formerly held that the king might in many cases dispense with penal statutes; but now by statute 1 Will. and M. stat. 2. c. 2. it is declared, that the suspending or dispensing with laws by regal authority, without consent of parliament, is illegal.

Bill of Rights. See the article LIBERTY.

BILLERICAY, a town of Essex in England, seated on a hill, in E. Long. 0. 25. N. Lat. 51. 35.

BILLET, in *Heraldry*, a bearing in form of a long square. They are supposed to represent pieces of cloth of gold or silver; but Guillem thinks they represent a letter sealed up, and other authors take them for bricks. *Billeté* signifies that the escutcheon is all over strewed with billets, the number not ascertained.

Billet-Wood, small wood for fuel, cut three feet and four inches long, and seven inches and a half in compass; the size of which is to be inquired of by justices.

BILLETING, in military affairs, is the quartering of soldiers in the houses of a town or village.—And, among fox-hunters, it signifies the ordure and dung of a fox.

BILLIARDS, an ingenious kind of game, played on a rectangular table, with little ivory balls, which are driven into hazards or holes, according to certain rules of the game.

This game was invented by the French, when it was played in a different manner from what it is at present, by having a pass or iron fixed on the table, through which the balls at particular periods of the game used to be played; but now this method is quite laid aside.

Soon after the French, the Germans, the Dutch, and Italians, brought this game into vogue throughout most parts of Europe, at which they became great proficients; and in a few years afterwards it became a favourite

Digitized by Google

Billiards. vourite diversion in many parts of England, particularly with persons of the first rank. Since that time, indeed, it has been in a great measure prostituted by designing and vulgar sorts of people: notwithstanding, it will never be out of fashion, being of itself very entertaining, and attended with that kind of moderate exercise which renders it the more agreeable.

The table on which the game is played is generally about twelve feet long and six feet wide, or rather in the exact form of an oblong; it is covered with fine green cloth, and surrounded with cushions to prevent the balls running off, and to make them rebound. There are six holes, nets, or pockets: these are fixed at the four corners, and in the middle, opposite to each other, to receive the balls, which when put into these holes or pockets are called hazards. The making of a hazard, that is, putting the adversary's ball in, at the usual game reckons for two in favour of the player.

The game is played with sticks called *maces*, or with cues; the first consists of a long straight stick, with a head at the end, and is the most powerful instrument of the two: the cue is a thick stick diminishing gradually to a point of about half an inch diameter; this instrument is played over the left hand, and supported by the fore-finger and thumb. It is the only instrument in vogue abroad, and is played with amazing address by the Italians and some of the Dutch; but in England the mace is the prevailing instrument, which the foreigners hold in contempt, as it requires not near so much address to play the game with, as when the cue is made use of; but the mace is preferred for its peculiar advantage, which some professed players have artfully introduced, under the name of *trailing*, that is, following the ball with the mace to such a convenient distance from the other ball as to make it an easy hazard. The degrees of trailing are various, and undergo different denominations amongst the connoisseurs at this game; namely, the shove, the sweep, the long stroke, the trail, and the dead trail or turn up, all which secure an advantage to a good player according to their various gradations: even the butt end of the cue becomes very powerful, when it is made use of by a good trailer.

Rules generally observed at the common or usual game.—1. For the lead, the balls must be put at one end, and the player must strike them against the farthermost cushion, in order to see which will be nearest the cushion that is next to them. 2. The nearest to the cushion is to lead and choose the ball if he pleases. 3. The leader is to place his ball at the nail, and not to pass the middle pocket; and if he holes himself in leading, he loses the lead. 4. He who follows the leader must stand within the corner of the table, and not place his ball beyond the nail. 5. He who plays upon the running ball loses one. 6. He who touches the ball twice and moves it, loses one. But these two rules are seldom or ever enforced, especially in England. 7. He who does not hit his adversary's ball, loses one. 8. He who touches both balls at the same time, makes a foul stroke, in which case if he should hole his adversary, nothing is gained by the stroke; but if he should put himself in, he loses two. 9. He who holes both balls, loses two. 10. He who strikes upon his adversary's ball, and holes himself, loses two. 11. He who plays at the ball without striking it, and holes himself, loses three. 12. He who strikes both balls over the table, loses two. 13. He who strikes his ball over the table, and does not hit his adversary's ball, loses three. 14. He who retains the end of his adversary's stick when playing, or endeavours to baulk his stroke, loses one. 15. He who plays another's ball or stroke without leave, loses one. 16. He who takes up his ball, or his adversary's without leave, loses one. 17. He who stops either ball when running, loses one; and being near the hole, loses two. 18. He who blows upon the ball when running loses one, and, if near the hole, loses two. 19. He who shakes the table when the ball is running, loses one. 20. He who strikes the table with the stick, or plays before his turn, loses one. 21. He who strikes his stick upon the table, and hits the ball, loses one. 22. If the ball stands upon the edge of the hole, and after being challenged it falls in, it is nothing, but must be put up where it was before. 23. If any person, not being one of the players, stops a ball, the ball must stand in the place where it was stopped. 24. He who plays without a foot upon the floor, and holes his adversary's ball, gets nothing for it, but loses the lead. 25. He who leaves the game before it is ended, loses it. 26. Any person may change his stick in play. 27. If any difference arise between players, he who marks the game or the majority of the company must decide it. 28. Those who do not play must stand from the table, and make room for the players. 29. If any person lays any wager, and does not play, he shall not give advice to the players upon the game.

Different kinds of games played at billiards.—Besides the common winning game, which is twelve up, there are several other kinds of games, viz. the losing game, the winning and losing, choice of balls, bricole, carambole, Russian carambole, the bar-hole, the one-hole, the four-game, and hazards.

The *losing-game*, is the common game nearly reversed; that is to say, except hitting the balls, which is absolutely necessary, the player gains by losing. By putting himself in, he wins two; by putting his adversary in, he loses two; but if he pockets both balls, he gets four. The game depends greatly upon particular strengths, and is therefore very necessary to be known to play the winning game well.

The *winning and losing game*, is a combination of both games; that is to say, all balls that are put in by striking first the adversary's ball, reckon towards game; and holing both balls reckons four. At this game and the losing, knocking over or forcing the balls over the cushion, goes for nothing, the striker only loses the lead.

Choice of the balls, is choosing each time which ball the player pleases, which is doubtless a great advantage, and is generally played against losing and winning.

Bricole, is being obliged to hit a cushion, and make the ball rebound or return to hit the adversary's ball, otherwise the player loses a point. This is a great disadvantage, and is reckoned between even players to be equal to receiving about eight or nine points.

Carambole, is a game newly introduced from France. It is played with three balls, one being red, which is neutral, and is placed upon a spot on a line with the stringing

stringing nail (i. e. that part of the table from whence the player strikes his ball at first setting off, and which is generally marked with two brass nails). Each antagonist at the first stroke of a hazard, plays from a mark which is upon a line with it at the other end of the table. The chief object at this game is, for the player to hit with his own ball the two other balls, which is called a *carambole*, and by which the player wins two. If he puts in the red ball he gets three, and when he holes his adversary's ball he gets two; so that seven may be made at one stroke, by caramboling and putting in both balls. This game resembles the losing, depending chiefly upon particular strengths, and is generally played with the cue. The game is sixteen up; nevertheless it is reckoned to be sooner over than the common game. The next object of this game, after making what we have distinguished by the *carambole*, is the *baulk;* that is, making the white ball, and bringing the player's own ball and the red one below the stringing nail, from whence the adversary's begin. By this means the opponent is obliged to play bricole from the opposite cushion; and it often happens that the game is determined by this situation.

The *Russian carambole* is a game that has still more lately been introduced from abroad, and is played in the following manner: The red ball is placed as usual on the spot made for that purpose; but the player when he begins, or after having been holed, never places his ball on any particular place or spot; he being at liberty to put it where he pleases. When he begins to play, instead of striking at the red ball, he leads his own gently behind it, and his antagonist is to play at which he thinks proper; if he plays at the red ball and holes it, he scores three as usual towards the game, which is twenty-four instead of sixteen points; and the red ball is put upon the spot again, at which he may strike again, or take his choice which of the two balls to push at, always following his stroke till both balls are off the table. He is entitled to two points each time that he caramboles, the same as at the other game; but if he caramboles and puts his own ball into any hole, he loses as many as he might have got had he not holed himself: for example, if he strikes at the red ball which he holes, at the same time caramboles and holes himself, he loses five points; and if he holes both balls when he caramboles, and likewise his own, he loses seven, which he would have got, if he had not holed his own ball. In other respects it is played like the common carambole game.

The *bar-hole*, is so called from the hole being barred which the ball should be played for, and the player striking for another hole; when this game is played against the common game, the advantage for the latter, between equal players, is reckoned to be about six.

The player at the *one-hole*, though it seems to those who are not judges of the game to be a great disadvantage, has in fact the best of it; for as all balls that go into the one hole reckon, the player endeavours to lay his ball constantly before the hole, and his antagonist frequently finds it very difficult to keep one or other ball out, particularly on the leads, when the one-hole player lays his ball (which he does as often as he can) on the brink of the hole; leading for that purpose from the opposite end, which in reality he has no right to do; for, the lead should be given from the end of the table at which the hazard is made; but when a person happens to be a novice, this advantage is often taken.

The *four-game*, consists of two partners on each side, at the common winning game; who play by succession after each hazard, or two points lost. The game is fifteen up; so that the point or hazard is an odd number, which makes a miss at this game of more consequence than it is at another; being as much at four, six, or eight, as it is at five, seven, or nine, at the single game.

Hazards are so called because they depend entirely upon the making of hazards, there being no account kept of any game. Any number of persons may play by having balls that are numbered; but the number seldom exceeds six, to avoid confusion. The person whose ball is put in, pays so much to the player according to what is agreed to be played for each hazard; and the person who misses, pays half the price of a hazard to him whose ball he played at. The only general rule is not to lay any ball a hazard for the next player, which may be in a great measure avoided, by always playing upon the next player, and either bringing him close to the cushion, or putting him at a distance from the rest of the balls. The table, when hazards are played, is always paid for by the hour.

BILLINGHAM, a town of Northumberland in England, seated in W. Long. 1. 35. N. Lat. 55. 20.

BILLON, in the history of coins, a composition of precious and base metals, where the latter predominates. Wherefore gold under twelve carats fine, is called *billon of gold;* and silver under six pennyweight, *billon of silver*. So little attention was paid formerly to the purity of gold and silver, that the term *billon of gold* was applied only to that which was under twenty-one carats, and *billon of silver* to that which was lower than ten pennyweight.

BILLON, a town of France, in the department of Puy de Dome, containing 5200 inhabitants. E. Long. 3. 30. N. Lat. 45. 36.

BILSDON, a small town of Leicestershire in England, situated in W. Long. 0. 15. N. Lat. 52. 40.

BILSEN, a town of the Netherlands, in the principality of Liege, seated on the river Demer, in E. Long. 5. 42. N. Lat. 50. 48.

BILSON, THOMAS, bishop of Winchester, in which city he was born and educated. In 1565, he was admitted perpetual fellow of New College, and in 1570 completed his degrees in arts. He was made bachelor of divinity in 1579, and doctor the year following. His first preferment was that of master of Winchester school; he was next made prebendary, and afterwards warden, of Winchester college. In 1596 he was consecrated bishop of Worcester; and about a year after, translated to the see of Winchester, and sworn of Queen Elizabeth's privy-council. He was one of the principal managers of the Hampton-court conference in 1604; and the English translation of the Bible in the reign of King James I. was finally corrected by this prelate, and Dr Miles Smith bishop of Gloucester. He died in the year 1616, and was buried in Westminster abbey, near the entrance of St Edmund's chapel, on the south side of the monument of King Richard II. The several authors who have mentioned

Digitized by Google

Bishop Bilson, agree in giving him the character of a learned divine, an able civilian, and an upright man. His style is in general much more easy and harmonious than that of cotemporary ecclesiastics. His works are, 1. Several Latin poems and orations. Manuscript, in Ant. Wood's library. 2. The true difference between Christian subjection and unchristian rebellion. Oxf. 1585, 4to. Lond. 1586, 8vo. 3. The perpetual government of Christ's church. Lond. 1593, 4to, Black Letter. 4. The effect of certain sermons touching the full redemption of mankind by the death and blood of Christ, &c. Lond. 1599, 4to. 5. The survey of Christ's suffering for man's redemption, and of his descent to Hades or Hell. Lond. 1604, fol. 6. A sermon preached before King James I. and his queen, at their coronation. Lond. 1603, 8vo.

BIMEDIAL, in *Mathematics*. If two medial lines, as AB and BC, commensurable only in power, containing a rational rectangle, are compounded, the whole line AC will be irrational, and is called a *first bimedial line*.

A————————B————————C

See Euclid, lib. x. prop. 38.

BIMINI, one of the Bahama islands, near the north-west extremity of the Bahama bank. It is about eight miles in length, and as much in breadth, covered with trees, and inhabited by the native Americans. It is very difficult of access on account of the shoals, but is a very pleasant place. W. Long. 79. 30. N. Lat. 25. 0.

BIMLIPATAN, a village in Hindostan, in the northern circars, seated on the west side of the bay of Bengal. The Dutch had formerly a small factory here, designed for buying up the cloth manufactured by the inhabitants. E. Long. 83. 5. N. Lat. 18. 0.

BINACLE, a wooden case or box, which contains the compasses, log-glasses, watch-glasses, and lights to show the compass at night. As this is called *bittacle* in all the old sea-books, even by mariners, it appears evidently to be derived from the French term *habittacle* (a small habitation), which is now used for the same purpose by the seamen of that nation. The binacle (Plate LXXXVIII. fig. 4.) is furnished with three apartments, with sliding shutters: the two side ones, *a b*, have always a compass in each *d*, to direct the ship's way; while the middle division *c*, has a lamp or candle with a pane of glass on either side to throw a light upon the compass in the night, whereby the man who steers may observe it in the darkest weather, as it stands immediately before the helm on the quarter-deck. There are always two binacles on the deck of a ship of war, one being designed for the man who steers, and the other for the person who superintends the steerage, whose office is called *conning*.

BINAROS, a small town of Spain, in the kingdom of Valentia, remarkable for good wine. It is seated near the sea, in E. Long. 0. 15. N. Lat. 40. 24.

BINARY ARITHMETIC, that wherein unity or 1 and 0 are only used. This was the invention of M. Leibnitz, who shows it to be very expeditious in discovering the properties of numbers, and in constructing tables; and Mr Dangecourt, in the history of the royal academy of sciences, gives a specimen of it concerning arithmetical progressionals; where he shows,

that because in binary arithmetic only two characters are used, therefore the laws of progression may be more easily discovered by it than by common arithmetic. All the characters used in binary arithmetic are 0 and 1; and the cypher multiplies every thing by 2, as in the common arithmetic by 10. Thus 1 is one; 10, two; 11, three; 100, four; 101, five; 110, six; 111, seven; 1000, eight; 1001, nine; 1010, ten; which is built on the same principles with common arithmetic. Hence immediately appears the reason of the celebrated property of the duplicate geometrical proportion in whole numbers; viz. that one number of each degree being had, we may thence compose all the other whole numbers above the double of the highest degree. It being here, v. gr. as if one should say, 111 is the sum of 4, 2, and 1, which property may serve essayers to weigh all kinds of masses with a little weight; and may be used in coins, to give several values with small pieces. This method of expressing numbers once established, all the operations will be easy: in multiplication particularly, there will be no need for a table, or getting any thing by heart. The author, however, does not recommend this method for common use, because of the great number of figures required to express a number; adding, that if the common progression were from 12 to 12, or from 16 to 16, it would be still more expeditious; but its use is in discovering the properties of numbers, in constructing tables, &c. What makes the binary arithmetic the more remarkable is, that it appears to have been the same with that used 4000 years ago among the Chinese, and left in *ænigma* by Fohi, the founder of their empire as well as of their sciences.

BINARY Measure, in *Music*, is a measure which is beaten equally, or where the time of rising is equal to that of falling. This is usually called *common time*.

BINARY Number, that composed of two units.

BINCH, a small fortified town of the Low Countries, in the county of Hainault, subject to the house of Austria. E. Long. 3. 21. N. Lat. 50. 23.

BIND, a country word for a stalk of hops.

BIND of Eels, a quantity, consisting of 250, or 10 strikes, each containing 25 eels.

BIND-WEED, in *Botany*. See CONVOLVULUS, BOTANY *Index*.

BINDBROKE, a town of Lincolnshire in England, seated in E. Long. 0. 10. N. Lat. 53. 32.

BINDING-JOISTS, in *Architecture*, are those joists in a floor, into which the trimmers of staircases, or well-holes of the stairs, and chimney-ways, are framed: they ought to be stronger than common joists.

BINDING, in the art of defence, a method of securing or crossing the adversary's sword with a pressure, accompanied with a spring from the wrist. See BEATING.

Unless a man by some kind of cross, secure, as it were, or render his adversary's sword incapable to offend him during the time of his performing a lesson upon him, it is impossible for him to be certain but that he may receive from his adversary, either a fortuitous *contretemps*, or an exchanged thrust, before the recovery of his body, or going off after a thrust.—The great objection made by some people, particularly those time-catchers, against the frequent use of binding,

Digitized by Google

ing, is, that when a man, in performing it, cleaves too much to his adversary's sword, he is liable to his adversary's slipping of him, and consequently of receiving either a plain thrust, or one from a feint.

BINDING is a term in falconry, which implies tiring, or when a hawk seizes.

BINDING of Books. See *Book-Binding*.

BING, in the alum-works, denotes a heap of alum thrown together in order to drain.

BINGAZI, a sea-port town of Africa, in the kingdom of Tripoli. E. Long. 19. 10. N. Lat. 32. 20.

BINGEN, an ancient and handsome town of Germany, in the grand duchy of Hesse, seated at the place where the river Nave falls into the Rhine. E. Long. 7. 48. N. Lat. 49. 55.

BINGHAM, JOSEPH, a learned divine, born at Wakefield in Yorkshire, in September 1668, educated at University college in Oxford, and afterwards presented by John Radcliffe, M. D. to the rectory of Headbournworthy, near Winchester. In this country retirement he began his learned and laborious work, *Origines Ecclesiasticæ:* or, The Antiquities of the Christian church; the first volume of which was published in 1708, and it was completed afterwards in nine volumes more. He published also several other books. But notwithstanding his great learning and merit, he had no other preferment than that of Headbournworthy till the year 1712, when he was collated to the rectory of Havant, near Portsmouth, by Sir Jonathan Trelawney bishop of Winchester, to whom he dedicated several of his books. He died August 17th, 1723, in the 55th year of his age.

BINGHAM, a town of Nottinghamshire in England, seated in the vale of Belvoir, and containing 1326 inhabitants in 1811. W. Long. 1. 10. N. Lat. 50. 3.

BINGIUM, in *Ancient Geography*, a village or town of the Vangiones in Gallia Belgica, seated at the confluence of the Nave and Rhine. Now BINGEN, which see.

BINGLEY, a town in the west riding of Yorkshire, seated on the river Aire. Population 4782, including Micklethwaite. W. Long. 1. 35. N. Lat. 53. 20.

BINN, *binna*, a sort of chest or cupboard, wherein to lock up bread, meat, or other provisions. The word is also used for a place boarded up to put corn in.

BINN, or BIN. The pease and oatmeal, used at sea, are apt to spoil in casks. Dr Hales proposes to prevent this, by putting them into large binns, with false bottoms of hair-cloths laid on bars, whereby fresh air may be blown upwards through them, at proper times, with small ventilators.

BINOCULAR TELESCOPE, a kind of dioptric telescope fitted with two tubes, joined in such a manner that one may see a distant object with both eyes at the same time. See OPTICS.

BINOMIAL, in *Algebra*, a root consisting of two members connected by the sign + or —. Thus $a+b$, and 8—3, are binomials, consisting of the sums and differences of these quantities. See ALGEBRA.

BINTAN, an island of Asia, in the East Indies, to the south of the peninsula of Malacca, situated in E. Long. 103. 50. N. Lat. 1. 0.

BIOGRAPHER, one who writes the lives of particular persons, as Plutarch, Suetonius, &c. See the next article.

BIOGRAPHY, a species of history which records the lives and characters of remarkable persons. This is at once the most entertaining and instructive kind of history. It admits of all the painting and passion of romance; but with this capital difference, that our passions are more keenly interested, because the characters and incidents are not only agreeable to nature, but strictly true. No books are so proper to be put into the hands of young people. See HISTORY.

BION, a bucolic poet, native of Smyrna, lived at the same time with Ptolemy Philadelphus, whose reign reached from the fourth year of the 123d Olympiad to the second year of the 133d. He was an incomparable poet, if we may believe the lamentations of his disciple Moschus. His few pieces which are left do not contradict this testimony. See MOSCHUS.

BION, surnamed *Borysthenites*, because he was of Borysthenes, was a philosopher of a great deal of wit, but of very little religion: he flourished about the 120th Olympiad; but, falling sick, he, like other profane persons, became superstitious.

BIORNBURG, a town of North Finland in Sweden, seated on the river Kune near its mouth in the gulf of Bothnia. E. Long. 22. 35. N. Lat. 62. 6.

BIOTHANATI, (from βια, *violence*, and θανατος, *death*), in some medical writers, denotes those who die a violent death. The word is also written, and with more propriety, *biathanati;* sometimes *biæothanti*.

In a more particular sense, it denotes those who kill themselves, more properly called *autothanati*. In this sense it is that the word is used both by Greek and Latin writers. By the ancient discipline of the church, they were punished by denying them burial, and refusing all commemoration of them in the prayers and offices of the church.

BIOTHANATI (supposed by some to be derived from βιος, *life*, and θανατος, *death*, and alluding to the belief of a future life after death) was also a name of reproach given by the Heathens to the primitive Christians, for their constancy and forwardness to lay down their lives in martyrdom.

BIOTHANATOS is also used, in some writers of the barbarous age, for wicked, damnable, or accursed.

BIOUAC, BIVOUAC, or BIOVAC, in the military art, a nightly guard performed by the whole army, when there is an apprehension of danger from the enemy. The word is formed by corruption from the German, *weywaght*, a *double watch* or *guard*.

BIPENNIS, a two-edged axe, used anciently by the Amazons in fight; as also by the seamen, to cut asunder the ropes and cordage of the enemy's vessels. The bipennis was a weapon chiefly of the oriental nations, made like a double axe, or two axes joined back to back, with a short handle. Modern writers usually compare it to our halbard or partizan; from which it differed in that it had no point, or that its shaft or handle was much shorter.

BIQUADRATE, or BIQUADRATIC, is the next power above the cube, or the square multiplied by itself.

BIQUADRATIC EQUATION, in *Algebra*, an equation raised to the fourth power, or where the unknown quantity of one of the terms has four dimensions: Thus $x^4+ax^3+bx^2+cx+d=0$ is a biquadratic equation. See ALGEBRA.

Digitized by Google

Biquadratic Parabola, in *Geometry*, a curve line of the third order, having two infinite legs tending the same way. See Parabola.

Biquadratic Power of any number, is the fourth power or squared square of that number: Thus 16 is the biquadratic power of 2; for $2\times 2=4$, and $4\times 4=16$

Biquadratic Root of any number, is the square root of the square root of that number: Thus the biquadratic root of 81 is 3; for the square root of 81 is 9, and the square root of 9 is 3.

BIQUALAR, in the customs of the Algerines, a cook of the divan.—The janizaries, whom the Algerines call *oldachis*, after serving a certain term as common soldiers, are preferred to be biqualars, or cooks of the divan, which is the first step towards arriving at higher preferment. Biqualars have the care of furnishing the officers and commanders of the Algerine soldiery with meat and drink in the camp, in garrison, &c. From biqualars they are made odobachis; this is, corporals of companies, or commanders of squadrons.

BIQUINTILE, an aspect of the planets, when they are 144 degrees distant from each other. It is thus called, because they are distant from one another by twice the fifth part of 360 degrees.

BIR, or Berr, a town of the province of Diarbeck in Turkey in Asia, with a castle where the governor resides, seated on the eastern bank of the river Euphrates, near a high mountain, in a very pleasant and fertile country. E. Long. 38. 6. N. Lat. 36. 10.

BIRAGUE, Clement, a Milanese engraver, and the inventor of the art of cutting diamonds, flourished about the year 1580.

BIRCH-tree. See Betula, Botany *Index*.

Birch-Bark, being bituminous, and consequently warm and emollient, is used in fumigations to correct a distempered air. The inner silken bark was anciently used for writing-tables before the invention of paper; though Ray rather assigns the office of paper to the cuticle, or outer skin, which peels off yearly. And with the outward, thicker, and coarser part, are houses in Russia, Poland, and other northern tracts, covered instead of slates and tyle. The Indians make pinnaces with white cedar, which they cover with large flakes of birch-bark; sewing them with thread of spruce roots, and pitching them, as the ancient Britons did, with the willow. Pliny speaks of a bitumen actually procured from the birch tree.

Fungus of Birch, an excrescence growing on its trunk. It is astringent, and good against hemorrhagies. When boiled, beaten, and dried in an oven, it makes excellent spunk or touchwood.

Birch-Leaves are of use in the dropsy, itch, &c. either internally or externally applied.

Birch-Twigs serve to make rods and brooms: smeared with bird-lime, they are used by fowlers; to say nothing of the ancient fasces carried by lictors.

Birch-Wine is made by fermenting the vernal juice. Formerly it was in great repute against all nephritic disorders, but is left out in the modern London practice. The preparation of birch-wine is well and amply described in a book entitled *Vinetum Britannicum*.

Birch, *Dr Thomas*, an eminent historical and biographical writer, was born in London in 1705. His parents were both of them Quakers; and his father, Joseph Birch, was a coffee-mill maker by trade. Thomas being put to school, was indefatigable in his application, and stole many hours from sleep to increase his stock of knowledge. By this unremitting diligence, though he had not the happiness of an university education, he soon became qualified to take holy orders in the church of England, to the surprise of his acquaintance. In 1728 he married the daughter of the Rev. Mr Cox, to whom he was curate: but his felicity was of short duration, Mrs Birch dying of a puerperal fever in less than 12 months after their marriage; an event which he deplores in a very elegant and pathetic poem, preserved in Nichols's Collection. In 1732 he was recommended to the friendship and favour of the late lord high chancellor Hardwicke, then attorney general; to which noble peer, and to the present earl of Hardwicke, he was indebted for all his preferments. The first proof he experienced of his patron's regard was the living of Ulting in the county of Essex, in the gift of the crown, to which he was presented 1732. In 1734 he was appointed one of the domestic chaplains to the unfortunate earl of Kilmarnock, who was beheaded in 1746. Mr Birch was chosen a member of the Royal Society, Feb. 20. 1734-5; and of the Society of Antiquaries, Dec. 11. 1735, of which he afterwards became director till his death. Before this, the Marischal college of Aberdeen had conferred on him, by diploma, the degree of master of arts. In 1743, by the interest of Lord Hardwicke, he was presented by the crown to the sinecure rectory of Landewy Welfrey in the county of Pembroke; and in 1743-4 was preferred, in the same manner, to the rectory of Sidington in St Peter's, in the county and diocese of Gloucester. We find no traces of his having taken possession of this living; and indeed it is probable that he quitted it immediately for one more suitable to his inclinations and to his literary engagements, which required his almost constant residence in town; for on the 24th of February 1743-4, he was instituted to the united rectories of St Michael Woodstreet, and St Mary Staining; and in 1745-6, to the united rectories of St Margaret Pattens and St Gabriel, Fenchurch-street (by lord chancellor Hardwicke, in whose turn the presentation then was). In January 1752, he was elected one of the secretaries of the Royal Society, in the room of Dr Cromwell Mortimer, deceased. In January 1753, the Marischal college of Aberdeen created him doctor of divinity; and in that year the same degree was conferred on him by Archbishop Herring. He was one of the trustees of the British Museum; for which honour he was probably indebted to the present earl of Hardwicke, as he was for his last preferment, the rectory of Depden in Essex, to which he was inducted Feb. 26. 1761. In the latter part of his life he was chaplain to the Princess Amelia. In 1765 he resigned his office of secretary to the Royal Society, and was succeeded by Dr Morton. His health declining about this time, he was ordered to ride for the recovery of it; but being a bad horseman, and going out Jan. 9. 1766, he was unfortunately thrown from his horse, on the road betwixt London and Hampstead, and died on the spot, in the 61st year of his age, to the great regret of the doctor's numerous

Digitized by Google

numerous literary friends; and was buried in St Margaret Pattens. Dr Birch had in his lifetime been very generous to his relations; and none that were nearly allied to him being living at his decease, he bequeathed his library of books and manuscripts, with his picture painted in 1735, and all his other pictures and prints not otherwise disposed of by his will, to the British Museum. He likewise left the remainder of his fortune, which amounted to not much more than 500l. to be laid out in government-securities, for the purpose of applying the interest to increase the stipend of the three assistant librarians; thus manifesting at his death, as he had done during his whole life, his respect for literature, and his desire to promote useful knowledge. To the Royal Society he bequeathed his picture painted by Wills in 1737, being the original of the mezzotinto print done by Fauber in 1741. His principal publications were, 1. The General Dictionary, Historical and Critical; including a new translation of Mr Bayle, and interspersed with several thousand new lives. Dr Birch's associates in this undertaking were, the Reverend John Peter Bernard, Mr John Lockman, and Mr George Sale. The whole design was completed in 10 volumes folio. 2. Dr Cudworth's Intellectual System (improved from the Latin edition of Mosheim), his Discourse on the true Notion of the Lord's Supper, and two Sermons, with an account of his Life and Writings, 2 vols. 4to, 1743. 3. The Life of the Honourable Robert Boyle, 1744; prefixed to an edition of that excellent philosopher's works, revised by Dr Birch. 4. The Lives of Illustrious Persons of Great Britain, annexed to the engravings of Houbraken and Vertue, 1747—1752. 5. An Inquiry into the Share which King Charles I. had in the Transactions of the earl of Glamorgan, 1747, 8vo. 6. An edition of Spenser's Fairy Queen, 1751, 3 vols. quarto, with prints from designs by Kent. 7. The Miscellaneous Works of Sir Walter Raleigh; to which was prefixed the Life of that great, unfortunate, and injured man, 1751, 2 vols. 8vo. 8. The Theological, Moral, Dramatic, and Poetical Works of Mrs Catharine Cockburn; with an Account of the Life of that very ingenious Lady, 1751, 2 vols. 8vo. 9. The Life of the Most Reverend Dr John Tillotson, Lord Archbishop of Canterbury. Compiled chiefly from his original Papers and Letters, 1752, 8vo. 10. Milton's Prose Works, 1753, 2 vols. 4to; with a New Life of that great poet and writer. 11. Memoirs of the Reign of Queen Elizabeth, from the year 1581 till her death. In which the secret intrigues of her court, and the conduct of her favourite Robert earl of Essex, both at home and abroad, are particularly illustrated. From the original papers of his intimate friend Anthony Bacon, Esq.; and other manuscripts never before published, 1754, 2 vols. 4to. 12. The History of the Royal Society of London for improving natural knowledge, from its first rise. In which the most considerable of those papers communicated to the Society, which have hitherto not been published, are inserted in their proper order as a supplement to the Philosophical Transactions, 1756 and 1757, 4 vols. 4to. 13. The Life of Henry Prince of Wales, eldest Son of King James I. Compiled chiefly from his own papers and other manuscripts, never before published, 1760, 8vo. His numerous communications to the Royal Society may be seen in the Philosophical Transactions; and his poetical talents are evident from the verses already referred to.

BIRD, William, an eminent musician and composer, was one of the children of the chapel in the reign of Edward VI. and, as it is asserted by Wood in the Ashmolean MS. was bred up under Tallis. It appears, that in 1575 Tallis and Bird were both gentlemen and also organists of the royal chapel; but the time of their appointment to this latter office cannot now be ascertained.

The compositions of Bird are many and various; those of his younger years were mostly for the service of the church. He composed a work entitled *Sacrarum Cantionum, quinque vocum*, printed in 1589; among which is that noble composition, *Civitas sancti tui*, which for many years past has been sung in the church, as an anthem, to the words "Bow thine ear, O Lord." He was also the author of a work entitled *Gradualia, ac Cantiones sacræ, quinis, quaternis, trinisque vocibus concinnatæ, lib. primus*. Of this there are two editions, the latter published in 1610. Although it appears by these his works that Bird was in the strictest sense a church musician, he occasionally gave to the world compositions of a secular kind: and he seems to be the first among English musicians that ever made an essay in the composition of that elegant species of vocal harmony, the madrigal: the *La Verginella* of Ariosto, which he set in that form for five voices, being the most ancient musical composition of the kind to be met with in the works of English authors. Of his compositions for private entertainment, there are extant, "Songs of sundry natures, some of gravitie, and others of myrth, fit for all companies and voyces, printed in 1589;" and two other collections of the same kind, the last of them printed in 1611. But the most permanent memorials of Bird's excellencies are his motets and anthems; to which may be added, a fine service in the key of D with the minor third, the first composition in Dr Boyce's Cathedral Music, vol. iii. and that well-known canon of his, *Non nobis Domine*.

Besides his salaries and other emoluments of his profession, it is to be supposed that Bird derived some advantages from the patent granted by Queen Elizabeth to Tallis and him, for the sole printing of music and music-paper: Dr Ward speaks of a book which he had seen with the letters T. E. for Thomas East, Est, or Este, who printed music under that patent. Tallis dying in 1585, the patent, by the terms of it, survived to Bird, who, no doubt for a valuable consideration, permitted East to exercise the right of printing under the protection of it; and he in the title-page of most of his publications styles himself the *assignee of William Byrd*. Bird died in 1623.

Bird-Call, a little stick, cleft at one end, in which is is put a leaf of some plant, wherewith to counterfeit the cry or call of several birds, and bring them to the net, or snare, or lime-twig, to be taken. A laurel-leaf fitted on the bird-call, counterfeits the voice of lapwings; a leek that of nightingales, &c.

Bird-Catching, the art of taking birds or wild-fowl, whether for food, for the pleasure of their song, or for their destruction as pernicious to the husbandman, &c. The methods are by bird-lime, nets, decoys, &c. See *Bird-Lime*, infra; and Decoy.

British Zoology, vol. ii. append. N° iv. by the Honourable Daines Barrington.

In the suburbs of London (and particularly about Shoreditch) are several weavers and other tradesmen, who, during the months of October and March, get their livelihood by an ingenious, and, we may say, a scientific method of *bird-catching*, which is totally unknown in other parts of Great Britain. The reason of this trade being confined to so small a compass, arises from there being no considerable sale for singing-birds except in the metropolis: as the apparatus for this purpose is also heavy, and at the same time must be carried on a man's back, it prevents the bird-catchers going to above three or four miles distance.

This method of bird-catching must have been long practised, as it is brought to a most systematical perfection, and is attended with a very considerable expence.

The nets are a most ingenious piece of mechanism; are generally twelve yards and a half long, and two yards and a half wide; and no one, on bare inspection, would imagine that a bird (which is so very quick in all its motions) could be catched by the nets flapping over each other, till he becomes eye-witness of the pullers seldom failing.

The wild birds *fly* (as the bird-catchers term it) chiefly during the month of October, and part of September and November; as the flight in March is much less considerable than that of Michaelmas. It is to be noted also, that the several species of birds of *flight* do not make their appearance precisely at the same time, during the months of September, October, and November. The pippet (A), for example, begins to fly about Michaelmas; and then the woodlark, linnet, goldfinch, chaffinch, greenfinch, and other birds of flight succeed; all of which are not easily to be caught, or in any numbers, at any other time, and more particularly the pippet and the woodlard.

These birds, during the Michaelmas and March flights, are chiefly on the wing from daybreak to noon, though there is afterwards a small flight from two till night; but this however is so inconsiderable, that the bird-catchers always take up their nets at noon.

It may well deserve the attention of the naturalist whence these periodical flights of certain birds can arise. As the ground, however, is ploughed during the months of October and March for sowing the winter and lent corn, it should seem that they are thus supplied with a great profusion both of seeds and insects, which they cannot so easily procure at any other season.

It may not be improper to mention another circumstance, to be observed during their flitting, viz. that they fly always against the wind: hence there is great contention amongst the bird-catchers who shall gain that point; if (for example) it is westerly, the bird-catcher who lays his nets most to the east, is sure almost of catching every thing, provided his call-birds are good: a gentle wind to the south-west generally produces the best sport.

The bird-catcher, who is a substantial man, and hath a proper apparatus for this purpose, generally carries with him five or six linnets, (of which more are caught than any singing bird), two goldfinches, two greenfinches, one woodlark, one redpoll, a yellow-hammer, titlark, and aberdavine, and perhaps a bullfinch; these are placed at small distances from the nets in little cages. He hath, besides, what are called *flur-birds*, which are placed within the nets, are raised upon the flur (B), and gently let down at the time the wild bird approaches them. These generally consist of the linnet, the goldfinch, and the greenfinch, which are secured to the flur by what is called a *brace* (C); a contrivance that secures the birds without doing any injury to their plumage.

It having been found that there is a superiority between bird and bird, from the one being more in song than the other; the bird-catchers contrive that their call-birds should moult before the usual time. They therefore, in June or July, put them into a close box under two or three folds of blankets, and leave their dung in the cage to raise a greater heat; in which state they continue, being perhaps examined but once a-week to have fresh water. As for food, the air is so putrid, that they eat little during the whole state of confinement, which lasts about a month. The birds frequently die under the operation; and hence the value of a stopped bird rises greatly. When the bird hath thus prematurely moulted, he is in song whilst the wild birds are out of song, and his note is louder and more piercing than that of a wild one; but it is not only in his note he receives an alteration, the plumage is equally improved. The black and yellow in the wings of the goldfinch, for example, become deeper and more vivid, together with a most beautiful gloss, which is not to be seen in the wild bird. The bill, which in the latter is likewise black at the end, in the stopped bird becomes white and more taper, as do its legs: in short, there is as much difference between a wild and a stopped bird, as there is between a horse which is kept in body-clothes and one at grass.

When the bird-catcher hath laid his nets, he disposes of his call-birds at proper intervals. It must be owned

(A) A small species of lark, but which is inferior to other birds of that genus in point of song.

(B) A moveable perch to which the bird is tied, and which the bird-catcher can raise at pleasure by means of a long string fastened to it.

(C) A sort of bandage, formed of a slender silken string that is fastened round the bird's body, and under the wings, in so artful a manner as to hinder the bird from being hurt, let it flutter ever so much in the raising.

Digitized by Google

owned that there is most malicious joy in these call-birds to bring the wild ones into the same state of captivity: which may likewise be observed with regard to the decoy ducks. See DECOY.

Their sight and hearing infinitely excel that of the bird-catcher. The instant that the (D) wild birds are perceived, notice is given by one to the rest of the call-birds, (as it is by the first hound that hits on the scent to the rest of the pack); after which, follows the same sort of tumultuous ecstacy and joy. The call-birds, while the bird is at a distance, do not sing as a bird does in a chamber; they invite the wild ones by what the bird-catchers call *short jerks*, which, when the birds are good, may be heard at a great distance. The ascendency by this call or invitation is so great, that the wild bird is stopped in its course of flight; and, if not already acquainted with the nets (E), lights boldly within 20 yards of perhaps three or four bird-catchers, on a spot which otherwise it would not have taken the least notice of. Nay, it frequently happens, that if half a flock only are caught, the remaining half will immediately afterwards light in the nets, and share the same fate; and should only one bird escape, that bird will suffer itself to be pulled at till it is caught; such a fascinating power have the call-birds.

While we are on this subject of the jerking of birds, we cannot omit mentioning, that the bird-catchers frequently lay considerable wagers whose call-bird can jerk the longest, as that determines the superiority. They place them opposite to each other, by an inch of candle; and the bird who jerks the oftenest, before the candle is burnt out, wins the wager. We have been informed, that there have been instances of a bird's giving 170 jerks in a quarter of an hour; and we have known a linnet, in such a trial, persevere in its emulation till it swooned from the perch: thus, as Pliny says of the nightingale, *victa morte finit sæpe vitam, spiritu prius deficiente quam cantu* *. It may be here observed, that birds when near each other, and in sight, seldom jerk or sing. They either fight, or use short and wheeling calls; the jerking of these call-birds, therefore, face to face, is a most extraordinary instance of contention for superiority in song.

* Lib. x. c. 29.

To these we may add a few particulars that fell within our notice during our inquiries among the bird-catchers; such as, that they immediately kill the hens of every species of birds they take, being incapable of singing, as also being inferior in plumage; the pippets likewise are indiscriminately destroyed, as the cock does not sing well: they sell the dead birds for threepence or fourpence a dozen. These small birds are so good, that we are surprised the luxury of the age neglects so delicate an acquisition to the table. The modern Italians are fond of small birds, which they eat under the common name of *beccaficos*: and the dear rate a Roman tragedian paid for one dish of singing birds is well known; (see the article ÆSOP).

Another particular we learned, in conversation with a London bird-catcher, was the vast price that is sometimes given for a single song-bird, which had not learned to whistle tunes. The greatest sum we heard of, was five guineas for a chaffinch, that had a particular and uncommon note, under which it was intended to train others: and we also heard of five pounds ten shillings being given for a call-bird linnet.

A third singular circumstance, which confirms an observation of Linnæus, is, that the male chaffinches fly by themselves, and in the flight precede the females; but this is not peculiar to the chaffinches. When the titlarks are caught in the beginning of the season, it frequently happens, that forty are taken and not one female among them: and probably the same would be observed with regard to other birds (as has been done with relation to the wheat-ear), if they were attended to. An experienced and intelligent bird-catcher informed us, that such birds as breed twice a-year, generally have in their first brood a majority of males, and in their second, of females, which may in part account for the above observation.

We must not omit mention of the bullfinch, though it does not properly come under the title of a singing bird, or a bird of flight, as it does not often move farther than from hedge to hedge; yet, as the bird sells well on account of its learning to whistle tunes, and sometimes flies over the fields where the nets are laid, the bird-catchers have often a call-bird to ensnare it, though most of them can imitate the call with their mouths. It is remarkable with regard to this bird, that the female answers the purpose of a call-bird as well as the male, which is not experienced in any other bird taken by the London bird-catchers.

The nightingale is not a bird of flight, in the sense the bird-catchers use this term. Like the robin, wren, and many other singing birds, it only moves from hedge to hedge, and does not take the periodical flights in October and March. The persons, who catch these birds, make use of small trap-nets, without call-birds; and are considered as inferior in dignity to other bird-catchers, who will not rank with them. The arrival of the nightingale is expected by the trappers in the neighbourhood of London, the first week in April: at the beginning, none but cocks are taken; but in a few days the hens make their appearance, generally by themselves, though sometimes a few males come along with them. The latter are distinguished from the females not only by their superior size, but by a great swelling of their vent, which commences on the first arrival of the hens. They are caught in a net-trap, the bottom of which is surrounded with an iron-ring; the net itself is rather larger than a cabbage net. When the trappers hear or see them, they strew some fresh mould under the place, and bait the trap with a meal-worm from the baker's shop. Ten or a dozen nightingales have been thus caught in a day.

The common way of taking larks, of which so many are used at our tables, is in the night, with those

(D) It may be also observed, that the moment they see a hawk, they communicate the alarm to each other by a plaintive note; nor will they then jerk or call though the wild birds are near.

(E) A bird acquainted with the nets, is by the bird-catchers termed a *sharper*; which they endeavour to drive away, as they can have no sport whilst it continues near them.

Digitized by Google

those nets which are called *trammels*. These are usually made of 36 yards in length, and about six yards over, with six ribs of pack-thread, which at the ends are put upon two poles of about 16 feet long, and made lesser at each end. These are to be drawn over the ground by two men, and every five or six steps the net is made to touch the ground, otherwise it will pass over the birds without touching them, and they will escape. When they are felt to fly up against the net, it is clapped down, and then all are safe that are under it. The darkest nights are properest for this sport; and the net will not only take larks, but all other birds that roost on the ground; among which are woodcocks, snipes, partridges, quails, fieldfares, and several others. In the depth of winter people sometimes take great numbers of larks by nooses of horse-hair. The method is this: Take 100 or 200 yards of pack-thread; fasten at every six inches a noose made of double horse-hair; at every 20 yards the line is to be pegged down to the ground, and so left ready to take them. The time to use this is when the ground is covered with snow, and the larks are to be allured to it by some white oats scattered all the way among the nooses. They must be taken away as soon as three or four are hung, otherwise the rest will be frighted; but though the others are scared away just where the sportsman comes, they will be feeding at the other end of the line, and the sport may be thus continued for a long time. Those caught in the day are taken in clap-nets of fifteen yards length, and two and a half in breadth; and are enticed within the reach by means of bits of looking-glass, fixed in a piece of wood, and placed in the middle of the nets, which are put in a quick whirling motion by a string the larker commands; he also makes use of a decoy lark. These nets are used only till the 14th November: for the larks will not *dare*, or frolic in the air, except in fine sunny weather; and of course cannot be inveigled into the snare. When the weather grows gloomy, the larker changes his engine, and makes use of a trammel net, twenty-seven or twenty-eight feet long, and five broad; which is put on two poles, eighteen feet long, and carried by men under each arm, who pass over the fields and quarter the ground as a setting dog: when they hear or feel a lark hit the net, they drop it down, and so the birds are taken.

Multitudes of the inhabitants of each cluster of the Orkney isles feed during the season on the eggs of the birds of the cliffs. The method of taking them is so very hazardous, as to satisfy one of the extremity to which the poor people are driven for want of food. Copinsha, Hunda, Hoy, Foula, and Noss-head, are the most celebrated rocks; and the neighbouring natives the most expert climbers and adventurers after the game of the precipice. The height of some is above fifty fathoms; their faces roughened with shelves or ledges sufficient only for the birds to rest and lay their eggs. To these the dauntless fowlers will ascend, pass intrepidly from the one to the other, collect the eggs and birds, and descend with the same indifference. In most places the attempt is made from above: they are lowered from the slope contiguous to the brink, by a rope, sometimes made of straw, sometimes of the bristles of the hog: they prefer the last even to ropes of hemp, as it is not so liable to be cut by the sharpness of the rocks; the former is apt to untwist. They trust themselves to a single assistant, who lets his companion down, and holds the rope, depending on his strength alone; which often fails, and the adventurer is sure to be dashed to pieces, or drowned in the subjacent sea. The rope is often shifted from place to place, with the impending weight of the fowler and his booty. The person above receives signals for the purpose, his associate being far out of sight, who, during the operation, by help of a staff, springs from the face of the rock, to avoid injury from the projecting parts.

But the most singular species of bird-catching is on the holm of Noss, a vast rock severed from the isle of Noss by some unknown convulsion, and only about sixteen fathoms distant. It is of the same stupendous height as the opposite precipice, with a raging sea between; so that the intervening chasm is of matchless horror. Some adventurous climber has reached the rock in a boat, gained the height, and fastened several stakes on the small portion of earth which is to be found on the top; correspondent stakes are placed on the edge of the correspondent cliffs. A rope is fixed to the stakes on both sides, along which a machine, called a cradle, is contrived to slide; and, by the help of a small parallel cord fastened in like manner, the adventurer wafts himself over, and returns with his booty.

The manner of bird-catching (see Plate XC. fig. 7.) in the Feroe islands is so very strange and hazardous, that the description should by no means be omitted. Necessity compels mankind to wonderful attempts. The cliffs which contain the object of their search are often two hundred fathoms in height, and are attempted from above and below. In the first case, the fowlers provide themselves with a rope 80 or 100 fathoms in length. The fowler fastens one end about his waist and between his legs, recommends himself to the protection of the Almighty, and is lowered down by six others, who place a piece of timber on the margin of the rock, to preserve the rope from wearing against the sharp edge. They have besides a small line fastened to the body of the adventurer, by which he gives signals that they may lower or raise him, or shift him from place to place. The last operation is attended with great danger, by the loosening of the stones, which often fall on his head, and would infallibly destroy him, was it not protected by a strong thick cap; but even that is found unequal to save him against the weight of the larger fragments of rock. The dexterity of the fowlers is amazing; they will place their feet against the front of the precipice, and dart themselves some fathoms from it, with a cool eye survey the places where the birds nestle, and again shoot into their haunts. In some places the birds lodge in deep recesses. The fowler will alight there, disengage himself from the rope, fix it to a stone, and at his leisure collect the booty, fasten it to his girdle, and resume his pendulous seat. At times he will again spring from the rock, and in that attitude, with a fowling-net placed at the end of a staff, catch the old birds which are flying to and from their retreats. When he hath finished his dreadful employ, he gives a signal to his friends above, who pull him up, and share the hard-earned profit. The feathers are preserved for exportation:

tion: the flesh is partly eaten fresh, but the greater portion dried for winter's provision.

The fowling from below has its share of danger. The party goes on the expedition in a boat; and when it has attained the base of the precipice, one of the most daring having fastened a rope about his waist, and furnished himself with a long pole with an iron hook at one end, either climbs, or is thrust up by his companions, who place a pole under his breech, to the next footing spot he can reach. He, by means of the rope, brings up one of the boat's crew; the rest are drawn up in the same manner, and each is furnished with his rope and fowling staff. They then continue their progress upwards in the same manner, till they arrive at the region of birds; and wander about the face of the cliff in search of them. They then act in pairs; one fastens himself to the end of his associate's rope, and in places where birds have nestled beneath his footing, he permits himself to be lowered down, depending for his security on the strength of his companion, who has to haul him up again: but it sometimes happens that the person above is overpowered by the weight, and both inevitably perish. They fling the fowl into the boat, which attends their motions, and receives the booty. They often pass seven or eight days in this tremendous employ, and lodge in the crannies which they find in the face of the precipice.

Plate XC. fig. 1. In some remote parts of Russia there is practised a singular invention for taking great quantities of gelinottes or grous. They choose the most open places in the birch woods; and there they plant long forks in the earth opposite the larger trees. On these forks is laid a horizontal stick, gallows-wise, to which are tied small bundles of ears of corn. At a small distance from this part of the contrivance, is a kind of large funnel or inverted cone, made with long birch twigs, thin and flexible, the lower extremities of which are stuck in the earth, very near to one another; but by spreading towards the top, forms there an opening of above a yard in diameter. In this opening is placed a wheel made of two circles that intersect each other, and are surrounded with straw and ears of corn. This wheel turns on an axis fastened to the side of the funnel, in such a manner, that there is room enough between the sticks of the cone and the circles to admit of the wheel's turning freely about. The birds first perch upon the transverse stick near the tree; and when they have a mind to fall upon the corn tied to the wheel, they must necessarily stand upon one of the projecting parts of the circles of which it is composed. At that instant the wheel turns, and the gelinotte falls, head foremost, to the bottom of the trap, which is there so contracted that he cannot get out. They sometimes find the machine half full of gelinottes.

The following method of netting or catching of wild pigeons is eagerly pursued as a diversion in different parts of Italy, particularly by the inhabitants of Cava in the Hither Principato, and is thus described by Mr Swinburne. The people "assemble in parties; and if any stranger chances to stray to their rendezvous, they give him a most cordial welcome. I am not in the least surprised (says Mr Swinburne) at their passionate fondness for this sport, as I found it extremely bewitching, keeping the attention constantly alive, and the springs of the mind pleasingly agitated by expectation; the situations where the toils are spread are incomparably beautiful, the air is pure and balsamic, and every thing around breathes health and satisfaction. When the periodical flights of stock-doves return from the northern and western parts of Europe to gain warmer regions for their winter abode, the fowler repairs to the mountain, and spreads his nets across the intermediate hollows, the passes through which the birds direct their course, to avoid unnecessary elevation in their flight. These nets are hung upon a row of large trees planted for the purpose. The branches being very thick and close at top, and the pole lofty and bare, a great opening is left below for the toils, which reach to the ground; and, by means of pulleys, fall in a heap with the least effort. Sometimes they are extended upon poles that exceed the height of the trees. At a small distance is a lofty circular turret, like a column with a little capital or cap, upon which a man is stationed to watch the approach of the game. As he commands a free view over all the country, and practice has made his sight acute as that of the lynx, he descries the birds at a wonderful distance. The doves advance with great velocity; but the alert watchman is prepared for them; and just as they approach his post, hurls a stone above them with a sling: upon this the whole flock, whose fears have birds of prey for their great object, supposing the stone to be an enemy of that kind ready to pounce them, dart down like lightning to avoid the blow by passing under the trees; but there they rush into the jaws of death, by dashing against the net, which instantly drops, and so entangles them that not one of them can escape the active hands of the fowler. These birds are sometimes taken by dozens at one fall, and are accounted fine eating. The dexterity with which the slingers manage their weapon is very remarkable; they throw the stone to a great height without any violent effort, and even without whirling the sling round before they discharge the pellet. In the Pyrenean mountains, where the same diversion is followed, the watchmen use a bow and arrow, trimmed with the feathers of a hawk."

The following simple but ingenious method of catching aquatic birds is used in Mexico by the natives. The lakes of the Mexican vale, as well as others of the kingdom, are frequented by a prodigious number of ducks, geese, and other water-birds. The Mexicans leave some empty gourds to float upon the water, where those birds resort, that they may be accustomed to see and approach them without fear. The bird-catcher goes into the water so deep as to hide his body, and covers his head with a gourd; the ducks come to peck at it; and then he pulls them by the feet under water; and in this manner secures as many as he pleases.

Bird-Lime, a viscid substance, prepared after different ways. The most common bird-lime among us is made from holly-bark, boiled ten or twelve hours; when the green coat being separated from the other, it is covered up a fortnight in a moist place; then pounded into a tough paste, so that no fibres of the wood are discernible, and washed in a running stream till no motes appear; put up to ferment four or five days,

skimmed

Bird-Lime. skimmed as often as any thing arises, and laid up for use. To use it, a third part of nut-oil, or thin grease, must be incorporated with it over the fire.

The juice of holly-bark is a very peculiar substance. But if trials were made, it seems probable, that many other juices would be found to have the same clammy nature. The misletoe affords a juice even superior to that of the holly; and if a young shoot of the common alder be cut through, there will a stringy juice draw out in threads, and follow the knife like bird-lime or the juice of the holly. It seems in this tree to be lodged, not in the bark, but in certain veins just within the circle of the wood. The roots of all the hyacinths also afford a tough and stringy juice of the same kind; and so does the asphodel, the narcissus, and the black bryony root, in a surprising quantity.

When twigs, &c. smeared with bird-lime, are to be put in places subject to wet, the common bird-lime is apt to have its force soon taken away. It is necessary, therefore, to have recourse to a particular sort, which, from its property of bearing water unhurt, is called *water bird-lime;* and is prepared thus: Take a pound of strong and good bird-lime; wash it thoroughly in spring-water, till the hardness is all removed; and then beat it well, that the water may be clean separated, so as not a drop remains; then dry it well, and put it into an earthen pot; add to it as much capon's grease as will make it run. Then add two spoonfuls of strong vinegar, one spoonful of oil, and a small quantity of Venice turpentine. Let the whole boil for some minutes over a moderate fire, stirring it all the time. Then take it off: and when there is occasion to use it, warm it, and cover the sticks well with it. This is the best sort of bird-lime for snipes and other birds that love wet places.

The most successful method of using the common bird-lime is this: Cut down the main branch or bough of any bushy tree whose twigs are thick, straight, long, and smooth, and have neither knots nor prickles. The willow and the birch-tree afford the best of this kind. Let all the superfluous shoots be trimmed off, and the twigs all made neat and clean; they must all be well covered with the bird-lime, within four inches of the bottom; but the main bough from which they grow must not be touched with the lime. No part of the bark, where the lime should come, must be left bare: but it is a nice matter to lay it on properly; for if it be too thick it will give the birds a distaste, and they will not come near it; and if there be too little of it, it will not hold them when they are there. When the bush is thus prepared, it must be set up in some dead hedge, or among some growing bushes near the outskirts of a town, a farmer's back-yard, or the like, if it be in the spring; for these places are the resort of the small birds at that time. If it be used in summer, the bush must be placed in the midst of a quickset hedge, or in groves, bushes, or white thorn trees, near fields of corn, hemp, flax, and the like; and in the winter, the proper places are about stacks of corn, hovels, barns, and the like. When the lime-bush is thus planted, the sportsman must stand as near it as he can without being discovered; and with the mouth, or otherwise, make such sorts of notes as the birds do when they attack or call to one another. There are bird-calls to be bought for this use; but the most expert method is to learn the notes of call of the several birds, and imitate them by a sort of whistling. When one bird is thus enticed to the bush, and hung fast, the business of the sportsman is not to run up to take it, but to be patient; for it will hang itself more fast by its struggling to get away; and its fluttering will bring more to the bush, so that several may be taken together. The time of the day for this sport is from sunrise to ten o'clock, and from one to sunset. Another very good method of bringing the birds together, is by a stale: a bat makes a very good stale; but it must be fastened, so as to be in sight at a distance. An owl is a still better stale; for this bird never goes abroad but it is followed by all the small birds in the neighbourhood. They will gather together in great numbers about it; and having no convenient place to sit on but the lime-bush, will be taken in great numbers. If a living owl or bat is not to be had, the skin stuffed will serve the purpose, and will last twenty years. Some have used the image of an owl carved in wood, and painted in the natural colours; and it has been found to succeed very well.

Divination by BIRDS. See AUGURY.

Migration of BIRDS. } See ORNITHOLOGY *Index*.
Nidification of BIRDS. }

Singing BIRDS are, the nightingale, blackbird, starling, thrush, linnet, lark, throstle, Canary-bird, bulfinch, goldfinch, &c. See some very curious experiments and observations on the singing of birds, Phil. Trans. vol. lxiii. part ii. N° 31. Their first sound is called *chirp*, which is a single sound repeated at short intervals; the next *call*, which is a repetition of one and the same note; and the third sound is called *recording*, which a young bird continues to do for ten or eleven months, till he is able to execute every part of his song; and when he is perfect in his lesson, he is said to *sing his song round*. Their notes are no more innate than language in man; they all sing in the same key. The honourable author Daines Barrington has there attempted to reduce their comparative merits to a scale; and to explain how they first came to have particular notes. See *Song of Birds*, ORNITHOLOGY *Index*.

Methods of preserving BIRDS. See ORNITHOLOGY *Index*.

BIRDS, in *Heraldry*, according to their several kinds, represent either the contemplative or active live. They are the emblems of liberty, expedition, readiness, swiftness, and fear. They are more honourable bearings than fishes, because they participate more of air and fire, the two noblest and highest elements, than of earth and water. Birds must be borne in coat-armour, as is best fitting the propriety of their natural actions of going, sitting, standing, flying, &c. Birds that are either whole-footed, or have their feet divided, and yet have no talons, are said to be *membered;* but the cock, and all birds of prey with sharp and hooked beaks and talons for encounter or defence, are termed *armed*. In the blazoning of birds, if their wings be not displayed, they are said to be borne close; as, *he beareth an eagle*, &c. close.

BIRDS-Nests, in *Cookery*, the nest of a small Indian swallow *, very delicately tasted, and frequently mixed among soups. On the sea-coasts of China, at certain seasons of the year, there are seen vast numbers of these birds;

* See B[...]rundo.

Digitized by Google

birds; they leave the inland country at their breeding-time, and come to build in the rocks, and fashion their nests out of a matter which they find on the shore, washed thither by the waves. The nature of this substance is scarcely yet ascertained. According to Kempfer, it is mollusccæ or sea-worms; according to M. le Poivre, fish-spawn; according to Dalrymple, sea-weeds; and, according to Linnæus, it is the animal substance frequently found on the beach, which fishermen call *blubbers* or *jellies*. The nests are of a hemispheric figure, and of the size of a goose's egg, and in substance much resemble the ichthyocolla or *isinglass*. The Chinese gather these nests, and sell them to all parts of the world; they dissolve in broths, &c. and make a kind of jelly of a very delicious flavour.

These nests (Mr Marsden informs us) are found in great abundance in the island of Sumatra, particularly about Croe, near the south end of the island. Four miles up the river of that name is a large cave, where the birds build in vast numbers. The nests are distinguished into white and black; of which the first are by far the more scarce and valuable, being found in the proportion of one only to twenty-five. "The white sort (says Mr Marsden) sells in China at the rate of 1000 to 1500 Spanish dollars the pecul; the black is usually disposed of at Batavia for about 20 dollars the same weight, where it is chiefly converted into glue, of which it makes a very superior kind. The difference between the two has by some been supposed to be owing to the mixture of the feathers of the birds with the viscous substance of which the nests are formed; and this they deduce from the experiment of steeping the black nests for a short time in hot water, when they are said to become in a great degree white. Among the natives I have heard a few assert that they are the work of a different species of bird. It was suggested to me, that the white might probably be the recent nests in which they were taken; and the black, such as have been used for a number of years successively. This opinion appearing plausible, I was particular in my inquiries as to that point, and learned what seemed much to corroborate it. When the natives prepare to take the nests, they enter the caves with torches, and forming ladders according to the usual mode, of a single bamboo, notched, they ascend and pull down the nests, which adhere in numbers together, from the side and top of the rock. They informed me, that the more frequently and regularly the cave is stripped, the greater proportion of white nests they are sure to find, and that on this experience they often make a practice of beating down and destroying the old nests in larger quantities than they trouble themselves to carry away, in order that they may find white nests the next season in their room. The birds, during the building time, are seen in large flocks on the beach, collecting in their bills the foam which is thrown up by the surf, of which there is little doubt but they construct their nests, after it has undergone perhaps a preparation, from a commixture with their saliva, or other secretion with which nature has provided them for that purpose."

BIREMIS, in Roman antiquity, a vessel with two rows of oars; concerning the disposition of which authors are not agreed.

BIRETUM, or BIRRETUM, a sort of black bonnet, or covering of the head, in form of a pyramid, much used in Italy and France, about 500 or 600 years ago, as a badge of victory, honour, or sacerdotal preferment.

BIRKENHEAD, or BERKENHEAD, SIR JOHN, a famous political author, was born about the year 1615. Being recommended to Dr William Laud archbishop of Canterbury, he became his secretary; in which office he showed such capacity and diligence, that the archbishop, by his diploma, created him master of arts in 1639; and in the year following, by letter commendatory from the same prelate, he was chosen probationer fellow of All-Soul's College. This obliged him to reside constantly at Oxford; and on King Charles I.'s making that city his head-quarters during the civil war, our author was made choice of to write a kind of journal in defence of the royal cause, by which he gained great reputation. By his majesty's recommendation, he was chosen reader in moral philosophy; which employment he enjoyed till 1648, when he was expelled by the parliament visitors. He retired afterwards to London, where he wrote several poetical pieces; and having adhered steadily to his principles, he acquired the title of the *loyal poet*, and suffered several imprisonments. He published, while he thus lived in obscurity, some very satirical compositions, mostly levelled against the republican grandees, and written with great poignancy. Upon the restoration of King Charles II. our author was rewarded for his loyalty. He was created, April 16. 1661, on the king's letters sent for that purpose, doctor of the civil law by the university of Oxford; and in that quality, as an eminent civilian, was consulted by the convocation on the question, Whether bishops ought to be present in capital cases? He was about the same time elected to serve in parliament for Wilton in the county of Wilts. He was knighted November 14. 1662; and upon Sir Richard Fanshaw's going in a public character to the court of Madrid, he was appointed to succeed him as master of requests. He lived afterwards in credit and esteem, and received various favours from the court, which, however, drew upon him some very severe attacks from those who opposed the court. Mr Wood has treated him with great severity; but his memory has been transmitted with honour to posterity by others, particularly by Dryden, Langbaine, and Winstanly. He died in Westminster, December 4. 1679; and was interred in St Martin's in the Fields.

BIRKENFIELD, a thriving village of the Prussian states, in the grand duchy of the Lower Rhine. It is seated near the river Nahe, in E. Long. 7. 9. N. Lat. 49. 35.

BIRMINGHAM, a very large town of Warwickshire in England, situated in W. Long. 1. 35. N. Lat. 52. 30. It is no corporation, being only governed by two constables and two bailiffs; and it is therefore free for any person to come and settle there; which has contributed greatly not only to the increase of the buildings, but also of the trade, which is the most flourishing of any in England for all sorts of iron work, besides many other curious manufactures. The town stands on the side of a hill, nearly in the form of a half-moon. The lower part is filled with the workshops and warehouses of the manufacturers, and consists chiefly of old buildings. The upper part of the town

Birmingham ‖ Birth.

town contains a number of new and regular streets, and a handsome square elegantly built. It has several handsome churches. A theatre was built here in 1792, which cost 14,000l. There is a large and well conducted school on Lancaster's principle, and another on Dr Bell's. There is a charity work-house, a general hospital built in 1766, and a dispensary built in 1808. Including the parishes of Aston and Edgebaston, Birmingham contained 85,753 inhabitants in 1811.

BIRON, Armand de Gontault, Lord of, Marshal of France, and a celebrated general in the 16th century, signalized himself by his valour and conduct in several sieges and battles. He was made grand-master of the artillery in 1569, and nobody dared to assault him at the massacre of St Bartholomew. He was the first who declared for Henry IV. He brought a part of Normandy under his subjection, and dissuaded him from retiring to England or Rochelle. But he was killed by a cannon-ball, at the siege of Epernay, on the 26th of July 1592. He was a very universal scholar: and used to carry a pocket-book, in which he wrote down every thing that appeared remarkable; which gave rise to a proverb very much used at court: When a person happened to say any thing uncommon, they told him, *You have found that in Biron's pocket-book.*

BIROTA, or Birotum, in Roman antiquity, a kind of vehicle, so denominated from its moving upon two wheels. It carried about 200 pound weight, and was drawn by three mules.

BIRRUS, in Roman antiquity, a cloak, made of woollen cloth, worn by the soldiers. Also a robe anciently worn by the priests or bishops.

BIRTH, in *Midwifery*, signifies the same with delivery. See Midwifery.

Birth is also used for a person's descent; and is said to be high or low according to the circumstances of his ancestry.

There is scarcely any truth (Mr Knox observes in his Essays) of which the world has been more frequently reminded by the moralists, than the unreasonableness of that veneration which is paid to birth. They have been told, that virtue alone is true nobility; but though they have acknowledged the assertion to be founded in reason, they have continued, with uniform perseverance, in the same error. The luminous glory of an illustrious ancestor, seems to have diffused a brilliancy over a long line of descendants, too opaque of themselves to emit any original irradiations.

"Gratitude (continues our elegant author), which first raises a benefactor to a distinguished rank in civil honours, is willing to continue its kindness to his immediate offspring. The distinction is rendered hereditary. This predilection for an ancestor soon leads to the accumulation of honours and possessions in his successors; and the incense originally offered because it was deserved, is at last lavished at the shrine of opulence, independently of merit.

"Subordination is, indeed, essential to society. The order of nobles, as hereditary guardians of the laws, is found an useful political establishment; and none seem so well adapted to supply it, as they who have been raised to eminence by their ancestors, and who possess a territorial patrimony in the land which they are to protect. All that is contended for is, that the recommendation of birth may not set aside or depreciate real merit, the praise of learning, and the intrinsic value of virtuous exertions.

Birth.

"It is a remarkable circumstance in the history of mankind, that some of the best books have been written, and some of the greatest achievements performed, by those whose origin was truly plebeian. The politest and genteelest books, whether the sentiments or the style be considered, have been produced by slaves, or the descendants of slaves. Horace, Phædrus, and Terence, wrote in a style which must have been the standard of a court, to an intercourse with which they were by no means entitled by their extraction. The founders of the most distinguished families emerged from the middle and the lower classes, by the superior vigour of their natural abilities, or by extraordinary efforts, assisted by fortune: and unless the adventitious circumstances of wealth and civil honours can effect a change in the constituent principles of the mind and body, there is certainly no real superiority to be derived in a boasted pedigree of Tudors and Plantagenets. And yet there have appeared flatterers, who have indirectly suggested, that the minds of the nobility seem to be cast in a finer mould, and to have an elegance inherent in their original constitution. According to this hypothesis, we must go on to suppose, that the mind of a commoner exalted to the higher order of senators, catches this elegance by the contagion of invisible effluvia. On his creation he undergoes a kind of new birth, and puts off the exuviæ which encumbered and degraded him in the lower regions. Thus are all the occult perfections of noble blood to be infused by the mandate of a monarch. 'But no,' said Maximilian to a man who asked to be ennobled by him, 'though I can give you riches and a title, I cannot make you noble.'

"In truth, there is many a nobleman, according to the genuine idea of nobility, even at the loom, at the plough, and in the shop; and many more in the middle ranks of mixed society. This genuine idea contains in it generosity, courage, spirit, and benevolence, the qualities of a warm and open heart, totally unconnected with the accidental advantages of riches and honour: and many an English sailor has possessed more of the real hero than a lord of the admiralty.

"If indeed there is any substantial difference in the quality of their blood, the advantage is probably on the side of the inferior classes. Their indigence and their manual employments require temperance and exercise, the best purifiers of the animal juices. But the indolence which wealth excites, and the pleasures which fashionable life admits without restraint, have a natural tendency to vitiate and enfeeble the body as well as the mind: and among the many privileges inherited by him who boasts nobility in his veins, he commonly receives the seeds of the most painful and the impurest diseases. He displays indeed a coronet on his coat of arms, and he has a long pedigree to peruse with secret satisfaction; but he has often a gout or a scrofula, which make him wish to exchange every drop derived from his Norman ancestors, for the pure tide that warms a peasant's bosom.

"The spirit of freedom, moral, mental, and political, which prevails in Britain, precludes that unreasonable

Digitized by Google

sonable attachment to birth, which, in the countries of despotism, tends to elevate the noble to a rank superior to humanity. In our neighbour's land, the region of external elegance united with real meanness, the implicit veneration paid to birth adds to the weight of legal oppression. A Frenchman of the plebeian order attends to a count or a marquis with all the silent submission of idolatry: on the contrary, there is no doubt but that an English gondolier would box with the best lord in the land, if he were affronted by him, without the least regard for his star and ribbon. It would indeed be an additional pleasure to the natural delight of conquest, to have bruised a puny lord. Even the more refined and polished do not idolize illustrious birth. In truth, wealth appears to be the object of more universal veneration. Noble blood and noble titles, without an estate to support them, meet with great compassion indeed, but with little respect; nor is the man who has raised himself to eminence, and who behaves well in it, neglected and despised because he derives no lustre from his forefathers. In a commercial country, where gain is the general object, they who have been most successful in its pursuit will be revered by many, whatever was their origin. In France, where honour is pursued from the monarch to the cleanser of a jakes, the distinction of birth, even with extreme poverty, is enviable. The brother of a marquis would rather starve on a beggarly pension, than pollute himself with a trade by which he might acquire the revenues of a German kingdom. In our land of good sense this folly is losing ground; and the younger brothers of noble houses often think it no disgrace to rival the heir in a princely fortune acquired by honourable merchandise.

"As the world becomes more enlightened, the exorbitant value which has been placed on things not really valuable will decrease. Of all the effects of man's capricious admiration, there are few less rational than the preference of illustrious descent to personal merit, of diseased and degenerate nobility to health, to courage, to learning, and to virtue. Of all the objects of pursuit which are not in our own power, the want of distinguished birth may most easily be dispensed with, by those who possess a solid judgment of that which makes and keeps us happy. There may be some reason to repine at the want of wealth and fame; but he who has derived from his parent health, vigour, and all the powers of perception, need not lament that he is unnoticed at the herald's office.

"It has been observed, that virtue appears more amiable when accompanied with beauty; it may be added, that it is more useful when recommended to the notice of mankind by the distinction of an honourable ancestry. It is then greatly to be wished, that the nobly born would endeavour to deserve the respect which the world pays them with alacrity, by employing their influence to benevolent purposes; to those purposes which can at all times be accomplished, even when the patriotic exertions of the field and cabinet are precluded."

Birth, or *Berth*, the station in which a ship rides at anchor either alone or in a fleet, or the distance between the ship and any adjacent object, comprehending the extent of the space in which she ranges at the length of her cables: as, *she lies in a good birth*, i. e. in a convenient situation, or at a proper distance from the shore and other vessels; and where there is good anchoring ground, and shelter from the violence of the wind and sea.

Birth also signifies the room or apartment where any particular number of the officers and ship's company usually mess and reside. In a ship of war there is commonly one of these between every two guns.

Birth-Day, the anniversary return of the day whereon a person was born. The ancients placed a good deal of religion in the celebration of birth-days, and took omens from thence of the felicity of the coming year. The manner of celebrating birth-days, was by a splendid dress: wearing a sort of rings peculiar to that day: offering sacrifices; the men to their genius, of wine, frankincense; the women to Juno: giving suppers, and treating their friends and clients; who in return made them presents, wrote and sung their panegyrics, and offered vows and good wishes for the frequent happy returns of the same day. The birth-days of emperors were also celebrated with public sports, feasts, vows, and medals struck on the occasion. But the ancients, it is to be observed, had other sorts of birth-days besides the days on which they were born. The day of their adoption was always reputed as a birth-day, and celebrated accordingly. The emperor Adrian, we are told, observed three birth days; viz. the day of his nativity, of his adoption, and of his inauguration. In those times it was held, that men were not born only on those days when they first came into the world, but on those days when they arrived at the chief honours and commands in the commonwealth, e. gr. the consulate. Hence that of Cicero in his oration *ad Quirites*, after his return from exile: *A parentibus, id quod necesse erat, parvus sum procreatus; a vobis natus sum consularis.*

BIRTHWORT. See Aristolochia, Botany *Index*.

BIRVIESCA, a town of Old Castile in Spain, and capital of a small territory called *Bureva*. W. Long. 2. 15. N. Lat. 42. 35.

BIRZA, a town of Poland, in the province of Samogitia. E. Long. 25. 5. N. Lat. 56. 35.

BISA, or Biza, a coin of Pegu, which is current there for half a ducat. It is also a weight used in that kingdom.

BISACCIA, a small handsome town of Italy, in the Ulterior Principato, and in the kingdom of Naples, with a bishop's see. E. Long. 15. 35. N. Lat. 41. 3.

BISACUTA, in middle-age writers, an axe with two edges, or which cuts either way; or a missive weapon pointed at both ends. Walsingham represents the *securis bisacuta* as peculiar to the Scottish nation. See *Battle Axe*.

BISBÆA, a feast celebrated by the Messapii after the pruning of their vines, to obtain of the gods that they might grow again the better. The word is formed from βισβη, used by some for a vine.

BISCARA, a town of Africa in the kingdom of Algiers, seated in the eastern or Levantine government, in E. Long. 5. 50. N. Lat. 35. 10. This city belonged to the province of Zeb in Numidia, which lies south of the kingdom of Labez; but the Algerines, in their annual inroads to carry off slaves, made themselves masters

Biscara, Biscay.

sters of Biscara, in order to facilitate their entrance into the southern provinces. It retains still some remains of the ancient city that gave name to this territory; and hath a garrison to keep the inhabitants in awe, and who usually bring lions, tigers, and other wild beasts for sale to strangers. The city of Algiers is never without a great number of Biscarans, who are employed in the hardest and lowest offices, as cleansing of streets, emptying of vaults, sweeping chimneys, &c.; and when they have got about 10 or 12 crowns by this drudgery, they return to their country, where they are respected as worthy men on account of their money, the inhabitants of this province being almost entirely destitute of coin, and reckoned the most miserable of all the Arabian tribes.

BISCAY, a province of Spain, bounded on the north by the sea called the *Bay of Biscay*, on the south by Old Castile, on the west by Asturias of Santilana, and on the east by the territories of Alava and Guipuscoa. It is in length about seventy-four miles; but the breadth is much less, and very unequal. This country in general is mountainous and barren; but in some places it produces corn, and everywhere a great quantity of apples, oranges, and citrons. They make cyder with the apples, which is their common drink. Besides this, they have wine called *chacolino*, which is pleasant, but will not keep long, and therefore is used instead of small beer. Their valleys produce a little flax, and their hills a great deal of timber for ships. The sea affords them excellent fish of all sorts. The wool that is exported here comes from Old Castile; but their greatest riches are produced by their mines of iron; which metal is extremely good, and is transported to all parts. They have likewise artificers that work in iron; and are, in particular, famous for working swords and knives. Biscay is the country of the ancient Cantabri, so imperfectly subdued by Augustus, and so slightly annexed to the Roman empire. Their mountains have in all ages afforded them temptations and opportunities of withdrawing themselves from every yoke that has been attempted to be imposed upon them. Their language is accounted aboriginal, and unmixed with either Latin, French, or Spanish. It is so totally different from the Castilian, that we seldom meet with any of the peasants that understand one word of Spanish. The Biscayners are stout, brave, and choleric to a proverb. The best sailors in Spain belong to the ports of Biscay, and its mountains produce a very valuable race of soldiers. Their privileges are very extensive, and they watch over them with a jealous eye. They have no bishops in the province, and style the king only *Lord of Biscay*. The men are well-built and active, like all mountaineers. The most singular thing in their dress is the covering of their legs: they wrap a piece of coarse gray or black woollen cloth round them, and fasten it on with many turns of tape. The women are beautiful, tall, light, and merry; their garb is neat and pastoral; their hair falls in long plaits down their backs; and a veil or handkerchief, twisted round in a coquetish manner, serves them for a very becoming head-dress. On Sundays they generally wear white, tied with rose-coloured knots. The population of Biscay in 1788 was only 310,758, of whom 4100 were monks and nuns.

BISCAY, *New*, a province of North America, in the audience of Guadalajara. It has New Mexico on the north, Culiacan on the west, Zacatecas on the south, and Panuca with Florida on the east. It is about 300 miles from east to west, and 360 from north to south. In general it is well watered, fruitful, moderately temperate, and abounds in all sorts of provisions, except the mountains of Topia, which are barren. The original inhabitants are not all brought under subjection, they having four large towns in the morasses, that are of difficult access; for this reason the Spaniards have built three small fortified towns, which are well inhabited, for the defence of their silver mines. The latitude is from 25 to 28 degrees.

Biscay ‖ Bischop.

BISCHOFISHEIM, a town of Germany, in the county of Hanau Munzenberg, and now included in the territory of the free town of Frankfort. It is three miles east of Hanau. E. Long. 9. 2. N. Lat. 50. 5.

BISCHOFF ZELL, a town of Switzerland, in the canton of Thurgau. It is governed by a council, partly Catholic and partly Lutheran; and both denominations hold divine service in the parish church. It was formerly subject to the bishop of Constance. It is seated on the Thur, at the place where the Sitter falls into this river, almost half way between Constance and St Gall. E. Long. 9. 23. N. Lat. 47. 33.

BISCHOP, or BISKOP, JOHN DE, an excellent artist, born at the Hague in 1646. He is spoken of with great commendation as a painter, and his drawings from the great masters are held in the highest estimation by the curious. In these he had succeeded so happily, as to preserve with the greatest exactness the style of the painter whose pictures he copied. But as an engraver he is most generally known; and his works are numerous. They are chiefly etchings, harmonized with the graver; and though slight, yet free, spirited, and pleasing. He gives a richness to the colour, and a roundness to the figures, far beyond what is usually done with the point, so little assisted by the graver. His figures in general are well drawn; but in a mannered, rather than a correct, style. The extremities indeed are not always well marked, or his heads equally expressive or beautiful. It is said of him, that he owed his excellence to his own genius alone, having never studied under any master by whose instruction he might have been benefited. He worked chiefly at Amsterdam, where he died in 1686, aged 40 years.

BISCHOP, *Cornelius*, portrait and history painter, was born at Antwerp in 1630, and was the disciple of Ferdinand Bol. His pencil, his tint of colouring, his style and manner, had a strong resemblance of his master; and by many competent judges he is esteemed not inferior to him in historical subjects as well as in portrait, having been always assiduous to study after nature. A painting by this master, consisting of a few figures by candle light, was so much admired by Louis XIV. that he purchased it at a high price, and placed it in the royal collection; and the king of Denmark admitted his works among those of the best masters. However, notwithstanding the encomiums bestowed on this master by the Flemish writers, an impartial judge would perhaps think his compositions but heavy and without expression, and his works in general not worthy of all that commendation which is lavished upon them. He died in 1674.

BISCHOP, *Abraham*, son of Cornelius Bischop, was instructed

Digitized by Google

instructed by his father to design historical subjects and portraits; but preferred the painting of fowl, particularly those of the domestic kind, to any other subjects which were recommended to him. He designed every object after nature, and usually painted in a large size, such as ornamental furniture for grand halls; and every species of fowl was so exactly like nature in its attitude, character, and plumage, that his works were beheld with universal approbation.

BISCHWELLER, a fortress of France in the department of the Lower Rhine. E. Long. 7. 0. N. Lat. 48. 40.

BISCHROMA, in *Music*, the same as our triple quaver. See CHROMA.

BISCUTELLA, BUCKLER-MUSTARD, or *Bastard Mithridate-mustard*. See BOTANY *Index*.

BISEGLIA, a populous town of Italy, in the kingdom of Naples and Terra de Bari, with a bishop's see, seated near the gulf of Venice, in E. Long. 16. 49. N. Lat 41. 18.

BISERRULA. See BOTANY *Index*.

BISERTA, a town of the kingdom of Tunis in Africa, seated on a gulf of the same name, in E. Long. 10. 40. N. Lat. 37. 20. The gulf is a very large one, and the *Sinus Hipponensis* of the ancients. It is formed by the Capes Blanco and Ziebeb; and has a beautiful sandy inlet near four leagues wide, which once admitted the largest vessels, but through the negligence of the Turks can now admit only those of the smallest size, and is in danger in a short time of being totally choked up. Some remains of the great pier of Hippo are still extant; by which it appears to have run out into the sea so as to break the north-east wind, and make this one of the safest and most beautiful havens in these parts. On the south, this gulf hath a communication with a lake of the same name, so as to form a kind of canal between it and the Mediterranean sea. Through this canal a constant stream is observed alternately discharging itself from the sea to the lake, and from the lake to the sea, in the same manner as the Atlantic ocean is observed to do in the Mediterranean, and back again; so that what the lake loses by exhalations is soon recruited by the sea, which in hot seasons runs into it with a very brisk current to keep up the equilibrium. The millets of this lake are the best in Barbary; great quantities of their roes, dried and made into BOTARGO, are sent from hence into the Levant, where they are accounted a great dainty. The town was formerly very considerable; and, though not above a mile in circuit, is said to have contained 6000 houses; whereas both it and the villages under it now scarcely contain that number of inhabitants. It has still, however, some strong castles and batteries to defend it, especially towards the sea. There are also two very capacious prisons for slaves, a large magazine or warehouse for merchandise, and two towers with some other works to defend the entrance of the haven. The city, though so near the sea, is well supplied with fresh water from springs that surround it on every side towards the land. It is likewise well furnished with variety of fish from the adjacent lake. Most of the inhabitants of Biserta, as well as of the adjacent country on both sides of the canal, are employed in the fishing trade, which begins about the end of October, and ends in the beginning of May; for the rains then sweetening the waters, make the fish come into it in vast quantities during that season; but afterwards they either disappear, or grow lean, dry, and unfit to eat. The people here are extremely poor; yet very proud, ill-natured, and faithless; insomuch that Muley Hasun Bey, one of their sovereigns, used to say, that none of his subjects deserved his resentment so much as they, since neither fear nor love could keep them faithful.—Biserta hath about eight villages under its government; a large plain called *Matter* or *Mater;* and the territory of Choros, the *Clypea* or *Corobis* of the ancients. This is a tract of great extent, and would be very fertile were it not for the frequent incursions of the Arabs. The people are very poor, live meanly, and go worse clad. Their choicest dainty is their couscou, a kind of cake, made of flour, eggs, and salt, which they dry and keep all the year round. Their dress is nothing else than a piece of coarse cloth wrapped round their bodies, and another round their heads by way of a turban; and most of them go barefooted and barelegged. The poorer sort have nothing but a few skins laid on the floor to sleep upon; but the rich have narrow couches fixed against the wall, about five or six feet high, to which they mount by a ladder. They are very expert horsemen, as most in these countries are, and ride without saddle or bridle; nor do they ever shoe their horses. They are still more miserable from the neighbourhood of the Arabs, who living altogether by plunder, robbery, and murder, oppress the poor inhabitants with their frequent inroads and cruel exactions. The Bisertines, both of the city and country, are the most superstitious people in Barbary, scarcely going anywhere without hanging a quantity of amulets about their own, or, if they ride, their horse's neck also. Their amulets are only scraps of parchment or paper, with some strange characters written upon them, which they sew up in a piece of leather, silk, &c. and imagine when worn about them to be a preservative against all accidents.

BISET, CHARLES EMANUEL, a painter of considerable eminence, was born at Mechlin in 1633; and even in his early productions showed a lively and ready invention. He was remarkable for introducing a multitude of figures into his designs, with an extraordinary variety of drapery peculiar to every nation. His general subjects were conversations, balls, concerts, and assemblies of gay and genteel persons, which were correctly designed and well coloured; though their actions and attitudes were sometimes very indelicate. His pictures had a strong effect at a distance; yet when they were more nearly inspected, they showed a neatness of pencil, a spirited touch, and a good expression.

BISHOP, a prelate or person consecrated for the spirtual government and direction of a diocese. The word comes from the Saxon *bischop*, and that from the Greek ἐπισκοπος, an *overseer* or *inspector:* which was a title the Athenians gave to those whom they sent into the provinces subject to them, to see whether every thing was kept in order; and the Romans gave the same title to those who were inspectors and visitors of the bread and provision. It appears from a letter of Cicero, that he himself had a bishopric; being *episcopus Oræ et Campaniæ*.

A bishop differs from an archbishop in the following particulars: That an archbishop with bishops consecrate a bishop, as a bishop with priests ordain a priest; that

Digitized by Google

Bishop. that the archbishop visits a province as the bishop a diocese; that the archbishop convocates a provincial synod as the bishop a diocesan one; and that the archbishop has canonical authority over all the bishops of his province, as the bishop over the priests in his diocese. It is a long time since bishops have been distinguished from mere priests or presbyters; but whether that distinction be of divine or human right, whether it was settled in the apostolical age or introduced since, is much controverted. But whether the apostles settled any thing of this kind themselves, or whether they left the spiritual economy in the hands of the presbyters, or of those together with the people, it appears that in a little time the functions of the priesthood were divided, and the priests distinguished into degrees; the political part of religion being, according to some, assigned principally to bishops, and the evangelical to the priests, &c. Or, according to others, the functions of teaching and preaching were reserved to the bishop, and that of ordination superadded; which was their principal distinction, and the mark of their sovereignty in their diocese.

By the ancient discipline, bishops were to be married once, and not to put away their wives on pretence of religion; but a second marriage was a disqualification for this order. If they lived chaste, they were ranked as confessors. Some bishops, in the middle age, on account of their *regalia* or temporalities, were obliged to a military service called *hostis*, by which they were to lead their vassals into the field, and attend the king in his military expeditions. This Charlemagne excused, and even forbade: but the prohibition was little regarded; since we find the thing often practised afterwards.

The election of bishops was anciently placed in the clergy, and the people of the parish, province, or diocese; but afterwards, princes and magistrates, patriarchs and popes, usurped the power. The election was to be within three months after the vacancy of the see; and the person to be chosen out of the clergy of that church. Formerly the bishop claimed a share in the election of an archbishop: but this was set aside by the popes.

In England, during the Saxon times, all ecclesiastical dignities were conferred by the king in parliament. At length, however, after several contests, especially between Archbishop Anselm and Henry I. in consequence of a grant of King John, recognized in Magna Charta, and established by stat. 25 Edw. III. stat. 6. § 3. bishops were elected by the chapters of monks or canons, some shadow of which still remains in the present method of disposing of bishoprics; but by stat. 25 Henry VIII. cap. 20. the right of nomination was restored to the crown.

Ordinarily at least three bishops are required in the ceremony of consecrating a bishop; but in some cases a single one might suffice. The English succession of Protestant bishops stands on this last ground. In England, the king being certified of the death of a bishop by the dean and chapter, and his leave requested to elect another, the *conge d'elire* is sent to them, with a letter missive, nominating the person whom he would have chosen. The election is to be within twelve days after the receipt of it, otherwise the king by letters patent appoints whom he pleases; and the chapter, in case of refusing the person named by the king, incurs a *præmunire*. After election, and its being accepted of the bishop, the king grants a mandate under the great seal for confirmation; which the bishop consigns to his vicar-general; consisting mostly in a solemn citation of such as have any objections to the bishop elect, a declaration of their contumacy in not appearing, and an administration of the oaths of allegiance and supremacy, of simony, and canonical obedience. Sentence being read by the vicar-general, the bishop is installed in the province of Canterbury by the archdeacon; the fact is recorded by a public notary; and the bishop is invested with full powers to exercise all spiritual jurisdictions, though he cannot sue for his temporalities till after consecration. Then follows the consecration by the archbishop or some other bishop appointed by lawful commissions, and two assistant bishops: the ceremony of which is much the same as in the Romish church, save that having put on the episcopal robes, the archbishop and bishops lay their hands on the new prelate's head, and consecrate him with a certain form of words. The process of the translation of a bishop to another bishopric only differs in this, that there is no consecration. The age of a bishop is to be at least thirty years; and by the ancient discipline, none were to be chosen but those who had passed through all the inferior orders; but in some cases of necessity this was dispensed with, and deacons, nay laymen, were raised *per saltum* to the episcopal dignity.

The form of consecrating a bishop is different in different churches. In the Greek church, the bishop elect being by the assistant bishops presented for consecration, and the instrument of election put in his hand; after several prayers (the first called *diaconicum*) demanding consecration, makes profession of his faith; after which he receives a benediction. He is then interrogated as to the belief of the Trinity; to which he answers by a *long profession of faith*, and receives a second benediction. Lastly, he is asked what he thinks of the *incarnation*; to which he answers in a *third profession of faith*; which is followed by a third benediction; after which the consecrator gives him the pastoral staff: then he is led up to the altar; where, after certain prayers, and three crosses on his head, he receives the *pallium*, if he be an archbishop or patriarch; he then receives the kiss of peace of his consecrator and two assistants; and sitting down, reads, prays, and gives the communion to his consecrators and others.

In the Romish church, the bishop elect being presented by the elder assistant to the consecrator, takes the oath: he is then examined as to his faith: and after several prayers, the New Testament is drawn over his head, and he receives the chrism or unction on his head. The pastoral staff, ring, and gospel, are then given him; and after communion, the mitre is put on his head; each ceremony being accompanied with proper prayers, &c. the consecration ends with *Te Deum*. These last-mentioned ceremonies are laid aside in the consecration of English bishops. Nevertheless, the book of consecration set forth in the time of Edward VI. and confirmed by act of parliament, in which some of them are enjoined, is declared to be the standard for this purpose by the thirty-sixth article.

The function of a bishop in England may be considered

Digitized by Google

sidered as twofold, viz. what belongs to his order, and what belongs to his jurisdiction. To the episcopal order belong the ceremonies of dedication, confirmation, and ordination; to the episcopal jurisdiction, by the statute law, belong the licensing of physicians, chirurgeons, and schoolmasters, the uniting small parishes (though this last privilege is now peculiar to the bishop of Norwich), assisting the civil magistrate in the execution of statutes relating to ecclesiastical matters, and compelling the payment of tenths and subsidies due from the clergy. By the common law, the bishop is to certify the judges, touching legitimate and illegitimate births and marriages; and by that and the ecclesiastical law, he is to take care of the probate of wills and granting administrations; to collate to benefices, grant institutions on the presentation of other patrons, command induction, order the collecting and preserving the profits of vacant benefices for the use of the successors, defend the liberties of the church, and visit his diocese once in three years. To the bishop also belong suspension, deprivation, deposition, degradation, and excommunication.

All bishops of England are peers of the realm, except the bishop of Man; and, as such sit and vote in the house of lords; they are barons in a threefold manner, viz. feudal, in regard to the temporalities annexed to their bishoprics; by writ, as being summoned by writ to parliament; and lastly, by patent and creation: accordingly they have the precedence of all other barons, and vote as barons and bishops; and claim all the privileges enjoyed by the temporal lords, excepting that they cannot be tried by their peers, because, in cases of blood, they themselves cannot pass upon the trial, for they are prohibited by the canons of the church (as already observed) to be judges of life and death. They have the title of *Lords and Right Reverend fathers in God.* Besides two archbishops, there are 24 bishops in England: exclusive of the bishop of Sodor and Man, who has no seat in the house of peers. The bishops of London, Durham, and Winchester, take place from the other bishops, who are to rank after them according to their seniority of consecration. —There is now also a bishop in our settlement of Nova Scotia. In Scotland, before the Presbyterian establishment, there were two archbishoprics and 12 bishoprics.

Bishop's Court, an ecclesiastical court, held in the cathedral of each diocese, the judge whereof is the bishop's chancellor, who judges by the civil and canon law; and if the diocese be large, he has his commissaries in remote parts, who hold what they call *consistory courts*, for matters limited to them by their commission.

Bishop and his Clerks, some little islands and rocks on the coast of Pembrokeshire, near St David's in Wales, which are very dangerous to mariners.

Bishop's-Aukland. See Aukland.

Bishop's Castle, a town of Shropshire in England, seated near the river Clun. It is a corporation, sends two members to parliament, and contained 1367 inhabitants in 1811. W. Long. 2. 55. N. Lat. 52. 30.

Bishop's-Stortford, a town of Hertfordshire in England, seated on the side of a hill, in E. Long. 0. 25. N. Lat. 51. 50. It has several good inns, but the streets are not paved. It has a large church, one Presbyterian and one Quaker meeting. Here was formerly a castle called *Weymore Castle*, wherein a garrison was kept. Population in 1811, 2630.

BISHOPING, a term among horse-dealers, to denote the sophistications used to make an old horse appear young, a bad one good, &c.

BISHOPRIC, the district over which a bishop's jurisdiction extends, otherwise called a diocese.

In England there are 24 bishoprics besides that of Sodor and Man; in Ireland 18.

BISI, Bonaventura, a celebrated miniature painter, was born at Bologna, and was a disciple of Lucio Massari. But his sole delight was in miniature painting, and in that way he arrived at great excellence. Instead of working from his own invention, or original design, he employed himself to imitate, in small size, the pictures of Guido, Corregio, Titian, and other great masters, and those he finished with astonishing grace, neatness, and beauty. A great number of the works of this master are in the duke's gallery at Modena, and are highly valued. He died in 1662, his age unknown.

BISIGNANO, a town of Italy, in the kingdom of Naples, and in the Hither Calabria. It hath a strong fort, a bishop's see, and the title of a principality. It is seated on a mountain near the river Boccona, in E. Long. 16. 40. N. Lat. 39. 37.

BISK or Bisque, in cookery, a rich sort of broth or soup, made of pigeons, chickens, force-meat, mutton-gravy, and other ingredients. The word is French, formed, as some think, from *biscocta;* because the bisque, consisting of a diversity of ingredients, needs several repeated coctions to bring it to perfection. There is also a *demi-bisque*, made at a low expence, in which only half the ingredients are used; and a bisque of fish, made of carps minced with their roes and lobsters.

BISKUIT, or Biscuit, a kind of bread prepared by the confectioners, of fine flour, eggs, and sugar, and rose or orange water; or of flower, eggs, and sugar, with aniseeds, and citron peel, baked again and again in the oven, in tin or paper moulds. There are divers sorts of biskuit; as seed-biskuit, fruit-biskuit, long-biskuit, round-biskuit, Naples-biskuit, sponge-biskuit, &c.

Sea-Biskuit is a sort of bread much dried by passing the oven twice, to make it keep for sea-service. For long voyages they bake it four times, and prepare it six months before the embarkation. It will keep good a whole year.

To preserve sea-biskuit from insects, Mr Hales advises to make the fumes of burning brimstone pass through the casks full of bread. Biskuit may be likewise preserved a long time, by keeping it in casks well calked, and lined with tin.

The ancients had their biskuit prepared after the like manner, and for the like use, as the moderns. The Greeks called it ἄρτος δίπυρος, *q. d.* bread put twice to the fire. The Romans give it the name of *panis nauticus*, or *capta.* Pliny denominates it *vetus aut nauticus panis tusus atque iterum coctus.* By which it appears, that after the first baking, they ground or pounded it down again for a second. In some middle-age writers, it is called *paximas, paximus*, and *panis paximatus.* Among the Romans we also meet with a kind of land-biskuit for the camp service, called *buccellatum*, sometimes *expeditionalis annona*, which was baked much; but to make it lighter for carriage, and less liable to corrupt, the coction was continued till the bread was reduced one-fourth of its former weight.

BISKOP. See Bischop.

BISMILLAH, a solemn form used by the Mahometans at the beginning of all their books and other writings, signifying, *In the name of the most merciful God*.

Bismillah is also used among the Arabs as a word of invitation to eat. An Arab prince will frequently sit down to eat in the street before his own door, and call to all that pass, even beggars, in this word, who do not fail to come and sit down to eat with him; for the Arabs are great levellers, and set every body upon a footing with them.

BISMUTH, or Tin-glass, a metal of a reddish or yellowish-white colour and a lamellated texture. See Chemistry and Mineralogy *Index*.

BISNAGAR, formerly a very large and powerful kingdom of Asia, comprehending the kingdoms of Kanara, Messowr, Travankor, Madura, Marava, and Tanjour. It was called *Bisnagar* from its capital city, and took the name of *Narsinga* from one of its rajahs or kings. We know nothing certain concerning this kingdom before the year 1520, when Khrisna Rajah, king of Bisnagar, made war with Adel Khan king of Visiapur, from whom he resolved to take the city of Rachol, situated in the island of Salsette near Goa, which he said had belonged to his ancestors. The king of Bisnagar's army consisted of 733,000 foot, 35,000 horse, 586 elephants with towers on their backs, each of which had four men in it; besides these were 12,000 water-carriers, and the army was followed by 20,000 common women. The city, however, resisted this formidable army for three months; at the end of which, Adel Khan came to its relief with an army of 120,000 foot, 18,000 horse, 150 elephants, and many heavy cannon. In the engagement the king of Bisnagar proved victorious, and almost entirely destroyed the army of Adel Khan, taking from him 4000 horses, 100 elephants, 400 cannon, &c. Soon after he took the city by assault; but consented to restore the booty taken in the former battle, provided Adel Khan consented to come and kiss his foot as the sovereign lord of Kanara. This base condition was accepted, but accidentally prevented from being put in execution. From this time we hear of nothing remarkable till the year 1558, when a Portuguese of the city of *Meliapur* or *St Thomas*, on the coast of Coromandel, persuaded Ramah Rajah, then king of Bisnagar, to march against that place, telling him the plunder would be worth 2,000,000, and that the destruction of Meliapur would be of great service to the images in the pagods which were thrown down by the Christians. The king set out accordingly with an army of 500,000 men; but the inhabitants, instead of preparing for their defence, sent him a present of 4000 ducats. This somewhat appeased him: however, he would not enter the city, but ordered the inhabitants of both sexes, with all their valuable effects, to be brought into his presence; which being done, he found that the value of their whole substance did not exceed 80,000 ducats. On this he ordered the informer to be thrown to the elephants, who tore him in pieces; after which he dismissed the citizens, and restored all their goods so punctually, that only a silver spoon happening to be missing, it was sought for, and returned to the owner. In 1565, the happy state of this kingdom excited the envy of the kings of Dekan: who, having raised an army of 500,000 foot and 50,000 horse, defeated and killed the king of Bisnagar, though at the head of an army almost twice as numerous, and took the royal city itself. They are said to have spent five months in plundering it, although the inhabitants had before carried off 1550 elephants loaded with money and jewels to the amount of upwards of 100,000,000 of gold; besides the royal chair for state days, whose price could not be estimated. The victors, however, found a diamond of the size of an ordinary egg, besides another of a size somewhat inferior, and several other jewels of immense value. Afterwards, however, they were forced to abandon the kingdom, as being too large for them to keep in their hands. From this time the kingdom of Bisnagar remained pretty much unmolested till about the year 1627, when it was subdued by Aurengzebe, second son to Shah Jehan, and hath ever since remained subject to the Great Mogul. In some places of this kingdom, it is said, the roads have great forests of bamboos on each side, which are so thick that it is impossible for a man to pass. These forests are full of monkeys; and what is singular, those on the one side seem to be enemies to those on the other; for if a basket of rice is set down on the road with a parcel of small sticks about it, the monkeys on each side will come out and fall a-fighting with the sticks till one of the parties retreats. This, it is said, is often done by travellers for diversion. They catch the wild elephants here in pitfalls, and then tame them by means of others already tamed. The town of Bisnagar is now in ruins. It is situated in E. Long. 78. 0. N. Lat. 15. 14.

BISNOW, or Bischnou, a sect of the Banians in the East Indies; they call their god Ram-ram, and give him a wife: They adorn his image with golden chains, necklaces of pearls, and all sorts of precious stones. They sing hymns in honour of their god, mixing their devotion with dances and the sound of drums, flagelets, brazen basons, and other instruments. This sect lives wholly upon herbs and pulse, butter and milk. In this sect, the wives do not burn themselves after their husband's death, as is practised by those of the *samarath* sect; but content themselves with a perpetual widowhood.

BISOMUM, or Disomum, in Roman antiquity, a tomb for two dead bodies, or the ashes of two. The ancients frequently buried two, three, or four bodies in the same sepulchre, disposed aside of each other; for it was held an impiety to lay one a-top of another. Hence the sepulchres of the primitive Christians had the words *bisomi*, *trisomi*, *quadrisomi*, &c. inscribed on them, to indicate the number of bodies deposited in them.

BISON, in *Zoology*, the trivial name of a species of bos. See Bos, Mammalia *Index*.

BISQUIT, or Biskuit. See Biskuit.

BISSAGOS, a cluster of islands on the coast of Negroland in Africa, situated between the mouth of the

Digitized by Google

the rivers Gambia and Rio Grande. Their names are *Bulam*, *Cassuabar*, *La Gallinci*, *Cazegut*, *Calacha*, and *Oranguana*, with some other small islands: but the only one which merits a particular description is that of Bulam. Each of these islands is governed by a king of its own; and as all those petty monarchs are quite independent, they frequently make war with each other, yet they always unite against the inhabitants of Bifara, who are their common enemies. They have canoes that carry from 25 to 40 men with their provisions and arms, which are sabres and bows and arrows. The inhabitants are negroes; who are tall, strong, and healthy, though they live only on fish, nuts, and palm-oil; choosing rather to sell the rice, millet, and other grain produced in their country, to the Europeans, than not to gratify their passion for trinkets and ornaments. In general they are idolaters; cruel and savage in their disposition, and when they happen to quarrel, and are disappointed of their revenge, they frequently drown or stab themselves. An attempt was made in 1792 to plant a colony on Bulama, one of these islands, but it entirely failed.

BISSAO, an island on the coast of Africa, a few leagues to the south-east of the river Gambia, and separated from the continent only by the channel of the river Geves. In this island the French have a factory, and there is also a fort belonging to the Portuguese, at both of which a great trade is carried on. The island is about 35 or 40 miles in circumference, having an agreeable prospect to the sea, from which it rises by a gentle ascent on every side to an eminence in the centre of the island. There are however a great many hills inferior in height to that in the middle, and separated by beautiful and fertile valleys divided by little rivulets, which at the same time augment the richness and elegance of the scene. So rich is the soil of Bissao, that wheat and maize spring up to the size of Indian corn, or rather resemble a field covered over with reeds or bamboos. The cattle also are of an extraordinary size, and seem to keep pace with the extravagant growth of the corn. Milk and wine are in the greatest abundance; but the island affords neither hogs nor horses. The former are forbid by the natives to be imported; and something in the soil or climate renders it unfit for the increase of the latter, which never thrive here. The dress of the men of all ranks in Bissao is only a skin fixed to the girdle before and behind. The dress of the married women consists of a cotton petticoat; but virgins go entirely naked, wearing only bracelets of different kinds on their arms and legs. If they are of high quality, their bodies are marked or painted with a variety of hideous forms of snakes and other figures, which, as their colour is jet-black, gives their skins somewhat the appearance of flowered satin. Even the princess royal herself, the eldest daughter of the emperor, is only distinguished from other women by the elegance of those paintings and the richness of her bracelets. One very extraordinary ornament used in this country is a large iron ring with a flat round surface on the outside instead of a stone, upon which the ring changes with a bit of iron, in such a manner as to converse with the greatest facility by means of the different sounds produced; but this kind of language is used only among the polite and the great. All the Bissaons are idolaters, nor has commerce introduced the smallest change in their manners, but their ideas of religion are exceedingly confused. Their chief idol is a little image called *China*, of which the worshippers give very absurd accounts; but, besides this, every man invents a god for himself: trees are held sacred; and if not adored as gods, are worshipped as the residence of some divinity. The government is despotic, the will of the emperor being a law to his people. Of this we have an instance in Bissao, not to be matched in any other country whatever. This is no other than a present which one subject may make of the house and estate of his neighbour to the emperor; and as it is most commonly his majesty's pleasure to accept of such presents, the proprietor dares not resist, but immediately sets about building another house, though even this he cannot do without the prince's leave; and if this should not be readily granted, he must live with his family in the open air till permission to build a new house can be obtained.

BISSAT, Peter, professor of canon law in the university of Bononia, in Italy, was descended from the earls of Fife in Scotland, and born in that county in the reign of James V. He was educated at St Andrews: from thence he removed to Paris; and, having spent some time in that university, proceeded to Bononia, where he commenced doctor of laws, and was afterwards appointed professor of canon law. He continued in that honourable employment several years with great reputation, and died in the year 1568. He is said to have been not only a learned civilian, but an excellent poet, orator, and philosopher. *Patricii Bissatti opera omnia*, viz. *poemata*, *orationes*, *lectiones feriales*, *&c. Lib. de irregularitate*, *&c.* were published at Venice in 1565, 4to.

BISSENPOUR, a small district of the kingdom of Bengal in the East Indies, which has all along preserved its independence. It has been governed time immemorial by a Bramin family of the tribe of Rajahput. Here the purity and equity of the ancient political system of the Indians are found unadulterated. This singular government, the finest and most striking monument in the world, has till now been beheld with too much indifference. We have no remains of ancient nations but brass and marble, which speak only to imagination and conjecture, those uncertain interpreters of manners and customs that no longer exist. Were a philosopher transported to Bissenpour, he would immediately be a witness of the life led by the first inhabitants of India many thousand years ago: he would converse with them; he would trace the progress of this nation, celebrated as it were from its very infancy; he would see the rise of a government which, being founded in happy prejudices, in a simplicity and purity of manners, in the mild temper of the people, and the integrity of the chieftains, has survived those innumerable systems of legislation, which have made only a transitory appearance on the stage of the world with the generations they were designed to torment. More solid and durable than those political structures, which, raised by imposture and enthusiasm, are the scourges of human kind, and are doomed to perish with the foolish opinions that gave them birth, the government of Bissenpour, the offspring of a just attention to order and the laws of nature, has been established and maintained

Digitized by Google

maintained upon unchangeable principles, and has undergone no more alteration than those principles themselves. The singular situation of this country has preserved to the inhabitants their primitive happiness and the gentleness of their character, by securing them from the danger of being conquered, or of imbruing their hands in the blood of their fellow-creatures. Nature has surrounded them with water; and they need only open the sluices of their river to overflow the whole country. The armies sent to subdue them have so frequently been drowned, that the plan of enslaving them has been laid aside; and the projectors of it have thought proper to content themselves with an appearance of submission.

Liberty and property are sacred in Bissenpour. Robbery, either public or private, is never heard of. As soon as any stranger enters the territory, he comes under the protection of the laws, which provide for his security. He is furnished with guides at free cost, who conduct him from place to place, and are answerable for his person and effects. When he changes his conductors, the new ones deliver to those they relieve an attestation of their conduct, which is registered and afterwards sent to the rajah. All the time he remains in the country, he is maintained and conveyed with his merchandise at the expence of the state, unless he desires leave to stay longer than three days in the same place. In that case, he is obliged to defray his own expences; unless he is detained by any disorder, or other unavoidable accident. This beneficence to strangers is the consequence of the warmth with which the citizens enter into each others interests. They are so far from being guilty of an injury to each other, that whoever finds a purse, or other thing of value, hangs it upon the first tree he meets with, and informs the nearest guard, who give notice of it to the public by beat of drum. These maxims of probity are so generally received, that they direct even the operations of government. Out of about 350,000l. on an average it annually receives, without injury to agriculture or trade, what is not wanted to supply the unavoidable expences of the state is laid out in improvements. The rajah is enabled to engage in these humane employments, as he pays the Moguls only what tribute and at what times he thinks proper.

BISSEXTILE, in *Chronology*, a year consisting of 366 days, being the same with our leap-year. See CHRONOLOGY.

BISTI, in commerce, a small coin of Persia: Some say that it is among the current silver coins of Persia, and worth only a little above three farthings of our money; others speak of it again as a money of account.

BISTONIS, in *Ancient Geography*, a lake of Thrace near Abdera, on which dwelt the Bistones: hence *Bistonius Tyrannus* is by Lucan used to denote Diomedes king of Thrace, who fed his horses with human flesh; and *Bistonius turbo*, a wind blowing from Thrace.

BISTORT, or KNOTGRASS. See POLYGONUM, BOTANY *Index*.

BISTOURY, in *Surgery*, an instrument for making incisions, of which there are different kinds; some being of the form of a lancet, others straight and fixed in the handle like a knife, and others crooked with the sharp edge on the inside.

BISTRE, among painters, signifies the burnt oil extracted from the soot of wood.

It is of a brown transparent colour, having much the same effect in water-painting, where alone it is used, as brown pink in oil. Though this colour is extremely serviceable in water-colours, and much valued by those who know and can procure it; yet it is not in general use here, perhaps on account of its not being easily procured of a perfect kind; hardly any of it being good, but what is imported from France. Perhaps the principal reason for this is, that dry beechwood affords the best soot for making it: and it is not easy to procure such here without mixture of the soot of green wood, or other combustibles that deprave it for this purpose: or it is possible that they who have pretended to prepare it, have been ignorant of the proper means; there not being any receipt or directions in books that treat of these matters, from whence they could learn the proper process.

Bistre may, however, be prepared with great ease in the following manner.—Take any quantity of soot, of dry wood, but let it be of beech wherever that can be procured. Put it into water in the proportion of two pounds to a gallon; and boil them half an hour: then after the fluid has stood some little time to settle, but while yet hot, pour off the clearer part from the earthy sediment at the bottom; and if on standing longer it forms another earthy sediment, repeat the same method, but this should be done only while the fluid remains hot: then evaporate the fluid to dryness: and what remains will be good bistre, if the soot was of a proper kind.—The goodness of bistre may be perceived by its warm deep brown colour, and transparency when moistened with water.

BISTRICZ, a handsome strong town of Transilvania, seated on a river of the same name, in E. Long. 25. 3. N. Lat. 47. 33.

BIT, or BITT, an essential part of a bridle. Its kinds are various. 1. The musrol, snaffle, or watering-bit. 2. The canon-mouth, jointed in the middle. 3. The canon with a fast mouth, all of a piece, only kneed in the middle, to form a liberty or space for the tongue; fit for horses too sensible or ticklish, and liable to be continually bearing on the hand. 4. The canon-mouth, with the liberty in form of a pigeon's neck; proper where a horse has too large a tongue. 5. The canon with a port-mouth, and an upset or mounting liberty; where a horse has a good mouth, but large tongue. 6. The scatch-mouth, with an upset; ruder but more secure than a canon-mouth. 7. The canon-mouth with a liberty; proper for a horse with a large tongue and round bars. 8. The masticadour, or slavering bit, &c. The several parts of a snaffle, or curb-bit, are the mouth-piece, the cheeks and eyes, guard of the cheek, head of the cheeks, the port, the welts, the campanel or curb and hook, the bosses, the bolsters and rabbets, the water-chains, the side-bolts and rings, kirbles of the bit or curb, trench, top-rol, flap and jieve. The importation of bits for bridles is now prohibited.

BITS, or *Bitts*, in *Ship-Building*, the name of two great timbers, usually placed abaft the manger, in the ship's ship's loof, through which the cross-piece goes: The use of it is to belay the cable thereto while the ship is at anchor.

BIT is also used in commerce for a piece of coin current in Jamaica, and valued at $7\frac{1}{2}$d.

BITBURGH, a town of the Netherlands, in the duchy of Luxemburg. E. Long. 6. 43. N. Lat. 50. 0.

BITCH, the female of the dog kind. See CANIS.

BITCHE, a town of Lorrain, now in the department of the Moselle, seated at the foot of the mountains near the river Swolbe. E. Long. 7. 44. N. Lat. 49. 5.

BITETO, a town of Italy, in the kingdom of Naples, and in the Terra di Bari. E. Long. 16. 56. N. Lat. 41. 8.

BITHYNIA, an ancient kingdom of Asia, formerly known by the names of *Mysia*, *Mygdonia*, *Babryicia*, *Mariandynia*, and *Bithynia*. It was bounded on the west by the Bosphorus Thracius and part of the Propontis, on the south by the river Rhyndacus and Mount Olympus, on the north by the Euxine sea, and on the east by the river Parthenius. The chief cities were *Myrlea*, *Nicomedia*, *Chalcedon*, *Heraclea*, and *Prusa*.—As to its history, we find nothing of moment recorded; except the infamous conduct of Prusias, one of its kings, in delivering up to the Romans Hannibal, the great Carthaginian general, who fled to him for protection. His great grandson Nicomedes IV. bequeathed the kingdom to the Romans. From them it was taken by the Turks, to whom it still remains subject, but has no modern name.

BITONTO, an episcopal town in Italy, in the kingdom of Naples and Terra di Bari. It is seated in a plain, eight miles south of the gulf of Venice, in E. Long. 16. 52. N. Lat. 41. 13.

BITTACLE. See BINACLE.

BITTER, an epithet given to all bodies of an opposite taste to sweetness. For the medical virtues of bitters, see MATERIA MEDICA.

BITTER, a sea term, signifying any turn of the cable about the bits, so as that the cable may be let out by little and little. And when the ship is stopped by a cable, she is said *to be brought up by a bitter*. Also that end of the cable which is wound about the bits is called *the bitter end of the cable*.

BITTER-Apple. See COLOCYNTHIS, BOTANY *Index*.

BITTER-Salt. See *EPSOM-Salt*.

BITTER-Sweet. See SOLANUM, BOTANY *Index*.

BITTERN. See ARDEA, ORNITHOLOGY *Index*.

BITTERN in the salt works, the brine remaining after the salt is concreted: this they ladle off, that the salt may be taken out of the pan, and afterwards put in again; when, being farther boiled, it yields more salt. See SALT.

BITUMENS, in *Natural History*, are oily matters, of a strong smell, and of different consistencies, which are found in many places within the earth. See CHEMISTRY and MINERALOGY.

BITUMEN JUDAICUM. See ASPHALTUM, MINERALOGY *Index*.

BITUREX, BITURIGES, or *Bituricæ*, afterwards corrupted to *Bourges*; the name of *Avaricum*, from the custom of the lower age of calling towns from the names of the people. See AVARICUM.

BITURIGES (Cæsar); *Bituriges Cubi* (Strabo, Pliny, Ptolemy); a people in that part of Gallia Celtica afterwards assigned to Aquitania. Now called *Berry*.

BITURIGES Vibisci (Ptolemy), a people of Aquitain.

BIVALVES, a term sometimes used for such shells as consist of two pieces.—It is also an appellation given by botanists to such pods or capsules as consist of two valves enclosing the seeds.

BIVENTER, in *Anatomy*, called also *digastric*, or *two-bellied*, a muscle of the lower jaw. See ANATOMY, *Table of the Muscles*.

BIUMBRES, in *Geography*, an appellation given to the inhabitants of the torrid zone, by reason, at two different seasons of the year, their shadows are projected two different ways. The biumbres are the same with those otherwise denominated *amphiscii*.

BIXA, the ROUCOU or *Arnotto Tree*. See BOTANY *Index*.

BIZARRE, denoting *capricious*, &c. a term used among florists for a particular kind of carnation, which has its flowers striped or variegated with three or four colours.

BIZARRO, in the Italian music, denotes a fanciful kind of composition, sometimes fast, slow, soft, strong, &c. according to the fancy of the composer.

BIZOCHI, or BISOCHI, in *Church History*, certain heretical monks, said to have assumed the religious habit contrary to the canons, rejected the sacraments, and maintained other errors.

BLACK, DR JOSEPH, distinguished for his discoveries in chemistry, was born in France, on the banks of the Garonne in the year 1728. His father was a native of Belfast, but descended from a Scotch family who had been some time settled there. Mr Black, the father, was engaged in the wine trade; and for the purpose of carrying it on, he resided chiefly at Bourdeaux.

He is represented as a man of extensive information, of candid and liberal sentiments, and of amiable manners; but particularly distinguished by the strength of his attachments and the warmth of his heart. These amiable and estimable qualities in the character of Mr Black, attracted the attention, and procured the friendship and intimacy of the discerning and benevolent Montesquieu, who was one of the presidents of the court of justice in the province while Mr Black resided at Bourdeaux. Letters and fragments of correspondence between the president and Mr Black are still preserved in the family, as precious relics and memorials of the intercourse, honourable to both, which subsisted between that great man and their ancestor.

Some time before Mr Black retired from business, he sent his son Joseph, then in his twelfth year, to Belfast, on account of his education. And having completed the usual course of instruction in a grammar school, he was sent to the university of Glasgow in the year 1746. During the time which he studied at that seminary, his attention seems to have been chiefly directed to physical science; and he became a favourite pupil of Dr Dick, then professor of natural philosophy. When Dr Black had finished the ordinary course of general study at the university, he made choice of the profession of medicine; and he directed his views to

those

Digitized by Google

Black. those pursuits and studies which were necessary to qualify him for that profession.

It was about this time that Dr Cullen had been appointed to the lectureship of chemistry in the university of Glasgow. Hitherto this science had been only treated as a curious and in some respect a useful art. This great man, conscious of his own strength, and taking a wide and comprehensive view, saw the unoccupied field of philosophical chemistry open before him. He was satisfied that it was susceptible of great improvement by means of liberal inquiry and rational investigation. He was therefore determined to enter the unbeaten path, and to lead his followers to those unexplored regions which are included in the wide ranges of this comprehensive and attractive science. It was at this time that Dr Black became the pupil of Dr Cullen; and it was perhaps to this fortunate coincidence that Dr Black was indebted for the foundation of his future reputation as a philosopher and a chemist. The liberal and extensive views of Cullen happily accorded with the enlarged habits of thought which the young philosopher had previously acquired. Dr Cullen took a deep interest in the progress of his students. He delighted in encouraging and aiding their efforts; and therefore perceiving the bias of Black's pursuits, soon attached him to himself. And by the intercourse and intimacy which followed he was led into the same train of thought, and conducted into the same course of studies. He was received into a closer connexion, and became a valuable assistant in all Dr Cullen's chemical operations. The experiments of Black were frequently adduced to prove facts which were stated in the lecture, and they were considered as good authority. Thus commenced a mutual confidence and friendship which was highly honourable to both, and was never afterwards mentioned by Dr Black but with gratitude and respect.

In the year 1751 Dr Black went to Edinburgh to complete the course of his medical studies. There he resided in the house of his cousin-german, Mr Russel, professor of natural philosophy in that university, a gentleman of enlarged views and liberal sentiments, whose conversation and studies must have been both agreeable and profitable to his young friend.

At this time the mode of action of lithontriptic medicines, but particularly lime-water, in alleviating the pains of stone and gravel, divided the opinions of professors and practitioners. This subject became extremely interesting both to the physician and chemist. And as it is usual for the students to enter warmly into those discussions which give rise to much difference of opinion among the teachers, this subject, quite suited to his taste, particularly attracted and interested the attention of Mr Black, who was then one of Dr Cullen's most zealous and intelligent pupils. It appears from some of his memorandums, that he at first held the opinion that the causticity of alkalies is owing to the igneous matter which they derive from quicklime. But having prosecuted his experiments on magnesia, this grand secret of nature was laid open to his view. This led him to conclude, that the acrimony of these substances was not owing to their combination with igneous particles; that it was their peculiar property; and that they lost this property and became mild, by combining with a certain portion of air, to which he gave the name of *fixed air*; because it was fixed or became solid in the substances in the composition of which it entered.

This grand discovery, which forms one of the most important eras of chemical science, was the subject of his inaugural dissertation, published at the time that he was admitted to his medical degree in the university of Edinburgh. He had not availed himself of the time he had studied at Glasgow, but took the whole course prescribed by the rules of the university. This delay, it has been suppo-ed, may have been owing to the investigation of the subject in which he had engaged not having been completed, which determined him to proceed with caution, till he had established his doctrine by a train of decisive experiments.

About the time that Dr Black obtained his medical degree, Dr Cullen was removed to Edinburgh, which made a vacancy in the chemical chair at Glasgow. While he remained at that university, Dr Black had been a diligent and attentive student; and the discovery published in his inaugural essay had added much to his reputation. He was therefore looked up to as a person amply qualified to fill the vacant chair; and accordingly, in the year 1756, he was appointed professor of anatomy, and lecturer on chemistry in the university of Glasgow. And it was perhaps fortunate for himself, fortunate for the public and for science, that a situation so favourable presented itself, a situation which allowed him full time to dedicate his talents chiefly to the cultivation of chemistry, which had now become his favourite science.

Along with the lectureship on chemistry, Dr Black's first appointment in the university of Glasgow was to the professorship of anatomy. The latter branch of medical study was either not so suitable to his taste, or he did not consider himself so well qualified to be useful in it; for soon after, arrangements were made with the professor of medicine, by which the professors exchanged departments, when Dr Black undertook that of the institutes and practice of medicine.

At this time, his lectures on medicine formed his chief task. And the perspicuity and simplicity, the caution and moderation which he discovered in the doctrines which he delivered, gave great satisfaction. The time and attention which were occupied in these lectures, and in the medical practice in some measure necessarily connected with his situation, are supposed by some to have been the principal cause of Dr Black's having suddenly stopped short in that brilliant career on which he at first so successfully entered. It is, however, more probable, that the calm and unambitious temper which seems to have been a striking feature of his character, and which a less friendly hand than his learned biographer would have set down as nearly allied to indolence, checked the spirit of ardour and perseverance which was necessary to encourage and carry him forward in the path of discovery and research. Whatever may have been the cause, it is to be regretted, that Dr Black, so conspicuous for his patient, judicious, and elegant mode of investigation, and so distinguished for the simplicity, perspicuity, and precision of his reasonings and deductions, should have contributed so little in rearing the noble superstructure of chemical science, the foundation of which he had been the means of establishing on a firm and sold basis.

The

Digitized by Google

The theory of the nature of quicklime, and the cause of its causticity, was soon known to the German chemists, and from them it met with strong opposition. Various mysterious doctrines at this time prevailed in the German schools concerning the peculiar nature of fire. As their notions of the causticity of alkaline substances involved some of these doctrines, a great many objections were started to a theory which threatened to overthrow long established and favourite opinions. The most formidable opponent to the new theory was Professor Meyer of Osnaburgh. All the phenomena of the causticity and mildness of lime and alkalies, were, according to his explanation, to be accounted for, by the action of a substance of a peculiar nature, to which he gave the name of *acidum pingue*. This substance, which was supposed to be formed in the lime during calcination, consisted of an igneous matter in a certain state of combination with other substances. It is a matter of some surprise that Dr Black should have experienced any uneasiness on account of the opposition made to his discovery by mere hypothesis unsupported by facts or even by plausible argument, when his own doctrine had been fully and irrefragably established by the sure test of decisive experiment. Nor is it less surprising, that he should have taken great pains for several years in the course of his lectures, in refuting the arguments and in combating the objections of Meyer to his own theory.

Dr Black's reception at the university of Glasgow was highly flattering and encouraging. As a student, he had not only done himself much credit by his successful progress in the different pursuits in which he was engaged, but he had also during his residence there conciliated the attachment and affection of the professors in a high degree. When he returned as a professor, he was immediately connected in the strictest friendship with Dr Adam Smith, then professor of moral philosophy in that university. And this friendship, which now commenced, grew stronger and stronger, and was never interrupted through the whole of their lives. A simplicity and sensibility, an incorruptible integrity, the strictest delicacy and correctness of manners, marked the character of each of the philosophers, and firmly bound them in the closest union.

At Glasgow, Dr Black soon acquired great reputation as a professor, and became a favourite physician in that large and active city. His engaging countenance, his agreeable and attractive manners, free from all studied endeavours to please, and the kind concern he took in the cases intrusted to his care, made him a most welcome visitor in every family.

It was between the years 1759 and 1763, that he brought to maturity his speculations concerning heat, which had occupied his attention at intervals, from the very first dawn of his philosophical investigations. His discoveries in this department of science were by far the most important of all that he made, and perhaps indeed the most valuable which appeared during the busy period of the 18th century. To enter fully into the nature of his investigations would be improper in this place; but the sum of them all was usually expressed by him in the following propositions.

When a solid body is converted into a fluid, there enters into it and unites with it, a quantity of heat, the presence of which is not indicated by the thermometer, and this combination is the cause of the fluidity which the body assumes. On the other hand, when a fluid body is converted into a solid, a quantity of heat separates from it, the presence of which was not formerly indicated by the thermometer. And this separation is the cause of the solid form which the fluid assumes.

When a liquid body is raised to the boiling temperature, by the continued and copious application of heat, its particles suddenly attract to themselves a great quantity of heat, and by this combination their mutual relation is so changed that they no longer attract each other, but are converted into an elastic fluid like air. On the other hand, when these elastic fluids, either by condensation or by the application of cold bodies, are reconverted into liquids, they give out a vast quantity of heat, the presence of which was not formerly indicated by the thermometer.

Thus water when converted into ice gives out 140° of heat, and ice when converted into water absorbs 140° of heat, and water when converted into steam absorbs about 1000° of heat without becoming sensibly hotter than 212°. Philosophers had been long accustomed to consider the thermometer as the surest method of detecting heat in bodies, yet this instrument gives no indication of the 140° of heat which enter into air when it is converted into water, nor of the 1000° which combine with water when it is converted into steam. Dr Black, therefore, said that the heat is concealed (*latet*) in the water and steam, and he briefly expressed this fact by calling the heat in that case *latent heat*.

Dr Black having established this discovery by simple and decisive experiments, drew up an account of the whole investigation, and read it to a literary society which met every Friday, in the faculty-room of the college, consisting of the members of the university, and several gentlemen of the city who had a relish for philosophy and literature. This was done April 23. 1762, as appears by the registers. This doctrine was immediately applied by its author to the explanation of a vast number of natural phenomena, and in his experimental investigations he was greatly assisted by his two celebrated pupils Mr Watt and Dr Irvine.

As Dr Black never published an account of his doctrine of latent heat, though he detailed it every year subsequent to 1762 in his lectures, which were frequented by men of science from all parts of Europe; it became known only through that channel, and this gave an opportunity to others to pilfer it from him piece-meal. Dr Crawford's ideas respecting the capacity of bodies for heat, were originally derived from Dr Black, who first pointed out the method of investigating that subject.

The investigations of Lavoisier and Laplace concerning heat, published many years after, were obviously borrowed from Dr Black, and indeed consisted in the repetition of the very experiments which he had suggested. Yet these philosophers never mention Dr Black at all: every thing in their dissertation assumes the air of originality; and indeed they appear to have been at great pains to prevent the opinions and discoveries of Dr Black from being known among their countrymen. But perhaps the most extraordinary procedure was that of Mr Deluc; this philosopher had

expressed

Digitized by Google

Black.

expressed his admiration of Dr Black's theory of latent heat, and had offered to become his editor. Dr Black, after much entreaty, at last consented, and the proper information was communicated to Mr Deluc. At last the *Idées sur la Meteorologie* of that philosopher appeared in 1788. But what was the astonishment of Dr Black and his friends, when they found the doctrine claimed by Deluc as his own, and an expression of satisfaction at the knowledge which he had acquired of Dr Black's coincidence with him in opinion! (M. Deluc has published an answer to this charge in his own vindication. See *Edin. Rev.* N° 12. 1805.)

Dr Black continued in the university of Glasgow from 1756 to 1766. In 1766 Dr Cullen was appointed professor of medicine in the university of Edinburgh, and thus a vacancy was made in the chemical chair of that university. Dr Black was with universal consent appointed his successor. In this new scene his talents were more conspicuous, and more extensively useful. He saw this, and while he could not but be highly gratified by the great concourse of pupils which the high reputation of the medical school of Edinburgh brought to his lectures, his mind was forcibly impressed by the importance of his duties as a teacher. This had an effect which perhaps was on the whole rather unfortunate. He directed his whole attention to his lectures, and his object was to make them so plain that they should be adapted to the capacity of the most illiterate of his hearers. The improvement of the science seems to have been laid aside by him altogether. Never did any man succeed more completely. His pupils were not only instructed but delighted. Many became his pupils merely in order to be pleased. This contributed greatly to extend the knowledge of chemistry. It became in Edinburgh a fashionable part of the accomplishment of a gentleman.

Perhaps also the delicacy of his constitution precluded him from exertion; the slightest cold, the most trifling approach to repletion, immediately affected his breast, occasioned feverishness, and if continued for two or three days brought on a spitting of blood. Nothing restored him but relaxation of thought and gentle exercise. The sedentary life to which study confined him was manifestly hurtful, and he never allowed himself to indulge in any intense thinking without finding these complaints sensibly increased.

So completely trammeled was he in this respect, that although his friends saw others disingenuous enough to avail themselves of the novelties announced by Dr Black in his lectures, and therefore repeatedly urged him to publish an account of what he had done, this remained unaccomplished to the last. Dr Black often began the task, but was so nice in his notions of the manner in which it should be executed, that the pains he took in forming a plan of the work, never failed to affect his health, and oblige him to desist. Indeed he peculiarly disliked appearing as an author. His inaugural dissertation was the work of duty. His *Experiments on Magnesia, Quicklime, and other alkaline substances*, was necessary to put what he had indicated in his inaugural dissertations on a proper foundation. His *Observations on the more ready freezing of Water that has been boiled*, published in the Philosophical Transactions for 1774, was also called for; and his *Analysis of the Waters of some Boiling Springs in Iceland*, made at the request of his friend T. I. Stanley, Esq. was read to the Royal Society of Edinburgh, and published by the council. And these are the only works of his which have appeared in print.

The aspect of Dr Black was comely and interesting. His countenance exhibited that pleasing expression of inward satisfaction, which, by giving ease to the beholder, never fails to please. His manner was unaffected and graceful. He was affable, and readily entered into conversation, whether serious or trivial. He was a stranger to none of the elegant accomplishments of life. He had a fine musical ear, with a voice which would obey it in the most perfect manner; for he sung, and performed on the flute, with great taste and feeling, and could sing a plain air at sight, which many instrumental performers cannot do. Without having studied drawing, he had acquired a considerable power of expressing with his pencil, and seemed in this respect to have the talents of a history painter. Figure indeed of every kind attracted his attention. Even a retort, or a crucible, was to his eye an example of beauty or deformity.

He had the strongest claim to the appellation of a man of propriety and correctness. Every thing was done in its proper season, and he ever seemed to have leisure in store. He loved society, and felt himself beloved in it; never did he lose a single friend, except by the stroke of death.

His only apprehension was that of a long continued sick bed, less perhaps from any selfish feeling, than from the consideration of the trouble and distress which it would occasion to attending friends: and never was this generous wish more completely gratified. On the 26th Nov. 1799, and in the 71st year of his age, he expired without any convulsions, shock, or stupor, to announce or retard the approach of death. Being at table with his usual fare, some bread, a few prunes, and a measured quantity of milk diluted with water, and having the cup in his hand, when the last stroke of the pulse was to be given, he set it down on his knees which were joined together, and kept it steady with his hand in the manner of a person perfectly at ease; and in this attitude expired without spilling a drop, and without a writhe in his countenance, as if an experiment had been required to show to his friends the facility with which he departed. His servant opened the door to tell him that some one had left his name; but getting no answer, stepped about half-way towards him, and seeing him sitting in that easy posture, supporting his bason of milk with one hand, he thought that he had dropt asleep, which sometimes happened after his meals. He went back and shut the door, but before he went down stairs, some anxiety which he could not account for, made him return again and look at his master. Even then he was satisfied after coming pretty near him, and turned to go away; but returning again, and coming close up to him, he found him without life. (*Preface to Black's Lect.* by Dr Robison).

BLACK, a well known colour, supposed to be owing to the absence of light, most of the rays falling upon black substances being not reflected but absorbed by them. Concerning the peculiar structure of such bodies as fits them for appearing of this or that particular colour, see COLOUR and DYEING.

Digitized by Google

BLACK-Act; the statute of 9 Geo. I. c. 22. is commonly called the *Waltham black act*, because it was occasioned by the devastations committed near Waltham in Essex, by persons in disguise, or with their faces blacked. By this statute it is enacted, that persons hunting armed and disguised, and killing or stealing deer, or robbing warrens, or stealing fish out of any river, &c. or any persons unlawfully hunting in his majesty's forests, &c. or breaking down the head of any fish-pond, or killing, &c. of cattle, or cutting down trees, or setting fire to house, barn, or wood, or shooting at any person, or sending letters either anonymous or signed with a fictitious name demanding money, &c. or rescuing such offenders, are guilty of felony, without benefit of clergy. This act is made perpetual by 31 Geo. II. c. 42.

BLACK-Bird. See TURDUS, ORNITHOLOGY *Index*.

BLACK-Book of the Exchequer. See EXCHEQUER.

BLACK-Books, a name given to those which treat of necromancy, or, as some call it, *negromancy*. The black-book of the English monasteries was a detail of the scandalous enormities practised in religious houses, compiled by order of the visitors under King Henry VIII. to blacken, and thus hasten their dissolution.

BLACK-Cap. See MOTACILLA, ORNITHOLOGY *Index*.

BLACK-Cock. See TETRAO, ORNITHOLOGY *Index*.

BLACK-Eagle. See FALCO, ORNITHOLOGY *Index*.

BLACK-Eunuchs, in the customs of the eastern nations, are Ethiopians castrated, to whom their princes commonly commit the care of their women. See EUNUCH.

BLACK-Forest, a forest of Germany, in Suabia, running from north to south between Ortnau, Brisgaw, part of the duchy of Wirtemberg, the principality of Fustemburg towards the source of the Danube, as far as the Rhine above Basil. It is part of the ancient Hercynian forest.

BLACK-Friars, a name given to the Dominican order; called also *predicants*, and *preaching friars*; in France, *jacobins*.

BLACK-Jack, or *Blende*, is a mineral also called *false galena*, *blinde*, &c. See BLENDE, MINERALOGY *Index*.

BLACK-Land, in *Agriculture*, a term by which the husbandmen denote a particular sort of clayey soil, which, however, they know more by its other properties than by its colour, which is rarely any thing like a true black, and often but a pale gray. This, however pale when dry, always blackens by means of rains, and when ploughed up at these seasons it sticks to the ploughshares, and the more it is wrought the muddier and duskier coloured it appears, This sort of soil always contains a large quantity of sand, and usually a great number of small white stones.

BLACK-Lead. See PLUMBAGO, MINERALOGY *Index*.

BLACK-Leather, is that which has passed the curriers hands, where, from the russet, as it was left by the tanners, it is become black, by having been scored and rubbed three times on the grain-side with copperas water. See LEATHER.

BLACK-Legs, a name given in Leicestershire to a disease frequent among calves and sheep. It is a kind of jelly which settles in their legs, and often in the neck, between the skin and flesh.

BLACK-Mail, a certain rate of money, corn, cattle, or other matter, anciently paid by the inhabitants of towns in Westmoreland, Cumberland, Northumberland, and Durham, to divers persons inhabiting on or near the borders, being men of name, and allied with others in those parts, known to be great robbers and spoil-takers; in order to be by them freed and protected from any pillage. Prohibited by 43 Eliz. c. 13. The origin of this word is much contested, yet there is ground to hold the word *black* to be here a corruption of blank or white, and consequently to signify a rent paid in a small copper coin called *blanks*. This may receive some light from a phrase still used in Picardy, where speaking of a person who has not a single halfpenny, they say, *il n' a pas une blanque maille*.

BLACK-Monks, a denomination given to the Benedictines, called in Latin *nigri monachi*, or *nigro-monachi*; sometimes *ordo nigrorum*, "the order of blacks."

BLACK-Oats. See OATS.

BLACK-Procession, in ecclesiastical writers, that which is made in black habits, and with black ensigns and ornaments. See PROCESSION. Anciently at Malta there was a black procession every Friday, where the whole clergy walked with their faces covered with a black veil.

BLACK-Rent, the same with black-mail, supposed to be rents formerly paid in provisions and flesh, not in specie.

BLACK-Rod. See ROD.

BLACK-Row Grains, a species of iron-stone or ore found in the mines about Dudley in Staffordshire.

BLACK Sea. See SUPPLEMENT.

BLACK-Sheep, in the oriental history, the ensign or standard of a race of Turcomans settled in Armenia and Mesopotamia; hence called the *dynasty of the black sheep*.

BLACK Stones and *Gems*, according to Dr Woodward, owe their colour to a mixture of tin in their composition.

BLACK-Strakes, a range of planks immediately above the wales in a ship's side. They are always covered with a mixture of tar and lamp black.

BLACK-Tin, in *Mineralogy*, a denomination given to the tin-ore when dressed, stamped, and washed ready for the blowing-house, or to be melted into metal. It is prepared into this state by means of beating and washing; and when it has passed through several buddles or washing troughs, it is taken up in form of a black powder, like fine sand, called *black-tin*.

BLACK-Wadd, in *Mineralogy*, a kind of ore of manganese, remarkable for its property of taking fire when mixed with linseed oil in a certain proportion. It is found in Derbyshire, and is used as a drying ingredient in paints; for when ground with a large quantity of oily matter it loses the property above mentioned. See MANGANESE, MINERALOGY *Index*.

BLACK-Water, the name of two rivers in Ireland; one of which runs through the counties of Cork and Waterford, and falls into Youghal bay; and the other, after watering the county of Armagh, falls into Lough Neagh.

BLACK-Whytlof, in our old writers, bread of a middle fineness betwixt white and brown, called in some parts *ravel-bread*. In religious houses, it was the bread made

Digitized by Google

made for ordinary guests, and distinguished from their household loaf, or *panis conventualis*, which was pure manchet, or white bread.

Black-Work, iron wrought by the blacksmiths; thus called by way of opposition to that wrought by white-smiths.

BLACKALL, Dr Offspring, bishop of Exeter in the beginning of the 18th century, was born at London in 1654, and educated at Catharine-Hall, Cambridge. For two years he refused to take the oath of allegiance to King William and Queen Mary, but at last submitted to the government, though he seemed to condemn the Revolution, and all that had been done pursuant to it. He was a man of great piety, had much primitive simplicity and integrity, and a constant evenness of mind. In a sermon before the house of commons, January 30. 1699, he animadverted on Toland's assertion in his life of Milton, that Charles I. was not the writer of the *Icon Basilike*, and for some insinuations against the authenticity of the Holy Scriptures; which produced a controversy between him and that author. In 1700, he preached a course of sermons in St Paul's at Boyle's lecture, which were afterwards published; and was consecrated bishop of Exeter in 1707. He died at Exeter in 1716, and was interred in the cathedral there.

BLACKBANK, a town of Ireland, in the county of Armagh and province of Ulster, seated in W. Long. 6. 55. N. Lat. 54. 12.

BLACKBERRY, See Rubus, Botany *Index*.

BLACKBURN, a town of Lancashire in England, seated near the river Derwent. It takes its name from the brook Blackwater which runs through it. W. Long. 2. 15. N. Lat. 53. 40.

BLACKING is sometimes used for a factitious black; as lamp-black, shoe-black, &c. A mixture of ivory or lamp-black with linseed-oil makes the common oil blacking. For a shining blacking, small-beer or water is used instead of oil, in the proportion of about a pint to an ounce of the ivory-black, with the addition of half an ounce of brown sugar, and as much gum arabic. The white of an egg substituted for the gum makes the black more shining; but is supposed to hurt the leather, and make it apt to crack.

BLACKLOCK, Dr Thomas, a clergyman, was born at Annan in the south of Scotland in the year 1721. His father was a bricklayer; but though in this humble sphere of life, was of a respectable character, and not deficient in knowledge and urbanity. The son was not quite six months old when he lost his eyesight in the smallpox. This misfortune rendered him incapable of learning any of the mechanical arts; and therefore his father kept him at home, and with the assistance of some friends fostered that inclination which, at a very early period, he showed for books. This was done by reading to him first the simple sort of publications which are commonly put into the hands of children, and then several of our best authors, such as Milton, Spenser, Prior, Pope, and Addison. His companions, whom his early gentleness and kindness of disposition, as well as their compassion for his misfortune, strongly attached to him, were very assiduous in their good offices, in reading to instruct and amuse him. By their assistance he acquired some knowledge of the Latin tongue, but he never was at a grammar-school till at a more advanced period of life. Poetry was even then his favourite reading; and he found an enthusiastic delight in the works of the best English poets, and in those of his countryman Allan Ramsay. Even at an age so early as twelve he began to write poems, one of which is preserved in the collection that was published after his death, and is not perhaps inferior to any of the premature compositions of boys assisted by the best education, which are only recalled into notice by the future fame of their authors.

He had attained the age of nineteen when his father was killed by the accidental fall of a malt-kiln belonging to his son-in-law. This loss, heavy to any one at that early age, would have been, however, to a young man possessing the ordinary means of support, and the ordinary advantages of education, comparatively light; but to him—thus suddenly deprived of that support on which his youth had leaned—destitute almost of every resource which industry affords to those who have the blessings of sight—with a body feeble and delicate from nature, and a mind congenially susceptible—it was not surprising that this blow was doubly severe, and threw on his spirits that despondent gloom to which he then gave way in the following pathetic lines, and which sometimes overclouded them in the subsequent period of his life.

"Dejecting prospect! soon the hapless hour
"May come; perhaps this moment it impends,
"Which drives me forth to penury and cold,
"Naked, and beat by all the storms of heav'n,
"Friendless and guideless to explore my way;
"Till, on cold earth this poor unshelter'd head
"Reclining, vainly from the ruthless blast
"Respite I beg, and in the shock expire."

He lived with his mother for about a year after his father's death, and began to be distinguished as a young man of uncommon parts and genius. These were at that time unassisted by learning; the circumstances of his family affording him no better education than the smattering of Latin which his companions had taught him, and the perusal and recollection of the few English authors which they, or his father in the intervals of his professional labours, had read to him. Poetry, however, though it attains its highest perfection in a cultivated soil, grows perhaps as luxuriantly in a wild one. To poetry, as we have before mentioned, he was devoted from his earliest days; and about this time several of his poetical productions began to be handed about, which considerably enlarged the circle of his friends and acquaintance. Some of his compositions being shewn to Dr Stevenson, an eminent physician of Edinburgh, who was accidentally at Dumfries on a professional visit, that gentleman formed the benevolent design of carrying him to the Scotch metropolis, and giving to his natural endowments the assistance of a classical education. He came to Edinburgh in the year 1741, and was enrolled a student of divinity in the university there, though at that time without any particular view of entering into the church. In that university he continued his studies under the patronage of Dr Stevenson till the year 1745, when he retired to Dumfries, and resided in the house of Mr M'Murdo, who had married his sister, during the whole time of the civil war, which then raged in the country, and particularly

Digitized by Google

cularly disturbed the tranquillity of the metropolis. When peace was restored to the nation, he returned to the university, and pursued his studies for six years longer. During this last residence in Edinburgh, he obtained, among other literary acquaintance, that of the celebrated Mr Hume, who attached himself warmly to Mr Blacklock's interests, and was afterwards particularly useful to him in the publication of the 4to edition of his Poems, which came out by subscription in London in the year 1756. Previously to this, two editions in 8vo had been published at Edinburgh, the first in 1746, and the second in 1754.

In the course of his education at Edinburgh, he acquired a proficiency in the learned languages, and became more a master of the French tongue than was then common in that city. For this last acquisition he was chiefly indebted to the social intercourse to which he had the good fortune to be admitted in the house of Provost Alexander, who had married a native of France. At the university he attained a knowledge of the various branches of philosophy and theology, to which his course of study naturally led, and acquired at the same time a considerable fund of learning and information in those various departments of science and belles lettres, from which his want of sight did not absolutely preclude him.

In 1757, he began a course of study, with a view to give lectures in oratory to young gentlemen intended for the bar or the pulpit. On this occasion he wrote to Mr Hume, informed him of his plan, and requested his assistance in the prosecution of it. But Mr Hume doubting the probability of its success, he abandoned the project; and then, for the first time, adopted the decided intention of going into the church of Scotland. After applying closely for a considerable time to the study of theology, he passed the usual trials in the presbytery of Dumfries, and was by that presbytery licensed a preacher of the gospel in the year 1759. As a preacher he obtained high reputation, and was fond of composing sermons, of which he has left some volumes in manuscript, as also a Treatise on Morals.

In 1762 he married Miss Sarah Johnston, daughter of Mr Joseph Johnston surgeon in Dumfries; a connexion which formed the great solace and blessing of his future life, and gave him, with all the tenderness of a wife, all the zealous care of a guardian and a friend. This event took place a few days before his being ordained minister of the town and parish of Kircudbright, in consequence of a presentation from the crown, obtained for him by the earl of Selkirk, a benevolent nobleman, whom Mr Blacklock's situation and genius had interested in his behalf. But the inhabitants of the parish, whether from that violent aversion to patronage, which was then so universal in the southern parts of Scotland, from some political disputes which at that time subsisted between them and his noble patron, or from those prejudices which some of them might naturally enough entertain against a pastor deprived of sight, or perhaps from all these causes united, were so extremely disinclined to receive him as their minister, that after a legal dispute of nearly two years, it was thought expedient by his friends, as it had always been wished by himself, to compromise the matter, by resigning his right to the living, and accepting a moderate annuity in its stead. With this slender provision he removed in 1764 to Edinburgh; and to make up by his industry a more comfortable and decent subsistence, he adopted the plan of receiving a certain number of young gentlemen as boarders into his house, whose studies in languages and philosophy he might, if necessary, assist. In this situation he continued till the year 1787, when he found his time of life and state of health required a degree of quiet and repose which induced him to discontinue the receiving of boarders. In 1767 the degree of doctor in divinity was conferred on him by the university and Marischal college of Aberdeen.

In the occupation which he thus exercised for so many years of his life, no teacher was perhaps ever more agreeable to his pupils, nor master of a family to its inmates, than Dr Blacklock. The gentleness of his manners, the benignity of his disposition, and that warm interest in the happiness of others which led him so constantly to promote it, were qualities that could not fail to procure him the love and regard of the young people committed to his charge; while the society, which esteem and respect for his character and his genius often assembled at his house, afforded them an advantage rarely to be found in establishments of a similar kind.

In this mixed society he appeared to forget the privation of sight, and the melancholy which it might at other times produce in his mind. He entered, with the cheerful playfulness of a young man, into all the sprightly narrative, the sportful fancy, and the humorous jest that arose around him. Next to conversation, music was perhaps the source of his greatest delight; for he not only relished it highly, but was himself a tolerable performer on several instruments, particularly the flute. He generally carried in his pocket a small *flageolet*, on which he played his favourite tunes; and was not displeased when asked in company to play or to sing them; a natural feeling for a blind man, who thus adds a scene to the drama of his society.

Of the happiness of others, however, we are incompetent judges. Companionship and sympathy bring forth those gay colours of mirth and cheerfulness which they put on for a while, to cover perhaps that sadness which we have no opportunity of witnessing. Of a blind man's condition we are particularly liable to form a mistaken estimate; we give him credit for all those gleams of delight which society affords him, without placing to their full account those dreary moments of darksome solitude to which the suspension of that society condemns him. Dr Blacklock had from nature a constitution delicate and nervous, and his mind, as is almost always the case, was in a great degree subject to the indisposition of his body. He frequently complained of a lowness and depression of spirits, which neither the attention of his friends, nor the unceasing care of a most affectionate wife, were able entirely to remove. The imagination we are so apt to envy and admire, serves but to irritate this disorder of the mind; and that fancy in whose creation we so much delight, can draw, from sources unknown to common men, subjects of disgust, disquietude, and affliction. Some of his latter poems express a chagrin, though not of an ungentle sort, at the supposed failure of his imaginative powers, or at the fastidiousness of modern times, which he despaired to please.

 "Such

Digitized by Google

Blacklock, Blackmore.

"Such were his efforts, such his cold reward,
"Whom once thy partial tongue pronounc'd a bard;
"Excursive, on the gentle gales of spring,
"He rov'd, whilst favour imp'd his timid wing;
"Exhausted genius now no more inspires,
"But mourns abortive hopes and faded fires;
"The short-liv'd wreath, which once his temple grac'd,
"Fades at the sickly breath of squeamish taste;
"Whilst darker days his fainting flames immure
"In cheerless gloom and winter premature."

These lines are, however, no proof of "exhausted genius," or "faded fires." "Abortive hopes," indeed, must be the lot of all who, like Dr Blacklock, reach the period of old age. In early youth, the heart of every one is a poet; it creates a scene of imagined happiness and delusive hopes; it clothes the world in the bright colours of its own fancy; it refines what is coarse, it exalts what is mean; it sees nothing but disinterestedness in friendship, it promises eternal fidelity in love. Even on the distresses of its situation it can throw a certain romantic shade of melancholy, that leaves a man sad, but does not make him unhappy. But at a more advanced age, "the fairy visions fade," and he suffers most deeply who has indulged them the most.

About the time that these verses were written, Dr Blacklock was, for the first time, afflicted with what to him must have been peculiarly distressful. He became occasionally subject to deafness, which, though he seldom felt it in any great degree, was sufficient, in his situation, to whom the sense of hearing was almost the only channel of communication with the external world, to cause very lively uneasiness. Amidst these indispositions of body, however, and disquietudes of mind, the gentleness of his temper never forsook him, and he felt all that resignation and confidence in the Supreme Being which his earliest and his latest life equally acknowledged. In summer 1791 he was seized with a feverish disorder, which at first seemed of a slight, and never rose to a very violent kind; but a frame so little robust as his was not able to resist it, and after about a week's illness it carried him off on the 7th day of July of that year.

Dr Blacklock's writings consist chiefly of poems, of which an edition in 4to was published in 1793. To that edition was added, an Essay on the Education of the Blind, translated from the French of M. Hauy. He was also the author of the article BLIND in the last edition of this work.

BLACKMORE, SIR RICHARD, a physician, and voluminous writer of theological, poetical, and physical works. Having declared himself early in favour of the Revolution, King William, in 1697, chose him one of his physicians in ordinary, and conferred the honour of knighthood on him. On Queen Anne's accession, Sir Richard was also appointed one of her physicians, and continued so for some time. Dryden and Pope treated the poetical performances of Blackmore with great contempt; and in a note to the mention made of him in the Dunciad, we are informed that his "indefatigable muse produced no less than six epic poems; Prince and King Arthur, 20 books; Eliza, 10; Alfred, 12; The Redeemer, 6; beside Job, in folio; the whole book of Psalms; The Creation, seven books; Nature of Man, three books; and many more." But notwithstanding Blackmore was much ridiculed by the wits, he is not without merit; and Addison has, in the Spectator, bestowed some liberal commendations on his poem on the Creation. It must be mentioned, too, in honour of Sir Richard, that he was a chaste writer, and a warm advocate for virtue, at a time when an almost universal degeneracy prevailed. He had been very free in his censures on the libertine writers of his age; and it was owing to some liberty he had taken of this kind, that he drew upon him the resentment of Mr Dryden. He had likewise given offence to Mr Pope; for having been informed by Mr Curl that he was the author of a travestie on the first Psalm, he took occasion to reprehend him for it in his Essay on Polite Learning. Besides what are above mentioned, Sir Richard wrote some theological tracts, and several treatises on the plague, small-pox, consumptions, the spleen, gout, dropsy, &c. and many other poetical pieces. He died October 9. 1729.

Blackmore, Blackstone.

BLACKNESS, the quality of a black body; or a colour arising from such a texture and situation of the superficial parts of the body as does, as it were, deaden, or rather absorb, the light falling upon it, without reflecting any, or very little of it, to the eye.—In which sense, *blackness* stands directly opposed to *whiteness*; which consists in such a texture of parts as indifferently reflects all the rays thrown upon it, of what colour soever they be.

Des Cartes, says Dr Priestley, though mistaken with respect to the nature of light and colours, yet distinguishes justly between black and white; observing, that black suffocates and extinguishes the light that falls upon it, but that white reflects it. See BLACK.

BLACKS, in *Physiology*. See NEGROES.

BLACKS, is also a name given to an association of disorderly and ill-designing persons, formerly herding chiefly about Waltham in Essex, who destroyed deer, robbed fish-ponds, ruined timber, &c. See *Black-Act*.

BLACKSTONE, SIR WILLIAM, an eminent English lawyer, was born at London, in July 1723. His father, Mr Charles Blackstone, a silk-man, citizen, and bowyer of London, died some months before the birth of our author, who was the youngest of four children: and their mother died before he was 12 years old. Even from his birth, the care both of his education and fortune was kindly undertaken by his maternal uncle Mr Thomas Bigg, an eminent surgeon in London, and afterwards on the death of his elder brothers, owners of the Chilton estate, which is still enjoyed by that family. In 1730, being about seven years old, he was put to school at the Charter-house; and in 1735 was, by the nomination of Sir Robert Walpole, on the recommendation of Charles Wither of Hall in Hampshire, Esq. his cousin by the mother's side, admitted upon the foundation there. In this excellent seminary he applied himself to every branch of youthful education, with the same assiduity which accompanied his studies through life. His talents and industry rendered him the favourite of his masters, who encouraged and assisted him with the utmost attention: so that at the age of 15 he was at the head of the school, and although so young, was thought well qualified to be removed to the university. He was accordingly entered a commoner at Pembroke college

Digitized by Google

Blackstone.

lege in Oxford, on the 30th of November 1738, and was the next day matriculated. At this time he was elected to one of the Charter-house exhibitions by the governors of that foundation, to commence from the Michaelmas preceding; but was permitted to continue a scholar there till after the 12th of December, being the anniversary commemoration of the founder, to give him an opportunity of speaking the customary oration which he had prepared, and which did him much credit. About this time also he obtained Mr Benson's gold prize-medal of Milton, for verses on that poet. In the February following, the society of Pembroke college unanimously elected him to one of Lady Holford's exhibitions for Charter-house scholars in that house. Here he prosecuted his studies with unremitting ardour; and although the classics, and particularly the Greek and Roman poets, were his favourites, they did not entirely engross his attention: logic, mathematics, and the other sciences, were not neglected. At the early age of 20, he compiled a treatise entitled *Elements of Architecture*, intended for his own use only, and not for publication; but esteemed by those judges who have perused it, in no respect unworthy his maturer judgment and more exercised pen.

Having determined on his future plan of life, and made choice of the law for his profession, he was entered in the Middle Temple on the 20th of November 1741. He now found it necessary to quit the more amusing pursuits of his youth, for the severer studies to which he had dedicated himself; and betook himself seriously to reading law. He expressed his disagreeable sensations on this occasion in a copy of verses, since published by Dodsley in vol. iv. of his miscellanies, entitled *The Lawyer's Farewell to his Muse;* in which the struggle of his mind is expressed so strongly, so naturally, with such elegance of sense and language, and harmony of versification, as must convince every reader that his passion for the muses was too deeply rooted to be laid aside without much reluctance; and that, if he had pursued that flowery path, he would perhaps have proved inferior to few of our English poets. Several little fugitive pieces besides this, have at times been communicated by him to his friends; and he left (but not with a view of publication) a small collection of juvenile pieces, both originals and translations, inscribed with this line from Horace,

Nec lusisse pudet, sed non incidere ludum.

Some notes on Shakespeare, which just before his death he communicated to Mr Steevens, and which were inserted by him in his last edition of that author, show how well he understood the meaning, as well as the beauties, of that his favourite among the English poets.

In November 1743, he was elected into the society of All-Soul's college; and in the November following, he spoke the anniversary speech in commemeration of Archbishop Chicheley the founder, and the other benefactors to that house of learning, and was admitted actual fellow. From this period he divided his time between the university and the Temple, where he took chambers in order to attend the courts: in the former he pursued his academical studies, and on the 12th of June 1745 commenced bachelor of civil law: in the latter he applied himself closely to his profession, both in the hall and in his private studies, and on the 28th of November 1746 was called to the bar. Though he was little known or distinguished in Westminster hall, he was actively employed during his occasional residence at the university, in attending to its interests, and mingling with and improving its interior concerns. In May 1749, as a small reward for his services, and to give him further opportunities of advancing the interests of the college, Mr Blackstone was appointed steward of their manors. And in the same year, on the resignation of his uncle Seymour Richmond, Esq. he was elected recorder of the borough of Wallingford in Berkshire, and received the king's approbation on the 30th of May. The 26th of April 1750, he commenced doctor of civil law, and thereby became a member of the convocation, which enabled him to extend his views beyond the narrow circle of his own society, to the general benefit of the university at large. In the summer 1753, he took the resolution of wholly retiring to his fellowship and an academical life, still continuing the practice of his profession as a provincial counsel.

His Lectures on the Laws of England appear to have been an early and favourite idea; for in the Michaelmas term, immediately after he quitted Westminster-hall, he entered on the province of reading them at Oxford; and we are told by the author of his life, that even at their commencement, such were the expectations formed from the acknowledged abilities of the lecturer, they were attended by a very crowded class of young men of the first families, characters, and hopes; but it was not till the year 1758, that the lectures in the form they now bear were read at the university. Mr Viner having by his will left not only the copyright of his abridgment, but other property to a considerable amount, to the university of Oxford, to found a professorship, fellowships, and scholarships of common law, he was on the 20th October 1758 unanimously elected Vinerian professor; and on the 25th of the same month read his first introductory lecture, which he published at the request of the vice-chancellor and heads of houses, and afterwards prefixed to the first volume of his Commentaries. His lectures now had gained such universal applause, that he was requested by a noble personage who superintended the education of our present sovereign, then prince of Wales, to read them to his royal highness; but as he was at that time engaged to a numerous class of pupils in the university, he thought he could not, consistently with that engagement, comply with this request, and therefore declined it. But he transmitted copies of many of them for the perusal of his royal highness; who, far from being offended at an excuse grounded on so honourable a motive, was pleased to order a handsome gratuity to be presented to him. It is doubtful whether the Commentaries were originally intended for the press; but many imperfect and incorrect copies having got abroad, and a pirated edition of them being either published, or preparing for publication in Ireland, the learned lecturer thought proper to print a correct edition himself; and in November 1765 published the first volume under the title of *Commentaries on the Laws of England;* and in the course of the four succeeding years, the remaining parts of this admirable work.

Blackstone, Blackwall.

work. It ought to be remarked, that before this period the reputation his lectures deservedly acquired him had induced him to resume his practice in Westminster-hall; and in a course somewhat inverted from the general progress of his profession, he who had quitted the bar for an academic life, was sent back from the college to the bar, with a considerable increase of business. He was likewise elected into parliament, first for Hindon, and afterwards for Westbury in Wilts; but in neither of these departments did he equal the expectations his writings had raised. The part he took in the Middlesex election drew upon him the attack of some persons of ability in the senate, and likewise a severe animadversion of one of the keenest polemical writers* in the paper war of that day. This circumstance probably strengthened the aversion he professed to parliamentary attendance; "where, (he said) amidst the rage of contending parties, a man of moderation must expect to meet with no quarter from any side:" and when, on the resignation of Mr Dunning in 1770, he was offered the place of solicitor-general, he refused that office; but shortly afterwards, on the promotion of Sir Joseph Yates to a seat in the court of common-pleas, accepted a seat on the bench, and by the death of Sir Joseph succeeded him there also. As a judge, he was not inactive; but, when not occupied in the duties of his station, was generally engaged in some scheme of public utility. The act for detached houses for hard labour for convicts, as a substitute for transportation, owed its origin in a great measure to him.

* *Junius.*

It ought not to be omitted, that the last augmentation of the judges salaries, calculated to make up the deficiencies occasioned by the heavy taxes they are subject to, and thereby render them more independent, was obtained in a great measure by his industry and attention. This respectable and valuable man died on the 14th of February 1780, in the 50th year of his age.

BLACKWALL, Anthony, A. M. a learned author, after completing his academical education at Emanuel college, Cambridge, was appointed head master of the free school at Derby, and lecturer of All-hallows there, where he first distinguished himself in the literary world by an edition of Theognis, printed at London in 1706, and was afterwards head master of the free school at Market-Bosworth in Leicestershire. The grammar whereby he initiated the youth under his care into Latin, was of his own composing, and so happily fitted for the purpose, that he was prevailed on to make it public, though his modesty would not permit him to fix his name to it, because he would not be thought to prescribe to other instructors of youth. It is entitled, "A New Latin Grammar; being a short, clear, and easy introduction of young Scholars to the Knowledge of the Latin Tongue; containing an exact Account of the two first Parts of Grammar." In his "Introduction to the Classics," first published in 1718, 12mo, he displayed the beauties of those admirable writers of antiquity, to the understanding and imitation even of common capacities; and that in so concise and clear a manner, as seemed peculiar to himself. But his greatest and most celebrated work was, "The sacred Classics defended and illustrated; or, An Essay humbly offered towards preserving the Purity, Propriety, and True Eloquence of the Writers of the New Testament," in 2 vols. Mr Blackwall had the felicity to bring up many excellent scholars in his seminaries at Derby and Bosworth; among others, the celebrated Richard Dawes, author of the *Miscellanea Critica*. A gentleman who had been his scholar, being patron of the church of Clapham in Surrey, presented him to that living as a mark of his gratitude and esteem. This happening late in life, and Blackwall having occasion to wait upon the bishop of the diocese, he was somewhat pertly questioned by a young chaplain as to the extent of his learning. "Boy (replied the indignant veteran), I have forgot more than ever you knew!" He died at Market-Bosworth, April 8. 1730.

Blackwall, Blackwell.

BLACKWELL, Thomas, an eminent Scottish writer, was son of a minister at Aberdeen, and born there 1701. He had his grammatical learning at a school in Aberdeen, studied Greek and philosophy in the Marischal college there, and took the degree of M. A. in 1718. Being greatly distinguished by uncommon parts, and an early proficiency in letters, he was, Dec. 1723, made Greek professor in the college where he had been educated; and continued to teach that language with applause even to his death. In 1737, was published at London, but without his name, "An Enquiry into the Life and Writings of Homer," 8vo; a second edition of which appeared in 1736; and not long after, "Proofs of the Enquiry into Homer's Life and Writings," which was a translation of the Greek, Latin, Spanish, Italian, and French notes, subjoined to the original work. In 1748, he published "Letters concerning Mythology," 8vo; without his name also. The same year, he was made principal of the Marischal college in Aberdeen, and is the only layman who hath been appointed principal of that college, since the patronage came to the crown, by the forfeiture of the Marischal family, in 1716; all the other principals having been ministers of the church of Scotland. March 1752, he took the degree of doctor of laws: and the year following came out the first volume of his Memoirs of the Court of Augustus, 4to. The second volume appeared in 1755; and the third, which was posthumous, and left incomplete by the author, was fitted for the press by John Mills, Esq. and published in 1764. At the same time was published a third edition of the two former volumes: Which is a proof of the good reception the work met with from the public; though it must be acknowledged that the parade with which it is written, and the peculiarity of its language, exposed it to some severity of censure.

Soon after he became principal of his college, he married a merchant's daughter of Aberdeen, by whom he had no children. Several years before his death, his health began to decline: his disorder was of the consumptive kind, and thought to be forwarded by an excess of abstemiousness which he imposed upon himself. His disease increasing, he was advised to travel, and accordingly set out in Feb. 1757; however, he was not able to go farther than Edinburgh, in which city he died the 8th of March following, in his 56th year. He was a very ingenious and very learned man: he had an equable flow of temper, and a truly philosophic spirit,

Digitized by Google

spirit, both which he seems to have preserved to the last; for on the day of his death he wrote to several of his friends.

BLACKWELL, *Alexander*, son of a dealer in knit-hose, at Aberdeen, where he received a liberal education, studied physic under Boerhaave at Leyden, took the degree of M. D. and acquired a proficiency in the modern languages. On his return home, happening to stay some time at the Hague, he contracted an intimacy with a Swedish nobleman. Marrying a gentleman's daughter in the neighbourhood of Aberdeen, he proposed practising his profession in that part of the kingdom; but in two years finding his expectations disappointed, he came to London, where he met with still less encouragement as a physician, and commenced corrector of the press for Mr Wilkins a printer. After some years spent in this employment, he set up as a printer himself: and carried on several large works till 1734, when he became bankrupt. In what manner he subsisted for a considerable time after this event we do not learn, unless it was by the ingenuity of his wife, who published "A curious Herbal, containing 500 Cuts of the most useful Plants which are now used in the Practice of Physic, engraved on folio Copperplates, after Drawings taken from the Life, by Elizabeth Blackwell. To which is added a short Description of the Plants, and their common Uses in Physic, 1739," 2 vols. folio. In or about the year 1740 he went to Sweden, and renewing his intimacy with the nobleman he knew at the Hague, again assumed the medical profession, and was very well received in that capacity; till turning projector, he laid a scheme before his Swedish majesty for draining the fens and marshes, which was well received, and many thousands employed in prosecuting it under the doctor's direction, from which he had some small allowance from the king. This scheme succeeded so well, he turned his thoughts to others of greater importance, which in the end proved fatal to him. He was suspected of being concerned in a plot with Count Tessin, and was tortured; which not producing a confession, he was beheaded August 9. 1748; and soon after this event appeared "A genuine Copy of a Letter from a merchant in Stockholm to his correspondent in London; containing an Impartial Account of Doctor Alexander Blackwell, his Plot, Trial, Character, and Behaviour, both under Examination and at the Place of Execution; together with a copy of a Paper delivered to a Friend upon the Scaffold." He possessed a good natural genius, but was somewhat flighty and a little conceited. His conversation, however, was facetious and agreeable; and he might be considered on the whole as a well-bred accomplished gentleman.

BLADDER, in *Anatomy*, a thin expanded membranous body, found in several parts of an animal, serving as a receptacle of some juice, or of some liquid excrement; from whence it takes various denominations, as *urine-bladder*, *gall-bladder*, &c.

BLADDER, by way of eminence, is a large vessel which serves as a receptacle of the urine of animals, after its secretion from the blood in the kidneys. This is sometimes also called, by way of distinction, the *urinary bladder*, *vesica urinaria*. The bladder is situated in the pelvis of the abdomen; in men immediately on the rectum; in women on the vagina uteri. See ANATOMY *Index*.

Though the urinary bladder be naturally single, yet there have been instances of nature's varying from herself in this particular. The bladder of the famous Casaubon, upon dissecting his body after his death, was found to be double; and in the Philosophical Transactions, we have an account of a triple bladder found in the body of a gentleman who had long been ill and no one could guess the cause.

The urinary bladders of brutes are differently contrived from the human bladder, and from each other according to the structure, economy, and manners of living of each creature. See ANATOMY *Index*.

Bladders, when below a certain magnitude, are more usually denominated by the diminutive vesicles, *vesiculæ*. Of these we meet with many sorts both in the animal and vegetable world; some natural, as in the lungs, especially of frogs, and, as some also imagine, in the muscles; others morbid or preternatural, as the *hydatides*, and those observable in the itch. Naturalists have also discovered bladders in the thorax and abdomen of birds, as well as others in the belly of fishes, called *air-bladders*, and *swims*.

Vegetable bladders are found everywhere in the structure of the bark, the fruit, pith, and *parenchyma* or pulp; besides those morbid ones raised on the surface of leaves by the puncture of insects.

BLADDER-Nut. See STAPHYLÆA, BOTANY *Index*.

BLADDER-Senna. See COLUTEA, BOTANY *Index*.

BLADE, in commerce, a thin slender piece of metal, either forged by the hammer or run and cast in moulds, to be afterwards sharpened to a point, edge, or the like.

Sword-blades are made by the armourers, knife-blades by the cutlers, &c. The English and Damascus blades are most esteemed; among the French, those of Vienne in Dauphiny have the preference. The conditions of a good blade of a small sword are, that it be light and tough, apter to bend than break. When it will stand in the bend, it is called *a poor man's blade*.

BLADEN, MARTIN, a translator and dramatic author, was formerly an officer in the army, bearing the commission of a lieutenant-colonel in Queen Anne's reign, under the great duke of Marlborough, to whom he dedicated a translation of Cæsar's Commentaries, which he had completed, and which is to this day a book held in good estimation. In 1714, he was made one of the Lords Commissioners of Trade and Plantations; and in 1717 was appointed envoy extraordinary to the court of Spain, in the room of —— Brett, Esq. but declined it, choosing rather to keep the post he already had, which was worth 1000l. per annum, and which he never parted with till his death, which was in May 1746. He was also many years member of parliament for the town of Portsmouth. He wrote two dramatic pieces; both of which (for the one is only a masque introduced in the third act of the other) were printed in the year 1705, without the author's consent. Their names are, 1. Orpheus and Euridice, a masque. 2. Solon, a tragic-comedy.

BLADUM, in the middle-age writers, is taken for all sort of standing corn in the blade and ear. The word is also written *blatum*, *blava*, and *blavium*.

In our old charters, the word *bladum* included the whole

Digitized by Google

whole product of the ground, fruit, corn, flax, grass, &c. and whatever was opposed to living creatures. It was sometimes also applied to all sorts of grain or corn thrashed on the floor. But the word was more peculiarly appropriated to bread-corn, or wheat, called in French *blé*. Thus the knights templars are said to have granted to Sir Wido de Meriton's wife *duas summas bladi*.

BLAEU, William, a famous printer of Amsterdam, a disciple and friend of Tycho Brahe's: his Atlas, his Treatises of the Globes, Astronomical Institutions, &c. and his fine impressions, have secured his memory. He died in 1638.

BLAFART, in commerce, a small coin, current at Cologne, worth something more than a farthing of our money.

BLAGRAVE, John, the second son of John Blagrave of Bulmarsh-court near Sunning in Berkshire, descended of an ancient family in that county. From a grammar school at Reading he was sent to St John's college in Oxford, where he applied himself chiefly to the study of mathematics, and without taking any degree, afterwards retired to his patrimonial seat of Southcole-lodge near Reading, where he spent the remainder of his life. In this mansion he died in the year 1611; and was buried in the church of St Lawrence, where a sumptuous monument was erected to his memory. Having never married, he bequeathed to all the posterity of his three brothers, the sum of 50l. each, payable at the age of 26; and he calculated his donation so well, that near fourscore of his nephews and their descendants have reaped the benefit of it. He also settled certain lands at Swallowfield in the same county, as a provision for the poor for ever. Among other charities, he left ten pounds to be annually disposed of in the following manner: On Good Friday, the church-wardens of each of the three parishes of Reading send to the town-hall *one virtuous maid, who has lived five years with her master*: there, in the presence of the magistrates, these three virtuous maids throw dice for the ten pounds. The two losers are returned with a fresh one the year following, and again the third year, till each has had three chances. He is said to have been not more remarkable for his mathematical knowledge than for his candour and generosity to his acquaintance. His works are, 1. *A mathematical jewel*. Lond. 1585, fol. 2. *Of the making and use of the familiar staff*. Lond. 1590, 4to. 3. *Astrolabium uranicum generale*. Lond. 1596, 4to. 4. *The art of dialing*. Lond. 1609, 4to.

BLAIN, among farriers, a distemper incident to beasts, being a certain bladder growing on the root of the tongue against the windpipe, which swells to such a pitch as to stop the breath. It comes by great chafing and heating of the stomach, and is perceived by the beast's gaping and holding out his tongue, and foaming at the mouth. To cure it, cast the beast, take forth his tongue, and then, slitting the bladder, wash it gently with vinegar and a little salt.

BLAIR, Dr Hugh, a distinguished clergyman of the church of Scotland, was born in Edinburgh in 1718. His father, John Blair, was a merchant in that city, and grandson of the famous Mr Robert Blair, minister of St Andrew's, and chaplain to King Charles I.; and one of the most distinguished clergymen of the period in which he lived. The views of Dr Blair, from his earliest youth, were turned toward the church, and his education received a suitable direction. After the usual grammatical course at school, he entered the humanity class in the university of Edinburgh, in October 1730, and spent eleven years at that celebrated seminary, assiduously employed in the literary and scientific studies prescribed by the church of Scotland to all who are to become candidates for her license to preach the gospel. During this important period he was distinguished among his companions both for diligence and proficiency; and obtained from the professors under whom he studied repeated testimonies of approbation. One of them deserves to be mentioned particularly, because in his own opinion it determined the bent of his genius toward polite literature. An essay, Πεϱι του καλου, *On the Beautiful*, written by him when a student of logic in the usual course of academical exercises, had the good fortune to attract the notice of Professor Stevenson, and, with circumstances honourable to the author, was appointed to be read in public at the conclusion of the session. This mark of distinction made a deep impression on his mind; and the essay which merited it he ever after recollected with partial affection, and preserved to the day of his death as the first earnest of his fame.

At this time Dr Blair commenced a method of study which contributed much to the accuracy and extent of his knowledge, and which he continued to practise occasionally even after his reputation was fully established. It consisted in making abstracts of the most important works which he read, and in digesting them according to the train of his own thoughts. History, in particular, he resolved to study in this manner; and, in concert with some of his youthful associates, he constructed a very comprehensive scheme of chronological tables for receiving into its proper place every important fact that should occur. The scheme devised by this young student for his own private use was afterwards improved, filled up, and given to the public, by his learned friend Dr John Blair, prebendary of Westminster, in his valuable work, "Chronology and History of the World."

In the year 1739, Dr Blair took his degree of A.M. On that occasion he printed and defended a thesis, *De Fundamentis et Obligatione Legis Naturæ*, which contains a short but masterly discussion of this important subject, and exhibits, in elegant Latin, an outline of the moral principles which have been since more fully unfolded and illustrated in his Sermons.

The university of Edinburgh, about this period, numbered among her pupils many young men who were soon to make a distinguished figure in the civil, the ecclesiastical, and the literary history of their country. With most of them Dr Blair entered into habits of intimate connection, which no future competition or jealousy occurred to interrupt, which held them united through life in their views of public good, and which had the most beneficial influence on their own improvement, on the progress of elegance and taste among their contemporaries, and on the general interests of the community to which they belonged.

On the completion of his academical course, he underwent the customary trials before the presbytery of Edinburgh, and received from that venerable body a license

Blair.

license to preach the gospel on the 21st of October 1741. His public life now commenced with very favourable prospects. The reputation which he brought from the university was fully justified by his first appearance in the pulpit; and, in a few months, the fame of his eloquence procured for him a presentation to the parish of Colessie in Fife, where he was ordained to the office of the holy ministry on the 23d of September 1742. But he was not permitted to remain long in this rural retreat. A vacancy in the second charge of the Canongate of Edinburgh furnished to his friends an opportunity of recalling him to a station more suited to his talents. And, though one of the most popular and eloquent clergymen in the church was placed in competition with him, a great majority of the electors decided in favour of this young orator, and restored him, in July 1743, to the bounds of his native city.

In this station Dr Blair continued eleven years, discharging with great fidelity and success the various duties of the pastoral office. His discourses from the pulpit in particular attracted universal admiration. They were composed with uncommon care; and occupying a middle place between the dry metaphysical discussion of one class of preachers, and the loose incoherent declamation of another, they blended together, in the happiest manner, the light of argument with the warmth of exhortation, and exhibited captivating specimens of what had hitherto been rarely heard in Scotland—the polished, well-compacted, and regular didactic oration.

In consequence of a call from the town-council and general session of Edinburgh, he was translated from the Canongate to Lady Yesters, one of the city churches, on the 11th of October 1754: and on the 15th of June 1758, he was promoted to the High Church of Edinburgh, the most important ecclesiastical charge in the kingdom. To this charge he was raised at the request of the lords of council and session, and of the other distinguished official characters, who have their seats in that church. And the uniform prudence, ability, and success, which, for a period of more than forty years, accompanied all his ministerial labours in that conspicuous and difficult station, sufficiently evince the wisdom of their choice.

Hitherto his attention seems to have been devoted almost exclusively to the attainment of professional excellence, and to the regular discharge of his parochial duties. No production of his pen had yet been given to the world by himself, except two sermons preached on particular occasions; some translations, in verse, of passages of Scripture, for the psalmody of the church; and a few articles in the Edinburgh Review, a publication begun in 1755, and conducted for a short time by some of the ablest men in the kingdom. But standing as he now did at the head of his profession, and released by the labour of former years from the drudgery of weekly preparation for the pulpit, he began to think seriously on a plan for teaching to others that art which had contributed so much to the establishment of his own fame. With this view, he communicated to his friends a scheme of Lectures on Composition; and having obtained the approbation of the university, he began to read them in the college on the 11th of December 1759. To this undertaking he brought all the qualifications requisite for executing it well; and along with them a weight of reputation which could not fail to give effect to the lessons he should deliver. For beside the testimony given to his talents by his successive promotions in the church, the university of St Andrews, moved chiefly by the merit of his eloquence, had, in June 1757, conferred on him the degree of D. D. a literary honour which at that time was very rare in Scotland. Accordingly his first course of lectures was well attended, and received with great applause. The patrons of the university, convinced that they would form a valuable addition to the system of education, agreed in the following summer to institute a rhetorical class, under his direction, as a permanent part of their academical establishment; and on the 7th of April 1762, his majesty was graciously pleased "To erect and endow a professorship of rhetoric and belles lettres in the university of Edinburgh, and to appoint Dr Blair, in consideration of his approved qualifications, regius professor thereof, with a salary of 70l." These lectures he published in 1783, when he retired from the labours of the office; and the general voice of the public has pronounced them to be a most judicious, elegant, and comprehensive system of rules for forming the style, and cultivating the taste of youth.

About the time in which he was occupied in laying the foundations of this useful institution, he had an opportunity of conferring another important obligation on the literary world, by the part which he acted in rescuing from oblivion the poems of Ossian. It was by the solicitation of Dr Blair and Mr John Home that Mr Macpherson was induced to publish his *Fragments of Ancient Poetry;* and their patronage was of essential service in procuring the subscription which enabled him to undertake his tour through the Highlands, for collecting the materials of Fingal, and of those other delightful productions which bear the name of Ossian. To these productions Dr Blair applied the test of genuine criticism; and soon after their publication gave an estimate of their merits in a *Dissertation*, which, for beauty of language, delicacy of taste, and acuteness of critical investigation, has few parallels. It was printed in 1763, and spread the reputation of its author throughout Europe.

The great objects of his literary ambition being now attained, his talents were for many years consecrated solely to the important and peculiar employments of his station. It was not till the year 1777, that he could be induced to favour the world with a volume of the sermons which had so long furnished instruction and delight to his own congregation. But this volume being well received, the public approbation encouraged him to proceed; three other volumes followed at different intervals; and all of them experienced a degree of success of which few publications can boast. They circulated rapidly and widely, wherever the English tongue extends; they were soon translated into almost all the languages of Europe; and his present majesty, with that wise attention to the interests of religion and literature which distinguishes his reign, was graciously pleased to judge them worthy of a public reward. By a royal mandate to the exchequer in Scotland, dated the 25th of July 1780, a pension of 200l. a-year was conferred on their author, which continued unaltered till his death.

The motives which gave rise to the fifth volume are

Digitized by Google

Blair.

are sufficiently explained by himself in his address to the reader. The sermons which it contains were composed at very different periods of his life; but they were all written out anew in his own hand, and in many parts recomposed, during the course of the summer 1800, after he had completed his eighty-second year. They were delivered to the publishers about six weeks before his death in the form and order in which they now appear. And it may gratify his readers to know that the last of them which he composed, though not the last in the order adopted for publication, was the sermon on *a Life of Dissipation and Pleasure*—a sermon written with great dignity and eloquence, and which should be regarded as his solemn parting admonition to a class of men whose conduct is highly important to the community, and whose reformation and virtue he had long laboured most zealously to promote.

The sermons which he has given to the world are universally admitted to be models in their kind; and they will long remain durable monuments of the piety, the genius, and sound judgment of their author. But they formed only a small part of the discourses he prepared for the pulpit. The remainder modesty led him to think unfit for the press: and, influenced by an excusable solicitude for his reputation, he left behind him an explicit injunction that his numerous manuscripts should be destroyed. The greatness of their number was creditable to his professional character, and exhibited a convincing proof that his fame as a public teacher had been honourably purchased by the most unwearied application to the private and unseen labours of his office. It rested on the uniform intrinsic excellence of his discourses in point of matter and composition, rather than on foreign attractions; for his delivery, though distinct, serious, and impressive, was not remarkably distinguished by that magic charm of voice and action which captivates the senses and imagination, and which in the estimation of superficial hearers, constitutes the chief merit of a preacher.

In that department of his professional duty which regarded the government of the church, Dr Blair was steadily attached to the cause of moderation. From diffidence, and perhaps from a certain degree of inaptitude for extemporary speaking, he took a less public part in the contests of ecclesiastical politics than some of his cotemporaries; and, from the same causes, he never would consent to become moderator of the general assembly of the church of Scotland. But his influence among his brethren was extensive: his opinion, guided by that sound uprightness of judgment which formed the predominant feature of his intellectual character, had been always held in high respect by the friends with whom he acted, and for many of the last years of his life it was received by them almost as a law. The great leading principle in which they cordially concurred with him, and which directed all their measures, was to preserve the church on the one side from a slavish corrupted dependence on the civil power, and on the other from a greater infusion of democratical influence than is compatible with good order, and the established constitution of the country.

The reputation which he acquired in the discharge of his public duties was well sustained by the great respectability of his private character. Deriving from family associations a strong sense of clerical decorum, feeling on his heart deep impressions of religious and moral obligation, and guided in his intercourse in the world by the same correct and delicate taste which appeared in his writings, he was eminently distinguished through life, by the prudence, purity, and dignified propriety of his conduct. His mind, by constitution and culture, was admirably formed for enjoying happiness:—well balanced in itself by the nice proportion and adjustment of its faculties, it did not incline him to any of those eccentricities, either of opinion or of action, which are too often the lot of genius; free from all tincture of envy, it delighted cordially in the prosperity and fame of his companions; sensible to the estimation in which he himself was held, it disposed him to dwell at times on the thought of his success with a satisfaction which he did not affect to conceal; inaccessible alike to gloomy and to peevish impressions, it was always master of its own movements, and ready, in an uncommon degree, to take an active and pleasing interest in every thing, whether important or trifling, that happened to become for the moment the object of his attention. This habit of mind, tempered with the most unsupecting simplicity, and united to eminent talents and inflexible integrity, while it secured to the last his own relish of life, was wonderfully calculated to endear him to his friends, and to render him an invaluable member of any society to which he belonged. Indeed few men have been more universally respected by those who knew him, more sincerely esteemed in the circle of his acquaintance, or more tenderly beloved by those who enjoyed the blessings of his private and domestic connection.

In April 1748, he married his cousin Catharine Bannatine, daughter of the Rev. James Bannatine, one of the ministers of Edinburgh. By her he had a son who died in infancy, and a daughter who lived to her twenty-first year, the pride of her parents, and adorned with all the accomplishments that became her age and sex. Mrs Blair herself, a woman of great good sense and spirit, was also taken from him a few years before his death, after she had shared with the tenderest affection in all his fortunes, and contributed near half a century to his happiness and comfort.

Dr Blair had been naturally of a feeble constitution of body; but as he grew up his constitution acquired greater firmness and vigour. Though liable to occasional attacks from some of the sharpest and most painful diseases that afflict the human frame, he enjoyed a general state of good health; and, through habitual cheerfulness, temperance, and care, survived the usual term of human life. For some years he had felt himself unequal to the fatigue of instructing his very large congregation from the pulpit; and, under the impression which this feeling produced, he has been heard at times to say, with a sigh, 'that he was left almost the last of his cotemporaries.' Yet he continued to the end in the regular discharge of all his other official duties, and particularly in giving advice to the afflicted, who from different quarters of the kingdom solicited his correspondence. His last summer was devoted to the preparation of his fifth volume of sermons; and in the course of it he exhibited a vigour of understanding and capacity of exertion equal to that of his best days.

He began the winter pleased with himself on account of the completion of this work, and his friends were

Digitized by Google

were flattered with the hope that he might live to enjoy the accession of emolument and fame which he expected it would bring. But the seeds of a mortal disease were lurking unperceived within him. On the 24th of December 1800, he complained of a pain in his bowels, which, during that and the following day, gave him but little uneasiness; and he received as usual the visits of his friends. On the afternoon of the 26th, the symptoms became violent and alarming: He felt that he was approaching the end of his appointed course: and retaining to the last moment the full possession of his mental faculties, he expired on the morning of the 27th, with the composure and hope which became a Christian pastor.

Blair, *John*, a Scottish author, was cotemporary with, and the companion, some say the chaplain, of Sir William Wallace. He attended that great hero in almost all his exploits: and, after his death, which left so great a stain on the character of Edward I. of England, he wrote his memoirs in Latin. The injury of time has destroyed this work, which might have thrown the greatest light on the history of a very busy and remarkable period. An inaccurate fragment of it only has descended to us, from which little can be learned, and which was published, with a commentary, by Sir Robert Sibbald.

Blair, *James*, an eminent divine, was born and bred in Scotland, where he had at length a benefice in the episcopal church; but meeting with some discouragements, he came to England in the latter end of the reign of King Charles II. and was sent by Dr Compton as a missionary to Virginia, and was afterwards, by the same bishop, made commissary for that colony, the highest office in the church there. He distinguished himself by his exemplary conduct and unwearied labours in the work of the ministry; and finding that the want of proper seminaries for the advancement of religion and learning was a great damp upon all attempts for the propagation of the gospel, he formed a design of erecting and endowing a college at Williamsburgh, in Virginia, for professors and students in academical learning. He therefore not only set on foot a voluntary subscription; but, in 1693, came to England to solicit the affair at court: when Queen Mary was so well pleased with the noble design, that she espoused it with particular zeal; and King William readily concurring with her majesty, a patent was passed for erecting and endowing a college by the name of the *William and Mary college*, of which Mr Blair was appointed president, and enjoyed that office near 50 years. He was also rector of Williamsburgh, and president of the council in that colony. He wrote, Our Saviour's divine Sermon on the Mount explained, in several sermons, 4 vols. octavo; and died in 1743.

Blair, *John*, an eminent chronologist, was educated at Edinburgh; and coming to London was for some time usher of a school in Hedge-Lane. In 1754, he presented to the world that valuable publication, "The Chronology and History of the World, from the Creation to the year of Christ 1753. Illustrated in LVI. Tables; of which four are introductory and contain the centuries prior to the first Olympiad; and each of the remaining LII. contains in one expanded view 50 years, or half a century." This volume, which is dedicated to Lord Chancellor Hardwicke, was published by subscription, on account of the great expence of the plates, for which the author apologized in his preface, where he acknowledged great obligations to the earl of Bath, and announced some chronological dissertations, wherein he proposed to illustrate the disputed points, to explain the prevailing systems of chronology, and to establish the authorities upon which some of the particular eras depend. In January 1755, he was elected a fellow of the Royal Society; and in 1761 of the Society of Antiquaries. In 1756 he published a second edition of his "Chronological Tables." In September 1757, he was appointed chaplain to the princess dowager of Wales, and mathematical tutor to the duke of York; and on Dr Townshend's promotion to the deanery of Norwich, the services of Dr Blair were rewarded, March 10. 1761, with a prebendal stall at Westminster. The vicarage of Hinckley happening to fall vacant six days after, by the death of Dr Morris, Dr Blair was presented to it by the dean and chapter of Westminster; and in August that year he obtained a dispensation to hold with it the rectory of Burton Coggles in Lincolnshire. In September 1763 he attended his royal pupil the duke of York in a tour to the continent; had the satisfaction of visiting Lisbon, Gibraltar, Minorca, most of the principal cities in Italy, and several parts of France, and returned with the duke in August 1764. In 1768 he published an improved edition of his "Chronological Tables," which he dedicated to the princess of Wales, who had expressed her early approbation of the former edition. To the new edition were annexed, "Fourteen Maps of Ancient and Modern Geography, for illustrating the Tables of Chronology and History. To which is prefixed a Dissertation on the Progress of Geography." In March 1771, he was presented by the dean and chapter of Westminster to the vicarage of St Bride's in the city of London; which made it necessary for him to resign Hinckley, where he had never resided for any length of time. On the death of Mr Sims, in April 1776, he resigned St Bride's, and was presented to the rectory of St John the Evangelist in Westminster; and in June that year obtained a dispensation to hold the rectory of St John with that of Horton, near Colebrooke Bucks. His brother Captain Blair falling gloriously in the service of his country in the memorable sea-fight of April 12. 1782, the shock accelerated the Doctor's death. He had at the same time the influenza in a severe degree, which put a period to his life, June 24. 1782. His library was sold by auction December 11-13th, 1782; and a course of his "Lectures on the Canons of the Old Testament" hath since been advertised as intended for publication by his widow.

Blair of Athol, a castle belonging to the duke of Athol, seated in a district of the same name, in Perthshire in Scotland. W. Long. 3. 30. N. Lat. 56. 46. This castle was besieged by the Highland army in 1746; and bravely defended by Sir Andrew Agnew, who was reduced to eat horse's flesh, until he was relieved by the Hessians under the earl of Crawford.

BLAISE, a military order instituted by the kings of Armenia, in honour of St Blaise, anciently bishop of Sebasta in that country, the patron saint of that nation.

Digitized by Google

Justinian calls them knights of St Blaise and St Mary, and places them not only in Armenia, but in Palestine. They made a particular vow to defend the religion of the church of Rome, and followed the rule of St Basil. The precise year of the institution of the knights of St Blaise is not known; but they appear to have commenced about the same time with the knights Templars and Hospitallers; to the former of which they bore a near affinity, the regulars being the same in both.

BLAISOIS, a late province of France, bounded on the north by Beauce, on the east by the Orleannois, on the south by Berry, and on the west by Touraine. It now forms the department of Loire and Cher. Blois is the capital town.

BLAKE, Robert, a famous English admiral, born August 1589 at Bridgewater in Somersetshire, where he was educated at the grammar-school. He went from thence to Oxford in 1615, where he was entered at St Alban's Hall. From thence he removed to Wadham college; and on the 10th of February 1617, he took the degree of bachelor of arts. In 1623, he wrote a copy of verses on the death of Mr Camden, and soon after left the university. He was tinctured pretty early with republican principles, and disliking that severity with which Dr Laud, then bishop of Bath and Wells, pressed uniformity in his diocese, he began to fall into the puritanical opinions. His natural bluntness causing his principles to be well known, the puritan party returned him member for Bridgewater in 1640; and he served in the parliament army with great courage during the civil war: but when the king was brought to trial, he highly disapproved the measure as illegal, and was frequently heard to say, *he would as freely venture his life to save the king, as ever he did to serve the parliament.* But this is thought to have been chiefly owing to the humanity of his temper, since after the death of the king he fell in wholly with the republican party, and, next to Cromwell, was the ablest officer the parliament had.

In 1648-9, he was appointed, in conjunction with Colonel Dean and Colonel Popham, to command the fleet; and soon after blocked up Prince Maurice and Prince Rupert in Kinsale harbour. But these getting out, Blake followed them from port to port: and at last attacked them in that of Malaga, burnt and destroyed their whole fleet, two ships only excepted, the Reformation in which Prince Rupert himself was, and the Swallow commanded by his brother Prince Maurice. In 1652, he was constituted sole admiral; when he defeated the Dutch fleet commanded by Van Tromp, Ruyter, and de Wit, in three several engagements, in which the Dutch lost 11 men of war, 30 merchant ships, and according to their own accounts, had 1500 men slain. Soon after Blake and his colleagues, with a grand fleet of 100 sail, stood over to the Dutch coast; and forced their fleet to fly for shelter into the Texel, where they were kept for some time by Monk and Dean, while Blake sailed northward. At last, however, Tromp got out, and drew together a fleet of 120 men of war; and on the 3d of June, the generals Dean and Monk came to an engagement with the enemy off the North Foreland with indifferent success: but the next day Blake coming to their assistance with 18 ships, gained a complete victory; so that if the Dutch had not saved themselves on Calais sands, their whole fleet had been sunk or taken.

In April 1653, Cromwell turned out the parliament, and shortly after assumed the supreme power. The states hoped great advantages from this, but were disappointed. Blake said on this occasion to his officers, "It is not for us to mind state affairs, but to keep foreigners from fooling us."—In November 1654 Cromwell sent him with a strong fleet into the Mediterranean, with orders to support the honour of the English flag, and to procure satisfaction for the injuries that might have been done to our merchants. In the beginning of December, Blake came into the road of Cadiz, where he was treated with all imaginable respect; a Dutch admiral would not hoist his flag while he was there; and his name was now grown so formidable, that a French squadron having stopped one of his tenders, which had been separated from Blake in a storm, the admiral, as soon as he knew to whom it belonged, sent for the captain on board, and drank Blake's health before him with great ceremony, under a discharge of five guns, and then dismissed him. The Algerines were so much afraid of him, that, stopping the Sallee rovers, they obliged them to deliver up what English prisoners they had on board, and then sent them freely to Blake, in order to purchase his favour. This, however, did not prevent his coming on the 10th of March before Algiers, and sending an officer on shore to the dey to demand satisfaction for the piracies committed on the English, and the release of all the English captives. The dey, in his answer, alleged, that the ships and captives belonged to private men, and therefore he could not restore them without offending all his subjects, but that he might easily redeem them: and if he thought good, they would conclude a peace with him, and for the future offer no acts of hostility to the English: and having accompanied this answer with a large present of fresh provisions, Blake left Algiers, and sailed on the same errand to Tunis; the dey of which place not only refused to comply with his request, but denied him the liberty of taking in fresh water. "Here (said he), are our castles of Goletto and Porto Ferino; do your worst." Blake, at hearing this, began, as his custom was when highly provoked, to curl his whiskers; and after a short consultation with his officers, bore into the bay of Porto Ferino with his great ships and their seconds; and coming within musket-shot of the castle and the line, fired on both so warmly, that in two hours time the castle was rendered defenceless, and the guns on the works along the shore were dismounted, though 60 of them played at a time on the English. Blake found nine ships in the road, and ordered every captain to man his long boat with choice men, to enter the harbour and fire the Tuniseens; which they happily effected, with the loss of 25 men killed and 48 wounded, while he and his men covered them from the castle by playing continually on them with their great guns. This daring action spread the terror of his name through Africa and Asia. From Tunis he sailed to Tripoli, caused the English slaves to be set at liberty, and concluded a peace with that government. Thence returning to Tunis, the Tuniseens implored his mercy, and begged him to grant them peace, which he did upon terms highly advantageous to England. He next sailed to Malta, and obliged the knights to restore the effects taken

Digitized by Google

taken by their privateers from the English; and by these great exploits so raised the glory of the English name, that most of the princes and states in Italy thought fit to pay their compliments to the Protector, by sending solemn embassies to him.

He passed the next winter either in lying before Cadiz, or in cruizing up and down the Straits: and was at his old station, at the mouth of that harbour, when he received information that the Spanish plate fleet had put into the bay of Sancta Cruz, in the island of Teneriffe: upon this he weighed anchor, with 25 men of war, on the 13th of April 1657; and on the 20th rode with his ships off the bay of Sancta Cruz, where he saw 16 Spanish ships lying in the form of a half-moon. Near the mouth of the haven stood a castle furnished with great ordnance; besides which there were seven forts round the bay, with six, four, and three guns on each, joined to each other by a line of communication manned with musketeers. To make all safe, Don Diego Diagues, general of the Spanish fleet, caused all the smaller ships to be moored close along the shore; and the six large galleons stood farther out at anchor, with their broadsides towards the sea. Blake having prepared for the fight, a squadron of ships was drawn out to make the first onset, commanded by Captain Stayner in the Speaker frigate; who no sooner received orders, than he sailed into the bay, and fell upon the Spanish fleet, without the least regard to the forts which spent their shot prodigally upon them. No sooner were these entered into the bay, but Blake, following after, placed several ships to pour broadsides into the castle and forts; and these played their parts so well, that, after some time, the Spaniards found their forts too hot to be held. In the mean time, Blake struck in with Stayner, and bravely fought the Spanish ships, out of which the enemy were beaten by two o'clock in the afternoon; when Blake, finding it impossible to carry them away, ordered his men to set them on fire; which was done so effectually, that they were all reduced to ashes, except two, which sunk downright, nothing remaining above the water but part of the masts. The English having now obtained a complete victory, were reduced to another difficulty by the wind, which blew so strong into the bay, that they despaired of getting out. They lay under the fire of the castles and of all the forts, which must in a little time have torn them to pieces. But the wind suddenly shifting, carried them out of the bay; where they left the Spaniards in astonishment at the happy temerity of their audacious victors. This is allowed to have been one of the most remarkable actions that ever happened at sea. "It was so miraculous (says the earl of Clarendon), that all men who knew the place wondered that any sober man, with what courage soever endowed, would ever have undertaken it; and they could hardly persuade themselves to believe what they had done; whilst the Spaniards comforted themselves with the belief, that they were devils and not men who had destroyed them in such a manner." This was the last and greatest action of the gallant Blake. He was consumed with a dropsy and scurvy; and hastened home, that he might yield up his last breath in his native country, which he had so much adorned by his valour. As he came within sight of land, he expired.—Never man, so zealous for a faction, was so much respected and esteemed by the opposite factions. Disinterested, generous, liberal; ambitious only of true glory, dreadful only to his avowed enemies; he forms one of the most perfect characters of that age, and the least stained with those errors and violences which were then so predominant. The Protector ordered him a pompous funeral at the public charge: but the tears of his countrymen were the most honourable panegyric on his memory. The lord Clarendon observes, "that he was the first man who brought ships to contemn castles on shore, which had ever been thought very formidable, and were discovered by him to make a noise only, and to fright those who could be rarely hurt by them. He was the first that infused that degree of courage into seamen, by making them see by experience what mighty things they could do if they were resolved; and the first that taught them to fight in fire as well as in water."

BLAMONT, a town of France, in the department of Meurthe, seated on a little river called *Vesouze*, 12 miles south of Luneville, and containing 1860 inhabitants in 1815. E. Long. 6. 51. N. Lat. 48. 35.

BLANC. See BLANK.

BLANC, a town of France, in the department of Indre, seated on the river Creuse, by which it is divided into two parts. The land about it is barren, and full of trees, heath, and lakes. Population 3850 in 1815. E. Long. 1. 13. N. Lat. 46. 38.

Mont BLANC, a stupendous mountain in Savoy, the highest of the Alps, and encompassed by those wonderful collections of snow and ice called the *Glaciers*. See ALPS.

Of these glaciers there are five, which extend almost to the plain of the vale of Chamouni, and are separated by wild forests, corn fields, and rich meadows; so that immense tracts of ice are blended with the highest cultivation, and perpetually succeed to each other in the most singular and striking vicissitude. All these several valleys of ice, which lie chiefly in the hollows of the mountains, and are some leagues in length, unite together at the foot of Mont Blanc; the highest mountain in Europe, and probably of the ancient world.

The summit of this mountain was deemed inaccessible before Dr Paccard, a physician at Chamouni, attempted to reach it in August 1786, and succeeded in the attempt. Soon after, the same undertaking was accomplished by M. de Saussure, who has published a narrative of the journey. He arrived at Chamouni, situated at the foot of the mountain, in the beginning of July 1787; but bad weather prevented him from ascending until the first of August, when he began his expedition, accompanied by a servant and eighteen guides, who carried his philosophical and other apparatus. His son was left at the Priory in Chamouni, and was employed in making meteorological observations, with which those made on the top of the mountain might be compared. Although it is scarcely six miles and three quarters in a straight line from the priory of Chamouni to the top of Mont Blanc, it requires nevertheless 18 hours to gain the summit, owing to the bad roads, the windings, and the great perpendicular height of the mountain. That he might be perfectly at liberty to pass the night on what part of the mountain he pleased, he carried a tent with him; and

Mont Blanc.

and he and his company slept in it the first night on that eminence which is first met with, and which is on the south of the priory, and about a mile perpendicularly above the village.

Hitherto the journey was free from danger, or even difficulty; the road being either rocky or covered with grass; but thence upwards it was either wholly covered with snow, or consisted of the most slippery ice. But the second day's journey was attended with many difficulties. The ice valley on the side of the hill must be passed, in order to gain the foot of that chain of rocks bordering on the perpetual snows which cover Mont Blanc. The passage through this valley is extremely dangerous, since it is intersected with numerous wide, deep, and irregular chasms, which can only be crossed by means of bridges naturally formed of snow, and these often very slender, extended as it were over an abyss. One of the guides had almost perished here the evening before, as he with two others went to reconnoitre the road. They had the precaution to tie themselves together with a long rope, and he in the middle had the misfortune to have the snow-bridge, over the wide and deep chasm, break under him, so that he remained suspended between his two comrades. M. de Saussure and his retinue passed very near the opening through which this man had fallen, and shuddered at the danger in which the poor fellow had been involved. The difficulties they had to encounter in this valley, and the winding road they were obliged to take through it, occasioned their being three hours in crossing it, although in a straight line its breadth is not above three quarters of a mile.

After having reached the rocks, they mounted in a serpentine direction to a valley filled with snow, which runs from north to south to the foot of the highest pinnacle. The surface of the snow in this valley has numerous fissures, which penetrate so deep that their bottom is nowhere to be seen, although they are of considerable breadth. The sides of these fissures, where the snow is broken perpendicularly, afford an opportunity of observing the successive horizontal layers of snow which are annually formed.

The guides were desirous of passing the night near one of the rocks on the side of this valley; but as the loftiest of them is at least 1400 yards perpendicularly lower than the summit of the mountain, M. de Saussure was desirous of ascending higher; in consequence of which it would be necessary to encamp on the snow: but he found it difficult to convince his companions of the practicability of the plan. They imagined that during the night an intolerable cold prevailed in those heights which were eternally covered with snow, and they were seriously afraid of perishing. By proper encouragements, however, he induced them to proceed; and at four in the afternoon they arrived at the second of the three plains of snow which they had to pass. Here they encamped at the height of 3100 yards above the priory of Chamouni, and 4250 yards above the level of the sea, which is about 200 yards higher than the peak of Teneriffe. They did not proceed to the last plain, on account of the day having been far advanced; and they were also apprehensive of exposing themselves to the avalanches which are frequently tumbling from the summit of the mountain. They dug a deep hole in the snow, sufficiently wide to contain the whole company, and covered its top with the tent-cloth.

Mont Blanc.

In making this encampment, they began to experience the effects of the rarity of the atmosphere. Robust men, to whom seven or eight hours walking or rather climbing were an absolute nothing, had scarcely raised five or six shovels full of snow, before they were under the necessity of resting and relieving each other almost incessantly. One of them, who had gone back a small distance to fill a cask with some water which he had seen in one of the crevices of the snow, found himself so much disordered in his way, that he returned without the water, and passed the night in great pain. M. de Saussure, who is so much accustomed to the air of mountains as to say, "That in general I feel myself better in such air than in that of the plains, was exhausted with the fatigue of making his meteorological observations. The principal inconvenience which the thinness of the air produces, is an excessive thirst. They had no means of procuring water but by melting the snow; and the little stove which they had carried with them, afforded but a feeble supply for twenty men.

This region of the mountain presents to the view nothing but snow of the purest and most dazzling whiteness, forming a very singular contrast with the sky, which appears remarkably black.

"No living creature (says M. de Saussure) is to be seen in these desolate regions, nor is the least trace of vegetation to be discovered. It is the habitation of cold and silence! When I reflected that Dr Paccard, and his guide Jacques Balmat, who first visited these deserts, arrived here at the decline of the day, without shelter, without assistance, and wholly ignorant where or how they were to pass the night, without even the certainty that it was possible for men to exist in the places they had undertaken to visit; and yet that they were able to pursue their journey with unremitted intrepidity, I could not but admire their strength and courage. My guides were so firmly prepossessed with the fear of cold, that they shut up every aperture of the tent with the utmost exactness; so that I suffered very considerably from the heat and the vitiated air, which had become highly noxious from the breaths of so many people in a small room. I was frequently obliged, in the course of the night, to go out of the tent, in order to relieve my breathing. The moon shone with the brightest splendour, in the midst of a sky as black as ebony. Jupiter, rayed like the sun, arose from behind the mountain in the east. The light of these luminaries was reflected from the white plain or rather bason in which we were situated; and dazzling eclipsed every star except those of the first and second magnitude. At length we composed ourselves to sleep. We were, however, soon awakened by the noise of an immense mass of snow (*avalanche*) which had fallen down from the top of the mountain, and covered part of the slope over which we were to climb the next day."

As they were obliged to melt a great quantity of snow, and prepare many necessaries for their farther progress in their journey, it was late the next morning before they took their departure.

"We began our ascent (continues M. de Saussure) to the third and last plain, and then turned to the left, in our way to the highest rock, which is on the east part

Digitized by Google

Mont Blanc.

part of the summit. The ascent is here very steep, being about 39 degrees inclined to the horizon, and bounded on each side by precipices. The surface of the snow was so hard and slippery, that our pioneers were obliged to hew out their footsteps with hatchets. Thus we were two hours in climbing a hill of about 530 yards high. Having arrived at this last rock, we turned to the westward, and climbed the last ascent, whose height is about 300 yards, and its inclination about 28 or 29 degrees. On this peak the atmosphere is so rare, that a man's strength is exhausted with the least fatigue. When we came near the top, I could not walk fifteen or sixteen steps without stopping to take breath; and I frequently perceived myself so faint, that I was under the necessity of sitting down from time to time; and in proportion as I recovered my breath, I felt my strength renewed. All my guides experienced similar sensations, in proportion to their respective constitutions. We arrived at the summit of Mont Blanc at 11 o'clock in the forenoon.

"I now enjoyed the grand spectacle which was under my eyes. A thin vapour, suspended in the inferior regions of the air, deprived me of the distinct view of the lowest and most remote objects, such as the plains of France and Lombardy; but I did not so much regret this loss, since I saw, with remarkable clearness, what I principally wished to see, viz. the assemblage of those high ridges, with the true form and situations of which I had long been desirous of becoming thoroughly acquainted. I could scarcely believe my eyes. I thought myself in a dream when I saw below my feet so many majestic peaks, especially the Needles, the Midi-Argentiere, and Géant, whose bases had proved so difficult and dangerous of access. I obtained a perfect knowledge of their proportion to, and connexion with, each other; of their form and structure: and a single view removed more doubts, and afforded more information, than whole years of study.

"While I was thus employed, my guides pitched my tent, and were fixing the apparatus for the experiments I had proposed to make on boiling water; but when I came to dispose my instruments for that purpose, I was obliged, almost at every instant, to desist from my labours, and turn all my thoughts to the means of respiration. When it is considered that the mercury in the barometer was no higher than 16 inches and a line (17.145 inches English), and that this air had consequently little more than half the density of that on the plains, the breathing must necessarily be increased, in order to cause, in a given time, the passage of a sufficient quantity of air through the lungs. The frequency of respiration increased the circulation of the blood, more especially as the arteries on the surface of the body had not the pressure they were usually accustomed to. We were all in a feverish state, as will be seen in the sequel.

"While I remained perfectly still, I experienced but little uneasiness more than a slight oppression about my heart; but, on the smallest bodily exertion, or when I fixed my attention on any object for some moments together, and particularly when I pressed my chest in the act of stooping, I was obliged to rest and pant for two or three minutes. My guides were in a similar condition. We had no appetite; and our provisions, which were all frozen, were not well calculated to excite it: nor had we any inclination for wine or brandy, which increased our indisposition, most probably by accelerating the circulation of the blood. Nothing but fresh waster relieved us; and much time and trouble were necessary to procure this article, as we could have no other than melted snow. I remained on the summit till half past three; and though I did not lose a single moment, I was not able to make all these experiments in four hours and a half, which I have frequently done in less than three on the sea-side. However, I made with great exactness those which were most essential.

"We returned much easier than I could have expected; since, in descending, we did not experience any bad effects from the compression of the thorax; our respiration was not impeded, and we were not under the necessity of resting, in order to recover our breath and strength. The road down to the first plain was nevertheless by no means agreeable, on account of the great declivity; and the sun, shining so bright on the tops of the precipices below us, made so dazzling an appearance, that it required a good head to avoid growing giddy from the prospect. We pitched our tent again on the snow, though we were more than 400 yards below our last night's encampment. I was here convinced that it was the rarity of the air, and not the fatigue of the journey, that had incommoded us on the summit of the mountain, otherwise we should not have found ourselves so well, and so able to attack our supper with a good appetite. I could now also make my meteorological observations without any inconvenience. I am persuaded that the indisposition in consequence of the rarity of the atmosphere is different in different people. For my own part I felt no inconvenience at the height of 4000 yards, or nearly two miles and a quarter; but I began to be much affected when I was higher in the atmosphere.

"The next day we found that the ice valley which we had passed on our first day's journey had undergone a considerable change from the heat of the two preceding days, and that it was much more difficult to pass than it had been in our ascent. We were obliged to go down a declivity of snow of no less than 50 degrees of inclination, in order to avoid a chasm which had happened during our expedition. We at length got down as low as the first eminence on the side about half after nine, and were perfectly happy to find ourselves on a foundation which we were sure would not give way under our feet."

From the narrative, we learn, that the summit of the mountain is a ridge nearly horizontal, lying east and west: the slope at each extremity is inclined from 28 to 30 degrees, the south side between 15 and 20, and the north about 45 or 50. This ridge is so narrow as scarcely to allow two people to walk abreast, especially at the west end, where it resembles the roof of a house. It is wholly covered with snow; nor is any bare rock to be seen within 150 yards of the top. The surface of the snow is scaly, and in some places covered with an icy crust, under which the snow is dusty, and without inconsistence. The highest rocks are all granites; those on the east side are mixed with steatites; those on the south and the west contain a large quantity of schoerl, and a little *lapis corneus*. Some of them, especially those on the east, which are about 150 yards below

low the summit, seem to have been lately shivered with lightning.

M. de Saussure saw no animals on the mountain, except two butterflies, which he supposes must have been driven thither by the wind. Lichens are the only vegetables which are found on the more elevated parts of these mountains; the *silene acaulis*, which grows in great quantities on the lower parts, disappears at the height of about two miles above the level of the sea.

M. de Saussure has given us the height of the barometer on the top of Mont Blanc, August 3. at noon, 16 inches, 0 lines, and $\frac{144}{188}$ of a line, French measure (i. e. 16.181 English); and Reaumur's thermometer was 2.3 below the freezing point. M. Sennebier, at the same time, observed at Geneva the barometer 27.2$\frac{1085}{1800}$ (29.020 inches English); and the thermometer 22.6 above freezing. From these data he makes the height of Mont Blanc 2218 toises, or 14180 English feet (about 2½ miles), according to M. de Luc's rule; and 2272 toises, or 14525 English feet, according to M. Trembley's. To these heights 13 toises, or 83 feet, the height of M. Sennebier's room above the lake of Geneva must be added, to give the height of the mountain above the level of the lake, 14263 feet according to M. de Luc, and 14608 feet according to M. Trembley. Sir George Shuckburgh made the height of Mont Blanc, by trigonometrical measurement, 14429 feet above the lake, which is almost the mean between the other two. The result of the observations made at Chamouni, contemporary with those on Mont Blanc, agrees still nearer with Sir George's measurement. The general mean result makes the summit of Mont Blanc 2450 toises, 14973 English feet, or three miles nearly, above the level of the sea.

M. de Saussure found by his electrometer, that the electricity of the air on the summit of the mountain was positive. Water boiled at 68.993 degrees of a thermometer, which rises to 80 with the barometer 27 French inches high. The wind was north, and extremely piercing on the summit; but, southward of the ridge, the temperature of the air was agreeable. The experiments with lime-water, and with the caustic alkali, show that the air was mixed with carbonic acid or fixed air. See ATMOSPHERE.

BLANC-Manger, Fr. *q. d.* white food, is a preparation of dissolved isinglass, milk, sugar, cinnamon, &c. boiled into a thick consistence, and garnished for the table with blanched almonds. It is cooling and strengthening.

BLANCARDS, a name given to certain linen-cloths, thus called, because the thread used to weave them has been half blanched or bleached before it was used. They are manufactured in Normandy, particularly in the places which are in the district or under the jurisdiction of Pont-Audemer, Bernay, and Lisieux.

BLANCH-FERME, or *Blank farm*, a white farm, that is, where the rent was to be paid in silver, not in cattle. In ancient times, the crown rents were many times reserved to be paid in *libris albis*, called *blanch firmes*: in which case the buyer was holden *dealbare firmam*, viz. his base money or coin, worse than standard, was melted down in the exchequer, and reduced to the fineness of standard silver; or instead thereof he paid to the king 12d. in the pound by way of addition.

BLANCH-Holding, in *Law*, a tenure by which the vassal is only bound to pay an elusory yearly duty to his superior merely as an acknowledgment of his right. See LAW.

BLANCHARD, JAMES, an excellent painter, was born at Paris, and learnt the rudiments of his profession under Nicholas Bolleri his uncle; but left him at 20 years of age, and travelled into Italy. He staid two years at Rome, and from thence went to Venice, where he was so charmed with the works of Titian, Tintoret, and Paul Veronese, that he resolved to follow their manner; and in this he succeeded so far, that at his return to Paris he soon became generally esteemed for the novelty, beauty, and force of his pencil. He painted two galleries at Paris, one belonging to Perault, the first president, and the other to Bullion, superintendant of the finances; but his capital piece is a picture of the descent of the Holy Ghost, in the church of Notre Dame. He was seized in the flower of his age, with a fever and imposthume in the lungs, of which he died in 1683. Of all the French painters Blanchard was esteemed the best colourist, he having carefully studied this part of painting in the Venetian school.

Carte-BLANCHE. See CARTE.

BLANCHING, the art or manner of making any thing white. See BLEACHING.

BLANCHING of Iron Plates, is performed with aquafortis and tin.

BLANCHING of Woollen Stuffs, is done with soap, chalk, or sulphur. See BLEACHING *Index*.

BLANCHING of Silk, is performed with soap and brimstone.

BLANCHING of Wax, is by exposing it to the sun and dew. See BLEACHING *Index*.

BLANCHING, in coinage, the operation performed on the planchets, or pieces of silver, to give them the requisite lustre and brightness. They also blanch pieces of plate, when they would have them continue white, or have only some parts of them burnished.—Blanching, as is now practised, is performed by heating the pieces on a kind of peel with a wood fire, in the manner of a reverberatory; so that the flame passes over the peel. The pieces being sufficiently heated and cooled again, are put successively to boil in two pans, which are of copper: in these they put water, common salt, and tartar of Montpelier. When they have been well drained of this water in a copper sieve, they throw sand and fresh water over them; and when dry, they are well rubbed with towels.

BLANCHING, among gardeners, an operation whereby certain salads, roots, &c. are rendered whiter than they would otherwise be.—It is thus: After pruning off the tops and roots of the plants to be blanched, they plant them in trenches about ten inches wide, and as many deep, more or less as is judged necessary; as they grow up, care is taken to cover them with earth, within four or five inches of their tops: this is repeated from time to time, for five or six weeks; in which time they will be fit for use, and of a whitish colour where covered by the earth.

BLANCHING also denotes the operation of covering iron plates with a thin coat or crust of tin. See LATTEN.

BLANCO,

Digitized by Google

BLANCO, a cape or promontory of Africa, in the Atlantic ocean. W. Long. 18. 30. N. Lat. 20. 0.

BLANCO, a promontory of Peru in South America, in the South sea. W. Long. 81. 10. N. Lat. 11. 50.

BLANDA, in *Ancient Geography*, a Roman city in the territory of Barcino in Hispania Citerior: Now *Blanes*, a sea-port town of Catalonia, situated near the river Tordara. E. Long. 3. 40. N. Lat. 41. 30.

BLANDFORD, a town of Dorsetshire in England. It is pleasantly situated on the river Store near the Downs, but has been subject to several dreadful fires, particularly in 1731, when almost the whole town was burnt down; but it has since been rebuilt finer than before. It has the title of a marquisate, and contained 2425 inhabitants in 1811. W. Long. 2. 15. N. Lat. 50. 50.

BLANDONONA, in *Ancient Geography*, a small city of Liguria in Italy: Now *Bron* or *Broni*. See that article.

BLANES. See BLANDA.

BLANK, or BLANC, in a general sense, signifies white; and *Blancus*, or *Blanca*, is more particularly used for a kind of white or silver money, of base alloy, coined by Henry V. in those parts of France then subject to England, valued at 8d. sterling. They were forbidden by his successor to be current in this realm. In some ancient charters they are called *solidi blanci, white shillings*.

BLANK also denotes a small copper coin, formerly current in France, at the rate of five deniers Tournois. They had also great blanks, or pieces of three blanks, and others of six, in respect whereof the single sort were called little blanks: but of late they are all become only moneys of account.

BLANK, or *BLANK-Ticket*, in lotteries, that to which no prize is allotted. The French have a game, under the denomination *blanque*, answering to our lottery.

BLANK, in coinage, a plate, or piece of gold or silver, cut and shaped for a coin, but not yet stamped.

BLANK-Bar, in *Law*, is used for the same with what we call a *common bar*, and is the name of a *plea in bar*, which in an action of trespass is put in to oblige the plaintiff to assign the certain place where the trespass was committed.

BLANKS, in judicial proceedings, certain void spaces sometimes left by mistake. A blank (if something material be omitted) in a declaration abates the same: and such a blank is a good cause of demurrer.

BLANK-Verse, in the modern poetry, that composed of a certain number of syllables, without the assistance of rhime. See POETRY, Part iii.

Point BLANK. See *POINT-Blank*.

BLANKENBURG, a town of Germany, in the circle of Westphalia and duchy of Berg. E. Long. 7. 18. N. Lat. 50. 54.

BLANKENBURG, a town of Germany, in the circle of Lower Saxony, and capital of the county of the same name, subject to the duke of Brunswic-Wolfenbuttle. The castle or palace is a modern building, and is the residence of the princess dowager. E. Long. 11. 20. N. Lat. 51. 50.

BLANKENHEIM, a small territory of Germany with the title of a county, which is part of that of Eyffel, near the archbishopric of Cologn and duchy of Juliers.

BLANKET, in *Commerce*, a warm woolly sort of stuff, light and loose woven, chiefly used in bedding. The manufacture of blankets is chiefly confined to Witney in Oxfordshire, where it is advanced to that height, that no other place comes near it. Some attribute a great part of the excellency of the Witney blankets to the abstersive nitrous water of the river Windrush, wherewith they are scoured; others rather think they owe it to a peculiar way of loose spinning which the people have thereabouts. Be this as it will, the place has engrossed almost the whole trade of the nation for this commodity; insomuch that the wool fit for it centres here from the furthermost parts of the kingdom. Blankets are made of felt-wool, i. e. wool from off sheep-skins, which they divide into several sorts. Of the head wool and bay wool they make blankets of twelve, eleven, and ten quarters broad; of the ordinary and middle sort, blankets of eight and seven quarters broad; of the best tail wool, blankets of six quarters broad, commonly called *cuts*, serving for seamen's hammocks. See HYKES.

Tossing in a BLANKET, a ludicrous kind of punishment, of which we find mention in the ancients under the denomination *sagatio*. Martial describes it geographically enough. *Ibis ab excusso, missus ad astra, sago.* A late writer represents it as one of Otho's imperial delights. But this is turning the tables: that emperor's diversion, as related by Suetonius, was not to be the subject, but the agent, in the affair: it being his practice to stroll out in dark nights, and where he met with a helpless or drunken man, to give him the discipline of the blanket.

BLANKOF, JOHN TEUNISZ, a painter of great abilities, was born at Alkmaar in 1628; and received his earliest instruction from Arent Tierling: but afterwards he was successively the disciple of Peter Scheyenburg and Cæsar Van Everdingen. When he had spent some years with these masters, he went to Rome, where during his continuance in that city, he was studiously diligent in copying the works of the best masters, and was admitted into the society of Flemish painters called *Bentvogels*, who gave him the name of *Jan Maat* (which in Dutch signifies mate or companion), and by that name he is most generally known. His subjects were landscapes, with views of rivers or sea shores, havens or ports, which he executed with a light free pencil; and in the representation of storms and calms (as nature was always his model) he described those subjects with great truth, exactness, and neatness of handling. The pictures of this master which are most commended are the Italian sea ports, with vessels lying before them. He possessed a lively imagination; nor was his hands less expeditious than his thoughts: and the connoisseurs agreed in opinion, that if he had bestowed more labour on his pictures than he usually did, or if he had finished them more highly, he would certainly have destroyed a great deal of their spirit, force, and effect. His most capital performance is a view of the sea shore, with the waves retiring at ebb tide; which is described by Houbraken as being wonderfully beautiful and natural. He died in 1670.

BLANQUILLE, in *Commerce*, a small silver coin current in the kingdom of Morocco, and all that part of the coast of Barbary; it is worth about three halfpence of our money.

Digitized by Google

BLARE, in *Commerce*, a small copper coin of Bern, nearly of the same value with the ratz.

BLAREGNIES, a town of the Netherlands, in the province of Hainault, seated in E. Long. 3. 35. N. Lat. 50. 30. Near this place the English and their allies under the duke of Marlborough obtained a very bloody victory over the French in 1709. This is most commonly called the *battle of Malplaquet*. See MALPLAQUET.

BLASE, bishop of Sebasta in Cappadocia, in the second and third centuries, suffered death under Dioclesian by decapitation, after being whipped and having his flesh torn with iron combs. He is a person of great note among the vulgar, who in their processions relative to the woollen trade, always carry a representation of him as the inventor or patron of the art of wool-combing; though that art must have been known long before his time. It is difficult to say how the invention came to be attributed to him; but it had probably no better origin than the circumstance of his being tortured by instruments used in combing of wool.

BLASIA, LEATHER-CUP. See BOTANY *Index*.

BLASPHEMY (*blasphemia*, or *blasphemium*), in middle-age writers, denotes simply the blaming or condemning of a person or thing. The word is Greek, βλασφημια, from βλαπτω, *lædo*. Among the Greeks to blaspheme was to use words of evil omen, or that portended something ill, which the ancients were careful to avoid, substituting in lieu of them other words of softer and gentler import, sometimes the very reverse of the proper ones.

BLASPHEMY is more peculiarly restrained to evil or reproachful words spoken of the Deity. Augustine says, *Jam vulgo blasphemia non accipitur nisi mala verba de Deo dicere*.

According to Lindwood, blasphemy is an injury offered to God, by denying that which is due and belonging to him; or attributing to him what is not agreeable to his nature. By the Mosaic law, blasphemy was punished with death; Levit. xxiv. ver. 13—16. As also by the civil law; Novel. 77. In Spain, Naples, France, and Italy, the pains of death are not now inflicted. In the empire, neither amputation or death is made the punishment of this crime.

By the canon law, blasphemy was punished only by a solemn penance; and by custom either by a pecuniary or corporal punishment. By the English laws, blasphemies of God, as denying his being or providence, and all contumelious reproaches of Jesus Christ, &c. are offences by the common law, and punishable by fine, imprisonment, and pillory. And, by the statute law, he that denies one of the persons in the Trinity, or asserts there are more than one God, or denies Christianity to be true, for the first offence is rendered incapable of any office; for the second, adjudged incapable of suing, being executor or guardian, receiving any gift or legacy, and to be imprisoned for three years.

According to the law of Scotland, the punishment of blasphemy is death. The first species thereof consists in railing at or cursing God; and here the single act constitutes the crime. The second consists in denying the existence of the Supreme Being, or any of the persons of the Trinity; and therein obstinately persevering to the last. For reiterated denial does not fully constitute the crime, because the stat. of Charles II. 1661, admits of repentance before conviction, as a complete expiation.

This statute of 1661 is ratified by a statute of King William, whereby the calling in question the existence of God, or of any of the persons of the Trinity, or the authority of Scripture, or the Divine Providence, is made penal: For the first offence, imprisonment till satisfaction given by public repentance in sackcloth; for the second, a fine of a year's valued rent of the real estate, and twentieth part of the personal estate; and the trial in both these cases is competent to inferior judges. The trial of the third offence is death, to be tried only by the justices.

BLASPHEMY against the Holy Ghost. Divines are not agreed with respect to the nature of the crime thus denominated (Mat. chap. xii. ver. 31.), and the grounds of the extreme guilt ascribed to it. Dr Tillotson maintains, that it consisted in maliciously attributing the miraculous operations which Christ performed by the power of the Holy Ghost to the devil. Dr Whitby refers it to the dispensation of the Holy Ghost, which commenced after our Lord's resurrection and ascension; and those were guilty of the crime who persisted in their unbelief and blasphemed the Holy Ghost, representing him as an evil spirit. The crime was unpardonable, because it implied a wilful opposition to the last and most powerful evidence which God would vouchsafe to mankind, and preclude the possibility of a recovery to faith and repentance.

BLAST, *flatus*, in the military art, a sudden compression of the air caused by the discharge of the bullet out of a great gun. The blast sometimes throws down part of the embrasures of the wall.

BLAST is also applied in a more general sense to any forcible stream of wind or air, excited by the mouth, bellows, or the air.

BLAST is also used in agriculture and gardening, for what is otherwise called a *blight*.

Blasts or blastings are by some supposed owing to cold; by others to the want of a due supply of sap; by others to ascending fumes of the earth; by others to sharp winds and frosts, immediately succeeding rains. That species called *uredines* or *fire-blasts*, is supposed by Mr Hales owing to the solar rays reflected from or condensed in the clouds, or even collected by the dense steams in hop-gardens and other places. The effect of them is to wither, shrivel, scorch, turn black, and as it were burn up the leaves, blossoms, and fruits of trees, shrubs, herbs, grass, corn, even for whole tracts of ground.

Physicians also speak of a kind of blasts affecting human bodies, and causing erysipelas, palsies, &c.

BLASTS, among miners. See DAMPS.

BLASTED, something struck with a blast. Among the Romans, places blasted with lightning were to be consecrated to Jupiter, under the name of *bidentalia* and *putealia*. It was also a ceremonial of religion to burn blasted bodies in the fire.

BLASTING, among miners, a term for the tearing up rocks, which they find in their way, by gunpowder. The method of doing which is this: they make a long hole like the hollow of a large gun-barrel in the rock they would split; this they fill with gunpowder; they then firmly stop up the mouth of the hole

Digitized by Google

hole with clay, except a touch-hole, at which they leave a match to fire it. A small quantity of powder suffices. See BLASTING, SUPPLEMENT.

BLATOBULGIUM, in *Ancient Geography*, (Antonine); a place of the Brigantines in Britain, having a camp of exploratores or scouts near Solway frith and promontory; now called *Bulness*, (Camden).

BLATTA, or COCKROACH. See ENTOMOLOGY *Index*.

BLATTARIÆ, (from *Blatta*, a moth or little worm), the title of Scopoli's 12th natural class, in his Flora Carniolica. It is taken from the *Blattaria*, which was Tournefort's generic name for the verbascum of Linnæus. See VERBASCUM.

BLAUBEUREN, a town of Germany, in the circle of Suabia, and kingdom of Wirtemberg. E. Long. 9. 57. N. Lat. 48. 22.

BLAVET, a sea-port town of Brittany in France, situated at the mouth of a river of the same name. It is one of the stations of the navy of France, and is sometimes called *Port Lewis*. W. Long. 3. 5. N. Lat. 47. 40.

BLAVIA, or BLAVIUM, in *Ancient Geography*, a town of Aquitain, on the bank of the Garonne, below its confluence with the Dordogne: Now *Blaye;* which see.

BLAYE, an ancient and strong town of France, in the department of Gironde. It is situated on the river Gironde, has a harbour much frequented by foreigners, and the ships which sail to Bourdeaux are obliged to leave their guns here. The river is 3800 yards broad at Blaye; for which reason a battery was built upon an island in 1689, to command the vessels that sail up. The city is built on a rock, and has a citadel with four bastions, which is called the *Upper Town*. The lower town is separated from the upper by a small river; and in the lower town the merchants reside with their magazines. The neighbourhood produces a great deal of corn. The town contained 4700 inhabitants in 1815. W. Long. 1. 23. N. Lat. 45. 6.

BLAZE, a white spot in a horse's face.

BLAZONING, or BLAZONRY, in *Heraldry*, the decyphering the arms of noble families. The word originally signified the blowing or winding of a horn; and was introduced into heraldry as a term denoting the description of things borne in arms, with their proper significations and intendments, from an ancient custom the heralds, who were judges, had of winding a horn at justs and tournaments, when they explained and recorded the atchievements of knights. See HERALDRY.

BLEA, in the anatomy of plants, the inner rind or dry bark. See PLANTS.

BLEACHING.

1. BLEACHING, or BLANCHING, (*Blanchiment*, Fr.) originally signifies the art of whitening any substance by other means than painting; but it is more particularly applied to a branch of trade or manufacture exercised by persons called *bleachers*, who, by certain processes of a chemical nature, give to woollen, linen, and cotton stuffs, &c. the greatest degree of *whiteness* of which they are susceptible.

2. Till lately this art had not occupied any considerable share of attention, except to those who were more immediately concerned in the practice of it. Its processes were few, and though exceedingly tedious, were simple and easily understood. The late rapid progress of chemical science, has however thrown so much light on the theory of the art, and contributed so materially to the improvement of its processes, that it is become a most pleasing field of investigation, and demands a much more considerable space in a modern encyclopædia than it has hitherto obtained.

3. We propose, therefore, to treat of bleaching in the following article more fully, and more in detail, than is usually done, and to bring, as far as possible, into one point of view, every thing of importance which has been lately written on the subject by Berthollet, De Charmes, Rupp, Kirwan, Higgins, Chaptal, O'Reilly, and other eminent chemists.

4. The improvements made by these gentlemen have been so rapid in their succession, and so important in their consequences, as to have rather created a new art than ameliorated the old. It will hereafter be scarcely credible, that in the space of about twenty years, the whole of an ancient system of bleaching, which had prevailed from time immemorial, should have been entirely overturned, and replaced by one of the most scientific accuracy, and expeditious management.

5. The origin of this art, like that of many others which are subservient to the comforts or conveniences of man, is involved in great obscurity. We find that a desire for rich and brilliant colours, and for garments of the purest white, has prevailed in civilized society from the earliest periods of which we have any accounts. This was more particularly the case in the eastern countries, as appears from the earliest writers, both of sacred and profane history. It is, however, probable, that the art of dyeing was antecedent to that of bleaching; but the effects of the sun and air in whitening garments, and in discharging the less permanent colours imprinted by the dyer, which must have been very observable in those climates, would soon lead an ingenious people to imitate or increase the action of the atmosphere, and turn to advantage as a luxury what in many cases must have been considered as an inconvenience. Of the methods employed by the ancients in whitening or scouring their various stuffs we are almost entirely ignorant; we know, however, that the Egyptians were accustomed to use some kinds of clay for these purposes, and that they availed themselves of the bleaching powers of the atmosphere. Pliny informs us, that a plant to which he gives the name *radicula*, was employed for scouring wool *; this is probably the same with what we call *soapwort*. The acrid juice of some species of euphorbia, especially the peplus, is said to have been used in France for whitening linen.

* Plin. lib. xix. c. 3.

Digitized by Google

Animal Substances.

6. The art of bleaching is very extensive, and comprehends a variety of objects, whether we consider it as a distinct branch of trade, or as an art called in to the assistance or completion of several of our manufactures. It is essential to the perfection of the linen, the cotton, the silken, the woollen manufacture; it is in many cases a necessary step in preparing stuffs for the dyer and the calico-printer; and to it the paper-maker and the wax-chandler are indebted for the beauty of their productions. To this art belong the scouring of clothes and stuffs, the removal of colours, spots, and stains, the cleaning of books and prints.

7. We shall in the following pages describe the various methods employed to answer these several purposes, and shall endeavour to trace the steps by which bleaching has arrived at the high degree of perfection which it has lately attained. In detailing the processes of the artist, we shall, however, avoid as much as possible his technical language, so as to render this article not only a useful assistant to the practical bleacher, but an interesting object to the philosophic chemist.

8. As the methods of bleaching animal and vegetable substances are different, we may properly divide this article into two parts; in the first of which we shall describe the processes for bleaching wool and silk, and in the second the methods employed in the bleaching of linen, cotton, paper, and other materials furnished by vegetables.

PART I. BLEACHING OF ANIMAL SUBSTANCES.

9. THE substances which are derived from the animal kingdom, and which we more particularly employ as articles of clothing, differ essentially from those which are the produce of vegetables. The art of bleaching depends very much on an exact knowledge of those peculiar characters, which form the line of separation between these two classes of bodies, and it is therefore of importance to him who is desirous not only to be master of the several processes in this art, but to understand the theory of the subject, to be acquainted with the nature and properties of each.

10. The animals from whose spoils we obtain our principal clothing are nourished by vegetables, which as they pass through their organs lose their former properties, and acquire others more akin to animal bodies. In particular they are found to contain a new element, *azote*, which is but sparingly found in the vegetable kingdom, but constitutes one of the most abundant products of animal bodies. They also contain *sulphur* and *phosphorus*, as appears from the examination of those pestilential exhalations which always accompany the decomposition of animal matters.

11. It is found that animal matters are more easily separated into their component principles than vegetable, owing to the weaker degree of their mutual attraction. Hence the action of acids and alkalies is much more violent on the former than on the latter, and consequently much more caution is requisite in their employment.

12. In bleaching animal substances recourse must be had to the united action of the fixed alkalies, soap, ammonia or volatile alkali, and sulphurous acid, the choice, preparation, and uses of which will be presently described. The animal matters with which the bleacher is more immediately concerned are wool and silk.

CHAP. I. *Of Wool.*

13. WOOL, like hair, of which it is a variety, is composed of filaments or tubes filled with a substance of an oily nature. The surrounding surface of these tubes is pierced with an infinite number of small holes which communicate with the internal cavity. By chemical analysis wool is found to contain carbonat of ammonia, and a considerable quantity of oil. It is very little altered by exposure to the air, and undergoes no change from the action of boiling water. It is of great consequence that the bleacher should attend to this circumstance, as will appear immediately.

14. A solution of caustic alkali, or caustic ley, destroys it altogether, and forms with it a soap, for the discovery and application of which we are indebted to Chaptal; it is but little acted on by acids, but the application of a violent heat reduces it to a state of fusion. From all these circumstances it appears that wool is nearly allied to oleaginous substances.

15. The examination of these chemical actions is of consequence to direct the bleacher in his operations on this substance: the trifling action which acids exert on wool, and its inalterability in water, even when assisted by heat, show the necessity of having recourse to alkalies or soapy matters; while at the same time the violent action which these exert, will point out the propriety of being cautious in their use.

Of Bleaching Wool.

16. The wool as it comes into the hands of the manufacturer usually contains a large portion of the natural greasy matter, from which it must be purified before it can undergo the process of bleaching. Sometimes the farmer cleans it from most of its oil, so as to diminish its weight by 50 or 60 per cent. in order to enhance the value of the article; but care is taken to leave some portion, as the natural fat is found to be the best preservative against the attacks of moths and other insects.

17. The first object then is to carry off the whole of the oily matter, which is called the operation of *scouring*, and is performed by means of an ammoniacal ley, which is thus prepared. Five parts of river or other soft water are to be mixed with one part of stale purified urine, which is found to contain a large quantity of ammonia (A). This

(A) The detergent property of urine has been long known, and it is frequently employed in washing to save

This mixture is to be boiled for a short time, and into this, at about the heat of 56 degrees, or so that the hand of the workman can be easily held in it for a considerable time, the wool is to be thrown. Four or five pailfuls will generally be sufficient for 20 pounds of wool. After steeping for a short time, the wool is to be stirred about in the mixture continually for about a quarter of an hour or 20 minutes, according to the quantity of greasy matter. It is then to be taken out and drained into a basket, so that the drainings may drop into the vessel in which it was steeped, that nothing may be lost. It must now be completely rinsed by exposing it in baskets to a continued stream of clear water, while a workman is perpetually employed in stirring it with a pole, till the water passes off perfectly clear. The wool is then removed, and a fresh quantity put into the basket, which is to be treated in the same manner. The steeping and rinsing are to be repeated till the wool has attained as great a degree of whiteness as it is capable of receiving from this operation. It is necessary, in order to conduct this process to the greatest advantage, that the workmen should attend to the following circumstances.

18. *1st*, A quantity of fresh ley must be from time to time added to the bath, as the immersion of the wool is found to weaken its power; but it is better not entirely to renew the bath, as the grease abstracted from the wool, during its immersion, forms with the ammonia of the urine a kind of soap, which much increases the cleansing quality of the bath.

19. *2d*, Increasing the temperature of the bath will augment its deterging powers, and may sometimes supply the want of an addition of stale urine; but both these circumstances require caution, as too great a degree of heat hardens the greasy matter, and renders it more difficult of solution; and again, too much urine makes the wool harsh.

20. *3d*, After being much used, the bath becomes too foul, and must be entirely renewed.

21. The wool which has properly undergone the process of scouring should be white, soft, elastic, and open; whereas before it was hard, stiff, and greasy. By this operation the wool loses much more of its weight, so that 100 pounds of raw wool, when completely scoured, will not yield more than 30 or 40 fit for the manufacture of cloth.

22. After scouring, the wool is sometimes carried to the fulling mill, in which it acquires an additional degree of whiteness. The above is chiefly employed for the coarser wools, and wool that has yet to be carded for the making of broad cloth, but for the finer kind it is better to employ a bath in which soap has been dissolved. This method is more expensive, but the expence is compensated by the superior quality of the wool which is thus treated. This operation is performed by the comber, and is thus conducted. The wool is divided into parcels containing each about six pounds and a half. A bath is prepared with two pounds and a half of green or black soap dissolved in a sufficient quantity of boiling water; and in this bath a parcel of the wool is to be washed for a longer or shorter time according to its foulness. It is then wrung by means of a hook, and hung in the sunshine or air to dry. Before it is combed it must undergo a second scouring, which clears it of all the natural oily matter.

23. This quantity of wool is not to be washed all at once, but in successive portions, and fresh hot water is to be added from time to time in order to free the wool more easily from the grease. For wringing it there is a hook fixed at each end of the washing-tub, on which the wool is fastened and turned round by means of a handle or winch, fixed to one of the hooks. As economy should be consulted in every manufacture, a method of scouring wool without soap, would be of considerable advantage. Fullers have long been in the habit of employing a species of clayey earth, called from them *fullers earth*, which has the property of combining with the greasy matter and rendering it more soluble in water. A new earth has lately been found on an estate belonging to Lord Warwick, which by certain processes is made to answer the purpose of soap, and a patent for its preparation has been granted to Mr John Vancouver. It is not distinguished by any particular name, and is disposed or situated in the ground in different strata or layers. The first or uppermost layer is of a greenish or grayish colour; the second layer is of a beautiful lilac or light purple; and the third or undermost is generally white, although the white is found intermixed with the purple. The stratum on which the earth lies, is indurated red marl, and it is superinduced by a bed of gravel. The thickness of the entire stratum of this earth is from four inches to one foot, and its general position is very even, regular, and level. When first taken out of the earth, its colours are very fine, particularly the lilac, which, on exposure to the sun's rays, or to the influence of frost, soon becomes white. On chemical examination, it appears to contain clay, siliceous sand, and the oxide of iron; but a more studied examination would probably shew the existence of other peculiarities, from which the detergent property of this earth might be found to arise.

The processes for manufacturing this earth are performed as follows:—After digging it out of the vein, it is dried by means of stoves or otherwise; then pulverised, and sifted through fine sieves; a size is then prepared from white shreds of leather, and the dry sifted earth is beaten up with the size; after which it is formed into convenient parcels or cakes, resembling those of soap, and of such sizes, figures, and dimensions, as are best adapted to the purposes of its intended application. The use of the size is to keep the parts of the earth together, and to moderate the effect of its absorbent quality, which is so extreme, as to cause it to become pulverulent, like quick-lime, when water is added to the dried earth; and on this account the patentee does not confine himself to the use of

save soap. At sea, where fresh water cannot be spared for the purpose of washing, the sailors are accustomed to scour their foul linen in stale urine, which so far cleanses them that a subsequent rinsing in salt water renders them tolerably pure and sweet.

Digitized by Google

Animal Substances.

of size made of leather, but applies other animal and vegetable mucilage to the same purpose, giving the preference to such, as by their cheapness and adhesive quality are best adapted to the purposes of the manufacture. The most distinctive property of this earth is that of cleansing wool in a manner much superior to soap; because it makes it equally white and clean, without robbing it of what manufacturers call its nature, as soap does; for, it is well known, that when wool is washed with coarse soap, it undergoes some change, either in the polish of its surface, or in the elasticity of its fibres, or in some other respects, which causes it to feel less full to the hand, so that it will not rise and spring up, after the pressure, in the same manner as it did before such washing. Whereas, on the contrary, wool, when treated with the washing-earth, becomes equally white and clean, at the same time that it remains in possession of all its original fulness and elasticity, which are of great consequence and value in the manufacture of this important article of produce *. Before the wool is quite dry it is combed, as this operation is found to succeed best when it is a little moist, it being then easier to form it into proper lengths of three or four feet. Considerable nicety is requisite in the conducting of these first processes, as much of the success of the succeeding operations depends on their proper management.

* Month. Mag. vol. xv. p. 354.

24. After combing, the wool sometimes undergoes two or three farther washings, especially when it is required of a very delicate white.

25. It is known that the wool has been properly scoured, by its filaments being smooth, long and slender, white, and perfectly free from foreign substances, and not having lost their natural tenacity. The Dutch wool is generally the purest: the English is next in quality, but is much harsher and fouler. The German wool is still harsher than the English, and the French is inferior to them all.

26. The loss sustained by the wools in scouring is proportional to their impurity. Thus the French and German lose about a third of their weight, while the Dutch and English do not lose above a fourth.

27. But this scouring, whether it be performed with urine, soap, or earth, is seldom sufficient to bring the wool to that brilliant whiteness which is desirable for some manufactures. This is given it by means of the vapour of sulphur, or by steeping it in sulphurous acid, which is called by the manufacturers *sulphuring*.

28. The usual method of sulphuring goods is to expose them in a very close apartment to the vapour of burning sulphur. The goods are hung on poles so disposed that the vapour can readily pass between the pieces, and when the chamber is filled, a quantity of sulphur, placed in very flat and broad dishes, is set fire to, and allowed to burn away gradually in the chamber, while every aperture by which the vapour could escape is carefully closed. The acid vapour generated by the combination of the sulphur with the oxygen of the air of the chamber, penetrates to every part of the cloth to which it can get access, destroys the colouring matter, and thus completes the bleaching. Every thing is allowed to remain quiet till it is supposed that the effect of the sulphureous vapour has fully taken place, which requires from 6 to 24 hours.

29. The action of the sulphureous vapour leaves a roughness and harshness on the cloth, which are removed by passing it through a bath slightly impregnated with soap.

Such was the usual method of *sulphuring* woollen cloth; but it was soon found to be very imperfect, as the effect of the vapour scarcely extends beyond the surface, and thus there is often a necessity for renewing the operation. O'Reilly has lately proposed to employ the sulphurous acid dissolved in water, and he thus describes the method of preparing and using it.

30. "The sulphurous acid, or that acid which is produced by the imperfect combustion of sulphur, differs from the sulphuric acid (oil of vitriol) in containing less of the acidifying principle, and constituting, as we may say, the mean between sulphur and sulphuric acid.

31. "Sulphurous acid combines very readily with water. In this state of combination it may be employed for the bleaching of wool and silk. We may procure it in this state by making the gas pass through water, in an apparatus similar to that which is employed for obtaining the *oxygenated muriatic acid*. The most economical mode of preparing this acid is by decomposing the sulphuric acid by means of some combustible substance which is capable of depriving it of a part of its oxygen. In the nice experiments of the laboratory, where the chemist wishes to have it in the greatest purity, it is obtained by means of metallic bodies, and especially mercury; but for our purpose, where we must consult economy, we shall recommend the most common materials.

32. "Take chopped straw, or saw-dust, and put it into a matrass; pour over it some sulphuric acid, and apply a moderate heat. Sulphurous acid gas, or sulphureous vapour, will be disengaged; which may be combined with water by means of the following apparatus.

33. "A matrass with a long neck is placed in a furnace, and made to communicate with a tubulated bottle in which a little water has been put to absorb the small quantity of sulphuric acid which might pass through the first reservoir without being decomposed. Care must be taken to place a small tube within the bottle, so that one of its extremities is immersed some way below the surface of the water to prevent absorption. A tube with a double curvature conducts the gas into the vessels in which it is to combine ultimately with the water. We propose to make a *hollow* cylinder of lead, or white wood, bound with varnished iron, of a pretty considerable height, and surmounted with one of Wolfe's bottles, the bottom of which has been removed, and which must be made to fit into a collar in the mouth of the leaden cylinder; and care must be taken to make it firm by means of wax, but so as to render the joining impervious to fluids. This capital of glass will allow us to see the number of bubbles which are disengaged on the surface of the water, and thus to ascertain the progress of the saturation, while the weight of this narrow and high column of water, pressing on the bubbles of sulphurous acid gas, as it is disengaged from the end of the tube at the bottom of the cylinder, will facilitate its combination with the water, and will accelerate its dissolution in that fluid. That nothing may be lost, we may have a series of two or three of these cylinders connected together, and

Digitized by Google

Animal Substances.

and they will then comprise the whole of the apparatus which we are describing. A cock fixed in the bottom of each cylinder will facilitate the discharge of the liquor into the tub for immersion.

34. "The apparatus which we would recommend for the immersion of the woollen and silken goods in the ley of sulphurous acid perfectly resembles what will be described hereafter for the immersion in oxygenated muriatic acid, and which we have constructed after the principles of Rupp. From conversing on this apparatus with Cit. Widmer of Jouy, we have conceived the design of the present, which is now making at the manufactory of Essonne. Let us suppose an oblong box, divided by a partition in the middle; on each side of this partition is a large reel, on which the stuffs are to be rolled; at each angle is fixed a roller, over which the stuffs pass before they proceed through the partition to be drawn over a similar number of rollers which conduct them to the second reel. The object of this disposition is to make the stuffs pass through the bleaching liquor, and expose it to the greatest possible surface.

35. "For the purpose of turning this reel, we make use of an axis or column of glass which passes through a collar of leather, and has one of its extremities, which is square, fixed into the reel, while the other is fixed to a winch, which gives it the rotatory motion; and in this way we may entirely avoid employing any metallic substance within the vessel. To prevent the escape of the gas, the cover of the tub is made with a ledge which fits exactly into the rim of the box, and of which at least an inch should pass into the deterging liquor.

36. "I propose the following method of bleaching woollen stuffs: We are first to scour them by immersion in a ley slightly alkaline, in the proportion of a pound of potash to 50 pounds of wool. The bath is heated to the temperature of 30 degrees (B).

37. "The old method with stale urine may also be employed. Urine is preferred, because it holds in solution a quantity of salt, which is not sufficient to injure the wool.

38. "When the grease is dissolved, and the wool has been well purified, it is to be washed in warm soapy water. This part of the process is sometimes performed in the fulling mill, sometimes by beaters, and sometimes by treading in the tub. In every case the grease must be separated by repeated washing before the sulphuring is employed. If we wish to obtain a brilliant whiteness, it would be proper to make the stuffs undergo heat a second, or even a third time, always in water slightly impregnated with soap, in the proportion of two ounces of this substance to a pound of wool. It would be better to repeat this operation, turning the stuffs about with a stick for half an hour, than to endanger injuring the quality of the stuffs by employing too strong a ley.

39. "After scouring with the greatest care, the stuffs are carried to the tubs for steeping in the *liquid sulphurous acid*, or, as it may be called, *the sulphur water;* the pieces are rolled upon the reels, and by turning the winch, are made to pass through the acid, till it is observed that they are sufficiently whitened. They are then taken out, and suffered to drain on a table covered with a cloth, that the action of the sulphurous acid on the wood may not injure them; they are afterwards washed in river water, and, if necessary, Spanish white is used. This is done by steeping the pieces in a tub of clear water, in which about eight pounds of Spanish white have been diffused. Two sulphurings are usually employed to obtain a fine white; but in our process, a single immersion, with turning for two or three hours, should be sufficient.

40. "Before recommending the employment of the liquid sulphurous acid, I have made a great many experiments on woollen threads and stuffs, varying the manipulations, and always with the most complete success *."

* O'Reilly Essai sur le Blanchiment.

41. Besides the whiting mentioned in the above extract, it is usual to pass the stuffs through water impregnated with blue, or, what is generally practised, after the whiting has been used, the stuffs are taken out, and to the same bath of Spanish whiting and water is added a pail of water, in which about an ounce and a half of fine indigo, or of Prussian blue, have been diffused, the blue being pounded, sifted, and tied up in a little bag, which is stirred round in the water. When the blue water has been added, the bath is well stirred, and the piece of cloth is again passed through it. It is afterwards laid on a packing cloth, and subjected to the fuller's thistle, to raise the nap, it being wetted from time to time with the liquor of the bath. It is then dried, and well beaten with twigs, to carry off the superfluous whiting.

42. Manufacturers have an idea that bad smells, such as foul breath, are capable of producing some change on the bath of blue and white, and thus render a repetition of the process necessary. It is certain, that without attention the white and blue will not be intimately diffused, and that thus a kind of vegetation will be produced on the cloth. When this happens, it must be washed by plunging it into hot water, and then the bath must be repeated.

43. It is chiefly to cloths that are to be of the finest quality that all these processes are adapted. For ordinary flannels, especially such as are intended to be worn next the skin, sulphuring and soap baths are less proper; and the soap especially diminishes the absorbency, which is so desirable a property in these flannels. They are usually prepared by scouring with bran and water, and subsequent rinsing in fair water.

Chap. II. *Of the Bleaching of Silk.*

44. Silk is a substance possessing some degree of transparency, and is spun by a caterpillar from a matter contained within its body, which has the property of hardening when exposed to the air. The silk-worm is an inhabitant of the southern climates, being originally brought from Asia, and naturalized in the south of Europe about the period of the decline of the Roman empire.

45. The

(B) About 100 degrees of Fahrenheit.

Animal Substances.

45. The filaments of silk, as left by the silk-worm, are rolled together into a kind of ball or clew, and in their natural, or what is called the *raw state*, are covered with a yellow varnish or gum, which obscures their lustre, and gives them an unpleasant roughness.

46. Water has no effect on silk at the boiling temperature, and no change is produced on it by alcohol; but alkaline leys, when tolerably strong, attack, and are capable of dissolving it. The yellow varnish is soluble also in alkaline leys, and it may even be separated by long-continued boiling of the silk. When the varnish is thus carried off, the silk is found to have lost about a fourth of its original weight.

47. Two methods are in practice for bleaching silk; the first, in which it is ungummed or deprived of the natural varnish; the second, in which this is retained, in order to give them that stiffness which is required for gauzes, blonds, &c.

48. In the first process, the silk is to undergo a scouring, similar to what we have described, as necessary for depriving wool of the natural oil. For this purpose, a quantity of water is put into a boiler over a fire, and for every hundred pounds of silk to be scoured, thirty pounds of very fine soap are dissolved. The solution is generally boiled, but before the silk is put into it, the heat must be lowered to about 90 degrees of Fahrenheit, and at this temperature it must be kept during the process. The silks are to be hung in the liquor upon rods or frames, and left till the gum is sufficiently destroyed, care being taken to alter their position now and then, so that every part may be exposed to the action of the bath. When perfectly ungummed, they are flexible and of a dull whiteness; in this state they are to be wrung with the pin to clear them of the soapy water, then well shaken, and put into coarse linen bags, in parcels of from twenty to thirty pounds each.

49. These bags are now to be steeped in a fresh bath, or, as the workmen speak, are to be baked. The bath is prepared in a manner and proportion much as before, except that the quantity of soap may be somewhat diminished, as the heat is to be increased; for the silk is now to be boiled for two or three hours, taking care to keep the bags from sticking to the bottom of the boiler, by frequently stirring them with a stick.

50. For silk that is intended to be dyed, the former steeping in the lukewarm bath is unnecessary, and the present boiling only is employed, using a greater quantity of soap in proportion to the fineness of the colour. Thus for the ordinary colours, the proportion above laid down, or even less, will suffice; but for the saffranum colours, and the poppy and cherry red, even 50 pounds are sometimes employed to the 100 pounds of silk.

51. After boiling, the silk is wrung as before, and then washed thoroughly in a stream of water; they are then examined, and if it appears that they are not sufficiently or not uniformly scoured, they must be submitted to a fresh bath.

52. The white silk usually sold has a bluish shade. This is given it by a bath impregnated with litmus, or indigo. This is prepared by dissolving a pound and a half of fine soap in about ninety gallons of water, in which a small quantity of litmus or indigo has been diffused. The bath is heated to about 90 degrees, and the silk is passed through it over rods or reels till it have acquired the requisite shade. Being taken out, it is wrung and dried.

53. From these processes, the silk acquires a tolerably clear white, but the highest degree is given to it by the action of the sulphurous acid, either in the state of vapours, as is usually practised, or by immersing it in the liquid acid, according to the method of M. O'Reilly.

54. From what has been said above of the action of various substances on silk, it will easily be conceived, that during scouring it must suffer considerably in its quality. To avoid this, a method has been lately proposed of carrying off the varnish by the aid of steam under an increased pressure. As this has been more extensively employed in the bleaching of cottons, we shall delay giving a detailed account of the process till a future part of this article. The following is the method proposed by O'Reilly.

55. "Take a solution of caustic soda, so weak that it indicates at most but a quarter of a degree of the areometer for salts, and fill with it the boiler of the apparatus for steam bleaching. Charge the frames with the skains of raw silk, and place them in the apparatus till it be filled, then close the door and cause the solution to boil; continue the ebullition for twelve hours; slacken the fire and open the door of the apparatus. The heat of the vapour, which is always above 100 degrees (c), will be sufficient to ungum and scour the silk. Wash the skains in warm water; wring them with the pin; and place them a second time on the frames of the apparatus to undergo another boiling. Then wash them in a considerable quantity of water, and if you desire the greatest degree of whiteness, rinse them in water slightly impregnated with soap, to give them a little softness.

56. "The last degree of whiteness is obtained by passing the skains through the sulphurous acid, using the method and apparatus which I have recommended for bleaching wool; and which here supersedes sulphuring. The incalculable advantage of that method over others, consists principally in the possibility of employing the operations in succession, without running the risk of injuring the quality of the silk by too strong leys*."

* O'Reilly Essai.

57. Such are the most approved methods of bleaching silk when deprived of the yellow gum; but when this is not required, the bleaching is to be performed by some substance which has the property of whitening the silk and its varnish without dissolving the gum. Of this description is alcohol, and two French authors have proposed a method of bleaching silk by means of this and muriatic acid. It was first proposed by M. Rigaud in 1778, and is thus shortly described by Pajot de Charmes.

58. "The silk intended to be bleached, is put into a glass vessel containing a mixture of spirit of wine and muriatic

(c) About 250 degrees of Fahrenheit.

Animal Substances.

muriatic acid, in the proportion of a pound of the former to half an ounce of the latter, and in quantity sufficient to float the silk. The vessel is then closed with wet parchment, and exposed for 12 hours to the sun, or otherwise it may be left 24 hours in the shade, at a temperature of between 16° and 20° Reaumur. The silk is then taken out and pressed, and again macerated for the same time, and under the same circumstances, in fresh acidulated spirit of wine, in another similar vessel, closed as before. The silk is then taken out, pressed, and washed for four or five minutes in pure spirit of wine. In the next place, it is kept for 24 hours in the sun, or 36 in the shade, in a third vessel, containing pure spirit of wine, which is to be renewed at intervals; after which, the silk is to be taken out, pressed or washed two or three times in clear water, which is to be changed at each washing. Lastly, the silk is to be exposed to dry upon a frame, so contrived as to stretch it with considerable force, and prevent its curling up as it dries."

59. In 1795 M. Baumé proposed an improvement of this method, with the means of recovering the alcohol, which we shall give in the words of Mr Nicholson in his Journal.

60. "Berthollet, in his *Elemens de l'Art de la Teinture*, published in the year 1791, after describing the usual methods of depriving silk of its resinous or gummy matter*, proceeds to remark, that, in the manufacture of blonds and gauzes, the natural elasticity and stiffness of this article are required to be preserved: whence it has become a desideratum to render the yellow silk of Europe white like that of China, without depriving it of its gum. He adds, that M. Baumé has solved this interesting problem, but had kept his process a secret; but from the facts he had possessed the means of obtaining, it appeared liable to accidents, and that the chief difficulty consisted in giving an uniform white colour when large quantities were operated upon. He also mentions a difficulty in dressing the whitened silk so as to prevent its curling, and observes that it ought certainly to be kept constantly stretched during the drying. It is besides requisite that the spirit of wine should be recovered after the process, which would else be rendered too expensive. This author does not say whether the white Chinese silk is subject to the same inconvenience of curling when dyed, which, it may be remarked, is a property of no consequence where the material is to be applied in the manufacture of white goods. The motives which led M. Baumé to communicate his process to the world, originally retained by him as a lucrative secret, do not appear. Whether the mistakes of those who carried it into effect in the large way might have led him to vindicate the reality of his discovery by publication; or whether the commercial advantages derived from superiority of quality and cheapness in this article over the Chinese silk in the market of France, might in the end have proved of less value than the scientific reputation to be derived from its disclosure; are circumstances which will, no doubt, have their proper weight with such manufacturers as may be induced gradually to adopt this process.

* Tom. i. p. 146.; or p. 141. of Dr Hamilton's translation.

61. "The silk of Nankin is perfectly white, silvery, brilliant, and possesses all the elasticity of raw silk. Our author affirms, that the value of this article imported into Europe amounts to upwards of twenty millions of livres (about 830,000l. sterling), of which France consumes about four or five millions in gauzes, blonds, ribbands, &c. This was formerly supposed to be produced of a white colour from the worm. The late M. Trudaine, intendant of commerce, procured the eggs of silk-worms from China, and cultivated them. The produce consisted of yellow cocons, and others of the most perfect whiteness. The latter afforded silk equal in this respect to those of Nankin. But M. Baumé affirms, that most of the Nankin silk is bleached by art, and, as he thinks, by a process similar to his own.

62. "As it is impossible to wind off a large quantity of silk in the short time previous to that of the insects eating their way through the mass, it is usual, in the first place, to deprive them of life. This is commonly done by exposing the cocons, properly wrapped up, for two hours, to the heat of about 158 degrees of Fahrenheit in an oven; after which they are kept for a certain time in a mass to preserve their heat, and effectually destroy such of the insects as might have escaped the power of the oven. The effect of this process is, that the silk is hardened, and is more difficult to wind off than before. Hence the produce of silk is less by one-ninth part in quantity, and inferior in quality to what might have been obtained by winding off without this previous baking. M. Baumé, not only from these views, but likewise because the silk which has not been baked proves susceptible of a greater lustre, was induced to destroy the chrysalis by spirit of wine. For this purpose he disposes them in a wooden box in a stratum six inches deep: upon each square foot half a chopin, or somewhat more, of spirit of wine is to be sprinkled with a small watering-pot made for that purpose. This quantity answers sufficiently near to our half pint. The liquid is to be equally distributed, but it is not necessary that all the cocons should be wetted. They are then to be mixed by hand. In the next place, another stratum is to be formed over the first, nearly of the same depth, which is to be sprinkled and treated as before. By this method of proceeding, the box becomes filled, and must then be covered and left for 24 hours, during which time they become spontaneously heated to about 100 degrees, and the vapour of the spirit of wine exerts itself with wonderful activity. Five hundred French pounds (D) of the cocons require 10 French pints, which is nearly the same number of English quarts. After this treatment they must be spread out to dry, which happens in a short time, and is absolutely necessary previous to winding off.

63. "When the operator proposes in this manner to extinguish various parcels of cocons belonging to different individuals, each parcel may be tied up loosely in a canvas bag, and wetted on the outside previous to closing the box.

64. "The spirit of wine to be used in this operation, ought to be of the strength of 34 degrees of Baumé's hydrometer at the temperature of 55 degrees. It is of the

(D) The Paris pound is to the English avoirdupois pound as 756 to 700. These quantities are not reduced, because the operation requires no great precision.

Digitized by Google

the greatest importance to use that spirit only which has been kept in vessels of glass, of tinned copper, or of pure tin. Leaden vessels are absolutely to be rejected; wooden vessels tinge the spirit, which gives the silk a degree of colour of considerable solidity, and very inimical to the bleaching process.

65. "With regard to the advantages of this method of extinction, in preference to that of the oven, the author remarks, that the cost of labour and fuel added to the loss of silk, and the probability of injury from too much or too little heat, constitute a sum of disadvantage much greater than the cost of the spirit of wine. It is besides a considerable advantage, that the spirit of wine renders more distinguishable such cocons as have perished previous to the application of the spirit. These afford a much worse silk, and must be picked out.

66. "The silk is wound off upon a reel, while the cocons are kept immersed in water almost boiling. Upon this part of the process M. Baumé remarks, 1st, That the dead cocons must be separated. These are known by the brown or black spots on their surface. 2. That well water, which on account of its clearness is almost universally used in the silk manufactories, mostly contains nitre, and is extremely prejudicial to the bleaching process. The presence of nitrous acid gives a yellow colour, which resists bleaching and even scouring; he therefore recommends river water. 3. In some countries a small quantity of alum is used. Neither this nor any other saline substance is of the least advantage to the colour, beauty, or quality of the silk.

67. "At the four places of contact of the silk upon the reel, all the threads stick together. It is absolutely necessary that this should be remedied. The method consists in soaking the silk in a sufficient quantity of warm water, at about 90 degrees, for about two hours; after which the threads are to be separated by opening the banks upon a pin, and lightly rubbing the parts which cohere. When the silk is dry, it is to be loosely folded in its original form, and is ready for bleaching.

68. "The silk while wet is soft, and part of its gummy matter is in such a state, that its threads would readily adhere, if wrung while warm for the purpose of clearing it of the water. After such improper treatment there would be no other remedy than to soak it again in warm water.

69. "The apparatus for bleaching the silk consists of a stone-ware vessel, nearly of a conical form, capable of holding about 12 gallons, having a large opening at the one end, and a smaller of about an inch diameter at the other end. Common pottery cannot be used in this operation, because it is soon rendered unserviceable by the action of the marine acid, and the stone-ware itself is not very durable. This vessel must be carefully examined, to ascertain that it does not leak in the slightest degree; after which the inside is to be rubbed with a pumice-stone, to clear it of asperities which might break the threads. A cover of the same material is to be fitted on by grinding; and the smaller aperture, which in the use is the lowest, is to be closed with a good cork, in the middle of which is thrust a small glass tube about a quarter of an inch in diameter; this is likewise stopped with a cork, excepting at the time when it is required to draw off the liquid contents of the jar. A small perforated false bottom is placed within the vessel, to prevent this tube from being obstructed.

70. "This jar, or as many of them as the purposes of the manufactory may require, is supported by a wooden frame or table, at such a height that a cask may be conveniently placed beneath to receive what may flow from the glass tube in the several periods of the operation.

71. "Six pounds of yellow raw silk are to be disposed in the earthen pot; upon this is to be poured a mixture, previously made, of 48 pounds (E) of spirit of wine at 30 degrees, with 12 ounces of very pure marine acid, absolutely exempt from all presence of nitrous acid, and of the strength of 14 or 15 degrees of Baumé's hydrometer. The pot is then to be covered, and the whole left in digestion till the following day, or until the liquor, which at first assumes a fine green colour, shall begin to assume that of a dusky brown (*feuille morte*).

72. "The acidulated spirit is then to be drawn off. To prevent evaporation, M. Baumé thrusts a cork in the bung-hole of the receiving cask, in which is a sliding glass tube. The use of this tube is completely to surround the small tube proceeding from the earthen vessel. When the whole of the fluid is thus almost entirely drawn off, clean spirit of wine is poured upon the silk, and drawn off repeatedly until it passes colourless. The silk is then suffered to drain without stirring it. In this state it is ready for a second infusion.

73. "Forty-eight pounds of spirit of wine acidulated with 12 ounces of marine acid is now to be poured on the silk, and the whole suffered to remain for 24 hours or longer, until the silk becomes perfectly white. The time required for this second infusion is commonly longer than for the first: it sometimes amounts to two, three, or even six days, according to circumstances, particularly the temperature and the nature of the silk. Silk which has been in the oven is in general more difficult to bleach.

74. "When the silk has thus obtained its utmost degree of whiteness, the acidulated spirit is to be drawn off into a separate vessel. This fluid is but slightly coloured, and may be used again in the first infusion of other yellow silk, with addition of six ounces more of marine acid. The receiving vessel is to be removed, and another clean vessel substituted in its place. The silk is then sprinkled with clean spirit, and occasionally pressed down with the hand. As soon as the spirit of wine comes off absolutely colourless, a third infusion is to be made, by pouring upon the silk 48 pounds of the pure spirit without acid, which is to remain till the following day: it is then to be drawn off, and

(E) The pound is nearly a pint, and is divided into 16 ounces.

Digitized by Google

Animal Substances.

and reserved for washing other silk after the first infusion.

75. " After the silk has been left to drain, and affords no more spirit, it still retains its own weight of that fluid. This is recovered by the very simple process of sprinkling the silk with a small quantity of very clear river water at a time. While the water applies itself and subsides along the silk, it drives the spirit of wine before it, so that the first portions which flow from the tube are scarcely diminished in strength. The addition of water is to be continued until nothing but mere water comes off below.

76. " In this situation the silk is found to be well bleached, but still retains a portion of marine acid sufficient to render it harsh to the touch, and after a time brittle. It must be washed off with water. The best method is to put the silk loosely into a coarse woollen bag, which is to be secured closely in another cloth like a small bed or pillow, then placed in a basket and left in a running stream for five or six hours; but where the convenience of a stream is wanting, the earthen pot containing the silk is to be covered with a cloth, and water pumped through it for five or six hours, or until that which issues from the lower aperture gives no red colour to the tincture of tournsol. At this period the lower opening is to be closed and the vessel filled with water, which must be changed once or twice in 24 hours.

77. " The time required for washing was occasionally abridged by passing spirit of wine, or river water impregnated with a small portion of alkali, through the silk. The natural salt thus produced is, in fact, less adherent to the silk than the acid itself, but nevertheless requires to be washed off with a very large quantity of water.

78. " In these, as in every other process relating to the silk, great care must be taken to ascertain that the water made use of contains no nitrous acid, which would infallibly occasion imperfection of colour, or spots in the article. After this treatment the silk is ready for drying and lustering; previous to the description of which, the author makes several remarks to the following purport:

79. " Though the mineral acids are the most powerful and destructive of all saline substances, yet they may be applied to silk, when diluted with spirit of wine, in very considerable doses. In trials, made to ascertain the maximum, two ounces of marine acid were added to one pound of spirit of wine, without altering the silk. Two drachms of marine acid cause a very perceptible alteration in one pound of silk. I suppose he means pure acid, or perhaps diluted with water; for the passage as it stands is obscure. Numerous experiments have shown that the marine acid is preferable to any other. The proportions admit of much latitude, though he prefers the dose herein before described.

80. " Spirit of wine which has been mixed with nitrous acid, cannot be used in bleaching, even though afterwards rectified upon the alkali, because it still retains a portion of nitrous gas.

81. " Pure spirit of wine without acid extracts a fine yellow colour from silk, which does not separate for years, even though exposed to the sun's light. Yellow silk exposed to the sun loses its colour in a short time. The acidulated spirit which has been used in the infusion of silk, is changed by exposure to the sun, but not in such a manner as to be rendered fit for use a second time.

82. " In order to obtain a beautiful colour, it is essential that the silk should be immersed in a large quantity of the fluid, especially at the first infusion. Without this management it would become necessary to make three infusions in the acidulated spirit. When the first infusion is well managed, the silk will have lost all its yellow colour, and become considerably white, at the same time that the liquor will have begun to change colour a little. As long as it continues of a fine green, it is certain that it has not exhausted its whole action upon the silk.

83. " The duration of this first infusion may be longer or shorter, without inconvenience, according to the temperature. When the temperature is at 20 degrees of Reaumur, which answers to 77 of Fahrenheit, the first infusion is often made in 10 or 12 hours. In small experiments the heat of the atmosphere may be supplied by the water-bath; in which case, all the infusions are easily made in the course of a day.

84. " When the first infusion is finished and the liquor drawn off, the silk appears greenish: the subsequent washings in spirit of wine clear it of the liquor it retained. The sprinkling should be made with the watering-pot, otherwise the quantity poured will be greater, and the management more wasteful.

85. " The cocons may be bleached in this way, but the inconveniences are too great to render this process desirable.

86. " Pieces of gauze and entire garments of silk have been successfully bleached in this way.

87. " The finest natural white silks are rendered infinitely whiter by this process. Spirit of wine alone has the property of depriving yellow silk of its colour, which it brings to the state of the naturally white silk. In this state the silk is disposed to acquire a greater degree of brightness by a single infusion in the acidulated spirit. This process has its advantages over the other, to which it is also inferior in certain respects; concerning neither of which the author has entered into any detail.

88. " The colouring matter was found to be a resin perfectly animalized, affording by distillation the same products as other animal matters, and the concrete volatile alkali.

89. " Silk whitened by scouring may be dried freely in the air without affecting its lustre. This is not the case with the silk bleached in the gum: if it be left at liberty to dry in the air, it resembles white flax without any lustre. The beauty of this silk consists in its shining brilliancy; to secure which, it must be dried in a state of tension. M. Baumé has contrived a simple machine for this purpose. It consists of a strong square frame of wood standing upright upon feet: the upper horizontal bar is six feet long, and has six iron pins driven through it at equal distances, so as to project on each side for the purpose of receiving twelve bobbins. The lower horizontal bar is moveable up and down in a mortice by means of a screw at each end: it is furnished with six holes, adapted to receive as many pins to

Digitized by Google

Animal Substances.

to correspond with those above. The skains of silk are to be dressed and arranged upon wooden pins, as they are taken out of the sack from washing. As soon as there are twelve together, they are to be wrung with a staff; after which the skains are to be hung one by one upon as many bobbins put upon the upper pins of the square frame. Another bobbin with tails is to be inserted in the lower loop of the skain, and fastened to the corresponding pin of the lower bar, by means of a strap and hook, which need not be described to such as are slightly acquainted with mechanical objects. When the machine is thus supplied with skains on both sides, the lower bar of the frame is to be pressed down by the screws until the silk is moderately stretched. When it is dry, the screws are to be equally slackened, the skains taken off, and folded with a slight twist, that they may not become entangled.

90. "After this description of the whole of his process, the author proceeds to make certain general remarks on the white China silk. He observes, that in his process the silks acquire the perfect whiteness without much handling, and consequently that there is little cause for them to become entangled. Accordingly the loss in unwinding is found to be no greater than when they are unwound in the yellow state: that is to say, from a drachm to a drachm and a half in the pound. This saving is of the greatest importance in the price of the silk.

91. "The silk of Nankin, which he supposes to be bleached by some process of the same nature, is probably handled much more. The loss is nearly twelve per cent. when it comes to be opened, and not unfrequently even 25 per cent.: a loss which cannot in any respect arise from the package. The quality of the Nankin silk differs much in the package; the external part being always of the best quality, and that which is packed within is of such an inferior quality as sometimes not to exceed half the value. On examining this silk, it not only exhibited unequivocal marks of alkali, but its imperfections were also of the same kind as those which had occurred to M. Baumé during the progressive improvement of his own manipulations. The best China silk was neither improved nor injured by the process of Baumé; whence he concludes that they are not naturally white, but have undergone a process similar to his.

92. "The result of the whole is, that the yellow silks of Europe may be bleached to equal or greater perfection than those of Nankin; and that these may be even greatly exceeded by winding the naturally white silk apart from the other, and bleaching it by itself.

93. "To complete the description of M. Baumé's process for bleaching silk, nothing more remains, than to shew in what manner he recovers the ardent spirit, and ensures the purity of the acid made use of. These circumstances are of essential importance to the art; for the process would be much too expensive if the spirit were lost, and it could not be made to succeed at all if the acid were impure.

94. "The alcohol which has been used in bleaching silk, is acid, and loaded with colouring matter. In this state it cannot be again used. There are two methods of distilling it; which have their respective advantages and inconveniences. By the first, the acid is lost; which is saturated with potash, in order that the distillation may be afterwards performed in a copper alembic. The second is performed by distilling with glass retorts, or an alembic of silver. In either of these vessels, which are not acted upon by the marine acid, the distillation may be performed, and the greater part of the acid recovered. The inventor most generally practised the saturation of the acid from reasons of convenience; but recommends the use of a silver alembic, as being most economical upon the whole, in a manufactory.

95. "A solution of potash is to be poured into the acid spirit, and stirred about to promote the saturation. Carbonic acid is disengaged with strong effervescence from the alkali, and the point of saturation is known by the usual test, that the fluid does not redden the tincture of tournsol. The distillation is then to be made in the copper alembic, and the alcohol reserved in proper vessels, as mentioned in the beginning of this memoir.

96. "If too much alkali should have been added, the liquor remaining in the alembic may be used in another saturation. The alkali in this process being an expensive article, M. Baumé endeavoured to supply its place by chalk, quick-lime, and lime which had been slaked by exposure to the air. But he found that the action of the spirit upon the calcareous earth, or perhaps the absence of water, prevented the acid from uniting with that substance. The union does not take place to perfect saturation in less than five or six weeks, even when the alcohol is diluted with upwards of 50 times its bulk of water.

97. "In the second process for distilling without alkali, the acid spirit is distributed into a great number of glass retorts, placed in the sand-bath, on the gallery of a furnace. The first product is scarcely acid; but what follows is more and more so, and must be kept in vessels of glass or stone-ware, which become embarrassing on account of their number. The fluid which remains in the retorts has the colour of beer slightly turbid, and contains the greatest part of the marine acid. It must be poured into one or more retorts, and concentrated by heat gradually applied. The first liquor which comes over is slightly red, turbid, and scarcely acid. This is to be thrown away, and the receivers changed. The succeeding product is the colourless marine acid, of an aromatic smell resembling the buds of poplar. The resin of the silk remains in the retort decomposed by the acid. The marine acid thus obtained is weaker than it originally was: which is in fact of little consequence, as it is pure, and may be safely used, either by increasing the dose proportional to its diminished strength, or by concentrating it, if required, in the usual way.

98. "If this distillation be made in a silver alembic, instead of retorts of glass, and a capital and worm of pure tin be annexed, the alcohol will be obtained so slightly acid as scarcely to redden the tincture of tournsol; but it is sufficiently acid to receive injury if preserved in a copper vessel.

99. "If a cucurbit of silver be prepared, of the capacity of three or four quarts, with a glass head, the residues of the first distillation may be treated in this vessel in the same manner as has been directed for glass retorts. M. Baumé affirms that he has practised all these

Digitized by Google

these operations with glass retorts and a small silver alembic, with the most perfect success; but that he made use of potash to saturate the marine acid, because he had not a silver vessel of sufficient capacity. From the danger of distilling large quantities of ardent spirit in glass vessels, he is of opinion that no motives of economy are sufficient to justify the risk attending this method. In the use of tin, it is necessary to be careful that it contains no adulteration of lead, because the vapours of marine acid have sufficient power to alter this last metal very considerably.

100. "Upon the first intimation of this new process in France, manufactories were immediately established, to the number of twenty or more, without the concurrence of M. Baumé, by persons who consequently were not aware of the apparently minute but very important circumstances necessary to ensure its success. In particular, the inventor states that the marine acid of commerce is unfit for this purpose.

101. "This acid was formerly prepared with the marine salt of the saltpetre manufacturers; and even when it is made with good salt, the decomposition is effected with a small quantity of vitriolic acid which contains nitrous acid. Marine acid mixed with a small quantity of nitrous acid does not prevent the silk from being beautifully whitened: it even accelerates the process considerably, and in the most satisfactory manner. But the alcohol, every time it is used and rectified, becomes charged with the acid and gas of nitre, which assume the characters of the nitrous anodyne liquor. In this state, neither distillations nor repeated rectifications from alkali are sufficient to separate the nitrous matter from the alcohol. Then it is that the success of the operator vanishes, with a degree of rapidity equal to the advances which encouraged his hopes at the commencement. The same disappointments befel M. Baumé at the beginning of his labours; to prevent which, he directs the preparation of the vitriolic and marine acids to the following effect.

102. "The vitriolic acid of commerce is obtained by burning sulphur in chambers of lead, with the addition of saltpetre, either crude or of the second crystallization, and a small portion of flax. This acid is concentrated and rectified in France, at the place of its fabrication, to 66° of Baumé's hydrometer, or specific gravity in the usual form 1.848. It contains sulphur, lead, vitriolated tartar, Glauber's salt, alum, selenite, and particularly the nitrous and marine acid.

103. "To purify it, 100 pounds of this vitriolic acid is to be mixed in a large bason of copper with the same quantity of river water, and stirred with a wooden spatula. The mixture instantly becomes heated to the boiling-water point, and a great quantity of red vapour is disengaged, which has the smell of aqua regia, and arises from the nitrous and marine acids. When this mixture is made, it is proper to immerse the bason to a suitable depth in a large vessel of water, to hasten the cooling. As soon as it is sufficiently cooled it is to be drawn off into bottles, and left to become clear during several days. Great part of the sulphur falls down. The author obtained from four to six drachms.

104. "A gallery must be provided, on which two rows of iron pots of eleven or twelve inches in diameter are to be properly placed for separate sand baths, as M. Baumé always practised in the sublimation of sal ammoniac. By this means the retorts are isolated, and if one breaks, the acid cannot diffuse itself and break the others in its vicinity. An empty retort is then to be placed in each pot, and covered with sand. In this way they are much more convenient to arrange, and are attended with no risk.

105. "The acid is in the next place to be decanted and conveyed into the retorts by a syphon funnel, and the rectification proceeded upon until it becomes perfectly white. Towards the end of the operation a small quantity of sulphur sublimes in the neck of the retort. Instead of receivers, a small glass cup is placed beneath the aperture of each retort, in order to facilitate the dissipation of the nitrous and marine acids.

106. "When the acid in the retorts is sufficiently cooled, it is poured a second time into the copper bason, and mixed with 100 pounds of river water, as at first, and again concentrated in the retorts till it becomes perfectly clear. Sulphur has been afforded in some instances by the second rectification. The liquor which distils is received in the cups as before, and the acid in the retorts is then sufficiently pure: that is to say, it is purified from all volatile matter. The lead and neutral salt still remain combined with the acid, but fortunately they can in no respect injure the purity of the marine acid.

107. "This concentrated acid exhibits 68 degrees by the hydrometer, or specific gravity 1.896. It still contains a portion of gas, but so small in quantity as not to injure the purity of the marine acid, to which it only gives the property of crystallizing when the temperature of the air is near the freezing point.

108. "During the rectification of this acid, what first comes over is mere water, and must be thrown away; but that which succeeds is the aqueous acid. If this be set apart, and concentrated, a considerable quantity of vitriolic acid is obtained of the greatest purity. As it has been carried over in distillation, it contains no foreign matter.

109. "The author attempted, but in vain, to dissipate the nitrous acid from the acid of vitriol by ebullition in an open vessel without concentration. The experiment was made with 50 pounds of common vitriolic acid and 60 of river water. This was kept boiling in the copper bason for four days, water being added from time to time to supply the loss by evaporation. The copper bason, by weighing before and after the operation, had lost by solution no more than ten drachms of copper. The acid was blue, but became white as usual during the rectification in the retorts. From this experiment, as the author observes, it is seen not only that the nitrous acid cannot be dissipated by simple ebullition without concentration, but that the action of the vitriolic acid upon copper is extremely slight.

110. "The marine acid is to be disengaged from common salt by the application of this vitriolic acid in the usual manner. But as M. Baumé's experience led him to various simple manipulations and remarks of importance, and more especially as he considers the description of this process as part of the new art of bleaching silk, he has annexed it to his memoir.

111. "The vitriolic acid obtained by the foregoing process

Digitized by Google

Animal Substances.

process being too concentrated, must be diluted in the copper bason as before with river water. It is convenient to add 18 ounces of water to each pound of the acid, because the marine acid is not wanted in a state of high concentration. This mixture ought to give 35 or 36 degrees by Baumé's hydrometer; which last answers to a specific gravity of 1.333. When it is cold it may be preserved in bottles for use.

112. "In the next place, four pounds of marine salt dried, because in that state it pours best, is to be put into a retort of the capacity of five or six French pints, or English quarts. This may be done by means of a paper funnel, or a long-necked funnel of glass, which must enter the body of the retort in order that the neck may remain clean. A number of these must be disposed on a gallery in two opposite rows, with the necks properly enclosed and enveloped in sand as usual.

113. "A bottle or gauge being provided of such a size as by previous experiment is known to hold four pounds of the vitriolic acid before mentioned; this quantity of the acid must be measured into each of the retorts by means of a curved funnel, the tube of which may pass into the body, to prevent the acid being spilled in the neck. If nevertheless a few drops should fall, no inconvenience will follow, as this pure acid is not detrimental to the bleaching process.

114. "The supports for the receivers are then to be placed, and the receivers applied, each being pierced with a small hole. The junctures are to be made good with pasted paper, and the distillation begun. A gradual heat is to be applied until the fluid boils gently. The marine acid which first rises is volatile and expansible (F), and requires the small holes of the receiver to be occasionally opened; but after one-fourth part of the time of distillation the acid comes over freely, and the vapours cease to be elastic.

115. "The distillation lasts two days: but it is practicable to avoid sitting up the intermediate night. The fire must be so managed that the contents of the retort may be very liquid in the evening: if it begins to thicken, there is reason to apprehend that it may be too hard the next day; in which case the heat will dilate the concrete matter before it liquefies, and break the containing vessel.

116. "Towards the close of the distillation the matter swells up considerably. When this happens, it is proper to empty the receivers, and raise the retorts, that more sand may flow in beneath them. When the matter is dry, and nothing more comes over, the operation is finished.

117. "Each retort affords five pounds of marine acid, of the strength of 14 or 15 degrees; specific gravity 1.114. When the retorts are half cooled, one pound of hot river water is to be poured into each, and the distillation being resumed affords 24 ounces of the same marine acid from each retort."

PART II. BLEACHING OF VEGETABLE SUBSTANCES.

118. THE composition of vegetable substances differs materially from that of animal bodies in the proportions of the three principles which are common to both, namely, oxygen, hydrogen, and carbon; and in wanting for the most part azote, which in the latter acts so conspicuous a part. The proportion of sulphur and phosphorus is also exceedingly small in vegetables.

119. As in animals, the substances derived from vegetable nature are formed by a peculiar process of secretion, from the nourishment which plants draw from the bosom of the earth, which after being absorbed by the roots, undergoes, in passing through the vessels of the plant, new modifications, and enters into new combinations.

120. By spontaneous decomposition the principles of vegetables, as of other organized matter, are separated and enter into new states. The hydrogen combines with part of the oxygen to form water, while the rest of this latter element, uniting with the carbon, generates carbonic acid.

121. These changes are the natural effect of exposure to moisture, heat, and atmospheric air; and upon the effect of these agents the chief dependence has been till lately placed in the processes for discharging the colour of vegetable substances. As the gradual improvement of the art of bleaching forms a pleasing object of contemplation both to the scientific manufacturer and the philosophic chemist, we shall, after saying something of the nature and previous preparation of the substances employed, endeavour to trace the steps which have led to the present improved state of bleaching, as it is in the linen and cotton manufactures that this is more peculiarly apparent.

122. The vegetable materials employed for clothing are usually distinguished into two kinds, linen and cotton, the former being derived from hemp and flax, the latter from the down of the cotton plant.

123. Of all the materials employed for clothing, wool seems to have been the most ancient; and indeed it was a natural and an easy step, from the skins of beasts, to the use of the detached hair. Silk seems to have been next in point of antiquity, and in a short time the fibres of hemp and flax were had recourse to for the same purposes. It is probable that the fibres of hemp were first applied to the service of man as cordage or sails, or to make tents for sheltering the inhabitant of the desert, or the soldier in the camp, as their coarseness and superior strength would point them out as

(F) It might be of advantage, even in the large way, to adapt a simple pneumatic apparatus to condense the marine acid air in water, as is usual in philosophical processes.

Digitized by Google

Vegetable Substances.

as better fitted to these uses, and less adapted to the purposes of clothing than the finer and more delicate fibres of flax.

124. The use of flax appears to have originated in Egypt, and its introduction is attributed to Isis.

125. Cotton has probably been employed among the Asiatics for a very long time: in Europe it was the latest of all the materials of which clothing is manufactured.

126. On examining the stalks of hemp and flax when they are pulled, we shall find them composed of four distinct substances; a delicate bark, a green juice or sap, the fibres which are to be employed in the manufacture, matted or twisted together, and within these the wood of the plant. As the fibres are thus enveloped in useless matter, the first object is to separate them, to peel off the bark, wash away the sap, and strip the fibres from the wood. The two first of these are effected by water and fermentation. The plants tied in bundles are placed in water, and proper methods taken to prevent their being carried away, if it be a stream, which is frequently the case (G). In a short time a fermentation begins to take place, which acts both on the bark, which it loosens, and on the sap, which it decomposes. It is necessary to be attentive not to let the fermentation proceed too far, as we thereby run the risk of injuring the texture of the fibres. As soon then, as, on examining the plants, by rubbing them between the hands, it be found that the wood breaks easily, while the plants are still green, they must be removed from the water and spread out upon the grass to dry.

In this operation, which is called *watering* the flax or hemp, it is necessary to employ *soft* water; as it is found that in hard water the fibres are much more readily injured. To account for this, it must be remembered that these waters owe their hardness to their containing a quantity of an earthy salt *; and these salts are found to promote the process of putrefaction, particularly the sulphate of lime or gypsum, which is the most abundant of these salts contained in hard waters.

* See *Mineral Waters*, CHEMISTRY *Index*.

127. The process of watering destroys the sap of the plants by effecting its decomposition. This sap is found to be composed chiefly of water, and what modern chemists have called extractive: by fermentation this extractive is separated into carbon, hydrogen, and oxygen. It is probable also that the water of the sap, as well as that in which the plants are steeped, is decomposed. These principles uniting again in different proportions form carbonated hydrogen, which is the cause of the offensive odour, and carbonic acid, which is found to proceed from the plants. The exposure to the air which they undergo, after steeping, contributes to the speedier escape of these principles.

After the drying the plants appear of a grayish white colour, which is called by workmen a flaxen gray.

128. One of the greatest advantages which modern chemistry has conferred on the manufacturer, is the enabling him to do the same work more completely in a shorter time than by the usual processes. Of this the present state of bleaching affords innumerable proofs. Even this process of *watering* may be greatly improved and considerably hastened. Several days are required before the fermentation is carried to a sufficient length, and with every attention, there is a chance of injuring the material. But it is found that this process may be performed by means of a weak alkaline ley without this danger.

129. The method recommended, is to convey the steam of water impregnated with caustic soda, in the manner which will be described hereafter for the bleaching of cotton and linen, through the plants of hemp and flax contained in a chamber of twenty or thirty feet square. The expence is trifling, as the ley need not be stronger than what was recommended for ungumming and bleaching silk.

130. When the watering is completed, the plants are to be kiln-dried. There now remains only the woody part inclosed in the fibres: to separate these is the object of the processes of beating and heckling. This is either performed by mallets and a sort of wooden anvils, and in this way hemp is beaten in houses of correction; or in mills erected for this purpose. In either way the wood is broken so as to allow of its being more easily detached from the fibres by heckling.

131. This refuse should not be thrown away, as it may be without much difficulty converted into paper.

132. The fibres are now ready for spinning and weaving, operations which it belongs not to this article to describe: we shall therefore take up the cloth as it proceeds from the hands of the weaver, when it comes properly under the direction of the bleacher.

133. The pieces of hempen and flaxen cloth, as they come from the loom, are covered with a dry coating of paste made of flour and water, which is called the *dressing*. This paste is applied to the threads of the weaver, to render the stretching of them more easy; and its removal is the first object in every method of bleaching.

134. For this purpose, all that is necessary is to steep the pieces in water for about forty-eight hours. Some manufacturers boil the pieces in the water, but this is improper, as the paste is not soluble in that fluid, even at the boiling temperature, but must undergo a decomposition by fermentation. To effect this the water should be of a temperature from 60° to 75° Fahrenheit; the fermentation then proceeds gradually, and the cloth sustains no injury. After remaining for a sufficient time, the pieces are taken out, and well rinsed in running water, either by treading with the feet or passing them under a fluted cylinder of wood.

135. By this operation the cloth is not only freed from the paste, but it acquires a degree of whiteness, and becomes of a lighter gray than before it was subjected to the water; for by the fermentation the texture

(G) It is very usual in Scotland to steep flax in burns or rivulets, as these are commonly found most convenient; but as the smell of the putrifying plants is intolerably offensive, and even unhealthy, and as the process is found to destroy any fish that may inhabit the stream, the practice ought to be discouraged, and in some countries is forbidden by the laws.

Digitized by Google

ture of the pieces is loosened, the threads swell, and part of the colouring matter is decomposed.

136. The gray substance, which it is the principal business of the bleacher to remove, is of a resinous nature; and as the theory of the processes which we are presently to describe depends on an intimate knowledge of its properties, we shall be somewhat particular respecting it.

137. Kirwan, to whom chemistry in all its departments is so highly indebted, has submitted this matter to a set of ingenious experiments.

He procured from the bleach grounds a quantity of what the workmen called *dead ley*, which is the alkaline ley in which cloth had been steeped, and is consequently charged in abundance with the colouring matter. He found this liquor to be turbid, of a bluish red colour, having a peculiar taste, and a strong odour. It possessed neither alkaline nor acid properties.

138. To five pints of this liquor he added two ounces of weak muriatic acid, or spirit of salt; no effervescence was produced, but a considerable quantity of greenish matter fell to the bottom, and the liquor above remained of a reddish amber colour.

139. He next day, by means of a syphon, decanted off the supernatant liquor from the green precipitate, upon which he poured two pints of distilled water, stirred them well together, and allowed the matter again to subside: he then decanted off the water, and added a like quantity of fresh. This water still exhibited strong marks of acidity, and was of a reddish colour. He could not believe that after the addition of so much water, this acidity could arise from the muriatic acid which he had employed, as this was scarcely more than sufficient to saturate the alkali, which the liquor had originally held in composition. He concluded therefore that the liquor had contained a peculiar acid, which from its weaker affinity with the alkali, had been separated from it by the muriatic acid. He set apart two pints of this for farther experiments.

140. After successive washings of the precipitate, till it no longer appeared to retain any acid, he threw it on a filter: after being dried for some time, it became a tenacious mass of a greenish colour.

141. A very small portion of it was thrown into 60 times its weight of boiling water, but not a particle appeared to be dissolved. The remainder was dried in a sand-bath, after which it was brittle, of a glossy black without, and internally of a dull green: it weighed about an ounce and a half.

142. From eight pints more of the dead ley, he obtained a larger quantity of this green matter, on which he made the following experiments:

1. A portion of it was digested with rectified alcohol; a reddish tincture was produced, and a considerable part of the matter was dissolved; but on the addition of distilled water, the solution became milky, and a white precipitate gradually subsided. The black mass obtained in the former experiment, gave the same results.

2. These two matters were digested for a long time in linseed oil and essential oil of turpentine, but were not dissolved in either.

3. The black matter thrown on red-hot coals, burned with a yellow flame, and emitted a black smoke, leaving behind a coaly matter.

4. The green matter exposed to the action of sulphuric, muriatic, and nitric acids, gave a brown tinge to the former, and a green to the latter.

143. It is pretty evident from these experiments, that the extractive matter of the fibres of flax, which is obtained from them by the action of alkalies, is a resin of a peculiar nature, differing from pure resins in its being insoluble in essential oils, and in this respect having some resemblance to lacs.

144. Kirwan thought it necessary to try the action of alkalies on this matter. Eight grains were digested in a saturated solution of crystallized soda, at the temperature of 60° Fahrenheit, which was immediately tinged of a deep brown colour. Two measures of this solution of soda, weighing each 265 grains, did not entirely dissolve the matter, but two measures of a solution of potash dissolved the whole.

A measure of caustic soda of the specific gravity 1.053, dissolved nearly the whole, leaving a small quantity of a white substance.

A measure of caustic potash of the specific gravity 1.039 dissolved the whole.

A measure of an alkaline sulphuret or liver of sulphur, of the specific gravity 1.170, also dissolved the whole.

A measure of ammonia dissolved a small portion of it.

145. These experiments were sufficient to satisfy Mr Kirwan; but, for the purposes of the manufacturer, he judged it proper to repeat them with the ordinary saline substances employed in bleaching, and with soap.

He therefore dissolved an ounce of the soda of commerce, and as much Dantzic potash, each in six ounces of distilled water; he added eight grains to an ounce measure of each solution, and allowed them to digest together in a temperature of 180° Fahrenheit for three hours and a half. At the end of this period it was found that more was dissolved in the potash than in the soda, and an ounce of this latter was required to complete the solution, whereas this was effected by the addition of half an ounce of the Dantzic potash liquor; thus shewing the superiority of the potash over soda.

An ounce of white soap was dissolved in eighteen ounces of distilled water; the solution remained turbid, and could be rendered transparent only by bringing it to the boiling heat, an operation which he found extremely difficult; for when the fluid was near boiling, it was thrown out to a distance of more than three feet from the matrass. After completing the solution, he found that three ounces of it were required to dissolve eight grains of the colouring matter.

146. In forming an accurate idea of the comparative effect of these solutions, it must be observed, that an ounce of the soda of commerce contains only 114 grains of pure soda, and consequently, supposing the solution to have been made as above, in six ounces of water, each ounce will contain 19 grains of soda, while an ounce of the solution of Dantzic potash contains fifty grains.

147. He tried the effect of lime on the colouring matter, on which it produced little effect; three ounces of water saturated with lime were employed, which contain at most three grains of that earth.

148. Having been so full on the nature and previous preparation of flax and hemp, it remains only to say something

something on cotton before we proceed to the bleaching of these substances.

149. Cotton is a filamentous substance or down, which is found surrounding the seeds of the cotton plant.

This substance, as it is first obtained from the plant, is covered with a brownish coloured matter, by which it is rendered dirty and opaque. This matter is of a greasy nature, in which it resembles the oil contained in wool, as is evident from the slowness with which raw cotton imbibes water, and the avidity with which it attracts it after having been scoured. Scouring, by removing this greasy matter, also renders it clear and transparent.

150. There is considerable variety in the quality of cottons, arising from their different kinds, the climate in which they were produced, and the degree of culture which they received. They are sometimes of a yellow colour, sometimes white, but most commonly their colour is a dirty yellow.

151. The bleaching of cotton does not call for those preparatory operations which we have described as necessary for hemp and flax. It is first to be scoured by steeping it in a slight alkaline solution, or, what is better, by exposing it to the vapour bath in the manner which we shall soon direct. After this operation, the cotton is to be placed in baskets in the stream of a river or other running water, so as to be well rinsed.

152. After the immersion of cotton in an alkaline ley, there is always left, however completely it be rinsed, a small quantity of an earthy sediment. This may be removed by the cautious use of acids. We know that cotton bears the action of acids much better than either hemp or flax, and that it may remain exposed to them for some time without injury. Advantage has been taken of so fortunate a discovery, and it is found, that by keeping the cotton for a short time pressed down in a very weak solution of sulphuric acid and subsequent thorough washing, to remove all the acid, this earthy sediment may be completely removed.

153. The methods which have been employed or recommended for the bleaching of hemp, flax, and cotton, may be reduced to five, viz.

1st, By the action of the atmospheric air, assisted by alkalies and soaps.

2d, By the action of water only.

3d, By the action of the oxygenated muriatic acid, or dephlogisticated marine acid of Scheele: and this method may be resolved into four; according as the acid is employed in its simple state of combination with water, or in combination with other matters.

a, By the action of oxy-muriatic acid alone.

b, By the action of oxy-muriatic acid combined with potash.

c, By the action of oxy-muriatic acid combined with lime or other earths.

d, By the action of oxy-muriatic acid combined with sulphuret of lime.

4th, By the action of diluted sulphuric acid.

5th, By the action of steam impregnated with caustic alkali, or by employing this alternately with the oxymuriats. Of these we shall treat in the above order.

I. *Of Bleaching by the Action of Atmospheric Air.*

154. This is the method which was commonly adopted till within these twenty years, and is still retained in some old manufactories. After steeping the cloth, as has been related (134.), to remove the weaver's dressing, the pieces are dried in the field, and then submitted to the operation of *bucking*.

For this purpose a ley is prepared by dissolving a quantity of potashes in soft water, and boiling it for about half an hour, when it is allowed to settle, and forms what is called the *mother ley*. For bucking, this mother ley is weakened by the addition of 16 or 18 times its bulk of water; and to this is generally added a quantity of soap, or, for the sake of economy, a few gallons of ley which has already been employed for the first buckings. This liquor, which has been called the *bucking ley*, is now heated to about 100 degrees, and poured on the pieces sorted according to their quality. After pressing the cloth well down in the ley, it is drawn off, heated a little higher, and again poured upon the cloth. This operation is repeated at intervals, allowing the ley to remain longer each succeeding time, and moderately increasing the heat to the bucking temperature, for five or six hours. Then the cloth is left steeping for three or four hours, when it is taken out, well rinsed, and carried to the field.

155. Here it is spread out upon the grass and secured by pins; water is sprinkled on it so as not to allow it to become dry for some hours. After it has lain about half a day the watering is less frequent, and at night it is left to the full action of the air and dews. On the succeeding days it is watered three or four times a-day if the weather be dry, and thus it remains on the field till the air seem to have less effect in whitening. It is then brought back to the coppers, and bucked again with a ley somewhat stronger than the last, rinsed, and again spread out on the field. It is thus alternately bucked and watered 10 or 15 times according to the weather, making the bucking stronger and stronger till about the middle, and then weaker and weaker till the last, after which it undergoes the process of scouring or steeping in some acid liquor.

156. The acid which has been usually employed in the process of scouring is generated by the fermentation of bran and water; or, where the bleachfield was in the neighbourhood of a dairy, sour whey was used for this purpose. It has been found that a very weak solution of sulphuric acid is more convenient and not more injurious than these, and this is now generally employed. The cloths are steeped in the souring for five or six days, if it be formed of milk or bran, or a less time where the sulphuric acid is used, and they are then given to the washers to be rubbed with soap, which is more particularly necessary to the selvages, as these resist the action of the air and alkalies longer than the rest of the cloth.

157. After being well soaped, the cloth is again bucked in a strong ley, rinsed, and again watered and exposed to the air, and all these processes are repeated in succession till it has acquired the requisite degree of whiteness. It must be observed that the strength of the acid liquors is diminished at each succeeding immersion.

Vegetable Substances.

158. The theory of these operations was, till lately, very little understood, but it admits of an easy explanation by the principles of modern chemistry. It has been proved, as will be shewn in chemistry, that the air of the atmosphere consists principally of two airs or gasses, oxygen gas or vital air, and azotic gas, in the proportion of about .23 of the former to .77 of the latter. The only active principle in most of the operations of art and nature appears to be the oxygen, and this uniting with various inflammable bodies produces acids. Now the colouring matter of cloth is a compound inflammable matter or resin, composed chiefly of carbon (the base of charcoal), and hydrogen (the base of hydrogenous gas or inflammable air). As has been shewn, this is partly soluble in alkalies; hence the use of the alkaline leys in bucking is to dissolve as much as possible of the colouring matter; but, as the action of the alkali extends only to the surface of the cloth, it is soon over. The subsequent exposure to the air promotes the union of the carbon and hydrogen with the oxygen of the atmosphere, producing carbonic acid gas, or fixed air, and water.

When it was the fashion to denominate every combination of oxygen with an inflammable substance, combustion, this was considered as a species of burning*.

*Vide *Higgins's Essay on Bleaching*, p. 53.

159. The great objection to this method of bleaching is its tediousness, two or three months being requisite to give the cloth the necessary whiteness. The simplicity of it, and the little apparatus it requires, recommend it however on some occasions; and accordingly it is employed by those country people who make their own cloth, particularly in Scotland.

The bucking of coarse cloths is expedited by boiling them in the ley, but this is seldom required for the finer kinds.

II. *Bleaching by Water only.*

160. We have observed (135.), that during the process of steeping, the cloth acquires some degree of whiteness; and it was long ago remarked, that the pulp from which paper is formed, while acted on by the stampers, was rendered whiter than before; it is found too, when the stalks of hemp and flax remain too long in the water in which they are steeped, they become considerably whiter, while, however, their texture is much injured. A manufacturer of Amiens, M. Brasse, conceived that, by cautious management, he might turn these facts to account, and bleach by means of water alone, which would be certainly one of the most economical methods. He allowed the hemp (for to this his experiments seem to have been confined) to remain steeping till the bark was pretty much destroyed by the fermentation. He then drew it through the teeth of a heckle or comb, which easily tore away the half putrid bark, permitting the fibres to pass uninjured between the teeth. During this process the hemp was perpetually immersed in water, by which means the green bark was much more easily separated, and the fibres acquired a much greater degree of brilliancy. Indeed, the whiteness produced in this way is truly surprising, and it is much to be regretted, that this cannot be obtained without injuring the quality of the cloth, which is prepared from the hemp thus treated. By this operation, however, the hemp does not acquire so pure a white as to render unnecessary the other processes, but by it these would be greatly shortened.

Vegetable Substances.

161. As it is a matter of the greatest consequence to the bleacher, to be perfectly acquainted with the nature of the substances which he employs, as well as the most economical and convenient methods of procuring or purifying them, we shall take an opportunity, in the course of this article, of treating these subjects pretty fully. There is no material which has been more extensively employed in bleaching than potash or potashes.

162. If a pile of wood, or a heap of land-plants tolerably dry, be kindled and burned in the open air till the whole is consumed, there remains a considerable quantity of ashes, which on being boiled in water, impart to this fluid a strong saline taste, and give it the property of tinging syrup of violets, or any blue vegetable infusion, of a green colour. It was long ago known, that this liquor, thus impregnated, possessed the valuable property of facilitating the removal of dirt and grease from cloth or linen, and with these views it has been employed from time immemorial; and is still used for this purpose by the country people. At length it was discovered, that by driving off the water by evaporation, the useful part of the liquor might be obtained in the form of a whitish solid substance, which being thus rendered capable of being carried to any distance, or kept in a dry place to any length of time, was much more convenient than the liquor itself. It is said that the Germans were the first who procured this salt in the solid state from the ashes of wood; and as it was prepared by boiling in iron pots, it received the name of *potash* or *potashes*.

163. Potashes have long been a considerable and lucrative article of commerce, and a great quantity is annually imported into the British empire, for the purposes of several manufactures, but particularly for the process of bleaching. The greatest quantity is brought from Russia and America, and of these the American is considered as the best. Good potashes should be very soluble in water, and should leave a small quantity of sediment, and they should have the property of easily *deliquescing* or becoming moist when freely exposed to the air. But as the sale of potashes is extremely extensive and beneficial, it has been found *convenient* to the vender to increase their bulk by the addition of some other substance which he can procure at a cheaper rate; it is therefore of much importance that the manufacturer should be able to detect this imposition, which he will not find a difficult matter.

164. The ashes of most plants, besides the alkaline salt, which is more properly called *potass*, and of which we shall speak presently, contain a compound salt, formed of this potass united to sulphuric acid, called sulphat of potass. This salt is an injurious addition to the potass, as it possesses no detergent properties, and is very little soluble in water, one part requiring 16 of water at an ordinary temperature to dissolve it. This salt is sometimes added to the potass by the merchant or the manufacturer to increase its bulk, and as it is a very cheap article in comparison with potass, the adulteration turns out very profitable.

"During a mineralogical excursion through England," says Mr Higgins, "in the summer and autumn of the year

year 1785, the different manufactures which fell in my way were not passed over. Upon inquiring of the distillers of aquafortis (nitrous acid) how they disposed of the large residuum left in the still, which is sulphat of potash, and which is of little or no use in the arts, they informed me it was bought up by the Irish merchants.

"Sulphat of potash, when ground down, cannot readily be distinguished as to its external appearance, from pearl-ash, and being so much cheaper than the latter, is well calculated for the above fraudulent purpose.

"By no means do I intimate that this is a common practice, as from experience I know the contrary.

"However, to pass it over in silence would be unpardonable, when it is considered that the bleacher is at the expence of an article of no use whatever in bleaching, and that, by the adulteration, the proportion best known by experience to answer his purpose, is varied; by which means his process, although not altogether frustrated, must be materially retarded *."

* Higgins on Bleaching, p. 14, 15.

165. The difficult solubility of sulphat of potash renders it easy to separate it from the pure alkaline salt. Higgins gives the following method.

"Three pounds of pearl-ash, and two quarts (a Scotch pint) of water, should boil together for a few minutes, then be removed from the fire and suffered to stand for twenty-four hours, when the clear liquor is to be decanted off. Half a pint more of cold water is to be poured upon the dregs, and this again drawn off when clear. The insoluble salt is afterwards to be well dried and weighed, which being a foreign salt, will give pretty nearly the quantity of impurities in the potash.

"I would recommend the above mode of analysis to the bleachers before they purchase or use this potash †."

† Ib. p. 16.

166. Though the potash in the state in which it is sold answers sufficiently well for many purposes, it is not, however, pure potash, but is a compound salt formed of this united to carbonic acid, or fixed air, and it is called by modern chemists *carbonat of potash*. It is necessary for some processes to have it in the pure and caustic state, in which it acts much more powerfully. The carbonic acid is carried off by means of lime, for which it has a greater affinity than for potash. For this purpose a quantity of quicklime fresh burnt is to be slaked with soft water in a wooden or iron pot, and afterwards the potash is to be added dissolved in water, after being purified in the manner above directed. They must stand together well covered from the air for some hours, frequently shaking the vessel, and then the fluid may be drawn off clear for use. This is commonly called soap-leys, as it is used in the manufacture of soft soap; it is called *caustic alkali*, from the violent action which it exerts on animal and vegetable matters, which it corrodes or burns very speedily; whereas the action of carbonat of potash is much less violent, and this is therefore distinguished by the name of *mild alkali*. The use of the caustic ley requires great caution, but when sufficiently diluted it is perfectly safe.

167. It is proper to remark here, for the sake of manufacturers who are not scientific chemists, that the lime is of no farther use here than taking the carbonic acid from the potash, by uniting with which it is converted into chalk or carbonat of lime. The effect which the lime has in rendering the alkali caustic, was long known to manufacturers, and they were led to suppose that it entered as an ingredient into the soap ley, and was itself useful as a detergent substance. This capital error led some into the employment of quicklime in bleaching without any addition, by which means the texture of the cloth was greatly injured.

168. As potash is the alkali which has been most employed in bleaching, we have mentioned it first; there is, however, another of still greater consequence in most manufactures, and which deserves our particular attention, from its being employed in the method of bleaching by steam, to be described hereafter. This is called *soda* or *mineral alkali*.

When sea-weed or wrack, and several plants which grow on the sea-coasts, particularly several species of salsola and salicornia, are burned, the ashes form an impure alkaline mass of a different nature from that produced by the burning of land plants. What is obtained on our coasts from the sea-weed is called *kelp*, and that which is brought from the continent, especially from Spain, is called *barilla*, or *barilha*. The latter is the purer of the two, and is generally employed in the manufacture of soap. When these masses are reduced to powder, boiled in water, and the liquor filtered, sufficiently evaporated and set by to cool, a quantity of large beautiful crystals are obtained, which are *carbonat of soda*, or *salt of soda*.

169. The soda, as contained in *barilla*, is in a much more caustic state, or less of it is combined with carbonic acid, than potash in the raw state; neither of these alkalies will crystallize in the caustic state, but by standing for some time freely exposed to the atmosphere, they imbibe from it carbonic acid gas, and are then capable of crystallization. It is therefore necessary to allow the solution obtained from barilla or kelp to stand thus exposed for about a week. It must then be evaporated to a proper degree, determined by experience or by the areometer for salts, and set by to crystallize. To make sure of obtaining crystals, which it is not always easy to procure, it would be better to evaporate to dryness, then dissolve the dry mass in the least possible quantity of boiling water, and, on cooling, crystals will be formed.

170. Soda, as existing in barilla and kelp, is sometimes contaminated by the mixture of muriat of soda, or common salt, from which it may be freed by careful evaporation. Carbonat of soda is less soluble in cold than in hot water, while the solubility of muriat of soda is much the same in both. After obtaining the first crop of crystals, therefore, which will be pure carbonat of soda, the remainder of the solution must be gently evaporated to about one half, when part of the muriat will separate and remain at the bottom of the vessel: the hot liquor is now to be poured off from it and set by to cool; when a fresh crop of crystals will be obtained, and thus the remainder is to be successively treated till all the soda is procured, and all the salt separated.

171. For most purposes of the manufacturer, soda is required in its caustic state, and for this purpose, the carbonic acid is removed by means of quick-lime. But as barilla contains most of it in a state sufficiently caustic for the ordinary purposes of the bleacher, he is seldom at the pains of purifying it. The usual way is to tie up a quantity of powdered barilla in a thick canvas bag, which is

Digitized by Google

Vegetable Substances. is suspended in the copper in which the cloth is boiled. A sufficient quantity of the soda is thus dissolved in the water, and imbibed by the cloth, while the insoluble dregs remain behind in the canvas bag. For the finer cloths, however, and for the purposes of bleaching with vapour impregnated with caustic soda, it would be much better to obtain the soda in its purest form.

172. Soap is an article of the utmost importance to the bleacher, and which we are naturally led to consider after speaking of potash and soda.

These alkalies readily combine with vegetable oils and animal fat, and on this property is founded the manufacture of the detersive substances denominated *soaps*. There is a difference sufficiently marked between the soap produced by the union of fatty matters with soda, and that formed from their union with potash. The former combination produces a hard, the latter a soft soap. The invention of this valuable substance is attributed by Pliny to the Gauls. The original composition of soap seems to have been much the same in all ages, but the first attempts to make it appear to have been extremely rude. The ancients formed their soap of goats fat mixed with the ashes of beech. Various improvements have been successively and gradually introduced into the manufacture, in proportion as accident, the parent of the most important discoveries, pointed out their necessity.

173. In France two kinds of soap are manufactured; hard, formed of soda, combined with olive-oil, and soft, composed of potash and vegetable oils, of inferior quality.

In Hungary and some parts of Germany, soap is made of tallow and barilla. A hard soap is prepared in Russia of bad salt butter, but it is held in little estimation, as the rancidity of the butter, and the quantity of cheesy matter which it contains, contribute to render it of a very inferior quality. We are informed by Weiglib that they also form a very hard soap of yellow and white bees wax, which has a very agreeable smell of almonds.

174. In Britain, where vegetable oils are by no means plentiful, and are consequently expensive, they manufacture this soap entirely with animal fat, employing either tallow, fish-oil, kitchen grease, or stale butter. There are four kinds of soap manufactured here. 1. A hard white soap formed of soda of Alicant, and of Varech, combined with tallow. 2. A marbled soap, made of soda, tallow, and kitchen grease: the marbling is produced, not by a metallic oxide, as is the case in France, but by mixing a little ley towards the end of the boiling with the whole matter, drawing off the surplus to prevent the marbled part from setting, and then quickly conveying the soap into the frames to cool suddenly; this is at least the way in which the red marbled soap is made with us, but the motled appearance in the blue marbled wash-balls is said to be occasioned by indigo*. 3. A hard yellow soap composed of soda, tallow, and rosin, which last seems to be added to make the soap cheaper, as it certainly does not increase its detersive property; and indeed it is said that the use of rosin is very injurious both to the arms and hands of the washers who employ this soap, which it irritates exceedingly, and to the linen washed with it, to which it gives a yellow colour. 4. A soft soap, formed of whale or other fish oil combined with potash.

* Monthly Mag. for July 1803.

175. Attempts were long made to discover substances, which might supply the place of these fatty matters, in the manufacture of soap. It was reserved for Chaptal to point out the road to this valuable end, by introducing his soap formed of wool, and thus converting scraps of cloth and pieces of old woollen garments, into an excellent soap. He has been followed in Britain by Sir John Dalrymple, who conceived, that by a process similar to Chaptal's he might form a soap of the muscular parts of the fat fish. Some successful experiments completely proved the justice of the idea (H).

III. *Of Bleaching by the Oxygenated Muriatic Acid.*

176. The *muriatic acid* (see CHEMISTRY), or *spirit of salt*, is not proved to contain oxygen, to which most other acids appear to owe their acidity. It is, however, capable of combining with this principle, by the addition of which it acquires new and very extraordinary properties. It will take oxygen from most of the metallic oxides or calces, as red lead, or, what is more commonly employed, the black oxide of manganese. If the muriatic acid be digested for some time, over either of these oxides, it acquires a most penetrating and suffocating odour, and instead of reddening a blue vegetable infusion, it banishes the colour altogether. It is this latter property of destroying colours, which renders the oxygenated muriatic acid of such importance in bleaching.

For the discovery of this acid, we are indebted to the immortal Scheele of Sweden, who was also acquainted with its property of discharging vegetable colours. The true application of this property, however, to the purposes of bleaching we owe to M. Berthollet, of whose paper in the annals of chemistry, (*Annales de Chimie*,) we shall present a brief abstract, as this was the foundation of all those improvements which have been lately made in the art, and of which we are presently to speak.

177. The oxygenated muriatic acid is obtained in the form of an air or gas, and was procured by Scheele in the following manner. He put a quantity of black oxide of manganese reduced to powder, into a glass retort, and poured on it some muriatic acid. To the retort he fixed a receiver, capable of holding twelve ounces; but containing only two drachms of water. On placing the retort in a sand bath, so that any acid which came over unchanged might fall back, and applying heat, the receiver was soon filled with a yellow-coloured gas. Having filled one receiver, he applied others successively, till no more gas was extricated, or till he had obtained sufficient for his experiments.

178. The experiments made by Scheele to ascertain the nature and property of this acid were few and simple; he suspended several substances in the necks of the receivers, and observed the following facts.

1. The

(H) For a full account of the manufacture of this soap, vide *Annales des Arts et Manufactures*, par O'Reilly.

Digitized by Google

1. The corks which closed the mouths of the vessels which contained the gas, were rendered yellow, as if they had been corroded by nitric acid (aquafortis). 2. Paper tinged blue, with infusion of litmus or tournsol, was rendered nearly white. 3. The red, blue, and yellow parts of flowers, as well as the green leaves of vegetables, were by the action of the gas rendered pale and colourless. 4. When those changes were produced by the action of water, by which this gas had been absorbed, the water was changed into very weak common muriatic acid. 5. Neither acids nor alkalies were capable of restoring the original colours thus changed.

179. Berthollet repeated and confirmed these experiments of Scheele's, and explained the theory of the changes produced by the action of this new substance. "I have shown," says he, "that one portion of the common muriatic acid employed in the preparation dissolves the oxyd of manganese, and displaces a part of the oxygen, or basis of vital air, which was, in that substance, combined with the metal in larger proportion than is necessary for enabling it to be dissolved in acids. This superabundant and now disengaged oxygen being in a non-elastic form, or, as Priestley calls it, *in a nascent state*, and being thereby greatly disposed to enter into new combination, unites itself to the other portion of the muriatic acid, and, in consequence of this union, the oxygenated muriatic acid gas is produced."

Having examined and explained the experiments of Scheele, Berthollet goes on to make others of his own.

180. His first object was to examine the degree of solubility of the gas in water, which he suspected to be greater than Scheele had supposed.

181. "He soon perceived, if a body with a recurved tube be filled with this water, impregnated with the dephlogisticated or oxygenated muriatic acid, and the outer extremity of the tube be immersed under a receiver filled with water; if, in this situation, the fluid be exposed to the light of the sun, bubbles are soon disengaged, which pass into the receiver, and are found to consist of pure or vital air. When the bubbles have ceased to be disengaged, the liquor is found to have lost its characteristic smell, colour, and all its distinctive properties; and is found to consist of mere water, containing a proportion of common muriatic acid. This simple experiment, M. Berthollet observes, ought to be sufficient to afford a conviction, that the oxygenated muriatic acid is really nothing but a combination of the muriatic acid with basis of vital air, or oxygen, which is found so abundantly in the black oxyd or calx of manganese, that nothing more is necessary than to urge this oxyd by a strong heat, in order to obtain a large quantity. Manganese, thus treated, is no longer proper to form the oxygenated muriatic acid; because it is deprived of that portion of oxygen which is required to combine with part of the muriatic acid.

182. "He remarks, that light possesses the property of disengaging the oxygen which was combined with the muriatic acid, by restoring that elasticity of which it was partly deprived; a restoration not to be effected by mere heat: he concludes therefore that the light combines with the oxygen, and that the elastic state of vital air is owing to this combination: which air, by losing a second time its elasticity in the process of combustion, that is to say, by a rapid combination with some other body, again suffers the principle of light to escape, at the same time that much heat is disengaged; the relation of which last substance with light is still an object for future discovery.

183. "If vegetable colours be plunged in the oxygenated muriatic acid, they disappear more or less speedily, and more or less perfectly. When the substance under examination possesses a mixture of different colouring parts, some disappear more readily, and leave only those which more effectually resist the power of this agent, but have nevertheless suffered a considerable alteration. The yellow colouring matters usually resist the most strongly, but at length they all disappear; and when the oxygenated muriatic acid has exerted its whole action, it is found to be reduced to the state of ordinary muriatic acid. Hence it follows, that the colouring matters have deprived it of its oxygen, or vital air; and have, by this combination, acquired new properties, at the same time that they have lost that of producing colours. This ingenious chemist declines entering, in his present memoir, into the properties of these oxygenated substances; and proceeds to observe, that the oxygenated muriatic acid owes its property of destroying colours to the oxygen, which not only is combined abundantly with it, but likewise adheres with very little force, and readily passes into a state of combination with such substances as have a certain degree of affinity with it. The habitudes of such a variety of colouring matters as exist in nature, with the oxygen, with light, with alkalies, and with other chemical agents, cannot but form a highly interesting, and almost entirely unexplored, part of natural philosophy.

184. "After having observed the action which the oxygenated muriatic acid exercises in general upon colouring matter, he concluded that it might produce the same effect upon those substances which colour thread and linen, and which the art of bleaching proposes to destroy. Without confining himself to describe the process as now practised, he enters into a concise detail of the imperfect essays he made at first, a detail which will be by no means without its utility to such as are desirous of carrying the process into execution.

185. "He at first used a very concentrated liquor, which he renewed when exhausted, until the thread or cloth appeared sufficiently white; but in this way, he soon perceived that their texture was considerably weakened, and that they were even entirely deprived of their solidity. He therefore slightly diluted the liquor, and succeeded in bleaching his cloth, without altering it; but it soon became yellow by keeping, and more especially when it was heated, or subjected to the action of an alkaline lixivium. He directed his reflections, therefore, to the circumstances of the usual process of bleaching, which he endeavoured to imitate; because he had adopted the opinion, that the oxygenated muriatic acid ought to act in the same manner as the exposure of cloth upon bleach-grounds; which exposure alone is not sufficient for the purpose, but appears merely to dispose the colouring matter to solution in the alkali of lixiviums. He examined the dew which is precipitated from the atmosphere, and likewise

wise that which is afforded by the nocturnal transpiration of plants; and observed that both the one and the other were saturated with oxygen to such a degree, as to destroy the colour of paper weakly tinged with tournsol; and he remarks that the ancient prejudices respecting May dew, which is the season wherein the transpiration of plants is abundant, might probably depend on some observation of this nature.

186. "He therefore employed, alternately, the lixiviums, and the action of the oxygenated muriatic acid; by which means he obtained a permanent white. And as it is the practice, in the ordinary way of bleaching, to pass the cloth through sour milk, or vitriolic acid, diluted with a large quantity of water, he made the trial likewise of passing his cloths through a very diluted solution of vitriolic acid, and observed that the white was much brighter.

187. "As soon as he had made use of the intermediate lixiviums, he found that it was not necessary to use a concentrated liquor, or to leave the cloth long in the fluid at each immersion. By this observation he avoided two inconveniences, which might have rendered the process impracticable in the large way: the first is, the suffocating smell of the fluid, which would be very incommodious, and even highly dangerous to be respired for a long time, and which has discouraged several operators from pursuing their attempts in this way: the second is, the danger of weakening the cloth. At this period of his experiments he likewise gave up the idea of mixing alkali with the oxygenated muriatic acid, as he had before done in most of his experiments *.

* *Journal de Phys.* 1785.

188. "This was the state of the experiments of this excellent chemist when he repeated them in the presence of the celebrated Mr Watt. A single glance, he observes, is sufficient to a philosopher whose abilities had been so long exercised upon the arts. Mr Watt soon afterwards wrote to him from England, that in his first operation he had bleached 500 pieces of cloth on the premises of Mr Grigor, who has large bleach-grounds at Glasgow, and continues to use this new process.

189. "In the mean time M. Bonjour, who had assisted M. Berthollet in his experiments, and who to a large share of sagacity has added a very extensive knowledge in chemistry, entered into an agreement with Mr Constant of Valenciennes to form an establishment in that town. The project was opposed by the prejudices and interest of the bleachers, who were apprehensive of the competition of a new method. Mr Constant could not even procure a piece of ground in the town of Valenciennes: but the Count de Belainge favoured this enterprise, and gave up a piece of ground which possessed every advantage; but, being at a certain distance from Valenciennes, would have the disadvantage of distance, if any manufactory should be established at Valenciennes itself. M. Bonjour had given up the well-grounded hopes which his knowledge and talents gave him reason to expect at Paris: and had in return found, in the enterprise to which he had devoted his attention, nothing but those disgusting circumstances which usually accompany new processes in the arts. He addressed himself to the Bureau de Commerce, not to reward his services, but to request that he might be defended from the disadvantages and obstacles which prejudice and an opposition of interest had created in Valenciennes, by granting to him a certain space of two leagues round Valenciennes and Cambray, in which he alone might, during a certain number of years, exercise this new art; without constraining in any respect those who might choose to adhere to the ancient processes, or attempt new processes, in which no use should be made of the oxygenated muriatic acid. He offered to instruct in his manufactory, in all the details of his process, all such as might be desirous of using it, and might obtain the sanction of the ministry. It is probable that, if his request had been granted, the establishment at Valenciennes might have produced a greater degree of confidence in those who had undertaken to make the necessary advances. It is probable, continues M. Berthollet, that they might have shortened their trials, instead of establishing the process at Courtray, as they have done; many artists might probably have been formed under the direction of M. Bonjour; and a great number of establishments might have been formed in the French provinces, by avoiding those fruitless trials which tend to throw discredit upon an useful art.

190. "As soon as M. Berthollet had reason to hope that the process might be executed in the large way, he endeavoured to diminish the price of the liquor, by decomposing the marine salt in the very operation which served to form it. His first trials were unsuccessful; but Mr Welter, a young ingenious chemist, to whom M. Berthollet had entrusted the management of the process, observed that it might be of advantage to dilute the vitriolic acid; and the operation then succeeded in the most satisfactory manner. He immediately wrote to M. Bonjour and Mr Watt, the latter of whom informed him that he had made this change from the first: and the operation was long afterwards described by M. Chaptal in a memoir forwarded by him to the Academy of Sciences. Mr Watt had likewise made use of a certain cask or butt, of a construction which M. Berthollet was not acquainted with; but, before this apparatus was mentioned, Mr Welter had constructed one, which is not only very proper to prepare the oxygenated muriatic acid, but very well calculated for several other chemical operations.

191. "The intention of this apparatus is to multiply the surfaces of contact between the gas and the water, as it is evident that the combination can take place only at their surfaces. That part of the gas which did not enter into combination in the lower space, where it is first conveyed, passes into a second cavity or space, which is above the tube intended to give it vent. The vessel which is intermediate between the pneumatic cask and the distillatory matrass, is designed to retain that part of the muriatic acid which is not oxygenated: a small quantity of water is put into this vessel, a glass tube being plunged therein, the height of which exceeds that of the column of water the gas must overcome in the cask. The gas which passes out of the matrass compresses the water in the intermediate vessel with a force equal to that opposed to its disengagement; so that the water rises in the tube of safety, and forms a column equal to the weight of the water which

Vegetable Substances.

which presses on the tube through which the gas enters the cask. But if, during the operation, a sudden cooling or rapid absorption of gas should take place, the water descends again in the tube, the air of the atmosphere enters, and prevents a vacuum from being formed within, which would have been attended with a resorption of the liquor, and consequently break the distilling vessel by the sudden cooling.

192. "If the oxide or calx of manganese be of a good kind, in small crystals, and contain very little foreign matter, the proportions which M. Berthollet found best calculated for distillation, are the following:

193. "Six ounces of pulverized calx of manganese, one pound of pulverized sea salt, twelve ounces of concentrated vitriolic acid, and from eight to twelve ounces of water. If the calx of manganese contain foreign earth or metallic substances, the quantity must be augmented in proportion to its impurity. It will be known, after the operation, whether a sufficient quantity has been employed; because a small quantity ought to remain undecomposed, and of its original black colour: from this observation, the quantity proper to be used in the following operations may be ascertained.

194. "When the calx of manganese is found to contain calcareous spar, as may be known by its effervescing upon the contact of a small quantity of vitriolic acid, it is proper to wash it before the operation with diluted vitriolic acid, to separate the calcareous part, which might be troublesome on account of the effervescence it produces: the calx must be dried after this washing.

195. "M. Berthollet is of opinion, from his trials, that when the calx of manganese contains much phlogisticated air, it is scarcely proper to form the oxygenated muriatic acid: M. Fourcroy, however, asserts, that the phlogisticated air escapes in distillation from manganese by a degree of heat less than ignition, but that ignition is necessary to deprive it of its vital air. It might perhaps be found advantageous to make use of this information to purify such manganese as contains phlogisticated air, by distilling off this last aerial substance by a moderate heat before it is applied to the purpose of oxygenating the marine acid.

196. "A greater or less quantity of water must be added, not only according to the degree of the concentration of the sulphuric acid, but likewise according to the quantity of matter subjected to distillation. If this quantity be considerable, the acid must be more diluted than if it be small. It might be more advantageous to make use of an acid which had not been concentrated; because the operation of concentrating it adds to its price, and it is obliged to be again diluted with water. But M. Berthollet observes, that this saving can only take place when the manufactory of the vitriolic acid is near at hand; for in those situations where this acid is to be brought from a considerable distance, the expence of carriage of a greater quantity of fluid might exceed that of concentrating it.

197. "When the materials are prepared, the calx of manganese must be carefully mixed with the sea-salt, and the mixture introduced into the distillatory vessel, placed on a sand bath: the vitriolic acid must then be diluted, and suffered to cool; after which it is to be poured on the mixture, and the tube of communication between the matrass and the intermediate vessel quickly fitted in. A particular attention to the lutings is required in this operation. M. Chaptal takes notice that when the vapour is perceived to escape by the smell, it is sometimes difficult to ascertain the imperfect place; but that if a feather dipped in volatile alkali be passed on such occasions over the lutes, it will shew the faulty place, by the white cloud of ammoniac formed in consequence of the combination of marine acid with the volatile alkali.

198. "The size of the vessels ought to be such, that the matrass should be about one-third empty; and that, for the quantity here laid down, the casks should contain 100 pints of water, with an empty space of the bulk of about ten pints; because, when the gas comes to occupy the cavities designed to receive it, the water will require a space into which it may ascend.

199. "Before the operation is begun, the pneumatic cask must be filled. The mixture being made, the gas, which soon begins to be disengaged, first drives the atmospheric air out of the apparatus. As soon as it is apprehended that the atmospheric air has passed into the cavities, it is emptied out by means of a recurved tube, successively introduced beneath each; and in order to drive the water out which has entered into the tube, M. Berthollet recommends blowing strongly into it. The operation is suffered to go on without the application of heat, until it is perceived that the bubbles are more slowly emitted: at this period, a slight degree of heat is applied. It must not be strongly urged at the beginning; but by a gradual increase it is at last to be carried to ebullition, towards the end of the operation. It may be known when the operation is near its termination, by the tube of communication and intermediate vessel becoming hot.

200. "When the gas is no longer disengaged but in small quantities, the fire is to be put out, and a sufficient time must be suffered to elapse until the matrass is nearly cold. The tube of communication may then be removed, and hot water poured in to keep the matter in solution, that it may be more easily taken out: this residue is to be poured into a large vessel, intended to preserve it for a use to be presently mentioned. The operation lasts longer in proportion to the quantity of matter. With the before mentioned quantity, it ought to last five or six hours. It is proper not to be too much in haste, because a larger quantity of gas is by that means obtained. One single person may inspect and manage several of these apparatus, and the quantities may be much larger.

201. "The intermediate vessel gradually becomes filled with a fluid, which consists of pure but weak muriatic acid: several operations may, however, be made without taking it out; but when it is apprehended that there is not a sufficient space left empty, this acid is taken out by means of a syphon: and, when its quantity is considerable enough, it may be substituted instead of the mixture of sulphuric acid and muriate of soda, in a similar operation, if it be not wanted for another use. In order that the quantity of common muriatic acid which passes out of the matrass, may be inconsiderable, it is expedient that the first tube should make a right angle, or even a more obtuse angle, with the body of the matrass. During the operation, it is necessary to stir

Vegetable Substances.

stir the water, from time to time, by means of the agitator, in the apparatus, to favour the absorption of the gas by the water. When this is completed, the liquor is sufficiently strong to be used in bleaching. A smaller proportion of water may be put into the cask, and the fluid may afterwards be properly diluted.

202. "In this state of concentration, though the liquor retains a considerably strong smell, yet it cannot prove noxious, or even very inconvenient, to those who use it. It is nevertheless proper to conduct it into the vessels in which the cloths are arranged, by wooden channels, fitted to the opening at the lower part of the cask. It is proper to draw off the liquor from the cask as soon as it is prepared, because it acts upon the wood, and not only becomes by that means weaker, but likewise hastens the destruction of the cask: but when it is conveyed into a vessel in which cloths are properly placed, these speedily weaken it to such a degree that it does not perceptibly act upon the wood.

203. "The cloths are to be prepared by leaving them 24 hours in water, or still better in the old lixivium, to extract the dressing; after which they must be once or twice well washed in alkaline lixiviums, because all that part which can be extracted by the lixiviums would have neutralized a portion of the liquor, which requires to be carefully used. After this the cloth must be carefully washed, and disposed upon sticks in such a manner that it may be impregnated with the liquor poured on it, without any part being compressed. The framing of the sticks, as well as the cask and vessel intended to contain the cloths, ought to be constructed without iron; because this metal becomes calcined by the oxygenated muriatic acid, and would produce iron moulds, not to be taken out but by means of salt of sorrel.

204. "The first immersion must be longer than the following ones; it may last three hours: after which, the cloth is to be taken out, lixiviated anew, and then put into a shallow vessel, in order that new liquor may be poured on it. It is sufficient that this immersion, and the following, should continue for the space of half an hour. The cloth is taken out, and cleared of the liquor by pressure; then lixiviated, and subjected to new immersions. The same liquor may be used until it is exhausted; and when it is found to be much weakened, a proportion of the liquor which has not been used may be added.

205. "When the cloth appears white, excepting at the selvages, and a few threads darker than the rest, it must be impregnated with black soap and strongly rubbed; after which it is to be lixiviated for the last time, and immersed once more in the liquor.

206. "The number of lixiviations and immersions which are necessary cannot be determined, because it varies according to the nature of the cloth: the limits of this number, however, are between four and eight for linen and hempen cloths. M. Berthollet expresses his inability to point out the best method of making the alkaline lixiviums; this useful art being still a matter of mere practice, and variously performed in different places. It appeared advantageous to him to render the alkali caustic, by mixing one-third of lime; but in this case care must be taken that the lixivium be strained through a cloth, in order that the calcareous earth may not mix itself with the linen, as its particles might corrode or wear it by their hardness. By this management the lixivium being rendered more active, does not require so large a quantity of alkali; and nevertheless, if the quantity of alkali be not too considerable, it produces no damage to the cloth, notwithstanding the contrary prejudice, which is very general. He has likewise remarked that it was of no advantage, and even prejudicial, that the lixiviations should be of long duration; but it is necessary that the fluid be very hot, and of considerable strength, otherwise the cloths bleached by the aerated marine acid would become coloured and ruddy when submitted to new lixiviations. This accident took place in the trials already mentioned. Cottons are much more easily and speedily bleached than linens: two lixiviums, or at most three, with the same number of immersions in the liquid, are sufficient; and as they are so much the more readily bleached, it is advantageous, when linen, hemp, and cotton, are to be bleached, to reserve the liquors for the latter, which have been already weakened by exerting their action on the former. Such liquors as are so exhausted as scarcely to act upon hemp or linen, will do very well for cotton.

207. "After the last immersion in the liquor, the cloth must be plunged in sour milk, or water acidulated with vitriolic acid. The true proportion is not well ascertained; but our author thinks, from his experiments, that one part of the acid by weight, with fifty parts of water may be employed successfully, and without danger. The cloths are to be kept about half an hour in this fluid, warmed; after which, they must be strongly pressed, or wrung, and immediately plunged in common water: for, if they were suffered to dry by evaporation, the vitriolic acid, becoming concentrated, would attack them. When the cloths are well washed, nothing more is necessary than to dry and prepare them in the usual manner.

208. "It is an obvious precaution, that this acid water be not too strong, as it would of course injure the texture of the stuffs.

209. "Fig. 5. Pl. XCI. exhibits the apparatus for preparing the liquid intended to be used in this new method of bleaching. ABC is a furnace; C is the matrass, or distillatory vessel; GHI the tube of communication with K, the intermediate vessel; L the tube of safety; M a tube communicating with the tub N, the section of which tub is exhibited in fig. 6. while the lower orifice of this tube is seen at y. In the tub N are fixed three inverted vessels, open beneath, as represented in fig. 7. and intended to contain the aeriform marine acid. PPP are agitators for the purpose of stirring the water by the rotation of the upright post OQ. The effect of this apparatus may be easily understood, by considering that the aeriform dephlogisticated marine acid, issuing from the tube y, passes into the vessel X, until it has excluded the water it may contain: after which the surplus issues through the tube Z, and runs into the second vessel; which, becoming also filled, affords its surplus to the third or uppermost vessel. Hence it follows, that three surfaces of the water are exposed to an atmosphere of dephlogisticated marine acid; and these surfaces must of course be changed by the rotation of the agitators. In this manner the water becomes impregnated, and may be drawn off at P. It is of consequence to ascertain its relative

Digitized by Google

Vegetable Substances.

relative strength, in order that the experiments may at all times be equally successful. M. de Croisille makes use of a solution of indigo in the vitriolic acid; for which purpose he takes one part of finely-pulverized indigo, with eight parts of concentrated vitriolic acid. This mixture is kept in a matrass for several hours on the water bath; and, when the solution is complete, it is diluted with a thousand parts of water. In order to ascertain the force of the oxygenated muriatic acid, one measure of this solution is put into a graduated tube of glass, and the liquor or impregnated water is added, until the colour of the indigo is completely destroyed. In this way it is ascertained, by means of the graduations, how many measures of any liquor whose goodness has been ascertained by direct experiments upon linen or cotton, are necessary to destroy the colour of one measure of the solution of indigo; and this number will serve to ascertain the respective force of all the liquors which are required to be compared together. Mr Watt makes use of a solution of cochineal for the same purpose.

210. "In the sixth volume of the Annals of Chemistry, M. Berthollet has published some additions to the foregoing Memoir, which, on account of its extensive utility, I have scarcely at all shortened. They are the following:—Mr Welter finds that it is advantageous to terminate the process, by exposing the thread or cloth for three or four days in the field; during which they must be occasionally watered, and afterwards washed with pure water. He considers this exposition as indispensable. But M. Berthollet observes, that other persons have bleached to the perfect satisfaction of artists without it; though he admits that it may happen, in the large way, that certain pieces may not turn out perfectly white after the last operation, in consequence of some of their parts having suffered casual pressure; and he thinks that, although a continuance of the operation would remove these imperfections, it might, in such cases, prove more advantageous to remove them by exposure on the grass; very little loss of time, and no considerable extent of premises, being required for this purpose.

211. "M. de Croisille has excluded the use of wood in every part of his apparatus; and has applied the process not only to bleaching, but to the discharging of colours in dyed cottons or linens.

212. "M. Berthollet further observes, that the precaution of plunging the cottons in pure water, after they have been taken out of the acidulated water, is not sufficient; but it is necessary to plunge them into a weak caustic lixivium, moderately heated, and keep them there for a short time.

213. "When the liquor is suffered to run immediately into troughs, care must be taken to mix it well with the agitator; because otherwise the most saturated liquor, which occupies the lower part of the vessel, running first, would exert too strong an action; or if half or three quarters of the liquor be drawn off, and mixed with the proper quantity of water, according to the precautions before established, the rest of the fluid may be used together with the water for the succeeding operation: lastly, he observes that this process, simple as it is, can scarcely be carried into execution, without, in the first instances, being directed by a person to whom the operations of chemistry are familiar. He observes that a diminution, or even an equality of the expences, relative to the ordinary process, is not to be hoped for, excepting for the bleaching of fine cloths, unless the operator possesses a good process to extract the soda from the residue of the distillation; and without this condition the bleaching of coarser cloths ought not to be undertaken, excepting in those cases wherein the advantages arising from the speed of the operation, the facility of performing it in all places and at all times, and the diminution of the stock or capital, are sufficient to compensate for the excess of the price. These observations are perhaps applicable to linens, and not cottons. It is not possible, he continues to observe, to lay down principles applicable to every particular case; but he advises those who may undertake this object, to begin by trials, and by means of those trials to form calculations, without any allowance on the favourable side. On the other hand, he advises the operator not to suffer himself to be imposed on by those losses which arise for want of being familiarized with the operations: as there is no great expence incurred by making trials for a time, by which this advantage is derived, that the operator renders himself more expert for carrying more extensive processes into effect *."

* Nichols. Chem. Dict.

214. Such is the method of procedure recommended by M. Berthollet, which was soon found liable to many inconveniences; and various amendments and alterations have been suggested, the principal of which we shall relate. Pajot de Charmes was one of the first improvers of the new method. He states the following objections to Berthollet's process.

1. He thinks the furnaces recommended by Berthollet not well adapted to the purpose, as they are difficult to procure and expensive; as they will only contain each one matrass; as they are not calculated to shew the progress of the process, are too speedily heated, and consequently endanger the lutes; and lastly, as they will not always guard against absorption, notwithstanding the tube of safety in the intermediate vessel. The furnace which he would have employed in place of these is thus constructed:

215. The furnace is supported upon a frame-work of wood, between which and the hearth tiles are disposed in a bed of clay. The furnace itself is built of brick, which he recommends to be lined with plaster of Paris. It ought always to be double, and is divided by a partition in the middle. In the upper part at the front are two cavities intended to admit the vessels used in the distilling; they may be either round or square; and, as the latter is most convenient to the builder, they should perhaps be always square, provided with a ledge, and rounded at bottom. The combustible matter, which may be charcoal, is burned in a sort of chaffer, or in a portable grate, which is introduced by an opening in the side of the furnace: and this opening may be closed during the process by a door of plate-iron so as to prevent the too free access of air. From behind the distilling vessels and charcoal grate proceeds a funnel, through which the vapour and heat of the fuel is conveyed into a cavity with raised edges, over which is placed an oblong vessel of sheet iron, intended to be kept filled with muriat of soda, which may dry during the process. At each extremity of this cavity is a hole which may be opened or closed as required, so as to admit

Digitized by Google

admit a greater or less quantity of air. Below the drying place, in the sides of the empty space at the back of the furnace, are places where boxes of sheet iron, containing the requisite proportion of manganese and salt, ready mixed, are kept for the purpose of keeping the materials dry.

In each of the square spaces is placed a capsule, which may be made either to contain sand or water, in which the distilling vessels are to be inserted. These capsules rest with their rims upon the edges of the cavities, and are supported below by a small bar. The furnaces, according to the directions of De Charmes, are made so as to be portable, an advantage which may perhaps, in most manufactories, be dispensed with.

216. 2. De Charmes next objects to the curved tube as being liable to be broken; and thus expose the workmen to the noxious gas, of which the accident will also cause a considerable loss. Berthollet's method of applying the tube is also objectionable from the destructible nature of the cork stoppers, and the difficulty of preserving the stability of the latter.

He proposes, instead of the matrass, tube, and intermediate vessel, to substitute tubulated retorts, furnished with curved necks of glass or lead; the beak of which is fitted by luting to a leaden support in the form of a funnel; and to that is adapted the end of a leaden tube which passes into the pneumatic tube, and has its lower extremity bent to a right angle, serving instead of the glass tube used by Berthollet.

217. 3. Berthollet's pneumatic tub was not provided with a cover close enough to prevent the escape of the gas; and his inverted vessels appear to De Charmes to be improper, from the difficulty there is of constructing their sides and borders so as to concentrate the gas in the best and most complete manner.

His pneumatic tub is conical, and divided into three parts by two false bottoms, which are made to rest on hoops or sliders within the tub, and kept firm by means of pins.

218. The distilling vessels employed by De Charmes are not high enough to prevent a portion of the sulphuric acid from passing over without combination; and they are besides too dear for ordinary use. In Ireland they employ leaden alembics of a sufficient height, and capable of containing 40 gallons of liquor, which is a capacity amply sufficient for allowing the swelling of the materials. These alembics are conical, have a broad bottom, which is supported in a vessel of water to regulate the heat; the neck is so long as to allow any sulphuric acid, which may rise, to fall back again, and the cover of it is perforated in two places; one of the perforations serving for the passage of a rod of iron with prongs entering within the alembic, but so covered with lead as to prevent the action of the sulphuric acid, and the handle passes through a leathern collar to prevent the escape of gas, the whole being intended for stirring the materials; the other hole intended to admit a leaden funnel carved like an S, to prevent the reaction of the gas on the diluted sulphuric acid which is to be introduced through it.

219. It is of the greatest importance to prevent the escape of the gas, as well to prevent danger to the workmen as loss to the manufacturer. "C. Widmer, at Jouy, has arranged his apparatus in such a manner as to lose the least gas possible during the condensation: he receives the gas under a capsule inverted at the bottom of the apparatus; above these are two *tours de goutiere* also inverted, then another capsule above these; then two more *tours de goutiere*, and then another capsule, which terminates the apparatus. The disposition of his tub is such, that he places around in his laboratory several distilling apparatuses, which are going at the same time.

"Apparatuses constructed on similar principles are also in use at Glasgow and Manchester. Bourbouleu-de-Bonneuil has likewise invented an apparatus, consisting of several matrasses, ranged as in an aquafortis manufactory, the tubes of which are conveyed into a chamber containing concentrating tubs. His apparatus for the bleaching of paper is very ingenious, and deserves to be described. In the last place, others have arranged five or six large casks, like Welfe's apparatus, in such a manner as to make each cask perform the functions of a tubulated flask *." * Phil. Mag. vol. x. p. 13.

220. Before we proceed to describe the most approved method of immersing the cloths in the oxygenated liquor, it will be proper to treat particularly of the materials employed in preparing this liquor, the mode of preparing them for the process, and the method of adjusting the apparatus and conducting the distillation.

221. The selection and preparation of the materials is of the greatest importance, as on them will depend in a very great measure the success of the operation.

The materials are either the muriatic acid and black oxyde of manganese, or this latter and sulphuric acid and muriat of soda, which are usually employed as being cheaper. There are, however, advantages in using the muriatic acid ready prepared, where the bleachfield is in the neighbourhood of such a manufactory, as the danger of breaking the vessels (where glass is employed) from the incrustation of the residuary salt is much less in this case.

222. The crystallized ore of manganese is to be preferred, such as appears to be composed of splendid needles slightly adhering to each other; this variety is generally purer, and much more easily reduced to powder, and a smaller quantity of it is sufficient. It must be reduced to a very fine powder, a short time before it is wanted, as if kept long in the state of powder, it is said to be injured.

223. The gray muriat of soda is employed in France as being cheaper than the white, but probably the present regulations of the salt duties in this country are such as preclude the manufacturer from employing it in this state †. The salt is to be dried on an iron plate in that part of the furnace described in 205, and then rubbed to a fine powder, and passed through a sieve; this is necessary, to mix it more intimately with the manganese, and to enable the sulphuric acid to act more uniformly and completely on it. † Nicholson's De Charmes.

224. In order to be more certain as to the proportion of the ingredients, the sulphuric acid should be procured in its concentrated state, and acid of the same specific gravity should always be employed. Before using, it is to be lowered with its weight of water, and it is proper to observe, that in making the mixture, the water should not be added to the acid, but the acid be poured in a gentle stream into the water, pouring it down the sides of the glass vessel in which the mixture

Digitized by Google

ture is made, adding the acid by portions at intervals, and turning the head aside to avoid any drops which may fly up from the effervescence produced, which, however, is much less in this way than when the mixture is made in any other way. As a heat greater than that of boiling water is generated, it is better that the vessels have the form of jugs with spouts and handles, that the mixture may be more easily poured into the distilling vessels.

225. The proportions in which the ingredients are employed, are variously adjusted by different manufacturers. De Charmes recommends the following.

Oxyd of manganese crystallized, twenty ounces.
Muriat of soda, four pounds.
Sulphuric acid (at 60° of Massy's aerometer), 44 ozs.
Water, three pounds and a quarter *.

* De Charmes.

Mr Rupp of Manchester recommends the following, as affording him the strongest liquor.

Manganese, three parts.
Muriat of soda, eight parts.
Sulphuric acid, six parts.
Water, twelve parts †.

† Manchest. Mem. vol. v. p. 1.

Mr Higgins uses the proportions as under:

Manganese, sixty pounds.
Muriat of soda, sixty pounds.
Sulphuric acid, fifty pounds.
Water, about thirty pounds ‡.

‡ Higgins's Essay.

In Germany, and in France at present, the proportions are nearly as follows:

Manganese, twenty parts.
Muriat, sixty-four parts.
Acid, forty-four parts.
Water, fifty-four parts §.

§ O'Reilly Essai.

226. It would conduce much to the economy of this method of bleaching, if the manufactory of sulphuric acid could be carried on under the same roof with the bleaching process, or if some method could be devised to prepare this acid, without employing the nitrat of potass (saltpetre). The latter has been attempted by De Charmes, and as his experiment may afford a hint to manufacturers, we shall copy it.

"The present is certainly the place to speak of the attempt I have made, to procure the sulphuric acid without the intermedium of nitre, and to describe the apparatus I made use of for that purpose. It consisted of a pitcher or pot of stone ware, perforated at the bottom, the neck of which communicated with two small two-necked glass bodies connected together, and each half filled with water. Under each of these glass vessels was lighted charcoal, to keep the water in a state of evaporation, and under the earthen pot there was likewise fire to heat and inflame the sulphur, which was put into the pot through the opening opposite the neck. This opening, which draws in the external air for the combustion of the sulphur, was closed with a stopper, perforated like the nozel of a garden-pot.

"The sulphur, thus inflamed, soon filled the vacant part of the glass vessels with its whitish cloudy vapour. This vapour, meeting that of the water, combined with it, and fell in acidulous drops on the lower water, over which the vapour of the sulphur circulating for a time, does also probably combine with it to a certain point. Another proof that this condensed water did combine with the vapour of the sulphur is, that the same vapour received in drops beyond the second glass vessel by means of a recurved adopter, came out in the acid state, reddening the tincture of tournsol, and effervescing with alkalies when concentrated. I have twice repeated this experiment with success, and with scarcely any inconvenience.

"I likewise attempted to burn sulphur and heat water, in two separate vessels communicating with a third. The two vapours combining together in the receiving vessel, likewise produced by their condensation a fluid, which afforded the same indications of acidity as that of the former experiment.

"When sulphur was burned in an earthen vessel, and its vapour communicated into an earthen jar, in which water almost boiling was poured, the results were the same.

"It is probable that if these experiments were repeated more at large, with a suitable apparatus, a longer series of glass vessels, and proper furnaces, the success would be more complete. I intend at some future time to resume this process, and shall hasten to communicate my success to the public, if success should attend my endeavours (1) *.

* Nicholson's De Charmes.

227. The disposal of the apparatus for the distillation will next demand our attention; and as much of the success of this operation will depend on the goodness of the lute, it is proper to make a few remarks on this subject. The following is recommended by De Charmes (or rather M. Baumé) as a fat lute. Take any quantity of good gray or blue clay, or, what answers extremely well, fullers earth. Let it be dried in thin cakes in an oven after the bread is baked, then pounded or sifted; a certain quantity of this clay is to be mixed with a sufficient quantity of boiled linseed-oil, in an iron or bell-metal mortar, in which they must be well beaten together for a long time, so as to form a tenacious stiff paste of a uniform consistence, and perfectly free from lumps. A considerable quantity of lute is usually made at once; and, so far from losing any of its tenacity by being kept, it is asserted that lute which has been made a twelvemonth, provided that it has been preserved in a cool damp place, as a cellar, and in covered vessel, is more pliant and better than when first made. If too dry and hard, it may be easily rendered of a due consistence by being warmed and worked with the fingers, or beaten in a warm mortar.

The lute which has been used in one distillation must not be thrown away, as, with proper management, it may serve again, and is even better than before. It must be carefully freed from the burnt and hard parts, however, as these would render it crumbly.

228. "When the quantity to be mixed, or kneaded up

(1) Chaptal made a great number of experiments in the large way, for the purpose of discovering the means of acidifying sulphur, without the expence of nitre; but upon the whole they were unsuccessful.

up again, is very small, the trouble of beating it in the mortar may be avoided, because the operation is performed very well, by kneading the matter with the hands. For this purpose, a portion of the lute already kneaded in the mortar, and soaked with oil, may be taken and rolled in the vessel containing the pounded and sifted earth; the portion of earth which adheres may then be worked in; and, by a repetition of this manipulation, the mass will speedily become enlarged, and must be strongly compressed, rolled out, and doubled again, until it is found that it possesses the requisite softness and tenacity, and does not crack when doubled.

"If it should happen that the lute should become too soft by excess of oil, and clay is not at hand to correct this fault, the mass will soon acquire firmness by exposing it to the open air upon parchment, or upon a plate. It must not be laid upon paper, because it is very difficult to separate this material entirely; and if any particles should remain, there would be reason to fear that, when incorporated in the mixture, they would either prevent the perfect adhesion of the lute, or would allow the passage through that kind of void or pore, which the fragments of paper would form. It is, moreover, to be remarked, that this lute cannot be too smooth and uniform. It ought not to afford any perception of inequality when it is handled, or kneaded, nor indicate the presence of foreign substances, such as sand, straw, earthy particles, &c. which are capable of preventing the intimate connexion of its parts.

"I strongly insist on the perfection of this lute, because it is the soul of distillation.

229. "Boiled linseed oil is thus made: two pounds of common linseed oil being put into a saucepan, or proper vessel, of copper, iron, or pottery, add three ounces of red litharge, finely powdered and sifted; after stirring the whole well together, place the vessel on the fire, heating it gradually, until the litharge is completely dissolved. It is necessary to stir the mixture very frequently with a wooden spatula, until the whole solution, which at first acquires a brick-dust colour, is completed: it is then to be removed from the fire, and, when cold, transferred into a stone or earthen vessel, and kept well corked. This is the boiled linseed oil above directed to be used in making the fat lute.

"When this oil, which is blackish after boiling, is well made, it congeals in the vessel as soon as it is cold. When it is required to be poured out, it may be rendered fluid by bringing it near the fire. To save the trouble of heating it, it may be poured, as soon as made, into a plate or shallow vessel, or left in the vessel used for boiling it. It is seldom necessary to heat it for the mere purpose of mixture; the quantities required for this purpose may be taken up with the fingers, or in any other manner.

"It is proper to observe, that the vessel in which the oil is boiled must be sufficiently high, to afford a space for the swelling of the fluid; for, as soon as the heat begins to act, it will rise and overflow the vessel, if particular attention be not paid to it. As soon as this process begins, the vessel must instantly be taken off the fire, and the mixture strongly agitated by plunging the spatula in it, at the same time blowing strongly at its surface with the mouth; by which means the ebullition will be checked. After this event has happened two or three times, it may with certainty be concluded, that the oil will be sufficiently consistent to form a good fat lute. By cooling, it immediately congeals, as has been remarked, to the consistence of plaster, of a black colour, inclining to brown.

230. "The lute made of linseed oil cake is thus made:

"The cake is first to be broken and pounded in an iron or bell-metal mortar, and afterwards sifted through a silken sieve: starch is then to be boiled up, to the consistence of size or glue; a small piece of this, being powdered with the flour of the oil-cake, is to be worked in a plate, or with the hands; more of the flour may then be added, and the kneading continued until the mass is absolutely without any lump, or inequality, and its consistence has become nearly the same as that of the fat lute; after which it is to be kept in a plate, or covered wooden bowl, in the cellar, for use. The same care must be taken with this, as with the fat lute, not to wrap it in paper, but in parchment, if thought necessary.

"This lute dries and hardens much on its outer surface, which remains uninjured at the place where it is applied; but it is decomposed more speedily than the fat lute, on account of its peculiar property to become hard and shrink with a strong heat. In this state, in consequence of the action of acids, it assumes a yellow colour, and is then good for nothing: it must be renewed.

"A very good lute is likewise made with equal parts of the flour of almonds, of linseed, and of starch, kneaded together. It must be understood, that the latter is to be boiled to the consistence of starch.

"To these different lutes we may add that which is composed of lime and white of egg, which has the property of acquiring a considerable degree of hardness.

"Among all these lutes, that to which I have constantly given the preference, and is always kept in sight in the present work, is the fat lute. The lute of white of egg and lime, retained by a cloth and a bandage, may be advantageously used as a covering to the fat lute.

"The fat lutes adhere very much to the hands, during the kneading or working; but it is not difficult to wash off the remains after the operation: nothing more is necessary, than to use warm water and soap, or soap leys, after having previously wiped off the greater part with blotting paper *."

* Nicholson's De Charmes.

231. As the directions given by De Charmes for disposing the apparatus will, with a few modifications, apply to every case, it will be proper to give them without abridgment.

"Our distillation may be performed either in a retort, or a tubulated body or bottle. There can be no difficulty in properly placing these vessels. The junction of the neck or tube, communicating with the pneumatic vessel, is the only object which requires particular care. The manner of joining these two parts, by means of lute alone, will be explained below.

"As the use of the retort requires more attention with regard to its form, and the application of the additional part, the following details will be of use to prevent accidents.

232. "When the retorts are new, and have not before

fore been luted to any additional part, it is advisable either to rub a small quantity of warmed wax on the parts where the lute is to be applied, that is to say, the neck of the retort, as well as the correspondent part of the additional piece, or to suffer a small quantity of starch or paste to dry upon those parts; without this precaution the lute could not be easily applied; it would slide and roll upon the glass instead of adhering.

"Care must afterwards be taken to fix round the neck of the retort a mass of lute, somewhat greater than is supposed to be necessary to fill the additional part to the place where it is to be fixed, in order that by the forcing of that piece upon the neck of the retort, the lute may extend and apply itself more intimately. The same attention must also be paid to the mass of lute, which is required to secure the beak of the additional piece in its connection with the pneumatic apparatus. These observations are of more importance, in order that the two pieces may, by this compression, be made to operate as if they formed one entire vessel.

"To apply these lutes with ease and convenience, the retort is to be held in one hand, in such a manner as that its belly or lower part may not touch or rest upon any thing whatever, because the slightest blow upon this very thin part will break it.

"Before the lutes are applied, care must be taken to introduce the neck of the retort into the additional piece, and mark with lute or wax upon the additional piece the place where the extremity of the retort touches it internally; and, in like manner, on the retort itself, the place where the extremity of the additional piece touches its neck. By means of these marks it is easy to estimate the thickness of the masses of lute, by placing the two vessels near each other in the respective positions they ought to have been fixed. Lastly, they are united together by sliding the recurved additional piece upon the neck of the retort, which is to be held firmly by its neck, resting the hand on the surrounding part, if the retort is small; or holding it by the recurved part, if it be large, or the additional piece should be too long and heavy. The greatest attention must be paid not to turn the parts round, during this operation, more than is absolutely necessary to bring them together; and if this can be done without any turning at all, it will be still better, as the lute will hold more effectually. The neck of the retort must be entered into the additional piece as far as it is capable of compressing the lute, or nearly to the marks made upon the pieces before they were put together. In this situation the lute, which forms a mass round the edge of the additional piece, must be raised so as to cover both surfaces, after having first pressed it as firmly as possible into the joint; smoothing it upon the two pieces, so as to prevent the smallest opening or crack. It is advisable after all to spread a thin coating of the boiled linseed oil over the lute, which not only renders it smoother and more perfect, but by the density it acquires from evaporation, it forms a kind of varnish or pellicle, which supports the lute, and prevents the fissures which might be formed during the actual operation. Whenever in the course of the work the lute should appear too dry, it must be supplied with a thin coating of oil.

"While the lute is thus spread and applied on the external part of the additional piece and the neck of the retort, the compound apparatus is to be held by the additional piece only, and the retort left to be supported, untouched, in the air, by its insertion at the neck only.

"Instead of luting the additional piece to the retort, simply at the extremity of the neck of this last, and at the place where the wider part of that piece touches the retort, we might apply the lute upon the whole surface comprehended between those parts. But I have found that it is sufficient if these two parts be made secure. A retort luted in this manner forms one single and entire body with its additional neck; and with very little care and attention, the lute will seldom or ever have occasion to be renewed before one or two months service.

233. "The tube on which the recurved additional piece rests during the distillation, and through which the gas is introduced into the pneumatic tube, is, as I have remarked, entirely of lead. If it be not cast, it ought to be carefully joined with strong solder; and for fear this last should fail, it will be prudent to cover it with a coating of yellow wax, pitch, or melted pitch.

"That part of the tube, (if soldered as before mentioned) which passes under the lower false bottom, ought to be carefully bended with a round corner, before it is coated with the wax or pitch; and in the bending it is safer to cause the soldered part to lie within the angle. It is likewise proper to stop the mouth of the tube with paper, or a cork, during the time of waxing or tarring, in order to prevent any introduction of those substances into its cavity, taking care to withdraw this temporary stopper before the apparatus is applied to actual use. It is not absolutely necessary to coat any other part of the tube, but that which is to be placed within the pneumatic apparatus, because it is easy to stop any other part, out of which the gas might issue, with soft wax or lute.

"The extremity of this tube, in which the recurved neck of the additional piece is to be inserted, must have the form of a small funnel, not only for the purpose of affording the most convenient support, and the more ready adaption to the various sizes of those necks, but also because it more readily supports the only kind of lute which in this work we suppose to be used. This lute is never deranged, if care be taken to press it against the internal surfaces of this small funnel, and of the glass or lead of the additional piece, so as to unite them as much as possible, it being always understood that the lute is good, and possesses the properties before described in treating of that substance.

234. "I have remarked, that the use of the retort with its additional neck might be dispensed with, by simply using a body or bottle with a neck (even a wine bottle may be used in case of necessity, provided its bottom be either very thin, or very gradually heated). In the orifice of the neck of these vessels, is to be adapted a tube of lead, properly bended, and of a due size. This method is in fact very advantageous and economical; but care must be taken to join the tube, if it be of sheet-lead, particularly in the parts below the bottle which are liable to become heated, a short time before the end of the distillation; to join it I say, without solder, by fusing the two edges together. For in process of time the solder, though ever so strong, yet

Vegetable Substances.

yet because it contains tin, is liable to excessive corrosion by the oxygenated muriatic acid, which, notwithstanding its heat, is not found to attack lead in any perceptible degree.

"But it may, perhaps, be more convenient to cast such a tube at one heat, as well as the additional piece in the apparatus, with the retort; unless, indeed, it should be practicable to have it made of stone-ware or porcelain, the latter of which is the least permeable to the gas. Or we might, with more advantage, make use of a thick tube of common glass, which might be easily bended in a charcoal fire, and might be adapted to the tubulated bottle, as well as the leaden tube. But the danger of its breaking, and the difficulty of procuring others in case of need, together with the expence, have led me to reject this, as well as the tubes of pottery or porcelain.

"In order that the tube adapted to the neck of the bottle may accurately fit, and prevent all escape of the oxygenated muriatic acid, it is defended by lute in such a manner, that it shall not be thrust into the neck of the bottle, without extruding a portion of that substance; and a border of luting must then be applied round the place of junction, which will effectually prevent the escape of any vapour which might issue through the first luting. Lastly, the whole surface of this external luting is to be smeared with boiled linseed oil; after which the distillatory apparatus may be considered as perfectly secure.

"If a tube of glass be used, it may be so adapted by grinding with emery as to fit the neck of the glass body, and require no luting. The same might be done with a tube of porcelain, if the material were sufficiently fine.

235. "With regard to the other neck which I have recommended, as well in the bottle as in the retort, it serves not only to introduce the materials when the leaden tube is previously luted in, but likewise to admit the external air, if by chance an absorption should be perceived to take place; that is to say, if the water, by diminution of the heat, which leaves a kind of vacuum, should rise from the pneumatic apparatus into the body: though even in this case there would be no reason to fear its breaking, notwithstanding its being considerably heated, as at the end of the operation. I have expressly made the trial several times, and always without any accident. The fluid becomes gradually heated in its passage along the sides of the tube or neck of the distilling apparatus, before it enters and mixes with the matter in the body itself; and again, if the tubulated bottle and tube be made use of, the water rising through the latter, and falling in the middle of that contained in the vessel, cannot directly touch the sides before it becomes mixed, But, at all events, if the smallest absorption be feared, it will be sufficient to raise the stopper, and return it to its place the instant after the introduction of the atmospheric air. Instead of a glass stopper, a cork may be used, which must be carefully luted round the neck, if there be any reason to think that the vapour should find its way through, in consequence of the neck being perfectly round.

236. "With regard to the pneumatic vessel, the following is the method of placing and fixing the false bottoms:

"A common wooden hoop is plained flat on the side which is to bear the false bottom, and fixed within the cask with pegs which do not pass quite through the staves. The false bottom, secured together by two dove-tails is placed upon this hoop, and fixed there by similar pegs, which penetrate part of the bottom itself, and by that means prevent it from either rising or turning. The cavities between the false bottom and the sides are then to be closed round with caulker's stuff (*brai sec*), or melted pitch. It must be remembered, that the vertical axis with its cross-arms is to be placed beneath each false bottom. The arms are fixed in a mortice by means of two pins, which prevent them from vibrating or getting loose. The leaden pipe in which the extremity of the additional neck is to be inserted, is not to be put into its place till the first false bottom is immoveably fixed. A notch is supposed to have been cut in this bottom to admit the tube; and when it is duly placed, the vacant space is to be made good, first with tow and then with melted pitch.

"Instead of the wooden hoop, which affords a solid support for the false bottom, it may answer the purpose very well, if cleats or blocks of wood, three inches thick, be pinned on, at different parts of the circumference; or, which is still better, if the trouble be taken to fit the false bottom so well, that it may bear simply upon the inclination of the staves, which naturally oppose its descent. This method would certainly be the quickest, and is not very difficult to be done.

"When the false bottom is thus fixed, it must be retained in its place by pins placed at certain distances, and afterwards made tight by caulking.

"In order that the tube may not be exposed to vary in its position, a mark must be made on the edge of the funnel which terminates one of its extremities, by which it is easy to ascertain the position of the bended part below, and place the same in the most favourable situation. It will be convenient to fix the pipe in this proper situation, by means of two pegs, which must be drawn out previous to the last fixing of the false bottoms.

237. "When the first or lowest false bottom is secured in its place, the second arm of the agitator is to be fastened to the axis, and the other false bottom is to be placed and made fast in the same manner as the first.

"It is particularly necessary to place these two partitions in such a manner, as that the holes of communication may not be in the same vertical line, but as far as possible from each other; that is to say, diametrically opposite. This disposition is necessary in order that the gas may have time to concentrate in one part, before it escapes to the other. For the same reason, it is proper to direct the lower opening of the leaden tube to that extremity of the diameter which is opposite the pipe of communication from the first to the second bottom, in case one distilling vessel only is used. If two or more communicate with each pneumatic apparatus, the openings of the tubes must be respectively disposed at equal distances, as far as possible from each other, and from the opening in the false bottom next above them.

"If instead of false bottoms the preference should be

Digitized by Google

be given to inverted tubs (*cuvettes*), the following method may be used to make the rims or sides, and to fix them immoveably.

"The rim may be made in two ways; either by short staves, fixed with wooden hoops as usual, scarfed or hooked together at their two extremities, or else, by simply fixing a broad wooden rim, like that of a sieve, round the bottom of this inverted vessel, by means of small wooden pins with heads.

"Both these methods are good. The second has the advantage of taking less room and being cheaper. If this method be used, the point of the pins must be made a little thicker than the stem, in order that they may be less disposed to draw out of the holes bored in the bottom. With regard to the joining of the two ends of this kind of broad hoop, it may be effected very firmly by sewing them together with a flat strip of osier, as is done in the better sort of chip boxes, or it may be very well managed by means of two pins with heads, which may be driven through the overlapping part, and secured at the other side by driving a small wedge into the tail of each pin. With regard to the empty spaces or openings which may be between the rim and its bottom, they must be stopped with glaziers putty (*mastic du vitrier*), which may be smoothed with oil. This putty is of excellent service when the muriatic acid is used without potass; but it is soon destroyed if potass be put into the pneumatic vessel. In this case the internal part of the places of junction must be pitched or caulked, as has been already shewn.

"The method of making these inverted vessels with staves and hoops, has the advantage of being close, and not requiring any particular caulking.

238. "Lastly, Instead of these inverted vessels, the operation may be performed merely by flat boards without rims, provided, however, that the upper board be some inches broader on every side than the lower, in order that the bubbles of gas may be forced in their ascent to strike each board in succession, and remain for a short time in contact with it. The essential circumstance in this arrangement will be to keep the upper part of the vessel well closed, which is to be defended at the hole which admits the axis of the agitator by a central tube to retain the gas; and the partial escape which might take place between that axis and the covering, must be more effectually prevented by a cloth soaked in alkaline leys. This method, besides its convenience, requires less care in fixing, but it renders it necessary to work the agitator more frequently, in order to hasten the absorption of the gas in the water. I have determined to relate all the methods which I have successfully practised, in order that those who may undertake any work of this nature, may determine for themselves, not only with regard to general motives of preference, but likewise the facility with which their own situation or circumstances may enable them to carry the same into execution.

239. "The next object is to fix these inverted vessels in the pneumatic apparatus. This is a very simple operation, and consists merely in fixing pieces of wood or brackets, three inches in length, under each of the two bars which connect the pieces of the bottoms of the inverted vessels together. The bracket pieces are fastened to the side of the vessel with oak pegs, and the cross-bars which rest upon them are secured by pins of the same material driven above them and on each side, in such a manner that the central perforation is in its true place, and the whole is incapable of being removed or disturbed.

"In this operation, as I have already recommended with regard to the false bottoms, it is advisable to place the revolving axis in its proper situation, in order to ascertain that it is not likely to be impeded in its action. It is best, indeed, to avoid fixing either the two inverted vessels or the two false bottoms, if these be used, until the clear movement of the agitator has been ascertained; without which precaution, there might probably be occasion to displace them, either in whole, or in part, to remove the impediments which might prevent the free motion of the parts.

"From the description I have here given, it may be seen that my pneumatic vessels have only two false bottoms or inverted vessels. I think it advisable not to use more, because I have remarked that three of these vessels requiring a greater depth, the distillation became much more laborious, particularly when I made use of the intermediate apparatus. 1. The lutes did not so well resist the pressure of the vapour. 2. It was not disengaged with the same speed, and consequently the operation was more tedious. It is better, therefore, to use shallower vessels, and enlarge their dimensions in the diametral direction, as I have constantly found. The proportions which have appeared to me to be advantageous for a small common workshop, are $1\frac{3}{4}$ foot in height, 32 inches in diameter below, and 36 inches diameter above, all inside measure.

240. "With regard to the kind of wood for constructing the vessels, it has appeared to me to be almost a matter of indifference. I used fir, oak, and chesnut, without observing that either the one or the other was productive of any inconvenience to the quality or clearness of the liquor, unless that, at the first or second distillation, the degree of force was a little altered, by soaking into the wood. That kind of wood may, therefore, be used which can the most readily be procured. I must, however, observe, that the large casks in which oil is brought from Languedoc, which are mostly made of chesnut-tree, are very convenient when cut in two to form the pneumatic vessels. They have even an advantage over the oak and fir casks, because they are closer in the joints, better hooped with iron and wooden hoops, and impregnated with the oil, in consequence of which they are not subject to become dry, how long soever they may be out of use, provided they are kept in a close place; whereas the tubs of fir wood require to be almost constantly filled with water. Oak does not contract so soon as fir.

"It must also be observed that the white deal must not be used, because it transmits water like a sponge. The yellow deal is to be preferred, because it undergoes less alteration from the fluid, no doubt on account of the resin it contains. But if the use of the white deal, or any other spongy wood cannot be avoided, it will be proper to paint the vessel within and without with one or two good coatings of white lead. I have had the great satisfaction to observe, that this treatment not only prevents the water from passing through, but likewise that the oxygenated muriatic acid

acid does not attack this colour, or, if it does attack it, a long course of time must be required for that purpose. Melted pitch or tar likewise afford a good defence for such wooden materials as have this defect. A mixture of yellow wax and resin is likewise of excellent service as a coating for the whole internal surface of the pneumatic vessel, including the inverted vessels and the agitator.

241. "Besides the false bottoms, or inverted vessels we have described, each apparatus must likewise have its cover chamfered, to fit the circumference, with apertures to admit the tubes and the central axis; together with two others, namely, one of considerable size, to receive a funnel through which water is poured as occasion requires, and the other smaller, to be opened on such occasions, in order that the air may escape. The cover being nailed, or rather fastened with wooden pins, in its place, is afterwards secured by glueing slips of paper over the line where it is applied to the vessel.

"Instead of the wooden pneumatic vessel, it might be more advantageous to use similar vessels of gritstone (*grès*), rolled or cast lead, or cement of loriot (K). Manufacturers must form an estimate of the advantages to be derived from the expences they incur. If leaden vessels be used, it will be proper to defend the soldered places with one or more coats of white lead, or putty, or resin, or pitch mixed with bees-wax. I have tried these preservatives against the destruction of the solder, and found them answer very well.

242. "As it is useful to possess a knowledge of the height and quantity of water contained in the tub, there is a tube of glass fixed against its outer side, the lower end of which is bended and enters the vessel about five or six inches from its bottom. This part, into which the tube is stuck by firm pressure, is to be previously defended by lute, which is afterwards trimmed and laid smooth upon the sides of the tube and the vessel.

"Lastly, As it is essentially necessary to ascertain, from time to time, the strength of the liquor, and to draw it off upon occasion, I have usually availed myself of a brass cock, covered with several coatings of white lead for this purpose. By means of this cock, it is easy to draw off any small quantity of the fluid at pleasure. It has likewise the advantage of readily filling the narrow-mouthed stone-ware or glass vessels, in which the liquor may be kept when there may be any to spare, or in case it is thought fit to preserve a quantity always in readiness.

"When it is required to draw off the acidulated water with speed and in abundance, it is convenient to use one or more wooden tubes or spigots, which may be opened separately, or all at once, into appropriate vessels. But it is most convenient that they should have stoppers of cork only, because those of wood, though covered with tow, are very apt to burst the wooden tubes by their swelling; besides which they very seldom fit with accuracy, unless turned with extraordinary care.

243. "With regard to the intermediate vessels mentioned in the *Annales de Chimie*, in case the operator is determined to use them, it is proper to avoid using stoppers of cork to close the orifices, and support the tubes at the same time. For this substance being very speedily acted upon by the corrosive gas, exposes the lutes and closures to frequent derangement, as well as the tubes which pass through them. At the beginning of my operations, I supplied the place of these stoppers as follows, when the necks were of a larger diameter than the tubes. I made stoppers of glass, with flanches on the sides. These were ground with emery upon the necks themselves, and they were perforated quite through with a hole, no larger than was proper to admit the passage of a glass or leaden tube. This tube was coated with lute of sufficient thickness, that it could not pass through the hole without forming a protuberant piece, which I pressed and smoothed against the tube as well as the orifice. Or if the stoppers of cork should, nevertheless, from convenience be chosen, the necks may be covered with lute, and the stoppers forced in. In case the interval be small, the parts may be heated a little, covered with virgin-wax, and then forced into the neck, and the small vacuities which may remain may be filled up with the same wax, melted and poured out of a spoon. Instead of lute, yellow wax may also be used to fix the tube of safety; and the same operation may be performed with regard to the glass or leaden tube, which communicates from the tube to the intermediate vessel. Stoppers and tubes luted in this manner, are, in some measure, fixed for ever; for when the wax is once hardened, they are in no further danger.

244. "If the operator be so situated, that he can order the intermediate vessels of whatever form he chooses, it will be advisable to have the orifices of no greater diameter than just to suffer the tubes to pass through. No other defence will then be necessary, than that they should be covered with lute at the time of placing them, which will render them sufficiently firm. The rim, or border of these orifices, ought likewise to be large enough to support the mass of lute which it is proper to apply round the tube *."

* Nicholson's Dic. Chemist.

245. Having adjusted the several parts of the apparatus, we proceed to prepare for the distillation, by filling the pneumatic tub with water, or such fluid as it is intended should be impregnated with the gas, and introducing the materials into the distilling vessels.

The cover of the tub is first to be properly secured by pegs and slips of paper, pasted over the joinings. The tub is then (if not done before) to be filled to within

(K) The author does not appear to speak from experience in this place. It is not probable that any manufacturer would be tempted to incur the expence of stone vessels; but it is nevertheless proper to remark, that every stone which could with facility be wrought, contains lime or clay, or both; the former of which would no doubt be speedily corroded by the liquor, on which it would also have a pernicious effect. It is not likely that clay would be more durable. So that on the whole there is no temptation to use, and many reasons to reject, the earths.

Digitized by Google

within an inch and a half of the top, with soft water. Care must be taken to leave open the orifice, by which the air may be allowed to escape on pouring in the water, as, were this close, the water would insinuate itself under the paper, and destroy the luting.

The distilling vessels are now to be placed in the capsules, or the vessels of water, and firmly secured. De Charmes directs the mixture of manganese and muriat of soda to be introduced at this time; but perhaps it would be better to have this ready done before fixing the vessels, and then nothing remains, but to add the sulphuric acid, which is best done by means of the crooked funnel. This being done, the stoppers are to be well secured, and the various jointures closed up with lute, where this has not been done before.

246. All these steps (except the addition of the acid) should be executed the evening before the distillation; and the next morning, the acid just distilled may be added, if the leaden alembics are used, but if glass retorts or bottles be employed, it is safer to allow the acid to cool before it is poured in.

"If the acid has been poured in warm, and the muriat is very dry, and well mixed, the sulphuric acid not more diluted than has been prescribed, and the manganese of a good quality, bubbles of air will be heard to pass into the wooden vessel, through the leaden tube, at the end of two or three minutes. If the above requisites be wanting, the escape will not take place till somewhat more than a quarter of an hour. In either case it is necessary, a few instants after the pouring of the acid, to place a chafing dish with lighted charcoal beneath the vessel which holds the retort.

247. "About half an hour after the pouring of the acid, a considerable effervescence takes place, which sometimes swells the materials as high as the neck of the retort, if this last be too small for its charge. The bubbles of the froth are large, and covered with a kind of pellicle, formed by a portion of the mixture carried up during the agitation. This intumescence lasts about two hours, during which time the bubbles of oxygenated muriatic acid gas are most abundantly disengaged in the water. They even succeed with such rapidity, that the intervals are not distinguishable, and an incessant noise is heard in the pneumatic vessel, which very often lasts three or four hours, according to the management of the fire, and the goodness and accurate mixture of the materials. The agitation produced by this rapid escape is commonly such, that it is scarcely necessary to move the agitator.

"The fire is not to be renewed till the expiration of two hours, even though it may have gone out in the mean time. After this, it is not to be renewed till the end of an hour and a half, and after that period, at the end of an hour, and so forth, without any perceptible increase of its intensity. It will be sufficient after these periods to keep up the fire, excepting that during the last two hours the fire must be maintained without suffering the charcoal to be almost burned away, as in the former cases, before it is renewed. The chafing dish must be raised upon bricks, to bring it nearer the retort, during the last hour. I must observe, with regard to this chafing dish, that the grate must not be too open, lest the charcoal should be too rapidly consumed. After the intumescence of the mixture has ceased, the rapid escape of bubbles does not diminish for a long time, in consequence of an effervescence which constantly proceeds. It is true that this continually diminishes, and towards the end of the distillation the bubbles, which pass into the tube appear only at intervals, notwithstanding the matter in the retort may, by the gradual augmentation of the heat, be brought into the state of ebullition. The heat is such, that eight or nine hours after the commencement of the operation, the hand can scarcely be endured near the aperture, or the neck of the retort, or other distillatory vessel, though between the fourth and sixth hours the same parts are scarcely warm. The distillation of one or more retorts or bodies into a single vessel, according to the doses before mentioned, takes usually eleven or twelve hours, and even less; the time for stopping the distillation is known from the escape of the bubbles being very slow, and the noise less perceptible. This slight noise is even a mark to form a judgment of the concentration of the gas, and the degree of saturation of the water. In order to hear the bubbles, it is often necessary to apply the ear against the tub. Moreover, the adopter of the retort begins to be heated, and the lute upon its neck becomes a little softened. Another indication that the process is near its termination, is had from the long vibrations of the water in the indicatory tube, placed on the outside of the tub, and likewise in the tube of safety, when an intermediate vessel is used.

248. "If a proper regard be not paid to the signs here enumerated, and the distillation be not stopped, there will not only be a loss of time and fuel, and a distillation of mere water; but the steam, when an intermediate vessel is used, will drive the water through the tube of safety, and itself immediately follow, if not instantly remedied by diminishing or removing the fire, and cooling the neck of the retort and its adopter with a wet cloth, or, which is better, by drawing the stopper of the retort for an instant.

"As soon as the distillation is stopped, the impregnated fluid of the pneumatic vessel is to be drawn off into tubs or other vessels, proper to receive the goods which are previously disposed therein. If it be not convenient to use it immediately, the liquor may be left in the tub without fear of any perceptible diminution of its virtue, provided the cover and its joinings be well closed with lute and stripes of paper pasted on, and likewise that the space between the axis of the agitator and the cover be similarly secured. It may likewise be drawn off in stoneware bottles well closed with corks, covered with lute at the place of their contact. In this manner the liquid may be preserved till wanted. I have kept it for several months without its goodness having been impaired.

249. "I must observe in this place, that if it be wished that the liquor at the upper part of the vessel should be equal in strength to that of the lower, without regarding the distillation (which may be uselessly prolonged for upwards of twenty-four hours, by an effect of the concentration of the gas in the bottom of the vessel, and the resistance it then opposes to its introduction, which singularly contributes to increase the heat of the retort); I have found no better method than that of drawing off the liquor, either into earthen pitchers or vessels filled with merchandise ready for immersion. I have done this after a limited time,

Digitized by Google

Vegetable Substances.

time, and repeated proofs of the good quality of the fluid. At the end of eight hours distillation, I drew off one fourth of the contents of the vessel; a second fourth two hours afterwards; a third fourth after ten hours and a half, or eleven hours; and the rest after twelve hours distillation, which formed the conclusion.

"When the liquor is entirely drawn off from the vessel, it must again be immediately filled with water, or at least to the height of five or six inches above the return of the leaden tube, otherwise the gas, which continues to escape from the distilling vessel, and then affords no resistance, might attack the pneumatic vessel itself.

250. "The fire must be taken from beneath the retort as soon as the distillation is finished, not only to prevent the effect of the gaseous vapours, which still continue slowly to escape, from acting on the sides of the tub, but likewise to dispose the retorts or bodies to receive a quantity of warm water, which is to be poured in up to the neck. There is no reason to fear an excess of quantity, and the hotter the vessels are, the better. It is essential, however, that it be not poured in cold, for fear of breaking the glass. The adopter is then to be unluted from the neck of the leaden tube, if the operator chooses; and in order that no vapour may escape into the workshop, a bit of lute or a cork may be applied to the beak of the adopter. The sand bath easily permits the retort to be raised and returned again to its place, as well as the application of the lute or stopper to the neck of the adopter, this last being raised with one hand while the cork is put in with the other.

"Nevertheless, as the lutes which connect the adopter with the retort are somewhat softened towards the end of the operation, it would be more prudent to leave every thing in its place, for fear of deranging those lutes. This danger is greater when the adopter is of lead, because the great length of this additional piece tends to force the luting still more on that account. If it be required to proceed immediately to a new distillation, the retort or bottle with its capsule or pan must be immediately taken from the furnace, and another substituted in its place ready prepared during the former distillation. This necessarily requires a double set of vesels.

251. "When the distilling vessel is cold, or nearly so, the whole of its contents must be shaken, by holding this vessel by the neck with one hand, and applying the other to its bottom. The stopper must then be taken out, and the vessel speedily inverted, shaking the residue to facilitate its escape. In this last situation the retort is to be held by the neck with one hand, and its side gently resting against the other. The vessels into which the water and residual matter of the retorts are poured, should rather be of stoneware, pottery, or lead, than of wood, unless these last be oil vessels, which are less subject to dry in the part above the fluid. If this circumstance be not attended to, there will be danger of losing great part of the contents.

"It is most convenient to disengage the retorts or bodies while they are still warm, which continues to be the case the next morning after distillation, in consequence of the heat of the sand bath. If they be left to cool entirely, the sulphate of soda will crystallize, and it will be necessary to dissolve in hot water such larger portions as cannot pass through the neck. But this inconvenience is not likely to happen, unless the quantity of water last added be too small, and the residues have been left undisturbed for several days. The same observation is applicable to that kind of incrustation which is formed by the muriat, if not properly pulverized, dried, or mixed; this cannot be separated from the bottom of the retort, but by means of hot water poured at different successive times. It is likewise essential to leave no crust or deposition of muriat, or other matter, in the vessels which are emptied, unless the same be moveable, in which case the risk is less. But if the urgency of business should then require that the same vessels be used without entirely clearing them, it will be necessary to range this residual matter on one side, where it will be less exposed to the heat, and will afford a greater degree of facility for the nitric acid to act upon it.

"In order that the vapour which exhales from the distilling vessels may not prove inconvenient, it is necessary to pour in a small quantity of alkaline lixivium in the first place, which instantly destroys the smell. This may be done immediately after the end of the distillation, and the weak alkaline solution may supply the place of the water used for diluting the residues. At the instant of pouring this lixivial water, a strong effervescence takes place; for which reason it is proper to pour it in by several successive portions, waiting a little between each time *."

252. The oxygenated liquor prepared in this way is very effectual in bleaching the stuffs which are immersed in it; but at the same time possesses an odour so suffocating as to render its use unpleasant and even injurious to the workmen employed in the process, should any of it escape. "I have witnessed, (says O'Reilly) in an extensive manufactory near Paris, the cruel sufferings experienced by the wretched workmen, from these suffocating vapours; I have seen them rolling on the ground in the excess of agony. Frequently even severe disorders are the consequence of the first effects produced by the oxygenated liquor †." De Charmes gives a long account of the sufferings which he underwent in his course of experiments with this acid. It produces symptoms completely resembling those of a violent cold, but which go off in a day or two after having desisted from the use of the liquor.

This inconvenience may be avoided in two ways:

1. By rendering the vessels for immersion so tight as to prevent the possibility of the escape of the gas.

2. By dissolving in the water some substance which has the property of so far neutralizing the acid as to correct its odour, without destroying its bleaching quality to any considerable degree.

253. Mr Rupp of Manchester contrived a tub for immersion, which is admirably adapted to answer the first purpose. Its construction is simple, and not expensive.

"It would therefore, be desirable to have an apparatus for the use of the pure oxygenated muriatic acid simply dissolved in water, which is at once the cheapest and best vehicle for it. This apparatus must be simple in its construction, and obtainable at a moderate expence; it must confine the liquor in such a manner as to prevent the escape of the oxygenated muriatic acid gas, which is not only a loss of power, but also an inconvenience

* Nicholson's De Charmes.

Vegetable Substances.

nience to the workmen and dangerous to their health; and it must, at the same time, be so contrived, that every part of the stuff which is confined in it, shall certainly and necessarily be exposed to the action of the liquor in regular succession. Having invented an apparatus capable of fulfilling all these conditions, I have the pleasure of submitting a description of it to the society, by means of the annexed drawing.

Plate XCI. "Fig. 4. is a section of the apparatus. It consists of an oblong deal cistern, ABCD, made water-tight. A rib, EE, of ash or beech wood, is firmly fixed to the middle of the bottom CD, being mortised into the ends of the cistern. This rib is provided with holes, at FF, in which two perpendicular axes are to turn. The lid, AB, has a rim, GG, which sinks and fits into the cistern. Two tubes, HH, are fixed into the lid, their centres being perpendicularly over the centres of the sockets, FF, when the lid is upon the cistern. At I, is a tube by which the liquor is introduced into the apparatus. As it is necessary that the space within the rim, GG, be air-tight, its joints to the lid, and the joints of the tubes, must be very close; and, if necessary, secured with pitch. Two perpendicular axes, KL, made of ash or beech wood, pass through the tubes, HH, and rest in the sockets, FF. A piece of strong canvas, M, is sewed very tight round the axis K, one end of it projecting from the axis. The other axis is provided with a similar piece of canvas. N, pieces of cloth rolled upon the axis L. Two plain pulleys, OO, are fixed to the axes, in order to prevent the cloth from slipping down. The shafts are turned by a moveable handle, P. Q, a moveable pulley, round which passes the cord, R. This cord, which is fastened on the opposite side of the lid (see fig. iv.), and passes over the small pulley S, produces friction by means of the weight T. By the spigot and fausset V, the liquor is let off, when exhausted.

"Fig. iv. A plan of the apparatus, with the lid taken off.

"The dimensions of this apparatus are calculated for the purpose of bleaching twelve or fifteen pieces of $\frac{7}{8}$ calicoes, or any other stuffs of equal breadth and substance. When the goods are ready for bleaching, the axis, L, is placed on a frame in the horizontal position, and one of the pieces, N, being fastened to the canvas, M, by means of wooden skewers, in the manner represented in fig. 4. it is rolled upon the axis by turning it with the handle, P. This operation must be performed by two persons; the one turning the axis and the other directing the piece, which must be rolled on very tight and very even. When the first piece is on the axis, the next piece is fastened to the end of it by skewers, and wound on in the same manner as the first. The same method is pursued till all the pieces are wound upon the axis. The end of the last piece is then fastened to the canvas of the axis K. Both axes are afterwards placed into the cistern, with their ends in the sockets FF, and the lid is put on the cistern by passing the axes through the tubes HH. The handle P is put upon the empty axis, and the pulley Q upon the axis on which the cloth is rolled, and the cord R, with the weight T, is put round it and over the pulley S. The use of the friction, produced by this weight, is to make the cloth wind tight upon the other axis. But as the effect of the weight will increase as one cylinder increases and the other lessens, I recommend that three or four weights be suspended on the cord, which may be taken off gradually, as the person who works the machine may find it convenient. As the weights hang in open hooks, which are fastened to the cord, it will be little or no trouble to put them on and to remove them.

"Things being thus disposed, the bleaching liquor is to be transferred from the vessels in which it has been prepared into the apparatus, by a moveable tube passing through the tube I, and descending to the bottom of the cistern. This tube being connected with the vessels, by means of leaden or wood pipes provided with cocks, hardly any vapours will escape in the transfer. When the apparatus is filled up to the line *a*, the moveable tube is to be withdrawn, and the tube I closed. As the liquor rises above the edge of the rim G, and above the tubes HH, it is evident that no evaporation can take place, except where the rim does not apply closely to the sides of the box: which will, however, form a very trifling surface, if the carpenter's work be decently done. The cloth is now to be wound from the axis L upon the axis K, by turning this; and when this is accomplished, the handle P and pulley Q are to be changed, and the cloth is to be wound back upon the axis L. This operation is, of course, to be repeated as often as necessary. It is plain, that, by this process of winding the cloth from one axis upon the other, every part of it is exposed, in the most complete manner, to the action of the liquor in which it is immersed. It will be necessary to turn, at first, very briskly, not only because the liquor is then the strongest, but also because it requires a number of revolutions, when the axis is bare, to move a certain length of cloth in a given time, though this may be performed by a single revolution when the axis is filled. Experience must teach how long the goods are to be worked; nor can any rule be given respecting the quantity and strength of the liquor, in order to bleach a certain number of pieces. An intelligent workman will soon attain a sufficient knowledge of these points. It is hardly necessary to observe, that, if the liquor should retain any strength after a set of pieces are bleached with it, it may again be employed for another set.

"With a few alterations, this apparatus might be made applicable to the bleaching of yarn. If, for instance, the pulley O were removed from the end of the axis K, and fixed immediately under the tube H; if it were perforated in all directions, and tapes or strings passed through the holes, skains of yarn might be tied to these tapes underneath the pulley, so as to hang down towards the bottom of the box. The apparatus being afterwards filled with bleaching liquor and the axis turned, the motion would cause every thread to be acted upon by the liquor. Several axes might thus be turned in the same box, and being connected with each other by pulleys, they might all be worked by one person at the same time; and as all would turn the same way and with the same speed, the skains could not possibly entangle each other †."

254. As far as respects the confinement of the gas, this apparatus of Mr Rupp is extremely well contri-

† Manchest. Mem. vol. v. p. 1.

 ved,

Digitized by Google

ved, but in his method of rolling up the stuffs, there is an inconvenience which M. O'Reilly has corrected. The inconvenience arises from the axis being vertical, as when several pieces are rolled upon the same axis, some parts of them are liable to sway down, and thus render the action of the bleaching liquor unequal. He proposes to remedy this inconvenience by making the axis horizontal, and to make the passage of the stuff through the liquor more complete, he places a roller at each end of the vessel, above and below, and three others in the middle, as will be explained when we describe the apparatus.

255. Soon after the appearance of Berthollet's paper in the *Annales de Chimie*, it was proposed to employ the oxygenated muriatic acid, in the state of gas applied immediately to the cloths previously moistened, and we believe that it has been so employed by some bleachers. We are, however, disposed to consider the method as highly injurious to cloth so bleached, although the danger to the workmen might be avoided, by the use of the immersing vessel above described.

256. In employing the simple oxygenated liquor, it is of consequence to possess some criterion, by which we may ascertain its comparative strength. The method contrived by M. Descroizilles has been described in paragraph 209. Mr Rupp has improved on this, by employing the acetite of indigo, prepared by pouring acetite of lead (sugar of lead) into a solution of indigo in sulphuric acid, as long as any precipitate appeared.

257. The second means of avoiding the unpleasant effects of the suffocating gas, we have said, consist in dissolving in the water through which the gas is passed, some substance which is capable of mixing with, and correcting it.

Two substances may be employed with this view, potash and lime.

258. When potash is employed, a quarter of a pound of the common potash, purified as directed in 165: is to be used for every pound of muriat of soda introduced into the distilling apparatus. This is to be dissolved in the water with which the pneumatic tub is filled. It is most convenient to dissolve the potash in a small quantity of water, and add the solution to the water in the tub; but care must be taken to stir them well together with the agitator, that the potash may be equally combined with the water.

But, although this weak solution of potash certainly renders the bleaching process much less inconvenient to the workmen employed, it is yet much more expensive than the simple oxygenated liquor, and more of it is necessary to perform the same work than is required of this latter. Mr Rupp has completely proved this by a set of ingenious experiments which he made, comparing the quantity of colouring matter in the acetite of indigo, and in an infusion of cochineal, destroyed by the same quantity of the two liquors. His experiments are highly interesting, and are thus related by himself.

"*Experiment* I.—To half an ounce of oxygenated muriatic acid, I added a solution of indigo in acetous acid (L), drop by drop, till the oxygenated acid ceased to destroy any more colour. It destroyed the colour of 160 grains of the acetite of indigo.

"*Experiment* II.—A repetition of Experiment I. The colour of 165 grains of acetite of indigo was destroyed in this experiment.

"*Experiment* III.—A repetition of Experiments I. and II. The colour of 160 grains of the acetite was destroyed.

"*Experiment* IV.—To half an ounce of the oxygenated muriatic acid, were added eight drops of pure potash in a liquid state. This quantity of alkali was about sufficient to deprive the acid of its noxious odour. This mixture destroyed the colour of 150 grains of the acetite of indigo.

"*Experiment* V.—A repetition of Experiment IV. The colour of 145 grains of the acetite was destroyed.

"*Experiment* VI.—To half an ounce of the oxygenated muriatic acid, ten drops of the same alkali were added. It destroyed the colour of 125 grains of the acetite of indigo.

"*Experiment* VII.—A mixture of half an ounce of the oxygenated acid, and 15 drops of the alkali, destroyed the colour of 120 grains of the acetite of indigo.

"Though I had taken the precaution of avoiding the sulphuric acid, for the reason stated in the foregoing note, I was not quite satisfied with these experiments, on account of errors which might have taken place through a double affinity. I therefore made the following experiment, in which I employed a decoction of cochineal in water, instead of the acetite of indigo.

"*Experiment* VIII.—To half an ounce of the oxygenated muriatic acid, a decoction of cochineal was added till the acid ceased to act on its colour. It destroyed the colour of 390 grains of the decoction.

"*Experiment* IX.—A repetition of Experiment VIII. The colour of 385 grains of the decoction was destroyed in this experiment.

"*Experiment* X.—To half an ounce of the acid, six drops of the liquid alkali were added. This mixture destroyed the colour of 315 grains of the decoction.

"*Experiment* XI.—Eight drops of the alkali were mixed with half an ounce of the acid. This mixture destroyed the colour of 305 grains of the decoction.

In order to shew the usefulness of this apparatus still more clearly, I request the society to attend to the following statement of the expence of a given quantity of bleaching liquor, with and without alkali, but of equal strength.

With

(L) It has been usual to estimate the strength of the oxygenated muriatic acid by a solution of indigo in sulphuric acid. This method was inadmissible in these experiments on the comparative strength of the bleaching liquor, with and without alkali; because the sulphuric acid would have decomposed the muriat of potash, and thereby produced errors. I therefore added to a solution of indigo in sulphuric acid, after it had been diluted with water, acetite of lead, till the sulphuric acid was precipitated with the lead. The indigo remained dissolved in the acetous acid.

With Alkali (M).

	L.	s.	d.
80 lb. of salt, at 1½d. per lb. -	0	10	0
60 lb. of oil of vitriol, at 6½d. per lb.	1	12	6
30 lb. of manganese, - -	0	2	6
20 lb. of pearl-ashes, at 6d. per lb.	0	10	0
	L. 2	15	0
But it appears, by the foregoing experiments, that the liquor loses strength by an addition of alkali. The value of this loss, which on an average amounts to 15 per cent. must be added to the expence, - -	0	8	3
	L. 3	3	3

Without Alkali.

	L.	s.	d.
80 lb. of salt, - - -	0	10	0
60 lb. of oil of vitriol, - -	1	12	6
30 lb. of manganese, - -	0	2	6
	L. 2	5	0

"It appears from this calculation, that a certain quantity of the liquor, for the use of my apparatus, costs only 2l. 5s.; but that the same quantity of the alkaline liquor costs 3l. 3s. 3d. which is 40 per cent. more than the other. The aggregate of so considerable a saving must form a large sum in the extensive manufactures of this country †."

† *Manchest. Memoirs*, vol. v.

259. "Indeed, that the addition of potash should diminish the bleaching power of the oxygenated muriatic acid might easily be inferred, from knowing that the oxygenated muriat of potash, or rather the hyperoxygenated muriat of potash, does not in any degree possess the power of destroying vegetable colours, and consequently, the more completely the acid is saturated with the potash, the more completely is its bleaching power destroyed.

260. The method of employing lime in correcting the oxygenated acid was first used in Ireland; and some years ago, there were not less than thirty apparatus for preparing this mixture established in the northern parts of that kingdom ‡. It has been also employed at Glasgow; and a patent, which is now set aside, was obtained by a manufacturer there for preparing the liquor, and a solid oxymuriat of lime, which might be employed at all times, and conveyed to any distance.

‡ *Higgins's Essay.*

The pneumatic tub should be of such a capacity as to hold 800 gallons of water; and to this is to be added eight pounds of slaked and well sifted lime, which is to be well mixed with the water by means of the agitator, both at the time of making the mixture and during the distillation.

Between the tub and the distilling vessel is placed a leaden receiver capable of holding eight gallons, which is to be two-thirds filled with water, intended to retain any common muriatic acid which may come over. For this purpose a leaden tube, three inches diameter in the bore, proceeds from the alembic, and passes nearly to the bottom of the receiver, and another tube of the same diameter passes from the upper part of this latter to the pneumatic tub. It is known that the limed water in the tub is saturated with acid, when on drawing off a portion of the liquor and adding lime to it, the lime sinks to the bottom. The liquor is then to be drawn off and mixed with thrice its bulk of water, when it is fit for bleaching.

The oxymuriat of lime is found to be superior to the oxymuriat of potash in bleaching, and it is certainly far less expensive. Barytes (ponderous earth) and strontites might probably be used with still greater advantage, from their greater solubility in water, and could be procured at a cheaper rate.

261. Previous to immersing the stuffs in any of this oxygenated liquor, they are to be steeped and fulled in the same way as in the old method, to deprive them of the weavers dressing, and the saliva of the spinners. For this purpose it is proper to employ a weak alkaline ley.

In Britain and Ireland machinery is commonly employed in the fulling process, but it is generally so constructed as to wear the cloth. O'Reilly has proposed the following machine for this purpose.

He constructs a circular platform, which revolves about a moveable axis, and is supported at the extremities of the spokes by rollers of cast iron, the circumference of the platform is indented to receive a paul or catch, which makes it recede one notch at each stroke produced by the motion of the mill-tree. To the axis of the mill-tree are fixed spokes which raise several wooden beaters, which falling on the platform loaded with cloth or thread, rinse them more completely than can be effected in any other way, water being constantly supplied from gutters which are filled by buckets attached to a water wheel.

Cotton, thread, and stuffs, more particularly require this preparation, as without it the ley cannot penetrate the substance of the cotton, because of the resinous matter with which it is impregnated.

In some manufactories a bath of soap is employed; but this is unnecessary, as all that is requisite is to form a combination of the oily matter of the cotton with an alkali in order to render it soluble in water, and afterwards to submit the colouring matter to the action which another part of the alkali may exert on it. The preparations which the stuffs must undergo previous to their immersion in the oxygenated liquors consist therefore in steeping in an alkaline ley, rinsing in water, and subsequent pressing and wringing.

262. In disposing the apparatus for the immersions, regard must be had to the objects on which we are to work. Skains of thread are to be suspended in the tub which is intended to receive them; and the stuffs are to be rolled round the rollers of the immersing tub which we have described. The method of doing this is as follows: A piece of cloth is to be fastened to one of

(M) I make no mention of the expence attending the preparation of the liquor, it being the same in both cases.

Digitized by Google

Vegetable Substances. of the horizontal axes which correspond to those of Mr Rupp, and is to be rolled round by means of the handle till the whole is upon the axis; to this is fastened a second piece, which is rolled on in the same manner, and thus as many pieces as required are rolled upon the axis. The end of the last piece is then made to pass over the roller *h* at the upper part of the extremity of the tub next *to g;* is carried down below the roller *h* at the lower part of the same extremity; is carried along the bottom of the tub under the next roller up to the roller at the upper part of the partition; passes over this to the roller at the bottom of the tub on the other side of the partition; so on below the lower roller at the other end of the tub, over the upper roller of the same end, from which it passes to the other horizontal axis, and is there secured.

Plate XCI. fig. 3.

When the pieces are thus fastened, the immersing tub is filled with the liquor intended to be used from the pneumatic tub; and this, if it be the oxymuriat of lime, may be done by a funnel, but if it be the simple oxygenated liquor, it is best done by a stop-cock passing from the pneumatic tub into the immersing vessel: when this is filled, the handle of the axis to which the last end of the cloth is fastened is turned till the whole of the cloth is unrolled from the first axis round the second, and then again the handle of the first is turned to reverse the situation of the cloth. Thus the cloth is made to pass to and fro through the liquor till the strength of this is exhausted.

263. This is discovered by drawing off a little of it, and adding to it a portion of the acetite of indigo; if the colour of this is not diminished, the liquor has lost its bleaching power, and the cloth may be removed, and the water, if the simple oxygenated liquor was employed, may be used for a new impregnation.

264. After the stuffs or thread have been removed, they must be well rinsed and again subjected to an alkaline ley. The lixiviations and immersions are repeated as often as is requisite till the bleaching is completed.

The number of lixiviations and immersions differs according to the articles. Cotton cloth requires only two operations of each; cotton-thread three; fine flax will require four; and articles of hemp five or six alternations.

265. "As it is of essential consequence to be aware of certain events, or facts, by which the progress of the bleaching may be ascertained, I shall here point out the gradations of colour, which the pieces assume after each immersion in the oxygenated muriatic acid without smell, made according to the proportions here described. The first immersion gives the thread, or piece-goods, a reddish colour, slightly inclining to yellow; the second, a colour inclining to ruddy yellow; the third, a whitish yellow; the fourth, a white, slightly inclining to a ruddy tinge; and by the fifth and sixth, the white becomes clearer and clearer. These are very nearly the shades which are assumed by coarse goods, for the fine goods frequently pass to the second or third gradation by one single immersion.

"When the liquor is strongly concentrated in potash, such as that which is denoted in the Annals of Chemistry by the name of *javelle*, the goods immediately, and without previous lixiviation, assume the third colour; but I have observed, that it is difficult to bleach them further without using the sulphuric acid, to remove the lees with which they are loaded. It must, moreover, be remarked, that in order to obtain this tone of colour, it is sufficient that the lixivium be diluted with water, so as to mark two or three degrees only on the aerometer, instead of eighteen or twenty, which it may mark after it is prepared by distillation.

"There are some who do not approve the colour which the thread acquires after the first immersion; but it may immediately be reduced by steeping the goods in cold or hot lees. The latter produces its effect more speedily; and after subsequent rinsing and drying, the goods retain a gray white colour, more or less deep according to the shade it has received. Many venders prefer this gray, or reduced colour, on account of its preferable sale in certain markets.

"With regard to the bright and perfect white, there are very few persons in the provinces who care for it, or appear to give it an exclusive preference. Two reasons may be given for this: first, because a prejudice is unfortunately established against the speed with which the new invented method of bleaching operates: and secondly, the consumer is constantly persuaded, whether the bleaching may have been performed in this manner or in the field, that when the goods have attained an extreme degree of whiteness, they cannot be so durable as such as are less white. It is thought to be rotten, or burnt; and this opinion leads to a preference in favour of such linens, and even cottons, which preserve after bleaching a solid shade of gray, or dulness in the white.

"From a prejudice of the same kind, it is, that in many countries, the women, particularly the peasants, prefer their linen, whether for clothing or household use, simply cleared without bleaching. The orders of proprietors, or purchasers, must therefore be attended to, and the number of immersions and lixiviations regulated accordingly.

"It may be considered as a rule, that when the goods no longer communicate a perceptible colour to new lees, they are entirely finished, and consequently, that every subsequent lixiviation, or immersion, will be attended with absolute loss, unless the immersion is necessary to clear off the last lees, on the supposition that simple rinsing in a large quantity of water may not be sufficient.

"I must, nevertheless, remark, that thread bleached by the oxygenated muriatic acid, may be used by the sempstress with much more speed and briskness than thread of the same quality bleached in the field; it is less brittle, and, on that account, is better for the weft, as well as the warp. It likewise may be struck much more effectually home to its place in weaving, and does not afterwards move. I received this valuable observation from impartial and unprejudiced manufacturers, for whom I bleached thread according to this method for making handkerchiefs *."

266. The theory of these operations is simply this. The oxygenated liquor supplies to the cloth the place of the oxygen of the atmospheric air, and this in greater abundance, and in a state which renders its action on the cloth more expeditious and more complete. By the union of the oxygen with the carbon of the colouring matter of the cloth, carbonic acid is formed, to produce and carry off which is the object of the several processes which we have described. It is carried

* Nicholson's Dr Chem.

Digitized by Google

ried off by the subsequent lixiviations, in which the alkali answers two purposes; part of it combining with the carbonic acid forms carbonate of potass, while another portion acts on the remaining colouring matter, and dissolving part of it prepares it for another immersion in the oxygenated liquors.

267. The expence of potash soon suggested to scientific bleachers the importance of endeavouring to discover a substitute for it which might render their process more economical. Kirwan with his usual ingenuity, discovered, that saline sulphurets would answer the purpose, and Mr Higgins has lately much improved on the discovery by bringing into use the sulphuret of lime, which he has fully proved may be employed as a substitute for potash with the greatest advantage. His account of his views, and of the method of preparing and using this substance are too interesting not to find a place in this article.

268. "Since I had the honour of being appointed chemist to the Linen Board, which is now more than three years, I have allotted a considerable portion of my time and attention to the investigation of the principles of that science, applicable to the art in which I am thus more particularly interested. It appeared, that until potash could be dispensed with, we must for ever remain in the power of foreign nations as to our staple commodity; observing also, that all the late improvements in bleaching were exclusively confined to the one object, that of imparting oxygen to the cloth, in a safe and expeditious manner, but that there had been no effort made to supersede the necessity of potash, by far the most extensive and uncertain article employed by the bleacher, and for which he is entirely dependent upon foreign markets; I directed my attention chiefly to discover a substitute for potash; which, provided it should be of Irish production, though it might be equally expensive, I conceived would be of the utmost national importance. Impressed with these ideas, I undertook a series of experiments with that view.

269. "To enumerate the many disappointments and failures I experienced during my investigation, would be endless, and an unnecessary intrusion upon my reader. Knowing, from an important observation of Mr Kirwan, that saline hepars, or the combination of an alkali with sulphur, might, from its detergent properties, be advantageously employed in bleaching, as a substitute for mere alkali, by an obvious analogy I was led to expect a similar effect from calcareous hepar, or, more properly speaking, sulphuret of lime, being a combination of lime and sulphur.

270. "In these expectations I was not disappointed, but at that time (about three years since) I contented myself (rather through necessity, for large cities are very unfavourable to experiments on bleaching by exposure to the atmosphere), with pointing it out to some of the principal bleachers from the north then in the town, earnestly recommending it to them to give it a fair trial with and without potash. Since that time, alkaline salts having become progressively dearer, and in consequence of a late proposal of substituting lime for potash, in condensing the oxymuriated gas, I was instigated to resume the subject, and make further and more varied trials. The result of which has been, that the use of the sulphuret of lime may be most advantageously combined with that of the oxymuriated lime, and that thus cloth may be perfectly whitened without the use of a particle of alkali. This then alone would seem to give it a decided preference over the methods at present in use, while at the same time it possesses peculiar advantages, and is exempted from the principal objections to which other substitutes are liable: for, 1st, Quicklime and sulphur, the materials of which the calcareous hepar consists, are both articles of trivial expence, especially as the latter enters but sparingly into the composition; 2dly, Their combination is effected in the easiest and most expeditious manner possible, and perfectly level with the capacity of the meanest workman; 3dly, As the manner of its application is, by steeping the cloth in it cold, the saving of fuel is a matter of great magnitude; and, lastly, There is no danger to be apprehended in the use of it, from the unskilfulness or negligence of the workman, as it appears to be incapable of injuring the texture of the cloth.

271. "The sulphuret of lime is prepared in the following manner: Sulphur, or brimstone in fine powder, four pounds; lime well slaked and sifted, 20 pounds; water, 16 gallons: these are all to be well mixed and boiled for about half an hour in an iron vessel, stirring them briskly from time to time. Soon after the agitation of boiling is over, the solution of the sulphuret of lime clears, and may be drawn off free from the insoluble matter, which is considerable, and which rests upon the bottom of the boiler (N). The liquor, in this state, is pretty nearly of the colour of small beer, but not quite so transparent.

"Sixteen gallons of fresh water are afterwards to be poured upon the insoluble dregs in the boiler, in order to separate the whole of the sulphuret from them. When this clears (being previously well agitated) it is also to be drawn off and mixed with the first liquor; to these again, 33 gallons more of water may be added, which will reduce the liquor to a proper standard for steeping the cloth.

"Here we have, (an allowance being made for evaporation, and for the quantity retained in the dregs) 60 gallons of liquor from four pounds of brimstone.

272. "Although sulphur by itself is not in any sensible degree soluble in water, and lime but very sparingly so, water dissolving but about $\frac{1}{7..}$th part of its weight of lime; yet the sulphuret of lime is highly soluble (O).

273.

(N) Although lime is one of the constituent principles of the sulphuret, yet being so intimately united to the sulphur, it has no longer the property of lime; upon the same principle that sulphuric acid in sulphat of potash, has not the property of that acid.

(O) When the above proportion of lime and sulphur is boiled with only 12 gallons of water, the sulphuret partly crystallizes upon cooling, and when once crystallized, it is not easy of solution.

Digitized by Google

Vegetable Substances.

273. "When the linen is freed from the weavers dressing, in the manner already described, it is to be steeped in the solution of sulphuret of lime (prepared as above) for about twelve or eighteen hours, then taken out and very well washed; when dry, it is to be steeped in the oxymuriate of lime for twelve or fourteen hours, and then washed and dried. This process is to be repeated six times, that is, six alternate immersions in each liquor, which I found sufficient to whiten the linen.

"When I submitted the linen to six boilings in potash, and to six immersions in the oxygenated liquor, it was not better bleached than the above.

"The three first boilings in potash, it is true, produced a somewhat better effect than as many steeps in the sulphuret; but towards the conclusion, that is, when the linen was bleached, the smallest difference was not observable as to colour. The linen bleached with the potash was thinner, or more impoverished than that treated with sulphuret, and the latter stood the test of boiling with soap much better than the former, although it did acquire a slight yellowish tinge, which I should suppose a week's, or at most, a fortnight's grass, as they term it, would remove.

274. "I contrasted the effects of hot and cold sulphuret in various temperatures, and although the difference appeared in favour of the hot liquor, yet it was so trifling as not to deserve consideration, or the expenditure of the smallest quantity of fuel.

275. "When I steeped the linen in the sulphuret first, and afterwards boiled it in potash, and then immersed it once in the oxygenated liquor, a better effect was produced than from two previous boilings in potash, or from two steeps in the sulphuret; so that the two substances seem to co-operate with each other.

"Indeed, from what I have seen, two successive steeps in fresh sulphuret, previous to the immersion in the oxygenated liquor, seemed to afford very little better effect than a single one, which is not the case with respect to potash.

276. "It was observable, that the cloth was invariably thicker or more swelled coming out of the sulphuret, than after being boiled in potash, and remained so even when washed and dried.

"It appears to me, that the sulphuret opens the fibres of the linen more speedily and better than the latter, by softening and swelling, rather than dissolving, the resinous or colouring matter. This accounts for the better effect of potash upon the linen when previously steeped in the sulphuret, than when used by itself.

277. "Probably those bleachers who do not at present find it convenient to use the oxygenated liquor, but continue to bleach by exposure to air, may derive some advantage from this, by using the sulphuret and potash conjointly or alternately.

"Mr John Duffy, of Ball's bridge (who from his knowledge of chemistry is very well acquainted with the principles of bleaching), was kind enough to repeat the above experiments, and his report to me corresponded with my own observations.

278. "It is almost impossible to ascertain to the full extent, more especially by small experiments in an elaboratory, the many advantages any substance not hitherto used in bleaching, will afford by varying the mode of application.

Vegetable Substances.

"The experimenter does a great deal by discovering the efficacy, proving the practicability, and ascertaining the safest and most economical method of directly using it, and also the best proportion of it. Before he can arrive at any one of these, many a round of changes are necessary; indeed a greater number than any man who is not used to experiments can be aware of. But I should hope that the bleacher need not hesitate to use it in the state in which I present it to him, more especially as he runs no risk of injuring the cloth with it. If he can make more of it hereafter, I shall feel happy upon the occasion; no discovery was ever brought to perfection at once.

"How gradually, and yet how progressively, the steam engine, from its first invention by the marquis of Worcester, was brought to its present degree of perfection! Undoubtedly, it was just so with respect to alkalies, the substances now used by the bleachers; it must have taken a considerable time after their first application in bleaching, before they could be made the most of.

279. "I will now conclude by pointing out the advantage likely to accrue from the use of the sulphuret, to the nation, and also the saving to the individual.

280. "Hence it seems, that the quantity of foreign alkalies imported into the kingdom every year, amounts to 265,968 pounds; and that the quantity used in bleaching alone, amounts to about 215,307 pounds annually.

"The average price of brimstone for the last three years, is about 25l. a-ton, which is at the rate nearly of 2½d. a-pound; four pounds of brimstone, and twenty pounds of lime, as already observed, will produce 60 gallons of liquor. In this country twenty pounds of lime may be valued at about 4d. so that the bleacher may have the 60 gallons at the expence of 1s. 1d.

281. "By what I could learn from different bleachers, the common allowance of alkali for 60 gallons of water is six pounds of barilla or four pounds of potash at the very least, and most bleachers use more than this. The price of four pounds of potash at the rate of 65l. a-ton, is about 2s. 4d. which is 2d. more than double the price of the sulphuret; but as the brimstone must be ground, an allowance should be made for it; and being easy of pulverization, a farthing per pound is an ample consideration for the expence attending it.

282. "The saving of fuel only remains now to be taken into consideration; and as this cannot be calculated with any degree of accuracy, I shall content myself by particularizing facts. In the first place, but 16 gallons of liquid are to be boiled in preparing 60 gallons of the sulphuret, while the whole 60 gallons must be boiled when the alkali is used; hence it might appear that two-thirds of the fuel are saved in the quantity of liquor, but it is not quite so much, suppose we estimate it at one half, which is rather under-rating it. Let us add to this the time necessary to boil the different liquors; the sulphuret requires but about half an hour, and the alkaline lixivium at the very least seven hours, to boil the linen in it, which is in the proportion of one to fourteen.

283. "The saving altogether to the bleacher from this

Digitized by Google

Vegetable Substances. this statement, is obviously very considerable; and as the Wicklow copper mines are sufficient to supply the whole kingdom, or indeed two such kingdoms, with abundance of sulphur, let the consumption be ever so great, the entire of the alkali, or 215,307 pounds, must be annually saved to the nation.

"But suppose two-thirds only of the quantity of alkali generally consumed in bleaching were dispensed with by the use of the sulphuret (which is a supposition not warranted by my experiments), still the saving to the nation, and to the individual, must evidently be great indeed *."

* *Higgins's Essay.*

284. The goods which have been bleached in the methods above described, require to undergo what are called dressings, to give them a clear and bright white. This is particularly necessary for the finer piece goods, sewing thread, stockings, gloves, and all cotton articles.

After the last immersion, the goods are to be pressed or wrung, and then immersed in a bath of water, holding in solution about a hundredth part of its weight of sulphuric acid. The acidulous bath may be employed cold, but it is better to heat it so moderately, that the hand may be borne in it. The best way to make the mixture of sulphuric acid and water, is to invert the bottle containing the acid in the water, when the acid by its greater specific gravity quits the bottle, and by agitation for a considerable time combines with the water.

It is usual to leave the goods for some days in the bath, but it is safer to allow them to remain only a few hours, and to renew the bath till they are sufficiently white. Too many articles must not be crowded together, nor too much pressed, that the acid may exert its action equably.

After removing the goods from the acid bath, they must be wrung, and washed repeatedly in fair water till they no longer retain any marks of acidity.

285. It is customary to give to linen cloth a bluish shade: this is produced by dispersing through the water in which it was last rinsed, a little indigo or Prussian blue; or it may be given by a solution of white or motled soap, in which the cloth is washed, while it still retains a little acid.

286. As accidents are apt to occur during these processes, it is proper to inform the artist how these may be remedied.

287. "*Accidents in the distillation.*—The principal accident which is capable of interrupting the distillation, is when the lutes of the adopter suffer the gas to escape. The most speedy remedy, in this case, to prevent the exhalation of the acid, which cannot be retained but with difficulty, seldom for any length of time, and then very imperfectly, in consequence of its great expansion; the shortest method, I say, at least if the distillation be not near its conclusion, is to remove the fire immediately from beneath the capsule of the retort, and to suffer this last to cool for a certain time, by raising it a little in its sand bath. If it be not possible to take it out of the furnace, together with its capsule, on account of the heat, or its sticking too fast, the adopter must be united from the funnel of the leaden tube, and the aperture of this tube closed with a cork, or lute, to prevent the gas of the pneumatic vessel from evaporating; after which the retort must be raised, and placed gently upon a bag of straw, or on coarse cloths folded together; and then holding the retort by its neck, near the flexure, the adopter must be entirely unluted, by twisting it round and drawing it off. The orifice of the neck of the retort is then to be closed with a cork stopper, but not so closely but that a very small portion of gas may be suffered to escape, for fear of an explosion. The stopper of the neck may, for greater safety, be slightly raised. This precaution is necessary, on account of the great expansion of the muriatic acid gas. The old lute must then be taken off, as well from the adopter as the retort, and the places to which they were applied must be well cleaned, in order to receive fresh lute, after having carefully wiped off the moisture with a cloth or a sponge. If the lute which comes off be still good, it may be kneaded again, adding, if required, a small quantity of boiled oil, or it may be mixed with new lute, if it be burned or decomposed. This decomposition in the fat lute may be known by the white or reddish colour which it acquires, and the facility with which it breaks, on account of its having lost the gluten which afforded it that toughness and tenacity, on which its goodness chiefly depends.

288. "With regard to the lute of linseed cake, it must, in almost every case, be totally renewed, particularly when internally applied, because the heat hardens it too much to admit of its being kneaded again, with any moderate degree of facility; the decomposition of this lute is known by the yellow colour it acquires, and the contraction it undergoes from the effect of the heat. The lutes being kneaded to a proper consistence, and duly placed according to the direction laid down in (232.) the adopter is to be fixed, previously removing the stopper from the mouth of the retort, and placing another in that of the small end of the adopter, to prevent any inconvenience from the vapour which might issue out during the time of fixing it. This vapour is likewise condensed within the adopter, in consequence of its coldness. The retort is then to be placed, as before, on the furnace, the adopter uncorked, and its beak luted into the tube of lead; after which, the fire is to be replaced beneath the capsule, and distillation very speedily recommences, and proceeds as usual. The operation is a work of some delicacy; it requires to be performed with speed, and great care must be taken while placing the lutes and the adopter in their proper situations, to stand always in such a position, that the current of the external air may drive the vapour from the operator himself.

289. "If the accident here described should take place towards the end of the distillation, as it may sometimes happen, in consequence of the strong heat which, at that time, may soften the lutes, it will be sufficient if the fire be taken from beneath the capsule. The distillation soon ceases when this is done, particularly if care be taken to condense the gas, by the prudent application of wet cloths on the neck of the retort, as well as of the adopter.

290. "This inconvenience would not take place, if the workmen in those glass-houses which are principally employed in the fabrication of chemical vessels, could make retorts with necks recurved in the form of the adopter. These kind of vessels may be assiduously supplied by making use of a tube of lead, so formed as to

Vegetable Substances.

to serve instead of the adopter, as I have already observed, with regard to the tubulated bottles or bodies (P). If, by accident, the lute which is adapted should fail, or suffer the gas to pass through, it may easily be stopped, by applying a new lute to the place of junction. Instead of the leaden tube, we may substitute, with still greater convenience (the danger of breaking excepted), a tube of glass, of which the end nearest the bottle, or tubulated body, should be ground with emery. By these means there would be no application of lute, and consequently no danger to be feared with regard to the filtration of the gas, the escape of which is easily perceived by the smell which diffuses itself through the workshop, and is more particularly perceived when the nose is applied near the vessels, or the lute. But as this last method of discovering the place where the lute has failed may be attended with the most serious consequences, if the greatest precaution be not used, it is more prudent to apply an open bottle of ammoniac near the suspected place; at the instant that it is presented, a white fume is formed, which immediately points out the defective spot. The bottle must be presented above the current of air, which takes place near the lute, or in the workshop. If this precaution be not attended to, the operator might be induced to remove a good lute, instead of one which was really defective.

291. "On the other hand, if in the course of the distillation, and for want of keeping up the heat, the fluid in the pneumatic vessel should be absorbed and rise into the distilling apparatus, it is necessary the instant it is perceived to withdraw for a moment the stopper out of the neck of the retort, where, as I have already had occasion to observe, the absorption instantly ceases. Nevertheless, if, for want of being observed in time, the water should rise so far as partly to fill the retort or body (for it never entirely fills it), the distillation will be stopped, from the coldness of the water, and its too great quantity. The shortest remedy is to draw out the excess of water, which is thus introduced into the distilling vessel, by the assistance of a glass pump, or syphon, and afterwards to heat the same vessel, first returning the water into the pneumatic vessel, if thought expedient: but if the distillation be properly attended to, this accident can never happen.

292. "*Accidents in the lixiviations and immersions.* I place the accidents arising from these two operations in the same class, because they can scarcely take place, but by the joint operation of both.

"Any article which is badly cleared of the lixivium, and afterwards immersed in the oxygenated muriatic acid, becomes almost immediately of a nankeen colour, particularly in the folds, either in spots where certain parts have not been sufficiently rinsed, or else the colour is general, if the whole has not been well rinsed.

"The same accident happens if soot has fallen on the linen or thread. The difference is simply in the colour, which approaches more to brown. The colours are capable of becoming more and more deep if the mismanagement be not remedied as soon as perceived, and that before the goods are subjected to other immersions in the alkaline lees, or of the oxygenated muriatic acid. The same accident is to be expected, if the goods, though white at the time of their immersion, are suffered to remain too long in the bleaching liquor. This does not fail to happen, particularly if the articles which are suffered to remain even in a weak solution, are kept in that state the whole night. The next day they are found to be yellow, or charged with lixivium.

293. "The only method of remedying these accidents consists in the use of water, slightly acidulated with sulphuric acid, no matter whether cold or hot, but the hot solution operates more speedily. The spotted or tinged goods are to be soaked in this water for a few minutes, or a quarter of an hour, accordingly as the colour may be more or less deep, in consequence of a series of lixiviations or immersions, more or less repeated. In this situation the offensive colour is seen almost immediately to disappear.

294. "Instead of making a sulphuric solution expressly for that purpose, that which has served for the dressing may answer very well: neither of these need be stronger than has been there directed, unless the goods be considerably charged with colour, and there be a great quantity to immerse at once. The acidulated water is tried by the aerometer, and if, in consequence of having been used, it should not be sufficiently strong, it may be restored by adding the requisite quantity of acid for that purpose. It is necessary, when any new acid is poured in, to mix it well with the water before any goods are immersed therein.

"It must, in this place, be observed, that though the thread and piece-goods may become charged with a foreign colour, in consequence of the accidents here pointed out, both these articles are frequently very well bleached at the under surface. It is even a proof that the muriatic acid has operated effectually, in causing the lixivium to produce such an effect: but these accidents are difficult to be observed on objects simply cleared, or in the crude state. In the latter case, a permanency of the original colour may alone shew the necessity of using the sulphuric acid, particularly when the lees and the muriatic acid which have been used are not at all exhausted.

295. "*Accidents attending the preparation or dressing.* When the piece-goods are immersed in a solution of soap, after having been taken out of the sulphuric acid, while they are still too strongly acidulated, or instead of rinsing them they be immediately conveyed from the acid into the solution of soap; this last solution is subject to curdle, or become immediately decomposed; whence the operator has the mortification to observe the whole surface of the goods covered with an infinite number of small spots of oil, in the form of clots, of a yellowish colour, and very tenacious, particularly on stockings or cotton goods, because they incorporate as it were with the nap or texture of the goods: they disappear

(P) This last method appears to be preferable to every other; because it requires only a slight attention to the lute, and can never produce those dangers which arise from the use of retorts.

Digitized by Google

appear in consequence of much washing or rinsing. I must particularly mention an accident which may happen to any one, namely, that of placing by mistake stockings or other bleached objects, which have received their first treatment in the solution of soap, upon articles which have been exposed to the vapour of sulphur. I have placed stockings upon gauze, which had been whitened by sulphur, and found, that after they had remained in this situation for the course of a night, they became entirely of a brown red at the place of contact. They appeared as if burnt or marked with a hot iron. This colour, which, no doubt, was produced by the combination of the volatile sulphuric acid, with the alkali of the soap, with which the stockings were still impregnated to a certain degree, immediately disappeared upon exposing them, first, to the action of a bath of the odorant oxygenated muriatic acid, and afterwards to another of water, slightly acidulated with the sulphuric acid.

296. " Every salt with excess of acid, such as the salt of sorrel, removes the ruddy spots here mentioned with equal ease. It is true, that this salt cannot with convenience be used, on account of its dearness; but the residue of the distilling vessels, that is to say, the water which holds in solution the residue of the distillation of the oxygenated muriatic acid, is very serviceable in this process, and may be advantageously used either hot or cold, to remove those very tenacious spots, which are not at all capable of being removed by soap or alkaline leys.

297. " When the spots of oxide of iron, commonly distinguished by the name of ironmould, are small, they may easily be taken out with the salt of sorrel in powder, laid upon the spot itself, which is afterwards to be moistened with a small quantity of water; or the part which is spotted may be steeped in a solution of the same salt. It soon becomes fainter, and at length disappears, after which the place must be very well rinsed. The sulphuric acid may be usefully applied instead of the salt of sorrel, as Berthollet seems to affirm in his memoir; and I have proved with success, that, though the spots may penetrate quite through the cloth, and be very broad, yet if they be soaked in a bath of sulphuric acid, either warm or cold, when the goods are taken out of the bath of muriatic acid, the effect will be that the spots insensibly disappear. If the goods be of close texture, the operation of the acid is slower (Q).

298. " With regard to the spots of rust which are frequently seen on thread or cotton stockings, they are produced by the needles of the engine, and commonly disappear during the dressing, that is to say, in the bath of sulphuric acid. The same observation is true of the spots of rust which sometimes appear on the piece-goods, in consequence of their having been in contact with iron. In general, the older any ironmould may be, the more tenacious it is, and the more difficult to be effaced; but every spot may be made to disappear in time.

299. " It frequently happens that piece-goods are spotted with tar, during their carriage by water, in boats, where they are liable to be placed upon the pitchy parts of the vessels, or in contact with tarred ropes. These spots may be soon taken out, by rubbing them with oil of olive, which dissolves the tar; or still better, by holding the part in spirit of wine, if this process should be thought more convenient. The latter method operates by the complete solution of the tar.

300. " With regard to spots of wine, cyder, or any kind of fruit, they may be effaced by dropping a few drops of the oxygenated muriatic acid upon them, which causes them almost instantly to disappear. But there are certain fruits, such as plums, of which the spots are more difficult to efface; they requiring one or two lixiviations. Those that are gray, or reddish, at first, assume a fine yellow colour in the muriatic acid, which does not disappear during a subsequent lixiviation, but requires a second immersion in the bleaching liquor.

301. " I must not omit a second very simple and economical method to take out every kind of spot occasioned by fruits, such as strawberries, gooseberries, &c. It consists in causing the spotted part to imbibe water, and afterwards to burn one or two common brimstone matches over the place: the sulphurous gas which is discharged soon causes the spot to disappear.

302. " There is a kind of indelible spot which is produced from red ochre and the charcoal black, with which the weavers mark the turns of the beam, in order to ascertain the length of the chain of piece-goods. This kind of mark, which is impressed on the goods at equal distances, is so far from being effaced, that it seems, in some measure, to receive strength from the oxygenated muriatic acid, notwithstanding the intermediate action of the leys."

Use of the Oxygenated Muriatic Acid in discharging the colours of dyed or printed goods.

303. There are several processes allied to bleaching, which depend on the agency of the oxygenated muriatic acid, and of which we shall therefore treat before proceeding to describe the remaining bleaching processes. These are the discharging of dyed or printed colours; the bleaching of paper; the cleaning of books, maps, and prints; and the bleaching of wax.

304. White silk and wool, on being steeped in oxygenated muriatic acid, acquire a yellow colour; hence this acid is of no use in bleaching these animal substances. It readily discharges the simple colours with which silk has been dyed, such as, indigo blue, gray, lilac and crimson, and gray, orange, green, Saxon blue, apple green, fawn colour, brown lemon, and dipped blue, with which wool has been dyed. It leaves the goods, however, of the same yellow cast as it imparts to white wool and silk; but this yellow colour is readily altered to a clear white, by immersion in the sulphurous acid, as described in the bleaching of these substances.

Silk dyed with some compound colours, as violets, greens, browns, blacks, acquires the same yellow colour,

(Q) The salt of sorrel is sold in London, in small bottles, by the perfumers and apothecaries, under the name of *salt of lemon*. The sulphuric acid, as prescribed above, must of course be diluted.

Digitized by Google

Vegetable Substances.

lour, but not so speedily, two immersions being usually found necessary to discharge the colours completely. In the brown violet and puce colours, which are composed of blue and red, the blue commonly first disappears, and by a subsequent immersion the red is discharged. The same happens with the yellow, which forms a part of the composition of green and orange, the blue of the former, and the red of the latter remaining. In blacks which are composed of brown laid upon a blue or a root colour, the brown first vanishes.

When more than one immersion is required, it is proper to use a bath of sulphuric acid between them; and this is particularly necessary where iron has entered into any of the colours.

These effects of the oxygenated muriatic acid serve to explain the action of the air in discharging the less permanent colours of woollen and silken goods, and in giving to white clothes a yellow colour. It is evidently oxygen which is in both cases the active principle, but its action is more speedy in the acid than in the atmosphere, from the facility with which the former is decomposed.

305. The colours employed in dyeing or printing cottons or linens are of two kinds; chemical, or, as they are sometimes called, false colours, and fast or true colours. The former disappear in a very short time upon one immersion in the acid, except one description of yellow, which contains in its composition sulphate of copper (blue vitriol), sulphate of iron (green vitriol or copperas), and acetite of lead (sugar of lead). Goods which have been dyed with this colour must first be well scoured with soap, which so far separates or decomposes the colour, that a subsequent immersion will readily discharge it, whereas, without this previous scouring, the acid would have completely fixed the colour.

Several of the fast colours, as the blues, yellows, and blacks, require a lixiviation before immersion; and two, or sometimes three, immersions, with intermediate baths of sulphuric acid, are necessary completely to remove them. Most other fast colours yield to a single immersion. A peculiar exception to this is the Adrianople red, which never becomes entirely white, however numerous the lixiviations, immersions, and acid baths employed.

306. "There is another thing no less worthy of remark, with regard to the black colour, which forms the outline or border of designs, namely, that if the muslin, or cleared fine piece, upon which the different flowers were designed which have been discharged, be folded together in several folds, or placed upon a dark-coloured ground, the effaced outline becomes visible according to the exposure of the piece under a certain obliquity of the light, exhibiting the appearance of a slight trace. The kind of outline which, under these circumstances, becomes visible, cannot be compared to any thing better than the embroidery of muslins placed on a coloured ground. This trace seen at a certain distance has the same effect, and even when closely observed, it is impossible to determine what it is, because it is not visible, except under a certain reflection of the light; nevertheless the whole piece appears white, and of a very superior quality. I have remarked, that this effect does not take place excepting with regard to the old prints of flowered designs of the true India calicoes imported from that part of the globe. For in the printed goods of our manufactures, such as those of Paris, Joly, St Denis, and Beauvais, all the traces of the designs completely disappeared, to my great surprise. It must, therefore, necessarily be admitted, that the difference in these results depends on the qualities of the mordants, which are more or less oily, or the manner of striking the blocks in the act of printing.

"If this effect were produced by the mordant with the outlines of the designs in the pieces of printed goods, it might, perhaps, be of advantage to take the same method of obtaining a substitute, instead of the rich expensive embroideries with which the fine muslins of India and Switzerland are covered. These designs likewise do not appear in their full effect, but when they are placed upon a transparent stuff of a deep colour, which exhibits all the outline. This method of producing so rich an effect would be extremely simple, singularly permanent, and highly economical. I think, however, that I may add, that, after many trials, I have at last succeeded in discharging this mordant, sometimes by a bath of sulphuric acid, rather stronger than usual, and at other times by soaping the goods before and after the bath. This management is very essential to be known, in order that the operator may not be exposed to the mortification of seeing the same designs return again by the second action of the madder applied to the same bleached piece in a subsequent printing process. To obviate every accident of this kind, it will be proper to inform the owner which of the methods have been used to bleach their goods, and in case the new method may have been used, it would then be prudent to pass them previously through a good bath of sulphuric acid *."

307. Colours laid in oil, which do not contain madder, must be first heated in an alkaline ley, and then scoured with soap.

* Nicholson's De Charmes.

Bleaching of Paper.

308. The bleaching of paper has been rendered considerably more expeditious by the use of the oxygenated muriatic acid. The following processes are given by De Charmes, as extracted from different French memoirs.

Bleaching of old printed Papers, to be worked up again.

309. "1. Boil your printed papers for an instant in solution of soda rendered caustic by potash. The soda of varech is good.

"2. Steep them in soap water, and then wash them, after which the material may be decomposed, or reduced to a pulp, by the machinery of the paper-mill. The washing with soap may be omitted without any great inconvenience.

Bleaching of old written Papers, to be worked up again.

310. "Steep your papers in a cold solution of sulphuric acid in water, after which wash them before they are taken to the mill. If the acidulated water be heated, it will be so much the more effectual.

Bleaching

Vegetable Substances.

Bleaching of printed Papers without destroying the texture of the Leaves.

311. "1. Steep the leaves in a caustic solution of soda, either hot or cold. 2. And in a solution of soap. 3. Arrange the sheets alternately between cloths, in the same manner as the paper-makers dispose thin sheets of paper when delivered from the form. 4. Subject the leaves to the press, and they will become whiter, unless they were originally loaded with size and printers ink. If the leaves should not be entirely white by this first operation, repeat the process a second, and if necessary, a third time. The bleached leaves, when dried and pressed, may be used again for the same purposes as before.

Bleaching of old written Papers without destroying the texture of the Leaves.

312. "1. Steep the paper in water acidulated with sulphuric acid, either hot or cold. 2. And in the solution of oxygenated muriatic acid. These papers, when pressed and dried, will be fit for use as before.

The method of bleaching Rags of the natural brown colour for the Manufactory of white Paper.

313. "1. Let the rags be opened or separated from each other, after previous soaking or maceration for a longer or a shorter time, according to their texture and quantity. 2. Give a lixiviation in caustic vegetable or mineral alkali. 3. Pass them through the oxygenated muriatic acid, more or less concentrated with alkali. 4. Let the mass be then worked for a sufficient time in the apparatus of the paper-mill, and it may be advantageously substituted instead of that which is afforded by white rags.

"The white colour will be still better, if, after the maceration, the rags be opened, and subjected, as usual, to the action of the mill; after which the paste itself must be subjected to one lixiviation, one immersion, and a bath of sulphuric acid. The mass being then well washed and pressed out, may be thrown into a trough to be manufactured.

Method of bleaching Rags, of all Colours whatever, in order to make white Paper.

314. "1. Let the rags be opened, as before. 2. Steep them in the oxygenated muriatic acid. 3. If, as it commonly happens, the colour is discharged by this first immersion, let these bleached and decomposed rags be immersed in water acidulated with sulphuric acid. 4. Complete the disorganization by the mallets or cylinders of the mill, after having previously well washed them.

"If the colour should not be sufficiently discharged by the first immersion in the oxygenated muriatic acid, which is very seldom the case, give them another alkaline lixiviation, and after that a second immersion in the oxygenated muriatic acid; after which steep them in water acidulated with sulphuric acid, either hot or cold, the latter of which is the most active and effectual; and, lastly, let them be subjected to the action of the mallets or cylinders.

"Red and blue colours are most tenacious. With regard to black, it will be sufficient if they be steeped after opening their texture, 1. In a diluted solution of sulphuric acid; and, 2. In a solution of the oxygenated muriatic acid. If the operator could know that these rags had been dyed in the raw state, a still more brilliant white might be obtained by following the second method described in the preceding article. But it very seldom happens that coloured rags have not been bleached before they were dyed. The manipulations may be performed with sufficient speed to bleach at least three thousand pounds weight in the course of the day, without appropriating any extraordinary edifice or workshop to this purpose *."

* Nicholson's De Charmes.

315. But by far the best method of bleaching paper, is by applying the gas to it while in the state of paste; the method of doing which, with the steps which led to it, are thus related in a Memoir of C. Loysel, in the *Ann. de Chimie*, as translated by Mr Nicholson, in his valuable Journal, from which we have extracted it.

316. "The process of bleaching the paste of the paper-maker, even when produced from the most common rags, will communicate to it the quality of the best sort. By these means our paper manufactories may supply our wants in fine white paper, and even obtain the preference in foreign markets. The result of this operation would be, that a greater number of workmen would find employment, and the advantages of this increase of industry would be of still greater national value, than even the foreign export which might be expected.

"The success of bleaching the paste of paper by the method of Citizen Berthollet is no longer problematical. The application which has been made to the paper used in making assignats, has placed this question beyond all doubt as to its solution.

317. "It was at the commencement of the year 2, that the committee of assignats and moneys of the national convention, of which I was a member, resolved to employ this method, together with that of stereotypage, which had been adopted, to oppose new obstacles to the practice of forgery.

"We particularly consulted Citizens Berthollet, Fourcroy, and Guyton on this enterprise. Their approbation of the project, and the information they afforded us, soon gave us the power of realizing it. We were also assisted with the knowledge of Citizens Welter, Athenas, Alban, Carny, Marchais and Ribaucour, who with great zeal communicated their processes, and permitted us to inspect their several manufactories.

318. "Our first processes were executed precisely according to the method of Citizen Berthollet. The rag was subjected in succession to different leys, to baths of the bleaching liquor and sulphuric acid pointed out in his memoir. Berthollet had shown, and we were also convinced by our own experience, that the gas is less confined in the simple fluid, prepared without addition of fixed alkali, than it is in that which contains potash or soda; and that it is consequently more disposed to separate and enter into new combinations. We therefore at first made use of this simple liquor; but the workmen soon exhibited a strong repugnance to its use on account of the fumes it emits, which are extremely inconvenient, even when chalk is diffused in the liquor. This inconvenience forced us to abandon it, though with regret. This sacrifice was so much the more considerable, as it occasioned a loss of time, and considerable increase of expence. We decided that

we

Digitized by Google

we would receive the gas in a solution of potash; but as the doses in which this alkali may be used have limits of great extent, we endeavoured to keep as near as possible to that preparation which is sufficient to prevent the spontaneous disengagement of the gas, and by that means cause the liquor to lose the odour we were desirous of avoiding. This dose was 5 kilograms of potash to 100 litres of water (11 pounds avoirdupois, to 21½ ale gallons.)

319. "The rags bleached in this manner became of the most brilliant white. Nevertheless, a part of this perfection disappeared, when the rag was converted into paste, and that paste into paper. It was easy to discover the cause; namely, that the interior parts of the thread in the rag were less exposed to the action of the liquor than those at the surface. This motive determined us to abandon the bleaching of the rags, and to operate upon the paste itself.

320. "We were here opposed by new obstacles. When the rag is converted into a paste proper to be worked, its coherence is such that it settles, and no longer permits the leys and baths of the bleaching liquor to penetrate through all its parts, in consequence of which property the paper was found to have veins and different shades of colour. We remedied this inconvenience, by taking the matter in a mean state between the rag and the paste proper to be converted into sheets of paper. We succeeded in this respect by destroying the texture of the rag under the first cylinder so as to separate its fibres, an operation which usually lasted two hours for a pile of 50 kilograms. Thus it was, that by successively avoiding the extremes of too much and too little mechanical connexion, we advanced towards our object.

321. "The apparatus which Citizen Welter imagined, and of which Citizen Berthollet has given a description in the first volume of the Journal of Arts and Manufactures, is applicable to all the methods which can be employed to procure the different kinds of bleaching liquor, whether the water of the receiver contains fixed alkali or not; whether the muriatic acid be used on the oxyd of manganese, or the gas be obtained by sulphuric acid, upon the mixture of oxyd of manganese and muriate of soda. This apparatus is particularly preferable to all others in the case where the water of the receiver contains no alkali, because the absorption of the gas is favoured by its being brought into contact with the water at a great number of surfaces. But as we had determined to use a solution of potash, we were able to make some modifications of this apparatus.

322. "One thousand litres of water are placed in the receiver, holding in solution fifty kilograms of white purified and calcined potash.

"When the disengagement of gas is effected by the muriatic acid, the materials are used in the following doses:

Oxyd of manganese	24 kilograms
Muriatic acid at 20 degrees of density according to the aerometer of Baumé,	68
	92

which makes for each of the eight distilling vessels 11½ kilograms of materials.

323. "The operation is begun by charging the receiver with 1000 litres of alkaline water, after which the aperture 8 is closed with its stopper well luted. Each matrass is then placed in its sand-bed; and pulverized manganese is introduced. The muriatic acid is poured upon the manganese, and the stoppers into which the tubes of communication pass, are duly placed. The juncture is luted with paper soaked in starch. And the lute is left to dry from six to twelve hours, after which the fire is lighted in the furnaces.

324. "The process of distillation lasts from ten to twelve hours. When it is finished the tubes are unluted, the fire extinguished, and the matrasses suffered to cool in their sand beds, till the temperature of these beds has descended to 60 or 70 degrees, (centigrade) at which period, water of the same heat is poured into the matrasses. The water dilutes the residue of the distillation, which mixture is to be poured out, and the vessels suffered to cool in baskets containing straw. If the precaution of introducing hot water in this manner upon the residue were not taken, it would become so solid when the operation is performed with sulphuric acid, in the manner we are about to describe, that it could not be extracted without much trouble and danger of breaking the vessels.

325. "If the disengagement of the gas be made by sulphuric acid, the following doses are used:

Oxyd of manganese	25 kilograms
Muriate of soda	70
Sulphuric acid at 50 degrees of density	25
Total	120

"The acid is to be diluted with an equal bulk of water, or 16 litres, which will reduce its density to 31 degrees.

"The eighth part of this for each matrass amounts to 14¼ kilograms.

326. "The oxyd of manganese and muriate of soda being pulverized are mixed together. The matrass is to be charged and the operation conducted as before described. This method is the most economical, because the sulphuric acid is cheaper than the muriatic, and also because it is practicable to obtain from the residue of the distillation, the soda of the muriate which is converted into sulphate of soda; that salt being decomposable by well known-processes.

"In order to measure the force of these liquors, or their bleaching power, we made use of the solution of indigo prescribed by Citizen Descroizilles.

"One part by measure of the bleaching liquid prepared as before mentioned, will usually destroy the blue colour of nine parts of proof solution of indigo; it was of the same strength as that of Javel, prepared by Citizen Alban.

Choice and Preparation of the Rags.

327. "The strength or tenacity of paper depends upon the staple or fibre of the material from which it is made. Rags of new cloth and cordage compose a paper more tough than old rags, and the first of these materials presents a great variety on account of the quality of the hemp or flax of which they are formed.

Rags

Rags of fine new cloth, whether raw or bleached by the oxygenated muriatic acid, stand in the first rank, after which cordage and old rags may be classed.

328. "Paper intended for bills of exchange, or other commercial and legal instruments, ought to be tough, in order that it may not be easily torn when thin. For this paper the materials of the first class must be entirely, or in large proportion, employed. The price which the consumers are disposed to pay for this article, is sufficient to indemnify the manufacturer for his care and industry, as this kind of paper is sold in France for 5 or 6 franks the kilogram.

329. "The other papers also require to be more or less tough, according to their thinness, and the use to which they are applied, but a clear white colour is sought in paper of every description. The first operation to which the rags are subjected is sorting, in order that each branch of the manufacture may have its appropriate material, after which they are cut with shears into pieces of about one decimeter, or three or four inches square.

330. "I will suppose that the object of the manufacturer, is to obtain paper of a beautiful white. If it is intended to be thin, so that, for example, a ream of the size denominated *raisin* should weigh only four or five kilograms, that is to say, about one-third of the weight of common paper of the same form; the manufacturer makes choice either of new rags already of a fine white, or of unbleached rags.

"In the case of the white rags, it is sufficient to pass them under the first cylinder, then to give them a bath of the bleaching liquor, and afterwards a bath of sulphuric acid, as we shall proceed to direct; after which they are passed under the finishing cylinder for seven or eight hours, and, lastly, conveyed to the working trough to be made into sheets of paper.

331. "Rags, which have never been bleached, may be treated by either of the following processes: that is to say, the first, which preserves the utmost degree of toughness to the paper, but is likewise the most expensive, consists in decomposing the rag, and afterwards applying the method of Citizen Berthollet for bleaching piece goods; namely, subjecting it to three or four lixiviations, and afterwards alternately to lixiviations, baths of the bleaching liquor, and baths of sulphuric acid. The weight of the raw unbleached material is diminished from 50 to 45 per cent. in these operations.

332. "This method was the first which we used for the assignat paper; but we soon perceived that we might omit most of the lixiviations and baths of the bleaching fluid, and still preserve as much toughness as the paper required. Nothing further was necessary for this purpose than to suffer the rag to undergo a degree of fermentation more or less advanced, by leaving it to rot. In this operation the colouring matter undergoes a slow combustion, and passes to a kind of saponaceous state, and is carried off by the water, by washing the rags in the vessel of the first cylinder.

"One single lixiviation, to baths of the bleaching liquor, and one of sulphuric acid, are then sufficient to bleach completely the raw rags or cordage. This is the second method. We were not at that time acquainted with the economical process of Citizen Chaptal in the operations of lixiviation. This will, no doubt, be used; but the effect of rotting, carefully conducted, will always be found very advantageous.

333. "Lastly, If the rags be neither perfectly white, nor raw and unbleached, but in a medium state, they are left to rot for a shorter time, for example, 12 or 14 days, and are taken up when the heat of the fermentation raises the thermometer to 30° or 35°, after which the process is to be conducted as before mentioned.

Composition of a bath of the bleaching liquor, for a pile of decomposed rags, weighing 50 kilograms.

334. "For each heap of rags, a certain number, for example, eight or nine, wooden tubs are disposed in a line, capable of containing in the whole 600 litres of water: 450 litres of pure water are poured in, and 90 litres of bleaching liquor are added in equal portions to each of the vessels, after which the 50 kilograms of decomposed rags are disposed in equal portions in each tub. The stuff is left for about 12 hours in this bath, agitating it from time to time, after which it is to be completely washed in clean water, and put into a bath of sulphuric acid, composed of water 200 litres, and acid at 50 degrees 3 kilograms, which bath will then have the strength of about four degrees of the aerometer of Baumé.

"The immersion in the bath must continue for three quarters of an hour or an hour, after which the materials must be well washed in clear water, and carried to the mill to be manufactured.

335. "If the action of the baths of bleaching liquor be not exhausted by the immersion of the decomposed rags (which may be ascertained by the solution of indigo), it may be applied to other materials of the same kind.

336. "Such was the state in which we left this new art in the year 3. Since that time Citizen Welter, to whom chemistry and the arts are indebted for a number of ingenious processes, has simplified that of preparing the bleaching liquor. He has found, for example, that instead of the three vessels of the receiver, it is sufficient to employ two even for the simple liquor that contains no fixed alkali.

"It was before seen that we were obliged to employ an alkaline solution in the receiver, to prevent that odour which the simple liquor emits when paper stuff is agitated in the baths. The use of alkali answered our purpose very well in this respect; but this expenditure, besides weakening the bleaching liquor, nearly doubled our expence. Though this difference in the price was of little consequence with regard to the object we then had in view, it is not so with regard to the common operation upon paper intended for sale. Every means of economy must then be used. Now Citizen Welter found that it is easy to obviate the inconvenience of the same liquor in the operation. His method consists in no longer agitating the goods or material in an open bath, but to close it exactly by means of a cover; and he agitates it by means of cross pieces attached to a handle turned on the outside.

337. "A rough estimate of the price of the simple bleaching liquor prepared by the sulphuric acid, this being the most economical process.

"The receiver is supposed to contain 1000 litres of water.

25 kilograms

Digitized by Google

	Fr.	cent.
25 kilograms of oxide of manganese cost at most	15	0
70 kilograms of muriate of soda	7	0
25 kilograms of sulphuric acid, at 50 c.	37	50
Three days work principal men	9	0
Three days do. assistant or labourer	4	50
Fuel, about	3	0
Wear and tear	6	0
Our apparatus cost 622 franks, and the carriage and fixing increased our expence to 1000 franks, the interest of which, at 10 per cent. is 100 franks; and if the work be repeated so many times in the year, the interest per operation will be	1	0
	Fr. 83	0

"Hence the litre of bleaching liquor will cost nearly 9 cents in round numbers (R).

338. "Estimate of the increase of expence occasioned in the operation upon a pile of 50 kilograms of the paste of paper, supposing one bath of the bleaching liquor and one of sulphuric acid, which is most commonly the case.

Ninety litres of the bleaching liquor at nine cents	8 fr.	10 c.
Three kilograms of sulphuric acid, at 1 fr. 50 c.	4	50
Workmanship	0	50
Total,	13	20

Which gives for each kilogram of paper an expence of 0,262 franks, or about 27 cents. Now the common paper in the market usually sells for about 1 fr. 30 c. or 1 fr. 40 c. the kilogram, and with the simple augmentation of 27 cents for the operations of bleaching, it obtains the preference beyond that which is sold for three, four, or even five franks, which can only be obtained in a limited quantity, on account of the selection of rags. The foregoing methods must therefore produce a great diminution in the price of fine paper. They are more particularly advantageous when applied to the manufacture of thin paper, because the expences of bleaching are always proportioned to the weight of the material, and consequently are least upon thin paper."

Of Whitening and Cleaning Prints, Maps, Books, and other Articles of Paper.

339. The oxygenated muriatic acid was first applied to this purpose by Citizen Chaptal, and the method has been employed with the greatest success by Citizens Vialard and Heudier.

The acid in the state of gas might be used for this purpose, but it is safer and equally efficacious to employ it in the liquid form.

340. 'Simple immersion in oxygenated muriatic acid, letting the article remain in it a longer or shorter space of time, according to the strength of the liquid, will be sufficient to whiten an engraving. If it be required to whiten the paper of a bound book, as it is necessary that all the leaves should be moistened by the acid, care must be taken to open the book well, and to make the boards rest on the edge of the vessel, in such a manner that the paper alone be dipped in the liquid: the leaves must be separated from each other, in order that they be equally moistened on both sides.

'The liquor assumes a yellow tint, and the paper becomes white in the same proportion. At the end of two or three hours the book may be taken from the acid liquor and plunged into pure water, with the same care and precaution as recommended in regard to the acid liquor, that the water may exactly touch the two surfaces of each leaf. The water must be renewed every hour, to extract the acid remaining in the paper, and to dissipate the disagreeable smell.

341. 'By following this process, there is some danger that the pages will not be all equally whitened, either because the leaves have not been sufficiently separated, or because the liquid has had more action on the front margins than on those near the binding. On this account the practice followed by book-binders, when they wish to whiten printed paper, is to be preferred. They destroy the binding entirely, that they may give to each leaf an equal and perfect immersion; and this is the second process recommended by M. Chaptal.

"They begin (says he) by unsewing the book and separating it into leaves, which they place in cases formed in a leaden tub, with very thin slips of wood or glass, so that the leaves when laid flat are separated from each other by intervals scarcely sensible. The acid is then poured in, making it fall on the sides of the tub, in order that the leaves may not be deranged by its motion. When the workman judges, by the whiteness of the paper, that it has been sufficiently acted upon by the acid, it is drawn off by a cock at the bottom of the tub, and its place is supplied by clear fresh water, which weakens and carries off the remains of the acid, as well as its strong smell. The leaves are then to be dried, and, after being pressed, may be again bound up.

"The leaves may be placed also vertically in the tub; and this position seems to possess some advantage, as they will then be less liable to be torn. With this view I constructed a wooden frame, which I adjusted to the proper height, according to the size of the leaves which I wished to whiten. This frame supported very thin slips of wood, leaving only the space of half a line between them. I placed two leaves in each of these intervals, and kept them fixed in their place by two small wooden wedges, which I pushed in between the slips. When the paper was whitened I lifted up the frame with the leaves, and plunged them into cold water to remove the remains of the acid, as well as the smell. This process I prefer to the other.

342.

(R) As the price of all these several items in France must materially differ from the same in England, it was thought unnecessary to reduce the numbers.

Digitized by Google

342. "By this operation books are not only cleaned, but the paper acquires a degree of whiteness superior to what it possessed when first made. The use of this acid is attended also with the valuable advantage of destroying ink spots. This liquor has no action upon spots of oil, or animal grease; but it has been long known, that a weak solution of potash will effectually remove stains of that kind.

343. "When I had to repair prints so torn that they exhibited only scraps pasted upon other paper, I was afraid of losing these fragments in the liquid, because the paste became dissolved. In such cases I enclosed the prints in a cylindrical glass vessel, which I inverted on the water in which I had put the mixture proper for extricating the oxygenated muriatic acid gas. This vapour, by filling the whole inside of the jar, acted upon the print; extracted the grease as well as ink spots; and the fragments remained pasted to the paper."

344. Vialard and Heudier have by this process restored several of the most valuable books of the French national library, and we believe they were the first who carried Chaptal's process into actual execution.

It is necessary, that we may fully succeed in this process, to be very precise in the quantity of the acid employed, and to use considerable address in the management of it, otherwise we shall injure the paper, and render the books incapable of being bound again. But with caution and a little experience, the method is perfectly safe and easy.

345. As it is convenient to be able to prepare the acid employed for this purpose in the most simple and economical way, we may recommend the following:

"To oxygenate the muriatic acid, nothing is necessary but to dilute it, and mix it in a very strong glass-vessel with manganese, in such a manner, that the mixture may not occupy the whole content of the glass. Air bubbles are formed on the surface of the liquor; the empty space becomes filled with a greenish vapour; and, at the end of some hours, the acid may be farther diluted with water and then used. It has an acid taste, because the whole is not saturated with oxygen; but it possesses all the virtues of the oxygenated muriatic acid. This process may be followed when there is not time to set up an apparatus for distilling, in order to procure the oxygenated acid."

346. It has been said, that the acid is not capable of removing spots of grease from books and prints. A method of doing this was lately published by M. Deschamps junior, and is as follows:

"After having gently warmed the paper stained with grease, wax, oil, or any fat body whatever, take out as much as possible of it, by means of blotting-paper. Then dip a small brush in the essential oil of well rectified spirit of turpentine, heated almost to ebullition (for when cold it acts only very weakly), and draw it gently over both sides of the paper, which must be carefully kept warm. This operation must be repeated as many times as the quantity of the fat body imbibed by the paper, or the thickness of the paper, may render necessary. When the greasy substance is entirely removed, recourse may be had to the following method to restore the paper to its former whiteness, which is not completely restored by the first process. Dip another brush in highly rectified spirit of wine, and draw it, in like manner, over the place which was stained, and particularly round the edges, to remove the border, that would still present a stain. By employing these means, with proper caution, the spot will totally disappear; the paper will resume its original whiteness; and if the process has been employed on a part written on with common ink, or printed with printers ink, it will experience no alteration.

Of Bleaching Yellow Wax.

347. Before the discovery of oxymuriatic acid and its application to bleaching, this was effected by exposing the yellow wax, formed into thin cakes, to the free action of the air, sun, and dews. The acid, however, as being far more expeditious, is to be preferred.

In the bleaching of wax, it is proper to employ the simple acid, and its action would be the most effectual if used in the gaseous form. For this purpose, a pneumatic tub, with a cover secured in the manner recommended by Rupp, is the most proper. This should be filled with water, and the wax shred very fine must be introduced, and the gas made to pass through the water, while the agitator is kept in constant motion. In the course of an hour or two the wax will be bleached, may be separated from the water, melted and formed into cakes.

On applying the Residuums to profit.

348. Before we conclude our account of the various bleaching processes in which the oxygenated muriatic acid is concerned, it will be proper to inquire how far the materials employed in procuring this acid may be turned to account after the distillation.

The substances which remain in the distilling articles are a portion of undecomposed oxide of manganese, some sulphat of manganese, and a large quantity of sulphat of soda (Glauber's salt).

The whole mixture may be employed with advantage as a glazing to coarse earthen-ware. This glazing has a dark colour, something like that of bronze, which it receives from the manganese: it is attended with this advantage, that it is perfectly safe, and is therefore much superior to any glazing, where lead enters as a part of the composition.

349. But the object of most importance is to decompose the sulphat of soda, in order to obtain the alkali. There are several methods of effecting this, but perhaps the two following are the best.

350. The first is that contrived by M. M. Malherbe and Athenas. The first object in this process, is to reduce the sulphate to the state of an alkaline sulphuret (liver of sulphur).

"Malherbe and Athenas have succeeded in this by employing iron as the intermediate substance: they mixed one part of charcoal dust with nine parts of the sulphat of soda, and exposed the mixture to the heat of a reverberating furnace: when the sulphuret entered into combustion, they added from three to five parts of old iron rendered as small as possible; and the whole being fused together, they obtained a black paste, composed of iron, soda, sulphat of iron, &c. This mixture was lixiviated, and filtered through a basket filled with

Digitized by Google

with lime: it was then evaporated to dryness, and the residuum was calcined in a reverberating furnace. When soda of a superior quality is required, the washing and calcination must be repeated.

"Dize and Le Blanc decomposed the sulphat of soda, by means of the carbonate of lime, in order to neutralize the alkali, by saturating it, at a very high temperature, with carbonic acid. Their process consists in taking two parts of sulphat of soda, dried to deprive it of its water of crystallization, two parts of well ground chalk (carbonate of lime), and one part of charcoal powder, mixing them well in a muffled mortar, and then bringing the mixture to a white heat in a reverberating furnace: when the matter is fused, it is stirred till the sulphur is consumed, and the ebullition and the jet of the flame produced by the hydrogen gas have ceased to appear. It is then taken from the furnace, and it may be lixiviated to obtain the soda very pure. In whatever manner the sulphat is decomposed, this object merits the greatest attention at bleachfields on account of the considerable degree of economy which results from the different manipulations. The ley of the oxygenated muriatic acid will be obtained at little or no expence by bleachers, when they seriously set about extracting the soda from the sulphat formed during the distillation.

Bleaching by Sulphuric Acid.

351. From the effects produced by sulphuric acid in the processes of bleaching, in which it has been seen to act a material part, a proposal was lately made to employ it solely for this purpose, but we believe the project has never been carried into execution. It is certain, that a very weak bath containing one part of acid to five hundred of water * may be employed with the greatest safety; and when cloth remains immersed in it for a considerable time, it acquires a high degree of whiteness.

* *Philosoph. Magazine*, p. 273.

Of Bleaching by Steam.

352. The various processes which we have described, form nearly a complete abridgment of the history of bleaching; we have endeavoured to follow as closely as possible the progress of human genius, and to show how the rapid advances of modern chemistry have contributed to the improvement of this interesting art.

353. We are now to describe a new method, for which we are indebted to C. Chaptal. This ingenious and learned man, published some time since a memoir on the method of bleaching with steam, a process which we received from the Levant soon after the introduction of the art of dyeing Adrianople red, and which has been ever since employed in the interior of France, under the name of *Blanchiment à la fumée*. At the time when the disinterested Chaptal published an account of this method, it was a secret, the knowledge of which was confined to a few manufacturers. They only employed it in bleaching cotton in the states of wool and thread, in imitation of the eastern nations; but Chaptal, with his usual ingenuity, perceived the possibility of extending the process to the bleaching of thread of flax and hemp, and he invited the assistance of artists for the purpose of effecting this desirable end.

354. This appeal of Chaptal, induced many manufacturers as well in France as in other countries, to make trial of this new method; and it was tried nearly at the same time at Paris and in Ireland. The apparatus constructed by C. Bawens, proprietor of the manufactory of cotton thread and stuffs at Bons Hommes near Passy, gave surprising results. He could bleach from two to three thousand ells of cotton in a day, with such facility, and at so moderate an expence, as proved the new method to be incomparably better than any before employed. The first trial was made on 1500 ells of cloth intended for printing; after the operation, it exhibited no variegation of surface, no shades, but one uniform complete whiteness. His apparatus resembles perfectly what has been described by C. Chaptal, and answers extremely well for bleaching cotton, both in the wool and when spun into thread. There have been several improvements lately made on it, which render it much more advantageous and of more extensive utility; but it will be proper, before examining these, to describe the apparatus recommended by Chaptal, which we shall do in his own words.

355. "At the distance of about sixteen inches above the grate of a common furnace, supplied with pit-coal, is fixed a copper boiler of a round form, 18 inches deep and four feet broad. The edges of this copper turned back, are made to rest on the side-walls of the brick-work of the furnace; they are about seven inches broad. The rest of the furnace is built of hewn stone, and forms an oval boiler six feet in height, and five feet in breadth at the centre: the upper part of this boiler has a round hole eighteen inches in diameter, which may be shut by a moveable piece of strong stone, or a copper lid adapted to it. Upon the edge of the copper boiler which forms the bottom of this kind of Papin's digester, is placed a grating made of wooden bars, so close together, that the cotton placed on them cannot fall through, and sufficiently strong to bear the weight of about 1600 pounds."

356. In the apparatus of C. Bawens, the mode of heating employed in Count Rumford's furnaces was used to reduce the quantity of fuel consumed, and thus render the process more economical. The heat of the chimney also served to heat the bath of weak sulphuric acid.

In other countries an apparatus has been employed, which possesses the advantage of winding up the stuffs within the copper, which resembles that of a steam engine with its tubes, safety valves, and collars of leather; but it has this inconvenience, that the stuff must be introduced at the top (s).

357. C. O'Reilly, to whom Chaptal had communicated

(s) The following passage translated by Nicholson from the *Journal de Physique*, is worthy of notice.

"A new method of bleaching has just been tried at Balynah, and has completely succeeded. The principle of the process appears to have been published by a French chemist, Chaptal, who is much respected by our manufacturers. I speak of the art of discolouring piece-goods in a digester, by caustic alkaline ley. Though our first

Digitized by Google

Vegetable Substances.

ed his ideas, soon conceived methods of improving the apparatus, and of applying it to various purposes suited to the different articles.

The first apparatus which he proposed to be executed at Jouy, represented an arched chamber of hewn stone, six feet eight inches long by three feet ten inches broad; and three feet and a half high above the level of the wooden grate. (See Plate XCII. fig. 8.). At one of the extremities is a door three feet long and two high, which is closed by a plate of cast iron, in which a hole is made for the introduction of a conical valve which is kept in its situation by a screw and a spring made as powerful as possible. The object of this valve was to guard against an explosion which might take place from the sudden expansion of the steam, which there is some cause to dread. The door was moveable, and fastened by ten bars and as many screws, which press against the rabbit, which is covered with tow or wet leather) so as to prevent any of the steam from escaping this way. The door should be made with two iron handles, that it may be removed with the more ease.

The copper which forms the bottom of this apparatus, and in which the caustic alkaline solution is boiled, is 18 inches deep, and its other dimensions are less by four inches than those of the chamber. This gives room for the edges of the copper, and for a wooden grate on which the men may walk and conduct the operations. In the middle of the chamber are fixed two reels, on which from eighteen to twenty pieces of cloth are rolled. The axes of these reels pass through collars of leather, which prevent the escape of the steam; they have handles on the outside to roll and unroll the pieces, and there is a regulator communicating with the inside of the copper, to point out the height of the liquor, and shew how far it is exhausted. It is heated after Count Rumford's plan.

358. Another apparatus was constructed at Troyes for the purpose of bleaching hosiery. As these goods cannot be rolled up; and as the action of the vapour might be lessened were they heaped together, O'Reilly contrived frames of wood covered with cloth, and placed at the distance of four inches, one above another. Upon these frames the goods were spread in such a manner that the vapour rising from the copper might penetrate to every part, destroy the colouring matter, and thus complete the bleaching.

359. From some farther observations he was led to propose a roller placed in such a way, that the cloth rolled on it might on occasion be drawn through the liquor in the copper, to moisten it now and then, and thus increase the action of the liquor *.

360. After this account of O'Reilly's apparatus, of which a more particular description will be given presently, we come to the actual method of bleaching by steam. The following are the directions given by Chaptal.

361. "The cotton, disposed in handfuls, must first be impregnated with a slight solution of soda rendered caustic by lime. This operation is performed in a wooden or stone trough, in which the cotton is trod down by means of the feet covered with wooden shoes. When the alkaline liquor has uniformly penetrated the cotton, it is put into the boiler, and piled up on the wooden grate before mentioned; the redundant liquor runs through the bars into the copper boiler, and forms a

* O'Reilly's Essai.

first attempts did not perfectly succeed, we were not discouraged. The linen was exposed to the action of vapour in the apparatus, but it was not equally affected, as it appeared to be blotched in several places; we were, therefore obliged to construct an apparatus, in order to unroll and separate the goods, and to expose the greatest surface possible to the action of the vapour. Suppose the boiler of a steam engine, in the form of an elongated ellipsis, provided with a safety valve, two tubes with cocks, to shew the consumption of the liquor, and a mercurial gage, to ascertain the strength of the steam. This boiler is bedded in masonry, or brick work, that it may resist the excessive pressure which necessarily takes place. In the interior part of the apparatus are six reels, three at each end, alternating with each other, in order that the action of the steam may be more equable upon the goods. These reels are slowly and uniformly carried round by simple tooth and pinion work of wood, and the first motion is given to an axis which passes out of the boiler through a stuffing box, which prevents the escape of vapour. At the top is an opening of about sixteen inches diameter, with a rim or flanch, on which the cover is fitted, and firmly secured by screws. Between the two metallic faces are placed strips of soaked leather, to prevent the vapour from escaping. When the cover is taken off, the workmen can enter the boiler, to dispose the goods upon the rollers, each of which contains about fifteen or twenty pieces, making in the whole about forty-five or sixty. The raw material, namely, cunnamara kelp, is an article of inconsiderable expence, or else the soda extracted from sea salt, in which there remains indeed a small portion indecomposed, but which we procure at a very reasonable price. It is rendered caustic by the addition of some good lime, which is made from our limestone of Parre. With these a ley is formed, which is equal to fourteen degrees of our hydrometer. In this lixivium the piece goods are boiled, and then conveyed to the digester, on the bottom of which the ley stands to about five inches in depth. The workman stands upon a perforated stage, which prevents him from stepping into the ley while he is arranging the pieces: after which, having placed them on the rollers, the apparatus is closed, the fire lighted, and the operation begins. As soon as ebullition takes place, the handle on the outside is incessantly turned, and as soon as the roller at one end is filled, the handle is shifted to the other roller, and the turning performed in the contrary direction. In this manner the operation is continued till the whole of the contents is bleached. From this description you may easily understand how this operation is performed; I shall, however, take the first opportunity of sending you a plan and description of the apparatus, if you wish for further information. You are at liberty to make whatever use you please of this account: the expence of bleaching is not more than one farthing per yard, including coals, workmen's wages, &c. as well as interest for the capital employed in the apparatus."

Digitized by Google

a stratum of liquid, which permits the mass to be heated without any danger of burning either the cotton or the metal. To form the alkaline ley, Alicant soda equal to a tenth of the weight of the cotton subjected to the operation is employed; and in a boiler such as that the dimensions of which I have given, about 800 pounds of cotton may be put at one time. The ley is generally of two degrees by the aerometer. As soon as the cotton is introduced into it, and arranged in the boiler, the upper aperture is shut with its usual covering, scarcely any opening being left, that the steam developed by the fire may assume a much more considerable degree of heat, and react with force on the cotton. When every thing is arranged, the fire in the furnace is kindled, and the ley is maintained in a state of slight ebullition during 36 hours. The apparatus is then suffered to cool, and the cotton being taken out is carefully washed; after which it is exposed on the grass for two or three days, extending it on poles in the day time, and spreading it out on the grass during the night. The cotton will then have acquired a high degree of whiteness; and if any portions of it be still found coloured, they must be put into the boiler for a second operation, or be left on the grass some days longer. These shades in bleaching cotton arise, in particular, from all the parts of the cotton in the first operation not having been completely and uniformly impregnated with the ley. They may be owing also to the cotton, when arranged in the boiler, having been too much accumulated on certain points. When it is judged that the ley has been exhausted by ebullition, the boiler is opened, and the dried cotton is moistened with a new quantity of the solution of soda: without this precaution it would be in danger of being burnt. It may be easily conceived, by an estimate of the matters and time employed in this operation, with how much saving of expence it is attended: cotton is bleached by this method in all the manufactories of the south of France, where it is used, at the low rate of two sols per pound."

362. Cloth may be bleached in the same way, but requires first to be freed from the weavers dressing, &c. as formerly directed.

363. While the goods are steeping so as to be perfectly impregnated with the alkaline ley, the copper is to be filled to the height of a foot with ley of the same strength. This may be done by means of a curved leaden funnel, but as the door is sufficiently large, the ley may be thrown in with buckets.

A workman then enters the chamber, and fixes one end of a piece of cloth by means of packthread to one of the arms of the farthest reel A (fig. 9. Plate XCII.) while another workman without turns the handle till the whole piece is wound on; the end of another piece is then fastened to the first, and so on till 18 or 20 pieces are wound round the first reel. The remaining extremity of the last piece is then passed over the roller B, near the arch of the chamber; from thence it is carried below the two rollers C, D, in the copper E E; is again carried to the arch, and made to pass over the roller F, and is lastly fastened to an arm of the other reel G. The workman then ascertains the height of the liquor in the copper by the regulator, and then shuts the cock, and closes up the door by rags and the proper screws, so as to prevent all escape of steam. The fire is then kindled, and the liquor made to boil. The workman then begins to wind off the pieces, commencing with the reel to which the last end was tacked, till this has received the whole charge; he then lowers the cranks of the lower rollers, so as to plunge the goods into the boiling ley, and immediately begins to reel off with dispatch; again raises the rollers, and reels the pieces back without passing through the ley.

At the end of two hours, more or less according to the fineness of the pieces, the alkali carried up by the heat will completely have penetrated the fibres of the cloth, which are swelled by the extraordinary heat of the steam.

The fire is now extinguished, and as soon as all is sufficiently cool, the door is opened, and they prepare for immersing the stuffs in the oxygenated muriatic acid, after they are first well rinsed in fair water.

364. For immersion the tub described in 262. is employed, and the pieces are fastened and reeled in the manner there described, till the liquor on examination is found pretty much exhausted. The pieces are then taken out separately, well rinsed in a stream of water, and exposed on the grass for three or four days. They are then passed through a bath of very weak sulphuric acid, and will then have acquired a high degree of whiteness.

If linen or hempen cloth should retain a slight yellow cast, which will sometimes happen, the steaming must be repeated; and they must be exposed again for a day or two on the grass.

365. Hosiery and threads are bleached in the same way, but they are to be placed on frames at such a distance from each other that they may be easily penetrated by the steam; but as these articles cannot, like the cloths, be made to pass through the ley in the copper, the process is to be stopped at the end of two hours, and then the upper frame is completely wet with ley, which oozes through, and thus moistens all the lower frames. The boiling is again commenced, and continued for four hours. For the immersion, the apparatus of Rupp with the vertical reels is the best possible, and the goods are to be hung on the upper end of the reel. After immersion, they are rinsed, exposed on the grass, and passed through the acid bath as other articles.

366. Chaptal has lately applied this method to a very important object, the scouring and whitening of foul linen.

"I have no doubt," says he, "but that linen garments may be bleached to advantage by the same process; but as it was necessary to bring these notions to the test of experiment, I invited Citizen Bawens to allow me to make the experiment on a large scale with his apparatus. Accordingly, on the 27th Pluviose, in the year 9, I had 200 pair of sheets from the hospital of the Hotel Dieu at Paris, chosen among those that were most soiled, and taken to the manufactory of Citizen Bawens.

"Three experiments were made upon these sheets.

"*Experiment* 1. One hundred and thirty sheets were impregnated with a caustic alkaline ley, containing one hundredth part of soda. They were kept for six hours in the engine of steam; after which they were impregnated again, in order to be placed again six hours in the same machine.

"The same process was repeated a third time; after which they were carefully rinsed, and no spots of wine,

wine, grease, blood, or animal ejection, were to be seen. One quarter of a pound of soap was used in rinsing these cloths.

"All the assistants were convinced that the ordinary processes would not have given either so perfect a white, nor so agreeable a lixivial smell.

"The texture was in no respect altered.

"*Experiment* 2. The alkaline ley contained only six parts of soda, but five pounds of soap were also added. The cloths were treated in the same manner, and the results appeared more advantageous. They were easily washed out.

Experiment 3. To the bath of the second experiment a sufficient quantity of new ley was added. One hundred and forty sheets were treated like the preceding, and the result was the same.

"It must be observed that the water of the Seine, in which these sheets were rinsed, was at that time very yellow.

"This experiment appeared to me to offer several results worth the attention of the Institute.

"In the first place the process is economical. Two hundred pair of sheets, which were bleaching by three successive operations, demanded an expenditure, according to the account furnished by Citizen Bawens, which is in the proportion of 7 to 10, compared with that commonly made in the hospitals. This expence may be reduced to less than one-third, if a suitable place and apparatus were appropriated to this use.

"2. Two days at most are required to complete the operation. This economy of time is incalculably beneficial.

"3. The linen is neither changed nor torn, as it passes through the hands only once, and it is of no use to beat it.

"4. The extreme heat to which the linen is exposed in the apparatus, causes its texture to be penetrated by the alkaline fluid to such a degree, that the substances with which it is impregnated cannot be masked from its action; so that the putrid exhalations, and other substances attached to its texture, are necessarily destroyed or changed in their nature.

"This effect must be more particularly seen with regard to its value, by physicians, who are aware with what facility the seeds of various disorders are perpetuated in hospitals, and how insufficient the greater number of processes used in washing linen have proved to destroy them."

367. It only remains that we should give a brief explanation of the manner in which the steam, thus confined, acts in bleaching the goods.

It has appeared from the former parts of this article, that the bleaching of vegetable substances depends on the united influence of moisture, light, and oxygen; and the mode in which these act, as also the action which alkalies exert on the colouring matter of cloth, has been explained. This action of the alkali is materially assisted by the increased temperature of this vapour bath, by which the fibres of the cloth, &c. are swelled and opened; and thus the caustic alkali carried up with the stream, greedily seizes on and destroys the colouring matter; or, should some part of it escape, a second steaming, after immersion and exposure to the air, never fails to discharge it. The increased temperature, independently of swelling and opening the texture of the cloth, seems also to render the alkali more active than it can be in the ordinary leys, in which the temperature never exceeds 162° Fahrenheit; for one degree of the aerometer is always a sufficient strength, and very seldom more than half a degree is required.

By passing the goods through a single bath of oxygenated muriatic acid, or oxymuriat of lime, a combination takes place between the oxygen of the liquor and the carbon produced by the destruction of the extracto-resinous matter by the alkali, and carbonic acid is formed, and this is dissipated by the subsequent exposure to the atmosphere.

368. We cannot however agree with O'Reilly *, that the steam itself possesses no bleaching power, as we are convinced from the common process of cooking green vegetables in steam, by which, as is well known, they lose their green colour, that this is not the case.

* *Essai sur le Blanch.* p. 147.

369. It has been supposed that the vapour arising from a boiling solution of caustic alkali would not itself be caustic, or produce the same effects as the solution; a supposition which was founded on the concentration of salts by evaporation; but we are by no means to infer, from what takes place in the open air, where the moisture is constantly absorbed as it rises, that the same will happen in a close apparatus, where the temperature is considerably increased; and, in fact, that alkali is capable of being raised by steam is fully proved by suspending paper tinged blue over a boiling solution of potash, when the blue will soon be converted into a green.

We shall conclude this article with M. Chaptal's observations on the art of scouring different kinds of stuffs.

"This art supposes, 1st, a knowledge of the different substances capable of staining any kind of cloth; 2d, of the substances to which recourse must be had in order to make those deposited on the stuff to disappear; 3d, a knowledge of the effects produced on colours by those re-agents which it may be necessary to employ to destroy stains; 4th, a knowledge of the manner in which the cloth is affected by those re-agents; 5th, of the art of restoring a colour changed or faded.—Of those bodies which occasion spots on different kinds of cloth, some are easily distinguished by their appearance, such as greasy substances; but others have more complex effects, such as acids, alkalies, perspired matter, fruits, urine, &c. Acids redden black, fawn, violet and puce-colour, and every shade communicated with orchilla-weed, iron, astringents, and every blue except indigo and Prussian blue. They render the yellows paler, except that of arnotto, which they change into orange.

"Alkalies change to violet the reds produced by Brazil wood, logwood, and cochineal. They render the greens on woollen cloth yellowish, make yellow brownish, and change the yellow produced by arnotto to aurora. Perspired matter produces the same effects as alkalies.

370. "When the spots are produced by simple bodies on stuffs, it is easy to remove them by the means already known. Greasy substances are removed by alkalies, soaps, the yolk of eggs, fat earths; oxyds of iron, by the nitric and oxalic acids; acids by alkalies, and reciprocally. Stains of fruit on white stuffs may be removed by the sulphurous acid, and still better by the oxygenated

Vegetable Substances.

oxygenated muriatic acid. But when the spots are of a complex kind, it will be necessary to employ several means in succession. Thus, to destroy the stain of coom from carriage-wheels, after the grease has been dissolved the oxide of iron may be removed by the oxalic acid.

371. "As colours are often changed by re-agents, it will be necessary, in order to restore them, that the scourer should possess a thorough knowledge of the art of dyeing, and how to modify the means according to circumstances. This becomes the more difficult when it is necessary to reproduce a colour similar to that of the rest of the stuff, to apply that colour only in one place, and often to restore the mordant by which it was fixed, and which has been destroyed, or even the first tint which gave the colour its intensity. It may be readily conceived that the means to be employed must depend on the nature of the colour, and the ingredients by which it was produced; for it is known that the same colour may be obtained from very different bodies. Thus, after an alkali has been employed to destroy an acid spot on browns, violets, blues, poppies, &c. the yellow spot which remains may be made to disappear by a solution of tin; a solution of sulphat of iron restores the colour to brown stuffs which have been galled; acids restore to their former splendour yellows which have been rendered dusky or brown by alkalies; blacks produced by logwood become red by acids; alkalies change these red spots to yellow, and a little of the astringent principle makes them again become black. A solution of one part of indigo in four parts of sulphuric acid, diluted with a sufficient quantity of water, may be employed with success to revive the blue colour of cotton or wool which has been changed. Scarlet may be revived by means of cochineal and a solution of the muriat of tin, &c.

"The choice of re-agents is not a matter of indifference. Vegetable acids are preferable; the sulphurous acid, however, may be employed for stains occasioned by fruit: it does not change the blue of silk nor colours produced by astringents: it does not degrade the yellow of cotton. Ammonia succeeds better than fixed alkalies in removing spots produced by acids. It is employed in vapour; its action is speedy, and seldom alters the colour.

372. "The means of removing greasy spots are well known. This effect is produced by alkalies, fullers earth, volatile oils dissolved in alcohol, a heat proper for volatilizing grease, &c. Spots occasioned by ink, rust, or iron-mould of any kind, and all those produced by the yellow oxide of iron, are removed by the oxalic acid: the colour may be restored by alkalies, or a solution of the muriat of tin. These spots may be removed also by the oxygenated muriatic acid, when they are on white stuffs or paper.

"The action of alkalies, and that of perspired matter, are the same: their spots may be effaced by acids, or even by a weak solution of the muriat of tin. When these spots arise from several unknown causes, in order to destroy them recourse must be had to *polychrest* compositions. The following may be considered as one of the most efficacious. Dissolve white soap in alcohol, and mix this solution with the yolks of from four to six eggs: add gradually essence of turpentine; and incorporate with the whole some fullers earth, in such a manner as to form balls of a suitable consistence. Moisten the spot; and, having rubbed it with these balls, the spot will be removed by washing the stuff. All spots, except iron-mould and ink, may be removed in this manner.

"Washing destroys the lustre, and leaves a tarnished place disagreeable to the eye; but the lustre may be restored by drawing over the washed place, and in the direction of the pile, a brush moistened in water impregnated with a little gum. You may then apply a sheet of paper, or a piece of cloth, and a considerable weight, under which the cloth must be left to dry."

Fig. 11. Plan of Loysel's Apparatus for Bleaching Paper.

1, 1, 1, &c. Eight furnaces, having a chimney of sheet iron common to each pair of furnaces.

2, 2, 2, &c. Eight vessels of cast iron, containing sand.

3, 3, 3, &c. Eight matrasses, balloons, or bottles of stone-ware, compact, and well baked, intended to contain the materials which afford the gas. Each matrass must be filled only to one-third of its capacity at most. Bodies of glass of little thickness may also be used for this purpose.

4, 4, 4, &c. Tubes of glass to conduct the gas into the receiver. Or these tubes may be made of lead.

5. The receiver. It is composed, 1. of an internal vessel, covered with plates of lead well soldered together, and provided near its bottom with a cock 6, to draw off the liquor when prepared. 2. Another vessel, 7, likewise covered with plates of lead within and without. This second tub is inverted in the first, to contain the gas in proportion as it is disengaged, and to keep in contact with the water of the receiver that portion of gas which had not time to be dissolved in passing through that fluid.

There is a hole, 8, in the upper part of this second vessel. It serves to suffer the common air to escape when water is first poured into this receiver, and it is afterwards closed with a stopper of lead or cork, covered with paper soaked in starch, and fastened to the cork by a piece of cloth or bladder, before the operation begin.

Fig. 12. Vertical section of the apparatus.

Fig. 13. Elevation of the apparatus.

The disposition of the furnaces about the receiver, and the circular form of the receiving vessels, was rendered necessary here by the local circumstances. In other circumstances square vessels might be employed, and all the furnaces might be ranged in a right line under a common chimney.

For an account of the most recent improvements in this art, see Bleaching, Supplement.

BLEAK, in *Ornithology*. See CYPRINUS.

BLECHINGLY, a town of Surry in England, which sends two members to parliament, and the bailiff who returns the members is chosen annually at the lord of the manor's court. The town stands on a hill, and contained 1116 inhabitants in 1811. W. Long. 0. 15. N. Lat. 51. 20.

BLEEDING, in *Therapeutics*; see MEDICINE *Index*. As a chirurgical operation, see SURGERY *Index*.

BLEEDING at the Nose, called *Epistaxis*. See MEDICINE *Index*.

BLEEDING is also used for a hæmorrhage or flux of blood from a wound, rupture of a vessel, or other accident. See HÆMORRHAGY.

BLEEDING of a Corpse, is a phenomenon said to have frequently happened in the bodies of persons murdered, which, on the touch, or even the approach, of the murderer, began to bleed at the nose, ears, and other parts; so as formerly to be admitted in England, and still allowed in some other parts, as a sort of detection of the criminal and proof of the fact. Numerous instances of these posthumous hæmorrhagies are given by writers. But this kind of evidence ought to be of small weight: for it is to be observed, that this bleeding does not ordinarily happen, even in the presence of the murderer; yet sometimes in that even of the nearest friends, or persons most innocent; and sometimes without the presence of any, either friend or foe. In effect, where is the impossibility that a body, especially if full of blood, upon the approach of external heat, having been considerably stirred or moved, and a putrefaction coming on, some of the blood-vessels should burst, as it is certain they all will in time?

BLEEDING is also used for the drawing out of the sap of plants, otherwise called *tapping*. See TAPPING.

BLEKING, a province in the south part of Sweden, having the Baltic sea on the south, Smaland on the north, and the province of Schonen on the west. Its principal towns are Christianstadt, Elleholm, Ahuys, Roterby, and Christianople, which last is the capital.

BLEMYES, or BLEMMYES, a fabulous people of Ethiopia, said to have had no heads; their eyes, mouths, &c. being situated in their breasts. See ACEPHALOUS.

BLENCH, or BLANCH. See BLANCH.

BLEND, or BLINDE. See BLENDE, MINERALOGY *Index*.

BLEND-Water, called also *morehough*, a distemper incident to black cattle, comes either from the blood, from the yellows, or from the change of ground.—In order to cure it, take bole armoniac, and as much charcoal-dust as will fill an egg shell, a good quantity of the inner bark of an oak, dried and pounded together to a powder, and give it to the beast in a quart of new milk and a pint of earning.

BLENHEIM, a village of Germany, in the kingdom of Bavaria; situated in E. Long. 2. 30. N. Lat. 48. 40. This village is remarkable for the defeat of the French and Bavarians in 1704, by the English and their confederates under Prince Eugene and the duke of Marlborough. The French army amounted to 60,000 veterans, who had shared in the conquests of their grand monarque; and were now commanded by two generals the most distinguished at that time in France, Marshal Tallard and the duke of Bavaria. The former had established his reputation by many victories. He was active and penetrating; his ardour often rose to impetuosity; but he was so shortsighted as to be incapable of seeing objects at a very small distance. The duke of Bavaria was equally experienced in the field, and had stronger motives for activity: His country was ravaged before his eyes, and nothing remained of his possessions but the army which he commanded. The allied army, commanded by Eugene and Marlborough, amounted to about 52,000 men, troops who had long been familiar with victory, and who had seen the French, the Turks, and the Russians, fly before them. Both armies, after many marches and countermarches, approached each other. The French were posted on a hill near the town of Hochstet; their right covered by the Danube and the village of Blenheim; their left by the village of Lutzengen; and their front by a rivulet, the banks of which were steep and the bottom marshy. The right wing of the French was commanded by Marshal Tallard; their left by the duke of Bavaria, and under him General Marsin, an experienced Frenchman. Their position being advantageous, they were willing to await the enemy rather than offer battle. On the other hand, Marlborough and Eugene were stimulated to engage them at all events, in consequence of an intercepted letter from Villeroy, intimating that he was preparing to cut off all communication between the Rhine and the allied army. The dispositions, therefore, being made for the attack, and the orders communicated to the general officers, the allied forces advanced into the plain, and were ranged in order of battle. The cannonading began about nine in the morning, and continued to about half after twelve. The troops then advanced to the attack; the right under the direction of Prince Eugene, the left headed by Marlborough, and opposed to Marshal Tallard. Marlborough, at the head of the English troops, having passed the rivulet, attacked the cavalry of Tallard with great bravery. This general being then reviewing the disposition of his troops to the left, his cavalry fought for some time without the presence of their commander. Prince Eugene had not yet attacked the forces of the elector; and it was near an hour before he could bring up his troops to the engagement. Tallard was no sooner informed that his right was attacked by the duke, than he flew to its head, where he found a furious encounter already begun; his cavalry being thrice driven back, and rallying as often. He had posted a large body of forces in the village of Blenheim; and he made an attempt to bring them to the charge. They were attacked by a detachment of Marlborough's troops so vigorously, that instead of assisting the main body, they could hardly maintain their ground. All the French cavalry being thus attacked in flank, was totally defeated. The English army now penetrated between the two bodies of the French, commanded by the marshal and elector, while the forces in the village of Blenheim were separated by another detachment. In this distressed situation Tallard flew to rally some squadrons; but from his shortsightedness mistaking a detachment of the enemy for his own, he was made prisoner by the Hessian troops who were in the allied army. Meanwhile, Prince Eugene on his part, after having been thrice repulsed, at last put the enemy into confusion. The rout then became general, and the flight precipitate. The consternation of the French soldiers was such, that they threw themselves into the Danube, without knowing whither they fled. The allies being now masters of the field of battle, surrounded the village of Blenheim, where a body of 13,000 men had been posted in the beginning of the action, and still maintained their ground. These troops seeing themselves cut off from all communication with the rest of the army, and despairing of being able to force their way through the allies, threw down their arms, and surrendered themselves prisoners of war. Thus ended the battle of Blenheim, one of the most complete victories that ever was obtained. Twelve thousand French and Bavarians were slain in the field or drowned in the Danube; 13,000 were made prisoners of war; and there were taken 100 pieces of cannon, 22 mortars, upwards of 100 pair of colours, 200 standards, 17 pair of kettle-drums, upwards of 3000 tents, 34 coaches, 300 loaded mules, two bridges of boats, and all the French baggage, with their military chest. Next day, when the duke of Marlborough visited his prisoner the marshal, the latter assured him that he had overcome the best troops in the world. "I hope, Sir (replied the duke), you will except those troops by whom they were conquered." The allies, in consequence of this victory, became masters of a country 100 leagues in extent.

Blenheim House, a noble and princely house erected in honour of the duke of Marlborough at Woodstock near Oxford, which with the manor of Woodstock is settled on the duke and his heirs, in consideration of the eminent services by him performed for the public; and for building of which house the sum of 500,000l. was granted by parliament, &c.—The tenure by which his grace holds the manor of Woodstock is the presenting at the castle of Windsor annually on the day in which the battle of Blenheim was fought, a flag embroidered with flowers-de-lis; which flag is shewn to all strangers who visit the castle.

BLENNIUS, the Blenny. See Ichthyology *Index*.

BLESS, Henry, painter of history and landscape, was born at Bovine, near Dinant, in 1480. He acquired his skill in the art merely by the strength of his natural genius, assisted by a diligent study and observation of the works of Patenier, without having any other instructor; and at last rendered himself very eminent, particularly by his landscapes. His best performances were bought up by the emperor Rodolph, and they are still preserved at Vienna. His style of composition in historical subjects resembles the style of the Flemish artists of that age, and exhibits a great number of figures finished with extreme neatness. But he crowded several subjects into one design; as in his picture of the disciples at Emmaus, he represented not only that incident, but, in different groups disposed in the back ground, he represented likewise the different parts of the passion of our Saviour. And yet, notwithstanding the impropriety of that manner of composing, his pictures were so delicately pencilled and finished, and his landscapes in particular so agreeably invented, so full of variety, and well executed, that even in Italy his works were in great request, and were distinguished there by the appellation of the *owl-pictures*: for he fixed an owl, as his peculiar mark, in every picture he painted; by which the works of this master are always indisputably known. He died in 1550.

BLESTIUM, a town in Britain. Now *Old-town*, not far from Hereford.

BLETONISM, a faculty of perceiving and indicating subterraneous springs and currents by sensation. The term is modern, and derived from a M. Bleton, who for some years past has excited universal attention by his possessing the above faculty, which seems to depend upon some peculiar organization. Concerning the reality of this extraordinary faculty, there occurred great doubts among the learned. But M. Thouvenel, a Frenchman of some consequence and a philosopher, seems to have put the matter beyond dispute, in two memoirs which he has published upon the subject. He was charged by the king with a commission to analyse the mineral and medicinal waters in France; and, by repeated trials, he had been so fully convinced of the capacity of Bleton to assist him with efficacy in this important undertaking, that he solicited the ministry to join him in the commission upon advantageous terms. All this shows that the operations of Bleton have a more solid support than the tricks of imposture or the delusions of fancy. In fact, a great number of his discoveries are ascertained by respectable affidavits. The following is a strong instance in favour of Bletonism. "For a long time the traces of several springs and their reservoirs in the lands of the abbé de Vervians had been entirely lost. It appeared, nevertheless, by ancient deeds and titles, that these springs and reservoirs had existed. A neighbouring abbey was supposed to have turned their waters for its benefit into other channels, and a law-suit was commenced upon this supposition. M. Bleton was applied to: he discovered at once the new course of the waters in question: his discovery was ascertained, and the law-suit was terminated."

Bleton has been mistaken more than once; and our author enumerates, with the fairest candour, the cases in which he has failed: but these cases are very rare in comparison with those in which he has succeeded. Besides, even the mistakes of Bleton do not invalidate the reality of his talents; since a talent may be real without being perfect, or exerting itself with the same success in every trial.

Many were indisposed against Bletonism, because they looked upon the facts on which it is founded as inexplicable. But M. Thouvenel assigns principles upon which the impressions made by subterraneous waters and mines may be naturally enough accounted for. Having ascertained a general law by which subterraneous electricity exerts an influence upon the bodies of certain individuals eminently susceptible of that influence, and shown that this law is the same whether the electrical action arises from currents of warm or cold water, from currents of humid air, from coal or metallic mines, from sulphur, and so on, he observes, that there is a diversity in the physical and organical impressions which are procured by this electrical action, according as it proceeds from different fossil bodies which are more or less conductors of electrical emanations. There are also artificial processes, which concur in leading us to distinguish the different focuses or conductors of mineral electricity; and in these processes the

Digitized by Google

the use of electrometrical rods deserves the attention of philosophers, who might perhaps in process of time substitute in their place a more perfect instrument. Their physical and spontaneous mobility, and its electrical cause, are demonstrated by indisputable experiments.

On the other hand, our author proves, by very plausible arguments, the influence of subterraneous electrical currents, compares them with the electrical currents of the atmosphere, points out the different impressions they produce according to the number and quality of the bodies which act, and the diversity of those which are acted upon. The ordinary sources of cold water make impressions proportional to their volume, the velocity of their currents, and other circumstances. Their stagnation destroys every species of electrical influence; at least, in this state they have none that is perceptible. Their depth is indicated by geometrical processes, founded upon the motion and divergence of the electrical rays; but there are second causes which sometimes diversify these indications, and occasion seeming errors. These errors, however, according to our author, are only exceptions to the general rule; exceptions which depend on the difference of mediums and situations, and not on the inconstancy or incertitude of the organical, sensitive, or convulsive faculties of the Bletonist.

All the hot springs in France, traced by our author from the places where they flow to the places where their formation commences (sometimes at a distance of 15 leagues), led him constantly to masses of coal; where they are collected and heated in basons of different depths and dimensions, nourished by the filtration of lakes and the course of torrents, and mineralized by saline, sulphureous, metallic, and bituminous substances, in the natural furnaces where they are heated, or in the strata through which they flow.

The last and the most singular and important phenomenon which our author met with in the course of his experiments must not be here omitted. Over the veins of iron mines alone the electrometrical rods assume a motion of rotation diametrically opposite to that which they exhibit over all other mines. This phenomenon takes place with the same distinction when iron and other metals are extracted from their mines and deposited under ground. But the most remarkable circumstance in this distinctive action of these metals is, that it has a uniform and constant direction from east to west in all metals, iron excepted, just as iron rendered magnetic has an action directed from south to north. The action of red metals is more palpable than that of the white; but the latter, though weaker, has nevertheless, a real existence in the sulphur. In the supplement to this memoir, there is an accurate account of the processes that have furnished these invariable results. They will naturally suggest, says our author, the idea of constructing an electrical compass, which may be of as eminent use in experimental philosophy as the magnetic compass is in navigation. The natural and spontaneous direction of metallic emanations towards the west being ascertained, it only remains to render them palpable by the construction of an instrument which may be substituted in the place of the electrometrical twig that goes vulgarly by the name of the *divining rod*.

His analysis of the hot springs of Bourbon-Lancy, to the source of which in the great mountains of Burgundy he was led by the electrical sensations of Bleton, shows the great intelligence and sagacity of our author in operations of this nature. He found the origin of these famous hot springs in the centre of an oblong rising ground, full of coal, and commanded on three sides by a group of mountains, of which the greatest part was filled with the same mineral. From a particular case, here circumstantially described, in which the electrical rays of the subterraneous water and those of the adjacent coal crossed each other, our author deduces a very natural account of the errors which may sometimes, though rarely, mislead for a time the greatest adepts in Bletonism, when they find themselves in combined spheres of electrical activity. Another observation, which seems confirmed by several facts, accounts farther for this fallibility; the observation is, that electrical rays, whether direct or collateral, issuing from subterraneous focuses, seem to undergo in certain cases a sort of refraction as they pass from one medium to another, or traverse bodies which differ with respect to the property of transmitting this electricity. In a word, it follows from these observations, that when such privileged investigators of currents or minerals as Bleton are placed upon the electrical spheres of these bodies, they will indicate their situation and their respective depths according to the impressions they feel within themselves, or the motions they observe in the electrometrical instruments which they employ: and if they meet with second accidental causes or complications of electrical spheres, which modify or alter these methods of trial, this will necessarily occasion mistakes in the results of their operations which they may probably rectify; but which, at all events, it would be unjust to lay to their charge, or allege as an objection against the reality of their talent.

BLIGHT, in *Husbandry*, a disease incident to plants, which affects them variously, the whole plant sometimes perishing by it, and sometimes only the leaves and blossoms, which will be scorched and shrivelled up, the rest remaining green and flourishing.

Some have supposed that blights are usually produced by an easterly wind, which brings vast quantities of insects eggs along with it, from some distant place, that, being lodged upon the surface of the leaves and flowers of fruit-trees, cause them to shrivel up and perish.

To cure this distemper, they advise the burning of wet litter on the windward side of the plants, that the smoke thereof may be carried to them by the wind, which they suppose will stifle and destroy the insects, and thereby cure the distemper.

Others direct the use of tobacco-dust, or to wash the trees with water wherein tobacco-stalks have been infused for 12 hours; which they say will destroy those insects, and recover the plants.

Pepper-dust scattered over the blossoms of fruit-trees, &c. has been recommended as very useful in this case; and there are some that advise the pulling off the leaves that are distempered.

The true cause of blights seems to be continued dry easterly winds for several days together, without the intervention of showers, or any morning dew, by which the perspiration in the tender blossom is stopped; and if

Digitized by Google

if it so happens that there is a long continuance of the same weather, it equally affects the tender leaves, whereby their colour is changed, and they wither and decay.

The best remedy for this distemper, is gently to wash and sprinkle over the tree, &c. from time to time, with common water; and if the young shoots seem to be much infected, let them be washed with a woollen cloth, so as to clear them, if possible, from this glutinous matter, that their respiration and perspiration may not be obstructed. This operation ought to be performed early in the day, that the moisture may be exhaled before the cold of the night comes on: nor should it be done when the sun shines very hot.

Another cause of blights in the spring, is sharp hoar-frosts, which are often succeeded by hot sunshine in the day-time. This is the most sudden and certain destroyer of the fruits that is known.

BLIGHTED CORN. See SMUT.

1 Blindness, what.

BLIND, an epithet applied to a person or sensitive creature deprived of the use of his eyes; or, in other words, to one from whom light, colours, and all the glorious variety of the visible creation, are intercepted by some natural or accidental disease. Such is the literal acceptation of the term: but it is likewise used in a metaphorical sense, to signify mental or intellectual darkness; and frequently implies, at the same time, some moral or spiritual depravity in the soul thus blinded, which is either the efficient or continuing cause of this internal malady. Yet, even in metaphor, the epithet of *blind* is sometimes applied to a kind of ignorance, which neither involves the idea of real guilt nor of voluntary error. It is, however, our present intention to consider the word, not in its figurative, but in its natural and primary sense. Nor do we mean in this place to regard it as a subject of medical speculation, or to explore its causes and enumerate its cures. These are in the department of another science *. It is rather our design to consider, By what means this inexpressible misfortune may be compensated or alleviated to those who sustain it; what advantages and consolations they may derive from it; of what acquisitions they may be susceptible; what are the proper means of their improvement; or by what culture they may become useful to themselves, and important members of society.

2 Either natural or metaphorical.

* See the Index subjoined to *Medicine*.

3 How the blind may be rendered useful in an individual or a social capacity.

There is not perhaps any sense or faculty of the corporeal frame, which affords so many resources of utility and entertainment as the power of vision; nor is there any loss or privation which can be productive of disadvantages or calamities so multiform, so various, and so bitter, as the want of sight. By no avenue of corporeal perception is knowledge in her full extent, and in all her forms, so accessible to the rational and inquiring soul, as by the glorious and delightful medium of light. For this not only reveals external things in all their beauties, in all their changes, and in all their varieties; but gives body, form, and colour, to intellectual ideas and abstract essences; so that the whole material and intelligent creation lie in open prospect, and the majestic frame of nature, in its whole extent, is, if we may speak so, perceived at a single glance. To the blind, on the contrary, the visible universe is totally annihilated; he is perfectly conscious of no space but that in which he stands, or to which his extremities can reach. Sound, indeed, gives him some ideas of distant objects; but those ideas are extremely obscure and indistinct. They are obscure, because they consist alone of the objects whose oscillations vibrate on his ear, and do not necessarily suppose any other bodies with which the intermediate space may be occupied, except that which gives the sound alone: they are indistinct, because sounds themselves are frequently ambiguous, and do not uniformly and exclusively indicate their real causes. And though by them the idea of distance in general, or even of some particular distances, may be obtained; yet they never fill the mind with those vast and exalting ideas of extension which are inspired by ocular perception. For though a clap of thunder, or an explosion of ordnance, may be distinctly heard after they have traversed an immense region of space; yet, when the distance is uncommonly great, it ceases to be indicated by sound; and therefore the ideas, acquired by auricular experiment, of extension and interval, are extremely confused and inadequate. The living and comprehensive eye darts its instantaneous view over expansive valleys, lofty mountains, protracted rivers, illimitable oceans. It measures, in an indivisible point of time, the mighty space from earth to heaven, or from one star to another. By the assistance of telescopes, its horizon is almost indefinitely extended, its objects prodigiously multiplied, and the sphere of its observation nobly enlarged. By these means, the imagination, inured to vast impressions of distance, can not only recal them in their greatest extent with as much rapidity as they were at first imbibed; but can multiply them, and add one to another, till all particular boundaries and distances be lost in immensity. Thus nature, by profusely irradiating the face of things, and clothing objects in a robe of diversified splendour, not only invites the understanding to expatiate on a theatre so extensive, so diversified, and so attractive; but entertains and inflames the imagination with every possible exhibition of the sublime or beautiful. The man of light and colours beholds the objects of his attention and curiosity from far. Taught by experience, he measures their relative distances; distinguishes their qualities; determines their situations, positions, and attitudes; presages what these tokens may import; selects his favourites; traverses in security the space which divides them from him; stops at the point where they are placed; and either obtains them with ease, or immediately perceives the means by which the obstacles that intercept his passage to them may be surmounted. The blind not only may be, but really are, during a considerable period, apprehensive of danger in every motion towards any place from whence their contracted power of perception can give them no intelligence. All the various modes of delicate proportion, all the beautiful varieties of light and colours, whether exhibited in the works of nature or art, are to them irretrievably lost. Dependent for every thing, but mere subsistence, on the good offices of others; obnoxious to injury from every point, which they are neither capacitated to perceive nor qualified to resist; they are, during the present state of being, rather to be considered as prisoners at large, than citizens of nature. The sedentary life, to which by privation of sight they are destined, relaxes their frame, and subjects them to all the disagreeable sensations which arise from dejection of spirits. Hence the most feeble

4 Disadvantages of blindness.

Digitized by Google

feeble exertions create lassitude and uneasiness. Hence the native tone of the nervous system, which alone is compatible with health and pleasure, destroyed by inactivity, exasperates and embitters every disagreeable impression. Natural evils, however, are always supportable; they not only arise from blind and undesigning causes, but are either mild in their attacks, or short in their duration: it is the miseries which are inflicted by conscious and reflecting agents alone, that can deserve the name of evils. These excruciate the soul with ineffable poignancy, as expressive of indifference or malignity in those by whom such bitter potions are cruelly administered. The negligence of wantonness, therefore, with which the blind are too frequently treated, is an enormity which God alone has justice to feel or power to punish.

5 The situation of the blind described by poets.

Those among them who have had sensibility to feel, and capacity to express, the effects of their misfortunes, have described them in a manner capable of penetrating the most callous heart. The venerable father of epic poetry, who in the person of Demodocus the Phæacian bard is said to have described his own situation, proceeds thus:

6 Homer.

> *Τον περι Μουσ' εφιλησε, διδου δ' αγαθον τε, κακον τε*
> *Οφθαλμων μεν αμερσε, διδου δ' ηδειαν αοιδην.* ODYS. θ.

> Dear to the muse, who gave his days to flow
> With mighty blessings mix'd with mighty wo,
> In clouds and darkness quench'd his visual ray,
> Yet gave him power to raise the lofty lay. POPE.

Milton, in his address to light, after a sublime description of his arduous and gloomy journey from the regions of primeval darkness to this our visible diurnal sphere, thus continues to apostrophize the celestial beam:

7 Milton.

> Taught by the heav'nly muse to venture down
> The dark descent, and up to reascend,
> Though hard and rare; thee I revisit safe,
> And feel thy sov'reign vital lamp: but thou
> Revisit'st not these eyes, that roll in vain
> To find thy piercing ray, and find no dawn:
> So thick a drop serene hath quench'd their orbs,
> Or dim suffusion veil'd. Yet not the more
> Cease I to wander, where the muses haunt
> Clear spring, or shady grove, or sunny hill,
> Smit with the love of sacred song: but chief
> Thee, Sion, and the flow'ry brooks beneath,
> That wash thy hallow'd feet, and warbling flow,
> Nightly I visit; nor sometimes forget
> Those other two equall'd with me in fate,
> So were I equall'd with them in renown,
> Blind Thamyris, and blind Mæonides,
> And Tiresias and Phineus prophets old:
> Then feed on thoughts, that voluntary move
> Harmonious numbers; as the wakeful bird
> Sings darkling, and in shadiest covert hid
> Tunes her nocturnal note. Thus with the year
> Seasons return; but not to me returns
> Day, or the sweet approach of ev'n or morn,
> Or sight of vernal bloom, or summer's rose,
> Or flocks, or herds, or human face divine;
> But cloud instead, and ever-during dark,
> Surrounds me, from the cheerful ways of men
> Cut off, and for the book of knowledge fair
> Presented with an universal blank,
> Of nature's works to me expung'd and ras'd,
> And wisdom at one entrance quite shut out.
> PAR. LOST, Book III.

The same inimitable author, in his tragedy of Sampson Agonistes, and in the person of his hero, deplores the misfortune of blindness with a pathos and energy sufficient to extort the deepest sighs from the most unfeeling hearts:

> ———————— But chief of all,
> O loss of sight, of thee I must complain!
> Blind among enemies, O worse than chains,
> Dungeon, or beggary, decrepid age.
> Light, the prime work of God, to me is extinct,
> And all her various objects of delight
> Annull'd, which might in part my grief have eas'd.
> Inferior to the vilest now become
> Of man or worm. The vilest here excel me:
> They creep, yet see; I dark in light, expos'd
> To daily fraud, contempt, abuse, and wrong,
> Within doors, or without, still as a fool,
> In power of others, never in my own;
> Scarce half I seem to live, dead more than half.
> O dark, dark, dark, amid the blaze of noon.
> Irrecoverably dark, total eclipse
> Without all hope of day!
> O first-created Beam, and thou great Word,
> *Let there be light*, and light was over all!
> Why am I thus bereav'd thy prime decree?
> The sun to me is dark,
> And silent, as the moon
> When she deserts the night,
> Hid in her vacant interlunar cave.
> Since light so necessary is to life,
> And almost life itself, if it be true
> That light is in the soul,
> She all in every part; why was the sight
> To such a tender ball as th' eye confin'd!
> So obvious, and so easy to be quench'd?
> And not, as feeling, throughout all parts diffus'd,
> That she might look at will through ev'ry pore?
> Then had I not been thus exil'd from light,
> As in the land of darkness, yet in light,
> To live a life half dead, a living death:
> And bury'd; but yet more miserable!
> Myself the sepulchre, a moving grave;
> Bury'd, yet not exempt
> By privilege of death and burial
> From worst of other evils, pains and wrongs,
> But made hereby obnoxious more
> To all the miseries of life.

8 Ossian.

Ossian, the Caledonian bard, who lived before the authenticated history of his nation dates its origin, who in his old age participated the same calamity, has in more than one passage of his works described his situation in a manner so delicate, yet so pathetic, that it pierces the inmost recesses, and excites the finest feelings of the heart. Of these passages, take the following:

"O thou that rollest above, round as the shield of my fathers! whence are thy beams, O sun! whence thy everlasting light? Thou comest forth in thy awful beauty, and the stars hide themselves in the sky; the moon,

Digitized by Google

moon, cold and pale, sinks in the western wave. But thou thyself movest alone: who can be a companion of thy course? The oaks of the mountains fall; the mountains themselves decay with years; the ocean shrinks and grows again; the moon herself is lost in heaven: but thou art for ever the same; rejoicing in the brightness of thy course. When the world is dark with tempests; when thunder rolls and lightning glances through the heavens; thou lookest in thy beauty from the clouds, and laughest at the storm. But to Ossian thou lookest in vain: for he beholds thy beams no more; whether thy yellow hair flows on the eastern clouds, or thou tremblest at the gates of the west. But thou art, perhaps, like me, for a season; and thy years will have an end; thou shalt sleep in thy clouds, careless of the voice of the morning.—Exult then, O sun, in the strength of thy youth! age is dark and unlovely; it is like the glimmering light of the moon, when it shines through broken clouds, and the mist is on the hills, the howling blast of the north is on the plain, the traveller shrinks in the midst of his journey."

9 The dejection attending blindness accounted for.

Thus dependent on every creature, and passive to every accident, can the world, the uncharitable world, be surprised to observe moments when the *blind* are at variance with themselves and every thing else around them? With the same instincts of self-preservation, the same irascible passions which are common to the species, and exasperated by a sense of debility either for retaliation or defence; can the blind be real objects of resentment or contempt, even when they seem peevish or vindictive? This, however, is not always their character. Their behaviour is often highly expressive, not only of resignation, but even of cheerfulness; and though they are often coldly, and even inhumanly, treated by men, yet they are rarely, if ever, forsaken of heaven. The common Parent of nature, whose benignity is permanent as his existence and boundless as his empire, has neither left his afflicted creatures without consolation or resource.

10 Some advantages peculiar to the blind.

Even from their loss, however oppressive and irretrievable, they derive advantages; not indeed adequate to recompense, but sufficient to alleviate, their misery. The attention of the soul, confined to these avenues of perception which she can command, is neither dissipated nor confounded by the immense multiplicity nor the rapid succession of surrounding objects. Hence her contemplations are more uniformly fixed upon herself, and the revolutions of her own internal frame. Hence her perceptions of such external things as are contiguous and obvious to her observation become more lively and exquisite. Hence even her instruments of corporeal sensation are more assiduously cultivated and improved, so that from them she derives such notices and presages of approaching pleasure or impending danger as entirely escape the attention of those who depend for security on the reports of their eyes. A blind man, when walking swiftly, or running, is kindly and effectually checked by nature from rudely encountering such hard and extended objects as might hurt or bruise him. When he approaches bodies of this kind, he feels the atmosphere more sensibly resist his progress; and in proportion as his motion is accelerated, or his distance from the object diminished, the resistance is increased. He distinguishes the approach of his friend from far by the sound of his steps, by his manner of breathing, and almost by every audible token which he can exhibit. Prepared for the dangers which he may encounter from the surface of the ground upon which he walks, his step is habitually firm and cautious. Hence he not only avoids those falls which might be occasioned by its less formidable inequalities, but from its general bias he collects some ideas how far his safety is immediately concerned; and though these conjectures may be sometimes fallacious, yet they are generally so true, as to preserve him from such accidents as are not incurred by his own temerity. The rapid torrent and the deep cascade not only warn him to keep a proper distance, but inform him in what direction he moves, and are a kind of audible cynosures to regulate his course. In places to which he has been accustomed, he as it were recognizes his latitude and longitude from every breath of varied fragrance that tinges the gale, from every ascent or declivity in the road, from every natural or artificial sound that strikes his ear; if these indications be stationary, and confined to particular places. Regulated by these signs, the *blind* have not only been known to perform long journeys themselves, but to conduct others through dangerous paths at the dark and silent hour of midnight, with the utmost security and exactness (A).

It

(A) We have read, in authors of good credit, of a very surprising blind guide who used to conduct the merchants through the sands and deserts of Arabia. Vide *Leo Afric.* Descr. Afr. lib. vi. p. 246. and *Casaub.* Treat. of Enthus. c. ii. p. 45.

An instance no less marvellous exists at this present time, 1788, and in our own country. "John Metcalf, a native of the neighbourhood of Manchester, where he is well known, became blind at a very early age, so as to be entirely unconscious of light and its various effects. This man passed the younger part of his life as a waggoner, and occasionally as a guide in intricate roads during the night or when the tracks were covered with snow. Strange as this may appear to those who can see, the employment he has since undertaken is still more extraordinary: it is one of the last to which we could suppose a blind man would ever turn his attention. His present occupation is that of a projector and surveyor of highways in difficult and mountainous parts. With the assistance only of a long staff, I have several times met this man traversing the roads, ascending precipices, exploring valleys, and investigating their several extents, forms, and situations, so as to answer his designs in the best manner. The plans which he designs, and the estimates he makes, are done in a method peculiar to himself; and which he cannot well convey the meaning of to others. His abilities in this respect are nevertheless so great, that he finds constant employment. Most of the roads over the Peak in Derbyshire have been altered by his directions; particularly those in the vicinity of Buxton: and he is at this time constructing a new one betwixt Wilmslow and Congleton, with a view to open a communication to the great London road, without being

11 Whether the blind are able to distinguish colours.

It were endless to recapitulate the various mechanical operations of which they are capable, by their nicety and accuracy of touch. In some the tactile powers are said to have been so highly improved, as to perceive that texture and disposition of coloured surfaces by which some rays of light are reflected and others absorbed, and in this manner to distinguish colours. But the testimonies for this fact still appear to us too vague and general to deserve public credit. We have known a person who lost the use of his sight at an early period of infancy, who in the vivacity or delicacy of his sensations was not perhaps inferior to any one, and who had often heard of others in his own situation capable of distinguishing colours by touch with the utmost exactness and promptitude. Stimulated, therefore, partly by curiosity to acquire a new train of ideas, if that acquisition were possible; but still more by incredulity with respect to the facts related; he tried repeated experiments, by touching the surfaces of different bodies, and examining whether any such diversities could be found in them as might enable him to distinguish colours: but no such diversity could he ever ascertain. Sometimes, indeed, he imagined that objects which had no colour, or, in other words, such as were black, were somewhat different and peculiar in their surfaces; but this experiment did not always nor universally hold. His scepticism therefore still continues to prevail (B). That their acoustic perceptions are distinct and accurate, we may fairly conclude from the rapidity with which they ascertain the acuteness or gravity of different tones, as relative one to another: and from their exact discernment of the various kinds and modifications of sound, and of sonorous objects, if the sounds themselves be in any degree significant of their causes. From this vivacity and accuracy of external sensation, and from the assiduous and vigorous application of a comprehensive and attentive mind alone, we are able to account for the rapid and astonishing progress which some of them have made, not only in those departments of literature which were most obvious to their senses and accessible to their understandings, but even in the abstractest, and (if we may be allowed the expression) in the most occult sciences.

12 Instances how far they are susceptible of abstract learning.

What, for instance, can be more remote from the conceptions of a blind man than the abstract relations and properties of space and quantity? yet the incomprehensible attainments of Dr Saunderson in all the branches of mathematics are now fully known and firmly believed by the whole literary world, both from the testimony of his pupils and the publication of his works. But should the fact be still uncertain, it might be sufficiently verified by a living prodigy of this kind with which our country is at present honoured. The gentleman of whom we now speak, though blind from his infancy, by the ardour and assiduity of his application, and by the force of a genius to which nothing is impenetrable, has not only made incredible advances in mechanical operations, in music, and in the languages; but is likewise profoundly skilled in geometry, in optics, in algebra, in astronomy, in chemistry, and in all the other branches of natural philosophy as taught by Newton and received by an admiring world. We are sorry that neither the modesty of this amiable philosopher, nor the limits of this article, will permit us to delineate his character in its full proportions: All we can do is to exhibit his example, that by it the vulgar prejudice, which presumes to think blindness and learning incompatible, may be dissipated; and that an instance of success so noble and recent may inflame the emulation and encourage the efforts of such as have genius and opportunity to pursue the same laudable path (C). If these glorious attempts should neither be perceived

---

ing obliged to pass over the mountains." Account by Dr Bew, published in the Transactions of the Manchester Society, vol. i.

(B) See, however, the extraordinary case subjoined to this article.

(C) As particular anecdotes of this astonishing genius have been, since a former edition of the Encyclopædia, delivered to the Manchester Society, by G. Bew, M. D. and afterwards published, we shall here take the liberty to transcribe them from the original volume in which they are inserted, as this freedom is authorized by a letter from Dr Bew's own hand.

"Dr Henry Moyes, who occasionally read Lectures on Philosophical Chemistry at Manchester, like Dr Saunderson, the celebrated professor of Cambridge, lost his sight by the small pox in his early infancy. He never recollected to have seen: 'but the first traces of memory I have (says he), are in some confused ideas of the solar system.' He had the good fortune to be born in a country where learning of every kind is highly cultivated, and to be brought up in a family devoted to learning.

"Possessed of native genius, and ardent in his application, he made rapid advances in various departments of erudition; and not only acquired the fundamental principles of mechanics, music, and the languages, but likewise entered deeply into the investigation of the profounder sciences, and displayed an acute and general knowledge of geometry, optics, algebra, astronomy, chemistry, and in short of most of the branches of the Newtonian philosophy.

"Mechanical exercises were the favourite employment of his infant years. At a very early age he made himself acquainted with the use of edged tools so perfectly, that notwithstanding his entire blindness, he was able to make little windmills; and he even constructed a loom with his own hands, which still show the cicatrices of wounds he received in the execution of these juvenile exploits.

"By a most agreeable intimacy and frequent intercourse which I enjoyed with this accomplished blind gentleman, whilst he resided in Manchester, I had an opportunity of repeatedly observing the peculiar manner in which he arranged his ideas and acquired his information. Whenever he was introduced into company, I remarked that he continued some time silent. The sound directed him to judge of the dimensions of the room, and the different voices of the number of persons that were present. His distinction in these respects was very accurate:

perceived nor rewarded by an unfeeling world, if human nature should forget to recognize its own excellence so nobly displayed in instances of this kind; yet besides the enjoyments resulting from a sublime and comprehensive understanding, besides the immortal and inexhaustible sources of delight, which are the peculiar portion of a self-approving mind, these happy pupils and favourites of Nature are as it were indulged with her personal intercourse. They become more intimately acquainted with her laws, till by exploring the beneficence of her economy, the sublimity of her ends, the regularity of her procedure, and the beauties of her frame, they imbibe the spirit, and feel the presence of her glorious Author:

By swift degrees the love of nature works,
And warms the bosom; till at last, sublim'd
To rapture and enthusiastic heat,
We feel the present deity, and taste
The joy of God to see a happy world.

THOMSON.

13
Accounts of the effects of recovered sight upon those who have been born blind uncertain.

Much labour has been bestowed to investigate, both from reason *à priori* and from experiment, what might be the primary effects of light and luminous objects upon such as have been born blind, or early deprived of sight, if at a maturer period they should instantaneously recover their visual powers. But upon this topic there is much reason to fear, that nothing satisfactory has yet been said. The fallacy of hypothesis and conjecture, when formed *à priori* with respect to any organ of corporeal sensation and its proper object, is too obvious to demand illustration. But from the nature of the eye, and the medium of its perception, to attempt an investigation of the various and multiform phenomena of vision, or even of the varieties of which every particular phenomenon is susceptible according as the circumstances of its appearance are diversified, would be a project worthy of philosophy in a delirium. Nay, even the discoveries which are said to accrue from experiment, may still be held as extremely doubtful and suspicious; because in these experiments it does not appear to have been ascertained, that the organs to which visible objects were presented immediately after chirurgical operations, could be in a proper state to perceive them. Yet, after all, it is extremely probable, that figure, distance, and magnitude, are not immediate objects of ocular sensation, but acquired and adjusted by long and reiterated experience (D). There are, however, many desiderata, which the perceptions of a man born blind might considerably illustrate, if his instruments of vision were in a right state, and assisted by a proper medium. Such a person might perhaps give a clearer account, why objects, whose pictures are inverted upon the retina of the eye, should appear to the mind in their real positions; or why, though each particular object is painted upon the retina of both our eyes, it should only be perceived as single. Perhaps, too, this new spectator of visible nature might equally amuse our curiosity and improve our theory, by attempting to describe his earliest sensations of colour, and its original effects upon his organ and his fancy. But, as we have already hinted, it is far from being certain, that trials of this kind have ever been fairly made. Such readers as may wish to see a more minute detail of these questions, may consult M. Diderot's *Lettre sur les aveugles, a l'usage de ceux qui voyent*: Works, vol. ii.

Diderot's Works, vol. ii.

---

accurate; and his memory so retentive, that he seldom was mistaken. I have known him instantly recognize a person, on first hearing him speak, though more than two years had elapsed since the time of their last meeting. He determined pretty nearly the stature of those he was speaking with by the direction of their voices: and he made tolerable conjectures respecting their tempers and disposition, by the manner in which they conducted their conversation.

"It must be observed, that this gentleman's eyes were not totally insensible to intense light. The rays refracted through a prism, when sufficiently vivid, produced certain distinguishable effects upon them. The red gave him a disagreeable sensation, which he compared to the touch of a saw. As the colours declined in violence, the harshness lessened, until the green afforded a sensation that was highly pleasing to him, and which he described as conveying an idea similar to what he felt in running his hand over a smooth polished surface. Polished surfaces, meandering streams, and gentle declivities, were the figures by which he expressed his ideas of beauty: Rugged rocks, irregular points, and boisterous elements, furnished him with expressions for terror and disgust. He excelled in the charms of conversation; was happy in his allusions to visual objects; and discoursed on the nature, composition, and beauty of colours, with pertinence and precision.

"Doctor Moyes was a striking instance of the power the human soul possesses of finding resources of satisfaction, even under the most rigorous calamities. Though involved 'in ever-during darkness,' and excluded from the charming views of silent or animated nature; though dependent on an undertaking for the means of his subsistence, the success of which was very precarious; in short, though destitute of other support than his genius, and under the mercenary protection of a person whose integrity he suspected, still Dr Moyes was generally cheerful, and apparently happy. Indeed it must afford much pleasure to the feeling heart to observe this hilarity of temper prevail almost universally with the blind. Though cut off from the ways of men, and the contemplation of the human face divine, they have this consolation; they are exempt from the discernment and contagious influence of those painful emotions of the soul that are visible on the countenance, and which hypocrisy itself can scarcely conceal. This disposition likewise may be considered as an internal evidence of the native worth of the human mind, that thus supports its dignity and cheerfulness under one of the severest misfortunes that can possibly befal us."

(D) The gentleman couched by Mr Cheselden had no idea of distance; but thought that all the objects he saw, touched his eyes, as what he felt did his skin. It was a considerable time before he could remember which was the cat and which the dog, though often informed, without first feeling them.

Blind.

voyent: "A letter concerning the blind for the use of those who see." To these may be added, *Mr Cheselden's Anatomy*, and *Locke's Essay on the Human Understanding*.

When we ruminate on the numberless advantages derived from the use of sight, and its immense importance, in extending the human capacity, or in improving and cultivating every faculty and every function of the mind, we might be strongly tempted to doubt the fidelity of those reports which we have heard concerning such persons as, without the assistance of light, have arrived at high degrees of eminence even in those sciences which appear absolutely unattainable but by the interposition of external mediums. It has, however, been demonstrated by a late ingenious author, that *blind* men, by proper instruction, are susceptible almost of every idea, and of every truth which can be impressed on the mind by the mediation of light and colours, except the sensations of light and colours themselves †.

† See Dr *Reid's Inquiry into the Human Mind*, chap. vi. § 1, 2.

14 How the blind catch the enthusiasm inspired by visual perceptions, a paradox.

Yet there is one phenomenon of this kind which seems to have escaped the attention of that great philosopher, and for which no author either of this or any former period has been able to offer any tolerable account. Still, however, it seems to merit the attention of a philosopher. For though we should admit, that the blind can understand with great perspicuity all the phenomena of light and colours; though it were allowed, that in these subjects they might extend their speculations beyond their instructions, and investigate the mechanical principles of optics by the mere force of genius and application, from the data which they had already obtained; yet it will be difficult, if not impossible, to assign any reason why these objects should be more interesting to a blind man than any other abstract truths whatever. It is possible for the blind, by a retentive memory, to tell you, That the sky is an azure; that the sun, moon, and stars, are bright; and the rose is red, the lily white or yellow, and the tulip variegated. By continually hearing these substantives and adjectives joined, he may be mechanically taught to join them in the same manner; but as he never had any sensation of colour, however accurately he may speak of coloured objects, his language must be like that of a parrot; without meaning, or without ideas. Homer, Milton, and Ossian, had been long acquainted with the visible world before they were surrounded with clouds and ever-during darkness. They might, therefore, still retain the warm and pleasing impressions of what they had seen. Their descriptions might be animated with all the rapture and enthusiasm which originally fired their bosoms, when the grand or delightful objects which they delineated were immediately beheld. Nay, that enthusiasm might still be heightened by a bitter sense of their loss, and by that regret which a situation so dismal might naturally inspire. But how shall we account for the same energy, the same transport of description, exhibited by those on whose minds visible objects were either never impressed, or have been entirely obliterated? Yet, however unaccountable this fact may appear, it is no less certain than extraordinary. But delicacy and other particular circumstances forbid us to enter into this disquisition with that minuteness and precision which it requires. We only mention the fact as one amongst the few resources for entertainment, and avenues to reputation, which are still reserved for the *blind*. Whoever thinks the subject of sufficient consequence to merit a nicer scrutiny, may consult the *Preface to Blacklock's Poems*, written by G. G. Esq. and printed at Edinburgh 1754, or the account of his life and writings by the Rev. Mr Spence, prefixed to a quarto edition of his poems published at London in 1756.

It is hoped, however, that we shall not be suspected of partiality for inserting a character of the same author by one who was a foreigner, a stranger to his person, and prepossessed in his favour by his works alone.

"Blacklock will appear to posterity a fabulous character: even now he is a prodigy. It will be thought a fiction and a paradox, that a man quite blind since he was three years old (E), besides having made himself so good a master of various languages, of Greek, Latin, Italian, and French, should also be a great poet in his own; and without hardly ever having seen the light, should be so remarkably happy in description ‡."

‡ *Carlo Denina Discorso de la Litteratura*, chap. xi.

15 Of the education of the blind.

It is impossible to enter into a detail of particulars with respect to the education of the blind. These must be left to be determined by the genius, the capacity, the circumstances, of those to whom the general rules which may be given should be applied. Much, therefore, must depend on their fortunes, much on their temper and genius; for, unless these particulars were known, every answer which could be given to questions of this kind must be extremely general, and of consequence extremely superficial. Besides, the task is so much more arduous, because whoever attempts it can expect to derive no assistance from those who have written on education before him: And though the blind have excelled in more than one science; yet, except in the case of Saunderson, professor of mathematics in the university of Cambridge, concerning whom we shall afterwards have occasion to speak, it does not appear, that any of them have been conducted to that degree of eminence at which they arrived, upon a premeditated plan. One should rather imagine, that they have been led through the general course and ordinary forms of discipline; and that, if any circumstances were favourable to their genius, they rather proceeded from accident than design.

This fact, if not supported by irrefragable evidence, should, for the honour of human nature, have been suppressed. When contemplated by a man of benevolence and understanding, it is not easy to guess whether his mortification or astonishment would be most sensibly felt. If a heart that glows with real philanthropy must feel for the whole vital creation, and become, in some measure, the *sensorium* of every suffering insect or reptile; how must our sympathy increase in tenderness and force, when the distressed individuals of our own species become its objects? Nor do the blind bear so small

(E) The author is here mistaken: Dr Blacklock only saw the light for five months.

Digitized by Google

small a proportion to the whole community, as even in a political view, to be neglected. But in this, as in every other political crime, the punishment returns upon the society in which it is committed. Those abandoned and unimproved beings, who, under the influence of proper culture and discipline, might have successfully concurred in producing and augmenting the general welfare, become the nuisances and burdens of those very societies who have neglected them.

16 Why the blind deserve, and how they may repay public sympathy.

There is perhaps no rank of beings in the sensible universe, who have suffered from nature or accident, more meritorious of public compassion, or better qualified to repay its generous exertions, than the blind. They are meritorious of compassion; for their sphere of action and observation is infinitely more limited than that of the deaf, the lame, or of those who labour under any other corporeal infirmity consistent with health. They are better qualified to repay any friendly interposition for their happiness; because, free from the distraction which attends that multiplicity of objects and pursuits that are continually obvious to the sight, they are more attentive to their own internal economy, to the particular notices of good and evil impressed on their hearts, and to that peculiar province in which they are circumscribed by the nature and cultivation of their powers.

17 Proper employments for the blind.

It will easily occur to the reader, that, if the pupil should not be placed in easy circumstances, music is his readiest and most probable resource. Civil and ecclesiastical employments have either something in their own nature, or in the invincible prejudices of mankind, which renders them almost entirely inaccessible to those who have lost the use of sight. No liberal and cultivated mind can entertain the least hesitation in concluding, that there is nothing, either in the nature of things, or even in the positive institutions of genuine religion, repugnant to the idea of a blind clergyman. But the novelty of the pheuomenon, while it astonishes vulgar and contracted understandings, inflames their zeal to rage and madness. Besides, the adventitious trappings and ceremonies assumed by some churches as the drapery of religion, would, according to these systems, render the sacerdotal office painful, if not impracticable, to the blind.

We have, some years ago, read of a blind gentleman *, descended from the same family with the celebrated lord Verulam, who, in the city of Brussels, was with high approbation created doctor of laws; since that period we have been honoured with his correspondence. He was deprived of sight at nine years of age by an arrow from a cross bow whilst he was attempting to shoot it. When he had recovered his health, which had suffered by the shock, he pursued the same plan of education in which he had been engaged; and having heard that one Nicasius de Vourde, born blind, who lived towards the end of the 15th century, after having distinguished himself by his studies in the university of Louvain, took his degree as doctor of divinity in the university of Cologne; this motive prevailed with him to make the same attempt. But the public, cursed with prejudices for which the meanest sensitive nature might blush, prejudices equally beneath the brutality and ignorance of the lowest animal instinct, treated his intention with ridicule: even the professors were not far from being of that sentiment; and they admitted him into their schools, rather from an impression, that it might amuse him, than become of any use to him. He had the good fortune, however, contrary to their expectations, to obtain the first places among his condisciples. It was then said, that such rapid advances might be made in the preliminary branches of his education; but would soon be effectually checked by studies of a more profound and abstracted nature. This, it seems, was repeated from school to school, through the whole climax of his pursuits; and when, in the course of academical learning, it became necessary to study poetry, it was the general voice that all was over, and that at length he had reached his *ne plus ultra*. But here he likewise confronted their prepossessions, and taught them the immense difference between blindness of body and blindness of soul. After continuing his studies in learning and philosophy for two years more, he applied himself to law, took his degree in that science, commenced pleading counsellor or advocate in the council of Brabant, and has had the pleasure of terminating almost every suit in which he has been engaged to the satisfaction of his clients.

* *Dr Nicholas Bacon.*

18 Law difficult, tho' not impossible, for the blind.

Had it not been for a fact so striking and so well authenticated, though there could have been no doubt that a blind man might discharge the office of a chamber-counsel with success; yet as a barrister, his difficulties must have appeared more formidable, if not absolutely insuperable. For he should remember all the sources, whether in natural equity or positive institutions, whether in common or statutory law, from whence his argument ought to be drawn. He must be able to specify, and to arrange in their proper order, all the material objections of his antagonists: these he must likewise answer as they were proposed, *extempore*.

When, therefore, it is considered how difficult it is to temper the natural association of memory with the artificial arrangements of judgment, the desultory flights of imagination with the calm and regular deductions of reason, the energy and perturbation of passion with the coolness and tranquillity of deliberation; some idea may be formed of the arduous task which every blind man must atchieve, who undertakes to pursue the law as a profession. Perhaps assistances might be drawn from Cicero's treatise on Topics and on Invention; which, if happily applied and improved, might lessen the disparity of a blind man to others, but could scarcely place him on an equal footing with his brethren. And it ought to be fixed as an inviolable maxim, that no blind man ought ever to engage in any province in which it is not in his power to excel. This may at first sight appear paradoxical; but it is easily explained. 19

The blind naturally subject to despondency, should be stimulated by the prospect of attainable excellence.

For the consciousness of the obvious advantages possessed by others, habitually predisposes a blind man to despondency: and if he ever gives way to despair (which he will be too apt to do when pursuing any acquisitions when others have a better chance of success than himself), adieu, for ever adieu, to all proficiency. His soul sinks into irretrievable depression; his abortive attempts incessantly prey upon his spirit; and he not only loses that vigour and elasticity of mind which are necessary to carry him through life, but that patience and serenity which alone can qualify him to enjoy it.

In this recapitulation of the learned professions, we have

20 Physic perhaps impracticable to the blind.

have intentionally omitted physic; because the obstacles which a blind man must encounter, whether in the theory or practice of that art, will be more easily conceived by our readers than described in detail. From this, therefore, let us pass to more general subjects.

It has been formerly hinted, that the blind were objects of compassion, because their sphere of action and observation was limited: and this is certainly true. For what is human existence, in its present state, if you deprive it of action and contemplation? Nothing *then* remains but the distinction which we derive from form or from sensitive and locomotive powers. But for these, unless directed to happier ends by superior faculties, few rational beings would, in our opinion, be grateful. The most important view, therefore, which we can entertain in the education of a person deprived of sight, is to redress as effectually as possible the natural disadvantages with which he is encumbered; or, in other words, to enlarge as far as possible the sphere of his knowledge and activity. This can only be done by the improvement of his intellectual, imaginative, or mechanical, powers; and which of these ought to be most assiduously cultivated, the genius of every individual alone can determine.

21 Too much often expected from the blind.

Were men to judge of things by their intrinsic natures, less would be expected from the blind than others. But, by some pernicious and unaccountable prejudice, people generally hope to find them either possessed of preternatural talents, or more attentive to those which they have than others: For it was not Rochester's opinion alone,

> That if one sense should be suppress'd,
> It but retires into the rest.

Hence it unluckily happens, that blind men, who in common life are too often regarded as rareshows, when they do not gratify the extravagant expectations of their spectators, too frequently sink in the general opinion, and appear much less considerable and meritorious than they really are. This general diffidence of their power at once deprives them both of opportunity and spirit to exert themselves; and they descend, at last, to that degree of insignificance in which the public estimate has fixed them.

22 The elements of education for the blind should neither be too difficult nor too easy.

From the original dawning, therefore, of reason and spirit, the parents and tutors of the blind ought to inculcate this maxim, That it is their indispensable duty to excel, and that it is absolutely in their power to attain a high degree of eminence. To impress this notion on their minds, the first objects presented to their observation, and the first methods of improvement applied to their understanding, ought, with no great difficulty, to be comprehensible by those internal powers and external senses which they possess. Not that improvement should be rendered quite easy to them, if such a plan were possible: For all difficulties, which are not really or apparently insuperable, heighten the charms and enhance the value of those acquisitions which they seem to retard.

23 The powers of action possessed by the blind should never be superseded.

But care should be taken that these difficulties be not magnified or exaggerated by imagination; for it has before been mentioned, that the blind have a painful sense of their own incapacity, and consequently a strong propensity to despair continually awake in their minds. For this reason, parents and relations ought never to be too ready in offering their assistance to the blind in any office which they can perform, or in any acquisition which they can procure for themselves, whether they are prompted by amusement or necessity. Let a blind boy be permitted to walk through the neighbourhood without a guide, not only though he should run some hazard, but even though he should suffer some pain.

If he has a mechanical turn, let him not be denied the use of edge-tools; for it is better that he should lose a little blood, or even break a bone, than be perpetually confined to the same place, debilitated in his frame, and depressed in his mind. Such a being can have no employment but to feel his own weakness, and become his own tormentor; or to transfer to others all the malignity and peevishness arising from the natural, adventitious, or imaginary evils which he feels. Scars, fractures, and dislocations in his body, are trivial misfortunes compared with imbecility, timidity, or fretfulness of mind. Besides the sensible and dreadful effects which inactivity must have in relaxing the nerves, and consequently in depressing the spirits, nothing can be more productive of jealousy, envy, peevishness, and every passion that corrodes the soul to agony, than a painful impression of dependence on others, and of our insufficiency for our own happiness. This impression, which, even in his most improved state, will be too deeply felt by every blind man, is redoubled by that utter incapacity of action which must result from the officious humanity of those who would anticipate or supply all his wants, who would prevent all his motions, who would do or procure every thing for him without his own interposition. It is the course of nature, that blind people, as well as others, should survive their parents; or, it may happen, that they should likewise survive those who, by the ties of blood and nature, are more immediately interested in their happiness than the rest of mankind. When, therefore, they fall into the hands of the world in general, such exigencies as they themselves cannot redress will be but coldly and languidly supplied by others. Their expectations will be high and frequent, their disappointments many and sensible; their petitions will often be refused, seldom fully gratified; and, even when granted, the concession will be so ungraceful, as to render its want infinitely more tolerable than its fruition. For all these reasons, we repeat it once more (because it can never be too frequently reiterated), that, in the formation of a blind man, it is infinitely better to direct than to supersede his own exertions. From the time that he can move and feel, let him be taught to supply his own exigencies; to dress and feed himself; to run from place to place, either for exercise, or in pursuit of his own toys or necessaries.

In these excursions, however, it will be highly proper for his parent or tutor to superintend his motions at a distance, without seeming to watch over him. A vigilance too apparent, may impress him with a notion that malignity or some other selfish motion may have produced it. When dangers are obvious and great, such as we incur by rivers, precipices, &c. those who are intrusted with the blind will find it neither necessary nor expedient to make their vigilance a secret. They ought then to acquaint their pupil, that they are present with him; and to interpose for his preservation, whenever his temerity renders it necessary. But objects of a nature less noxious which may give him some pain without any permanent injury or mutilation, may with design be thrown in this way: providing, however, that this design be always industriously concealed. For his own experience of their bad effects will be an infinitely more eloquent and sensible monitor, than the abstract and frigid counsels of any adviser whatever.

24 Exercises suitable to the blind. When the volatile season of puerile amusement is expired, and the impetuous hurry of animal-spirits subsides, through the whole demeanour of his pupil the tutor will probably observe a more sensible degree of timidity and precaution, and his activity will then require to be stimulated more than restrained. In this crisis, exercise will be found requisite, rather to preserve health, and facilitate the vital functions, than

25 Riding on horseback. merely for recreation. Of all the different kinds of exercise, riding, not in a machine, but on horseback, is by far the most eligible, and most productive of its end. On these occasions, however, care must be taken that the horses employed may neither be capricious nor unmanageable; for on the mansuetude of the creature which he rides, not only his safety, but his confidence, will entirely depend. In these expeditions, whether long or short, his companion or attendant ought constantly to be with him; and the horse should always either be taught implicitly to follow its guide, or be conducted by a leading rein besides the bridle which

26 Walking in all weathers that are tolerable. he himself holds. Next to this mode of exercise, is walking. If the constitution of the blind boy be tolerably robust, let him be taught to endure every vicissitude of weather which the human species can bear with impunity. For if he has been bred with too much delicacy, particular accidents may supersede all his former scruples, and subject him to the necessity of suffering what will not only be severe in its immediate sensation, but dangerous in its future consequences. Yet, when the cold is so intense, or the elements so tempestuous, as to render air and exercise abroad impracticable, there are methods of domestic exercise, which, though

27 Dumb-bells. not equally salutary, may still be eligible; such as dumb-bells, or the bath chair. The first of these are made of lead, consisting of a cylinder, the middle of which may either be rectilineal or arcuated for the conveniency of holding, and terminates at each end in a semiglobular mass. Their weight must be conformed to the strength and age of the person who uses them. The method of employing them is to take one in each hand, and swing them backwards and forwards over his head describing a figure somewhat like a parabola. This not only strengthens the arms, and opens the chest, but pro-

28 Bath-chair. motes the circulation of the fluids. The bath chair is a deal of 12 feet in length, as free from knots and as elastic as possible, supported by a fulcrum at each end, upon which may be placed two rolling cylinders to give it greater play; when seated upon this, by alternately depressing it with his own weight, and suffering it to return to its natural situation, he gives himself a motion, though not equal in its energy, yet somewhat resembling the trot of a horse. There are other elastic seats of the same kind constructed with steel springs, but one of this simple fabrication may answer the purpose.

The spring-deal here recommended by the author, was preferred, as being suitable to the blind in all spheres or conditions of life; but he has since been taught by experience, in a valetudinary state, that the elastic chair is of infinitely greater utility. It consists of three false bottoms, and one real, which is the basis of the whole. The lowest is by far the most extensive. The highest is stuffed to render it an easy seat, and covered with plush, baize, or duffle. Between each of the false bottoms, at either end, behind and before, are placed steel springs, fixed above and below to the boards; not with nails, but staples, and curved in a spiral or serpentine form, each consisting of seven spires or volumina. The volumina are formed in such a manner, that one of them can pass through another, and thus give the springs full play in rising or descending. The lowest bottom or basis of the whole is protended about four inches; which assists you to mount the seat with more facility, and serves as a support for your feet when you ride. This operation is performed by alternately depressing or raising yourself upon the seat, so that the springs yielding to your weight as you descend, and resisting as you rise, may give you a motion like that of the deal above described, but more violent, more rapid, and consequently more salutary. The whole frame of the seat is surrounded with leather, having different apertures to admit or reject the air occasioned by the motion. These general hints are sufficient to give any ingenious artisan an idea of the nature and structure of the machine, which he may alter or improve as conveniency shall dictate.

To these modes of domestic exercise may be added that of a swing, which is formed by a rope suspended from two screws, which ought to be strongly fixed, at proper distances, in the joists of a capacious chamber, with a board and a cushion for a seat, and cords fastened behind and before, lest the impetuosity of the motion should shake the patient out of his position. But this instrument of health is so often formed by children for their amusement, and depends so much upon the form and extent of the area where it vibrates, that a more minute detail of its nature and office would here be unnecessary.

His meals should be temperate, his diet light and 29 Diet.
of easy digestion. If the tone of his stomach be vigorous, vegetables should be preferred to animal food, particularly those vegetables which are most farinaceous and least acescent. Fermented liquors and ardent spirits should never be given him but to gratify the real demands of exhausted nature; for though they exhilarate the spirits, they at the same time corrode the vessels and relax the nerves; a misfortune doubly pernicious to sedentary life. The safest and most wholesome beverages are milk and water. If he should be tired with these, he may be indulged with the variety of chocolate, balm, sage, or ground ivy. Coffee may sometimes be taken with impunity; but tea should be interdicted with inflexible severity; for no vegetable juice under heaven is more noxious to sedentary people. Let him also, for similar reasons, be prohibited the use of tobacco in all its forms. In the observations of diet and exercise, let him neither be mechanically regular, nor entirely eccentric. In the one case, he will be a slave to habit, which may create some inconvenience; in the other, he will form no habits at all, which may still be productive of greater.

Blind.

30 Low spirits.

We have more than once hinted, during the course of this article, that the blind, as liable to all the inconveniences of sedentary life, are peculiarly subjected to that disorder which may be called *tædium vitæ* or low spirits. This indisposition may be said to comprehend in it all the other diseases and evils of human life; because, by its immediate influence on the mind, it aggravates the weight and bitterness of every calamity to which we are obnoxious. In a private letter, we have heard it described as a formidable precipice, in the regions of misery, between the awful gulfs of suicide on the one hand and phrenzy on the other; into either of which, a gentle breeze, according to the force of its impulse and the line of its direction, may irrecoverably plunge the unhappy victim; yet from both of which he may providentially escape. Though the shades of the metaphor may, perhaps, be unnaturally deepened, yet those who have felt the force of the malady will not fail to represent it by the most dreadful images which its own feelings can suggest. Parents and tutors therefore, if they have the least pretence to conscience or humanity, cannot be too careful in observing and obviating the first symptoms of this impending plague. If the limbs of your blind child or pupil be tremulous; if he is apt to start, and easily susceptible of surprise; if he finds it difficult to sleep; if his slumbers, when commenced, are frequently interrupted, and attended with perturbation; if his ordinary exercises appear to him more terrible and more insuperable than usual; if his appetite become languid and his digestion slow; if agreeable occurrences give him less pleasure, and adverse events more pain than they ought to inspire:—this is the crisis of vigorous interposition. The regimen and exercise above prescribed are the best preventives of this evil, and perhaps its best remedies when unhappily incurred. But if the symptoms should escape your attention till the patient is actually seized with the distemper, you may then, according to its depth and permanency, apply the cold bath, vitriolic acid, and Peruvian bark. Magnesia alba will, from time to time, be found useful to lenify the severe and corrosive acid, generated in the stomach; it is preferable to chalk, to crabs eyes, or any of the other absorbents, because of its laxative tendency. The tincture or infusion of wild valerian, pills of asafœtida, and white mustard-seed, are likewise prescribed. Care should be taken that the patient may never be suffered to remain costive, otherwise the function of digestion will be impeded. Gentle cathartics should therefore be administered; but with caution, that their operation may clear the bowels without weakening nature. Emetics may sometimes give the patient a temporary relief, by exerting and bracing the fibres of the stomach; but if used too frequently, they will have a contrary effect: previous to the use of bark, however, they should always be taken to prepare the vessel for its reception. The symptoms above enumerated would seem to indicate the origin of the distemper from extreme weakness or relaxation of nerves: that relaxation may be caused by severe and intemperate thought; by supine indolence; by excessive or habitual drinking; and above all, by venereal gratifications prematurely and frequently indulged, by which the approaches of this evil are accelerated, its continuance insured, and its poignancy augmented. Parents and tutors, therefore, as they value the welfare of their charge, and would answer to God for their conduct, should be scrupulously careful to observe when any of these illegitimate propensities inflame the youthful mind, to check, or rather elude them; not so much by severe reprehension and solemn interdict, as by endeavouring to preoccupy the soul, and engage the attention with other favourite amusements. Against every act of arbitrary power, the mind strongly and naturally revolts. She should therefore be rather allured to wisdom and virtue, by rational motives and gentle methods, than by cruel menaces and stern commands. Those who are afflicted with low spirits may be said to be doubly unfortunate; for they have not only their own internal sufferings to sustain, but the contempt and ridicule of a thoughtless and unfeeling world, by whom their complaints are thought to be imaginary, and their depression affected. Should the sarcastic or sceptical reader apologize for his want of humanity, by asking in what these internal sufferings consist, it will be easy to give him a clear and solid answer: They arise from a severe and acute feeling of nature's incapacity to discharge the vital functions with tolerable ease; from the sharp and constant irritation inflicted on the stomach and lower intestines by every thing not sweet or insipid that passes through them; and from a degree of sensibility too exquisite for the precarious and fluctuating state of our nature: these are the vindictive, inexorable demons that arm every thought with the stings of scorpions, and render the sense of existence itself insupportable. We have heard of hypochondriacs who thought themselves made of glass; and of others who believed their persons grown to a size so enormous, that they could not enter into any door: but it has never been our fortune to be personally acquainted with any of these fantastics. Those with whom we have conversed were rather inclined to exaggerate real, than to create imaginary, evils; rather to anticipate gloomy possibilities, than to dwell upon improbable or chimerical catastrophes: the tender parent, therefore, or the faithful guardian, will beware of treating them with neglect or levity. He will suit his conversation, as much as possible, to the present tone of their feelings; he will avoid all innovations in their management, except such as are absolutely necessary for their cure.

Be careful never to reason or expostulate with your patient on the nature of his malady. Tell him not that his uneasy feelings, far from being real, are the fictitious impositions of a depraved fancy. His disagreeable sensations will be more than sufficient to demonstrate the falsehood of your assertions: thus your argumentative and persuasive powers will not only be exerted in vain, but may considerably retard, if not finally prevent, his recovery; and may leave such indelible prepossessions against you, in his mind, as no length of time, no vicissitudes of life, will ever be able to efface. Opium has also been recommended; but, excepting desperate cases, it will be found a fallacious and dangerous remedy:—fallacious, because the ease it gives is only temporary, and infallibly succeeded by sharper paroxysms:—dangerous, because it may be rendered habitual, and subject the patient to unmixed torment when omitted. Though we have already inculcated a regimen and exercise which appeared proper

per for the blind in general, and not incompatible with peculiar situations, it still seems necessary to add a few results of painful experience upon these subjects, as being particularly conducive to the present ease and future amendment of such as labour under the diseases now in question. And first, let it be observed, that animal food is their proper nutriment, as being of easiest digestion; better too, if well done upon the spit or gridiron: for instead of being allowed to imbibe adventitious fluids, it should be as much as possible drained of its own; neither should it be too fat: beef, mutton, or fowls arrived at maturity, give the stomach least labour; veal, lamb, chickens, and every other kind of young meat, answer the purposes of nature with more difficulty, as the parts are not only too succulent, but prevented by their softness and lubricity from acting forcibly one upon another to facilitate the efforts of the stomach in digestion. Of all vegetable substances, white bread is perhaps the only ingredient which they can eat with the greatest impunity; and even this would still be safer were the paste formed with as little water as possible, and prepared without fermentation. Whether eggs are vegetable or animal substances, let physicians determine; but this we know, that by people in low spirits they may be eaten, even at supper, with great impunity. Every other herb or root is not only extremely flatulent, but productive of that sharp and intense acid for which we have formerly prescribed magnesia as the best remedy. Patients of this description should rather be frequent than liberal in their meals, and scrupulously careful of all heterogeneous mixture. Their most eligible beverage except simple water, if they can afford it, is port-wine, as being least convertible into that poignant fluid: porter likewise, if not stale, may, by its strength and bitterness, assist the action of the stomach. Neither of these fermented liquors should be taken in large quantities at once: let the clamours of nature be satisfied, and no more; for if the spirits are unnaturally elated, they will be certain to sink proportionably when the stimulus ceases to operate. The moderate use of genuine rum or brandy, properly diluted, when the other liquors cannot be had, may be productive of good effects, but should never be used at or near natural periods of repose; because, even when diluted, they occasion a febricity or pyrexia, incompatible with sound and refreshing sleep. Care should likewise be taken that the patient may never be too much warmed, either by clothes or exercise, especially when in bed. Exertions of body, particularly in the open air, are indispensably necessary for promoting digestion and acquiring strength; but should never be carried to fatigue. The mind should likewise be diverted from attention to itself and its disorder, by reading and conversation. But there is an uncommon degree of discernment and delicacy requisite in the topics, that they may neither be too cheerful nor too serious, for the state of the mind, when they are applied. Neither let these injunctions be esteemed trivial: such little attentions, uniformly and tenderly exerted for their satisfaction, will contribute in no small degree to their present tranquillity, and of consequence to their future restoration. We have thought it necessary to expatiate thus far, on a subject gloomy and forbidding in itself, but of sufficient importance to demand particular attention; and, besides, what we have said may not only be useful to the blind in particular, but applicable to all those who labour under the same depression. It only remains to add, that the order, the periods, and the quantities, in which the remedies above enumerated should be applied, must be determined by wisdom and experience, or regulated by the advice of a skilful and vigilant physician. We are sorry that truth obliges us to acknowledge, that we have found the faculty less intelligent in this disease, and less attentive to its various aspects, than could be wished, or than its malignity requires.

31 Natural curiosity to be gratified when possible; when otherwise, a reason to be given.

The natural curiosity of children renders them extremely and indefatigably inquisitive. This disposition is often peculiarly prevalent in the blind. Parents and tutors, therefore, should gratify it whenever their answers can be intelligible to the pupil; when it is otherwise, let them candidly confess the impossibility or impropriety of answering his questions. At this period, if their hearts be tender and their powers inventive, they may render his amusements the vehicles, and his toys the instruments, of improvement: why, for instance, may not the centrifugal and centripetal forces be illustrated from the motion of a top, or the nature and power of elasticity by the rebound of a ball? These hints may lead to others, which, if happily improved and applied, may wonderfully facilitate the progress of knowledge. Nor will the violence of exercise, and the tumult of play, be productive of such perils and accidents as may be apprehended.

For the encouragement of such parents as choose to take these advices with regard to exercise, let us inform them, that though, till the age of twenty, some blind persons were on most occasions permitted to walk, to run, to play at large, they have yet escaped without any corporeal injury from these excursions.

32 The blind not to be indulged in promiscuous company.

Parents of middle, or of higher rank, who are so unfortunate as to have blind children, ought, by all possible means, to keep them out of vulgar company. The herd of mankind have a wanton malignity, which eternally impels them to impose upon the blind, and to enjoy the painful situation in which these impositions place them. This is a stricture upon the humanity of our species, which nothing but the love of truth and the dictates of benevolence could have extorted from us. But we (F) have known some who have suffered so much from this diabolical mirth in their own persons, that it is natural for us, by all the means in our power, to prevent others from becoming its victims.

Blind people have infinitely more to fear from the levity and ignorance, than from the selfishness and ill-nature, of mankind. In serious and important negociations, pride and compassion suspend the efforts of knavery or spleen; and that very infirmity, which so frequently renders the blind defenceless to the arts of the

(F) The author of these observations, though he chooses to express himself in this manner, is blind.

Digitized by Google

the insidious, or to the attempts of malice, is a powerful incentive to pity, which is capable of disarming fury itself. Villany, which frequently piques itself more upon the arts by which it prevails, than upon the advantages which it obtains, may often with contempt reject the blind, as subjects beneath the dignity of its operation; but the ill-natured buffoon considers the most malicious effects of his merriment as a mere jest, without reflecting on the shame or indignation which they inspire when inflicted on a sensible temper.

33 They must not be permitted to hear marvellous and frightful tales.

But vulgar credulity and ignorance are no less dangerous to those who want sight, than the false and mechanical wit so universally practised in common life. We know, we sympathetically feel, the strong propensity of every illiterate mind, to relate or to believe whatever is marvellous and dreadful. These impressions, when early imbibed, can scarcely be eradicated by all the conspiring efforts of mature reason and confirmed experience. Those philosophers who have attempted to break the alliance between darkness and spectres, were certainly inspired by laudable motives. But they must give us leave to assert, that there is a natural and essential connection betwixt night and *orcus*. Were we endued with senses to advertise us of every noxious object before its contiguity could render it formidable, our panics would probably be less frequent and sensible than we really feel them. Darkness and silence, therefore, have something dreadful in them, because they supersede the vigilance of those senses which give us the earliest notices of things. If you talk to a blind boy of invisible beings, let benevolence be an inseparable ingredient in their character. You may, if you please, tell him of departed spirits, anxious for the welfare of their surviving friends; of ministering angels, who descend with pleasure from heaven to execute the purposes of their Maker's benignity; you may even regale his imagination with the sportive gambols and innocent frolics of fairies; but let him hear as seldom as possible, even in stories which he knows to be fabulous, of vindictive ghosts, vindictive fiends, or avenging furies. They seize and pre-occupy every avenue of terror which is open in the soul; nor are they easily dispossessed. Sooner should we hope to exorcise a ghost, or appease a fury, than to obliterate their images in a warm and susceptible imagination, where they have been habitually impressed, and where these feelings cannot be dissipated by external phenomena.

34 The association between darkness and spectres founded in nature.

35 The method of dissipating the fears of the blind.

If horrors of this kind should agitate the heart of a blind boy, which may happen notwithstanding the most strenuous endeavours to prevent it, the stories which he has heard will be most effectually discredited by ridicule. This, however, must be cautiously applied, by gentle and delicate gradations. If he is inspired with terror by effects upon his senses, the causes of which he cannot investigate, indefatigable pains must be taken to explain these phenomena, and to confirm that explication, whenever it can be done, by the testimony of his own senses, and his own experience. The exertion of his locomotive and mechanical powers (the rights of which we have formerly endeavoured to assert) will sensibly contribute to dispel these terrors.

36 The invention of the blind may be assisted, but neither anticipated not checked.

His inventive faculties ought likewise to be indulged with the same freedom. The data which they explore may be presented in such a manner, as to render discoveries easy: but still let invention be allowed to cooperate. The internal triumph and exultation which the mind feels from the attainment and conviction of new truths heighten their charms, impress them deep on the memory, and give them an influence in practice of which they could not otherwise have boasted.

There are a sort of people in the world, whose views and education have been strictly confined to one province, and whose conversation is of consequence limited and technical. These, in literary intercourse, or fashionable life, are treated with universal contempt, and branded with the odious name of *mere men of business*. Nor is it any wonder that the conversation of such should prove nauseous and disgusting. It would be arrogance in them to expect, that indifferent persons should either enter into their private interests, or the peculiarities of their craft, with a warmth equal to their own. We have known the intrusion of such a person involve a numerous company in gloom, and terminate the freedom and vivacity of agreeable discourse in lazy yawning and discontented silence. Of all innocent characters, this ought to be avoided by the blind; because of all others, it is the character which they run the greatest hazard of adopting. The limitation of their powers naturally contracts their views and pursuits, and, as it were, concentrates their whole intellectual faculties in one, or at best in few objects. Care should therefore be taken to afford the mind a theatre for its exertions, as extensive as possible, without diverting it from one great end, which, in order to excel, it ought for ever to have in prospect.

37 The manners of the blind.

There are few sciences in which the blind have not distinguished themselves: even those whose acquisition seemed essentially to depend upon vision, have at last yielded to genius and industry, though deprived of that advantage. Mr Saunderson, whom we formerly mentioned, has left behind him the most striking evidences of astonishing proficiency in those retired and abstract branches of mathematics which appeared least accessible to persons of his infirmity. Sculpture (G) and painting are not, perhaps, the most practicable arts for a blind man: yet he is not excluded from the pleasing creation and extensive regions of fancy. However unaccountable it may appear to the abstract philosophers, yet nothing is more certain in fact, than that a blind man may, by the inspiration of the muses, or, to strip the figure of its mythological dress, may, by the efforts of a cultivated genius, exhibit in poetry the most natural images and animated descriptions, even of visible objects,

(G) Yet there are instances of persons who have been enabled to take the figure and idea of a face by the touch, and mould it in wax with the utmost exactness; as was the case of the blind sculptor mentioned by De Piles, who thus took the likeness of the duke de Bracciano in a dark cellar, and made a marble statue of King Charles I. with great elegance and justness. Vid. *De Piles* Cours de Peint. p. 329. and *Wolf.* Psychol. Rat. § 162.

Blind. jects, without either incurring or deserving the imputation of plagiarism.

In the sister art of music, there are, at present, living and noble instances how far the blind may proceed.

If we look into former periods, we shall find illustrious and pregnant examples, how amply nature has capacitated the blind to excel both in the scientific and practical departments of music. In the 16th century, when the progress of improvement both in melody and harmony was rapid and conspicuous, Franciscus Salinas was eminently distinguished. He was born A. D. 1513, at Burgos in Spain; and was son to the treasurer of that city. Though afflicted with incurable blindness, he was profoundly skilled both in the theory and practice of music. As a performer, he is celebrated by his cotemporaries with the highest encomiums. As a theorist, his book, if we may believe Sir John Hawkins, is equal in value to any now extant in any language. Though he was deprived of sight in his earliest infancy, he does not content himself to delineate the various phenomena in music, but the principles from whence they result, the relations of sound, the nature of arithmetical, geometrical, and harmonical ratios, which at that period were esteemed essential to the theory of music, with a degree of intelligence which would have deserved admiration though he had been in full possession of every sense requisite for these disquisitions. He was taken to Rome in the retinue of Petrus Sarmentus archbishop of Compostella; and having passed twenty years in Italy, he returned to Salamanca, where he obtained the professorship of music, an office at that time equally respectable and lucrative. Having discharged it with reputation and success for some time, he died at the venerable age of 77.

In the same period flourished Caspar Crumbhorn, blind from the third year of his age: yet he composed several pieces in many parts with so much success, and performed both upon the flute and violin so exquisitely, that he was distinguished by Augustus elector of Saxony. But preferring his native Silesia to every other country, he returned thither, and was appointed organist of the church of St Peter and Paul in the city of Lignitz, where he likewise had often the direction of the musical college, and died June 11. 1621.

To these might be added Martini Pesenti of Venice, a composer of vocal and instrumental music almost of all kinds, though blind from his nativity; with other examples equally worthy of public attention. But if vulgar prejudice is capable of blushing at its own contemptible character, or of yielding to conviction, those already quoted are more than sufficient to show the musical jugglers of our time, who are generally as absolute strangers to learning and taste as to virtue, that their art is no monopoly with which those alone who see are invested by the irreversible decree of heaven.

For Saunderson's method of calculation, both in arithmetic and algebra, see the account prefixed to his own treatise on that subject. But there is a much fuller and more circumstantial detail both of its nature and its various uses, given by M. Diderot in his "Letter concerning the Blind, for the use of those who see," which we shall here translate.

"It is much easier (says that author) to use signs already invented, than to become their inventor; as one is forced to do, when engaged in circumstances for which he is not provided. Of what advantage might not this be to Saunderson to find a palpable arithmetic already prepared for him at five years of age, which he might have otherwise felt the necessity of inventing for himself at the advanced period of twenty-five! This Saunderson, Madam, is an author deprived of sight, with whom it may not be foreign to our purpose to amuse you. They relate prodigies of him; and of these prodigies there is not one, which his progress in the belles lettres, and his mathematical attainments, do not render credible. Blind. 35 Saunderson's plan of notation.

"The same instrument served him for algebraical calculations, and for the construction of rectilineal figures. You would not perhaps be sorry that I should give you an explanation of it, if you thought your mind previously qualified to understand it: and you shall soon perceive that it presupposes no intellectual preparations of which you are not already mistress: and that it would be extremely useful to you if you should ever be seized with the inclination of making long calculations by touch.

"Imagine to yourself a square, such as you see fig. 1. divided into four equal parts by perpendicular lines at the sides, in such a manner, that it may present you the nine points 1, 2, 3, 4, 5, 6, 7, 8, 9. Suppose this square pierced with nine holes capable of receiving pins of two kinds, all of equal length and thickness, but some with heads a little larger than the others. Plate XCIII.

"The pins with large heads are never placed anywhere else but in the centre of the square; those with smaller heads never but at the sides, except in one single case, which is that of making the figure 1, where none are placed at the sides. The sign of 0 is made by placing a pin with a large head in the centre of the little square, without putting any other pin at the side*. The number 1 is represented by a pin with a small head placed in the centre of the square, without putting any other pin at the sides; the number 2, by a pin with a large head placed in the centre of the square, and by a pin with a small head placed on one of the sides at the point 1: the number 3, by a pin with a large head placed in the centre of the square, and by a pin with a small head placed on one of the sides at the point 2: the number 4, by a pin with a large head placed in the centre of the square, and by a pin with a small head placed on one of the sides at the point 3: the number 5, by a pin with a large head placed in the centre of the square, and by a pin with a small head placed on one of the sides at the point 4: the number 6, by a pin with a large head placed in the centre of the square, and by a pin with a small head placed on one of the sides at the point 5: the number 7, by a pin with a large head placed in the centre of the square, and by a pin with a small head placed on one of the sides at the point 6: the number 8, by a pin with a large head placed in the centre of the square, and by a pin with a small head placed on one of the sides at the point 7: the number 9, by a pin with a large head placed in the centre of the square, and by a pin with a small head placed on one of the sides at the point 8.

* See fig. 1.

"Here

Blind.

"Here are plainly ten different expressions obvious to the touch, of which every one answers to one of our ten arithmetical characters. Imagine now a table as large as you please, divided into small squares, horizontally ranged, and separated one from the other at similar distances, as you see it in fig. 3. Thus you will have the instrument of Saunderson.

39 This notation applied to numerical operations.

"You may easily conceive that there is not any number which one cannot express upon this table; and, by consequence, no arithmetical operation which one cannot execute upon it.

"Let it be proposed, for instance, to find the sum, or to work the addition of the nine numbers following.

1	2	3	4	5
2	3	4	5	6
3	4	5	6	7
4	5	6	7	8
5	6	7	8	9
6	7	8	9	0
7	8	9	0	1
8	9	0	1	2
9	0	1	2	3

"I express them on the table in the order as they are dictated to me; the first figure at the left of the first number, upon the first square to the left of the first line; the second figure to the left of the first number, upon the second square to the left of the same line; and so of the rest.

"I place the second number upon the second row of squares, units beneath units, and tens beneath tens, &c.

"I place the third number upon the third row of squares, and so of the rest. Then with my fingers running over each of the rows vertically from the bottom to the top, beginning with that which is nearest to my right, I work the addition of the numbers which are expressed, and mark the surplus of the tens at the foot of that column. I then pass to the second column, advancing towards the left; upon which I operate in the same manner; from thence to the third; and thus in succession I finish my addition.

40 The same instrument applied to the construction of rectilineal figures.

"We shall now see how the same table served him for demonstrating the properties of rectilineal figures. Let us suppose this proposition to be demonstrated, That parallelograms which have the same basis and the same height are equal in their surfaces. He placed his pins as may be seen in fig. 4. He gave names to the angular points, and finished his demonstration with his fingers.

"If we suppose that Saunderson only employed pins with large heads to mark the limits of his figures, around these he might arrange his pins with small heads in nine different manners, all of which were familiar to him. Thus he scarcely found any embarrassment but in those cases where the great number of angular points which he was under a necessity of naming in his demonstration obliged him to recur to the letters of the alphabet. We are not informed how he employed them.

"We only know that his fingers ran over the board with astonishing agility; that he undertook with success the longest calculations; that he could interrupt the series, and discover his mistakes; that he proved them with the greatest ease; and that his labours required infinitely less time than one could have imagined, by the exactness and promptitude with which he prepared his instruments and disposed his table.

41 Preparation of the instrument.

"This preparation consisted in placing pins with large heads in the centres of all the squares: having done this, no more remained to him than to fix their values by pins of smaller heads, except in cases where it was necessary to mark a unit; then he placed in the centre of a square a pin with a small head, in the place of a pin with a large head with which it had been occupied.

"Sometimes, instead of forming an entire line with these pins, he contented himself with placing some of them at all the angular points, or points of intersection; around which he tied silk threads, which finished the formation of the limits of his figures." See fig. 4.

It may be added by way of improvement, that for the division of one series of numbers from another, a thin piece of timber in the form of a ruler with which lines are drawn, having a pin at each end for the holes in the squares, might be interposed between the two series to be distinguished.

This geometrician left other instruments behind him; but as we do not know their uses, we need not add their descriptions.

It must be owned, that by the notation here exhibited, every modification of number may be expressed, and of consequence every arithmetical operation successfully performed; but we have been recently favoured with another form of palpable arithmetic, which appears to us equally comprehensive and much more simple than that of Saunderson. It was originally invented, and is still used in calculation, by Dr Henry Moyes; a gentleman whom we had formerly occasion to mention with merited applause in this article, and whose character and attainments we have endeavoured more fully to illustrate than had been done in the former edition, as well from personal knowledge as from the anecdotes of Dr Bew, as the most eligible introduction to the account of his notation, given in the words of his own letter, and exemplified in a figure copied from a drawing directed by himself.

"To the Editor of the Encyclopædia Britannica.

42 Dr Moyes's form of a palpable notation.

"Sir, In compliance with your request, I send you the following brief account of a palpable notation which I have generally used for these 20 years to assist my memory in numerical computations. When I began to study the principles of arithmetic, which I did at an early period of life, I soon discovered, to my mortification, that a person entirely deprived of sight could scarcely proceed in that useful science without the aid of palpable symbols representing the ten numerical characters. Being at that time unacquainted with the writings of Saunderson, in which a palpable notation is described, I embraced the obvious, though, as I afterwards found, imperfect expedient of cutting into the form of the numerical characters thin pieces of wood or metal. By arranging these on the surface of a board, I could readily represent any given number, not only to the touch, but also to the eye; and by covering the board with a lamina of wax, my symbols were prevented from changing their places, they adhering to the board from the slightest pressure. By this contrivance,

Blind.

contrivance, I could solve, though slowly, any problem in the science of numbers; but it soon occurred to me, that my notation, consisting of ten species of symbols or characters, was much more complicated than was absolutely necessary, and that any given number might be distinctly expressed by three species of pegs alone. To illustrate my meaning, let A, B, C, D, (fig. 5.), represent a square piece of mahogany a foot broad and an inch in thickness; let the sides AB, BC, CD, DA, be each divided into 24 equal parts; let every two opposite divisions be joined by a groove cut in the board sufficiently deep to be felt with the finger, and let the board be perforated at each intersection with an instrument a tenth of an inch in diameter.

"The surface of the board being thus divided into 576 little squares, with a small perforation at each of their angles, let three sets of pegs or pins, resembling those represented in the plate at the figures 6, 7, 8, be so fitted to the holes in the board, that when stuck into them they may keep their positions like those of a fiddle, and require some force to turn them round. The head of each peg belonging to the first set is a right-angled triangle about one-tenth of an inch in thickness; the head of each peg belonging to the second set differs only from the former in having a small notch in its sloping side or hypothenuse; and the head of each peg belonging to the third set is a square, of which the breadth should be equal to the base of the triangle of the other two. These pegs should be kept in a case consisting of three boxes or cells, each cell being allotted to a set, and the case must be placed close by the board previous to the commencement of every operation. Each set should consist of 60 or 70 pegs (at least when employed in long calculations); and when the work is finished, they should be collected from the board and carefully restored to their respective boxes.

"Things being thus prepared, let a peg of the first set be fixed into the board, and it will acquire four different values according to its position respecting the calculator. When its sloping side is turned towards the left, it denotes one, or the first digit; when turned upwards, or from the calculator, it denotes two, or the second digit; when turned to the right, it represents three; and when turned downwards, or towards the calculator, it denotes four, or the fourth digit. Five is denoted by a peg of the second set, having its sloping side or hypothenuse turned to the left; six, by the same turned upwards; seven, by the same turned to the right; and eight, by the same turned directly down, or towards the body of the calculalor. Nine is expressed by a peg of the third set when its edges are directed to right and left; and the same peg expresses the cypher when its edges are directed up and down. By three different pegs the relative values of the ten digits may therefore be distinctly expressed with facility; and by a sufficient number of each set, the steps and result of the longest calculation may be clearly represented to the sense of feeling. It seems unnecessary to illustrate this by an example; suffice it to express in our characters the present year of the Christian era 1788: Take a peg of the first set, and fix it in the board with its sloping side turned towards the left, equal to one; take now a peg of the second set and fix it in the next hole in the same groove, proceeding as usual from left to right, with its sloping side turned to the right, equal to 7; next take a peg of the same set, and fix it in the next hole, with its sloping side turned downwards, equal to 8; lastly, take another peg of the same set, and place it in the next hole in the same position, equal to 8; and the whole will express the number required.

"When it is necessary to express a vulgar fraction, I place the numerator in the groove immediately above, and the denominator in that immediately below the groove in which the integers stand; and in decimal arithmetic an empty hole in the integer groove represents the comma or decimal point. By similar breaks I also denote pounds, shillings, pence, &c. and by the same expedient I separate in division the divisor and quotient from the dividend.

"This notation, which supplies me completely with coefficients and indices in algebra and fluxions, seems much superior to any of the kind hitherto made public in the west of Europe. That invented and described by Mr Grenville, having no less than ten sets of pegs, is by much too complicated for general practice; and that which we owe to the celebrated Saunderson is apt to puzzle and embarrass the calculator, as the pegs representing the numerical digits can seldom or never be in the same straight line. If you agree with me that the above notation may promote the knowledge, and therefore the happiness, of persons denied the benefit of sight, you have my consent to give it a place in the present edition of your valuable work. I am, Sir, with respect, your obedient servant, HENRY MOYES."

We have seen the machine above mentioned, which was exhibited to the society for the improvement of polite arts, &c. by Mr Grenville, who is himself also deprived of sight. But though this has met with the approbation of Mr Stanley, we cannot forbear to think it less simple in its structure than that of Dr Moyes's, more multiform in its apparatus, and of consequence more laborious and complex in the process of its operation; for where every single peg has only one power, and acquires no diversity of value from its position, their forms must be indefinitely varied and their numbers prodigiously multiplied; which must cost both the memory and judgment of the pupil numberless painful and fatiguing exertions before he contracts a habit of using the instrument with promptitude and success. On these accounts, a particular description of it is omitted in this place.

43
A new mathematical instrument proposed.

In the higher parts of mathematics, such as conic sections, the same solid figures which are mediums of perception to those who see, may perform the same useful office to the blind. But, for the structure of superficial figures, we should imagine, that a kind of matter might be found soft enough to be easily susceptible of impressions, yet hard enough to retain them till effaced by an equal pressure. Suppose, for instance, a table were formed, four feet broad and eight in length; for the figures, that they may be the more sensible to the touch, ought to be larger than ordinary. Suppose this table had brims, or a moulding round it, rising an inch above the surface: let the whole expanse, then, be filled with bees-wax, and the surface above pressed extremely

Digitized by Google

Blind.

extremely even with a polished board, formed exactly to fit the space within the mouldings. This board will always be necessary to efface the figures employed in former propositions, and prepare the surface for new ones. We think we have pondered the minutest inconvenience that can arise from this method of delineating and conceiving geometrical truths; and, after all, the table appears to us the best and the least troublesome apparatus which a blind man can use. We can see no reason why general ideas of geography or topography might not be conveyed to him in the same manner, by spheres composed of or covered with the same impressible matter.

44 Geographical instruments proposed for the blind.

Such were the mediums that occurred to the author, when this article was originally written, for conveying to persons deprived of sight those remote and complicated truths which vision alone was thought capable of representing; but a work has lately been published at Paris which supersedes every former attempt to promote or facilitate the improvement of the blind. The invention of a plan so arduous in its appearance and so practicable in its execution, demanded the highest exertions of the noblest genius to produce it, and the most strenuous efforts of indefatigable humanity to render it effectual. It is entitled, "An Essay on the Education of the Blind." Its object is to teach them, by palpable characters impressed on paper, not only the liberal arts and sciences, but likewise the principles of mechanical operation, in such a manner, that those who have no genius for literary improvement may yet become respectable, useful, and independent members of society, in the capacity of common artisans. By these tangible signatures they are taught to read, to write, and to print; they are likewise instructed in geometry, in algebra, geography, and, in short, in every branch of natural philosophy. Nor are their efforts circumscribed by mere utility; a taste for the fine arts has likewise been cultivated among them. They have been taught to read music with their fingers as others do with their eyes; and though they cannot at once feel the notes and perform them upon an instrument, yet are they capable of acquiring any lesson with as much exactness and rapidity as those who enjoy all the advantages of light. But we shall give a more particular account of the wonderful topics contained in this essay. In his first chapter, the author discovers the end proposed by that delineation of culture which he offers to the blind; it is to enlarge their sphere of knowledge, and of consequence to increase their capacities and improve their powers of action, so that they may become happy and independent in themselves, and useful and agreeable to others. The 2d chapter contains an answer to the objections urged against the general utility of this institution. These objections are candidly stated, and answered in the most satisfactory manner: but were we to recapitulate them in detail, it would protract this article to a length much beyond its due proportion, even upon the extended plan of the Encyclopædia. The 3d chapter treats of reading as adapted to the practice of the blind. The 4th chapter consists of answers to various objections against the method of reading proposed for the blind; but these, for reasons formerly given, we cannot with propriety delineate in this article. In the 5th chapter is shown the art of printing as practised by the blind for their peculiar use. In the 6th chapter is described the manner of teaching the blind the art of printing for those that see. In the 7th is represented the manner of teaching the blind to write. The 8th chapter explains the method of teaching the blind arithmetic; the 9th, geography; the 10th, music. The 11th, contains an account of the mechanic arts in which the blind are employed, and of the way by which they are formed for such occupations. The 12th shows in general the proper manner of instructing the blind, and draws a parallel between their education and that of the deaf and dumb. Chapter 13th treats of the method of instructing them in the languages, mathematics, history, &c. What remains of the book is taken up with notes which illustrate each particular chapter; a short historical account of the rise, the progress, and the present state, of the academy for the formation of the blind; an ode on the cultivation of the blind, by one that laboured under that affliction; an extract from the register of the royal academy of sciences; opinion of the printers; models of the various pieces which blind children are capable of printing; and an account of the exercises performed by blind children in presence of the king, queen, and royal family, during the Christmas solemnities 1786. Thus having given a cursory view of the various topics contained in the essay, we proceed to give some account of the manner in which the blind print and write.

45 Account of a new plan for the improvement of the blind.

46 Printing performed by the blind.

The blind compositor, then, has a box for every alphabetical character in use; on the outside of these boxes are palpably marked the peculiar character belonging to each; they are filled with types, which he chooses and sets as they are called for, but not in the position in which they are to be read; on the contrary, they are inverted as objects are seen painted on the retina of an eye by an optician. Having thus fixed and arranged his types, he chooses a page of the strongest paper that can be found, which he gently moistens in a degree sufficient to render it more easily susceptible of impressions, without being dilacerated or worn by the shock which it must afterwards undergo. He then lays it upon the types; and by the cautious operation of the press, or by the easy strokes of a little hammer, which are frequently repeated over the whole expanse, he causes the impression of the type to rise on the opposite side of the paper, where, when dry, it continues not only obvious to the sight but the touch, and is far from being easily effaced. On the upper side of the paper, the letters appear in their proper position, and their sensible elevation above the common surface renders it practicable for the blind to read them with their fingers.

47 Their manner of writing, &c.

Their manner of writing is analogous to this operation: the pupil, by repeated experiments, having familiarised himself to the forms of the letters, both in their inverted and in their proper position, gradually learns to delineate them upon paper, moistened as before, with the point of an iron pen, which has no split, and which is just sharp enough to impress without piercing the paper: thus, on the side next to the writer's hand, the letters are formed sunk and inverted; but when the paper is turned they appear right and *in relievo*. Thus the blind are enabled to form and decypher, not only the characters required in common language, but also mathematical diagrams, arithmetical and geographical processes,

processes, and all the characters used in the written language of music. If this account should appear incredible to any of our readers, let him be informed, that the author of this article has conversed with two gentlemen of learning and veracity who saw the blind perform all the wonders here recapitulated with astonishing success, to the universal satisfaction of numberless spectators whom curiosity and compassion impelled to visit the academy, that they might behold with their own eyes a spectacle so interesting to humanity. Let the incredulous be also informed, that the composer of the article has in his own hands a copy of this work now reviewed, which is printed and bound by the blind themselves. They exhibit at their own academy every Wednesday and Saturday between one and two o'clock at noon, to crowds of charitable admirers, by whose liberal donations the institution is now chiefly supported.

48 The blind susceptible of astronomy.

The knowledge of astronomy might likewise be of infinite use, both by enlarging the blind person's ideas of the universe, and by giving him higher and more confirmed impressions of that energy by which the stars are moved, and of that design by which their motions are regulated. But these objects are too vast; their distances, their magnitudes, their periods of revolution, are too complex to be apprehended in the mind, or impressed in the memory, without sensible mediums. For this purpose, an orrery, or some machine of a similar construction, will be indispensably requisite.

49 Of natural philosophy.

The science of causes and effects might likewise yield him the most sublime and rational entertainment of which an intelligent being, in his present state, is susceptible. By this he might enter into the laws, the vicissitudes, the economy of nature. Nor is it absolutely necessary that he should be an ocular witness of the experiments by which these laws are detected and explained. He may safely take them for granted; and if, at any time, a particular experiment should prove faithless, he may, from general principles, be able to discover its fallacy, whether in the nature of the subject, the inaptitude of the instruments, or the process of the execution. The laws of motion, the various ratios or proportions of forces, whether simple or compound, he may calculate and ascertain by the same means and in the same method so happily used by Saunderson.

50 Of moral philosophy and theology.

Moral and theological knowledge he may easily obtain, either from books, or instructions delivered *viva voce*. The last, if communicated by one who understands and feels the subject, with a proper degree of perspicuity and sensibility, are infinitely the most eligible. By morals, we would not merely be understood to mean a regular and incalculable series of action, but the proper exertion and habitual arrangement of the whole internal economy, of which external actions are no more than mere expressions, and from which the highest and most permanent happiness alone can proceed. By theology, we do not mean that systematic or scholastic jargon, which too frequently usurps its venerable name; but those sublime and liberal ideas of the nature and government of a Supreme being, whether discoverable by nature or revealed in Scripture, which enforce every moral obligation, which teach us what is the ultimate good of our nature, which determine our efforts and animate our hopes in pursuing this most important of all objects. What Cicero says of the arts and sciences may with great propriety be applied to religion: *Nam cætera neque temporum sunt, neque ætatum omnium, neque locorum; at hæc studia adolescentiam alunt, senectutem oblectant, secundas res ornant, adversis perfugium ac solatium præbent; delectant domi, non impediunt foris; pernoctant nobiscum, peregrinantur, rusticantur.* Translated thus: 'For other 'studies are not suited to every time, to every age, and 'to every place: but these give strength in youth, and 'joy in old age; adorn prosperity, and are the support 'and consolation of adversity; at home they are delightful, and abroad they are easy; at night they are 'company to us; when we travel, they attend us; 'and in our rural retirements, they do not forsake 'us.'

To this may be added, that the joys of religion are for ever adequate to the largest capacity of a finite and progressive intelligence; and as they are boundless in extent, so they are endless in duration. We have already, more than once, observed, that the soul of a blind man is extremely obnoxious to melancholy and dejection. Where, therefore, can he find a more copious, intimate, permanent, and efficacious source of comfort than in religion? Let this then be inculcated with the utmost care and assiduity. Let the whole force of the soul be exerted in showing him that it is reasonable. Let all the noblest affections of the heart be employed in recommending it as amiable: for we will venture to assert, that the votary of religion alone is the man,—

Quem, si fractus illabatur orbis,
Impavidum ferient ruinæ:

Thus translated;

Whom, though with nature's wreck oppress'd,
Unmanly fears could ne'er infest.

When the situation of the blind, and its natural effects upon their characters, are considered; when we reflect how exquisite their distresses, how pungent their disappointments, how sensible their regrets, how tedious and gloomy their periods of solitude; we must be wretches indeed, if we can grudge either labour or expence in procuring them every source of entertainment, which, when procured, remains in their own power, and yields what may be in some measure termed *self-derived enjoyment*. These amusements are prolific of numberless advantages: they afford us at once entertainment and exertion; they teach us to explore a thousand resources for preservation and improvement, which would otherwise have escaped our attention; they render us awake and sensible to a thousand notices both of external and intellectual objects, which would otherwise have passed unobserved.

Thus far have we proceeded without mentioning philological learning; though we know it to be attainable by the blind in a high degree, and though we are conscious of its importance both to their use and ornament. But as it is not indispensable, and as its acquisition is tedious and operose, we thought it less necessary to be early and minutely specified. We cannot doubt that learning different languages adds to the treasure of our ideas, and renders those which we

Digitized by Google

we possess more clear and definite. It must be acknowledged, that the possession of other languages elucidates our own. The technical terms of almost every science are exotic; and without clearly understanding those, we cannot properly possess the ideas of which they are the vehicles. But these motives are common to every candidate for philological improvement with the blind.

51 Of grammar.

The paths of grammar, however, are dry and rugged; and it will be necessary for the pedagogue, whoever he is, to take all the opportunities that offer of enlightening the darkness and polishing the asperities of the road. When, therefore, the intellect of the pupil begins to open and exert its penetration, it will be proper to show him how the nature, the forms, and arrangements, of words, flow from our ideas and their relations. Every substance must naturally be in some state; it must either act, or be acted upon. The actions which it performs or suffers must be performed or suffered in some definite manner or degree. It must likewise have some qualities, whether temporary and accidental, or natural and permanent. These qualities must likewise be susceptible of degrees. When different substances are considered in the same state, its common participation forms a connexion: when regarded in different states, that difference forms an opposition. The constant repetition of the names of substances and qualities produces a disagreeable monotony in language. They must therefore be implied in other words, which likewise in some cases serve to connect the parts of a sentence. There is a difference between such words as imply the connexion of sentences, and such as imply the connection of states or circumstances. Actions to be performed or suffered may be either positively affirmed of any substance, or merely attributed to them. Living and percipient substances have immediate sensations of pain or pleasure, which likewise are productive of desire and aversion. To these sentiments particular sounds are adapted, whether immediately inspired by nature, or resulting from association and tacit convention.

Thus we have a foundation for all the different parts of speech; and from their natures and offices their forms and arrangements may be deduced, according to the analogy of every language.

52 The blind susceptible of logic, history, and the *belles lettres*.

The art of reasoning, the knowledge of history, and a taste for the *belles lettres*, are easily attainable by the blind; and as they are copious funds of entertainment, they should be inculcated, though at the expence of care and labour.

53 A companion should be united to the blind by more than the ties of interest and conveniency.

The relations of persons subjected to this misfortune, if in easy circumstances, will find it highly conducive to the improvement of their charge, to select some one among his coevals, of a sound understanding, a sweet and patient temper, a docile mind, a warm heart, and a communicative disposition. These two should be taught to find their interest and happiness in their connexion with one another. Their bed, their board, their walks, their entertainments, their lessons, should be common. These are the best eyes with which art can endow a blind man: and if properly selected, they will on some occasions yield very little, in utility and perfection, to those of nature; nay, at some junctures they may be preferable.

54 Music one of the most proper employments for the blind. Mediocrity, however, pernicious.

If the blind must depend upon the exercise of their own powers for bread, we have already pointed out music as their easiest and most obvious province; but let it at the same time be remembered, that mediocrity in this art may prove the bitterest and most effectual curse which a parent can inflict upon his offspring, as it subjects them to every vicious impression or habit which may be imbibed or contracted from the lowest and most abandoned of mankind. If, your pupil therefore, be not endowed with natural talents exquisitely proper both for the theory and practice of this art, suffer him by no means to be initiated in it. If his natural genius favours your attempts, the spinet, harp, or organ, are the most proper instruments for him to begin: because by these instruments he may be made more easily acquainted with the extent of musical scales, with the powers of harmony, with the relations of which it is constituted, and of course with the theory of his art. It would be not only unnecessary, but impracticable, to carry him deep into the theory, before he has attained some facility in the practice. Let, therefore, his head and his hands (if we may use the expression) be taught to go *pari passu*. Let the one be instructed in the simplest elements, and the others conducted in the easiest operations, first: contemplation and exercise will produce light in the one and promptitude in the other. But as his capacity of speculation and powers of action become more and more mature, discoveries more abstract and retired, tasks more arduous and difficult, may be assigned him. He should be taught the names and gradations of the diatonic scale, the nature and use of time, the diversity of its modes whether simple or mixed. He should be taught the quantity or value of notes, not only with respect to their pitch, but to their duration. Yet, let him be instructed not to consider these durations as absolutely fixed, but variable according to the velocity of the movements in which they are placed. Thus we reckon a semibreve equal to 4 vibrations of a pendulum; a minim to 2; a crotchet to 1, &c. But if the number of aliquot parts, into which a semibreve is divided, be great, and consequently the value of each particular part small, the minim, crotchet, quaver, &c. will increase in their intrinsic durations, though they must always preserve the same proportions relatively one to another. He should never be habituated to take a piece of music, either from the sound of a voice or an instrument. His companion ought to read the music by the names and values of its characters, with the same exactness as the words in any other language. When he becomes a considerable adept in the art, tangible signs may be invented, by which he may not only be enabled to read, but even to set music for himself. Such exercises will render him infinitely more accurate, both in his principles and practice, than he would otherwise be.

There is a hint of such tangible signs given in Tansure's Musical Grammar, p. 93. and which, though (like the rest of the book) obscure and indigested, may be improved and applied with advantage.

For the sake of those in whose hands it may not be, we quote the passage at length.

55 Scheme of musical notation.

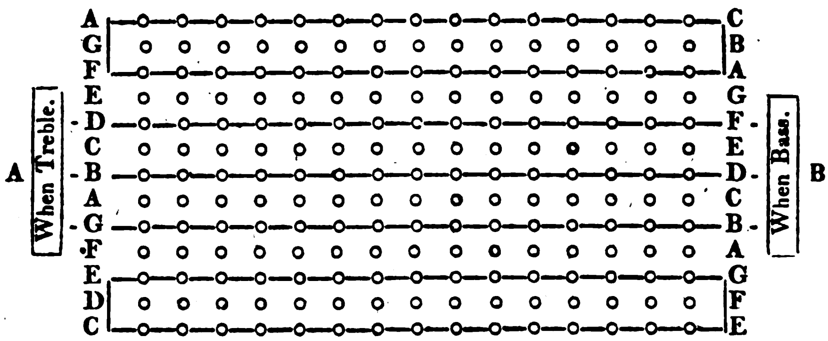
"As it is the pleasure of the Almighty, that some persons are destitute of *eye-sight*; in like manner it is

Digitized by Google

his infinite goodness to make them a double amends another way by giving them a greater share of memory, &c. whereby they become very dexterous in playing on musical instruments, mathematics, &c. as we may observe by Dr Stanley organist of St Andrew's Holborn in London, the blind professor of mathematics in the university of Cambridge, and many others too tedious here to mention, who were born *blind*, and never saw the least glance of light; yet God gave them such a light in *knowledge*, that they became the wonder of all such as had the benefit of seeing, &c.

"And as *blind persons*, at first, cannot possibly have so clear an idea of *notes* and *musical characters* as they that see them, until they are taught by a master or tutor: I have (for the good-will I bear to such unfortunate persons) contrived the following table; that, by *feeling*, they may understand notes, and learn any tune that shall be set them, in their master's absence.

A New Music-Table *for such as are* Blind.



Explanation.

"Let A—B be a smooth board, 3 or 4 feet long, 1 inch thick, and 9 inches wide, with 5 square ledges glued thereon, each being half an inch asunder, half an inch wide, and half an inch high; which rising ledges represent our 5 lines of music, and their spaces: and the 2 outward lines, being made a little lower, may serve as leger lines on occasion. The cyphers represent so many holes bored into every line and space, half an inch asunder; wherein *pegs* of different shapes are to be set, to represent the several sorts of notes and characters of the tune; which pegs the blind person may know by feeling, as well as he does his keys of the organ or harpsichord: so that, by keeping his fingers on the 5 lines, he feels the several pegs as they come on, and are set to represent the several sorts of notes, on both line and space; whilst his right hand strikes the respective key, &c. he first knowing the names of all his keys, his lines, spaces, and the mark of every peg. Let each peg be about half an inch high, when set in very fast. [N. B. The blind person must first be taught the names of the above lines and spaces in both the treble and bass cliffs; and that he must feel his treble with his right hand, and his bass with the left hand; each being contrary, as you may see by the letters of the above table, A and B; and must learn each part separate.]

"Of pegs, he must have a great number of every sort, to set his tune with, which he may mark as follows:

For a *Semibreve*, 4 top-notches.
Minim, 2 top-notches.
Crotchet, 1 top-notch.
Quaver, 1 corner cut off.
For a *Semiquaver*, 2 corners cut off.
Demisemiquaver, all 4 corners cut off.
Rests, a notch in the corner.
A *Flat*, 1 notch on the side.
Sharp, 2 notches on the side.
Point, 3 notches on the side.
Bar, a flat thin top.
Repeat, a sharp-pointed top, &c. &c. &c.

"But it is best for every performer to make and mark his own pegs; and deliver them one by one as they are called for by the person that sets his *tune*."

Thus far our author. We have already complained that Tansure's Musical Notation is imperfect; and perhaps every table or instrument of the same kind may be liable to the same censure, as not being comprehensive of all the characters in the written language of music, so that the blind reader may find no deficiency in acquiring any lesson: yet as the cushion of Mr Cheese appears to have more powers than any other instrument for the same purpose that has hitherto occurred to our observation, though attended with many formidable objections, we here insert it. It may possibly, however, be best for every blind adept in the musical art, after being sufficiently instructed in its theoretical and practical principles, to invent for himself a table, by which may be expressed all the various phenomena of music, in which, by varying the forms and positions of his pegs, he may habitually associate them with sounds, durations, rests, intervals, chords, cadences, da-capos, repeats, and all the various graces which give animation and expression to musical sounds: for thus, being the immediate creatures of his own imagination, they will more easily become familiar to his memory, and be more strongly and readily associated with the phenomena

Blind.

phenomena which they are intended to signify, than if he had assumed the inventions of any other.

56
Cheese's machine, Pl. XCIII. fig. 9.

Mr Cheese's description of his machine for teaching music to people deprived of sight, and to enable them to preserve their compositions, in the act of composing, without the assistance of a copyist.—" That part of the machine which represents the book, or paper, is a small cushion stuffed, on a little frame; along which, is sewed a number of packthread strings at equal distances from each other; these represent the lines in a music book: the five which compose the stave, are made of large twine; and those which represent the leger or occasional lines, drawn through the heads of the notes, where the music exceeds the compass of the established stave, are made of small twine, and are on this machine of the same length as the others.

" If the practitioner only wishes to write harpsichord music, the cushion may be what length he pleases, and about five or six inches wide; the strings must be sewed in the following order; beginning with the first or lowest, near the edge of the cushion; four small ones, which correspond with the notes in the base of the instrument ff, rr, cc, ee: Next five large ones, for the stave which correspond with the lines in the book, or notes in the instrument g, b, d, f, r; one small one which represents the occasional line between the base and treble, or middle c; five large ones for the treble stave, which makes the notes e, g, b, d, f; three small ones, which represent the leger lines when the music goes in alt. These provide for the note a in alt, c in alt, and e in alt; in the space above which, next the edge of the cushion, the f in alt is wrote, when it is wanting, which completes the compass of the instrument.

" Those who only sing or play on single instruments, such as violins, &c. should have their cushions not above half the width of those above-mentioned, upon which there should be but one stave, and that in the following order:—Two small lines at bottom, five large ones in the middle, and three small ones at top. Neither of the outside lines of these small cushions should be sewed close to the edge, as there are notes supposed above and below. At either end of these small cushions, there should be a small wire staple, in order that any number of them may be combined together at pleasure, by running a rod through the staples: this will enable the practitioner to write what musicians call SCORE, in any number of parts he pleases; and by this means a thorough knowledge of the great works of Handel, and all other classical authors, may be acquired as well without sight as with it.

" The characters used to write on this machine are pins; some with two, three, or more heads; others bent in different forms—some, the heads taken off and the top beat flat; some of these are split; others the head taken off, and placed near the middle. The bars are pieces of wire crooked at each end; a double bar is made by placing two single ones close together; a double sharp and double flat in the same manner.

" The characters are kept in a box in the same style as the printer keeps his types; each different compartment of which must be marked with a character in writing signifying what each, contained in the several compartments, is intended to represent. That the master may be acquainted with them, the student must be taught to distinguish each of the characters contained in the box by the feel, as well as the names of each line and space upon the cushion. When he can do this readily, some music should be read to him, which it will be well for him to copy on the cushion: and when that is filled, let it be laid on the desk of the harpsichord before him; and then by feeling over a passage or sentence at a time, and afterwards playing it, his playings always commencing with the beginning of the piece, or at some particular part of it, this will soon enable him to recollect the whole, when the hands are taken off the cushion, to play what has been last felt. One of these characters, called a direct, must be placed against the note to be next felt: This will enable the student to go on again, after playing, without any difficulty. The person who reads the music, must be instructed not to call the lines or spaces by the letters which distinguish them, lest confusion may ensue, every eighth being the same; but must read in the following manner: first the name of the character must be mentioned, whether minim, crotchet, or quaver, &c. then the line or space; as for example, minim on the first line, crotchet on the first space, quaver on the second, &c. &c. When the music exceeds the compass of the stave, it must be particularly mentioned whether above or below, first calling the character, then the leger line or space.

Blind.

" The technical term at the beginning of each piece, is better remembered than wrote down on the machine: The accidental terms, which are best marked by placing some character, not much used, either above or below the note on which it happens, the ingenious mind will find out a method of doing for itself.

" This machine will not only teach music; but calling the characters letters, any one will be enabled to spell, read, or write down his sentiments on any subject, and even convey them to his friend without the assistance of a secretary. Arithmetic may be also taught upon this machine; as by calling the dot 1, and the pause 10, a complete set of figures will be formed.

" *Explanation of the figures.* A, B, C, D, the form of the cushion, which in its full size is about three feet long, and five inches and three quarters wide, having thereon a representation of musical notes, shown by different pins stuck on it. The lines a, b, c, d, e, are of large packthread; and the lines f, g, h, are of small twine.

" Pins, N° 1. A semibreve. 2. A semibreve rest. 3. A minim. 4. A minim rest. 5. Dots. 6. A crotchet. 7. A crotchet rest. 8. A quaver. 9. A quaver rest. 10. A sharp. 11. A semiquaver. 12. A semiquaver rest. 13. A demiquaver. 14. A demiquaver rest. 15. A flat. 16. A demisemiquaver. 17. A demisemiquaver rest. 18. A semidemiquaver. 19. A semidemiquaver rest. 20. A natural. 21. Bars. 22. A direct. 23. A tye. 24. Bass. 25. Tenor cliff. 26. Treble cliff. 27. A repeat. 28. Pause. 29. This character placed on any line or space signifies as many notes on that line or space as there are doubles on the pins; if turned upwards, it implies the same number ascending; if downward, that number descending. 30. A beat or inverted shake. 31. A shake; and when there is a dot placed over it, signifies a turned shake. Two dots placed over each other, above the notes, without this character, signify a turn only. 32. This character is used over the note to signify *forte*; and if a dot is placed

Digitized by Google

Blind.

placed above it, *fortissimo*; if the dot is placed above the note and below the character, it implies *crescendo*; if the character is placed below the note, it implies *piano*; and if a dot is placed under it, *pianissimo*; but if the dot is above the character, and below the note, it signifies *diminuendo*. In concertos, the inventor uses the same character placed above the note in the same manner, with two dots over it, to signify *toote*; and below the notes, with two dots under it, to signify *solo*: in vocal music, the same character above the notes, with three dots over it, signifies *symphony*; and below the notes, with three dots under it, signifies *song*."

It is certain, that when playing concertos, or, if you please, when performing in *score*, the blind must depend upon memory, and upon memory alone: but happily their retentive powers are remarkably strong; and there are few pieces in music which will be found either too intricate to be acquired, or too long to be remembered, by a person deprived of sight. Mr Stanley, the gentleman formerly mentioned by Tansure, performs what is still more astonishing. If our information, which we cannot doubt, be true, he accompanies any lesson with a thorough bass, though he never has heard it before. We have never yet heard of any person, though blessed with the full use of sight, and with all the advantages accruing from it, who could thus anticipate harmony before the chords were sounded, and accompany it in a manner suitable to its nature.

When he becomes a more profound theorist, if he has adopted the notion that music and geometry are congenial and inseparable (which, however, in our judgement is frivolous), he may peruse Malcolm's Essay on Music, and Treydell's Theory and Practice of Music. But if he chooses to hear the same principles delivered without that unnecessary parade and ostentation of profundity, let him be instructed by D'Alembert (see the article Music in this Dictionary); by Rameau, in his Principles of Composition; and by Rousseau's Musical Dictionary (the substance of which is engrossed in the present Work, either under the respective detached articles, or in the notes added to the article Music). It is true, that the forms and proportions of instruments, the thickness, length, and tension of musical strings, may be mathematically adjusted; their relations one to another may be determined by the coincidence of their vibrations, or by the number and velocity of these vibrations when dissonant; but experience and a good ear, are amply sufficient for these purposes. Yet, if the necessity of geometry in music should still remain an indelible article in his creed, he may peruse Dr Smith's Philosophical Principles of Harmony. There has also lately been published an explication of Tartini's theory, entitled, *The Principles and Power of Harmony*; which, after he has made considerable progress, may be read to him with sensible improvement.

57 Apostrophe to the public.

Thus we have endeavoured to form an estimate of the inconveniencies suffered, and the advantages possessed, by the blind; we have attempted to show, of what kind of culture their remaining faculties are susceptible, and what appeared to us the easiest and properest means of their improvement. We have illustrated not only its possibility, but its certainty, by incontestable facts, which demonstrate, even in the eyes of scepticism and incredulity, to what degrees of eminence, both in the mechanical and liberal arts, the blind may be carried. It now remains to demand a categorical answer from society, Whether it is more humane and eligible, that such unhappy persons should be suffered to languish out their lives in torpid and miserable obscurity, wretched in themselves, and burdensome to others; or to cultivate and improve their powers in such a manner, as that they may be qualified for internal enjoyment and public utility? Surely there is not a human being, who does not disgrace the works of God, that can be at any loss in answering this question. Have we not then a right to call the world to an account? have we not a right to demand, why rational beings, susceptible of felicity in themselves, and capable of transfusing happiness through the societies with whom they are connected, should be abandoned to a state of insignificance and misery? Is it possible that men who are every moment subjected to the same contingencies with which they behold their fellow-creatures afflicted, should not with all their souls endeavour to alleviate the misfortunes of their suffering brethren? Is the native and hereditary portion of human woe so light and supportable in itself, that we should neglect and despise those to whom it is embittered by accidental circumstances of horror and distress? You who are parents, who feel the strong and powerful pleadings of nature, do not, by a brutal negligence and insensibility, render the existence which you have given a curse to its possessors. Do not give them reason to upbraid your memory; and to answer those who ask what patrimony you have left them, that their sole inheritance was ignorance, incapacity, and indigence. You men of wealth and eminence, you whom Providence has rendered conspicuous on the theatre of nature, to whom it has given the noblest opportunities of participating the divine beatitude by the exercise of universal benevolence and genuine patriotism; yours is the glorious province of bringing neglected merit from obscurity, of healing the wounds inflicted by adverse fortune, and of cultivating those talents which may be exerted for your own advantage and the honour of your species. Thus you shall rise in the heraldry of heaven, and your names diffuse a lustre through the extent of space and the archives of eternity. Otherwise the temporary glare and parade of your situation can produce nothing else but a despicable mimicry of real and intrinsic greatness, and are no more than a splendid mask to cover what in itself is infamous or detestable.

By way of appendix to the preceding article, we shall add one or two very singular histories, with which it is hoped our readers will not be displeased.

An account of some remarkable particulars that happened to a lady after having had the confluent kind of smallpox.] "In the course of this disease, during which the lady was attended by the late Sir Hans Sloane, several threatening symptoms appeared, which however were at length overcome; and the patient being thought out of danger, took several doses of such purgative medicines as are usually administered in the decline of the disease, without any bad consequence.

"But in the evening of the day on which she had taken the last dose that was intended to be given her on

E. Mitchell, p.

on that occasion, she was suddenly seized with pains and convulsions in the bowels; the pain and other symptoms became gradually less violent as the force of the medicine abated, and by such remedies as were thought best adapted to the case, they seemed at length to be entirely subdued.

"They were, however, subdued only in appearance; for at eleven o'clock of the forenoon of the next day they returned with great violence, and continued some hours; when they went off, they left the muscles of the lower jaw so much relaxed, that it fell down, and the chin was supported on the breast. The strength of the patient was so much exhausted during this paroxysm, that she lay near two hours with no other signs of life than a very feeble respiration, which was often so difficult to be discerned that those about her concluded she was dead.

"From this time the fits returned periodically every day, at about the same hour. At first they seemed to affect her nearly in the same degree; but at length all the symptoms were aggravated, the convulsions became more general, and her arms were sometimes convulsed alternately; it also frequently happened, that the arm which was last convulsed remained extended and inflexible some hours after the struggles were over. Her neck was often twisted with such violence, that the face looked directly backwards, and the back part of the head was over the breast; the muscles of the countenance were also so contracted and writhed by the spasms, that the features were totally changed, and it was impossible to find any resemblance of her natural aspect by which she could be known. Her feet were not less distorted than her head; for they were twisted almost to dislocation at the instep, so that she could not walk but upon her ancles.

"To remove or mitigate these deplorable symptoms, many remedies were tried; and, among others, the cold bath: but either by the natural effect of the bath, or by some mismanagement in the bathing, the unhappy patient first became blind, and soon afterwards deaf and dumb. It is not easy to conceive what could increase the misery of deafness, dumbness, blindness, and frequent paroxysms of excruciating pain; yet a very considerable aggravation was added; for the loss of her sight, her hearing, and her speech, was followed by such a stricture of the muscles of her throat, that she could not swallow any kind of aliment either solid or liquid. It might reasonably be supposed that this circumstance, though it added to the degree of her misery, would have shortened its duration; yet in this condition she continued near three quarters of a year; and during that time was supported in a very uncommon manner, by chewing her food only; which having turned often, and kept long in her mouth, she was obliged at last to spit out. Liquors were likewise gargled about in her mouth for some time; and then returned in the same manner, no part of them having passed the throat by an act of deglutition: so that whatever was conveyed into the stomach, either of the juices of the solid food, or of liquids, was either gradually imbibed by the sponginess of the parts which they moistened, or trickled down in a very small quantity along the sides of the vessels.

"But there were other peculiarities in the case of this lady, yet more extraordinary. During the privation of her *sight* and *hearing*, her *touch* and her *smell* became so exquisite, that she could distinguish the different colours of silk and flowers, and was sensible when any stranger was in the room with her.

"After she became blind, and deaf, and dumb, it was not easy to contrive any method by which a question could be asked her, and an answer received. This, however, was at last effected, by talking with the fingers, at which she was uncommonly ready. But those who conversed with her in this manner, were obliged to express themselves by touching her hand and fingers instead of their own.

"A lady who was nearly related to her, having an apron on, that was embroidered with silk of different colours, asked her, in the manner which has been described, if she could tell what colour it was? and after applying her fingers attentively to the figures of the embroidery, she replied, that it was red, and blue, and green; which was true. The same lady having a pink coloured ribbon on her head, and being willing still further to satisfy her curiosity and her doubts, asked what colour that was! her cousin, after feeling some time, answered, that it was pink colour: this answer was yet more astonishing, because it showed not only a power of distinguishing different colours, but different kinds of the same colour: the ribbon was not only discovered to be red, but the red was discovered to be of the pale kind called a *pink*.

"This unhappy lady, conscious of her own uncommon infirmities, was extremely unwilling to be seen by strangers, and therefore generally retired to her chamber, where none but those of the family were likely to come. The same relation, who had by the experiment of the apron and ribbon discovered the exquisite sensibility of her *touch*, was soon after convinced by an accident, that her power of *smelling* was acute and refined in the same astonishing degree.

"Being one day visiting the family, she went up to her cousin's chamber, and after making herself known, she intreated her to go down, and sit with her among the rest of the family, assuring her that there was no other person present: to this she at length consented, and went down to the parlour door; but the moment the door was opened, she turned back, and retired to her own chamber much displeased; alleging, that there were strangers in the room, and that an attempt had been made to deceive her: it happened indeed that there were strangers in the room; but they had come in while the lady was above stairs, so that she did not know they were there. When she had satisfied her cousin of this particular, she was pacified; and being afterwards asked how she knew there were strangers in the room, she answered, by the smell.

"But though she could by this sense distinguish in general between persons with whom she was well acquainted and strangers, yet she could not so easily distinguish one of her acquaintance from another without other assistance. She generally distinguished her friends by feeling their hands; and when they came in, they used to present their hands to her, as a mean of making themselves known; the make and warmth of the hand produced, in general, the differences that she distinguished; but she sometimes used to span the wrist, and measure the fingers. A lady, with whom she was very well acquainted, coming in one very hot day, after

Digitized by Google

Blind.

having walked a mile, presented her hand as usual; she felt it longer than ordinary, and seemed to doubt whose it was; but after spanning the wrist, and measuring the fingers, she said, 'It is Mrs M. but she is warmer today than ever I felt her before.'

"To amuse herself in the mournful and perpetual solitude and darkness to which her disorder had reduced her, she used to work much at her needle; and it is remarkable, that her needle-work was uncommonly neat and exact: among many other pieces of her work that are preserved in the family, is a pin-cushion, which can scarcely be equalled. She used also sometimes to write: and her writing was yet more extraordinary than her needle-work: it was executed with the same regularity and exactness; the character was very pretty, the lines were all even, and the letters placed at equal distances from each other: but the most astonishing particular of all, with respect to her writing, is, that she could by some means discover when a letter had by some mistake been omitted, and would place it over that part of the word where it should have been inserted with a caret under it. It was her custom to sit up in bed at any hour of the night, either to write or to work, when her pain or any other cause kept her awake.

"These circumstances were so very extraordinary, that it was long doubted whether she had not some faint remains both of hearing and sight, and many experiments were made to ascertain the matter; some of these experiments she accidentally discovered, and the discovery always threw her into violent convulsions. The thought of being suspected of insincerity, or supposed capable of acting so wicked a part as to feign infirmities that were not inflicted, was an addition to her misery which she could not bear, and which never failed to produce an agony of mind not less visible than that of her body. A clergyman who found her one evening at work by a table with a candle upon it, put his hat between her eyes and the candle, in such a manner that it was impossible she could receive any benefit from the light of it if she had not been blind. She continued still at her work, with great tranquillity; till, putting up her hand suddenly to rub her forehead, she struck it against the hat, and discovered what was doing; upon which she was thrown into violent convulsions, and was not without great difficulty recovered. The family were by these experiments, and several accidental circumstances, fully convinced that she was totally deaf and blind; particularly by sitting unconcerned at her work, during a dreadful storm of thunder and lightning, though she was then facing the window, and always used to be much terrified in such circumstances. But Sir Hans Sloane, her physician, being still doubtful of the truth of facts which were scarce less than miraculous, he was permitted to satisfy himself by such experiments and observations as he thought proper; the issue of which was, that he pronounced her to be absolutely deaf and blind.

"She was at length sent to Bath, where she was in some measure relieved; her convulsions being less frequent, and her pains less acute: but she never recovered her speech, her sight, or her hearing, in the least degree.

"Many of the letters dated at Bath, in some of which there are instances of interlineations with a caret, the writer of this narrative hath seen, and they are now in the custody of the widow of one of her brothers, who, with many other persons, can support the facts here related, however wonderful, with such evidence as it would not only be injustice, but folly, to disbelieve."

An account of a French lady, blind from her infancy, who can read, write, and play at cards, &c.]—"A young gentlewoman of a good family in France, now in her 18th year †, lost her sight when only two years old, her mother having been advised to lay some pigeons blood on her eyes, to preserve them in the small-pox; whereas, so far from answering the end, it ate into them. Nature, however, may be said to have compensated for the unhappy mistake, by beauty of person, sweetness of temper, vivacity of genius, quickness of conception, and many talents which certainly much alleviate her misfortune.

† *Annual Register* for 1762.

"She plays at cards with the same readiness as others of the party. She first prepares the packs allotted to her, by pricking them in several parts; yet so imperceptibly, that the closest inspection can scarcely discern her indexes. She sorts the suits, and arranges the cards in their proper sequence, with the same precision, and nearly the same facility, as they who have their sight. All she requires of those who play with her, is to name every card as it is played; and these she retains so exactly, that she frequently performs some notable strokes, such as show a great combination and strong memory.

"The most wonderful circumstance is, that she should have learned to read and write; but even this is readily believed on knowing her method. In writing to her, no ink is used, but the letters are pricked down on the paper; and by the delicacy of her touch, feeling each letter she follows them successively, and reads every word with her finger ends. She herself in writing makes use of a pencil, as she could not know when her pen was dry; her guide on her paper is a small thin ruler and of the breadth of her writing. On finishing a letter, she wets it, so as to fix the traces of her pencil, that they be not obscured or effaced; then proceeds to fold and seal it, and write the direction; all by her own address, and without the assistance of any other person. Her writing is very straight, well cut, and the spelling no less correct. To reach this singular mechanism, the indefatigable cares of her affectionate mother were long employed, who accustomed her daughter to feel letters cut in cards or pasteboard, brought her to distinguish an A from a B, and thus the whole alphabet, and afterwords to spell words; then, by the remembrance of the shape of the letters, to delineate them on paper; and, lastly, to arrange them so as to form words and sentences.

"She has learned to play on the guitar, and has even contrived a way of pricking down the tunes as an assistance to her memory. So delicate are her organs, that in singing a tune, though new to her, she is able to name the notes.

"In figured dances she acquits herself extremely well, and in a minuet with inimitable ease and gracefulness. As for the works of her sex, she has a masterly hand; she sews and hems perfectly well; and in all her works she threads the needles for herself, however small.

"By the watch her touch never fails telling her exactly the hour and minute,"

From

Digitized by Google

From this account, however, it would appear, that except reading and writing, the French lady has nothing to boast of in which she is not excelled by Mr Stanley already mentioned, if we may credit all that is reported of him. The works peculiar to her sex are gained mechanically; but the *distinguishing colours*, telling the precise time by a watch, naming the notes in music, and many other things depending upon the ear and touch, are said to be so familiar to him, that his friends cease to think them extraordinary. Attainments still more wonderful are ascribed to him; as, the naming the number of persons in a room on entering it; the directing his voice to each person in particular, even to strangers when they have once spoken; the missing any person absent, and telling who that person is; and, lastly, his being able to form just conceptions of youth, beauty, symmetry, and shape.

Pore-Blind, or *Pur-blind*. A person who is very shortsighted is said to be *pur-blind*.

Moon-Blind, denotes horses that lose their sight at certain times of the moon. See FARRIERY *Index*.

Blind Harry. See *Henry the Minstrel*.

Blind-Worm. See ANGUIS, OPHIOLOGY *Index*.

BLINDE, among mineralists, a species of lead-marcasite, by our miners called mock-ore, mock-lead, and wild lead, &c. The German mineralists call it *blende*, whence our denomination *blinde*. It answers to what in Agricola is called *Galena inanis*.

It usually lies immediately over the veins of lead-ore, in the mines which produce it, for it is not found in all. When the miners see this, they know the vein of ore is very near.

BLINDS, or BLINDES, in the art of war, a sort of defence commonly made of oziers, or branches interwoven, and laid across between two rows of stakes, about the height of a man, and four or five feet asunder, used particularly at the heads of trenches, when they are extended in front towards the glacis; serving to shelter the workmen, and prevent their being overlooked by the enemy.

BLINDING, a species of corporeal punishment anciently inflicted on thieves, adulterers, perjurers, and others; and from which the ancient Christians were not exempt. Sometimes lime and vinegar, or barely scalding vinegar, was poured into the eyes till their balls were consumed; sometimes a rope was twisted round the head till the eyes started out. In the middle age, they changed total blindness for a great darkness or diminution of sight; which they produced by holding a red-hot iron dish or bason before the eyes till their humours were dried and their coats shrivelled up.

The inhabitants of the city Apollonia executed it on their watch whom they found asleep.—Democritus (according to Plutarch, Cicero, and A. Gellius), put out his own eyes, that he might be less disturbed in his mental contemplations, when thus freed from the distraction of the objects of sight.

BLINDNESS, a privation of the sense of sight, arising from a total deprivation of its organs, or an involuntary obstruction of their functions. See the article BLIND.

Total Blindness, is that wherein all sight or perception, even of light, is wanting, as in the case of those who are said to be *stone-blind*. A blind man, by the civil law, cannot make a testament except under certain modifications; but in every case he is disabled from being a witness to a testament, on account of his blindness.

Partial Blindness, is that wherein some faint glimmering is left, as is always the case in people who have ripe cataracts, who are never so blind but they can discern day from night.

Perpetual Blindness, is that which remains alike under all the diversity of seasons, times, ages, &c.

Transient Blindness, is that which gives way of itself in due time, as that of whelps, which continues for several days, sometimes nine, rarely twelve, after they are littered. The Nogais Tartars, according to Father Du Ban the Jesuit, who lived among them, are born blind, and open not their eyes till several days.

Periodical Blindness, is that which comes and goes by turns, according to the season of the moon, time of day, and the like.

Diurnal Blindness, is called *hemeracopia*.

Nocturnal Blindness, called also *nyctalopia*, that which ensues on the setting of the sun in persons who see perfectly in the day, but become quite blind as soon as night comes on. Brigg, in Phil. Trans. N° 159. p. 560, where an instance of it is given. See a singular case of this kind related by Dr Samuel Pye, in the Medic. Observ. and Inquir. vol. i. p. 111.

The causes of blindness are either ordinary, as a decay of the optic nerve (an instance whereof we have in the Academy of Sciences, where upon opening the eye of a person long blind, the optic nerve was found extremely shrunk and decayed, and having no medulla in it); or some external violence, vicious conformation, growth of a cataract, *gutta serena*, small pox, or the like. See MEDICINE *Index*.

Extraordinary causes of blindness are malignant stenches, poisonous juices dropped into the eye, baneful vermin, long confinement in the dark, or the like. The ducks which breed under ground, and break out into the Zirchnitzer sea in Carniola after all great storms, are blind at their first eruption; but in some time come to their sight. The author of the Embassy of D. Garcias de Sylva Figueroa into Persia tells us, that in several parts of that kingdom are found vast numbers of blind people of all ages, sexes, and conditions; by reason of a species of little flies which prick the eyes and lips, and enter the nostrils, carrying certain blindness with them when they light on the eyes.

BLINDNESS, in *Farriery*, is a disease incident to horses, especially those of an iron gray or dapple-gray colour, when ridden too hard or backed too young. It may be discovered by the walk or step, which in a blind horse is always uncertain and unequal, because he dares not set down his feet boldly when led in one's hand; though if the same horse be mounted by an expert horseman, and the horse of himself be mettled, the fear of the spur will make him go more freely; so that his blindness can hardly be perceived. Another mark whereby a horse may be known to have lost his sight is, that upon hearing anybody enter the stable, he will prick up his ears, and move them backwards and forwards, as mistrusting every thing and being in continual alarm by the least noise. Dr Lower first showed the cause of the ordinary blindness in horses, which

Digitized by Google

which is a spongy excrescence, growing in one, sometimes in two or three places of the *uvea*, which being at length overgrown, covers the pupil when the horse is brought into the light, though in a dark stable it dilates again.

BLINKS, among ancient sportsmen, denoted boughs broken down from trees, and thrown in the way where deer are likely to pass, to hinder their running, or rather to mark which way a deer runs, in order to guide the hunter.

BLINKING OF BEER, in Lincolnshire, signifies letting the wort stand for some time in the vat, till it hath acquired some degree of acidity, in order to dispose it to fine, and be the sooner ready for drinking.

BLISSOM, among husbandmen, corruptly called *blossom*, is the act of a ram when coupling with an ewe.

BLISTER, in *Medicine*, a thin bladder containing a watery humour, whether occasioned by burns and the like accidents, or by vesicatories applied to different parts of the body for that purpose.

BLITE. See BLITUM, BOTANY *Index*.

BLITH, a town of Nottinghamshire, in England, seated in W. Long. 0. 55. N. Lat. 53. 25.

BLITUM, BLITE, *Strawberry Spinach*. See BOTANY *Index*.

BLOATING, a puffing up or inflation of the exterior habit of the body, lodged chiefly in the adipose cells. It is the same with what physicians call an *emphysema*.

BLOCH, MARK ELEAZER, a German naturalist of Jewish extraction. See SUPPLEMENT.

BLOCK is used for a piece of marble as it comes out of the quarry, before it has assumed any form from the hand of a workman.

BLOCK, in the mechanic arts, a large piece of solid wood whereon to fasten work or to fashion it; strength and stability being the requisite properties. In this sense, we say a *chopping block; a sugar-finer's block; a smith's block*, on which his anvil is fastened, &c.

BLOCK, among cutters in wood, is a form made of pear-tree, box, or other hard and close-grained wood, free from knots, on which they cut their figures in relievo with knives, chissels, &c.

BLOCK, in *Falconry*, denotes the perch whereon a bird of prey is kept. This is to be covered with cloth.

BLOCKS, in sea-language, are pieces of wood belonging to ships, in which the shivers of pulleys are placed, and wherein the running-ropes go. Of these some are single, some double; and some have three, four, or five shivers in them. They are named and distinguished by the ropes they carry, and the uses they serve for.

BLOCK Machinery; machinery lately introduced into the naval dock-yards of Britain for manufacturing blocks. See SUPPLEMENT.

Mounting-BLOCK, an eminence usually of stone, cut in steps or notches, serving as a help to mount on horseback. These were much in use among the ancients, who were unacquainted with stirrups. The Romans erected them at proper stations along all their great roads.

BLOCK, *Daniel*, portrait painter, was born at Stettin in Pomerania in 1580, and gave early proofs of a good genius; which induced his parents to place him as a disciple with Jacob Scherer, a master capable of giving him the best directions, to qualify him for proceeding successfully in his profession. He chiefly painted portraits, in which (according to Sandrart) he was very eminent, and had the honour to paint the portraits of Christian IV. king of Denmark, and of Gustavus Adolphus king of Sweden. The extraordinary merit of this master recommended him to the esteem of the prince of Mecklenburg, who retained him in his service for 44 years; and by order of that prince, he painted the portraits of his whole family at full length, as large as life, and in the antique habit; by which works his reputation was established effectually. By the agreeable manner of his colouring, and the easy attitudes of his figures, his paintings became so acceptable to all persons of rank, that before the decline of life, he had acquired a very large fortune; but unfortunately he lost it all, in the compass of a few hours, by the sudden irruption of a plundering party, and with great difficulty his own life was preserved. He died in 1661.

BLOCKADE, in the art of war, the blocking up a place, by posting troops at all the avenues leading to it, to keep supplies of men and provisions from getting into it; and by these means to starve it out. See BLOCKADE, SUPPLEMENT.

To raise a BLOCKADE, is to force the troops that keep the place blocked up from their posts.

BLOCKLAND, ANTHONY DE MONTFORT, history and portrait painter, was born of a noble family at Montfort in 1532. He learned the art of painting in the school of Francis Floris, whose manner he always followed; and became an artist of great distinction, by endeavouring principally to imitate the taste of the Roman school in design and composition. His genius was best adapted to grand compositions, of which he designed many; some at Delft, but more at Utrecht. His designs had grandeur, the airs of his heads were noble, and the profiles of his female figures approached near to the taste of Parmigiano. Several of his works are in so good a taste, and particularly a Venus, and the history of Joseph and his brethren, that they seem to have been painted by a master educated in the school of Florence. He died in 1583.

BLOCZIL, a fortress of Overyssel in the United Provinces, seated on the river A, at the place where it falls into the Zuyder Zee. It has a port sufficient to contain 200 vessels, and serves to defend those ships that cross the sea. Its fortifications, which were considerable, have been allowed to fall to decay. E. Long. 6. 0. N. Lat. 52. 44.

BLOEMART, ABRAHAM, painter of landscape, cattle, history, and portrait, was born at Gorcum in 1564, according to Houbraken: but according to Sandrart, whose authority seems to claim the preference, he was born in 1567, and lived mostly at Utrecht. In his youth he applied himself diligently to design after the works of Francis Floris, and afterwards received instructions from several artists of no great repute; but the power of his own genius proved his principal director in the art of painting. He formed a manner peculiar to himself, making nature his model for many of the objects he painted, particularly his cattle, in which he excelled. He died in 1647. He left four sons

Digitized by Google

sons who were all of them artists; but the most famous was *Cornelius*, the subject of the following article.

Bloemart, *Cornelius*, the youngest son of Abraham, was born in 1603 at Utrecht. The first principles of drawing and painting he learned from his father; but his natural inclination for the art of engraving was so powerful, that he applied himself wholly to the pursuit of it. He first studied under Crispin de Pas, an engraver much more famous for the neatness than the good taste of his works. Not satisfied with what he learned from this artist, he went to Rome, in order to perfect himself from the works of the greatest masters: And in that city (where the far greater part of his engravings were made) he died in a very advanced age.—" The manner of engraving, adopted by this excellent artist, appears to me (says Mr Strutt) to be not only quite original, but the source from which we may trace that style in which the greatest and best French masters excelled; those I mean who worked with the graver only. He covered the lights upon his distances, and the other parts of his plates which required tinting, with great care. The lights, whether on the distant hills, trees, buildings, or figures, in the engravings prior to his time, had been left quite clear, and by so many white spots scattered in various parts of the same design, the harmony was destroyed, the subject confused, and the principal figures prevented from relieving with any striking effect. By this judicious improvement, Bloemart gave to his prints a more clear and finished appearance, than all the laboured neatness even of Jerom Wierix had been able to produce. He drew correctly: but from his style of engraving, which was executed entirely with the graver, the extremities of his figures are heavy, and his heads are not always equally beautiful or expressive. With respect to the mechanical part of the works, few indeed have excelled him, either in clearness, or freedom of execution. His great fault, however, is want of variety. The naked parts of his figures, the draperies, and the back-ground, are equally neat, and engraved precisely in the same manner. Hence the effect is flat; and the flesh, for want of sufficient distinction, appears cold and silvery. His works are justly held in high estimation. They are very numerous, and many of them difficult to be procured."

BLOIS, a town of France, in the department of Loire and Cher, is seated on the banks of the river Loire, partly on a plain, and partly on an eminence, in the midst of one of the most agreeable countries of France. The castle is the ornament of this city. At the first view, it seems to be two distinct buildings; but it is joined by a passage cut out of the rock. Joining to this, on the west side, is the tower of *Chateau Regnaud*, so called because that lordship may be discovered from hence, though 20 miles distant. At the east end of this is another small tower, which is partly ancient and partly modern. That part of the castle which was built by the duke of Orleans, in the room of that which he demolished in 1632, is a superb edifice, but unfinished. The court, before it, where the church of St Saviour is built, is very large, and was formerly used for tournaments. The most remarkable thing in this castle is a fine long gallery, adorned with many curious and uncommon pieces; it is in the midst of two gardens, one of which is full of fruit-trees, and the other of parterres, fountains, cascades, and marble statues brought from Italy. Beyond these, there is a large park, where there is game in abundance. On all the gates of the city there is the image of the Virgin Mary, who they believe freed them from the plague in 1631. There are several parish-churches, chapters, and religious houses for both sexes. The church of St Solenne is the cathedral, and is the handsomest in the city. The front of the Jesuits church is decorated with three orders of architecture, the Doric, Ionic, and Corinthian; but there is only the Doric on the inside. The town-house is a tolerable building, and stands in a street which terminates at the quay, where there is a public walk that has a fine prospect on the Loire, over which there is a bridge that leads to the suburbs of Vienna. There are a few houses on the bridge, and a tower at each end to guard the entrance. About three quarters of a mile from the city, the water runs down the clefts of a rock into a large aqueduct, by which it is conveyed to a reservoir near the walls, and from hence distributed by leaden pipes to the several parts of the city. The country about Blois produces corn, wine, cattle, and game of every kind, and the waters a great quantity of fish. The meadows are so rich and fertile, that the cows yield excellent milk, good in consumptive cases, and which affords the best cream in the kingdom. About a league from Blois, there are mineral springs, which have the same virtues as those of Forges. The trade of Blois is chiefly in wine and brandy; but they also make some serges and stuffs at this place. It contained 13,000 inhabitants in 1815. Several kings have kept their courts at Blois; for which reason they speak the French language in perfection. E. Long. 1. 30. N. Lat. 47. 35.

BLOMARY, or Bloomary, in *Metallurgy*, the first forge through which iron passes, after it is melted out of the ore.

BLOEMEN, Peter Van, a celebrated painter, born at Antwerp, was brother to John Francis Van Bloemen, called by the Italians Orizonti, and lived for several years at Rome along with his brother. As soon as he found himself competently skilled in colouring and penciling, as well as in designing, he returned to his native city, where, in the year 1699, he was appointed director of the academy. The composition of this master is rich, and his pictures are generally filled with a number of figures. His subjects are, the marchings of squadrons of cavalry, encampments, artillery, battles, Italian fairs, markets, and festivals; in which he shewed great correctness in his design and in his drawing; and an elegance in the manner of dressing his figures, whom he frequently represented in oriental habits. He designed horses in an admirable style; and in his battles gave them abundance of spirit, graceful attitudes, and an expression that was full of life and nature. His landscapes are enriched with elegant architecture, with basso-relievos, and mutilated statues, in a noble taste; and rendered still more pleasing by a good tone of colour, by animals of different kinds, and excellent figures.—His best works are admired in all parts of Europe, and afford large prices: but it is to be observed, that some of his pictures seem rather to be too

Digitized by Google

too much laboured or stiff, and (according to the artists phrase) smell of the palette; and those are proportionably less estimable.

BLOEMEN, *John Francis Van*. See ORIZONTI.

BLOEMEN, *Norbert Van*, brother of the preceding, was a painter of portraits and conversations; but in merit was very inferior to his brothers, although he had a good deal of employment.

BLOND, CHRISTOPHER LE, painter of portraits in miniature and all kinds of subjects on paper, was born in 1670. Very few circumstances relative to his education or life are mentioned by any writers till he was known at Rome in the year 1716, being at that time painter to the Count Martinetz, ambassador at the court of Rome. By the solicitation of Overbeke he was induced to go to Amsterdam, and in that city was employed to paint small portraits for bracelets, rings, and snuff-boxes; of which, although they were painted in water-colours, yet the colouring was as lively and natural as if they had been painted in oil. However, as he found his sight much impaired by the minuteness of his work, he discontinued water-colour painting, and attempted the use of oil with a reasonable degree of success. After he had resided for some years in the Low Countries, he went to England, and set up a new method of printing mezzotinto plates in colours so as to imitate the pictures of which they were copies. In this manner he executed in England, several large plates, from pictures of the greatest masters, and disposed of the prints by lottery. But those who obtained the prizes (Mr Strutt says) appear not to have held them in any very great estimation. "The prints (he adds) certainly possess some merit, exclusive of their novelty; but, in general, the colours are flat and dirty; the effect is neither striking nor judiciously managed; and the drawing is frequently very incorrect, especially in the extremities of his figures." Mr Pilkington speaks of them with greater approbation. "The artist (he says) imitated his models with so much skill, such exact resemblance, such correctness of outline, such similarity of colour and expression, that at first they amazed every beholder, who viewed them at a proper distance; and many of those prints are still extant, which are much esteemed by persons of good taste." And Mr Walpole observes, that some heads, coloured progressively, according to their several gradations, bear witness to the success and beauty of his invention. He had another merit to the public, with which few inventors begin; for he communicated his secret in a thin quarto, entitled *Coloritto*, or "The harmony of colouring in painting reduced to mechanical practice, under easy precepts and infallible rules." His method was performed by several mezzotinto plates for one piece, each expressing different shades and parts of the piece in different colours. He was not, however, it is said, the original inventor of that manner of managing colours, but took it from Lastman and others, who, with much greater regularity of morals, equal capacities, and more discreet conduct, had before undertaken it without success. Le Blond, whose head was continually full of schemes, next set on foot a project for copying the cartoons of Raphael in tapestry, and made drawings from the pictures for that purpose. Houses were built and looms erected at the Mulberry Ground at Chelsea; but the expences being too great, or the contributions not equal to the first expectations, the scheme was suddenly defeated, and Le Blond disappeared, to the no small dissatisfaction of those who were engaged with him. From hence he went to Paris, where, Basan informs us, he was in the year 1737; and in that city he died, 1740, in an hospital. Le Blond was also author of a treatise, in French, on ideal beauty. It was published in 1732, and has since been translated into English.

BLONDEL, DAVID, a Protestant minister, distinguished by his skill in ecclesiastical and civil history, was born at Chalons sur Marne, and was admitted minister at a synod of the Isle of France, in 1614. He wrote, 1. A defence of the reformed churches of France. 2. A work against the decretal epistles. 3. *De Episcopis et Presbyteris;* and other pieces. Bayle informs us, that he had a very singular way of studying; he lay on the ground, and had round about him the books which he wanted for the work he was about. He died in 1665, aged 64.

BLONDEL, *Francis*, regius professor of mathematics and architecture, was employed in several negociations, arrived at the dignity of marshal de camp and counsellor of state, and had the honour of being chosen to teach the dauphin the mathematics; he was also made member of the Academy of Sciences at Paris, and director of the Academy of Architecture. He died at Paris in 1688, aged 68. He wrote, 1. Notes on the Architecture of Savot. 2. A course of architecture and mathematics. 3. The art of throwing bombs. 4. A new manner of fortifying places. 5. A comparison between Pindar and Horace; and other works.

BLONDUS, FLAVIUS, an historian born at Forli, in Italy, in 1388, was secretary to Eugenius IV. and other popes. He composed a great many books; and, among others, a History from the year 400 to 1440. He died in 1463.

BLONIEZ, a town of Poland, in the province of Warsovia. E. Long. 20. 35. N. Lat. 52. 0.

BLOOD, a red liquor circulating through the vessels of the human body and the bodies of the larger animals, which appears immediately and essentially necessary to the preservation of life.

1 No animal without some liquid equivalent to blood.

Though there is no living creature as yet known whose life doth not immediately depend upon the circulation of some kind of fluid through its vessels, yet unless such fluid is of a red colour, it does not obtain the name of *blood*; and therefore such creatures as have a colourless or milky liquor circulating through their vessels, are called *exsanguious animals*.

2 Blood of different thickness in different animals.

The blood has a very different degree of thickness or viscidity in different animals, and even in the same animal at different times. Though it is in all cases endowed with a considerable degree of tenacity, yet in strong animals that tenacity is remarkably greater than in weak ones; and hence the blood of bulls was made use of by the ancients as a poison, its extreme viscidity rendering it totally indigestible by the powers of the human stomach. It is well known also by physicians, that there are some states of the human body in which the blood becomes vastly tenacious, so as in a great measure to refuse any intimate connection with water; and others, in which its crasis is almost totally dissolved, so as to appear, when drawn out of the body, like a fluid and half putrid mass. See MEDICINE *Index*.

3 That of bulls anciently used as a poison.

The

Blood.

4 Appearance of the blood when drawn from a vein.

The common appearance of the blood when drawn from a vein of the human body is well known. It first seems a homogeneous red liquor; then it consolidates into one uniform mass; in a little time, a yellowish watery liquor begins to separate from it, which is more or less in quantity according to the state in which the blood happens to be; the red mass, in the mean time, contracts greatly in its dimensions, and increases in solidity. But this increase of solidity is likewise proportional to the state of the blood at the time: in strong people, if attacked with a violent inflammatory disease, the solid part is exceedingly tough, insomuch that Dr Huxham says he has sometimes found it almost like a piece of flesh itself; whereas, in other diseases, the solid part is very soft and tender, breaking in pieces with the slightest touch. The spontaneous separation of the blood into crassamentum, serum, and coagulable lymph, hath been already taken notice of under ANATOMY. See ANATOMY *Index*.

5 Blood chemically analysed.

The attention of physiologists hath been very much engaged by enquiries into the nature and composition of the blood, and accordingly it hath been examined in all possible ways. By a chemical analysis, it discovers the same principles with other animal substances; giving over in distillation a great quantity of phlegm, a volatile spirit, with much fetid oil; after which, there remains a charred matter, that, burnt in an open fire, leaves a white earth similar to calcined hartshorn.

6 Contains an acid, according to some chemists.

Some eminent chemists, Mr Homberg particularly, have asserted that blood contains an acid as well as an alkali, but that the former doth not arise till towards the end of the distillation: but what is very singular, and indeed must throw no small suspicion on the whole account is, that the acid and alkali, notwithstanding their great tendency on all other occasions to unite with each other, do here remain separate, so that the liquor may be even redistilled without their forming any neutral compound.

7 Experiment in confirmation of this.

An experiment in confirmation of this is recorded in the memoirs of the Royal Academy for 1712. Six pounds of human blood distilled to dryness with a gentle heat, were reduced to a pound and a half; after which, the mass was urged with a graduated fire, till the retort at last became red hot. The produce was 17 ounces of liquor; 12 of which were a red and very empyreumatic volatile spirit, the other five were oil. The caput mortuum was a light coal weighing four ounces and a half. On rectifying the volatile spirit in a small retort, about an ounce of red fetid liquor remained, which had a very acid smell, and turned the juice of tournsol red. Mr Homberg now imagined, that the acid contained in the blood of animals could not disengage itself perfectly by these distillations without addition. He therefore determined to distil human blood with an admixture of some other substance; but as earths contain a salt, which might render the operation uncertain, he determined to use only the caput mortuum of a former distillation of the same substance. For this purpose, four pounds of a coagulum of human blood being well mixed with a large quantity of this residuum, and the whole dried in the sun, it was put into a retort, and distilled with a fire, raised, towards the end of the operation, to the utmost violence. The oil being separated from the volatile spirit, the latter was rectified; and the consequence was, that there came over four pounds of a red acid liquor, that turned the tincture of tournsol very red. All the distillations of the aqueous liquors already mentioned, obtained by similar processes, being mixed together, and separated from their yet remaining oil, by careful dilution with water and filtration, they were at length distilled together; the liquor that came over was clear as water, and its first quantities contained a great deal of volatile salt, but the last two ounces were found to be as sour as distilled vinegar.—The same products were obtained from the blood of carnivorous animals, as well as from that of animals feeding solely upon vegetables.

8 Dr Lewis's account of the blood.

In Dr Lewis's notes on Newman's Chemistry we have the following account of the blood, and the parts into which it may be resolved. "Recent blood is equally fluid, and in taste somewhat saline. Viewed by a microscope, it appears composed of numerous red globules swimming in a transparent fluid. On standing for a little time, it separates into a thick crassamentum and fluid serum. By agitation, it continues fluid: A consistent polypous matter adheres to the stirrer, which by repeated ablution with water becomes white.—Received from the vein in warm water, it deposites a quantity of transparent filamentous matter, the red portion continuing dissolved in the water. On evaporating the fluid, a red powdery substance is left.—It congeals by frost, and becomes fluid again by warmth; after liquefaction, it quickly putrefies.—Fluid and florid blood, exposed to a temperate air, putrifies sooner than such as is more dense. Inspissated to dryness, it leaves a dark-coloured mass, amounting, at a medium, to about one fourth of the weight of the blood, of a bitter saline taste, easily inflammable, burning with a bluish flame. The exsiccated blood is not soluble in acid or alkaline liquors; but gives some tincture to water and to spirit of wine, and is more powerfully acted upon by dulcified spirit of nitre. Recent blood is coagulated by the mineral acids, and by most of the combinations of them with earthy and metallic bodies. With vegetable acids, and with solutions of neutral salts, it mingles equably without coagulation. Alkalies, both fixed and volatile, render it more fluid, and preserve it from coagulating.

"The serum of blood is more saline than the crassamentum, and does not so speedily putrefy. It freezes somewhat more difficultly than pure water; and its aqueous part evaporates, by a gentle warmth, somewhat more readily, leaving about one-twelfth of the weight of the serum of a solid yellowish pellucid matter. Exposed to heat a little greater than that of the human body, it coagulates into a solid mass, without any considerable evaporation. Both this coagulum and the inspissated serum are readily inflammable in the fire, not dissoluble in water, or in spirits of wine, in acid or in alkaline liquors."

9 Texture of the blood according to Leeuwenhoek.

But the texture of the blood discoverable by a microscope, hath engaged the attention of the learned much more than the chemical analysis ever did. Leeuwenhoek was the first who discovered, or fancied he discovered, that the blood, as it exists in the body of an animal, consists of a quantity of red globular particles swimming in a large quantity of transparent liquor. Each of these globules, he imagined, was composed of six smaller ones packed together. While the six continued to adhere, their colour was red; but when separated,

Digitized by Google

Blood.

parated, they became yellow, and thus formed what is called the *serum*. He even pretended to have discovered that each of the serous globules consisted of six smaller ones, and that these when broken down constituted some more subtile and penetrating liquor than the serum, &c. This was for a long time received almost universally as an undoubted fact; and many theories were built upon it, and elaborate calculations made, of which (we hope) no account needs now be given, as the falsity of these pretended discoveries is generally allowed.

10 According to Father de Torre.

Father de Torre, with microscopes which he pretended were capable of magnifying to an incredible degree, found that the red particles of the blood were of an annular figure, with a perforation in the middle; and that the ring itself was formed of several joints. Some of these extraordinary magnifiers, however, being sent over to England, those who were appointed by the Royal Society to make trial of them found them totally useless, so that the credit of Father de Torre's discoveries must have rested principally on his own evidence.

11 According to Mr Hewson.

The falsity of his hypothesis, as well as that of Leeuwenhoek, was detected by the late Mr Hewson, whose microscopical experiments on the blood being the latest that have appeared, we shall transcribe the following particular account of them, given by himself in a letter to Dr Haygarth physician in Chester.——" The red particles of the blood, improperly called *globules*, are flat in all animals, and of very different sizes in different animals. In man they are small, as flat as a shilling, and appear to have a dark spot in the middle. In order to see them distinctly, I dilute the blood with fresh serum. My predecessors, not having thought of this, could not see them distinctly. And Leeuwenhoek in particular, imagining a round figure fittest for motion, concluded they must be round in the human body; though he and others allowed that in frogs, &c. where they viewed them distinctly from the blood being thinner, they were flat. Now I prove that they are flat in all animals. In the human blood, where these particles are small, it is difficult to determine what that black spot is which appears in the centre of each. Some have concluded that it was a perforation: but in a frog, where it is six times as large as in a man, it is easy to show that it is not a perforation, but on the contrary is a little solid, which is contained in the middle of a vesicle. Instead, therefore, of calling this part of the blood red *globules*, I should call it red *vesicles;* for each particle is a flat vesicle, with a little solid sphere in its centre.

" I find that the blood of all animals contains vesicles of this sort. In human blood there are millions of them; and they give it the red colour. But in insects they are white, and less numerous in proportion than in man and quadrupeds. As they are flat in all animals, I suspect that shape is a circumstance of importance, but can be altered by a mixture with different fluids. And I find that it is by a determinate quantity of neutral salt contained in the serum that this fluid is adapted to preserving these vesicles in their flat shape: for, if they be mixed with water, they become round, and dissolve perfectly; but add a little of any neutral salt to the water, and they remain in it, without any alteration in their shape, and without dissolving.

" Now, when it is considered, that the blood of all animals is filled with these particles, we must believe that they serve some very important purpose in the animal economy; and since they are so complicated in their structure, it is improbable they should be made by mechanical agitation in the lungs or blood-vessels, as has been suspected, but probably have some organs set apart for their formation. This I shall endeavour to prove, when I have explained their structure a little more particularly, and mentioned the manner in which I exhibit it. I take the blood of a toad or frog, in which they are very large; I mix it with the serum of human blood to dilute it; I find them appear all flat; so they do in the blood-vessels of this animal, as I have distinctly seen in the web between its toes, whilst the animal was alive and fixed in the microscope. Their appearance in these animals is not unlike slices of cucumber. I next mix a little of the blood with water, which immediately makes them all round, and then begins to dissolve them whilst they are round. I incline the stage of the microscope, so as to make them roll down it; and then I can distinctly see the solid in the middle fall from side to side like a pea in a bladder. A neutral salt added to them at this time brings them back to their flat shape: but if the salt be not added, the water gradually dissolves away the vesicle; and then the little sphere is left naked. Such is the composition of these particles. I have exhibited these experiments to a considerable number of my acquaintance, who all agree in their being satisfactory.

" The microscope I use is a single lens, and therefore as little likely to deceive us as a pair of spectacles, which, as is allowed by all who use them, do not disfigure objects, but only represent them larger.

" From farther experiments, I am convinced, that the use of the thymus and lymphatic glands is to make the middle solid pieces: and I can prove it in as satisfactory manner as you can do the use of any viscus in the human body; that is, by opening these glands, and examining the fluid contained in their cells, which I find to be full of these little solids. I moreover find, that the lymphatic vessels take them up from those glands, and convey them into the blood-vessels, which carry them to the spleen, in whose cells they have the vesicles laid over them; so that the thymus and lymphatic glands make the central particles, and the spleen makes the vesicles that surround them. That this is the use of the spleen appears from examining the lymph which is returned from its lymphatic vessels; for that lymph, contrary to what is observed in other parts of the body, is extremely red.

" But besides having these glands set apart for making the red vesicles of the blood, I find that they are also made in the lymphatic vessels in different parts of the body, whose coats have blood-vessels properly constructed for this secretion. So that the thymus and lymphatic glands are no more than appendages of the lymphatic system, for making the middle particles; and the spleen an appendage to the lymphatic vessels, for making the vesicles which contain these middle particles.

" I conjecture that it is the coagulable lymph which is converted into this red part of the blood, from a curious fact that has long been known: namely, that the blood in the splenic vein does not coagulate when exposed

Digitized by Google

Blood.

posed to the air, as the blood of other veins does; so that it seems to be robbed of its coagulable lymph in passing through the spleen.

"It is very remarkable, that the spleen can be cut out of an animal, and the animal do well without it. I made the experiment on a dog, and kept him a year and a half without observing his health to be in the least impaired. From this some have concluded the spleen to be an useless weight; which is absurd, when we consider that all animals with red blood have it. Therefore it is more consistent with what we know of the animal economy, to conclude, that since an animal can do well without it, there is probably some part of the body that can supply its place.

"Insects have vesicles constructed in a similar way to ours, but differing in colour. But insects have neither spleen, thymus, nor lymphatic glands; and therefore in them probably these vesicles are entirely fabricated in the lymphatic vessels. But to us, and other of the more perfect animals, besides the lymphatic vessels, nature has given those glands, that a proper quantity of these important vesicles might be the better secured to us; just as she has given us two ears, the better to secure us hearing through life, though we can hear perfectly well with one."

12 Objection to his hypothesis.

This letter, we apprehend, contains the strength of Mr Hewson's evidence for his hypothesis; on which we shall only remark, that if the red globules are prepared in the manner above mentioned, and the lymphatic vessels are excretories of those glands where the red particles are formed; then if there is any vessel where all these excretories unite, in that vessel the lymph ought to appear very red, on account of the accumulated quantity of red globules brought thither from all parts of the body. But no such redness seems ever to have been taken notice of by any anatomist: this therefore must be an objection to Mr Hewson's hypothesis; and such a one, perhaps, as will not be easily removed.

13 Opinion of Dr Wilson.

Many other hypotheses have been invented concerning the formation of the red blood, and various opinions delivered concerning its red colour. In a lecture delivered at Newcastle in 1773, by Dr Wilson of that place, he asserts "that it is self-evidently the office of the veins to elaborate the fluids into that form and composition which we know by the name of *red blood*." The self-evidence, here, however, is by no means apparent to us; nor doth he at all point it out in an intelligible manner.—Dr Cullen, in his physiological part of The Institutions of Medicine, acknowledges that we know but little of the formation of any of the animal fluids; and concerning the microscopical observations, &c. on the blood, he gives his opinion in the following words, § ccliv. "The red globules have been considered as an oily matter, and from thence their distinct and globular appearance has been accounted for: but there is no direct proof of their oily nature; and their ready union with, and diffusibility in, water, renders it very improbable. As being microscopical objects only, they have been represented by different persons very differently. Some have thought them spherical bodies, but divisible into six parts, each of which in its separate state was also spherical; but other persons have not observed them to be thus divisible. To many observers they have appeared as perfectly spherical; while others judge them to be oblate spheroids, or lenticular. To some they have appeared as annular, and to others as containing a hollow vesicle. All this, with several other circumstances relating to them, very variously represented, show some uncertainty in microscopical observations; and it leaves me, who am not conversant in such observations, altogether uncertain with respect to the precise nature of this part of the blood. The chemical history of it is equally precarious; and, therefore, what has been hitherto said of the production and changes happening to these red globules, we choose to leave untouched.—We suppose that the red globules, when viewed singly, have very little colour; and that it is only when a certain number of them are laid upon one another, that the colour appears of a bright red: but this also hath its limits; so that when the number of globules laid on one another is considerable, the colour becomes of a darker red. Upon this supposition, the colour of the mass of blood will be brighter or darker as the colouring part is more or less diffused among the other parts of the mass; and we think this appears to be truly the case from every circumstance that attends the changes which have been at any time observed in the colour of the blood."

14 Of Dr Cullen.

15 He accounts for the colour of the blood from the number of red particles contained in it.

16 Colour of the blood accounted for from the action of the air.

Concerning the uncertainty of microscopical as well as chemical experiments, we shall not dispute; though the conclusion against them seems carried too far. But with regard to the colour of the blood, we apprehend it hath been known, almost, if not altogether, since the discovery of the circulation, that the florid or dark colour depends on the presence or absence of air, and not upon any number of globules. Thus the blood returning from the veins is of a dark colour. Though diluted with the fresh chyle from the subclavian vein, it continues of the same dark colour till it passes through the lungs, upon which it instantly assumes a very florid red; but it can never be proved that the globules in the pulmonary vein are at all less numerous than in the pulmonary artery.—That this change of colour may be effected by the air through membranes much thicker than we can suppose the vessels of the lungs to be, has been demonstrated by Dr Priestley, but whether the change is occasioned by the mere separation of some principle from the blood, or by the absorption of another in its stead, is not yet determined, though the latter is indeed acknowledged by Dr Priestley himself to be the more probable opinion. He even supposes the redness to be owing to a portion of dephlogisticated air absorbed in the lungs. It must therefore be the elastic principle of this air, which is absorbed, while the other combined with part of the phlogiston emitted by the blood is converted into fixed air.

17 Uses of the blood in animals.

18 The vital principle thought by some to reside in the blood.

This leads us to consider the uses to which the blood is subservient in the animal economy, and the changes that happen to it in respiration. The uses of this fluid are so various, and of such an important nature, that some have not scrupled to affirm the blood to be actually possessed of a living principle, and that the life of the whole body is derived from it. This opinion was first broached by the celebrated Harvey, the discoverer of the circulation: but in this he was never much followed; and the hypothesis itself, indeed, has been pretty much laid aside and neglected, till of late that it was revived by Mr J. Hunter, professor of anatomy

19 Mr Hunter's arguments in favour of this opinion.

in London. This gentleman supports his opinion by the following arguments: 1. The blood unites living parts, in some circumstances, as certainly as the yet recent juices of the branch of one tree unite it with that of another. Were either of these fluids to be considered as extraneous or dead matters, he thinks they would act as stimuli, and no union would take place in the animal or vegetable kingdom. This argument, Mr Hunter imagines, is still farther established by the following experiment. Having taken off the testicle from a living cock, he introduced it into the belly of a living hen. Many weeks afterwards, upon injecting the liver of the hen, he injected the testicle of the cock; which had come in contact with the liver, and adhered to it. He alleges, that in the nature of things, there is not a more intimate connection between life and a solid, than between life and a fluid. For although we are more accustomed to connect it with the one than the other, yet the only real difference which can be shown between a solid and a fluid is, that the particles of the one are less moveable among themselves than those of the other. Besides, we often see the same body fluid in one case and solid in another. 2. The blood becomes vascular like other living parts. Mr Hunter affirms, that, after amputations, the coagula in the extremities of arteries may be injected by injecting these arteries; and he has a preparation in which he thinks he can demonstrate vessels rising from the centre of what had been a coagulum of blood, and opening into the stream of the circulating blood. 3. Blood taken from the arm in the most intense cold which the human body can bear, raises the thermometer to the same height as blood taken in the most sultry heat. This he considers as a strong proof of the blood's being alive; as living bodies alone have the power of resisting great degrees both of heat and cold, and of maintaining in almost every situation, while in health, that temperature which we distinguish by the name of *animal heat*. 4. Blood is capable of being acted upon by a stimulus. In proof of this, he observes, that it coagulates from exposure, as certainly as the cavities of the abdomen and thorax inflame from the same cause. The more it is alive, that is, the more the animal is in health, it coagulates the sooner on exposure; and the more it has lost of its living principle, as in the case of violent inflammations, the less is it sensible to the stimulus produced from its being exposed, and it coagulates the later. 5. The blood preserves life in different parts of the body. When the nerves going to a part are tied or cut, the part becomes paralytic, and loses all power of motion; but it does not mortify. If the artery be cut, the part dies, and mortification ensues. What keeps it alive in the first case? Mr Hunter believes it is the living principle which alone can keep it alive; and he thinks that this phenomenon is inexplicable on any other supposition, than that life is supported by the blood. 6. Another argument he draws from the case of a fractured os humeri he had occasion to observe. A man was brought into St George's hospital for a simple fracture of the os humeri, and died about a month after the accident. As the bones had not united, Mr Hunter injected the arm after death. He found that the cavity between the extremities of the bones was filled up with blood which had coagulated. This blood was become vascular. In some places it was very much so. He does not maintain that all coagulated blood becomes vascular: and indeed the reason is obvious; for it is often thrown out and coagulated in parts where its becoming vascular could answer no end in the system: as, for example, in the cavities of aneurismal sacs. If it be supposed, that, in such cases as that just now mentioned, the vessels are not formed in the coagulum, but come from the neighbouring arteries, he thinks it equally an argument that the blood is alive; for the substance into which vessels shoot must be so. The very idea that such a quantity of dead matter as the whole mass of blood circulates in a living body, appears to him absurd.

20 Nervous system alone thought by some to contain the vital principle.

The system which at present stands opposed to that of Mr Hunter, considers the brain and nervous system as the fountain of life; and that, so far from receiving its life from the blood, the nervous system is capable of instantaneously changing the crasis of the blood, or any other animal fluid; and though the nervous system cannot continue its action for any length of time if the action of the blood-vessels is suspended, yet the heart and blood-vessels cannot act for a single moment without the influence of the nervous fluid. Hence, say they, it is plain, we must suppose the nervous system, and not the blood, to contain properly the life of the animal, and consequently to be the principal vital organ. The secretion of the vital fluid from the blood by means of the brain, is, by the supporters of this hypothesis, denied. They say, that any fluid secreted from the blood must be aqueous, inelastic, and inactive; whereas the nervous fluid is full of vigour, elastic, and volatile in the highest degree. The great necessity for the circulation of the blood through all parts of the body, notwithstanding the presence of the nervous fluid in the same parts, they say is, because some degree of tension is necessary to be given to the fibres, in order to fit them for the influx of the nervous fluid; and this tension they receive from the repletion of the blood-vessels, which are everywhere dispersed along with the nerves.

21 Decisive arguments in favour of Mr Hunter's opinion.

To follow this dispute through every argument that hath been, or that may be, used by both parties, would prove tedious, and to us appears in a great measure unnecessary, as the following short considerations seem to decide the matter absolutely against the patrons of the nervous system. In the first place, then, if we can prove the life of the human body to have existed in, or to have been communicated from a fluid to the nervous system, the analogical argument will be very strongly in favour of the supposition that the case is so still. Now, that the case once was so, is most evident; for the human body, as well as the body of every other living creature, in its first state, is well known to be a gelatinous mass, without muscles, nerves, or blood-vessels. Nevertheless, this gelatinous matter, even at that time, contained the nervous fluid. Of this there can be no doubt, because the nerves were formed out of it, and had their power originally from it; and what is remarkable, the brain is observed to be that part of the animal which is first formed. Of this gelatinous fluid we can give no other account, than that it was the nutritious matter from which the whole body appears to be formed. At the original formation of man, and other animals, therefore, the nutritious matter was the substratum of the whole body, consisting of muscles, nerves, blood-

Blood.

blood-vessels, &c. nay more, it was the immediate efficient cause of the nervous power itself. Why should it not be so now as well as then! Again, in the formation of the embryo, we see a vital principle existing as it were at large, and forming to itself a kind of regulator to its own motions, or a habitation in which it chooses to reside, rather than to act at random in the fluid. This habitation, or regulator, was undoubtedly the nervous system, and continues so to this moment; but at the same time, it is no less evident that a nutritious fluid was the immediate origin of these same nerves, and of that very nervous fluid. Now we know, that the fluid which in the womb nourishes the bodies of all embryo animals, is necessarily equivalent to the blood which nourishes the bodies of adult ones; and consequently, as soon as the blood became the only nutritious juice of the body, at the same time the vital or nervous fluid took up its residence there, and from the blood diffused itself along the nerves, where it was regulated exactly according to the model originally formed in the embryo. Perhaps it may be said, that the vital power, when once it hath taken possession of the human or any other body, requires no addition or supply, but continues there in the same quantity from first to last. If we suppose the nervous power to be immaterial, this will indeed be the case, and there is an end of reasoning upon the subject; but if we call this power a volatile and elastic fluid, it is plain that there will be more occasion for recruits to such a power than to any other fluid of the body, as its volatility and elasticity will promote its escape in great quantities through every part of the body. It may also be objected, that it is absurd to suppose any fluid, or mechanical cause, capable of putting matter in such a form as to direct its own motions in a particular way: but even of this we have a positive proof in the case of the electric fluid. For if any quantity of this matter has a tendency to go from one place to another where it meets with difficulty, through the air for instance, it will throw small conducting substances before it, in order to facilitate its progress. Also, if a number of small and light conducting substances are laid between two metallic bodies, so as to form a circle, for example; a shock of electricity will destroy that circle, and place the small conducting substances nearer to a straight line between the two metals, as if the fluid knew there was a shorter passage, and resolved to take that, if it should have occasion to return *. Lastly, it is universally allowed, that the brain is a secretory organ, made up of an infinite number of small glands, which have no other excretories than the medullary fibres and nerves. As a considerable quantity of blood is carried to the brain, and the minute arteries end in these small glands, it follows, that the fluid, whatever it is, must come from the blood. Now, there is no gland whatever, in the human, or any other body, but will discharge the fluid it is appointed to secrete, in a very considerable quantity, if its excretory is cut. Upon the cutting of a nerve, therefore, the fluid secreted by the brain ought to be discharged; but no such discharge is visible. A small quantity of glairy matter is indeed discharged from the large nerves; but this can be no other than the nutritious juice necessary for their support. This makes it plain, even to demonstration, that the fluid secreted in the brain is *invisible* in its nature; and as we know the nervous fluid hath its residence in the brain, it is very probable, to use no stronger impression, that it is the peculiar province of the brain to secrete this fluid from the blood, and consequently that the blood originally contains the vital principle.

* See *Electricity*.

22 Vivifying spirit supposed to be derived from the air.

After it is allowed that the blood contains the vital principle, it becomes another question, not very easily solved, Whence is this vital principle derived?—For this we can only discover two sources; namely, the chyle or aliment from which the blood is prepared, and respiration. The latter hath been commonly held as the principal source of the vital principle; and, for a long time, it was generally thought that there was a kind of vivifying spirit in the air, which being absorbed by the blood at each inspiration, communicated to that fluid the quality necessary for preserving animal life. As a proof of this it was urged, that life cannot be supported without respiration, and that air which hath been often breathed ceases to be capable of supporting life; because when once it has been totally deprived of its vivifying spirit, it can communicate none to the blood in any subsequent respirations.—This doctrine, however, hath been denied, and generally thought to be exploded by modern discoveries. Dr Hales brings several experiments against it; of which the following may serve for a specimen, and which we shall give in his own words.

23 This doctrine for some time generally denied.

24 Dr Hales's experiment against a vivifying spirit. *Statical Essays*, vol. i. p. 255.

"I tied a middle-sized dog alive on a table, and, having laid bare his windpipe, I cut it asunder just below the larynx, and fixed fast to it the small end of a common fosset: the other end of the fosset had a large bladder tied to it, which contained 162 cubic inches; and to the other end of the bladder was tied the great end of another fosset whose orifice was covered with a valve that opened inwards, so as to admit any air that was blown into the bladder, but none could return that way; yet, for further security, that passage was also stopped by a spigot.

"As soon as the first fosset was tied fast to the windpipe, the bladder was blown full of air through the other fosset; when the dog had breathed the air in the bladder to and fro for a minute or two, he then breathed very fast, and showed great uneasiness, as being almost suffocated.

"Then with my hand I pressed the bladder hard, so as to drive the air into his lungs with some force; and thereby made his abdomen rise by the pressure of the diaphragm, as in natural breathings; then taking alternately my hand off the bladder, the lungs with the abdomen subsided: I continued in this manner to make the dog breathe for an hour; during which time, I was obliged to blow fresh air into the bladder every five minutes, three parts in four of that air being either absorbed by the vapours in the lungs, or escaping through the ligatures upon my pressing hard on the bladder.

"During this hour, the dog was frequently near expiring, whenever I pressed the air but weakly into his lungs; as I found by his pulse, which was very plain to be felt in the great crural artery near the groin, which place an assistant held his finger on most part of the time: but the languid pulse was accelerated so as to beat fast, soon after I dilated the lungs much by pressing hard upon the bladder; especially when the motion of the lungs was promoted by pressing alternately

Blood.

the abdomen and the bladder, whereby both the contraction and dilatation of the lungs were increased.

And I could by this means rouse the languid pulse whenever I pleased, not only at the end of every five minutes, when more air was blown into the bladder from a man's lungs, but also towards the end of the five minutes, when the air was fullest of fumes.

At the end of the hour, I intended to try whether I could have by the same means kept the dog alive some time longer, when the bladder was filled with the fumes of burning brimstone; but being obliged to cease for a little time from pressing the air into his lungs, while matters were preparing for this additional experiment, in the mean time the dog died, which might otherwise have lived longer if I had continued to force the air into the lungs.

Now, though this experiment was so frequently disturbed, by being obliged to blow more air into the bladder 12 times during the hour; yet since he was almost suffocated in less than two minutes, by breathing of himself to and fro the first air in the bladder, he would have died in less than two minutes when one-fourth of the old air remained in the bladder immediately to taint the new air admitted from a man's lungs; so that his continuing to live through the whole hour, must be owing to the forcible dilatation of the lungs by compressing the bladder, and not to the vivifying spirit of the air."

25 Dr Priestley's opinion.

Dr Priestley at first concluded from his own observations, and no doubt very justly, that air which hath been often breathed becomes pernicious by its accumulated phlogiston, stimulating the lungs, and making the animal fall into convulsions. Respiration, therefore, he supposed to be a phlogistic process, in which the blood parts with its superfluous phlogiston. He did not say, that the blood receives nothing in exchange; but rather that it may receive some nitrous principle, which gives it the red colour; but as to a vivifying spirit, he doth not appear to have the least idea of any such thing being received at that time. Nay, in his first volume, p. 277. he expressly adopts the other hypothesis, namely, that the vital principle is received from the chyle. "My conjecture (says he) is, that animals have a power of converting phlogiston, from the state in which they receive it in their nutriment, into that state in which it is called the *electrical fluid*; that the brain, besides its other proper uses, is the great laboratory and repository for this purpose; that by means of the nerves, this great principle, thus exalted, is directed into the muscles, and forces them to act in the same manner as they are forced into action, when the electric fluid is thrown in them *ab extra*.

26 Dr Hales's experiment inconclusive.

These theories were opposed in the former edition of this work. With regard to Dr Hales's opinion, that the want of elasticity, or pressure, is the reason why phlogisticated air cannot support animal life, we apprehended it to be totally inconclusive, because it doth not at all appear that phlogisticated air wants elasticity; on the contrary, from Dr Priestley's experiments, it appears to be more elastic than common air. Besides, we know that the elasticity of every fluid must always be in proportion to the pressure upon it, as reaction is always equal to action. Supposing therefore the elasticity of any portion of air to be destroyed, the pressure of the superincumbent atmosphere will reduce it into a proportionably less bulk, and then it is equally elastic with the rest; for if it was not, it would behove it still to yield under the pressure. Hence we may see, that as the bladder made use of in Dr Hales's experiment was by no means sufficient to keep off the pressure of the external atmosphere, the death of the dog could not be fairly ascribed to want of elasticity in the tainted air. When he applied more force than the natural elasticity of the air, he kept the dog *alive*, as he calls it, for an hour; but we can by no means allow a mechanical circulation of the blood to be life, any more than we can allow a dead body to be alive on account of the motion of its arm or any other member by mechanical means. The experiment, however, is valuable, because it shows that respiration is one of the immediate mechanical agents by which the circulation of the blood is carried on; but in order to prove that the dog was really kept alive by this means, he ought to have recovered from the effects of the experiment. Had Dr Hales tried a similar experiment on himself, by taking the fosset in his mouth, closing his nostrils, and causing another person compress the bladder, we have not the least doubt that he would then have felt such a method of breathing not to be a way of preserving life, but of destroying it.

27 Cause of the diminution of air by phlogiston, &c.

As to Dr Priestley's conclusions, it was argued, that "though he found air diminished by admitting phlogiston to it, Dr Priestley finds the mere accession of any material substance can never diminish, but must increase, its bulk. The diminution, therefore, on the accession of phlogiston, is an evident proof that some part of the air is actually taken away. That the phlogiston received is not incorporated with the air is likewise evident, as well as that it takes up space in the tainted air, because, by agitation in water, the phlogistic matter separates from the air, and enters into the water. The consequence of this is, that the air is still farther diminished in bulk; and what remains is pure air, fit for supporting animal life, and of being farther diminished by phlogiston as before. It appears also certain, that phlogiston is not endowed with any inherent power by which it can expand itself; otherwise it would fly off *in vacuo*, which it is never known to do. Another circumstance we must also attend to is, that the action of phlogiston seems to be entirely confined to a particular part of the atmosphere; namely, that which is now so well known by the name of *fixed air*. This it entirely deprives of its elastic principle, so that it is actually no longer air, but becomes a solid substance, making a part, and that no inconsiderable one, of innumerable terrestrial substances, as chalk, limestone, &c.

That the justness of the conclusion about to be drawn from Dr Priestley's experiments may be more apparent, the phenomena were summed up in the two following propositions. "1. Phlogiston cannot act by itself without the assistance of air. 2. The emission of phlogiston is attended with the total destruction of the elasticity of a certain quantity of fixed air, which then ceases to be fluid. Hence we affirm, that it is not the phlogistic substance which acts upon the air, but the elastic principle in the fixed air contained in the common atmosphere that acts on the phlogistic substance. This elastic principle, entering the phlogistic body, displaces a quantity of phlogiston equivalent to its own quantity,

28 Why phlogistic substances part with their phlogiston.

quantity, and takes its place: and hence proceeds the first diminution of the air, not from an accession of phlogiston, but from an escape of the elastic principle belonging to fixed air. The phlogiston and fixed particles of the air now hang loose like smoke or vapour, and are ready to be attracted by any thing capable of imbibing them; and hence proceeds the second diminution by agitation in water.

29 Proof of a reception of the vivifying principle from the air.

"Now to apply this reasoning to the point in question: The blood is found to emit phlogiston from the lungs at every exspiration: therefore we affirm it hath received a proportional quantity of elastic vapour which it had not before. Again: The air expelled from the lungs is found to contain much of the fixable part floating loose, and capable of being attracted by lime-water, &c.; therefore we say, this elastic principle hath come from that part of the atmosphere. But, to put the matter beyond doubt, the very inspection of arterial and venous blood will show, that the first hath a quantity of elastic matter in it which the last wants; and as the brain as well as all other parts of the body are supplied with arterial blood, we think it abundantly evident, that this elastic principle is absolutely and essentially necessary to life; that it is continually expended thereon; and that it may be said with the utmost propriety, that every time we draw the air into our lungs, we receive a portion of vivifying or vital spirit from it into our blood. Add to all this, that many substances which are commonly observed to phlogisticate air, appear to receive an elastic spirit by so doing. Putrefying bodies swell; they would not do so *in vacuo*; and therefore we must conclude, that they receive this elastic principle which swells them from the external air; and experience shows that it is communicated by this fixable part of the atmosphere.

"The foregoing reasoning, which to us appeared sufficiently conclusive, leads to a very important discovery in natural philosophy, viz. That it is to the atmosphere, and to that particular part of it which goes by the name of *fixed air*, that we are every moment indebted for that vital spirit which animates our bodies, and is the immediate bond of union betwixt our immaterial spirit and this visible world.

30 Objection answered.

It may be asked indeed, If fixed air is capable of supplying this spirit in such plenty, how comes it to be so instantaneously fatal when breathed? The reply to this, however, is obvious: it communicates too great a degree of elasticity to the blood; whence the circulation is stopped, and instant death ensues. That this is really the case, appears from the following account of the symptoms observed on the dissection of persons who have been suffocated by this kind of air.

Edinburgh Medical Comment. vol. iii. p. 256.

31 Appearances on the dissection of those suffocated by fixed air.

"1. The vessels of the brain are gorged with blood, and the ventricles of that viscus are filled sometimes with a frothy, sometimes with a bloody, serosity. 2. The trunk of the pulmonary artery is much distended, and the lungs appear nearly in a natural state. 3. The right ventricle and auricle of the heart, the venæ cavæ, and jugular veins, are full of frothy blood. 4. Bloody serosity is often found in the bronchiæ. 5. The trunk of the pulmonary veins, and the left auricle, are either empty, or almost empty, of blood. 6. The blood found in the places that have been mentioned is generally fluid, and as it were in a dissolved state. It is easily extravasated into the cellular texture, of the head particularly, because it is in this part that it abounds most. 7. The epiglottis in suffocated persons is raised, and the glottis open and free. 8. The tongue is much swelled, and can hardly be contained within the mouth. 9. The eyes protrude, and preserve their lustre to the second or third day. They are often even brighter than natural. 10. The body preserves its heat for a long time. Nay the heat is sometimes greater than it is during life, or at least consistently with health. 11. The limbs are flexible for a long time after death. 12. The face is more swelled, and often more red than usual. 13. The neck and upper extremities are sometimes so much swelled, that they appear to be inflamed. These swellings, however, do not, like œdematous ones, preserve the impressions of the finger.

"This account seemed so much in favour of what we had already advanced concerning the action of fixed air, that no observation was made upon it farther than that this elastic principle would seem also to be the cause of animal heat; for as the blood evidently received a vast quantity of elastic fluid, it also received a much greater proportion of heat than usual." 32 Fixed air supposed the cause of animal heat.

Such was the mode of reasoning adopted at that time, derived from the discoveries which had been made in *Aerology*. Succeeding discoveries, however, have made it evident, that fixed air is not one of the natural component parts of our atmosphere, but that it consists of two different fluids; one of which has been called *phlogisticated*, the other *dephlogisticated*, *air*. It is the latter which supplies the vital principle; and the above reasoning still holds good, only substituting the words *dephlogisticated air* for *fixed air*. The poisonous quality of the latter seems also still to depend on its too easy decomposition; by which means the elastic principle is discharged into the blood in such quantity as to burst the small vessels, as has already been observed. This is shown indeed by the remedies most proper for the recovery of those who have suffered from the noxious qualities of fixed air. These consist in evacuation, and especially sprinkling the body with cold water, in order to take off the superfluous heat, and produce an universal contraction of the vessels. 33 This theory corrected.

It now remains only to give some account of the means by which the circulation of the blood is carried on in the living body. From the time of Harvey till very lately, this was supposed to be chiefly the muscular power of the heart and arteries, which by some physiologists have been thought to be prodigiously great; and accordingly many calculations, requiring no small degree of mathematical knowledge to understand them, have been made of the forces requisite to perform this circulation. Other physiologists, however, have thought proper to take in several auxiliary helps, as the motion of the muscles, respiration, &c.; and from Dr Hales's experiment above mentioned, it appears that respiration hath a considerable influence in this matter. It cannot, however, be the sole cause, seeing the circulation is carried on in animals which do not respire.—In 1773, Dr Wilson, in the lecture already quoted, suggested a new principle of motion, which we believe was never used before to account for the circulation of animal fluids. It is shortly this: "As the fluids of the human body do all of them suffer a continual waste, and consequently require a constant supply in proportion, we must look upon their going out of the body to be the 34 Circulation of the blood how carried on. 35 New hypothesis by Dr Wilson.

Digitized by Google

the end of their motion, and on their entering into the body to be the beginning of it; and hence we are to look for the origin of all the motion of the fluids in that part of the system where the new supplies are taken in. This is the primæ viæ, where the lacteals absorb a fluid from the digested aliment, and convey it into the blood. The power by which this is accomplished, is necessarily independent of the heart, as having not the least connexion with it. It has been said to be the same with that which causes fluids rise in the capillary tubes; but though very probably the powers in both cases may be the same, there is this remarkable difference between them, that in the capillary tubes the fluids only rise to a certain height, and will not rise at all unless the tubes are empty. In the lacteals they rise in vessels already full, and continue to do so. Neither is the force whereby this absorption is performed to be accounted little; seeing the supply by the chyle must constantly be equal to the waste which is continually taking place in the fluids already contained in the vessels. We see also with what force an absorption of this kind sometimes takes place in other cases; thus ropes will absorb water with such strength as to raise immense weights fastened to them, and which no mechanical injection of water into small tubes could possibly accomplish. What is already said of the lacteals applies also to the lymphatics; and from thence we are almost tempted to conclude, that the case is the same with the sanguiferous veins also; that though there may be a continuation of some arteries into the veins corresponding with them, yet that for the most part these vessels extravasate the blood into small cavities, which is then taken up by the absorbent power of the veins, and returned to the heart.

"If, however, the vessels continued absolutely full, it would be impossible that any motion should be carried on in them; and to continue and regulate the circulation, the heart with its cavities, is provided. Let us suppose, that by the above-mentioned power the veins are all full, and the auricles or chambers into which the veins empty themselves are full also; where is the collected stream in the veins to go next? There is no room for more in the auricle. What must be done? The auricle contracts and empties itself. The consequence is a sudden vacuum equal to what the auricle could contain; the turgid veins, urged by the absorbing power above mentioned, rush their contents into the auricle to fill up the vacuum again; and all behind moving in the venous direction advances forward with so much force, that the veins near the heart sustain a pulsation from the regurgitation of the impetuous stream, when the auricle shuts upon it to empty itself. In short, the full auricle occupies a determinate quantity of space in the breast: when it is emptied, there is a non-resisting vacuum of so much space as was full before, and thither there is a mechanical nisus from the remotest filament of a vein over the whole body, which becomes conspicuous in the torrent that rushes every other moment from the mouth of the vena cava into this vacuum."

This is a short abstract of Dr Wilson's new theory of the circulation. According to him, this absorbing power of the veins is the principal agent, while the heart and arteries do no more than empty themselves of the blood with which they are filled by the veins. Even this cause, however, he says, would not be sufficient to carry on the circulation for a single moment, without the presence of another which he calls *life*, and does not consider as absolutely unmechanical, though we cannot reduce it either to mechanical rules or ideas. But as we apprehend all speculations concerning such causes must be arbitrary and without foundation, we forbear to give any account of the doctor's opinion on this subject.

36 Blood contains no air while in the bodies of animals.

It hath been a general opinion, that blood, as it exists in the bodies of animals, contains a considerable quantity of common air; and indeed it is certain, that blood, after it has been drawn from the veins of any animal, and afterwards placed under the receiver of an air-pump, yields a very considerable quantity of air upon exhausting the receiver: but if a portion of any blood-vessel is tied up so as to prevent the escape of its contents, and then cut out of the body and placed under a receiver, it will not swell, or show the least sign of its containing any quantity of air whatever.

37 Medicinal and other uses of blood.

Blood was formerly held in great esteem as a medicine for some particular diseases. Baths of the blood of infants have been recommended as an infallible remedy for the elephantiasis, &c.; and the blood of goats and some other animals was used by the Galenists, and is recommended even by Dr Mead in pleurisies: but the first abominable medicine, as well as the other, is now deservedly exploded. The principal use of blood in the arts is for making Prussian blue, or sometimes for clarifying certain liquors; it is also recommended in agriculture as an excellent manure for fruit-trees. A mixture of blood with lime makes an exceedingly strong cement; and hence it is of use in the preparation of some chemical lutes, the making floors *, &c. As a food it hath been disputed whether blood really affords any nourishment or not. The best judges, now, however, are generally agreed that it is very nutritious; and though out of the body, like the white of an egg, it is very insoluble, yet, like that too, *in* the body it is commonly of easy digestion. It is, however, highly alkalescent in hot climates: on which account the prohibition of it to the Israelites was very proper. Even in this country, when blood was used as food in great quantity, the scurvy was more frequent than at other times; but to a moderate use of it here no such objection takes place.

* See *Architecture*, N° 116.

In some countries, we are told that the barbarians were accustomed to intoxicate themselves by drinking the warm blood of animals; and as it has been shown that this fluid is the immediate reservoir of the vital principle, it seems by no means improbable that it may be possessed of an inebriating quality. Some expressions in Scripture seem to countenance this hypothesis.

Religious uses of BLOOD. Among the ancients blood was used for the sealing and ratifying covenants and alliances, which was done by the contracting parties drinking a little of each others blood; and for appeasing the manes of the dead; in order to which blood was offered on their tombs as part of the funeral ceremony.

The blood of victims was anciently the portion of the gods; and accordingly was poured or sprinkled on the altars in oblation to them.

The priests made another use of blood, viz. for divination:

Digitized by Google

tion: the streaming of blood from the earth, fire, and the like, was held a prodigy or omen of evil.

The Roman priests were not unacquainted with the use of blood in miracles; they had their fluxes of blood from images, ready to serve a turn; witness that said to have streamed from the statue of Minerva at Modena, before the battle at that place. But we know not whether in this their successors have not gone beyond them. How many relations in ecclesiastical writers of Madonas, crucifixes, and wafers, bleeding? At least the liquefaction of the blood of St Januarius at Naples, repeated annually for so many ages, seems to transcend by far all the frauds of the Grecian or Roman priesthood. But the chemists at last got into the secret; and we find M. Neumann at Berlin to have performed the mirable of the liquefaction of dried blood, with all the circumstances of the Neapolitan experiment.

Among the schoolmen we find a famous dispute, under Pope Pius II. whether the blood of Christ, which fell from him in the three days passion, retained or lost the hypostatic union; and consequently whether it was the proper object of adoration. The Dominicans maintained the former, the Franciscans the latter. It seems the Dominican doctrine gained the ascendant, as being fitted to favour the profits of the monks; who becoming possessed some way or other of a few drops of this precious liquor, were secured of ample offerings from the deluded laity, who flocked to pay their homage to the sacred relic. Joseph of Arimathea is said to have first brought into Britain two silver vessels filled with the blood of Christ, which by his order was buried in his tomb. King Henry III. had a crystal, containing a portion of the same blood, sent him by the master of the temple of Jerusalem, attested with the seals of the patriarch; which treasure the king committed to the church of St Peter's, Westminster, and obtained from the bishops an indulgence of six years and 116 days to all that should visit it. Mat. Paris even assures us, that the king summoning his nobles and prelates to celebrate the feast of St Edward in St Peter's church, was chiefly *pro veneratione sancti sanguinis Christi nuper adepti*, "in veneration of the holy blood of Christ lately acquired." Divers others of our monasteries were possessed of this profitable relic; as the college of Bons Hommes at Ashridge, and the abbey of Hales, to whom it was given by Henry, son of Richard duke of Cornwall and king of the Romans. To it resorted a great concourse of people for devotion and adoration; till in 1538, as the Reformation took place, it was perceived to be only honey clarified and coloured with saffron, as was shown at St Paul's cross by the bishop of Rochester. The like discovery was made of the blood of Christ, found among the relics in the abbey of Feschamp in Normandy, pretended to have been preserved by Nicodemus, when he took the body from the cross, and given to that abbey by William duke of Normandy; it was buried by his son Richard, and again discovered in 1171, and attended with different miracles; but the cheat, which had been long winked at, was at length exposed, the relation of which is given by Speed.

Avenger of BLOOD, among the Jews, was the next of kin to the person murdered, who was to pursue the murderer.

Ecclesiastical judges retire, when judgment is to be given in *cases of blood*, by reason the church is supposed to abhor blood: it condemns no person to death; and its members become irregular, or disabled from their functions, by the effusion of blood.

Field of BLOOD, in Syriac *Aceldama*, was a field purchased by the Jews with the thirty pieces of silver which had been given to Judas for betraying his master, and which he had restored. It still serves for a burial-ground, in which all pilgrims who die in their pilgrimage at Jerusalem, are interred.

BLOOD-*Hound*, in *Zoology*, the canis sagax of Linnæus *, *le chien courant* of Buffon, the *sleuthounde* of the Scots: The hound or dog, with long, smooth, and pendulous ears. It was a dog of great use, and in high esteem with our ancestors: its employ was to recover any game that had escaped wounded from the hunter, or been killed and stole out of the forest. It was remarkable for the acuteness of its smell, tracing the lost beast by the blood it had spilt; from whence the name is derived. This species could, with the utmost certainty, discover the thief by following his footsteps, let the distance of his flight be ever so great, and through the most secret and thickest coverts; nor would it cease its pursuit till it had taken the felon. They were likewise used by Wallace and Bruce during the civil wars. The poetical historians of the two heroes frequently relate very curious passages on this subject; of the service these dogs were of to their masters, and the escapes they had from those of the enemy. The blood-hound was in great request on the confines of England and Scotland; where the borderers were continually preying on the herds and flocks of their neighbours. The true blood-hound was large, strong, muscular, broad-breasted, of a stern countenance, of a deep tan-colour, and generally marked with a black spot above each eye.

* See *Canis*.

BLOOD-*Shotten*. See OPHTHALMIA, MEDICINE *Index*.

BLOOD-*Spaven*. See FARRIERY *Index*.

Spitting of BLOOD, or *Hæmoptöe*. See MEDICINE *Index*.

Whole and Half BLOOD; a kinsman of the *whole blood* is he that is derived from the same couple of ancestors; whereas a person of *half blood* descends from either of them singly by a second marriage.

BLOOD *of Christ*, the name of a military order instituted at Mantua in 1608. The number of knights was restricted to 20, besides the grand-master. Their device was, *Domine, probasti me*; or, *Nihil hoc, triste, recepto*: "Lord, thou hast proved me;" or, "Fortified by this, no evil can prevail."

Precious BLOOD, a denomination given to a reformed congregation of Bernardine nuns at Paris, first established under that name in 1661.

Dragon's BLOOD. See DRAGON.

BLOOD-*Stone*. See HÆMATITES, MINERALOGY *Index*.

BLOOD-*Vessels*. See ANATOMY *Index*.

BLOOD-*White*, in ancient law writers, signifies *blood*, and a customary amercement paid as a composition for the shedding or drawing of blood. The word is also written *blodwhite*, *blodwita*, *blodwyta*, *bloodwit*, *blodwit*, *bloudwit*, and *bluidweit*. It is formed from the ancient Saxon *blud*, "blood," and *vite* or *wite*, "a fine or penalty." The word also denotes an exemption from this penalty,

Digitized by Google

Blood.

penalty, granted by the king to certain persons and communities as a special favour. King Henry II. granted to all tenants within the honour of Wallingford—*Ut quieti sint de hidagio et blodwite et bredwite.*

Blood-Wort. See Rumex, Botany *Index.*

Blood, *Thomas*, generally known by the appellation of *Colonel Blood*, was a disbanded officer of Oliver Cromwell's, famous for his daring crimes and his good fortune. He was first distinguished by engaging in a conspiracy to surprise the castle of Dublin; which was defeated by the vigilance of the duke of Ormond, and some of his accomplices were executed. Escaping to England, he meditated revenge against Ormond; and actually seized him one night in his coach at St James's street, where he might have finished his purpose if he had not studied refinements in his vengeance. He bound him on horseback behind one of his associates, resolving to hang him at Tyburn, with a paper pinned to his breast: but, when they got into the fields, the duke, in his efforts for liberty, threw himself and the assassin, to whom he was fastened, to the ground; and, while they were struggling in the mire, he was rescued by his servants; but the authors of this attempt were not then discovered. A little after, in 1671, Blood formed a design of carrying off the crown and regalia from the Tower; a design to which he was prompted, as well by the surprising boldness of the enterprise, as by the views of profit. He was very near succeeding. He had bound and wounded Edwards the keeper of the jewel-office, and had got out of the Tower with his prey; but was overtaken and seized, with some of his associates. One of them was known to have been concerned in the attempt upon Ormond; and Blood was immediately concluded to be the ringleader. When questioned, he frankly avowed the enterprise; but refused to discover his accomplices. "The fear of death (he said) should never engage him either to deny a guilt or betray a friend." All these extraordinary circumstances made him the general subject of conversation; and the king was moved with an idle curiosity to see and speak with a person so noted for his courage and his crimes. Blood might now esteem himself secure of pardon; and he wanted not address to improve the opportunity. He told Charles, that he had been engaged, with others, in a design to kill him with a carabine above Battersea, where his majesty often went to bathe; that the cause of this resolution was the severity exercised over the consciences of the godly, in restraining the liberty of their religious assemblies: that when he had taken his stand among the reeds, full of these bloody resolutions, he found his heart checked with an awe of majesty; and he not only relented himself, but diverted his associates from their purpose: that he had long ago brought himself to an entire indifference about life, which he now gave for lost; yet could he not forbear warning the king of the danger which might attend his execution: that his associates had bound themselves by the strictest oaths to revenge the death of any of their confederacy; and that no precaution or power could secure any one from the effect of their desperate resolutions. Whether these considerations excited fear or admiration in the king, they confirmed his resolution of granting a pardon to Blood; but he thought it a requisite point of decency first to obtain the duke of Ormond's consent. Arlington came to Ormond in the king's name, and desired that he would not prosecute Blood, for reasons which he was commanded to give him. The duke replied, that his majesty's commands were the only reason that could be given: and being sufficient, he might therefore spare the rest. Charles carried his kindness to Blood still farther; he granted him an estate of 500l. a-year in Ireland; he encouraged his attendance about his person; he showed him great countenance; and many applied to him for promoting their pretensions at court. And while old Edwards, who had bravely ventured his life, and had been wounded in defending the crown and regalia, was forgotten and neglected, this man, who deserved only to be stared at and detested as a monster, became a kind of favourite. Blood enjoyed his pension about ten years, till being charged with fixing an imputation of a scandalous nature on the duke of Buckingham, he was thrown into prison, where he died August 24. 1680.

Blood || Bloss.

BLOODY, something belonging to or abounding with blood.

Bloody-Flux. See Medicine *Index.*

Bloody-Hand is when a trespasser is apprehended in a forest with his hands or other parts bloody; which is a circumstance of his having killed the deer, though he be not found chasing or hunting them.

Bloody-Rain. See Rain.

Bloody-Sweat. Many instances of this are recorded, in which it has been owing to bodily disorder, or extreme mental agitation and agony. See particularly Aristotle's Hist. Animal. lib. iii. cap. 19. apud Oper. tom. i. Thuanus Hist. Temp. &c. lib. ii. apud Oper. tom. i. Melanges d'Histoire et de Literature, &c. par M. V. Marville, tom. iii. p. 149. Acta Physico-Med. Norimbergæ, vol. i. p. 84. and vol. viii. p. 428.

Bloody-Urine. See Medicine *Index.*

BLOOM, a mass of iron after having undergone the first hammering called *blomary*. It has yet to undergo many hammerings before it become iron fit for the smith's use, and be first made what they call the *ancony*. See Ancony.

BLOOT, Peter, a Flemish painter, whose works are not frequently seen in these kingdoms; nor are they easily purchased in Holland, being carefully preserved in private collections, and are highly esteemed. The subjects he chose to paint were always taken from the lowest life; such as boors drinking, feasting, dancing, or quarrelling; shepherds piping, and sometimes the marriages of villagers. He was a faithful, and indeed too servile an imitator of nature; never departing from the actions, attitudes, or draperies of his models. He showed a good knowledge of the chiaroscuro and perspective; he had a delicate manner of penciling, and his colouring was mellow; but he had no idea of elegance: yet his pictures have in many respects great merit, and his defects seem rather imputable to the taste of his country than to his own genius; some of his works being for the lightness of the touch, the neatness of handling, and transparence of colour, equal to the best of his time. He died in 1667.

BLOSSOM, in a general sense, denotes the flower of any plant. See the article Flower.

Blossom, in a more proper sense, is restrained to the flowers of trees which they put forth in the spring, and

Digitized by Google

as the forerunners of their fruit, otherwise called their *bloom*. The office of the blossom is partly to protect, and partly to draw nourishment to, the embryo fruit or seed.

Blossom, or *Peach-Coloured*, in the manege, a term applied to a horse that has his hair white, but intermixed all over with sorrel and bay hairs. Such horses are so insensible and hard, both in the mouth and the flanks, that they are scarcely valued; besides they are apt to turn blind.

BLOSSOMING of Plants, the act of blowing, or putting forth flowers or blossoms, called also *flowering*. The blossoming of the Glastonbury thorn piously on Christmas-day morning, is a vulgar error; owing to this, that the plant, besides the usual blossoming in the spring, sometimes puts forth a few white transient blossoms in the middle of winter. For the blossoming of the rose of Jericho on the same day, as it is commonly held in England, or in the time of midnight mass, as it is held in France, is somewhat more than an error, being really a fraud on one side, and a superstition on the other. This rose, whose leaves are only closed and shrivelled up in winter, will, at any time, upon setting its pedicle in water, expand and blossom a-new; because the pedicle being spongy imbibes the fluid apace, and thus fills and swells out the shrivelled leaves; which property some monks have turned to good account.

BLOTELING, or Blooteling, Abraham, an engraver who flourished about the year 1672. He was a native of Amsterdam, and designed as well as engraved. From the style of his etchings, which have great merit, he is supposed to have frequented the school of the Visschers. He came into England about the year 1672, or 1673, at the time the French invaded Holland; but he did not reside there long. He not only etched, but also scraped, several mezzotintos, which were much esteemed. Vertue informs us, that whilst he was in England, he received 30 guineas for an etching of the Duke of Norfolk. From hence he returned to Amsterdam, where, in all probability, he died. In the year 1685, he published at Amsterdam the *gems* of Leonardo Augustino, and etched the plates himself.

BLOUNT, Thomas, a learned English writer of the 17th century, born at Bordesley in Worcestershire. He had not the advantage of an university education; but, by strength of genius and great application, made a considerable progress in literature. Upon the breaking out of the popish plot in the reign of King Charles II. being much alarmed on account of his being a zealous Roman Catholic. he was seized with a palsy; and died in December, 1679, aged 61. He wrote, 1. The Academy of Eloquence, containing a complete English rhetoric. 2. Glossographia, or a dictionary interpreting such hard words, whether Hebrew, Greek, Latin, Italian, &c. as are now used in our refined English tongue, &c. 3. Boscobel; or the History of his Majesty's Escape after the Battle of Worcester. 4. A law dictionary. 5. Animadversions upon Sir Richard Baker's chronicle. 6. *Fragmenta Antiquitatis*; and other works.

Blount, *Sir Henry*, an English writer, born at his father's seat in Hertfordshire in 1602. After a regular education, he set out on his travels in 1634. He became acquainted with a janizary at Venice, and accompanied him into the Turkish dominions. Having been abroad two years, he returned and published a relation of his travels in the Levant, which went through several editions. He was knighted by Char. I. and was at the battle of Edge-Hill, at which time he is supposed to have had the charge of the young princes; but, after the king's death, was employed by the parliament, and by Cromwell. Yet after the restoration of the royal family he was appointed high sheriff of the county of Hertford, and from that time lived as a private gentleman above 20 years. He published, 1. An account of his travels. 2. Six comedies written by John Lilly, under the title of *Court Comedies*. 3. The Exchange Walk, a satire; and, 4. An Epistle in praise of Tobacco. He died October 9. 1682.

Blount, *Sir Thomas Pope*, baronet, an eminent writer, and the eldest son of the former, was born at Upper Holloway, in the county of Middlesex, September 12. 1649. He was educated under the eye of his father; and always distinguished himself as a lover of liberty, a sincere friend to his country, and a true patron of learning. He was advanced to the degree of baronet by King Charles II. in whose reign he was elected burgess for St Alban's in two parliaments, and was knight of the shire in three parliaments after the Revolution. He wrote in Latin, 1. A critique on the most celebrated writers. 2. Essays on several subjects. 3. A natural history, extracted out of the best modern writers; and, 4. Remarks upon poetry, with characters and censures of the most considerable poets, whether ancient or modern. He died June 30. 1697.

Blount, *Charles*, younger brother of Sir Thomas Pope Blount, had also an excellent capacity, and was an eminent writer. His *Anima Mundi*, or An Historical narration of the opinions of the ancients, concerning man's soul after this life, according to unenlightened nature, gave great offence, and was complained of to the bishop of London. But the work which rendered him most known, was his translation of Philostratus's Life of Apollonius Tyaneus, published in 1680; which was soon suppressed, as an attack on revealed religion. Another work of the same complexion he published the same year, called Great is Diana of the Ephesians, &c. in which, under colour of exposing superstition, he struck at revelation. In 1684, he printed a kind of Introduction to Polite Literature. In the warmth of his zeal for the Revolution, he wrote a pamphlet to prove King William and Queen Mary conquerors; which was condemned to be burnt by both houses of parliament. The close of his life was very unhappy. For, after the death of his wife, he became enamoured of her sister, who was only scrupulous against their union on account of their prior connexion by the marriage. On this subject he wrote a letter, as the case of a third person, with great learning and address. But the archbishop of Canterbury and other divines deciding against him, and the lady on this growing inflexible, threw him into a frenzy, in which he shot himself, in 1693. After his death, his miscellaneous pieces were collected and published.

BLOW, Dr John, a famous musician and composer, was born in 1648 at North Collingham in the county

Blow.

county of Nottingham; and was one of the first set of children after the Restoration, being bred up under Captain Henry Cook. He was also a pupil of Hingeston, organist to Oliver Cromwell, and after that of Dr Christopher Gibbons. On the 16th day of March, 1673, he was sworn one of the gentlemen of the chapel in the room of Roger Hill; and in July 1674, upon the decease of Mr Pelham Humphrey, was appointed master of the children of the chapel. In 1685, he was made one of his majesty's private music; and in 1687, was appointed almoner and master of the choristers of the cathedral church of St Paul. Blow was not a graduate of either university; but Archbishop Sancroft, in virtue of his own authority in that respect, conferred on him the degree of doctor in music. Upon the decease of Purcell in 1695, he became organist of Westminster-abbey. In the year 1699, he was appointed composer to his majesty, with a salary. Blow was a composer of anthems while a chapel-boy, and on the score of his merit, was distinguished by Charles II. The king admired very much a little duet of Carissimi to the words 'Dite o Cieli,' and asked of Blow if he could imitate it. Blow modestly answered he would try; and composed in the same measure, and the same key of D with a minor third, that fine song, 'Go perjured man.' The *Orpheus Britannicus* of Purcell had been published by his widow soon after his decease; and contained in it some of that author's finest songs: the favourable reception it met with was a motive with Blow to the publication, in the year 1700, of a work of the same kind, entitled *Amphion Anglicus*, containing compositions for one, two, three, and four voices, with accompaniments of instrumental music, and a thorough bass figured for the organ, harpsichord, or theorbolute. To this book are prefixed commendatory verses by sundry persons; and among them an ode, in the second stanza of which are the following lines:

> 'His *Gloria Patri* long ago reach'd Rome,
> 'Sung and rever'd too in St Peter's dome;
> 'A canon will outlive her jubilees to come.'

The canon here meant is that fine one to which the Gloria Patri in Dr Blow's gamut service is set. Dr Blow set to music an ode for St Cecilia's day, in 1684, the words by Mr Oldham, published together with one of Purcell on the same occasion performed the preceding year. He also composed and published a collection of lessons for the harpsichord or spinet, and an ode on the death of Purcell, written by Mr Dryden. There are also extant of his composition sundry hymns printed in the *Harmonia Sacra*, and a great number of catches in the latter editions of the Musical Companion. This great musician died in the year 1708, and lies buried in the north aisle of Westminster-abbey. On his monument is the canon above mentioned, engraven on a book with an inscription above it.

Blow, in a general sense, denotes a stroke given either with the hand, a weapon, or instrument. In fencing, blows differ from thrusts, as the former are given by striking, the latter by pushing.

Military Blow, alapa militaris, that given with a sword on the neck or shoulder of a candidate for knighthood, in the ceremony of dubbing him. The custom seems to have taken its rise from the ancient ceremony of manumission. In giving the blow, the prince used the formula *Esto bonus miles*, "Be a valiant soldier;" upon which the party rose a complete knight, and qualified to bear arms in his own right.

Blow

|

Blubber.

Blow, in *Law*. See Battery.

Fly-Blows, the ova of flies deposited on flesh, or other substances proper for hatching them.

Blow-Pipe, in *Chemistry* and *Mineralogy*, an instrument by which the blast of the breath may be directed upon the flame of a lamp or candle, in such a manner as to vitrify any small portion of mineral substance; and thus the process of assaying in the dry way may be performed in a very short time, where either want of instruments or opportunity prevents other methods from being used.

Mr Bergman observes, that this instrument is extremely useful to chemists, as many experiments are daily neglected, either because they require furnaces and a large apparatus of vessels; from the want of time to examine them in the ordinary way; or from the quantity required in the common way for examination, when the matter may be too scarce or too dear. In all these cases the blow-pipe may be advantageously used; as, 1. Most of the experiments which can be performed in the large way may also be done with the blow-pipe. 2. The experiments which in the large way require many hours, may in this method be finished in a few minutes; and, 3. The smallest particle is sufficient. The only defect is, that the proportions cannot be determined with any precision; and therefore experiments on a large scale are still to be preferred. See Chemistry and Mineralogy *Index*. See also Blow-pipe, Supplement.

BLOWING, in a general sense, denotes an agitation of the air, whether performed with a pair of bellows, the mouth, a tube, or the like. Butchers have a practice of blowing up veal, especially the loins, as soon as killed, with a pipe made of a sheep's shank, to make it look larger and fairer.

Blowing of Glass, one of the methods of forming the various kinds of works in the glass manufacture. It is performed by dipping the point of an iron blowing pipe in the melted glass, and blowing through it with the mouth, according to the circumstances of the glass to be blown. See Glass.

Blowing of Tin, denotes the melting its ore, after being first burnt to destroy the mundic.

Blowing Machines. See also *Blowing Machines*, Supplement.

Blowing, among gardeners, denotes the action of flowers, whereby they open and display their leaves. In which sense, blowing amounts to much the same with flowering or blossoming.

The regular blowing season is in the spring; though some plants have other extraordinary times and manners of blowing, as the Glastonbury thorn. Divers flowers also, as the tulip, close every evening, and blow again in the morning. Annual plants blow sooner or later as their seeds are put in the ground; whence the curious in gardening sow some every month in summer, to have a constant succession of flowers. The blowing of roses may be retarded by shearing off the buds as they put forth.

BLUBBER, denotes the fat of whales and other large sea-animals, whereof is made train-oil. It is properly

Digitized by Google

properly the *adeps* of the animal: it lies immediately under the skin, and over the muscular flesh. In the porpoise it is firm and full of fibres, and invests the body about an inch thick. In the whale its thickness is ordinarily six inches; but about the under lip, it is found two or three feet thick. The whole quantity yielded by one of these animals ordinarily amounts to 40 or 50, sometimes to 80 or more, hundred weight. The use of blubber to the animal seems to be partly to poise the body, and render it equiponderant to the water; partly to keep off the water at some distance from the blood, the immediate contact whereof would be apt to chill it; and partly also for the same use that clothes serve us, to keep the fish warm, by reflecting or reverberating the hot steams of the body, and so redoubling the heat: since all fat bodies are, by experience, found less sensible of the impressions of cold than lean ones. Its use in trade and manufactures is to furnish train-oil, which it does by boiling down. Formerly this was performed ashore in the country where the whales were caught: but of late the fishers do not go ashore; they bring the blubber home stowed in casks, and afterwards boil it down in the preparation of the oil.

Sea-Blubber. See Medusa.

BLUE, one of the seven colours into which the rays of light divide themselves when refracted through a glass prism. For an account of the particular structure of bodies by which they appear of a blue colour, see the article Chromatics.—The principal blues used in painting are Prussian blue, bice, saunders blue, azure, or smalt, verditer, &c.; for the preparation of which, see *Colour-Making*.—In dyeing, the principal ingredients for giving a blue colour, are indigo and woad. See Dyeing.

Blue Colour of the Sky. See Sky.

Blue-Bird. See Motacilla, Ornithology *Index*.

Blue-Fish. See Coryphena, Ichthyology *Index*.

Blue Japan. Take gum-water, what quantity you please, and white-lead a sufficient quantity; grind them well upon a porphyry; then take isinglass size what quantity you please, of the finest and best smalt, a sufficient quantity; mix them well; to which add, of your white-lead, before ground, so much as may give it a sufficient body. Mix all these together to the consistence of a paint.

Blue John, among miners, a kind of mineral which has lately been fabricated into vases and other ornamental figures. It is of the same quality with the cubical spar, with respect to its fusibility in the fire. It loses its colour, and becomes white in a moderate heat: the weight of a cubic foot of the bluest kind is 3180 ounces, and that of the least blue is 3140 ounces. This substance began first to be applied to use about 18 years ago at one of the oldest mines in Derbyshire, called *Odin mine*, probably from its being dedicated to Odin the great god of the northern nations, at the foot of a high mountain called *Mam-Tor* in Castleton. Here the greatest quantities are still found; the largest pieces are sold for 9l. a ton, the middle-sized for 6l. and the least for 50s.

Prussian Blue. See Chemistry *Index*.

BLUING, the act or art of communicating a blue colour to bodies otherwise destitute thereof. Laundresses blue their linen with smalt; dyers their stuffs and wools with woad or indigo.

Bluing of Metals is performed by heating them in the fire till they assume a blue colour; particularly practised by gilders, who blue their metals before they apply the gold and silver leaf.

Bluing of Iron, a method of beautifying that metal sometimes practised; as for mourning buckles, swords, and the like. The manner is thus: Take a piece of grindstone or whetstone, and rub hard on the work, to take off the black scurf from it: then heat it in the fire; and as it grows hot, the colour changes by degrees, coming first to light, then to a darker gold colour, and lastly to a blue. Sometimes they also grind indigo and salad-oil together; and rub the mixture on the work with a woollen rag, while it is heating, leaving it to cool of itself. Among sculptors we also find mention of bluing a figure of bronze, by which is meant the heating of it, to prepare it for the application of gold-leaf, because of the bluish cast it acquires in the operation.

BLUFF-head, among sailors. A ship is said to be bluff-headed that has an upright stern.

BLUNDERBUSS, a short fire-arm with a wide bore, capable of holding a number of bullets at once.

BLUSHING, a suffusion or redness of the cheeks, excited by a sense of shame, on account of consciousness of some failing or imperfection.

Blushing is supposed to be produced from a kind of consent or sympathy between several parts of the body, occasioned by the same nerve being extended to them all. Thus the fifth pair of nerves being branched from the brain to the eye, ear, muscles of the lips, cheeks, palate, tongue, and nose; a thing seen or heard that is shameful, affects the cheeks with blushes, driving the blood into the minute vessels thereof, at the same time that it affects the eye and ear. For the same reason it is, as Mr Derham observes, that a savoury thing seen or smelt affects the glands and parts of the mouth: if a thing heard be pleasing, it affects the muscles of the face with laughter: if melancholy, it exerts itself on the glands of the eyes, and occasions weeping, &c. And to the same cause Dr Willis ascribes the pleasure of kissing.

BOA, or Boæ, -arum, in *Ancient Geography*, an island on the coast of Illyricum over against Tragurium. A place of banishment for condemned persons; now called *Bua*, an island in the Adriatic, joined to the continent and to Tragurium, now *Tran*, by a bridge.

Boa. See Ophiology *Index*.

BOADADA bashee, in the Turkish military orders, an officer of the janizaries whose business it is to walk every day about the principal parts of the city, with a number of janizaries to attend him, to keep order, and see that all things are regular, even to the dress. This office is for three months, and from this the person is usually advanced to be a serach.

BOADICEA, a valiant British queen in the time of Nero, the emperor, wife to Prasutagus king of the Iceni in Britain, who by his will left the emperor and his own daughters co-heirs to his great treasures, in expectation of procuring by that means Nero's protection for his family and people: but he was no sooner dead, than the emperor's officers seized all. Boadicea opposed these unjust proceedings; which was resented to

Digitized by Google

to such a pitch of brutality, that they ordered the lady to be publicly whipped, and her daughters to be ravished by the soldiers. The Britons took arms, with Boadicea at their head, to shake off the Roman yoke; and made a general and bloody massacre of the Romans in all parts. The whole province of Britain would have been lost, if Suetonius Paulinus had not hastened from the isle of Mona to London, and with 10,000 men engaged the Britons. The battle was fought for a long time with great vigour and doubtful success, till at last victory inclined to the Romans. Boadicea, who had behaved with all the bravery imaginable, despatched herself by poison.

BOAR, in the manege. A horse is said to boar when he shoots out his nose as high as his ears, and tosses his nose in the wind.

BOAR, a male swine. See SUS.

The wild boar, among huntsmen, has several names, according to its different ages: the first year, it is called *a pig of the saunder;* the second it is called *a hog;* the third, *a hog-steer;* and the fourth, *a boar;* when leaving the saunder, he is called a *singler* or *sangler*. The boar generally lives to 25 or 30 years, if he escapes accidents. The time of going to rut is in December, and lasts about three weeks. They feed on all sorts of fruits, and on the roots of many plants; the root of fern in particular seems a great favourite with them; and when they frequent places near the sea-coasts, they will descend to the shores, and demolish the tenderer shell-fish in very great numbers. Their general places of rest are among the thickest bushes that can be found: and they are not easily put out of them, but will stand the bay a long time. In April and May they sleep more sound than at any other time of the year, and this is therefore the successful time for the taking them in the toils. When a boar is roused out of the thicket, he always goes from it, if possible, the same way by which he came to it; and when he is once up, he will never stop till he comes to some place of more security. If it happens that a saunder of them are found together, when any one breaks away, the rest all follow the same way. When the boar is hunted in the wood where he was bred, he will scarcely ever be brought to quit it; he will sometimes make towards the sides to listen to the noise of the dogs, but retires into the middle again, and usually dies or escapes there. When it happens that a boar runs a-head, he will not be stopped or put out of his way, by man or beast, so long as he has any strength left. He makes no doubles or crossings when chased; and, when killed, makes no noise, if an old boar; the sows and pigs will squeak when wounded.

The season for hunting the wild boar begins in September, and ends in December, when they go to rut. If it be a large boar, and one that has lain long at rest, he must be hunted with a great number of dogs, and those such as will keep close to him; and the huntsman, with his spear, should always be riding in among them, and charging the boar as often as he can, to discourage him: such a boar as this, with five or six couple of dogs, will run to the first convenient place of shelter, and there stand at bay and make at them as they attempt to come up with him. There ought always to be relays also set of the best and staunchest hounds in the kennel; for if they are of young eager dogs, they will be apt to seize him, and be killed or spoiled before the rest come up. The putting collars with bells about the dogs necks is a great security for them; for the boar will not so soon strike at them when they have these, but will rather run before them. The huntsmen generally kill the boar with their swords or spears: but great caution is necessary in making the blows; for he is very apt to catch them upon his snout or tusks; and if wounded and not killed, he will attack the huntsman in the most furious manner. The place to give the wound with the spear is either between the eyes in the middle of the forehead, or in the shoulder; both these places make the wound mortal.

When this creature makes at the hunter, there is nothing for it but courage and address; if he flies for it, he is surely overtaken and killed. If the boar comes straight up, he is to be received at the point of the spear: but if he makes doubles and windings, he is to be watched very cautiously, for he will attempt getting hold of the spear in his mouth; and if he does so, nothing can save the huntsman but another person attacking him behind; he will on this attack the second person, and the first must then attack him again: two people will thus have enough to do with him; and were it not for the forks of the boar-spears that make it impossible to press forward upon them, the huntsman who gives the creature his death wound, would seldom escape falling a sacrifice to his revenge for it. The modern way of boar-hunting is generally to dispatch the creature by all the huntsmen striking him at once; but the ancient Roman way was, for a person on foot, armed with a spear, to keep the creature at bay; and in this case the boar would run of himself upon the spear to come at the huntsman, and push forward till the spear pierced him through.

The hinder claws of a boar are called *guards.* In the corn, he is said to *feed;* in the meadows or fallow-fields, to *rout, worm,* or *fern;* in a close, to *grass.* The boar is farrowed with as many teeth as he will ever have; his teeth only increasing in bigness, not in number: among these there are four called *tushes,* or *tusks;* the two biggest of which do not hurt when he strikes, but serve only to whet the other two lowest, with which the beast defends himself, and frequently kills, as being greater and longer than the rest.

It is very remarkable, that these creatures in the West Indies are subject to the stone; few of them are absolutely free from it, yet scarcely any have the stones of any considerable size. It is common to find a great number in the same bladder; and they are usually of about a scruple weight, are angular, and very regular, each having five angles.

Among the ancient Romans boar's flesh was a delicacy; a boar served up whole was a dish of state.

The boar was sometimes also the military ensign borne by the Roman armies, in lieu of the eagle.

Among physicians, a boar's bladder has been reputed a specific for the epilepsy. The tush of the wild boar still passes with some as of great efficacy in quinsies and pleurisies.

BOARD, a long piece of timber, sawed thin for building and several other purposes. See TIMBER.

Deal-boards are generally imported into England ready sawed, because done cheaper abroad, in regard

Digitized by Google

we want saw-mills. Cap-boards are imported from Sweden and Dantzic. Oak-boards chiefly from Sweden and Holland; some from Dantzic. We also import white boards for shoemakers; mill and scale-boards, &c. for divers artificers. Scale-board is a thinner sort, used for the covers of primers, thin boxes, and the like. It is made with large planes; but might probably be sawed with mills to advantage.

Board is also used for a kind of table or bench, whereon several artificers perform their work. In this sense we say a work-*board*, shop-*board*, tailor's-*board*, &c.

Board is also used for a flat machine, or *frame*, used in certain games, and the like. In this sense, we say a draught-*board*, a chess-*board*, a shovel *board*, and the like.

Board, *Bureau*, is also used for an office where accounts are taken, payments ordered, and the like. In this sense, we say the *board* of works, *board* of ordnance, *board* of treasury, and the like.

Board, among seamen. *To go aboard*, signifies to go into the ship. *To slip by the board*, is to slip down by the ship's side. *Board and board*, is when two ships come so near as to touch one another, or when they lie side by side. *To make a board*, is to turn to windward; and the longer your boards are, the more you work into the wind. *To board it up*, is to beat it up, sometimes upon one tack and sometimes upon another. *She makes a good board*, that is, the ship advances much at one tack. *The weather board*, is that side of the ship which is to windward.

BOARDING, in a naval engagement, is a desperate and furious assault made by one ship on another, after having found every other method to reduce her ineffectual: it may be performed in different places of the ship, according to their circumstances and situation, by the assailant detaching a number of men armed with pistols and cutlasses on the decks of his antagonist, who stands in the same predicament with a city stormed by the besiegers. This expedient, however, is rarely attempted by king's ships, which generally decide the combat without grappling each other; but is chiefly practised by privateers, which, bearing down on the enemy's quarter or broadside, drop from the bowsprit, which projects over the defendant's deck, an earthen shell, called a *stink-pot*, charged with fiery and suffocating combustibles, which immediately bursts, catches fire, and fills the deck with insufferable stench and smoke: in the middle of the confusion thus occasioned, the privateer's crew rush aboard, under cover of the smoke, and easily overpower the astonished enemy, unless they have close quarters to which they can retreat and beat them off the deck.

BOAT, a small open vessel, conducted on the water by rowing or sailing. The construction, machinery, and even the names of boats, are very different, according to the various purposes for which they are calculated, and the services on which they are to be employed. Thus they are occasionally slight or strong, sharp or flat bottomed, open or decked, plain or ornamented; as they may be designed for swiftness or burden, for deep or shallow water, for sailing in a harbour or at sea, and for convenience or pleasure.

The largest boat that usually accompanies a ship is the *long-boat*, which is generally furnished with a mast and sails: those which are fitted for men of war, may be occasionally decked, armed, and equipped, for cruising short distances against merchant ships of the enemy, or smugglers, or for impressing seamen, &c. The *barges* are next in order, which are longer, slighter, and narrower: they are employed to carry the principal sea-officers, as admirals, and captains of ships of war, and are very unfit for sea. *Pinnaces* exactly resemble barges, only that they are somewhat smaller, and never row more than eight oars; whereas a barge properly never rows less than ten. These are for the accommodation of the lieutenants, &c. *Cutters* of a ship, are broader, deeper, and shorter, than the barges and pinnaces; they are fitter for sailing, and are commonly employed in carrying stores, provisions, passengers, &c. to and from the ship. In the structure of this sort of boats, the lower edge of every plank in the side overlays the upper edge of the plank below, which is called by ship-wrights *clinch-work*. *Yawls* are something less than cutters, nearly of the same form, and used for similar services; they are generally rowed with six oars.

The above boats more particularly belong to men of war; as merchant-ships have seldom more than two, viz. a long-boat and yawl: when they have a third, it is generally calculated for the countries to which they trade, and varies in its construction accordingly. Merchant-ships employed in the Mediterranean find it more convenient to use a *lanch*, which is longer, more flat-bottomed, and better adapted every way to the harbours of that sea, than a long-boat.

A *wherry* is a light sharp boat, used in a river or harbour for carrying passengers from place to place. *Punts* are a sort of oblong flat-bottomed boats, nearly resembling floating stages; they are used by ship-wrights and caulkers, for breaming, caulking, or repairing a ship's bottom. A *moses* is a very flat broad boat, used by merchant-ships amongst the Caribbee islands, to bring hogsheads of sugar off from the sea beach to the shipping which are anchored in the roads. A *felucca* is a strong passage-boat used in the Mediterranean, from 10 to 16 banks of oars. The natives of Barbary often employ boats of this sort as cruisers.

For the larger sort of boats, see the articles Craft, Cutter, Pe·iagua, and Shallop.

Of all the small boats, a *Norway yawl* seems to be the best calculated for a high sea, as it will often venture out to a great distance from the coast of that country, when a stout ship can hardly carry any sail.

An account of several trials made on a Boat, *or Sloop, fit for inland navigation, coasting voyages, and short passages by sea, which is not, like ordinary vessels, liable to be overset or sunk by winds, waves, water-spouts, or too heavy a load; contrived and constructed by Monsieur Bernieres, director of the bridges and causeways in France,* &c. &c.] Some of these trials were made on the first of August 1777, at the gate of the Invalids in Paris, in the presense of the provost of the merchants, of the body of the town, and a numerous concourse of spectators of all conditions.

The experiments were made in the way of comparison with another common boat of the same place, and of equal size. Both boats had been built ten years, and their exterior forms appeared to be exactly similar. The common boat contained only eight men, who rocked it and made it incline so much to one side, that it it presently filled with water, and sunk; so that the men were obliged to save themselves by swimming; a thing common in all vessels of the same kind, either from the imprudence of those who are in them, the strength of the waves or wind, a violent or unexpected shock, their being overloaded, or overpowered in any other way.

The same men who had just escaped from the boat which sunk, got into the boat of M. Bernieres; rocked it, and filled it, as they had done the other, with water. But, instead of sinking to the bottom, though brim full, it bore being rowed about the river, loaded as it was with men and water, without any danger to the people in it.

M. Bernieres carried the trial still farther. He ordered a mast to be erected in this same boat, when filled with water; and to the top of the mast had a rope fastened, and drawn till the end of the mast touched the surface of the river, so that the boat was entirely on one side, a position into which neither winds nor waves could bring her; yet as soon as the men who had hauled her into this situation let go the rope, the boat and mast recovered themselves perfectly in less than the quarter of a second; a convincing proof that the boat could neither be sunk nor overturned, and that it afforded the greatest possible security in every way. These experiments appeared to give the greater pleasure to the public, as the advantages of the discovery are not only so sensible, but of the first importance to mankind.

Boat-Bill. See Cancroma.

Boat-Insect. See Notonecta, Entomology *Index*.

BOATING, a kind of punishment in use among the ancient Persians for capital offenders. The manner of boating was thus: the person condemned to it being laid on his back in a boat, and having his hands stretched out, and tied fast on each side of it, had another boat put over him, his head being left out through a place fit for it. In this posture they fed him, till the worms, which were bred in the excrements he voided as he thus lay, ate out his bowels, and so caused his death, which was usually 20 days in effecting, the criminal lying all this while in most exquisite torments.

BOATSWAIN, the officer who has the boats, sails, rigging, colours, anchors, and cables, committed to his charge.

It is the duty of the boatswain particularly to direct whatever relates to the rigging of a ship, after she is equipped from a royal dock-yard. Thus he is to observe that the masts are properly supported by their shrouds, stays, and back-stays, so that each of those ropes may sustain a proportional effort, when the mást is strained by the violence of the wind, or the agitation of the ship. He ought also to take care that the blocks and running-ropes are regularly placed, so as to answer the purposes for which they are intended; and that the sails are properly fitted to their yards and stays, and well furled or reefed when occasion requires.

It is likewise his office to summon the crew to their duty; to assist with his mates in the necessary business of the ship; and to relieve the watch when it expires. He ought frequently to examine the condition of the masts, sails, and rigging; and remove whatever may be judged unfit for service, or supply what is deficient: and he is ordered by his instructions to perform this duty with as little noise as possible.

Boatswain's Mate has the peculiar command of the long-boat, for the setting forth of anchors, weighing or fetching home an anchor, warping, towing, or mooring; and is to give an account of his store.

BOB, a term used for the ball of a short pendulum.

BOBARTIA. See Botany *Index*.

BOBBIN, a small piece of wood turned in the form of a cylinder, with a little border jutting out at each end, bored through to receive a small iron pivot. It serves to spin with the spinning-wheel, or to wind thread, worsted, hair, cotton, silk, gold, and silver.

BOBBING, among fishermen, a particular manner of catching eels, different from sniggling. Bobbing for eels is thus performed: They scour well some large lobs, and with a needle run a twisted silk through them from end to end, taking so many as that they may warp them about a board a dozen times at least: then they tie them fast with the two ends of the silk, that they may hang in so many hanks; which done, they fasten all to a strong cord, and, about a handful and a half above the worms, fix a plummet three quarters of a pound weight, and make the cord fast to a strong pole. With this apparatus fishing in muddy water they feel the eels tug lustily at the bait; when they think they have swallowed it sufficiently, they gently draw up the rope to the top, and bring them ashore.

BOBIO, an episcopal town of Italy, in the Sardinian part of the Milanese, seated on the river Trebia, in E. Long. 9. 30. N. Lat. 44. 48.

BOCA-chica, the strait or entrance into the harbour of Carthagena in South America. It is defended by several forts belonging to the Spaniards, all which were taken by the English in 1741; they were nevertheless obliged to raise the siege of Carthagena in a short time after.

Boca-del-Drago, a strait so called, between the island of Trinidad and Andalusia, in the province of Terra Firma in South America.

BOCANUM, in *Ancient Geography*, a town of Mauritania Tingitana, to the south of Mount Atlas; said to be that of Morocco in Africa. W. Long. 9. 0. N. Lat. 31. 0.

BOCCA, in glass-making, the round hole in the working furnace, by which the metal is taken out of the great pots, and by which the pots are put into the furnace. This is to be stopped with a cover made of earth and brick, and removeable at pleasure, to preserve the eyes of the workmen from the violence of the heat.

BOCCACE, or Boccacio, John, one of the most polite and learned writers of his age, was born in Tuscany in 1313. His father first placed him with a merchant; but as he gave signs of genius, he was put afterward to study the canon law: he lost almost as much time at this as at the last occupation; and thought of nothing but poetry. He came under the instruction of Petrarch; but did not so entirely devote himself to poetry, as to forget other studies. In the prosecution of these, however, as he sought everywhere for the best masters, and had not an income sufficient for his expences, he was reduced to such circumstances as to stand in need of the bounty of others; he was particularly obliged to Petrarch, who furnished him with money as well as books, and assisted him in many other respects. Boccace was a great admirer of

Digitized by Google

the Greek language: he found means to get Homer translated into Latin for his own use; and procured a professor's chair at Florence for Leontius Pylatus, in order to explain this poet. The republic of Florence honoured Boccace with the freedom of that city; and employed him in public affairs, particularly to negociate the return of Petrarch: but this poet not only refused to return to Florence, but persuaded Boccace also to retire from thence, on account of the factions which prevailed in that republic. Having quitted Florence, he went to several places in Italy, and stopped at last at the court of Naples, where King Robert gave him a very kind reception. He conceived a violent affection for the natural daughter of that prince, which made him remain a considerable time at Naples. He also made a long stay in Sicily, where he was in high favour with Queen Joan. He returned to Florence when the troubles were a little appeased: but not liking the course of life he must have followed there, he retired to Certaldo; and, far from the noise of business, he spent his time in study agreeably to his own humour. His great application brought on him an indisposition, of which he died in 1376. He wrote several books, some learned and serious, others of gallantry and full of stories. It is by his *Decameron* chiefly that he has immortalized himself. Petrarch found so many charms in this composition, that he was at the pains to translate it into Latin for his own satisfaction.

BOCCALE, or BOCAL, a liquid measure used at Rome, answering to what among us is called a bottle, being equivalent to about an English quart. Seven boccales and a half make the rubbia.

BOCCALINI, TRAJAN, a celebrated satirical writer, born at Rome, who, in the beginning of the 17th century, obtained the admiration of all Italy by his refined and delicate criticisms. Sovereign princes themselves did not escape the lash of his satire. The cardinals Borghese and Gætan having declared themselves his protectors, he published his *Ragguaglio di Parnasso*, and *La Secretaria di Apollo*, which is the continuation of the former. These two works were received by the public with uncommon applause. He there feigns, that Apollo, holding his court at Parnassus, heard the complaints of the whole world, and did justice according as the cases required. He at length printed his *Pietra de Parangone;* wherein he attacks the court of Spain, setting forth their designs against the liberty of Italy, and inveighing particularly against them for the tyranny they exercised in the kingdom of Naples. The Spaniards complained of him in form, and were determined at any rate to be revenged. Boccalini was frightened, and retired to Venice; but was there assassinated in a very strange manner. He lodged with one of his friends, who having got up early one morning, left Boccalini in bed: a minute after, some armed men entered his chamber, and gave him so many blows with bags full of sand, that they left him for dead; so that his friend returning some time after, found him speechless. Great search was made at Venice for the authors of this murder; and though they were never discovered, it was universally believed that they were employed by the court of Spain.

BOCCARELLA, in the glass-manufacture, a small hole or aperture of the furnace, one of which is placed on each side of the bocca, almost horizontally with it. Out of them the servitors take coloured or finer metal from the piling pot.

BOCCIARDI, CLEMENTE, called *Clementone*, history and portrait painter, was born at Genoa in 1620, and was the disciple of Bernardo Strozzi, an artist of good reputation; but he found in himself so strong an ambition to arrive at excellence in his profession, that he left Genoa and went to Rome; there to explore that true sublimity of style, which can only be obtained by a judicious observation of the ancient sculptures and the works of the celebrated modern artists. By the guidance of an excellent genius, and also by a most industrious application to design, he discovered the art of uniting and blending the antique and modern gusto in a style that at once exhibited both gracefulness and strength. Most of the works of this master (except his portraits, which were lively, natural, and graceful) are in the chapels of Genoa, Pisa, and other cities of Italy; of which places they are, at this day, accounted the greatest ornaments, and are most exceedingly esteemed.

BOCCONI, SYLVIO, a celebrated natural historian, born at Palermo in Sicily. After he had gone through the usual course of studies, he applied himself chiefly to natural history, in which he made a most surprising progress. He was afterwards ordained priest, and entered into the Cistercian order, at which time he changed his Christian name *Paul* into that of *Sylvio*. This new way of life did not in the least divert him from his favourite study: for he pursued it with greater vigour than ever, and travelled not only over Sicily, but likewise visited the isle of Malta, Italy, the Low Countries, England, France, Germany, Poland, and several other nations; and, in 1696, was admitted a member of the academy of the virtuosi in Germany. Upon his return to Sicily, he retired to a convent of his own order near Palermo; where he died in 1704, being 71 years of age. He left many curious works.

BOCCONIA, GREATER TREE CELANDINE. See BOTANY *Index*.

BOCHART, SAMUEL, one of the most learned men in the 17th century, was born at Roan in Normandy. He made a very early progress in learning, and became a great proficient in the oriental languages. He was many years pastor of a Protestant church at Caen; where he was tutor to Wentworth Dillon earl of Roscommon, author of the Essay on Translated Verse. Here he particularly distinguished himself by his public disputations with Father Veron, a very famous controvertist. The dispute was held in the castle of Caen, in the presence of a great number of Catholics and Protestants. Bochart came off with great honour and reputation: which were not a little increased in the year 1646, upon the publication of his *Phaleg* and *Canaan*, which are the titles of the two parts of his *Geographia Sacra*. He acquired also great fame by his *Hierozoicon*, printed in London in 1675. This treats *de animalibus sacræ scripturæ*. The great learning he displayed in his works rendered him esteemed not only among those of his own profession, but amongst all lovers of knowledge of whatever denomination. In 1652, the queen of Sweden invited him to Stockholm, where she gave him many proofs of her regard and esteem. At his return to Caen, he resumed the functions of the ministry,

Digitized by Google

stry, and was received into the acadamy of that city. His learning was not his principal qualification, he had a modesty equal to it; and hence enjoyed his great reputation in tranquillity, sheltered from those unhappy quarrels which so many other learned men draw upon themselves. He died suddenly while he was speaking in the above academy, on the 16th of May, 1667, aged 78. A complete edition of his works was published in Holland, in two volumes folio, 1712.

BOCHIUS, or BOCQUI, JOHN, a Latin poet, born at Brussels in 1555. He travelled into Italy, Germany, Poland and Muscovy, and at his return became secretary to the duke of Parma. He died on the 13th of January, 1609. The critics in the Netherlands set so great a value on his poetry, that they gave him the name of the *Belgic Virgil*. He wrote, 1. *De Belgii Principatu*. 2. *Parodia Heroica Psalmorum Davidicorum*. 3. *Observationes Physicæ, Ethicæ, Politicæ, et Historicæ, in Psalmos*. 4. *Vita Davidis*. 5. *Orationes*. 6. *Poemata*.

BOCHETTA, a place of Italy, famous in the war of 1746 and 1747. It is a chain of mountains over which the great road lies from Lombardy to Genoa; and on the very peak of the highest mountain is a narrow pass, which will hardly admit three men to go abreast. This pass is properly called the *Bochetta;* for the defence of which there are three forts. It is the key of the city of Genoa; and was taken in 1746 by the imperialists; by which means they opened a way to that city.

BOCKHOLT, a town of Germany in the circle of Westphalia and principality of Munster, capital of a small district, and subject to Prussia. E. Long. 6. 20. N. Lat. 51. 40.

BOCKING, a very large village of Essex in England, adjoining to Braintree, from which it is separated only by a small stream. Its church is a deanery, and very large; and there are here two or three meeting-houses; but the market is kept at Braintree. It contained 2544 inhabitants in 1811. There is a large manufactory of baize, chiefly for exportation, which gives employment to a great number of men, women, and children. It is 42 miles north-east of London.

BOCK-LAND, in the Saxons time, is what we now call *freehold lands*, held by the better sort of persons by charter or deed in writing; by which name it was distinguished from *folkland* or copy-hold land, holden by the common people without writing.

BODERIA, or BODOTRIA, the ancient name for the frith of Forth in Scotland.

BODIN, JOHN, native of Angiers, one of the ablest men in France in the 16th century, famous for his *Method of History*, his *Republic*, and other works. He was in great favour with Henry III. who imprisoned John de Serre for writing an injurious piece against Bodin, and forbade him upon pain of death to publish it. But his favour was not of long continuance. The duke of Alençon, however, gave him several employments; and carried him to England with him as one of his counsellors, where he had the pleasure and glory to see his books *de Republica* read publicly in the university of Cambridge, having been translated into Latin by the English. He had written them in French. In the Ragguaglio of Boccalini he is condemned as an atheist to the fire, for having said in his books that liberty of conscience ought to be granted to sectaries. He declared himself pretty freely against those who asserted that the authority of monarchs is unlimited; but yet he displeased the republicans. Upon the death of the duke of Alençon, Bodin retired to Laon, where he married. He had an office in the presidial of this city; and in Charles IX.'s time he was the king's solicitor, with a commission for the forests of Normandy. He died of the plague at Laon, in 1596.

BODKIN, a small instrument made of steel, bone, ivory, &c. used for making holes.

BODLEY, SIR THOMAS, founder of the Bodleian library at Oxford, was born at Exeter in Devonshire, in 1544. When he was about 12 years of age, his father, Mr John Bodley, being a Protestant, was obliged to leave the kingdom. He settled at Geneva with his family, and continued there till the death of Queen Mary. In that university, then in its infancy, young Bodley studied the learned languages, &c. under several eminent professors. On the accession of Queen Elizabeth, he returned with his father to England; and was soon after entered of Magdalen college in Oxford. In 1563, he took the degree of bachelor of arts, and the year following was admitted fellow of Merton college. In 1565, he read a Greek lecture in the hall of that college. He took a master of arts degree the year after, and read natural philosophy in the public schools. In 1569, he was one of the proctors of the university, and for some time after officiated as public orator. In the year 1576, he quitted Oxford, and made the tour of Europe; but returned to his college after four years absence. He became gentleman-usher to Queen Elizabeth, in the year 1583; and in 1585 he married the widow of Mr Bell, daughter of Mr Carew of Bristol, a lady of considerable fortune. Mr Bodley was soon after sent ambassador to the king of Denmark, and other German princes. He was next charged with an important commission to Henry III. of France; and in 1588, went ambassador to the United Provinces, where he continued till the year 1597. On his return to England, finding his preferment obstructed by the jarring interests of Burleigh and Essex, he retired from court, and could never afterwards be prevailed on to accept of any employment. He now began the foundation of the Bodleian library, which was completed in 1599. Soon after the accession of King James I. he received the honour of knighthood, and died in the year 1612. He was buried in the choir of Merton college. His monument is of black and white marble, on which stands his effigy in a scholar's gown, surrounded with books. At the four corners are the emblematical figures of Grammar, Rhetoric, Music, and Arithmetic; two angels, &c.; with a short inscription, signifying his age and time of his death. Sir Thomas Bodley was a polite scholar, an able statesman, and a worthy man. Mr Granger observes, that he merited much as a man of letters; but incomparably more in the ample provision he made for literature, in which he stands unrivalled; and that his library is a mausoleum which will perpetuate his memory as long as books themselves endure. Sir Thomas wrote his own Life to the year 1609; which, together with the first draught of the Statutes, and his Letters, have been published from the originals

Digitized by Google

originals in the Bodleian library, by Mr Thomas Hearn, in 1703.

BODMIN, a town of Cornwall in England, seated in a bottom between two high hills, which renders the air very unwholesome. It consists chiefly of one street, and the many decayed houses show that it has once been a place of greater note. It is a mayor-town, sends two members to parliament, and had formerly the privilege of the coinage of tin. Population 2050 in 1811. W. Long. 4. 5. N. Lat. 50. 32.

BODON, a fortified town of Bulgaria, in Turkey in Europe, with an archbishop's see. It is seated on the Danube, in E. Long. 25. 24. N. Lat. 45. 10.

BODROCH, a town of Hungary, seated on the north-east shore of the river Danube, in E. Long. 20. 20. N. Lat. 46. 15.

BODRUN. See TEOS.

BODY, in *Physics*, an extended solid substance, of itself utterly passive and inactive, indifferent either to motion or rest.

Colour of BODIES. See CHROMATICS.

BODY, with regard to animals, is used in opposition to soul, in which sense it makes the subject of anatomy. The height of the human body is said to be different in different parts of the day; ordinarily it is an inch more in the morning than at night *. The body ceases to grow in height when the bones are arrived at a degree of firmness and rigidity which will not allow of farther extension by the effort of the heart and motion of the blood.

* Phil. Trans. No. 283.

BODY, among painters, as to *bear a body*, a term signifying that the colours are of such a nature, as to be capable of being ground so fine, and mixing with the oil so entirely, as to seem only a very thick oil of the same colour.

BODY, in the manege. A horse is chiefly said to have a *good body*, when he is full in the flank. If the last of the short ribs be at a considerable distance from the haunch-bone, although such horses may for a time have pretty good bodies, yet, if they are much laboured, they will lose them: and these are properly the horses that have no flank. It is also a general rule, that a man should not buy a light-bodied horse, and one that is fiery, because he will soon destroy himself.

BODY, in the art of war, a number of forces, horse and foot, united and marching under one commander.

Main BODY *of an Army*, the troops encamped in the centre between the two wings, and generally infantry; the other two bodies are the vanguard and the rear-guard; these being the three into which an army, ranged in order of battle, is divided.

BODY, in matters of literature, denotes much the same with system, being a collection of every thing belonging to a particular science or art, disposed in proper order: thus we say, a body of divinity, law, physic, &c.

Body-Corporate. See CORPORATION.

BOECE, or BOETHIUS, HECTOR, the historian, was born at Dundee about the year 1470, studied at Aberdeen, and afterwards in the university of Paris. There he became acquainted with Erasmus, and laid the foundation of a friendship which was so honourable to him. In 1500 he was recalled to Aberdeen by Bishop Elphingston, who made him principal of that university. Gratitude for this promotion engaged him to write with particular attention the Life of that prelate. It appeared in the history of the diocese of Aberdeen; and may be considered, perhaps, as the most valuable portion of that work. His History of Scotland, a more useful undertaking, was first published in the year 1526. In 1574 it underwent a second impression, and was enriched with the 18th book and a part of the 19th. A farther continuation of it was executed by Joannes Ferrerius Pedemontanus. Boece died about the year 1550. He has been compared, and not without reason, to Geoffroy of Monmouth. He had a propensity to fable and exaggeration; a fault which the elegance of his expression does not compensate. His judgment was not equal to his genius; and his fictions as a historian are a contrast to his probity as a man. John Ballenden, archdeacon of Murray, translated his history into the Scottish language at the desire of James V. This translation William Harrison converted, though with imperfections, into English; and his associate Hollingshed published his work in his chronicle, with additions and improvements by the ingenious Francis Thynne.

BOEDROMIA, in antiquity, solemn feasts held at Athens in memory of the succour brought by Ion to the Athenians, when invaded by Eumolpus son of Neptune in the reign of Erectheus. Plutarch gives another account of the Boedromia; which, according to him, were celebrated in memory of the victory obtained by Theseus over the Amazons, in the month Boedromion.

BOEDROMION, in *Chronology*, the third month of the Athenian year, answering to the latter part of our August and beginning of September.

BOEHMEN, JACOB, called the *Teutonic philosopher*, was a noted visionary of the 17th century, born in a village of Germany near Gorlitz, in 1575. He was bred a shoemaker: and marrying, supported a large family by this occupation; until, after amusing himself with chemistry, a visionary turn of mind, heated by sermons and German divinity, got the better of his common sense, and produced raptures and notions of divine illumination. These he first gave vent to in 1612, by a treatise entitled Aurora, or the Rising of the Sun; being a mixture of astrology, philosophy, chemistry, and divinity, written in a quaint obscure style. This being censured by the magistrates of Gorlitz, he remained silent for seven years; but improving that interval by pursuing the flights of his imagination, he resumed his pen; and resolving to redeem the time he had lost, in the remaining five years of his life, he published above 20 books, which greatly needed what he concluded with, *A Table of his Principles, or a Key to his Writings*; though this has not proved sufficient to render them intelligible to common apprehensions. The key above mentioned appeared in 1624, and he did not long survive it. For early in the morning of the 18th of November that year, he called one of his sons, and asked him "if he also heard that excellent music?" to which being answered in the negative, he ordered the door to be set open, that the music might be the better heard. He asked afterwards what o'clock it was? and being told it had struck two, he said "It is not yet my time; my time is three hours hence." In the interim he was heard to speak these words:

Digitized by Google

"O thou strong God of hosts, deliver me according to thy will! O thou crucified Lord Jesus, have mercy upon me, and receive me into thy kingdom!" When it was near six o'clock, he took his leave of his wife and sons, and blessed them, and said, "Now I go hence into paradise;" then bidding his son turn him, he immediately expired his last breath in a deep sigh. A great number of persons have been misled by the visions of this fanatic, notwithstanding his talents in involving the plainest things in mystery and enigmatical jargon. Among others, the famous Quirinus Kahlman may be reckoned the principal of his followers in Germany: who says, he had learned more being alone in his study, from Boehmen, than he could have learned from all the wise men of that age together; and, that we may not be in the dark as to what sort of knowledge this was, he acquaints us, that amidst an infinite number of visions it happened, that, being snatched out of his study, he saw thousands of thousands of lights rising round about him. Nor has he been without admirers, and those in no small number, in England: among the foremost of whom stands the famous Mr William Law, author of *Christian Perfection*, &c. who has favoured his countrymen with an English edition of Jacob Boehmen's works in 2 vols. 4to.

BOEOTIA, the name of two ancient kingdoms, one of which was founded or rather restored by Cadmus, and named by him *Bœotia*, from the ox which is said to have directed him to the place where he built the capital of his new kingdom, better known afterwards by the name of *Thebes*. But as the inhabitants were scarcely ever distinguished as a nation by the name of *Bœotians*, but of *Thebans*, we refer to the article THEBES for their history, &c.

The other Bœotia was in Thessaly, and is said to have been founded by Bœotus the son of Neptune and brother of Æolus, by Arne the daughter of Æolus king of Æolis. This last, having sent his daughter to Metapontum a city of Italy, she was there delivered of those two sons, the eldest of whom she called after her father's name *Æolus;* and he possessed himself of the islands in the Tyrrhenian, now the Tuscan sea, and built the city of Lipara. Bœotus the younger son went to his grandfather and succeeded him in his kingdom, called it after his own name, and the capital city, *Arne*, from his mother. All that we know of these Bœotians is, that they held this settlement upwards of 200 years; and that the Thessalians expelled them from it; upon which they came and took possession of that country, which till then had been called *Cadmeis*, and gave it the name of *Bœotia*. Diodorus and Homer tell us, that these Bœotians signalized themselves at the Trojan war; and the latter adds, that five of Bœotus's grandsons, viz. Peneleus, Leitus, Prothœnor, Arcesilaus, and Clonius, were the chiefs who led the Bœotian troops thither.

BOERHAAVE, HERMAN, one of the greatest physicians, as well as the best men, that this or perhaps any age has ever produced, was born in 1668, at Vorhout, a village near Leyden. At the age of 16 he found himself without parents, protection, advice, or fortune. He had already studied theology and the other ecclesiastical sciences, with the design of devoting himself to a clerical life; but the science of nature, which equally engaged his attention, soon engrossed his whole time. This illustrious person, whose name afterwards spread throughout the world, and who left at his death above 200,000l. could at that time barely live by his labours, and was compelled to teach mathematics to obtain necessaries. But in 1693, being received doctor in the science of physic, he began practice; and his merit being at length discovered, many powerful friends patronized him, and procured him three valuable employments: the first was that of professor of medicine in the university of Leyden; the second, that of professor of chemistry; and, thirdly, that of professor of botany. The Academy of Sciences at Paris, and the Royal Society at London, invited him to become one of their members. He communicated to each his discoveries in chemistry. The city of Leyden became in his time the school of Europe for this science, as well as for medicine and botany. All the princes of Europe sent him disciples, who found in this skilful professor, not only an indefatigable teacher, but even a tender father, who encouraged them to pursue their labours, consoled them in their afflictions, and solaced them in their wants. When Peter the Great went to Holland in 1715, to instruct himself in maritime affairs, he also attended Boerhaave to receive his lessons. His reputation was spread as far as China: a mandarin wrote to him with this inscription, "To the illustrious Boerhaave, physician in Europe;" and the letter came regularly to him. The city of Leyden has raised a monument in the church of St Peter, to the salutary genius of Boerhaave, *Salutifero Boerhaavii genio sacrum*. It consists of an urn upon a pedestal of black marble: six heads, four of which represent the four ages of life, and the two sciences in which Boerhaave excelled, form a group issuing between the urn and its supporters. The capital of this basis is decorated with a drapery of white marble, in which the artist has shown the different emblems of disorders and their remedies. Above, upon the surface of the pedestal, is the medallion of Boerhaave: at the extremity of the frame, a ribband displays the favourite motto of this learned man: *Simplex sigillum veri*, "Truth unarrayed."

From the time of the learned Hippocrates, no physician has more justly merited the esteem of his cotemporaries, and the thanks of posterity, than Boerhaave. He united to an uncommon genius, and extraordinary talents, the qualities of the heart, which gave them so great a value to society. He made a decent, simple, and venerable appearance, particularly when age had changed the colour of his hair. He was an eloquent orator, and declaimed with dignity and grace. He taught very methodically, and with great precision; he never tired his auditors, but they always regretted that his discourses were finished. He would sometimes give them a lively turn with raillery; but his raillery was refined and ingenious, and it enlivened the subject he treated of, without carrying with it any thing severe or satirical. A declared foe to all excess, he considered decent mirth as the salt of life. It was the daily practice of this eminent person, through his whole life, as soon as he rose in the morning, which was generally very early, to retire for an hour to private prayer and meditation on some part of the Scriptures. He often told his friends, when they asked him how it was possible

Digitized by Google

sible for him to go through so much fatigue? that it was *this* which gave him spirit and vigour in the business of the day. *This* he therefore recommended as *the best rule* he could give: for nothing, he said, could tend more to the health of the body than the tranquillity of the mind; and that he knew nothing which could support himself, or his fellow-creatures, amidst the various distresses of life, but a well grounded confidence in the supreme Being upon the principles of Christianity. This was strongly exemplified in his own illness in 1722, which can hardly be told without horror; and by which the course of his lectures as well as his practice was long interrupted. He was for five months confined to his bed by the gout, where he lay upon his back without daring to attempt the least motion; because any effort renewed his torments, which were so exquisite, that he was at length not only deprived of motion but of sense. Here his medical art was at a stand; nothing could be attempted, because nothing could be proposed with the least prospect of success. But, having (in the sixth month of his illness) obtained some remission, he determined to try whether the juice of fumitory, endive, or succory, taken thrice a-day in large quantity, (viz. above half a pint each dose), might not contribute to his relief; and by a perseverance in this method he was wonderfully recovered. This patience of Boerhaave's was founded not on vain reasonings, like that of which the Stoics boasted; but on a religious composure of mind, and Christian resignation to the will of God.

Of his sagacity and the wonderful penetration with which he often discovered and described, at the first sight of a patient, such distempers as betray themselves by no symptoms to common eyes, such surprising accounts have been given, as scarcely can be credited though attested beyond all doubt. Yet this great master of medical knowledge was so far from having presumptuous confidence in his abilities, or from being puffed up by his riches, that he was condescending to all, and remarkably diligent in his profession: and he often used to say that the life of a patient (if trifled with or neglected) would one day be required at the hand of the physician. He always called the poor his *best patients;* for God (said he) is their paymaster. The activity of his mind sparkled visibly in his eyes. He was always cheerful, and desirous of promoting every valuable end of conversation; and the excellency of the Christian religion was frequently the subject of it: for he asserted, on all proper occasions, the divine authority and sacred efficacy of the Scriptures; and maintained, that they only could give peace of mind, that sweet and sacred peace which passeth all understanding; since none can conceive it but he who has it; and none can have it but by divine communication. He never regarded calumny nor detraction (for Boerhaave himself had enemies), nor ever thought it necessary to confute them. "They are sparks (said he) which, if you do not blow, will go out of themselves. The surest remedy against scandal, is to *live it down* by a perseverance in well-doing; and by praying to God that he would cure the distempered minds of those who traduce and injure us." Being once asked by a friend, who had often admired his patience under great provocations, whether he knew what it was to be angry, and by what means he had so entirely suppressed that impetuous and ungovernable passion? he answered, with the utmost frankness and sincerity, that he was naturally quick of resentment: but that he had, by daily prayer and meditation, at length attained to this mastery over himself.

About the middle of the year 1737, he felt the first approaches of that fatal illness which brought him to the grave, viz. a disorder in his breast, which was at times very painful, often threatening him with immediate suffocation, and terminated in an universal dropsy: but during this afflictive and lingering illness, his constancy and firmness did not forsake him; he neither intermitted the necessary cares of life, nor forgot the proper preparations of death. About three weeks before his dissolution, when the Rev. Mr Schultens, one of the most learned and exemplary divines of the age, attended him at his country-house, the doctor desired his prayers, and afterwards entered into a most remarkably judicious discourse with him on the spiritual and immaterial nature of the soul; and this he illustrated to Mr Schultens with wonderful perspicuity, by a description of the effects which the infirmities of his body had upon his faculties; which yet they did not so oppress or vanquish, but his soul was always master of itself, and always resigned to the pleasure of its Maker—and then he added, "He who loves God ought to think nothing desirable but what is most pleasing to the supreme goodness." These were his sentiments, and such was his conduct in this state of weakness and pain. As death approached nearer, he was so far from terror or confusion, that he seemed less sensible of pain, and more cheerful under his torments, which continued till the 23d day of September, 1738, on which he died (much honoured and lamented) between four and five in the morning, in the 70th year of his age—often recommending to the bye-standers a careful observation of St John's precepts concerning the love of God, and the love of man, as frequently inculcated in his first epistle, particularly in the fifth chapter. His funeral oration was spoken in Latin before the university of Leyden, to a very numerous audience, by Mr Schultens, and afterwards published at their particular desire. He wrote, 1. *Institutiones Medicæ.* 2. *Aphorismi de cognoscendis et curandis Morbis.* 3. *Institutiones et Experimenta Chemiæ.* 4. *Libellus de Materia Medica, et remediorum formulis quæ serviunt aphorismus.* Swieten published, *Commentaries upon his Aphorisms*, in 5 vols 4to; and several other works, all greatly esteemed.

BOERHAAVIA. See Botany *Index*.

BOESCHOT, a town of the Netherlands, in the province of Brabant, seated on the river Nethe, in E. Long. 4. 45. N. Lat. 51. 5.

BOETHIUS, or Boetius, Flavius Anicius Manlius Torquatus Severinus, a prose as well as poetical writer of the 6th century, born of one of the noblest families of the city of Rome. The time of his birth is related to have been about that period in the Roman history when Augustulus, whose fears had induced him to a resignation of the empire, was banished, and Odoacer king of the Herulians began to reign in Italy, viz. in the year of Christ 476, or somewhat after. The father of Boetius dying while he was yet an infant, his relations undertook the care of his education and the direction of his studies. His excellent parts were soon discovered; and,

Digitized by Google

and, as well to enrich his mind with the study of philosophy as to perfect himself in the Greek language, he was sent to Athens. Returning young to Rome, he was soon distinguished for his learning and virtue, and promoted to the principal dignities in the state, and at length to the consulate. Living in great affluence and splendour, he addicted himself to the study of theology, mathematics, ethics, and logic; and how great a master he became in each of these branches of learning, appears from those works of his now extant. The great offices which he bore in the state, and his consummate wisdom and inflexible integrity, procured him such a share in the public councils, as proved in the end his destruction: for as he employed his interest with the king for the protection and encouragement of deserving men, so he exerted his utmost efforts in the detection of fraud, the repressing of violence, and the defence of the state against invaders. At this time Theodoric the Goth had attempted to ravage Campania; and it was owing to the vigilance and resolution of Boetius that this country was preserved from destruction. At length, having murdered Odoacer, Theodoric became king of Italy, where he governed 33 years with prudence and moderation, during which time Boetius possessed a large share of his esteem and confidence. It happened about this time that Justin, the emperor of the east, upon his succeeding to Anastasius, made an edict condemning all the Arians, except the Goths, to perpetual banishment from the eastern empire: in this edict Hormisda bishop of Rome, and also the senate, concurred. But Theodoric, who, as being a Goth, was an Arian, was extremely troubled at it; and conceived an aversion against the senate for the share they had borne in this proscription. Of this disposition in the king, three men of profligate lives and desperate fortunes, Gaudentius, Opilio, and Basilius, took advantage. Having entertained a secret desire of revenge against Boetius, for having been instrumental in the dismission of the latter from a lucrative employment under the king, they accused him of several crimes; such as the stifling a charge, the end whereof was to involve the whole senate in the guilt of treason; and an attempt, by dethroning the king, to restore the liberty of Italy; and, lastly, they suggested, that, to acquire the honours he was in possession of, Boetius had had recourse to magical art. Boetius was at this time at a great distance from Rome; however, Theodoric transmitted the complaint to the senate, enforcing it with a suggestion that the safety, as well of the people as the prince, was rendered very precarious by this supposed design to exterminate the Goths. The senate, perhaps fearing the resentment of the king, and having nothing to hope from the success of an enterprise which, supposing it ever to have been meditated, was now rendered abortive, without summoning him to his defence, condemned Boetius to death. The king, however, apprehending some bad consequence from the execution of a sentence so flagrantly unjust, mitigated it to banishment. The place of his exile was Ticinum, now the city of Pavia, in Italy. Being in that place separated from his relations, who had not been permitted to follow him into his retirement, he endeavoured to derive from philosophy those comforts which that alone was capable of affording to one in his forlorn situation, sequestered from his friends, in the power of his enemies, and at the mercy of a capricious tyrant; and accordingly he there composed that valuable discourse, entitled, *De Consolatione Philosophiæ.* About two years after his banishment Boetius was beheaded in prison by the command of Theodoric. His tomb is to be seen in the church of St Augustine, at Pavia, near the steps of the chancel.

The extensive learning and eloquence of this great man are conspicuous in his works, which seem to have been collected with great care: an edition of them was printed at Venice, in one volume folio, in 1499. In 1570, Glareanus, of Basil, collated that with several manuscripts, and published it, with a few various readings in the margin. His chief performance is that above mentioned, *De Consolatione Philosophiæ;* a work well known in the learned world, and to which the afflicted have often applied. In particular, our Saxon King Alfred, whose reign, though happy upon the whole, was attended with great vicissitudes of fortune, had recourse to it at a time when his distresses compelled him to seek retirement: and that he might the better impress upon his mind the noble sentiments inculcated in it, he made a complete translation of it into the Saxon language, which, within these few years, has been given to the world in its proper character. And Camden relates, that Queen Elizabeth, during the time of her confinement by her sister Mary, to mitigate her grief, read and afterwards translated it into very elegant English. But it deserves also particular notice, that he is the most considerable of all the Latin writers on music; and that his treatise *De Musica* supplied for some centuries the want of those Greek manuscripts which were supposed to have been lost.

BOG properly signifies a quagmire, covered with grass, but not solid enough to support the weight of the body; in which sense it differs only from marshes or fens, as a part from the whole: some even restrain the term *bog* to quagmires pent up between two hills; whereas fens lie in champaign and low countries, where the descent is very small.—To drain boggy lands, a good method is, to make trenches of a sufficient depth to carry off the moisture; and if these are partly filled up with rough stones, and then covered with thorn-bushes and straw, to keep the earth from filling up the interstices, a stratum of good earth and turf may be laid over all; the cavities among the stones will give passage to the water, and the turf will grow at top.

Bog, or *Bog of Gight*, a small town of Scotland, seated near the mouth of the river Spey, in W. Long. 2. 23. N. Lat. 57. 48.

BOGALCUND, a province of Hindostan. See Supplement.

BOGARMITÆ. See Bogomili.

BOGHO, or Bueil, a town in the county of Nice in Piedmont, situated in the frontiers of France, in E. Long. 6. 45. N. Lat. 44. 12.

BOGLIO, a district in the territories of the duke of Savoy, lying on the river Tinca on the frontiers of Provence; the capital is of the same name.

Boglio, a town of Piedmont, and county of Nice, being the capital of a territory of the same name. E. Long. 6. 55. N. Lat. 44. 5.

BOGOMILI, or Bogarmitæ, in church history, a

Digitized by Google

a sect of heretics, which sprung up about the year 1179. They held, that the use of churches, of the sacrament of the Lord's Supper, and all prayer, except the Lord's prayer, ought to be abolished; that the baptism of catholics is imperfect; that the persons of the Trinity are unequal; and that they oftentimes made themselves visible to those of their sect. They said, that devils dwelt in the churches, and that Satan had resided in the temple of Solomon from the destruction of Jerusalem to their own time.

BOGOTA, or SANTA FE DE BOGOTA, the capital of New Granada in South America, belonging to Spain. It was taken by the Independents under Bolivar in 1819. W. Long. 74. 10. N. Lat. 4. 35.

BOGUDIANA (Pliny), a part of the Mauritania Tingitana in Africa. According to Cluverius, it is the *Tingitana*, anciently so called from King Bogud.

BOHADDIN, an eminent Arabian writer. See SUPPLEMENT.

BOHEA, in commerce, one of the coarsest kinds of tea that come from China. See THEA.

BOHEMIA, a kingdom of Europe subject to the house of Austria, and surrounded on every side with woods and mountains as with a natural rampart. It is bounded on the east by Moravia and part of Silesia, on the north by Lusatia and Upper Saxony, on the west by Franconia, and on the south by Bavaria. Although this kingdom is situated in the middle of Germany, and its king is an elector of the empire, it has nevertheless its particular assemblies, customs, and language, different from the Germans. It is one of the most elevated countries of Europe: for no river enters into it, though many have their source there; the chief of which are the Elbe, the Oder, the Vistula, and the Morava. Its greatest length is 200 miles, its breadth 180, and it comprehends an area of 20,000 square miles. The climate of the interior is temperate and healthy, but on the frontiers it is raw and inclement, on account of the high grounds. The soil is generally rich. Besides corn, flax, hemp, hops, saffron, it produces wine, though only in small quantity. Nearly one-third of the country is covered with wood. It is rich in minerals. Its gold mines are exhausted: but it has mines of silver, iron, mercury, copper, lead, cobalt, zinc, calamine, antimony, pit coal; and its mines of tin are next in value to those of Cornwall. Its manufactures consist of yarn, linen, cambric, stockings, lace, woollen stuffs, glass, cotton and silk stuffs, leather, &c. and amounted in value in 1792 to 3,630,000l. sterling, of which about a third is exported.

Bohemia is the most populous of all the Austrian dominions beyond the Alps. The number of inhabitants in 1789 was 2,852,463, and in 1817 it was 3,236,140. The Bohemian nobility consist of 10 princes, 110 counts, 82 barons, and 238 knights. The original language of the people is a dialect of the Sclavonian; but German is spoken in all the large towns. The established religion is the Roman Catholic; but there are about 100,000 dissenters, consisting of Jews, Lutherans, and Calvinists. There is a university at Prague, the chief town, and there are about 2200 schools in the country.

The name *Bohemia*, in the German language, signifies the *home* or *abode of the Boii*, a people of ancient Gaul, who under their leader Sergovesus settled in that country about 500 years before the Christian era. These Boii were soon after expelled by the Marcomanni, a nation of the Suevi, who were afterwards subdued by the Sclavi, a people of Scythia, whose language is still spoken in Bohemia and Moravia. Notwithstanding this expulsion of the Boii, the present inhabitants are still called *Bohemians* by foreigners, but the natives call themselves *Zechs*. At first they were governed by dukes; but the emperor Otho I. conquered the duke of Bohemia, and reduced the province under the empire. Afterwards Henry V. gave the title of *king* to Ladislaus duke of Bohemia; and since that time these kings have been electors and chief cup-bearers of the empire, and the kingdom has been elective; which privileges have been confirmed by the golden bull. Formerly the kings of Bohemia received the kingdom as a fief of the empire, which ceremony was practised upon the frontiers; after which the standards of the principalities of which it is composed were given to them, without being torn and given to the people, as is done with the ensigns of the other fiefs of the empire. Ferdinand I. of Austria, having married Anne, sister of Louis, last king of Bohemia, who died without issue, and being elected king, that kingdom has remained in his family ever since. But the crown is conferred with some appearance of election; which right the states of Bohemia still pretend to claim, notwithstanding that, by the treaty of Westphalia, Bohemia is declared hereditary in the house of Austria.

The king of Bohemia was formerly the first secular elector, and gave his opinion after the elector of Cologne. The states of Bohemia have never been comprehended in the government or in the circles of the empire; they are not subject to any of its jurisdictions, nor to the Roman months, taxes, or public contributions; and they owed nothing to the empire but what the king voluntarily imposed upon himself. The government of Bohemia is different from that of all other states, the affairs of the kingdom being managed by six different courts. First, the council of the regency, or the great royal council, in which presides the great judge or burgrave of Bohemia, and who has under him 18 lieutenants of the king and other assessors. Secondly, The council or superior chamber of justice, at which the great master of the kingdom is president. Thirdly, The chamber of fiefs. Fourthly, The new tribunals to judge the appeals of the German vassals in their differences on the account of fiefs; which court has also its president, vice-president, and assessors. Fifthly, The royal chamber of finances, which has a president and vice-president. Sixthly, The chancery, which always follows the court. Besides, every circle of Bohemia is governed by two bailiffs, who administer justice in their prefecture. The states are composed of the clergy, lords, nobles, and burghers. As to Moravia, there is a grand bailiff who governs it in the name of the king of Bohemia, as margrave of Moravia. He is at the head of the royal council, which is composed of three assessors, and in which all is transacted in the name of the king. This province is divided into five circles, each of which has a bailiff. There are, besides, other officers of justice, who have a right of judging only at certain times, and in particular cases, where an appeal is allowed.

Bohemia was divided by the emperor Charles IV. into 12 provinces, in each of which he ordered two captains to be appointed every year for the administration of the government. The same emperor caused the church of Prague to be erected into an archbishopric, with

Bohemia ‖ Boiemum.

with this advantage, that the archbishop of Prague should have the prerogative that the archbishop of Mentz formerly enjoyed, viz. of crowning the king of Bohemia. The duchy of Silesia, the marquisate of Moravia, and that of Lusatia, formerly held of this crown; but now only that of Moravia, which is incorporated with the kingdom of Bohemia, and is in the possession of the house of Austria. The total revenue of Bohemia is about 2,000,000l. sterling; and its peace establishment amounts to 50,000 or 60,000 men.

The only remarkable occurrence in the Bohemian history is the rebellion of the disciples of John Huss, and Jerome of Prague, on account of their leaders having been burnt as heretics. This occasioned a bloody war of 16 years continuance; for a particular account of which, see the article Hussites.

BOHEMIAN bole. See Bole.

Bohemian Brethren, a sect of Christian reformers which sprung up in Bohemia in the year 1467. They treated the pope and cardinals as antichrist, and the church of Rome as the whore spoken of in the Revelation. They rejected the sacraments of the Romish church, and chose laymen for their ministers. They held the Scriptures to be the only rule of faith, and rejected the popish ceremonies in the celebration of the mass, nor did they make use of any other prayer than the Lord's Prayer. They consecrated leavened bread. They allowed no adoration but of Jesus Christ, in the communion. They rebaptized all such as joined themselves to their congregation. They abhorred the worship of saints and images, prayers for the dead, celibacy, vows, and fasts; and kept none of the festivals but Christmas, Easter, and Whitsuntide.

In 1504, they were accused by the Catholics to King Ladislaus II. who published an edict against them, forbidding them to hold any meeting either privately or publicly. When Luther declared himself against the church of Rome, the Bohemian Brethren endeavoured to join his party. At first, that reformer showed a great aversion to them; but the Bohemians sending their deputies to him in 1523 with a full account of their doctrines, he acknowledged that they were a society of Christians whose doctrines came nearest to the purity of the gospel. The sect published another confession of faith in 1535, in which they renounced anabaptism, which they at first practised: upon which a union was concluded with the Lutherans, and afterwards with the Zuinglians, whose opinions from thenceforth they continued to follow.

BOHOL, one of the Philippine islands in Asia, lying to the northward of Mindanao, in E. Long. 122. 5. N. Lat. 10. 0.

BOIANO, a town of Italy, in the kingdom of Naples, and county of Molese, with a bishop's see. It is seated at the foot of the Apennines, near the river Tiferno, in E. Long. 14. 38. N. Lat. 41. 30.

BOIARDO, Matteo Maria, of Ferrara, count of Scandiano, celebrated for his Italian poems, lived in the 15th century. His principal work is his *Orlando inamorato*. His Latin eclogues and sonnets are also much admired.

BOJARS, denote Russian noblemen. See Russia.

BOIEMUM, in *Ancient Geography*, a part of Germany, surrounded with the Montes Sudeti (Ptolemy); now called Bohemia. It took its name from the Boii, a people of Gaul, who removed thither before Cæsar's expedition into that country, (Cæsar); though he seems to err in the name. The Boii were afterwards driven out by the Marcomanni, and settled in the west of Vindelicia, which was afterwards called Bayern, and hence the name Bavaria.

Boiemum ‖ Boileau.

BOII, (Cæsar); a people of Celtica, extending from the Ligeris to the Elaver, whence came the Boii of Gallia Cisalpina, whose migration is related by Livy.

Boii. See Bohemia.

BOIGUACU, in *Zoology*, a synonyme of the boa constrictor. See Boa, Ophiology *Index*.

BOIL, or Furuncle. See the *Index* subjoined to Medicine and Surgery.

BOILEAU, Sieur Nicholas Despreaux, a celebrated French poet, was born at Paris in 1636. After he had gone through his course of polite literature and philosophy, his relations engaged him to the study of the law, and he was admitted advocate. But though he had all the talents necessary for the bar, yet he could not adapt himself to a science which turns upon continual equivocations, and often obliges those who follow it to clothe falsehood in the garb of truth. He therefore determined to study theology; but he could not long endure the thorns of school divinity. He imagined, that, to allure him more cunningly, chicanery, which he thought to avoid, had only changed her habit; and so he renounced the Sorbonne, betook himself entirely to the belles lettres, and took possession of one of the foremost places in Parnassus. The public gave his works the encomium they deserved; and Louis XIV. who always loved to encourage the sciences and polite literature, was not only pleased to have M. Boileau's works read to him constantly as he composed them, but settled a yearly pension of 2000 livres upon him, and gave him the privilege of printing all his works. He was afterwards chosen a member of the French academy, and also of the academy of medals and inscriptions. This great man, who was as remarkable for his integrity, his innocence, and diffusive benevolence, as for the keenness of his satires, died of a dropsy on the 2d of March 1711, in the 75th year of his age. The Lutrin of Boileau, still considered by some French critics of the present time as the best poem to which France has given birth, was first published in 1674. It is with great reason and justice that Voltaire confesses the Lutrin inferior to the Rape of the Lock. Few poets can so properly be compared as Pope and Boileau; and, wherever their writings will admit of comparison, we may, without any national partiality, adjudge the superiority to the English bard. These two great authors resembled each other as much in the integrity of their lives, as in the subjects and execution of their several compositions. There are two actions recorded of Boileau, which sufficiently prove that the inexorable satirist had a most generous and friendly heart. When Patru, the celebrated advocate, who was ruined by his passion for literature, found himself under the painful necessity of selling his extensive library, and had almost agreed to part with it for a moderate sum, Boileau gave him a much superior price; and, after paying the money, added this condition to the purchase, that Patru should retain, during his life, the possession of the books. The succeeding instance of the poet's generosity is yet nobler:—when it was rumoured at court that the king intended to retrench the pension of Corneille, Boileau hastened to Madame de Montespan,

Digitized by Google

Montespan, and said, that his sovereign, equitable as he was, could not, without injustice, grant a pension to an author like himself, just ascending Parnassus, and take it from Corneille, who had so long been seated on the summit; that he entreated her, for the honour of the king, to prevail on his majesty rather to strike off *his* pension, than to withdraw that reward from a man whose title to it was incomparably greater; and that he should more easily console himself under the loss of that distinction, than under the affliction of seeing it taken away from such a poet as Corneille. This magnanimous application had the success which it deserved, and it appears the more noble, when we recollect that the rival of Corneille was the intimate friend of Boileau. The long unreserved intercourse which subsisted between our poet and Racine was highly beneficial and honourable to both. The dying farewell of the latter is the most expressive eulogy on the private character of Boileau: "*Je regarde comme un bonheur pour moi de mourir avant vous*," said the tender Racine, in taking a final leave of his faithful and generous friend.

BOILING, or EBULLITION, the bubbling up of any fluid. The term is most commonly applied to that bubbling which happens by the application of fire, though that which ensues on the mixture of an acid and alkali is sometimes also distinguished by the same name. Boiling, in general, is occasioned by the discharge of an elastic fluid through that which is said to boil; and the appearance is the same, whether it is common air, fixed air, or steam, that makes its way through the fluid. The boiling of water is proved by Dr Hamilton of Dublin, in his essay on the ascent of vapour, to be occasioned by the lowermost particles of the water being heated and rarefied into vapour by reason of the vicinity of the bottom of the containing vessel; in consequence of which, being greatly inferior in specific gravity to the surrounding fluid, they ascend with great velocity, and lacerating and pushing up the body of water in their ascent, give it the tumultuous motion called *boiling*. That this is occasioned by steam, and not by particles of air or fire, as some have imagined, may be very easily proved in the following manner: Let a common drinking glass be filled with hot water, and then inverted into a vessel of the same: as soon as the water in the vessel begins to boil, large bubbles will be observed to ascend in the glass, which will displace the water in it, and in a short time there will be a continual bubbling from under its edge; but if the glass is then drawn up, so that its mouth may only touch the water, and a cloth dipt in cold water be applied to the outside, the steam within it will be instantly condensed, and the water will ascend so as to fill it entirely, or very nearly so. See the article EVAPORATION.

BOILING, in trade and manufactures, is a preparation given to divers sorts of bodies by making them pass over the fire, chiefly in water, though sometimes in other liquors. In this sense we speak of the boiling of salt, boiling of sugar, copperas, &c.

BOILING of Silk with Soap is the first preparation in order to dyeing it. Thread is also boiled in a strong lixivium of ashes to prepare it for dyeing.

BOILING, in the culinary art, is a method of dressing meats by coction in hot water, intended to soften them, and dispose them for easier digestion. The effects of boiling are different according to the kinds and qualities of the water. Pulse boiled in sea-water grow harder: mutton boiled in the same becomes softer and tenderer than in fresh water, but tastes saltish and bitter.

BOILING to Death (*caldariis decoquere*), in the middle age; a kind of punishment inflicted on thieves, false coiners, and some other criminals.

BOILING is also a method of trying or essaying the goodness or falseness of a colour or dye. The stuff is to be boiled in water with certain drugs, different according to the kind or quality of the colour, to try whether or no it will discharge, and give a tincture to the water. With this view crimson silks are boiled with alum, and scarlets with soap, in quantity equal to the weight of the silk.

BOILING-Wells, in *Natural History*. See *BURNING-Springs*, and ICELAND.

BOINITZ, a town of Upper Hungary, in the county of Zell, remarkable for its baths and the quantity of saffron that grows about it. E. Long. 19. 10. N. Lat. 48. 42.

BOIOBI, in *Zoology*, the name of a species of serpent found in America, and called by the Portuguese *cobra de verd*. It is about an ell in length, of the thickness of a man's thumb, and is all over of a very beautiful and shining green. Its mouth is very large, and its tongue black. It loves to be about houses, and never injures any creature unless provoked or hurt; but it will then bite, and its poison is very fatal. The natives take as a remedy against its poison, the root *caa apia* bruised and mixed with water. See *CAA-Apia*.

BOIORUM DESERTA, in *Ancient Geography*, a district of Pannonia, so called from the excision of the Boii by the Getæ. Now the Weinerwald, of Lower Austria, towards Stiria, to the east of Mount Cetius, or the Hahlenberg, and south of Vindobona or Vienna.

BOIQUIRA, the American name for the rattlesnake.

BOIS-LE-DUC, called by the Dutch *Hertogen-bosch*, a large, strong, and handsome town of the Netherlands, in Dutch Brabant, seated between the rivers Dommel and Aa, among morasses, in E. Long. 6. 16. N. Lat. 51. 45.

Bois de Soignies, the forest of Soignies in the Austrian Netherlands and province of Brabant, about three miles south-east of Brussels.

Bois de Coissi, the name given to a South American tree growing about Surinam, held in the highest estimation by the Indians in that part of the world, and now recommended to the physicians of Europe by Dr Fernin in a treatise lately published at Amsterdam. The root is esteemed an excellent stomachic, restoring the appetite and assisting digestion; but it is chiefly celebrated as an infallible remedy against even the most inveterate intermittents. It is said also to be used with great safety and advantage in every species of remittent and continued fever, with patients of all ages, sexes, and conditions, even during pregnancy, and in the puerperal state. Before employing it, however, it is absolutely necessary to administer either a purgative or emetic. The best method of exhibiting it is in decoction: half an ounce of the bark of the root must be boiled in a close vessel with six pints of water till one half

Digitized by Google

half be consumed; the decoction is then strained off, and a cupful taken every two hours till the fever is entirely extinguished. Six or seven days after a cure is thus performed, it is generally necessary to repeat the purgative.

BOISSARD, John James, a famous antiquarian, born at Besançon the capital of Franche Compte in France. He published several collections which are of great use to such as are desirous to understand the Roman antiquities. He had a great passion for this study; and drew with his own hand plans of all the ancient monuments of Italy. He died at Metz, October 30th, 1602. His principal works are, 1. Four volumes in folio of Roman antiquities, adorned with plates engraved by Theodore de Bey and his two sons. 2. *Theatrum Vitæ Humanæ;* which contains the lives of 198 famous persons, with their portraits. 3. A treatise *De Divinatione et Magicis Præstigiis.* These works are scarce, and esteemed by the antiquarians.

BOIT, an excellent painter in enamel. He was born in Stockholm, and bred a jeweller; which profession he intended to follow in England; but changed his design, and went into the country, where he taught children to draw. He there engaged a gentleman's daughter, who was one of his scholars, to promise him marriage; but the affair being discovered, he was thrown into prison. In that confinement, which lasted two years, he studied enamelling; an art to which he fixed, on his return to London, and practised with the greatest success. The prices he is said to have obtained for his work are almost incredible: but being engaged in a very large design for the court, and Queen Anne dying before it was completed, he ran in debt, his goods were seized by execution, and he fled to France; where he changed his religion, was countenanced by the regent, and obtained a pension of 250l. per annum, but died suddenly at Paris in 1726. There is a large piece done by him at Kensington, representing Queen Anne sitting, and Prince George standing by her; and at Bedford-house is another very large plate of the duke's father and mother.

BOITJAPO, in *Zoology*, the name of a species of serpent found in *America;* and called by the Portuguese there, *cobra di apo.* It grows to seven or eight feet long, is about the thickness of a man's arm, and very small and taper towards the tail. Its back is of an olive colour; its belly yellow, and covered with very regular and elegant triangular scales. It feeds on frogs, &c. but is very poisonous, and its bite extremely fatal.

BOKHARA, a city of Tartary, in Asia, and capital of Great Bukharia, situated one day's journey to the north of the river Jehun, or Amu; in E. Long. 62. 45. N. Lat. 39. 15. In 1219 it was besieged by Jenghiz Khan, as being part of Sultan Mohammed's dominions, a descendant of the famous Mahmud Gazni. At that time, besides the city-walls, which were very strong, Bokhara had an outward enclosure 12 leagues in compass; which shut in not only the suburbs, but also many pleasant seats and farms watered by the river Soghd, from whence the ancient Sogdiana took its name. The Mogul army arrived before the place in July, and continued the siege during the following winter. In March 1220, they forced the outer wall, and began to besiege the city in form. Sultan Mohammed had left in the city a very numerous garrison under the command of three generals, who made a sally at the head of 20,000 men: but being repulsed with great loss, their courage failed them; and, instead of staying to defend the inhabitants, as soon as they had got into the city by one gate, passed out by another with their families, and almost all their soldiers, hoping to escape by the darkness of the night; but their design being discovered, they were pursued by a detachment of 30,000 Moguls; and being overtaken at the river Amu, they were, after a bloody dispute, almost all cut to pieces. Mean time, Jenghiz Khan, being informed of the confusion into which the city had been thrown by the desertion of the garrison, ordered an attack to be made on all sides at once; but while he was preparing for this, the magistrates and clergy went out and presented him with the keys of the city. Jenghiz Khan granted them their lives, on condition that they gave no shelter to any of the sultan's soldiers, and put out all who should be suspected of being in that prince's interest; which they promised to do upon oath. All the young people, however, who were displeased with the surrender, retired with the governor to the castle, which was very strong, and resolved to defend themselves to the last extremity. Jenghiz Khan having taken possession of Bokhara, entered on horseback into the great mosque, and asked merrily if that was the sultan's palace? On being answered that it was the house of God, he alighted; and giving the principal magistrate his horse to hold, mounted the gallery where the ecclesiastics usually sat, and then taking up the Koran, threw it under the feet of his horses. Having staid there for some time, he retired to his camp; where, some days after, having assembled the principal people of Bokhara, and ascended a pulpit erected for that purpose in the midst of them, he began his speech by praising God, and recounted all the favours he had received from the Almighty: he then mentioned the perfidious behaviour of their sultan towards himself, telling them that God had sent him, to rid the world of such wicked men. As to them, he testified his satisfaction for their having freely furnished his army with necessaries; and promised that his soldiers should not meddle with any goods which they made use of in their houses; but commanded them to deliver up what they had hidden, under pain of being tortured. This speech had such an effect, that the poor inhabitants delivered up every thing, as well what they had concealed as what they had present use for; notwithstanding which, the tyrant soon after caused the city to be burnt, on pretence that some of the sultan's soldiers were concealed in it. As all the houses were made of wood, except the sultan's palace which was built of stone, and some few private houses of brick, the whole was utterly consumed; and Jenghiz Khan having found some few soldiers that had actually concealed themselves, put them all to death without mercy. The castle surrendered at discretion soon after; and though it was demolished, the governor and garrison, out of a very extraordinary piece of clemency from so bloody a tyrant, had their lives spared. Bokhara continued in ruins for some years, but at length Jenghiz Khan ordered it to be rebuilt. It is now large and populous; and is the residence of a khan who is altogether despotic, though his power reaches but a little

Digitized by Google

little way without the city. The town is seated on a rising ground, with a slender wall of earth and a dry ditch. The houses are low, built mostly of mud: but the caravanseras and mosques, which are numerous, are all of brick. The bazars or market-places, which have been stately buildings, are now mostly in ruins. The inhabitants are said to amount to 100,000, and are more civilized and polite than some of their neighbours. Great numbers of Jews and Arabians frequent this place. A plan was proposed so far back as 1557, and revived in 1741, for supplying the town with English goods; but it was found that the price brought was not sufficient to indemnify the hazard of the conveyance.

BOL, Hans or John, a painter, born at Mechlin in 1534. He received his first instructions from a master of no great repute, whom he soon left; and going to Heidelberg, employed himself in copying several pictures of the eminent artists. His subjects are chiefly landscapes with animals; but he also sometimes painted history, with no small success. We have by him a set of landscapes, views in Holland, slightly etched, but in a style that indicates the hand of the master. He died in 1593.

Bol, *Ferdinand*, a celebrated painter both of history and portraits, was born at Dort in 1611, and educated at Amsterdam. In the school of the celebrated Rembrandt Gerretz, he received his instructions as a painter; and imitated the style of his master with no little success, not only in his pictures but in his engravings. Bol's etchings are bold and free. The lights and shadows in them are broad and powerful, which renders the effect very striking: but they want that lightness of touch and admirable taste which those of Rembrandt possess in so great a degree. Bol died at Dort, the place of his birth, in 1681, aged 70.

BOKHARIA. See Bukharia.

BOLANDUS, John, a famous Jesuit, born at Tillemont in the Netherlands, in 1696. He distinguished himself by writing the lives of the saints, under the title of *Acta Sanctorum*, of which he published five volumes in folio; but died while he was labouring at the sixth, in the 70th year of his age. The continuators of that work are called *Bolandists*.

BOLBITINUM, in *Ancient Geography*, the second mouth of the Nile reckoning from west to east; now very small, choked up with sand, and called *le Bras de Beltin*.

BOLENTIUM, in *Ancient Geography*, a town of Pannonia Superior; now *Rackersburg* in Stiria. See Rackersburg.

BOLES, are viscid earths, less coherent and more friable than clay; more readily uniting with water, and more freely subsiding from it. They are soft and unctuous to the touch; adhere to the tongue: and by degrees melt in the mouth, impressing a light sense of astringency. There is a great variety of these earths; the principal of which are the following.

1. Armenian bole, when pure, is of a bright red colour with a tinge of yellow: It is one of the hardest and most compact bodies of this class, and not smooth and glossy like the others, but generally of a rough and dusty surface. It does not effervesce with acids, though some part of it is dissolved by all of them. Neuman observes, that four ounces of Armenian bole distilled in a glass retort in an open fire, yielded three drachms of a saline phlegm, which smelt a little urinous, and changed syrup of violets green. In the neck of the retort was found a little powdery saline matter which had an ammoniacal taste, but it was in too small quantity to be collected or further examined. Like most other coloured earths, this kind of bole contains a portion of ferruginous matter, to which the colour is owing; and which may be separated by the magnet, after the bole has been calcined with oil or other inflammable matters. It is likewise impregnated with vitriolic acid; and hence, when mixed with nitre or sea salt, it extricates the acids of these salts in the fire.

2. French bole is of a pale red colour, variegated with irregular specks of white and yellow. It is much softer than the Armenian, and slightly effervesces with acids.

3. Bole of Blois is yellow, remarkably lighter than most of the other yellow earths, and effervesces strongly with acids.

4. Bohemian bole is of a yellow colour, with a cast of red, and generally of a flaky texture. It is not acted on by acids.

5. Lemnian earth is of a pale red colour, and slightly effervesces with acids.

6. Silesian bole is of a pale yellow colour, and acids have no sensible effect upon it.

These and other earths, made into little masses, and stamped with certain impressions, are called *terræ sigillatæ*. They have been recommended as astringent, sudorific, and alexipharmic; but these and many other virtues that have been ascribed to them appear to have no foundation. They are still, however, prescribed in fluxes and complaints of the primæ viæ.

BOLESLAFF, or Buntzlau, a town of Silesia, seated on the river Bobar, in E. Long. 16. 0. N. Lat. 51. 12.

BOLESLAUS I. and II. kings of Poland. See Poland.

BOLETUS, Spunk. See Botany *Index*.

BOLEYN, Ann, queen of Henry VIII. of England; memorable in the English history, as the first cause of the reformation, as the mother of Queen Elizabeth under whom it was completely established, and also on account of her own sufferings. She was the daughter of Sir Thomas Boleyn, and born in 1507. She was carried into France at seven years of age by Henry VIII.'s sister, who was wife of Louis XII.: nor did she return into England when that queen retired thither after the death of her husband; but staid in the service of Queen Claudia the wife of Francis I. and after the death of that princess went to the duchess of Alençon. The year of her return is not well known: some will have it to have been in 1527, others in 1525. This much is certain, that she was maid of honour to Queen Catharine of Spain, Henry VIII.'s first wife; and that the king fell extremely in love with her. She behaved herself with so much art and address, that by refusing to satisfy his passion, she brought him to think of marrying her: and the king, deceived by her into a persuasion that he should never enjoy her unless he made her his wife, was induced to set on foot the affair of his divorce with Catharine, which at last was executed

Digitized by Google

Boleyn.

with great solemnity and form. A celebrated author observes, that "That which would have been very praise-worthy on another occasion, was Anne Boleyn's chief crime: since her refusing to comply with an amorous king, unless he would divorce his wife, was a much more enormous crime than to have been his concubine. A concubine (says he) would not have dethroned a queen, nor taken her crown or her husband from her; whereas the crafty Anne Boleyn, by pretending to be chaste and scrupulous, aimed only at the usurpation of the throne, and the exclusion of Catharine of Arragon and her daughters from all the honours due to them." In the mean time, Henry could not procure a divorce from the Pope; which, we know, made him resolve at length to throw off his authority, and to fling off his yoke. Nevertheless he married Anne Boleyn privately upon the 14th of November 1532, without waiting any longer for a release from Rome; and as soon as he perceived that his new wife was with child, he made his marriage public. He caused Anne Boleyn to be declared queen of England on Easter-eve 1533, and to be crowned the first of June following. She was brought to bed upon the 7th of September of a daughter, who was afterwards Queen Elizabeth; and continued to be much beloved by the king, till the charms of Jane Seymour had fired that prince's heart in 1536. Then his love for his wife was changed into violent hatred: he believed her to be unchaste, and caused her to be imprisoned and tried. "She was indicted of high treason, for that she had procured her brother and other four to lie with her, which they had done often: that she had said to them, that the king never had her heart; and had said to every one of them by themselves, that she loved him better than any person whatever; which was to the slander of the issue that was begotten between the king and her. And this was treason according to the statute made in the 26th year of this reign; so that the law which was made for her and the issue of her marriage, is now made use of to destroy her." She was condemned to be either burnt or beheaded; and she underwent the latter on the 19th of May 1536. The right reverend author of the *History of the Reformation*, relates some very remarkable things of her behaviour during the time of her imprisonment, and a little before her execution. When she was imprisoned, she is said to have acted very different parts; sometimes seeming devout and shedding abundance of tears, then all of a sudden breaking out into a loud laughter. A few hours before her death, she said, that the executioner was very handy; and besides, that she had a very small neck; at the same time feeling it with her hands, and laughing heartily. However, it is agreed that she died with great resolution; taking care to spread her gown about her feet, that she might fall with decency; as the poets have related of Polyxena, and the historians of Julius Cæsar. Roman Catholic writers have taken all occasions to rail at this unhappy woman, as well through vexation at the schism which she occasioned, as for the sake of defaming and dishonouring Queen Elizabeth by this means; and they have triumphed vehemently, that in the long reign of that queen, no endeavours were used to justify her mother. But either Queen Elizabeth or her ministers are greatly to be admired for prudence in this respect; since it is certain, that Anne Boleyn's justification could never have been carried on without discovering many things which must have been extremely prejudicial to the queen, and have weakened her right instead of establishing it. For though the representations of the papists are in nowise to be regarded, yet many things might have been said to the disadvantage of her mother, without transgressing the laws of true history; as that she was a woman gay even to immodesty, indiscreet in the liberties she took, and of an irregular and licentious behaviour.

Boleyn, Boling-broke.

BOLINGBROKE, or BULLINGBROKE, a town of Lincolnshire in England, and of great antiquity, but now in a mean condition. It gives title of viscount to the St Johns of Battersea. Population 361 in 1811. E. Long. 0. 40. N. Lat. 53. 15.

BOLINGBROKE, *Henry St John*, lord visount, a great statesman and philosopher, descended from an ancient and noble family, was born about the year 1672. He had a regular and liberal education; and by the time he left the university, was considered as a person of uncommon qualifications: but with great parts, he had, as it usually happens, great passions, and these hurried him into many indiscretions and follies. Contrary to the inclinations of his family, he cultivated Tory connections; and gained such an influence in the house of commons, that in 1704 he was appointed secretary of war and of the marines. He was closely united in all political measures with Mr Harley: when, therefore, that gentleman was removed from the seals in 1707, Mr St John resigned his employment; and in 1710, when Mr Harley was made chancellor of the exchequer, the post of secretary of state was given to Mr St John. In 1712 he was created Baron St John of Lediard-Tregoze in Wiltshire, and Viscount Bolingbroke. But being overlooked in the bestowal of vacant ribbons of the order of the Garter, he resented the affront, renounced the friendship of Harley then earl of Oxford, and made his court to the Whigs. Nevertheless on the accession of George I. the seals were taken from him; and being informed that a resolution was taken to pursue him to the scaffold, for his conduct regarding the treaty of Utrecht, he withdrew to France. Here he accepted an invitation to enter into the Pretender's service, and accepted the seals as his secretary; but he was as unfortunate in his new connections as in those he had renounced; for the year 1715 was scarcely expired, when at the same time that he was attainted of high treason at home, the seals and papers of his foreign secretary's office were taken from him; followed by an accusation from the Pretender and his party, of neglect, incapacity, and treachery. Such a complication of distressful events threw him into a state of reflection, that produced by way of relief a *consolatio philosophica*, which he wrote the same year under the title of *Reflections upon exile*; and the following year he drew up a vindication of his conduct with respect to the Tories, in the form of *A Letter to Sir William Wyndham*. His first lady being dead, he about this time espoused a niece of the famous Madame Maintenon, and widow of the Marquis de Vilette, with whom he had a very large fortune. In 1723 the king was prevailed on to grant him a free pardon, and he returned in consequence to England; but was by no means satisfied within, while he was yet no more than a mere titular lord, and remained excluded from the

house

Digitized by Google

house of peers. This stigma operated to fix him in enmity to Sir Robert Walpole, to whose secret enmity he attributed his not receiving the full extent of the king's clemency: hence he distinguished himself by a multitude of political writings, till the year 1735; when being thoroughly convinced that the door was finally shut against him, he returned once more to France. In this foreign retreat he began his course of Letters on the study and use of History, for the use of Lord Cornbury, to whom they are addressed. Upon the death of his father, who lived to be extremely old, he settled at Battersea, the ancient seat of his family, where he passed the remainder of his life in philosophical dignity. Pope and Swift, one the greatest poet, the other the greatest wit of the time, perfectly adored him; and it is well known that the former received from him the materials for his incomparable poem the "Essay on Man."—He died in 1751, and left the care and benefit of his MSS. to Mr Mallet, who published them together with his former printed work, in 5 vols. 4to; they are also printed in 8vo.

BOLISAW, a town of the kingdom of Bohemia in Germany, situated in E. Long. 14. 35. N. Lat. 20. 25.

BOLKOWITZ, a town of Silesia in the duchy of Glogaw. E. Long. 15. 20. N. Lat. 51. 27.

BOLLARDS, large posts set into the ground on each side of a dock. On docking or undocking ships, large blocks are lashed to them; and through these blocks are reeved the transporting hawsers to be brought to the capstans.

BOLLITO, a name by which the Italians call a *sea-green colour* in artificial crystal. To prepare this colour, you must have in the furnace a pot filled with 40 lb. of good crystal, first carefully skimmed, boiled, and purified, without any manganese: then you must have twelve ounces of the powder of small leaves of copper thrice calcined, and half an ounce of zaffre in powder: mix them together; and put them at four times into the pot, that they may the better mix with the glass; stirring them well each time of putting in the powder, lest the mixture should swell and run over.

BOLOGNA, an ancient, large, and very handsome town of Italy, in the territory of the church, and capital of the Bolognese; an archbishop's see, and an university. The public buildings are magnificent, as well with regard to the architecture as the ornaments, especially the paintings, which are done by the greatest masters. There is a vast number of palaces, in one of which the pope's nuncio resides; the private houses are also well built. Here are 169 churches, and in 1806 the town contained 63,420 inhabitants. It is a place of great trade, which is in some measure owing to a canal that runs from the city to the river Po. The Reno, which runs near Bologna, turns 400 mills that are employed in the silk-works; besides, they deal in wax, soap, hams, sausages, and even lap-dogs, which are greatly esteemed. This city fell into the hands of the French in 1796, was retaken by the Austrians in 1799, but lost again after the battle of Marengo. It was restored to the pope in 1815. It is seated at the foot of the Apennine mountains. E. Long. 11. 30. N. Lat. 44. 27.

BOLOGNE, by the English commonly called *Bullen*, a city of France, in the department of the Straits of Calais, and capital of the Bolonnois, seated near the sea. It is divided into two towns, the Upper and Lower. The port is at the mouth of the river Lianne, but the water is so shallow that no ships of burden can enter it. It is defended on the side of the river by a mole, which shelters it from the winds, and at the same time prevents the river from filling it with filth. It contained 10,140 inhabitants in 1815. E. Long. 1. 40. N. Lat. 50. 42.

BOLOGNESE, a small province of Italy, in the territory of the church, bounded on the north by the Ferrarese, on the west by the duchy of Modena, on the south by Tuscany, and on the east by Romagna. It is watered by a great number of small rivers, which render its soil the most fertile of any in Italy. Bologna is the capital, and from the great produce of the land about it is called *Bologna the fat*. It produces abundance of all sorts of grain and fruits; particularly muscadine grapes, which are in high esteem. Here are mines of alum and iron; and the inhabitants fabricate large quantities of linen, silk stockings, and cloth. This territory was overrun by the French in 1796, but was restored to the pope in 1815.

BOLOGNESE. See GRIMALDI.

BOLOGNIAN or BONONIAN STONE, a phosphoric substance first discovered near Bologna in Italy, whence it received its name. It has been supposed to contain some metallic matter, on account of its great specific gravity; but it is now found to be only a compound of ponderous earth and sulphuric acid. See BARYTES, MINERALOGY *Index*.

BOLSANE, a town of Germany, in the territory of Tyrol, and circle of Austria. It is very agreeably situated in the midst of a fine large valley, full of villages, and abounding in vineyards. The wines in this valley are the best in all Tyrol; but they must be drank the year after that of their growth, otherwise they become unfit for use. E. Long. 11. 11. N. Lat. 46. 42.

BOLSENNA, a town of Italy, in the territories of the pope, seated on a lake of the same name. E. Long. 11. 3. N. Lat. 42. 37.

BOLSTER, among surgeons, a soft yielding substance, either laid under the head or a broken limb. In this sense, bolsters are contrived for crooked, bunched, and otherwise distorted backs, shoulders, &c.

By a constitution made under Archbishop Burchier, the clergy are forbidden to wear bolsters about their shoulders, in their gowns, coats, or doublets. The occasion of the prohibition is variously construed. Some say that bolsters came in fashion in the reign of King Richard III. who being necessitated, by his natural deformity, to pad, the courtiers, and even the clergy, did the same, out of complaisance to their prince; so that every body who had the misfortune to be born straight, was obliged to wear a bolster on his shoulders to be in the fashion. Others, however, controvert this; alleging that the constitution above mentioned was made 20 years before the usurpation of Richard.

BOLSTERS of a Saddle, those parts of a great saddle, which are raised upon the bows, both before and behind, to hold the rider's thigh, and keep him in a right posture.

BOLSWAERT, a town of the United Provinces, in West Friesland, and in the county of Westergoe. E. Long. 5. 35. N. Lat. 53. 6.

Digitized by Google

Bolswert. BOLSWERT, or BOLSUERD, *Boetius Adam à*, an engraver and printseller established at Antwerp, was the descendant of a family who resided at the city of Bolswert in Friesland, from whence he derived his name. He flourished about 1620; but by what master he was instructed in the art of engraving, does not appear. He worked with the graver only; the free open style of the Bloemarts he imitated with great success; and perhaps perfected himself in their school. When he worked from Rubens, he altered that style; and his plates are neater, fuller of colour, and more highly finished. The two following from this master may be here mentioned. 1. The resurrection of Lazarus, a large upright plate. 2. The Last Supper, its companion. Basan, speaking of this print, says, that it proves by its beauty, and the knowledge with which it is engraved, that Boetius could sometimes equal his brother Scheltius.

BOLSWERT, or *Bolsuerd*, *Scheltius à*, an admirable engraver, was the brother of Boetius Adam à Bolswert mentioned in the preceding article. We have no other account of his family than what is there given; nor unfortunately any of himself of the least consequence. The time of his birth and of his death, and the name of the master he studied under, are equally unknown. Bolswert worked entirely with the graver, and never called in the assistance of the point. His general character as an artist is well drawn by Basan, in the following words: "We have a large number of prints, which are held in great esteem, by this artist, from various masters; but especially from Rubens, whose pictures he has copied with all possible knowledge, taste, and great effect. The freedom with which this excellent artist handled the graver, the picturesque roughness of etching, which he could imitate without any other assisting instrument, and the ability he possessed of distinguishing the different masses of colours, have always been admired by the connoisseurs, and give him a place in the number of those celebrated engravers, whose prints ought to be considered as models by all historical engravers, who are desirous of rendering their works as useful as they are agreeable, and of acquiring a reputation as lasting as it is justly merited." He drew excellently, and without any manner of his own; for his prints are the exact transcripts of the pictures he engraved from. His best works, though not always equally neat or finished, are always beautiful, and manifest the hand of the master. Sometimes we find his engravings are in a bold, free, open style; as the Brazen Serpent, the Marriage of the Virgin, &c. from Rubens. At other times they are very neat and sweetly finished: as, the Crowning with Thorns, and the Crucifixion, &c. from Vandyck. Mr Strutt observes, that his boldest engravings are from Rubens, and his neatest from Vandyck and Jordaens.—How greatly Bolswert varied his manner of engraving appears from some prints, which, like the greater part of those of his brother Boetius, bear great resemblance to the free engravings of the Bloemarts, and to those of Frederic Bloemart especially; and form a part of the plates for a large folio volume, entitled *Academie de l'Espee*, by Girard Thibault of Antwerp, where it was published, A. D. 1628; and to these he signs his name, "Scheltius," and sometimes "Shelderic Bolswert," adding the word Bruxelle. His name is usually affixed to his plates in this manner, "S. A. Bolswert." It is very necessary to caution the collectors of this master's works (those especially who are not very conversant with them), that many of them have been copied in a very careful manner, so as easily to deceive the unskilful. Some of these copies, as the Marriage of the Virgin, from Rubens, &c. are by Lauwers. But those which are most likely to mislead, are by Ragot, a French engraver, employed by Mariette the printseller, who frequently meeting with the reverses or counterproofs from the prints of Bolswert, gave them to the engraver; and he imitated them with the utmost precision. By this means the impressions from the plate copied come upon the paper the same way with the original. It is true his name is usually affixed at the bottom; but it is often cut off, and then the copy is not easily distinguished from the original. Among other prints thus imitated by Ragot from Bolswert, is Christ crucified between the two Thieves, where the soldier is represented piercing his side, from Rubens.

Among the variety of estimable engravings by this great artist, the few following may be here mentioned: 1. The Brazen Serpent, a large plate, lengthwise, from Rubens. Those impressions are the most estimable which have only the word *Antuerpiæ* at the right-hand corner, without the name of Giles Hendrix, which was afterwards inserted above it, and part of the small circle over the arms is left white. 2. Abraham offering his son Isaac, a large plate nearly square, from Theodore Rombout. 3. The education of the Virgin by Saint Anne, a middling-sized upright plate, from Rubens. Those impressions without the name of Hendrix are the most esteemed. 4. The marriage of the Virgin, a middling-sized upright plate, from the same painter. Those impressions are best in which the word *Antuerpiæ* is not added to the name of Hendrix. 5. The adoration of the wise men, a middling-sized upright plate, from the same. The good impressions of this plate have the name of Vanden Enden. 6. The feast of Herod, in which is represented the daughter of Herodias, presenting the head of John the Baptist to her mother; a large plate, lengthwise, from the same. 7. The miraculous draught of fishes; a large print lengthwise, on three plates, from the same. 8. Christ crowned with thorns; a large upright plate from Vandyck: An admirable print; with the name of Vanden Enden. 9. A crucifixion, where a figure appears presenting the sponge to Christ, St John and the Virgin are standing at the foot of the cross, and Mary Magdalene is reclining towards it; a large upright plate, from Vandyck. Of this admirable engraving there appear to have been four different impressions; though Basan mentions only three, and says that in the first the left hand of St John is hid. The chief marks of those impressions are: In the 1st, St John's left hand appears on the shoulder of the Virgin (A). In

(A) Prints of this impression are very rare, and at sales have been known to fetch from 25l. to 30l.

Digitized by Google

In the 2d impression, the hand is erased: This Basan calls the first impression; and it sells at a very high price. In the 3d impression, the hand is restored: In the 4th, it is again erased: And in both, the short strokes upon the ground near the great toe of the figure who holds the sponge are crossed with second strokes; which cross-hatchings are not in the two first impressions. There are several other crucifixions by the same master after different designs. 10. The god Pan playing upon his flute, from Jordaens. 11. Mercury and Argus, a large plate lengthwise, from the same. 12. A drunken Silenus, supported by a satyr, and another figure; a middling-sized upright plate, from Rubens. Of these three last, the impressions without the address of Bloteling are the best. 13. A chase of lions: a large plate lengthwise, from the same. 14. A variety of landscapes.

BOLT, among builders, an iron fastening fixed to doors and windows. They are generally distinguished into three kinds, viz. plate, round and spring bolts.

Bolts, in *Gunnery*, are of several sorts; as, 1. Transum-bolts, that go between the cheeks of a gun-carriage, to strengthen the transums. 2. Prise bolts; the large knobs of iron on the cheeks of a carriage, which keep the handspike from sliding, when it is poizing up the breech of a piece. 3. Traverse bolts; the two short bolts, that, being put one in each end of a mortar carriage, serve to traverse her. 4. Bracket-bolts; the bolts that go through the cheeks of a mortar, and by the help of quoins keep her fixed at the given elevation. And, 5. Bed bolts; the four bolts that fasten the brackets of a mortar to the bed.

Bolts, in a ship, are iron pins, of which there are several sorts, according to their different makes and uses. Such are drive-bolts, used to drive out others. Ray-bolts, with jags or barbs on each side, to keep them from flying out of their holes. Clench-bolts, which are clenched with rivetting hammers. Forelock-bolts, which have at the end a forelock of iron driven in to keep them from starting back. Set-bolts used for forcing the planks, and bringing them close together. Fend or fender bolts, made with long and thick heads, and struck into the uttermost bends of the ship, to save her sides from bruises. And ring-bolts, used for bringing to of the planks, and those parts whereto are fastened the breeches and tackling of the guns.

Bolt of Canvas, in commerce, the quantity of 28 ells.

Bolt-Rope, in naval affairs, a rope passing round the sail, to which the edges of it are sewed, to prevent the sail from tearing: the bottom part of it is called the *foot-rope;* the side *leeches;* and if the sail be oblong or square, the upper part is called the *head-rope*.

BOLTED flour, that which has passed through the bolters. See the following article.

BOLTER, or Boulter, a kind of sieves for meal, having the bottoms made of woollen, hair, or even wire. The bakers use bolters which are worked by the hand; millers have a larger sort, wrought by the motion of the mill.

BOLTING, a term of art used in our inns of court, whereby is intended a private arguing of cases. The manner of it at Gray's inn is thus: An ancient and two barristers sit as judges; three students bring each a case, out of which the judges choose one to be argued; which done, the students first argue it, and after them the barristers. It is inferior to *mooting:* and may be derived from the Saxon word *bolt*, "a house," because done privately in the house for instruction. In Lincoln's inn, Mondays and Wednesdays are the bolting days in vacation time; and Tuesdays and Thursdays the moot days.

Bolting, or *Boulting*, the act of separating the flour from the bran by means of a sieve or bolter. See Bolter.

Bolting-Cloth, or *Bolster-cloth*, sometimes also called *Boulting-cloth*, denotes a linen or hair-cloth for sifting meal or flour.

Bolting-Mill, a versatile engine for sifting with more ease and expedition. The cloth round this is called the *bolter*.

Bolting, or *Boulting*, among sportsmen, signifies rousing or dislodging a coney from its resting place. They say, to *bolt* a coney, *start* a hare, *rouse* a buck, &c.

BOLTON, or Boulton, *Edmund*, an ingenious English antiquarian, who lived in the beginning of the 17th century. His most considerable work is that entitled *Nero Cæsar*, or *Monarchie depraved*, dedicated to the duke of Buckingham, lord-admiral, printed at London 1624, folio, and adorned with several curious and valuable medals. It is divided into 55 chapters, in some of which are introduced curious remarks and observations. In the 24th and 25th chapters he gives an account of the revolt in Britain, against the Romans, under the conduct of Boadicea, which he introduces with a recapitulation of the affairs in Britain from the first entrance of the Romans into this island under Julius Cæsar, till the revolt in the reign of Nero. In chapter 36th he treats of the East India trade in Nero's time, which was then carried on by the river Nile, and from thence by caravans over land to the Red sea, and thence to the Indian ocean; the ready coin carried yearly from Rome upon this account amounting, according to Pliny's computation, to above 300,000l. sterling; and the usual returns in December and January yielding in clear gain a hundred for one. Besides this he wrote, 1. An English translation of Lucius Florus's Roman History. 2. Hypercritica, or a rule of judgment for reading or writing our histories. 3. The elements of armories, &c.; and some other works.

Bolton, a town of Lancashire in England, seated on the river Croell. It has a manufacture of fustians, and the market is considerable for cloth and provisions. Great and Little Bolton together contained 24,149 inhabitants in 1811. W. Long. 2. 15. N. Lat. 53. 55.

BOLUS, in *Pharmacy*, an extemporaneous form of a medicine, soft, coherent, a little thicker than honey, and the quantity of which is a little morsel or mouthful; for which reason it is by some called *buccella*.

BOMAL, a town of Luxemburg in the Netherlands, situated on the river Ourt, in E. Long. 5. 30. N. Lat. 50. 20.

BOMB, in military affairs, a large shell of cast iron, having a great vent to receive the fusee, which is made of wood. The shell being filled with gunpowder, the fusee

Digitized by Google

fusee is driven into the vent or aperture, within an inch of the head, and fastened with a cement made of quicklime, ashes, brick-dust, and steel filings, worked together in a glutinous water; or of four parts of pitch, two of colophony, one of turpentine, and one of wax. This tube is filled with a combustible matter, made of two ounces of nitre, one of sulphur, and three of gunpowder-dust, well rammed. To preserve the fusee, they pitch it over, but uncase it when they put the bomb into the mortar, and cover it with gunpowder-dust; which having taken fire by the flash of the powder in the chamber of the mortar, burns all the time the bomb is in the air; and the composition in the fusee being spent, it fires the powder in the bomb, which bursts with great force, blowing up whatever is about it. The great height a bomb goes in the air, and the force with which it falls, makes it go deep into the earth.

Bombs may be used without mortar-pieces, as was done by the Venetians at Candia, when the Turks had possessed themselves of the ditch, rolling down bombs upon them along a plank set sloping towards their works, with ledges on the sides, to keep the bomb right forward. They are sometimes also buried under ground to blow up. See CAISSON.—Bombs came not into common use before the year 1634, and then only in the Dutch and Spanish armies. One Malthus an English engineer is said to have first carried them into France, where they were put in use at the siege of Colliouse. The French have lately invented a new sort of bombs of vast weight, called *Comminges*.—The art of throwing bombs makes a branch of gunnery, founded on the theory of projectiles, and the laws and qualities of gunpowder. See GUNNERY, PROJECTILES, GUNPOWDER, &c.

BOMB-Chest, is a kind of chest filled usually with bombs, sometimes only with gunpowder, placed under ground, to tear and blow it up in the air with those who stand on it. Bomb-chests were formerly much used to drive enemies from a post they had seized or were about to take possession of: they were set on fire by means of a saucissee fastened at one end, but they are now much disused.

BOMB-Vessels, which are small ships formed for throwing bombs into a fortress, are said to be the invention of M. Reyneau, and to have been first used at the bombardment of Algiers. Till then it had been judged impracticable to bombard a place from the sea. See KETCH.

BOMBARD, a piece of ordnance anciently in use, exceedingly short and thick, and with a very large mouth. There have been bombards which have thrown a ball of 300 pounds weight. They made use of cranes to load them. The bombard is by some called *basilisk*, and by the Dutch *donberbass*.

BOMBARDIER, a person employed about a mortar. His business is to drive the fusee, fix the shell, and load and fire the mortar.

BOMBARDIER. See CARABUS, ENTOMOLOGY *Index*.

BOMBARDMENT, the havock committed in throwing bombs into a town or fortress.

BOMBARDO, a musical instrument of the wind kind, much the same as the bassoon, and used as a bass to the hautboy.

BOMBASINE, a name given to two sorts of stuffs, the one of silk, and the other crossed of cotton.

BOMBAST, in composition, is a serious endeavour, by strained description, to raise a low or familiar subject beyond its rank; which, instead of being sublime, never fails to be ridiculous. The mind in some animating passions is indeed apt to magnify its objects beyond natural bounds; but such hyperbolical description has its limits; and when carried beyond these, it degenerates into burlesque, as in the following example.

Sejanus. ——————Great and high,
The world knows only two, that's Rome and I.
My roof receives me not; 'tis air I tread,
And at each step I feel my advanc'd head
Knock out a star in heaven.

SEJAN. of *Ben Johnson*, Act v.

A writer who has not natural elevation of genius is extremely apt to deviate into bombast. He strains above his genius, and the violent effort he makes carries him generally beyond the bounds of propriety.

BOMBAX, or SILK COTTON TREE. See BOTANY *Index*.

BOMBAX, in *Zoology*, a synonyme of a species of CONUS. *Bombax* is also used sometimes for silk or cotton; but the true botanic name of cotton is GOSSYPIUM. It is likewise applied by Linnæus to signify such insects as have incumbent wings, and feelers resembling a comb.

BOMBAY, an island in the East Indies near the coast of Decan, situated in N. Lat. 19. 0. and E. Long. 73. 0. It has its present name from the Portuguese *Buon-bahia*, on account of the excellent bay formed by it, together with the winding of other islands adjacent. The harbour is spacious enough to contain any number of ships, and has likewise excellent anchoring ground, affording also, by its land-locked situation, a shelter from any winds to which the mouth may be exposed.

1 This island more healthy now than formerly, and why.

This island was formerly reckoned exceedingly unhealthy, insomuch that it had the name of the burying ground of the English, though it is now so far improved in this respect as to be no worse than any other place in the East Indies under the same parallel of latitude. The reasons of this unhealthiness and the subsequent improvements are enumerated by Mr Grose. 1. The nature of the climate, and the precautions required by it, being less understood than they are at present. 2. Formerly there obtained a very pernicious practice of employing a small fry of fish as manure for the cocoa-trees which grow in plenty on the island; though this has been denied by others, and perhaps with justice, as the putrid effluvia of animal bodies seems to be very effectually absorbed by the earth, when buried in it. All agree, however, that the habitations in the woods or cocoa-nut groves are unwholesome, by reason of the moisture, and want of a free circulation of air. 3. Another cause has been assigned for the superior healthiness of this island, viz. the lessening of the waters by the banking of a breach of the sea, though this does not appear satisfactory to our author. There is still, says he, a great body of salt water on the inside of the breach, the communication of which with the ocean being less free than before the breach was built,

Bombay.

built, must be proportionably more apt to stagnate, and to produce noxious vapours.

Whatever may be the cause, however, it is certain, that the island of Bombay no longer deserves its former character, provided a due degree of temperance be observed; without which health cannot be expected in any warm climate.

2 Climate, &c.

The climate of Bombay seems to be drier than many other parts under the same parallel. The rains last only four months of the year, but with short intermissions. The setting-in of the rains is commonly ushered in by a violent thunder-storm, called there the *Elephanta* from its extraordinary violence. The air, however, is then agreeably cooled, and the excessive heat, then nearly at its height, much moderated. The rains begin about the end of May, and go off in the beginning of September; after which there never falls any, except a short transient shower, and that but very rarely.

3 Fish in all the stagnant pools formed by the rains.

A very extraordinary circumstance is related by Mr Ives concerning the island of Bombay during the rainy season, viz. that, ten days after the rains set in, every pool and puddle swarms with a species of fish about six inches long, and somewhat resembling a mullet. Such a phenomenon has occasioned various speculations. Some have imagined that the exhaling power of the sun is so strong in the dry season as to be able to raise the spawn of these fishes into the atmosphere, and there suspend and nourish it till the rains come on, when it drops down again in the state of living and perfectly formed fish. A less extravagant supposition is, that after the ponds become dry, the spawn may possibly fall into deep fissures below the apparent bottom, remaining there during the dry season, and being supplied with a sufficient quantity of moisture to prevent it from corruption.

4 Account of the quantity of rain that falls during the rainy season.

The quantity of rain that falls at Bombay in one season has been accurately measured by Mr Thomas, Mr Ives's predecessor as hospital surgeon. His apparatus consisted of a lead cylinder about nine inches diameter, and as many deep, marked on the inside with inches and tenths. To prevent the water from splashing over, he cut a hole two inches from the bottom, and placed the cylinder in a glazed earthen vessel; after which a wax-cloth was securely tied round it, so as to cover the vessel, and prevent any water from getting in, excepting what passed through the cylinder. When more than two inches fell, the hole in the side was stopped with wax, and the water poured from the vessel into the cylinder to ascertain its quantity. It was kept in an open place free from houses, and measured at six in the morning, noon, and six in the evening. The following table shows the quantity of rain that fell from the 25th of May, when it first began, though the sky looked cloudy over land from the beginning of the month.

In this journal our author makes no mention of the elephanta above mentioned from Mr Grose as the forerunner of the rainy season, though he mentions a storm under

Bombay.

under that name on the 9th of October. It was an excessive hard gale, with violent thunder, lightning, and rain; of which last there fell two inches in no more than four hours. Neither is the quantity of thunder and lightning at all comparable to what people unacquainted with hot climates might be apt to expect. The only thunder-storms mentioned in the journal were on May 31st, June 3d, 5th, 12th, 14th, September 7th, October 9th, an elephanta; and some thunder on the 15th of the same month.

5 Vegetable productions of Bombay.

The vegetable productions of Bombay are very insignificant. Mr Ives says, that its "soil is so barren as not to produce any one thing worth mentioning;" but afterwards informs us, that its "natural produce is the cocoa-nut tree, from which they extract a liquor called *toddy*. This is soft and mild when drunk immediately: but if it stands long, it gathers strength, and becomes very intoxicating; whence probably arose the term *toddy-headed*. For each tree a tax of 20s. a-year is paid to the company, which is appropriated towards maintaining the garrison and ships of war."

Mr Grose gives an account somewhat different.—"The *oarts*, or cocoa-nut groves, make the most considerable part of the landed property, being planted wherever the situation and soil is favourable to them. When a number of these groves lie contiguous to each other, they form what is called the *woods;* through which there is a due space left for roads and path-ways, where one is pleasantly defended from the sun at all hours in the day. They are also thick set with houses belonging to the respective proprietors, as well as with the huts of the poorer sort of people; but are very unwholesome, for the reasons already given. As to the cocoa-nut tree itself, not all the minute descriptions I have met with in many authors seem to me to come up to the reality of its wonderful properties and use. The cultivation of it is extremely easy, by means of channels conveying water to the roots, and by the manure already mentioned laid round them. An owner of 200 cocoa-nut trees is supposed to have a competency to live on.

"As to the rice fields, they differ in value, according to the fineness and quantity of rice they produce. The growth of this grain has a particularity not unworthy of notice, viz. that as it loves a watery soil, so to whatever height the water rises wherever it is planted, the growth of the rice keeps measure with it, even to that of 12 and 14 feet; the summit always appearing above the surface of the water. It is also remarked, that the eating of new rice affects the eyes. The fact is certain, though the physical reason of it is unknown.

"Here and there are interspersed some few *brab trees*, or rather wild palm trees (the word *brab* being derived from *brabo*, which in the Portuguese signifies *wild*). They bear an insipid kind of fruit, about the bigness of a common pear; but the chief profit from them is the toddy, or liquor drawn from them by incisions at the top, of which the arrack is reckoned better than that produced by the cocoa-nut trees. They are generally near the sea-side, as they delight most in a sandy soil. It is on this tree that the *toddy birds*, so called from their attachment to it, make their exquisitely curious nests, wrought out of the thinnest reeds and filaments of branches, with an inimitable mechanism. The birds themselves are about the size of a partridge, but are of no value either for plumage, song, or the table.

"This island is a strong instance of the benefits of a good government, and a numerous population; for not a spot of it remains uncultivated; so that though it is far from producing sufficient for the consumption of its inhabitants, and notwithstanding its many disadvantages of situation and soil, it yields incomparably more than the adjacent island of Salsette."

6 Curiosities in this island.

Among the curiosities of Bombay Mr Ives mentions a large *terapin* or land tortoise kept at the governor's house, the age of which was upwards of 200 years. Frogs, which abound everywhere through the East Indies, are very large at Bombay. Our author saw one that measured 22 inches from the extremities of the fore and hind feet when extended; and he supposes that its weight would not have been less than four or five pounds. On the sea-shore round the island are a great variety of beautiful shells, particularly the sort called *ventle-traps* or *wendle-traps*, held in great esteem among the ladies some time ago. Several pounds sterling are said to have been given by a *virtuoso* for one of these shells when Commodore Leslie's collection of shells was sold by auction.

7 Different kinds of serpents found here.

Mr Ives enumerates the following kinds of snakes found on this island and other parts of the British empire in the East Indies. 1. The *cobra de capella*, growing from four to eight or nine feet long. They kill by their bite in 15 minutes. 2. The *cobra manila* is a small bluish snake, of the size of a man's little finger, and about a foot long, frequently seen about old walls. A species of these found at Bombay kill much sooner than even the former. 3. The *palmira*, a very thin beautiful snake, of different colours: its head is like that of the common viper, but much thicker than the body. Our author saw one that was four feet long, and the body not much thicker than a swan's quill. 4. The green snake is of a very bright green colour, with a sharp head: towards the tail it is smaller than in the middle. The largest part of it is no bigger than a tobacco-pipe. 5. The sand snake is small and short, but not less deadly than the others. 6. The *cobra de aurelia* resembles an earth-worm, is about six inches long, and no bigger than a small crow-quill. It kills by getting into the ear, causing madness, &c. 7. The *manila bomba* is a very beautiful snake, of almost the same size throughout the whole length, except at the two ends, where it comes to a point. It is white on the belly, but finely variegated on the back. It lives in the sand, and is said to sting with its tail, which occasions contractions in the joints.

Bombay is the most considerable English settlement on the Malabar coast; and by reason of its situation, may be styled the grand storehouse of all the Arabian and Persian commerce. It is also the most convenient place in all the East Indies for careening or heaving down large ships; and for small ones they have a very good dock. They have also a very good rope-yard; and indeed, says Mr Ives, "this is the only place, in this distant part of the world, for shattered ships to refit at, having always a good quantity of naval stores, and its very name conveying an idea of a safe retreat in foul weather."

8 Different forts, &c.

On this island are many little forts and batteries, which

Digitized by Google

Bombay.

which carry some guns; but the principal fort, which defends the place, has above an hundred. Mr Grose finds fault with the situation of this last fort, which, he says, not only does not command the harbour sufficiently, but is itself overlooked by an eminence called Dungharee point. The castle itself is a regular quadrangle, well built of strong hard stone. In one of the bastions facing Dungharee point is a large tank or cistern which contains a great quantity of water constantly replenished by the stationary rains. There is also a well within the fort, but the water is not very good, and liable to be dried up by the heats. The water of Bombay in general indeed is not good, which has been given as a reason why the Gentoo merchants were not fond of settling upon it; for as they drink no wine nor spirituous liquors, they are very nice judges of the taste and qualities of waters.

When the town of Bombay began to increase considerably, it was judged proper to add the security of a wall round it to the strength of the fort it had before. Even then, however, it was neglected to take in the dangerous post of Dungharee, which now evidently commands both the town and fort. There has since that time been added, at a great expence, a ditch that encompasses the wall, and can be flooded at pleasure, by letting in the sea, which terminates the ditch on two sides, so that the town is now entirely surrounded with water, and is one of the strongest places in India.

Next to Bombay, the most considerable fort on the island is that of *Mahim*. It is situated at the opposite extremity of the island, and commands the pass of Bandurah, a fort directly opposite to it on the coast of Salsette. From this island Bombay is separated by an arm of the sea, capable of receiving only small craft. The other forts are capable of making but a slight defence.

About two miles out of town, towards the middle of the island, the sea had gained so far as almost to divide it in two, and rendered the roads impassable. A great quantity of this water, however, was drained off at a very considerable expence, and a causeway raised which kept it from overflowing again. This causeway is above a quarter of a mile in length, and considerably broad; "but (says Mr Grose), there is one gross fault remarked in it; that, being bending near the middle, the architect has opposed to the sea a re-entering angle instead of a salient one." Within the beach, however, there is still a considerable body of water, that has a free communication with the sea, as appears by its ebbing and flowing; so that it is probable the causeway itself, erected at the expence of at least 100,000l. may in no long time be totally undermined and thrown down.

9
Division, &c.

When the island of Bombay was ceded to the English by the Portuguese, it was divided and still continues to be so, into three Roman Catholic parishes, Bombay, Mahim, and Salvacam. The churches of these are governed by priests of that religion, and of any nation excepting Portugal, who were expressly objected to at the time of cession. The bulk of the land-proprietors at that time were Mestizos and Canarins. The former are a mixed breed of the natives and Portuguese; the latter purely aborigines of the country converted to the Popish religion. The other land-owners were Moors, Gentoos, and Parsees; but these last are of more modern date, having purchased estates on the island. The company has also a very considerable landed estate either by purchases, confiscations for crimes, or seizures for debt. The land is laid out in cocoa-nut groves, rice fields, and onion grounds, which last are reckoned of an excellent quality.

There is only one English church at Bombay, a very neat commodious building, seated in a spacious area called the Green; which continues from the church to the fort, and is pleasantly laid out in walks planted with trees, round which the houses of the English inhabitants are mostly situated. These are generally only ground-floored, with a court-yard before and behind, in which are the offices and out-houses. They are substantially built of stone and lime, and smooth plastered on the outside. They are often kept white-washed, which, however neat, is in some respects very disagreeable, by reason of the excessive glare it occasions in reflecting the light of the sun. Few of them have glass windows to any apartment; the sashes being generally paned with a kind of transparent oyster-shells, square cut; which have the singular property of transmitting sufficient light, at the same time that they exclude the violent glare of the sun, and have beside a cool look. The flooring is generally composed of a kind of loam or stucco called *chunam*, being a lime made of burnt shells, which if well tempered in a peculiar manner known to the natives, is extremely hard and lasting, and takes such a smooth polish, that one may see his own face in it. But where terraces are made of this substance, unless it be duly prepared, and which is very expensive, it is apt to crack by the sun's heat. Some attempts have been made to paint the stucco walls in apartments; but these have proved abortive through the ignorance of the artists, who have not chosen colours capable of resisting the alkaline power of the lime *. Our author remarks, that in the gardens of Surat he saw this kind of stucco made use of intead of gravel for the walks. They were a little raised above the garden beds, so that they must be instantly dry after the most violent rain; though their whiteness and polish must not only produce a disagreeable reflection in sunshine, but be extremely slippery to walk on. The houses of the black merchants are for the most part extremely ill built and inconvenient; the window lights small, and the apartments ill distributed. Some, however, make a better appearance if only one story high; but even the best of them have a certain meanness in the manner, and clumsiness in their execution, which renders the architecture contemptible in comparison of the European. There is one convenience, however, in all the houses of Bombay, viz. small ranges of pillars that support a penthouse or shed, forming what are called in the Portuguese language *verandas*, either all round the house, or on particular sides of it, which afford a pleasing shelter from the sun, and keep the inner apartments cool and refreshed by the draught of air under them. The pagodas, or temples of the Gentoos, are low mean buildings, having usually no light but what is admitted by the door; facing which is the principal idol. They imagine that a dark gloomy place inspires a kind of religious horror and reverence; and are very fond of

* See *Colour Making*.

Bombay.

of having these pagodas among trees, and near the side of a tank or pond, for the sake of their frequent ablutions. These tanks are often very expensive; being generally square and surrounded with stone steps that are very convenient for the bathers.

10 Inhabitants, manners, &c.

The natives of Bombay, though composed of almost every Asiatic nation, are shorter of stature and stronger than the inhabitants of the Coromandel coast. Here a palanquin, which requires six men to carry it at Madras, or Fort St David, is carried by four. Here are some Parsees, who like their forefathers the ancient Persians, are followers of Zoroaster, who is said to have reduced into order the religion of the Persian magi; the fundamental maxim of which was the worshipping of one God under the symbol of light. They adore the sun, particularly when rising, with the most profound reverence and veneration; and likewise pay a kind of adoration to common fire. Mr Ives had once the opportunity of observing the manner in which they perform this devotion. A large brass pan was placed in the middle of the house with fire in it: before this fire, or rather on each side of it, two men were kneeling at their devotions, pronouncing their prayers with great rapidity. He was afterwards informed, that one of them was a priest, at that time on a visit to another priest in a fit of sickness. He was likewise informed, that the Parsees have such a veneration for the fire, that they never put it out, or even breathe upon it; and he observed, that while the two priests were at their prayers over the pan of coals, they had a little white bib over their mouths, as he supposed to prevent their breath from approaching their favourite element. The prayers, however, from the similarity of the sounds, appeared to him only to be a repetition of the same set of words. The visiting priest used many gestures with his hands over the fire, and afterwards stroaked down the face of the sick priest, which our author looked upon to be the final benediction, as the ceremony ended immediately.

As the Gentoos burn their dead, one would imagine that the Parsees, who have such a veneration for fire, would be desirous of having their bodies consumed by that element; but instead of this, they expose their dead bodies to be devoured by birds of prey; because, say they, a living man is composed of all the elements; so that it is but reasonable, after he is dead, that every particular element should receive its own again. On the top of Malabar hill, about two miles from the town of Bombay, there are two round buildings for receiving the dead bodies of the Parsees, which remain there till the bones are clean picked by the birds. This is certainly an abominable custom, and affords very shocking spectacles; however, a guard is always placed at a little distance to prevent people from prying too narrowly into these matters, or, as Mr Ives says, to ensure the vultures of their repast without any disturbance. Mr Grose tells us, that on his going to look into one of these repositories, a Parsee advised him in a friendly manner to let it alone, as no person, who was not a party concerned, would long survive such curiosity. He tells us also, that the person appointed to look after the dead, carefully observes which eye is first picked out by the birds, and from thence judges of the situation of the soul of the deceased; a state of happiness being indicated by the right eye being first picked out. Mr Ives observes, that by reason of the heat of the sun, much less noxious vapour is emitted by these bodies than might be expected; the flesh being soon shrivelled up, and the bones turning quite black.

Bombay | Bona.

At the extreme point of Malabar-hill there is a rock, on the descent to the sea, flat on the top, in which there is a natural crevice, which communicates with a hollow terminating at an exterior opening to the sea. This place is used by the Gentoos as a purifier from their sins. This purification is effected by their going in at the opening, and coming through the crevice, though it seems too small for people of any corpulence to pass.

11 Oxen used here instead of horses.

In Bombay, and indeed in many other places of the East Indies, oxen are generally used instead of horses, not only for drawing carriages but for riding; and, however ridiculous such a practice may seem to us, it appears that they are not in this respect inferior to ordinary horses, being capable of going at the rate of seven or eight miles an hour. They are commonly of a white colour, with large perpendicular horns, and black noses. The only inconvenience that attends them, is, that, by being naturally subject to a lax habit of body, they sometimes incommode the rider with filth thrown upon him by the continual motion of their tails. In other respects they are far preferable to Indian horses, and will trot and gallop as naturally as the horses of this country. Admiral Watson, while at Bombay, was allowed a chaise drawn by two of these oxen by the East India company. At the end of every stage the driver puts the near bullock in the place of the other; he then puts his hand into their mouths, to take out the froth; without this they would be in danger of suffocation. See BOMBAY, SUPPLEMENT.

For the History, Government, &c. of Bombay, see the articles INDOSTAN and *East India* COMPANY.

BOMB-KETCH, a small vessel built and strengthened with large beams for the use of mortars at sea.

BOMBUS, in *Music*, an artificial motion with the hands, imitating in cadence and harmony the buzzing of bees. The word is originally Greek, and signifies the buzz or noise of bees, gnats, and the like. In this sense, bombus made one of the species of applause used by the ancient auditories.

BOMBUS, in *Medicine*, denotes a murmuring noise, as of wind breaking out of a narrow into a larger cavity, frequently heard in the thick intestines. The bombus heard in the ears in acute diseases, is laid down by Hippocrates as a sign of death.

BOMBYLIUS. See ENTOMOLOGY *Index*.

BOMENE, a sea-port town of the United Provinces, in Zealand, seated on the northern shore of the island of Schonen, opposite to the island of Goree, in E. Long. 4. 0. N. Lat. 51. 50.

BOMMEL, a town of Dutch Guelderland, situated on the northern shore of the river Waal, in E. Long. 3. 50. N. Lat. 52. 0.

BOMONICI, in Grecian antiquity, young men of Lacedæmon, who contended at the sacrifices of Diana which of them was able to endure most lashes; being scourged before the altar of this goddess.

BONA, by the Moors called *Balederna*, a sea-port town of the kingdom of Algiers in Africa, situated in E. Long. 7. 57. N. Lat. 36. 5. It was formerly rich, populous,

populous, capital of the province of the same name under the kingdom of Constantina, and is supposed by some to be the ancient Hippo, once the seat of the great St Austin, and a sea-port built by the Romans. The inhabitants, however, deny it to be the ancient Hippo, which had been so often taken, retaken, and destroyed by the wars; and pretend it to be since rebuilt at the distance of two or three miles from the ancient Hippo, out of its ruins, and called *Baleed-el-Ugned*, from a sort of trees of that name that grow in the neighbourhood. It is now a very mean place, poorly built, and thinly inhabited, with scarce any traces of its former grandeur, except the ruins of a cathedral, or, as others guess, of a monastery, built by St Austin, about three miles distant from the city. Near these ruins is a famed spring called by his name, much resorted to by the French and Italian sailors, who come to drink of its waters, and pay their devotions to a maimed statue said also to belong to the saint, but so mutilated that no traces either of face or dress are remaining; and as each of them strives to break off some splinter, or to scrape off some part of it on account of its supposed sanctity, it will probably be soon reduced to a state of non-existence. Bona was taken by the pirate Barbarossa, and joined to his new kingdom of Algiers; but as quickly lost, and recovered by its old masters the Tuniseens, who soon after lost it again. It is commanded by a little fort, in which is a garrison of about 300 Turks, under the command of an aga, who is also governor of the town. The road for the ships is good for nothing before the town, but a little farther west is very deep and safe. Dr Shaw tells us, that the continual discharging of ballast into the road, and the neglect of cleansing the port, is the cause of both becoming so unsafe and incommodious. In 1816, a number of Neapolitans, Genoese, &c. assembled here for the purpose of prosecuting the coral fishery, were attacked and massacred by a body of Turkish troops.

Bona Dea, the good goddess, in Pagan mythology, one of the names of Cybele. Others say, she was a Roman lady, the wife of one Faunus, and was famous for her chastity, and that after her death she was deified. Her sacrifices were performed only by matrons; and in so secret a manner, that it was no less than death for any man to be present at the assembly (see Cybele). Cicero reproaches Clodius with having entered into this temple disguised as a singing woman, and having by his presence polluted the mysteries of the good goddess. What kind of mysteries these were, we may learn from Juvenal, Sat. vi. 313. The poet there mentions the adventure of Clodius.

Atque utinam ritus veteres, et publica saltem
His intacta malis agerentur sacra: sed omnes
Noverunt Mauri, atque Indi, quæ psaltria penem
Majorem, quam sint duo Cæsaris Anticatones,
Illuc testiculi sibi conscius, unde fugit mus,
Intulerit.

I wish at least our sacred rites were free
From those pollutions of obscenity:
But 'tis well known what singer, how disguis'd,
A lewd audacious action enterpris'd:
Into the fane, with women mix'd, he went,
Arm'd with a huge two-handed instrument;
A grateful present to these holy choirs,
Where the mouse, conscious of his sex, retires.
DRYDEN.

Bona Fides, in *Law*. When a person performs any action which he believes at the time to be just and lawful, he is said to have acted *bona fide*.

Bona Mobilia, the same with moveable effects or goods.

Bona Notabilia, are such goods as a person dying has in another diocese than that wherein he dies, amounting to the value of 5l. at least; in which case the will of the deceased must be proved, or administration granted, in the court of the archbishop of the province, unless, by composition or custom, any dioceses are authorised to do it, when rated at a greater sum.

Bona Patria, an assize of countrymen or good neighbours, where 12 or more are chosen out of the country to pass upon an assize, being sworn judicially in the presence of the party.

Bona Peritura, perishable goods. By stat. 13 Ed. I. cap. 4. the cargo of a ship that has been cast away shall be kept for a year and a day, and restored to the rightful owner; and if the goods are such as will not endure so long, they are *bona peritura*, which the sheriff is allowed to sell, and to account in money for the value.

Bona Vacantia, goods, such as royal-fish, shipwrecks, treasure-trove, waifs, and estrays, in which no one can claim a property. These goods by the law of nature, and by the imperial law, belonged to the first occupant or finder; but in the modern constitutions of European governments, they are annexed to the supreme power by the positive laws of the state.

BONAIRE, an island of South America, near the north coast of Terra Firma. It lies about 30 miles east of Curaçoa, and abounds in kabritoes and salt. W. Long. 68. 18. N. Lat. 12. 30.

BONAIS, very high mountains in Italy, in the duchy of Savoy, not far from Lassoreburg: in some seasons they cannot be ascended without great danger.

BONARELLI, Count Guid' Ubaldo, an Italian poet, was the son of Count Pietro Bonarelli, minister of the duke of Urbino. He was intrusted with several important negociations, and was esteemed an able politician and learned philosopher. He was the author of a fine Italian pastoral entitled *Filli di Sciro*. He died at Fano, in 1608, aged 45.

BONAVENTURA, The Bay of, in America on the coast next the South sea, in the Popayan. It has a port and harbour for ships; but the air is very unwholesome. W. Long. 78. N. Lat. 3. 20.

BONAVENTURE, a celebrated cardinal, called, from his works, the *seraphic doctor*. He was born at Bagnarea, a small town of Tuscany, in 1221; and his original name was *John Fidanza*. He took the habit of a monk of the order of St Francis in 1243, became doctor of Paris in 1255, and the next year general of his order. After the death of Clement IV. the cardinals disagreeing about the election of a new pope, engaged themselves by a solemn promise to elect him who should be named by Bonaventure, even though it should be himself; but he chose Theobald archdeacon of of Liege, who was then in the Holy Land, and took the name of *Gregory* X. This pope, in return, in 1272, made him cardinal and bishop of Alba, and ordered him to assist at the second general council of Lyons, where he died in 1274. His works were printed at Rome in 8 vols folio.

BONAVISTA, an island in the Atlantic ocean, the most easterly and first discovered of the Cape de Verd islands. It is 20 miles long, and 13 broad; has plenty of goats and cotton, and some indigo. The inhabitants are remarkable for slothfulness; they have a town, and two roads where ships come to an anchor. W. Long. 23. 6. N. Lat. 16. 5.

BOND, John, a commentator on Horace and Persius, was born in Somersetshire in the year 1550, and educated at Winchester school. In 1569 he was entered a student of the university of Oxford, probably in the New college, of which he became either one of the clerks or one of the chaplains. He took his bachelor of arts degree in 1573, and that of master in 1579; soon after which he was appointed by his college, master of the free school at Taunton in Somersetshire. In this employment he continued many years with great reputation: but being at length weary of his laborious employment, he commenced physician, and we are told became eminent in that capacity. He died in the year 1612, possessed of several lands and tenements in his neighbourhood; but whether acquired by the practice of physic, does not appear. He wrote, 1. *Commentarii in poemata Q. Horatii*, 8vo. 2. *Commentarii in sex satyras Persii*, Lond. 1614, 8vo.

Bond, in *Law*, is a deed whereby the obligor obliges himself, his heirs, executors, and administrators, to pay a certain sum of money to another at a day appointed. If this be all, the bond is called a simple one, *simplex obligatio*. But there is generally a condition added, that if the obligor does some particular act, the obligation shall be void, or else shall remain in full force: as payment of rent; performance of covenants in a deed; or repayment of a principal sum of money borrowed of the obligee, with interest; which principal sum is usually one half the penal sum specified in the bond. In case this condition is not performed, the bond becomes forfeited, or absolute at law, and charges the obligor while living; and after his death the obligation descends upon his heir, who (on defect of personal assets) is bound to discharge it, provided he has real assets by descent as a recompense.

If the condition of a bond be impossible at the time of making it, or be to do a thing contrary to some rule of law that is merely positive, or be uncertain, or insensible, the condition alone is void, and the bond shall stand single and unconditional: for it is the folly of the obligor to enter into such an obligation from which he can never be released. If it be to do a thing that is *malum in se*, the obligation itself is void: for the whole is an unlawful contract, and the obligee shall take no advantage from such a transaction. And if the condition be possible at the time of making it, and afterwards becomes impossible by the act of God, the act of law, or the act of the obligee himself, there the penalty of the obligation is saved: for no prudence or foresight of the obligor could guard against such a contingency. On the forfeiture of a bond, or its becoming single, the whole penalty was recoverable at law; but here the courts of equity interposed, and would not permit a man to take more in conscience than he ought, viz. his principal, interest, and expences, in case the forfeiture accrued by non-payment of money borrowed: the damages sustained upon non-performance of covenants; and the like. And the statute 4 and 5 Ann. c. 16. hath also enacted, in the same spirit of equity, that in case of a bond, conditioned for the payment of money, the payment or tender of the principal sum due, with interest and costs, even though the bond be forfeited and a suit commenced thereon, shall be a full satisfaction and discharge.

Bond, in masonry and brick-laying, is when bricks or stones are as it were knit and interwoven; and when they say, make *good bond*, they mean that the joints are not made over or upon other joints; but reach at least six inches, both within the wall and on the surface, as the art of building requires.

BONDAGE, properly signifies the same with slavery, but in old law books is used for villenage (see Villenage). Tenants in bondage paid kenots, and did fealty; they were not to fell trees in their own garden, without license of the lord. The widow of a tenant in bondage held her husband's estate *quam diu vixerit sine marito*, "as long as she lived single."

Bondage by the Forelock, or *Bondagium per anteriores crines capitis*, was when a freeman renounced his liberty, and became a slave to some great man; which was done by the ceremony of cutting off a lock of hair from the forehead, and delivering it to his lord; denoting that he was to be maintained by him for the future. Such a bondman, if he reclaimed his liberty, or were fugitive from his master, might be drawn again to his servitude by the nose, whence the origin of the popular menace to pull a man by the nose.

BONDMAN, in the English law, is used for a villain, or tenant in the villenage *.—The Romans had two kinds of bondmen; one called *servi*, who were those either bought for money, taken in war, left by succession, or purchased by some other lawful acquisition; or else born of their *bondwomen*, and called *vernæ*. We may add a third kind of bondmen mentioned by Justinian, called *adscriptitii glebæ*, or *agricensiti*; who were not bound to the person, but to the ground or place, and followed him who had the land. These in our law are called *villains regardants*, as belonging to the manor or place.

* See *Villain* and *Villenage*.

BONE-ace, a game at cards played thus: The dealer deals out two cards to the first hand, and turns up the third, and so on through all the players, who may be seven, eight, or as many as the cards will permit: he that has the highest card turned up to him carries the bone; that is, one half of the stake; the other half remaining to be played for. Again, if there be three kings, three queens, three tens, &c. turned up, the eldest hand wins the bone. But it is to be observed, that the ace of diamonds is bone-ace, and wins all other cards whatever. Thus much for the bone: and as for the other half of the stake, the nearest to 31 wins it; and he that turns up or draws 31 wins it immediately.

BONES, their origin, formation, composition, texture, variety, offices, &c. See Anatomy.

Bones Whitened for Skeletons. Two processes are described in the *Acta Hoffniensia* for whitening bones.

Professor

Digitized by Google

Professor Rau had a method of giving them a great degree of whiteness. By bare exposure to the air, sun, and rain, for a length of time, they become notably white; but the whitest bones, kept in a room tainted with smoke or fuliginous vapours, grow in a little time yellowish, brownish, and unsightly. It is customary for the purification of bones, to boil them in alkaline liquors; which, by dissolving and extracting the superfluous fat, improves their whiteness.

Bones Hardened and Softened. Boerhaave observes, that alkaline salts render bones harder and firmer, and that acids make them softer and more flexible. These effects succeed in certain circumstances, but not universally; for bones may be hardened and softened both by acids and alkalies, according to the quantity of saline matter employed, and the manner in which it is applied. Newman made bones harder and more compact by treating them with the strongest of the mineral acids; though, when the acid is in sufficient proportion, it destroys or dissolves them. In Papin's digester (a strong close vessel in which the steam of boiling liquors is confined, and the fluid by this means made to undergo a greater degree of heat than it could otherwise sustain), the hardest bones are reduced in a short time, by the action of simple water into a soft pap or jelly; and alkaline liquors produce this effect still sooner.

In the history of the French Academy for the years 1742 and 1743, there is an account that Mr Geoffroy produced before the academy a small ivory spoon, which by long lying in mustard, was become flexible and transparent like horn: that Mr Fouchy saw an ivory spoon, which, by lying for a considerable time in milk, was become supple like leather; and that Mr Hunauld produced bones, which had been softened by steeping in vinegar, afterwards hardened to their natural state by steeping in water, and softened a second time by steeping in vinegar. Dr Lewis observed that the nitrous and marine acids diluted, and the acetous acid, make bones flexible and tough like leather; but that the diluted vitriolic acid, though it renders them notably soft, makes them at the same time brittle. It seems as if a great part of the earthy matter, which is the basis of the bone, and on which its hardness depends, was dissolved and extracted by the three first; whilst the latter, incapable of dissolving this kind of earth into a liquid form, only corrodes it into a kind of selenitic concrete, which remains intermixed in minute particles among the gelatinous matter. Dr Lewis did not find that the softened bones, whatever acid they were softened by, recovered their hardness by steeping in water. Slips of softened ivory, after lying above a month in water, continued nearly as soft as when they were taken out of the acid liquor.

There is a singular induration of bones produced by fire; the effects of which agent are here remarkably different according to its degree and the circumstances of its application. Bones exposed to a moderate fire, either in open vessels, or in contact with the burning fuel, become opaque, white, and friable throughout; and an increase of fire, after they have once suffered this change, renders them only more and more friable. But if they are urged at first with a strong fire, such as that in which copper or iron melts, they become hard, semitransparent, and sonorous, like the hard mineral stones. This curious experiment deserves to be further prosecuted.

Colouring of Bones. Bones may be stained of a variety of colours by the common dyeing infusions and decoctions of animal and vegetable substances. They are stained also, without heat, by metallic solutions; and by means of these may be spotted or variegated at pleasure. Thus, solution of silver in aquafortis gives a brown or black according to its quantity; solution of gold in aqua regia, or in the spirit of salt, a fine purple; solution of copper in the acetous acid, a fine green; and solutions of the same metal in volatile alkalies, a blue, which is at first deep and beautiful, but changes, upon exposure to the air, into a green or bluish-green. If the bone is but touched with the two first solutions, and exposed to the air, it does not fail to acquire the colour in a few hours: In the two latter, it requires to be steeped for a day or longer in order to its imbibing the colour. In these and other cases where immersion for some time is necessary, the bone may be variegated, by covering such parts as are to remain white, with wax or any other matter that the liquor will not dissolve or penetrate.

Oeconomical Uses of Bones. Bones are a very useful article, not only for making different kinds of toys, but likewise in several of the chemical arts; as, for making cast iron malleable, for absorbing the sulphur of sulphureous ores; for forming tests and cupels, or vessels for refining gold and silver with lead (burnt bones composing a mass of a porous texture, which absorbs the vitrified lead and other matters, while the unvitrescible gold and silver remain entire behind); for the preparation of milky glasses and porcelains; for the rectification of volatile salts and empyreumatic oils; and for making glue. The bones of different animals are not equally fit for these uses: even the glue, or gelatinous part of the bones of one animal is notably different both in quantity and cohesiveness from that of another.

The human skull-bone, or cranium, the natural defence of the seat of sensation and perception in the noblest animal, has been recommended medicinally as a cure for epilepsies, deliria, and all disorders of the senses, from the same philosophy which ascribed antiasthmatic virtues to the lungs of the long-winded fox; and expected, because fowls are said to digest even small stones, that the skin of the gizzard, dried and powdered, would produce a similar effect in the human stomach. To such lengths of extravagance have the sons of physic been carried by the blind superstition of former ages!

Bones in the funeral Solemnities of the Ancients.— Divers usages and ceremonies relating to the bones of the dead have obtained in different ages; as gathering them from the funeral pile, washing, anointing, and depositing them in urns, and then into tombs: translating them, which was not to be done without the authority of the pontiffs; not to say worshipping of them, still practised to the bones of the saints in the Romish church. Among the ancients, the bones of travellers and soldiers dying in foreign countries were brought home to be buried; till, by an express S. C. made during the Italic war, it was forbid, and the soldiers bodies ordered to be buried where they died.

The Romans had a peculiar deity under the denomination,

Digitized by Google

mination of *Ossilago*, to whom the care of the induration and knitting of the human bones was committed; and who, on that account, was the object of the adoration of all breeding women.

Fossil or *Petrified* BONES, are those found in the earth, frequently at great depths, in all the strata, even in the bodies of stones and rocks; some of them of a huge size, usually supposed to be the bones of giants, but more truly of elephants or hippopotami. It is supposed they were reposited in those strata when all things were in a state of solution; and that they incorporated and petrified with the bodies where they happened to be lodged.

In the museum of the Russian Academy of Sciences, there is a vast collection of fossil bones, teeth, and horns, of the elephant, rhinoceros, and buffalo, which have been found in different parts of this empire, but more particularly in the southern regions of Siberia. Naturalists have been puzzled to account for so great a variety being found in a country where the animals of which they formerly made a part were never known to exist. It was the opinion of Peter, who, though he deserves to be esteemed a great monarch, was certainly no great naturalist, that the teeth found near Voronetz were the remains of elephants belonging to the army of Alexander the Great, who, according to some historians, crossed the Don, and advanced as far as Kostinka. The celebrated Bayer, whose authority carries greater weight in the literary world, conjectures, that the bones and teeth found in Siberia belonged to elephants common in that country during the wars which the Mogul monarchs carried on with the Persians and Indians; and this plausible supposition seems in some measure to be corroborated by the discovery of the entire skeleton of an elephant in one of the Siberian tombs. But this opinion, as Mr Pallas* very justly observes, is sufficiently refuted by the consideration, that the elephants employed in the armies of all India could never have afforded the vast quantities of teeth which have been discovered, not to mention those which it is justly to be presumed may still be buried. They have been already dug up in such plenty as to make a considerable article of trade. The same ingenious naturalist has given an ample description of those fossil bones, and has endeavoured to account for their origin. Upon examining those in the museum, he was led to conclude, that as these bones are equally dispersed in all the northern regions of Europe, the climate probably was in the earlier ages less severe than at present, and then possibly sufficiently warm to be the native countries of the elephant, rhinoceros, and other quadrupeds, now found only in the southern climates. But when he visited, during his travels, the spots where the fossil bodies were dug up, and could form a judgment from his own observations, and not from the accounts of others, he renounced his former hypothesis; and, in conformity with the opinions of many modern philosophers, asserted, that they must have been brought by the waters; and that nothing but a sudden and general inundation, such as the deluge, could have transported them from their native countries in the south, to the regions of the north. In proof of this assertion, he adds, that the bones are generally found separate, as if they had been scattered by the waves, covered with a stratum of mud evidently formed by the waters, and commonly intermixed with the remains of marine plants, and similar substances; instances of which he himself observed during his progress through Siberia, and which sufficiently prove that these regions of Asia were once overwhelmed with the sea.

* *Nov. Com. de Ossibus Siberiæ fossilibus.* p. 440.

We often find in the earth petrified bones, the greatest part of their gelatinous matter being extracted by the moisture, and a stony one introduced in its room. In some parts of France petrified bones are met with which have an impregnation of copper. Hence, on being calcined in an open fire, a volatile salt is produced from the remains of their gelatinous principle, and the bone is tinged throughout of a fine greenish blue colour, copper always striking a blue with volatile alkalies. The French turcoise stones are no other than these bones prepared by calcination: they are very durable, and bear to be worked and polished nearly in the same manner as glass; without the imperfection, inseparable from glassy bodies, of being brittle. See the article TURCOISE.

There have been lately discovered several enormous skeletons, five or six feet beneath the surface, on the banks of the Ohio, not far from the river Miami in America, 700 miles from the sea-coast. Some of the tusks are seven, others ten feet long; one foot six inches in circumference at the base, and one foot near the point; the cavity at the root or base, 19 inches deep. Besides their size, there are several other differences which will not allow the supposition of their having been elephants: the tusks of the true elephant have sometimes a very slight lateral bend; these have a larger twist, or spiral curve, towards the smaller end: but the great and specific difference consists in the shape of the grinding teeth: which, in these newly found, are fashioned like the teeth of a carnivorous animal; not flat and ribbed transversely on their surface like those of the modern elephant, but furnished with a double row of high and conic processes, as if intended to masticate, not to grind, their food. A third difference is in the thigh-bone, which is of great disproportionable thickness to that of the elephant; and has also some other anatomical variations. These fossil bones have been also found in Peru and the Brazils; and when cut and polished by the workers in ivory, appear in every respect similar. It is the opinion of Dr Hunter, that they must have belonged to a larger animal than the elephant; and differing from it in being carnivorous. But as yet this formidable creature has evaded our search; and if indeed, such an animal exists, it is happy for man that it keeps at a distance; since what ravage might not be expected from a creature, endowed with more than the strength of the elephant, and all the rapacity of the tiger? See MAMMOUTH.

BON ESPERANCE, the same with the Cape of Good Hope. See GOOD HOPE.

BONET, THEOPHILUS, an eminent physician, born at Geneva, March 15th 1620. He took his degree in physic in 1643, after he had gone through most of the famous universities, and was for some time physician to the duke of Longueville. Meanwhile his skill in his profession got him considerable practice; but being seized with deafness, it obliged him to retire from business, which gave him leisure to collect all the observations

tions he had made during a practice of 40 years. He wrote, 1. *Polyalthes, sive Thesaurus Medico-practica*, 3 vols. folio. 2. *Labyrinthi Medici extricati*. 3. *Medicini Septentrionalis Collatitia*; and other works.

BONFADIO, JAMES, one of the most polite writers of the 16th century, was born in Italy, near the lake Garda. He was secretary to the cardinal de Bari, and after his death to the cardinal Ghinucci. He afterwards read public lectures on Aristotle's politics, and on rhetoric; and was made historiographer to the republic of Genoa. He applied himself to compose the annals of that state, in which he wrote too satirically on some families. This creating him enemies who were resolved to ruin him, they accused him of the unnatural sin; and, as witnesses were found to convict him of it, he was condemned to be burnt. Some say that this sentence was executed; and others, that his punishment was changed, and that he was beheaded. This was in the year 1560. Upon the day of his execution he wrote a note to John Baptist Grimaldi, to testify his gratitude to the persons who had endeavoured to serve him; and promised to inform them how he found himself in the other world, if it could be done without frightening them. But it does not appear that he performed his promise, any more than the many who had promised the like before him.—His history of Genoa is esteemed. We have also some letters, some orations, and Latin and Italian poems, of his, which were printed at Bologna in the year 1744, octavo.

BONFINIUS, ANTHONY, flourished in the 15th century. He was a native of Ascoli in Italy, and attached himself to the study of the belles lettres. Matthias Corvin king of Hungary, having heard of his learning, sent for him, retained him, and settled upon him a pension. He wrote, 1. A history of Ascoli; 2. A treatise of virginity and conjugal chastity; 3. An history of Hungary; and other works.

BONFRERIUS, JAMES, a learned Jesuit, born at Dinant, in 1573. He wrote a commentary on the Pentateuch, and learned notes on the Onomasticon of the places and towns mentioned in the Scripture. He died at Tournay in 1643, aged 70.

BONGARS, JAMES, in Latin *Bongarsius*, a native of Orleans, was one of the most learned men of the 16th century. He applied himself to the study of critical learning, and was for near 30 years employed in the most important negociations of Henry IV. whose resident he was several times at the courts of the princes of Germany, and at length his ambassador. He was of the Protestant religion; and, when very young, had the courage to write and post up in Rome a very spirited answer to a bull of Pope Sixtus V. The public is obliged to him for the edition of several authors who have written the History of the expeditions to the Holy Land; he also published, among other works, an edition of Justin, in which he restored several passages that had been corrupted, by consulting valuable muanuscripts, and added notes which explained many dufficulties. He died in 1612, aged 58.

BONIFACE, the name of several eminent men, particularly of nine popes. To the first of these, who was chosen pope in 418, St Augustine dedicated his four books against the two epistles of the Pelagians. The third of that name prevailed upon the emperor Phocas to consent that the title of *Universal Bishop* should be conferred on no other than the bishop of Rome. Boniface IV. obtained from the same emperor, the Pantheon, a famous heathen temple built by Agrippa, and converted it into a church which is now called "Our Lady della Rotunda." Several works are also attributed to him, but they appear to be spurious. Boniface VII. hath the title of *antipope*; because in 974 he caused Benedict VI. to be strangled in prison, and after the election of Benedict VII. removed the treasures of the church to Constantinople. He, however, at length returned after the death of Benedict, and caused his successor John XIV. to be murdered; but died himself soon after, and was dragged naked by the feet about the streets. Boniface VIII. canonized St Lewis in 1297, and in 1300 appointed the jubilee to be solemnized every 100 years after.

BONIFACE is also the name of a saint, who before he took that name was called *Winifred*, and was born at Kirton in Devonshire. He chose to go and preach the gospel among the barbarous nations; and though created archbishop of Mentz, soon after resigned his office, to go and preach in East Friezland, where he was killed by the Pagans on the 5th of June 754. His letters were published by Senarius.

BONIFACIO, a town in the island of Corsica, beyond the mountains, near the strait called *Bocca di Bonifacio*. It is well fortified, and contains 3170 inhabitants. E. Long. 9. 0. N. Lat. 41. 25.

BONIS NON AMOVEDENIS, in *Law*, is a writ directed to the sheriffs of London, &c. charging them that a person against whom judgment is obtained, and prosecuting a writ of error, be not suffered to remove his goods until the error is determined.

BONITO. See SCOMBER, ICHTHYOLOGY *Index*.

BONN, an ancient and strong city of Germany, in the duchy of the Lower Rhine, subject to Prussia. It is of great consequence in the time of war; because it is situated on the Rhine, in a place where it can stop every thing that comes down that river. It is well fortified, and 1801 in contained 8837 inhabitants. The Jews are the principal traders. E. Long. 7. 5. N. Lat. 50. 44.

BONNA, in *Ancient Geography*, one of the 50 citadels built by Drusus on the Rhine; supposed by some to be the same with the *Ara Ubionum*: Now BONN.

BONNEFONS, JOHN, or BONNEFONIUS, a Latin poet, was born at Clermont in Auvergne, in 1554. He became an advocate in the parliament of Paris, and was appointed lieutenant-general of Bar sur Seine, and acquired great reputation by his *Pancharis*, and other poems. He died under the reign of Louis XIII. He ought not to be confounded with John Bonnefons his son, another Latin poet.

BONNER, EDMUND, bishop of London, of infamous memory, was born at Hanley in Worcestershire, and generally supposed to be the natural son of one Savage a priest; and that priest was the natural son of Sir John Savage of Clifton in the same county. Strype, however, says, he was positively assured that Bonner was the legitimate offspring of a poor man, who lived in a cottage known to this day by the name of *Bonner's place*. About the year 1512, he entered student of Broadgate Hall in Oxford. In 1519, he was admitted bachelor of the canon and civil law. About the

same

Bonner, Bonnestable.

same time he took orders, and obtained some preferment in the diocese of Worcester. In 1525, he was created doctor of canon law. Having now acquired the reputation of a shrewd politician and civilian, he was soon distinguished by Cardinal Wolsey, who made him his commissary for the faculties, and heaped upon him a variety of church preferments. He possessed at the same time the livings of Blaydon and Cherry-Burton in Yorkshire, Ripple in Worcestershire, East Dercham in Norfolk, the prebend of St Paul's, and archdeaconry of Leicester. Bonner was with the cardinal at Caw-wood, when he was arrested for high treason. After the death of that minister, he soon found means to insinuate himself into the favour of Henry VIII. who made him one of his chaplains, and employed him in several embassies abroad, particularly to the pope. In 1532, he was sent to Rome, with Sir Edward Kame, to answer for the king, whom his holiness had cited to appear in person or by proxy. In 1533, he was again despatched to Pope Clement VII. at Marseilles, upon the excommunication of King Henry on account of his divorce. On this occasion he threatened the pope with so much resolution, that his holiness talked of burning him alive, or throwing him into a caldron of melted lead; upon which Bonner thought fit to decamp. His infallibility did not foresee that the man whom he thus threatened was predestined to burn heretics in England. In 1538, being then ambassador at the court of France, he was nominated bishop of Hereford; but, before consecration, was translated to the see of London, and enthroned in April 1540. Henry VIII. died in 1547, at which time Bonner was ambassador with the emperor Charles V. During this reign he was constantly zealous in his opposition to the pope; and, in compliance with the king, favoured the reformation. Henry VIII. was not to be trifled with; but on the accession of young Edward, Bonner refused the oath of supremacy, and was committed to the Fleet; however, he soon thought fit to promise obedience to the laws, and was accordingly released. He continued to comply with reformation; but with such manifest neglect and reluctance, that he was twice reprimanded by the privy council, and in 1549, after a long trial, was committed to the Marshalsea, and deprived of his bishopric. The succeeding reign gave him ample opportunity of revenge. Mary was scarce seated on the throne before Bonner was restored to his bishopric; and soon after appointed vicegerent and president of the convocation. From this time he became the chief instrument of papal cruelty: he is said to have condemned no less than 200 Protestants to the flames in the space of three years. Nor was this monster of a priest more remarkable for his cruelty than his impudence. When Queen Elizabeth came to the crown, he had the insolence to meet her, with the rest of the bishops, at Highgate. In the second year of her reign, refusing to take the oath of allegiance and supremacy, he was again deprived, and committed to the Marshalsea; where he died in 1569, after ten years confinement. There cannot be a stronger instance of the comparative lenity of the Protestant church, than its suffering this miscreant to die a natural death. Several pieces were published under his name.

BONNESTABLE, a town of France, in the department of Sarte, which carries on a great trade in corn. E. Long. 0. 30. N. Lat. 48. 11.

Bonnestable, Bonnet.

BONNET, Charles, an eminent naturalist, was born in 1720 at Geneva, of a French family who had been forced on account of religious principles to leave their native country. As he was an only son, his father paid great attention to his education, and finding that he made little progress at the public schools, both from a dislike to the dry study of grammar, and deafness, with which he was very early afflicted, he put him under the care of a domestic tutor, and under him his progress was rapid and successful in general literature. At the early age of 16, his attention was so deeply engaged in the perusal and study of *Le Spectacle de la Nature*, that it seems to have directed the bias and taste of his future studies. The history and the habits of the ant-lion (*formica leo*), particularly attracted his attention, and led him to make his first observations in natural history. He discovered the haunts of this curious insect, watched and studied its manners and habits, and added many observations to those of Poupart and Reaumur. Reaumur's Memoir on insects happening to fall accidentally in his way, he perused it with great eagerness, and this perusal probably decided his taste for natural history. To the observations and experiments of that naturalist, Bonnet added many new facts which he had discovered, the detail of which he communicated to Reaumur, who was not less surprised than pleased to find so much sagacity and acuteness of research exhibited in the investigations of a young man of eighteen.

Young Bonnet had been destined by his father to the profession of the law; but it was with no small reluctance that he entered on the studies necessary to qualify himself for that profession. The bias of his mind leaned too strongly to natural history, to permit him to occupy his attention with other pursuits. The study of some of the elementary books on law was therefore submitted to merely as a task. In the years 1738 and 1739, he sent to Reaumur many interesting observations on different species of caterpillars; and in 1740, he communicated a paper to the Academy of Sciences respecting the propagation or multiplication of *aphides*, or tree-lice, without actual conjunction. This question had been left unsettled by Reaumur. It was now determined by decisive experiments; and his paper on the subject obtained for him the honour of being admitted a correspondent member of the Academy. His experiments on the generation of these insects were conducted with such closeness of attention, and such minuteness of research, as to injure his eyesight to such a degree as he never afterwards recovered. In the year 1741, he instituted a set of experiments, on the effects that follow the division of worms, and he found that many species possessed in some degree the same reproductive power as the polype. In the following year his investigations and experiments were directed to the peculiarities in the mode of respiration of caterpillars and butterflies; and he proved that this function was performed by means of pores to which the name of stigmata has been given. It was about the same time that he made some curious discoveries respecting the *tænia*, or tapeworm. In the year 1743, when he was raised to the rank of doctor of laws, he procured a welcome dispensation

Digitized by Google

dispensation from the farther prosecution of studies which had never been agreeable to him, and which being no longer absolutely necessary, he relinquished for ever. In consequence of a memoir on insects which he communicated to the Royal Society of London, the same year, he was admitted a member of that body. Next year he published in one work, his observations on aphides and worms, under the title of *Insectology*. To this work he prefixed a preface, in which he exhibits a philosophical sketch of his ideas concerning the system of the developement of germs, and the scale of organized beings. This work was in general well received by the public. The want of delicacy was objected to in some journals, which, it was alleged, appeared in his descriptions of the mode of propagation of tree-lice.

But the constant labours to which Bonnet had subjected himself in all his inquiries began to produce very serious consequences on his health. His eyes particularly began to be affected with severe pains, and his general health visibly declined. This not only obliged him to lay aside the use of the microscope, but also to forego for a time all reading and writing. Like a true philosopher, he bore his afflictions with patience. But he was not idle: for though he was interdicted from all observation, his mind was fully occupied in reflection. After some time's relaxation from his usual pursuits, he was at last restored to tolerable health and ease, but he never could employ his eyes with the same freedom as formerly. About the year 1746, he undertook a course of experiments on the vegetation of plants in moss and other substances; and in the following year his researches were directed to the functions of the leaves of plants, with the view of ascertaining the different action of the different sides of the leaves. Another question in vegetation offered itself to his consideration. This was the ascent of the sap. And to determine whether it rose by the bark or wood, he employed coloured injections. This investigation, with some observations which he made on vegetable monsters, was the foundation of one of his most interesting and original works, his "Inquiries into the use of the Leaves of Plants." This work was first published in 4to at Leyden in 1754. A supplement was added to it in 1779.

Observation and experiment had been the first passion of Bonnet, yet these now began to give way to speculation; and his inquiries in natural history, in which he had so much studied the nature and generation of the lowest part of the scale of beings, led him to consider the faculties and destination of the highest. Malebranche and Leibnitz laid the foundation of his metaphysical ideas. He engaged deeply in all the discussions connected with the history of the human mind; and the first fruit of his meditations was a kind of abridgement of the materials he had collected, under the title of an "Essay on Physiology," published in London in 1755, but without his name, nor did he acknowledge it till near thirty years afterwards. This work contains in a concise form the fundamental principles of his philosophy. It traces the origin and progress of the human mind, from the first germ of life to the developement of all its faculties, the mutual dependence of which it points out, as deduced from actual observation. It enters into the difficult subject of human liberty, and endeavours to reconcile it with the divine prescience, and the philosophical principle, that every effect must have an adequate cause. From the essential properties of the activity of the soul, and the effects of habit upon it, the whole art of education and government is deduced; and a system of the former is laid down, materially different from the usually established methods. It was the freedom with which he had discussed some of these delicate points, and the fear of being involved in personal controversy, which induced the author to remain so long concealed. It met with a number of critics, yet its success was brilliant.

The next work of Bonnet was a developement of part of the substance of the preceding, viz. the origin and progress of the mental faculties. After a labour of five years on the subject, he produced his "Analytical Essay on the faculties of the soul." This was first printed at Copenhagen in 1760, in 4to, at the expence of the king of Denmark. In this work, like that of the abbé Condillac, he takes the supposition of a statue organized like the human body, which he by degrees animates, and shows how its ideas would arise from impressions on the organs of sense. This work was well received by philosophers, though with some it subjected him to the charge of materialism. To these he made no reply, but contented himself with proceeding in those efforts for the service of religion and morals, to which the best part of his life was devoted. His retired and studious habits, together with his deafness and other bodily infirmities, had ever prevented him from joining in the assemblies of the young and gay; at the same time they rendered domestic comforts more essential to him. In 1756, he married a lady of the respectable family of de la Rive, and with her he passed thirty-seven years of that perfect union which results from mutual tenderness, directed by good sense and virtue. The celebrated Saussure was the nephew of Mad. Bonnet, and it was no small pleasure to her husband to witness the early display of genius and knowledge in this extraordinary young man.

The next work of our author was properly the physical part of his great system. It appeared at Amsterdam in 1762, under the title of "Considerations on organized bodies," 2 vols. 8vo. Its principal objects were, to give in an abridged form all the most interesting and well-ascertained facts respecting the origin, developement, and reproductions of organized bodies; to refute the different systems founded upon *epigenesis*; and to explain and defend the system of germs. This publication, though well received by philosophers in general, was, from some suspicion of its principles, prohibited in France; but a remonstrance from the author to M. des Malesherbes, then licenser of the press, caused the interdict to be removed, after a new examination. His "Contemplation of Nature," which appeared in 1764, Amst. 2 vols. 8vo, was a work rather meant for popular use, in which the principal facts relative to the different orders of created beings are displayed in a manner both instructive and entertaining, and set off by the charms of an eloquent style, with a continual reference to final causes, and the proofs of wisdom and benevolence in the Creator. It has been translated into most of the European languages, and enriched with notes by several hands, as well as by the author himself in a new edition.

The concluding work of Bonnet was his "Palingenesie Philosophique," printed at Geneva in 1769, 2 vols 8vo. In this he treats on the past and future state of living beings, and supports the idea of the survival of all animals, and the perfecting of their faculties in a future state. Attached to this work is "An Inquiry into the Evidences of the Christian Revelation, and the Doctrines of Christianity," which, with a treatise "On the Existence of God," was published separately at Geneva in 1770. It was likewise translated into German, and dedicated by the translator to a celebrated Jew, with a summons to him to refute it, or acknowledge his conviction. Bonnet, who had an invincible repugnance for controversy, no sooner heard of this step, than he wrote to the Jew, assuring him, that he had no share in it; and the two philosophers mutually agreed to forbear any discussion of a topic in which their opinions were totally different. The temper of Bonnet was, indeed, the direct reverse of that which disposes to contention; and tranquillity was the great object of his life. He readily corrected his own errors; and never but once entered into a defence of himself. This was on occasion of a charge of plagiarism brought against him as having borrowed from Leibnitz his hypothesis on the resurrection. He had, in the earlier part of life, made an anonymous attack in the French Mercury upon Rousseau's discourse on the origin of inequality among men, to which that writer made a reply; but the controversy went no further.

After having in some measure relinquished speculative philosophy, he resumed his attention to natural history, and in 1773, published in Rozier's Journal a memoir on the method of preserving insects and fish in cabinets. In 1774 he communicated to the same journal a memoir on the loves of plants, originating in the discovery of a kind of cleft or mouth in the pistil of a lily. Some experiments on the reproduction of the heads of snails, and of the limbs and organs of the water salamander, furnished matter for other memoirs. He also made observations on the pipa or Surinam toad, on bees, on the blue colour acquired by mushrooms from exposure to the air, and on various other subjects in natural history, which agreeably and usefully occupied his leisure. His reputation was now fully established. There was scarcely an eminent learned society in Europe which did not associate him as a member: and these honours were crowned in 1783 by his election into the small and very select number of foreign associates of the academy of sciences at Paris. His literary correspondents were numerous. Among these were the distinguished names of Reaumur, Du Hamel, De Geer, Haller, Van Swieten, Spallanzani, and Merian. Though attached by inclination to the pursuit of scientific studies in retirement, he did not entirely withdraw from public duties. He entered into the great council of the republic in 1752, and kept his seat in it till 1768, having frequently distinguished himself by the manly eloquence with which he supported wise and moderate measures, and his constant zeal in the cause of morals and religion, on which he thought the prosperity of the state essentially founded. The last twenty-five years of his life he passed entirely in the country, in a simple and uniform mode of living, happy in an easy competence, and in a small circle of friends. It appears that he was, for some time, engaged in the education of youth, an employment for which he was peculiarly fitted, and in which he obtained the warmest attachment of his pupils. The publication of all his works, corrected and revised, in a general collection, occupied near eight years of his life, which greatly injured his health, from the intense application which he bestowed upon it. This appeared at Neufchatel, in 9 vols 4to, and 18 vols 8vo.; and besides the works already mentioned, contains a number of smaller pieces, both in natural history and metaphysics. They are all written in French. It was not till about 1788 that his constitution, feeble as it was, visibly gave way. The symptoms of a dropsy in the chest then began to manifest appearance; and these with some intervals, gradually increased upon him, occasioning a variety of sufferings, which he bore with great patience and serenity. He died on May 20. 1793, at the age of 73. Public honours were rendered to his remains by his fellow-citizens, and his funeral eulogy was pronounced by his learned friend and kinsman, M. de Saussure.

BONNET, in a general sense, denotes a cover for the head, in common use before the introduction of hats. Bonnets are still used in many parts of Scotland.

BONNET, in *Fortification*, a small work consisting of two faces, having only a parapet with two rows of palisadoes, at about 10 or 12 feet distance; it is generally raised before the salient angle of the counterscarp, and has a communication with the covered way, by a trench cut through the glacis, and palisadoes on each side.

BONNET *à Pretre*, or *Priest's Bonnet*, in *Fortification*, is an out-work, having at the head three salient angles, and two inwards. It differs from the double tenaille only in this, that its sides, instead of being parallel, are like the *queue d'aronde*, or swallow's tail, that is, narrowing, or drawing close at the gorge, and opening at the head.

BONNET, in the sea-language, denotes an addition to a sail; thus we say, lace on the bonnet, or shake off the bonnet.

BONNEVAL, CLAUDIUS ALEXANDER, COUNT DE, known in the latter part of his life by the name of *Osman Bashaw*, descended from a family related to the blood-royal of France, entered himself at the age of 16 in the service of that crown, and married the daughter of Marshal de Biron. He made the campaign of Flanders in 1690; but soon after left the French army, and entered into the Imperial service under Prince Eugene, who honoured him with an intimate friendship. The intrigues of the marquis de Prié, his inveterate enemy, ruined his credit, however, at the court of Vienna, and caused him to be banished the empire. He then offered his service to the republic of Venice and to Russia; which being declined, his next tender was to the Grand Signior, who gladly received him. It was stipulated that he should have a body of 30,000 men at his disposal; that a government should be conferred on him, with the rank of bashaw of three tails, and a salary of 10,000 aspers a-day; and that, in case of war, he should be commander in chief. The first expedition he engaged in after his arrival at Constantinople, was to quell an insurrection in

Arabia

Arabia Petræa, which he happily effected; and at his return had large offers made him by Kouli Khan, but he did not choose to accept them. Some time after, he commanded the Turkish army against the emperor, over whose forces he gained a victory on the banks of the Danube. But success does not always protect a person against disgrace, for Bonneval, notwithstanding his service, was first imprisoned, and then banished to the island of Chio. The sultan, however, continued his friend; and the evening before his departure made him bashaw-general of the Archipelago, which, with his former appointment of beglerbeg of Arabia, rendered him one of the most powerful persons in the Ottoman empire. In this island he found a retirement quite agreeable to his wishes; but did not long enjoy it, being sent for back, and made *topigi* or master of the ordnance, a post of great honour and profit. He died in this employment, aged 75, in 1747; and wrote the memoirs of his own life.

BONNEVAL, a town of France, in the department of Eure and Loire, which had before the revolution a fine Benedictine abbey. It is seated on the river Loire, in E. Long. 1. 30. N. Lat. 48. 10.

BONNEVILLE, a town of Savoy, capital of Faucigny, situated on the north side of the river Arve, and subject to the king of Sardinia. It is situated at the foot of a mountain called the *Mole*, and is 20 miles south of Geneva. E. Long. 6. 10. N. Lat. 46. 18.

BONNY, among miners, a bed of ore, differing only from a squat as being round, whereas the squat is flat. See SQUAT.

BONNY, a town of France, in the department of Loiret, seated at the confluence of a river of the same name with the Loire. E. Long. 2. 54. N. Lat. 47. 36.

BONONCINI, GIOVANNI, an eminent composer of music, for some time divided the opinions of the *conoscenti* of this kingdom with respect to the comparative merits of himself and the great Handel, which gave occasion for the following epigram, said to have been written by Dr Swift:

> Some say that Signior Bononcini
> Compar'd to Handel's a mere ninny;
> Others aver, that to him Handel
> Is scarcely fit to hold the candle.
> Strange! that such high disputes should be
> 'Twixt *Tweedle Dum* and *Tweedle Dee*.

There is one opera (Italian) published with his name prefixed to it, entitled *Pharnaces;* but whether the words, or only the music, are his composition, is uncertain; and indeed, in the general, the language of those pieces, written merely for musical representation, is so extremely paltry, and so opposite to every thing that can be deemed poetry, that the greatest compliment that can be paid to the authors of them is, to suffer their names to lie buried in the shades of obscurity.

BONONIA, in *Ancient Geography*, a town of Gallia Belgica, supposed to be the *Portus Iccius* of Cæsar, and the *Gessoriacum* of Mela, and to have had three different names (Cluverius). Peutinger's map expressly calls Gessoriacum *Bononia*. Now *Boulogne*. E. Long. 1. 30. N. Lat. 50. 40.

BONONIA, a town of Italy, in the Gallia Cispadana; a name probably given by the Gauls, there being a *Bononia* in Gallia Belgica. Its ancient name, when in the hands of the Tuscans, who were expelled by the Gauls, was *Fulsina*. In the 563d year of the city the Romans led a colony thither; which, about the beginning of the Actiac war, was increased by Augustus, and is the *Colonia Bononiensis* of Tacitus. Now *Bologna;* which see.

BONONIA, a town of Pannonia Inferior, between Mursa to the north-west, and Taurinum to the east.—Another Bononia, a town of Mœsia Superior, on the Danube; now *Bodon* in Bulgaria. See BODON.

BONONIAN. See BOLONIAN.

BONOSIANI, or BONOSIACI, an ancient branch of *Adoptiani*, in the fourth century, denominated from their leader Bonosus, a bishop of Macedonia. The Bonosiani were prior to the Feliciani, and even to Nestorius; whence some rather consider them as a branch of Arians. They allowed Christ to be no otherwise the Son of God than by adoption.

BONPOURNICKEL, a coarse kind of bread used in Westphalia. See BREAD.

BONS HOMMES, or *Bon-hommes*, a sort of hermits of St Augustin, founded by F. de Paula. They were brought over into England in 1283, by Edmund earl of Cornwall, and settled at Ashorug in Bucks, besides which they had only one house more at Edingdon in Wiltshire. They followed the rule of St Austin, and wore a blue habit. The name is said to have arisen from Louis XI. of France, who used to call F. de Paula, prior of the order, *Le bon homme*. Till then they had been called the *Minimi*, or the order of Grammont. See ALBIGENSES.

BONTIA, WILD OLIVE OF BARBADOES. See BOTANY *Index*.

BONVINCINO, ALESSANDRO, called LE MORETTO, history and portrait painter, was born at Rovate in 1514. He was first the disciple of Titian, under whose direction he studied diligently for some years. But, having accidentally seen the designs of Raphael, he felt an elevation of mind that he never had before experienced. He therefore gave himself up entirely to study those masterpieces of art and genius; and his observations were guided with such judgment, as well as attention, that his improvement was truly surprising, and he became an exceeding good painter. His works were eagerly bought up, as being extremely admired for the tenderness of the pencilling; for the correctness and spirited expression of the figures; for the neatness of the finishing; and for the rich variety of his draperies, which usually consisted of velvets, damasks, or satins, all copied after nature, and being wonderfully imitated. He was also equally excellent in portrait, and by many was placed in competition even with Titian. He died in 1564.

BONUS HENRICUS. See CHENOPODIUM, BOTANY *Index*.

BONZES, Indian priests. The Tonquinese have a pagod or temple in each town; and each pagod has at least two bonzes belonging to it: some have 30 or 40. These bonzes, in order to distinguish themselves from the laity, wear a chaplet about their necks consisting of 100 beads; and carry a staff, at the end of which is a wooden bird. They live upon the alms of the people; yet are very charitably disposed; and maintain several orphans and widows out of their own collections.

Digitized by Google

The bonzes of China are the priests of the Fohists or sect of Fohi. It is one of their established tenets that there are rewards allotted for the righteous, and punishments for the wicked, in the next world; and that there are various mansions in which the souls of men will reside, according to their different degrees of merit. But, in order to deserve the favour of heaven, the bonzes instruct the people to treat the priests with respect and reverence, to support and maintain them, and to erect temples and monasteries for them. They tell them, that, unless they comply with these injunctions, they will be cruelly tormented after death, and pass through a disagreeable variety of transmigrations: in short, that they will be changed into mules, asses, rats, and mice.

The Chinese bonzes, according to F. le Compte, are no better than a gang of dissolute idle fellows. All their aim is to incite people to commiserate their abject condition: to which end they have recourse to several tricks and impostures. When the common arts of address fail them, they try what public acts of penance will do. Some of them drag heavy chains 30 feet long after them; some sit in the highway knocking their heads against flint stones; others set particular drugs on fire upon their heads: all these are several ways of drawing the attention and exciting the compassion of the people, and they seldom fail of success.

The bonzes of Japan are generally gentlemen of the highest extraction; for when a gentleman of quality finds his family grow too numerous, nay, when he has only two sons, he very often makes the youngest a bonze, to prevent all domestic broils and confusions. These priests are dressed in various colours; their apartments are very commodious, and situated in the healthiest parts of the country.

F. Navarette tells us, that the bonzes are obliged to chastity; and that, on the 2d of April 1667, a petty king of Canton had condemned 11 of them to be burnt alive for incontinence. He adds, that it was reported of an empress of the last reigning family, who had a particular kindness for the bonzes, that she granted them a dispensation for the use of women during three days. The bonzes of China, according to the same author, are computed at 50,000.

BOOBY. See Pelicanus, Ornithology *Index*.

BOOK, the general name of almost every literary composition; but, in a more limited sense, is applied only to such compositions as are large enough to make a volume. As to the origin of books or writing, those of Moses are undoubtedly the most ancient that are extant: But Moses himself cites many books which it behoved to be written before his time.

Of profane books, the oldest extant are Homer's poems, which were so even in the time of Sextus Empiricus; though we find mention in Greek writers of several others prior to Homer; as Hermes, Orpheus, Daphne, Horus, Linus, Musæus, Palamedes, Zoroaster, &c.: but of the greater part of these there is not the least fragment remaining; and of others, the pieces which go under their names are generally held, by the learned, to be supposititious.

Several sorts of materials were used formerly in making books: Plates of lead and copper, the bark of trees, bricks, stone, and wood, were the first materials employed to engrave such things upon as men were willing to have transmitted to posterity. Josephus speaks of two columns, the one of stone, the other of brick, on which the children of Seth wrote their inventions and astronomical discoveries: Porphyry makes mention of some pillars, preserved in Crete, on which the ceremonies observed by the Corybantes in their sacrifices were recorded. Hesiod's works were originally written upon tables of lead, and deposited in the temple of the Muses, in Bœotia: The ten commandments, delivered to Moses, were written upon stone; and Solon's laws upon wooden planks. Tables of wood, box, and ivory, were common among the ancients: When of wood, they were frequently covered with wax, that people might write upon them with more ease, or blot out what they had written. The leaves of the palm-tree were afterwards used instead of wooden planks, and the finest and thinnest part of the bark of such trees, as the lime, the ash, the maple, and the elm; from hence comes the word *liber*, which signifies the inner bark of the trees: and as these barks are rolled up, in order to be removed with greater ease, these rolls were called *volumen*, a volume; a name afterwards given to the like rolls of paper or parchment.

Thus we find books were first written on stones, witness the Decalogue given to Moses: Then on the parts of plants; as leaves, chiefly of the palm-tree, the rind and barks, especially of the tilia, or phillyrea, and the Egyptian papyrus. By degrees wax, then leather, were introduced, especially the skins of goats and sheep, of which at length parchment was prepared; then lead came into use; also linen, silk, horn, and lastly paper itself.

The first books were in the form of blocks and tables; but as flexible matter came to be wrote on, they found it more convenient to make their books in the form of rolls: These were composed of several sheets fastened to each other, and rolled upon a stick, or *umbilicus*; the whole making a kind of column, or cylinder, which was to be managed by the umbilicus as a handle, it being reputed a crime to take hold of the roll itself: The outside of the volume was called *frons*; the ends of the umbilicus, *cornua*, which were usually carved, and adorned with silver, ivory, or even gold and precious stones: The title, συλλαβος, was struck on the outside; the whole volume, when extended, might make a yard and a half wide, and fifty long. The form which obtains among us is the square, composed of separate leaves; which was also known, though little used, by the ancients.

To the form of books belongs also the internal economy, as the order and arrangement of points and letters into lines and pages, with margins and other appurtenances. This has undergone many varieties. At first the letters were only divided into lines; then into separate words; which, by degrees, were noted with accents, and distributed, by points and stops, into periods, paragraphs, chapters, and other divisions. In some countries, as among the orientals, the lines began from the right and ran leftward; in others, as the northern and western nations, from left to right; others, as the Greeks, followed both directions, alternately going in the one, and returning in the other, called *boustrophedon*: In most countries, the lines run from

Digitized by Google

from one side to the other; in some, particularly the Chinese, from top to bottom.

Multitude of Books has been long complained of: the complaint is as old as Solomon, who lived three thousand years ago: they are grown too numerous not only to procure and read, but to see, to learn the names of, or even to number. England has more to fear on this score than other countries; since, besides our own produce, we have for some years past drained our neighbours. However, as Bishop Caramuel's scheme miscarried, which was to write about an hundred volumes in folio, and then prevail on the civil and military powers to oblige all their subjects to read them, we need not much regret the multitude of books.

As knowledge, however, is naturally advantageous, and as every man ought to be in the way of information, even a superfluity of books is not without its use, since hereby they are brought to obtrude themselves on us, and engage us when we had least design. This advantage, an ancient father observes, we owe to the multiplicity of books on the same subject, that one falls in the way of one man, and another best suits the level or the apprehension of another. "Every thing that is written (says he) does not come into the hands of all persons: perhaps some may meet with my books, who may hear nothing of others which have treated better of the same subject. It is of service, therefore, that the same questions be handled by several persons, and after different methods, though all on the same principles, that the explication of difficulties and arguments for the truth may come to the knowledge of every one by one way or other." Add, that the multitude is the only security against the total loss or destruction of books: it is this that has preserved them against the injuries of time, the rage of tyrants, the zeal of persecutors, and the ravages of barbarians; and handed them down, through long intervals of darkness and ignorance, safe to our days. *Solaque non norunt hæc monumenta mori.*

Scarcity of Books. Of the scarcity and value of books during the seventh and many subsequent centuries, the following curious account is given by Mr Warton in his history of English Poetry, vol. i.

"Towards the close of the seventh century (says he), even in the papal library at Rome, the number of books was so inconsiderable, that Pope Saint Martin requested Sanctamund bishop of Maestricht, if possible, to supply this defect from the remotest parts of Germany. In the year 855, Lupus, abbot of Ferrieres in France, sent two of his monks to Pope Benedict III. to beg a copy of *Cicero de Oratore,* and Quintilian's Institutes, and some other books: 'for (says the abbot) although we have part of these books, yet there is no whole or complete copy of them in all France.' Albert, abbot of Gemblours, who with incredible labour and immense expence had collected a hundred volumes on theological, and fifty on profane subjects, imagined he had formed a splendid library. About the year 790, Charlemagne granted an unlimited right of hunting to the abbot and monks of Sithin, for making their gloves and girdles of the skins of the deer they killed, and covers for their books. We may imagine that these religious were more fond of hunting than reading. It is certain that they were obliged to hunt before they could read: and at least it is probable, that under these circumstances, and of such materials, they did not manufacture many volumes. At the beginning of the tenth century books were so scarce in Spain, that one and the same copy of the Bible, Saint Jerome's epistles, and some volumes of ecclesiastical offices and martyrologies, often served several different monasteries. Among the constitutions given to the monks of England by Archbishop Lanfranc, in the year 1072, the following injunction occurs. At the beginning of Lent, the librarian is ordered to deliver a book to each of the religious: a whole year was allowed for the perusal of this book; and at the returning Lent, those monks who had neglected to read the books they had respectively received, are commanded to prostrate themselves before the abbot, and to supplicate his indulgence. This regulation was partly occasioned by the low state of literature which Lanfranc found in the English monasteries. But at the same time it was a matter of necessity, and is in a great measure to be referred to the scarcity of copies of useful and suitable authors. In an inventory of the goods of John de Pontissara, bishop of Winchester, contained in his capital palace of Wulvesey, all the books which appear are nothing more than *Septendecem species librorum de diversis scientiis.* This was in the year 1294. The same prelate, in the year 1299, borrows of his cathedral convent of St Swithin at Winchester, *Bibliam bene glossatam;* that is, the Bible with marginal annotations, in two large folio volumes; but gives a bond for due return of the loan, drawn up with great solemnity. This Bible had been bequeathed to the convent the same year by Pontissara's predecessor, Bishop Nicholas de Ely: and in consideration of so important a bequest, that is, *pro bona Biblia dicti episcopi bene glossata,* and one hundred merks in money, the monks founded a daily mass for the soul of the donor. When a single book was bequeathed to a friend or relation, it was seldom without many restrictions and stipulations. If any person gave a book to a religious house, he believed that so valuable a donation merited eternal salvation; and he offered it on the altar with great ceremony. The most formidable anathemas were peremptorily denounced against those who should dare to alienate a book presented to the cloister or library of a religious house. The prior and convent of Rochester declare, that they will every year pronounce the irrevocable sentence of damnation on him who shall purloin or conceal a Latin translation of Aristotle's Physics, or even obliterate the title. Sometimes a book was given to a monastery on condition that the donor should have the use of it during his life; and sometimes to a private person, with the reservation that he who receives it should pray for the soul of his benefactor. The gift of a book to Lincoln cathedral, by Bishop Repingdon, in the year 1422, occurs in this form, and under these curious circumstances. The memorial is written in Latin with the bishop's own hand, which I will give in English, at the beginning of Peter's Breviary of the Bible. 'I Philip of Repyndon, late bishop of Lincoln, give this book, called *Peter de Aureolis,* to the new library to be built within the church of Lincoln: reserving the use and possession of it to Richard Trysely, clerk, canon, and prebendary, of Miltoun, in fee, and to the term of his life; and afterwards to be given up and restored to the said library, or the keepers

Digitized by Google

Books. keepers of the same, for the time being, faithfully, and without delay. Written with my own hand, A. D. 1422." When a book was bought, the affair was of so much importance, that it was customary to assemble persons of consequence and character, and to make a formal record that they were present on this occasion. Among the royal manuscripts, in the book of the Sentences of Peter Lombard, an archdeacon of Lincoln has left this entry: 'This book of the Sentences belongs to master Robert archdeacon of Lincoln, which he bought of Geoffrey the chaplain, brother of Henry vicar of Northelkington, in the presence of master Robert de Lee, master John of Lirling, Richard of Luda clerk, Richard the almoner, the said Henry the vicar, and his clerk, and others: and the said archdeacon gave the said book to God and St Oswald, and to Peter abbot of Barton, and the convent of Barden.' The disputed property of a book often occasioned the most violent altercations. Many claims appear to have been made to a manuscript of Matthew Paris, belonging to the last-mentioned library; in which John Russel, bishop of Lincoln, thus conditionally defends or explains his right of possession. 'If this book can be proved to be or to have been the property of the exempt monastery of St Alban in the diocese of Lincoln, I declare this to be my mind, that in that case I use it at present as a loan under favour of those monks who belong to the said monastery. Otherwise, according to the condition under which this book came into my possession, I will that it shall belong to the college of the blessed Winchester Mary at Oxford, of the foundation of William Wykham. Written with my own hand at Buckdane, 1st Jan. A. D. 1488. Jo. Lincoln. Whoever shall obliterate or destroy this writing, let him be anathema.' About the year 1225, Roger de Insula, dean of York, gave several Latin Bibles to the university of Oxford, with a condition that the students who perused them should deposit a cautionary pledge. The library of that university, before the year 1300, consisted only of a few tracts, chained or kept in chests in the choir of St Mary's church. In the year 1327, the scholars and citizens of Oxford assaulted and entirely pillaged the opulent Benedictine abbey of the neighbouring town of Abingdon. Among the books they found there, were one hundred psalters, as many grayles, and 40 missals, which undoubtedly belonged to the choir of the church: but besides these, there were only twenty-two codices, which I interpret books on common subjects. And although the invention of paper, at the close of the eleventh century, contributed to multiply manuscripts, and consequently to facilitate knowledge, yet, even so late as the reign of our Henry VI. I have discovered the following remarkable instance of the inconveniences and impediments to study, which must have been produced by a scarcity of books. It is in the statutes of St Mary's college at Oxford, founded as a seminary to Oseney abbey in the year 1446: 'Let no scholar occupy a book in the library above one hour, or two hours at most, so that others be hindered from the use of the same.' The famous library established in the university of Oxford, by that munificent patron of literature Humphrey duke of Gloucester, contained only 600 volumes. About the commencement of the 14th century there were only four classics in the royal library of Paris. These were one copy of Cicero, Ovid, Lucan, and Boethius. The rest were chiefly books of devotion, which included but few of the fathers: many treatises of astrology, geomancy, chiromancy, and medicine, originally written in Arabic, and translated into Latin or French: pandects, chronicles, and romances. This collection was principally made by Charles V. who began his reign in 1365. This monarch was passionately fond of reading; and it was the fashion to send him presents of books from every part of the kingdom of France. These he ordered to be elegantly transcribed and richly illuminated; and he placed them in a tower of the Louvre, from thence called *La Tour de la Libraire*. The whole consisted of 900 volumes. They were deposited in three chambers; which, on this occasion were wainscotted with Irish oak, and ceiled with cypress curiously carved. The windows were of painted glass, fenced with iron bars and copper wire. The English became masters of Paris in the year 1425; on which event the duke of Bedford, regent of France, sent the whole library, then consisting of only 853 volumes, and valued at 2223 livres, into England; where perhaps they became the ground-work of Duke Humphrey's library, just mentioned. Even so late as the year 1471, when Louis XI. of France borrowed the works of the Arabian physician Rhasis from the faculty of medicine at Paris, he not only deposited, by way of pledge, a quantity of valuable plate, but was obliged to procure a nobleman to join with him as surety in a deed, by which he bound himself to return it under a considerable forfeiture. The excessive prices of books in the middle ages afford numerous and curious proofs. I will mention a few only. In the year 1174, Walter, prior of St Swithin's at Winchester, afterwards elected abbot of Westminster, a writer in Latin of the lives of the bishops who were his patrons, purchased of the monks of Dorchester in Oxfordshire, Bede's Homilies and St Austin's Psalter, for twelve measures of barley, and a pall on which was embroidered in silver the history of St Birinus converting a Saxon king. Among the royal manuscripts in the British museum, there is Comestor's Scholastic History in French; which as it is recorded in a blank page at the beginning, was taken from the king of France at the battle of Poictiers; and being purchased by William Montague earl of Salisbury for 100 marcs, was ordered to be sold by the last will of his countess Elizabeth for 40 livres. About the year 1400, a copy of John of Meun's *Roman de la Rose*, was sold at Paris for 40 crowns, or 33l. 6s. 6d. See BIBLIOGRAPHY, SUPPLEMENT.

Books, Burning of, was a kind of punishment much in use among the Romans, by legal sentence: sometimes the care of the execution was committed to *triumviri* appointed on purpose; sometimes to the prætors, and sometimes to the ædiles. Labienus, whom from his satirical spirit some have called *Rabienus*, is said to have been the first who underwent the severity of it. His enemies procured a *senatusconsultum*, whereby all his books published during seven years were ordered to be collected and burnt. "The thing (says Seneca) then appeared new and strange, to take revenge on learning!" *Res nova et insueta! supplicium de studiis sumi.* Cassius Servius, a friend of Labienus, hearing the sentence pronounced, cried aloud, "That they must burn him too, since he had got all the books by heart:" *Nunc*

Book. *Nunc me vivum uri oportet, quia illos didici.* Labienus could not survive his books, but shutting himself up in the tomb of his ancestors, pined away, and was buried alive. Divers other ancient testimonies concerning the burning of books are given in Reimm. *Idea Syst. Antiq. Liter.* p. 389.

Book is also used for a part or division of a volume or large work. In this sense we say, the *book of Genesis*, the *first book of Kings*, the *five books of Moses*, &c. The Digest is contained in fifty books, the Code in twelve books.

Books are usually subdivided into chapters, sometimes into sections or paragraphs: accurate writers quote chapter and book.

Everlasting Book.—We find in Signior Castaquo's account of the asbestus, a scheme for the making of a book, which, from its imperishable nature, he is for calling *the book of eternity*. The leaves of this book were to be of the asbestus paper, the covers of a thicker sort of work of the same matter, and the whole sewed with thread spun from the same substance. The things to be commemorated in this book were to be written in letters of gold; so that the whole matter of the book being incombustible, and everlastingly permanent against the force of all the elements, and subject to no changes from fire, water, or air, must remain for ever, and always preserve the writing committed to it. He carried this project so far towards execution, as to find a way of making a sort of paper from the asbestus, which was so tractable and soft, that it very well resembled a thin parchment; this, by the same process, was capable of being thickened or thinned at pleasure, and in either state equally resisted the fire. The covering of the thinnest kind of this paper with fire, only makes it red hot and very clear, the fire seeming to pass through it without wasting or altering any part of it. Copper, iron, or any other metal except gold or silver, exposed to the same degree of fire in the same thin plates, would be found not to bear it in this manner, but to scale and burn into scoriæ at the surface, which this stone does not.

END OF THE THIRD VOLUME.
