ADD. VOL.

ENCYCLOPÆDIA BRITANNICA.

B O O

Book-Binding.

BOOK-BINDING is the art of gathering together and sewing the sheets of a book, and covering it with a back, &c. It is performed thus: The leaves are first folded with a folding-stick, and laid over each other in the order of the signature; then beaten on a stone with a hammer, to make them smooth and open well; and afterwards pressed. They are sewed upon bands, which are pieces of cord or packthread; six bands to a folio book; five to a quarto, octavo, &c.; which is done by drawing a thread through the middle of each sheet, and giving it a turn round each band, beginning with the first and proceeding to the last. After this the books are glued, and the bands opened and scraped, for the better fixing the pasteboards; the back is turned with a hammer, and the book fixed in a press between two boards, in order to make a groove for fixing the pasteboards; these being applied, holes are made for fixing them to the book, which is pressed a third time. Then the book is at last put to the cutting press, between two boards; the one lying even with the press, for the knife to run upon; the other above it, for the knife to run against; after which the pasteboards are squared.

B O O

Book-Binding.

The next operation is the sprinkling the leaves of the book; which is done by dipping a brush into vermilion and sap-green, holding the brush in one hand, and spreading the hair with the other; by which motion the edges of the leaves are sprinkled in a regular manner, without any spots being bigger than the other.

Then remain the covers, which are either of calf-skin or of sheep-skin: these being moistened in water, are cut out to the size of the book; then smeared over with paste made of wheat flour; and afterwards stretched over the pasteboard on the outside, and doubled over the edges withinside; after having first taken off the four angles, and indented and platted the cover at the head-band: which done, the book is covered, and bound firmly between two bands, and then set to dry. Afterwards it is washed over with a little paste and water, and then sprinkled with a fine brush, unless it should be marbled; when the spots are to be made larger by mixing the ink with vitriol. After this the book is glazed twice with the white of an egg beaten, and at last polished with a polishing iron passed hot over the glazed cover.

BOOK-KEEPING

IS the art of recording mercantile transactions in a regular and systematic manner.

1. A merchant's books should contain every particular which relates to the affairs of the owner. They should exhibit the state of all the branches of his business, the connection of the different parts, the amount and success of the whole. They should be so full and so well arranged, as to afford a ready information in every point for which they may be consulted.

The matter which the books should contain is comprehended under the three following heads: First, The debts which are owing to the owner, and the debts which he owes to others. Secondly, The goods and other articles of property which belonged to him; the quantity and value sold, or otherwise disposed on; and the quantity and value which still remain in his possession. Thirdly, The amount of his stock when the books were opened; the profits he has obtained, and

VOL. IV. Part I.

the losses he has suffered, since; and the amount of his stock at present.

That method of book-keeping which answers these purposes most clearly and concisely, is the best. The Italian method, by *double entry*, is generally preferred; at least, it is founded upon the most universal principles, and is the most convenient in extensive and complicated business; and the accountant who understands it, will find little difficulty in following, or even in inventing, other methods that are better accommodated to any particular purpose.

The Italian method requires three principal books; the Waste-Book, Journal, and Leger.

SECT. I. *Of the WASTE-BOOK.*

2. THE waste-book, or day-book, contains an exact register of all occurrences in following, or even in inventing, other methods that are better accommodated to any particular purpose.

A

as

Waste-
Book.

as they take place. It begins with an inventory of every thing belonging to the owner, a list of the debts due to him, and of the debts he owes to others: It is carried on with a full relation of all the money he receives or pays; of all the goods he buys or sells; and of every other occurrence in his business. Each article should be entered as soon as the transaction takes place, and should be clearly expressed in the plainest language. It should require no supply from the accountant's memory, but should be fully intelligible to any person, however unacquainted with the business; at the same time, it should be written with all convenient brevity; and, therefore, sometimes refers to invoices and other accounts, for particulars. The accountant's first care should be to have nothing defective or ambiguous; his second, to have nothing superfluous.

3. The date is written in text on the top of each page. The articles are separated from each other by a line: and the transactions of one day are separated from those of another by a double line, in the middle of which there is left a blank space for inserting the day of the month. This book must be kept with the greater care, as it contains the materials from which the other books are composed; and any error or defect will occasion a like one in the others. Besides, it is the book whose authority is trusted to, and which must be exhibited to judges, or arbiters, when an account is disputed. As the journal is filled up from the waste-book, the authority of the former is esteemed more authentic, unless there be an obvious mistake through hurry; and either of these books is depended on rather than the leger, which, from its form, is more liable to error, and may be more easily vitiated by a fraudulent design.

4. As the waste-book contains the whole substance of the business, it may be applied so as to afford any information that can be wanted: but the labour of consulting it would be very great. For instance, if it were required to know how much any person owes us, we must look over the book from the beginning, and mark down every article in which we have dealt with him; or, if it were required to know what quantity of goods we should have on hand, we must look over the whole book, and mark down every article bought or sold. This operation would not only be found very tedious, but much exposed to the risk of omissions. To prevent these inconveniences, another book is used, in which the articles are arranged in a methodical order. This book is called the *Leger*, and we shall consider it next; because the journal, though it comes before it in the order of writing, cannot be well understood, till the nature of the leger be explained.

SECT. II. Of the LEGER.

5. IN the leger, articles of the same kind are collected together; and, for that purpose, it is divided into many accounts, under which the different branches of business are arranged. Each account is introduced by a proper title, to explain the nature of the articles it contains; and articles of opposite kinds, which belong

to the same account, are placed on the opposite pages of the same folio: for instance, money received on the one side, and money paid on the other; or goods bought on the one side, and goods sold on the other. The left-hand page is called the *Debtor* or *Dr.* side of the account, and the right-hand page the *Creditor* or *Cr.* side. The difference between the sums of the *Dr.* and *Cr.* sides is called the *Balance*.

Accounts in the leger are of three kinds, which answer to the three purposes of book-keeping mentioned § 1.

6. First, Personal Accounts. It is necessary to open an account for every person or company with whom there are any dealings on credit. At opening the books, if they be indebted to the owner, the debt is entered on the *Dr.*; but if he be indebted to them, it is entered on the *Cr.* During the course of the business, goods sold on trust, money paid, and every thing for which they are accountable to him, is entered on the *Dr.*; but goods bought on trust, money received, and every thing for which he is accountable to them, is entered on the *Cr.* The balance shows how much they owe him, when the *Dr.* side is greatest: and how much he owes them, when the *Cr.* side is greater.

7. Secondly, Real Accounts. By this we understand accounts of property, of whatever kind, such as ready money, goods, houses, lands, ships, shares in public companies, and the like.

The account of ready money is entitled *Cash*. On the *Dr.* side, the money on hand at opening the books is entered, and afterwards every article of money received. On the *Cr.* side there is entered every article of money paid out; and the balance shows how much ought to be on hand. The sum of the *Dr.* side of this account is always greater than that of the *Cr.* side.

8. Accounts of goods are generally ruled with inner columns for entering the quantities. When the books are opened, the goods on hand are entered on the *Dr.* side of the respective accounts; the quantities being placed in the inner, and the values in the outer column. Goods bought are entered in the same manner, and goods sold are entered on the *Cr.* side; the quantities and values being placed in the proper columns. Charges laid out on goods are entered on the *Dr.* side; and, when an incidental advantage arises from them, such as public bounty, it is entered on the *Cr.*

If the sums of the inner columns on the opposite sides be equal, it shows that the goods are all sold, and then the balance of the money-column shows the gain or loss. If the *Cr.* side be greater, it is gain: if the *Dr.* side be greater, it is loss. If the sum of the inner column be greater on the *Dr.* side, it shows that part of the goods are on hand; and their value must be added to the sum of the *Cr.* side, in order to determine the gain or loss.

9. If there be two or more kinds of the same sort of goods, they may be entered in the same account, allowing as many inner columns as there are kinds, and entering the quantities of each kind in the inner column reserved for it. This method exhibits the gain or loss on the whole goods; but does not show how much of it arises from each kind.

Leger.

Leger.

Or, a separate account may be opened for each kind, distinguishing the titles by the qualities, or by some other mark. Thus, one account may be kept for fine linen, another for coarse linen; one for port-wine crop 1787, another for port-wine crop 1788; one for rum from Jamaica, another for rum from Barbadoes. This method shows the gain or loss on each kind.

When there are more kinds than can be conveniently introduced in the same account, they may be divided into several classes, each class being placed in a separate account: and the particular kinds distinguished in inner columns. Thus the account of fine linen may be divided into several columns, for different kinds, distinguished by the number of threads in the breadth, or by any other convenient character.

10. Accounts of ships contain on the Dr. the value of the ship when the books are opened, and all expences laid out thereon; on the Cr. all freights received. In like manner, accounts of houses or lands have the value of the subject, and all repairs or other charges, entered on the Dr. and all rents or other profits received on the Cr. If the subject be sold in whole or in part, the sale is entered on the Cr. And the balance after valuing the subject (if any) on hand, shows the gain or loss.

Accounts of property in the public funds, or shares in companies, public or private, contain the value, or money paid in, on the Dr. and the dividends received on the Cr. and are balanced as other real accounts.

Some persons open accounts for household furniture, plate, jewels, books, or the like. The entries on these accounts are made in the same manner.

In general, real accounts contain the value of the property, and all charges, on the Dr. and the sales and other returns on the Cr. When the account is to be balanced, if any property remains, the value thereof is placed on the Cr.; and then the balance shows the loss or gain, according as the Dr. or Cr. side is greatest.

11. Thirdly, Accounts of STOCK, PROFIT and Loss, and its subsidiary accounts, which are sometimes called *fictitious accounts*.

The *stock* account contains on the Dr. the amount of the debts which the owner owes when the books are opened; and on the Cr. the amount of ready money, goods, debts, and property of every kind belonging to him: therefore the balance shows what his nett stock is; or, in case of bankruptcy, how much his debts exceed his effects. There is nothing further entered on this account till the books are balanced: and then, if the business has yielded profit, the nett gain is entered on the Cr.; if it has been unsuccessful, the nett loss is entered on the Dr.: after which, the balance shows the nett stock at the time the books are closed.

12. The *Profit and Loss* account contains every article of gain on the Cr. and every article of loss on the Dr. The balance shows the nett gain or loss, and is transferred to the proper side of the stock-account, as mentioned above. This account is partly composed of articles that occur while the books are running. For example, legacies received are entered on the Cr. goods destroyed on the Dr. The rest of the articles are those

Leger.

of gain and loss, arising from the real accounts, which are collected when the books are balanced.

13. It has been found convenient to open several subsidiary accounts, in order to shorten and methodize that of profit and loss. These contain certain articles of gain or loss, which may be reduced under distinct heads. They are in effect so many parts of the profit and loss account, and their balances are entered on the proper side of that account when the books are closed. The chief of these accounts are the following.

Interest account, Which contains on the Dr. sums paid or incurred for interest; and on the Cr. sums received, or become due for the same.

Commission account, Which contains on the Cr. articles of gain received or owing us for our trouble in transacting business for others. There are seldom any entries on the Dr.

Charges merchandise, Which contains on the Dr. all charges paid or incurred on the business, which do not belong to any particular account, as shop-rent, public burdens for trade, clerks wages, postages, and the like. If any of these should afterwards be charged to some other account, the sum so charged is entered on the Cr.

Proper expences, Which contains on the Dr. money or any thing else, withdrawn from the trade for our private use. There are seldom any entries on the Cr. The amount of this account, as well as the former, is not properly loss; but as it has the same effect in diminishing the stock, it is placed in the same manner to the Dr. of profit and loss.

Loss by bad debts, Which contains on the Dr. such debts as we reckon desperate; and on the Cr. any of these which may happen to be unexpectedly recovered.

Account of abatements, Which contains on the Dr. discounts allowed by us on payments received; on the Cr. discounts (if any) allowed to us on payments made. It is particularly useful in retail business, where discounts are often given, to show how much they amount to.

Insurance account, Which contains on the Cr. premiums received for making insurances; and, on the Dr. losses sustained on the same. There may be several accounts of this kind, such as insurance against sea-hazard, which is the most common; insurance against fire; insurance of lives; and insurance of debts. The balance shows the gain or loss which arises from being concerned in insurance.

More or fewer of these accounts may be used, according as the articles are frequent; and others may be invented to suit the purposes of the business which the books are kept for.

14. Every simple transaction in business belongs to two accounts, and must be entered on the Dr. of the one and on the Cr. of the other. Thus, when a person becomes indebted to us, the article he owes must be entered on the Dr. of his account; and, if it be for money paid him, it is also entered on the Cr. of cash; if for goods sold, it is entered on the Cr. of the account of goods; if for any thing delivered him by another person at our desire, it is entered on the Cr. of the deliverer's account; if for any wager or bargain, by which we are gainers, it is entered on the Cr. of profit and

Leger. loss. Thus, in whatever way the debt arises, it is entered on the Cr. of some other account, as well as on the Dr. of the person's account who owes it.

In like manner, when we become indebted to any person, the article we owe must be entered on the Cr. of his account. If it be for money received, it is also entered on the Dr. of cash; if for goods bought, it is entered on the Dr. of the account of goods; if for any thing delivered to another person at our desire, it is entered on the Dr. of the receiver's account; and if it be in consequence of a losing bargain, it is entered on the Dr. of profit and loss.

Again, when goods are received, the transaction is entered on the Dr. of the account of goods. If they be bought for ready money, it is also entered on the Cr. of cash; if on trust, it is entered on the Cr. of the seller; if they be exchanged for other goods, it is entered on the Cr. of the goods delivered; if they be obtained by some profitable business, without any return, it is entered on the Cr. of profit and loss.

When goods are delivered, the transaction is entered on the Cr. of the account of goods; and, if they be sold for ready money, it is also entered on the Dr. of cash; if on credit, it is entered on the Dr. of the purchaser; if exchanged for other goods, it is entered on the Dr. of the goods received; and, if they be given gratis, or destroyed, it is entered on the Dr. of profit and loss.

Lastly, When any article of loss occurs, the transaction is entered on the Dr. of profit and loss; and as we must either pay it in money or goods, or remain indebted to some person for it, it must be entered on the Cr. of cash, or of goods delivered, or of the person entitled to receive it. And, when an article of gain occurs, it is entered on the Cr. of profit and loss, and also on the Dr. of cash or goods, if money or goods be received; and on the Dr. of the person accountable for it, if not immediately paid.

Thus, every article in any account, whether personal or real, or belonging to profit and loss, corresponds to some other article on the opposite of a different account. The same sum is entered on the Dr. of one account and on the Cr. of the other; and it follows from this, that, *If all the accounts in the ledger be added, the amount of the sums of the Dr. will be equal to those of the Cr.*

SECT. III. Of the JOURNAL.

15. THE journal is a fair record of all the transactions compiled from the waste-book, in the same order as they stand there; but expressed in a technical style, that it may be transferred to the ledger with more ease.

When we are to enter any article in the journal, we must consider which accounts in the ledger it will require to be placed to, both on the Dr. and Cr. and write [*the former account*] *Dr. to* [*the latter account*]; then we annex an explanation of the article, and place the sum in the money-column.

EXAMPLE.

Waste-book.) Sold for ready money, 30 yards linen, at 3s. L. 4 10 —

Journal.) *Cash Dr. to Linen,* Sold 30 yards, at 3s. L. 4 10 —

Here we consider, that the article must be entered on the Dr. of cash, because money is received; and on the Cr. of linen, because linen is delivered: Therefore we write *Cash Dr. to Linen*, to which we annex the nature of the transaction. The article thus entered is called a *journal-post*; *Cash* is called the *Dr.*; *Linen* the *Cr.*; the words "*Cash Dr. to Linen*," the *Entry*, and the following words the *Narration*.

The purpose of expressing the article in this form, is to point out the accounts in the ledger, to which it will require to be posted, and thereby enable the accountant to write the ledger with more ease than he could do if it were filled up immediately from the waste-book.

The learner will be able, from this example, to enter any simple article in the journal, providing he knows the accounts to which it should be posted on the Dr. and Cr. of the ledger. This must be collected from the description of the ledger accounts already given § 6—13. and the nature and tendency of the article.

16. GENERAL RULES for the JOURNAL-ENTRIES.

I. *Every thing received, or person accountable to us, is Dr.*

II. *Every thing delivered, or person to whom we are accountable, is Cr.*

17. As the whole art of writing the journal depends on a proper choice of the Drs. and Crs. we shall give some particular rules for the most common cases, and a few examples for the illustration and practice of each.

Rule I. *The person to whom any thing is delivered is Dr. to the thing delivered, when nothing is received in return.*

Therefore when money is paid, the receiver is Dr. to cash.

When goods or other property is sold on credit, the purchaser is Dr. to the thing sold. Thus,

Waste-book.)	Paid John Bell in full	L. 52 — —
Journal.)	<i>John Bell Dr. to Cash,</i> paid him in full	52 — —
Waste-book.)	Sold 50 yards cloth to J. Hill, at 12s.	30 — —
Journal.)	<i>J. Hill Dr. to Cloth,</i> sold him 50 yards, at 12s.	30 — —

18. Rule II. *A thing received is Dr. to the person from whom it is received, when nothing is delivered in return.*

Therefore, when money is received, Cash is Dr. to the payer: when goods are bought, the goods are Dr. to the seller. Thus,

Waste-book.)	Received from Thomas Gay in full	L. 72 — —
Journal.)	<i>Cash Dr. to Thomas Gay,</i> received in full	72 — —

Waste-book.)

Journal. Waste-book.) Bought from J. Hawley
60lb. wool, at 9d. L. 2 5 —
Journal.) *Wool Dr. to J. Hawley,*
bought 60lb. at 9d. 2 5 —

19. Rule III. *A thing received is Dr. to the thing given for it.*

Therefore goods bought for ready-money are Dr. to cash.

When goods are sold for ready money, Cash is Dr. to the goods.

When goods are bartered, the goods received are Dr. to the goods delivered. Thus,

Waste-book.) Bought for ready money
10 hds. wine, at 15l. L. 150 — —
Journal.) *Wine Dr. to Cash,* bought
10 hds. at 15l. 150 — —
Waste-book.) Sold for ready money
100 gallons rum, at 9s. 45 — —
Journal.) *Cash Dr. to Rum,* sold 100
gallons, at 9s. 45 — —
Waste-book.) Bartered 3 hds. wine, at
15l. for 100 gallons rum at 9s. 45 — —
Journal.) *Rum Dr. to Wine,* received 100
gallons at 9s. in barter for 3 hds. at 15l. 45 — —

20. Rule IV. *Goods and other real accounts are Dr. for all charges laid out on them. If money be laid out, they are Dr. to Cash; if any thing else be delivered, they are Dr. to the thing delivered: if the charge be taken in trust, they are Dr. to the person to whom it is due.* Thus,

Waste-book.) Paid for repairs to ship
Traffic L. 18 — —
Journal.) *Ship Traffic Dr. to Cash,*
paid for repairs 18 — —
Waste-book.) Delivered wood from my
timber yard for repairing the Angel-
tavern 15 — —
Journal.) *Angel Tavern Dr. to Wood,*
delivered for repairing the same 15 — —
Waste-book.) Due to William Carpen-
ter for repairs to the Angel-tavern 12 — —
Journal.) *Angel-tavern Dr. to William
Carpenter,* due him for repairs 12 — —

21. Rule V. *When rents of houses or lands, freights of ships, bounties on goods, or any other profits from real accounts, are received, Cash is Dr. to the account from which the profit arises: if any thing besides money be received, the article received is Dr.: if they remain unpaid, the person who owes them is Dr.* Thus,

Waste-book.) Received freight of the
ship Traffic for a voyage to London L. 35 — —
Journal.) *Ship Traffic Dr. to Cash,*
received freight to London 35 — —
Waste-book.) Received 100 barrels
salmon, being the rent of Inver fish-
ery, at 52s. 260 — —
Journal.) *Salmon Dr. to Inver fishery,*
received the rent, being 100 barrels,
at 52s. 260 — —

Waste-book.) John Public owes me a
year's rent of the Angel-tavern L. 52 — —
Journal.) *John Public Dr. to Angel-
tavern,* for a year's rent due by him 52 — —

22. Rule VI. *When an article of loss occurs, Profit and Loss, or some subsidiary account, is Dr. If the loss be paid in ready money, it is Dr. to Cash: if it be paid in any thing else, it is Dr. to the thing delivered. If it remain unpaid, it is Dr. to the person to whom it is owing.* Thus,

Waste-book.) Given my daughter at
her marriage L. 500 — —
Journal.) *Profit and Loss Dr. to Cash,*
given my daughter at her marriage 500 — —
Waste-book. Taken for family use from
my granary 3 bolls meal, at 13s. 4d. 2 — —
Journal.) *Profit and Loss [or Proper
expences] Dr. to Meal,* taken for fa-
mily use, 3 bolls, at 13s. 4d. 2 — —
Waste-book.) Due James Rich for a
year's interest on 1000l. at 4 per cent. 40 — —
Journal.) *Profit and Loss [or Interest
account] Dr. to James Rich,* due him a
year's interest on 1000l. at 4 per cent. 40 — —

23. Rule VII. *When an article of gain occurs, that is not immediately connected with any real account, Cash, the article received, or the person accountable for it, is Dr. to Profit and Loss, or to some subsidiary account.* Thus,

Waste-book.) Received in a gift from
my father L. 100 — —
Journal.) *Cash Dr. to Profit and Loss,*
received from my father 100 — —
Waste-book.) Received in like manner
at opening shop, 100 yards cloth at 12s. 60 — —
Journal.) *Cloth Dr. to Profit and Loss,*
received from my father at opening
shop 100 yards, at 12s. 60 — —
Waste-book.) James Barbour owes me
a year's interest of 1000l. 50 — —
Journal.) *James Barbour Dr. to Profit
and Loss [or Interest account]* due by
him for a year's interest of 1000l. 50 — —

24. Rule VIII. *When one person pays money, or delivers any thing else to another on our account, the person who receives it is Dr. to the person who pays it.* Thus,

Waste-book.) James Goldsmith has paid
the Bank of Scotland on my account, L. 100 — —
Journal.) *Bank of Scotland Dr. to
James Goldsmith,* paid them by him 100 — —
Waste-book.) Arthur Young has deli-
vered James Baker 100 qrs. wheat for
which I am to account to him, at 30s. 150 — —
Journal.) *James Baker, Dr. to Arthur
Young,* for 100 qrs. of wheat deliver-
ed him on my account, at 30s. 150 — —

Payments of this kind are often transacted by bills of exchange.

25. These

BOOK-KEEPING.

Journal. 25. These examples will make the learner acquainted with the form of the journal, and the rules extend to the greatest part of the simple transactions that occur in domestic trade. We may observe, that the technical sense of the words *Dr.* and *Cr.* has an analogy to their meaning in common language, but is not precisely the same. Thus in *Ex. 1.* Rule VIII. the journal entry is, *Bank of Scotland Dr. to James Goldsmith*; by which we are not to understand that the bank is indebted to James Goldsmith; for a debt between them has no connection with our business, and therefore ought not to be entered in our books: the meaning of the entry is, that the bank becomes indebted to us by the transactions narrated; and that we become indebted to James Goldsmith by the same.

26. An article which contains more *Drs.* or more *Cr.s.* than one, is called a *complex post*. The form of these will appear from the following examples.

<i>Ex. 1.] Sold William Drapier,</i>	
25 pieces cloth, at 15 <i>l.</i>	
per piece	L.375 — —
130 stones wool, at 5 <i>s.</i> 6 <i>d.</i>	
per stone	35 15 —
	L.410 15 —

If the two articles sold to William Drapier were entered separately in the Waste-book, and transferred to the Journal by Rule I. they would stand thus:

<i>William Drapier Dr. to Cloth, sold him</i>	
25 pieces, at 15 <i>l.</i>	L.375 — —
<i>William Drapier Dr. to Wool, sold him</i>	
130 stones, at 5 <i>s.</i> 6 <i>d.</i>	35 15 —

And if these were posted to the ledger, there would be two articles placed to the *Dr.* of William Drapier, one to the *Cr.* of Cloth, and one to the *Cr.* of Wool.

But the sales may be entered in the form of one complex journal post, as follows.

<i>William Drapier Dr. to Sundries,</i>	
<i>To Cloth, for 25 pieces,</i>	
at 15 <i>l.</i>	L.375 — —
<i>To Wool, for 130 stones,</i>	
at 5 <i>s.</i> 6 <i>d.</i>	35 15 —
	L.410 15 —

And then there is only one article on the *Dr.* of William Drapier in the ledger.

<i>Ex. 2.] Sold 10 pieces of cloth to W. Drapier,</i>	
at 15 <i>l.</i>	L.150 — —
12 ditto to J.	
Mercer, at do.	180 — —
	L.330 — —
22	

This example also falls under Rule I. But whereas there was one *Dr.* and two *Cr.s.* in the former example; there are two *Drs.* and one *Cr.* in this: William Drapier and John Mercer, the purchasers, are *Drs.* for their respective quantities; and cloth, which is the only thing delivered, is *Cr.* for the whole quantity. The journal post is,

<i>Sundries Drs. to Cloth,</i>	
<i>W. Drapier, for 10 pieces, at 15<i>l.</i></i>	L.150 — —
<i>J. Mercer, for 12 ditto at 15<i>l.</i></i>	180 — —
	L.330 — —
22	

<i>Ex. 3.] Bought from H. Hood,</i>	
5 puncheons rum, at 42 <i>l.</i>	L.210 — —
3 hds. claret, at 33,	99 — —
2 pipes madeira, at 56,	112 — —
	L.421 — —

This example falls under Rule II. The articles received, rum, claret, and madeira, are *Drs.*; and the person from whom they are received is the only *Cr.*

<i>Sundries Dr. to Henry Hood,</i>	
<i>Rum, for 5 puncheons, at 42<i>l.</i></i>	L.210 — —
<i>Claret, for 3 hds. at 33,</i>	99 — —
<i>Madeira, for 2 pipes, at 56,</i>	112 — —
	L.421 — —

<i>Ex. 4.] Bt. 50 qrs. wheat from J.</i>	
Tull, at 35 <i>s.</i>	L.87 10 —
12 from S. Ellis, 36 <i>s.</i> 2 <i>d.</i>	12 — —
	L.109 2 —
62	

This example also falls under Rule II. There is only one *Dr.* wheat being the only thing received; and two *Cr.s.* because it is received from different persons.

<i>Wheat Dr. to Sundries,</i>	
<i>To J. Tull, for 50 qrs. at 35<i>s.</i></i>	L.87 10 —
<i>To E. Ellis, for 12 qrs. at 36<i>s.</i></i>	21 12 —
	L.109 2 —
62	

In like manner, examples might be given of complex posts under every rule, which contained either several *Drs.* or several *Cr.s.*; but as it is unnecessary to enlarge so far, we shall only add a few examples of cases, in which the different parts of the complex article fall under different rules.

<i>Ex. 5.] Sold 150 qrs. beans to A. Arnot,</i>	
at 13 <i>s.</i> 4 <i>d.</i>	L.100 — —
75 ditto to S. Berry,	
at 13 <i>s.</i> 4 <i>d.</i>	50 — —
18 ditto for ready	
money, 13 <i>s.</i> 2 <i>d.</i>	11 17 —
	L.161 17 —
243	

Here beans are delivered, some to different purchasers on trust, and some for ready money. The purchasers are *Drs.* for the quantity sold to each, by Rule I.; Cash is *Cr.* for the quantity sold for ready money, by Rule III.; and beans are *Cr.* for the whole.

<i>Sundries Dr. to Beans,</i>	
<i>A. Arnot, for 150 qrs. at 13<i>s.</i> 4<i>d.</i></i>	L.100 — —
<i>S. Berry, for 75</i>	13 <i>s.</i> 4 <i>d.</i> 50 — —
<i>Cash, for 18</i>	13 <i>s.</i> 2 <i>d.</i> 11 17 —
	L.161 17 —

Ex.

BOOK-KEEPING.

Journal.

Ex. 6.] Bought from David Young
 8 cwt. 3 qrs. copper, at 12l.
 per cwt. L.105 —
 Paid in part, L.50 — —
 Balance 55 — —
 L.105 — —

Here the article received, copper, is the only Dr.; but as it is bought partly for ready money, and partly on credit, it is Dr. to cash for the value of the former, by Rule III. and to the seller for the value of the latter, by Rule II.

Copper Dr. to Sundries.
 For 8 cwt. 3 qrs. at 12l. per cwt. L.105 — —
 To Cash in part, L.50 — —
 To D. Young, for balance due him, 55 — —
 L.105 — —

Ex. 7.] James Wilson being bankrupt, I have accepted a composition on the debt due by him to me of 150l. and discharged the same.
 The composition received, at 15s. per L. is, L.112 10 —
 And the balance lost 37 10 —
 L.150 — —

Here the whole debt of 150l. due by James Wilson, is cancelled; and he must therefore be stated as Cr. for that sum. Cash is Dr. for the sum received, by Rule II.; and Profit and Loss, or Loss by bad debts, for the rest, by Rule VI.

Sundries Dr. to James Wilson,
 Cash, for compt, on 150l. at 15s. per L. L.112 10 —
 Profit and Loss, for balance lost 37 10 —
 L.150 — —

Ex. 8.] Shipped for William Smith, per the Bonaventure, Forbes, from Leith to London,
 1000 yds linen, at 1s. 2d. L.58 6 8
 600 lb. leather, bought from J. Currier, at 1s. 30 — —
 Paid charges at shipping — 13 4
 L.89 — —

Here William Smith is Dr. for the amount of the cargo; he is debtor to linen for the quantity delivered, as by Rule I. and to J. Currier for the leather delivered by him, by Rule VIII. and to cash for the charges paid by us, by Rule I.

William Smith Dr. to Sundries,
 To Linen, for 1000 yards at 1s. 2d. L.58 6 8
 To J. Currier, for 600 lb. leather at 1s. 30 — —
 To Cash, for charges at shipping — 13 4
 Shipped per the Bonaventure, Forbes, from Leith to London. L.89 — —

27. The learner may be assisted in understanding these and other complex posts, by resolving them into simple ones. Most of them might have been stated in

Journal.

that manner; and the complex form is only preferred for abridging the ledger. In some articles the different classes are so connected, that they cannot be separated with propriety.

The narration is sometimes equally diffused through the post, after the Dr. and Cr. as in the five first examples. Sometimes the chief circumstances are narrated before the Drs. or Crs. be specified, as in Ex. 6.; sometimes after the first, as in Ex. 7.; and sometimes at the end, as in Ex. 8.

28. In some articles, there are both more Drs. and more Crs. than one. These may be entered in one journal-post, *Sundries Dr. to Sundries*, specifying first the Drs. and then the Crs. But, as this method is somewhat confused, we would recommend it as a better way to divide the transaction into two journal-posts; so that the first may contain only one Dr. and the second only one Cr.

Ex. Bartered with James Fotheringal 100 pieces osnaburgs, at 12s. L.60 — —
 100lb. thread, at 3s. 6d. 17 10 —
 L.77 10 —

 To Thread, for 100lb. at 3s. 6d. 17 10 —
 Delivered in barter L.77 10 —

29. It is neither practicable nor necessary to enumerate all kinds of complex posts that may occur in business. We shall here only mention the entries which occur at opening the books.

The first journal post contains the substance of the inventory. The entry is *Sundries Drs. to Stock*; the particular Drs. are Cash, the different kinds of goods and other property belonging to us, and the persons indebted to us.

The

Journal.

The second journal-post contains the debts due by us. The entry is, *Stock Dr. to Sundries*; the particular Crs. are the persons to whom we are indebted.

The form of these entries is more fully exhibited at the beginning of the following sets.

30. The journal should be written by one person, in a fair hand and at leisure hours. The articles are separated, and the titles and dates marked in the same manner as in the waste-book, § 3. The entries are written in half-text for ornament and distinction. In the inventory, the designation (or the business, station, and the place of residence) of every person is mentioned; and the same is done the first time that any name occurs in journal-entry. At other times it is sufficient to enter the name without the designation, unless we have dealings with two persons of the same name; in which case, it is always necessary to annex the designation, in order to distinguish them. The narration should be complete, without referring to the waste-book; and so clear, that every person, acquainted with the style of the journal, may understand it with ease. When the post is written, we mark a dash / against the article, on the margin of the waste-book, to show how far the writing of the journal is advanced.

SECT. IV. Of POSTING and BALANCING the LEGER.

31. THE first thing to be done in the leger, is to allot a proper space for each account. The accounts may be either opened in the same order that they occur in the journal; or accounts of the same kind may be placed together, the personal accounts in one part of the leger, and the real accounts in another. The accounts of Stock and Profit and Loss are generally placed at the beginning. The room which each will require cannot be exactly known, but it must be conjectured from the number of transactions that are likely to follow.

The number of the folio is marked in strong text at each corner of the top-line; and the titles of the accounts are written in fair text through both folios, if necessary. The designations of the personal accounts may be written in half text, or Italian hand: and some write the titles in Saxon hand for ornament. The word *Dr.* is prefixed to the title on the left-hand page: and *Contra Cr.* annexed to it on the right-hand page.

32. Next, An Index must be provided for pointing out the folios where the accounts are opened. The titles of the accounts are entered alphabetically in the index, and the number of the folio annexed. Personal accounts are entered by the first letter of the surname; companies, by the first letter of the surname of the first partner; and all other accounts by the first letter of the first word. The most convenient kind of index is a long narrow book, of 24 leaves, one for each letter of the alphabet. A is marked on the top of the first leaf, and the paper pared away below it; B is marked on the second leaf under A; and the other letters on the following leaves, in the same manner; by means of which we can turn at once to any letter required.

33. In posting the leger, proceed by the following directions. First, look for the *Dr.* of the journal-post

in the index, under the proper letter, and this directs you to the folio of the leger where the account is, if it be already opened; if not, you must allot a space for it, write the title, and enter it in the index. Then enter the article on the left-hand page of the account under the title of the former article, by writing the date on the margin, and the name of the creditor on the line, with the word *To* prefixed, and a short narration of the transaction annexed, and inserting the sum in the money column, and the quantity, if it be an account of goods, in the inner column. Then turn to the account of the *Cr.* of the journal-post, and enter the article in the right-hand page, prefixing the word *By* to the name of the *Dr.*

Posting and Balancing the Leger.

34. This being done, turn to the journal, and mark on the margin the number of the folios to which the article is posted. The figures which point out the reference to the *Dr.* and *Cr.* folios should be separated by a line: for example, if the *Dr.* entry be on the third folio, and the *Cr.* entry on the fifth, the reference is marked $\frac{3}{5}$. These figures show how far the posting is advanced, and are useful in comparing the books.

The figures for dates or references should be written in a lighter hand than the figures in the columns for money or quantity.

35. There is often a reference-column ruled in the leger, for pointing out the other entry, corresponding to any article. In this column, the folio of the *Cr.* entry is marked against the *Dr.* article, and the folio of the *Dr.* entry against the *Cr.* article.

Sometimes the accounts are numbered according to their order in the leger; and the references, both in the journal and leger, point out the number of the account instead of the folio.

36. In complex posts turn to the several *Drs.* or *Crs.* in their order, and enter the articles according to the foregoing directions; placing the sums belonging to each in the money-column against their respective entries.

37. An article in the leger is generally comprehended in one line. The narration should be as full as can be contained in that bounds. If it cannot be narrated completely, the journal is referred to for further particulars, by writing *per Journal*, (or *p. J.*), either after an incomplete narration, or immediately after the *Dr.* or *Cr.* when there is no room for a proper narration. In complex posts there can seldom be any narration annexed to the single *Dr.* or the single *Cr.* The entry is generally to *To Sundries per J.* or *By Sundries per J.* If the sense of the whole article can be narrated, it should be done; but it is improper to narrate the first or any other part of the article, and omit the others.

38. When the space allotted for an account in the leger is filled up, the account must be transported to another folio. For this purpose add the columns on both sides, and write against the sum, *Transported to folio* , inserting the number of the folio where the new account is opened, in the reference column, or on the line, if no reference-column be used. Then, after titling the new account, and entering the number of the folio in the index, write on the *Dr.* *To amount brought from folio* , inserting the number of the folio

Posting
and Balancing
the Leger.

lio where the old account was; and on the Cr. *By amount, brought from folio*; and place the sums and quantities, if any, in the proper columns.

When either side of an account is full, both sides should be transported, and diagonal lines drawn, to fill up the vacant space of the side which requires it.

39. The books should be written up as frequently as can be done conveniently; so that the journal may keep pace nearly with the waste-book, and the leger with the journal. Each book should be carefully revised, and compared with the book from which it is posted. In comparing the leger, observe the following directions:

Begin with the first journal post, and turn to the folio of the leger where the Dr. is entered, which you are directed to by the marginal reference, and compare the date, entry, and sum. If you find them to correspond, it is well; if not, the leger must be altered till it correspond with the journal. Then place a dot before the reference-figure in the journal, and a mark \wedge before the sum in the leger.

Proceed in the same manner to compare the Cr. of the journal post, and all the following posts in their order. The dots in the journal show how far the comparison is advanced, and the marks in the leger show what articles are compared.

The sums of accounts transported should be left blank till the books be compared; as an error in any article will occasion an alteration in the sum.

40. Some accountants correct all errors in the leger, without erasing any thing, by the following methods: 1st, If the sum be entered too small, they make a second entry for the deficiency. 2d, If it be entered too large, they make an entry on the opposite side for the excess. 3d, If it be entered on the wrong side of the account, they enter it twice on the other; once, to counterbalance the error, and a second time for the true entry. 4th, If it be entered on a wrong account, they charge the wrong account Dr. to, or Cr. by, the right one.

41. We do not much approve of these methods, as they give the books a confused appearance; and would rather recommend the following rules; 1st, If an article be omitted, do not attempt to interline at the place where it should have been; but insert it under the last article when you discover the omission, and make a cross \times against it on the margin, and another at the place where it should have been. 2d, If you discover a mistake immediately when committed, correct it, without cancelling any thing, as in this example. *To Cash, say, To James Spiers received to account.* 3d, If you have written a line entirely wrong, or in a wrong place, write the word *Error* at the end, prefix a cross, and omit or cancel the sum. 4th, Cancel errors, by drawing a line lightly through them, so that the old writing may still be legible; by which it will be evident, that the book has not been vitiated for a fraudulent purpose. The same method should be followed in correcting errors in the journal.

42. When the comparison of the books is finished, glance over the leger, to observe if the mark of comparison be affixed to every article. If not, you must turn to the journal, and observe if the articles be right which had been marked.

43. Because the whole sum of the Dr. side of the

VOL. IV. Part I.

†

leger should be equal to the whole sum of the Cr. § 14. it is proper to try if they correspond. For this purpose, you may add the Dr. of every account, except such as are already balanced, placing the sums in an inner column, and extending them at the end of one or more folios, as you find most convenient, to the outer column; and as you go along add the Cr. in the same manner. If the sum total of both sides be equal, it gives a presumption that the books are right; if they differ, there is certainly some mistake. This is called the *Trial-balance*. The labour bestowed upon it is not lost, as the sums may be reserved for assisting us to collect the balances: the method of which will be explained afterwards.

44. If the sums of the trial balance do not correspond, the books must be examined again. For this purpose, begin with the first article on the Dr. side of the first account, and turn to the account where the corresponding entry is, which you will find by the figure in the reference-column. If the articles agree, mark them with a dot. Proceed in like manner with the other articles on the Dr. of the first account; then with the articles on the Cr. of the same; and then with the following accounts in their order, till the error or errors be discovered. In complex entries, observe if the amount of the sums on one side be equal to the sum on the other. When you come to a dotted article, you may pass it by, because it has been examined already.

If the errors be not discovered at the first revision, you must repeat the same operation again, till you bring the books to balance. Marks different from the former ones, or differently placed, may be used, to signify that an article has been examined a second or third time. As the detection of errors is the most tedious and disagreeable part of book-keeping, the accountant will be induced to guard against them with all possible care, when he has once experienced the trouble which they occasion.

45. Before we explain the method of balancing the books, it will be proper to direct the learner how to balance particular accounts. When we settle accounts with any person, and ascertain how much is owing at either hand, it is necessary to balance his account in the leger, and open a new one, beginning with the sum that was due according to the settlement; and when we clear accounts again, we must go back to that article, and no farther.

If any articles be charged on either side, at the time of settling, they must be immediately entered on the waste-book; from which they will pass in course to the journal and leger; and a remark must be entered in the waste-book, that the account was settled, and the balance transferred to the proper side of the new account. This remark is transcribed in the journal; and the leger account is balanced, when it occurs, in the course of posting.

If the balance be due to you, write on the Cr. *By balance due to him to Dr. new account*, and insert the sum due you; after which, the amount of both sides will be equal. Add the account, placing the sums opposite to each other; and, if the sides be unequal, draw a diagonal line through the vacant space of the shorter side, and close the old account by drawing lines under the sums. Then open the new account immediately

B

diately

Posting
and Balancing
the Leger.

Posting
and Balan-
cing the
Leger.

diately under the old one, or in a new folio, if the old one be full, by writing on the Dr. *To balance of former account due by him*. If the balance be due by you to him, the entries are made on the opposite sides, with the necessary alterations. When the new account is opened in the same folio, it is unnecessary to repeat the title; but the year and month, as well as the day, are repeated at the date of the first article.

46. Sometimes when an account is balanced, one or more articles are left out on purpose: For example, goods lately bought on credit, may be left out, and the settlement may only relate to articles of longer standing. When this is the case, if the articles omitted be on the Dr. of the leger, we write on the Cr. thus, *By articles sold him since 1st January replaced*: and when we have balanced the account, and opened a new one, we write on the Dr. *To articles replaced at settling, furnished since 1st January*: or, if the articles were left out for any other reason, we explain the same in the narration. If the omitted articles be on the Cr. the like entries are made on the opposite sides. It should be noticed in the waste-book and journal when this operation is necessary.

47. When we post any common article from the journal, we enter the sum on the Dr. of one account, and on the Cr. of another: when we balance an account, we place the balance sum on the Dr. of the old account, and on the Cr. of the new one, or contrarywise: and when we replace an article, as above directed, to the Dr. or Cr. of the old account, we place it after balancing to the Cr. or Dr. of the new one. Thus, in these entries, as well as in common posts, there are like sums entered on the Dr. and Cr. of the leger, and the general equality of the sides is still preserved.

48. Merchants generally balance their books once a-year. The design of this operation is, to collect the various branches of their business, diffused through the books, into a concise abstract; to ascertain their gain or loss since the last balance; and exhibit the present state of their funds. If the business be of such a kind, that most of the branches naturally come to an issue at a certain time of year, that time is the proper one for making the balance. Otherwise the end of the year, or the least busy time, may be chosen.

49. It is proper, before balancing, to settle as many personal accounts as possible; to clear all arrears and small charges; to take an exact inventory of the goods on hand, as far as can be done; and affix a moderate value to each article, according to the current prices at the time; such a value as you would be willing at present to buy for. It is more proper to value the goods on hand in conformity to the current prices, than at prime cost; for the design of affixing any value is to point out the gain or loss, and the gain is in reality obtained so soon as the prices rise, or the loss suffered so soon as they fall; therefore it is impossible to make up a just state of the affairs, unless the present prices be attended to.

50. These things being done, proceed to make the balance as follows: Prepare two sheets of paper, ruled with money-columns, in the form of Dr. and Cr.; write *Profit and Loss* as the title of the first, and *Balance* as the title of the second.

Prepare also some paper for computing the balances, and mark down the folios, titles, and sums of each

account in the leger, in a regular order. If a trial-balance was made, the sums may be transcribed from it. Pass by such accounts as are already closed; also the accounts of Stock and Profit and Loss, which are always the last of being balanced. Then subtract the lesser sum from the greater, and enter the difference on either of the sheets that the nature of the article points out, and on the side of that sheet which corresponds to the greater sum of the account. More particularly,

In personal accounts, enter the difference, which is the debt owing to you, or by you, on the proper side of the balance-sheet.

In the cash account, enter the difference, which is the money in hand, on the Dr. side of the balance-sheet.

In accounts of goods or other property, if there be nothing remaining on hand, enter the difference, which is the gain or loss, on the proper side of the profit and loss sheet.

If the whole be still on hand, enter the present value on the Dr. of the balance-sheet; and if this be different from the prime cost, charges included, enter the difference in the proper side of the profit and loss sheet.

If part be sold, and part on hand, place the value of the quantity on hand under the sum of the Cr. and add them. The sum is the whole return that will be obtained, if the rest of the goods be sold at the estimated value; and this, being compared with the sum of the Dr. which is the whole expence, shows the gain or loss. Enter the same in the proper side of the profit and loss sheet, and enter the quantity and value on hand on the Dr. of the balance-sheet.

Observe if the quantities in the inner columns be equal on both sides, when the goods are all sold; or, if the difference, when only part is sold, be equal to the quantity on hand. If they correspond, you have a just account of the goods. If the Dr. be greater, there is something amissing, which you must enter on the Dr. of the balance-sheet, and mark the cause of the deficiency, as intake, waste, or the like. If the Cr. be greater, there is an excess, which you must enter on the Cr. of the balance-sheet, together with the occasion of it, as difference of measure, or the like.

In accounts subsidiary to profit and loss, enter the difference on the proper side of the profit and loss sheet.

When there is nothing written on one side of an account, enter the sum of the article or articles on that sheet which the kind of the account points out.

51. When you have collected all the balances, sum up both sheets, and add to the profit and loss sheet the sums of the profit and loss account in the leger: then subtract the lesser sum of each sheet from the greater.

This being done, mark the sums of the stock-account on your computation paper, and add thereto the balance of the profit and loss sheet on the side which corresponds with the greater sum of that account: then subtract the lesser sum from the greater. The remainder will be equal to the difference of the sides of the balance-sheet, if the books be right, and the balances exactly collected.

52. We shall prove that this equality must always hold,

Posting
and Balan-
cing the
Leger.

Posting
and Balan-
cing the
Leger.

hold, from the nature of the articles collected. The Dr. of the balance-sheet contains every kind of property belonging to you, and every debt owing to you; and the Cr. contains every debt owing by you: therefore the difference of the sides shows what your nett estate amounts to. The profit and loss sheets, when the articles from the leger are included, contain every thing you have gained on the Cr. and every thing you have lost on the Dr.; and the difference of the sides is your nett gain or loss. The stock-account contained your effects and debts at the time the books were opened; and therefore, when the gain or loss is added to the proper side, it must show the extent of your nett estate at present. Thus the stock-account and the balance-sheet both point out how much you are worth at present; the one from your former stock, allowance being made for your gains or losses; the other from a view of your present effects and debts; and they will correspond, because both must be agreeable to the truth, if the books be correct.

53. Though the books must balance, if free from error, yet it is sometimes difficult to adjust them exactly, especially when the business is extensive, and the errors trifling. If there be still a difference, which we do not think it worth while to make further search for, we may close the books, by making Profit and Loss Dr. or Cr. for the same. This introduces an article on one side of the leger, which has none corresponding to it on the other, but is balanced by some undiscovered error.

54. The balance being struck, your next work is to close the books. Every article in the leger should be posted from the journal; therefore, the most regular way of finishing both is by inserting the following articles in the journal, and posting them in the common manner to the leger.

1st, *Profit and Loss Dr. to Sundries, for loss, on the following accounts.* The particulars are taken from the Dr. of the Profit and Loss sheet.

2d, *Sundries Dr. to Profit and Loss, for gain, on the following accounts.* The particulars are taken from the Cr. of the Profit and Loss sheet.

3d, *Balance-account Dr. to Sundries, for debts and property belonging to me.*

4th, *Sundries Dr. to balance-account, for debts due by me.* The particulars of this and the former are taken from the respective sides of the balance-sheet.

5th, *Profit and Loss Dr. to Stock for nett gain; or Stock Dr. to Profit and Loss, for nett loss.*

6th, *Balance-account Dr. to Stock for nett stock.*

55. When the four first of these articles are posted

in the leger, all the personal, real, and subsidiary accounts will balance, and you may add them as you go along. In accounts of goods, if there be any deficiency, you must enter it on the Cr. in the inner column; and, if there be any outcome, you must enter it on the Dr. before you add the account. Then the sums of every account and every column on the opposite side will be equal.

The only accounts that remain open are, *Profit and Loss, Stock and Balance.* The fifth post balances the profit and loss account, and the sixth balances the stock-account. It was noticed, § 14. that the whole sums of Dr. and Cr. of the leger are equal; and therefore, if the sides of every account, except one, be balanced, that one will balance of its own accord. The balance account alone remains open, and, upon trial, you will find that the sides are equal. This affords an additional proof, or, at least, a different view of what was demonstrated, with respect to the balance of the books, in § 52.

The lines above and under the sums, at a general balance, may be drawn with red ink; and, at the balancing of particular accounts, with black ink, for distinction.

56. Some choose to insert the particulars of the profit and loss and balance sheets in the respective accounts of the leger. If this be done, it is unnecessary to enumerate them also in the journal.—Some choose to balance the accounts of goods, whenever the quantity is sold off; and we approve of this method, as it lessens the work at the general balance, which is always sufficiently laborious.

57. Thus is the state of a person's affairs brought together, in a short compass, under his view; and the articles of the balance-sheet supply materials for a new inventory. It is convenient, however, to alter the order, and arrange the real accounts together, and the personal ones together.

58. It is not necessary to begin new books, nor open the accounts anew, unless the old folios be full. The accounts may be continued in the former folios; but it is best to begin a new leger, if the old one be not likely to hold all the business of the next year. When one comes to have several sets of books, it is common to distinguish them by the letters of the alphabet. The first waste-book, journal, and leger, are marked A, the second B; and so on.

In the following specimen, the waste-book and journal are placed on opposite pages, that the learner may easily compare them; and the rules are referred to by their numbers.

Subsidiary
Books.

The present article, it is hoped, will appear sufficiently extended for a work of this nature. It contains the general principles of Italian book-keeping; and is sufficient to unfold the nature and design of that art to the speculative inquirer, to direct the accountant in common and easy cases, and prepare him for understanding those that are more complicated. In fact, if he has a clear apprehension of the sense of the transactions, the tendency of the journal entries, and the import of the balances in the ledger, he will seldom be at a loss how to proceed.

Subsidiary Books used by Merchants.

Though all merchants accounts may be kept by the *Waste-book*, *Journal*, and *Leger*, alone; yet men of great business find it convenient, either for abridging these, or for other ends, to use some others, generally called *Subsidiary* or *Subservient Books*; the most common of which are the nine following, viz.

1. *Cash-Book*. This book is kept in a folio form, like the *leger*, and serves to abridge the cash-account there. On the left-hand page, or Dr. side, *Cash* is charged Dr. for all the sums received; and on the right-hand page *Cash* is made creditor for all the sums paid. Once a week, or, which is more ordinary, once a month, this book is posted to the *leger*; or, if you please, first to the journal, by two entries, viz. *Cash* Dr. to *Sundries*, for all the receipts, and *Sundries*, Drs. to *Cash*, for all the payments. By this means the cash account in the *leger* will be so far contracted as to consist of 12 lines, viz. one for each month in the year.

2. *Book of Charges of Merchandise*. This book is only paged, and designed to abbreviate the cash-book. It contains particular charges on goods and voyages; such as carriage, custom, freight, cranage, wharfage, &c.: as also other expences that affect trade in general; such as, warehouse-rent, shop-rent, accountant's wages, postage of letters, and the like. At the end of each month the money-columns of this book are added up, and the sum carried to the credit-side of the cash-book.

3. *Book of House-expence*. This book is also paged, and designed likewise to ease the cash-book. It contains all disbursements for family provisions, servants wages, house-rent, apparel, utensils, &c. The money-columns of this book are also added up at the end of each month, and the sum transferred to the credit side of the cash-book.

4. *Invoice-book*. This book, which is used chiefly by factors, is paged, and contains doubles or copies of the invoices of goods sent to sea, or of goods received from abroad.

5. *Sales-book*. This book too is chiefly used by factors; and into it are posted, from the waste-book, the particular sales of every consigned cargo; by which means the several articles of a sale, that lie scattered in the waste-book, are brought together, and represented under one view, and that in a manner more full and minute than they are collected in the *leger* account. This book exhibits the sales of every consignment separately and by themselves: to which are subjoined the respective charges, such as freight, custom, the factor's commission, as also abatements allowed to buyers, &c. whose sum subtracted from the gross amount of sales gives the neat proceeds. From this book, when a car-

go is sold off, an account of sales is drawn out, in order to be transmitted to the employer.

6. *Bill-book*. The design of this *Bill-book*, or *Month-book*, is to furnish a merchant with a ready way of knowing the time when bills or other debts become payable to or by him. It consists of 12 folios, one for each month in the year. The left-hand page contains the debts that fall due to the merchant in the month on the top, and the right-hand page contains the debts payable by him to others in the same month.

7. *Receipt-book*. In this book a merchant takes receipts of the payments he makes. The receipt should contain the date; the sum received, expressed in words at large, and also in figures in the money-columns; the reason why; and whether in full or in part; and must be signed by the person receiving. But there is no occasion to mention the merchant's name; for the book being his own, sufficiently implies that.

8. *Letter-book*. It is very imprudent in any person to send away a letter of business, without keeping a double of it to himself; and therefore to prevent the bad consequence of such a careless practice, merchants are provided with a large book in folio, into which is copied *verbatim* every letter of business before it be sent off. So that this book, together with the letters received (which must also be carefully kept in files or boxes), makes a complete history of all the dealings that pass betwixt a merchant and his correspondents; which may be very useful and necessary on many occasions.

9. *Pocket-book*. This is a small book, of a portable size, which a merchant carries in his pocket when business calls him abroad to a tavern, a fair, the country, or other places. In this he sets down the bargains he makes, the expences he is at, the debts he pays, or sums he receives, with every other part of business he transacts while abroad; as also any occurrence or piece of news he thinks worth while to record. And when he comes home to his counting house or shop, he transfers the things contained in this book, each to their proper places in the waste-book, or book subsidiary.

Factors of great business sometimes keep another small book called the *Memorandum-book*. Into this book is copied, from letters as they come to hand, short notes of the several commissions for buying goods contained in them; and as the commissions are effected, the notes are crossed, or have some mark affixed to them. This is more convenient in doing business, than to be continually running to the letters themselves.

The above are the subsidiary books most in use: but a merchant is not tied down or restricted to them; he may keep some, and neglect others, or invent more as the nature of his business requires, and he finds convenient.

New Method of BOOK-KEEPING by Mr Jones.

A new method of keeping books, entitled the *English System of Book-keeping*, has been proposed by Mr Edward Thomas Jones of Bristol, for which a patent was granted in January 1796.

Three books are required in the *English System of book-keeping*, viz. a *Day-book* or *Journal*, an *Alphabet*, and a *leger*. The day-book must have three columns on each page; one of which to receive the amount of debits

Subsidiary
Books.

A new Method.

debits and credits; one column to receive the debits only; and one column to receive the credits only; or it may be ruled with only two columns on each page, one of which to receive the amount of the debits, and the other to receive the amount of the credits. On each page of the day-book, there must also be four other columns ruled, two on the left side next the amount of the debits, and two on the right side next the amount of the credits. These columns are intended for receiving the letter or mark of posting, and the page of the ledger to which each amount is to be posted. It is not necessary that the alphabet be ruled, but it must contain the name of every account in the ledger, the letter annexed to it as a mark of posting, and the page of the ledger. The ledger is to be ruled with three, four, five, or seven columns on each page, as may be most agreeable, for receiving the amounts of the transactions which are entered in the day-book. The plan of making up books of accounts, according to this system, is the following:

When a person begins trade, either as an individual or in company, he must open an account with himself in the ledger. He must first enter in the day-book, and then to the credit of his account in the ledger, the amount of the property which he has advanced into the trade. His name only may be placed at the head of the account, or it may be called *stock-account*.

When goods are purchased, give the person credit of whom they are bought; when goods are sold, debit the person to whom they are sold. When you pay money, debit the person to whom it is paid, not only for the amount you pay, but also for any discount or abatement that may be allowed, and give the cashier credit for the neat amount paid. When money is received, credit the person of whom it is received, not only for what he pays, but also for any discount you have allowed, and debit the cashier for the neat sum received. In these entries a plain narrative of the fact should only be introduced. Technical phrases, excepting the terms debit and credit, should be avoided. These are the only terms applicable to every transaction, and may be affixed to every entry.

In the hurry of business, entries may be made to the debit instead of the credit of an account in the day-book, and *vice versa*. To obviate this evil, Mr Jones proposes to have only one column for receiving the amount of every transaction, whether debit or credit, at the time of making the entry; and that the debits may be conveniently separated from the credits, previous to posting, which is necessary to prevent confusion, he has two other columns in the same page; the column on the left side receives the amount of every debit, and the column on the right side receives the amount of every credit. These columns must be cast up once a month. The column of debits and credits of itself forms one amount; the column of debits forms a second amount; and the column of credits a third amount. The second and third amounts, when added together, it is plain, must agree with the first amount, which includes both the debits and credits, otherwise there must be some error, either in making the entry or in the addition.

In this manner the accountant may obtain an accurate statement of the transactions recorded in his books for every month, which will shew how much

he owes for that month, and how much is owing to him; and by subtracting the amount of the credit from the whole amount of the debits for any given time, with the value of the stock of goods on hand, the profits of the trade for that period will at once appear.

The next part of the operation in this system is that of posting. An account is opened in the ledger with every person to whose debit or credit an entry has been made in the day-book; and to each account a letter is affixed, which is to be used as a mark of posting. The name of the person, his place of abode, and the folio of the ledger, must then be entered in the alphabet, with the same letter prefixed to each name, as is affixed to the account in the ledger. The next step of the process is to affix to each amount in the day-book in the column for that purpose, the page of the ledger on which each account is opened. This will be seen in the alphabet. The date and amount of each debit are then to be posted in the proper columns in the ledger, on the left or debit side of that account to which it relates; taking care to enter as a mark of posting in the day-book, against each amount, the same letter that is affixed to the account in the ledger to which said amount may be posted. The debits of January, February, March, &c. it is to be observed, must be posted into the column for those months in the ledger, and the credits must also be posted in like manner, each account being filled up in the centre, at the expiration of every month, with the whole amount of the month's transactions. Thus may the whole statement of each person's account for the year be included in a small space. The columns to the right and left contain the separate amount of each transaction. The column in the centre exhibits a monthly statement.

Having shewn in what manner the entries are to be made and carried through the different books, according to this system; the next thing is to describe the method of examining them, so as to ascertain with certainty their accuracy; and not only to discover if each transaction has been correctly posted, with regard to its amount, but also that it has been rightly entered to the debit or credit of its proper account. The mode of examination proposed by this system is different from those which have been hitherto practised, both in expedition and accuracy. All that is necessary is to add together the different sums in the debit and credit columns, through the ledger: and the amount of these columns, if right, must agree with the columns in the day-book for the same period. This examination should take place once every month; and if the amounts do not agree, the posting must be called over, and when the time allotted to each column of the ledger, whether it be for one or more months, has expired, the amount of each column should be put at the bottom of the first page, and carried forward to the bottom of the next, and so on to the end of the accounts. The amount in the day-book for each month's transactions, must be brought into one gross amount for the same time.

But this process, although it proves that the ledger contains the whole contents of the day-book, is not to be considered as complete without some mode of ascertaining if each entry be posted to the right account. To discover this the following method is adopted. It is to be admitted as a rule, that a letter, which may be used

A new Method. used alphabetically in any form or shape, is to be affixed to each account in the ledger, and the same letter prefixed to the names in the alphabet. These letters are to be used as marks in posting, and affixed to each account in the day-book as it is posted. It is therefore only necessary to compare and see that the letter affixed to each entry in the day-book is the same as that which is prefixed to the same name in the alphabet. If there be no difference, it must be right, otherwise there must be some error.

When the accounts are to be balanced at the end of the year, or at any other time, if the profits of the trade are to be stated in the books, the value of the stock of goods on hand at prime cost, either in one sum, or by specifying the amount of every article, may be entered in the day-book, and an account opened for it in the ledger, to the debit of which it is to be

posted. The casting up of the ledger is then to be completed; and when it is found to agree with the day-book, and the amount placed at the bottom of each column, subtract the credits from the debits, and the difference will show the profit of the trade; but if the credits be the greater amount, then a loss has followed. To avoid error in taking off the balances of the ledger, one rule must be observed. First, find out the difference between the whole amounts of the credits and debits on each page for the year, with which the differences of the outstanding balances of the several accounts on each page must exactly agree, otherwise the balances have not been taken right. Proceeding in his way every page will be proved, and the balances of any number of ledgers, according to this plan, cannot be taken off wrong without being observed.

B O O

Bookseller. BOOKSELLER, one who trades in books, whether he prints them himself, or gives them to be printed by others.

Booksellers, among us, are the same with the *bibliopola* of the ancients, whose office was distinct from that of *librarii*. Petty dealers, or venders of small ware, were distinguished by the diminutive appellation *libelliones*. At Rome, the *Argiletum* was the mart of books, as Paul's Church-yard, or Fleet-street, and Paternoster-row, have been in London: whence that of Martial.

*Argiletanas mavis habitare tabernas,
Cum tibi, parve liber, scrinia nostra vacent.*

Booksellers in many places are ranked among the members of universities, and entitled to the privileges of students: as at Tübingen, Saltsburg, and Paris, where they have always been distinguished from the vulgar and mechanical traders, and exempted from divers taxes and impositions laid on other companies.

Formerly, the offices of booksellers and printers were united in the same persons. Labbe gives a list of learned booksellers; most of whom were also authors. Of late, booksellers have drawn their business into less compass, and leaving the labour of composing books to one set of persons, and that of printing them to another, content themselves with the gainful part; thus ministering to the republic of letters not with the head or the hand, but the purse only. In this view, they have been very important and useful agents between authors and the public; and have contributed, in no small degree, to the encouragement of genius and literary industry, and the spread of science. There are few authors, who have undertaken the printing and publishing of any work likely to be transmitted to posterity, without being connected with some bookseller, or booksellers, eminent in their profession.

The fairs of Francfort and Leipsic are famous for the resort of booksellers, not only from all parts of the empire, but Holland, Flanders, &c. They have each their shop or warehouse, over which is inscribed the

B O O

name of some celebrated bookseller of former times; Bookseller, *Officina Elzeviriana, Frobeniana, Morelliana, Jansoni- Boom.* ana, &c.

An acquaintance with the booksellers marks or signs frequently expressed on the title page of their books, is of some use; because many books, especially in the last century, have no other designation either of printer, bookseller, or even city. The anchor is the mark of Raphelengius at Leyden; and the same with a dolphin twisted round it, of the Manutii at Venice and Rome; the Arion denotes a book printed by Oporinus at Basil; the caduceus, or Pegasus, by the Wecheliuses at Paris and Francfort; the cranes, by Cramoisy; the compass, by Plantin at Antwerp; the fountain, by Vascosan at Paris; the sphere in a balance, by Janson or Blaew, at Amsterdam; the lily, by the Juntas at Venice, Florence, Lyons, and Rome; the mulberry-tree, by Morel at Paris; the olive-tree, by the Stephenses at Paris and Geneva, and the Elzeviers at Amsterdam and Leyden; the bird between two serpents, by the Frobeniuses at Basil; the Truth, by the Commelins at Heidelberg and Paris; the Saturn, by Colinaeus; the printing-press, by Badius Ascencius, &c.

The traffic of books was anciently very inconsiderable, insomuch that the book-merchants of England, France, Spain, and other countries, were distinguished by the appellation of *stationers*, as having no shops, but only stalls and stands in the streets. During this state, the civil magistrates took little notice of the booksellers, leaving the government of them to the universities, to whom they were supposed more immediate retainers; who accordingly gave them laws and regulations, fixed prices on their books, examined their correctness, and punished them at discretion. But when, by the invention of printing, books and booksellers began to multiply, it became a matter of more consequence; and the sovereigns took the direction of them into their own hands, giving them new statutes, appointing officers to fix prices, and granting licenses, privileges, &c.

BOOM, in the sea-language, a long piece of timber with

Boom
|
Boot

with which the clew of the studding-sail is spread out; and sometimes the boom is used to spread or boom out the clew of the main-sail.

BOOM, denotes also a cable stretched athwart the mouth of a river or harbour; with yards, top-masts, battling or spars of wood lashed to it, to prevent an enemy's coming in.

BOOMING, among sailors, denotes the application of a boom to the sails. A ship is said to come booming forwards, when she comes with all the sail she can make.

BOONEN, ARNOLD, portrait painter, was born at Dort in 1669, and at first was a disciple of Arnold Verbeis, a painter of history and portrait. Afterwards he placed himself with Godfrey Schalcken, and continued with that artist for six years. The sweetness of his colouring, and the neatness of his touch, with a striking likeness in his portraits, procured him a number of admirers. He painted in the manner of his master, particularly subjects by candle-light, which were very delicate, and very natural; and much more of his work was requested by the lovers of the art than it was possible for him to undertake. He had the honour to paint the portraits of the czar of Muscovy; of Frederick I. king of Prussia; of the victorious duke of Marlborough, as well as many of the princes of Germany; and most of the noblemen who attended the czar. His style of colouring was extremely good, and he had an elegant manner of disposing the attitudes of his figures: his handling was neat, and the whole had so much harmony that he was justly ranked among the ablest artists of his time. The small pictures of Boonen are in the taste of his master Schalcken; but his excessive application, to answer the multitude of his engagements, impaired his health, and destroyed while it enriched him. He died in 1729.

BOOPHTHALMUS, a kind of agate with large circles in it, bearing some resemblance to an ox's eye, from whence it has got this name.

BOOPS, in *Zoology*, the trivial name of a species of balæna. See *BALÆNA, CETOLOGY Index*.

BOOSHATTER, formerly the city of Utica, famous for the retreat and death of Cato, lies about seven miles inland from *PORTO FARINA* in the bay of *TUNIS*. Nothing remains of its ancient grandeur except part of a large aqueduct, some cisterns, and other magnificent ruins, which cover a large extent of ground, and show it to have been a very considerable place. The sea, it is known, came up anciently to this city, though now seven miles distant.

BOOT, a leathern cover or defence for the leg, used on horseback, both to keep the body more firm, and defend the part from the injuries of the weather. Boots seem to have taken their name from the resemblance they bear to a sort of jacks or leathern bottles formerly in use, and called *botta*, in the old French *bouts*. Borel derives the name from the old French word *bot*, a stump, by reason the boot gives the leg this appearance. The Chinese have a kind of boots made of silk or fine stuff, lined with cotton, a full inch thick, which they always wear at home. This people are always booted; and when a visit is made them, if they happen to be without their boots, their guest must wait till they put them on. They never stir out of doors without their

Boot
|
Booth.

boots on; and their scrupulousness in this respect is the more remarkable, as they are always carried in their chairs.

The boot was much used by the ancients, by the foot as well as by the horsemen. It was called by the ancient Romans *ocrea*; in middle-age writers, *grova*, *gamberia*, *bainberga*, *bembarga* or *benbarga*. The boot is said to have been the invention of the Carians. It was at first made of leather, afterwards of brass or iron, and was proof both against cuts and thrusts. It was from this that Homer called the Greeks *brassen-booted*. The boot only covered half the leg; some say the right leg, which was more advanced than the left, it being advanced forwards in an attack with the sword; but in reality it appears to have been used on either leg, and sometimes on both. Those who fought with darts or other missile weapons, advanced the left leg foremost, so that this only was booted.

Fishing-Boots, are a thick strong sort used in dragging ponds and the like. *Hunting-boots*, a thinner kind used by sportsmen. *Jack-boots*, a kind of very strong boots used by the troopers.

BOOT, is likewise a kind of torture for criminals; to extort a confession, by means of a boot, stocking, or buskin of parchment; which being put on the leg moist, and brought near the fire, in shrinking squeezes the leg violently, and occasions intolerable pain.

There is also another kind of boot; consisting of four thick strong boards bound round with cords: two of these are put between the criminal's legs, and the two others placed one on the outside of one leg and the other on the other; then squeezing the legs against the boards by the cords, the criminal's bones are severely pinched, or even broken, &c.

The boot is now disused in England and Scotland; but it subsists still in some other countries.

Boot-Tree, or *Boot-last*, an instrument used by shoemakers to widen the leg of a boot. It is a wooden cylinder slit into two parts, between which, when it is put into the boot, they drive by main force a wedge or quoin.

BOOTES, a constellation of the northern hemisphere, consisting of 23 stars according to Ptolemy's catalogue, of 18 in Tycho's, of 34 in Bayer's, of 52 in Hevelius's, and of 54 in Mr Flamstead's catalogue.

BOOTH, BARTON, a famous English actor, born in Lancashire in 1681, and educated in Westminster school under the celebrated Dr Bushby, where his success in the Latin plays customarily performed by the scholars gave him an inclination for the stage. He was intended for the church; but running away from school to Dublin, he there commenced actor. His first appearance was in the part of Oroonoko, in which he came off with every testimonial of approbation from the audience. From this time he continued daily improving; and after two successful campaigns in that kingdom, conceived thoughts of returning to his native country, and making a trial of his abilities on the English stage. To this end, he first, by letter, reconciled himself to his friends; and then, as a farther step towards insuring his success, obtained a recommendation from Lord Fitzharding (one of the lords of the bed-chamber to Prince George of Denmark) to Mr Betterton, who with great candour and good nature took him under his care, and gave him all the assistance in his,

Booth.

his power. The first part Mr Booth appeared in at London was that of Maximus in Lord Rochester's Valentinian, his reception in which exceeded even his most sanguine expectations; and very soon after his performance of Artaban, in Rowe's Ambitious Stepmother, which was a new tragedy, established his reputation as second at least to his great instructor. Pyrrhus, in the Distressed Mother, was another part in which he shone without a rival. But he was indebted to a happy coincidence of merit and chance, for that height of fame which he at length attained in the character of Cato, as drawn by Mr Addison, in 1712. For this play being considered as a party one, the Whigs, in favour of those principles it was apparently written, thought it their duty strongly to support it, while at the same time the Tories, who had too much sense to appear to consider it as a reflection on their administration, were still more vehement in their approbation of it, which they carried to such a height, as even to make a collection of 50 guineas in the boxes during the performance, and present them to Mr Booth, with this compliment, "That it was a slight acknowledgment for his honest opposition to a perpetual dictator, and his dying so bravely in the cause of liberty." Besides this, he had a present of an equal sum from the managers, in consideration of the great success of the play, which they attributed in a good measure to his extraordinary merit in the performance; and certain it is, that no one since that time has ever equalled, or even nearly approached, his excellence in that character.— But these were not the only advantages which were to accrue to Mr Booth from his success in this part; for Lord Bolingbroke, then one of the principal secretaries of state, in a little time after, procured a special license from Queen Anne, recalling all the former ones, and nominating Mr Booth as joint manager with Wilkes, Cibber, and Dogget; none of whom were pleased at it; but the last especially took such disgust as to withdraw himself from any further share in the management. In 1704, Mr Booth had married a daughter of Sir William Barkham, Bart. who died in 1710, without issue. Being now established in the management, he once more turned his thoughts towards matrimony; and in the year 1719 united himself to the celebrated Miss Hester Santlow, a woman of a most amiable disposition, whose great merit as an actress, added to the utmost discretion and prudential economy, had enabled her to save up a considerable fortune. During the 20 years in which Mr Booth continued a manager, the theatre was in the greatest credit; and his illness and death, which happened on the 10th of May 1733, contributed not a little to its decline.

Mr Booth wrote a dramatic entertainment called *Dido and Eneas*; but his masterpiece was a Latin inscription to the memory of Mr William Smith, a celebrated actor, who died while he was young. As an actor, his excellency lay wholly in tragedy, not being able to endure such parts as had not strong passion to inspire him. And even in this walk, dignity, rather than complacency, rage rather than tenderness, seemed to be his taste. For a particular idea of his abilities, we must refer to the description Mr Cibber has given of him in his Apology; and the admirable character drawn of him by that excellent judge of dramatic per-

fection, Aaron Hill, Esq. in a political paper published by him called the *Prompter*, which may be seen at length in Theoph. Cibber's Lives of the Poets, and Chetwood's History of the Stage. His character as a man was adorned with many amiable qualities, among which, a goodness of heart, the basis of every virtue, was remarkably conspicuous; and so particularly was he distinguished and caressed, and his company sought by the great, that, as Chetwood relates of him, not one nobleman in the kingdom had so many sets of horses at command as he had.

BOOTY, whatever is taken from an enemy in time of war. Among the Greeks, the booty was divided in common among the army, the general only claiming a larger share. By the military discipline of the Romans, spoils taken from the enemy belonged to the republic, particular persons having no right to them. The generals who piqued themselves on their probity carried it wholly to the public treasury. Sometimes indeed they divided it among the soldiery, to animate them, and serve in lieu of a reward. But this distribution depended on the generals, who were to conduct themselves herein with great equity and moderation; otherwise it became a crime of peculate to lay hands on the pillage, as regularly belonging only to the state. The consuls Romulus and Vaturius were condemned for having sold the booty taken from the Equi. Among the Jews, the booty was divided equally between the army and the people, though under the kings a different kind of distribution obtained. Among the Mahometans, two thirds of the spoils are allowed to the army: the other third to God, to Mahomet and his relations, and to the orphans, the poor, and the pilgrims.— Among us, formerly, the booty was divided among the soldiery. If the general be in the field, every body takes what he can lay hold on: if the general be absent, the booty is distributed among the soldiery, two parts being allowed to the cavalry and one to the infantry. A captain is allowed ten shares, a lieutenant six, and a cornet four.

BOPPART, a town of Germany, in the duchy of the Rhine, and subject to Prussia; it is seated at the foot of a mountain near the Rhine, in E. Long. 7. 35. N. Lat. 50. 19.

BOPSINGEN, a town of Suabia in Germany, seated on the river Egar, in E. Long. 9. 55. N. Lat. 48. 51.

BOQUINIANS, in church history, a sect of heretics, so called from Boquinus their founder, who taught that Christ did not die for all mankind, but only for the faithful, and consequently was only a particular Saviour.

BORAGO, BORAGE. See BOTANY *Index*.

BORACK, among Mahometans, a fabulous animal, supposed to be of the middle kind between an ass and a mule, whereon their prophet was carried in his nocturnal flight from Jerusalem into the heavens. This animal the Arabians call *Al Borak*, q. d. *skining*. The night when the journey was performed is called *Lailat al Meeraga*, i. e. *the night of ascension*; and the flight itself *Al Mesra*; concerning which there is a multitude of traditions.

BORAX, in *Chemistry*, a salt in appearance somewhat similar to crystals of alum, brought originally from

Booth
|
Boran.

Borax
Bord-Lode.

from the East Indies in an impure state, and afterwards freed from its impurities by certain processes in the European countries. It was long a matter of uncertainty whether this salt be a natural or factitious substance in those countries from whence it is brought; but it is now beyond a doubt, that it is naturally produced in the mountains of Thibet, from whence other parts of the eastern continent are supplied.

According to an account in the Philosophical Transactions, vol. lxxvii. by Mr Blane, it is produced in the kingdom of Jumlate, about 30 days journey north from Betowle, a small principality about 200 miles north-east of Lucknow. The place where it is found is said to be a small valley surrounded with snowy mountains, in which is a lake about six miles in circumference; the water of which is constantly so hot that the hand cannot bear it for any time. Around this lake the ground is perfectly barren, not producing even a blade of grass; and the earth is so full of a saline matter, that after falls of rain or snow it concretes in white flakes on the surface like the natron of Hindostan. On the banks of this lake, in the winter season, when the falls of snow begin, the earth is formed into small reservoirs six inches high: when these are filled with snow, the hot water from the lake is thrown upon it; which, together with the water from the melted snow, remains in the reservoir, to be partly absorbed by the earth and partly evaporated by the sun; after which there remains at the bottom a cake of sometimes half an inch thick of crude borax, which is taken up and reserved for use. It can only be made in the winter season, because the falls of snow are indispensably requisite, and also because the saline appearances upon the earth are strongest at that time. When once it has been made on any spot, it cannot be made again on the same spot till the snow has fallen and dissolved three or four times, when the saline efflorescence appears as before. See CHEMISTRY and MINERALOGY Index.

BORBETOMAGUS, in *Ancient Geography*, a city of the Vangiones on the Rhine; now *Worms*, in Germany.

BORBONIA. See BOTANY Index.

BORBORITES, in church history, a sect of Gnostics, in the second century, who, besides embracing the errors of these heretics, denied the last judgment. Their name comes from the Greek *Borbore*, "filth;" on account of a custom they had of daubing their faces and bodies with dirt and filth.

BORCH, a town of the duchy of Magdeburg in Lower Saxony, seated on the river Elbe, in E. Long. 12. 14. N. Lat. 52. 25.

BORCHLOEN, a town of the Prussian states in Germany, situated in E. Long. 5. 28. N. Lat. 50. 50.

BORCOVIUM, in *Ancient Geography*, a town of the Ottadini in Britain; now *Berwick on Tweed*.

BORD-HALFPENNY, a small toll by custom paid to the lord of the town for setting up boards, tables, booths, &c. in fairs and markets.

Bord-Lands, the demesnes which lords keep in their hands for the maintenance of their board or table.

Bord-Lode, a service required of tenants to carry timber out of the woods of the lord to his house. It is also used to signify the quantity of provision which the bordmen paid for their bord-lands.

Bord-Service
Borde.

Bord-Service, the tenure of bord-lands, by which some lands are held of the bishop of London, and the tenants pay sixpence per acre, in lieu of sending provision anciently for their lord's table.

BORDA, JOHN CHARLES, an eminent French mathematician. See SUPPLEMENT.

BORDAT, in commerce, a small narrow stuff, which is manufactured in some parts of Egypt, particularly at Cairo, at Alexandria, and Damietta.

BORDE, ANDREW, a physician, was born at Pevensy in Sussex, early in the 16th century, and supposed to have been educated at Westminster school. In his *Introduction to Knowledge*, he says, that he was a student of Oxford; but of what college he does not mention. He left the university without a degree, and entered himself a brother of a Carthusian convent in or near London; but not liking the severe discipline of that order, he returned to Oxford, and applied himself to the study of physic. Some time after, he embarked for the continent; and, as himself expresses it, "travelled through and round about Christendom, and out of Christendom into some parts of Africa." In the years 1541 and 1542, he resided at Montpellier in France, where he was made doctor of physic, and after his return to England was incorporated into the same degree at Oxford. From the preface to his *introduction* above mentioned, it appears that he had been in Scotland, which probably was soon after his return from France. Having now satisfied his inclination for travelling, he settled first at Pevensy where he was born, afterwards at Winchester, and finally in London, where he is said to have become a fellow of the college of physicians, and first physician to King Henry VIII. But notwithstanding his eminence in his profession, he had the misfortune to spend the latter part of his life in the Fleet prison, where he died in the year 1549. As to his character, Wood says that "he was esteemed a noted poet, a witty and ingenious person, and an excellent physician." Pits calls him a man of sufficient learning, but too volatile and inconstant. Bale and some others, on the contrary, abuse him grossly. His writings are, 1. A book of the introduction of knowledge, the which doth teach man to speak part of all manner of languages, &c. Lond. 1542, 4to; dedicated, from Montpellier, to the Lady Mary daughter to Henry VIII. It is written partly in verse, and partly in prose, containing 39 chapters, before each of which is a wooden print of a man. 2. The breviary of health, wherein are remedies for all manner of sicknesses and diseases, &c. Lond. 1547, &c. 4to. 3. Dietary of health, Lond. 1576, 8vo. 4. The merry tales of the madmen of Gotham. Printed, says Wood, in the time of Henry VIII. in whose reign, and after, it was accounted a book full of wit and mirth by scholars and gentlemen. Afterwards being often printed, it is now only sold on the stalls of ballad-singers. 5. A right pleasant and merry history of the mylner of Abington, with his wife and his fair daughter, and of two poor scholars of Cambridge. Lond. printed by Richard Jones, 4to. 6. A book of every region, country, and province; which shows the miles and leagues distant from city to city, and from town to town, with the noted things in the said cities and towns. Wood says that the author lent the manuscript of this book.

Borda
||
Borel.

book to his friend Thomas Cromwell, who lost it, to the great grief of the author, who would otherwise have published it. In this instance, however, the antiquary was misinformed; for it has since been published by Hearne at the end of *Benedictus abbas Peterb. de vita Henrici II.* Oxf. 1735, 8vo. 7. The principles of astronomy, the which diligently persecuted is in a manner a prognostication to the world. Lond. printed by Robert Copland, 12mo. The author says that he wrote this little book in four days, with one old pen without mending.

BORDER, in *Gardening*, is made to enclose parterres, that they may not be injured by walking in them. Borders are made either circular, straight, or in cants; and are turned into knots, scrolls, volutes, and other compartments. They are rendered very ornamental by the flowers, shrubs, yews, &c. that are raised in them. They are always laid with a sharp rising in the middle; because, if they are flat, they are noways agreeable to the eye: and as for their breadth, the largest are allowed five or six feet, and the smallest commonly four.

BORDUNI, or **BORDONE**, *Paris*, an excellent Italian painter, was born at Venice about the year 1512; and, being of a noble family, had a polite education. He was the disciple of Titian; but has been admired more for the delicacy of his pencil than for the truth of his outlines. He was at the court of France in the reign of Francis I. who had a great esteem for him, and for whom he drew not only abundance of history-pieces, but the portraits of several court-ladies, in so fine a manner, that original nature was hardly more charming. He at length returned to Venice, laden with riches and honour; and having gained great reputation in all parts of Italy, died in 1587, aged 75.

BORDURE, in *Heraldry*. See there, N^o 10.

BORE, among engineers, denotes the diameter of the barrel of a gun or cannon, or rather its whole cavity.

BOREAS, a Greek name, now in common use for the north wind. Pezron observes, that anciently Boreas signified the *north-east wind* blowing at the time of the summer solstice. The Greeks erected an altar to Boreas. He is represented on the temple at Athens with his robe before his mouth, as if he felt the cold of the climate over which he presides, agreeably to the description of Ovid, who calls him *gelidus tyrannus*, "the shivering tyrant," Met. vi. ver. 711. But he is usually described by the Roman poets as violent and impetuous; *ibid.* ver. 686—ver. 707. In painting, he is generally represented like an old man with a horrible look, his hair and beard covered with snow or hoar frost, with the feet and tail of a dragon. M. Spierlingius has a treatise in praise of Boreas, wherein he shows the honours paid to him by antiquity. Boreas, according to this author, purifies the air, renders it calm and salubrious, preserves buildings from decay, drives away the plague and other noxious diseases, and expels locusts and other vermin hurtful to the grounds.

BOREL, **PETER**, a learned physician, was the son of James Borel who published several poems, and was born at Castres in 1620. He applied himself to the

study of physic, of which he was created doctor, and practised with great success in the city of Castres. Towards the end of the year 1653, he went to Paris, and was soon after made physician in ordinary to the king. In 1674, he was received into the academy of sciences, and distinguished himself by writing a great number of works. The most esteemed are, 1. *Historiarum et observationum medico-physicarum centuriæ quinque.* 2. *Bibliotheca chymica, duodecimo.* 3. *De vero telescopii inventore, cum brevi omnium conspiscillorum historia.* He died in 1678.

BORELLI, **JOHN ALPHONSO**, a famous philosopher and mathematician, born at Naples on the 28th of January 1608. He was professor of philosophy and mathematics in some of the most celebrated universities of Italy, particularly at Florence and Pisa, where he became highly in favour with the princes of the house of Medicis; but having been engaged in the revolt of Messina, he was obliged to retire to Rome, where he spent the remainder of his life under the protection of Christina queen of Sweden, who honoured him with her friendship, and by her liberality towards him softened the rigour of his hard fortune. He continued two years in the convent of the regular clergy of St Pantaleon, called the *pious schools*, where he instructed the youth in mathematical studies. He died there of a pleurisy, the 31st of December 1679, in the 72d year of his age. He wrote in Latin, 1. *Euclid restored.* 2. *The theory of the influence of the planets in medicine, deduced from physical causes.* 3. *Of percussive force.* 4. *Of natural motions depending upon gravity.* 5. *An historical and meteorological account of the burning of Mount Ætna, in the year 1669.* 6. *Of the motion of animals; and several other works, some of which are in Italian.*

BORGIA, **CÆSAR**, natural son of Pope Alexander VI. was a brave general, but a most abandoned villain. See (*History of*) ITALY.—It is incredible what numbers he caused to be taken off by poison, or by the sword; and it is notorious that swarms of assassins were constantly kept in pay by him at Rome, for the sake of removing all who were either obnoxious or inconvenient to him. He experienced various turns of fortune; and was sometimes very prosperous, sometimes the reverse. He very narrowly escaped dying by poison in 1503; for having concerted with the pope a design of poisoning nine newly created cardinals at once, for the sake of possessing their effects, the poisoned wine, destined for the purpose, was by mistake brought to and drank by themselves. The pope died of it; but Cæsar, by the vigour of his youth, and the force of antidotes, after many struggles, recovered. He only recovered to outlive his fortune and grandeur, to see himself depressed, and his enemies exalted; for he was soon after divested of all his acquisitions, and sent a prisoner to Spain, in order to free Italy from an incendiary, and the Italian princes from those dangers which the turbulent and restless spirit of Cæsar made them fear, even though he was unarmed. He escaped from thence; and got safe to Navarre to King John his brother-in-law, who was then at war with his subjects. Cæsar served as a volunteer in that war, and was killed in 1507.

BORGO,

Borgo
Boring.

BORGO, a town of Russia, seated on the gulf of Finland, in the province of Kymenegard. E. Long. 26. N. Lat. 60. 34.

Borgo de St Sepulchro, a town of Tuscany, in Italy, situated in E. Long. 13. 0. N. Lat. 43. 30.

Borgo de Val de Foro, a town of Italy, in the duchy of Parma, in E. Long. 10. 36. N. Lat. 44. 35.

Borgo Forte, a town of the Mantuan in Italy, situated at the confluence of the rivers Po and Menzo. E. Long. 11. 0. N. Lat. 44. 50.

Borgo San Domino, a town of Italy, in the duchy of Parma, with a bishop's see. E. Long. 10. 31. N. Lat. 41. 53.

BORGOGNONE, a celebrated painter, whose true name was *Giacomo Cortesi*; but he is commonly called *Borgognone*, from the country where he was born, about the year 1605. He was much admired and highly applauded for his admirable gusto and grand manner of painting battles. He had for several years been conversant in military affairs, was an officer of considerable rank in the army, made the camp his school, and formed all his ideas from what he had seen performed in the field. His style is roughly noble, full of fire and spirit, and there are a few prints etched by his own hand. Towards the close of his life he retired to the Jesuits convent at Rome, where he is said to have taken sanctuary to rid his hands of an ill bargain he had got of a wife; but happily surviving her, he lived in great esteem and honour till after the year 1675.

BORIA, a small town of Spain, in the kingdom of Arragon. W. Long. 2. 2. N. Lat. 41. 50.

BORING, in a general sense, the art of perforating, or making a hole through any solid body.

BORING of Water-pipes. The method of boring water-pipes is as follows. The poles of alder, which is a very useful wood in making pumps, water-pipes, &c. being laid on horses or trassels of a foot height, to rest the augre upon while they are boring, they set up a lathe to turn the least end of the poles, to fit them to the cavities of the great end of the others. They turn the small ends of the poles about five or six inches in length, to the size they intend to bore the bigger ends about the same depth, viz. five or six inches. This is designed to make a joint to shut each pair of poles together, the concave part being the female part, and the other the male of the joint. In turning the male part, they turn the channel in it, or a small groove at a certain distance from the end; and in the female part they bore a small bole to fit over this channel. This being done, they bore the poles through; and to prevent them from boring out at the side, they stick great nails at each end to be a guide in boring. It is usual, however, to bore them at both ends; so that a crooked pole can be bored through and not spoil it. See **BORING**, SUPPLEMENT.

BORING, in *Farricry*, a cruel and absurd method of treating a wrenched shoulder. See **FARRIERY Index**.

BORING, in *Mineralogy*, a method of piercing the earth with scooping irons, which being drawn back at proper times, bring up with them samples of the different strata through which they have passed; by the examination of which the skilful mineralogist will be able to guess whereabouts a vein of ore or a stratum

VOL. IV. Part I.

of coal may lie, or whether it will be worth while to open a mine for the purpose of working it.

BORIQUEN, one of the Caribbee islands in North America, near that of Porto Rico. The English formerly had a settlement there, but were driven away by the Spaniards. It is at present without inhabitants, though agreeable and fertile; the air being wholesome, and the water good. There are a great number of land-crabs, whence some have called it *Crab Island*. W. Long. 64. 35. N. Lat. 18. 0.

BORISTHENES, in *Ancient Geography*, the largest river of Sarmatia Europea, thus described by Me-la, who copies *verbatim* from Herodotus: "It runs through a cognominal people, is the most pleasant of all the rivers in Scythia, and calmer than all of them in its course, and very agreeable to drink: it feeds very rich pastures, and produces large fish of the best flavour, and without bones; it comes a great way, rising from springs unknown; its course is a distance of 40 days, and so far is it navigable." It is now called the *Dnieper* or *Nieper*.

BORKELO, a strong town in the United Provinces, in the county of Zutphen, seated on the river Bor-
kel, in E. Long. 6. 30. N. Lat. 52. 15.

BORLASE, DR EDMUND, an eminent physician and English writer in the 17th century, was the son of Sir John Borlase, master of the ordnance, and one of the lords justices of Ireland in 1643. He studied in Dublin college, and afterwards at the university of Leyden, at which last place he took the degree of doctor of physic. He afterwards practised physic with great success in the city of Chester, and was incorporated doctor of the faculty in the university at Oxford. Among the books which he wrote and published are the following. 1. Latham Spaw in Lancashire, with some remarkable cases and cures performed by it. 2. The reduction of Ireland to the crown of England. 3. The History of the Irish rebellion. 4. Brief reflections on the earl of Castlehaven's memoirs, &c. He died after the year 1682.

BORLASE, *William*, a very ingenious and learned writer, was of an ancient family in Cornwall, and born at Pendeen, in the parish of St Just, Feb. 2. 1695-6. He was put early to school at Penzance, and in 1709 removed to Plymouth. March 1712-13, he was entered of Exeter College, Oxford; and, June 1719, took a master of arts degree. In 1720, he was ordained a priest; and, in 1722, instituted to the rectory of Ludgvan in Cornwall. In 1732, Lord-chancellor King presented him to the vicarage of St Just, his native parish; and this, with the rectory aforesaid, were all the preferments he ever had. In the parish of Ludgvan were rich copper works, which abound with mineral and metallic fossils: and these, being a man of an active and inquisitive turn, he collected from time to time, and thence was led to study at large the natural history of his native county. He was struck at the same time with the numerous monuments of remote antiquity that are to be met with in Cornwall; and enlarging therefore his plan, he determined to gain as accurate an acquaintance as possible with the Druid learning, and with the religion and customs of the ancient Britons, before their conversion to Christianity. In 1750 he was admitted a fellow of the Royal Society; and, in 1753, published

Boring
Borlase.

E

in

Borlase
||
Boraceo.

in folio at Oxford his "Antiquities of Cornwall:" a second edition of which was published, in the same form, at London, 1769, with this title, "Antiquities, historical and monumental, of the county of Cornwall; consisting of several essays on the ancient inhabitants, Druid superstition, customs and remains of the most remote antiquity in Britain and the British isles, exemplified and proved by monuments now extant in Cornwall and the Scilly islands; with a vocabulary of the Cornu-British language. Revised, with several additions, by the author. To which is added a map of Cornwall, and two new plates." His next publication was, "Observations on the ancient and present state of the islands of Scilly, and their importance to the trade of Great Britain; Oxf. 1756," 4to. This was the extension of a paper which had been read before the Royal Society in 1753. In 1758 came out his "Natural history of Cornwall; Oxf." fol. After these publications, he sent a variety of fossils and remains of antiquity which he had described in his works, to be repositd in the Ashmolean museum: for which, and other benefactions of the same kind, he received the thanks of the university, in a letter from the vice-chancellor, Nov. 18. 1758; and March 1766, the degree of doctor of laws. He died in 1772, aged 77 years, leaving two sons out of six, whom he had by a lady he married in 1724. Besides his literary connections with many ingenious and learned men, he had a particular correspondence with Mr Pope; and there is still existing a large collection of letters written by that poet to Dr Borlase. He furnished Pope with many of the materials which formed his grotto at Twickenham, consisting of curious fossils; and there may at present be seen Dr Borlase's name in capitals, composed of crystals, in the grotto. On which occasion Pope says to Borlase in a letter, "I am much obliged to you for your valuable collection of Cornish diamonds: I have placed them where they may best represent yourself, *in a shade, but shining*;" alluding to the obscurity of the doctor's situation, and the brilliancy of his talents. Besides the above works, he sent many curious papers to the Philosophical Transactions, and had in contemplation several other works.

BORMIO, a county depending on Switzerland, formerly on the republic of the Grisons, but now subject to Austria, and included in the district called the Valtelline. It is 15 miles over both ways; and is divided into five communities, viz. the town of Bormio, the valley of Forbia, the Interior Valley, the Lower Valley, and the Valley of Luvino. Bormio, which is the only town in this district, contains about 1000 inhabitants, and is meanly built, but stands in a delightful country. It is seated at the confluence of the rivers Adda and Isalacua, in E. Long. 10. N. Lat. 46. 25.

BORN, IGNATIUS, BARON VON, a late German mineralogist. See SUPPLEMENT.

BORNE, a market town of Lincolnshire in England. W. Long. 0. 20. N. Lat. 52. 40.

BORNEO, an island of Asia, in the East Indies, and one of the three great Sunda islands. It is thought to be the largest island in the world, next to New Holland; being 800 miles long, and 700 broad. It is seated under the equator, that line cutting it almost through the middle. It is almost of a circular figure: abounds

with gold; and the finest diamonds in the Indies are found in its rivers, being probably washed down from the hills by torrents. Here are also mines of iron and tin, and loadstones. Birds nests* are to be had in this island, which are eatable, and reckoned a great delicacy. The beasts are, oxen, buffaloes, deer, goats, elephants, tigers, and monkeys. This island has fine rivers, especially towards the west and south. In their monsoon, from April to September, the wind is westerly; and they have continual heavy rains, attended with violent storms of thunder and lightning. The rainy season continues for eight months of the year; and as during that time all the flat country near the coast is overflowed, the air is rendered very unhealthy, and the inhabitants are forced to build their houses on floats, which they make fast to trees. The houses have but one floor, with partitions made with cane; and the roofs are covered with palmetto leaves, the eaves of which reach within four or five feet of the bottom. The west and north-east sides of the island are almost desert, and the east is but little known. The inland parts are very mountainous; and the south-east, for many leagues together, is a stinking morass, which, being overflowed in the wet season, is very unhealthy.

The Portuguese, who first discovered Borneo, had arrived in the Indies above 30 years before they knew any thing of it more than the name, and its situation, by reason of their frequently passing by its coast. At last one Captain Edward Corril had orders to examine it more narrowly; and being once acquainted with the worth of the country, they made frequent voyages thither. They found the coasts inhabited by Malayan Moors, who had certainly established themselves there by conquest; but the original inhabitants still remain in the mountains, and are styled *Beajus*, which in the Malayan language signifies a *wild man*. The most authentic account of these people is the following, which was extracted from the papers of Father Antonio Ventimiglia, an Italian missionary. He was sent to Borneo from Macao, on board a Portuguese ship, converted great numbers to Christianity, and died on the island about the year 1691. The Beajus have no kings, but many little chiefs. Some are subject to the Moorish kings, and pay them tribute; but such as live far up the country are altogether independent, and live according to their own customs. They are generally very superstitious, and much addicted to augury. They do not adore idols; but their sacrifices of sweet wood and perfumes are offered to one God, who, they believe, rewards the just in heaven, and punishes the wicked in hell. They marry but one wife; and look upon any breach of conjugal faith, either in the man or woman, as a capital offence. The Beajus are naturally honest and industrious, and have a brotherly affection for one another. They have a notion of property, which yet does not render them covetous. They sow and cultivate their lands; but in the time of harvest, each reaps as much as will serve his family, and the rest belongs to the tribe in common; by which means they prevent necessity or disputes. With the Moors on the coasts the Portuguese for some time carried on a considerable trade, and at their request settled a factory there; which, however, was afterwards surprised and plundered by the Moors, who put most of the

Boraceo.

Bornou.

the people to the sword. The chief town, also called *Borneo*, is on the north-west side of the island. See BORNEO, SUPPLEMENT.

BORNHOLM, an island in the Baltic sea, to the south-east of the province of Schonen in Sweden. It is twenty-one miles in length, and above thirteen in breadth. It has three considerable towns, Rattum, Sandwick, and Nexia; with a great number of villages; and is fertile and populous. It was conquered by the Swedes in 1658: but the inhabitants, under the conduct of Jens Roefods, voluntarily surrendered it to the king of Denmark, on account of the bad usage they received from the former. In 1678, a body of 5000 Swedish troops, in their passage from Pomerania to Sweden, being shipwrecked on this island, such of them as remained were made prisoners of war. The inhabitants defend the island by their own militia, without any expence to the crown. It was a short time in the hands of the British, who took it from the Danes in 1809. E. Long. 14. 56. N. Lat. 55. 15.

BORNOU, a kingdom or province of Zaara in Africa, extending from 12 to 22 degrees of east longitude, and from 17 to 21 degrees of north latitude. The northern part is poor, and like the rest of the provinces of Zaara: but all the rest is well watered by springs and rivers that tumble down with a dreadful noise from the mountains; rendering the country prolific in corn, grass, and fruits, and giving it a pleasing aspect. The eastern and western frontiers are divided into mountains and valleys, the latter being all covered with flocks of cattle, fields of rice and millet, and many of the mountains with wood, fruit-trees, and cotton. On the north-west stands the mountain of Tarton, having plenty of good iron mines; and on the south flows the river Niger, which, it is said, after running a great many leagues under a long chain of mountains, rears up its head again, and mingles its streams with the waters of the lake Bornou in its course, from whence it washes the walls of the capital of this kingdom. The compilers of the Universal History, however, are of opinion, that in these mountains the river Niger hath its source, because no river hath been traced to the eastward, except the Nile, which runs in a different course from north to south, and the White river, on the western frontiers of Abyssinia, which is a branch of the Nile. The eastern and western parts of Bornou are inhabited by a people of a roving disposition, who live in tents, and have their women, children, and every thing else, in common; the word *property*, or any idea equivalent to it, being utterly unknown among them. They have neither religion, laws, government, nor any degree of subordination; and hence they have been supposed by Cluverius to be the lineal descendants of the ancient Garamantes, and this to have been the residence of that people. In these parts, the natives are almost to a man shepherds and husbandmen. In summer they go naked, except a short apron before; but in winter they are warmly clothed with the softest sheep-skins, of which they also form their bedclothes; and indeed this is scarce a sufficient defence against the inclemency of the weather at certain seasons of the year, when a cold piercing wind blows from the northern mountains, that chills the blood in proportion as the pores of the body have been opened by the scorching heats of summer.

Bornou
||
Borough.

Baudrand and Draper affirm, that the natives are scarce superior in their understanding to brutes; not even having any names whereby to distinguish each other, except what they take from some personal defect or singularity; such as lean, fat, squinting, humpbacked, &c. In the towns, however, it is acknowledged that they are something more civilized and polite, being many of them merchants; but of these towns, or indeed of the kingdom in general, very little is known.

BORODINO, a village in Russia, near the river Moskwa, about 90 miles west of Moscow; remarkable for the great battle fought there on the 7th September 1812, between the French and Russians. The Russian army, of 120,000 men, occupied a position of no great strength. The firing began at six o'clock in the morning, and soon became general in the centre and Russian left. The Russians had extended their line too much; and the French, after making an impression with their artillery and musketry, pushed forward, regardless of loss, and carried several batteries, about eight o'clock. The Russians resisted obstinately till noon, and even till two o'clock; and during the following night retired from the field. The loss on each side was believed to be about 30,000 men.

BOROMÆUS. See BORROMEUS.

BORONDON, St. an island in the Atlantic ocean, mentioned by some writers, particularly Linschotten, in their description of the Canary islands, as something supernatural. It is said to be about 100 leagues distant from Ferro, probably west, though no writer has pretended to lay down its exact situation. Here it is affirmed several ships have touched by accident, and all agree in their relations of the state of the inhabitants and island. They affirm, that it is perpetually clothed with a great variety of wood, chiefly fruit-trees: that the valleys are in a perpetual state of verdure. It is said to be peopled by Christians, who have a language of their own, apparently combined of a variety of modern languages. It is remarkable that no ships, expressly sent upon this discovery, were ever fortunate enough to fall in with the island of St Borondon, though the Spaniards have several times attempted it from the Canaries. Hence it has been called the *marvellous island*; and hence indeed we may conclude, either that it exists wholly in imagination, or at least that it is surrounded with such currents as insensibly carry ships out of their course, and prevent their meeting with it.

BOROUGH, BURROUGH, Borow, or Burgh, is frequently used for a town or corporation which is not a city.

BOROUGH, in its original Saxon *borge*, or *borgh*, is by some supposed to have been primarily meant of a tithing or company consisting of ten families, who were bound and combined together as each others pledge. Afterwards, as Verstegan informs us, borough came to signify a town that had something of a wall or inclosure about it: so that all places which among our ancestors, had the denomination borough, were one way or other fenced or fortified. But, in latter times, the same appellation was also bestowed on several of the *villæ insigniores*, or country towns of more than ordinary note, though not walled.

The ancient Saxons, according to Spelman, gave the name burgh to those called, in other countries, cities. But divers canons being made for removing the

Borough
Borough-
English.

episcopal sees from villages and small towns to the chief cities, the name *city* became attributed to episcopal towns, and that of *borough* retained to all the rest; though these too had the appearance of cities, as being governed by their mayors, and having laws of their own making, and sending representatives to parliament, and being fortified with a wall and castle, and the like.

BOROUGH, or *Burgh*, is now particularly appropriated to such towns and villages as send burgesses or representatives to parliament. Boroughs are equally such, whether they be incorporate or not; there being great numbers of our English boroughs not incorporated; and, on the contrary, several corporations that are not boroughs; *e. gr.* Kingston, Deal, Kendal, &c.

BOROUGHs, in Scotland. See **LAW**.

Royal Boroughs, in Scotland, are corporations made for the advantage of trade, by charters granted by several of their kings; having the privilege of sending commissioners to represent them in parliament, besides other peculiar privileges. The royal boroughs are not only so many distinct corporations, but do also constitute one entire body, governed by, and accountable to, one general court, anciently called *the court of four boroughs*, held yearly to treat and determine concerning matters relating to the common advantage of all boroughs. The four boroughs which composed this court were, Edinburgh, Stirling, Roxburgh, and Berwick; which two last falling into the hands of the English, Linlithgow and Lanark were put in their places; with a saving to the former whenever they should return to their allegiance. But this court not being sufficient to answer the necessities of the royal boroughs, they were all empowered under James III. in 1487, to send commissioners to a yearly convention of their own, which was then appointed to be held at Inverkeithing, but is now held at Edinburgh, under the denomination of the *convention of boroughs*, vested with great power, and having for their object the benefit of trade, and the general interest of the boroughs.

Borough-Courts, are certain courts held in boroughs, by prescription, charter, or act of parliament: such are the sheriff's court, and court of hustings, in London.

Borough-English, a customary descent of lands or tenements, in some ancient boroughs and copyhold manors, by which the younger son, and not the eldest succeeds to the burgage tenement on the death of his father. For which Littleton gives this reason; because the younger son, by reason of his tender age, is not so capable as the rest of his brethren to help himself. Other authors have indeed given a much stranger reason for this custom; as if the lord of the fee had anciently a right to break the seventh commandment with his tenant's wife on her wedding night; and that therefore the tenement descended, not to the eldest, but to the youngest son, who was more certainly the offspring of the tenant. But it cannot be proved that this custom ever prevailed in England, though it certainly did in Scotland, (under the name of *mercheta*, or *marcheta*), till abolished by Malcolm III. But perhaps a more rational account than either may be brought from the practice of the Tartars; among whom, according to Father Dubalde, this custom of

descent to the youngest son also prevails. That nation is composed totally of shepherds and herdsmen; and the elder sons, as soon as they are capable of leading a pastoral life, migrate from their father with a certain allotment of cattle, and go to seek a new habitation. The youngest son, therefore, who continues latest with his father, is naturally the heir of his house, the rest being already provided for. And thus we find, that among many other northern nations it was the custom for all the sons but one to migrate from the father, which one became his heir. So that possibly this custom, wherever it prevails, may be the remnant of that pastoral state of the ancient Britons and Germans which Cæsar and Tacitus describe.

Borough-Head, or *Head-Borough*, called also *borough-holder*, or *burgholder*, the chief man of the decenna, or hundred, chosen to speak and act in behalf of the rest.

Head-borough also signifies a kind of head constable, where there are several chosen as his assistants, to serve warrants, &c. See **CONSTABLE**.

BOROUGHBRIDGE, a town in the north riding of Yorkshire in England, seated on the river Your, over which there is a handsome stone bridge. The town is not large, but commodious, and sends two members to parliament. W. Long. 1. 15. N. Lat. 54. 10.

BOROZAIL, or the zeal of the Ethiopians, a disease epidemic in the countries about the river Senegal. It principally affects the pudenda, but it is different from the lues venerea. It owes its rise to excessive venery: in the men this distemper is called *asab*, in women *assabatus*.

BORRACHIO. See **CAOUTCHOUK**.

BORRAGE. See **BORAGO**, **BOTANY Index**.

BORRELISTS, in church-history, a Christian sect in Holland, so denominated from their founder Borrel, a person of great learning in the Hebrew, Greek, and Latin tongues. They reject the use of the sacraments, public prayer, and all other external acts of worship. They assert, that all the Christian churches of the world have degenerated from the pure apostolical doctrines, because they have suffered the word of God, which is infallible, to be expounded, or rather corrupted, by doctors who are not infallible.

BORRICHIOUS, one of the most learned men of his age, the son of a Lutheran minister in Denmark, was born in 1626. He applied himself to physic in the university of Copenhagen, and began to practise during a most terrible plague that made great havoc in that city. He travelled: but before his departure, in 1660, he was appointed professor in poetry, botany, and chemistry; and at his return discharged his duties with great assiduity, of which the works he published afford full proof. He was raised to the office of counsellor in the supreme council of justice, in 1686; to that of counsellor of the royal chancery, in 1689; and died of the operation for the stone, in 1690. He published, 1. *Lingua pharmacopœorum*. 2. *Dissertationes de poeticis Græcis et Latinis*. 3. *De ortu et progressu chemiæ*; and several other works.

BORROMEAN ISLANDS, certain islands in the lake Maggiore in Italy, celebrated for their picturesque beauty. See **SUPPLEMENT**.

BORROMEUS, **St CHARLES**, cardinal, and archbishop

Borough-
English
Borromeus

Borromeus, bishop of Milan; a personage of great note in the Romish kalendar, and whose sincere piety, simplicity of manners, and zeal for reformation, render him indeed a character equally interesting and instructive to the members of any church. He was the son of Gilbert Borromeus count of Arona and of Mary of Medicis, and was born at the castle of Arona upon Lake Major in the Milanese, in October 1538. When he was about 12 years old, Julius Cæsar Borromeus resigned an abbacy to him of a considerable revenue, which was considered as an hereditary inheritance of the family; which Charles accepted, but applied the revenue wholly in charity to the poor. Having acquired a sufficient knowledge of the languages at Milan, he studied the civil and canon law at Pavia, where he lived like another Lot in Sodom, preserving his innocence among a thousand snares by which it was endangered. He received great advantage from the company and conversation of Francis Alciat, one of the most learned men of the age, for whom he afterwards procured the purple. He would accept no new benefice, but upon condition that he should be at liberty to apply the revenue to public uses. In the year 1554, Charles being then 16 years old, his father died, an event which brought him back to the castle of Arona; where, though he had an elder brother, Count Frederick, he was requested by the family to take upon him the management of the domestic affairs, to which at length he consented.

After some time he returned again to his studies, which, in the year 1559, being then just 21, he finished by a solemn act, and took his doctor's degree. The promotion of his uncle to the pontificate, by the name of *Pius IV.* which happened the year following, seemed to have very little effect upon him; but he was very soon made prothonotary, and entrusted both with the public and privy seal of the ecclesiastical state: he was also, at the same time, created cardinal deacon, and soon after archbishop of Milan. In obedience to the will of his uncle the pope, he lived in great splendour, having a brilliant retinue and a great number of domestics; yet his own temperance and humility were never brought into question. In order to render even his amusements useful, he established an academy of select and learned persons, as well ecclesiastics as laics, from among his household and dependants, who were employed in some exercise which tended to inspire a love of virtue, and to form a just taste. Each of them was to write on some chosen subject, either in verse or in prose, and to communicate to each other in frequent conferences the fruits of their studies. The works produced by this society have been published in many volumes, under the title of *Noctes Vaticanæ*, because these useful assemblies were held at the Vatican, and at night, after the business of the day was over. About this time Charles also formed a design of founding a college at Pavia, which should at the same time be a school of science and an asylum from the vices and vanities of the world. In prosecution of this design, he raised a large edifice upon the foundations of several houses which belonged to the family of Borromeus in that city; he obtained from the pope several benefices, which he attached to his building; he provided it with all things necessary for the young

scholars out of his own revenue; and he dedicated his college to Justina virgin and martyr.

Upon the death of his only brother Frederick, his relations, his friends, and even the pope himself, advised him to change his state, to quit the church, and marry, that his family might not become extinct. Charles, however, contrary to this advice and the expectations of the world, received the priesthood, and addressed the pope in these terms: "Do not complain of me, Holy Father, for I have taken a spouse whom I love, and on whom my wishes have been long fixed." From this time he became more fervent in exercises of piety and ecclesiastical knowledge: He perceived that some literati who had departed from the faith had also corrupted the writings of some holy doctors of the church, and he thought he should render religion good service if he could restore the genuine reading: He therefore employed Achilles Statius, a Portuguese of great learning, in this work, whom for that purpose he retained at Rome. To his zeal and attention also is owing the congregation of eight cardinals, still subsisting, to resolve doubts and obviate difficulties which should arise in explanations of the council of Trent.

There was a very intimate friendship between Borromeus, and Don Barthelemy des Martyrs archbishop of Prague, and author of a work entitled *Stimulus Pastorum*. This work falling into Borromeus's hands gave him an earnest desire to become a preacher, as he was now convinced that preaching was one of the principal duties of a prelate. An almost inconceivable multiplicity of business, ill health, a feeble voice, and a difficult pronounciation, were no inconsiderable obstacles to his design, yet he surmounted them all; and although his beginnings were weak, yet perseverance crowned them with success.

Having obtained permission to visit his church, which the pope had hitherto refused, as he found his presence necessary at Rome, he prepared to set out for Milan. He had before sent thither his grand vicar Ormanetus, whose labours at first had not been unsuccessful, but who soon found opposition so pertinacious and obstinate as to put an end to his hopes: Borromeus therefore saw the necessity of going in person, and he was received with the most distinguished honours. He was, however, soon recalled to Rome, where many things made his presence necessary: the pope was gradually dying; and Charles arrived just time enough to administer to him the last sacraments.

Pius IV. died on the 7th of January 1566, and 28 days afterwards Cardinal Alexandrine mounted the papal chair, and assumed the name of *Pius V.* the skill and diligence of Borromeus having contributed not a little to prevent the cabals of the conclave.

As soon as this event had taken place, and all was quiet at Rome, Borromeus gave himself wholly up to the reformation of his diocese, where the most flagitious irregularities were openly practised, having first made another reform in his own family. He began by making pastoral visits in his metropolis, where the canons were not distinguished for the purity of their manners. He soon restored proper decency and dignity to divine service, by a variety of wise and necessary regulations: In conformity to the decrees of the council of Trent, he cleared the cathedral of many pompous

Borromeus pompous tombs, rich ornaments, banners, arms, and in general of all the trophies with which the vanity of man had disfigured the house of God; and in order to give a sanction to his zeal by his example, he spared not the monuments of his nearest relations. Nor did his zeal stop here: he divided the nave of the church through its whole length into two parts, by strong thick planks, that the two sexes, being separated, might perform their devotions without any attention to each other, and with a modesty and recollection more suitable to the place.

This pastoral care extended from the cathedral to the collegiate churches, and even to the fraternities or societies of penitents, particularly that of St John the Baptist. The duty of this society was to attend criminals to the place of punishment, to assist, comfort, and prepare them for death; but the spirit of the institution was now forgotten, and the wretches who were condemned to death were commonly dragged to execution like beasts, without any spiritual assistance or consolation. But the archbishop revived the original fervour of this order, in the exercise of their peculiar duty, and persuaded many of the nobility and principal persons of the city to become members of a society appropriated to so eminent a branch of Christian charity. The reformation of the monasteries followed that of the churches, and the vigilance of the pastor soon extended itself from the city to the country round it, which abounded with irregularities that required his correction. The great abuses and irregularities which had overrun the church at this time arose principally from the gross ignorance of the clergy; in order therefore to attack these evils at the root, Charles established seminaries, colleges, and communities, for the education of young persons intended for holy orders. He met with many difficulties, and much opposition in his endeavours to bring about a reformation of manners; but he prevailed against every obstacle by an inflexible constancy, tempered with great sweetness of manners.

The governor of the province, and many of the senators, were apprehensive that the cardinal's ordinances and proceedings would encroach upon the civil jurisdiction, and become inconsistent with the rights of his Catholic majesty, to whom the duchy of Milan was then in subjection. And this was a fruitful source of remonstrances, representations, and complaints, which long troubled the courts of Rome and Madrid, and which the king of Spain, Philip II. referred entirely to the decision of the pope. But Borromeus had a more formidable opposition to struggle with, that of several religious orders, particularly the Brothers of Humility. Three provosts of the society entered into a conspiracy to cut him off; and one of their confederates, called *Jerom Donat*, whose surname was *Farina*, took upon him to carry the design into execution. For this purpose he mixed with the crowd that went into the archiepiscopal chapel, where the cardinal spent an hour every evening in prayer with his domestics and other pious persons; and having watched his opportunity, he fired a harquebuss at him, which was loaded with a ball suited to the bore of the piece, and with a considerable charge of leaden shot. It is said that the ball struck him on the spinal bone, but fell down at his feet without doing any other damage than soil-

ing his rochet, and that one of the shot penetrated his **Borromeus** clothes to the skin, and there stopped, without imprinting any wound, which was considered as a miracle, especially as another shot tore away part of a wall, and went quite through a table.

In the year 1576, the city and diocese of Milan were visited by the plague, which swept away incredible numbers; and the behaviour of Borromeus, on this occasion, was truly Christian and heroic: He not only continued on the spot, but he went about giving directions for accommodating the sick, and burying the dead, with a zeal and attention that were at once ardent and deliberate, minute and comprehensive: and his example stimulated others to join in the good work. He avoided no danger, and he spared no expence; nor did he content himself with establishing proper regulations in the city, but went out into all the neighbouring parishes where the contagion raged, distributing money to the poor, ordering proper accommodations for the sick, and punishing those, especially the clergy, who were remiss in the duties of their calling. Charles, notwithstanding the fatigue and perplexity which he suffered by thus executing his pastoral charge, abated nothing of the usual austerity of his life, nor omitted any of his stated devotions; for, whatever approached to luxury or magnificence, he considered as incompatible with the propriety of his character. It happened, that being once on a visit to the archbishop of Sienna at his palace, a very sumptuous entertainment was provided for him. Borromeus, though he had been used to content himself with bread and water, yet sat down at the table, where however he ate but little, and gave sufficient intimation that he was much displeased with such ostentatious prodigality; but what was his surprise when he saw the table again covered with a dessert, consisting of whatever was most rare, exquisite, and costly! He immediately rose hastily from his seat, as if he had suddenly recollected some pressing business, and gave orders for his departure, notwithstanding the rain, and the most earnest entreaties of the archbishop. "My lord," said the cardinal, "if I should tarry here to-night, you would give me another such treat as that I have just seen, and the poor will then suffer another loss, great numbers of whom might have been fed with the superfluities that have been now set before us."

The continual labours and austerities of Borromeus naturally shortened his life; he went to Vercal to put an end, if possible, to the divisions which threatened the most fatal consequences; and, when he was there, he received a message from the duke of Savoy, requesting his presence at Turin. From Turin he retired to a place called the *Sepulchre*, on the mountain Varais, where he was seized with an intermittent fever, which scarce permitted him to return alive to Milan, where he arrived on the 3d of November 1584, and died the next day. He was lamented by the city and the whole province with such marks of sincere sorrow as are rarely seen; and he was immediately worshipped as a saint, without waiting for the pope's approbation. The pope, however, when he was told of it by Cardinal Baronius, gave directions that the devotion of the people should not be restrained, though Borromeus was not canonized till the 1st of November 1610, in the pontificate of Leo XI. Since that time many churches

Borromeus, Borrowing. churches and chapels have been erected in honour of this saint, and many religious societies instituted and put under his protection.

The foregoing particulars are extracted from an account of the life of Borromeus, written some years ago by Father Anthony Touron. Upon a comparison of this life with that written by Ribadeneira a Spanish Jesuit above a century ago, it appears that the improvement of knowledge has made a very striking difference in this kind of biography. Ribadeneira, who lived in the midst of ignorance and superstition, did not suspect that the time was at hand when the incredible and ridiculous fables he recites could not be believed: his life of this saint, therefore, abounds with particulars which Touron has justly omitted. We are told that a miraculous light was seen over the chamber of Borromeus's mother when she was in labour: That Borromeus, seeing two persons carried violently down a rapid river on their horses, and just ready to perish, caused their horses suddenly to leap with them out of the water, by giving them his benediction: That Octavian Varese, a gentleman of Milan, who was confined to his bed by sickness, when Borromeus died, became instantly well, by recommending himself to the saint's intercession. That a daughter of Julius Bonacina was instantly cured of a disorder in her eye, which had taken away the sight of it, by performing an act of devotion in honour of this saint: That a count of Ferrara was instantly seized with a violent disease upon speaking irreverently of Borromeus's picture, but was cured upon confessing his fault. It would certainly be a work of infinite service to the Romish church, to new-write the lives of her saints in such a manner as can now be believed, since the lives already written might by that means be gradually superseded, which are a better antidote against Popery than the arguments of the best reasoner in the world.

BORROWING AND HIRING, in *Law*, are contracts, by which a qualified property may be transferred to the hirer or borrower; in which there is only this difference, that hiring is always for a price or stipend, or additional recompense; borrowing is merely gratuitous. But the law in both cases is the same. They are both contracts, whereby the possession and transient property is transferred for a particular time or use, on condition and agreement to restore the goods so hired or borrowed, as soon as the time is expired or the use performed, together with the price or stipend (in case of hiring) either expressly agreed upon by the parties, or left to be implied by law, according to the value of the service. By this mutual contract, the hirer or borrower gains a temporary property in the thing hired, accompanied with an implied condition to use it with moderation, and not to abuse it; and the owner or lender retains a reversionary interest in the same, and acquires a new property in the price or reward. Thus if a man hires or borrows a horse for a month, he has the possession and a qualified property therein during that period; on the expiration of which his qualified property determines, and the owner becomes (in case of hiring) entitled also to the premium or price for which the horse was hired.

There is one species of this price or reward the most usual of any, but concerning which many good and learned men have in former times very much perplexed

themselves and other people, by raising doubts about its legality *in foro conscientia*. That is, when money is lent on a contract to receive not only the principal sum again, but also an increase by way of compensation for the use, which is generally called *interest* by those who think it lawful, and *usury* by those who do not so. But as to this, see the article **INTEREST**.

BORROWSTOWNNESS. See **BURROWSTOWNNESS**.

BORSEHOLDER, among the Anglo-Saxons, one of the lowest magistrates, whose authority extended only over one free burgh, tithing, or decennary, consisting of ten families. Every freeman who wished to enjoy the protection of the laws, and not to be treated as a vagabond, was under the necessity of being admitted a member of the tithing where he and his family resided; and in order to obtain this admission, it was as necessary for him to maintain a good reputation; because all the members of each tithing being mutual pledges and sureties for each other, and the whole tithing sureties to the king for the good behaviour of all its members, they were very cautious of admitting any into their society who were of bad or doubtful characters. Each tithing formed a little state or commonwealth within itself, and chose one of its most respectable members for its head, who was sometimes called the *alderman* of such a tithing or freeburgh, on account of his age and experience, but most commonly *borseholder*, from the Saxon words *borh*, "a surety," and *alder*, "a head or chief." This magistrate had authority to call together the members of his tithing, to preside in their meetings, and to put their sentences in execution. The members of each tithing, with their tithing-man or borseholder at their head, constituted a court of justice, in which all the little controversies arising within the tithing were determined. If any dispute of great difficulty or importance happened, or if either of the parties was not willing to submit to a sentence given in the tithing-court, the cause was referred or appealed to the next superior court, or court of the hundred.

BORSET, or **BORSETT**, celebrated for its baths, a place about half a league from Aix-la-Chapelle in Germany. The abbey here is a very magnificent pile of building. It was formerly a monastery; but serves for a nunnery, whose abbess is a princess of the empire, and lady of Borset. The waters are warm, and of the nature of those of Aix-la-Chapelle; but they are only used as baths for the diseases in which the waters last mentioned are recommended, and also in dropsical and oedematous cases. The waters are distinguished into the upper and lower springs. The former were found by Dr Simmons to raise the thermometer to 158°, the latter to only 127°. All the baths are supplied by the first. Dr Simmons observed, that these waters were much less sulphureous than those of Aix-la-Chapelle, probably on account of their greater heat. He likewise found that they abounded much with selenites, which incrust the pipe through which the water passes, and likewise the sides of the bath.

BORYSTHENES. See **BORISTHENES**.

BOS, JOHN BAPTIST DU, a celebrated author and member of the French academy, was born at Beauvais in 1670, and finished his studies at the Sorbonne. In 1695, he was made one of the committee for foreign affairs.

Borrowing
H
Eoa

Bos
||
Boscawen.

affairs under Mr Torez; and was afterwards charged with some important transactions in England, Germany, Holland, and Italy. At his return to Paris, he was handsomely preferred, made an abbé, and chosen perpetual secretary of the French academy. He was the author of several excellent works; the principal of which are, 1. Critical reflections upon poetry and painting, 3 vols 12mo. 2. The History of the four Gordians, confirmed and illustrated by medals. 3. A critical History of the establishment of the French Monarchy among the Gauls, 2 vols 4to, 4 vols 12mo. He died at Paris on the 23d of March 1742.

Bos, *Lewis Janssen*, an esteemed painter, was born at Bois-le-Duc. Having been carefully instructed in the art of painting by the artists of his native city, he applied himself entirely to study after nature, and rendered himself very eminent for the truth of his colouring and the neatness of his handling. His favourite subjects were flowers, and curious plants, which he usually represented as grouped, in glasses, or vases of crystal, half filled with water; and gave them so lively a look of nature, that it seemed scarce possible to express them with greater truth or delicacy. It was frequent with this master to represent the drops of dew on the leaves of his objects, which he executed with an uncommon transparency; and embellished his subjects with butterflies, bees, wasps, and other insects, which Sandrart says, were superior to any thing of that kind performed by his cotemporary artists. He likewise painted portraits with very great success; and showed as much merit in that style as he did in his compositions of still life. He died in 1507.

BOS. See MAMMALIA *Index*.

Bos, in antiquity, was peculiarly used for an ancient Greek silver coin which was *didrachmus*, or equivalent to two drachms. It was so called as having on it the impression of an ox, and chiefly obtained among the Athenians and Delians; being sometimes also struck of gold. From this arose the phrase *Bos in lingua*, applied to those who had taken bribes to hold their tongue.

BOSA, a maritime town in the western part of the island of Sardinia, with a castle, a good port, and a bishop's see. It is seated on the river Bosa, to the north-east of an island of the same name; and has good salt pits. E. Long. 8. 30. N. Lat. 40. 19.

BOSCAGE, the same with a grove or thicket.

BOSCAGE, in a law sense, is that food which trees yield to cattle; as mast, &c. But Manhood says, to be quit of boscage is to be discharged of paying any duty for windfall wood in the forest.

BOSCAGE, among painters, denotes a landscape representing much wood and trees.

BOSCAN, JOHN, a Spanish poet of the 16th century, born at Barcelona. He was the friend of Garcilasso de Vega, another Spanish poet. These two were the first who made any great improvement in the poetry of their nation, and their pieces were printed together. Boscan, who died about the year 1542, principally succeeded in sonnets.

BOSCAWEN, EDWARD, a brave British admiral, was the second son of Hugh late lord viscount Falmouth. Having early entered into the navy, he was, in 1740, captain of the Shoreham; and behaved with

great intrepidity as a volunteer under Admiral Vernon, Boscawen, at the taking of Porto Bello. At the siege of Carthage, in March 1740-1, he had the command of a party of seamen who resolutely attacked and took a batter of 15 twenty-four pounders, though exposed to the fire of another fort of five guns. Lord Aubrey Beauclerk being killed at the attack of Boca-Chica, Captain Boscawen succeeded him in the command of the Prince Frederic of 70 guns. In May 1742, he returned to England, and married Frances daughter of William Glanville, Esq. and the same year was elected representative for Truro in Cornwall. In 1744, he was made captain of the Dreadnought of 60 guns; and soon after he took the Medea, a French man of war commanded by M. Hoquart, the first king's ship taken in that war. May 3. 1747, he signalized himself under the admirals Anson and Warren, in an engagement with the French fleet off Cape Finisterre, and was wounded in the shoulder with a musket ball. Here M. Hoquart, who then commanded the Diamond of 56 guns, again became his prisoner; and all the French ships of war, which were ten in number, were taken. On the 15th of July he was made rear-admiral of the blue, and commander in chief of the land and sea forces employed on an expedition to the East Indies; and, on the 4th of November, sailed from St Helen's, with six ships of the line, five frigates, and 2000 soldiers. On the 29th of July 1748, he arrived at St David's, and soon after laid siege to Pondicherry; but the men growing sickly, and the monsoons being expected, the siege was raised, and Mr Boscawen showed himself as much the general as the admiral in his retreat. Soon after he had news of the peace, and Madras was delivered up to him by the French. In April 1750, he arrived at St Helen's in the Exeter, and found that in his absence he had been appointed rear-admiral of the white. He was the next year made one of the lords commissioners of the admiralty, and chosen an elder brother of the Trinity-house. In February 1755, he was appointed vice-admiral of the blue. On the 19th of April, sailing in order to intercept a French squadron bound to North America, he fell in with the Alcide and Leys of 64 guns each, which were both taken: on this occasion M. Hoquart became his prisoner a third time, and he returned to Spithead with his prizes and 1500 prisoners. In 1756, he was appointed vice-admiral of the white; and in 1758, admiral of the blue, and commander in chief of the expedition to Cape Breton; when, in conjunction with General Amherst, and a body of troops from New England, the important fortress of Louisbourg and the whole island of Cape Breton were taken, for which he afterwards received the thanks of the house of commons. In 1759, being appointed to command in the Mediterranean, he arrived at Gibraltar, where hearing that the Toulon fleet, under M. de la Clue, had passed the Straits, in order to join that at Brest, he got under sail, and on the 18th of August saw, pursued, and engaged the enemy. His ship, the Namur of 90 guns, losing her main-mast, he shifted his flag to the Newark; and, after, a sharp engagement, took three large ships, and burnt two in Lagos bay, and the same year arrived at Spithead with his prizes and 2000 prisoners. On December 8. 1760, he was appointed general

Boscawen general of the marines with a salary of 3000l. per annum, and was also sworn one of the privy council. **Boscovich** He died in 1761.

BOSCH, JACOB VANDEN, a painter of still life, was born at Amsterdam, in 1636, and painted summer fruits, of various kinds, peaches, pears, apples, plums, nectarines, and cherries, with extraordinary neatness of pencil. He painted all his objects after nature, and imitated every sort of fruit with so great truth and delicacy, with such natural and transparent colour, that they appeared delicious and almost real. He died in 1676.

BOSCHAERTS, THOMAS WILLEBORTS, a celebrated painter, was born at Bergen-op-zoom; and, like the great painters who flourished at that time, began to draw when very young, in the books that were intended for other studies. Preferring his pencil to every thing else, he drew his own picture, by his resemblance in a looking-glass, so like, that those who saw it were astonished. This he did before he had the least instruction from any one, and when he was only 12 years of age. Upon this his parents sent him to a master, that he might follow the bent of his genius; but his first master being only an indifferent painter, and incapable of satisfying his earnest desire of learning, he left him, and engaged himself with Gerard Seegers; under whom, after four years practice, he proved a most accomplished artist. Antwerp being at that time the seat of arts, where there was a conflux of the most eminent painters, he thought it the fittest place for his improvement; and there executed such a number of noble pieces as added greatly to the splendour of that wealthy city. In 1642, Henry Frederic prince of Orange, and his son Prince William, employed him in their service; in which he continued several years, and made those excellent pieces that are to be seen in that prince's palace at the Hague and other parts of Holland, and painted portraits for most of the persons of quality that were then living. He died in the flower of his age, in 1670.

BOSCO, or BOSCHI, a town of Italy, in the Milanese, seated on the river Orbe. E. Long. 9. 44. N. Lat. 44. 53.

BOSCOI, or BOSCI, in ecclesiastical history, denotes a species or tribe of monks in Palestine, who fed on grass like the beasts of the fields. The word is Greek, *βοσκος*, q. d. "graziers;" formed from *βοσκω, pasco*, "I feed." The Boscoi are ranked among the number of Adamites, not so much on account of their habit, as food. They took no care about provision; but when eating time came, or any of them was hungry, went into the fields, with each his knife in his hand, and gathered and ate what he could find.

BOSCOVICH, ROGER JOSEPH, the founder of an original and sublime theory of natural philosophy, deserves to be particularly noticed in a work of this nature; but we have to regret that the materials from which our biographical memoir must be compiled, are insufficient to satisfy the curiosity concerning the literary habits, and the characteristic features, of this very illustrious man.

His rank, indeed, as a philosopher, we are enabled to appreciate by perusing some of the immortal works which he hath bequeathed us; but, for a knowledge of his moral character, disposition, and temporal con-

cerns, we can only have recourse to the eulogies of his friends. These are certainly entitled to much of our confidence; and when the names of M. de la Lande, M. Fabroni, Stay, and Zamagna are mentioned, we may be thought fastidious, in implying the least distrust of their testimony. It is our respect for the public and for truth, and it is our knowledge of the nature of eulogies, which have made us so.

We have, therefore, endeavoured, rather to relate the incidents in the life of Boscovich, than to give a transcript of friendly effusion; and yet perhaps it may be discovered, that our report is luminous with eulogium, whilst its outlines are poorly defined.

Boscovich was born on the 11th of May 1711, at Ragusa, a sea-port on the coast of the Adriatic, and capital of a small republic of the same name, under the protection of the Turks and the Venetians. We know so little of his parents, that we can only conjecture at their circumstances and capacity, from the education which they gave to their son being liberal and judicious.

It does not appear that our author gave any tokens of superior genius, till he was sent to learn grammar and philosophy in the schools of the Jesuits, who were at that time the principal teachers in Ragusa, and throughout Italy. Amongst them his docility and obedience could not pass unnoticed, but were sufficient to mark him as a likely subject for future eminence, and consequently to procure to him particular attention. In his 15th year, after he had gone through the ordinary course of education, and when it was necessary to determine his farther pursuits, application was made to admit him into the order; and for the reasons we have mentioned, it was readily complied with. This was agreeable to his own inclination, and proved the source of that distinction in learning to which he afterwards attained.

The Jesuits, it is well known, had much interest and authority to promote in the city of Rome; whither it was customary in them to send those members whom they knew to be qualified for that purpose, and those youths of whom they had great expectations, for more instruction. As Boscovich was sent there in the year 1725, we may reasonably imagine he had profited much by his teachers, and was signalized for his abilities. This zeal in the cultivation of youth, which the Jesuits ever preserved, and which perhaps tended more to the preservation of their power than all their religious artifices, was attended with consequences the most beneficial to humanity; and when we recollect how many and how great the geniuses were which it discovered, and fostered and brought to maturity, we are almost induced to believe that it counterbalanced all the ill effects of their order. Had this education been confined to some limited sphere; had it embraced the prattling doctrines of casuistry and the unwieldy mass of cloistered theology alone; unfortunate and melancholy for the world would have been this zeal: no refuge for the venial penitent, no security against boisterous sectarianism would have remained; an unmanly lethargy would have debased the mind, and the moral and the intellectual world would have sunk to a dread chaos of confusion. But the Jesuits knew well the benignant influence of literature, and the salutary elevation of science; they saw that wealth, and power, and honour,

Boscovich nour, followed philosophy; and that philosophy had driven famine, wretchedness, and vice, from their habitations. We dare not say that the interest and aggrandizement of their order were secondary considerations; but we will avow it as our opinion, that the short reign of the Jesuits, and the objects at which they aimed, and above all the means which they employed, were more instructive, promised better, and effected more to humanity, than all the accumulated humility and sanctity of all the religious societies of the Romish church. We have been led into this digression by the coincidence of certain considerations operating at the time on our minds. Boscovich was of the order of Jesuits; that order is no more; its destruction took place in his life-time; gratitude for the delight and the instruction we have received from him and many others of the order; the present disposition among mankind to detract from its merits, to magnify its imperfections, and to confound it with the fanatical and enthusiastic groups of every persuasion which have disgraced the name and the dignity of religion. But to return; our author, on his arrival in Rome, entered the noviceship of the order, where his studies wore a new aspect, but were still pursued with diligence. Christian morality, the rules and constitutions of the order, claimed his attention for two years; after which he was instructed in rhetoric, and became well versed in general literature, in a particular manner in Latin poetry, which at that time was very much cultivated.

From the noviciate he was sent to the Roman college to study mathematics and physics. It was in these sciences that his elevated genius and uncommon abilities shone forth so conspicuously, and procured to him the admiration of his superiors. In three years time he was able to give private lessons on mathematics; and was then exempted from a law, by which the noviciates were bound to teach Latin and the belles lettres for five years before they commenced the study of theology. This exemption was in consequence of his great predilection to the mathematics, of which he was soon afterwards made public professor. It would appear to us, that the science of theology, as it was then inculcated, had little attraction for the mind of Boscovich; for it is not likely that a mind intimately acquainted with truth, and accustomed to find her ever plain and undisguised, could relish the retiring obscurities of sophistry, or the flimsy decorations of a mystical religion; nor can we wonder, that during the four years in which he was constrained to the study, he should become more familiar with Leibnitz, Maclaurin, and Newton, than with Loyola, and Laynez, and Aquaviva.

For the professorship of mathematics he was eminently qualified, as besides a thorough knowledge of all the modern productions in the science, he had acquired a pristine severity of demonstration by studying the works of the ancient geometricians; and he conjoined withal an obliging accommodation of his own powers to the deficiencies of his pupils. It was for their benefit he at this time composed elementary treatises on arithmetic, algebra, geometry and trigonometry. But notwithstanding the arduous duties of his situation which he invariably fulfilled, he found time to instruct and enlighten more than boys; for about this pe-

Boscovich riod, he entertained some of those original notions which were destined to grow up into system, and one day to astonish the whole world of science. These, as they grew, were strengthened by solid arguments in the public disputations, by anticipating obstacles, overcoming and removing them, and by mighty efforts in extending and applying them to the most remote and discrete actions of the universe. The animating spirit of discovery and invention led him to consider every portion of physical science; and indeed so versatile and so vigorous was his mind, we would be at a loss to specify one portion, which, within a few years, it did not comprehend, elucidate, and advance. In confirmation of this we beg to present our readers with an enumeration of the principal subjects to which he turned his attention, and concerning which he published dissertations whilst he continued in the professorship. The transit of Mercury over the sun; the spots in the sun; the aurora borealis; the construction of spheric trigonometry; the figure of the earth; a new telescope to determine celestial objects; the ancient arguments for the rotundity of the earth; oscillating circles; on infinites and infinitely little quantities; the motion of bodies in unresisting spaces; the aberration of the fixed stars; the inequalities in terrestrial gravity; on astronomy; on the limits of certainty in astronomical observations; on the solid of greatest attraction; the cycloid; the logistic curve lines; the *vires vivæ*; the comets; light; tides; the rainbow; the calculation of fractions; the centre of gravity; the moon's atmosphere; the law of continuity; lenses and dioptrical telescopes; the objective microscope; the divisibility of matter. Some of these are short, but all of them contain curious and valuable matter. It is only by perusing them we are able to discover the gradual progress of his mind; and to understand the manner in which he arrived at the theory of natural philosophy, which alone will render his name immortal.

About this time a taste for philosophical poetry was much prevalent amongst the learned, and some of our author's acquaintances had laboured in it with success. Of these we may mention Father Noceti, who wrote on the rainbow and the aurora borealis, and the justly celebrated Benedict Stay, whose poems on the philosophy of Descartes, and on the more modern philosophy, are excellent examples of fine Latin composition and scientific investigation. Boscovich published their works with annotations and supplements, in which a splendid fund of information and learning is displayed.

By such undertakings, the fame of our author was widely diffused, and he became an object of general admiration. The learned societies of many countries in Europe conferred on him unsolicited honours, and several foreign princes invited him to their courts. His opinions on various subjects of civil architecture, topography, and hydrodynamics, were asked and entertained by Pope Benedict XIV. John V. of Portugal, and others. These necessarily required his presence in different states, where he never failed to increase his reputation, and often terminated disputes which might otherwise have gone on to open warfare.

He was employed to correct the maps of the papal dominions, and to measure a degree of the meridian passing

Boscovich. passing through them. In this he was assisted by an English Jesuit, Christopher Maire. An account of their expedition was printed at Rome and Paris, and is interspersed with some curious anecdotes, concerning the opinions which the peasants of the Apennines formed of them, and the operations which they had to perform; but it is valuable on account of the accurate detail which is given of their observations.

In the year 1757, he was sent to Vienna by the republic of Lucca, to reconcile some differences concerning the draining of a lake, in which the grand duke of Tuscany, the emperor Francis I. and that republic, were concerned. It was after he had succeeded in the object of his visit to that city, that he published there his *Theoria Philosophiæ Naturalis* in 1758; and that he gained the esteem of the empress-queen.

Another occasion for his mediating powers soon presented itself, and which more nearly interested him, as his native city of Ragusa required them. It had been suspected by the British government, that some ships of war were fitted out at that port for the service of the French, thereby infringing the neutrality. Such a suspicion having no just foundation, alarmed the senate of Ragusa, and required speedy removal, as the consequences of it might be extremely prejudicial to their commerce. Boscovich, who had often been successful in similar circumstances for other powers, appeared to them the most proper person for this purpose, and was accordingly entrusted with it. He repaired to London, and here also effected the object of his mission with honour to himself. He visited the Royal Society, which received him with distinguishing marks of respect, and which he soon afterwards complimented with an excellent Latin poem on the solar and lunar eclipses. This was in the year 1760, when Dr Johnson was in London. Mr Murphy speaks of an interview which took place between our author and Johnson; but in order to magnify the unruly powers of the *tremendous companion*, he rather unhandsomely tells us of the *easy cant* with which a *priest* might travel through Italy and France. We are unwilling to mention what effects on some minds may have been produced by the formidable society of a Johnson; but if they are a contempt of elegant simplicity and ingenuous ease, and an affected devotion to repulsive pomp and authoritative ostentation, be our lot far from his influence, amid the peace and liberty of social life.

Boscovich was invited by the Royal Society to be of the party of their members sent to America, to observe the transit of Venus over the sun's disk, which happened in the year 1762. The nature of his embassy, and the necessity of returning home, however, prevented his acceptance of the invitation. Soon after his return, and when his embassy was fulfilled, he was appointed by the senate of Milan to the mathematical chair in the university of Pavia, and to superintend the observatory of the royal college of Brera. He continued in this situation for six years, when he was made professor of astronomy and optics in the Palatine schools of Milan by the empress-queen; who also requested him to continue his attention to the observatory. This he expected to be the most agreeable part of his life. Admired by the learned; beloved by his friends; having an adequate income, and a constitution sound and vi-

gorous; he promised to himself, happy, because useful **Boscovich.** days, in the tranquil cultivation of the sciences: but a cloud long impending now burst over his head, and these bright days never came.

The mysterious regulation in the political constitution of the Jesuits, though it had attracted the keen curiosity of the world, had, for very substantial reasons, never been explored; nay, such was the influence of the order over the minds of the most enlightened statesmen, that this impenetrable mystery was held sacred by the civil power in many countries, as if no danger could exist in what was not understood. But the rapid progress of science, and the gradual decay of superstition, required some evidence of security, and some proof that it was ever necessary to conceal good intentions, and to cover virtuous principles with any other garb than what truth could bestow. These, it is well known, the Jesuits either could not, or were unwilling to give; and they, therefore, justly incurred the suspicion of men. The most trivial circumstances would augment this suspicion, and the least deviation from rectitude in any of the order would serve to justify it: these were not wanting, and soon became invincible; the interest of the Jesuits rapidly declined for many years, and at last, in 1773, their order was totally abolished.

No exemption from the edict for its downfall could be procured; all who held offices were dismissed; and Boscovich sought refuge in the city of Paris. Thither indeed he was invited by the minister (we believe Turgot), by whose means he was made one of the directors of optics for the sea service, and received a pension: but it does not seem that his situation was agreeable to him; for it is well known that the peculiar nature of his circumstances was the sole cause of his long residence in Paris.

Whether his dislike arose from the envy of some of the French, his own irritability of temper, or the incongruity of the prevailing manners with his own, we cannot determine: but it is reasonable to imagine, that the ruin of his order, and the subsidence of his own importance, would leave some indelible mark in his mind; and perhaps when he contemplated the apparent levity and the real scepticism of the age, he might be brought to fear that the degradation or the downfall of the world was concomitant. Sentiments very opposite to those of the French would thence naturally arise; morosity and discontent would invade him, and he wished to revisit the scenes of his youth. Be all this, however, as it may, certain it is, he applied for leave of absence for two years, after he had resided in Paris for ten years: this he easily procured, and accordingly set out for Bassano in the republic of Venice. At this place he published, in five vols. quarto, a collection of the works which he had finished in Paris. This forms a body of optical and astronomical knowledge, well worthy the attention of the philosophical and mechanical cultivators of the sciences. It may be worth mentioning, that by proceeding on the principles contained in one of the dissertations in this collection, an amiable philosopher of our own country (Dr Robison) believed it possible to ascertain the motions of the earth, though the observer should be confined in a cellar; in prosecuting the subject, however, he

Boscovich found that an error into which Boscovich had fallen, concerning the aberration of light, undermined the principles on which he had erected such a wonderful but legitimate problem. The candid and very interesting acknowledgment of the error, and his extreme disappointment in the discovery of it, which the doctor made in the 3d vol. of the Edinburgh Transactions, is at once an evidence of his own liberality, and an undefeasible testimony to Boscovich's genius.

We beg to recommend to our readers the perusal of the works which we have now mentioned; they would tend to form the mind to the true mode of investigating the phenomena of nature, and will satisfactorily shew that this mode is always rewarded by discovery. The following is a pretty just account of their contents: A new instrument for determining the refracting and diverging forces of diaphanous bodies; a demonstration of the falsehood of the Newtonian analogy between light and sound; the algebraic formulæ regarding the focuses of lenses, and their applications for calculating the sphericity of those which are to be used in achromatical telescopes; the corrections to be made in ocular lenses, and the error of the sphericity of certain glasses; the causes which hinder the exact union of the solar rays by means of the great burning glasses, and the determination of the loss arising from it; the method of determining the different velocities of light passing through different mediums by means of two dioptrical telescopes, one common, the other of a new kind, containing water between the objective glass and the place of the image: a new kind of objective micrometers; the defects and inutility of a dioptrical telescope proposed and made at Paris, which gives two images of the same object, the one direct, the other inverse, with two contrary motions of moveable objects; masses floating in the atmosphere, as hail of an extraordinary size, seen on the sun with the telescope, and resembling spots; the astronomical refractions, and various methods for determining them; various methods for determining the orbits of comets and of the new planet, with copious applications of these doctrines to other astronomical subjects, and still more generally to geometry and to the science of calculation; the errors, the rectifications, and the use of quadrants, of sextants, of astronomical sectors, of the meridian line, of telescopes called the instruments of transits, of the meridian, and of the parallactic machine; the trigonometrical differential formulæ, which are of so much use in astronomy; the use of the micrometrical rhombus, extended to whatever oblique position; the error arising from refractions in using the astronomical ring for a sundial, and the correction to be made; the appearing and the disappearing of Saturn's ring; the methods of determining the rotation of the sun by means of the spots, proposed formerly by the author, and now perfected;

the greatest exactness possible in determining the length of a pendulum oscillating every second of middle time by the comparison of terrestrial and celestial gravity; a compend of astronomy for the use of the marine, containing the elements of the heavenly motions, and of the astronomical instruments, to be explained to a prince in the course of one month; a method for determining the altitudes of the poles with the greatest exactness, by means of a gnomon alone, where other instruments are not to be had; the determination of the illuminated edge of the moon to be observed on the meridian; a method of using the retrograde return of Venus to the same longitude, for determining the less certain elements of her orbit; a method for correcting the elements of a comet, of which the longitude of the node is given, and the inclination of the orbit has been found nearly; another method for the same purpose, and for finding the elliptical orbit, when the parabolic one does not agree with the observations; a method for correcting the elements of a planet by three observations; the projection of an orbit inclined in the plane of the ecliptic; the projection of an orbit inclined in any other plane; the calculation of the aberration of the stars, arising from the successive propagation of light; some beautiful theorems belonging to triangles, which are of great use in astronomy, reduced to the most simple demonstrations.

After the publication of these works, our author left Bassano, and went to Rome to visit the companions of his youth. From Rome, he proceeded to Milan, where he revised some of his own works, and prepared for publication the two last volumes of Stay's poems.

In such occupations, and amidst friends whom equal misfortune and temporary separation had still more endeared, he had remained happy, and might perhaps have been still further useful to the world; but his leave of absence was now nearly expired, and his dislike to a residence in Paris was augmented by the contrast which his present abode afforded. He was too delicate to apply for more leave of absence; and though he was sensible of the gratitude which he owed to France, he could not reconcile it with the destruction of his own repose. About this time also he had several attacks of gout, but he would admit no medical aid. Under these distresses, and others which we have before mentioned, our illustrious author at last sunk: a melancholy despondency seized on and subjugated his mind, so that for five months he remained perfectly fatuous; and an imposthume having burst in his breast, terminated his existence on the 13th of February 1787, in the 76th year of his age.

The following inscription was composed by Benedict Stay, and engraved on marble by order of the senate of Ragusa, in memory of their useful citizen the illustrious Boscovich.

 M. P. P.

Besides the works which we have mentioned, he wrote several others on various subjects, as, on the project of turning the navigation to Rome from Fiumicino to Maccarese; a third on two torrents in the territory of Perugia; a fourth on the bulwarks on the river Ponaro; a fifth on the river Sidone in the territory of Placentia; a sixth on the entrance into the sea of the Adige. He wrote other such works on the bulwarks of the Po; on the harbours of Ancona, of Rimini, of Magna Vacca, and Savona, besides others, almost all which were printed. He had likewise received a commission from Clement XIII. to visit the Pomptin lakes, on the draining of which he drew up his opinion in writing, to which he added further elucidations at the desire of Pius VI.

as many of the principles which we have to consider in this theory, much difficulty in investigation is to be expected, and perhaps the metaphorical language which we are constrained to employ, will tend not a little to embarrass and mislead us. We are also aware of the many obstacles which a theory of such magnitude has to encounter in the improved mode of philosophising of the present day; we are aware that at the bare mention of a new theory in natural philosophy, some of our readers will revolt from our page, affect a contempt of our labours, and call to their aid the authority of Bacon. But we would ask such, from whence does their spirit arise? we have found it in those who never studied a page of Bacon; and we have known it accompanied by indolence, and by a supine indifference to aught that dignifies and elevates humanity. It is surely no hard matter to condemn a theory, merely because it is a theory: nor is it at all demonstrable that such condemnation requires any great effort of genius or understanding. Now the spirit of Bacon is a spirit of zeal, and labour, and perseverance, and above all, of investigation. Not then from his writings has this contempt arisen, but from a total ignorance of them; not from his doctrine, but from an imaginary inspiration of his principles.

Boscovich's Theoria Philosophiæ Naturalis. We have spoken of Boscovich as the founder of a new system of natural philosophy, which has occupied much of the attention of the learned, and which alone will render the name of its author immortal. It becomes us therefore to give such a synopsis of it, as may satisfy the general reader, or induce the student to search for more information in the work from which we ourselves have derived it.

In a subject so abstruse and remote from observation,

We.

Boscovich's System of Natural Philosophy.

We have reason to believe that the theory of Boscovich would have received the sanction of the illustrious Bacon: because the foundation on which it is erected is consecrated by irradiation from his works. Be this, however, as it may, we are convinced that such an example of true genius will be acceptable to every friend of humanity, and to every cultivator of science.

That we may do justice to our author in giving a synopsis of his theory, we shall follow the order which he himself has adopted; and shall subjoin some general observations and remarks which have occurred to us in the course of the work.

2 divided into three parts;

Boscovich's *Theoria Philosophiæ Naturalis* is divided into three parts; of which the *first* contains the explication of the theory, its analytic deduction, and its vindication.

The *second* contains the application of the theory to mechanics, and

The *third* the application of the theory to physics. Of these in order, and first of the explication of the theory.

3 has some resemblance to other theories.

This theory has something in common with the Leibnitzian and the Newtonian.

With the former it admits that the elements of matter are simple and inextended; but it differs from it, in denying the *continued extension* of the elements, and in asserting that the elements are perfectly homogeneous.

4 Leibnitzian.

Like the Newtonian, it allows the existence of mutual powers or forces, which vary according to the distance by certain laws; but it goes further, in that it asserts these powers are both repulsive and attractive, and that when either of these terminates the other begins: but it differs from the Newtonian in explaining by one principle phenomena to which the latter applies three.

5 Newtonian.

This one principle may be expressed by an algebraic formula, or by one continued geometrical curve; and it is the law by which the powers of repulsion and attraction act. As continued extension of bodies is rejected from this theory, it is obvious, that as on the one hand a repulsive power must render it impossible, so on the other an attractive power must give rise to the apparent examples of it, to the phenomena of cohesion: this accordingly is one essential characteristic of the theory.

From these few remarks we may deduce the principles of the theory.

6 Principles of it.

The first elements or atoms of matter are indivisible, inextended, but simple, homogeneous, and finite in number. They are dispersed in an immense space, in such a manner as that any two or more may be distant from each other any assignable interval. This interval may be *indefinitely* augmented or diminished, but cannot entirely vanish. Actual contact of the atoms is therefore impossible, seeing that the repulsive power which prevents the entire vanishing of the interval, must be sufficient to destroy the greatest velocities by which the atoms tend to unite. The repulsive power must *encircle* every atom, must be equal at equal distances from the atoms, and moreover, must increase as the distance from the atoms diminishes. On the contrary, if the distance from the atoms increases, the repulsive power will diminish, and at last become equal to nothing, or vanish; then, and not till then, an at-

tractive power commences, increases, diminishes, vanishes. But the theory does not stop here; for it supposes, that a repulsive power succeeds to the second or attractive, increases, diminishes, vanishes; and that there are several alternations of this kind, till at the last an attractive power prevails, and though diminishing sensibly, as the squares of the distances increase, extends to the most distant regions of our system.

Boscovich's System of Natural Philosophy.

Such a process as we have now mentioned may seem A geometrical curve complicated and confused; but the curve line which expresses it is so simple, that we are persuaded, our readers, though unacquainted with geometry, will comprehend, and hence will be able to understand the theory itself.

A geometrical curve will express the whole of the theory.

We shall now proceed therefore to exhibit this curve, and to shew in what manner it elucidates the principles of the theory.

The axis CAC has an asymptote of a curve in the point A, viz. the indefinite right line AB; on each side of which are placed two equal and similar branches of a curve, viz. D'E'F'G', &c. and DEFGHIKLMNOPQRSTV: the latter of these having the asymptotical arch ED, though indefinitely produced towards the right line AB, will never touch it; but it accedes to the axis CAC, and touches it in some point E. From this point it recedes on the opposite side of the axis to some point F, bends again to the axis CAC, and cuts it in the point G; from this it recedes in a similar manner, on the side of the axis from whence it originated, and arrives at the point H. From the point H it bends to the axis CAC, and cuts it in the point I; and so on in alternate fits of accession and recession till it has completed the remaining arches IKL,LMN,NOP,PQR,RST; after which it becomes asymptotical, forming the arch T p s V, which approaches the axis CAC on the side opposite that from which it originated, in such a manner as that the distances from the axis shall be in the reciprocal duplicate ratios of the distances from the asymptote BA.

Plate XCIV. Fig. 1.

Now, if we raise and let fall perpendiculars on the axis CAC in the points a, b, d, &c. the segments of the axis so formed, viz. A a, A b, A d, &c. are abscisses, and will represent the distances between any two atoms or points of matter; and the perpendiculars so constructed, viz. a g, b r, d h, are ordinates, and will represent the intensity of the repulsive or attractive powers, according to their situation with respect to the axis CAC; for; if on the same side with the asymptote AB, as a g, b r, they represent the former; and if on the side opposite to the asymptote, as d h, the latter power.

From what we have said, it is manifest, that the ordinate a g may be increased beyond any assignable limit, provided the corresponding abscissa A a be diminished beyond any assignable limit; seeing that the limb of the curve ED is asymptotical which terminates the ordinate a g, and consequently never touches the right line AB; but that, if the abscissa be increased as to A b, then the ordinate will be diminished to b r; and that by perpetually increasing the abscissa to the point E, the ordinate will be perpetually diminished till at the point E it will totally vanish.

Moreover, if we shall increase the abscissa to A d, we shall find that on the opposite side of the axis CAC, there will appear the ordinate d h, which, by continuing the

Boscovich's the same increase of the abscissa will increase to the point F, and then will diminish perpetually, as it approaches to the point G, where it will totally vanish. If the abscissa be still increased, an ordinate arises on the opposite side, increases to H, diminishes to I, and vanishes, appears again, increasing to K, diminishing to L, vanishing; and so on through all the remaining points and situations of the curve, till at length coming to *po* and *sv*, it continues to diminish perpetually, but never again totally vanishes.

Such then is the nature of the curve, and such, it must be admitted, will comply with the description of the repulsive and attractive powers, and the manner in which they alternate, so essential to the theory. The first power or that next the atoms is repulsive, and is greatest at the least distances from them; by increasing the distances it diminishes, vanishes; is succeeded by attraction, which increases, diminishes, vanishes; is in like manner succeeded by repulsion; and those two powers alternate repeatedly, when the attraction succeeding, constitutes the general gravity of Sir Isaac Newton, and reaches to the planets, and the far distant comets of the system of the sun.

It is obvious, that the transitions which we have described must occur in the insensible distances, being all comprehended betwixt the atoms and the exterior attractive power; but it is also obvious that this law of the forces differs much from the Newtonian gravity, as the curve which expresses the latter is a hyperbola of the third order, lying all on one side of its axis which it never cuts; consequently it does not admit of any transitions, as we have before hinted at. It is of consequence to remember this distinction, for we shall find that on it depends much of our reasoning in the application of the theory to physics.

Some further explanation of the curve remains to be given in the second part: in the mean time we proceed to take notice of certain geometrical properties essential to it, as answering the conditions of the principles of the theory.

Boscovich, in an after part of the work, demonstrates strictly that the curve is possessed of these properties; but we do not think it necessary to detail his demonstration, as it is only accessible to those who are versed in the high geometry, and as we imagine that a bare statement of the conditions required will satisfy the generality of our readers.

The conditions necessary in the curve are six in number. First, That it be regular, simple, and not an aggregate of arches of different curves. Secondly, That it shall cut the axis C'AC in certain given points only, and at the two distances AE', AE; AG', AG, &c. which are equal on both sides of the asymptote, the right line AB. Thirdly, That there shall be ordinates to correspond to every abscissa. Fourthly, That there shall be equal ordinates at equal abscissas on each side of AB. Fifthly, That the right line AB be an asymptote to the curves on each side of it; the area BAED asymptotical and therefore indefinite. Sixthly, That the arches which are terminated by any two intersections may be varied in any manner, recede from the axis C'AC to any distance, and accede to whatever arches of whatever curves, cutting, touching, or oscillating them wheresoever, and howsoever we please.

If these conditions be answered, it must be evident that by this curve we can express any intensity of any force, in any direction we please; and of consequence, that by one law of the forces, every thing in the universe, connected in any manner with motion, may be explained.

We come now to consider the analytic deduction of the theory, in which we shall follow closely the steps of Boscovich.

Boscovich sets out, by examining the nature of the law of continuity, and the principles on which it is founded. In the year 1745 he published a dissertation *De Viribus vivis*, in which he was led to consider the phenomenon of the collision of bodies, and in consequence, the dilemma into which former philosophers had fallen by their mode of investigating it, and the breach of the law of continuity which some had allowed to extricate themselves from the dilemma.

Maclaurin, of whom Boscovich speaks in terms of the highest respect, "Summus nostri ævi geometra et philosophus," was the principal advocate for the breach of the law of continuity in the collision of bodies, and spoke with some indignation of those who asserted, that this law was universal. He of course believed in the production of motion by impulse, and in the immediate contact of bodies. Now Boscovich, as we have before mentioned, rejects both of these suppositions, and consequently explains the phenomenon in a very different manner from Maclaurin, and endeavours to prove that the law of continuity is universal, and that no instance of a breach of it is ever observable or possible.

Before proceeding to his reasoning on this subject, we shall explain what is meant by the law of continuity, and give one example of it, to which all others are referable.

The law of continuity (says Boscovich) consists in this, that any quantity whilst passing from one magnitude to another, must pass through all the intermediate magnitudes of the same kind: or, according to the law of continuity, all changes in nature are produced by insensible and infinitely small degrees; so that no body can in any case pass from motion to rest, or from rest to motion, without passing through all possible intermediate degrees of motion. Maclaurin's Newton, b. 1. c. 4.

Let there be a right line AB (fig. 2.), to which another line CDE is related; let AB represent the time, and from any points of it, F, H, let there be erected the perpendiculars FG, HI, which (ordinates) may represent any quantities continually variable, and will correspond to the moments of time F, H; but to the intermediate moments K, M, other magnitudes KL, MN, will correspond; and if from the point G to the point I there goes a continued and finite part of the line CDE, it is evident that there is no intermediate point of the line AB, as K, to which some ordinate KL does not correspond; and conversely that there is no ordinate of magnitude intermediate betwixt FG, HI which does not correspond to some point intermediate betwixt F, H. Now the variable quantity expressed by this variable ordinate, changes according to the law of continuity; because from the magnitude FG, which it has in the moment of time F, to the magnitude HI, which it has in the moment of time H, it passes

tinuity.

Boscovich's passes through all the intermediate magnitudes KL, MN corresponding to the intermediate moments, K, M, and to every moment a determinate magnitude corresponds.

This then may be sufficient to explain the nature of the law of continuity, about which, we may remark, there can be no ambiguity; for the terms which express it are precise, it is a matter of fact, and one example of it is enough to give us an adequate idea of it. We proceed, therefore, to consider on what its universality is founded; and here two questions naturally occur: Have we discovered the universality of this law by a laborious induction? or does it necessarily result from the nature of continuity? Boscovich answers both of these questions in the affirmative.

¹²
which is
discovered
to be uni-
versal.

1. It is discovered by induction. Here we beg to transcribe the words of our author, as much more satisfactory than any thing we can give: "Quin immo in motibus ipsis continuitas servatur etiam in eo, quid motus omnes in lineis continuis fiunt nusquam abruptis. Plurimos ejusmodi motus videmus. Planetæ et cometæ in lineis continuis cursum peragunt suum, et omnes retrogradationes fiunt paulatim, ac in stationibus semper exiguus quidem motus, sed tamen habetur semper, atque hinc etiam dies paulatim per auroram venit, per vespertinum crepusculum abit, solis diameter non per saltum, sed continuo motu supra horizontem ascendit, vel descendit. Gravia itidem obliquè projecta in lineis itidem pariter continuis motus exercent suos, nimirum in parabolis seclusa aeris resistentia, vel ea considerata, in orbibus ad hyperbolas potius accedentibus, et quidem semper cum aliqua exigua obliquitate projiciuntur, cum infinitis infinitam improbabilitatem habeat motus accuratè verticalis inter infinitas infinitas inclinationes, licet exiguas, et sub sensum non cadentes, fortuito obveniens, qui quidem motus in hypothesis telluris motæ a parabolicis plurimum distat, et curvam continuam exhibent etiam pro casu projectionis accuratè verticalis, quo quiescente penitus tellure, et nulla ventorum vi deflectente motum, haberetur, ascensus rectilineus, vel descensus. Immo omnes alii motus a gravitate pendentes, omnes ab elasticitate, a vi magnetica, continuitatem itidem servant, cum eam servent vires illæ ipsæ, quibus gignuntur. Nam gravitas, cum decrescat in ratione reciproca duplicata distantiarum, et distantia per saltum mutari non possint, mutatur per omnes intermedias magnitudines. Videmus pariter vim magneticam a distantibus pendere lege continua; vim elasticam ab inflexione, uti in laminis, vel a distantia, ut in particulis aeris compressis. In iis, et omnibus ejusmodi viribus, et motibus, quos gignunt, continuitas habetur semper, tam in lineis, quæ describuntur, quam in velocitatibus, quæ pariter per omnes intermedias magnitudines mutantur, ut videre est in pendulis, in ascensu corporum gravium, et in aliis mille ejusmodi, in quibus mutationes velocitatis fiunt gradatim, nec retro cursus reflectitur, nisi immutata velocitate per omnes gradus. Ea diligentissimè continuitatem servant omnia. Hinc nec ulli in naturalibus motibus habentur anguli, sed semper mutatio directionis fit paulatim, nec vero anguli exacti habentur in corporibus ipsis, in quibus utcumque videatur tenuis acies, vel cuspidis, microscopii saltem ope videri solet curvatura, quam etiam habent alvei fluviorum semper, habent arborum folia, et frondes, ac rami, habent la-

pides quicunque, nisi forte alicubi cuspidis continuæ occurrant, vel primi generis, quas natura videtur affectare in spinis, vel secundi generis, quas videtur affectare in avium unguibus, et rostro, in quibus tamen manente in ipsa cuspide unica tangente continuitatem servari videbimus infra. Infinitum esset singula persequi, in quibus continuitas in natura observatur. Satis est generaliter provocare ad exhibendum casum in natura, in quo continuitas non servetur, qui omnino exhiberi non poterit." (*Theoria*, p. 18.)

Boscovich's
System of
Natural
Philosophy.

From these and other examples, in which the law of continuity is manifestly held, Boscovich infers, that it is universal; and that in so far as induction supports us, we are at liberty to apply it in the explanation of phenomena. Nay, we are by the same principle compelled to admit it in cases where observation fails us; because to imagine that in such cases this law is broken and some other is adopted, is to transgress one of the fundamental principles of true philosophy: it is to multiply causes unnecessarily; it is to limit the power of the Creator by the imperfection of our own senses; and it will plunge us into difficulties which no effort of human reason will remove. Besides this, it is very easy to conceive that the law is permanent; and as no absurdity, therefore, accompanies the supposition, and no fact can be brought to overthrow it, whereas the contrary is unsupported by any fact, but is plainly repugnant to all, it is surely rational to make use of it, and to hold it as the general principle, till some higher one be discovered on which it depends.

From induction alone, therefore, we may infer the universality of the law; but Boscovich has other arguments, which he calls positive, to support and evince this. This leads us to the second question, Does this universality necessarily arise from the nature of continuity? The limit which joins the precedent and consequent of any thing, is common to both, and is therefore indivisible. Thus a superficies separating two solids, wants thickness, and is that in which a transition from the one to the other occurs; a line dividing two parts of a continued superficies wants breadth; a point discriminating two segments of a continued line wants every dimension. So it is with regard to time, for the limit of two conjunct portions is common to both, and indivisible; and, as every change of a variable quantity from one magnitude to another must be made in time, so every change must be influenced by the continuity of time. But to every moment of time, a certain magnitude of the variable quantity corresponds, and the limit of two moments of time is common and indivisible; therefore, the limit of two magnitudes corresponding to these two moments must be common and indivisible. Moreover, it is impossible for any quantity to have two magnitudes at the same time, and when continually varying, that it shall have the same magnitude at different times; much more impossible, therefore, that in the limit of two moments of time it shall have two magnitudes, the one corresponding to the precedent, and the other to the consequent moment, or shall not have gone through the intermediate magnitudes in the intermediate moments of time. For the same reason, a body cannot have two velocities at the same time, and therefore cannot have two velocities in the limit common to two moments of time; and when continually changing its velocity, cannot have the same

¹³
Its univer-
sality evin-
ced by a
positive ar-
gument;

Boscovich's same velocity in different moments of time, but must go through all the intermediate velocities in the intermediate moments of time. Hence then, in passing from the magnitude 8 to the magnitude 12, the variable quantity passes through the magnitudes 9, 10, 11. In going from the velocity 7 to the velocity 11, a body must go through the velocities 8, 9, 10. The increase of temperature goes on gradually: the mercury in the thermometer rises gradually, going through every intermediate degree from one to another. Now as this reasoning is uninfluenced by any considerations of the hardness, softness, elasticity or other property of bodies; these, it is evident, do not influence the universality of the law as resulting from the nature of continuity.

14 therefore actual contact impossible.

From these arguments, therefore, and from induction, Boscovich concludes, that the law of continuity is essentially universal, and that a breach of it is metaphysically impossible. The use made of this deduction in explaining the collision of bodies, must at once be understood by our philosophical readers. If in this and all other phenomena, the law of continuity is preserved, there can no actual contact take place amongst bodies; and it is from the universality of the law so established that Boscovich derives this original principle of his theory.

To apply this then in the collision of bodies, we argue in the following manner. Since the bodies cannot come into immediate contact with the preceding velocities, it is necessary that their respective velocities be changed before contact, that either the velocity of the antecedent body shall be augmented, or that the velocity of the consequent body shall be diminished, or that both of these changes shall occur. Now the cause operating betwixt the bodies, so as to retard the one, and to accelerate the other, must be a power, and must act *from* the bodies, and must also be sufficient to overcome the greatest velocities with which the bodies tend to unite, and be mutual, because action and re-action are equal. In fine, this is the interior repulsive power according to the definition. This mode of explaining the phenomena, we may observe, is general, seeing that no hardness, softness, or elasticity of the bodies, has any influence on the general principle from which it is deduced; but these properties will influence the particular cases of the phenomenon, and cause certain modifications, which, however, do not concern us at present.

15 Repulsive power.

In this manner we derive evidence for the existence of the interior repulsive power; but for this we have also the light of induction to assist us, as we shall prove in the conclusion of our article.

16 Inextension of the atoms.

As the repulsive power may be increased to infinity, by diminishing to infinity the distance betwixt the atoms of matter, it is obvious, that no part of matter can be contiguous to another part; from which it follows, that the primary elements of matter are simple and uncompounded. From similar arguments, and from others deduced from the absurdities involved in the contrary supposition, Boscovich maintains, that they are also inextended and indivisible.

17 Attractive power.

The existence of an attractive power is allowed on all hands; we need not therefore enumerate Boscovich's arguments on the subject. For proofs of the

transitions from one power to another, we are referred to the phenomena of effervescence, fermentation, cohesion, &c.; the consideration of which belongs to the third part of our subject.

Boscovich's System of Natural Philosophy

To prove the homogeneity of the atoms, Boscovich makes use of the same reasons which have been employed by other philosophers; and he removes the objections made to it by Leibnitz, on the principle of the sufficient reason, and the visible diversity of bodies: the former he contends to be safe, being founded on that doctrine of necessity which Leibnitz maintained; and with respect to the latter, he describes a beautiful and striking analogy, which we cannot refrain from transcribing.

18 Homogeneity of the atoms.

“ Fieri possent nigricantes literæ, non ductu atramenti continuo, sed punctulis rotundis nigricantibus, et ita parum a se invicem remotis, ut intervalla non nisi ope microscopii discerni possent, et quidem ipsæ literarum formæ pro typis fieri possent ex ejusmodi rotundis sibi proximis cuspidibus constantes. Concipiatur ingens quædam bibliotheca, cujus omnes libri constarent literis impressis, ac sit incredibilis in ea multitudo librorum conscriptorum linguis variis, in quibus omnibus forma characterum sit eadem. Si quis scripturæ hujusmodi et linguarum ignarus circa ejusmodi libros, quos omnes à se invicem discrepantes intueretur, observationem institueret cum diligenti contemplatione, primo quidem inveniret vocum farraginem quandam, quæ in quibusdam libris occurrerent sæpe, cum in aliis nusquam apparerent, et inde lexica posset quædam componere totidem numero, quot idiomata sunt, in quibus singulis omnes ejusdem idiomatis voces reperirentur, quæ quidem numero admodum pauca essent, discrimine illo ingenti tot, tam variorum librorum reducto ad illud usque adeo minus discrimen, quod continerentur lexicis illis, et haberetur in vocibus ipsa lexica constituentibus. At inquisitione promotâ, facile adverteret, omnes illas tam varias voces constare ex 24 tantummodo diversis literis, discrimen aliquod inter se habentibus in ductu linearum, quibus formantur, quorum ‘combinatio diversa pareret omnes illas voces tam varias, ut earum combinatio libros efformaret usque adeo magis à se invicem discrepantes. Et ille quidem si aliud quodcunque sine microscopio examen institueret, nullum aliud inveniret magis adhuc simile elementorum genus, ex quibus diversa ratione combinatis orirentur ipsæ literæ; at microscopio arrepto, intueretur utique illam ipsam literarum compositionem è punctis illis rotundis prorsus homogeneis, quorum sola diversa positio ac distributio literas exhiberet. Hæc mihi quædam imago videtur esse eorum quæ cernimus in natura. Tam multi, tam varii, illi libri corpora sunt, et quæ ad diversa pertinent regna, sunt tanquam diversis conscripta linguis. Horum omnium chemica analysis principia quædam invenit minus inter se difformia, quam sint libri, nimirum voces. Hæc tamen ipsæ inter se habent discrimen aliquod, ut tam multas oleorum, terrarum, salium species eruit chemica analysis è diversis corporibus. Ulterior analysis horum veluti vocum literas minus adhuc inter se difformes inveniret, et ultima juxta theoriam meam deveniret ad homogœna punctula, quæ ut illi circuli nigri literas, ita ipsa diversas diversorum corporum particulas per solam dispositionem diversam efformarent: usque adeo analogia

Boscovich's ex ipsa naturæ consideratione derivata non ad difformitatem, sed ad conformitatem elementorum nos ducit." System of Natural Philosophy. (*Theoria*, p. 49.)

Objections to the theory obviated.

19

It is from these simple principles which we have enumerated that Boscovich deduces analytically the whole of his system; and he now proceeds to remove or explain away the objections to it.

It has been objected in the first place to the mutual powers, that they are occult qualities, and that they induce action at a distance. But in reply, so far from being occult they are very manifest, an idea of them can easily be formed, their existence is evinced by a positive argument, and their effects are continually before our eyes; we may add also, that the same objection was made to the Newtonian attraction, and that the same arguments serve to remove it from both. As to the mutual powers inducing action at a distance, much indeed may be said, but it is very questionable if all that can be said will ever clear up the obscurity that perpetually involves this inextricable phenomenon. We reserve some remarks on the commonly received notions on the subject, for our conclusion; in the mean time, we may affirm, that it is as easy to conceive motion produced by the powers we have spoken of, i. e. at a distance, as produced by immediate impulse. We know, indeed, that till of late, philosophers were accustomed to consider the connexion between impulse and motion so essential, and their notions on the subject so clear and fundamental, that whenever they could reduce any phenomenon to that predicament, they flattered themselves every difficulty vanished, and consequently farther investigation was superfluous. But we also know, that till of late, water was held to be a simple body, and that when it could be shewn to arise in any chemical experiment, it was customary in chemists to believe it had previously existed in the subjects of their experiment. Do we coincide in this belief in the present day?

It has been objected, that the theory itself admits a sudden transition from one power to another; but a due inspection of the curve, and the explanation of it which we have given, will convince that this is impossible, for that every change is made by passing through every intermediate degree.

The principal objections, as might have been expected, have been made to the rejection of contact, to the inextension of the atoms, and to their indivisibility. But it is allowed, that bodies approach so near to each other, as to leave no sensible distance between them; and that the resistance which we experience is made by the repulsive power which gives us the same sensation as actual contact. We can form no idea, it is true, of an inextended indivisible atom of matter, because all our ideas of matter are associated with extension and parts; and so difficult is it to break the association, we imagine these are essential to it. Boscovich directs us to consider the nature of a mathematical point, in which there is involved no notion of extension or parts, and that from this we can form no idea of an inextended atom. The notion of an inextended and simple atom is not peculiar to the theory of Boscovich. Zeno and his followers among the ancients, and the modern Leibnitzians, adopted it. But Boscovich, by denying actual contact and continued extension, gets rid of the absurdities which resulted from their opinions.

Some have asserted that the atoms of this theory do not differ from spirits, because they have not extension, which is the characteristic of matter. Does then extension constitute matter, and the want of it spirit? We apprehend not. The discrimination of matter and spirit consists in these two circumstances: the former is perceptible by our senses, and is incapable of thought and volition; whereas, the latter does not affect our senses, but can both think and will. But the perceptibility of matter arises from its impenetrability, not from continued extension. Besides this, the atoms have repulsive and attractive powers, though they do not therefore resemble spirit. For were we to admit the existence of a kind of being possessed of these active powers, conjoined with inertia, and having at the same time cogitation and volition; it would neither be matter nor spirit, but a *tertium quid*, distinguished from the former by cogitation and volition, and from the latter by inertia, and by powers which induce impenetrability.

Boscovich's System of Natural Philosophy.

Boscovich treats the other metaphysical objections to his theory in a similar manner; but we think it very unnecessary to dwell longer on them, and shall therefore proceed to the second part of our subject.

II. We are obliged to be concise in our account of the application of the theory to mechanics, because, though very valuable in itself, it can hardly be abridged, and would prove interesting to those only who are versed in mechanical science. There remains, however, some farther circumstances of the curve to be considered, which are essential to the fully understanding the theory itself, and the manner in which it is to be applied either to mechanics or to physics. We propose to deliver them in this place in conformity with our author's plan, though they are equally suitable to any of the three parts.

Application to mechanics.

The circumstances we mean are of three kinds. 1st, The arches of the curve. 2dly, The areas comprehended betwixt the axis, and the arches which the ordinates generate by continually flowing. 3dly, The points in which the curve cuts the axis.

Further remarks on the curve.

1. The arches are either repulsive or attractive, according as they are situated on the same side of the axis with the asymptotic limb ED, or on the side opposite, and terminate the ordinates exhibiting the repulsive or the attractive powers. The arches may bend towards the axis, and turn again from it without touching or cutting it, as in the arch Pef; this bending may be repeated, and may occur on either side of the axis, and it may admit of many varieties in figure and size, so as to express every possible action and mode of action.

Archae.

2. The areas may be of any magnitude, however great or small, or they may be infinite, according as the arches depart more or less from the axis, or become asymptotical with respect to it. The abscisses represent the distances betwixt the atoms, and the ordinates the present force by which they are acting: the areas which the ordinates run through, express the increment or the decrement of the squares of the velocities which are generated. From these principles it is easy to see in what manner the doctrine of dynamics may be applied in the theory. And from this very circumstance it is clear that this theory does not interfere with principles in mechanics which are deduced from reasoning abstractedly

Areas.

Boscovich's System of Natural Philosophy. structuredly on space, velocity, and time, and in which the nature and properties of matter have no place. This remark is momentous, because it serves us in forming an adequate opinion of the merits of the theory, and it completely overthrows the scepticism concerning mechanical knowledge into which some have been led by imperfectly understanding the object and the principles of Boscovich. We beg to impress this on the minds of our readers, and to assure them, that though the theory of Boscovich be most satisfactorily established, there will not one fundamental principle in the science of mechanics be overturned. This will no doubt mortify the ignorant sceptic, but it will animate the true student to greater exertions, and it may open to him a field in which glory and fame remain yet to be reaped. To return, the asymptotic area included betwixt any asymptote and ordinate may be either infinite, or finite of any magnitude however great or small: or, more generally, the area is infinite if the ordinate increases in the simple reciprocal ratio; but if the ratio be less in any degree, the area is finite.

24 Points.

3. The points in which the curve cuts the axis are of two kinds, one where the transition is from repulsion to attraction, the other where it is from attraction to repulsion. Now these are called limits, and though they have something common with each other, yet do they essentially differ. They have this in common, that if two atoms be placed at the distance of any limits from each other, no mutual power is exerted by them; consequently if they are respectively at rest, they continue so. But if they be moved from their respective rest, then an essential difference is observable betwixt these two kinds of limits. In the limit of the first kind, viz. where the transition is from repulsion to attraction, the atoms resist further separation, and endeavour to regain their former distance by the attractive power then operating; and they resist nearer approach than the limit, and endeavour to regain their former distance, by the repulsive power then operating. This therefore is called a *limit of cohesion*, seeing that if an atom be any way removed from it, it endeavours to regain it.

25 Limits of cohesion.

26 Of non-cohesion.

But in the limit of the second kind, if the distance betwixt the atoms be in the least increased, then will these atoms tend from each other more and more, by the repulsive power then operating; and if the distance betwixt them be in the least diminished, then they will tend to each other more and more, by the attractive power then operating. This therefore is called a *limit of non-cohesion*, seeing that if an atom be any way removed from, it departs more and more from it. Now the limits of cohesion may be very strong or very weak; for if the curve cuts the axis perpendicularly, it is evident that the ordinates on each side of the limit are the greatest, and therefore the forces which they express the greatest. On the other hand, if the curve cuts the axis in a very small angle, it is also evident that the ordinates on each side of the limit are very small, and therefore the forces which they express very small; and these in any proportion. Of the limits of non-cohesion we may observe that, in a similar manner, according to the angle formed by the curve in cutting the axis at the points representing them, the atoms will recede from, or accede to each other with greater or smaller velocity, when their respective distance is changed.

The remarks which we have now made, together with the former explanation of the curve, are sufficient to acquaint our readers with the general principles of the theory, and will serve to exhibit the manner in which it may be applied to mechanics and to physics. Of the former, we have already mentioned, it is difficult to give even an abridgment; we propose then to employ the remainder of this part in enumerating the particular subjects in mechanics to which our author has applied his theory, and in giving our opinion of the degree of success with which his application is attended.

Boscovich's System of Natural Philosophy.

He commences by showing in what manner masses of matter may be formed by the atoms, supposing them endowed with the powers of repulsion and attraction; and first of the combination of two atoms, then of three, and so to the most complicated bodies. He proves that the masses so formed will be possessed of different properties, in consequence of the disposition of the powers which in certain cases will always attract, in others always repel, and in others again will do neither, i. e. will be neutral. From these differences will necessarily result peculiarities in the mode of the action of different masses, and these so endless and diversified, as to include every possible phenomenon in nature. It is easy to conceive that the varieties in figure will readily result from the position of the atoms, and the influence of the powers in respect to each other. Thus a pyramid may be formed of four atoms, and a cube of eight; these smaller or primary masses may be combined to form secondary, and so on to any order. Regular and irregular bodies will thence be formed; and yet it may be shown that the most irregular and complicated may be reduced to the primary or original forms, from whence they were constructed. The crystallization of salts, for example, may in this manner be accounted for, and the reduction of them into the primitive forms be explained on the principles of the theory. These phenomena imply composition and equilibrium of forces, which strictly belong to mechanics; our author therefore proceeds to consider these and other subjects connected with them: as the centre of gravity; the equality of action and reaction; the collision of bodies; the centre of equilibrium; the centre of oscillation; the centre of percussion. In all of these we may observe his law of the forces is strictly applicable; that by it some very difficult problems are solved, and some intricate phenomena explained, with an accuracy and precision highly creditable to Boscovich, and strongly presumptive of the value of his theory. The formulæ which his investigations afford are certainly curious and interesting to the speculative, and may be useful to the practical mechanic. He adds a few remarks on the pressure and velocity of fluids, which are equally clear, and in our opinion satisfactory.

27 Combinations of the atoms

28 forming different bodies.

III. We have already anticipated some of the principles which more properly belong to this part, in which we consider his application of the theory to physics. This necessarily comprehends all the general properties of matter, some of which have already engaged our attention when treating of the analytic deduction and vindication of the theory, but still require some particular observations.

29 causing the mechanical phenomena.

The impenetrability of the atoms is a necessary consequence of the interior repulsive power increasing as the distance is changed.

30 Application to physics.

31 Impenetrability.

Boscovich's System of Natural Philosophy.

the distance diminishes; but it also arises from the extension of the atoms, and their indivisibility: because as space is infinitely divisible, it is infinitely improbable that any two atoms should ever meet in the same part of it, though no repulsive power existed, seeing that they may move in an infinite number of the parts of space which are unoccupied. So that, independent of any repulsive power, it is infinitely improbable that any compenetration should occur.

32 Extension.

Physical extension necessarily arises from the impenetrability of the atoms; because by it no two atoms can occupy the same part of space, and are therefore kept without each other; but it is not mathematical or continued extension, seeing that some space must intervene betwixt all the atoms. Our senses, it is true, cannot perceive this space on account of its smallness; no more can they perceive the distances betwixt the particles of water or other fluid, and yet from certain phenomena it is demonstrable that such distances exist.

33 Figurability.

From extension arises *figurability*, seeing that by the combination of the atoms certain forms must be produced: it can be easily shewn that, on account of the various limits of cohesion, there may be very different quantities of matter under the same figure; and this involves the consideration of *density*. The mass of a body is the whole quantity of matter pertaining to it, or the number of atoms which compose it. But it may be remarked that our idea of the mass is very vague, arbitrary, and confused, owing to the apparent heterogeneity of bodies.

34 Inertia.

The inertia of bodies is the consequence of the inertia of the atoms and of the mutual powers; and by it we understand the determination to persevere in the same state of rest or uniform motion in a right line, unless forced by something external to change from it.

35 Mobility.

Mobility, one of the general properties of bodies, being essential to the atoms, is so to the masses formed of them. It is a consequence of the mutual powers of the theory. Now all the motion we observe is merely relative, either in respect of the earth, the planetary system, or the system of the fixed stars. From this perhaps we may derive an argument for the universality of the law of continuity in the case of motion, seeing that the instances where the law appears to be broken, must be explained by the combined influence of moving powers which act continually and gradually; and that there is not one example of absolute rest in the universe.

36 Compossibility.

Though continued extension and divisibility be denied to the atoms, it is allowed that they may be infinitely compounded; and hence compossibility is contrasted with divisibility in the theory.

37 Gravity.

General gravity, according to the Newtonian principles, is allowed in this theory, as we have before mentioned; and we may now remark, that the objection urged against it, as tending to produce an aggregate of all the matter in the universe, by drawing the planets, comets, and fixed stars, into one portion of space, may be obviated by supposing that a repulsive power succeeds the attractive after it has reached to the comets of our system; or that as by the curve, the limb $TpsV$ ceases to be asymptotical, and cuts the axis so as to exhibit an arch of repulsion on the opposite side.

Of all the general properties of matter, that of co-

hesion is most simply and beautifully explained by this theory; but as we have already spoken of its limits and their varieties, we need not now enlarge on it. We have to consider certain other properties of bodies, which from not being general have been called *secondary*. Of these the principal are solidity and fluidity.

Fluidity.—Boscovich imagines that the particles of fluid bodies are spherical, and that their forces are more directed to their centres than to their surfaces; by which motion is allowed freely when any force is applied to them from without; and that when at rest all the particles are in equilibrium in respect of each other, but that the pressure of incumbent bodies, and containing vessels, always causes some deviation from it. He says, there are three kinds of fluids: one in which the particles or massules have no mutual power; one in which they have repulsive power, and the other in which they have an attractive power. Of the first we have examples in sand and fine powders; of the second are the elastic fluids, as air; and of the third, all liquors, as water, mercury, &c. Now these three kinds are produced by the original differences in the primary particles which compose them; and we are able on the principles of the theory to specify the causes of the diversity in the phenomena which they exhibit.

Solidity is the consequence of the irregular figure of the particles and their great deviation from sphericity, by which free motion among them is prevented, and their cohesion better secured. Now the diversity in solids arises from the various degrees of strength in the limits of cohesion; and the same principles will give rise to a class of bodies intermediate betwixt solids and fluids, viz. the viscous, whose particles attract each other more strongly than the fluids, and not so strongly as the solids.

If we imagine the particles to be so formed as to attract on some sides, and to repel on others, and to attract certain particles similarly constructed, and to repel others, we may conceive in what manner the regular bodies denominated *organized* are compounded; and for these the varieties admitted in the limits of cohesion, situation, and combination of atoms, will abundantly suffice. Humidity is only relative, seeing that water, e. g. adheres to our fingers, and may be easily spread out on glass, wood, &c. whereas it does not affect oleaginous and resinous bodies: now this is in consequence of the partial arrangement of the powers in different bodies, and the varieties in the combination, &c. of the particles.

Of the chemical operations Boscovich remarks in general, that they may be all traced to the same principle, the law of the forces, and the differences in the particles which thence arise; and that were they subjected to the observation of our senses, a general reason for them would be discovered; but for this there are required an intimate knowledge of the texture of all the particles, and a power of geometry and analysis which far exceeds the human mind. He explains some of them in the following manner: And first of solution. The particles of some solids have a less attraction for each other than for the particles of some fluids, and consequently when these are applied to each other, the particles of the former will separate and combine with those of the latter, so as to form a mixture in which the two bodies are suspended in combination.

But

Natural
Philosophy.

But the separation of the partioles of the solid can only take place so long as the particles of the fluid are in the sphere of their attraction; and when either of them get beyond it, or when the attraction of the mixture so formed, becomes equivalent to the attraction of the particles of the solid for each other, then no more solution will take place, and the menstruum is said to be saturated. But if into this mixture another solid, whose particles have a greater attraction for the menstruum than those of the former, be thrown, then the menstruum will leave the former solid, or its particles, and adhere or combine with the latter; in which case the former solid in the form of powder will fall to the bottom, or what is called precipitation will occur. In short, he gives pretty nearly the common explanation of the phenomena; and on similar principles he accounts for the mixture of fluids. Now if the particles of two fluids which are mixed together, come into the limits of cohesion, a solid will be thereby generated, of which we have some examples. On the other hand, two solids triturated together may compose a fluid, in consequence of the particles of each departing from the limits of cohesion.

If we consider that the first limb of the curve exhibits impenetrability, the last gravity, and the intersections the various kinds of cohesion, we may form some notion of the manner in which fermentation, evaporation, deflagration, &c. are caused; for whilst atoms accede to each other with any velocity, they increase the velocity in every attractive arch, but they diminish it in every repulsive arch; whereas, on the contrary, whilst they recede from each other, they increase it in every repulsive arch, and diminish it in every attractive arch, until in the former case they arrive at a repulsive arch, or in the latter an attractive one, which is sufficiently strong to extinguish the whole velocity. When they do so, they are reflected in the same course, and oscillate backwards and forwards. Besides this, if bodies composed of particles which have different properties, in consequence of the different situation and combination of the powers, be mixed together, an agitation among them must necessarily arise in order to obtain an equilibrium; hence oscillations, perturbations of various kinds, will follow, and cause the great diversity of phenomena which are observed. Now all of these take place within the sphere of general gravity, which does not *immediately* influence the operations. Substances which are dissolved may not only be obtained again by precipitation, but also by evaporation of the menstruum in which they are dissolved. In this latter case the bodies generally assume some regular forms, denominated crystals. Now this arises from the particles coming gradually into the sphere of the attractive power of each other, and consequently attaining to some limit of cohesion, by the menstruum, which formerly kept them asunder, being gradually removed; whereas in the former case, where we obtain them by precipitation, the menstruum is suddenly removed from betwixt the particles, which are consequently left beyond the sphere of attraction of each other, and do not therefore assume any regular form. It will follow from this, that the more slowly evaporation is performed, the more regular will be the crystals which are deposited; and this is verified by observation.

We profess not to understand Boscovich's notions of the nature of fire; but lest our readers may require it, we beg to transcribe his own words: "Ignem ego arbitror esse quoddam fermentationis genus, quod acquiritur vel potissimum, vel etiam sola, sulphurea substantia, cum qua fermentat materia lucis vehementissimè, si in satis magna copia collecta sit. Ignem autem voco eum, qui non tantum rarefacit motu suo, sed et calefacit, et lucet; quæ omnia habentur, quando materia illa sulphurea satis fermentescit." And he observes in another place, that if fire be excited only by a fermentation of sulphureous substance, where there is none of this substance there is no danger of fire!

Boscovich retains the Newtonian opinion concerning light, viz. that it is an effluviu or emission from the sun, propagated with immense celerity, and retained in certain bodies, from which it may be extricated by certain means. He holds the atoms of light to be immense, but still finite in number, and endeavours on the principles of his theory to account for the wonderful properties with which light is endowed. In doing so, he makes extensive use of the repulsive power, the varieties in the limits of cohesion, and, we may add, with much plausibility and success. Sir Isaac Newton, in explaining the reflection of light, found it necessary to admit the existence of a repulsive power, for which, however, he had made no provision in his system. The late experiments in optics by Mr Brougham serve to confirm the supposition of the existence of a repulsive power in regard of light at least. Boscovich refers his reader to his dissertation *De Lumine* for more information concerning the reflection, refraction, &c. of light and colours, and for the application of the principles of his theory to them.

He proceeds to explain many of our sensations; but we must confess there is very little praiseworthy in his remarks concerning them: indeed we can see no reason why they should be introduced at all into a system of natural philosophy, erected on such or any other foundation which concerns the external world only. In the small example of the ardour of systematic arrangement and application of physical principles to the intellectual world, which Boscovich has given us, we observe a striking coincidence with the doctrine of Hartley; but our opinion of that doctrine is not in the least meliorated by such coincidence. It is a doctrine which affects to teach more than it is given to man to know; a doctrine by which we are induced to depart from the humble but secure path of observation, and to wander in the boundless incomprehensible field of transcendentials, and which, howsoever harmless its consequences may be, as it augments the vanity of man, prevents the employment of his faculties in the inquiry into familiar truths.

Boscovich adopts Franklin's hypothesis of electricity, which he defends on the principles of his theory; but we must refer our readers to the work itself, for his reasoning on electricity and magnetism. We would only remark, that as our knowledge of these curious phenomena is much augmented even since the time of Boscovich, his theory was applied to them with disadvantage; but perhaps these very phenomena afford the best proofs of the truth of some of its principles.

We have now followed Boscovich through the consideration of his theory, and we flatter ourselves that

Natural
Philosophy

in so doing, we have given such an exhibition of its peculiar principles as will at least excite the curiosity of our readers, though it may not gratify it; and indeed, little more could be expected from us in detailing a system of such magnitude, and affecting to comprehend so much. We have, however, engaged ourselves to give such observations and remarks as may have been suggested to us in the course of the work. In conformity with this, we beg the retrospection of our readers to those circumstances in the theory which are most peculiar to it, and which serve to fix on it the characteristic feature of originality. Of these the rejection of contact, as it is the most conspicuous, so it requires the most particular attention, as on it rests the greatest part of the reasoning and fabric of the system.

We have seen that Boscovich supports this principle on the universality of the law of continuity, and on the existence of the interior repulsive power. Of the former we have to observe, that the mode of proving it by induction is strictly philosophical, just, and convincing; but that the metaphysical or *positive* arguments used for the same purpose are by no means so. We do not mean to assert, that these arguments have no weight, but only that they are not so far removed from a considerable source of error and misconception as to prevent all suspicion of their accuracy, and to entitle them to an unqualified application to the subject we consider. It is true, indeed, that no appeal to observation can directly determine the question, and therefore, it may be said, we must have recourse to some other authority. But, to us at least, it seems as true, that the proof by induction is the only satisfactory one we can have; and that if we are careful to keep in view that precept of philosophy which teaches us not to multiply causes unnecessarily, and to reason from analogy on the simplicity and steady uniformity of nature, there will be no occasion to have recourse to other authority.

We are disposed to believe, that the metaphysical arguments which Boscovich employs may be retorted on the theory itself. Does not the theory seem to admit a breach in the law of continuity, when it denies the continued extension of bodies? Or, as it rejects the divisibility and extension of atoms, must we not imagine and believe, on the faith of the law of continuity, that these atoms are mere *nuclei* of repulsive powers? Or shall we admit that the law of continuity depends on some higher principle not yet discovered, a principle in which extension or duration are concerned; that where there is neither extension nor duration, the law does not hold; that consequently, in the case of the atoms and their mode of union, this law suffers a breach; i. e. that the metaphysical arguments do not prove its universality, or that a breach of it is impossible? Such are the mysteries in which we are enveloped, when we wander from that path which is assigned to human reason.

As to the existence of the interior repulsive power, it may be observed, that if it be proved or evinced to us, the impossibility of contact must be admitted. Now we are of opinion, that a power of repulsion does exist in the nearest vicinity of many bodies; but we pretend not to know the law by which it operates, or even that it increases to infinity on the diminution of the distance. We are satisfied that it occasions many very curious phe-

nomena, some of which have been explained by it; and we sincerely believe that the investigation of its laws and the extent of its influence will fabricate a crown as unfading as that of Newton. But we are convinced that were the theory of Boscovich concerning it tacitly confided in, such a crown could never be obtained. Nay we insist further, that though by *reasoning* it could be determined that such a power does exist, it would be useless to us, till the most laborious induction be practised, to discover how far it influences observable phenomena, and how far it may be subjected to human artifice and ingenuity.

The phenomena which give evidence of the existence of a power of repulsion are chiefly optical; but it belongs not to this article to explain them. We may however just mention that we allude to the experiments of the object-glasses of long telescopes, the brilliancy of dew drops while supported on leaves or rolling on the surface of water, in which it is demonstrable that a certain space intervenes betwixt bodies which are apparently in contact, and that this space can be caused by repulsive power alone. Sir Isaac Newton himself virtually admitted the existence of such a power, as appears from the last question of his Optics; indeed it is very certain that the attractive power alone will not produce many of the phenomena of which he speaks.

Concerning the other principles of the theory we have little to remark, seeing that most of them result from those we have now considered. The transition of the powers are in our opinion to be ascertained only by observation, and this it must be confessed is no easy matter: the phenomena of fermentation, effervescence, &c. to which we are referred for proofs of the existence of these transitions, seem to be easily explained on such a supposition; but it is nevertheless probable that the supposition was prior to the observation of the laws by which these phenomena are regulated. It may be worth while remarking, that if we are able to conceive these transitions as existing, we can also conceive how motion may be produced at a distance, which was held up as an absurdity in the schools. It must be very evident to our readers that the theory of Boscovich supposes this production of motion, and that any other mode is impossible, seeing that contact is so. But we are not therefore to believe that the repulsive or attractive powers are efficient causes; though they certainly are physical ones, i. e. they are higher principles than the phenomena which succeed them, and may for aught we know depend on some one more general principle which this theory does not comprehend. We do not therefore foresee any dangerous consequences of the supposition of matter acting on matter at a distance; nor can we believe that these two expressions are equivalent or consecutive, viz. if matter act where it is not, it may act when it is not. The one is a reference to space, the other to time, and betwixt these we know no mean of comparison.

We see then that the theory of Boscovich is intimately connected with the most abstruse metaphysical inquiries and disquisitions that can employ the mind of man; in particular, that which attempts to discover the mode in which our perception of the material world is carried on. For such, we confess, we have not talents of investigation, and indeed we are convinced that no investigation has yet been, or ever will be, successful;

Boscovich's
System of
Natural
Philosophy.

Boscovich's
System of
Natural
Philosophy:

ful; but we are also convinced, that if the theory of Boscovich be established, many preposterous dogmas will be overturned: as such we prefer it to any that has hitherto been offered to the world. But it is to be considered as valid, in so far only as induction satisfies us of its principles; that it can be satisfactorily applied to the solution of any phenomena where other theories fail us; that it does not in anywise inform us of the nature, or supersede inquiry into the laws, of matter. We are of opinion that it was his very intimate knowledge of these laws, and his diligent inquiry into matters of fact, that led Boscovich to the discovery of the law of continuity and of the forces, and made him see the propriety of erecting some new system in which these might bear a part. The merit of Boscovich consists not in having discovered the *cause* of motion, or on what it depends. He attempted a more humble strain: he investigated familiar operations, and acquainted himself with vulgar things. No mysterious analogy indeed conducted him either to the harmony or to the beauty of the spheres; but then, no stupendous vacuum intercepted his path, and no unruly vortices whirled him from rectitude. That he stopped not where prudence might have directed, and beyond which his guide could go no farther, was the failing of genius elevated by success, the lot of the resplendent few who are dazzled by their own lustre. But it would ill become his followers to attempt continuing to the end on that path which he pointed out; moderate minds should accompany him as their friend, only so long as they perceive he is directed by a friend which is greater than him: let them remember that it is his observations alone which are valuable, the simple arrangement of them which they should esteem; it is the plain narrative of the honest traveller which will assist them, not the pompous fabric of the self-deuded novelist.

The only theory with which we can properly compare this of Boscovich, is the Newtonian, and in so doing its superiority will appear; but for very obvious reasons we enter not minutely into the comparison, and will only add that in the Newtonian, we

must have recourse to the three principles of gravity, cohesion, and fermentation, for the explanation of phenomena; and even these are insufficient in the modern chemistry; but we learn from the former that these are only portions of a more general principle, that they result from one fundamental law, and that to this law may be referred as well the formation of a dew drop, as the rolling of the spheres (A).

Boscovich's
System of
Natural
Philosophy.

Some of the admirers of Boscovich may be surprised that we affirm, his theory gives no information of any one efficient cause in nature, and that all the discovery he has made is, that of some events which precede the Newtonian gravity. We have already borne ample testimony to the merits of Boscovich, and we think we are secure from any suspicion that we endeavour to depreciate the value of his theory; such indeed is far from our thoughts, but we must say it is farther from our thoughts to consider it as the ultimatum in natural philosophy, or that it discloses to us the most supreme process in nature. We will venture farther; for we will maintain, that though all the principles of the theory were established on a firm and invariable foundation, as they are not, it would be impossible for any one to determine what shall be the consequences resulting from them, prior to experience of the regularity and the constancy of the conjunction of events; and that of consequence the same, nay greater, labour of induction and observation is required in the phenomena of the material world; greater, because the objects are increased in number by the discovery which Boscovich has made. But this assertion concerns the laws of nature alone, not the laws of human thought, of which, in our opinion, Boscovich has made too free use. He tells us that one consequence of the interior repulsive power is, the impossibility of contact, and that another is the impenetrability of the atoms. Now it requires no great exertion of understanding to perceive that he is displaying a law of human thought, for these consequences of which he speaks are parts of the same conception, and that no reasoning *a priori* is employed to determine their connexion; for we cannot possibly imagine, that contact or penetrability of the atoms should

(A) It may be a satisfaction to our readers to know that Sir Isaac Newton entertained notions very similar to those of Boscovich concerning the causes of motion at insensible distances, though it is to be regretted that he had made no provision for them in his system. The last question in his *Optics* plainly indicates that he himself was convinced that no law by which an attractive force might be supposed to act would be sufficient for the explanation of certain phenomena which take place in the immediate vicinity of the atoms of matter. "And if all these things are so, then all nature will be very simple, and consistent with itself, effecting all the great motions of the heavenly bodies by the attraction of gravity, which is mutual between all those bodies, and almost all the less motions of its particles by another certain attractive and repulsive force, which is mutual between those particles. Now it seems that these elementary particles not only have in themselves the *vis inertiae*; and those passive laws of motion which necessarily arise from that force, but that they likewise perpetually receive a motion from certain active principles; such as gravity, and the cause of fermentation, and of the cohesion of bodies. And I consider these principles, not as occult qualities, which are feigned to flow from the specific forms of things, but as universal laws of nature, by which the things themselves were formed. For that truly such principles exist, the phenomena of nature shew, although what may be their causes has not as yet been explained. To affirm that every species of things is endued with specific occult qualities, by which they have a certain power, is indeed to say nothing; but to deduce two or three general principles of motion from the phenomena of nature, and then to explain how the properties and action of all corporeal things follow from those principles, this truly would be to have made a great advancement in philosophy, although the causes of those principles were not as yet known. Wherefore I do not hesitate to maintain the above said principles of motion, seeing they extend widely through all nature." *Newton's Optics.*

Boscovich's should occur, if such a repulsive power exists, or that the impossibility of the former, and impenetrability, should be caused by any thing else than such a power. The most ignorant of the sons of men are as well qualified to understand this as the greatest philosophers who have adorned humanity; and if it be entitled to the name of discovery, it is one in which all mankind have shared: but for having expressed it in words, and incorporated it with others which some kindred genius alone could have made, all are indebted to Boscovich, and must acknowledge that in his hands it has served to fabricate a lasting monument of genius, industry, and sagacity. We are not therefore to consider that these are instances wherein any consequences have been determined *à priori*; and they do not affect our assertion, that prior to the experience of the regularity and constancy of the conjunction of events, it would be impossible for any one to determine *à priori* what shall be the consequences resulting from the principles of the theory. To illustrate our meaning in the assertion, we shall suppose that the transitions of the powers have been *discovered* to exist in the constitution of matter; and we then ask, if, prior to the knowledge of the phenomena of fermentation, &c. it could have been determined that these phenomena should necessarily result from them: we apprehend it could not, and our reason is, that we cannot find any mode of connexion betwixt any transitions of any forces and these phenomena; for we can conceive the former to exist without the latter, and this might have been the case, for aught we know to the contrary; and we think we are authorized in saying, that these transitions are only rules or methods observed in the production of such phenomena, that they are events prior to fermentation, &c. and remain themselves to be accounted for. We may say the same of the repulsive and attractive powers, and of all the other principles in the theory which are not laws of human thought. Causation is inscrutable, the labours of every age serve only to add to its mystery, seeing that they conduct us nearer to the boundaries of human observation, and discover to us the delusive glare of every weak meteor which promised permanent and enlightening lustre.

We have seen that the general properties of matter may be well explained by the theory; and so far therefore we must admit that the theory is applicable to the objects of investigation, and may be useful to connect together some general principles. There remains to us to make one remark concerning one of these, viz. Newtonian gravity. The supposition that it terminates beyond the comets of our system, and is succeeded by repulsion, appears to us very unnecessary, not to say unlikely, though highly worthy the accommodating genius of Boscovich. We are of opinion, that the objections urged against Sir Isaac Newton on this subject, may be much better and more simply obviated by a supposition which the modern improvements in astronomy have nearly confirmed, viz. that there are systems of suns and revolving planets, similar to, and reaching to the limits of our own; and that those are sufficient to counteract the necessary effects of universal gravity or attraction. If such be the case, inequalities in our systematic motions, relative to others, may arise from the varying situations of the other system; and, if we consider the fixed stars as forming these, we may ob-

serve differences in their positions and magnitudes, in consequence of such variations. Our astronomical readers will perceive that we allude to the apparent approach of our sun to the constellation Hercules in the northern hemisphere, the gradual widening of the stars in that quarter of the heavens, and the consequence of it. But without any such confirmation it must be acknowledged, that our supposition is much more probable, and gives a more elevated notion of the great Artificer's skill than that of Boscovich, and we are the more anxious to retain it, that one of the principles in the theory may not be broken, that the transitions of the powers occur in the insensible distances. We request the attention of our readers to Boscovich's *provident* supposition on another account. Does it not indicate one of the modes by which the theory was formed? Does it not plainly shew us how far genius will be exerted when observation fails? Does it not satisfactorily demonstrate that part of this splendid theory is the offspring of an imagination heated by systematic love, and animated by a reconciling enthusiasm? Indeed when the imagination is the provider, the reason can be well satisfied; for what is wanting can be readily supplied, what is displeasing can be easily rejected, what is unshapely can be fashioned to conformity, and all can be decorated and adorned, till at last there arises some fine fabric to please and to delight. But we require more than delusive ornament, and yet we expect not perfection; we know that every theory of natural philosophy has failed hitherto, not from a deficiency but rather from a luxuriance in grandeur, which, surpassing, has eclipsed the minute gems that glitter below; no one has failed in *explaining* the stupendous structure and the mighty rollings of worlds, which no eye ever comprehended and no hand ever approached; but take it from its god-like work to the mean purposes and the trivial uses of man, and behold the airy phantom shrink from our view! It is in explaining familiar circumstances, or, so to speak, the events of our neighbourhood, that every one has failed; but it is consoling to mankind to know, that in every succeeding one, there is a greater approximation to perfection, a greater extent and more facility of application; and we will acknowledge that this of Boscovich, though not totally invaluable, certainly leaves the least uncovered.

The observations which we have now made seem to us very proper to introduce those we have to offer on the application of the theory to physics. We are of opinion that Boscovich, in his account of solidity and fluidity, has rather given a description, and related some properties, than proposed an explanation or deduction on the principles of his theory: but in a system of such extent, and promising so much, we require more than this, and it is our opinion that more may be given. Without pretending that we have complete success in our attempt, or wishing to preclude others, we offer the following as at least a probable one.

We can imagine, that any number of atoms shall come into the limits of cohesion of each other in such a manner as that a mass of some determined form shall be produced; and that the powers on each side of these limits are so strong, as to withstand considerable divellent force from without. Now in a mass so constructed

Boscovich's System of Natural Philosophy. structured every atom is retained in its situation by powers of the same kind, acting by the same laws, and which cannot be increased or diminished by any other means than varying the distance betwixt these atoms. The powers so influenced are those only which belong to the particular atoms whose respective distances are changed; for the powers of the atoms whose distances are not changed remain the same; therefore a portion of the mass may be separated, or the whole mass may be moved, without causing any relative motion among the atoms: for, in the former case, a few only, in the latter, none, of the limits of cohesion are disturbed. This then is the structure which the atoms of matter would form, did such laws as we have considered exist; and it appears to us that it is the *natural* structure; for we ourselves cannot conceive how a fluid body should be composed by such laws independent of composition of them. But admitting composition, we would explain fluidity in the following manner: As in a mass, such as we have described, there are spaces betwixt all the atoms; it is possible that other atoms may be introduced *within* it, or that in the vacant intervening space the powers of other atoms may operate. Now, it is easy to conceive, that in the former case very various effects will result in consequence of the differences in the proximity of the atoms; for some will quit the limits of cohesion in which they were prior to the introduction of the adventitious atoms, and will enter into new ones, and will vibrate from one to another, if there be a constant addition of atoms made, or if any of those which have been introduced be removed; and that in the latter case, in consequence of the composition of forces, very different effects will result, according as the composition is of similar or different powers acting in the same or different directions, and of different intensities: in either case relative motion among the particles will occur, and the mass will yield to the least extrinsic force; an equilibrium will sometimes be produced, but it will be destroyed very readily in different ways, as by the addition or subtraction of the adventitious atoms, and by the application of forces to the mass. We might specify some of the particular circumstances which would tend to the production of different fluids, did our limits permit; but as this would be prolix, we shall only mention some of the consequences which may be deduced from the principles we have stated, and granting that they are well founded, we shall consider how far they coincide with the phenomena we observe. *Every fluid must be a compound body.* This will be pretty generally admitted by modern chemists; for though they well know that the composition of several fluids is not yet discovered, they will allow that the rational presumption from analogy is, that when our analytical powers are augmented, we shall be able to discover the composition of all of them; nor is it any objection to the rationality of the presumption that many of the *gaseous* fluids are simple or elementary, for it must be remembered, that all of them are combined with caloric or the matter of heat. Nay caloric itself, which we hold to be a substance, may, for ought we know to the contrary, be a solid body: it is indeed almost universally believed to be a fluid, and essentially so; but, for this belief we can find no other reason than that it causes fluidity, and surely that is a very

unphilosophical one; for in a similar manner, and, we venture to say, with as much truth, if matter or its atoms be constructed in the way Boscovich describes, and if they possess the power of repulsion and attraction, then all matter is fluid, for all the atoms of it will cause fluidity in certain circumstances. We do not deny that when it combines in sufficient quantity with bodies it causes fluidity; but we beg to remind our readers that there are cases of fluids being generated by the trituration of solids together, and surely they will acknowledge, that what is true in the one case, is at least possible in the other; but we will even admit, that caloric is the principal cause of fluidity (though we are aware that in admitting it, we depart from true philosophy), and yet we do not perceive, that the least objection to our supposition will thence arise. May not caloric be composed of the very smallest, or the primary atoms of matter, and consequently be more easily insinuated betwixt the atoms of other bodies which are composed of the aggregates of these primary atoms? Do we not find that it corresponds pretty accurately with the description of these atoms which Boscovich has given? Does it not seem in the least distances to repel its own particles, and at greater distances to be attracted by the particles or atoms of other bodies?

The constant addition of adventitious atoms to the interstices in a solid body, as we have before mentioned, will cause vibrations, and will at last, by totally separating the atoms from the limits of cohesion and the sphere of the attractive power, render them susceptible of the influence of surrounding bodies, so that they leave each other, and combine with those which surround them. When caloric is the body added, the most general effect which results from its repeated and constant addition is evaporation. Now the particles of an evaporated fluid will recombine if the superabundant caloric which holds them asunder be withdrawn, provided the bodies with which they unite do not attract them more powerfully than they do each other. But it is possible that such an addition will in certain cases strengthen the combination of a solid, i. e. that fluidity will not always be the consequence of insinuating atoms into the vacant spaces, for it is possible to specify circumstances, in which a body, already fluid, may be rendered solid by interposing amongst its particles, the particles of another fluid.

When the adventitious atoms are removed, one of two consequences will occur, either the atoms of a solid which has been rendered fluid by such insinuation, will be left within their spheres of attraction, and consequently will enter into limits of cohesion, and form a solid again, or they may be left beyond these spheres, so as not to enter into limits of cohesion, but to form a loose uncombined pulverulent substance. It may happen that, in the latter case, the particles being separated from each other beyond their spheres of attraction, will enter into combinations with other bodies, of whose influence they are now susceptible. We have instances of both of these in the fusion of metals: sometimes on cooling these form again into solids; others, having their atoms too far separated from each other, cannot so unite, but combine with other bodies (generally oxygen), and form powders which retain no characteristics of metals; and some combine with other metals, constituting alloys.

Boscovich's
System of
Natural
Philosophy.

We recommend the prosecution of this subject to the philosophical chemist; and though we encounter the charge of vanity, we cannot help flattering ourselves with having pointed out a mode, by which, though nothing should be discovered, yet to resolve some apparently unconnected phenomena into one general principle, and hence to abridge the labour of acquiring the science of chemistry, and to facilitate the application of it to the practical purposes of life. We are of opinion that the facts in chemistry are now so numerous, as to acquire a generalizing spirit to reduce them into some kind of order, to shew their connection in the chain of nature, and to derive from them by induction, certain principles which may be employed in the synthetic process. Indeed, without such it will soon be found that no ordinary memory can retain what may be useful, but certainly is elegant in the art, and that a great body of evidence is insufficient to enforce conviction, if it be huddled together in chaotic confusion: pillars and porticoes, and carved stones may be collected, and may astonish us by their grandeur; but unless they be methodized, connected, and combined, our astonishment will resemble that which we feel, when we contemplate the preposterous structure of some natural monster, whose limbs are individually elegant, but serve by their elegance to magnify the error of their position. We do not wish to depreciate the merits of modern chemists, but we must confess, they appear to us more scrupulous about ascertaining the few grains of earth in the *cockle-shell*, than anxious to erect a temple to their science; and are themselves too much elevated by the discovery of a semi-metal, to be concerned about the deities which preside. What we have said may be thought mere declamation, if we do not accompany it with some example of the employment of such a generalizing spirit; we know not how far it may become us to do so, but as the consideration of the theory of Boscovich, in which we have been engaged, has naturally led us to those phenomena which seem best qualified to admit of its application, and as therefore, in some sort resulting from, or connected with our subject, we shall attempt to give a small specimen of it. It is well known to chemists, that although certain individual or single bodies of the saline class be very soluble in water, the compounds formed of them are very insoluble in that fluid, i. e. that though alkalis or acids be singly very soluble in water, the neutral salts formed by them are very insoluble; and that many varieties in the degrees of solubility are to be met with in the compound bodies or neutral salts, which are contrary to what we should expect from reasoning on the varieties of these degrees, in the *simple* or elementary bodies which compose them.

For example, the sulphuric acid is very soluble in water, and so is the vegetable alkali or potass; but the sulphate of potass, which is a compound of these, is so difficult of solution, that 16 times its own weight of water, at the temperature of 60°, is required to effect it. The acetite of potass affords another example, though not so remarkable, requiring only about 10 times its own weight of water at the same temperature. Indeed, there are many instances of a compound or neutral salt being less soluble than either the alkali or the acid which enter into its composition; but in those we have mentioned, the difference is so great as to have

merited much attention, though, as far as we know, there has not been assigned a reason for it. Now we apprehend the reason to be, that as both the simple bodies have an attraction for water, or that as there is an attraction betwixt water and these two bodies, the degree of attraction will be equal to the difference only of the separate attractions betwixt water and the bodies individually; or, in other words, the attraction betwixt water and one of the bodies will be lessened by the attraction betwixt water and the other body, so that the difference only of these two will influence. Now, in certain cases, this difference will be equal to nothing, when the attractions are equal; but in every case, it is evident, it will be less than the greater of the attractions, and, of consequence, the solubility of the compound will be less than that of the simple bodies which compose it. Now this consequence is not affected by the *absolute* solubility of the simple bodies, but by their solubility in respect to each other, i. e. relative alone; therefore, the compound of simple bodies, which themselves are highly soluble, may be no more soluble than the compound of simple bodies, which themselves are very little soluble.

The principle is universal. Other consequences will result, which are not only curious, but in our opinion important; and we do not in the least hesitate to assert, that the principle may be applied to determine *a priori* the degrees of solubility of neutral salts, provided we are sufficiently acquainted with the relative solubility of the simple bodies which compose them. One consequence will be, that a compound formed of a very soluble and a very insoluble simple body will be nearly, or quite, as soluble as the former, seeing that the attraction betwixt it and water will be little or not at all diminished by the attraction betwixt the other very insoluble body and water. As a proof of this, we may take the instance of the sulphat of magnesia, which is soluble in its own weight of water at temperature 60°: Now, in this case, the magnesia is soluble to a very small amount only; but the acid, it is well known, is so to a great degree; even the small solubility of the magnesia, however, does in a certain degree impair the solubility of the compound. The same is true of the nitrat and muriat of magnesia; and, did, our limits permit, we might adduce very many examples of the same: we might shew, that the compounds of very soluble acids with the metallic oxides are soluble, if these oxides are not so; but if they are, the solubility of the compound is impaired: and we might also apply the principle to bodies soluble in alcohol and other menstrua, where it will be found to hold. But we leave the prosecution of the subject to our chemical readers, confessing, however, that we have found exceptions to its universality, which as yet we have not been able to reconcile. Perhaps, a principle still more general, and higher in the order of events, may influence or modify this which we have specified; it may be connected with some of these varieties in the composition of forces, which *must* take place in the insensible distances, changing the limits of cohesion, and modifying the position and the action of the atoms of matter. We have ventured far in the exposition we have given; did we persevere, there might be imputed to us temerity.

We have attempted to apply Boscovich's theory to several

Boscovich's
System of
Natural
Philosophy.

Boscovich's several other chemical phenomena, particularly those of elective attraction and disposing affinity; but though our success has been somewhat flattering, we have not been able hitherto to collect and arrange our principles and results, so as to present them properly to the public. At some future stage of this work, however, such may be in our power, when we hope to convince our readers, that the theory is sufficiently accommodated to that object, and that it will assist us in deducing principles more general, than any yet received in chemical sciences.

It is now time for us to conclude our account of the theory of Boscovich; and in so doing, it becomes us to recommend to our readers, that they endeavour to form a just and an adequate opinion of its merits, of the objects which it has in view, and of the means which it employs to accomplish them. Considered in respect to itself only, as the production of a great and an enlightened mind, no labour to comprehend it can be in vain or worthless, and no one can comprehend it without receiving the most elevated pleasure; but there is another inducement for us to effect this purpose, different from any we have yet mentioned: we mean the tendency it will have to modify, and to subvert, many of the leading doctrines in the metaphysics of the day. Nor ought this to alarm any of our readers; for if these doctrines be true and legitimate, they will be paramount to all objections, and the improvements made in every other science will serve to confirm them; but if they are not so, surely the sooner they are subverted the better it will be for science and for us all; at all events, an inquiry into them is rational, and it may do good. This, however, we dare not now propose to ourselves, and will therefore recommend our readers to peruse the *Essays on Perception*, by Professors Reid and Stewart, where they will find sentiments which derive most of their validity from some of the Boscovichian principles. They are sentiments in which we have the honour to agree with these true philosophers; though it is somewhat mortifying to us to confess, that they have convinced us that the phenomenon of which they treat is inexplicable.

It is indeed very mortifying to humanity to be convinced, that for many, very many centuries, our forefathers have been unceasingly attempting to explain phenomena intellectual and material by a nullity, on principles which do not exist; but it would be still more mortifying to find, that though there is ground for such convictions, men calling themselves philosophers should persevere stedfastly in the same invariable course of error and absurdity. In our own days, a light, clear and authoritative, has arisen to direct and to animate us in the search after truth; it is our own faults if we shut our eyes against its splendour, and suffer the interior man to be dark and unenlightened. Of this light the theory of Boscovich forms a part: it has succeeded and surpassed that of Newton; it will be the parent of a greater than either; it professes to conduct us to the interior veil of the temple of nature; but it has failed in this very sublime attempt, failed, however, only after it has conducted us beyond Descartes, Leibnitz, and Newton.

BOSEA, GOLDEN-ROD TREE. See BOTANY *Index*.

BOSHIES-MEN, a species of Hottentots, so cal-

ed, according to Dr Sparrman, from their dwelling in woody or mountainous places. They are sworn enemies to a pastoral life. Some of their maxims are, to live on hunting and plunder, and never to keep any animal alive for the space of one night. By this means they render themselves odious to the rest of the inhabitants of the Cape; and are pursued and exterminated like the wild beasts, whose manners they have assumed. Others of them again are kept alive, and made slaves of. Their weapons are poisoned arrows, which shot out of a small bow will fly to the distance of 200 paces, and will hit a mark with a tolerable degree of certainty at the distance of 50 or even 100 paces. From this distance they can by stealth, as it were, convey death to the game they hunt for food, as well as to their foes, and even to so large and tremendous a beast as the lion; this noble animal thus falling by a weapon which perhaps it despised, or even did not take notice of. The Hottentot, in the mean time, concealed and safe in his ambush, is absolutely certain of the operation of his poison, which he always culls of the most virulent kind; and it is said he has only to wait a few minutes in order to see the wild beast languish and die. The dwellings of these foes to a pastoral life are generally not more agreeable than their maxims and manners. Like the wild beasts, bushes and cliffs in rocks by turns serve them instead of houses; and some of them are said to be so far worse than beasts, that their soil has been found close by their habitations. A great many of them are entirely naked; but such as have been able to procure the skin of any sort of animal, great or small, cover their bodies with it from the shoulders downwards as far as it will reach, wearing it till it falls off their back in rags. As ignorant of agriculture as apes and monkeys, like them they are obliged to wander about over hills and dales after certain wild roots, berries, and plants (which they eat raw), in order to sustain a life that this miserable food would soon extinguish and destroy, were they used to better fare. Their table, however, is sometimes composed of several other dishes, among which may be reckoned the larvæ of insects, or that kind of caterpillars from which butterflies are generated; and in like manner a sort of white ants (the *termes*), grasshoppers, snakes, and some sorts of spiders. With all these changes of diet, the Boshies-man is nevertheless frequently in want, and famished to such a degree as to waste almost to a shadow. "It was with no small astonishment (says Dr Sparrman), that I for the first time saw in Lange Kloof a lad belonging to this race of men, with his face, arms, legs, and body, so monstrously small and withered, that I could not have been induced to suppose but that he had been brought to that state by the fever that was epidemic in those parts, had I not seen him at the same time run like a lapwing. It required but a few weeks to bring one of these starvelings to a thriving state, and even to make him fat; their stomachs being strong enough to digest the great quantity of food with which they are crammed, as they may rather be said to bolt than eat. It sometimes happens indeed that they cannot long retain what they have taken in; but this circumstance, it is said, does not hinder them from beginning again upon a new score."

The capture of slaves from among this race of men

Boshies-
Men.

is by no means difficult; and is effected (Dr Sparrman informs us) in the following manner. "Several farmers that are in want of servants join together and take a journey to that part of the country where the Boshies-men live. They themselves, as well as their Lego-Hottentots, or else such Boshies-men as have been caught some time before, and have been trained up to fidelity in their service, endeavour to spy out where the wild Boshies-men have their haunts. This is best discovered by the smoke of their fires. They are found in societies from 10 to 15 and 100, reckoning great and small together. Notwithstanding this, the farmers will venture in a dark night to set upon them with six or eight people, which they contrive to do by previously stationing themselves at some distance round about the craal. They then give the alarm by firing a gun or two. By this means there is such a consternation spread over the whole body of these savages, that it is only the most bold and intelligent among them that have the courage to break through the circle and steal off. These the captors are glad enough to get rid of at so easy a rate; being better pleased with those that are stupid, timorous, and struck with amazement, and who consequently allow themselves to be taken and carried into bondage. They are, however, at first treated by gentle methods; that is, the victors intermix the fairest promises with their threats, and endeavour, if possible, to shoot some of the larger kinds of game for their prisoners, such as buffaloes, sea-cows, and the like. Such agreeable baits, together with a little tobacco, soon induce them, continually cockered and feasted as they are, to go with a tolerable degree of cheerfulness to the colonist's place of abode. There this luxurious junketting upon meat and fat is exchanged for more moderate portions, consisting for the most part of butter-milk, frumenty, and hasty-pudding. This diet, nevertheless, makes the Boshies-man fat in a few weeks. However, he soon finds his good living embittered by the maundering and grumbling of his master and mistress. The words *v'guneri* and *t'gaunatsi*, which perhaps are best translated by those of 'young sorcerer,' and 'imp,' are expressions which he must frequently put up with, and sometimes a few curses and blows into the bargain; and this for neglect, remissness, or idleness: which last failure, if it cannot be said to be born with him, is however in a manner naturalized in him. So that, both by nature and custom detesting all manner of labour, and now from his greater corpulency becoming still more slothful, and having besides been used to a wandering life subject to no controul, he most sensibly feels the want of his liberty. No wonder, then, that he generally endeavours to regain it by making his escape: but what is really a subject for wonder is, that when one of these poor devils runs away from his service, or more properly bondage, he never takes with him any thing that does not belong to him. This is an instance of moderation in the savages towards their tyrants which is universally attested, and at the same time praised and admired by the colonists themselves; which, however, I cannot easily reconcile with what I have learned of the human heart. Is it in consequence of their fearing to meet with harder usage in case they should be retaken? This far, however, is certain, that none of this species of Hottentots are

much given to violence or revenge. Free from many wants and desires that torment the rest of mankind, they are little, if at all, addicted to thieving, if we except brandy, victuals, and tobacco. It is not improbable likewise, that the advantages accruing from a theft may be overlooked by them, when their thoughts are taken up with regaining their liberty, the greatest of all treasures. It is necessary to observe here, that some of the Hottentots or Boshies-men, who are thus forced into the service of the colonists, live in small societies peaceably and quietly in desert tracts, where the colonists cannot easily come at them, and are sometimes in the possession of a few cows. These people probably originate from Boshies-men who have run away from the colonists service.

"I must confess (continues our author), that the Boshies-men in some husbandmen's service are treated in the gentlest manner, and perhaps even without ever having a harsh word given them; live very well with regard to provisions; are well clad, relatively to their condition in life; and are very comfortably lodged, in comparison of what others are, in their own straw cottages. The chief of their business perhaps consists in tending a herd of cattle or flock of sheep during the heat of the day, when they have an opportunity of getting into a gentle state of intoxication by smoking tobacco; a state which excites in them sensations of as agreeable a nature as the frenzy produced by spirituous liquors and opium seems to afford to many others, who are never at ease but when they can procure to themselves this delicious pleasure. And yet, though they may thus agreeably pass away the otherwise tedious hours of their lives in smoking and sleep, they nevertheless generally run away. The colonists wonder at this, as a procedure entirely devoid of reason; without perceiving, that in so doing they suppose the Hottentots not endued with a desire, which has its immediate foundation in nature, and which is common to the human race, and even to most brute animals, viz. an earnest longing after their birthplace and families, and especially after their liberty.

"The slave business, that violent outrage to the natural rights of mankind, always in itself a crime, and which leads to all manner of misdemeanors and wickedness, is exercised by the colonists in general with a cruelty towards the nation of Boshies-men which merits the abhorrence of every one; though I have been told that they pique themselves upon it: and not only is the capture of those Hottentots considered by them merely as a party of pleasure, but in cold blood they destroy the bands which nature has knit between husbands and their wives and children. Not content, for instance, with having torn an unhappy woman from the embraces of her husband, her only protection and comfort, they endeavour all they can, and that chiefly at night, to deprive her likewise of her infants; for it has been observed, that the mothers can seldom persuade themselves to flee from their tender offspring. The amiable tenderness of the mother, which perhaps glows with a more lively flame in the breast of this poor heathen than in those of her Christian tyrants, is the very circumstance laid hold on by their persecutors in order to rivet the chains of this wretched female so much the faster. There are some mothers, however, that set themselves free, when they have lost

Boshies-
Men.

all.

Bosches-
Men
Bosquets.

all hopes of saving their children. After having made their escape, they sometimes keep secretly about the neighbourhood, in hopes of finding some opportunity of recovering their infants again."

BOSNA SERAGO, a large and strong town of Turkey in Europe, and capital of the province of Bosnia. E. Long. 18. 57. N. Lat. 44. 40.

BOSNIA, a province of Turkey in Europe, seated between Slavonia and Dalmatia. It belongs entirely to the Turks; but they were on the point of being expelled from it by the Christians, when the Spaniards invaded Sicily, and obliged the emperor to conclude the peace of Passarowitz in 1718, by which he gave up Bosnia to the Turks. It is 200 miles in length, and 75 in breadth. It is a barren country, and but little cultivated: the principal revenue arising chiefly from the silver mines. Among the game there are falcons, which are held in great esteem.

BOSPHORUS, or **BOSPORUS**, in *Geography*, a long and narrow sea, which it is supposed a bullock may swim over. In a more general sense, it is a long narrow sea running in between two lands, or separating two continents, and by which two seas, or a gulf and a sea, are made to communicate with each other: In which sense, bosphorus amounts to the same with what we otherwise call an arm of the sea, channel, or strait; the Italians, *faro*; the Latins, *fretum*; and the French *pas, manche*. The word is Greek, *βασπυρος*, formed from *βας*, "bullock," and *ωρος*, "passage."

The name *bosphorus*, is chiefly confined to two straits in the Mediterranean sea, viz. the *bosphorus of Thrace*, commonly called the *straits of Constantinople*, or *channel of the Black sea*; and the *Cimmerian* or *Scythian bosphorus*, so called, it seems, from its resemblance to the Thracian; now more commonly the *straits of Kapha*, or *Kiderleri*, from two cities standing on it.

The origin of the name is better agreed on than the reason why it was first given to the Thracian bosphorus. Nymphius tells us, on the authority of Accarion, that the Phrygians, desiring to pass the Thracian strait, built a vessel, on whose prow was the figure of a bullock; and which was hence called *βας*, "bullock;" and served them for a ferry-boat. Dionysius, Valerius Flaccus, Callimachus, Apollodorus, Marcellinus, &c. say, that Io, being transformed into a cow by Juno, passed this strait swimming, which hence was called *bosphorus*. Arrian tells us, that the Phrygians were enjoined by the oracle, to follow the route which a bullock should mark out to them; and that, upon stirring one up, it jumped into the sea to avoid their pursuit, and swam over this strait. Others say, that an ox, tormented by a gad-fly, threw itself in, and swam over: and others, that anciently the inhabitants of these coasts, when they would pass over, joined little boats together, and had them drawn over by bullocks, &c.

BOSQUETS, in *Gardening*, groves so called from *boschetto*, an Italian word which signifies a *little wood*. They are compartments in gardens formed by branches of trees disposed either regularly in rows, or wildly and irregularly, according to the fancy of the owner. A bosquet is either a plot of ground enclosed with palisades of hornbeam, the middle of it being filled with tall trees, as elm or the like, the tops of which make

a tuft or plume; or it consists of only high trees, as horse-chesnut, elm, &c. The ground should be kept very smooth and rolled, or else covered with grass, after the manner of green plots. In planting bosquets, care should be taken to mix the trees which produce their leaves of different shapes, and various shades of green and hoary or mealy leaves, so as to afford an agreeable prospect. Bosquets are only proper for spacious gardens, and require a great expence to keep them up.

BOSSAGE, in *Architecture*, a term used for any stone that has a projecture, and is laid rough in a building, to be afterwards carved into mouldings, capitals, coats of arms, &c. Bossage is also that which is otherwise called *rustic-work*; and consists of stones which advance beyond the naked or level of the building, by reason of indentures or channels left in the joinings. These are chiefly used in the corners of edifices, and thence called *rustic quoins*. The cavities or indentures are sometimes round, sometimes chain-framed, or bevelled, sometimes in a diamond form, sometimes enclosed with a cavetto, and sometimes with a listel.

BOSSE, **ABRAHAM**, an able engraver, born at Tours, was well skilled in perspective and architecture. He wrote two treatises, which are esteemed; the one on the manner of designing, and the other upon engraving.

BOSSINEY, or **BOSS-CASTEE**, a town of Cornwall, in England, which sends two members to parliament. W. Long. 5. 0. N. Lat. 50. 40.

BOSSU, **RENE LE**, born at Paris in 1631, was admitted a canon regular in the abbey of St Genevieve, in 1649; and after a year's probation, took the habit. He taught polite literature with great success in several religious houses for 12 years, when he gave up the task for retirement. He then published a parallel betwixt the principles of Aristotle's natural philosophy and those of Des Cartes, with a view to reconcile them; which was but indifferently received. His next treatise was on epic poetry; which Boileau declared one of the best compositions on that subject in the French language, and which produced a great friendship between them. He died in 1680, and left a great number of MSS. which are kept in the abbey of St John de Chartres.

BOSSUET, **JAMES BENIGNE**, bishop of Meaux, was born at Dijon, on the 27th of September, 1627. He distinguished himself by his preaching, and the zeal he discovered in his endeavours to bring over the Protestants of France to the Romish church; by his opposition to quietism; and by his numerous writings both in French and Latin, which have been collected together, and printed at Paris in 17 vols 4to. This famous divine died at Paris, in 1704, aged 77.

BOSSUPT, a town in the kingdom of the Netherlands, in the province of Brabant. E. Long. 4. 30. N. Lat. 50. 52.

BOSSUS, **MATTHEW**, distinguished by his virtue and his learning, was born in 1427. He devoted himself to the ecclesiastical state in 1451, in the congregation of regular canons of Lateran, and afterwards taught divinity at Padua. His orations, his sermons, and his letters, have been often printed. He also wrote a sort of an apology for Phalaris, and other works. He died at Padua in 1502, aged 75.

BOST, a very strong town of Persia, and capital of the

Bosquets
Bost.

Bost
H
Boston.

the province of Zablestan. E. Long. 64. 15. N. Lat. 31. 50.

BOSTANGIS, in the Turkish affairs, persons employed in the garden of the seraglio, out of whose number are collected those that are to row in the Grand Signior's brigantines, when he has a mind to divert himself with fishing, or to take the air upon the canal. They who row upon the left hand are only capable of mean employments in the gardens: but they who row on the right hand may be promoted to the charge of *bo-stangi-hachi*, who has the general intendency of all the grand signior's gardens, and commands above 10,000 *bo-stangis*.

BOSTON, a corporation town of Lincolnshire in England, which sends two members to parliament. It is commodiously seated on both sides the river *Witham*, over which it has a handsome high wooden bridge; and, being near the sea, enjoys a good trade. It has a spacious market place, and the largest parish church without cross aisles in Europe, the steeple of which serves for a land-mark to sailors. Boston is a barony in the *Irby* family. The population in 1811 was 8113. E. Long. 0. 15. N. Lat. 53. 3.

BOSTON, the capital of the state of Massachusetts, and of New England, in North America, built in 1630, in a peninsula of about four miles in circumference, at the bottom of Massachusetts bay, in a very convenient situation for trade. The town stands in W. Long. 71. 5. N. Lat. 42. 24. about nine miles from the mouth of the bay. At the entrance of this bay are several small rocks which appear above water, and a number of small islands, some of which are inhabited. There is but one safe channel to approach the harbour, and that so narrow, that two ships can hardly sail through abreast; but within the harbour there is room for 500 sail to lie at anchor in a good depth of water. On one of the islands stands a fort. At the bottom of the bay is a noble pier near 2000 feet in length; along which on the north side extends a row of warehouses for the merchants; and to this pier ships of the greatest burden may come and unload without the help of boats. The greatest part of the town lies round the harbour in the form of a half-moon, the country beyond it rising gradually and affording a delightful prospect. The neck of land which joins the peninsula to the continent is but 40 yards over. Boston contained about 40,000 inha-

bitants in 1817; and the tonnage of the vessels belonging to it in 1815, amounted to 137,008 tons, which is greater than that of any other American port, except New York. The merchants are remarkably active and enterprising, and the inhabitants in general bear the character of being well informed, sober, and industrious, but sharp and overreaching. The austerity of the old Puritans is less relaxed here than in any of the other large towns in America. Boston is the headquarters of federalism, or rather of aristocracy, in politics, and of unitarianism in religion. Though professing republicanism, they are ridiculously vain of those titles which are still retained. The Independents are the prevailing religious sect, and have twelve churches here. There are besides three Baptist churches, two Episcopalian, one Quaker, one Universalist, one Catholic, and two Methodist. Besides the churches, the principal buildings are the statehouse, courthouse, two theatres, concert-hall, jail, almshouse, workhouse, and bridewell. The town is well paved, and has excellent flagged footpaths. The streets, though generally narrow, are for the most part clean, and in good order. Boston is connected with the minor towns of Cambridge and Charlestown, by two handsome wooden bridges, the one 1503 feet in length, the other 3483 feet. Boston has frequently suffered by fire, but the houses that were thus destroyed have always been rebuilt to advantage. The late American war began here by the attack at Bunkers-hill, when many brave men lost their lives.

Boston
Botallus

BOSWORTH, a town of Leicestershire in England, containing 791 inhabitants in 1811. It has a lofty situation on a hill, and the country about it is fertile in corn and grass. It is memorable for the decisive battle fought near it between Richard III. and the earl of Richmond, afterwards Henry VII. wherein the former lost his crown and life. W. Long. 1. 24. N. Lat. 52. 25.

BOTALLUS, LEONARD, physician to the duke of Alençon, and to Henry III. was born at Asti in Piedmont. He introduced at Paris the practice of frequent letting of blood; which was condemned by the faculty; but soon after his death it came into practice with all the physicians. He published several books in physic and surgery; and the best edition of his works is that of Leyden, in 1660, octavo.

B O T A N Y

IS that science which arranges, distinguishes, and names all plants and vegetables, to enable us to study their properties and uses.

Vegetables consist of an innumerable succession of individuals which it is impossible to examine, and would be useless if it were possible. It is therefore necessary to diminish the labour by forming them into groups or classes, that the same name may apply to a great number of individuals. Now certain individual plants have so close a resemblance to others in their flower, fruit, leaves, and general appearance, that almost every man at first sight would give them the same name. Thus every man who has seen the common daisy once, and knows its name, will probably apply the same name without mistake to every other

individual of the same species. This forms the first step in botany, or what is called arranging and naming plants according to their species. Nor is it only the first, but the easiest step in botany. It is also the most important; for all the individuals of the same species must in similar circumstances possess the same qualities. For example, we have no reason to doubt that each individual plant of common hemlock, or of foxglove, possesses the same medical qualities, though from their place of growth these qualities may differ in degree. It is therefore the individuals of the species alone that are useful; and the whole value of any arrangement consists in enabling the botanist to distinguish and name the individuals, with the greatest ease and accuracy. If the number of species were small, definitions or descriptions

Elementa. scriptions of them would alone be sufficient; but as they amount perhaps to 40,000 or 50,000 or more, to search for every single species amid such a multitude would be a task for which neither human patience nor human life would be sufficient.

To shorten the labour, it has been found very expedient to arrange plants into various divisions; first into some very general divisions which may reduce them into a small compass, then to subdivide these general divisions into others less comprehensive, and these into others, till we arrive at the particular species which we are in search of. Thus the arrangement descends from a general division of all plants to every particular species.

Many plans of this kind have been attempted by various botanists, but the arrangement of the celebrated Linnæus is incomparably the most ingenious, most accurate, as well as the simplest and easiest. That illustrious botanist divided all plants into classes, the classes into orders, the orders into genera, and the genera into species. The orders, too, and the species, when numerous, he frequently subdivided into sections.

Objections have been made to the arrangement of Linnæus, because it admits divisions which do not appear natural. But such persons, though distinguished botanists, seem to us to have misunderstood the use and intention of that arrangement. It is not, and ought not to be, its object to give what has been called a natural arrangement; for nature does not class her productions. She places before us innumerable individuals, and leaves us to classify them according to the purpose which we have in view. If nature had formed plants into classes, orders, and genera, the botanist would have nothing to do but to study these. But in none of her works has nature done this. Classification is the work of man; and it is necessary for man merely on account of the limited nature of the faculties of his mind. Classification enables us to accomplish by several steps or operations what we cannot accomplish by one. But were our faculties much more exalted, were our penetration much more acute, and our memories perfectly retentive; could we at once survey all the qualities of objects, discern their relations to one another, and retain the remembrance of these accurately, we should have no occasion to generalize at all. As generalization or classification is necessary to aid our li-

Elementa. mited faculties, the best classification is that which leads us without error, and by the easiest process, to the particular object which we have occasion to investigate.

The arrangement of Linnæus is therefore the best: It is, however, not so perfect in some of its parts as it may yet be rendered. This is the case in some of the genera which are distinguished by marks that are too minute. But when we consider the indefatigable mind of that illustrious man, the chaos in which he found botany, and the beautiful arrangement which he gave to it, we may justly enroll the name of Linnæus in the same list with Bacon, and Newton, and Locke.

A botanical system is a dictionary by which a person who has studied the rudiments of the science may find out the name of every plant which he meets with. This dictionary has been much enlarged by the labours of the great many eminent botanists of the present time. We shall therefore point out the method of consulting it, after giving a very concise view of the principles upon which it is founded. We will give a concise view, because we think most or perhaps all the elementary books of this science tend to confound and disgust beginners by physiological definitions, and by the multiplicity of terms which they require to be studied at the very first outset. Their plan is just as if a teacher of Latin was to require his pupils first to make themselves masters of a Latin dictionary before he allowed them to translate. Our plan is to require of a beginner no more elementary knowledge than what is sufficient to enable him to consult the system as he would do a dictionary. The meaning of the rest of the botanical terms we think can best be learned by having recourse to an explanation in an alphabetical form, as they occur in the investigation. This we intend to add to the present article. And we wish sincerely that every man who publishes a system of botany would do the same; for we have strong reasons to believe that different writers use the same words in different senses from one another. Linnæus, indeed, has defined his botanical terms; but in his two works, *Delineatio Plantarum* and *Philosophia Botanica*, he sometimes defines the same word differently. Now we ought to know which of his definitions succeeding botanists have adopted. Besides almost every botanist introduces terms of his own, which we shall look for in vain in the definitions of Linnæus.

ELEMENTS OF BOTANY.

THE parts of a plant which it is necessary for the young botanist first to know, are the flower and fruit. These include seven; the calyx, corolla, stamen, pistil, pericarp or seed-vessel, seed, and receptacle. We will describe these in the order which will make them most easily distinguished.

1. The corolla, which in common language is called the flower, and in fruit-trees the blossom, is the part which is most beautifully coloured, which is of the finest texture, and is often odorous. It is to be found of every colour, except green, a hue which it very seldom assumes. It is white, as in the blossoms of the cherry; yellow, as in the primrose and ranunculus or butter-cup; red, as in the rose; blue, as in the violet.

It is sometimes of one piece, and sometimes divided into distinct pieces, called *petals*. When the corolla consists of one petal, the outer or upper part, which is broad, is named the *limb* or border; and the lower part, which is narrow and hollow, by which it is fixed, is called the *tube*. When the corolla consists of more than one petal, the lower part is called a *claw*, and the upper *lamina*.

In the corolla it is necessary to attend to its form, its divisions, the number of its petals, its colour and the part to which it is attached. See Plate XCV. Fig. 11. a corolla of one petal; *a*, the tube; *b*, the laminas. Fig. 13. a corolla of more than one petal; *d*, the claw; *b b*, the laminas.

2. The

Elements. 2. The calyx is situated on the outside of the corolla, and enclosing it commonly at the base. It is generally of a greenish colour, and of a coarser texture than the corolla. It consists of one part, or of two, three, &c. and is then said to be one-leaved, two-leaved, three-leaved, many-leaved. The calyx is of various shapes, tubular, globular, inflated, &c.

There are seven species of calyx; perianth, involucre, glume, ament, spathe, calyptra, and volve. For explanation of these, consult the vocabulary and Plate XCV. Fig. 18. *a*, the calyx.

3. The pistil, or pistils, commonly appear in the centre of the corolla, from which they rise like so many columns. There are from one to twelve in the same flower, and sometimes more.

A pistil consists of three parts, the stigma, the style, and the germen. 1. The stigma is the highest part of the pistil; which is sometimes globular, sometimes cleft, sometimes cross-shaped, &c. 2. The style is the pillar or thread which supports the stigma. 3. The germen is the pedestal or base of the pistil, most commonly of a roundish or globular shape; but sometimes long and slender. Sometimes there are several germens together. See Plate XCV. fig. 12. *c*, the stigma; *b*, the style; *a*, the germen.

4. The stamens, which resemble threads or pillars, usually stand between the corolla and the pistil, are placed in regular order round the pistils, or alternate with the petals. They are in number on one flower from one to several hundreds. But it is not necessary to count them when they are more than twenty.

A stamen consists of two parts, the anther and the filament. 1. The anther is the summit of the stamen, containing a mealy or powdery substance called pollen, and is generally of a different colour from the filament. They are of different forms, globular, horned, &c. 2. The filaments are the threads or pillars which support the anthers. The stamens are attached to the corolla, to the calyx, to the receptacle, or to the style. See Plate XCV. fig. 18. Filaments marked by *e, e, e, e, e, e*. Anthers *f, f, f, f, f, f*.

5. The pericarp, or seed-vessel, is the case or covering of the seed, and is the external part of the germen come to maturity. It is of various shapes; globular, as in the poppy; long, as in the pod of the common garden or field pea: it is pulpy, with a stone in the middle, as in the plum; pulpy, containing seeds enclosed in a case, as in the pear; juicy, and containing seeds which have only an external case, as the currant and gooseberry.

There are eight species of pericarp; capsule, silique, legume, follicle, drupe, pome, berry, and strobile. A description of these will be given in the vocabulary. Consult also Plate XCV. fig. 23. to 30.

6. The seeds are so well known, that they require no description in the elements of the science.

7. The receptacle is a point, line, or broad base, to which some or all of the six parts now described are attached. When it is the base of all these parts, it is called the receptacle *of the fructification*. When the calyx, corolla, and stamens only are attached to it, it is called the receptacle *of the flower*. When the germen together with the pistil only is fixed to it, it is called the receptacle *of the fruit*. It is called *proper* when only one flower with its fruit is inserted into it.

Elements. It is called *common* when many flowers are attached to it, as in the common daisies, dandelion. See Plate XCV. Fig. 13. *c*, a proper receptacle. Fig. 9. 10. a common receptacle.

Attention to the receptacle is most necessary chiefly in classes 11th, 13th, and 19th.

Besides these seven, which are called the parts of fructification, because when they exist together, they are supposed necessary for producing proper fruit, there is another part which Linnæus calls the *nectary*, that requires attention, as it is the foundation of some genera. It is difficult for beginners to distinguish it, as it varies much in its appearance, and is not very discernible in a great many species. - It is sometimes the name of a small gland; sometimes of a scale or a number of scales; sometimes of a cup; sometimes of a horn or spur on the corolla, as in larkspur and violet; sometimes of a groove or excavation. In short, it appears to be a name for any singular or irregular appearance of any of the parts of the flower. In all accurate and perspicuous systems, it is so well described that it can be easily found out. If this be done the name may be admitted, but if not it must lead to ambiguity and want of precision.

OF THE CLASSES.

The descriptions now given are sufficient to enable the young botanist to understand the classes and orders.

All plants are arranged into 24 divisions, called classes. In 23 of these classes, the flowers, or the pistils and stamens, or at least the stigmas and anthers, are evident. The 24th class comprehends all plants in which the flowers are invisible to the naked eye, as mosses, ferns, mushrooms.

The principles upon which the classes are formed are few, simple, and beautiful. All plants which have only one stamen, are of the first class; those that have only two, are of the second; those that have only three, are of the third: and so on, the number of stamens being the same with the number of the class in the first ten classes. See Plate XCIV. fig. 1, 2, 3, 4, 5, 6, 7, 8, 9, 10.

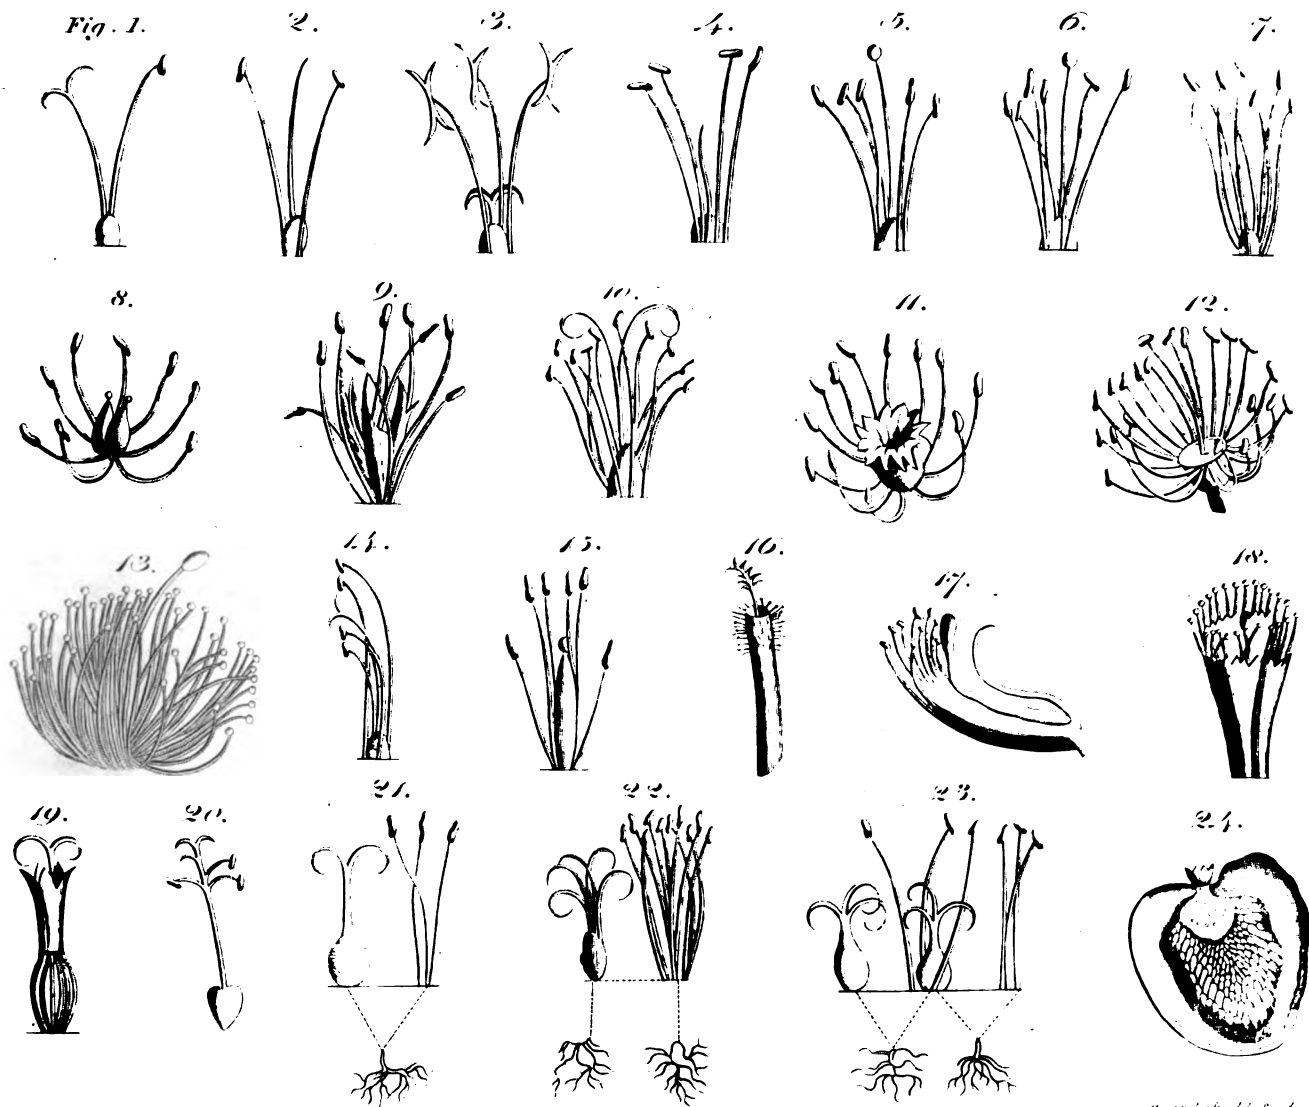

In the next three classes, the place to which the stamens are fixed must be attended to as well as the number of the stamens. Thus the 11th contains those plants which have from 12 to 19 stamens inclusive, fixed to the receptacle. The 12th those that have 20 stamens fixed to the inside of the calyx. In this class the place of insertion is more to be relied on than the number of the stamens, for they are sometimes less than 20, often more. The 13th class comprehends those that have more than 20 stamens attached to the receptacle. See Plate XCIV. fig. 11, 12, 13. For an example of the 12th class a rose may be examined, and for an example of the 13th a poppy, or a ranunculus.

The 14th and 15th classes depend upon the number and proportion of the stamens. When there are four stamens in a flower, of which two are longer, it belongs to the 14th class. When there are six stamens, of which four are longer, it belongs to the 15th class. For an example of the 14th class the flowers of the dead nettle, mint, thyme, or foxglove, may be examined;

BOTANY.

CLASSES.

W. Schacht Sculp.

Elements. mined, and for a specimen of the 15th class, inspect the flowers of shepherds purse, or mustard. See also Plate XCIV. fig. 14. and 15.

The 16th, 17th, 18th, and 19th classes depend upon the manner in which the stamens are connected, whether they be joined by their filaments into one set, or two sets, or more than two; or be united by the anthers into a cylinder.

In the 16th class the stamens are united by their filaments into one set, forming a case round the lower part of the pistils, but separating at the top. A geranium forms a specimen of this class. In the 17th the corollas are papilionaceous, like the blossom of a bean; the stamens are connected by their filaments, but divided into two sets or parcels, one of which is thicker and forms a case round the pistil; the other is smaller and leans towards the pistil. Specimens of these may be found in the flowers of peas and beans. In the 18th class, the stamens are united by their filaments into more than two sets, or parcels. See Plate XCIV. fig. 18.

The 19th class is difficult to a beginner. It consists of compound flowers, as the common daisy, dandelion. They are called compound, because each single flower consists of a collection of little flowers or florets, attached to the same broad receptacle, and contained within one calyx. Each floret consists of a corollet, or little corolla, five stamens united by their anthers into a hollow or tubular cylinder, and a pistil which passes up through the tube of the cylinder. See Plate XCIV. fig. 19. and examine a dandelion, or thistle, or common groundsel, or a sun-flower. See also the beginning of the 19th class in the system, where a fuller account will be given of this class.

In the 20th class, the stamens are attached to the pistil. An orchis will afford a specimen of this. See also Plate XCIV. fig. 20.

In the three next classes, the pistils and stamens are situated on separate flowers, or distinct plants, or on plants which bear flowers with pistils and stamens, others with stamens or with pistils, or flowers of both kinds.

The 21st class contains those plants which have flowers of different kinds on the same plant, some bearing pistils, and others bearing stamens only. The flowers with pistils we shall call *pistillar* or *stagnate*, and those with stamens *staminal* or *anthered*. The birch affords an example of this class. See also fig. 21.

The 22d class consists of those species which have stamens on one plant and pistils on another. Instances of this may be found in the willow, poplar, and juniper. See fig. 22.

The 23d class comprehends those plants which have at least two and sometimes three kinds of flowers. 1. Some anther-stagnate, or with pistils and stamens on the same flower. 2. Others have pistils only, or stamens only. 3. Or having flowers with pistils only, or flowers with stamens only. This may be expressed more concisely. Some having flowers anther-stagnate, some stagnate, or some anthered, or having both anthered flowers and stagnate flowers. The common ash tree may be examined for a specimen of this class. See also fig. 23.

The names of the classes are formed from Greek words, and express the characteristic of each class. The first ten classes are named from the Greek
VOL. IV. Part I. †

numerals and the word *andria*, which the botanist must **Elements.** consider as synonymous with stamens.

1. Mon -andria.
2. Di -andria.
3. Tri -andria.
4. Tetr -andria.
5. Pent -andria.
6. Hex -andria.
7. Hept -andria.
8. Oct -andria.
9. Enne -andria.
10. Dec -andria.
11. Dodec-andria, 12 stamens.
12. Icos -andria, 20 stamens.
13. Poly -andria.
14. Di -dynamia, 2 powers.
15. Tetra -dynamia, 4 powers.
16. Mon -adelfia, one brotherhood.
17. Di -adelfia, two brotherhoods.
18. Poly -adelfia, many brotherhoods.
19. Syn -genesia means origin or production together, so called from the stamens being united by the anthers.
20. Gyn -andria, pistils and stamens together.
21. Mon-ocia, one house.
22. Di -ocia, two houses.
23. Poly-gamia, many kinds of flowers. The etymology here would throw no light upon the class to a beginner; nor does it throw any on the next class.
24. Crypto-gamia, therefore, is to be understood to mean *invisible flowers*.

OF THE ORDERS.

THE formation of the orders is as ingenious and simple as that of the classes. In the first thirteen classes, the names and characters are taken from the number of pistils or styles; when these are wanting, from the number of stigmas. Thus:

- Mono -gynia, 1 style.
- Di -gynia, 2 styles.
- Tri -gynia, 3 styles.
- Tetra -gynia, 4 styles.
- Penta -gynia, 5 styles.
- Hexa -gynia, 6 styles.
- Hepta -gynia, 7 styles.
- Deca -gynia, 10 styles.
- Dodeca-gynia, 12 styles.
- Poly -gynia, many styles.

In the 14th class Didynamia there are only two orders, which depend on the presence or absence of the pericarp or seed-vessel.

1. GYMNOSPERMIA. Four naked seeds in the bottom of the calyx; as in mint, dead-nettle, thyme.
2. ANGIOSPERMIA. Seeds enclosed in a pericarp, as in fox-glove, eye-bright, toad-flax, fig-wort.

In the 15th class, Tetradyndamia, there are also two orders, which are taken from the form of the pericarp.

1. SILICULOSA. Seeds enclosed in a silicle, or roundish seed-vessel, consisting of two pieces called valves, and the seeds fixed to both edges or sutures, as in shepherds purse, scurvy-grass.
2. SILIQUOSA.

Elements. 2. **SILIGUOSA.** Seeds enclosed in a silique or long seed-vessel; as in mustard.

In the 16th, 17th, and 18th classes, the names and characters of the orders are taken from the number of stamens.

In the 19th class there are six orders, which it is difficult at first to distinguish accurately.

1. **POLYGAMIA ÆQUALIS.** Florets anther-stigmate, or having both stamens and pistils in the same floret; as in dandelion, thistle, sow-thistle, artichoke.
2. **POLYGAMIA SUPERFLUA.** When the flower is composed of two parts, a disk or central part, and rays projecting outwards; as in corn-marygold, tansy, daisy, golden-rod, groundsel, chamomile, milfoil. The florets of the disk are anther-stigmate; those of the ray stigmate.
3. **POLYGAMIA FRUSTRANEA.** Florets of the disk anther-stigmate; those of the rays with styles but no stigmas; as blue-bottle, knapweed.
4. **POLYGAMIA NECESSARIA.** Florets of the disk anther-styled, without stigmas; those of the rays stigmate. Garden marygold will afford a specimen.
5. **POLYGAMIA SEGREGATA.** When each of the florets has a calyx, besides the common or general calyx of the flower. Specimens of this can only be found in botanic gardens.
6. **MONOGAMIA.** When the flower is not compound but single, and the anthers united. This order ought to be transferred to the class Pentandria, as, indeed, has been done in some very valuable systems. Examples of it may be found in the violet.

In the classes Gynandria, Monœcia, and Diœcia, the orders are formed from the number of stamens, with three of a different kind, monadelphia, syngenesia, and gynandria, in the classes Monœcia and Diœcia.

1. **MONOECIA.** When the flowers are anther-stigmate and anthered; or anther-stigmate and stigmate, on the same individual plant.
2. **DIOECIA.** When the flowers are anther-stigmate and anthered, or anther-stigmate and stigmate, on two different individual plants.
3. **TRIOECIA.** When the flowers of one individual plant of the same species are anther-stigmate; upon a second individual plant, anthered; and upon a third individual plant, stigmate.

The orders into which the 24th class, *Cryptogamia*, is divided, will be explained in the introduction to that class.

OF THE SECTIONS.

The orders are generally subdivided into what may be called *sections*. These may vary in number, according as the system is partial or universal; but they are almost as well established as the classes and orders. Sections are not employed in the 11th, 12th, 16th, 18th, 19th, 20th, 21st, 22d, 23d classes. The principles on which they are formed are few and very simple.

In the first ten classes they depend upon the following circumstances; on the flower being superior or inferior or naked, complete or incomplete, calyced, enclosed in a spathe or glume, aggregate, umbelled, involucred; on the number of petals, the seeds being naked or enclosed; on the number of seeds, and the number of cells in the capsule or seed-vessel, or number of berries.

The flower is said to be *superior* when the receptacle of the flower is above the germen, and *inferior* when the receptacle is below the germen. A flower is said to be *naked* when the calyx is absent; it is called *complete* when it has both a calyx and corolla, and *incomplete* when either of these is wanting. It is said to be *calyced* when the calyx has a small calyx or calycol at the base. An *aggregate* flower, is a flower composed of florets standing on footstalks, attached to a broad receptacle.

An umbelled plant, is one which sends out towards the top, from the same point or centre, a number of branches like the spokes of an umbrella, and bearing flowers on the top. All the spokes, with their flowers, form an *universal* umbel. On the top of each spoke arises an umbellet, or *partial* umbel. At the base of the spokes of the umbel, or universal umbel, is a sort of calyx, called an involucre, or universal involucre; and at the base of the spokes of the umbellet is a *partial* involucre, or an involucret. This will suffice for explaining the sections of the first ten classes. The sections of the 13th depend on the number of petals.

In the 14th class, *Didynamia*, the sections depend upon the calyx; which is said to be cleft when it is cut or divided into so many parts, and two-lipped when its mouth has a resemblance to two lips.

In the 15th class the sections depend on the silicle and calyx. The silicle in one section is notched at the point, and in another unnotched or entire. In the first section of the order *siliquosa*, the calyx is closed by its own leaflets. In the second it is not closed, and the leaflets are separated at the upper end.

In the 17th class, *Diadelphia*, and the order *decandria*, there are six sections. 1. The first comprehends those flowers which have their stamens all united as in the class *Monadelphia*, and therefore forms an exception to the regularity of the class. 2. In the second, the stigma is pubescent or hairy. The stamens not. 3. The seed-vessel or legume, has two cells, without the connected marks of the former sections. 4. The legume contains only one seed, without the marks of the former three sections. 5. The legume is somewhat jointed, without the marks of the former. 6. The legume has only one apartment, but many seeds, without the marks already mentioned.

The only remaining class, whose orders are divided into sections, is the 19th, *Syngenesia*. 1. In the first section of the first order, the corollets are ligulate, that is, flat towards the exterior or upper end, and tubular only at the base. 2. *Capitate* or headed, when the flowers grow in globular forms; as the thistle. 3. *Discoid*, when the corollets are all tubular, not ligulate. In the order *polygamia superflua* are two sections. 1. *Discoid* corollets. 2. *Rayed* or *radiate*, when all the corollets are ligulate.

We

Elements We will now present a connected view of the Classes and Orders in a Table.

XII. Elements ICOSANDRIA, 20 stamens or more fastened to the inside of the calyx.

I. MONANDRIA, 1 stamen.

1. Monogynia, 1 style.
2. Digynia, 2 styles.

II. DIANDRIA, 2 stamens.

1. Monogynia, 1 style.
2. Digynia, 2 styles.
3. Trigynia, 3 styles.

III. TRIANDRIA, 3 stamens.

1. Monogynia, 1 style.
2. Digynia, 2 styles.
3. Trigynia, 3 styles.

IV. TETRANDRIA, 4 stamens. If the two nearest stamens be shorter, the plant belongs to class 14th.

1. Monogynia, 1 style.
2. Digynia, 2 styles.
3. Tetragynia, 4 styles.

V. PENTANDRIA, 5 stamens.

1. Monogynia, 1 style.
2. Digynia, 2 styles.
3. Trigynia, 3 styles.
4. Tetragynia, 4 styles.
5. Pentagynia, 5 styles.
6. Polygynia, more than 5.

VI. HEXANDRIA, 6 stamens. If the two opposite stamens be shorter, the plant is of the 15th class.

1. Monogynia, 1 style.
2. Digynia, 2 styles.
3. Tetragynia, 4 styles.
4. Polygynia, more than 4.

VII. HEPTANDRIA, 7 stamens.

1. Monogynia, 1 style.
2. Digynia, 2 styles.
3. Tetragynia, 4 styles.
4. Heptagynia, 7 styles.

VIII. OCTANDRIA, 8 stamens.

1. Monogynia, 1 style.
2. Digynia, 2 styles.
3. Trigynia, 3 styles.
4. Tetragynia, 4 styles.

IX. ENNEANDRIA, 9 stamens.

1. Monogynia, 1 style.
2. Trigynia, 3 styles.
3. Hexagynia, 6 styles.

X. DECANDRIA, 10 stamens.

1. Monogynia, 1 style.
2. Digynia, 2 styles.
3. Trigynia, 3 styles.
4. Pentagynia, 5 styles.
5. Decagynia, 10 styles.

XI. DODECANDRIA, 12 to 19 stamens, inserted in the receptacle.

1. Monogynia, 1 style.
2. Digynia, 2 styles.
3. Trigynia, 3 styles.
4. Pentagynia, 5 styles.
5. Dodecagynia, 12 styles.

1. Monogynia, 1 style.

2. Digynia, 2 styles.
3. Trigynia, 3 styles.
4. Pentagynia, 5 styles.
5. Polygynia, more than 5 styles.

XIII. POLYANDRIA, more than 20 stamens fastened to the receptacle,

1. Monogynia, 1 style.
2. Digynia, 2 styles.
3. Trigynia, 3 styles.
4. Tetragynia, 4 styles.
5. Pentagynia, 5 styles.
6. Hexagynia, 6 styles.
7. Polygynia, more than 6 styles.

XIV. DIDYNAMIA, 4 stamens, 2 longer than the rest.

1. Gymnospermia, 4 naked seeds in the bottom of the calyx.
2. Angiospermia, seeds enclosed in a seed-vessel.

XV. TETRADYNAMIA, 6 stamens, 4 longer than the rest.

1. Siliculosa, seeds contained in a silique or roundish seed-vessel.
2. Siliquosa, seeds contained in a silique or long seed-vessel.

XVI. MONADELPHIA, stamens united by their filaments into one set or body.

1. Triandria, 3 stamens.
2. Pentandria, 5 stamens.
3. Octandria, 8 stamens.
4. Enneandria, 9 stamens.
5. Decandria, 10 stamens.
6. Endecandria, 11 stamens.
7. Dodecandria, 12 stamens.
8. Polyandria, more than 12 stamens.

XVII. DIADELPHIA, stamens united by their filaments into two bodies.

1. Pentandria, 5 stamens.
2. Hexandria, 6 stamens.
3. Octandria, 8 stamens.
4. Decandria, 10 stamens.

XVIII. POLYADELPHIA, filaments united and divided into more than two sets.

1. Pentandria, 5 stamens.
2. Icosandria, 20 stamens.

XIX. SYNGENESIA, anthers united into a cylinder.

1. Polygamia equalis, florets all anther-stigmate.
2. Polygamia superflua, florets of the disk anther-stigmate; florets of the ray stigmate.
3. Polygamia frustranea, florets of the disk anther-stigmate; florets of the ray styled, but not stigmate.
4. Polygamia necessaria, florets of the disk anther-styled; florets of the ray anther-stigmate.
5. Polygamia segregata, several calycklets in one calyx.
6. Monogamia, flowers single, not compound, with anthers united.

Elements XX. GYNANDRIA, stamens fastened to the pistils.

1. Diandria, 2 stamens.
2. Triandria, 3 stamens.
3. Tetrandria, 4 stamens.
4. Pentandria, 5 stamens.
5. Hexandria, 6 stamens.
6. Decandria, 10 stamens.
7. Dodecandria, 12 stamens.
8. Polyandria, more than 12 stamens.

XXI. MONOECIA, stamens and pistils not in the same flowers, but in the same plant.

1. Monandria, 1 stamen.
2. Diandria, 2 stamens.
3. Triandria, 3 stamens.
4. Tetrandria, 4 stamens.
5. Pentandria, 5 stamens.
6. Hexandria, 6 stamens.
7. Heptandria, 7 stamens.
8. Polyandria, more than 7.
9. Monadelphia, filaments united.
10. Syngenesia, anthers united.
11. Gynandria, stamens fixed to pistils.

XXII. DIOECIA, stamens and pistils on different plants.

1. Monandria, 1 stamen.
2. Diandria, 2 stamens.
3. Triandria.
4. Tetrandria.
5. Pentandria.
6. Hexandria.
7. Octandria.
8. Enneandria.
9. Decandria.
10. Dodecandria.
11. Polyandria.
12. Monadelphia.
13. Syngenesia.
14. Gynandria.

XXIII. POLYGAMIA.

1. Monoecia, anther-stigmate and stigmate, or anthered in the same plant.
2. Dioecia, anther-stigmate and stigmate, or anthered in two plants.
3. Triecia, anther-stigmate in one plant, stigmate in a second, and anthered in a third.

XXIV. CRYPTOGAMIA.

1. Filices, or ferns.
2. Mosses.
3. Algae, or sea-weeds.
4. Funguses.

OF THE GENERA.

HAVING now shown how plants are arranged into classes, orders, and sections, we come to the next division, called *genera*. The characteristic marks of the genera are derived from the flower and fruit. A genus consists of a certain number of species, which resemble one another in some parts of the flower or of the fruit, or both. By way of illustrating the principles on which the formation and distinction of genera are founded, we shall run over the British genera in each class.

I. In the first class, Order I. sect 1. the calyx is one-leaved or indistinct, corolla absent. Sect. 2. the berry contains many seeds, the spadix contains many flowers, and the capsule is one-seeded. Order II. genus 5. calyx wanting, two petals present; seeds four, not enclosed in a seed-vessel.

II. In the 2d class, DIANDRIA, Order I. the genera depend upon the figure of the corolla, which is divided, wheel-shaped, ringent, furnished with a spur, or two-petaled; on the calyx being cleft or being two-leaved; on the number of seeds which the berry contains; on the shape of the capsule, and the number of seeds enclosed in it; on the stamens being distant, or standing on a footstalk.

In the 2d order, the only genus is a grass, the calyx and corolla of which are called glumes.

III. In the 3d class, TRIANDRIA, Order I. sect. 1. the distinction of the genera depends on the number of divisions of the calyx and singularities of the stigma. In sect. 8. the genera are distinguished by the peculiarities of the glumes and seeds.

In the 2d order, Digynia, sect. 1, 2, 3, and 4, the genera are distinguished,

1. By the number of valves or pieces of which the glumes or corolla and calyx consist.
2. By the peculiarities of these valves.
3. By the number of flowers contained in the calyx.
4. By the peculiarities of the stigma and seed.
5. By the form of the spikelets, and
6. By the peculiarities of the spine or thread, or form of the receptacle.

In the 3d order, Trigynia, the genera are distinguished,

1. By the number of leaves of which the calyx is composed.
2. By the number of petals.
3. By the form of the capsule, the number of valves composing it, and seeds contained in it.

IV. In the 4th class, TETRANDRIA, Order I. the genera are determined,

Sect. 1.

1. By the peculiarities of the common and partial calyx, or of the calyx and calyulet.
2. By the corolla being superior.

Sect. 2. and 3.

1. By the form of the corolla,
2. By the peculiarities of the fruit.

Sect. 4.

1. By the number and the peculiarities of the nectaries.
2. By their absence.
3. By the nature of the seed-vessel; by its situation, and the number of cells or seeds it contains.

Sect. 5.

By the peculiarities of the calyx and seed.

Digynia and Trigynia, Order I. and II.

1. By the number of petals, and by their absence.
2. By the nature of the pericarp, and by the number of its valves and cells, and seeds.

V. In the 5th class, PENTANDRIA, Order I. the genera are distinguished,

Sect.

Elements.

Sect. 1.

1. By the shape of the corolla, by the peculiarities of its throat.
2. By the shape of the calyx, and the number of its divisions.
3. By the peculiarities of the seeds.

Sect. 2, 3, 4, and 5.

1. By the number of valves and cells of the seed-vessel, and other peculiarities.
2. By the shape and division of the corolla.
3. By the situation and figure of the stamens and peculiarities of the anther.
4. By the divisions and shape of the stigma.
5. By the shape of the calyx and number of its divisions.

Sect. 6.

1. By the number of seeds and situations of the capsule.
2. By the number of divisions of the calyx, and its relation to the stamens.

Digynia, the genera are distinguished,

Sect. 1, 2, and 3.

1. By the nature and shape of the capsule, and the number of cells and seeds it contains.
2. By the shape of the corolla and the absence or presence of pores.
3. By the shape, number, and situation of the seeds.

Sect. 4. comprehending the umbelled plants, is formed into three subdivisions.

1. Plants that have an involucre and involucret.
2. Those that have only involucrets.
3. Those that have neither, or only a small involucre.

The genera are distinguished,

1. By the flowers being formed into heads.
2. By the flowers being tubular, by being radiate or rayed, that is, some tubular and some flat, by their being fertile or abortive, producing seed or not producing it.
3. By the form of the petals.
4. By the calyx being entire or divided, or indistinct.
5. By the peculiarities of the involucre or involucrets.
6. By the peculiarities of the stigmas and fruit.

The other orders have nothing peculiar.

VI. HEXANDRIA, the genera are distinguished,

1. By the number of petals, shape, divisions, and situation of the corolla.
2. By the number of leaves, form, and situation of the calyx.
3. By the number of cells and seeds of the seed-vessels, and shape of the seed.
4. By the peculiarities of the stamens.
5. By the form and number of the stigmas.

The next seven classes form their genera in so similar a manner to those already described, that we omit them.

XIV. In the 14th class, DIDYNAMIA, Order I. Gynospemia, the genera are determined;

1. By peculiarities of the anthers and filaments.
2. By peculiarities of the lips and throat of the corolla.
3. By peculiarities of the calyx.

Order II. Angiosperma.

1. By the number of cells and directions of the partitions of the capsule or seed-vessel.
2. By the form and number of the seeds.
3. And by other marks of the calyx and corolla, which require no explanation.

XV. TETRADYNAMIA.

I. Siliculosa, the genera are distinguished,

1. By the silicle or short roundish seed-vessel, by the shape and position of its valves or pieces, by its being entire or notched, and the number of seeds it contains.

II. Siliquosa. The genera are distinguished,

1. By the shape of the silique or long seed-vessel, which is composed of two valves or pieces, with the seeds fastened to both sutures, or joinings of the valves; by the manner in which the silique opens.
2. By peculiar glands.
3. By the calyx being open or spreading.
4. By the position of the petals.
5. By the stigma being notched or entire.

XVI. In the 16th class, MONADELPHIA, the genera are distinguished,

1. By the number of styles.
2. By the divisions of the outer calyx.
3. By the position of the capsules and number of seeds contained in each.
4. By the seeds being beaked spirally or backwards.

XVII. DIADELPHIA. Here it is necessary to describe the corolla, which is called papilionaceous, or pea-blossomed, and usually consists of four petals. The lower petal, shaped like a boat, is called *the keel*; the upper petal, which spreads and rises upwards, is called the standard, and the two side petals are called the wings. The seed-vessel is called a *legume*, and consists of two pieces or valves, and the seeds are fixed to one of the sutures or joinings.

In the order Decandria, the genera are distinguished,

1. By the form and divisions of the calyx.
2. By the form and roughness of the style and stigma.
3. By the peculiarities of the standard, keel, and wings.
4. By the legume; its form, length, and the number of seeds it contains.

XIX. In the 19th class, SYNGENESIA, the genera are distinguished,

1. By the nature and form of the receptacle, by its smoothness or roughness, its being dotted, or like a honeycomb.
2. By the nature of the pappus, which is the feathery, or flying, or winged crown of the seed by which it flies.
3. By the peculiarities of the calyx, its resembling tiles, being double, accompanied with scales, &c.
4. By the number of florets in the ray.

XX. GYNANDRIA, Diandria, the genera are distinguished,

By the form of the nectary, which is the lower lip of the corolla.

XXI. In the 21st class, MONOECIA, the genera are distinguished,

1. By

Elements.

Elements.

1. By peculiarities in the male or anthered flower of the calyx and corolla.
2. By similar peculiarities in the female or stigmatic flowers.
3. By the form of the ament. The ament is a species of flower consisting of a thread-form receptacle, to which a number of chaffy scales are attached. A specimen of it may be seen in the flowers of the fir, birch, hazel, beech, and oak.

XXII. XXIII. In the 22d and 23d classes, DIOECIA and POLYGAMIA, the genera are distinguished in a manner similar to those already described. We have only to remark, that what in other systems are called hermaphrodite flowers, in the class Polygamia we call anther-stigmate, or pistil-staminal, that is, flowers having both anthers and stigmas, or pistils and stamens.

OF THE SPECIES.

THE species consist of such groups or collections of plants as have certain resemblances, which render it convenient to class them under one genus. The species are distinguished from one another, either by marking in a few words the most striking differences, or by giving a minute description of each species. In the foreign plants, we have adopted the first method for the sake of brevity. But in the British, which it is of consequence we should study more perfectly, we have adopted the second. The first is a translation of Willdenow's *Species Plantarum*, the most complete system hitherto published, and the second, or the description of the British plants, is a translation from Dr Smith's *Flora Britannica*, which we have no hesitation in saying is a model of botanical description. For precision it is worthy of Linnæus, and is so minute that nothing peculiar to any species seems to have escaped the author.

The species, when numerous, are formed into subdivisions. This we think should always be done, when it can be done with propriety. There are some eminent botanists who disapprove of this practice, because, say they, it separates species that have the closest resemblance to one another. This, however, is of no consequence; for it is not the object of botanical arrangement to place these plants next one another, which are most like; but to point out the species, and most certain method of discovering the names of such plants as we have occasion to examine. We cannot help regretting, therefore, that Mr Salisbury, in his new arrangement of ERICA, a genus consisting of more than 240 species, should, in order to class them according to their affinities, have neglected to form them into subdivisions: the subdivision of the species diminishes the unnecessary labours of the botanist, and tends to increase the precision of inquiry. For example, 32 species of the campanula have leaves smooth polished, and the rest have leaves rough to the touch. This circumstance forms a very convenient subdivision. Again, 44 species of the selanum have neither prickles nor thorns, 39 are prickled, and one is thorny or spinous. Thus, in examining a selanum, we can have no occasion to run over 84 species; we are required only to go over 44, or 39, or one. There is as much propriety in forming the numerous species of a genus into subdivisions,

Elements.

as there is in separating plants that have a close resemblance into different genera. Who would have supposed that the botanist who has separated the *Erica vulgaris* or common heath, from the genus to which it has hitherto belonged, would have thought it improper to arrange so extensive a genus into subdivisions. We can only account for it, by supposing that an eminent botanist may sometimes forget the principles of the Linnæan classification, to seek after a natural classification; a thing which we suspect is like the government of Utopia, that exists only in the mind of the inventor.

OF VARIETIES.

EVERY part of a plant is subject to variation from climate, soil, cultivation, and diseases, or injuries produced by insects, winds, &c. The corolla and leaves are most liable to change. Variations arising from such accidents are not permanent; they may indeed be propagated by slips, but vanish in those plants which are raised from seeds. It is by rearing plants from seeds that we can determine whether a plant be a variety or a distinct species.

RULES FOR DIRECTING THE YOUNG BOTANIST IN INVESTIGATING A PLANT.

After the young botanist understands the principles upon which the classification is formed, he ought immediately to proceed to the examination of plants.

I. 1. The botanist ought to select flowers in different states, some expanded, some unopened, and if possible, some that are ripened into fruit.

2. If the flower contain both stamens and pistils, it belongs to some one of the first 20 classes. If either the pistils or stamens be wanting, it belongs to the 21st, 22d, or 23d. To this rule there are a few exceptions, which if the young botanist cannot overcome, he may pass them over till he has made some progress in the art of investigation.

3. He must next examine whether the stamens be connected or separate, and whether two of them be uniformly shorter than the rest. If the stamens be not connected, and two of them be not uniformly shorter, the plant belongs to one of the first 13 classes. If the stamens do not amount to 12, the number of the stamens and number of the class is the same. If the stamens be 12 or more, then, besides counting them, it is necessary to observe whether they be fixed at the lower end to the calyx or receptacle. This may be best known by tearing off the calyx; if the stamens do not come away with the calyx, the plant belongs to the class dodecandria. If the stamens be about 20, less or more, and fixed to the calyx, the plant belongs to icosandria. If 20 or more, and attached to the calyx, the class is polyandria.

In all these classes the orders may be known by examining the pistils.

4. If the stamens be four or six, and two shorter than the rest, the plant belongs to didynamia or tetradynamia. The corolla in didynamious plants is one petal divided into two lips; and the corolla of tetradynamious plants consists always of four petals, placed somewhat in the form of a cross: hence called *cruciform*.

The orders of the class didynamia may be known by observing whether the seeds be enclosed in a seed-vessel,

Elements. vessel, be four in number, and naked at the bottom of the calyx.

In tetradynamia, the orders are distinguished by the form of the seed-vessel. If long, the order is siliquosa; if roundish it is siliculosa.

5. If the stamens be connected by the filaments into one set round the pistil, but separated at the top, and the petals five, the class is monadelphia. If the stamens be formed into two sets, and the corolla like the blossoms of a pea or bean, the class is diadelphia; and if formed into more than two sets, the class is polyadelphia. The orders depend upon the number of the stamens.

6. If the flower be compound, that is, if one calyx contain a great many corollets, each of which has five stamens united to a cylinder at the anthers, the flower belongs to the class syngenesia.

The orders are to be determined by examining the florets, that is, the corollets of the disk and ray, in order to know whether they both contain pistils and stamens, or anthers and stigmas, or otherwise. 1. If all the florets contain stamens and a pistil, the order is polygamia aequalis. 2. If the disk or central part have florets with a pistil and stamens, but the rays contain only a pistil, the order is polygamia superflua. 3. If the florets of the disk have stamens and pistils, or be anther-stigmate, but those of the rays have only a style, the order is polygamia frustranea. 4. If the florets of the disk have stamens and styles, but no stigmas, and those of the rays a pistil only, the order is polygamia necessaria. 5. When each of the florets has a small calyx, the order is the polygamia segregata. 6. And when the flower is not compound, but single with anthers united, the order is monogamia. But such plants are commonly now added to the class pentandria.

7. If the stamens be fixed to the pistil, the class is gynandria. The flower has something of a monstrous or irregular appearance. The petals are five, the style grows from the inner petal of the lower lip of the corolla, so as scarcely to be distinguishable.

The orders are determined by the number of the stamens.

8. When the flowers are imperfect, that is, when some in the same individual plant have only pistils and some only stamens, the plant belongs to the class monœcia. When the pistils are in one plant, and the stamens on another, the class is diœcia; and when perfect and imperfect flowers occur on the same plant, or on two or three different plants, the class is polygamia.

The orders of monœcia and diœcia, are known by the number of stamens; and in polygamia, if imperfect and perfect flowers, that is, anther-stigmate, and stigmate or anthered, be found on the same plant, the order is monœcia; if on two plants, the order is diœcia; and if anther-stigmate flowers be on one plant, stigmate on another, and anthered on a third, the order is triœcia.

9. Different flowers should be examined, and especially those that are anopened, if the number of stamens and pistils should vary. And if after this examination, different unopened or unexpanded flowers should vary, a preference should be given to the flowers that terminate the stalk. We ought always, therefore, to compare different flowers before we inquire after the class or orders.

Elements. II. 1. After determining the class and order, the botanist ought to compare with the flower which he is investigating the different sections of the order when it is divided into sections. He may then proceed to examine the genus.

2. In the beginning of each class he will find all the genera arranged as they agree and differ in some essential characters of the flower and fruit. But they are numbered in that order which brings those that have the closest resemblance next to one another. After the section is determined, then the flower must be compared with each of the genera of that section, or of the order when it is not divided into sections.

3. If none of the essential characters agree with the flower and fruit of the plant which is examined, then the plants which are named at the end of the orders are to be sought for and examined.

In this system we have first given the essential marks of all the genera at the beginning of each class in Latin, and also in English.

4. After determining the genus, the plant may be compared with the description of the species. In foreign plants we have in general given only the essential character of the species. But in some British plants we have added also, from Dr Smith's Flora Britannica, a minuter and fuller account, as an example of botanical description.

We have not referred to those books which give plates of the species, because they are accessible but to very few, and because we do not think that a man will ever be a botanist whose knowledge is indebted to plates. It is much better to consult an experienced botanist than a book of plates. Those, however, who wish to consult plates may do so from this system as well as from any other, after ascertaining the class and order.

As to the language which is employed in the following system, we need say very little. We have endeavoured to make it as much English as possible. We have always preferred words of English origin when we thought them sufficiently accurate; but when we had reason to believe that such words were so vague that they might lead into error, we thought it better to adopt the Linnean terms, and to give them an English termination. In a few cases we have retained the Linnean terms unaltered, as corolla, bractea, stipula, because we thought any such change would be unpleasant to the ear, as corol, bracte, stipule. Besides, it would be no disadvantage to the harmony of our language to have more words ending with vowels.

We once intended to have given English names to many of the genera, and to all the species, and had done so through the first four or five classes; but it was objected, that this would increase the synonymes, which are already too numerous; and consequently would tend to mislead than to be useful. It would certainly be much better that plants were known in all nations by the same name.

Of the Method of forming an Herbarium or Hortus Siccus.

Every man who wishes to be a complete botanist will find it necessary to preserve and to form into a collection the plants which he has examined.

The

Elements.

The best method of preserving them is by drying them: specimens ought to be collected when dry, and carried home in a tin box. Plants may be dried by pressing, in a box of sand, or with a hot smoothing iron. Each of these has its advantages.

1. If pressure be employed, a botanical press may be procured. The press is made of two smooth boards of hard wood, 18 inches long, 12 broad, and two thick. Screws must be fixed to each corner with nuts. If a press cannot easily be had, books may be employed.

Next, some quires of unsized blossom blotting paper must be provided. The specimens, when taken out of the tin box, must be carefully spread on a piece of paste-board covered with a single sheet of the blossom paper quite dry; then place three or four sheets of the same paper above the plant, to imbibe the moisture as it is pressed out; it is then to be put into the press. As many plants as the press will hold may be piled up in this manner. At first they ought to be pressed gently.

After being pressed for twenty-four hours or so, the plants ought to be examined, that any leaves or petals which have been folded may be spread out, and dry sheets of paper laid over them. They may now be replaced in the press, and a greater degree of pressure applied. The press ought to stand near a fire, or in the sunshine. After remaining two days in this situation, they should be again examined, and dry sheets of paper be laid over them. The pressure then ought to be considerably increased. After remaining three days longer in the press, the plants may be taken out, and such as are sufficiently dry may be put in a dry sheet of writing paper. Those plants which are succulent may require more pressure, and the blossom paper again renewed.

Plants which dry very quickly, ought to be pressed with considerable force when first put into the press; and if delicate, the blossom paper should be changed every day. When the stem is woody it may be thinned with a knife, and if the flower be thick or globular, as the thistle, one side of it may be cut away; as all that is necessary, in a specimen, is to preserve the character of the class, order, genus and species.

2. Plants may be dried in a box of sand in a more expeditious manner, and this method preserves the colour of some plants better. The specimens, after being pressed for ten or twelve hours, must be laid within a sheet of blossom paper. The box must contain an inch deep of fine dry sand, on which the sheet is to be placed, and then covered with sand an inch thick; another sheet may then be deposited in the same manner, and so on, till the box be full. The box must be placed near a fire for two or three days. Then the sand must be carefully removed, and the plants examined. If not sufficiently dried, they may again be replaced in the same manner for a day or two.

3. In drying plants with a hot smoothing iron, they must be placed within several sheets of blotting paper, and ironed till they become sufficiently dry. This method answers best for drying succulent and mucilaginous plants.

4. When properly dried, the specimens should be placed in sheets of writing paper, and may be slightly fastened by making the top and bottom of the stalk pass through a slip of the paper, cut neatly for the pur-

pose. Then the name of the genus and species should be written down, the place where it was found, nature of the soil, and the season of the year. These specimens may be collected into genera, orders, and classes, and titled and preserved in a portfolio or cabinet. The method of preserving many of the cryptogamous plants is more difficult, on account of the greater quantity of moisture which they contain, and the greater delicacy of their texture.

We will now conclude this introduction with particular reference to the plates.

EXPLANATION OF THE PLATES.

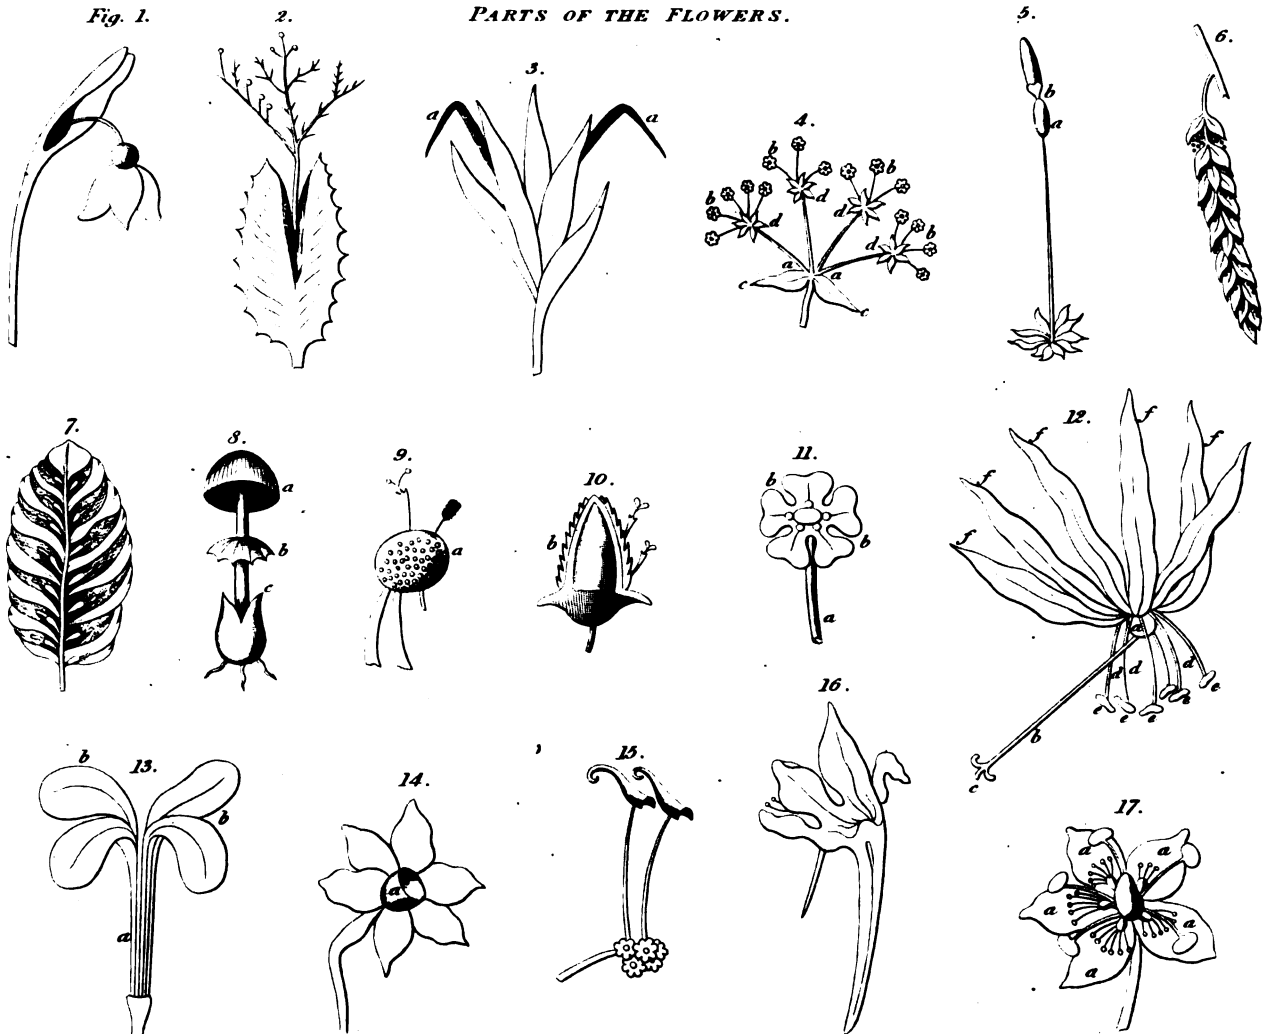

PLATE XCIV. exhibits the 24 CLASSES; fig. 1. representing the first class, or Monandria; fig. 2. the second class, or Diandria; fig. 3. the third class, or Triandria; and so on, according to the enumeration in the table.

PLATE XCV. represents the parts of a plant upon which the investigation of the GENUS depends.

Parts of the FLOWER.—Fig. 1. Spathe. Fig. 2. Spadix. Fig. 3. *Ghuma*, or glume; b b, *arista*, or awn. Fig. 4. *Umbella* and *involucrum*; a, *Umbella universalis*, or universal umbel; b, *partialis*, or partial umbel; c, *Involucrum universale*, universal involucre; d, *partiale*, or partial involucre. Fig. 5. *Calyptra*, calyptra or veil; a, *capitulum*; b, *operculum*; parts of mosses. Fig. 6. Amentum. Fig. 7. *Strobilus*, strobile. Fig. 8. a, *Pileus*, cap; b, *volva*; c, *stipes*; parts of fungi or mushrooms. Fig. 9. a, *Receptaculum commune nudum*, the common receptacle or base of the flower when the stamens, pistillum, capsule, &c. are taken off. Fig. 10. *Receptaculum commune paleis imbricatum*, or common receptacle imbricated with paleæ or membranaceous lamella. Fig. 11. a the tube, b the edge or margin, of a one-petaled corolla. Fig. 12. is a flower laid in a proper position for showing its different parts. a, *Germen*, which includes the seeds and capsule in which they are enclosed; b, *style*, a continuation of the germen; c, *stigma*, or top of the stylus; d d d d d, *filaments*, or threads; e e e e, *anthers*; f f f f f, *petals*. Fig. 13. a, the *claws*, b, the *laminæ* or plates, of a many-petaled corolla. Fig. 14. a, Bell-shaped nectary of the narcissus. Fig. 15. Horned nectaries of monkshood. Fig. 16. Horned nectary in the calyx of the tropæolum. Fig. 17. a a a a, The nectaries of the parnassia grass, five in number, each of which has 13 styles, with round buttons on their tops.

Parts of FRUCTIFICATION.—Fig. 18. a, *Perianth*; b, *germen*; c, *style*; d, *stigma*; e e, *filaments*; f f, *anthers*, some shedding the pollen or dust; g, the appearance of the anther before it sheds the pollen. Fig. 19. a, the *filament*, and b, the *anther*, separated from the flower. Fig. 20. a, one grain of the *pollen* magnified by a microscope; b, an elastic aura supposed to be necessary for impregnating the seeds. Fig. 21. a, *Germen*; b, *style*; c c, *stigma*. Fig. 22. *Follicle*: The seeds not adhering to the suture, are enclosed in a particular receptacle, a. Fig. 23. *Legume*, or a double-valved pericarp, having the seeds fixed only to one of the sutures a a. Fig. 24. *Siliqua*, or a double-valved pericarp, with the seeds fixed to both sutures or margins, a b. Fig. 25. *Pome*, or a fleshy pericarp, contain-

Fig. 42. Lanceolate. Fig. 43. Linear. Fig. 44. Subulate, or awl-shaped. Fig. 45. Reniform, or kidney-shaped. Fig. 46. Cordate, or heart-shaped. Fig. 47. Lunulated, or crescent form. Fig. 48. Triangular. Fig. 49. Sagittate. Fig. 50. Cordato-Sagittate, heart-shaped behind, and sharp like the point of an arrow before. Fig. 51. Hastate, or halbert-shaped. Fig. 52. Cleft. Fig. 53. Three-lobed, or having three (55) lobes. Fig. 54. Præmorse, fore-bitten. Fig. 55. Lobed. Fig. 56. Quinqueangular, or five-angled. Fig. 57. Eroded. Fig. 58. Palmate. Fig. 59. Pinnated. Fig. 60. Laciniate. Fig. 61. Sinuate. Fig. 62. Dent-sinuate. Fig. 63. Sinuate backwards. Fig. 64. Partite or parted. Fig. 65. Repand, or scalloped. Fig. 66. Dentated, or dentated. Fig. 67. Serrated or sawed. Fig. 68. Doubly serrated. Fig. 69. Doubly notched. Fig. 70. Cartilaginous. Fig. 71. Acutely notched. Fig. 72. Obtusely notched. Fig. 73. Plaited. Fig. 74. Crenate, notched. Fig. 75. Curled. Fig. 76. Blunt or obtuse. Fig. 77. Acute. Fig. 78. Acuminate, or awl-pointed. Fig. 79. Obtuse with an acumen, blunt with a sharp point superadded. Fig. 80. Acutely emarginated. Fig. 81. Cuneiform emarginate, wedgiform and notched at the end. Fig. 82. Retuse. Fig. 83. Long-haired. Fig. 84. Tomentose, or cottony. Fig. 85. Hispid, or bristle-haired. Fig. 86. Ciliated. Fig. 87. Rugose or wrinkly. Fig. 88. Veined. Fig. 89. Nerved. Fig. 90. Papillous. Fig. 91. Linguiform or tongue-shaped. Fig. 92. Scimitar-shaped. Fig. 93. Hatchet-shaped. Fig. 94. Deltoid. Fig. 95. Three-sided or triquetrous. Fig. 96. Channelled. Fig. 97. Furrowed. Fig. 98. Cylindrical. B. *Compound* Leaves. Fig. 99. Three-lobed. Fig. 100. Binate. Fig. 101. Ternate. Fig. 102. Digitate, or fingered. Fig. 103. Pedate. Fig. 104. Pinnated with an odd leaflet. Fig. 105. Abruptly pinnated. Fig. 106. Pinnated alternately. Fig. 107. Abruptly pinnated. Fig. 108. Pinnated with a cirrhous. Fig. 109. Pinnated with only two leaflets. Fig. 110. Pinnated decursively. Fig. 111. Pinnated jointedly. Fig. 112. Lyre-shaped. Fig. 113. Biternate, or duplisco-ter-

nate, biternate, (100), or doubly ternate, or having three ternate (100) leaves upon one petiole. Fig. 114. Bipinnate or doubly pinnate, i. e. having the primary pinnae pinnated again a second time. Fig. 115. Triter-nate, or triple ternate, or consisting of three biternate (113) leaves. Fig. 116. Triple pinnated without an odd leaflet, or having the secondary pinnae pinnated again, and these last pinnae not terminated with an odd leaflet. Fig. 117. Triple pinnated with an odd leaflet.

2. LEAVES, as to determination.—Fig. 118. Incurvated. Fig. 119. Erect. Fig. 120. Patent or spreading. Fig. 121. Horizontal. Fig. 122. Reclined or reflex. Fig. 123. Revolute or rolled back. Fig. 124. Seminal leaves, or seed-leaves. Fig. 125. Cauline or stem-leaf. Fig. 126. A branch-leaf. Fig. 127. Floral; leaf next the flower; also termed a *bractea*. Fig. 128. Peltate, or target-shaped. Fig. 129. On a leaf-stalk. Fig. 130. Sessile. Fig. 131. Decurrent. Fig. 132. Stem-clasping. Fig. 133. Perfoliate. Fig. 134. Connate, or united at the base. Fig. 135. Sheathing. Fig. 136. Articulated or jointed. Fig. 137. Stellate, or verticilled. Fig. 138. *Quaterna*, *quina*, *senæ*, &c. denote different species of stellated or verticilled leaves, when there are four, five, or six, &c. leaves in one verticil or whirl. Fig. 139. Opposite. Fig. 140. Alternate. Fig. 141. Linear and persisting. Fig. 142. Imbricated, or tiled. Fig. 143. Fascicled. Fig. 144. *Fronde*; a species of stalk or trunk, consisting of branches and leaves, and sometimes the fructification, all united together; peculiar to the Filices or Ferns, and the Palmæ. Fig. 145. (Sauv.) Spatulate, or roundish above, with a long linear base. Fig. 146. Parabolical; having its longitudinal diameter longer than the transverse, and growing narrower from the base till it terminate somewhat like an oval.

3. CAULES, or STEMS.—Fig. 147. A scaly culm or stalk. Fig. 148. *Caulis repens*, a repent or creeping stalk or stem; appropriated to herbaceous plants. Fig. 149. Scape. Fig. 150. A jointed culm (147) or stalk. Fig. 151. A twining stem. Fig. 152. A dichotomous or two-forked stem. Fig. 153. Brachiated.

4. FULCRA, or SUPPORTS.—Fig. 154. *a*, A clasper or tendril; *b*, *Stipulas*, the little scales at the base of the foot-stalk of the leaf, or at the base of the flower-stalk; *c*, Small hollow glands for the secretion of some particular fluid. Fig. 155. *a*, Small glands. Fig. 156. *a*, *Bractea*; on footstalk, or differing from the other leaves of the plant. Fig. 157. *a*, A simple or one-pointed spine. *b*, A triple or three-pointed spine. Fig. 158. A triple or three-pointed prick. Fig. 160. Opposite leaves; *a*, the *axil*, or angle betwixt the leaf and the stalk.

5. ROOTS.—Fig. 161. A scaly bulb. Fig. 162. A solid bulb. Fig. 163. A tunicated or coated bulb. Fig. 164. A tuberous root. Fig. 165. Fusiform or spindle-shaped. Fig. 166. A branchy root. Fig. 167. A repent or creeping root.

EXPLANATION OF SIGNS.

Duration. { \odot Annual.
 { δ Biennial.
 { \times Perennial.
 Magnitude h Tree or shrub.
 Time of flowering. } I. II. III. January, February, March, &c.

K CLASSIFICATION.

CLASSIFICATION.

CLASSIS I.
MONANDRIA.

ORDO I. MONOGYNIA.

Sect. I. SCITAMINEÆ, *Fructu infero uni vel triloculari.*

12. KÆMPFERIA. Cal. obsoletus. Cor. 6-partita: laciniis 3 majoribus patulis, unica bipartita. Stigma bilamellatum.

3. RENEALMIA. Cal. 1-phyllus rumpens. Cor. 3-fida inæqualis. Nectar. oblongum basi utrinque unidentatum. Bacca.

2. HELLENIA. Cal. spathiformis. Cor. limbus duplex: exterior subtrifidus. Nect. diphyllum s. bifidum.

6. HEDYCHIUM. Cal. 1-phyllus rumpens. Cor. tubus longissimus; limbus duplex 3-partitus. Nect. 2-phyllum.

11. CURCUMA. Cal. 2-fidus. Cor. 4-partita. Nect. 3-lobum. Anth. basi bicalcarata.

5. HORNSTEDTIA. Cal. 2-fidus. Cor. tubus longus filiformis; limbus duplex, exterior tripartitus. Nect. tubulosum.

8. ALPINIA. Cal. 3-dentatus æqualis tubulosus. Cor. 3-partita æqualis. Nect. 2-labiatum: labio inferiore patente.

4. AMOMUM. Cal. 3-fidus inæqualis cylindricus. Cor. 3-partita inæqualis patens. Nect. 2-labiatum erectiusculum.

7. COSTUS. Cal. 3-fidus gibbus. Cor. 3-partita ringens. Nect. 2-labiatum, labio inferiore maximo trilobo.

10. MARANTA. Cal. 3-phyllus. Cor. 3-fida. Nect. 3-partitum: lacinia tertia superiore latere antherifera.

1. CANNA. Cal. 3-phyllus. Cor. 6-partita. Nect. 2-partitum. Caps. 3-locularis.

14. PHRYNIUM. Cal. 3-phyllus. Cor. 3-petala tubo nectararii adnata. Nect. tubo filiformi, limbo 4-partito. Caps. 3-locul. Nuce 3.

13. THALIA. Cal. 3-phyllus. Cor. 5-petala: duo interiora minora. Nect. lanceolatum concavum. Drupa nuce unilocul.

9. MYROSMA. Cal. duplex: exterior 3-phyllus: interior 3-partitus. Cor. 5-partita irregularis.

Sect. II. *Fructu infero quadriloculari.*

18. LOPEZIA. Cal. 4-phyll. Cor. 5-petala inæqualis. Caps. 4-locul. 4-valvis, polysperma.

Sect. III. *Fructu supero.*

15. PHYLIDRUM. Spatha 1-flora. Cal. 0. Cor. 4-petala irregularis. Caps. 3-locul. polysperma.

2

CLASS I.
MONANDRIA.

ORDER I. MONOGYNIA.

Sect. I. SCITAMINEÆ or *Spicy Plants. The Germen Inferior, and 1 or 3-celled.*

12. K. Cal. indistinct. Cor. 6-parted, the three greater segments open in two-parted stigmas, bilamellated.

3. R. Cal. 1-leaved, bursting. Cor. 3-cleft, unequal. Nect. oblong, one tooth on each side of the base. A berry.

2. H. Cal. spathiform. Cor. limb double, exterior one subtrifid. Nect. two-leaved, or bifid.

6. H. Cal. 1-leaved, bursting. Cor. tube long, limb double, 3-parted. Nect. diphyllous.

11. C. Cal. 2 cleft. Cor. 4-parted. Anth. two horns at the base. Nect. 3-lobed.

5. H. Cal. 2-cleft. Cor. long, filiform; limb double, the exterior one 3-parted. Nect. tubulous.

8. A. Cal. 3-dented, equal. Cor. 3-parted, equal. Nect. 2-lipped, inferior lip spreading.

4. A. Cal. 3-cleft, unequal. Cor. 3-parted, unequal. Nect. 2-lipped, somewhat erect.

7. C. Cal. 3-cleft, gibbous. Cor. 3-parted, ringent. Nect. 2-lipped, inferior lip greatest, and 3-lobed.

10. M. Cal. 3-leaved. Cor. 3-cleft. Nect. 3-parted, third segment on the higher side anther-bearing.

1. C. Cal. 3-leaved. Cor. 6-parted. Nect. 2-parted. Caps. 3-celled.

14. P. Cal. 3-leaved. Cor. 3-petaled. Nect. tube filiform. Limb 4-parted. Caps. 3-celled. Nuts 3.

13. T. Cal. 3-leaved. Cor. 5-petaled, two interior pet. less. Nect. lanceolate, concave. Drupe 1 cell.

9. M. Cal. double; exterior one 3-leaved, interior 3-parted. Cor. 5-parted, irregular.

Sect. II. *Germen inferior, and four-celled.*

18. L. Cal. 4-leaved. Cor. 5-petals, unequal. Caps. 4 cells, 4 valves, many seeds.

Sect. III. *Germen superior.*

15. P. Spathe one flower. Cal. none. Cor. 4-petals irregular. Caps. 3 cells, many seeds.

16. CUCULLARIA.

16. CUCULLARIA. Cal. 4-partitus. Cor. 4-petala inaequalis calcarata. Fil. petaliforme. Anth. loculis discretis!

17. QUALEA. Cal. 4-partitus. Cor. dipetala. Bacca?

19. USTERIA. Cal. 4-dentatus, lacinia unica reliquis multo majore. Cor. infundibuliformis 4-dentata. Caps. 1-locul. 2-sperma.

† *Mangifera Indica. Tradescantia monandra.*

Sect. IV. MONOSPERME.

20. BOERHAAVIA. Cal. superus margo integerrimus. Cor. 1-petala campanulata.

* 23. HIPPIURIS. Cal. superus margo bilobus. Cor. o.

22. SALICORNIA. Cal. 1-phyllus ventricosus. Cor. o.

21. POLLICIA. Cal. 1-phyllus 5-dentatus. Cor. o. Sem. 1, receptaculi squamis 2 baccatis tectum.

24. MITHRIDATEA. Recep. multiflorum 4-fidum. Cal. o. Cor. o. Sem. solitaria recept. carnoso immersa.

* CHARA. Cal. o. Cor. o. Anth. sessilis. Styl. o. Stigma 5-fidum. Sem. plura.

* ZOSTERA. Spadix linearis, altera latere fructifero. Cal. o. Cor. o. Stam. alterna. Sem. solitar. alterna.

† *Valeriana rubra, angustifolia. Calcitrapa. Scirpi et Cyperi nonnullae species. Alchemilla Aphanes, monandra. Polycnemum monandrum.*

ORDO II. DIGYNIA.

Sect. I. PLANTÆ.

25. LACISTEMA. Cal. amenti squama. Cor. 4-partita. Fil. 2-fid. Bac. pedicellata monosperma.

26. CORISPERMUM. Cal. o. Cor. 2-petala. Sem. 1.

* 27. CALLITRICHE. Cal. o. Cor. 2-petala. Cap. 2-locularis.

28. BLITUM. Cal. 3-fidas baccatus. Cor. o. Sem. 1.

29. MNIARUM. Cal. 4-partitus superus. Cor. o. Sem. 1.

Sect. II. GRAMINEÆ.

30. CINNA. Cal. gluma 1-flora. Cor. gluma, 2-valvis.

† *Leersia Monandra.*

1. CANNA, Flowering Reed.

Cor. 6-parted, erect. Nect. 2-parted, rolled back. Style lanceolate, adhering to the corolla. Cal. 3-leaved.

indica.
rubra.
lutea.

1. C. leaves ovate, acuminate ribbed.

α C. whole flower reddish, leaves ellipse-ovate.

β C. interior petals erect and yellow, the segments of the nectary rolled back and sprinkled with reddish lines; leaves ovate elliptical.

soccinea.

γ C. interior petals erect, scarlet, the segments of the nectary rolled back, yellow sprinkled with red lines, leaves ovate elliptical.

patens.

δ C. interior petals reflected, scarlet leaves lanceolate oblong. Between the tropics.

16. C. Cal. 4-parted. Cor. 4 petals unequal, spur-shaped. Fil. petal-shaped.

17. Q. Cal. 4-parted. Cor. 2 petals. A berry.

19. U. Cal. 4-dented, one segment greater than the rest. Cor. funnel-shaped, 4-dentate. Caps. 1 cell, 1 seed.

† *Mangifera Indica. Tradescantia monandra.*

Sect. IV. MONOSPERME, or having one Seed.

20. B. Cal. superior, margin very entire. Cor. 1 petal, campanulated or bell-shaped.

* 23. H. Cal. superior, margin two-lobed. Cor. none.

22. S. Cal. 1-phyllous, ventricose. Cor. o.

21. P. Cal. 1-phyllous, 5-dented. Cor. o. Seed 1, fleshy, scaly, inclosing the germen.

24. M. Cal. none. Cor. none. Recep. fleshy, having many flowers.

* C. Cal. o. Cor. o. Anth. sessile. Style o. Berry many seeds.

* Z. Spadix linear, sheathed by the leaves, fruit-bearing. Cal. o. Cor. o. Seeds solitary alternate.

† *Valeriana rubra, angustifolia. Calcitrapa. Several species of Scirpus and Cyperus, Alchemilla Aphanes, monandra. Polycnemum monandrum.*

ORDER II. DIGYNIA.

Sect. I. PLANTS.

25. L. Cal. scale of an ament. Cor. 4-parted. Fil. 2-cleft, berry on a footstalk, 1 seed.

26. C. Cal. o. Cor. 2 petals, seed 1.

* 27. C. Cal. o. Cor. 2 petals. Caps. 2 cells.

28. B. Cal. 3-cleft, enclosing a berry. Cor. o. seed 1.

29. M. Cal. 4-parted, superior. Cor. o. Seed 1.

Sect. II. GRASSES.

30. C. Cal. glume, 1-flowered. Cor. glume, 2-valved.

† *Leersia Monandra.*

2. C. leaves lanceolate on footstalks, ribbed. *Small angustifolia. Flowering reed. America.*

3. C. leaves lanceol. petiol. glaucous beneath, with-glaucous ribs. Carolina.

4. C. leaves linear, ribbed. *Rushy flowering reed. juncea. China.*

2. HELENIA.

Limb of the cor. double, the outer one commonly 3-cleft. Nect. 2-leaved or 2-cleft. Caps. 3-celled, coriaceous, inflated, subglobose. Cal. spathiform, campanulated, 2-cleft.

1. H. Nect. 2-leaved. Caps. subspungious, leaves *alughas*. entire. Ceylon.

K 2

2. H.

- alba*. 2. H. Nect. diphyllous. Caps. striated, leaves entire. China.
chinensis. 3. H. Nect. 2-leaved, leaves ciliated. China.
aquatica. 4. H. Nect. 1-leaved, 2-cleft, leaves denticulated. India.

3. RENEALMIA.

Cor. trifid. Nect. oblong. Cal. 1-leaved, having two or three irregular dents. Anth. sessile, opposite to the nectary. Berry fleshy.

- exaltata*. 1. R. *High or tall renealmia*. It is a tree which grows 20 feet high; the leaves are lanceolated, and 5 or 6 feet long. Surinam.

4. AMOMUM, *Ginger*.

Cal. 3-cleft, unequal, cylindrical. Cor. 5-parted, unequal, spreading. Nect. bilabiate, almost erect.

- zingiber*. 1. A. Scape naked, spike and scales ovate, leaves lanceolate, ciliated on the margin near the apex. α . East Indies, and Jamaica.—This plant grows to the height only of two or three feet. It is valued chiefly on account of its root, which is tuberous, of the thickness of a finger, white or reddish within, and pale or yellow without. Ginger is reckoned a good stomachic. It is much used by the Indians by way of seasoning. It grows in Malabar, Ceylon, Amboina, and China, and is cultivated in the West Indies. As it is very plentiful on the mountains of Gingi, some suppose that from this circumstance the name *Gingiber* or *Zingiber* was derived.

- zerumbet*. 2. A. Scape naked; spike oblong, obtuse; scales roundish; leaves ovate, smooth on the margin. α . East Indies.

- sedoaria*. 3. A. scape naked; spike loose, cylindrical, truncated; leaves ovate acuminate. α . India.

- sylvestre*. 4. A. scape naked, spike elongated, bractees oblong ventricose, leaves broad lanceolate. α . Jamaica.

- mioga*. 5. A. scape very short, capsule ovate, leaves sword-form and acute. α . Japan.

- angustifolium*. 6. A. scape naked, very short, spike-headed; leaves linear lanceolate. α . Madagascar.

- cardamomum*. 7. A. spike radical sessile obovate, leaves obovate-elliptical and cuspidate. α . India.

- villosum*. 8. A. scape sheathed very short, spike roundish; bractees lanceolate, longer than the flower. α . India.

- echinatum*. 9. A. spike radical, somewhat globular, capsules furrowed, echinate and globular. α . India.

- repens*. 10. A. scape branchy, decumbent; leaves lanceolate. α . Malabar.

- granum paradisi*. 11. A. scape branched loose, leaves ovate. α . Madagascar, Guinea, and Ceylon.—The fresh leaves of this plant, which grows to the height of 10 or 12 feet, have a strong aromatic taste, but somewhat bitter. Its grains have the same qualities in a higher degree. The Indians mix them with betel, in order to promote digestion. Their taste is very agreeable; when squeezed in the mouth, they produce a pleasant coolness. They are an object of commerce on the Malabar coast.

5. HORNSTEDTIA.

Cal. bifid. Tube of the corolla long, filiform; border double, outer one three-parted. Nect. tubular; capsule three-celled, oblong.

1. H. leaves tomentose beneath. α . Malacca. *scyphus*.
 2. H. leaves smooth ciliated. α . Malacca. *leoninus*.

6. HEDYCHUM.

Cal. 1-leaved, bursting. Cor. with a very long tube; border double, three-parted. Nect. 2-leaved.

1. H. α . India.

coronarum.

7. COSTUS.

Cal. trifid, gibbous. Cor. 3-parted, ringent. Nect. 2-lipped, the inferior lip largest, 3-lobed.

1. C. leaves smooth on both sides, spike with few *arabicus*. flowers, scales leaf-like at the apex, the highest ones fastigate. α . America.

2. C. leaves smooth on both sides; spike many-*spiratus*. flowered, somewhat ovate, closely imbricated; scales ovate simple. α . Brasil and the Caribbee islands.

3. C. leaves covered beneath with a silky velvet *speciosus*. down. α . East Indies.

8. ALPINIA.

Cal. 3-dented, equal, tubular. Cor. 3-parted, equal. Nect. bilabiate, lower lip spreading.

1. A. the raceme or cluster terminating spiked, *racemosa*. flowers alternate, lip of the nectary 3-cleft; leaves oblong acuminate. α . America.

2. A. the cluster terminating loose with flowers *al-galanga*. ternate, lip of the nectary emarginated, leaves lanceolate. α . East Indies.

3. A. spike terminating hairy, bractees longer than *comosa*. the flower, coloured leaves, oblong-obovate pubescent. α . America.

4. A. cluster radical, compound, erect; nectary *occidentale*. emarginate at the apex, capsule 3-celled, leaves *lan-lis*. lanceolate-ovate and very smooth. *Swarts* prod. 11. α . Jamaica and St Domingo.

9. MYROSMA.

Cor. 5-parted, irregular. Cal. double, the outer part 3-leaved, the inner 3-parted. Caps. 3-angled, 3-celled with many seeds.

1. M. β . Surinam.

caninaformis.

10. MARANTA.

Cal. 3-leaved. Cor. 3-cleft. Nect. 3-parted, the third being a segment, the superior side anther-bearing.

1. M. culm branched and herbaceous, leaves ovate-*arundina*. lanceolate, somewhat hairy beneath. α . America. *cca*.

2. M. culm branched, shrub-like, leaves ovate *tonchat*. smooth. β . Cochin China.

3. M. culm simple, leaves oblong, on footstalks, silky, *malaccen*. pubescent beneath. α . Malacca. This species has *sis*. not yet been accurately examined.

4. M. stemless scape; naked, spiked, hairy, the *comosa*. leaflets of the hair reflected. α . Surinam. It is uncertain whether this plant may not belong to an unformed genus; at any rate, it is very different from the other species of maranta already mentioned.

11. CURCUMA.

Cal. bifid. Cor. quadripartite. Nect. 3-lobed. Anth. with two spurs at the base.

1. C. leaves lanceolate-ovate, ribs or nerves lateral, *rotunda*. very few. α . India.

2. C.

longa. 2. C. leaves lanceolate, ribs lateral and very numerous. α . India.

12. KÆMPFERIA.

Cal. indistinct. Cor. 6-parted, the three greater segments a little expanded, one two-parted. Stigma bilamellated.

galanga. 1. K. leaves ovate sessile. *Galangale.* α . India.
rotunda. 2. K. leaves lanceolate on footstalks. α . India.

13. THALIA.

Cor. 5-petaled; the two inner petals less. Nect. lanceolate concave. Nect. one cell. Cal. 3-leaved.

geniculata. 1. T. cor. 5-petaled. Nect. lanceolate. α . South America.

cannaformis. 2. T. Cor. 5-petaled. Nect. 2-cleft, erect. α . New Hebrides.

14. PHRYNIUM.

Cal. 3-leaved. Petal three, equal, adhering to the tube of the nectary. Nect. 1-leaved, tube filiform, border four-parted. Caps. three-celled. Nuts 3.

capitatum. 1. P. α . Malabar, Cochinchina, and China.

15. PHYLIDRUM.

Spathe one flower. Cal. none. Cor. 4-petaled, irregular. Caps. 3-celled, with many seeds.

lanuginosum. 1. P. α . Cochinchina, and China.

16. CUCULLARIA.

Cal. 4-parted. Cor. 4-petaled unequal, with a spur. Fil. petaliform.

excelsa. 1. C. Guiana. A lofty tree, with leaves opposite, obovate acute veined; racemes terminating, flowers yellow.

17. QUALEA.

Cal. 4-parted. Cor. 2-petaled.

rosea. 1. Q. Guiana.
cærulea. 2. Q. petals emarginate, leaves acute. Guiana.

18. LOPEZIA.

Cal. 4-leaved. Cor. 5-petaled unequal. Caps. 4-celled, 4-valved, many seeds.

mexicana. 1. L. \odot . Mexico. The *Lopezia hirsuta* of Jacquin is only a variety.

19. USTERIA.

Cal. 5-dented, one dent much larger than the rest. Cor. funnel-shaped, 4-dented. Caps. one cell, 2 seeds. Seeds arilled.

guineensis. 1. U. Guinea. $\frac{1}{2}$ with opposite branches; leaves opposite, roundish, ovate, entire. Flowers panicled terminating.

20. BOERHAAVIA.

Cal. margin quite entire. Cor. 1 petal, campanulate plaited. Seed 1, naked, inferior.

erecta. 1. B. stem 4-angled smooth, the internodes viscos,

flowers corymbose-panicled. α . Vera Cruz, and Jamaica. The stamens are two in number.

2. B. leaves oblong-ovate, a little fleshy, flowers *ascendens*. panicled, fruitstalks with two flowers, stem ascending or rising like an arch. Guinea.

3. B. stem tapering pubescent, flowers capitate *diffusa*. corymbose. α . South America. The leaves are whitish beneath. Flowers purple, with one stamen.

4. B. stem a little tapering; hirsute flowers *capit-hirsuta*. tate. α . Jamaica. The stem is a foot long, the flowers blood-coloured, the stamens two.

5. B. leaves nearly heart-shaped; orbicular-acute, *plumbapubescent* beneath, flowers umbellated. α . Spain. *ginca*. The corolla is of a pale rose hue, the stamens three, the fruit top-shaped and striated.

6. B. stem erect, flowers umbellated bistaminal, *scandens*. leaves heart-shaped. West Indies. $\frac{1}{2}$ six feet high, erect, smooth. The branches alternate, the umbels green, bearing six flowers, the involucre 5-leaved.

B. stem erect, leaves inferior heart-shaped ovate, *excelsa*. the highest leaves ovate, flowers umbellated, 3-stamined. $\frac{1}{2}$. The corolla is purple, the stamens three.

8. B. stem erect, leaves heart-shaped *repando-sinu-repanda*. ated, flowers umbellated, 3-stamined. China.

9. B. leaves bipinnatifid, dented; flowers umbel-*charo-*lated and 3-stamined. *Valeriana Chærophylloides* of *phylloides*. Dr Smith. \odot . Chancay in Peru.

10. B. stem creeping. α . Nubia.

repens.
angustifol.

11. B. leaves linear and acute.
12. B. stem creeping, flowers 4-stamined. Society *tetrandra*. islands.

Several species of Boerhaavia resemble the Valeriana.

21. POLLICHIA.

Cal. 1-leaved, 5-dented. Cor. none. Seed 1. Recept. including the fruit within its scales.

1. P. δ . Cape of Good Hope. *campestris*

22. SALICORNIA, *Samphire*.

Cal. ventricose, entire. No petals. Stam. 1 or 2. Seed 1, covered with the calyx.

* 1. S. Knees compressed, emarginate, internodes ob-*herbacea*. conical, spikes on footstalks tapering towards the apex. Europe.

α *S. Europæa*; small jointed glasswort.

β *S. erecta*, leaves short; woody-jointed.

γ *S. myosuroides*, procumbent shoots very long.

δ More branched, procumbent, leaves short, purplish.

Marsh samphire, jointed glasswort, or saltwort.

Frequent on the sea shore in muddy or sandy places.

\odot or δ . Flowers VIII. and IX.

The root is fibrous, small. Stem commonly erect, subdivided at the base, branched above. Branches opposite, simple erect, very succulent, without leaves; kneed, knees compressed, dilated at the summit, emarginated. Spikes opposite terminating with a large odd one, on footstalks, tapering gradually towards the summit, somewhat pointed, jointed. Flowers opposite, three commonly on each side.

β Has a more branched stem, spikes longer and thicker.

Note, The genera and species of plants found in Britain are marked with an asterisk.

- thicker. γ A diffuse stem, spikes very long. δ A stem very much branched, spikes small, purplish. ϵ A stem very much branched, firmer, spikes shorter, green.
- fruticosa*. * 2. S. knees cylindrical, entire, internodes equal, spikes sessile cylindrical obtuse. *Shrubby samphire* or *jointed glasswort*. Is found in sea marshes. α . Flowers in VIII. and IX. The root is woody and perennial, the stem somewhat shrubby, ascending, very much branched, the branches and branchlets opposite. All the internodes commonly cylindrical. The spikes generally sessile, cylindrical obtuse, many-flowered, joints very short.
- perennans* 3. S. knees compressed emarginate, spikes axillary, three together on fruitstalks, scales acute, root perennial. Siberia.
- strobilacea* 4. S. stem prostrate shrubby, genicles truncated alternately bearing spikes; spikes naked, very short opposite. η . Near the Caspian sea.
- virginica*. 5. S. erect, branches very simple. Virginia.
- arabica*. 6. S. leaves alternate, sheathing, obtuse dehiscent. η . Arabia.
- foliata*. 7. S. leaves linear, alternate, stem-clasping, decurrent. Siberia. η .
- amplexicaulis*. 8. S. leaves heart-shaped, stem-clasping. Tunis. η .
- caespica*. 9. S. genicles cylindrical, spikes filiform. Shores of the Caspian and Mediterranean. η .

23. HIPPURIS.

Cal. indistinct, entire. Cor. none. Stigma simple. Seed 1, inferior.

- vulgaris*. * 1. H. with leaves verticilled and linear. In ditches and muddy stagnant pools, but not common. Near Hornsey and Lynn: also in the King's park at Edinburgh. α . Flowers in V. The root is composed of long verticilled fibres; the stem very simple, erect, often kneed, immersed and leafless to the middle, leafy above. The leaves verticilled, from 8 to 12, spreading, linear, acute, very entire, smooth. Flowers axillary, solitary, sessile.
- tetraphyllus*. 2. H. leaves inferior in fours, higher leaves six together obtuse. Sweden.

24. MITHRIDATEA.

Recep. has many flowers, and is 4-cleft. Cal. none. Cor. none. Seeds solitary, immersed in a fleshy receptacle.

- quadrifida* 1. M. η . Madagascar, Mauritius, and Bourbon. It has opposite branches, leaves on footstalks opposite, elliptical obtuse, entire, venous; flowers solitary on footstalks, four-cleft, lateral on the older branches. The fruit is fleshy, and of the size of an apple.

CHARA.

Cal. none. Cor. none. Anth. sessile. Style none. Berry many seeds.

- vulgaris*. * 1. C. without prickles striated, leaves awl-shaped, jointed. *Common Chara*.
 β C. *minor*, with stems and leaves very slender. Frequent in muddy waters. β In water more pure. \odot . Flowers in VII. The whole plant immersed, fetid, brittle, and commonly incrustated with a whitish calcareous gritty substance. The stem is a foot long, filiform, branchy, leafy, striated, twisted. The leaves ver-

ticilled, about 8-subulate, acute, jointed, striated, channelled above, flower-bearing. The anther naked, sessile, depressed, fleshy, rimose. The germen surrounded with four leaflets, near the anther, ovate, striated spirally, 5-dented at the summit. The berry corticated, and many seeds. No stigma is visible.

* 2. C. furrowed, the leaves subulate and jointed, the leaflets verticilled, the prickles on the stem bristly and deflected.

β C. *major*, brittle, and somewhat ash-coloured. *Prickly Chara*. Grows in pools and ditches. North of England; in Guillon Loch, East Lothian. \odot . Flowers in VII. and VIII. The habit of this species the same as the former, but larger, the stem being five times thicker, furrowed rather than striated, very prickly above, the higher prickles all deflected, the lower ones varying in direction. The leaflets verticilled. The flowers resemble those of the *vulgaris*.

Variety β is chiefly distinguished by its stem being prickly only under the higher verticils.

* 3. C. without prickles, smooth, diaphanous, leaves *flexilis*. cylindrical obtuse, a little dagger-pointed. *English Smooth Chara*. Grows in ditches and lakes. \odot . Flowers in VII. and VIII. Green, pellucid, smooth, not striated. Stem round, branched, equal. Leaves verticilled, cylindrical, filiform, obtuse, mucronulate, often jointed and branched; hence might be called branchlets: the flower-bearing ones are aggregate, terminating shorter.

ZOSTERA, Grass-wrack.

Spadix linear-sheathed by the leaves, flower-bearing.

Cal. none. Cor. none. Anth. sessile opposite to the germen. Stigmas two, linear. Caps. 1 seed.

- * 1. Z. with sessile pericarps. *English Grass-wrack, marina*. On the sea-shore in salt marshes and ditches. α . Flowers in VIII. and IX. The root is fibrous. Stems tapering, smooth geniculated, decumbent at their base, striking root; partly floating, leafy, somewhat branched and a little compressed. The leaves alternate, on leafstalks, linear, a little obtuse, entire, smooth, opening a little above the same into a longitudinal chink, and exhibiting a spadix plane and linear, flower-bearing on one side. The anther oblong, sessile at the side of the germen. The germen sessile, oblong. Stigmas 2, linear, acute, somewhat spreading. Capsule elliptical, pendulous, 1-seeded.

ORDER II. DIGYNIA.

25. LACISTEMA.

Cal. scale of an ament. Cor. 4-parted. Fil. 2-cleft. Berry on a fruitstalklet, 1 seed.

1. L. Jamaica and Surinam. η .

myricoides

26. CORISPERMUM, Tickseed.

Cal. none. Petals 2. Seed 1, oval, naked.

1. Cor. spikes terminal, leaves linear, ribless, awn-hyssopifolious. Russia, Tartary, and south of France. \odot .
 2. Cor. spikes axillary, squarrose, leaves lanceolate-acuminate, pungent, nerved, or ribbed. Banks of the Wolga and the deserts of the Cossacs. \odot .

27. CALLITRICHE.

Cal. none. Petals two. Stigmas acute. Seeds 4, compressed,

compressed, naked, with a membranous margin on one side. Some flowers are monococious.

- aquatica*. * 1. *C.* commonly called *verna*.
 β *Stellaria minor*, creeping.
 γ *C. autumnalis*.

English Water Star-wort. Flowers from IV. to X. The whole plant floats in spring, and after the season of flowering sinks a little. Roots fibrous simple. Stems filiform, branched, leafy, smooth. Leaves opposite, spatulate, obtuse, entire, triple, nerved, pellucid, smooth. Lower leaves linear, with one nerve, emarginate. Flowers axillary, solitary, sessile, small, white, hermaphrodite or anther-stigmate, the pistils and stamens sometimes intermingled. Fruit small, sessile, with four keels.

The variety γ, which has been called *Cal. Autumnalis*, and considered as a distinct species, is entirely immersed, all the leaves uniform, linear, emarginate; all the flowers anther-stigmate. It flowers in the beginning of summer.

28. BLITUM.

Cal. 3-cleft. Petals none. Seed 1, in a berried calyx.

1. *B.* little heads spiked, terminal. South of Europe, especially of the Tyrol, Switzerland. ☉.

2. *B.* little heads scattered and lateral. *virgatum*.
 β. *B. chenopodioides*, little heads verticilled and juiceless. Tartary, Spain and France. ☉.

29. MNJARUM.

Cal. 4-parted, superior. Cor. none. Seed 1.

1. *M.* New Zealand and Terra del Fuego. α. *biflorum*. This genus very much resembles the genus *Mignartia* in the 3d class.

30. CINNA.

Cal. a glume 2-valved, one flower. Cor. a glume 2-valved.

1. *C.* Canada. α. This plant seems to be a species of *agrostis*, though evidently distinct from *AGROS. cca.* *TIS CINNA.*

In the class *Monandria* are

30 Genera; and 84 species, 8 of which are British.

CLASSIS II.
 DIANDRIA.

ORDO I. MONOGYNIA.

Sect. I. *Flores inferi, monopetali, regulares.*

36. OLEA. Cor. 4-fida: laciniis subovatis. Drupa monosperma.
 37. CHIONANTHUS. Cor. 4-fida: laciniis longissimis. Drupa monosperma, nuce striata.
 35. PHILLYREA. Cor. 4-fida. Bacca monosperma.
 * 34. LIGUSTRUM. Cor. 4-fida. Bacca tetrasperma.
 40. PIMELEA. Cor. 4-fida. Cal. nullus. Stam. fauci inserta. Nux corticata unilocularis.
 38. SYRINGA. Cor. 4-fida. Caps. bilocularis.
 41. ERANTHEMUM. Cor. 4-fida: laciniis obovatis planis. Capsula.
 31. NYCTANTHES. Cor. 4-fida: laciniis truncatis. Caps. 2-locularis marginata. Sem. solitaria.
 32. JASMINUM. Cor. 5-8-fida. Bacca dicocca. Sem. solitaria arillata.
 33. GALIPEA. Cor. 4-5-fida. Stam. 4, duo sterilia. Capsula?

Sect. II. *Flores inferi, monopetali, irregulares. Fructus capsularis.*

45. PÆDEROTA. Cor. 4-fida, fauce glabra. Cal. 5-partitus. Caps. 2-locul.
 46. WULFENIA. Cor. 4-fida, fauce barbata. Cal. 5-partitus. Caps. 2-locul.
 * 44. VERONICA. Cor. 4-fida, limbo planiusculo: lacinia inferiore angustiore. Caps. 2-locul.

CLASS II.
 DIANDRIA.

ORDO I. MONOGYNIA.

Sect. I. *Flowers inferior.*

36. O. Cor. 4-cleft, segments subovate. Drupe 1 seed.
 37. C. Cor. 4-cleft, segments very long. Drupe 1 seed. Nut striated.
 35. P. Cor. 4-cleft. Berry 1 seed.
 * 34. L. Cor. 4-cleft. Berry with 4 seeds.
 40. P. Cor. 4-cleft. Cal. 0. Stam. inserted into the throat. Nut.
 38. S. Cor. 4-cleft. Capsule corticated, 2-celled.
 41. E. Cor. 5-cleft, segments obovate, plane.
 31. N. Cor. 4-cleft, segments truncated. Caps. 2-celled, marginate. Seeds solitary.
 32. J. Cor. 5-8-cleft. Berry 2-grained. Seeds solitary, arillate.
 33. G. Cor. 4-5-cleft. Stamens 4, 2 barren.

Sect. II. *Flowers inferior, one-petaled, irregular. Fruit capsular.*

45. P. Cor. 4-cleft, throat bare. Cal. 5-parted. Caps. 2-celled.
 46. W. Cor. 4-cleft, throat bearded. Cal. 5-parted. Caps. 2-celled.
 * 44. V. Cor. limb 4-parted, lower segment narrowest.

49. GRATIOLA.

49. GRATIOLO. Cor. 4-fida bilabiata resupinata. Stamina 4: duo sterilia. Caps. 2-locul.

50. SCHWENKIA. Cor. subæqualis: ore plicato-stellato glanduloso. Stam. 5: 3 sterilia. Caps. 2-locul.

48. JUSTICIA. Cor. irregularis. Caps. 2-locul. unguis elastico dissiliens: Dissepimentum contrarium adnatum.

47. CYRTANDRA. Cor. irregularis. Stam. 4: 2 sterilia. Bacca 2-locularis.

* 53. PINGUICULA. Cor. ringens, calcarata. Cal. 5-fidus. Casp. 1-locul.

51. CALCEOLARIA. Cor. ringens, inflata. Cal. 4-fidus. Casp. 2-locula. 4-valvis.

52. BAEA. Cor. ringens. Cal. 5-partitus. Caps. 2-locul. 4-valvis.

* 54. UTRICULARIA. Cor. ringens, calcarata. Cal. 2-phyllus. Caps. 1-locularis.

55. GHINIA. Cor. ringens. Cal. 5-aristatus. Nux carnosæ 4-locula.

66. SCIURIS. Cor. ringens. Stam. 5: 3 sterilia. Caps. 5 coalitæ.

† *Hemimeris sabulosa, diffusa, montana.* *Bignonia catalpa, longissima.*

SECT. III. *Flores inferi monopetali, irregulares. Fructus gymnospermi.*

* 56. VERBENA. Cor. subæqualis. Cal. lacinia supra brevior.

* 57. LYCOPUS. Cor. 4-fida subæqualis; lacinia unica emarginata. Stam. distantia.

58. AMETHYSTEA. Cor. 5-fida subæqualis: lacinia infima concava. Stam. approximata.

60. ZIZIPHORA. Cor. ringens: galea reflexa. Cal. filiformis.

61. MONARDA. Cor. ringens: galea lineari obvolvante genitalia.

62. ROSMARINUS. Cor. ringens: galea fornicata bifida. Stam. curva cum dente.

* 63. SALVIA. Cor. ringens. Fil. transversè pedicellata.

59. CUNILA. Cor. ringens, galea plana. Stam. 4: 2 sterilia.

64. COLLINSONIA. Cor. subringens: labio capillari multifido.

Sect. IV. *Flores inferi polypetali.*

42. FONTANESIA. Cor. 2-petala. Cal. 4-partitus. Caps. 2-locul. non dehiscent.

68. LITHOPHILA. Cor. 3-petala. Cal. 3-phyllus. Peric. 2-locul.

69. LINOCIERA. Cor. 4-petala. Cal. 4-dentatus. Bacca 2-locul.

39. DIALIUM. Cor. 5-petala. Cal. nullus.

† *Polycnemum sclerospermum.*

Sect. V. *Flores superi.*

65. MORINA. Cal. fructus dentato-aristatus, floris bifidus.

49. G. Cor. 4-cleft, bilabiate, resupinate. Stam. 4, 2 barren. Caps. 2-celled.

50. S. Cor. subequal, mouth plaited-stellate glandular. Stam. 5, 3 barren. Caps. 2-celled.

48. J. Cor. irregular. Caps. 2-celled, bursting, with an elastic claw.

47. C. Cor. irregular, 4 stamens, 2 barren. Berry.

* 53. P. Cor. ringent, spurred. Cal. 5-cleft, 1-celled.

51. C. Cor. ringent, inflated. Cal. 4-cleft. Caps. 2-celled, 4-valved.

52. B. Cor. ringent. Cal. 5-parted. Caps. 2-celled, 4-valved.

* 54. U. Cor. ringent, spurred. Cal. 2-leaved. Caps. 1-celled.

55. G. Cor. ringent. Cal. 5-awned. Nut fleshy, 4-celled.

66. S. Cor. ringent. 5 Stam. 3 barren. Caps. 5, united.

Plants apt to be confounded with those are,

Hemimeris sabulosa, diffusa, montana. *Bignonia catalpa, longissima.*

Sect. III. *Flowers inferior, one-petaled, irregular. Seeds naked.*

* 56. V. Cor. subequal. Cal. highest segment shorter.

* 57. L. Cor. subequal. Stamens distant.

58. A. Cor. 5-cleft subequal, longest segment concave cleft. Stamens near.

60. Z. Cor. ringent, helmet reflected. Cal. filiform.

61. M. Cor. ringent, helmet linear, covering the pistils and stamens.

62. R. Cor. ringent, helmet arched, 2-cleft. Stam. crooked.

* 63. S. Cor. ringent. Fil. on a transverse foot-stalk, with a dent.

59. C. Cor. ringent, helmet plane. 4 Stam. 2 barren.

64. C. Cor. subringent, lip capillary many-cleft.

Sect. IV. *Flowers inferior, many-petaled.*

42. F. Cor. 2-petaled. Cal. 4-parted. Caps. 2-celled, not dehiscent.

68. L. Cor. 3-petaled. Cal. 3-leaved. Peric. 2 cells.

69. I. Cor. 4-petaled. Cal. 4-dented. Berry 2 cells.

39. D. Cor. 5-petaled. Cal. none.

Flowers sometimes Diandrous.

Polycnemum sclerospermum.

Sect. V. *Flowers superior.*

65. M. Cal. double, that of the fruit dented; that of the flower 2-cleft.

43. CIRCÆA.

* 43. CIRCÆA. Cal. 2-phyllus. Cor. 2-petala obovata.

67. GLOBBA. Cal. 3-fidus. Cor. 3-fida. Caps. 3-locularis.

Flowers sometimes Diandrous, resembling those of Sect. V.

† *Valeriana Cornucopia. Boerhaavia erecta, hirsuta, scandens.*

Sect. VI. *Flores apetalis.*

70. ANCISTRUM. Cal. 4-phyllus. Drupa exsucca, hispida, 1-locul.

71. ARUNA. Cal. 5-partitus. Bacca 1-locularis.

ORDO II. DIGYNIA.

* 72. ANTHOXANTHUM. Cal. gluma 2-valvis, 1-flora. Cor. gluma 2-valvis, acuminata aristata.

73. CRYPSIS. Cal. gluma 2-valvis, 1-flora. Cor. gluma 2-valvis, mutica.

Flower resembling these.

Saccharum Cylindricum Thunbergii.

ORDO III. TRIGYNIA.

74. PIPER. Cal. 0. Cor. 0. Bacca 1-sperma.

43. C. Cal. 2-leaved. Cor. 2-petaled.

67. G. Cal. 3-cleft. Cor. 3-cleft. Caps. 3-celled.

Sect. VI. *Flowers without Petals.*

70. A. Cal. 4-leaved. Drupe juiceless, hispid, 1-celled.

71. A. Cal. 5-parted. Berry 1 cell.

ORDER II. DIGYNIA.

72. A. Cal. a 2-valved glume, 1 flower. Cor. a 2-valved glume, acuminate awned.

73. C. Cal. a 2-valved glume, 1 flower. Cor. a 2-valved glume, awnless.

ORDER III. TRIGYNIA.

74. P. Cal. none. Cor. none. Berry 1 seed.

31. NYCTANTHES.

Cor. salver-shaped, the segments truncated. Caps. 2-celled, marginate. Seeds solitary.

arbor tristis. 1. N. with a stem four-cornered, leaves ovate, sharp-pointed, seed-vessels membranaceous and flattened. $\frac{1}{2}$. East Indies.

32. JASMINUM, *Jasmine.*

Cor. salver-shaped, from five to eight-cleft. Berry 2-grained. Seeds solitary in a seed-coat.

Subdiv. I. *Leaves simple.*

sambac. 1. J. with leaves simple, opposite, elliptical ovate, membranaceous and opaque, the branchlets and footstalks pubescent, the segments of the calyx awl-shaped. India. $\frac{1}{2}$.

α With a simple flower.

β With a multiplied flower, segments oblong acute, shorter than the tube.

γ With full flowers, segments roundish, longer than the tube.

2. J. with leaves ovate, sharp-pointed, a little waved, the branches columnar. Malabar. $\frac{1}{2}$.

hirsutum. 3. J. with leafstalks and fruitstalks villous. India. $\frac{1}{2}$.

angustifolium. 4. J. with leaves blunt, lanceolate and ovate. India. $\frac{1}{2}$.

vimineum. 5. J. with leaves opposite, ovate, dagger-pointed, fruitstalks axillary, one-flowered, those terminating three

VOL IV. Part I.

flowered. $\frac{1}{2}$. Java and Malabar. Has a great affinity to the preceding.

6. J. with leaves opposite, ovate, heart-shaped, pubescent on both sides. $\frac{1}{2}$. Calcutta.

7. J. with leaves opposite, simple, ovate-oblong, tapering; panicles right-angled; segments of the calyx bristle-shaped, bent back. Bengal.

8. J. with leaves heart-shaped, lanceolate, acute, and long; branches columnar. *Nyctanthes elongata* of Linn. Suppl. E. Indies.

9. J. with leaves opposite, simple, lanceolate, glossy. the segments of the calyx awl-shaped. *Nyctanthes glauca* of Linn. Suppl. $\frac{1}{2}$. Cape of Good Hope.

10. J. with leaves opposite, simple, ovate, tapering, three-nerved; footstalks axillary and commonly one-flowered. Java.

11. J. with leaves opposite, ovate-lanceolate, simple. Friendly islands.

Subdiv. II. *Leaves ternate.*

12. J. with leaves ternate opposite, leaflets ovate, blunt; branches angular and leafstalks villous, fruitstalks axillary, three-flowered. *Jasminum capense* of Thunberg. Cape of Good Hope.

13. J. with leaves opposite ternate, leaves the flower-bearing branchlets simple; the calyxes angled, the branches columnar and pubescent. Malabar.

14. J. smooth, with leaves ternate and opposite, stem climbing, branches columnar. E. Indies.

15. J.

- didymum*. 15. J. smooth with leaves ternate, opposite, leaflets ovate-lanceolate, branches axillary. Society islands.
- uzoricum*. 16. J. with leaves ternate, opposite; leaflets ovate and a little heart-shaped waved; branches smooth, columnar, the segments of the calyx equal to the tube. Azores.
- fruticans*. 17. J. with leaves ternate and alternate, leaflets obovate, wedge-shaped and blunt, branches angled, segments of the calyx awl-shaped. South of Europe, and the Levant.
- humile*. 18. J. with leaves ternate, alternate acute pinnated, branches angled, the segments of the calyx very short. *Obs.* Pinnated leaves are seldom found in this species.
- odoratissimum*. 19. J. with leaves ternate, alternate bluntish and pinnated, branches columnar, segments of the calyx very short. Madeira.

Subdiv. III. *Leaves pinnated.*

- officinale*. 20. J. with leaves opposite and pinnated, leaflets sharp-pointed, the buds a little erect. India and Switzerland.
- grandiflorum*. 21. J. with leaves opposite and pinnated, leaflets bluntish, buds horizontal. East Indies.

33. GALIPEA.

Cal. four or five-cornered, four or five-toothed. Cor. salver-shaped, four or five parted. Stamens four, two barren.

- trifoliata*. 1. G. Guiana. h 6 feet high, with leaves alternate on footstalks ternate; leaflets sessile, lanceolate, sharp-pointed, entire. The flowers small, grow in a cyme.

34. LIGUSTRUM, Privet.

Cor. 4-cleft; berry superior, 2-celled, with four seeds.

- vulgare*. * 1. L. leaves ellipse-lanceolate, obtuse, mucronulated. *Privet, Print or Prim print.* Grows in woods, thickets, and hedges, especially in a gravelly moist soil. Europe. h. Flowers in V. and VI. The branches are wand-like. The leaves opposite, subsessile, dark green, smooth, lanceolate, sometimes elliptical, entire, pointed like a dagger, but not very sharp, sometimes continuing through the winter; panicles terminating and crowded with flowers. Flowers milky, strong smelled. Berries black, very bitter, as are also the leaves and bark. This plant is not injured by the smoke of towns.
- japonicum*. 2. L. with leaves ovate, sharp-pointed; panicle obtuse-angled. Japan.

35. PHILLYREA.

Cor. 4-cleft. Berry one seed.

- media*. 1. P. with leaves oblong-lanceolate, serrated.
 * *P. ligustrifolia*, with leaves oblong-lanceolate.
 β *P. virgata*, with leaves lanceolate, branches erect and wand-like.
 γ *P. pendula*, with leaves lanceolate, branches obtuse-angled, hanging.
 δ *P. oleaefolia*, with leaves oblong-lanceolate, branches nearly erect.
 ε *P. buxifolia*, with leaves oval-oblong and bluntish. South of Europe.
- angustifolia*. 2. P. with leaves linear-lanceolate and very entire.

2

* *P. lanceolata*, with lanceolate leaves, and straight branches.

β *P. rosmarinifolia*, with leaves lanceolate awl-shaped, long; branches straight.

γ *P. brachiata*, with leaves oblong-lanceolate shorter; branches obtuse-angled. South of Europe.

3. P. with leaves ovate-heart-shaped, serrated.

* *P. laevis*, with leaves ovate, plane, indistinctly serrated.

β *P. spinosa*, with leaves ovate-oblong, acute, sharply serrated and plane.

γ *P. obliqua*, with leaves lanceolate-oblong, acute, serrated, bending obliquely. South of Europe.

latifolia.

36. OLEA, Olive.

Cor. 4-cleft, segments nearly ovate. Drupe one seed.

1. O. with leaves lanceolate, very entire, racemes *europea*. axillary and condensed.

* *O. communis*, with leaves lanceolate, plane, hoary beneath.

β *O. verrucosa*, with leaves lanceolate, plane, whitish beneath, branches warted.

γ *O. longifolia*, with leaves linear-lanceolate, plane, silvery beneath.

δ *O. latifolia*, leaves oblong plane, hoary beneath.

ε *O. ferruginea*, leaves lanceolate, rusty beneath.

ζ *O. obliqua*, leaves oblong, banding obliquely, pale beneath.

* *O. buxifolia*, leaves oblong-oval. *Common olive.*

h. South of Europe, and north of Africa. β Cape of Good Hope.

2. O. with leaves ovate very entire, branches panicled, obtuse-angled.

* *O. coriacea*, leaves ovate-oblong, stiff, plane, with red leafstalks.

β *O. undulata*, leaves elliptical waved, leafstalks green. *Cape olive.* h. Cape of Good Hope.

3. O. with leaves lanceolate-elliptical, very entire, racemes narrow, all the bractees permanent, connate and small. Carolina and Florida.

4. O. with leaves oblong lanceolate, very blunt; racemes axillary, simple; flowers drooping. Madagascar. h.

5. O. with leaves elliptical, flowers racemous without petals. New Zealand.

6. O. with leaves elliptical, acute, bractees perfoliate; the lowest cup-shaped, permanent; the higher leafy, large, deciduous. Madeira.

7. O. with leaves lanceolate and serrated, leafstalks lateral, aggregate, bearing one flower. Cochinchina, China and Japan.

37. CHIONANTHUS, Fringe-tree.

Cor. 4-cleft, segments very long. The kernel of the drupe striated.

1. C. with a panicle terminating 3-cleft, fruit-stalks bearing three flowers, the leaves acute. North America.

* *C. latifolia*, with leaves ovate-elliptical.

β *C. angustifolia*, with leaves lanceolate. *Obs.* The corolla varies with 4, 5, or 6 segments, and 4 stamens.

2. C. with a panicle terminating trichotomous, fruit-stalks bearing three flowers, leaves blunt. Ceylon.

cotinifolia.

3. C.

- compacta.* 3. C. with panicles trichotomous, the last flowers almost head-shaped, the calyxes villous, the leaves lanceolate oblong, the anthers sharp-pointed. Caribbees.
- zeylanica.* 4. C. the branches of the axillary panicle opposite, flowers almost sessile. *h.* Ceylon.
- incrassata.* 5. C. with panicles axillary, trichotomous, all the flowers separate, and anthers blunt. Guiana and Jamaica.

38. SYRINGA, *Lilac.*

Cor. 4-cleft. Caps. 2-celled.

- vulgaris.* 1. S. with leaves ovate heart-shaped. *Common lilac.*
h. Persia.
α *S. cærulea*, with blue flowers. *Blue lilac.*
β *S. violacea*, with violet flowers. *Violet lilac.*
γ *S. alba*, with white flowers. *White lilac.*
- chinensis.* 2. S. with leaves ovate lanceolate. *h.* China.
- persica.* 3. S. with leaves lanceolate. Persia.
α with leaves lanceolate entire.
β *S. laciniata*, leaves pinnatifid.
γ *S. cærulea*, with leaves simple, flowers blue.
δ *S. alba*; leaves simple, flowers white.
- sussiensis.* 4. S. with leaves ovate serrated and ternate. Japan.

39. DIALIUM.

Cor. 5-petaled. Cal. 0. Stam. on the higher side.

- indicum.* 1. D. with a panicle simple and nodding. *h.* India.
- guineensis.* 2. D. with a panicle, more than doubly compound, and erect. Guinea.

40. PIMELEA.

Cal. none. Cor. 4-cleft. Stam. inserted into the throat. The nut corticated and 1-celled.

- linifolia.* 1. P. with leaves linear lanceolate, heads terminating involucred; corolla villous on the outside. New Holland.
- gnidia.* 2. P. with leaves oblong lanceolate-acute, very smooth; corolla villous on the outside. New Zealand. *Banksia gnidia* of Forster. *Passerina gnidia* of Lin. Suppl.
- pilosa.* 3. P. hairy, with leaves linear, blunt. New Zealand. *Banksia tomentosa* of Forster. *Banksia pilosa*, *Passerina pilosa* of Lin. Suppl.
- prostrata.* 4. P. hairy, leaves ovate, sessile, fleshy. New Zealand. *Banksia prostrata* of Forster. *Passerina prostrata* of Lin. Suppl.

41. ERANTHEMUM.

Cor. 5-cleft, tube thread-shaped. Anth. without the tube. Stigma simple.

- capense.* 1. E. with leaves lanceolate-ovate on footstalks. Ethiopia.
- angustifolium.* 2. E. with leaves linear, remote, acute-angled to the stem. Ethiopia.
- parvifolium.* 3. E. with leaves ovate-linear, imbricated. Cape of Good Hope.
- salsoloides.* 4. E. shrubby, leaves fleshy, somewhat tapering, linear, very smooth; racemes axillary and the calyxes pubescent, tube bowed downwards.

42. FONTANESIA.

Cor. 2-petaled. Cal. 4-parted inferior. Caps. membranaceous, not opening, 2-celled; cells contain one seed.

1. F. Syria.

43. FRAXINUS, *the Ash.*

Cal. none or 4-parted. Cor. none or 4-parted. Caps. superior, 2-celled, leafy above, compressed. Seeds solitary, pendulous. Some of the flowers have pistils only.

* F. with leaflets serrated, flowers destitute of a calyx *excelsior.* and corolla. *Common Ash Tree.* There is a variety with pendulous branches, called *weeping ash.* *h.* Flowers in IV. and V. and thrives best in calcareous soils on mountains. It is a very lofty and beautiful tree, its bark is of the colour of wood ashes, its buds are large and black. The flowers grow in loose panicles, pistostaminal, intermixed with pistils sometimes very numerous. The anthers are large, dark-purple. When these fall off, the leaves unfold themselves. This is the latest of all our native trees of coming into leaf. The leaves are pinnate, terminated by an odd one, serrated, sometimes simple, very easily injured by frost in autumn. The capsules soon fall. The seeds are flat.

44. CIRCEA, *Enchanter's Nightshade.*

Cor. 2-petaled. Cal. 2-leaved, superior. Caps. 2-celled. Seeds single.

* 1. C. with stem upright, leaves egg-shaped, edged *lutetiana.* with small teeth, opaque, pubescent. *Common enchanter's nightshade.* Grows in shady moist places. Europe and North America. *γ.* Flowers in VI. and VII. The root creeps, and can scarcely be eradicated. The stem is erect, not much branched, having commonly but one raceme, which is terminal. The leaves when full grown are egg-shaped, faintly green, pubescent, opaque, somewhat repand, edged with small teeth not serrated. The calyx not membranaceous.

* 2. C. with a stem ascending, leaves heart-shaped, *alpina.* serrated, and glossy, the calyx membranaceous. *Mountain enchanter's nightshade.* Grows in shady moist places on mountains and rocks; in Lancashire, Westmoreland, and Cumberland, at the foot of the mountains; about Loch Broom, Ross-shire, and in Hamilton Wood, Scotland; and in the cold countries of Europe. *γ.* Flowers in VII. and VIII. The root creeps, and the whole plant is less pubescent than the former. The stalk is short, spreading at the base; the knee-joints red, the leaves tender, pale-green, glossy, heart-shaped, tooth-serrated, the leaf-stalks edged with a membrane.

45. VERONICA, *Speedwell.*

Cor. 4-cleft, wheel-shaped, the lowest segment least. Caps. superior, 2-celled.

Subdiv. 1. *Spiked.*

* 1. V. with a terminating spike; the leaves opposite, bluntnish, notched-serrulated, very entire at the extremity; the stalk ascending, very simple. *Spiked Speedwell.* Grows in meadows and calcareous soils. On Newmarket heath and Gogmagog hills; on Cavenham heath near Bury; and near Penny-bridge, Lancashire. Flowers in VII. and often continues in flower till IX. The stalk are seven inches high, ascending, simple, somewhat

BRITISH SPECIES.

somewhat round, leafy, somewhat woody, pubescent. The leaves opposite, commonly blunt, sometimes a little sharp-pointed, crenate-serrated, entire at the extremity, hairy. Spike erect, many flowered. The flowers are of a deep blue, the throat of the corolla bearded. This species varies, with leaves linear and almost entire.

hybrida.

* 2. V. with spikes terminating, leaves opposite, elliptical, blunt, unequally crenate-serrated, the stalk somewhat erect. *Welsh speedwell.* Grows on the sides of mountains, but is very rare. It is found on Craig Wreidhin, Montgomeryshire, and at Cartmell Fells, Lancashire. α . Flowers in VII. Nearly allied to the preceding, but twice as large in every part: the spikes generally numerous; the stalk and leaves more rugged above, and more deeply serrated: the leaf-stalk in the former is often found winged.

officinalis

* 3. V. with lateral spikes on footstalks, leaves opposite, scabrous, stalk procumbent. Europe. *Male or common speedwell.* Grows commonly in barren sandy pastures. Flowers in V. and VI. The stalk has wide-spreading branches; the leaves pale, a little stiff and roughish; the spikes axillary, solitary, on footstalks, many-flowered, hairy, longer than the stalk; the flowers of a faint blue, with deeper veins.

Subdiv. 2. *Corymb racemosus.*

saxatilis.

* 4. V. with a corymb terminating and bearing few flowers, the leaves elliptical, stalks spreading, capsule egg-shaped, 4-valved. *Blue rock speedwell.* Grows on Ben Lawers, Perthshire; and on the Alps. α . Flowers in VII. The stalks decumbent at the base, somewhat shrubby, branched; the branches ascending, simple, leafy; the leaves opposite, small, elliptical or elliptical-lanceolate, blunt, very entire, sometimes but seldom serrated on the middle, light-green, somewhat fleshy, smooth, crowded at the base of the branches, more distant above; the flowers three or five in a terminating corymb, on footstalks which are three or four times longer than the floral leaf or bractea, large, beautiful, of a blue-violet hue, the throat red. The calyx 4-cleft, almost equal, blunt, pubescent; the capsule pubescent, egg-shaped, 4-valved. It differs from the *fruticulosa* in having generally broader leaves, stalks more spreading, in having a larger corolla, which is blue and not flesh-coloured; and is still more distinguished by having longer footstalks, fewer, and in being corymbous, not spiked.

fruticulosa.

* 5. V. with a corymb terminating many-flowered, spiked, leaves elliptico-lanceolate, stalks erect, capsule egg-shaped, 4-valved. *Flesh-coloured shrubby speedwell.* Grows in Cruachan, Argyleshire, and Ben Lawers, Perthshire. Also on the Alps and Pyrenees. α . Flowers in VII. The stalks are branched at the base, twisted, lying upon the ground, a little shrubby, afterwards becoming erect, stiff, and straight, seven inches long, simple, leafy, round, a little pubescent. The leaves are opposite, elliptico-lanceolate, most commonly entire, sometimes serrated, pale green, hollowish, and a little shaggy on the edge. The corymb is terminating, pubescent, a little spiked, and afterwards extended into a long leafy raceme. The flower-bearing footstalks are of the same length with the bracteas, and those which bear the fruit half as long again. The calyx is four-cleft, almost equal, blunt, shaggy. The corolla of a

pale flesh colour, with purple lines less than the preceding. The capsule egg-shaped, shaggy, four-valved.

* 6. V. with a corymb terminating, a little spiked; *alpina.*

leaves oval, smooth, slightly serrated, the calyx ciliate, stem ascending and simple. *Alpine speedwell.* Grows on wet spongy places, on mountains about Garwaymoor, on Ben Nevis, and on the mountains of Badenoch, and on the Alps. α . Flowers in VII. and VIII. The stalks are a finger long, ascending simple, leafy, rooting at the base. The leaves opposite, elliptic-oval, thin, slightly shaggy, often entire, sometimes notched, commonly three-nerved, pale green, shining. The flowers are small, blue, on a small corymb, which afterwards extends into a short raceme. The fruitstalks are of the same proportion as in the preceding. The calyx is nearly equal, bluntish, ciliate, and often shaggy. The hairs jointed like the pubescence of the leaves. The capsule elliptical, emarginate, two-valved, pubescent, terminated with a short persisting style.

* 7. V. with a raceme terminating, approaching to a *serpyllifolia* spike; the leaves oval, a little notched, three-nerved, *lia.* smooth; the capsule obcordate, shorter than the style. Europe and N. America.

* *V. Humifusa. Smooth Speedwell, or Paul's Betony.*

The first variety grows in meadows and pastures; the second on the highest mountains in Scotland, under wet shady rocks. α . Flowers in V. and VI. The plant is shining, somewhat fleshy; in moist places smooth, in mountains rough-haired. The stalks decumbent and taking root, leafy; the branches commonly erect. The leaves on footstalks oval or roundish, more or less crenated, three-nerved. The raceme terminating, long, loose, many-flowered, oftener pubescent. The bracteas elliptical. The segments of the calyx are obovate-elliptical, smoothish, equal. The corolla of a blue or flesh-coloured whitish colour, with violet streaks. The capsule obcordate, double, of the length of the style or a little shorter.

The variety called *humifusa*, has a procumbent stem with a shorter raceme.

* 8. V. with racemes lateral, leaves elliptical and *beccabunga* plane, and stalk creeping. *Brooklime.* Europe. Grows frequently in rivulets and ditches containing clear water.

α . Flowers in VI. and VII. The plant is very smooth and glossy. The stalks decumbent or swimming, columnate. The leaves on short footstalks, elliptical, broad pointed, indistinctly serrated, of a beautiful green, somewhat fleshy. The racemes axillary, opposite, on footstalks, many-flowered. The bracteas linear, lanceolate, shorter than the fruitstalks. The segments of the calyx sharp-pointed. The corolla blue. The capsule almost double.

* 9. V. with racemes lateral and opposite, leaves *anagallis* lanceolate and serrated, stalk erect. *Water speedwell, or long-leaved brooklime.* Europe and the Levant. Grows in ditches and marshes. α . Flowers in VII. It is distinguished from the former by leaves lanceolate, longer, a little ovate or elliptical, and by an erect stalk. The racemes are longer and more pointed.

* 10. V. with racemes lateral and alternate, fruit *scutellata* stalklets divaricate, leaves linear and denticulate. *Narrow-leaved marsh speedwell.* Europe. Grows in marshes and places that have been overflowed with water

water in a sandy soil. α . Flowers in VII. and VIII. The stalks are feeble, and have spreading branches. The leaves are linear lanceolate, seldom very entire, often denticled, sometimes serrated. The racemes are axillary, solitary, alternate, never opposite, loose, divaricate, varying in length. The flowers are small, of a blue flesh colour, streaked. The capsule approaching to double. Sometimes its stalk and leaves are pubescent.

montana. * 11. V. with racemes lateral, long, thread-shaped, few-flowered; leaves ovate, serrated, on footstalks, the stalk hairy on all sides. *Mountain speedwell*, or *mountain madwort*. Italy, Switzerland, and Germany. Grows in woods, in moist shady places, and beside hedges in a calcareous soil. It is found in Charlton wood, Kent; in the Devil's ditch, Newmarket heath; at Linton, in Gamlingay park and Kingston wood, near Worcester, near Virginia water, about Kirkstall abbey near Leeds, at Shortwood, Pucklechurch, Gloucestershire; and is very common in Yorkshire. Also in the woods at Dunglass, near the river, Berwickshire, and on the banks of the Esk near Rowlin, Mid-Lothian. α . Flowers in V. and VI. The root is fibrous. The stalks decumbent, feeble, hairy on all sides, leafy. The leaves grow on footstalks, ovate, serrated with teeth of unequal size, slender, glossy, somewhat hairy. The racemes axillary, alternate, flaccid, few-flowered. The flowers light blue, diversified with purple. The capsule circular, double, flat, acutely edged, ciliated.

chamaedrys. * 12. V. with lateral racemes, leaves ovate, sessile, wrinkled, incised, serrated; the stalk hairy on two sides. Europe. *Germander speedwell*, or *wild germander*. Grows in meadows and pastures, and under hedges, and is very common. α . Flowers in V. The stalks form an acute angle with the branches, are decumbent, and have a longitudinal line of hair on each side. The leaves are sessile, ovate, serrated with unequal teeth, the edge very hairy. The racemes are axillary, opposite, many-flowered, longer than the stalk. The flowers are large, beautiful, of a fine blue colour in the inside, and flesh-coloured on the outside. The capsule is obcordate and small.

Subdiv. 3. *Flowers solitary*.

agrestis. * 13. V. with flowers solitary, leaves ovate, incised, serrated, shorter than the flower-stalk, stalk procumbent, seeds pitcher-shaped. *Procumbent speedwell*, or *germander chickweed*. Grows in cultivated grounds, and among rubbish. \odot . Flowers from IV. to IX. The stalks are several, procumbent, simple towards the top. The leaves scattered, almost sessile, heart-shaped-ovate, widely serrated. Footstalks axillary, solitary, one-flowered, of the length of the leaves or longer; the fruitstalks curved downwards. The segments of the calyx ovate-lanceolate, broad at the points, ciliated. The corolla small, and of a bright blue colour. The capsule double, swelling in the middle, rough-haired. The seeds sixfold on each side, dimpled and wrinkled.

arvensis. * 14. V. with flowers solitary, leaves ovate, incised, serrated; flowers lanceolate, longer than the leafstalk, stalk erect. Europe. *Wall speedwell*, or *speedwell chickweed*. Grows frequently in dry cultivated grounds, on walls, and among rubbish. \odot . Flowers in V.

The stalk is often branchy at the base, erect, seven inches high. The flowers are sessile, issuing from the axils of lanceolate bracteas, which are quite dissimilar to the leaves. For which reason, this species might have been arranged among the *Spiked Veronicas*, were it not for its affinity to the preceding and following species. The segments of the calyx are lanceolate, unequal and acute. The corolla is pale blue. The capsule is sessile, erect, obcordate, flattened. The seeds are elliptical, plane and furrowed in the middle.

* 15. V. with flowers solitary, leaves heart-shaped, *hederifolium*, five-lobed, the segments of the calyx heart-shaped, the seeds pitcher-shaped. Europe. *Ivy-leaved speedwell*, or *small henbit*. Grows in cultivated grounds and among rubbish. \odot . Flowers from IV. to IX. The stalks are procumbent and unbranched. The leaves alternate on longer footstalks, kidney-heart-shaped, five-lobed, the central lobe being largest. The fruitstalks are longer than the leaves. The segments of the calyx are widely heart-shaped, acute, ciliate. The corolla is pale blue. The capsule is double, and swelling in the middle. The seeds are large, two on each side, dimpled, wrinkled.

* 16. V. with solitary flowers, superior leaves divided *triphyllos*, to the base, fruitstalks longer than the calyx, seeds flattened. Europe. *Fingered speedwell*, or *upright chickweed*. Grows in sandy cultivated grounds, but rare. It is found on the borders of Norfolk and Suffolk, near Bury, and near Rossington, Yorkshire. \odot . Flowers in IV. The stalk commonly branchy, flexuose. The lowest leaves entire, seldom lobed, the higher almost sessile, three-parted, the central lobe largest, obovate, the lateral lobes commonly two-parted. The flowers on long footstalks and erect, as well as the fruit. The segments of the calyx are obovate-oblong, blunt, ciliate, unequal. The corolla a deep blue. The capsule circular emarginate, flattened. The seeds numerous, obovate-flattened. The plant becomes blackish when dried.

* 17. V. with flowers solitary, leaves deeply divided, *verna*, the fruitstalks shorter than the calyx; the stalk stiff and straight. Germany, Sweden, and Spain. *Vernal speedwell*. Grows in dry sandy cultivated fields. Is found near Bury, and at Foulden, Norfolk. \odot . Flowers in IV. It resembles the *arvensis* in its habit, in the figure of its seeds and situation of its flowers; but is of a pale colour, and never grows blackish when dried. It is sufficiently distinguished by leaves deeply divided, by the central lobe being obovate; the floral leaves are three-parted. The stalk is scarcely a finger length, stiff and straight, often branchy. The segments of the calyx are lanceolate, acute, nearly equal. The capsule obcordate flattened.

Subdiv. 1. *Spiked*. FOREIGN SPECIES.

18. V. with spikes terminating, leaves in sevens *sibirica*, tilled, stem a little shaggy. Dauria. α .

19. V. with spikes terminating, leaves in fours or *virginica*, fives. Virginia and Japan.

20. V. with spikes terminating, leaves in fours, *spuria*, equally serrated. South of Europe, of Siberia, and Thuringia. α .

21. V. with spikes terminating, leaves nearly heart-*maritima*, lanceolate, unequally serrated. Var. with broader leaves. European sea-coasts.

22. V.

- longifolia*. 22. V. with spikes terminating, leaves lanceolate, sharp-pointed, serrated. Tartary, Austria, and Sweden. α .
- incana*. 23. V. with spikes terminating, leaves opposite, crenated blunt, stem erect, downy. Native of the Ukraine, Samara. α . *Obs.* It varies with a white flower.
- pinnata*. 24. V. with spike terminating, leaves linear, pinnatifid, bunched; segments thread-shaped, forming an obtuse angle. Siberia. α .
- laciniata*. 25. V. with a raceme approaching to a spike, and terminating, leaves pinnatifid, jagged. Siberia. α .
- incisa*. 26. V. with spikes terminating, leaves lanceolate, cut into irregular segments, pinnatifid, smooth. Siberia. α .
- catarractae*. 27. V. with racemes terminating flexuose, stem somewhat shrubby, leaves lanceolate, serrated. New Zealand. β .
- elliptica*. 28. V. with racemes lateral, stem shrubby, leaves elliptical, very entire. New Zealand. β .
- macrocarpa*. 29. V. with racemes almost terminating erect; leaves lanceolate, very entire, smooth, plain; stem shrubby. New Zealand. β .
- salicifolia*. 30. V. with racemes lateral, nodding; leaves lanceolate, very entire; stem shrubby. New Zealand. β .
- parviflora*. 31. V. with racemes almost terminating; leaves linear-lanceolate, very entire, smooth, dagger-pointed; stem shrubby. New Zealand. β .
- alkionii*. 32. V. with spikes lateral, on footstalks; leaves opposite, roundish, glossy, rigid; stalk smooth, creeping. The Alps. β .
- decussata*. 33. V. with racemes axillary, few-flowered; leaves elliptical, perennial, very entire; stem shrubby. Falkland islands. β .
- *Subdiv. 2. *Corymb racemosus*.
- aphylla*. 34. V. with a corymb terminating, and naked stem. α *V. Kamtschatka*, rough-haired; raceme three-flowered, long, lateral, and without leaves; leaves ovate, oblong, serrated, rough-haired, hairs jointed. The Alps and north of Asia.
- bellidoides*. 35. V. with a corymb terminating, stem ascending, two-leaved; leaves obtuse, crenated; calyx shaggy. Pyrenees and Alps of Switzerland. β .
- gentianoides*. 36. V. with a corymb terminating, stem ascending; leaves lanceolate, cartilaginous on the edge, the lower leaves connate, sheathing. Cappadocia and Armenia. α .
- ponae*. 37. V. with a raceme terminating, stem very little branched, leaves heart-ovate, dented, sessile. Var. 1. *Pumila*, with unbranched stem, terminating with a bunch of flowers; leaves ovate, acute, dented. Native of the Pyrenees, the var. *pumila* on the top of the Piedmontese Alps.
- integrifolia*. 38. V. with a corymb terminating; leaves opposite, elliptical, blunt, very entire; calyxes hairy. The Alps. α .
- tenella*. 39. V. with leaves oblong, crenated, stems creeping, calyxes villous. Pyrenees and Piedmontese Alps. α .
- teucrium*. 40. V. with racemes lateral, and very long; leaves ovate, wrinkly, dented, bluntnish stalks, procumbent. *Obs.* This is a doubtful species.
- pilosa*. 41. V. with racemes axillary, leaves ovate, blunt, plaited, deeply dented; stalk procumbent, hairy on both sides. Austria. *Obs.* Dr Smith suspects that this is only a variety of the *latifolia*.
42. V. with racemes lateral, leaves oblong, ovate, prostrata, and serrated, stalks procumbent. Germany, Italy, and Switzerland. α .
43. V. with racemes lateral, leafy; leaves oblong, *pectinata*, comblike-serrated; stems procumbent. Constantinople.
44. V. with racemes lateral; leaves pinnatifid, *orientalis*, smooth, acute, tapering at the base; the calyxes unequal, the footstalks capillary, and longer than the bractea. Armenia. α .
45. V. with racemes lateral, leaves many-parted, *multifida*, segments pinnatifid, lobes decurrent, footstalk short, calyx very smooth, stalk villous. Siberia. α .
46. V. with racemes lateral; leaves a little hairy, *li-austriaca*, near, pinnatifid, lowest segments longer; the calyxes a little hairy, the footstalks shorter than the bractea. Austria, Silesia, and Carniola. α .
47. V. with racemes lateral; leaves a little hairy, *taurica*, linear, undivided, and pinnatifid, denticulate; footstalks longer than the bractea, the calyx four-cleft, smooth. Tauria. α .
48. V. with racemes lateral; leaves heart-shaped, *verticifossile*, sessile, sharply serrated, sharp-pointed; stem stiff and *andlia*, straight, the leaflets of the calyx in fours. Switzerland, Bithynia, Austria, and Bavaria. α .
49. V. with racemes lateral; leaves heart-shaped, *latifolia*, sessile, wrinkled, bluntly serrated, stem stiff and straight, leaflets of the calyx in fives. Austria and Switzerland. α .
50. V. with racemes lateral and very long; leaves *paniculata* lanceolate, in threes; serrated; stem ascending. Tartary and Bohemia. *Veronica dentata* of Schmidt. α .
- Subdiv. 3. *Fruitstalks bearing one flower*.
51. V. with flowers solitary; leaves heart-lanceolate, *biloba*, dented; the segments of the calyx equal, ovate, sharp-pointed, three-nerved. Cappadocia. \odot .
52. V. with flowers solitary; leaves heart-shaped, *filiformis*, crenated, shorter than the fruitstalk, segments of the calyx lanceolate. Levant. \odot .
53. V. with flowers solitary, sessile; all the leaves *digitata*, finger-parted, stem stiff and straight. Bohemia, Montpellier, and Spain. \odot .
54. V. with flowers on footstalks solitary; leaves *asinifolia*, ovate, smooth, crenated; stem erect, a little hairy. α *V. romana* of Allionius and Schmidt. Warm climates of Europe. \odot .
55. V. with flowers sessile and solitary; leaves lanceolate-linear, smooth, blunt, very entire; stem erect. North of Europe. \odot .
56. V. with flowers solitary, on footstalks; leaves *bellardi*, linear, very entire, rough-haired, longer than the flower; stalk very little branched, erect. Piedmont. \odot .
57. V. with flowers solitary, sessile, leaves linear, *marilandica*, stems with spreading branches. Virginia.

45. PÆDEROTA.

Cor. ringent, four-cleft, the throat naked. Cal. 5-part-ed. Caps. 2-celled.

1. P. with leaves sharply pointed, helmet of the *co-ageria*, rolls two-cleft. *Pæderota lutea* of Lin. Suppl. Carniola and Italy. α .

2. P. with leaves roundish-ovate, the helmet of the *bonarata*, corollas entire. Alps. α . *Pæderota caerulea* of Lin. Suppl.

3. P.

minimus. 3. P. with leaves oblong, entire, opposite; flowers axillary, opposite, teeth of the calyx hairy within. India.

46. WULFENIA.

Cor. ringent, upper lip short, entire; the inferior three-parted; throat bearded. Cal. 5-parted. Caps. 2-celled.

carinthia-ca. 1. W. *Pæderota Wulfenii* of Lamarck. *Carinthian Wulfenia*. Highest mountains of Carinthia. h.

47. CYRTANDRA.

Cor. five-cleft, irregular. Cal. five-dented, almost 2-lipped. Stamens four, two of them barren. Berry 2-celled.

biflora. 1. C. with fruitstalks somewhat branched; leaves elliptical, almost quite entire, smooth. Otobeite.

cymosa. 2. C. with fruitstalks nearly cymous; leaves ovate, crenated, oblique at the base, pubescent beneath. Tamna.

48. JUSTICIA.

Cal. simple, sometimes double. Cor. of one petal, irregular. Caps. bursting by means of an elastic claw, the partition opposite, and adhering to the valves.

Subdiv. 1. *Calyx double, one anther.*

fustosa. 1. J. with thyrses terminating, pointing one way, leaves lance-elliptical. Tranquebar. h.

forskæli. 2. J. with thyrses axillary, terminating, leaves ovate, sharp-pointed. Arabia Felix and India. h. *Justicia paniculata* of Forskael.

purpurea. 3. J. with spikes axillary, and terminating; bracteas lanceolate, smooth, branches pubescent. China.

verticillaris. 4. J. villous, with flowers axillary, verticilled; exterior calyxes awnless, leaves ovate. Cape of Good Hope.

aristata. 5. J. villous, with flowers axillary and verticilled, exterior calyxes awned, leaves ovate. Cape of Good Hope.

chinensis. 6. J. with fruitstalks axillary, verticilled, three-cleft; bracteas ovate, dagger pointed, coloured at the base. China and Arabia Felix.

triflora. 7. J. with fruitstalks axillary, long, three-flowered; bracteas linear-lanceolate. Arabia Felix.

Subdiv. 2. *Calyx double, anthers two.*

sulcata. 8. J. with spikes terminating, flowers verticilled, leaves ovate, heart-shaped. Arabia Felix.

bicalyculata. 9. J. with panicles axillary and dichotomous. *J. ligulata* of Lamarck. *Dianthera Malabarica* of Lin. Suppl. *Dianthera bicalyculata* of Retz. *Dianthera paniculata* of Forskael. *Justicia Malabarica* of Aiton. Malabar and Arabia Felix. ☉.

bivalvis. 10. J. with fruitstalks axillary, three-cleft, fruit-stalklets lateral, two-flowered; bracteas ovate, awned, nerved. Arabia and India. h.

falcata. 12. J. with flowers axillary, nearly sessile, leaves ovate-lanceolate. Mauritius. h.

Subdiv. 3. *Calyx single; corollas 2-lipped, lips undivided.*

sexangularis. 13. J. with fruitstalks bearing three flowers, bracteas wedge-shaped, leaves ovate, branches six-angled. Vera Cruz, and Jamaica. ☉.

14. J. with spikes axillary, arched downwards; *scorpioides* leaves lanceolate-ovate, shaggy, sessile. Vera Cruz. h.

15. J. with racemes terminating, axillary and *sim-gangetica*. ple; flowers alternate, pointing one way; bracteas indistinct. India.

16. J. with spikes axillary, terminating, branched; *assurgens*. flowers alternate, bracteas linear. Jamaica and Santa Cruz.

Subdiv. 4. *Calyx single, corollas 2-lipped, lips divided. One anther.*

17. J. stemless, leaves crenated, veins villous beneath. *acaulis*. Tranquebar. h.

Var. 1. with leaves lyre-pinnatifid, veins smooth. *Obs.* It is doubtful whether the var. 1. be not a distinct species.

18. J. with fruitstalks terminating, many-flowered, *hispida*. segments of the calyx and bracteas linear awl-shaped, ciliated, leaves oblong-lanceolate, branches hispid-pubescent. Sierra Leona. h.

19. J. with spikes terminating, four-cornered; bracteas ovate, imbricated, ciliated, dagger-pointed; the helmet of the corollas linear, and bent back. Arabia, Malabar, and Ceylon. h. *Justicia viridis* of Forskael.

20. J. with spikes terminating, four-cornered; bracteas ovate, imbricated, keel-shaped, ciliated; leaves crenate and smooth. Cayenne. h.

21. J. with spikes terminating; leaves and bracteas *coccinea*. elliptical, bare on the edge; the helmet of the corollas lanceolate, bent back at the apex. Cayenne. h.

22. J. with spikes terminating and axillary; bracteas *pulcherri-ovate*, imbricated, ciliated, and awnless; helmet of the *ma*. corollas lanceolate, erect. South America. h.

23. J. with spikes axillary, terminating four-corner-*carthagi-ed*; bracteas oblong, imbricated, ciliated. *Carthagena-nensis*. and Martinico.

24. J. with spikes axillary, terminating four-corner-*hirsuta*. ed; bracteas ovate, imbricated, hirsute; leaves dented. Java.

25. J. with spikes axillary, opposite, double on each *sphero-side*; bracteas linear, lengthened; seeds globular and *sperma*. shining. Caribbees.

26. J. with spikes terminating, leafy, flowers verti-*gendarus-cilled*, leaves lanceolate, lengthened. Ceylon, Java, *sa*. and Malabar. h.

27. J. with spikes axillary, terminating; calyxes of *procum*-four segments, ciliated; bracteas of the length of the *bens*. calyx, leaves lanceolate. Ceylon. h.

28. J. with spikes axillary and terminating; calyxes *diffusa*. of four segments, smooth; bracteas shorter than the *calyx*, leaves elliptical. India. h.

29. J. with spikes axillary, opposite, pointing one *echinoides*. way, ascending, linear, rough with hair. Malabar and Ceylon. h.

30. J. with spikes axillary, double, opposite, pointing *longifolia*. one way; leaves lanceolate, long. Malie.

31. J. with spikes terminating, a little branched; *latifolia*. inferior leaves verticilled; leaves ovate, sharp-pointed. East Indies. h.

32. J. with racemes axillary and terminating, flowers *picta*. verticilled, leaves ovate and coloured. Asia. h.

33. J. with racemes terminating, a little branch-*nitida*. ed, flowers commonly verticilled, leaves lance-ellipti-cal,

- cal, tapering. Martinico, Santa Cruz, and Guadeloupe. $\frac{h}{2}$.
- variegata*. 34. J. with spikes terminating, axillary simple, flowers opposite, calyxes hispid, leaves ovate and sessile.
- stricta*. 35. J. with racemes axillary, two-parted; flowers pointing one way, leaves lance-elliptical, filaments smooth. Malabar.
- paniculata*. 36. J. with panicles axillary, terminating, dichotomous; flowers pointing one way, filaments hirsute, capsules flattened, leaves lanceolate. East Indies.
- nutans*. 37. J. with racemes terminating, nodding at the apex, flowers reversed, leaves dented. Java.
- nasuta*. 38. J. with fruitstalks axillary and dichotomous, leaves elliptical and very entire. India. $\frac{h}{2}$.
- scandens*. 39. J. with fruitstalks axillary, trichotomous, obtuse-angled; leaves ovate, sharp-pointed, somewhat repand, the branches villous. Malabar. $\frac{h}{2}$.
- ciliaris*. 40. J. with flowers axillary, opposite; leaves lanceolate. \odot .
- Subdiv. 5. *Calyx single; corollas two-lipped, the lips divided. Anthers two.*
- secunda*. 41. J. with racemes terminating, compound racemets pointing one way; leaves ovate-lanceolate, sharp-pointed. Trinity island.
- debilis*. 42. J. with spikes axillary and terminating; bractees ovate, imbricated, and ciliated. Arabia Felix. $\frac{h}{2}$.
- violacea*. 43. J. with spikes terminating; bractees lanceolate, imbricated, ciliated; leaves lanceolate. Arabia Felix. *Dianthera violacea* of Vahl. $\frac{h}{2}$.
- bracteolata*. 44. J. with a raceme terminating, fruitstalks three-flowered, leaves tapering oblong, stem four-cornered, edge scabrous. Caraccas. $\frac{h}{2}$.
- rohrii*. 45. J. with spikes terminating, compound, imbricated, pubescent; bractees ovate, leaves elliptical, very entire.
- polystachia*. 46. J. with spikes axillary, opposite, pointing one way; bractees ovate, hirsute, leaves lanceol-ovate. Cayenne.
- retusa*. 47. J. with spikes terminating; bractees obovate, commonly retuse, imbricated; leaves ovate, sharp-pointed. Santa Cruz.
- flava*. 48. J. with spikes terminating, flowers in pairs, bractees lanceolated, blunt, leaves lanceol-oblong. Arabia Felix. $\frac{h}{2}$. *Dianthera flava* of Vahl. *D. Americana flava* of Forskael.
- americana*. 49. J. with spikes axillary, flowers crowded, fruitstalks long, alternate, leaves lanceolate. Virginia and Florida.
- punctata*. 50. J. with spikes terminating, flowers distant, commonly verticilled, bractees lanceolate, sharp-pointed, leaves lanceol-ovate. Arabia Felix. *Dianthera punctata* of Vahl. *D. Americana alba* of Forskael.
- eustachiana*. 51. J. with spikes axillary and terminating; flowers in pairs below, above solitary; bractees wedge-shaped. St Eustatius. $\frac{h}{2}$.
- caracasana*. 52. J. with spikes axillary and terminating; bractees sharp-pointed, shorter than the calyx; leaves ovate, sharp-pointed, waved, pubescent. Caraccas. $\frac{h}{2}$.
- pectoralis*. 53. J. with a panicle terminating, dichotomous. St Domingo and Martinico. α .
- comata*. 54. J. with spikes terminating, thread-shaped; spikelet verticilled. Jamaica. α . *Dianthera comata*.
- undulata*. 55. J. with fruitstalks terminating, umbelled, simple, three-cleft; leaves lanceolate, undulated. Java and Malabar.
56. J. with umbels axillary, compound, on long foot-frondose stalks; bractees obovate, rhomboid, blunt, smooth. Ota-beite.
57. J. with fruitstalks axillary, opposite, four-flower-pubescent, on fruitstalklets; bractees ovate, roundish, dagger-pointed, pubescent. Botany island. *Dianthera cærulea* of Forskael.
58. J. with fruitstalks axillary, opposite, bearing three *levigata* flowers on fruitstalklets; bractees oblong, dagger-pointed, pubescent. Java. $\frac{h}{2}$.
59. J. with fruitstalks axillary, verticilled, bearing *cuspidata* commonly three flowers on fruitstalklets; bractees wedge-shaped, awned, anthers double. Arabia Felix. *Dianthera verticillata* of Forskael.
60. J. with fruitstalks axillary, verticilled, bearing *lithosperone* flower; bractees linear-lanceolate; leaves oblong, *misfolia* scabrous. α .
61. J. with fruitstalks axillary, two-flowered; leaves *biflora* ovate, equal; bractees awl-shaped. East Indies. $\frac{h}{2}$.
62. J. with flowers axillary, solitary, and sessile; *sessilis* leaves ovate and crenated. St Eustatius. $\frac{h}{2}$.
- Subdiv. 6. *Calyx single, corollas ringent; one anther.*
63. J. with spikes axillary and opposite, bractees *adhatoda* ovate, acute, nerved. Ceylon. $\frac{h}{2}$. *Malabar Nut*.
64. J. with spikes terminating; bractees ovate, sharp-pointed, vein-netted, coloured. India. $\frac{h}{2}$.
65. J. with spikes axillary, terminating, and smooth; *repens* bractees dorsal, pointing two ways, membranaceous at the edge. α . Ceylon.
66. J. with fruitstalks axillary, solitary, bearing one *sanguinolenta* flower, alternate; leaves oblong, stalk creeping. Ceylon. *Obs.* The whole plant is of a blood colour.
- Subdiv. 7. *Calyx single, corollas ringent; two anthers.*
67. J. with spikes axillary and terminating, leaves *peruviana* ovate and acute. Lima. α .
68. J. with fruitstalks axillary, alternate, commonly *crinita* bearing four flowers on fruitstalklets; bractees lanceolate, ciliated. Japan. \odot . *Dianthera Japonica* of Thunberg.
69. J. with fruitstalks axillary, usually bearing three *trisulca* flowers, flowers sessile; leaves oblong, blunt. Arabia Felix. $\frac{h}{2}$.
70. J. with fruitstalks axillary, generally bearing *hyssopifolia* one flower; leaves lanceolate, blunt. Canaries. $\frac{h}{2}$. *lia*.
71. J. with flowers axillary, solitary, almost sessile; *periplocifolia* leaves ovate, sharp-pointed. Caraccas. *Obs.* It is uncertain whether this be a distinct species or a variety of the *peruviana*.
72. J. with fruitstalks one-flowered, axillary; leaves *orchisoides* lanceolate, rigid, acute. Cape of Good Hope. $\frac{h}{2}$.
73. J. with fruitstalks axillary, one-flowered; leaves *madrensis* oblong and dented. $\frac{h}{2}$. Madeira.
74. J. with flowers axillary, solitary, sessile, and leaves *cuneata* obovate, emarginate. Cape of Good Hope. $\frac{h}{2}$.
75. J. with flowers axillary, solitary, sessile, leaves *tranquebar* obovate, branches hoary. Tranquebar. $\frac{h}{2}$. *Justicia bariensis parvifolia* of Lamarek.
76. J. with flowers axillary, sessile, opposite, leaves *odora* roundish, branches smooth. Arabia Felix. *Dianthera odora* of Forskael.

Subdiv.

Subdiv. 8. *Calyx single, corollas almost equal.*

- infundibuliformis.* 77. J. with spikes terminating; leaves lanceol-ovate, in fours. India. h.
sinuata. 78. J. with fruitstalks axillary, trifid; leaves linear, sinu-pinnatifid. Tanna. h. *J. longifolia* of Ferskael.
vineoides. 79. J. with fruitstalks axillary, generally bearing one flower, leaves ovate, stalk unarmed. Madagascar. h.
spinosa. 80. J. with fruitstalks bearing one flower, leaves oblong, spikes axillary. South America. h.

Subdiv. 9. *Species indeterminate in the calyx and corolla.*

- repanda.* 81. J. shrubby, leaves ovate repand, fruitstalks axillary, trifid. Tanna. h.
armata. 82. J. shrubby, prickly; leaves oblong emarginate, stiff like leather, glossy. Jamaica. h.
acicularis. 83. J. shrubby, branches spreading, thorny, thorns bristle-shaped, flowers on footstalks axillary and solitary. Jamaica. h.
parviflora. 84. J. with branches spreading, leaves ovate, entire, spikes pointing one way, bracteas lanceolate, anterior, winged. Calcutta. h.
remorsa. 85. J. with a stalk herbaceous, four-cornered, a little erect; leaves ovate-lanceolate, spikes ovate. Jamaica and Hispaniola. x.
japonica. 86. J. herbaceous, with leaves ovate and serrated, spikes terminating, bracteas bristle-shaped, stem forming an acute angle. Japan.
lancea. 87. J. with flowers verticil-aggregate; leaves entire, lanceolate. Japan. o.
reptans. 88. J. two-anthered, stalk herbaceous creeping, leaves blunt, spike terminating and undivided. St Domingo. o.
humifusa. 89. J. two-anthered, stalk herbaceous decumbent, leaves ovate and heart-shaped, spikes umbelled. Jamaica. o.

49. GRATIOLA.

Cor. irregular, reversed. Stam. two, barren. Caps. two-celled. Calyx of several segments, the two outer segments spreading.

- officinalis.* 1. G. with leaves lanceolate and serrated, flowers on footstalks. South of Europe.
 a *G. alpina.*
monnieria. 2. G. with leaves oblong entire, fruitstalks bearing one flower, leaves longer, stem bending. Antilles. x.
repens. 3. G. with leaves ovate, stalk creeping, calyx five-leaved, style bifid. Jamaica.
rotundifolia. 4. G. with leaves ovate, three-nerved. Malabar.
lucida. 5. G. with a stalk branched, spreading, taking root; leaves heart-ovate, dented; fruitstalks axillary, longer than the leaves. Malabar, Amboina, and China.
veronicifolia. 6. G. with a stalk creeping, leaves ovate-lanceolate, acutely serrated, flowers terminating, opposite, calyx 5-leaved. India. o.
hyssopoides. 7. G. with leaves lanceolate, somewhat serrated, shorter than the stem joint. Tranquebar. o.
lobelioides. 8. G. with stem almost naked, stipulated; leaves oblong, very entire; panicle dichotomous, capsules a little globular. India. o.
trifida. 9. G. with leaves linear-lanceolate, in fours, dent-

ed at the apex, trifid; capsules hairy. Malabar. o.
Gratiola chamædrifolia of Lamarck.

10. G. with leaves lanceolate, blunt, a little dent-*virginica.* ed. Virginia.
 11. G. with flowers almost sessile. Peru. *peruviana*
 12. G. with stalks decumbent, leaves ovate, serrated, fruitstalks opposite, capsules awl-shaped. Tranquebar, Madras, Siam, Malacca.
 13. G. with stem ascending, leaves lanceolate, ser-oppositated, fruitstalks opposite to the leaves. Tranquebar.
 14. G. with stem very little branched; leaves ovate, notched, acute; fruitstalks axillary, bearing one flower, longer than the leaves. India. o.

50. SCHWENKIA.

Cor. nearly equal; throat plaited, glandular. Stamens three, barren. Caps. 2-celled, with many seeds.

1. SCHWENKIA. Berbice. ♂. *americana*

51. CALCEOLARIA.

Cor. ringent, inflated. Caps. 2-celled, 2-valved. Cal. 4-parted, equal.

1. C. with leaves pinnated. *pinnata.* Var. with pinnae of the leaves fewer and broader. Peru. o.
 2. C. with leaves lanceolate, wrinkled, serrated; flowers panicled and terminating. Peru. *integrifolia.*
 3. C. with a branched stem, leaves ovate and crenated. Peru. o. *Calceolaria dichotoma* of Lamarck.
C. integrifolia of Lin. Suppl.
 4. C. with stem perfoliate, leaves sagittate, villous on both sides. New Granada and Peru. *perfoliata.*
 5. C. with leaves sessile, oblong, acute, crenated; flowers cymous, terminating the stalk and branches. Peru. *crenata.*
 6. C. with leaves linear, very entire, bent back at the edge, downy below; stem smooth. Peru. *rosmarinifolia.*
 7. C. with leaves battledore-shaped, very entire; fruitstalks scape-like, bearing one flower. Falkland islands. ♂. *fothergillii*
 8. C. with scapes bearing few flowers, leaves rhombous and serrated. *Calceol. biflora* of Lamarck. S. America near the straits of Magellan. x. *neana.*
 9. C. with scapes bearing one flower, leaves ovate and very entire. *Calceol. uniflora* of Lamarck. S. America near the straits of Magellan. x.

52. BAEA.

Cor. ringent, tube very short, upper lip plain, 3-dented, the lower lip plane and 2-lobed. Cal. 2-celled, 4-valved, contorted. Caps. 5-parted, and equal.

1. B. Near the straits of Magellan. x. *magellanica.*

53. PINGUICULA, Butterwort.

Cor. ringent, spur-shaped. Cal. 2-lipped, 5-cleft. Caps. 1-celled.

- * 1. P. with a blunt nectary shorter than the petal, the scape villous, the capsule globular. *lusitanica.* Synon. *Pinguicula villosa.* *Viola palustris.* Pale Butterwort. It grows on the sides of marshes and bogs. x. Flowers in VI. and VII.
 * 2. P. with a cylindrical nectary, acute, and of the length of the petal, the capsule ovate. *vulgaris.* Com-

max butterwort, or *Yorkshire manick*. Grows in spongy marshes. Europe. α . Flowers in V. and VI.

The inhabitants of Lapland and of the north of Sweden, give to milk the consistence of cream, by pouring it when warm from the cow upon the leaves of this plant. They then strain it, and lay it aside for two or three days, till it becomes a little acid. In this state they are extremely fond of it.

- grandiflora*. 3. P. nectary awl-shaped, straight; upper lip spreading, emarginate. Alps. α .
- alpina*. 4. P. nectary awl-shaped, bent down, shorter than the petals, Lapland, Switzerland, and Austria. α .
- villosa*. 5. P. scape stiff, straight and pubescent; nectary very short; leaves nerved. Lapland and Siberia. α .

54. UTRICULARIA.

The corolla is ringent and spur-shaped. The calyx has two equal segments. The capsule superior and one-celled.

- vulgaris*. * 1. U. with a conical nectary and a scape with few flowers. *Lentibularia* of Ray. *Common bladder-wort*, or *hooded milfoil*. Grows in stagnant waters. Europe. α . Flowers in VI.
- minor*. * 2. U. with a nectary keel-shaped, very short and blunt. *Lentibularia minor* of Ray. *Less hooded milfoil*. Grows in ditches and marshes, but rarely. Europe. α . Flowers in VI.
- alpina*. 3. U. with an awl-shaped nectary, leaves ovate and very entire. Martinico.
- foliosa*. 4. U. with a conical nectary, fruits drooping, rootlets without any bottle or bladder. S. America.
- obtus*. 5. U. with nectary bent inwards, blunt, somewhat emarginate. Jamaica.
- subulata*. 6. U. with awl-shaped nectary. Virginia. *Obs.* The leaves are like hairs, the flowers white.
- gibba*. 7. U. with gibbous nectary. Virginia.
- bifida*. 8. U. with a scape naked and bifid. China.
- capillacea*. 9. U. scape naked, capillary, commonly bearing three nodding flowers; capsule awl-shaped. India.
- cerulea*. 10. U. with a naked scape; scales alternate, scattered, awl-shaped. Ceylon.
- stellaris*. 11. U. *verticillo utriculario bractearum cilari* Lin. Suppl. India.

55. GHINIA.

Cal. 5-awned. Cor. ringent, limb 5-cleft. Nut fleshy, 4-celled. Seeds solitary.

- spinosa*. 1. G. with fruit having 4 spines or thorns, leaves smooth. *Verbena curassavica*. Antigua and the Caribbee islands. \odot .
- mutica*. 2. G. with fruits awnless, leaves downy. Guiana. \odot .

56. VERBENA, *Vervain*.

Cor. funnel-shaped, almost equal, curved. Cal. with one dent, truncated. Seeds two or four naked.

Subdiv. 1. *Diandrous*; two anthers, and two seeds.

- orubica*. 1. V. with spikes very long and leafy. Oruba in North America.
- indica*. 2. V. spikes long, fleshy, naked; leaves lanceolate, obliquely dented; stalk polished. Ceylon. \odot .
- jamaicensis*. 3. V. spikes fleshy, naked; leaves battedore-ovate, serrated; stem rough with hair. Caribbees.
- mutabilis*. 4. V. spikes fleshy, naked; leaves ovate, long at

2

the base, dented, downy beneath; stalk shrubby. South America. β .

5. V. spikes loose; calyxes alternate, priamatic, *prismatic* truncated, awned; leaves ovate, blunt. Jamaica. \odot .

6. V. spikes loose; calyxes of the fruit turned down-wards, rounded and double, bispid. Mexico. α .

7. V. spikes ovate, leaves lanceolate serrate-plaited, *stoechadi-stem* shrubby. Jamaica. *folia*.

Subdiv. 2. *Tetrandrous*, or species with four stamens.

8. V. spikes globular, leaves lanceolate, crenated *globiflora*. wrinkled, scabrous; stem shrubby. South America. β .

9. V. spikes cylindrical, leaves rhomb-ovate crenate *javanica*. stem erect. Java.

10. V. spikes capitate conical, leaves wedge-shaped, *nodiflora*. dented; stalk creeping. Naples, Sicily, E. and W. Indies, and Virginia. α .

11. V. spikes fascicled; leaves lanceolate, stem *boenariensis*. clapping. Boenos Ayres. α .

12. V. spikes long, sharp-pointed; leaves hastate. *hastata*. Canada. α .

13. V. flowers panicled, leaves in threes, stem shrub-*triphylla*. by. Chili. β .

14. V. calyxes fruit-bearing, roundish, inflated; *lappulacea*. seeds echinated. Caribbee islands.

15. V. the calyxes fruit-bearing, roundish, beak-*forskachi*. ed, sharp-pointed; seeds rounded, wrinkly. Arabia Felix.

16. V. spikes thread-shaped; leaves undivided, *lacarolinia*. ocolate-serrated, sessile. North America. α .

17. V. spikes panicled; leaves undivided, ovate, *urticifolia*. serrated, on footstalks. Virginia and Canada. α .

18. V. spikes loose, solitary; leaves trifid, incised. *aubletia*. Virginia. \odot .

19. V. spikes thread-shaped, leaves multifid-lacini-*spuris*. ated, stems numerous. Canada and Virginia.

20. V. spikes thread-shaped, panicled; leaves mul-*officinalis*. tific-lacinated, stem solitary. *Common vervain*. Europe. \odot .

21. V. spikes thread-shaped, solitary; leaves doubly *supina*. pinnatifid.

57. LYCOPUS.

Cor. four-cleft, one segment emarginate. Stamens distant. Seeds four, retuse.

* 1. L. with sinuate-serrated leaves. *L. palustris glaucus*. *europaeus* of Ray. *Marrubium aquaticum* of Gerhard. *Water horehound*, or *gypswort*. Banks of rivers and lakes, Europe. α . Flowers in VII. and VIII.

2. L. leaves pinnatifid-serrated at the base. Italy. *exaltatus*. *Obs.* The stem is about the height of a man.

3. L. with leaves equally but slightly serrated. Vir *virginicus* ginia. α .

58. AMETHYSTEA.

Cor. five-cleft: lowest segment more spreading. Stamens near. Cal. almost bell-shaped. Seeds four, gibbous.

A. Siberia. \odot .

carulea.

59. CUNILA.

Cor. ringent, upper lip erect, plane. Filaments two, without anthers. Seeds four.

1. C. with leaves linear, rolled back, downy be-*fruticosa*. neath; flowers axillary; stem shrubby. New Hol- land.

land. *h.* *Obs.* This species is not probably well ascertained.

- capitata.* 2. *C.* with leaves ovate, flowers terminating, umbel roundish. Siberia.
- mariana.* 3. *C.* with leaves ovate, serrated, corymbs terminating and dichotomous. Virginia. *x.*
- pulegioides.* 4. *C.* with leaves oblong, having two dents, flowers verticilled. Virginia and Canada. *o.*
- thyroides.* 5. *C.* with leaves oval, very entire, flowers verticilled, stem four-cornered. Montpellier. *o.*

60. ZIZIPHORA.

Cor. ringent, upper lip bent back, entire. Cal. thread-shaped. Seeds four.

- capitata.* 1. *Z.* with fascicles terminating, leaves ovate. Syria, Armenia, and Siberia. *o.*
- hispanica.* 2. *Z.* with leaves ovate, flowers raceme-spiked, bracteas obovate, nerved, acute. Spain. *o.*
- tenuior.* 3. *Z.* with flowers lateral, and leaves lanceolate. *o.*
- acinoïdes.* 4. *Z.* with flowers lateral, leaves ovate. Siberia. *o.*

61. MONARDA.

Cor. unequal, upper lip linear, wrapping the filaments. Seeds four.

- fistulosa.* 1. *M.* with leaves oblong-lanceolate, heart-shaped, villous, plane. Canada. *x.*
- oblongata.* 2. *M.* leaves oblong-lanceolate, rounded, and tapering at the base, villous, plane. N. America. *x.*
- didyma.* 3. *M.* with leaves ovate smooth, heads verticilled, flowers approaching to the didynamious, the stem acute-angled. Pennsylvania and New York. *x.*
- rugosa.* 4. *M.* with leaves ovate-lanceolate, heart-shaped, smooth, wrinkled. North America. *x.*
- chinopodia.* 5. *M.* with leaves ovate-lanceolate, rounded at the base, unequal, smooth. Virginia. *x.* *Obs.* This resembles the preceding, but it bears leaves like *Climopodium*. Its spike is not red but purple, and its leaves very smooth.
- punctata.* 6. *M.* with flowers verticilled, corollas dotted, bracteas coloured. *Obs.* The corollas are yellow with purple dots.
- ciliata.* 7. *M.* with flowers verticilled, corollas longer than the involucre. Virginia.

62. ROSMARINUS.

Cor. unequal, upper lip two-parted. Filaments long, curved, simple with a dent.

- officinalis.* 1. *R.* with sessile leaves. S. of Europe. *h.*
- chilensis.* 2. *R.* with leaves on footstalks. Chili. *h.*
- Obs.* This plant has not been properly examined.

63. SALVIA, Sage.

Cor. unequal. Filaments two, very short, supporting two others fixed transversely upon them almost by the middle. Seeds four, and naked.

- pratensis.* * 1. *S.* with leaves heart-shaped oblong and crenated, the highest stem-clasping. The verticils commonly without leaves, the corollas glutinous in the upper lip. *Meadow Clary.* In dry meadows and under hedges, but rarely. Europe. *x.* Flowers in VII. This is a beautiful species, with large corollas of a blue violet colour, arched.

* 2. *S.* with leaves serrated, sinuated and smoothish, *verbena* the corollas narrower than the calyx. *Wild English cca. clary.* Grows in meadows and pastures. Europe. *x.* Flowers from VI. to X.

3. *S.* with leaves lanceolate, slightly dented, flowers *egyptiaca.* on footstalks. *Melissa perennis* of Forskael. Egypt and the Canaries. *o.* *Obs.* The flowers are often tetrandrous.

4. *S.* with leaves linear-oblong, dent-pinnatifid, *verdentata.* verticils two-flowered, segments of the calyx blunt. Cape of Good Hope. *h.*

5. *S.* with leaves linear-lanceolate, flowers with two *cretica.* pistils, calyxes of two segments. Crete. *h.* *Obs.* This seems to be a variety of the *Salvia officinalis.*

6. *S.* with root-leaves lyrated, dented, the helmet *lyrata.* of the corollas very short.

Var. 2. *Horminum virginicum,* with leaves wedge-oblong, stem with two leaves. N. America. *x.*

7. *S.* with leaves linear-lanceolate, slightly crenat-*leucantha.* ed, wrinkled, flowers verticil-spiked, calyxes downy. Mexico. *x.*

8. *S.* with leaves linear, very entire, pubescent, *hablizi-* sessile, flowers verticil-spiked, bracteas ovate, awl-*ana.* pointed. Taurea. *x.* This is a beautiful plant.

9. *S.* leaves lanceol-ovate, slightly crenated, verticils *officinalis.* few-flowered, calyx dagger-pointed. S. of Europe.

10. *S.* with leaves heart-oblong, crenated, verticils *grandiflora.* many-flowered, calyxes acute. *h.*

11. *S.* downy, leaves on footstalks, very wrinkly, *triloba.* three-lobed, the middle lobe oblong and extended, the side lobes ovate and blunt. Crete and Syria. *h.*

12. *S.* with leaves heart-elliptical, blunt, downy, *pomifera.* slightly crenate-waved on the margin, verticils crowded, calyxes trifid, blunt. Crete and Syria. *h.*

13. *S.* with leaves ovate-oblong, doubly serrated; *urticifolia.* calyxes three-dented, highest segment three-dented. Virginia and Florida. *x.* *Obs.* The corollas are small, the upper lip short, the pistil longer than the upper lip.

14. *S.* with leaves ovate, serrated, spikes flexible, *occidentabra-* bracteas heart-shaped, commonly with three flowers. *lis.* Caribbees. *x.*

15. *S.* with leaves heart-shaped, wrinkled, crenated, *tiliaefolia.* and equally serrated, acute; calyxes smoothish, awned. *x.*

16. *S.* with leaves heart-shaped, serrated, soft; flowers *serotina.* raceme-spiked, corollas scarcely longer than the calyx.

17. *S.* with leaves heart-shaped, stalk thread-shaped, *tenella.* creeping, spikes ascending. Jamaica. *o.*

18. *S.* with leaves oblong crenated, helmet of the *viridis.* corollas semicircular, calyxes fruit-bearing, turned back. Italy. *o.*

19. *S.* with leaves blunt, crenated, the highest *horminum.* bracteas barren and coloured, and larger. Greece. *o.*

20. *S.* with leaves oblong, heart-shaped, wrinkled, *virgata.* crenated; hairs of the stem and calyx glandular at the apex. Armenia. *x.*

21. *S.* leaves heart-shaped, wrinkled, twice-serrated; *sylvestris.* bracteas coloured, shorter than the flower, awl-pointed; hairs of the stem and calyx simple. Europe. *x.*

22. *S.* with leaves heart-shaped, lanceolate, serrated *nemorosa.* and plane; bracteas coloured, the lowest lip of the corolla turned back. Austria and Tartary. *x.*

23. *S.* with leaves heart-shaped and dented, in-*syriaca.*

- ferior leaves repand; bracteas heart-shaped, short, acute; calyxes downy. The Levant. *h*.
- viscosa*. 24. *S.* with leaves oblong, obtuse, erose-crenated, viscid; flowers in verticils; bracteas heart-shaped, acute. Italy. α .
- hæmatodes*. 25. *S.* with leaves heart-ovate, wrinkled, downy; calyxes hispid; root knobby. Italy and Istria. α .
- bicolor*. 26. *S.* with leaves ovate erose-dented; flowers nodding, the middle segment of the lower lip of the corolla hollow. Barbary. α .
- indica*. 27. *S.* with leaves heart-shaped, lateral, a little lobed, the highest leaves sessile, the verticils almost naked and very remote. India. α .
- dominica*. 28. *S.* with leaves heart-shaped, blunt, crenated, and somewhat downy; the corolla narrower than the calyx. E. Indies. α .
- scabra*. 29. *S.* scabrous, with leaves lyrated, dented and wrinkled; stem panicle-branched. C. of G. Hope. *h*.
- runcinata*. 30. *S.* scabrous; leaves runcina-pinnatifid and dented; flowers spiked and verticilled. C. of G. Hope.
- clandestina*. 31. *S.* with leaves serrated, pinnatifid, and very much wrinkled; spike blunt; the corollas narrower than the calyx. Italy and Africa. δ .
- austriaca*. 32. *S.* with leaves ovate, heart-shaped, erose-sinuated; the root-leaves on footstalks; stem almost leafless; the stamens double the corolla in length. Austria, Hungary, and Moldavia. α .
- pyrenaica*. 33. *S.* leaves blunt and erose; stamens twice the corolla in length. Pyrenees.
- disermas*. 34. *S.* leaves heart-oblong erose; the stamens equalling the corolla. Syria.
- rugosa*. 35. *S.* leaves heart-shaped, oblong-lanceolate, erose-crenated, wrinkled, a little hairy; the stamens shorter than the corolla. C. of G. Hope. *h*.
- nubia*. 36. *S.* leaves oblong, nearly heart-shaped; the sides unequal, wrinkled, crenated. Africa. α .
- nilotica*. 37. *S.* leaves sinuate, angled, crenate-dented; the dents of the calyx spinous; the angles and edge of the throat ciliated. Egypt. α .
- mexicana*. 38. *S.* leaves ovate, awl-pointed, serrated. Mexico. *h*.
- amethystina*. 39. *S.* leaves heart-shaped, acute, serrated, woolly beneath; verticils naked, calyxes trifid, corollas pubescent. New Granada. *h*.
- fulgens*. 40. *S.* with leaves heart-shaped, acute, crenated, wrinkled, downy beneath; verticils naked, calyxes trifid, helmet of the corollas villous. Mexico. α .
- formosa*. 41. *S.* leaves somewhat heart-shaped, the helmet of the corollas bearded, the calyxes three-lobed, stem becoming shrubby. Peru. *h*.
- tubiflora*. 42. *S.* leaves heart-shaped, crenated, somewhat hairy; calyxes trifid, corollas very long, and tubular; stamens protruded. Lima. *h*.
- longiflora*. 43. *S.* leaves ovate, acute, serrated, pubescent; calyxes trifid, corollas very long, tubular, pubescent; stamens of the length of the corolla. Mexico. α . *Obs.* The corolla of this and the preceding is scarlet.
- coccinea*. 44. *S.* leaves heart-shaped, acute, downy, and serrated; the corollas double the length of the calyx, but narrower. Florida. *h*.
- pseudococcinea*. 45. *S.* leaves ovate, acute, serrated, unequal at the base; stem hairy; corollas double the length of the calyx. S. America. *h*.
- hispanica*. 46. *S.* leaves ovate; leafstalks dagger-pointed; spikes four-cornered, imbricated; calyxes trifid. \odot . Italy.
47. *S.* lower leaves lyrated, highest heart-shaped, flowers verticilled, the calyxes dagger-pointed and ciliated. Africa. α .
48. *S.* leaves heart-shaped, crenate-dented; verticils almost naked; style of the corolla leaning upon the lower lip. Germany and Switzerland. α .
49. *S.* leaves heart-shaped, crenate-dented, the lower one hastate and lyrated; verticils almost naked, upper lip shorter. Italy and France.
50. *S.* leaves heart-sagittate, serrated, and acute. Europe. α . *Obs.* The calyx is three-lobed; the corolla sickle-shaped, yellow, dotted with brown; the middle lobe of the lower lip crenated.
51. *S.* leaves unequally dented, awl-pointed, heart-shaped, angle-hastate at the base; verticils almost naked. Spain. α .
52. *S.* leaves hastate-triangular, oblong, crenated, blunt. Canaries. *h*.
53. *S.* villous, with leaves ovate, dented, ear-shaped; flowers verticil-spiked. C. of G. Hope.
54. *S.* leaves roundish, serrated, truncated at the base and dented. Cape of Good Hope. *h*.
55. *S.* leaves roundish and very entire, truncated at the base and dented. C. of Good Hope. α .
56. *S.* leaves elliptical, almost quite entire, downy; the limb of the calyx membranaceous and coloured. C. of G. Hope. α .
57. *S.* leaves obovate-wedge-shaped, slightly dented, and naked; stem shrubby. Africa. *h*.
58. *S.* leaves obovate and dented; calyxes bell-shaped, forming an acute angle, hairy; stem shrubby. Levant. *h*.
59. *S.* leaves oblong and repand; calyxes thorny; bracteas heart-shaped, dagger-pointed, hollow. Egypt. α .
60. *S.* leaves heart-shaped, erose-dented; calyxes thorny; bracteas very entire, heart-shaped, dagger-pointed, hollow, ciliated. Africa. *h*. *Obs.* Smell very fetid.
61. *S.* leaves wrinkled, heart-shaped, oblong, villous, serrated: floral bracteas longer than the calyx, hollow, awl-pointed. Syria and Italy. δ .
62. *S.* leaves ovate-lanceolate, serrated: flowers spiked, terminating, the largest bracteas coloured. Mexico. α . *Obs.* This is a very beautiful plant in the number and magnitude of its flowers.
63. *S.* leaves wrinkled, pinnatifid, woolly; the highest verticils barren. Persia. δ .
64. *S.* leaves oblong, gnawed, woolly; verticils woolly; bracteas arched downwards, a little thorny. Var. 2. with lacinated leaves. Greece, Africa, and France. δ . The lower lip coheres on the fore part, and forms a sack.
65. *S.* leaves lanceolate, almost entire; stem woolly. Verticils barren, bracteas hollow. Crete. α . This species connects the *sclarea* and *athrops*.
67. *S.* leaves pinnated and very entire, the terminal leaflet greatest. Levant. *h*.
68. *S.* leaves pinnated, pinnae gnawed. Crete and the Levant. δ .

incarnata. 69. S. leaves pinnated and serrated, stalks procumbent and hirsute. Levant. α . *Obs.* The stem is quadrangular; the inferior leaves are pinnated, the superior ternate.

rosaefolia. 70. S. leaves pinnated, hoary, leaflets serrated, calyxes ringent. Armenia. α .

japonica. 71. S. leaves twice pinnated and smooth. Japan. \odot .

ceratophylloides. 72. S. leaves pinnatifid, wrinkled, villous; stem pinnated, much branched. Sicily and Egypt. δ .

forskælii. 73. S. leaves lyre-earshaped, stem almost leafless, the helmet of the corolla half bifid. The East. α .

nutans. 74. S. leaves heart-shaped, indistinctly 5-lobed gnawed, stem roundish, racemes nodding. Russia. α .

hastata. 75. S. leaves hastate-lanceolate, crenated, stalk almost naked, racemes drooping. Supposed a native of Russia.

betonica. 76. S. leaves lanceolate crenated, stem almost naked, racemes drooping. Russia.

64. COLLINSONIA.

Cor. unequal, the lower lip multifid, hair-like. Seed one, perfect.

canadensis 1. C. leaves ovate, and stems smooth. α . North America.

scabriuscula. 2. C. leaves ovate, and somewhat heart-shaped, and a little hairy; stem a little hairy and scabrous. Florida. α .

65. MORINA.

Cor. unequal. Cal. of the fruit 1-leaved, dented. Calyx of the flower bifid. Seed one, crowned with the calyx of the flower.

persica. 1. MORINA. Persia. α .

66. SCIURIS.

Cor. unequal, upper lip trifid, inferior bifid and shorter. Stamens are five, but three of them are without anthers. Caps. five, united into one body, with one cell and one seed.

aromatica. 1. SCIURIS. Guiana. δ .

67. GLOBBA.

Cor. equal, trifid. Cal. superior, trifid. Caps. 3-celled. Seeds many.

marantina 1. G. East Indies. α . The stalk is simple, herbaceous. The leaves alternate on foot-stalks, which are membranaceous, sheathing, the sheaths truncated at the apex.

nutans. 2. G. spike terminating and pendulous, leaves ellipse-lanceolate. East Indies.

japonica. 3. G. raceme terminating and drooping, leaves sword-shaped entire. Japan.

uviformis. 4. G. with a lateral spike. East Indies. α .

68. LITHOPHILA.

Cal. three segments. Cor. 3-petaled. Nectary two segments. Seed-vessel 2-celled.

muscoïdes. 1. LITH. Navaza.

69. LINOCIERA.

Cal. four dented. Cor. four-petaled. Anth. connecting the two opposite petals to the base. Berry 2-celled, cells 2-seeded.

1. LIN. *Thouinia ligustrina* of Swartz. *Privet-like ligustrina.* *Linociera.* Jamaica and Hispaniola. δ .

70. ANCISTRUM.

Cal. four segments. Cor. none. Stigma many-parted. Drupe juiceless, hispid, 1-celled.

1. A. stems decumbent; leaflets obovate, equally *sanguinidented*, silky, pubescent below; spike globular. *New sorbæ.* Zealand. α .

2. A. stalks commonly below water, fruitstalks scape-*lucidum.* form, spikes ovate; leaflets oblong, very entire, acute, usually fasciated. Falkland islands. α .

3. A. stems immersed, fruitstalks scapeform, spikes *latebrosum* long, leaflets oblong, cut, villous, fruits armed on all sides. C. of G. Hope. α . *Ancistrum decumbens* of Thunberg.

71. ARUNA.

Cal. 5-parted, segments turned back. Cor. none. Berry 1-celled, with one or two seeds.

1. ARU. Guiana. δ .

divaricata

ORDER II. DIGYNIA.

72. ANTHOXANTHUM.

Cal. is a glume of two valves, and contains one flower. Cor. a two-valved awned glume. Seed one.

* 1. A. with a spike ovate oblong, the florets on little *odoratum.* fruitstalklets longer than the awn. *Sweet-scented vernal grass.* Grows in meadows and pastures, very common. α . Flowers in V. *Obs.* This grass gives the fragrance to hay.

2. A. a linear spike; florets sessile, longer than the *indicum.* awn. India. It approaches nearest to the genus *anthoxanthum*, though very different in appearance, and the number of stamens do not agree.

3. A. a panicle pressed together, awns very long. *crinitum.* New Zealand. A tall smooth grass, the corolline glume awned.

4. A. spike pointed one way, calyxes hairy, flo-*avena-*rets with a long twisted awn. Malabar. It has *secum.* every appearance of an oat stalk except the two stamens.

73. CRYPSIS.

Cal. a two-valved glume with one flower. Cor. a two-valved awnless glume.

1. C. *Anthoxanthum aculeatum* of Lin. Suppl. *Phleum aculeata.* *schanoides* of Jacquin. *Phalaris vaginiflora* of Forskael.

V. 2. *Phleum schanoides*, with spikes ovate obovulate, leaves very short, dagger-pointed, stem-clasping. Siberia, Spain, Sicily. \odot .

ORDER III. TRIGYNIA.

74. PIPER, *Pepper.*

Cal. none. Cor. none. Berry one seed.

1. P. leaves ovate, about 7-nerved, smooth fruitstalks *nigrum.* very simple. India. δ .

2. P. leaves ovate oblongish, awl-pointed, 7-nerved, *betle.* fruitstalks 2-dented. India. δ .

3. P. leaves obliquely ovate or oblong, veined acute, *cubeba.* spike solitary on footstalks, opposite to the leaves, fruits on fruitstalks. Java and Guinea. δ .

- lusiafolium*. 4. P. leaves obovate, blunt, veined; spike single terminating. West Indies. h.
- capense*. 5. P. leaves ovate, nerved, awl-pointed, nerves villos. Cape of Good Hope.
- malamiris*. 6. P. leaves ovate, somewhat sharp, scabrous beneath, 5 nerves raised beneath. E. and W. Indies.
- discolor*. 7. P. leaves broad ovate with 5 nerves, very smooth, of different colours behind, spikes flexible, florets remote. Jamaica. h.
- medium*. 8. P. with leaves ovate, awl-pointed oblique, a little heart-shaped at the base, 5-nerved; spikes axillary nodding. h.
- axalago*. 9. P. leaves lanceol-ovate, 5-nerved, wrinkled. Jamaica and Hispaniola. h.
- siriboa*. 10. P. leaves heart-shaped, having about 7 nerves, veined. India. h.
- excelsum*. 11. P. leaves circular heart-shaped, having about 7 nerves; fruitstalks terminating single, 2 cleft; stem woody. New Zealand. h.
- longum*. 12. P. leaves heart-shaped, on footstalks sessile. India. h.
- methysticum*. 13. P. leaves heart-shaped, awl-pointed, many-nerved; spikes axillary, single, very short, on footstalks spreading very much. S. Sea islands. h.
- latifolium*. 14. P. leaves circular-heart-shaped, nine-nerved; spikes axillary, aggregate, on footstalks. S. Sea islands. h.
- decumanum*. 15. P. leaves heart-shaped, 9-nerved, netted. Martinico and Caraccas. h. It seems a variety of the *reticulatum*.
- reticulatum*. 16. P. leaves heart-shaped, seven-nerved, netted. Martinico, Brasil, and Hispaniola. h.
- aduncum*. 17. P. leaves oblong-ovate, awl-pointed, unequal at the base, veined; spikes single, axillary, hooked at the end. Jamaica. h.
- macrophyllum*. 18. P. leaves ellipse-ovate, awl-pointed, smooth, unequal at the base, veined; leafstalks appendiculate, spikes axillary and single. Jamaica and Martinico. h.
- geniculatum*. 19. P. leaves oblong awl-pointed, oblique, many-nerved or veined, smooth; stem and branches kneed. Jamaica. h.
- verrucosum*. 20. P. first herbaceous, then woody; leaves oblong, awl-pointed, oblique, many-nerved or veined, smooth, coriaceous; stem and branches warted. *P. tuberculatum* of Jacquin. Jamaica and Guinea. h.
- hispidum*. 21. P. leaves ovate, awl-pointed, oblique, hirsute, wrinkled; nerves (or veins) alternate, spikes erect. Jamaica. h.
- nitidum*. 22. P. leaves lanceol-ovate, oblique at the base, smooth, glossy. Jamaica. h.
- pellucidum*. 23. P. leaves heart-shaped, on footstalks; stem herbaceous. S. America.
- alpinum*. 24. P. herbaceous, stem erect, and a little simple; leaves ovate-roundish acute, without veins beneath; spikes axillary. Jamaica. h.
- hispidulum*. 25. P. herbaceous, somewhat erect; leaves roundish, on very slender leaf-stalks, rough-haired above.
- tenellum*. 26. P. herbaceous, simple, decumbent; leaves 2-ranked, ovate, veinless, ciliated on the margin; spike, ascending. Jamaica. ☉.
- acuminatum*. 27. P. herbaceous, leaves lanceol-ovate, nerved, fleshy; stem a little erect. S. America. x.
- bandum*. 28. P. leaves in threes, lanceolate, awl-pointed, nerved, ciliated, dotted below. Caraccas. x.
29. P. sub-herbaceous; leaves lanceol-ovate, stem *amplexicaespis*, nerved, fleshy; stem erect, simple. East Indies. x.
30. P. leaves alternate, obovate, commonly 3-nerved; spikes single, usually terminating. Society islands.
31. P. with leaves obovate and nerveless. South America. *obtusifolium*.
32. P. leaves obovate and retuse. Cape of Good Hope.
33. P. herbaceous, with leaves ovate, awl-pointed; *glabellum*, stem declining, taking root, much branched. Jamaica.
34. P. herbaceous, with leaves ovate, acute; stem *scandens*, taking root, simple, ascending. Jamaica.
35. P. herbaceous, with leaves roundish-acute, plane, *serpens*, of different colours; stem creeping. Jamaica.
36. P. herbaceous, with leaves inversely heart-shaped, *cordifolium*, plano-convex, fleshy; stem creeping. Jamaica.
37. P. herbaceous, with leaves circular, convex-concave; stem threadlike, creeping, taking root. Jamaica. *nummularifolium*.
38. P. herbaceous, with leaves roundish, plane, *rotundifolium*, fleshy; stem threadlike and creeping. S. America. *folium*.
39. P. leaves target-shaped ovate. St Domingo. *maculorum*.
40. P. leaves target-shaped, circular heart-shaped, *perlatum*, blunt-repand; spikes umbelled. St Domingo. x.
41. P. leaves somewhat target-shaped, circular-*subpelto* heart-shaped, awl-pointed; spikes umbelled. Antigua. *boyna*. x.
42. P. leaves ovate, awl-pointed, spikes conjugate, *distachyon*, stem taking root. S. America. x.
43. P. leaves circular heart-shaped, awl-pointed, *umbellato*, veined, spikes umbelled; stem erect, furrowed, pubescent. E. Indies. x.
44. P. leaves in threes and roundish. America. *trifolium*.
45. P. leaves verticilled in threes or fours, elliptical, *pereskia*, three-nerved, smooth; spike terminating single, stem *folium*, spotted. Venezuela. x.
46. P. leaves verticilled, rhomb-ovate, very entire, *polystachyon*, on footstalks, three-nerved, pubescent. Jamaica. x. *chison*.
47. P. leaves in fours, wedge-shaped, obovate, *emarginate*, almost sessile; stem erect. S. America. *quadrifolium*.
48. P. leaves verticilled in fours, elliptical, blunt, *verticillatum*, 3-nerved. Jamaica. ☉.
49. P. leaves verticilled, commonly in fours, oblong, *stellatum*, awl-pointed, 3-nerved. Jamaica. x. *Obs.* This species differs from the *verticillatum* in having leaves awl-pointed, and spikes three times longer.
50. P. leaves in fours, rhombous, fleshy, turned back *reflexum*, and spreading; stem creeping. E. Indies. Cape of Good Hope. *Piper tetraphyllum* of Forster.
51. P. leaves in fours, almost sessile oblong, *nerveless*, very entire; spikes terminating. Jamaica. x. *lum*.
52. P. herbaceous, with leaves linear blunt, the *filiforme*, highest verticilled, the stem threadlike and creeping. Jamaica. *Obs.* It is remarkable that of the 53 species of piper here described, 21 species are natives of Jamaica.

In the class Diandria are,

39 Genera, which include 299 Species; 29 species are found in Britain.

CLASSIS

CLASSIS III.
TRIANDRIA.

ORDO I. MONOGYNIA.

Sect. I. *Flores superi.*

- * 75. VALERIANA. Cor. 5-fida basi gibba. Sem. unicum.
84. MELOTHEIA. Cor. 5-fida rotata. Bacca trilocularis.
* 92. CROCUS. Cor. 6-partita, erecto-petala. Stig. convoluta colorata.
95. ANTHOLYZA. Cor. 6-fida tubulosa recurvata: laciniis inæqualibus.
94. GLADIOLUS. Cor. 6-partita tubulosa: laciniis subæqualibus, superioribus convergentibus.
* 97. IRIS. Cor. 6-partita; laciniis alternis reflexis. Stip. petaloideum.
93. IXIA. Cor. 6-partita patens. Stig. tria simplicia.
96. ARISTEA. Cor. 6-petala. Styl. declinatus. Stig. infundibuliforme, hians.
98. MORÆA. Cor. 6-petala; petalis alternis inæqualibus patentibus.
100. DILATRYA. Cor. 6-petala hirsuta. Fil. tertium reliquis minus. Stigma simplex.

Sect. II. *Flores inferi.*

101. WITSENIA. Cor. 6-partita cylindrica. Stig. emarginatum. Cal. o.
99. MARCIA. Cor. 6-partita: laciniis alternis duplo minoribus. Stigma petaloideum trifidum laciniis indivisis. Cal. o.
103. WACHENDORFIA. Cor. 6-petalis inæqualis. Cal. o.
HÆMODORUM. Cor. 6-petala, tria interiora supra medium staminifera. Stigma obtusum. Casp. infera trilocularis.
102. XIPHIDIUM. Cor. 6-petala æqualis. Cal. o.
104. COMMELINA. Cor. 6-petala: Petala 3 s. 4 calyciformibus. Nect. cruciata pedicellata.
76. OXYBAPHUS. Cor. 5-dentata infundibuliformis. Cal. 3-fid. Nux 5-gona calyce alata!
78. MACROLOBIUM. Cor. 5-petala inæqualis. Cal. duplex: exterior 2-phyll. inter. 5-dentatus. Legumen.
79. ROHRIA. Cor. 5-petala inæqualis. Cal. 5-partitus. Stig. 3, revoluta. Caps.
89. HIPPOCRATEA. Cor. 6-petala. Cal. 5-partit. Caps. 3, bivalves.

CLASS III.
TRIANDRIA.

ORDER I. MONOGYNIA.

Sect. I. *The Flowers inserted above the Germen.*

- * 75. V. Cor. 5-cleft, gibbous at the base. Seed 1.
84. M. Cor. 5-cleft, wheel-shaped. Berry 3-celled.
* 92. C. Cor. 6-parted, equal. Stigma convolute.
95. A. Cor. 6-cleft, tubular, arched downwards; the segments unequal.
94. G. Cor. 6-parted and tubular; the segments nearly equal, the higher segments converging.
* 97. I. Cor. 6-parted, petals alternate, turned back. Stigma petaliform.
93. I. Cor. 6-parted and spreading. The stigmas three and simple.
96. A. Cor. 6-petaled. Style declining. Stigma funnel-shaped and gaping.
98. M. Cor. 6-petaled; the petals alternate, unequal and spreading.
100. D. Cor. 6-petaled and hirsute. The third filament less than the rest. Stigma simple.

Plants resembling those belonging to other classes.

I. *Boerhaavia excelsa, repanda charophylloides, plumbaginea.* VI. *Pentstemon Ænosa.*

Sect. II. *The Flowers inserted below the Germen.*

101. W. Cor. 6-parted and cylindrical. Stigma emarginated. Cal. none.
99. M. Cor. 6-parted; the alternate segments half the size of the rest. Stigma petal-shaped, 3-cleft; the segments not divided. Cal. none.
103. W. Cor. 6-petaled, unequal. Cal. o.
H. Cor. 6-petaled, the three interior petals staminiferous above the middle. Stigma obtuse. Caps. inferior and 3-celled.
102. X. Cor. 6-petaled, equal. Cal. o.
104. C. Cor. 6-petaled; petals 3 or 4, calyxform. Nect. cruciform and on the fruitstalklet.
76. O. Cor. 5-dentate, funnel-shaped. Cal. 5-cleft. Nut 5-angled, winged at the calyx.
78. M. Cor. 5-petaled, unequal. Cal. double, the exterior calyx 2-leaved, the interior one 5-dentate. A legume.
79. R. Cor. 5-petaled, unequal. Cal. 5-parted. Stigmas three, rolled back.
89. H. Cor. 5-petaled. Cal. 5-parted. Caps. three, 2-valved.
90. TONSELLA.

90. *TONSELLA*. Cor. 5-petala. Cal. 5-partit. Nect. urceolatum. Bacca 1-locul. 4-sperma.
87. *LOEFLINGIA*. Cor. 5-petala. Cal. 5-phyllus. Caps. 1-locularis.
83. *WILLICHIA*. Cor. 4-fida. Cal. 4-fidus. Caps. 2-locularis.
105. *CALLISIA*. Cor. 3-petala. Cal. 3-phyllus. Caps. 2-locularis.
106. *SYENA*. Cor. 3-petala. Cal. 3-phyllus. Caps. 3-valvis unilocularis.
80. *RUMPHIA*. Cor. 3-petala. Cal. 3-fidus. Drupa nuce 3-loculari.
91. *FISSILIA*. Cor. 3-petala cohaerens: petalis 2, bifidis. Cal. urceolatus integer. Stam. 8; quorum 5 sterilia. Nux 1-sperma.
81. *CNEORUM*. Cor. 3-petala. Cal. 3-dentatus. Bacca 3-cocca.
107. *XYRIS*. Cor. 3-petala. Cal. 2-valvis. Caps. 3-locularis.
82. *COMOCLADIA*. Cor. 4-partita. Cal. 3-partitus. Stylus o. Drupa.
77. *OLAX*. Cor. 3-fida. Cal. integer. Glans.
85. *ROOTALA*. Cor. o. Cal. 3-dentatus. Caps. 3-locul.
86. *ORTEGIA*. Cor. o. Cal. 5-phyll. Caps. 1-locul.
88. *POLYCNEMUM*. Cor. o. Cal. 5-phyll. subtus 3-phyll. Sem. 1.
90. *T.* Cor. 5-petala. Cal. 5-partit. Nect. pitcher-shaped. Berry 1-celled, and 4-seeded.
87. *L.* Cor. 5-petala. Cal. 5-leaved. Caps. 1-celled.
83. *W.* Cor. 4-cleft. Cal. 4-cleft. Caps. 2-celled.
105. *C.* Cor. 3-petala. Cal. 3-leaved. Caps. 2-celled.
106. *S.* Cor. 3-petala. Cal. 3-leaved. Caps. 1-celled, 3-valved.
80. *R.* Cor. 3-petala. Cal. 3-cleft. Drupe with nut, 3-celled.
91. *F.* Cor. three petals cohering; two petals 2-cleft. Cal. pitcher-shaped, entire. Stam. eight, of which 5 are barren; the nut 1-seeded.
81. *C.* Cor. 3-petala. Cal. 3-dented. Berry 3-grained.
107. *X.* Cor. 2-petala. Cal. 2-valved. Caps. 3-celled.
82. *C.* Cor. 3-parted. Cal. 3-parted. Style none. A drupe.
77. *O.* Cor. 3-cleft. Cal. entire.
85. *R.* Cor. none. Cal. 3-dented. Caps. 3-celled.
86. *O.* Cor. none. Cal. 5-leaved. Caps. 1-celled.
88. *P.* Cor. none. Cal. 5-leaved. Seed one.

Plants of other classes resembling these are thus classed.

† VI. *Tradescantia multiflora*. V. *Hirtella triandria*.
IV. *Fagura spinosa, acuminata*.

Sect. III. *Flores graminei; valvulis gluma calycina.*

- * 111. *SCHOENUS*. Cor. o. Cal. paleis fasciculatis. Sem. subrotundum.
- * 112. *CYPERUS*. Cor. o. Cal. paleis distichis. Sem. nudum.
- * 113. *SCIRPUS*. Cor. o. Cal. paleis imbricatis. Sem. nudum.
- * 115. *ERIOPHORUM*. Cor. o. Cal. paleis imbricatis. Sem. lana cinctum.
110. *MAPANIA*. Cor. o. Cal. 6-valvis. Involucre triphyllum.
117. *NARDUS*. Cor. bivalvis. Cal. o. Sem. tectum.
114. *MIEGIA*. Cor. 2-valvis. Cal. 2-valvis. Nect. 1-valve germen involvens.
109. *KYLLINGIA*. Cor. 2-valvis. Cal. 2-valvis. Ament. imbricatum.
119. *CENCHRUS*. Cor. 2-valvis. Cal. 2-valvis. Involucr. 3 s. 4-florum laciniatum echinatum.
118. *LYGEUM*. Cor. 3-valvis. Cal. spatha. Nux 2-locularis.
116. *POMMEREULIA*. Cor. 3 s. 4-bivalvis aristata. Cal. turbinatus bivalvis.
108. *FUIRENA*. Cor. 3-valvis. Cal. o. Ament. imbricat. squamis aristatis.

ORDO II. DIGYNIA.

127. *PANICUM*. Cal. 3-valvis; tertio dorsali minori.

Sect. III. *Grasses. The glumes of the calyx valved.*

- * 111. *S.* Glumes chaffy, crowded, the exterior one barren. Seeds roundish.
- * 112. *C.* Glumes chaffy, tiled in two ranks.
- * 113. *S.* Glumes chaffy, tiled on all sides.
- * 115. *E.* Glumes chaffy, tiled on all sides. Seed surrounded with very long wool.
110. *M.* Cor. o. Cal. 6-valved. Involucre 3-leaved.
117. *N.* Cor. a 2-valved glume.
114. *M.* Cor. 2-valved. Nect. 1-valved, inclosing the germen.
109. *K.* Cor. 2-valved. Cal. 2-valved. Ament. imbricated.
119. *C.* Cor. 2-valved. Cal. 2-valved. Involucre 3 or 4 flowered, laciniated and echinated.
118. *L.* Cor. 2-valved. Cal. a spathe. Nut 2-celled.
116. *P.* Cor. 3 or 4 bivalved, awned. Cal. top-shaped bivalve.
108. *F.* Cor. 3-valved. Cal. o. Ament. imbricated, the scales awned.

ORDER II. DIGYNIA.

127. *P.* Cal. 1-valved, the third valve least.

120. *CORNUCOPIA*.

120. CORNUCOPIÆ. Cal. 2-valvis. Cor. 1-valvis. Involucrum commune 1-phyllum multiflorum.

146. ARISTIDA. Cal. 2-valvis. Cor. 1-valvis, apice aristis tribus.

* 129. ALOPECURUS. Cal. 2-valvis. Cor. 1-valvis, apice simplici.

* 128. PHLEUM. Cal. 2-valvis, truncatus, mucronatus, sessilis.

* 125. PHALARIS. Cal. 2-valvis: valvis carinatis æqualibus, corollam includentibus.

126. PASPALUM. Cal. 2-valvis: valvis subrotundis figura corollæ.

* 130. MILIUM. Cal. 2-valvis: valvis ventricosis corolla majoribus, subæqualibus.

* 131. AGROSTIS. Cal. 2-valvis: valvis acutis corolla brevioribus.

* 137. DACTYLIS. Cal. 2-valvis: valva majore longiore compressa carinata.

* 141. STIPA. Cal. 2-valvis. Cor. arista terminali inarticulata.

143. LAGUROS. Cal. 2-valvis villosus. Cor. aristis 2 terminalibus et 1 dorsali.

122. SACCHARUM. Cal. 2-valvis, lanugine extus vestitus. Cor. 2-valvis.

121. MUHLENBERGIA. Cal. 1-valvis. Cor. 2-valvis.

123. PEROTIS. Cal. o. Cor. 2-valvis, lanugine extus vestita.

124. LEERSIA. Cal. o. Cor. 2-valvis clausa.

120. C. Cal. 2-valved. Cor. 1-valved. Common involucre 1-leaved, many-flowered.

146. A. Cal. 2-valved. Cor. 1-valved, 3 awns at the apex.

* 129. A. Cal. 2-valved. Cor. 1-valved, the apex simple.

* 128. P. Cal. 2-valved, truncated, dagger-pointed and sessile.

* 125. P. Cal. 2-valved; the valves keeled, equal, enclosing the corolla.

126. P. Cal. 2-valved; the valves roundish, of the figure of the corolla.

* 130. M. Cal. 2-valved; the valves ventricose, greater than the corolla, nearly equal.

* 131. A. Cal. 2-valved; valves acute, shorter than the corolla. Stigmas feathered.

* 137. D. Cal. 2-valved, flattened; the greater valve keel-shaped.

* 141. S. Cal. 2-valved. Cor. with terminating awn, jointed at the base.

143. L. Cal. 2-valved, awns villous.

122. S. Cal. 2-valved, covered with down on the outside. Cor. 2-valved.

121. M. Cal. 1-valved. Cor. 2-valved.

123. P. Cal. o. Cor. 2-valved, covered with down on the outside.

124. L. Cal. o. Cor. 2-valved, shut.

Plants belonging to the third Sect. of this order resembling these.

Arundo epigeios, calamagrostis, arenaria.

Sect. II. *Flowers scattered, 2 in each calyx.*

* 132. A. Cal. 2-valved. Florets without the rudiments of a third.

* 133. M. Cal. 2-valved, commonly 2-flowered, with the rudiments of a third.

H. Cal. 2-valved. Cor. awned.

Plant resembling these.

Tripsacum hermaphroditum.

Sect. III. *Flowers scattered, many in each calyx.*

136. U. Cal. many-valved, keeled.

* 135. B. Cal. 2-valved. Cor. bellied, valves heart-shaped, blunt. Seed adhering to the corolla.

* 134. P. Cal. 2-valved. Cor. valves ovate, a little sharp, awnless.

* 139. F. Cal. 2-valved. Spikelet oblong, glumes sharp-pointed.

* 140. B. Cal. 2-valved. Spikelet oblong, glumes awned under the apex, the inner one ciliated.

* 142. A. Cal. 2-valved. Cor. a glume, roundish, awned on the back. Awn contorted.

* 144. A. Cal. 2-valved. Florets surrounded by permanent wool. Awnless.

145. P. Cal. 2-valved. Cor. 2-valved with many awns.

Sect. II. *Flores biflori, vagi.*

* 132. AIRA. Cal. bivalvis. Flosculi absque rudimento tertii.

* 133. MELICA. Cal. 2-valvis. Rudimentum tertii inter flosculos.

HOLCUS. Cal. 2-valvis. Cor. aristata.

Sect. III. *Flores multiflori, vagi.*

136. UNIOLA. Cal. multivalvis, carinatus.

* 135. BRIZA. Cal. 2-valvis. Cor. cordata: valvis ventricosis.

* 134. POA. Cal. 2-valvis. Cor. ovata: valvis acutiusculis.

* 139. FESTUCA. Cal. 2-valvis. Cor. oblonga: valvis mucronatis.

* 140. BROMUS. Cal. 2-valvis. Cor. oblonga: valvis sub apice aristatis.

* 142. AVENA. Cal. 2-valvis. Cor. oblonga: valvis dorso arista contorta.

* 144. ARUNDO. Cal. 2-valvis. Cor. basi lanata, mutica.

145. PAPPOPHORUM. Cal. 2-valvis. Cor. 2-valvis multi-aristata.

VOL. IV. Part I.

+

N

153. LAPPAGO.

led.
- 158. K. Cor. none. Cal. 3-leaved. Seed 1, o-
vate.

Plant resembling.

Tillæa.

Sect. II. *Flowers inserted above the germen.*

- 160. D. Cor. many-petaled. Cal. 3-leaved.
- 156. P. Cor. none. Cal. 3-parted. Seed 1, 3-
celled.

- 2. V. tailed flowers; leaves very entire, strap-shaped. *angustifo-*
lia. S. of Europe. 2.
- 3. V. monandrous flowers; leaves with winged clefts. *calcitrapa.*
Portugal and the East. 3.
- * 4. V. flowers stamiferous and pistilliferous on disse-
dioica. rent plants, with very entire winged leaves. 2.
- 5. V. triandrous flowers, with leaves winged, and *capensis.*
florets oval-toothed. C. of G. Hope.

6. V.

officinalis. * 6. V. leaves all winged and toothed.—It is this species which is in so much repute as a medicine. The root has a strong, but not an agreeable smell. Its taste is warm, bitterish, and subacrid. It communicates its properties to wine, water, and spirit; but it is best in substance, and may be taken from half a drachm to two drachms for a dose. There is no doubt of its possessing antispasmodic virtues in an eminent degree. It is often prescribed with advantage in hysterical cases, and instances are not wanting where it appears to have removed some obstinate epilepsies. In habitual costiveness it is an excellent medicine, and frequently loosens the bowels when other stronger purgatives have been tried in vain. Cows eat the leaves. Sheep are not fond of them. Cats are greatly delighted with the roots. Rats are said to be equally fond of them, and that the rat-catchers employ them to draw the rats together.

phu. 7. V. with stem-leaves winged, those issuing from the root undivided. Europe. ♀.

tripteris. 8. V. toothed leaves, those rising from the root undivided; those of the stem in threes, oval-oblong. Alps. ♀.

montana. 9. V. leaves oval-oblong, nearly tooth-shaped with an undivided stem.

celtica. 10. V. leaves oval-oblong, obtuse, very entire. The Alps. ♀.

tuberosa. 11. V. root-leaves spear-shaped, very entire; the rest winged, cleft. South of Europe. ♀.

saxatilis. 12. V. leaves nearly toothed; the root-leaves oval; the stem-leaves strap-spear-shaped. S. of Europe. ♀.

elongata. 13. V. radical leaves oval; stem-leaves heart-shaped sitting, snipt nearly, halbert-shaped. S. of Europe. ♀.

pyrenaica. 14. V. stem-leaves heart-shaped, toothed, having leaf-stalks; the highest in threes. Pyrenees. ♀.

scandens. 15. V. leaves in threes, the stem climbing.

mixta. 16. V. stem 4-cleft, the lowest leaves double-winged cleft, with a feathery down.

supina. 17. V. small involucrems 5-leaved, 3-flowered; the leaves entire. Alps. ♀.

villosa. 18. V. inferior leaves ear-shaped, the superior leaves toothed, woolly. Japan.

polystachya. 19. V. winged leaves, with a compound spike in whirls.

sibirica. 20. V. winged cleft leaves; seeds connected with an oval chaff. Siberia. ♂.

ruthenica. 21. V. leaves oval, fleshy, winged, cleft, toothed; seeds connected with an oval chaff. Siberia. ♀.

carnosa. 22. V. oval, toothed, fleshy, hoary leaves.

cornucopia. 23. V. flowers diandrous, leaves oval sitting. S. of Europe. ♂.

echinata. 24. V. toothed leaves, fruit strap-shaped, 3-toothed; the outward larger and bent back. S. of Europe. ♂.

olistoria. 25. V. forked stem; leaves spear-shaped, very entire; fruit naked. Europe. ♂.

dentata. 26. V. stem forked; leaves spear-shaped, entire; fruit 3-toothed; 2 teeth very short. Europe. ♂.

vesicaria. 27. V. stem forked, leaves spear-shaped, toothed; fruit inflated globular. Crete. ♂.

coronata. 28. V. stem forked; leaves spear-shaped, toothed; fruit 6-toothed. Portugal. ♂.

discoidea. 29. V. stem forked, leaves spear-shaped, toothed; fruit 12-toothed with hooked teeth.

radiata. 30. V. stem forked, leaves oblong-obtuse, little heads with involucrems.

31. V. forked stem, the lower leaves toothed, the *pumila*. highest strap-shaped, many-cleft.

As we have already given to our readers an example of the mode in which the different species of plants are discriminated by botanists, and as such extreme minuteness might seem inconsistent with the nature of our work, we shall avoid pursuing it, unless where the peculiar nature of any species may appear to require such a degree of attention, either as an object of scientific curiosity, or of general utility. At the commencement of the succeeding class, however, we shall give a further example, taken from the extensive genus *Protea*, of the manner in which the species of plants ought to be defined. With this exception, however, we shall confine ourselves to the definition of the more important plants. At the same time, that our work may be as complete as its nature will permit, we shall state the names of all the species included under every genus (excepting the almost boundless class of *Cryptogamiae*), taking care to distinguish the foreign from the British plants, by affixing to the latter the usual mark (*). Thus there will be exhibited to the reader, nearly a complete enumeration of the objects contained under this extensive and curious branch of science; together with an account of whatever it contains most interesting or useful.

76. OXYBAPHUS

Contains one species; viz. viscosus.

77. OLAX.

One species; viz. zeylanica. Ceylon.

78. MACROLOBIUM.

Three species; viz. pinnatum, hymenæoides, sphaerocarpum.

79. ROHRIA.

One species; viz. petioliflora. Cape, Japan, West Indies.

80. RUMPHIA.

One species; viz. amboinensis. Amboyna.

81. CNEORUM, *Widow-wail*.

One species; viz. tricocon. S. Europe.

82. COMOCLADIA, or *Maiden-plume*.

Four species; viz. integrifolia, dentata, ilicifolia, angulosa. Jamaica, S. America.

83. WILLICHIA.

One species; viz. repens. Mexico.

84. MELOTHRIA, *Small-creeping Cucumber*.

One species; viz. pendula. N. America.

85. ROTALA.

One species; viz. verticillaris. E. Indies.

86. ORTEGIA.

Two species; viz. hispanica, dichotoma. S. Eur.

87. LOEFLINGIA.

Two species; viz. hispanica, indica. India, Spain.

88. POLYCNEMUM.

Five species; viz. monandrum, sclerospermum, arvense, salsum, oppositifolium. S. Europe.

89. HIPPOCRATEA.

Three species; viz. *volubilis*, *indica*, *comosa*. S. Am.

90. TONSELLA.

Two species; viz. *scandens*, *africana*. Guiana.

91. FISSILIA.

One species; viz. *psittacorum*. Isle Bourbon.

92. CROCUS, or *Saffron*.

Two species; viz. * *sativus*, * *vernus*.

sativus.

* C. sheath one valve rising from the root; tube of the blossom very long.—The summits of the pistils of the *Cr. officinalis* carefully collected, and moderately dried, are the saffron of the shops. That collected in England is preferred to all other. It affords a beautiful colour to water, wine, or spirit, and gives out the whole of its virtues to them. It has been held in high repute as a cordial; but modern practice pays no great attention to it, since it has been found to produce no sensible effect, even when given in doses greatly larger than those generally prescribed.

93. IXIA.

47 species; viz. *fruticosa*, *minuta*, *rosea*, *chloroleuca*, * *bulbocodium*, *cruciata*, *fragrans*, *humilis*, *pilosa*, *hirta*, *secunda*, *villosa*, *rubrocyanea*, *pumicea*, *purpurea*, *crispa*, *cinnamomea*, *corymbosa*, *heterophylla*, *anemonæflora*, *coelestina*, *spicata*, *plantaginea*, *linearis*, *incarnata*, *patens*, *capillaris*, *flexuosa*, *angusta*, *radiata*, *virgata*, *longiflora*, *scillaris*, *aristata*, *pendula*, *bulbifera*, *leucantha*, *erecta*, *maculata*, *deusta*, *crocata*, *squalida*, *lancea*, *pentandra*, *alulca*, *falcata*, *excisa*. Alps, Africa, China, Magellan.

94. GLADIOLUS, or *Corn-flag*.

50 species; viz. *montanus*, *parviflorus*, *flexuosus*, *recurvus*, *falcatus*, *biflorus*, *tenellus*, *dichotomus*, *striatus*, *crispus*, *cuspidatus*, *tristis*, *albidus*, *hyalinus*, *gracilis*, *carinatus*, *galeatus*, *imbricatus*, *brevifolius*, *communis*, *carneus*, *hirsutus*, *watsonius*, *mevanellus*, *merianus*, *laccatus*, *iridifolius*, *refractus*, *alatus*, *bicolor*, *anceps*, *sessifolius*, *silenoides*, *roseus*, *juncus*, *setifolius*, *marginatus*, *angustus*, *undulatus*, *flarus*, *securiger*, *tubiflorus*, *tubatus*, *floribundus*, *blandus*, *plicatus*, *strictus*, *mucronatus*, *spathaceus*, *gramineus*. Europe, Africa.

95. ANTHOLYZA.

Six species; viz. *lucidior*, *æthiopica*, *nervosa*, *cunonia*, *ringens*, *plicata*. Persia, Africa.

96. ARISTEA.

One species; viz. *cyanea*. Cape of Good Hope.

97. IRIS

Contains 53 species; viz. the following: *ciliata*, *minuta*, *pumila*, *lutescens*, *cristata*, *susiana*, *florentina*, *flavissima*, *biflora*, *aphylla*, *variegata*, *squalens*, *japonica*, *sambucina*, *lurida*, *germanica*, *pallida*, *compressa*, *dichotoma*, *tripetala*, *tricuspis*, * *xiphium*, *xiphoides*, * *pseud-acorus*, * *foetida*, *virginica*, *versicolor*, *halophille*, *ochroleuca*, *spathacea*, *ramosa*, *sisyrinchium*, *verna*, *persica*, *juncæa*, *angusta*, *setacea*, *tenuifolia*, *ventricosa*, *graminea*, *ensata*, *spuria*, *orientalis*, *sibirica*, *martinicensis*, *pavonia*, *crispa*, *papilionacea*, *edulis*, *tristis*, *polystachya*, *viscaria*, *bituminosa*, *tuberosa*. Europe, Barbary, Persia, N. America. Of these the following deserve notice.

pseudacorus.

I. Every other segment of the cor. or blossom smaller than the summit.—The juice of the fresh fruit of

this species is very acrid, and has been found to produce plentiful evacuations from the bowels, after other powerful means had failed. It may be given for this purpose in doses of 80 drops every hour or two: but the degree of its acrimony is so uncertain that it can hardly ever come into general use. In some cases it proves diuretic. The fresh roots have been mixed with the food of swine bitten by a mad dog; and they escaped the disease when others bitten by the same dog died raving mad. The root loses most of its acrimony by drying. Goats eat the leaves when fresh; but cows, horses, and swine refuse them: cows will eat them when dry. The roots are used in the island of Jura to dye black.

I. Stem with one angle. The juice of the root, *fatida*. both of this and the preceding species, is sometimes used to excite sneezing; but it is an unsafe practice. Violent convulsions have sometimes been the consequence. Neither horses, sheep, nor cows eat it. The scarlet seeds displayed by the opening capsules give the hedge banks in England a gay appearance in autumn. The leaves when bruised smell like rancid bacon.

98. MORÆA.

This genus chiefly inhabits the C. of G. Hope, and has 17 species; viz. *melaleuca*, *spiralis*, *pusilla*, *magellanica*, *gladiata*, *aphylla*, *filiformis*, *spathacea*, *flexuosa*, *polyanthos*, *cærulea*, *plicata*, *umbellata*, *crispa*, *iriopectala*, *iridioides*, *chinensis*. Africa.

99. MARICA

Has one species; viz. *marica paludosa*. Guiana.

100. DILATRIA

Has three species; viz. *corymbosa*, *viscosa*, *paniculata*. C. of G. Hope.

101. WITSENIA

Has one species; viz. *witsenia maura*. C. of G. Hope.

102. XIPHIDIUM

Has two species; viz. *album*, *cæruleum*. Guiana.

103. WACHENDORFIA

Has five species; viz. *thyrsiflora*, *paniculata*, *hirsuta*, *tenella*, *graminea*. C. of G. Hope.

104. COMMELINA, or *Day-flower*,

Has 13 species; viz. *communis* of America, *africana*, *benghalensis*, *erecta*, *virginica*, *longicaulis*, *mollis*, *tuberosa*, *vaginata*, *nudiflora*, *cucullata*, *japonica*, *spirata*; chiefly Indian, unless otherwise denoted by the name.

105. CALLISIA

Has one species; viz. *callisia repens*. S. America.

106. SYENA

Has one species; viz. *syena fluviatilis*. Guiana.

107. XYRIS

Has four species; viz. *indica*, *pauciflora* of Malabar, *americana*, *capensis*.

108. FUIRENA

Has one species; viz. *fuirena umbellata*. Surinam.

109. KYLLINGIA

Has eight species; viz. *monocephala*, *brevifolia*, *triceps*, *panicea*, *filiformis*, *umbellata*, *cyperina*, *incompleta*. Surinam, E. and W. Indies.

110. MAPANIA

Has one species; viz. *mapania sylvatica*. Guiana.

111. SCHOENUS, or *Base Cypress*,

Has 39 species; viz. *mariscus*, *junceus*, *mucronatus*, *pilosus*, *filiformis*, *striatus*, *capitellum*, *scariosus*, *nigricans*, *ferrugineus*, *fuscus*, *tristachyos*, *cuspidatus*, *aristatus*, *compar*, *flexuosus*, *capillaceus*, *ustulatus*, *spicatus*, *bobartia*, *stellatus*, *bulbosus*, *inanis*, *cephalotes*, *cyperoides*, *cyrnosus*, *glomeratus*, *cladium*, *effusus*, *restioides*, *surinamensis*, *thermalis*, *laevis*, *lanceus*, *albus*, *gracilis*, *setaceus*, *pusillus*, *capillaris*. Chiefly tropical.

112. CYPERUS, or *Greater Galangale*,

Has 76 species; viz. *minimus*, *setaceus*, *arenarius*, *prolifer*, *effusus*, *articulatus*, *marginatus*, *complanatus*, *texillis*, *compactus*, *monostachyos*, *distachyos*, *triflorus*, *nanus*, *filiformis*, *dubius*, *capitatus*, *niveus*, *pannonicus* of Austria, *mucronatus*, *laevigatus*, *squarrosus*, *nitens*, *polystachyos*, *conglomeratus*, *cruentus*, *aristatus*, *luzulae*, *confertus*, *viscosus*, *ligularis*, *glomeratus*, *imbricatus*, *maderas-patanus*, *castaneus*, *elegans*, *surinamensis*, *flavidus*, *flavescens*, *fuscus*, *virescens*, *difformis*, *jemenicus*, *strigosus*, *tenuis*, *tuberosus*, *pumilus*, *stoloniferus*, *compressus*, *pulcher*, *vegetus*, *albidus*, *rotundus*, *glaber*, *odoratus*, *esculentus*, *tenuiflorus*, *pangorei*, *denudatus*, *lanceus*, *longus*, *fastigiatus*, *canaliculatus*, *monti*, *iria*, *santonici*, *corymbosus*, *racemosus*, *haspan*, *elatus*, *distans*, *diphyllus*, *papyrus*, *flabelliformis*, *alternifolius*, *spathaceus*. Chiefly Arabia, C. of G. Hope, S. of Europe, and tropical.

113. SCIRPUS, or *Rush grass*,

Has 70 species; viz. *mutatus*, *spiralis*, *articulatus*, *plantagineus*, *nutans*, * *palustris*, *geniculatus*, *caricis*, * *caespitosus*, *bæthryon*, *campestris*, *capitatus*, *ovatus*, *astropurpureus*, *polytrichoides*, * *acicularis*, * *fluitans*, * *lacustris*, *glomeratus*, *arvensis*, *truncatus*, *laciniatus*, *membranaceus*, *pilosus*, *hystrix*, * *holoschoenus*, *australis*, * *romanus*, *nodosus*, *radiatus*, * *setaceus*, *supinus*, *natans*, *vaginatus*, *tristachyos*, *uncinatus*, *aristatus*, *autumnalis*, *diphyllus*, *fastigiatus*, *globulosus*, *globiferus*, *capillaris*, *trispicatus*, *lateralis*, * *triqueter*, *mucronatus*, *dichotomus*, *echinatus*, *retrofractus*, *ferrugineus*, *spadicens*, *anomalus*, *miliaceus*, * *maritimus*, *grossus*, *luzulae*, * *sylvaticus*, *corymbosus*, *aestivalis*, *squarrosus*, *dipsacus*, *junciformis*, *melchiamus*, *ciliaris*, *hottentotus*, *antarcticus*, *argenteus*, *menander*, *cephalotes*. S. Europe, E. and W. Indies, America. Of these *S. lacustris* is worthy of notice. It is thus described: Straw cylindrical, naked; spikes several, egg-shaped, on fruitstalks, terminating; calyx fringed, 3-cleft, middle segment awl-shaped. When fodder is exhausted, cattle will live upon this species. Cottages are sometimes thatched, and pack-saddles stuffed with it. Bottoms of chairs are very commonly made of this rush. If cut at one year old it makes the fine bottoms. Coarse bottoms are made of it at two years old; and such as are still older, mixed with the leaves of the iris *pecudacorus*, make the coarsest bottoms of all. Mats are likewise made either of the *scirpus lacustris* alone, or mixed with the aforesaid leaves. Goats and swine eat it, cows and sheep refuse it.

114. MIEGIA

Has one species; viz. *miegia maritima*. Cayenne.

115. ERIOPHORUM, or *Cotton Grass*,

Has six species; viz. *vaginatum*, *polystachyon*, an-

gustifolium, *virginicum*, *cyparinum*, *lypinum*. European, except the species called *virginicum*.

116. POMMEREULIA

Has one species; viz. *pommereulia cornucopise*. India.

117. NARDUS, or *Matt-grass*,

Has four species; viz. *stricta*, *aristata*, *indica*, *ciliaris*. Two first, Europe; two last, India.

118. LYGEUM

Has one species; viz. *lygeum spartum*. Spain.

119. CENCHRUS, or *Hedgehog-grass*,

Has ten species, viz. *lappaceus*, *capitatus*, *echinatus*, *tribuloides*, *ciliaris*, *setosus*, *geniculatus*, *hordeiformis*, *purpurescens*, *frutescens*. Generally hot climates.

ORDER II. DIGYNIA.

It is highly worthy of being remarked, that under this second order of the class of triandria in the Linnaean system are included a considerable number of the plants that are very valuable in agriculture, especially the grasses. This branch of botany, therefore, deserves the attention of those engaged in the culture of artificial grasses, and even of all persons in any way engaged in the cultivation of the soil. Several advantages result from being able to discriminate the particular grasses that naturally rise upon a field, and the name which they bear. A farmer or other cultivator of lands may thus, in the first place, be enabled to derive greater benefit from the perusal of publications upon the art on which he is engaged. In the next place, it is to be remarked, that some grasses rising spontaneously upon a soil indicate that it is of bad quality, or that it has been impoverished by severe cropping; whereas there are other grasses, which demonstrate, by their spontaneous growth, that the land is in excellent condition. It is of obvious utility to be able to discriminate such plants. It is also of importance, when artificial grasses have sprung up, to be able to discern the kinds to which they belong, and consequently to know whether the proper sorts of seed have been sown, and which of the sorts may have failed to spring up. For these and other reasons we shall give the botanical description, in as concise terms as possible, of a considerable number of the species of this order.

120. CORNUCOPLE, or *Horn-of-plenty grass*,

Includes two species; * *cucullatum*, with an awnless spike, and a scolloped cone; and * *alopecuroides*, with an awned spike received in a hemispherical cone.

121. MUHLENBERGIA

Has one species, viz. *diffusa*.

122. SACCHARUM, or the *Sugar Cane*,

Contains eleven species, viz. *teneriffæ*, *spontanum*, *japonicum*, *officinatum*, *polystachyon*, *arundinaceum*, *benghalense*, *repens*, *ravennæ*, *cylindricum*, *thunbergii*. Tropical.

123. PEROTIS

Has two species; viz. *latifolia*, and *polystachyle*. Tropical.

124. LEERSIA.

Four species; viz. *orizoides*, *virginica*, *monandra*, *hexandra*. Tropical.

125. PHALARIS, or *Canary-grass*.

Cal. 2; valves heeled, equal in length, including the corolla.

- canaricensis*. * 1. P. an awnless panicle nearly oval; spiked, boat-shaped, entire. Cor. 4-valved; the exterior valves spear-shaped and smooth; the interior woolly. Cultivated for its seeds, with which canary birds are fed. ☉.
- aquatica*. 2. P. panicle awnless, cylindrical, spike-formed; chaff boat-shaped, slightly toothed. Cor. 3; valves, the interior woolly, the exterior small, awl shaped. Egypt and Italy.
- capensis*. 3. P. panicle spiked, oval, husks entire; the straw knee-jointed, decumbent. C. of G. Hope. ☉.
- bulbosa*. * 4. P. panicle awnless, cylindrical, spike-formed; husks boat-shaped, toothed. Cor. 2, valves smooth; roots bulbous. ♀. Spain.
- nodosa*. * 5. P. panicle oblong; leaves rigid.
- dentata*. 6. P. spike panicle, cylindrical; husks serrated; straw knee-jointed. ☉. C. of G. Hope.
- phleoides*. * 7. P. panicle awnless, cylindrical, spike-formed; husks heeled, entire, rough like a file. Cor. 2, valves smoothish. ☉.
- arenaria*. * 8. P. panicle awnless, cylindrical, spike-formed; husks heeled, entire, fringed; stem branched. ☉.
- aspera*. 9. P. panicle awnless, cylindrical, spike-formed; husks heeled, bulging above. Cor. 2, valves smooth. ☉.
- utriculata*. 10. P. panicle oval, spike-formed; husks boat-shaped, the back dilated; the awn longer than the chaff. Italy. ☉.
- paradoxa*. 11. P. panicle awnless, oblong, spike-formed; husk boat-shaped, one-toothed. Cor. 2, valves smooth, small flowers as if bitten off below. India. ☉.
- hispida*. 12. P. spikes finger-like; chaff rough like a file; leaves oval. Japan.

126. PASPALUM.

Fifteen species, viz. dissectum, scrobiculatum, villosum, virgatum, paniculatum, stoloniferum, repens, hirsutum, kora, longiflorum, distichum, conjugatum, vaginatum, filiforme, decumbens. S. America, and E. Indies.

127. PANICUM, or *Panic grass*.

Cor. with 3 valves; the third valve very small. It is thus defined by *Withering*. Cal. 2-valved, 2-flowered.

- polystachyon*. 1. P. with tapering spikes, small envelopes of one flower, in fascicles bristly; the straw erect above, branched. India. ♂.
- sericeum*. 2. P. a tapering spike, covering bristly, hairy, single flowers; leaves plain. W. Indies. ☉.
- verticillatum*. * 3. P. spike cylindrical, rough when stroked downwards; partial involucrems with 2 bristles, and 1 floret.
- helvolum*. 4. P. spike tapering, small involucrems, single flowers, in bristly bunches. Seeds fibrous. ☉.
- glaucum*. 5. P. spike tapering, small involucrems, double flowers, with hairy fascicles. Seeds with undulated wrinkles. ☉.
- viride*. * 6. P. spike cylindrical, soft to the touch; partial involucrems, with 3 bristles and 1 floret.
- germanicum*. 7. P. a compressed compound spike, spicule congregated, small involucrems bristle-shaped, longer than the flower; spike-stalk shaggy. ☉.
- italicum*. 8. P. a compound spike with an interrupted nodding

base. Small spikes congregated. Small involucrems much longer than the flower. Cottony spike-stalk. ☉.

- * 9. P. spikes alternate and in pairs; little spikes subdivided; husks awned and rough strong hairs. Spike stalked, with five angles.
- * 10. P. spikes finger-like, knotty on the inside of *sanguinale* the base; flowers in pairs, without awns; sheath of the leaves dotted.
- * 11. P. spikes fingered, expanding soft hairs on *indactylon*. sides of the base, flowers solitary, roots with creeping runners.

To these are to be added the following species; setosum, * lanceolatum, stagninum, crus corvi, setigerum, colonum, fluitans, flavidum, dimidiatum, burmanni, hirtellum, pilosum, molle, fasciculatum, carthaginense, conglomeratum, interruptum, umbrosum, filiforme, ægyptiacum, ciliare, lineare, cimicinum, distachyon, squarrosum, hispidulum, compositum, elatius, dichotomum, ramosum, deustum, coloratum, repens, ischæmoides, remotum, aristatum, miliaceum, antidotale, notatum, muricatum, capillare, flexuosum, grossarium, acuminatum, rigens, fuscum, laxum, latifolium, flavescens, diffusum, oryzoides, clandestinum, arborecens, curvatum, virgatum, patens, trigonum, pollens, lanatus, arundinæceum, polygamum, glutinosum, brevifolium, radicans, tricoides, and divaricatum. Chiefly hot climates.

128. PHELEUM, or *Cat's-tail grass*.

Cal. 2-valved, sitting, strap shaped, lopped, ending in 2 dagger points, enclosing the cor.

1. P. spike egg-shaped, fringed; straw branched. *arenarium*
2. P. panicle cylindrical, spike-like; husks naked; *paniculatum*. straw sometimes branched.
3. P. spike cylindrical, very long; calyx fringed, *pratense*. and awned; straw upright.—This grass is represented by all travellers in America as the great support of cattle, &c. wherever meadows are found. It is there called *timothy-grass*. It is best adapted to clayey soils, moist loam, and especially peat. The seeds are to be had very clean dressed, at about one guinea a bushel.
4. P. spike cylindrical; straw ascending; leaves *nodosum*. slanting; root bulbous.
5. P. spike egg-cylindrical. *alpinum*.

129. ALOPECURUS, or *Foxtail-grass*.

Cal. 2-valved. Cor. 1 valve. Nect. none. Some kinds of this grass are very valuable.

1. P. spiked; straw upright. Cal. hairy. Cor. awn-*pratensis*. ed. This grass (meadow foxtail) has scarcely a superior for the use of the farmer. It is very early, and abides on the farm, when sown, for many years. It produces few seed-stalks. It is difficult to procure the seed in any degree of plenty, on account of an insect that feeds upon it and destroys it.
- * 2. P. spiked; straw upright; calyx not hairy; its *agrestis*. husks united at the base.
- * 3. P. straw upright; spike cylindrical; root bulbous. *bulbosus*.
- * 4. P. spiked; straw knee-jointed. *geniculatus*
- * 5. P. panicle spike-like. Cal. rough. Cor. awned. *monospe-*
- * 6. P. panicle spike-like. Cal. set with soft hairs. *liensis*. Cor. awned. To these may be added the following *panicews*. species, viz. indicus, capensis, and echinatus, being all foreign plants.

130. MILIUM, or *Millet*.

Cal. 2-valved, 1-flowered; valves nearly equal.
Cor. very short: summits pencil-shaped.

- lendergerum* 1. M. panicle spike-like; flowers with awns.
effusum. 2. M. flowers in panicles scattered; awnless. The foreign species are, *capense*, *punctuatum*, *compressum*, *digitatum*, *panicum*, *confertum*, *globosum*, *paradoxum*, *villosum*, and *ramosum*. *Globosum* is found in Japan. The rest tropical.

131. AGROSTIS, or *Bent-grass*.

Cal. 2-valved, 1-flowered, rather smaller than the cor.; outer petal smooth; summits set lengthways, with stiffish hairs.

It is otherwise described thus: Cal. 1-flowered, 2-valved, spear-shaped, acute, generally rough on the heel; longer than the cor. Cor. 2-valved; summits hairy.

Of the British species the following have awns:

- spicaventi*. * 1. A. cal. husks nearly equal; cor. valves equal; awn twice the length of the cal. fixed just beneath its point.
palustris. * 2. A. cal. husks equal. Cor. outer valve twice the length and breadth of the inner awn, shorter than the cor. fixed just beneath its point.
canina. * 3. A. cal. husks nearly equal; cor. valves very unequal. Awn twice as long as the cor. fixed just beneath its middle.
vincalis. * 4. A. cal. husks equal; cor. valves nearly equal; awn as long as the cor. fixed just beneath its middle.
pallida. * 5. A. cal. husks unequal; cor. inner valve hair-like, very short; awn rather longer than the cor. fixed beneath its middle.
alpina. * 6. A. cal. husks unequal; cor. without hairs at the base; awn twice the length of the blossom, fixed near its base.
littoralis. * 7. A. panicle spike-like; cal. awned.

The following British plants have no awns:

- alba*. * 8. A. panicle large spreading; cal. both valves serrulated on the heel.
nigra. * 9. A. panicle scattered, branches bare at the base; florets few; cal. inner valve smooth.
stolonifera. * 10. A. panicle compact; branches short, stiff, densely crowded with florets at the base; cal. inner valve smooth; outer one serrated upwards.—This is a water grass, and a very noxious plant. It grows upon poor wet loams and clay. When it is found in meadows or pasture lands, it is proof that the soil is either naturally poor, or has been rendered so by scourging crops.
maritima. * 11. A. panicle large, rather spreading; longer branches naked at the base, shorter crowded with florets; cal. inner valve smooth, outer serrulated upwards.
vulgaris. * 12. A. panicle spreading; branches bare at the base; florets numerous; cal. inner valve smooth, outer serrulated upwards; cor. inner valve but half the size of the outer; deciduous.
minima. * 13. A. cal. husks equal, blunt, smooth. To those are to be added the following foreign species; viz. *interrupta*, *spiciformis*, and *hirauta*, *panicea*, *miliacea*, *tenuiflora*, *bromoides*, *arundinacea*, *calamagrostis*, *seratina*, *rubra*, *stricta*, *ovata*, *matrella*, *rupestris*, *compressa*, *capillaris*, *hispida*, *scabra*, *anomala*, *diandra*,

sylvatica, *pumila*, *ciliata*, *capensis*, *tremula*, *virginica*, *pungens*, *spicata*, *mexicana*, *verticillata*, *coromandelina*, *tenacissima*, *purpurescens*, *indica*, *procera*, *linearis*, *lenta*, *stellata*. Chiefly of Japan, India, America, and S. of Europe.

132. AIRA, or *Hair-grass*.

Cal. 2-valved, 2-flowered, without any intervening substance between the florets.

- * 1. A. florets awnless; panicle expanding, smooth, *aquatica*. longer than the calyx; leaves flat.
* 2. A. leaves flat; panicle expanding; petals woolly *cæspitosa*. and awned at the base; awn straight, short.
* 3. A. leaves like bristles; straws almost naked; *flemosa*. panicles diverging; fruitstalks zigzag.
* 4. A. leaves like bristles; panicle slender and *com-montana*. pact; florets hairy and awned at the base; awn twisted and longer.
* 5. A. leaves like bristles; sheaths rough; flowers in *canescens*. a panicle; awn not longer than the cal.
* 6. A. leaves like bristles; sheaths smooth, angular, *præcox*. with furrows; panicle spike-like; awn taller than the cal.
* 7. A. leaves like bristles; sheaths smoothish, fur-*caryophyl-*rowed; panicle wide spreading when ripe; awns taller *lea*. than the cal.

To these add the species called *arundinacea*, *minuta*, *involutrata*, *pubescens*, of N. of Europe: *subspicata* and *alpina*, of the Alps: *antarctica* of N. Zealand: *chineseis*, of China: *setacea*.

133. MELICA, or *Melic*, or *Rope-grass*.

Cal. 2-valved, 2-flowered, with a little substance on a pedicle betwixt the florets; nect. 1 leaf; stamens dilated at the base.

- * 1. M. petals not fringed; panicle drooping, *undi-nutans*. vided.
* 2. M. panicle compact; flowers cylindrical; straw *cærulea*. without knots.
* 3. M. panicle thinly set; cal. with 2 florets, 1 her-*uniflora*. maphrodite, the other neutral. Add to these *ciliata*, *gigantea*, *geniculata*, *decumbens*, *racemosa*, *ramosa*, *capensis*, *minuta*, *papilionacea*, *altissima*. Chiefly of Cape of Good Hope.

134. POA, or *Meadow-grass*.

Cal. 2-valved, many-flowered; spikets egg-shaped; valves shining at the edge, rather acute.

- * 1. P. panicles spreading; spikets strap-shaped, 6-*aquatica*. flowered.
* 2. P. panicles with subdivided branches; spikets *distant*. 5-flowered; florets distant, blunt; cal. valve very unequal.
* 3. P. panicle spreading; spikets 5-flowered, smooth; *pratensis*. straw cylindrical; upright sheath; scale short and blunt. This is an excellent grass, when sown upon rich loams.
* 4. P. panicle spreading, very much branched; spi-*alpina*. kets 6-flowered, heart-shaped.
* 5. P. panicle spreading; spikets 4-flowered, pubes-*angustifo-*cent; straw cylindrical, upright; root-leaves doubled *lia*. together, very slender; sheaths smooth; sheath-scale short, lopped.
* 6. P. little spikes egg-shaped; florets smoothish; *bulbosa*. acute; straw upright, bulbous at bottom.
* 7. P. panicle spreading horizontally; branches in *annua*. pairs;

- pairs; spikets mostly 4-flowered; leaves flat; sheaths smooth.
- trivialis.* * 8. P. panicle spreading; spikets flowered, woody at the base; straw upright, rough; sheath-scale tapering to a point.—It is said that Mr Boys of Betsbanger in Kent has been the largest cultivator of this species in the kingdom, and sold large quantities of the seed; but gave it up for want of a demand. It is an excellent grass on good and sound and moist loams. It is accounted in Lombardy “the queen of meadow plants” (*la regina dell'erbe*), whether for dry pastures or water meadows; multiplying itself much by seed and little by the root; so that if attention be not paid to permit some seed to fall, its quantity will sensibly diminish. Excellent for all sorts of cattle.
- cristata.* * 9. P. panicle spike-like. Cal. husks rather hairy, 2 or 3 (rarely) 4-flowered, longer than the little fruit-stalk; petals awned, awn pointed.
- nemoralis.* * 10. P. panicle slender, open when in flower; spikets mostly 2-flowered, pointed, rough; straw feeble.
- minima.* * 11. P. cal. 1-flowered.
- rigida.* * 12. P. panicle spear-shaped, somewhat branched; branches alternate, pointing one way; fruitstalk bordered.
- rupestris.* * 13. P. panicle spear-shaped, branches alternate; cal. ribbed, 3 or 4-flowered; straw knee-jointed.
- maritima.* * 14. P. panicle compact, branched; branches in pairs; spikes oblong; florets blunt; leaves sharp, edges rolled in; straw cylindrical, slanting.
- compressa.* * 15. P. panicle compact; straw slanting, compressed.
- decumbens.* * 16. P. panicle close; outer petal hairy at the edge; straw lying down.
- glauca.* * 17. P. panicle open; spikets mostly 3-flowered; florets tapering to a point, woolly at the base; leaves awl-shaped.

To these add the species called *laxa* of Europe; *biflora*, of India; *hirta* and *ferruginea*, of Japan; *cili-anensis*, *nervata*, *trinervata*, *sudetica*, *rubens*, *anceps*, *flava*, *barbata*, *pilosa*, *palustris*, *glutinosa*, *prolifera*, *amabilis*, *eragrostis*, *badensis*, *cynosuroides*, *unioloides*, *racemosa*, *cyperoides*, *verticillata*, *abyssinica*, *capillaris*, *japonica*, *malabarica*, *chinensis*, *punctata*, *nutans*, *tenella*, *spinosa*, *sarmentosa*, *striata*, *amboynensis*, *viscosa*, *contracta*, *filiformis*, *disticha*, *bifaria*, *bromoides*, *spicata*, *divaricata*, *peruviana*, *glomerata*, *ciliaris*, *silu-mosa*. Chiefly of the warmer climates.

135. BRIZA, or Quaking-grass.

Cal. 2-valved, many-flowered; spikets 2-rowed; valve heart-shaped, blunt; the inner minute.

- minor.* * 1. B. spikets triangular; cal. longer than the florets.
- media.* * 2. B. spikets egg-shaped, forming a bunch.
- Add *virens*, of S. Europe; *geniculata* and *capensis*, of C. of Good Hope; and *eragrostis*, of S. Europe.

136. UNIOLA, or Sea-side Oats of Carolina,

Has three species, viz. *paniculata*, *nucronata*, *spicata*, of America or India.

137. DACTYLIS, or Cock's-foot grass.

Cal. 2-valved, many-flowered; valves broader on one side. Cor. 2-valved, inclosing the seed. Nectaries 2.

- stricta.* * 1. D. spikes terminating sometimes in pairs; florets not expanding; straw and leaves stiff and straight.

* 2. D. panicle crowded, pointing one way.—This *glomerata*. grass is cultivated to advantage on wet loams on a clayey marl bottom, upon which the finer grasses are apt to give way to the indigenous produce. If suffered to rise high, it is very coarse; but, when fed close, is a very valuable sheep-pasture. Women and children are said to make good earnings in gathering the seed at 4s. a bushel. Upon an English acre two bushels may be sown, with ten pounds of common red clover. When the clover wears out, the grass covers the land, and abides well in it. It grows well in winter.

Add the species *cynosuroides*, *cespitosa*, *littoralis*, *lævis*, *villosa*, *serrata*, *ciliaris*, *hispida*, *geniculata*, *brevifolia*, *lagopoides*, *pungens*, of America, India, and Africa.

138. CYNOSURUS, or Dogs-tail Grass.

Cal. 2-valved, many-flowered, equal; cor. 2-valved; 1 valve concave, longer. Nect. 2-leaved.

* 1. C. floral leaves, with winged clefts.—The crested *cristatus*. dogs-tail is highly spoken of in the Milanese. The Rev. Arthur Young speaks thus of it: “To judge from the appearance of the bents of this grass, in poor upland but moist pastures, a man would think it a very unpromising plant; but the rich marshes of Bridge-water and Boston; the famous pasturages of Paniton in Devonshire, and those close to Mr Buller’s castle near Leskeard in Cornwall; Mr Thorne’s bullock ground, on Dunstone bottom, near Tavistock; Mrs Williams’s at Little Malvern in Worcestershire, (which are among the richest pastures in the kingdom) all abound very greatly in this grass; in some of them it is the predominant herbage. Mr Marshall places it as the most prevailing plant in the best grass meadows of the vale of Pickering; some of which will feed a large cow from Mayday to Michaelmas. Very fortunately it abounds much with seed; so that I have had many bushels gathered in a season by poor women and children, at 1s. a pound, and laid down many acres of it successfully. Attention should be paid to its being ripe; for I once ordered eight bushels to be sown on eight acres, and it failed from deficiency in ripeness.”

2. C. floral leaves winged, segments awned.

3. C. floral leaves entire; spike nearly egg-shaped. The remaining species are the following: *calcutas*, of Cape of Good Hope; *crucæformis* of Europe; *paniculatus*, of C. of G. Hope; *lima* of Spain; *olurnis*, of Europe; *retroflexus*, *sphærocephalus*, *uniolæ*, *filiformis*, *monostachyos*, *coracanus*, *floccifolius*, *penicillatus*, *paspaloides*, *ægyptius*, *indicus*, *virgatus*, *aureus*.

139. FESTUCA, or Fescue grass.

Cal. 2-valved; spikes oblong, roundish; husks tapering to a point, or terminating in an awn.

- * 1. H. spikes upright, smooth. Cal. valves, one *en-bromoides* tire, the other tapering to an awn-like point.
- * 2. H. panicle spike-like, drooping. Cal. smaller, *myurus*. valve very minute; florets rough, awns very long.
- * 3. H. panicle compact, awned; straw four-corner-*rubra*. ed, almost naked; leaves bristle-shaped.—It flourishes best in a dry sandy soil. Cows, horses, and goats will eat it; but it is the favourite food of sheep: they prefer it before all other grass, and are said soonest to grow fat upon it; for, though small, it is succulent. The Tartars, who lead a wandering life, tending their

flocks and herds, always choose those spots where this grass abounds. Such may be its just character in the uncultivated wilds of nature; and as it prefers a dry soil, its growth is an indubitable indication of the salubrity of such places for flocks of sheep; but in a more rich and cultivated country, it is said to be of little value as a pasture grass, being extremely diminutive; nor will it remain long in the ground if sown, but will soon give place to more luxuriant grasses.

rubra. * 4. F. panicle rough; spikets 6-flowered, awned; floret at the end awnless; straw semi-cylindrical.

duriuscula. * 5. F. panicle oblong; spikes oblong, smooth; leaves bristle-shaped.—A very excellent grass for the agriculturist, as springing very early, being productive, and grateful to all kinds of cattle, and is found in most good meadows and pastures.

dimidiorum. * 6. F. panicle spike-like, pubescent; leaves thread-shaped.

glabra. * 7. F. panicle branched, upright, compact; spikets awl-shaped, 3-flowered, awned, smooth.

cambrica. * 8. F. panicle oblong, upright, branched, spikets awned, smooth; leaves flat, naked.

tenuifolia. * 9. F. leaves like bristles, rather long, upright; straw naked, spikets rough.

elatior. * 10. F. panicle upright; spikets scarcely awned, the outer ones cylindrical. It makes an excellent pasture, but requires a rich soil. Horses, cows, sheep, and goats eat it.

avitans. * 11. F. panicle branched, upright; spikets nearly sitting, cylindrical, awnless.—The seeds are small, but very sweet and nourishing. They are collected in several parts of Germany and Poland, under the name of *manna seeds*; and are esteemed a delicacy in soups and gruels, on account of their nutritious quality and excellent flavour. When ground to meal, they make bread very little inferior to that in common use from wheat. The bran, separated in preparing the meal, is given to horses that have the worms; but they must be kept from water for some hours afterwards. Geese are very fond of the seeds, and well know where to look for them. The plant affords nourishment to the *phalæna festuæ*. Horses and swine will run risks to get at it.

loliacea. * 12. F. spiked; spikets alternate, sitting, compressed, awnless.

decumbens. * 13. F. panicle upright; spikets nearly egg-shaped, awnless; cal. larger than the florets; straw lying down.

pinnata. * 14. F. spikets sitting; straw undivided; awn shorter than the blossoms.

sylvatica. * 15. F. spikets sitting; straw undivided; awn as long as the blossom. To these add the following species; viz. *tenella*, *pumila*, *amethystina*, *reptatrix*, *heterophylla*, *sciuroides*, *mioglumis*, *spadicea*, *scabra*, *fusca*, *pauciflora*, *cristata*, *miseria*, *indica*, *calycina*, *pungens*. Mild climates.

140. BROMUS, or Bromc-grass.

Cal. 2-valved; spikets oblong, cylindrical, 2-rowed; awn beneath the point. This genus includes 33 species; viz. *secalinus*, *multiflorus*, *mollis*, *pectinatus*, *lanceolatus*, *alopecurus*, *squarrosus*, *japonicus*, *bifidus*, *purgans*, *catharticus*, *inermis*, *asper*, *litoreus*, *ciliatus*, *sterilis*, *arvensis*, *geniculatus*, *tectorum*, *giganteus*, *rubens*, *scoparius*, *rigens*, *racemosus*, *triflorus*, *madritensis*, *rigidus*, *ramosus*, *gracilis*, *pinnatus*, *cristatus*, *distachyos*, *stipoides*. Chiefly European. The following are thus described.

VOL. IV. Part L

†

* B. panicle expanding; spikets egg-shaped; awn *polymorpha*.—Its merit or demerit in an agricultural view *phus* does not seem sufficiently ascertained. It is said to be disliked by farmers, as being in corn fields a troublesome weed, and in pastures and mowing grounds of little value, since it has generally shed its seed by the time of mowing, and produces very few root leaves.

* B. panicle drooping; spikets egg-shaped; awns *squarrosus*; straddling; panicle imbranched.

* B. panicle upright, ending abruptly; spikets *ob-erectus*. long, hairy, awned, about 5 florets in each; straws upright; leaves hard. A coarse grass, disliked by cattle, as are all the bromes. Properly a fescue, but has the habit of a brome.

* B. panicle diffuse, upright but open; spikets strap-*madritensis*-shaped, the middlemost in pairs; pedicles thickest at *sis*. the top.

* B. panicle drooping, rough; spikets hairy; awned; *asper*. leaves rough.

* B. panicle spreading; spikets oblong; florets two-*sterilis*. rowed; cal. taper-pointed; awns very long.

* B. panicle drooping; spikets egg-oblong. *arvensis*.

* B. panicle drooping; spikets four-flowered, shorter *giganteus*. than the awns.

* B. straw undivided; spikets alternate, nearly sit-*pinnatus*. ting; cylindrical, somewhat awned.

141. STIPA, or Feather-grass.

Cal. 2-valved, 1-flowered. Cor. outer valve ending in an awn; awn jointed at the base. This genus includes 11 species; viz. *pennata*, *junceae*, *capillata*, *aristella*, *paleacea*, *tenacissima*, *capensis*, *spicata*, *bicolor*, *avenacea*, *membranacea*. Europe, and Cape of Good Hope. The following is thus described.

* S. awns woolly.

pennata.

142. AVENA, or Oats.

Cal. 2-valved, many-flowered. Awn from the back of the cor. twisted. The genus includes 34 species; viz. *sibirica*, *elatior*, *stipiformis*, *aristoides*, *tristata*, *pallida*, *pennsylvanica*, *loeflingiana*, *brevis*, *alba*, *strigosa*, *orientalis*, *sativa*, *forskaeli*, *nuda*, *fatua*, *elephantina*, *sequitertia*, *lutea*, *tenuis*, *pubescens*, *sterilis*, *hispida*, *pratensis*, *versicolor*, *distichophylla*, *filiformis*, *spica*, *bromoides*. Chiefly C. of Good Hope and mild climates. The following are thus described.

A. panicle; cal. 3-flowered; male floret awned; *elatior*. hermaphrodite floret somewhat awnless. Cows, sheep, and goats eat it. The roots are sometimes very troublesome to the farmers in arable lands, producing a kind of squitch. It produces a large crop, but is unpalatable to cattle, especially to horses, as are the *avenæ* in general.

* A. panicle; cal. 3-flowered, shorter than the *re-nuda*. ceptacle; petals awned upon the back; the third floret awnless. This is nearly as good as the cultivated oat; it will make gruel or oat cake, and feed cattle, as well as that. Ray says it sells in Cornwall at the price of wheat.

* A. panicle; cal. 3-flowered, all the florets awned *fatua*. and hairy at the base. Horse, sheep, and goats eat it. The awns are used for hygrometers. Sometimes so prevalent amongst barley as almost entirely to choke it. It may be extirpated by repeated fallowing, or laying down the land in grass.

O

* A.

- pubescens.* * A. panicle spike-like; cal. 3-flowered; cor. bearded at the base; leaves flat, downy.
- flavescens.* * A. panicle loose; cal. 3-flowered, short, all the florets awned.
- pratensis.* * A. panicle spike-like; cal. 5-flowered.
- strigosa.* * A. panicle oblong, compact, pointing one way; florets in pairs, with 2 awns at the end, and a jointed awn on the back.

143. LAGURUS, or *Hare's-tail Grass.*

Cal. 2-valved, awn woolly. Cor. entire, petal with 2 awns at the end, and a twisted awn at the back. This genus includes one species; viz.

- ovatus.* * L. spike egg-shaped, awned.

144. ARUNDO, or *Reed.*

Cal. 2-valved. Cor. awnless, surrounded with down at the base. This genus includes 11 species; viz. *donax*, *phragmites*, *bifaria*, *benghalensis*, *tenax*, *karka*, *conspicua*, *epigejos*, *calamagrostis*, *colorata*, *arenaria*. Chiefly of warm climates, except the following, which are thus described.

- phragmites.* * A. cal. 5-flowered; panicle spreading.—The panicles are said to be used by the country people in Sweden to dye woollen green. The reeds are much more durable than straw for thatching: Screens to keep off the cold winds in gardens are made of them; and they are laid across the frame of wood-work as the foundation for plaster floors.
- epigejos.* * A. cal. 1-flowered; panicle upright; leaves smooth underneath.
- calamagrostis.* * A. cal. 1-flowered, smooth; blossoms woolly; straw branched.
- arenaria.* * A. cal. 1-flowered; leaves rolled in at the edges, sharp-pointed.

145. PAPPAPHORUM

Has one species; viz. *alopeuroideum*.

146. ARISTIDA, or *Oat-grass,*

Includes ten species; viz. *adscensionis*, *americana*, *gigantea*, *hystrix*, *vestita*, *plumosa*, *capensis*, *setacea*, *depressa*, *arundinacea*. Cape, and milder climates.

147. LOLIUM, *Darnel* or *Rye-grass.*

Cal. 1. leaf fixed, many-flowered; spikelets alternate. This genus includes five species; viz. *perenne*, *tenue*, *temulentum*, *masimum*, *distachyon*. The following are thus described:

- perenne.* * L. spike awnless; spikelets compressed, many-flowered, longer than the calyx.—It makes an excellent hay upon dry chalk or sandy soils. It is cultivated with advantage along with clover, and springs earlier than the other grasses, thereby supplying food for cattle at a season when it is most difficult to be obtained. Cows, horses, and sheep eat it. Goats are not fond of it. Though it succeeds best upon light soils, it will flourish on any land except stiff clay, and will grow even on that; but upon rich sands and loams it becomes not only a good spring grass, but if properly managed by due mixtures, turns out well as permanent pasture land; always, however, most valuable by being sheep fed, for which it is singularly adapted. It is worthy of remark, however, that there is reason to think that the common cultivated rye-grass has degenerated from its natural qualities; and that it is inferior in many respects, particularly in its duration, to the

rye-grass which grows naturally in the best British meadows and pastures.

- * L. spikes awned, compressed, many-flowered, not *temulca*-longer than the calyx; straw rough.—The seeds mixed *tum.* with bread corn produce but little effect, unless the bread be eaten hot; but if malted with barley, the ale soon occasions drunkenness.
- * L. spikelets awnless, rather shorter than the calyx; *arvense.* cal. 2-valved; straw smooth.—It is very injurious to a wheat crop, but may readily be avoided as it is sown along with the seed.
- * L. panicle undivided, pointing one way; spikelets *bromoides.* awned.

148. ROTTBOLLIA, or *Sea hard-grass.*

Cal. of 1 or 2 valves, egg-spear-shaped, flat. Florets alternate, on a zigzag spike-stalk. Cor. 2-valved, awnless. This genus includes 16 species; viz. *incurvata*, *filiformis*, *cylindrica*, *thomaca*, *repens*, *laevis*, *pilosa*, *compressa*, *hirsuta*, *cymbachne*, *celorachis*, *dimidiata*, *exaltata*, *corymbosa*, *muricata*, *sanguinea*. Chiefly of Europe and India. The following is thus described.

- * R. spike cylindrical, awl-shaped; cal. husk awl-*incurvata.* shaped, contiguous, divided into two.

149. ELYMUS, or *Line-grass.*

Cal. lateral, 2-valved, several together, many-flowered. This genus contains 12 species; viz. *arenarius*, *giganteus*, *sibiricus*, *tener*, *philadelphicus*, *canadensis*, *caninus*, *virginicus*, *striatus*, *europæus*, *caput medusæ*, *hystrix*. Chiefly of Europe and America. The following are thus described.

- * E. spike upright, compact; cal. woolly, longer than *arenarius.* the floret.—It resists the spreading of the loose sand on the sea shore. It is not capable of being formed into ropes as the *stipa tenacissima* is in Spain. Cows, horses, and goats eat it; sheep refuse it.
- * E. spike compact, leaning; spikelets upright without *caninus.* an involucre, the lowermost in pairs.
- * E. spike upright; spikelets 2 florets in each, as long *europæus.* as the calyx.

150. SECALE, or *Rye,*

Contains four species; viz. *cereale*, *villosum*, *orientale*, *creticum*.

151. HORDEUM, or *Barley.*

Cal. lateral, 2-valved, 1-flowered; three together. This genus includes ten species; viz. *vulgare*, *hexastichon*, *distichon*, *zeocriton*, *bulbosum*, *nodosum*, *murinum*, *secalinum*, *maritimum*, *jubatum*. The following are thus described.

- * H. lateral florets male, awned, smooth on the heel; *murinum.* involucre of the intermediate florets fringed. Sheep and horses eat it. It feeds the brown moth (*phalæna granella*), and the barley fly (*musca frit*).
- * H. lateral florets male, awnless; involucre bristle-*pratense.* shaped, rough. In moist meadows it produces a considerable quantity of hay, but is not to be recommended as one of the best grasses for the farmer.
- * H. lateral florets male, awnless; middle floret her-*mariti-* maphrodite, with a long awn.
- * H. all the florets hermaphrodite, awned: cal. *grow-sylvaticum* ing together at the base, shorter than the awns.

152. TRITICUM, or *Wheat.*

Cal. 2-valved, solitary, mostly 3-flowered; floret bluish.

bluntish. This genus includes 18 species; viz. aestivum, hybernum, compositum, turgidum, polonicum, spelta, monococcum, hispanicum, prostratum, pumilum, junceum, distichum, repens, maritimum, tenellum, unioloides, loliaceum, unilaterale. Of mild climates. The following are thus described:

junceum.
repens.

* T. Cal. 5-flowered, lopped; leaves edges rolled in.
* T. Cal. 4-flowered, awl-shaped, tapering to a point; leaves flat.—It is a most troublesome weed in arable lands, and can only be destroyed by fallowing in a dry summer. At Naples the roots are collected in large quantities, and sold in the market to feed horses; they have a sweet taste, something approaching to that of liquorice; when dried, and ground to meal, they have been made into bread in years of scarcity. The juice of them drank liberally is recommended by Boerhaave in obstructions of the viscera; particularly in cases of scirrhus liver and jaundice. Cattle are frequently found to have scirrhus livers in the winter, and they soon get cured when turned out to grass in the spring. Dogs eat the leaves to excite vomiting; horses eat them when young, but leave them when fully grown; cows, sheep, and goats eat them.

caninum.

* T. cal. pointed, mostly 4-flowered; awns longer than the cor.; spikets upright.

liaceum.

* T. spike simple, compressed; spikets egg-shaped, but pointed; cal. many-flowered.

153. LAPPAGO

Has one species, called racemosa. Europe, India, and Arabia.

ORDER III. TRIGYNIA.

154. ERIOCAULON, or *Net-work*,

Has eight species; viz. triangulare, quinquangulare, sexangulare, setaceum, decangulare, repens, fasciculatum, umbellatum. India, and S. America.

155. MONTIA, or *Small Water Chick-weed*.
Cal. 2 leaves. Cor. 1 petal, irregular. Caps. 1-celled, 2-valved. It has only one species, called * fontana.

156. PROSERPINACA.

One species, called palustris. Virginia.

157. HOLOSTEUM

Has five species; viz. cordatum, diandrum, succulentum, hirsutum, * umbellatum. Chiefly hot climates.

158. KOENIGIA.

One species, called islandica. Iceland.

159. POLYCARPON.

One species, called tetraphyllum. Europe.

160. DONATIA.

One species, called fascicularis. Ter. del Fuego.

161. MOLLUGO, or *African Chick-weed*,

Has five species; viz. oppositifolia, stricta, hirta, pentaphylla, verticillata. Hot climates.

162. MINUARTIA

Has three species; viz. dichotoma, campestris, montana. Spain.

163. QUERIA

Has three species; viz. hispanica, canadensis, trichotoma. The last of Japan.

164. LECHEA

Has three species; viz. minor and major, of Candia; verticillata of E. Indies.

In the class Triandria are

90 Genera, including 920 Species, of which 14 are found in Britain.

CLASSIS IV.

TETRANDRIA.

ORDO I. MONOGYNIA.

Sect. I. *Flores monopetali, monospermi, inferi.*

169. GLOBULARIA. Cor. 1-petalæ, irregulares. Sem. pappo nudis.

Sect. II. *Flores monopetali, monospermi, superi, aggregatæ.*

* 171. DIPSACUS. Cal. communis foliaceus. Recept. conicum, palaeaceum. Sem. columnaria.

* 172. SCABIOSA. Cal. communis. Recept. elevatum, subpalaeaceum. Sem. coronata, involuta.

173. KNAUTIA. Cal. communis oblongus. Recept. planum, nudum. Sem. apice villosa.

CLASS IV.

TETRANDRIA.

ORDER I. MONOGYNIA.

Sect. I. *Flowers with one petal, 1-seeded, inferior.*

G. or *Blue Daisy*. Cor. 1 petal, irregular; seed without down.

Sect. II. *Flowers monopetalous, 1-seeded, incorporated.*

* D. or *Teasel*. Cal. common, leafy. Receptacle conical, chaffy. The seeds columnar.

* S. or *Scabious*. The cal. common. The receptacle elevated, somewhat chaffy. The seed crowned, rolled inwards.

K. Cal. common, oblong. Receptacle flat, naked. Seeds with a woolly top.

O 2

174. ALLIONIA.

174. ALLIONIA. Cal. comm. triphyllus, 3-florus, proprius superus o. Sem. nuda.

† *Valeriana Sibirica. Boerhaavia tetrandra.*

Sect. III. *Flores monopetali, tetraspermi.*

188. MATTUSCHKEA. Cor. 4-fida hypocrateriformis. Cal. 4-partitus.

Sect. IV. *Flores monopetali, monocarpi, inferi.*

203. PYROSTRIA. Cor. campanulata. Cal. 4-dent. Drupa nucibus 8-fecta.

202. MYONIMA. Cor. tubulosa. Cal. integerrimus. Drupa nuce 4-locul. 4-sperma.

201. PETITIA. Cor. tubulosa. Cal. 4-dentat. Drupa nuce 2-locul.

210. AQUARTIA. Cor. rotata. Cal. subquadridus. Bacca polysperma.

190. ROUSSEA. Cor. campanulata. Cal. 4-phyll. Bacca 4-angul. polysperma.

209. CALLICARPA. Cor. tubulosa. Cal. 4-fidus. Bacca 4-sperma.

208. WALLEIA. Cor. tubulosa. Cal. 4-fid. Bacca 1-sperma.

211. WITHERINGIA. Cor. subcampanulata. Cal. obsolete 4-dentat. Pericarp. 2-locul.

205. AEGIPHILA. Cor. hypocraterif. Cal. 4-dentatus. Bacca 2-locul. Stylus semibifidus.

170. CEPHALANTHUS. Cor. infundibuliformis. Cal. 4-fidus. Caps. 4-locul. non dehiscens.

215. LASIOTOMA. Cor. infundibuliformis, fauce villosa. Cal. 5-fid. Caps. 1-locul. 2-sperma.

223. SCOPARIA. Cor. rotata. Cal. 4-partitus. Caps. 1-ocularis, 2-valvis.

224. CENTUNCULUS. Cor. rotata. Cal. 4-partitus. 1-ocularis, circumscissa.

* 222. PLANTAGO. Cor. refracta. Cal. 4-partitus. Caps. 2-ocularis, circumscissa.

213. POLYPREMUM. Cor. rotata. Cal. 4-phyllus. Caps. bilocularis, emarginata.

220. BUDDLEIA. Cor. campanulata. Cal. 4-fidus. Caps. 2-ocularis bisulca.

221. EXACUM. Cor. subcampanulata. Cal. 4-phyllus. Caps. 2-ocularis compressa.

212. MYRMECIA. Cor. tubulosa. Cal. 5-dentatus. Caps. 2-locul. polysperma.

214. LABATIA. Cor. subcampanulata. Cal. 4-phyll. Caps. 4-ocularis.

218. PENÆA. Cor. campanulata. Cal. 2-phyllus. Caps. 4-ocularis, 4-valvis.

219. BLÆRIA. Cor. subcampanulata. Cal. 4-partitus. Caps. 4-ocularis, angulis dehiscens.

† *Justicia pulcherrima, lycium tetrandrum, cordia tetrandra.*

Sect. V. *Flores monopetali, monocarpi, superi.*

200. CHOMELIA. Cor. tubulosa. Cal. 4-fidus. Drupa nuce 2-locul.

204. CUNNINGHAMIA. Cor. infundibuliformis. Cal. 4-dentat. Drupa nuce 2-locul.

A. Cal. common, 3-leafed; 3-flowered; the proper superior wanting. Seed naked.

Sect. III. *Flowers monopetalous, 4-seeded.*

M. Cor. 4-cleft, salver-shaped. Cal. quadripartite.

Sect. IV. *Flowers monopetalous, one fruit-vessel, inferior.*

P. Cor. bell-shaped. Cal. 4-toothed. A drupe 8-seeded with nuts.

M. Cor. tubular. Cal. entire. A drupe with a nut, and 4 cells and 4 seeds.

P. Cor. tubulosa. Cal. 4-toothed. A drupe with a 2-celled nut.

A. Cor. wheel-shaped. Cal. nearly 4-cleft. A berry many-seeded.

R. Cor. bell-shaped. Cal. 4-leafed. A berry 4-angular, many-seeded.

C. or *Tonsonia*. Cor. tubulosa. Cal. 4-cleft. Berry 4-seeded.

W. Cor. tubulosa. Cal. 4-cleft. Berry 1 seed.

W. Cor. nearly bell-shaped. Cal. obscure, 4-toothed. Seed-vessel 2-celled.

A. Cor. salver-shaped. Cal. 4-toothed. Berry 2-celled. Style half-cleft.

C. or *Button-wood*. Cor. funnel-shaped. Cal. 4-cleft. Caps. 4-celled; not wide.

L. Cor. funnel-shaped, with a woolly mouth. Cal. 5-cleft. Caps. 1-celled, 2-seeded.

S. Cor. wheel-shaped. Cal. 4-parted. Caps. 1-celled, 2-valved.

C. or *Base Pimpernel*. Cor. wheel-shaped. Cal. 4-cleft. Caps. 1-cell, cut round.

* P. or *Plantain*. Cor. bent back. Cal. 4-cleft. Caps. 2-celled, cut round.

P. or *Carolina Flax*. Cor. wheel-shaped. Cal. 4-leaved. Caps. 2-cells, notched.

B. Cor. bell-shaped. Cal. 4-cleft. Caps. 2-celled, 2-furrowed.

E. Cor. nearly bell-shaped. Cal. 4-leaved. Caps. 2-celled, compressed.

M. Cor. tubulosa. Cal. 5-toothed. Caps. 2-celled, many-seeded.

L. Cor. nearly bell-shaped. Cal. 4-leaved. Caps. 4-celled.

P. Cor. bell-shaped. Cal. 2-leaved. Caps. 4-celled, 4-valved.

B. Cor. nearly bell-shaped. Cal. 4-partite. Caps. 4-celled, with open angles.

Sect. V. *Flowers monopetalous, 1 seed-vessel, superior,*

C. Cor. tubulosa. Cal. 4-cleft. A drupe with a 2-celled nut.

C. Cor. funnel-shaped. Cal. 4-cleft. A drupe with a 2-celled nut.

182. *SCOLOSANTHUS*. Cor. tubulosa, limbo revolutus. Cal. 4-fid. Drupa 1-sperma.
195. *PAVETTA*. Cor. tubulosa. Cal. 4-dentatus. Bacca 1-sperma.
194. *IXORA*. Cor. tubulosa. Cal. 4-partitus. Bacca 2-locularis. Sem. 2.
188. *PETESIA*. Cor. tubulosa. Cal. 4-dentatus. Bacca 2-locularis, polysperma.
193. *CATESBÆA*. Cor. tubulosa. Cal. 4-dentatus. Bacca 1-locularis, polysperma.
191. *FROELICHIA*. Cor. tubulosa. Cal. 4-partit. Bacca 1-sperma exsucca. Sem. arillatum.
199. *HOFFMANNIA*. Cor. tubulosa. Cal. 4-dentatus. Filamenta 0. Bacca 2-locul. polysperma.
196. *ERNODEA*. Cor. tubulosa. Cal. 4-partitus. Bacca 2-locul. Sem. solitaria.
197. *SIDERODENDRUM*. Cor. tubulosa. Cal. 4-dentatus. Bacca 2-locul. Sem. solitaria.
207. *COCCOPCYSILUM*. Cor. infundibulif. Cal. 4-fid. Bacca inflata 2-locul. polysperma.
206. *MITCHELLA*. Cor. 2, tubulosæ. Cal. 4-dentatus. Bacca 4-sperma, biflora, bifida.
176. *HEDYOTIS*. Cor. tubulosa. Cal. 4-partitus. Caps. didyma, polysperma, apice dehiscens.
240. *OLDENLANDIA*. Cor. tubulosa. Cal. 4-partitus. Caps. didyma, polysperma, dehiscens inter dentes.
181. *HYDROPHYLAX*. Cor. infundibulif. Cal. 4-partit. Caps. angulata, 2-locul. dissepimentis contrariis. Sem. solitar.
216. *MANETTIA*. Cor. tubulosa. Cal. 8-phyllus. Caps. 1-locularis.
183. *CARPHALEA*. Cor. tubulosa, intus hirta. Cal. 4-fid. Caps. 2-locul. polysperma.
217. *BELLARDIA*. Cor. 4-fida. Cal. 4-fid. Caps. 2-locul. 2-partibil. polysperma.
- * 225. *SANGUISORBA*. Cor. plana supera. Cal. 2-phyllus inferus. Caps. 4-gona inter calycem et corollam.
- † *Coffea occidentalis*. *Bondeletia pilosa, virgata*. *Hillia tetrandra*. *Guettarda elliptica, membranacea*. *Portlandia tetrandra*.
- Sect. VI. *Flores monopetalis, dicocci, inferi.*
184. *HOUSTONIA*. Cor. tubulosa. Cal. 4-dentatus. Caps. 2-locularis, 2-valvis.
- Sect. VII. *Flores monopetalis, dicocci, superi. Stellata.*
- * 187. *RUBIA*. Cor. campanulata. Fructus baccati.
- * 185. *GALIUM*. Cor. plana. Fructus subglobosi.
- * 179. *ASPERULA*. Cor. tubulosa. Fructus subglobosi.
- * 178. *SHERARDIA*. Cor. tubulosa. Fructus coronatus. Sem. 3-dentatis.
177. *SPERMACOCE*. Cor. tubulosa. Fructus coronatus. Sem. 2-dentatis.
182. *KNOXIA*. Cor. tubulosa. Fructus bipartibilis sulcatus.
- S. Cor. tubulous, with a border rolled back. Cal. 4-cleft. A drupe with 1 seed.
- P. Cor. tubulous. Cal. 4-toothed. A berry with 1 seed.
- I. or *American Jessamine*. Cor. tubulous. Cal. 4-partite. A 2-celled berry; 2 seeds.
- P. Cor. tubulous. Cal. 4-toothed. A 2-celled berry, many-seeded.
- C. or *Lily Thorn*. Cor. tubulous. Cal. 4-toothed. A berry with 1 cell, many seeds.
- F. Cor. tubulous. Cal. 4-partite. Berry 1 dry seed. Seed coated.
- H. Cor. tubulous. Cal. 4-cleft; no filaments. A berry with two cells and many seeds.
- E. Cor. tubulous. Cal. 4 cleft. A 2-celled berry, 1 seed.
- S. Cor. tubulous. Cal. 4-toothed. A berry with 2 cells; 1 seed in each.
- C. Cor. funnel-shaped. Cal. 4-cleft. A berry inflated, with 2 cells and many seeds.
- M. Cor. double, tubulous. Cal. 4-toothed. A berry 4-seeded, double-flowered, cleft.
- H. Cor. tubulous. Cal. 4-partite. Caps. double; many seeds; with an open top.
- O. Cor. tubulous. Cal. 4-partite. Caps. double; many seeds; opening between the teeth.
- H. Cor. funnel-shaped. Cal. 4-partite. Caps. angular, 2-celled, with opposite partitions. The seeds solitary.
- M. Cor. tubulous. Cal. 8-leaved. Caps. 1 cell.
- C. Cor. tubulous, rough-haired within. Cal. 4-cleft. Caps. 2 cells, many seeds.
- B. Cor. 4-cleft. Cal. 4-cleft. Caps. 2-celled, divisible into two. Many seeds.
- * S. or *Greater Wild Burnet*. Cor. flat above. Cal. 2-leaved; bent downwards. Caps. 4-gonous between the cal. and the cor.
- H. Cor. tubulous. Cal. 4-toothed. Caps. 2-celled; 2-valved.
- Sect. VII. *Flowers monopetalous, 2 capsules united, each with one cell, superior. Starlike.*
- * R. or *Madder*. Cor. bell-shaped. Fruit a berry.
- * G. or *Ladies Bed-straw*. Cor. flat. Fruit nearly round.
- * A. or *Wood-roof*. Cor. tubulous. Fruit nearly round.
- * S. or *Little Field-madder*. Cor. tubulous. Fruit crowned. Seed 3-toothed.
- S. or *Butter-weed*. Cor. tubulous. Fruit crowned. Seed 2-toothed.
- K. Cor. tubulous. Fruit divisible; furrowed.

185. DIODIA. Cor. tubulosa. Fructus tetragonus, conatus, 2-valvis.
186. CRUCIANELLA. Cor. tubulosa, aristata. Fructus nudus. Sem. linearia.

Sect. VIII. *Flores monopetalis, tetracocci, inferi.*

189. SIPHONANTHUS. Cor. tubulosa. Cal. 5-partitus. Baccæ 4, 1-spermae.

Sect. IX. *Flores tetrapetalis, inferi.*

175. OPERCULARIA. Cor. 4 s. 5-fida. Stam. receptaculo inserta. Semina solitaria receptaculo immersa.

- D. Cor. tubulosus. Fruit 4-cornered, united at the base, 2-valved.
C. or *Petty Madder*. Cor. tubulosus, awned. Fruit naked. Seed strap-shaped.

Sect. VIII. *Flowers monopetalous, with 4 capsules united, each with 1 cell, inferior.*

- S. Cor. tubulosus. Cal. 5-partite; 4 berries, one seed in each.

Sect. IX. *Flowers four-petaled, inferior.*

- E. 4 honied petals, incumbent. Cal. 4-leaved. A pod with 1 cell.
P. or *Shrub Trefoil*. The petals leather-like. Cal. 4-partite. Two stigmas. Seed-vessel 1-seeded.
B. Petals oblong. Cal. 4-toothed. Stigma single. A 1-seeded berry.
S. Petals concave. Cal. 4-partite. A berry, 4-seeded.
M. Petals strap-shaped. Cal. 4-cleft. Berry 2-celled.
S. Petals with a pitted base. Cal. 4-partite. A roundish drupe. Stigma funnel-shaped.
H. Pet. expanding. Cal. 5-cleft. A drupe with a nut and 2 seeds.
C. or *Hassagay-trees*. Pet. obtuse. Cal. 4-partite. A drupe, and 4 or 5 cells.
F. The petals shorter than the stamens. Cal. 4-cleft. Caps. 4-valved, 1 seed.
O. Pet. spear-shaped. Cal. 4-partite. Stigma sitting. Caps.
O. Pet. spear-shaped. Cal. 4-partite. The stigma with a head. Caps.
A. Pet. rarely present. Cal. tubulosus, 8-toothed. Caps. 4-celled.

Sect. X. *Flowers four-petaled, inferior.*

- T. or *Floating Water Caltraps*. Cal. 4-partite. A nut armed with opposite conical thorns.
C. Cal. surrounding the seed-bud. A berry with 1 seed.
G. Cal. 4-toothed. A drupe with a nut, and 1 seed.
* C. or *Dogwood, or Cornel-cherry*. Cal. 4-toothed, deciduous. A drupe with a 2-celled nut.
L. or *Base Virginian Loosestrife*. Cal. 4-partite. Caps. 4-celled, 4-cornered.
S. or *Sanders*. Cor. 4. Pet. fixed in the cal. A berry with 1 seed.

Sect. XI. *Flowers incomplete, inferior.*

- S. Cor. 4-cleft. A berry with 1 seed, dry. Nectary with 8 glands.
O. Cor. 4 or 5-cleft. The stamens inserted in the receptacle. The seed solitary, sunk in the receptacle.

165. PROTEA. Cor. 4-fida. Antheræ infra apices corollæ insertæ. Nux 1-sperma.

167. RUPALA. Cor. 4-petala. Stamina medio petalorum inserta. Bacca 1-sperma.

166. BANSKIA. Cor. 4-petala. Stamina limbo inserta. Caps. 2-valvis, 2-sperma. Semina alata.

168. EMBOTHRUM. Cor. 4-petala. Stam. limbo inserta. Folliculus polyspermus. Sem. alata.

245. POTHOS. Cor. 4-petala. Spatha 1-phylla. Bacca 2-locul.

253. KRAMERIA. Cor. 4-petal. Bacca sicca 2-sperma echinata.

255. RIVINA. Cor. 4-petala. Bacca 1-sperma. Sem. scabrum.

248. CHLORANTHUS. Petalum 3-lobum. Bacca 1-sperma.

256. SALVADORA. Cal. 4-fidus. Bacca 1-sperma. Sem. arillatum.

257. CAMPHOROSMA. Cal. 4-fidus. Caps. 1-sperma.

258. ALCHEMILLA. Cal. 4-fidus. Sem. 1, calyoe inclusum.

244. DORSTENIA. Cal. recept. planum, carnosum, commune.

246. CORNETES. Umbella 4-phylla, 3-flora. Caps. 3-cocca.

† *Corchorus coreta. Convallaria bifolia. Ammannia.*

Sect. XII. Flores incompleti superi.

250. GONATOCARPUS. Cor. 4-fida. Drupa nuce 1-sperma.

254. ACÆNA. Cal. 4-phyllus. Bacca echinata 1-sperma.

242. ISNARDIA. Cal. campanulatus, persistens. Caps. 4-locularis.

249. ELÆAGNUS. Cal. campanulatus, deciduus. Drupa.

† *Thesium Alpinum.*

ORDO II. DIGYNIA.

260. BUFONIA. Cor. 4-petala. Cal. tetraphyllus. Caps. 1-locularis, 2-valvis, 2-sperma.

263. HYPECOUM. Cor. 4-petala, inæqualis. Cal. 2-phyllus. Siliqua.

261. HAMAMELIS. Cor. 4-petala longissima. Cal. duplex. Nux 2-locularis bicornis.

* 262. CUSCUTA. Cor. 4-fida, ovata. Cal. 4-fidus. Caps. 2-locularis circumscissa.

264. NERTERIA. Cor. campanulata. Cal. o. Bacca 2-locul.

265. GALOPINA. Cor. campanulata. Cal. o. Sem. 2 muricata.

259. CRUZITA. Cor. o. Cal. 4-phyllus, exterior 3-phyllus. Sem. 1.

† *Herniaria fruticosa. Gentena quadrifida. Swertia corniculata dichotoma.*

P. or *Silver-tree*. Cor. 4-cleft. The anthers inserted below the points of the cor. A nut, 1 seed.

R. Cor. with 4 petals. The stamens inserted in the middle of the petals. A berry with 1 seed.

B. Cor. with 4 petals. The stamens inserted in the border. Caps. 2-valved, 2-seeded; the seeds winged.

E. Cor. with 4 petals. The stamens inserted in the border. An air-bag, many-seeded; seeds winged.

P. or *Scunkweed*. Cor. with 4 petals. Sheath 1-leaved. A berry with 2 cells.

K. Cor. 4-petaled. A dry berry, 1 seed, prickly.

R. Cor. 4-petaled. A berry with one seed. Seed rough.

C. or *Tea-leaved Chulan*. Pet. 3-lobed. A berry with 1 seed.

S. Cal. 4-cleft. A berry with one seed. Seed coated.

C. Cal. 4-cleft. Caps. 1 seed.

A. or *Ladies Mantle*. Cal. 4-cleft. Seed 1, in the calyx.

D. or *Contragerva*. Cal. and receptacle flat, fleshy, common.

C. an umbel 4-leaved, 3-flowered. Caps. 3-celled.

Sect. XII. Flowers incomplete, superior.

G. Cor. 4-cleft. A drupe with a 1-seeded nut.

A. Cal. 4-leaved. A prickled 1-seeded berry.

I. Cal. bell-shaped, permanent. Caps. 4-cleft.

E. or *Oleaster*, or *Wild-olive*. Cal. bell-shaped, deciduous. A drupe.

ORDER II. DIGYNIA.

B. or *Toadgrass*. Cor. 4-petaled. Cal. 4-leaved. Caps. 1 cell, 2 valves, 2 seeds.

H. Cor. 4-petaled unequal. Cal. 4-leaved. A ped.

H. or *Witch-hazel*. Cor. 4-petaled, very long. Cal. double. A nut, 2-celled, 2-horned.

* C. or *Dodder*. Cor. 4-cleft, oval. Cal. 4-cleft. Caps. 2-celled, cut round.

N. Cor. bell-shaped. No cal. A berry with 2 cells.

G. Cor. bell-shaped. No cal. A seed, thorny on two sides.

C. No cor. Cal. 4-leaved. On the outside 3-leaved. Seed 1.

ORDO

ORDO III. TRIGYNIA.

266. BOSCIA. Cor. 4-petala. Cal. 4-dentatus. Caps. 4-locularis.

ORDO IV. TETRAGYNIA.

267. ILEX. Cor. 1-petala. Cal. 4-dentatus. Bacca 4-sperma.

268. COLDENIA. Cor. 1-petala. Cal. 4-phyllus. Sem. 2, bilocularia.

271. SAGINA. Cor. 4-petala. Cal. 4-phyllus. Caps. 4-locularis, polysperma.

272. TILLÆA. Cor. 3 s. 4-petala. Cal. 3 s. 4-phyllus. Caps. 3 s. 4, polysperma.

273. MYGINDA. Cor. 4-petala. Cal. 4-partitus. Drupa 1-sperma.

269. POTAMOGETON. Cor. o. Cal. 4-phyllus. Sem. 4, sessilia.

270. RUPPIA. Cor. o. Cal. o. Sem. 4, pedicellata.

ORDER III. TRIGYNIA.

B. Cor. 4-petaled. Cal. 4-toothed. Caps. 4-celled.

ORDER IV. TETRAGYNIA.

I. or *Holly*. Cor. 1-petaled. Cal. 4-toothed. A berry, 4-seeded.

C. Cor. 1-petaled. Cal. 4-leaved. Two seeds, 2-celled.

S. or *Pearlwort*. Cor. 4-petaled. Cal. 4-leaved. Caps. 4-celled, many seeds.

T. or *Small Annual Houseleek*. Cor. 3 or 4-petaled. Cal. 3 or 4-leaved. Caps. 3, or 4, many seeds.

M. Cor. 4-petaled. Cal. 4-partite. A drupe with 1 seed.

P. No cor. Cal. 4-leaved. Seeds 4, sitting.

R. or *Sea or Tassel-grass*. No cor. No cal. Seeds 4, on a pedicle.

ORDER I. MONOGYNIA.

165. PROTEA, or *Silver-tree*.

Cor. 4-cleft. The anthers strap-shaped, inserted in the petals beneath the apex. No proper calyx. A nut. One seed.

decumbens 1. P. with leaves 3-cleft, thread-shaped; the stem decumbent. C. of G. Hope. h.

florida 2. P. with leaves 3-cleft, winged, thread-shaped; stem erect, with solitary little heads, surrounded by leaves. C. of G. Hope. h.

cyanoides 3. P. with leaves 3-cleft, winged, thread-shaped; stem erect, naked, solitary, little heads. C. of G. Hope. h.

patula 4. P. with leaves 3-cleft, thread-shaped; erect stem, little heads incorporated. C. of G. Hope. h.

pulchella 5. P. with leaves double-winged, smooth, thread-shaped, with terminal heads, club-shaped, without floral leaves. New Holland. h.

sphaerocephala 6. P. with double-winged thread-shaped leaves; fruit-stalks shorter than the tops, with the scales of the cal. oval, woolly at the base. C. of G. Hope. h.

serraria 7. P. with double-winged, thread-shaped, hairy leaves; fruit-stalks longer than the tops; with the scales of the cal. egg-spear-shaped and hairy. C. of G. Hope. h.

triternata 8. P. with double-winged, thread-shaped, smooth leaves. The fruit-stalks longer than the head, with the scales of the cal. spear-shaped and hairy. C. of Good Hope. h.

glomerata 9. P. with double-winged thread-shaped leaves; and naked, common, elongated fruitstalk; the pedicles longer than the knobs. C. of G. Hope. h.

phyllicoides 10. P. with double-winged thread-shaped leaves; and terminal knobs, solitary, and cottony. C. of G. Hope. h.

11. P. with double-winged thread-shaped leaves; *lagopus*. and aggregate knobs in spikes. C. of G. Hope. h.

12. P. with double-winged thread-shaped leaves; *spicata*. and heads spiked and distinct. C. of G. Hope. h.

13. P. with double-winged inferior leaves; the *su-sceptum*. perior being 3-cleft and entire. C. of G. Hope. h.

14. P. with smooth 5-cleft leaves; stem erect; and *crinita*. terminal heads by three's. C. of G. Hope. h.

15. P. with 5-toothed smooth leaves; stem erect, and *conocarpa*. a terminal head. C. of G. Hope. h.

16. P. with 3-toothed, smooth, elliptical leaves; *elliptica*. erect stem and terminating heads. C. of G. Hope. h.

17. P. with 3-toothed smooth leaves, a decumbent *hypophylla*. stem and terminal head. C. of G. Hope. h.

18. P. with 3-toothed smooth leaves and lateral heads. *cucullata*. C. of G. Hope. h.

19. P. with 3-toothed cottony leaves. C. of *Good tomentosa*. Hope. h.

20. P. with 4-toothed entire leaves, and stem decum- *hetero-* bent. C. of G. Hope. h. *phylla*.

21. P. with thread-shaped leaves, and flowers bunchy *pinifolia*. and smooth; cal. not double. C. of G. Hope. h.

22. P. with leaves thread-shaped; flowers cottony, *racemosa*. in bunches with a double cal. C. of G. Hope. h.

23. P. with leaves thread-shaped, bent inwards, and *incurva*. smooth, and bunchy spiked cottony knobs. C. of G. Hope. h.

24. P. with hairy thread-shaped leaves, and sitting *caudata*. spiked heads or knobs. C. of G. Hope. h.

25. P. with thread-shaped channelled leaves, a ter- *bracteata*. minal knob, and many-cleft floral leaves. C. of G. Hope. h.

26. P. with inferior thread-shaped leaves, the supe- *comosa*. rior spear-shaped, and a terminal or terminating knob. C. of G. Hope. h.

27. P. with strap-shaped, bent-back leaves, crooked *purpurea*. terminal

- terminal knobs, and decumbent stem. *h.* C. of G. Hope.
- prolifera.* 28. P. with awl-shaped compressed leaves, and a flower-bearing stem. *h.* C. of G. Hope.
- corymbosa.* 29. P. with strap-awl-shaped contiguous leaves, and little flat-topped branches in whirls. *h.* C. of G. Hope.
- nana.* 30. P. with strap-awl-shaped leaves, a terminal knob and coloured calyx. *h.* C. of G. Hope.
- lanata.* 31. P. with contiguous 3-square leaves, and a woolly terminal knob. *h.* C. of G. Hope.
- torta.* 32. P. with oblique, strap-shaped, obtuse leaves. *h.* C. of G. Hope.
- alba.* 33. P. with strap-shaped, silky, cottony leaves. *h.* C. of G. Hope.
- aulacea.* 34. P. with strap-battledore-shaped, smooth leaves; flowers in bunches; single calyx. *h.* C. of G. Hope.
- umbellata.* 35. P. with strap-battledore-shaped, smooth leaves; terminal knobs, many-cleft; floral leaves. *h.* C. of G. Hope.
- linearis.* 36. P. with strap-battledore-shaped smooth leaves; a cottony terminal knob. *h.* C. of G. Hope.
- cinerea.* 37. P. with strap-wedge-shaped silky leaves, and a silky terminal knob. *h.* C. of G. Hope.
- scolymus.* 38. P. with sharp spear-shaped leaves, and a round terminal knob or head. *h.* C. of G. Hope.
- abyssinica.* 39. P. with spear-shaped leaves, obtuse and slender at the base, and a hemispherical terminal knob. *h.* Abyssinia.
- mellisera.* 40. P. with strap-elliptical-shaped leaves, and an oblong terminal knob. *h.* C. of G. Hope.
- repens.* 41. P. with spear-elliptical-shaped smooth leaves, an oval knob, and short decumbent stem. *h.* C. of G. Hope.
- plumosa.* 42. P. with spear-wedge-shaped hoary leaves, an oblong terminal knob, petals smooth beneath, and hairy above. *h.* C. of G. Hope.
- obliqua.* 43. P. with strap-spear-shaped, callous, smooth, oblique leaves, and a terminal knob belonging to the stem. *h.* C. of G. Hope.
- parviflora.* 44. P. with elliptical obtuse, callous, oblique leaves, and smooth terminal heads of little branches. *h.* C. of G. Hope.
- pallens.* 45. P. with leaves spear-shaped, slender at the base, smooth, sharp, callous; and a terminal knob fenced with a pale cover. *h.* C. of G. Hope.
- conifera.* 46. P. with leaves spear-shaped, attenuate at the base, smooth, sharp, callous, and a terminal head, fenced with a long sharp cover of the same colour. *h.* C. of G. Hope.
- levisimus.* 47. P. with leaves inversely egg-shaped, obtusely tapering, tiled smooth, a hairy stem, and a head with an obtuse long covering. *h.* C. of G. Hope.
- strobilina.* 48. P. with elliptical leaves, blunt, callous, smooth, and a terminal knob. *h.* C. of G. Hope.
- imbricata.* 49. P. with leaves spear-shaped, smooth, scored, tiled, and a terminal knob. *h.* C. of G. Hope.
- sericea.* 50. P. with leaves spear-shaped; silky, thread-shaped branches; stem decumbent. *h.* C. of G. Hope.
- saligna.* 51. P. with spear-shaped silky leaves; a shrubby stem; and oblong enveloped knobs. *h.* C. of G. Hope.
- argentea.* 52. P. with leaves spear-shaped, silver-cottony, fringed, with woody stem and globular knobs. *h.* C. of G. Hope.

53. P. with leaves oblong and smooth; a globular *acaulis*. knob or head; and a short decumbent stem. *h.* C. of G. Hope.

54. P. with oblong smooth leaves; and aggregate *myrtifolia*. terminal knobs. *h.* C. of G. Hope.

56. P. with smooth oblong leaves without veins, a *glabra*. hemispherical knob, and a shrub-like stem. *h.* C. of G. Hope.

57. P. with oblong smooth leaves, an oblong knob, *speciosa*. the scales of the calyx barbed at the point. *h.* C. of G. Hope.

58. P. with oval, smooth, callous leaves; cor. hairy, *totta*. and cylindrical. *h.* C. of G. Hope.

59. P. with smooth, oval leaves; and lateral flowers. *hirta*. *h.* C. of G. Hope.

60. P. with oval leaves; and cottony terminal knobs. *pubera*. *h.* C. of G. Hope.

61. P. with hairy oval leaves, terminal knobs, and *divaricata* straddling branches. *h.* C. of G. Hope.

62. P. with smooth, battledore conical leaves. *h.* *spathulata* C. of G. Hope.

63. P. with leaves nearly round; and smooth leaf-*cyanaroides*. stalks. *h.* C. of G. Hope.

64. P. with heart-shaped leaves. *h.* C. of G. Hope. *cordata*.

166. BANKSIA.

Recept. common, elongated, scaly. Cor. 4 petals. The stamens inserted in the border. The caps. 2-valved, 2-seeded. A moveable partition between the seeds, which are winged.

Of this genus there are 8 species, viz. *serrata*, *grandis*, *integrifolia*, *pyriformis*, *dentata*, *spinulosa*, *ericæfolia*, *gibbosa*. N. Holland.

167. RUPALA.

This genus has two species; viz. *montana*, and *sesifolia*.

168. EMBOTHRIMUM.

Eight species; viz. *speciosissimum*, *coccineum*, *grandiflorum*, *umbellatum*, *hirsutum*, *buxifolium*, *sericeum*, *silaifolium*.

169. GLOBULARIA, or *Blue Daisy*.

Four species; viz. *longifolia*, *nana*, *nudicaulis*, *orientalis*. S. Eur.

170. CEPHALANTHUS, or *Button-wood*,

Has one species; viz. *occidentalis*. N. America.

171. DIPSACUS, or *Teasel*,

Has four species; viz. **fullonum*, **sylvestris*, *lacinatus*, and **pilosus*.

* D. leaves sitting, serrated; chaff bent backwards. *fullonum*.

It is cultivated for the use of the clothiers, who employ the heads with crooked awns, to raise the nap upon woollen cloths. For this purpose they are fixed round the circumference of a large broad wheel, which is made to turn round, and the cloth is held against them. The plant flowers in June and July, and the heads are collected in August. It is sometimes sown along with caraway and coriander; by which means three crops are on the soil at once, without inconvenience, as they ripen at different periods.

172. SCABIOSA, or *Scabious*.

Has 41 species; viz. *alpina*, *ustulata*, *rigida*, *attenuata*, *scabra*, *transylvanica*, *syriaca*, *leucanthia*, **succisa*, *integrifolia*, *amplexicaulis*, *humilis*, *decurrens*, *tatarica*,

tatarica, *arvensis, uralensis, sylvatica, graminifolia, *co-
umbaria, pyrenaica, sicula, rutæfolia, *maritima, stel-
lata, prolifera, atropurpurea, argentea, indurata, afri-
cana, monspeliensis, pumila, cretica, limonifolia, gra-
minifolia, lyrata, palestina, isetensis, ucranica, ochroleu-
ca, papposa, pteroccephala. S. Eur. Ind. Afr.

succisa. * S. blossoms 4-cleft, equal; stem undivided; branches
approaching; leaves spear-eggshaped.—The dried leaves
are used to dye wool yellow or green. (Linn.) A
strong decoction of it continued for a considerable
length of time, is an empirical secret for gonorrhœas.

arvensis. * S. blossoms 4-cleft, radiating; leaves wing-cleft, and
jagged; stem rough with strong hairs. Sheep and
goats eat this species. Horses and cows are not fond of
it. It is slightly astringent, bitter and saponaceous.

173. KNAUTIA,

Has four species; viz. orientalis, propontica, pale-
stina, and plumosa. Levant, Archipelago.

174. ALLIONIA,

Has two species; viz. violacea, and incarnata. Am.

175. OPERCULARIA,

Has three species; viz. umbellata, aspera, diphylla.
N. Holland.

176. HEDYOTIS,

Has 11 species; viz. fruticosa, racemosa, auricularia,
hispida, maritima, pumila, diffusa, herbacea, graminifolia,
virgata, rupestris. E. and W. Ind. S. Amer.

177. SPERMACOCE, or *Button-weed*,

Has 20 species; viz. tenuior, latifolia, cœrulescens,
alata, hexagona, prostrata, radicans, longifolia, verti-
cillata, sumatrensis, aspera, hirta, villosa, hipsida, sca-
bra, articularis, stricta, linifolia, procumbens, spinosa.
E. Ind. Afr. Amer.

178. SHERARDIA, or *Little Field-madder*,

Contains three species; viz. arvensis, muralis, fruti-
cosa. Eur. Isle of Ascension.

179. ASPERULA, or *Woodroof*,

Has seven species; viz. odorata, hexaphylla, arven-
sis, taurina, crassifolia, calabrica, aristata, tinctoria,
pyrenaica, cynanchica, lævigata. Eur.

odorata. A. leaves 8 in a whirl, spear-shaped; flowers in bun-
dles on fruitstalks. The scent of it is said to drive away
ticks and other insects. (Linn.) It gives a grateful
flavour to wine. Cows, horses, sheep, and goats eat it.

180. DIODIA,

Has 6 species; viz. virginica, simplex, verticillata,
prostrata, scandens, sarmentosa. Amer. Jamaica.

181. HYDROPHYLAX,

Contains only one species; viz. maritima.

182. KNOXIA,

Has under it two species; viz. zeylanica, and co-
rymbosa. Ceylon.

183. CARPHALEA,

Has one species; viz. corymbosa. Madagasear.

184. HOUSTONIA,

Has three species; viz. cœrulea, longifolia, and pur-
purea. N. America.

185. GALIUM, or *Ladies Bed-straw*,

Includes 50 species; viz. rubiodes, *palustre, trifi-
dum, fruticosum, *montanum, tinctorium, capense, mu-
cronatum, expansum, asperum, glabrum, austriacum,
*boconni, viscosum, saxatile, tenue, jussiei, pyrenaicum,

minutum, *pusillum, *acabrum, *verum, molle, syl-
vaticum, linifolium, rigidum, aristatum, hierosolymi-
tanum, paschale, glaucum, purpureum, rubrum, mega-
lopernum, spurium, hircynicum, *uliginosum, *ho-
reale, rotundifolium, bermudianum, ericoides, hirtum,
ruthenicum, aparine, *aparine, album, microcarpum,
parisiense, pilosum, maritimum, græcum. Eur. Arab.
N. Amer. Of these the following deserve notice.

* G. leaves 8 in a whirl, strap-shaped, furrowed; flower-
ing branches short.—The flowers will coagulate boiling-
milk; and their juice changes blue infusions to a red
colour, thereby discovering marks of acidity. The
French prescribe them in hysteric and epileptic cases.
Boiled in alum-water, they tinge wool yellow. The
roots dye a very fine red, not inferior to madder, and
are used for this purpose in the island of Jura. (Pen-
nant 1772. p. 212). Sheep and goats eat it. Horses
and swine refuse it. Cows are not fond of it. It is
subject to a disease, in which the stem and leaves are
set with fleshy balls, about the size of a pea, hollow
within and covered with a purplish skin.

* G. leaves 4 in a whirl, spear-shaped, smooth, 3-fibred; *boreale*.
stem upright.—The roots afford a red dye for woollens.

* G. leaves 8 in a whirl, spear-shaped; keel rough *aparine*.
with prickles pointing backwards; joints woolly.—The
branches are used by the Swedes instead of a soi to strain
milk. Young geese are very fond of them. The seeds
may be used instead of coffee. The plant is eaten by
horses, cows, sheep, and goats. Swine refuse it. (Linn.)
The expressed juice of the stem and leaves, taken to
the amount of four ounces night and morning, is very
efficacious in removing many of those cutaneous eruptions,
which are called, although improperly, scorbutic.
It must be continued for several weeks.

186. CRUCIANELLA, or *Petty madder*.

Nine species; viz. angustifolia, latifolia, ægyptiaca,
patula, ciliata, pubescens, maritima, capita, monspeli-
aca. S. Eur. Arab.

187. RUBIA, or *Madder*.

Seven species; tinctorum, or *dyers madder*, with an-
nual leaves and a prickly stem, χ ; chilensis, peregrina,
lucida, fruticosa, angustifolia, cordifolia. Siber.
S. Eur. Canar.

188. MATTUSCHKEA.

One species; viz. hirsuta. Carolina.

189. SIPHONANTHUS.

Two species; viz. indica, and angustifolia. India.

190. ROUSSEA.

One species; viz. simplex. Mauritius.

191. FROELICHIA.

One species; viz. paniculata.

192. SCOLOSANTHUS.

One species; viz. versicolor.

193. CATESBÆA, or *Lily Thorn*.

Two species; viz. spinosa, and parviflora. Jamaica,
Isle of Providence.

194. IXORA, or *American Jessamine*.

Six species; viz. coccinea, parviflora, alba, america-
na, fasciculata, and multiflora. E. Ind. Jam. S. Am.

195. PAVETTA.

Five species; viz. indica, villosa, longiflora, caffra,
pentandra. C. of G. Hope.

196. ERNODEA.
One species; viz. littoralis. Jamaica.
197. SIDERODENDRUM.
One species; viz. triflorum. S. Amer.
198. PETESIA.
Three species; viz. stipularis, carnea, tomentosa.
199. HOFFMANNIA.
One species; viz. pedunculata. Jamaica.
200. CHOMELIA.
One species; viz. spinosa.
201. PETITIA.
One species; viz; domingensis. St Domingo.
202. MYONIMA.
Two species; viz. obarata, lanceolata. Isle of Bourb.
203. PYROSTRIA.
One species; viz. salicifolia.
204. CUNNINGHAMIA.
Two species; viz. sarmentosa, verticillata. Guiana, Isle of Bourbon.
205. ÆGIPHILA.
Eight species; viz. martinicensis, elata, mixta, villosa, arborescens, hævis, foetida, trifida. W. Indies.
206. MITCHELLA.
One species; viz. repens. N. America.
207. COCCOCYPSILUM.
Three species; viz. repens, uniflorum, biflorum. Jam.
208. WALLENTIA.
One species; viz. laurifolia. Jamaica.
209. CALLICARPA, or *Johnsonia*.
Ten species; viz. americana, cana, lanata, macrophylla, ferruginea, reticulata, longifolia, integrifolia, villosa, japonica. N. Amer. Jap. Jamaica.
210. AQUARTIA.
Two species; viz. aculeata, microphylla. S. Am.
211. WITHERINGIA.
One species; viz. solanacea. S. Am.
212. MYRMECIA.
One species; viz. scandens. Guiana.
213. POLYPHREMUM, or *Carolina Flax*.
One species; viz. procumbens. N. Amer.
214. LABATIA.
Two species; viz. sessiliflora, pedunculata. Hispan.
215. LASIOSTOMA.
One species; viz. cirrhosa. Guiana.
216. MANETTIA.
Five species; viz. reclinata, lygistum, coccinea, picta, lanceolata. S. Amer. Jam.
217. BELLARDIA.
One species; viz. repens. Guiana.
218. PENEA.
Nine species; viz. sarcocolla, mucronata, marginata, lateriflora, tomentosa, sucata, squamosa, fruticulosa, myrtoides. C. of G. Hope.
219. BLERIA.
Nine species; viz. cricoides, scabra, fascicula, articulata, purpurea, muscosa, pusilla, glabella, ciliaris. Cape.
220. BUDDLEIA.
Nine species; viz. americana, occidentalis, globosa,

salvifolia, madagascariensis, salicifolia, diversifolia, virgata, incompta. Cape, S. Amer. W. Indies.

221. EXACUM.

18 species; viz. viscosum, pedunculatum, albens, aureum, sessile, cordatum, punctatum, quadrangulare, gujanense, diffusum, tenuifolium, * filiforme, apyllum, heteroclitum, spicatum, ramosum, verticillatum, lryssopifolium. Asia, Africa.

222. PLANTAGO, or *Plantain*.

33 species; viz. * major, crassa, asiatica, maxima, * media, virginica, altissima, * lanceolata, capensis, lagopus, lusitanica, patagonica, albicans, hirsuta, alpina, bellardi, cretica, barbata, * maritima, subulata, recurvata, macrorhiza, serraria, * coronopus, loeflingii, cornuti, amplexicaulis, psyllium, squarrosa, indica, pumila, cynops, afra. Eur. Egypt, China, N. Amer.
* P. leaves spear-shaped; spike nearly egg-shaped, *na-lanceolata* ked; stalk angular.—It is usually called rib-wort or rib-grass. Linnæus says it is eaten by horses, sheep, and goats, and that cows refuse it; but Haller attributes the richness of the milk in the famous Alpine dairies to this plant, and to the alchemilla vulgaris. The total absence of this plant in marshy lands, is a certain criterion of the wretched quality thereof: in proportion as such soils are meliorated by draining, this plant will flourish and abound. When sown for pasturage upon rich sands and loams, this plant gives a considerable herbage; and on poorer and drier soils, it does well for sheep, but is inferior to some others. Mr Marshall observes that it has stood the test of 20 years established practice, in Yorkshire, and is in good estimation, though not well affected by horses, and bad for hay from retaining its sap. The plantago major or great plantain, is called *septimervia*, from its having 7 large nerves or ribs running along each leaf; the narrow-leaved sort, above described, has only five ribs, and hence it is called *quinquenervia*. The leaves are lightly astringent, and the seeds are said to be so; and hence they stand recommended in hæmorrhagies and other cases of this kind, where medicines of this kind are proper. The leaves bruised a little are the common application of the common people to slight flesh wounds.

Plantain has been alleged to be a cure for the bite of the rattlesnake; but for this there is probably little foundation, although it is one of the principal ingredients in the remedy of the negro Cæsar, for the discovery of which he received a considerable reward from the assembly of S. Carolina.

223. SCOPARIA.

Three species; viz. dulcis, procumbens, arborea. Egypt, N. America.

224. CENTUNCULUS, or *Base Pimpernel*.

One species; called minimus. Germ. S. Eur.

225. SANGUISORBA, or *Great Wild Burnet*.

Three species; viz. * officinalis, media, canadensis. Europe, N. America.

226. CRISUS.

18 species; vitiginea, capensis, repanda, latifolia, cordifolia, rotundifolia, sicyoides, quadrangularis, acida, cirrhosa, trifoliata, microcarpa, crenata, carnea, obovata, japonica, pentaphylla, pedata. Arabia, Ind. Jam.

227. EPIMEDIUM, *Barren-wort*.

One species; viz. * alpinum.

228. *CORNUS*, or *Dogwood*, *Cornel Cherry*.
12 species; viz. * *suecica*, *canadensis*, *florida*, *mas-
cula*, *japonica*, * *sanguinea*, *alba*, *sericea*, *circinata*, *stri-
ata*, *paniculata*, *alternifolia*. Asia, Amer.
sanguinea * *C.* branches straight; leaves egg-shaped, green on
both sides; tuft flattened.—The wood is very hard and
smooth, fit for the purposes of the turner. The leaves
change to a blood-red in autumn: the berries are bit-
ter and styptic; they dye purple. Horses, sheep, and
goats eat it. Swine and cows refuse it.
229. *GLOSSOMA*.
One species; viz. *arborescens*. Guiana.
230. *SAMARA*.
Four species; viz. *laeta*, *coriacea*, *pentandra*, *flori-
bunda*. Cape, E. Ind. Jam. Guiana.
231. *FAGARA*.
12 species; viz. *triphylla*, *evodia*, *pterota*, *piperita*,
tragodes, *zanthoxyloides*, *horrida*, *capensis*, *armata*, *avi-
cennæ*, *octandra*, *elaphrium*. W. Ind. Japan.
232. *HARTOGIA*.
One species; viz. *capensis*. C. of G. Hope.
233. *MONETIA*.
Two species; viz. *barlerioides*, *diacantha*. E. Ind.
234. *BLACKBURNIA*.
One species; viz. *pinnata*.
235. *PTELEA*, or *Shrub Trefoil*.
One species; viz. *trifoliata*. N. Amer. S. sea isles.
236. *SKIMMIA*.
One species; viz. *japonica*. Japan.
237. *OTHERA*.
One species; viz. *japonica*. Japan.
238. *ORIXA*.
One species; viz. *japonica*.
239. *LUDWIGIA*, or *Base Virginian Loose-strife*.
Five species; viz. *alternifolia*, *hirsuta*, *jussiacoides*,
oppositifolia, *erigata*. India, Amer. Jam.
240. *OLDENLANDIA*.
13 species; viz. *verticillata*, *digynia*, *trinervia*, *de-
pressa*, *capensis*, *uniflora*, *biflora*, *pentandra*, *umbellata*,
corymbosa, *hirsuta*, *debilis*, *foetida*.
241. *AMMANIA*.
Seven species; viz. *latifolia*, *ramosior*, *debilis*, *sangui-
volenta*, *octandra*, *baccifera*, *pinnatifida*. Ind. Virginia.
242. *ISNARDIA*.
One species; viz. *palustris*. Eur. China, N. Amer.
W. Ind.
243. *TRAPA*, or *Floating Water-caltraps*.
Two species; viz. *natana*, *bicornis*. Eur. China.
244. *DORSTENIA*, or *Contrajerva*.
Ten species; viz. *cordifolia*, *brasiliensis*, *arifolia*,
houstoni, *contrajerva*, *drakena*, *caulescens*, *lucida*, *pu-
bescens*. Arab. S. Amer.
245. *POTHOS*, or *Skunk-weed*.
12 species; viz. *scandens*, *acaulis*, *lanceolata*, *cre-
nata*, *violacea*, *crassinervia*, *cordata*, *macrophylla*, *pin-
nata*, *palmata*, *digitata*, *pentaphylla*. Ind. Amer.
246. *COMETES*.
One species; viz. *alterniflora*. E. Ind. Surat.
247. *CURTISIA*, or *Hassagay-tree*.
One species; *faginea*. C. of G. Hope.
248. *CHLORANTHUS*, or *Tea-leaved Chu-lan*.
One species; viz. *inconspicuus*. Cape, China, Jap.
249. *ELEAGNUS*, or *Oleaster* or *Wild Olive*.
Ten species; viz. *angustifolia*, *orientalis*, *spinosa*,
pungens, *latifolia*, *crispa*, *multiflora*, *umbellata*, *glabra*,
macrophylla. S. Eur. China, Japan.
250. *GONATOCARPUS*.
One species; viz. *micranthus*. Japan.
251. *SANTALUM*, or *Sanders*.
One species; viz. *album*.—What is usually called
White Sanders wood, is brought from the East Indies,
in billets about the size of a man's leg, of a pale whitish
colour. It constitutes the outer part of the timber, or
that part of the tree which is nearest the bark. This
white part has little sensible smell or taste. The inner
part of the timber, which usually receives the appella-
tion of *Yellow Sanders wood*, is of a pale yellowish
colour, of a pleasant smell and a bitterish aromatic taste,
accompanied with an agreeable sort of pungency. Di-
stilled with water it yields a fragrant essential oil, which
thickens in the cold to the consistence of a balsam.
Digested in pure spirit it imparts a rich yellow tincture,
which being committed to distillation, the spirit arises
without bringing over any thing considerable of the
virtues of the sanders. The residuum contains the
virtues of six times its weight of the wood. Hoffman
looks upon this extract as a medicine of similar virtues
to ambergris, and recommends it as an excellent resto-
rative in great debilities.
252. *STRUTHIOLA*.
Five species; viz. *virgata*, *nana*, *juniperina*, *erecta*,
ovata. C. of G. Hope.
253. *KRAMERIA*.
One species; viz. *ixina*. S. Amer.
254. *ACÆNA*.
One species; viz. *elongata*. Mexico.
255. *RIVINA*.
Four species; viz. *humilis*, *lævis*, *brasiliensis*, *octan-
dra*. W. Indies.
256. *SALVADORA*.
One species; viz. *persica*. Persia, India.
257. *CAMPHOROSMA*.
Five species; viz. *paleacea*, *monspeliaca*, *acuta*, *gla-
bra*, *pteranthus*. S. Eur. Cape.
258. *ALGHEMILLA*, or *Ladies-mantle*.
Six species; viz. *capensis*, * *vulgaris*, * *alpina*, *pen-
taphylla*, *aphanoides*, *aphanes*. Alps of Eur.
* *A.* leaves gashed.—The whole of this plant is astringent.
gent. In the province of Smolandia in Gothland, they
make a tincture of the leaves, and give it in spasmodic
or convulsive diseases. Horses, sheep, and goats eat it.
Swine refuse it. Cows are not fond of it.

ORDER II. DIGYNIA.

259. *CRUZITA*.
One species; viz. *hispanica*.

260. *BUFONIA*, or *Toad-grass*.
One species; viz. * *tenuifolia*.

261. HAMAMELIS, or *Witch Hazel*.

One species; virginica. Carolina, Virginia.

262. CUSCUTA, or *Dodder*.

Five species; viz. europea, americana, africana, monogynia, chinensis.

* C. flowers sitting, mostly 4-cleft.—The seeds of this species sown in a pot produce plants, but which soon die, unless they can attach themselves to some other plant. As soon as the shoots have twined about an adjoining plant, they send out from their inner surface a number of little vesicles or papillæ, which attach themselves to the bark or rind of the plant. By degrees the longitudinal vessels of the stalk, which appear to have accompanied the vesicles, shoot forth from their extremities and make their way to the foster plant, by dividing the vessels and insinuating themselves into the tenderest part of the stalk; and so intimately are they united with it, that it is easier to break than to disengage them from it.

263. HYPECOUM.

Four species, viz. procumbens, littorale, pendulum, erectum.

264. NERTERIA.

One species, viz. depressa. S. America.

265. GALOPINA.

One species; viz. circæoides. C. of G. Hope.

ORDER III. TRIGYNIA.

266. BOSCIA.

One species; viz. undulata.

ORDER IV. TETRAGYNIA.

267. ILEX, or *Holly*.

19 species; viz. *aquifolium, japonica, opaca, crocea, serrata, latifolia, perado, prinoides, cassine, vomitoria, crenata, emarginata, salicifolia, asiatica, integra, rotunda, obcordata, acuminata, cuneifolia. Asia, N. America.

* I. leaves egg-shaped, acute, thorny, on leaf-stalks; flowers in a kind of umbel, axillary.—All the varieties which gardeners reckon, to the amount of 40 or 50, are derived from this one species, and depend upon the

variegation of the leaves or thorns, and the colour of the berries. Sheep are fed in the winter with the croppings, as are also deer. Birds eat the berries. The bark fermented, and afterwards washed from the woody fibres, makes the common bird-lime. It makes an impenetrable fence, and bears cropping; nor is its verdure, or the beauties of its scarlet berries, ever observed to suffer from the severest of our winters. The wood is used in veneering, and is sometimes stained black to imitate ebony. Handles for knives and cogs for mill-wheels are made of it.—It is said to have been observed by Linnæus, that the lower branches within reach of cattle bear thorny leaves, whilst the upper ones which stand in no need of such defence are without thorns.

268. COLDENIA.

One species; viz. procumbens. E. Indies.

269. POTAMOGETON, or *Pond-weed*.

14 species; viz. natans, fluitans, heterophyllum, perfoliatum, densum, *lucens, *crispum, serratum, *conipressum, *pectinatum, *setaceum, *gramineum, *marinum, *pusillum. Europe, N. America.

* P. leaves oblong egg-shaped, on leafstalks, floating. natans. —The leaves of this plant floating upon the surface of water, afford an agreeable shade to fish, and are the habitation and food of the phalæna potamogeton. The roots are a favourite food of the swan.

270. RUPPIA.

One species; viz. *maritima.

271. SAGINA, or *Pearl-wort*.

Five species; viz. *cerastoides, *procumbens, *apetala, *erecta, and virginica of Virginia.

272. TILLEA, or *Small Annual House-leek*.

Five species; viz. aquatica, prostrata, vaillantii, capensis, perfoliata, umbellata, decumbens, muscosa. Eur. C. of G. Hope.

273. MYGINDA.

Five species; viz. vragoga, rhacoma, latifolia. N. America, W. Indies.

In the class *Tetrandria* are

117 Genera, which include 638 Species. Of these 56 species are found in Britain.

CLASSIS V.

PENTANDRIA.

ORDO I. MONOGYNIA.

Sect. I. Flores monopetalæ, inferi, monospermi.

373. MIRABILIS. Nux infra corollam. Cor. infundibulif. Stigma globosum papillosum.

295. TRICRATUS. Nux 5-angularis. Cor. infundibulif. laciniis bilobis. Cal. o.

CLASS V.

PENTANDRIA.

ORDER I. MONOGYNIA.

Sect. I. Flowers monopetalous, inferior, one-seeded.

M. Nut beneath the cor. The cor. funnel-shaped. Stigma globular pimpled.

T. Nut 5-angular. Cor. funnel-shaped with 2-lobed segments. No calyx.

318. PLUMBAGO. Sem. 1. Stam. valvis inserta. Cor. infundibulif. Stigma 5-fidum.

317. WEIGELIA. Sem. 1. Cor. infundibulif. Stylus à latere germinis.

470. QUINCHAMALA. Sem. 1. Cor. tubulosa. Antheræ sessiles.

408. CORYMBUM. Sem. 1, lana involut. Cor. infundibulif. Cor. 2-phyll. Anth. connatæ.

Sect. II. *Flores monopetali, inferi, dispermi. Asperifoliae.*

281. CERINTHE. Cor. fauce nuda ventricosa. Nuc. 2, osseæ, 2-loculares.

287. MESSERSCHMIDIA. Cor. fauce nuda, infundib. Nuc. 2, suberosæ.

Sect. III. *Flores monopetali, inferi, tetraspermi. Asperifoliae.*

286. ECHIDM. Cor. fauce nuda, irregularis, campanulata.

274. HELIOTROPIUM. Cor. fauce nuda, hypocraterif. lobis dente interjectis. Sem. 4.

279. PULMONARIA. Cor. fauce nuda, infundib. Cal. prismaticus.

276. LITHOSPERMUM. Cor. fauce nuda, infundib. Cal. 5-partitus.

282. ONOSMA. Cor. fauce nuda, ventricosa. Sem. 4.

280. SYMPHYTUM. Cor. fauce dentata, ventricosa.

283. BORAGO. Cor. fauce dentata, rotata.

285. LYCOPSIS. Cor. fauce fornicata, infundib. tubo curvato.

284. ASPERUGO. Cor. fauce fornicata, infundib. Fructus compressus.

278. CYNOGLOSSUM. Cor. fauce fornicata, infundib. Sem. depressa, latere affixa.

277. ANCHUSA. Cor. fauce fornicata, infundib. tubo basi prismatico.

275. MYOSOTIS. Cor. fauce fornicata, hypocraterif. lobis emarginatis.

Sect. IV. *Flores monopetali, inferi, pentaspermi.*

289. NOLANA. Cor. monopetala. Nuces 5, 2 s. 4-loculares.

Sect. V. *Flores monopetali, inferi. Angiospermi.*

374. CORIS. Caps. 1-locularis, 5-valvis. Cor. irregularis. Stigma capitatum.

303. HYDROPHYLLUM. Caps. 1-locularis, 2-valvis. Cor. nectariis 5, exarata. Stigma bifidum.

434. GALAX. Caps. 1-locularis, 2-valvis. Cor. hypocrat. Stigma subrotundum.

432. BARRERIA. Caps. ? Cor. rotata. Anth. coherentes. Stigmata 3.

294. CORTUSA. Caps. 1-locularis, oblonga. Cor. rotata. Stigma subcapitatum.

306. ANAGALLIS. Caps. 1-locularis, circumscis. Cor. rotata. Stigma capitatum.

P. Seed 1. Stamen inserted in the valves. Cor. funnel-shaped. Stigma 5-cleft.

W. 1 Seed. Cor. funnel-shaped. Style with lateral seed-buds.

Q. 1 Seed. Cor. tubular. Anther sitting.

C. 1 Seed, covered with wool. Cor. funnel-shaped. Cal. 2-leaved. Anthers united at the base.

Sect. II. *Flowers monopetalous, inferior, 2-seeded. Rough leaves.*

C. Cor. with a naked mouth, distended. Nuts 2, hard as bone, 2-celled.

M. Cor. with a naked mouth, funnel-shaped. Nuts 2, eroded beneath, 2-seeded.

Sect. III. *Flowers monopetalous, inferior, 4-seeded. Rough leaves.*

E. Cor. with a naked mouth, irregular, bell-shaped.

H. Cor. with a naked mouth, and lobes divided by a salver-shaped tooth. Seeds 4.

P. Cor. with a naked mouth, funnel-shaped. Cal. prism-shaped, i. e. differing from cylindrical in the cup being angular.

L. Cor. with a naked mouth, funnel-shaped. Cal. 5-partite.

O. Cor. with a naked mouth, distended. Seeds 4.

S. Cor. with a toothed mouth, distended.

B. Cor. with a toothed mouth, wheel-shaped.

L. Cor. with a vaulted mouth, funnel-shaped; tube curved.

A. Cor. with a vaulted mouth, funnel-shaped; fruit compressed.

C. Cor. with a vaulted mouth, funnel-shaped. Seed depressed, fixed in the side.

A. Cor. with a vaulted mouth, funnel-shaped; the tube prismatic at the base.

M. Cor. with a vaulted mouth, salver-shaped; lobes notched at the end.

Sect. IV. *Flowers monopetalous, inferior, 5-seeded.*

N. Cor. monopetalous. 5 Nuts, 2 or 4-celled.

Sect. V. *Flowers monopetalous, inferior. Seeds in a capsule.*

C. Caps. 1-celled, 5-valved. Cor. irregular. The stigmas growing in heads.

H. Caps. 1-celled, 2-valved. Cor. furrowed with 5 nectaries. Stigma 2-cleft.

G. Caps. 1-celled. 2-valved. Cor. salver-shaped. Stigma nearly round.

B. Caps. ? Cor. wheel-shaped. Anthers covering. Stigmata 3.

C. Caps. 1-celled, oblong. Cor. wheel-shaped. Stigma nearly growing in heads.

A. Caps. 1-celled, cut round. Cor. wheel-shaped. Stigma growing in a head.

305. *LYSIMACHIA*. Caps. 1-locularis, 10-valvis. Cor. rotata. Stigma obtusum.
300. *DOROENA*. Caps. 1-locul. 1-valv. polysperma. Cor. 5-fida. Stigma emarginatum.
298. *CYCLAMEN*. Caps. 1-locularis, intus pulposa. Cor. reflexa. Stigma acutum.
297. *DODECATHION*. Caps. 1-locul. oblonga. Cor. reflexa. Stigma obtusum.
296. *SOLDANELLA*. Caps. 1. locularis. Cor. lacera. Stigma simplex.
395. *LITA*. Caps. 1-locul. 2-valv. Cor. hypocraterif. Anth. in tubo sessiles. Stigma truncatum.
293. *PRIMULA*. Cap. 1-locularis. Cor. infundib. fauce pervia. Stigma globosum.
291. *ARETIA*. Caps. 1-locul. Cor. hypocraterif. Stigma depresso capitatum.
302. *BACOPA*. Caps. 1-locul. Cor. hypocraterif. Cal. inæqual. Stigma capitatum.
301. *HOTTONIA*. Cor. fauce fornicata, infundib. Sem. depressa, latere affixa.
313. *SHEFFIELDIA*. Caps. 1-locul. 5-valv. Cor. campanulata. Stam. alterna sterilia.
299. *MENYANTHES*. Caps. 1-locularis. Cor. villosa. Stigma bifidum.
479. *ALLAMANDA*. Caps. 1-locularis, lentiformis, bivalvis, valvulis cymbiformibus. Sem. imbricata.
507. *THEOPHRASTA*. Caps. 1-locularis, maxima. Cor. campanulata. Stigma acutum.
371. *GENIOSTOMA*. Caps. 2-locul. Cor. infundibulif. fauce villosa.
308. *SPIGELIA*. Caps. 2-locularis, didyma. Cor. infundib. Stigma simplex.
334. *SPHENOCLEA*. Caps. 2-locularis, circumscissa. Cor. 5-fid. calyce minor. Stigma capitatum.
309. *OPHIORHIZA*. Caps. 2-locul. 2-partita. Cor. infundib. Stigma 2-fidum.
321. *RETZIA*. Caps. 2-locul. Cor. cylindrica, extus villosa. Stigm. 2-fidum.
323. *CONVOLVULUS*. Caps. 2-locularis, 2-sperma. Cor. campanulata. Stigm. 2-fidum.
310. *LISIANTHUS*. Caps. 2-locularis, polysperma. Cor. infundib. ventricosa. Styl. persistens.
377. *DATURA*. Caps. 2-locul. 4-valvis. Cor. infundib. Cal. deciduus.
378. *HYOSCIAMUS*. Caps. 2-locularis operculata. Cor. infundib. Stigma capitatum.
379. *NICOTIANA*. Caps. 2-locularis. Cor. infundib. Stigm. emarginatum.
376. *VERBASCUM*. Caps. 2-locular. Cor. rotata. Stigma obtusum. Stam. declinata.
394. *CHIRONIA*. Caps. 2-locular. Cor. tubo urceolato. Antheræ desoratæ spirales.
322. *PORANA*. Fructus bivalvis. Calyx in fructu grandifactus. Stylus elongatus semibifidus.
290. *DIAPENSIA*. Caps. 3-locularis. Cor. hypocrat. Cal. 8-phyllus.
320. *PHLOX*. Caps. 3-locularis. Cor. hypocrater. tubo curvo. Stigm. trifidum.
326. *POLEMONIUM*. Caps. 3-locularis. Cor. 5-partita. Stam. valvis imposita.
324. *CANTUA*. Caps. 3-locul. 3-valv. Sem. alata. Cor. infundibulif. Stigm. 3-fid.
325. *IPOMOEA*. Caps. 3-locularis. Cor. infundib. Stigma capitatum.
- L. Caps. 1-celled, with 10 valves. Cor. wheel-shaped. Stigma blunt.
- D. Caps. 1-celled, 1-valved, many-seeded. Cor. 5-cleft. Stigma notched at the end.
- C. Caps. 1-celled, pulpy within. Cor. bent back. Stigma sharp.
- D. Caps. 1-celled, oblong. Cor. bent back. Stigma blunt.
- S. Caps. 1-celled. Cor. ragged. Stigma undivided.
- L. Caps. 1-celled, 2-valved. Cor. salver-shaped. Anthers sitting in the tube. Stigma lopped.
- P. Caps. 1-celled. Cor. funnel-shaped with a pervious mouth. Stigma globular.
- A. Caps. 1-celled. Cor. salver-shaped, flat-headed.
- B. Caps. 1-celled. Cor. salver-shaped. Cal. unequal. Stigma headed.
- H. Cor. with a vaulted mouth, funnel-shaped. Seed sunk, fixed in the side.
- S. Caps. 1-celled, 5-valved. Cor. bell-shaped. Alternate stamens barren.
- M. Caps. 1-celled. Cor. woolly. Stigma 2-cleft.
- A. Caps. 1-celled, globular, but compressed, 2-valved, with boat-shaped valves. Seed tiled.
- T. Caps. 1-celled, very large. Cor. bell-shaped. Stigma acute.
- G. Caps. 2-celled. Cor. funnel-shaped, with woolly mouth.
- S. Caps. 2-celled, double. Cor. funnel-shaped. Stigma undivided.
- S. Caps. 2-celled, cut round. Cor. 5-cleft, less than the calyx. Stigma headed.
- O. Caps. 2-celled, 2-partite. Cor. funnel-shaped. Stigma 2-cleft.
- R. Caps. 2-celled. Cor. cylindrical, outside woolly. Stigma 2-cleft.
- C. Caps. 2-celled, 2-seeded. Cor. bell-shaped. Stigma 2-cleft.
- L. Caps. 2-celled, many-seeded. Cor. funnel-shaped. distended. Style permanent.
- D. Caps. 2-celled, 4-valved. Cor. funnel-shaped. Cal. deciduous.
- H. Caps. 2-celled, covered with a lid. Cor. funnel-shaped. Stigma headed.
- N. Caps. 2-celled. Cor. funnel-shaped. Stigma notched at the end.
- V. Caps. 2-celled. Cor. wheel-shaped. Stigma obtuse. Stamens bent.
- C. Caps. 2-celled. Cor. with a pitcher-shaped tube. Anthers twisted after having shed their pollen.
- P. Fruit 2-valved. Calyx swelling with the fruit. Style elongated, half-cleft.
- D. Caps. 3-celled. Cor. salver-shaped. Cal. 8-leaved.
- P. Caps. 3-celled. Cor. salver-shaped, with a crooked tube. Stigma 3-cleft.
- P. Caps. 3-celled. Cor. 5-partite. Stamens placed on valves.
- C. Caps. 3-celled, 3-valved. Seeds winged. Cor. funnel-shaped. Stigma 3-cleft.
- I. Caps. 3-celled. Cor. funnel-shaped. Stigma with a little head.

375. *BROSSEA*. Caps. 5-locul. Cor. truncata. Cal. carnosus.
 312. *AZALEA*. Caps. 3-locul. Cor. campanulata. Stigm. obtusum.
 315. *EPÆRIS*. Caps. 5-locul. Cor. infundibulif. villosa. Squama nectarif.
 481. *NERIUM*. Follic. 2, erecti. Cor. fauce coronata. Sem. papposa.
 482. *ECHITES*. Follic. 2, erecti. Cor. infundib. fauce nuda. Sem. papposa.
 483. *PLUMIERIA*. Follic. 2, retracti. Cor. infundib. Sem. alata.
 484. *CAMERARIA*. Follic. 2, lobati. Cor. hypocrat. Sem. alata.
 485. *TABERNÆMONTANA*. Follic. 2, pulposi. Cor. hypocrat. Sem. simplicia.
 480. *VINEA*. Follic. 2, erecti. Cor. hypocrat. Sem. simplicia.
 475. *CERBERA*. Drupæ 2, nuces submonospermæ. Cor. infundibulif.
 339. *THOUINIA*. Drupa. Cor. campanulata, extus hispida. Cal. 5-phyll.
 402. *TECTONA*. Drupa sicca, nuce 3-locul. Cor. infundibulif.
 391. *ARDISIA*. Drupa 1-sperma. Cor. hypocra-terif. limbo reflexo.
 401. *BUMELIA*. Drupa 1-sperma. Cor. hypocra-terif. limbo dentibus interjecto. Nect. 5-phyll.
 474. *GYNOPOGON*. Drupa nuce semibilocul. Cor. hypocra-terif. Stigma globosum villosum.
 399. *LAUGERIA*. Drupa 1-sperma. Nux 5-locular. Stigm. capitatum.
 398. *VARRONIA*. Drupa 1-sperma. Nux 4-locul. Stigm. 4-plex.
 396. *CORDIA*. Drupa 1-sperma. Nux 4-locularia. Stigma dichotomum. Cal. baccæ accretus.
 386. *IGNATIA*. Drupa polysperma. Cor. infundibulif. tubo longissimo.
 397. *EHRETIA*. Drupa 4-sperma. Nux 2-locular. Stigm. emarginatum.
 316. *STYPHELIA*. Drupa 5-locularis. Cor. tubulosa.
 478. *WILLUGHBEJA*. Cor. hypocra-terif. Stigm. capitatum.
 473. *CARISSA*. Baccæ 2, polyspermæ.
 392. *JAQUINIA*. Bacca 1-sperma. Cor. 10-fida. Nect. 5-phyll.
 421. *MYRSINE*. Bacca 1-sperma. Cor. campanulata. Stigm. villosum.
 422. *BLADHIA*. Bacca 1-sperma. Sem. arillatum. Cor. rotata.
 472. *PÆDERIA*. Bacca 2-sperma, inflata, fragilis.
 471. *RAUWOLFIA*. Bacca 2-sperma. Sem. cordata.
 415. *ARDUINA*. Bacca 2-sperma. Sem. oblonga. Cor. curvata. Stigm. 2-fidum.
 387. *CESTRUM*. Bacca 1-locularis. Filamenta dente notata.
 311. *FRAGÆA*. Bacca 2-locul. carnos. Cor. infundibulif. tubo longo. Stigm. capitatum.
 288. *TOURNEFORTIA*. Bacca 2-locul. loculis 2-sperma, apice perforata.
 385. *STRYCHNOS*. Bacca 2-locularis corticosa. Stigma capitatum.
- B. Caps. 5-celled. Cor. lopped. Cal. fleshy.
 A. Caps. 5-celled. Cor. bell-shaped. Stigma blunt.
 E. Caps. 5-celled. Cor. funnel-shaped, woolly. A scale honey-bearing.
 N. Air-bags 2, erect. Cor. with a crowned mouth. Seeds downy.
 E. Air-bags 2, erect. Cor. funnel-shaped, with a naked mouth. Seeds downy.
 P. Air-bags 2, drawn back. Cor. funnel-shaped. Seeds winged.
 C. Air-bags 2, gashed. Cor. salver-shaped. Seeds winged.
 T. Air-bags 2, pulpy. Cor. salver-shaped. Seeds undivided.
 V. Air-bags 2, erect. Cor. salver-shaped. Seeds undivided.
 C. Drupes 2, nuts nearly 1-seeded. Cor. funnel-shaped.
 T. A drupe. Cor. bell-shaped, rough without, with stiff bristly hairs. Cal. 5-leaved.
 T. A drupe, dry, with a 3-celled nut. Cor. funnel-shaped.
 A. A drupe 1-seeded. Cor. salver-shaped, border turned back.
 B. A drupe with 1 seed. Cor. salver-shaped, border notched with teeth. Nect. 5-leaved.
 G. A drupe with a nut half 2-celled. Cor. salver-shaped. Stigma globular, woolly.
 L. A drupe with 1 seed. A nut 5-celled. Stigma with a knob.
 V. A drupe 1-seeded. Nut 4-celled. Stigma 4-fold.
 C. A drupe 1-seeded. Nut 4-celled. Stigma forked. Cal. growing to the berry.
 I. A drupe. Many seeds. Cor. funnel-shaped, with a very long tube.
 E. A drupe, 4-seeded. Nut 2-celled. Stigma notched at the end.
 S. A drupe, 5-celled. Cor. tubular.
 W. Cor. salver-shaped. Stigma with a little head or knob.
 C. Berries 2, many-seeded.
 J. Berry 1-seeded. Cor. 10-cleft. Nectary 5-leaved.
 M. Berry 1 seed. Cor. bell-shaped. Stigma woolly.
 B. Berry 1 seed. Seed coated. Cor. wheel-shaped.
 P. Berry 2-seeded, inflated, brittle.
 R. Berry 2-seeded. Seeds heart-shaped.
 A. Berry 2-seeded. Seeds oblong. Cor. crooked. Stigma 2-cleft.
 C. Berry 1-celled. Filaments toothed.
 F. Berry 2-celled, fleshy. Cor. funnel-shaped, with a long tube. Stigma with a knob.
 T. Berry 2-celled, with 2-seeded cells perforated at the point.
 S. Berry 2-celled, bark-like. Stigma with a knob.

384. **CAPSIUM.** Bacca 2-locul. exsucca. Antheræ conniventes.
 * 383. **SOLANUM.** Bacca 2-locularis. Antheræ biperforatæ.
 382. **PHYSALIS.** Bacca 2-locul. Calyce inflato. Antheræ approximatae.

 332. **TRACHELIUM.** Caps. 3-locul. perforata. Cor. infundibulif. Stigm. capitatum.
 * 329. **CAMPANULA.** Caps. 2 s. 3-locul. Cor. 1, perforata. Cor. campanul. Stigm. 3-fidum.

VOL. IV. Part I.

- C. Berry 2-celled, dry. Anthers converging.
 * S. Berry 2-celled. Anthers double perforated.
 P. Berry 2-celled. Calyx bellied. Anthers approaching.
 J. Berry? Cor. very long, tubular.
 * A. Berry 2-celled. Stamens distant, bowed inwards.
 E. Berry 2-celled. Seeds 2, one superior.
 L. Berry 2-celled. Stamens closing with a hairy base.
 C. Berry 2-celled. Cor. funnel-shaped, inserted in the calyx. Nectary 1-leaved, closing the corolla.
 C. Berry 4-celled, woolly, many-seeded. Cor. wheel-shaped. Cal. 5-partite.
 T. Berry 4-celled, cells 2-seeded. Cor. bell-shaped. Cal. 5-toothed.
 S. Berry 4-celled, many-seeded. Cor. funnel-shaped. Cal. gaping.
 M. Berry 4-celled. Cal. 3-leaved. Stigmas 2.
 L. Berry 5-seeded. Cor. wheel-shaped. Nectary pitcher-shaped, 5-cleft, bearing the stamens.
 S. Berry 5-seeded. Cor. 10-cleft, the inner segments converging.
 C. Berry 10-seeded. Cor. 10-cleft, the outer segments very open.
 B. Berry many-seeded, knotted. Cor. wheel-shaped.
 B. Berry many-seeded. Cor. tubular. Cal. double.

Sect. VI. *Flowers monopetalous, superior.*

- * S. Caps. 1-celled, with 5 valves at the top. Cor. salver-shaped. Stigma with a knob.
 V. Caps. 1-celled. Cor. funnel-shaped. Cal. 5-toothed, the teeth interjected.
 B. Caps. 1-celled, dimple-beaked. Cor. wheel-shaped. Stigma sharp.
 M. Caps. 2-celled, turban-shaped. Cor. bell-shaped. Stigma 2-lobed. Seeds tiled.
 D. Caps. 2-celled. Cor. funnel-shaped, with segments 3-toothed.
 C. Caps. 2-celled; cell 1-seeded. Cor. funnel-shaped. Stigma 2-partite.
 R. Caps. 1-celled, nearly globular. Cor. funnel-shaped. Stigma obtuse.
 C. Caps. 2-celled, gaping within. Cor. shaggy. Stigma undivided.
 P. Caps. 2-celled, crowned. Cor. bellied. Stigma undivided. Seeds tiled.
 R. Caps. 2-celled, crowned. Cor. wheel-shaped. Stigma 2-cleft.
 G. Caps. 2-celled. Cor. 1 petal, cleft lengthwise.
 * P. Caps. 2 or 3-celled, perforated. Cor. 5-partite. Stigma 2 or 3-cleft.
 T. Caps. 3-celled, perforated. Cor. funnel-shaped. Stigma with a knob.
 C. Caps. 2 or 3-celled, perforated. Cor. bell-shaped. Stigma 3-cleft.

Q

* 342.

- * 342. *LOBELIA*. Caps. 2 s. 3-locul. Cor. 1 petal. irregul. Anth. connate.
345. *SCÆVOLA*. Drupa 1-sperma. Cor. irregularis flabelliformis, fissura longitudinali.
367. *SCHOEFFIA*. Drupa 1-sperma. Cor. campanulata. Cal. duplex, alter inferus, alter superus.
372. *MATTHIOLA*. Bacca 1-sperma. Cor. infundibulif. indivisa. Stigm. obtusum.
363. *MORINDA*. Bacca 1-sperma, aggregata. Cor. infundib. Stigma 2-fidum.
349. *PSYCHOTRIA*. Bacca 2-sperma. Sem. sulcata. Cor. infundib. Stigm. emarginatum.
353. *COFFEA*. Bacca 2-sperma. Sem. arillata. Cor. hypocrat. Stigm. 2-partitum.
354. *CHIOCCOCA*. Bacca 2-sperma. Cor. infundib. Stigm. simplex.
389. *SERISSA*. Bacca 2-sperma. Cor. infundibulif. fauce ciliata, laciniis limbi subtrilobis.
357. *CEPHELIS*. Bacca 2-sperma. Cor. tubulosa. Involucr. subtetraphyll. Recept. paleaceum.
355. *VANGUERIA*. Bacca 4 s. 5-sperma. Cor. hypocraterif. tubo-globozo, fauce pilosa.
347. *SOLENA*. Bacca 1-locul. Cor. hypocraterif. tubo longissimo. Stigm. 3-fid.
356. *CANEPHORA*. Fruct. 2-locul. Cor. campanulata. Cal. communis tubulosus multifloris.
358. *BERTIERA*. Bacca 2-locul. Cor. hypocraterif. Stigm. 2-lamellat. Stam. tubo inserta.
- * 361. *LONICERA*. Bacca 2-ocularis subrotunda. Cor. inæqualis. Stigm. capitatum.
476. *WEBERA*. Bacca 2-locul.; locul. 1-sperm. Cor. infundibulif.
477. *GARDENIA*. Bacca 2-ocularis polysperma. Cor. infundibulif.
348. *UCRIANA*. Bacca 2-locul. Cor. hypocraterif. tubo longissimo. Stigm. 2-lamellat. Stam. fauci inserta.
362. *TRIOSTEUM*. Bacca 3-locul. coriacea. Cor. inæqualis. Stigm. oblongum.
467. *PLOCAMA*. Bacca 3-locul.; locul. 1-spermis. Corolla campanulata.
370. *MUSSÆNDA*. Bacca 4-ocularis, oblonga. Cor. infundib. Stigm. 2-part.
360. *SCHWENKFELDIA*. Bacca 5-locul. polysperma. Cor. hypocraterif. Stigm. 5-part.
359. *HAMELLIA*. Bacca 5-ocular. polysperma. Cor. tubo longo. Stigm. lineare.
368. *ERITHALIS*. Bacca 10-locul. subglobosa. Cor. rotata. Stigm. acutum.
- † *Ixia pentandra, pavetta pentandra, oldenlandia, digyna pentandra, rubia et crucianella nonnulla, prinos.*

Sect. VII. *Flores tetrapetali.*

365. *STROEMIA*. Bacca corticosa 2-valv. Cal. 4-phyll. Nect. ligulat.

Sect. VIII. *Flores pentapetali, inferi.*

442. *HIRELLA*. Bacca 1-sperma. Stylus lateralis. Stam. persistentia, spiralia.
- * 405. *RHAMNUS*. Bacca 3-ocularis, rotunda. Cal. tubul. Corollifer. petala 5 convergentia.

2

- * L. Caps. 2 or 3-celled. Cor. 1 petal, irregular. Anthers twins, that is, united at the base.

S. A drupe 1-seeded. Cor. irregular, fan-shaped, with a longitudinal fissure.

S. A drupe 1-seeded. Cor. bell-shaped. Cal. double, one inferior, the other superior.

M. Berry 1-seeded. Cor. funnel-shaped undivided. Stigma obtuse.

M. Berry 1-seeded, incorporated. Cor. funnel-shaped. Stigma 2-cleft.

P. Berry 2-seeded. Seeds furrowed. Cor. funnel-shaped. Stigma notched at the end.

C. Berry 2-seeded. Seeds coated. Cor. salver-shaped. Stigma 2-partite.

C. Berry 2-seeded. Cor. funnel-shaped. Stigma undivided.

S. Berry 2-seeded. Cor. funnel-shaped, with a fringed mouth, the segments of the border nearly 3-lobed.

C. Berry 2-seeded. Cor. tubular. Involucrum nearly 4-leaved. Receptacle chaffy.

V. Berry 4 or 5-seeded. Cor. salver-shaped, with a globular tube and hairy mouth.

S. Berry 1-celled. Cor. salver-shaped, with a very long tube. Stigma 3-cleft.

C. Fruit 2-celled. Cor. bell-shaped. Cal. common, tubular, many-flowered.

B. Berry 2-celled. Cor. salver-shaped. Stigma 2-gilled. The stamens inserted in a tube.

* L. Berry 2-celled, nearly round. Cor. unequal. Stigma with a knob.

W. Berry 2-celled, cell 1-seeded. Cor. funnel-shaped.

G. Berry 2-celled, many-seeded. Cor. funnel-shaped.

U. Berry 2-celled. Cor. salver-shaped, with a very long tube. Stigma 2-gilled. The stamens inserted in the mouth.

T. Berry 3-celled, leather-like. Cor. unequal. Stigma oblong.

P. Berry 3-celled, cells 1-seeded. Corolla bell-shaped.

M. Berry 4-celled, oblong. Cor. funnel-shaped. Stigma 2-partite.

S. Berry 5-celled, many-seeded. Cor. salver-shaped. Stigma 5-cleft.

H. Berry 5-celled, many-seeded. Cor. with a long tube. Stigma strap-shaped.

E. Berry 10-celled, nearly globular. Cor. wheel-shaped. Stigma acute.

Sect. VII. *Flowers 4-petaled.*

- S. Bark-like berry with 2 valves. Cal. 4-leaved. Nectary strap-shaped.

Sect. VIII. *Flowers 5-petaled, inferior.*

- H. Berry 1-seeded. Style lateral. Stamens permanent, twisted.

- * R. Berry 3-celled, round. Cal. tubular. Cor. bearing 5 converging petals.

412. *CEANOTHUS*. Bacca 3-cocca. Cal. tubul. Corollifer petala fornicata.
- * 424. *EVONYMUS*. Bacca capsularis, lobata. Cal. patens. Sem. baccato-arillata.
423. *CELASTRUS*. Bacca 3-cocca. Cal. planus. Sem. arillata.
429. *STAAVIA*. Bacca 5-sperma corticata. Recept. paleaceo-villosum. Stam. calyci inserta.
454. *EUPAREA*. Bacca exsuoca 1-locul. polysp. Petal. 5-12.
440. *BILLARDIERA*. Bacca polysperma. Stigm. simpl.
414. *RUYSCHIA*. Bacca polysperma. Styl. o. Cor. reflexa.
453. *VITIS*. Bacca 5-sperma. Cor. sæpe connata. Stylus nullus.
439. *ESCALONIA*. Bacca 2-ocularis. Stigma capitat.
441. *MANGIFERA*. Drupa reniformis. Cor. petalis lanceolat. Nux lanuginosa.
406. *ZIZIPHUS*. Drupa nuce 2-locul. Cal. tubul. corollifer. Petala oris 5, convergentia.
404. *SCHREBERA*. Drupa sicca nuce 2-locul. Nect. margo elevat.
438. *ELÆODENDRUM*. Drupa nuce 2-locul. Petal. subrotund. Glandula sub germine.
430. *WALKERA*. Drupæ 5, monospermæ. Cal. 5-part.
451. *CORYMOCARPUS*. Nux clavata. Nect. 5, petaliformia basi glandulosa.
435. *HUMBOLDTIA*. Legumen. Petal. 5, lanceolata. Cal. 4-part.
425. *PILOCARPUS*. Caps. 2-5, infernè coalitæ. Stam. infra germen inserta.
436. *CEDRELA*. Caps. 5-ocularis, basi dehiscens. Cor. receptaculo unita. Sem. alata.
437. *CALODENDRUM*. Caps. 6-locul. 5-angulat. petal. lanceolat. Germen pedicellat. Nect. 5-phyll.
413. *SCOPOLIA*. Caps. baccata 5-locul. 3-locul. 1-sperm. Stigm. capitat.
420. *POLYCARDIA*. Caps. 5-locul. Sem. arillata. Petala rotundata. Stigm. lobatum.
431. *PITOSPORUM*. Caps. 2-5-locul. 5-valv. Sem. tecta pulpa. Petala conniventia in tubum.
417. *BUTTINERIA*. Caps. 5-cocca. Cal. petalis auriculatus. Stam. nectario annexa.
418. *AYENIA*. Caps. 5-locul. Petala in stellulam connata. Nect. urceolus pistillum tegens staminiferum.
419. *GLUTA*. Capsula? Petala pedicello germinis inserta. Cal. campanulat. deciduus.
426. *DIOSMA*. Caps. 5-plex. Nectar. gerna coronans. Sem. arillata.
314. *SPRENGELIA*. Caps. 5-locul. 5-valv. polysperma. Anth. connatæ.
427. *HOVENIA*. Caps. 3-locul. 3-valv. Petala obovata. Stigm. 3.
335. *NAUCLEA*. Caps. 2-locul. polysperm. Recept. commun. pilosum.
447. *IMPATIENS*. Caps. 1-locul. 5-valv. Cor. irregul. calcarat. Cal. 2-phyll. Anth. coherentes.
- * 446. *VIOLA*. Caps. 1-locul. 3-valv. Cor. irregul. calcarata. Cal. 5-phyll. Anth. coherentes.
459. *CLAYTONIA*. Caps. 1-locul. 3-valvis. Cal. 2-valvis. Stigm. 3-fidum.
- C. Berry 3-celled. Cal. tubular. Cor. bearing vaulted petals.
- * E. Berry capsular, lobed. Cal. extending. Seeds berried-coated.
- C. Berry 3-celled. Cal. flat. Seeds coated.
- S. Berry 5-seeded, barked. Receptacle chaffy-woolly. Stamens inserted in the calyx.
- E. Berry dry, 1-celled, many-seeded. Petals 5-12.
- B. Berry many-seeded. Stigma undivided.
- R. Berry many-seeded. No style. Cor. bent back.
- V. Berry 5-seeded. Cor. often united at the base. No style.
- E. Berry-celled. Stigma with a little head.
- M. A drupe kidney-shaped. Cor. with spear-shaped petals. Woolly nut.
- Z. A drupe with a 2-celled nut. Cal. tubular, bearing the cor. Petals of the mouth 5, converging.
- S. A dry drupe, with a 2-celled nut. The margin of the nectary elevated.
- E. A. drupe, with a 2-celled nut. Petals nearly round. A gland beneath the germen.
- W. 5 drupes, 1-seeded. Cal. 5-partite.
- C. Club-shaped nut. Nectaries 5, petal-shaped, with a glandular base.
- H. A leguminous plant. Petals 5, spear-shaped. Cal. 4-partite.
- P. Caps. 2-5 uniting beneath. Stamens inserted beneath the germen.
- C. Caps. 5-celled, gaping at the base. Cor. united to the receptacle. Seeds winged.
- C. Caps. 6-celled, 5-angled. Petals spear-shaped. Germen on a pedicle. Nectary 5-leaved.
- S. Caps. berried, 5-celled. Cells 1-seeded. Stigma with a little head.
- P. Caps. 5-celled. Seeds coated. Petals rounded. Stigma lobed.
- P. Caps. 2-5-celled, 5-valved. Seeds covered with pulp. Petals converging into a tube.
- B. Caps. 5-celled. Cal. ear-shaped with petals. Stamens annexed to the nectary.
- A. Caps. 5-celled. Petals united at the base into a star. A pitcher-shaped nectary covering the pistil which bears the stamens.
- G. Capsule? Petals inserted in the pedicle of the germen. Cal. bell-shaped, deciduous.
- D. Caps. 5-fold. Nectary crowning the germen. Seeds coated.
- S. Caps. 5-celled, 5-valved, many-seeded. Anthers united at the base.
- H. Caps. 3-celled, 3-valved. Petals egg-shaped with the small end downwards. Stigm. 3.
- N. Caps. 2-celled, many-seeded. The common receptacle hairy.
- I. Caps. 1-celled, 5-valved. Cor. irregular, having a spur. Cal. 2-leaved. Anthers cohering. #
- * V. Caps. 1-celled, 3-valved. Cor. irregular, spurred. Cal. 5-leaved. Anthers cohering.
- C. Caps. 1-celled, 3-valved. Cal. 2-valved. Stigma 3-lobed.

457. RORIDULA. Caps. 1-locul. 3-valvis. Nectarium scrotiforme.
 433. ITEA. Caps. 1-locul. 2-valvis. Cal. corollifer. Stigm. obtusum.
 455. ÆGICERAS. Caps. 1-locul. arcuata, 1-valv. 1-sperma. Cal. 5-fid.
 458. SAUVAGESIA. Caps. 1-locul. Nectarium 5-phyllum. Petala imbricata.
 407. VENTILAGO. Samara 1-sperma, apice alata. Cal. 5-fid. corollifer.
 428. BRUNIA. Sem. 1, villosum. Recept. commune villosum. Stam. unguibus petal. inserta.

† *Cæsalpinia pentandra*. *Bombax pentandrum*. *Cassia nictitans*.

Sect. IX. *Flores pentapetali, superi.*

- * 445. RIBES. Bacca polysperma. Cal. corollif. Sty. 2-fidus.
 * 452. HEDERA. Bacca 5-sperma. Cal. cingens fruct. Stigm. simplex.
 444. PLECTRONIA. Bacca 2-sperma. Cal. unguibus clausus. Antheræ inclusæ geminatæ.
 443. STRUMFFIA. Bacca 1-sperma. Cal. 5-dent. Anth. in corpus ovatum coalitæ.
 409. PHYLICA. Bacca 3-cocca. Cal. tubulosus, corollifer, squamis 5 convergentibus.
 410. CARPODETUS. Bacca sicca, 5-locul. petala calycis margini inserta.
 448. GRONOVIA. Caps. 1-sperma, colorata. Cal. coloratus. Petala minuta.
 * 328. JASIONE. Caps. 2-locul. Involuc. 10-fid. Cal. 5-part. Anth. basi cohærentes.
 343. CYPHIA. Capsula ? Petala æqualia linearia. Filamenta pilosa, basi cohærentia. Stigm. cavum, gibbum.
 450. ARGOPHYLLUM. Caps. 3-locul. Petala lanceolata. Nect. 5-angul. pyramidatum.
 327. LIGHTFOOTIA. Caps. 3-5-locul. Cor. fundo clausa, valvis staminiferis. Cal. 5-phyll.
 458. LAGOECIA. Sem. 2, nuda. Cal. pinnato-pectinatus. Pet. bicornia.
 366. CONOCARPUS. Sem. 1, depressum. Recept. aggregens. Petala conniventia.

Sect. X. *Flores incompleti, inferi.*

462. ÆHYRANTHES. Sem 1, oblongum. Cal. exterior, 3-phyllus, nudus.
 464. CHENOLIA. Utriculus depressus, 1-spermus.
 463. CELOSIA. Caps. 3-sperma. Cal. exterior, 3-phyllus; coloratus.

 * 525. ECHINOPHORA. Fl. radiati, abortivi. Invol. simplex. Sem. sessilia.
 * 528. CAUCALIS. Fl. radiati, abortivi. Invol. simplex. Sem. muricata.
 529. ARTEDIA. Fl. radiati, abortivi. Invol. pinnatum. Sem. margine crenis foliaceis.
 * 530. DAUCUS. Fl. radiati, abortivi. Invol. pinnatum. Sem. hispida.
 * 527. TORDYLIUM. Fl. radiati, fertiles. Invol. simplex. Sem. margine crenata.
 540. LASERPITTIUM. Fl. flosculosi, abortivi. Pet. cordata. Sem. 4-alata.
 * 536. PEUCEDANUM. Fl. flosculosi, abortivi. Invol. simplex. Sem. depressa, striata.
 531. AMMI. Fl. flosculosi, fertiles. Invol. pinnatum. Sem. gibba, lævia.
 526. HASSELIQUISTIA. Fl. floscul. fertiles. Petala cordata. Sem. radii plana; disci urceolata.

- * C. 1. round and flat seed. Cal. 5-leaved, with concave leaflets.
 * B. 1 seed, kidney-shaped. Cal. 5-leaved, seed adhering to the base.
 * H. 1 oval covered seed. Cal. 5-partite. 5 barren filaments.
 G. Caps. 1-seeded, cut round. Cal. 2-leaved, compressed, coloured.
 B. A berry 1-seeded. Cal. 5-leaved.
 * U. Seed-vessel compressed. Cal. 1 leaf, fading.
 M. A drupe, dry, prickly. Cal. 5-leaved, expanding.

Sect. IV. *Flowers 5-petaled, superior, capsular.*

- V. Caps. lopped, 1-celled, 2-valved. Petals oval. Cal. 5-leaved.

Sect. V. *Flowers with 5 petals, superior, 2-seeded, umbellated.*

A. *With an universal and partial involucrem.*

- P. Flowers dispersed.
 * E. Flowers with little heads. Receptacle chaffy.
 * H. Flowers nearly umbellated, fertile. Seeds compressed.
 A. Flowers nearly umbellated, fertile. Seeds nearly globular, 3-toothed, furrowed.
 C. Flowers nearly umbellated. The extremity of the receptacle dilated into a 5-toothed calyx.
 * S. Flowers nearly umbellated, barren. Seeds covered with sharp points.
 A. Flowers umbellated, barren. Involucrem coloured. Seeds wrinkled.
 * H. Flowers radiated, barren. Involucrem deciduous. Seeds membranaceous.
 * O. Flowers radiated, outer florets barren. Involucrem undivided. Seeds crowned, sitting.
 * E. Flowers radiated, barren. Involucrem undivided. Seeds sitting.
 * C. Flowers radiated, barren. Involucrem undivided. Seeds covered with sharp points.
 A. Flowers radiated, barren. Involucrum winged. Seeds in the border with scolloped leaves.
 * D. Flowers radiated, barren. Involucrem winged. Seeds rough, with bristly hairs.
 * T. Flowers radiated, fertile. Involucrem undivided. Seeds scolloped at the border.
 L. Flowers with tubular florets, barren. Petals heart-shaped. Seeds 4-winged.
 * P. Fl. tubular florets, barren. Involucrem undivided. Seeds depressed, scored.
 A. Fl. tubular florets, fertile. Involucrem winged. Seeds bulging, level.
 H. Fl. tubular florets, fertile. Petals heart-shaped. Seeds of the ray flat; of the disk pitcher-shaped.

* 533. *CONIUM*. Fl. floscul. fertiles. Pet. cordata. Sem. gibba, costato-sulcata; involuella dimidiata.

524. *EXOACANTHA*. Fl. floscul. fertiles. Petal. cordata. Sem. ovata, striata. Involucrum et involuella spinosa.

* 532. *BUNIUM*. Flor. flosc. fert. Pet. cordata. Involuella setacea.

* 535. *ATHAMANTA*. Fl. flosc. fert. Pet. cordata. Sem. convexa, striata.

* 523. *BUPLEURUM*. Fl. flosc. fert. Pet. involuta (plerisque folia indivisa, s. involuella petaliformia).

* 544. *SIUM*. Fl. flosc. fert. Pet. cordata. Sem. subovata, striata.

* 534. *SELINUM*. Fl. flosc. fert. Pet. cordata. Sem. depressa, striata.

547. *CUMINUM*. Fl. flosc. fert. Pet. cordata. Umb. 4-fid. Invol. setacea, longissima.

539. *FERULA*. Fl. flosc. fert. Pet. cordata. Sem. plana.

* 537. *CRITHMUM*. Fl. flosc. fert. Pet. planiuscula. Invol. horizontale.

546. *BUBON*. Fl. flosc. fert. Pet. planiusc. Invol. 5-phyllum.

538. *COCHRYA*. Fl. flosc. fert. Pet. planiusc. Sem. cortice suberoso.

* 542. *LIGUSTICUM*. Fl. flosc. fert. Pet. involuta. Invol. membranacea.

* 543. *ANGELICA*. Fl. flosc. fert. Pet. planiusc. Umbellulae globosae.

* 545. *SISON*. Fl. flosc. fert. Pet. planiusc. Umbell. depauperata.

B. Involucris partialibus; universali nullo.

* 551. *ÆTHUSA*. Flor. subradiati, fertiles. Involuella dimidiata.

* 552. *CORIANDRUM*. Fl. radiati, abortivi. F. subglobosi.

* 553. *SCANDIX*. Flor. radiat. abort. Fr. oblongi.

* 554. *CHÆROPHYLLUM*. Fl. floscul. abort. Fr. subglobosi.

* 549. *PHELLANDRIUM*. Fl. floscul. fert. Fr. coronati.

* 555. *IMPERATORIA*. Fl. flosc. fert. Umbell. expanso-plana.

556. *SESELI*. Fl. flosc. fert. Umbell. rigidula.

* 550. *CICUTA*. Fl. flosc. fert. Pet. planiuscula.

† *Bupleurum rotundifolium*. *Apium petroselinum et anisum*.

C. Involucro nullo; nec universali, nec partialibus.

* 559. *SMYRNIUM*. Flor. floscul. abortivi. Sem. reniformia angulata.

* 561. *CARUM*. Fl. floscul. abortivi. Sem. gibba, striata.

557. *THAPSIA*. Fl. floscul. fert. Sem. membranacea, alata, emarginata.

* 558. *PASTINACA*. Fl. flosc. fert. Sem. depresso-plana.

* 560. *ANETHUM*. Fl. flosc. fert. Sem. marginata, striata.

* C. Flowers with tubular florets, fertile. Petals heart-shaped. Seeds bulging, rib-furrowed; the small involucrems extending half round.

E. Fl. tubular florets, fertile. Petals heart-shaped. Seeds oval, scored. The total and partial involucrems thorny.

* B. Fl. tubular florets fertile. Petals heart-shaped. Seeds convex, striped.

* A. Fl. florets fertile. Petals heart-shaped. Seeds convex, scored.

* B. Fl. florets fertile. Petals rolled inwards (usually the leaves undivided, or the involuella or small involucrems petal-shaped).

* S. Fl. florets fertile. Petals nearly heart-shaped. Seeds nearly egg-shaped, scored.

* S. Fl. florets fertile. Petals heart-shaped. Seeds depressed, scored.

C. Fl. florets fertile. Petals heart-shaped. An umbel 4-cleft. Involucrems very long, bristly.

F. Fl. florets fertile. Petals heart-shaped. Seeds flat.

* C. Fl. florets fertile. Petals little planes. Involucreum horizontal.

B. Fl. florets fertile. Petals flattened. Involucreum 5-leaved.

C. Fl. florets fertile. Petals flattened. Seeds with a gnawed bark.

* L. Fl. florets fertile. Petals rolled inwards in a membranaceous involucreum.

* A. Fl. florets fertile. Petals flattened. Small globular umbels.

* S. Fl. florets fertile. Petals flattened. Slender umbel.

B. With partial involucrems; none universal.

* Æ. Flowers nearly radiated, fertile. Small involucrems going half round.

* C. Flowers radiated, barren. Fruits nearly globular.

* S. Flowers radiated, barren. Fruits oblong.

* C. Flowers are florets, barren. Fruits nearly globular.

* P. Flowers are florets, fertile. Fruits crowned.

* I. Flowers are florets, fertile. An umbel expanding, flat.

S. Flowers are florets, fertile. Inflexible umbel.

* C. Flowers are florets, fertile. Petals flattened.

C. With no involucreum, neither universal nor partial.

* S. Flowers barren florets. Seeds kidney-shaped, angular.

* C. Flowers barren florets. Seeds bulging, scored.

T. Flowers fertile florets. Seeds membranaceous, notched at the end.

* P. Flowers fertile florets. Seeds sunk flat.

* A. Flowers fertile florets. Seeds bordered, scored.

- * 564. *ÆGOPODIUM*. Fl. flosc. fert. Sem. gibba, striata. Pet. cordata.
- * 563. *APIUM*. Fl. flosc. fert. Sem. minuta, striata. Pet. inflexa.
- * 562. *PIMPINELLA*. Fl. flosc. fert. Umbell. ante florescentiam nutantes. Pet. cordata.

ORDER I. MONOGYNIA.

274. HELIOTROPIUM, or *Turnsole*,

Includes, 22 species; viz. peruvianum, amplexicaule, indicum, parviflorum, inundatum, villosum, europeum, coromandelianum, malabaricum, marifolium, supinum, undulatum, lineatum, strigosum, curassavicum, zeylanicum, persicum, scabrum, orientale, gnaphaloidea, ternatum, pinnatum. S. Eur. Asia, W. Indies, Peru.

275. MYOSOTIS.

12 species; viz. scorpioides, * arvensis, nana, fruticosa, spatulata, rupestris, virginiana, lappula, squarrosa, echinophora, spinocarpos, pectinata. Europe, N. America.

276. LITHOSPERMUM, or *Gromwell*.

16 species; viz. * officinale, arvense, incanum, papposum, virginianum, tinctorium, apulum, scabrum, orientale, * purpureo-cæruleum, fruticosum, callosum, ciliatum, tenuiflorum, dispernum, retortum. Europe, Egypt, Virginia.

* L. seeds wrinkled; corolla or blossoms hardly longer than the calyxes or cups.—The girls in the north of

VOL. IV. Part I.

Europe, it is said, paint their faces with the juice of the root of this plant upon days of festivity. The bark of the root tinges wax and oil of a beautiful red, similar to that which is obtained from the root of the foreign alkanet that is kept in the shops. Sheep and goats eat it. Cows are not fond of it. Horses and swine refuse it.

* L. seeds smooth; corol. scarcely longer than the calyx; leaves lanceolate or spear-shaped.—This species is found wild in dry fields and hedges. Its seeds are roundish, hard, of a whitish colour, like little pearls; and from these circumstances, they were at one time supposed peculiarly serviceable in calculous disorders. Their taste is merely farinaceous.

277. ANCHUSA, or *Bugloss*.

13 species; viz. paniculata, capensis, officinalis, italica, angustifolia, undulata, tinctoria, hispida, virginica, lanata, * sempervirens, parviflora, cespitosa. Europe, Madeira, N. America.

278. CYNOGLOSSUM, or *Hounds-tongue*.

24 species; viz. * officinale, pictum, lanceolatum, virginicum, limense, cheirifolium, apenninum, hispidum, hirsutum, echinatum, muricatum, angustifolium, lævigatum,

R

gatum, glastifolium, cristatum, lusitanicum, linifolium, lanatum, japonicum, lateriflorum, scorpioides, omphalodes, cappadicum, myosotoides. S. Europe, Japan, Virginia.

officinale. * C. stamens shorter than the blossom; leaves broad, spear-shaped, sitting, cottony.—Both the root and leaves of this plant have been suspected to possess narcotic properties, but some will not admit of the fact. It is discarded from the present practice; though some individuals are said to use a decoction of the roots inwardly, and cataplasms of them outwardly, in strumous and scrophulous cases. Its scent is very disagreeable, and very much resembles that of mice. Goats eat it. Cows, horses, sheep, and swine, refuse it. It furnishes food to the *phalæna domina*.

279. PULMONARIA, or *Lungwort*.

Seven species; viz. * *angustifolia*, * *officinalis*, *suffruticosa*, *paniculata*, *virginica*, *sibirica*, * *maritima*. Europe, N. America.

officinalis. * P. root-leaves egg-heart-shaped, rough; upper leaves egg-shaped, acute.—This plant, when burnt, is said to afford a larger quantity of ashes than almost any other vegetable; often 1-7th of its weight. Sheep and goats eat it. Cows are not fond of it. Horses and swine refuse it. The *chrysomela nemorum* feeds upon it.

280. SYMPHYTUM, or *Comfrey*.

Three species; viz. *officinale*, * *tuberosum*, *orientale*. Ger. Fr. Spain, India.

officinale. * S. leaves egg-shaped, decurrent.—The particles of the pollen are said to appear in the microscope like two globules united together. The leaves give a grateful flavour to cakes and panada, and the young stems and leaves are excellent when boiled. The roots are glutinous and mucilaginous, and a decoction of them is used by dyers to extract the colouring matter of gum lac. Cows and sheep eat it. Horses, goats, and swine refuse it.

281. CERINTHE, or *Honey-wort*.

Three species; viz. *major*, *aspera*, *minor*. Austria, S. Europe.

282. ONOSMA.

Eight species; viz. *simplicissima*, *orientalis*, *echioides*, *sericea*, *coerulea*, *tenuiflora*, *caespica*, *micrantha*. Europe, India.

283. BORAGO, or *Borage*.

Seven species; viz. *officinalis*, *indica*, *africana*, *longifolia*, *zeylanica*, *orientalis*, *cretica*. E. Indies, Africa.

officinalis. * B. all the leaves alternate; cal. expanding.—It appears by experiment that the juice of this plant affords a true nitre. It is seldom used inwardly, but as an ingredient in cool tankards for summer drinking, though the young and tender leaves are good in salads, or as a pot herb. It is said to afford nourishment to the *phalæna gamma*. Horses are said to have eaten it.

284. ASPERUGO, or *Small Wild Bugloss*.

Two species; viz. * *procumbens* and *ægyptiaca*. Europe, Egypt.

285. LYCOPSIS.

Nine species; viz. *vesicaria*, *pulla*, *ciliata*, *obtusifolia*, *variegata*, * *arvensis*, *echioides*, *orientalis*, *virginica*. Germ. S. Eur. Virginia.

286. ECHIUM, or *Vipers Bugloss*.

26 species; viz. *fruticosum*, *candicans*, *giganteum*, *stricteum*, *argenteum*, *sericeum*, *setosum*, *trichotomum*, *hispidum*, *paniculatum*, *trigonum*, *capitatum*, *lævigatum*, *glabrum*, *incanum*, *spicatum*, *caudatum*, *plantagineum*, * *italicum*, *rubrum*, * *vulgare*, * *violaceum*, *maritimum*, *creticum*, *orientale*, *lusitanicum*. S. Europe, Cape, Canaries.

* E. stem rough with bristles and tubercles; stem-*vulgare*. leaves spear-shaped, rough with hair; flowers in lateral spikes.—Cows and sheep are said not to be fond of this plant. Horses and goats refuse it. Bees are fond of the flowers, but get their wings torn by its strong hairs.

287. MESSERSCHMIDIA.

Three species; viz. *fruticosa*, *arguzia*, *cancellata*. Siber. Canaries.

288. TOURNEFORTIA, or *Basket Withe*.

Eleven species; viz. *serrata*, *hirsutissima*, *volubilis*, *syringifolia*, *foetidissima*, *humilis*, *bicolor*, *cymosa*, *argentea*, *sericea*, *suffruticosa*. Ceylon, West Indies, S. America.

289. NOLANA.

One species; viz. *prostrata*. Peru.

290. DIAPENSIA.

One species; viz. *lapponica*. Lapland.

291. ARETIA.

Three species; viz. *helvetica*, *alpina*, *vitaliana*. Alps, Pyrenees.

292. ANDROSACE.

Ten species; viz. *maxima*, *elongata*, *filiformis*, *septentrionalis*, *odoratissima*, *villosa*, *chamæjasme*, *obtusifolia*, *lactea*, *carnea*. N. Eur. Archipelago.

293. PRIMULA, or *Primrose*.

17 species; viz. *verticillata*, * *veris*, * *elatior*, * *farinosa*, *cortusoides*, *villosa*, *nivalis*, *longiflora*, *glutinosa*, *marginata*, *auricula*, *gigantea*, *minima*, *integri-folia*, *carniolica*, *finmarchica*, *viscosa*, *sibirica*. Europe. * P. leaves toothed, wrinkled, scape many-flowered, *veris*. lumbus of the cor. concave.—This is a low plant, growing wild in woods and hedges, and producing pale yellow flowers in the spring. The leaves have an herbaceous taste. The roots are slightly bitter, with a kind of aromatic flavour, which some compare to that of aniseeds; their expressed juice purified by settling is sometimes used as a sternutatory. The flowers have an agreeable flavour, but very weak; an infusion of them in wine, and a spirit distilled from them, are used in some places as cordial and nervine.

294. CARTUSA, or *Bears-ear Sanicle*.

Two species; viz. *mathioli*, *gmelini*. Alps of Siberia and Austria.

295. TRICRATUS.

One species; viz. *admirabilis*.

296. SOLDANELLA, or *Soldanel*.

One species; viz. *alpina*. Alps of Austria and Switzerland.

297. DODECATHEON, or *Virginian Cowslip*.

One species; viz. *meadia*. North America.

298. CYCLAMEN, or *Sow-bread*.

Five species; viz. *coum*, * *europæum*, *persicum*, *hederæfolium*, *indicum*. Austria, S. Europe, Ceylon.

299.

299. MENYANTHES, or *Bog-bean*.

Four species; viz. *nymphoides, ovata, indica, *trifoliata. Europe, Cape, Ceylon, Malta.
trifoliata. * M. leaves growing by threes; cor. segments entire at the edge, shaggy on the upper surface.—An infusion of the leaves of this plant is said to be extremely bitter, and is prescribed in rheumatism and dropsies. A dram of them in powder, purges and vomits. It is sometimes given to destroy worms. In a scarcity of hops, this plant is used in the north of Europe to bitter the ale. Two ounces supply the place of a pound of hops. Some people smoke the dried leaves. The powdered roots are sometimes used in Lapland instead of bread, but they are unpalatable. Some people say that sheep will eat it, and that it cures them of the rot. But from the usual experiments, it appears that though goats eat it, sheep sometimes will and sometimes will not. Cows, horses, and swine, refuse it.

300. DORÆNA.

One species; viz. japonica.

301. HOTTONIA, or *Water-violet*.

Four species; viz. *palustris, sessiliflora, indica, serrata. North of Europe and India.

302. BACOPA.

One species; viz. aquatica. Guiana, Cayenne.

303. HYDROPHYLLUM, *Water-leaf*.

Two species; viz. virginicum, canadense. North America.

304. ELLISIA.

One species; viz. nyctelea. Virginia.

305. LYSIMACHIA, or *Loose-strife*.

15 species; viz. *vulgaris, decurrens, ephemerum, atro-purpurea, dubia, stricta, *thyrsiflora, quadrifolia, punctata, linum, stellatum, mauritiana, *nemorum, japonica, *nummularia. Europe, Japan, N. America.
nummularia. * L. leaves somewhat cordate, flowers solitary, stem creeping.—This species, called *Moneywort*, or *Herb Twopence*, grows spontaneously in moist watery places, and creeps on the ground with two little roundish leaves at each joint. Their taste is subastringent and very slightly acid; hence they stand recommended by Boerhaave in the hot scurvy, and in uterine and other hemorrhagies. But their effects are so inconsiderable, that common practice takes no notice of them.

306. ANAGALLIS, or *Pimpernel*.

Six species; viz. *arvensis, pumila, monelli, latifolia, linifolia, *tenella. Europe, Jamaica.

307. THEOPHRASTA.

Two species; viz. americana, longifolia. Amer.

308. SPIGELIA, or *Worm-grass*.

Two species; viz. anthelmia, marilandica. North America, W. Indies.—This last species grows wild in the southern parts of North America. The roots are celebrated as an anthelmintic, particularly for the expulsion of lumbrici from the alimentary canal. Some order it in doses of ten or fifteen grains, and allege it is apt to occasion nervous affections if given in larger doses; while others order it in dram doses, alleging that the bad effects mentioned more readily happen from small, as the large ones often purge or poke: some prefer the form of infusion. An emetic is gene-

rally premised; and its purgative effect assisted by some suitable additions.

309. OPHIORRHIZA, or *Serpents-tongue*.

Three species; viz. mungos, mitreola, subumbellata. E. Indies, S. America.

310. LISIANTHUS.

15 species; viz. longifolius, glaucifolius cœrulescens, alatus, chelonoides, purpurascens, grandiflorus, exsertus, glaber, frigidus, latifolius, umbellatus, cordifolius, carinatus, trinervius. West Indies, Surinam.

311. FAGRÆA.

One species; viz. zeylanica. Ceylon.

312. AZALEA, or *Amer. Upright Honeysuckle*.

Six species; viz. pontica, indica, nudiflora, viscosa, lapponica, *procumbens. N. Europe, N. America.

313. SHEFFIELDIA.

One species; viz. repens.

314. SPRENGELIA.

One species; viz. incarnata.

315. EPACRIS.

Four species; viz. grandiflora, longifolia, rosmarini-folia, pumila. Caribbee Isles.

316. STYPHELIA.

Eight species; viz. tubiflora, ericoides, strigosa, scoparia, daphnoides, lanceolata, elliptica, juniperina.

317. WEIGELIA.

Two species; viz. japonica, corœensis. Japan.

318. PLUMBAGO, or *Lead-wort*.

Seven species; viz. europœa, lapathifolia, capensis, zeylanica, rosea, scandens, auriculata. S. Europe, E. Indies, S. America.

319. TRIGUERA.

Two species; viz. ambrosiaca, inodora. Isle of Bourbon.

320. PHLOX, or *Base Lychnis, Lichnidea*.

12 species; viz. paniculata, undulata, suaveolens, maculata, pilosa, carolina, glaberrima, divarica, ovata, subulata, sibirica, setacea. Siberia, N. America.

321. RETZIA.

One species; viz. spicata. Cape of Good Hope.

322. PORANA.

One species; viz. volubilis. East Indies.

323. CONVULVULUS, or *Bind-weed*.

120 species; viz. *arvensis, *sepium, wheleri, scammonia, involucratus, sibiricus, rupestris, farinosus, lanuginosus, incanus, emarginatus, medium, filicaulis, tridentatus, angustifolius, japonicus, hastatus, panduratus, bracteatus, bicolor, trilobus, platanifolius, acuminatus, carolinus, hederaceus, nil, purpureus, obscurus, flavus, angularis, batatas, maximus, biflorus, gemellus, striatus, pentanthus, gujanensis, capitatus, hispidus, parvislorus, triflorus, verticillatus, violaceus, umbellatus, tuguriorum, cordifolius, bifidus, malabaricus, coelestis, canariensis, ferrugineus, muricatus, triqueter, anceps, turpethum, grandiflorus, speciosus, trinervius, peltatus, jalapa, macrospermus, tenellus, sericeus, tomentosus, quinqueslorus, hermannie, arenarius, althæoides, cairicus, quinquelobus, copticus, vitifolius, dissectus, mucronatus, macrocarpus,

paniculatus, macrorrhizos, quinquefolius, venosus, glaber, pentaphyllus, tenuifolius, siculus, pentapetaloides, lineatus, saxatilis, cneorum, linearis, cantabrica, amanii, pilosellæfolius, dorycnium, proliferus, lanatus, hystrix, spinosus, scoparius, cænotheroides, floridus, cuneatus, corymbosus, spithameus, persicus, tricolor, acetosæfolius, repens, reptans, edulis, hirtus, * soldanella, imperati, pes capræ, brasiliensis, multifidus, sublobatus, capensis, sagittatus, littoralis, martinicensis. Europe, Asia, Africa, America.

sepium.

* *C.* leaves arrow-shaped, lopped at the base; fruit-stalk four-cornered, bearing 1 flower.—The inspissated juice of this plant, in doses of 20 or 30 grains, is said to be a powerful drastic purge. Scammony is the inspissated juice of a species of convolvulus, so much resembling this, that they are with difficulty distinguished. Though an acrid purgative to the human race, it is eaten by hogs in large quantities without any detriment. Sheep, goats, and horses eat it. Cows refuse it.

soldanella.

* *C.* leaves kidney-shaped; fruitstalks with 1 flower.—It is said, that half an ounce of the juice, or a drachm of the powder of this plant, is an acrid purge. The leaves applied externally, are said to diminish dropsical swellings of the feet. The different species furnish nourishment to the *sphinx convolvuli*, and *phalena elpenor*.

jalap.

The root of the species termed *jalapa*, is brought to us in thin slices from Xalpa, a province of New Spain. Such pieces should be chosen as are most compact, hard, weighty, dark-coloured, and abound most with black circular striæ. Slices of bryony root are said to be sometimes mixed with jalap. These may be easily distinguished by their whiter colour and less compact texture. This root has no smell, and very little taste upon the tongue; but when swallowed it affects the throat with a sense of heat, and occasions a plentiful discharge of saliva. Taken in substance in a dose of about half a drachm, (less or more, according to the circumstances of the patient) in plethoric or cold phlegmatic habits, it proves an effectual, and, in general, a safe purgative; performing its office mildly, seldom occasioning nausea or gripes, which too frequently accompany other strong cathartics. In hypochondriacal cases, and hot bilious temperaments, it gripes violently if the jalap be good; but rarely takes due effect as a purge. An extract made with water purges almost universally, but weakly; and, at the same time, has a considerable effect by urine: the root remaining after this process gripes violently. The pure resin, prepared by spirit of wine, occasions most violent gripings and other distressing circumstances, but proves scarce at all cathartic. Triturated with sugar or with almonds, into the form of an emulsion, or dissolved in spirits and mixed with syrups, it purges plentifully in a small dose, without occasioning much disorder. The part of the jalap remaining after the separation of the resin, yields to water an extract, which has no effect as a cathartic, but operates powerfully by urine.

Frederic Hoffman particularly cautions against giving this medicine to children, and assures us that it will destroy appetite, weaken the body, and perhaps occasion death. In this point this celebrated practitioner was probably deceived. Children, whose veg-

sels are lax, and their food soft and lubricating, bear these kinds of medicines, as Geoffrey observes, better than adults; and, accordingly, inoculators make much use of the tincture mixed with simple syrup. A compound powder of it is employed in dropsy as a hydragogue purge; and where stimulus is not contra-indicated, jalap is considered as a safe cathartic.

The species of the genus convolvulus, called *scammony*, is a climbing plant, which grows in Asiatic Turkey, and affords a gum resin. The best sorts of the gum resin come from Aleppo, in light spongy masses, easily friable, of a shining ash-colour verging to black; when powdered, of a light gray or whitish colour. An inferior sort is brought from Smyrna in more compact ponderous pieces, of a darker colour, and full of sand and other impurities. This juice is chiefly of the resinous kind. Rectified spirit of wine dissolves five ounces out of six; the remainder is a mucilaginous substance mixed with dross: proof spirit totally dissolves it, the impurities only being left. It has a faint and unpleasant smell, and a bitterish somewhat acrimonious taste. Scammony is an efficacious and a strong purgative. Its dose is from three to 12 grains.

324. CANTUA.

Four species; viz. *pyrifolia*, *buxifolia*, *hoitzia*, *coronopifolia*. Peru.

325. IPOMOEA, or *Quamoclit*.

28 species; viz. *quamoclit*, *dissecta*, *umbellata*, *carolina*, *coccinea*, *lacunosa*, *leucantha*, *solanifolia*, *tuberosa*, *digitata*, *bona nox*, *campanulata*, *violacea*, *verticillata*, *carnea*, *repanda*, *filiformis*, *hastata*, *glaucefolia*, *simplex*, *hederacea*, *triloba*, *sanguinea*, *bederifolia*, *parviflora*, *hepaticifolia*, *tamifolia*, *pes tigridis*. E. and W. Indies, America.

326. POLEMONIUM, or *Greek Valerian*.

Five species; viz. * *cæruleum*, *reptans*, *dubium*, *roelloides*, *campanuloides*. N. Eur. Asia, C. of G. Hope, America.

327. LIGHTFOOTIA.

Two species; viz. *oxyccoccoides*, *subulata*. Cape of Good Hope.

328. JASIONE, or *Sheep's Scabious*.

One species; viz. * *montana*. Europe, C. of G. Hope.

329. CAMPANULA, or *Bell-flower*.

85 species; viz. *cenesia*, *uniflora*, *bellardi*, *pulla*, *zoysii*, *gracilis*, *glauca*, *grandiflora*, *tetraphylla*, *triphylla*, *verticillata*, * *rotundifolia*, *linifolia*, *pubescens*, *linarioides*, *carpatia*, *lobelioides*, *porosa*, *undulata*, *linearis*, *sessiliflora*, * *patula*, * *rapunculus*, *unidentata*, *fasciculata*, *persicifolia*, *pyramidalis*, *americana*, *nitida*, *latifolia*, *ensifolia*, *rhomboides*, * *latifolia*, *urticifolia*, *stylosa*, *rapunculoides*, *bononiensis*, *vesula*, *ptarmicæfolia*, *graminifolia*, * *trachelium*, * *glomerata*, *cervicaria*, *marginata*, *thyssoidea*, *petræa*, *adpressa*, *subulata*, *hispidula*, *paniculata*, *cinerea*, *peregrina*, *cernua*, *allionii*, *punctata*, *medium*, *barbata*, *spicata*, *strigosa*, *alpina*, *mollis*, *saxatilis*, *alliarisefolia*, *sibirica*, *tridentata*, *laciniata*, *stricta*, *aurea*, *fruticosa*, *speculum*, * *hybrida*, *prismatocarpus*, *cochlearifolia*, *limonifolia*, *pentagonia*, *perfoliata*, *capensis*, *procumbens*, *tenella*,

tenella, elatines, diffusa, *hederacea, crinoides, heterophylla, erinus. Europe, N. America, Cape, Japan.

* *C. leaves waved*; root-leaves spear-oval; panicle compact.—The roots of this plant are said to be eaten raw in salads, or boiled like asparagus. In gardens they are blanched.

330. ROELLA.

Five species; viz. ciliata, squarrosa, decurrens, muscosa, spicata. Africa.

331. PHYTEUMA, or *Rampions*.

16 species; viz. pauciflora, scheuchzeri, michelli, hemisphaerica, comosa, *orbicularis, nigra, betonicæfolia, spicata, ovata, virgata, lobelioides, lanceolata, rigida, amplexicaulis, pinnata. Europe.

332. TRACHELIUM.

Three species; viz. cœruleum, diffusum, tenuifolium. Italy, Levant, Cape.

333. SAMOLUS, *Water Pimpernel*.

One species; viz. *valerandi. Europe, Asia, America.

334. SPHENOCLEA.

One species; viz. zeylanica.

335. NAUCLEA.

Six species; viz. orientalis, purpurea, parvifolia, africana, aculeata, cordifolia. E. Indies, Guiana.

336. RONDELETIA.

13 species; viz. americana, odorata, trifoliata, virgata, pilosa, thyrsoides, racemosa, laurifolia, tomentosa, umbellulata, incana, hirsuta, hirta. East and West Indies.

337. MACROCNEUM.

Three species; viz. jamaicense, candidissimum, coccineum. Jamaica.

338. BELLONIA.

Two species; viz. aspera and spinosa. America.

339. THOUINIA.

One species; viz. spectabilis. Jamaica, Hispaniola.

340. PORTLANDICA.

Four species; viz. tetrandra, grandiflora, coccinea, hexandra. Jamaica, S. America.

341. SOLANDRA.

One species; viz. grandiflora. Jamaica.

342. LOBELIA, or *Cardinal-flower*.

48 species; viz. linearis, simplex, pinifolia, *dortmanna, tupa, kalmii, paniculata, graminea, grandis, cornuta, depressa, columnæ, arborea, bellidifolia, triquetra, cinerea, longiflora, tomentosa, secunda, acuminata, stricta, patula, asurgens, cardinalis, ferruginea, debilis, siphilitica, sarinamensis, inflata, cliffortiana, *urens, minuta, laurentia, radicans, campanuloides, evinus, erinoides, anceps, repens, thermalis, pubescens, zeylanica, lutea, angulata, hirsuta, pygmæa, coronopifolia, crenata. Cape, East and West Indies, America.

The species called *siphilitica* grows in moist places in Virginia, and bears our winters. It is perennial, has an erect stalk three or four feet high, blue flowers,

a milky juice, and a rank smell. The root consists of white fibres about two inches long, resembles tobacco in the taste, which remains on the tongue, and is apt to excite vomiting. It is used by the North American Indians as a specific for the venereal disease. The form is that of decoction; the dose of which is ordered to be gradually increased till it bring on very considerable purging, then to be intermitted for a little, and again used in a more moderate degree till the cure be completed. The ulcers are also washed with the decoction, and the Indians are said to sprinkle them with the powder of the inner bark of the spruce tree. The same strictness of regimen is ordered as during a salivation or mercurial course. The benefit to be derived from this article has not, so far as we know, been confirmed either in Britain, or by the practitioners of Virginia; for there, as well as in this country, recourse is almost universally had to the use of mercury. Hence the London college have omitted it in their list of medical plants; though in some cases it would seem to deserve trial.

343. CYPHIA.

Six species; viz. volubilis, digitata, bulbosa, cardamines, incisa, phyteuma.

344. GOODENIA.

Nine species; viz. ovata, albida, lævigata, paniculata, bellidifolia, stricta, ramosissima, heterophylla, hederacea.

345. SÆVOLA.

Three species; viz. lobelia, koengii, sericea. South America.

346. CINCHONA, or *Jesuits-bark Tree*.

Nine species; viz. officinalis, pubescens, macrocarpa, caribæa, corymbifera, lineata, floribunda, brachycarpa, angustifolia. Peru, West Indies, South sea.

The *cinchona officinalis* (Peruvian or Jesuits-bark tree) is described as being in general about 15 feet high and six inches thick. It somewhat resembles our cherry tree, grows promiscuously in forests, particularly in the hilly parts of Quito in Peru, and is spontaneously propagated from its own seeds. The bark has some odour, to most people not unpleasant, and very perceptible in the distilled water, in which floating globules, like essential oil, have been observed. Its taste is bitter and astringent, accompanied with a degree of pungency, and leaving a considerably lasting impression on the tongue. Two sorts are mentioned, viz. the coloured and the white. The coloured includes the pale, the red, the yellow, and the knotty; their barks being coloured, having the cinchona taste and smell, and the trees having very smooth leaves and purplish flowers. The white includes four varieties, their barks being of a whitish colour, with very little taste or smell, and the trees having broad hairy leaves, very fragrant red flowers, with hairs on the inside. The proper red bark, and one of the white kinds, have been found in the province of Santa Fe.

Dr Wright has described very accurately a species of cinchona, under the appellation of *cinchona jamaicensis*, from its being found chiefly in Jamaica. It is there called the *sea-side becch*, and grows from 20 to

40 feet high. The white-furrowed thick outer bark is not used; the dark-brown inner bark has the common flavour, with a mixed kind of taste at first of the horse-radish and ginger, becoming at last bitter and astringent. It seems to give out more extractive matter than the officinalis. Some of it was imported from St Lucia, in consequence of its having been successfully used in the army and navy; and Dr Kentish has treated of it at great length, under the name of *St Lucia bark*. When fresh, it is considerably cathartic and emetic, but is said to lose these properties on drying.

The pale and the red are chiefly used in Britain. The pale is brought to us in pieces of different sizes, either flat or quilled, and the powder is rather of a lighter colour than that of cinnamon. The red is generally in much larger thicker flattish pieces, but sometimes also in the form of quills, and its powder is reddish, like that of the Armenian bole. It is much more resinous, and possesses the sensible qualities of the cinchona in a much higher degree, than the other sorts; and the more nearly the other kinds resemble the red bark, the better they are now considered. The red bark is heavy, round, and dry; friable between the teeth; does not separate into fibres; and breaks, not shivery, but short, close, and smooth. It has three layers; the outer is thin, ragged, of a reddish-brown colour, but frequently covered with mossy matter; the middle is thicker, more compact, darker-coloured, very resinous, brittle, and yields first to the pestle. The inmost is more woody, fibrous, and of a brighter red.

The Peruvian bark yields its virtues both to cold and boiling water; but the decoction is thicker, gives out its taste more readily, and forms an ink with a chalybeate more suddenly, than the fresh cold infusion. This infusion, however, contains at least as much extractive matter, but more in a state of solution; and its colour, on standing some time with the chalybeate, becomes darker, while that of the decoction becomes more faint. When they are of a certain age, the addition of a chalybeate renders them green; and when this is the case, they are found to be in a state of fermentation, and effete. Mild or caustic alkalies, or lime, precipitate the extractive matter, which in the case of the caustic alkali is re-dissolved by a farther addition of the alkali. Lime-water precipitates less from a fresh infusion, than from a fresh decoction; and in the precipitate of this last some mild earth is perceptible. The infusion is by age reduced to the same state with the fresh decoction, and then they deposit nearly an equal quantity of mild earth and extractive matter; so that lime-water, as well as chalybeate, may be used as a test of the relative strength and perishable nature of the different preparations, and of different barks. Accordingly, cold infusions are found, by experiments, to be less perishable than decoctions; infusions and decoctions of the red bark than those of the pale: those of the red bark, however, are found, by length of time, to separate more mild earth with the lime-water, and more extractive matter. Lime-water, as precipitating the extract, appears an equally improper and disagreeable menstruum.

The power of different menstrua, as acting upon Peruvian bark, is comparatively in the following order; the most powerful solvent being placed first.

1. Dulcified spirit of vitriol,
2. Caustic ley,
3. French brandy,
4. Soft water,
5. Vinegar and water,
6. Dulcified spirit of nitre,
7. Mild volatile alkali,
8. Rectified spirit of wine,
9. Mild vegetable alkali,
10. Lime water.

The antiseptic powers of vinegar and bark united, are double the sum of those taken separately. The astringent power of the bark is increased by acid of vitriol; the bitter taste is destroyed by it. The officinal preparations of the bark are,

1. The powder. Of this, the first parcel that passes the sieve, being the most resinous and brittle layer, is the strongest.
2. The extract. The watery and spirituous extracts conjoined form the most proper preparations of this kind.
3. Spirituous tincture. This is best made with proof spirit.
4. The decoction. This preparation, though frequently employed, is inferior to a simple watery infusion.

The best form is that of powder; in which the constituent parts are in the most effectual proportion. The cold infusion, which can be made in a few minutes by agitation, the spirituous tincture, and the extract, are likewise proper in this respect. For covering the taste, different patients require different vehicles, liquorice, aromatics, acids, port-wine, small beer, porter, butter milk, brandy, rum, currant-jelly, &c.

According to some, the Peruvians learned the use of the bark, by observing certain animals affected with intermittents, instinctively led to it; while others say, that a Peruvian, having an ague, was cured by having drank of a pool, in which some felled trees had so long soaked, as to give the taste of their bark to the water: and its use in gangrene is said to have originated from its curing one in an aguish patient. About the year 1640, the lady of the Spanish viceroy, the Comitissa del Cinchon, was cured by the bark, which has therefore been called *cortex* or *pulvis comitissæ*, *cinchona*, *chinachina* or *chinchina*, *kinakina* or *kinkina*, *quinaquina* or *quinquina*; and from the interest which the cardinal de Lugo and the Jesuits took in its distribution, it has been called *cortex* or *pulvis Cardinalis de Lugo*, *Jesuiticus*, *Patrum*, &c.

As it was first introduced into practice for the cure of intermittent fevers, so it seldom fails of success, when properly exhibited in these. Practitioners, however, have differed as to the best mode of exhibiting it; some prefer giving it just before the fit, some during the fit, others immediately after it. Some again, order it in the quantity of an ounce between the fits, the dose being the more frequent and larger, according to the frequency of the fits: and this mode of exhibition, although it may sometimes lead to the employment of more bark than is necessary, is thought, upon the whole, preferable, from being the best suited to most stomachs. The requisite quantity is very different in different cases, and in many vernal intermittents it seems even hardly necessary.

It often pukes and purges, and sometimes oppresses the stomach. These, or any other irregular effects that may take place, are to be counteracted by remedies particularly appropriated to them. Thus, vomit-

ing

ing is often restrained by exhibiting it in wine; looseness, by combining it with opium; and oppression at stomach, by combining it with an aromatic. But, unless for obviating particular occurrences, it is more successful when exhibited in its simplest state, than with any addition.

It is now given from the very commencement of the disease, and is to be continued, not only till the paroxysms cease, but till the natural appetite, strength, and complexion, return. Its use is then to be gradually left off, and repeated at proper intervals to secure against a relapse, to which there is a tendency, especially when the wind blows from the east. An emetic is often advantageously employed before commencing the use of it, but other evacuates seem hurtful.

The Peruvian bark seems not only suited to intermittent fevers, both latent and formed, but to that state of the constitution on which all diseases, rigidly periodical, seem to depend; as periodical pain, inflammation, hæmorrhagy, spasm, cough, loss of external sense, &c. Bark is now used by some in all continued fevers, taking care to keep the bowels clean, and to promote, when necessary, the evacuation of redundant bile. In confluent smallpox it promotes languid eruption and suppuration, diminishes the fever through the whole course of it, and prevents or corrects putrescence or gangrene. In gangrenous sore throats it is much used, as it is externally and internally in all cases of gangrene. In contagious dysentery, after due evacuation, it has been used by the mouth, and by injection, with and without opium.

In all those hæmorrhagies called *passive*, which all hæmorrhagies are very apt to become, and likewise in all other increased discharges, it is much used; and, in certain undefined cases of hæmoptysis, some allege that it is remarkably effectual, when joined with an absorbent. It is used for obviating the disposition to nervous and convulsive diseases; and some have great confidence in it, joined with the acid of vitriol, in cases of phthisis, scrofula, ill-conditioned ulcers, rickets, scurvy, and in states of convalescence. In these cases, however, it ought, in general, to be joined with a milk diet.

In dropsy, not depending on any particular local affection, it is often alternated or conjoined with diuretics or other evacuates; and by its early exhibition after the water is drawn off, or even begins to be freely discharged, a fresh accumulation is prevented, and a radical cure obtained. In obstinate venereal cases, particularly those which appear under the form of pains in the bones, the Peruvian bark is often successfully subjoined to mercury, or even given in conjunction with it. On the whole this remedy is useful in such a vast variety of cases, that its virtues cannot be sufficiently explained, by considering it merely as an ordinary tonic or astringent; and hence many practitioners consider it as possessing specific qualities peculiar to itself, the nature of which is by no means well understood.

347. SOLENA.

One species; viz. *longiflora*.

348. UCRIANA.

One species; viz. *speciosa*.

349. PSYCHOTRIA, or *Ipecacuanha*.

39 species; viz. *asiatica*, *glabrata*, *axillaris*, *laurifolia*, *parviflora*, *hirsuta*, *foetens*, *citrifolia*, *nitida*, *marginata*, *tenuifolia*, *nervosa*, *carthaginensis*, *myristiphylum*, *laxa*, *parasitica*, *horizontalis*, *nutans*, *speciosa*, *involucrata*, *flexuosa*, *racemosa*, *violacea*, *brachiata*, *grandis*, *patens*, *uliginosa*, *serpens*, *herbacea*, *emetica*, *corymbosa*, *pubescens*, *pedunculata*, *crocea*, *alpina*, *paniculata*, *palicurea*, *lutea*, *longiflora*. E. and W. Indies, S. America, China.

The root of the *Psychotria emetica*, or common ipecacuan is brought from the Spanish W. Indies. It is divided into two sorts, the Peruvian and Brazilian: but the eye distinguishes three; ash-coloured or gray, brown, and white. The ash-coloured or Peruvian ipecacuan of the shops is a small wrinkled root, bent and contorted into a great variety of figures; brought over in short pieces full of wrinkles, and deep circular fissures, quite down to a small white woody fibre that runs in the middle of each piece. The cortical part is compact, brittle, looks smooth and resinous upon breaking. It has very little smell: the taste is bitterish and subacid, covering the tongue as it were with a kind of mucilage. The brown is small and somewhat more wrinkled than the foregoing; of a brown or blackish colour without and white within: this is brought from Brasil. The white sort is woody and has no wrinkles, and no perceptible bitterness in taste. The first sort, the ash-coloured or gray ipecacuan, is that usually preferred for medicinal use. The brown has been sometimes observed, even in a small dose, to produce violent effects. The white, though taken in a large one, has scarce any effect at all: Mr Geoffrey calls this sort bastard ipecacuan, and complains that it is an imposition upon the public. Geoffrey, Newman, Dale, and Sir Hans Sloane inform us, that the roots of a kind of *Apocynum* (dog's-bane) are frequently brought over instead of it; and instances are given of ill consequences following from the use of these roots. If the marks above laid down, particularly of the ash-colour, brittleness, deep wrinkles, and bitterish taste, be carefully attended to, all mistakes of this kind may be prevented.

Ipecacuan was first brought to Europe about the middle of the century before the last, and an account of it published about the same time by Piso; but it did not come into general use till about the year 1686, when Helvetius, under the patronage of Lewis XIV. introduced it into practice. This root is one of the mildest and safest emetics with which we are acquainted; and has this peculiar advantage, that if it should not operate by vomit, it passes off by the other emunctories. It was first introduced among us with the character of an almost infallible remedy in dysenteries and other inveterate fluxes, as menorrhagia and leucorrhœa, and also in disorders proceeding from obstructions of long standing: nor has it lost much of its reputation by time. In dysenteries it almost always produces happy effects, and often very speedily performs a cure. In other fluxes of the belly, in beginning dysenteries, and such as are of a malignant kind, or where the patient breathes a tainted air, it has not been equally successful: in these cases it is necessary to continue the use of this medicine for several days, and to join with it opiates, diaphoretics, and the like. This root given in substance is as effectual, if not more so, than any of the preparations

rations of it: the pure resin acts as a strong irritating emetic, but is of little service in dysenteries; whilst an extract prepared with water, is almost of equal service in these cases with the root itself, though it has little effect as an emetic. Geoffrey concludes from hence that the chief virtue of ipecacuan in dysenteries depends upon its gummy substance, which, lining the intestines with a soft mucilage when their own mucus has been abraded, occasions their exulcerations to heal, and defends them from the acrimony of the juices; and that the resinous part, in which the emetic quality resides, is required where the morbid matter is lodged in the glands of the stomach and intestines. Water assisted by a boiling heat takes up from all vegetables a considerable portion of resinous along with the gummy matter: if the ipecacuan remaining after the action of water be digested with pure spirit, it will not yield half so much resin as at first; so that the aqueous extract differs from the crude root only in degree, being proportionably less resinous, and having less effect both as an emetic, and in the cure of dysenteries. The virtues of ipecacuan in this disorder depend on its producing perspiration, the freedom of which here is of the utmost importance, and an increase of which, even in healthful persons, is generally observed to decrease the evacuation by stool. In dysenteries the skin is for the most part dry and tense, and perspiration obstructed: the common diaphoretics pass off without effect through the intestinal canal; but ipecacuan, if the patient after a puke or two be covered up warm, brings on a plentiful sweat. After the removal of the dysentery, it is necessary to continue the use of the medicine for some time longer, in order to prevent a relapse; for this purpose a few grains divided into several doses, so as not to occasion any sensible evacuation, may be exhibited every day: by this means the cure is effectually established. And indeed small doses given even from the beginning have been found to have better effects in the cure of this disease than larger ones. The only officinal preparation of this root is a tincture made in wine, which has the appellation of *Vinum Ipecacuanhae* both in the London and Edinburgh Pharmacopoeias. Ipecacuan, particularly in the state of powder, is now advantageously employed in almost every disease in which full vomiting is requisite; and when combined with opium, it furnishes us with the most useful and active sweating medicine that we possess. It is also often given with advantage in small doses, so as neither to operate by vomiting, purging, nor sweating. The full dose of the powder is a scruple or half a dram, and double that in form of watery infusion. The full dose is recommended in the paroxysm of spasmodic asthma, and a dose of three or four grains every morning in habitual asthmatic indisposition: a dose of one-third or half a grain rubbed with sugar, and given every four hours or oftener is recommended in uterine hæmorrhage, cough, pleurisy, hæmoptoe, &c. and has often been found highly serviceable. Dr Irving found that by long boiling, the activity of the root is almost totally destroyed; but that its emetic property was most effectually counteracted by means of the acetous acid; inasmuch that 30 grains of the powder, taken in two ounces of vinegar, produced only some loose stools.

350. CHIMARRHIS.

One species; viz. *cymosa*. Martinico.

351. DENTELLA.

One species; viz. *repens*. South sea isles.

352. VIRECTA.

One species; viz. *biflora*. Cayenne, Surinam.

353. COFFEA, or *Coffee-tree*.

Eight species; viz. *sambucina*, *opulina*, *odorata*, *arabica*, *triflora*, *gujanensis*, *paniculata*, *occidentalis*. Yemen in Arabia, W. Indies, S. America.

The coffee arabica, though it came originally from Arabia, is now cultivated in the West Indies. Its fruit is employed rather as food than as a medicine. The medical effects expected from it are to assist digestion, promote the natural secretions, and prevent or remove a tendency to sleepiness. It has been recommended in spasmodic asthma; and in some cases it is found highly useful in alleviating severe headach. In the influenza, or epidemic complaint of spring 1803, the use of coffee as the chief article of food was found to be attended with the best effects, particularly in removing that extreme debility which was the most universal and remarkable symptom of the disease.

354. CHIOCOCCA, or *Snow-berry*.

Two species; viz. *racemosa* and *barbata*. Jamaica, S. America.

355. VANGUERIA.

One species; viz. *edulis*. Isle of Madagascar.

356. CANEPHORA.

Two species; viz. *axillaris* and *capitata*. Madagascar.

357. CEPHÆLIS.

12 species; viz. *violacea*, *tomentosa*, *punicea*, *elata*, *axillaris*, *purpurea*, *alba*, *glabra*, *involucrata*, *tetrandra*, *sessiliflora*, *muscosa*.

358. BERTIERA.

One species; viz. *gujanensis*.

359. HAMELLIA.

Five species; viz. *patens*, *axillaris*, *chrysantha*, *ventricosa*, *sessiliflora*. S. America, W. Indies.

360. SCHWENKFELDIA.

Three species; viz. *hirta*, *cinerea*, *aspera*. West Indies.

361. LONICERA, or *Honeysuckle*.

20 species; viz. *caprifolium*, *dioica*, *sempervirens*, *grata*, *implexa*, * *periclymenum*, *japonica*, *nigra*, *quadrifolia*, *tatarica*, * *xylosteum*, *pyrenaica*, *alpigena*, *cærulea*, *orientalis*, *flexuosa*, *symphoricarpos*, *diervilla*, *bulbina*, *corymbosa*. Eur. Cape, Japan, N. Amer.

* L. heads egg-shaped, tiled, terminating; leaves *di-periclymen-stinct*, deciduous; blossom gaping.—The beauty and *num.* fragrance of the flowers of this plant render it a pleasing ornament to our gardens, hedges, and arbours. Cows, goats, and sheep, eat it; horses refuse it. Various insects feed upon it.

* L. fruitstalks 2-flowered; berries distinct; leaves *xylosteum*. very entire, pubescent. In the north of Europe this is a common plant; Linnæus informs us it makes excellent garden hedges in a dry soil: that the clear parts between the joints of the shoots are used in Sweden as tubes for tobacco pipes, and that the wood being extremely hard makes teeth for rakes, &c.

362. **TRIOSTEUM**, or *Fever-root, Tinker's Weed*.
Three species; viz. *perfoliatum*, *angustifolium*, *triflorum*.

363. **MORINDA**.
Three species; viz. *umbellata*, *citrifolia*, *royoc*.

364. **BÆBOTRUS**.
Two species; viz. *memoralis* and *lanceolata*.

365. **STROEMIA**.
Four species; viz. *farinosa*, *tetrandra*, *glandulosa*, *rotundifolia*. Arabia.

366. **CONOCARPUS**, or *Button-tree*.
Three species; viz. *erecta*, *procumbens*, *racemosa*.
W. Indies, Brazil.

367. **SCHOEPFIA**.
One species; viz. *americana*.

368. **ERITHALIS**.
Two species; viz. *fruticosa*, *polygama*. Jamaica,
S. America.

369. **MENAI**.
One species; viz. *topiaria*. S. America.

370. **MUSSËNDA**.
Two species; viz. *frondosa*, *glabra*.

371. **GENIOSTOMA**.
One species; viz. *rupestris*. South sea isles.

372. **MATHIOLA**.
One species; viz. *scabra*.

373. **MIRABILIS**, or *Marvel of Peru*.
Three species; viz. *dichotoma*, *longiflora*, and *ialapa*.
E. and W. Indies, Mexico, Peru.

374. **CORIS**, or *Heath Low Pine*.
One species; viz. *monspeliensis*. S. of Europe.

375. **BROSSËA**.
One species; viz. *coccinea*. S. America.

376. **VERBASCUM**, or *Mullein*.
17 species; viz. * *thapsus*, * *thapsoides*, *boerhaavii*,
hæmorrhoidale, *phomoides*, * *lychnitis*, *ferrugineum*,
* *nigrum*, *phœniceum*, * *blattaria*, *gallicum*, *sinuatum*,
pinnatifidum, *barnadesii*, *osbeckii*, *spinosum*, *miconi*.
S. of Europe, Madeira.

thapsus. * V. leaves decurrent, cottony on both sides; stem unbranched; summit globular.—This plant externally used is said to be emollient. Dr Home advises a decoction of it, two ounces to a quart, in diarrhœas of an old standing. It eases the pains of the intestines: it is used as an injection in tenesmus with advantage; and is often applied externally to the piles. It is said to intoxicate fish so that they may be taken with the hand. In Norway they give it to cows that are consumptive. The down serves for tinder. Neither cows, goats, sheep, horses or swine will eat it.

377. **DATURA**, or *Thorn-apple*.
Seven species; viz. *ferox*, * *stramonium*, *tatula*, *fastuosa*, *metel*, *lævis*, *arboorea*. Europe, Asia, Africa, America.

stramonium. * D. seed-vessel thorny, upright, egg-shaped; leaves egg-shaped, smooth.—At night the leaves, particularly the upper ones, rise up and enclose the flowers. An ointment prepared from the leaves gives ease in external
VOL. IV. Part I. †

nal inflammations and hemorrhoids. The Edinburgh college directs an extract to be prepared by evaporating the expressed juice of the leaves. This has been given with great advantage in convulsive affections and epilepsies: out of 14 epileptic patients, 8 were entirely cured by it at Stockholm. The dose from 2 to 16 grains a day. The seeds or leaves given internally bring on delirium, tremors, swelling, itching, eruption, and inflammation on the skin; these effects were produced by a dose of a drachm and a half in a girl nine years old. Cows, goats, sheep, and horses, refuse it.

378. **HYOSCYAMUS**, or *Henbane*.
Eight species; viz. * *niger*, *reticulatus*, *albus*, *aureus*, *muticus*, *pusillus*, *physaloides*, *scopolia*. S. Europe, Siberia, Persia.

* H. leaves embracing the stem, indented flowers *sit-nigra*. ting.—The seeds, the leaves, and the roots taken internally are reputed poisonous; and well-attested instances of their bad effects are recorded: madness, convulsion, and death, are the general consequences. But Dr Smith says, he has often eaten the seeds with impunity. It is said that the leaves scattered about a house will drive away mice. The Edinburgh college order the expressed juice of the plant to be evaporated to an extract: and perhaps in this state it may be advantageously joined with opium, where the effects of that medicine are desirable, and costiveness is to be avoided. There is no doubt of its being an useful medicine under proper management. The dose is from half a scruple to half a drachm. Goats are not fond of it; horses, cows, sheep, and swine refuse it; sheep are, however, said sometimes to eat it when young: *Chrysomela hyoscyami* and the *cimex hyoscyami* are found upon it.

379. **NICOTIANA**, or *Tobacco*.
Seven species; viz. *tabaccum*, *fruticosa*, * *rustica*, *paniculata*, *urens*, *glutinosa*, *pusilla*. America, China.

The species called *N. tabaccum* was first brought into Europe about the year 1560 from the island of Tobago in America; and is now sometimes cultivated for medicinal uses in our gardens, but in general imported from America in large quantities. The leaves are about two feet long, of a pale green colour while fresh, and when carefully dried of a lively yellowish cast. They have a strong disagreeable smell, like that of the narcotic plants, and a very acrid burning taste. Taken internally, they prove virulently cathartic and emetic, occasioning almost intolerable cardialgic anxieties. By boiling water their virulence is abated, and at length destroyed: an extract made by long coction is recommended by Stahl and other German physicians, as a safe and most effectual aperient, expectorant, detergent, &c.; but this medicine, which is extremely precarious and uncertain in strength, has never come into esteem among us. Of late, however, tobacco, under the form of a vinous or watery infusion, and taken in such small doses as to produce little effect from its action on the stomach, has been recommended by Dr Fowler. He found it to be a very useful and powerful diuretic, and published many cases of dropsy and dysury in which its employment was attended with the best effects. These good effects have been confirmed by the observation of other physicians.

Tobacco is sometimes used externally in unguents for destroying cutaneous insects, cleansing old ulcers, &c.

Beaten into a mash with vinegar or brandy, it has sometimes proved serviceable in removing hard tumours of the hypochondres. Injections by the anus of the smoke or decoction have been used with advantage in cases of obstinate constipation threatening ileus, of incarcerated hernia, of ascarides, of spasmodic asthma, and of persons apparently dead from drowning or other sudden causes. It has been used internally in form of syrup, conserve, and infusion, in cases of worms, epilepsy, amenorrhœa, asthma, &c.; but it is certainly too active to be thus ventured on.

The *N. rustica* is found wild on dunghills in several parts of England. It is said to be often substituted in the market for true tobacco, from which, however, it may be known by the leaves being much smaller and the flowers not reddish like those of the proper sort, but of a yellowish green colour.

380. JABOROSA.

Two species; viz. *integrifolia*, *runcinata*. Monte Video, Buenos Ayres.

381. ATROPA, or *Deadly Nightshade*.

Seven species; viz. *mandragora*, **belladonna*, *physaloides*, *procumbens*, *solanacea*, *arborescens*, *frutescens*. Europe, Peru, Lima.

belladonna.

* *A.* stem herbaceous; leaves egg-shaped, entire.—The whole of this plant is poisonous; and children, allured by the beautiful appearance of the berries, have too often experienced their fatal effects. Tumours of the breasts, even of the cancerous kind, are said to have been resolved by a topical application of the fresh leaves. Dr Graham says he found great benefit from a poultice made of the roots, boiled in milk, and applied to hard ill-conditioned tumours and ulcers: and relates a deplorable case in which this poultice effected a perfect cure. There is no doubt but their external application may be productive of good effects in several cases, but the following instance shows us that their application is dangerous when the skin is broken: A lady who had a small ulcer, a little below one of her eyes, which was supposed to be of a cancerous nature, put a small bit of the green leaf upon it. In the morning the uvea of that eye was so affected, that the pupil would not contract even by the brightest light; whilst the other eye retained its usual powers. The leaf being removed, the eye was gradually restored to its former state. This could not be an accidental effect, for it was repeated three separate times, and the same circumstances attended each application. The juice of the ripe berries stains paper of a beautiful and durable purple.

Med. Com. mun. vol. i. p. 419.

382. PHYSALIS, or *Alkekengi Winter Cherry*.

17 species; viz. *somnifera*, *aristata*, *flexuosa*, *arborescens*, *curassavica*, *tomentosa*, *viscosa*, *pennsylvanica*, *alkekengi*, *peruviana*, *angulata*, *pubescens*, *barbadensis*, *chenopodiifolia*, *minima*, *pruinosa*, *prostrata*. Europe, E. and W. Indies, Carolina.

383. SOLANUM, or *Nightshade*.

83 species; viz. *laurifolium*, *verbascifolium*, *aureolatum*, *pubescens*, *bombense*, *pseudo-capsicum*, *microcarpum*, *terminale*, *pauciflorum*, *diphyllum*, *fugax*, *geminatum*, *retrofractum*, *stellatum*, **dulcamara*, *triquetrum*, *scandens*, *lyratum*, *tegore*, *quercifolium*, *laciniatum*, *radicans*, *havannense*, *triste*, *racemosum*, *co-*

rymbosum, *quadrangulare*, *repandum*, *bonariense*, *macrocarpon*, *tuberosum*, *pimpinellifolium*, *lycopersicum*, *pseudo-lycopersicum*, *peruvianum*, *montanum*, *rubrum*, *nodiflorum*, **nigrum*, *æthiopicum*, *melongena*, *subinerms*, *longiflorum*, *muricatum*, *insaanum*, *torvum*, *volubile*, *ferox*, *campechiense*, *fuscatum*, *mamosum*, *hirtum*, *paniculatum*, *aculeatissimum*, *virginianum*, *aquini*, *xanthocarpum*, *coagulans*, *jamaicense*, *indicum*, *carolinense*, *sinuatum*, *sodomeum*, *capense*, *margiuatum*, *stramonifolium*, *vespertilio*, *sanctum*, *hybridum*, *tomentosum*, *polygamum*, *bahamense*, *obscureum*, *giganteum*, *flexuosum*, *lanceifolium*, *lanceolatum*, *eleganifolium*, *polyacanthos*, *igneum*, *milleri*, *trilobatum*, *lycioides*. Eur. Asia, Africa, Amer.

* *S.* stem without prickles, rather shrub-like, zigzag: *dulcamara* upper leaves halberd-shaped: flowers in tuft-like bunches. *ra.*

—Boerhaave says it is a medicine far superior to china and sarsaparilla as a sweetener and restorative. Linnæus says, an infusion of the young twigs is an admirable medicine in acute rheumatisms, inflammations, fevers, and suppression of the lochia. Dr Hill says he has found it very efficacious in the asthma. Dr Hallenberg advises it in ischiatic and rheumatic pains, jaundice, scurvy, and lues venerea. He directs a pint of boiling water to be poured upon two drachms of the stalks sliced and dried after standing half an hour. It must be boiled 15 minutes. The dose is two cups full or more, morning and evening. The stalks may be gathered early in spring, or at the end of autumn. The root has the smell of the potato. Sheep and goats eat it; horses, cows, and swine refuse it.

* *S.* stem without prickles, herbaceous; leaves egg-shaped, toothed, angular, bunches nodding, pointing two ways.—From one to three grains of the leaves infused in boiling water and taken at bed-time occasions a copious perspiration, increases the secretion by the kidneys, and generally purges more or less the following day. These properties judiciously applied render it capable of doing essential service in several diseases. But its effects on the nervous system are so uncertain, and sometimes so considerable, that it must ever be administered with the greatest caution. The leaves, externally applied, abate inflammation and assuage pain. The flowers smell like musk. Horses, cows, goats, sheep, and swine refuse it.

384. CAPSICUM, or *Guinea Pepper*.

Six species; viz. *annuum*, *baccatum*, *sinense*, *grossum*, *frutescens*, *cerasiforme*. E. and W. Ind.—The *capsicum annum* is cultivated in our gardens. It ripens its seeds in September and October. The taste of capsicum is extremely pungent and acrimonious, setting the mouth as it were on fire. It is chiefly employed for culinary purposes, and has long been used in that way; but of late it has been employed also in the practice of medicine. And there can be little doubt that it furnishes us with one of the purest and strongest stimulants which can be introduced into the human stomach, while at the same time it has nothing of the narcotic effect of ardent spirit. Dr Mackitrick Adair, who was perhaps the first that employed it as a medicine, directs its being given to the extent of six or eight grains under the form of pills, or under the form of tincture, by infusing half an ounce in a pound of rectified spirit, and giving this from one to three drachms, diluted,

dilated, for a dose. He found it useful in a variety of affections, particularly in that morbid disposition which he calls the *cachexia africana*, and which he considers as a most frequent and fatal predisposition to disease among the slaves. This pepper has also been successfully employed in a species of cynanche maligna (putrid sore throat), which proved fatal in the W. Indies, resisting the use of Peruvian bark, wine, and the other remedies commonly employed. A variety of it, called in the West Indies *bird-pepper*, is the basis of a powder brought us from thence under the name of cayen pepper.

385. STRYCHNOS, or *Poison-nut*.

Three species; viz. *nux-vomica*, *calubrina*, *potatorum*. E. Indies.

386. IGNATIA, or *St Ignatius's Beans*.

One species; viz. *amara*. India.

387. CESTRUM.

11 species; viz. *laurifolium*, *nocturnum*, *parqui*, *auriculatum*, *scandens*, *vespertinum*, *diurnum*, *venenatum*, *tomentosum*, *hirtum*, *latifolium*. W. Indies, Péru.

388. LYCIUM, or *Box-thorn*.

11 species; viz. *afrum*, *rigidum*, *ruthenicum*, *tetrandrum*, *barbarum*, *cinereum*, *europæum*, *horridum*, *barbatum*, *boerhaavisefolium*, *capsulare*. Europe, Asia, Africa, America.

389. SERISSA.

One species; viz. *fetida*.

390. CRYPTOSTOMUM.

One species; viz. *laurifolium*. Guiana.

391. ARDISIA, or *Aderno*.

Nine species; viz. *tinifolia*, *coriacea*, *serrulata*, *acuminata*, *humilis*, *solanacea*, *lateriflora*, *excelsa*, *parasitica*. Madeira, Ceylon, W. Indies.

392. JAQUINIA.

Five species; viz. *arboorea*, *armillaris*, *venosa*, *ruscifolia*, *linearis*. W. Indies, S. America.

393. BASSOVIYA.

One species; viz. *sylvatica*. Guiana.

394. CHIRONIA.

16 species; viz. *trinervia*, *jasminoides*, *lychnoides*, *nudicaulis*, *campanulata*, *angularis*, * *pulchella*, *chilensis*, * *centaurium*, *inaperta*, *maritima*, *spicata*, *linoides*, *baccifera*, *frutescens*, *tetragona*. Ceylon, Cape, N. America.

centaurium.

* *C. herbaceus*; leaves spear-shaped; calyx shorter than the tube of the blossom.—This plant is extremely bitter. It is the basis of the famous Portland powder, which prevents fits of the gout, when taken in a large quantity, and a long time together; but brings on hardness of the liver, palsy, and apoplexy. A tincture of the leaves, and the upper part of the root, is a good medicine in weak stomachs and cachectic habits. A decoction of the whole plant destroys lice, and cures the itch. Cows are not fond of it, and in sheep-pasture it is frequently left untouched.

395. LITA.

Two species; viz. *rosea*, *cœrulea*.

396. CORDIA, or *Sebesten Plum*.

18 species; viz. *myxa*, *obliqua*, *monoica*, *spinescens*, *sebestena*, *aspera*, *dichotoma*, *geracanthus*, *flavescens*,

toquere, *macrophylla*, *micranthus*, *elliptica*, *colococca*, *hirsuta*, *tetrandra*, *patagonula*, *tetraphylla*. Guiana.

397. EHRETIA, or *Base Cherry tree*.

Nine species; viz. *tinifolia*, *aspera*, *lævis*, *internodis*, *spinosa*, *beurreria*, *virgata*, *exsucca*, *buxifolia*. W. Indies, S. America.

398. VARRONIA.

Nine species; viz. *lineata*, *bullata*, *mirabiloides*, *martenicensis*, *globosa*, *curassavica*, *angustifolia*, *alba*, *monosperma*. W. Indies, S. America.

399. LAUGERIA.

Five species; viz. *odorata*, *lucida*, *coriacea*, *resinosa*, *tomentosa*. W. Indies, S. America.

400. CHRYSANTHEMUM, or *Star-apple*.

Seven species; viz. *cainito*, *monopyrenum*, *microcarpum*, *argenteum*, *rugosum*, *pyriforme*, *glabrum*. W. Indies, S. America.

401. BUMELIA.

12 species; viz. *nigra*, *pallida*, *tenax*, *retusa*, *foetidissima*, *salicifolia*, *mangillo*, *montana*, *nervosa*, *pentagona*, *rotundifolia*, *cuneata*. W. Indies.

402. TECTONA, or *Indian Oak* or *Teak-wood*.

One species; viz. *grandis*.—The teak-wood is extremely valuable for ship-building, on account of its resisting in the Indian seas the worms which so speedily destroy oak and all other sorts of timber. That which is used at Calcutta is chiefly or rather entirely imported from Rangoon, a port belonging to the Birman empire in the eastern peninsula of India. See ASIA, N° 106.

403. SIDEROXYLON, or *Iron-wood*.

Nine species; viz. *mite*, *inermis*, *melanopheum*, *cy-mosum*, *sericeum*, *argenteum*, *tomentosum*, *lycioides*, *decandrum*. Morocco, Cape, N. America.

404. SCHREBERA.

One species; viz. *albena*. C. of G. Hope.

405. RHAMNUS, or *Buck-thorn*.

32 species; viz. * *catharticus*, *infectorius*, *lycioides*, *erythroxyton*, *eleoides*, *crenulatus*, *saxatilis*, *theezans*, *sarcomphalus*, *ferreus*, *levigatus*, *tetragonus*, *polifolius*, *valentinus*, *cubensis*, *colubrinus*, *dauricus*, *alpinus*, *pumilus*, * *frangula*, *latifolius*, *glandulosus*, *ellipticus*, *prinooides*, *mystacinus*, *almifolius*, *sphaerospermus*, *hybridus*, *alaternus*, *carpinifolius*, *capensis*, *circumscissus*. Europe, E. and W. Indies, Africa, N. America.

* R. thorns terminating: flowers 3-cleft; male and *catharticus* female on different plants: leaves egg-shaped; stem *cus*. upright.—A purgative syrup prepared from the berries of this plant is kept in the shops. About an ounce of it is a moderate dose; but it generally occasions so much sickness and griping that it is falling into disuse. The flesh of birds that feed upon the berries is said to be purgative. The juice of the unripe berries is of the colour of saffron, and is used for staining maps or paper. These are sold under the name of French berries. The juice of the ripe berries mixed with alum, is the sap-green of the painters: but if they are gathered late in the autumn the juice is purple. The bark affords a beautiful yellow dye. Goats, sheep, and horses eat it: cows refuse it.

* R. without thorns: flowers hermaphrodite, with 1 *frangula*. pistil: leaves very entire.—It is said, that from a

quarter to half an ounce of the inner bark of this plant boiled in small beer, is a sharp purge. In dropsies or constipations of the bowels of cattle, it is a very certain purgative. The berries gathered before they are ripe, dye wool green. The bark dyes yellow, and with preparation of iron black. Charcoal prepared from the wood is preferred by the makers of gunpowder. The flowers are particularly grateful to bees: goats devour the leaves voraciously, and sheep will eat them. The *papilio rhamnii* and *argus* live upon both the species.

406. ZIZYPHUS.

Ten species; viz. *lineatus*, *volubilis*, *paliurus*, *lotus*, *napeca*, *jujuba*, *xylopyrus*, *cenoplia*, *vulgaris*, *spina christi*.

407. VENTILAGO.

One species; viz. *maderaspatana*.

408. CORYMBIUM.

Four species; viz. *scabrium*, *filiforme*, *glabrum*, *vilosum*. C. of G. Hope.

409. PHYLICA, or *Base Alaternus*.

19 species; viz. *ericoides*, *lanceolata*, *bicolor*, *capitata*, *eriphoros*, *plumosa*, *villosa*, *imberbis*, *stipularis*, *pinifolia*, *cordata*, *dioica*, *buxifolia*, *spicata*, *callosa*, *paniculata*, *imbricata*, *racemosa*, *parviflora*. C. of G. Hope.

410. CARPODETUS.

One species; viz. *serratus*. South sea isles.

411. COLLETIA.

One species; viz. *horrida*. Brazil, Peru.

412. CEANOTHUS, or *New-Jersey Tea*.

Five species; viz. *americanus*, *macrocarpus*, *asiaticus*, *africanus*, *capsularis*. N. America, Cape, Ceylon.

413. SCOPOLIA.

Two species; viz. *aculeata*, *inermis*. South sea isles.

414. RUYSCHIA.

Two species; viz. *clusiæfolia*, *surubea*. W. Indies, Guiana.

415. ARDUINA, or *Cape Buckthorn*.

One species; viz. *bispinosa*. C. of G. Hope.

416. CAMAX.

One species; viz. *fraxinea*. Guiana.

417. BUTTNERIA.

Seven species; viz. *scabra*, *tereticaulis*, *microphylla*, *ovata*, *cordata*, *herbacea*, *catalpæfolia*. S. America.

418. AYENIA.

Four species; viz. *pusilla*, *lævigata*, *tomentosa*, *magna*. Jamaica, Cumana, Peru.

419. GLUTA.

One species; viz. *benghas*. Java.

420. POLYCARDIA.

One species; viz. *madagascarensis*. Madagascar.

421. MYRSINE, or *African Box-tree*.

Two species; viz. *africana*, *retusa*. Azores, Africa.

422. BLADHIA.

Four species; viz. *japonica*, *glabra*, *villosa*, *crispa*. Japan.

423. CELASTRUS, or *Staff-tree*.

32 species; viz. *lucidus*, *microphyllus*, *bullatus*, *lanrinus*, *rostratus*, *undulatus*, *octogonus*, *filiformis*, *scan-*

dens, *paniculatus*, *procumbens*, *acuminatus*, *cassinoides*, *striatus*, *ceruis*, *undatus*, *edulis*, *crenatus*, *dilatatus*, *myrtifolius*, *maytenus*, *tetragonus*, *articulatus*, *alatus*, *linearis*, *integrifolius*, *emarginatus*, *phyllacanthus*, *buxifolius*, *pyracanthus*, *rotundifolius*, *parviflorus*. Amer. Cape, isle of Bourbon, Japan.

424. EVONYMUS.

Seven species; viz. *tobira*, *japonicus*, * *europæus*, *verrucosus*, *latifolius*, *atro-purpureus*, *americanus*. * E. flowers mostly 4-cleft; leaves sitting.—The berries vomit and purge violently. They are fatal to sheep. Powdered, and sprinkled upon the hair, they destroy lice. If the wood is cut when the plant is in blossom, it is tough, and not easily broken; and in that state is used by watch-makers, for cleaning watches, and to make skewers and toothpicks. Goats and sheep eat it; horses refuse it; cows are so fond of the shoots in the spring as constantly to break down the banks of the fields wherever a plant of it stands.

425. PILOCARPUS.

One species; viz. *racemosus*.

426. DIOSMA, or *African Spiræa*.

30 species; viz. *oppositifolia*, *obtusata*, *linearis*, *virgata*, *alba*, *hirsuta*, *rubra*, *pectinata*, *ericoides*, *hispida*, *ciliata*, *bifurca*, *bifida*, *capitata*, *villosa*, *cupressina*, *imbricata*, *marginata*, *lanceolata*, *pubescens*, *latifolia*, *crenata*, *tetragona*, *uniflora*, *rugosa*, *ovata*, *barbigera*, *pulchella*, *betulina*, *orbicularis*. C. of G. Hope.

427. HOVENIA.

One species; viz. *dulcis*. Japan.

428. BRUNIA.

Eight species; viz. *nodiflora*, *paleacea*, *lanuginosa*, *verticillata*, *abrotanoides*, *superba*, *fragarioides*, *ciliata*. C. of G. Hope.

429. STAARIA.

Two species; viz. *radiata*, *glutinosa*.

430. WALKERA.

One species; viz. *serrata*. India.

431. PITTOSPORUM.

One species; viz. *coriaceum*. Madeira, Canary isles.

432. BARBERIA.

One species; viz. *theabromæfolia*. Guiana.

433. ITEA.

Two species; viz. *virginica*, *cyrilla*. N. America.

434. GALAX.

One species; viz. *aphylla*. Virginia.

435. HUMBOLDTIA.

One species; viz. *laurifolia*.

436. CEDRELA, or *Barbadoes Base Cedar*.

One species; viz. *odorata*. West Indies.

437. CALODENDRUM.

One species; viz. *capense*. C. of G. Hope.

438. ELEODENDRUM.

Two species; viz. *orientale*, *argan*. Cape, isle of Mauritius.

439. ESCALONIA.

Two species; viz. *myrtilloides*, *serrata*. S. America.

440. BILLARDIERA.

One species; viz. scandens.

441. MANGIFERA, or *Mango-tree*.

Three species; viz. indica, laxiflora, axillaris. E. Indies.

442. HIRTELLA.

Three species; viz. americana, triandra, paniculata. W. Indies, Cayenne.

443. STRUMPFIA.

One species, viz. maritima. America.

444. PLECTRONIA.

One species; viz. ventosa. C. of G. Hope.

445. RIBES, or *Currant and Gooseberry*.

16 species; viz. rubrum, petraeum, procumbens, glandulosum, alpinum, fragrans, triste, nigrum, floridum, diacantha, saxatile, reclinatatum, grossularia, uva crispa, oxyacanthoides, cynosbati. Eur. N. Amer.

446. VIOLA, or *Violet*.

39 species; viz. palmata, pedata, pinnata, sagittata, lanceolata, obliqua, cucullata, primulifolia, *hirta, magellanica, palustris, *odorata, *canina, montana, nummularifolia, cenisia, canadensis, striata, pubescens, mirabilis, biflora, uniflora, decumbens, *tricolor, grandiflora, zoyssii, calcarata, cornuta, capensis, arborescens, stipularis, parviflora, enneasperma, suffruticosa, calceolaria, oppositifolia, hybanthus, ipecacuanha, diandra. Alps, Pyren. Cape, America.

odorata. * V. leaves heart shaped; suckers creeping.—The flowers and seeds of this plant are said to be mild laxatives. The powdered root, in doses from 40 to 80 grains, vomits and purges. The petals give the colour to the syrup of violets, for which purpose they are cultivated in large quantities at Stratford-upon-Avon. This syrup is very useful in many chemical inquiries, to detect an acid or an alkali, the former changing the blue colour to a red, and the latter to a green. Slips of white paper stained with the juice of the petals, and kept from the air and light, answer the same purpose.

tricolor. * V. stem branched; leaves egg-shaped, toothed; cal. smooth, but half the size of the blossom.—Some allege that it infallibly cures the scabby complaints in young children, called *crusta lactea*. Boil a handful of the fresh, or half a dozen of the dried leaves, in half a pint of milk, and give this milk morning and evening, for some weeks.

447. IMPATIENS, or *Balsam balsamine*.

12 species; viz. bifida, chinensis, latifolia, capensis, oppositifolia, fasciculata, cornuta, balsamina, biflora, triflora, natans, *nolitangere. Europe, N. America, E. Indies, China.

nolitangere. * I. fruitstalks many-flowered, solitary; leaves egg-shaped; stem swollen at the joints.—The whole of this plant is considerably acrid. Goats eat it. Horses, cows, and sheep refuse it. The *sphinx elpenor* lives upon it.

448. GRONOVIA.

One species; viz. scandens. Jamaica, Vera Cruz.

449. LEEA.

Three species; viz. sambucina, squata, crispa. Cape, E. Indies.

450. ARGOPHYLLUM.

One species; viz. nitidum. New Caledonia.

451. CORYNOCARPUS.

One species; viz. laevigata. New Zealand.

452. HEDERA, or *Ivy*.

Four species; viz. *helix, pendula, mutans, terebinthinacea. Europe, N. Amer. Jam.

* H. leaves some egg-shaped, others lobed.—The roots *helix* are used by leather-cutters to whet their knives upon. Its evergreen leaves adorn our walls, and cover the naked trunks of trees. Apricots and peaches covered with ivy during the month of February, have been observed to bear fruit plentifully. The leaves have a nauseous taste. Some say they are given in Germany as a specific in the atrophy of children. The common people apply them to issues. The berries have a little acidity. They purge and vomit. In warm climates a resinous juice exudes from the stalks. Horses and sheep eat it. Goats and cows refuse it. Sheep are fond of it, and in severe weather it is stripped off the trees as food.

453. VITIS, or *Vine*.

12 species; viz. vinifera, palmata, indica, flexuosa, labrusca, vulpina, heterophylla, laciniosa, hederacea, heptaphylla, pinnata, arborea. Temperate parts of the world.

V. with leaves gashed, indented, naked.—The leaves of this species, which is the proper vine tree, were formerly celebrated as astringents, but have for a long time been entirely disregarded; their taste is herbaceous with only a slight degree of roughness. The trunk of the tree wounded in the spring produces a limpid watery juice; this, called the tear of the vine, has been accounted excellent for sore eyes, and by some recommended also in ardent and malignant fevers, and as a diuretic. The flowers have a pleasant smell, which water elevates from them in distillation; along with the water a small portion of an elegant essential oil is said to arise, possessing in great perfection the fragrance of the flowers. The unripe fruit is of a very harsh, rough, sour taste; its expressed juice, called *verjuice*, was in great esteem among the ancients, and still continues so in some places, as a cooling astringent medicine; a rob and a syrup were formerly prepared from it. The ripe fruit or grapes, of which there are many kinds, properly cured and dried, are the raisins of the shops. The juice by fermentation affords wine, vinegar, and tartar, of which mention will be made under their proper heads.

454. EUPAREA.

One species; viz. amœna. New Holland.

455. ÆGICERAS.

Two species; viz. majus, minus.

456. LAGOECIA, or *Wild Cumin*.

One species; viz. cuminoides. Crete, Levant.

457. RORIDULA.

One species; viz. dentata. C. of G. Hope.

458. SAUVAGESIA.

One species; viz. erecta. Jamaica, St Domingo, Surinam.

459. CLAYTONIA.

Three species; viz. virginica, sibirica, perfoliata. Siberia, N. Amer.

460. *HELICONIA*, or *Base* or *Wild Plantain*.
Five species; viz. *caribæa*, *behai*, *humilis*, *peittacorum*, *hirsuta*. Cape, W. Indies.

461. *STRELITZIA*.
Two species; viz. *reginæ*, *angusta*. Cape of G. Hope.

462. *ACHYRANTHES*.
16 species; viz. *argentea*, *aspera*, *lappacea*, *echinata*, *muricata*, *patula*, *prostata*, *sarmentosa*, *alternifolia*, *polygonoides*, *altissima*, *nivea*, *stellata*, *corymbosa*, *tenuifolia*, *dichotoma*. S. Enr. E. and W. Indies.

463. *CELOSIA*, or *Cock's Comb*.
18 species; viz. *argentea*, *albida*, *margaritacea*, *crispata*, *comosa*, *paniculata*, *nitida*, *coccinea*, *castrensis*, *monsoniæ*, *corymbosa*, *caudata*, *trigyna*, *virgata*, *polygonoides*, *baccata*, *gnaphaloides*, *nodiflora*. China, E. and W. Indies, Senegal.

464. *CHENOLEA*.
One species; viz. *diffusa*.

465. *ILLECEBRUM*, or *Mountain Knot-grass*.
19 species; viz. *brachiatum*, *sanguinolentum*, *lanatum*, *javanicum*, *verticillatum*, *aristatum*, *canariense*, *cymosum*, *paronychia*, *capitatum*, *divaricatum*, *benghalense*, *arabicum*, *achyrantha*, *frutescens*, *polygonoides*, *ficoideum*, *sessile*, *alsinefolium*. S. Europe, East Indies, S. America.

466. *GLAUX*, or *Sea Milk-wort*.
One species; viz. *maritima*. Europe.

467. *PLOCAMA*.
One species; viz. *pendula*. Canary isles.

468. *HEDYCREA*.
One species; viz. *incana*. Guiana.

469. *THESIUM*, or *Base Toad-flax*.
19 species; viz. *linophyllum*, *alpinum*, *humile*, *lineatum*, *squarrosus*, *frisea*, *funale*, *spicatum*, *capitatum*, *strictum*, *umbellatum*, *fragile*, *scabrum*, *paniculatum*, *amplexicaule*, *triflorum*, *euphorbioides*, *colpoon*, *spinousum*. Alps of Europe, Cape, N. Amer.

470. *QUINCHAMALA*.
One species; viz. *chilensis*. Chili.

471. *RAUWOLFIA*.
Four species; viz. *nitida*, *glabra*, *canescens*, *tomentosa*. W. Indies. S. America.

472. *PÆDERIA*.
Two species; viz. *foetida*, *fragrans*. India.

473. *CARISSA*.
Five species; viz. *carandas*, *spinarum*, *edulis*, *inermis*, *mitis*. India, Arabia.

474. *GYNOPOGON*.
Three species; viz. *stellatum*, *alyxia*, *scandens*. South sea isles.

475. *CERBERA*.
Five species; viz. *ahovai*, *ovata*, *parviflora*, *manghas*, *thevetia*. S. Amer.

476. *WEBERA*.
Three species; viz. *corymbosa*, *cymosa*, *tetrandra*.

477. *GARDENIA*, or *Cape Jessamine*.
17 species; viz. *radicans*, *florida*, *thunbergia*, *lati-*

folia, *clusiæfolia*, *gummifera*, *musseada*, *genipa*, *rothmaunia*, *uliginosa*, *armata*, *spinosa*, *dometorum*, *radia*, *micranthus*, *scandens*, *multiflora*. Cape, E. and W. Indies, Japan.

478. *WILLUGHBEJA*.
Two species; viz. *aciaca*, *scandens*. Guiana.

479. *ALLAMANDA*.
One species; viz. *cathartica*. Surinam, Cayenne.

480. *UNICA*, or *Periwinkle*.
Five species; viz. *minor*, *major*, *lutea*, *rosea*, *parviflora*. Ger. Fr. Sp. E. Indies, N. Amer.
U. stems trailing; leaves spear-egg-shaped; flowers *minor* on fruitstalks.—The fruit of this plant seldom comes to maturity. It may, however, be easily obtained by planting the *U. major* in a pot, where the roots not having free room to extend themselves, the juices are more copiously expelled towards the pistil, which then expands into well-formed seed-vessels.

481. *NERIUM*, or *Oleander*, or *Rose Bay*.
Eight species; viz. *oleander*, *odorum*, *salicinum*, *obesum*, *zeylanicum*, *divaricatum*, *antidysentericum*, *coronarum*. S. Europe, E. Indies.

482. *ECHITES*, or *Savanna-flower*.
22 species; viz. *biflora*, *quinquangularis*, *annularis*, *tomentosa*, *suberecta*, *domingensis*, *agglutinata*, *asperuginis*, *torulosa*, *umbellata*, *circinalis*, *floribunda*, *trifida*, *repens*, *corymbosa*, *costata*, *spicata*, *sibbilitica*, *candata*, *scholaris*, *succulenta*, *bispinosa*. W. India, Surinam, Carolina, Cape.

483. *PLUMIRIA*, or *Red Jessamine*.
Four species; viz. *rubra*, *alba*, *obtusata*, *pubida*. W. Indies, S. America.

484. *CAMERARIA*.
Four species; viz. *latifolia*, *zeylanica*, *lutea*, *angustifolia*. W. Indies, S. America.

485. *TABERNÆMONTANA*.
12 species; viz. *citrifolia*, *laurifolia*, *echinata*, *grandiflora*, *cymosa*, *amygdalifolia*, *discolor*, *persicariæfolia*, *elliptica*, *alternifolia*, *amsonia*, *angustifolia*. East and West Indies, N. America, Japan.

ORDO II. DIGYNIA.

486. *PERGULARIA*.
Five species; viz. *glabra*, *edulis*, *tomentosa*, *purpurea*, *japonica*. India, Japan.

487. *PERIFLOCA*, or *Virginian Silk*.
11 species; viz. *græca*, *secamone*, *laevigata*, *angustifolia*, *esculenta*, *emetica*, *indica*, *capularis*, *africana*, *tunicata*, *sylvestris*. Syria, Cape, India.

488. *CYNANCHUM*, or *Base Dogs-bane*.
25 species; viz. *viminale*, *filiforme*, *crispum*, *tonellum*, *obtusifolium*, *capense*, *acutum*, *planiflorum*, *rostratum*, *grandiflorum*, *nigrum*, *racemosum*, *maritimum*, *suberosum*, *carolinense*, *obliquum*, *hirtum*, *crispiflorum*, *prostratum*, *monspeliacum*, *extensum*, *reticulatum*, *undulatum*, *parviflorum*, *erectum*. S. Europe, Cape, E. Indies, America.

489. *APOCYNUM*, or *Dogs-bane*.
14 species; viz. *filiforme*, *hastatum*, *androsemifolium*,
lium,

lium, cannabium, hypericifolium, venetum, frutescens, paniculatum, umbellatum, reticulatum, cordatum, lanceolatum, triflorum, lineare. Am. isles, Adriatic, India.

490. ASCLEPIAS, or *Swallow-wort*.

41 species; viz. *aphylla*, *undulata*, *crispa*, *pubescens*, *mucronata*, *procera*, *gigantæa*, *grandiflora*, *carnosa*, *syriaca*, *amoena*, *purpurascens*, *variegata*, *curassavica*, *nivea*, *laniflora*, *parviflora*, *incarnata*, *pulchra*, *critifolia*, *decumbens*, *lactifera*, *vincetoxicum*, *nigra*, *fostida*, *convolvulacea*, *volubilis*, *alexiciaca*, *asthmatica*, *viminalis*, *arborescens*, *fruticosa*, *sibirica*, *daurica*, *setosa*, *filiformis*, *verticillata*, *mexicana*, *linaria*, *rubra*, *tuberosa*. Europe, Africa, East Indies, America.

491. HOSTEA.

One species; viz. *viridiflora*.

492. MELODINUS.

One species; viz. *scandens*. New Caledonia.

493. CYROPEGIA.

Eight species; viz. *candelabrum*, *tuberosa*, *bulbosa*, *biflora*, *juncea*, *acuminata*, *sagittata*, *tenuiflora*. Cape, Ceylon, Malabar.

494. STAPELIA, or *African Swallow-wort*.

49 species; viz. *ciliata*, *revoluta*, *hirsuta*, *sororia*, *grandiflora*, *ambigua*, *pulvinata*, *asterias*, *gemmiflora*, *divaricata*, *rufa*, *acuminata*, *reclinata*, *elegans*, *cæspitosa*, *arida*, *parviflora*, *subulata*, *concinna*, *glandulifera*, *pedunculata*, *aperta*, *gordoni*, *pilifera*, *caudata*, *articulata*, *mammillaris*, *pruinosa*, *ramosa*, *pulla*, *adscendens*, *quadrangula*, *incarnata*, *punctata*, *geminata*, *decora*, *pulchella*, *vetula*, *verrucosa*, *irrorata*, *mixta*, *variegata*, *campanulata*, *barbata*, *venusta*, *guttata*, *humilis*, *reticulata*, *clarata*. C. of G. Hope.

495. LINCONIA.

One species; viz. *aloppecuroidea*. C. of G. Hope.

496. HERNIARIA, or *Rupture-wort*.

Six species; viz. * *glabra*, * *hirsuta*, *alpina*, *fruticosa*, *lenticulata*, *polygonoides*. Germany, Spain, Italy, Chili.

glabra.

* H. Plant smooth.—This plant is a little saltish, and astringent. It is said to increase the secretions by the kidneys, and that the juice takes away specks in the eye; but, to the virtue for which it has been most celebrated, that of curing ruptures, it has no title. Cows, sheep, and horses eat it. Goats and swine refuse it.

497. CHENOPODIUM, or *Goosefoot*, or *Wild Orache*.

25 species; viz. * *bonus henricus*, *mucronatum*, *triandrum*, * *urubicum*, *atriplicis*, * *rubrum*, *guineense*, * *murale*, *quinoa*, *serotinum*, * *album*, * *viride*, * *hybridum*, *botrys*, *ambrosioides*, *multifidum*, *anthelminticum*, * *glaucum*, * *vulvaria*, * *polyspermum*, *caudatum*, *laterale*, *scoparia*, * *maritimum*, *oppositifolium*, *aristatum*. Europe, China, America.

bonus henricus.

* C. Leaves triangular, arrow-shaped, very entire; spikes compound, leafless, axillary.—This plant is said to be cultivated as spinach by the poor people at Boston in Lincolnshire. The young shoots, peeled and boiled, may be eaten as asparagus, which they resemble in flavour. They are gently laxative. The leaves are often boiled in broth. The roots are given to sheep that

have a cough. Goats and sheep are not fond of it. Cows, horses, and swine, refuse it.

* C. leaves diamond triangular, gnawed, entire behind, *album*. the uppermost oblong; bunches upright.—Cows, goats, and sheep eat it. Horses refuse it. Swine are extremely fond of it. A black *aphis* feeds upon it, and sometimes destroys it.

* C. leaves awl-shaped, semi-cylindrical.—It is an ex-marit-cellent pot-herb. The *phalæna lubricipeda* feeds upon *mum*. most of the species.

C. with leaves oblong indented; branches naked, *botrys*. many-cleft. Called *Jerusalem oak*.—It is cultivated in gardens. It has a strong, not disagreeable smell, and a warm, somewhat pungent taste. It is recommended as a carminative pectoral, and it has also been recommended as an emmenagogue. Infusions of the leaves and seed may be drunk as tea; and in this form it has been recommended in cases of chronic catarrh. But the proper menstruum, both for the leaves and seed, is rectified spirit.

* C. with entire, diamond-shaped, oval leaves, with *vulvaria*. flowers incorporated at the bosom of the leaves. *Stinking orach*. It is a low plant, sprinkled all over with a kind of whitish clammy meal; it grows about dunge-hills and waste places. The leaves have a strong fetid smell, with which the hand, by a light touch, becomes so impregnated, as not to be easily freed from it. Its smell has gained it the character of an excellent anti-hysterical; and this is the only use it is applied to.—Tournefort recommends a spirituous tincture, others a decoction in water, and others a conserve of the leaves, as of wonderful efficacy in uterine disorders; but in the present practice it is little employed.

498. BETA, or *Beet*.

Four species; viz. *vulgaris*, *patula*, *cicla*, *maritima*. France, Portugal, Madeira.—The *beta vulgaris* has of late attracted much notice on the continent, from the discovery of M. Achard of Berlin, that sugar may be extracted from it in large quantities with profit. See SUGAR.

499. MICROTEA.

One species; viz. *debilis*.

500. SALSOLA, or *Glass-wort*.

25 species; viz. * *kali*, *tragus*, *rosacea*, *soda*, *sativa*, *spicata*, *altissima*, *trigyna*, *salsa*, *nudiflora*, *flaves-cens*, *hirsuta*, *laniflora*, *hyssopifolia*, *polyclonos*, *prostrata*, *monandra*, *vermiculata*, *arbuscula*, *aphylla*, *arbo-rescens*, * *fruticosa*, *indica*, *sedoides*, *muricata*. Europe, Egypt, Cape, Asia, Carnatic.

501. ANABASIS, or *Berry-bearing Glass-wort*.

Five species; viz. *aphylla*, *cretacea*, *foliosa*, *spinossissima*, *tamariscifolia*. Spain, Caspian sea, Egypt.

502. CRESSA.

Two species; viz. *cretica*, *indica*. Crete, Arabia.

503. GOMPHRENA, or *Globe Amaranth*.

Ten species; viz. *globosa*, *perennis*, *hispida*, *angustifolia*, *vermicularis*, *brasiliensis*, *serrata*, *interrupta*, *flava*, *arborescens*. India, S. Amer. New Gran.

504. BOSEA, or *Golden-rod Tree*.

One species; viz. *yervamora*. Canary isles.

505. ULMUS, or *Elm-tree*.

Seven species; viz. * *campestris*, *suberosa*, *effusa*, *americana*,

americana, *nemoralis*, *pumila*, *integrifolia*. N. Europe, N. America.

campestris. * U. leaves doubly serrated, unequal at the base; flowers almost sitting, coronated together.—A decoction of the inner bark, drank freely, has been known to carry off the water in dropsies. It cures the *lepra ichthyosis* of Sauvages. The bark dried and ground to powder has been mixed with meal in Norway, to make bread in times of scarcity. The flowers have a violet smell. The wood, being hard and tough, is used to make axle-trees, mill-wheels, heels of boots, chairs, and coffins. The tree is beautiful, and well adapted to make shady walks, as it does not destroy the grass; and its leaves are acceptable to cows, horses, goats, sheep, and swine; for this purpose, it should be grafted upon the *U. glabra*, and then the roots will not send out suckers, which the common elm is very apt to do, and give a great deal of trouble to keep the ground clear of them. It loves an open situation, and black or clayey soil. It bears to be transplanted. *Papilio polychloros* and *C. album*, *phalæna lubricipeda*, *pavonia betularia* et *vellica*, *cimex ulmi* et *striatus*, *cicada ulmi*, *aphis ulmi*, feed upon it. The latter generally curl the leaves so as to make them a secure shelter against the weather. Silk worms will devour the tender leaves with great avidity.

506. NAMA.

One species; viz. *jamaicensis*. Jamaica.

507. HYDROLEA.

Three species; viz. *spinosa*, *trigynia*, *zeylanica*. E. and W. Indies, America.

508. ROCHEFORTIA.

Two species; viz. *cuneata*, *ovata*. Arabia.

509. HEUCHERA, or *Virginian Sanicle*.

One species; viz. *americana*. Virginia.

510. VELEGIA.

One species; viz. *rigida*. Spain.

511. SWERTIA, or *Marsh-Gentian*.

Six species; viz. * *perennis*, *difformis*, *decumbens*, *corniculata*, *dichotoma*, *tetrapetala*. Siberia, Austria, Virginiana, Canada.

512. GENTIANA, or *Gentian*.

56 species; viz. * *lutea*, *purpurea*, *pannonica*, *punctata*, *campanulata*, *septemfida*, *asclepiadea*, *montana*, *cruciata*, *macrophylla*, *adscendens*, * *pneumonante*, *triflora*, *frigida*, *algida*, *saxosa*, *saponaria*, *ochroleuca*, *villosa*, *linearis*, *quinqueflora*, *aurea*, *glauca*, *exaltata*, *acaulis*, *altaica*, *pyrenaica*, *verna*, *utriculosa*, *bavarica*, *imbricata*, *prostrata*, * *nivalis*, *pumila*, *aquatica*, *scilloides*, *uniflora*, *germanica*, * *amarella*, *obtusifolia*, *uliginosa*, *pratensis*, * *campestris*, *auriculata*, *tenella*, *glacialis*, *dichotoma*, *nana*, *carinthiaca*, *sulcata*, *rotata*, *ciliata*, *crinita*, *barbata*, *dentosa*, *serrata*.—The *gentiana lutea* is said to be found wild in some parts of England; but the dried roots are most commonly brought from Germany. They are much used in medicine. They should be chosen fresh, and of a yellow or bright colour within. This root is a strong bitter, and as such very frequently made use of in practice: in taste it is less exceptionable than most other bitters. Infusions of it, flavoured with orange-peel, are sufficiently grateful. It is the capital ingredient in the

bitter wine, tincture, and infusion of the druggists. An extract from it is likewise prepared. This useful bitter is not used as a powder, as it loses considerably by the drying, which is requisite for giving it that form. As a very trifling quantity of it gives taste to a large quantity of water, it is said to be sometimes fraudulently used in malt liquors, to save the more expensive ingredient of hops.

513. DICHONDRA.

Two species; viz. *repens*, *sericea*. Jamaica, South sea isles.

514. VAHLIA.

One species; viz. *capensis*. C. of G. Hope.

515. BUMALDA.

One species; viz. *trifolia*. Japan.

516. PHYLLIS, or *Base Hares-ear*.

One species; viz. *nobla*. Canary isles.

517. CUSSONIA.

Two species; viz. *thyrsiflora*, *spicata*. C. of Good Hope.

518. ERYNGIUM, or *Sea-holly*.

11 species; viz. *foetidum*, *aquaticum*, *planum*, *pusillum*, *tricuspidatum*, * *maritimum*, * *campestre*, *amethystinum*, *triquetrum*, *alpinum*, *bourgati*. Europe, N. America, W. Indies.

* E. root leaves roundish, plaited, thorny; flowering *maritima* heads on fruitstalks; chaff 3-pointed.—The leaves are *mum.* sweetish, with a light aromatic warmth and pungency. The roots are supposed to have the same aphrodisiac virtues as the orchis tribe. They are kept in the shops, candied.

519. HYDROCOTYLE, or *Water Navel-wort*.

18 species; viz. * *vulgaris*, *umbellata*, *bonariensis*, *americana*, *hirsuta*, *moschata*, *asiatica*, *erecta*, *villosa*, *glabrata*, *spananthe*, *ranunculoides*, *saniculæfolia*, *solandra*, *tridentata*, *chinensis*, *linifolia*, *virgata*. Eur. N. America, India.

520. AZORELLA.

Two species; viz. *filamentosa*, *scpitosa*.

521. SANICULA, or *Sanicle*.

Three species; viz. * *europæa*, *canadensis*, *marilandica*. Europe, N. America.

522. ASTRANTIA, or *Black Master-wort*.

Five species; viz. *epipactis*, *major*, *carniolica*, *minor*, *ciliaris*. Alps of Europe.

523. BUPLEURUM, *Hares-ear*.

23 species; viz. * *rotundifolium*, *stellatum*, *petraeum*, *graminifolium*, *angulosum*, *pyrenaicum*, *longifolium*, *falcatum*, *caricifolium*, *odontites*, *semicompositum*, *ranunculoides*, *rigidum*, * *tenuissimum*, *baldense*, *gerardi*, *junceum*, *nudum*, *fruticosum*, *coriaceum*, *frutescens*, *spinosum*, *difforme*. Germany, Switzerland, S. Europe.

525. ECHINOPHORA, or *Prickly Parsnip*.

Two species; viz. * *spinosa*, *tenuifolia*. Apulia, Med. sea shores.

526. HASSELQUISTIA.

Two species; viz. *ægyptiaca*, *cordata*. Egypt, Levant.

527. *TORDYLIUM*, or *Hart-wort of Crete*.

Six species; viz. *syriacum*, * *officinale*, *peregrinum*, *apulum*, * *maximum*, *siifolium*. Austria, Italy, Crete, Syria.

528. *CAUCALIS*, or *Base Parsley*.

13 species; viz. *grandiflora*, * *daucoides*, * *latifolia*, *mauritanica*, *pumila*, *orientalis*, *africana*, *leptophylla*, *platycarpus*, * *arvensis*, * *anthriscus*, *japonica*, * *nodosa*. S. Europe, Egypt, India.

529. *ARTEDIA*.

One species; viz. *squamata*. Levant.

530. *DAUCUS*, or *Carrot*.

Six species; viz. * *carota*, *mauritanicus*, *lucidus*, *visnaga*, *gingidium*, *muricatus*. Europe, Barb. Carolina.—For the culture and properties of the carrot, see AGRICULTURE, N° 40, 341—353.

531. *AMMI*, or *Bishop's-weed*.

Four species; viz. *magus*, *copticum*, *glaucofolium*, *daucifolium*. Austria, S. Europe, Egypt.

532. *BUNIUM*, or *Pig* or *Earth-nut*.

Three species; viz. * *bulbocastanum*, *majus*, *aromaticum*. Germany, France.

533. *CONIUM*, or *Hemlock*.

Four species; viz. * *maculatum*, *rugosum*, *rigens*, *africanum*. Europe, Cape.

maculatum.

* *C.* seeds without prickles; stem greatly branched, smooth, spotted.—The whole plant is poisonous, and many instances are recorded of its deleterious effects; but modern experience has proved it to be less virulent than was formerly imagined, and though it may not cure cancers, it is certainly a very useful medicine when properly prepared. The powder of the dried leaves is now only prescribed. Let the leaves be gathered about the end of June when the plant is in flower. Pick off the leaves and throw away the leafstalks. Dry these selected little leaves in a hot sun on a tin dropping-pan or pewter dish, before a fire. Preserve them in bags made of strong brown paper; or powder them, and keep the powder in glass phials, in a drawer, or something that will exclude the light; for the light soon dissipates the beautiful green colour, and with its colour the medicine loses its efficacy. From 15 to 25 grains of this powder may be taken, twice or thrice a-day. It has been found particularly useful in chronic rheumatism, and also in many of those diseases which are usually supposed to arise from acrimony. This plant is recommended as well worth the medical practitioner's attention.

534. *SELINUM*, or *Milk Parsley*.

Nine species; viz. *sylvestre*, * *palustre*, *austriacum*, *sibiricum*, *carvifolia*, *chabræi*, *seguieri*, *monnieri*, *deciens*. Europe.

535. *ATHAMANTA*, or *Base Spignel*.

11 species; viz. * *libanotis*, *cervaria*, *sibirica*, *condensata*, *incana*, *oreosolinum*, *ficula*, *mathioli*, *cretensis*, *amnia*, *chinensis*. Europe.—The seeds of the *A. Cretensis* or *Candy Carrot*, are brought from the Levant. It is an umbelliferous plant which grows in the island of Candy and the south of Europe. The seeds have a warm biting taste, and an aromatic smell. They are said to be diuretic, but are not at present regarded in medical practice.

VOL. IV. Part I.

†

536. *PEUCEDANUM*.

11 species; viz. * *officinale*, *alpestre*, *capillaceum*, *tenuifolium*, *sibiricum*, *japonicum*, * *silaus*, *alsaticum*, *aureum*, *nodosum*, *geniculatum*. Alps, Canaries, Japan.

* *P.* leaves five times divided into three; thread-strap-shaped.—The roots have a strong fetid smell, and an acrid, bitterish, unctuous taste. Wounded in the spring, they yield a considerable quantity of yellow juice, which dries into a gummy resin, and retains the strong scent of the root. Its virtues have not yet been ascertained with precision.

537. *CRITHMUM*, or *Sampshire*.

Two species; viz. * *maritimum*, *latifolium*. Sea shores Europe, Canary.

* *C.* leaves spear-shaped, fleshy.—Poor people on the sea coast eat it as a pot-herb, and gather it for sale, it being much used as a pickle. Sheep and cows eagerly feed, and are said to grow fat upon it.

538. *CACHRYS*.

Seven species; viz. *odontalgica*, *libanotis*, *morisoni*, *sicula*, *taurica*, *cretica*, *panacisfolia*. Spain, Sicily.

539. *FERULA*, or *Fennel giant*.

12 species; viz. *communis*, *sibirica*, *glauca*, *rablensis*, *tingitana*, *ferulago*, *orientalis*, *meoides*, *nodiflora*, *canadensis*, *assafœtida*, *persica*. Europe, Persia, N. America.

The large umbelliferous plant, with obtuse leaflets, alternately indented, called *ferula assafœtida*, is a native of Persia, and produces a valuable concrete juice. This juice exudes from wounds made in the root of the plant, liquid and white like milk. On being exposed to the air it turns of a brownish colour, and gradually acquires different degrees of consistency. It is brought to us in large irregular masses, composed of various little shining lumps or grains, which are partly of a whitish colour, partly reddish, and partly of a violet hue. These masses are accounted the best, which are clear, of a pale reddish colour, and variegated with a great number of elegant white tears. This drug has a strong fetid smell, somewhat like that of garlic. It loses, with age, of its smell and strength, a circumstance to be attended to in the use of it. It consists of about one-third part of pure resin, and two thirds of gummy matter; the former soluble in rectified spirit, the latter in water. Proof spirit dissolves almost the whole into a turbid liquor; the tincture in rectified spirit is transparent.

Assafœtida is the strongest of the fetid gums, and of frequent use in hysteric and different kinds of nervous complaints. It is likewise of considerable efficacy in flatulent colics, and for promoting all the fluid secretions in either sex. The ancients attributed to this medicine many other virtues, which are not at present expected from it. This gummy resin is an ingredient in the gum pills of the druggists, fetid tincture, tincture of soot, and fetid volatile spirit.

540. *LASERPITIUM*, or *Laser-wort*.

23 species; viz. *latifolium*, *libanotis*, *capense*, *trilobum*, *aquilegifolium*, *gallicum*, *angustissimum*, *formosum*, *angustifolium*, *aureum*, *prutenicum*, *dauricum*, *silafolium*, *aciphylla*, *peucedanoides*, *silex*, *archangelica*,

T

lica, chironium, lucidum, ferulaceum, hirsutum, scabrum, simplex. Europe, New Zealand.

541. HERACLUM, or *Wou-parsnip*.

10 species; viz. * spondylium, flavescens, angustifolium, elegans, sibiricum, panacea, tuberosum, austriacum, alpinum, pumilum. Siber. Austria, Alps, Italy. * H. leaflets wing-cleft, even; flowers radiated.—In Poland and Lithuania the poor people are said to prepare a liquor from the leaves and seeds of this plant, which undergoes a fermentation, and is drunk instead of ale. The stalks, when peeled, are eaten by the Kamtschatkans. The Russians take the leaf-stalks of the root-leaves, peel them, and hang them in the sun to dry a little: then they tie them in little bundles, and hang them up again till they become yellow: in this state they put them into bags, and a mealy substance like sugar forms upon the surface of them. This they shake of, and treat their guests with it as a great delicacy. They likewise distil an ardent spirit from it. The peelings of the stalks are acrid. The leaves are a favourite food of rabbits, hogs, and asses. Cows, goats, and sheep eat them; but horses are not fond of them.

spondylium.

542. LIGUSTICUM, or *Lovage*.

13 species; viz. levisticum, * scoticum, aquilegifolium, nodiflorum, peloponense, austriacum, * cornubiense, pyrenæum, candicans, peregrinum, balearicum, gingidium, longifolium. Alps, Austria, Portugal, Barbary.

scoticum.

* L. Leaves doubly threefold.—This plant is much valued in the isle of Skye. The root is reckoned a good carminative, and an infusion of the leaves a good purge for calves. It is, besides, used as food, either as a salad, or boiled as greens. Horses, sheep, and goats eat it. Cows refuse it.

543. ANGELICA.

Six species; viz. * archangelica, * sylvestris, razoulli, verticillaris, atropurpurea, lucida. N. Europe, N. America.

sylvestris.

* A. leaflets equal, egg-spear-shaped, serrated.—It is warm, acrid, bitter, and aromatic: but the species cultivated in our gardens, possessing these properties in a higher degree, has been long neglected. *Papilio machaon* feeds upon it. Cows, goats, and swine eat it. Horses refuse it.

544. SIUM, or *Water Parsnip*.

18 species; viz. filifolium, * latifolium, angustifolium; * nodiflorum, * repens, sisarum, rigidus, japonicum, falcaria, paniculatum, grandiflorum, patulum, græcum, decumbens, siculum, asperum, hispidum, villosum. Europe, China, Japan, N. America.

latifolium

* S. leaves winged; leaflets egg-spear-shaped, regularly and sharply serrated; the terminating leaflet 3-cleft; umbels terminating. Horses and swine eat it. Sheep are not fond of it. The roots are noxious to cattle.

nodiflorum.

* S. leaves winged; leaflets tooth-serrated; umbels lateral, opposite the leaves, sitting or on fruitstalks.—It is said, that a young lady, six years old, was cured of an obstinate cutaneous disease, by taking three large spoonfuls of the juice twice a-day. Three or four ounces have been repeatedly given to adults, every morning, in similar complaints, with the greatest advantage.

It is not nauseous, and children take it readily, if mixed with milk. In the doses given, it neither affects the head, the stomach, nor the bowels.

545. SISON, or *Base Stone-parsley*.

Eight species; viz. * amomum, * segetum, canadense, ammi, * inundatum, * verticillatum, salsum, crinitum. Europe, N. America.

546. BUBON, or *Macedonian Parsley*.

Five species; viz. macedonicum, galbanum, lævigatum, gummiferum, rigidus. Greece, Barb. Cape.

547. CUMINUM, or *Cumin*.

One species: viz. cuminum. Egypt, Ethiopia.—This umbelliferous plant resembles fennel in appearance, but is much smaller. The seeds used in Britain are brought chiefly from Sicily and Malta. Cumin seeds have a bitterish warm taste, accompanied with an aromatic flavour, not of the most agreeable kind. An essential oil is obtained from them by distillation, in which their activity is concentrated; and they are not infrequently used externally, giving name both to a plaster and cataplasm in medical practice.

548. OENANTHE, or *Water Drop-wort*.

11 species; viz. * fistulosa, * crocata, prolifera, globulosa, peucedanifolia, * pimpinelloides, inebrians, tenuifolia, ferulacea, interrupta, exaltata. Europe, Carolina.

* O. sending forth suckers; stem-leaves winged, *fistulosa*. thread-shaped, hollow.—Cows and horses refuse this plant, though, from experiments made on purpose, it does not appear to be in the least degree noxious to the former.

* O. all the leaves many-cleft, blunt, nearly equal.—*crocata*. The whole of this plant is poisonous; and Dr Pulteney remarks, that the root is the most virulent of all the vegetable poisons that Great Britain produces: many instances of its fatal effects are recorded. It is said, that an infusion of the leaves, or three tea-spoonfuls of the juice of the root taken every morning, effected a cure in a very obstinate cutaneous disease, but not without occasioning very great disturbances in the constitution. Some say, that the country people in Westmoreland apply a poultice of the herb to the ulcer which forms in the fore-part of the cleft of the hoof in horned cattle, and is called the *foul*. Sheep eat it. Cows and horses refuse it.

549. PHELLANDRIUM.

Two species; viz. * aquaticum, mutellina. Europe. * P. ramifications of the leaves straddling.—The seeds *aquaticum* are recommended in intermittents, and are said to be diuretic, antiseptic, and expectorant; dose from one to three drachms daily. The leaves are sometimes added to discutient cataplasms. It is generally esteemed a fatal poison to horses, occasioning them to become paralytic: but this effect is owing to an insect (*curculio paraplecticus*), which generally inhabits within the stems. The usual antidote is pig-dung. In the winter, the roots and stems, dissected by the influence of the weather, afford a very curious skeleton or net-work. Horses, sheep, and goats eat it. Swine are not fond of it. Cows refuse it. *Chrysomela phellandria*, and the *gilt leptura*, are found upon the roots, and the *curculio paraplecticus* within the stems.

550. *CICUTA*, or *Water-Hemlock*.

Three species; viz. * *virosa*, *bulbifera*, *maculata*.

Eur. N. Amer.

virosa. * *C.* umbels opposite the leaves; leafstalks bordered, blunt.—This is one of the rankest of our vegetable poisons. Numerous instances are recorded of its fatality to the human species. Early in the spring, when it grows in the water, cows often eat it, and are killed by it; but, as the summer advances, and its scent becomes stronger, they carefully avoid it. Though a certain and fatal poison to cows, goats devour it greedily, and with impunity. Horses and sheep eat it with safety.

551. *ÆTHUSA*, or *Fools-parsley*.

Four species; viz. * *cynapium*, *bunius*, * *meum*, *fatua*. Europe.

cynapium. * *Æ.* all the leaves alike; fruit nearly globular.—This plant, from its resemblance to common parsley, has sometimes been mistaken for it, and when eaten, it occasions sickness. If the curled-leaved parsley only was cultivated in our gardens, no such mistakes would happen. Cows, horses, sheep, and swine eat it. It is noxious to geese.

meum. * *Æ.* all the leaves divided into many bristle-shaped segments; involucre 1 leaf; fruit egg-oblong, tapering at each end.—Linnaeus says, that the radical fibres of this plant form the basis of the *calculus ægragopila*. The roots and seeds are aromatic and acrid. They have been used as stomachics and carminatives. They are sometimes given to cure tertians; and there is no doubt but they will often answer as well as pepper, and other acrid aromatics.

552. *CORIANDRUM*, or *Coriander*.

Two species; viz. * *sativum*, *testiculatum*. S. of Eur.

sativum. * *C.* fruit globular.—The leaves have a very strong and disagreeable scent. The seeds are grateful to the taste, and incrustated with sugar are sold by the confectioners, under the name of coriander comfits. The Edinburgh college use them as correctors in the bitter infusion, and the preparations of senna; nothing so effectually covering the disagreeable taste of that medicine. They have been considered as suspicious, if not deleterious; but six drams of them have been taken at once, without any remarkable effect.

553. *SCANDIX*, or *Shepherds-needle*.

11 species; viz. * *odorata*, * *pecten*, *chilensis*, * *cerefolium*, * *anthriscus*, *australis*, *nodosa*, *trichosperma*, *infesta*, *grandiflora*, *procumbens*. Eur. Virg. Chili.

odorata. * *S.* seeds furrowed; angular.—The seeds are used in the north of England, for polishing and perfuming oak floors and furniture.

cerefolium. * *S.* seeds glossy, cylindrical and beaked; umbels lateral, nearly sitting.—It is cultivated in our gardens as a pot-herb, and for salads. It is slightly aromatic and aperient. Cows are extremely fond of it. Sheep and goats eat it. Horses refuse it.

554. *CHÆROPHYLLUM*, or *Wild Chervil*.

11 species; viz. * *sylvestre*, *bulbosum*, *aristatum*, * *temulum*, *capense*, *scabrum*, *hirsutum*, *aromaticum*, *coloratum*, *aureum*, *arborescens*. Eur. Virg. Jap.

sylvestre. * *C.* stem smoothish, scored, a little swoln at the knots. The roots, eaten as parsnips, have been found poisonous. The umbels afford an indifferent yellow dye; the leaves and stems a beautiful green. Its presence indicates a

fruitful soil. Neither horses, sheep, or goats, are fond of it. Swine refuse it. Rabbits are fond of it. In some parts of the kingdom, in times of scarcity, it is used as a pot-herb. Cows are so fond of it, that, when a pasture is overrun with it, as is often the case about Dudley, they always turn them in to eat it up.

555. *IMPERATORIA*, or *Master-wort*.

One species; viz. *ostruthium*. Alps of Austria, Switzerland.—Root warm and aromatic, a sudorific, diuretic, and sialagogue; recommended in dropsy, debilities of the stomach and bowels; and an infusion of it in wine is said to have cured quartans that have resisted the bark. When chewed, it excites a copious flow of saliva, exciting a warm and not disagreeable sensation in the gums, and frequently curing the rheumatic toothach.

556. *SESELI*, or *Hart-wort of Marseilles*.

15 species; viz. *filifolium*, *pimpinelloides*, *montanum*, *striatum*, *glaucum*, *aristatum*, *annuum*, *chærophyloides*, *ammoides*, *tortuosum*, *turbith*, *hippomarathrum*, *pyrenæum*, *saxifragum*, *elatum*. Germ. S. Eur.

557. *THAPSIA*, or *Deadly Carrot*.

Five species; viz. *villosa*, *foetida*, *asclepium*, *garganica*, *trifoliata*. France, Spain, Portugal, Lev. Virg.

558. *PASTINACA*, or *Parsnip*.

Three species; viz. *lucida*, *sativa*, *opopanax*. South of Europe.

P. leaves simply winged.—The roots, when cultivated, are sweeter than carrots, and are much used by those who abstain from animal food in Lent; they are highly nutritious. In the north of Ireland, they are brewed instead of malt, with hops, and fermented with yeast. The liquor thus obtained is agreeable. The seeds contain an essential oil, and will often cure intermittent fevers. Hogs are fond of the roots, and quickly grow fat with them. See AGRICULTURE *Index*.

559. *SMYRNIUM*, or *Alexanders*.

Seven species; viz. *perfoliatum*, *ægyptiacum*, *laterale*, * *olusatrum*, *apiifolium*, *aureum*, *integerrimum*, Italy, Crete, Egypt, N. Amer.

* *S.* stem leaves growing by threes on leafstalks, *ser-olusatrum*.—It was formerly cultivated in our gardens, but its place is now better supplied by celery. It is boiled, and greedily eaten by sailors returning from long voyages, who happen to land at the south-west corner of Anglesea.

560. *ANETHUM*, or *Dill*.

Three species; viz. *graveolens*, *segetum*, * *fœniculum*. Germ. Spain, Portugal.

* *A.* leaves with many divisions, hair-like; seeds egg-*fœniculum* oblong, tapering at each end, not bordered.—The tender buds are useful in salads. The leaves, boiled, are used in sauce for several kinds of fish, and eaten raw with pickled fish. In Italy the stalks are blanched as a winter salad. The seeds abound with an essential oil, which is carminative and diuretic, but not heating. The *papilio machaon* feeds upon it.

561. *CARUM*, or *Caraways*.

Two species; viz. * *carui*, *simplex*. Europe.

* *C.* The young roots are said to be better eating than *carui*. parsnips; the tender leaves may be boiled with pot-herbs. The seeds are used in cakes. Incrustated with sugar,

gar, they are called caraway comfits, and are distilled with spirituous liquors, for the sake of the flavour they afford. The seeds were formerly recommended by Dioscorides to pale-faced girls, and in more modern days their use is not forgotten.—They are no despicable remedy in tertian agues. They abound with an essential oil, which is antispasmodic and carminative. Sheep, goats, and swine eat it. Cows and horses are not fond of it.

562. PIMPINELLA, or *Burnet Saxifrage*.

Ten species; viz. saxifraga, nigra, * magna, dissecta, glauca, capensis, peregrina, anisum, dichotoma, * dioica. Europe, Egypt.

magna.

* P. leaves uniform, winged; leaflets spear-shaped, irregularly serrated; floral leaves wing-cleft.—This and the saxifraga partake nearly of the same qualities. The root is very acrid, burning the mouth like pepper. It affords a blue oil. Its acrimony hath occasioned it to be used to cure the toothach, and to cleanse the skin from freckles. It is chewed to promote the secretion of saliva, and is used in gargles for dissolving viscid mucus in the throat. In Germany it is prescribed in the asthma and dropsy. The *papilio machaon* is found upon both species.

563. APIUM, or *Parsley*.

Two species; viz. petroselinum, * graveolens. Sardinia, Carolina.

graveolens

* A. stem-leaves wedge-shaped.—The root in its wild state (when it grows near water) is fetid, acrid, and noxious; but when cultivated in dry ground it loses these properties, and the root and lower part of the leaf-stalks and stem, blanched by covering them up with earth, are eaten raw, boiled in soups, or stewed. In this latter state it is called *celery*. They are said to be hurtful to people subject to nervous complaints. They are certainly good antiscorbutics. The seeds yield an essential oil. Sheep and goats eat it; cows are not fond of it; horses refuse it.

564. ÆGOPODIUM, or *Gout-weed*.

One species; viz.

podagraria.

* A. upper leaves three together; lower ones in triple threes.—The leaves may be eaten early in the spring with other pot-herbs. Cows, sheep, and goats eat it; horses are not fond of it.

ORDER III. TRIGYNIA.

565. SEMICARPUS.

One species; viz. anacardium. Ceylon.

566. RHUS, or *Sumach* or *Poison-tree*.

33 species; viz. coriaria, tiphynum, javanicum, glabrum, elegans, vernix, succedanium, semialatum, copallinum, alatum, pauciflorum, metopium, digitatum, cirrhiflorum, tridentatum, radicans, toxicodendron, aromaticum, suaveolens, dentatum, sinuatum, cuneifolium, incisum, tomentosum, villosum, pubescens, viminalis, angustifolium, rosmarinifolium, lævigatum, lucidum, cotinus, astrum. S. Europe, Cape, China, N. Amer.

coriaria.

R. with winged leaves, and leaflets elliptical, bluntly toothed, woolly beneath. Called *common sumach*.—This tree or shrub is cultivated in the south of Europe on account of the culinary uses of its fruits, and for the purposes of the dyers, &c. Amongst us it is met with only

in the gardens of the curious. The seeds and berries are of a red colour, in shape round and flat. But these and the leaves are moderately astringent, and have sometimes been exhibited with this intention by medical practitioners; but they are not at present used.

R. with winged entire leaves, with a membranaceous *copallinum* jointed leaf-stalk.—This tree grows in New Spain, and produces a resin called *copal*, which is brought to us in irregular lumps, some transparent, of a yellowish or brown colour; others semitransparent and whitish. It is used for making a very pure and hard varnish by painters. It has never come into use in medicine in this country, though it is introduced into some of the foreign pharmacopœias, and may be considered as an article deserving attention.

567. VIBURNUM, or *Pliant Mealy-tree*.

23 species; viz. tinus, tinoides, villosum, scandens, nudum, primifolium, davuricum, dentatum, plicatum, erosum, * lantana, tomentosum, hirtum, acerifolium, orientale, * opulus, dilatatum, macrophyllum, cuspidatum, lentago, cassinoides, nitidum, lævigatum. S. of Europe, N. America.

* V. leaves heart-shaped, serrated, veined, cottony underneath.—The bark of the root is used to make bird-lime. The berries are drying and astringent.

568. CASSINE, or *Cashew-berry-bush*, *South-Sea Tea*.

Four species; viz. capensis, colpoon, barbara, maurocenia. C. of G. Hope.

569. SAMBUCUS, or *Elder-tree*.

Five species; viz. * ebulus, canadensis, * nigra, japonica, racemosa. Europe, China, N. America.

* S. tufts with three divisions; stipulæ leaf-like; stem *ebulus*.

herbaceous.—This plant has the same medical properties with the *S. nigra*, but in some respects more violent, and therefore less manageable: A dram and a half of the root is a strong purge: The berries give out a violet colour: The green leaves drive away mice from granaries, and the Silesians strew them where their pigs lie, under a persuasion that they prevent some of the diseases to which they are liable. Neither cows, goats, sheep, horses, or swine, will eat it.

* S. tufts with five divisions; leaves winged; leaflets *nigra*.

nearly egg-shaped, serrated; stem tree-like.—The whole plant has a narcotic smell; it is not well to sleep under its shade. The wood is hard, tough, and yellow. It is commonly made into skewers for butchers; tops for angling-rods; and needles for weaving nets. It is not a bad wood to turn in the lathe. The inner green bark is purgative, and may be used with advantage where acrid purgatives are requisite. In smaller doses it is diuretic, and has done eminent service in obstinate glandular obstructions, and in dropsies. If sheep that have the rot are placed in a situation where they can get at the bark and the young shoots, they will soon cure themselves. It is an ingredient in the black dye. The leaves are purgative like the bark, but more nauseous. They are an ingredient in several cooling ointments. If turnip-cabbages, fruit-trees or corn, which are subject to blight from a variety of insects, are whipped with the green leaves and branches of elder, the insects will not attack them. A decoction of the flowers, taken internally, is said to promote expectoration in pleurisies. If the flowers are fresh gathered.

gathered they loosen the belly. Externally they are used in fomentations to ease pain and abate inflammation. Many people use them to give a flavour to vinegar. They are fatal to turkeys. A rob prepared from the berries is a gentle opener, and promotes perspiration. The juice of the berries is employed to give a red colour to raisin or sugar wines. The berries are poisonous to poultry. The pith, being exceedingly light, is cut into balls used in electrical experiments. Sheep eat it; horses, cows, and goats refuse it. The *aphis sambuci* and the *phakena sambucaria* are found upon it.

570. SPATHELIA.
One species; viz. simplex. Jamaica.

571. STAPHYLEA, or *Bladder-nut*.
Three species; viz. occidentalis, pinnata, trifolia. S. Europe, Virginia, Jamaica.

572. TAMARIX, or *Tamarisk*.
Four species; viz. *gallica, songarica, germanica, articulata. Germany, France, Spain, Italy, Barbary.

573. XYLOPHYLLA, or *Love-flower*.
Seven species; viz. longifolia, latifolia, arbuscula, falcata, angustifolia, montana, ramiflora. Siberia, Jamaica, Bahama isles.

574. REICHELIA.
One species; viz. palustris.

575. SALMASIA.
One species; viz. racemosa. Guiana.

576. TURNERA, or *Nettle-leaved Cistus*.
Nine species; viz. ulmifolia, pumilea, rupestris, fidoides, frutescens, rugosa, cistoides, racemosa, gujanensis. Jamaica, Martinico, Guiana.

577. TELEPHIUM, or *True Orpine*.
Two species; viz. imperati, oppositifolium. South of France, Italy, Barbary.

578. CORRIGIOLA, or *Base Knot grass*.
Two species; viz. *littoralis, capensis. Germany, France, Arabia.

579. PHARNACEUM.
14 species; viz. cerviana, lineare, teretifolium, microphyllum, marginatum, mollugo, glomeratum, serpyllifolium, quadrangulare, incanum, albens, dichotomum, distichum, cordifolium. Russia, Spain, Asia, Africa.

580. ALSINE, or *Chickweed*.
Three species; viz. *media, segetalis, mucronata. S. Europe, Egypt.

581. DRYPSIS.
One species; viz. spinosa. Italy, Barbary.

582. BASELLA, or *Malabar Nightshade*.
Five species; viz. rubra, alba, lucida, cordifolia, vesicaria. East Indies, China.

583. SAROTHTA, or *Base Gentian*.
One species; viz. gentianoides. Virginia, Pennsylvania.

584. PORTULACARIA, or *Purslane tree*.
One species; viz. afro. Africa.

ORDER IV. TETRAGYNIA.

585. PARNASSIA, or *Grass of Parnassus*.
One species; viz. *palustris. Europe.

586. EVOLVULUS.

Seven species; viz. mammillarius, gangeticus, emarginatus, alsinoides, hirsutus, linifolius, sericeus. East Indies, Jamaica.

ORDER V. PENTAGYNIA.

587. ARALIA, or *Berry-bearing Angelica*.

10 species; viz. arborea, capitata, cordata, japonica, pentaphylla, seiodaphyllum, spinosa, chinensis, racemosa, nudicaulis. China, West Indies, North America.

588. GLOSSOPETALUM.

Two species; viz. glabrum, tomentosum. Guiana.

589. STATICE, or *Thrift*, or *Sea-pink*.

37 species; viz. *armeria, juniperifolia, alliacea, cephalotes, graminifolia, *limonium, gmelini, scoparia, latifolia, oleaeifolia, incana, auriculæfolia, cordata, scabra, tetragona, *reticulata, echiodes, speciosa, tatarica, echinus, flexuosa, purpurata, longifolia, minuta, pectinata, suffruticosa, monopetala, axillaris, cylindrifolia, linifolia, aurea, ferulacea, pruinosa, sinuata, lobata, spicata, micronata. Europe, Barbary, Canary, Amer. * S. stalk simple, with a head of flowers; leaves strap-shaped.—It is much used in gardens as an edging for borders, and, when in full blossom, gives a glowing tinge to pastures on the sea-coast. Horses and goats eat it; sheep are not fond of it.

590. LINUM, or *Flax*.

29 species; viz. *usitatissimum, *perenne, viscosum, hirsutum, aquilinum, narbonense, reflexum, *tenuifolium, selaginoides, prostratum, gallicum, maritimum, alpinum, austriacum, virginianum, flavum, monopetalum, strictum, monogynum, suffruticosum, arboreum, campanulatum, africanum, æthiopicum, nodiflorum, *catharticum, *radiola, quadrifolium, verticillatum. Europe, Africa, America.
* L. cal. and capsules dagger-pointed; petals scolopendry-shaped; leaves spear-shaped; stem generally solitary.—*usitatissimum*. This valuable plant originally came from those parts of Egypt which are exposed to the inundations of the Nile. The seeds yield, by expression only, a large proportion of oil, which is an excellent pectoral, as is likewise the mucilaginous infusion. They make an easy and useful poultice in cases of external inflammation; and they are the food of several small birds. After the oil is expressed, the remaining farinaceous part, called *oil-cake*, is given to oxen, who soon grow fat upon it. The oil itself differs in several respects from other expressed oils; it does not congeal in winter, nor does it form a solid soap with fixed alkaline salts; and it acts more powerfully as a menstruum upon sulphureous bodies. When heat is applied during the expression, it gets a yellowish colour, and a peculiar smell. In this state it is used by the painters and the varnishers. The fibres of the stem are manufactured into linen, and this linen, when worn to rags, is made into paper.
* L. leaves opposite, egg-spear-shaped; stem forked. *catharticum*. Cor. pointed.—An infusion of two drams or more of *cum*, the dried plant is an excellent purge, and has been given with advantage in many obstinate rheumatism. It frequently acts as a diuretic. Horses, sheep, and goats eat it.

591. ALDROVANDA.

One species; viz. vesiculosa. Italy, India.

592. DROSERA, or *Sun-dew*.

10 species; viz. acaulis, * rotundifolia, cuneifolia, burmanni, * longifolia, capensis, lusitanica, cistifolia, peltata, indica. Europe, Asia, Africa, America.

*rotundi-
folia.*

* D. stalks from the root; leaves circular.—The whole plant is acrid, and sufficiently caustic to erode the skin; but some ladies know how to mix the juice with milk, so as to make it an innocent and safe application to remove freckles and sunburn. The juice that exudes from it unmixed will destroy warts and corns. This plant has the same effect upon milk as the *pinguicula vulgaris*, and like that too is supposed to occasion the rot in sheep. The sour coagulated milk of the Syrians, called *leban* or *leven*, is supposed to be at first prepared with some plant of this kind. The name *sun-dew* seems to be derived from a very striking circumstance in the appearance of these plants; the leaves are fringed with hairs, supporting small drops or globules of a pellucid liquor like dew, which continue even in the hottest part of the day and in the fullest exposure to the sun. Perhaps the acrimony of the plant resides in this secreted liquor.

593. GISCHLA.

One species; viz. pharnacioides. E. Indies.

594. CRASSULA, or *Lesser Orpine*.

71 species; viz. coccinea, cymosa, flava, pubescens, pruinosa, scabra, corallina, vestita, argentea, perfoliata, perforata, fruticulosa, ramosa, mollis, tetragona, muricata, punctata, obvallata, cultrata, obliqua, spathulata, punctata, marginalis, cordata, lactea, arborescens, rupestris, pinnata, spinosa, retroflexa, lineolata, centauroides, dichotoma, glomerata, pulchella, strigosa,

mucosa, pyramidalis, columnaris, hemisphærica, aleoideis, capitella, cotyledonis, barbata, ciliata, thyrsiflora, spicata, subulata, alternifolia, rubens, cœspitosa, minima, moschata, verticillaris, expansa, dentata, nudicaulis, tecta, cephalophora, montana, turrita, alpestris, marginata, tomentosi, crenulata, deltoidea, orbicularia, sparsa, diffusa, prostrata, pellucida. Switzerland, Italy, Cape, China.

595. MAHERNIA.

Eight species; viz. verticillata, pinnata, pulchella, diffusa, incisa, glabrata, heterophylla, biserrata. C. of G. Hope.

596. COMMERSONIA.

One species; viz. echinata. Otabeita.

597. SIBBALDIA.

Three species; viz. * procumbens, erecta, altaica. Siberia, Alps in Europe.

ORDER VI. DECAGYNIA.

598. SCHEFFLERA.

One species; viz. digita. South Sea isles.

ORDER VII. POLYGYNIA.

599. MYOSURUS, or *Mouse-tail*.

One species; viz. * minimus. Europe.

600. ZANTHORHIZA.

One species; viz. apiifolia.

In the class Pentandria are

325 Genera, including 2537 Species, of which 168 are found in Britain.

CLASSIS VI.

HEXANDRIA.

ORDO I. MONOGYNIA.

Sect. I. *Flores calyculati, calyce corollaque instructi, absque spathis.*

602. BROMELIA. Cor. 3 partita. Cal. 3-partitus, superus. Bacca.

603. PITCAIRNIA. Cor. 3-partita. Cal. 3-partitus, semisuperus. Capsula.

604. TILLANDSIA. Cor. 3-petala. Cal. 3-partitus, inferus. Sem. comosa.

606. BURMANNIA. Cor. 3-petala. Cal. 1-phyllus, inferus, triquetro-alatus, coloratus.

607. TRADESCANTIA. Cor. 3-petala. Cal. 3-phyllus, inferus. Filamenta barbata.

686. STEPHANIA. Cor. 4-petala. Cal. 2-lobus. Germ. pedicellatum.

CLASS VI.

HEXANDRIA.

ORDER I. MONOGYNIA.

Sect. I. *Flowers double calyxed, furnished with a calyx and corolla, and without sheaths.*

B. Cor. 3-partite. Cal. 3-partite, superior. A berry.

P. Cor. 3-partite. Cal. 3-partite, half superior. A capsule.

T. Cor. 3-petalous. Cal. 3-partite, inferior. Seeds hairy.

B. Cor. 3-petalous. Cal. 1 leaf, inferior, three-winged, coloured.

T. Cor. 3-petalous. Cal. 3-leaved, inferior. Filaments bearded.

S. Cor. 4-petalous. Cal. 2-lobed. Germen on a pedicle.

690. FRANKENIA. Cor. 5-petala. Cal. 1-phyllus, inferus. Caps. 1-locularis, polysperma.
 675. COSSIGNEA. Cor. 5-petala. Cal. 5-partitus. Caps. 3-locularis.
 684. LORANTHUS. Cor. 6-partita. Cal. margo superus. Bacca 1-sperma.
 687. HILLIA. Cor. 6-fida. Cal. 6-phyllus, superus. Fructus 2-locularis, polyspermus.
 685. SCHRADERA. Cor. 6-fida. Cal. truncatus. Bacca polysperma.
 DUROIA. Cor. 6-partita. Cal. truncatus. Pomum.
 671. RICHARDIA. Cor. 6-fida. Cal. 6-fidus, superus. Sem. 3, nuda.
 665. TACCA. Cor. 6-petala. Cal. 6-partitus. Bacca infera.
 676. BARBACENTIA. Cor. 6-petala. Cal. 6-dentatus. Filamenta dentata. Capsula.
 677. BERBERIS. Cor. 6-petala. Cal. 6-phyllus, inferus. Bacca 2-sperma.
 644. LEONTICE. Cor. 6-petala. Cal. 6-phyllus, inferus. Bacca inflata, supera.
 679. NANDINA. Cor. 6-petala. Cal. polyphyllus, imbricatus. Bacca 2-sperma.
 674. PRINOS. Cor. 6-fida. Cal. 6-fidus, inferus. Bacca 6-sperma.
 678. PSATHURA. Cor. 6-fida. Cal. 6-dentatus. Pomum 6-loculare.
 689. CANABINA. Cor. 6-fida. Cal. 6-phyllus, superus. Caps. 6-locularis.
 673. ACHRAS. Cor. 12-fida. Cal. 6-phyllus, inferus. Bacca 12-sperma.
 683. CAPURA. Cor. 12-fida. Cal. nullus. Germen superum. Bacca.

† *Chlora imperfoliata*. *Portlandia hexandra*. *Lythra aliquid*. *Fumaria*. *Cucullaria*.

Sect. II. *Flores calyculati, calyce, corolla, spathisque instructi.*

666. CORYPHA. Cor. 3-partita. Cal. 3-phyllus. Drupa.
 667. LICOALA. Cor. 3-partita. Cal. 3-partitus. Nectar. sertiforme. Drupa.
 608. MNASIMUM. Cor. 3-dentata. Cal. 5-partit. Spatha 2-valvis. Antheræ foliaceæ.

Sect. III. *Flores spathacei glumacei.*

601. URANIA. Cor. supera 3-petala. Spathæ alternæ.
 610. HEMANTHUS. Cor. supera, 6-partita. Involucrum polyphyllum, maximum.
 613. LEUCOIMUM. Cor. supera, 6-petala, campanulata. Stamina aequalia.
 614. STRUMARIA. Cor. 6-petala, plana.
 612. GALANTHUS. Cor. supera, 6-petala. Nectar. campanulatum, extra stamina.
 617. PANCRACTIUM. Cor. supera, 6-petala. Nectarium campanulatum, staminibus terminatum.
 622. AMARYLLIS. Cor. supera, 6-petala, irregularis. Stam. inæqualia, declinata.
 618. CRINUM. Cor. supera, 6-fida, basi tubulosa. Stam. distantia, fauci inserta.

- F. Cor. 3 petals. Cal. 1 leaf, inferior. Caps. 1 cell, many seeds.
 C. Cor. 5 petals. Cal. 5-partite. Caps. 3-celled.
 L. Cor. 6-partite. Cal. border superior. Berry 1 seed.
 H. Cor. 6-cleft. Cal. 6-leaved, superior. Fruit 2-celled, many seeds.
 S. Cor. 6-cleft. Cal. lopped. A berry with many seeds.
 D. Cor. 6-partite. Cal. lopped. An apple.

- R. Cor. 6-cleft. Cal. 6-cleft, superior, 3 naked seeds.
 T. Cor. 6 petals. Cal. 6-partite. Berry inferior.

- B. Cor. 6 petals. Cal. 6-toothed. Filaments toothed. A capsule.
 B. Cor. 6 petals. Cal. 6-leaved, inferior. Berry 2-seeded.
 L. Cor. 6 petals. Cal. 6-leaved, inferior. Berry inflated, superior.
 N. Cor. 6 petals. Cal. many-leaved, tiled. Berry with 2 seeds.
 P. Cor. 6-cleft. Cal. 6-cleft, inferior. Berry 6 seeds.
 P. Cor. 6-cleft. Cal. 6-toothed. A 6-celled apple.

- C. Cor. 6-cleft. Cal. 6-leaved, superior. Caps. 6-celled.
 A. Cor. 12-cleft. Cal. 6-leaved, inferior. Berry 12-seeded.
 C. Cor. 6-cleft. No calyx. Germen superior. Berry.

Sect. II. *Double calyked flowers, furnished with a corolla and sheaths.*

- C. Cor. 3-partite. Cal. 3-leaved. A drupe.
 L. Cor. 3-partite. Cal. 3-partite. Nectary garland-shaped. A drupe.
 M. Cor. 3-toothed. Cal. 3-partite. Sheath 2-valved. Anthers leafy.

Sect. III. *Flowers sheathed husked.*

- U. Cor. superior, 3-petaled. Sheaths alternate.
 H. Cor. superior, 6-partite. The involucre many-leaved, very large.
 L. Cor. superior, 6-petaled, bell-shaped. Stamens equal.
 S. Cor. 6-petaled, flat.
 G. Cor. superior, 6-petaled. Nectary bell-shaped, without the stamens.
 P. Cor. superior, 6-petaled. Nectary bell-shaped, ending with stamens.
 A. Cor. superior; 6-petaled, irregular. The stamens unequal, bending.
 C. Cor. superior, 6-cleft, tubular at the base. Stamens distant, inserted in the mouth.

621. *CYRTANTHUS*. Cor. supera, 6-fida, clavata. Filamenta simplicia.
 620. *EUSTEPHIA*. Cor. supera, 6-fida, tubulosa. Filamenta tricuspидata.
 619. *AGAPANTHUS*. Cor. infera, 6-fida, infundibuliformis, regularis.
 609. *PONTERERIA*. Cor. infera, 6-fida, ringens.
 624. *BULBOCODIUM*. Cor. infera, 6-petala; unguibus longissimis staminiferis.
 615. *TULBAGIA*. Cor. infera, 6-petala; tribus inferioribus. Nectarium cylindricum extus petaliferum.
 626. *ALLIUM*. Cor. infera, 6-petala. Petala ovata, sessilia.
 636. *CURCULIGO*. Cor. infera, 6-petala. Styl. 3-partitus.
 625. *APHYLLANTHES*. Cor. infera, 6-petala. Spathæ dimidiatæ, glumosæ.
 611. *MASSONIA*. Cor. infera, 6-partita. Stem. nect. inserta.
 637. *HYPOXIS*. Cor. supera, 6-petala. Spathæ glumacæ.

Sect. IV. *Flores nudi.*

605. *XEROPHYTA*. Cor. 6-partita supera. Stigma clavatum.
 661. *ALSTROEMERIA*. Cor. supera, 6-petala, unguibus tubulosis.
 655. *LANARIA*. Cor. supera, 6-fida, subcampanulata.
 662. *HÉMÉROCALLIS*. Cor. infera, 6-partita. Stam. declinata.
 660. *AGAVE*. Cor. supera, 6-fida, limbo erecto, filamentis brevior.
 635. *GETHYLLIS*. Cor. supera, 6-partita. Bacca clavata, polysperma.
 659. *ALOE*. Cor. infera, 6-fida. Filam. receptaculo inserta.
 657. *ALETRIS*. Cor. infera, 6-fida, rugosa. Stamina faucis inserta.
 656. *VOLTHEIMIA*. Cor. infera, 6-fida. Stamina corollæ basi inserta.
 650. *POLYANTHES*. Cor. infera, 6-fida, tubo curvato.
 649. *CONVALLARIA*. Cor. infera, 6-fida. Bacca trisperma.
 648. *SANSEVIERA*. Cor. 6 partita. Bacca 1-sperma.
 652. *HYACINTHUS*. Cor. infera, 6-fida, subcampanulata. Stamina receptaculo inserta.
 651. *DRIMIA*. Cor. infera, 6-fida, campanulata. Stamina tubo corollæ inserta.
 623. *MILLEA*. Cor. infera, 6-fida, infundibulif. Germen pedicellatum.
 642. *ASPHODELUS*. Cor. infera, 6-partita. Nectarium valvulis 6 staminiferis.
 629. *EUCOMIS*. Cor. infera, 6-partita, persistens. Filamenta nectarium adnata.
 643. *ANTHERICUM*. Cor. infera, 6-petala, plana.
 681. *ENARGEA*. Cor. infera, 6-petala, petalis alternè basi biglandulosis.
 653. *PHORMIUM*. Cor. infera, 6-petala, inæqualis. Caps. triquetra.
 654. *LACHENALIA*. Cor. infera, 6-petala, inæqualis. Caps. trialata.

- C. Cor. superior, 6-cleft, club-shaped. Filaments undivided.
 E. Cor. superior, 6-cleft, tubular. Filaments 3-pointed.
 A. Cor. inferior, 6-cleft, funnel-shaped, regular.
 P. Cor. inferior, 6 cleft, gaping.
 B. Cor. inferior, 6-petaled, with very long claws bearing the stamens.
 T. Cor. inferior, 6-petals; three inferior. A cylindrical nectary without, bearing the petals.
 A. Cor. inferior, 6 petaled. Petals oval, sitting.
 C. Cor. inferior, 6-petaled. Style 3-partite.
 A. Cor. inferior, 6-petaled. Sheaths extending half round, husky.
 M. Cor. inferior, 6-partite. Stamens inserted in a nectary.
 H. Cor. superior, 6-petaled. Sheaths husky.

Sect. IV. *Flowers naked.*

- X. Cor. 6-partite superior. Stigma club-shaped.
 A. Cor. superior, 6-petaled, with tubular claws.
 L. Cor. superior, 6-cleft, nearly bell-shaped.
 H. Cor. inferior, 6-partite. Stamens bent.
 A. Cor. superior, 6-cleft, with an erect border shorter than the filaments.
 G. Cor. superior, 6-partite. Berry club-shaped, many-seeded.
 A. Cor. inferior, 6-cleft. Filaments inserted in the receptacle.
 A. Cor. inferior, 6-cleft, wrinkled. Stamens inserted in the mouth.
 V. Cor. inferior, 6-cleft. Stamens inserted in the base of the corolla.
 P. Cor. inferior, 6-cleft, with a crooked tube.
 C. Cor. inferior, 6-cleft. Berry 3-seeded.
 S. Cor. inferior, 6-partite. Berry 1-seeded.
 H. Cor. inferior, 6-cleft, nearly bell-shaped. Stamens inserted in the receptacle.
 D. Cor. inferior, 6-cleft. Bell-shaped. Stamens inserted in the tube of the corolla.
 M. Cor. inferior, 6-cleft, funnel-shaped. Germen on a pedicle.
 A. Cor. inferior, 6-cleft. Nectarium with 6 valves, bearing the stamens.
 E. Cor. inferior, 6-partite, permanent. Filaments connected with the nectary.
 A. Cor. inferior, 6 petals, flat.
 E. Cor. inferior, 6 petals, the petals alternately biglandular at the base.
 P. Cor. inferior, 6 petals, unequal. Caps. with 3 flat sides.
 L. Cor. inferior, 6 petals, unequal, Caps. 3-winged.

ORDER I. MONOGYNIA.

601. URANIA.

One species; viz. speciosa. Isle of Madagascar.

602. BROMELIA, or *Pine-apple, Ananas.*

10 species; viz. ananas, pinguin, karatas, lingulata, bracteata, paniculigera, chrysantha, nudicaulis, humilis, acanga. W. Indies, S. America.—The ananas is the most grateful of all the tropical fruits. It requires a very powerful heat for its cultivation in hot-houses.

603. PITCAIRNIA.

Three species; viz. bromeliæfolia, angustifolia, latifolia. Jamaica, Santa Cruz.

604. TILLANDSIA.

16 species; viz. utriculata, serrata, lingulata, tenuifolia, flexuosa, setacea, paniculata, fasciculata, nutans, polystachya, monostachya, pruinosa, canescens, angustifolia, recurvata, usneoides. N. Amer. Jamaica.

605. XEROPHYTA.

One species; viz. pinifolia. Isle of Madagascar.

606. BURMANNIA.

One species; viz. disticha, biflora. Ceyl. Virg.

607. TRADESCANTIA, or *Virginia Spider-wort.*

17 species; viz. virginica, crassifolia, erecta, zanonina, discolor, malabarica, nervosa, divaricata, geniculata, monandra, multiflora, cordifolia, procumbens, axillaris, formosa, cristata, papilionacea. Virginia, Maryland, E. and W. Indies.

608. MNASIUM.

One species; viz. paludosum. Guiana.

609. PONTEDERIA.

Six species; viz. rotundifolia, azurea, vaginalis, limosa, cordata, hastata. E. and W. Indies.

610. HÆMANTHUS, or *Blood-flower.*

14 species; viz. coccineus, coarctatus, puniceus, multiflorus, tigrinus, quadrivalvis, pubescens, ciliaris, albiflos,

albifloſ, toxicarius, lanceæfolius, carinatus, pumilis, spiralis. Africa.

611. MASSONIA.

Four species; viz. latifolia, angustifolia, undulata, echinata. C. of G. Hope.

612. GALANTHUS, or *Snow-drop*.

One species; viz. * nivalis. South of Europe.

613. LEUCOLIUM, or *Greater Snow-drop*.

Three species; viz. * vernum, * æstivum, autumnale. Germany, Switzerland, Italy, Cape.

614. STRUMARIA.

Six species; viz. linguæfolia, truncata, rubella, undulata, angustifolia, filifolia.

615. TULBAGIA.

Two species; viz. alliacea, cepacea. Cape of Good Hope.

616. NARCISSUS, or *Daffodil*.

17 species; viz. * poeticus, incomparabilis, * pseudonarcissus, bicolor, minor, moschatus, triandrus, orientalis, trilobus, odorus, * biflorus, calathinus, tazetta, dubius, bulbocodium, serotinus, jonquilla. South of Europe, Levant.

617. PANCRACTIUM, or *Sea-daffodil*.

11 species; viz. zeylanicum, mexicanum, humile, caribæum, maritimum, fragrans, littorale, speciosum, amœnum, illyricum, amboinense. S. Europe, America, E. and W. Indies.

618. CRINUM, or *Asphodel Lily*.

Five species; viz. asiaticum, americanum, erubescens, bracteatum, nervosum. Asia, Africa, America.

619. AGAPANTHUS, or *African Blue-lily*.

Two species; viz. umbellatus, ensifolius. Cape of Good Hope.

620. EUSTEPHIA.

One species; viz. coccinea.

621. CYRTANTHUS.

Three species; viz. angustifolius, ventricosus, obliquus. Guiana.

622. AMARYLLIS, or *Lily-daffodil*.

38 species; viz. lutea, pumilio, bubispatha, tubiflora, atamasco, maculata, chilensis, clavata, formosissima, reginæ, purpurea, linearis, equestris, reticulata, tatarica, belladonna, vittata, falcata, ornata, longifolia, montana, zeylanica, revoluta, latifolia, aurea, orientalis, sarniensis, marginata, curvifolia, undulata, radiata, humilis, flexuosa, radula, striata, crispa, stellaris, caspia. S. Europe, Cape, E. Indies, America.

623. MILLEA.

One species; viz. biflora.

624. BULBOCODIUM, or *Mountain-saffron*.

One species; viz. vernum. Spain.

625. APHYLLANTHES.

One species; viz. monspeliensis. Montpellier.

626. ALLIUM, or *Garlick*.

53 species; viz. * ampeloprasum, porrum, lineare, suaveolens, deflexum, rotundum, victorialis, subhirsutum, magicum, obliquum, ramosum, tataricum, roseum, * sativum, scorodoprasum, * arenarium, * carinatum, sphærocephalon, parviflorum, pallasii, descendens, moschatum, flavum, pallens, paniculatum, * vineale, * ole-

raceum, nutans, ascalonicum, senescens, illyricum, odorum, inodorum, angulosum, striatum, narcissiflorum, pedemontanum, nigrum, canadense, * ursinum, clusianum, triquetrum, cepa, moly, tricocum, fistulosum, * schoenoprasum, sibiricum, stellerianum, capillare, tenuissimum, gracile, chamæ-moly. Europe, N. America, Jamaica.

* A. umbel globular; stamens 3-pointed, petals rough *ampelo-* on the heel.—This is eaten along with other pot-herbs. *prasmus*. It communicates its flavour to the milk and butter of cows that eat it.

* A. filaments undivided; leaves semi-cylindrical, *oleraceum* rough furrowed underneath; (leaves not rough.)—The tender leaves are very commonly boiled in soups, or fried with other herbs. Cows, goats, sheep, and swine, eat it.

* A. stalk 3-square; leaves spear-shaped on leaf-stalks; umbel flat-topped.—An infusion of this plant in brandy is esteemed a good remedy for the gravel. Other plants growing near it do not flourish. Cows eat it in the spring when grass is scarce; but it communicates an offensive flavour to the milk and butter.

* A.—The roots of this plant, which is the proper *gar-* *sativum*. lick, are of an irregularly roundish shape, with several fibres at the bottom; each root is composed of a number of lesser bulbs, called *cloves of garlick*, enclosed in one common membranaceous coat, and easily separated from each other. All the parts of this plant, but more especially the roots, have a strong offensive smell, and an acrimonious, almost caustic, taste. The root applied to the skin inflames and often exulcerates the part. Its smell is extremely penetrating and diffusive. When the root is applied to the feet, its scent is soon discoverable in the breath; and when taken internally its smell is communicated to the urine, or the matter of an issue, and perspires through the pores of the skin.

This pungent root warms and stimulates the solids, and attenuates tenacious juices. Hence in cold leucoplegmatic habits, it proves a powerful expectorant, diuretic, and, if the patient be kept warm, sudorific; it has also been by some supposed to be an emmenagogue. In catarrhus disorders of the breast, flatulent colics, hysterical and other diseases, proceeding from laxities of the solids, it has generally good effects; it has likewise been found serviceable in many hydropic cases. Sydenham relates, that he has seen the dropsy cured by the use of garlick alone; he recommends it chiefly as a warm strengthening medicine in the beginning of the disease.

Garlick is with some also a favourite remedy in the cure of intermittents; and it has been said to have sometimes succeeded in obstinate quartans after the Peruvian bark had failed, particularly when taken to the extent of one or two cloves daily in a glass of brandy or other spirits. The liberal use of garlick, however, is apt to occasion headaches, flatulencies, thirst, febrile heats, inflammatory distempers, and sometimes discharges of blood from the hæmorrhoidal vessels. In hot bilious constitutions, where there is already a degree of irritation, and where there is reason to suspect an unsound state of the viscera, this stimulating medicine is manifestly improper, and never fails to aggravate the distemper.

The most commodious form of taking garlick, a medicine to most people not a little unpleasant, is that

of a bolus or pill. Infusions in spirit, wine, vinegar, and water, although containing the whole of its virtues, are so acrimonious as to be unfit for general use. A syrup and oxymel of it were formerly kept in the shops; but it does not now enter any officinal preparation in our pharmacopœias; and it is proper that even the pills should always be an extemporaneous prescription, as they suffer much from keeping.

Garlick made into an ointment with oils, &c. &c. applied externally, is said to resolve and discuss cold tumours, and has been by some greatly esteemed in cutaneous diseases. It has likewise sometimes been employed as a repellent. When applied under the form of a poultice to the pubes, it has sometimes proved effectual in producing a discharge of urine, when retention has arisen from want of a due action of the bladder; and some have recommended, in certain cases of deafness, the introduction of a single clove, wrapt in thin muslin or gauze, into the meatus auditorius or passage of the ear. Sydenham assures us, that among all the substances which occasion a derivation or revulsion from the head, none operates more powerfully than garlick applied to the soles of the feet; hence he was led to make use of it in the confluent smallpox. About the eighth day after the face began to swell, the root cut in pieces, and tied in a linen cloth, was applied to the soles, and renewed twice a-day till all danger was over.

The roots of the *allium cepa*, or *onion*, are considered rather as articles of food than of medicine. They are supposed to afford little nourishment, and when eaten liberally in their raw state, produce flatulencies, occasion thirst, headaches, and troublesome dreams. In cold phlegmatic habits, where viscid mucus abounds, they doubtless have their use; as by their stimulating quality they tend to excite appetite, attenuate thick juices, and promote their expulsion: by some they are strongly recommended in suppressions of urine, and in dropsies. The chief medicinal use of onions in the present practice is in external applications, boiled as a cataplasm, for suppurating tumours.

627. LILIUM, or *Lily*.

16 species; viz. cordifolium, longiflorum, candidum, japonicum, lancifolium, bulbiferum, catesbæi, speciosum, pomponium, chalconicum, superbum, martagon, canadense, maculatum, kamschatense, philadelphicum. Europe, Japan, N. America.—The *Lilium candidum*, or *white lily*, is cultivated in gardens more for its beauty than utility. The mucilaginous root is used by some as a poultice; but it possesses no advantage over the poultices formed of vegetable farina.

628. FRITILLARIA, or *Crown-imperial*, *Fritillary*.

Six species; viz. imperialis, persica, verticillata, pyrenaica, * meleagris, latifolia. Aust. Pyren. Italy, Pers.

629. EUCOMIS.

Five species; viz. nana, bifolia, regia, undulata, punctata. C. of G. Hope.

630. UVULARIA.

Six species; viz. amplexifolia, hirta, lanceolata, perfoliata, sessilifolia, cirrhosa. Germ. N. Amer. Jap.

631. GLORIOSA, or *Superb Lily*.

Two species; viz. superba, simplex. Guiana, E. Ind.

632. ERYTHRONIUM, or *Dogs-tooth Violet*.

One species; viz. dens canis. Siberia, Italy, Virg. Carolina.

633. TULIPA, or *Tulip*.

Five species; viz. * sylvestris, suaveolens, gesneriana, biflora, breyniana. S. Eur. Lev. Cape.

634. ALBUCA, or *Base Star of Bethlehem*.

14 species; viz. altissima, major, flaccida, minor, viridiflora, coarctata, fastigiata, candata, setosa, aurea, abyssinica, fragrans, viscosa, spiralis. C. of G. Hope.

635. GETHYLLIS.

Five species; viz. spiralis, ciliaris, villosa, plicata, lanceolata. C. of G. Hope.

636. CURCULIGO.

One species; viz. orchioides.

637. HYPOXIS, or *Base Star-flower*.

15 species; viz. erecta, sobolifera, villosa, decumbens, obliqua, aquatica, minuta, alba, ovata, veratrifolia, stellata, serrata, juncea, fascicularis, sessilis. N. Amer. Jamaica, Cape, Japan.

638. ERIOSPERMUM.

Three species; viz. latifolium, lanceifolium, parvifolium.

639. ORNITHOGALUM, or *Star of Bethlehem*.

43 species; viz. uniflorum, striatum, bulbiferum, spathaceum, bohemicum, * luteum, minimum, circinatum, paradoxum, niveum, * umbellatum, * pyrenaicum, stachyoides, lacteum, ovatum, ciliatum, crenulatum, pilosum, revolutum, conicum, narbonne, latifolium, altissimum, scilloides, longibracteatum, japonicum, comosum, pyramidale, tenellum, odoratum, suaveolens, secundum, fuscatum, barbatum, polyphyllum, juncifolium, rupestre, arabicum, thyrsoides, aureum, coarctatum, candatum, nutans. Eur. Egypt, Madeira, Cape.

* O. stalk angular, 2-leaved; fruitstalks in an unbranched umbel.—The bulbous roots of all the species are nutritious and wholesome, and those of this species have been employed for food in a scarcity of provision. Horses, goats, and sheep eat it; swine are not fond of it; cows refuse it.

640. SCILLA, or *Squill*.

16 species; viz. maritima, lilio-hyacinthus, italica, tetraphylla, peruviana, japonica, amœna, præcox, campanulata, * bifolia, * verna, lusitanica, orientalis, hyacinthoides, * autumnalis, unifolia. Eur. Barb. Madeira, Japan.

S. flowers naked; floral leaves bent backwards as if broken.—This is the squill or sea-onion well known in medicine. It is a kind of onion growing spontaneously upon dry sandy shores in Spain and the Levant, from whence the root is annually brought into Europe. It should be chosen plump, sound, fresh, and full of clammy juice: some have preferred the red sort, others the white, though neither deserves the preference to the other. The only difference perceivable between them is that of the colour, and hence both may be used promiscuously. This root is to the taste very nauseous, intensely bitter and acrimonious. Much handled it ulcerates the skin. With regard to its medical

dical virtues, it powerfully stimulates the solids and attenuates viscid juices; and by these qualities promotes expectoration, urine, and, if the patient be kept warm, sweat: if the dose be considerable it proves emetic, and sometimes purgative. The principal use of this medicine is where the *primæ viæ* abound with mucous matter, and the lungs are oppressed by tenacious phlegm. Dr Wagner, in his clinical observations, recommends it given along with nitre in hydropical swellings, and in the nephritis; and mentions several cures that he performed by giving from four to ten grains of the powder for a dose, mixed with a double quantity of nitre: he says, that thus managed, it almost always operates as a diuretic, though sometimes it vomits or purges. In dropsy, dried squills are often combined with mercury. The most commodious form for the taking of squills, unless when designed as an emetic, is that of a bolus or pill; liquid forms are to most people too offensive, though these may be rendered less disagreeable both to the palate and stomach by the addition of aromatic distilled waters. This root yields the whole of its virtues both to aqueous and to vinous menstrua, and likewise to vegetable acids. Its officinal preparations are a conserve of dried squills, a syrup and vinegar, an oxymel, and pills.

641. CYANELLA.

Four species; viz. *capensis*, *orchidiformis*, *lutea*, *alba*. C. of G. Hope.

642. ASPHODELUS, or *Asphodel*, or *King's-spear*.

Seven species; viz. *luteus*, *creticus*, *ramosus*, *albus*, *fistulosus*, *altaicus*, *liburnicus*. Austria, S. Europe.

643. ANTHERICUM, or *Spider-wort*.

55 species; viz. * *serotinum*, *fragens*, *filifolium*, *flexifolium*, *filiforme*, *exuviatum*, *elongatum*, *græcum*, *planifolium*, *squamatum*, *comosum*, *floribundum*, *revolutum*, *ramosum*, *elatum*, *falcatum*, *contortum*, *vespertinum*, *graminifolium*, *japonicum*, *longifolium*, *hirsutum*, *adenanthera*, *reflexum*, *pilosum*, *undulatum*, *triflorum*, * *canaliculatum*, *albucoides*, *liliago*, *liliastrum*, *spirale*, *frutescens*, *rostratum*, *alooides*, *nutans*, *incurvum*, *latifolium*, *pugoniforme*, *præmorsum*, *asphodeloides*, *longiscapum*, *annuum*, *hispidum*, *muricatum*, *ciliatum*, *cauda felis*, *triquetrum*, *scabrum*, *cirrhatum*, *crispum*, * *ossi-fragum*, *physodes*, *pusillum*, * *calyculatum*. Alps of Swed. S. Eur. Cape, Japan.

* A.—It is believed in Sweden to be noxious to sheep, and has been supposed to soften the bones of animals that eat it. Cows and horses eat it; sheep and swine refuse it.

644. LEONTICE, or *Lions Leaf*.

Five species; viz. *chrysoagonum*, *leontopetalum*, *vesicaria*, *altaica*, *thalietroides*. Levant, N. America.

645. POLLIA.

One species; viz. *japonica*. Japan.

646. ASPARAGUS.

20 species; viz. * *officinalis*, *declinatus*, *decumbens*, *flexuosus*, *scandens*, *falcatus*, *racemosus*, *retrofractus*, *æthiopicus*, *asiaticus*, *albus*, *acutifolius*, *subulatus*, *dependens*, *horridus*, *aphyllus*, *lanceus*, *capensis*, *sarmentosus*, *verticillaris*. S. Eur. Asia, Africa.

* A. stem herbaceous, cylindrical, upright; leaves bristle-shaped; leaf-scales solitary or in pairs; male and female flowers sometimes on distinct plants.—The

young shoots of this plant, in its cultivated state, are very universally esteemed for their flavour and nutritious qualities. They impart to the urine the scent of water in which they have been boiled. The *sparagus chrysomela* lives upon it.

647. DRACÆNA, or *Dragon-tree*.

14 species; viz. *draco*, *indivisa*, *umbraculifera*, *australis*, *cernua*, *ferrea*, *terminalis*, *marginata*, *striata*, *undulata*, *erecta*, *ensifolia*, *borealis*, *graminifolia*. Cape, E. Indies, China, N. America.

648. SANSEVIERA.

Three species; viz. *guineensis*, *zeylanica*, *lanuginosa*.

649. CONVALLARIA, or *Lily of the Valley*.

11 species; viz. * *majalis*, *japonica*, *spicata*, * *verticillata*, * *polygonatum*, * *multiflora*, *latifolia*, *racemosa*, *stellata*, *trifolia*, *bifolia*. N. Eur. N. America, Japan.

* C, stalk naked, semi-cylindrical; flowers spiked, *majalis*. nodding.—The flowers are highly fragrant, but when dried are of a narcotic scent: reduced to powder, they excite sneezing. An extract prepared from the flowers, or from the roots, partakes of the bitterness as well as of the purgative properties of aloes. The dose from 20 to 30 grains. A beautiful and durable green colour may be prepared from the leaves by the assistance of lime. Sheep and goats eat it; horses, cows, and swine refuse it.

* C. leaves alternate, embracing the stem; stem 2-polygonal-edged; fruitstalks axillary, mostly 1-flowered.—In a *tum*. scarcity of provisions the roots have been made into bread. Sheep and goats eat it; horses, cows, and swine refuse it.

* C. leaves alternate embracing the stem; stem cylindrical: fruit-stalks axillary, many-flowered.—The young shoots are eaten by the Turks as asparagus, and the roots have been made into bread as the *C. polygonatum*. Cows, goats, and sheep eat it.

650. POLYANTHUS, or *Tuberose*.

Two species; viz. *tuberosa*, *pygmæa*. E. Indies.

651. DRIMIA.

Five species; viz. *ciliaris*, *elata*, *pusilla*, *undulata*, *media*.

652. HYACINTHUS, or *Hyacinth*.

13 species; viz. * *non-scriptus*, *cernuus*, *amethystinus*, *orientalis*, *flexuosus*, *corymbosus*, *convallarioides*, *brevifolius*, *romanus*, *muscaris*, *comosus*, *betryoides*, *racemosus*. S. Eur. Levant.

* H. blossoms tubular-bell-shaped, with six divisions, *non-scriptus* segments rolled back; floral leaves in pairs.—The fresh roots are poisonous: They may be converted into starch. *Phalæna plantaginis* lives upon it.

653. PHORMIUM.

One species; viz. *tenax*.

654. LACHENALIA.

24 species; viz. *glaucina*, *orchioides*, *pallida*, *hyacinthoides*, *angustifolia*, *contaminata*, *viridis*, *serotina*, *pusilla*, *patula*, *fragrans*, *liliflora*, *pustulata*, *purpureo-coerulea*, *violacea*, *purpurea*, *lanceæfolia*, *unifolia*, *hirta*, *isopetala*, *tricolor*, *rubina*, *punctata*, *pendula*. Cape, New Zealand.

655. LANARIA.

One species; viz. plumosa. C. of G. Hope.

656. VOLTHEIMIA.

Four species; viz. viridifolia, glauca, uvaria, punila.

657. ALETRIS, or *Base Aloe*.

Two species; viz. farinosa, fragrans. Afr. N. Amer. Ceylon, Japan.

658. YUCCA, or *Adam's Needle*.

Four species; viz. gloriosa, aloifolia, draconis, filamentosa. Amer.

659. ALOE.

17 species; viz. dichotoma, spicata, perfoliata, picta, sinuata, humilis, arachnoides, margaritifera, verrucosa, carinata, maculata, lingua, plicatilis, variegata, viscosa, spiralis, retusa. Africa.

These plants are chiefly or rather only valuable, on account of the medicinal virtues of their inspissated juice. The ancients distinguished two sorts of aloes: The one was pure and of a yellowish colour inclining to a red, resembling the colour of a liver, and thence named hepatic; the other was full of impurities, and hence supposed to be only the dross of the better kind. At present various sorts are met with in commerce, which are distinguished from the place in which they are produced, or from their sensible qualities.

1. The Socotorine aloes, said to be obtained from a variety of the *aloe perfoliata*. This is the purest sort. It is brought from the island Socotora in the Indian ocean, wrapt in skins. It is of a glossy surface, clear, and in some degree pellucid; in the lump, of a yellowish red colour, with a purple cast; when reduced to powder, of a bright golden colour. It is hard and friable in the winter, and somewhat pliable in summer, and grows soft betwixt the fingers. Its taste is bitter, accompanied with an aromatic flavour, but insufficient to prevent its being disagreeable; the smell is not very unpleasant, and somewhat resembles that of myrrh.

2. Barbadoes or hepatic aloes. Hepatic aloes is not so clear and bright as the foregoing sort: it is also of a darker colour, more compact texture, and for the most part drier. Its smell is much stronger and more disagreeable: the taste intensely bitter and nauseous, with little or nothing of the fine aromatic flavour of the Socotorine. The best hepatic aloes comes from Barbadoes in large gourd shells: an inferior sort of it (which is generally soft and clammy), is brought over in casks.

3. Fetid, caballine, or *horse aloes*, may easily be distinguished from each of the foregoing, by its strong rank smell; although in other respects it agrees pretty much with the hepatic, and is not unfrequently sold in its stead. Sometimes the caballine aloes is prepared so pure and bright, as not to be distinguished by the eye from the Socotorine; but its offensive smell, of which it cannot be divested, readily betrays it. It has not now a place in almost any pharmacopœia, and is employed chiefly by farriers.

All the sorts of aloes dissolve in pure spirit, proof spirit, and proof spirit diluted with half its weight of water; the impurities only being left. They dissolve also by the assistance of heat in water alone; but as the

liquor grows cold, the resinous part subsides, the gummy remaining united with the water. The hepatic aloes is found to contain more resin, and less gum than the Socotorine, and this than the caballine. The resins of all the sorts, purified by spirit of wine, have little smell: that obtained from the Socotorine has scarce any perceptible taste; that of the hepatic, a slight bitterish relish; and the resin of the caballine a little more of the aloetic flavour. The gummy extracts of all the sorts are less disagreeable than the crude aloes: the extract of Socotorine aloes has very little smell, and is in taste not unpleasant; that of the hepatic has a somewhat stronger smell, but is rather more agreeable in taste than the extract of the Socotorine; the gum of the caballine retains a considerable share of the peculiar rank smell of this sort of aloes, but its taste is not much more unpleasant than that of the extracts made from the two other sorts.

Aloes is a stimulating cathartic bitter: if given in so large a dose as to purge effectually, it often occasions an irritation about the anus, and sometimes a discharge of blood. Small doses of it, frequently repeated, not only cleanse the *primæ viæ*, but likewise warm the habit, quicken the evacuation, and promote the uterine and hemorrhoidal fluxes. This medicine is particularly serviceable in habitual costiveness, to persons of a phlegmatic temperament and sedentary life, and where the stomach is oppressed and weakened. In dry bilious habits, aloes proves injurious, immoderately heating the body and inflaming the bowels.

The juice is likewise, on account of its bitterness, supposed to kill worms, either taken internally, or applied in plasters to the umbilical region. It is also celebrated for restraining external hæmorrhages, and cleansing and healing wounds and ulcers.

The ancients gave aloes in much larger doses than is customary at present. Dioscorides orders half a dram or a dram for gently loosening the belly; and three drams were intended to have the full effect of a cathartic. But modern practice rarely exceeds a scruple, and limits the greatest dose to two scruples. For the common purposes of this medicine ten or twelve grains suffice; taken in these or less quantities, it acts as a gentle stimulating eccoprotic, capable of removing, if duly continued, very obstinate obstructions. Aloes are much less frequently used to operate as a purgative than merely to obviate costiveness: and indeed their purgative effect is not increased in proportion to the quantity that is taken. Perhaps the chief objection to aloes, in cases of habitual costiveness, is the tendency which they have to induce and augment hæmorrhoidal affections; and with those liable to such complaints they can seldom be employed. Their purgative effect seems chiefly to depend on their proving a stimulus to the rectum.

Some are of opinion, that the purgative virtue of aloes resides entirely in its resin: but experience has shown, that the pure resin has little or no purgative quality, and that the gummy part, separated from the resinous, acts more powerfully than the crude aloes. If the aloes indeed be made to undergo long coction in the preparation of the gummy extract, its cathartic power will be considerably lessened, not from the separation of the resin, but from an alteration made in the juice

juice itself by the heat. The strongest vegetable cathartics become mild by a like treatment, without any remarkable separation of their parts.

Socotorine aloes, as already observed, contain more gummy matter than the hepatic; and hence are likewise found to purge more, and with greater irritation. The first sort therefore is most proper where a stimulus is required, as for promoting or exciting the menstrual flux; whilst the latter is better calculated to act as a common purge. It is supposed that the vulnerary and balsamic virtues of this juice reside chiefly in the resin, and hence the hepatic aloes, which is most resinous, is most serviceable in external application.

Aloes enter many of the official preparations and compositions, particularly different pills and tinctures; and according to the particular purposes for which these are intended, sometimes the Barbadoes, sometimes the Socotorine aloes are the most proper.

660. AGAVE, or *Common American Aloe*.

Seven species; viz. americana, vivipara, virginica, cubensis, lurida, tuberosa, foetida. America.

661. ALSTROEMERIA.

Six species; viz. pelegrina, pulchella, ligtu, salsilla, ovata, multiflora. Pero, Lima.

662. HEMEROCALLIS, *Day-lily*.

Four species; viz. flava, fulva, lancifolia, japonica. Siberia, Hungary, Levant, Japan.

663. ACORUS, or *Sweet-smelling Rush*.

Two species; viz. calamus, gramineus. Europe, India.

calamus.

* A. floral leaf very much longer than the spike.—The root powdered might supply the place of our foreign spices. It is our only native truly aromatic plant. The powder of the root has cured agues, when the Peruvian bark has failed. The roots have a strong aromatic smell, and a warm pungent bitterish taste. The flavour is greatly improved by drying. They are commonly imported from the Levant, but those of our own growth are full as good. The Turks candy the roots, and think they are a preservative against contagion. Neither horses, cows, goats, sheep, or swine will eat it.

664. ORONTIUM, or *Floating Arum*.

Two species; viz. aquaticum, japonicum. N. America, Japan.

665. TACCA.

One species; viz. pinnatifida. E. Indies, Otaheite.

666. CORYPHA, or *Mountain Palm*.

Two species; viz. umbraculifera, rotundifolia. East Indies, Carolina.

667. LICUALA.

One species; viz. spinosa. Africa, Amboyna.

668. THRINAX, or *Small Jamaica Fan-palm*.

One species; viz. parviflora. Jamaica, Hispaniola.

669. CALAMUS.

Eight species; viz. rotang, verus, draco, niger, viminalis, rudentum, equestris, zalacca. India.

670. JUNCUS, or *Rush*.

40 species; viz. *acutus, *conglomeratus, *effusus, glaucus, *inflexus, arcticus, *filiformis, capillaceus,

grandiflorus, magellanicus, rubens, *trifidus, *squarrosus, capitatus, capensis, punctorius, nodosus, *articulatus, sylvaticus, subverticillatus, tenageja, *bulbosus, tenuis, *bufonius, cephalotes, stygius, jacquini, *biglumis, *triglumis, *pilosus, maximus, spadiceus, luteus, parviflorus, serratus, albidus, niveus, *campestris, sudeticus, *spicatus. Europe, Cape, N. America. * J. straw stiff and straight; panicle lateral, loose; *effusus*. flowers egg-shaped, blunt, 3 stamens in each.—Rushes are sometimes used to make little baskets. The pith of this species is used instead of cotton to make the wick of rush lights. Horses and goats eat it.

* J. straw rigid; leaves like bristles; panicle terminal-squarrotting, leafless.—Horses eat it. The leaves lying close sus. to the ground elude the stroke of the scythe. It indicates a barren soil.

671. RICHARDIA.

One species; viz. scabra. Vera Cruz.

672. DUROIA.

One species; viz. eriopila. Surinam.

673. ACHRAS, or *Sapota*.

Three species; viz. dissecta, mammosa, sapota. W. India, S. America.

674. PRINOS, or *Winter-berry*.

Seven species; viz. verticillatus, montanus, dioicus, nitidus, glaber, lucidus, sideroxyloides. N. America, Jamaica, Montserrat.

675. COSSIGNEA.

Two species; viz. triphylla, pinnata. India.

676. BARBACENIA.

One species; viz. brasiliensis.

677. BERBERIS, or *Barberry*, or *Pipperidge Bush*.

Five species; viz. *vulgaris, ilicifolia, microphylla, cretica, sibirica. Europe, Canada, Terra del Fuego. * B. fruitstalks forming bunches; thorns 3 together.—*vulgaris*. The leaves are gratefully acid. The flowers are offensive to the smell when near, but at a proper distance their odour is extremely fine. The berries are so very acid that birds will not eat them, but boiled with sugar they form a most agreeable rob or jelly. They are used, likewise, as a dry sweetmeat, and in sugar plums. An infusion of the bark in white wine is purgative. The roots boiled in lye dye wool yellow. In Poland they dye leather of a most beautiful yellow with the bark of the root. The inner bark of the stems dyes linen of a fine yellow, with the assistance of alum. This shrub should never be permitted to grow in corn lands, for the ears of wheat that grow near it never fill, and its influence in this respect has been known to extend as far as 3 or 4 hundred yards across a field. This very extraordinary fact well merits investigation.

678. PSATHURA.

One species; borbonica. Isle of Bourbon.

679. NANDINA.

One species; viz. domestica. Japan.

680. LINDERA.

One species; viz. umbellata. Japan.

681. ENARGEA.

One species; viz. marginata. Terra del Fuego.

682. PHILESIA.

One species; viz. *buxifolia*. Straits of Magellan.

683. CAPURA.

One species; viz. *purpurata*. India.

684. LORANTHUS.

26 species; viz. *scurrula*, *tetrapetalus*, *glaucus*, *biflorus*, *parvifolius*, *falcatus*, *uniflorus*, *europæus*, *longibracteatus*, *buddleioides*, *nodosus*, *elevatus*, *longiflorus*, *elasticus*, *americanus*, *emarginatus*, *occidentalis*, *loniceroides*, *pedunculatus*, *sessilis*, *marginatus*, *stelis*, *pau-ciflorus*, *brasilienis*, *pentandrus*, *spicatus*. Europe, E. Ind. Jam. Amer.

685. SCHRADERA.

Two species; viz. *capitata*, *cephalotes*.

686. STEPHANIA.

One species; viz. *cleomoides*. Guiana.

687. HILLIA.

Two species; viz. *longiflora*, *tetrandra*. Jamaica, S. Amer.

688. ISERTIA.

Two species; viz. *coccinea*, *parviflora*. Guiana.

689. CANARINA, or *Canary Bell-flower*.

One species; viz. *campanula*. Canary isles.

690. FRANKENIA, or *Sea-heath*.

Four species; viz. * *lævis*, *nothria*, *hirsuta*, * *pul-verulenta*. Europe, Arabia.

691. PEPLIS, or *Water Purslain*.

Two species; viz. * *portula*, *indica*. Europe.

692. GAHNIA.

Two species; viz. *procera*, *schœnoides*. New Zealand.

693. BAMBUSA.

Two species; viz. *arundinacea*, *verticillata*.

694. EHRHARTA.

Five species; viz. *cartilaginea*, *bulbosa*, *longiflora*, *panicea*, *calycina*. Africa.

ORDER II. DIGYNIA.

695. ORYZA, or *Rice*.

One species; viz. *sativa*. E. and W. Indies, N. America.—Rice is the produce of many countries, particularly of the East Indies; but as used in Britain, it is brought chiefly from Carolina, where this plant is cultivated in large quantities. It is sufficiently nutritious, and affords an useful food in diarrhœas, dysenteries, and other disorders from a thin acrimonious state of the juices.

696. NECTRIS.

One species; viz. *aquatica*. Guiana.

697. FALKIA.

One species; viz. *repens*. C. of G. Hope.

698. ATRAPHAXIS.

Two species; viz. *spinosa*, *undulata*. Lev. Cape.

ORDER III. DIGYNIA.

699. RUMEX, or *Dock*.

36 species; viz. *patentia*, * *sanguineus*, *spathulatus*, *verticillatus*, *britannica*, * *hydrolapathum*, * *crispus*, *ne-molapathum*, *persicarioides*, *ægyptiacus*, *dentatus*, * *mar-ritimus*, *divaricatus*, * *acutus*, *obtusifolius*, * *pulcher*, *bucephalophorus*, *aquaticus*, *lunaria*, *vesicarius*, *roseus*, *tingitanus*, *scutatus*, *nervosus*, * *digynus*, *lanceolatus*, *alpinus*, *spinousus*, *tuberosus*, *multifidus*, * *acetosa*, * *ac-etosella*, *aculeatus*, *luxurians*, *arifolius*, *bipinnatus*. Europe, Egypt, Barbary.

* R. valves strongly veined; leaves spear-shaped, acute, waved and curled at the edge.—In Norfolk this plant is the pest of clover fields. The fresh roots bruised, and made into an ointment or decoction, cure the itch. The seeds have been given with advantage in the dysentery. Cows, goats, and horses refuse it.

* R. valves veinless; leaves oval-spear-shaped, uneven *acutus*. at the edges.—Cows and horses refuse it. It is infected by the *aphis rumicis*. The root is used by the dyers. It gives a great variety of shades, from straw colour to a pretty fine olive, and a fine deep green to cloths which have been previously blued.

* R. leaves spear-shaped, smooth, acute, very entire, *hydrola-tapering* at the base. It is a medicine of considerable *pathum*. efficacy, both externally applied as a wash for putrid spongy gums, and internally in some species of scurvy.

In rheumatic pains and chronical diseases, owing to obstructed viscera, it is said to be useful. The powdered root is one of the best things for cleaning the teeth. The root has sometimes a reddish tinge, but soon changing to a yellowish brown when exposed to the air. The *curculio lapathi* is found upon the leaves.

* R. leaves heart-oblong, bluntish, finely notched.—*obtusifolia* Fallo-deer eat this and the *R. acutus* with avidity, biting it close to the root, so that it is very rare to see a dock growing in a park.

* R. leaves oblong, arrow-shaped.—The leaves are *acetosa*. eaten in sauces and in salads. The Laplanders use them to turn their milk sour. In France they are cultivated for the use of the table, being introduced in soups, ragoouts and fricassees. In some parts of Ireland they eat them plentifully with milk, alternately biting and supping. The Irish also eat them with fish, and other alkalinescent food. The dried root gives out a beautiful red colour when boiled. Horses, cows, goats, sheep, and swine eat it. The *aphis acetosæ* feeds upon it.

700. FLAGELLARIA.

One species; viz. *indica*. E. Ind. Guiana.

701. SCHEUCHZERIA, or *Lesser Floweting Rush*.

One species; viz. *palustris*. Lapland, Sweden, Helvetia.

702. TRIGLOCHIN, or *Arrow-headed Grass*.

Three species; viz. * *palustre*, *bulbosum*, *mariti-mum*. Europe.

* T. capsule 3-celled, nearly strap-shaped.—Cows are *palustre*. extremely fond of this plant. Horses, sheep, goats, and swine eat it.

* T. capsule 6-celled, egg-shaped.—It is salt to the *mariti-taste*; but horses, goats, sheep, and swine are very *mun*. fond of it.

703. WURMBEA.

Three species; viz. *pumila*, *campanulata*, *longiflora*.

704. MELANTHIUM.

14 species; viz. *virginicum*, *sibiricum*, *lætum*, *capense*, *triquetrum*, *ciliatum*, *juncum*, *secundum*, *phalangoides*, *indicum*, *viride*, *uniflorum*, *eucomoides*, *pumilum*. Siberia, Cape, N. America.

705. MEDEOLA, or *Climbing African Asparagus*.

Three species; viz. *virginica*, *asparagoides*, *angustifolia*. Cape, Virginia.

706. TRILLIUM, or *Three-leaved Nightshade*.

One species; viz. *sessile*. N. America.

707. COLCHICUM, or *Meadow-saffron*.

Three species; viz. * *autumnale*, *montanum*, *variegatum*. S. of Europe, Archipelago.

autumnale.

* *C.* leaves flat, spear-shaped, upright.—This is one of those plants which, upon the concurrent testimony of ages, was condemned as poisonous; but Dr Storck of Vienna hath taught us that it is an useful medicine. The roots have a good deal of acrimony. An infusion of them in vinegar, formed into a syrup by the addition of sugar or honey, is found to be a very useful pectoral and diuretic; it seems in its virtues very much to resemble squill, but is less nauseous, and less acrimonious, though more sedative. In a pasture in which

were several horses, and eaten down pretty bare, the grass was closely cropped, even under the leaves, but not a leaf bitten.

708. HELONIAS.

Four species; viz. *bullata*, *borealis*, *asphodeloides*, *pumila*. Pennsylvania, Virginia.

ORDER IV. HEXAGYNIA.

709. WENDLANDIA.

One species; viz. *populifolia*.

710. DAMASONIUM.

One species; viz. *indicum*.

ORDER V. POLYGYNIA.

711. ALISMA, or *Water-plantain*.

Ten species; viz. * *plantago*, *flava*, *sagittifolia*, * *damazonium*, *cordifolia*, *parnassifolia*, *repens*, * *natans*, * *ranunculoides*, *subulata*. Europe, N. America.

In the class Hexandria are

111 Genera, including 784 Species, of which 63 are found in Britain.

713. DISANDRA. One species; viz. prostrata. Madeira.

714. PISONIA, or *Fringido*. Five species; viz. aculeata, subcordata, nigricans, coccinea, mitia. West Indies.

715. PETIVERIA, or *Guinea-hen-weed*. One species; viz. alliacea. West Indies.

716. PANCOVIA. One species; viz. bijuga.

717. ÆSCULUS, or *Horse-Chesnut*. Three species; viz. hippocastanum, pavia, flava. N. of Asia, America.

The fruit of this plant has been used as food for sheep and poultry, and as soap for washing. It was much employed in powder as a sternutatory by an itinerant oculist, and has been recommended by some others in certain cases of ophthalmia, headach, &c. in which errhines are indicated.

Its effects as a sternutatory may also be obtained by using it under the form of infusion or decoction drawn up into the nostrils; and it is entirely with a view to its errhine power that it is now introduced into the Pharmacopœia of the Edinburgh college. But besides this, the bark has also been represented by some as a cure for intermittent fevers, and it is probably with this intention, that this part of the hippocastanum is introduced as an officinal article in the Pharmacopœia Rossica.

718. PETROCARYA. Two species; viz. montana, campestris. Guiana.

D. A boat-shaped sheath. The sheathed fruitstalk covered. No cal. Cor. 5 petals. A berry.

Sect. I. *Flores completi.*

743. *MIMUSOPS*. Cor. 8-petala. Cal. 8-phyllus, inferus. Drupa.
 745. *CUPANIA*. Cor. 5-petala. Cal. 5-phyllus. Caps. 3-locularis, loculis monospermis. Sem. arillatum.
 765. *DIMOCARPUS*. Cor. 5-petala. Cal. 5-dentatus. Baccæ 2, monospermæ.
 727. *TROPÆOLUM*. Cor. 5-petala. Cal. 5-fidus, inferus, calcaratus. Nuces 3.
 779. *BÆCKEA*. Cor. 5-petala. Cal. 5-fidus, superus. Caps. 4-locularis.
 747. *EPHIELIS*. Cor. 5-petala. Cal. 5-partitus. Caps. 1-locul. 2-sperma.
 748. *MOLINÆA*. Cor. 5-petala. Cal. 5-partitus. Caps. 3-locul. 3-valvis.
 742. *HONCKENYA*. Cor. 5-petala. Cal. 5-phyllus. Nectar. staminiformia. Caps. cchinata.
 751. *HAGENIA*. Cor. 5-petala. Cal. 2-phyllus. Nectar. 5-phyllum.
 766. *MEMECYLON*. Cor. 4-petala. Cal. integerimus, superus.
 734. *COMBRETUM*. Cor. 4-petala. Cal. 5-dentatus, superus. Sem. 4.
 738. *ROXBURGHIA*. Cor. 4-petala. Cal. 4-phyllus inferus. Antheræ nectario insertæ. Caps. 2-valvis.
 * 732. *EPILOBIUM*. Cor. 4-petala. Cal. 4-fidus, tubulosus, superus. Caps. 4-locular. Sem. comosa.
 731. *GAURA*. Cor. 4-petala. Cal. 4-fidus, tubulosus, superus. Nux 1-sperma.
 730. *OENOTHERA*. Cor. 4-petala. Cal. 4-fidus, tubulosus, superus. Caps. 4-locularis. Anther. lineares.
 735. *VITMANNIA*. Cor. 4-petala. Cal. 4-fidus, inferus. Nux 1-sperma.
 729. *RHEXIA*. Cor. 4-petala. Cal. 4-fidus. Caps. 4-locularis, supera. Anth. arcuatæ.
 728. *OSBECKIA*. Cor. 4-petala. Cal. 4-fidus. Caps. 4-locularis, infera. Anth. rostratæ.
 737. *TETRATHECA*. Cor. 4-petala. Cal. 4-fidus. Antheræ 4-locularis. Caps. 2-locularis.
 736. *GRISLEA*. Cor. 4-petala. Cal. 4-dentatus, inferus. Caps. 1-locularis.
 750. *KOEBREUTERIA*. Cor. 4-petala, nectario cylindrico. Cal. 4-phyllus. Caps. 3-locularis.
 752. *PERSOONIA*. Cor. 4-petala, nectario cylindrico. Cal. 4-partitus. Caps. 1-locul. polysperma.
 753. *GUAREA*. Cor. 4-petala, nectario cylindrico. Cal. 4-dentatus, inferus. Caps. 4-locularis, 4-valvis. Sem. solitaria.

CLASS VIII.
OCTANDRIA.

ORDER I. MONOGYNIA.

Sect. I. *Flowers complete.*

- M. Cor. 8-petaled. Cal. 8-leafed, inferior. A drupe.
 C. Cor. 5-petaled. Cal. 5-leafed. Caps. 3-celled, 1 seed in each cell. Seed coated.
 D. Cor. 5-petaled. Cal. 5-toothed. Berries 2, 1-seeded.
 T. Cor. 5 petals. Cal. 5-cleft, inferior, having a spur. Nuts 3.
 B. Cor. 5 petals. Cal. 5-cleft, superior. Caps. 4-celled.
 E. Cor. 5 petals. Cal. 5-partite. Caps. 1-celled, 2-seeded.
 M. Cor. 5 petals. Cal. 5-partite. Caps. 3-celled, with 3 valves.
 H. Cor. 5-petaled. Cal. 5-leaved. Nectaries in the form of stamens. Caps. prickly.
 H. Cor. 5-petaled. Cal. 2-leaved. Nectary 5-leaved.
 M. Cor. 4-petaled. Cal. very entire, superior.
 C. Cor. 4-petaled. Cal. 5-toothed, superior. Seeds 4.
 R. Cor. 4 petals. Cal. 4-leaved, inferior. Anthers inserted in the nectary. Caps. with 2 valves.
 E. Cor. 4 petals. Cal. 4-cleft, tubular, superior. Caps. 4-celled. Seeds hairy.
 G. Cor. 4-petaled. Cal. 4-cleft, tubular, superior. Nut, with one seed.
 O. Cor. 4-petaled. Cal. 4-cleft, tubular above. Caps. 4-celled. Anthers strap-shaped.
 V. Cor. 4-petaled. Cal. 4-cleft, beneath. Nut 1-seeded.
 R. Cor. 4-petaled. Cal. 4-cleft. Caps. 4-celled, above. Anthers bowed.
 O. Cor. 4-petaled. Cal. 4-cleft. Caps. 4-celled, beneath or inferior. Anthers having a beak.
 T. Cor. 4-petaled. Cal. 4-cleft. Anthers 4-celled. Caps. 2-celled.
 G. Cor. 4-petaled. Cal. 4-toothed, inferior. Caps. 1-celled.
 K. Cor. 4-petaled, with a cylindrical nectary. Cal. 4-leaved. Caps. 3-celled.
 P. Cor. 4-petaled, with a cylindrical nectary. Cal. 4-partite. Caps. 1-celled, many-seeded.
 G. Cor. 4-petaled, with a cylindrical nectary. Cal. 4-toothed, inferior. Caps. 4-celled, 4-valved. Seeds solitary.

741. CORREA. Cor. 4-petala. Cal. 4-dentatus. Caps. 4-locul. loculis 1-spermis.
733. ANTICORUS. Cor. 4-petala. Cal. 4-phyllus, inferus. Caps. 4-locul. 4-valvis, polysperma.
740. ALLOPHYLLUS. Cor. 4-petala. Cal. 5-phyllus, inferus. Stigma 4-fidum.
739. ORNITROPHE. Cor. 4-petala. Cal. 4-phyllus, inferus. Styl. 2-fidus. Baccæ 2, monospermæ.
744. JAMBOLIFERA. Cor. 4-petala. Cal. 4-dentatus, inferus. Filamenta planiuscula. Drupa.
746. XYLOCARPUS. Cor. 4-petala. Cal. 4-dentatus, inferus. Nect. 8-fidum. Drupa sicca.
757. XIMENIA. Cor. 4-petala. Cal. 4-fidus. Nect. o. Drupa 1-sperma.
763. LAWSONIA. Cor. 4-petala. Cal. 4-fidus, inferus. Bacca 4-locularis.
749. MELIHOCCA. Cor. 4-petala refracta. Cal. 4-partitus. Drupa corticosa. Stigma peltatum, anceps.
755. AMYRIS. Cor. 4-petala. Cal. 4-dentatus, inferus. Bacca 1-sperma.
764. MELICOPE. Cor. 4-petala. Cal. 4-partitus. Caps. 4, monospermæ.
775. GNIDIA. Cor. 4-petala. Cal. 4-fidus, corollif. Nux 1-sperma.
758. FUSCHIA. Cor. 4-petala. Cal. 4-fidus, corollif. Bacca 4-locularis, polysperma.
754. HEDWIGIA. Cor. 4-fida. Cal. 4-dentatus. Caps. tricocca.
760. MICHAUXIA. Cor. 8-partita. Cal. 16-partitus. Caps. 8-locularis.
- * 759. CHLORA. Cor. 8-fida. Cal. 8-phyllus, inferus. Caps. 1-locul. 2-valvis, polysperma.
- * 768. VACCINIUM. Cor. 1-petala. Cal. 4-dentatus, superus. Filam. receptaculi. Bacca.
769. MENZIESIA. Cal. repandus inferus. Cor. 1-petala. Filam. receptaculi. Capsula.
- * 770. ERICA. Cor. 1-petala. Cal. 4-phyllus, inferus. Filam. receptaculi. Capsula.

His simillima notanda quæ ad classes diversas pertinent.
Bizophora Mangle. Æsculus Pavia. Monotropa Hypopithys. Ruta graveolens. Jussiaea nonnullæ species. Portulaca quadrifida. Portulaca meridiana. Capparides duæ. Duis octandra. Ammania octandra. Fagara octandra. Melastomæ nonnullæ species. Trichilia pallida acuminata. Gilibertia ovata, heterophylla. Elais. Cleome juncea.

Sect. II. Flores incompleti.

771. OPHIRA. Cal. o. Involucr. 2-valve, triflorum. Cor. 4-petala supera. Bacca 1-locularis.
772. GRUBBIA. Cal. o. Involucr. 2-phyll. triflorum. Cor. 4-petala infera.
767. BUGINVILLÆA. Cal. o. Cor. tubulosa, subintegra. Stam. inclusa.
778. LACHNÆA. Cal. 4-fidus, corollinus, inæqualis. Stam. exserta.
774. DIRCA. Cal. elimbis, corollinus, inæqualis. Stam. exserta.
- * 773. DAPHNE. Cal. 4-fidus, corollinus, æqualis. Stam. inclusa. Drupa pulposa, monosperma.
- * 777. PASSERINA. Cal. 4-fidus, corollinus, æqualis. Stam. supra corollam.

- C. Cor. 4-petala. Cal. 4-toothed. Caps. 4-celled, with 1-seeded cells.
- A. Cor. 4-petala. Cal. 4-leaved, inferior. Caps. 4-celled, 4-valved, many-seeded.
- A. Cor. 4-petala. Cal. 4-leaved, inferior. Stigma 4-cleft.
- O. Cor. 4-petala. Cal. 4-leaved. Style 2-cleft. Berries 2, 1-seeded.
- J. Cor. 4-petala. Cal. 4-toothed, inferior. Filaments flattened. A drupe.
- X. Cor. 4-petala. Cal. 4-toothed, inferior. Nectary 8-cleft. A dry drupe.
- X. Cor. 4-petala. Cal. 4-cleft. No nectary. A 1-seeded drupe.
- L. Cor. 4-petala. Cal. 4-cleft, inferior. Berry four-celled.
- M. Cor. 4-petala, bent back as if broken. Cal. 4-partite. Drupe barky. Stigma target-shaped, two-edged.
- A. Cor. 4-petala. Cal. 4-toothed, inferior. Berry 1-seeded.
- M. Cor. 4-petala. Cal. 4-partite. Caps. 4, one-seeded.
- G. Cor. 4-petala. Cal. 4-cleft, bearing the corolla. A nut, 1-seeded.
- F. Cor. 4-petala. Cal. 4-cleft, bearing the blossom. Berry 4-celled, many-seeded.
- H. Cor. 4-cleft. Cal. 4-toothed. Caps. 3-celled.
- M. Cor. 8-partite. Cal. 16-partite. Caps. 8-celled.
- * C. Cor. 8-cleft. Cal. 8-leaved, inferior. Caps. 1-celled, 2-valved, many-seeded.
- * V. Cor. 1-petala. Cal. 4-toothed, superior. Filam. of the receptacle. Berry.
- M. Cal. serpentine beneath. Cor. 1-petala. Filaments of the receptacle. Capsule.
- * E. Cor. 1-petala. Cal. 4-leaved, inferior. Filaments of the receptacle. Capsule.

Sect. II. Flowers incomplete.

- O. No cal. Involucrum 2-valved, 3-flowered. Cor. 4-petala, superior. Berry 1-celled.
- G. No cal. Involucr. 2-leaved, 3-flowered. Cor. 4-petala, inferior.
- B. No. cal. Cor. tubular, nearly entire. Stamens enclosed.
- L. Cal. 4-cleft, blossom-like, unequal. Stamens protruding.
- D. Cal. not bordered, blossom-like, unequal. Stamens protruding.
- * D. Cal. 4-cleft, blossom-like, unequal. Stamens enclosed. A drupe, pulpy, 1-seeded.
- P. Cal. 4 cleft, blossom-like, equal. Stamens above the corolla.

776. STELLERA. Cal. 4-fidus, corollinus, æqualis. Stam. inclusa. Nux.

761. DODONÆA. Cal. 4-phyllus. Cor. o. Caps. 3-locularis.

762. VALENTINIA. Cal. 5-partitus. Cor. o. Caps. baccata, 4-sperma.

756. CADROTA. Cal. 6-partitus. Cor. o.

ORDO II. DIGYNIA.

783. CODIA. Cor. 4-petala. Cal. 4-phyllus. Involucrum 4-phyllus.

782. WEINMANNIA. Cor. 4-petala. Cal. 4-phyllus. Caps. 2-locul. 2-rostris.

784. MOEHRINGIA. Cor. 4-petala. Cal. 4-phyllus. Caps. 1-locul.

780. SCHMIEDELIA. Cor. 4-petala. Cal. 2-phyllus. Pericarp. 2, pedicellata.

781. GALENIA. Cor. o. Cal. 4-fidus. Caps. 2-locularis, 2-sperma.

† *Chrysoplenium. Polygonum Pensylvanicum.*

ORDO III. TRIGYNIA.

788. SERIANA. Cor. 4-petala. Cal. 4-phyllus. Samaræ 3.

787. PAULLINIA. Cor. 4-petala. Cal. 4-phyllus. Caps. 3-locul. 1-sperma.

789. CARDIOSPERMUM. Cor. 4-petala. Cal. 4-phyllus. Caps. 3-locul. 1-sperma.

791. PONÆA. Cor. 4-petala. Cal. 4-partitus. Caps. 3-locul. 3-sperma.

790. SAPINDUS. Cor. 4-petala. Cal. 4-phyllus. Bacca 3-cocca, 1-sperma.

786. COCCOLOBA. Cor. o. Cal. 5-partitus. Bacca calycina, 1-sperma.

* 785. POLYGONUM. Cor. o. Cal. 5-partitus. Sem. 1, nudum.

ORDO IV. TETRAGYNIA.

* 794. ADOXA. Cor. 4 s. 5-fida, supra. Cal. 2-phyllus. Bacca 4 s. 5-sperma.

792. VERA. Cor. 4-fida. Cal. 4-fidus. Caps. 4, polysperma.

796. HALLORAGIS. Cor. 4-petala. Cal. 4-fidus. Drupa sicca, 4-locul.

* 795. ELATINE. Cor. 4-petala. Cal. 4-phyllus. Caps. 4-locul.

797. FORSKOLEA. Cor. 8-petala. Cal. 4-phyllus. Sem. 4.

† *Petiveria alliacea. Myriophyllum verticillatum.*

ORDER I. MONOGYNIA.

727. TROPÆOLUM, or *Indian Cress.*

Five species; viz. minus, majus, hybridum, peregrinum, pentaphyllum. Peru, Lima.

S. Cal. 4-cleft, blossom-like, equal. Stamens enclosed. A nut.

D. Cal. 4-leaved. No cor. Caps. 3-celled.

V. Cal. 5-partite. No cor. Caps. berried, 4-seeded.

C. Cal. 6-partite. No cor.

ORDER II. DIGYNIA.

C. Cor. 4-petaled. Cal. 4-leaved. Involucrum 4-leaved.

W. Cor. 4-petaled. Cal. 4-leaved. Caps. 2-celled, with 2 beaks.

M. Cor. 4-petaled. Cal. 4-leaved. Caps. 1-celled.

S. Cor. 4-petaled. Cal. 2-leaved. Seed-vessels 2, with pedicles.

G. No cor. Cal. 4-cleft. Caps. 3-celled, 2-seeded.

ORDER III. TRIGYNIA.

S. Cor. 4-petaled. Cal. 4-leaved. Seed-vessels 3.

P. Cor. 4-petaled. Cal. 4-leaved. Caps. 3-celled, 1-seeded.

C. Cor. 4-petaled. Cal. 4-leaved. Caps. 3-celled, 1-seeded.

P. Cor. 4-petaled. Cal. 4-partite. Caps. 3-celled, 3-seeded.

S. Cor. 4-petaled. Cal. 4-leaved. Berry 3-celled, 1-seeded.

C. No cor. Cal. 5-partite. Berry cup-like, 1-seeded.

* P. No cor. Cal. 5-partite. Seed 1, naked.

ORDER IV. TETRAGYNIA.

* A. Cor. 4 or 5-cleft, superior. Cal. 2-leaved. Berry 4 or 5-seeded.

V. Cor. 4-cleft. Cal. 4-cleft. Caps. many-seeded.

H. Cor. 4-petaled. Cal. 4-cleft. A drupe, dry, 4-celled.

* E. Cor. 4-petaled. Cal. 4-leaved. Caps. 4-celled.

F. Cor. 8-petaled. Cal. 8-leaved. Seeds 4.

728. OSBECHIA, or *Gold-rose Feather.*

Two species; viz. chinensis, zeylanica. Ceylon, China.

729. RHEXIA, or *Soap-Wood.*

17 species; viz. virginica, mariana, trichotoma, bivalvis.

valvis, trivalvis, jussiceoides, hypericoidea, glutinosa, acisanthera, glomerata, longifolia, aspera, inconstans, latifolia, villosa, aquatica, uniflora. N. America, Jamaica, Brasil.

730. OENOTHERA, or *Tree-primrose*.

15 species; viz. biennis, grandiflora, parviflora, mucronata, longiflora, mollissima, nocturna, villosa, odorata, sinuata, tetraptera, fruticosa, pumila, rosea, purpurea. America.

731. GAURA, or *Virginian Loose-strife*.

Three species; viz. biennis, fruticosa, mutabilis. Virginia, Pennsylvania.

732. EPILOBIUM, or *Willow-herb*.

12 species; viz. * angustifolium, angustissimum, latifolium, * hirsutum, pubescens, villosum, * montanum, glabellum, rotundifolium, * tetragonum, * palustre, * alpinum. North of Europe.

* E. leaves scattered, strap-spear-shaped; blossoms irregular.—Goats are extremely fond of this plant. Cows and sheep eat it. Horses and swine refuse it. The *phalæna porcellus* and *sphinx elpenor* are found upon it. The suckers of the root are eatable. An infusion of the plant has an intoxicating property, and the Kamtschatcades brew a sort of ale from the pith, and from the ale make vinegar. The down of the seeds also, mixed with cotton or fur, has been manufactured into stockings and other articles of clothing.

* E. leaves egg-spear-shaped, hairy, half embracing the stem; stem very much branched and hairy.—The top-shoots have a delicate fragrance, resembling scalded codlings (whence one of its names), but so transitory, that before they have been gathered five minutes, it is no longer perceptible. Horses, sheep, and goats, eat it. Cows are not fond of it. Swine refuse it.

733. ANTICHORUS.

One species; viz. depressus. Arabia.

734. COMBRETUM.

Five species; viz. laxum, secundum, purpureum, decandrum, alternifolium. America.

735. VITMANNIA.

One species; viz. elliptica.

736. GRISLEA.

Two species; viz. secunda, tomentosa. America.

737. TETRATHECA.

One species; viz. pincea.

738. ROXBURGHIA.

One species; viz. gloriosoides.

739. ORNITROPHE.

Six species; viz. integrifolia, serrata, cobbe, cominia, occidentalis, rigida. Isle of Bourbon.

740. ALLOPHYLLUS.

One species; viz. zeylanicus. Ceyl. Jam. Hispan.

741. CORREA.

One species; viz. alba.

742. HONCKENYA.

One species; viz. ficifolia.

743. MIMUSOPS.

Four species; viz. elengi, hexandra, kanhi, imbricaria. Arabia, India.

744. JAMBOLIFERA.

One species; viz. pedunculata.

745. CUPANIA.

Three species; viz. tomentosa, glabra, saponarioides. Coromandel, W. Indies.

746. XYLOCARPUS.

One species; viz. granatum. Ceylon, E. Indies.

747. EPHIELIS.

One species; viz. fraxinea. Guiana.

748. MOLINÆA.

Three species; viz. lævis, canescens, alternifolia.

749. MELICocca.

One species; viz. bijuga. Jamaica.

750. KOELREUTERIA.

One species; viz. paniculata. China.

751. HAGENIA.

One species; viz. abyssinica. Abyssinia.

752. PERSOONIA.

One species; viz. gaureoides.

753. GAUREA.

One species; viz. trichilioides.

754. HEDWIGIA.

One species; viz. balsamifera. Hispaniola.

755. AMYRIS, or *Shrubby Sweetwood*.

19 species; viz. polygama, elemifera, sylvatica, maritima, kataf, gileadensis, opobalsamum, enneandria, heterophylla, gujanensis, ambrosiaca, decandra, altissima, toxifera, protium, dentata, anisata, zeylanica, balsamifera. E. Indies, Carolina, Jamaica.

The *A. elemifera* produces a resin, which is brought from the Spanish W. Indies, and sometimes from the E. Indies, in large roundish cakes, generally wrapped up in flag leaves. The best sort is softish, somewhat transparent, of a pale whitish yellow colour, inclining a little to green; of a strong, not unpleasant smell. It almost totally dissolves in pure spirit, and sends over some part of its fragrance along with this menstruum in distillation: distilled with water it yields a considerable quantity of pale coloured, thin, fragrant essential oil. This resin gives name to one of the officinal unguents, and is at present scarce any otherwise made use of; though it is certainly preferable for internal purposes to some others, which are held in greater esteem.

The fruit of the *amyris gileadensis* is the product of the tree that yields the opobalsam, or balsam of Gilead. It is about the size of a pea, of a whitish colour, enclosed in a dark-brown wrinkled bark. This fruit, when in perfection, has a pleasant warm glowing taste, and a fragrant smell, resembling that of the opobalsam itself. It is very rarely found in the shops; and such as we now and then do meet with, has almost entirely lost its smell and taste. It had formerly a place in the mithridate and theriaca formulæ, now banished from our pharmacopœias; but even then the college permitted cubebs to be employed as a substitute for the carpopbalsamum, which could seldom be procured; and it is probably on this account that it has now no place in our lists.

756. CEDROTA.

One species; viz. longifolia. Guiana.

757. XIMENIA.

Three species; viz. americana, elliptica, inermis. West Indies, Guiana.

758. FUSCHIA.

Four species; viz. triphylla, coccinea, excorticata, multiflora. Jam. Chili, New Zealand.

759. CHLORA, or *Yellow Centaury*.

Five species; viz. * perfoliata, quadrifolia, dodecandra, sessilis, imperfoliata. S. Eur. Lev. Virginia.

760. MICHAUXIA.

One species; viz. campanuloides. Levant.

761. DODONÆA.

Three species; viz. viscosa, triquetra, angustifolia. Tropical climates, Cape.

762. VALENTINIA.

One species; viz. ilicifolia. Cuba, Hispaniola.

763. LAWSONIA.

Four species; viz. inermis, purpurea, acronychia, spinosa. Egypt, East Indies.

764. MELICOPE.

One species; viz. ternata. South Sea isles.

765. DIMOCARPUS.

One species; viz. litchia.

766. MEMECYLON.

Four species; viz. capitellatum, tinctorium, grande, cordatum. Ceylon.

767. BUGINVILLÆA.

One species; viz. spectabilis. Brazil.

768. VACCINIUM, or *Bill-berry*, or *Whortle-berry*.

27 species; viz. * myrtillus, pallidum, hirtum, stamineum, * uliginosum, album, mucronatum, diffusum, angustifolium, corymbosum, bracteatum, ciliatum, fuscatum, frondosum, venustum, ligustrinum, resinosum, amoenum, virgatum, tenellum, arctostaphylos, meridionale, cereum, * vitis-idea, * oxycoccus, hispidulum, macrocarpon. N. Europe, Levant, N. America, Jamaica. * V. fruitstalks 1-flowered; leaves serrated, egg-shaped; stem angular.—The berries of this plant are very acceptable to children, either eaten by themselves, or with milk, or in tarta. The moor game live upon them in the autumn. The juice stains paper or linen purple. Goats eat it. Sheep are not fond of it. Horses and cows refuse it.

myrtillus.

uliginosum

vitis-idea.

oxycoccus.

* V. fruitstalks 1-flowered; leaves very entire, inversely egg-shaped, blunt, smooth.—Children are said sometimes to eat the berries; but in large quantities they occasion dizziness and a slight headach, especially when full grown, and quite ripe. Many vintners in France are said to make use of the juice to colour their white wines red. Horses, cows, sheep, and goats eat it. Swine refuse it.

* V. bunches terminating, nodding; leaves inversely egg-shaped; edge very entire, and rolled back, dotted underneath.—The berries are acid, and not very grateful; but they are eaten by the Finlanders, and by the country people in Sweden, and are sent in large quantities from W. Bothnia to Stockholm for pickling. They are also made into tarta, rob, and jelly. Goats eat it. Cows, sheep, and horses, refuse it.

* V. fruitstalks single or in pairs; leaves egg-shaped,

very entire, edges rolled back; stem thread-shaped, trailing, not hairy.—The berries, made into tarta, are much esteemed; but on account of a peculiar flavour, are disliked by some. They may be kept for several years if wiped clean; and then closely corked in dry bottles, or the bottles may be filled with water.—At Longtown in Cumberland, 20 or 30l.'s worth are sold by the poor people each market day, for five or six weeks together. The most general name, cranberry, probably originated from the fruitstalks being crooked at the top, and before the expansion of the blossom, resembling the neck and head of a crane.

769. MENZIESIA.

One species; viz. ferruginea.

770. ERICA, or *Heath*.

127 species; viz. glutinosa, lutea, paniculata, depressa, halicacaba, monsoniana, discolor, densifolia, cruenta, nigrita, phyllicoides, regerminans, urceolaria, marifolia, planifolia, hirta, bicolor, articularis, viridi-purpurea, pubescens, persoluta, gracilis, strigosa, cæssa, arborea, stricta, florida, mucosa, pitulifera, amoena, * tetrabix, inflata, gilva, abietina, verticillata, pateronia, mammosa, empetrifolia, spicata, octophylla, fascicularis, obliqua, * vulgaris, gnaphaloidea, corifolia, calycina, triflora, scoparia, bergiana, formosa, rubens, incarnata, * cinerea, australis, ramentacea, quadriflora, lateralis, margaritacea, baccata, pendula, physodes, cernua, reorta, * daboecia, tenuifolia, albans, bracteata, thunbergii, tetragona, umbellata, nudiflora, petiolata, bryantia, stelleriana, fucata, axillaris, imbricata, sexfaria, melanthera, leucanthera, taxifolia, spumosa, capitata, bruniaea, passerina, totta, absynthioides, ciliaris, cærolea, hispidula, petiverii, banksii, sebana, monadelphica, plukenetii, versicolor, perapicua, aitonii, cephalotes, pulchella, longifolia, vestita, pinea, leea, coccinea, purpurea, coecinna, grandiflora, cylindrica, curviflora, simpliciflora, tabiflora, lanata, procera, conspicua, glandulosa, transparent, cerinthoides, sparmanni, massoni, ventricosa, ampullacea, fastigiata, incurva, globosa, comosa, denticulata, muscari, viacaria, pyramidalis, mediteranea, multiflora, herbacea, purpurascens, * vagans, quibica, racemosa. Europe, Madeira, Cape.

* E. leaves arrow-shaped.—This plant, but little regarded in happier climates, is made subservient to a great variety of purposes, in the bleak and barren highlands of Scotland. The poorer inhabitants make walls for their cottages, with alternate layers of heath, and a kind of mortar made of black earth and straw, the woody roots of the heath being placed in the centre, the tops externally and internally. They make their beds of it, by placing the root downwards; and the tops only being uppermost, they are sufficiently soft to sleep upon. Cabins are thatched with it. In the island of Ilay, ale is frequently made by brewing one part malt and two parts of the young tops of heath; sometimes they add hops. It is said, that this liquor was much used by the Picts. Woollen cloth boiled in alum water, and afterwards in a strong decoction of the tops of heath, comes out a fine orange colour. The stalks and tops will tan leather. In England besoms are made of it, and faggots to burn in ovens, or to fill up drains that are to be covered over. Sheep and goats will sometimes eat the tender shoots, but they are not fond of them. Bees extract a great deal of honey from the

the flowers; but where heath abounds, the honey has a reddish cast.

771. OPHIRA.

One species; viz. stricta. Africa.

772. GRUBBIA.

One species; viz. rosmarinifolia. C. of G. Hope.

773. DAPHNE, or *Mezereon*, *Spurge laurel*.

30 species; viz. * mezereum, thymelæa, dioica, calycina, pubescens, vermiculata, villosa, tarton-raira, nitida, alpina, * laureola, pontica, pendula, lagette, polystachya, monostachya, tinifolia, gnidium, indica, fœtida, rotundifolia, odora, occidentalis, cneorum, altaica, squarrosa, glomerata, eleoides, sericea, collina. Europe, China, Japan, W. Indies.

mezereum * D. flowers sitting on the stem, mostly three together; leaves spear-shaped, deciduous; berries globular.—An ointment prepared from the bark or the berries, has been successfully applied to ill-conditioned ulcers. The whole plant is very corrosive; six of the berries will kill a wolf. A woman gave 12 grains of the berries to her daughter, who had a quartan ague; she vomited blood, and died immediately.—A decoction made of two drams of the cortical part of the root, boiled in three pints of water till one pint is wasted, and this quantity drank daily, is found very efficacious in resolving venereal nodes, and other indurations of the periosteum. It is said to have been once given, in a case of difficulty in swallowing, seemingly occasioned by a paralytic affection. The patient was directed to chew a thin slice of the root, as often as she could bear to do it; and in about two months, she recovered her power of swallowing. This woman bore the disagreeable irritation, and the ulceration its acrimony occasioned in her mouth, with great resolution; but she had been reduced to skin and bone, and for three years before had suffered extremely from hunger, without being able to satisfy her appetite; for she swallowed liquids very imperfectly, and solids not at all. This complaint came on after lying in.

laureola.

* D. bunches of about five flowers; axillary leaves spear-shaped, smooth.—Very happy effects have been experienced from this plant in rheumatic fevers. It operates as a brisk and rather severe purgative. It is an efficacious medicine in worm cases; and upon many accounts deserves to be better known to physicians; but in less skilful hands, it would be dangerous, as it is possessed of considerable acrimony. The whole plant has the same qualities, but the bark of the root is the strongest. Dr Alston fixes the utmost dose at ten grains.

774. DIRCA, or *Leather-wood*.

One species; viz. palustris. Virginia.

775. GNIDIA.

16 species; viz. pinifolia, radiata, filamentosa, carinata, scabra, simplex, capitata, lævigata, biflora, racemosa, tomentosa, argentea, imbricata, sericea, oppositifolia, daphnæfolia. Cape, Madagascar.

776. STELLERA, or *German Groundsel*.

Two species; viz. passerina, chamæiasme. Eur.

777. PASSERINA, or *Sparrow-wort*.

16 species; viz. filiformis, hirsuta, ericoides, nervosa, cephalophora, capitata, orientalis, ciliata, uniflora,

grandiflora, canescens, spicata, laxa, striata, anthylloides, pentandra. C. of G. Hope.

778. LACHNÆA.

Two species; viz. eriocephala, conglomerata. C. of G. Hope.

779. BÆCHEA.

Two species; viz. frutescens, densifolia. China.

ORDER II. DIGYNIA.

780. SCHMIDELIA.

One species; viz. racemosa. E. Indies.

781. GALENIA, or *Cape Jessamine*.

Two species; viz. africana, procumbens.

782. WEINMANNIA.

Six species; viz. glabra, hirta, tomentosa, trifoliata, racemosa, parviflora. Cape, Jamaica, New Zealand.

783. CODIA.

One species; viz. montana. New Caledonia.

784. MOHRINGIA, or *Mountain Chickweed*.

One species; viz. muscosa. Alps, S. of Eur.

ORDER III. TRIGYNIA.

785. POLYGONUM, or *Knot-grass*.

43 species; viz. frutescens, grandiflorum, * bistorta, * viviparum, virginianum, lapathifolium, * amphibium, ocreatum, * hydropiper, filiforme, tinctorium, * minus, * persicaria, incanum, glabrum, barbatum, tomentosum, orientale, pennsylvanicum, maritimum, * aviculare, bellardi, setosum, erectum, articulatum, divaricatum, alpinum, undulatum, sericeum, serratum, corymbosum, chinense, sagittatum, arifolium, crassifolium, perfoliatum, tartaricum, emarginatum, * fagopyrum, * convolvulus, dumetorum, scandens, multiflorum. Eur. E. Ind. China, N. Amer.

* P. flowers with cloven pistils; stipulæ somewhat fringed; leaves spear-shaped.—The whole plant has an acrid burning taste. It cures little aphthous ulcers in the mouth: It dyes wool yellow. The ashes of this plant mixed with soft soap, is a nostrum in a few hands for dissolving the stone in the bladder; but it may be reasonably questioned, whether it has any advantage over other semicaustic preparations of the vegetable alkali. Its acrimony rises in distillation; and the distilled water, drank to the amount of two or three half pints daily, has been found very effectual in some nephritic cases. Horses, cows, goats, sheep, and swine, refuse it.

* P. styles 2; spikes egg-oblong; leaves spear-shaped; stipulæ fringed.—Its taste is slightly acrid and astringent. Woollen cloth, dipped in a solution of alum, obtains a yellow colour from this plant. Goats, sheep, and horses eat it; cows and swine refuse it.

* P. leaves egg-shaped, extended at the base along the leafstalks.—The root is one of the strongest vegetable astringents. The young shoots are eaten in herb-pudding in the north of England; and about Manchester they are substituted for greens, under the name of patience dock.

* P.

viviparum * P. leaves spear-shaped; spike terminating.—Plants cultivated for four years in a garden, constantly produced perfect seeds in July, and flowered as constantly a second time in September. These latter germs vegetated on the stem.

aviculare. * P. flowers axillary; leaves spear-shaped; stem trailing.—The seeds are useful for every purpose in which those of the next species are employed. Great numbers of small birds feed upon them. Cows, goats, sheep, horses, and swine eat it. The stubbles in Sweden are purpled over with this plant. It affords nourishment to the *chrysomela polygoni*.

fagopyrum. * P. leaves heart-arrow-shaped; stem nearly upright, without prickles; angles of the seeds equal.—This plant is very impatient of cold, dying at the very first attack of frost. The seeds furnish a nutritious meal, which is not apt to turn acid on the stomach. It is made into thin cakes in some parts of England, called *crumpits*. It is usual with farmers to sow a crop of buckwheat, and to plough it under when fully grown as a manure to the land. The seeds are excellent food for poultry. Sheep that eat this plant become unhealthful. As it flowers late in the summer, M. du Hamel, in his observations upon the management of bees, advises to move the hives in the autumn to a situation where plenty of this plant is sown. Cows, goats, and sheep eat it; swine and horses refuse it.

convolvulus. * P. leaves heart-shaped; stem twining, angular; flowers blunted.—The seeds of this plant are quite as good for use as those of the preceding species, are produced in greater quantity, and the plant bears cold better. Cows and goats eat it; sheep, swine, and horses refuse it. The *phalæna lubricipeda* is found upon several of the species.

786. COCCOLOBA, or *Sea-side Grape*.

13 species; viz. *uvifera*, *australis*, *pubescens*, *diversifolia*, *flavescens*, *excoriata*, *nivea*, *punctata*, *obtusifolia*, *microstachya*, *emarginata*, *barbadensis*, *tenuifolia*. W. Indies, S. America.

787. PAULLINIA, or *Supple-jack*.

14 species; viz. *nodosa*, *curuvu*, *carthaginensis*, *caribæa*, *curassavica*, *barbadensis*, *polyphylla*, *tetragona*, *vespertilio*, *pinnata*, *tomentosa*, *cauliflora*, *japonica*, *diversifolia*. E. and W. Indies, Japan, S. America.

788. SERIANA.

10 species; viz. *sinuata*, *divaricata*, *caracasana*, *racemosa*, *spectabilis*, *mexicana*, *angustifolia*, *lupulina*, *lucida*, *triternata*.

789. CARDIOSPERMUM, or *Heart-pea*.

Four species; viz. *halicacabum*, *hirsutum*, *corindum*, *grandiflorum*. E. and W. Indies, Brazil.

790. SAPINDUS, or *Soap-berry*.

10 species; viz. *saponaria*, *longifolius*, *spinosis*, *laurifolius*, *emarginatus*, *rubiginosus*, *tetraphyllus*, *rigidus*, *arborescens*, *frutescens*. E. and W. Indies, China.

791. PONEA.

One species; viz. *saponarioides*. Guiana.

ORDER IV. TETRAGYNIA.

792. VERA.

One species; viz. *crenata*.

793. PARIS, or *True Love*, or *One-berry*.

One species; viz. * *quadrifolia*.

* P. cal. 4-leaved; petals 4, narrower; berry 4-cell-*quadrifolia*.—The leaves and berries are said to partake of the *lia* properties of opium. The juice of the berries is useful in inflammations of the eyes. Linnæus says the roots will vomit as well as ipecacuanha, but it must be given in a double quantity. Europe.

794. ADOXA, or *Moschatel*.

One species; viz. * *moschatellina*. Europe.

795. ELATINE, or *Water-wort*.

Two species; viz. *hydropiper*, * *alsinastrum*. Eur.

796. HALORAGIS.

Two species; viz. *cercodia*, *prostrata*. New Zealand, New Caledonia.

797. FORSKOLEA.

Three species; viz. *tenacissima*, *candida*, *angustifolia*. Egypt, Teneriffe, Cape.

In the class *Octandria* are

70 Genera, including 493 Species, of which 30 are found in Britain.

CLASSIS IX.

ENNEANDRIA.

ORDO I. MONOGYNIA.

798. LAURUS. Cal. 0. Cor. 6-petala, calycina. Bacca 1-sperma. Nectarium glandulæ bisetæ.

800. PANKE. Cal. 4-fidus. Cor. 4-fida. Caps. monosperma.

799. ANACARDIUM. Cal. 5-partitus. Cor. 5-petala. Stamina decimo castrato. Nux receptaculo carnos.

CLASS IX.

ENNEANDRIA.

ORDER I. MONOGYNIA.

L. No Cal. Cor. 6-petaled, cup or calyx-like. A berry, 1-seeded. The glands of the nectary bristled.

P. Cal. 4-cleft. Cor. 4-cleft. Caps. 1-seeded.

A. Cal. 5-partite. Cor. 5-petaled. The 10th stamen without an anther. A nut with a fleshy receptacle.

801. PLEGORHIZA. Cal. o. Cor. 1-petala. Caps. 1-locul. 1-sperma.

802. CASSYTA. Cal. o. Cor. 6-partita, calycina. Baccæ 1-sperma. Nectarium glandulæ truncatæ.

† *Anacardium stamine decimo castrato. Amyris enneandra. Brounæa enneandra. Gurdensia Thunbergia.*

ORDO II. TRIGYNIA.

803. RHEUM. Cal. o. Cor. 6-fida. Sem. 1, triquetrum.

ORDO III. HEXAGYNIA.

804. BUTOMUS. Cal. o. Cor. 6-petala. Caps. 6, polysperma.

P. No cal. Cor. 1-petala. Caps. 1-celled, 1-seeded.

G. No cal. Cor. 6-partite, cup-like. Berry 1-seeded. The glands of the nectary lopped.

ORDER II. TRIGYNIA.

R. No cal. Cor 6-cleft. Seed 1, triangular.

ORDER III. HEXAGYNIA.

B. No cal. Cor. 6-petala. Caps. 6, many-seeded.

ORDER I. MONOGYNIA.

798. LAURUS, or Bay-tree.

34 species; viz. cinnamomum, cassia, camphora, culilaban, montana, chloroxylon, glauca, pedunculata, caustica, nobilis, indica, scetens, persica, borbonia, martinicensis, exaltata, alpigena, triandra, sanguinea, surinamensis, hexandra, salicifolia, coriacea, leucoxylon, membranacea, patens, parviflora, pendula, floribunda, lucida, umbellata, æstivalis, benzoin, sassafras. Of these we shall take notice of the following, as of considerable importance.

1. The nobilis, or ever-green bay-tree, is a native of Italy, and hath an upright trunk branching on every side from the bottom upward; with spear-shaped, nervous, stiff, evergreen leaves, three inches long and two broad; and small, yellowish, quadrifid, dioecious flowers, succeeded by red berries in autumn and winter. Of this species there are varieties with broad, narrow, striped, or waved leaves. 2. The æstivalis, or deciduous bay, grows naturally in North America. It rises with an upright stem, covered with a purplish bark; having oblong, oval, acuminate, veined, deciduous leaves, two or three inches long, and half as broad, growing opposite; with small white flowers, succeeded by red berries. 3. The benzoin, or benjamin-tree, is also a native of North America; grows 15 or 20 feet high, divided into a very branchy head; with oval, acute, deciduous leaves, three or four inches long, and half as broad; and small yellowish flowers, not succeeded by berries in this country. 4. The sassafras is a native of the same country. It hath a shrub-like straight stem, garnished with both oval and three-lobed, shining, deciduous leaves, of different sizes, from three or six inches long, and near as broad, with small yellowish flowers, succeeded by blackish berries, but not in this country. 5. The indica, or Indian bay tree, rises with an upright straight trunk, branching regularly, 20 or 30 feet high: adorned with very large, spear-shaped, plane, nervous, evergreen leaves on reddish footstalks; and bunches of small whitish green flowers, succeeded by large oval black berries which do not ripen in this country. 6. The borbonia, or Carolina red bay tree, rises with an upright straight stem, branching 15 or 20 feet high; with large spear-sha-

ped, evergreen leaves, transversely veined; and long bunches of flowers on red footstalks, succeeded by large blue berries sitting in red cups. 7. The camphora, or camphire tree, grows naturally in the woods of the western parts of Japan, and in the adjacent islands. The root smells stronger of camphire than any of the other parts, and yields it in greater plenty. The bark of the stalk is outwardly somewhat rough; but in the inner surface smooth and mucous, and therefore easily separated from the wood, which is dry and of a white colour. The leaves stand upon slender footstalks, have an entire undulated margin, running out into a point: have the upper surface of a lively and shining green, the lower herbaceous and silky; and are furnished with a few lateral nerves, which stretch archways to the circumference, and frequently terminate in small warts; a circumstance peculiar to this species of laurus. The flowers are produced on the tops of footstalks, which proceed from the armpits of the leaves; but not till the tree has attained considerable age and size. The flower stalks are slender, branched at the top, and divided into very short pedicles, each supporting a single flower. These flowers are white, and consist of six petals, which are succeeded by a purple and shining berry of the size of a pea, and in figure somewhat top-shaped. It is composed of a soft pulpy substance that is purple, and has the taste of cloves and camphire; and of a nucleus or kernel of the size of a pepper, that is covered with a black, shining, oily corticle, of an insipid taste. 8. The cinnamomum, or cinnamon tree, is a native of Ceylon. It hath a large root, and divides into several branches, covered with a bark, which on the outer side is of a grayish brown, and on the inside has a reddish cast. The wood of the roots is hard, white, and has no smell. The body of the tree, which grows to the height of 20 or 30 feet, is covered, as well as its numerous branches, with a bark which at first is green and afterwards red. The leaf is longer and narrower than the common bay tree; and it is three-nerved, the nerves vanishing towards the top. When first unfolded, it is of a flame colour: but after it has been for some time exposed to the air, and grows dry, it changes to a deep green on the upper surface, and to

a lighter on the lower. The flowers are small and white, and grow in large bunches at the extremity of the branches: they have an agreeable smell, something like that of the lily of the valley. The fruit is shaped like an acorn, but is not so large. 9. The cassia, or base cinnamon, has lanceolated leaves, triple-nerved. 10. The persea, avocado pear tree, or alligator pear, rises to a considerable height, with a straight trunk, of which the bark and wood are of a grayish colour. The leaves are long, oval, pointed, of a substance like leather, and of a beautiful green colour. The flowers are produced in large knots or clusters at the extremities of the branches, and consist each of six petals disposed in the form of a star, and of a dirty white or yellow colour, with an agreeable odour, which diffuses itself to a considerable distance. It is a native of the West Indies. The persea begins to bear two years and a half, or at most three years, after being planted; and, like most of the trees in warm climates, bears twice a year. The other species of this genus are possessed of no remarkable properties.

The first species are propagated by layers, or by the berries. In order to raise a quantity of these trees by layers, some stools should be planted for the purpose; and after these are shot about a yard high, the branches must be brought down to the ground in the winter, all the preceding summer's shoots laid on it, and pegged down, being first slit in the joint, and the leaves taken off, which would otherwise be under ground. In one year's time these layers will have taken root; and in the spring they should be taken up, and planted in the nursery a foot asunder, in rows two feet distance. After they are planted out, if the weather should prove dry, they must be constantly watered; for without such care, it is difficult to make this tree grow. After they have taken well to the ground, they will require no farther trouble than keeping them clean from weeds, and digging between the rows each winter, till they are finally planted out. 2. In order to raise this tree from the berries, they ought to hang on the trees till about January before they are gathered. A well-sheltered spot of ground for the seminary must be made choice of: and having the mould smooth and fine, they should be sown soon after they are gathered, in beds or drills, rather more than half an inch deep. Towards the close of the spring the plants will come up, and during summer must be duly attended, by watering and weeding. In the winter following, their sheltered situation must not be trusted to, to defend them from the frost: Furze bushes, or some such things, ought to be stuck in rows between the beds or drills, to guard them from the black frosts. Indeed, without this precaution, if the winter should prove very frosty, few of the young seedlings will be alive in spring. During the following summer, weeding and watering must be observed, and the winter after that they should be defended with covering as before; for they will be still in danger of being destroyed by severe frosts. In the ensuing spring, the strongest may be taken out of the seed-beds, and planted in the nursery way; though, if they have not by that time made good shoots, it will be advisable to let them remain in their beds till the third spring; for a small plant of this kind is with more difficulty made to grow than one which is larger. When they are planted in the nur-

sery, the distance which should be allowed them is the same as the layers, a foot asunder and two feet distance in the rows; and this will not be found too close: for notwithstanding the greatest care is exerted in planting them in the nursery, even making choice of rainy and cloudy weather, which must always be observed in setting them out, many of them will be lost by being transplanted. After they are thus planted out in the nursery, whether layers or seedlings, they must be still watered in dry weather, kept free from weeds, and the rows dug between every winter. You will even find, that those plants which suffer least by being transplanted will have met with a check, which they will not recover in two or three years; and till they have acquired new strength they should not be taken from the nursery; but when they appear to be good stiff plants, having the year before made a vigorous shoot, they will be then proper plants for planting out where they are to remain. Holes should be got ready for their reception; and as soon as the first autumnal rains fall, the work should be set about, especially if the land be gravelly or dry; but if it be moist, the spring will do as well. Being now planted at one yard distance, they will make a poor progress for two or three years more; but after this, when they have overcome all these difficulties, they will grow very fast, and arrive to be good trees in a few years. Although this tree flourishes best in old gardens, where the soil has been made rich and deep, and loves the shade, Hanbury tells us, "it thrives nevertheless exceedingly well in our hottest gravels and sands; and after it has surmounted the hardships of transplanting, will grow in such situations extremely fast, and arrive to a large bulk."

The propagation of the three next sorts of trees may be performed two or three ways: 1. By the seeds. These we receive from the places where the trees grow naturally, in the spring. They should be preserved in sand; and as soon as they arrive, should be sown in largish pots an inch deep. The soil for their reception should be taken from a rich pasture at least a year before, with the sward. It should also be laid in a heap, and frequently turned, until the sward is grown rotten, and the whole appears well mixed and fine. If the pasture from whence it was taken near the surface is a sandy loam, this is the best compost for these seeds; if not, a small addition of drift or sea sand should be added, and well mixed with the other mould. After filling the pots with this soil, the seeds should be sown an inch deep; and then they should be plunged into common mould up to the rim. If the soil be naturally moist, it will keep them cooler, and be better; and if the place be well sheltered and shaded, it will be better still. Nothing more than weeding, which must be constantly observed during the summer, will be necessary; and in this station they may remain until the March following: about the middle of which month having prepared a good hot-bed, the pots should be taken up and plunged therein. Soon after the seeds will come up: and when the young plants have sufficiently received the benefit of this bed, they should be inured by degrees to the open air. Weeding and watering must be observed during the summer; and at the approach of the cold weather in the autumn, they should be removed under a hotbed frame, or some

cover, to be protected from the frosts during the winter. In the spring, when this danger is over, they should resume their first station; namely, the pots should be plunged up to the rim, as when the seeds were first sown; and if this place be well sheltered, they may remain there all winter: if not, and severe frosts threaten, they should be taken up and placed under cover as before. After they have been thus managed three years from the seeds, they should be taken out of the pots with care, and planted in the nursery ground at small distances, where they may remain until they are strong enough to be finally set out. By sowing the seeds in pots, and assisting them by a hot-bed, a year at least is saved; for they hardly ever come up, when sown in a natural border, under two years from the seeds; nay, they have been known to remain three, and even some plants to come up the fourth year after sowing; which at once shows the preference of the former practice, and should caution all who have not such convenience, not to be too hasty in disturbing the beds when the seeds are sown in the natural ground; as, especially if they are not well preserved in mould or sand, these may be some years before they appear. Indeed, it is the long time we are in obtaining these plants, either by seeds, layers, &c. that makes them at present so very scarce amongst us.

2. These plants may also be increased by layers; but very slowly; for they will be two and sometimes three, or even four years, before they have struck out good roots; though the benjamin tree is propagated the fastest by this method. The young twigs should be laid in the ground in the autumn; and it will be found that twisting the wire round the bud, so as in some degree to stop the progress of the sap, and taking away with a knife a little of the bark, is a more effectual method of obtaining good roots soon than by the slit or twisting, especially when practised on the sassafras tree.

3. Plants of those sorts are likewise sometimes obtained by suckers, which they will at all times throw out, and which may be often taken off with pretty good roots; but when they are weak, and with bad roots, they should be planted in pots, and assisted by a moderate heat in a bed: with such management they will be good plants by the autumn, and in the spring may be planted out anywhere.

4. Cuttings of these trees, when planted in a good bark bed, and duly watered, will also oftentimes grow. When this method is practised, and plants obtained, they must be inured by degrees to the open air, till they are hardy enough to be finally planted out.

The Indian bay, the camphire, the avocado, and the cinnamon tree, require the treatment common to greenhouse plants; the latter, however, is rather a stove plant in this country.—Of its culture or propagation in its native places, no particular account has been given by botanical writers; but it must now become an important consideration with us, since the island of Ceylon, where cinnamon chiefly grows, now belongs to Great Britain. Of the advantages promised by this acquisition we are indebted for the first accounts to Dr Wright in 1787; from whom also we learn, that its propagation is very easy, and its culture requires little care, as more particularly noticed below. Since that time, some observations by Dr Dancez, relative to its cultivation, have appeared in the Transactions of the Society of Arts,

&c. These observations confirm, without adding any thing essential to, the concise notice of Dr Wright. We are informed, that as the tree "puts out numerous side branches, with a dense foliage, from the very bottom of the trunk; this furnishes an opportunity of obtaining plenty of layers, and facilitates the propagation of the tree, as it does not perfect its seeds in any quantity under six or seven years; when it becomes so plentifully loaded, that a single tree is sufficient almost for a colony. It seems to delight in a loose moist soil, and to require a southern aspect; the trees, thus planted, flourishing better than others growing in loam, and not so well exposed to the sun. When healthy, it is (from layers) of pretty quick growth, reaching in eight years the height of fifteen or twenty feet, is very spreading, and furnished with numerous branches of a fit size for decortication. The seeds, however, are a long time in coming up, and the plants make small progress for the first year or two." It is added, that "the birds appear to be very fond of the berries, and will probably propagate this tree in the same way they do many others everywhere over the island; so that in a short time it will grow spontaneously, or without cultivation." The age for decortication, said above to be eight years, it will be observed, is different from that specified below for the trees in Ceylon.

Evelyn says, he has seen bay trees near 30 feet high, and almost two feet in diameter; and enumerates the bay amongst useful trees. Hanbury catches at this idea, and tells us in general terms, that "it will grow to 30 feet in height, with a trunk of two feet in diameter;" and accordingly he arranges it among his forest trees: he acknowledges, however, at the same time, that the wood is of little value. The bay is nevertheless a fine aromatic and a beautiful evergreen: It is said to be the true *laurus* or laurel of the ancients, with which they adorned the brows of their successful generals. Like the holly, box, and laurel, the bay will bear the shade and drip of taller trees; and it is, upon the whole, a very desirable, as being a very ornamental, evergreen.

The leaves and berries of this tree have a moderately strong aromatic smell, and a warm, bitterish, pungent taste: the berries are stronger in both respects than the leaves, and afford in distillation a larger quantity of essential aromatic oil; they yield also an almost insipid oil to the press, in consequence of which they prove unctuous in the mouth. They are warm carminatives, and sometimes exhibited in this intention against flatulent colics, and likewise in hysterical disorders. Their principal use in the present practice is in glisters, and some external applications. The deciduous bay, in a moist rich soil, in which it principally delights, will grow to be about 16 feet high; but in some soils, that are possessed of the opposite qualities, it will hardly arrive at half that height. The flowers are succeeded in May by large red berries, which never ripen in England: so that notwithstanding the leaves in summer are very pretty, and the colour of the bark makes a variety in winter, it is principally the scarcity of this plant which makes it valuable.

The *bensoin* tree will grow to a much larger size than the other, and its branches are more numerous. They

They are smooth, and of a fine light green colour. The leaves on their upper surface are smooth and of a fine light green colour, but their under surface is venose, and of a whitish cast. When bruised, they emit a fine fragrance. This tree was formerly mistaken for that which produces the drug called *benzoin*; which is now known to be obtained from a species of *styrax*.

The *sassafras* will grow to nearly the height of the others, though the branches are not so numerous. Its bark is smooth, and of a red colour, which beautifully distinguishes it in winter; whilst the fine shining green of its leaves constitutes its greatest beauty in summer. In these, indeed, there is a variety, and a very extraordinary one. Some are large and of an oval figure; others are smaller, and of the same shape; whilst others again are divided into three lobes, so as to resemble the leaves of some sorts of the fig tree. In America, the *sassafras* generally stands single in the woods, and along the fences round the fields. It flowers in May before the leaves come out; and being entirely covered with them, it is distinguished at a great distance by their beautiful yellow colour.

The root of the *sassafras* has a fragrant smell, and a sweetish, aromatic, subacid taste: the bark tastes much stronger than any other part, and the small twigs stronger than the large pieces. It is a warm aperient and corroborant, and frequently employed with good success for purifying and sweetening the blood and juices. For these purposes, infusions made from the rasped root or bark may be drank as tea. In some constitutions indeed, such liquors are, by their fragrance, apt, on first taking them, to affect the head; but in such cases they may be advantageously freed from their flavour by boiling. A decoction of *sassafras*, boiled down to the consistence of an extract, proves simply bitterish and subastringent. Hoffman assures us, that he has frequently given this extract to the quantity of a scruple at a time, with remarkable success, for strengthening the tone of the viscera in cachexies; as also in the decline of intermittent fevers and in hypochondriacal spasms. *Sassafras* yields in distillation an extremely fragrant oil of a penetrating pungent taste, so ponderous (notwithstanding the lightness of the drug itself) as to sink in water. Rectified spirit extracts the whole taste and smell of *sassafras*; and elevates nothing in evaporation: hence the spirituous extract proves the most elegant and efficacious preparation, as containing the virtue of the root entire.

The bark of this tree is used by the women in Pennsylvania and other parts of North America in dyeing worsted a fine lasting orange colour, which does not fade in the sun. They use urine instead of alum in dyeing; and boil the dye in a brass boiler, because in an iron vessel it does not yield so fine a colour. The wood is made use of for posts belonging to the enclosures, for it is said to last a long time in the ground; but it is likewise said, that there is hardly any kind of wood which is more attacked by worms than this when it is exposed to the air without cover; and that in a short time it is quite worm-eaten through and through. On cutting some part of the *sassafras* tree, or its shoots, and holding it to the nose, it has a strong but pleasant smell. Some people peel the root, and boil

the peel with the beer which they are brewing, because they believe it wholesome. For the same reason, the peel is put into brandy either whilst it is distilling, or after it is made. Professor Kalm informs us, that a decoction of the root of *sassafras* in water, drank every morning, is used with success in the dropsy. When part of a wood is destined for cultivation, the *sassafras* trees are commonly left upon it, because they have a very thick foliage, and afford a cool shade to the cattle during the great heats. Some people get their bed-posts made of *sassafras* wood, in order to expel the bugs; for its strong scent, it is said, prevents those vermine from settling in them. For two or three years together this has the desired effect, or about as long as the wood keeps its strong aromatic smell; but after that time it has been observed to lose its effect. In Pennsylvania some people put chips of *sassafras* into their chests, where they keep all sorts of woollen stuffs, in order to expel the moths (or larvæ of caterpillars of moths or tinies) which commonly settle in them in summer. The root keeps its smell for a long while: Professor Kalm saw one which had lain five or six years in the drawer of a table, and still preserved the strength of its scent. The people also gather its flowers, and use them as tea.

The *persea*, or *alligator pear-tree*, is cultivated universally in the West Indies by all ranks of people. The fruit is pear-shaped, and from one to two pounds in weight. On removing a green skin or covering, we come to a yellow butyraceous substance; and in the heart find a large round seed or stone, which is unequal in the surface, and exceedingly hard and woody. This fruit is ripe in August and September, and constitutes one of the most agreeable articles of diet for six or eight weeks to the negroes. These pears, with a little salt and a plantain or two, afford a hearty meal. They are also served up at the tables of white people as choice fruit. When the pear is ripe, the yellow or eatable substance is firmer than butter, and tastes somewhat like butter or marrow: hence it is called by some the *vegetable marrow*. But however excellent this fruit is when ripe, it is very dangerous when pulled and eaten before maturity. Dr Wright says, he has repeatedly known it to produce fever and dysentery, which were removed with difficulty. The leaves of this tree, and those of the bead vine or wild liquorice, are made into pectoral decoctions by the common people. The large stone is used for marking linen. The cloth is tied or held over the stone, and the letters are pricked out by a needle through the cloth and into the seed. The stain is a reddish brown, which never washes out.—The buds of the alligator tree are said to be used with success in ptisans against the venereal disease. An infusion of them in water, drank in the morning fasting, is strongly recommended for dislodging coagulated blood in the stomach, produced by a fall or a severe stroke on that important entrail. "The wild boars in the East Indies (says Labat) eat greedily of the mammees and avocado pears, which give their flesh a luscious and most agreeable savour."

Cassia. The bark of this species is known in the shops by the name of *cassia lignea*. This bark, which is imported from different parts of the East Indies and from China, has a very near resemblance to the cinnamon; though distinguishable from it by being of a thicker.

thicker and coarser appearance, and by its breaking short and smooth, while the cinnamon breaks fibrous and shivery. It resembles cinnamon still more exactly in its aromatic flavour than in its external appearance; and seems only to differ from it in being somewhat weaker, in abounding more with a viscous mucilaginous matter, and in being less astringent. Accordingly, it has not only a place in the Edinburgh Pharmacopœia, but is also the basis of a distilled water. It is perhaps surprising that the London college have given it no place in their lists. But although it does not enter their Pharmacopœia, yet we may venture to assert, that it will not be neglected by the apothecaries. At present it is very common with many of them to substitute the cassia in every case for the more expensive article cinnamon: and indeed almost the whole of what is at present sold under the title either of simple or spirituous cinnamon water is entirely prepared from cassia; and not even entirely from the bark, but from a mixture of the bark and buds.

Cinnamon is the under bark of the *cinnamomum*. The best season for separating it from the outer bark, which is gray and rugged, is the spring, when the sap flows in the greatest abundance. It is cut into thin slices, and exposed to the sun, and curls up in drying. The old trees produce a coarse kind of cinnamon; the spice is in perfection only when the trees are not older than three or four years. When the trunk has been stripped of its bark, it receives no further nourishment; but the root is still alive, and continues to throw out fresh shoots. The fruit of the tree is shaped like an acorn, but is not so large. Its seed, when boiled in water, yields an oil which swims at top, and takes fire. If left to cool, it hardens into a white substance, of which candles are made, which have an agreeable smell, and are reserved for the use of the king of Ceylon. The cinnamon is not reckoned excellent unless it be fine, smooth, brittle, thin, of a yellow colour, inclining to red, fragrant, aromatic, and of a poignant yet agreeable taste. The connoisseurs give the preference to that, the pieces of which are long but slender. That which comes to us is generally mixed with the cassia bark; but this last is easily distinguished. Cinnamon splinters in breaking, and has a roughness along with its aromatic flavour; while the cassia breaks over smooth, and has a mucilaginous taste. Cinnamon is a very elegant and useful aromatic, more grateful both to the palate and stomach than most other substances of this class. By its astringent quality it likewise corroborates the viscera, and proves of great service in several kinds of alvine fluxes, and immoderate discharges from the uterus.

The cinnamon plant, with other valuable ones, was taken in a French ship by Admiral Rodney in the last war, and presented by him to the assembly of Jamaica. One of the trees was planted in the botanic garden in St Thomas in the East; the other by Hinton East, Esq. in his noble garden at the foot of the Blue Mountains. From these parent trees some hundreds of young trees are already produced from layers and cuttings, and dispersed to different parts of the country, in all which it thrives luxuriantly with little trouble: we may therefore, hope it will soon be a valuable addition to our commerce. Upon comparing the parts of the tree with the description and figure given by Burman

and other botanists, it appears to be the real Ceylon cinnamon, and of the best kind, culled by the natives *Rasle Coronde*: but the specimens of bark taken put it out of all doubt, being, in the opinion of the best judges, of an equal, if not superior, quality to any imported from India. The smallest bit of the bark, Dr Wright assures us, is quite a cordial. The cinnamon we have from Holland, he observes, is often inert, and gives room to suspect that it has been subjected to a slight process in distillation.

In regard to the trees growing in Jamaica, Dr Dancer informs us, in his paper already quoted, that "The best cinnamon bark, according to the different trials I have made, is taken from the small branches, of about an inch diameter, the larger limbs not being so easily decorticated, and not yielding so good or so strong a cinnamon. The smaller twigs, or those that have not acquired a cineritious bark, are too full of sap and mucilage, and have little *aroma*. It is the *liber*, or inner bark, that constitutes the cinnamon; from which the two external barks must be carefully and entirely separated, or they vitiate the flavour of the cinnamon; to do which with dexterity, and to raise the bark from the wood, requires some practice. The bark being separated, the smaller pieces are to be placed within the larger: which, by exposure to the sun or the air, presently coil up, and require no further preparation. A dry season is the proper one for taking the bark, as it is found to be weakened after long or heavy rains. Cinnamon, though more retentive of its virtues than any of the other spices, yet requires to be protected when taken, from the air and moisture, by close packing in cedar chests. The leaves of this tree, whether recent or dried, are so strongly impregnated with an *aroma*, as to afford a good succedaneum for the bark both in cookery and medicine. Distilled, they give an excellent simple and spirituous water, and an essential oil. Powdered, they are a good aromatic species, or mareschal perfume."

Camphor, though solid, is the essential oil of the *laurus camphora*; and is obtained from it by distillation in the East Indies. (See the article CAMPHORA.)—The tree is another of the captured plants given to the inhabitants of Jamaica; and, if cultivated with care, will also be an useful acquisition.

The abbé Grosier informs us, that in China some of these trees are found above 100 cubits in height, and so thick that 20 persons cannot enclose them. The tree is there called *tchang*; and it is said that the trunk, when old, emits sparks of fire, but of so subtle a nature as not even to injure the hair of those who are near it. Common camphire costs only a penny the ounce at Pe-king; but it is inferior to that of Borneo, in the judgment even of the Chinese.

The manner in which some authors have spoken of camphire (the abbé observes), gives us reason to conclude that they have been entirely ignorant of the process employed to obtain this salutary gum. The camphire does not drop to the earth, like the gums of certain resinous trees, which are preserved by discharging that part of their substance which is too oily; neither does it distil from the top to the bottom of the tree through an incision made in it. The Chinese would practise this method could it be employed with success; for it is very common in China to make such kind

kind of incisions in resinous trees. The method used by the Chinese for obtaining camphire is as follows.— They take some branches fresh from the *tehang*, chop them very small, and lay them to steep in spring-water for three days and three nights. After they have been soaked in this manner, they are put into a kettle, where they are boiled for a certain time, during which they keep continually stirring them with a stick made of willow. When they perceive that the sap of these small chips adheres sufficiently to the stick in the form of white frost, they strain the whole, taking care to throw away the dregs and refuse. This juice is afterwards poured gently into a new earthen bason well varnished, in which it is suffered to remain one night. Next morning it is found coagulated, and formed into a solid mass. To purify this first preparation, they procure some earth from an old earthen wall, which, when pounded, and reduced to a very fine powder, they put into the bottom of a bason made of red copper; over this layer of earth they spread a layer of camphire, and continue thus until they have laid four strata. The last, which is of very fine earth, they cover up with the leaves of the plant *po ho*, or pennyroyal; and over the whole they place another bason, joining it very closely to the former by means of a kind of red earth that cements their brims together. The bason thus prepared is put over a fire, which must be managed so as to keep up an equal heat: experience teaches them to observe the proper degree. But above all they must be very attentive lest the plaster of fat earth which keeps the basons together should crack or fall off; otherwise the spirituous part would evaporate, and ruin the whole process. When the basons have been exposed to the necessary heat, they are taken off and left to cool; after which they are separated, and the sublimated camphire is found adhering to the cover. If this operation be repeated two or three times, the camphire is found purer and in larger pieces. Whenever it is necessary to use any quantity of this substance, it is put between two earthen vessels, the edges of which are surrounded with several bands of wet paper. These vessels are kept for about an hour over an equal and moderate fire: and when they are cool, the camphire is found in its utmost perfection and ready for use. This method of procuring camphire, even from the heart of the tree, may be practised in all seasons of the year; which would not be the case (our author observes), were it extracted like other resinous substances that only flow during a certain short space of time. Besides, by lopping the branches of the camphire tree, less hurt is done to it than by making incisions, which are always hazardous.

799. ANACARDIUM, or *Cashew-nut*, or *Acajou*.
One species; viz. occidentale. E. and W. Indies.

800. PANKE.
Two species; viz. tinctoria, sonchifolia. Chili.

801. PLEGORRHIZA.
One species; viz. adstringens. Chili.

802. CASSYA.
Two species; viz. filiformis, corniculata. Egypt,
E. Indies, S. America.

ORDER II. TRIGYNIA.

803. RHEUM, or *Rhubarb*.

Eight species; viz. rhaponticum, undulatum, palmatum, compactum, tartaricum, ribes, hybridum, leucorrhizum. Siberia, Levant, Tartary, India, China.

The *rheum palmatum*, which is of the dock kind, grows spontaneously in China, and endures the colds of our own climate. Two sorts of rhubarb are met with in the shops. The first is imported from Turkey and Russia, in roundish pieces, freed from the bark, with a hole through the middle of each; they are externally of a yellow colour, and on cutting, appear variegated with lively reddish streaks. The other, which is less esteemed, comes principally from China, in longish pieces, harder, heavier, and more compact than the foregoing. The first sort, unless kept very dry, is apt to grow mouldy and worm-eaten; the second is less subject to these inconveniences. Some of the more industrious artists are said to fill up the worm holes with certain mixtures, and to colour the outside of the damaged pieces with powder of the finer sorts of rhubarb, and sometimes with cheaper materials; this is often so nicely done, as effectually to impose upon the buyer, unless he very carefully examines each piece. The marks of good rhubarb are, that it be firm and solid, but not flinty; that it be easily pulverable, and appear, when powdered, of a fine bright yellow colour; that upon being chewed, it impart to the spittle a saffron tinge, without proving slimy or mucilaginous in the mouth. Its taste is subacid, bitterish, and somewhat astringent; the smell lightly aromatic.

Rhubarb is a mild cathartic, which operates without violence or irritation, and may be given with safety even to pregnant women and to children. In some people, however, it always occasions severe griping. Besides its purgative quality, it is celebrated for an astringent one, by which it strengthens the tone of the stomach and intestines, and proves useful in diarrhoea, and disorders proceeding from a laxity of the fibres. Rhubarb, in substance, operates more powerfully as a cathartic than any of the preparations of it. Watery tinctures purge more than the spirituous ones; whilst the latter contain, in greater proportion, the aromatic, astringent, and corroborating virtues of the rhubarb. The dose, when intended as a purgative, is from a scruple to a dram or more.

The Turkey rhubarb is, among us, universally preferred to the East India sort, though this last is, for some purposes, at least equal to the other; it is manifestly more astringent, but has somewhat less of an aromatic flavour. Tinctures drawn from both, with rectified spirit, have nearly the same taste; on distilling off the menstruum, the extract left from the tincture of the East India rhubarb, proved considerably the strongest. They are both the produce of the same climate, and probably the roots of the same plant, taken up at different times, or cured in a different manner.

Rhubarb is now raised in Britain equal to any that is imported.

The officinal preparations of this drug are a watery and

and a vinous infusion, a simple and compound tincture. It is also an ingredient in different compositions, such as the *elixir ex aloe et rheo*, the *pilulæ stomachicæ*, and some others.

* B.—Neither cows, horses, sheep, swine, or goats, *umbellatus* will eat it. It is an ornament to the banks of our rivers and marshy ditches. Europe.

ORDER III. HEXAGYNIA.

804. BUTOMUS, or *Flowering rush*.
One species; viz. * *umbellatus*.

In the class *Enneandria* are
7 Genera, including 49 Species, of which one only is found in Britain.

CLASSIS X.
DECANDRIA.

ORDO I. MONOGYNIA.

Sect. I. *Flores polypetalis irregulares.*

805. SOPHORA. Cor. papilion. vexillo adscendente. Lomentum moniliforme.
806. PODALYRIA. Cor. papilion. vexillo adscendente. Legumen ventricosum polyspermum.
807. PULTENÆA. Cor. papilion. Alæ vexillo breviores. Legumen dispermum.
808. ANAGYRIS. Cor. papilion. vexillo brevi recto. Carina alis longiore.
809. CERCIS. Cor. papilion. alis vexilliformibus. Nect. gland. styliiformis, sub germine.
810. BAUHINIA. Cor. patens, unguiculata, adscendens. Petala lanceolata.
811. HYMENÆA. Cor. subæqualis. Legum. lig-nosum, pulpa farinosa.
829. MYROXYLON. Cor. petalo supremo latiore. Legumen 1-spermum, apice dilatatum.
812. PARKINSONIA. Cor. petalo infimo reniformi. Legum. teres, tortuosum.
815. CÆSALPINIA. Cor. petalo infimo pulchriore. Cal. lacinis inæquales. Legum. compressum.
828. TOLUIFERA. Cor. petalo infimo majore. Cal. campanulatus.
813. CASSIA. Cor. inæqualis. Anth. rostratæ. Lomentum planum.
814. CUBÆA. Cor. subæqualis, petalis 2 deflexis. Legumen coriaceum, ventricosum. Semina subreniformia.
816. GUILANDINA. Cor. subæqualis, calyci insidens. Legum. rhombeum. Sem. ossea.
817. HYPERANTHERA. Cor. subæqualis. Legumen 3-valve. Sem. alata.
837. GERTNERA. Cor. subæqualis. Cal. 4-partitus. Samara quadrialata.
851. GOMPHIA. Cor. subæqualis. Baccæ plures receptaculo magno insertæ.
824. DICTAMNUS. Cor. patula. Filam. pulveracea. Caps. 5, connexæ. Sem. arillata.
866. RHODORA. Cor. inæqualis tripetala. Cal. 5-dentatus. Caps. 5-loculares.

CLASS X.

DECANDRIA:

ORDER I. MONOGYNIA.

Sect. I. *Flowers polypetalous, irregular.*

- S. Cor. papilionaceous or butterfly-shaped. The standard ascending. The lomentum bracelet-shaped.
P. Cor. papilionaceous. The standard ascending. A leguminous plant, bellied, many-seeded.
P. Cor. papilionaceous. Wings shorter than the standard. A leguminous plant, 2-seeded.
A. Cor. papilionaceous. A short straight standard. The keel of the wing long.
C. Cor. papilionaceous; with standard-shaped wings. The glands of the nectary style-shaped, under the germen.
B. Cor. expanding, clawed, ascending. Petals spear-shaped.
H. Cor. nearly equal. Leguminous, woody, with a farinaceous pulp.
M. Cor. with the last leaf broader. Leguminous, 1-seeded, dilated at the extremity.
P. Cor. with the lowest petal kidney-shaped. Leguminous, tapering, twisted.
C. Cor. with the lowest petal beautiful. Cal. unequal segments. Leguminous, compressed.
T. Cor. lowest leaf larger. Cal. bells-shaped.
C. Cor. unequal. Anthers beaked. Lomentum flat.
C. Cor. nearly equal, with 2 leaves bent downwards. Leguminous, bark-like, bellied. Seeds nearly kidney-shaped.
G. Cor. nearly equal, sitting in the cal. Leguminous, diamond-shaped. Seeds bony, i. e. shining.
H. Cor. nearly equal. Leguminous, 3-valved. Seeds winged.
G. Cor. nearly equal. Cal. 4-partite. Seed-vessel 4-winged.
G. Cor. nearly equal. Berries, several inserted in a large receptacle.
D. Cor. open. Filaments dusty. Caps. 5, connected. Seeds coated.
R. Cor. unequal, 3-petaled. Cal. 5-toothed. Caps. 5-celled.

Sect.

Sect. II. *Flores polypetalis, aequales.*

820. CYNOMETRA. Cal. 4-phyllus; lacin. oppos. major. Legum. 1-spermum, carnosum.
831. PROSOPIS. Cal. hæmisphericus, 4-dentatus. Legum. polyspermum.
818. SCHOTIA. Cal. 5-fidus, æqualis. Legum. compressum, polyspermum.
832. CADIA. Cal. 5-fidus. Petala obcordata. Legum. polyspermum.
836. ADENANTHERA. Antheris glandula insidens. Leg. compressum membranaceum.
830. HÆMATOXYLON. Pistilli stigma emarginatum. Legumen valvis navicularibus.
839. GILIBERTIA. Nectar. tubulosum truncatum. Antheræ sessiles. Caps. 4-locularis.
840. TRICHILIA. Nectar. tubulosum, 5-dentatum. Caps. 3-locularis, 3-valvis. Sem. baccata.
841. TURRÆA. Nectar. tubulosum, 10-dentatum. Caps. 5-cocca. Sem. bina.
845. MELIA. Nect. tubulosum, 10-dentatum. Drupa nuce 10-loculari.
842. SANDORICUM. Nect. tubulosum, 10-dentatum. Drupa nucibus 5.
843. SWIETENIA. Nect. tubulosum, 10-dentatum. Caps. lignosa, 5-valvis. Sem. imbricata, margine membranaceo.
819. GUAIACUM. Cal. lacinia 2 exteriores minores. Caps. carnosæ, 3 s. 5-locularis, angulata.
827. RUTA. Germen punctis 10 melliferis. Caps. 5-fida, 5-locularis, polysperma.
848. TRIBULUS. Pistilli stylus nullus. Caps. 5, connexæ, polyspermæ.
847. FAGONIA. Cor. unguis calyci insertæ. Caps. 5-locularis, 10-valvis, 1-sperma.
846. ZYGOPHYLLUM. Nect. squamæ 10 staminiferæ. Caps. 5-locularis, polysperma.
850. ZWINGERA. Caps. 5, coriaceæ, non-dehiscentes.
849. QUASSIA. Caps. 5, bivalves, 1-spermæ, insertæ receptaculo carnosæ.
861. CERATOPETALUM. Cor. 5-petala, pinnatifida. Cal. 5-fidus, staminiferus. Caps. 2-locularis.
852. THRYALLIS. Cor. 5-petala. Caps. tricocca.
835. EKEBERGIA. Cor. 4-petala. Bacca 5-sperma.
857. SCHOUSBOEA. Cor. 5-petala calyci inserta. Bacca inserta 5-gona monosperma.
826. PETALOMA. Cor. 5-petala inter calycis lacinias inserta. Bacca 1-locularis.
853. LIMONIA. Cor. 5-petala. Bacca 3-sperma.
844. COOKIA. Cor. 5-petala. Pomum 5-loculare, loculis monospermis.
858. HEISTERIA. Cor. 5-petala. Drupa insidens calyci colorato grandifacto.
859. QUISQUALIS. Cor. 5-petala, calyci insidens filiformi.
- * 854. MONOTROPA. Cal. corollinus, basi gibbus. Caps. 5-locularis, monosperma.
- * 872. CLETHRA. Pistilli stigmata tria. Caps. 3-locul. polysperma.
- * 873. PYROLA. Antheræ sursum bicornes. Caps. 5-locul. polysperma.
865. LEDUM. Cor. plana, 5-partita. Caps. 5-locul. polysperma.

VOL. IV. Part I

†

Sect. II. *Flowers polypetalous, equal.*

- C. Cal. 4-leaved; largest segments opposite. Leguminous, 1-seeded, fleshy.
- P. Cal. hemispherical, 4-toothed. Leguminous, many-seeded.
- S. Cal. 5-cleft, equal. Leguminous, compressed, many-seeded.
- C. Cal. 5-cleft. Petals heart-shaped reversed. Leguminous, many-seeded.
- A. Gland sitting in the anthers. Leguminous, compressed, membranaceous.
- H. Stigma of the pistil notched at the end. Leguminous, with boat-shaped valves.
- G. Nectary tubular lopped. Anthers sitting. Caps. 4-celled.
- T. Tubular nectary, 5-toothed. Caps. 3-celled, 3-valved. Seeds berried.
- T. Nectary tubular, 10-toothed. Caps. 5-celled. Seeds double.
- M. Nectary tubular, 10-toothed. Drupe with a 10-celled nut.
- S. Nectary tubular, 10-toothed. Drupe with 5 nuts.
- S. Nectary tubular, 10-toothed. Caps. woody, 5-valved. Seeds tiled, with a membranous border.
- G. Two outer segments of the cal. small. Caps. fleshy, 3 or 5-celled, angular.
- R. Germen with 10 honey-bearing points. Caps. 5-cleft, 5-celled, many-seeded.
- T. No style of the pistil. Caps. 5, connected, many-seeded.
- F. Claws of the cor. inserted in the cal. Caps. 5-celled, 10-valved, 1-seeded.
- Z. Nectary of 10 stamen-bearing scales. Caps. 5-celled, many-seeded.
- Z. Caps. 5, bark-like, not gaping.
- Q. Caps. 5, 2-valved, 1-seeded, inserted in a fleshy receptacle.
- C. Cor. 5-petaled, wing-cleft. Cal. 5-cleft, bearing the stamens. Caps. 2-celled.
- T. Cor. 5-petaled. Caps. 3-celled.
- E. Cor. 4-petaled. Berry 5-seeded.
- S. Cor. 5 petals inserted in the calyx. Berry inferior, 5-gon, 1-seeded.
- P. Cor. 5 petals inserted between the segments of the cal. Berry 1-celled.
- L. Cor. 5-petaled. Berry 3-seeded.
- C. Cor. 5-petaled. Apple 5-celled, with 1-seeded cells.
- H. Cor. 5-petaled. Drupe sitting in the cal. coloured, enlarged.
- Q. Cor. 5-petaled, sitting in a thread-shaped cal.
- * M. Cal. corol-like, bulging at the base. Caps. 5-celled, 1-seeded.
- * C. 3 stigmas of the pistil. Caps. 3-celled, many-seeded.
- * P. Anthers 2-horned upwards. Caps. 5-celled, many-seeded.

810. BAUMINIA, or *Mountain Ebony*.

15 species; viz. scandens, parviflorum, racemosa, aculeata, divaricata, aurita, porrecta, unguolata, variegata, candida, purpurea, tomentosa, acuminata, gujanensis, rubescens. Egypt, E. and W. Indies.

811. HYMENÆA, or *Locust-tree*.

Three species; viz. courbaril, venosa, verrucosa. W. Indies.

812. PARKINSONIA, or *Jerusalem Thorn*.

One species; viz. aculeata. W. Indies.

813. CASSIA, or *Wild Senna*.

50 species; viz. *diphylla*, *absus*, *viminea*, *bacillaris*, *tagera*, *tora*, *bicapsularis*, *emarginata*, *obtusifolia*, *sennoides*, *acuminata*, *corymbosa*, *longisiliqua*, *falcata*, *servicea*, *occidentalis*, *planisiliqua*, *patula*, *lineata*, *atomaria*, *pilosa*, *arborescens*, *senna*, *ruscifolia*, *biflora*, *chinensis*, *multiglandulosa*, *hirsuta*, *tomentosa*, *serpens*, *mexicana*, *angustifolia*, *ligustrina*, *florida*, *stipulacea*, *alata*, *marilandica*, *fastigiata*, *frondosa*, *tenuissima*, *virgata*, *sophera*, *bracteata*, *auriculata*, *brevifolia*, *mollis*, *javanica*, *grandis*, *nigricans*, *polyphylla*, *chamæcrista*, *glandulosa*, *mimosoides*, *microphylla*, *flexuosa*, *capensis*, *fistula*, *nictitans*, *procumbens*. Egypt, East and West Indies, America.

The fruit of the *cassia fistula* is a cylindrical pod, scarcely an inch in diameter; a foot or more in length. The outside is a hard brown bark: the inside is divided by thin transverse woody plates, covered with a soft black pulp, of a sweetish taste, with some degree of acrimony. There are two sorts of this drug in the shops; one brought from the East Indies, the other from the West; the canes or pods of the latter are generally large, rough, thick-rinded, and the pulp nauseous; those of the former are less, smoother, the pulp blacker, and of a sweeter taste; this sort is preferred to the other. Such pods should be chosen as are weighty, new, and do not make a rattling noise (from the seeds being loose within them) when shaken. The pulp should be of a bright shining black colour, and a sweet taste, not harsh, which happens from the fruit being gathered before it has grown fully ripe, or sourish, which it is apt to turn upon keeping. It should neither be very dry nor very moist, nor at all mouldy, which from its being kept in damp cellars, or moistened, in order to increase its weight, it is very subject to be. Greatest part of the pulp dissolves both in water and in rectified spirit, and may be extracted from the cane by either. The shops employ water, boiling the bruised pod therein, and afterwards evaporating the solution to a due consistence.

The pulp of cassia is a gentle laxative medicine, and frequently given, in a dose of some drams in costive habits. Some direct a dose of two ounces, or more as a cathartic, in inflammatory cases where the more acrid purgatives have no place; but in these large quantities it generally nauseates the stomach, produces flatulencies, and sometimes griping of the bowels, especially if the cassia be not of a very good kind: these effects may be prevented by the addition of aromatics, and exhibiting it in a liquid form. Some say it does excellent service in the painful tension of the belly, which sometimes follows the imprudent use of antimonials; and that it may be advantageously acuated with the more acrid purgatives or antimonial emetics, or employed to abate their force. Vallisnieri relates, that the purgative virtue of this medicine is remarkably promoted by manna: that a mixture of four drams of cassia, and two of manna, purges as much as 12 drams of cassia, or 32 of manna alone. Sennertus observes, that the urine is apt to be turned of a green colour, by the use of cassia, and sometimes, where a large quantity has been taken, blackish. This drug gives name to an official electuary, and is an ingredient also in another.

814. CUBÆA.

Two species; viz. *paniculata*, *trigona*. Guiana.

815. CÆSALPINIA, or *Brasiletto*.

Nine species; viz. *bijuga*, *pulcherrima*, *elata*, *coriaria*, *brasiliensis*, *echinata*, *sappan*, *crista*, *mimosoides*. E. and W. Indies.

816. GUILANDINA, or *Bonduc*, or *Nickar-tree*.

Five species; viz. *bonduc*, *bonducella*, *nuga*, *paniculata*, *axillaris*. E. and W. Indies.

817. HYPERANTHERA, or *Nephritic-wood*.

Four species; viz. *decandra*, *moringa*, *semidecandra*, *cochinchinensis*. Egypt, Ceylon, N. America.

818. SCHOTIA.

One species; viz. *speciosa*. C. of G. Hope.

819. GUAIAIACUM, or *Lignum-vitæ*, *Pockwood*.

Three species; viz. *dubium*, *officinale*, *sanctum*. Africa, China, W. Indies.

The wood of the *guaiacum officinale* is very ponderous, of a close compact texture; the outer part is of a yellow colour, the heart of a deep blackish green, or variegated with black, green, pale, and brown colours; the bark is thin, smooth, externally of a dark grayish hue: both have a lightly aromatic, bitterish, pungent taste; the bark is somewhat the weakest. The resin, which exudes from incisions made in the trunk of the tree, is brought to us in irregular masses, usually friable, of a dusky greenish, and sometimes of a reddish cast, with pieces of the wood among them: its taste is more acrid and pungent than that of the wood or bark.

Their general virtues are those of a warm stimulating medicine: they strengthen the stomach and other viscera; and remarkably promote the urinary and cuticular discharge. Hence, in cutaneous defecations, and other disorders, proceeding from obstructions of the excretory glands, and where sluggish serous humours abound, they are eminently useful; rheumatic and other pains have often been relieved by them. They are also laxative. The resin is the most active of these drugs; and the efficacy of the others depends upon the quantity of this part contained in them. The resin is extracted from the wood in part by watery liquors, but much more effectually by spirituous ones. The watery extract of this wood kept in the shops, proves not only less in quantity, but considerably weaker, than one made with spirit. This last extract is of the same quality with the native resin, and differs from that brought to us only in being purer. The gum or extracts are given from a few grains to a scruple or half a dram; which last dose proves, for the most part, considerably purgative. The officinal preparations of guaiacum are, an extract of the wood, a solution of the gum in rectified spirit of wine, and a solution in volatile spirit, and an empyreumatic oil distilled from the wood.

Guaiac, in form of decoction, has been said to cure the venereal disease; and in this country it is frequently used as an adjuvant to mercury. The resin, dissolved in rum, or combined with water by means of mucilage or the yolk of eggs, or in the form of volatile tincture or elixir, is much employed in gout and chronic rheumatism. The tincture or elixir has
been,

been given to the extent of half an ounce twice a-day, and is sometimes usefully combined with laudanum.

820. CYNOMETRA.

Two species; viz. cauliflora, ramiflora.

821. CRUDIA.

Two species; viz. spicata, aromatica. Guiana.

822. PANZERA.

One species; viz. falcata. Carolina.

823. CODON.

One species; viz. royeri. C. of G. Hope.

824. DICTAMNIS, or *Fraxinella*, *White Dittany*.

One species; viz. albus. Germ. France, Italy.

The *dictamnus albus* grows wild in the mountainous parts of France, Italy, and Germany. From thence the cortical part of the root, in a dry state, rolled up in little quills, is sometimes brought to us. It is of a white colour, of a weak, not very agreeable smell, and of a durable bitter, lightly pungent taste. It has been recommended as an alexipharmac, a tonic, and an anthelmintic; but it is very seldom used, and has no place in the London Pharmacopœia.

825. NICANDRA.

One species; viz. amara. Guiana.

826. PETALOMA.

Two species; viz. myrtilloides, muriri. W. Indies, Guiana.

827. RUTA, or *Rue*.

Seven species; viz. graveolens, montana, chalepensis, pinnata, patavina, linifolia, fruticulosa. S. Eur. Africa.

The *ruta graveolens* is a small shrubby plant met with in gardens, where it flowers in June, and holds its green leaves all the winter. We frequently find in the markets a narrow-leaved sort, which is cultivated by some in preference to the other, on account of its leaves appearing variegated during the winter with white streaks.

Rue has a strong ungrateful smell, and a bitterish penetrating taste. The leaves, when in full vigour, are extremely acrid, insomuch as to inflame and blister the skin if much handled. With regard to their medicinal virtues, they are powerfully stimulating, attenuating, and detergent. And hence, in cold phlegmatic habits, they quicken the circulation, dissolve tenacious juices, open obstructions of the excretory glands, and promote the fluid secretions. The writers on the materia medica, in general, have entertained a very high opinion of the virtues of this plant. Boerhaave is full of its praises; particularly of the distilled oil and the distilled water, cohobated or re-distilled several times from fresh parcels of the herb: after somewhat extravagantly commending other waters prepared in this manner, he adds, with regard to that of rue, that the greatest commendations he can bestow upon it fall short of its merit. "What medicine (says he) can be more efficacious for promoting sweat and perspiration, for the cure of the hysteric passion and of epilepsies, and for expelling poison." Whatever service rue may be of in the two last cases, it undoubtedly has its use in the others; the cohobated water, however, is not the most efficacious preparation of it. An extract, made by rectified spirit, contains, in a small compass, the whole virtues of the rue; this menstruum

taking up by infusion all the pungency and flavour of the plant, and elevating nothing in distillation. With water its peculiar flavour and warmth arise; the bitterness, and a considerable share of the pungency, remaining behind.

The only officinal preparation of rue now retained in our pharmacopœias is the extract; but it is an ingredient in the compound powder of myrrh and some other compositions.

828. TOLUIFERA, or *Balsam of Tolu tree*.

One species; viz. balsamum. Carthage.

The *toluifera balsamum* flows from a tree growing in Tolu in the Spanish West Indies; from whence the balsam is brought to us in little gourd shells. It is of a yellowish brown colour inclining to red; in consistence thick and tenacious; by age it grows hard and brittle, without suffering any great loss of its more valuable parts. The smell of this balsam is extremely fragrant, somewhat resembling that of lemons; its taste warm and sweetish, with little of the pungency, and nothing of the nauseous relish, which accompany the other balsams. It has the same general virtues with the balsamum rabasiri, but is much milder; and for some purposes, particularly as a corroborant in gleet and seminal weaknesses, is supposed to be more efficacious.

829. MYROXYLON, or *Balsam of Peru*.

Three species; viz. peruiferum, pedicellatum, frutescens. Mexico, Peru.

The *myroxylon peruiferum*, as brought to us, is nearly of the consistence of thin honey, of a reddish brown colour, inclining to black, an agreeable aromatic smell, and a very hot biting taste. Distilled with water, it yields a small quantity of a fragrant essential oil of a reddish colour; and in a strong fire, without addition, a yellowish red oil.

Balsam of Peru is a very warm aromatic medicine, considerably hotter and more acrid than copaiva. Its principal effects are to warm the habit, to strengthen the nervous system, and attenuate viscid humours. Hence its use in some kinds of asthmas, gonorrhœas, dysenteries, suppressions of the uterine discharges, and other disorders proceeding from a debility of the solids, or a sluggishness or inactivity of the juices. It is also employed externally for cleansing and healing wounds and ulcers, and sometimes against palsies and rheumatic pains.

This balsam does not unite with water, milk, expressed oils, animal fats or wax; it may be mingled in the cold with this last, and likewise with the sebaceous substance called *expressed oil of mace*; but if the mixture be afterwards liquefied by heat, the balsam separates and falls to the bottom. It may be mixed with water into the form of an emulsion, after the same manner as the balsam of Copaiva. Alkaline lixivium dissolve great part of it; and rectified spirit the whole.

It is an ingredient in several officinal compositions, in some of which it has rather a bad than a good effect.

There is another sort of balsam of Peru of a white colour, and considerably more fragrant than the former. This is very rarely brought to us. It is said to be the produce of the same plant which yields the common or black balsam, and to exude from incisions made

made in the trunk; while the former is alleged to be obtained by boiling. Besides the white, there is also a third kind, commonly called the *red* or *dry*. This is supposed to obtain a different state from the white, merely in consequence of the treatment to which it is subjected, after it is got from the tree. In its fragrance it in some degree approaches to the balsam of Gilead, held in so high esteem among the eastern nations; but it is very rarely in use in Britain, and almost never to be met with in our shops.

830. HEMATOXYLON, or *Logwood*.

One species; viz. campechianum. Campeachy, S. America.—This species is brought chiefly from Campeachy in the bay of Honduras. It is usually in large logs, very compact and hard, of a red colour, and an astringent sweet taste. It has been for a long time used by the dyers, but not till very lately as a medicine; a decoction of it, and the extract, are in use in our hospitals, and said to have proved very serviceable in diarrhoea. It frequently tinges the stools, and sometimes the urine. The extract is now received into the shops, and it is found to be a very useful astringent.

831. PROSOPIS.

One species; viz. spicigera. India.

832. CADIA.

One species; viz. purpurea. Arabia.

833. MURRAYA.

One species; viz. exotica. E. Indies, New Guinea.

834. BERGERA.

One species; viz. koenigii.

835. EKEBERGIA.

One species; viz. capensis. C. of G. Hope.

836. ADENANTHERA, or *Base Flower-fence*.

Three species; viz. pavonina, falcata, scandens. India.

837. GÆRTNERA.

One species; viz. racemosa. India.

838. STRIGILIA.

One species; viz. racemosa. Peru.

839. GILIBERTIA.

Four species; viz. decandra, ovata, heterophylla, oppositifolia. Isles of Bourbon and Mauritius.

840. TRICHILIA.

12 species; viz. hirta, spondoides, emetica, glabra, pallida, moschata, spectabilis, alliacea, heterophylla, trifoliata, nervosa, spinosa. Jam. Hisp. S. Amer.

841. TURRÆA.

Five species; viz. virens, pubescens, maculata, sericea, lanceolata. E. Indies.

842. SANDORICUM.

One species; viz. indicum. India.

843. SWIETENIA, or *Mahogany Tree*.

Three species; viz. mahogoni, febrifuga, chloroxylon. W. Indies.

844. COOKIA.

One species; viz. punctata. New Holland, China.

845. MELIA, or *Bead-tree*.

Four species; viz. azedarach, sempervivens, composita, azadirachtah. Spain, Syria, E. Indies.

846. ZYGOPHYLLUM, or *Bean-caper*.

14 species; viz. simplex, cordifolium, labago, foetidum, maculatum, coccineum, album, morgiana, microphyllum, sessilifolium, spinosum, æstuans, lanatum, arboreum. Syria, Cape, Caucasus, S. America.

847. FAGONIA.

Four species; viz. cretica, hispanica, arabica, indica. Spain, Crete, Arabia, India.

848. TRIBULUS, or *Caltrop*.

Four species; viz. maximus, lanuginosus, terrestris, cistoides. S. of Europe, Cape, Jamaica.

849. QUASSIA, or *Simarouba Bark*.

Three species; viz. amara, simaruba, excelsa. W. Indies, Cayenne, Guiana.

850. ZWINGERA.

One species; viz. amara. Guiana.

851. GOMPHIA.

Five species; viz. angustifolia, nitida, jabotapita, lævigata, laurifolia. W. Indies

852. THRYALLIS.

One species; viz. brasiliensis. Brazil.

853. LIMONIA.

Eight species; viz. monophylla, trifoliata, acidissima, lucida, mauritiana, pentaphylla, madagascarensis, minuta. E. Indies.

854. MONOTROPA, or *Birds-nest*.

Two species; viz. *hypopithus, uniflora. N. of Europe, N. America.

855. DIONÆA, or *Venus's Fly-trap*.

One species; viz. muscipula. N. America.

856. JUSSIEUA, or *Tree-primrose*.

12 species; viz. repens, tenella, linearis, linifolia, peruviana, hirta, pubescens, octovalvis, suffruticosa, acuminata, inclinata, erecta. India, America.

857. SCHOUSBOEA.

One species; viz. coccinea. Martinico.

858. HEISTERIA.

One species; viz. coccinea. Martinico.

859. QUISQUALIS.

One species; viz. indica. India.

860. DAIS.

Three species; viz. conitifolia, disperma, octandra. Cape, India.

861. CERATOPETALUM.

One species; viz. gummiferum.

862. MELASTOMA, or *American Gooseberry*.

85 species; viz. calyptrata, crocea, patens, crenata, rigida, decussata, montana, procera, adscendens, aspera, ledifolia, strigosa, holosericea, velutina, sessilifolia, ramiflora, glabra, chrysophylla, quadrangularis, trinervia, repens, grossularioides, parviflora, succosa, arborescens, longifolia, prasina, agrestis, scandens, alata, flavescens, hirta, spicata, acinodendron, cymosa, grandiflora, elegans, rufescens, rubra, majeta, heterophylla, physiphora, purpurea, argentea, elata, impetiolearis, fragilis, coriacea, grossa, malabathrica, strigillosa, tamonea, albicans, capitata, splendens, lævigata, crispata, hirsuta, microphylla, micrantha, capillaris, rubens, glabrata, glandulosa, hirtella, triflora, octandra, divaricata, tetrandra, fascicularis, angustifolia, purpurascens,

purascens, alpina, verticillata, acuminata, lateriflora, elæagnoides, scabrosa, virgata, umbrosa, hispida, sessiliflora, pilosa, discolor, coccinea. America, West Indies.

863. MERIANIA.

Two species; viz. leucantha, purpurea.

864. KALMIA, or *Dwarf American Laurel*.

Four species; viz. latifolia, angustifolia, glauca, hirsuta. N. Amer.

865. LEDUM, or *Marsh Cistus*.

Three species; viz. palustre, latifolium, buxifolium. N. Eur. N. Amer.

866. RHODORA.

One species; viz. canadensis. N. Amer.

867. RHODODENDRON, or *Dwarf Rose-bay*.

10 species; viz. ferrugineum, dauricum, camtschaticum, hirsutum, chamæcistus, caucasicum, chrysanthum, ponticum, maximum, punctatum. Siberia, Alps, Gibraltar, Levant, N. Amer.

The *rhododendron chrysanthum* is a native plant of Siberia, where a weak infusion of it is used as tea. The Siberians use a kind of decoction of it in rheumatism and gout. They put about two drams of the dried shrub in an earthen pot with about ten ounces of boiling water, keeping it near a boiling heat for a night, and this they take in the morning. It is said to occasion heat, thirst, a degree of delirium, and a peculiar creeping-like sensation in the parts affected. The use of liquids is not allowed during its operation, as this is apt to induce vomiting. In a few hours the pain and disagreeable symptoms are relieved; and it is said, two or three doses generally complete the cure. The powder has also been used in doses of a few grains.

Hitherto it has been so little employed in Britain, that it has no place in the London Pharmacopœia: but in some cases, in which it has been used at Edinburgh, it has been productive of good effects; and accordingly it is now introduced into the Edinburgh Pharmacopœia, as well as into the *Pharmacopœia Rossica*, where it had first a place.

868. ANDROMEDA, or *Base Heath*.

26 species; viz. tetragona, ericoides, hypnoides, lycopodioides, empetrifolia, myrsinites, mariana, ferruginea, fasciculata, jamaicensis, octandra, pulverulenta, * polifolia, salicifolia, buxifolia, japonica, paniculata, arborea, racemosa, catesbæi, axillaris, coriacea, acuminata, rupestris, anastomosans, calyculata. N. Eur. Amer. Cape, Jam.

869. EPIGÆA, or *Trailing Arbutus*.

Two species; viz. repens, cordifolia. Virginia, Canada.

870. GUALTHERIA.

Two species; viz. procumbens, antipoda.

871. ARBUTUS, or *Strawberry Tree*.

18 species; viz. * unedo, laurifolia, andrachne, ferruginea, acadensis, * alpina, * uva ursi, mucronata, microphylla, pumila. Europe, N. America, Terra del Fuego.

unedo.

* A. stem tree-like; leaves smooth, bluntly serrated; panicle terminating; berries with many seeds.—It is a beautiful ornament to our shrubberies, not only on ac-

count of its foliage and flowers, but of its fruit, which is pleasing to the eye, though not grateful to the taste. The country people, however, in Ireland eat it, but always drink water after.

* A. stem trailing; leaves wrinkled, somewhat serrated, and fringed with hairs.—The berries have something of the flavour of black currants, but they are not so good. Goats refuse it.

* A. stems trailing; leaves oblong egg-shaped, very entire, veined like net-work underneath.—The berries of this plant are insipid, pulpy, and mealy. The plant is much used in Sweden, to dye an ash colour, and to tan leather. Half a dram of the powdered leaves, given every, or every other day, has been found useful in calculous cases. It was first used for this purpose at Montpellier, and afterwards by Dr De Haen at Vienna, who relates several cases, in which it proved of the greatest service. Its success in England has been uncertain. Sometimes the patients found no relief, but thought their complaints rather aggravated than alleviated; while, in other calculous and nephritic cases, the symptoms have been almost entirely removed. Perhaps, upon the whole, we shall find it no better than other vegetable astringents; some of which have been long used by the country people in gravelly complaints, and with very great advantage, though hitherto unnoticed by the regular practitioners. Horses, cows, goats, and sheep, refuse it.

872. CLETHRA.

Four species; viz. aluifolia, paniculata, arborea, tinifolia. N. Amer. Jam. Madeira.

873. PYROLA, or *Winter-green*.

Six species; viz. * rotundifolia, * minor, * secunda, umbellata, maculata, * uniflora. N. Europe, Asia, America.

874. STYRAX, or *Storax-tree*.

Four species; viz. * officinale, grandifolium, benzoin, lævigatum. Italy, Levant, S. Carolina.

The *styrax officinale* is an odoriferous resinous substance, exuding from a tree growing in the warmer climates.

It has been customary to distinguish three sorts of storax, though only one is usually met with in the shops.

1. *Styrax calamita*, or *storax in the cane*; so called from its having been formerly brought inclosed in reeds from Pamphylia. It is either in small distinct tears, of a whitish or reddish colour, or in larger masses composed of such.

2. *Storax in the lump*, or *red storax*. This is in masses of a uniform texture, and yellowish red or brownish colour; though sometimes, likewise, interspersed with a few whitish grains. Of this sort, there has been some lately to be met with in the shops, under the name of *storax in the tear*.

3. The common storax of the shops, is in large masses, considerably lighter and less compact than the foregoing; it appears, upon examination, to be composed of a resinous juice, mixed with saw-dust. For what purpose this addition is made, it is difficult to say; but it can scarcely be supposed to be done with any fraudulent view, since the saw-dust appears at sight. This common storax is much less esteemed than the two first sorts; though, when freed from the woody matter, it proves superior in point of fragrance to either of them.

Rectified

Rectified spirit, the common menstruum of resins, dissolves the storax, leaving the wood behind; nor does this tincture lose considerably of its valuable parts, in being inspissated to a solid consistence; whilst aqueous liquors elevate almost all the fragrant of the storax.

Storax is one of the most agreeable of the odoriferous resins, and may be exhibited to great advantage in languors, and debilities of the nervous system; it is not, however, much used in common practice.

875. INOCARPUS.

One species; viz. *edulis*. Otaheite.

876. SAMYDA.

Nine species; viz. *nitida*, *macrophylla*, *multiflora*, *villosa*, *glabrata*, *spinescens*, *pubescens*, *serrulata*, *polyandra*. West Indies, S. America.

877. CASEARIA.

12 species; viz. *spinosa*, *nitida*, *ramiflora*, *hirta*, *parviflora*, *parvifolia*, *sylvestris*, *macrophylla*, *serrulata*, *elliptica*, *ovata*, *hirsuta*. Jamaica, S. America.

878. AQUILARIA.

One species; viz. *ovata*. West Indies.

879. AUGEA.

One species; viz. *capensis*.

880. COPAIFERA, or *Balsam of Copivi Tree*.

One species; viz. *officinalis*. Brazil, Antilles.

The tree which produces this balsam is a native of the Spanish West India islands, and of some parts of the continent of South America. It grows to a large size, and the balsamum copaiva flows, under the form of a resinous juice, from incisions made in the trunk.

The juice is clear and transparent, of a whitish or pale yellowish colour, an agreeable smell, and a bitterish pungent taste. It is usually about the consistence of oil, or a little thicker; when long kept, it becomes nearly as thick as honey, retaining its clearness; but has not been observed to grow dry or solid, as most of the other resinous juices do. We sometimes meet with a thick sort of balsam of copaiva, which is not at all transparent, or much less so than the foregoing, and generally has a portion of turbid watery liquor at the bottom. This sort is probably either adulterated by the mixture of other substances, or has been extracted by coction from the bark and branches of the tree; its smell and taste are much less pleasant than those of the genuine balsam.

Pure balsam of copaiva dissolves entirely in rectified spirit, especially if the menstruum be previously alkalinized; the solution has a very fragrant smell. Distilled with water, it yields a large quantity of a limpid essential oil, and in a strong heat, without addition, a blue oil.

The balsam of copaiva is a useful corroborating detergent medicine, accompanied with a degree of irritation. It strengthens the nervous system, tends to loosen the belly; in large doses proves purgative, promotes urine, and cleans and heals excoriations in the urinary passages, which it is supposed to perform more effectually than any of the other balsams. Fuller observes, that it gives the urine an intensely bitter taste, but not a violet smell, as the turpentine do.

This balsam has been principally celebrated in gleet and the fluor albus, and externally as a vulnerary.—

VOL. IV. Part I.

The author above mentioned recommends it likewise in dysenteries, in scorbutic cachexies, in diseases of the breast and lungs, and in an acrimonious or putrescent state of the juices: he says, he has known very dangerous coughs, which manifestly threatened a consumption, cured by the use of this balsam alone; and, that notwithstanding its being hot and bitter, it has good effects, even in hectic cases. Most physicians seem now, however, to consider balsams and resins too stimulant to be ventured on in phthisical affections.

The dose of this medicine rarely exceeds 20 or 30 drops, though some direct 60, or more. It may be conveniently taken in the form of an elæosaccharum, or in that of an emulsion, into which it may be reduced by triturating it with almonds, or rather with a thick mucilage of gum arabic, till they are well incorporated, and then gradually adding a proper quantity of water.

881. BUCIDA.

Two species; viz. *buceras*, *capitata*. Jamaica.

ORDER II. DIGYNIA.

882. ROYENA, or *African Bladder-nut*.

Seven species; viz. *lucida*, *villosa*, *pallens*, *glabra*, *hirsuta*, *polyandra*, *angustifolia*. C. of G. Hope.

883. HYDRANGEA.

Four species; viz. *arborescens*, *hortensis*, *radiata*, *quercifolia*. Virginia, Carolina.

884. CUNONIA.

One species; viz. *capensis*. C. of G. Hope.

885. TRIANTHEMA, or *Horse Purslain*.

Seven species; viz. *monogyna*, *crystallina*, *pentandra*, *fruticosa*, *humifusa*, *anceps*, *decandra*. Egypt, India, Jamaica.

886. CHRYSOSPLENIUM, or *Golden Saxifrage*.

Two species; viz. * *alternifolium*, * *oppositifolium*. N. Europe, Canada.

887. SAXIFRAGA, or *Saxifrage*.

49 species; viz. *cotyledon*, *aizoön*, *mutata*, *pensylvanica*, *hieracifolia*, *androsacea*, *caesia*, *burseriana*, *sedoides*, *tenella*, *brysidis*, *bronchealis*, * *stellaris*, *crassifolia*, * *nivalis*, *bellardi*, *davurica*, *sarmentosa*, *punctata*, * *umbrosa*, *hirsuta*, *cuneifolia*, *geum*, * *oppositifolia*, *aspera*, * *hirculus*, * *aizoides*, *autumnalis*, *rotundifolia*, * *granulata*, *bulbifera*, * *cernua*, *rivularis*, *geranioides*, *ajugifolia*, *sibirica*, *rupestris*, * *tridactylites*, *petræa*, *adscendens*, * *moschata*, *muscoides*, *cæspitosa*, *tricuspidata*, *cymbalaria*, *hederacea*, *orientalis*, *cuneata*, * *hypnoides*.

888. TIARELLA, or *American Sanicle*.

Two species; viz. *cordifolia*, *trifoliata*. North of Asia and America.

889. MITELLA, or *Base American Sanicle*.

Three species; viz. *diphylla*, *cordifolia*, *nuda*. N. of Asia, America.

890. SCLERANTHUS, or *Knawel*, *German Knot-grass*.

Three species; viz. * *annuus*, * *perennis*, * *polycarpus*. Europe.

* S. calyx, segments thornless, tapering to a point, *annuus*. open when the fruit is ripe.—The Swedes and Germans

A a

are

are said to receive the vapour arising from a decoction of it into their mouths to cure the toothach. Goats and sheep eat it; cows refuse it.

perennis. * *S. cal.* segments blunata, closed when the fruit is ripe. —The Polish cochineal (*coccus polonicus*) is found upon the roots in the summer months.

891. GYPSOPHILA.

13 species; viz. *repens*, *prostrata*, *paniculata*, *viscosa*, *adscendens*, *altissima*, *arenaria*, *struthium*, *fastigiata*, *perfoliata*, *muralis*, *rigida*, *saxifraga*. Europe.

892. SAPONARIA, or Soap-wort.

Nine species; viz. * *officinalis*, *vaocaria*, *cretica*, *porrigens*, *illyrica*, *ocymoides*, *orientalis*, *lutea*, *bellidifolia*. Europe.

The *saponaria officinalis* grows wild, though not very common, in low wet places, and by the sides of running waters; a double-flowered sort is frequent in our gardens. The leaves have a bitter not agreeable taste; agitated with water, they raise a saponaceous froth, which is said to have nearly the same effects with solutions of soap itself in taking out spots from clothes and the like. The roots taste sweetish, and somewhat pungent, and have a light smell like those of liquorice; digested in rectified spirit, they yield a strong tincture, which loses nothing of its taste or flavour in being inspissated to the consistence of an extract. This elegant root has not come much into practice among us, though it promises from its sensible qualities to be a medicine of considerable utility. It is much esteemed by the German physicians as an aperient, corroborant, and sudorific, and preferred by the college of Wirtemberg, by Stahl, Neumann and others, to sarsaparilla.

893. DIANTHUS, or Pink, Carnation.

32 species; viz. * *barbatus*, *carthusianorum*, *atrorubens*, *ferrugineus*, * *armeria*, *japonicus*, * *prolifer*, *diminutus*, * *caryophyllus*, *sylvestris*, *pomeridianus*, * *deltoides*, *albens*, *crenatus*, *chinensis*, *monspeliacus*, *libanotis*, *plumarius*, *crinitus*, *superbus*, *attenuatus*, *purgens*, *virgineus*, *arenarius*, *repens*, * *caesioides*, *capitosus*, *scaber*, *alpinus*, *pumilus*, *arborescens*, *juniperinus*. Europe, Cape, China, America.

Of the species called *caryophyllus*, or *clove july-flower*, a great variety is met with in our gardens; those made use of in medicine ought to be of a deep crimson colour and a pleasant aromatic smell, somewhat like that of cloves; many sorts have scarce any smell at all. The *caryophylla rubra* are said to be cardiac and alexipharmac. Simon Paulli relates that he has cured many malignant fevers by the use of a decoction of them, which he says powerfully promotes sweat and urine, without greatly irritating nature, and also raises the spirits and quenches thirst. At present the flowers are chiefly valued for their pleasant flavour, which is entirely lost even by light coction; hence the college direct the syrup, which is the only official preparation of them, to be made by infusion.

ORDER III. TRIGYNIA.

894. CUCUBALUS, or Berry-bearing Chickweed.

18 species; viz. * *behen*, *fabarius*, *viscosus*, *stellatus*, *egyptiacus*, *italicus*, *multiflorus*, *fruticulosus*, *tartaricus*, *sibiricus*, *catholicus*, *mollissimus*, * *otites*, *parviflorus*,

reflexus, *saxifragus*, *spergulifolius*, *polygonoideus*. Europe, Egypt, and North America.

* *C. cal.* nearly globular, smooth, with a network of *behen*-veins; leaves egg-spear-shaped, glaucous, smooth.—The leaves boiled have something of the flavour of pease, and proved of great use to the inhabitants of the island of Minorca in the year 1685, when a swarm of locusts had destroyed the harvest. The Gothlanders apply the leaves to erysipelatous eruptions.

895. SILENE, or Viscous Campion.

56 species; viz. * *anglica*, *lusitanica*, * *quinquevulnera*, *ciliata*, *sericea*, *nocturna*, *gallica*, *cerastoides*, *mutabilis*, *chlorantha*, * *nutans*, *amonsa*, *paradoxa*, *fruticosa*, *bupleuroides*, *longiflora*, *gigantea*, *crassifolia*, *viridiflora*, * *conoidea*, * *conica*, *bellidifolia*, *dichotoma*, *vespertina*, *behen*, *stricta*, *pendula*, *baccifera*, * *maritima*, *procumbens*, * *noctiflora*, *ornata*, *undulata*, *virginica*, *antirrhina*, *sedoides*, *apetala*, *rubella*, *inaperta*, *clandestina*, *portensis*, *cretica*, *muscipula*, *polyphylla*, * *armeria*, *orchidea*, *egyptiaca*, *catesbei*, *cordifolia*, *chloræfolia*, *alpestris*, *rupestris*, *saxifraga*, *vallesia*, *pumila*, * *acaulis*. Eur. Persia, Africa, N. Amer.

896. STELLARIA, or Greater Chickweed.

17 species; viz. * *nemorum*, *dichotoma*, *radians*, *bulbosa*, * *holostea*, * *graminea*, *palustris*, *crassifolia*, *alsina*, *undulata*, * *cerastoides*, *multicaulis*, *homifusa*, *biflora*, *grælandica*, *arenaria*, *scapigera*. Eur. N. America.

897. ARENARIA, or Sandwort.

36 species; viz. * *peploides*, *tetraquetra*, *biflora*, *lateriflora*, * *trinervia*, *ciliata*, *balearica*, *multicaulis*, * *serpillifolia*, *procumbens*, *polygonoideus*, *triflora*, *montana*, * *rubra*, * *media*, *bavarica*, *gypsophiloideus*, *cucubuloideus*, *dianthoides*, *saxatilis*, *caespitosa*, * *verna*, *bispida*, *verticillata*, * *juniperina*, * *tenuifolia*, * *laricifolia*, *recurva*, *lanceolata*, *striata*, *filifolia*, *fasciculata*, *austriaca*, *grandiflora*, *liniflora*, *gerardi*. Europe.

898. CHERLERIA.

One species; viz. * *sedoides*. Alps of Austria, Switzerland.

899. DEUTZIA.

One species; viz. *scabra*. Japan.

900. BRUNNICHIA.

One species; viz. *cirrhosa*. Bahama isles.

901. GARIDELLA, or Cretan Fennel flower.

One species; viz. *nigellastrum*. S. France, Italy, Crete.

902. MALPIGHIA, or Barbados Cherry.

20 species; viz. *glabra*, *biflora*, *pumicifolia*, *faginea*, *glandulosa*, *tuberculata*, *nitida*, *armeniaca*, *dubia*, *urena*, *angustifolia*, *canescens*, *crassifolia*, *spicata*, *altissima*, *verbascifolia*, *lucida*, *coriacea*, *aquifolia*, *coccifera*. W. Indies, America.

903. BANISTERIA.

24 species; viz. *angulosa*, *palmata*, *sagittata*, *auriculata*, *ciliata*, *emarginata*, *quapara*, *sinemariensis*, *purpurea*, *microphylla*, *chrysophylla*, *aurifolia*, *longifolia*, *dichotoma*, *ovata*, *fulgens*, *heterophylla*, *brachiata*. W. Indies, Guiana.

904. HIRSEA.

Three species; viz. *reclinata*, *odorata*, *pinnata*. Carthage.

905. **TRIOPTERIS.**

Eight species; viz. *jamaicensis*, *indica*, *ovata*, *rigida*, *acutifolia*, *acuminata*, *buxifolia*, *citrifolia*. Jamaica, Hispaniola.

906. **ERYTHROXYLON.**

12 species; viz. *arcolatum*, *hypericifolium*, *buxifolium*, *ferrugineum*, *rufum*, *havanense*, *coca*, *sideroxyloides*, *squamatum*, *macrophyllum*, *laurifolium*, *longifolium*. West Indies.

ORDER IV. PENTAGYNIA.

907. **AVERRHOA.**

Two species; viz. *bilimbi*, *carambola*. India.

908. **JONCQUETIA.**

One species; viz. *paniculata*. Guiana.

909. **SPONDIAS, or Hog-plumb.**

Four species; viz. *mombin*, *myrobalanus*, *mangifera*, *dulcis*. West Indies, South America.

910. **ROBERGIA.**

One species; viz. *frutescens*. Guiana.

911. **ONESTIS.**

Four species; viz. *glabra*, *polyphylla*, *corniculata*, *trifolia*. Isle of Madagascar.

912. **COTYLEDON, or Navel-wort.**

24 species; viz. *orbiculata*, *paniculata*, *fascicularis*, *cuneata*, *spuria*, *purpurea*, *toretifolia*, *caecalioides*, *reticulata*, *pupillaris*, *mamillaris*, *hemisphaerica*, *triflora*, *coocinea*, *malacophyllum*, *serrata*, * *umbilicus*, * *lutea*, *lanceolata*, *lanciniata*, *alternans*, *nudicaulis*, *hispanica*, *viscosa*. Sib. France, Spain, Cape, East Indies.

913. **SEDUM, or Lesser Houseleek, Stonecrop.**

29 species; viz. *verticillatum*, * *telephium*, *anacamperos*, *divaricatum*, *aizoon*, *hybridum*, *populifolium*, *stellatum*, *alsinifolium*, *cepsa*, *libanoticum*, * *dasyphyllum*, * *reflexum*, *virens*, * *rupestre*, *saxatile*, *quadrifidum*, *hispanicum*, *lineare*, *coeruleum*, * *album*, * *acae*, * *sexangulare*, * *anglicum*, *annuum*, *pubescens*, * *villosum*, *atratum*, *nodum*. Europe, Madeira, Japan.

telephium. * S. leaves flattish, serrated; corymbus leafy; stem upright.—A decoction of the leaves in milk is a forcible diuretic. It has been given with success to cure the piles. Cows, goats, sheep, and swine, eat it. Horses refuse it.

acae. * S. leaves nearly egg-shaped, growing to and sitting, bulging, nearly upright, alternate; tuft with three divisions.—This species of sedum is a small perennial, succulent, evergreen plant; growing in great abundance on the tops of walls and roofs of houses. It has a faint smell, and at first an herbaceous taste; but it afterwards shows considerable acrimony, exciting a sense of biting heat in the mouth and fauces. In its recent state it shows very active powers, proving emetic, purgative, and diuretic. The expressed juice taken, to the quantity of a table spoonful, has been said to prove a very drastic medicine; but the plant in its dried state shows little or no activity. In this country it is hardly employed, and has no place in our pharmacopœias. Its activity, however, points it out as a subject deserving attention. Goats eat it; cows, horses, sheep, and swine, refuse it.

* S. leaves awl-shaped in five rows, crowded, loose at *rupestre*. the base; flowers in tufts.—Both this and the *S. rosifolium* are cultivated in Holland and Germany, to mix with lettuces in salads. It is acrid to the taste.

914. **PENTHORUM.**

One species; viz. *sedoides*. Virginia.

915. **BERGIA.**

Two species; viz. *verticillata*, *glomerata*. Cape of Good Hope.

916. **SURIANA.**

One species; viz. *maritima*. Jamaica.

917. **GRIELUM.**

One species; viz. *tenuifolium*. Ethiopia.

918. **OXALIS, or Wood-sorrel.**

93 species; viz. *monophylla*, *lepida*, *rostrata*, *asinina*, *lanceifolia*, *leporina*, *crispa*, *fabæfolia*, *laburnifolia*, *sanguinea*, *ambigua*, *undulata*, *fuscata*, *glandulosa*, *tricolor*, *rubro-flava*, *flaccida*, *exaltata*, *variabilis*, *grandiflora*, *sulphurea*, *purpurea*, *breviscapa*, *speciosa*, * *acetosella*, *magellanica*, *marginata*, *pulchella*, *obtusata*, *lancinata*, *truncatula*, *strumosa*, *punctata*, *luteola*, *macrogonya*, *fallax*, *tonella*, *minuta*, *pusilla*, *compressa*, *sericea*, *megalorrhiza*, *tetraphylla*, *violacea*, *caprina*, *cernua*, *dentata*, *livida*, *ciliaris*, *arcuata*, *linearis*, *cuneata*, *cuneifolia*, *glabra*, *bifida*, *filicaulis*, *longiflora*, *nutans*, *convexula*, *versicolor*, *elongata*, *reclinata*, *polyphylla*, *tenuifolia*, *macrostylis*, *hirta*, *tubiflora*, *secunda*, *multiflora*, *rubella*, *rosacea*, *repens*, *reptatrix*, *disticha*, *incarnata*, *conorrhiza*, *crenata*, *lateriflora*, *dillenii*, *stricta*, * *corniculata*, *plumieri*, *pentantha*, *rhombifolia*, *rosea*, *barrelieri*, *burmanni*, *tomentosa*, *lupinifolia*, *pectinata*, *flabellifolia*, *flava*, *sensitiva*. S. Europe, Cape, North America.

* O. stalk with one flower; leaves three together; *acetosella*. leaflets inversely heart-shaped, hairy.—An infusion of the leaves is an agreeable liquor in ardent fevers, and boiled with milk they make an agreeable whey. Sheep, goats, and swine eat it. Cows are not fond of it. Horses refuse it. The juice is gratefully acid. The London college directs a conserve to be made of the leaves, beaten with thrice their weight of fine sugar. The expressed juice depurated, properly evaporated, and set in a cool place, affords a crystalline acid salt in considerable quantity, which may be used whenever vegetable acids are wanted. It is employed to take iron moulds out of linen, and is sold under the name of essential salt of lemons. We are lately assured, that the leaves and stalks wrapped in a cabbage leaf, and macerated in warm ashes until reduced to a pulp, have been successfully applied to scrophulous ulcers. This poultice should remain on the sore 24 hours, and be repeated four times. Afterwards the ulcer is to be dressed with a poultice made of the roots of the meadow-sweet bruised, and mixed up with the scum of sour butter-milk.

919. **AGROSTEMMA, or Rose Campion, Wild Lychnis.**

Four species; viz. * *githago*, *coronaria*, *flos jovis*, *cœli-rosa*. Europe.

920. **LYCHNIS, or Campion.**

11 species; viz. *chalcedonica*, * *flos cuculis*, *coronata*, *quadridentata*, * *viscaria*, *alpina*, *magellanica*, *sibirica*.

sibirica; beta, * dioica, apetala. Russia, Alps of Europe, China.

921. CERASTIUM, or *Mouse-ear Chickweed*.

20 species; viz. perfoliatum, * vulgatum, anomalum, * viscosum, * semidecandrum, pentandrum, * arvense, lineare, dichotomum, longifolium, * alpinum, repens, strictum, suffruticosum, maximum, * aquaticum, dioicum, * latifolium, * tomentosum, manticum. Eur.

922. SPERGULA, or *Spurrey*.

Seven species; viz. * arvensis, pentandra, nodosa, laricina, saginoides, * subulata, glabra. Europe.

arvensis. * S. leaves in whirls; flowers with more than five stamens; stems thick at the joints.—Poultry are fond of the seeds; and the inhabitants of Finland and Norway make bread of them when their crops of corn fail. Experience shows it to be very nutritious to the cattle that

eat it. Horses, sheep, goats, and swine eat it. Cows refuse it.

ORDER V. DECAGYNIA.

923. NEURADA.

One species; viz. procumbens. Numidia, Egypt.

924. PHYTOLACCA, or *American Nightshade*.

Six species; viz. octandra, stricta, abyssinica, decandra, icosandra, dioica. East Indies, Africa, America.

In the class Decandria are

119 Genera, which include 987 Species. Of these 84 are found in Britain.

CLASSIS XI.

DODECANDRIA (A).

ORDO I. MONOGYNIA.

927. BOCCONIA. Cor. o. Cal. 2-phyllus, inferus. Caps. 2-valvis, 1-sperma.

* 925. ASARUM. Cor. o. Cal. 3-fidus, superus. Caps. 6-locularis.

955. STERCULIA. Cor. o. Cal. 5-partit. Nectar. staminiferus. Germen pedicellatum. Caps. 5.

931. RHIZOPHORA. Cor. 4-partita. Cal. 4-partitus, inferus. Sem. 1, clavatum, receptaculo carnos.

938. GARCINIA. Cor. 4-petala. Cal. 4-phyllus, inferus. Bacca 8-sperma, coronata.

943. CRATÆVA. Cor. 4-petala. Cal. 4-fidus, inferus. Bacca 2-locularis, pedicellata.

928. DODECAS. Cor. 4-petala. Cal. 4-fidus. Caps. 1-locul. 4-valvis.

932. CRENÆA. Cor. 4-petala. Cal. 4-fidus. Caps. 5-locularis, polysperma.

939. HALESIA. Cor. 4-fida. Cal. 4-dentatus superus. Pericarp. 4-spermum, 4-angulatum.

933. ARACTIS. Cor. 4-petala. Cal. o. Stam. 16.

926. TORNEX. Cor. 5-petala. Cal. o. Involucrum 4 s. 5-phyllum, 5-12-florum. Bacca 1-sperma.

945. EURYA. Cor. 5-petala. Cal. duplex. Caps. 5-locularis.

944. TRIUMFETTA. Cor. 5-petala. Cal. 5-phyllus, inferus. Caps. 4-locul. 2-sperma, muricata.

946. PEGANUM. Cor. 5-petala. Cal. 5-phyllus, inferus. Caps. 3-locul. Stam. 15.

954. KLEINHOFIA. Cor. 5-petala. Cal. 5-phyll.

CLASS XI.

DODECANDRIA.

ORDER I. MONOGYNIA.

B. No cor. Cal. 2-leaved, inferior. Caps. 2-valved, 1-seeded.

* A. No cor. Cal. 3-cleft, superior. Caps. 6-celled.

S. No cor. Cal. 5-partite. Nectary bearing the stamens. Germ. on a pedicle. Caps. 5.

R. Cor. 4-parted. Cal. 4-parted, inferior. Seed 1, club-shaped, in a fleshy receptacle.

G. Cor. 4-petaled. Cal. 4-leaved, inferior. Berry 8-seeded, crowned.

C. Cor. 4-petaled. Cal. 4-cleft, inferior. Berry 2-celled, with a pedicle.

D. Cor. 4-petaled. Cal. 4-cleft. Caps. 1-celled, 4-valved.

C. Cor. 4-petaled. Cal. 4-cleft. Caps. 5-celled, many-seeded.

H. Cor. 4-cleft. Cal. 4-toothed, superior. Seed-vessel 4-seeded, 4-angled.

A. Cor. 4-petaled. No cal. Stam. 16.

T. Cor. 5-petaled. No cal. Involucrum 4 or 5-leaved, 5-12-flowers. Berry 1-seeded.

E. Cor. 5-petaled. Cal. double. Caps. 5-celled.

T. Cor. 5-petaled. Cal. 5-leaved, inferior. Caps. 4-celled, 2-seeded, covered with sharp points.

P. Cor. 5-petaled. Cal. 5-leaved, inferior. Caps. 3-celled. Stamens 15.

K. Cor. 5-petaled. Cal. 5-leaved. Nectary bear-

(A) Thus far the classes have received their denomination from the number of stamens contained in the flowers. The name given to the present class would seem to imply, that the flowers arranged under it contained only 12 stamens; but it is in fact an assemblage of plants, whose flowers contain from 11 to 19 stamens, inclusive.

Nectar. staminiferum. Germen pedicellatum. Caps. 5-angularis, inflata.

948. NITRARIA. Cor. 5-petala. Cal. 5-fidus, inferus. Drupa 1-sperma. Stam. 15.

941. ARISTOTELIA. Cor. 5-petala. Cal. 5-partitus. Bacca 3-locularis.

937. GRANGERIA. Cor. 5-petala. Cal. 5-fidus. Drupa monosperma.

936. VATICA. Cal. 5-petala. Anth. 15, quadriloculares; loculis interioribus brevioribus.

947. HUDSONIA. Cor. 5-petala. Cal. 3-phyllus, inferus. Caps. 1-locularis, 3-valvis, 3-sperma.

942. CANELLA. Cor. 5-petala. Cal. 3-lobus, inferus. Bacca 1-locul. 2 s. 4-sperma. Nectarium antheriferum.

949. PORTULACA. Cor. 5-petala. Cal. 2-fidus, inferus. Caps. 1-locul. circumscissa.

950. TALINUM. Cor. 5-petala. Cal. 2-phyllus. Caps. 1-locularis, trivalvis. Sem. arillata.

* 951. LYTHRUM. Cor. 6-petala. Cal. 5-fidus, inferus. Caps. 2-locularis.

952. CUPHEA. Cor. 6-petala, inæqualis. Cal. 6-dentatus, inæqualis. Caps. 1-locul. ante maturitatem dehiscens.

953. GINORIA. Cor. 6-petala. Cal. 6-fidus, inferus. Caps. 1-locul. 4-valvis.

934. BLAKEA. Cor. 6-petala. Cal. 6-phyllus. Flos superus, indivisus. Caps. 6-locularis. Antheræ connexæ.

929. AGATHOPHYLLUM. Cor. 6-petala. Cal. truncatus. Drupa monosperma.

935. BEFARIA. Cor. 7-petala. Stam. 14. Bacca exsucca, 7-locularis.

930. BASSIA. Cor. 8-fida. Stam. 16. Drupa 5-sperma.

940. DECUMARIA. Cor. 10-petala. Cal. 10-phyllus, superus.

Cleome viscosa dodecandra. Chlora dodecandra. Samyda pubescens, serrulata. Rivina octandra. Passerina capitata.

ORDO II. DIGYNIA.

956. HELIOCARPUS. Cor. 4-petala. Cal. 4-phyllus. Caps. 2-locul. 1-sperma, compresso-radiata.

* 957. AGRIMONIA. Cor. 5-petala. Cal. 5-fidus. Sem. 1 s. 2.

ORDO III. TRIGYNIA.

* 958. RESEDA. Cor. petalis multifidis. Cal. partitus. Caps. 3-locularis, hians.

960. VISNEA. Cor. petalis ellipticis. Cal. 5-phyll. Nux.

* 959. EUPHORBIA. Cor. petalis peltatis. Cal. ventricosus. Caps. 3-coeca.

ORDO IV. TETRAGYNIA.

962. APONOGETON. Cor. o. Cal. o. Caps. 4.

961. CALLIGONUM. Cor. o. Cal. 5-partitus. Nux monosperma.

Tormentilla erecta. Reseda aliquot.

ing stamens. Germ. on a pedicle. Caps. 5-angular, inflated.

N. Cor. 5-petaled. Cal. 5-cleft, inferior. A drupe, 1-seeded. Stamens 15.

A. Cor. 5-petaled. Cal. 5-partite. Berry 3-celled.

G. Cor. 5-petaled. Cal. 5-cleft. Drupe 1-seeded.

V. Cor. 5-petaled. Anth. 15, 4-celled, the inner cells shorter.

H. Cor. 5-petaled. Cal. 3-leaved, inferior. Caps. 1-celled, 3-valved, 3-seeded.

C. Cor. 5-petaled. Cal. 3-lobed, inferior. Berry 1-celled, 2 or 4-seeded. Nectary bearing the anthers.

P. Cor. 5-petaled. Cal. 2-cleft, inferior. Caps. 1-celled, cut round.

T. Cor. 5-petaled. Cal. 2-leaved. Caps. 1-celled, 3-valved. Seeds coated.

* L. Cor. 6-petaled. Cal. 12-cleft, inferior. Caps. 2-celled.

C. Cor. 6-petaled, unequal. Cal. 6-toothed, unequal. Caps. 1-celled, opening before maturity.

G. Cor. 6-petaled. Cal. 6-cleft, inferior. Caps. 1-celled, 4-valved.

B. Cor. 6-petaled. Cal. 6-leaved. Flower superior, undivided. Caps. 6-celled. Anthers united at the base.

A. Cor. 6-petaled. Cal. lopped. Drupe 1-seeded.

B. Cor. 7-petaled. Stam. 14. Berry dry, 7-celled.

B. Cor. 8-cleft. Stamens 16. Drupe 5-seeded.

D. Cor. 10-petaled. Cal. 10-leaved, superior.

ORDER II. DIGYNIA.

H. Cor. 4-petaled. Cal. 4-leaved. Caps. 2-celled, 1 seed, compressed, radiated.

* A. Cor. 5-petaled. Cal. 5-cleft. Seeds 1 or 2.

ORDER III. TRIGYNIA.

* R. Cor. with many-cleft petals. Cal. partite. Caps. 3-celled, gaping.

V. Cor. with elliptical petals. Cal. 5-leaved. A nut.

* E. Cor. with target-shaped petals. Cal. bellied. Caps. 3-celled.

ORDER IV. TETRAGYNIA.

A. No cor. No cal. Caps. 4.

C. No cor. Cal. 5-partite. A 1-seeded nut.

ORDO:

ORDER V. PENTAGYNIA.

963. GLINUS. Cor. o. nisi setulae. Cal. 5-phyllus. Caps. 5-locul.

964. BLACKWELLIA. Cor. 15-petala. Cal. 5-fid. Caps. 1-locul. polysperma.

Raceda purpurascens.

ORDO VI. DODECAGYNIA.

* 965. SEMPERVIVUM. Cor. 12-petala. Cal. 12-partitus. Caps. 12.

Alisma cordifolia.

ORDER V. PENTAGYNIA.

G. No cor. except little bristles. Cal. 5-leaved. Caps. 5-celled.

B. Cor. 15-petaled. Cal. 5-cleft. Caps. 1-celled, many-seeded.

ORDER VI. DODECAGYNIA.

* 8. Cor. 12-petaled. Cal. 12-partite. Caps. 12.

ORDER I. MONOGYNIA.

925. ASARUM, or *Asarabacca.*

Three species; viz. * *europæum*, *canadense*, *virginicum*. Europe, N. America.

europæum. * A. leaves kidney-shaped, blunt, in pairs.—This is a very low plant, growing naturally in France, Italy, and other warm countries. It grows readily in our gardens, and although the dried roots have been generally brought from the Levant, those of our own growth do not seem to be weaker. Both the roots and leaves have a nauseous, bitter, acrimonious, hot taste. Their smell is strong, and not very disagreeable. Given in substance from half a dram to a dram, they evacuate powerfully both upwards and downwards. It is said, that tinctures made in spirituous menstrua, possess both the emetic and cathartic virtues of the plant: that the extract, obtained by inspissating these tinctures, acts only by vomiting, and with great mildness: that an infusion in water proves cathartic, rarely emetic: that aqueous decoctions, made by long boiling, and the watery extract, have no purgative or emetic quality, but prove good diaphoretics, diuretics, and emmenagogues. The principal use of this plant among us is as a sternutatory. The root of asarum is perhaps the strongest of all the vegetable errhines, white hellebore itself not excepted. Snuffed up the nose in the quantity of a grain or two, it occasions a large evacuation of mucus, and raises a plentiful spitting. The leaves are considerably milder, and may be used to the quantity of three, four, or five grains. Geoffrey relates, that after snuffing up a dose of this errhine at night, he has frequently observed the discharge from the nose to continue for three days together; and that he has known a paralysis of the mouth and tongue cured by one dose. He recommends this medicine in stubborn disorders of the head, proceeding from viscid tenacious matter, in palsies, and soporific distempers. The leaves are the principal ingredient in the *pulvis sternutatorius*, or *pulvis asari compositus*, as it is now termed, of the shops.

926. TORNEX.

Three species; viz. *japonica*, *tetranthera*, *sobifera*. Arabia.

927. BACCOMIA.

Two species; viz. *frutescens*, *cordata*.

928. DODECAR.

One species; viz. *surinamensis*. Surinam.

929. AGATHOPHYLLUM.

One species; viz. *aromaticum*. East Indies.

930. BASSIA.

Three species; viz. *longifolia*, *latifolia*, *obovata*. Malabar.

931. RHIZOPHORA, or *Mangrove-candle of India.*

Five species; viz. *conjugata*, *gymnorhiza*, *candel*, *mangle*, *cylindrica*. India, Malabar, Molucca.

932. CRENÆA.

One species; viz. *maritima*. Guiana.

933. ARACTIS.

One species; viz. *japonica*. Japan.

934. BLAKEA.

Three species; viz. *trinervis*, *triplinervis*, *pulverulenta*. Jamaica, Surinam.

935. BEFARIA.

Two species; viz. *resinosa*, *satnans*. New Granada.

936. VATIGA.

One species; viz. *chinensis*. China.

937. GRANGERIA.

One species; viz. *borbonica*. Isle of Bourbon.

938. GARCINIA, or *Mangostan.*

Four species; viz. *mangostana*, *celebica*, *cambogia*, *cornea*. East Indies.

939. HALESLIA, or *Snow-drop Tree.*

Two species; viz. *tetraptera*, *diptera*. Carolina.

940. DECUMARIA.

Two species; viz. *barbara*, *sarmentosa*. Carolina.

941. ARISTOTELIA.

One species; viz. *macqui*. Chili.

942. CANELLA, or *White Cinnamon.*

One species; viz. *alba*. West Indies.

The bark of the *canella alba* is brought to us rolled into

into long quills, thicker than cinnamon, and both outwardly and inwardly of a whitish colour, lightly inclining to yellow. It is the produce of a tall tree, growing in great plenty in the low lands in Jamaica, and other American islands. Infusions of it in water are of a yellowish colour, and smell of the canella; but they are rather bitter than aromatic. Tinctures in rectified spirit have the warmth of the bark, but little of its smell. Proof spirit dissolves the aromatic, as well as bitter matter of the canella, and is therefore the best menstruum. The canella is the interior bark, freed from an outward thin rough one, and dried in the shade. The shops distinguish two sorts of canella, differing from each other in the length and thickness of the quills; they are both the bark of the same tree, the thicker being taken from the trunk, and the thinner from the branches. This bark is a warm pungent aromatic, not of the most agreeable kind, nor are any of the preparations of it very grateful. *Canela alba* is often employed where a warm stimulant to the stomach is necessary, and as a corrigent of other articles. It is now, however, little used in composition by the London college, the only officinal formula which it enters being the *puleis alacticus*; but with the Edinburgh college it is an ingredient in the *tinctora amara*, *vinum amarum*, *vinum rhei*, &c. It is useful as covering the taste of some other articles.

943. CRATAEVA, or *Garlick-pear*.

Five species; viz. *gynandra*, *tapia*, *obovata*, *religiosa*, *marmelos*. E. and W. Indies.

944. TRIUMFETTA, or *Bur-bark Tree*.

11 species; viz. *lappula*, *glandulosa*, *bartramia*, *velutina*, *procumbens*, *hirta*, *semitriloba*, *grandiflora*, *macrophylla*, *rhombocfolia*, *annua*. E. and W. Indies, Brazil.

945. EURYA.

One species; viz. *japonica*. Japan.

946. PEGANUM, or *Wild Syrian Rue*.

Four species; viz. *harmala*, *crithmifolium*, *retusum*, *dauricum*. Siberia, Spain, Syria.

947. HUDSONIA.

One species; viz. *ericoides*. Virginia.

948. NITRARIA.

Two species; viz. *schoberi*, *tridentata*. Siberia.

949. PORTULACA, or *Purslane*.

Five species; viz. *oleracea*, *pilosa*, *quadrifida*, *halimoides*, *meridiana*. Europe, Cape, India, Amer.

The *portulaca oleracea* is cultivated in gardens for culinary uses. The seeds are ranked among the lesser cold seeds, and have sometimes been employed in emulsions and the like, along with the others of that class.

950. TABINUM.

Seven species; viz. *triangulare*, *crassifolium*, *anacampseros*, *patens*, *cuneifolium*, *decumbens*, *fruticosum*.

951. LYTHRUM, or *Willow-herb*.

16 species; viz. * *salicaria*, *virgatum*, *acuminatum*, *triflorum*, *verticillatum*, *petiolatum*, *racemosum*, *ciliatum*, *pompis*, *dipetalum*, *lineare*, *parsonia*, *melanium*, *cordifolium*, * *hysoopifolia*, *thymifolia*. Europe, N. America, W. Indies.

952. CUPHEA.

One species; viz. *viscosissima*. America.

953. GINORIA.

One species; viz. *americana*. America.

954. KLEINHOFIA.

One species; viz. *hospita*. E. Indies.

955. STERCULIA.

Eight species; viz. *lancoolata*, *balanghas*, *crinita*, *cordifolia*, *colerata*, *urens*, *platanifolia*, *foetida*. Arabia, East and West Indies, China.

ORDER II. DIGYNIA.

956. HELIOCARPUS, or *Sun-weed*.

One species; viz. *americana*. Vera Cruz.

957. AGRIMONIA, or *Agrimony*.

Five species; viz. * *eupatoria*, *odorata*, *repens*, *parviflora*, *agrimonoides*. Europe, N. America.

* A. stem-leaves winged, the odd leaflet on a leafstalk; *eupatoriæ*. fruit hispid.—The Canadians are said to use an infusion of the roots in burning fevers, and with great success. An infusion of six ounces of the crown of the root, in a quart of boiling water, sweetened with honey, and half a pint of it drank three times a-day, Dr Hill says, is an effectual cure for the jaundice. He advises to begin with a vomit, afterwards to keep the bowels soluble, and to continue the medicine as long as any symptoms of the disease remain. Sheep and goats eat it. Cows, horses, and swine refuse it. The flowers fresh gathered smell like apricots.

ORDER III. TRIGYNIA.

958. RESEDA, or *Mignonette*, *Base-rocket*.

13 species; viz. * *luteola*, *canescens*, *glauca*, *dipetala*, *purpurascens*, *sesamoides*, *fruticulosa*, *alba*, *undata*, * *lutea*, *phytouma*, *mediterranea*, *odorata*. S. Europe, Egypt, Cape.

* R. leaves spear-shaped, entire, with a tooth on each *luteola*. side the base; cal. 4-cleft.—This plant affords a most beautiful yellow dye for cotton, woollen, mohair, silk, and linen, and is that which is most commonly used by the dyers for that purpose, as it gives the brightest dye. Blue cloths dipped in a decoction of it become green. The yellow colour of the paint called *Dutch pink* is got from this plant. The colouring quality resides in the stems and roots, and it is cultivated in sandy soils, rich soil making the stalk hollow and not so good. Cattle will not eat it, but sheep sometimes browse it a little.

959. EUPHORBIA, or *Burn*, *Thorny-plant*, *Spurge*.

124 species; viz. *antiquorum*, *canariensis*, *virosa*, *heptagona*, *mammillaris*, *cereiformis*, *officinarium*, *triangulata*, *nereifolia*, *hystrix*, *tribuloides*, *stellata*, *cucumerina*, *meloformis*, *caput medusæ*, *tuberculata*, *anacantha*, *clava*, *bupleurifolia*, *lophogona*, *mauritanica*, *piscatoria*, *balsamifera*, *tirucalli*, *laurifolia*, *pyrifolia*, *lithymaleoides*, *heterophylla*, *cyathophora*, *nudiflora*, *cotinifolia*, *mellifera*, *glabrata*, *linarifolia*, *linifolia*, *cuneata*, *ocymoidea*, *levigata*, *origanoides*, *atoto*, *hype-*
ricifolia,

ricifolia, prostrata, rosea, maculata, scordifolia, picta, hirta, pilulifera, brasiliensis, byssopifolia, thymifolia, parviflora, canescens, chamæsyce, granulata, *peplis, polygonifolia, linearis, graminea, ipecacuanhæ, portulacoides, adiantoides, myrtifolia, imbricata, elliptica, rubra, herniariæfolia, *peplus, falcata, *exigua, oblitterata, spatulata, micrantha, dracunculoides, tuberosa, lathyris, terracina, diffusa, apios, læta, genistoides, spinosa, epithymoides, villosa, duleis, ambigua, carniolica, angulata, pithyusa, *portlandica, saxatilis, *paralias, juncea, aleppica, pinea, segetalis, provincialis, *helioscopia, pubescens, serrata, *verrucosa, glauca, punicea, corollata, corallioides, pilosa, orientalis, squamosa, *platyphyllos, literata, esula, gerardiana, *cyparissias, nicacensis, myrsinites, palustris, pallida, emarginata, *hiberna, salicifolia, dendroides, amygdaloides, sylvatica, *characias. Eur. Asia. Afr. Am.

The *Euphorbia officinarum*, or gummi-resinous substance, is a spontaneous exudation from a large oriental tree. It is brought to us immediately from Barbary, in drops of an irregular form, some of which, upon being broken, are found to contain little thorns, small twigs, flowers, and other vegetable matters; others are hollow, without any thing in their cavity. The tears are in general of a pale yellow colour externally, somewhat white withinside; they easily break between the fingers. Slightly applied to the tongue, they affect it with a very sharp biting taste; and upon being held for some time in the mouth, prove vehemently acrimonious, inflaming and ulcerating the fauces, &c. Euphorbium is extremely troublesome to pulverize, the finer part of the powder, which flies off, affecting the head in a violent manner. The acrimony of this substance is so great, as to render it absolutely unfit for internal use; several correctors have been contrived to abate its virulence, but the best of them are not to be trusted to; and as there seems to be no real occasion for it, unless for some external purposes, some think that it ought to be expunged from the catalogue of internal medicines; and accordingly, it has now no place in the London or Edinburgh pharmacopœias; but it is still retained in most of the foreign ones, and is sometimes used as a sternutatory.

* E. umbel with many spokes, spokes forked; involu-cellums perforated, notched at the end; leaves very entire; stem shrub-like.—The powdered leaves in doses of 15 to 25 grains operate as a purge. The juice of

every species of spurge is so acrid, that it corrodes and ulcerates the body wherever it is applied; so that physicians have seldom ventured to use it internally. Warts or corns anointed with the juice presently disappear. A drop of it put into the hollow of a decayed and aching tooth, destroys the nerve, and consequently removes the pain. Some people rub it behind the ears, that it may blister and by that means give relief.

960. VISNEA.

One species; viz. mocanera. Canary isles.

ORDER IV. TETRAGYNIA.

961. CALLIGONUM.

Three species; viz. polygonoides, comosum, pallosia. Russia, Siberia.

962. APONOGETON.

Four species; viz. monostachyon, crispum, distachyon, angustifolium. Cape, E. Indies.

ORDER V. PENTAGYNIA.

963. GLINUS.

Three species; viz. lotoides, setiflorus, dictamnoides. Spain, Levant, Egypt.

964. BLACKWELLIA.

Three species; viz. integrifolia, paniculata, axillaris. W. Indies.

ORDER VI. DODECAGYNIA.

965. SEMPERVIVUM, or *House-leek*.

14 species; viz. arboreum, canariense, glutinosum, glandulosum, *tectorum, globiferum, villosum, tortuosum, stellatum, arachnoideum, hirtum, montanum, sediforme, monanthos. Eur. Canaries, Madeira.

* S. leaves fringed; offsets expanding.—The juice of *tectorum*. this plant either applied by itself, or mixed with cream, gives present relief to burns, and other external inflammations. Mixed with honey, it is a useful application in apthous cases. Sheep and goats eat it.

In the class Dodecandria are

41 Genera, including 273 Species, of which 18 are found in Britain.

CLASSIS XII.

ISOCANDRIA (B).

ORDO I. MONOGYNIA.

966. CACTUS. Cal. superus, 1-phyllus. Cor. multifida. Bacca 1-locul. polysperma.

CLASS XII.

ICOSANDRIA.

ORDO I. MONOGYNIA.

C. Cal. superior, 1-leaved. Cor. many-cleft. Berry 1-celled, many-seeded.

972.

(B) Although this is called the class of twenty stamens, because the flowers arranged under it generally contain about

972. *EUGENIA*. Cal. superus, 4-partitus. Cor. 4-petala. Bacca 1-locul. 1-sperma.
 967. *PHILADELPHUS*. Cal. superus, 5 s. 4-partitus. Cor. 5 s. 4-petala. Stigma 4-fidum. Caps. 5-4-locul. polysperma.
 968. *LEPTOSPERMUM*. Cal. superus, 5-fidus. Petala 5-unguiculata, staminibus longiora. Stigma capitatum. Caps. 4 s. 5-locularis.
 969. *FABRICIA*. Cal. superus, 5-fidus. Petala 5 sessilia. Stigma capitatum. Caps. multilocularis.
 970. *METROSIDEROS*. Cal. superus, 5-fidus. Petala 5. Stam. longissima exserta. Stigma simplex. Caps. 3 s. 4-locularis.
 971. *PSIDIUM*. Cal. superus, 5-fidus. Cor. 5-petala. Bacca 1-locul. polysperma.
 973. *MYRTUS*. Cal. superus, 5-fidus. Cor. sub 5-petala. Bacca 3-locul. polysperma.
 980. *PUNICA*. Cal. superus, 5-fidus. Cor. 5-petala. Pomum 10-loculare, polyspermum.
 985. *ROBINSONIA*. Cal. superus, 5-dentatus. Petala 5. Bacca striata, 7-locul.
 974. *CALYPTRANTHES*. Cal. superus, truncatus, operculo tectus. Cor. o. Bacca 1-locul. 1-4-sperma.
 975. *EUCALYPTUS*. Cal. superus, truncatus, operculo tectus. Cor. o. Caps. 4-locul. polysperma.
 978. *FOETIDIA*. Cal. superus, 4-fidus. Cor. o. Caps. 4-locul. lignosa.
 986. *SONNERATIA*. Cal. inferus, 6-fidus. Pet. 6. Bacca multilocularis, loculis polyspermis.
 981. *AMYGDALUS*. Cal. inferus, 5-fidus. Cor. 5-petala. Drupa, nucleo foraminoso.
 * 982. *PRUNUS*. Cal. inferus, 5-fidus. Cor. 5-petala. Drupa, nucleo integro.
 984. *CHRYSOBALANUS*. Cal. inferus, 5-fidus. Cor. 5-petala. Drupa sulcata.
 976. *BANARA*. Cal. inferus, 4-fidus. Petala 4. Bacca 1-locul. polysperma.
 977. *ANTHERYLIUM*. Cal. inferus, 5-partitus. Petala 4. Caps. 1-locularis, 3-valvis, polysperma.
 979. *SCOLOPIA*. Cal. inferus, 3 s. 4-partitus. Pet. 3 s. 4. Bacca 1-locularis. Semina arillata.

Cleome icosandra.

ORDO II. DIGYNIA.

- * 987. *CRATÆGUS*. Cal. superus, 5-fidus. Cor. 5-petala. Bacca 2-sperma.
 988. *WALDSTEINIA*. Cal. 10-fidus, laciniis alternis. Petala 5. Semina 2, obovata.

ORDO III. TRIGYNIA.

- * 989. *SORBUS*. Cal. superus, 5-fidus. Cor. 5-petala. Bacca 3-sperma.
 990. *SESUVIUM*. Cal. inferus, 5-fidus. Cor. nulla. Caps. 3-locularis, circumscissa.

† *Spiræa opulifolia.*

E. Cal. superior, 4-partite. Cor. 4-petaled. Berry 1-celled, 1-seeded.

P. Cal. superior, 5 or 4-partite. Cor. 5 or 4-petaled. Stigma 4-cleft. Caps. 5 or 4-celled, many-seeded.

L. Cal. superior, 5-cleft. Petals 5-clawed, longer than the stamens. Stigma with a little head. Caps. 4 or 5-celled.

F. Cal. superior, 5-cleft. Petals 5, sitting. Stigma with a little head. Caps. many-celled.

M. Cal. superior, 5-cleft. Petals 5. Very long protruded stamens. Stigma simple. Caps. 3 or 4-celled.

P. Cal. superior, 5-cleft. Cor. 5-petaled. Berry 1-celled, many-seeded.

M. Cal. superior, 5-cleft. Cor. nearly 5-petaled. Berry 3-celled, many-seeded.

P. Cal. superior, 5-cleft. Cor. 5-petaled. An apple, 10-celled, many-seeded.

R. Cal. superior, 5-toothed. Petals 5. Berries striped, 7-celled.

C. Cal. superior, lopped, covered with a lid. No cor. Berry 1-celled, 1 to 4-seeded.

E. Cal. superior, truncated, covered with a lid. No cor. Caps. 4-celled, many-seeded.

F. Cal. superior, 4-cleft. No cor. Caps. 4-celled, woody.

S. Cal. inferior, 6-cleft. Petals 6. Berry many-celled, with many-seeded cells.

A. Cal. inferior, 5-cleft. Cor. 5-petaled. Drupe with a kernel full of holes.

* P. Cal. inferior, 5-cleft. Cor. 5-petaled. Drupe with an entire kernel.

C. Cal. inferior, 5-cleft. Cor. 5-petaled. Drupe furrowed.

B. Cal. inferior, 4-cleft. Petals 4. Berry 1-celled, many-seeded.

A. Cal. inferior, 4-partite. Petals 4. Caps. 1-celled, 3-valved, many-seeded.

S. Cal. inferior, 3 or 4-partite. Petals 3 or 4. Berry 1-celled. Seeds coated.

ORDER II. DIGYNIA.

- * C. Cal. superior, 5-cleft. Cor. 5-petaled. Berry 2-seeded.
 W. Cal. 10-cleft, with alternate segments. Petals 5. Seeds 2, nearly oval.

ORDER III. TRIGYNIA.

- * S. Cal. superior, 5-cleft. Cor. 6-petaled. Berry 3-seeded.
 S. Cal. inferior, 5-cleft. Cor. o. Caps. 3-celled, cut round.

ORDO

about that number; yet the mark or character of the class is not to be taken merely from the number of stamens, but from attending also to the following circumstances: 1. The calyx, consisting usually of one concave leaf; 2. Petals, fixed by claws to the inside of the calyx; and, lastly, Stamens, more than 19, standing upon the petals or the calyx, but not upon the receptacle. Very few are poisonous.

ORDO IV. PENTAGYNIA.

993. TETRAGONIA. Cal. superus, 5 s. 4-fidus. Cor. o. Peric. nucleo 5 s. 4-loculari.
 991. MESPILUS. Cal. superus, 5-fidus. Cor. 5-petala. Bacca 5-sperma.
 * 992. PYRUS. Cal. superus, 5-fidus. Cor. 5-petala. Pomum 5-loculare, polyspermum.
 994. MESEMBRYANTHEMUM. Cal. superus, 5-fidus. Cor. multifida. Caps. carnosae, loculariae, polyspermae.
 995. AIZOON. Cal. inferus, 5-fidus. Cor. 5-petala. Caps. plures congestae.
 * 996. SPIRÆA. Cal. inferus, 5-fidus. Cor. 5-petala. Caps. plures congestae.

ORDO V. POLYGYNIA.

- * 997. ROSA. Cal. 5-fidus. Cor. 5-petala. Cal. baccatus, polyspermus.
 * 998. RUBUS. Cal. 5-fidus. Cor. 5-petala. Bacca composita.
 * 1001. TORMENTILLA. Cal. 8-fidus. Cor. 4-petala. Sem. 8, mutica.
 * 1003. DRYAS. Cal. 8-fidus. Cor. 8-petala. Sem. plurima arista lanata.
 * 999. FRAGARIA. Cal. 10-fidus. Cor. 5-petala. Sem. plurima supra receptaculum baccatum, decidua.
 * 1000. POTENTILLA. Cal. 10-fidus. Cor. 5-petala. Sem. plurima mutica.
 * 1002. GEUM. Cal. 10-fidus. Cor. 5-petala. Sem. plurima. Arista geniculata.
 * 1004. COMARUM. Cal. 10-fidus. Cor. 2-petala. Sem. plurima supra receptaculum carnosum, persistens.
 1005. CALYCANTHUS. Cal. squamosus, corollinus. Cor. o. Sem. caudata calyce.

Spiræa filipendula, ulmaria. Phytolacca icosandra. Mesembryanthema aliquot.

ORDER I. MONOGYNIA.

966. CACTUS, or *Melon Thistle*.
 24 species; viz. mamillaris, melocactus, pitajaya, heptagonus, tetragonus, hexagonus, pentagonus, repandus, lanuginosus, peruvianus, royeri, grandiflorus, flagelliformis, parasiticus, triangularis, moniliformis, opuntia, ficus india, tuna, cochenillifer, curassavicus, phyllanthus, pereshia, portulacifolius. West Indies, America.

967. PHILADELPHUS, or *Mock Orange, Syringa*.
 Two species; viz. coronarius, inodorus. S. Eur. Carolina, New South Wales.

968. LEPTOSPERMUM
 Has 12 species; viz. scoparium, thea, flavescens, attenuatum, lanigerum, pubescens, parvifolium, arachnoideum, juniperinum, baccatum, ambiguum, virgatum. New Holland.

969. FABRICIA
 Has two species; viz. myrtifolia, lævigata. New Holland.

ORDER IV. PENTAGYNIA.

- T. Cal. superior, 5 or 4-cleft. No cor. A seed vessel with a kernel 5 or 4-celled.
 M. Cal. superior, 5-cleft. Cor. 5-petaled. Berry 5-seeded.
 * P. Cal. superior, 5-cleft. Cor. 5-petaled. An apple, 5-celled, many-seeded.
 M. Cal. superior, 5-cleft. Cor. many-cleft. Caps. fleshy, celled, many-seeded.
 A. Cal. inferior, 5-cleft. Cor. 5-petaled. Caps. several, heaped together.
 * S. Cal. inferior, 5-cleft. Cor. 5-petaled. Caps. several heaped together.

ORDER V. POLYGYNIA.

- * R. Cal. 5-cleft. Cor. 5-petaled. Cal. berry-like, many-seeded.
 * R. Cal. 5-cleft. Cor. 5-petaled. Berry compound.
 * T. Cal. 8-cleft. Cor. 4-petaled. Seeds 8, awnless.
 * D. Cal. 8-cleft. Cor. 5-petaled. Seeds many, with a woolly awn.
 * F. Cal. 10-cleft. Cor. 5-petaled. Seeds many, upon a berried receptacle, deciduous.
 * P. Cal. 10-cleft. Cor. 5-petaled. Seeds many, awnless.
 * G. Cal. 10-cleft. Cor. 5-petaled. Seeds many. Awn knee-jointed.
 * C. Cal. 10-cleft. Cor. 5-petaled. Seeds many, above a fleshy receptacle, permanent.
 C. Cal. scaly, corol-like. No cor. Seeds with a tailed cup.

970. METROSIDEROS.

14 species; viz. hispida, floribunda, costata, diffusa, villosa, florida, glomulifera, angustifolia, ciliata, linearis, lanceolata, saligna, viminalis, capitata. N. Holland, N. Zealand, C. of G. Hope.

971. PSIDIUM, or *Guava, or Bay Plum*.
 Three species; viz. pyriferum, pomiferum, decaspermum. East and West Indies.

972. EUGENIA, or *Pomey Rose, Yambo*.
 Seven species; viz. malaccensis, jambos, pseudo-psidium, uniflora, cotinifolia, acutangula, racemosa. E. Indies, Jamaica, S. America.

973. MYRTUS, or *Myrtle*.
 14 species; viz. communis, brasiliensis, biflora, angustifolia, laevis, lucida, cumini, dioica, chytracutia, zuzyginum, zeylanica, androsæmoides, caryophyllata, pimenta. S. Europe, Asia, Africa, America.—The *myrtus communis* is an evergreen shrub, growing in Italy, and cultivated in our botanic gardens. The leaves and berries have been sometimes made use of as astringents,

astringents, but not at present regarded. The pimento is the fruit of a large tree growing spontaneously in the mountainous parts of Jamaica, called by Sir Hans Sloane, *myrtus arborea aromatica, foliis laurinis*. The smell of this spice resembles a mixture of cinnamon, cloves, and nutmegs; its taste approaches to that of cloves, or a mixture of the three foregoing; whence it has received the name of *all-spice*. The shops have been for some time accustomed to employ this aromatic as a succedaneum to the more costly spices, and from them it has been introduced into our hospitals.

Pimento is now in our pharmacopœias the basis of a distilled water, a spirit, and an essential oil; and these are not unfrequently employed, where aromatics are indicated.

974. CALYPTRANTHES.

Six species; viz. *suzygium, guineensis, caryophyllifolia, jambolana, chrytraculia, rigida*. Jamaica, Guæna, East Indies.

975. EUCALYPTUS.

12 species; viz. *robusta, pilularis, tereticornis, resinifera, capitellata, saligna, botryoides, hæmastoma, piperita, obliqua, corymbosa, paniculata*. N. Holland.

976. BANARA.

One species; viz. *fagifolia*. Cayenne.

977. ANTHERYLUM.

One species; viz. *rohrii*. W. Indies.

978. FOETIDIA.

One species; viz. *mauritiana*. Isle Mauritius.

979. SCOLOPIA.

One species; viz. *pusilla*. Ceylon.

980. PUNICA, or *Pomegranate-tree*.

Two species; viz. *granatum, nana*. Spain, Italy, Barb. W. Indies.—The pomegranate is a low tree, or rather shrub, growing wild in Italy, and other countries in the south of Europe: it is sometimes met with in our gardens; but the fruit, for which it is chiefly valued, rarely comes to such perfection as in warmer climates. This fruit has the general qualities of the other sweet summer fruits, allaying heat, quenching thirst, and gently loosening the belly. The rind is a strong astringent, and as such, is occasionally made use of. The flowers are of an elegant red colour, in appearance resembling a dried red rose. Their taste is bitterish and astringent. They are recommended in diarrhœas, dysenteries, and other cases where astringent medicines are proper.

981. AMYGDALUS, or *Almond tree*.

Four species; viz. *persica, communis, pumila, nana*. Persia, Jordan, Barbary.—The flowers of the *amygdalus persica* have an agreeable smell, and a bitterish taste. Distilled without any addition, by the heat of a water bath, they yield one-sixth their weight, or more, of a whitish liquor; which, as Mr Bolduc observes, communicates to a large quantity of other liquors, a flavour like that of the kernels of fruits. An infusion in water, of half an ounce of the fresh-gathered flowers, or a dram of them when dried, sweetened with sugar, proves for children an useful laxative and anthelmintic; the leaves of the tree are, with this intention,

somewhat more efficacious, though less agreeable. The fruit has the same quality with the other sweet fruits, that of abating heat, quenching thirst, and gently loosening the belly.

The almond of the *amygdalus communis*, is a flattish kernel, of a white colour, covered with a thin brownish skin, of a soft sweet taste, or a disagreeable bitter one. The skins of both sorts are unpleasant, and covered with an acrid powdery substance; they are very apt to become rancid on keeping, and to be preyed on by a kind of insect which eats out the internal part, leaving the almond to appearance entire. To these circumstances regard ought to be had, in the choice of them.

The fruit which affords these kernels, is the produce of a tree nearly resembling the peach. The eye distinguishes no difference betwixt the trees which produce the sweet and bitter, or betwixt the kernels themselves; it is said that the same tree has, by a difference in culture; afforded both.

Both sorts of almonds yield, on expression, a large quantity of oil, which has no smell, or any particular taste; this oil separates, likewise, upon boiling the almonds in water, and is gradually collected on the surface; but on triturating the almonds with water, the oil and water unite together, by the mediation of the other matter of the kernel, and form an unctuous milky liquor.

Sweet almonds are of greater use in food than as medicines, but they are reckoned to afford little nourishment; and when eaten in substance, are not easy of digestion, unless thoroughly comminuted. They are supposed, on account of their soft unctuous quality, to obtund acrimonious juices in the primæ viæ. Peeled sweet almonds, eaten six or eight at a time, sometimes give present relief in the heartburn.—Bitter almonds have been found poisonous to dogs, and sundry other animals; and a water distilled from them, when made of a certain degree of strength, has had the same effects. Nevertheless, when eaten, they appear innocent to men, and have been not unfrequently used as medicines. Boerhaave recommends them in substance, as diuretics which heat but moderately, and which may therefore be ventured upon in acute diseases.

The oils obtained by expression from both sorts of almonds, are in their sensible qualities the same. The general virtues of these oils are, to blunt acrimonious humours, and to soften and relax the solids; hence their use, internally, in tickling coughs, heat of urine, pains and inflammations; and externally in tension, and rigidity of particular parts.—The milky solutions of almonds in watery liquors, commonly called emulsions, contain the oil of the subject, and participate in some degree of its emollient virtue; but have this advantage above the pure oil, that they may be given in acute or inflammatory disorders, without danger of the ill effects which the oil might sometimes produce; since emulsions do not turn rancid or acrimonious by heat, as all the oils of this kind in a little time do. Several unctuous and resinous substances, of themselves not miscible with water, may, by trituration with almonds, be easily mixed with it into the form of an emulsion; and are thus excellently fitted for medicinal use. In this form camphor and the resinous purgatives may be commodiously taken. The only officinal preparations of almonds, are the expressed oil and emulsion. The com-

mon emulsion, or the *lac amygdala*, as it is now called by the London college, is prepared from the sweet almond alone; but in the emulsion of the Edinburgh college, a small proportion of bitter almonds is added, which has a much better effect in improving its taste, than the sugar added by the London college.—An emulsion formed entirely of bitter almonds, taken to the quantity of a pint or two daily, is said to have been given in obstinate intermittents with success.

982. PRUNUS, or *Plum-tree*.

22 species; viz. * *padus*, *virginiana*, *canadensis*, *lutanica*, *lauro-cerasus*, *elliptica*, *paniculata*, *mahaleb*, *armeniaca*, *sibirica*, *pumila*, * *cerasus*, * *avium*, *pen-sylvanica*, * *domestica*, * *insititia*, * *spinosa*, *aspera*, *japonica*, *glandulosa*, *incisa*, *tomentosa*. Europe, N. Amer. W. Indies.

padus. * P. flowers in bunches; leaves deciduous with two glands at the base on the under side.—This plant grows well in woods, groves, or fields, but not in a moist soil. It bears lopping, and suffers the grass to grow under it. The fruit is nauseous; but bruised and infused in wine or brandy, it gives it an agreeable flavour. A strong decoction of the bark is used by the Finlanders to cure venereal complaints, which practice is corroborated by the testimony of M. Broerland. He directs six ounces of the dry, or eight of the fresh bark, to be boiled in eight to four pints of water. The dose is four ounces, four times a-day. It alone cures the slighter infections, and combined with mercury facilitates the cure of the severer states of the disease; and a decoction of the berries is sometimes given with success in the dysentery. The wood being smooth and tough, is made into handles for knives and whips. Sheep, goats, and swine eat it. Cows are not fond of it. Horses refuse it.

cerasus. * P. umbels mostly on short fruitstalks; leaves egg-spear-shaped, smooth, doubled together.—This plant loves a sandy soil and an elevated situation. The gum that exudes from this tree is equal to gum arabic. It is said, that more than 100 men during a siege were kept alive for near two months, without any other sustenance than a little of this gum taken into the mouth sometimes and suffered gradually to dissolve. The common people eat the fruit either fresh or dried; and it is frequently infused in brandy for the sake of its flavour. The wood is hard and tough. It is used by the turner, and is formed into chairs, and stained to imitate mahogany. This tree is the original stock from which many of the cultivated kinds are derived.

avium. * P. umbels sitting; leaves egg-spear-shaped, downy underneath, doubled together.—This plant grows best in a rich soil on the side of hills, unmixed with other trees. It bears cropping, and suffers the grass to grow under it. In Hertfordshire there is a cultivated variety called *carross*, which are larger and much finer flavoured than the common sort.

domestica. * P. fruitstalks mostly solitary; leaves spear-egg-shaped, coiled; branches thornless.—This plant loves a lofty exposure, and is favourable to pasturage. The varieties have probably originated from the red and white cultivated plums, either sown by design or accident. The cultivated garden plums are derived from this species. The bark dyes yellow. Its medical effects are to abate heat and gently loosen the belly; which they perform by lubricating the passage, and softening

the excrement. They are of considerable service in costiveness, accompanied with heat and irritation, which the more stimulating cathartics would tend to aggravate. Where prunes are not of themselves sufficient, their effects may be promoted by joining with them a little rhubarb or the like; to which may be added some carminative ingredient, to prevent their occasioning flatulencies.

* P. fruitstalks in pairs; leaves egg-shaped, slightly *insititia*. woolly, coiled; branches with thorns.—The fruit is acid, but so tempered by a sweetness and roughness, as not to be unpleasant, particularly after it is mellowed by the frosts. A conserve is prepared by mixing the pulp with thrice its weight of sugar. The bark of the root and branches is considerably styptic. An infusion of the flowers, sweetened with sugar, is a mild purgative, not improper for children.

* P. fruitstalks solitary; leaves spear-shaped, smooth; branches thorny.—This plant is not well adapted to grow in hedges, because it spreads its roots wide, and encroaches upon the pasturage; but it makes a good dead fence. The wood is hard and tough, and is formed into teeth for rakes and walking-sticks. From some effects which have been repeatedly observed to follow the prick of the thorns, there is reason to believe there is something poisonous in them, particularly in autumn. The tender leaves dried are sometimes used as a substitute for tea, and are thought the best substitute that has yet been tried. The fruit bruised and put into wine, gives it a beautiful red colour, and a pleasant subacid roughness. An infusion of a handful of the flowers is a safe and easy purge. The bark powdered, in doses of two drams, will cure some agues. Letters written upon linen or woollen with the juice of the fruit will not wash out. Sheep, goats, and horses eat the leaves. The different species of *Prunus* furnish nourishment to various insects.

983. PLINIA.

Two species; viz. *crocea*, *pendunculata*. Surinam, Brazil.

984. CHRYSOBALANUS, or *Cocoa Plum*.

One species; viz. *icaco*. W. Indies, S. America.

985. ROBINSONIA.

One species; viz. *melianthifolia*. Guiana.

986. SONNERATIA.

One species; viz. *acida*. East Indies, China.

ORDER II. DIGYNIA.

987. CRATÆGUS, or *Wild Service Tree*.

15 species; viz. * *avia*, * *torminalis*, *coccinea*, *viridis*, *punctata*, *crus galli*, *tomentosa*, *indica*, * *oxycantha*, *monogyna*, *azarolus*, *maura*, *villosa*, *lævis*, *glabra*. Europe, India, N. America.

* C. leaves egg-shaped, cut, serrated, cottony underneath.—It loves dry hills and open exposures, and flourishes either in gravel or clay. It bears lopping, and permits the grass to grow. The wood, being hard, tough, and smooth, is used for axle-trees, wheels, walking sticks, carpenters and other tools. The fruit is eatable when mellowed by the autumnal frosts, and an ardent spirit may be distilled from it. It seldom bears a good crop of fruit two years together. Sheep and

and goats eat it. The wood affords an excellent charcoal for the makers of gunpowder.

oxyacantha.

* *C.* leaves mostly 3-cleft; segments blunt, serrated.—Upon account of the stiffness of its branches, the sharpness of its thorns, its roots not spreading wide, and its capability of bearing the severest winters without injury, this plant is universally preferred for making hedges, whether to clip or to grow at large. The wood is tough, and is formed into axle-trees and handles for tools. The berries are the winter food of thrushes and many other birds. Its different species afford nourishment to various insects.

988. WALDSTENIA.

One species; viz. *geoides*. Hungary.

ORDER III. TRIGYNIA.

989. SORBUS, or *Service-tree*.

Three species; viz. * *ancuparia*, * *hybrida*, * *domestica*. Europe.

ancuparia.

* *S.* leaves winged, smooth on both sides.—It grows either in woods or open fields, but best on the sides of hills and in fertile soil. It will not bear lopping. Plants grow well in its shade. The wood is soft, tough, and solid. It is converted into tables, spokes for wheels, shafts, chairs, &c. The roots are formed into handles for knives and wooden spoons. The berries, dried and reduced to powder, make wholesome bread; and an ardent spirit may be distilled from them, which has a fine flavour, but it is small in quantity. The berries too, infused in water, make an acid liquor somewhat like perry, which is drunk by the poorer people in Wales. In Germany, the fowlers use the berries to entice the redwings and fieldfares into nooses of hair, suspended in the woods; hence its trivial name.

domestica.

* *S.* leaves winged, woolly underneath.—The fruit is mealy and austere, not much unlike the medlar. The wood is valuable for making mathematical rulers and excisemen's gauging sticks.

990. SESUVIUM.

One species; viz. *portulacastrum*. W. Indies.

ORDER IV. PENTAGYNIA.

991. MESPILUS, or *Medlar-tree*.

Eight species; viz. *pyracantha*, * *germanica*, *arbutifolia*, *amelanchia*, *chamæ-mespilus*, *canadensis*, *japonica*, *gotoncaster*. Europe, N. America.

germanica.

* *M.* thornless; leaves spear-shaped, cottony underneath; flowers solitary, sitting.—Many people are fond of the fruit when it becomes soft by keeping; it is somewhat austere, and binds the bowels.

992. PYRUS, or *Pear-tree*.

Nine species; viz. * *communis*, *pollveria*, * *malus*, *baccata*, *coronaria*, *cydonia*, *nivalis*, *salicifolia*, *japonica*.

communis.

* *P.* leaves serrated, smooth; flowers forming a corymbus.—This plant loves a fertile soil and sloping ground; but will not thrive well in moist bottoms. It stands the severest winters, and does not destroy the grass. The wood is light, smooth, and compact; it is used by turners, and to make joiners tools; and for

picture frames to be stained black. The leaves afford a yellow dye, and may be used to give a green to blued cloths. The fruit is austere: but when cultivated, highly grateful, as is proved by the great variety of excellent pears, which the industry of mankind has raised, for they all originate from this. The juice of the fruit fermented, is called *perry*, large quantities of which are raised in Worcestershire and Herefordshire for that purpose. The Squash, the Oldfield, and the Barland perrys are reckoned the best, and are little inferior to wine. Horses, cows, sheep, and goats, eat the leaves, which afford nourishment to various insects.

* *P.* leaves serrated; flowers in umbels, sitting.—This plant flourishes better on declivities and in shady places, than in open exposures or boggy lands. Grass, and even corn, will grow beneath it. It is much used as a stock, on which to ingraft the better kind of apples, because its fruits are neither killed by frost nor eaten by field-mice. The bark affords a yellow dye. The wood is tolerably hard; it turns very clean, and when made into cogs for wheels obtains a polish and wears a long time. The acid juice of the fruit is called by the country people *veryjuice*, and is much used in sprains and in other cases, as an astringent or repellent. With a proper addition of sugar, it is probable, that a very grateful liquor might be made with the juice, but little inferior to old hock. Horses, cows, sheep, and goats eat it. Swine are very fond of the fruit.

The fruit of the *pyrus cydonia* have a very austere acid taste; taken in small quantity, they are supposed to restrain vomiting and alvine fluxes, and, more liberally, to loosen the belly. The seeds abound with a mucilaginous substance of no particular taste, which they readily impart to watery liquors; an ounce will render three pints of water thick and ropy, like the white of an egg. A mucilage of the seeds is kept in the shops. A syrup of the fruit had formerly a place, but is now rejected.

993. TETRAGONIA.

Seven species; viz. *fruticosa*, *herbacea*, *ivæfolia*, *hirsuta*, *spicata*, *expansa*, *japonica*. Cape, Peru, New Zealand.

994. MESEMBRYANTHEMUM, or *Fig-marygold*.

50 species; viz. *nodiflorum*, *crystallinum*, *copticum*, *geniculiflorum*, *noctiflorum*, *splendens*, *umbellatum*, *expansum*, *tripolium*, *calamiforme*, *apetalum*, *criniflorum*, *cordifolium*, *bellidifolium*, *deltoides*, *barbatum*, *hispidum*, *villosum*, *scabrum*, *emarginatum*, *uncinatum*, *spinosum*, *tuberosum*, *tenuifolium*, *stipulaceum*, *crassifolium*, *glomeratum*, *loreum*, *filamentosum*, *falcatum*, *forcicatum*, *edule*, *bicolorum*, *serratum*, *micans*, *glaucum*, *corniculatum*, *tortuosum*, *pomeridianum*, *veruculatum*, *papulosum*, *pinnatifidum*, *rostratum*, *ringens*, *dolabriforme*, *diforme*, *albidum*, *lingueforme*, *pugioniforme*, *capillare*. Greece, Cape, New Zealand.

995. AIZOON.

Ten species; viz. *canariense*, *hispanicum*, *lanceolatum*, *sarmentosum*, *paniculatum*, *perfoliatum*, *glinoides*, *secundum*, *fruticosum*, *rigidum*. Spain, Cape, Canary.

996. SPIRÆA, or *Spiked Willow*, *Dropwort*.

18 species; viz. *lævigata*, * *salicifolia*, *tomentosa*, *callosa*.

callosa, *hypericifolia*, *chamædrifolia*, *incisa*, *crenata*, *argentea*, *triloba*, *opulifolia*, *sorbifolia*, *aruncus*, * *filipendula*, * *ulmaria*, *lobata*, *palmata*, *trifoliata*. Europe, N. America.

filipendula * S. leaves interruptedly winged; leaflets strap-spear-shaped, irregularly serrated, very smooth; flowers in tufts.—The tuberant pea-like roots of this plant, dried and reduced to powder, make a kind of bread, which in times of scarcity is not to be despised. Hogs are very fond of them. When expanded and enlarged by cultivation, it is a beautiful addition to the flower-garden.

ulmaria. * S. leaves interruptedly winged; leaflets egg-shaped, double serrated, hoary underneath; flowers in tufts.—The flowers, infused in boiling water, give it a fine flavour, which rises in distillation. Sheep and swine eat it. Goats are extremely fond of it. Cows and horses refuse it.

ORDER V. POLYGYNIA.

997. ROSA, or *Rose*.

21 species; viz. *eglanteria*, * *rubiginosa*, *cinnamomea*, * *arvensis*, *pimpinellifolia*, * *spinosissima*, *rugosa*, *carolina*, * *villosa*, *sinica*, *sempervivens*, *centifolia*, *gallica*, *pumila*, *alpina*, *canina*, *collina*, *indica*, *pendulina*, *alba*, *multiflora*. Europe, Persia, China, N. America.

spinosissima. * R. germens and fruitstalks smooth; stem and leafstalks fully set with straight prickles; leaflets circular, smooth.—The ripe fruit is eaten by children; it has a grateful subacid taste. The juice of it, diluted with water, dyes silk and muslin of a peach colour, and, with the addition of alum, a deep violet; but it has very little effect on woollen and linen. Its dwarfish growth, and the singular elegance of its little leaves, which resemble those of the upland burnet, entitle it to a place in the flower-garden.

canina. * R. germens and footstalks smooth; stem and leafstalks prickly.—A perfumed water may be distilled from the blossoms. The pulp of the berries, beat up with sugar, makes the conserve of hips of the London dispensatory. Mixed with wine, it is an acceptable treat in the north of Europe. Several birds feed upon the berries. The leaves of every species of rose, but especially of this, are recommended as a substitute for tea, giving out a fine colour, a sub-astringent taste, and a grateful smell, when dried, and infused in boiling water. It is a difficult matter to say, which are species, and which are varieties only, in this genus; some think that there are no certain limits prescribed by nature. Various insects are nourished by the different species; and those mossy prickly excrescences which are frequently found upon the branches of roses, especially upon the last species, are the habitations of the *cynips rosæ*. This excrescence was formerly in repute as a medicine, and was kept in the shops under the name of *bedeguar*. An infusion of the full blown blossoms of all the roses, especially the paler kinds, is purgative; but the petals of the red roses, gathered before they expand, and dried, are astringent.

The *rosa centifolia* is an elegant flower, common in our gardens. Its smell is very pleasant and almost universally admired; its taste bitterish and subacid. In distillation with water, it yields a small portion of

butyraceous oil, whose flavour exactly resembles that of the roses. This oil, and the distilled water, are very useful and agreeable cordials. Hoffman strongly recommends them as of a singular efficacy for raising the strength, cheering and recruiting the spirits and allaying pain; which they perform without raising any heat in the constitution, rather abating it when inordinate. Damask roses, besides their cordial aromatic virtue, which resides in their volatile parts, have a mildly purgative one, which remains entire in the decoction left after the distillation; this with a proper quantity of sugar forms an agreeable laxative syrup, which has long kept its place in the shops.

The *rosa gallica* has very little of the fragrance of the foregoing pale sort, and instead of its purgative quality, a mild gratefully astringent one, especially before the flower has opened: this is considerably improved by hasty exsiccation; but both the astringency and colour are improved by slow drying. In the shops there are prepared a conserve, an infusion, a honey, and a syrup of this flower.

998. RUBUS, or *Raspberry*.

20 species; viz. * *idaeus*, *occidentalis*, *hispidus*, *parvifolius*, *jamaicensis*, *triphyllus* * *cæsus*, * *fruticosus*, *canadensis*, *odoratus*, *moluccanus*, *palmatus*, *villosus*, *incisus*, *japonicus*, *trifidus*, * *saxatilis*, * *arcticus*, * *chamæmoros*, *dalibarda*. North Europe, Asia, America.

* R. leaves winged with five or three leaflets, stem prickly; leaf-stalk channelled.—The fruit of this plant is extremely grateful as nature presents it, but made into a sweetmeat with sugar, or fermented with wine, the flavour is improved. It is fragrant, subacid, and cooling. It dissolves the tartarous concretions of the teeth; but for this purpose it is inferior to the strawberry. The white berries are sweeter than the red, but they are generally contaminated by insects. The fresh leaves are the favourite food of kids.

* R. leaves winged with three or five leaflets; stem and leafstalks prickly; panicle oblong.—The berries when ripe are black, and do not eat amiss with wine. The green twigs are of great use in dyeing woollen, silk, and mohair black. Cows and horses eat it. Sheep are not fond of it. Silk worms will sometimes feed upon the leaves in defect of those of the mulberry.

* R. leaves simple, lobed; stem without prickles, with one flower; male and female flowers on different plants. —The berries are not unpleasant, and held to be an excellent antiscorbutic. The Norwegians pack them up in wooden vessels and send them to Stockholm, where they are served up in desserts or made into tarts. The Laplanders bury them under the snow, and thus preserve them fresh from one year to another. They bruise and eat them with the milk of the rein deer. In the Highlands of Scotland also they are sometimes brought to table with the dessert.

999. FRAGARIA, or *Strawberry*.

Three species; viz. * *vesca*, *monophylla*, * *sterilis*. North of Europe, America.

* F. leaves three together; runners creeping.—The berries eaten either alone or with sugar, or with milk, are universally esteemed a most delicious fruit. They are grateful, cooling, subacid, juicy, and have a delightful smell. Taken in large quantities, they seldom disagree

disagree with the stomach. They promote perspiration, impart a violet scent to the urine, and dissolve the tartarous incrustations upon the teeth. People afflicted with the gout or stone, have found great relief from using them largely. The bark of the root is astringent. Sheep and goats eat it. Cows are not fond of it. Horses and swine refuse it.

1000. POTENTILLA, or *Cinquefoil*.

31 species; viz. * *fruticosa*, * *anserina*, seracea, multifida, fragarioides, * *rupestris*, bifurca, pimpinelloides, pensylvanica, supina, recta, argentea, intermedia, hirta, stipularis, opaca, * *verna*, * *aurea*, astracanica, canadensis, * *alba*, caulescens, elusiana, nitida, valderia, * *reptans*, monspeliensis, norvegica, nivea, grandiflora, subacaulis. Europe, North America.

fruticosa. * P. leaves winged, stem-shrub-like.—The beautiful appearance of its numerous flowers has gained it admittance into gardens. Besoms are made of it. Cows, horses, goats, and sheep eat it. Swine refuse it.

anserina. * P. leaves winged, serrated; stem creeping; fruit-stalks with one flower.—The leaves are mildly astringent. Dried and powdered they have been given with success in agues. The usual dose is a meal spoonful of the powder every three hours between the fits. The roots in the winter time eat like parsnips. Swine are fond of them. Cows, horses, goats, and swine eat it. Sheep refuse it.

reptans. * P. leaflets five together, stem creeping; fruit-stalks one-flowered.—The red cortical part of the root is mildly astringent and antiseptic. A decoction of it is a good gargle for loose teeth and spongy gums. Horses, cows, goats, and sheep, eat it.

1001. TORMENTILLA, or *Tormentil*.

Two species; viz. *arctica*, * *reptans*. Europe.—The tormentil is found wild in woods and on commons; it has long slender stalks, with usually seven long narrow leaves at a joint; the root is for the most part crooked and knotty, of a blackish colour in the outside, and reddish within. This root has an austere styptic taste, accompanied with a slight kind of aromatic flavour; it is one of the most agreeable and efficacious of the vegetable astringents, and is employed with good effect in all cases where medicines of this class are proper. It is more used both in extempore

aneous prescription, and officinal composition, than any of the other strong vegetable astringents. It is an ingredient in the two compound powders of chalk. A tincture made from it with rectified spirit, possesses the whole astringency and flavour of the root, and loses nothing of either in inspissating.

1002. GEUM, or *Avens*, *Herb-bennet*.

Eight species; viz. *virginianum*, * *urbanum*, canadense, japonica, * *rivale*, hybridum, montanum, reptans. Europe, North America.

* G. flowers upright; fruit globular, woolly; awns *urbanum*. hooked, bare; root-leaves lyre-shaped; stem-leaves in threes.—The roots gathered in the spring before the stem grows up, and put into ale, give it a pleasant flavour, and prevent its growing sour. Infused in wine it is a good stomachic. Its taste is mildly austere and aromatic, especially when it grows in a warm dry situation; but in shady and moist places it has little virtue. Cows, goats, sheep, and swine, eat it.

* G. flowers nodding, fruit oblong; awns feathered, *rivale*. twisted; petals blunt, round, wedge-shaped; leaves winged.—The powdered root will cure tertian agues, and is daily used for that purpose by the Canadians. Sheep and goats eat it. Cows, horses, and swine are not fond of it. It is made use of to cure rosy malt liquor.

1003. DRYAS.

Three species; viz. *anemonoides*, *geoides*, * *octopetala*. Alps of Europe, Kamtschatka.

1004. COMARUM, or *Marsh-cinquefoil*.

One species; viz. * *palustre*. Europe.
* C. leaves winged, petals smaller than the calyx. *palustre*. The root dyes a dirty red. The Irish rub their milking pails with it, and it makes the milk appear thicker and richer. Goats eat it. Cows and sheep are not fond of it. Horses and swine refuse it.

1005. CALYCANTHUS, or *Carolina All-spice*.

Two species; viz. *floridus*, *præcox*. Carolina, Florida, Japan.

In the class *Icosandria* are

39 Genera, including 346 Species, of which 42 are found in Britain.

CLASSIS XIII.

POLYANDRIA (c).

ORDO I. MONOGYNIA.

Sect. I. *Monopetali*.

1094. SWARTZIA. Cal. 4-partitus. Petalum planum laterale. Legumen.

CLASS XIII.

POLYANDRIA.

ORDO I. MONOGYNIA.

Sect. I. *One-petaled*.

S. Cal. 4-partita. A flat lateral petal. Leguminous.

1006.

(c) The flowers of this class have, as its title implies, many stamens, that is from 20 to 1000 or more; so that it is unnecessary to attempt to count them farther, than to be satisfied that they amount to 20 or upwards. The stamens

1006. *MARCGRAVIA*. Cal. 6-phyllus, imbricatus. Cor. 1-petala, clausa. Bacca multilocularis.

1007. *TERNSTROEMIA*. Cal. 5-partitus. Cor. rotata, limbo campanulato, 5-partito. Bacca exsucca, bilocularis.

Sect. II. *Tripetali*.

1008. *TRILIX*. Cal. 3-phyllus. Bacca 5-locularis, polysperma.

† *Sterbeckia latiflora*. *Tetracera nonnulla*.

Sect. III. *Tetrapetali*.

1023. *MAMMEA*. Cal. 2-phyllus. Bacca 1-locularis. Sem. callosa.

* 1015. *PAPAVER*. Cal. 2-phyllus. Caps. 1-locul. coronata.

* 1014. *CHELIDONIUM*. Cal. 2-phyllus. Siliqua.

1022. *SPARRMANIA*. Cal. 4-phyllus. Caps. pentagona quinque-locularis, loculis dispermis.

1010. *CAPPARIS*. Cal. 4-phyllus. Bacca pedicellata, corticosa.

* 1011. *ACTÆA*. Cal. 4-phyllus. Bacca 1-locularis. Sem. gemino ordine.

1026. *CALOPHYLLUM*. Cal. 4-phyllus. Drupa globosa. Nucleus subglobosus.

1025. *GRIAS*. Cal. 4-fidus. Drupa 1-sperma. Nucleus 8-sulcatus.

Vallea stepularis. *Legnotis elliptica*. *Cleome cheledonia*, *felina*. *Tetracera nitida*.

Sect. IV. *Pentapetali*.

1044. *STERBECKIA*. Caps. cylindræa corticosa. Semina imbricata in pulpa nidulantia.

1043. *LOASA*. Caps. semi-infera, 1-locularis, semitri-valvis, polysperma.

1042. *MENTZELIA*. Caps. infera, 1-locularis, 3-valvis, polysperma.

1050. *BONNETIA*. Caps. supera, 3-locularis, 3-valvis, polysperma. Cal. 5-partitus.

1049. *VALLEA*. Caps. supera, 4 s. 5-angularis, unilocularis, polysperma.

1036. *LEGNOTIS*. Caps. supera, 3-locularis, 3-valvis. Sem. solitaria. Cal. 5-fidus.

1046. *FREZIERA*. Bacca exsucca, 3-locularis, Cal. 5-phyllus.

1034. *MARILA*. Caps. 4-locularis, 4-valvis, polysperma. Cal. 5-phyllus.

* 1048. *CISTUS*. Caps. subrotunda. Cal. 5-phyllus, foliola, 2 minora.

1038. *LEMNISCIA*. Pericarp. 5-loculare. Cal. 5-dentat. Nectarium cyathiforme.

1052. *CORCHORUS*. Caps. sub-5-locularis. Cal. 5-phyllus, longitudine corollæ, deciduus.

1018. *SARRACENIA*. Caps. 5-locularis. Stigma clypeatum. Cal. exter, 3-phyllus, super. 5-phyllus.

M. Cal. 6-leaved, tiled. Cor. 1-petaled, closed. Berry many-celled.

T. Cal. 5-partite. Cor. wheel-shaped, with a bell-shaped border, 5-partite. Dry, 2-celled berry.

Sect. II. *Three-petaled*.

T. Cal. 3-leaved. Berry 5-celled, many-seeded.

Sect. III. *Four-petaled*.

M. Cal. 2-leaved. Berry 1-celled. Seeds callous.

* P. Cal. 2-leaved. Caps. 1-celled, crowned.

* C. Cal. 2-leaved. A long pod.

S. Cal. 4-leaved. Caps. a 5-celled pentagon, 2 seeds in each cell.

C. Cal. 4-leaved. Berry pedicled, i. e. with a foot-stalk, bark-like.

* A. Cal. 4-leaved. Berry 1-celled. Seeds in a double row.

C. Cal. 4-leaved. Globular drupe. Kernel nearly globular.

G. Cal. 4-cleft. Drupe 1-seeded. Kernel 8-furrowed.

Sect. IV. *Five-petaled*.

S. Caps. cylindrical, bark-like. Seeds tiled, dispersed in the pulp.

L. Caps. half-inferior, 1-celled, half 3-valved, many-seeded.

M. Caps. inferior, 1-celled, 3-valved, many-seeded.

B. Caps. superior, 3-celled, 3-valved, many-seeded. Cal. 5-parted.

V. Caps. superior, 4 or 5-angular, 1-celled, many-seeded.

L. Caps. superior, 3-celled, 3-valved. Seeds solitary. Cal. 5-cleft.

F. Berry dry, 3-celled. Cal. 5-leaved.

M. Caps. 4-celled, 4-valved, many-seeded. Cal. 5-leaved.

* C. Caps. nearly round. Cal. 5-leaved, 2 leaflets small.

L. Pericarp. 5-celled. Cal. 5-toothed. Nectary glass-shaped.

C. Pericarp. 5-celled. Cal. 5-leaved, of the length of the corolla, deciduus.

S. Caps. 5-celled. Stigma shield-like. Cal. exterior, 3-leaved, superior 5-leaved.

1028.

stamens stand upon the receptacle. If the exact situation of the stamens may be readily perceived by carefully and slowly pulling off the petals and segments of the calyx, if the stamens remain in their place they may then be considered as growing upon the receptacle. Very many plants of this class are poisonous.

* 1028. *TILIA*. Caps. 5-locul. coriacea, 1-sperma. Cal. deciduus.

1022. *AUBLETIA*. Caps. echinata, 10-locularis, polysperma. Cal. coloratus.

1024. *OCHNA*. Baccæ 5, in receptaculo carnosio. Petala unguibus elongatis.

1039. *ASCIUM*. Bacca unilocularis, polysperma. Cal. 5-phyllus.

1031. *GREWIA*. Drupa 4-loba, 4-locularis. Cal. 5-phyllus.

1017. *MUNTINGIA*. Bacca 5-locularis, umbilicata. Cal. partitus.

1035. *ELÆOCARPUS*. Drupa nucæ crispæ. Petala lacera.

1033. *MICROCOS*. Drupa nucæ triloculari. Petala linearia.

† *Delphinium consolida. Ajacis. Aconiti. Latia completa.*

 * C. No cal. Cor. 4-petaled. Seeds many, awned.
 * T. No cal. Cor. 4-5-petaled. Seeds many, nearly awnless, naked.
 I. No cal. Cor. 5-petaled, deciduous. Nectaries 5. Caps. many-seeded.
 * H. No cal. Cor. 5-petaled, permanent. Nectaries several. Caps. many-seeded.
 * C. No cal. Cor. 5-petaled. Caps. many. Nectaries none.
 * A. No cal. Cor. 6-petaled. Seeds many.
 M. Cal. truncated. Cor. 8-petaled. Berries 4-seeded, congregated.
 * T. No cal. Cor. 14 petals. Nect. strap-shaped. Caps. many-seeded.
 X. Cal. 3-leaved. Cor. 5-petaled. Caps. one or 2-seeded, in a hemispherical receptacle.
 U. Cal. 3-leaved. Cor. 6-petaled. Berries bracket-shaped, 2-seeded, in a hemispherical receptacle.
 U. Cal. 3-leaved. Cor. 6-petaled. Berries many-seeded, affixed to a long receptacle.
 A. Cal. 3-leaved. Cor. 6-petaled. Berry many-seeded, with a tiled bark.
 L. Cal. 3-leaved. Cor. 6-petaled. Seed-vessels many, spear-shaped, tiled.
 M. Cal. 3-leaved. Cor. 9-petaled. Caps. congregated, 2-valved. Seeds pendulous.
 N. Cal. 4-5-leaved. Cor. many-petaled. Nuts one-seeded, immersed in the receptacle.
 D. Cal. 5-leaved. Cor. 5-petaled. Seeds many. Petals with a honey-bearing claw.
 * R. Cal. 5-leaved. Cor. 5-petaled. Seeds many. Petals with a honey-bearing claw.
 I. Cal. 6-leaved. Petals 27. Caps. 1-seeded, in a circle.
 * A. Cal. 5-leaved. Cor. 5 or 10-petaled. Seeds many, angled, bark-like.

Nigella nonnullæ.

ORDER I. MONOGYNIA.

1006. MARCGRAVIA.

Two species; viz. umbellata, coriacea. West Indies.

1007. TERNSTROEMIA.

Five species; viz. meridionalis, elliptica, punctata, japonica, dentata. Jap. W. Ind. Guiana.

1008. TRILIX.

One species; viz. lutea. Carthagera.

1009. LUDIA.

Three species; viz. heterophylla, myrtifolia, sessiliflora. Isle of Mauritius.

1010. CAPPARIS, or *Caper-bush*.

30 species; viz. spinosa, ovata, ægyptia, tomentosa, acuminata, zeylanica, horrida, erythrocarpos, sepiara,

citrifolia, corymbosa, mariana, panduriformis, badduca, torulosa, longifolia, frondosa, ferruginea, grandis, jamaicensis, odoratissima, verrucosa, amplissima, cynophallophora, saligna, pulcherrima, tenuisiliqua, linearis, breynia, hastata. S. Europe, East and West Indies, South America.—The bush of the *capparis spinosa* is a low prickly bush, found wild in Italy and other countries; it is raised with us by sowing the seeds upon old walls, where they take root between the bricks, and endure for many years. The bark of the root is pretty thick, of an ash-colour, with several transverse wrinkles on the surface; cut in slices and laid to dry, it rolls up into quills. This bark has a bitterish acid taste; it is reckoned aperient and diuretic, and recommended in several chronic disorders for opening obstructions of the viscera. The buds pickled with vinegar, &c. are used at table. They are supposed to

C c 2 excite

excite appetite and promote digestion; and to be particularly useful, as detergents and aperients, in obstructions of the liver and spleen. Their taste and virtues depend more upon the saline matter introduced into them, than on the caper buds.

1011. *ACTÆA*, or *Herb-christopher*.

Three species; viz. * *spicata*, *racemosa*, *japonica*. Europe, N. Amer. Japan.

spicata.

* *A.* bunch egg-shaped; fruit berry-like.—The plant is a powerful repellent. The root is useful in some nervous cases, but it must be administered with caution. The berries are poisonous in a very high degree. It is said that toads, allured by the foetid smell of this plant, resort to it; but it grows in shady places, and toads are fond of damp and shady situations. Sheep and goats eat it. Cows, horses and swine refuse it.

1012. *SANGUINARIA*, or *Puncoon*, *Blood-root*.

One species; viz. *canadensis*. N. Amer.

1013. *PODOPHYLLUM*, or *Duck's-foot*, or *May-apple*.

Two species; viz. *peltatum*, *diphyllum*. North America.

1014. *CHELIDONIUM*, or *Celandine*.

Five species; viz. * *majus*, *japonicum*, * *glauicum*, * *corniculatum*, * *hybridum*. Eur. Egypt. Jap.

majus.

* *C.* fruitstalks forming umbels.—This plant grows upon old walls, among rubbish, and in waste shady places. The bark is of a bluish green colour; the root of a deep red; both contain a gold-coloured juice. Their smell is disagreeable, the taste somewhat bitterish, very acrid, biting and burning the mouth; the root is the most acrid. The juice of celandine has long been celebrated in disorders of the eyes; but it is too sharp, unless plentifully diluted, to be applied with safety to that tender organ. It has been sometimes used, and it is said with good success, for extirpating warts, cleansing old ulcers, and in cataplasms for the *herpes miliaris*. This acrimonious plant is rarely given internally. The virtues attributed to it are those of a stimulating aperient, diuretic, and sudorific: it is particularly recommended in the slow kind of jaundice, where there are no symptoms of inflammation, and in dropsies. Some suppose the root to have been Helmont's specific in the *hydrops ascites*. Half a dram or a dram of the dry root is directed for a dose; or an infusion in wine of an ounce of the fresh root.

1015. *PAPAVER*, or *Poppy*.

Nine species; viz. * *hybridum*, * *argemone*, *alpinum*, *nudicaule*, *rhœas*, *dubium*, *sonniferum*, * *cambricum*, *orientale*. Europe.

rhœas.

* *P.* capsules smooth, urn-shaped; stem hairy, many-flowered; leaves wing-cleft, jagged.—The petals give out a fine colour when infused, and a syrup prepared from the infusion is kept in the shops. It partakes in a small degree of the properties of opium.

sonniferum.

* *P.* calyx and capsules smooth; leaves embracing the stem, jagged.—Opium is the juice of this plant. This juice has of late been collected by way of experiment, by certain individuals, from poppies cultivated in Great Britain, and has been found not inferior in quality to that brought from the warmer climates. It is obtained by making wounds with a small sharp instrument in the smooth capsule of the plant when nearly ripe, and

thereafter collecting the juice that exudes from the wounds. It is probable, however, that the high price of labour will scarcely permit the rearing of British opium to become an important object of agriculture. Egypt, Persia, and Hindostan, have hitherto supplied us with this commodity: in those countries large quantities of poppies are cultivated for this purpose. The opium prepared about Thebes in Egypt, hence named *Thebaic opium*, has been usually esteemed the best; but this is not now distinguished from that collected in other places. This juice is brought to us in cakes or loaves covered with leaves and other vegetable matters, to prevent their sticking together: it is of a solid consistence, yet somewhat soft and tenacious, of a dark reddish-brown colour in the mass, and when reduced into powder yellow; of a faint disagreeable smell, and a bitterish taste, accompanied with a pungent heat and acrimony.

In the province of Bahar in the East Indies, it is said, the poppy seeds are sown in October or November, at about eight inches distance; and are well watered till the plants are about half a foot high, when a compost of nitrous earth, dung, and ashes, is spread over the areas; and a little before the flowers appear they are again watered profusely till the capsules are half grown: and then the opium is collected; for, when fully ripe, they yield little juice. Two longitudinal incisions, from below upwards, without penetrating the cavity, are made at sunset for three or four successive evenings; and then they are allowed to ripen their seeds. In the morning the juice is scraped off with an iron scoop, and worked in an earthen pot, in the sun's heat, till it be of a consistence to be formed into thick cakes of about four pounds weight, which are covered over with the leaves of poppy or tobacco, and dried. It is said to be adulterated with various unknown substances, with the extract of the poppy plant procured by boiling, and even with cow-dung. It is purified by reducing it to a pulp with hot water, and strongly pressing it while hot through a linen cloth from its impurities. It is then evaporated by a water-bath, or other gentle heat, to its original consistence. This extract is found to contain a resin, a kind of essential oil, a principle of odour, an essential salt, and a soapy extract.

Opium has a reddish brown colour, a strong peculiar smell, a taste at first nauseous and bitter, but soon becoming acrid, with a slight warmth: and it appears to have some astringency, as a watery tincture of it forms an ink with a chalybeate solution.

The external and internal effects of opium appear to be various in different constitutions, and in the same at different times. By some, when applied to the tongue, the nose, the eye, or any part deprived of skin, it has been said to stimulate, and to induce, in the eye in particular, a slight degree of redness. But if this effect do take place, it is at the utmost extremely inconsiderable, particularly when compared with the effect of volatile alkali, ardent spirit, or a variety of other articles applied to the same organ. And there can be no doubt, that in a very short time the sensibility of the part to which it is applied, even when there has not taken place the slightest mark of preceding stimulus or inflammation, is very considerably diminished. Some allege, that when applied to the skin, it allays pain and

and spasm, procures sleep, and produces all the other salutary or dangerous effects which result from its internal use; while others allege, that thus applied, it has little or no effect whatever. This variety probably arises from differences in the condition of the subcutaneous nerves, and of the sensibility of the surface, as being more or less defended. But there is no doubt that when mixed with caustic, it diminishes the pain, which would otherwise ensue, probably by deadening the sensibility of the part. It sometimes allays the pain from a carious tooth; and a watery solution of it has been used in various ulcers, certain ophthalmias, and virulent gonorrhœa, when pain and inflammation have before that given very great distress.

Opium, when taken into the stomach to such an extent as to have any sensible effect, gives rise to a pleasant serenity of mind, in general proceeding to a certain degree of languor and drowsiness. The action of the sanguiferous system is diminished, the pulse becoming for the most part softer, fuller, and slower than it was before. There often take place swelling of the subcutaneous veins, and sweating; both probably the consequences of a diminution of resistance at the surface, from a diminution of muscular action, as is particularly exemplified in its effect of binding the belly. Opium taken into the stomach in a large dose, gives rise to confusion of head and vertigo. The power of all stimulating causes, as making impressions on the body, is diminished; and even at times, and in situations, when a person would naturally be awake, sleep is irresistibly induced. In still larger doses, it acts in the same manner as the narcotic poison, giving rise, not only to vertigo, headach, tremours, and delirium, but to convulsions also; and these terminating in a state of stupor, from which the person cannot be roused. This stupor is accompanied with slowness of the pulse, and with stertor in breathing; and the scene is terminated in death, attended with the same appearances as take place in apoplexy.

From these effects of opium, in a state of health, it is not wonderful that recourse should have been had to it in disease, as mitigating pain, inducing sleep, allaying inordinate action, and diminishing morbid sensibility. That these effects do result from it is confirmed by the daily experience of every observer; and as answering one or other of these intentions, most, if not all, of the good consequences derived from it in actual practice are to be explained. If, therefore, by a sedative medicine, we mean an article capable of allaying, assuaging, mitigating, and composing, no substance can have a better title to the appellation of sedative than opium.

As answering the purposes of mitigating pain, inducing sleep, allaying inordinate action, and diminishing sensibility, it naturally follows, that opium may be employed with advantage in a great variety of different diseases. Indeed there is hardly any affection in which it may not, from circumstances, be proper; and in all desperate cases, it is the most powerful means of alleviating the miseries of patients.

Some practitioners are averse to its use where there takes place an active inflammation; but others have recourse to it in such cases, even at an early period, especially after blood-letting; and where such affections are attended, not only with pain and spasm, but with

watchfulness and cough, it is often productive of the greatest benefit. Opium, combined with calomel, has of late been extensively employed in every form of active inflammation, and with the greatest success. It is found also to be of very great service in allaying the pain and preventing the symptomatic fever liable to be induced by wounds, fractures, burns, or similar accidents.

In intermittents, it is said to have been used with good effect before the fit, in the cold stage, in the hot stage, and during the interval. Given even in the hot stage, it has been observed to allay the heat, thirst, headach and delirium; to induce sweat and sleep; to cure the disease with the less bark, and without leaving abdominal obstructions or dropsy.

It is often of very great service in fevers of the typhoid type, when patients are distressed with watchfulness or diarrhœa. But where these or similar circumstances do not indicate its use, it is often distressing to patients, by augmenting thirst and constipation.

In smallpox, when the convulsions before eruption are frequent and considerable, opium is liberally used. It is likewise given from the fifth day onwards; and is found to allay the pain of suppuration, to promote the ptyalism, and to be otherwise useful.

In dysentery, after the use of gentle laxatives, or along with them, opium, independently of any effect it may have on the fever, is of consequence in allaying the tormina and tenesmus, and in obviating that laxity of bowels which is so frequently a relick of that disease.

In diarrhœa, the disease itself generally carries off any acrimony that may be a cause, and then opium is used with great effect. Even in the worst symptomatic cases it seldom fails to alleviate.

In cholera and pyrosis it is almost the only thing trusted to. In cholic it is employed with laxatives; and no doubt often prevents ileus and inflammation, by relieving the spasm. Even in ileus, and in incarcerated hernia, it is often found to allay the vomiting, the spasms, the pain, and sometimes to diminish the inflammation, and prevent the gangrene of the strangulated gut. It is given to allay the pain, and favour the descent of calculi, and to relieve in jaundice and dysuria proceeding from spasm.

It is of acknowledged use in the different species of tetanus, affords relief to the various spasmodic symptoms of dyspepsia, hysteria, hypochondriasis, asthma, rabies canina, &c. and has been found useful in some kinds of epilepsy.

Of late, in doses gradually increased to five grains, three, four, or even six times a-day, it has been used in syphilis; and some instances are recorded in which it would seem, that by this remedy alone a complete cure had been obtained: In other instances, however, after the fairest trial for a considerable length of time, it has been found ineffectual; and upon the whole, it seems rather to be useful in combating symptoms, and in counteracting the effects resulting from the improper use of mercury, than in overcoming the venereal virus.

It is found useful in certain cases of threatened abortion and lingering delivery, in convulsions during parturition, in the after pains and excessive flooding.

The only form perhaps necessary for opium, is that

of

of pill; and as it is so soluble in every menstruum, there seems the less occasion for the addition of either gum or soap. This form is more apt to sit on the stomach than any liquid form, but requires rather more time to produce its effects. The administration of opium to the unaccustomed, is sometimes very difficult. The requisite quantity of opium is wonderfully different in different persons, and in different states of the same person. A quarter of a grain will, in one adult, produce effects, which ten times the quantity will not do in another; and a dose that might prove fatal in cholera or colic, would not be perceptible in many cases of tetanus or mania. The lowest fatal dose to the unaccustomed, as mentioned by authors, seems to be four grains; but a dangerous dose is so apt to puke, that it has seldom time to occasion death. When given in too small a dose, it is apt to produce disturbed sleep and other disagreeable consequences; and in some cases, it seems impossible to be made agree in any dose or form. Often, on the other hand, from a small dose, sound sleep and alleviation of pain will be produced, while a larger one gives rise to vertigo and delirium. Some prefer the repetition of small doses, others the giving of a full dose at once. In some, it seems not to have its proper effect till after a considerable time. The operation of a moderate dose is supposed to last, in general, about eight hours from the time of taking it.

Pure opium is partially soluble in water and in rectified spirit, and totally in proof spirit, wine, or vinegar. Water, rubbed with opium, and decanted repeatedly till it come off colourless, yields, on gentle evaporation, an extract which some use and recommend as one of the best preparations of this substance, and which requires to be given in double the dose of common opium.

It is said that alkalies diminish its soporific effects; that the fixed render it diuretic, the volatile determine it to the skin; and that acids destroy its activity almost entirely. But when conjoined with acids, particularly the diluted vitriolic acid, it often sits easily on the stomach, when it would not otherwise be retained, and afterwards produces all its sedative effects.

The chief officinal preparations of opium are, the *opium purificatum*, *pilulæ ex opio*, *pulvis opiatus*, *tinctura opii*, and *tinctura opii camphurata*. Besides this, it enters a great variety of different compositions, as the *pulvis sudorificus*, *balsamum anodynum*, *electuarium japonicum*, *pulvis & creta compositus*, &c.

The occasional bad effects of opium may result from the same power, by which in other states of the system it proves beneficial. The methods, therefore, proposed of correcting these by roasting, fermentation, long-continued digestion, repeated solutions and distillations, have not succeeded.

1016. ARGEMONE, or *Prickly Poppy*.

Three species; viz. *mexicana*, *armeniaca*, *pyrenaica*. W. Indies, Mexico, Pyrenees.

1017. MUNTINGIA.

One species; viz. *calabura*. W. Indies.

1018. SARRACENIA, or *Side-saddle-flower*.

Four species; viz. *flava*, *minor*, *rubra*, *purpurea*. N. America.

1019. NYMPHÆA, or *Water Lily*.

Seven species; viz. * *lutea*, *advena*, * *alba*, *odorata*, *stellata*, *lotus*, *pubescens*. Europe, India, Africa, America.

* N. leaves heart-shaped, very entire; cal. 5-leaved, *lutea* much larger than the petals.—The roots rubbed with milk destroy crickets and cockroaches. Swine eat it. Goats are not fond of it. Cows, sheep, and horses refuse it. An infusion of a pound of the fresh root, to a gallon of water, taken in the dose of a pint night and morning, cured a leprous eruption of the arm.

* N. leaves heart-shaped, very entire; calyx 4-cleft. *alba*.—It extends itself by long runners, which form a root at the end, and send up leafstalks in deep water. The root is bulbous. It is one of the most beautiful of the English plants, and may be propagated by transplanting the bulbous roots in winter. The petals gradually lessen as they approach the centre of the flower, where the outer filaments expanding in breadth, gradually assume the form of petals, as is generally the case in the double flowers of our gardens. The roots are used in Ireland, and in the island of Jura, to dye a dark brown. Swine eat it. Goats are fond of it. Cows and horses refuse it.

1020. BIXA, or *Anotta*.

One species; viz. *orellana*. W. Indies.

1021. SLOANEA, or *Apeiba of the Brazils*.

Three species; viz. *dentata*, *massoni*, *sinemariensis*. Brazil, Caribbee isles.

1022. AUBLETIA.

Four species; viz. *tibourbon*, *petonmo*, *aspera*, *lævis*. Guiana.

1023. MAMMEA, or *Mammee-tree*.

Two species; viz. *americana*, *humilis*. Jamaica, Hispaniola.

1024. OCHNA.

Two species; viz. *squamosa*, *parvifolia*. Africa, E. and W. Indies.

1025. GRIAS.

One species; viz. *cauliflora*. Jamaica.

1026. CALOPHYLLUM.

Two species; viz. *inophyllum*, *calaba*. E. and W. Indies.

1027. SPARRMANNIA.

One species; viz. *africana*. Africa.

1028. TILIA, or *Lime-tree*.

Four species; viz. * *europæa*, *americana*, *pubescens*, *alba*. Eur. N. Amer.

* T. flowers without a nectary; berry 4-celled.—*europæa*. This plant flourishes best on the side of hills, but it will live very well in meadow grounds. It is easily transplanted, and grass grows beneath it: it is useful to form shady walks and clipped hedges. The wood is soft, light, and smooth; close grained, and not subject to the worm. It makes good charcoal for gunpowder and for designers. It is used for leather-cutters boards, and for carved works. It is also employed by the turner. The leaves are dried in some countries as winter food for sheep and goats. Cows eat them in the autumn; but they give a bad taste to the milk. The bark, macerated in water, may be made into ropes

ropes and fishing nets. The flowers are fragrant, and afford the best honey for bees. The sap, inspissated, affords a quantity of sugar.

1029. *LÆTIA*.

Four species; viz. *apetala*, *guidonia*, *thamnia*, *completa*. Jamaica.

1030. *RYANIA*.

One species; viz. *speciosa*.

1031. *GREWIA*.

11 species; viz. *occidentalis*, *populifolia*, *orientalis*, *mallocoeca*, *lævigata*, *glandulosa*, *hirsuta*, *excelsa*, *asiatica*, *tiliæfolia*, *velutina*. Asia, Cape, Amer. S. seas.

1033. *MICROCOS*.

One species; viz. *paniculata*.

1034. *MARILA*.

One species; viz. *racemosa*. West Indies.

1035. *ELÆOCARPUS*.

Five species; viz. *serratus*, *dentatus*, *dicera*, *integrifolius*, *copalliferus*. India, New Zealand.

1036. *LEGNOTIS*.

Two species; viz. *elliptica*, *cassipourea*. West Indies, Guiana.

1037. *MYRODENDRUM*.

One species; viz. *amplexicaule*. Guiana.

1038. *LEMNISCIA*.

One species; viz. *floribunda*. Guiana.

1039. *ASCIUM*.

One species; viz. *violaceum*. Guiana.

1040. *LECYTHIS*.

Eight species; viz. *ollaria*, *minor*, *grandiflora*, *amara*, *zabucajo*, *idatimon*, *parviflora*, *bracteata*. America.

1041. *ALANGIUM*.

Two species; viz. *decapetalum*, *hexapetalum*. Coast of Malabar.

1042. *MENTZELIA*.

Two species; viz. *aspera*, *hispida*. America.

1043. *LOASA*.

Six species; viz. *hispida*, *contorta*, *acanthifolia*, *grandiflora*, *chenopodisia*, *nitida*.

1044. *STERBECHIA*.

One species; viz. *lateriflora*.

1045. *LAGERSTROEMIA*.

Five species; viz. *indica*, *reginæ*, *hirsuta*, *munchausia*, *parviflora*. East Indies, China.

1046. *FREZIERA*.

Two species; viz. *theacoides*, *undulata*.

1047. *THEA*, or *Tea-tree*.

Two species; viz. *bohea*, *viridis*. China, Japan.

The several sorts of tea met with among us, are the leaves of this same genus collected at different times, and cured in a somewhat different manner; the small young leaves, very carefully dried, are the finer green, the older afford the ordinary green and bohea. The two first have a sensible flavour of violets, the other of roses; the former is the natural odour of the plant, the latter, as Neumann observes, is probably introduced by art. Some of the dealers in this commodity in Europe, are not ignorant that bohea tea is imitable by the leaves

of certain plants, artificially tintured and impregnated with the rose flavour. The taste of both sorts is lightly bitterish, subastringent, and somewhat aromatic. The medical virtues attributed to these leaves are sufficiently numerous, though few of them have any foundation; little more can be expected from the common infusions than that of a diluent acceptable to the palate and stomach; the diuretic, diaphoretic, and other virtues for which they have been celebrated, depend more on the quantity of warm fluid, than any particular qualities which it gains from the tea. Nothing arises in distillation from either sort of tea with rectified spirit; water elevates the whole of their flavour.

Good tea, in a moderate quantity, seems to refresh and strengthen; but if taken in a recent highly flavoured state, and in considerable quantity, its use is apt to be succeeded by weakness and tremors, and other similar consequences, resulting from the narcotic vegetables; yet it is highly probable that many of the bad, as well as good effects, said to result from it, are consequences of the warm water.

1048. *CISTUS*, or *Rock-rose*.

79 species; viz. *capensis*, *villosus*, *populifolius*, *laurifolius*, *vaginatus*, *ledon*, *ladaniferus*, *monspeliensis*, *laxus*, *salvifolius*, *heterophyllus*, *incanus*, *creticus*, *parviflorus*, *albidus*, *sericeus*, *hybridus*, *crispus*, *formosus*, *halimifolius*, *elongatus*, *libanotis*, *umbellatus*, *lævipes*, *calycinus*, *fumana*, *canus*, *scabrosus*, *cinereus*, *ocymoides*, *italicus*, *marifolius*, *origanifolius*, *mollis*, *dichotomus*, * *anglicus*, *vinealis*, *celandicus*, *alternifolius*, *globularifolius*, *tuberaria*, *plantagineus*, *serratus*, * *guttatus*, *canadensis*, *punctatus*, *ledifolius*, * *salicifolius*, *niloticus*, *ægyptiacus*, *squamatus*, *lippii*, *sessiliflorus*, *ellipticus*, * *surrejanus*, *polyanthos*, *glaucus*, *nummularius*, *canariensis*, *serpillifolius*, *violaceus*, *linearis*, *lævis*, *strictus*, *glutinosus*, *thymifolius*, *pilosus*, *lavandulifolius*, *racemosus*, *ciliatus*, *angustifolius*, * *helianthemum*, *mutabilis*, *foetidus*, *croceus*, *hirtus*, *apenninus*, * *polifolius*, *arabicus*. Alps, S. Europe, Egypt, Cape.

1049. *VALLEA*.

One species; viz. *stipularis*. New Granada.

1050. *BONNETIA*.

One species; viz. *palustris*. Guiana.

1051. *PROCKIA*.

Four species; viz. *crucis*, *serrata*, *theæformis*, *integrifolia*. Isle of Santa Cruz.

1052. *CORCHORUS*, or *Jews-mallow*.

14 species; viz. *olitorius*, *trilocularis*, *tridens*, *æstuans*, *acutangulus*, *fascicularis*, *capsularis*, *scandens*, *serratus*, *hirsutus*, *japonicus*, *flexuosus*, *hirtus*, *siliquosus*.

1053. *SEGUIERIA*.

One species; viz. *americana*.

1054. *SWARTIA*.

Six species; viz. *simplicifolia*, *grandiflora*, *dodecandra*, *triphylla*, *pinnata*, *alata*. Caribbee isles, Guiana.

ORDER II. DIGYNIA.

1055. *PÆONIA*, or *Peony*.

Seven species; viz. *officinalis*, *corallina*, *albiflora*, *humilis*, *anomala*, *hybrida*, *tenuifolia*. Switz. Ukraine.
The

The *Pæonia officinalis* is cultivated in our gardens on account of the beauty of its flowers. The female peony, which is the largest and most elegant, and for this reason the most common, is the only one with which the shops are supplied. In quality they are scarce sensibly different; and hence they may be taken promiscuously. The roots and seeds of peony have, when recent, an unpleasant scent, approaching to that of the narcotic plants, and a somewhat glutinous subacid taste, with a light degree of bitterness and astringency; the leaves also discover an astringent quality, both to the taste, and by changing chalybeate solutions of a purple colour; the flowers have little taste, and a very faint not agreeable smell. The parts which have chiefly been used for medicinal purposes, are the roots and seeds. These are looked upon as emollient, corroborant, and lightly anodyne, and supposed to be of service in some kinds of obstructions, erosions of the viscera, heat of urine, pains in the kidneys, and the like. The virtue they are chiefly celebrated for, is that of curing spasmodic and epileptic complaints, which many have been absurd enough to believe, that the root of this plant would do by being only worn about the neck.

1056. CURATELLA.

One species; viz. americana. America.

1057. FOTHERGILLA.

One species; viz. alnifolia. N. America.

1058. TRICHOCARPUS.

One species; viz. laurifolia. Guiana.

1059. LACIS.

One species; viz. fluviatilis. Guiana.

ORDER III. TRIGYNIA.

1060. HOMALIUM.

Two species; viz. racemosum, racoubea. Jamaica, Guiana.

1061. DELPHINIUM, or *Larkspur*.

14 species; viz. * *consolida*, *ajacis*, *aconiti*, *ambiguum*, *peregrinum*, *grandiflorum*, *intermedium*, *elatum*, *hybridum*, *exaltatum*, *urceolatum*, *punicum*, *staphisagria*, *pentagynum*. Europe, N. America.

* *D. capsule* single; nectary of one leaf; stem subdivided.—The expressed juice of the petals, with the addition of a little alum, makes a good blue ink; the seeds are acrid and poisonous. When cultivated, the blossoms often become double. Sheep and goats eat it. Horses are not fond of it. Cows and swine refuse it.

1062. ACONITUM, or *Wolfsbane*, *Monkshood*.

15 species; viz. *lycoctonum*, *japonicum*, *pyrenaicum*, *ochroleucrum*, *anthora*, *album*, *septentrionale*, *nappellus*, *neomontanum*, *tauricum*, *volubile*, *cornuum*, *variegatum*, *cammarum*, *uncinatum*. Europe, N. America, Japan.

ORDER IV. TETRAGYNIA.

1063. WINTERA, or *Winter's Bark*.

Three species; viz. *aromatica*, *granadensis*, *axillaris*. New Granada, S. seas.

1064. TETRACERA.

12 species; viz. *sarmentosa*, *tomentosa*, *aspera*, *doliocarpus*, *stricta*, *calinea*, *obovata*, *nitida*, *eurandra*, *volubilis*, *lævis*, *alnifolia*. Ceylon, West Indies, South sea isles.

1065. CARYOCAR.

Three species; viz. *nuciferum*, *butyrosum*, *tomentosum*. Barbary.

1066. WAHLBOMIA.

One species; viz. *indica*.

1067. CIMICIFUGA.

One species; viz. *fœtida*. Siberia.

ORDER V. PENTAGYNIA.

1068. AQUILEGIA, or *Columbine*.

Five species; viz. *viscosa*, * *vulgaris*, *alpina*, *canadensis*, *viridiflora*.

* *A. nectaris* bowed inwards, nearly equal to the petals; leaflets all on leafstalks; lobes distant, roundish, bluntish.—The beauty of its flowers has long introduced it into our flower borders. Goats eat it. Sheep are not fond of it. Cows, horses, and swine refuse it.

1069. NIGELLA, or *Fennel-flower*.

Five species; viz. *damascena*, *sativa*, *arvensis*, *hispanica*, *orientalis*. Germany, S. Europe, Egypt.

1070. REAUMURIA.

Two species; viz. *verniculata*, *hypericoidea*. Sicily, Syria, Egypt.

ORDER VI. POLYGYNIA.

1071. DILLENIA.

Eight species; viz. *scandens*, *integra*, *speciosa*, *elliptica*, *serrata*, *pentagyna*, *retusa*, *dentata*. India.

1072. ILLICIUM, or *Aniseseed-tree*.

Two species; viz. *anisatum*, *floridanum*. Florida, China, Japan.

1073. LIRIODENDRON, or *Tulip-tree*.

Four species; viz. *tulipifera*, *coco*, *figo*, *liliifera*. Amboyna, N. America.

1074. MAGNOLIA, or *Laurel-leaved Tulip-tree*.

Eight species; viz. *grandiflora*, *plumieri*, *glauca*, *obovata*, *tomentosa*, *acuminata*, *tripetala*, *auriculata*. N. America.

1075. NELUMBIUM.

Four species; viz. *speciosum*, *luteum*, *pentapetalum*, *reniforme*.

1076. MICHELIA.

Two species; viz. *champæa*, *tsiampæa*. Indies.

1077. UVARIA.

11 species; viz. *zeylanica*, *lanceolata*, *cerusoides*, *suberosa*, *tomentosa*, *odorata*, *monosperma*, *lutea*, *ligularis*, *longifolia*, *japonica*. Ceylon, Japan, Jamaica, Surinam.

1078. ANNONA, or *Custard-apple*.

18 species; viz. *muricata*, *tripetala*, *squamosa*, *paludosa*, *longifolia*, *punctata*, *hexapetala*, *palustris*, *glabra*, *triloba*,

triloba, asiatica, ambotay, africana, pygmaea, obovata, grandiflora, amplexicaulis. Egypt, E. and W. Indies, America.

1079. XYLOPIA, or *Bitter-wood*.

Three species; viz. muricata, frutescens, glabra. America.

1080. UNONA.

Four species; viz. discreta, tomentosa, discolor, concolor.

1081. ANEMONE, or *Wind-flower*.

29 species; viz. hepatica, patens, cernua, vernalis, halleri, *pulsatilla, *pratensis, alpina, apiifolia, coronaria, hortensis, palmata, sibirica, baldensis, sylvestris, virginiana, decapetala, triternata, pensylvanica, dichotoma, trifolia, quinquefolia, *nemorosa, *apennina, reflexa, *ranunculoides, narcissiflora, umbellata, thalictroides. Europe, N. America.

pratensis. * A. leaves double-winged; petals the ends turned back.—This is the most acrid of the anemonies; and is recommended by Dr Stoerk in the quantity of half an ounce of the distilled water, or five grains of the extract, twice or thrice a-day, in venereal nodes, pains, ulcers with caries, chronic eruptions, amenorrhœa, various chronic affections of the eye, particularly blindness from obscurities of the cornea. Its common effects are nausea or vomiting, an augmented discharge of urine, diarrhœa, and increased pain at first in the affected part.

pulsatilla. * A. leaves doubly winged; petals straight.—The whole plant is acrid, and blisters the skin. The juice of the petals stains paper green. Goats and sheep eat it. Horses, cows, and swine, refuse it.

nemorosa. * A. seeds pointed; leaflets snipt; petals roundish; stem mostly 2-flowered.—The flowers fold up in a curious manner against rain. The whole plant is acrid. When sheep are unaccustomed to eat it, it brings on a bloody flux. Goats and sheep eat it. Horses, cows, and swine, refuse it. This plant is sometimes found with yellow dots on the under surface of the leaves.

1082. ATRAGENE.

Six species; viz. alpina, ochotensis, japonica, capensis, tenuifolia, zeylanica. Alps of Europe, Ceylon, Cape.

1083. CLEMATIS, or *Virgin's-bower*.

24 species; viz. cirrhosa, florida, viticella, viorna, crispa, calycina, orientalis, glauca, hexapetala, triflora, virginiana, japonica, trifoliata, dioica, indivisa, paniculata, *vitalba, chinensis, flammula, maritima, angustifolia, erecta, ochroleuca, integrifolia. Europe, N. America.—The *clematis erecta* is introduced into but few of the modern pharmacopœias, and has never been found in Britain. As well as many other active articles, supposed to be of a poisonous nature, it was some time ago recommended to the attention of practitioners by Dr Stoerk of Vienna. Its leaves and flowers are so acrid as to blister. Dr Stoerk recommends it in venereal, cancerous, and other cutaneous affections, in those headaches, pains of the bones, and wastings of the habit, the consequences of *lues venerea*. Externally the acrid powder is sprinkled on the ulcers, and the forms for internal use are those of infusion and extract.

1084. THALICTRUM, or *Meadow-rue*.

23 species; viz. *alpinum, foetidum, tuberosum, VOL. IV. Part I.

cornuti, dioicum, elatum, *majus, medium, *minus, rugosum, sibiricum, squarrosum, purpurascens, angustifolium, *flavum, nigricans, simplex, lucidum, aquilegifolium, contortum, petaloideum, styloideum, japonicum. Europe, N. America.

* T. stem furrowed, leafy; leaflets acute, 3-cleft; *pa-flavum*. nicle much branched, upright, compact; flowers upright.—A cataplasm made of the leaves has been known to give relief in the sciatica. The root dyes wool yellow. Cows, horses, goats, and sheep, eat it. Swine are not fond of it.

1085. ADONIS, or *Pheasants Eye*.

Eight species; viz. *æstivalis, *autumnalis, flamma, vernalis, apennina, filia, capensis, vesicatoria. S. Europe, Cape.

1086. RANUNCULUS, or *Crow-foot*.

61 species; viz. *flammula, *reptans, *lingua, nodiflorus, *gramineus, pyrenæus, parnassifolius, ophioglossoides, amplexicaulis, bullatus, saluginosus, *ficaria, frigidus, thora, creticus, cassubicus, *auricomus, abortivus, trilobus, *sceleratus, aconitifolius, platanifolius, spicatus, illyricus, fiabellatus, asiaticus, japonicus, rutæfolius, glacialis, seguieri, nivalis, montanus, gonani, alpestris, lapponicus, hyperboreus, monopeliacus, pensylvanicus, ternatus, *bulbosus, philonotis, polyrhizos, *repens, polyanthemus, *acris, cappadocicus, lanuginosus, chærophyllus, millefoliatus, parvulus, oxyspermus, *arvensis, muricatus, *parviflorus, orientalis, grandiflorus, falcatus, polyphyllus, *hederaceus, *aquatilis, fluviatilis. Europe, Asia, N. America.

* R. leaves heart-shaped, angular, on leaf-stalks; stem *ficaria*. 1-flowered; flowers with eight petals; calyx with three leaves.—This is a very small plant, found in most meadows, and by hedge sides. The roots consist of slender fibres with some little tubercles among them, which are supposed to resemble the hæmorrhoids; from thence it has been concluded, that this root must needs be of wonderful efficacy for the cure of that distemper. To the taste it is little other than mucilaginous; and although still retained in several of the foreign pharmacopœias, it is hardly in use in this country.

* R. leaves egg-spear-shaped, on leaf-stalks; stem *flammula*. clining.—This plant is very acrid; applied externally, it inflames and blisters the skin. Horses eat it. Cows, sheep, goats, and swine refuse it. Its acrimony rises in distillation. Some years ago, a man travelled in several parts of England administering vomits, which, like white vitriol, operated the instant they were swallowed. The distilled water of this plant was his medicine. It is said, that in the case of poison being swallowed, or other circumstances occurring, in which it is desirable to make a patient vomit instantaneously, it is preferable to any other medicine yet known, and does not excite those painful contractions in the upper part of the stomach, which the white vitriol sometimes does, thereby defeating the intention for which it was given.

* R. lower leaves hand-shaped, the upper fingered; *sceleratus*. fruit oblong.—The whole plant is very corrosive; and beggars are said to use it to ulcerate their feet, which they expose in that state to excite compassion. Goats eat it. Cows, horses, and sheep refuse it.

* R. cal. expanding; fruit-stalks cylindrical; leaves *acris*. with three divisions, and many clefts, the uppermost

strap-shaped.—Sheep and goats eat it. Cows, horses, and swine refuse it. Cows and horses leave this plant untouched, though their pasture be ever so bare. It is very acrid, and easily blisters the skin.

arvensis. * R. seeds prickly; upper leaves doubly compound, strap-shaped.—It has lately been said that cows, horses, and sheep, in Italy, eat it greedily, though it is so acrid as to poison the latter. Three ounces of the juice killed a dog in four minutes. Its growing chiefly, if not solely, in corn-fields where cattle are excluded, may possibly be the reason why we have not heard of mischief being done by it in this country.

1087. TROLLIUS, or *Globe-ranunculus*.

Two species; viz. *europæus, asiaticus. Europe, Asia.

1088. ISOPYRUM.

Three species; viz. *fumarioides*, *thalictroides*, *aquilegoides*. Siberia, Alps of Austria, Italy.

1089. HELLEBORUS, or *Black Hellebore*.

Eight species; viz. *hyemalis*, *ranunculinus*, *niger*, **viridis*, *orientalis*, **foetidus*, *lividus*, *trifolius*. Austria, Italy, Canada.

foetidus. * H. stem many-flowered; leafy; leaves bird-footed. *Bearsfoot*, or *Helleboraster*.—The leaves of this plant, taken in several different forms, have been by some recommended as a very powerful anthelmintic. They are particularly extolled by Dr Bissett, in his essay on the medical constitution of Great Britain, especially under the form of syrup, made by moistening the leaves of the fresh herb in vinegar, and then pressing out their juice, which was formed into a syrup with coarse sugar. Of this syrup, Dr Bissett gave to children from two to six years of age, one tea-spoonful at bed-time, and another in the morning, for two or three days successively. The dose was increased or diminished according to the strength of the patient; and in this way he found it very successful in the expulsion of lumbrici.

Where the helleboraster is to be employed, this form is perhaps the best, and we doubt not that it may succeed where others have failed; but it should not, we apprehend, be employed till safer anthelmintics have been tried in vain. For we have heard of some instances where the imprudent administration of it has been attended even with fatal consequences.

The species called *helleborus niger*, black hellebore or melampodium, grows wild in the mountainous parts of Switzerland, Austria, and Stiria; the earliness of its flowers, which sometimes appear in December, has gained it a place in our gardens. In some parts of Germany, a species of black hellebore has been made use of, which not unfrequently produced violent and sometimes deleterious effects; this the Wirttemberg college particularly caution against, though without mentioning any marks by which it may be distinguished, or even giving the precise name of the plant. It appears to be the foetid hellebore of Linnæus, called in England, where it grows, setterwort, settelwort, or bastard hellebore; the roots of this may be distinguished from the officinal sort by their being less black. The roots of the poisonous aconites resemble in appearance those of the black hellebore; and in the Breslaw collections we find some instances of fatal effects occasioned by mistaking the former for the latter:

these also are happily discoverable by their colours; the *aconitum* being lighter coloured than even the palest of the black hellebores. The faculty of Paris, by allowing the use of one of the paler hellebores (the green-flowered which grows wild in England, and is called by our farriers peg-root) have in some degree deprived the shops of the benefit of this criterion. Since, therefore, the two noxious roots which the buyer is most apt to mistake for this, are distinguishable from it by their colour, but have no other external mark by which they may be with certainty known, particular regard ought to be had to this circumstance; only the deepest black being chosen, and all the paler roots rejected.

The taste of the hellebore is acrid and bitter. Its acrimony is first felt on the tip of the tongue, and then spreads immediately to the middle, without being much perceived on the intermediate part; on chewing it for a few minutes the tongue seems benumbed and affected with a kind of paralytic stupor, as when burnt by eating any thing too hot; the fibres are more acrimonious than the head of the root from which they issue. Black hellebore root, taken from fifteen grains to half a dram, proves a strong cathartic, and as such has been celebrated for the cure of maniacal and other disorders proceeding from what the ancients called the *atrabilis*; in these cases medicines of this kind are doubtless occasionally of use, though they are by no means possessed of any specific power. It does not however appear, that our black hellebore acts with so much violence as that of the ancients, whence many have supposed it to be a different plant; and indeed, the descriptions which the ancients have left us of their hellebore, do not agree to any of the sorts usually taken notice of by modern botanists. Another species has been discovered in the Eastern countries, which Tournefort distinguishes by the name of *black oriental hellebore*, with a large leaf, a lofty stem, and purplish flower; and supposes to be the true ancient hellebore, from its growing in plenty about Mount Olympus, and in the island of Anticyra, celebrated of old for the production of this antimaniacal drug; he relates that a scruple of this sort given for a dose, occasioned convulsions.

Our hellebore is at present looked upon principally as an alterative; and in this light is frequently employed in small doses, for attenuating viscid humours, promoting the uterine and urinary discharges, and opening inveterate obstructions of the remoter glands; it often proves a very powerful emmenagogue in plethoric habits, where steel is ineffectual or improper. An extract made from this root with water, is one of the mildest, and, for the purposes of a cathartic, the most effectual preparations of it: this operates sufficiently, without occasioning the irritation which the pure resin is accompanied with. A tincture drawn with proof spirit contains the whole virtue of the hellebore, and seems to be one of the best preparations of it when designed for an alterative; this tincture and the extract are kept in shops.

The melampodium is the basis of Bacher's tonic pills for the dropsy. The root is ordered to be macerated in rectified spirit of wine; the liquor expressed is repeatedly mixed with water, and duly evaporated. This is made up into pills, with an extract of myrrh and

and powder of *carduus benedictus*. They are said to be cathartic and diuretic, and at the same time strengtheners of the solids.

1090. *CALTHA*, or *Marsh-marygold*.

Two species; viz. * *palustris*, natans. Europe. *palustris*. * C. the flowers of this plant gathered before they expand, and preserved in salted vinegar, are a good substitute for capers. The juice of the petals, boiled with a little alum, stains paper yellow. The remarkable yellowness of butter in the spring has been supposed to be caused by this plant: but cows will not

eat it, unless compelled by extreme hunger, and then, as some say, it occasions such an inflammation that they generally die. Upon May-day the country people in England strew the flowers before their doors.

1091. *HYDRASTIS*, or *Yellow-root*.

One species; viz. *canadensis*. Carolina, Canada.

In the class *Polyandria* are

85 Genera, including 563 Species, of which 50 are found in Britain.

CLASSIS XIV.

DIDYNAMIA (D).

ORDO I. GYMNOSPERMIA.

Sect. I. *Calyces subquinquefidi*.

- 1103. *PERILLA*. Styli duo. Stam. distantia.
- * 1105. *GLECOMA*. Antherarum paria cruciata.
- 1096. *HYSSOPUS*. Filam. distantia, recta. Cor. ringens, labio inferiore tripartito, subcrenato.
- 1098. *ELSHOLTZIA*. Filam. distantia, recta. Cor. ringens, labio inferiore indiviso.
- 1101. *BYSTROPOGON*. Filam. distantia, recta. Cor. ringens, labio inferiore trilobo.
- * 1102. *MENTHA*. Filam. distantia, recta. Cor. subaequalis.
- 1104. *HYPTIS*. Filam. declinata. Cor. ringens; labio sup. bifido, inferiore trifido, lacinia media concava.
- 1100. *SIDERITIS*. Stigma alterum vaginans alterum.
- 1099. *LAVANDULA*. Corolla resupinata.
- * 1093. *TEUCRIUM*. Cor. labium superius nullum, sed fissura loco labii.
- * 1092. *AJUGA*. Cor. lab. superius staminibus brevius.
- 1113. *PHLOMIS*. Cor. lab. superius hirtum, compressum.
- * 1112. *LEONURUS*. Cor. labium superius erectum, indivisum, planum. Stamina fauce longiora.
- 1108. *BETONICA*. Cor. lab. superius planum, ascendens, tubo cylindrico. Stam. longitudine faucis.
- * 1106. *LAMIUM*. Cor. lab. inferius utrinque dente setaceo.
- * 1107. *GALEOPSIS*. Cor. lab. inferius lateribus reflexum. Stam. deflorata ad latera deflexa.

CLASS XIV.

DIDYNAMIA, OR TWO STAMENS LONGER.

ORDER I. GYMNOSPERMIA, or Seeds naked.

Sect. I. *The Calyces or Cups nearly 5-cleft*.

- P. Styles 2. Stamens far asunder.
- * G. Pairs of anthers cross-shaped.
- H. Filaments asunder, straight. Cor. gaping, with the inferior lip 3-cleft, nearly scalloped.
- E. Filaments far asunder, straight. Cor. gaping, with the inferior lip undivided.
- B. Filaments far asunder and straight. Cor. gaping with the inferior lip 3-lobed.
- * M. Filaments far asunder and straight. Cor. nearly equal.
- H. Filam. declining. Cor. gaping; the superior lip 2-cleft, the inferior 3-cleft, the middle segments concave.
- S. The one stigma sheathing the other.
- L. Cor. horizontally turned upside down.
- * T. Cor. with no superior lip, but a fissure in place of a lip.
- * A. Cor. having the upper lip shorter than the stamens.
- P. Cor. the upper lip rough-haired, compressed.
- * L. Cor. the upper lip erect, undivided, flat. The stamens longer than the mouth.
- B. Cor. the upper lip flat, ascending with a cylindrical tube. Stamens of the length of the mouth.
- * L. Cor. the inferior lip on both sides with a bristle-shaped tooth.
- * G. Cor. the inferior lip bent back to the sides. The stamens bent to the sides after the anthers have shed their pollen.

D d 2

1097.

(D) The essential character of this class consists of the flowers of the plants which it contains having four stamens, two of which are long, and two short. The short stamens stand next together, and adjoining to the style of the pistil. They are covered by the corolla or blossom, which is irregular in its shape.

* 1097. *NEPETA*. Cor. lab. inferius crenatum. Faux margine reflexo.

1094. *SATUREIA*. Cor. laciniis subæqualibus. Stam. remota.

* 1110. *BALLOTA*. Cal. 10-striatus. Cor. labium superius fornicatum.

1111. *MARRUBIUM*. Cal. 10-striatus. Cor. lab. superius rectum.

1114. *MOLUCCELLA*. Cal. campanulatus. Corolla amplior, dentibus spinosis.

Verbena species aliquot. Monarda didyma.

Sect. II. *Calyces bilabiati.*

* 1124. *SCUTELLARIA*. Cal. fructiferus, operculatus.

* 1117. *THYMUS*. Cal. fauce villis clausus.

1122. *PLECTRANTHUS*. Cor. resupinata basi sursum calcarata. Filamenta subulata.

1121. *OCIMUM*. Cor. resupinata basi nuda. Filamenta bina, basi processu.

* 1125. *PRUNELLA*. Filamenta omnia apice bifurca.

1126. *CLEONIA*. Filamenta bifurca, apici altero antherifero. Stigma quadrifidum.

1123. *TRICHOSTEMA*. Filamenta longissima.

1119. *DRACOCEPHALUM*. Corollæ faux inflato-dilatata.

* 1116. *ORIGANUM*. Strobilus calyces colligens.

* 1115. *CLINPODIUM*. Involucrum calyces colligens.

1095. *THYMBRA*. Calyx utrinque linea ciliata carinatus. Stylus semibifidus. Cor. labia plana.

* 1120. *MELITTIS*. Cal. tubo corolla amplior. Corollæ lab. superius planum, integrum. Antheræ cruciatæ.

* 1118. *MELISSA*. Cal. angulatus, scariosus, labio superiore adscendente.

1127. *PRASIMUM*. Semina baccata.

1128. *PHRYMA*. Sem unicum. Cor. ringens.

1129. *SELAGO*. Sem. unicum. Corollæ limbo quinquefido inæquali.

ORDO II. ANGIOSPERMIA.

Sect. I. *Calyces indivisi.*

1185. *ÆGINETIA*. Caps. multilocularis. Cor. campanulata. Cal. indivisus, spathaceus.

1161. *TANÆCIUM*. Bacca corticosa. Cor. tubulosa, subæqualis. Cal. tubulosus, truncatus.

Sect. II. *Calyces bifidi.*

1184. *OBOLARIA*. Caps. 1-locularis. Cor. campanulata, 4-fida. Filam. ex divisuris corollæ.

* 1186. *OROBANCHE*. Caps. 1-locularis. Cor. subæqualis, 4-fida. Glandula sub basi germinis.

1172. *HEBENSTREITIA*. Caps. 2-sperma. Cor. 1-labiata, 4-fida. Stam. margini laterali corollæ inserta.

1149. *TORENIA*. Caps. 2-locularis. Cor. personata. Filam. duo bifida.

1205. *CASTILLEIA*. Caps. 2-locularis. Cor. bilabiata, labio inferiore brevissimo. Cal. unilabiatus, bidentatus.

* *N.* Cor. the inferior lip scooped. The mouth with a border bent back.

S. Cor. with segments nearly equal. Stamens remote.

* *B.* Cal. 10-striated. Cor. the superior lip vaulted.

M. Cal. 10-striated. Cor. the upper lip straight.

M. Cal. bell-shaped. Cor. large, with prickly teeth.

Sect. II. *Calyces 2-lipped.*

* *S.* Cal. fruit-bearing, covered with a lid.

* *T.* Cal. with a mouth shut with soft hairs.

P. Cor. horizontally turned upside down at the base, upwards, having a spur. Filaments awl-shaped.

O. Cor. naked, horizontally turned up at the base. Filaments 2, with an enlargement at the base.

* *P.* Filaments all with a 2-forked top.

C. Filaments 2-forked. The alternate apex bearing an anther. Stigma 4-cleft.

T. Filaments very long.

D. Mouth of the cor. inflato-dilated.

* *O.* A cone collecting the calyces.

* *C.* Involucrum collecting the cups.

T. Cal. keeled on both sides with a fringed line. Style half 2-cleft. Cor. flat lips.

* *M.* Cal. with a tube larger than the cor. the upper lip of the cor. flat, entire. Anthers cross-shaped.

* *M.* Cor. angled, skinny, the upper lip ascending.

P. Seeds berry-like.

P. Seed 1. Cor. gaping.

S. Seed 1. Border of the cor. unequal, 5-cleft.

ORDER II. ANGIOSPERMIA, or with Seeds in a Capsule.

Sect. I. *Cups undivided.*

Æ. Caps. many-celled. Cor. bell-shaped. Cal. undivided, chaffy.

T. Berry barked. Cor. tubular, nearly equal. Cal. tubular, lopped.

Sect. II. *Cups two-cleft.*

O. Caps. 1-celled. Cor. bell-shaped, 4-cleft. Filam. from the divisions of the corolla.

* *O.* Caps. 1-celled. Cor. nearly equal, 4-cleft. Gland under the base of the germen or seed-bud.

H. Caps. 2-seeded. Cor. 1-lipped, 4-cleft. Stamens inserted in the lateral margin of the cor.

T. Caps. 2-celled. Cor. gaping. Filam. 2, two-cleft.

C. Caps. 2-celled. Cor. 2-lipped, under lip very short. Cal. 1-lipped, 2-toothed.

1211. ACANTHUS. Caps. 2-locularis. Cor. 1-labiata, 3-fida. Antheræ villosæ.
 1164. PREMNA. Drupa 1-sperma, nuce 4-loculari. Cor. 4-fida, inæqualis.
 1160. CRESCENTIA. Bacca 1-locularis, corticosa. Cor. tubo campanulata. Germen pedicellatum.

Sect. III. *Calyces trifidi.*

1159. HALLERIA. Bacca 2-locul. Cor. 4-fida, labio superiore longiore.

Sect. IV. *Calyces quadrifidi.*

1189. LIPPIA. Caps. 2-sperma, 2-locularis. Cor. hypocraterif. Cal. compressus.
 1134. LATHRÆA. Caps. 1-locularis. Cor. personata. Glandula sub germine.
 1130. BARTSIA. Caps. 2-locularis. Cor. personata. Cal. coloratior.
 * 1132. EUPHRASIA. Caps. 2-locularis. Cor. personata. Antheræ inferiores spinosæ.
 * 1131. RHINANTHUS. Caps. 2-locularis. Cor. personata. Caps. compressa.
 * 1133. MELAMPYRUM. Caps. 2-locularis. Cor. personata. Sem. bina gibbosa.
 1135. SCHWALBEA. Caps. 2-locularis? Cor. personata. Cal. laciniæ superiores sensim minores.
 1196. BARLERIA. Caps. 2-locularis. Cor. infundibul. Sem. bina. Caps. elastica.
 1168. LOESELIA. Caps. 3-locular. Cor. laciniis secundis. Stam. petalo adversa.
 1162. GMELINA. Drupa nuce 2-locul. Cor. bilabiata. Antheræ binæ crassiores, bipartitæ.
 1165. LANTANA. Drupa nuce 2-locul. Cor. hypocraterif. Stigma uncinatum.

Sect. V. *Calyces quinquefidi.*

1209. AVICENNIA. Caps. 1-locularis, coriacea. Cor. labio superiore quadrato. Sem. unicum.
 1136. TOZZIA. Caps. 1-locul. Cor. hypocraterif. Sem. unicum.
 1179. PHAYLOPSIS. Caps. 1-locularis. Cor. ringens, labio superiore minimo. Semina quatuor.
 * 1178. LIMOSELLA. Caps. 1-locul. Cor. campan. regular. Sem. plurima.
 1175. BROWALLIA. Caps. 1-locul. Cor. hypocraterif. Sem. numerosa.
 1151. BRUNFELSIA. Caps. 1-locul. baccata. Cor. infundibuliformis.
 1193. HOLMSKIOLDIA. Caps. 1-locul.? Cor. ringens. Cal. ampliatus.
 1170. LINDERNIA. Caps. 1-locular. Cor. ringens. Stam. inferiora dente terminali.
 1182. CONOBEA. Caps. 1-locularis. Cor. ringens. Stylus pilosus.
 1210. COLUMNEA. Caps. 1-locularis. Cor. ringens, supra basin gibba. Antheræ connexæ.
 1180. VANDELLIA. Caps. 1-locul. Cor. ringens. Stam. inferiora disco labii enata.
 1181. RUSSELLIA. Caps. 1-locularis. Cor. bilabiata.
 1213. ALECTRA. Caps. 2-locularis didyma. Cor. infundibuliformis. Filamenta barbata. Semina solitaria.

- A. Caps. 2-celled. Cor. 1-lipped, 3-cleft. Anthers woolly.
 P. Drupe 1-seeded, with a 4-celled nut. Cor. 4-cleft, unequal.
 C. Berry 1-celled, bark-like. Cor. with a bell-shaped tube. Germen on a pedicel or footstalk.

Sect. III. *Cups 3-cleft*

- H. Berry 2-celled. Cor. 4-cleft; the upper lip longer.

Sect. IV. *Cups 4-cleft.*

- L. Caps. 2-seeded, 2-celled. Cor. salver-shaped. Cal. flattened.
 L. Caps. 1-celled. Cor. gaping. A gland under the seed-bud.
 B. Caps. 2-celled. Cor. gaping. Cal. coloured.
 * E. Caps. 2-celled. Cor. gaping. Inferior anthers thorny.
 * R. Caps. 2-celled. Cor. gaping. Caps. compressed.
 * M. Caps. 2-celled. Cor. gaping. Seeds 2, bulging.
 S. Caps. 2-celled? Cor. gaping. Upper segments of the cor. gradually less.
 B. Caps. 2-celled. Cor. funnel-shaped. Seeds 2. Caps. elastic.
 L. Caps. 3-celled. Cor. with segments pointing one way. Stamens opposite to the petals.
 G. Drupe, with a 2-celled nut. Cor. 2-lipped. Two coarse anthers, 2-parted.
 L. Drupe, with a 2-celled nut. Cor. salver-shaped. Stigma hooked at the end.

Sect. V. *Cups 5-cleft.*

- A. Caps. 1-celled, leather-like. Cor. with an upper lip squared. Seed 1.
 T. Caps. 1-celled. Cor. salver-shaped. Seed 1.
 P. Caps. 1-celled. Cor. gaping, upper lip small. Seeds 4.
 * L. Caps. 1-celled. Cor. bell-shaped, regular. Seeds many.
 B. Caps. 1-celled. Cor. salver-shaped. Seeds numerous.
 B. Caps. 1-celled, berry-like. Cor. funnel-shaped.
 H. Caps. 1-celled? Cor. gaping. Cal. enlarged.
 L. Caps. 1-celled. Cor. gaping. Inferior stamens with a terminal tooth.
 C. Caps. 1-celled. Cor. gaping. Style hairy.
 C. Caps. 1-celled. Cor. gaping, bulged above the base. Anthers connected.
 V. Caps. 1-celled. Cor. gaping. Inferior stamens rising from the surface of the lip.
 R. Caps. 1-celled. Cor. 2-lipped.
 A. Caps. 2-celled, double. Cor. funnel-shaped. Filam. bearded. Seeds solitary.

1143. *GESNERIA*. Caps. 2-locul. Cor. supera incurvata.
1141. *CYRILLA*. Caps. 2-locularis. Cor. supera declinata. Rudimentum filamentum quinti.
- * 1152. *SCROPHULARIA*. Caps. 2-locul. Cor. resupinata. Lab. segmento intermedio interno.
1183. *STERNODIA*. Caps. 2-locul. Cor. inæqualis. Stam. bifida. Antheræ geminæ.
1190. *ACHIMENES*. Caps. 2-locularis. Cor. subæqualis, 4-fida.
1153. *CELSIA*. Caps. 2-locul. Cor. rotata. Filamenta lanata.
1154. *HEMIMERIS*. Caps. 2-locular. Cor. rotata, ringens.
- * 1177. *SIBTHORPIA*. Caps. 2-locul. Cor. rotata. Stam. 2, et 2 approximata.
1169. *CAPRARIA*. Caps. 2-locul. Cor. campanulata. Stigm. cordatum, bivalve.
- * 1155. *DIGITALIS*. Caps. 2-locularis. Cor. campan. subtus ventricosa. Stam. declinata.
1157. *BIGNONIA*. Caps. 2-locul. Cor. campanulata. Sem. alata, imbricata. Rudimentum filamentum quinti.
1156. *INCARVILLEA*. Caps. 2-locularis. Cor. infundibuliformis. Semina alata. Rudimentum filamentum quinti nullum.
1195. *RUELLIA*. Caps. 2-locul. Cor. campanulata. Stam. per paria approximata.
1174. *BUCHNERA*. Caps. 2-locul. Cor. hypocraterif. Limbi laciniis obcordatis æqualibus.
1173. *ERINUS*. Caps. 2-locul. Cor. bilabiata; labio superiore brevissimo, reflexo.
1163. *PETREA*. Caps. 2-locul. Cor. rotata, calyce colorata minor. Sem. solitaria.
1171. *MANULEA*. Caps. 2-locul. Cor. limbus 5-partitus; lacinia infima profundiore, reflexa.
- * 1144. *ANTIRRHINUM*. Caps. 2-locul. Cor. personata, subtus nectario prominente.
1145. *ANARRHINUM*. Caps. 2-locularis, multivalvis. Cor. bilabiata, fauce pervia.
1138. *GERARDIA*. Caps. 2-locul. Cor. hypocrat. inæqual. Caps. basi dehiscens.
- * 1137. *PEDICULARIS*. Caps. 2-locul. Cor. personata. Sem. tunicata.
1194. *MIMULUS*. Caps. 2-locul. Cor. personata. Cal. prismaticus.
1188. *DODARTIA*. Caps. 2-locul. Cor. personata; labio superiori brevi adscendente.
1139. *CHELONE*. Caps. 2-locularis. Cor. personata, inflata, clausa. Rudiment. filamentum quinti glabrum.
1140. *PENTSTERNON*. Caps. 2-locularis. Cor. bilabiata, ventricosa. Rudimentum filamentum quinti barbatum.
1191. *SESAMUM*. Caps. 2-locul. Cor. campan. inæqual. Rudim. filam. quinti.
1142. *GLOXINIA*. Caps. semibilocularis. Cor. campanulata. Rudiment. quinti filamentum cum reliquis receptaculo insertum.
1147. *TOURETTIA*. Caps. 4-locularis, hamata. Cor. unilabiata.
1148. *MARTYNIA*. Caps. 4-locul. Cor. campanulata. Rudim. filam. quinti.
1204. *MAURANDIA*. Capsulæ 2, coalitæ apice, semi-

- G. Caps. 2-celled. Cor. bent inwards above.
- C. Caps. 2-celled. Cor. at the upper part bent downwards. Rudiment of a fifth filament.
- * S. Caps. 2-celled. Cor. horizontally turned upside down. Lip, with an internal intermediate segment.
- S. Caps. 2-celled. Cor. unequal. Stamens 2-cleft. Anthers in pairs.
- A. Caps. 2-celled. Cor. nearly equal, 4-cleft.
- C. Caps. 2-celled. Cor. wheel-shaped. Filaments cottony.
- H. Caps. 2-celled. Cor. wheel-shaped, gaping.
- * S. Caps. 2-celled. Cor. wheel-shaped. Stam. 2, and 2 approximated.
- C. Caps. 2-celled. Cor. bell-shaped. Stigma heart-shaped, 2-valved.
- * D. Caps. 2-celled. Cor. bell-shaped, underneath bellied. Stamens declining.
- B. Caps. 2-celled. Cor. bell-shaped. Seeds winged, tiled. Rudiment of a fifth filament.
- I. Caps. 2-celled. Cor. funnel-shaped. Seeds winged. No rudiment of a fifth filament.
- R. Caps. 2-celled. Cor. bell-shaped. Stamens near together by pairs.
- B. Caps. 2-celled. Cor. salver-shaped. Segments of the border equal, inversely heart-shaped.
- E. Caps. 2-celled. Cor. 2-lipped; upper lip very short, turned back.
- P. Caps. 2-celled. Cor. wheel-shaped, less than the coloured cal. Seeds solitary.
- M. Caps. 2-celled. Cor. with a 5-parted border, lower segment deeper, bent back.
- * A. Caps. 2-celled. Cor. gaping, a nectary prominent from underneath.
- A. Caps. 2-celled, many-valved. Cor. 2-lipped, with an open mouth.
- G. Caps. 2-celled. Cor. salver-shaped, unequal. Caps. open at the base.
- * P. Caps. 2-celled. Cor. gaping. Seeds coated.
- M. Caps. 2-celled. Cor. gaping. Cal. prismatic.
- D. Caps. 2-celled. Cor. gaping; upper short lip ascending.
- C. Caps. 2-celled. Cor. gaping, inflated, shut. Smooth rudiment of a fifth filament.
- P. Caps. 2-celled. Cor. 2-lipped, bellied. Barbed rudiment of a fifth filament.
- S. Caps. 2-celled. Cor. bell-shaped, unequal. Rudim. of a fifth filament.
- G. Caps. half 2-celled. Cor. bell-shaped. Rudim. of a fifth filam. inserted with the rest in the receptacle.
- T. Caps. 4-celled, hooked. Cor. 1-lipped.
- M. Caps. 4-celled. Cor. bell-shaped. Rudiment of a fifth filament.
- M. Two capsules united at the point, half 5-valved. quinquevalves.

- quinquevalves. Cor. campanulata, inaequalis. Filamenta basi callosa.
1100. MALLINGTONIA. Siliqua? Corolla regularis, quadrifida. Antheræ deformes.
1192. TORTULA. Nuces 2, biloculares, externæ, rugosæ. Corollæ tubus spiralis.
1214. PEDALIUM. Nux bilocularis.
- * 1176. LINNÆA. Bacca 3-locularis, sicca. Cor. campan. Cal. superus.
1167. CORNUTIA. Bacca 1-sperma. Cor. ringens. Stylus longissimus.
1199. OVIEDA. Bacca 4-sperma. Cor. longissima; limbo 3-fido. Cal. fructiferus, campanulatus.
1207. AMASONIA. Bacca 4-sperma. Cor. subæqualis.
1150. BESLERIA. Bacca polysperma, unilocularis. Cor. inæqualis.
1208. BONTIA. Drupa monosperma. Cor. labium inferius revolutum. Sem. plicatum.
1166. SPIELMANNIA. Drupa monosperma, nucæ 2-loculari. Cor. hypocrateriformis.
1206. VITEX. Drupa monosperma, nucæ 4-loculari. Cor. ringens, labio superiore 3-fido.
1198. MYOPORUM. Drupa disperma, nucæ 2-loculari. Cor. campanulata, subæqualis.
1158. CITHAREXYLON. Drupa disperma, nucæ 2-loculari. Cor. infundibuliformis, subæqualis.
1201. VOLKAMERIA. Drupa disperma, nucæ 2-loculari. Cor. hypocrateriformis, laciniis secundis.
1202. CLERODENDRON. Drupa tetrasperma, nucæ uniloculari. Cor. bilabiata.
1197. DURANTA. Drupa tetrasperma, nucæ 2-loculari. Cor. subæqualis, tubo curvo.

Gratiola Monnieria.

Sect. VI. *Calyces multifidi.*

1187. HYOBANCHE. Caps. 2-locul. Car. unilabiata. Cal. heptaphyllus.
1212. LEPIDAGATHIS. Caps. 2-locul. Cor. bilabiata. Cal. 2, polyphylli, imbricati.
1146. CYMBARIA. Caps. 2-locul. Cor. ringens. Cal. 10-dentatus.
1203. THUNBERGIA. Caps. 2-locul. Cor. campanulata. Cal. duplex, exterior diphyllus, interior 12-dentatus.

Sect. VII. *Polypetalæ.*

1215. MELIANTHUS. Caps. 4-locul. 4-loba. Cor. 4-petal. labium inferius consistens.

Cor. bell-shaped, unequal. Filaments hard at the base.

M. A long pod? Cor. regular, 4-cleft. Anthers deformed.

T. Nuts 2, 2-celled, external, wrinkled. Tube of the cor. spiral.

P. A 2-celled nut.

* L. Berry 3-celled, dry. Cor. bell-shaped. Cal. superior.

C. Berry 1-seeded. Cor. gaping. Style very long.

O. Berry 4-seeded. Cor. very long, with a border 3-cleft. Cal. fruit-bearing, bell-shaped.

A. Berry 4-seeded. Cor. nearly equal.

B. Berry many-seeded, 1-celled. Cor. unequal.

B. Drupe 1-seeded, under lip of the cor. rolled back. Seed plaited.

S. Drupe 1-seeded, with a 2-celled nut. Cor. salver-shaped.

V. Drupe 1-seeded, with a 4-celled nut.* Cor. gaping, with the upper lip 3-cleft.

M. Drupe 2-seeded, with a 2-celled nut. Cor. bell-shaped, nearly equal.

C. Drupe 2-seeded, with a 2-celled nut. Cor. funnel-shaped, nearly equal.

V. Drupe 2-seeded, with a 2-celled nut. Cor. salver-shaped, with segments pointing one way.

C. Drupe 4-seeded, with a 2-celled nut. Cor. 2-lipped.

D. Drupe 4-seeded, with a 2-celled nut. Cor. nearly equal, with a crooked tube.

Sect. VI. *Cups many-cleft.*

H. Caps. 2-celled. Cor. 1-lipped. Cal. 7-leaved.

L. Caps. 2-celled. Cor. 2-lipped. Cups 2, many-leaved, tiled.

C. Caps. 2-celled. Cor. gaping. Cal. 10-toothed.

T. Caps. 2-celled. Cor. bell-shaped. Cal. double, the outer 2-leaved, the inner 12-toothed.

Sect. VII. *Many-petaled.*

M. Caps. 4-celled, 4-lobed. Cor. 4-petaled, constituting the lower lip.

ORDER I. GYMNOSPERMIA.

1092. AJUGA, or *Bugle.*

10 species; viz. orientalis, decumbens, *pyramidalis, alpina, *genevensis, *reptans, *chamæpithys, chia, iva, salicifolia. Europe.

* A. leaves 3-cleft, strap-shaped, very entire; flowers sitting, lateral, solitary; stem spreading.—This plant has a degree of bitterness and acrimony; but its

real use is far from being ascertained. It stands recommended in the gout, jaundice, and intermitting fevers.

1093. TEUERIUM, or *Germander.*

64 species; viz. campanulatum, lævigatum, orientale, parviflorum, botrys, nissolianum, trifidum, pseudo-chamæpithys, fruticos, brevifolium, creticum, marum, quadratum, multiflorum, regium, laxmanni, sibiricum, asiaticum, cubense, arduini, canadense, virginicum,

ginicum, japonicum, inflatum, villosum, hyrcanicum, abutiloides, * scorodonia, pseudo-scorodonia, betonicum, resupinatum, massiliense, salviastrum, * scordium, scordioides, * chamædrys, heterophyllum, bracteatum, lucidum, nitidum, flavum, montanum, supinum, thymifolium, pyrenaicum, rotundifolium, buxifolium, aureum, flavescens, gnaphalodos, achæmenis, polium, trifoliatum, pseudhyssopus, valentinum, capitatum, lusitanicum, pycnophyllum, verticillatum, libanitis, pumilum, angustissimum, cœleste, spinosum. Europe, Persia, N. America, W. Indies.

scorodonia.

* T. leaves heart-shaped, serrated, on leaf-stalks; flowers in lateral bunches, pointing one way; stem upright.—The people of Jersey are said to make use of this plant in brewing. It possesses the bitterness and a good deal of the flavour of hops; but, upon trial, it gave too much colour to the liquor.

scordium.

* T. leaves oblong, sitting, toothed, nakedish; flowers in pairs, on fruitstalks, axillary; stem pubescent, spreading.—The fresh leaves of this plant are bitter, and somewhat pungent. Powdered, they destroy worms. A decoction of this plant is a good fomentation in gangrenous cases. If cows eat it, when compelled by hunger, their milk gets a garlick flavour. Sheep and goats eat it. Horses, cows, and swine, refuse it.

chamædrys.

* T. leaves wedge-egg-shaped, cut, scolloped, on leaf-stalks; flowers 3 together; stems somewhat hairy.—This plant is bitter, with a degree of aroma, and may be used with advantage in weak and relaxed constitutions. It is an ingredient in the celebrated gout powders.

The *teucrium chamæpithys* is a low hairy plant, clammy to the touch, of a strong aromatic resinous smell, and a little roughish taste. It is an aperient and vulnerary, and is used also in gouty and rheumatic pains.

The *teucrium marum* is a small shrubby plant, growing spontaneously in Syria, Candy, and other warm climates, and cultivated with us in gardens. The leaves have an aromatic bitterish taste, and, when rubbed betwixt the fingers, a quick pungent smell, which soon affects the head and occasions sneezing. Distilled with water, they yield a very acrid, penetrating essential oil, resembling one obtained by the same means from scurvy grass. These qualities sufficiently point out the uses to which this plant might be applied: at present, it is little otherwise employed than in cephalic snuffs.

1094. SATUREJA, or Savory.

II species; viz. *juliana*, *nervosa*, *thymbra*, *gracea*, *filiformis*, *montana*, *rupestris*, *hortensis*, *capitata*, *spinosa*, *viminea*. S. Europe, Jamaica.—The herb of the *satureja hortensis* is raised annually in gardens for culinary purposes. It is a very warm aromatic, and affords in distillation with water, a subtile essential oil, of a penetrating smell, and very hot acrid taste. It yields little of its virtues by infusion to aqueous liquors; rectified spirit extracts the whole of its taste and smell, but elevates nothing in distillation.

1095. THYMBRA, or Mountain-hyssop.

Three species; viz. *spicata*, *verticillata*, *ciliata*. Spain, Italy, Levant.

1096. HYSSOPUS, or Hyssop.

Four species; viz. *officinalis*, *lophanthus*, *nepetoides*,

scrophularifolius. Siberia, S. Europe, N. America.—The leaves of hyssop have an aromatic smell, and a warm pungent taste. Besides the general virtues of aromatics, they are particularly recommended in humoral asthmas, coughs, and other disorders of the breast and lungs, and said to promote expectoration; but so little dependence is put upon any property of this kind, that hyssop has now no place in the Pharmacopœia of the London college.

1097. NEPETA, or Nep, or Cat-mint.

29 species; viz. * *cataria*, *angustifolia*, *crispa*, *heliotropifolia*, *pannonica*, *cœrulea*, *violacea*, *incana*, *japonica*, *ucranica*, *nepetella*, *nuda*, *melissæfolia*, *hirsuta*, *italica*, *multibracteata*, *reticulata*, *tuberosa*, *lanata*, *scordotis*, *virginica*, *malabarica*, *indica*, *amboinica*, *madagascariensis*, *multifida*, *botryoides*. Europe, India, N. America.

* N. flowers in spikes; whirls on short fruit-stalks: leaves on leaf-stalks, heart-shaped, tooth serrated.—An infusion of this plant is deemed a specific in chlorotic cases. Two ounces of the expressed juice may be given for a dose. Cats are so delighted with this plant that they can hardly be kept out of the garden wherein it grows. Mr Miller says, that cats will not meddle with it if it is raised from seeds; and in support of this opinion quotes an old saying, "If you set it, the cats will eat it; if you sow it, the cats will not know it." It cannot well be planted without being more or less bruised. Sheep eat it; cows, horses, goats, and swine, refuse it.

1098. ELSHOLTZIA.

Two species; viz. *cristata*, *paniculata*.

1099. LAVANDULA, or Lavender.

Eight species; viz. *spica*, *stœchas*, *viridis*, *dentata*, *pimata*, *multifida*, *abrotanoides*, *carnosa*. S. Europe, Madeira, E. Indies.

There are different varieties of the *lavandula spica*, particularly the narrow and broad leaved. The flowers of both have a fragrant smell, to most people agreeable, and a warm pungent bitterish taste; the broad-leaved sort is the strongest in both respects, and yields in distillation thrice as much essential oil as the other; its oil is also hotter and specifically heavier: hence in the southern parts of France, where both kinds grow wild, this only is made use of for the distillation of what is called *oil of spike*. The narrow-leaved is the sort commonly met with in our gardens.

Lavender is a warm stimulating aromatic. It is principally recommended in vertigoes, palsies, tremors, suppression of the menstrual evacuations; and in general in all disorders of the head, nerves, and uterus. It is sometimes also used externally in fomentations for paralytic limbs. The distilled oil is particularly celebrated for destroying various cutaneous insects. If soft spongy paper, dipt in this oil, either alone or mixed with that of almonds, be applied at night to the parts infested by the insects, they will certainly be all found dead in the morning. The officinal preparations of lavender are, the essential oil, a simple spirit, and a compound tincture.

The *Lavandula stœchas* is a shrubby plant, considerably smaller than the common lavender. The flowery heads are brought from Italy and the southern parts of France;

Franco; they are very apt to grow mouldy in the passage; and even when they escape this inconvenience, are generally much inferior to those raised in our gardens. The best stœchas which we receive from abroad has no great smell or taste: Pomet affirms, that such as the shops of Paris are supplied with is entirely destitute of both; whilst that of our own growth, either when fresh, or when carefully dried, has a very fragrant smell, and a warm, aromatic, bitterish, subacid taste: distilled with water, it yields a considerable quantity of a fragrant essential oil; to rectified spirit it imparts a strong tincture, which inspissated proves an elegant aromatic extract. This aromatic plant is rarely met with in prescription; the only officinal compositions into which it was admitted were the mithridate and theriaca.

There is another plant called *stœchas*, which from the beauty and durability of its flowers has of late years had a place in our gardens, and whose aromatic qualities render it worthy of attention; this is the *gnaphalium arenarium*, the golden stœchas, goldilocks, or yellow cassidony: its flowers stand in umbels on the tops of the branches; they are of a deep shining yellow colour, which they retain in perfection for many years; their smell is fragrant and agreeable, somewhat of the musky kind; their taste warm, pungent, and subastringent; they impart their flavour to water in distillation, and by infusion to rectified spirit.

1100. SIDERITIS, or *Iron-wort*.

20 species; viz. *canariensis*, *candicans*, *cretica*, *montana*, *elegans*, *romana*, *syriaca*, *taurica*, *distans*, *perfoliata*, *ciliata*, *incana*, *virgata*, *glauca*, *hyssopifolia*, *scordioides*, *spinosa*, *hirsuta*, *ovata*, *lanata*. S. Europe, Canary, Madeira.

1101. BYSTROPOGON.

Seven species; viz. *pectinatum*, *sidesfolium*, *suaveolens*, *plumosum*, *origanifolium*, *canariense*, *punctatum*. Madeira, Canary, Japan.

1102. MENTHA, or *Mint*.

22 species; viz. *auricularia*, **sylvestris*, *nemorosa*, *gratissima*, *niliaca*, *glabrata*, **viridis*, **rotundifolia*, *crispa*, **hirsuta*, **aquatica*, *citrata*, **piperita*, *sativa*, *dentata*, **gentilis*, **arvensis*, *austriaca*, *canadensis*, **pulegium*, *cervina*, *perilloides*. Europe, Egypt, Canada.

viridis. * M. spikes oblong; leaves spear-shaped, naked, serrated, sitting; stamens longer than the blossom.—The flavour of this species being more agreeable than that of the others, it is generally preferred for culinary and medicinal purposes. A conserve of the leaves is very grateful; and the distilled waters, both simple and spirituous, are universally thought pleasant. The leaves are used in spring salads; and the juice of them, boiled up with sugar, is formed into tablets. The distilled waters, and the essential oil, are often given to stop retching, and frequently with success. Dr Lewis says, that dry mint digested in rectified spirit of wine, gives out a tincture which appears by daylight of a fine dark green, but in candle light of a bright red colour. The fact is, that a small quantity of this tincture is green, either by daylight, or by candle light; but a large quantity of it seems impervious to common day-

VOL. IV. Part I.

light; however, when held between the eye and a candle, or between the eye and the sun, it appears red; so that if put into a flat bottle, it appears either green or red, as it is viewed through the flat side or through the edge of the bottle.

* M. leaves egg-shaped, on leafstalks; stamens short-pipcrita. or than the blossom.—The stem and leaves of it are beset with numbers of very minute glands, containing the essential oil, which rises plentifully in distillation. Peppermint-water is well known as a carminative and antispasmodic. The essence of peppermint is an elegant medicine, and possesses the most active properties of the plant.

* M. leaves egg-shaped, acute, serrated; stamens as *arvensis*. long as blossoms.—This species prevents the coagulation of milk; and when cows have eaten it, as they will do largely at the end of summer when the pastures are bare, and hunger distresses them, their milk can hardly be made to yield cheese; a circumstance which sometimes puzzles the dairy-maids. Horses and goats eat it; sheep are not fond of it; cows and swine refuse it.

* M. leaves egg-shaped, blunt, somewhat scolloped; *pulegium*. stems roundish, creeping; stamens longer than the blossom.—The expressed juice of this plant, with a little sugar, is not a bad medicine in the whooping cough. A simple and a spirituous water, distilled from the dried leaves, are kept in the shops. They are prescribed in hysterical affections, and are not without considerable antispasmodic properties. An infusion of the plant may be used with the same intention.

1103. PERILLA.

One species; viz. *ocymoides*. India.

1104. HYPTIS.

Four species; viz. *verticillata*, *capitata*, *radiata*, *chamedrys*.

1105. GLECHOMA, or *Gill*, or *Ground-Ivy*.

One species; viz. *hederacea*. N. of Europe.

G. leaves kidney-shaped, scolloped.—The leaves of this plant, thrown into the vat with ale, clarify it and give it a flavour. Ale thus prepared is often drank as an antiscorbutic. The expressed juice, mixed with a little wine, and applied morning and evening, destroys the white specks upon horses eyes. The plants that grow near it do not flourish. It is said to be hurtful to horses if they eat much of it. Sheep eat it; horses are not fond of it; cows, goats, and swine, refuse it. Little protuberances, composed of many cells, are sometimes found upon the leaves, and are occasioned by insects.

1106. LAMIUM, or *Dead-nettle*.

13 species; viz. *ovvala*, *lævigatum*, *rugosum*, *garbaticum*, *maculatum*, **album*, *molle*, **purpureum*, *incisum*, *bifidum*, *tomentosum*, **amplexicaule*, *multifidum*. Europe.

* L. leaves heart-shaped, tapering to a point, serrated, *album*. on leafstalks; flowers about 20 in a whirl.—This plant grows wild in hedges; and flowers in April and May. The flowers have been particularly celebrated in hterine fluors, and other female weaknesses, and also in disorders of the lungs; but they appear to be of very weak virtue, and are at present little used in Britain.

E e

1107.

1107. GALEOPSIS, or *Hedge-nettle*.

Four species; viz. *ladanum, *grandiflora, *terabit, *cannabinna. Europe.

1108. BETONICA, or *Betony*.

Eight species; viz. *officinalis, stricta, incana, orientalis, alopecuros, hirsuta, grandiflora, heraclea.

officinalis.

* B. spike interrupted; blossoms, upper lip entire; lower lip, the upper segment notched; calyxes smoothish.—This is a low plant, growing in woods and shady places, in several parts of England; the flowers come forth in June or July; they are of a purplish colour, and stand in spikes on the top of the stalks. The leaves and flowers have an herbaceous, roughish, somewhat bitterish taste, accompanied with a very weak aromatic flavour. This herb has long been a favourite among writers on the materia medica, who have not been wanting to attribute to it abundance of good qualities. Experience does not discover any other virtue in betony than that of a mild corroborant; as such, an infusion or light decoction of it may be drank in tea, or a saturated tincture in rectified spirit given in suitable doses, in laxity and debility of the viscera, and disorders proceeding from thence. The powder of the leaves, snuffed up the nose, provokes sneezing; and hence betony is sometimes made an ingredient in sternutatory powders: this effect does not seem to be owing, as is generally supposed, to any peculiar stimulating quality in the herb, but to the rough hairs which the leaves are covered with. The roots of this plant differ greatly in quality from the other parts; their taste is bitter, and very nauseous; taken in a small dose, they vomit and purge violently, and are supposed to have somewhat in common with the roots of hellebore. It is pretty singular, if true, that betony affects those who gather any considerable quantity of it, with a disorder resembling drunkenness, as affirmed by Simon Paulli and Bartholinus. From these sensible qualities and operative effects, although it has now no place in our pharmacopœias, yet it is perhaps to be considered as a vegetable deserving farther attention.

1109. STACHYS, or *Base Horehound*.

26 species; viz. *sylvatica, circinata, coccinea, *palustris, alpina, *germanica, intermedia, lanata, cretica, heraclea, tenuifolia, glutinosa, spinosa, orientalis, palestina, maritima, æthiopica, hirta, lavandulifolia, rugosa, recta, arenaria, annua, *arvensis, latifolia, artemisia. Europe, Barbary, Cape, Carolina.

sylvatica.

* S. six flowers in a whirl; leaves heart-shaped, on leaf-stalks.—It will dye yellow. The whole plant has a fetid smell, and toads are thought to be fond of living under its shade. Sheep and goats eat it. Horses, cows, and swine refuse it.

1110. BALLOTA, or *Black Horehound*.

Four species; viz. *nigra, alba, lanata, disticha. Europe, East Indies.

nigra.

* B. leaves heart-shaped, undivided, serrated; calyx, teeth tapering to a point.—It stands recommended in hysterical cases. The Swedes reckon it almost an universal remedy in the diseases of their cattle. Horses, cows, sheep, and goats refuse it.

1111. MARRUBIUM, or *Horehound*.

14 species; viz. alyssum, astracanicum, peregrinum, creticum, candidissimum, superium, catarisefolium, *vul-

gare, africanum, crispum, hirsutum, hispanicum, pseudo-dictamnus, acetabulosum.

* M. teeth of the calyx bristle-shaped, hooked.—It is *vulgare*. very bitter to the taste, and not altogether unpleasant to the smell. It was a favourite medicine with the ancients in obstructions of the viscera. In large doses it loosens the belly. It is a principal ingredient in the negro Cæsar's remedy for vegetable poisons. A young man who had occasion to take mercerial medicines, was thrown into a salivation which continued for more than a year. Every method that was tried to remove it rather increased the complaint. At length Linnæus prescribed an infusion of this plant, and the patient got well in a short time. Horses, cows, sheep, and goats refuse it.

1112. LEONURUS, or *Lions-tail*.

Seven species; viz. crispus, *cardiaca, marrobbas-trum, galeobdolon, supinus, tataricus, sibiricus. Russia, Siberia, Austria.

* L. stem-leaves spear-shaped, 3-lobed.—The leaves *cardiaca*. have a strong but not agreeable smell, and a bitter taste. Goats, sheep, and horses eat it. Cows are not fond of it. Swine refuse it.

1113. EHLOMIA, or *Jerusalem Sage*.

27 species; viz. fruticosa, purpurea, italica, missilii, armenica, lychnites, laciniata, samia, crinita, biloba, pungens, herba venti, alpina, tuberosa, zeylanica, martinicensis, urticifolia, decedentata, biflora, chinensis, indica, moluccoides, glabrata, alba, nepetifolia, leonurus, leonites. South Europe, Cape, East and West Indies.

1114. MOLUCCELLA, or *Molucco-Balm*.

Six species; viz. spinosa, lævis, tuberosa, persica, frutescens, grandiflora. Siberia, Levant, India.

1115. CLINOPodium, or *Field Basil*.

Three species; viz. *vulgare, ægyptiacum, incanum. Europe, Egypt, North America.

1116. ORIGANUM, or *Wild Marjoram*.

16 species; viz. ægyptiacum, dictamnus, sipyleum, tournefortii, ciliatum, benghalense, creticum, srynæum, heracleoticum, *vulgare, glandulosum, onites, syriacum, maru, majorana, majoranoides. S. Europe, Egypt, Carolina.

* O. spikes roundish, paniced, clustered; floral leaves *vulgare*. egg-shaped, longer than the calyx.—The whole plant, is a warm aromatic. The dried leaves, used instead of tea, are exceedingly grateful. The essential oil of this plant is so acrid, that it may be considered as a caustic, and is much used with that intention by farriers. A little cotton wool moistened with it, and put into the hollow of an aching tooth, frequently relieves the pain. The country people use the tops to dye purple. Goats and sheep eat it. Horses are not fond of it. Cows refuse it.

The *origanum dictamnus* is a kind of origanum said to grow plentifully in the island of Candy, in Dalmatia, and in the Morea; it has been found hardy enough to bear the ordinary winters of our climate. The leaves, which are the only part in use with us, come from Italy. The best sort are well covered over with a thick white down, and now and then intermixed with purplish flowers. In smell and taste they somewhat resemble lemon thyme: but have more of an aromatic flavour,

flavour, as well as a greater degree of pungency. When fresh they yield a considerable quantity of an excellent essential oil; but they have now no place either in the London or Edinburgh Pharmacopœias.

The *origanum majorana* is raised annually in our gardens for culinary as well as medicinal uses; the seeds are commonly procured from the southern parts of France, where the plant grows wild. It is a moderately warm aromatic, yielding its virtues both to aqueous and spirituous liquors by infusion, and to water in distillation. It is principally used in disorders of the head and nerves, and in the humoural asthmas and catarths of old people. An essential oil of the herb is kept in the shops. The powder of the leaves proves an agreeable erbine, and enters the official sternutatory powder.

1117. THYMUS, or *Thyme*.

22 species; viz. * serpyllum, lanuginosus, lævigatus, vulgaris, lanceolatus, numidicus, zygis, marshallianus, inodorus, * acinos, patavinus, alpinus, montanus, piperella, browni, filiformis, cephalotus, striatus, villosus, mastichina, tragoriganum, virginicus. Europe, N. America, Jamaica.

* *T. flowers* in heads, stems creeping; leaves flat, blunt, fringed at the base.—The whole plant is fragrant, and yields an essential oil that is very heating. An infusion of the leaves removes the headach occasioned by the debauch of the preceding evening. A general opinion prevails, that the flesh of sheep that feed upon aromatic plants, particularly upon thyme, is much superior in flavour to common mutton: but some say this is a vulgar error, that sheep are not fond of aromatic plants; that they will carefully push aside the thyme to get at the grass growing beneath it; and that they never touch it unless when walking apace, and then they will catch at any thing. The attachment of bees to this and other aromatic plants is well known. Sheep and goats eat it. Swine refuse it.

1118. MELISSA, or *Balm*.

Seven species; viz. officinalis, grandiflora, * calamintha, * nepeta, pyrenaica, cretica, fruticosa. South of Europe.

The *melissa officinalis*, when in perfection, has a pleasant smell, somewhat of the lemon kind, and a weak roughish aromatic taste. The young shoots have the strongest flavour; the flowers, and the herb itself when old, or produced in very moist rich soils, or rainy seasons, are much weaker both in smell and taste. Balm, the herb of this plant is appropriated by the writers on the materia medica, to the head, stomach, and uterus: and in all disorders of these parts is supposed to do extraordinary service. So high an opinion have some of the chemists entertained of balm, that they have expected to find in it a medicine which should prolong life beyond the usual period. The present practice, however, holds it in no great esteem, and ranks it, where it certainly deserves to be, among the weaker corroborants. In distillation it yields an elegant essential oil, but in very small quantity; the remaining decoction tastes roughish. Strong infusions of the herb, drank as tea, and continued for some time, have done service in a weak lax state of the viscera; these liquors, lightly acidulated with juice of lemons, turn

of a fine reddish colour, and prove an useful, and to many a very grateful, drink in dry parching fevers.

1119. DRACOCEPHALUM, or *Dragon's-head*.

18 species; viz. virginianum, denticulatum, canariense, pinnatum, origanoides, palmatum, peregrinum, fruticulosum, austriacum, ruyschiana, grandiflorum, al-taiense, sibiricum, moldavica, canescens, peltatum, nutans, thymiflorum. N. Europe, N. America, Canaries.

1120. MELITTIS, or *Base-balm*.

Two species; viz. * melissophyllum, japonica.

1121. OCIMUM, or *Basil*.

27 species; viz. thyriflorum, inflexum, virgatum, monachorum, gratissimum, album, tomentosum, grandiflorum, basilicum, minimum, integerrimum, sanctum, rugosum, crispum, scabrum, americanum, verticillatum, acutum, tenuidorum, polystachyon, serpyllifolium, menthoides, molle, adscendens, scutellarioides, prostratum, capitellatum. Persia, E. Indies, Japan, Chili.

1122. PLECTRANTHUS.

Six species; viz. fruticosus, galeatus, nudiflorus, forskoeli, crassifolius, punctatus. Africa.

1123. TRICHOSTEMA.

Two species; viz. dichotoma, brachiata. North America.

1124. SCUTELLARIA, or *Scull-cap*.

17 species; viz. orientalis, albida, alpina, lupulina, latiflora, * galericulata, hastifolia, * minor, integrifolia, havanensis, purpurascens, hyssopifolia, peregrina, columnæ, indica, altissima, cretica. Europe, China, N. America.

* S. leaves heart-spear-shaped; scalloped flowers axil-galericularly.—When the blossom falls off, the cup closes upon latera. the seeds, which when ripe, being still smaller than the cup, could not possibly open its mouth, or overcome its elastic force, as the down of the seeds do in the compound flowers, and must consequently remain useless, without a possibility of escaping. But nature, ever full of resources, finds a method to discharge them. The cup grows dry, and then divides into two parts; so that the seeds, already detached from the receptacle, fall to the ground. Cows, goats, and sheep eat it; horses and swine refuse it.

1125. PRUNELLA, or *Self-heal*.

Three species; viz. * vulgaris, grandiflora, hyssopifolia. Europe, Barbary.

1126. CLEONIA.

One species; viz. lusitanica. Spain, Portugal.

1127. PRASIMUM, or *Shrubby Hedge-nettle*.

Two species; viz. majus, minus. Spain, Italy, Carolina.

1128. PHRYMA.

Two species; viz. leptostachia, dehiscens. North America.

1129. SELAGO.

20 species; viz. corymbosa, cinerea, polystachya, verbenacea, rapunchloides, spuria, hirta, rotundifolia, fasciculata, polygaloides, ovata, coccinea, canescens, geniculata, divaricata, capitata, triquetra, fruticosa, hispida, ciliata. C. of G. Hope.

ORDER II. ANGIOSPERMIA.

1130. BARTSIA.

Five species; viz. *coccinea*, *pallida*, * *viscosa*, *gymnandra*, * *alpina*. Alps of Europe, Hudson's Bay.

1131. RHINANTHUS, or *Elephants-head*.

10 species; viz. *orientalis*, *elephas*, * *crista-galli*, *trixago*, *maximus*, *versicolor*, *capensis*, *indicus*, *virginicus*, *trifidus*. Europe, Cape, India, Virginia.

1132. EUPHRASIA, or *Eye-bright*.

12 species; viz. *latifolia*, * *officinalis*, *salisburgensis*, *tricuspidata*, *cuneata*, * *odontites*, *lutea*, *linifolia*, *viscosa*, *purpurea*, *longiflora*, *aspera*. Europe.

officinalis. * F. leaves egg-shaped, serrated, sharply toothed.—It is a weak astringent, and was formerly in repute as a remedy for impaired vision. It will not grow but when surrounded by plants taller than itself. Cows, horses, goats, and sheep eat it. Swine refuse it.

1133. MELAMPYRUM, or *Cow-wheat*.

Seven species; viz. * *cristatum*, * *arvense*, *barbatum*, *nemorosum*, * *pratense*, * *sylvaticum*, *lineare*. Eur.

arvense. * M. spikes conical, loose; floral leaves, with bristle-shaped teeth, coloured.—The seeds when ground with corn give a bitterish and grayish cast to the bread, but do not make it unwholesome. Cows and goats eat it. Sheep refuse it.

pratense. * M. flowers lateral, pointing one way: leaves in distant pairs; blossoms closed.—Where this plant abounds, the butter is yellow and uncommonly good. Swine are very fond of the seeds. Sheep and goats eat it. Cows are very fond of it. Horses and swine refuse it.

1134. LATHRÆA.

Three species; viz. *clandestina*, *aublatum*, * *squamaria*. Europe.

1135. SCHWALBEA.

One species; viz. *americana*. N. America.

1136. TOZZIA.

One species; viz. *alpina*. Alps of Austria, Italy, Pyrenees.

1137. PEDICULARIS, or *Rattle-coxcomb*.

34 species; viz. * *palustris*, * *sylvatica*, *euphrasioides*, *myriophylla*, *spicata*, *resupinata*, *sceptrum carolinum*, *tristis*, *lapponica*, *asplenifolia*, *flava*, *striata*, *sudetica*, *recutita*, *elata*, *foliosa*, *canadensis*, *groenlandica*, *incarnata*, *uncinata*, *interrupta*, *verticillata*, *acaulis*, *flammea*, *hirsuta*, *rosea*, *rostrata*, *tuberosa*, *gyroflexa*, *fasciculata*, *rubens*, *compacta*, *achilleifolia*, *comosa*. Europe, N. America.

palustris. * P. stem branched; calyx crested with callous dots; lip of the blossom slanting.—This plant is an unwholesome guest in meadows, being very disagreeable to cattle. Goats eat it. Horses, sheep, and cows refuse it. Swine are not fond of it.

sylvatica. * P. stem branched; calyx oblong, angular, smooth; lip of the blossom heart-shaped.—The expressed juice, or a decoction of this plant, has been used with advantage as an injection for sinuous ulcers. It is said, that if the healthiest flock of sheep be fed with it, they become scabby and scurfy in a short time; the wool will get loose, and they will be overrun with vermine. Cows and swine refuse it.

1138. GERARDIA.

12 species; viz. *tuberosa*, *delphinifolia*, *purpurea*, *tenuifolia*, *tubulosa*, *nigrina*, *flava*, *scabra*, *pedicularia*, *japonica*, *glutinosa*, *sessilifolia*. E. Indies, China, Japan, N. America.

1139. CHELONE, or *Humming-bird Tree*.

Four species; viz. *glabra*, *obliqua*, *ruellioidea*, *barbata*. N. America.

1140. PENTSTERNON.

Four species; viz. *hirsuta*, *pubescens*, *lævigata*, *campanulata*. N. America.

1141. CYRILLA.

One species; viz. *pulchella*. Jamaica.

1142. GLOXINIA.

One species; viz. *maculata*. Guiana.

1143. GESNERIA.

11 species; viz. *humilis*, *corymbosa*, *acaulis*, *pumila*, *craniolearia*, *grandis*, *tomentosa*, *scabra*, *exserta*, *calycina*, *ventricosa*. Jamaica, Hispan. S. America.

1144. ANTIRRHINUM, or *Snap-dragon*, *Calves-snout*.

70 species; viz. * *cymbalaria*, *pilosum*, *lanigerum*, *dentatum*, *heterophyllum*, * *elatine*, *elatinoides*, * *spurium*, *cirrhosum*, *ægyptiacum*, *fruticosum*, *hexandrum*, *triphyllyum*, *latifolium*, *virgatum*, *triornithophorum*, *purpureum*, *versicolor*, *linarioides*, * *repens*, *monspesulanum*, *sparteum*, *bipunctatum*, *amethystinum*, *laxiflorum*, *triste*, *hælava*, *thymifolium*, *supinum*, *simplex*, * *arvense*, *pelisserianum*, *parviflorum*, *flavum*, *saxatile*, *micranthum*, *viscosum*, *aparinoides*, *multicaule*, *reticulatum*, *marginatum*, *glaucum*, *alpinum*, *aphyllum*, *bicorne*, *macrocarpum*, *villosum*, *origanifolium*, *flexuosum*, * *minus*, *dalmaticum*, *hirtum*, *genistifolium*, *juncum*, * *linarea*, *linifolium*, *lagopedioides*, *canadense*, *chalepense*, *reflexum*, *pedunculatum*, * *majus*, *siculum*, *sempervirens*, * *orontium*, *papilionaceum*, *asarina*, *molle*, *pinnatum*, *unilabiatum*. Europe, Egypt, Barbary, Cape.

* A. leaves heart-shaped, 5-lobed, alternate; stems *cymbalaria* trailing.—Its trailing branches, variously interwoven, often cover old moist walls with a thick tapestry, and when in blossom, make a beautiful appearance.

* A. leaves halberd-shaped, alternate; stems trailing. *elatine*.—This is considerably more bitter than the other species, and is said to have been used successfully in cases of foul ulcers, and in cutaneous eruptions.

* A. leaves spear-strap-shaped, crowded; stem upright; *linaria*. spikes terminating, sitting.—An infusion of the leaves is diuretic and purgative. An ointment, prepared from them, gives relief in the piles. The expressed juice, mixed with milk, is a poison to flies, as is likewise the smell of the flowers. Cows, horses, and swine, refuse it. Sheep and goats are fond of it.

* A. blossom without a spur; flowers in spikes; cups rounded.—Though the seeds of this plant vegetate on any ground, it is only in dry soils and situations that the plant continues to live long enough to produce flowers.

1145. ANARRHINUM.

Five species; viz. *bellidifolium*, *pedatum*, *fruticosum*, *crassifolium*, *tenellum*.

1146. CYMBARIA.

One species; viz. *daurica*. Dauria.

1147.

1147. TOURETTIA.

One species; viz. lappacea. Isle of Bourbon.

1148. MARTYNNIA.

Four species; viz. diandra, carniolaria, proboscidea, longiflora. Cape, America.

1149. TORENIA.

Two species; viz. asiatica, hirsuta. India.

1150. BESLERIA.

Eight species; viz. multifolia, lutea, violacea, incarnata, serrulata, cristata, coccinea, bivalvis. West Indies, S. America.

1151. BRUNFELSIA.

Two species; viz. americana, undulata. W. Indies.

1152. SCROPHULARIA, or *Fig-wort*.

26 species; viz. marilandica, * nodosa, * aquatica, auriculata, appendiculata, * scorodonia, glabrata, betonicifolia, orientalis, frutescens, rupestris, heterophylla, altaica, * vernalis, arguta, trifoliata, sambucifolia, mellifera, hispida, canina, lucida, variegata, chinensis, meridionalis, coccinea, peregrina. Europe, Barb. Madeira, America.

nodosa.

* S. leaves oblong heart-shaped, 3-fibred at the base; corners of the stem acute.—This plant is hardly known in modern practice; but the rank smell and bitter taste of the leaves seem to indicate some active properties. Swine that have the scab are cured by washing them with a decoction of the leaves. Goats eat it. Cows, horses, sheep, and swine refuse it.

1153. CELSIA.

Five species; viz. orientalis, arcturus, coromandelina, cretica. Crete, Levant, E. Indies.

1154. HEMIMERIS.

Five species; viz. montana, sabulosa, diffusa, urticifolia, coccinea. C. of G. Hope.

1155. DIGITALIS, or *Fox-glove*.

12 species; viz. * purpurea, minor, thapsi, parviflora, lutea, ambigua, ferruginea, orientalis, lanata, obscura, canariensis, sceptrum. S. Europe, Canary, Madeira.

purpurea.

* D. segments of the calyx egg-shaped, acute; blossom blunt, upper lip nearly entire.—This species is certainly a very active medicine, and merits more attention than modern practice till very lately bestowed upon it. It grows wild in woods and on uncultivated heaths: the elegant appearance of its purple flowers (which hang in spikes along one side of the stalk), has gained it a place in some of our gardens. The leaves have been strongly recommended, externally, against scrophulous tumours, and likewise internally, in epileptic disorders; what service they may be capable of doing in these cases, is not ascertained by accurate experiments. Several examples are mentioned by medical writers of their occasioning violent vomiting, hypercatharsis, and disordering the whole constitution; insomuch that Boerhaave accounts them poisonous. Their taste is bitter, and very nauseous. Digitalis, however, has lately been employed with great success in other diseases. A treatise has lately been published by Dr Withering, professedly on the subject of its use in medicine, and containing many important and useful observations.

An infusion of two drams of the leaf, in a pint of water, given in half-ounce doses every two hours or

so, till it begin to puke or purge, is recommended in dropsy, particularly that of the breast. It is said to have produced an evacuation of water so copious and sudden, in ascites, by stool and urine, that the compression of bandages was found necessary. The plentiful use of diluents is ordered during its operation. The remedy, however, is inadmissible in many weakly patients. But besides being given in infusion, it has also been employed in substance; and when taken at bed-time, to the extent of one, two, or three grains of the dried powder, it often in a short time operates as a very powerful diuretic, without producing any other evacuation. Even this quantity, however, will sometimes excite very severe vomiting; and that too, occurring unexpectedly. During its operation, it has often very remarkable influence in rendering the pulse slower; and it frequently excites very considerable vertigo, and an affection of vision.

Besides dropsy, digitalis has of late been employed in some instances of hæmoptysis, of phthisis, and of mania, with apparent good effects. But its use in these diseases is much less common than in dropsy.

1156. INCARVILLEA.

One species; viz. sinensis.

1157. BIGNONIA, or *Trumpet-flower*.

54 species; viz. catalpa, longissima, tomentosa, linearis, sempervirens, tenuisiliqua, cassinoides, obtusifolia, microphylla, unguis, staminea, squinoctialis, alliacea, spectabilis, laurifolia, rigescens, lactiflora, paniculata, elongata, corymbifera, crucigera, grandifolia, capreolata, pubescens, villosa, echinata, heterophylla, triphylla, mollis, hirsuta, pentaphylla, orbiculata, chrysantha, fluvialis, leucoxydon, serratifolia, radiata, radicans, grandiflora, stans, africana, bijuga, racemosa, compressa, spathacea, chelonoides, variabilis, alba, peruviana, indica, longifolia, procera, cœrulea, brasiliانا. E. and W. Ind. Amer.

1158. CITHAREXYLON, or *Fiddle-wood*.

Six species; viz. cinereum, caudatum, villosum, subserratum, quadrangulare, melanocardium. W. Ind.

1159. HALLERIA, or *African Fly-honeysuckle*.

Two species; viz. lucida, elliptica. Cape of Good Hope.

1160. CRESCENTIA, or *Calabash Tree*.

Two species; viz. cujete, cucurbitina. Virginia, Jamaica, Brazil.

1161. TANÆCIUM.

Three species; viz. parasiticum, jaroba, pinnatum. Jamaica.

1162. GMELINA.

One species; viz. asiatica. Asia.

1163. PETREA.

One species; viz. volubilis. S. Amer.

1164. PREMNA.

Three species; viz. integrifolia, tomentosa, serratifolia. E. Indies.

1165. LANTANA, or *American Viburnum*.

15 species; viz. mista, trifolia, viburnioides, annua, stricta, radula, camara, involucrata, recta, odorata, lavandulacca, salvifolia, melissifolia, scabrida, aculeata. W. Ind. S. Amer.

1166. SPIELMANNIA.
One species; viz. africana. C. of G. Hope.
1167. CORNUTIA.
Two species; viz. pyramidata, punctata. W. Ind.
1168. LOESELIA.
One species; viz. ciliata. Vera Cruz.
1169. CAPRARIA, or *Sweet-weed*.
Six species; viz. biflora, lucida, lanceolata, semi-serrata; undulata, humilis. E. and W. Indies, Cape, S. America.
1170. LINDERNIA.
Three species; viz. pyxidaria, dianthera, japonica. Jap. Virg. Hispan.
1171. MANULEA.
17 species; viz. cheiranthus, corymbosa, altissima, pinnatifida, plantaginis, capitata, antirrhinoides, thyr-siflora, argentea, tomentosa, rubra, capillaris, cunei-folia, coerules, heterophylla, integrifolia, microphylla. C. of G. Hope.
1172. HEBENSTREITIA.
Six species; viz. dentata, ciliata, integrifolia, eri-noides, fruticosa, cordata. C. of G. Hope.
1173. ERINUS.
Seven species; viz. alpina, maritimus, africanus, lychneidea, fragrans, peruvianus, tristia. Alps, Pyre-nees, Cape, Peru.
1174. BUCHNERA.
14 species; viz. americana, elongata, cernua, cu-neifolia, cordifolia, grandiflora, aethiopica, viscosa, ca-pensis, humifusa, asiatica, euphrasioides, gesnerioides, pinnatifida. Cape, Ceylon, China, America.
1175. BROWALLIA.
Three species; viz. demissa, elata, alienata. South America.
1176. LINNEA.
One species; viz. * borealis. N. Europe, Asia, and America.
1177. SIBTHORPIA, or *Base Money-wort*.
One species; viz. europæa. Europe, Africa.
1178. LIMOSELLA, or *Mud-wort*.
Two species; viz. * aquatica, diandra. North of Europe.
1179. PHAYLOPSIS.
One species; viz. parviflora.
1180. VANDELLIA.
Two species; viz. diffusa, pratensis. Isle of St Thomas.
1181. RUSSELLA.
One species; viz. sarmentosa.
1182. CONOBEA.
One species; viz. aquatica. Guiana.
1183. STERNODIA.
Five species; viz. maritima, durantifolia, ruderalis, camphorata, aquatica. Jamaica.
1184. OBOLARIA.
One species; viz. virginica. N. America.
1185. ÆGINETIA.
One species; viz. indica.
1186. ORORANCHE, or *Broom-rape*.
18 species; viz. * major, fœtida, caryophyllacea, coerulescens, elatior, purpurea, minor, alba, gracilis, americana, virginiana, uniflora, coerules, phelypæa, tinctoria, cernua, * ramosa, coccoinea. Europe, Ma-labar, N. Amer.
1187. HYOBANCHE.
One species; viz. sanguinea. Cape of Good Hope.
1188. DODARTIA.
Two species; viz. orœnalis, indica. Lev. Ind.
1189. LIPPIA.
Five species; viz. americana, hirsuta, umbellata, cymosa, hemisphœrica. Cape, America.
1190. ACHIMENES.
One species; viz. sesamoides. East Indies.
1191. SESAMUM, or *Oily Purgin-grain*.
Four species; viz. orientale, luteum, indicum, laci-niatum. E. Indies.
1192. TORTULA.
One species; viz. aspera.
1193. HOLMSKILDIA.
One species; viz. sanguinea.
1194. MIMULUS, or *Monkey-flower*.
Four species; viz. ringens, glutinosus, alatus, lu-teus. Virginia, Canada, Peru.
1195. RUELLIA.
46 species; viz. blechum, blechioides, angustifolia, ovata, strepens, patula, pallida, fragrans, lactea, clan-destina, violacea, rubra, macrophylla, guttata, imbricata, aristata, intrusa, paniculata, tuberosa, tentacula-ta, biflora, crispa, fasciculata, mollissima, undulata, involuocrata, repanda, ringens, coccinea, repens, uligi-nosa, pilosa, hirta, depressa, cordifolia, secunda, rep-tans, japonica, alopecuroidea, barbata, balsamea, sali-cifolia, longiflora, difformis, rupestris, scabrosa. E-gypt, E. and W. Ind. Jap. Amer.
1196. BARLERIA.
13 species; viz. longifolia, solanifolia, hystrix, prio-nitis, trispinosa, bispinosa, buxifolia, nodiflora, acan-thoides, cristata, strigosa, pungens, longiflora.
1197. DURANTA.
Three species; viz. plumieri, ellisia, mutisii. W. Ind. S. Amer.
1198. MYOPORUM.
Four species; viz. lætum, pubescens, crassifolium, tenuifolium. South sea isles.
1199. OVIEDA.
Two species; viz. spinosa, mitia. Java, W. Indies.
1200. MALLINGTONIA.
One species; viz. hortensis.
1201. VOLKAMERIA.
Eight species; viz. aculeata, legostrina, intermis, ca-pitata, serrata, scandens, japonica, kœmpferi. E. and W. Indies, Japan.
1202. CLERODENDRUM.
Eight species; viz. infortunatum, fortunatum, cala-mitosum, phlomodoides, squamatum, trichotomum, diver-sifolium, paniculatum. E. Indies, Japan.

1203. THUNBERGIA.

Two species; viz. *capensis*, *fragrans*. C. of Good Hope.

1204. MAURANDIA.

One species; viz. *semperflorans*.

1205. CASTILLEJA.

Two species; viz. *integrifolia*, *sessifolia*. Egypt, E. Indies, S. America.

1206. VITEX, or *Chaste-Tree*.

13 species; viz. *ovata*, *triflora*, *divaricata*, *pubescens*, *altissima*, *agnus castus*, *incisa*, *leucoxyloa*, *trifolia*, *umbrosa*, *capitata*, *negundo*, *pinnata*. Naples, Sicily, E. and W. Indies.

The *vitex agnus castus* is a small tree, or rather shrub, growing spontaneously in Italy, &c. and raised with us in gardens. Its fruit, which is about the size of a pepper corn, contains four longish seeds, which are said to be of an aromatic smell and an acrid bitterish taste, but which are found, on examination, to be almost inodorous and insipid. These seeds have been celebrated as antiprodisiacs, and were formerly much used by the monks for allaying the venereal appetite; but experience does not warrant their having any such virtues.

1207. AMASSONIA.

Two species; viz. *erecta*, *punica*. Surinam.

1208. BONTIA, or *Barbadoes Wild-olive*.

One species; viz. *daphnoides*. W. Indies.

1209. AVEICENNIA.

Three species; viz. *tomentosa*, *resinifera*, *nitida*. Martinico, Carthage.

1210. COLUMNEA.

Four species, viz. *scandens*, *hirsuta*, *rutilans*, *hispidula*. Martinico, Jamaica.

1211. ACANTHUS, or *Bears-breech*. [†]

14 species; viz. *mollis*, *carduifolius*, *spinosus*, *arborescens*, *dioscoroides*, *ilicifolius*, *ebracteatus*, *capensis*, *furcatus*, *procumbens*, *integrifolius*, *repens*, *edulis*, *maderapatensis*. S. Europe, Cape, W. Indies.

1212. LEPIDAGATHIS.

One species; viz. *cristata*.

1213. ALECTRA.

One species; viz. *capensis*.

1214. PEDALJUM.

One species; viz. *murex*. E. Indies.

1215. MELLANTHUS, or *Honey-flower*.

Three species; viz. *major*, *minor*, *comosus*. C. of G. Hope.

In the class *Didynamia* are

125 Genera, which include 1006 Species. Of these 72 are found in Britain.

CLASSIS XV.

TETRADYNAMIA, (K)

ORDO I. SILICULOSÆ.

Sect. I. *Silicula integra, nec apice emarginata.*

* 1225. DRABA. Silic. valvulis planiusculis. Stylus nullus.

* 1224. LUNARIA. Silic. valvulis planis, pedicellata. Stylus exsertus.

* 1224. SUBULARIA. Silic. valvulis semioratis. Stylus brevior silicula.

* 1216. MYAGRUM. Silic. valvulis concavis. Stylus persistens.

CLASS XV:

TETRADYNAMIA, OR FOUR LONG AND TWO SHORT STAMENS.

ORDER I. SILICULOSÆ, or those having a Pouch, or broad Pock.

Sect. I. *The Pouch entire, not notched at the point.*

* D. Pouch with flattened valves. No style.

L. Pouch on a pedicel with flat valves. Style protruding.

* S. Pouch with half-oval valves. Style shorter than the pouch.

* M. Pouch with concave valves. Style permanent.

* 1222.

(K) In the flowers of this class of plants there are six stamens, four of them long and two short. It is also most worthy of notice, that the flowers of this class have uniformly four petals, a circumstance which renders it easy to distinguish them. The difference in length of the stamens is not always very obvious, but as the *Hexandria* class contains no plants with four petals, this last circumstance readily distinguishes the plants of the present class. The orders are two, and are distinguished by the figure of the seed-vessel, which in the first order is a broad and short *pouch*; that is, a roundish flat seed-vessel furnished with a *style*, which is sometimes as long as the seed-vessel itself. In the second order, the seed-vessel is a *long pod*; that is, a very long seed-vessel, without any remarkable style. This is a natural rather than an artificial class. The plants belonging to it are called *antiscorbutic*, and their taste is acid and watery. They lose most of their virtues by drying. None of them are

- * 1222. VELLA. Silic. valvulis dissepimento dimidio brevioribus.
 * 1219. CAKILE. Silic. lanceolata biarticulata, articulis monospermis, articulo supremo secedente.
 * 1218. PUGIONUM. Silic. transversalis utrinque rostrata, evalvis, monosperma.
 * 1217. BUNIAS. Silic. tetraëdra, evalvis, bi s. quadrilocularis, rugosa.
 * 1220. CRAMBE. Silic. globosa, unilocularis, monosperma, evalvis.

Sect. II. *Silicula emarginata apice.*

- * 1229. IBERIS. Petala duo exteriora majora.
 * 1130. ALYSSUM. Filamenta quædam latere interiore dente notata. Sil. bilocularis.
 * 1131. CLYPEOLA. Silic. orbiculata, valvulis planus, decidua.
 * 1232. PELTARIA. Silic. orbiculata, compresso-plana, non dehiscens.
 * 1228. COCHLEARIA. Silic. cordata, valvulis obtusis, gibbis.
 * 1226. LEPIDIUM. Silic. cordata, valvulis acutè carinatis.
 * 1227. THLAPSI. Silic. obcordata, valvulis marginato carinatis.
 * 1221. ISATIS. Silic. obcordata, valvulis carinatis, bipartibilis, 1-sperma, dissepimento fenestrato.
 * 1233. BISCUTELLA. Silic. biloba supra infraque, margine carinato.
 * 1223. ANASTATICA. Silic. retusa. Valvulis dissepimento mucronato longioribus.

ORDO II. SILIQUOSÆ.

Sect. I. *Calyx clausus foliis longitudinaliter conniventibus.*

- * 1247. RAPHANUS. Siliq. articulata.
 * 1239. ERYSIMUM. Siliq. tetragona.
 * 1240. CHEIRANTHUS. Siliq. germine utrinque glandula notato.
 * 1242. HESPERIS. Glandula intra stamina breviora. Pet. obliqua.
 * 1143. ARABIS. Glandulæ 4 intra foliola calycina. Stigma simplex.
 * 1245. BRASSICA. Glandulæ 2 intra stamina breviora, 2 extra stamina longiora.
 * 1248. CORDYLOCARPUS. Siliq. torulosa, semine supremo in articulo discreto.
 * 1244. TURRITIS. Petala erecta.
 * 1256. DENTARIA. Siliq. valvis revolutis dehiscens.
 * 1236. RICOTIA. Siliq. unilocularis.

Sect. II. *Calyx hians, foliis superne distantibus.*

1249. CLEOME. Siliq. dehiscens, unilocularis.

- * V. Pouch with valves shorter by half than the partition.
 * C. Pouch spear-shaped, 2-jointed, with 1-seeded joints, the last joint retiring.
 * P. Pouch placed crossways, beaked on both sides, no valves, 1-seeded.
 * B. Pouch 4-sided, without valves, 2 or 4-celled, wrinkled.
 * C. Pouch bulging, 1-celled, 1-seeded, without valves.

Sect. II. *Pouch with a notched end.*

- * I. Two outer petals large.
 * A. Some filaments in the inner side toothed. Pouch 2-celled.
 * C. Pouch round and flat, with flat valves, deciduous.
 * P. Pouch round and flat, compressed plane, not opening.
 * C. Pouch heart-shaped, with blunt bulging valves.
 * L. Pouch heart-shaped, with valves sharply keeled.
 * T. Pouch heart-shaped, reversed; valves keel bordered.
 * I. Pouch heart-reversed; keeled valves, divisible into 2, 1-seeded; window-shaped partition.
 * B. Pouch 2-lobed above and beneath, with a keel-shaped border.
 * A. Pouch bluntly notched at the end. Valves long, with a dagger-pointed partition.

ORDER II. SILIQUOSÆ, or those having a long Pod.

Sect. I. *Calyx shut by leaflets closing lengthwise.*

- * R. A jointed pod.
 * E. Pod 4-gon.
 * C. Pod, with a seed-bud marked on both sides with a gland.
 * H. A gland between the shorter stamens. Petals oblique.
 * A. Four glands between the leaflets of the calyx. Stigma undivided.
 * B. Two glands betwixt the shorter stamens, 2 beyond the longer stamens.
 * C. Pod a little swelling out, with the last seed in a separate joint.
 * T. Petals erect.
 * D. Pod with valves rolled back, open.

R. Pod 1-celled.

Sect. II. *Calyx open, with leaflets distant above.*

C. Pod open, 1-celled.

1237.

are poisonous It is not a little singular, that they are most acrimonious in moist situations, and wet seasons. Thus the *cochlearia armoracia* (horse radish), growing near water, is so very acrimonious that it can hardly be used; and the *brassica rapa* (turnip) whose root in a dry sandy soil is succulent and sweet, in stiff wet lands is hard and acrimonious.

* 1237. *CARDAMINE*. Siliq. dehiscent, valvulis revolutis.

* 1246. *SINAPIS*. Siliq. dehiscent. Cal. horizontaliter patens.

* 1238. *SISYMBRIUM*. Siliq. dehiscent, valvis rectiusculis. Cal. patulus.

1241. *HELIOPHILA*. Siliq. dehiscent. Nectararia 2 recurvata.

* G. Pod open, with valves rolled back.

* S. Pod open. Cal. horizontally expanding.

* S. Pod open, with valves rather straight. Cal. open.

H. Pod open. Nectararies 2, bent back.

ORDER I. SILICULOSÆ.

1216. *MYAGRUM*, or *Gold of Pleasure*.

12 species; viz. perenne, orientale, rugosum, hispanicum, perfoliatum, chloræfolium, sativum, dentatum, austriacum, paniculatum, saxatile, ægyptium. Europe, Egypt.

1217. *BUNIAS*, or *Sea Rocket*.

11 species; viz. spinosa, erucago, aspera, orientalis, cochlearioides, tatarica, syriaca, myagroides, ægyptiana, balearica, prostrata. Europe, Africa, America.

1218. *PUGIONIUM*.

One species; viz. cornutum.

1219. *CAKILE*.

Two species; viz. maritima, ægyptiaca.

1220. *CRAMBE*, or *Sea-cabbage*, or *Kale*.

Eight species; viz. * maritima, tatarica, orientalis, hispanica, reniformis, filiformis, fruticosa, strigosa. Sea shores of Europe, Madeira.

maritima. * C. leaves and stem smooth.—The young and tender plants are boiled as cabbage; but when full grown they occasion giddiness. Horses, cows, goats, sheep, and swine eat it.

1221. *ISATIS*, or *Woad*.

Four species; viz. * tinctoria, lusitanica, armena, alpina. Sea shores of Europe, Egypt.

tinctoria. * I. root-leaves scolloped; stem-leaves arrow-shaped; ponches oblong.—With the juice of this plant, it is said, the ancient Britons painted their bodies, to render themselves more terrible to their enemies. It is much used by the dyers for its blue colour, and it is the basis of many other colours. It is cultivated for their use. Cows eat it; horses, sheep, and goats refuse it.

1222. *VELLA*, or *Spanish Cress*.

Two species; viz. * annua, pseudo-cytisus. Siberia, Spain.

1223. *ANASTATICA*, or *Rose of Jericho*.

One species; viz. hierochuntica. Austria, Levant.

1224. *SUBULARIA*, or *Awl-wort*.

Two species; viz. * aquatica, alpina. N. of Europe, Arabia.

1225. *DRABA*, or *Whitlow-grass*.

16 species; viz. aizoides, rigida, ciliaris, alpina, hispanica, * verna, caroliniana, nivalis, * stellata, androsacea, pyrenaica, * muralis, nemoralis, hirta, * incana, magellanica. Alps of Europe, N. America.

VOL. IV. Part I.

†

* D. stalks naked; leaves sparingly serrated; petals *verna* divided.—This is one of our earliest flowering plants. It is good as a salad. Goats, sheep, and horses eat it; cows are not fond of it; swine refuse it.

1226. *LEPIDIUM*, or *Dittander*.

29 species; viz. perfoliatum, vesicarium, nudicaule, procumbens, alpinum, calycinum, * petræum, cardamines, spinosum, sativum, lyratum, crassifolium, * latifolium, amplexicaule, glastifolium, oleraceum, piscidium, subulatum, graminifolium, apetalum, suffruticosum, * didymum, * ruderale, virginicum, divaricatum, iberis, pollichii, bonariense, chalepense. Europe, Cape, America, New Zealand.

* L. leaves egg-spear-shaped, entire, serrated.—This is *latifolium* one of the antiscorbutics, and was formerly used in the place of *horse-radish*. An infusion of it excites vomiting.

1227. *THLASPI*, or *Treacle-mustard*.

14 species; viz. peregrinum, arabicum, * arvense, alliaceum, psychine, saxatile, hirtum, * campestre, * montanum, alpinum, * perfoliatum, * alpestre, * bursa pastoris, ceratocarpon. Europe.

Two sorts of the *thlaspi arvense* are used promiscuously; they both grow wild: their seeds have an acrid biting taste like common mustard, with which they agree in medical qualities.

The *thlaspi bursa pastoris* is common in waste places, and is found in flower all the summer. Shepherd's-purse, or the leaf, has long been celebrated as an astringent, and strongly recommended in diarrhoeas, dysenteries, uterine fluors, and in general in all diseases where astringents of any kind can avail. Some have esteemed it so powerful a styptic as scarcely to be safely exhibited internally. Others have thought it to be of a hot fiery nature, and supposed it to stop fluxes and hemorrhagies by coagulating the juices like alcohol, and burning or searing the orifices of the vessels. The sensible qualities of shepherd's purse discover little foundation for either of these opinions: it has no perceptible heat, acrimony, pungency, and scarcely any astringency: the taste is almost merely herbaceous, so as sufficiently to warrant the epithet given to this plant, *fatuum*. It is hardly in use in Britain.

1228. *COCHLEARIA*, or *Scurvy-grass*.

11 species; viz. * officinalis, * danica, * anglica, * groenlandica, sibirica, acaulis, * coronopus, * armoracia, macrocarpa, glastifolia, draba. Europe.

* C. root-leaves heart-circular; stem-leaves oblong, a *officinalis* little indented.—Notwithstanding this plant is a native of the sea coast, it is cultivated in our gardens without any sensible alteration of its properties. It possesses a

F f

considerable

considerable degree of acrimony, and this acrimony seems to reside in a very subtle essential oil. Its effects as an antiscorbutic are universally known, and it is a powerful remedy in the pituitous asthma, and in what Sydenham calls the scorbutic rheumatism. A distilled water and a conserve are prepared from the leaves, and its juice is prescribed along with that of oranges, by the name of antiscorbutic juices. It may be eaten as a salad. Cows eat it. Horses, goats, and sheep, refuse it.

armoracia * C. root-leaves spear-shaped, scolloped; stem-leaves snipt.—The root of this plant, scraped, is in common use in England as a condiment for fish, roast beef, &c. and it is used for many other culinary purposes. An infusion of it in cold milk makes one of the softest and best cosmetics. In paralytic and dropsical cases, it is a useful stimulant and diuretic. A strong infusion of it excites vomiting. A distilled water is prepared from it. Horses, cows, goats, sheep, and swine refuse it.

anglica. * C. all the leaves egg-spear-shaped. This is a pungent stimulating medicine; capable of dissolving viscid juices, opening obstructions of the viscera and the more distant glands, and promoting the fluid secretions; it is particularly celebrated in scurvies, and is the principal herb employed in these kinds of disorders in the northern countries.

1229. IBERIS, or *Candy-tuft*.

18 species; viz. *semperflorens*, *cappadocica*, *semper-virens*, *gibraltarica*, *saxatilis*, *vermiculata*, *rotundifolia*, *cepæfolia*, *carnosa*, *ciliata*, *parviflora*, *nana*, *umbellata*, * *amara*, *linifolia*, *odorata*, * *nudicaulis*, *pinnata*. S. Europe, Arabia, Persia.

1230. ALYSSUM, or *Mad-wort*.

31 species; viz. *spinosum*, *maritimum*, *halimifolium*, *tenuifolium*, *saxatile*, *lunarioides*, *argenteum*, *alpestre*, *serpyllifolium*, *atlanticum*, *orientale*, *hyperboreum*, *incanum*, *minimum*, *strictum*, *calycinum*, *sibiricum*, *spathulatum*, *montanum*, *tortuosum*, *campestre*, *linifolium*, *clypeatum*, *cheiranthifolium*, *sinuatum*, *creticum*, *gemonense*, *dasy carpum*, *utriculatum*, *vesicaria*, *deltoidum*. Europe, N. Amer.

1231. CLYPEOLA, or *Treacle-mustard*.

One species; viz. *jonthlaspi*. Italy, France, Carolina.

1232. PELTARIA.

Three species; viz. *alliacea*, *garcini*, *capensis*. Cape.

1233. BISCUTELLA, or *Buckler-mustard*.

Ten species; viz. *auriculata*, *apula*, *lyrata*, *raphanifolia*, *coronopifolia*, *lævigata*, *subspathulata*, *montana*, *sempervirens*, *peruviana*. Europe, N. Amer.

1234. LUNARIA, or *Moon-wort*, *Honesty*.

Two species; viz. *rediviva*, *annua*. N. of Eur.

ORDER II. SILIQUOSÆ.

1235. RICOTIA.

One species; viz. *ægyptiaca*. Egypt.

1236. DENTARIA, or *Tooth-wort*.

Seven species; viz. *enneaphylla*, *glandulosa*, *laciniata*, * *bulbifera*, *microphylla*, *pinnata*, *pentaphyllos*. Alps of Austria; S. Europe.

1237. CARDAMINE, or *Lady's-smock*.

22 species; viz. * *bellidifolia*, *alpina*, *asarifolia*, *nudicaulis*, *nivalis*, *resedifolia*, *trifolia*, *scutata*, *africana*, *chelidonia*, *thalictroides*, *macrophylla*, * *impatiens*, *parviflora*, *pensylvanica*, *græca*, * *hirsuta*, *latifolia*, * *pratensis*, * *amara*, *granulosa*, *virginica*. Europe, America.

* C. leaflets of the root-leaves roundish, those of the stem-leaves spear-shaped, very entire.—This is a perennial plant which grows in meadow grounds, sends forth purplish flowers in the spring, and in its sensible qualities resembles the *nasturtium aquaticum*. Long ago it was employed as a diuretic, and of late it has been introduced in nervous diseases. A dram or two of the powder is given twice or thrice a-day. It has little sensible operation, except that it sometimes sweats.—Goats and sheep eat of it. Horses and swine refuse it. Cows are not fond of it.

* C. leaves winged; suckers from the bosom of the leaves; leaflets of the stem-leaves angular, sitting.—Sheep eat it. Cows are not fond of it. The young leaves are acrid and bitterish, but do not taste amiss in salads. They are much used for that purpose in Lancashire. The leaves are pungent, bitter, and aromatic, in such a degree as to promise very considerable uses.

1238. SISYMBRIUM, or *Water-cresses*.

53 species; viz. * *nasturtium*, * *sylvestre*, *palustre*, * *amphibium*, *pyrenaicum*, *tanacetifolium*, *ceratophyllum*, *coronopifolium*, *tenuifolium*, *sagittatum*, *amplexicaule*, *supinum*, *polyceratium*, *filifolium*, *bursifolium*, *torulosum*, * *murale*, * *monense*, *repandum*, *tillieri*, *vimineum*, *barrelieri*, *arenosum*, *valentinum*, *parra*, *asperum*, *lævigatum*, *millefolium*, * *sophia*, *album*, *cinnereum*, *altissimum*, *echartsbergense*, *pannonicum*, *erysimoides*, * *irio*, *columnæ*, *loeselii*, *obtusangulum*, *orientale*, *barbareæ*, *lyratum*, *catholicum*, *heterophyllum*, *glaciale*, *strictissimum*, *pendulum*, *hispanicum*, *pumilum*, *salsuginosum*, *integrifolium*, *indicum*, *hispidum*. Europe, Canaries, India.

* S. leaves winged; leaflets egg-shaped.—This plant is very universally used as an early and wholesome spring salad. It is an excellent antiscorbutic and stomachic, with less acrimony than the scurvy-grass. It is an ingredient in the antiscorbutic juices. It is recommended as of singular efficacy for accelerating the circulation, strengthening the viscera, opening obstructions of the glands, promoting the fluid secretions, and purifying the blood and humours; for these purposes the expressed juice, which contains the peculiar taste and pungency of the herb, may be taken in doses of an ounce or two, and continued for a considerable time.

* S. pods oblong egg-shaped; leaves wing-cleft, serrated; petals longer than the cup.—The ends of the general fruitstalks are often swollen into a cauliflower-like substance, purplish, and containing small grubs of the same colour. Cows refuse it. Sheep and goats are not fond of it.

* S. petals smaller than the cups; leaves doubly compound, winged.—The pods retain the seeds all winter, and small birds feed upon them. The plant has been sometimes prescribed in hysteric and dysenteric cases; and the seeds are given to destroy worms. Sheep and cows eat it. Horses and goats are not fond of it. Swine refuse it.

1239. ERYSIMUM, or *Hedge-mustard*.

14 species; viz. * officinale, * barbarea, præcox, * aliaría, repandum, * cheiranthoides, hieracifolium, odoratum, virgatum, diffusum, angustifolium, junceum, bicornè, quadricornè. Europe, Barbary, Canary, Carolina.

officinale. * E. pods pressed to the spike-stalks; leaves notched.—This plant is warm and acrid to the taste; and when cultivated is used as a spring pot-herb. Birds are fond of the seeds. Sheep and goats eat it. Cows, horses, and swine refuse it. By means of it a hoarseness, occasioned by loud speaking, is said to have been cured in three days by Rondeletius.

barbarea. * E. pods indistinctly four-cornered; leaves lyre-shaped, the terminating segment circular.—The common people in Sweden are said to use this plant in salads, early in the spring, and late in the autumn; they also boil them as kale. It is sown in gardens as an early spring salad; and also in England, where it is called French cress. Cows eat it. Horses and swine refuse it. Goats and sheep are not fond of it.

aliaria. * E. leaves heart-shaped.—The Prussians are said to eat the leaves along with salted meats in the spring. They are used with lettuce and the colder salads. The seeds excite sneezing. Cows and goats eat it. Horses, sheep, and swine refuse it. When it grows in poultry yards the fowls eat it, and it gives an intolerably rank taste to their flesh. In Wales it is much used as a frying herb.

cheiranthoides. * E. stem very much branched; leaves spear-shaped, oblique, waving and toothed; pods expanding.—The country people give the seeds of this plant to destroy worms, and with good effect. Horses, cows, goats, sheep, and swine, eat it.

1240. CHEIRANTHUS, or *Stock July-flower*.

34 species; viz. erysimoides, helveticus, alpinus, lan- ceolatus, * cheiri, fruticosus, callosus, strictus, tenuifolius, mutabilis, apricus, chius, maritimus, parviflori, salinus, bicuspidatus, incanus, fenestralis, annuus, litto- reus, contortuplicatus, leucanthenus, tristis, trilobus, pul- chellus, pinnatifidus, tricuspidatus, tomentosus, odoratis- simus, sinuatus, taraxacifolius, cuspidatus, quadrangu- lus, farsetia. Alps, S. Europe, Egypt, Madeira.

cheiri. * C. leaves spear-shaped, acute, smooth; branches an- gular; stem shrub-like.—This plant has found place in our gardens, where it has produced a considerable number of varieties, but none which have a more de- lightful scent than the wild one. The flowers have a pleasant smell, and a subacid, bitterish, not agree- able taste; they are said to be cordial, anodyne, ape- rient, and emmenagogue, but are wholly neglected in the present practice.

1241. HELIOPHILA.

12 species; viz. integrifolia, incana, circæoides, am- plexicaulis, flava, canescens, pusilla, filiformis, pendula, pinnata, coronopifolia, digitata. C. of G. Hope.

1242. HESPERIS, or *Dames-violet, Rocket*.

Ten species; viz. tristis, lanciniata, matronalis, * ino- dora, tatarica, africana, ramosissima, arenaria, verna, lacera. Siberia, S. Europe, Africa.

1243. ARABIS, or *Base Tower-mustard*.

21 species; viz. alpina, grandiflora, * thaliana, crant- ziana, recta, serpillifolia, reptans, coerulea, bellidifolia,

nutans, lyrata, hispida, * stricta, halleri, œvicensis, ca- nadensis, lucida, pendula, * turrita, saxatilis, aspera. N. Europe, N. America.

1244. TURRITIS, or *Tower-mustard*.

Eight species; viz. * glabra, lævigata, stricta, * hir- suta, patula, pubescens, ciliata, alpina. Europe.

1245. BRASSICA, or *Cabbage*.

24 species; viz. * orientalis, austriaca, * campestris, arvensis, alpina, * napus, * rapa, * oleracea, richerii, cretica, suffruticosa, chinensis, violacea, subhiastata, po- lymorpha, teretifolia, erucastrium, eruca, pinnatifida, elongata, cheiranthus, vessicaria, lyrata, crassifolia. Europe, China.

* B. the root a regular continuation of the stem, spin- dle-shaped.—The roots of the cultivated variety may be eaten like the turnip, but they have a strong taste; and its seeds, which are called cole-seed, afford a large quantity of expressed oil, called *rape oil*: what remains after expressing the oil, is called *oil-cake*, and is used for fattening oxen. In Norfolk, the cakes are broken to pieces, and strewed on the land as a manure. It is thought to be a very efficacious one, and is sold from 4l. to 6l. per ton. About half a ton is laid on an acre. Cows, goats, and swine eat it.

* B. the root a regular continuation of the stem, cylin- drical, fleshy. *Turnip*.—The roots of it are eaten either raw, boiled, or roasted. Pepper is commonly used with them. They relax the bowels, and are supposed to sweeten the blood. They are hurtful to pregnant and hysterical women, and to those who are subject to fla- tulencies. The juice well fermented affords by distilla- tion an ardent spirit. The rind is acrimonious. If the roots are kept in sand, or in a cellar, during the winter, they send out white shoots, and yellowish leaves, which being rather sweet, and not unpleasant to the palate, are used as salad, when other esculent plants are not to be had. But the greatest use of turnips is in feeding oxen and sheep in the winter.

* B. the root a regular continuation of the stem, cylin- drical, fleshy. *Sea and Common Cabbage*.—Early in the spring, the sea-cabbage is preferred to the cultivated kinds, but when gathered on the sea-coast, it must be boiled in two waters, to take away the saltness. The roots may be eaten like those of the preceding species, but they are not so tender. The different varieties of cultivated garden cabbage originate from this, all of which are much in use at our tables. The red cabbage is chiefly used for pickling. In some countries they bury the white cabbage when fully grown in the autumn, and thus preserve it all winter. The Germans cut them to pieces, and along with some aromatic herbs and salt press them close down in a tub, where they soon fer- ment, and are then eaten under the name of *sour-crowt*. If cabbages are sowed or planted for several years to- gether in the same soil, the heads become smaller, and the roots knotty. This is occasioned by the larvæ of flies. Horses eat the leaves, but do not seem fond of them. Cows grow fat upon them.

The *brassica eruca* was formerly much cultivated in gardens, for medical use, and for salads; but is at present less common. In appearance it resembles must- ard, but it is easily distinguishable, by the smoothness of its leaves and its disagreeable smell. The seeds have a pungent taste of the mustard kind, but weaker; they

have long been celebrated as aphrodisiacs; and may probably have in some cases a title to this virtue, in common with other acrid plants.

1246. SINAPIS, or *Mustard*.

19 species; viz. *arvensis, orientalis, brassicata, *alba, *nigra, pyrenaica, pubescens, hispida, chinensis, juncea, allioni, erucoides, cornua, hispanica, japonica, incana, frutescens, radicata, lævigata. Europe, China, Madeira.

arvensis. * S. pods with many angles, swollen and bunched out by the seeds; smooth, longer than the 2-edged beak.—The Scandinavians are said to boil and eat it as a cabbage, and in Ireland the tender tops are collected for the same purpose. Cows, goats, and swine eat it. Sheep are very fond of it. Horses generally refuse it.

alba. * S. pods rough with hair; beak very long, slanting, sword-shaped.—It is sown in the winter and early in the spring, to supply our tables with salading. The seeds have nearly the same properties as those of the next species.

nigra. * S. pods smooth, laid flat to the spike-stalk.—The seeds of this plant, reduced to powder, make the common mustard so much in request at our tables. They yield a considerable quantity of expressed oil, which partakes but little of the acrimony of the plant. The seeds when unbruised impart but little taste to boiling water. Taken inwardly, in the quantity of a table spoonful or more, they gently loosen the bowels, and are of service in asthma, chronic rheumatism, and palsy. The powdered seeds curdle milk, and give a strong impregnation to boiling water. This infusion taken in considerable quantity vomits, in smaller doses it is an useful aperient and diuretic. Cataplasms formed with crumb of bread, vinegar, and powdered mustard seed,

are very commonly applied to the soles of the feet, as stimulants, in fevers that require such treatment; they are used with advantage, topically applied, in fixed rheumatic and sciatic pains. Upon the whole, wherever we want a strong stimulus, that acts upon the nervous system, without exciting much heat, we know none preferable to mustard seed. Its acrimony consists in an essential oil.

1247. RAPHANUS, or *Radish*.

Eight species; viz. sativus, caudatus, *raphanistrum, sibiricus, tenellus, arcuatus, lanceolatus, pilosus. Europe, Egypt, China.

* R. pods round, jointed, smooth, of one cell.—In *raphanistrum* wet seasons it grows in great quantity amongst the barley in Sweden, and the common people who eat barley bread, are afflicted with very convulsive complaints, in those provinces, and in those seasons, wherein this plant abounds. Horses eat it. Cows refuse it.

1248. CORDYLOCARPUS.

Two species; viz. muricatus, lævigatus.

1249. CLEOME, or *Base Mustard*.

23 species; viz. juncea, heptaphylla, pentaphylla, triphylla, polygama, icosandra, viscosa, dodecandra, felina, chelidonii, gigantea, aculeata, spinosa, serrata, ornithopodioides, violacea, arabica, tenella, filifolia, gujanensis, monophylla, capensis, procumbens. Portugal, Cape, East and West Indies.

In the class *Tetradynamia* are

34 Genera, including 436 Species, of which 58 are found in Britain.

CLASSIS XVI.

MONADELPHIA (F).

ORDO I. TRIANDRIA.

1253. GALAXIA. Monogyna. Spatha 1 s. 2-phylla. Cor. 1-petala, 6-fida.

1251. SISYRINCHIUM. Monogyna. Spatha 2-phylla. Petala 6, subæqualia.

CLASS XVI.

MONADELPHIA.

ORDER I. TRIANDRIA, or 3 Stamens.

G. One pistil. Sheath 1 or 2-leaved. Cor. 1-petaled, 6-cleft.

S. One pistil. Sheath 2-leaved. Petals 6, nearly equal.

1252.

(F) In this class the filaments are all united together at the bottom, but separate at the top. The union at the bottom gives rise to the name *Monadelphia* or *one brotherhood*. The orders are determined by the number of stamens. The plants of this class were considered by Tournefort as having only one petal. But all the petals are distinct at the base; though, by the intervention of the united filaments, they cohere all together as one body; on which account they may properly be considered as having five petals. Linnæus remarks, that the fruit does not afford sufficient marks whereby to distinguish the genera in this class; but that the calyx is of the utmost importance, as it furnishes invariable characters. Withering observes, that the petals are truly a continuation of the cylindrical sheath formed by the united filaments, which incloses the styles and germens as it descends; when rising upwards it spreads out into petals.

1252. FERRARIA. Monogyna. Spatha 2-phylla. Petala 6, tribus exterioribus latioribus.

1254. APHYTEIA. Monogyna. Cal. 3-fidus. Petala 3. Bacca polysperma.

1250. TAMARINDUS. Monogyna. Cal. 4-partitus. Petala 3. Legumen.

ORDO II. PENTANDRIA.

1263. ERODIUM. Monogyna. Arilli 5, monospermi, ad basin receptaculi rostrati. Cal. 5-phyll. Cor. 5-petala. Nect. squamæ 5.

1256. SYMPHONIA. Monogyna. Bacca 5-locularis, 5-sperma. Cal. 5-phyll. Cor. 5-petala.

1255. OZOPHYLLUM. Monogyna. Caps. 5-locularis. Cal. 5-dentatus. Cor. 5-petala, infundibuliformis.

1261. OCHROMA. Monogyna. Caps. 5-locularis. Cal. duplex. Cor. 5-petala. Antheræ anfractuossæ.

1257. LERCHEA. Monogyna. Caps. 3-locularis, polysperma. Cal. 5-fidus. Cor. 1-petala.

1258. WALTHERIA. Monogyna. Caps. 1-locularis, 1-sperma. Cal. duplex. Cor. 5-petala.

1262. PASSIFLORA. Trigyna. Cal. 5-partitus. Cor. 5-petala, calyci inserta. Nectar. filamentosum.

1259. HERMANNIA. Pentagyna. Caps. 5-locularis. Cal. 5-fidus. Petala 5, cucullata, obliqua. Filamenta dilatata.

1260. MELOCHIA. Pentagyna. Caps. 5-locularis, 1-sperma. Cal. sub-duplex. Petala 5, patentia. Filamenta subulata.

Linum, Anagallis, Lysimachia, Pelargonium betonicum, &c. Geranium pusillum. Mahernia, Leea, Ayenia, Buttneria.

ORDO III. HEPTANDRIA.

1264. PELARGONIUM. Monogyna. Arilli 5, monospermi, ad basin receptaculi rostrati. Cal. 5-partitus, nectariferus. Cor. 5-petala, inæqualis.

ORDO IV. OCTANDRIA.

1266. AITONIA. Monogyna. Bacca sicca, unilocularis. Cal. 4-partitus. Petala 4.

1265. PISTIA. Monogyna. Caps. 1-locul. Cal. spathaceus, 1-phyllus. Cor. 0.

Erica monadelphia, Guarea, Persoonia.

ORDO V. DECANDRIA.

1271. GERANIUM. Monogyna. Arilli 5, monospermi, ad basin receptaculi rostrati. Cal. 5-phyllus. Cor. 5-petala.

1270. SENRÆA. Monogyna. Caps. 5-locularis. Cal. duplex. Cor. 5-petala.

1267. CRINODENDRUM. Monogyna. Caps. unilocularis, trisperma. Cal. 0. Cor. 6-petala.

1268. CONARUS. Monogyna. Caps. 1-sperma. Cal. 5-partitus. Cor. 5-petala.

1269. HUGONIA. Pentagyna. Drupa 1-sperma. Cal. 5-part. inæqualis. Cor. 5-petala.

Oxalis et nonnullæ Papilionaceæ, Gærtneria, Trichilia, Turraea, Sandoricum, Swietenia, Strigilia, Melia, Samyda, Cuscaria, Erythroxylon, Malpighia, Banisteria, Hiræa, Triopteris, Averrhoa.

F. One pistil. Sheath 2-leaved. Petals 6, the 3 outermost broadest.

A. One pistil. Cal. 3-cleft. Petals 3. Berry many-seeded.

T. One pistil. Cal. 4-parted. Petals 3. Leguminous.

ORDER II. PENTANDRIA, or 5 Stamens.

E. One pistil. Seed-coats 5, 1-seeded at the base of a beaked receptacle. Cal. 5-leaved. Cor. 5-petaled. Nect. 5 scales.

S. One pistil. Berry 5-celled, 5-seeded. Cal. 5-leaved. Cor. 5-petaled.

O. One pistil. Caps. 5-celled. Cal. 5-toothed. Cor. 5-petaled, funnel-shaped.

O. One pistil. Caps. 5-celled. Cal. double. Cor. 5-petaled. Anthers turning.

L. One pistil. Caps. 3-celled, many-seeded. Cal. 5-cleft. Cor. 1-petaled.

W. One pistil. Caps. 1-celled, 1-seeded. Cal. double. Cor. 5-petaled.

P. Three pistils. Cal. 5-parted. Cor. 5-petals inserted in the cal. Nectary like a filament.

H. Five pistils. Caps. 5-celled. Cal. 5-cleft. Petals 5, cone-shaped, oblique. Filaments dilated.

M. Five pistils. Caps. 5-celled, 1-seeded. Cal. nearly double. Petals 5, expanding. Filaments awl-shaped.

ORDER III. HEPTANDRIA, or 7 Stamens.

P. One pistil. Seed-coats 5, 1-seeded, beaked at the base of the receptacle. Cal. 4-parted, bearing the nectary. Cor. 5-petaled, unequal.

ORDER IV. OCTANDRIA, or 8 Stamens.

A. One pistil. Berry dry, celled. Cal. 4-parted. Petals 4.

P. One pistil. Caps. 1-celled. Cal. sheath-like, 1-leafed. No cor.

ORDER V. DECANDRIA, or 10 Stamens.

G. One pistil. Seed-coats 5, 1-seeded, beaked at the base of the receptacle. Cal. 5-leaved. Cor. 5-petaled.

S. One pistil. Caps. 5-celled. Cal. double. Cor. 5-petaled.

C. One pistil. Caps. 1-celled, 3-seeded. No cal. Cor. 6-petaled.

C. One pistil. Caps. 1-seeded. Cal. 5-parted. Cor. 5-petaled.

H. Five pistils. Drupe 1-seeded. Cal. 5-parted, unequal. Cor. 5-petaled.

ORDO VI. ENDECANDRIA.

1272. *BROWNEA*. Monogyna. Cal. 2-fidus. Cor. exterior, 5-fida; interior 5-petala. Legumen.

ORDO VII. DODECANDRIA.

1274. *MONSONIA*. Monogyna. Cal. simplex, 5-phyllus. Cor. 5-petala, dentata. Arilli 5, monospermi, ad basin receptaculi rostrati.

1276. *HELICTERIS*. Monogyna. Cal. simplex, 5-fidus. Cor. 5-petala. Caps. 5, spirales.

1275. *PLAGIANTHUS*. Monogyna. Cal. simplex, 5-fidus. Cor. 5-petala. Bacca.

1273. *ACIA*. Monogyna. Cal. simplex, 5-partitus. Cor. 5-petala. Drupa.

1281. *PTEROSPERMUM*. Monogyna. Cal. simplex. Cor. 5-petala. Caps. 5-locularis. Semina alata.

1277. *CIENFUEGIA*. Monogyna. Cal. duplex. Cor. 5-petala. Caps. 3-locularis, 3-sperma.

1280. *PENTAPETES*. Monogyna. Cal. duplex. Cor. 5-petala. Caps. 3-locularis, dissepimentis contrariis.

1279. *DOMBEIA*. Monogyna. Cal. duplex. Cor. 5-petala. Caps. 5, bivalves, coalitæ.

1278. *ASSONIA*. Pentagyna. Cal. duplex. Cor. 5-petala. Caps. 5, bivalves, coalitæ.

Halesia, Styrax, Sterculia, Kleinhofia.

ORDO VIII. POLYANDRIA.

1282. *CAROLINEA*. Monogyna. Cal. simplex, subtruncatus. Caps. lignosa, 1-locul. polysperma.

1301. *GORDONIA*. Monogyna. Cal. simplex, 5-phyllus. Caps. 5-locularis. Sem. bina, alata.

1305. *MORISONIA*. Monogyna. Cal. simplex, 2-fidus. Bacca capsularis, pedicellata. Petala 4.

1309. *GUSTAVIA*. Monogyna. Cal. simplex, 4 s. 6-fidus. Bacca sicca, 4 s. 5-locul. polysperma. Petala 4 s. 6.

1307. *CROSSOSTYLIS*. Monogyna. Cal. simplex, 4-partitus. Bacca unilocul. polysperma.

1304. *MYRODIA*. Monogyna. Cal. simplex, rumpens. Drupa 2 s. 3-locularis. Petala 5.

1308. *BARRINGTONIA*. Monogyna. Cal. simplex, 2-phyllus. Drupa nuce tetragona. Petala 4.

1303. *MESUA*. Monogyna. Cal. simplex, 4-phyllus. Nux tetragona, 1-sperma. Petala 4.

1306. *POUREATIA*. Monogyna. Cal. simplex, 5-partitus. Drupa sicca, 1-sperma, 5-alata. Petala 5.

1300. *STUARTIA*. Pentagyna. Cal. simplex, patens. Caps. 5-locularis. Sem. solitaria.

1287. *PALAVIA*. Monogyna. Cal. simplex, 5-fidus. Capsulæ monospermæ, conglomeratæ absque ordine.

1285. *LAGUNÆA*. Monogyna. Cal. simplex, 5-fidus. Caps. 5-locularis, dissepimentis contrariis.

1286. *SIDA*. Submonogyna. Cal. simplex, angulatus. Caps. multilocularis, 1-sperma.

1284. *BOMBAX*. Monogyna. Cal. simplex. Caps. 5-locularis, polysperma. Stylus indivisus. Semina lanata.

ORDER VI. ENDECANDRIA, or 11 Stamens.

B. One pistil. Cal. 2-cleft. Outer cor. 5-cleft; inner 5-petaled. Leguminous.

ORDER VII. DODECANDRIA, or 12 Stamens.

M. One pistil. Cal. simple, 5-leaved. Cor. 5-petaled, toothed. Seed-coats 5, 1-seeded, beaked at the base of the receptacle.

H. One pistil. Cal. simple, 5-cleft. Cor. 5-petaled. Caps. 5, spiral.

P. One pistil. Cal. simple, 5-cleft. Cor. 5-petaled. A berry.

A. One pistil. Cal. simple, 5-parted. Cor. 5-petaled. Drupe.

P. One pistil. Cal. simple. Cor. 5-petaled. Caps. 5-celled. Seeds winged.

C. One pistil. Cal. double. Cor. 5-petaled. Caps. 3-celled, 3-seeded.

P. One pistil. Cal. double. Cor. 5-petaled. Caps. 5-celled, with opposite partitions.

D. One pistil. Cal. double. Cor. 5-petaled. Capsules 5, 2-valved, united.

A. Five pistils. Cal. double. Cor. 5-petaled. Caps. 5, 2-valved, united.

ORDER VIII. POLYANDRIA, or many Stamens.

C. One pistil. Cal. simple, nearly lopped. Caps. woody, 1-celled, many-seeded.

G. One pistil. Cal. simple, 5-leaved. Caps. 5-celled. Seeds 2, winged.

M. One pistil. Cal. simple, 2-cleft. Capsular berry, pedicled. Petals 4.

G. One pistil. Cal. simple, 4 or 6-cleft. Berry dry, 4 or 5-celled, many-seeded. Petals 4 or 6.

C. One pistil. Cal. simple, 4-parted. Berry 1-celled, many-seeded.

M. One pistil. Cal. simple, breaking. Drupe 2 or 3-celled. Petals 5.

B. One-celled. Cal. simple, 2-leaved. Drupe with a 4-gon nut. Petals 4.

P. One pistil. Cal. simple, 4-leaved. Nut 4-gon, 1-seeded. Petals 4.

P. One pistil. Cal. simple, 5-parted. Drupe dry, 1-seeded, 5-winged. Petals 5.

S. Five pistils. Cal. simple, expanding. Caps. 5-celled. Seeds solitary.

P. One pistil. Cal. simple, 5-cleft. Caps. 1-seeded, incorporated without order.

L. One pistil. Cal. simple, 5-cleft. Caps. 5-celled, with opposite partitions.

S. Nearly 1 pistil. Cal. simple, angular. Caps. many-celled, 1-seeded.

B. One pistil. Cal. simple. Caps. 5-celled, many-seeded. Style undivided. Seeds cottony.

1283. ADANSONIA. Monogyna. Cal. simplex. Caps. 10-locularis, polysperma. Pulpa farinacea.
 1296. GOSSYPIUM. Monogyna. Cal. exterior, 3-fidus. Caps. 3 s. 4-locul. polysperma, coadunata.
 1292. RUIGIA. Decagyna. Cal. exterior, 3-phyl- lus. Caps. 10-locul. globoso-verticillatæ.
 * 1291. LAVATERA. Polygyna. Cal. exterior, 3- fidus. Caps. 1-spermæ, verticillatæ.
 1288. MALACHRA. Polygyna. Cal. exterior, 3- phyllus. Caps. 5, monospermæ.
 * 1290. MALVA. Polygyna. Cal. exterior, 3-phyl- lus. Caps. 1-spermæ, verticillatæ, plures.
 1293. MALOPE. Polygyna. Cal. exterior, 3-phyl- lus. Caps. 1-spermæ, conglomeratæ, absque ordine.
 1295. URENA. Monogyna. Cal. exterior, 5-fidus. Caps. 5-locularis, 5-partibilis, loculamentis classis.
 1298. PAVONIA. Monogyna. Cal. exterior, 8- phyllus. Caps. 5-locularis, 5-partibilis, loculamentis 2-valvibus.
 1297. HIBISCUS. Monogyna. Cal. exterior, 8- phyllus. Caps. 5-locularis, polysperma.
 1299. ACHANIA. Monogyna. Cal. exterior, 8- phyllus. Bacca 5-locularis.
 1294. KITAIBELIA. Polygyna. Cal. exterior, 7 s. 9-fidus. Caps. monospermæ, in capitulum quinquelobum glomeratæ.
 * 1289. ALTHÆA. Polygyna. Cal. exterior, 6-9- fidus. Caps. 1-spermæ, verticillatæ.
 1302. CAMELLIA. Monogyna. Cal. exterior, im- bricatus. Caps. loculis polyspermis. Stylus indivisus.

Hypericum Brathy, Mimose nonnullæ.

- A. One pistil. Cal. simple. Caps. 10-celled, ma- ny-seeded. A farinaceous pulp.
 G. One pistil. Cal. exterior, 3-cleft. Caps. 3 or 4- celled, many-seeded, joined together at the base.
 R. Ten pistils. Cal. exterior, 3-leaved. Caps. 10- celled, globular in whirls.
 * L. Many pistils. Cal. exterior, 3-cleft. Caps. 1- seeded, in whirls.
 * M. Many pistils. Outer cal. 3-leaved. Caps. 5, 1- seeded.
 * M. Many pistils. Outer cal. 3-leaved. Several caps. 1-seeded, growing in whirls.
 M. Many pistils. Outer cal. 3-leaved. Caps. 1- seeded, incorporated and without order.
 U. One pistil. Outer cal. 5-cleft. Caps. 5-celled, 5-divisible, with closed cells.
 P. One pistil. Outer cal. 8-leaved. Caps. 5-celled, 5-divisible, with 2-valved cells.
 H. One pistil. Outer cal. 8-leaved. Caps. 5-celled, many-seeded.
 A. One pistil. Outer cal. 8-leaved. Berry 5-cel- led.
 K. Many pistils. Outer cal. 7 or 9-cleft. Caps. 1- seeded, incorporated into a 5-lobed knob.
 * A Many pistils. Outer cal. 6-9-cleft. Caps. 1- seeded, growing in whirls.
 C. One pistil. Outer cal. tiled. Caps. with many- seeded oells. Style undivided.

ORDER I. TRIANDRIA.

1250. TAMARINDUS, or *Tamarind-tree*.
 One species; viz. indica. Egypt, E. and W. In- dies.—The fruit of this species is a pod resembling that of a bean, including several hard seeds, together with a dark-coloured viscid pulp of a pleasant acid taste: the East India tamarinds are larger than the West Indian sort; the former containing six or seven seeds each, the latter rarely above three or four. The pulp of these fruits, taken from the quantity of two or three drams to an ounce or more, proves gently laxa- tive or purgative; and at the same time by its acidi- ty quenches thirst, and allays immoderate heat. It in- creases the action of the purgative sweets, cassia and manna, and weakens that of the resinous cathartics. Some have supposed it capable of abating the virulence of antimonial preparations; but experience shows that it has rather a contrary effect, and that all vegetable acids augment their power. Tamarinds are an ingre- dient in the electuary of cassia, the lenitive electuary, and decoction of tamarinds with senna.

1251. SISYRINCHIUM, or *Bermudana*.
 Eight species; viz. elegans, collinum, grandiflorum, bermudiana, anceps, micranthum, palmifolium, striatum. Bermuda, W. Indies.

1252. FERRARIA.

Four species; viz. undulata, ferrariola, pavonia, ixi- oides. Cape, Mexico.

1253. GALAXIA.

Three species; viz. ovata, graminea, narcissoides. C. of G. Hope.

1254. APHYTEJA.

One species; viz. hydнора. C. of G. Hope.

ORDER II. PENTANDRIA.

1255. OZOPHYLLUM.

One species; viz. trifoliatum.

1256. SYMPHONIA.

One species; viz. globulifera. Surinam, Guiana.

1257. LERCHEA.

One species; viz. longicauda. E. Indies.

1258. WALTHERIA.

Six species; viz. americana, indica, lophanthus, ova- ta, angustifolia, elliptica. E. and W. Indies, S. Ame- rica.

1259. HERMANNIA.

30 species; viz. althæifolia, plicata, candicans, di- sticha, salvifolia, micans, involucrata, scordifolia, denu- data, disermæfolia, alnifolia, cuneifolia, holosericea, hirsuta, scabra, multiflora, flammea, angularis, hyssopi- folia,

folia, trifurcata, odorata, lavandulifolia, linifolia, filifolia, trifoliata, triphylla, procumbens, vesicaria, grossularifolia, incisa. C. of G. Hope.

1260. MELOCHIA.

14 species; viz. pyramidata, tomentosa, crenata, depressa, truncata, venosa, hirsuta, concatenata, odorata, lupulina, caracasana, nodiflora, corchorifolia, supina. E. and W. Indies, Brazil.

1261. OCHROMA, or *Down-tree*, or *Cork-wood*.
One species; viz. lagopus. Jam. Hispan.

1262. PASSIFLORA, or *Passion-flower*.

46 species; viz. serratifolia, pallida, adulterina, cuprea, tiliæfolia, maliformis, quadrangularis, alata, laurifolia, coccinea, mucronata, glandulosa, multiflora, perfoliata, rubra, normalis, lunata, murucuja, vespertilia, oblongata, capsularis, rotundifolia, orbiculata, punctata, lutea, angustifolia, minima, suberosa, peltata, hederacea, glauca, holosericea, hirsuta, fœtida, ciliata, serrulata, aurantia, coneifolia, incarnata, tomentosa, mixta, cœrulea, filamentosa, serrata, pedata, heterophylla. West Indies, S. America.

1263. ERODIUM.

34 species; viz. crassifolium, stephanianum, tataricum, supracanum, petræum, absinthoides, glandulosum, bipinnatum, alpinum, ciconum, cicutarium, pimpinellifolium, romanum, moschatum, præcox, pulverulentum, hirtum, laciniatum, gruinum, chium, asplenoides, hymenodes, murcicum, guttatum, glaucophyllum, incarnatum, arduinum, ribifolium, arborescens, heliotropioides, malacoides, maritimum, malopoides, chamædryoides.

ORDER III. HEPTANDRIA.

1204. PELARGONIUM.

120 species; viz. longifolium, longiflorum, dipetalum, oxaloïdes, ficaria, ciliatum, auriculatum, auritum, hirtum, punctatum, bifolium, hirsutum, atrum, trifidum, heterophyllum, triphyllum, nervifolium, pinnatum, barbatum, melananthon, carneum, rapaceum, lobatum, triete, appendiculatum, flavum, œnothæræ, chamædrifolium, ovale, trichostomon, blattarium, eriostemon, elegans, stipulaceum, articulatum, tabulare, alchimilloïdes, odoratissimum, grossularioides, anceps, athæoides, columbinum, coronopifolium, capillare, tricolor, seneciodes, myrrhifolium, lacerum, multicaule, coriandrifolium, caucalifolium, minimum, glaucum, diversifolium, betulinum, acetosum, scandens, stenopetalum, hybridum, zonale, inguinans, heterogamum, monstrum, crassicaule, peltatum, lateripes, tetragonum, cordatum, cucullatum, angulosum, acerifolium, papilionaceum, cortusæfolium, fuscum, saniculæfolium, patulum, grandiflorum, variegatum, cotyledonis, echinatum, australe, vitifolium, capitatum, glutinosum, hispidum, tomentosum; ribifolium, quercifolium, graveolens, asperum, balsameum, radula, denticulatum, bicolor, tricuspdatum, scabrum, spinosum, rigidum, crispum, hermannifolium, adulterinum, semitrilobum, tripartitum, fulgidum, gibbosum, exstipulatum, ternatum, lævigatum, fragile, incisum, carnosum, ferulaceum, alternans, ceratophyllum, crithmifolium, ramosissimum, abrotanifolium, fruticosum, hirtum, tenuifolium.

ORDER IV. OCTANDRIA.

1265. PISTIA, or *Water House-leek*.

One species; viz. stratiotes. Asia, Africa, South America.

1266. AITONIA.

One species; viz. capensis. C. of G. Hope.

ORDER V. DECANDRIA.

1267. CRINODENDRUM.

One species; viz. patagua. Chili.

1268. CONNARUS, or *Ceylon Sumach*.

Seven species; viz. africanus, asiaticus, pentagynus, decumbens, pinnatus, santaloides, mimosoides. Ceylon, Africa.

1269. HUGONIA.

Three species; viz. mystax, serrata, tomentosa. India.

1270. SENÆA.

One species; viz. incana.

1271. GERANIUM, or *Cranes-bill*.

39 species; viz. spinosum, sessiliflorum, sibiricum, * sanguineum, tuberosum, anemonefolium, macrorrhizum, * phæum, fuscum, reflexum, lividum, * nodosum, striatum, angulatum, ibericum, * sylvaticum, palustre, asphodeloides, aconitifolium, collinum, * pratense, maculatum, pilosum, canescens, incanum, argenteum, varium, * pyrenaicum, bohemicum, divaricatum, * lucidum, molle, carolinianum, * columbinum, * dissectum, * rotundifolium, pusillum, robertianum, purpureum. Europe, Africa, N. America.

ORDER VI. ENDECANDRIA.

1272. BROWNEA.

Four species; viz. coccinea, grandiceps, rosa de monte, pauciflora. S. America.

ORDER VII. DODECANDRIA.

1273. ACIA.

Two species; viz. dulcis, amara. Guiana.

1274. MONSONIA.

Five species; viz. tenuifolia, speciosa, lobata, ovata, spinosa. C. of G. Hope.

1275. PLAGIANTHUS.

One species; viz. divaricatus. S. S. isles.

1276. HELICTERIS, or *Screw-tree*.

Eight species; viz. baruensis, jamaicensis, isora, hirsuta, angustifolia, pentandra, carthaginensis, apetala. Malabar, China, Jamaica.

1277. CIENFUEGIA.

One species; viz. digitata. Senegal.

1278. ANSONIA.

One species; viz. populnea. Isle of Bourbon.

1279. DOMBEYA.

12 species; viz. palmata, acutangula, angulata, tiliæfolia, tomentosa, umbellata, ferruginea, erythroxyllon, decanthera, velutina, ovata, punctata. Chili.

1280. PENTAPETES.

One species; viz. *phœnicea*. Arabia, India, St Helena.

1281. PTEROSPERMUM.

Two species; viz. *suberifolium*, *acerifolium*.

ORDER VIII. POLYANDRIA.

1282. CAROLINEA.

Two species; viz. *princeps*, *insignis*. W. Indies.

1283. ADANSONIA, or *Sour-gourd*, *Monkeys-bread*.

One species; viz. *digitata*. Senegal, Egypt.

1284. BOMBAX, or *Silk Cotton-tree*.

Six species; viz. *pentandrum*, *erianthos*, *ceiba*, *heptaphyllum*, *globosum*, *gossypinum*. E. and W. Indies, S. Amer.

1285. LAGUNEA.

Three species; viz. *lobata*, *ternata*, *aculeata*. Coast of Coromandel.

1286. SIDA, or *Indian Mallow*.

99 species; viz. *linifolia*, *angustifolia*, *acuta*, *canariensis*, *lanceolata*, *spinosa*, *frutescens*, *carpinifolia*, *jamaicensis*, *orientalis*, *glomerata*, *maculata*, *suberosa*, *capensis*, *microphylla*, *micans*, *pusilla*, *rhombifolia*, *canescens*, *retusa*, *alnifolia*, *ciliaris*, *periplocifolia*, *excelsior*, *hernandioides*, *nudiflora*, *triquetra*, *fragrans*, *lignosa*, *reflexa*, *humilis*, *repens*, *bivalvis*, *ulmifolia*, *multiflora*, *microsperma*, *viscosa*, *foetida*, *calycina*, *crispa*, *persica*, *sylvatica*, *arborea*, *mauritiana*, *occidentalis*, *americana*, *abutilon*, *abutiloides*, *asiatica*, *populifolia*, *hirta*, *indica*, *mollissima*, *sonneratiana*, *pubescens*, *althæifolia*, *glutinosa*, *extipularis*, *nutans*, *borbonica*, *flavescens*, *radicans*, *arguta*, *multicaulis*, *pilosa*, *rotundifolia*, *supina*, *truncata*, *herbacea*, *emarginata*, *alba*, *cordifolia*, *hederifolia*, *verticillata*, *urens*, *umbellata*, *pyramidata*, *paniculata*, *dumosa*, *ramosa*, *spicata*, *terminalis*, *vesicaria*, *crassifolia*, *biflora*, *obtusa*, *gigantea*, *javensis*, *hastata*, *cristata*, *dilleniana*, *triloba*, *ternata*, *pterosperma*, *ricinoides*, *jatrophoides*, *napæa*, *dioca*, *phyllanthus*. E. and W. Indies, Cape, America.

1287. PALAVIA.

Two species; viz. *malvifolia*, *moschata*. Lima, Peru.

1288. MALACHRA.

Six species; viz. *capitata*, *fasciata*, *a'cæfolia*, *radiata*, *bracteata*, *plumosa*. W. Indies.

1289. ALTHÆA, or *Marsh-mallow*.

Nine species; viz. * *officinalis*, *narbonensis*, *cannabinna*, *hirsuta*, *ludwigii*, *acaulis*, *rosea*, *pallida*, *ficifolia*. Europe, Hispaniola.

* *A.* leaves undivided, angular, cottony. This plant grows wild in marshes and other moist places in several parts of England, though frequently cultivated for medicinal use in gardens. All the parts of it have a slimy taste, and abound with a soft mucilaginous substance which is readily extracted by water: the mucilage of the roots appears to be the strongest; and hence this part is generally made use of in preference to the others.

This plant has the general virtues of an emollient medicine, and proves serviceable where the natural

mucus of the intestines is abraded. It is chiefly recommended in sharp defluxions upon the lungs, hoarseness, dysenteries, and likewise in nephritic and calculous complaints; not, as some have supposed, that this medicine has any particular power of dissolving or expelling the calculus, but as, by lubricating and relaxing the vessels, it procures a more free and easy passage. *Althæa* root is sometimes employed externally for softening and maturing hard tumours; chewed, it is said to give ease in difficult dentition of children.

1290. MALVA, or *Mallow*.

55 species; viz. *spicata*, *polystachya*, *tomentosa*, *scoparia*, *gangetica*, *coromandeliana*, *americana*, *calycina*, *cuneifolia*, *angustifolia*, *subhastata*, *scabra*, *peruviana*, *limensis*, *capitata*, *bryonifolia*, *umbellata*, *abutiloides*, *abulensis*, *lobata*, *fastigiata*, *bonariensis*, *stricta*, *lactea*, *operculata*, *fragrans*, *capensis*, *balsamica*, *grossularifolia*, *virgata*, *miniata*, *retusa*, *tridactylides*, *althæoides*, *caroliniana*, *prostrata*, *cretica*, *parviflora*, *nicænsis*, * *rotundifolia*, *acaulis*, *sherardiana*, * *sylvestris*, *mauritiana*, *hispanica*, *verticillata*, *crispa*, *papaver*, *stipulæca*, *alcea*, * *moschata*, *elegans*, *tournefortiana*, *ægyptia*, *trifida*. Europe, Barbary, Cape, China, America.

* *M.* stem rough; leaves 5 or 7-lobed; toothed; outer calyx leaflets partly united at the base.—The leaves of this plant have a somewhat mucilaginous sweetish taste. They are ranked the first of emollient herbs: they were formerly in some esteem as food of a laxative quality; at present decoctions of them are sometimes employed in dysenteries, heat and sharpness of urine, and in general for obtunding acrimonious humours; their principal use is in emollient glysters, cataplasms, and fomentations. The leaves enter the officinal decoction for glysters, and a conserve was formerly prepared from the flowers.

1291. LAVATERA, or *Mallow-tree*.

12 species; viz. * *arborea*, *micans*, *hispida*, *olbia*, *triloba*, *lusitanica*, *maritima*, *thuringiaca*, *cretica*, *flava*, *punctata*, *trimestris*. Europe.

1292. RUIZIA.

Three species; viz. *cordata*, *lobata*, *variabilis*. Isle of Bourbon.

1293. MALOPE, or *Base Mallow*.

Three species; viz. *malacoides*, *multiflora*, *trifida*. Hetruria, Mauritania.

1294. KITAIBELIA.

One species; viz. *vitifolia*.

1295. URENA, or *Indian Mallow*.

Eight species; viz. *lobata*, *reticulata*, *tricuspis*, *americana*, *sinuata*, *multifida*, *procumbens*, *viminea*. China, E. Indies, Surinam.

1296. GOSSYPIUM, or *Cotton-tree*.

Ten species; viz. *herbaceum*, *indicum*, *micranthum*, *arboreum*, *vitifolium*, *hirsutum*, *religiosum*, *latifolium*, *barbadense*, *peruvianum*. Lev. E. and W. Indies.

1297. HIBISCUS, or *Syrian Mallow*.

66 species; viz. *moscheutos*, *incanus*, *lasiocarpus*, *palustris*, *militaris*, *hastatus*, *ferrugineus*, *cordifolius*, *populneus*, *tiliaceus*, *elatus*, *lampas*, *membranaceus*, *lunarifolius*, *rosa sinensis*, *spiralis*, *brasilienis*, *unilateralis*, *acuminatus*, *phœniceus*, *ovalifolius*, *clandestinus*, *rigidus*.

rigidus, micranthus, gossypinus, ovatus, zethiopicus, microphyllus, urens, calycinus, mutabilis, syriacus, rhombifolius, liliiflorus, bifurcatus, trilobus, diversifolius, domingensis, ficulneus, sabdariffa, speciosus, cannabinus, fraternus, sororius, surrattensis, radiatus, manihot, digitatus, flavescens, spicatus, micans, abelmoschus, columnaris, pendunculatus, esculentus, longifolius, clypeatus, senegalensis, tubulosus, obtusifolius, vitifolius, tricuspis, virginicus, pentacarpus, vesicarius, trionum. Syria, Cape, E. and W. Indies, N. Amer.

The seeds of the *hibiscus abelmoschus* are the product of a plant indigenous in Egypt, and in many parts both of the East and West Indies. They are of a small size and reniform shape; they are very remarkable from possessing a peculiar and very fragrant odour; the smell which they give out may be compared to that of musk and amber conjoined; those brought from the island of Martinico are generally esteemed the most odorous, but we have seen some, the product of hot-houses in Britain, which in point of flavour seemed not inferior to any imported from abroad.

These seeds, although introduced into some of the foreign pharmacopœias, have hitherto been used principally, if not only, as a perfume; and as their medical powers still remain to be ascertained, it is perhaps with propriety, that hitherto no place has been given them in the list either of the London or Edinburgh colleges. But their flavour as well as other sensible qualities point them out as a subject well deserving a particular investigation.

1298. PAVONIA.

15 species; viz. *præmorsa, leptocarpa, typhalea, hastata, spinifex, papilionacea, cancellata, racemosa, corymbosa, paniculata, odorata, coccinea, columella, urens, zeylanica.* E. and W. Indies, Africa, S. America.

1299. ACNANIA, or *Base Hibiscus*.

Three species; viz. *malvafisous, mollis, pilosa.* Jamaica, S. America.

1300. STUARTIA.

Two species; viz. *malachodendron, pentagyna.*

1301. GORDONIA, or *Boblolly-bay*.

Four species; viz. *lasianthus, hæmatoxylon, pubescens, franklini.* N. America.

1302. CAMELLIA, or *Japan-rose*.

Two species; viz. *japonica, sasanqua.* China, Japan.

1303. MESUA, or *Indian Rose-chenut*.

One species; viz. *ferrea.* Egypt, India.

1304. MYRODIA.

Two species; viz. *turbinata, longiflora.* Guiana.

1305. MORISONIA.

One species; viz. *americana.*

1306. POURRETIA.

One species; viz. *arborea.*

1307. CROSSOSTYLIS.

One species; viz. *biflora.* South sea isles.

1308. BARRINGTONIA.

One species; viz. *speciosa.* Chili, Moluc. South sea isles.

1309. GUSTAVIA.

One species; viz. *angusta, fastuosa.* Surinam, Cayenne.

In the class *Monadelphis* are

60 Genera, including 682 species, of which 16 are found in Britain.

CLASSIS XVII.

DIADELPHIA (G).

ORDO I. PENTANDRIA.

851. MONNIERIA. Cal. 5-partitus. Cor. ringens. Filamentum superius antheris 2; inferius 3. Capsulæ 5.

CLASS XVII.

DIADELPHIA.

ORDER I. PENTANDRIA.

M. Cal. 5-parted. Cor. gaping. Superior filam. with 2 anthers, inferior with 3. Capsules 5.

ORDO

(G) This class comprehends the butterfly-shaped flowers, and the leguminous plants of some authors. Linnæus takes the character of the class from the number of the stamens, and the character of the orders from their number. From the title of this class, *Diadelphia* or *two brotherhoods*, it might be supposed, that the filaments are always found in two sets. This, however, is by no means always correctly the case. The papilionaceous or butterfly shape of the corolla or blossom, as in a garden pea, will therefore be a surer guide. The class is not artificial, but perfectly natural, and the structure of the flowers extremely singular: their situation is generally obliquely pendent. The seeds of this class furnish food for men and other animals; they are farinaceous and stultent. The leaves are food for cattle. None of them are poisonous.

ORDO II. HEXANDRIA.

- * 849. FUMARIA. Cal. 2-phyllus. Cor. ringens, basi gibbosa nectarifera. Filamenta antheris 3.
1267. SARACA. Cal. o. Cor. 4-fida. Filamenta utrinque 3, connexa.

ORDO III. OCTANDRIA.

- * 850. POLYGALA. Cal. 2 laciniae, alaeformes. Cor. vexillum cylindricum. Stamina connexa. Caps. obcordata, 2-ocularis.
852. SECURIDÆA. Cal. 3-phyllus, Vexillum nul-
lud. Legum 1-spermum, ala ligulata.
1461. DALBERGIA. Stamina filamenta 2, apice 4-fida. Fructus pedicellatus, non dehiscens, legumi-
nosus, membranaceo-compressus, seminiferus.

ORDO IV. DECANDRIA.

Sect. I. *Stamina omnia connexa.*

853. NISSOLIA. Legum. 1-spermum, terminatum ala ligulata.
854. PTEROCARPUS. Legum. foliaceum. Stamina bina trianthera.
861. AMORPHA. Alae carinaque nulles.
855. ERYTHRINA. Alae carinaque brevissimæ. Cal. poro mellifero.
1286. ABRUS. Filamenta 9, basi infima connexa, latere superiore distincta. Sem. spherica.
* 858. SPARTIUM. Filamenta adhaerentia germinali. Stigma adnatum, villosum.
* 859. GENISTA. Pistillum deprimens carinam. Stigma involutum.
865. LUPINUS. Antheras alternæ rotundæ; alteræ oblongæ. Legum. coriaceum.
* 864. ANTHYLLIA. Cal. turgidus, includens siliquam.
856. PISCIDIA. Legumen, alis 4 longitudinalibus.
857. BORBONIA. Legumen mucronatum. Stigma emarginatum.
* 881. ULEX. Cal. diphyllus. Legum. viz calyce longius.
876. ARACHIS. Cor. resopinata. Legum. coriaceum.
895. EBENUS. Cor. alis oblitteratis. Legum. monospermum.
860. ASPALATHUS. Legumen mutisum, ovatum, subdispermum.
* 863. ONONIS. Legumen rhombicum, sessile. Vexillum striatum.
862. CROTALARIA. Legumen pedicellatum, turgidum.

Sect. II. *Stigma pubescens (nec priorum nota).*

880. COLUTEA. Legumen inflatum, supra basin dehisceas.
866. PHASEOLUS. Carina stylusque spirales.
867. DOLICHOS. Vexillum basi callis duobus.

ORDER II. HEXANDRIA.

- * F. Cal. 2-leaved. Cor. gaping, with a bulging base, nectariferous. Filaments with 3 anthers.
S. No cal. Cor. 4-cleft. Filaments on both sides 3, connected.

ORDER III. OCTANDRIA.

- * P. Cal. 2 segments, wing-shaped. Cor. standard cylindrical. Stamens connected. Caps. heart-shaped reversed, 2-celled.
S. Cal. 3-leaved. No standard. Legume 1-seeded, wing strap-shaped.
D. Filam. of the stamens 2, with the apex 4-cleft. Fruit pedicled, not open, leguminous, compressedly membranaceous, seed-bearing.

ORDER IV. DECANDRIA.

Sect. I. *All the stamens connected.*

- N. A legume, i. e. leguminous plant, 1-seeded, terminated by a strap-shaped wing.
P. Legume leafy. Two stamens, 3-anthered.
A. Wings and keel none.
E. Wings and keel very short. Cal. with a melliferous little hole.
A. Filam. 9, connected at the lowest base, on the upper side distinct. Seeds spherical.
* S. Filam. adhering to the germen. Stigma connected, woolly.
* G. Pistil depressing the keel. Stigma rolled inwards.
L. Anthers alternately round and oblong. Legume leather-like.
* A. Cal. swelling, including a pod.
P. Legume, with 4 longitudinal wings.
B. Legume dagger-pointed. Stigma notched at the end.
* U. Cal. 2-leaved. Legume scarce longer than the calyx.
A. Cor. horizontally turned upside down. Legume leather-like.
E. Cor. with obscure wings. Legume 1-seeded.
A. Legume awnless, oval, nearly 2-seeded.
* O. Legume diamond-shaped, sitting. Standard streaked.
C. Legume pedicled, turgid.

Sect. II. *Stigma pubescent, i. e. downy (not marked like the above).*

- C. Legume inflated, open above the base.
P. Keel and style spiral.
D. Standard, with 2 calli or hardnesses at the base.
G g 2 * 871.

- * 871. OROBUS. Stylus linearis, teretiusculus, supra villosus.
- * 870. PISUM. Stylus supra carinatus villosusque.
- * 872. LATHYRUS. Stylus supra planus villosusque.
- * 873. VICIA. Stylus sub stigmatē barbatus.

Sect. III. *Legumen sub-biloculare (nec priorum).*

- * 892. ASTRAGALUS. Legum. 2-loculare, rotundatum.
- 893. BISSERRULA. Legum. 2-loculare, planum, dentatum.
- 891. PHACA. Legum. semibiloculare.

Sect. IV. *Legumina submonosperma (nec priorum.)*

- 894. PSORALEA. Cal. punctis glandulosis.
- * 896. TRIFOLIUM. Legum. viz. calyce longius, 1 a. 2-spermum. Flores capitati.
- 882. GLYCYRRHIZA. Cal. 2-labiatus, superiore 3-fido.

Sect. V. *Legumen subarticulatum.*

- 888. ÆSCHYNOMENE. Legum. articulis monospermis. Cal. bilabiatus.
- * 887. HEDYSARUM. Legum. articulis subrotundis compressis. Carina obtusissima.
- 883. CORONILLA. Legum. isthmis interceptum, rectum.
- * 884. ORNITHOPUS. Legum. articulatum, arcuatum.
- 886. SCORPIURUS. Legum. isthmis interceptum, teretiusculum, involutum.
- * 885. HIPOCREPIS. Legum. compresso-membranaceum; altera sutura emarginat. ad medium excisa.
- * 899. MEDICAGO. Legum. spirale membranaceo-compressum. Pistillum carinam deflectens.

Sect. VI. *Legumen uniloculare polyspermum (nec priorum.)*

- 898. TRIGONELLA. Vexillum alæque patentes quasi tripetale. Carina minuta.
- 868. GLYCINE. Carina vexillum reflectens.
- 869. CLITORIA. Vexillum amplum, alas obtegens. Cor. resupinata.
- 879. ROBINIA. Vexillum reflexo-patens, subrotundum.
- 889. INDIGOFERA. Carina utrinque denticulo.
- 875. CICER. Calycis 4 lacinia superiores vexillo incumbentes.
- * 874. ERVUM. Cal. 5-partitus, subæqualis, longitudine fere corollæ.
- 1319. LIPARIA. Calycis lacinia infima elongata. Alæ inferius bilobæ.
- 877. CYTISUS. Legum. pedicellatum. Cal. bilabiatus.
- 1417. MULLERA. Pericarpium elongatum, carnosum, mouiliforme, globulis monospermis.
- 890. GALEGA. Legum. lineare, striis oblique transversis.
- * 897. LOTUS. Legum. teres, farctum seminibus cylindricis.
- 878. GEOFFROYA. Drupa, nucleo ligneo.

- * O. Style strap-shaped, rather tapering, woolly above.
- * P. Style keeled and woolly above.
- * L. Style above flat and woolly.
- * V. Style barbed under the stigma.

Sect. III. *Legume nearly 2-celled (not marked as above.)*

- * A. Legume 2-celled, rounded.
- B. Legume 2-celled, flat, toothed.
- P. Legume half 2-celled.

Sect. IV. *Leguminous, nearly 1-seeded (not as above.)*

- P. Cal. with glandular points.
- * T. Legume scarce longer than the cal. 1 or 2-seeded. Flowers growing in heads.
- G. Cal. 2-lipped, upper 3-cleft.

Sect. V. *Legume nearly jointed.*

- Æ. Legume, with 1-seeded joints. Cal. 2-lipped.
- * H. Legume with joints nearly round, compressed. Keel very obtuse.
- C. Legume interrupted by necks, straight.
- * O. Legume jointed, bowed.
- S. Legume interrupted by necks, tapering, rolled inwards.
- * H. Legume compressed, membranous; one seam notched, cut at the middle.
- * M. Legume spiral, membranous compressed. Pistil bending away the keel.

Sect. VI. *Legume 1-celled, many-seeded (not as above.)*

- T. Standard and wings expanding, as if 3-petaled. Keel minute.
- G. Keel bending back the standard.
- C. Standard large, covering the wings. Cor. horizontally turned upside down.
- R. Standard bent back, expanding, nearly round.
- I. Keel toothed on both sides.
- C. Four upper segments of the cal. leaning on the standard.
- * E. Cal. 5-parted, nearly equal, almost of the length of the cor.
- L. Lower segments of the cal. long. Wings 2-lobed below.
- C. Legume pedicled. Cal. 2-lobed.
- M. Pericarp. elongated, fleshy, bracelet-shaped, with 1-seeded globules.
- G. Legume strap-shaped, with streaks obliquely transverse.
- * L. Legume tapering, filled with cylindrical seeds.
- G. Drupa, with a woody kernel.

ORDER

ORDER I. PENTANDRIA.

851. MONNIERA.

One species; viz. trifolia.

ORDER II. HEXANDRIA.

1267. SARACA.

One species; viz. indica. India.

849. FUMARIA, or *Fumitory*.

14 species; viz. cucullaria, spectabilis, nobilis, bulbosa, sempervirens, lutea, sibirica, *capnoides, encephylla, *officinalis, *capreolata, spicata, *claviculata, vesicaria. Europe, Barb. Cape, N. America.

officinalis. * F. seed vessels in bunches, 1 seed in each; stem spreading.—Cows and sheep eat it. Goats are not fond of it. Horses and swine refuse it. The leaves are succulent, saline, and bitter. The expressed juice, in doses of two or three ounces, is useful in hypochondriacal, scorbutic, and cachectic habits. It corrects acidity, and strengthens the tone of the stomach. Some prefer it to all other medicines as a sweetener of the blood. There is no doubt of its utility in obstructions of the viscera and the diseases arising therefrom. An infusion of the leaves is used as a cosmetic to remove freckles and clear the skin.

ORDER III. OCTANDRIA.

851. POLYGALA, or *Milk-wort*.

38 species; viz. incarnata, aspalatha, brasiliensis, trichosperma, amara, *vulgaris, major, monspeliaca, paniculata, sibirica, bracteolata, umbellata, myrtifolia, oppositifolia, spinosa, teretifolia, theezans, trinervia, penaca, diversifolia, microphylla, cæstuanis, chinensis, chamæbuxus, alopecuroides, mixta, squarrosa, heisteria, stipulacea, senega, lutea, viridescens, triflora, glaucoides, ciliata, sanguinea, verticillata, cruciata. Europe, Cape, India, N. America.

vulgaris. * P. flowers in bunches; stems herbaceous, simple, trailing; leaves strap-spear-shaped.—This plant has been found to possess the properties of the Senega rattlesnake root (*polygala senega*), but in an inferior degree. The powdered root may be given in doses of half a dram. Cows, goats, and sheep eat it. Swine refuse it. An infusion of the herb, which is very bitter, taken in the morning fasting, about one fourth of a pint daily, promotes expectoration, and is good for a catarrhus cough.

The *polygala senega* grows spontaneously in Virginia, and bears the winters of our own climate. This root is usually about the thickness of the little finger, variously bent and contorted, and appears as if composed of joints, whence it is supposed to resemble the tail of the animal whose name it bears: A kind of membranous margin runs on each side, the whole length of the root. Its taste is at first acid, afterwards very hot and pungent.

The Senegavo Indians are said to prevent the fatal effects which follow from the bite of the rattlesnake, by giving it internally, and by applying it externally to the wound. It has been strongly recommended in pleurisies, peripneumonies, and other inflammatory distempers. Its more immediate effects are those of a diu-

retic, diaphoretic, and cathartic; sometimes it proves emetic: the two last operations may be occasionally prevented by giving the root in small doses along with aromatic simple waters, as that of cinnamon. The usual dose of the powder is 30 grains or more.

Some have likewise employed this root in hydropic cases and not without success. There are examples of its occasioning a plentiful evacuation by stool, urine, and perspiration; and by this means removing the disease, after the common diuretics and hydragogues had failed. Where this medicine operates as a cathartic it generally proves successful; if it acts by liquefying the blood and juices, without occasioning the due discharge, it should either be abstained from, or assisted by proper additions.

852. SECURIDÆA, or *Hatchet-vetch*.

Two species; viz. erecta, volubilis. W. Indies.

1416. DALBERGIA.

Two species; viz. lanceolaria, monetaria. Surinam, Ceylon.

ORDER IV. DECANDRIA.

853. NISSOLIA.

Two species; viz. arborea, fruticosa. S. Amer.

1286. ABRUS, or *Jamaica Wild Liquorice*.

One species; viz. preicatorius. E. and W. Indies.

854. PTEROCARPUS, or *Red Sanders*.

Five species; viz. draco, lunatus, santalinus, ecas-taphyllum, buxifolius. E. and W. Indies.

855. ERYTHRINA, or *Coral Tree*.

Five species; viz. herbacea, corollodendrum, picta, crista galli, planisiliqua. Carolina, E. and W. Indies, Brazil.

856. PISCIDIA, or *Dogwood Tree*.

Two species; viz. erythrina, carthaginensis. West Indies.

857. BORBONIA.

Six species; viz. ericifolia, lævigata, trinervia, lanceolata, cordata, ternata. C. of G. Hope.

858. SPARTIUM, or *Broom*.

16 species; viz. contaminatum, sepiarium, junceum, monospermum, sphærocarpon, purgans, aphyllum, scorpius, angulatum, patens, supranulium, complicatum, *scoparium, radiatum, cytisoides, spinosum. S. Europe, Barbary, Cape, Madeira.

* S. leaves in threes, and solitary; branches without *scoparium* prickles.—The young flowers are sometimes preserved as pickles. The plant, when burnt, affords a tolerable pure alkaline salt. Dr Mead relates the case of a dropsical patient, that was cured by taking half a pint of a decoction of green broom-tops, with a spoonful of whole mustard seed, every morning and evening. The patient had been tapped three times, and tried the usual remedies before. An infusion of the seeds, drank freely, has been known to produce similar happy effects; but whoever expects these effects to follow in every dropsical case, will be greatly deceived. A strong lixivium of the ashes was used in the Swedish army in the year 1759, to cure dropsies, consequential to a catarrhal epidemic fever. The urine became plentiful, and the dropsies soon disappeared. Some use the seeds.

seeds toasted, so as to make a kind of coffee. The plant, when growing large, merits a place among our flowering-shrubs, on account of the profusion of its golden-coloured blossoms. Cows, horses, and sheep refuse it.

859. GENISTA, or *Dyers Broom*.

14 species; viz. canariensis, candicans, linifolia, sagittalis, tridentata, * tinctoria, sibirica, florida, * pilosa, humifusa, * anglica, germanica, hispanica, lusitana. Europe, Canaries.

tinctoria. * G. branches scored, cylindrical, upright; leaves spear-shaped, smooth; legumen cylindrical.—A yellow colour may be prepared from the flowers; and for wool that is to be dyed green, the dyers prefer it to all others. A dram and a half of the powdered seeds operates as a mild purgative. A decoction of the plant is sometimes diuretic, and therefore has proved serviceable in dropsical cases. Horses, cows, goats, and sheep, eat it.

The wood or root of the *genista canariensis* is chiefly brought to us from the Canary islands. In the shops of the apothecaries it usually receives the appellation of *lignum rhodium*. It is in long crooked pieces full of knobs, which when cut, appear of a yellow colour like box, with a reddish cast. The largest, smoothest, most compact, and deepest coloured pieces, should be chosen; and the small, thin, or pale ones, rejected. The taste of this wood is lightly bitterish, and somewhat pungent; its smell very fragrant, resembling that of roses: long kept, it seems to lose its smell; but, on cutting or rubbing one piece against the other, it smells as well as at first. Distilled with water, it yields an odoriferous essential oil, in very small quantity. Rhodium is at present in esteem, only upon account of its oil, which is employed as a high and agreeable perfume in scenting pomatums and the like. But if we may reason from analogy, this odoriferous simple might be advantageously applied to more useful purposes; a tincture of it in rectified spirit of wine, which contains in small volume the virtues of a considerable deal of the wood, bids fair to prove a serviceable cordial, not inferior perhaps to any thing of this kind.

860. ASPALATHUS, or *African Broom*.

35 species; viz. spinosa, verrucosa, capitata, glomerata, astroites, chenopoda, albens, thymifolia, ericifolia, nigra, carnosae, ciliaris, genistoides, hystrix, galioides, retroflexa, uniflora, araneosa, asparagoides, sericea, canescens, heterophylla, indica, ebenus, cretica, quinquefolia, tridentata, pilosa, anthylloides, laxata, argentea, callosa, orientalis, mucronata, pinnata. Crete, Cape, E. Indies.

881. ULEX, or *Furse, Whins, Gorse*.

Two species; viz. * europæus, capensis. Germany, France, Cape.

europæus. * U. leaves woolly, acute; thorns scattered.—Gorse is in some respects a very hardy plant, and will make fences upon the bleakest mountains, and close to the sea-side, where the spray of the sea destroys almost every other shrub; but it is impatient of cold, is often destroyed by severe frost, and is rarely found in the northern parts of our island. In Cornwall, where fuel is scarce, it is cultivated to advantage, and it is generally cut to make faggots for heating ovens, which it

does very soon, burning rapidly, and with a great degree of heat. The ashes are used to make ley. Team horses may be supported by this plant, if it is cut young and bruised in a mill to break the thorns. Goats, cows, sheep, and horses feed upon the tender tops.

861. AMORPHA, or *Shrubby Bass Indigo*.

One species; viz. fruticosa. Carolina.

862. CROTALARIA, or *Rattle-wort*.

23 species; viz. perforata, perfoliata, amplexicaulis, sagittalis, chinensis, juncea, imbricata, retusa, sessiliflora, triflora, verrucosa, biflora, opposita, linifolia, bifaria, latifolia, lanaris, laburnifolia, cordifolia, incana, incanescens, heterophylla, quinquefolia. E. and W. Indies, Africa, America.

863. ONONIS, or *Rest-harrow*.

31 species; viz. antiquorum, * spinosa, * arvensis, repens, minutissima, mitissima, alepcuroides, variegata, pubescens, hircina, cernua, umbellata, argentea, involucreta, filiformis, capensis, prostrata, reclinata, conisia, cherleri, viscosa, ornithopodioides, pinguis, natrix, tridentata, crispa, hispanica, fruticosa, rotundifolia, macrophylla, mauritanica. Europe, Cape.

* O. flowers in bunches, solitary; leaves solitary or spinosa. three together; branches thorny.—A decoction of the roots has been recommended in cases of stone and jaundice. Cows and goats eat it. Sheep are very fond of it. Horses and swine refuse it. A horse is said to have refused the whole branch, but ate of the younger shoots when picked off.

863. ANTHYLLIS, or *Lady's Finger, Kidney-cotch*.

15 species; viz. tetraphylla, * vulneraria, montana, cornicina, lotoides, gerardi, quinqueflora, involucreta, linifolia, barba-jovis, heterophylla, visciflora, cytioides, hermanica, erinacea. Europe.

* A. herbaceous; leaves winged, unequal; flowers in vulnura—a double head.—The country people get a yellow dye from it. It makes an excellent pasturage for sheep. Where the soil was a reddish clay, Linnæus observed the blossoms to be red, but in white clay white. Goats and cows eat it.

876. ARACHIS, or *Ground Nut*.

One species; viz. hypogæa. Carolina, S. Amer.

895. EBENUS, or *Ebony of Crete*.

One species; viz. cretica. Crete, Lev. Barb.

865. LUPINUS, or *Lupine*.

Seven species; viz. perennis, albus, varius, hirsutus, pilosus, angustifolia, luteus. S. Europe, Egypt, Virginia.

The seeds of the *lupinus albus* have a leguminous taste, accompanied with a disagreeable bitter one. They are said to be anthelmintic, both internally taken, and applied externally. Hoffman cautions against their internal use, and tells us that they have sometimes occasioned death. Simon Pauli also observes, that he saw a boy of eight or ten years of age, after taking a drachm of these seeds in powder, seized with exquisite pains of the abdomen, a difficulty of respiration, and almost total loss of voice; and that he was relieved from these complaints by a glyster of milk and sugar, which brought away a vast quantity of worms. But Mr Geoffroy observes, very justly, that either these

these symptoms were owing to the worms, and not to the medicine; or that these seeds, if they have any noxious quality, lose it, with their bitterness, in boiling, since they were commonly used among the Greeks as food, and recommended by Galen as very wholesome.

866. PHASEOLUS, or *Kidney Bean*.

17 species; viz. *vulgaris*, *lunatus*, *bipunctatus*, *inacmenus*, *farinosus*, *vexillatus*, *helvalus*, *semierectus*, *alatus*, *caracalla*, *aconitifolius*, *nanus*, *radiatus*, *max*, *mungo*, *lathyroides*, *sphaerospermus*. E. and W. Indies, Africa, America.

887. DOLICHOS, or *Cow-itch*.

31 species; viz. *benghalensis*, *lablab*, *sinensis*, *uncinatus*, *luteolus*, *unguiculatus*, *tranquebaricus*, *ensiformis*, *tetragonolobus*, *sesquipedalis*, *altissimus*, *pruriens*, *urens*, *minimus*, *lineatus*, *capensis*, *scarabæoides*, *incurvus*, *bulbosus*, *trilobus*, *aristatus*, *filiformis*, *purpureus*, *regularis*, *liguosus*, *polystachios*, *ensiformis*, *saja*, *catiag*, *biflorus*, *repens*. Egypt, E. and W. Indies, Cape, America.

The *dolichos pruriens* is a plant growing in great abundance in warm climates, particularly in the West India islands, and there it is very troublesome to cattle and other domestic animals: for on account of the spiculæ of the seed-pod, it excites, when touched, a very uneasy itching. These spiculæ have been long used in South America, in cases of worms; and have of late been frequently employed in Britain. The spiculæ of one pod, mixed with syrup or molasses, and taken in the morning fasting, is a dose for an adult. The worms are said to appear with the second or third dose; and by means of a purge in some cases, the stools are said to have consisted almost entirely of worms; and in cases of lumbrici it is said to produce a safe and effectual cure. Those who have used it most affirm, that they have never seen any inconvenience resulting from the internal use of it, notwithstanding the great uneasiness it occasions, on the slightest touch, to any part of the surface.

868. GLYCINE, or *Kidney-bean tree*.

15 species; viz. *subterranea*, *monoica*, *triloba*, *villosa*, *javanica*, *camosa*, *tomentosa*, *hituminosa*, *nummularia*, *labialis*, *striata*, *suaevolens*, *apios*, *frutescens*, *monophylla*. Cape, East and West Indies, North America.

869. CLITORIA.

Five species; viz. *ternatea*, *brasiliens*, *virginiana*, *mariana*, *galætia*. East and West Indies, America.

870. PISUM, or *Poa*.

Four species; viz. *sativum*, *arvense*, * *maritimum*, *ochrus*. Europe, North America.

maritimum.

* P. leaf-stalks flattish above; stem angular; stipulæ arrow-shaped; fruitstalks many-flowered.—In 1555, during a time of great scarcity, the people about Orford in Sussex were preserved from perishing by eating the seeds of this plant which grew there in great abundance upon the sea coast. Cows, horses, sheep, and goats eat it.

871. OROBUS, or *Bitter Vetch*.

12 species; viz. *lathyroides*, *hirsutus*, *luteus*, *verrus*, * *tuberosus*, * *sylvaticus*, *angustifolius*, *albus*, *caucasicus*, *niger*, *pyrenæicus*, *sylvaticus*. Europe.

* O. leaves winged, spear-shaped; stipula half-arrow-shaped, very entire; stem simple.—The roots, when boiled, are savoury and nutritious; ground to powder they may be made into bread. They are held in high esteem by the Highlanders of Scotland, who chew them as our people do tobacco, and find that they prevent the uneasy sensation of hunger. They imagine that they promote expectation, and are very efficacious in curing disorders of the lungs. They know how to prepare an intoxicating liquor from them. Horses, cows, goats, and sheep eat it.

LATHYRUS, or *Chickling Vetch*.

21 species; viz. * *apliaca*, * *nissolia*, *amphicarpos*, *cicera*, *sativus*, *inconspicuus*, *setifolius*, *angulatus*, *articulatus*, *odoratus*, *annuus*, *tingitannus*, *clymenum*, * *hirsutus*, *tuberosus*, * *pratensis*, * *sylvestris*, * *latifolius*, *heterophyllus*, * *palustris*, *pisiformis*. Europe, Barbary, Ceylon.

* L. tendrils with two leaves, quite simple, leaflets spear-shaped.—This has been recommended as a new plant for the experiments of the farmers, and premiums have been offered for its cultivation. But it does not seem to be a plant at all agreeable to cattle, as where they have a choice of food they seldom touch it. Besides it produces very few seeds, and those are for the most part devoured by a species of curculio.

873. VICIA, or *Vetch, Bean, Tare*.

20 species; viz. *pisiformis*, *dumetorum*, * *sylvatica*, *cassubica*, * *cracca*, *gerardi*, *onobrychioides*, *nissoliana*, *biennis*, *benghalensis*, * *sativa*, * *lathyroides*, * *lutea*, * *hybrida*, *peregrina*, * *sepium*, * *bithynica*, *narbonensis*, *faba*, *serratifolia*. Europe, Egypt, India.

* V. legumens mostly in pairs, upright; leaflets inversely spear-shaped, blunt, notched; stipulæ toothed; seeds compressed.—In Gloucestershire and Worcestershire, they sow it as pasturage for horses, and eat it off early enough to allow of turnips being sown the same year.—The seeds are excellent food for pigeons. Horses, cows, sheep, and goats, eat it.

* V. legumens mostly four together, upright; leaflets egg-shaped, very entire, the outer ones gradually smaller.—This plant shoots earlier in spring than any plant eaten by cattle, vegetates late in the autumn, and continues green all winter; but it is difficult to collect the seeds, as the pods burst and scatter them about, and moreover, hardly a third part of them will vegetate, being made the nidus of an insect. A patch of them sown in drills in a garden was cut five times in the course of the second year, and produced at the rate of 24 tons per acre of green food, which when dry would weigh near 4½ tons.

The seeds of the *vicia faba*, or common bean, are a strong flatulent food, sufficiently nutritious, but not easy of digestion, especially when growing old. A water distilled from the flowers has been celebrated as a cosmetic, and still retains its character among some female artists.

874. ERVUM, or *Bitter Vetch*.

Six species; viz. *lens*, * *tetraspermum*, * *hirsutum*, *soloniense*, *monanthos*, *ervilia*. Europe, Asia.

* E. fruitstalks many-flowered; seeds 2, globular.—*hirsutum*. Horses, cows, goats, and sheep eat it. In wet seasons whole fields of corn have been overpowered and wholly destroyed by it.

875. CICER, or *Chick-pease*.

One species; viz. *arietinum*. S. Eur. Lev.

1319. LIPARIA.

Five species; viz. *sphærica*, *graminifolia*, *umbellata*, *villosa*, *sericea*. C. of G. Hope.

876. CYTISUS, or *Trefoil-tree*.

17 species; viz. *laburnum*, *nigricans*, *wolgaricus*, *sessilifolius*, *cajan*, *patens*, *hirsutus*, *capitatus*, *austriacus*, *supinus*, *prolifer*, *argenteus*, *pendulinus*, *purpureus*, *glaber*, *græcus*, *tener*. Eur. Cape, E. Indies.

1417. MULLERA.

One species; viz. *moniliformis*. Surinam.

878. GEOFFROYA, or *Base Cabbage-tree*.

One species; viz. *spinosa*. Jam. Brazil.

879. ROBINIA, or *False Acacia*.

Nine species; viz. *pseud-acacia*, *violacea*, *hispida*, *mitis*, *holodendron*, *caragana*, *spinosa*, *frutescens*, *pygmaea*. Siberia, Tartary, N. Amer. W. Indies.

880. COLUTEA, or *Bladder-senna*.

Four species; viz. *arborescens*, *frutescens*, *perennans*, *herbacea*. Austria, Italy, Levant, Africa.

882. GLYCYRRHIZA, or *Liquorice*.

Four species; viz. *echinata*, *glabra*, *hirsuta*, *asperrima*. Spain, Italy, Levant, Apulia.

883. CORONILLA, or *Joint-podded Colutea*.

11 species; viz. *emerus*, *junceus*, *valentina*, *glauca*, *coronata*, *minima*, *argentea*, *securidæa*, *varia*, *cretica*, *scandens*. S. Europe, Amer.

884. ORNITHOPUS, or *Birds-foot*.

Four species; viz. * *perpusillus*, *compressus*, *scorpioides*, *tetraphyllus*. S. Eur. Jam. Barbary.

885. HIPPOCREPIS, or *Horse-shoe Vetch*.

Four species; viz. *unisiliquosa*, *multisiliquosa*, * *comosa*, *balearica*. S. Europe.

886. SCORPIURUS, or *Caterpillars*.

Four species; viz. *vermiculata*, *muricata*, *sulcata*, *subvillosa*. S. Eur.

888. ÆSCHYNOMENE, or *Base Sensitive Plant*.

Eight species; viz. *grandiflora*, *arborica*, *coccinea*, *aspera*, *americana*, *indica*, *sesban*, *pumila*. Egypt, E. and W. Indies.

887. HEDYSARUM, or *French honeysuckle*.

97 species; viz. *alhagi*, *bupleurifolium*, *linifolium*, *nummularifolium*, *moniliferum*, *styracifolium*, *reniforme*, *sororium*, *vespertilionis*, *gangeticum*, *muculatum*, *latebrosum*, *vaginale*, *imbricatum*, *triquetrum*, *strobiliferum*, *diphyllum*, *pulchellum*, *spartium*, *lineatum*, *retroflexum*, *umbellatum*, *biarticulatum*, *heterocarpon*, *viscidum*, *canadense*, *canescens*, *marilandicum*, *frutescens*, *viridiflorum*, *hirtum*, *junceum*, *violaceus*, *paniculatum*, *nudiflorum*, *repens*, *hamatum*, *triflorum*, *barbatum*, *lagopodioides*, *microphyllum*, *racemosum*, *caudatum*, *tomentosum*, *sericeum*, *virgatum*, *pilosum*, *striatum*, *volubile*, *gyrans*, *argentatum*, *alpinum*, *obscurum*, *coronarium*, *flexuosum*, *humile*, *spinosissimum*, *virginicum*, *fruticosum*, *pumilum*, * *onobrychis*, *saxatile*, *caput galli*, *crista galli*, *crinitum*, *cornutum*, *incanum*. S. Eur. E. and W. Indies, N. Amer.

* H. leaves winged; legumens with one-seed prickly; *onobrychis* wings as long as the calyx; stem growing long.—This *chis* plant is cultivated like clover for feeding cattle, and is particularly advantageous in dry hilly situations and chalky soils.

889. INDIGOFERA, or *Indigo*.

23 species; viz. *sericea*, *ovata*, *trifoliata*, *psoraloides*, *procumbens*, *sarmentosa*, *denudata*, *mexicana*, *trita*, *filiformis*, *digitata*, *stricta*, *frutescens*, *enneaphylla*, *pentaphylla*, *glabra*, *cytisoides*, *hirsuta*, *angustifolia*, *anil*, *tinctoria*, *disperma*, *argentea*. Arabia, E. and W. Indies, Cape, Carolina.

890. GALEGA, or *Goats-rue*.

12 species; viz. *officinalis*, *cinerea*, *littoralis*, *virginiana*, *villosa*, *spinosa*, *maxima*, *purpurea*, *caribæa*, *cœrulea*, *tinctoria*, *senticosa*. S. Europe, E. and W. Indies, America.

The *galega officinalis* was celebrated as an alexipharmac; but its sensible qualities discover no foundation for any virtues of this kind; the taste is merely leguminous, and in Italy, where it grows wild, it is said to be used as food.

891. PHACA, or *Base Milk-vetch*.

Ten species; viz. *bætica*, *alpina*, *salsuta*, *sibirica*, *australis*, *trifoliata*, *vesicaria*, *prostrata*, *microphylla*, *muricata*. Lapland, Siber. S. Eur.

892. ASTRAGALUS, or *Liquorice*, or *Milk-vetch*.

45 species; viz. *alopeuroides*, *christianus*, *capitatus*, *pilosus*, *sulcatus*, *galegiformis*, *chinensis*, *onobrychis*, *uliginosus*, *carolinianus*, *asper*, *canadensis*, *cicer*, *microphyllus*, * *glycyphyllos*, *hamosus*, *contortuplicatus*, *bæticus*, *laxmanni*, *stella*, *sesameus*, *austriacus*, *leontinus*, *pentaglottis*, *epiglottis*, * *hypoglottis*, *syriacus*, *arenarius*, *glauus*, *sinicus*, *alpinus*, *ammodytes*, *trimestris*, *verticillaris*, *montanus*, *vesicarius*, *physodes*, *caprius*, * *uralensis*, *monspeulanus*, *incanus*, *campestris*, *depressus*, *uncatus*, *exscapus*. Europe, Egypt, Barbary.

893. BISSERULA, or *Base Hatchet-vetch*.

One species; viz. *pelecinus*. S. Eur.

894. PSORALEA.

23 species; viz. *rotundifolia*, *pinnata*, *aculeata*, *bracteata*, *spicata*, *axillaris*, *stachydes*, *aphylla*, *tenuifolia*, *capitata*, *hirta*, *repens*, *bituminosa*, *glandulosa*, *palæstina*, *americana*, *tetragonalia*, *corylifolia*, *pentaphylla*, *prostrata*, *dalea*, *enneaphylla*, *lævigata*. S. Europe, India, Africa, America.

896. TRIFOLIUM, or *Trefoil, Clover*.

46 species; viz. *cœrulea*, *indica*, *messanense*, *polonica*, * *officinalis*, *italica*, *cretica*, * *ornithopodioides*, *lupinasta*, *reflexum*, *strictum*, * *hybridum*, * *repens*, *comosum*, *alpinum*, * *subterraneum*, *globosum*, *cheleri*, *lappaceum*, *rubens*, * *pratense*, *alpestre*, *pannonicum*, *squarrosum*, *incarnatum*, * *ochroleucum*, *angustifolium*, * *arvense*, *stellatum*, *clypeatum*, * *scabrum*, * *glomeratum*, * *striatum*, *alexandrinum*, *uniflorum*, *spinosum*, *resupinatum*, *tomentosum*, * *fragiferum*, *montanum*, *agrarium*, *spacticeum*, * *procumbens*, *filiforme*, *biflorum*, * *suffocatum*. Europe, India, Africa, N. America.

* T. capsules in bunches, often 2-seeded, wrinkled, *officinalis* acute; stem upright.—This plant is more fragrant when

when dry than when green. A water distilled from the flowers possesses but little odour in itself, but improves the flavour of other substances. Horses are extremely fond of it. Cows, goats, sheep, and swine eat it.

repens. * T. heads like umbels; legumens 4-seeded; stem creeping.—Horses, cows, and goats eat it. Sheep are not fond of it. Swine refuse it. The leaves stand upright against rain. Wherever this plant abounds spontaneously, it is considered as an indication of the goodness of the soil, and this is a thing well known to farmers. The richness of meadows and pastures is naturally owing to their abounding principally with the trefoils, and others of the same class, with a due mixture of the more acceptable grasses.

pratense. * T. spikes crowded: blossoms unequal; calyx with four of the teeth equal; stipulæ awned; stems ascending.—In a great scarcity of provisions, bread has been made of the flowers. The heads are used in Sweden to dye woollen green. With alum they give a light, with copperas a dark green.

897. LORUS, or Birds-foot Trefoil.

18 species; viz. maritimus, filigosus, tetragonolobus, conjugatus, tetraphyllus, edulis, peregrinus, angustissimus, arabicus, ornithopodioides, jacobæus, creticus, hirsutus, græcus, rectus, * corniculatus, cytisoides, dorycnium. Europe, Arabia, Madeira.

corniculatus. * L. heads of the flowers flatted at the top; stems herbaceous, trailing: legumens cylindrical, expanding.—The flowers of this plant become greenish when dried, in which respect they resemble the flowers of the plants which produce indigo. Cows, goats, and horses eat it. Sheep and swine are not fond of it. In Hertfordshire it is cultivated as pasturage for sheep. There is no doubt but it might be cultivated to great advantage. In moist meadows it grows to a great height, and makes extremely good hay.

898. TRIGONELLA, or Fenugreek.

12 species; viz. ruthenica, platycarpus, striata, polycerta, hamosa, spinosa, corniculata, monspeliaca, la-

ciniata, fœnum græcum, sylvestris, indica. Siberia, S. Europe, Egypt, India.

The *trigonella fœnum græcum* is cultivated chiefly in the southern parts of France, Germany, and Italy; from whence the seeds are brought to us. They are of a yellow colour, rhomboidal figure, a disagreeable strong smell, and a mucilaginous taste. Their principal use is in cataplasms, fomentations, and the like, and in emollient glysters.

899. MEDICAGO, or Medick, Moon-trefoil.

24 species; viz. arborea, virginica, radiata, circinnata, * sativa, * falcata, * lupulina, marina, polymorpha, prostrata, orbicularis, scutellata, tornata, turbinata, intertexta, * arabica, coronata, ciliaris, hirsuta, rigidula, * minima, * muricata, nigra, laciniata. Europe, North America.

* M. flowers in bunches; legumens narrow, regular, *sativa*. twisted; stem upright, smooth.—Modern writers upon husbandry strongly recommend the cultivation of this plant, for the purpose of feeding cattle; but it is not yet generally adopted.

* M. flowers in bunches; legumens crescent-shaped; *falcata*. stem prostrate.—In hot, dry, barren sandy places it is well worth the trouble of sowing for the purpose of making hay; a practice long since adopted in some parts of Sweden. Cows, horses, goats, and sheep eat it.

* M. spikes oval; seed-vessels kidney-shaped, with 1 *lupulina*. cell and 1 seed; stems trailing.—Cows, horses, goats, and sheep eat it; but it is less grateful to them than the other species. It is cultivated in Norfolk under the name of *nonsuch*, and is usually sown mixed with rye-grass. The crop is then called black and white nonsuch. It has been sown in the isle of Wight. It is sometimes sown along with clover and rye grass.

In the class Diadelphia are

56 Genera, including 710 Species, of which 59 are found in Britain.

CLASSIS XVIII.

POLYADELPHIA (H).

ORDO I. PENTANDRIA.

900. THEOBROMA. Cal. 3-phyllus. Cor. 5-petala, nectariis 5. Stam. 5. Anther. 3. Pistill. 3.

1418. ABROMA. Pentagyna. Caps. 5-locularis, 1-valvis, apice dehiscentis. Semina reniformia, receptaculo hirsuto.

CLASS XVIII.

POLYADELPHIA.

ORDER I. PENTANDRIA.

T. Cal. 3-leaved. *Cor. 5-petaled. Nectarics 5. Stam. 5. Anthers 3. Pistils 3.

A. Pistils 5. Caps. 5-celled, 1-valved, open at the extremity. Seeds kidney-shaped. Receptacle shaggy.

ORDO

(H) This class comprehends the plants whose flowers have stamens united by the filaments into three or more sets. The orders depend upon the number of stamens. There is only a single genus of British plants belonging to this class, viz. the *hypericum*.

ORDO II. DODECANDRIA.

1268. *MONSONIA*. Cal. 5-phyllis. Cor. 5-petala. Stam. 5. Anther 3. Pistill. 5-fidum.

ORDO III. ICOSANDRIA.

901. *CITRUS*. Cal. 5-dentatus. Cor. 5-petala. Stam. 20, in cylindrum passim connata. Pistill. 1. Bacca locularis, pulpa vesiculari.

ORDO IV. POLYANDRIA.

1269. *MELALEUCA*. Cal. 5-partitus superus. Cor. 5-petala. Caps. semivestita calyce baccato.

1270. *HOPEA*. Cal. 5-fidus, superus. Cor. 5-petala. Drupa nucleo 3-oculari.

DURIO. Cal. 5-fidus, urceolatus, inferus. Cor. 5-petala, parva. Stylus 1. Stam. phalanges 5, ex septem. Pomum 5-loculare.

1320. *GLABRARIA*. Cal. 5-fidus, inferus. Cor. 5-petala. Stylus 1. Stam. phalanges 5 ex senis. Drupa.

1321. *MUNCHHAUSIA*. Cal. inferus, 6-fidus. Cor. 6-petala. Caps. 6-ocularis.

677. *SYMPLOCOS*. Cal. 5-fidus, inferus. Cor. 5-petala. Stam. 4-plici serie corollae adnata.

* 902. *HYPERICUM*. Cal. 5-partitus, inferus. Cor. 5-petala. Styli 1, 3, s. 5. Caps. locularis.

* 903. *ASCYRUM*. Cal. 2-phyllus, inferus. Cor. 4-petala. Styli 2. Caps. 2-valvis.

ORDER II. DODECANDRIA.

M. Cal. 5-leaved. Cor. 5-petaled. Stam. 5. Anthers 3. Pistil. 5-cleft.

ORDER III. ICOSANDRIA.

C. Cal. 5-toothed. Cor. 5-petaled. Stam. 20, everywhere united into a cylinder. Pistil 1. Berry celled, in a vesicular pulp.

ORDER IV. POLYANDRIA.

M. Cal. 5-parted superior. Cor. 5-petaled. Caps. half covered with a berry-like cal.

H. Cal. 5-cleft superior. Cor. 5-petaled. Drupe with a 3-celled nut.

D. Cal. 5-cleft, pitcher-shaped, inferior. Cor. 5-petaled, small. Style 1. Stam. phalanges 5 of 7. Apple many-celled.

G. Cal. 5-cleft, inferior. Cor. 5-petaled. Style 1. Stam. phalanges 5 of 6. Drupe.

M. Cal. inferior, 6-cleft. Cor. 6-petaled. Caps. 6-celled.

S. Cal. 5-cleft, inferior. Cor. 5-petaled. Stam. connected with the corol. by a 5-fold series.

* H. Cal. 5-parted inferior. Cor. 5-petaled. Styles 1, 3, or 5. Caps. celled.

A. Cal. 2-leaved, inferior. Cor. 4-petaled. Styles 2. Caps. 2-valved.

ORDER I. PENTANDRIA.

900. *THEOBROMA*, or *Chocolate-nut Tree*.

Two species; viz. cacao, guama. Jamaica, S. America.—The nuts of the *theobroma cacao* are the fruit of an American tree resembling the almond: The tree, though small, bears a large fruit, shaped like a cucumber, which contains 30 or more of the nuts. These, by pressure, yield a considerable quantity of a fluid oil. Boiled in water, they give out a large portion of a sebaceous matter, which congeals on the surface of the liquor as it cools. The principal use of these nuts is for the preparation of the dietetic liquor chocolate. This is a mild, unctuous, nutritious fluid, capable of softening acrimonious humours, and of great service in consumptive disorders, especially if made with milk, and with only a small proportion of aromatics.

1418. *ABROMA*.

One species; viz. augusta. California.

ORDER II. DODECANDRIA.

1268. *MONSONIA*.

Three species; viz. filia, speciosa, lobata. C. of G. Hope.

ORDER III. ICOSANDRIA.

901. *CITRUS*, or *Lemon-orange, Shaddock*.

Four species; viz. medica, aurantium, decumana, japonica. Asia, India.

The citron, or the *citrus medica*, is an evergreen tree or shrub, of the same genus with the orange and lemon: it was first brought from Assyria and Media (whence the fruit is called *mala assyria*, *mala medica*) into Greece, and thence into the southern parts of Europe, where it is now cultivated. Citrons are rarely made use of among us; they are of the same quality with lemons, except that their juice is somewhat less acrid. They are with us frequently employed as a condiment.

The juice of lemons is similar in quality to that of oranges, from which it differs little otherwise than its being more acid. The yellow peel is an excellent aromatic, and is frequently employed in stomatic tinctures and infusions: it is considerably less hot than orange peel, and yields in distillation with water a less quantity of essential oil; its flavour is nevertheless more perishable, yet does not arise so readily with spirit of wine; for a spirituous extract made from lemon peel possesses the aromatic taste and smell of the subject, in much greater perfection than an extract prepared in the same manner from

from the peel of oranges. In the shops a syrup is prepared from the juice, and the peel is candied: the peel is an ingredient in the bitter infusions and wines: the essential oil enters the volatile aromatic spirit, or *spiritus ammoniac compositus*, as it is now called, and some other formulæ.

The orange or the *citrus aurantium* is a beautiful evergreen tree, or rather shrub; it is a native of the warmer climates, and does not easily bear the winters of this.

The flowers are highly odoriferous, and have been for some time past in great esteem as a perfume; their taste is somewhat warm, accompanied with a degree of bitterness. They yield their flavour by infusion to rectified spirit, and in distillation both to spirit and water: the bitter matter is dissolved by water, and on evaporating the decoction, remains entire in the extract. An oil distilled from these flowers is brought from Italy, under the name of *oleum* or *essentia neroli*.

Orange flowers were at one time said to be an useful remedy in convulsive and epileptic cases; but experience has not confirmed the virtues attributed to them. The leaves of the orange have also been recommended for the same purpose, but have by no means answered the expectations entertained by some.

The outer yellow rind of the fruit is a grateful aromatic bitter; and proves an excellent stomachic and carminative, promoting appetite, warming the habit, and strengthening the tone of the viscera. Orange peel appears to be very considerably warmer than that of lemons, and to abound more with essential oil: to this circumstance, therefore, regard ought to be had in the use of these medicines. The flavour of the fruit is likewise supposed to be less perishable than that of the other; hence the London college employ orange-peel in the spirituous bitter tincture, which is designed for keeping; whilst in the bitter watery infusion, lemon-peel is preferred. A syrup and distilled water are for the same reason prepared from the rind of oranges in preference to that of lemons.

The outer rind of the orange is the basis of a conserve both in the Edinburgh and London pharmacopœias; and this is perhaps one of the most elegant and convenient forms for exhibiting it.

The juice of oranges is a grateful acid liquor, of considerable use in febrile or inflammatory distempers, for allaying heat, abating exorbitant commotions of the blood, quenching thirst, and promoting the salutary excretions; it is likewise of use in genuine scorbutus or sea-scurvy. Although the Seville or *bitter orange*, as it is called, has alone a place in our pharmacopœias, yet the juice of the China or sweet orange, is much more employed. It is more mild and less acid; and it is employed in its most simple state with great advantage, both as a cooling medicine, and as

an useful antiseptic in fevers of the worst kinds, as well as in many other acute diseases, being highly beneficial in allaying thirst.

ORDER IV. POLYANDRIA.

1320. GLARRARIA.

One species; viz. *tersa*. E. Indies.

1321. MUNCHHAUSIA.

One species; viz. *speciosa*.

DURIO.

One species; viz. *zibethinus*. E. Indies.

1269. MELALEUCA, or *Cayputi-trex*.

Seven species; viz. *leucadendron*, *latifolia*, *angustifolia*, *lucida*, *villosa*, *scoparia*, *virgata*. New S. Wales, New Zealand.

1270. HOPEA.

One species; viz. *tinctoria*. Carolina.

677. SYMPLOGOS.

One species; viz. *martinicensis*. Jamaica, Martinico.

902. HYPERICUM, or *St John's Wort*.

42 species; viz. *balearicum*, *kalmianum*, *cayanense*, *bacciferum*, *calycinum*, *guineense*, *petiolatum*, *patulum*, *ascyrum*, * *androsæum*, *olympicum*, *petiolatum*, *canariense*, *hircinum*, *ægyptium*, *orientale*, *scabrum*, *repens*, *prolificum*, *oricoides*, *canadense*, *virginicum*, *mexicanum*, *reflexum*, * *quadrangulare*, * *perforatum*, * *humifusum*, *crispum*, * *montanum*, *barbatum*, * *hirsutum*, *tomentosum*, *perfoliatum*, * *elodes*, * *pulchrum*, *nummularium*, *japonicum*, *erectum*, *coris*, *mutilum*, *setosum*, *monogynum*. Europe, Azores, China, North America.

* H. stem 2-edged; leaves blunt; with pellucid dots. — This plant has long held a place in the materia medica, but its use is very much undetermined. The semitransparent dots on the leaves are the receptacles of an essential oil. The leaves given in substance are said to destroy worms. The flowers tinge spirits and oils of a fine purple colour, which is probably derived from the little glands upon the anther, and upon the edges of the petals. Cows, goats, and sheep eat it. Horses and swine refuse it.

903. ASCYRUM, or *St Peter's Wort*.

Three species; viz. *crux andrœe*, *hypericoides*, *villosum*. N. America.

In the class Polyadelphia are

12 Genera, which include 65 species. Of these 8 are found in Britain.

CLASSIS XIX.

SYNGENESIA (1).

ORDO I. POLYGAMIA ÆQUALIS.

Sect. I. *Semiflosculi Tournefortii, corollis ligulatis omnibus.*

922. SCOLYMUS. Recept. paleaceum. Pappus nullus. Cal. imbricatus, spinosus.
 * 921. CICHORIUM. Recept. subpaleaceum. Pappus sub 5-dentatus. Cal. calyculatus.
 920. CATANANCHE. Recept. paleaceum. Pappus aristatus, sessilis. Cal. imbricatus, scariosus.
 917. SERIOLA. Recept. paleaceum. Pappus subpilosus. Cal. simplex.
 * 918. HYPOCHÆRIS. Recept. paleaceum. Pappus plumosus. Cal. imbricatus.
 904. GEROPOGON. Recept. paleaceum. Pappus plumosus disci, 5-aristatus radii. Cal. simplex.
 915. ANDRYALA. Recept. villosum. Pappus pilosus, sessilis. Cal. subæqualis, rotundatus.
 * 905. TRAGOPOGON. Recept. nudum. Pappus plumosus, stipitatus. Cal. simplex.
 * 907. PICRIS. Recept. nudum. Pappus plumosus, stipitatus. Cal. calyculatus.
 * 912. LEONTODON. Recept. nudum. Pappus plumosus, stipitatus. Cal. imbricatus squamis laxis.
 906. SCORZONERA. Recept. nudum. Pappus plumosus, stipitatus. Cal. imbricatus, margine scarioso.
 * 914. CREPIS. Recept. nudum. Pappus pilosus. Cal. calyculatus, squamis difformibus.
 910. CHONDRILLA. Recept. nudum. Pappus pilosus, stipitatus. Cal. calyculat. multiflorus.
 * 911. PRENANTHES. Recept. nudum. Pappus pilosus. Cal. calyculat. sub 5-florus.
 * 909. LACTUCA. Recept. nudum. Pappus pilosus, stipitatus. Cal. imbricatus, margine scarioso.

CLASS XIX.

SYNGENESIA, OR COMPOUND FLOWERS.

ORDER I. POLYGAMIA ÆQUALIS, or with both stamens and pistils in the same florets.

Sect. I. *Semiflascular of Tournefort, all the florets ligulate, or strap-shaped.*

- S. Recept. chaffy. No down. Cal. tiled, prickly.
 * C. Recept. nearly chaffy. Down nearly 5-toothed. Cal. calyced, i. e. having a double calyx.
 C. Recept. chaffy. Down awned, sitting. Cal. tiled, skinny.
 S. Recept. chaffy. Down somewhat hairy. Cal. simple.
 * H. Recept. chaffy. Down feathered. Cal. tiled.
 G. Recept. chaffy. Down of the disc feathered, of the radius 5-awned. Cal. simple.
 A. Recept. woolly. Down hairy, sitting. Cal. nearly equal, rounded.
 * T. Recept. naked. Down feathered, pedicled. Cal. simple.
 * P. Recept. naked. Down feathered, pedicled. Cal. calyced.
 * L. Recept. naked. Down feathered, pedicled. Cal. tiled with loose scales.
 S. Recept. naked. Down feathered, pedicled. Cal. tiled, with a skinny border.
 * C. Recept. naked. Down hairy. Cal. calyced, with irregular scales.
 C. Recept. naked. Down hairy, pedicled. Cal. calyced, many-flowered.
 * P. Recept. naked. Down hairy. Cal. calyced, nearly 5-flowered.
 * L. Recept. naked. Down hairy, pedicled. Cal. tiled, with a skinny border.

* 913.

(1) This class comprehends those flowers which botanists have very generally agreed to call *compound*. The essential character of a compound flower, consists in the anthers being united so as to form a cylinder, and a single seed being placed upon the receptacle under each floret. The dandelion and thistle are compound flowers; that is, each of these flowers is composed of a number of small flowers called *florets*. The plants of this class are supposed to have various specific virtues. Most of them are bitter; almost none of them are poisonous. The *lactuca virosa*, when growing in shady situations, is however said to be an exception to this last rule.

The elasticity of the calyx in the *picris*, *carduus*, and many other genera, is too remarkable to pass unnoticed by the slightest observer. It seems as if the expansion of the plants first burst the calyx open, and when these wither it closes again. The downy hairs that crown the seeds, before upright, now begin to expand, and by this expansion again open the leaves of the calyx, and bend them quite back. The seeds now escape, and the calyx, becoming dry and withered, no longer retains its elastic power.

The hairy or downy appendages of the seeds occasion them to be wafted about in the air, and disseminated far and wide. The structure of this down deserves our notice; there is hardly a child that is insensible to its curious and beautiful appearance in the *leontodon* or *dandelion*.

In this class the orders are determined by the state of the florets with regard to stamens and pistils.

- * 913. *HIERACIUM*. Recept. nudum. Pappus pilosus, sessilis. Cal. imbricatus, ovatus.
- * 908. *SONCHUS*. Recept. nudum. Pappus pilosus, sessilis. Cal. imbricatus, gibbus.
- * 919. *LAPSANA*. Recept. nudum. Pappus nullus. Cal. calyculatus.
- * 916. *HYOSERIS*. Recept. nudum. Pappus calyculo coronatus. Cal. subæqualis.

Sect. II. *Capitati*.

- 930. *ATRACTYLIS*. Corolla radiata.
- 1419. *BARNADESIA*. Cor. radiata. Cal. nudus, imbricatus, pungens. Pappus radii plumosus; disci setosus, retrofractus.
- * 929. *CARLINA*. Cal. radiatus, radiis coloratus.
- 926. *CNICUS*. Cal. bracteis obvallatus.
- * 923. *ARCTIUM*. Cal. squamis apice incurvato-hamosis.
- 931. *CARTHAMUS*. Cal. squamis squarrosus foliaceis.
- 928. *CYNARA*. Cal. squamis squarrosus canaliculatis, spinosis.
- * 925. *CARDUUS*. Cal. squamis spinosis, ventricosus.
- * 927. *ONOPORDON*. Cal. squamis ventricosus spinosis. Recept. favosum.
- * 924. *SERRATULA*. Cal. squamis acutiusculis muticis imbricatus, subcylindricus.

Sect. III. *Discoidi*.

- 934. *ETHULIA*. Recept. nudum. Pappus nullus. Cal. æqualis.
- 936. *AGERATUM*. Recept. nudum. Pappus 5-
aristatus. Cal. subæqualis. Corollulæ 4-fidæ.
- 933. *BACALIA*. Recept. nudum. Pappus pilosus. Cal. calyculos.
- 939. *CHRYSOCOMA*. Recept. nudum. Pappus pilosus. Cal. imbricatus. Pist. brevissima.
- * 935. *EUPATORIUM*. Recept. nudum. Pappus plumosus. Cal. imbricatus. Pist. longissima.
- * 942. *SANTOLINA*. Recept. paleaceum. Pappus nullus. Cal. imbricatus, hemisphæricus.
- 941. *CALEA*. Recept. paleaceum. Pappus pilosus. Cal. imbricatus.
- 943. *ATHANASIA*. Recept. paleaceum. Pappus paleaceus. Cal. imbricatus.
- 1287. *SPILANTHUS*. Recept. paleaceum. Pappus bidentatus. Cal. subæqualis.
- * 932. *BIDENS*. Recept. paleaceum. Pappus aristatus. Cal. imbricatus.
- 938. *STÆHELINA*. Recept. paleaceum. Pappus plumosus, ramosus. Antheræ caudatæ.
- 937. *PTERONIA*. Recept. setis partitis. Pappus subplumosus. Cal. imbricatus.
- 940. *TRACHONANTHUS*. Recept. pilosum. Pappus pilosus, vestiens. Cal. turbinatus, monophyllus.

ORDO II. POLYGAMIA SUPERFLUA.

Sect. I. *Discoidi*.

- * 945. *ARTEMISIA*. Recept. subnudum. Papp. nullus. Cor. radii nulla.

- * H. Recept. naked. Down hairy, sitting. Cal. tiled, oval.
- * S. Recept. naked. Down hairy, sitting. Cal. tiled, bulged.
- * L. Recept. naked. No down. Cal. calyced.
- * H. Recept. naked. Down crowned with a calycle. Cal. nearly equal.

Sect. II. *Capitate, or growing in heads*.

- A. Cor. radiated.
- B. Cor. radiated. Cal. naked, tiled, pungent. Down of the radius feathered; of the disc bristly, broken backwards.
- * C. Cal. radiated (or with the outer different from the central florets); radii (outer florets) coloured.
- C. Cal. surrounded by floral leaves.
- * A. Cal. with scales hooked, curved at the point.
- C. Cal. scurfy, with leafy scales.
- C. Cal. scurfy, with channelled scales, thorny.
- * C. Cal. bellied, with thorny scales.
- * O. Cal. bellied, with thorny scales. Recept. honey-combed.
- * S. Cal. tiled with sharp awnless scales, nearly cylindrical.

Sect. III. *Discoid (florets tubular)*.

- E. Recept. naked. No down. Cal. equal.
- A. Recept. naked. Down 5-awned. Cal. nearly equal. Cor. 4-cleft.
- B. Recept. naked. Down hairy. Cal. calyced.
- C. Recept. naked. Down hairy. Cal. tiled. Pist. very short.
- * E. Recept. naked. Down feathered. Cal. tiled. Pist. very long.
- * S. Recept. chaffy. No down. Cal. tiled, hemispherical.
- C. Recept. chaffy. Down hairy. Cal. tiled.
- A. Recept. chaffy. Down chaffy. Cal. tiled.
- S. Recept. chaffy. Down 2-toothed. Cal. nearly equal.
- * B. Recept. chaffy. Down awned. Cal. tiled.
- S. Recept. chaffy. Down feathered, branched. Anthers tailed.
- P. Recept. with parted bristles. Down nearly feathered. Cal. tiled.
- T. Recept. hairy. Down hairy, covering. Cal. turban-like, 1-leaved.

ORDER II. POLYGAMIA SUPERFLUA.

(See p. 66.)

Sect. I. *Discoid (without ligulate florets)*.

- * A. Recept. nearly naked. No down. No cor. in the florets of the radius.

948. *CARPESIUM*. Recept. nudum. Papp. nullus. Cor. radii 5-fidæ.
 * 944. *TANACETUM*. Recept. nudum. Papp. submargin. Cor. radii 3-fidæ.
 968. *COTULA*. Recept. subnudum. Papp. margt natus. Cor. disci 4-fidæ.
 949. *BACCHARIS*. Recept. nudum. Papp. pilosus. Cor. femineæ hermaphroditis mixtæ.
 * 950. *CONYZA*. Recept. nudum. Papp. pilosus. Cor. radii 3-fidæ.
 * 946. *GNAPHALIUM*. Recept. nudum. Papp. plumosus. Cal. scariosus, squam. concavis.
 947. *XERANTHEMUM*. Recept. paleaceum. Papp. sub-setaceus. Cal. scariosus, radio explanato.
 969. *ANACYCLUS*. Recept. paleaceum. Papp. nullus. Sem. marginata, emarginata.

Sect. II. *Semiflosculosi, sub-bilabiati.*

960. *PERDICIUM*. Recept. nudum. Papp. pilosus. Cor. trifidæ, exteriore majore, 3-loba.

Sect. III. *Radiati.*

- * 962. *BELLIS*. Recept. nudum. Papp. nullus. Cal. squamis æqualibus simplex.
 * 967. *MATRICARIA*. Recept. nudum. Papp. nullus. Cal. squamis imbricatus acutis.
 * 966. *CHRYSANTHEMUM*. Recept. nudum. Papp. nullus. Cal. squamis intimis scariosis.
 1420. *UNXIA*. Recept. nudum. Papp. nullus. Cal. 5-phyllus. Flores radii et disci quinque.
 * 959. *DORONICUM*. Recept. nudum. Papp. pilosus. Pappus radii nullus.
 958. *ARNICA*. Recept. nudum. Papp. pilosus. Stamina radii castrata.
 * 956. *INULA*. Recept. nudum. Papp. pilosus. Anthere basi bisetæ.
 * 951. *EPIGERON*. Recept. nudum. Papp. pilosus. Cor. radii capillares.
 * 955. *SOLIDAGO*. Recept. nudum. Papp. pilosus. Cor. radii subsæni, remoti.
 * 957. *CINERARIA*. Recept. nudum. Papp. pilosus. Cal. æqualis, simplex.
 * 953. *SENECIO*. Recept. nudum. Papp. pilosus. Cor. squamis apice sphacelatis.
 * 952. *TUSSILAGO*. Recept. nudum. Papp. pilosus. Cal. squamis sub-membranaceis.
 * 954. *ASTER*. Recept. nudum. Papp. pilosus. Cal. sub-squarrosus.
 1421. *MUTISIA*. Recept. nudum. Papp. plumosus. Cal. cylindricus imbricatus. Corollæ radii ovali-oblongæ; disci trifidæ.
 1322. *BELLIUM*. Recept. nudum. Papp. aristatus, 8-phyllusque. Cal. simplex.
 964. *TAGETES*. Recept. nudum. Papp. aristatus. Cal. 1-phyllus. Radius 5-florus.
 961. *HELENIUM*. Recept. seminudum. Papp. aristatus. Cal. multipartitus. Radii cor. 3-fidis.
 965. *PECTIS*. Recept. nudum. Papp. aristatus. Cal. 5-phyllus. Radius 5-florus.
 963. *LEYSERA*. Recept. semipaleaceum. Papp. plumosus. Cal. scariosus.

- C. Recept. naked. No down. Cor. of the outer florets 5-cleft.
 * T. Recept. naked. Down with a slight border. Cor. of the ray 3-cleft.
 C. Recept. nearly naked. Down with a border. Cor. of the disc 4-cleft.
 B. Recept. naked. Down hairy. Cor. female, mixed with hermaphrodites.
 * C. Recept. naked. Down hairy. Cor. of the ray 3-cleft.
 * G. Recept. naked. Down feathered. Cal. skinny, with concave scales.
 X. Recept. chaffy. Down a little bristly. Cal. skinny, the ray flattened.
 A. Recept. chaffy. No down. Seeds bordered and not bordered.

Sect. II. *Florets half tubular, nearly 3-lipped.*

- P. Down hairy. Cor. 3-cleft, the outer largest, 3-lobed.

Sect. III. *Radiati.*

- * B. Recept. naked. No down. Cal. simple with equal scales.
 * M. Recept. naked. No down. Cal. tiled with sharp scales.
 * C. Recept. naked. No down. Cal. inner scales skinny.
 U. Recept. naked. No down. Cal. 5-leaved. Flowers of the ray and disc (extremity and centre) five.
 * D. Recept. naked. Down hairy. No down of the ray.
 A. Recept. naked. Down hairy. Stamens of the ray without anthers.
 * I. Recept. naked. Down hairy. Anthers at the base 2-bristled.
 * E. Recept. naked. Down hairy. Cor. of the ray hairy-like.
 * S. Recept. naked. Down hairy. Cor. of the ray nearly in sixes, remote.
 * C. Recept. naked. Down hairy. Cal. equal, simple.
 * S. Recept. naked. Down hairy. Cor. with scales, brittle at the point.
 * T. Recept. naked. Down hairy. Cal. with scales nearly membranous.
 * A. Recept. naked. Down hairy. Cal. nearly scurfy.
 M. Recept. naked. Down feathered. Cal. cylindrical, tiled. Cor. of the ray oval-oblong, of the disc 3-cleft.
 B. Recept. naked. Down awned, and 8-leaved. Cal. simple.
 T. Recept. naked. Down awned. Cal. 1-leaved. Ray 5-flowered.
 H. Recept. half naked. Down 5-awned. Cal. many-parted. Cor. with 3-cleft rays.
 P. Recept. naked. Down awned. Cal. 5-leaved. Ray 5-flowered.
 L. Recept. half chaffy. Down feathered. Cal. skinny.

973. *SIGESBECKIA*. Recept. paleaceum. Papp. nullus. Radius dimidiatus.
 1321. *ECLIPTA*. Recept. paleaceum. Papp. nullus. Cor. disci 4-fidæ.
 * 970. *ANTHEMIS*. Recept. paleaceum. Papp. nullus. Cal. hemisphericus.
 * 971. *ACHILLEA*. Recept. paleaceum. Papp. nullus. Radius sub 5-florus. Cal. oblongus.
 977. *BUPHTHALMUM*. Recept. paleaceum. Papp. marginatus. Stigma hermaphrodit. simplex.
 978. *AMELLUS*. Recept. paleaceum. Papp. pilosus. Cal. imbricatus.
 972. *TRIDAX*. Recept. paleaceum. Papp. pilosus. Cor. radii 3-partitæ.
 975. *VERBESINA*. Recept. paleaceum. Papp. aristatus. Flosculi radii circiter 5.
 974. *ZINNIA*. Recept. paleaceum. Papp. aristatus. Radius 5-florus, persistens. Cal. imbricat.

Tetragonotheca, vide Polymniam.

ORDO III. POLYGAMIA FRUSTRANEA.

- SCLEROCARPUS*. Recept. nudum. Papp. nullus. Cal. sulcatus.
 982. *GORTERIA*. Recept. nudiusculum. Papp. pilosus. Radius corollæ ligulatus.

1006. *LOBELIA*. Cal. 5-dentatus. Cor. 5-petala,
regularis. Caps. infera, 2-locularia.
1007. *VIOLA*. Cal. 5-phyllus. Cor. 5-petala, irre-
gularis. Caps. supera, 3-valvis.
1000. *IMPATIENS*. Cal. 5-phyllus. Cor. 5-petala
irregularis. Caps. supera, 5-valvis.

ORDER I. POLYGAMIA ÆQUALIS.

904. *GEROPOGON*, or *Old Man's Beard*.
Three species; viz. glabrum, hirsutum, calyculatam.
Italy.

905. *TRAGOPOGON*, or *Goats Beard*.

14 species; viz. * *pratense*, mutabile, undulatum,
orientale, majus, * *porrifolium*, *crocifolium*, *villosum*,
dalechampii, *picroides*, *asperum*, *dandelion*, *lanatum*,
virginicum. Europe, North America.

* *T.* calyx as long as the rays of the blossom; leaves
entire, quite straight; fruit-stalk cylindrical. *Yellow*
goats beard.—Before the stems shoot up, the roots boiled
like asparagus have the same flavour, and are nearly
as nutritious. Cows, sheep, and horses eat it. Swine
devour it greedily. Goats are not fond of it.

906. *SCORZONERA*, or *Vipers Grass*.

14 species; viz. *tomentosa*, *humilis*, *parviflora*, *his-*
panica, *graminifolia*, *purpurea*, *angustifolia*, *hirsuta*,
resedifolia, *laciniata*, *orientalis*, *taraxacifolium*, *tingita-*
na, *picroides*. Europe, Arabia, Barbary.

907. *PICRIS*, or *Ox Tongue*.

Four species; viz. * *echioides*, * *hieracioides*, *japo-*
nica, *asplenioides*. Germany, France, Italy, Japan.

- S. Recept. chaffy. Down 2-awood. Cal. scurfy.

- C. Recept. chaffy. Down 3-awood. Seeds with
peculiar calyxes.

ORDER V. POLYGAMIA SEGREGATA.

- S. Perianth. 1-flowered. Down feathered. Poly-
gamy equal. (See page 66.)
O. Recept. chaffy. Down chaffy. Perianth. pro-
per, with tubular and strap-shaped florets.
E. Perianth. 1-flowered. Down pubescent. Poly-
gamy equal.
E. Perianth. 4-flowered. Down bristly. Polygamy
equal.
G. Recept. 5-flowered. No down. Polygamy frustr.
(See page 66.)
J. Recept. chaffy. Perianth. common, 3-flowered.
Florets tubular, 2-lipped; outer lip strap-shaped, the
inner 2-parted.
S. Recept. many-flowered. No down. Polygamy
necessary. (See p. 66.)

ORDER VI. MONOGAMIA.

- S. Cal. 5-toothed. Cor. 5-petaled, regular. Berry
inferior, 1-seeded.
S. Cal. tiled. Cor. 1-petaled, regular. One oblong
seed.
C. Cal. 2-leaved. Cor. 1-petaled, regular. One cot-
tony seed.
L. Cal. 5-toothed. Cor. 5-petaled, regular. Caps.
inferior, 2-celled.
V. Cal. 5-leaved. Cor. 5-petaled, irregular. Caps.
superior, 3-valved.
L. Cal. 5-leaved. Cor. 5-petaled, irregular. Caps.
superior, 5-valved.

908. *SONCHUS*, or *Sow-thistle*.

13 species; viz. * *canadensis*, * *arvensis*, * *palustris*,
* *oleraceus*, *maritimus*, *fruticosus*, *tenerimus*, *plumieri*,
alpinus, *floridanus*, *sibiricus*, *tataricus*, *tuberosus*. Eu-
rope, Madeira, N. Amer. Jam.

* *S.* fruit and calyxes rough with hair in a sort of umb-
bels; leaves naked, heart-shaped at the base. *Corn*
or *sow thistle*.—The flowers follow the sun very regu-
larly. Cows and goats eat it; horses are very fond
of it.

* *S.* fruitstalks cottony; calyxes smooth. *Common oleraceus*.
sow-thistle.—The leaves are good among other pot-
herbs. They are a very favourite food with hares and
rabbits. Sheep, goats, and swine, eat it. Horses are
very fond of it.

909. *LACTUCA*, or *Lettuce*.

Ten species; viz. * *scariola*, * *virosa*, * *saligna*,
quercina, *intybacea*, *sativa*, *tuberosa*, *canadensis*, *indi-*
ca, *perennis*. Europe, E. Indies, N. America.

* *L.* all the leaves horizontal, toothed; their mid-rib *viresc.*
prickly on the back. *Wild lettuce*.—The juice smells
like opium. It is milky, acrid and bitter. Dr Cullen
relates 24 cases of dropsy, out of which 23 were cured
by taking the extract prepared from the expressed juice
in

in doses, from 18 grains to three drams in the 24 hours. It commonly proves laxative, promotes urine and gentle sweats, and removes the thirst. It must be prepared when the plant is in flower.

910. CHONDRILLA, or *Gum Succory*.

Three species; viz. *juncea*, *crepoides*, *nudicaulis*. Germany, Switzerland, France.

911. PRENANTHES, or *Wild Lettuce*.

19 species; viz. *tenuifolia*, *chinensis*, *viminea*, *purpurea*, * *muralis*, *altissima*, *chondrilloides*, *japonica*, *alba*, *repens*, *pinnata*, *integra*, *debilis*, *dentata*, *hastata*, *humilis*, *multiflora*, *lyrata*, *squarrosa*. Europe, Japan, N. America.

912. LEONTODON, or *Dandelion*.

10 species; viz. * *taraxacum*, *bulbosum*, *aureum*, *hastile*, *tuberosum*, * *autumnale*, *alpinum*, * *hispidum*, * *hirtum*, *tomentosum*. Europe, Africa, N. America.

913. HIERACIUM, or *Hawkweed*.

39 species; viz. *incanum*, *pumilum*, * *alpinum*, * *taraxaci*, *alpestre*, *venosum*, * *pilosella*, * *dubium*, * *auricula*, *cymosum*, *præmorsum*, *aurantiacum*, *gronovii*, *gmelini*, *sanctum*, *capense*, *pontanum*, *paniculatum*, *porrifolium*, *chondrilloides*, * *murorum*, *humile*, * *paludosum*, *lyratum*, *cerinthoides*, *amplexicaule*, *pyrenaicum*, *blattarioides*, *pilosum*, *austriacum*, *helveticum*, * *molle*, *stipitatum*, * *villosum*, *glutinosum*, *kalmii*, *sprengerianum*, * *sabandum*, * *umbellatum*.

alpinum. * *H.* leaves oblong, entire, toothed; stalk almost naked; calyx hairy.—This differs from the other lactescent plants, being less bitter and more astringent. It is esteemed hurtful to sheep. Goats eat it. Sheep are not fond of it. Horses and cows refuse it.

914. CREPIS, or *Base Hawkweed*.

16 species; viz. *pygmaea*, *bursifolia*, *barbata*, *vesicaria*, *alpina*, *rubra*, * *fœtida*, *aspera*, *rhagadioloides*, *sibirica*, * *tectorum*, * *biennis*, *virens*, *dioscoridis*, *pulchra*, *neglecta*. Siberia, Alps, Azores, Arabia.

915. ANDRYALA, or *Downy Sow-thistle*.

Three species, viz. *integrifolia*, *ragusina*, *lanata*. S. Europe, Archipelago, Canary.

916. HYOSERIS, or *Yellow-eye*.

Nine species; viz. *fœtida*, *radiata*, *lucida*, *scabra*, *virginica*, * *minima*, *hedyppois*, *rhagadioloides*, *cretica*. Europe, N. America, Madeira.

917. SERIOLA.

Four species; viz. *lævigata*, *æthnensis*, *cretensis*, *urens*. S. of Europe.

918. HYPOCHÆRIS, or *Goshmore*.

Four species; viz. *helvetica*, * *maculata*, * *glabra*, * *radicata*. Europe.

maculata. * *H.* stem almost bare, with a solitary branch; leaves egg-oblong, entire, toothed.—The leaves of this plant are boiled, and eaten as cabbage. Horses are fond of this plant when green, but they do not like it when dry. Cows, goats, and swine eat it. Sheep are not fond of it. The country people believe it a cure for tetters and other cutaneous eruptions, possibly through a vulgar prejudice, founded on its spotted leaves.

919. LAPSANA, or *Nipple-wort*.

Five species; viz. * *communis*, *zacintha*, *stellata*, *kolpini*, *rhagadiolus*. Siberia, S. of Europe.

920. CATANANCHE, or *Candia Lion's-foot*.
Three species; viz. *cœrulea*, *lutea*, *græca*. South of Europe.

921. CICHORIUM, or *Succory, Endive*.

Three species; viz. * *intybus*, *endivia*, *spinosum*. Europe.

* *C.* flowers in pairs, sitting; leaves notched.—The *intybus* leaves, when blanched, are eaten early in the spring in salads. They lose their bitterness by cultivation. The roots, gathered before the stem shoots up, are eatable, and when dried, will make bread. Sheep, goats, and swine eat it.

The seed of the *cichorium endivia* is raised in gardens for culinary use. It is a gentle cooler and aperient, nearly of the same quality with the former species. The seeds are ranked among the four lesser cold seeds.

922. SCOLYMUS, or *Golden Thistle*.

Two species; viz. *maculatus*, *hispanicus*. S. Eur.

923. ARCTIUM, or *Burdock*.

Three species; viz. *lappa*, *personata*, *carduelis*. Europe.

* *A.* leaves heart-shaped, without thorns, on leaf-stalks. *lappa*.—Before the flowers appear, the stems, stripped of their rind, are boiled, and eaten like asparagus; when raw, they are good with oil and vinegar. A decoction of the roots is esteemed by some very sensible physicians, as equal, if not superior to that of sarsaparilla. Boys catch bats by throwing the prickly heads up into the air. Cows and goats eat it. Sheep and horses refuse it. Swine are not fond of it.

924. SERATULLA, or *Saw-wort, Way-thistle*.

15 species; viz. * *tinctoria*, *coronata*, *japonica*, * *alpina*, *salicifolia*, *multiflora*, *noveboracensis*, *præalta*, *glauca*, *squarrosa*, *scariosa*, *spicata*, *amara*, *centauroides*, * *arvensis*. Europe, N. America.

* *S.* leaves lyre-shaped and wing-cleft; the terminating segments very large; florets all alike.—This plant is very much used by the dyers to give a yellow colour, but is inferior to the *reseda*; therefore its use is confined to the coarser woollen cloths. Goats eat it. Horses are not fond of it. Sheep, swine, and cows refuse it.

* *S.* leaves toothed, thorny.—This species is said to *arvensis*. yield a very pure vegetable alkali when burnt. Goats eat it: neither cows, horses, sheep, or swine are fond of it. Horses sometimes eat the young tops.

925. CARDUUS, or *Thistle*.

38 species; viz. *leucographus*, * *lanceolatus*, *arabicus*, * *nutans*, * *acanthoides*, *crispus*, *polyanthemus*, * *palustris*, *pycnocephalus*, *argentatus*, *australis*, *dissectus*, *cyanooides*, *canus*, *pectinatus*, *decoloratus*, *mons-pesulanus*, *pannonicus*, *tuberosus*, *chius*, *parviflorus*, *linearis*, *casabonæ*, *stellatus*, * *marianus*, *syriacus*, *eriphorus*, *altissimus*, *virginianus*, *heterophyllus*, * *helenioides*, *serratuloides*, *tataricus*, *ciliatus*, *flavescens*, *rivularis*, *mollis*, * *acaulis*. Europe, North America, Barbary, Japan.

* *C.* leaves toothed, thorny at the edge; flowers in bunches, upright; fruitstalks without thorns.—This, *palustris*: and almost all the other species of this genus, may be eaten like the burdock, before the flowers are formed. Swine eat it. Horses are very fond of it. Cows refuse it.

lanceolata. * C. leaves with winged clefts, hispid; segments straddling; calyx egg-shaped, thorny, woolly; stem hairy.—Few plants are more disregarded than this, and yet its use is very considerable. If a heap of clay is thrown up, nothing would grow upon it for several years, did not the seeds of this plant, wafted by wind, fix and vegetate thereon. Under the shelter of this other vegetables appear, and the whole soon becomes fertile. The flowers, like those of the artichoke, have the property of curdling milk. Sheep and swine refuse it. Neither horses, cows, nor goats are fond of it.

marianus. * C. leaves embracing the stem, halberd-shaped and wing-cleft, thorny; calyx without any leaves near it; thorns channelled, and set with other little thorns.—This plant is eaten as a salad when young. The young stalks, peeled and soaked in water to take off the bitterness, are excellent. The scales of the cup are as good as artichokes. The root is good to eat early in the spring.

acaulis. * C. stemless; calyx smooth.—Cows refuse the plant. It kills all plants which grow beneath it, whence it is very injurious.

926. CNICUS, or Blessed Thistle.

Nine species; viz. oleraceus, crisithales, ferox, pygmaeus, acarna, spinosissimus, centauroides, uniflorus, cernuus. Europe.

927. ONOPORDUM, or Woolly or Cotton Thistle.

Five species; viz. * acanthium, illyricum, arabicum, graecum, acanlon. Europe, Arabia.

acanthium. * O. calyx scales expanding, their points standing out; leaves egg-oblong, indented.—The receptacle and the young stems may be boiled and eaten like artichokes. The ancients thought this plant a specific in cancerous cases. Cows, sheep, and horses refuse it.

928. CYNARA, or Artichoke.

Four species; viz. scolymus, cardunculus, humilis, acaulis. S. Europe, Madeira, Barbary.

929. CARLINA, or Carline Thistle.

Eight species; viz. acaulis, lanata, corymbosa, * vulgaris, racemosa, pyrenaica, xeranthemoides, atrachyloides. Europe, Cape, Barbary.

vulgaris. * C. stem, with many flowers in a corymbus; flowers terminating; rays of the calyx yellow white.—Its flowers expand in dry, and close in moist weather. They retain this property a long time, and therefore are employed as hygrometers. It is said to be an excellent remedy in hysterical cases. Goats eat it. Cows refuse it. Its presence indicates a very barren soil.

The *carlina acaulis* is a very prickly sort of thistle, growing spontaneously in the southern parts of France, Spain, Italy, and the mountains of Switzerland; from whence the dried roots are brought to us. This root is about an inch thick, externally of a pale rusty brown colour, corroded, as it were, on the surface, and perforated with numerous small holes, appearing, when cut, as if worm-eaten. It has a strong smell, and a subacid, bitterish, weakly aromatic taste. Carlina is looked upon as a warm diaphoretic and alexipharmac; and has been for some time greatly esteemed by foreign physicians, but never came much into use among us: the present practice has entirely rejected it, nor is it often to be met with in the shops.

930. ATRASTYLIS, or Distaff Thistle.

Eight species; viz. gummifera, humilis, cancellata, lancea, ovata, oppositifolia, purpurea, mexicana. S. Europe, Mexico, Japan.

1419. BARNADESIA.

One species; viz. spinosa. S. America.

931. CARTHAMUS, or Base Saffron.

10 species; viz. tinctorius, lanatus, creticus, tingitanus, caeruleus, mitissimus, carduncellus, arboreseens, salicifolius, corymbosus. S. Eur. Barb. Madeira, Carolina.

The *carthamus tinctorius* is a soft kind of thistle, with only a few prickles about the edges of the leaves. It is cultivated in large quantity in some parts of Germany, from whence the other parts of Europe are supplied with the flowers as a colouring drug, and the seeds as a medicinal one. The flowers, well cured, are not easily distinguishable by the eye from saffron; but their want of smell readily discovers them. The seeds are white, smooth, of an oblong roundish shape, yet with four sensible corners, about a quarter of an inch in length, so heavy as to sink in water; of a viscid sweetish taste, which in a little time becomes acrid and nauseous. These seeds have been celebrated as a cathartic: they operate very slowly, and for the most part disorder the bowels, especially when given in substance. Triturated with aromatic distilled waters, they form an emulsion less offensive, yet inferior in efficacy to more common purgatives.

1287. SPILANTHUS.

Seven species; viz. urens, pseudo-acmella, acmella, salivaria, atriplicifolia, insipida, oleracea. E. Indies, Peru, Jamaica.

932. BIDENS, or Water Hemp-agrimony.

12 species; viz. * tripartita, minima, nodiflora, tenella, * cernua, frondosa, pilosa, bipinnata, nivea, verticillata, scandens, bullata. Europe, E. and W. Ind. America.

933. CACALIA, or Foreign Colts-foot.

27 species; viz. papillaris, anteuphorbium, cuneifolia, kleinia, ficoides, laciniata, repens, suffruticosa, laurifolia, cordifolia, asclepiadea, appendiculata, tomentosa, porrophyllum, sonchifolia, incana, saracenic, hastata, suaveolens, atriplicifolia, alpina, echinata, albifrons, bipinnata, acaulis, radicans, articulata. Alps, E. Indies, N. America.

934. ETHULIA.

Five species; viz. conyzoides, sparganophora, divaricata, tomentosa, bidentis. India, Jam. Carolina.

935. EUPATORIUM, or Hemp Agrimony.

28 species; viz. dalea, hyssopifolium, scandens, houstonia, zeylanicum, sessilifolium, album, chinense, rotundifolium, altissimum, hastatum, syriacum, trifoliatum, * cannabinum, cinereum, purpureum, maculatum, scabrum, perfoliatum, caelestinum, aromaticum, ageratoides, odoratum, ivæfolium, urticæfolium, stæchadifolium, microphyllum, japonicum. Europe, America, E. and W. Indies, Japan.

* E. calyx 5-flowered; leaves with finger-like divisions.—An infusion of a handful of it vomits and purges smartly. An ounce of the root, in decoction,

is a full dose. In similar doses the Dutch peasants take it as an alterative, and as an antiscorbutic. Goats eat it. Cows, horses, sheep, and swine refuse it.

936. *AGERATUM*, or *Base Hemp-ugrimony*.
Two species; viz. *conyzoides*, *ciliare*. America.

937. *PETRONIA*.

17 species; viz. *camphorata*, *oppositifolia*, *flexicaulis*, *retorta*, *hirsuta*, *glabrata*, *inflexa*, *scariosa*, *glomerata*, *cinerea*, *villosa*, *membranacea*, *spinosa*, *cephalotes*, *pallens*, *minuta*; *fasciculata*. C. of G. Hope.

938. *STACHELINA*.

Eight species; viz. *gnaphaloides*, *dubia*, *arborescens*, *fruticosa*, *ilicifolia*, *corymbosa*, *chamæpeuce*, *imbricata*. S. of France, Spain, Cape, S. America.

939. *CHRYSOCOMA*, or *Goldyllocks*.

13 species; viz. *oppositifolia*, *comaurea*, *dichotoma*, *sericea*, *patula*, *cernua*, *ciliata*, *tomentosa*, *scabra*, *linosyris*, *biflora*, *graminifolia*, *villosa*. Europe, Cape, Carolina.

940. *TRACHONANTHUS*, or *Shrubby African Flea-bane*.
Three species; viz. *camphoratus*, *glaber*, *ericoides*. C. of G. Hope.

941. *CALEA*, or *Halbert-weed*.

Four species; viz. *jamaicensis*, *oppositifolia*, *amellus*, *scoparia*. W. Indies, S. sea isles, Carolina.

942. *SANTOLIA*, or *Lavender Cotton*.

Four species; viz. *chamæcyparissus*, *rosmarinifolia*, *alpina*, *anthemoides*. S. of Europe.

943. *ATHANASIA*.

20 species; viz. *squarrosa*, *sessiliflora*, *pumila*, *crenata*, *uniflora*, *capitata*, *maritima*, *genistifolia*, *pubescens*, *annua*, *trifurcata*, *crithmifolia*, *linifolia*, *dentata*, *parviflora*, *pinnata*, *pectinata*, *dentata*, *filiformis*, *cinerea*. S. Europe, Africa, Carolina.

ORDER II. POLYGAMIA SUPERFLUA.

944. *TANACETUM*, or *Tansey*.

Seven species; viz. *sibiricum*, *incanum*, *cotuloides*, *annuum*, *monanthos*, * *vulgare*, *balsamita*. Europe, C. of G. Hope.

vulgare. * T. leaves doubly winged, cut, serrated.—This plant is a warm deobstruent bitter, and its flavour not ungrateful. The tender leaves are sometimes used to give a colour and flavour to puddings. If a dead animal substance is rubbed with this plant, the flesh-fly will not attack it. The Finlanders obtain a green dye from it. Cows and sheep eat it. Horses, goats, and swine refuse it. The seeds are an excellent vermifuge.

The *tanacetum balsamita* was formerly a very common garden plant, and of frequent use both for culinary and medicinal purposes; but it is at present very little regarded for either, though it should seem from its sensible qualities to be equal or superior, as a medicine, to some aromatic herbs which practice has retained. The leaves have a bitterish warm aromatic taste; and a very pleasant smell, approaching to that of mint, or a mixture of mint and maudlin. Water elevates their flavour in distillation, and rectified spirit extracts it by infusion. It has been recommended in

hysterical affections; and by some it has been supposed to be very powerful in correcting the influence of opium. The leaves should be collected in the month of July or August.

945. *ARTEMISIA*, or *Wormwood*, *Mugwort*.

29 species; viz. *vermiculata*, *capillaris*, *judaica*, *æthiopica*, *contra*, *abrotanum*, *arborescens*, *santonica*, * *campestris*, *palustris*, *crithmifolia*, *maritima*, *glacialis*, *rupestris*, *spicata*, *pontica*, *austriaca*, *annua*, *tanacetifolia*, * *absinthium*, * *vulgaris*, *pectinata*, *integrifolia*, *japonica*, *cærulescens*, *dracunculus*, *chinensis*, *maderaspatana*, *minima*. Eur. Cape, Egypt, China.

* A. leaves many-cleft, cottony; bunches on crooked *maritima*. footstalks; female florets 3.—This plant, in its wild state, smells like marum or camphor; but in our gardens it is less grateful, though still much more grateful than the next species. It is used as an ingredient in distilled waters, and beat with thrice its weight of fine sugar, it is formed into a conserve. Its virtues are the same with those of the next species, but in a weaker degree. Horses eat it. Cows, goats, and sheep, refuse it.

* A. leaves compound, many-cleft; flowers somewhat *absinthii*-globular, pendant; receptacle woolly.—The leaves *um.* and flowers of this species are very bitter: the roots are warm and aromatic. A considerable quantity of essential oil rises from it in distillation. This oil is used both externally and internally to destroy worms. The leaves put into sour beer, soon destroy the acescency. They resist putrefaction, and are therefore a principal ingredient in antiseptic fomentations. An infusion of them is a good stomachic; and, with the addition of fixed alkaline salt, a powerful diuretic in some dropsical cases. The ashes afford a more pure alkaline salt than most other vegetables, excepting bean-stalks, broom, and the larger trees. Linnæus mentions two cases, wherein an essence prepared from this plant, and taken for a considerable time, prevented the formation of stones in the kidneys or bladder: the patients forbearing the use of wine and acids. It might be suspected, that, like other bitters, its long continued use must weaken the action of the nervous system; but in these instances no such effect took place. An infusion of it given to a woman that suckles, makes her milk bitter. It gives a bitterness to the flesh of sheep that eat it. Horses and goats are not fond of it. Cows and swine refuse it. Turkeys are fond of it. The plant, steeped in boiling water, and repeatedly applied to a bruise, will remove the pain in a short time, and prevent the swelling and discoloration of the part.

* A. leaves wing-cleft, flat, cut, cottony underneath; *vulgaris*. bunches simple, bending; florets of the circumference 5.—In some countries this plant is used as a culinary aromatic. A decoction of it is taken by the common people to cure the ague. The Chinese make use of it in healing wounds, applying the fresh plant bruised. A dram of the leaves, powdered, was given four times a-day, by Dr Home, to a woman who had been affected with hysteric fits for many years. The fits ceased in a few days. Sheep and swine refuse it. Neither horses, cows, or goats, are fond of it. Dr Anderson informs us, that sheep are very fond of it, devouring it with great greediness, especially the roots, which seem to form a most delicate morsel.

The *artemisia abrotanum*, or southernwood, is a shrub-

by plant, clothed with very finely divided leaves, of a light-green colour. The flowers, which are very small and yellowish, hang downwards, several together, from the middle of the branches to the top. It is not, like some other species of the *artemisia*, indigenous in Britain; but although a native of warm climates, it readily bears the vicissitudes of ours, and is easily cultivated in gardens; from thence alone it is obtained when employed for medical purposes. The leaves fall off every winter, but the roots and stalks continue for many years.

Southernwood has a strong smell, which to most people is not disagreeable. It has a pungent, bitter, and somewhat nauseous taste. These qualities are very completely extracted by rectified spirit, and the tincture, thus formed, is of a beautiful green colour. They are less perfectly extracted by watery liquors, the infusion being of a light brown colour.

Southernwood, as well as some other species of the same genus, particularly the *absinthium* and *santonium*, has been recommended as an anthelmintic; and it has also been sometimes used as a stimulant, detergent, and sudorific. It has likewise been employed externally in discutient and antiseptic fomentations. It has also been used under the form of lotion and ointment for cutaneous eruptions, and for preventing the hair from falling off. It is at present very little employed in practice.

The worm-seed of the *artemisia austriaca* is the produce of a plant of the wormwood or mugwort kind, growing in the Levant. It is a small, light, chaffy seed, composed, as it were, of a number of thin membranous coats, of a yellowish colour, an unpleasant smell, and a very bitter taste. These seeds are celebrated for anthelmintic virtues, which they have in common with other bitters; and are sometimes taken with this intention, either mixed with molasses or candied with sugar: their unpleasant taste renders the form of a powder or decoction inconvenient.

946. GNAPHALIUM, or *Everlasting*, or *Cudweed*.

59 species; viz. *eximium*, *arborescens*, *grandiflorum*, *fruticans*, *crispum*, *appendiculatum*, *coronatum*, *discolorum*, *muricatum*, *ericoides*, *teretifolium*, *mucronatum*, *stoechas*, *ignescens*, *dentatum*, *serratum*, *patulum*, *petiolatum*, *crassifolium*, *maritimum*, *repens*, *umbellatum*, *hispidum*, *cylindricum*, *orientale*, *arenarium*, *rutilans*, *milleflorum*, *imbricatum*, *cymosum*, *nodifolium*, * *luteo-album*, *pedunculare*, *odoratissimum*, *sanguineum*, *fœtidum*, *undulatum*, *crispum*, *helianthemifolium*, *squarrosum*, *stellatum*, *obtusifolium*, * *margaritaceum*, *plantagineum*, * *dioicum*, *alpinum*, *indicum*, *purpureum*, *denudatum*, * *sylvaticum*, *verticillatum*, *oculus cati*, *pilosellum*, *declinatum*, *coronatum*, * *supinum*, *uliginosum*, *glomeratum*, *japonicum*. Eur. Ind. Africa, N. America.

947. XERANTHEMUM, or *Austrian Sneezewort*.

16 species; viz. *annuum*, *vestitum*, *speciosissimum*, *proliferum*, *imbricatum*, *canescens*, *retortum*, *spinosum*, *sesamoides*, *virgatum*, *stachelina*, *variegatum*, *paniculatum*, *fulgidum*, *stoloniferum*, *recurvatum*. S. Europe, Cape.

948. CARPESIUM.

Two species; viz. *cernuum*, *abrotanoides*. Austria, Spain, Italy, China.

949. BACCHARIS, or *Ploughman's Spikenard*.

Eight species; viz. *ivæfolia*, *nerviifolia*, *arborea*, *halimifolia*, *dioscoridis*, *indica*, *brasiliiana*, *fœtida*. Cape, India, America.

750. CONYZA, or *Greater Fleabane*.

25 species; viz. * *squarrosa*, *linifolia*, *sordida*, *saxatilis*, *canescens*, *rupestris*, *scabra*, *asteroides*, *bifrons*, *lobata*, *bifoliata*, *pubigera*, *tortuosa*, *candida*, *anthelminthica*, *balsamifera*, *cinerea*, *odorata*, *chinensis*, *hirsuta*, *arborescens*, *fruticosa*, *virgata*, *decurrens*, *aurita*. Europe, Cape, E. and W. Indies, America.

951. ERIGERON, or *Lesser Fleabane*.

22 species; viz. *viscosum*, *graveolens*, *glutinosum*, *siculum*, *carolinianum*, * *canadense*, *bonariense*, *jamaicense*, *philadelphicum*, *ægyptiacum*, *gouani*, * *acre*, * *alpinum*, *uniflorum*, *gramineum*, *camphoratum*, *japonicum*, *scandens*, *tuberosum*, *fœtidum*, *tricuneatum*, *pinnatum*. Europe, China, Africa, America.

952. TUSSILAGO, or *Colts-foot*.

12 species; viz. *anandria*, *dentata*, *nutans*, *alpina*, *discolor*, *sylvestris*, * *farfara*, *japonica*, *frigida*, *alba*, * *hybrida*, * *petasites*. Europe, Japan, Newfoundland, Jamaica.

* T. stalks with one flower, tiled; leaves somewhat heart-shaped, angular, finely toothed.—This is the first plant that vegetates in marble, or limestone rubble.

The downy substance on the under surface of the leaves, wrapped in a rag, dipped in a solution of saltpetre, and dried in the sun, makes the best tinder; the leaves are the basis of the British herb-tobacco. They are somewhat austere, bitterish, and mucilaginous to the taste. They were formerly much used in coughs and consumptive complaints; and perhaps, not without reason, for Dr Cullen has found them to do considerable service in scrophulous cases: he gives a decoction of the dried leaves, and finds it succeed where sea water has failed. And Fuller relates a case of a girl, with 12 scrophulous sores, who was cured by drinking daily as much as she could, for above four months, of a decoction of the leaves made so strong as to be sweetish and glutinous. Goats and sheep eat it. Cows are fond of it. Horses and swine refuse it. It may be destroyed by cutting off the crown of the root in March.

* T. panicle egg-shaped; female florets few.—Its roots abound with a resinous matter. They have a strong smell, and a bitterish acrid taste. Horses, cows, goats, and sheep eat it. Its large leaves afford shelter from showers to poultry and other small animals.

953. SENECEO, or *Groundsel*, *Ragwort*.

59 species; viz. *hieracifolius*, *purpureus*, *cernuus*, *persicifolius*, *virgatus*, *divaricatus*, *pseudo-chyna*, *reclinatus*, *vulgaris*, *arabicus*, *peucedanifolius*, *japonicus*, *triflorus*, *ægyptius*, *lividus*, *trilobus*, * *viscosus*, * *sylvaticus*, *nebrodensis*, *glaucus*, *varicosus*, *hastatus*, *pubigerus*, *elegans*, *squalidus*, *erucifolius*, *incanus*, *abrotanifolius*, *canadensis*, *diffusus*, * *jacobæa*, * *tenuifolius*, *aureus*, *lyratus*, *alpinus*, *umbellatus*, *linifolius*, *rosmarinifolius*, * *paludosus*, *nemorensis*, * *sarracenicus*, *sibiricus*, *dorea*, *doronicum*, *longifolius*, *cruciatum*, *juniperinus*, *byzantinus*, *halimifolius*, *ilicifolius*, *rigidus*, *polifolius*, *angulatus*, *maritimus*, *erosus*, *marginatus*, *lanatus*, *cordifolius*, *glastifolius*. Europe, Africa, E. Indies, Japan, N. America.

* S.

vulgaris. * S. leaves winged, indented, embracing the stem; flowers scattered.—A strong infusion of this plant vomits. The bruised leaves are a good application to boils. The seeds are very acceptable to linnets and goldfinches when confined in cages. Cows are not fond of it. Goats and swine eat it. Horses and sheep refuse it.

jacobæa. * S. leaves lyre-shaped, almost winged; segments finely jagged; stem upright. If this plant is gathered before the flowers open, and used fresh, it dyes wool of a full green, but the colour is apt to fade. If woollen cloth is boiled in alum water, and then in a decoction of the flowers, it takes a beautiful deep yellow. Horses and sheep refuse it. Cows are not fond of it. Horses and cows, however, eat it when young.

954. ASTER, or *Starwort.*

38 species; viz. *taxifolius*, *reflexus*, *crinitus*, *fruticosus*, *tenellus*, *alpinus*, *sibiricus*, * *tripolium*, *amellus*, *divaricatus*, *hissopifolius*, *dumosus*, *ericoides*, *tenuifolius*, *linariifolius*, *linifolius*, *acris*, *concolor*, *rigidus*, *novæangliæ*, *undulatus*, *grandiflorus*, *cordifolius*, *punicæus*, *annuus*, *vernus*, *indicus*, *lævis*, *mutabilis*, *tradescanti*, *novi-belgii*, *tardiflorus*, *miser*, *macrophyllus*, *chinensis*, *tataricus*, *hispidus*, *scaber*. Europe, Cape, Asia, N. America.

tripolium. * A. leaves strap-spear-shaped, fleshy, smooth, 3-fibred; calyx scales blunt, somewhat membranaceous.—Goats and horses eat this species. Cows and swine refuse it. Sheep are not fond of it.

955. SOLIDAGO, or *Golden Rod.*

14 species; viz. *sempervirens*, *canadensis*, *altissima*, *lateriflora*, *bicolor*, *lanceolata*, *cæsia*, *mexicana*, *flexicaulis*, *latifolia*, * *virgaurea*, *minuta*, *rigida*, *noveboracensis*. Europe, N. America.

virgaurea * S. stem serpentine, branched; leaves mostly sitting; flowers in crowded panicles.—This plant is found wild on heaths and in woods, producing spikes of yellow flowers in August. The leaves have a moderately astringent bitter taste; and hence prove serviceable in debility and laxity of the viscera, and disorders proceeding from that cause.

957. CINERARIA, or *Sky-flower.*

26 species; viz. *geifolia*, *cymbalarifolia*, *sibirica*, *glauca*, *sonchifolia*, *cordifolia*, *crispa*, * *integrifolia*, *longifolia*, * *palustris*, *aurea*, *maritima*, *canadensis*, *capillacea*, *linifolia*, *purpurata*, *amelloides*, *americana*, *alata*, *elongata*, *caicalioides*, *denticulata*, *perfoliata*, *lineata*, *hastifolia*, *japonica*. Europe, Africa, N. America, Jamaica.

956. INULA, or *Elecampane.*

29 species; viz. * *helenium*, *odora*, *suaveolens*, *odorus-christi*, *britannica*, * *dysenterica*, *undulata*, *indica*, *pulicaria*, *arabica*, *spiræifolia*, *æquarrosa*, *bubonium*, *salicina*, *hirta*, *mariana*, *germanica*, *japonica*, *dubia*, *ensifolia*, *crithmifolia*, *provincialis*, *montana*, *æstuans*, *bifrons*, *cœrulea*, *aromatica*, *pinifolia*, *fœtida*. Europe, Cape, E. Indies, N. America.

helenium. * I. leaves embracing the stem, egg-shaped, wrinkled, cottony underneath; scales of the calyx egg-shaped.—This is a large downy plant, sometimes found wild in moist rich soils. The elecampane, or root, especially when dry, has an agreeable aromatic smell; its taste on first chewing, is glutinous, and as it were, somewhat ran-

cid; in a little time it discovers an aromatic bitterness, which by degrees becomes considerably acrid and pungent. Elecampane root possesses the general virtues of alexipharmacs; it is principally recommended for promoting expectoration in humoral asthmas and coughs; liberally taken, it is said to excite urine, and loosen the belly. In some parts of Germany large quantities of this root are candied and used as a stomachic, for strengthening the tone of the viscera in general, and for attenuating tenacious juices; spirituous liquors extract its virtues in greater perfection than watery ones: the former scarcely elevate any thing in distillation; with the latter an essential oil arises, which concretes into white flakes: this possesses at first the flavour of the elecampane, but is very apt to lose it on keeping. An extract made with water, possesses the bitterness and pungency of the root, but in a less degree than one made with spirit. The root is esteemed a good pectoral. Dr Hill says, he knows, from his own experience, that an infusion of the fresh root, sweetened with honey, is an excellent medicine in the whooping-cough. A decoction of the root cures sheep that have the scab. Horses and goats eat it. Cows, sheep, and swine refuse it.

* I. leaves embracing the stem, heart-oblong; stem *dysenterica* woolly, forming a kind of panicle; scales of the calyx *ca.* bristle-shaped.—It has a peculiar scent, compared by some to that of soap. The Russian soldiers in the Persian expedition under General Keit were much troubled with the bloody flux, which was cured by the use of this plant. Cows are not fond of it. Sheep and goats refuse it.

958. ARNICA, or *Leopard's Banc.*

11 species; viz. *montana*, *piloselloides*, *scorpioides*, *doronicum*, *maritima*, *crocea*, *ciliata*, *japonica*, *palmaria*, *gerbera*, *coronopifolia*. Europe, Africa, Japan.

The *arnica montana* had formerly a place in our pharmacopœias, under the title of *doronicum germanicum*. Then, however, it was little known or used; and being justly considered as one of the deleterious vegetables, it was rejected: but it has again been introduced into the list both of the London and Edinburgh colleges on the authority of fresh observations, particularly of those of Dr Collins of Vienna, who has lately published a dissertation on the medical virtues of the arnica.

This plant grows in different parts of Europe, particularly Germany. It has an acrid bitter taste, and when bruised, emits a pungent odour, which excites sneezing. On this account the country people in some parts of Germany use it in snuff, and smoke it like tobacco. It was formerly represented as a remedy of great efficacy against effusions and suffusions of blood from falls, bruises, and the like; and it was then also mentioned as a remedy in jaundice, gout, nephritis, &c. but in these affections it is now very little if at all employed.

Of late it has been principally recommended in paralytic affections, or in cases where a loss or diminution of sense arises from an affection of the nerves, as in instances of amaurosis. In those it has chiefly been employed under the form of infusion. From a dram to half an ounce of the flowers has been directed to be infused in a pint of boiling water, and taken in differ-

ent:

ent doses in the course of the day; sometimes it produces vomiting, sometimes sweating, sometimes diuresis: but frequently its use is attended with no sensible operation, unless it can be considered as such, that in some cases of paralysis, the cure is said to be preceded by a peculiar prickling, and by shooting pains in the affected parts.

Besides being employed in paralytic affections, it has also been of late represented as a very powerful antispasmodic; and it is said to have been successfully employed in fevers, particularly those of the intermittent kind, and likewise in cases of gangrene. In those diseases it has been said to prove as efficacious as the Peruvian bark, when employed under the form of a pretty strong decoction, taken in small doses frequently repeated, or under the form of an electuary with honey.

But these alleged virtues of the arnica have not been confirmed by any trials made in Britain, with which we are acquainted; and we are of opinion that its real influence still remains to be determined by future observations. It is, however, one of those active substances from which something may be expected.

959. *DORONICUM*, or *Leopard's Bane*.

Three species; viz. * *pardalianches*, *plantagineum*, *bellidiastrum*. Europe, N. Amer.

960. *PERDICIUM*.

Five species; viz. *semiflosculare*, *radiale*, *brasiliense*, *magellanicum*, *tomentosum*. Cape, Japan, Jamaica, S. America.

1421. *MUTISIA*.

One species; viz. *clematis*. New Granada.

961. *HELENIUM*, or *Base Sun-flower*.

One species; viz. *autumnale*. N. Amer.

962. *BELLIS*, or *Daisy*.

Two species; viz. * *perennis*, *anua*. Europe.

* *B.* stalk naked.—The leaves are slightly acrid. The roots have a penetrating purgency. No attention is paid to it, except what it claims from the beauty of its flowers. The flowers close at night. Horses, sheep, and cows refuse it.

1322. *BELLIUM*, or *Base Daisy*.

Two species; viz. *bellidioides*, *minutum*. Levant, India.

964. *TAGETES*, or *African Marygold*.

Three species; viz. *patula*, *erecta*, *minuta*. Mex. Chili.

963. *LEYSERA*.

Three species; viz. *gnaphalodes*, *callicornia*, *paleacea*. Cape, California, Carolina.

974. *ZINNIA*.

Two species; viz. *pauciflora*, *multiflora*. N. America, Peru.

965. *PECTIS*.

Three species; viz. *ciliaris*, *punctata*, *linifolia*. America.

966. *CHRYSANTHEMUM*, or *Corn Marygold*.

24 species; viz. *frutescens*, *serotinum*, *atratum*, *alpinum*, * *leucanthemum*, *montanum*, *graminifolium*, *monspeliense*, *balsamita*, * *inodorum*, *achillæa*, *corymbosum*, *indicum*, *pinnatifidum*, *arcticum*, *pectinatum*, * *segetum*, *myconis*, *italicum*, *millefoliatum*, *bipinnatum*,

coronarium, *flosculosum*, *japonicum*. Europe, India, Africa, N. Amer.

* *C.* leaves embracing the stem, oblong, serrated upwards, toothed at the base.—The young leaves may be eaten in salads. Horses and goats eat it. Cows and swine refuse it.

* *C.* leaves embracing the stem, jagged upwards, tooth-serrated towards the base.—This species was imported into Sweden along with corn from Jutland about the end of the last century. In Denmark there is a law to oblige the farmers to root it up from their corn fields. It may be destroyed by danging the ground in autumn, followed by a summer fallow, and harrowing the land about five days after sowing the grain. Its yellow flowers, however, which follow the sun in a very remarkable manner, give a very remarkable brilliancy to the fields in tillage, and please the eye of the passing traveller.—A large quantity which grew on some arable land, was cut when in flower, dried and eaten by horses as a substitute for hay. It is used by the Germans for dyeing yellow.

967. *MATRICARIA*, or *Feverfew*.

Six species; viz. * *parthenium*, * *maritima*, *suaveolens*, * *chamomilla*, *argentea*, *asteroides*. Europe, Curaçoa, S. Amer.

* *M.* leaves compound, flat; leaflets egg-shaped, cut; *parthenium* fruitstalks branched.—The whole plant has a strong smell and a bitter taste, and yields an essential oil by distillation. A horse refused it.

* *M.* receptacle conical, rays expanding; calyx scales equal at the edges.—Its properties resemble those of *milli*, *anthemidis nobilis*. The Finlanders use an infusion of it in consumptive cases. Cows, goats, and sheep eat it. Horses are not fond of it. Swine refuse it.

1420. *UNXIA*.

One species; viz. *camphorata*. Surinam.

968. *COTULA*, or *May-weed*.

13 species; viz. *anthemoides*, *aurea*, *stricta*, *cornipifolia*, *umbellata*, *quinqueloba*, *viscosa*, *turbinata*, *tanacetifolia*, *verbesina*, *capensis*, *pilulifera*, *servicea*. S. Eur. Barb. Cape, Jam.

969. *ANACYCLUS*.

Four species; viz. *creticus*, *orientalis*, *aureus*, *valentinus*. Europe.

970. *ANTHEMIS*, or *Chamomile*.

18 species; viz. *cota*, *altissima*, * *maritima*, *tomentosa*, *mixta*, *alpina*, *chia*, * *nobilis*, *arvensis*, *austriaca*, * *cotula*, *pyrethrum*, *valentina*, *repanda*, *trinerchia*, *americana*, * *tinctoria*, *arabica*. Europe, Africa, N. America.

* *A.* receptacle conical; chaff bristle-shaped; seeds naked.—Toads are said to be fond of this plant. It is very ungrateful and displeasing to bees. Goats and sheep are not fond of it. Horses, cows, and swine refuse it. It frequently blisters the skin of reapers, and of children who happen to gather it. The heads rubbed between the fingers smell intolerably disagreeable.

* *A.* leaves winged compound, strap-shaped, somewhat woolly.—The leaves and flowers have a strong not ungrateful smell, and a bitter nauseous taste. They afford an essential oil. An infusion of the flowers is often used as a stomachic, and as an antispasmodic. In large quantities it excites vomiting. The powdered flowers

flowers in large doses have cured agues, even when the bark had failed. Both the leaves and flowers possess very considerable antiseptic properties, and are therefore used in antiseptic fomentations and poultices. From their antispasmodic powers they are frequently found to relieve pain, either applied externally or taken internally. Ray recommends the flowers in calculous cases.

tinctoria.

* A. leaves doubly winged, serrated, cottony underneath; stem supporting a corymbus.—The flowers afford a remarkably clean and good yellow dye. The flowers of the *chrysanthemum segetum* resemble them much in appearance, but experience proves they cannot be substituted in their place. Horses and goats eat it. Sheep are not fond of it. Cows and swine refuse it.

971. *ACHILLEA*, or *Milfoil*, *Yarrow*.

21 species; viz. *santolina*, *ageratum*, *falcata*, *tomentosa*, *pubescens*, *abrotanifolia*, *bipinnata*, *ægyptiaca*, *macrophylla*, *impatiens*, *clavennæ*, * *ptarmica*, *alpina*, *atrata*, *moschata*, *nana*, *magna*, * *millefolium*, *nobilis*, *odorata*, *cretica*. Europe, Africa.

ptarmica.

* A. leaves strap spear-shaped, embracing the stem, finely serrated.—The roots have a hot biting taste. The young tops are sharp and pleasant in spring salads. The powdered leaves excite sneezing. Horses, cows, sheep, goats, and swine eat it.

millefolium.

* A. leaves doubly winged; segments of the wings strap-shaped, toothed.—The flowers of this plant yield an essential oil. The leaves are celebrated by the materia medica writers for a variety of purposes, but they are little attended to at present. Sheep and swine refuse it. Horses, cows, and goats are not fond of it.

972. *TRIDAX*, or *Trailing Star-wort*.

One species; viz. *procumbens*. Vera Cruz.

973. *SIGESBECKIA*.

Two species; viz. *orientalis*, *occidentalis*. India, China, Virginia, Peru.

975. *VERBESINA*, or *Indian Hemp-agrimony*.

11 species; viz. *alata*, *chinensis*, *virginica*, *lavenia*, *dichotoma*, *biflora*, *calendulacea*, *nodiflora*, *fruticosa*, *gigantea*, *bosvallea*. E. and W. Indies, China, North America.

977. *BUPHTHALMUM*, or *Ox-eye*.

11 species; viz. *frutescens*, *arborescens*, *sericeum*, *spinosum*, *aquaticum*, *maritimum*, *durum*, *salicifolium*, *grandiflorum*, *speciosissimum*, *helianthoides*. Europe, N. America, Arabia, Jamaica.

978. *AMELLUS*, or *Star-flower*.

Two species; viz. *lychnites*, *umbellatus*. Cape, Jamaica, Carolina.

1321. *ECLIPTA*.

Four species; viz. *erecta*, *punctata*, *latifolia*, *prostrata*. E. and W. Indies.

ORDER III. *POLYGAMIA FRUSTRANEA*.

979. *HELIANTHUS*, or *Sun-flower*.

13 species; viz. *annuus*, *indicus*, *multiflorus*, *tuberosus*, *decapetalus*, *frondosus*, *strumosus*, *giganteus*, *altissimus*, *lævis*, *angustifolius*, *divaricatus*, *atrovirens*. America.

980. *RUDEBECKIA*, or *Dwarf Sun-flower*.

Six species; viz. *laciniata*, *triloba*, *hirta*, *purpurea*, *oppositifolia*, *angustifolia*. N. America.

981. *COREOPSIS*, or *Tick-seed Sun-flower*.

12 species; viz. *verticillata*, *coronata*, *leucantha*, *chrysantha*, *tripteris*, *alba*, *reptans*, *baccata*, *auriculata*, *lanceolata*, *bidens*, *alternifolia*. N. America.

982. *GORTERIA*.

12 species; viz. *personata*, *rigens*, *squarrosa*, *setosa*, *ciliaris*, *asteroides*, *herbacea*, *hispida*, *spinosa*, *cernua*, *uniflora*, *barbata*. C. of G. Hope.

SCLEROCARPUS.

One species; viz. *africanus*. Africa.

983. *OSMITES*.

Four species; viz. *bellidiastrum*, *camphorina*, *asteriscoides*, *calycina*. C. of G. Hope.

1271. *ZOEGEA*.

Two species; viz. *leptaurea*, *capensis*. C. of G. Hope.

984. *CENTAUREA*, or *Blue-bottle*, *Knapweed*.

66 species; viz. *crupina*, *moschata*, *erucifolia*, *lippii*, *alpina*, *centaureum*, *purpuria*, *capillata*, *uniflora*, *linifolia*, *pectinata*, * *nigra*, *pullata*, *montana*, * *cyaneus*, *paniculata*, *spinosa*, *ragusina*, *cineraria*, *argentea*, *sibirica*, *sempervirens*, * *scabiosa*, *tatarica*, *stoebe*, *acaulis*, *orientalis*, *behen*, *repens*, *jacea*, *amara*, *alba*, *splendens*, *rhapontica*, *babylonica*, *glastifolia*, *conifera*, *sonchifolia*, *seridis*, *romana*, *sphærocephala*, *isnardi*, *nupifolia*, *aspera*, *benedicta*, *eriphora*, *ægyptiaca*, * *calcitrapa*, *calcitrapoides*, * *solstitialis*, *melitensis*, *sicula*, *centauroides*, *collina*, *rupestris*, *verutum*, *salmantica*, *cichoracea*, *muricata*, *peregrina*, *radiata*, *nudicaulis*, *crocodilium*, *pumila*, *tingitana*, *galactites*. Europe, Egypt, Arabia, Persia.

* C. calyx scales serrated; leaves strap-shaped, very entire; the lower ones toothed.—The expressed juice of the petals is a good blue ink; it stains linen of a beautiful blue, but the colour is not permanent in the mode it has hitherto been applied. Mr Boyle says, the juice of the central florets, with the addition of a very small quantity of alum, makes a lasting transparent blue, not inferior to ultramarine. Cows, goats, and sheep eat it. Horses and swine refuse it.

The *centaurea centaurium* is a large plant cultivated in gardens. The root has a rough, somewhat acrid taste, and abounds with a red viscid juice; its rough taste has gained it some esteem as an astringent; its acrimony as an aperient; and its glutinous quality as a vulnerary. The present practice takes little notice of it with any intention.

The *centaurea benedicta* is an annual plant cultivated in gardens; it flowers in June and July, and perfects its seeds in the autumn. The herb should be gathered when in flower, dried in the shade, and kept in a very dry airy place, to prevent its rotting or growing mouldy, which it is very apt to do. The leaves have a penetrating bitter taste, not very strong or durable, accompanied with an ungrateful flavour, which they are in a great measure freed from by keeping. Water extracts, in a little time, even without heat, the lighter and more grateful parts of this plant; if the digestion be continued for some hours, the disagreeable parts are taken

up;

up; a strong decoction is very nauseous and offensive to the stomach. Rectified spirit gains a very pleasant bitter taste, which remains uninjured in the extract.

The virtues of this plant seem to be little known in the present practice. The nauseous decoction is sometimes used to provoke vomiting, and a strong infusion to promote the operation of other emetics. But this elegant bitter, when freed from the offensive parts of the herb, may be advantageously applied to other purposes. Excellent effects have frequently been experienced from an infusion of this plant, in loss of appetite, where the stomach was injured by irregularities. A stronger infusion made in cold or warm water, if drank freely, and the patient kept warm, occasions a plentiful sweat, and promotes all the secretions in general.

The seeds of this plant are also considerably bitter, and have been sometimes used with the same intentions as the leaves.

ORDER IV. POLYGAMIA NECESSARIA.

985. MILLERIA.

Two species; viz. *quinqueflora*, *biflora*. Panama, Vera Cruz.

1323. BALTIMORA.

One species; viz. *recta*. Maryland, Virginia.

986. SILPHIUM, or *Base Chrysanthemum*.

Eight species; viz. *laciniatum*, *terebinthaceum*, *perfoliatum*, *connatum*, *asteriscus*, *solidaginoides*, *trifoliatum*, *trilobatum*. N. America.

987. POLYMNIA, or *Dwarf Sun-flower*.

Seven species; viz. *canadensis*, *carnosa*, *uedalia*, *tetragonotheca*, *abyssinica*, *spinosa*, *wodelia*. Africa, Canada, Virginia.

988. CHRYSOGONUM.

One species; viz. *virginianum*. Virginia.

989. MELAMPODIUM.

Two species; viz. *americanum*, *australe*. Jamaica, St Domingo, S. America.

990. CALENDULA, or *Marygold*.

Nine species; viz. *arvensis*, *sancta*, *officinalis*, *pluvialis*, *hybrida*, *nudicaulis*, *graminifolia*, *fruticosa*, *tomentosa*. Europe, Cape.

arvensis. * C. seeds boat-shaped, prickly, turned inwards; the innermost crowded together, the outermost upright, furnished with a tail.—This is a very common plant in the corn fields, and in the vineyards in Portugal; and is used as food for milch cows. It is found in England near Falmouth, to which place it has probably been imported from Portugal, in consequence of the frequent communication by the packets and otherwise. The milk yielded by the cows which are fed upon it is very good.

The herb of the *calendula officinalis* is common in gardens, where it is found in flower greatest part of the summer. Marygold flowers are supposed to be aperient and attenuating, and also cardiac, alexipharmac, and sudorific; they have been principally celebrated in uterine obstructions, in the jaundice, and for throwing out the smallpox. Their sensible qualities give little foundation for these virtues; they have scarce-

ly any taste and no considerable smell. The leaves of the plant discover a viscid sweetishness, accompanied with a more durable saponaceous pungency and warmth: these seem capable of answering some useful purposes as a stimulating and aperient medicine; but at present they are so little employed in Britain, that they have now no place in our pharmacopoeias, and they are also rejected from several of the latest and best foreign ones.

991. ARCTOTIS.

12 species; viz. *calendulacea*, *hypochondriaca*, *tristis*, *coruscans*, *superba*, *serrata*, *tenuifolia*, *plantaginea*, *angustifolia*, *aspera*, *paradoxa*, *dentata*, *anthemoides*, *tenuifolia*, *acaulis*. Cape, Carolina.

992. OSTEOSPERMUM, or *Hard-seeded Chrysanthemum*.

15 species; viz. *spinosum*, *pisiferum*, *moniliferum*, *ilicifolium*, *ciliatum*, *junceum*, *triquetrum*, *corymbosa*, *imbricatum*, *herbaceum*, *niveum*, *perfoliata*, *polygaloides*, *calendulaceum*, *arctotoides*. Cape, E. Indies.

993. OTHONNA, or *African Rag-wort*.

26 species; viz. *bulbosa*, *tagetes*, *trifida*, *pectinata*, *abrotanifolia*, *athanasiæ*, *ciliata*, *pinnata*, *trifurcata*, *munita*, *coronopifolia*, *cheirifolia*, *crassifolia*, *parviflora*, *tenuissima*, *linifolia*, *digitata*, *lingua*, *lateriflora*, *heterophylla*, *acalioides*, *ericoides*, *capillaris*, *virginea*, *frutescens*, *arborescens*. Africa.

1324. HIPPIA, or *Shrubby Tansy*.

Three species; viz. *integrifolia*, *minuta*, *frutescens*. Cape, E. Indies, America.

994. ERIOCEPHALUS.

Two species; viz. *africanus*, *racemosus*. C. of G. Hope.

995. FILAGO, or *Cotton*, or *Cud-weed*.

Seven species; viz. *acaulis*, * *germanica*, *pyramidata*, * *montana*, * *gallica*, *arvensis*, *leontopodium*. Europe.

996. MICROPUS, or *Base Cud-weed*.

Two species; viz. *supinus*, *erectus*. Spain, Portugal, Italy, Levant.

ORDER V. POLYGAMIA SEGREGATA.

997. ELEPHANTOPUS, or *Elephants-foot*.

Two species; viz. *scaber*, *tomentosus*. E. and W. Indies.

1325. OEDERA.

Two species; viz. *prolifera*, *aliena*. C. of G. Hope.

998. SPHERANTHUS, or *Globe-flower*.

Three species; viz. *indicus*, *africanus*, *chinensis*. E. Indies, China.

999. ECHINOPS, or *Globe-thistle*.

Four species; viz. *sphærocephalus*, *spinosus*, *ritro*, *strigosus*. Siberia, Austria, France, Spain, Italy.

1000. GUNDELIA.

One species; viz. *tournefortii*. Syria, Aleppo, Amer.

1422. JUNGIA.

One species; viz. *ferruginea*. S. America.

1001. STOEBE, or *Base Ethiopian Elychrisium*.

Nine species; viz. *æthiopica*, *ericoides*, *prostrata*, *guaphaloides*,

gnaphaloides, gomphrenoides, scabra, reflexa, rhinocerotis, disticha. C. of G. Hope.

ORDER VI. MONOGAMIA.

1002. STRUMPFIA.

One species; viz. *maritima*. America.

1003. SERIPHIMUM.

Four species; viz. *cinereum*, *plumosum*, *fuscum*, *ambiguum*. C. of G. Hope.

1004. CORYMBIUM.

Four species; viz. *scabrum*, *glabrum*, *filiforme*, *villosum*. C. of G. Hope.

1005. JASIONE, or *Sheep's Scabious*.

Two species; viz. * *montana*, *perennis*. Eur. Cape.

1006. LOBELIA, or *Cardinal-flower*.

42 species; viz. *simplex*, *pinifolia*, * *dortmanna*, *tupa*, *anceps*, *kalmii*, *paniculata*, *grandis*, *cornuta*, *phyteuma*, *columnæ*, *bellidiflora*, *bulbosa*, *triquetra*, *longiflora*, *tomentosa*, *secunda*, *patula*, *assurgens*, *cardinalis*, *lævigata*, *ferruginea*, *debilis*, *siphilitica*, *surinamensis*, *inflata*, *cliffortiana*, *urens*, *minuta*, *volubilis*, *bulbosa*, *laurentia*, *erinus*, *erinoides*, *zeylanica*, *lutea*, *hirsuta*, *coronopifolia*, *comosa*, *tenella*, *depressa*. Cape, E. and W. Indies, America.

The *lobelia siphilitica* grows in moist places in Virginia, and bears our winters. It is perennial, has an erect stalk three or four feet high, blue flowers, a milky juice, and a rank smell. The root consists of white fibres about two inches long; resembles tobacco in taste, which remains on the tongue, and is apt to excite vomiting. It is used by the North American Indians as a specific in the venereal disease. The form is that of decoction; the dose of which is ordered to be gradually increased, till it bring on very considerable purgings, then to be intermitted for a little, and again used in a more moderate degree till the cure be completed. The ulcers are also washed with the decoction, and the Indians are said to sprinkle them with

the powder of the inner bark of the spruce tree. The same strictness of regimen is ordered as during a salivation or mercurial course. The benefit to be derived from this article, has not, as far as we know, been confirmed either in Britain or by the practitioners in Virginia; for there, as well as in this country, recourse is almost universally had to the use of mercury; and it is probably from this reason that the London college have not received it into their list. It, however, seems to be an article, which, in some cases at least, deserves a trial.

1007. VIOLA, or *Violet*.

28 species; viz. *palmata*, *pedata*, *pinnata*, *lanceolata*, *primulifolia*, * *hirta*, * *palustris*, * *odorata*, * *canina*, *montana*, *cenisia*, *canadensis*, *mirabilis*, *biflora*, *uniflora*, *decumbens*, * *tricolor*, * *grandiflora*, *calcarata*, *cornuta*, *arborescens*, *snæcasperma*, *suffruticosa*, *calceolaria*, *oppositifolia*, *hybanthus*, *ipecacuanha*, *diantra*. Alps, Pyrenees, Cape, America.

The *viola odorata* is often found wild in hedges and shady places, and flowers in March: the shops are generally supplied from gardens. In our markets we meet with the flowers of different species; these may be distinguished from the others by their being large, of a pale yellow colour, and of no smell. The officinal flowers have a very pleasant smell, and a deep purplish blue colour, denominated from them *violet*. They impart their colour and flavour to aqueous liquors: A syrup made from this infusion has long maintained a place in the shops, and proves an agreeable and useful laxative for children.

1008. IMPATIENS, or *Balsam, Balsamine*.

Seven species; viz. *chinensis*, *latifolia*, *oppositifolia*, *cornuta*, *balsamina*, *triflora*, *noli-tangere*. Europe, N. America, E. Indies, China.

In the class *Syngenesia* are

115 Genera, including 1252 Species, of which 113 are found in Britain.

CLASSIS XX.

GYNANDRIA (κ).

ORDO I. DIANDRIA.

- * 1009. ORCHIS. *Nectarium corniculatum*.
- * 1010. SATYRIUM. *Nect. scrotiforme*.
- * 1011. OPHRYS. *Nect. subcarinatum*.

CLASS XX.

GYNANDRIA.

ORDER I. DIANDRIA.

- * O. Nectary horned.
- * S. Nect. purse-shaped.
- * O. Nect. nearly keel-shaped:

* 1012:

(κ) This class is distinguished from the others by the situation of the stamens (male parts of the flower) upon the pistils (female parts). The stamens are either placed upon the style itself, or upon the receptacle, which in that case is lengthened into the appearance of the style which supports the pistil with the stamens, and forms a part of the pistil. The orders are determined by the number of stamens.

- * 1012. SERAPIAS. Nect. ovatum, subtus gibbum.
 1013. LIMODORUM. Nect. pedicellatum.
 * 1015. CYPRIPIEDUM. Nect. inflato-ventricosum.
 1016. EPIDENDRUM. Nect. turbinatum.
 1014. ARETHUSA. Nect. connatum, cum corolla ringente.
 1272. GUNNERA. Digyna. Amenti cal. o. Cor. o. Sem. 1.
 1423. DISA. Spatha 1-valvis. Petala 3; tertium minus, bipartitum, basi gibbosum.
 1424. FORSTERA. Cal. duplex; exterior inferos, 3-phyllus; interior superus, 6-fidus. Cor. tubulosa.

ORDO II. TRIANDRIA.

1017. SISYRINCHIUM. Monogyna. Cal. o. Cor. 6-petala, plana. Stigmata 3. Caps. 3-locularis, infera.
 1018. FERRARIA. Monogyna. Cal. o. Cor. 6-petala, crispa. Stigma cucullatum. Caps. 3-locularis, infera.
 1326. SALACIA. Monogyna. Cal. 5-partitus. Cor. 5-petala. Antheræ germini insidentes.
 1273. STILAGO. Monogyna. Cal. 1-phyllus. Cor. o. Bacca.

ORDO III. TETRANDRIA.

1019. NEPENTHES. Monogyna. Cal. 4-partitus. Cor. nulla. Caps. 4-locularis.

ORDO IV. PENTANDRIA.

1327. GLUTA. Monogyna. Cal. 1-phyllus. Cor. 5-petala. Germen columnæ, corollæ adglutinatæ, insidens.
 1020. AYENIA. Monogyna. Cal. 5-phyllus. Cor. 5-petala. Caps. 5-cocca.
 1021. PASSIFLORA. Trigyna. Cal. 5-partitus. Cor. 5-petala. Bacca pedicellata.

ORDO V. HEXANDRIA.

- * 1022. ARISTOLOCHIA. Hexagyna. Cal. nullus. Cor. 1-petala. Caps. 6-locularis.
Cui similis, Cleome.

ORDO VI. OCTANDRIA.

1425. SCOPOLIA. Cal. 2-phyllus, multiflorus. Cor. 4-fida. Antheræ connatæ in duplici columna.

ORDO VII. DECANDRIA.

1024. KLEINHOVIA. Monogyna. Cal. 5-phyllus. Cor. 5-petala. Nectarium staminiferum. Caps. 5-cocca.
 1025. HELICTERIS. Monogyna. Cal. 1-phyllus. Cor. 5-petala. Caps. 5, 1-loculares, polyspermæ.

ORDO VIII. DODECANDRIA.

1232. CYTINUS. Monogynus. Cal. 4-fidus. Cor. o. Bacca 8-locularis.

- * S. Nect. oval, bulged beneath.
 L. Nect. on a pedicle.
 * C. Nect. inflate-bellied.
 E. Nect. tarban-shaped.
 A. Nect. united at the base, with a gaping cor.

- G. Two pistils. Catkin no cal. No cor. One seed.
 D. Sheath 1-valved. Three petals; the third less, bipartite, bulged at the base.
 F. Cal. double, the outer inferior, 3-leaved; the inner superior, 9-cleft. Cor. tubular.

ORDER II. TRIANDRIA.

- S. No cal. Cor. 6-petaled, flat. Stigmas 3. Caps. 3-celled, inferior.
 F. One pistil. No cal. Cor. 6-petaled, crisp. Stigm. cone-shaped. Caps. 5-celled, inferior.

- S. One pistil. Cal. 5-parted. Cor. 5-petaled. Anthers sitting on the germen.
 S. One pistil. Cal. 1-leaved. No cor. Berry.

ORDER III. TETRANDRIA.

- N. One pistil. Cal. 4-parted. No cor. Caps. 4-celled.

ORDER IV. PENTANDRIA.

- G. One pist. Cal. 1-leaved. Cor. 5-petaled. Germ. fixed to a pillar attached to the cor.

- A. One pist. Cal. 5-leaved. Cor. 5-pet. Caps. 5-celled.
 P. Three pist. Cal. 5-parted. Cor. 5-petaled. Berry pedicled.

ORDER V. HEXANDRIA.

- * A. Six pist. No cal. Cor. 1-petaled. Caps. 6-celled.

ORDER VI. OCTANDRIA.

- S. Cal. 2-leaved, many-flowered. Cor. 4-cleft. Anthers united in a double pillar.

ORDER VII. DECANDRIA.

- K. One pist. Cal. 5-leaved. Cor. 5-petaled. Nect. bearing the stamens. Caps. 5-celled.

- H. One pist. Cal. 1-leaved. Cor. 5-petaled. Five caps. 1-celled, many-seeded.

ORDER VIII. DODECANDRIA.

- C. One pist. Cal. 4-cleft. No cor. Berry 8-celled.

ORDO

ORDO IX. POLYANDRIA.

1027. XYLOPIA. Monogyna. Cal. 1-phyllus. Cor. 6-petala. Drupa sicca.
 1026. GREWIA. Monogyna. Cal. 5-phyllus. Cor. 5-petala. Bacca locularis.
 1031. POTHOS. Spatha. Cal. nullus. Cor. 4-petala. Bacca 1-sperma.
 1029. DRACONTIUM. Spatha. Cal. nullus. Cor. 5-petala. Bacca polysperma.
 1030. CALLA. Spatha. Cal. nullus. Cor. nulla. Stam. mixta pistillis.
 * 1028. ARUM. Spatha. Cal. nullus. Cor. nulla. Stam. supra pistilla.
 1238. AMBROSINIA. Spatha. Cal. nullus. Cor. nulla. Stamina alterius lateris dissepimenti.
 * 1032. ZOSTERA. Folium. Cal. nullus. Cor. nulla. Sem. alterna, nuda.

ORDER IX. POLYANDRIA.

- X. One pist. Cal. 1-leaved. Cor. 6-petaled. Drupe dry.
 G. One pist. Cal. 5-leaved. Cor. 5-petaled. Berry celled.
 P. Sheath. No cal. Cor. 4-petaled. Berry 1-seeded.
 D. Sheath. No cal. Cor. 5-petaled. Berry many seeded.
 C. Sheath. No cal. No cor. Stam. mixed with pistils.
 * A. Sheath. No cal. No cor. Stam. above the pistils.
 A. Sheath. No cal. No cor. Stam. on one side of a division.
 * Z. A leaf. No cal. No cor. Alternate seeds, naked.

ORDER I. DIANDRIA.

1009. ORCHIS, *Orch* or *Butterfly Flower*.

50 species; viz. bicornis, biflora, cornuta, spathulata, flexuosa, tripetaloides, sagittalis, barbata, draconis, tenella, sancta, susannæ, ciliaris, habenaria, * bifolia, ornithis, flexuosa, cucullata, globosa, * pyramidalis, coriophora, cubitalis, * morio, mascula, * ustulata, * militaris, fusca, moravica, papilionacea, rubra, pallens, hispidula, speciosa, * latifolia, incarnata, sambucina, maculata, odoratissima, * conopsea, flava, frutescens, strateumatica, hyperborea, * abortiva, psychodes, spectabilis, flicornis, tipuloides, japonica, falcata. Europe, Cape, Asia, W. Indies.

mascula.

* O. lip of the nectary 4-lobed, finely scalloped; horn blunt; upper petals turned back.—This species is called *satyrium*, or *early orchis*. It is frequent in shady places and moist meadows. Each plant has two oval roots of a whitish colour, a viscid sweetish taste, and a faint unpleasant smell. They abound with a glutinous slimy juice. With regard to their virtues, like other mucilaginous vegetables, they defend the solids against acrimonious humours: they have also been celebrated, though on no good foundation, for analeptic and aphrodisiac virtues, and frequently made use of with these intentions. Salep, a celebrated restorative among the Turks, is the prepared root of plants of this genus. It has been successfully imitated by means of the roots of this species. Mr Moulton, in a letter to Dr Percival, describes his method of making salep. He observes, that the best time to gather the roots, is when the seed is formed and the stalk going to fall, for then the new bulb, of which salep is made, is arrived at its full size. The new roots being separated from the stalk, are to be washed in water, and the outer thin skin taken off. They are then to be set on a tin-plate in an oven, heated to the degree of a bread oven. In six, eight, or ten minutes, they will have acquired a transparency like horn, without being diminished in size. They are then to be removed into another room to dry and

Phil. Trans.
vol. v.

harden, which will be done in a few days; or they may be finished in a very slow heat in a few hours. Salep, thus prepared, may be sold for less than a shilling a pound, and affords a mild nutriment, which in times of scarcity, in cases of dysentery and strangury, and on shipboard, may be extremely useful. The salep, hitherto imported from Turkey, may thus be prepared at home. The plants must be propagated by the roots, as the seeds seldom come to perfection.

1010. SATYRIUM, or *Lizard-flower*.

15 species; viz. bircinum, tabulare, triste, giganteum, aculeatum, viride, nigrum, albidum, epigonium, plantagineum, repens, capense, hians, orobanchoides, pedicellatum. Europe, Cape, America.

1011. OPHRYS, *Twy*, or *Tway-blade*.

28 species; viz. * nidus avis, * coralorhiza, * spiralis, cernua, ovata, * cordata, lilifolia, * loeselii, paludosa, monophyllos, alata, myodes, arachnides, * monorchis, alpina, camtschatea, * authropophora, crucigera, volucris, bracteata, atrata, catholica, circumflexa, caffra, bivalvata, alaris, patens, nervosa. Alps. N. America, Cape.

1012. SERAPIAS, or *Helleborine*.

11 species; viz. * ensifolia, * grandiflora, * lancifolia, * latifolia, * longifolia, * rubra, lingua, cordigera, capensis, erecta, falcata. S. Europe, Cape, W. Indies.

1013. LIMODORUM, or *Base Hellebore*.

Three species; viz. tuberosum, altum, striatum.

1014. ARETHUSA.

Seven species; viz. bulbosa, ophioglossoides, divaricata, capensis, villosa, ciliaris, biplumata. Cape, N. America.

1423. DISA.

Four species; viz. grandiflora, racemosa, longicornu, maculata. C. of G. Hope.

1016. EPIDENDRUM, or *Vanilloe*.

32 species; viz. vanilla, flos æris, tenuifolium, spatulatum,
K k 2

tulatum, furvum, coccineum, secundum, lineare, punctatum, caudatum, ovatum, ciliare, nocturnum, cucullatum, teres, nodosum, carinatum, aloifolium, guttatum, juncifolium, scriptum, retusum, amabile, cochleatum, tuberosum, pusillum, ensifolium, moniliforme, ophioglossoides, ruscifolium, graminifolium, capense. E. and W. Indies, China, Japan.

1015. *CYPRIPEDIUM*, or *Lady's Slipper*.

Three species; viz. *calceolus, bulbosum, japonicum. Europe, Asia, Japan, America.

1424. *FORSTERA*.

One species; viz. *sedifolia*. New Zealand.

1272. *GUNNERA*.

One species; viz. *perpensa*. Cape, straits of Magellan.

ORDER II. TRIANDRIA.

1017. *SISYRINCHIUM*, or *Bermudiana*.

Two species; viz. *bermudiana*, *palmifolium*. Bermudas, West Indies.

1018. *FERRARIA*.

Two species; viz. *undulata*, *pavonia*. Cape, Mexico.

1326. *SALACIA*.

One species; viz. *chinensis*. China.

1273. *STILAGO*.

One species; viz. *bunius*.

ORDER III. TETRANDRIA.

1010. *NEPENTHES*.

One species; viz. *distillatoria*. Ceylon.

ORDER IV. PENTANDRIA.

1020. *AYENIA*.

Three species; viz. *pusilla*, *tomentosa*, *magna*. Jamaica, Cumana, Peru.

1327. *GLUTA*.

One species; viz. *benghas*. Java.

1021. *PASSIFLORA*.

28 species; viz. *serratifolia*, *pallida*, *cuprea*, *tilsefolia*, *maliformis*, *quadrangularis*, *laurifolia*, *multiflora*, *adulterina*, *perfoliata*, *rubra*, *normalis*, *murucuja*, *vespertilio*, *capsularis*, *rotundifolia*, *punctata*, *lutea*, *minima*, *suberosa*, *holosericea*, *hirsuta*, *fetida*, *incarnata*, *mixta*, *cœrulia*, *serrata*, *pedata*. West Indies, South America.

ORDER V. HEXANDRIA.

1022. *ARISTOLOCHIA*, or *Birthwort*.

32 species; viz. **clematitis*, *bilobata*, *trilobata*, *pentandra*, *peltata*, *maxima*, *bilabiata*, *erecta*, *arborescens*, *caudata*, *odoratissima*, *anguicida*, *maurorum*, *indica*, *bœtica*, *sempervirens*, *serpentaria*, *pistlochchia*, *rotunda*, *longa*, *hirsuta*, *clematitis*. South Europe, America.

1023. *PISTIA*, or *Water House-leek*.

One species; viz. *stratiotes*. Asia, Africa, South America.

ORDER VI. OCTANDRIA.

1425. *SCOPOLIA*.

One species; viz. *composita*. South sea isles.

ORDER VII. DECANDRIA.

1024. *KLEINHOVIA*.

One species; viz. *hospita*. E. Indies.

1025. *HELICTERES*, or *Screw-tree*.

Six species; viz. *barvensis*, *isora*, *angustifolia*, *pentandra*, *carthaginensis*, *apetala*. Malabar, China, Jam.

ORDER VIII. DODECANDRIA.

1232. *CYTINUS*.

One species; viz. *hypocistis*. Spain, Italy.

ORDER IX. POLYANDRIA.

1027. *XYLOPIA*, or *Bitter-wood*.

Two species; viz. *muricata*, *glabra*. America.

1026. *GREWIA*.

Six species; viz. *occidentalis*, *orientalis*, *asiatica*, *malococca*, *salvifolia*, *microcos*. Asia, Cape, America, South seas.

1228. *AMBROSINIA*.

One species; viz. *bassii*. Palermo, Turkey.

1028. *ARUM*, or *Wake-robin*, *Dragon*.

25 species; viz. **maculatum*, *draconculus*, *dracontium*, *pentaphyllum*, *triphyllum*, *ternatum*, *colocasia*, *esculentum*, *macrorrhizon*, *peregrinum*, *divaricatum*, *trilobatum*, *sagittæfolium*, *virginicum*, *proboscideum*, *arisarum*, *pictum*, *ovatum*, *tenuifolium*, *cannæfolium*, *muscivorum*, *arborescens*, *hederaceum*, *lingulatum*, *auritum*. S. Europe, E. Indies, America.

* *A.* leaves halberd-shaped, very entire; spike-stalk club-shaped.—This root grows wild under hedges, and by the sides of banks, in most parts of England. It sends forth in March three or four triangular leaves, which are followed by a naked stalk, bearing a purplish pistil, enclosed in a long sheath: this is succeeded in July by a bunch of reddish berries. In some plants the leaves are spotted with black, in others with white spots, and in others not spotted at all: the black spotted sort is supposed to be the most efficacious in medicine. All the parts of the *arum maculatum*, particularly the root, have an extremely pungent acrimonious taste; if the root be but slightly chewed, it continues to burn the tongue for some hours, occasioning at the same time a considerable thirst: these symptoms are alleviated by butter milk and oily liquors. Dried and kept some time, it loses much of its acrimony, and becomes at length an almost insipid farinaceous substance. The root is a powerful stimulant and attenuant. It is reckoned a medicine of great efficacy in some cachectic and chlorotic cases, in weakness of the stomach occasioned by a load of phlegm. Great benefit is said to have

have been obtained from it in deeply seated rheumatic pains. In these cases it may be given from 10 grains to a scruple of the fresh root, twice or thrice a-day, made into a bolus or emulsion, with unctuous or mucilaginous substances, which cover its pungency, and prevent its making any painful impression on the tongue. Neither wine nor spirits extract its virtues. The root, dried and powdered, is used by the French to wash the skin, and is sold at a high price under the name of *cypress powder*. It is undoubtedly a good and an innocent cosmetic. Starch may be made from the roots.

1029. DRACONTIUM, or *Dragons*.

Five species; viz. polyphyllum, spinosum, foetidum, oamscatcense, pertusum. Ceylon, W. Indies, America.

1030. CALLA, or *Ethiopian Arum*.

Two species; viz. aethiopica, palustris. Europe, Cape.

1031. POTHOS, or *Scuak-weed*.

Seven species; viz. scandens, acaulis, lanceolata, crenata, cordata, pinnata, palmata. India, America.

1032. ZOSTERA, or *Grass-wrack*.

Two species; viz. * marina, * oceanica.
* Z. seed-vessels sitting, stems much branched; leaves *marina*. floating, long, grass-like, blunt from leaf-scales.—It is thrown on the sea-shore by the tide in great plenty, and mounds or walls are built with it to resist the encroachment of the sea. Exposure to the weather bleaches it white. Buildings are thatched with the green leaves, and it will endure upwards of a century. It is used by the inhabitants of Gothland in Sweden as a manure, and also for stuffing beds, in preference to hay, as being softer. Horses and swine eat it. Cows are not fond of it.

In the class *Gynandria* are

32 Genera, including 270 Species, of which 28 are found in Britain.

CLASSIS XXI.

MONŒCIA (L).

ORDO I. MONANDRIA.

- * 1203. CHARA. (1) Cal. nulla. Cor. nulla. (2) Cal. 4-phyllus. Cor. o. Stigma 3-fidum. Sem. 1.
- * 1034. ZANNICHELLIA. (1) Cal. o. Cor. o. (2) Cal. 1-phyll. Cor. o. Pist. 4. Sem. 4.
- 1035. CERATOCARPUS. (1) Cal. 2-partitus. Cor. o. (2) Cal. 2-phyllus. Cor. o. Styl. 2. Sem. 1. inferum.
- 1426. ARTOCARPUS. (1) Cal. bivalvis. Cor. o. (2) Cal. o. Cor. o. Styl. 1. Drupa multilocularis.
- NIPA. (1) Spatha. Cor. 6-petala. (2) Spatha. Cor. o. Drupæ angulatæ.
- 1036. ELATERIUM. (1) Cal. o. Cor. hypocrateriform. (2) Cal. o. Cor. hypocrateriform. Caps. infera, pulposa, 1-locularis, polysperma.
- 1033. CYNOMORIUM. (1) Cal. amenti. Cor. o. (2) Cal. amenti. Cor. o. Styl. 1. Sem. 1, subrotundum.
- 1427. PHYLLACHNE. (1) Cal. 3-phyllus superus. Cor. infundibuliformis. (2) Cal. 3-phyllus, superus. Cor. infundibuliformis. Styl. 1. Stigma tetragonum. Caps. infera, polysperma.
- 1428. CASUARINA. (1) Cal. amenti. Cor. squamulæ bipartitæ. (2) Cal. amenti. Cor. o. Styl. bifidus. Strobilus.

CLASS XXI.

MONŒCIA.

ORDER I. MONANDRIA.

- * C. (1) No cal. No cor. (2) Cal. 4-leaved. No cor. Stigm. 3-cleft. Seed 1.
- * Z. (1) No cal. No cor. (2) Cal. 1-leaved. No cor. Pist. 4. Seeds 4.
- C. (1) Cal. 2-parted. No cor. (2) Cal. 2-leaved. No cor. Styl. 2. Seed 1, inferior.
- A. (1) Cal. 2-valved. No cor. (2) No cal. No cor. Styl. 1. Drupe many-celled.
- N. (1) Sheath. Cor. 6-petaled. (2) Sheath. No cor. Angular drupes.
- E. (1) No cal. Cor. salver-shaped. (2) No cal. Cor. salver-shaped. Caps. inferior, pulpy, 1-celled, many-seeded.
- C. (1) Cal. catkin. No cor. (2) Cal. catkin. No cor. Styl. 1. Seed 1, roundish.
- P. (1) Cal. 3-leaved, superior. Cor. funnel-shaped. (2) Cal. 3-leaved, superior. Cor. funnel-shaped. Styl. 1. Stigm. 4-gon. Caps. inferior, many-seeded.
- C. (1) Cal. catkin. Cor. scales 2-parted. (2) Cal. catkin. No cor. Styl. 2-cleft. A cone.

1429.

(L) In this class the stamens and pistils are found in different flowers on the same plant. The flowers that have stamens, but want pistils, are, according to the principles of Linnæus's sexual system, which we have adopted, called *male flowers*; whereas the flowers that have pistils, but want stamens, are styled *female flowers*. In the following account of the genera the definition of the male flowers is marked (1), and that of the female flowers (2).

1429. *ÆGOPRICON*. (1) Cal. 3-fidus. Cor. o. (2) Flores solitarii. Cal. ut in mare. Cor. o. Stylis tres. Bacca 3-cocca.

Æ. (1) Cal. 3-cleft. No cor. (2) Flowers solitary. Cal. as in the male. No cor. Styl. 3. Berry 3-celled.

ORDO II. DIANDRIA.

1037. *AUGURIA*. (1) Cal. 5-fidus. Cor. 5-petala. (2) Cal. 5-fidus. Cor. 5-petala. Pomum biloculare, polyspermum.
* 1038. *LEMNA*. (1) Cal. 1-phyllus. Cor. o. (2) Cal. 1-phyllus. Cor. o. Styl. 1. Caps. 1-locularis.

Gunnera.

ORDER II. DIANDRIA.

A. (1) Cal. 5-cleft. Cor. 5-petaled. (2) Cal. 5-cleft. Cor. 5-petaled. Apple 2-celled, many-seeded.
* L. (1) Cal. 1-leaved. No cor. (2) Cal. 1-leaved. No cor. Style 1. Caps. 1-celled.

ORDO III. TRIANDRIA.

1042. *ZEA*. (1) Glum. 2-flora, 2-valvis. (2) Glum. 1-flora, 2-valvis. Styl. 1. Sem. 1, nudum, subrotundum.

1044. *TRIPSACUM*. (1) Glum. 4-flora, 2-valvis. (2) Glum. 2 s. 4-part. 2-valvis. Styl. 2. Sem. 1. Gluma sinu perforata.

1043. *COIX*. (1) Glum. 2-flora, 2-valvis. (2) Glum. biflora, 2-valvis. Styl. 2-fid. Sem. 1, tectum nucæ.

1045. *OLYRA*. (1) Glum. 1-flora, 2-valvis. (2) Gl. 1-flora, 2-valvis. Styl. 2-fid. Sem. 1, nudum.

* 1046. *CAREX*. (1) Ament. 1-florum. Cor. nulla. (2) Ament. 1-florum. Cor. 1. Styl. 1. Sem. 1, tunicatum.

* 1041. *SPARGANIUM*. (1) Cal. 3-phyllus. Cor. o. (2) Cal. 3-phyllus. Cor. o. Stigm. 2. Sem. 1-sperma.

* 1040. *TYPHA*. (1). Cal. 3-phyllus. Cor. nulla. (2) Cal. capillaris. Cor. o. Styl. 1. Sem. 1, papigerum.

1047. *AXYRIS*. (1) Cal. 3-partitus. Cor. o. (2) Cal. 2-phyllus. Cor. o. Styl. 2. Sem. 1, subrotundum.

1050. *PHYLLANTHUS*. (1) Cal. 6-partitus. Cor. o. (2) Cal. 6-partitus. Cor. o. Styl. 3. Caps. 3-cocca.

1048. *TRAGIA*. (1) Cal. 3-partitus. Cor. o. (2) Cal. 5-partitus. Cor. o. Styl. 3-fid. Caps. 3-cocca.

1049. *HERNANDIA*. (1) Cal. 3-partitus. Cor. 3-petala. (2) Cal. truncatus. Cor. 6-petala. Drupa excavata.

1039. *OMPHALEA*. (1) Cal. 4-phyllus. Cor. o. Anth. immersæ receptaculo. (2) Cal. 4-partitus. Cor. o. Stigm. 3-fid. Caps. 3-locul. 1-sperma.

Elate. Amaranthi varii.

ORDO IV. TETRANDRIA.

* 1054. *URTICA*. (1) Cal. 4-phyllus. Cor. o. Nect. cyathiforme. (2) Cal. 2-valvis. Cor. o. Stigm. villos. Sem. 1, ovatum.

* 1053. *BUXUS*. (1) Cal. 3-phyllus. Cor. 2-petala. (2) Cal. 4-phyllus. Cor. 3-pet. Stigm. 3. Caps. 3-locularis.

ORDER III. TRIANDRIA.

Z. (1) Glume or husk 2-flowered, 2-valved. (2) Husk 1-flowered, 2-valved. Style 1. Seed 1, naked, roundish.

T. (1) Husk 4-flowered, 2-valved. (2) Husk 2 or 4-parted, 2-valved. Styles 2. Seed 1. Husk perforated.

C. (1) Glume 2-flowered, 2-valved. (2) Glume 2-flowered, 2-valved. Style 2-cleft. Seed 1, covered with a nut.

O. (1) Glumes 1-flowered, 2-valved. (2) Glumes 1-flowered, 2-valved. Style 2-cleft. Seed 1, naked.

* C. (1) Catkin 1-flowered. No cor. (2) Catkin 1-flowered. Cor. 1. Style 1. Seed 1, coated.

* S. (1) Cal. 3-leaved. No cor. (2) Cal. 3-leaved. No cor. Stigm. 2. Seed 1.

* T. (1) Cal. 3-leaved. No cor. (2) Cal. hair-like. No cor. Seed 1, downy.

A. (1) Cal. 3-parted. No cor. (2) Cal. 2-leaved. No cor. Styles 2. Seed 1, roundish.

P. (1) Cal. 6-parted. No cor. (2) Cal. 6-parted. No cor. Styles 3. Caps. 3-celled.

T. (1) Cal. 3-parted. No cor. (2) Cal. 5-parted. No cor. Style 3-cleft. Caps. 3-celled.

H. (1) Cal. 3-parted. Cor. 3-petaled. (2) Cal. lopped. Cor. 6-petaled. Drupe hollow.

O. (1) Cal. 4-leaved. No cor. Anth. sunk in the receptacle. (2) Cal. 4-parted. No cor. Stigm. 3-cleft. Caps. 3-celled, 1-seeded.

ORDER IV. TETRANDRIA.

* U. (1) Cal. 4-leaved. No cor. Nect. glass-shaped. (2) Cal. 2-valved. No cor. Stigm. woolly. One oval seed.

* B. (1) Cal. 3-leaved. Cor. 2-petaled. (2) Cal. 4-leaved. Cor. 3-pet. Stigm. 3. Caps. 3-celled.

* 1052.

* 1052. *BETULA*. (1) Ament. 5-florum. Cor. 4-partita. (2) Ament. 2-florum. Cor. o. Styl. 2. Sem. 1, ovatum.

1051. *CENPELLA*. (1) Involucr. 4-phyllum, multiflorum. Petal. 4. (2) Involucr. 2-phyllum. Styl. 2. Pericarp. inferum, 2-loculare.

1274. *SERPICULA*. (1) Cal. 4-dentatus. Cor. 4-petala. (2) Cal. 4-phyllus. Cor. Nux torulosa.

AUCUBA. (1) Cal. 4-dentatus. Cor. 4-petala. (2) Nect. o. Nux 1-locularis.

* 1328. *LITTORELLA*. (1) Cal. 4-phyllus. Cor. 4-fida. Stam. longissima. (2) Cal. o. Cor. 4-fida. Stylus longissimus. Sem. nux.

1275. *COCCA*. (1) Cal. 4-phyllus. Cor. nulla. (2) Cal. 4-phyllus. Cor. o. Styl. 4-fid. Caps. 4-coeca.

Plantago uniflora.

ORDO V. PENTANDRIA.

1277. *NEPHELIUM*. (1) Cal. 5-dentatus. Cor. o. Anth. bifidæ. (2) Cal. 4-dentatus. Cor. o. Styl. 2, inter germina.

* 1056. *XANTHIUM*. (1) Cal. comm. polyph. Cor. 5-fida. Filam. connexa. (2) Cal. o. Cor. o. Styl. 2. Drupa 2-locularis.

1057. *AMBROSIA*. (1) Cal. comm. 1-phyll. Cor. 5-fida. (2) Cal. 1-flor. 2-phyll. Cor. o. Styl. 1. Nux 5-dentata.

1058. *PARTHENIUM*. (1) Cal. comm. 5-phyll. Cor. disci super. (2) Cal. idem mari. Cor. radii ligulat. Styl. 1. Sem. 1.

1326. *CLIBADIUM*. (1) Cal. comm. imbricatus. Cor. disci 5-fidæ. (2) Cal. idem mari. Cor. radii 5-fidæ. Drupæ umbilicatæ.

1059. *IVA*. (1) Cal. comm. 5-phyll. Cor. disci super. (2) Cal. idem mari. Cor. radii o. Styl. 2. Sem. 1.

* 1060. *AMARANTHUS*. (1) Cal. propr. 5-phyll. Cor. o. Stam. 3 s. 5. (2) Cal. propr. 5-phyll. Cor. o. Styl. 3. Caps. circumscissa.

1276. *LEEA*. (1) Cal. 5-fidus. Cor. 5-fida. (2) Cal. 5-fidus. Cor. 5-fida. Styl. 1. Peric. 6-loculare. Sem. solitaria.

Diosma.

ORDO VI. HEXANDRIA.

1062. *ZIZANIA*. (1) Cal. glum. o. Cor. gl. 2-valvis. (2) Cal. glum. o. Cor. gl. 2-valvis. Styl. 2. Sem. 1. Corolla circumscissa.

1063. *PHARUS*. (1) Cal. glum. 1-flora. Cor. gl. 2-valvis. (2) Cal. glum. 1-flora. Cor. gl. 2-valvis. Styl. 1. Sem. 1.

Rumex spinosus.

ORDO VII. HEPTANDRIA.

1064. *GUETTARDA*. (1) Cal. cylindric. Cor. 7-fida. (2) Cal. cylindric. Cor. 7-fida. Styl. 1. Drupa sicca.

* B. (1) Catkin 5-flowered. Cor. 4-parted. (2) Catkin 2-flowered. No cor. Styl. 2. Seed 1, oval.

C. (1) Involucrum 4-leaved, many-flowered. Pet. 4. (2) Involucrum 2-leaved. Styl. 2. Pericarp. inferior, 2-celled.

S. (1) Cal. 4-toothed. Cor. 4-petaled. (2) Cal. 4-leaved. Cor. Nut swelling out.

A. (1) Cal. 4-toothed. Cor. 4-petaled. (2) No nect. Nut 1-celled.

* L. (1) Cal. 4-leaved. Cor. 4-cleft. Stam. very long. (2) No cal. Cor. 4-cleft. Styl. long. Seed a nut.

C. (1) Cal. 4-leaved. No cor. (2) Cal. 4-leaved. No cor. Styl. 4-cleft. Caps. 4-celled.

ORDER V. PENTANDRIA.

N. (1) Cal. 5-toothed. No cor. Anth. 2-cleft. (2) Cal. 4-toothed. No cor. Styl. 2, betwixt the germs.

* X. (1) Cal. common, many-leaved. Cor. 5-cleft. Filam. connected. (2) No cal. No cor. Styl. 2. Drupe 2-celled.

A. (1) Cal. common, 1-leaved. Cor. 5-cleft. (2) Cal. 1-flowered, 2-leaved. No cor. Styl. 1. Nut 5-toothed.

P. (1) Cal. common, 5-leaved. Cor. of the disc superior. (2) Cal. as in the male. Cor. of the ray strap-shaped. Styl. 1. Seed 1.

C. (1) Cal. common, tiled. Cor. of the disc 5-cleft. (2) Cal. as in the male. Cor. of the ray 5-cleft. Drupes dimpled.

L. (1) Cal. common, 5-leaved. Cor. of the disc superior. (2) Cal. as in the male. No cor. of the ray. Styl. 2. Seed 1.

* A. (1) Cal. proper, 5-leaved. No cor. Stamens 3 or 5. (2) Proper cal. 5-leaved. No cor. 3 styles. Caps. cut round.

L. (1) Cal. 5-cleft. Cor. 5-cleft. (2) Cal. 5-cleft. Cor. 5-cleft. Styl. 1. Peric. 6-celled. Seeds solitary.

ORDER VI. HEXANDRIA.

Z. (1) Cal. husk none. Cor. a 2-valved husk. (2) Cal. husk none. Cor. a 2-valved husk. Styles 2. Seed 1. Cor. cut round.

P. (1) Cal. a husk 1-flowered. Cor. a husk 2-valved. (2) Cal. a 1-flowered husk. Cor. a 2-valved husk. Styl. 1. Seed 1.

ORDER VII. HEPTANDRIA.

G. (1) Cal. cylindrical. Cor. 7-cleft. (2) Cal. cylindrical. Cor. 7-cleft. 1 Style. Drupe dry.

ORDO

ORDO VIII. POLYANDRIA.

1156. BEGONIA. (1) Cal. o. Cor. 4-petala. (2) Cal. o. Cor. 4-petala. Styl. 3, bifidi. Caps. infera, 3-locularis, polysperma.
 * 1067. SAGITTARIA. (1) Cal. 3-phyllus. Cor. 3-petala. Stam. 24 circiter. (2) Cal. 3-phyll. Cor. 3-pet. Pist. 100. Sem. numerosa.
 * 1066. MYRIOPHYLLUM. (1) Cal. 4-phyllus. Cor. o. Stam. 8. (2) Cal. 4-phyllus. Cor. o. Pist. 4. Sem. 4.
 * 1065. CERATOPHYLLUM. (1) Cal. sub 7-partitus. Cor. o. Stam. 18 circiter. (2) Cal. sub 7-partitus. Cor. o. Pist. 1. Sem. 1.
 1068. THELIGONUM. (1) Cal. 2-fidus. Cor. o. Stam. 12 circiter. (2) Cal. 2-fidus. Cor. o. Pist. 1. Sem. 1, corticatum.
 * 1069. POTERIUM. (1) Cal. 4-phyllus. Cor. 4-partita. Stam. 32 circiter. (2) Cal. 4-phyllus. Cor. 4-pet. Pist. 2. Sem. 2, obducta.
 * 1072. FAGUS. (1) Cal. 5-fidus. Cor. o. Stam. 12 circiter. (2) Cal. 4-fidus. Cor. o. Styl. 3. Caps. 2-sperma.
 * 1070. QUERCUS. (1) Cal. 5-fidus. Cor. o. Stam. 10 circiter. (2) Cal. integer. Cor. o. Styl. 5. Nux coriacea.
 1071. JUGLANS. (1) Ament. imbricat. Cor. 6-partita. Stam. 18 circiter. (2) Cal. 4-fidus. Cor. 4-pet. Styl. 2. Drupa coriacea.
 * 1074. CORYLUS. (1) Ament. imbricat. Cor. o. Stam. 8. (2) Cal. 2-phyllus. Cor. o. Styl. 2. Nux nuda.
 * 1073. CARPINUS. (1) Ament. imbricat. Cor. o. Stam. 10. (2) Cal. 6-fidus. Cor. o. Pist. 2. Nux nuda.
 1075. PLATANUS. (1) Ament. globos. Cor. obsoleta. Anther. circumnatæ. (2) Ament. globos. Cor. 5-pet. Styl. 1. Sem. 1, papposum.
 1076. LIQUIDAMBAR. (1) Cal. 4-phyllus. Cor. o. Stam. plurima. (2) Cal. 4-phyllus. Cor. o. Styl. 2. Caps. polysperma.

Areca, Caryota.

ORDO IX. MONADELPHIA.

ORDER I. MONANDRIA.

1034. ZANNICHELLIA, or *Three-headed Pond-weed*.
One species; viz. palustris.

1035. CERATOCARPUS.
One species; viz. arenarius. Tartary.

1426. ARTOCARPUS, or *Bread-fruit*.
Two species; viz. *incisa*, *integrifolia*.—It has a cylindric amentum or catkin, which thickens gradually, and is covered with flowers; the male and female in a different amentum. In the *male*, the calyx is two-valved, and the corolla is wanting. In the *female*, there is no calyx nor corolla; the stylus is one, and the drupa is many-celled.

Though this tree had been mentioned by many voyagers, particularly by Dampier, by Rumphius, and by Lord Anson, yet very little notice seems to have been taken of it till the return of Captain Wallis from the South sea, and since that time by others who have touched at Otaheite and some countries in the East Indies. Captain Dampier relates, that in Guam, one of the Ladrone islands, "there is a certain fruit called the *bread-fruit*, growing on a tree as big as our large apple-trees, with dark leaves. The fruit is round, and grows on the boughs like apples, of the bigness of a good penny-loaf; when ripe, it turns yellow, soft, and sweet; but the natives take it green, and bake it in an oven till the rind is black; this they scrape off, and eat the inside, which is soft and white, like the inside of new baked bread, having neither seed nor stone; but if it is kept above 24 hours it is harsh. As this fruit is in season eight months in the year, the natives feed upon no other sort of bread during that time. They told us that all the Ladrone islands had plenty of it. I never heard of it in any other place."

Rumphius, after describing the tree, observes, that "the fruit is shaped like a heart, and increases to the size of a child's head. Its surface or rind is thick, green, and covered everywhere with warts of a quadrangular or hexagonal figure, like cut diamonds, but without points. The more flat and smooth these warts are, the fewer seeds are contained in the fruit, and the greater is the quantity of pith, and that of a more glutinous nature. The internal part of the rind, or peel, consists of a fleshy substance, full of twisted fibres, which have the appearance of fine wool; these adhere to, and in some measure form it. The fleshy part of this fruit becomes softer towards the middle, where there is a small cavity formed without any nuts or seeds, except in one species, which has but a small number, and this sort is not good, unless it is baked or prepared some other way; but if the outward rind be taken off, and the fibrous flesh dried and afterwards boiled with meat as we do cabbage, it has then the taste of artichoke bottoms. The inhabitants of Amboyna dress it in the liquor of cocoa nuts; but they prefer it roasted on coals till the outward part or peel is burnt. They afterwards cut it into pieces, and eat it with the milk of the cocoa-nut. Some people make fritters of it, or fry it in oil; and others, as the Sumatrans, dry the internal soft part, and keep it to use instead of bread with other food. It affords a great deal of nourish-

ment, and is very satisfying, therefore proper for hard-working people: and being of a gentle astringent quality, is good for persons of a laxative habit of body.

It is more nourishing boiled in our manner with fat meat than roasted on coals. The milky juice which distils from the trunk, boiled with the cocoa-nut oil, makes a very strong bird-lime. This tree is to be found on the eastern parts of Sumatra, and in the Malay language is called *soccus* and *socum capas*. It grows likewise about the town of Bantam in Java, and in Ballega and Madura, and is known there by the name of *socum*."

In Anson's voyage we are informed, "that the rima, or bread-fruit tree, is common in all the Ladrone islands and some of the Philippines. It is somewhat larger than our apple tree, and bears a broad dark-coloured leaf with five indentures on each side. The fruit hangs on the boughs like apples; and is of the size of a penny loaf, with a thick tough rind, which when full ripe turns yellow. The natives gather it before it is quite ripe, and bake it till the crust is pretty black; when they rasp it, and there remains a pretty loaf, with a tender yellow crust, and the crumb of it is soft and sweet as a new baked roll: it is without any seeds or stones. This fruit the inhabitants enjoy for about seven months; during which they never eat any other kind of bread: but they are obliged to bake it every day; for when it grows a little stale, it becomes harsh and husky, somewhat like the potato bread made in the west of England. There is, however, a remedy for this; which is cutting the loaf into slices when it is new, and drying it in the sun, by which it is changed into the pleasantest rusk that can be eaten."

Captain Cook, in his voyage, observes, that this fruit not only serves as a substitute for bread among the inhabitants of Otaheite and the neighbouring islands, but also, variously dressed, composes the principal part of their food. It grows on a tree that is about the size of a middling oak; its leaves are frequently a foot and a half long, of an oblong shape, deeply sinuated like those of the fig-tree, which they resemble in colour and consistence, and in the exuding of a milky juice upon being broken. The fruit is about the size and shape of a new-born child's head; and the surface is reticulated, not much unlike a truffle; it is covered with a thin skin, and has a core about as big as the handle of a small knife. The eatable part lies between the skin and the core; it is as white as snow, and somewhat of the consistence of new bread; it must be roasted before it is eaten, being first divided into three or four parts; its taste is insipid, with a slight sweetness, somewhat resembling that of the crumb of wheaten bread mixed with a Jerusalem artichoke. This fruit is also cooked in a kind of oven, which renders it soft, and something like a boiled potato; not quite so farinaceous as a good one, but more so than those of the middling sort. Of the bread-fruit they also make three dishes, by putting either water or the milk of the cocoa nut to it, then beating it to a paste with a stone pestle, and afterwards mixing it with ripe plantains, bananas, or the sour paste which they call *mahie*.

The mahie, which is likewise made to serve as a succedaneum for ripe bread-fruit before the season comes on, is thus made: The fruit of the bread-tree is gathered

there'd just before it is perfectly ripe; and being laid in heaps, is closely covered with leaves: in this state it undergoes a fermentation, and becomes disagreeably sweet; the core is then taken out entire, which is done by gently pulling out the stalk, and the rest of the fruit is thrown into a hole which is dug for that purpose, generally in the houses, and neatly lined in the bottom and sides with grass: the whole is then covered with leaves and heavy stones laid upon them; in this state it undergoes a second fermentation, and becomes sour, after which it will suffer no change for many months. It is taken out of the hole as it is wanted for use; and being made into balls, it is wrapped up in leaves and baked: after it is dressed, it will keep five or six weeks. It is eaten both cold and hot; and the natives seldom make a meal without it, though to Europeans the taste is as disagreeable as that of a pickled olive generally is the first time it is eaten. The fruit itself is in season eight months in the year, and the mahie supplies the inhabitants during the other four.

To procure this principal article of their food (the bread fruit), costs these happy people no trouble or labour except climbing up a tree: the tree which produces it does not indeed grow spontaneously; but if a man plants ten of them in his life time, which he may do in about an hour, he will as completely fulfil his duty to his own and future generations, as the native of our less temperate climate can do by ploughing in the cold of winter, and reaping in the summer's heat, as often as these seasons return; even if, after he has procured bread for his present household, he should convert a surplus into money, and lay it up for his children.

We have said that there are two species of artocarpus, viz. the incisa, with gashed leaves; and the integrifolia, with entire leaves. There is also said to be another distinction, into that which bears fruit with stones or seeds, and that in which the fruit has none. The parts of fructification of that tree which bears the fruit without stones are defective. The amentum, or catkin, which contains the male parts, never expands. The styli, or female parts of the fruit, are likewise deficient. From which it follows, that there can be no stones or seeds, and therefore that this tree can be propagated only by suckers or layers; although it is abundantly evident, that it must have originally proceeded from the seed-bearing bread-fruit tree. Instances of this kind we sometimes find in European fruits; such as the barberry, and the Corinthian grape from Zant, commonly called currants, which can therefore be increased only by layers and cuttings. Dr Solander was assured by the oldest inhabitants of Otaheite and the adjoining islands, that they well remembered there was formerly plenty of the seed-bearing bread-fruit; but they had been neglected upon account of the preference given to the bread-fruit without seeds, which they propagate by suckers.

The British government sent Lieutenant Bligh in the Bounty in 1787 to Otaheite to procure and transport to our West India colonies this valuable plant. The project was at that time unsuccessful, in consequence of a mutiny of the ship's crew, who seized the vessel, and carried her back to Otaheite. The object, however, was accomplished at a future period, and the

bread-fruit is now reared in Jamaica and the other West India islands. Plants of this genus have also been brought to his majesty's gardens at Kew. The taste of the fruit is said to be a sort of medium between the taste of common wheaten bread, and the taste of a boiled potato. Those who prefer potatoes to ordinary bread also prefer the bread-fruit to it.

1033. CYNOMORIUM.

One species; viz. coccineum. Jamaica.

NIPA.

One species; viz. fruticans. Africa.

1203. CHARA.

Four species; viz. * flexilis, * hispida, * tomentosa, * vulgaris.

1036. ELATERIUM, or *Spring-gourd*.

Two species; viz. carthaginense, trifoliatum. Carthage.

1427. PHYLLACHNE.

One species; viz. uliginosa. Terra del Fuego.

1428. CASUARINA.

Two species; viz. equisetifolia, nodiflora. E. Indies, New S. Wales.

1429. ÆGOPRICON.

One species; viz. betulium. Surinam, Cayenne.

ORDER II. DIANDRIA.

1037. ANGURIA.

Three species; viz. trilobata, pedata, trifoliata. America.

1038. LEMNA, or *Duck-meat*.

Five species; viz. * gibba, * minor, * polyrhiza, * trisulca, arhiza. Europe.

ORDER III. TRIANDRIA.

1040. TYPHA, *Cat's-tail*, *Reed-mace*.

Two species; viz. * angustifolia, * latifolia.

1041. SPARGANIUM, or *Burr-reed*.

Four species; viz. * erectum, * natans, * ramosum, * simplex.

1042. ZEA, or *Indian* or *Turkey Wheat*.

One species; viz. mays. America.

1043. COIX, or *Job's-tears*.

One species; viz. lacryma. E. Indies.

1044. TRIPSACUM.

Two species; viz. dactyloides, hermaphroditum. Virginia, Canada, Jamaica.

1045. OLYRA.

One species; viz. latifolia. W. Indies.

1046. CAREX, or *Sedge*, *Cyperus-grass*.

67 species; viz. * acuta, * ampullacea, * arenaria, * atrata, * axillaris, * cæspitosa, * capillaris, * clandestina, * curta, * depauperata, * digitata, * dioica, * distans, * divisa, * divulsa, * extensa, * filiformis, * flava, * hirta, * incurva, * intermedia, * limosa, * muricata, * ovalis, * pallescens, * palludosa, * panicata, * paniculata, * pauciflora, * pendula, * pilulifera,

fera, * præcox, * pseudocyperus, * pulicaris, * recurva, * remota, * rigida, * riparia, * stellulata, * stricta, * trigosa, * sylvatica, * teretiusculá, * vesicaria, * vulpina, capitata, squarrosa, uncinata, baldensis, uliginosa, leporina, brizoides, loliacea, elongata, canescens, indica, brunnea, pœdata, montana, tomentosa, globularis, saxatilis, tristachya, folliculata, japonica, pumila, lithosperma. Eur. Asia, Africa, America.

1047. AXYRIS.

Four species; viz. ceratoides, amaranthoides, hybrida, prostrata. Siber. Tartary.

1039. OMPHALEA.

Two species; viz. diandra, triandra. Jam.

1048. TRAGIA.

Six species; viz. volubilis, involucrata, mercurialis, urens, chamælia, cannabina. India, Virg. Carolina.

1049. HERNANDIA, or *Jack-in-a-box*.

Two species; viz. sonora, ovigera. W. Indies, S. America.

1050. PHYLLANTHUS, or *Sea-side Laurel*.

Seven species; viz. grandifolia, niruri, urinaria, baciformis, racemosa, emblica, maderaspatensis. Arab. E. and W. Ind. Carolina.

ORDER IV. TETRANDRIA.

1274. SERPICULATA.

Two species; viz. * verticillata, repens. India.

AUCUBA.

One species; viz. japonica. Japan.

1328. LITTORELLA.

One species; viz. * lacustris.

1275. CICCA.

One species; viz. disticha. India.

1052. BETULA, or *Birch-tree*.

Eight species; viz. * alba, * alnus, * nana, dalearica, nigra, lenta, pumila, incana. Europe, N. America.

1053. BUXUS, or *Box-tree*.

One species; viz. sempervirens.—The wood is very hard and smooth, and not apt to warp, and therefore well adapted for the use of the turner. Combs, mathematical instruments, knife handles, and button moulds are made of it. An empyreumatic oil, distilled from the shavings, is often used as a topical application for the piles, and seldom fails to procure ease. It will frequently relieve the toothach, and has been given internally in epilepsies. The leaves, powdered, destroy worms. In the south of Europe it is cultivated in gardens, and kept in flower-pots, with as much attention as we bestow upon myrtle.

1054. URTICA, or *Nettle*.

28 species; viz. * dioica, * pilulifer, * urens, balearica, dodartii, pumila, grandifolia, cannabina, alienata, cylindrica, parietaria, ciliaris, spicata, macrophylla, rhombea, æstuans, capitata, divaricata, canadensis, interrupta, nivea, baccifera, arborea, capensis, frutescens, stimulan, japonica, villosa. Europe, N. Amer. E. and W. Indies.

dioica.

* U. leaves opposite, heart-shaped; bunches in pairs.—This species is the common nettle. Its stings are

very curious microscopic objects: They consist of an exceedingly fine-pointed tapering hollow substance, with a perforation at the point, and a bag at the base; or they are sharp tubes seated upon a bag. When the sharp point of the tube, that is to say the sting, is pressed upon, it readily punctures the skin, and the same pressure forces up an acrimonious fluid from the bag, which is squirted into the wound, and produces an effect which most persons have experienced. The plant was formerly used as an astringent, but is now disregarded. A stalk of it, when the leaves are in their prime, put into milk, coagulates it, and may serve to prepare it for being made into cheese. A leaf, put upon the tongue, and then pressed against the roof of the mouth, is pretty efficacious in stopping a bleeding at the nose. Paralytic limbs have been recovered by stinging them with nettles. The young shoots are gathered early in the spring to boil in broth or gruel. Cows eat the leaves when they are a little withered. The leaves are cut to pieces to mix with the food of young turkeys and other poultry. Cows, horses, sheep, goats, and swine, refuse them. Asses are fond of it, and cows eat it in hay. The stalks may be dressed like flax or hemp for making cloth or paper. In Kamschatka they make use of no other material in the manufacture of cordage or sailcloth, and linen; and consider these fabrics, when produced from nettles, as superior in every respect to those made from hemp and flax. As the nettle seems of all plants the most congenial to our soil and climate, growing in all situations both fertile and barren, in spite of every attempt to extirpate it; and as there exists no doubt, that as a material of manufacture, it is not inferior to either flax or hemp, it is a singular circumstance that it has never come into general use. This, perhaps, is chiefly to be accounted for from the difficulty of collecting its seeds and handling it: difficulties, however, which a little attention and industry would probably soon enable us to overcome.

1055. MORUS, or *Mulberry-tree*.

Seven species; viz. alba, nigra, papyrifera, rubra, indica, tartarica, tinctoria. Italy, China, Japan, America.—The mulberry is chiefly remarkable on account of the value of its leaves, as the food of that valuable insect the silk-worm. The *morus alba* or white mulberry, with leaves obliquely heart-shaped and level, grows in Britain in the open air, as far northward as the frith of Forth, and silk-worms may be fed with it. The fruit of the black mulberry has the common qualities of other sweet fruits, abating heat, quenching thirst, and promoting the grosser secretions; a syrup, made from the juice, is kept by the apothecaries. The bark of the roots has been in considerable esteem as a cure for worms; its taste is bitter and somewhat astringent.

ORDER V. PENTANDRIA.

1277. NEPHELIUM.

One species; viz. lappaceum. India.

1056. XANTHIUM, or *Lesser Burdock*.

Five species; viz. * strumarium, orientale, echinatum, spinosum, fruticosum. S. Eur. Ceylon, China, Peru.

* X.

strumarium. * X. stem thornless; leaves heart-shaped, three-fibred. —The leaves are bitter and astringent. A decoction of the whole plant affords a showy yellow colour; but it is better if only the flowers are used. Horses and goats eat it. Cows, sheep, and swine refuse it.

1057. AMBROSIA.

Four species; viz. *trifida*, *elatior*, *artemisifolia*, *maritima*.

1058. PARTHENIUM, or *Bass Feverfew*.

Two species; viz. *hysterophorus*, *integrifolium*. Virginia, Jamaica.

1059. IVA, or *False Jesuits-bark Tree*.

Two species; viz. *annua*, *frutescens*. Virginia, Carolina, Jamaica.

1329. CLIBADIUM.

One species; viz. *surinamense*. Surinam.

1060. AMARANTHUS, or *Flower-gentle*.

24 species; viz. *albus*, *græcoizans*, *melancholicus*, *tricolor*, *polygamus*, *gangeticus*, *mangostanus*, *tristis*, *lividus*, *oleraceus*, *blitum*, *viridis*, *deflexus*, *polygoides*, *scandens*, *hybridus*, *paniculatus*, *sanguineus*, *retroflexus*, *flavus*, *hypochondriacus*, *cruentus*, *caudatus*, *spinousus*. Europe, E. and W. Indies, America.

1276. LEEA.

Two species; viz. *æquata*, *crispa*. Jamaica.

ORDER VI. HEXANDRIA.

1062. ZIZANIA, or *Water-oats*, *Tare-grass*.

Three species; viz. *aquatica*, *palustris*, *terrestris*. Malabar, N. America, Jamaica.

1063. PHARUS.

One species; viz. *latifolius*. Jamaica, S. Amer.

ORDER VII. HEPTANDRIA.

1064. GUETTARDA.

One species; viz. *speciosa*. Java, W. Indies.

ORDER VIII. POLYANDRIA.

1065. CERATOPHYLLUM, or *Hornwort*.

Two species; viz. * *demersum*, * *submersum*.

1066. MYRIOPHYLLUM, or *Water Milfoil*.

Two species; viz. * *spicatum*, * *verticillatum*.

1067. SAGITTARIA, or *Arrowhead*.

Five species; viz. * *sagittifolia*, *obtusifolia*, *lancifolia*, *acutifolia*, *trifolia*. Europe, Asia, America.

sagittifolia.

* *S.* leaves arrow-shaped, acute.—It grows in ditches and on the banks of slow-running rivers. There is always a bulb at the lower part of the root, growing in the solid earth beneath the mud. This bulb constitutes a considerable part of the food of the Chinese, and upon that account they cultivate it. Horses, goats, and swine eat it. Cows are not fond of it.

1156. BEGONIA.

Three species; viz. *ferruginea*, *capensis*, *urtica*. Cape, E. and W. Indies.

1068. THELIGONUM, or *Dogs-cabbage*.

One species; viz. *cynocrambe*. S. of Europe.

1069. POTERIUM, or *Garden Burnet*.

Three species; viz. * *sanguisorba*, *hybridum*, *spinosum*.

* *P.* without thorns; stems somewhat angular.—The *sanguis*-leaves and seeds of this plant are mildly astringent, and *sorba*. have been used in dysenteries and hemorrhagies. The seeds, when bruised, smell like cucumbers. There are large tracts of the finest parts of what are called the *South Downs* in England, upon which this plant forms half the indigenous pasturage. It seems to grow naturally (without being sown) only on chalky soils; but it will flourish, when sown, on any soil; on sand, clay, peat, &c. It is chiefly valuable for sheep pastures that are to be kept fully stocked. It forms a fine herbage when close bitten; but when suffered to run to a height it is rather coarse.

1070. QUERCUS, or *Oak-tree*.

20 species; viz. * *pbellos*, *molucca*, *glabra*, *acuta*, *glauca*, *cuspidata*, *serrata*, *ilex*, *suber*, *coccifera*, *prinus*, *dentata*, *nigra*, *rubra*, *alba*, *esculus*, * *robur*, *egilops*, *cerris*, * *femina*.

* *Q.* leaves on leaf-stalks, oblong, broadest towards the *robur*-end; indentations rather acute, angles blunt; fruit nearly sitting.

* *Q.* leaves oblong, on short leaf-stalks, blunt, *wing-femina*-cleft, with indentations; fruit mostly solitary, on long fruitstalks. *Withering*, vol. iii. p. 387. The oak is a native of the temperate climates. It loves hilly better than boggy ground, and thrives best, while young, in large plantations. Its roots descend deep into the earth, and therefore will not bear to be transplanted. Much lopping destroys it. Grass will hardly grow beneath it. The wood is hard, tough, tolerably flexible, not easily splintering; and therefore is preferred before all other timber for building ships of war. It is well adapted to almost every purpose of the carpenter; but an attempt to enumerate the uses of this well-known wood, would be equally superfluous and difficult. Oak saw-dust is the principal indigenous vegetable used in dyeing fustian. All the varieties of drabs and different shades of brown are made with oak saw-dust, differently managed and compounded. The balls or oak apples are likewise used in dyeing, as a substitute for galls. The black, got from them by the addition of copperas, is more beautiful than that from galls, but not so durable. The bark is universally used to tan leather; and it is said, that the saw-dust has been used for the same purpose with equal success. The bark is used to make writing ink. Its astringent properties might be rendered useful in medicine. An infusion of it, with a small quantity of copperas, is used by the common people to dye woollen of a purplish blue: the colour, though not very bright, is durable. The balls or galls upon the leaves, are occasioned by a small insect with four wings, called *cynips quercifolii*, which deposits an egg in the substance of the leaf by making a small perforation in the under surface. The ball presently begins to grow, and the egg in the centre of it changes to a worm; this worm again changes to a nymph, and the nymph to the flying insect, with four wings. Horses, cows, sheep, and goats, eat the leaves. Swine and deer fatten on the acorns. The oak grows in a good soil sometimes to a most immense size. At Little Shelsley in Worcestershire,,

shire, an oak measured close to the ground nearly 48 feet, and about two yards from the ground 22 feet four inches. Lightfoot mentions one growing near Ludlow in Shropshire in 1764, the trunk of which measured 68 feet in girth, and 23 in length; so that allowing 90 square feet for the larger branches, it contained 1455 feet of timber. An oak near Welbeck measured in girth, at 11 feet from the ground, 38 feet; and one growing at Cowthorpe near Wetherby, Yorkshire, measured 48 feet in circumference at three feet from the ground, and 78 feet close to the ground.

1071. JUGLANS, or *Walnut-tree*.

Five species; viz. regia, alba, nigra, cinerea, bacata. Persia, N. America.—This tree, when planted in Scotland, seldom ripens its fruit.

1072. FAGUS, or *Beech, Sweet Chestnut*.

Three species; viz. * castanea, pumila, * sylvatica. Europe, N. America.

castanea.

* F. leaves spear-shaped, with tapering serratures, naked underneath.—In the shade of this species, called the *chestnut*, nothing will thrive. The wood is applicable to the same uses that oak is. Pipes made of it to convey water under ground, are said to last longer than those made of oak. Poles for espaliers, &c. made of it without removing the bark, also last very long. Some of the oldest buildings in London are said to be constructed of the wood of the chestnut tree. At Tortworth in Gloucestershire, is said to be a tree 52 feet round, which is proved to have stood since the year 1150, and was then very old. It is supposed to be 1100 years old. In 1759, its girth, at six feet from the ground, was 46 feet six inches. The nuts are used to whiten linen cloth, and to make starch. They constitute a great proportion of the food of the common people in the south of Europe; and hogs, feeding on them as they run wild in the forests, are reckoned particularly excellent.

sylvatica.

* F. leaves egg-shaped; indistinctly serrated. *Common beech*.—This tree is large and beautiful, but no verdure is found under its shade. It retains its old leaves during the winter, and may be trained to form very lofty hedges. The wood is brittle, soon decays in the air, but endures under water. It is formed into tool handles, planes, mallets, chairs, and bedsteads. Split into thin layers, it is used to make scabbards for swords. It is excellent fuel, and its ashes afford much potash. The leaves, gathered in autumn before they are much injured by frost, make much better mattresses than straw or chaff, and last seven or eight years. The nuts or mast, when eaten, occasion giddiness and headache; but when well dried and powdered, make wholesome bread. They are sometimes roasted and substituted for coffee. They fatten swine, and are devoured greedily by mice, squirrels, and birds. The poor people in Silesia use the expressed oil instead of butter. Sheep and goats eat the leaves.

1073. CARPINUS, *Hornbeam-tree*.

Two species; viz. * betulus, ostrya. Europe, N. America.

betulus.

* C. scales of the cones flat.—This, which is the common hornbeam, loves a poor stiff soil on the sides of hills, is easily transplanted, and bears lopping. Cattle eat the leaves, but no pasture grows under its

shade. The wood burns like a candle: it is very white, very tough, harder than hawthorn, and capable of supporting a great weight. It is useful in turning, and for many implements of husbandry. Cogges for millwheels made of it are superior to those of yew. The inner bark is used in Scandinavia to dye yellow.

1074. CORYLUS, *Hazel, or Nut-tree*.

Two species; viz. * avellana, columna. Europe, N. America.

* C.—This wood is profitably planted in many places *avellana*, in hedges and coppices, for the purpose of cutting down portions in rotation, to be converted into charcoal for forges. The wood is used for fishing-rods, walking-sticks, hoops, &c. The roots are preferred where beautiful wood is wanted for inlaying or staining. It is a practice in Italy, to put chips of hazel into turbid wine to clear it, which it does in 24 hours. In countries where yeast is scarce, they twist together hazel twigs, so as to leave a multitude of chinks: these they steep in their ale while it is fermenting; then hang them up to dry, and when they brew again they put them into the wort instead of yeast. Charcoal of hazel, when used in drawing, leaves stains which are easily rubbed out. The nuts, which are agreeable to most people, afford, by pressure, an oil for the use of painters.

1075. PLATANUS, or *Plane-Tree*.

Two species; viz. orientalis, occidentalis. Levant, N. America.

1076. LIQUIDAMBAR, or *Sweet Gum*.

Two species; viz. styraciflua, peregrina. Levant, N. America.—The resinous juice of the former of these species, brought from America, was once used as a perfume, but is now neglected.

ORDER IX. MONADELPHIA.

1077. PINUS, or *Pine-tree*.

12 species; viz. * sylvestris, pinea, taeda, cembra, strobus, cedrus, larix, picea, balsamea, canadensis, abies, orientalis. Europe, north of Asia, America.

* P. leaves in long pairs, rigid; cones egg-conical, *sylvestris*, mostly in pairs, as long as the leaves; scales oblong, blunt. *Scotch fir*.—This species, which is a native of our island, flourishes best on a poor sandy soil. In a grove the trunk is tall and naked; in open places branched. It does not bear the least clipping, as the terminating buds send forth the branches. The roots spread near the surface of the earth, except the central root, which pushes perpendicularly downwards. If it is either broken off or interrupted in its passage, the stem ceases to shoot upwards, and the tree remains a dwarf. Hence it is apt to suffer by transplanting. The bark will tan leather. In the north of Europe bread is thus made from it by the inhabitants: They choose a straight tree, as these have least resin, and strip off the bark in the spring, when it separates most readily. This they first dry gently in the shade; then in a greater heat, and reduce it to powder. With this powder they mix a small quantity of corn meal, and with water they knead it into bread. This they eat, not only in times of scarcity, but at other times, from an apprehension, that long disuse might render it disagreeable

agreeable to them. Their children are very fond of the fresh bark in the spring time, either shaved with a knife or grated with a rasp. The young shoots, distilled, afford a fragrant essential oil. Sheep and goats are not fond of it. Horses refuse it. Burnt with a close smothering fire, the wood of this species yields tar. The species called *larix* has risen into considerable reputation in this country, on account of its beauty, rapid growth, and the value of the timber. It is extremely hardy, growing in Siberia almost to the coasts of the Icy sea; but this very hardness, or capacity of vegetating with a very small degree of heat, renders it in this country delicate when young. The first warmth of the spring is sufficient to bring forth its buds, which are thus, by the unsteadiness of our climate, exposed to frequent pernicious frosts. In this way nurserymen often suffer great losses by the *larix*, in consequence of an early spring and a premature vegetation, which is afterwards nipt by frosty weather. From the trees of the genus *pinus* the different turpentine are extracted by bleeding the trees, by wounds in the bark or branches.

1079. CUPRESSUS, or *Cypress-tree*.

Six species; viz. *sempervirens*, *disticha*, *thyoides*, *juniperoides*, *pendula*, *japonica*. Crete, Cape, Japan, N. America.

1080. PLUKENETIA.

One species; viz. *volubilis*. E. and W. Indies.

1081. DALECHAMPIA.

Two species; viz. *colorata*, *scandens*. W. Indies, New Granada.

1082. AGALYPHA.

Five species; viz. *virginica*, *virgata*, *indica*, *villosa*, *australis*. N. America, E. and W. Indies.

1083. CROTON, or *Base Ricinus, Tallow-tree*.

23 species; viz. *variegatum*, *casoarilla*, *castaneifolium*, *palustre*, *glabellum*, *tinctorium*, *glandulosum*, *argenteum*, *sebiferum*, *japonicum*, *acutum*, *tiglium*, *lucidum*, *lacciferum*, *balsamiferum*, *aromaticum*, *humile*, *ricinocarpus*, *moluccanum*, *flavens*, *capense*, *lotum*, *spinosum*. China, Japan, W. Indies, N. America.

279. CUPANIA.

One species; viz. *americana*. West Indies, Cozumandel.

1084. JATROPHA, or *Cassada, Manihot*.

Nine species; viz. *gossypifolia*, *moluccana*, *cnrcas*, *multifida*, *manihot*, *janipha*, *urens*, *herbacea*, *elastica*. Africa, S. America.

1085. RICINUS.

Four species; viz. *inermis*, *communis*, *tanarius*, *mappa*. Vera Cruz.—The species called *R. communis* produces nuts about the size of small beans, which like bitter almonds are deleterious. An oil is obtained from them by expression, called *castor oil*, which is used as a safe and mild laxative; half an ounce or an ounce for an adult, and a dram for an infant.

1086. STERCULIA.

Three species; viz. *balanghas*, *fœtida*, *plataniifolium*. Arabia, E. and W. Indies, China.

1087. HURA, or *Sandbon-tree*.

One species; viz. *crepitans*. Mexico, W. Indies.

1088. HIPPOMANE.

Three species; viz. *maucinella*, *biglandulosa*, *spinosa*.

1278. GNETUM.

One species; viz. *gnemon*. India.

1279. STILLINGIA.

One species; viz. *sylvatica*. Carolina.

ORDER X. SYNGENESIA.

1089. TRICHOSANTHES, or *Serpent-cucumber*.

Four species; viz. *anguina*, *nervifolia*, *cucumerina*, *amara*. E. Indies, China.

1090. MOMORDICA, or *Male Balsam-apple*.

Eight species; viz. *balsamina*, *charantia*, *operculata*, *luffa*, *cylindrica*, *trifolia*, *pedata*, *elaterium*. S. Europe, India, America.

1091. CUCURBITA, or *Gourd*.

Seven species; viz. *lagenaria*, *hispida*, *ovifera*, *pepo*, *verrucosa*, *melo*, *citrullus*. E. and W. Indies, America.

1092. CUCUMIS, or *Cucumber*.

13 species; viz. *colocynthis*, *prophetarum*, *anguria*, *africanus*, *acutangulus*, *melo*, *dudaim*, *chate*, *sativus*, *anguinus*, *flexuosus*, *conomon*, *maderaspatanus*. Levant, India, Africa, Jamaica.—The species called *sativus*, is the ordinary garden cucumber. It is less apt to grow rancid by keeping than others of the class. The *C. colocynthis*, called *coloquintida* or bitter apple, is a native of Turkey. The fruit is about the size of an orange. Its medullary part, freed from the rind and seeds, is light, white, and spongy, composed of membranous leaves, of an extremely bitter, nauseous, acrimonious taste. Colocynth is one of the most powerful and violent cathartics; but is accounted dangerous by the best physicians. The best mode of abating its virulence, consists of triturating it with gummy farinaceous substances, or oily seeds. Without this precaution, a few grains of it will often disorder the body, and even occasion a discharge of blood. The *C. melo* is used in hot countries as a cooling and agreeable food.

1093. BRYONIA, or *Bryony*.

11 species; viz. *alba*, **dioica*, *grandis*, *cordifolia*, *laciniata*, *africana*, *crstica*, *scabra*, *scabrella*, *japonica*. Crete, Africa, E. Indies.

* B. leaves hand-shaped, rough on both sides, with *dioica*. callous points; male and female flowers on different plants.—The root is purgative and acrid. A dram of it in substance, or half an ounce of it infused in wine, is a full dose. A cold infusion of the root in water is used externally in sciatic pains. A cataplasm of it is a most powerful discutient. A decoction, made with one pound of the fresh root, is the best purge for horned cattle. The plant is rough, growing on dry banks under hedges, and climbing upon the bushes. The roots are large, sometimes as thick as a man's thigh. Their juice, when fresh, soon excoriates the skin, but in drying they lose much of their acrimony.

1094.

1094. *SICYOS*, or *Single-seeded Cucumber*.
Three species; viz. *angulata*, *laciniata*, *garcini*.
America.

1320. *AGYNEIA*.
Two species; viz. *impubes*, *pubera*. China.

ORDER XL GYNANDRIA.

1695. *ANDRACHNE*, or *Base Orpine*.
Two species; viz. *telephioides*, *fruticosa*. Italy,
Levant, Egypt.

In the class *Monœcia* are

78 Genera, including 392 Species, of which 83 are
found in Britain.

CLASSIS XXII.

DIOECIA (M).

ORDO I. MONANDRIA.

1430. *PANDANUS*. (1) Cal. o. Cor. o. Anthera
sessilis, ramificationibus thyrsi inserta. (2) Cal. o.
Cor. o. Stigmata 2. Fruct. compositus.

1096. *NAJAS*. (1) Cal. 2-fidus. Cor. 4-fida. Filam.
nullum. (2) Cal. nullus. Cor. o. Pist. 3. Caps. 1-
locularis.

ORDO II. DIANDRIA.

ORDER I. MONANDRIA.

1430. PANDANUS, or *Screw-pine*.
One species; viz. odoratissima. East Indies, South sea isles.

1096. NAJAS.

One species; viz. marina. Europe.

ORDER II. DIANDRIA.

1097. VALLISNERIA.
One species; viz. spiralis. Italy.

1099. CECROPIA, or *Trumpet-tree*.
One species; viz. peltata. Jamaica.

1098. SALIX, or *Willow*.
34 species; viz. * acuminata, * alba, * amygdalina, * aurita, * caprea, * cinerea, * fragilis, * fusca, * herbacea, * lanata, * lapponum, * monandra, * myr-

sinites, * pentandra, * repens, * reticulata, * retosa, * rosmarinifolia, * rubra, * triandra, * viminalis, * vitellina, phyllicifolia, japonica, hastata, ægyptiaca, babylonica, helix, arbuscula, myrtilloides, integra, glauca, arenaria, incubacea. Europe, America.

* S. leaves strap-shaped, upper leaves oblique; catkins *monandra* downy; one stamen.—*Rose willow*, or *purple willow*. Withering. Called by Linnæus *S. purpurca*. Baskets, cradles, and all sorts of twig-work are made of its long, slender, and flexible shoots.

* S. leaves oblong, spear-shaped; flowers with three *triandra* stamens, sometimes two. *Smooth willow*.—The bark, in doses of one or two drams, cures agues.

* S. leaves egg-shaped, acute; flowers with five sta-*pentandra* mens. *Sweet willow*, or *bay-leaved willow*. Called by Linnæus *S. hermaphroditica*. The wood crackles greatly in the fire. The dried leaves afford a yellow dye. Used in Yorkshire to make the large sort of baskets.

* S. leaves egg-spear-shaped, acute, smooth above, *ser-vitellina*;

M m 2

rature

rature like gristle. *Yellow willow*.—The wood is white and very tough. The shoots are used by basket-makers.

fragilis. * S. leaves egg-spear-shaped; leaf-stalks toothed with glands. *Crack willow*.—A quick grower, and bears cropping. Thrives in any soil if moist. The bark in doses of one or two drams cures agues.

rubra. * S. leaves strap-spear-shaped, acute. *Red willow*.—The twigs much sought after by basket-makers.

viminialis. * S. leaves spear-strap-shaped, very long, acute, silky underneath; branches rod-like. *Osier*.—Much used for making hoops, and the larger baskets. Is planted to prevent the banks of rivers from being washed away by torrents.

alba. * S. leaves spear-shaped, tapering to a point, serrated, downy on both sides; the lowermost serratures glandular. *White willow*. Grows quick, and bears lopping. The bark collected in summer when full of sap, and dried by a gentle heat, is extremely valuable, as a substitute for Peruvian bark, in the cure of intermittent fevers. It will tan leather. Horses, cows, sheep, and goats, eat the leaves and young shoots. If a shady walk with willows is wanted, male sets only ought to be planted, otherwise they will speedily multiply so as to form a thicket instead of a grove.

ORDER III. TRIANDRIA.

1100. EMPETRUM, or *Berry-bearing Heath*.

Two species; viz. * *nigrum*, *album*.

nigrum. * E. with stems trailing.—The berries boiled with alum afford a dark purple dye. Eaten in quantities they occasion headache.

1101. OSYRIS, or *Poets-cassia*.

Two species; viz. *alba*, *japonica*. South Europe, Japan.

1431. MABA.

One species; viz. *elliptica*. Tongataboo, Namoka.

1331. RESTIS.

Nine species; viz. *paniculatus*, *verticillaris*, *dichotomus*, *vimineus*, *triflorus*, *simplex*, *elegia*, *cernuus*, *tectorum*. C. of G. Hope.

1102. EXCOECARIA, or *Aloes wood*.

One species; viz. *agallocha*. Amboyna, Malacca, China.

1280. CATURUS.

Two species; viz. *spiciflorus*, *ramiflorus*. East and West Indies.

ORDER IV. TETRANDRIA.

1103. TROPHIS.

One species; viz. *americana*. Jamaica.

1104. BATIS.

One species; viz. *maritima*. Jamaica.

1105. VISCUM, or *Mistletoe*.

Nine species; viz. * *album*, *rubrum*, *purpureum*, *spuntioides*, *capense*, *verticillatum*, *pauciflorum*, *terrestre*, *rotundiflorum*. Europe, Cape, West Indies, North America.

album. * V. leaves spear-shaped, blunt; stem forked; spikes axillary. *White mistletoe*.—A singular parasitical evergreen plant. The barren plant opposite to the fertile one. The root insinuates itself into the substance of

the tree on which it grows. Blossom greenish white. Berries whitish. Birdlime may be made from the berries or the bark. Birds having swallowed the berries, void them unchanged upon trees, where they take root. No art has hitherto been able to make them take root in the earth. Sheep eat it greedily; and in the southern English counties, where chiefly it grows, it is often torn from the trees to feed them. It is said to preserve them from the rot. If the berries, when fully ripe, be rubbed on the smooth bark of almost any tree, they will adhere closely, and produce plants the following winter.

1432. MONTINIA.

One species; viz. *acris*. C. of G. Hope.

1106. HIPPOPHAE, or *Sea-buckthorn*.

Two species; viz. * *rhamnoides*, *canadensis*.

* H. leaves spear-shaped.—Cows refuse it. Horses, *rham-* goats, and sheep eat it. The berries are very acid, with *noides*. an austere vinous flavour. The fishermen of the gulf of Bothnia prepare a rob from them, which imparts a grateful flavour to fresh fish. In sunny and sandy situations it is planted for hedges.

1107. MYRICA, or *Candle-berry Myrtle, Gale*.

Seven species; viz. * *gale*, *cerifera*, *aethiopica*, *quercifolia*, *cordifolia*, *trifoliata*. Europe, Madeira, Cape, North America.

* M. leaves spear-shaped, somewhat serrated; stem *gale*. shrub-like. *Sweet willow*, *Dutch myrtle*, *gale*, *goule*.—

Dyed in autumn, it dyes wool yellow. It is used to tan calfskins. The Welch lay bunches of it under their beds to keep off fleas and moths, and give it as a vermifuge in powder and infusion, applying it also externally to the abdomen. Its essential oil rises in distillation. The catkins boiled in water throw up a waxy scum fit to make candles. From the *M. cerifera* the myrtle candles are prepared.

ORDER V. PENTANDRIA.

1108. PISTACIA, or *Pistacia-nut*.

Five species; viz. *trifolia*, *narbonensis*, *vera*, *terebinthus*, *lentiscus*. South Europe, Barbary, Persia, India.

The *P. vera*, with leaves unequal winged, leaflets nearly egg-shaped, bent back, produces a moderately large nut, containing a pale greenish kernel, with a reddish skin. The tree grows spontaneously in Persia, Arabia, and the Archipelago; and has been found able to produce fruit in England. Pistachio nuts have a pleasant, sweet, unctuous taste, resembling almonds, and are esteemed by some in certain weaknesses, and in emaciated habits.

The *P. lentiscus* with leaves abruptly winged, and spear-shaped leaflets, in like manner bears our winters. The wood is brought to us in thick knotty pieces, with an ash-coloured bark and white within, of a rough somewhat pungent taste, and a grateful but faint smell. A decoction of it, under the pompous appellation of *aurum potable*, potable gold, is recommended by the Germans in catarrhs, nausea, and weakness of stomach. In the island of Chio, this tree affords mastich, which is a resinous substance brought from thence in small yellowish transparent grains or tears, of a pleasant smell, especially when heated. It is recommended in old coughs, dysenteries and all cases of laxity.

1109.

1109. ZANTHOXYLUM.

Two species; viz. *clava-herculis*, *trifoliatum*.

1111. ASTRONIUM.

One species; viz. *graveolens*. South America.

1281. CANARIUM.

One species; viz. *commune*. India.

1110. ANTIDESMA, or *Chinese Laurel*.

One species; alexiteria. E. Indies, China, Japan.

1113. IRESINE.

One species; viz. *celosia*. Virginia, Jamaica.

1112. SPINACIA, or *Spinage*.

Two species; viz. *oleracea*, *fera*. Siberia.

1114. ACNIDA, or *Virginian Hemp*.

One species, viz. *cannabina*. Virginia.

1115. CANNABIS, or *Hemp*.

One species; viz. *sativa*. India. See AGRICULTURE *Index*.

1116. HUMULUS, or *Hops*.

One species; viz. * *lupulus*. Europe.—Cultivated in England to preserve malt liquors. The young shoots are eaten in the spring instead of asparagus. Strong cloth is in Sweden made from the stalks, which are soaked in water all winter, and in the spring dressed like flax. A decoction of the roots, or from 20 to 30 grains of the extract, is said to be sudorific.

1117. ZANONIA.

One species; viz. *indica*. Coast of Malabar.

1118. FEVILLEA.

Two species; viz. *trilobata*, *cordifolia*. W. Indies.

ORDER VI. HEXANDRIA.

1119. TAMUS, or *Black Bryony*.

Two species; viz. * *communis*, *cretica*. South Europe, Cape.

1120. SMILAX, or *Rough Bindweed*.

14 species; viz. *aspera*, *excelsa*, *zeilanica*, *sarsaparilla*, *china*, *rotundifolia*, *laurifolia*, *tamnoides*, *caduca*, *bona nox*, *herbacea*, *tetragona*, *lanceolata*, *pseudochina*. South Europe, East Indies, North America.

1121. RAJANIA.

Five species; viz. *hastata*, *cordata*, *quinquefolia*, *quinata*, *hexaphylla*. Japan, North America, West Indies.

1122. DIOSCOREA, or *Indian Yam*.

12 species; viz. *pentaphylla*, *triphylla*, *trifida*, *aculeata*, *alata*, *bulbifera*, *sativa*, *villosa*, *oppositifolia*, *septemloba*, *quinquelobata*, *japonica*. East and West Indies, North America.

ORDER VII. OCTANDRIA.

1123. POPULUS, or *Poplar-tree*.

Five species; viz. * *alba*, * *nigra*, * *tremula*, *balsamifera*, *heterophylla*. South Asia, Italy, Archipelago, North America.

* *P.* leaves nearly triangular, toothed, and regular; cottony underneath. *White poplar*.—It loves low situations, and flourishes best in clay. It grows quick and bears cropping, but is unfavourable to pasturage. The wood is soft, white, and stringy, and makes good wain-

scoting, being little subject to swell or shrink. Floors, laths, packing boxes, and turners ware, are made of it. Horses, sheep, and goats eat it. Cows are not fond of it.

* *P.* leaves circular, toothed, and angular; smooth on *tremula*. Both sides. *Asp*, *aspen tree*, *trembling poplar*.—This tree grows in all soils, but worst in clay. It impoverishes the land, destroys the grass; and the numerous shoots of the roots spread so near the surface of the earth, that they permit nothing else to grow; but rise in all quarters, whether they are wanted or not. It is easily transplanted. The wood is extremely light, white, smooth, woolly, soft, durable in the air. The bark is the principal food of beavers. The bark of the young trees is made into torches.

* *P.* leaves trowel-shaped, tapering to a point, serrated, *nigra*. smooth on both sides. *Black poplar*.—It loves a moist black soil, grows rapidly, and bears cropping. The bark being light like cork, supports the nets of fishermen. Cattle eat it.

1124. RHODIOLA, or *Rose-root*.

One species; viz. * *rosea*.—The root, particularly when dried, has the fragrance of a rose; but cultivated in a garden it loses most of its sweetness.

1433. MARGARITARIA.

One species; viz. *nobilis*. Surinam.

ORDER VIII. ENNEANDRIA.

1125. MERCURIALIS, or *Mercury*.

Three species; viz. * *annua*, * *perennis*, *tomentosa*, *perennis*. Europe.

* *M.* stem undivided, leaves rough. *Dogs mercury*.—It is noxious to sheep, and deleterious to man. In drying, it turns blue. Steeped in water it affords a fine deep blue colour; which, however, is destructible both by alkalies and acids.

1126. HYDROCHARIS, or *Frogs-bit*.

One species; viz. * *morsus ranæ*.

ORDER IX. DECANDRIA.

1127. CARICA, or *Papaw tree*.

Two species; viz. *papaya*, *posoposa*. E. and W. Indies.

1128. KIGGELARIA.

One species; viz. *africana*. C. of G. Hope.

1130. SCHINUS, or *Indian Mastich tree*.

Two species; viz. *molla*, *arcira*. Peru, Brazil, Chili.

1129. CORIARIA, or *Myrtle-leaved Sumach*.

Two species; viz. *myrtifolia*, *ruscifolia*. Spain, S. France, Peru.

ORDER X. DODECANDRIA.

EUCLEA.

One species; viz. *racemosa*. C. of G. Hope.

1132. DATISCA, or *Base Hemp*.

Two species; viz. *cannabina*, *hirta*. Crete, N. America.

1131. MENISPERMUM, or *Moon-seed*.

11 species; viz. *canadense*, *virginicum*, *japonicum*, *carolinum*,

alba.

carolinum, coculus, crispum, acutum, orbiculatum, hirsutum, myostoides, trilobum. N. America, Japan.

ORDER XI. POLYANDRIA.

1133. CLIFFORTIA.

18 species; viz. odorata, ilicifolia, ruscifolia, ferruginea, graminea, polygonifolia, filifolia, crenata, pulchella, trifoliata, sarmentosa, strobilifera, obcordata, ternata, juniperina, falcata, teretifolia, ericæfolia. C. of G. Hope.

1432. HEDYCARIA.

One species; viz. dentata. N. Zealand.

ORDER XII. MONADELPHIA.

1134. JUNIPERUS, or *Juniper-tree*.

11 species; viz. * communis, thurifera, barbadensis, bermudiana, chinensis, sabina, virginiana, oxycedrus, phœnicea, lycina. Europe, Bermudas, America.
communis. * J. leaves three together, expanding, sharp pointed, longer than the berry.—It grows in all soils and situations, and to a corresponding variety of sizes. It is easily transplanted, and bears cropping. Grass will not grow beneath it, but the *avena pratensis* destroys it. The wood is hard and durable. The bark may be made into ropes. The berries are two years in ripening.—When bruised they afford a pleasant diuretic liquor, but it is not easy to prevent its growing sour. It is esteemed a good antiscorbutic. Ardent spirits, impregnated with the essential oil of those berries, is termed gin, though it is said that some distillers know how to produce the same effect, by means of the spirit of turpentine. Gum sandarach, more commonly called pounce, is the product of this tree. Horses, sheep, and goats eat it. From the *J. lycina*, a gum resin called *olibanum* is produced. From the *J. sabina*, is extracted an essential oil, which is accounted a most powerful emmenagogue. It is a warm, irritating, aperient medicine.

1135. TAXUS, or *Yew-tree*.

Four species; viz. * baccata, nucifera, macrophylla, verticillata. Eur. Cape, Jap. N. America.

* T. leaves solitary, strap-shaped, prickle-pointed, near *baccata*. together; receptacle of the male flowers somewhat globular.—It grows best on a moist loamy soil, and languishes in bogs and dry mountains. It bears transplanting, even when old; and, as an evergreen hedge, is a valuable screen to delicate plants. The wood is used for bows, axletrees, spoons, cups, cogs for mill-wheels, and flood gates for fish ponds, which hardly ever decay. The berries are sweet, viscid, and harmless. The fresh leaves are fatal to the human species.

1136. EPHEDRA, or *Shrubby Horse-tail*.

Two species; viz. distachya, monostachya. Siberia, France, Spain.

1138. CISSAMPELOS.

Five species; viz. parreira, caepeba, smilacina, fruticosa, capensis. Cape, America.

836. NAPÆA.

Two species; viz. lævis, scabra. Virginia.

1137. ADELIA.

Three species; viz. bernardia, ricinella, acidoton. Jamaica.

ORDER XIII. SYNGENESIA.

1139. RUSCUS, or *Knee-holly*, or *Butchers-broom*.

Five species; viz. * aculeatus, hypophyllum, hypoglossum, androgynus, racemosus. Hungary, Fr. Italy, Canaries.

ORDER XIV. GYNANDRIA.

1140. CLUTIA.

Nine species; viz. alaternoides, polygonoides, pulchella, hirta, tomentosa, retusa, eluteria, stipularis, acuminata.

In the class *Diccia* are

55 Genera, including 219 Species, of which 38 are found in Britain.

CLASSIS XXIII.

POLYGAMIA (o).

ORDO I. MONOECIA.

1141. MUSA. (3) Cal. nullus. Cor. 2-petala. Stam. 6, 1 fertil. Pist. 1. Bacca infera. (3) Cal. nullus. Cor. 2-petala. Stam. 6, 5 perfect. Pist. 1. Bacca nulla.

CLASS XXIII.

POLYGAMIA.

ORDER I. MONOECIA.

M. (3) No cal. Cor. 2-petaled. Stam. 6, 1 fertile. Pist. 1. Berry inferior. (3) No cal. Cor. 2-petaled. Stam. 6, 5 perfect. Pist. 1. No berry.

1146.

(o) The character of this class consists of the following circumstances: that every plant belonging to it produces, 1st, Hermaphrodite flowers, that is, flowers having both stamens and pistils in the same flower; and, 2dly, In addition to the hermaphrodite flowers, the same plant produces also other flowers, not hermaphrodite, but either male or female, that is, which have stamens, one or more, without pistils, or the reverse. The hermaphrodite

T. (3) Cal. 5-parted. No cor. Stam. 10. Drupe inferior. (1) Cal. 5-parted. No cor. Stamens 10.

C. (3) Cal. 8-leaved. Cor. 4 or 6-petaled. Anthers incorporated. Stigm. 4 to 6. Caps. 6-celled, many-seeded. (1) Cal. 4 or 6-leaved. Cor. 6-petaled. Stamens many.

1332.

maphrodite flowers of this class are usually imperfect in one of their parts (either stamens or pistils), which renders an additional male or female flower necessary. Sometimes there are two hermaphrodite flowers on the same plant of different powers: and this circumstance constitutes the polygamy, or is understood to bring the plant under the present class. As in the two former classes, the male and female flowers are here distinguished by prefixing to them the figures (1) and (2). The hermaphrodite flowers are here marked (3).

1332. HERMAS. (3) Umbella. Floris cor. 5-petala. Stam. 5, sterilia. (1) Umbella. Florum cor. 5-petala. Stam. 5, fertilia. Styli 2. Sem. 2, infera, suborbiculata.

ORDER I. MONOECIA.

1141. MUSA, or *Plantain-tree*.

Three species; viz. *paradisaica*, *sapientum*, *trogodytarum*. E. and W. Indies.

1144. VERATRUM, or *White Hellebore*.

Three species; viz. *album*, *nigrum*, *luteum*. Russia, Austria, Italy, N. America.—The *V. album* grows spontaneously on the mountains of Switzerland and Germany. The root is nauseous and acrid. If wounded, when fresh, it emits an acrid juice, which is said to prove dangerous when mixed with the blood by an issue, occasions violent purging. Snuffed up the nose, it is a strong, but not always a safe sternutatory. It is also a violent emetic. The ancients used it in desperate cases; but modern practice rejects it, though it is said to have been given with success to the amount of a scruple in cases of manja.

1333. SPINIFEX.

One species; viz. *squarrosus*. E. Indies.

1145. ANDROPOGON, or *Beard-grass*.

25 species; viz. *caricosum*, *contortum*, *crinitum*, *divaricatum*, *gryllus*, *nutans*, *ciliatum*, *serratum*, *cotuliferum*, *cymbarium*, *squarrosum*, *prostratum*, *alopeuroides*, *distachyum*, *schœnanthus*, *virginicum*, *bicornis*, *hirtum*, *insulare*, *barbatum*, *nardus*, *muticum*, *ischæmum*, *fasciculatum*, *polydactylon*. S. Europe, E. and W. Indies, America.

The *A. nardus*, Indian nard or spikenard, as it comes from the East Indies, is a matted congeries of fibres issuing from one head, and probably forming the root of the plant. Spikenard has a warm, pungent, bitterish taste, and a strong not very agreeable smell. It is stomachic and carminative; and said to be alexipharmac, diuretic, and emmenagogue; but it is at present little employed.

1146. HOLCUS, or *Indian Millet*.

14 species; viz. * *avenaceus*, * *lanatus*, * *mollis*, *spicatus*, *bicolor*, *sorghum*, *halepensis*, *saccharatus*, *laxus*, *striatus*, *serratus*, *odoratus*, *latifolius*, *pertusus*. N. Europe, India, N. America.

anatus.

* *H.* husks two-flowered, woolly; hermaphrodite floret awnless; male floret with a bent awn, inclosed in the calyx.—This grass flourishes well on any moist soil, and grows very generally, except on the most dry and barren ones. It should be sown chiefly with a view to pasturage by sheep. It makes a soft spongy hay unfit for horses.

1147. AFLUDA.

Four species; viz. *mutica*, *aristata*, *zeugites*, *digitata*. E. and W. Indies, N. America.

1148. ISCHÆMUM.

Two species; viz. *muticum*, *aristatum*. India, China, Carolina.

1149. CENCHRUS, or *Hedgehog-grass*.

Nine species; viz. *racemosus*, *lappaceus*, *muricatus*, *capitatus*, *echinatus*, *tribuloides*, *ciliaris*, *granularis*, *frutescens*. S. Europe, Virginia, W. Indies.

Vol. IV. Part I. †

1150. ÆGILOPS, or *Hard-grass*.

Four species; viz. *ovata*, *caudata*, *triuncialis*, *squarrosa*. S. Europe, Carolina.

1334. MANISURIS.

One species; viz. *myurus*. E. and W. Indies, N. America.

1151. VALANTIA, or *Cross-wort*.

Eight species; viz. * *aparine*, * *cruciata*, *muralis*, *hispida*, *cucullaria*, *articulata*, *glabra*, *hypocarpa*. Austria, S. Europe, Canaries, Jamaica.

1152. PARIETARIA, or *Pellitory*.

Eight species; viz. * *officinalis*, *indica*, *judaica*, *lutescens*, *urticæfolia*, *cretica*, *zeylanica*, *microphylla*. S. Europe, Canaries, isle of Bourbon.

1153. ATRIPLEX, or *Orache*, *Sea Purslane-tree*.

12 species; viz. * *hastata*, * *laciniata*, * *littoralis*, * *patula*, * *pedunculata*, * *portulacoides*, *halymus*, *glauca*, *rosea*, *sibirica*, *tatarica*, *hortensis*. Europe, Tartary, America.

1283. TERMINALIA, or *Benzoin*.

Two species; viz. *catappa*, *benzoin*. E. Indies.—From the last of these species a resin of the same name is supposed to be extracted, though others represent it as the product of another plant called *styrax benzoi*. Benzoin is used in perfumes, and as a cosmetic.

160. BRABEIIUM, or *African Almond*.

One species; viz. *stellulifolium*.

1154. CLUSIA, or *Balsam-tree*.

Four species; viz. *rosea*, *alba*, *flava*, *venosa*. America, Jamaica.

1142. OPHIOXYLUM.

One species; viz. *serpentinum*. E. Indies.

1155. ACER, *Maple-tree*.

17 species; viz. * *campestre*, * *pseudoplatanus*, *sempervirens*, *tataricum*, *rubrum*, *saccharinum*, *dissectum*, *japonicum*, *palmatum*, *septemlobum*, *pictum*, *platanoides*, *pensylvanicum*, *monspeulanum*, *creticum*, *trifidum*, *negundo*. Europe, N. America, Japan.
* *A.* leaves 5-lobed, blunt, unequally serrated; flowers *pseudo*-in compound pendent bunches. *Sycamore tree*, *sy-platanus*, *comore maple*.—It flourishes best in open places and sandy ground, but will thrive in a richer soil. It grows quick, is easily transplanted, bears cropping, and the grass flourishes under its shade. It is said to grow well near the sea, and that a plantation of these trees, at 50 feet asunder, with three sea allow thorns between every two of them, will make a fence sufficient to defend the herbage of the country against the sea spray. *Gent. Mag.* 1757, p. 252. The wood is soft and very white, and is used by the turners. By boring a hole into the body of the tree, when the sap rises in spring, a sweetish watery liquor is obtained, which is used in making wine, and, if inspissated, affords a fine sugar. From the *A. saccharinum* large quantities of sugar are annually thus made in North America. See UNITED STATES, and SUGAR.

1143. CELTIS, or *Lote*, *Nettle-tree*.

Three species; viz. *australis*, *occidentalis*, *orientalis*. S. Europe, Virginia, W. Indies.

N n

1157.

1157. *GOWANIA*, or *Chaw-stick*.
One species; viz. *domingensis*. West Indies.

1332. *HERMAS*.
Five species; viz. *depauperata*, *gigantea*, *capitata*, *quinquedentata*, *ciliata*. C. of G. Hope.

1158. *MIMOSA*, or *Sensitive Plant*.
53 species; viz. *simplicifolia*, *inga*, *sagifolia*, *nodosa*, *natans*, *bigemina*, *unguis-cati*, *tergemina*, *latifolia*, *purpurea*, *reticulata*, *viva*, *circinalis*, *cinerea*, *casta*, *sensitiva*, *pudica*, *entada*, *scandens*, *plena*, *virgata*, *punctata*, *pernambucana*, *arborea*, *lebbeck*, *odoratissima*, *speciosa*, *vaga*, *latisiliqua*, *polystachya*, *muricata*, *peregrina*, *glauca*, *cinerea*, *cornigera*, *catechu*, *horrida*, *eburnea*, *latronum*, *tortuosa*, *sarnesiana*, *nilotica*, *pigra*, *asperata*, *senegal*, *cæsia*, *pinnata*, *intsia*, *semispinosa*, *quadri-valvis*, *tenuifolia*, *ceratonia*, *tamarindifolia*. Egypt, E. and W. Indies, New Holland.
—The plants of this genus possess the singular property of shrinking or drawing in their leaves, when touched, which has obtained for them the English appellation of *sensitive plants*. From the species *M. catechu* a vegetable extract is obtained, which has long improperly received the appellation of *terra japonica* or Japan earth. This extract is outwardly of a reddish colour, internally of a dark brown, with a slight cast of red. It is capable of being reduced to the state of a powder; and is a mild but powerful astringent. It is particularly useful in alvine fluxes; and where these require astringents, no one is so beneficial. It is likewise employed in uterine profluvia, and in laxity and debility of the viscera in general. It is often suffered to dissolve leisurely in the mouth, as a topical astringent, for laxities and exulcerations of the gums, for aphthous ulcers in the mouth, and similar affections: and it is in some other cases applied externally under the form of solution, and as an ointment. Catechu dissolves in water, with the exception of its impurities, which amount to an eighth part of the mass. Rectified spirit dissolves seven-eighths of the pure matter into a red liquor, leaving, undissolved, an insipid mucilaginous substance. The best form of administering it is that of simple infusion in warm water, with the addition of some cinnamon or cassia. From the *M. nilotica* gum arabic exudes, the uses of which are well known to be extremely numerous. The inspissated juice of the unripe fruit of this tree is termed *acacia*, and is used as a mild astringent medicine.

ORDER II. DIOECIA.

1159. *GLEDITSIA*, or *Three-horned Acacia*.
Two species; viz. *triacanthos*, *inermis*. Java, N. America.

1160. *FRAXINUS*, or *Ash-tree*.
Three species; viz. * *excelsior*, *ornus*, *americana*. S. Europe, N. America.
* *F.* leaflets serrated; flowers without petals.—It flourishes best in groves, but grows in a rich soil, though in the open field. It bears transplanting and lopping. Horses, cows, sheep, and goats, eat it; but it is said

to spoil the milk of cows. It will give a good, though not a beautiful green, to cloths that have been dyed blue. The wood is nearly as good when young as when old. It is hard and tough, and much used to make the tools employed in husbandry. The bark is used to tan calf-skin. An infusion of the leaves, from half an ounce to an ounce, is a very good purge; and a decoction of two drams of the bark, or of six drams of the leaves, has been used to cure agues.

1161. *DIOSPYROS*, or *Indian Date-plum*.
Five species; viz. *lotus*, *virginiana*, *kaki*, *hirsuta*, *ebenum*. Italy, Barbary, Ceylon, N. America, Japan.

1163. *NYSSA*, or *Tupelo-tree*.
One species; viz. *aquatica*. N. America.

1164. *ANTHOSPERMUM*, or *Ambur-tree*.
Three species; viz. *æthiopicum*, *ciliare*, *herbaceum*. C. of G. Hope.

1336. *STILBE*.
Three species; viz. *pinastra*, *ericoides*, *cernua*. C. of G. Hope.

1165. *ARCTOPUS*.
One species; viz. *echinatus*. C. of G. Hope.

1162. *PISONIA*, or *Fingrifo*.
Two species; viz. *aculeata*, *inermis*. W. Indies.

1166. *PANAX*, or *Ginseng*.
Five species; viz. *quinquefolium*, *trifolium*, *spinosa*, *arborea*, *fruticosum*. China, North America, West Indies.—The root of the *P. quinquefolium* is the ginseng of the Chinese, of which they have an extraordinary opinion, regarding it as an universal restorative in all decays from age, intemperance, or disease. It is also found in North America, and frequently exported from thence to China. It has a very sweet taste, accompanied with a slight bitterness and warmth.

1335. *CHRYSITRIX*.
One species; viz. *capensis*. C. of G. Hope.

ORDER III. TRIOECIA.

1168. *CERATONIA*, or *Crab-tree*, *St John's Bread*.
One species; viz. *siliqua*. Spain, Sicily, Levant, Chili.

1168. *FICUS*, or *Fig-tree*.
15 species; viz. *carica*, *sycamorus*, *religiosa*, *benjamina*, *benghalensis*, *indica*, *racemosa*, *pertusa*, *pumila*, *toxicaria*, *maculata*, *trigona*, *hispida*, *heterophylla*, *microcarpa*. S. Europe, India, China, America.—The dried fruit of the *F. carica*, or ordinary fig-tree, is sometimes used in medicine as a soft emollient sweet substance. It is much esteemed by some as a suppurative; in which case it is applied as warm as it can well be endured.

—
In the class *Polygamia* are

34 Genera, including 222 Species, of which 15 are found in Britain.

CLASSIS XXIV.
CRYPTOGAMIA (o).

ORDO I. FILICES.

Sect. I. *Fructificationes spicatae.*

- * 1169. EUISETUM. Spica sparsa. Fructif. peltatae, basi valvulae.
- 1222. CYCAS. (1) Ament, imbricatum. Pollen squamam tegens. (2) Spadix ensiformis. Drupa nucleo lignoso.
- 1227. ZAMIA. (1) Strobilus squamis subtus polline tectis. (2) Strobilus squamis in utroque margine. Drupa solitaria.
- 1170. ONOCLEA. Spica disticha. Fructif. 5-valves.
- * 1171. OPHIOGLOSSUM. Spica articulata. Fructif. circumscissae.
- * 1172. OSMUNDA. Spica racemosa. Fructif. 2-valves.

Sect. II. *Fructificationes frondosa, in pagina inferiore.*

- * 1173. ACROSTICHUM. Macula discum totum occupans.
- * 1179. POLYPODIUM. Puncta disci distincta.

CLASS XXIV.
CRYPTOGAMIA.

ORDER I. FERNS.

Sect. I. *Fructifications spiked.*

- * E Spike scattered. Fructifications target-shaped, valved at the base.
- C. (1) Catkin tiled. Pollen or dust covering the scale. (2) Sheath sword-shaped. Drupe with a woody kernel.
- Z. (1) A cone with scales covered beneath with pollen. (2) A cone with scales in each border. Drupe solitary.
- O: A 2-rowed spike. Fructifications 5-valved.
- * O. A jointed spike. Fructifications cut round.
- * O. Spike branchy. Fructifications 2-valved.

Sect. II. *Fructifications frondosa, in the under surface.*

- * A. A spot occupying the whole disc.
- * P. Distinct spots on the disc.

1176.

(o) This class contains a number of vegetables whose stamens and pistils are too minute to admit of that mode of investigation which prevails through the preceding classes. The structure too of these vegetables differs considerably from that of other plants.

The *Filices* or *Ferns* constitute the first order. Their flowers are generally disposed in spots or lines on the under surface of the leaves, but sometimes in spikes. In the male flowers the anthers are found sitting or supported on a very short filament, egg-shaped or globular, scattered on the under surface of the leaves. The male flowers unite so as to form a spike or bunch, or form lines or dots underneath the leaves, either on the surface at the edge, or at the point. In some cases they entirely cover the under surface. None of the flowers have any corolla, or even a calyx, excepting perhaps a scale formed from the leaf, opening, containing globules. The seeds are very minute and globular.

The second order, called *Musci* or *Mosses*, have the female parts of fructification inclosed in a veil, which adheres to the top of the ripe capsules, and covers it. Capsule opening transversely. Stem leafy. Leaves membranaceous, reticulated; after being dead, reviving when soaked in water. In general the stamens and pistils are on separate flowers on the same or distinct plants.

The third order, or *Algæ*, includes a division of plants which scarcely admit of a distinction of root, stem, and leaf; much less can the parts of their flowers be described. Their substance is flesh-like or leather-like, membranaceous or fibrous, jelly-like or horn-like, or resembling calcareous earth. The female fructifications are either found in saucers or tubercles, as in *lichens*; in hollow bladders, as in *fucus*; or dispersed through the substance of the plant, as in *ulva*. The aquatic genera, which grow on the sea-coast, are called, in ordinary language, *sea-weeds*, or *sea-ware*, and, by incineration, produce soda or mineral alkali. The lichens are of much importance in the economy of nature. They grow on the barest rocks, and their remains form a soil on which better vegetables afterwards flourish. Some of them afford valuable colours.

The order of *Fungi*, or *Mushrooms*, consists of plants mostly of a cork-like texture, and short duration, bearing their seeds either in gills or tubes, or attached to fibres or to a spongy substance. As little is known of their fructification, the generic characters are taken from their external form.

1176. HEMIONITIS. Lineæ disci decussantes.
 * 1178. ASPLENIUM. Lineæ disci subparallele, varie.
 * 1175. BLECHNUM. Lineæ disci costæ utrinque adjacentes.
 1177. LONCHITIS. Lineæ marginis ad sinus.
 * 1174. PTERIS. Lineæ marginis ad peripheriam.
 * 1180. ADIANTHUM. Maculæ apicium margini reflexo obtectum.
 * 1181. TRICHOMANES. Fr. solitariae, margini ipsi insertæ.

Sect. III. *Fructificationes radicales.*

1182. MARSILEA. Fruct. 4-capsularis.
 * 1183. PILULAREA. Fruct. 4-locularis.
 * 1184. ISOETES. Fruct. 2-locularis.

ORDO II. MUSCI.

Sect. I. *Calypttrati.*

- * 1185. LYCOPODIUM. Anthera 2-valvis, sessilis.
 1186. PORELLA. Anthera pertusa poris.
 * 1187. SPHAGNUM. Anthera ore lævi.

Sect. II. *Calypttrati declini.*

- * 1191. SPLACHNUM. Anth. cum apophysi maxima.
 * 1192. POLYTRICHUM. Anth. cum apophysi minima, marginata.
 * 1193. MNIMUM. Anth. sine apophysi.

Sect. III. *Calypttrati monoclini.*

- * 1189. PHASCUM. Anth. operculata, ore ciliato.
 * 1194. BRYUM. Anth. pedunculo terminali è tuberculo.
 * 1195. HYPNUM. Anth. pedunculo laterali è perichætio.
 * 1190. FONTINALIS. Anth. sessilis, perichætio imbricato obvoluta.
 * 1188. BUXBAUMIA. Anth. pedunculata, altero latere membranacea.

ORDO III. ALGÆ.

Sect. I. *Terrestres.*

- * 1198. MARCHANTIA. Fl. calyci communi peltato, subtus florido.
 * 1196. JUNGERMANNIA. Fl. calyci simplici, 4-valvi.
 * 1197. TARGIONIA. Fl. calyci 2-valvi.
 * 1201. ANTHOCEROS. Fl. calyce tubuloso. Anther. subulata, bivalvis.
 * 1199. BLASIA. Fr. cylindrica, tubulosa.
 * 1200. RICCIA. Fr. granulis frondi innatis.
 * 1202. LICHEN. Fr. receptaculo lævi nitido.
 1208. BYSGUS. Substantia lanuginosa, vel pulverulenta.

- H. Lines of the disc cross pairs.
 * A. Lines of the disc nearly parallel, various.
 * B. Lines of the disc adjacent to the rib on each side.
 L. Lines at the inside of the margin.
 * P. Lines at the extremity of the margin.
 * A. Spots covered with the reflected margin of the points.
 * T. Fructifications solitary, placed on the very margin.

Sect. III. *Fructification at (or very near) the root.*

- M. Fructification 4-capsuled.
 * P. Fructif. 4-celled.
 * I. Fructif. 2-celled.

ORDER II. MOSSES.

Sect. I. *Not calyptred, i. e. not veiled.*

- * L. Anther 2-valved, sitting.
 P. Anther pierced with holes.
 * S. Anther with a level mouth.

Sect. II. *Veiled dioicous.*

- * S. Anth. with a very large excrescence.
 * P. Anth. with a very small excrescence, bordered.
 * M. Anth. without an excrescence.

Sect. III. *Veiled monoicous.*

- * P. Anth. lidded, mouth fringed.
 * B. Anth. on a terminal fruit-stalk arising out of a little solid pimple.
 * H. Anth. on a lateral fruit-stalk out of an involucre or cover.
 * Anth. sitting, enveloped in a tiled cover.
 * B. Anth. on a fruit-stalk, one side membranous.

N. B. The term *anthera* in this order ought rather to be translated by the word *capsule*, as there are seeds contained in it.

ORDER III. ALGÆ.

Sect. I. *Terrestrial.*

- * M. Flower with a common calyx, target-shaped, flowering underneath.
 * J. Flow. calyx simple, 4-valved.
 * T. Flow. calyx 2-valved.
 * A. Flow. calyx tubular. Anther awl-shaped, 2-valved.
 * B. Fructif. cylindrical, tubular.
 * R. Fructif. granules imbedded in the frond.
 * L. Fructif. receptacle even, shining.
 B. Substance downy, or powdery.

Sect.

Sect. II. *Aquaticæ.*

- * 1204. TREMELLA. A. gelatinosa.
- * 1206. ULVA. A. membranacea.
- * 1205. FUCUS. A. coriacea.
- * 1207. CONFERVA. A. capillaris.

ORDO IV. FUNGI.

Sect. I. *Pileati.*

- * 1209. AGARICUS. Pileus subtus lamellosus.
- * 1210. BOLETUS. Pileus subtus porosus.
- * 1211. HYDNUM. Pileus subtus echinatus.
- * 1212. PHALLUS. Pileus subtus lævis.

Sect. II. *Pileo destituti.*

- * 1213. CLATHRUS. F. cancellatus.
- * 1214. HELVELLA. F. turbinatus.
- * 1215. PEZIZA. F. campanulatus.
- * 1216. CLAVARIA. F. oblongus.
- * 1217. LYCOPERDON. F. globosus.
- * 1218. MUCOR. F. vesicularis stipitatus.

Sect. II. *Aquaticæ.*

- * T. A. gelatinous.
- * U. A. membranous.
- * F. A. leather-like.
- * C. A. capillary.

ORDER IV. FUNGI.

Sect. I. *With a cap.*

- * A. Cap gilled underneath.
- * B. Cap porous underneath.
- * H. Cap prickly underneath.
- * P. Cap smooth beneath.

Sect. II. *Without a cap.*

- * G. F. latticed.
- * H. F. turban-shaped.
- * P. F. bell-shaped.
- * C. F. oblong.
- * L. F. globular.
- * M. F. little bladders on a pillar.

WITHOUT reciting the names of the species of this class, we shall state their numbers, and such circumstances relative to particular kinds of plants belonging to it as seem most worthy of attention.

ORDER I. FERNS.

1169. Equisetum.

Seven species; of which six are British.

hyemale.

* E. stem naked, rough, somewhat branched at the base. *Rough horsetail, shave-grass, pewter-wort, Dutch rushes.*—The turners or cabinet-makers use it to polish their work. It is said to be wholesome to horses, but hurtful to cows. Sheep dislike it.

1222. GYCAS, or *Todda Pana.*

Two species. E. Indies, China, Japan.

1227. ZAMIA.

Two species. Cape, E. Florida, W. Indies.

1190. ONOCLEA, or *Sensible Fern.*

Two species. N. America.

1171. OPHIOGLOSSUM, or *Adder's Tongue.*

Nine species; one British. Europe, East and West Indies, America.

1172. OSMUNDA, or *Flowering Fern.*

22 species; 4 British. Europe, America.

1173. ACROSTICHUM, or *Forked Fern.*

35 species; 2 British. Europe, Africa, America.

1179. POLYPODIUM, or *Polypody.*

78 species; 18 British. Europe, Madeira, India, America.

filix-mas.

* P. leaves almost doubly winged; leaflets strap-spear-shaped; stem and midribs chaffy. *Male fern, male*

polypody.—The Siberians boil it in their ale, and are fond of the flavour it imparts. The powder of the root is a remedy for expelling the tape-worm. A liquid lubricating supper is given to the patient; and, if costive, a common glyster. Early next morning two or three drams of the root in powder are mixed with water, and swallowed. If thrown up, the dose must be repeated. The patient must fast two hours, and then take a strong purge.

1176. HEMIONITIS, or *Mules-fern.*

Four species. Jamaica, South America.

1178. ASPLENIUM, or *Spleenwort.*

28 species; 9 British. Europe, Java, America.

1175. BLECHNUM.

Six species; one British. America, Cape, E. Indies.

1117. LONCHITIS, or *Rough Spleenwort.*

Four species. Jamaica, South America.

1174. PTERIS, *Brakes, or Female-fern.*

23 species; two British. Europe, E. and W. Indies, N. America, China.

* P. leaves more than doubly compound; leaflets wing-aquilina. ed; wings spear-shaped; the lowermost wing-cleft, the upper ones smaller.—The common people in many parts of England mix the ashes with water, and form them into balls; these balls are afterwards made hot in the fire, and then used to make an alkaline ley for scouring linen. It makes very durable thatch, and is excellent litter for horses and cows. It affords a violent heat, and, where coal is scarce, is used to burn limestone and heat ovens.

1180. ADIANTHUM, or *Maiden-hair.*

27 species; one British. Europe, Africa, America.

1181.

1181. TRICHOMANES, or *Tunbridge Maiden-hair*.
13 species; two British. S. Europe, Cape, China,
America.

1182. MARSILEA.
Three species. Siber. France, Italy, S. Amer.

1183. PILULARIA, or *Pepper-grass*.
One species; British.

1184. ISOETES, or *Quillwort*.
Two species; one British. Coromandel.

ORDER II. MUSCI.

1185. LYCOPODIUM, or *Club-moss*.
29 species; three British. E. and W. Indies, Ma-
deira, America.

clavatum. * L. leaves scattered, terminating in threads; spikes cylindrical, on fruitstalks, in pairs. *Common club-moss, wolf's claw*.—In Sweden they form it into mats or besses, which lie at their doors to clean shoes upon. It restores ropy wine in a few days. The seeds flash when cast into a flame, and are said to be sometimes used in theatres to imitate lightning. They are with difficulty made wet, and if scattered on a basin of water, the hand may be dipped to the bottom without wetting it.

1186. PORELLA.
One species. Pennsylvania.

1187. SPHAGNUM, or *Bog-moss*.
Three species; all found in Britain.

1191. SPLACHNUM, or *Bottle-moss*.
13 species; 12 British. Europe.

1192. POLYTRICHUM, or *Golden Maiden-hair*.
18 species; 16 British. Jamaica, Magellan.

1193. MNIMUM.
20 species; all British.

1189. PHASCUM.
13 species; 11 British. Eur. N. Amer.

1194. BRYUM.
93 species; British.

1195. HYPNUM.
70 species; all British. W. Indies, &c.

1190. FONTINALIS, or *Water-moss*.
Six species; British.
antipyretica. * F. capsules lateral; leaves acute, keeled, doubled together, disposed in three rows. *Greater water-moss*.—Contrary to the nature of all other mosses, this species is scarcely combustible. Accordingly, the Scandinavians line the inside of their chimneys with it to defend them against fire.

1188. BUXBAUMIA.
Two species; one British. Europe.

ORDER III. ALGÆ.

1198. MARCHANTIA, or *Liver-green*.
Seven species; five British. N. Amer. W. Ind.

1196. JUNGERMANNIA, or *Star-tip*.
48 species; British.

1197. TARGIONIA.
Two species; British. S. Europe.

1201. ANTHOCEROS.
Three species; two British. N. Amer. Jam.

1199. BLASIA.
One species; British.

1200. RICCIA, *Marsh Liverwort*.
Five species; British. Jamaica.

1202. LICHEN, or *Liverwort*.
218 species; all British. Also Cape, India, Ame-
rica.

Lord Dundonald obtained a patent, dated July 31. 1802, for the discovery of a substitute for the foreign gums, to be obtained from the plants of this genus. The specification of his lordship's patent is in these terms: "My invention consists in procuring a substitute or substitutes for gum senegal, or other gums, from the class of plants called in botany *lichens*; from the plants of hemp and flax, previous to being steeped in water, or after being steeped; likewise from the bark or rind of the willow or lime tree. The process for obtaining the gum may be varied according to circumstances, and is done by washing the materials in water; digestion, and boilings, and with or without the aid of fixed or volatile alkaline salts or their solutions.

"It does not appear, from such trials as I have hitherto made, that there is any very great difference of the produce of gum from the lichen collected from different trees or shrubs: all of them answer equally well for yielding a gum fit for calico-printing. The lichen is most abundant on the trees which grow in a poor stiff clay soil, and particularly if situated at some considerable height above sea level. It should be pulled in dry weather, otherwise it is apt to break in the pulling; besides, in this case, requiring to be dried before it can with safety be laid up in the storehouse, where, if put in dry, it may be kept for years. Should a sufficient quantity of it not be found in this country, it may be had in almost unlimited abundance in Sweden, Norway, and in the northern parts of America, where it grows to the length of from a foot to 18 inches, depressing the branches of the trees by its weight. There is, however, every reason to believe that a sufficient quantity is to be had in this country. According to information received from botanists, it takes three or four years in coming to maturity or its full size; so that a crop from the same tree may be had every fourth year. The lichen does not consist entirely of a gummy matter; there is the outer skin or cuticle, below that a green resinous matter. The remainder of the plant consists of partly gum, partly somewhat analogous to animal substances, and a small proportion of fibrous matter, which cannot be dissolved by boiling, or the action of alkaline salts.

"The first process in preparing gum from the lichen, is to free it of the outer skin of the plant and the resinous matter. This is done by scalding the lichen two or three times with boiling water, allowing it to remain so long in the water as by absorbing it to swell; in doing this the skin cracks, and comes off along with the greatest part of the resinous matter; or it may be freed from them by gently boiling the lichen for about 15 or 20 minutes, then washing it in cold water,

water, laying it afterwards on a stone or brick floor, where it should lie for 10 or 12 hours, perhaps more. The reason for this is, that the exposure for that time to air, greatly facilitates the subsequent extraction of the gum.

"The scalded lichen is then to be put into a copper boiler, with a due proportion of water, say three Scots pints, or two wine gallons, to every pound of lichen, and boiled during 10 or 12 hours, adding about a quarter of an ounce of soda or pearl ashes for every pound of lichen; or instead of these salts, about two ounces of volatile alkali. The boiling should be continued until the liquor acquires a considerable degree of gummy consistence. It is then to be taken out of the boiler, allowed to drain or drip through a wire or haircloth searce. The residuum to be put into a haircloth bag or bags, and to be squeezed in a press similar to that which is used by the melters or rinders of tallow.

"The first boiling does not extract the whole of the gum. The lichen should be boiled a second, or even a third time, repeating the process as above described, diminishing at each process the quantity of water and the quantity of alkali, which a little experience will soon point out: when three boilings are employed, the gummy extract of the last boiling should be kept for the first boiling of a fresh batch of lichen; the extract proceeding from the first and second boilings should be mixed together, and evaporated to the consistence necessary for block or press printing. The evaporating vessels should be of tin or thin lead, placed over a range of stoves, and moderately heated by fire, or the steam of water. It has been neglected to state, that before evaporating the gummy extract to the consistence necessary, it should be kept 10 or 12 hours, so as to allow the sediment or dregs to subside. The clean liquor may either be drawn off by a syphon, or the dregs may be drawn off by a cock at the bottom of the wooden vessel; the bottom of which should be made sloping, higher at the back than the fore part, in order that the dregs may run more completely off. The proportion of gummy matter remaining in the dregs may be got off by mixing them with a due proportion of boiling water, allowing the liquor to clear, and proceeding as above directed, employing this weak solution for boiling the next batch of lichen. When volatile alkali is used, the boiler should be of iron, as volatile alkali acts on copper. Hemp, flax, and the bark of the willow and lime trees, or sea weed, are to be heated in a similar manner, to extract the gum or mucilage contained in them. Likewise it is intended that this patent shall include every tree, plant, or vegetable of whatever kind, from whence a mucilage or gum is to be obtained by the action of volatile or fixed alkaline salts, or their solutions, when used in the processes of maceration, digestion, or boiling these vegetable matters; being a method of obtaining a mucilage or gum never before practised and adopted by any other person."

The above invention was for some time practised to a great extent by the calico-printers in the west of Scotland, where it was found to answer for almost all colours. We have heard, however, that the use of it has been discontinued; whether from the price of gum senegal, for which it was employed as a substitute, ha-

ving fallen, or that it has otherwise failed of its effect, we have not been informed.

* *L. tubercles* black, crust clear white.—Grows only *calcarcus*. on limestone rocks. When dried, powdered, and steeped in urine, it is used to dye scarlet by the Welsh and the inhabitants of the Orkneys. The colour is said to be very fine.

* *L. saucers* white, mealy, with yellowish white, thick, *parellus*. blunt borders; crust yellow white.—Grows on rocks, walls, trunks of trees, &c. Litmus is prepared from this species. For this purpose it is collected from the rocks in the north of England, and sent to London in casks.

* *L. saucers* yellow, with a white border; crust whitish. *tartareus*. —Grows on rocks and stones. In Derbyshire it is gathered for the dyers. It gives a purple colour.

* *L. saucers* dull purple; leaves hoary, smooth, blunt, *omphamany-cleft*, sprinkled with rising dots. *Cork, corker, lodes, or arcell*.—It dyes wool a reddish brown, or a dull but durable crimson or purple, paler but more lasting than that of orchal. In Ireland it is prepared by steeping in stale urine, adding a little salt to it, and making it up into balls with lime. Wool dyed with it, and then dipped in the blue vat, becomes of a beautiful purple. With rotten oak it makes a dark brown. It has been used as a styptic.

* *L. tubercles* brown; plant hoary, hollow, much *rangiferi*-branched; terminating branches turned downwards.—*nus*. The Laplanders could not exist without this plant, which feeds, and even fattens, their rein-deer.

* *L. plant* lemon-coloured, upright, much branched; *vulpinus*. branches nearly of a length, angular; angles unequal. —In Norway they mix this plant with powdered glass, and strew it upon dead carcases to poison wolves.

* *L. saucers* brown, white on the outside, on pedicles; *prunastra*. foliage nearly white, quite white and cottony underneath; pitted rather than upright.—It imbibes and retains odours in a remarkable degree, and is therefore the basis of many perfumed powders.

* *L. saucers* red brown, mostly on the edges of the *fo-pulmona*-liage; leaves green, jagged, blunt, smooth; pitted, *rius*. downy underneath. *Lungwort, hazel-rag, or hazel-crotties*.—It is recommended for consumptive cases. Woollen cloth, boiled in it, is said to become of a durable orange. In Herefordshire it is used to dye stockings of a durable brown.

* *L. saucers* red brown; foliage pale green, wrinkled, *caperatus*. waved at the edge, creeping.—In Ireland and the Isle of Man, it is used to dye wool of an orange colour. Serge, dyed with it, becomes of a lemon colour; but, if previously infused and boiled in urine, of a russet brown.

* *L. saucers* black, flattish; foliage gray brown, consist-*pustulatus* ing of a single leaf, circular, slightly lobed, sprinkled with a black bran-like powder; pitted underneath.—A beautiful red colour may be prepared from it (Linnaeus). It may be converted into an exceedingly black paint.

1208. BYSSUS.

12 species; British.

1204. TREMELLA, or Star-jelly.

19 species; British.

1206. ULVA, or Laver.

14 species; British.

1205. FUCUS, or *Wrack, Sea-weed*.
85 species; British.

1207. CONFERYA, or *Crow-fike*.
53 species; British.

ORDER IV. FUNGI.

1209. AGARICUS, or *Agaric*.
278 species; British.

1218. BOLETUS.
50 species; British. China, America.

1211. HYDNUM.
11 species; British. N. Amer. W. Indies.

1212. PHALLUS, or *Stink-horns*.
Four species; three British.

1213. CLATHRUS.
Four species. S. Europe.

1214. HELVELLA, or *Turban-top*.
13 species; British.

1215. PEZIZA, or *Cup-mushroom*.
39 species; British.

1216. CLAVARIA, or *Club-mushroom*.
24 species; British.

1217. LYCOPERDON, or *Truffle, Puff-ball*.
25 species; British.

1218. MUCOR, or *Mould*.
17 species; British.

In the class *Cryptogamia* are

51 Genera, including 1467 Species, of which 1210 are found in Britain.

APPENDIX.

PALMÆ, tripetalæ (F).

Sect. I. *Flabellifolia*.

1219. CHAMÆROPS. Dioeca. Drupæ tres.
1220. BORASSUS. Dioeca. Drupa 3-sperma.
1221. CORYPHA. Dioeca. Drupa 1-sperma.

Sect. II. *Pennatifolia*.

1224. PHOENIX. Dioeca. Drupa 1-sperma.
1284. ELÆIS. Dioeca. Drupa 1-sperma, coriacea.
Cal. et cor. 6-partita.
1225. ARECA. Monœca. Drupa 1-sperma, calyce imbricata.
1226. ELATĒ. Monœca. Drupa 1-sperma.
1223. COCOS. Monœca. Drupa 1-sperma, coriacea.

Sect. III. *Bipennatifolia*.

1228. CARYOTA. Monœca. Drupa 2-sperma.
1436. MAURITIA. Masc. amentum.

PALMS, 3-petaled.

Sect. I. *Fan-shaped leaves*.

- C. Dioecious. Drupes 3.
B. Dioecious. Drupe 3-seeded.
C. Dioecious. Drupe 1-seeded.

Sect. II. *Wing-shaped leaves*.

- P. Dioecious. Drupe 1-seeded.
E. Dioecious. Drupe 1-seeded, leather-like. Cal. and cor. 6-parted.
A. Monœcious. Drupe 1-seeded. Cal. tiled.
E. Monœcious. Drupe 1-seeded.
C. Monœcious. Drupe 1-seeded, leather-like.

Sect. III. *Double wing-shaped leaves*.

- C. Monœcious. Drupe 2-seeded.
M. Male flower catkin.

1219.

(F) These, though capable of being arranged in the several classes of the system, yet on account of their singular structure, have been placed in an appendix, containing such genera as have a spadix and spathe, i. e. whose flowers and fruit are produced on that particular receptacle or seat called a *spadix*, protruded from a common calyx in form of a sheath called *spatha*. This order consists of trees and shrubs only. These have always a simple stem, not branched, bearing leaves at the top resembling those of fern, being a composition of a leaf and a branch, called *frondes*; and the corolla hath always three petals, or three deep divisions. The known genera are 10 in number.

1219. *CHAMÆROPS*, or *Dwarf Palm, Palmetto*.
Two species; viz. *humilis*, *excelsa*. S. Europe.

1220. *BORASSUS*, or *Fan Palm*.
One species; viz. *flabelliformis*. Malabar.

1221. *CORYPHA*, or *Mountain Palm*.
Two species; viz. *umbraculifera*, *minor*. E. Indies, Carolina.

1223. *COCOS*, or *Cocoa-nut Tree*.
Three species; viz. *nucifera*, *butyracea*, *guineensis*. Guinea, E. and W. Indies.—This tree is well known on account of the rich milky juice that its nut contains. The species, styled *butyracea*, yields what is called *palm oil*. This oil, as brought to us from the West Indies and Africa, is about the consistence of an ointment, and of an orange colour. It has a strong, not disagreeable smell, but very little taste. By long keeping it loses its high colour, and becomes white, when it ought to be rejected as no longer fit for use. The inhabitants of the Guinea coast are said to make the oil part of their food, and to employ it for the same purposes as we do butter. With us it is rarely given inwardly, and used only in some external applications for pains and weaknesses of the nerves, cramps, sprains, and the like. The common people apply it for the cure of chilblains; and when early made use of, not without success.

1224. *PHOENIX*, or *Common Palm, Date-tree*.
One species; viz. *dactylifera*. Levant, India.—Dates, the fruit of this tree, are imported into Britain in the state of a half-dried fruit, about the size of an acorn, but generally larger, consisting of a sweet pulpy part, and a hard stone: the best are brought from Tunis. They were formerly used in pectoral decoctions; and supposed, besides their emollient and in-crassating virtue, to have a slight astringency. They form the principal part of the food of the inhabitants of some of the oases, or inhabited spots, of the great African desert.

1284. *ELÆIS*.
One species; viz. *guineensis*. Guinea.

1225. *ARECA*, or *Cabbage-tree*.
Two species; viz. *catechu*, *oleracea*. E. and W. Ind.

1228. *CARYOTA*.
One species; viz. *urens*. India.

1229. *ELATE*, or *Wild Malabar Palm*.
One species; viz. *sylvestris*. E. Indies.

1436. *MAURITIA*, or *Ginkgo, Maiden-hair-tree*.
One species; viz. *flexuosa*.

In the order of Palmæ are

10 Genera, including 15 species, all foreign.

The following TABLE contains a statement of the number of Plants which we have mentioned or described in this Treatise.

	Genera.	Spec.	B. Spec.
I. MONANDRIA contains	30	84	8
II. DIANDRIA	39	299	29
III. TRIANDRIA	90	920	147
IV. TETRANDRIA	117	638	56

HISTORY OF BOTANY.

HAVING thus stated the botanical arrangement contrived by Linnæus, which proceeds upon the supposition of the existence of a sexual system in the vegetable world; we proceed to take notice of some other important circumstances connected with this branch of science, more particularly its history, and the natural orders, as opposed to the above artificial classification of plants.

Sect. I. *Ancient Writers upon Botany.*

THE origin of this science, like that of most others, cannot be found out from the most ancient histories; but it is very probable, that some degree of botanical knowledge has existed in every age of the world. The first botanical writings of which we have any account

VOL. IV. Part I.

are those of Solomon, who we are informed by Scripture wrote a treatise upon this subject; which, however, is absolutely lost, not being quoted by any ancient author, nor the least fragment of it remaining. Among the Greeks, Anaxagoras, Pythagoras, and other ancient philosophers, wrote treatises on plants; but their works are also lost; and from the quotations that yet remain in the works of Theophrastus, Dioscorides, and Pliny, we learn, that those first botanical writings could convey but very little information.

The historical æra of botany, therefore, commences with Theophrastus the disciple of Aristotle. He was born at Eresium, in the island of Lesbos; and flourished in the third century before the Christian æra, being about 100 years posterior to Hippocrates. His work is entitled *The History of Plants*, and treats of their origin,

origin, propagation, anatomy, and construction; of vegetable life, and of vegetation. It consisted originally of ten books; but of which only nine are now extant. In these, vegetables are distributed into seven classes or primary divisions; which have for their object, the generation of plant; their place of growth; their size, as trees and shrubs; their use, as pot herbs, and esculent grains; and their lactescence, or the liquor, of whatever colour, that flows from plants when cut. In his work, above 500 different plants are described.

The next botanist of any note was Dioscorides, a Grecian by birth, but under the Roman empire, being near 300 years posterior to Theophrastus. He describes about 600 plants; and these he has arranged, from their uses in medicine and domestic economy, into four classes, which are thus designed: aromatics; alimentary vegetables, or such as serve for food; medicinal, and vinous plants.

Almost cotemporary with Dioscorides flourished Antonius Musa, Cato, Varro, Virgil, and Columella; the first, author of a treatise still extant on the plant *betony*; the four others celebrated for their useful tracts on agriculture and rural economy.

Pliny the Elder, in his voluminous work entitled *The History of the World*, hath a botanical part which is contained in 15 books. In these, besides the plants of Theophrastus and Dioscorides, he has given descriptions of several new species, extracted probably from works which would otherwise have been totally lost. Pliny uses scarce any mode of arrangement, except the ancient, but very incorrect, distinction into trees, shrubs, and herbs. His plan, however, extends not only to botanical distinctions, but to gardening, agriculture, and whatever is connected either more nearly or remotely with the science of plants. He gives descriptions of above 1000 different species; but from the want of a proper systematic arrangement, it is often difficult, and perhaps impossible, to determine what plants he or other ancient botanists do really describe.

This want of precision in properly arranging their plants was the reason why the botany of the ancients was always very limited, and after the time of Pliny declined so rapidly. On the destruction of the Western empire by the Goths and other barbarous nations, it is not to be thought that botany could survive any more than the other sciences. It was not till near the close of the eighth century, that the ancient botany began again to appear in Arabia. Serapion, well known in medicine, stands first in the Arabian catalogue of botanists; to him succeeded Razis, Avicenna, Averrhoes Actuarius, &c. An author known by the name of *Plato Apuleius*, or *Apoliensis*, of whose *Herbarium* very old manuscript copies are preserved in some curious libraries, is supposed to have lived near this period. The works of most of these botanists, however, were only translations and compilations from the Greek writers: so that, for want of a proper systematic arrangement, the science sunk a second time into total oblivion. For near 400 years after Abenguefit, an Arabian physician who flourished in the end of the 12th century, scarce any attempts were made in the botanical way. Some obscure writers indeed appeared in several parts of Europe; as Arnoldus de Ville Nova; Platearius; Mattheus Sylvaticus; and Bartholomew Glanvil,

commonly called *Bartholomew Anglus*, a Franciscan monk, descended of the family of the earls of Suffolk, who lived in the reign of King Edward III. and wrote a book of natural history, antititled *De proprietatibus rerum*, which was translated into English by John de Trevisa in 1398: but though all these wrote of plants, they were so totally destitute of method, that their works remain one great chaos, from whence it is impossible to extract any thing intelligible.

On the revival of letters in the beginning of the 16th century, the botany of the ancients was restored a second time. The Greek writings were translated into Latin the common language of Europe. Gaza, a Greek refugee at Rome, made elegant translations of Aristotle and Theophrastus, who afterwards were commented upon by Scaliger and Stapel. Dioscorides was also translated and commented on. His best commentators are Hermolaus Barbarus, Fuchsius, Ruellus Cordus, Gesner, and Matthioli. The most distinguished commentators on Pliny are Dalechamp in 1604, Salmasius in 1689, Harduin and Guilandinus. Meursius and Ursinus have written commentaries upon Cato; Campegius and Monardes upon Mesue the Arabian, and Lonicer upon Avicenna. This last hath been translated by several writers, particularly Alpagus, Costæus, and Plempius, into Latin; and by one writer, Amalthæus, into Hebrew.

Hieronymus Bock, or Bouc, a German, generally known by the name of *Tragus*, is the first modern who has given a methodical distribution of vegetables. In 1532, he published a History of Plants, in which he describes 800 species; and these he divides into three classes, founded on the qualities of vegetables, their figure, habit, and size. The same method of arrangement was followed by Lonicer, Dodonæus. L'Obel, Clusius, Brunsfelsius, Monardes, Cordus and some other botanists of this period. How far such a method was deficient, shall be considered in the following section; however, it was not till 1560 that Conrad Gesner first proposed to the world an arrangement of vegetables from the parts of the flower and fruit. He did not establish any plan founded upon this principle; but having suggested the idea, left the application to be made by others: and in 1582 Dr Andrew Cæsalpinus, physician at Pisa, and afterwards professor of botany at Padua, first availing himself of the ingenuity of his predecessor, proposed a method of arrangement which has the fruit for its basis; and thus gave origin to systematic botany, the second grand æra in the history of that science.

Even this improved method of Cæsalpinus was not without very great inconveniences, which shall be taken notice of hereafter. As it was, however, so greatly superior to every thing that had happened before, it might have been expected that the learned would have immediately adopted it, and that all the former equivocal and insufficient characters would have been rejected. But the fact was otherwise. Cæsalpinus's method of arrangement died with him; and it was not till near a century after, that Dr Robert Morrison of Aberdeen, attaching himself to the principles of Gesner and Cæsalpinus, re-established scientific arrangement upon a solid foundation; so that, from being only the restorer of system, he has been generally celebrated as its founder. In the long interval between Cæsalpinus and

and Morrison flourished some eminent botanists. The most noted are, Dalechamp, author of *A general History of Plants*; Theodore, surnamed *Tabernaemontanus*, and Thalius, two German writers; Porta, an Italian, famous for an arrangement of plants from their relations to the stars, to men, and other animals; Prosper Alpinus, author of a Catalogue of the Plants of Egypt; Fabius Columna, inventor of many of the botanical terms now used; the two Bauhins; Gerard and Parkinson; Zaluzianski, a Pole, author of an arrangement from the qualities and habits of plants; Margrave and Piso, celebrated for their natural history of Brazil; Hernandez, equally celebrated for his history of Mexico; Passæus, or Du Pas, author of an arrangement of plants from the time of flowering, of all characters the most uncertain and insufficient; Johnston; Bontius, a Dutchman, author of a *Natural History of the East Indies*; Aldrovandus, the celebrated naturalist; and Rheede, governor of Malabar, and author of the well-known *Hortus Malabaricus*.

The method proposed by Morrison has the fruit for its basis, as well as that of Cæsalpinus; to which, however, it is greatly inferior both in the plan and execution. It is indeed of all others the most difficult in practice, and was therefore not adopted by any succeeding writer, except Bobart, who in 1699 completed Morrison's *Universal History of Plants*, and an anonymous author whose work appeared in 1720. Imperfect, however, as his method is, it furnished many useful hints, which succeeding botanists have not failed to improve. Ray and Tournefort have owed him much, and are not ashamed to own the obligation. The same has been done even by Linnæus; who hath established the science of botany on the most solid foundation, by introducing a method of arrangement, if not absolutely perfect, at least as nearly approaching to perfection as can be expected; and which therefore hath been deservedly followed, in preference to every other, by all botanists, since its first publication. But to give a particular account of all the different botanical systems, with the particular advantages and disadvantages attending each, shall be the business of the subsequent sections.

Sect. II. *Of the Ancient Method of arranging Vegetables.*

Defects of the arrangement of Dioscorides.

IN giving an account of the works of Theophrastus and Dioscorides, we have already taken notice that the former chose seven distinguishing characters, viz. the generation of plants; their place of growth; their size, as trees and shrubs; their use, as pot herbs and esculent grains; and their lactescence, or liquor that flows from them when cut. Dioscorides divided them into aromatics, alimentary, medicinal, and vinous plants. The good properties of this method are, that the botanist as it were comes to the point at once; and when he knows the plant, knows also its virtues and uses, or at least part of them: but this convenience is greatly overbalanced by innumerable disadvantages; for the qualities and virtues of plants are neither fixed and invariable, nor are they impressed in legible characters on the plants themselves. The different parts of a plant often possess different and even opposite virtues; so that supposing the virtues to be known, and applied to the

purpose of vegetable arrangement, the roots must frequently fall under one division, the leaves under a second, and the flower and fruit under a third. Besides, if we reflect that the sole end of such arrangement is to facilitate the knowledge of plants to others, the insufficiency and even absurdity of methods founded upon their virtues will immediately appear. A stalk of vervain, for instance, is presented to me, which I am to investigate from a presupposed knowledge of the virtues of plants. Before I can settle the class to which it belongs, I must discover whether or not it has the virtues belonging to any of the plants I know; and this discovery being the result of repeated experiments on various parts of the human body, may require many years for its accomplishment.

The same causes which render methods founded on the virtues of plants unfavourable for the purpose of investigation, must evidently disqualify all their other variable quantities and accidents from having a place in a genuine systematic arrangement. The *natale solum* of plants, which is one of Theophrastus's divisions, affords no better distinctive characters than their powers and virtues. Many countries as well as many soils produce the same individual plants. The same species which crown the mountains, frequently cover the fens; and plants which have long been reckoned the peculiar inhabitants of some parts of Asia and America, are now found to grow naturally in equal perfection in the very different climates of Lapland and Siberia. The size of plants, which suggested the ancient division into trees and shrubs, is no less an equivocal mark of distinction than the circumstances already mentioned. The vine, which modern botanists denominate a shrub, was ranged by Theophrastus in his third class containing trees. In fact, every thing respecting size is so much affected by differences of soil, climate, and culture, that the same plant, in different circumstances, shall differ exceedingly in height; and in a method founded upon the size, would sometimes be ranged as a tree, and sometimes as a shrub, or even an under-shrub, according as it happens to exceed, equal, or fall short of, a given standard. No less insufficient are characteristic marks drawn from the colour, taste, and smell of plants. Of all the attributes of vegetable nature, colour is perhaps the most inconstant. Heat, climate, culture, soil, &c. contribute to the production of endless diversities of colour, and render the transition from one to another natural and easy. Red and blue pass easily into white, white into purple, yellow into white, red into blue, blue into yellow, &c. In the same leaf or flower, different colours are frequently observed. Variations too in point of colour are frequently observed to take place not only in different individuals of the same species, but even in similar parts of the same plant. Marvel of Peru and sweetwilliam produce flowers of different colour upon the same stalk. Objections equally valid lie against characteristic marks drawn from the taste and smell. The former varies in different individuals from differences of age, and even in the same individual at different times, according to the morbid or sound state of the organ. The latter is different in different subjects, and varies in each; nor are the effluvia sent forth from the same body always of equal intensity. In plants, taste is subject to continual variations, from difference of climate, soil, and culture.

Garlic in some climates, particularly in Greece, is said to lose its rankness: apples and pears that grow naturally in the woods, are intolerably acid; celery and lettuce, which culture renders sweet and palatable, are in their wild uncultivated state bitter, disagreeable, and in some cases noxious.

These considerations are abundantly sufficient to show the imperfections of the ancient system of botany; and, indeed, considering the vague and uncertain marks by which the ancients distinguished one plant from another, we may rather wonder how such a science as botany came to have an existence among them, than that they arrived at no greater perfection in it, or suffered it so soon to fall into oblivion.

Sect. III. *Of the different Botanical Systems from the time of Gesner to that of Linnaeus.*

THE insufficiency of the ancient botanical system being so fully shown in the last section, we think it needless to take much notice of the methods used by Tragus and his cotemporaries and followers. The virtues of plants being found an insufficient characteristic, succeeding botanists had taken in the root, stem, and leaves; but these being also found insufficient and variable, Gesner turned his eye to the flower and fruit, as being the most permanent and unchangeable parts of the plant. In proposing the parts of fructification, however, as the most proper for arranging plants, he communicated no hints respecting the choice of some of those parts in preference to others. Each particular organ of the flower and fruit furnishes sufficient variety to serve as the foundation of a method; but all of them are not equally proper for this purpose. Cæsalpinus, the first follower of Gesner, made a mistake in his choice, and took his distinguishing characteristics only from the fruit. The parts of the flower, therefore, being employed by the first systematic writers only as subaltern directions in finding out orders and genera, it is evident that the plant could not be fully investigated for several months. Suppose a plant ripens its fruit in October, and does not produce flowers till the following May: the class, upon inspection of the fruit in the month of October, is immediately ascertained; but the plant still remains unknown, and will continue so upwards of six months after, if the characters of the order and genus have been made to depend on any part of the flower. Methods founded on the fruit have another inconvenience; plants constantly ripen their fruit in these countries where they grow naturally, but not always in the countries to which they may be accidentally transported. So far from this, that many plants that are natives of a warm climate, neither ripen nor form fruit in a cold one. Few of the African, Asiatic, and West Indian plants produce fruit in Britain. A method, therefore, founded upon the fruit, could only facilitate the knowledge of such plants to the inhabitants of those countries where they grow: to the English botanist they could be of little or no service. The same objection cannot reasonably be urged against methods founded on the flower, since the influence of climates much colder than that of Britain has not been able to destroy the faculty of producing flowers in many, perhaps in most of the plants just mentioned.

Cæsalpinus sets out with an ancient distinction of

vegetables, from their duration, into trees and herbs. With the former he combines shrubs; with the latter, under-shrubs; and distributes his plants into the 15 following classes. 1. Trees with the germ (radicle or principle of life in the seed) on the point of the seed. 2. Trees with the germ on the base of the seed. 3. Herbs having one seed only. 4. Herbs having two seeds. 5. Herbs having four seeds. 6. Herbs having many seeds. 7. Herbs having one grain or kernel. 8. Herbs having one capsule. 9. Herbs having two capsules. 10. Herbs having fibrous roots. 11. Herbs having bulbous roots. 12. Herbs having succory or endive-like flowers. 13. Herbs having common flowers. 14. Herbs having several follicles or seed-bags. 15. Herbs having neither flower nor seed.

The inconveniences of this method have been already pointed out pretty fully, and will evidently appear upon an attempt to refer any common plant to one of the 15 above-mentioned classes. His sections, orders, or secondary divisions, are 47 in number, and depend upon a variety of parts and circumstances. The principal of these are, the disposition, situation, and figure of the flowers; the nature of the seed-vessel, or cover of the seeds; the situation of the radicle in the seed; the number of seed-lobes, or seminal leaves; the disposition of the leaves, and colour of the flowers. The lactescence too, or milkiness, which is observed in the compound flowers with flat florets, is made a characteristic distinction, and discriminates the first order of the 12th class. Thus, in the first systematic arrangements, the characters of the classes only were borrowed from the parts of fructification; while those of the subaltern divisions were very numerous, and respected every part of the plant; but that such divisions might be perfect, they should be constituted, like the classes, from the modifications of a single part of the fructification.

The great object had in view by Morrison, who comes next in order to Cæsalpinus, was to investigate the order of nature, not to fabricate an easy method of arranging plants. Hence his system is devoid of uniformity, and clogged with a multiplicity of characters; his classes are frequently not sufficiently distinguished from one another, and the key of arrangement seems totally lost. He sets out with a division of plants, from their consistence, into ligneous or woody, and herbaceous. He finds his system on the fruit, the corollæ or blossoms, and the habit of the plants. His classes are as follow: 1. Trees. 2. Shrubs. 3. Under-shrubs. 4. Herbs climbing. 5. Herbs leguminous or papilionaceous. 6. Herbs podded. 7. Herbs trilocular or with three capsules. 8. Herbs with four or five capsules. 9. Herbs corymbiferous. 10. Herbs having a milky juice, or downy tops. 11. Herbs culmiferous, as grasses. 12. Herbs umbelliferous. 13. Herbs having three kernels. 14. Herbs having helmet-shaped flowers. 15. Herbs having many capsules. 16. Herbs berry-bearing. 17. Herbs called *capillary plants*, as the fern kind. 18. Anomalous or irregular herbs.

Of these classes, the fourth and eighth possess no genuine distinctive character; nor are the ninth and tenth classes sufficiently distinguished; the fifteenth class is not sufficiently distinguished from the eighth, nor the 16th from the fourth. His sections or secondary divisions, which are 108 in number, arise from the figure and substance of the fruit; the number of seeds, leaves,

Gesner's
arrangement.

Cæsalpinus.

leaves, and petals; the figure of the root; the direction of the stem; the colour of the flowers; the place of growth; and, in one class, from the medicinal virtues of some of the plants that compose it.

Ray's method.

In 1682, Ray proposed his method to the world, two years after the publication of Morrison's, which served in some measure as its basis. It consisted originally of the following 25 classes: 1. Trees. 2. Shrubs. 3. Herbs imperfect. 4. Herbs having no flowers. 5. Capillary plants. 6. Staminate herbs having only the stamina. 7. Those having one naked seed. 8. Umbelliferous herbs. 9. Verticillate, annular, or ring-shaped ones. 10. Rough-leaved plants. 11. Stellated or star-shaped ones. 12. Apple-bearing herbs. 13. Berry-bearing herbs. 14. Herbs having many pods. 15. Monopetalous uniform, or regular herbs. 16. Monopetalous irregular, or having different forms. 17. Tetrapetalous, having large pods. 18. Tetrapetalous, having small pods. 19. Papilionaceous. 20. Pentapetalous herbs. 21. Corns. 22. Grasses. 23. Grass-leaved plants. 24. Bulbous-rooted plants. 25. Plants near akin to the bulbous.

This method Ray carefully corrected and amended at different times; so that the plan of arrangement which now bears the name of that author, and was first published in 1700, is entirely different from what had appeared in 1682. It now consists of 33 classes. Their distinguishing marks are taken from the port or habit of the plants; their greater or less degree of perfection; their place of growth; the number of seed-lobes, or seminal leaves, petals, capsules, and seeds; the situation and disposition of the flowers, flower-cup, and leaves; the absence or presence of the buds, flower-cup, and petals; the substance of the leaves and fruit; and the difficulty of classing certain plants. They are as follow: 1. Submarine, or sea plants. 2. Fungi. 3. Mosses. 4. Capillary plants. 5. Those without petals. 6. *Planipetalæ*, those with compound flowers; semiflosculous, or half-florets. 7. Those with compound flowers radiated. 8. Those with compound flowers, flosculous, or with whole florets. 9. Plants with one seed. 10. Plants umbellated. 11. Those stellated or star-shaped. 12. Rough-leaved plants. 13. Plants verticillate or whorled. 14. Those with many seeds. 15. Apple-bearing herbs. 16. Berry-bearing herbs. 17. Those with many pods. 18. Monopetalous herbs. 19. Those with two and three petals. 20. Those with great and small, or long and short pods. 21. Leguminous plants. 22. Pentapetalous ones. 23. Bulbs, and bulbous-like plants. 24. Stamineous ones, or those having only the stamina. 25. Anomalous plants, or those of an uncertain family. 26. The palms. 27. Trees without petals. 28. Trees with an umbilicated fruit. 29. Trees with fruit not umbilicated. 30. Trees with a dry fruit. 31. Trees with podded fruit. 32. Anomalous or irregular trees.

The distinction into herbs and trees with which Ray's method sets out, acknowledges a different, though not more certain principle than that of Cæsalpinus and Morrison. The former, in making this distinction, had an eye to the duration of the stem; the latter to its consistence. Ray called in the buds as an auxiliary; and denominates trees, "all such plants as bear buds;" herbs, "such as bear none." But against this auxiliary there lies an unanswerable objection; namely, that

though all herbaceous plants rise without buds, all trees are not furnished with them: many of the largest trees in warm countries, and some shrubby plants in every country, being totally destitute of that scaly appearance which constitutes the essence of a bud. In other respects, it is evident that neither Mr Ray's plan nor execution is in any degree calculated to facilitate the knowledge of plants. In fact, it seems to have been Ray's great object, no less than Morrison's, to collect as many natural classes as possible; and these being separately investigated, a multiplicity of characters and steps was necessarily required to connect them: and hence the intricacy complained of in both these methods, which must always take place where the classes give rise to the connecting characters, not the characters to the classes. The characters of the orders, or secondary divisions, in Ray's method, are no less multifarious than those of the classes. They respect the place of growth of plants; their qualities; the figure of the stem; the number, situation, substance, and division, of the leaves; the situation and disposition of the flowers and calyx; the number and regularity of the petals; with the number and figure of the fruit. In his improved method, Ray has adopted Tournefort's characters of the genera, wherever his plan would permit. His general History of Plants contains 18,655 species, and varieties. The third volume, which was not published till 1704, and was designed as a supplement to the two former, contains the plants discovered by Tournefort in the Levant, and by Camelli at Luzon one of the Philippine islands. Ray's method was followed by Sir Hans Sloane, in his Natural History of Jamaica; by Petiver, in his British Herbal; by Dillenius, in his Synopsis of British plants; and by Martin, in his Catalogue of plants that grow in the neighbourhood of Cambridge.

To Ray's original method succeeded that of Christopher Knaut, a German; which acknowledges the same principle, and is manifestly founded upon it. In his enumeration of the plants that grow round Hal in Saxony, published in 1687, he divides vegetables into 17 classes, which have for their basis the size and duration of plants, the presence or absence of the petals, the disposition of the flowers, the substance of the fruit, the number of capsules or seeds, the number and figure of the petals, and the presence, absence, or figure of the calyx. His classes are, 1. Herbs berry-bearing. 2. Monopetalous, or with one flower-leaf. 3. Tetrapetalous and regular, with four petals. 4. Tetrapetalous and irregular. 5. Pentapetalous, or with five petals. 6. Hexapetalous, or six petals. 7. Polypetalous, or many petals. 8. Multicapsular, or many capsules. 9. Naked seeds. 10. Solid, or not downy. 11. Downy seeds. 12. Without petals. 13. Stamineous, without petals or calyx. 14. Imperceptible. 15. Imperfect. 16. Trees. 17. Shrubs.

The sections or subdivisions of the classes in Knaut's method are 62 in number; and arise from the figure of the stem and petals, the number of capsules and cells, their figure, the number of seeds and leaves, and situation of the flowers.

In 1696, a new method, proposed by Dr Herman Herman's professor of botany at Leyden, was published by Zum-bac, who arranged according to it the plants contained in the public garden of Leyden. Rudbeckius the Younger, in a dissertation published the same year, on the

the fundamental knowledge of plants, adopted Herman's method, with a few inconsiderable variations. The classes of Dr Herman are 25 in number. They are founded on the size and duration of the plants; the presence or absence of the petals and calyx; the number of capsules, cells, and naked seeds; the substance of the leaves and fruit; the form and consistence of the roots; the situation and disposition of the flowers; leaves, and calyx; and figure of the fruit. 1. Herbs having one naked seed and a simple flower. 2. Having one naked seed and a compound flower. 3. With two naked seeds, and stellated or star-shaped. 4. Two naked seeds, and umbelliferous. 5. Four naked seeds, and rough leaves. 6. Four naked seeds, and verticillated or whorl-shaped. 7. With many naked seeds. 8. Having seed-vessels, bulbous and tricapsular. 9. Having one seed-vessel. 10. With two seed-vessels. 11. With three seed-vessels. 12. With four seed-vessels. 13. With five seed-vessels. 14. Podded, which are always tetrapetalous. 15. Leguminous and papilionaceous. 16. With many capsules. 17. Having fleshy fruit, berry-bearing. 18. With fleshy fruit, apple-bearing. 19. Without petals, but having a calyx. 20. Without petals, chaffy, or staminate. 21. Without petals, calyx, chaff, or stamina, *z. e.* naked anthers, as the mosses. 22. Trees. Imperfect fructification, bearing catkins. 23. Trees with a fleshy fruit, umbilicated. 24. Trees with a fleshy fruit, not umbilicated. 25. Trees with a dry fruit.

The classes in Herman's method are subdivided into 82 sections or orders; which have for their basis the number of petals, seeds, capsules, and cells, the figure of the seeds and petals, and disposition of the flowers.

Boerhaave's method.

To the method of Dr Herman succeeded that of Dr Boerhaave, who succeeded to the botanical chair of Leyden in 1709. His method is that of Herman, blended with part of the systems of Tournefort and Ray; and contains the following classes. 1. Herbs submarine, or sea plants. 2. Imperfect land plants. 3. Capillary plants, of the fern kind. 4. Many naked seeds. 5. Four naked seeds, and verticillated. 6. Four naked seeds, and rough leaves. 7. Four naked seeds, and four petals. 8. Plants having one seed-vessel. 9. Two seed-vessels. 10. Three seed-vessels. 11. Four seed-vessels. 12. Five seed-vessels. 13. Many seed-vessels. 14. Two naked seeds, and umbelliferous. 15. Two naked seeds, and star-shaped. 16. One naked seed, and a simple flower. 17. One naked seed and compound flowers semiflosculous. 18. One naked seed, and compound flowers radiated. 19. One naked seed, and compound flowers corymbiferous. 20. One naked seed, and compound flowers flosculous. 21. Berry-bearing herbs. 22. Apple-bearing herbs. 23. Without petals. 24. One cotyledon, and having petals. 25. One cotyledon, and without petals. 26. Trees having one cotyledon. 27. Many podded. 28. Podded. 29. Tetrapetalous and cruciform. 30. Leguminous. 31. Having no petals. 32. Bearing catkins. 33. Monopetalous flowers. 34. Rosaceous flowers.

These 34 classes of Dr Boerhaave are subdivided into 104 sections, which have for their characters, the figure of the leaves, stem, calyx, petals, and seeds; the number of petals, seeds, and capsules; the substance of the leaves; the situation of the flowers, and their difference in point of sex. By this method, Dr Boerhaave

arranged near 6000 plants, the produce of the botanical garden at Leyden, which he carefully superintended for the space of 20 years, and left to his successor Dr Adrien Royen, in a much more flourishing state than he himself had received it. His Index or Catalogue of the Leyden plants was published in octavo in 1710; and afterwards with great additions, in quarto, in 1720. This last edition contains descriptions of 5650 plants; of which number upwards of two-thirds had been introduced into the garden since the time of Herman, by his illustrious successor. Boerhaave's characters are derived from the habit or general appearance of plants combined with all the parts of fructification; so that, as Linnæus very properly observes, he was the first who employed the calyx, stamina, and style, in determining the genus. About 17 new genera were established by this author; among others, the very splendid family of the protea and silver tree, which, although partly described by Morrison, had remained generally unknown till this period. His method was adopted by one Emsting, a German, in a treatise entitled *The first Principles of Botany*, published in octavo at Wolfenbüttele, in 1748.

Hitherto all the botanists had been intent upon investigating the order of nature, rather than facilitating the arrangement of vegetables; therefore their methods were very intricate and perplexed; and their writings, however entertaining to the learned, could afford but very little instruction to the young botanist. In 1690, however, Augustus Quirinus Rivinus, a German, professor of botany at Leipsic, relinquishing the pursuit of natural affinities, and convinced of the insufficiency of characteristic marks drawn only from the fruit, attached himself to the flower, which, he was sensible, would furnish characters no less numerous, permanent, and conspicuous, than those drawn from the fruit. The calyx, petals, stamina, and style or pointal, which constitute the flower, are sufficiently diversified in point of number, figure, proportion, and situation, to serve as the basis of a mode of arrangement; yet all are not equally proper for this purpose. Rivinus made use of the petals as the largest and most beautiful part, and that from which the flower itself is commonly characterized. His method consists in the following 18 classes, which have for their basis the perfection and disposition of the flowers, and regularity and number of the petals. 1. Regular monopetalous, or having one petal. 2. Dipetalous. 3. Tripetalous. 4. Tetrapetalous. 5. Pentapetalous. 6. Hexapetalous. 7. Polypetalous, or having many petals. 8. Irregular monopetalous. 9. Irregular dipetalous. 10. Irregular tripetalous. 11. Irregular tetrapetalous. 12. Irregular pentapetalous. 13. Irregular hexapetalous. 14. Irregular polypetalous. 15. Compound flowers of regular florets. 16. Compound flowers of regular and irregular florets. 17. Compound flowers of irregular florets only. 18. Incomplete or imperfect plants.

As Rivinus set out with the professed design of imparting facility to botany, he judged very properly in divesting his method of all extraneous matter, and rendering it as simple and uniform as the nature of the science would admit. The distinction into herbs and trees had been adopted by every writer on plants since the time of Aristotle. Rendered in some measure sacred by its antiquity, this distinction maintained a kind

of

of importance to which it was by no means essentially entitled. Rivinus was the first who in this matter dared to think for himself. He was early sensible of the inconveniences to which those had submitted who employed it as a primary division; and therefore resolved at once to get rid of a distinction that is frequently uncertain, always destructive to uniformity, and in its nature repugnant to the genuine spirit of system, because totally unconnected with the parts of fructification. In the uniformity of its orders or secondary divisions, which are 91 in number, and acknowledge the fruit for their principle, Rivinus's method equals, perhaps excels, all that went before or succeeded it. Only three classes of this method were published by Rivinus himself. These are the 11th, 14th, and 15th, which were offered to the public at different times, illustrated with very splendid figures. The method was completed and published entire by Heucher, in a work entitled *Hortus Wirtembergensis*, printed in quarto at Wirtemberg in 1711.

Followers
of Rivinus.

Several German authors have followed Rivinus's method, either wholly or in part, without offering any considerable amendment. The principal of these are, Koenig, in a work on vegetables, published at Basil in 1696; Welch, in his *Basis Botanica*, printed at Leipzig in octavo, in 1697; Gemeinhart, in a catalogue of plants published in 1725; Kramer, in a work entitled *Tentamen Botanicum*, published at Dresden in 1728, and afterwards reprinted with additions at Vienna in 1744; and Hecker, in a dissertation on botany published at Hal in Saxony, in 1734. To these may be added Hebenstreit, an ingenious botanist, who in a treatise on plants published at Leipzig in 1731, just before his famous African expedition, established general characters, which had hitherto been wanting in Rivinus's method.

The writers who have attempted to improve upon Rivinus's method are Bernard Ruppian, Christopher Ludwig, and Christian Knaut. Ruppian, in his *Flora Jenensis*, published at Francfort in 1718, has arranged the 1200 plants there described by a method partly Rivinus's and partly his own. It consists of 17 classes, and sets out with the same divisions and subdivisions as that of Rivinus's; with this difference, however, that, whereas in Rivinus's method all perfect flowers are divided into simple and compound, in Ruppian the division of regular and irregular flowers precedes that just mentioned, and simple and compound flowers are made subdivisions of the regular flowers only.

Ludwig's
method.

Christopher Ludwig's method, which was published in 1737, and consists of 20 classes, differs but little from that of Rivinus. The author accompanied Hebenstreit on his expedition to Africa, and seems to have made plants his favourite study. The improvement, however, which he has made on Rivinus's plan, consists only in rendering it more universal, having enriched it with a multitude of genera collected from the works of Tournefort, Ray, Boerhaave, Dillenius, and other eminent botanists, whose general characters he has likewise adopted. His plan of arrangement has been followed by two succeeding writers: M. Wedel, in a botanical essay published in 1747; and three years after by M. Bochner, in his catalogue of the plants which grow in the garden of Leipzig.

The method of Christian Knaut is much more pro-

perly his own, and departs in a much greater degree from that of Rivinus than either of the two former. The regularity and number of the petals furnished the classical divisions in Rivinus's method: in that of Knaut, number takes place of regularity; so that it is very properly termed by Linnæus, "The system of Rivinus inverted." This method was published in 1716; and sets out with a division into flowers which have one petal, and such as have more than one. It consists of the 17 following classes. 1. Monopetalous uniform or regular. 2. Monopetalous difform or irregular. 3. Monopetalous compound uniform or regular. 4. Monopetalous compound difform or irregular. 5. Monopetalous compound uniform and difform together. 6. Dipetalous uniform or regular. 7. Dipetalous difform or irregular. 8. Tripetalous uniform or regular. 9. Tripetalous difform or irregular. 10. Tetrapetalous uniform or regular. 11. Tetrapetalous difform or irregular. 12. Pentapetalous uniform or regular. 13. Pentapetalous difform or irregular. 14. Hexapetalous uniform or regular. 15. Hexapetalous difform or irregular. 16. Polypetalous uniform or regular. 17. Polypetalous difform or irregular.

Christian
Knaut's
method.

The sections or secondary divisions in Knaut's method are 121, and depend upon the internal divisions of the fruit; and upon this his opinions are somewhat singular. Every kind of fruit, whether pulpy or membranaceous, is termed by our author a *capsule*. Neither is the term restricted to fruits properly so called: it is extended also to those termed by botanists *naked seeds*, the existence of which Knaut absolutely denies. Agreeable to this opinion, capsules, he says, with respect to their consistence or substance, are of two sorts; pulpy, or membranaceous. The former correspond to the fruits of the apple, berry, and cherry kind; the latter to the capsules properly so called, and naked seeds of other botanists. Again, with respect to their cells or internal divisions, capsules are either simple or compound. Simple capsules have an undivided cavity or a single cell; compound capsules are internally divided into two or more cells. With other botanists, the umbelliferous flowers bear two, the lip flowers four, naked seeds; according to Knaut, the former produce two, the latter four, simple capsules. Ranunculus, adonis, anemone, herb-bennet, and some other plants, have their flowers succeeded by a number of naked seeds collected into an aggregate or head; each of these seeds passes with Knaut for a simple capsule; so that the whole is an aggregate of several capsules with an undivided cavity or single cell. In numbering the cells or internal divisions of the pulpy fruits, our author has adopted a very singular method. Some fruits of the apple kind enclose a capsule that is divided into five membranaceous cells. It might then be very reasonably expected to find such fruits arranged with compound capsules of five cells: but, instead of this, the author whimsically enough combines in their arrangement the idea both of a simple and compound capsule. The pulpy part is undivided; in other words, it is a simple capsule furnished with one cell; the compound capsule enclosed contains five cells, which added to that of the pulp make the number six; and those kinds of fruits are arranged with those having capsules of six cells. By the same kind of reasoning, the fruit of the dogwood, which is of the cherry kind, and contains a stone

stone with two cells or cavities, is placed by Knaut among compound capsules with three cells; the pulp passing for one division, and cavities of the stone or nut for the remaining two. This method of calculation is not the only singularity for which Knaut is remarkable. The essence of the flower is made by Ray, Tournefort, Rivinus, and most other botanists, to consist in the stamina and style. This position Knaut absolutely denies; and has established for a principle, that the flower is essentially constituted by the petals only. With him, the flower-cup, stamina, and style, are of little significance: their presence does not constitute a flower, if the petals are wanting; neither is their absence sufficient to destroy its existence, if the petals are present: from this it follows, 1. That there can be no flowers without petals; and, 2. That the regularity or irregularity of the flower can never depend on the stamina and style, which are only occasionally present, and no-wise essential to its existence; both of which are evidently false to every botanical reader.

Tournefort's method.

Since the time of Rivinus, no leading method in botany has appeared except those of Tournefort and Linnæus. Tournefort sets out with reviving the distinction of plants into herbs and trees, which had been exploded by Rivinus. His system is founded on the regularity and figure of the petals, together with the twofold situation of the receptacle of the flowers; his orders, on the pistillum or calyx. The classes are, 1. Herbs with simple flowers monopetalous, and bell-shaped. 2. Simple flowers monopetalous, tunnel and wheel-shaped. 3. Simple flowers monopetalous, labiated or lipped. 4. Simple flowers monopetalous, anomalous or irregular. 5. Simple flowers polypetalous, cruciform or cross-shaped. 6. Simple flowers polypetalous, and rosaceous or rose-like. 7. Simple flowers polypetalous, umbellated. 8. Simple flowers polypetalous, caryophyllaceous, or clove-form. 9. Simple flowers polypetalous, liliaceous or lily-form. 10. Simple flowers polypetalous, papilionaceous, or butterfly-form. 11. Simple flowers polypetalous, anomalous or irregular. 12. Compound flowers, flosculous, tubular or whole florets. 13. Compound flowers, semiflosculous, flat or half florets. 14. Compound flowers radiated, like the spokes of a wheel. 15. Apetalous, having no petals. 16. No flower, but bearing seed. 17. No flower nor seed, in the vulgar estimation. 18. Trees with no petals, but bare stamina. 19. Trees with no petals bearing catkins. 20. Trees monopetalous. 21. Trees rosaceous. 22. Trees papilionaceous.

The secondary divisions in Tournefort's method, which are 122 in number, have obtained the name of *sections*. Their general distinctions are founded principally upon the fruit, as those of the classes are upon the flower.

Other writers.

Tournefort hath been followed by a vast number of botanical writers, of whom the most considerable are, Dr William Sherard, an eminent botanist of the last and present centuries. In 1689, he published the first sketch of Tournefort's method, under the title of *Schola Botanica*; or a catalogue of the plants demonstrated by Dr Tournefort, in the royal gardens at Paris. It was not till five years after, that the *Elementa Botanica*, a work which contains the rudiments and illustration of his method, was published by Tournefort himself.—

Father Plumier, termed by way of eminence the *Tournefort of America*, published in 1703, at Paris, a description of American plants, which he has arranged according to the system of Tournefort. In this work he accurately characterized 96 new genera. Falogi, an Italian, has described, in pretty elegant Latin verse, all the genera of Tournefort, in a work entitled *Prosopopoeia Botanica*, published at Florence, 12mo, 1705. Several celebrated French academicians, particularly Marchant, Dédart, Nissolle, Jussieu, and Vaillant, have also occasionally paid their tribute of acknowledgement to this author, from the year 1700 to 1740. The other authors of note who have followed Tournefort's method, are, M. Petit, an ingenious French botanist; Jöhren, a German, author of a treatise published at Colberg in 1710, entitled *Vade mecum Botanicum, seu Odegius Botanicus*; Fueille, in his description of the plants of Chili and Peru, published at Paris in quarto, 1714; Christopher Valentin, a German, author of a book entitled *Tournefortius Contractus*, published at Francfort, in folio, 1715; Ripa, an Italian, in a work entitled *Historia Universalis Plantarum Conscripta*, published in quarto, at Padua, in 1718; Michael Valentin, a German, in his *Viridarium Reformatum*, published in folio, at Francfort, in 1719; the celebrated Dillenius, professor of botany at Oxford, and author of several much esteemed publications on botany; particularly the *Hortus Elthamensis*, and History of Mosses, in his *Flora Gissensis*, printed at Francfort in 1719; Pontedera, an Italian, author of the delineation of a method which combines those of Tournefort and Rivinus, published at Padua, in his botanical dissertations, in 1720; Monti, an Italian, in a work published at Bologna in 1724, under the title of *Indices Plantarum Varii*; Dindem, a German, in his *Tournefortius Alsaticus*, first published in 1728; Signior Micheli, author of several curious discoveries respecting mosses and mushrooms, in his *Nova Genera Plantarum*, published in folio at Florence in 1729; Elvebemes, a Swede, in a work published in the Swedish language at Upsal in 1730; Fabricius, a German, author of a work entitled *Primitiæ Floræ Butisbacensis, seu sex Decades Plantarum Rariorum*, published in 1743; Sabbati, an Italian, in his catalogue of the plants that grow in the neighbourhood of Rome, printed at Rome in 1745; and the ingenious Dr Charles Alston, late professor of botany at Edinburgh, in his *Tyrocinium Botanicum*, published at Edinburgh in 1753.

Of all this numerous list of writers, Father Plumier and Pontedera alone have ventured to quit the track pointed out by Tournefort. The former, in his arrangement of American plants, has relinquished the distinction into herbs and trees; but the latter has attempted more considerable variations. His classes are, 1. Uncertain. 2. Having no flowers. 3. Without buds, imperfect plants. 4. Anomalous or irregular. 5. Labiated. 6. Bell-shaped. 7. Saucer-shaped. 8. Wheel-shaped. 9. Tunnel-shaped. 10. Flosculous. 11. Semiflosculous. 12. Radiated. 13. Irregular. 14. Papilionaceous. 15. Liliaceous. 16. Caryophyllaceous. 17. Cruciform or cross-shaped. 18. Umbellated. 19. Staminous, or with naked stamina. 20. Bearing buds apetalous, or without petals. 21. Bearing buds irregular. 22. Bearing buds bell-shaped. 23. Bear-

Plumier's method.

ing buds wheel-shaped. 24. Bearing buds tunsel-shaped. 25. Bearing buds papilionaceous. 26. Bearing buds rosaceous.

Magnol's method.

Besides all these methods, there have been invented two others, founded upon the calyx. The first of these was the invention of Peter Magnol, a celebrated professor of botany at Montpellier, and published in 1720, five years after the author's death. The other was delineated by Linnæus, and published in his *Classes Plantarum* in 1738, three years after the publication of the sexual system. Magnol distinguishes two kinds of calyx; one external, which envelopes and sustains the flower, and is the flower-cup properly so called; the other internal, which is the seed-vessel or fruit. According to this idea, all plants, whether herbaceous or woody, are furnished with either the external calyx only, or with both. His classes are, 1. Herbs with the calyx external, including a flower unknown. 2. Calyx external, including a flower staminate. 3. Calyx external, including a flower monopetalous. 4. Calyx external, including a flower polypetalous. 5. Calyx external, including a flower compound. 6. Calyx external, supporting a flower monopetalous. 7. Calyx external, supporting a flower polypetalous. 8. Calyx internal only, which is the corolla. 9. Calyx external and internal, flower monopetalous. 10. Calyx external and internal, flower with two and three petals. 11. Calyx external and internal, tetrapetalous. 12. Calyx external and internal, polypetalous. 13. Trees with the calyx external only. 14. Calyx internal only. 15. Calyx external and internal both.

The characters of the orders, or secondary divisions, in Magnol's method, are derived chiefly from the figure of the calyx, petals, and seeds; from the disposition of the flowers; from the number of petals, and substance of the fruit. Fifty-five sections or orders arise from the combination of these characters with those of the classes; and these are again subdivided into genera, which possess this singularity, that, in place of distinctive characters hitherto employed, they exhibit complete descriptions of all the parts of fructification of one or two species of each genus. From this improvement Linnæus manifestly borrowed the hint of his generical characters.

Sir John Hill, in his *Vegetable System*, endeavours to class plants according to their internal structure*. "Perhaps (says he), upon the foundation of a true anatomy of plants a natural method may be established: for it is certain, the forms of all the external parts of vegetables depend on the disposition of the internal; and all their differences are founded there. On the different inner structure of the vegetable body, under certain courses of its vessels, evidently depend the differences which characterize the seven first families, to the distinctions of which all classes are subordinate; and as these original distinctions are truly natural, we may here begin very safely.

"The seven families are these: 1. The mushrooms. 2. The algæ, or foliaceous sea and land plants. 3. The mosses. 4. The ferns. 5. The grasses. 6. The palms. 7. The common race of plants. Their distinctions one from another are these:

"1. The mushrooms are fleshy; and are destitute of leaves and visible flowers. 2. The algæ are merely foliaceous, the entire plant consisting of a leafy matter

VOL. IV. Part I.

without other visible parts. 3. The mosses have processes of the inner rind for leaves. 4. The ferns consist of a single leaf raised on a stalk; and bear their flowers upon its back. 5. The grasses have jointed stalks and undivided leaves, and husks to hold the seeds. 6. The palms have a simple trunk, with leaves only on the top, and have the flowers and fruit in divided ears."

Lastly, The seventh class, which he calls the *common race of plants*, are such as have their roots, leaves, stalks, flowers, and fruits, distinct and obvious; and have not the characters of any of the other six families.

To this natural method his artificial one, consisting of 43 classes, and which takes up the whole of his voluminous work, is designed only as an index; but as this is universally allowed to be inferior to Linnæus's, though he intends to improve that system, we think it needless to take any further notice of it.

Besides the sexual system of Linnæus, which is now Linnæus's almost universally followed, he formed another, which, arrangement by the calyx, like that of Magnol, had the calyx for its basis, but greatly superior both in the idea and execution, being indeed singularly serviceable to the novice in botany, by familiarizing to him various appearances of an organ so important in its nature, and so diversified in its form, as the calyx is. The classes are, 1. Spatheaceous, like a sheath or hose. 2. Glumose or chaffy. 3. Amentaceous, or catkins. 4. Umbellated. 5. Common calyx or flower-cup. 6. Double calyx. 7. Flowering; the petals and stamina inserted into the flower-cup. 8. Crowned, or crown-shaped, with a radius. 9. Irregular. 10. Difform, or different shapes. 11. Caducous, which fall off or shed their leaves. 12. Not caducous, uniform and monopetalous. 13. Not caducous, uniform and polypetalous. 14. Not caducous, difform and monopetalous. 15. Not caducous, difform and polypetalous. 16. Incomplete calyx. 17. Apetalous, or a bare calyx without petals. 18. Naked, or neither petals nor calyx.

Sect. IV. Of the Sexes of Plants.

As many philosophers and botanists deny that such a thing as the distinction of sexes takes place in vegetables, it will be necessary to give a statement of the arguments employed by both parties on this subject. We shall begin with the arguments in favour of the sexes.

I. Linnæus is at great pains in tracing the notion of Sexual sexes in plants to the remotest periods of antiquity. He informs us, that Empedocles, Anaxagoras, and other ancient philosophers, not only attributed the distinction of sexes to plants, but maintained that they were capable of perceiving pleasure and pain.

Hippocrates and Theophrastus are next introduced as distinguishing the conyza, the abies, the filix, &c. into male and female. The latter of these writers affirms that the fruits of the female palm will not germinate, unless the pollen of the male be shaken over the spathe of the female previous to the ripening of the seed.

Dioscorides takes notice of a male and female mandragora, mercurialis, cistus, &c.

P p

Pliny

Sir John Hill's system. * Vol. i. p. 150.

Pliny does not confine his views of sex to animals, but exclaims, that every thing this earth produces is characterized by the distinction of sex.

From the days of Pliny to those of Cæsalpinus, who lived in the 16th century, the analogy between the vegetable and animal seems to have been entirely neglected. Cæsalpinus tells us, that the males of the oxycedrus, taxus, mercurialis, urtica, and cannabis, are barren; and that the females of these plants only bear fruit.

After Cæsalpinus, we find Dr Grew and Sir Thomas Millington engaged in a conversation concerning the utility of the stamina and styli of plants. The result of this conversation was the mutual agreement of these two eminent naturalists, that the stamina and styli of vegetables were analogous to the organs of generation in animals, and that they were adapted by nature to answer the same purposes. Dr Grew, in his anatomy of plants, after enumerating the analogies between plants and animals, concludes, that the pollen probably emits certain *vivific* effluvia, which may serve for the impregnation of the seeds.

Mr Ray gave further sanction to the doctrine of sexes, by concurring with Grew, and adding some further illustrations from analogy.

In the year 1695, Camerarius attempted to prove the sexes of plants. But, as he trusted solely to the palm-tree, and withal seemed to be doubtful as to the authenticity of the fact, he cannot be considered as having done any thing in confirmation of the sexual hypothesis.

Mr Morland, in the year 1703, adopted the same hypothesis, but gave it a new modification, by supposing that the pollen contained the seminal plant in miniature, and consequently that it behoved one pollen at least to be conveyed into every separate seed before it could be properly impregnated. Analogy and the structure of the parts are the only arguments he employs.

Some years after this, Mr Geoffroy wrote a treatise on the sexes of plants: but as he advanced nothing new, we shall take no further notice of him.

Vaillant, in the year 1717, judiciously considering that the canal in the stylus of most plants was too narrow to admit the pollen itself, republished Dr Grew's theory of impregnation by means of a subtile seminal aura.

These were the sentiments of the principal botanists with regard to the generation of plants, till the celebrated Linnæus made his appearance as a botanical writer, who has extended the idea so far as to compose a complete system upon it.

Although Linnæus can have no claim to the supposed discovery of the sexual hypothesis, his being precisely the same with that of Dr Grew; yet, as he is the chief supporter and improver of this doctrine, we shall give a succinct narration of the arguments he makes use of in order to prove that vegetables propagate their species by a regular commerce of sexes.

In a treatise entitled, *Sponsalia Plantarum*, published as an inaugural dissertation by Wahlbom, in the first volume of the *Amœnitates Academicae*, all the arguments made use of by Linnæus in his *Fundamenta Botanica*, and other works, are collected and arranged in one

view. But as Wahlbom honestly attributes all the merit of this dissertation to his great master, we shall here drop his name altogether, and give the arguments as the property of Linnæus, by whom they were originally employed.

Linnæus, then, first attempts to show, that vegetables are endowed with a certain degree of life; and, secondly, that they propagate their species in a manner similar to that of animals.

“That vegetables are really living beings (says he), Vegetables must be obvious at first sight; because they possess all the properties contained in that accurate definition of life laid down by the great Dr Harvey, namely, *Vita est spontanea propulsio humorum*. But universal experience teaches, that vegetables propel humours or juices: hence it is plain that vegetables must be endowed with a certain degree of life.”

Not trusting solely to a syllogism founded on a definition, Linnæus proceeds to support the life of vegetables by arguments drawn from the following particulars in their economy; the first of which he entitles,

“1. *Nutritio*.—The very idea of nutrition implies a propulsion of humours, and of course the idea of life. But vegetables derive their nourishment from the earth, air, &c. and consequently must be considered as living creatures.

“2. *Ætas*.—Every animal must not only begin to exist, and have that existence dissolved by death, but must likewise pass through a number of intermediate changes in its appearance and affections. *Infancy, youth, manhood, old age*, are characterized by *imbecility, beauty, fertility, dotage*. Are not all these vicissitudes conspicuous in the vegetable world? Weak and tender in *infancy*; beautiful and salacious in *youth*; grave, robust, and fruitful, in *manhood*; and when *old age* approaches, the head droops, the springs of life dry up, and, in fine, the poor tottering vegetable returns to that *dust* from whence it sprung.

3. *Motus*.—No inanimate body is capable of self-motion. Whatever moves spontaneously, is endowed with a living principle: for motion depends on the spontaneous propulsion of humours: and wherever there is a spontaneous propulsion of humours, there also is life. That vegetables are capable of motion, is evident from the following facts: Plants, when confined within doors, always bend towards the light, and some of them even attempt to make their escape by the windows. The flowers of many plants, especially those of the syngenesia class, pursue the sun from east to west, rejoicing in his beams. Who then can deny that vegetables are possessed of living and self-moving powers?

“4. *Morbus*.—The term *disease* means nothing more than a certain corruption of life. It is well known, that vegetables are subject to diseases as well as animals: when over-heated, they turn thirsty, languish, and fall to the ground; when too cold, they are tormented with the chilblain, and not unfrequently *expire*: they are sometimes afflicted with cancers; and every plant is infested with lice peculiar to its species.

“5. *Mors*.—Death is opposed to life, the former being only a privation of the latter. Experience shows that every living creature must die. But as vegetables are daily cut off by internal diseases and external injuries; as they are subject to death from the attack of hunger,

hunger, thirst, heat, cold, &c. with what propriety could vegetables be thus said to *die*, unless we allow that they previously *lived*?

“6. *Anatomia*.—Under this article we are referred to Malpighius and Grew for the organic fibres, membranes, canals, vesicles, &c. of plants, as additional proofs of their living powers.

“7. *Organization*.—Vegetables not only propel humours, but also prepare and secrete a number of different juices for the fruit, the nectar, &c. analogous to the various secretions in animal bodies.”

From these facts and observations, Linnæus concludes, that plants are unquestionably endowed with life as well as animals; and then proceeds in the following manner to show how these animated vegetables propagate their species.

Arguments for the sexual system. After discussing the long-exploded doctrine of equivocal generation, he lays hold of another maxim of Dr Harvey, viz. *Omne vivum ex ovo*.—“It being fully evident (says he), from the foregoing chain of reasoning that vegetables are endowed with life, it necessarily follows, agreeable to this maxim of Harvey’s, that every vegetable must in like manner derive its existence from an *egg*. But as vegetables proceed from eggs, and as it is the distinguishing property of an egg to give birth to a being similar to that which produced it, the seeds must of course be the *eggs* of vegetables.

“Granting then that the seeds of vegetables are intended by nature to answer the same end as the eggs of animals, and considering at the same time that no egg can be fecundated without receiving an impregnation from the male, it follows, that the seeds or eggs of vegetables cannot be fecundated by any other means. Hence also the necessity of vegetables being provided with organs of generation. But where are these organs situated? The answer is easy:—We have already found impregnated seeds within the flowers of plants; and it is natural to expect that the *genitalia* should not be at a greater distance. Now, as *copulation* always precedes *birth*, and every *flower* precedes the *fruit*, the *generating faculty* must be ascribed to the *flower*, and the *birth* to the *fruit*. Again, As the *antheræ* and *stigmata* are the only essential parts of flowers, these parts must necessarily be the *organs of generation*.”

Being thus far advanced, Linnæus affirms, that the *antheræ* are the *testes*, and that the pollen performs the office of the male *semen*. These affirmations he attempts to establish by the following arguments; the first of which he terms

“1. *Præcedentia*.—The antheræ, or vegetable testes, always precede the fruit; and as soon as the antheræ come to maturity, which constantly happens before the maturity of the fruit, they continue to throw out their pollen as long as the flower lasts; but decay and fall off whenever the fruit comes to perfection.

“2. *Situs*.—The antheræ of all plants are uniformly situated in such a manner that the pollen may, with the greatest facility, fall upon the stigma or female organ.

“3. *Tempus*.—The antheræ and stigma always flourish at the same time, whether the flowers be of the hermaphrodite or dioecious kind.

“4. *Loculamenta*.—When the antheræ are dissected, they discover as great a variety of structure as the pericarpia or seed-capsules; for some of them have

one cell, as the mercury; some two, as the hellebore, &c.

“5. *Castratio*.—If all the antheræ be cut off from an hermaphrodite plant, just before the flowers begin to expand, taking care at the same time that no plant of the same species grow near it, the fruit will either prove entirely abortive, or produce barren seeds.

“6. *Figura*.—When the pollen of different plants is examined by the microscope, it exhibits as great a variety of figures as is discoverable in the seeds themselves.

“The accumulated force of these arguments (concludes Linnæus) amounts to a full demonstration that the antheræ are the testes, and that the pollen is the semen or genitura of vegetables.

“The male organ being thus investigated, we hope (says Linnæus) that none will hesitate to pronounce the stigma to be the female organ, especially when the following observations are attended to.

“The pistillum is composed of the germen, stylus, and stigma. The germen, being only a kind of rudiment of the future foetus or seed, ceases to exist as soon as the flower comes to maturity. Neither is the stylus an essential part, as many flowers have no stylus. But no fruit ever comes to maturity without the assistance of the stigma. It follows, that the stigma must be the female organ adapted by nature for the reception of the pollen or impregnating substance. This will appear still clearer from the following chain of reasoning.

“1. *Situs*.—The stigmata are always situated so that the pollen may with most ease fall upon them. Besides, it is remarkable, that in most plants (though not in all) the number of the stigmata exactly corresponds with the loculaments or cells of the pericarpium.

“2. *Tempus*.—Here the observation, that the stigmata and antheræ constantly flourish at the same time, is repeated.

“3. *Decidentia*.—The stigmata of most plants, like the antheræ, decay and fall off as soon as they have discharged their proper function; which evidently shows, that their office is not to ripen the fruit, but solely to answer the important purpose of impregnation.

“4. *Abscissio*.—The argument here is precisely the same with the castration of the antheræ; and the result is likewise the same, namely the destruction of the fruit.

“These arguments (concludes Linnæus) are sufficient to demonstrate, that the stigma is the female organ of generation, or that organ which is suited for the reception and conveyance of the semen to the *vegetable eggs*. Hence plants may be said to be *in actu veneris*, when the antheræ or testiculi spread their pollen over the stigma or female *vulva*.”

To show how the *coitus* of vegetables is effected, is our author’s next object of investigation. He affirms, that the pollen is conveyed, by means of the wind or insects, to the moist stigma; where it remains until it discharges a subtile fluid, which being absorbed by the vessels of the stigma, is carried to the seeds or ova, and impregnates them. His proofs are taken from the following particulars.

“1. *Oculus*.—When the flowers are in full blow, and the pollen flying about, every one may then see the pollen adhering to the stigma. This he illustrates by

mentioning as examples the *viola tricolor*, *iris*, *campanula*, &c.

" 2. *Proportio*.—The stamina and pistilla, in most plants, are of equal heights, that the pollen, by the intervention of the wind, may, with the greater facility, fall upon the stigma.

" 3. *Locus*.—The stamina of most plants surround the pistillum, to give the pollen an opportunity of falling upon the stigma at every breeze of wind. Even in the monocœcia class, the male flowers stand generally above the female ones, to afford an easier conveyance of the pollen to the stigma.

" 4. *Tempus*.—It is remarkable that the stamina and pistilla constantly appear at the same time, even in plants belonging to the monocœcia class.

" 5. *Pluvia*.—The flowers of most plants expand by the heat of the sun, and shut themselves up in the evening or in rainy weather. The final cause of this must be to keep the moisture from the pollen, lest it should be thereby coagulated, and of course prevented from being blown upon the stigma.

" 6. *Palmicolas*.—That the cultivators of palm-trees were in use to pull off the spadices from the males, and suspend them over the spathæ of the females, is attested by Theophrastus, Pliny, Prosper Alpinus, Kempfer, and many others. If this operation happened to be neglected, the dates were sour and destitute of nuts. Kempfer adds this singular circumstance, that the male spadix, after being thoroughly dried and kept till next season, still retained its impregnating virtue.

" 7. *Flores nutantes*.—As the pollen is specifically heavier than air, such flowers as have their pistillum longer than the stamina, hang down or incline to one side, e. g. the *fritillaria*, *campanula*, &c. An easy admission of the pollen to the stigma is the final cause of this appearance.

" 8. *Submersi*.—Many plants that grow below water, emerge when their flowers begin to blow, and swim upon the surface till they receive their impregnation, and then sink down.

" 9. *Omniùm florum genuisâ consideratio*.—Here a number of particulars are recited. We shall confine ourselves to those that are most striking and applicable to the subject.

" When the flowers of the male hemp are pulled off before those of the female are fully expanded, the females do not produce fertile seeds. But as a male flower is sometimes found upon a female plant, this may be the reason why fertile seeds are sometimes produced even after this precaution has been observed.

" The tulip affords another experiment of the same purpose. Cut off all the antheræ of a red tulip before the pollen is emitted; then take the ripe antheræ of a white tulip, and throw the pollen of the white one upon the stigma of the red; the seeds of the red tulip being thus impregnated by one of a different complexion, will next season produce some red, some white, but most variegated flowers."

In the year 1744, Linnæus published a description of a new genus which he called *peloria*, on the supposition of its being a *hybrid* or *mule* plant, i. e. a plant produced by an unnatural commixture of two different genera. The root, leaves, caulis, &c. of this plant are exceedingly similar to those of the *antirrhinum linaria*; but the flower and other parts of the fructification are

totally different. On account of its similarity to the *linaria* in every part but the flower, Linnæus imagined it to have been produced by a fortuitous commixture of the *linaria* with some other plant, although he has never yet been able to point out the father. This doctrine of the production of *mule* plants has since been greatly prized, and carefully propagated, by Linnæus and the other supporters of the sexual hypothesis. In the third volume of the *Amœnitates Academicae*, there is a complete dissertation, entitled *Planta Hybrida*, wherein the doctrine of *vegetable mules* is much improved and extended. This dissertation contains a list of 47 mules, with their supposed fathers and mothers. For example,

The *Veronica spuria* is said to be a *mule* plant begot by the *Verbena officinalis* upon the *Veronica maritima*.

The *Delphinium hybridum*, a *mule* begot by the *Aconitum napellus* upon the *Delphinium elatum*.

The *Arctotis calendula*, a *mule* begot by the *Calendula pluvialis* upon the *Arctotis tristis*.

The *Asclepias nigra*, a *mule* begot by the *Cynanchum acutum* upon the *Asclepias vincetoxicum*, &c.

From the examples given in this dissertation, Linnæus draws this conclusion, That only two species of each genus existed *ab origine*; and that all the variety of species which now appear have been produced by unnatural embraces betwixt species of different genera.

Under this head Linnæus likewise quotes from Ray the story of Richard Baal gardener at Brentford. This Baal sold a large quantity of the seeds of the *brassica florida* to several gardeners in the suburbs of London. These gardeners, after sowing their seeds in the usual manner, were surprised to find them turn out to be plants of a different species from that which Baal made them believe they had purchased; for, instead of the *brassica florida*, the plants turned out to be the *brassica longifolia*. The gardeners, upon making the discovery, commenced a prosecution of fraud against Baal in Westminster-hall. The court found Baal guilty of fraud, and decreed him not only to restore the price of the seeds, but likewise to pay the gardeners for their lost time, and the use of their ground. "Had these judges (says Linnæus) been acquainted with the sexual hypothesis, they would not have found Baal guilty of any crime, but would have ascribed the accident to the fortuitous impregnation of the *brassica florida* by the pollen of the *brassica longifolia*.

Linnæus next proceeds to celebrate the utility of insects, because they convey the pollen of the male to the stigma of the female. "In this way (says he), it is reasonable to think that many dioicous plants are impregnated. Nay, even the hermaphrodites themselves are greatly obliged to the different tribes of insects, which, by fluttering and treading in the corolla, are constantly scattering the pollen about the stigma.

"Upon the whole then (concludes Linnæus), the coitus of vegetables is evident to a demonstration. This coitus is nothing more than the conveyance of the pollen to the stigma, to which it adheres till it bursts, and discharges a subtile elastic fluid. This fluid or aura is absorbed by the vessels of the stylus, and carried directly to the ovarium or germen, where the mysterious work of impregnation is fully completed."

THESE are the arguments employed by Linnæus and other

other advocates for the sexual commerce of vegetables. Let us next attend to those employed by the opposers of this hypothesis.

Objections
to the sex-
ual system.

It is admitted by Pontedera, Dr Alston, &c. that some of the ancients applied the terms *male* and *female* to several plants. But then they deny that these terms conveyed the same ideas to the ancients that they do to the moderns. *Male* and *female*, when applied to plants, were to the ancients mere terms of distinction, serving only as trivial names to distinguish one species or variety from another. The ancients were ignorant of the very characters which constitute the difference between what is called a *male* and *female* plant among the moderns. Theophrastus, Dioscorides, Pliny, and, in a word, the whole ancient botanical writers, confound the very notion of the modern sexes: they call the real female, or seed-bearing plant, the *male*; and the male, or barren plant, the *female*. Nay, they have even applied the terms *male* and *female* to many plants which bear nothing but hermaphrodite flowers.

Such is the nature of this controversy, that it cannot be determined with any degree of certainty, but by experiments made upon dioicous plants. If a female plant can produce fertile seeds without having any communication with the pollen of the male, the use of this pollen with respect to the impregnation of seeds must of necessity be entirely superseded.

Now, both Camerarius and Dr Alston tried these experiments with the same success. These two eminent botanists took female plants of the mercury, spinage, and hemp; transplanted them at a great distance from any males of the same genus, and besides had them enclosed by double rows of hedges. The result was, that each of these plants produced great quantities of fertile seeds. Tournefort made the same trial upon the lupulus, Miller upon the bryony, and Geoffroy upon the mays; and all of them declared that the seeds of these plants were as fertile as if they had been surrounded by a thousand males.

Linnæus, in his first argument for the coitus of plants, refers every man to the evidence of his senses.

“Do we not see (says he) the stigma of almost every hermaphrodite flower covered over with the pollen or impregnating substance? Do not we see the parietaria, the urtica, &c. by violent explosions, discharging their pollen in the open air, that it may be carried in that vehicle to the stigmata of their respective females?—All this is admitted by the opposers of the sexes: but then they deny that these explosions, &c. are intended to create any intercourse between the male and the female; and further allege, that this ejection of the pollen is intended by nature to throw off something excrementitious, or at least something which, if retained, would prove noxious to the fructification.

Linnæus takes his second argument from the proportion which the stamina bear to the stylus, alleging that they are generally of the same height.—This observation (say the anti-sexualists) is not only contrary to experience, but, allowing it to be universal, no conclusion can be drawn from it either for or against the sexual hypothesis.

The third argument is taken from the *locus* or situation of the stamina with respect to the stylus: “and as the male flowers in the monœcia class stand always above the female flowers, it must be concluded (says

Linnæus), that the intention of nature, in this disposition of the parts, is to allow a free and easy access of the pollen to the stigma.”—But the stamina cannot be said to surround the pistillum in the monœcia and diœndria classes: and the position of the male flowers in the monœcia class is a mere chimæra; for in the ricinua, one of the examples which Linnæus mentions in confirmation of his doctrine, the female flowers stand uniformly some inches above the males.

That the stamina and pistilla generally come to perfection at the same time, and that this happens even in the dioicous plants, is Linnæus's fourth argument. But, as it is acknowledged by Linnæus himself, that there are many exceptions with respect to this fact, the opposers of the sexual hypothesis allege that it carries the best answer in its own bosom.

The fifth argument is founded on the circumstance of some flowers shutting up their petals in rainy or moist evenings.—But many flowers do not shut themselves up, either in the night or moist weather, as the passion-flower, &c.: the *lychnis noctiflora*, *mirabilis peruviana*, &c. open their flowers in the night, and shut them at the approach of the sun. Hence this is another final cause (say the anti-sexualists) perverted to support a favourite hypothesis.

We come now to the culture of the palm tree, which in the sixth and most plausible argument employed by the sexualists. Of this, the most authentic account we have is the following by Dr Hasselquist, in one of his letters to Linnæus, dated Alexandria, May 18. 1750. “The first thing I did after my arrival was to see the date tree, the ornament and a great part of the riches of this country. It had already blossomed; but I had, nevertheless, the pleasure of seeing how the Arabs assist its fecundation, and by that means secure to themselves a plentiful harvest of a vegetable, which was so important to them, and known to them many centuries before any botanist dreamed of the difference of sexes in vegetables. The garuæser informed me of this before I had time to enquire; and would show me as a very curious thing, the male and female of the date or palm trees; nor could he conceive how I, a Frank, lately arrived, could know it before; for (says he) all who have yet come from Europe to see this country, have regarded this relation either as a fable or miracle. The Arab seeing me inclined to be further informed, accompanied me and my French interpreter to a palm tree, which was very full of young fruit, and had by him been wedded or fecundated with the male when both were in blossom. This the Arabs do in the following manner: when the spadix has female flowers, that come out of its spathe, they search on a tree that has male flowers, which they know by experience, for a spadix which has not yet bursted out of its spathe: this they open, take out the spadix, and cut it lengthwise in several pieces, but take care not to hurt the flowers. A piece of this spadix with male flowers they put lengthwise between the small branches of the spadix which hath female flowers, and then lay the leaf of a palm over the branches. In this situation I yet saw the greatest part of the spadices which bore their young fruit; but the male flowers which were put between were withered. The Arab besides gave me the following anecdotes: First, Unless they in this manner wed and fecundate the date tree, it bears no fruit. Secondly,

condly, They always take the precaution to preserve some unopened spathæ with male flowers from one year to another, to be applied for this purpose, in case the male flowers should miscarry or suffer damage. Thirdly, If they permit the spadix of the male flowers to burst or come out, it becomes useless for fecundation: it must have its *maidenhead* (these were the words of the Arab), which is lost in the same moment the blossoms burst out of their case. Therefore the person who cultivates date trees must be careful to hit the right time of assisting their fecundation, which is almost the only article in their cultivation. Fourthly, On opening the spatha, he finds all the male flowers full of a liquid which resembles the finest dew; it is of a sweet and pleasant taste, resembling much the taste of fresh dates, but much more refined and aromatic; this was likewise confirmed by my interpreter, who hath lived 32 years in Egypt, and therefore had opportunities enough of tasting both the nectar of the blossoms and the fresh dates.

Now, though this account seems fully to confirm the fact, viz. that such a practice obtains among the Arabs, and that they assert its efficacy in fecundating the trees, it is certain (say the opposers of this doctrine), that no intelligent person, who is not already wedded to an hypothesis, will attempt to found an argument upon the assertions of a people so full of ridiculous superstitions. Before Dr Hasselquist, or any other person, can draw any argument from the above-mentioned account, he ought to see the experiment several times repeated, with his own eyes, and not take it upon the word of a people who, besides their superstition, may very probably find it their interest to impose upon travellers.

Mr Milne, author of the Botanical Dictionary, however, relates an experiment, near akin to the above mentioned, which merits some attention: "In the garden of M. de la Serre, of the Rue S. Jacques at Paris, was a female turpentine tree, which flowered every year, without furnishing any fruit capable of vegetation. This was a sensible mortification to the owner, who greatly desired to have the tree increased. Messieurs Duhamel and Jussieu very properly judged that they might procure him that pleasure by the assistance of a male pistachio tree. They sent him one very much loaded with flowers. It was planted in the garden of M. de la Serre, very near the female turpentine tree, which the same year produced a great quantity of fruits, that were well conditioned, and rose with facility. The male plant was then removed; the consequence of which was, that the turpentine tree of M. de la Serre in none of the succeeding years bore any fruit that, upon examination, was found to germinate."

Upon this experiment it is observed by the antisexualists, that, though it were a thousand times repeated, it never could be decisive. The nature of the controversy, say they, is such, that one experiment is more decisive in favour of their opinion than 10,000 can be against them. The reason is plain: If there is such a thing as a sexual intercourse in vegetables, it is as wonderful that any seeds should be perfected without that intercourse, as that a virgin should have a child; the last is not in the least more extraordinary than the first. One experiment, therefore, which shows that seeds may

be perfected without such sexual intercourse, is either to be resolved into a miracle, or must prove absolutely decisive against the sexual system; while numberless experiments, such as that above mentioned, could prove nothing, because we know not what effect vegetables may have by growing in each other's neighbourhood, independent of any sexual intercourse.

In Milne's Botanical Dictionary, under the article *Sexus Plantarum*, the author quotes Dr Alston's experiments partially. The facts recorded by Dr Alston are as follow: 1. Three sets of spinach, planted at a great distance from each other, proved all of them fertile, and ripened *plenty* of seeds, which were found to answer as well as other spinach seed. 2. A plant of hemp growing by itself, being taken care of, produced about 30 good seeds, though in a situation very much exposed, and plucked up too soon, on account of bad weather, in the autumn. 3. This experiment, which is the most remarkable of the three, we shall give in the Doctor's own words. "In the spring of 1741, I carried two young seedling plants of the French mercury, long before there was any in, from this city physic garden, the only place where it was then to be found in this country, to the king's garden at the Abbey; which are more than 700 yards distant from one another, with many high houses, trees, hedges, and part of a high hill between them; and planted one of them in one enclosure, where it was shaded from the sun the greatest part of the day; and the other in another 25 yards distant, exposed to the south and west. Both plants ripened fertile seeds; and the last shed them so plentifully, that it proved a troublesome weed for several years, though none of the species was to be found in that garden for more than 20 years preceding."

Of this experiment Mr Milne hath not taken any notice; but upon the other two, has the following remark: "The result of these, and such like experiments, can be accounted for, on the principle of the sexes, in no other way than on the supposition that some male flowers have been intermixed with the female, and operated the fecundation in question. This appears the more probable, as only a *part* of the seed in the above experiments attained to perfect maturity, so as to be capable of vegetation.

The seventh argument of Linnæus is taken from the *flores nutantes*.—The pistils of these flowers, according to Linnæus, are always longer than the stamina; and nature has assigned them this pensile posture, that the pollen, which is specifically heavier than air, may the more conveniently fall upon the stigma. But the pistils of the campanula, liliium, and many other *flores nutantes*, are not longer than the stamina. Besides, granting this were uniformly the case; yet, as the pollen is heavier than air, this posture must of necessity either make the pollen miss the pistillum altogether, or, at any rate, it can only fall upon the back part of the pistil in place of the stigma; and, of course, such a direction would rather tend to frustrate than promote the impregnation of the seed.

The eighth argument is taken from the *plantæ submersæ*, which are said to emerge as soon as their flowers begin to blow, lest the pollen should be coagulated or washed off by the water. But many submarine and aquatic plants fructify entirely below water; and, supposing they did not, the same argument would equally prove

prove it to be the intention of nature, that the pollen should be blown away by the winds, as that it should be subservient to the impregnation of the seed.

The ninth and last argument is entitled *Omnium florum genuina consideratio*; which (say the antisexualists) is nothing more than a collection of vague observations upon the structure and economy of particular plants, some of them true, others false, but all of them evidently thrust in as supports to a favourite hypothesis.

Farther arguments by Linnæus.

THUS the dispute rested some years ago; but of late there has appeared a translation of one of Linnæus's works upon the subject, which, though published in 1759, was but little known in this country. A treatise on the Sexual System had also been published by the abbé Spalanzani, in which he not only opposed the Linnæan doctrine, but treated it with ridicule, though without taking any notice of this last publication, which he seems to have been ignorant of. In this he mentions an experiment with hemp similar to some of those already related; but which was also tried by Linnæus, and in his hands turned out the very reverse of what it did with Spalanzani. In the treatise alluded to, Linnæus mentions Sir Thomas Millington as the first among the moderns who thought of the distinction of sexes in plants. He was Savilian professor at Oxford; and Dr Grew, in his *Anatomy of Plants*, relates, that in a conversation on the nature of the antheræ of flowers, Sir Thomas hinted, that those parts might probably be analogous to the male organs of animals, and serve for the impregnation of the fruit. Grew improved on the idea, and pursued it. That the subject, however, may be properly understood, our author is of opinion, that we should first accurately understand the nature of vegetable bodies; and in order to do this, we ought first to consider the operations of nature in the human frame, and from thence continue our researches through the various tribes of inferior animals, till at last we arrive at the vegetable creation. In like manner, to illustrate the generation of plants, we must likewise take our first lights from the animal kingdom, and pursue the same chain till we come to vegetables. This subject, indeed, he owns to be so obscure, that no naturalist has hitherto been able to say any thing satisfactory concerning it; he only mentions some remarkable facts concerning the production of mule animals from the copulation of two individuals of different species. In the horse kind we see two different kinds of mules produced. "From the mare and male ass (says he) proceeds the mule properly so called, which in its nature, that is, in its medullary substance and nervous system, agrees with its mother; but in its cortical substance and outward form, in its mane and tail, resembles the ass. Between the female ass and the horse, the other kind of mule is engendered, whose nature or medullary substance resembles that of the ass; but its cortical structure that of the horse. If the he-goat of Angora copulates with the common she-goat, the kid, by that means procured, inherits the external structure and valuable coat of its father; while, on the other hand, if the common he-goat impregnates the goat of Angora, the kid produced has the same external form, and bears the same worthless hair with its father. Hence it seems probable, that the medullary substance, with

what Malpighi calls the keel (*carina*), and the nervous system, are latent in the egg of the mother; the cortical substance, or vascular system, being derived from the father."

These cortical and medullary substances are previously explained by our author to be those of which both animal and vegetable bodies are composed. By the medullary substance in animal bodies, he means the spinal marrow arising from the organized brain, and sending off the nerves; by the cortical substance the vessels with the heart attached to them, by which the medullary part is nourished. In vegetables, the cortical part nourishes the plant, not only by its roots, but with its whole surface. For a small branch torn from the parent stem, and placed in water, imbibes nourishment at its pores. Thus the *Fuci*, and other marine vegetables, are nourished without a root, solely by the pores dispersed through their whole substance. The bark of trees every year deposits its gelatinous internal layer, which is added to the wood, and assimilates itself to it. The medullary, which is the other essential part of vegetables, is multiplied and extended without end; and whenever it is entirely lost, the death of the plant necessarily follows. In examining this substance, we must be careful, in two cases, that we be not misled; first, by the straws of grasses, and by other hollow stems, where the medulla lies the inside of the bark; and secondly, by large trees, whose trunks become perfectly solid, throughout, except in the very summits of the branches. The wood performs the office of bones, when there is no longer any occasion for the medulla in that part; and trees, although become hollow, continue nevertheless to grow so long as this substance remains in the extreme branches. It is by no means necessary that the medulla should have any connexion with the root, as it is only nourished by the cortical substance of the plant, and is therefore increased at its upper extremity without end if it meets with no resistance. In those animals whose spinal marrow is surrounded by a bony covering, as in the larger and more perfect kinds, this substance never comes out of its confinement; and the harder its case, the more absolutely is its increase prevented; but in the smaller tribes of worms, where this covering is less rigid, a perpetual and unlimited increase of the animal takes place.

"The most important parts of the flower, and which are absolutely essential to it (our author proceeds to observe *), are the stamina and pistilla. So essential are they, that among the many thousands of flowers with which we are acquainted, no one can be found not furnished with both these organs. The stamina derive their origin from the substance of the wood, which was originally formed from the inner bark, and they may therefore be said to spring from the cortical substance of the vegetable. This is perfectly evident in the *asarum* (*asarabacca*), whose twelve stamina proceed from twelve fibres in the inner bark. Double flowers illustrate the same fact: in them, the stamina being weakened and dissolved by excess of nourishment, the woody substance re-assumes the softness of the inner bark, of which it was originally formed. All stamina consist of vessels containing the pollen, or impregnating powder, which they discharge in due time, not without the strictest observance of certain natural laws. The form of these vessels, like that of the

* *Dissert. on the Sexes of Plants*, Smith's Transl. p. 8. seq.

the capsules of the fruit, is accurately defined, as well as their cells, their particular manner of bursting, and the pollen which they contain; this pollen, likewise, is no less certain and uniform in its figure, size, and colour, than the seeds themselves.

"The pistillum is the only part which originates from the medullary substance, and is therefore invariably situated in the centre of the flower. It always contains the rudiments of the seed, which, in process of time, ripen into fruit. The rudiments of the fruit are called the *germen*, or seed-bud; this has constantly another organ connected with it, named the *stigma*, which is in its highest degree of vigour and perfection during the time of flowering.

"Another circumstance worthy of attention is, that the root, which the first year of its growth is large and filled with medullary pulp, the following season becomes hollow, in producing the stem, flowers, and seed; all this pulp being conveyed to the flower, and seeming to be only destined to the formation of seed, so many new and distinct animations being formed from it as there are rudiments of new plants. This is particularly observable in the turnip.

"Thus vegetables, like insects, are subject to a metamorphosis; with this difference only, that their flowers are fixed to one spot, instead of being able, like insects, to fly from place to place; and that their nourishment is not given them by means of peculiar organs for the formation of chyle. We have seen, that the outer bark becomes calyx, the internal bark corolla, the wood stamina, and the medulla pistillum; the fructification exhibiting the internal parts of a plant naked and unfolded. We have likewise seen, that the fructification puts an end to vegetation in the part from whence it arises, stopping the progress of the medulla, which would otherwise have extended itself without end by the branches, and occasioning the division of that medulla into a number of seeds, each endowed with a separate living principle. But as the medulla exists naked in the *germen*, it cannot support itself, or make any farther progress, without the assistance of the cortical substance which it has left; it must therefore receive this assistance by some means or other, and in fact does receive it from the stamina and their pollen, which owe their origin to the woody matter derived from the inner bark, and originally generated by the outer bark. But if it happens that the cortical substance is able to invest the medullary rudiments of the seed in the flower itself, the plant becomes viviparous, as in *festuca*, *aira* and *poa vivipara*, in which nearly the same thing takes place as in the medulla of other plants, which remains in the branches, and is variously distributed, being at once both clothed and nourished by the bark, and enabled to form new branches, just as it happens in the compound animals, or *serularia*.

"The organs common in general to all plants are, 1. The root, with its capillary vessels, extracting nourishment from the ground. 2. The leaves, which may be called the *limbs*, and which, like the feet and wings of animals, are organs of motion; for being themselves shaken by the external air, they shake and exercise the plant. 3. The trunk, containing the medullary substance, which is nourished by the bark, and for the most part multiplied into several compound plants.

4. The fructification, which is the true body of the plant, set at liberty by a metamorphosis, and consists only of the organs of generation; it is often defended by a calyx, and furnished with petals, by means of which it in a manner flutters in the air.

"Many flowers have no calyx, as several of the lily tribe, the *hippuris*, &c.; many want the corolla, as grasses, and the plants called *apetalous*; but there are none destitute of stamina and pistilla, those important organs destined to the formation of fruit. We therefore infer from experience, that the stamina are the male organs of generation, and the pistilla the female; and as many flowers are furnished with both at once, it follows that such flowers are hermaphrodites. Nor is this so wonderful, as that there should be any plants in which the different sexes are in distinct individuals; for plants being immoveably fixed to one spot, cannot, like animals, travel in search of a mate. There exists, however, in some plants, a real difference of sex. From seeds of the same mother, some individuals shall be produced, whose flowers exhibit stamina without pistilla, and may therefore be properly called *males*; while the rest, being furnished with pistilla without stamina, are therefore denominated *females*: and so uniformly does this take place, that no vegetable was ever found to produce female flowers, without flowers furnished with stamina being produced, either on the same individual, or on another plant of the same species, and *vice versa*.

"As all seed-vessels are destined to produce seeds, so are the stamina to bear the *pollen*, or fecundating powder. All seeds contain within their membranes a certain medullary substance, which swells when dipped into warm water. All pollen, likewise, contains in its membrane an elastic substance, which although very subtle and almost invisible, by means of warm water often explodes with great vehemence. While plants are in flower, the pollen falls from the antheræ, and is dispersed abroad, as seeds are dislodged from their situation when the fruit is ripe. At the same time that the pollen is scattered, the pistillum presents its stigma, which is then in its highest vigour, and, for a portion of the day at least, is moistened with a fine dew. The stamina either surround this stigma, or, if the flowers are of the drooping kind, they are bent towards one side, so that the pollen can easily find access to the stigma; where it not only adheres by means of the dew of that part, but the moisture occasions its bursting, by which means its contents are discharged. What issued from it, being mixed with the fluid of the stigma, is conveyed to the rudiments of the seed. Many evident instances of this present themselves to our notice; but I have nowhere seen it more manifest than in the jacobean lily (*amaryllis formosissima*), the pistillum of which, when sufficient heat is given to the plant to make it flower in perfection, is bent downwards, and from its stigma issues a drop of limpid fluid, so large that one would think it in danger of falling to the ground. It is, however, gradually re-absorbed into the style about three or four o'clock, and becomes invisible till about ten the next morning, when it appears again; by noon it attains its largest dimensions; and in the afternoon, by a gentle and scarcely perceptible decrease, it returns to its source. If we shake the antheræ over the stigma, so that the pollen may fall

fall on this limpid drop, we see the fluid soon after become turbid, and assume a yellow colour; and we perceive little rivulets, or opaque streaks, running from the stigma towards the rudiments of the seed. Some time afterwards, when the drop has totally disappeared, the pollen may be observed adhering to the stigma, but of an irregular figure, having lost its original form. No one, therefore, can assent to what Morland and others have asserted, that the pollen passes into the stigma, pervades the style, and enters the tender rudiments of the seed, as Leeuwenhoek supposed his worms to enter the ova. A most evident proof of the falsehood of this opinion may be obtained from any species of *mirabilis* (marvel of Peru), whose pollen is so very large, that it almost exceeds the style itself in thickness, and, falling on the stigma, adheres firmly to it; that organ sucking and exhausting the pollen, as a cuttle-fish devours every thing that comes within its grasp. One evening in the month of August I removed all the stamina from three flowers of the *mirabilis longiflora*, at the same time destroying all the rest of the flowers which were expanded; I sprinkled these three flowers with the pollen of *mirabilis jalappa*: the seed-buds swelled, but did not ripen. Another evening I performed a similar experiment, only sprinkling the flowers with the pollen of the same species; all these flowers produced ripe seeds.

“Some writers have believed, that the stamina are parts of the fructification which serve only to discharge an impure or excrementitious matter, and by no means formed for so important a work as generation. But it is very evident, that these authors have not sufficiently examined the subject; for as, in many vegetables, some flowers are furnished with stamina only, and others only with pistilla, it is altogether impossible, that stamina situated at so very great a distance from the fruit as on a different branch, or perhaps on a separate plant, should serve to convey any impurities from the embryo.

“No physiologist could demonstrate, *a priori*, the necessity of the masculine fluid to the rendering the eggs of animals prolific; but experience has established it beyond a doubt. We therefore judge *a posteriori* principally of the same effect in plants.

“In the month of January 1760 the *antholyxa cunonia* flowered in a pot in my parlour: but produced no fruit, the air of the room not being sufficiently agitated to waft the pollen to the stigma. One day, about noon, seeing the stigma very moist, I plucked off one of the antheræ, by means of a fine pair of forceps, and gently rubbed it on one of the expanded stigmata. The spike of flowers remained eight or ten days longer; when I observed, in gathering the branch for my herbarium, that the fruit of that flower only on which the experiment had been made had swelled to the size of a bean. I then dissected this fruit, and discovered that one of the three cells contained seeds in considerable number, the other two being entirely withered.

“In the month of April I sowed the seeds of hemp (*cannabis*) in two different pots. The young plants came up so plentifully, that each pot contained 30 or 40. I placed each by the light of a window, but in different and remote apartments. The hemp grew extremely well in both pots. In one of them I permit-

VOL. IV. Part I.

ted the male and female plants to remain together, to flower and bear fruit, which ripened in July; and being macerated in water and committed to the earth, sprung up in twelve days. From the other, however, I removed all the male plants as soon as they were old enough for me to distinguish them from the females. The remaining females grew very well, and presented their long pistilla in great abundance, these flowers continuing a very long time, as if in expectation of their mates; while the plants in the other pot had already ripened their fruit, their pistilla having, quite in a different manner, faded, as soon as the males had discharged all their pollen. It was certainly a beautiful and truly admirable spectacle, to see the unimpregnated females preserve their pistilla so long green and flourishing, not permitting them to begin to fade till they had been for a considerable time exposed, in vain, to the access of the male pollen. Afterwards, when these virgin plants began to decay through age, I examined all their calyxes in the presence of several botanists, and found them large and flourishing, although every one of the seed-buds was brown, compressed, membranaceous, and dry, not exhibiting any appearance of cotyledons or pulp. Hence I am perfectly convinced, that the circumstance which authors have recorded, of the female hemp having produced seeds, although deprived of the male, could only have happened by means of pollen brought by the wind from some distant place. No experiment can be more easily performed than the above; none more satisfactory in demonstrating the generation of plants.

“The *clucia tenella* was in like manner kept growing in my window through the months of June and July. The male plant was in one pot, the female in another. The latter abounded with fruit, not one of its flowers proving abortive. I removed the two pots into different windows of the same apartment: still all the female flowers continued to become fruitful. At length I took away the male entirely, leaving the female alone, and cutting off all the flowers which it had already borne. Every day new ones appeared from the axilla of every leaf; each remained eight or ten days; after which their footstalks turning yellow, they fell barren to the ground. A botanical friend, who had amused himself with observing this phenomenon with me, persuaded me to bring from the stove in the garden a single male flower, which he placed over one of the female ones, then in perfection, tying a piece of red silk round its pistillum. The next day the male flower was taken away, and this single seed-bud remained and bore fruit. Afterwards I took another male flower out of the same stove, and with a pair of slender forceps pinched off one of its antheræ, which I afterwards gently scratched with a feather, so that a very small portion of its pollen was discharged upon one of the three stigmata of a female flower, the other two stigmata being covered with paper. This fruit likewise attained its due size; and on being cut transversely, exhibited one cell filled with large seed, and the other two empty. The rest of the flowers, being unimpregnated, faded and fell off. This experiment may be performed with as little trouble as the former.

“The *datisca cannabina* came up in my garden from seed ten years ago, and has every year been plentifully increased by means of its perennial root. Flowers in

Q q

great

great number have been produced by it; but being all female, they proved abortive. Being desirous of procuring male plants, I obtained more seeds from Paris. Some more plants were raised; but these likewise, to my great mortification, all proved females, and bore flowers but no fruit. In the year 1757, I received another parcel of seeds. From these I obtained a few male plants, which flowered in 1758. These were planted at a great distance from the females; and when their flowers were just ready to emit their pollen, holding a paper under them, I gently shook the spikes or panicle with my finger, till the paper was almost covered with the yellow powder. I carried this to the females, which were flowering in another part of the garden, and placed it over them. The cold nights of the year in which this experiment was made, destroyed these datiseas, with many other plants, much earlier than usual. Nevertheless, when I examined the flowers of those plants which I had sprinkled with the fertilizing powder, I found the seeds of their due magnitude; while in the more remote datiseas, which had not been impregnated with pollen, no traces of seeds were visible.

"Several species of *momordica*, cultivated with us, like other Indian vegetables, in close stoves, have frequently borne female flowers; which, although at first very vigorous, after a short time have constantly faded and turned yellow, without perfecting any seed, till I instructed the gardener, as soon as he observed a female flower, to gather a male one and place it above the female. By this contrivance we are so certain of obtaining fruit, that we dare pledge ourselves to make any female flowers fertile that shall be fixed on.

"The *jatropha urens* has flowered every year in my hot-house; but the female flowers coming before the males, in a week's time dropped their petals, and faded before the latter were opened; from which cause no fruit has been produced, but the germina themselves have fallen off. We have therefore never had any fruit of the *jatropha* till the year 1752, when the male flowers were in vigour on a tall tree at the same time that the females began to appear on a small *jatropha* which was growing in a garden pot. I placed this pot under the other tree, by which means the female flowers bore seeds, which grow on being sown. I have frequently since amused myself with taking the male flowers from one plant, and scattering them over the female flowers of another, and have always found the seeds of the latter impregnated by it.

"Two years ago I placed a piece of paper under some of these male flowers, and afterwards folded up the pollen which had fallen upon it, preserving it so folded up, if I remember right, four or six weeks, at the end of which time another branch of the same *jatropha* was in flower. I then took the pollen, which I had so long preserved in paper, and strewed it over three female flowers, the only ones at that time expanded. These three females proved fruitful, while all the rest which grew in the same bunch fell off abortive.

"The interior petals of the *ornithogalum*, commonly, but improperly, called *canadense*, cohere so closely together, that they only just admit the air to the germen, and will scarcely permit the pollen of another flower to pass: this plant produced every day new

flowers and fruit, the fructification never failing in any instance; I therefore, with the utmost care, extracted the anthers from one of the flowers with a hooked needle; and, as I hoped, this single flower proved barren. This experiment was repeated about a week after with the same success.

"I removed all the anthers out of a flower of *chelidonium corniculatum* (scarlet horned poppy), which was growing in a remote part of the garden, upon the first opening of its petals, and stripped off all the rest of the flowers; another day I treated another flower of the same plant in a similar manner, but sprinkled the pistillum of this with the pollen borrowed from another plant of the same species; the result was, that the first flower produced no fruit, but the second afforded very perfect seed. My design in this experiment was to prove, that the mere removal of the anthers from a flower is not in itself sufficient to render the germen abortive.

"Having the *nicotiana fruticosa* growing in a garden-pot, and producing plenty of flowers and seed, I extracted the anthers from a newly-expanded flower before they had burst, at the same time cutting away all the other flowers; this germen produced no fruit, nor did it even swell.

"I removed an urn, in which the *asphodelus fastuosus* was growing, to one corner of the garden, and from one of the flowers which had lately opened I extracted its anthers; this caused the impregnation to fail. Another day I treated another flower in the same manner: but bringing a flower from a plant in a different part of the garden, with which I sprinkled the pistillum of the mutilated one, its germen became by that means fruitful.

"*Lia chinensis*, flowering in my stove, the windows of which were shut, all its flowers proved abortive. I therefore took some of its anthers in a pair of pincers, and with them sprinkled the stigmata of two flowers, and the next day one stigma only of a third flower; the seed-buds of these flowers remained, grew to a large size and bore seed; the fruit of the third, however, contained ripe seed only in one of its cells.

"To relate more experiments would only be to fatigue the reader unnecessarily. All nature proclaims the truth I have endeavoured to inculcate, and every flower bears witness to it. Any person may make the experiment for himself, with any plant he pleases, only taking care to place the pot in which it is growing in the window of a room sufficiently out of the reach of other flowers; and I will venture to promise him that he will obtain no perfect fruit, unless the pollen has access to the pistillum."

Sect. V. Of the Natural Method of Classification.

BESIDES all the above-mentioned methods of classing and distributing plants into their different orders, genera, &c. which are deduced from the fructification, and are therefore called *artificial*, Linnæus and most other botanists are of opinion that there is a natural method, or nature's system, which we should diligently endeavour to find out. That this system, say they, is no chimera, as some imagine, will appear particularly from hence, that all plants, of what order soever, show an affinity to some others; and thus, as formerly observed,

served, not only the virtues of a great number of species may be ascertained, but we may know with certainty how to find a proper succedaneum for plants which cannot easily be had.—Linnæus divides vegetables into the 58 natural methods following.

1. *Palmæ*. These are perennial, and mostly of the shrub and tree kind. The stem is in height from 2 to 100 feet and upwards. The roots form a mass of fibres which are commonly simple and without any ramifications. The stem is generally simple, without branches, cylindrical, and composed of strong longitudinal fibres. The leaves, which are a composition of a leaf and a branch, by Linnæus called *frondes*, are of different forms; being sometimes shaped like an umbrella or fan; sometimes singly or doubly winged; the small or partial leaves, which are often three feet in length, being arranged alternately. The branches, or principal leaves, are six, eight, ten, or twelve feet long; the length varying according to the age and size of the plant. They are covered at first with a thick brown dust, like those of the ferns. The base of the leaves frequently embraces the greater part of the stem. The flowers are male and female upon the same or different roots. The flowers are all disposed in a panicle or diffused spike, except in the hydrocharis, stratiotes, and vallisneria; in which they proceed singly from the wings or angles of the leaves. The common calyx, in this order, is that termed *spatha* or *sheath*, and has either one or two valves. The spadix, or head of flowers protruded from the sheath, is generally branched. Each flower is generally furnished with a perianthium or proper flower-cup, consisting of three leaves or divisions that are small and permanent. The petals are three in number, of a substance like leather, and permanent like the leaves of the calyx. The stamina are from 2 to 20 and upwards, cohering slightly at their base. The seed-buds are from one to three in number, placed in the middle of the flower, and supporting a like number of styles, which are very short. The seed-vessel is generally a pulpy fruit of the berry or cherry kind, containing one cell filled with fibrous flesh, and covered with a skin which is of a substance like leather. The seeds are in number from one to three in each pulpy fruit, of a hard bony substance, round or oval, and attached by their base to the bottom of the fruit.—These plants, particularly the seeds, are astringent, and of efficacy in dysenteries.

2. *Piperitæ*. These plants are mostly herbaceous and perennial. The stalks of pothos creep along rocks and trees, into which they strike root at certain distances. The greatest height which any of them is known to attain is 15 feet; the greater part do not exceed three or four. The fleshy roots of many of these plants are extremely acrid when fresh. They lose this pungent quality, however, by being dried, and become of a soapy nature. The smell of many of them is extremely fetid, frequently resembling that of human excrements. The flowers, however, of an Ethiopian dracunculus or arum, and the cover in which they are involved, are said to emit a very fragrant odour. With regard to their virtues, these plants are commonly astringent.

3. *Calamitæ*. In this class the base of the leaf,

which embraces the stalk like a glove, has no longitudinal aperture, but is perfectly entire. The stalk is generally triangular, and without knots or joints. The roots of some are long and knotty; in others they are composed of fleshy fibres which pierce deep into the ground; and in others, of a bulb. The flowers are either hermaphrodite, or male and female upon the same root. The mode of inflorescence in this order is generally a spike; sometimes a capitulum or head. The calyx is either a gluma or an amentum. The corolla is wanting. The filaments of the stamina are three in number, short, slender like a hair, and sometimes bristly. The antheræ are generally long, slender, and erect. The seed-bud is very small, blunt, and sometimes three-cornered. The style is thread-shaped, and of the length of the scaly calyx. The stigmata are generally three in number; slender, hairy, and sometimes permanent. The virtues, uses, and sensible qualities, of this order of plants are the same with those of the following.

4. *Gramina*. Most of these plants are annual or perennial herbs; some of them creep upon the ground, others are erect. The roots, in the greatest number, are creeping, and emit fibres from each knot or joint; in others they are simply branching and fibrous. The stems and branches are round. The leaves are simple, alternate, entire, very long, and commonly narrow. They form below a sort of sheath, which embraces or surrounds the stem, and is generally cleft or divided on one side through its whole length. The flowers are either hermaphrodite, male and female on the same root, or hermaphrodite and male on the same root. They proceed either singly from the sheath of the leaves, or are formed into a panicle or loose spike. The calyx and corolla in this order are not sufficiently ascertained; in some a single scale or husk, in others two, supply the place of both covers; some grasses have four husky scales, two of which serve for the calyx, and the other two for the corolla; some have five; others six, four of which constitute the calyx, and the other two are termed improperly enough the *husky petals*. The corolla is sometimes composed of one petal with two divisions; and in general the husks of the calyx are always placed opposite to those of the corolla. The stamina are generally three in number, and placed irregularly with regard to the situation of the calyx and corolla. The antheræ are long, furnished with two cells, and slightly attached to the filaments. The seed-bud is placed upon the same receptacle as the calyx, corolla, and stamina. The style is generally double, and crowned with a hairy stigma or summit. The seed-vessel is wanting. The seeds are single, oval, and attached below to the bottom of the flower.—The roots of the grasses are opening; such as have an aromatic smell are stomachic; their seeds are mealy, mucilaginous, and nourishing. All the parts of these plants are wholesome.

5. *Tripetaloidea* (from *tres*, three; and *petalum*, a petal). These plants have no very striking characters, and are nearly allied to the grasses. All the genera of this order have not the circumstance expressed in the title.

6. *Ensata*. This order, which is very nearly allied to the grasses and filiceous plants, furnishes a very beautiful

beautiful collection of perennial herbs, which are of different heights, from one inch to 15 feet. The roots are tuberous or fleshy, and garnished with fibres: the stalks are simple, and commonly flat or compressed on the sides. The leaves are simple, alternate, entire, sword-shaped, and, like the liliaceous plants, form at their origin a sheath or glove, which in the greatest number is cleft or divided through the whole length, except at the base, where it is entire, and embraces the stalk like a ring. The flowers are hermaphrodite, and generally proceed from the summit of the stalks either singly, in an umbel, a spike, or in a panicle. In pontederia they proceed from the wings or angles of the leaves either singly or in an umbel. Most of these plants want the perianthium or flower-cup; the flowers burst from a common cover or sheath, termed by Linnæus *spatha*, which in this order is frequently permanent. The petals are in number from one to six. The stamina are generally three. The seed-bud is placed sometimes above the flower, sometimes below it. The style is generally single, and crowned with a triple stigma. The seed-vessel is a dry capsule, generally of an oblong shape, and opens at three valves, discovering the same number of cells, each inclosing a quantity of roundish seeds.—These plants resemble the liliaceous in their powers and sensible qualities: very few of them, however, are used in medicine.

7. *Orchideæ*. The roots of many of these plants are composed of one or more fleshy tubercles or knobs, attached to the lower part of the stem, and sending forth fibres from the top. Those of orchis bear an obvious resemblance to the scrotum in animals: from which circumstance the genus has derived its name. The leaves are of a moderate size, inscribed with a number of longitudinal nerves or ribs, and without any foot-stalk. At their origin they form round the stalk a kind of sheath, which is long, entire, cylindrical, but not furnished, like the grasses and some other plants, with a crown at top. The flowers are hermaphrodite, and placed at the summit of the stalk either in a spike or in a panicle. The calyx is that sort termed by Linnæus a *spatha* or *sheath*, that bursting open protrudes a head or cluster of flowers, termed the *spadix*, which have no perianthium or flower-cup. The petals are five in number, and very irregular. The nectarium in this order is remarkably conspicuous; yet so different in the different genera, that Linnæus has employed it for his principal character or mark of distinction, instead of the root, which had chiefly engaged the attention of former botanists. It has the appearance of a sixth petal. The filaments are always two in number, and placed upon the pistillum or female organ. The antheræ are erect, and generally covered by the upper lip of the nectarium. The seed-bud is either oblong or pillar-shaped, twisted like a screw, and universally placed below the receptacle of the flower. The style is single, very short, and forms one substance with the inner margin of the nectarium. The seed-vessel is generally a capsule with one cavity or cell, and three valves or openings, which are keel-shaped, and open on the angular sides, being jointed both at the bottom and top. The seeds are numerous; very small, like saw-dust; and attached, without foot-stalks, to a slender receptacle or rib, which extends itself lengthwise

in the middle of each inclosure or valve. The plants of this order are reckoned strong aphrodisiacs.

8. *Scitamineæ*. This class consists of beautiful exotic plants, all natives of very warm countries. Some of them furnish exquisite fruits; but though the plants rise very high, they are perennial only by their roots. Those which have only one filament, have in all their parts an aromatic odour, and an acid or poignant taste; qualities, however, possessed in a much greater degree by the roots, which are hot and resinous.

9. *Spathaceæ*, so called because their flowers are protruded from a *spatha* or sheath. They are nearly allied in habit and structure to the liliaceous plants, from which they are chiefly distinguished by the *spatha* out of which their flowers are protruded.

10. *Coronariæ*. These plants are herbaceous, perennial, and from one inch to 15 feet high. The roots are either bulbous, fibrous, or composed of small fleshy knots, which are jointed at top. The bulbs either consist of scales laid over each other like tiles, or are solid. The stem of the liliaceous bulbous plants is properly wanting; what supplies its place being nothing else than the base of the leaves, which, wrapping or enfolding each other, form at bottom a roundish fleshy bulb, hitherto distinguished, though perhaps improperly, by the name of *root*. In the others the stem is simple, that is, has few branches, and is either furnished with leaves, or rises naked. The branches are alternate and cylindrical. The leaves are simple, alternate, and entire. Those next the root, termed *radical leaves*, generally form at their origin a sheath, which in a great number is entire, that is, goes all round; whilst in others, it is cleft or divided longitudinally on one side. The flowers are universally hermaphrodite, except in white hellebore, which has both male and hermaphrodite flowers mixed together on the same root. The flowers are sometimes single, and terminate the stem; sometimes they form an umbel, sometimes a spike, and sometimes a panicle. The calyx or flower-cup, in this order, according to Linnæus, is generally wanting. In strict propriety, however, the single cover that is present in most of these plants, though beautifully coloured, ought to be denominated a *calyx*; as its divisions, generally six in number, are placed opposite to the stamina. The petals, or, to speak more properly, the coloured leaves of the flower, are in number from one to six. Plants which have a single petal, have the limb or upper part split into six divisions or segments. The petals in some species are rolled or turned back. The nectarium is various; in the lily it is a longitudinal line which runs through each petal, and reaches from the base to the middle. In crown imperial, it is a small hollow or pore, formed at the base of each petal; in asphodel it consists of six very small valves, which, approaching, form a globe, and are inserted into the base of the petal; in hyacinth, it is composed of three melliferous pores, situated on the top of the seed-bud. In pineapple, it is a small scale lying within the substance of each petal above the base; and in albuca, or bastard star of Bethlehem, it consists of two sharp-pointed bodies proceeding from the furrows of the seed-bud, and covered by the broader base of the three fertile filaments. In some species of lily the nectarium is hairy; in others it is naked. The stamina are six in number; erect,

erect, and inserted into the common receptacle, if the flower consists of many petals; into the tube, or divisions of the corolla, if it consists of one. The antheræ are long, commonly divided below, and slightly attached by their sides to the filaments on which they turn like a vane or the needle of a compass. The seed-bud is single, and placed either within the flower-cup or below it. The style is single, thread-shaped, and generally of the length of the petals. The stigma is generally single, of a conic form, and shaggy or hairy at the extremity. The seed-vessel is generally a capsule, divided externally into three valves, internally into three cells.—With respect to the powers of the plants of this order, it may be affirmed in general, that such as have little taste or smell, as the roots of tulip, and star of Bethlehem, are perfectly innocent; whilst those which have a heavy nauseous smell, as squill, hyacinth, crown imperial, and spider-wort, are at least suspicious, and frequently prove noxious.

11. *Sarmentosæ*, (from *sarmentum*, a long shoot, like that of a vine). This order consists of plants which have climbing stems and branches, that, like the vine, attach themselves to the bodies in their neighbourhood for the purpose of support. These plants are far from being a true natural assemblage; in fact they scarce agree in a single circumstance, except that expressed in the title, which is far from being peculiar to this order.

12. *Holeraceæ*. This order consists of plants which are used for the table, and enter into the economy of domestic affairs; it contains trees, shrubs, perennial and annual herbs. Some of the woody vegetables retain their green leaves during the winter. The roots are very long, and frequently spindle-shaped; from the knots on the stems and branches of such plants as creep on the ground, or float on the water, proceed fibrous and branching roots. The stems and young branches are cylindrical; and in the greatest part of the aquatic plants of this order, the stalks are hollow within. The buds are of a conic form, and naked; that is, not accompanied with scales. The leaves are generally simple, entire, alternate, and attached to the branches by a cylindrical foot-stalk, which is sometimes very long, but commonly very short. Some plants of this kind have two stipulæ or scales which are attached to the branches near the origin of the foot-stalk of each leaf. In many others, instead of stipulæ, each leaf bears on its foot-stalk a membranaceous sheath, which is cylindrical, frequently fringed on the margin, and pierced or penetrated by the stem. The flowers are either hermaphrodite; male and female upon the same root; male and female upon different roots; hermaphrodite and male on the same root; hermaphrodite and female on the same root; or hermaphrodite and male on different roots.

13. *Succulentæ*. This order consists of flat, fleshy, and juicy plants, most of them evergreens. They are astringent, refreshing, and very wholesome.

14. *Gruinales* (from *grus* a crane). These consist of *geranium*, vulgarly called *cranes-bill*, and a few other genera which Linnæus considers as allied to it in their habit and external structure. The order furnishes both herbaceous and woody plants. The roots are sometimes fibrous, sometimes tuberosus. In some species of wood-sage they are jointed. The stems are cylindrical; the

young branches, in some, nearly square. The buds are of a conic form, and covered with scales. The leaves are either simple or compound. The flowers are hermaphrodite; they proceed from the wings of the leaves either singly or in clusters. The calyx or flower-cup consists of five distinct leaves, or of one leaf divided almost to the bottom into five parts. It generally accompanies the seed-bud to its maturity. The petals are five in number, spreading, and frequently funnel-shaped. The stamina are generally ten in number, awl-shaped, erect, and of the length of the petals. The stamina are generally oblong; and frequently attached to the filaments by the middle, so as to lie, and sometimes to veer about, upon them. The seed-bud is either oblong or five-cornered. The number of styles is either one or five. In *tribulus*, the style is wanting. The seed-vessel is generally a five-cornered capsule, with one, three, five, or ten cells. The seeds are generally equal in number to the internal divisions or the cells of the seed-vessel; one seed being placed in each cell.

15. *Inundatæ*. The plants of this order are aquatic, of low stature, herbaceous, and mostly perennial. The roots are fibrous. The stem is generally wanting. In its place is an assemblage of leaves, which wrapping or enfolding each other mutually form a sheath; and from the middle of this sheath is produced the foot-stalk of the flower. The leaves are sometimes alternate, sometimes placed in whirls round the stem. In a great many genera the foot-stalk is extended at its origin into a membranaceous substance, which forms a sheath that is cleft through the whole length, on the side opposite to the leaf. The flowers are hermaphrodite, or male and female on the same root. The flower-cup is either wanting, or consists of three, four, or five divisions or leaves, which accompany the seed-bud to its maturity. The petals are generally wanting. The stamina are in number from 1 to 16 and upwards. The filaments in some genera are so short, that they seem wanting. The antheræ are short, and generally marked with four longitudinal furrows. The seed-buds are in number from one to four, the style is frequently wanting. The seed-vessel is universally wanting, except in elatine, which has a dry capsule, with four external openings, and the same number of cells. The seeds are generally four in number.

16. *Calycifloræ*, (from *calyx* the flower-cup, and *flos* the flower), consisting of such plants as have the stamina (the flower) inserted into the calyx. All the plants of this order are of the shrub and tree kind. Some of them rise to the height of 12 or 14 feet; others not above two or three. The roots are branching, fibrous, and woody. The stems are cylindrical. The branches, when young, are cornered; the buds of a conic form, and without scales. The leaves are simple, alternate, and attached to the branches by a very short footstalk. The flowers are either male or female upon distinct roots, or hermaphrodite and male on the same root. The calyx is a perianthium composed of one leaf, divided into two, three, or four segments. It is commonly placed upon the germen or seed-bud, which accompanies it to maturity. The corolla is universally wanting, except in *trophis*, the male plants of which, according to Linnæus, have four obtuse and spreading petals. The stamina are generally four in number, slender

slenderlike a hair, short, placed at a considerable distance from the style, and inserted into the tube of the calyx. The pistillum is composed of a roundish germen, crowned with the calyx; a single thread-shaped style; and a cylindrical stigma. The seed-vessel is either an obtuse oval fruit of the cherry kind, or a globular berry with one cell, containing a roundish seed. The plants of this order are astringent.

17. *Calycanthemæ*, (from *calyx* the flower-cup, and *anthos* the flower); consisting of plants, which, among other characters, have the corolla and stamina inserted in the calyx. This order furnishes trees, shrubs, and annual, biennial, and perennial herbs. The herbaceous annuals are by much the most numerous. The roots are branching and fibrous: the stems and branches cylindrical, square, or four-cornered while young. The buds are of a conic form, and without scales. The leaves are generally either alternate, simple, and attached to the branches by a short foot-stalk, or opposite at the bottom of the stem; and, in some, alternate towards the top. They are universally sessile; that is, attached to the branches without any foot-stalk. The calyx is universally a perianthium, and generally monophyllous, or composed of one leaf. The corolla consists of four, five, and six petals, which are attached to the tube of the calyx, and are sometimes placed alternate, sometimes opposite to the divisions of the limb. The stamina, which are in number from 4 to 20 and upwards, are attached to the tube of the calyx either on its margin or lower down. When the number of stamina is double the divisions of the calyx, the stamina which stand opposite these divisions are a little longer than the rest. The antheræ are generally of a hemispherical figure; frequently cleft or slit below; and by that aperture attached slightly to the filaments, on which they often veer about like a vane or needle. They are surrounded longitudinally, and open on the sides into two loculi or cells. The pollen, or male dust, consists of a number of minute particles, of an oval figure, yellow and transparent. The germen, or seed-bud, is placed either above or under the receptacle of the flower. The style is single, thread-shaped, and of the length of the stamina. The stigma is generally single and undivided. The seed-vessel is a capsule, which is generally divided internally into four loculi or cells. The seeds are numerous, minute, and frequently three-cornered. The plants of this order are reckoned astringent.

18. *Bicornes*, (from *bis* twice, and *cornu* a horn), plants whose antheræ have the appearance of two horns. This appearance, however, is not very conspicuous, unless in a few genera. The plants of this order are all of the shrub and tree kind. The roots are branching and fibrous. The stems and branches are cylindrical; the buds conic, sometimes covered with scales, and sometimes naked. The leaves are generally alternate. In most plants of this order they are either sessile, or supported by a very short foot-stalk, which is semi-cylindrical, and flat above. The flowers are universally hermaphrodite, except in one genus, the Indian date-plum, where hermaphrodite and male flowers are produced in the same species upon distinct roots. They proceed either solitary, or in a corymbus, from the angles formed by the leaves and branches: or hang down in spikes and clusters at the end of the branches; each flower having a small scale or floral leaf placed

under it. In most plants of this order the calyx is placed around or below the germen. The calyx is universally a perianthium, and generally monophyllous or of one piece, deeply divided into four or five segments, which are permanent, that is, accompany the germen to its maturity. The segments are often acute, and sometimes coloured. The corolla is generally monopetalous, and bell or funnel-shaped: the figure, however, is not very constant, even in plants of the same genus. The limb or upper part of the petal, is generally divided into four or five segments, which are sometimes rolled back, sometimes bent inwards. The limb too is sometimes slightly cut, sometimes divided almost to the bottom. The tube, or lower part of the petal, is cylindrical, and generally of the same length with the calyx. The number of stamina is from 4 to 20. These are generally erect, and attached to the lower part of the tube of the corolla. The antheræ are bifid or forked below, and, being slightly attached to the filaments, are frequently inverted in such a manner as to exhibit the appearance of two horns at top. The germen or seed-bud, is generally roundish, and seated above the receptacle. The style is single, thread-shaped, of the same length with the corolla, and in a few genera permanent. The seed-vessel is either a capsule with five cells, a roundish berry, or an oblong four-cornered nut with two cells.—The plants of this order are astringent.

19. *Hesperideæ*, (from the Hesperides, whose orchards are said to have produced golden apples). The plants of this order are of the shrub and tree kind, and mostly evergreen. The bark of the stalks is slender, and comes off in thin plates. The leaves are generally opposite, and covered with small transparent points. In some, the leaves are placed opposite at the bottom of the stalks, and alternate above. The buds are of a conic form, the flowers generally hermaphrodite; they proceed from the wings of the leaves either singly, or in clusters like ivy-berries. The calyx is placed above the seed-bud, and accompanies it to its maturity. The petals are three, four, or five in number, and stand upon the brims of the tube of the calyx. The seed-bud is large, oblong, and placed below the receptacle of the flower. The style is single, awl-shaped, of the length of the stamina, and terminated with a single stigma. The seed-vessel in some genera is a berry furnished with one or three cells; a capsule with four cells, or of the nature of the cherry, containing a stone. The seeds are generally numerous, small and oblong. The leaves and fruits are astringent, the berries esculent.

20. *Rotaceæ* (from *rota*, a wheel), consisting of plants with one wheel-shaped petal without a tube. These resemble in quality those of the order of *Preciæ*, to which they are in all respects very nearly allied; but very few of them can be said in strict propriety to possess the character specified in the title.

21. *Preciæ* (from *precus* early). These consist of primrose, an early flowering plant, and some others which agree with it in habit and structure, though not always in the character or circumstance expressed in the title. These plants, which possess no striking uniform characters, are, in general, innocent in their quality; yet the root of sow-bread is dangerous, if taken internally.

22. *Caryophylleæ*. All the plants of this order are herbaceous, and mostly annual. Some of the creeping kinds

kinds do not rise above an inch, and the tallest exceed not seven or eight feet. The roots are branching, fibrous, and of a moderate length. The stems are cylindrical. The branches proceed from the wings or angles of the leaves, and are generally opposite, and as it were jointed at each knot. In some species of *cerastium* the branches are square. The leaves are generally placed opposite in pairs, so as to resemble a cross; and are slightly united at the bottom by their foot-stalks, which form a sort of glove round the stem. The hairs are simple, like silk. The flowers are hermaphrodite; but some have male and female flowers upon distinct roots. They either stand single on their foot-stalks, and proceed from the wings or angles of the leaves and branches, or are disposed in a spike, corymbus, umbel, or panicle. The calyx is permanent, and composed either of one piece with five indentments, or of four or five distinct leaves. The corolla generally consists of five petals, which have claws of the length of the calyx; and a spreading limb, sometimes entire, but oftener cleft or divided into two. The stamina are in number from 3 to 15, and of a moderate length. When their number is double the divisions of the calyx, they are attached alternately to the claws of the petals, those so attached being shorter than the rest; the remaining stamina are inserted into the common receptacle, and stand opposite to the segments of the calyx. In some genera of this order the number of stamina is found to vary, even in the different flowers of the same plant. The antheræ are short, hemispherical, marked with four longitudinal furrows, frequently divided or cleft below, most commonly erect; sometimes, however, *in-cumbent*, that is, fastened to the filaments by the sides. The pointal is composed of a single seed-bud, which is generally roundish, sometimes cornered. The styles are thread-shaped, of the length of the stamina, and crowned with a simple stigma, which is sleek or smooth externally, and slightly hollowed or vaulted within. The seed-vessel is a dry capsule, of an oval form, of the length of the calyx, and consists of one or three cells. The plants of this order are innocent in their quality; they abound in a watery sort of phlegm, and have bitter seeds. With respect to their virtues, they are reckoned astringent, attenuating, and detensive.

23. *Trichilata* (from *tres* three, and *hitum* an external mark on the seed); consisting of plants with three seeds, which are marked distinctly with an external cicatrix or scar, where they are fastened within to the fruit.

23. *Corydalis* (from *καρυς*, a helmet); consisting of plants which have irregular flowers, somewhat resembling a helmet or hood. These plants are mostly herbaceous and perennial. The roots are tuberosous or knobby. The stems are generally branching. The leaves are alternate, sometimes simple, but most commonly winged. The footstalk of the leaves is strait or narrow, except in *epimedium*, where it is large, and has a membranous edge or border. The flowers are universally hermaphrodite. They proceed either singly from the wings and angles of the leaves, or are collected in clusters at the end of the branches. The calyx consists of two, four, five, or six leaves, which are frequently coloured, and commonly fall off immediately before, or very soon after, the expansion of the petals. The corolla is generally irregular; of one, or many

pieces; gaping; and furnished with a nectarium, which is very different in the different genera. The stamina are in number from two to six, and of a proportionate length, except in honey-flower, which has two shorter than the rest. The filaments are distinct, except in two genera, fumitory and *monnieria*, which have two sets of strings or filaments united in a cylinder. The antheræ are universally distinct, except in *impatiens*, where they are formed into a cylinder divided at the base. The seed-bud is generally roundish, but sometimes angular or cornered. The style is commonly single, extremely short, slender, or thread shaped, and crowned with a simple stigma. The seed-vessel is either a hollow blown-up berry, a capsule of one cell, a longish, or a roundish pod. The seeds are generally numerous and round.

25. *Putamineæ* (from *putamen*, a shell): consisting of a few genera of plants allied in habit, whose fleshy seed-vessel or fruit is frequently covered with a hard woody shell. Most of these plants are acrid and penetrating; and yield, by burning, a great quantity of fixed alkali. With respect to their virtues, they are powerful aperients. The Indians pretend that the fruit of a species of caper-bush, which they call *baduycca*, extinguishes the flames of love.

26. *Multisiliquæ* (from *multus* many, and *siliqua* a pod); consisting of plants which have more seed-vessels than one. From the etymology of the term, one would naturally imagine that the seed-vessels in question were of that kind called by Linnaeus *siliqua*, or pod; but the fact is, that not a single plant of this order bears pods; the greater part having many dry capsules, and the remainder being furnished properly with no seed-vessel, but bearing numerous distinct seeds. Plants of this order are mostly perennial herbs: the stems of some are erect; others creep upon the ground, and produce roots near the origin of each leaf; lastly, others climb, and attach themselves to the bodies in their neighbourhood, either by the footstalk of the leaves, or by tendrils and claspers which terminate the footstalk. The greatest height of those which rise erect, seldom exceeds eight feet. Those which climb rarely exceed 15 or 20 feet. The roots are generally fleshy. In some they are hand-shaped; in others finger-shaped, or cylindrical. In some species of hellebore and ranunculus they are divided into spherical knobs. Lastly, in some plants of this order, the roots are fibrous. The stems and young branches are cylindrical. The leaves which are of different forms, being sometimes simple and entire, sometimes hand-shaped or winged, are generally alternate. The footstalk, which is sometimes cylindrical, sometimes angular, is membranous, and very large at its origin, surrounding a great part of the stem from which it proceeds. The flowers are hermaphrodite. They proceed either singly from the wings of the leaves or termination of the branches, or terminate the branches in a spike, panicle, or head. The calyx in some is wanting; in others it is generally composed of five pieces, which fall off with the petals. The petals are in number from 4 to 15; generally equal, and sometimes disposed in two or three series; five is the prevailing number. The stamina are in number from 5 to 300, distinct, and attached generally in several rows or series to the receptacle. The seed-buds are generally numerous; the style is frequently wanting. In some

from the seed-vessel is wanting; in others it is composed of several dry capsules, each containing a single cell. The seeds are numerous, and frequently angular. Most of these plants are acrid, and many of them poisonous. In general, plants that have a great number of stamina are noxious in their quality. When burnt, these plants furnish a fixed alkali; by distillation there is drawn from them a kind of nitrous and aluminous substance. With respect to their virtues, they are caustic and purgative.

27. *Rhæadæa*, consisting of poppy, and a few genera which resemble it in habit and structure. These plants, upon being cut, emit plentifully a juice, which is white in poppy, and yellow in the others. With respect to their virtues, they seem to operate principally upon the nerves. Their juice is soporific and narcotic, their seeds less so, their roots aperient. Applied externally they are slightly corrosive.

28. *Lurida*, consisting of plants whose pale and ominous appearance seems to indicate something baleful and noxious in their natural quality. Most of these plants are herbaceous and perennial. Many of them are of the masked tribe of flowers; others resemble these in their general appearance, but differ from them essentially in the equality of their stamina. The roots are generally branched, sometimes tuberous. The stems and branches are cylindric. The leaves are generally simple, and placed alternate. The flowers are hermaphrodite. They proceed either singly or in clusters from the angle formed by the leaves and branches. In some species of lycium, they terminate the branches. The calyx is generally of one piece, deeply divided into five parts. The corolla consists of one petal, which is either bell, funnel, or wheel-shaped. The stamina are four or five in number; and those either of equal lengths, as in the greater, or unequal. The seed-bud is placed above the receptacle of the flower. The style is single; and is terminated by a summit which is hemispherical, and frequently channelled or furrowed. The seed-vessel, in such as have equal stamina, is a berry; in the rest, it is generally a capsule. The seeds are numerous, and frequently kidney-shaped.—These plants in general are poisonous. They have an insipid taste, and a nauseous disagreeable smell.

29. *Campanacææ* (from *campana*, a bell); plants with bell-shaped flowers. The plants of this order are herbaceous and perennial. The roots are either spindle-shaped, or branching and fibrous. The stems are round. The branches are generally alternate. The leaves are simple alternate, and commonly attached to the branches by a semi-cylindric footstalk, which is furrowed above. The indentments are terminated by a small white tubercle or knob, which renders them conspicuous. The flowers are hermaphrodite; and proceed either solitary from the wings of the leaves, or are collected into a spike and head at the end of the flower-stalk. The calyx is universally a perianthium situated upon or round the germen, and generally composed of one leaf deeply divided into five segments. The corolla is monopetalous, and of the bell, funnel, or wheel shape. The tube, in flowers of the bell and wheel shape, is very short; in those of the funnel shape, very long. In Greek valerian, the tube is shut with five valves, which are placed on its apex or top. The limb or upper part of the corolla is deeply divided into five seg-

ments, which spread, and are alternate with the divisions of the calyx. The corolla is generally permanent. The stamina are five in number, attached to the base of the tube of the corolla, alternate with its divisions, and opposite to those of the calyx. The filaments are distinct; very large at their origin; and frequently approach so as to form a sort of vault, which covers the summit of the germen. They are slender and awl-shaped above. The antheræ are very long; oval; marked with four longitudinal furrows, either distinct, or united in a cylinder. The pollen is composed of very small, spherical, white, shining, and transparent particles. The germen is roundish, and situated either wholly or in part under the flower. The style is generally single, and of the length of the stamina or corolla. The stigma is commonly single, but deeply divided. The seed-vessel is a roundish capsule, generally divided into three cells, and furnished externally with the same number of valves. The seeds are small, numerous, attached to a receptacle in the centre of the fruit, generally rounded, and sometimes cornered.—This order furnishes many excellent medicines. The plants abound with a white milky juice, which, upon the stalk being cut, flows out in great quantities.

30. *Contorta*, (from *con* together, and *torqueo* to twist); consisting of plants which have a single petal that is twisted or bent towards one side. This order furnishes trees, shrubs, and fat succulent plants, some of which retain their leaves during the winter. The herbaceous vegetables in this order are generally perennial. The roots are sometimes branching, but commonly fleshy, succulent, and garnished with fibres or strings like those of turnip. The stems are round, and in some genera pulpy and succulent. The branches are sometimes placed alternate, and sometimes opposite. The buds are of a conic form, and naked or without scales. The leaves are sometimes alternate, sometimes placed opposite in pairs, and not seldom surround the stem in whirls. They are attached to the branches by a cylindrical footstalk, which is short, and frequently united to the footstalk of the opposite leaf. The defensive and offensive weapons in this order are a downy sort of pubescence, and simple or forked prickles, which, in some genera, issue from the wings of the leaves. The flowers are hermaphrodite; and stand either singly upon their footstalks, or are collected into umbels and clusters. These bunches or collections of flowers sometimes terminate the branches, sometimes proceed from the angles of the branches, and sometimes stand at the side of the wings without issuing from them. The flower-cup is composed of one leaf divided almost to the base in five unequal segments, which embrace each other, and are permanent, or accompany the seed-bud to its maturity. The corolla consists of one petal, which in the different genera is bell, salver, funnel, or wheel-shaped. The limb, or upper spreading part of the petal, is generally divided into five equal parts, which are slightly bent or twisted to the left, and embrace or enfold each other like the petals of the mallow tribe. The tube is generally long and cylindrical; sometimes club-shaped, and often wanting. In several flowers of this order the petal is accompanied with that species of superfluity termed a *nectarium*. In the different genera, however, it assumes very different appearances. The stamina are five in number, short, equal,

equal, attached at the same height to the tube of the petal, alternate with its divisions, and opposite to those of the calyx. The antheræ are generally erect, and frequently approach so as to form a compact body in the middle of the flower. The seed-bud is either single or double. In some the style is wanting. The stigma is frequently double. The seed-vessel in some genera is a pulpy fruit, of the berry and cherry kind; but most frequently that species termed by Linnæus *conceptaculum*, and *folliculus*, which has one valve or external enclosure, opens lengthways on one side, and has not the seeds fastened to it. Two of these dry fruits, with a single cell, compose the seed-vessel of most plants of this order. The seeds are generally numerous, and in several genera crowned with a long pappus or downy wing like that of the compound flowers, by means of which they easily disperse and sow themselves. — The plants of this order being cut, emit a juice which is generally milky, and sometimes of a greenish white. From the circumstance of their abounding in this milky juice, the greater part are deemed poisonous; repeated observations having established this aphorism, That milky plants, except those of the plain compound flowers, are generally of a baneful destructive nature, and ought at least to be administered with caution. With respect to their sensible qualities, they are bitter; particularly the seed, roots, and bark, in which resides their principal virtue.

31. *Vepriculæ*, (from *vepres*, a briar or bramble), consisting of plants resembling the daphne, dirca, gnidia, &c. but which, however, do not constitute a true natural assemblage.

32. *Papilionaceæ*, plants that have papilionaceous flowers, *i. e.* somewhat resembling a butterfly in shape; of which number are all the leguminous plants. The plants of this order are of very different duration; some of them being herbaceous, and those either annual or perennial; others woody vegetables of the shrub and tree kind, a few of which rise to the height of 70 feet and upwards. The herbaceous plants of this order generally climb; for, being weak, and as it were helpless of themselves, they are provided by nature with tendrils, and even sharp-pointed hooks, at their extremities, to fasten upon the neighbouring trees or rocks; or the stalks are endowed with a faculty of twisting themselves, for the purpose of support, around the bodies in their neighbourhood. The pea, vetch, and kidney-bean, afford familiar examples of this appearance. The shrubs and trees of this order are mostly armed with strong spines. The roots are very long, and furnished with fibres; but some genera have fleshy knobs or tubercles placed at proper intervals along the fibres. The stems are cylindrical, as likewise the young branches, which are placed alternately; those which climb, twist themselves from right to left, in a direction opposite to the apparent motion of the sun. The bark of the large trees is extremely thick and wrinkled, so as to resemble a net with long meshes; the wood is very hard in the middle, and commonly coloured or veined. The buds are hemispherical, without scales, and proceed from the branches horizontally a little above the angle which they form with the leaves. The leaves are alternate, and of different forms, being either simple, finger-shaped, or winged. This last form is very common; the lobes or lesser leaves are entire, and sometimes placed

Vol. IV. Part I.

in pairs, but most commonly the winged leaf is terminated by an odd lobe. The winged or pinnated leaves of this order have a daily or periodical motion, depending upon the progress of the sun in his diurnal course. The common footstalk of the winged and compound leaves is marked on the upper surface with a cavity or furrow which runs through its whole length. The flowers are hermaphrodite, and proceed either from the wings of the leaves, or from the extremity of the branches. The calyx is a perianthium of one leaf, bell-shaped, bunching out at the bottom, and cut on its brim or margin into five irregular divisions or teeth; the lowermost of which, being the odd one, is longer than the rest: the other four stand in pairs, of which the uppermost is shortest, and stands farthest asunder. The bottom of the calyx is moistened with a sweet liquor like honey, so may be deemed the nectarium of these plants. The petals are four or five in number, very irregular, and from their figure and position bear an obvious resemblance to a butterfly expanding its wings for flight. These petals have been characterized by distinct names; the upper one, which is commonly the largest, is termed the *standard*, (*vexillum*); the two side petals, the *wings*, (*alæ*); and the lowermost, which is generally united at top, and divided at bottom, the *keel*, (*carina*). The stamina are generally ten: these are either totally distinct, or united by the filaments into one or two bundles involving the seed-bud. In the latter case, where there are two sets of united filaments, one of the sets is composed of nine stamina, which are united into a crooked cylinder, that is cleft on one side through its whole length; along this cleft lies the tenth filament or stamen, which constitutes the second set, and is often so closely attached to the second bundle, that it cannot be separated without some difficulty. The antheræ are small, round, marked with four longitudinal furrows, and slightly attached to the filaments. In lupine, the antheræ are alternately round and oblong. The seed-bud is single, placed upon the receptacle of the flower, oblong, cylindrical, slightly compressed, of the length of the cylinder of the united stamina by which it is involved, and sometimes elevated by a slender footstalk which issues from the centre of the calyx. The style is single, slender, and generally crooked or bent. The stigma is commonly covered with a beautiful down, and placed immediately under the antheræ. The seed-vessel is that sort of pod termed a *legumen*, which is of an oblong figure, more or less compressed, with two valves, and one, two, or more cavities. These cavities are often separated, when ripe, by a sort of joints. The seeds are generally few in number, round, smooth, and fleshy. Jointed pods have generally a single seed in each articulation. The seeds are all fastened along one suture, and not alternately to both, as in the other species of pod termed *siliqua*. — The plants of this family are, in general, mucilaginous. From the inner bark of most of them flows, either naturally or by incision, a clammy liquor, which dries and hardens like gum; the juice of others is sweet like sugar; some taste bitter, and are purgative, emetic, or even mortal. A species of eastern astragalus, with goats-rue leaves, is said to be remarkably caustic, and to burn the tongue excessively when chewed. In general, however, these plants are soft and clammy. With respect to their virtues, the plants of this order are highly emollient; some of them are

R r

vulnerary

vulnerary and astringent; and the root of anonis, or rest-harrow, is diuretic.

33. *Lomentaceæ*, (from *lomentum*, a colour used by painters.) Many of these plants furnish beautiful tinctures, and some of them are much used in dyeing. They very much resemble the last order, differing only in the following particulars. 1. In all plants of this order, except milk-wort, the stamina are distinct. The flower is not shaped like a butterfly, but is less irregular, and frequently consists but of one petal. The leaves are sometimes simple, but most commonly winged. The seeds are commonly marked with a circular furrow on both sides. Like those of the leguminous tribe, the plants of this order are generally mucilaginous. From the inner bark of the greater number exudes, either naturally or by incision, a mucilaginous liquor, which sometimes dries upon the plant, and becomes a gummy substance.

34. *Cucurbitaceæ*, (from *cucurbita*, a gourd); consisting of plants which resemble the gourd in external figure, habit, virtues, and sensible qualities.—The plants of this order, which generally climb, and have long diffused branches, are mostly herbaceous and perennial. The roots in the perennial plants of this order are shaped like those of the turnip; in the annuals they are branching and fibrous. The stems are cylindrical and succulent. The young branches have generally five corners. In some species of passion-flower they are square. The leaves are alternate, angular, and sometimes hand-shaped. They are attached to the branches by a footstalk, which is pretty long and cylindrical, without any furrow. From the wing or angle of each of the upper leaves proceeds a tendril, which is either simple or branching, and twists itself spirally round the different bodies in its neighbourhood, for the purpose of supporting and training of the branches. The lower leaves have no tendril. The flowers are either hermaphrodite or male and female. In this last, the male flowers are generally separated from the female upon the same root; and that either in the same wing or angle of the leaves, or in different angles. The flower-cup, in the female flowers, is placed upon the seed-bud; and generally consists of one bell-shaped leaf, that is deeply divided into five unequal segments, and unlike the other plants which have the calyx seated upon the fruit, falls off with the petals and the other parts of the flower. The corolla consists of one petal, with five equal divisions, which adhere to the tube of the calyx, as if glued to it. A species of passion-flower, termed by Linnæus *passiflora suberosa*, wants the petals. The stamina are in number from one to five, short, and generally inserted into the calyx. The filaments are distinct; and the antheræ of many genera are united in a cylinder. In the passion-flower they are slightly attached to the filaments, on which they turn like a vane or the needle of a compass. The seed-bud is single, and placed below the receptacle of the flower. The style is generally single, cylindrical, of the length of the calyx, and crowned with a triple stigma. The seed-vessel is generally pulpy, of the apple or berry kind, and consists of one, two, or three cells. The seeds are numerous, generally flat or compressed, and sometimes covered with that kind of proper coat called by Linnæus *arillus*.—The fruit of these plants is generally purga-

tive and refreshing; that of some of them proves a very violent emetic when used too freely.

35. *Sentiaceæ* (from *sentis*, a briar or bramble); consisting of the rose, bramble, and other plants which resemble them in port and external structure. These plants are so nearly allied in form, habit, and structure, to those of the natural order *Pomaceæ*, that they ought never to have been separated from it. The leaves have a styptic taste; the fruits are acid and cooling. With respect to their virtues, the leaves are vulnerary and astringent, the roots are diuretic. The acid fruits, as strawberry and raspberry, are used with success in putrid and bilious fevers, as likewise in contagious and epidemic dysenteries, which prevail in summer and autumn, and are occasioned by a sudden transition from a hot to a cold air, or by the acrid humour which flows into the intestines.

36. *Pomaceæ*, (from *ponum* an apple); consisting of those which have a pulpy esculent fruit, of the apple, berry, or cherry kind. The plants of this order, which furnish many of our most esteemed fruits, are mostly of the shrub and tree kind. The roots are branched, fibrous, and in the greater part very long. The stems and branches are cylindrical. These last are placed alternate; and, when young, are, in some genera, angular. The bark is thick and wrinkled. The buds are of a conic form, placed in the angles of the leaves, and covered with scales which lie over each other like tiles. The leaves, which differ in form, being in some genera simple, in others winged, are, in the greater number, placed alternate. The footstalks of the leaves is furrowed above, and frequently accompanied by a number of knobs like glands. Most of these plants are furnished with two stipulæ at the origin of the young footstalks of the leaves. These, in some genera, are pretty large; in others, they are so small as scarce to be perceived; and in cocou-plum, in particular, they by their minuteness resemble hairs. The flowers are universally hermaphrodite, except in *spiræa arancus*, in which male and female flowers are produced on distinct parts. In the greater number of genera they are produced in clusters or heads at the end of the branches. The calyx is of one piece, with five segments or divisions, which are permanent, and placed above the seed-bud in some; in the rest, they either fall off with the flower, or wither upon the stalk. The petals are five in number, and are inserted into the tube of the calyx. The stamina are generally 20 and upwards, and attached like the petals to the margin of the tube of the calyx. The antheræ are short, and slightly attached to the filaments. The seed-bud is single; and in those genera which have the calyx permanent, it is placed below the receptacle of the flower. The seed-vessel is a pulpy fruit of the apple, berry, or cherry kind. Those of the apple kind are divided internally into a number of cavities or cells. The seeds are numerous.—The pulpy fruits of this order are acid, esculent, and of great efficacy in putrid and bilious fevers.

37. *Columniferae*, (from *columna* a pillar, and *fero* to bear); consisting of plants whose stamina and pistil have the appearance of a column or pillar in the centre of the flower. This order furnishes a choice collection of herbs both annual and perennial, shrubs and trees. These are very different in size and height, from the creeping

creeping willows, and low shrubby tea-tree, to the stately limes, and the more lofty silk-cotton trees, which by some modern writers are affirmed to be so large as not to be fathomed by 16 men, and so tall that an arrow cannot reach their top. The shrubs and trees of this order are deciduous, pretty thick, of a beautiful appearance, with an erect stem, which is formed by its branches and foliage into a round head. The roots are extremely long, branch but little, and either run perpendicularly downwards, or extend themselves horizontally below the surface. The stems are cylindric. The young branches, though commonly of the same figure, are sometimes angular. The bark is thick and pliant. The wood, in general, is very soft and light. The buds are of a conic form, naked, or without scales; and situated either at the extremity of the branches, or in the angle formed by the branch and leaf. The leaves are alternate, simple, divided into several lobes, and frequently hand or finger-shaped. The ribs or nerves on the back of the leaf, in some genera of this order, are provided near their origia with a number of hollow furrows or glands, which, being filled with a clammy honey-like liquor, have been considered as so many vessels of secretion. The foot-stalk of the leaves is cylindric, swelled at its origin, and appears jointed at its junction with the branch. The flowers are universally hermaphrodite, except in *higgeleria* and a species of Virginian marshmallow, called by Linnæus *nayasa divica*; the former of which bears male and female, the latter male and hermaphrodite, flowers on different roots. In many plants of this order, the flowers generally open about nine in the morning, and remain expanded till one in the afternoon. The flowers either terminate the branches, proceed from the angles of the leaves, or are disposed either singly, or in a corymbus, along the branches or stem. In most of these genera the calyx is single, but in others frequently double. In these last the inner calyx is always of one piece, generally divided into five segments; the outer consists either of one leaf, of three distinct leaves, or of many. The calyx, when single, is sometimes composed of one leaf which is permanent, or of several distinct leaves, which are generally coloured, and fall off with the petals. In plants that have a double calyx, both flower-cups are generally permanent. The petals in this order are from four to nine; five is the prevailing number. The stamina, which are in number from 5 to 20 and upwards, are generally inserted into the common receptacle of the calyx, or into the pistillum or seed-bud. The filaments are either distinct, or united in a cylinder, which, proceeding from the receptacle of the calyx, surrounds the seed-bud, and attaches itself to the base of the petals, with which it slightly unites. The antheræ are frequently roundish, and placed erect on the filament; most commonly, however, they are oblong or kidney-shaped, and slightly attached by the middle, or sides, to the filaments, on which they turn like a vane or needle. This last is, particularly, the characteristic of all the mallow tribe. The seed-bud is generally roundish or conic; and sometimes, as in the tea-tree, angular. The seed-vessel is generally a capsule; sometimes a pulpy fruit of the berry or cherry kind. In some it is a woody or membranous capsule, divided into as many cells internally as there were partitions in the seed-bud. The seeds are generally solitary, sometimes angular, and sometimes

kidney-shaped.—These plants are mucilaginous and lubricating.

48. *Tricocceæ* (from *tricus*, three, and *semen*, a grain); consisting of plants with a single three-cornered capsule, having three cells or internal divisions, each containing a single seed. The single seed-vessel of these plants is of a singular form, and resembles three capsules, which adhere to one common footstalk as a centre, but are divided externally into three pretty deep partitions. This family is not completely natural. It must be observed, however, that the character expressed in the title is a striking one; and that though the plants which possess it are not connected by such numerous relations as to form a true natural assemblage, yet they are by that circumstance distinguished from all other plants with as great, nay greater facility, than by any artificial character yet known. But all the genera of this order have not the striking character just mentioned.

39. *Siliquosæ*, (from *siliqua* a pod); consisting of plants which have a pod for their seed-vessel. This order chiefly furnishes biennial and perennial herbs of an irregular figure. The roots are long, branched, crooked, and fibrous. In some they are succulent and fleshy, in others jointed. The stems and young branches are cylindric. The leaves, which differ in point of form, being sometimes simple, sometimes winged, are generally placed alternate. The flowers are hermaphrodite, and in the greater number disposed in a spike at the extremity of the branches. The flower-cup is composed of four leaves, which are oblong, hollow, blunt, hunched at the base, and fall with the flower. These leaves are sometimes erect, and sometimes spread horizontally. The petals, which are four in number, spread at top, and are disposed like a cross: the claws or lower part of the petals are erect, flat, awl-shaped, and somewhat longer than the calyx. The upper part widens outwards. The stamina are six in number; two of which are of the length of the calyx, and the remaining four somewhat longer, but shorter than the petals. The antheræ are of an oblong figure, pointed, thicker at the base, and erect. Betwixt the stamina, in plants of this order, are generally lodged one, two, or four, round greenish knots, which in some genera are so small as to elude the sight. These glands, called by Linnæus *glandula nectariferæ*, and used very improperly by that author as an essential character in discriminating the genera, seem to be prominences of the receptacle of the flower, occasioned by the stamina being deeply lodged in its substance. The seed-bud is single, and stands upon the receptacle of the flower. The style, which is either cylindric or flat like a scale, is of the length of the four longer stamina in some genera; in others it is very short, or even wanting. It accompanies the seed-bud to its maturity. The stigma is blunt, and sometimes deeply divided into two parts. The seed-vessel is either a long pod or a short and round one. Either sort has two valves, or external openings, and in a great many genera the same number of internal cavities or cells, the partition of which projects at the top beyond the valves. The seeds are roundish, small, and attached alternately by a slender thread to both sutures or joinings of the valves. These plants have a watery, sharp, lixivial taste; and are charged with a fixed alkaline

salt, which is drawn from them by burning, and being distilled without any addition produces a volatile alkali. Most of them have a stinking smell. With respect to their virtues, they are diuretic, attenuating, detersive, and antiscorbutic. These qualities, however, are most eminently possessed by the live plants; when dried, they either entirely disappear, or are greatly diminished. Applied externally, these plants are useful in diseases of the skin, as the itch, leprosy, &c.

40. *Personatæ* (from *persona*, a masque); consisting of a number of plants whose flowers are furnished with an irregular, gaping, or grinning petal, in figure somewhat resembling the snout of an animal. This order furnishes both herbaceous and woody vegetables of the shrub and tree kind. The roots are generally fibrous and branched. The stems and branches are cylindric when young, except in some species of figwort, in which they are square. The leaves are simple, generally placed opposite in pairs at the bottom of the branches, but in many genera stand alternate towards the top. The flowers are universally hermaphrodite; they proceed either singly or in clusters from the wings of the leaves, or terminate the branches in a spike, panicle, or head. The calyx is of one leaf, which is cut into two, three, four, or five segments, or divisions, that are permanent. The corolla is composed of one irregular petal, with two lips, resembling, as was already observed, the head or snout of an animal. In some plants the stamina are two or four in number, and of an equal length; in others they are universally four in number, two of which are long and two short. The seed-bud is single, and placed above the receptacle of the flower. The calyx is single; thread-shaped; bent in the direction of the stamina; and crowned with a stigma, which is generally blunt, and sometimes divided into two. The seed-vessel is a capsule, generally divided internally into two cavities or cells, and externally into the same number of valves or enclosures. The seeds are numerous, and affixed to a receptacle in the middle of the capsule.—These plants possess nearly the same qualities with the lip flowers, though in a less degree. With respect to their virtues, many of them are aperient, anodyne, purgative, and even emetic. The internal use of many of them is extremely pernicious; applied externally, they are anodyne, and powerful resolvents.

41. *Asperifolia*, rough-leaved plants. The greatest part of these are herbaceous and perennial. The roots are branching and fibrous; the stems and branches rounded: the buds of a conic form, naked or without scales. The leaves are simple, alternate, commonly very rough to the touch, and in most of the herbaceous plants sessile, or attached to the stem and branches without any footstalk. In the few trees, however, of this order, the leaves have a footstalk, the lower part of which, after the fall of the leaves, remains like a spine or thorn. The hairs are simple, and generally very rough to the touch. The flowers are in some genera solitary; but commonly collected in a spike or corymbus. They do not proceed from the angle formed by the stem or branch with the leaf, as in many plants; but from the side of the leaf, or from that part of the stem which is opposite to the leaf. They are almost universally hermaphrodite: in a few species of *cordia*, male and female flowers are pro-

duced upon different roots. The calyx is composed of one leaf, which is divided into from three to ten equal or unequal parts. Those with four naked seeds have the calyx deeply divided into five parts which are permanent. The corolla is monopetalous, or composed of one petal, which in different plants is bell, funnel, salver, and wheel-shaped. The divisions of the limb or upper part of the petal are generally five, alternate with those of the calyx; equal and regular, except in *echium*. The stamina are five in number, alternate with the divisions of the corolla. They are equal, attached to the tube of the corolla, a little above its origin, and of the same height. The anthers are in some genera *connivent*; that is, approach and form a compact body above the filaments. The pistillum is generally composed of a slender style of the same length with the stamina, and crowned with a simple stigma. It proceeds from a germen or seed-bud, which in some plants is divided, but generally split into four. The seeds are generally four in number, and lodged in the bottom of the calyx. Most of the rough-leaved plants are used in medicine: the flowers are esteemed cordial; the leaves and roots vulnerary and astringent; and the hard bony seeds are reckoned powerful promoters of urine. Externally, these plants are used for burnings and poisonous bites; they extirpate warts, and relieve disorders of the loins.

42. *Verticillatæ*, consisting of herbaceous vegetables, having four naked seeds, and the flowers placed in whorls round the stalk. The roots are branched and fibrous. The stems are round when old, but square when young; as are likewise the young branches, which stand opposite. The leaves are opposite, and in the greater number covered with transparent points. Those which are placed next the flower generally differ from the stem leaves. In the greater number of plants of this kind, the leaves are supported upon a long cylindrical footstalk that is furrowed above. The flowers are universally hermaphrodite, except in a species of thyme mentioned by Mr Adanson, which appears to have male or barren flowers on one root, and female or fertile flowers on the other. They are disposed round the stem in whorls or small heads with short footstalks. The calyx is of one piece, that is generally cut into five unequal divisions, whose disposition sometimes represents two lips; the uppermost of which has commonly a less number of divisions: it accompanies the seeds, which it nourishes in its bosom, to their maturity. The petal is of the gaping or lip kind, and in the different genera is more or less irregular or unequal, either in its tube, or in the divisions of the lips; the number of which varies from two to five. These divisions frequently form two lips; of which the uppermost, termed the *crest* and the *helmet*, is sometimes entire, sometimes more or less deeply cut into two; the lowermost, termed the *beard*, generally into three. The stamina are two or four in number. In the greater part there are four stamina of unequal length, two of them being long and two short. These four unequal stamina are frequently dissimilar, and approach by pairs: they are inclined towards the back of the petal, and parallel: the two innermost being shortest, and attached somewhat lower than the two others to the tube of the flower. The seed-bud which consists of four distinct ovaries, is placed upon the seat of the flower, and elevates

vates from their centre a common style, which is slender, bent in the same manner as the filaments, which it somewhat exceeds in length, and terminated by a double stigma or summit, the divisions of which are unequal, and turned backwards. The seed-vessel in this order is wanting. The seeds are four in number, and lodged in the bottom of the calyx as in a matrix or seed-vessel. Each seed has two covers; the one external, of a cartilaginous or leathery substance; the other internal, membranaceous, of a very fine texture, and placed immediately above the radicle or embryo plant. The plants of this order are fragrant, warm, penetrating, and accounted cordial and cephalic. Their chief virtue resides in the leaves.

43. *Dumosa*, (from *dumus*, a bush); consisting of a number of shrubby plants, which are thick set with irregular branches, and bushy. The plants of this order are all of the shrub and tree kind, thick and bushy, rising from 6 to 25, 30, and even 40 feet high. Many of them too, as bastard alaternus, holly, iron wood, New Jersey tea, star apple, viburnum, winter berry, and some others, retain their beautiful leaves during the whole year. The roots are branched and fibrous. The stems are cylindric; the young branches sometimes angular. The buds are naked, that is, without scales, in the evergreen shrubs of this order; covered with scales in most of the others. The leaves, which in some genera are simple, in others compound, are placed alternate in some, and opposite in others. The flowers are mostly hermaphrodite. They proceed from the wings of the leaves either singly or in clusters; or they terminate the stem in that sort of flowering head called a *corymbus*. The calyx is generally very small, placed below or around the seed-bud; and consists of one leaf, with four, five, or six divisions, which are permanent. The rhamnus has no calyx. The petals are in number from one to five. The stamina are either four, five, six, or ten. The seed-bud is generally roundish, and placed within the flower. The style is commonly single, and sometimes wanting. The stigma is either single or triple. The seed-vessel is generally a berry, sometimes a dry capsule; the seeds are generally single and egg-shaped. The berries, bark, and flowers of many of these plants are purgative, and act particularly on the lymph and bile.

44. *Sepiurice*, (from *sepes*, a hedge); consisting of a beautiful collection of woody plants, some of which, from their size, elegance, and other circumstances, are very proper furniture for hedges. This order furnishes woody plants both of the shrub and tree kind, most of which do not drop their leaves till nearly the time when the new leaves begin to appear.

45. *Umbellatae*, (from *umbella*, an umbel); consisting of plants whose flowers grow in umbels, with five petals that are often unequal, and two naked seeds, that are jointed at top and separated below. These plants are herbaceous, and chiefly perennial. The roots are either tuberous or spindle-shaped, and sometimes forked. The stems are cylindric, full of pith, and frequently hollow. The branches are alternate. The leaves, which like the branches are put on alternately, are very different in point of form; being simple and entire in some; target-shaped, in a species of navel-wort; finger or hand-shaped, in some others; and winged or pinnated with numerous minute divisions,

as in the greater number. They are supported by a footstalk, which is very broad and membranous at its origin, and commonly embraces the whole contour of the stem and branches. The flowers are in general hermaphrodite. There are, however, some that have male or barren flowers in the same umbel. This is particularly the case with those umbelliferous plants which have the petals in the flowers of the circumference large and unequal. In these plants the flowers in the circumference only prove fertile; those in the centre, or disk, proving abortive. *Oenanthe* and *imperatoria*, on the contrary, have the flowers in the circumference abortive. In ginseng, hermaphrodite and male flowers are produced upon distinct plants. The flowers are disposed in an umbel, which is either simple or compound. The common calyx in this order is that sort termed very improperly by Linnæus *involucrum*, or the flower-cover; which in the greater number consists of one or more leaves placed under the partial or universal umbel, or both, for the purpose of support. The presence or absence of one or both of these covers affords excellent marks in discriminating the genera of this very similar order of plants. The proper calyx of each flower, in the aggregate, consists of five minute indentments placed upon the seed-bud, which it envelopes, and accompanies to its maturity. The petals are five in number, and disposed upon the sides of the flower-cup in form of a rose. In the florets of the centre, the petals are generally pretty equal and small; in those of the circumference, they are frequently unequal and larger; in the greater number, they are heart-shaped, and cut almost to the middle in two. The stamina are five in number, placed opposite to the divisions of the flower-cup, and alternate with the petals. The seed-bud is universally placed under the seat of the flower, and supports two styles which are turned backwards, and crowned with simple summits which do not differ in appearance from the styles. The seed-vessel in this order is wanting. The seeds are two in number, which, when ripe, separate below, but remain closely attached at top. The plants of this order, which grow in dry places, are sudorific, stomachic, and warming. Their virtue resides chiefly in the seeds and leaves. Those which grow in marshy places are generally poisonous; but, notwithstanding the extremely warm and even caustic quality of most of these plants, many of them are employed in the kitchen, and in the economy of domestic affairs.

46. *Hederaceæ* (from *hedera*, ivy); consisting of ivy and a few other genera that seem nearly allied to it. This order furnishes both herbaceous and shrubby plants; most of which, particularly ivy and vine, have creeping branches, which attach themselves by roots or tendrils to the bodies in their neighbourhood. The roots are long, with few branches. The stems and young branches are cylindric. In some species of vine they are square. The leaves are alternate; sometimes simple, sometimes winged, in which the surface of the leaves is covered with points. The footstalk of the leaves is cylindrical, and without any furrow. The buds are of a conic form, and without any scales. The flowers are either hermaphrodite, male and female upon different roots, or hermaphrodite and male upon different roots. In some they terminate the branches in an umbel; in others they proceed in clusters from the side.

side opposite to the leaves; and in some, they are produced along the branches. The calyx consists of one leaf divided in five parts, which are small and generally permanent. The stamina are in number five; awl-shaped, erect, and generally of the length of the petals. *Cissus* has only four stamina, which are inserted into the nectarium, a sort of border surrounding the seed-bud. The antheræ are roundish, and sometimes, as in ivy, attached to the filaments by the sides. The seed-bud is sometimes round, sometimes shaped like a top or pear, and ends in one, two, or five awl-shaped styles, which are crowned with a simple stigma. The flowers of the vine have no style. The seed-vessel is of the berry kind, with one, two, or five styles. The seeds are from one to five in number; placed either in distinct cells, or dispersed through the pulp without any partition.

47. *Stellatæ*, (from *stella*, a star); consisting of plants with two naked seeds, and leaves disposed round the stem in form of a radiant star. This order contains herbs, shrubs, and trees. The herbs, which are most numerous, are chiefly annual, and creep along the surface of the ground. The shrubs and trees are mostly evergreens, which rise erect, and are of an agreeable conic form.—These plants are opening; some of their seeds, particularly those of coffee, are bitter and cordial; some of them are used in dyeing, and others in medicine.

48. *Aggregatæ*, (from *aggregare*, to assemble or collect); comprehending those plants which have aggregate flowers, consisting of a number of florets or small flowers, each of which has a proper and common calyx.

49. *Compositæ*, consisting of plants with compound flowers. In this order Linnæus has constructed his first or primary divisions from the different sexes of the florets, which he terms *polygamy*; the subaltern divisions are constructed from the figure of the petals, the disposition of the flowers, the pappus or crown of the seed, the common receptacle, and other circumstances which characterize the subaltern divisions in other authors.

50. *Amentaceæ* (from *amentum* a catkin), plants bearing catkins; as *salix*, *populus*, *plantanus*, &c.

51. *Coniferæ*, (from *conus* a cone, and *fero* to bear); consisting of plants whose female flowers, placed at a distance from the male, either on the same or distinct roots, are formed into a cone. In this character, the only one expressed in the title, the plants in question seem to be nearly allied to the family of mosses: from which, however, they are easily distinguished by their habit, as well as by the structure of the small flowers, in which the stamina are united below into a cylinder, and distinct at top. The plants of this order are mostly of the shrub and tree kind, and retain their leaves all the year. The form of these plants is generally conic, and extremely beautiful, from the disposition of the branches, which cover the stems even to the roots, extending themselves horizontally and circularly like so many rays. The height of some genera of this order does not exceed half a foot, that of others approaches to a hundred. The roots are short, branching, not very fibrous, and extend horizontally. The stems and branches are cylindrical. The bark is thin, and split into slender scales. The wood, except that of the yew tree, possesses little hardness. The buds are of a conic form,

and naked, or without scales. The leaves are entire, small, and thick, frequently triangular, and generally pointed. Juniper has a prickly and thorny leaf. With respect to situation, they admit of great variety, being either alternate, opposite, placed in whorls round the stem, or collected into small bundles which proceed from a single point. They are placed on the branches without any sensible footstalk. The flowers in this order are universally male and female. In some genera, the male flowers are collected into a spike or cone at the end of the branches; in others, they proceed singly from the wings of the leaves, or termination of the branches. The female flowers are generally collected into a cone; but in yew tree and shrubby horse-tail they are single, and terminate the branches. The calyx of the male flowers is a catkin; of the female, a cone. The petals of this order are wanting; except in the female flowers of juniper, which have three sharp, rigid, and permanent petals. The stamina are in number from 3 to 20 and upwards; united by their filaments into a cylinder or pillar, which rises out of the centre of the calyx. The antheræ are erect, distinct, of a roundish form, and divided into internal partitions or cells, which, in the different genera, are in number from two to ten. The seed-buds are generally numerous, and placed betwixt the scales of the cone, which serve for a calyx. From each seed-bud arises a very short cylindrical style, crowned with a simple stigma, of a conic form. These plants have probably no seed-vessel or fruit; the seeds being naked, and involved only by the scales of the calyx. In some genera these scales are of a bony nature, and almost united; in others, they are of a substance like leather; in juniper, they are united, and become fleshy and succulent like a berry. The seeds in this order, being nourished, as in a seed-vessel, by the scales of the cone, or common calyx, differ in nothing from the germina or seed-buds.—Most of the cone-bearing plants are resinous, or gummy; and the gums proceeding from them have a bitter taste, but generally a very agreeable smell.

52. *Coadunatæ*, (from *coadunare*, to join or gather together); so termed from the general appearance of the seed-vessels, which are numerous, and being slightly attached below, form altogether a single fruit in the shape of a sphere or cone; the parts of which, however, are easily separated from one another. This order, which consists of exotic plants, furnishes a beautiful and choice collection of shrubs and trees, both evergreen and deciduous. The trees are often 60 feet high, and garnished from the bottom to the top with spreading branches and leaves of a bright green colour, which assume a very agreeable conic form. The roots are branching and fibrous. The stems are cylindrical, and the wood very hard. The buds are conic, flat, and generally without scales. The leaves are universally simple and alternate. The footstalk is cylindrical, without furrows, frequently swelled at its origin, and appears jointed at its insertion into the branch. The flowers are hermaphrodite, and are generally produced either along or at the end of the branches. The calyx generally consists of three oblong plain leaves, like petals, which fall off with the flower. The petals are in number from 6 to 18, oblong, concave, and frequently disposed in two or three series or rows, the outermost of which are largest. The stamina are numerous, short, inserted into the

common

common receptacle in some, and into the seed-bud in others. The filaments are very short and slender, some genera having scarce any at all. The antheræ are numerous, slender, and placed round the seed-bud. The pistillum generally consists of a number of seed-buds disposed in the form of a cone, and seated upon a receptacle which rises like a small pillar above the receptacle of the calyx. From each seed-bud generally arises a cylindric style, which is very short. The stigma is commonly blunt. The seed-vessel is commonly a berry; but in magnolia it is an oval cone, consisting of a number of roundish capsules laid over each other like tiles. The fruits or seed-vessels, whether of the berry, capsule, or cherry kind, are equal in number to the seed-buds, and generally slightly attached below. The seeds are numerous, hard, roundish, and sometimes cornered. The plants of this order have a strong, agreeable, and aromatic smell; the fruits and seeds have a pungent taste like pepper: the bark and wood are bitter.

53. *Scabridæ*, (from *scaber*, rough, rugged or bristly), consisting of plants with rough leaves. There seems to be some impropriety in characterizing these plants by a name expressive of the roughness of their leaves, as that circumstance had previously furnished the classic character of the *Aspenifolia*. The degree of roughness, however, is much greater in the plants which make the subject of the present article.—The plants of this order are in general of an astringent nature: their taste is bitter and styptic.

54. *Miscellaneæ*, miscellaneous plants. This order consists of such genera as are not connected together by very numerous relations. They are, *datisca*, *poterium*, *reseda*, *sanguisorba*, *lemna*, *pistia*, *coriaria*, *empetrum*, *achyranthus*, *amaranthus*, *celesia*, *gomprena*, *resine*, *phyllacca*, *nymphæa*, *saracenia*, *cedrela*, *ewientia*, *corrigola*, *limoum*, *telephium*.

55. *Filices*, ferns; consisting of plants which bear their flower and fruit on the back of the leaf or stalk. These plants, in figure, approach the more perfect vegetables; being furnished, like them, with roots and leaves. The roots creep, and extend themselves horizontally under the earth, throwing out a number of very slender fibres on all sides. The stem is not to be distinguished from the common foot-stalk, or rather middle rib of the leaves: so that in strict propriety the greater number of ferns may be said to be *acaules*; that is, to want the stem altogether. In some of them, however, the middle rib, or stalk proceeding from the root, overtops the leaves, and forms a stem upon which the flowers are supported. The leaves proceed either singly, or in greater number, from the extremities of the branches of the main root. They are winged or hand-shaped in all the genera except in adders-tongue, pepper-grass, and some species of spleen-wort. The flowers, whatever be their nature, are, in the greater number of genera, fastened, and as it were glued, to the back of the leaves; in others, they are supported upon a stem which rises above the leaves; but in some, are supported on a flower-stalk, as already mentioned. The stamina are placed apart from the seed-bud in a genus termed by Mr Adanson *pálma filix*: in the other ferns, where we have been able to discover the stamina, they are found within the same covers with the seed-bud. Most of the ferns have a heavy disagreeable

small: as to their virtues, they are opening and attenuating.

56. *Musci*, mosses. These plants resemble the pines, firs, and other evergreens of that class, in the form and disposition of their leaves, and manner of growth of the female flowers, which are generally formed into a cone. They frequently creep, and extend themselves like a carpet upon the ground, trees, and stones, being generally collected into bunches and tufts: the smallest are only one-third of an inch in height, and the largest do not exceed five or six. Few of the mosses are annual: small as they are, the greater number are perennial and evergreens. Their growth is remarkably slow, as may be judged by the time that the antheræ take to ripen. This, reckoning from the first appearance of the antheræ to the dispersion of its powder or male dust, is generally four or six months. Although preserved dry for several years, these plants have the singular property of resuming their original verdure upon being moistened. It would be worth while to determine whether they do not also resume their vegetative quality. The roots of plants of this order are fibrous, slender, branched, and short. The stems are cylindric and weak, as are also the branches; they creep upon the ground, and strike root on every side. The leaves are very small and undivided. They differ with respect to situation; being either alternate, opposite, or placed by fours round the stalk. They have no perceptible foot-stalk nor middle rib, and are seated immediately upon the stems. The flowers are universally male and female: in some, the male flowers are produced upon the same plants with the female, and stand before them; in others, they are produced sometimes on the same, and sometimes on distinct plants. The male flowers consist entirely of antheræ, and their covering; proceed either singly, or in clusters, from the extremity of the branches, or angles of the leaves; and are either seated immediately upon the branches, or supported by a long foot-stalk. The female flowers, which generally resemble capsules or cones, are all placed immediately upon the stem or branches, without any foot-stalk; and proceed singly either from the wings of the leaves, or summit of the branches; when produced upon the same plant with the male, they are always placed under them. The female cones of the mosses greatly resemble those of the pines and evergreen trees of that class; the scales which form them are true leaves, each containing in its wing or angle a single seed. When the seeds are ripe, the cones probably open for their dispersion. When shut, they resemble buds, and have sometimes been ignorantly mistaken for such. The calyx, in this order, if it can be called such, is that appearance resembling a veil or monk's cawl, which in the male flower covers or is suspended over the tops of the stamina like an extinguisher, and is termed by Linnæus *calyptra*. The petals are universally wanting. The mosses in general are almost tasteless, have few juices, and being once dried do not readily imbibe moisture from the air. Those which grow in water, being thrown into the fire, grow red, and are reduced to ashes without receiving or communicating any flame; on which account some superstitious people, the Siberians in particular, place water-moss in their chimneys as a preservative against fire. Most of the mosses are purgative; some violently so, and even emetic. They are all of wonderful efficacy in preserving

servings dry such bodies as are susceptible of moisture; and in retaining, for a long time, the humidity of young plants, without exposing them to putrefaction. For this reason, such plants as are to be sent to any considerable distance, are generally wrapped up in them.

57. *Algæ*, flags; consisting of plants whose root, leaf, and stem, are all one. Under this description are comprehended all the sea weeds, and some other aquatic plants.

58. *Fungi*, mushrooms. These plants are rarely branched, sometimes creeping, but most commonly erect. Such as are furnished with branches have them of a light spongy substance like cork. Mushrooms differ from the fuci, in that those which, like the fuci, have their seeds contained in capsules, are not branched, as that numerous class of sea weeds are. The greatest part of mushrooms have no root: some, instead of roots, have a number of fibres, which, by their inosculation, frequently form a net with unequal meshes,

some of which produce plants similar to their parent vegetable. The stamina in these plants are still undetermined. The seeds are spread over the surface of the plant, or placed in open holes or cavities, resembling the open capsules of some of the fuci. In mushrooms which are branched, the seeds are frequently visible by the naked eye, and always to be distinctly observed by the assistance of a good microscope. These plants are very astringent, and some of them are used for stopping violent hæmorrhagies. As a vegetable food they are at best suspicious: some of them are rank poison.

Dubii ordinis. Under this name Linnæus classes all the other genera which cannot be reduced to any of the above-mentioned orders, and which are near 120 in number.

For a historical view of the different systems of botany, and of the progress and latest improvements of the science, see **BOTANY, SUPPLEMENT.**

ALPHABETICAL EXPLANATION OF BOTANICAL TERMS.

A.

ABRUPT (abruptus), when a winged leaf ends without a little leaf.

Acorn, the seed of the oak.

Acotyledones, seeds without lobes, which produce no seminal leaves.

Acute (acutus), tapering to a slender, but not thorny termination.

Air-bag (folliculus), a distended seed-vessel opening on one side.

Alternate (alternus), applied to branches, leaves, or flowers, springing out regularly one above another.

Androgynous, having some flowers on the same plant, bearing stamens, but no pistils; and other flowers bearing pistils, but no stamens.

Angiospermia, seeds in a capsule.

Angular (angulatus) having corners; opposed to cylindrical.

—— capsule, as in flower-de-luce.

Annual (annuus), living only one year.

Anomalous (anomalus), irregular.

Anther (anthera), the top of the stamen fixed on the filament, and containing the pollen.

Apex, termination.

Apophysis, excrescence.

Approaching, see *Converging*.

Arrow-shaped, (sagittatus), leaf shaped like an arrow head, as sorrel.

Ascending, growing first horizontally, and then bent upwards.

Attenuate (attenuatus), tapering.

Awl-shaped (subulatus), slender.

Awn (arista) or beard, the sharp substance growing to the valves of corn or grass.

Awnless (muticus), without awns.

Axillary (axillaris) at the base of the leaves or branches.

B.

Bark (cortex), the covering of the stems, roots, and branches of vegetables.

Barren (masculi, abortivi), flowers or florets which produce no perfect seeds; generally wanting pistils.

Base, see *Axillary*.

Battledore-shaped (spatulatum), rounded with a neck.

Beaded (granulatus), consisting of many little knobs, connected by small strings.

Beak or Bill (rostrum), a projecting appendage to some seeds.

Bearded (barbatus), beset with straight parallel hairs.

Bell-shaped (campanulatus), like the blossom of the convolvulus.

Bellying (ventricosus) distended.

Beneath (inferus). A blossom is beneath, when it includes the germen, and is attached to the part immediately below it. A germen is said to be beneath when it is not included in the corolla or blossom.

Berry (bacca), a pulpy seed-vessel without valves.

Biennial, continuing alive for two years.

Bird-footed (pedatus), resembling the foot of a land fowl.

Biten, ending in no regular form, not tapering.

Bill (rostrum), a long substance attached to a seed.

Bladders, air-bags on some species of fucus.

Bladder-shaped (inflatus), inflated or distended.

Blistered, when the surface of a leaf rises high above the veins.

Blossom (corolla), part of a flower, consisting of one or more leaves called *petals*. It is an expansion of the inner bark of the plant, and is the ornamented cover of the stamens and pistils.

Blunt (obtusus), opposed to acute.

Boat-shaped (navicularis), like a little keel-bottomed boat.

Border (limbus), the upper part of a corolla of one petal.

Bowed (arcuatus), bent.

Branched (ramosus), having lateral divisions.

Bristles (setæ), stiff cylindrical hairs.

Bristle-shaped (setaceus), slender, and like a bristle.

Bud (gemma), a protuberance on the stem or branches, containing the rudiments of the leaves or flowers to be expanded the following year.

Bulb (bulbus), a bud placed on the root or stem.

Bulging (gibbus) irregularly swollen out.

Bunch

Bunch (racemus), a fruitstalk with short lateral branches.

Bundle (fasciculus), several flowers rising to the same point from their respective fruitstalks, as in sweet-william.

Bundled, applied to leaves, as in the larch.

Butterfly-shaped (papilionaceus), as the pea and broom flowers.

C.

Calycled (calyculatus), having a double calyx.

Calyptra, veil.

Calyx, or empalement, a continuation of the outer bark of the plant, forming part of the flower, is called a cup, as in primrose, involucre in carrot, catkin in hazel, calyptra in the mosses, a husk in oats, a sheath in the narcissus, and a curtain in some funguses.

Capsule, a dry hollow seed-vessel opening in some determinate manner.

Catkin (amentum), a composition of flowers and chaff on a long thread-shaped receptacle; the whole like a cat's tail; e. g. the willow.

Cell (loculamentum), vacuity in the capsule to lodge the seed.

Central florets (flores flosculosi); those which occupy the middle part of a compound flower, as the yellow ones in a common daisy.

Chaff (palea), thin membranaceous substance separating the florets from each other, and growing on a common receptacle.

Channelled (canaliculatus), having a furrow from the base to the end.

Cicatrised, scarred.

Ciliate, fringed.

Circumference, the florets farthest from the centre of a compound flower, as the white ones in the common daisy.

Clammy (viscosus), adhesive like bird-lime.

Claw (unguis), the part of a petal next the base, distinguished from the limb or upper part.

Cleft, divided half-way down.

Climbing (scandens), plants that rise by the aid of others.

Clothing (pubes), hairiness on the surface of plants.

Cloven, see *Cleft*.

Club-shaped (clavatus), thinner at the base, and thicker upwards.

Cluster (thyrsus), flowers collected in somewhat of an egg-shaped form, like the lilac.

Coated (tunicatus), root, composed of layers like the onion.

Cobwebbed (arachnoideus), covered with a substance resembling a cobweb.

Coloured (coloratus), not green.

Column (columella), the little pillar in the centre of some capsules to which the seeds are fixed.

Comb (coma), a collection of floral leaves terminating the flowering stem, as in the pine-apple.

Comb-like (pectinatum), a sort of winged leaf, the leaflets of which are like the teeth of a comb.

Common calyx, including several flowers, as in thistles.

Compact, growing close together.

Compound flowers (compositi flores) consist of many florets or little flowers, on a receptacle or seat, as in thistles.

Compressed (compressus), a cylindrical substance, more or less flattened.

Conc (strobilus), a seed-vessel, formed by a catkin, with hardened scales, as in the pine and fir.

Cone-shaped (cucullatus), applied to leaves rolled up, as the grocers roll up paper to hold spices, sugar, &c.

Confluent (confluentia folia), running into one another at the base.

Congregated (glomeratus), spikes, &c. crowded together, somewhat in a globular form.

Connected (adnatus) leaves, having their upper surface at the base, growing to the stem or branch.

Contiguous (adpressus) leaves, &c. close to the stem.

Converging (connivens), approaching at the top.

Convex, rising like the surface of a globe.

Convolute, twisted spirally.

Corolla, blossom.

Corymb, a collection of flowers standing each on its own fruitstalk, with fruitstalks of such a length, that the whole collection forms a flat broad surface at the top, as in the pear-tree.

Cotton, *Cottony* (tomentosum, tomentosus), downy, covered with a whitish soft substance.

Cotyledones, seed-lobes.

Creeping (repens) stem; creeping along the ground, as ivy.

——— root, as spearmint.

Crescent-shaped (lunaris, lunatus), shaped like a waxing moon, like the anthers of the strawberry.

Crested (cristatus) flowers, tufted.

Crooked (cernuus) fruitstalk, with the flower facing the earth, and so stiff, that it cannot be straightened without breaking; as in the crown imperial.

Cross-pairs (decussatus), leaves in pairs, each pair pointing in a direction different from the pair above or below it.

Cross-shaped (cruciatus, cruciformis) flowers, having four petals in a form of a cross; called cruciform plants.

Crowned (coronatus) seed, a seed to which the calyx adheres, e. g. teazel.

Cruciform, see *Cross-shaped*.

Cryptogamia, stamens and pistils indistinct.

Cup (perianthium), a calyx contiguous to the other parts of the flower.

——— double (calyculatus), when the base of one cup is surrounded by another cup.

Curtain (volva), the calyx of agarics and boleti.

Cut-round (circumscissus), when a seed-vessel opens in a circle, and not longways.

Cylindrical (teres), round like a walking stick.

D.

Dagger-pointed (mucronatus), ending, not gradually, but suddenly in a sharp point.

Deciduous (deciduus) leaves, which fall at the approach of winter.

——— cup or calyx, falling off before the blossom.

——— seed-vessel, falling off before it opens.

Declining (declinatus), bent like a bow, with the arch downwards.

Decurrent (decurrens) leaf, without a leafstalk, but where the leaf runs down the stem.

Dented (retusus), a blunt leaf with a blunt notch at the end.

Depressed (depressus), when the surface of a leaf is slightly sunk.

Diadelphia, the 17th class of plants, having the filaments united into two sets.

Diamond-shaped (rhombus), applied to leaves resembling a diamond on cards.

Diandria, two stamens.

Didynamia, the 14th class, having two stamens longer.

Digynia, two pistils.

Dimpled (umbilicatus), having a hollow dot.

Diœcia, dioecious, having the flowers bearing stamens and those bearing pistils on different plants.

Disk (discus) of a leaf is its surface: of a compound flower is its central florets; thus, in a daisy, the minute yellow florets form the disc, and the larger white-shaped florets form the ray.

Distant (distant), far asunder, as the stamens of mint.

Distended (ventricosus), as the cup of the rose.

Diverging (divergens), spreading wide from the stem almost horizontally, opposed to compact.

Divided (partitus), or parted, partite, signifies that a cup, leaf, or petal, is parted more than half way down.

Dodecandria, 12 stamens.

Dorsal, fixed to the back.

Dotted (punctatus), marked with little hollow dots.

Double (didymus), applied to two anthers on one filament.

Doubly-compound (decompositus) leaves, having the primary leaf-stalk divided, so that each division forms a compound leaf. They are twin-fork (begemius), when a forked leaf-stalk has several leaflets at the end of each fork; or, doubly-threefold (bi-ternatus), when a leaf-stalk, with three divisions, has three leaflets on the end of each division or fork; or doubly winged (duplicato-pinnatum, bi-pinnatum), when a leaf-stalk has lateral ribs, each of which forms a winged leaf.

Down (pappus), the fine hair or feather-like substance, crowning the seeds of some plants, and wafting them abroad.

Downy leaf, see *Cottony*.

Drupe, a pulpy seed-vessel, without valves, consisting of a nut surrounded by a pulpy substance, *ex gr.* a cherry.

Dusted (pulveratus), applied to some plants which appear covered with a kind of powder.

E

Ear-shaped (auriculatus), somewhat resembling a human ear.

Egg-shaped (ovatus), in form of an egg.

Egg-spear-shaped (ovato-lanceolatum), see *Spear-egg-shaped*.

Elliptic, oval.

Embracing (amplexicaulis) the stem, when the base of a leaf nearly surrounds the stem.

Entire (integer), opposed to cleft, gashed, &c.

Equal (æqualis), regular.

Erect, upright.

Even (lævis) surface; level, regular.

Excrescence (apophysis), a substance growing on some of the mosses from the seat of the flower.

Expanding (patens), between upright and horizontal.

Eye (hilum), the scar by which a seed is fixed to the seed-vessel.

F.

Feathered (plumosum), the down of seeds when it sends out lateral hairs.

Feeble (debilis), unable to stand upright.

Female flowers or florets, such as have one or more pistils, but no stamens.

Ferns, the first order of the class of cryptogamia.

Fertile (fertiles vel feminei) flowers, those that produce seed capable of vegetation. Those that have stamens only are always barren. Those that have pistils only, are only barren when placed beyond the reach of the pollen coming from the anthers of staminate flowers.

Fibres (nervi), woody strings running along a leaf.

Fibrous (fibrosus) roots, composed of small threads or fibres.

Fiddle-shaped (panduriformis), oblong, but narrow in the middle, and broader below.

Filament or thread (filamentum) the slender part of a stamen supporting the anther.

Fistulous, hollow.

Finger-like (digitatus) leaves, expanded like a man's hand, in pairs, threes and fives.

Flat-topped (fastigiatus), rising to the same height, so as to form a flat surface.

Fleshy seed-vessel, *ex gr.* an apple.

Floral leaves (bractæ) are generally on the fruitstalk, so that they are sometimes mistaken for the calyx; but the calyx withers when the fruit is ripe, whereas the floral leaves endure as long as the other leaves of the plant.

Floret (flosculus), one of the small flowers forming a compound or incorporated flower.

Flower (flos), a temporary part of a plant subservient to the formation of the seed. It consists of eight parts, a calyx, corolla or blossom, stamens, pistils, seed-vessel, seeds, receptacle, and a nectary. Wanting any of these parts, a flower is incomplete.

Forked (furcatus, dichotomus), divided.

Fringed (alatus), as the blossom of the buck-bean.

Fruit (fructus), a part of a flower consisting of the seed-vessel, seed, and receptacle.

Fruitstalk (pedunculus), a part of a branch or stem bearing flowers, but not leaves.

Fungus, the last order of the class of cryptogamia.

Funnel-shaped (infundibuliformis), when a one-petaled blossom is tubular at the base, and conical at the top.

Furrowed (sulcatus), marked with lines running lengthwise.

G

Gaping (ringens, personatus) blossom, so called from its resemblance to a gaping mouth.

Gashed (lobatus), divided nearly half way down into lobes, convex at the edges, and distant from each other.

Gelatinous, jelly-like.

Gem, a bud.

General involucre, a calyx at the base of a general umbel, as in carrot.

Germ, germen, seed-bud.

Gibbous, bulged, or bulging.

Gills (lamellæ), thin plates on the under side of the pileus

pileus or hat of an agaric; remarkable in the common mushroom.
Glass-shaped (cyathiformis), tubular, but widening towards the mouth.
Glaucous (glaucus), hoary, as the back of a cabbage-leaf.
Globular (globosus), like a round ball.
Glume (gluma), husk.
Gnawed (erosum), when an indented leaf seems as if bitten at the edges.
Granulated, resembling beads.
Gymnospermia, naked seeds.
Gynandria, stamens on the pistils.

H.

Hair-like (capillaris), slender, undivided, and cylindrical.
Hairs (pili), by some thought secretory ducts.
Hand-shaped (palmatus), like the human hand with the fingers expanded.
Hat (pileus), the upper broad part of funguses.
Hatchet-shaped (dolabriforme) leaf, like an axe of unequal thickness.
Headed (capitulus) stalk, supporting one compact knob of flowers at its extremity.
Heads (capitatus) of flowers, growing in compact knobs, as in peppermint.
Heart (corculum), that part of a seed which is the future plant in miniature.
Helmet (galea), the upper part of a gaping blossom.
Hemispherical, like a half globe.
Herbaceous stem, succulent, opposed to woody.
Hermaphrodite flowers or florets, such as contain both a stamen or stamens, and a pistil or pistils, as the greater part of flowers.
Hexagonal, or six-sided.
Hexagynia, having six pistils.
Hexandria, six-stamened.
Hoary (incanus), covered with a silvery-looking substance.
Honey-combed (favosum), a receptacle with cells open at the top, and having a seed in each.
Husk (gluma), the calyx of a grass plant.
Hybrid (hybrida), a plant produced by the pollen of one plant fertilizing the germen of a plant of a different species. A mule.

J.

Jagged (laciniatus) leaves, irregularly divided and subdivided into lobes.
Icosandria, 20-stamened.
Imperfect flowers, wanting anther or pistil, or both.
Incomplete flowers want the cup, the corolla, or some other important part. See FLOWER. The tulip wants a cup, and the nettle has no blossom or corolla.
Incorporated (aggregatus), when little flowers or florets form a compound flower, as a daisy.
Incumbent, anthers fixed by the side, or stamens leaning or resting against.
Indented leaf, having the edges deeply scalloped, and the lobes far asunder.
Inflated, as if blown up like a bladder.
Inferior, see Beneath.
Interrupted, broken in its regular form, as a spike by leaves intervening.
Inversely heart-shaped (obcordatus), with the point of the heart next the stem.

Involucellum, a partial involucre.
Involucre or fence, the calyx of an umbel placed at a distance from the flowers.
Jointed (articulatus), *ex gr.* a wheat straw.

K.

Keel, the lowest petal in a butterfly-shaped corolla.
Keeled (carinatus), bent.
Knob, see Heads.

L.

Lactescent, having a milky juice.
Laminated, when the flat surfaces of leaves lie close on each other.
Lateral branches, growing from the sides of the stem, opposed to terminating.
Leaf, the part of a plant corresponding to the lungs, and also to the organs of motion of animals.
Leaflet, or little leaf, one of the single leaves of a compound leaf.
Leaf-stalk (petiolus), the footstalk of a leaf.
Leather-like (coriaceus), tough like leather.
Legume (legumen) or shell, a seed-vessel of two valves with the seeds fixed to one seam, as in the pea.
Level, when several branches or fruitstalks grow to equal heights.
Lid (operculum), a cover to the capsules of several mosses.
Ligulate, strap-shaped.
Limb, the upper spreading part of a petal.
Limber (flaccidus) bending with its own weight.
Lip, the upper or under division of a gaping corolla.
Lobes, the division of a gashed leaf.
Lopped (truncatus), looking as if cut off by scissors.

M.

Male flowers, which have stamens, but no pistils.
Matted (cæspitosus), thickly interwoven.
Membranous (membranaceus), thin, skinny, and semi-transparent.
Monadelpia, united filaments.
Monandria, one stamen.
Monocia, one house, or plants having the stamens and pistils in different flowers, but on the same plant.
Monogynia, one pistil in each flower.
Monopetalous, one-petaled.
Mouth (faux), the upper or opening part of the tube in a one-petaled corolla.
Mules, see Hybrid.

N.

Naked, without leaves or hairs.
Nectary, or honey-cup, the part of the flower which secretes the honey.

O.

Oblong-egg-shaped, oblong at the base, but egg-shaped towards the end.
Octandria, eight-stamened.
Octagynia, eight pistils.

P.

Paleaceous, chaffy.
Panicle, an irregular assemblage of flowers.
Papilionaceous flowers, butterfly-shaped, as the pea.
Parasitical plants, which grow not on the earth, but on other plants.
Pedicle, a little fruitstalk.
Pentagon, five-cornered.
Pentagynia, five pistils.

Pentandria, five stamened.
Perennial, continuing more than two years.
Petals (petala), the leaves which constitute the corolla or blossom.
Pillar (stipes), the pedicle of the down of some seeds, as in dandelion.
Pimpled (papillosus), beset with little hard protuberances.
Pistil, a part of a flower consisting of the germen, the style, and the summit.
Pitcher-shaped (urceolatus), bellying like a jug.
Pith, a soft substance filling the cavities of some plants.
Plaited, folded.
Pod (siliqua), seed-vessel of two valves, within which the seeds are alternately fixed to each seam.
Pollen (farina), a fine powder in the anthers of flowers.
Polyadelphia, stamens in three or more sets.
Polyandria, many stamens.
Polygamia, see introduction to the 23d class.
Pores, little holes.
Pouch, a short pod.
Prism-shaped, different from cylindrical, in having the circumference angular.
Proliferous, when one flower, &c. springs out of another.
Pubescent, clothed with soft wool or hair.

R.

Radiate, compound flowers in which the florets of the centre differ from those of the circumference. See *Disk*.
Rays (radii), outer florets of a radiate compound flower. See *Disk*.
Receptacle, the seat or base of a flower.
Reflected, bent back.
Remote whirls, having a considerable length of stem between each.
Rhomboidal, nearly diamond-shaped.
Rigid, inflexible.
Root-leaves (radicalia), those which proceed immediately from the root.
Ruffle or ring, the part of the curtain of an agaric which adheres to the stem after the outer part is gone.
 S.
Salver-shaped (hypocrateriformis), when a one-petaled corolla has its lower part tubular, and its higher part flat and expanded.
Scaly (squamosus), like the skin of a fish.
Scurfy (scurrosus), applied to the rough cup of some compound flowers.
Seed, that which contains the rudiments of the new plant.
Seed-lobes (cotyledones), the perishable part of a seed which affords food to the rest in germination.

Seminal leaves, those which rise from the seed-lobes.
Serrated, like the teeth of a saw.
Sheath (spatha), a kind of calyx like that of the crocus.
Simple, undivided.
Sitting leaves or flowers, without leaf or flower-stalks.
Solitary, only one in a place.
Spear-egg-shaped, like a spear at the base, and an egg at the extremity.
Spike (spica), a collection of flowers placed alternately on each side of a common fruitstalk without little fruitstalks.
Stamen, consists of a filament and anther.
Stamiferous, bearing stamens.
Streaked, marked with depressed lines.
Syngenesia, united anthers.

T.

Target-shaped leaf, having the stalk fixed, not in the edge, but the centre.
Tetragynia, four pistils.
Tetradynamia, four stamens longer.
Tiled, one leaf or scale partly covering another.
Tooth-serrated, when the edge of a leaf is marked with little serrated teeth.
Triandria, three stamens.
Trigynia, three pistils.
Tuberled, having solid warts; applied to certain lichens.
Tuberous root, having many roundish knobs in a bundle.
Tubular, hollow like a tube.

U.

Umbel (umbella), an assemblage of flowers in which a number of slender fruitstalks, proceeding from the same centre, rise to nearly the same height, so as to form a regular surface at the top, as in hemlock or carrot.
Unequal florets (radiati), when the florets of an umbel are larger in the circumference than in the centre.
Valve, the pieces of a capsule are called valves.
Vaulted (fornicatus), like the roof of the mouth.
Veil (calyptra), the calyx of mosses.

W.

Wheel-shaped, a corolla of one petal, with a flat border and a short tube.
Whirls of branches, leaves or flowers; *ex gr.* the branches of the fir.
Wings, the lateral petals of a butterfly-shaped blossom.
Winged leaf-stalk, with a thin membrane on each side.
 ——— leaf, when an undivided leaf-stalk has many little leaves growing from each side.
Wing-cleft, a leaf deeply cut.
Woody, opposed to herbaceous.
Woolly, curly haired clothing on some plants.

Z.

Zigzag, having many contrary bendings.

Botany-
Bay
|
Bothnia.

BOTANY-BAY, so called from the great number of new plants which were discovered by the naturalists who first visited it. See *New-HOLLAND*.

BOTANOMANCY, (from *Botanica*, *herb*, and *μαντις*, *divination*), an ancient species of divination, by means of plants; especially sage and fig leaves. The manner of performing it was thus: the persons who consulted wrote their own names and their questions on leaves, which they exposed to the wind; and as many of the letters as remained in their own places were taken up, and being joined together, contained an answer to the question.

BOTARGO, a kind of sausage, made with the eggs and blood of the mullet, a large fish common in the Mediterranean. The best kind comes from Tunis in Barbary: It must be chosen dry and reddish. The people of Provence use a great deal of it, the common way of eating it being with olive oil and lemon juice. There is also a great consumption of it throughout the Levant.

BOTE, (Sax.), signifies a recompense, satisfaction, or amends: hence comes *manbote*, compensation or amends for a man slain, &c. In King Ina's laws is declared what rate was ordained for expiation of this offence, according to the quality of the person slain. From hence likewise we have our common phrase, *to-boot*, i. e. *compensationis gratia*. There are *house-bote*, *plough-bote*, &c. privileges to tenants in cutting of wood, &c.

BOTELESS, (*sine remedio*). In the charter of Hen. I. to Tho. archbishop of York, it is said, "that no judgment or sum of money shall acquit him that commits sacrilege; but he is in English called *boteless*, viz. without emendation." We retain the word still in common speech; as, It is *bootless* to attempt such a thing; that is, It is in vain to attempt it.

BOTH, JOHN and ANDREW, Flemish painters, and pupils of Bloemart. The union of these brothers was very singular; they were inseparable in their studies, travels and painting. John painted the landscape part of their pictures in the manner of Lorrain, and Andrew the figures and animals in the style of Bamboche. They both died in 1650. John's taste in landscape is elegant; his ideas are grand; his composition beautiful; and his execution rich and masterly in the highest degree. His light is not always well distributed; but his figures are excellent. It is to be regretted that we have not more of his works; for they are certainly, upon the whole, among the best landscapes we have.

BOTHNIA, a province of Sweden, at the end of

B O T

the gulf of the same name. It is divided into two parts, called *east* and *west Bothnia*, the former of which belongs to Finland, and is now subject to Russia. West Bothnia is full of mountains; the earth is sandy, and yet a scarcity of provisions is seldom known. Cattle and game are so common, salmon and a sort of herrings so plenty, and the trade of skins is so gainful, that the inhabitants can command what they want from their neighbours. There are only two towns worth mentioning, viz. Tornea and Uma. The inhabitants of this province are Protestants.

BOTRYS, BOTRUS, or *Bostra*, in *Ancient Geography*, a town of Phoenicia, on the Mediterranean, built by Saturn, (a proof at least of antiquity); twelve miles to the north of Byblus, and twenty to the south of Tripolis. Now almost in ruins, and called *Boteron* or *Boturna*, (Postellus). E. Long. 37. 30. N. Lat. 34. 6.

BOTT, among bone-lace weavers, a kind of round cushion of light matter placed on the knee, whereon they work or weave their lace with bobbins, &c.

BOTT, in *Zoology*. See **BOTTS**.

BOTTICELLI, SANDRO, or **ALESANDRO**, born at Florence in 1437, learned the rudiments of painting under Filippo Lippi. He executed several pictures for Pope Sixtus IV. and others for the city of Florence: for these he received large sums of money, all of which he expended, and died at last in great distress, aged 78. He was not only a painter but a man of letters. Baldini, according to the general report, communicated to him the secret of engraving, then newly discovered by Finiguerra their townsman. The famous edition of Dante's poem of Hell, printed at Florence by Nicholo Lorenzo della Magna, A. D. 1481, and to which, according to some authors, Botticelli undertook to write notes, was evidently intended to have been ornamented with prints, one for each canto; and these prints (as many of them as were finished) were designed, if not engraved, by Botticelli. It is remarkable, that the two first plates only were printed upon the leaves of the book, and for want of a blank space at the head of the first canto, the plate belonging to it is placed at the bottom of the page. Blank spaces are left for all the rest; that as many of them as were finished might be pasted on. Mr Wilbraham possesses the finest copy of this book extant in any private library; and the number of prints in it amounts to nineteen. The two first, as usual, are printed on the leaves; and the other seventeen, which follow regularly, are pasted on the blank spaces; and these apparently were all that Botticelli ever executed. About

Botticelli
||
Bottling.

the year 1460, it is said that he engraved a set of plates, representing the *Prophets and Sibyls*. Basan tells us that he marked these plates with a *monogram* composed of an A and a B joined together.

BOTTLE, a small vessel proper to contain liquors, made of leather, glass, or stone. The word is formed from *butellus* or *botellus*, used in barbarous Latin writers, for a lesser vessel of wine; being a diminutive of *bota*, which denoted a but or cask of that liquor.

The ancient Jewish bottles were cags made of goats or other wild beasts skins, with the hair on the inside, well swed and pitched together; an aperture in one of the animals paws serving for the mouth of the vessel.

Glass bottles are better for cyder than those of stone. Foul glass bottles are cured by rolling sand or small shot in them; musty bottles, by boiling them. See **GLASS**.

Bottles are chiefly made of thick coarse glass: though there are likewise bottles of boiled leather made and sold by the case-makers. Fine glass-bottles covered with straw or wicker, are called *flasks* or *bettees*. The quality of the glass has been sometimes found to affect the liquor in the bottle.

Dr Percival cautions against the practice of cleaning of wine bottles with leaden shot. It frequently happens, he thinks, through inattention, that some of the little pellets are left behind; and when wine or beer is again poured into the bottles, this mineral poison will slowly dissolve, and impregnate those vinous liquors with its deleterious qualities. The sweetness which is sometimes perceived in red port wine may arise from this cause, when such an adulteration is neither designed nor suspected.—Potash is recommended for cleansing bottles: a small quantity in the water will clean two gross.

BOTTLING, the operation of putting up liquors in bottles corked, to keep, ripen, and improve. The writers on good husbandry give divers rules concerning the bottling of beer, cyder, and the like. The virtues of Spaw, Pyrmont, Scarborough, and other waters, depend on their being well bottled and corked, otherwise they lose both their taste and smell. To preserve them, it is necessary the bottles be filled up to the mouth, that all the air may be excluded, which is the great enemy of bottled liquors. The cork is also further secured by a cement. Some improve their bottled beer, by putting crystals of tartar, and wine or malt spirits, and others, by putting sugar boiled up with the essence of some herb, and cloves, into each bottle.

Cyder requires special precautions in the bottling; being more apt to fly, and burst the bottle, than other liquors. The best way to secure them, is to have the liquor thoroughly fine before it be bottled. For want of this, some leave the bottles open a while, or open them after two or three days bottling to give them vent. If one bottle break, through fermentation, it is best to give them all vent, and cork them up again. Mean cyder is apter to break the bottles than rich. Some soak the corks in scalding water, to render them more pliant and serviceable. Another particular to be observed is, to lay the bottles so as that the liquor may always keep the cork wet and swelled. Something also depends on the place where the bottles are set, which

ought to be such as exposes them as little as possible to the alterations and impressions of the air; the ground is better for this purpose than a frame; sand better than the bare ground: and a running water, or a spring often changed, best of all.

To hasten the ripening of bottled liquors, they are sometimes set in a warm place, or even exposed to the sun, when a few days will bring them to maturity.

BOTTOM, in a general sense, denotes the lowest part of a thing, in contradistinction to the top or uppermost part.

BOTTOM, in *Navigation*, is used to denote as well the channel of rivers and harbours, as the body or hull of a ship. Thus, in the former sense, we say, *gravelly bottom*, *clayey bottom*, *sandy bottom*, &c. and in the latter sense, a *British bottom*, a *Dutch bottom*, &c. By statute, certain commodities imported in foreign bottoms, pay a duty called *petty custom*, over and above what they are liable to if imported in British bottoms.

BOTTOMRY, in *Commerce*, (a practice which originally arose from permitting the master of a ship in a foreign country to hypothecate the ship in order to raise money to refit), is in the nature of a mortgage of a ship; when the owner takes up money to enable him to carry on his voyage, and pledges the keel or bottom of the ship (*pars pro toto*) as a security for the repayment. In which case it is understood, that if the ship be lost, the lender loses also his whole money; but if it return in safety, then he shall receive back his principal, and also the premium or interest agreed upon, however it may exceed the legal rate of interest. And this is allowed to be a valid contract in all trading nations, for the benefit of commerce, and by reason of the extraordinary hazard run by the lender. And in this case, the ship and tackle, if brought home, are answerable (as well as the person of the borrower) for the money lent. But if the loan is not upon the vessel, but upon the goods and merchandise, which must necessarily be sold or exchanged in the course of the voyage, then also the borrower, personally, is bound to answer the contract; who therefore, in this case, is said to take up the money at *respondentia*. These terms are also applied to contracts for the repayment of money borrowed, not on the ship and goods only, but on the mere hazard of the voyage itself; when a man lends a merchant 1000*l.* to be employed in a beneficial trade, with condition to be repaid with extraordinary interest, in case such a voyage be safely performed; which kind of agreement is sometimes called *fenus nauticum*, and sometimes *usura maritima*. But as this gave an opening for usurious and gaming contracts, especially upon long voyages, it was enacted by the statute 19 Geo. II. c. 37. that all moneys lent on bottomry, or at *respondentia*, on vessels bound to and from the East Indies, shall be expressly lent only upon the ship, or upon the merchandise; that the lender shall have the benefit of salvage; and that if the borrower has not on board effects to the value of the sum borrowed, he shall be responsible to the lender for so much of the principal as hath not been laid out, with legal interest and all other charges, though the ship and merchandise be totally lost.

BOTTONY. A cross bottony, in *Heraldry*, terminates

Bottling

Bottony.

Bottony
||
Botts.

nates at each end in three buds, knots, or buttons, resembling, in some measure, the three-leaved grass; on which account Segoing, in his *Tresor Heraldique*, terms it *croix trefflee*. It is the badge of the order of St Maurice. See *HERALDRY Plates*.

BOTTRIGARO, HERCOLE, a person eminently skilled in the science of music, though not a musician by profession. He was a man of rank in Bologna; and appears, from several letters to him that have been printed, to have had the title of *Count*. He published several controversial pieces on the subject of music. It seems that he entertained strong prejudices in favour of the ancient music; and that he attempted, as Vincentine and others had done, to introduce the chromatic genus into practice, but with no better success than had attended the endeavours of others. He corrected Gogavino's Latin version of Ptolemy in numberless instances; and that to so good a purpose, that Dr Wallis has in general conformed to it in that translation of the same author which he gave to the world many years after. He also translated into Italian *Boetius de Musica*, and as much of Plutarch and Macrobius as relates to music: besides this, he made annotations upon Aristoxenus, Franchinus, Spataro, Vicentino, Zarlino, and Galisiei; and, in short, on almost every musical treatise he could lay his hands on, as appears by the copies which were once his own, and are now reposed in many libraries in Italy. Of Bottrigaro's works it is said, that they contain greater proofs of his learning and skill in music, than of his abilities as a writer, his style being remarkably inelegant: nevertheless, he affected the character of a poet; and there is extant a collection of poems by him, in 8vo, printed in 1557. Walther * represents him as an able mathematician, and a collector of rarities; and says that he was possessed of a cabinet, which the emperor Ferdinand II. had a great desire to purchase. He died in 1609.

BOTTS, in *Zoology*, a species of worms which can be produced and nourished only in the intestines of a horse. It is there alone they can enjoy the proper temperature of heat, and receive the nourishment necessary for them. See *OESTRUS, ENTOMOLOGY Index*.

Besides the long worms which have been observed in the bodies of horses, there are also short ones.—By these are to be understood what we call *botts*.

All authors, both ancient and modern, who have treated of the diseases of horses, have taken notice of these worms; but M. Vallisnieri is the first who has traced them to the last stage of their transformation, and has seen them change into a hairy kind of fly like the drone.

The flies from which these botts are produced inhabit the country, and do not come near houses, at least not near those of large towns: and therefore horses are never liable to have the worms (i. e. botts) in their bodies, if they have been kept in the house, especially in a town, during the summer and autumn.

It is in the former of these seasons, and perhaps too in the beginning of the latter, that the females of these flies apply themselves to the anus of horses, and endeavour to gain admittance, in order there to deposit their eggs, or perhaps their worms.

The precise instant of their entrance will scarce admit of an eye-witness, but by the merest chance; yet M. Vallisnieri says, that Dr Gaspari had attained this

very uncommon sight. The doctor (he tells us) was one day looking at his mares in the field; and from being very quiet, he observed, that on a sudden they became very restless, and ran about in great agitation, prancing, plunging, and kicking, with violent motions of their tails. He concluded, that these extraordinary effects were produced by some fly buzzing about them, and endeavouring to settle upon the anus of one of them; but the fly not being able to succeed, he observed it to go off with less noise than before, towards a mare that was feeding at a distance from the rest; and now the fly taking a more effectual method to obtain its design, passed under the tail of the mare, and so made its way to the anus. Here at first it occasioned only an itching, by which the intestine was protruded with an increasing aperture of the anus; the fly taking the advantage of this, penetrated further, and secured itself in the fold of the intestine:—this effected, it was in a situation proper for laying its eggs. Soon after this, the mare became very violent, running about, prancing, and kicking, and throwing herself on the ground; in short, was not quiet, nor returned to feeding, till after a quarter of an hour.

The fly then, we see, can find means of depositing its eggs, or perhaps its worms (i. e. botts), in the fundament of the horse; which once effected, it has done all that it is necessary for them. If these bott-worms are not hatched when first deposited in the horse, but are then only eggs, it will not be long before it happens, from the nutritive heat they there receive.

These bott-worms soon make their way into the intestines of the horse: they occupy such parts of this region as are to them most convenient; and sometimes (as we shall see presently) they penetrate even to the stomach. All the hazard they appear to be exposed to, is that of being carried away from the places they have fixed on by the excrement, which may seem likely to drive all before it. But nature has provided for all things; and when we shall have further described these bott-worms, it will seem that they are able to maintain their situation, and to remain in the body of the horse, as long as they please.

There is a time when these bott-worms are of themselves desirous to leave this their habitation, it being no longer convenient for them after the purposes of their growth are answered. Their transformation to a fly must be performed out of the horse's body: and accordingly, when the time of their transformation draws near, they approach towards the anus of the horse; and then leave him of their own accord, or with the excrement, with which they then suffer themselves to be carried along.

According to M. de Reaumur's observations, the bott-worms have two unequal claws, by which they are enabled to remain in the intestines of the horse in opposition to all efforts of the excrement to force them out.—These claws are a sort of anchor, differently disposed from those of common anchors, but contrived to produce the same effect. Besides these two claws, nature has given them a great number of triangular spines or bristles, very sufficient to arm them against the coats of the intestines, and to resist the force employed to drive them towards the anus, provided the head be directed towards the stomach of the horse.

It will be asked, no doubt, if these bott-worms are

Botts.

Bova.

not dangerous to horses?—The mares which afforded M. de Reaumur, for several years, those on which he made his observations, did not appear to be less in health than those which had none, but it may sometimes happen, that they are in so great a quantity in the body of the horse as to prove fatal to him. M. Vallisnieri supposes these bott-worms to have been the cause of an epidemical disease that destroyed a great many horses about Verona and Mantua in the year 1713.—The observations communicated to him by Dr Gaspari sufficiently confirm his supposition. This gentleman, upon dissecting some horses that died of this distemper, found in their stomachs a surprising quantity of short worms; of which to give us some idea, he compares them to the kernels of a pomegranate opened; each of these, by gnawing on the coat of the stomach, had made to itself a kind of cellule therein, each of which would easily contain a grain of Indian wheat. It is easy to imagine by this means the stomach must be reduced to a wretched condition; the outer membranes were inflamed, and the inner ones ulcerated and corrupted; a very small quantity of these worms was found in the small intestines, and only a few in the larger, to which last they were found affixed, but had not corroded them. It is only perhaps when these bott-worms are in great numbers, and thereby incommode each other in the intestines of the horse, that they make their way towards the stomach; and indeed a very few flies must be enough to overstock the inside of a horse, provided they should deposite all their eggs, and such should all be animated, M. Vallisnieri having counted 700 and odd in the body of one single fly.

When one of these botts has left the anus of the horse, it falls on the ground; and immediately seeks out for some place of safety, where it may retire, to prepare for the last stage of its transformation, by which it is to become a fly. And now by degrees the skin hardens and thickens; and at length forms a solid shell or cod, the form of which scarce differs from that of the worm. It is first of a pale red colour, which changes into chesnut; and at length, by the addition of gradual and successive shades of brown, the shell is rendered black. The worm or bott, before it passes into a nymph, is of the form of an oblong ball; it remains in this form much longer than worms of the flesh-fly kind. M. de Reaumur met with worms that retained this figure five or six days: as yet, one can perceive no traces of the legs, wings, and head of the nymph. Hence he first learned, that those bott-worms do not become nymphs immediately upon their first change; but that, in order to become flies, they must undergo one change more than caterpillars ordinarily do to become butterflies.—For the cure of horses troubled with botts, see FARRIERY *Index*.

BOTWAR, a town of Germany, in the circle of Suabia, and subject to the king of Wirtemberg. E. Long. 9. 15. N. Lat. 49. 0.

BOTZENBURG, a town of Germany, in the duchy of Mecklenburg. It had a castle, which was destroyed by the Danes in 1202. It is seated on the Elbe, and the vessels that pass by are obliged to pay a considerable toll. E. Long. 10. 48. N. Lat. 53. 34.

BOVA, an episcopal town of Italy, in the kingdom of Naples, seated near the Apennine mountains. E. Long. 16. 15. N. Lat. 37. 15.

Bouchain
||
Housers.

BOUCHAIN, a fortified town of the French Netherlands, in the department of the north. It is divided into two parts by the river Scheld. It was taken by the French in 1676: and by the allies under the duke of Marlborough in 1711, which was the last military achievement of that great general; but the following year it was retaken by the French. E. Long. 3. 15. N. Lat. 50. 17.

BOUCHE OF COURT, the privilege of having meat and drink at court scot-free. The word is also written *bouge*, *bouge*, and *budge*; it is mere French, where it signifies *mouth*.—The French still use the phrase, *Avoir bouche à la cour*; that is, *to have table or diet at court*. This privilege is sometimes only extended to bread, beer, and wine; it was a custom anciently in use, as well in the houses of noblemen as in the king's court. Thomas earl of Lancaster retained Sir John de Ewre, to serve him with ten men at arms in time of war, allowing them *bouge of court*, with livery of hay and oats, horse-shoes and nails. Sir Hugh Merrill had the same privilege for life, on condition of serving King Edward II.

BOUCHET, JOHN, a French poet and historian, flourished in the 16th century. The most considerable of his writings are the *Annals of Aquitaine*, and his *Chapelet des Princes*.

BOUDRY, a small town of Switzerland, in the province of Neuchâtel, and capital of a chatelainry of the same name. E. Long. 7. 5. N. Lat. 47. 11.

BOVEY COAL, an inflammable fossil found in England, France, Italy, Switzerland, Germany, Ireland, &c. Its colour is brown or brownish black, and of a laminar structure. It is composed of wood, penetrated with petrol or bitumen; and frequently contains pyrites, alum, and copperas.

BOUFLERS, LEWIS FRANCIS, DUKE OF, a peer and marshal of France, and a general of distinguished reputation, was the son of Francis count of Boufflers. He was born in the year 1644, and entering early into the army, was raised in 1669 to the rank of colonel of dragoons, and in the conquest of Lorraine, served under Marshal Crequi. In the war against Holland he served under the celebrated Turenne, and frequently distinguished himself by his skill and bravery; and when that general was killed, in 1675, he commanded the rear-guard during the retreat of the French army. After performing various military services in Germany, in Flanders, and on the frontiers of Spain, he gradually rose in rank as well as in reputation. In 1690, he was created general of the army of the Moselle. In the following year, he acted as lieutenant-general, under the king in person; and while he invested Mons was wounded in an attack on that place. He conducted the bombardment of Liege, although it was defended by a superior enemy, and he forced the allied generals to abandon Luxemburg. He was entrusted with the command of the covering army, against King William, at the siege of Namur; and for this and many other important services, he was raised in 1693 to the high rank of marshal of France. In 1694, he was appointed governor of French Flanders, and of the town of Lisle. By a skilful manœuvre he threw himself into Namur, in 1695, and held out for sixty-three days, against the combined armies of the allies under King William. Having agreed to a capitulation, he was arrested prisoner of war,

Bouffers
Bougie.

war, because the French had not performed the stipulated terms on which the garrison had surrendered; and when he remonstrated that the garrison should have been retained rather than himself, he received a fine compliment, by being answered, that he was estimated at 10,000 men. In the conferences which were held with the earl of Portland, and which terminated in the peace of Ryswick, he had a principal share.

During the following war, when Lisle was again threatened, in 1708, with a siege by the duke of Marlborough and Prince Eugene, Bouffers was appointed to the command, and made a very obstinate resistance of four months. His magnanimity was not less remarkable than his military conduct; for when a partisan represented to him that it would not be difficult to kill Prince Eugene, he was told by the marshal, that he might expect a great reward for taking him prisoner, but the severest punishment if any thing were attempted against his life. He was rewarded and honoured by the king for his defence of Lisle, as if he had been victorious. When the affairs of France were threatened with the most urgent danger, though a senior officer to Villars, he made an offer to serve under that general, and was with him at the battle of Malplaquet. Here he again displayed his military skill, by conducting the retreat, so that he lost neither cannon nor prisoners. He died at Fountainbleau in the year 1711, at the age of 68, and left the character of a true patriot, as well as of a great commander. Madame de Maintenon, said of him, "that his heart was the last part that died." His conduct was uninfluenced by private interest, and superior to court intrigue. When he was ordered to take upon him the defence of Lisle, and permitted to have the choice of his lieutenants, he waited not to arrange or regulate his private affairs, or even to take leave of his family, but flew to the place, and carried with him only two officers, one taken from the Bastille, and another who had been in disgrace; preferring merit obscured in the shades of retirement, to the gaudy flutterer in the sunshine of court favour.

BOUGAINVILLE, L. A. a celebrated French navigator. See SUPPLEMENT.

BOUGEANT, WILLIAM HYACINTH, a famous Jesuit, first taught humanity at Caen and Nevers, and afterwards settled at the college of Louis the Great, where he employed himself in writing several works; the principal of which were, 1. A collection of physical observations, extracted from the best authors. 2. A history of the wars and negotiations which preceded the treaty of Westphalia. 3. The female doctor, a philosophical amusement on the language of beasts, &c. He died in 1743.

BOUGH, denotes much the same with BRANCH.—Green boughs anciently made part of the decoration of altars and temples, especially on festival occasions. Oaken boughs were offered to Jupiter; those of laurel, to Apollo; of olive, to Minerva; myrtle, to Venus; ivy, to Bacchus; pine, to Pan; and cypress to Pluto.

BOUGIE, in the French language, signifies a wax candle, and is applied to a machine which (as the wax candle formerly was) is introduced into the urethra for removing obstructions there. Mons. Daran, a French surgeon, lately boasted of his introducing them as an improvement in his art, and acquitted considerable

profit by making and selling them. Scultetus, about the middle of the 17th century, used bougies in diseases of the urethra, and Mons. Daran probably took the hint from him. Different compositions have been used, and generally mercury was a part of them. Riverius made a plaster as follows: ℞ ol. oliv. ℥ iv. ceræ citrin. ℥ ii. minii & ceruss. āā ℥ iss, tereb. venet. & rez. alb. āā ℥ iii. m. Whether the bougies are made up of this or any other composition, they must be of different sizes, from the bigness of a knitting needle to that of a goose quill. They are made of linen rags, spread with a proper matter, and then rolled up as follows. Having spread any quantity of the linen rag with the composition that is chosen for the purpose, cut it into slips from six to ten inches long, and from half an inch to an inch broad: then dexterously roll them on a glazed tile into the form of a waxed candle: and as the end of the bougie that is to be entered first into the urethra should be somewhat smaller than the rest, it would be as well to cut the slips a little tapering. It should also be observed, that when the bougies are rolled up, that side must be outward on which the plaster is spread.

Mons. Daran, and some others, attributed the action of their bougies to the composition they made use of in forming them. Mr Sharp apprehended, that as much of their efficacy was owing to the compression they made on the affected part, as to any other principle; and Mr Aiken very justly says, As it is evident that bougies of very different compositions succeed equally well in curing the same disorders in the urethra, it is plain that they do not act by means of any peculiar qualities in their composition, but by means of some property common to them all. This must be their mechanical form and texture, therefore their mode of action must be simple compression. The efficacy of mere compression in many cases of constriction is well known, from the use of sponge tents for widening parts that are straitened by cicatrices; and admitting obstructions in the urethra to be from a constriction formed by cicatrized ulcers, or a projection of the spongy substance of the urethra into the canal, we may easily conceive, that a gentle continued elastic compression will in time overcome the disease. We may also readily account for the inferior efficacy of metallic and whalebone bougies, from their not having the property of swelling with moisture, and therefore not making so equal a compression. As to bougies procuring a discharge of matter, there is no doubt but the mechanical stimulus of a foreign body in such a tender part, though free from disease, must produce it in some degree; and that this will be varied according to the chemically irritating quality of the composition, and the irritable state of the urethra; but it seems an absurdity to apply a topic, made uniform throughout, to the whole length of a canal, with a view of producing extraordinary effects upon a particular part of it, by means of some powerful quality in the ingredients. That a part of the bougie is particularly covered with matter, is probably owing to the greater irritation of that part of the urethra where the disorder is.

BOUGUER, PETER, an eminent French mathematician. See SUPPLEMENT.

BOUHOURS, DOMINIC, a celebrated French critic,

Bougie
Bouhours.
Motherby's
Med. Dict.

Bouhours,
Bouillon.

lic, was born at Paris in 1628; and has been by some considered as a proper person to succeed Malherbe, who died about that time. He was entered into the society of Jesuits at the age of 16; and was appointed to read lectures upon polite literature in the college of Clermont at Paris, where he had studied; but he was so incessantly attacked with the headach, that he could not pursue the destined task. He afterwards undertook the education of two sons of the duke of Longueville, which he discharged with great applause. The duke had such a regard for Bouhours, that he would needs die in his arms; and the "Account of the pious and Christian death" of this great personage was the first work which Bouhours gave the public. He was sent to Dunkirk to the Popish refugees from England; and in the midst of his missionary occupations, found means to compose and publish books. Among these were, *Entretiens d'Ariste et d'Eugene*, or "Dialogues between Aristus and Eugenius;" a work of a critical nature, and concerning the French language. His book was printed no less than five times at Paris, twice at Grenoble, at Lyons, at Brussels, at Amsterdam, at Leyden, &c. and embroiled him in quarrels with a great number of censors, with Menage in particular, who, however, lived in friendship with our author before and after. The fame of this piece, and the pleasure he took in reading it, recommended Bouhours so effectually to the celebrated minister Colbert, that he trusted him with the education of his son the marquis of Segnelai. He wrote afterwards several other works; the chief of which are, 1. Remarks and doubts upon the French language. 2. Dialogues upon the art of thinking well in works of genius. 3. The life of St Ignatius. 4. The art of pleasing in conversation. 5. The life of St Francis Xavier, apostle of the Indies and of Japan. This last work was translated from the French into English by Mr Dryden, and published at London in the year 1668, with a dedication prefixed to James II.'s queen.

BOUILLON, a town of the Netherlands, in the duchy of the same name, and in the county of Luxemburg, with a fortified castle, which is seated on a rock that is almost inaccessible. The French took it in 1676; upon which it was given to the duke of Bouillon. This duchy was a sovereignty, independent of France; and in 1792, the king of Great Britain granted to Philip d'Auvergne, captain in the royal navy, his license to accept the succession to the said duchy, in the case of the death of the hereditary prince, only son of the reigning duke, without issue male, pursuant to a declaration of his serene highness, in 1791, "at the desire, and with the express and formal consent of the nation." Accordingly, Captain d'Auvergne afterwards assumed the title of prince of Bouillon. In May 1794 this town was taken by storm, by General Beaulieu, after defeating a considerable body of republicans, and given up to pillage; 1200 French were killed, and 300 taken prisoners. It is seated near the river Semois, 12 miles north of Sedan. E. Long. 5. 20. N. Lat. 49. 45.

BOUILLON, in the manege, a lump or excrescence of flesh that grows either upon or just by the frush, inso-much that the frush shoots out, just like a lump of flesh, and makes the horse halt; and this is called the *flesh blowing upon the frush*. Manege horses, that never wet

VOL. IV. Part I.

†

their feet, are subject to these excrescences, which make them very lame. See FRUSH.

BOVINA AFFECTIO, a distemper of black cattle, caused by a worm lodging between the skin and the flesh, and perforating the same. This distemper is not mentioned by the ancient Greeks, and is but little known in Europe.

BOVINES, a small town of the French Netherlands, in the department of the North, seated on the river Maese, in E. Long. 4. 50. N. Lat. 49. 45.

BOVINO, an episcopal town of Italy, in the Capitanata, seated at the foot of the Apennine mountains, in E. Long. 16. 15. N. Lat. 41. 17.

BOVIUM (Itinerary); a town of the Silures, in Britain, fifteen miles to the south of Isca Silurum, or Caerleon, in Monmouthshire: Now called *Cowbridge*; according to Baudrand, *Bangor* in Caernarvonshire.

BOULAINVILLIERS, HENRY DE, Lord of St Saise, and an eminent French writer, was descended from a very ancient and noble family, and born at St Saise in 1658. His education was among the fathers of the oratory; where he discovered from his infancy those uncommon abilities for which he was afterwards distinguished. He applied himself principally to the study of history; and his performances in this way are numerous and considerable. He was the author of a history of the Arabians; fourteen letters upon the ancient parliaments of France; a history of France to the reign of Charles VIII.; the state of France, with historical memoirs concerning the ancient government of that monarchy, to the time of Hugh Capet, "written (says M. Montesquieu) with a simplicity and honest freedom worthy of that ancient family from which their author was descended." M. Boulainvilliers died at Paris in 1722; and after his death was published his *Life of Mahomet*.

BOULANGER, NICHOLAS ANTHONY, a very singular Frenchman, was born at Paris in 1722, and died there in 1759, aged only 37. During his education, he is said to have come out of the college of Beauvais almost as ignorant as he entered into it; but struggling hard against his inaptness to learn, he at length overcame it. At seventeen, he began to study mathematics and architecture; and in three or four years made such a progress, as to be useful to the baron of Thiers, whom he accompanied to the army in quality of engineer. Afterwards he had the supervision of the highways and bridges; and he executed several public works in Champagne, Burgundy, and Lorraine. The author of his life, in the *Dictionnaire des Hommes celebres*, writes, that in this province a terrible spirit discovered itself in him, which he himself did not suspect before; and this was, it seems, the spirit of "thinking philosophically." In cutting through mountains, directing and changing the courses of rivers, and in breaking up and turning over the strata of the earth, he saw a multitude of different substances, which (he thought) evinced the great antiquity of it, and a long series of revolutions which it must have undergone. From the revolutions in the globe, he passed to the changes that must have happened in the manners of men, in societies, in governments, in religion; and he formed many conjectures upon all these. To be farther satisfied, he wanted to know what, in the history of ages, had been said upon these particulars; and

U a

that

Bouillon
Boulangier.

Boulangier that he might be informed from the fountain-head, he learned first Latin and then Greek. Not yet content, he plunged into Hebrew, Syriac, Chaldaic, and Arabic; and acquired so immense an erudition, that, if he had lived, he would have been one of the most learned men in Europe: but death, as we have observed, prematurely took him off. His works are, 1. *Traité du Despotism Oriental*, 2 vols 12mo; a very bold work; but not so bold and licentious, as, 2. *L'Antiquité dévoilée*, 3 vols 12mo. This was posthumous. 3. He furnished to the *Encyclopedie* the articles *Deluge*, *Corvée*, and *Société*. 4. He left behind him in MS. a Dictionary, which may be regarded as a concordance in ancient and modern language. As a man, he is said to have been of a sweet, calm, and engaging temper; which, however, it is very difficult to reconcile with the dark, impetuous, ardent spirit, that appears to have actuated him as a writer.

Strutt's
Dict.

BOULANGER, John, an engraver, who flourished towards the end of the last century, was a native of France. His first manner of engraving appears to have been copied, in some degree, from that of Francis de Poilly; but soon after he adopted one of his own, which, though not original, he however greatly improved: He finished the faces, hands, and all the naked parts of his figures, very neatly, with dots instead of strokes, or strokes and dots. The effect is singular enough, and by no means unpleasing: only, in some few instances, he has opposed the coarse graving of his draperies and back ground, so violently to the neater work of the flesh, that the outline of the latter is thereby rendered hard, and the general appearance of it flat and chalky. This style of engraving has been carried to its greatest perfection in the present day, particularly in England. He did not draw the naked parts of his figures correctly, or with fine taste. His draperies are apt to be heavy, and the folds not well marked. However, his best prints possess much merit, and are deservedly held in great esteem.

BOULAY, CÉSAR EGASSE DU, in Latin *Bulæus*, was born at St Ellier, a village of Maine in France; and became professor of humanity at the college of Navarre, register, rector, and historiographer of the university of Paris. He died in 1678, after having published several works. The principal of them are, A History of the University of Paris, in Latin, 6 vols folio; and the Treasure of Roman Antiquities, in 1 vol. folio.

BOULCOLACA, among the modern Greeks, denotes the spectre of some wicked person who died excommunicated by the patriarch, reanimated by the devil, and causing great disturbance among the people; of which many strange stories are told. The word is Greek, and is sometimes written *βουκολακος*, *bourkolakos*; and supposed to be derived from *βουκος*, or *βουκα*, "mud," and *λακος*, a "ditch," on account of the filthiness of the sight.

BOULDER-WALL, a kind of wall built of round flints or pebbles, laid in strong mortar, and used where the sea has a beach cast up, or where there are plenty of flints.

BOULETTE, in the manege. A horse is called *boulette*, when the fetlock, or pastern-joint, bends forward, and out of its natural situation, whether through violent riding, or by reason of being too short jointed, in which case the least fatigue will bring it.

BOULLOGNE, LEWIS, painter to the French king, and professor of the academy of painting, distinguished himself by his art; and died at Paris in 1674, aged 65. There are three of his pictures in the church of Notre Dame.—He left two sons who were admired for their skill in painting. The elder, who is well known under the name of *Bon Boullogne*, was first instructed by his father; after which he went to perfect himself in Italy, and for that purpose the king allowed him a pension: at his return, he was made professor of the academy of painting. Louis XIV. employed him in adorning several of his palaces; and there is a great number of his pictures at Paris. His talents for copying the pictures of the great Italian masters were so very extraordinary, that he frequently deceived the greatest judges. He died in 1717.—*Lewis Boullogne*, his brother, after being also instructed by his father, gained the prize of painting at 18 years of age; upon which he obtained the king's pension. He set out for Italy at his brother's return, and acquired great skill in designing and colouring. At his return to Paris he was much employed: and at length became director of the academy of painting, knight of the order of St Michael, and first painter to the king. Louis XIV. allowed him several pensions, and raised him and his posterity to the rank of nobility. He embellished the church of the Invalids, the chapel of Versailles, &c.

Boullogne
Boulognois
Pilkington.

BOULLOGNE, Bon de, a painter of some eminence, was born at Paris in 1649. From his father Louis de Boullogne he learned the first principles of the art: but went to Rome in order to perfect himself from the works of the best masters. He abode in Italy five years. He excelled in history and portrait. His talents for copying the pictures of the great Italian painters were so very extraordinary, that he frequently deceived the greatest judges. He died at Paris in 1717, aged 68.

BOULLOGNE, Louis de, born at Paris in 1654, was the younger brother of the preceding; and, like him, learned from his father the first principles of painting, and afterwards went to Rome to complete his studies. His works, on his return, were so much esteemed, that Louis XIV. honoured him with the order of St Michael, and, after the death of Anthony Coypell, appointed him his principal painter. He chiefly excelled in historical and allegorical subjects. He died at Paris in 1734, aged 80 years.

BOULOGNE, a large sea-port town of Picardy in France, and capital of the Boulognois, now called the department of the Straits of Calais, with a harbour, and formerly a bishop's see. It is divided into two towns; the higher, and the lower. The former is strong both by nature and art; and the latter is only surrounded with a single wall. The harbour has a mole for the safety of shipping, which at the same time prevents it from being choaked up. The lower town is inhabited by merchants, and has three large streets, one of which leads to the high town, and the other two run in a line on the side of the river. It is situated at the mouth of the river Lianne, and contained 10,140 inhabitants in 1815. E. Long. 1. 42. N. Lat. 50. 42.

BOULOGNOIS, a territory of France, in the north part of Picardy, about 30 miles in length and 20 in breadth. The chief town is Boulogne, and the chief trade

*Boulognois,
Boulogne.*

trade is in pit-coal and butter. It now forms the department of the Straits of Calais.

BOULTER, Dr HUGH, was born in or near London, of reputable and wealthy parents. He was educated at Merchant-tailors school; and, before the Revolution, was from thence admitted a commoner of Christ-church in Oxford. Some time after he was chosen a demy of Magdalen college, at the same election with Mr Addison and Dr Wilcox. From the merit and learning of the persons elected, this was commonly called by Dr Hough, president of the college, the *golden election*. He afterwards became fellow of the same college; in which station he continued in the university till he was invited to London by Sir Charles Hodges, principal secretary of state, in the year 1700, who made him his chaplain, and recommended him to Dr Tonison archbishop of Canterbury; but his first preferments were owing to the earl of Sunderland, by whose interest and influence he was promoted to the parsonage of St Olave in Southwark, and the archdeaconry of Surry. Here he continued discharging very faithfully and diligently every part of his pastoral office, till he was recommended to attend George I. as his chaplain when he went to Hanover in 1719. He had the honour to teach Prince Frederic the English language; and by his conduct he so won the king's favour, that he promoted him to the deanery of Christ-church, and the bishopric of Bristol, in the same year. As he was visiting his diocese five years afterwards, he received a letter from the secretary of state, acquainting him that his majesty had nominated him to the archbishopric of Armagh and primacy of Ireland. This honour he would gladly have declined; and desired the secretary to use his good offices with his majesty to excuse him from accepting it. Ireland happened to be at this juncture in a great flame, occasioned by Wood's ruinous project; and the ministry thought that the bishop would greatly contribute to quench it by his judgment, moderation, and address. The king therefore laid his absolute commands upon him: to which he submitted, but with some reluctance. As soon as he had taken possession of the primacy, he began to consider that country, in which his lot was cast for life, as his own; and to promote its true interest with the greatest zeal and assiduity. Accordingly, in innumerable instances, he exerted himself in the noblest acts of beneficence and public spirit. In seasons of the greatest scarcity, he was more than once instrumental in preventing a famine which threatened that nation. On one of these occasions he distributed vast quantities of corn throughout the kingdom, for which the house of commons passed a vote of public thanks; and at another time 2500 persons were fed at the poor-house in Dublin, every morning, and as many every evening, for a considerable time together, mostly at the primate's expence. When schemes were proposed for the advantage of the country, he encouraged and promoted them not only with his counsel but his purse. He had great compassion for the poor clergy of his diocese, who were disabled from giving their children a proper education; and he maintained several of the children of such in the university. He erected four houses at Drogheda for the reception of clergymen's widows, and purchased an estate for the endowment of them. His charities for augmenting small livings and buying glebes amounted to upwards

of 30,000*l.* besides what he devised by will for the like purposes in England. In short, the instances he gave of his generosity and benevolence of heart, his virtue, his piety, and his wisdom, are almost innumerable, and the history of his life is his noblest panegyric. This excellent prelate died at London, on the 2d of June 1742, and was interred in Westminster-abbey, where a beautiful monument of finely polished marble is erected to his memory.

BOULTINE, a term which workmen use for a moulding, the convexity of which is just one-fourth of a circle; being the member just below the plinth in the Tuscan and Doric capital.

BOULTON, MATTHEW, an eminent English engineer. See SUPPLEMENT.

BOULUKE, in the military orders of the Turks, a body of the janizaries, with an officer in the place of a colonel at their head, sent upon some particular enterprise.

BOUM, in *Ancient Geography*, a town in Ethiopia beyond Egypt, on the west side of the Nile.

BOUM SOLIS STABULA, in *Ancient Geography*, the territory of Mylæ, so called: A peninsula on the east coast of Sicily, to the north of Syracuse; remarkable for its fertility and rich pastures (Theophrastus): and hence arose the fable of the oxen of the sun feeding there (Scholiast on Apollonius). Pliny and Seneca say, that something like dung is thrown out on the coast of Mylæ and Messana, which gave rise to the fable of the oxen of the sun being stalled there; and at this day the inhabitants affirm the same thing (Cluverius).

BOUNCE, in *Ichthyology*, the English name of a species of squalus. See SQUALUS.

BOUND, in dancing, a spring from one foot to the other; by which it differs from a hop, where the spring is from one foot to the same. It also differs from a half coupee, as in the latter the body always bears on the floor, either on one foot or the other; whereas, in the bound, it is thrown quite from the floor.

BOUND-Bailiffs, are sheriffs officers for executing of process. The sheriffs being answerable for their misdemeanors, the bailiffs are usually bound in a bond for the due execution of their office; and thence are called *bound-bailiffs*, which the common people have corrupted into a much more homely appellation.

BOUNDS OF LANDS. See ABUTTALS.

BOUNTY, in *Commerce*, a premium paid by government to the exporters of certain British commodities, as sail-cloth, gold and silver lace, silk stockings, fish, corn, &c. The happy influence which bounties have on trade and manufactures is well known: nor can there be a more convincing proof of the good intentions of the government under which we live, than the great care that is taken to give all possible encouragement to those who shall establish or improve any hazardous branch of trade.

All undertakings, in respect either to mercantile enterprises, or in the establishment of manufactures, are weak and feeble in their beginnings; and if unsuccessful, either sink entirely, or at least are seldom revived in the same age. Accidents of this nature are not only destructive to private persons, but exceedingly detrimental to the public interest. On this principle, more

Bounty.*

Bounty. especially since trade, for which Providence designed us, hath been attended to, such attempts have been thought deserving, and have been favoured, with public support. This in former times usually flowed from the crown, in the form of letters-patent, charters, or other grants of privileges, which, however requisite they might be, were notwithstanding very frequently objects of censure. If such as obtained them failed in their endeavours, they were reputed *projectors*; if, on the other hand, they succeeded, they were considered as *monopolisers*. Corporations, which imply the uniting certain individuals into a body, that they may thereby become more useful to the community, are created by the crown. Many of these were formed for promoting trade; and, according to the old system of our government, were necessary and useful. On the same principle, privileges were granted to private persons, on a suggestion, that what was immediately of use to them would terminate in public utility. These also did good in bringing in many arts and manufactures; though, in some cases, tending to private interest more than public emolument, they were liable to legal correction. In later times, and in concerns of moment, a much better method has been adopted, as often as it hath been found practicable, by rejecting private or particular interest, and proposing the designed advantages to such as should perform the stipulations on which they are granted. These bounties, as they are paid by the public, so they are solely calculated for the benefit of the public. They are sometimes given to encourage industry and application in raising a necessary commodity; which was intended by the bounty on exporting corn. The intention of this bounty was to encourage agriculture; and the consequence hath been, that we now grow more than twice as much as we did at the establishment of the bounty; we even consume twice as much bread as we then grew; yet in A. D. 1697, we exported a fifteenth part of what we grew, of late years a twenty-ninth part only. The bounty on this twenty-ninth part amounted to somewhat more than 50,000*l.* and the produce to more than 400,000*l.* It is evident that all this is so much clear gain to the nation. But this is far from being all that we have annually gained. For if our cultivation is double, as indeed it is, then the rent of lands, the subsistence of working hands, the profits of the tradesmen supplying them with utensils, clothes, the value of horses employed, &c. must all be taken into the account. Besides this, we must add the freight (amounting to half the bounty), to make the idea of the advantages complete.

Sometimes bounties are given with a view to promote manufactures, as in the case of those made of silk. Many laws are to be found in our statute books in favour of the silk manufacture, made with great wisdom and propriety, for the encouragement and support of many thousands of industrious persons employed therein. By statute 8 Geo. I. cap. 15. § 1. a bounty was given on the due exportation of ribbons and stuffs, of silk only, of three shillings upon a pound weight; silk, and ribbons of silk, mixed with gold and silver, four shillings a-pound; on silk gloves, silk stockings, silk fringes, silk laces, and sewing silk, one shilling and threepence a-pound; on stuffs of silk and gogram yarn, eightpence a-pound; on silks mixed with inkle or cotton,

one shilling; on stuffs of silk mixed with worsted, sixpence a-pound, for three years; and, from experience of their utility, these were continued by subsequent statutes. **Bounty.**

Sometimes bounties are given to support a new manufacture against foreigners already in possession of it, as in making linen and sail-cloth. The promoting of the manufacture of British sail-cloth was undoubtedly a very important national object, as the consumption was very large, and of consequence the purchase of it from foreigners a heavy expence on the public. Many methods were therefore devised, and countenanced by law, both here and in Ireland, for introducing and encouraging our own in preference to that of strangers, more especially in the royal navy. By stat. 12 Ann. cap. 16. § 2. a bounty was given of one penny per ell on all that was exported for a term, and continued by subsequent statutes. By 4 Geo. II. cap. 27. § 4. an additional bounty of another penny an ell is granted. These bounties were to be paid out of an additional duty on imported sail-cloth. By the same statute every ship built in Britain, or in the plantations, is, under the penalty of 50*l.* to be furnished with a complete suit of sails of British manufacture. The amounts of these bounties mark the progress of the manufacture, which is also assisted by the fund on which the payment is assigned.

The assistances, however, are never bestowed but on mature deliberation; in virtue of strong proofs, and with a moral certainty of a national benefit. The great intention of bounties is to place the British trader on such ground as to render his commerce beneficial to his country. In order to this, some profit must accrue to himself, otherwise he would not embark therein; but this, whatever it be, must prove inconsiderable in comparison of what results to the public. For if, by the help of such a bounty, one or many traders export to the value of 1000, 10,000, or 100,000 pounds worth of commodities or manufactures, whatever his or their profit or loss (for the latter, through avidity and overloading the market, sometimes happens) may be, the nation gains the 1000*l.* 10,000*l.* or 100,000*l.*; which was the object of the legislature in granting the bounty. Upon this consideration, that the entire produce of what is exported accrues to the nation, the legislature, when an alteration of circumstances required it, have made no scruple of augmenting a bounty; as in the case of refined sugar exported, from three to nine shillings per hundred weight. In like manner, the original bounty of one pound per ton in favour of vessels employed in the whale-fishing hath been doubled, and many new regulations made, in order to render this fishery more advantageous to the public. As a bounty is given on malt when allowed to be exported, so an equivalent of 30 shillings per ton hath been granted on all British-made malt-spirits when exported, which is a common benefit to land, manufactures, and commerce.

It is indeed true, that on whatever account, or to whatever amount, this reward is given, the public seem to pay, and private persons seem to receive. But these private persons receive it as the hire from the public, for performing a service which otherwise they would not perform, the benefit of which accrues to the public, and who can therefore very well afford to pay that reward in reality, which, as we have stated it, she on-

Bounty. ly seems to do. For, looking a little closer, we cannot help observing, that the bounty is paid to individuals, who, as such, make a part of the public. But the commodities or manufactures exported are sold to foreigners, and the whole produce of them, be it what it will, comes into the purse of the public. By attending to this self-evident doctrine, every reasonable and public-spirited man will be easily reconciled to bounties; and the three following considerations will be sufficient to obviate the most common objections that have been made to the practice of giving them. 1. That no bounty can be desired but on the plea of national utility, which always deserves notice, and cannot be mistaken. It must likewise be alleged and proved, that this is the only means whereby the national benefit can be attained. 2. The sums issued on this account not only show the clear expence of the bounty, but also indicate the profit gained by the public; for as the one cannot exist without the other, that amount must be the incontestable index of both. 3. It must be remembered (and of this too some instances might be given), that if bounties should be improperly bestowed, they will of course prove ineffectual, and after a few fruitless trials will remain unclaimed, and consequently produce no expence. There is indeed another objection which hath been made against the giving of bounties. This is grounded on the frauds to which they are supposed to be liable; and particularly the relanding of the goods on which the bounty hath been paid, and thereby deceiving and cheating the public. But whoever peruses the laws made on this head, and attentively considers the numerous precautions taken to fix every circumstance relative to the obtaining the bounty, the checks on the shipping of goods, the securities taken for their due exportation, the certificates required to ascertain their being actually delivered and sold in a foreign market, must be convinced, that to discharge all those securities, in case of an intended fraud, is a thing very difficult, if not impossible.

To these remarks we may add, that bounties are usually granted only for a limited time, and then expire; are always liable to be suspended; and of course can never be the cause of any great national loss. There is no doubt that, exclusive of frauds, the immoderate thirst of gain may tempt interested men to aim at converting what was calculated for public benefit to its detriment, for their own private advantage. Thus, on a prospect of short crops in other countries, men may take measures within the letter, but directly against the spirit, of the law, to send so much of our corn abroad as to endanger a famine at home. For this the wisdom of parliament provides, not barely by suspending the bounty, but by prohibiting exportation and opening the ports for foreign supplies. We cannot with any shadow of justice ascribe scarcity to the bounty on the exportation. If this was the case, suspensions would be frequent, whereas there have been but five in a course of 70 years. If the bounty had any share, the larger the exportation, the greater would be the scarcity. In A. D. 1750 we exported more than one fifth of our growth of wheat, which was notwithstanding but at four shillings per bushel; whereas a century before, A. D. 1650, when we had neither bounty nor exportation, wheat was at nine shillings and sixpence per bushel. The causes of scarcity are unkindly sea-

sons; which though human policy cannot prevent, yet their sad effects have been evidently lessened by our increased growth, since the taking place of bounty and exportation.

Queen Anne's BOUNTY, for augmenting poor living under 50l. per annum, consists of the produce of the first fruits and tenths, after the charges and pensions payable out of the same are defrayed. A corporation for management of the same was settled, &c. in 1704. See AUGMENTATION.

BOURBON, or **MASCARENHAS**, *Isle of*, an island in the Indian ocean, lying on the east of Madagascar, in E. Long. 58. 30. S. Lat. 21. 23. This island has no port, and is in some places inaccessible. Its length and breadth have not been well determined; but the circumference, according to the account of a person who resided there some time, is about 57 leagues. It is for the most part mountainous, but in some places there are very beautiful and fertile plains. In the south part of the island there is a burning mountain, which has thrown out vast quantities of bitumen, sulphur, and other combustible materials; neither does it cease throwing them out still, so that the country about it is useless, and is called by the inhabitants *pays brulé*, that is, burnt land. The shore is high and rocky all round; but though on this account it hath no ports, there are several good roads, particularly one on the west, and another on the north-east. As to its form, this island is irregular, so that it is difficult to judge from the maps whether it is round or long. The air is equally pleasant and wholesome, insomuch that the people live to a great age without feeling either infirmities or diseases. This is occasioned by the hurricanes, of which they have one or two every year. These purge and cleanse the air so as to render it highly salubrious; the certainty of which is thus distinguished, that when they fail of making their annual visits, as sometimes they do, diseases and death find an entrance into the island, which otherwise would soon be overstocked with inhabitants. The climate is hot, but not to such a degree as might be expected from its situation, the breezes from the mountains being constant and very refreshing. The tops of these mountains are in winter covered with snow; which, melting in the summer, furnishes abundance of rivers and rivulets, with which the country is plentifully watered: so that the soil, though not very deep, is wonderfully fruitful, producing Turkey corn and rice twice a-year, and the latter in great abundance. Most sorts of cattle are found here, good in their kind, and are very cheap; wild goats and wild hogs are found in the woods and on the tops of the mountains; here also are vast quantities of wild fowl of different kinds, fish, and land tortoises, affording at once the most delicate and wholesome food. As to fruits, they have bananas, oranges, citrons, tamarinds, and other kinds; neither does it want valuable commodities, particularly ebony, cotton, white pepper, gum benzoin, aloes, and tobacco; all excellent in their kind, when compared with those of other countries. This island is also happy in its deficiencies; for no animals that are venomous are to be found therein, and only two sorts that are disagreeable to the sight, viz. spiders of the size of a pigeon's egg, which weave nets of a surprising strength, reckoned by some capable of being treated so as to become as valuable.

Bounty,
Bourbon

Bourbon.

luable as silk; and bats of a most enormous size, which are not only skinned and eaten, but esteemed also the greatest delicacy that they have.

The island of Bourbon was discovered by the Portuguese in 1545, as appears by a date inscribed by them upon a pillar when they first landed; but when the French settled in Madagascar, this island was totally desolate. Three Frenchmen being banished thither, and left there for three years, made such a report of it at their return as surprised their countrymen. They lived most of that time upon pork; and though they were in a manner naked, yet they affirmed that they never had the least pain or sickness whatever. This tempted one Anthony Taureau to go over thither in 1654, accompanied by seven French and six negroes, who carried with them the cattle from which the island has been stocked ever since. The first thing they did was to erect the arms of France, by order of M. Falcourt who was governor of Madagascar, and to bestow upon the island a new name. Then they set up huts, and laid out gardens, in which they cultivated melons, different sorts of roots, and tobacco; but just as the last became ripe, the whole plantation was destroyed by a hurricane. The French, however, went to work again; and by having some acquaintance with the climate, succeeded better, and added aloes to the rest of their plantations; but receiving no succour from Madagascar, and being tired of living by themselves in the isle of Bourbon, they very readily embraced the offer of an English captain, and in the year 1658 embarked for Madras. When the last great blow was given to the French at Madagascar by the natives, who surprised and cut them off in one night, there escaped as many men as, with their wives, who were natives, filled two canoes; and these being driven by the wind on the isle of Bourbon, were the next set of people who inhabited it. This last colony, for want of an opportunity to remove, were constrained to cultivate this new country of theirs, and to remain in it. It was not long before a further stock of inhabitants arrived. A pirate that had been committing depredations in the Indies, returning to Europe, ran ashore and was split to pieces on the rocks, so that the crew was forced to join themselves to the former inhabitants; and as they had on board their vessel a great many Indian women whom they had made prisoners, they lived with them, and in process of time had a numerous posterity. As East India ships touched frequently here, when too late to double the Cape, many of the sailors, for the sake of the women, deserted at the time of their departure, and staying behind became planters in the isle of Bourbon. As the place grew more populous, the people naturally became more civilized, and desirous of living in a more commodious manner; which induced them to build small vessels, that in these they might sometimes make a trip to Madagascar, in order to purchase slaves, whom they employed in their plantations to cultivate aloes, tobacco, and other things, with which they drove a small trade, when ships of any nation anchored in their roads for the sake of refreshments. In this situation they were, when the French East India Company put in their claim; and assuming the property of the island, sent thither five or six families and a governor. At first the inhabitants expected to reap

Bourbon.

some benefit from their new masters; but finding very little, and thinking the governor took too much upon him, they revolted at the instigation of a priest, seized their governor and put him into a dungeon, where he died of hunger and grief. For this some of the ring-leaders were punished, a kind of fort was erected, some guns placed on it, and the French flag kept flying; but in other respects, so little care was taken, that, till within these 40 years, the island was in no state of defence.

The number of inhabitants in the year 1717 was computed at 2000; viz. 900 free, and 1100 slaves. Amongst these people the usual distinction of whites and blacks entirely fails: for even the free are of different colours; and a French writer assures us, that he saw in a church one family, consisting of five generations, of all complexions. The eldest was a female, 108 years of age, of a brown black, like the Indians of Madagascar; her daughter, a mulatto: her grand-daughter, a mestizo; her great grand-daughter, of a dusky yellow; her daughter again, of an olive colour; and the daughter of this last, as fair as an English girl of the same age. These people are, general speaking, of a gentle quiet disposition, very industrious, and submissive enough to authority, provided it is exercised with a tolerable degree of equity and decency; for otherwise the whole of them are apt to rise in rebellion at once; and the slaves have so little reason to complain of their masters, that they are always on the same side. The island is divided into four quarters. The first is that of St Paul, which is the largest and best peopled: their houses are built at the foot of a steep mountain, on both sides of a fresh water lake. As for the plantations, they are on the top of a mountain, which they ascend by a very rough and troublesome passage. On the summit there is a spacious plain, a great part of which is divided into plantations of rice, tobacco, corn, sugar, and fruits. The quarter of St Dennis lies seven leagues from that of St Paul, towards the east, and there the governor resides. It is not so well peopled as the former; but the country is more pleasant, and the situation better. At two leagues distance, proceeding along the sea-coast, is the quarter of St Mary's, which is but thinly peopled. The last and most fertile quarter is that of St Susannah, which is at the distance of four leagues from St Dennis. The road between these two quarters is tolerable, though part of it has been cut with much difficulty through a wood; but the passage from St Dennis to St Paul is only by sea.

When the present company of India became, by their perpetual establishment, possessed of the island of Bourbon, they began to improve it exceedingly; raising new forts and batteries, so as to render it in a manner inaccessible; and importing coffee-trees from Arabia; which have succeeded so well, that it is believed they produce an eighth, according to some a sixth, part as much coffee as is raised in the kingdom of Yemen in Arabia, and it is likewise held next in goodness to that. — In 1763, the population amounted to 4627 white people, and 15,149 blacks; the cattle consisted of 8702 beeves, 4084 sheep, 7405 goats, and 7619 hogs. Upon an extent of 125,909 acres of cultivated land, they gathered as much cassava as would feed their slaves, 1,135,000 pounds weight of corn, 844,100 pounds of rice,

Bourbon rice, 2,879,100 pounds of maize, and 2,535,100 pounds of coffee; which last the company bought up at about 3d. per pound. In 1811 the population was 16,400 Europeans, 3496 free negroes, and 60,450 slaves.

In 1748, Admiral Boscawen appeared before this island with a British fleet; but found it too strong to be attacked. See **BOURBON, SUPPLEMENT.**

BOURBON, Nicholas, a famous Latin poet in the 16th century, was a native of Vandœuvre near Langres, and the son of a wealthy man who was master of several forges. Margaret de Valois appointed him preceptor to her daughter Jane d'Albert of Navarre, the mother of King Henry IV. At length he retired to Conde, where he had a benefice, and died about the year 1550. He wrote eight books of Epigrams; and a poem on the forge, which he has entitled *Ferraria*. He had great knowledge of antiquity, and of the Greek language. Erasmus praises his Epigrams.

BOURBON, Nicholas, a celebrated Greek and Latin poet, was nephew of the preceding. He taught rhetoric in several colleges of Paris; and the cardinal de Perron caused him to be nominated professor of eloquence in the Royal College: he was also canon of Langres, and one of the 40 of the French academy. At length he retired to the fathers of the oratory, where he died in 1644, aged 70. He is esteemed one of the greatest Latin poets France has produced. His poems were printed at Paris in 1630.

BOURBON-Lancy, a town of France, in the department of Saone and Loire. It is remarkable for its castle and baths; and there is a large marble pavement, called the *great bath*, which is a work of the Romans. It is seated near the river Loire, in E. Long. 3. 46. N. Lat. 46. 37.

BOURBON L'Archevêque, a town of France, in the department of Allier, remarkable for its baths, which are exceedingly hot. E. Long. 3. 28. N. Lat. 46. 35.

Family of Bourbon, the present royal family of France. Henry IV. in 1589, though of the 10th generation, was the nearest heir, and succeeded Henry III. (the last of the Valois race), whose brother Francis II. married Mary queen of Scots, and both died without issue. Louis XVI. was the fifth king of this family in succession. This family also mounted the throne of Spain in 1700, by Philip V. grandson to Louis XIV. which was the occasion of the long and bloody war that ended in the peace of Utrecht. A branch of the Spanish family likewise mounted the throne of the two Sicilies in 1734. These three branches entered into a treaty offensive and defensive in 1761, which goes by the name of the *family-compact*.

BOURBONNE-LE-BAINS, a town of France, in Champagne, and in the Bassigni, famous for its hot baths. E. Long. 5. 45. N. Lat. 47. 54.

BOURBONNOIS, a province of France; with the title of a duchy; bounded on the north, by Nivernois and Berry; on the west, by Berry and a small part of Upper Marche; on the south, by Auvergne; and on the east, by Burgundy and Forez. It abounds in corn, fruits, pastures, wood, game, and wine. Its principal town is Moulins; and the rivers are the Loire, the Allier, and the Chur.

BOURBOURG, a town in French Flanders, whose fortifications are demolished. It is seated on a canal

that goes to Dunkirk, in E. Long. 2. 15. N. Lat. 50. 55.

BOURCHIER, JOHN, Lord Bemars, grandson and heir of a lord of the same name, who was descended from Thomas of Woodstock, duke of Gloucester, and had been knight of the Garter and constable of Windsor-castle. Under Edward IV. our Lord John was created a knight of the Bath, at the marriage of the duke of York second son of Edward IV. and was first known by quelling an insurrection in Cornwall and Devonshire, raised by Michael Joseph a blacksmith, in 1495, which recommended him to the favour of Henry VII. He was a captain of the pioneers at the siege of Therouanne, under Henry VIII. by whom he was made chancellor of the exchequer for life, lieutenant of Calais and the Marches, appointed to conduct the lady Mary, the king's sister, into France on the marriage with Louis XII. and had the extraordinary happiness of continuing in favour with Henry VIII. for the space of 18 years. He died at Calais in 1532, aged 63. He translated, by King Henry's command, Froissart's Chronicle; which was printed in 1532, by Richard Pinson, the scholar of Caxton, and the fifth on the list of English printers. His other works were a whimsical medley of translations from French, Spanish, and Italian novels, which seem to have been the mode then, as they were afterwards in the reign of Charles II. These were, The life of Sir Arthur, an Armorican knight; The famous exploits of Sir Hugh Bourdeaux; Marcus Aurelius; and, The Castle of Love. He composed also a book of the duties of the inhabitants of Calais; and a comedy entitled *Ite in Vineam*, which is mentioned in none of our catalogues of English plays. Anthony Wood says it was usually acted at Calais after vespers.

BOURDALOUE, LEWIS, a celebrated preacher among the Jesuits, and one of the greatest orators France has produced, was born at Bourges on the 20th of August 1632. After having preached in Provence, he in 1699 went to Paris; and there met with such applause, that the king resolved to hear him; on which he was sent for to court, and frequently preached before Louis XIV. He assisted the sick, visited the prisoners and hospitals; and was very liberal in giving alms. He died at Paris on the 13th of May 1704. The best edition of his sermons is in octavo.

BOURDEAUX, an ancient, large, handsome, and rich town in France, in the department of Gironde, is the capital of Guienne, and an archbishop's see; has an university and an academy of arts and sciences. It is built in the form of a bow, of which the river Garonne is the string. This river is bordered by a large quay, and the water rises four yards at full tide, for which reason the largest vessels can come up to it very readily. The castle called the *Trumpet* is seated at the entrance of the quay; and the river runs round its walls. Most of the great streets lead to the quay. The town has 12 gates; and near another castle are fine walks under several rows of trees. The ancient city of Bourdeaux, though considerable in point of size, was ill built, badly paved, dangerous, without police or any of those municipal regulations indispensably requisite to render a city splendid or elegant. It has entirely changed its appearance within these last thirty years. The public edifices are very noble, and all the streets newly built are regular and handsome. The quays are four

Bourdeaux, four miles in length, and the river itself is considerably broader than the Thames at London bridge. On the opposite side, a range of hills covered with woods, vineyards, churches, and villas, extends beyond the view. Almost in the centre of the town is a fine equestrian statue in bronze erected to Louis XV. in 1743, with the following inscription:

*Ludovico quindecimo,
 Sæpe victori, semper pacificatori;
 Suos omnes, quam latè regnum patet,
 Paterno pectore gerenti;
 Suorum in animis penitus habitanti.*

The beauty of the river Garonne, and the fertility of the adjoining country, were probably the causes which induced the Romans to lay the foundations of this city. The ruins of a very large amphitheatre yet remain, constructed under the emperor Gallienus; it is of brick, as are most of the edifices of that period, when the empire was verging to its fall, and the arts began rapidly to decline. During the irruptions of the barbarous nations, and particularly in those which the Normans repeatedly made, Bourdeaux was ravaged, burnt, and almost entirely destroyed. It only began to recover again under Henry II. of England, who having united it to the crown by his marriage with Eleanor of Aquitaine, rebuilt it, and made it a principal object of his policy to restore the city again to the lustre from which it had fallen. The Black Prince received all Guienne, Gascony, and many inferior provinces, in full sovereignty from his father Edward III. He brought his royal captive, John king of France, to this city, after the battle of Poitiers in 1356; and held his court and residence here during eleven years. His exalted character, his uninterrupted series of good fortune, his victories, his modesty, his affability, and his munificence, drew strangers to Bourdeaux from every part of Europe; but all this splendour soon disappeared. He lived to experience the ingratitude of Peter the Cruel, to whom he had restored the kingdom of Castile; he became a prey to distempers in the vigour of life; he saw his dominions reunited again in many of their branches to the crown of France, by Charles V.; he lost his eldest son Edward, a prince of the highest expectations; and at length, overcome with sorrow at this last affliction, he quitted Bourdeaux, and re-embarked for England, there to expire a memorable example of the hasty revolution of human greatness! In 1453, Charles VII. king of France, re-entered the city, and subjected the whole province of Guienne, which had been near three centuries under the English government. Conscious of the importance of such a conquest, he ordered the Chateau Trompette to be built to defend the passage of the river; and Louis XIV. afterwards employed the celebrated Vauban to erect a new fortress in the modern style of military architecture, on the same spot.—Madame de Maintenon, whom fortune seemed to have chosen as the object of her extremest rigour and extremest bounty, was removed from the prisons of Niort in Poictou, where she was born, with her father the Baron d'Aubigne, to this castle, where she used to play with the daughter of the turnkey, in the greatest indigence. Bourdeaux presents few remains of antiquity. The cathedral appears to be very

old, and has suffered considerably from the effects of time. The unfortunate duke of Guienne, brother to Louis XI. who was poisoned in 1473, lies buried before the high altar. The adjacent country is exceedingly pleasant, and at the season of the vintage forms one of the most delicious landscapes in the world. The population in 1815 was 92,374. W. Long. 0. 39. N. Lat. 44. 50.

BOURDELLOT, JOHN, a learned French critic, who lived at the close of the 16th and beginning of the 17th centuries. He distinguished himself by writing notes on Lucian, Petronius, and Heliodorus; by an Universal History; Commentaries on Juvenal; a Treatise on the Etymology of French words; and by some other works which were never published.—There was also an abbé Bourdelot, his sister's son, who changed his name from Peter Michon to oblige his uncle. He was a celebrated physician at Paris, who gained great reputation by a Treatise on the Viper, and other works. He died in 1685.

BOURDINÈS, a town of the Netherlands, in the province of Namur. E. Long. 5. 0. N. Lat. 50. 35.

BOURDON, SEBASTIAN, a famous painter, born at Montpellier, in 1619. He studied seven years at Rome; and acquired such a reputation, that at his return to France he had the honour of being the first who was made rector of the academy of painting at Paris. He succeeded better in his landscapes than in his history painting. His pieces are seldom finished; and those that are so, are not always the finest. He once laid a wager with a friend, that he should paint twelve heads after the life, and as big as the life, in one day. He won it: and these are said not to be the worst things he ever did. His most considerable pieces are, The gallery of M. de Bretonvilliers, in the aisle of Notre Dame; and, The seven works of mercy, which he etched by himself. But the most esteemed of all his performances is, The martyrdom of St Peter, drawn for the church of Notre Dame: It is kept as one of the choicest rarities of that cathedral. Bourdon was a Calvinist; much valued and respected, however, in a Popish country, because his life and manners were good. We have also by this master a great number of etchings; which are executed in a bold masterly style, and much more finished than those we generally meet with from the point of the painter. They are justly held in the highest estimation by the generality of the collectors. He died in 1673, aged 54.

BOURDONE'E, in *Heraldry*, the same with **PO-MEE**.

BOURG, the capital of the island of Cayenne, a French colony on the coast of Guiana, in South America, in W. Long. 52. 0. N. Lat. 5. 0.

BOURG-en-Bresse, a town in France, and capital of Bresse, in the province of Burgundy. It is seated on the river Resousse, almost in the centre of Bresse, in E. Long. 4. 19. N. Lat. 46. 13.

BOURG sur-Mer, a sea-port town of France in Guienne, and in the Bourdelois, with a tolerable good harbour: seated at the confluence of the rivers Dordogne and Garonne, in W. Long. 3. 35. N. Lat. 45. 0.

BOURGES, an ancient town of France, in the department of Cher, and formerly an archbishop's see, with a famous university. The archbishop assumes the title

Bourdeaux
 ||
 Bourges.

Bourges,
Bouget.

title of *Patriarch of the Aquitains*, and enjoys the rights of primacy with regard to Albi. It is seated between two small rivers, the Every and the Orron, upon a hill that has a gentle descent down to these rivers, by which it is almost surrounded, for there is but one avenue to it by land, which is that of Port Bourbonnoux. It stands upon a great deal of ground; but one part of it is without houses; and the rest is but thinly peopled with gentlemen, students, and ecclesiastics, the whole number of souls amounting only to about 16,400. They have no manner of trade but for their own necessaries. It is divided into the old and new town. The walls of the old are almost entire, and the new town is almost as large as the old. There are several churches, convents, and nunneries. The parish-church, dedicated to St Stephen, is a fine old Gothic structure: it is seated in the highest part of the city, and on each side of the front are two handsome high towers. The new one, which is built in the room of one which fell down, is almost 200 feet high. Bourbon-square is the largest in the city, where there was formerly an amphitheatre, and now a market. There is a fine walk from St Michael's gate into the fields, and three alleys, formed by four ranks of trees, the middlemost of which is spacious; besides which, there is a very long mall. The university is famous for the study of the law. This city stands almost in the centre of France. E. Long. 2. 30. N. Lat. 47. 10.

BOUGET, DOM JOHN, an ingenious French antiquary, was born at the village of Beaumains near Falaise, in the diocese of Seez, in 1724. He was educated at the grammar-school at Caen, whence he was removed to that university, and pursued his studies with great diligence and success till 1745, when he became a Benedictine monk of the abbey of St Martin de Seez. Some time after this, he was appointed prior claustral of the said abbey, and continued six years in that office, when he was nominated prior of Tiron en Perche: whence being translated to the abbey of St Stephen at Caen, in the capacity of sub-prior, he managed the temporalities of that religious house during two years, as he did their spiritualities for one year longer; after which, according to the custom of the house, he resigned his office. His superiors, sensible of his merit and learning, removed him thence to the abbey of Bec, where he resided till 1764. He was elected an honorary member of the Society of Antiquaries of London, Jan. 10. 1765; in which year he returned to the abbey of St Stephen at Caen, where he continued to the time of his death. These honourable offices, to which he was promoted on account of his great abilities, enabled him not only to pursue his favourite study of the history and antiquities of some of the principal Benedictine abbeys in Normandy, but likewise gave him access to all their charters, deeds, register-books, &c. &c. These he examined with great care, and left behind him in MS. large and accurate accounts of the abbeys of St Peter de Jumieges, St Stephen, and the Holy Trinity at Caen (founded by William the Conqueror and his queen Matilda), and a very particular history of the abbey of Bec. These were all written in French. The "History of the Royal Abbey of Bec" (which he presented to Dr Ducarel in 1764) is only an abstract of his larger work. This ancient abbey (which hath produced se-

VOL. IV. Part L

veral archbishops of Canterbury and other illustrious prelates of this kingdom) is frequently mentioned by our old historians. The death of our worthy Benedictine (which happened on new-year's day 1776) was occasioned by his unfortunate neglect of a hurt he got in his leg by falling down two or three steps in going from the hall to the cloister of the abbey of St Stephen at Caen, being deceived by the ambiguous light of a glimmering lamp that was placed in the passage. He lived universally esteemed, and died sincerely regretted by all those who were acquainted with him; and was buried in the church of the said abbey, Jan. 3. 1776.

BOURGET, a town of Savoy, subject to the king of Sardinia, seated at the southern extremity of a lake of the same name. E. Long. 5. 55. N. Lat. 44. 45.

BOURGOGNE, or BURGUNDY, as it is called; a considerable province of France, with the title of a duchy. It is 130 miles in length, and 75 in breadth. It is bounded on the east, by the Franche Comte; on the west, by Bourbonnois and Nivernois; on the south, by Lyonnaise; and on the north by Champagne. It is very fertile in corn and fruit, and produces excellent wine. It is watered by the rivers Seine, Dehune, Brebince, Armançon, Ouche, Souzon, Tille, and Saone. There are four mineral springs, at Apoiny, Primeau, Bourbon-Lancy, and St Reine. The first are obscure, and the two last in high reputation. In the canton of Bresse, there are two subterranean lakes which often overflow in times of the greatest drought, and lay a large tract of ground under water: one of them has no apparent spring or opening; and yet in a dry season, it throws out water enough to overflow the meadow-land near it. The grottoes or caves of Arcy are seated about 18 miles from Auxerre, and over them is soil about 10 feet deep. The entrance into these cavities is 200 paces long, but narrow. Twenty paces from the entrance is a lake, which seems to be formed by that part of the water that will not petrify. The highest of these vaults is not above eight feet. About 80 paces from the entrance there is a kind of hall, with a coffee-coloured ceiling, wherein there are a thousand odd figures, which have a very agreeable effect. Dijon is the capital town.

BOURGOING, J. F. DE, an eminent French writer. See SUPPLEMENT.

BOURGUIGNONS, or BURGUNDIANS, one of the northern nations who overran the Roman empire, and settled in Gaul. They were of a great stature, and very warlike; for which reason the emperor Valentinian the Great engaged them in his service against the Germans. They lived in tents which were close to each other, that they might the more readily unite in arms on any unforeseen attack. These conjunctions of tents they called *burgs*; and they were to them what towns are to us. Sidonius Apollinaris tells us that they wore long hair, took great pleasure in singing, and were fond of praise for their vocal talents. He adds, that they ate great quantities; and anointed their hair with butter, deeming that unction very ornamental. Their crown was at first elective, and the authority of their kings expired with their success. They were not only accountable for their own misconduct, but likewise for the calamities of nature, and the caprice of fortune. They

X x

were

Bouget
Bourguignons.

Bourguignons
Bouro.

were deposed if they had lost a battle ; if they succeeded ill in any enterprise ; or if, in short, any great event had not corresponded with the hopes of the public. They were not more favourably treated in case of a bad harvest or vintage, or if any epidemical distemper had ravaged the state. At first they were governed by many kings, and *henden* was the title of the royal dignity. But in latter times they were subject to one sovereign ; and they grew humane and civilized, especially when Christianity was propagated in their country. Before that epocha their religion was much the same with that of the other northern nations. They had many priests, the chief of whom was distinguished by the name of *sinistrus*. He was perpetual, and they paid him great respect and veneration.

BOURIGNON, ANTONIETTA, a famous enthusiastic preacher and pretended prophetess, was born at Lisle in 1616. At her birth she was so deformed, that it was debated some days in the family whether it was not proper to stifle her as a monster : but her deformity diminishing, she was spared ; and afterwards attained such a degree of beauty, that she had her admirers. From her childhood to her old age she had an extraordinary turn of mind. She set up for a reformer, and published a great number of books filled with very singular notions ; the most remarkable of which are entitled *The light of the World*, and *The Testimony of Truth*. She was an enemy to reason and common sense, which she maintained ought to give place to the illumination of divine faith ; and asserted, that whenever any one was born again by embracing her doctrine, she felt the pains and throws of a woman in labour. Of her pretended visions and revelations we shall give one instance as a sample. In one of her ecstasies she saw Adam in the same form in which he appeared before his fall, and the manner in which he was capable of procreating other men, since he himself possessed in himself the principles of both sexes *. Nay she pretended it was told her that he had carried this procreating faculty so far as to produce the human nature of Jesus Christ. "The first man (says she), whom Adam brought forth without any concurrent assistance in his glorified state, was chosen by God to be the throne of the Divinity ; the organ and instrument by which God would communicate himself externally to men : This is Christ the first born united to human nature, both God and man." Besides these and such like extravagancies, she had other forbidding qualities : her temper was morose and peevish, and she was extremely avaricious and greedy of amassing riches. She dressed like a hermit, and travelled to France, Holland, England, and Scotland. In the last she made a strong party, and some thousand sectarists, known by the name of *Bourignonists*. She died at Franeker in the province of Frise, October 30. 1680. Her works have been printed in 18 vols. 8vo.

BOURN, a town of Lincolnshire, in England, seated in E. Long. 1. 17. N. Lat. 52. 40. It is a pretty large place, has a good market for corn and provisions, and is noted for the coronation of King Edmund.

BOURNE, or BURN, an appellation anciently given to all little brooks or rivulets, and still used in the same sense in Scotland and in the north of England.

BOURO, an island in the East Indian ocean, be-

tween the Moluccas and Celebes. It is well cultivated ; and is now subject to the Dutch, who have built a fortress here. Some mountains in it are exceeding high, and the sea on one side is uncommonly deep. It produces nutmegs and cloves, as well as cocoa and banana trees ; besides many vegetables introduced by the Dutch. It is about 30 miles in circumference. E. Long. 129. 8. Lat. 4. 30.

BOU'TANT, or ARCH-BOU'TANT, in *Architecture*, an arch, or part of an arch, abutting against the reins of a vault to prevent its giving way.

A *Pillar BOU'TANT*, is a large chain or pile of stone, made to support a wall, terrace, or vault.

BOU'TE', in the manege. A horse is called *bouté*, when his legs are in a straight line from the kneé to the coronet : short-jointed horses are apt to be *bouté*, and on the other hand long-jointed horses are not.

BOU'TS-RIMES, a popular term in the French poetry ; signifying certain rhymes, disposed in order, and given to a poet together with a subject, to be filled up with verses ending in the same words, and the same order. The invention of the bouts-rimes is owing to one Du Lot, a poet, in the year 1649. In fixing the bouts, it is usual to choose such as seem the remotest, and have the least connexion.

Some good authors fancy that these rhymes are of all others the easiest, that they assist the invention, and furnish the most new thoughts of all others. Sarasin has a poem on the defeat of the bouts-rimes. The academy of Lanternists at Thoulouse have contributed towards keeping in countenance the bouts-rimes, by proposing each year a set of fourteen, to be filled up on the glories of the grand monarch ; the victorious sonnet to be rewarded with a fine medal. An instance hereof may be given in the following one, filled up by P. Commire.

<i>Tout est grand dans le roi, l'aspect seul de son</i>	buste
<i>Rend nos fiers ennemis plus froids que des</i>	glaçons.
<i>Et Guillaume n'attend que le tems des</i>	moissons,
<i>Pour se voir succomber sous un bras si</i>	robuste.
<i>Qu'on ne nous vante plus les miracles d'</i>	Auguste ;
<i>Louis de bien regner lui feroit des</i>	leçons :
<i>Horace en vain l'égale aux dieux dans ses</i>	chausons :
<i>Moins que mon heros il étoit sage et</i>	juste, &c.

BOU'TON, an island in the East Indian ocean, about 12 miles distant from the south-east part of the island of Macassar, or Celebes. The inhabitants are small but well shaped, and of a dark olive complexion. The principal town is Callasjung, which is about a mile from the sea, on the top of a small hill, and round it a stone wall. The houses are not built upon the ground, but on posts. The religion of the inhabitants is Mahometanism. E. Long. 122. 30. S. Lat. 4. 30.

BOUVILLON, a city of Luxemburg in the kingdom of the Netherlands, situated in E. Long. 5. 0. N. Lat. 49. 55.

BOW, (*arcus*), a weapon of offence made of wood, born, or other elastic matter, which, after being strongly bent, by means of a string fastened to its two ends, in returning to its natural state throws out an arrow with great force. It is also called the *long-bow*, by way of distinction from the cross-bow or arbalest.

The bow is the most ancient, and the most universal

Bosso
Bow.

* See the article Adam.

Bow.

of all weapons. It has been found to obtain among the most barbarous and remote people, and who had the least communication with the rest of mankind.

The use of the bow and arrow was first abolished in France under Louis XI. in 1481, and in their place were introduced the Swiss arms, that is, the halberd, pike, and broad-sword. The long-bow was formerly in great vogue in England; most of our victories in France were acquired by it; and many laws were made to regulate and encourage its use. The parliament under Henry VIII. complain "of the disuse of the long-bow, heretofore the safeguard and defence of this kingdom, and the dread and terror of its enemies." 33 Hen. VIII. cap. 6.

The art of using bows is called *archery*, and those practised therein, *archers* or *bowmen*. See ARCHERY.

The strength of a bow may be calculated on this principle, that its spring, i. e. the power whereby it restores itself to its natural position, is always proportionate to the distance or space it is removed therefrom.

The most barbarous nations often excel in the fabric of the particular things which they have the greatest necessity for in the common offices of life. The Laplanders, who support themselves almost entirely by hunting, have an art of making bows, which we, in these improved parts of the world, have never arrived at. Their bow is made of two pieces of tough and strong wood, shaved down to the same size, and flatted on each side; the two flat sides of the pieces are brought closely and evenly together, and then joined by means of a glue made of the skins of perch, which they have in great plenty, and of which they make a glue superior in strength to any which we have. The two pieces, when once united in this manner, will never separate, and the bow is of much more force to expel the arrow, than it could possibly have been under the same dimensions if made only of one piece.

Among the ancients, the bow-string, called *τεξωνίς*, was made of horses hair, and hence also called *ισπύρις*; though Homer's bow-strings are frequently made of hides cut into small thongs: whence *τεξία βόω*. The uppermost part of the bow, to which the string was fastened, was called *καρπύς*, being commonly made of gold, and the last thing towards finishing the bow. The Grecian bows were frequently beautified with gold or silver; whence we have mention of *aurei arcus*; and Apollo is called *Αργυροτόξος*. But the matter of which they were ordinarily composed, seems to have been wood: though they were anciently, Scythian-like, made of horn, as appears from that of Pandarus in Homer, Iliad. 3. v. 105.

The invention of the bow is usually ascribed to Apollo, and was communicated to the primitive inhabitants of Crete, who are said to have been the first of mortals who understood the use of bows and arrows. And hence, even in later ages, the Cretan bows were famous, and preferred by the Greeks to all others. Some, however, rather choose to honour Perseus, the son of Perseus, with the invention of the bow; while others ascribe it to Scythus, son of Jupiter, and progenitor to the Scythians, who were excellent at this art, and by many reputed the first masters of it. From them it was derived to the Grecians, some of whose ancient nobility were instructed by the Scythians in the use of the bow, which in those days passed for a

most princely education. It was first introduced into the Roman army in the second Punic war.

The Indians still retain the bow. In the repository of the Royal Society we see a West Indian bow two yards long.

The Scythian bow was famous for its incurvation, which distinguished it from the bows of Greece and other nations; being so great as to form a half moon or semicircle: whence the shepherd in Athenæus, being to describe the letters in Theseus's name, and expressing each of them by some apposite resemblance, compares the third to the Scythian bow; meaning not the more modern character *Σ*, but the ancient *Ϛ*, which is semicircular, and bears the third place in ΘΗΕΥΓ.

Cross-Bow, is also called *arbalest* or *arbalet*; which word is derived from *arbalista*, i. e. *arcubalista*, "a bow with a sling." The arbalet consists of a steel bow set in a shaft of wood, furnished with a string and a trigger; and is bent with a piece of iron fitted for that purpose. It serves to throw bullets, large arrows, darts, &c. The ancients had large machines for throwing many arrows at once, called *arbalets* or *ballista*.

Bow, is also an instrument used at sea, for taking the sun's altitude; consisting of a large arch of 90° graduated, a shank or staff, a side vane, a sight vane, and a horizon vane. It is now out of use.

Bow, among builders, a beam of wood or brass, with three long screws that direct a lathe of wood or steel to any arch; chiefly used in drawing draughts of ships and projections of the sphere, or wherever it is requisite to draw large arches.

Bow, in *Music*, a small machine, which being drawn over the strings of a musical instrument, makes it resound. It is composed of a small stick, to which are fastened 80 or 100 horse hairs, and a screw which serves to give these hairs a proper tension. In order that the bow may touch the strings briskly, it is usual to rub the hairs with rosin. The ancients do not appear to have been acquainted with bows of hair: in lieu hereof they touched their instruments with a plectrum; over which our bows have great advantage, for giving long and short sounds, and other modifications which a plectrum cannot produce.

Bow, among artificers, an instrument so called from its figure; in use among gunsmiths, locksmiths, watchmakers, &c. for making a drill go. Among turners it is the name of that pole fixed to the ceiling, to which they fasten the cord that whirls round the piece to be turned.

Bow, a town of Devonshire in England, 188 miles west from London, and a little to the west of Crediton, has a weekly market, and two fairs in the year. The court of the duchy of Lancaster is commonly kept here.

Bows of a Saddle, are two pieces of wood laid arch-wise to receive the upper part of a horse's back, to give the saddle its due form, and to keep it tight.

The fore-bow which sustains the pommel, is composed of the withers, the breasts, the points or toes, and the corking.

The hind-bow bears the torsequin or quilted roll. The bows are covered with sinews, that is, with bulls pizzles beaten, and so run all over the bows to make them stronger. Then they are strengthened with bands

Bow. of iron to keep them tight; and on the lower side are nailed on the saddle-straps, with which they make fast the girths.

Bow (*Epaule*), in *Ship-Building*, the rounding part of a ship's side forward, beginning at the place where the planks arch inwards; and terminated where they close, at the stem or prow. It is proved by a variety of experiments, that a ship with a narrow bow is much better calculated for sailing swiftly, than one with a broad bow; but is not so well fitted for a high sea, into which she always *pitches* or plunges her fore part very deep, for want of sufficient breadth to repel the volume of water which she so easily divides in her fall. The former of these is called by seamen a *lean*, and the other a *bluff*, bow. "The bow which meets with the least resistance in a direct course, not only meets with the least resistance in oblique courses, but also has the additional property of driving the least to leeward; which is a double advantage gained by forming the bow so as to give it that figure which will be least resisted in moving through any medium *."

* *Bouguier's*
Traité de
Navire.

On the Bow, in *Navigation*, an arch of the horizon comprehended between some distant object and that point of the compass which is right a-head, or to which the ship's stem is directed. The phrase is equally applicable when the object is beheld from the ship, or discovered by trigonometrical calculation: As, We saw a fleet at day-break bearing three points *on the starboard bow*: that is, three points from that part of the horizon which is right a-head, towards the right hand. See the article **BEARING**.

Bow-dye, a kind of scarlet red, superior to madder; but inferior to the true scarlet grain for fixedness and duration. It was brought into England, and first practised at the village of Bow, near London, by Kephler, a Dutchman, in the year 1643.

Bow-grace, in the sea-language, a frame or composition of old ropes or junks of cables, used to be laid out at the bows, stems, and sides of ships, to preserve them from great flakes of ice, chiefly when they sail in high north or south latitudes.

Bow-net, or **Bow-wheel**, an engine for catching fish, chiefly lobsters and craw-fish, made of two round wicker baskets, pointed at the end, one of which is thrust into the other; at the mouth is a little rim, four or five inches broad, somewhat bent inwards. It is also used for catching sparrows.

Bow-legged or **Bandy-legged**. Some children are bow-legged from their birth: others become so from setting them on their feet too early. The tibia of some is crooked; the knees of others are distorted; from a fault in the ankle, the feet of some are turned inwards. These are called *vari*; and in others, who are called *valgi*, they are turned outwards. The best method of preventing these disorders in weakly children is to exercise them duly, but not violently, by dancing or tossing them about in one's arms; and not setting them much upon their feet, at least not without properly supporting them: if the disorder attends at the birth, or increases after it is begun, apply emollients, then apply boots of strong leather, wood, &c. so as gradually to dispose the crooked legs to a proper form; or other instruments may be used instead of boots, which, when not too costly, are usually to be preferred.

Slighter instances of these disorders yield to careful nursing, without instruments.

Bow-line, or **Bowling**, a rope fastened near the middle of the leech, or perpendicular edge of the square sails, by three or four subordinate parts called *bridles*. It is only used when the wind is so unfavourable that the sails must be all braced sideways, or close hauled to the wind: in this situation the bow-lines are employed to keep the weather or windward edges of the principal sails tight, forward, and steady, without which, they would always be shivering, and rendered incapable of service. To *check* the bow-line is to slacken it, when the wind becomes large.

Bow-Pieces, are the pieces of ordnance at the bow of a ship.

Rain-Bow. See **RAIN-BOW**.

Bow-Bearer, an inferior officer of the forest, who is sworn to make inquisition of all trespasses against vert or venison, and to attach offenders.

BOWELS, in *Anatomy*, the same with intestines. See **ANATOMY Index**.

BOWER, in *Gardening*, a place under covert of trees, differing only from an arbour, as being round or square, and made with a kind of dome or ceiling at top; whereas the arbour is always built long and arched.

BOWER, in the sea-language, the name of an anchor carried at the bow of a ship. There are generally two bows, called *first* and *second*, *great* and *little*, or *best* and *small* bower. See **ANCHOR**.

BOWESS, or **BOWET**, in *Falconry*, a young hawk, when she draws any thing out of her nest, and covets to clamber on the boughs.

BOWL, denotes either a ball of wood, for the use of bowling: or a vessel of capacity, wherein to hold liquors.

BOWLDER STONES, small stones of a roundish figure, and no determinate size, found on the sea-shore, and on banks or rather channels of rivers.

BOWLING, the art of playing at bowls.—This game is practised either in open places, as *bares* and *bowling-greens*, or in close-bowling-alleys.

The skill of bowling depends much on a knowledge of the ground, and the right choice of a bowl suitable to it: for close alleys, the flat bowl; for green swards, plain and level, the bowl as round as a ball is preferred.

The terms used in bowling are, to *bowl wide*, which is when the bias does not hold, or is not strong enough; *narrow*, when it is too strong, or holds too much; *finely bowled*, is when the ground is well chosen, and the bowl passes near the block, even though it goes much beyond it; *bowling through*, or a *yard over*, is done in order to move the block; an *over-bowl*, that which goes beyond it; a *bowl laid at hand*, is that put down within the gamester's reach, to be in the way of the next bowler, and hinder his having the advantage of the best ground; *bowling at length*, neither bowling through nor short; a *dead length*, a just or exact one; *throwing* or *singing*, is discharging a bowl with a strength purposely too great for a length, in order to carry off either the block or some near bowl; *bowl-room*, or *missing-wood*, is when a bowl has free passage without striking on any other; *get off*, is when a bowl being

Bow
Bowling.

Bowling being narrow, is wanted to be wider; *bowl best at block*, that nearest the block: *drawing a cast or bowl*, is to win it by bowling nearer, without stirring either the bowl or block; a bowl is said to *rub*, when it meets with some obstacle in the ground, which retards its motion, and weakens its force; *it is gone*, when far beyond the block. *Block* signifies a little bowl laid for a mark, also called a *jack*. *Mark*, is a proper bowling distance, not under so many yards; and being at least a yard and a half from the edge of the green. *Ground*, a bag or handkerchief laid down to mark where a bowl is to go. *Lead*, the advantage of throwing the block, and bowling first. *Cast*, is one best bowl at an end. *End*, a hit, or when all the bowls are out. *The game; or up*, is five casts or best bowls.

BOWLING-Green, in *Gardening*, a kind of parterre in a grove, laid with fine turf, requiring to be frequently mowed, laid out in compartments of divers figures, with dwarf-trees and other decorations. Bowling-greens are of English origin, but have been adopted by the French and Italians, who have them only for ornament; being unacquainted with or not fancying the exercise, on account of which they were first made in England.

BOWLING-Bridles, are the ropes by which the bowline is fastened to the leech of the sail.

BOWSE, in the sea-language, signifies as much as to *hale* or *pull*. Thus *bowsing upon a tack*, is hauling upon a tack. *Bowse away*, that is, Pull away all together.

BOWSPRIT, or **BOLTSPRIT**, a kind of mast, resting sloopwise on the head of the main stern, and having its lower end fastened to the partners of the fore-mast, and farther supported by the fore stay. It carries the sprit-sail, sprit-top-sail, and jack-staff; and its length is usually the same with that of the fore-mast.

BOWYER, WILLIAM, the most learned printer of his age, was born at White Friars in London, December 17. 1699. His father, whose name also was William, had been eminent in the same profession; and his maternal grandfather (Icabod Dawke) was employed in printing the celebrated Polyglott bible of Bishop Walton. At a proper age, he was placed for grammatical education under the care of Mr Ambrose Bonwicke, a nonjuring clergyman of known piety and learning, who then lived at Headly, near Leatherhead in Surry. Here Mr Bowyer made great advances in literature, and a firm attachment commenced betwixt him and his master. On the 30th of January 1713, the whole property of the elder Mr Bowyer was destroyed by fire; on which occasion Mr Bonwicke generously undertook the education of his pupil for one year. In 1716, young Mr Bowyer was admitted a sizar at St John's college, Cambridge, where Dr Robert Jenkin was at that time master. He continued at the college of Cambridge under the tuition of the reverend Dr John Newcombe till June 1722, during which period he probably took his degree of bachelor of arts; and it appears that he was desirous of obtaining a fellowship, though it is not certain that he ever stood a candidate for that honour. Soon after this he had an opportunity of repaying the kindness which Mr Bonwicke had shown him, by officiating some time after his death in the capacity of a schoolmaster for the benefit of his family.

Mr Bowyer now entered into the printing-business along with his father. One of the first books which received the benefit of his correction was the complete edition of Selden, in three volumes folio, by Dr David Wilkins. This edition was begun in 1722, and finished in 1726; and Mr Bowyer's great attention to it appeared in his drawing up an epitome of Selden *de Synedriis*, as he read the proof sheets. In 1727, he drew up an excellent sketch of William Baxter's Glossary of the Roman Antiquities. This was called "A view of a book entitled *Reliquiæ Baxterianæ*. In a letter to a friend." A single sheet 8vo. By this first public proof of Mr Bowyer's abilities, Dr Wotton and Mr Clarke were highly pleased; but as it was never published, and a very few copies printed, it is seldom found with the glossary. In 1727 Mr Bowyer lost his mother; on which occasion he received a letter of consolation from Mr Chishull the learned editor of the *Antiquitates Asiaticæ*. In October 1728 he married Miss Ann Prudom, his mother's niece, a very accomplished lady, by whom he had two sons, William and Thomas: the former of whom died an infant, and the latter survived his father. In 1729 Mr Bowyer published a curious treatise, entitled, "A Pattern for young Students in the University; set forth in the Life of Ambrose Bonwicke, some time scholar of St John's College, Cambridge:" but though this treatise was generally ascribed to Mr Bowyer, it was in reality the production of Mr Ambrose Bonwicke the elder. About this time it appears, that Mr Bowyer had written a pamphlet against the Separatists, though neither the title nor the occasion of it are now remembered. The same year, through the friendship of the Right Hon. Arthur Onslow, he was appointed printer of the votes of the house of commons; which office he held, under three successive speakers, for near fifty years. In 1731 Mr Bowyer published, and, it is believed, translated, Voltaire's Life of Charles XII. This year also his wife died; on which occasion his friends Mr Clarke and Mr Chishull wrote him very affectionate and Christian letters. He remained a widower till 1747, when he married a very benevolent and worthy woman, Mrs Elizabeth Bill, by whom he had no children. In 1733 he published a piece in two sheets 4to, entitled, "The Beau and the Academic:" being a translation from a Latin poem recited that year at the Sheldonian theatre: and in 1736 he was admitted into the Society of Antiquarians, where he became an active and useful member. In 1737 Mr Bowyer lost his father; and on this occasion Mr Clarke again addressed to him a letter of consolation. In 1742 our author published a translation of Trapp's Latin Lectures on Poetry, in which he was assisted by Mr Clarke, though the latter had a contemptible opinion of the performance.

In 1749, Mr Bowyer, along with Dr Burton, was virulently attacked by Dr King in a piece entitled, *Elogium famæ inserviens Jacci Etonensis sive Gigantis*: or "The praises of Jack Eaton, commonly called *Jack the Giant*."—This abuse was probably occasioned by Mr Bowyer's having hinted in conversation some doubts concerning the Doctor's skill in Latin. Our author drew up some strictures in his own defence, which he intended to insert at the conclusion of a preface to Montesquieu's Reflections; but by Dr Clarke's advice they

Bowyer. they were omitted. In 1730, a prefatory critical dissertation and some notes were annexed by our author to Kuster's Treatise *De usu verborum mediourum*; a new edition of which, with farther improvements, appeared in 1773. He wrote likewise about the same time a Latin preface to Leodes's *Veteres poetas citati*, &c.—Being soon after employed to print an edition of Col. Bladen's translation of *Cæsar's Commentaries*, that work received considerable improvements from Mr Bowyer's hands, with the addition of such notes in it as are signed TYROGR. In the subsequent editions of this work, though printed by another person during our author's lifetime, the same signature, though contrary to decorum, and even to justice, was still retained. In 1751, he wrote a long preface to Montesquieu's "Reflections on the rise and fall of the Roman Empire;" translated the dialogue between Sylla and Socrates; made several corrections to the work from the Baron's "Spirit of Laws;" and improved it with his own notes. A new edition, with many new notes, was printed in 1759. In 1751 he also published the first translation that ever was made of Rousseau's paradoxical oration, which gained the prize at the academy of Dijon in 1750; and which first announced that singular genius to the attention and admiration of Europe. On the publication of the third edition of Lord Orrery's "Remarks on the Life and Writings of Dr Swift," in 1752, Mr Bowyer wrote and printed, but never published, "Two Letters from Dr Bentley in the Shades below, to Lord Orrery in a Land of thick darkness." The notes signed B, in the ninth quarto volume of Swift's works, are extracted from these Letters. In 1753, he endeavoured to allay the ferment occasioned by the Jew bill; with which view he published, in quarto, "Remarks on the speech made in common-council, on the bill for permitting persons professing the Jewish religion to be naturalized, so far as prophecies are supposed to be affected by it." This little tract was written with spirit, and well received by those who were superior to narrow prejudices. Its design was to show that whatever political reasons might be alleged against the bill, Christianity was in no danger of being prejudiced by the intended protection promised to the Jews. The same year some of Mr Bowyer's notes were annexed to Bishop Claton's translation of "A Journal from Grand Cairo to Mount Sinai and back again."—In 1754, Mr Bower, with a view of lessening his fatigue, entered into partnership with a relation; but some disagreement arising, the connection was dissolved in three years. On the death of Mr Richardson in 1761, Mr Bowyer succeeded him as printer to the Royal Society, through the favour of the late Earl of Macclesfield; and, under the friendship of five successive presidents, enjoyed that office till his death.

In 1763, Mr Bowyer published an excellent edition of the Greek Testament, in two vols 12mo. It appeared under the following title: *Novum Testamentum Græcum; ad fidem Græcorum solum Codicum MSS. nunc primum impressum, ad stipulante Joanne Jacobo Wetstenio, juxta Sectiones Jo. Alberti Bengelii divisum; et nova interpretatione sapius illustratum. Accesserit in altero volumine, Emendationes conjecturales virorum doctorum undecunque collectæ.* This sold with great rapidity: the Conjectural Emendations were well received

by the learned, and are thought to be a valuable work. The president and fellows of Havard college in Cambridge expressed their approbation of this edition in very high terms, in a letter to Mr Bowyer, written in the year 1767. "This work (say they), though small in bulk, we esteem as a rich treasure of sacred learning, and of more value than many large volumes of the commentators." A second edition of the *Conjectures on the New Testament*, with very considerable enlargements, was separately published, in one vol. 8vo, in 1772. Bishop Warburton having censured a passage in the former edition, Mr Bowyer sent him a copy of this book, with a conciliatory letter. Dr Warburton's *Divine Legation* had received very considerable advantage from Mr Bowyer's corrections; and this even in an edition which was necessarily given to another press. In 1761 he was employed to print his *Lordship's Doctrine of Grace*. A second edition being soon wanted, and Mr Bowyer not having been intrusted with the care of it, he prepared a series of letters to the bishop in his own defence; of which, together with a few he had formerly received from that great writer, he afterwards printed *twelve copies*, of which *ten* have since been destroyed. However, there is the best authority for asserting, that notwithstanding any little altercations which happened, Dr Warburton always retained a sincere regard for our author. In 1765, at the request of Thomas Hollis, Esq. Mr Bowyer wrote a short Latin preface to Dr Wallis's *Grammatica Lingue Anglicanae*. He wrote also a large English preface for the same work, which, however, still remains unprinted. In 1766 he entered into partnership with Mr Nichols, who had been trained by him to the profession, and had for several years assisted him in the management of his business. The same year, Mr Bowyer wrote an excellent Latin preface to *Joannis Harduini, Jesuitæ, ad Censuram Scriptorum veterum Prolegomena. Juxta Autographum*. In 1767 he was appointed to print the journals of the house of lords and the rolls of parliament. This year he printed Mr Clarke's excellent and learned work on "The Connection of the Roman, Saxon, and English Coins;" and wrote some notes upon it, which are interspersed throughout the volume with those of the author. Part of the *Dissertation on the Roman sesterce* was likewise Mr Bowyer's production; and the index, which is an uncommonly good one, was drawn up by him entirely.

In January 1771 Mr Bowyer lost his second wife, and again received a letter of consolation from his old friend Mr Clarke, who had sent him one almost forty years before on a similar occasion. In the *Philosophical Transactions* for this year was printed a very ingenious "Inquiry into the Value of the ancient Greek and Roman Money," by the late Matthew Raper, Esq. But his opinions not coinciding with those of Mr Bowyer, he printed a small pamphlet, entitled, "Remarks, occasioned by a late Dissertation on the Greek and Roman Money." In 1773 three little tracts were published by him, under the title of "Select Discourses. 1. Of the correspondence of the Hebrew months with the Julian, from the Latin of Professor Michaelis. 2. Of the Sabbatical years, from the same. 3. Of the years of Jubilee, from an anonymous writer in Masson's *Histoire Critique de la Republique* des

Bowyer

Bowyer,
Box.

des Lettres." In 1774 he corrected a new edition of Schrevelius's Greek Lexicon; to which he has added a number of words, distinguished by an asterisk, which he himself had collected in the course of his studies. Considerable additions, still in manuscript, were made by him to the lexicons of Hederic and Buxtorf, the Latin ones of Faber and Littleton, and the English Dictionary of Bailey; and he left behind him many other proofs of his critical skill in the learned languages. In 1774 was published, "The origin of printing, in two essays. 1. The substance of Dr Middleton's Dissertation on the Origin of Printing in England. 2. Mr Meerman's Account of the Invention of the art at Haarlem, and its progress to Mentz, with occasional Remarks, and an appendix." The original idea of this valuable tract was Mr Bowyer's, but it was completed by Mr Nichols.

Although our author, during the last ten years of his life, had been afflicted with the palsy and stone, he not only preserved a remarkable cheerfulness of temper, but was enabled to support the labour of almost incessant reading; and he regularly corrected the learned works, especially the Greek books, which came from his press. This he continued to do till within a few weeks of his death, which happened in November 1777, when he had nearly completed his 78th year. For more than half a century Mr Bowyer was unrivalled as a learned printer; and many of the most masterly productions of this kingdom have come from his press. To his literary and professional abilities he added an excellent moral character; and he was particularly distinguished by his inflexible probity, and an uncommon alacrity in relieving the necessitous.

BOWYERS, artificers whose business is to make bows: in which sense, bowers stand distinguished from fletchers, who made arrows.

The bowyers company in London was incorporated in 1620: and consists of a master, two wardens, twelve assistants, and 30 on the livery. See ARCHERY.

BOX, in its most common acceptation, denotes a small chest or coffer for holding things.

Dice-Box, a narrow deep cornet, channelled within, wherein the dice are shaken and thrown. This answers to what the Romans called *fritillus*; whence, *crepitantes fritilli*; and, in Seneca, *resonante fritillo*. The same author uses also *concutere fritillum*, figuratively, for playing. Besides the fritillus, the Romans, for greater security, had another kind of dice-box called *pyrgus*, *suavis*, and sometimes *turricula*. It was placed immoveable in the middle of the table, being perforated or open at both ends, and likewise channelled within; over the top was placed a kind of funnel, into which the dice were cast out upon the fritillus; whence descending, they fell through the bottom on the table; by which all practising on them with the fingers was effectually prevented. For want of some contrivance of this kind, our sharpers have opportunities of playing divers tricks with the box, as palming, topping, slabbing, &c.

Box, is also used for an uncertain quantity or measure: Thus a box of quicksilver contains from one to two hundred weight; a box of prunellas only 14 pounds; a box of rings for keys, two gross, &c.

Box-Tree. See BUXUS, BOTANY Index.

African Box. See MYRSINE, BOTANY Index.

BOXERS, a kind of *athleta*, who combat or contend for victory with their fists. Boxers amount to the same with what among the Romans was called *pugiles*. The ancient boxers battled with great force and fury, insomuch as to dash out each others teeth, break bones, and often kill each other. The strange disfigurements the boxers underwent were such that they frequently could not be known, and rendered them the subject of many railleries. In the Greek anthology there are four epigrams of the poet Lucilius, and one of Lucian, wherein their disfigurements are pleasantly enough exposed. See BOXING.

BOXHORNIIUS, MARC ZUERIIUS, a learned critic, born at Bergen-op-Zoom in 1612, was professor of eloquence at Leyden, and at length of politics and history in the room of Heinsius. He published, 1. *Theatrum urbium Hollandiæ*. 2. *Scriptores historiæ Augustæ, cum notis*. 3. *Poetæ satyrici minores, cum comment.* 4. Notes on Justin, Tacitus; and a great number of other works. He died in 1653, aged 41.

BOXING, the exercise of fighting with the fists, either naked or with a stone or leaden ball grasped in them: in which sense, boxing coincides with the *pugilatus* of the Romans, and what in our amphitheatres is sometimes called trial of manhood. When the champions had *σφαίραι*, or balls, whether of lead or stone, it was properly denominated *σφαίρομαχία*. The ancient boxing differed from the *pugna cestuum*, in which the combatants had leathern thongs on their hands, and balls to offend their antagonists; though this distinction is frequently overlooked, and fighting with the *cestus* ranked as a part of the business of *pugiles*. We may distinguish three species of boxing; viz. where both the head and hands were naked; where the hands were armed and the head naked; and where the head was covered with a kind of cap, called *amphotides*, and the hands also furnished with the *cestus*.

Boxing is an ancient exercise, having been in use in the heroic ages. Those who prepared themselves for it, used all the means that could be contrived to render themselves fat and fleshy, that they might be better able to endure blows: whence corpulent men or women were usually called *pugiles*, according to Terence: *Siqua est habilior paulo, pugilem esse aiunt*.

In modern times this art has been in a manner appropriated by the English. About half a century ago it formed as regular an exhibition as we now see at any of the places of public amusements, the theatres alone excepted. It was encouraged by the first ranks of the nobility, patronized by the first subjects in the realm, and tolerated by the magistrates. Before the establishment of Broughton's amphitheatre, a booth was erected at Tottenham Court, in which the proprietor, Mr George Taylor, invited the professors of the art to display their skill, and the public to be present at its exhibition. The bruisers then had the reward due to their prowess, in a division of the entrance money, which sometimes was 100l. or 150l. The general mode of sharing was for two-thirds to go to the winning champion, while the remaining third was the right of the loser; though sometimes by an express agreement of the parties, the conqueror and the vanquished shared alike. The nobility and gentry having complained of the inconveniences sustained at Taylor's Booth, prevailed on Mr Broughton, who was then

||
Boyd.

then rising into note, as the first bruiser in London, to build a place better adapted for such exhibitions. This was accordingly done in 1742, principally by subscription, behind Oxford-road. The building was called Broughton's New Amphitheatre; and, besides the stage for the combatants, had seats corresponding to the boxes, pit, and galleries, much in the same manner with those at Astley's. After a course of years, however, these exhibitions became gradually less patronized and frequented, owing probably to the refinement of our manners. Some time ago, indeed, they seemed to be revived, and very considerably engaged the attention of the public; but a fatal issue which attended one of them, brought the practice again into disrepute. One of the combatants was killed on the spot. His royal highness the prince of Wales was present, and declared that he would have some settlement made on the nearest relation of the deceased, but that, on account of the dreadful example he had then witnessed, he would never more either see or patronize another stage-fight.

BOXING, among sailors, is used to denote the rehearsing the several points of the compass in their proper order.

BOXING is also used for the tapping of a tree, to make it yield its juice. The boxing of maple is performed by making a hole with an axe or chissel into the side of the tree, about a foot from the ground; out of it flows a liquor of which sugar is made.

BOXTEHÜDE, a town of Germany, in the circle of Lower Saxony, subject to the Danes. It is seated on the rivulet Essee, which falls into the Elbe, in E. Long. 9. 35. N. Lat. 53. 40.

BOXTEL, a town in Dutch Brabant, with sluices, seated on the river Bommel. E. Long. 5. 15. N. Lat. 51. 30.

BOYAR, a term used for a grandee of Russia and Transylvania. Becman says that the boyars are the upper nobility; and adds, that the Czar of Muscovy, in his diplomas, names the boyars before the waywodes. See **WAYWODE**.

BOYAU, in *Fortification*, a ditch covered with a parapet, which serves as a communication between two trenches. It runs parallel to the works of the body of the place; and serves as a line of contravallation, not only to hinder the sallies of the besieged, but also to secure the miners. But when it is a particular cut that runs from the trenches to cover some spot of ground, it is drawn so as not to be enfiladed or scoured by the shot from the town.

BOYD, **MARK ALEXANDER**, an extraordinary genius, was son of Robert Boyd, who was eldest son of Adam Boyd of Pinkhill, brother to Lord Boyd. He was born in Galloway on the 13th of January 1562; and came into the world with teeth. He learned the rudiments of the Latin and Greek languages at Glasgow, under two grammarians; but was of so high and untractable a spirit, that they despaired of ever making him a scholar. Having quarrelled with his masters, he beat them both, burnt his books, and forswore learning. While he was yet a youth, he followed the court, and did his utmost to push his interest there; but the fervour of his temper soon precipitated him into quarrels, from which he came off with honour and safety, though frequently at the hazard of his life. He, with

the approbation of his friends, went to serve in the French army, and carried his little patrimony with him, which he soon dissipated at play. He was shortly after roused by that emulation which is natural to great minds, and applied himself to letters with unremitting ardour, till he became one of the most consummate scholars of his age. He is said to have translated Cæsar's Commentaries into Greek in the style of Herodotus, and to have written many Latin poems which were little inferior to the first productions of the Augustan age. He also left several manuscripts on philological, political, and historical subjects, in Latin and French, which languages were as familiar to him as his native tongue. He could with facility dictate to three amanuenses at the same time, in different languages, and on different subjects. He was also one of the best Scottish poets of the age. To all this we must add, that his personal beauty and accomplishments were equal to his mental superiority. He died at Pinkhill in Scotland, in 1601. The following works, which are all that have been printed, were published in the *Delicia Poetarum Scotorum*; Amstel. 1637, 12mo. 1. *Epigrammata*, lib. ii. 2. *Heroidum Epistolæ* XIV. lib. ii. 3. *Hymni* XIV.

BOYER, **ABEL**, a well-known glossographer and historiographer, born at Castres in France, in 1664. Upon the revocation of the edict of Nantz, he went first to Geneva, then to Franeker, where he finished his studies; and came finally to England, where he applied himself so assiduously to the study of the English language, and made so great a proficiency therein, that he became an author of considerable note in it, being employed in the writing of several periodical and political works. He was for many years concerned in a newspaper called the *Post-boy*, of which he had the principal management. He likewise published a monthly work entitled the *Political State of Great Britain*. He wrote a life of Queen Anne in folio, which is esteemed a very good chronicle of that period of the English history. But what has rendered him the most known, and has most firmly established his reputation, are the excellent Dictionary and Grammar of the French language, which he compiled, and which are still reckoned the best in their kind. He also wrote, or rather translated from the French of M. de Racine, the tragedy of Iphigenia, which he published under the title of *The Victim*. It was performed with success at the theatre of Drury-Lane, and is far from being a bad play. Nor can there perhaps be a stronger instance of the abilities of its author, than success in such an attempt; since writing with any degree of correctness or elegance, even in prose, in a foreign language, is an excellence not very frequently attained; but to proceed so far in the perfection of it as to be even tolerable in poetry, and more especially in that of the drama, in which the diction and manner of expression require a peculiar dignity and force, and in a language so difficult to attain the perfect command of as the English, is what has been very seldom accomplished. He died in 1729.

BOYER, in *Navigation*, a kind of Flemish sloop, or small vessel of burden, having a boltsprit, a castle at each end, and a tall mast; chiefly fit for the navigation of rivers, and in many of its parts resembling a smack.

Boyd,
Boyer.

BOYES,

Boyes,
Boyle.

BOYES, idolatrous priests among the savages of Florida. Every priest attends a particular idol, and the natives address themselves to the priest of that idol to which they intend to pay their devotion. The idol is invoked in hymns, and his usual offering is the smoke of tobacco.

BOYLE, RICHARD, one of the greatest statesmen of the 17th century, and generally styled the *Great earl of Cork*, was the youngest son of Mr Roger Boyle, and was born at Canterbury, on the 3d of October 1566. He studied at Bennet college, Cambridge, and afterwards became a student in the Middle Temple. Having lost his father and mother, and being unable to support himself in the prosecution of his studies, he became clerk to Sir Richard Manhood, one of the chief barons of the exchequer; but finding that by his employment he could not improve his fortune, he went to Ireland in 1588, with fewer pounds in his pocket than he afterwards acquired thousands a-year. He was then about 22, had a graceful person, and many accomplishments, which enabled him to render himself useful to several of the principal persons employed in the government, by drawing up for them memorials, cases, and answers. In 1595, he married Jean the daughter and co-heiress of William Anseley, who had fallen in love with him; and she dying in 1599 in labour of her first child, which was stillborn, left him an estate of 500l. a-year in land. In consequence of various services, and the great abilities he displayed, he gradually rose to the highest offices, and even to the dignity of the peerage of Ireland; to which he was raised by King James I. on the 29th of September 1616, by the style and title of *baron of Youghall*, in the county of Cork: four years after, he was created Viscount Dungarvan and earl of Cork; and in 1631 was made lord treasurer of Ireland, an honour that was made hereditary to his family. He particularly distinguished himself by the noble stand he made, when the fatal rebellion broke out in that kingdom, in the reign of Charles I.; and in his old age acted with as much bravery and military skill, as if he had been trained from his infancy to the profession of arms. He turned the castle of Lismore, his capital seat, into a fortress capable of demanding respect from the Irish. He immediately armed and disciplined his servants and Protestant tenants; and by their assistance, and a small army raised and maintained at his own expense, which he put under the command of his four sons, defended the province of Munster, and in the space of a year took several strong castles, and killed upwards of 3000 of the enemy: during which time he paid his forces regularly; and when all his money was gone, like a true patriot converted his plate into coin. This great man died on the 15th of September 1634.

BOYLE, Richard, earl of Burlington and Cork, son to the former, was a nobleman of unblemished loyalty in rebellious times, and of untainted integrity in times of the greatest corruption. He was born at Youghall, October 20. 1612, while his father was in the beginning of his prosperity, and only Sir Richard Boyle. He distinguished himself by his loyalty to King Charles I. He not only commanded troops, but raised and for a long time paid them, and continued to wait upon the king as long as any one place held out for him in England, and then was forced to compound for

VOL. IV. Part I. †

Boyle.

his estate. He contributed all in his power to the Restoration; on which King Charles II. raised him to the dignity of earl of Burlington, or Bridlington, in the county of York, in the year 1663. He died Jan. 15. 1697-8, in the 86th year of his age.

BOYLE, Roger, earl of Orrery, younger brother of the former, and the fifth son of Richard, styled the *Great earl of Cork*, was born April 25. 1621; and by the credit of his father with the lord deputy Faulkland, raised to the dignity and title of *Baron Broghill*, when only seven years old. He was educated at the college of Dublin, where he soon distinguished himself as an early and promising genius. He afterwards made the tour of France and Italy; and at his return assisted his father in opposing the rebellious Irish, in which he behaved with all the spirit of a young, and all the discretion of an old, officer. Upon the murder of the king, he retired to Marston in Somersetshire, and hid himself in the privacy of a close retirement; but being at length ashamed to sit the tame spectator of all the mischief that appeared round him, he resolved to attempt something in favour of the king; and under the pretence of going to the Spa for the recovery of his health, he determined to cross the seas, and apply himself to King Charles II. for a commission to raise what forces he could in Ireland, in order to restore his majesty, and recover his own estate. To this purpose, he prevailed on the earl of Warwick to procure a license for his going to the Spa; and having raised a considerable sum of money, came up to London to prosecute his voyage; but he had not been long in town when he received a message from Cromwell, who was then general of the parliament's forces, that he intended to wait upon him. The lord Broghill was surprised at this message, having never had the least acquaintance with Cromwell; and desired the gentleman to let the general know, that he would wait upon his excellency. But while he was waiting the return of the messenger, Cromwell entered the room; and after mutual civilities had passed between them, told him in few words, that the committee of state were apprised of his design of going over and applying to Charles Stuart for a commission to raise forces in Ireland; and that they were determined to make an example of him, if he himself had not diverted them from that resolution. The lord Broghill interrupted him, by assuring him that the intelligence which the committee had received was false, and that he neither was in a capacity nor had any inclination to raise disturbances in Ireland: but Cromwell, instead of making any reply, drew some papers out of his pocket, which were the copies of several letters which the lord Broghill had sent to those persons in whom he most confided, and put them into his hands. The lord Broghill, upon the perusal of these papers, finding it to no purpose to dissemble any longer, asked his excellency's pardon for what he had said, returned him his humble thanks for his protection against the committee, and intreated his direction how to behave in such a delicate conjecture. Cromwell told him, that though till this time he had been a stranger to his person, he was not so to his merit and character: he had heard how gallantly his lordship had behaved in the Irish wars; and therefore, since he was named *lord lieutenant of Ireland*, and the reducing that kingdom was now become his province, he had obtained

Y y

Boyle. obtained leave of the committee to offer his lordship the command of a general officer, if he would serve in that war; and he should have no oaths or engagements imposed upon him, nor be obliged to draw his sword against any but the Irish rebels.

The lord Broghill was infinitely surprised at so generous and unexpected an offer. He saw himself at liberty, by all the rules of honour, to serve against the Irish, whose rebellion and barbarities were equally detested by the royal party and the parliament. He desired, however, some time to consider of what had been proposed to him. But Cromwell briskly told him, that he must come to some resolution that very instant: that he himself was returning to the committee, who were still sitting; and if his lordship rejected their offer, they had determined to send him to the Tower. Upon this, the lord Broghill, finding that his liberty and life were in the utmost danger, gave his word and honour that he would faithfully serve him against the Irish rebels: on which Cromwell once more assured him, that the conditions which he had made with him should be punctually observed; and then ordered him to repair to Bristol, adding, that he himself would soon follow him into Ireland. Lord Broghill, therefore, having settled the business of his command, went over into that country; where, by his conduct and intrepidity, he performed many important services, and fully justified the opinion Cromwell had conceived of him. By his own interest he now raised a gallant troop of horse, consisting chiefly of gentlemen attached to him by personal friendship; which corps was soon increased to a complete regiment of 1500 men. These he led into the field against the Irish rebels; and was speedily joined by Cromwell, who placed the highest confidence in his new ally, and found him of the greatest consequence to the interest of the commonwealth.

Among other considerable exploits performed by Lord Broghill, the following deserves to be particularly mentioned. Whilst Cromwell laid siege to Clonmell, Broghill being detached to disperse a body of 5000 men who had assembled to relieve the place, he with 2000 horse and dragoons, came up with the enemy at Maccrooms on the 10th of May 1656; and, without waiting for the arrival of his foot, immediately attacked and routed them, making their general prisoner. Then proceeding to the castle of Carrigdrohid, he sent a summons to the garrison to surrender before the arrival of his battering cannon, otherwise they were to expect no quarter. His own army was surprised at this summons, as knowing he had not one piece of heavy cannon: but Broghill had ordered the trunks of several large trees to be drawn at a distance by his baggage horses; which the besieged perceiving, and judging from the slowness of the motion that the guns must be of a vast bore, immediately capitulated. He afterwards relieved Cromwell himself at Clonmell, where that great commander happened to be so dangerously situated, that he confessed, nothing but the seasonable relief afforded him by Lord Broghill could have saved him from destruction. When Ireton sat down before Limerick, he gave Broghill 600 foot and 400 horse, with orders to prevent Lord Muskerry's joining the pope's nuncio, who had got together a body of 8000 men, and was determined to attempt the relief of Limerick. Muskerry was at the head of 1000

Boyle. horse and dragoons, and about 2000 foot: notwithstanding which, Lord Broghill fell resolutely upon him. The Irish, having the advantage of the ground and numbers, would have conquered, but for a stratagem of Lord Broghill. In the heat of the action he desired those about him to repeat what he said; and then cried out as loud as he could, "They run, they run." The first line of the Irish looked round to see if their rear broke; and the rear seeing the faces of their friends, and hearing the shouts of the enemy, imagined that the first line was routed, and fled. The taking of Limerick, which put an end to the war in Ireland, was the consequence of this defeat.

When Cromwell became protector, he sent for Lord Broghill, merely to take his advice occasionally. And we are told, that, not long after his coming to England, he formed a project for engaging Cromwell to restore the old constitution. The basis of the scheme was to be a match between the king (Charles II.) and the protector's daughter. As his lordship maintained a secret correspondence with the exiled monarch and his friends, it was imagined that he was beforehand pretty sure that Charles was not averse to the scheme, or he would not have ventured to have proposed it seriously to Cromwell; who at first seemed to think it not unfeasible. He soon changed his mind, however, and told Broghill that he thought his project impracticable: "For (said he) Charles can never forgive me the death of his father." In fine, the business came to nothing, although his lordship had engaged Cromwell's wife and daughter in the scheme; but he never durst let the protector know that he had previously treated with Charles about it.

On the death of the protector, Lord Broghill continued attached to his son Richard, till, when he saw that the honesty and good-nature of that worthy man would infallibly render him a prey to his many enemies, he did not think it advisable to sink with a man that he could not save. The dark clouds of anarchy seemed now to be hovering over the British island. Lord Broghill saw the storm gathering, and he deemed it prudent to retire to his command in Ireland, where he shortly after had the satisfaction of seeing things take a turn extremely favourable to the design that he had long been a wellwisher to, viz. that of the king's restoration. In this great event Lord Broghill was not a little instrumental; and, in consideration of his eminent services in this respect, Charles created him earl of Orrery by letters-patent bearing date September 5. 1660. He was soon after made one of the lords justices of Ireland; and his conduct, while at the head of affairs in that kingdom, was such as greatly added to the general esteem in which his character was held before.

His lordship's active and toilsome course of life at length brought upon him some diseases and infirmities which gave him much pain and uneasiness; and a fever which fell into his feet, joined to the gout with which he was often afflicted, abated much of that vigour which he had shown in the early part of his life: but his industry and application were still the same, and bent to the same purposes; as appears from his letters, which show at once a capacity, and an attention to business, which do honour to that age, and may serve as an example to this.

Notwithstanding

Boyle.

Notwithstanding his infirmities, on the king's desiring to see his lordship in England, he went over in 1665. He found the court in some disorder; where his majesty was on the point of removing the great earl of Clarendon, lord high chancellor; and there was also a great misunderstanding between the two royal brothers. Lord Orrery undertook to reconcile the king with the duke of York; which he effected by prevailing on the latter to ask his majesty's pardon for some steps he had taken in support of the lord chancellor.

On his return to Ireland, he found himself called to a new scene of action. The Dutch war was then at its height; and the French, in confederacy with the Hollanders, were endeavouring to stir up the ashes of rebellion in Ireland. The duke de Beaufort, admiral of France, had formed a scheme for a descent upon Ireland; but this was rendered abortive by the extraordinary diligence, military skill, and prudent measures, of Lord Orrery.

But, in midst of all his labours, a dispute arose, founded on a mutual jealousy of each other's greatness, betwixt him and his old friend the duke of Ormond, then lord lieutenant; the bad effects of which were soon felt by both disputants, who resorted to England to defend their respective interests and pretensions, both having been attacked by secret enemies who suggested many things to their prejudice. This quarrel, though of a private beginning, became at last of a public nature; and producing first an attempt to frame an impeachment against the duke of Ormond, occasioned in the end, by the way of revenge, an actual impeachment against the earl of Orrery. He defended himself, however, so well against a charge of high crimes, and even of treason itself, that the prosecution came to nothing. He nevertheless lost his public employments; but not the king's favour: he still came frequently to court, and sometimes to council. After this revolution in his affairs, he made several voyages to and from Ireland; was often consulted by his majesty on affairs of the utmost consequence; and on all occasions gave his opinion and advice with the freedom of an honest plain-dealing man and a sincere friend; which the king always found him, and respected him accordingly.

In 1678, being attacked more cruelly than ever by his old enemy the gout, he made his last voyage to England for advice in the medical way. But his disorder was beyond the power of medicine; and having in his last illness given the strongest proofs of Christian patience, manly courage, and rational fortitude, he breathed his last on the 16th of October 1679, in the 59th year of his age. His lordship wrote, 1. A work entitled "The Art of War." 2. *Parthenissa*, a romance, in one volume folio. 3. Several poems. 4. Dramatic pieces, two volumes. 5. State-tracts, in one volume folio, &c. Mr Walpole, speaking of this nobleman, says, he never made a bad figure but as a poet. As a soldier, his bravery was distinguished, his stratagems remarkable. As a statesman, it is sufficient to say, that he had the confidence of Cromwell. As a man, he was grateful, and would have supported the son of his friend: but, like Cicero and Richelieu, he could not be content without being a poet; though he was ill qualified, his writings of that kind being flat and trivial.

Boyle.

BOYLE, *Robert*, one of the greatest philosophers as well as best men that our own or indeed any other nation has produced, was the seventh son and the 14th child of Richard earl of Cork, and born at Lismore in the province of Munster in Ireland, January 25. 1626-7. Before he went to school, he was taught to write a very fair hand, and to speak French and Latin, by one of the earl's chaplains, and a Frenchman that he kept in the house. In the year 1635, his father sent him over to England, in order to be educated at Eton school, under Sir Henry Wotton, who was the earl of Cork's old friend and acquaintance. Here he soon discovered a force of understanding which promised great things, and a disposition to cultivate and improve it to the utmost. While he remained at Eton, there were several very extraordinary accidents that befel him, of which he has given us an account; and three of which were very near proving fatal to him. The first was, the sudden fall of the chamber where he was lodged, when himself was in bed; when, besides the danger he run of being crushed to pieces, he had certainly been choked with the dust during the time he lay under the rubbish, if he had not had presence of mind enough to wrap his head up in the sheet, which gave him an opportunity of breathing without hazard. A little after this, he had been crushed to pieces by a starting horse that rose up suddenly, and threw himself backwards, if he had not happily disengaged his feet from the stirrups, and cast himself from his back before he fell. A third accident proceeded from the carelessness of an apothecary's servant, who, by mistaking the phials, brought him a strong vomit instead of a cooling julep.

He remained at Eton upon the whole, between three and four years; and then his father carried him to his own seat at Stalbridge in Dorsetshire, where he remained for some time under the care of one of his chaplains who was the parson of the place. In 1638, he attended his father to London; and remained with him at the Savoy, till his brother Mr Francis Boyle espoused Mrs Elizabeth Killigrew; and then, towards the end of October, within four days after the marriage, the two brothers, Francis and Robert, were sent abroad upon their travels, under the care of Mr Marcombes. They embarked at Rye in Sussex, and from thence proceeded to Dieppe in Normandy: then they travelled by land to Rouen, so to Paris, and from thence to Lyons; from which city they continued their journey to Geneva, where his governor had a family; and there the two gentlemen pursued their studies without interruption. Mr Boyle, during his stay here, resumed his acquaintance with the mathematics, or at least with the elements of that science, of which he had before gained some knowledge. For he tells us, in his own memoirs, that while he was at Eton, and afflicted with an ague, before he was ten years old, by way of diverting his melancholy, they made him read *Amadis de Gaul*, and other romantic books, which produced such a restlessness in him, that he was obliged to apply himself to the extraction of the square and cube roots, and to the more laborious operations of algebra, in order to fix and settle the volatile operations of his fancy.

In September 1641, he quitted Geneva, after having spent 12 months in that city; and passing through

Boyle.

Switzerland and the country of the Grisons, entered Lombardy. Then, taking his route through Bergamo, Brescia, and Verona, he arrived at Venice; where, having made a short stay, he returned to the continent, and spent the winter at Florence. Here he employed his spare hours in reading the modern history in Italian, and the works of the celebrated astronomer Galileo, who died in a village near this city during Mr Boyle's residence in it. It was at Florence that he acquired the Italian language; which he understood perfectly, though he never spoke it so fluently as the French. Of this indeed he was such a master, that as occasion required he passed for a native of that country in more places than one during his travels.

About the end of March 1642, he began his journey from Florence to Rome, which took up but five days. He surveyed the numerous curiosities of that city; among which, he tells us, "he had the fortune to see Pope Urban VIII. at chapel, with the cardinals, who, severally appearing mighty princes, in that assembly looked like a company of common friars." He visited the adjacent villages which had any thing curious or antique belonging to them; and had probably made a longer stay, had not the heats disagreed with his brother. He returned to Florence; from thence to Leghorn; and so by sea to Genoa: then passing through the county of Nice, he crossed the sea to Antibes, where he fell into danger from refusing to honour the crucifix: from thence he went to Marseilles by land. He was in that city, in May 1642, when he received his father's letters, which informed him that the rebellion had broken out in Ireland, and how difficultly he had procured the 250l. then remitted to them in order to help them home. They never received this money; and were obliged to go to Geneva with their governor Marcombes, who supplied them with as much at least as carried them thither. They continued there a considerable time without either advice or supplies from England; upon which Marcombes was obliged to take up some jewels upon his own credit, which were afterwards disposed of with as little loss as might be; and with the money thus raised, they continued their journey for England, where they arrived in the year 1644. On their arrival, Mr Boyle found his father dead; and though the earl had made an ample provision for him, by leaving him his manor of Stalbridge in England, as well as other considerable estates in Ireland, yet it was some time before he could receive any money. However, he procured protections for his estates in both kingdoms from the powers then in being; from which he also obtained leave to go over to France for a short space, probably to settle accounts with his governor Mr Marcombes.

In March 1646, he retired to his manor at Stalbridge, where he resided for the most part till May 1650. He made excursions sometimes to London, sometimes to Oxford; and in February 1647, he went over to Holland; but he made no considerable stay anywhere. During his retirement at Stalbridge, he applied himself with incredible industry to studies of various kinds, to those of natural philosophy and chemistry in particular. He omitted no opportunity of obtaining the acquaintance of persons distinguished for

Boyle.

parts and learning; to whom he was in every respect a ready, useful, generous assistant, and with whom he held a constant correspondence. He was also one of the first members of that small but learned body of men which, when all academical studies were interrupted by the civil wars, secreted themselves about the year 1645; and held private meetings, first in London, afterwards at Oxford, for the sake of canvassing subjects of natural knowledge upon that plan of experiment which Lord Bacon had delineated. They styled themselves then *The philosophic college*; and, after the Restoration, when they were incorporated, and distinguished openly, they took the name of the *Royal Society*.

In the summer of 1654, he put in execution a design he had formed for some time of residing at Oxford, where he chose to live in the house of one Mr Crosse, an apothecary, rather than in a college, for the sake of his health, and because he had more room to make experiments. Oxford was indeed the only place at that time in England where Mr Boyle could have lived with much satisfaction; for here he found himself surrounded with a number of learned friends, such as Wilkins, Wallis, Ward, Willis, Wren, &c. suited exactly to his taste, and who had resorted thither for the same reasons that he had done, the philosophical society being now removed from London to Oxford. It was during his residence here that he improved that admirable engine the air-pump; and by numerous experiments was enabled to discover several qualities of the air, so as to lay a foundation for a complete theory. He was not, however, satisfied with this; but laboured incessantly in collecting and digesting, chiefly from his own experiments, the materials requisite for this purpose. He declared against the philosophy of Aristotle, as having in it more words than things; promising much, and performing little; and giving the inventions of men for indubitable proofs, instead of building upon observation and experiment. He was so zealous for, and so careful about, this true method of learning by experiment, that though the Cartesian philosophy then made a great noise in the world, yet he would never be persuaded to read the works of Des Cartes, for fear he should be amused and led away by plausible accounts of things founded on conjecture, and merely hypothetical. But philosophy, and inquiries into nature, though they engaged his attention deeply, did not occupy it entirely; since we find that he still continued to pursue critical and theological studies. In these he had the assistance of some great men, particularly Dr Edward Pocock, Mr Thomas Hyde, and Mr Samuel Clarke, all of great eminence for their skill in the oriental languages. He had also a strict intimacy with Dr Thomas Barlow, at that time head keeper of the Bodleian library, and afterwards bishop of Lincoln, a man of various and extensive learning. In the year 1659, Mr Boyle, being acquainted with the unhappy circumstances of the learned Sanderson, afterwards bishop of Lincoln, who had lost all his preferments on account of his attachment to the royal party, conferred upon him an honorary stipend of 50l. a-year. This stipend was given as an encouragement to that excellent master of reasoning to apply himself to the writing of "*Cases of Conscience*;" and accord-

ingly

Boyle. ingly he printed his lectures *De obligatione conscientia*, which he read at Oxford in 1647, and dedicated them to his friend and patron.

Upon the restoration of Charles II. Mr Boyle was treated with great civility and respect by the king, as well as by the two great ministers the lord treasurer Southampton and the lord chancellor Clarendon. He was solicited by the latter to enter into holy orders, not only out of regard to him and his family, but chiefly with a view to serve the church itself; for Mr Boyle's noble family, his distinguished learning, and, above all, his unblemished reputation, induced Lord Clarendon to think that any ecclesiastical preferments he might attain would be worthily discharged, so as to do honour to the clergy, and service to the established communion. Mr Boyle considered all this with due attention: but, to balance these, he reflected, that, in the situation of life in which he was, whatever he wrote with respect to religion would have so much the greater weight as coming from a layman: since he well knew that the irreligious fortified themselves against all that the clergy could offer, by supposing, and saying, that it was their trade, and that they were paid for it. He considered likewise, that, in point of fortune and character, he needed no accessions; and indeed he never had any appetite for either. He chose, therefore, to pursue his philosophical studies in such a manner as might be most effectual for the support of religion; and began to communicate to the world the fruit of these studies.

The first of these was printed at Oxford in 1660, in 8vo, under the title of, 1. New experiments, physico-mechanical, touching the spring of the air and its effects. 2. Seraphic love; or some motives and incentives to the love of God, pathetically discoursed of in a letter to a friend. 3. Certain physiological essays and other tracts, 1661, 4to. 4. Sceptical chemist, 1662, 8vo; a very curious and excellent work, reprinted about the year 1679, 8vo, with the addition of divers experiments and notes about the producibleness of chemical principles.

In the year 1663, the Royal Society being incorporated by King Charles II. Mr Boyle was appointed one of the council; and as he might be justly reckoned among the founders of that learned body, so he continued one of the most useful and industrious of its members during the whole course of his life. In June 1663, he published, 5. Considerations touching the usefulness of Experimental Natural Philosophy, 4to. 6. Experiments and considerations upon Colours; to which was added a letter, containing Observations on a Diamond that shines in the dark, 1663, 8vo. This treatise is full of curious and useful remarks on the hitherto unexplained doctrine of light and colours; in which he shows great judgment, accuracy, and penetration; and may be said to have led the way to that mighty genius, the great Sir Isaac Newton, who has since set that point in the clearest and most convincing light. 7. Considerations on the style of the Holy Scriptures, 1663, 8vo. It was an extract from a larger work, entitled, "An Essay on Scripture;" which was afterwards published by Sir Peter Pett, a friend of Mr Boyle's.

In 1664, he was elected into the company of the royal mines; and was all this year taken up in the

prosecution of various good designs, which probably was the reason why he did not send abroad any treatises either of religion or philosophy. The year following, came forth, 8. Occasional reflections upon several subjects; whereto is prefixed a discourse about such kinds of thoughts, 1665, 8vo. This piece is addressed to *Sophronia*, under which name he concealed that of his beloved sister the viscountess of Ranelagh. The thoughts themselves are on a vast variety of subjects, written many years before; some indeed upon trivial occasions, but all with great accuracy of language, much wit, more learning, and in a wonderful strain of moral and pious reflection. Yet this exposed him to the only severe censure that ever was passed upon him; and that too from no less a man than the celebrated Dean Swift, who, to ridicule these discourses, wrote *A pious meditation upon a broomstick, in the style of the honourable Mr Boyle*. But as his noble relation, the late Lord Orrery has said, "To what a height must the spirit of sarcasm arise in an author, who could prevail on himself to ridicule so good a man as Mr Boyle? The sword of wit, like the scythe of time, cuts down friend and foe, and attacks every object that lies in its way. But, sharp and irresistible as the edge of it may be, Mr Boyle will always remain invulnerable."

The same year, he published an important work, entitled, 9. New experiments and observations upon cold, 1665, 8vo. In the year 1666, he published, 10. Hydrostatical paradoxes made out by new experiments, for the most part physical and easy, in 8vo. 11. The origin of forms and qualities, according to the corpuscular philosophy, illustrated by considerations and experiments. This treatise did great honour to Mr Boyle, whether we consider the quickness of his wit, the depth of his judgment, or his indefatigable pains in searching after truth. We must not forget to observe, that, both in this and the former year, he communicated to his friend Mr Oldenburg, who was secretary to the Royal Society, several curious and excellent short treatises of his own, upon a great variety of subjects, and others transmitted to him by his learned friends both at home and abroad, which are printed and preserved in the Philosophical Transactions.

In the year 1668, Mr Boyle resolved to settle in London for life: and removed for that purpose to the house of his sister, the lady Ranelagh, in Pall-Mall. This was to the infinite benefit of the learned in general, and particularly to the advantage of the Royal Society, to whom he gave great and continual assistance, as the several pieces communicated to them from time to time, and printed in their Transactions, do abundantly testify. Those who applied to him, either to desire his help, or to communicate to him any new discoveries in science, he had his set hours for receiving; otherwise it is easy to conceive that he would have had very little of his time for himself. But, besides these, he kept a very extensive correspondence with persons of the greatest figure, and most famous for learning, in all parts of Europe. In the year 1669, he published, 12. A continuation of new experiments touching the weight and spring of the air; to which is added, A discourse of the atmospheres of consistent bodies: and the same year he revised and made many additions to several of his former tracts, some of which

Boyle. which were now translated into Latin, in order to gratify the curious abroad. 13. Tracts about the cosmical qualities of things; cosmical suspicions: the temperature of the subterraneous regions; the bottom of the sea: to which is prefixed an introduction to the history of particular qualities. This book occasioned much speculation, as it seemed to contain a vast treasure of knowledge which had never been communicated to the world before; and this too grounded upon actual experiments, and arguments justly drawn from them, instead of that notional and conjectural philosophy which in the beginning of the 17th century had been so much in fashion.

In the year 1671, he published, 14 Considerations on the usefulness of experimental and natural philosophy; the second part, 4to. And, 15. A collection of tracts upon several useful and important points of practical philosophy, 4to. Both of which works were received as new and valuable gifts to the learned world. 16. An essay about the origin and virtues of gems, 1672, 8vo. 17. A collection of tracts upon the relation between flame and air; and several other useful and curious subjects: besides furnishing, in this and the former year, a great number of short dissertations upon a vast variety of topics, addressed to the Royal Society, and inserted in their Transactions. 18. Essays on the strange subtilty, great efficacy, and determinate nature of effluvia; to which were added a variety of experiments on other subjects; 1673, 8vo. 19. A collection of tracts upon the saltness of the sea, the moisture of the air, the natural and preternatural state of bodies; to which is prefixed a dialogue concerning cold; 1674, 8vo. 20. The excellency of theology, compared with philosophy, 1673, 8vo. This discourse was written in the year 1665, while Mr Boyle, to avoid the great plague which then raged in London, was forced to go from place to place in the country, and had little or no opportunity of consulting his books. It contains a great number of curious and useful, as well as just and natural observations. 21. A collection of tracts containing suspicions about hidden qualities of the air; with an appendix touching celestial magnets; animadversions upon Mr Hobbes's problem about a vacuum; and a discourse of the cause of attraction and suction; 1674, 8vo. 22. Some considerations about the reconcilableness of reason and religion. By T. E. a layman. To which is annexed a discourse about the possibility of the resurrection. By Mr Boyle, 1675, 8vo. The reader must be informed, that both these pieces were of his writing; only he thought fit to mark the former with the final letters of his name. Among other papers that he communicated this year to the Royal Society, there were two connected into one discourse; the first was entitled, An experimental discourse of quicksilver growing hot with gold; the other related to the same subject; and both of them contained discoveries of the utmost importance.

In the year 1676, he published, 23. Experiments and notes about the mechanical origin or production of particular qualities; in several discourses on a great variety of subjects, and among the rest on electricity. In 1678, he communicated to Mr Hooke a short memorial of some observations made upon an artificial substance that shines without any preceding illustra-

tion; which that gentleman thought fit to publish in his *Lectiões Cutlerianæ*. 24. Historical account of a degradation of gold made by an anti-elixir. This made a great noise both at home and abroad, and is looked upon as one of the most remarkable pieces that ever fell from his pen; since the facts contained in it would have been esteemed incredible, if they had been related by a man of less integrity and piety than Mr Boyle. The regard which the great Newton had for Mr Boyle, appears from a very curious letter, which the former wrote to him, at the latter end of this year, for the sake of laying before him his sentiments of that ethereal medium, which he afterwards considered in his Optics as the cause of gravitation. This letter is to be found in the life of our author by the reverend Dr Birch.

In the year 1680, Mr Boyle published, 25. The aerial noctiluca; or some new phenomena, and a process of a factitious self-shining substance, 8vo. This year the Royal Society, as a proof of the just sense of his great worth, and of the constant and particular services which through a course of many years he had done them, made choice of him for their president; but he being extremely, and, as he says, peculiarly tender in point of oaths, declined the honour done him, by a letter addressed to "his much respected friend Mr Robert Hooke, professor of mathematics at Gresham college." 26. Discourse of things above reason; inquiring, whether a philosopher should admit any such; 1681, 8vo. 27. New experiments and observations upon the icy noctiluca: to which is added a chemical paradox, grounded upon new experiments, making it probable that chemical principles are transmutable, so that out of one of them others may be produced; 1682, 8vo. 28. A continuation of new experiments, physico-mechanical, touching the spring and weight of the air, and their effects; 1682, 8vo. In 1683, he published nothing but a short letter to Dr Beale, in relation to the making of fresh water out of salt. In 1684, he published two very considerable works; viz. 29. Memoirs for the natural history of human blood, especially the spirit of that liquor, 8vo; and, 30. Experiments and considerations about the porosity of bodies, &c.

In 1685, Mr Boyle obliged the world with, 31. Short Memoirs for the natural experimental history of mineral waters, with directions as to the several methods of trying them; including abundance of new and useful remarks, as well as several curious experiments. 32. An essay on the great effects of even languid and unheeded motion; whereunto is annexed an experimental discourse of some hitherto little regarded causes of the salubrity and insalubrity of the air and its effects. None of his treatises, it is said, were ever received with greater or more general applause than this. 33. Of the reconcilableness of specific medicines to the corpuscular philosophy; to which is annexed a discourse about the advantages of the use of simple medicines, 8vo. Besides these philosophical tracts, he gave the world, the same year, an excellent theological one, 34. Of the high veneration man's intellect owes to God, peculiarly for his wisdom and power, 8vo.

At the entrance of the succeeding year, came abroad his, 35. Free inquiry into the vulgarly received notion of

Boyle.

of nature; a piece which was then, and will always be, greatly admired by those who have a true zeal and relish for pure religion and philosophy. In 1687, he published, 36. The martyrdom of Theodora and Didymia; a work he had drawn up in his youth. 37. A disquisition about the final causes of natural things; wherein it is inquired, whether, and (if at all) with what caution, a naturalist should admit them; with an appendix about vitiated light; 1688, 8vo. In the month of May this year, our author, though very unwilling, was constrained to make his complaint to the public, of some inconveniences under which he had long laboured; and this he did by an advertisement, about "the loss of many of his writings addressed to J. W. to be communicated to those of his friends that are virtuosi; which may serve as a kind of preface to most of his mutilated and unfinished writings." He complains in this advertisement of the treatment he had met with from plagiarists both at home and abroad; and though it might have been difficult in any other man to have done so without incurring the imputation of self-conceit and vanity, yet Mr Boyle's manner is such as only to raise in us a higher esteem and admiration of him. This advertisement is inserted at length in his life by Birch.

He began now to find that his health and strength, notwithstanding all his care and caution, gradually declined, as he observes in a letter to M. le Clerc, dated May 30. 1689; which put him upon using every possible method of husbanding his remaining time for the benefit of the learned. It was with this view that he no longer communicated particular discourses, or new discoveries to the Royal Society; because this could not be done without withdrawing his thoughts from tasks which he thought of still greater importance. It was the more steadily to attend to these, that he resigned his post of governor of the corporation for propagating the gospel in New England; nay, he went so far as to signify to the world that he could no longer receive visits as usual, in an advertisement which begins in the following manner: "Mr Boyle finds himself obliged to intimate to those of his friends and acquaintance, that are wont to do him the honour and favour of visiting him, 1. That he has by some unlucky accidents, namely, by his servant's breaking a bottle of oil of vitriol over a chest which contained his papers, had many of his writings corroded here and there, or otherwise so maimed, that, without he himself fill up the lacunæ out of his memory or invention, they will not be intelligible. 2. That his age and sickliness have for a good while admonished him to put his scattered and partly defaced writings into some kind of order, that they may not remain quite useless. And, 3. That his skilful and friendly physician, Sir Edmund King, seconded by Mr Boyle's best friends, has pressingly advised him against speaking daily with so many persons as are wont to visit him, representing it as what cannot but waste his spirits, &c. He ordered likewise a board to be placed over his door, with an inscription signifying when he did, and when he did not, receive visits."

Among the other great works, which by this means he gained time to finish, there is great reason to believe, that one was a collection of elaborate processes in chemistry; concerning which he wrote a letter to

Boyle.

a friend, which is still extant; wherein we read, that "he left it as a kind of hermetic legacy to the studious disciples of that art." Besides these papers committed to the care of one whom he esteemed his friend, he left very many behind him at his death, relating to chemistry: which, as appears by a letter directed to one of his executors, he desired might be inspected by three physicians whom he named, and that some of the most valuable might be preserved.

In the mean time, Mr Boyle published some other works before his death; as, 38. *Medicina Hydrostatica*; or, Hydrostatics applied to the materia medica, showing how, by the weight that divers bodies used in physic have in water, one may discover whether they be genuine or adulterated. To which is subjoined a previous hydrostatical way of estimating ores, 1690, 8vo. 39. The Christian virtuoso; showing, that, by being addicted to experimental philosophy, a man is rather assisted than indisposed to be a good Christian. To which are subjoined, 1. A discourse about the distinction that represents some things as above reason, but not contrary to reason. 2. The first chapters of a discourse entitled *Greatness of mind promoted by Christianity*. The last work which he published himself, was in the spring of 1691; and is entitled, 40. *Experimenta et Observationes Physicæ*: wherein are briefly treated of several subjects relating to natural philosophy in an experimental way. To which is added a small collection of strange reports, 8vo.

About the entrance of the summer, he began to feel such an alteration in his health as induced him to think of settling his affairs; and accordingly, on the 18th of July, he signed and sealed his last will, to which he afterwards added several codicils. In October, his distempers increased; and on the last day of December 1691, he departed this life, in the 65th year of his age. He was buried in St Martin's church in the Fields, Westminster, on the 7th of January following; and his funeral sermon was preached by Dr Gilbert Burnet, bishop of Salisbury. The bishop made choice upon this occasion of a text very apposite to the subject; namely, "For God giveth to a man that is good in his sight, wisdom, knowledge, and joy *." After explaining the meaning of the words, he applied the doctrine to the honourable person deceased; of whom, he tells us, he was the better able to give a character, from the many happy hours he had spent in conversation with him, in the course of 29 years. He gives a large account of Mr Boyle's sincere and unaffected piety; and more especially of his zeal for the Christian religion, without having any narrow notions concerning it, or mistaking, as so many do, a bigotted heat in favour of a particular sect, for that zeal which is an ornament of a true Christian. He mentions as a proof of this, his noble foundation for lectures in defence of the gospel against infidels of all sorts; the effects of which have been so conspicuous in the many volumes of excellent discourses which have been published in consequence of that noble and pious foundation. He was at the charge of the translation and impression of the New Testament into the Malayan tongue, which he sent over all the East Indies. He gave a noble reward: to him that translated Grotius's incomparable book "Of the truth of the Christian religion" into Arabic; and was at the charge of a whole impression, which he took care should:

* Eccles. ix. 26.

Boyle. should be dispersed in all the countries where that language was understood. He was resolved to have carried on the impression of the New Testament in the Turkish language; but the company thought it became them to be the doers of it, and so suffered him only to give a large share towards it. He was at 700l. charge in the edition of the Irish bible, which he ordered to be distributed in Ireland; and he contributed liberally to the impression of the Welsh bible. He gave, during his life, 300l. to advance the design of propagating the Christian religion in America; and as soon as he heard that the East India Company were entertaining propositions for the like design in the east, he sent 100l. for a beginning, as an example, but intended to carry it much farther when it should be set on foot to purpose.

In other respects his charities were so bountiful and extensive, that they amounted, as this prelate tells us, from his own knowledge, to upwards of 1000l. a-year. But as our limits will not allow us to follow the bishop in the copious and eloquent account he has given of this great man's abilities, we must therefore content ourselves with adding the short eulogium by the celebrated physician, philosopher, and chemist, Dr Herman Boerhaave; who, after having declared Lord Bacon to be the father of experimental philosophy, asserts, that "Mr Boyle, the ornament of his age and country, succeeded to the genius and inquiries of the great chancellor Verulam. Which (says he) of all Mr Boyle's writings shall I recommend? All of them. To him we owe the secrets of fire, air, water, animals, vegetables, fossils: so that from his works may be deduced the whole system of natural knowledge." The reader perhaps may here be pleased to know, that Mr Boyle was born the same year in which Lord Bacon died.

As to the person of this great man, we are told, that he was tall, but slender; and his countenance pale and emaciated. His constitution was so tender and delicate, that he had divers sorts of cloaks to put on when he went abroad, according to the temperature of the air; and in this he governed himself by his thermometer. He escaped indeed the small-pox; but for almost forty years he laboured under such feebleness of body, and such lowness of strength and spirits, that it was astonishing how he could read, meditate, make experiments, and write, as he did. He had likewise a weakness of his eyes; which made him very tender of them, and extremely apprehensive of such distempers as might affect them. He imagined likewise, that if sickness should confine him to his bed, it might raise the pains of the stone to a degree which might be above his strength to support; so that he feared his last minutes should be too hard for him. This was the ground of all the caution and apprehension with which he was observed to live; but as to life itself, he had that just indifference for it which became a philosopher and a Christian. However, his sight began to grow dim not above four hours before he died; and when death came upon him, he had not been above three hours in bed before it made an end of him, with so little pain that the flame appeared to go out merely for want of oil to maintain it.

Mr Boyle was never married; but Mr Evelyn was assured, that he courted the beautiful and ingenious

daughter of Cary earl of Monmouth, and that to this passion was owing his "Seraphic Love." In the memorandum of Mr Boyle's life set down by Bishop Burnet, it is remarked that he abstained from marriage, at first out of policy, afterwards more philosophically; and we find by a letter of Dr John Wallis to him, dated at Oxford, July 17th 1669, that he had an overture made him with respect to the lady Mary Hastings, sister to the earl of Huntingdon: But it does not appear from any of his papers, that he had ever entertained the least thoughts of that kind; nay, there is a letter of his, wrote when he was young, to the lady Barrymore his niece, who had informed him of a report that he was actually married, which almost shows that he never did. The letter is written with great politeness, and in the true spirit of gallantry; and is a clear proof that though Mr Boyle did not choose to marry, yet it was no misanthropic cynical humour which restrained him from it. It is impossible to entertain the reader better than by presenting him with that part of it which concerns the point in question. "It is high time for me to hasten the payment of the thanks I owe your ladyship for the joy you are pleased to wish me, and of which that wish possibly gives me more than the occasion of it would. You have certainly reason, madam, to suspend your belief of a marriage, celebrated by no priest but fame, and made unknown to the supposed bridegroom. I may possibly ere long give you a fit of the spleen upon this theme; but at present it were incongruous to blend such pure raillery, as I ever prate of matrimony and amours with, among things I am so serious in as those this scribble presents you. I shall therefore only tell you, that the little gentleman and I are still at the old defiance. You have carried away too many of the perfections of your sex to leave enough in this country for reducing so stubborn a heart as mine; whose conquest were a task of so much difficulty, and so little worth it, that the latter property is always likely to deter any that hath beauty and merit enough to overcome the former. But though this untamed heart be thus insensible to the thing itself called *love*; it is yet very accessible to things very near of kin to that passion; and esteem, friendship, respect, and even admiration, are things that their proper objects fail not proportionably to exact of me, and consequently are qualities which in their highest degrees are really and constantly paid my lady Barrymore by her most obliged humble servant, and affectionate uncle, ROBERT BOYLE."

We shall conclude this account of Mr Boyle with the mention of his posthumous works, which are as follow. 1. "The general history of the air designed and begun." 2. "General heads for the natural history of a country, great or small; drawn out for the use of travellers and navigators." 3. "A paper of the honourable Robert Boyle's, deposited with the secretaries of the Royal Society, October 14th, 1680, and opened since his death; being an account of his making the phosphorus, September 30. 1680." Printed in the Philosophical Transactions. 4. "An account of a way of examining waters as to freshness or saltness." 5. "A free discourse against customary swearing, and a dissuasive from cursing, 1695, 8vo." 6. "Medicinal experiments, or a collection of choice remedies, chiefly simple and easily prepared, useful in families, and fit for the service of the country people. The third and last volume,

Boyle. volume, published from the author's original manuscript; whereunto is added several useful notes explanatory of the same," 1698, 12mo. Beautiful editions of all his works have been printed at London, in 5 volumes folio, and six volumes 4to.

BOYLE, Charles, earl of Orrery in Ireland, and baron of Maaton in the county of Somerset, was the second son of Roger the second earl of Orrery, and was born in August 1679. He was educated at Christ-church in Oxford, and soon distinguished himself by his learning and abilities. Like the first earl of Orrery, he was an author, a soldier, and a statesman. He translated the life of Lysander from the Greek of Plutarch; and published a new edition of the epistles of Phalaris, which engaged him in a literary dispute, in which he defended the genuineness of those epistles against Dr Bentley. He was three times member for the town of Huntingdon; but his elder brother, Lionel earl of Orrery dying on the 23d of August 1703 without issue, he succeeded to that title; and, entering into the queen's service, had a regiment given him, when he behaved with such bravery, that in 1709 he was raised to the rank of major-general, and sworn one of her majesty's privy council. At the famous battle of the Wood, he gave the strongest proofs of his intrepid courage, remaining at the head of his regiment in the warmest part of the action, till the victory was complete, which, as it was one of the most glorious, so it was the dearest bought, of any of that war. His lordship had the honour of being appointed the queen's envoy to the states of Brabant and Flanders; and having honourably discharged the trust, was raised to the dignity of a British peer, by the title of Lord Boyle, baron of Maaton, in Somersetshire. He enjoyed several other additional honours in the reign of King George I.; but having the misfortune to fall under the suspicion of the government, his lordship was committed to the Tower: he was, however, at length, admitted to bail; and nothing being found that could be esteemed sufficient ground for prosecution, he was discharged. His lordship died after a slight indisposition, on the 21st of August 1731. To his tutor Mr Atterbury, he probably owed a good part of that fine relish he had for the writings of the ancients. He made these his constant study, and expressed a high contempt, says Budgell, for the greater part of our modern wits and authors. He was delighted with the company of two sorts of persons; either such as were really geniuses of the first rank, who had fine understandings, strong judgments, and true tastes; or such as had a few foibles, and an eye of ridicule in them, which served to make him laugh. He would rally these in so agreeable, and yet in so tender a manner, that, though it diverted himself and others, it was never offensive to the person rallied. The instrument which was invented by him, and bears his name, representing the solar system according to the sentiments of the new astronomers, is an undeniable proof of his mechanic genius. His lordship had also a turn for medicine; which led him not only to buy and read whatever was published on that subject, but also to employ his friends to send him accounts of herbs and drugs in foreign countries.

BOYLE, John, earl of Cork and Orrery, a nobleman distinguished by his learning and genius, was the only son of Charles earl of Orrery, and was born on the

2d of January 1707. He was educated at Christ-church college in Oxford; but, as he himself declares, early disappointments, indifferent health, and many untoward accidents, rendered him fond of retirement, and of improving his talents for polite literature and poetry; of which last art he gave several excellent specimens. He also wrote a translation of Pliny the Younger's letter, with various notes, for the service of his eldest son the Lord Boyle, in two volumes, 4to. This was first published in 1751. The year following, he published the Life of Dean Swift, in several letters, addressed to his second son Hamilton Boyle; and afterwards printed Memoirs of Robert Cary earl of Monmouth, a manuscript presented to him by a relation, with explanatory notes. He died in 1762.

BOYLE'S Lectures, a course of eight sermons or lectures preached annually, set on foot by the honourable Robert Boyle, Esq. by a codicil annexed to his will in 1691; whose design, as expressed by the institutor, is, to prove the truth of the Christian religion against infidels, without descending to any controversies among Christians; and to answer new difficulties, scruples, &c. For the support of this lecture he assigned the rent of his house in Crooked-lane to some learned divine within the bills of mortality, to be elected for a term not exceeding three years, by the late Archbishop Tension and others. But the fund proving precarious, the salary was ill paid; to remedy which inconveniences, the said archbishop procured a yearly stipend of 50l. for ever, to be paid quarterly, charged on a farm in the parish of Brill in the county of Bucks. To this appointment we are indebted for many elaborate defences both of natural and revealed religion.

BOYNE, a river in Ireland, which rises in Queen's county in the province of Leinster, and runs north-east by Trim and Cavan, falling at last into the Irish channel a little below Drogheda. It is memorable for a battle fought on its banks between James II. and King William III. in which the former was defeated.

BOYSE, Boys or Bois, John, one of the translators of the Bible in the reign of James I. was son of William Bois, rector of West Stowe, near St Edmundsbury, Suffolk, and born at Nettlestead in Suffolk on the 3d of January 1560. He was taught the first rudiments of learning by his father; and his capacity was such, that at the age of five years he read the Bible in Hebrew. He went afterwards to Hadley school; and at 14 was admitted of St John's college, Cambridge, where he distinguished himself by his skill in Greek. Happening to have the small-pox when he was elected fellow, he, to preserve his seniority, caused himself to be carried in blankets to be admitted. He applied himself for some time to the study of medicine; but, fancying himself affected with every disease he read of, he quitted that science. He was ten years chief Greek lecturer in his college, and read every day. He voluntarily read a Greek lecture for some years at four in the morning, in his own chamber, which was frequented by many of the fellows. On the death of his father, he succeeded him in the rectory of West Stowe. At the age of 36, he married the daughter of Mr Holt, rector of Buxworth, in Cambridgeshire; whom he succeeded in that living, October 13. 1596. On his quitting the university, the college gave him

Boyse.

Boyse.

1001. His young wife, who was bequeathed to him with the living, which was an advowson, proving a bad economist, and he himself being wholly addicted to his studies, he soon became so much involved in debt, that he was obliged to sell his choice collection of books, consisting of almost every Greek author then extant. When a new translation of the Bible was by King James I. directed to be made, Mr Bois was elected one of the Cambridge translators. He performed not only his own, but also the part assigned to another, with great reputation; though with no profit, for he had no allowance but his commons. He was also one of the six who met at Stationers Hall to revise the whole; which task they went through in nine months, having each from the company of stationers, during that time 30s. a-week. He afterwards assisted Sir Henry Savile in publishing the works of St Chrysostom. In 1615, Dr Lancelot Andrews, bishop of Ely, bestowed on him, unasked, a prebend in his church. He died on the 14th of January 1643, in the 84th year of his age. He left a great many manuscripts behind him, particularly a Commentary on almost all the books of the New Testament.—When he was a young student at Cambridge, he received from the learned Dr Whitaker three rules for avoiding those distempers which usually attend a sedentary life, to which he adhered with equal constancy and success. The first was, To study always standing; the second, Never to study in a window; and the third, Never to go to bed with his feet cold.

BOYSE, *Joseph*, a late eminent dissenting minister in Dublin, much respected not only for learning and abilities, but his extensive humanity and undisssembled piety. During his ministerial charge at Dublin, he published many sermons which compose several folio volumes, a few poems, and other tracts; but what chiefly distinguished him as a writer, was the controversy he carried on with Dr King, archbishop of Dublin, and author of the *Origin of Evil*, concerning the office of a scriptural bishop. This controverted point was managed on both sides with great force of argument and calmness of temper. The bishop asserted, that the episcopal right of jurisdiction had its foundation in the New Testament: Mr Boyse, consistent with his principles, denied that any ecclesiastical superiority appeared there, with the greatest candour and good manners. He was father to

BOYSE, *Samuel*, the poet, a man remarkable for the fineness of his genius, the lowness of his manners, and the wretchedness of his life. He was born in 1708, and received the rudiments of his education in a private school in Dublin. When he was but 18 years old, his father, who probably intended him for the ministry, sent him to the university of Glasgow, that he might finish his education there. He had not been a year at the university, when he fell in love with the daughter of a tradesman in that city, and was imprudent enough to interrupt his education by marrying her before he had entered into his 20th year. The natural extravagance of his temper soon exposed him to want; and as he had now the additional charge of a wife, his reduced circumstances obliged him to quit the university, and go over with his wife (who also carried a sister with her) to Dublin, where they relied on the old gentleman for support. Young Boyse was of all men the furthest re-

Boyse.

moved from a gentleman; he had no graces of person, and fewer still of conversation. Never were three people of more libertine characters than young Boyse, his wife, and sister-in-law; yet the two ladies wore such a mask of decency before the old gentleman, that his fondness was never abated. The estate his father possessed in Yorkshire was sold to discharge his debts; and when the old man lay in his last sickness, he was entirely supported by presents from his congregation, and buried at their expence. We have no further account of Mr Boyse, till we find him soon after his father's death at Edinburgh. At this place his poetical genius raised him many friends, and some patrons of very great eminence. He published a volume of poems in 1731, to which are subjoined *The Tablature of Cobes*, and *A Letter upon Liberty*, inserted in the *Dublin Journal*, 1726; and by these he obtained a very great reputation. They are addressed to the countess of Eglinton. This amiable lady was the patroness of all men of wit, and greatly distinguished Mr Boyse while he resided in that country. Upon the death of the viscountess Stormont, Mr Boyse wrote an elegy, which was very much applauded by her ladyship's relations. This elegy he entitled *The Tears of the Muses*, as the deceased lady was a woman of the most refined taste in the sciences, and a great admirer of poetry. The lord Stormont was so much pleased with this mark of esteem paid to the memory of his lady, that he ordered a very handsome present to be given to Mr Boyse by his attorney at Edinburgh. The notice which Lady Eglinton and the lord Stormont took of our poet, recommended him likewise to the patronage of the duchess of Gordon; who was so solicitous to raise him above necessity, that she employed her interest in procuring the promise of a place for him. She gave him a letter, which he was next day to deliver to one of the commissioners of the customs at Edinburgh. It happened that he was then some miles distant from the city; and the morning on which he was to have rode to town with her grace's letter of recommendation proved to be rainy. This slender circumstance was enough to discourage Boyse, who never looked beyond the present moment: he declined going to town on account of the rainy weather; and while he let slip the opportunity, the place was bestowed upon another, which the commissioner declared he kept for some time vacant in expectation of seeing a person recommended by the duchess of Gordon. Boyse at last having defeated all the kind intentions of his patrons towards him, fell into contempt and poverty, which obliged him to quit Edinburgh. He communicated his design of going to London to the duchess of Gordon; who, having still a very high opinion of his poetical abilities, gave him a letter of recommendation to Mr Pope, and obtained another for him to Sir Peter King the lord chancellor of England. Lord Stormont recommended him to the solicitor-general his brother, and many other persons of the first fashion. Upon receiving these letters, he, with great caution, quitted Edinburgh, regretted by none but his creditors. Upon his arrival in London, he went to Twickenham, in order to deliver the duchess of Gordon's letter to Mr Pope; but that gentleman not being at home, Mr Boyse never gave himself the trouble to repeat his visit. He wrote poems; but those, though excellent in their kind, were lost to the world, by being introduced with no advantage.

He

Boyse.

He had so great a propensity to gravelling, that his acquaintances were generally of such a cast as could be of no service to him; and those in higher life he addressed by letters, not having sufficient confidence or politeness to converse familiarly with them. Thus unfit to support himself in the world, he was exposed to a variety of distresses, from which he could invent no means of extricating himself but by writing mendicant letters. It will appear amazing, that this man, of so abject a spirit, was voluptuous and luxurious; he had no taste for any thing elegant, and yet was to the last degree expensive. Can it be believed, that often when he had received but a guinea in consequence of a supplicating letter, he would go into a tavern, order a supper to be prepared, drink of the richest wines, and spend all the money that had just been given him in charity, without having any one to participate the regale with him, and while his wife and child were starving at home?

It was about the year 1740, that Mr Boyse, reduced to the last extremity of human wretchedness, had not a shirt, a coat, or any kind of apparel, to put on; the sheets in which he lay were carried to the pawn-broker's, and he was obliged to be confined to his bed with no other covering than a blanket. He had little support but what he got by writing letters to his friends in the most abject style; but was perhaps ashamed to let this instance of his distress be known, which probably was the occasion of his remaining six weeks in that situation. During this time he had some employment in writing verses for the Magazines; and whoever had seen him in his study, must have thought the object singular enough: he sat up in bed with the blanket wrapt about him, through which he had cut a hole large enough to admit his arm, and placing the paper upon his knee, scribbled in the best manner he could the verses he was obliged to make: whatever he got by those, or any other of his begging letters, was but just sufficient for the preservation of life. And perhaps he would have remained much longer in this distressful state, had not a compassionate gentleman, upon hearing this circumstance related, ordered his clothes to be taken out of pawn, and enabled him to appear again abroad.

About the year 1745, Mr Boyse's wife died. He was then at Reading, and pretended much concern when he heard of her death. His business at Reading was to compile a Review of the most material transactions at home and abroad during the last war: in which he has included a short account of the late rebellion. Upon his return from Reading, his behaviour was more decent than it had ever been before; and there were some hopes that a reformation, though late, would be wrought upon him. He was employed by a bookseller to translate *Benelon on the Existence of a God*; during which time he married a second wife, a woman in low circumstances, but well enough adapted to his taste. He began now to live with more regard to his character, and supported a better appearance than usual; but while his circumstances were mending, and his irregular appetites losing ground, his health visibly declined. He had the satisfaction, while in this lingering illness, to observe a poem of his, entitled *The Deity*, recommended by two eminent writers, the ingenious Mr Fielding,

and the reverend Mr James Harvey author of *The Meditations*.

Mr Boyse's mind was often religiously disposed; he frequently talked upon that subject, and probably suffered a great deal from the remorse of his conscience. The early impressions of his good education were never entirely obliterated; and his whole life was a continued struggle between his will and reason, as he was always violating his duty to the one, while he fell under the subjection of the other. It was in consequence of this war in his mind, that he wrote a beautiful poem called *The Recantation*. In May 1749, he died in obscure lodgings near Shoe-lane; but in sentiments, there is the greatest reason to believe, very different from those in which he had spent the greatest part of his life. An old acquaintance of his endeavoured to collect money to defray the expences of his funeral, so that the scandal of being buried by the parish might be avoided; but in vain; the remains of this son of the muses were, with very little ceremony, hurried away by the parish-officers.

Never was a life spent with less grace than that of Mr Boyse, and never were such distinguished abilities given to less purpose. His genius was not confined to poetry only: he had a taste for painting, music, and heraldry; with the latter of which he was very well acquainted. His poetical pieces, if collected, would make six moderate volumes. Many of them are scattered in *The Gentleman's Magazine*, marked with the letter Y, and *Alceus*. Two volumes were published in London. An ode of his in the manner of Spenser, entitled *The Olive*, was addressed to Sir Robert Walpole, which procured him a present of ten guineas. He translated a poem from the High Dutch of Van Haren, in praise of peace, upon the conclusion of that made at Aix-la-Chapelle; but the poem which procured him the greatest reputation was that upon the attributes of the Deity. He was employed by Mr Ogle to translate some of Chaucer's tales into modern English, which he performed with great spirit, and received at the rate of threepence a line for his trouble. Mr Ogle published a complete edition of that old poet's *Canterbury Tales modernized*; and Mr Boyse's name is put to such tales as were done by him. In 1743, Mr Boyse published, without his name, an ode on the battle of Dettingen, entitled *Albion's Triumph*.

BOZOLA, a town of Italy, in the duchy of Mantua, capital of a territory of the same name, and subject to the house of Austria. E. Long. 10. 25. N. Lat. 45. 9.

B. QUADRO, QUADRATO, or *Durale*, in Music, called by the French *b quarre*, from its figure \natural . This is what we call B natural or sharp, in distinction to B flat or flat. See FLAT and SHARP.

If the flat \flat be placed before a note in the thorough-bass, it intimates, that its third is to be minor; and if placed with any cypher over a note in the bass, as $\flat 6$, or $\flat 5$, &c. it denotes, that the fifth or sixth thereto are to be flat. But if the quadro \natural be placed over any note, or with a cypher, in the thorough-bass, it has the contrary effect; for thereby the note or interval thereto is raised to its natural order.

BRABANCIONES, in middle age writers, a kind of Netherland soldiery, infamous for rapine, being lit-

Boyse
Braban-
ciones.

Braban-
cioncs
Bracciolini.

the better than commissioned banditti, who hired themselves to fight for any that could pay them best. The word is variously written by the historians of those days; all given them from the country of Brabant, which was the chief nursery of those troops. They are also frequently confounded with the *Routiers*, *Routiers*, *Ruptarii*, *Ruterarii*, *Corteraux*, &c.

BRABANT, a large province of the Netherlands, with the title of a duchy. It is bounded on the north by the province of Holland and the duchy of Guelderland; on the east, by the same duchy and the bishopric of Liege; on the south, by the province of Namur and Hainault; and on the west, by Zealand. It was formerly divided into Dutch Brabant and Austrian Brabant; and is watered by several rivers, of which the Scheld, the Ruppel, and the Dommel, are the chief. The soil is very fertile; and it contains 26 fortified towns, of which Brussels is the capital.

BRABEJUM, the AFRICAN ALMOND. See BOTANY *Index*.

BRABEUTES, or BRABEUTA, in antiquity, an officer among the Greeks, who presided at the public games, and decided controversies that happened among the antagonists in the gymnastical exercises. The number of brabeutæ was not fixed; sometimes there was only one, but more commonly they amounted to nine or ten.

BRACCIANO, a town of St Peter's patrimony, about 12 miles north of Rome, situated on the west side of a lake to which it gives name. E. Long. 13. N. Lat. 42.

BRACCIOLINI, FRANCIS, an Italian poet, a native of Postoia, and the friend of Pope Urban VIII. was born about the year 1566. Removing to Florence, he was admitted into the academy there, and devoted himself to literature. At Rome he entered into the service of Cardinal Maffeo Barberini, with whom he afterwards went to France. After the death of Clement VIII. he returned to his own country, and for some years prosecuted his studies in retirement. When his patron Barberini was elected pope, under the name of Urban VIII. Bracciolini repaired to Rome, where he was well received, and made secretary to the pope's brother, Cardinal Antonio. He had also the honour conferred on him of taking a surname from the arms of the Barberini family, which were Bees; and thenceforth he was known by the name of *Bracciolini dell' Api*. He resided in Rome during the whole of that pontificate, frequenting the most illustrious academies, and listened to with general applause, but, at the same time, censured for his sordid avarice. He returned at length to his native city, where he died in the year 1645.

Bracciolini was a copious writer. There is scarcely any species of poetry, epic, dramatic, pastoral, lyric, or burlesque, which he did not attempt. He is principally noted for his mock-heroic poem, entitled *Scherno degli Dei*, which is a ridicule of the heathen mythology, and which disputes priority of date with Tassoni's *Secchia Rapita*. In merit, indeed, its inferiority is acknowledged, yet it obtained considerable applause. Of his serious heroic poems, the most celebrated is the *Croce Racquistata*, which by some is placed next to the great works of Ariosto and Tasso, but not without a large interval. He celebrated the elevation of his

patron Urban VIII. in a poem of twenty-three books, which shews with what facility he could write verses. His dramatic pastoral entitled *L'Amoroso Sdegno*, is accounted one of the best productions of the age in which it was written; and some of his tragedies met with much applause, particularly his *Evandro*.

BRACE is commonly taken for a couple or pair, and applied by huntsmen to several beasts of game, as a brace of bucks, foxes, hares, &c.

BRACE, or *Brasse*, is also a foreign measure, answering to our fathom. See FATHOM.

BRACE, in *Architecture*, a piece of timber framed in with bevil joints, the use of which is to keep the building from swerving either way. When the brace is framed into the kinglesses or principal rafters, it is by some called a *strut*.

BRACE, in writing or printing, a crooked line enclosing a passage, as in a triplet.

BRACES, in the sea-language, are ropes belonging to all the yards of a ship, except the mizen, two on each yard, reeved through blocks that are fastened to pennants, seized to the yard-arms. Their use is either to square or traverse the yards. Hence to brace the yard, is to bring it to either side. All braces come aftward on; as, the main brace comes to the poop, the main-top-sail brace comes to the mizen-top and thence to the main-shrouds; the fore and fore-top-sail braces come down by the main and main-top-sail stays, and so of the rest. But the mizen-bowline serves to brace to the yard, and the cross-jack braces are brought forwards to the main-shrouds, when the ship sails close by a wind.

BRACES of a Coach, thick straps of leather on which it hangs.

BRACELET, an ornament worn on the wrist, much used among the ancients; it was made of different materials, and in different fashions, according to the age and quality of the wearer. The word is French, *bracelet*; which Menage derives further from *bracellum*, a diminutive of *braciale*, a word occurring in writers of the Justinian age; all formed from the Latin *brachium*, *arm*. It amounts to the same with what was called by the ancients *armilla*, *brachiale*, *occabus*; in the middle age, *boga*, *bauga*, *armispatha*.

Bracelets are much worn by the savages of Africa, who are so excessively fond of them, as to give the richest commodities, and even their fathers, wives, and children, in exchange for those made of no richer materials than shells, glass-beads, and the like.

They form also, in modern civilized countries, a very common part of the ornaments of the ladies.

BRACHIÆUS, the name of a muscle. See ANATOMY, *Table of the Muscles*.

Coraco-BRACHIALIS. See ANATOMY *Index*.

BRACHIUM, or ARM. See ANATOMY *Index*.

BRACHMINS, or BRACHMANS, a branch of the ancient Gymnosophists, or philosophers of India, remarkable for the severity of their lives and manners. See the article GYMNOSOPHISTS.

Some say they derive their name from the patriarch Abraham, whom they call in their language *Brachma*, or *Brama*. Others deduce it from the name of their god *Brachma*; which some again take to be the same with Abraham: whence Postel calls them *Abrachmans*.

F. Thomassin

Brachmins
|
Brackets.

F. Thomassin derives the word from the Hebrew *barach*, to fly or escape; because the Brachmans retire into the country and live in deserts. The same author gives us another derivation, viz. from the Hebrew *barach* (*benedicere, orare*), to bless or pray; in regard this is their principal occupation.—The Greeks ascribe to them the doctrine of the immortality of the soul, and certain notions concerning the nature of the Supreme Being and future rewards and punishments. To this species of knowledge the Brachmans added an infinite number of religious observances, which were adopted by Pythagoras in his school; such as fasting, prayer, silence, and contemplation. They were looked upon as the friends of the gods, because they affected to pay them so much regard; and as the protectors of mankind, because they paid them no regard at all. No bounds were therefore set to the respect and gratitude that were shown them: princes themselves did not scruple to consult these recluses upon any critical conjuncture, from a supposition, no doubt, that they were inspired; since it was impossible to imagine that they had the advantages of experience. We can scarcely, however, deny, that there might be among them some men of real virtue, whose minds relished the pure and ingenious delights of study and science; and who, by nobly raising their thoughts to the contemplation of the First Being, must have had more powerful incitements to render themselves worthy of his care, and none to justify them in deceiving and tyrannizing over their fellow-creatures.

There appear still some remains of the ancient brachmans in the east, under the denomination of Bramins. See BRAMINS.

BRACHYGRAPHY, the art of short-hand-writing. See SHORT HAND.

BRACHYLOGY, (from *βραχυς* and *λογος* "expression"), in *Rhetoric*, the expressing any thing in the most concise manner. This, so far as consistent with perspicuity, is a virtue and beauty of style; but if obscurity be the consequence, which is often the case, it becomes a blemish and inexcusable defect.—Quintilian gives an instance of brachylogy from Sallust: *Mithridates corpore ingenti perinde armatus*; "Mithridates, as it were, armed with the hugeness of his stature."

BRACHYPTERA, a term used by Willoughby, to denote those hawks which have their wings so short as not to reach to the end of the tail. Of this kind are the goshawk, sparrow hawk, &c.

BRACHYPRENIA, in the history of fossils, a genus of septariæ, with a short, roundish nucleus. See SEPTARIA.

BRACHYTELOSTYLA, in *Natural History*, the name by which Dr Hill calls those crystals which are composed of a short hexangular column terminated at each end by an hexangular pyramid. See CRYSTAL.

BRACKET, among carpenters, &c. a kind of wooden stay, serving to support shelves and the like.

BRACKETS, in a ship, the small knees, serving to support the galleries, and commonly carved. Also the timbers that support the grating in the head are called brackets.

BRACKETS, in *Gunnery*, are the cheeks of the carriage of a mortar: they are made of strong planks of wood, of almost a semicircular figure, and bound round with thick iron plates; they are fixed to the beds by four bolts, which are called *bed-bolts*; they rise up on

each side of the mortar, and serve to keep her at any elevation by means of some strong iron bolts, called *bracket-bolts*, which go through these cheeks or brackets. Brackets. Bradford.

BRACKLAU, a strong town in Poland, capital of a palatinate of the same name. The houses are built of wood. It was taken by the Turks in 1672, but retaken three years afterwards. It is seated on the river Bog, in E. Long. 29. 20. N. Lat. 48. 5.

BRACKLAW, a palatinate of that name, which is the eastern part of Podolia; it is also called *Lower Podolia*, and is of greater extent than Upper Podolia, but is more desolate, on account of the neighbourhood of the Tartars.

BRACKLEY, a borough-town in Northamptonshire, in England, seated on the edge of the county, next Buckinghamshire, on a branch of the river Ouse. It is an ancient and large corporation-town, containing two parish-churches; is governed by a mayor and aldermen; and sends two members to parliament. It had formerly a college, which is turned into a free school. W. Long. 1. 15. N. Lat. 52. 0.

BRACTEA, in *Natural History*, denotes a spangle, or thin flake of any substance.

BRACTEA, in *Botany*, a thin leaf or plate of any *folium florale*, ranged by Linnæus among the *fulcra* of plants. These floral leaves differ in shape and colour, from the other *folia* of the plant; and are generally situated on the pedunculus, and often so near the corolla as to be easily mistaken for the *calyx*; than which, however, the *bractæ* are generally more permanent. Examples of the floral leaves are seen in the *tilia*, *fumaria bulbosa*, *lavendula* and *herminum*.

BRACTEARIA, in *Natural History*, a genus of talcs, composed of small plates in form of spangles, each plate either being very thin, or fissile into very thin ones.

Of this genus there are a great many species, called from their different colours, *mica aurea*, or gold-glimmer; and *mica argentea*, silver-glimmer, or cats-silver, &c.

BRACTON, HENRY, lord chief justice of England in the reign of Henry III. was probably a native of Devonshire. He was educated at Oxford, where he took the degree of doctor of laws, and was made one of the itinerant judges about the year 1244. Ten years after he became chief justice, and had the earl of Derby's house in London assigned him for his town residence, during the minority of that nobleman. He is said to have filled this important office with singular reputation during 20 years. When he died is not known; probably it was in the reign of Edward I. He wrote *De legibus et consuetudinibus Angliæ*, which is one of the most ancient, and also most methodical books on our laws. His method is copied from Justinian. This work was printed at London in 1569, folio; and in 1640, 4to. The first is very incorrect.

BRAD, a town of Sclavonia, seated on the north side of the river Save, in E. Long. 18. 40. N. Lat. 45. 20.

BRADFIELD, a town of Essex in England, in E. Long. 0. 30. N. Lat. 51. 14.

BRADFORD, a town of Wiltshire in England, seated in W. Long. 2. 40. N. Lat. 51. 20.

BRADFORD, *John*, a divine, and martyr to the reformation,

Bradford

Bradley.

formation, was born in the former part of the reign of Henry VIII. at Manchester in Lancashire. Being a remarkable penman and accountant, he became secretary to Sir John Harrington, who was several times employed by King Henry, and his successor Edward VI. as paymaster to the troops abroad. Bradford at this time was a gay man, and to support his extravagance made free with the king's money; but being at last unable to support the reflection of his guilt, he determined to make restitution, and actually repaid the money. Quitting his employment of secretary, about the year 1547, he took chambers in the inner temple, and for some time studied the law; but finding in himself an inclination to preach the gospel, in the following year he removed to Catbarine-hall in Cambridge, where he applied with such uncommon assiduity to the study of divinity, that in a much shorter time than usual he was admitted to the degree of master of arts, and soon after made fellow of Pembroke-hall. Bishop Ridley, who, in 1550, was translated to the see of London, charmed with Bradford's application and zeal, now sent for him to the metropolis, ordained and appointed him his chaplain. In 1553, he was also made chaplain to Edward VI. during which time he became one of the most popular preachers in the kingdom. Such a reformer was too dangerous to be suffered in the succeeding reign. Mary was hardly in possession of the crown, before Bradford's persecutions began. He was first confined in the Tower for sedition, where he continued a year and a half; during which time he wrote several epistles that were dispersed in various parts of the kingdom. He was afterwards removed to other prisons, and at last brought to his trial before that infernal court of inquisition in which Gardiner sat as chief inquisitor, where he defended his principles to the last, in contempt of their utmost power. They condemned him to the flames; and he was accordingly burnt alive in Smithfield, on July 1. 1555. His works are, 1. Seventy-two letters, written to various people, whilst the author was in prison; printed in Bishop Coverdale's collection. 2. Ten letters, printed in Fox's Acts and Monuments. 3. Complaint of verity, 1559, 8vo. 4. Three examinations before the commissioners, and his private talk with the priests, with the original of his life, 1561, octavo. 5. Two notable sermons 1574, octavo, 1631. 6. Godly meditations and prayers 1614, 24to. 7. Treatise of repentance, 1622. With several translations and other pieces.

BRADFORTH, a town in the west of Yorkshire, seated on a breach of the river Aire, containing 7767 inhabitants in 1811. W. Long. 1. 35. N. Lat. 53. 40.

BRADLEY, DR JAMES, a famous English astronomer, was the third son of William and Jane Bradley, and was born at Sherborne in Dorsetshire in the year 1692.

He was educated for the university at North Leach by Mr Egles and Mr Brice, who kept a boarding-school there; and from North Leach he was sent to Oxford. His friends intended him for the church, and his studies were regulated with that view; and as soon as he was of sufficient age to receive holy orders, the bishop of Hereford, who had conceived a great esteem for him, gave him the living of Bridstow, and soon after he was inducted to that of Welfrie in Pembrokeshire. But notwithstanding these advantages, from which he

might promise himself still farther advancement in the church, he at length resigned his livings, that he might be wholly at liberty to pursue his favourite study the mathematics, and particularly astronomy. He was nephew to Mr Pound, a gentleman who is well known in the learned world by many excellent observations, and who would have enriched it with more, if the journals of his voyages had not been burnt at Pulo Comdore, when the place was set on fire, and the English who were settled there cruelly massacred, Mr Pound himself very narrowly escaping with his life. With this gentleman, Mr Bradley passed all the time that he could spare from the duties of his function; and perhaps he sometimes trespassed upon them: he was then sufficiently acquainted with the mathematics to improve by Mr Pound's conversation; yet it does not appear that, in this study, he had any preceptor but his genius, or any assistant but his labour.

It may be easily imagined, that the example and conversation of Mr Pound did not render Bradley more fond of his profession than he was before; he continued, however, as yet to fulfil the duties of it, though at this time he had made such observations as laid the foundation of those discoveries which afterwards distinguished him as one of the greatest astronomers of his age. Though these observations were made as it were by stealth, they gained him at first the notice, and then the friendship, of the lord chancellor Macclesfield, Mr Newton, afterwards Sir Isaac, Mr Halley, and many other members of the Royal Society, into which he was soon elected a member. About the same time, the chair of Savilian professor of astronomy became vacant by the death of the celebrated Dr Keil; and Mr Bradley was elected to succeed him on the 31st of October 1721, being then just 29 years old; and his colleague was Mr Halley, who was professor of geometry on the same foundation. Bradley, upon his being elected into this professorship, gave up both his livings, and with great joy quitted a situation in which his duty was directly opposite to his inclination. From this time, he applied himself wholly to the study of his favourite science; and in the year 1727 he published his theory of the aberration of the fixed stars, which is allowed to be one of the most useful and ingenious discoveries of modern astronomy. Three years after this discovery, by which Mr Bradley acquired very great reputation, he was appointed lecturer in astronomy and physics, at the museum of Oxford.

He pursued his studies with equal application and delight; and in the course of his observations, which were innumerable, he discovered that the inclination of the earth's axis upon the plane of the ecliptic was not always the same, but that it varied backwards and forwards some seconds, and that the period of these variations was nine years. This period seemed altogether unaccountable, as it could not be supposed to have any thing in common with the revolution of the earth, which is performed in one year. Mr Bradley, however, discovered the cause of this phenomenon in the Newtonian system of attraction. He published this discovery in 1737, so that in the space of about ten years he communicated to the world two of the finest discoveries in modern astronomy, which will for ever make a memorable epocha in the history of that science.

Mr

Bradley.

Mr Bradley always preserved the esteem and friendship of Mr Halley; who, being worn out by age and infirmities, thought he could do nothing farther for the service of astronomy, than procure for Mr Bradley the place of regius professor of astronomy at Greenwich, which he had possessed himself many years with the greatest reputation. With this view, he wrote many letters, which have been since found among Mr Bradley's papers, desiring his permission to apply for a grant of the reversion of it to him, and even offering to resign in his favour, if it should be thought necessary: but before Mr Halley could bring this kind project to bear, he died. Mr Bradley, however, obtained the place afterwards, by the favour and interest of Lord Macclesfield, who was afterwards president of the Royal Society. As soon as the appointment of Mr Bradley to this place was known, the university of Oxford sent him a diploma creating him doctor of divinity. The appointment of astronomer at Greenwich placed Mr Bradley in his proper element, and he pursued his observations with unwearied diligence. However numerous the collection of astronomical instruments at the observatory at Greenwich, it was impossible that such an observer as Dr Bradley should not desire to increase them, as well to answer those particular views, as in general to make observations with greater exactness. In the year 1748, therefore, he took the opportunity of the annual visit made by the Royal Society to the observatory, in order to examine the instruments and receive the professor's observations for the year, to represent so strongly the necessity of repairing the old instruments, and purchasing new, that the society thought proper to represent it to his majesty, and his majesty gave them 1000*l.* for that purpose. This sum was laid out under the direction of Dr Bradley, who, with the assistance of the late celebrated Mr Graham and Mr Bird, furnished the observatory with as complete a collection of astronomical instruments, as the most skilful and diligent observer could desire. Dr Bradley, furnished with such assistance, pursued his observations with new assiduity, an incredible number of which were found after his death, and put into the hands of the Royal Society.

It has been already observed, that when Dr Bradley was elected to the professor's chair at Oxford, he gave up his two livings, which were at such a distance, that he could not possibly fulfil the duties of them himself; but it happened that after he was settled at Greenwich the living of that parish became vacant, which is very considerable, and which was offered to him, as he was upon the spot to perform the duty, and had the claim of uncommon merit to the reward. This living, however, Dr Bradley, very greatly to his honour, refused, fearing the duties of the astronomer would too much interfere with those of the divine. His majesty, however, hearing of the refusal, was so pleased with it, that he granted him a pension of 250*l.* a-year, in consideration of his great abilities and knowledge in astronomy and other branches of the mathematics, which had procured so much advantage to the commerce and navigation of Great Britain, as is particularly mentioned in the grant, which is dated the 15th of February 1752. Dr Bradley, about the same time, was admitted into the council of the Royal Society. In the year 1748, he was admitted a member of the royal

academy of sciences and belles lettres of Berlin, upon the death of M. Crevier, first physician to his Catholic majesty; in the year 1752, a member of the imperial academy at Petersburg; and in 1757, of that instituted at Bologna.

Bradley
Bradshaw.

Dr Bradley was still indefatigable in his observations, and whatever honour he received became an incitement to obtain new distinction; his corporeal abilities, however, at length declined, though his intellectual suffered no abatement. In the year 1780, he became extremely weak and infirm; and towards the end of June 1762, he was attacked with a total suppression of urine, caused by an inflammation of the reins, which on the 12th of July following put an end to his life, in the 70th year of his age. He was buried at Mitchin Hampton, in Gloucestershire, in the same grave with his mother and his wife. In the year 1744, he married Susannah Peach, the daughter of a gentleman of that name in Gloucestershire, by whom he had only one daughter.

As to his character, he was remarkable for a placid and gentle modesty, very uncommon in persons of an active temper and robust constitution. It was still more remarkable, that, with this untroubled equanimity of temper, he was compassionate and liberal in the highest degree. Although he was a good speaker, and possessed the rare but happy art of expressing his ideas with the utmost precision and perspicuity, yet no man was a greater lover of silence, for he never spoke but when he thought it absolutely necessary. He did indeed think it necessary to speak when he had a fair opportunity to communicate any useful knowledge in his own way; and he encouraged those that attended his lectures to ask him questions, by the exactness with which he answered, and the care he took to adapt himself to every capacity. He was not more inclined to write than to speak, for he has published very little; he had a natural diffidence, which made him always afraid that his works should injure his character; and therefore suppressed many, which probably were well worthy of the public attention. He was even known, as it were, in spite of himself; and, in spite of himself, he was known much, and consequently much esteemed. He was acquainted with many of the first persons in this kingdom, persons eminent as well for their rank as their abilities; he was honoured by all men of learning in general; and there was not an astronomer of any eminence in the world with whom he had not a literary correspondence. Upon the whole, it may be said of Dr Bradley, that no man cultivated great talents with more success, or had a better claim to be ranked among the greatest astronomers of his age.

BRADNINCH, a town of Devonshire, once a considerable place, but some time ago totally destroyed by fire. W. Long. 3. 35. N. Lat. 50. 45.

BRADS, among artificers, a kind of nails used in building, which have no spreading heads as other nails have. They are distinguished by ironmongers by six names; as *joiner's brads*, *flooring-brads*, *batten-brads*, *bill-brads*, or *quarter-heads*, &c. Joiners-brads are for hard wainscot; batten-brads are for soft wainscot; bill-brads are used when a floor is laid in haste, or for shallow joists subject to warp. See NAIL.

BRADSHAW, HENRY, a Benedictine monk, was born at Chester, about the middle of the 15th century. Discovering

Bradshaw
||
Brady.

Discovering an early propensity to religion and literature, he was received while a boy into the monastery of St Werberg in that city; and having there imbibed the rudiments of his education, he was afterwards sent to Gloucester college, in the suburbs of Oxford, where for a time he studied theology with the novices of his order, and then returned to his convent at Chester: here, in the latter part of his life, he applied himself chiefly to the study of history, and wrote several books. He died in the year 1513, the fifth of Henry VIII. His poetry is not inferior to that of any of his contemporaries. His works are, 1. *De antiquitate et magnificentia urbis Cestriæ*. 2. *Chronicon*. 3. The life of the glorious virgin St Werberg. Printed Lond. 1521, 4to, in verse. The life of St Werberg makes only part of this work; for it contains also a description of the kingdom of Mercia, life of St Etheldred, the life of St Sexburg, the foundation and history of Chester, and the chronicles of some kings. Possibly this work may include the two first. Bishop Tanner says that he wrote a chronicle in English verse, extracted from Bede, Malmsbury, Giraldus, and others. Probably this is the chronicle above mentioned.

BRADWARDIN, THOMAS, archbishop of Canterbury, was born at Hartfield in Sussex, about the close of the 13th century. He was educated at Merton college, Oxford, where he took the degree of doctor of divinity; and acquired the reputation of a profound scholar, a skilful mathematician, and consummate divine. Authors are not agreed as to his first preferments. Pitt says he was professor of divinity at Oxford. They agree, however, in asserting, that from being chancellor of the diocese of London, he became a courtier and confessor to Edward III. whom he constantly attended during his war with France, assisting that victorious prince with his advice, animating the troops, and fervently praying for their success. After his return from the war, he was made prebendary of Lincoln, and afterwards archbishop of Canterbury. He died at Lambeth in the year 1349, forty days after his consecration; and was buried in St Anselm's chapel, near the south wall. His works are, 1. *De causa Dei*, printed at London, 1618, published by J. H. Savil. 2. *De geometria speculativa*, &c. Paris, 1495, 1512, 1530. 3. *De arithmetica practica*, Paris, 1502, 1512. 4. *De proportionibus*, Paris, 1495. Venice, 1505, folio. 5. *De quadratura circuli*, Paris, 1495, folio.

BRADY, ROBERT, born in Norfolk in 1643, was master of Caius college, Cambridge, regius professor there, and twice representative of that university in parliament. In 1685, he was made keeper of the records in the Tower, and was physician in ordinary to James II. He wrote, An introduction to Old English history; A history of England, from the time of the Romans to the end of the reign of Richard II.; and, A treatise on English boroughs. He died in 1700.

BRADY, Nicholas, an excellent divine and poet, born at Bandon, in the county of Cork, October 28th 1659. He studied at Westminster-school, and afterwards at Oxford and Dublin college. He was a zealous promoter of the Revolution; and, in 1690, when the troubles broke out in Ireland, by his interest with M'Carty, King James's general, he thrice prevented the burning of the town of Bandon. Having quitted several preferments in Ireland, he settled in London,

where he was successively promoted to several livings; and at the time of his death was rector of Clapham, minister of Richmond, and chaplain to the duke of Ormond's troop of horse-guards. He wrote part of the new version of the Psalms, now sung in many churches in England and Ireland; the *Æneids* of Virgil, in 4 vols; and 3 vols of sermons. He died May 20th 1726.

BRADYPUS, or SLOTH, a genus of quadrupeds, belonging to the order of bruta. See MAMMALIA Index.

BRAE-MAR, a mountainous territory of Scotland, in the shire of Aberdeen, where the last earl of Mar began to raise a rebellion in 1715. It is 27 miles north-west of Aberdeen.

BRAE-Murray, a mountainous and woody tract of land, lying in the shires of Elgin and Nairn in Scotland.

BRAG, an ingenious and pleasant game at cards, where as many may partake as the cards will supply; the eldest hand dealing three to each person at one time, and turning up the last card all round. This done, each gamester puts down three stakes, one for each card.—The first stake is won by the best card turned up in the dealing round; beginning from the ace, king, queen, knave, and so downwards. When cards of the same value are turned up to two or more of the gamesters, the eldest hand gains; but it is to be observed, that the ace of diamonds wins, to whatever hand it be turned up.—The second stake is won by what is called the *brag*, which consists in one of the gamesters challenging the rest to turn up cards equal to his: Now it is to be observed, that a pair of aces is the best brag, a pair of kings the next, and so on; and a pair of any sort wins the stake from the most valuable single card. In this part consists the great diversion of the game; for, by the artful management of the looks, gestures, and voice, it frequently happens, that a pair of fives, treys, or even deuces, outrags a much higher pair, and even some pairs royal, to the no small merriment of the company. The knave of clubs is here a principal favourite, making a pair with any other card in hand, and with any other two cards a pair royal.—The third stake is won by the person who first makes up the cards in his hand one and thirty; each dignified card going for ten, and drawing from the pack, as usual in this game.

BRAGA, the capital of the province of Entre-minho-duro, in Portugal, situated on the river Cavado, in W. Long. 8. 40. N. Lat. 41. 20.

BRAGANZA, a city of Portugal, and capital of a duchy of the same name. It is seated on an eminence, by a brook called *Farvenca*; and is divided into two parts, the old city and the town. The former is upon an eminence, and fortified with a double wall. That part next the town has five bastions, but no ditch; the citadel is on the opposite side joined to the wall. The town is in a plain, and defended by a fort with four bastions. It is seated near the river Sabor, on the frontiers of Galicia, in W. Long. 6. 15. N. Lat. 41. 27.

BRAGGOT, a kind of drink made of malt, honey, and spices, much used in Wales.

BRAHE, TYCHO, a celebrated astronomer, descended of an illustrious family originally of Sweden, but settled at Denmark, was born December 14. 1546, at

Brady
||
Brahe.

Brahe.

at Knudstorp in the county of Schonon. He was taught Latin when seven years old, and studied five years under private tutors. His father dying, his uncle sent him, in April 1559, to study philosophy and rhetoric at Copenhagen. The great eclipse of the sun on the 21st of August 1560, happening at the precise time the astronomers had foretold, he began to look upon astronomy as something divine; and purchasing the tables of Stadius, gained some notion of the theory of the planets. In 1562, he was sent by his uncle to Leipsic to study law; but astronomy wholly engrossed his thoughts, and in purchasing books on that science he employed all his pocket-money. Having procured a small celestial globe, he was wont to wait till his tutor was gone to bed, in order to examine the constellations and learn their names; and when the sky was clear, he spent whole nights in viewing the stars. In 1565, a difference arising between Brahe and a Danish nobleman, they fought, and the former had part of his nose cut off; which defect he so artfully supplied with one made of gold and silver, that it was not perceivable. It was about this time that he began to apply to chemistry, proposing nothing less than to obtain the philosopher's stone. In 1571, he returned to Denmark; and was favoured by his mother's brother, Steno Belle, a lover of learning, with a convenient place at his castle of Herritzvad near Knudstorp, for making his observations, and building a laboratory. His marrying a country girl, beneath his rank, occasioned such a violent quarrel between him and his relations, that the king was obliged to interpose to reconcile them. In 1574, by his majesty's command, he read lectures upon the theory of the comets at Copenhagen. The year following he began his travels through Germany, and proceeded as far as Venice: he then resolved to remove his family, and settle at Basil; but Frederic II. king of Denmark being informed of his design, and unwilling to lose a man that was capable of being such an ornament to his country, promised to enable him to pursue his studies, to bestow upon him for life the island of Huen in the Sound, to erect an observatory and laboratory there, and to defray all the expences necessary for carrying on his designs. Tycho Brahe readily embraced this proposal; and accordingly the first stone of the observatory was laid August 8. 1576. The king also gave him a pension of 2000 crowns out of the treasury, a fee in Norway, and a canoury of Roschild, which brought him in 1000 more. James VI. of Scotland, afterwards raised to the crown of England, going to Denmark in order to marry the princess Anne, paid a visit to our author in his retirement at Uraniaburg, made him several presents, and with his own hand wrote a copy of verses in his praise; but, soon after the death of King Frederic, he was deprived of his pension, fee, and canoury; upon which, finding himself incapable of bearing the expences of his observatory, he went to Copenhagen, whither he brought some of his instruments, and continued his astronomical observations in that city, till Valkendorf, chamberlain to the household of Christian IV. commanded him by the king's order to discontinue them. He then removed his family to Rostock, and afterwards to Holstein, in order to solicit Henry Ranzou to introduce him to the emperor; and that gentleman complying with his request,

VOL. IV. Part I.

he was received by the emperor at Prague with the utmost civility and respect. That prince gave him a magnificent house, till he could procure one for him more fit for astronomical observations; assigned him a pension of 3000 crowns; and promised upon the first opportunity, a fee for him and his descendants: but he did not long enjoy this happy situation; for, upon the 24th of October 1601, he died of a retention of urine, in the 55th year of his age, and was interred in a very magnificent manner in the principal church at Prague, where a noble monument was erected to him. — His skill in astronomy is universally known, and he is famed for being the inventor of a new system, which he endeavoured, though without success, to establish upon the ruins of that of Copernicus. He was very credulous with regard to judicial astrology and presages. If he met an old woman when he went out of doors, or a hare upon the road in a journey, he used to turn back immediately, being persuaded that it was a bad omen. When he lived at Uraniaburg, he had at his house a madman, whom he placed at his feet at table, and fed himself. As he imagined that every thing spoken by mad persons presaged something, he carefully observed all that this man said; and because it sometimes proved true, he imagined it might always be depended on. A mere trifle put him in a passion; and against persons of the first rank, with whom it was his duty to keep on good terms, he openly discovered his resentment. He was very apt to rally others, but highly provoked if the same liberty was taken with himself. His principal works are, 1. *Progymnasmata astronomica*. 2. *De mundi aetherei recentioribus phaenomenis*. 3. *Epistolarum astronomicarum liber*.

BRAHMA. See BRAMA.

BRAIDALBIN, a district of Perthshire in Scotland, stretching 32 miles from east to west, and 13 where broadest from south to north. It is a mountainous country, lying among the Grampian hills, supposed to be the country anciently known by the name of *Albani*; whence the Highlanders to this day call themselves *Albinich*. It is bounded on the west by Lochaber, Lorn, and Knapdale; on the north and east, by part of Lochaber and part of Athol; and on the south by Strathern and Monteith. It produces plenty of game and black cattle; is inhabited by Highlanders said to be the most ferocious in all Scotland; and gives the title of earl to a branch of the Campbell family, which is possessed of a noble and magnificent seat in this division. Much flax is cultivated here. Some years ago, when premiums were given for the greatest crops, from 70 to 120 hogsheds of linseed were annually sown, each peck yielding two stones of dressed flax; and when the yarn sold highest, 2000l. worth has been sold out of the country. Oats and potatoes are the other crops. Oats yield from four to six fold at the most, oftener less; bear from eight to ten, at an average six. The corn raised seldom suffices the number of inhabitants, so they are often obliged to have recourse to importation. From their potatoes some have distilled a very strong spirit, which has been found cheaper than what is distilled from any grain. Starch is also made from them; and, in some places, bread. Corcur, or the *lichen omphaloides*, is an article of commerce; great quantities have been scraped from the rocks, and exported for the use of the dyers,

Brahe

Braidalbin.

Braidalbin at the price of 1s. or 16d. per stone. A good many sheep are reared here, and much wool is sent out of the country. There are few horses raised in this country: such as feed on the tops of the higher hills are often afflicted with a distemper that commonly proves fatal, if a remedy is not applied within 24 hours. It attacks them in the months of July and August, usually after a fall of rain, or before the dew rises in the morning. An universal swelling spreads over the body; the remedy is exercise, chafing, or any other method that promotes urine and perspiration. The common people attribute this evil to a certain animal that scatters its poison over the grass; but more probably it arises from some noxious vegetable, hitherto unobserved. Before the year 1745, Lord Braidalbin was obliged to keep a constant guard for the protection of his vassals cattle, or to retain spies among the thievish clans; having too much spirit to submit to pay an infamous tax, called *black mail*, to the plundering chieftans, as the price of their safety.

Bramber.

BRAIL, or **BRAILS**, in a ship, are small ropes made use of to furl the sails across: they belong only to the two courses and the mizen-sail; they are reeved through the blocks, seized on each side the ties, and come down before the sail, being at the very skirt thereof fastened to the cringles; their use is, when the sail is furled across, to hale up its bunt, that it may the more easily be taken up or let fall. Hale up the brails, or brail up the sail; that is, Hale up the sail, in order to be furled or bound close to the yard.

BRAILOW, a town of Poland, in the province of Podolia, seated on the river Bog, in E. Long. 29. 0. N. Lat. 43. 50.

BRAIN, in *Anatomy*, is that large, soft, whitish mass, enclosed in the cranium or skull; wherein all the organs of sense terminate, and the soul is supposed principally to reside. See *ANATOMY Index*.

BRAIN le Comte, a town of the Austrian Netherlands, in the province of Hainault. E. Long. 4. 11. N. Lat. 50. 35.

BRAINTREE, a large town of Essex in England, situated in E. Long. 0. 30. N. Lat. 51. 50.

BRAKE, denotes female fern, or the place where it grows.—Also a sharp bit or snaffle for horses; and a baker's kneading-trough.—Also an instrument with teeth to bruise flax or hemp. See *FLAX-Dressing*.

BRAKEL, a town of Germany, in the bishopric of Paderborn. E. Long. 9. 8. N. Lat. 51. 46.

BRAMA, or **BRUMA**, a pagan deity of the East Indies. He is the first person of a kind of trinity in their theology; is the great progenitor of mankind; and has created as many worlds as there are considerable parts in his body. See the article **BRACHMANS**, **BRAMINS**, and **INDOSTAN**.

BRAMA, in *Ichthyology*, the trivial name of a species of cyprinus.
